ABSTRACT

Tabular data on Ph.D.'s earned by graduates of baccalaureate colleges and universities are presented for 50 top institutions, the 8 Ivy League universities, the "Big Ten" universities, 12 leading technical institutions, and colleges belonging to the Great Lakes Colleges Association and the Associated Colleges of the Midwest. The Ph.D.'s were conferred during 1951-1980 to students who earned bachelor's degrees during 1946-1976. Included are overall totals and subtotals by field (humanities, science, empirical science, life science, and social science). Using statistics from the National Research Council and the National Center for Education Statistics, institutional productivity ratios were adjusted for institutional size. A brief narrative summary provides highlights, including: high productivity ratios for a few leading technical institutions, high productivity of small liberal arts colleges, and high productivity in both science and humanities at four liberal arts colleges. Appended are information on the research methodology, data on the average number of bachelor's degrees conferred and the number of years for which data were available, and group data (e.g., the average number of Ph.D.'s per year for each institution in each group). DESCRIPTION OF THE STUDY

The numbers of baccalaureate graduates of colleges and universities who go on to earn a Ph.D. have been collected and periodically published by the National Research Council as one measure of institutional productivity. This list is, predictably, dominated by the larger universities, most of which award thousands of bachelor's degrees annually.

A separate list, comparing only undergraduate colleges in the total numbers of their graduates who have earned Ph.D.'s, has been published by Franklin and Marshall College since 1978.

We became intrigued by the kinds of comparisons which could be made if one took account of institutional size, that is, if one examined not only the number of an institution's graduates who earned a Ph.D., but also the percentage of its graduates who did so. An initial attempt at such comparisons was made and published by Professor Alfred Hall of the College of Wooster (*Change*, April 1984, pp. 40-43). Hall used data from several years over the period 1920-1980 to construct an "index of productivity." This study broadens and refines Hall's work, comparing institutional productivity based on the average number of baccalaureates awarded and the average number of Ph.D.'s earned by graduates of all accredited institutions during the years between 1951 and 1980.

The comparisons of Ph.D. productivity made possible by this study, because it takes account of institutional size, are interesting in themselves, and may be useful to government agencies and to foundations in selecting institutions for the investment of grant funds. Prospective students and parents may also find these comparative data helpful in assessing various choices for baccalaureate study. Professional academics who are intrigued by most comparative rankings of institutions will find in these assessments of institutional productivity a new focus for their interest.

The research for this study was sponsored by the Great Lakes Colleges Association. The research was supported, in part, by a grant from the Lilly Endowment.

The National Research Council provided data for Ph.D.'s earned, by graduates of baccalaureate institutions, from 1951-1980, with overall totals, subtotals by field, and separate tabulations for men and women. These Ph.D. data were used, along with baccalaureate data produced by the National Center for Educational Statistics, to produce institutional productivity ratios. The results are reported in the tables which follow. (For a more complete description of the process by which these data were derived, see Appendix A, "Description of Methodology.")

When one looks at Ph.D.'s earned in all fields, the productivity of a few leading technical institutions is striking. Very large proportions of the undergraduates at Harvey Mudd, Cal Tech, and MIT have gone on to earn Ph.D.'s—more than one in five during the years covered by this study. Only a few liberal arts colleges—Reed, Swarthmore, Haverford, and Oberlin—match the productivity ratios of these major technical institutions.

As one goes down the list of the most productive institutions (Tables 1A and 1B), the impressive achievements of the best undergraduate liberal arts colleges are notable. Liberal arts colleges constitute half of the top 50 institutions. These colleges were of particular interest to the author and sponsor of the study, and so some group comparisons were also made. The twelve liberal arts colleges of the Great Lakes Colleges Association (GLCA) were compared with the eight universities of the Ivy League, and the GLCA colleges proved to be more productive during the period covered by this study (see Tables 8A and B and 10A and B). The GLCA colleges, and those of the Associated Colleges of the Midwest, were also compared to the leading universities of their region, the Big Ten, and again the small liberal arts colleges were more productive (see Tables 8A and B, 9A and B, and 11A and B).

There are some variations in the rankings when one compares productivity of Ph.D.'s in various fields. For science Ph.D.'s, the leading technical institutions are even more productive, with a significant number of liberal arts colleges also in that top 50 (Table 3A). Those technical institutions disappear from the list comparing productivity of Ph.D.'s in the Humanities, but liberal arts colleges which ranked high in the science list—Reed, Haverford, Swarthmore, Oberlin—are also among the most productive for Humanities (see Table 2).

Those interested in data for particular institutions may consult Appendix B, which serves as an index to the various tables on which each institution is listed.

As a further indication of the new insights about Ph.D. productivity made possible when one takes account of institutional size, it is interesting to compare the more familiar list of top institutions in total numbers of Ph.D.'s earned by their baccalaureate graduates (Table 7) with the list of top 50 in productivity adjusted for institutional size (Table 1). Only 10 institutions ranking among the top 50 in total numbers are also on the top 50 list when institutional size is taken into account.

In presenting this analysis, we hope that it will demonstrate both the possibility and the utility of productivity comparisons which take account of differences in institutional size. Comparative studies might be undertaken of the baccalaureate origins of leading corporate executives, political leaders, winners of various prizes and recognitions, and people with a special commitment to service, such as Peace Corps volunteers. We believe that such comparisons will add to our understanding of the effects of baccalaureate education, and of the comparative strengths of various institutions and groups of institutions.

Appendix A

DESCRIPTION OF METHODOLOGY

For all institutions listed in the 12th (1983) edition of **American Universities and Colleges**, a productivity ratio was computed using average numbers of bachelor's degrees conferred based on 10 years of data (with an average interval of 3 years), and total Ph.D.'s produced, 1951-1980. For institutions which merged during the period covered, data for all predecessor institutions were included. (Seminaries were not included in this study.)

All institutions were ranked on the productivity ratio, and those with an overall ratio greater than 3.49 were identified (a total of 277 institutions). Complete data for baccalaureates awarded, 1946-1976, were compiled for those institutions, and for the top 50 in total numbers of Ph.D.'s awarded. The lists of 50 leading institutions by productivity ratio for Ph.D.'s in various fields were constructed from these data.

The total Ph.D.'s numbers were obtained directly from data supplied by the National Academy of Sciences. The productivity ratio was computed by dividing the average number of Ph.D.'s produced (1951-1980) by the average number of bachelor's degrees conferred (1946-1976). The higher the resulting ratio, the more productive the institution.

Average numbers per year were computed to make the Ph.D. figures comparable for institutions of different ages. The average baccalaureate-Ph.D. lapse is ten years.* Those receiving their baccalaureate degrees in 1971 or later would not, on average, have completed a Ph.D. by 1980. Thus, institutions awarding their first baccalaureate in 1971 or later were not included in this study. For those institutions awarding their first baccalaureate after 1941, the number of years over which the Ph.D. totals were averaged was computed by subtracting the date of first baccalaureate from 1971. For institutions which awarded their first baccalaureate degree prior to 1942, the number of years used for the average was 30.

An average was also computed for each institution for the number of bachelor's degrees conferred to take into account both the varying dates of first-baccalaureate and, in a few cases, missing data. The number of years used for this average was the actual number of years for which data were available (those numbers are reported in the table in Appendix B).

***A Century of Doctorates: Data Analysis of Growth and Change**, Lindsey R. Harmon, Project Director. National Academy of Sciences, Washington, D.C., 1978, page 55.

The groupings of disciplines are those used by the National Academy of Sciences in organizing Ph.D. data. The field of Humanities includes History, English and American Language and Literature, Foreign Language and Literature, and Other Humanities. Empirical Sciences includes Physics, Astronomy, Chemistry, Earth Sciences, Mathematics, Chemical Engineering and Engineering. Life Sciences includes Biochemistry, Basic Medical Sciences, Other Biosciences, Medical Sciences, and Agricultural Sciences. Social Sciences includes Psychology, Economics, Anthropology and Sociology, Political Science, and Other Social Science. Total Science Ph.D.'s were the sum of those included in Empirical Sciences, Life Sciences, and Social Sciences. All Fields included Professional Fields, Education, and Other Unspecified Fields, as well as Total Science and Humanities degrees.

In ranking various groups of "top 50 institutions," institutions with the same productivity ratio are listed in alphabetical order. Institutional names are those used in 1980. A few of the "top 50" lists contain more than 50 institutions because of ties for the 50th place on the list.

Appendix B provides, for each institution, the average number of bachelor's degrees conferred, and the number of years for which data were available. For each institution, the "top 50" listings on which it appears are identified; Appendix B can thus serve as an index to individual institutional listings in this study.

Appendix C provides group data, including the average number of Ph.D.'s per year for each institution in each group, and the sum for each group of the average Ph.D.'s per year for each institution.
