ABSTRACT

This report synthesizes the findings of the Illinois statewide curriculum census projects of 1977 and 1982. The census was designed to produce normative data relative to offerings and enrollments in Illinois public secondary schools and establish a source of information on secondary school curriculum. Statistical information include: (1) demographic characteristics of the schools; (2) population profiles of science students; (3) science curricular offerings; and (4) male versus female enrollments in the sciences. Data are also categorized by enrollment sizes and community types (rural, suburban, independent and central city). Findings reveal that diversification of course offerings exist in the surveyed schools showing a range of 45 to 59 different courses. Enrollment figures indicate that the sciences serve only a minority of the total student population (approximately 3 percent in Physics and 6 percent in Chemistry) and that male enrollments exceed female enrollments. It was noted that limited courses exist which are oriented to contemporary societal issues and problems. Implications are given to aid in decision-making for teacher preparation, inservice needs, specific curricular needs, and basic research. (ML)

RESEARCH AND STATISTICS SECTION**

FOREWORD

In 1977 the Illinois State Board of Education in cooperation with the Illinois Association for Supervision and Curriculum Development conducted a Census of Secondary School Course Offerings. This was the first statewide census of basic curriculum data in Illinois. The Census was designed to produce normative data relative to offerings and enrollments in Illinois public secondary schools and establish a source of information on secondary school curriculum. A second Census was conducted in 1982 to update the original database.

The Census project was directed by Dr. William L. Humm, Research and Statistics Section, Illinois State Board of Education. This special report on science was written by Dr. Donald K. Hamilton, College of Education, Western Illinois University and edited by Dr. Humm. It is based on statistics from the Census project databases for 1977 and 1982.

Observations and conclusions in this report are those of the writer and do not necessarily represent the policies or views of the Illinois State Board of Education or the State Superintendent of Education.

Donald G. Gill
State Superintendent of Education

Special Report on Science

Summary Highlights

The most commonly reported science offerings in the junior high and high school grades include general science (grades 7, 8, and 9), earth science, biology, chemistry, and physics.

With the variety of course offerings reported it is possible for individual schools in different community settings to offer courses which make the science program somewhat unique.

Science enrollment of males exceeds that of females. However, female enrollment in the biological sciences typically exceeds that of males, while male enrollment in the physical sciences and remedial science typically exceeds that of females.

While most high school students take at least a year of science in high school, courses in upper level, advanced science such as chemistry and physics enroll a relatively small percent of the total student population.

While the proportion of enrollment in high school biology, chemistry, and physics increased slightly since 1977, the proportion of enrollment in all science courses decreased by about 2%. Overall enrollment in junior high school science decreased since 1977 by just over 1%.

The decrease in science enrollment in the high schools and junior high schools was due to a decline in male enrollment in science, as the relative proportions of female enrollments in science in 1982 changed only slightly from those of 1977.

Courses reflecting contemporary societal issues and problems are infrequently found in the science curricula, and where they are found, they have minimal enrollments.

ILLINOIS SECONDARY SCHOOL OFFERINGS, 1980
SPECIAL REPORT ON SCIENCE

An analysis of enrollment data from the Illinois Census of Junior High and Secondary School Course Offerings can reveal the "state of the art" at a time when current practices in science education are under critical review from many quarters. The researcher, curriculum developer, state agency or any other individual or group acting as a change agent needs to be able to look at specific grade level data, and concomitantly evaluate that data as it relates to the total school science curriculum. In order to provide a meaningful mechanism for data evaluation, the presentation here will begin at the state level with global data, and move down to individual grade analysis.

THE SCHOOLS IN THE CENSUS: DEMOGRAPHIC CHARACTERISTICS

Census data were collected from 489 public junior high schools and 719 public high schools. The participating schools represent 82 percent of the junior high schools and 99 percent of the high school in the defined population of the Census.

Schools were classified by grade level composition, by school size, and by community type. Schools classified as junior high schools were typically two-year, grade 7-8 schools (92 percent). Another 6 percent were three-year, grade 7-9 schools. High schools included four-year, grade 9-12 schools (88 percent); three-year, grade 10-12 schools (3 percent); and junior-senior high schools including grades 7-12 (6 percent).

There is a direct relationship between school size and community type, with larger schools located in central cities and smaller schools in rural areas. This relationship is particularly strong for high schools, as indicated in Table 1. Most of the rural high schools (99 percent) had under 1000 students, even when six-year (7-12) schools were included. On the other hand, 61 percent of the urban schools had enrollments over 1000. Table 2 shows the range and quartile data for high schools in the Census.

TABLE 1. ILLINOIS PUBLIC HIGH SCHOOLS INCLUDED IN THE CENSUS OF COURSE OFFERINGS BY SIZE AND COMMUNITY TYPE, 1981-82.

Size	Community Type				All	%
	Central City	Suburb	Independent City	Rural		
1-199	4	3	1	181	189	26.3
200-499	1	19	44	130	194	27.0
500-999	10	28	36	28	102	14.2
1000-1699	38	57	17	2	114	15.9
1700-2599	36	61	1	0	98	13.6
2600+	6	15	0	1	22	3.1
ALL	95	183	99	342	719	
%	13.2	25.5	13.8	47.6		

TABLE 2. ENROLLMENT SUMMARY STATISTICS FOR PUBLIC HIGH SCHOOLS INCLUDED IN THE CENSUS OF COURSE OFFERINGS, 1981-82

Mean	Smallest	10th Percent	25th Percent	MEDIAN	75th Percent	90th Percent	Largest
826	33	119	191	452	1350	2100	4614

Table 3 presents data by school size and community type for junior high schools. Junior high schools generally enrolled over 500 students (93 percent) in central cities, between 200 and 1000 in suburbs (93 percent) and independent cities (80 percent), and under 500 (97 percent) in rural areas. Table 4 gives the range and quartile data for junior high schools in the Census.

TABLE 3. ILLINOIS PUBLIC JUNIOR HIGH SCHOOLS INCLUDED IN THE CENSUS OF COURSE OFFERINGS BY SIZE AND COMMUNITY TYPE, 1981-82

Size	Community Type					All	%
	Central City	Suburb	Independent City	Rural			
1-199	0	13	15	102	130	26.6	
200-499	2	103	48	39	192	39.3

403	40	94	180	370	592	757	1198

POPULATION DATA - STUDENTS TAKING SCIENCE

As the demographic data indicate, school enrollment was broken down into six categories at the high school level and four categories at the junior high level. Total high school science enrollment for each of the school enrollment categories is summarized in Table 5. The data reported are year equivalent course enrollments, but will be referred to in this report as "number of students taking science," "number of students enrolled," or as "enrollment in course."

TABLE 5. STUDENT SCIENCE ENROLLMENTS IN ILLINOIS HIGH SCHOOLS

<u>Size</u>	<u>Number of Schools Offering Science</u>	<u>Number of Students in Schools Offering Science</u>	<u>Number of Students Taking Science</u>	<u>Percent of Students Taking Science</u>
1-199	187	25,413	14,005	55.1
200-499	193	62,683	31,531	50.3
500-999	101	73,293	32,658	44.6
1000-1699	116	155,612	71,832	46.2
1700-2599	97	205,490	102,063	49.7
2600 +	20	68,931	34,245	49.7

The range in percentages of students taking science was from 44.6% to 55.1%. The schools with an enrollment of less than 200 students had the highest percentage (55.1%) of the student body enrolled in science courses. It should also be noted that approximately 50% of the students in the state's high schools were not enrolled in a science course during the 1981-82 school year.

The junior high population census data is represented in Table 6.

TABLE 6. STUDENT SCIENCE ENROLLMENTS IN ILLINOIS JUNIOR HIGH SCHOOLS

<u>Size</u>	<u>Number of Schools Offering Science</u>	<u>Number of Students in Schools Offering Science</u>	<u>Number of Students Taking Science</u>	<u>Percent of Students Taking Science</u>
1-199	128	13,219	12,447	94.2
200-499	190	50,449	46,535	92.2
500-999	159	91,596	91,306	88.8
1000 +	8	8,838	6,975	78.9

The data in Table 6 indicate a range in percentages of students taking science in the junior high schools in Illinois from 78.9% to 94.2%. A similarity is noted with the data in Table 5 as the small schools (less than 200 enrollment) had the highest percentage of students enrolled in science courses. It is of interest to note that although these percentages are considerably greater than those associated with the high schools, they suggest that some students in the State of Illinois are not taking any science courses in grades 7-8, or that in some cases, the instruction is less than a full year in length.

THE SCIENCE CURRICULUM

The theme of the National Science Teacher's Association convention as far back as 1960 was "Science K-12." Since that time it has become commonplace to look at science education as an articulated program through all of the grades. On the other hand, the science curricula that were developed on a national scale in the post-Sputnik days were generally single grade level programs. The analysis which follows will:

1. Examine the "typical" natural science curriculum as proposed in the "Special Report on Science" which utilized data from the 1977 census and make comparisons with current data.
2. Outline the grades 7-12 science curriculum in the various school enrollment ranges.
3. Compare the grades 7-12 science curriculum in the various community types.
4. Make comparisons in grades 7-12 of science course participation by the two sexes.

The Typical Natural Science Programs in Illinois High Schools

One of the advantages in the current census analysis is the opportunity to compare 1981-82 data with the 1976-77 data. In the 1977 document "typical" was defined as courses which enrolled in excess of 2% of the state enrollment. Courses were listed by popularity and the "typical" courses identified and utilized for further comparisons. Table 7 provides comparative data from the two censuses. An additional column has been added to indicate the numbers of students taking the identified courses.

TABLE 7. SCIENCE COURSES IN WHICH THE LARGEST RELATIVE PROPORTIONS OF ILLINOIS HIGH SCHOOL STUDENTS ARE ENROLLED

Course Title	# Schools Offering		% of State Total		# of Students Enrolled 1982	% of Students Enrolled		% of School's Enrollment

Biol. 2nd Yr. Advanced	354	375	50.3	52.2	10,760	2.1	1.8	3.8	3.3
<hr/>									
BSCS Yellow/ Spec.	45	26	6.4	3.6	4,428	1.3	0.8	11.7	12.0
Biol.-Life Sci.	85	91	12.1	12.7	5,553	1.0	0.9	6.7	5.7
Remedial Sci.	37	45	5.3	6.3	4,169	1.1	1.0	10.0	7.6
BSCS Green/Blue	52	40	7.4	5.6	5,264	1.0	0.7	11.1	11.7
PSSC Physics	21	18	3.0	2.5	1,175	0.2	0.2	2.8	3.5
Chem. Study	24	19	3.4	2.6	2,384	0.4	0.4	5.1	6.8

The number of schools offering biology, chemistry, physical science, general science, earth science, physics, advanced biology and life science increased during the five year interval between 1977 and 1982. The percent of students enrolled in biology, chemistry, and physics increased, with all other science offerings showing a decrease. There was an increase in the percentage of schools' enrollment in biology, chemistry, physics, earth science, BSCS yellow version biology, BSCS green/blue version biology, and Chem. Study and a decrease in the remaining offerings.

In summary, the first seven courses listed in Table 7 account for 74.7% of the science enrollments, an increase of 4.4% in the interval between the 1977 and 1982 census. It should be noted that advanced biology fell below the 2% category to 1.8% of the students enrolled in the state. There was a concomitant decrease in enrollments in the remaining courses, all of which fell below the 1% mark of the percentages of students in the state. PSSC physics and Chem Study chemistry were added to the table to provide data for those interested in the enrollment figures of the former "big three alphabet" programs, i.e., BSCS biology, PSSC physics and Chem Study chemistry.

The Typical Natural Science Programs in Illinois Junior High Schools

Nine natural science courses enroll 2% or more of the Illinois junior high school students. These nine courses make up 96.8% of the junior high enrollments in science courses. Enrollments in general science, grade 7, are up 1.2% and in grade 8, are down 1.2%, with the combination of the enrollments in these two courses accounting for 76.7% of the students taking science in the junior high school. The percentage of state enrollment in ISCS, grade 7, dropped from 3.1% to 2.0%, and ISCS in grade 8 dropped from 2.5% to 2.0%.

The percentages of enrollment in biology, life science, physical science, and earth science have changed little since the 1977 census. There remain eight additional selections, introductory physical science (IPS), remedial science, health-biology, environmental science, Harvard project physics, ecology/conservation, advanced biology, space science aeronautics, and aviation which collectively accounted for approximately 3% of the state enrollment. Table 8 provides comparative data from the two censuses.

TABLE 8. SCIENCE COURSES IN WHICH THE LARGEST RELATIVE PROPORTIONS OF ILLINOIS JUNIOR HIGH SCHOOL STUDENTS ARE ENROLLED

Course Title	# Schools Offering		% of State Total		# of Students Enrolled	% of Students Enrolled		% of School's Enrollment

THE SCIENCE CURRICULUM IN THE VARIOUS SIZES OF SCHOOLS

Schools of Less than 200 Enrollment

In the junior high schools in this category, general science was being offered at grade 7 (47.5% of the schools) and grade 8 (46.6% of the schools). The ISCS (Intermediate Science Curriculum Study) program was being utilized by 3.2% of the schools in both grades 7 and 8. This figure has decreased about 0.6% between the 1977 and the 1982 Census. Other offerings, including IPS (Introductory Physical Science), environmental science, life science, and physical science accounted for less than 3% of the schools sampled in this category.

The offerings in the high schools in this category are significant in that the data include 7th and 8th grade general science which suggest that approximately 16% of the schools have grades 7-12 programs. The sequencing of courses follows the format of general science, biology, chemistry and physics, supplemented by a diverse selection from among 14 offerings in the life sciences, and 8 different offerings in the physical sciences. The "alphabet programs", BSCS, IPS, PSSC, Chem Study, HPP, each have less than one percent of the enrollments in the state. Table 9 summarizes the science curriculum in the schools of less than 200 enrollment.

* Includes environmental science, earth science, IPS, life science, and physical science.

** Includes remedial science, general studies biology, health biology, microbiology, botany, zoology, and life science.

*** Includes chemistry/physics, career chemistry, independent study chemistry, and Harvard project physics.

In comparing the 1977 and 1982 census data, the percent of the state enrollment increased in: General Science Grade 7 (+3.0%), High School Physical Science (+0.4%), and Chemistry (+1.2%), and decreased in ISCS Grade 7 (-0.5%), ISCS Grade 8/9 (-0.6%), Life Science (-2.2%), Earth Science (-2.0%), General Science Grade 9 (-1.5%) and High School Earth Science (-0.3%). The percentages in Biology remained virtually unchanged (+0.1%).

Schools of 200-499 Enrollment

The sequencing of courses in this range parallels that found in the smaller schools; however, the percent of students taking the courses is consistently lower than that found in the smaller schools. Approximately 6% of the high schools in this category include grades 7 and 8. In the 9-12 schools, the curriculum offers the standard assortment of courses including general science, biology, chemistry and physics supplemented from among thirteen selections in the life sciences and thirteen selections in the physical sciences. The science curriculum in schools with an enrollment range of 200-499 is listed in Table 10.

TABLE 10. GRADES 7-12 SCIENCE CURRICULUM FOR SCHOOLS OF 200-499 ENROLLMENT

* Includes remedial science, ecology/conservation, environmental science, botany, biology, HPP/IME/TSM/TOPIC, IPS, and space science/aeronautics/aviation.

** Includes remedial science, general studies biology, health biology, microbiology, botany, zoology, and life science.

*** Includes advanced physical science, career chemistry, independent study chemistry, advanced physics, Harvard project physics, IPS, space science/aeronautics/aviation, astronomy, meteorology, and geology.

In comparing the 1977 and 1982 census data, the percent of the state enrollment increased in: Earth Science, 7-9 (+0.6%), High School Earth Science (+0.4%), Biology, (+1.3%), Chemistry (+1.3%), and decreased in: General Science Grade 7 (-0.4%), ISCS Grade 7 (-2.0%), General Science Grade 8 (-2.2%), ISCS Grades 8/9 (-2.5%), and Life Science (-0.4%).

Schools of 500-999 Enrollment

In this enrollment range, the enrollment increases in the diverse offerings causing a subsequent drop in the enrollment in the standard courses of general science, biology, chemistry and physics. There is a slight increase in the number of electives, including 15 selections in the life science and 16 selections in the physical sciences. This science curriculum for schools in the enrollment range 500-999 is displayed in Table 11.

* Includes remedial science, health-biology, environmental science, biology, HPP/IME/TSM/TOPIC, IPS.

** Includes remedial science, ISCS, general studies biology, health-biology, microbiology, botany, zoology, life science.

*** Includes chemistry/physics, Chem Study chemistry, honors chemistry, career chemistry, independent study chemistry, advanced physics, HPP, IPS, honors physics, space science/aeronautics/aviation, astronomy/meteorology, geology.

In comparing the 1977 and 1982 census data, the percent of the state enrollment increased in: General Science Grade 7 (+2.0%), Physical Science, 7-9 (+0.3%), Advanced Biology (+0.4%), High School Earth Science (+0.4%), Chemistry (+1.1%), Physics (+0.8%), and decreased in: ISCS Grade 7 (-1.1%), General Science Grade 8 (-0.4%), General Science Grade 9 (-1.4%), High School General Science Grade 9 (-0.5%), and High School Physical Science (-2.1%).

Schools with 1000-1699 Enrollment

In this enrollment range, there is a continued decrease in the percentages of students taking the standard courses, accompanied by a greater diversity of offerings. The high schools are all grade 9-12 schools. There is sufficient enrollment in the so-called "alphabet" programs to include them among the major offerings. The science curriculum for grades 7-12 in the 1000-1699 enrollment range is listed in Table 12.

TABLE 12. GRADES 7-12 SCIENCE CURRICULUM FOR SCHOOLS OF 1000-1699 ENROLLMENT

* Includes remedial science.

** Includes general studies biology, ISCS, health-biology, botany.

*** Includes chemistry/physics, applied physical science, career chemistry, independent study chemistry, HPP, IPS, space science/aeronautics/aviation, astronomy/meteorology, geology.

No comparison will be made for junior high school science courses in the 1000 and above enrollment category, as the number of schools in this category is quite small and decreased from 15 in 1977 to 8 in 1982. For high schools, the percent of the state enrollment increased in: Biology (+0.8%), Chemistry (+0.3%), Physics (+0.4%), and decreased in: General Science Grade 9 (-0.8%), and Advanced Biology (-0.4%).

School with 1700-2599 Enrollment

Only high schools are included in this enrollment range. The science curriculum in grades 9-12 in schools with the enrollment range of 1700-2599 is listed in Table 13.

TABLE 13. GRADES 9-12 SCIENCE CURRICULUM FOR SCHOOLS OF 1700-2599 ENROLLMENT

Other Phys. Sci.**			2.2	

* Includes remedial science, ISCS, health biology, botany, zoology, life science.

** Includes chemistry/physics, independent study chemistry, IPS, honors physics, space/aeronautics, astronomy/meteorology, geology.

In comparing the 1977 and 1982 census data, the percent of the state enrollment increased in: Biology (+1.7%), Chemistry (+1.6%), and Physics (+1.3%), and decreased in: Physical Science (-2.2%), General Science Grade 9 (-0.5%), and Advanced Biology (-0.5%). It should be noted, however, that the number of high schools in this enrollment range decreased from 48 in 1977 to 22 in 1982. This substantial change may have contributed significantly to the changes in the proportions of course enrollment observed.

THE SCIENCE CURRICULUM IN SCHOOLS OF VARIOUS COMMUNITY TYPES

In the analysis of data relating to community type, two factors were taken into consideration in the preparation of Tables 15-18, i.e., percent of schools offering a course and the percent of state total (enrollment) taking the course. The reasoning for adding the percent of schools offering a course was that it became evident that in certain community types a particular course was considered of such importance that it was being offered by a high percentage of the schools even though the enrollment in that course did not make up a significant proportion of the total state enrollment. In Tables 15-18, all courses which were offered by more than 25% of the schools in that category and all courses in which the enrollment was more than 2% of the state total enrollment are included.

Comparisons across community type indicate only minor variations in percentage of state enrollments between rural and suburban categories in all offerings. There were significant variations in the data in the other categories. In the independent city and central city data, the percentage of students enrolled in general science is approximately 10% less than the rural and suburban schools. Enrollment in ISCS courses is consistent in rural, suburban and independent city communities, and does not appear in central city data. The central city data, however, reflect a much higher percentage of state enrollment in biology (5.1%) and life science (7.9%) than do the data for the other three community types. The enrollments in earth science at the junior high level varied from a low of 2.4% in the suburban communities to a high of 9.1% in the central city communities.

The percent of enrollment varied in biology from a high of 15.3% in rural communities and suburban communities to 13.0% in independent city schools, to a low of 11.1% in the central city schools. BSCS biology enjoyed the highest percent of enrollment in the suburbs (1.7%), but did not rank at the 2% "typical" level in any community. Chemistry and physics enrollments varied little from community to community. The central city data were unique in that remedial biology was offered in more than 25% of the schools with a concomitant enrollment of 2.0% of the state's students qualifying this course as "typical." Two other offerings, honors chemistry and honors physics, were unique in the central city data in that both were offered by more than 25% of the schools in that category. Physiology/anatomy was a popular offering (33.3%) in the suburban schools.

TABLE 15. THE SCIENCE CURRICULUM IN RURAL COMMUNITIES

A comparison of the 1977 and the 1982 census data in central city communities reveals an increase in: junior high Biology (+1.6%), junior high Life Science (+3.6%), junior high Physical Science (+1.0%), Earth Science (+5.4%), Physics (+0.2%), high school Earth Science (+0.3%) and a decrease in: General Science Grade 7 (-1.8%), General Science Grade 8 (-3.2%), General Science Grade 9 (-6.0%), high school General Science Grade 9 (-2.7%), Biology (-1.3%), and Advanced Biology (-0.1%).

MALE VS. FEMALE ENROLLMENTS IN THE SCIENCE CURRICULUM

In the Various Community Types

In making comparisons among the four community types in regard to enrollment by sex, certain patterns emerge. The female enrollments tend to exceed the male enrollments in the life sciences. The male enrollments tend to exceed the female enrollments in physics, earth science and physical science. There is practically no difference in female and male enrollments in chemistry. Tables 19-22 list the selected courses in the science curricula in the various community types.

TABLE 19. MALE VS. FEMALE ENROLLMENTS IN THE CENTRAL CITY SCIENCE CURRICULUM

Course Title	# Male Enrolled	# Female Enrolled	Difference		% State Total Male	% State Total Female
			# Male- # Female	Percent Difference		
Gen. Sci. Gr. 7	2,741	2,591	150	2.8	26.3	26.2

Earth Science	2,043	1,784	259	6.7	2.5	2.3

Note: The enrollment ratios of males to females for high school is 50.5:49.5.

Male enrollments exceeded female enrollments significantly in five of the sixteen courses listed in Table 19 and female enrollments exceeded male enrollments significantly in five of the sixteen courses. Female enrollments exceeded male enrollments significantly in biology, advanced biology, physiology/anatomy, chemistry, and honors chemistry. Male enrollments exceeded female enrollments significantly in physics, high school physical science, earth science, general science grade 9, and remedial science. The two extremes were physiology/anatomy which had 28.7% more females enrolled than males, and physics which had 24.8% more males enrolled than females.

Note: The enrollment ratio of males to females for high schools is 51.1:48.9.

Male enrollments exceeded female enrollments significantly in five of the eighteen courses listed in Table 20, and female enrollments exceeded male enrollments significantly in three of the eighteen courses. Female enrollments exceeded male enrollments significantly in biology, advanced biology and physiology/anatomy. Male enrollments exceeded female enrollments significantly in general science grade 9, remedial science, physics, honors physics and earth science. The two extremes were physiology/anatomy which enrolled 22.1% more females than males and physics which enrolled 29.1% more males than females.

TABLE 21. MALE VS. FEMALE ENROLLMENTS IN THE SCIENCE CURRICULUM IN THE INDEPENDENT CITY SCHOOLS

Course Title	# Male Enrolled	# Female Enrolled	Difference		% State Total Male	% State Total Female
			# Male-# Female	Percent Difference		
Gen. Sci. Gr. 7	3,865	3,699	166	2.1	30.5	31.5

Physics	1,143	495	648	39.5	3.3	1.5
Earth Science	1,089	946	143	7.0	3.1	2.9

Note: The enrollment ratio of males to females for high schools is 51.7:48.3.

Male enrollments exceeded female enrollments significantly in two of the thirteen courses listed in Table 21. Female enrollments exceeded male enrollments significantly in physiology/anatomy, biology, and advanced biology. Male enrollments exceeded female enrollments significantly in general science grade 9 and physics. The two extremes were physiology/anatomy in which 31.9% more females were enrolled than males, and physics in which 39.5% more males were enrolled than females.

TABLE 22. FEMALE VS. MALE ENROLLMENTS IN THE SCIENCE CURRICULUM IN RURAL COMMUNITIES

Course Title	# Male Enrolled	# Female Enrolled	Difference		% State Total Male	% State Total Female
			# Male-# Female	Percent Difference		
Gen. Sci. Gr. 7	3,919	3,667	252	3.3	37.7	38.8

Earth Science	1,278	1,031	247	10.6	2.8	2.4

Note: The enrollment ratio of males to females for high schools is 51.4:48.6.

Male enrollments exceeded female enrollments significantly in four of the thirteen courses listed in Table 22. Female enrollments exceeded male enrollments significantly in physiology/anatomy, biology and advanced biology. Male enrollments exceeded female enrollments significantly in physics, earth science, physical science, and general science grade 9. The two extremes were physiology/anatomy with 17.9% more females than males enrolled and physics with 31.7% more males than females enrolled.

In Schools of Varying Enrollments

An examination of the census data across the varying population ranges reveals the same generalization in relationship to female vs. male enrollments in science courses that has been reported in the different community type data. Male enrollments exceeded female enrollments in physics, earth science, general science, and remedial science whereas female enrollments exceeded male enrollments in physiology/anatomy and biology.

In Table 23, data reflecting female vs. male enrollments in selected junior high and high school courses are displayed. This table is similar to one found in the 1977 report but uses year equivalent course enrollment for comparison of 1977 and 1982 data.

TABLE 23. FEMALE VS. MALE ENROLLMENTS IN SELECTED SCIENCE COURSES

Course Title	# Male Enrolled	# Female Enrolled	Junior High School			
			% of State Total		1977	1982
			Male	Female		
			1977	1982	1977	1982
Biology	1,634	1,713	2.0	1.9	2.2	2.1
Life Science	3,625	3,588	4.3	4.2	4.2	4.4

Adv. Physics	735	306	0.2	0.2	0.1	0.1
Honors Physics	686	634	0.1	0.2	0.1	0.2

The data in Table 23 reveal a similar proportion of enrollment in courses in the junior high schools in 1977 and 1982. The greatest increase (+0.4%) was in Earth Science. In the high schools there was a decrease in the proportion of science enrollment between 1977 and 1982. The greatest decrease was (-1.0%) in the male enrollment and (-0.8%) in the female enrollment in General Science Grade 9. Biology enjoyed the greatest increase (+1.0% male, +1.5% female) in the percent of state enrollments between 1977 and 1982.

Chemistry (+0.6% male and +0.9% female), Physics (+0.3% male and +0.5% female), and Advanced Chemistry (+0.2% male and +0.2% female) were other subjects that displayed a positive gain in both of the sex categories.

CONCLUSIONS

From the voluminous quantity of data presented in this report, only a finite number of possible conclusions can be presented here. Looking back to the 1977 report, the major theme of the document was what could be considered a "typical" science curriculum in a multitude of independent settings. The number of course offerings in the enrollment data varied from 45 in the schools of less than 200 enrollment to a maximum of 55 in the enrollment range 500-1000. Across the community types, there were 48 different course offerings in the rural schools, 50 different offerings in the central city schools, 54 different offerings in the independent city schools, and 59 different offerings in the suburban schools.

With the variety of permutations available, the science curriculum in a given school in the state of Illinois has the potential to be unique.

This does not imply a lack of commonalities in the data, but is intended to point out the magnitude of the diversification that exists.

The commonalities include a sequence of courses, general science, earth science, biology, chemistry and physics, beginning in grade 7 and ending in grade 12. Notably absent from this list are the "alphabet" curricula which came about as the result of massive federal expenditures in the late 1960's and early 1970's. It should be pointed out, however, that where they exist, the "alphabet" courses generally enroll a higher percent of the students in a given school population than do the more traditional courses at the same grade level.

The first generation "alphabet curricula" in science education have all but disappeared from the scene.

Although this analysis did not deal with requirements, the percentages of participation in science courses at all levels clearly define a program of limited scope.

The science curriculum in Illinois schools in 1982 serves only a minority of the total student enrollment.

Of particular concern are the percentages of the state total enrollments in Chemistry (approximately 6%) and Physics (approximately 3%).

Although the analysis of the male vs. female enrollments did not reveal any surprises, the general conclusion from this evaluation is:

In the science curriculum, male enrollments exceed female enrollments.

In recent times, it has been proposed that the science curriculum more clearly relate to societal issues and problems, yet the data show that course titles that reflect these areas of study (i.e., environmental science, ecology, etc.) are available to only a small proportion of the student population. Further, the extent to which such issues and problems are addressed in other more traditionally titled courses is unknown.

Course titles reflecting contemporary societal issues and problems are all but absent from the science curricula, and where they exist, these courses have minimal enrollments.

IMPLICATIONS

From the perspective of a biologist, who sees strength in diversification, the science curricula in the State of Illinois would reflect a rich potential. To those who might suggest more required courses, the census data might respond, "In what?" The myriad of offerings would enable students to meet a course requirement and still not be exposed to any appropriate level of scientific literacy. The census data clearly come down on the side of those groups which suggest that emphasis in the curriculum be placed on "outcomes."

The College Entrance Examination Board in a 1983 document "What Students Need to Know and Be Able to Do" supports the emphasis on student outcomes as a challenge to schooling in the 1980's. The Illinois State Board of Education has taken the position of favoring student outcomes over mandated course requirements, a policy which is supported by the diversity of findings in this document.

To the educator, government agency and publisher, information found here provides a data base on which competent decisions can be made in regard to teacher preparation, inservice needs, specific curriculum needs, and basic research. In anticipation of the possible uses of these data, this report has included a vast assortment of tables. Responses can be provided to legitimate concerns expressed from a variety of quarters. The American Association for the Advancement of Sciences in its perspective "Education in the Sciences, A Developing Crisis" states, "The AAAS believes the immediate --and central--goal must be to improve science and mathematics education in the junior and senior high schools." In the "Nation at Risk," concern was expressed that "there was a steady decline in science achievement scores of U.S. 17-year-olds as measured by national assessments of science." The National Science Teachers Association in its document "What Research Says to the Science Teacher" identifies a science curriculum based on personal needs, societal issues, salient knowledge, and care knowledge and awareness. The cry goes out for massive expenditures. The Census data in retrospect indicate that what was done before has had its limitations.

A number of task force groups are currently addressing the whole spectrum of issues relating to the science curriculum in the schools in the State of Illinois. Recommendations from the various groups followed by implementation of change must be accompanied by ongoing data collection such as that

found in this report. The census provides an essential measure of the "state of the art," and the ability to base competent judgements on hard data is critical at this juncture in science education evolution. In the future, agents of change will continue to demand knowledge available through subsequent census reports.
