**ABSTRACT**

As a supplement to the March 1982 Current Population Survey, the Bureau of the Census collected data on age, marital status, education, voting and registration, fertility, employment, family composition and size, income, and poverty status of Spanish-origin persons residing in the United States. Data were compared to data for the overall population and for persons not of Spanish origin. Data indicated that in March 1982 there were about 14 million Hispanics in the United States. About 11% were under 5 years of age and 4% were 65 years old and over. The proportion of single Hispanic women (26%) was substantially lower than the proportion of single Spanish men (34%). About 46% of Hispanic persons 25 years old and over were high school graduates. Of the 8.8 million Hispanics 18 years old and over, only 35% had registered to vote in the November 1982 election; only 25% had voted. Spanish-origin women 15 to 44 years old had borne more children on the average than had non-Spanish women. Spanish-origin families averaged about 3.89 persons per family compared to 3.22 persons for non-Spanish families. In 1981, 24% of Spanish families were below the poverty level compared to 10% for non-Hispanic families. (NQA)

# PERSONS OF SPANISH ORIGIN IN THE UNITED STATES: MARCH 1982

## INTRODUCTION

This report represents a continuation of the annual series of reports presenting demographic, social, and economic data on persons of Spanish origin<sup>1</sup> residing in the United States. Most of the data shown were collected as a supplement to the March 1982 Current Population Survey (CPS) of the Bureau of the Census; additional data from other CPS supplements also are included.

This report includes data for the total Spanish-origin population and its subcategories: Mexican, Puerto Rican, Cuban, Central or South American, and Other Spanish origin.<sup>2</sup> Among the characteristics presented are age, marital status, education, voting and registration, fertility, employment, family composition and size, income, and poverty status. In addition to the data for the Hispanic-origin population, data for

the overall population and for persons not of Spanish origin also are shown in the report.

The March 1982 CPS estimated a total of 14.0 million Hispanics in the United States. There is some statistical evidence that this 1982 estimate was lower than the 14.6 million Hispanics counted in the 1980 census. (The March 1980 and March 1981 CPS estimates of Hispanics were also lower than the 1980 census count.) This inconsistency is a result of several factors, outlined in Appendix A, Methodology for the Development of Preliminary-Independent Post-Censal Estimates of Hispanics.

To establish conformity between the March 1982 CPS estimates of the Spanish-origin population and the 1980 census count of that population, the Census Bureau has developed national post-censal estimates of Hispanics to serve as controls for the CPS estimates. For April 1, 1981 the controls produce a total of 15.0 million Hispanics and for April 1, 1982, 15.4 million Hispanics. The methodology for deriving these controls is discussed in appendix A of this report.

Both the total number of Hispanics estimated from the regular March 1982 CPS and the number derived from the

<sup>1</sup>The terms "Spanish" and "Hispanic" are used interchangeably in this report.

<sup>2</sup>Persons reporting "Other Spanish" origin are those whose origins are from Spain, the Spanish-speaking countries of Central or South America, or they are Spanish-origin persons identifying themselves generally as Spanish, Spanish American, Hispano, Latino, etc.

**Table A. Persons of Spanish Origin, by Sex and Type of Spanish Origin: March 1982**

(For the United States. Numbers in thousands)

Type of Spanish origin	Both sexes		Male		Female	
	Number	Percent	Number	Percent	Number	Percent
Persons of Spanish origin	14 043	100.0	6 876	100.0	7 167	100.0
Mexican	8 829	62.9	4 416	64.2	4 413	61.6
Puerto Rican	1 888	13.4	890	12.9	998	13.9
Cuban	849	6.0	424	6.2	426	5.9
Central or South American	1 391	9.9	668	9.7	723	10.1
Other Spanish	1 086	7.7	478	7.0	608	8.5

**Table B. Persons of Spanish Origin From the 1980 Census, March 1982 Current Population Survey (CPS), and March 1982 CPS Controlled to Independent Estimates of Hispanics**

(For the United States. Numbers in thousands. For meaning of symbols, see text)

Type of Spanish origin	1980 census	March 1982 CPS		March 1982 CPS (controlled)	
		Number	Confidence Interval (one standard error)	Number	Confidence Interval (one standard error)
Persons of Spanish origin	14 609	14 043	13 702 to 14 384	15 364	(x) (x)
Mexican	8 740	8 829	8 555 to 9 103	9 642	9 461 to 9 821
Puerto Rican	2 014	1 888	1 759 to 2 017	2 051	1 925 to 2 177
Cuban	803	849	762 to 936	950	861 to 1 039
Central or South American	13 051	1 391	1 280 to 1 502	1 523	1 412 to 1 634
Other Spanish		1 086	988 to 1 184	1 198	1 099 to 1 297

In the 1980 census, the "Other Spanish" category included persons from Spain, the Spanish-speaking countries of Central or South America, and Hispanic persons who identified themselves generally as Latino, Spanish American, Spanish, etc. In the CPS, the category "Central or South American" is listed as a separate origin.

March 1982 CPS controlled to independent estimates of Hispanics are shown in table B. Data on the characteristics of Hispanics based on these independent estimates are shown in appendix B.

Our evaluation of the controlled estimates shows that the primary difference between the two sets of data is in the size of the estimated Hispanic population by type of Hispanic. Since the methodology that produced the independent estimates of the total number of Hispanics is still preliminary, the estimates from the regular CPS are used in the text and tables of this report, unless noted otherwise. However, the Census Bureau is continuing research to improve the methodology to derive and implement independent estimates of the total number of Hispanics for use in future CPS's.

## HIGHLIGHTS

- The Spanish-origin population is considerably younger than the non-Spanish population. In 1982, about 11 percent of all Hispanics were under 5 years of age compared to 7 percent of the non-Spanish population. In addition, only 4 percent of Hispanics were 65 years old and over compared to 12 percent of non-Hispanics.
- In 1982, the proportion of single Hispanic women, 26 percent, was substantially lower than the proportion of single Spanish men, 34 percent. By contrast, partly because men marry sooner after divorce than women, the proportion of divorced Hispanic women was about double that for Spanish men; about 8 percent of Hispanic women were divorced compared to 4 percent of Hispanic men.
- In the United States, the educational attainment level of Hispanics is lower than for non-Hispanics. For persons 25 years old and over, the March 1982 CPS showed that about 46 percent of Hispanic persons were high school graduates compared to 72 percent of non-Hispanic persons.
- The proportion of Hispanic persons who registered and voted in the election of November 1982 lagged far behind that for non-Hispanic persons. For example, of the 8.8 million Hispanics 18 years old and over, only 35 percent reported that they had registered to vote in that election compared to 66 percent of non-Hispanics. Voter turnout of Hispanics was also considerably lower than for non-Hispanics; only 25 percent of Spanish persons voted compared to 50 percent of non-Spanish persons.
- Spanish-origin women 15 to 44 years old, had borne more children on the average than had non-Spanish women of the corresponding ages. According to information from the June 1982 CPS, Spanish-origin women had an average 1.6 children per woman compared with 1.3 children per non-Spanish woman.
- In 1982, Hispanics were more likely to be unemployed than were non-Hispanics. The average annual rate of unemployment of Spanish-origin persons 16 years old and over in the civilian labor force was 13.8 percent compared to 9.5 percent of non-Hispanics.
- Hispanic and non-Hispanic men alike had larger earnings than their women counterparts. Median earnings of Hispanic women 15 years old and over was about 62 percent of the median earnings of Hispanic men of that age group, and median earnings of non-Hispanic women was only 47 percent of the non-Hispanic male earnings.
- Although most Hispanic families in the Nation were married-couple families (73 percent), a substantial proportion of Hispanic families were maintained by Spanish women with no husband present (23 percent).
- In general, Spanish families were larger than non-Spanish families. In 1982, Spanish-origin families averaged about 3.89 persons per family while non-Spanish families averaged about 3.22 persons per family.
- Hispanic families with a median money income of \$16,400 in 1981 were less affluent than non-Hispanic families who had a median of \$22,800 in that year.
- Spanish families were much more likely to be in poverty than were non-Spanish families. In 1981, 24 percent of Spanish families were below the poverty level compared to 10 percent for non-Hispanic families.

## CHARACTERISTICS OF PERSONS

**Age.** Overall, the Spanish-origin population is a much younger population than the overall population of the Nation. The youthfulness of Hispanics is clearly indicated by the median age, the age at which half the population is older and half is younger; for example, the median age for Hispanics in the United States was 23.7 years compared to a median of 31.0 years for non-Hispanics. The youthfulness of the Spanish population is largely attributed to their relatively high fertility rate.

Significant differences, however, exist in age distribution among Hispanics. The Mexican- and Puerto Rican-origin populations are very young, each having a median age of about 22 years. By contrast, the Cuban-origin population is much older with a median age of about 38.1 years. This high median age for Cubans reflects the older ages of those who left Cuba in large numbers in the early 1960's to enter the United States (tables 3 and 4).

**Marital status.** Hispanic men were more likely than Hispanic women to be single and the differential was most marked among the young adults. Specifically, among Hispanics 16 to 19 years, the proportion single was 93 percent for men compared to 83 percent for women. For Hispanics 20 to 24 years old, 66 percent of the men were single compared to

only 45 percent of the women. And for Hispanics 25 to 29 years old, 31 percent of the men were single compared to only 20 percent of the Hispanic women.

Differences by sex also were evident in the proportion of divorced Hispanics 15 years old and over. Generally, Hispanic females were twice as likely to be divorced as Hispanic males, and this was particularly evident for the ages 35 to 64 years (tables 5 and 6).

**Education.** The educational attainment level of persons of Spanish origin lagged significantly behind the non-Spanish origin population. Among Hispanics 25 years old and over, only 46 percent had completed 4 or more years of high school compared to 72 percent of non-Hispanic persons of the same age group. In addition, although 8 percent of Spanish persons had completed 4 or more years of college, about 18 percent of non-Spanish persons had done so (table 8).

For younger Hispanics, the educational attainment picture is somewhat brighter. In 1982, about 58 percent of Spanish-origin persons 25 to 34 years of age were high school graduates compared to 38 percent of Hispanics 35 years old and over. Similarly, 24 percent of Hispanics 25 to 34 years of age had completed 1 or more years of college compared to 15 percent for Hispanics 35 years old and over.

Differences in educational attainment levels were also particularly evident among the groups of Spanish origin. For instance, about 50 percent of Cuban-origin persons and 62 percent of persons of Other Spanish origin had completed 4

or more years of high school compared to only 41 percent of Mexican origin and 42 percent of Puerto Rican-origin persons. And persons of Cuban and Other Spanish origin were also more likely to have obtained a college degree (14 percent and 12 percent, respectively) than persons of Mexican (6 percent) and Puerto Rican origin (5 percent) (table 8).

**School Enrollment.** In 1981, most Hispanic and non-Hispanic children of compulsory schoolage (about 5 to 15 years old) were enrolled in school. However, for Hispanic children 3 and 4 years old, the school enrollment rates (25 percent) were lower than for non-Hispanic children (37 percent). Also, at the ages of 16 and 17 years (the beginning ages of noncompulsory school attendance) about 83 percent of Hispanics were enrolled in school compared to 91 percent of non-Hispanics (table 9).

**Geographical mobility.** From March 1981 to March 1982, one of every five Hispanics in the Nation changed residence; but most of these residential changes involved only short distance moves. In that time period, the vast majority of Hispanic movers changed residence within the same standard metropolitan statistical area (SMSA).

The March 1982 CPS data show that the mobility rate of Hispanics is related to the labor force status of Hispanic persons; for instance, Hispanics 16 years old and over in the civilian labor force were more likely to move than those not.

Figure 1. Median Age of All Persons and Persons of Spanish Origin, by Type of Spanish Origin: March 1982

<sup>1</sup> Includes persons who did not know or did not report on origin.

in the labor force (22 percent and 18 percent, respectively) (table 10).

**Voting and registration.** Spanish-origin persons of voting age totalled 8.8 million in November 1982. Of these persons, 3.1 million reported that they had registered and 2.2 million reported voting in the November 1982 congressional election. The registration rate for Hispanics in that election was relatively low, 35 percent, compared to a rate of 66 percent for non-Hispanics. The Hispanic voter turnout also was relatively low, 25 percent, compared to a 50-percent turnout for non-Hispanic persons (table 11).

The low Hispanic voter participation rate is partly due to the high proportion of noncitizens among Hispanics. For instance, in the November 1982 CPS, 43 percent of Hispanic nonvoters 18 years old and over were not citizens of the United States. By contrast, only 5 percent of non-Hispanics not voting in that election were not citizens.

The Nation's younger population of voting age is less likely to vote than the older population, and this is particularly true among Hispanics. In the November 1982 election, only 14 percent of Hispanics 18 to 24 years old voted compared to 40 percent of Hispanics 45 to 64 years old.

The voter participation rates of Hispanics appears directly related to their educational attainment level. For example, 50 percent of Hispanics with 4 years or more of college educa-

tion voted in the November 1982 election compared to 26 percent for Hispanics with no more than a high school education and 24 percent for those with only 8 years of school completed. But at each educational level the proportions of Hispanics registering and voting in the 1982 election were substantially lower than for non-Hispanic persons.

Hispanic voter participation also is differentiated according to occupational status. Hispanic white-collar workers were more likely to vote (42 percent) than Hispanic workers in any of the other occupational groups. The proportion voting among Hispanic blue-collar workers was 22 percent; service workers, 23 percent; farm workers, 11 percent.

The voting patterns of Spanish persons also are differentiated according to family income: the higher the income, the more likely were Hispanic family members to vote. For example, of those persons in Hispanic families with incomes of \$25,000 or more, about 42 percent voted; the voter participation rate for Hispanics in families with incomes below \$10,000 was only 18 percent (table 11).

**Fertility.** The June 1982 survey showed that, in general, the fertility of Spanish women was higher than for non-Spanish women; specifically, Spanish-origin women 15 to 44 years old averaged 1.6 children per woman compared to non-Spanish women who averaged 1.3 children per woman. Also, the proportion childless of Spanish women was 38 percent,

Figure 2. Percent of Persons of Spanish Origin 18 Years Old and Over Reported Having Registered or Voted in the Elections of November 1976, 1978, 1980, and 1982

<sup>1</sup> Includes persons who did not know or did not report on origin

lower than the comparable proportion (45 percent) for non-Spanish women (table 12).

The higher the educational attainment of Spanish women in the United States the fewer children they have borne. The June 1982 CPS showed that Hispanic women without high school diplomas averaged 1.8 children per woman. However, among Hispanic women this average dropped to 1.6 children per woman for women with no more than 4 years of high school, and 1.0 children for college graduates. Interestingly, the average number of children per woman for Hispanic women completing 1 or more years of college was not significantly different from that of non-Hispanic women of the same educational level (about 1.0 children per woman) (table 12).

**Employment and occupation.** The employment situation in March 1982 was less favorable for Hispanics in the civilian labor force than for non-Hispanics. Specifically, Spanish-origin persons 16 years old and over were more likely to be unemployed than were non-Spanish persons. In March 1982, the unemployment rate of Hispanics was 13.4 percent compared to a 9.5 percent unemployment for non-Hispanics. In addition, differences in the unemployment rate were evident between the Spanish-origin groups. Persons of Puerto Rican origin, for example, had a much higher unemployment rate, at 17.3 percent, than the 10.8 percent for Cuban-origin persons.

The occupational distribution differed between the Hispanics and non-Hispanics employed in 1982. The proportion of Hispanic men employed in white-collar occupations was 26 percent compared to 46 percent for non-Hispanic men. By contrast, Spanish men had higher proportions in both blue-collar and service occupations. The occupational distributions of Hispanic and non-Hispanic women also were dissimilar. For example, 53 percent of Spanish women were employed in white-collar positions compared to 67 percent of non-Spanish women (table 14).

**Earnings of persons.** The earnings of civilian Hispanics were substantially lower than those for non-Hispanics in 1981. The median earnings for Hispanics 15 years old and over was \$8,700 compared to a median of \$10,700 for non-Spanish persons of the same age group. In particular, very marked differences in earnings were noticeable between Spanish and non-Spanish men; for instance, the 1981 median earnings of Spanish men was \$10,800, about 70 percent of the median for non-Spanish men, \$15,400 (table 15).

Regardless of whether they were Spanish, in 1981, civilian women 15 years old and over in the Nation earned on the average considerably less than men. The 1981 median earnings of Spanish women was \$6,700, about 62 percent of the median earnings of Hispanic men. For non-Hispanic women, the 1981 median of \$7,300 was only 47 percent that of non-Hispanic men.

Figure 3. Median Money Income in 1981 of All Families and Families of Spanish Origin, by Type of Spanish Origin: March 1982

<sup>1</sup> Includes Central or South American origin and other Spanish origin.

<sup>2</sup> Includes families maintained by persons who did not know or did not report on origin.

**Money income of persons.** The money income level of persons is related to their educational attainment level. In particular, Hispanic men 25 years old and over with only 8 years of elementary school education had a median money income in 1981 of \$11,800. The median for those with only a high school education was higher at \$14,700; but for Hispanic men with a college education the median income reached \$20,800 in 1981. The same pattern occurred for Hispanic women; however, the income of Hispanic women in 1981 still lagged significantly behind that of Spanish men (table 19).

**Poverty status of persons.** In 1981, a large number of Hispanics were in poverty. The March 1982 CPS showed that about 3.7 million Hispanics, one of every four persons of Spanish origin, was below the poverty level in the United States. However, noticeable differences occurred among the Spanish-origin groups. For example, 43 percent of all Puerto Rican-origin persons were below the poverty level, compared to only 20 percent of persons classified as of Other Spanish origin.

## CHARACTERISTICS OF FAMILIES

**Family composition.** Families of Spanish origin in the United States totalled 3.3 million in March of 1982. Most of these families, about 2.4 million, were married-couple families; however, there was also a substantial number of Spanish families supported by Spanish women with no husband present. These families supported by women were especially numerous among families of Puerto Rican origin; about 45 percent of all Puerto Rican-origin families in the Nation were maintained by women with no husband present (table 22).

Almost all of the 5.4 million Spanish-origin children under 18 years old in the United States lived within families. However, not all of these children lived with both parents; 25 percent lived with the mother only and 2 percent lived with the father only. In addition, a small proportion of Hispanic children, 3 percent, lived with one or more related persons other than a parent (table 26).

The living arrangements of Hispanic children varied significantly by type of Spanish origin. In 1982, only 40 percent of Puerto Rican-origin children lived with both parents compared to 76 percent of Mexican-origin children. Furthermore, the proportion of Puerto Rican-origin children living only with their mother (54 percent) was higher than for any other Spanish-origin group.

**Family size.** In 1982, Spanish-origin families in the United States were larger than non-Spanish families; Spanish families averaged about 3.89 persons per family, while non-Spanish families averaged 3.22 persons. Also, Spanish families were more than twice as likely as non-Spanish families to include six or more persons in the family, while non-Spanish families were much more likely to consist of only two persons.

**Residence.** Hispanic families were more prone than non-Hispanic families to live in the metropolitan areas of the Nation and to reside in the central cities of those areas. However,

differences existed among the Hispanic groups: 76 percent of all Puerto Rican-origin families lived in the central cities of metropolitan areas compared to 41 percent of Cuban families who were more likely than Puerto Rican families to live in the suburbs of central cities (table 22).

**Money income of families.** Generally, Spanish families had less money income in 1981 than non-Spanish families; the median money income of Spanish-origin families was \$16,400 compared to a median of \$22,800 for non-Spanish families. In addition, a wide discrepancy existed in family income according to type of Spanish-origin family. Puerto Rican-origin families, for example, had a median income of only \$11,300 compared to a median of \$18,000 for Cuban-origin families. Furthermore, only 15 percent of Puerto Rican families had incomes of \$25,000 or more compared to 33 percent of Cuban-origin families. The lower median income of Puerto Rican families is partly a reflection of the relatively large proportion of these families maintained by Puerto Rican women with no husband present—these families usually have less income than married-couple families. The low income of Puerto Rican families also is partly due to the smaller proportion of these families with earners and the relatively low educational attainment levels of Puerto Rican persons (table 28).

Among Spanish married-couple families, 49 percent had wives in the paid labor force. Such families averaged \$23,500 in 1981, compared to a median of \$15,600 for Hispanic families without wives in the paid labor force (table 27).

**Workers in the family.** In 1982, the number of workers per Spanish family was only slightly different from non-Spanish families. The proportion of Spanish and non-Spanish families with two or more workers in the family were 53 and 56 percent, respectively. Similarly, the proportions with no workers in the family were the same for both Spanish and non-Spanish families, 14 percent. However, among the types of Spanish-origin families, the workers per family varied. Puerto Rican families had a higher proportion of families with no workers, 32 percent, compared to Mexican families, 10 percent, and families of Other Spanish origin, 12 percent. Also, the proportion of Puerto Rican families with two or more workers was 34 percent compared to 56 percent of Mexican-origin families.

**Poverty status of families.** In 1981, Spanish families were much more likely than non-Spanish families to be below the poverty level: 24 percent of Hispanic families were in poverty compared to 10 percent of non-Hispanic families. Among Hispanic families in poverty, 76 percent had householders 25 years old and over who were not high school graduates. Also, about half of all Hispanic families below the poverty level were supported by women of Spanish origin (tables 33 and 34).

<sup>1</sup>The family income data presented in this report do not reflect non-cash income such as that represented by food stamps, public housing, free and reduced price school lunches, Medicaid, Medicare, etc. (See "Definitions and Explanations" section for a more detailed explanation.)

## Appendix A. Methodology for Development of Preliminary Independent Post-Censal Estimates of Hispanics

During the past decade, the Census Bureau has instituted a number of procedures to improve the estimates of the Hispanic population from the CPS. The development of independent post-censal estimates of the Hispanic population to be used as population controls for the March 1982 CPS data on Hispanics is a continuation of this effort. These controls are designed to eliminate annual fluctuations in the CPS Hispanic estimates and establish a post-censal time series of Hispanic estimates more comparable with the 1980 census count of Hispanics. This section presents background information and the methodology used for deriving these independent estimates, using techniques of demographic analysis.

### BACKGROUND INFORMATION

Table A-1 shows CPS estimates from March 1975 to March 1982 of the total number of Spanish-origin persons by type. These estimates, based on a sample, are subject to sampling error and the annual fluctuations of the estimates do not reflect true annual growth patterns. For example, the difference between the March 1979 CPS estimate of Hispanics and the March 1978 figure was not statistically significant, whereas the March 1980 total showed a significant increase of about 1.2 million Hispanics over the March 1979 estimate.

The Hispanic population estimates from the March 1980 and 1981 CPS's were lower than the 1980 census count, and there is some evidence that the Hispanic estimate from the March 1982 CPS was also lower than the census count of Hispanics. The March 1981 and March 1982 CPS estimates of Hispanics were more in conformity with the census because they were based on 1980 census controls of the overall population by age, sex, and race; however, substantial differences still remained between these CPS estimates and the 1980 census count.

Several factors contributed to the difference between the number of Hispanics from the March 1982 CPS estimate and the 1980 census count:

1. The March 1982 CPS sample design was based on 1970 census data that have been updated for changes in the population since that time. (The forthcoming CPS sample redesign, based on 1980 census information, will take effect sometime in 1985.)
2. The CPS used different procedures from those of the 1980 census for collecting and processing information on the population. For instance, the census used self-

enumeration while the CPS is conducted by personal interview, mostly by telephone.

3. Spanish-origin identification in the CPS is determined through an ethnic question listing six specific Spanish ethnic groups and eight non-Spanish groups, whereas the 1980 census used a direct question on Spanish/Hispanic origin which listed four specific Spanish groups and included a single general non-Spanish category.

In addition to the factors listed above, general improvements in the 1980 census, including better coverage of the population and an effective public relations campaign, contributed to the higher 1980 census count.

The annual fluctuations in the CPS Hispanic estimates and the inconsistencies in number of Spanish-origin persons between the post-censal CPS's and the 1980 census suggested a need for developing national post-censal estimates of Hispanics to serve as controls for the CPS. These Spanish population controls, derived independently of the CPS, will eliminate annual fluctuations in the CPS Hispanic estimates and establish a post-censal time series of Hispanic estimates more comparable with the 1980 census count of Hispanics.

### METHODOLOGY

The development of independent post-censal estimates of Hispanics required data on Hispanic births, deaths, immigrants, and emigrants. The 1980 census data on Hispanics by age and sex were used as base for the estimates. For the 1980-1982 period, the Bureau estimated and/or determined (1) the number of Hispanic births, (2) the number of Hispanic deaths, (3) the number of immigrants of Hispanic origin, (4) the number of Hispanic alien emigrants, (5) the net movement of persons to and from Puerto Rico, and (6) the change in Hispanic personnel in the Armed Forces overseas.

**Births.** The number of Hispanic births during the 1980-1982 period were estimated from the annual fertility supplements of the Current Population Survey. These supplements are taken in June every year and include a question on date of birth of a woman's last child. For each age group, the ratio of Hispanic women who had births to all Hispanic women was calculated and this ratio provided a very good approximation to the age-specific fertility rates of Hispanic women. These data are presently the best source of current information on Hispanic fertility; however, in the future the Bureau plans to

complement these CPS data with birth data from other sources.

**Deaths.** The effect of the death component for estimating the Hispanic population during the 1980-1982 period was relatively small because this population is basically a young population. Although mortality data on persons of Spanish origin are not available nationwide, several States do collect mortality data on the population. Using these data in conjunction with census data, Bureau demographers generated life tables for the Hispanic population and consequently derived mortality estimates for that population.

**Immigration.** The Immigration and Naturalization Service (INS) furnishes legal immigration data on Hispanics. These data refer to country of origin, while CPS data on Hispanics refer to reported ethnic origin. To estimate the immigration com-

ponent of Hispanic population growth, this discrepancy was solved by assigning immigrants from each country to either Hispanic or non-Hispanic origin categories on the basis of the 1980 census Hispanic foreign born counts.

Presently, no reliable estimates exist of the number of illegal immigrants of Hispanic origin in the United States, and no allowance is made for this component in the estimates shown in this report. However, Bureau research now in progress may allow inclusion of illegal migration data on Hispanics to determine the estimates shown in future reports.

Similarly, emigration estimates of Hispanics are assumed to be zero for the 1980-1982 period. However, for future independent post-censal estimation of Hispanics, emigration estimates by country of birth can be used to estimate emigration for the 1970-1980 period and if the levels of recent emigration continue into the 1980s, calculation of post-1980 emigration rates is possible.

A substantial proportion of the Hispanic population growth occurring between 1980 and 1981 also was due to the approximately 124,000 entrants arriving in this country from Cuba. Data on age and sex for these persons were used to construct the March 1982 independent post-censal estimates of Hispanics; the data came from the Office of Refugee Resettlement of the Department of Health and Human Services.

## CONCLUSION

The estimation of the total number of Hispanics in March 1982 by use of the population components specified above is more reliable than estimation by the CPS and more in accordance with the total number of Hispanics enumerated in the 1980 census. Specifically, the population component method produces a total Hispanic population of 15.0 million persons for April 1, 1981, and a total of 15.4 million for April 1, 1982.

The main difference between the Hispanic population estimates derived from the regular March CPS and from the

March CPS controlled to independent estimates of Hispanics (by use of the component method) is the size of the total Hispanic-origin population and that of the subgroups composing that population (e.g., Mexican, Puerto Rican, etc.). However, hardly any statistically significant differences are found between the two data sources for derived measures such as percents, medians, means, or rates. In any case, there are two advantages in estimating the annual total Spanish origin population by the component method: (1) The annual Hispanic estimates will be more consistent with the 1980 census total, and (2) the year-to-year growth of the total Hispanic population will be more realistic and devoid of annual fluctuations.

The population component method used for developing independent post-censal estimates of Hispanics still requires some refinement of the ingredients constituting that methodology. Also, the method does not yet allow for generation of independent estimates of the individual component groups of the Hispanic population (e.g. Mexican, Puerto Rican, Cuban, etc.). The Census Bureau is continuing research in the development of these independent estimates.

PERCENT NOT A HIGH SCHOOL GRADUATE . . . . .	54.8	76.2	(X)	59.9	80.7	(X)

<sup>1</sup>AGE SHOWN IS FOR HUSBAND IN MARRIED-COUPLE FAMILIES.

<sup>2</sup>MEAN BASED ON PERSONS OF SPANISH OR OTHER ORIGIN IN SPANISH-ORIGIN FAMILIES.

## Appendix C. Definitions and Explanations

**Population coverage.** This report includes the civilian noninstitutional population of the United States and members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

**Symbols.** A dash (-) represents zero or rounds to zero, and the symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

**Rounding.** The numbers in this report are in thousands. The figures may differ slightly from table to table since individual numbers were rounded to the nearest thousand without being adjusted to group totals. Similarly, individual percentages were rounded and parts may not always add to 100 percent.

**Persons of Spanish/Hispanic origin.** Persons of Spanish (Hispanic) origin in this report were identified by a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin.

**Age.** This classification is based on the age of the person at his or her last birthday.

**Marital status.** The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is divided into "married, spouse present" and "married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or vacation, visiting, in a hospital, etc., at the time of the enumeration. The group "married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, was residing in an institution, had moved to another area, had separated from their spouse because of marital discord, or had a different place of residence for any other reason.

**Metropolitan-nonmetropolitan residence.** The population residing in standard metropolitan statistical areas (SMSA's)

constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

**Comparability of metropolitan and nonmetropolitan data from the March 1982 CPS with data for previous years.** Changes in CPS design and procedures over the last several years have made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures should be avoided. Trends in metropolitan and nonmetropolitan population growth over the 1970-82 and 1976-82 periods should not be appreciably affected by the procedural changes.

The major revisions to the CPS sample design and estimation methods have involved the expansion of the number of sample units from 55,000 housing units to 65,500 housing units. This incorporation of approximately 10,000 supplemental housing units into the March CPS sample in 1977 was accompanied by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample that the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS supplement data had resulted in an apparent overestimate of the nonmetropolitan population and a corresponding underestimate of the metropolitan population for those years. For March 1979, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a spurious, large increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 levels.

The March 1979 CPS metropolitan/nonmetropolitan population estimates also reflect other operational changes including the introduction of a coverage improvement sample designed to provide greater accuracy in survey estimation. The net effect of all changes in procedure was to increase the metropolitan area estimates. Research and detailed analysis of the impact of each procedural change on the population estimates is underway and the results will be issued in a forthcoming technical report.

**Family.** A family is a group of two or more persons (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

**Spanish-origin family.** A Spanish-origin family is defined as a family in which the family householder is of Spanish origin.

**Household.** A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

**Group quarters.** Group quarters are defined in the Current Population Survey as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing five or more persons unrelated to the person in charge. Beginning in 1972, inmates of institutions have not been included in the Current Population Survey.

**Householder.** The term "householder" refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the household head (householder) in married couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

**Head versus householder.** Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have

made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head." The householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded.

**Family household.** A family household is a household maintained by a family (as defined above), including among the household members any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of Family.)

**Related subfamily.** A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. The most common example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. The number of related subfamilies is not included in the count of families.

**Unrelated subfamily.** An unrelated subfamily (formerly called a secondary family) is a group of two or more persons who are related to each other by birth, marriage, or adoption, but who are not related to the householder. The unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members, but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

**Married couple.** A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband wife"

or "married couple" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. The number of married couples equals the count of married-couple families plus related and unrelated married-couple subfamilies.

**Unrelated individuals.** Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

**Nonfamily householder.** A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

**Secondary individual.** A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

**Own children and related children.** "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the householder. Similarly, "own" children in a subfamily are sons and daughters of the married couple or parent in the subfamily. (All children shown as members of related subfamilies are own children of the person maintaining the subfamily.) "Related" children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status. The totals include never-married children living away from home in college dormitories.

**Years of school completed.** In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus,

"regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

**School enrollment.** The school enrollment statistics from the October 1981 CPS are based on replies to the enumerator's inquiry as to whether the person was enrolled in school. Enumerators were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year in any type of graded public, parochial, or other private school in the regular school system. Such schools include nursery schools, kindergartens, elementary schools, high schools, colleges, universities, and professional schools. Attendance may be on either a full-time or part-time basis and during the day or night. Thus, regular schooling is that which may advance a person toward an elementary or high school diploma, or a college, university, or professional school degree. Children enrolled in nursery schools and kindergarten are also included in the enrollment figures for "regular" schools.

"Special" schools are those which are not in the regular school system, such as trade schools or business colleges. Persons attending "special" schools are not included in the enrollment figures.

Persons enrolled in classes which do not require physical presence in school, such as correspondence courses or other courses of independent study, and in training courses given directly on the job, are also excluded from the count of those enrolled in school, unless such courses are being counted for credit at a "regular" school.

**Mobility status.** The population 1 year old and over was classified according to mobility status on the basis of a comparison between the place of residence of each individual at the time of the March 1982 survey and the place of residence 1 year earlier. Nonmovers are all persons who were living in the same house at the end of the period as at the beginning of the period. Movers are all persons who were living in a different house at the end of the period than at the beginning. Movers are further classified as to whether they were living in the same county, State, or region; were movers from abroad; were living in the same or different central city or SMSA; or had made some other type of move.

**Reported voter participation and registration.** Voter participation data for 1982 were derived from replies to the following question asked of persons (excluding noncitizens) of voting age: "In any election some people are not able to vote because they are sick or busy, or have some other reason, and others do not want to vote. Did (this person) vote in the election held on November 2d?"

Those of voting age were classified as "voted" or "did not vote." This "did not vote" class includes those reported as "did not vote," "do not know if voted," and nonrespondents. Nonrespondents and persons who reported that they did not

know if they voted were included in the "did not vote" class because of the general overreporting by respondents in the sample.

The data shown on registration were obtained by tabulating replies to the following question for those persons included in the category "did not vote." "Was (this person) registered to vote in the November 2d election?"

All persons reported as having voted were assumed to have been registered. Therefore, the total registered population is obtained by combining the number of persons who voted and persons included in the category "did not vote," but who had registered.

The population of voting age includes a considerable number of persons who meet the age requirement but cannot register and vote. Only citizens are eligible to vote. Among citizens of voting age, some persons are not permitted to vote because they have been committed to penal institutions, mental hospitals, or other institutions, or because they fail to meet State and local resident requirements for various reasons. The eligibility to register is governed by State laws which differ in many respects.

**Children ever born.** The question "How many babies has . . . ever had, if any? (Do not count stillbirths)" was asked of all women 15 to 59 years old who were reported as married (including separated), widowed, or divorced, and all women 18 to 59 years old who were reported single (never married). When asking about children ever born, interviewers were instructed to include children born to the woman before her present marriage, children no longer living, and children away from home as well as children who were still living in the home. It is possible that some never-married mothers living with one or more of their natural children reported themselves as having been married. In addition, many mothers who first married after the birth of one or more children counted those children, as they were expected to do. Nevertheless, data are probably less complete for births out of wedlock than for births within wedlock.

In filling out the interview schedule, the interviewer entered the number of children ever born from 0 to a terminal category of "10 or more." For purposes of computing the total number of children ever born, the terminal category was counted as 10.

**Labor force.** Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians 15 years old and over classified as employed or unemployed.

**Paid labor force.** Persons are classified as in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

**Employed.** Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid

employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

**Unemployed.** Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

**Occupation.** The data on occupation of employed persons 16 years old and over refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week. The occupation groupings used here are mainly the major groups used in the 1970 Census of Population. The composition of these groups is shown in *1970 Census of Population, Volume I, Characteristics of the Population, Chapter C*. The categories used are combinations of detailed classifications.

*Four occupation divisions.* The major groups of occupations are arranged in four divisions as follows:

*White collar.* Professional, technical, and kindred workers; managers and administrators, except farm; sales workers; and clerical and kindred workers.

*Blue collar.* Craft and kindred workers; operatives, including transport; and laborers, except farm.

*Farm workers.* Farmers and farm managers; farm laborers and farm supervisors.

*Service workers.* Service workers, including private household workers.

The sequence in which these four divisions appear is not intended to imply that any division has a higher social or skill level than another.

**Income.** For each person in the sample 15 years old and over,

questions were asked on the amount of money income received in the preceding calendar year. Although the income statistics refer to receipts during the preceding year, the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Money income data presented in this report do not reflect the fact that some families receive part of their income in the form of noncash benefits such as food stamps, health benefits, and subsidized housing; that some farm families receive noncash benefits in the form of rent-free housing and goods produced and consumed on the farm; or that noncash benefits are also received by some nonfarm residents, such as the use of business transportation facilities, full or partial payments by business for retirement programs, and medical and educational expenses. These elements should be considered when comparing income levels. For a detailed explanation of noncash benefits, see Current Population Reports, Series P-60, No. 136, *Characteristics of Households and Persons Receiving Selected Noncash Benefits: 1981*.

**Money earnings.** Money earnings are the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment. For a detailed explanation, see Current Population Reports, Series P-60, No. 137, *Money Income of Households, Families, and Persons in the United States: 1981*.

**Number of earners.** This number includes all persons in the family with \$1 or more in wages and salaries, or \$1 or more or a loss in net income from farm or nonfarm self-employment.

**Poverty definition.** Families and unrelated individuals are

classified as being above or below the poverty level using the poverty index originated at the Social Security Administration in 1964 and revised by Federal Interagency Committees in 1969 and 1980. The poverty index is based solely on money income and does not reflect the fact that many low income persons receive noncash benefits such as food stamps, Medicaid, and public housing. The index is based on the Department of Agriculture's 1961 economy food plan and reflects the different consumption requirements of families based on their size and composition. It was determined from the Department of Agriculture's 1955 survey of food consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index (CPI).

The average poverty threshold for a family of four was \$9,287 in 1981. For a detailed explanation of the poverty definition, see Current Population Reports, Series P-60, No. 138, *Characteristics of the Population Below the Poverty Level: 1981*.

**Median.** The median is presented in connection with the data on age, years of school completed, and income. It is the value which divides the distribution into two equal parts, one-half of the cases falling below this value and one-half of the cases exceeding this value.

**Mean.** The mean (average) is presented in connection with data on number of persons per family, income of persons, and income of families. The mean number of persons per family is the value obtained by dividing the number of persons having the characteristic under consideration by the appropriate number of families. The mean income is the amount obtained by dividing the total income of a group by the number of persons, or families, in that group.

## APPENDIX D. SOURCE AND RELIABILITY OF THE ESTIMATES

### SOURCE OF DATA

The estimates for the Spanish origin population presented in this report are primarily based on data obtained in March 1982 in the Current Population Survey (CPS) of the Bureau of the Census. The monthly CPS deals mainly with labor force data for the civilian, noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, questions are asked monthly about ethnic origin for all persons 14 years old and older. For March, in addition to the standard set of questions on labor force participation and Spanish origin, questions are asked about income, work experience, and mobility status.

To obtain more reliable data for the Spanish-origin population, the March 1982 CPS sample was enlarged to include all households from the previous November sample which contained at least one sample person of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included.

The present CPS sample was initially selected from the 1970 census files with coverage in all 50 States and the District of Columbia and is continuously updated to reflect new construction. The current CPS sample is located in 629 areas comprising 1,148 counties, independent cities, and minor civil divisions in the Nation. In this sample, approximately 66,000 occupied households were eligible for interview.<sup>1</sup> Of this number, about 3,000 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

Description of the Current Population Survey

Time period	Number of sample areas <sup>a</sup>	Housing units eligible <sup>b</sup>	
		Interviewed	Not interviewed
March 1982.....	629	60,000	3,000
March 1981.....	629	63,000	3,000
March 1980.....	629	65,000	3,000
March 1978 & 1979..	614	53,000	3,000
March 1971-1977....	461	45,000	2,000

<sup>a</sup>These areas were chosen to provide coverage in each State and the District of Columbia.

<sup>b</sup>Numbers reflect the initial size of the CPS sample and do not include enlargements for Spanish households.

<sup>c</sup>Includes supplemental Spanish households.

The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces.

The estimation procedure used for March 1980 through March 1982 data utilized independent estimates based on the 1980 decennial census. Data for 1970 to 1979 were obtained using independent population estimates based on the 1970 decennial census. The estimation procedure for the data also involved a further adjustment so that husband and wife of a household receive the same weight.

### Decennial Census of Population

Decennial census data in this report are based on the complete count or on the sample associated with the census. Descriptions of sample from the census are found in the appropriate census publications.

### RELIABILITY OF ESTIMATES

Since the CPS estimates were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling errors. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

**Nonsampling variability.** Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the 1980 decennial census, is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error, including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978, and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

**Sampling variability.** The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population

parameters using sample estimates. The most common types of hypotheses appearing in this report are (1) the population parameters are identical versus (2) they are different. An example of this would be a comparison of the median age of farm residents versus the median age of nonfarm residents. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between parameters is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison is qualified in some way; e.g., by the use of the phrase "some evidence."

**Comparability of data.** Data obtained from the CPS and other governmental sources are not entirely comparable. This is due in large part to differences in interviewer training and experience and in differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Also, in using metropolitan and nonmetropolitan data, caution should be used in comparing estimates for 1977 and 1978 to each other or to any other years. Methodological and sample design changes occurred in these years resulting in relatively large differences in the metropolitan and nonmetropolitan area estimates. However, estimates for 1979 and later are comparable as are estimates for 1976 and earlier.

Caution should also be used when comparing estimates for 1980 and later, which reflect 1980 census-based population controls, to those for 1971 through 1979, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percent distribution, but did have a significant impact on levels. For example, use of 1980-based population controls resulted in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimate of levels for 1980 and later will differ from those for earlier years by more than what could be attributed to actual changes in the population and these differences could be disproportionately greater for certain subpopulation groups than for the total population.

**Note when using small estimates.** Summary measures (such as medians and percent distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates

are provided primarily to permit such combinations of the categories as serve each data user's needs.

tions were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

**Standard error tables and their use.** To derive standard errors that would be applicable to a larger number of estimates and could be prepared at a moderate cost, a number of approxima-

<sup>1</sup>These a and b parameters are to be used to calculate standard errors of 1982 CPS estimates that are presented in table A and tables 1 through 14 of this report.

<sup>2</sup>Factors for Spanish-origin characteristics should be applied to tables D-2 and D-3; factors for total U.S. population characteristics should be applied only to tables D-2 and D-4.

<sup>3</sup>These a and b parameters are to be used to calculate standard errors of levels only. To obtain standard errors on levels for this characteristic, use formula (2) only; do not use formula (1).

<sup>4</sup>This b parameter is to be used to calculate the standard error of percentages only.

<sup>5</sup>To obtain standard errors on levels for this characteristic, use formula (2) only; do not use formula (1).

Estimates provided in this report are divided into two groups; the first is based on the current CPS controls and is presented in tables 1 through 34, and the second is based on the independent post-censal estimates of the Hispanic population and is presented in appendix B.

The figures in tables D-2 through D-4 are approximations to standard errors of various CPS estimates presented in tables 1 through 34. Factors in table D-1 must be applied to these standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by interpolation. Two parameters are used (denoted "a" and "b") to calculate standard errors for each characteristic; they are presented in table D-1. These parameters were used to calculate the standard errors in tables D-2 through D-4 and the factors in table D-1. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Direct computation of the standard errors will give more accurate results than the use of the standard error tables. Both methods of computation are given in the following sections. Illustrations of the computation of standard errors are given at the ends of these sections.

To directly calculate the standard errors for estimates presented in appendix B, the formulas given in the following sections and the appropriate parameters in table D-5 are to be used

**Table D-2. Standard Errors of Estimated Numbers of Spanish-Origin Persons or Families Controlled to Total Population and Total U.S. Persons or Families**

To obtain standard errors for the characteristic of interest multiply these values by the appropriate factor provided in table D-1.

**Standard errors of estimated numbers.** The approximate standard error,  $\sigma_x$  of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

where  $f$  is the appropriate factor from table D-1, and  $\sigma$  is the standard error on the estimate obtained by interpolation from table D-2. Or, alternatively, it may be approximated using the following formula (2) from which the standard errors in table D-2 were calculated. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \quad (2)$$

Here  $x$  is the size of the estimate and  $a$  and  $b$  are the parameters in table D-1 associated with the particular characteristic.

When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

*Illustration of the computation of the standard error of an estimated number*

Table 4 of this report shows that in 1982 there were 8,829,000 persons of Mexican origin in the United States. Interpolation in table D-2, application of the factor 2.50 from table D-1, and use of formula (1) show the standard error of an estimate of this size to be approximately 262,000.<sup>2</sup> The 68-percent confidence interval for the number of persons of Mexican origin in the United States is from 8,567,000 to 9,091,000. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average estimate derived from all possible samples lies within the interval from 8,305,000 to 9,353,000 (using twice the standard error).

**Standard errors of estimated percentages.** The reliability of an estimated percentage computed using sample data for both numerator and denominator, depends on the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated by the numerator. The approximate standard error,  $\sigma_{(x,p)}$  of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \quad (3)$$

<sup>2</sup>Formula (2) with  $a = .000044$  and  $b = 8917$  gives a standard error of 274,000.

**Table D-3. Standard Errors of Estimated Percentages of Spanish-Origin Persons or Families Controlled to Total Population**

Base of percentage (thousands)	Estimated percentage <sup>1</sup>					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	1.4	1.9	3.0	4.1	6.0	6.9
100	1.2	1.7	2.6	3.6	5.2	6.0

500	0.5	0.7	1.2	1.6	2.3	2.7
1,000	0.4	0.5	0.8	1.1	1.6	1.9
2,500	0.2	0.3	0.5	0.7	1.0	1.2
5,000	0.2	0.2	0.4	0.5	0.7	0.8
7,500	0.14	0.2	0.3	0.4	0.6	0.7
12,000	0.11	0.15	0.2	0.3	0.5	0.5

Note: See table D-1 for factors to apply to obtain standard errors for the characteristic of interest.

<sup>1</sup>To obtain standard errors for residence estimates multiply the above figures by 1.4.

**Table D-4. Standard Errors of Estimated Percentages of Total U.S. Population**

Base of percentage (thousands)	Estimated percentage <sup>1</sup>					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
500	0.7	0.9	1.4	2.0	2.9	3.3
1,000	0.5	0.7	1.0	1.4	2.0	2.3
5,000	0.2	0.3	0.5	0.6	0.9	1.1
10,000	0.15	0.2	0.3	0.4	0.6	0.7
20,000	0.10	0.15	0.2	0.3	0.5	0.5
30,000	0.09	0.12	0.2	0.3	0.4	0.4
40,000	0.07	0.10	0.2	0.2	0.3	0.4
50,000	0.07	0.09	0.14	0.2	0.3	0.3
70,000	0.06	0.08	0.12	0.2	0.2	0.3
100,000	0.05	0.07	0.10	0.14	0.2	0.2

Note: See table D-1 for factors to apply to obtain standard errors for the characteristic of interest.

<sup>1</sup>To obtain standard errors for residence estimates multiply the above figures by 1.4.

In this formula,  $f$  is the appropriate factor from table D-1, and  $\sigma$  is the standard error of the estimate from either table D-3 or D-4. Alternatively, standard errors may be approximated by the following formula (4), from which the standard errors in tables D-3 and D-4 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} p (100 - p)} \quad (4)$$

Here  $x$  is the size of the subclass of persons or families and unrelated individuals which is the base of the percentage,  $p$  is the percentage ( $0 < p < 100$ ), and  $b$  is the parameter in table D-1 associated with the particular characteristic in the numerator of the percentage.

*Illustration of the computation of the standard error of an estimated percentage*

Table 5 of this report shows that in 1982 there were 4,557,000 males 15 years old and over of Spanish origin in

the United States. Of these, 1,557,000, or 34.2 percent, were single (never married). Interpolation in table D-3 and application of the factor 1.77 show the standard error of a percentage of this size to be 1.4 percent.<sup>3</sup>

Consequently, the 68-percent confidence interval for the percentage of single males of Spanish origin in the United States is from 32.8 to 35.6 percent. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average estimate derived from all possible samples lies within the interval from 31.4 to 37.0 percent, i.e.,  $34.2 \pm (2 \times 1.4)$  percent.

<sup>3</sup>Using formula (4), the standard error on 34.2 percent with a base of 4,557,000 is approximately 1.5 percent.

Note: Parameters for total or non-Spanish population are given in table D-1.

— Represents zero.  
X Not applicable.

These a and b parameters are to be used to calculate standard errors of the 1982 CPS estimates that are presented in appendix B of this report.

**Standard error of an estimated difference.** For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma(x-y) = \sqrt{\sigma_x^2 + \sigma_y^2} \quad (5)$$

where  $\sigma_x$  and  $\sigma_y$  are the standard errors of the estimates  $x$  and  $y$ , the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) relation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

For percents, formula (5) can be written as

$$\sigma(p_1, p_2) = \sqrt{\frac{\sigma_1^2}{p_1} + \frac{\sigma_2^2}{p_2}} \quad (6)$$

$$\sqrt{\frac{b_1}{x_1} p_1 (100 - p_1) + \frac{b_2}{x_2} p_2 (100 - p_2)}$$

In this situation the bases of the two percentages,  $x_1$  and  $x_2$ , are not the same. When the base,  $x$ , of the two percent ages is the same, use the following formula (7)

$$\sigma(p_1, p_2) = \sqrt{\frac{b}{x} [100(p_1 + p_2) - (p_1^2 + p_2^2)]} \quad (7)$$

In formula (6);  $b_1$  and  $b_2$  are the parameters for the characteristics and population in question, and  $p_1$  and  $p_2$  are the percentages being compared, with  $(0 \leq p_1 \leq 100)$  and  $(0 \leq p_2 \leq 100)$ . In formula (7),  $b$  is the  $b$ -parameter for the characteristic in question.

Formula (6) is to be used when the bases do not overlap; for example, males of Mexican origin and males of Puerto Rican origin. It can also be used when one base is a subset of the other, for example, males of Mexican origin and all Spanish-origin males; but in this case, (6) will overestimate the standard error of the difference.

Formula (7) is to be used when the base of the two percents is the same, the percents do not overlap and the characteristics in the numerators of  $p_1$  and  $p_2$  are of the same type, i.e., they have the same  $b$  parameter. For example, if the base is all families with head of Spanish origin and one is comparing the percent of these families living in central cities with the percent in the suburbs, one may use formula (7) to calculate the standard error of the difference.

*Illustration of the computation of the standard error of a difference between estimated percentages.*

Table 5 of this report shows that in 1982 there were 2,834,000 males and 2,917,000 females 15 years old and over of Mexican origin in the United States. Of these, 952,000 males, or 33.6 percent, and 709,000 females, or 24.3 percent, were single (never married). The apparent difference is 9.3 percent. Using formula (4), the standard errors on 33.6 percent with a base of 2,834,000 and 24.3 percent with a base of 2,917,000 are found to be 1.9 and 1.7 percent, respectively.

Therefore, using formula (5), the standard error of the estimated difference of 9.3 percent is approximately

$$2.6 = \sqrt{(1.9)^2 + (1.7)^2}$$

This means that the 68-percent confidence interval for the difference between the percentages of single males and females of Mexican origin in the United States is from 6.7 to 11.9. A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 4.1 to 14.5. Since this interval does not contain zero, we may conclude with 95-percent confidence that the percent of single Mexican males is greater than the percent of single Mexican females.

**Standard error of an estimated median.** The sampling variability of an estimated median depends upon the form of the

distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step 1.
3. Using the distribution of the characteristic, calculate the 68-percent confidence interval by calculating the values corresponding to the two points established in step 2.
4. Once the limits of the 68-percent confidence interval are computed, the standard error of a median can be computed by the formula

$$\sigma_{\text{median}} = \frac{U-L}{2}$$

where:  $U$  = Upper limit of the 68-percent confidence interval

$L$  = Lower limit of the 68-percent confidence interval.

*Illustration of the computation of a confidence interval for an estimated median*

Table 4 of this report shows that the median age in March 1982 of persons of Spanish origin living in the United States was 23.7 years. Table 4 also shows that the base of the distribution from which this median was determined is 14,043,000 persons.

1. The standard error of 50 percent on a base of 14,043,000 is about 1.3 percent.\*
2. To obtain a 68-percent confidence interval on an estimated median, add to and subtract from 50 percent the standard error found in step 1. This yields percent limits of 48.7 and 51.3.
3. Since 46.7 percent of the persons of Spanish origin living in the United States (March 1982) had an age under 22 years old and 5.9 percent were between 22 to 24 years old, the lower limit of the median age may be found by interpolation to be

$$22 + (25 - 22) \left( \frac{48.7 - 46.7}{5.9} \right) = 23.0 \text{ years}$$

Similarly, the upper limit may be found to be about

$$22 + (25 - 22) \left( \frac{51.3 - 46.7}{5.9} \right) = 24.3 \text{ years}$$

Thus, the 68-percent confidence interval for the median age of persons of Spanish origin living in the United States (March 1982) is from 23.0 to 24.3 years.

4. The standard error of the median is, therefore,

$$\frac{24.3 - 23.0}{2} = 0.7 \text{ years}$$

**Standard error of an estimated ratio.** Certain mean values for persons in families or households shown in this report were calculated as the ratio of two numbers. For example, the mean number of persons per family or household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families or households}}{\text{total number of families or households}}$$

Standard errors for these means may be approximated as shown below. The denominator  $y$  represents a count of families or households of a certain class, and the numerator  $x$  represents a count of persons with the characteristic under consideration who are members of these families or households. The standard errors are approximated by the following formula:

$$\sigma_{\frac{x}{y}} = \sqrt{\left(\frac{x}{y}\right)^2 \left[ \left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 \right]} \quad (8)$$

The standard error of the estimated number of families or households,  $\sigma_y$ , and the standard error of the estimated number of persons with the characteristics in those families or households,  $\sigma_x$ , may be calculated by the method described above.

**Standard error of an estimated arithmetic mean.** The standard error of an arithmetic mean can be approximated by formula (9) below. Because of the approximations used in developing formula (9), an estimate of the standard error of the mean obtained from that formula will generally underestimate the true standard error. The formula used to estimate the standard error of a mean is

$$\sigma_x = \sqrt{\frac{b}{y}} S^2 \quad (9)$$

where  $y$  is the size of the base and  $b$  is the parameter from table D-1 corresponding to the characteristic of interest. The variance,  $S^2$ , is given by formula (10)

\*The standard error of 1.3 percent was obtained by using formula (4) where  $b = 8917$ ,  $p = 50$ , and  $x = 14,043,000$ .

$$S^2 = \sum_{i=1}^c p_i x_i^2 - \bar{x}^2 \quad (10)$$

where  $\bar{x}$  is the mean of the distribution;  $c$  is the number of groups,  $i$  indicates a specific group, thus taking on values 1 through  $c$ ;  $p_i$  is the estimated proportion with the characteristic in group  $i$ ,  $Z_{i-1}$  and  $Z_i$  are the lower and upper interval boundaries, respectively, for group  $i$ , and

$x_i = \frac{Z_{i-1} + Z_i}{2}$  which is assumed to be the most representative value for the characteristic for persons or families in group  $i$ . Group  $c$  is open-ended, i.e., no upper interval boundary exists. For this group, an approximate average value is

$$x_c = (3/2) Z_{c-1}$$

# current population reports

from the BUREAU OF THE CENSUS

In addition to the findings of the Census of Population, conducted every 10 years, the Bureau of the Census publishes continuing and up-to-date statistics on population counts, characteristics, and other special studies of the American people. Data are issued in the seven separate series of reports described here and are released under the general title, Current Population Reports.

**P-20 Population Characteristics.** Current national and, in some cases, regional data on geographic residence and mobility, fertility, educational attainment, school enrollment, marital status, numbers and characteristics of households and families, and persons of Spanish origin. Approximately 20 reports each year.

**P-23 Special Studies.** Reports on methods, concepts, or specialized data. Included in the series are periodic reports on the Black population, metropolitan nonmetropolitan population, American youth, the older population, and other topics.

**P-27 Farm Population.** Data on the size and selected characteristics of the farm population of the United States. Issued jointly with the Bureau of the Census and the U.S. Department of Agriculture. One report each year.

**P-60 Consumer Income.** Information on the proportions of families, individuals, and households at various income levels. Data are also presented on the relation

ship of income to age, sex, race, family size, education, occupation, work experience, and other characteristics. A special annual report provides detailed information on low-income families and individuals. Four to five reports each year.

**P-25 Population Estimates and Projections.** Includes monthly estimates of the total population of the United States; annual mid-year estimates of the population of States by broad age groups; and of the United States by age, race, and sex; annual estimates of the components of population change. Annual estimates of the population of metropolitan areas and their component counties will be released, as well as projections for the United States and individual States. Generally, about 23 series P-25 reports are published each year.

**P-26 Local Population Estimates.** Annual county population estimates, most of which are produced under the auspices of the Federal-State Cooperative Program for Local Population Estimates, are published in the P-26 reports individually for each State (50 reports). Also published individually in the P-26 series, on a biennial basis, are the subcounty revenue sharing estimates for each State (50 reports). These estimates were published previously in the P-25 series. In addition, annual estimates of the population of Puerto Rico municipios will also be published. There will be approximately 100 reports published in this series.

**P-28 Special Censuses.** Presents results of population censuses taken at the request and expense of city or other local governments. Biannual summaries showing the total population figures for all the censuses conducted during the particular period as well as individual reports issued for areas of 50,000 or more, showing the population by age, sex, and race, are available separately. See "How to Order Reports."

## HOW TO ORDER REPORTS

Current Population Reports are sold as two separate subscriptions. Series P-20, 23, 27, and 60 (Population Characteristics, Special Studies, Farm Population, and Consumer Income) cost \$71 a year (\$88.75 for foreign mailing). The second subscription, Series P-25 (Population Estimates and Projections) is priced at \$25 a year (\$31.25 for foreign mailing). Release of the P-26 Series and single copies of the individual Series P-28, Special Censuses, must be ordered separately through the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Prices vary.

For information concerning subscription pricing on Current Population Reports, write to Data User Services Division, Customer Services (Publications), Bureau of the Census, Washington, D.C. 20233.
