ABSTRACT

This book reports on the current condition of teaching in the United States and presents an analysis of variables for each state and the District of Columbia that affect teaching now and in the future. These variables include population changes, enrollment patterns, numbers of teachers, projected teacher shortages, salaries, school spending and the economy in general, who is going into teaching, and the education and certification of teachers. Statistical data are presented on tables with narrative analysis and commentary. In the foreword, Ernest L. Boyer makes recommendations on how to strengthen the teaching profession. (JD)

LIST OF TABLES

Table No.	Table Name	Page
1	Percent change in population by region and state: 1960-1980 and projected 1980-2000	3
2	Fopulation (in thousands)	5
3	Population under age 5	6
4	Percent change in the resident population of regions by age: April 1, 1980 to July 1, 1983	7
5	Population changes by selected age and race: 1970 and 1982, with percent changes	9
6	Resident population by race: 1960-1983 and projected 1985-2000, with percent changes	10
7	Public elementary and secondary enrollment	13
8	States showing continuous enrollment increases since 1972-73	14
9	Additional states showing enrollment gains in 1984-85	14
10	Public elementary school enrollment	15
11	States showing greatest elementary school enrollment gains in 1964-85	17
12	Public secondary school enrollment	18
13	Minority enrollment as a percentage of total enrollment	20
14	Numbers of public elementary and secondary teachers	23

Vii

15	States that added teachers in 1983-84 and in 1984-85	24
16	States that decreased numbers of teachers in 1983-84 and 1984-85	25
17	Numbers of public elementary school teachers	27
18	Numbers of public secondary school teachers	28
19	Trends in estimated demand for classroom teachers in elementary/secondary schools and estimated supply of new teacher graduates: fall 1980 to fall 1993 (numbers in thousands)	31
20	Teacher education graduates, undergraduate enrollment in teacher education programs, and newly admitted teacher education students by control of institution and enrollment size: 1973 and 1983	33
21	Percentage distribution of teachers and college graduates by household income: 1983	37
22	Percentage distribution of teachers by years taught and by whether or not they have tenure compared with the working public: 1983	38
23	Salaries by occupation: 1982	40
24	Salaries of state and local government employees compared with salaries of teachers: 1983 and two-year gain	42
25	Total teachers' salaries	43
26	Change in numbers of teachers and in teachers' salaries: 1984 to 1985 and 1983 to 1984	44
27	Elementary teachers' salaries	45
28	Secondary teachers' salaries	46
29	Percentage changes for elementary and secondary teachers' salaries: 1983-84 to 1984-85 and 1982-83 to 1983-84	47

46	Profile of high school seniors taking the SAT: 1984	78
47	SAT score changes for intended education majors and for states having largest gains in SAT verbal and math scores for intended education majors: 1982 to 1984 and 1978 to 1982	79
48	Numbers of institutions of higher education (IHE's) that have teacher education programs, numbers of teacher education graduates, numbers of new teaching certificates issued, percent who got new jobs: 1984	82
49	Average number college semester hours required to complete the teacher education program by field of study	83
50	States' semester hour course requirements for teacher certification	84
51	States requiring specific tests for certification as of summer 1985	87
52	Tests required for certification: 1985 and projected within the next three years, by state	88
53	Substandard, limited or emergency certificates issued in 1983, by state	90
54	Teachers' credentials: 1984	91

x

SOURCES OF DATA

While the basic data used for this report were obtained from many sources, the compilation and analyses are original. General population numbers were obtained from several documents published by the U. S. Department of Commerce, Bureau of the Census, and Bureau of Economic Analysis. Public school enrollments, numbers of teachers, salaries of teachers, and expenditures and revenues were obtained from the National Education Association because NEA has the most current data available. Personal income and per-capita income figures came from the U.S. Department of Commerce, Bureau of Economic Analysis. The U.S. Department of Labor, Bureau of Labor Statistics provided salary data for professions other than teaching. Basic data concerning who is going into teaching and qualifications of new teacher graduates were obtained from the U.S. Department of Education, National Center for Education Statistics and the National Education Association. The College Entrance Examination Board provided Scholastic Aptitude Test (SAT) data for each state. Teacher certification data were obtained from a survey The National Center for Fducation Information conducted among the states in summers 1984 and 1985, The National Association of State Directors of Teacher Education and Certification and the National Education Association.

хi

By Ernest L. Boyer

C. Emily Feistritzer, has done a remarkable job in bringing together information about the nation's teachers and providing an analysis of the changes that have occurred since the first Carnegie report on the condition of teaching was released in 1983. As in the case of her earlier work, this analysis will be a valuable tool for policy makers and others interested in the status of education in the nation.

In issuing the 1985 update, our goal once again is to put the spotlight on the teacher. It remains our view that excellence in education means excellence in teaching. The big push for school reform will accomplish little if we do not give greater status and recognition to those who meet with young people in the classroom every day.

In this latest report there is grounds for cautious hope. Teachers' salaries have gone up and there are indications that we may be improving the quality of prospective teachers and raising the standards of teacher certification. Still, the challenge confronting teaching in this country is far greater than its achievements. And if the teaching profession is to be strengthened, the following steps are urgently required.

First, outstanding people must be attracted into teaching

During the next five years, as many as half of today's teachers will be leaving the profession or retiring. The National Center for Education Statistics (NCES) projects a need for more than one million new elementary teachers and more than a half-million secondary teachers by 1993.

And yet, in the fall of 1982, only 4.7 percent of college freshmen said they planned to be a teacher. Compare that to 1972 when almost twenty percent (19.3) were attracted to the classroom. To compound the problem, the quality of those who choose teaching is not outstanding. Students now majoring in education have a

ERIC*

xiii

combined average SAT score of 852. That is 73 points below the average of students overall.

Clearly, a national program of teacher recruitment is required. It must begin within the school itself, but national leadership is needed as well. Last year, Congress passed the Talented Teacher Act, which is on the books but still remains unfunded. This Act would provide \$5,000 a year scholarships for outstanding high school graduates who agree to teach two years for each year they receive such national support.

Schools also have a role to play. For example, high school teachers should identify gifted students who might enter the profession, arrange for them to work as tutors and, occasionally, to have seminars with outstanding school and college teachers.

Teacher recruitment must involve higher education, too. Unfortunately, when colleges call for "excellence in the schools," there is, quite frankly, a lot of hypocrisy at work. On many campuses, there is open hostility toward teaching in the public schools. At one prestigious institution we visited several years ago, a college sophomore said he'd like to be a teacher but he couldn't tell his roommate or faculty advisor. "I'd just be ridiculed," he said.

Recruiting future teachers is at least as important as recruiting fullbacks. And all colleges and universities should give scholarships to outstanding students who plan to teach. Such a program is already in place at Trinity University in Texas and at several other higher learning institutions.

Second, the professional standards of teaching must be tightened

If the profession of teaching is to be improved, teacher candidates must be more carefully selected, teacher education must be dramatically overhauled, and apprentice teachers must spend more time learning from outstanding teachers already in the classroom.

Certification must also be split off from teacher education. Today, colleges not only enroll and educate students, they also recommend them for credentials. If teaching is to become a recognized profession this monopoly must be broken.

хiv

We proposed, in <u>High School</u>, that credentialing be separated from college preparation. To qualify for credentials, each candidate would submit written recommendations from a member of the faculty in his or her academic major; a member of the faculty in his or her education sequence; and a teacher who has supervised his or her school internship.

Before being credentialed, the candidate would also pass a written examination in English proficiency and subject matter competence administered by a Board of Teacher Licensure to be established in every state. We would urge that the majority membership on such boards be comprised of senior classroom teachers.

Once credentialed, a candidate would become an associate teacher. For two years this teacher would work under the mentoring of senior teachers. He or she would have a full teaching load. During this time, however, there would be continuous assessment and counseling by senior teachers to screen out individuals whose performance is inadequate.

After two years, a candidate's performance would be more formally reviewed. The evaluation of the teacher would be based upon testimony of the mentor, the written record, and testimony of other school personnel, including students. Direct observations would be crucial. Equally important are character, motivation, and, most especially, success in the classroom. If the review is favorable, the associate teacher would be given full teacher status.

The testing of prospective teachers also is essential. Paper and pencil examinations cannot identify those who will be successful in the classroom. However, they may help to weed out candidates who cannot read with understanding, who cannot use with accuracy the number system, or who have not acquired basic information about our world. Serious, not superficial, teacher testing is essential if students are to be well served and if public confidence is to be sustained and strengthened.

Third, teachers must be given more recognition and rewards

In his 1975 study Schoolteacher, Professor Dan Lortie talks about three kinds of rewards for teachers: psychic, extrinsic, and ancillary. Extrinsic rewards are those

xv

that take the form of "earnings" of different kinds: financial compensation, to be sure, but also status, prestige, and "power over others." Ancillary rewards include security, spare time, convenient schedules, freedom from rivalry, and a subjective sense that what one is doing is "appropriate" for himself or herself—what we have just described as the working conditions of the teacher.

Psychic rewards come from the satisfaction of reaching students and helping them learn, the chance to work with young people, the opportunity to associate with other teachers, to study, and to read.

Today, psychic rewards appear to be harder to come by. Teachers say, for example, that many of today's students "don't like to study anymore," "aren't interested in learning."

Another complaint we frequently heard was that students are no longer motivated to learn. Even more devastating is the subtle disrespect many adults have for teachers.

The time has come to reaffirm the centrality of teaching, to support good teachers, and give them the recognition they deserve. Students and parents have the most frequent opportunities for extending such recognition. A student's "thank you" for making a difficult lesson clear, or a complimentary note from home are simple examples, rendered special by the infrequency with which they occur. Prompt parent responses to ! .chers' requests for conferences, and public participation in school events also signal community support.

Fourth, the salaries of teachers must improve

The cornerstone of recognition is, of course, renumeration. Here, progress has been made. In the Carnegie study, <u>High School</u>, we proposed a 25 percent salary increase over three years for beginning teachers. Our goal is now within reach. During the past two years, as Dr. Feistritzer reports, teachers' salaries have increased about 14 percent. And, in one state, the overall salary average has increased 23 percent.

But rejoicing should be muted. We still have states where beginning salaries are disgraceful, and the average annual average for all salaries is less than \$18,000. If this nation continues to shortchange its teachers, we will surely shortchange our students, too.

xv i

Our society pays for what it values. Unless teacher salaries become more commensurate with those of other professions, teacher status cannot be raised; able stidents cannot be recruited.

Fifth, continuing education must be a centerpiece of every teacher contract

The continuing education of the teacher has been consistently neglected. It is fascinating that, while the corporate world is recognizing the importance of the worker, in education we increasingly try to fix "the system" from the top. And while doctors and business executives have lifelong learning programs, we keep teachers in the classrooms—except for an occasional in-service workshop where they listen to experts on leave from Mt. Olympus.

If we're serious about the quality of teaching, every school district should provide an authentic program of continuing education so that all teachers can be intellectually enriched. And the teachers should participate in shaping the program.

In <u>High School</u> we proposed that a two-week Teacher Professional Development Term be added to the school year, with appropriate compensation. This would be a time for study, a period to improve instruction, and an opportunity to expand knowledge. The planning of such a term would be largely controlled by teachers at the local school or district level. Local colleges would be actively involved.

We also recommend that every five years teachers be eligible to receive a special contract with pay to match to support a Summer Study Term. To qualify and to compete for this extended contract, each teacher would prepare a study plan. Such a plan would be subject to review and approval both by peer panels and by the school and district administrators.

Finally, there should be a Teacher Travel Fund. An informal survey of select math and science teachers reveals that their most urgent need was not higher salaries but contact with colleagues in the profession. The fund would make it possible for teachers, based on competitive applications, to travel occasionally to keep current in their field—a practice that is commonplace and respected in other professions.

xv i i

We will need more, not less, outstanding new teachers in the years to come. We have the facts and the figures. Now it is time to move beyond the data. It is time to take the actions needed to advance teaching, not only to serve the profession but also the students who are taught.

xviii

The Typical American Teacher

Any analysis of the current condition of teaching in the United States depends for success upon an understanding of who teachers are. We don't know very much about what kinds of people go into teaching, but we do have data about such things as their ages, years of experience, and job satisfaction, and all of these help explain who they are.

A "typical" American teacher today would be a woman in her early forties who had taught for fifteen years, mostly in her present district. Over those years, she would have returned to her local college or university often enough to acquire enough credits for a master's degree. She would be married and the mother of two children. She would be white and not politically active. Her formal political affiliation, if she had one, would be with the Democratic Party. She would teach in a suburban elementary school staffed largely by women, although, in all likelihood, the school principal would be male. She would have about twenty-three pupils in her class. Counting her after-hours responsibilities, she would put in a work week slightly longer than that of the average worker. The median household income of the average teacher is comparable to that of college graduates in general. Both groups had a median household income of about \$30,000 in 1982.

Age: The typical American teacher is almost forty-one years of age, about five years older than the typical American worker. Most of today's teachers in elementary and secondary schools are just entering middle age. Compared with teachers in 1970, they are both older and younger. Until now, the number of new or recently hired teachers has been reduced because of declining enrollments. Staff cuts fell heavily on young teachers: In 1970, almost 17 percent of all teachers were under twenty-five. Today that figure is around 1 percent. There are also fewer older teachers in the teaching force. In 1970, almost 14 percent of all teachers

хiх

were over fifty-five. Today, teachers over fifty-five constitute only about 12 percent of the total teaching force.

Experience: The typical classroom teacher, having taught for fifteen years, with most of them in the current district, could be considered a top performer at the peak of her or his career. But another, less flattering interpretation is that opportunities for further development and substantive salary increases could be over. Many teachers, in fact, view themselves as having reached the plateau where they are stranded. They see no real opportunities for growth or reward. A number of teachers report this as a major problem.

Nearly half (48 percent) of all teachers have taught at least fifteen years, and 27 percent have taught for twenty years or more. Eighty-one percent of teachers hold tenured positions.

Academic preparation: Teachers are a relatively experienced and nontransient lot. They also are going to school longer and getting more degrees. Today, more than half (52.0 percent) of the teachers in elementary and secondary schools have earned at least a master's degree compared with 25 percent in 1963. This increase in proportion of teachers with a master's degree is directly related to the fact that the teaching force is older. The only requirement for getting one's certificate to teach renewed in most states is to take more college courses. Since 48 percent of current teachers have been teaching fifteen or more years, it is not surprising they have taken enough courses to get a master's degree.

Sex: The great major ty of the 1,184,337 public elementary school teachers in the classrooms today are women. In 1984-85, there were 988,508 women teaching in elementary schools and approximately 195,829 men; as a result, the ratio of women to men in elementary schools remains high—as it has historically—at about five to one. In secondary schools, there is a relative balance between men and women. The 1984-85 estimates showed 479,956 (49.9 percent) men and 481,249 (50.1 percent) women.

Marital Status: The typical American teacher is more likely to be married than is the average American worker. Seventy-four percent of teachers are married compared with 64 percent of the working public. In addition, 74 percent of

хx

all teachers have children. Only 51 percent of the working public have children. Half of the current teachers have school-age children.

Ethnic background: If males are underrepresented in the teaching force, especially in elementary schools, so are minority groups. Almost nine of every ten teachers are white. It is estimated that blacks constitute 8.6 percent of the teaching force. The proportion of teachers from other minority groups is very Hispanics represent 1.8 percent of teachers in kindergarten through high school, and Asian American and American Indians represent less than 1 percent. There is great variation in the racial/ethnic distribution according to geographic location. Southern states have a much higher percentage of minority teachers than the national average, which is consistent with their share of the minority population. Examples of states with large percentages of minority teachers in 1980 include: Mississippi, 38.6 percent; Louisiana, 35.3 percent; Georgia, 27.6 percent; Alabama, 27.2 percent; and South Carolina, 26.1 percent. On the other hand, some non-Southern states fall short in proportions of minority teachers by comparison with their percentages of minority population and school enrollment. Examples of these states include New York, 7.8 percent minority teachers; Colorado, 6.8 percent; Iowa, 1.1 percent; Minnesota, 0.8 percent; and South Dakota, 0.8 percent.

Where they teach: The basic administrative unit for the American school system is the local school district. There has been a continuing decrease in the number of districts as consolidations occurred to avoid duplication and conserve costs. In 1931, there were more than 127,000 school districts. Today there are 15,248. These districts contain 50,926 elementary schools, 9,785 junior high schools and 13,837 senior high schools. A fourth (27.4 percent) of the elementary schools enroll more than 500 students. A third (32.8 percent) of senior high schools enroll more than 1,000 students.

Only 11 percent of our teachers work in what is considered the inner core of a city, while another 12 percent work elsewhere in urban areas. Almost one-third teach in a suburb (31 percent) or a small town (31 percent). Another 14 percent teach in schools characterized as rural.

Of the 2,145,542 teachers employed in K-12 schools in 1984-85, 1,184,337

xx i

were in elementary schools and 961,205 in secondary schools. In 1983, almost half of all teachers were categorized as strictly elementary (47.0 percent), nearly one quarter (21.0 percent) as middle or junior high school teachers, 30 percent as senior high school teachers, and 2 percent as teachers at more than one level.

Classroom demand: Although classroom size diminished over the past decade at both the elementary and secondary levels, it appears that teacher-pupil ratios are beginning to edge upward again. Difficult economic conditions offer one explanation for the turn-around.

Teachers estimate the average number of hours in the required school day to be 7.3. Since they also estimate that they spend about 50-55 hours per week on teaching-related duties, it would appear that teachers spend an additional two hours each day beyond normal school hours on their teaching responsibilities. The average school year across the country is 180 teaching days. 10

Job Satisfaction: The data on job satisfaction for teachers are mixed. Ninety-six percent of all teachers report they love to teach. The vast majority of teachers say they are satisfied with their jobs, although teachers are less satisfied than are working people in general. Eighty-one percent of teachers are at least somewhat satisfied with their jobs, and 40 percent are very satisfied. Comparable figures for the working public are 87 percent and 52 percent. Eighteen percent of teachers and 13 percent of the working public report dissatisfaction with their jobs. 11

Even though 8 out of 10 teachers report relative job satisfaction, nearly half of them say if they had to do it over again they would not go into teaching. In 1983, 13 percent of teachers said they certainly would not become a teacher again if they could go back to their college days. An additional 30 percent reported they probably would not become a teacher again. 12

These are relatively high statistics compared with less than twenty years ago (1966) when only 9.1 percent of teachers said they would not choose teaching if they had it to do over again. 13

The amount of time spent on record keeping and clerical duties is reported by teachers as the number one variable contributing to job dissatisfaction. Salary

xxii

and treatment of education by the media are tied for second, followed by lack of clerical help available from teacher aides or other support staff. 14

Regardless of whether they are satisfied or not, teachers tend to stick with it. More than half of all teachers surveyed in 1983 said they planned to remain in teaching either until required to retire (12 percent) or until eligible for retirement (39 percent). Another quarter (24 percent) said they would continue teaching unless something better came along. Only 9 percent said they definitely planned to leave teaching as soon as they could, and 16 percent said they were undecided. 15

These proportions haven't changed much since 1976, when 59 percent of teachers said they wouldn't leave until retirement, 10 percent reported they would stay unless something better came along, 5 percent said they'd leave teaching as soon as they could and 26 percent were indecided. 16

The remaining chapters in this report on the current condition of teaching in America will analyze variables for each state and the District of Columbia that affect teaching and will for decades to come—population changes, enrollment patterns, numbers of teachers, projected teacher shortages, salaries, school spending and the economy in general, who's going into teaching and the education and certification of teachers.

This project could not have been done without the help and support of many people. My deepest gratitude goes especially to my assistant Betty Moran and to Sarah Ince who tracked information for weeks and to Fred Quelle who told the computer to do what I wanted done.

xxiii

CHAPTER I

Population Changes in the United States

The baby boomlet of the late 1970s is hitting our schools right now. Reversing fifteen years of steady decline, enrollment in elementary schools went up in the fall of 1984. Enrollments in elementary schools are expected to rise for the next decade while secondary enrollments will continue to decline until the current bumper crop of under six-year-olds gets to high school. About the time that happens—the mid-1990s—elemen*ary school enrollments will start descending again.

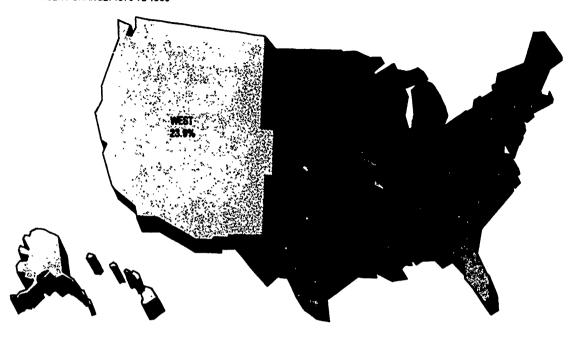

Population shifts in the United States are such that school enrollment patterns are by no means uniform. While most states show either an increase in elementary enrollments or at least a slowing down of a downward trend since 1972, eight states are experiencing a continuation of declining enrollments across-the-board at both the elementary and secondary levels—the District of Columbia, Illinois, Maryland, Missouri, New Jersey, New Mexico, Pennsylvania and West Virginia.

The southern and western regions continue to grow in population at much faster rates than the Northeast and North Central regions. The net migration alone from the industrial Northeast and North Central states to the "sun belt" of the South and West totaled 3.2 million from 1970 to 1980, contributing to an overall increase of 21 million people (22 percent) for the South and West during the decade. This compares with a 3.3 million (3 percent) increase in total population in the Northeast and North Central states (Chart 1).

The Census Bureau expects a 22.2 percent increase in the West's population from 1980 to 1990, and an 18.1 percent rise from 1990 to the end of the century. Projections for the other regions from 1980 to 1990 are: South 15.9 percent

RESIDENT POPULATION—
PERCENT CHANGE: 1970 TO 1980

increase, North Central 2.1 percent increase, and Northeast 1.7 percent decrease; projections from 1990 to 2000: South 12.8 percent increase, North Central 0.9 percent decrease, and Northeast 4.2 percent decrease (Table 1 and Chart 2).

Chart 1

The ten fastest-growing states, in terms of numerical and percentage increases—all in the South and West—draw much of their gain from high growth rates for children under five years of age.

California had the largest growth in actual numbers from July 1, 1982 to July 1, 1984, a total of 925,000 that included 146,000 children under-five. Other leaders were Texas, which grew by 660,000 for the period (111,000 children under-five), and Florida, with another 510,000 (including 69,000 children under-five).

Percentage increases in total population for the ten fastest growing states for the period were: Alaska, 12.6 percent; Arizona, 5.6 percent; Utah, 5.2 percent; Florida, 4.9 percent; Texas, 4.3 percent; Hawaii and New Mexico, 4.2 percent; Nevada, 4.0 percent; California, 3.7 percent and Colorado, 3.5 percent. Their gains

TABLE 1. Percent change in population by region and by state: 1960-1980 and projected 1980-2000

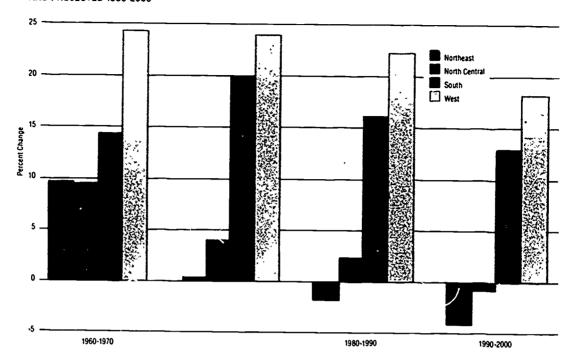

Chart 2

for children under five-years-old: Alaska, 21.7 percent; Florida, 10.6 percent; Arizona, 9.2 percent; Oklahoma, 8.9 percent; Colorado, 8.6 percent; Texas, 8.4 percent; Delaware, 7.7 percent; California, 7.6 percent; Hawaii, 7.1 percent; and Nevada, 6.1 percent (Tables 2 and 3).

The West and West South Central regions also are experiencing rapid growth among 25-to-44-year-olds—the child-bearing age group that began as the baby boomers after World War II and the Korean War. The West's 6.5 percent increases overall between 1980 and 1983 reflected gains of 15.8 percent for under-fives and 13.7 percent for the 25 to 44's (Table 4).

The West South Central's total increases of 8.6 percent included increases of 17.7 percent for children under-five and 17.0 percent for 22-44 year-olds, and the Northeast's 0.8 percent gain overall covered a 5 percent growth for children under-five and an 8.5 percent increase for the 25-44 year-old category.

Both of these age groups constituted a greater proportion of the entire

SOURCE: Selected data from U.S. Bureau of the Census, Estimates of the Population of States, by Age: July 1, 1981 to 1983, CPR Series P-25, No. 951, (Washington: May 1984), p. 12.

population for 1983 than they did three years earlier—29.7 percent for the 25-44's (up from 27.7 percent three years earlier). The population over 65 years of age rose slightly during the period, from 11.3 percent to 11.7 percent, but every other age group recorded a decline as a proportion of the total. 17

Trends in Racial and Ethnic Composition of the U.S.

The new baby boom is disproportionately non-white. The number of underfives in the white population actually decreased 2.7 percent (14,464,000 in 1970 to 14,075,000 in 1982). Black children in this age group showed an 11.6 percent gain, from 2,434,000 to 2,717,000 (Table 5 and Chart 3).

The number of white children between five and thirteen years of age dropped 19.8 percent as figures for the same age group for black children showed a 9.9 percent drop. Numbers of all children between fourteen and seventeen years old decreased 5.6 percent, representing a 9.1 percent decline among white and 7.1 percent increase for black children fourteen to seventeen.

The percentage of black Americans increased from 11.1 percent in 1970 to 11.7 percent in 1980; of American Indians from 0.4 percent to 0.6 percent, of Asian

and Pacific Islanders from 0.8 percent to 1.5 percent, and of persons of Spanish origin from 4.5 percent to 6.4 percent.

From 1970 to 1980, the black population increased by 17.3 percent. There were also increases in the population of American Indians, by 71 percent; Chinese, 85.3 percent; Filipinos, 125.8 percent; Japanese, 18.5 percent, and Korean, 412.8 percent.

The white population in the United States increased by only 6 percent from 1970 to 1980. Still the overwhelming majority, it nevertheless dropped, as a percentage of total population, from 87.4 percent in 1970 to 83.2 percent in 1980.

Blacks, the second largest racial group in this country, represented about 12 percent of the total population in 1980. Fifty-three percent of all blacks, about the same proportion as a decade ago, live in the South. In 1980, the District of Columbia had the greatest proportion of blacks, 70.3 percent; followed by

Mississippi, 35.2 percent; South Carolina, 30.4 percent; Louisiana, 29.4 percent; Georgia, 26.8 percent, and Alabama, 25.6 percent.

Although the West recorded the smallest proportion of blacks of any region in both 1970 and 1980, it was the only region that experienced an increase in the percentage of black residents—from 7.5 percent in 1970 to 8.5 percent in 1980. The Northeast had a slight decline in its black population, from 19.0 percent in 1970 to 18.0 percent in 1980. The proportion of blacks in the North Central region remained about the same, 20.6 percent.

The fastest growing minority group of significant size in the United States includes persons of Spanish origin. Their numbers increased by 61.0 percent—9,294,500 in 1970 to 14,609,000 in 1980. In both 1970 and 1980, more than 60 percent of the nation's Hispanics lived in California, Texas, and New York. California ranks first in the number of Hispanics—4.5 million (19.2 percent of the state's total population); followed by Texas, with 3.0 million (21.0 percent), and New York, 1.7 million (9.5 percent). Other states with large Hispanic populations include New Mexico, 37.0 percent; Arizona, 16.0 percent, and Colorado, 12.0 percent.

Population Summary and Projections

For all age groups, the black population increased 49.5 percent from 1960 to 1983; the white, 25.8 percent; and the other-races group 294.7 percent.

According to the United States Bureau of the Census, our total population

will grow 12.3 percent from 1985 to 2000, with the white population increasing 9.6 percent and the black 23 percent. For the school-age category (ages five through seventeen), a 12.2 percent increase is projected for the next fifteen years, reversing declines of the past fifteen.

For the under-fives, who jumped 9 percent in the past three years (three times the rate of growth of all the population), a drop of 4.5 percent is expected toward the end of the century. The college-age category (eighteen to twenty-four) is forecast at a 14.4 percent decline by the end of the century.

The implications of these population changes for schooling in America are obvious. Enrollments in elementary schools will rise while secondary and college enrollments will fall in the next few years. Then enrollments at the secondary and college levels will pick up as the students pass through elementary schools. By the year 2000, enrollments in elementary grades will fall again.

CHAPTER II

Public Elementary and Secondary School Enrollment

Rapidly changing demographics are having a dramatic impact on schooling in America. Not only are elementary school enrollments on the rise, but the composition of enrollments is changing, making new demands on teachers.

- o The population of children under five grew 9 percent—three times faster than the overall population in the U.S.—between 1980 and 1983.
- o There are many more poor children coming to public schools today than there were fifteen years ago. Today, 13 million of the 62 million children under eighteen live below the poverty level, compared with 10 million of the 69 million children in 1970.
- o Minority children made up 14.8 percent of all children under eighteen in 1970. They now comprise 18.3 percent of all children.

Classrooms today are filled with students from many different ethnic backgrounds. Minority encollment in public elementary and secondary schools nationwide rose from 21.7 percent in 1972 to 26.7 percent in 1981 and is expected to reach one-third by the mid-1990s.

The rate of increase in minority school enrollments is in line with the general rate of growth of minority populations—up 25 percent for blacks, 150 percent for all other races, compared with 12 percent growth for whites since 1970.

Again, the rates of growth among minority populations and reflected in school enrollments differ radically from state to state. Further, in every state

where minority populations are high, the greatest concentrations can be found in urban areas. Consequently, urban schools have the highest proportions of minorities enrolled.

Public School Enrollment Trends in the States

Enrollments in elementary and secondary schools started upward last fall for the first time since 1972-73, the highest year ever. After dropping 14.0 percent for a decade and continuing downward 1.1 percent from 1982-83 to 1983-84, public school enrollments rose 0.3 percent from 1983-84 to 1984-85 reaching a total of 39,373,476 (Table 7).

All but four states (New Jersey, New Mexico, Tennessee and West Virginia) had either more students enrolled in their public schools last fall than the year before or showed a slowing down of enrollment declines.

The positive turn-around in total enrollment is due to increases at the elementary level. Elementary school enrollment went up 1.3 percent last year over the year before while secondary enrollment continued to drop. There were 1.1 percent fewer students enrolled in secondary schools last year than in 1983-84 continuing the downward trend of 17.9 percent for the decade between 1972-73 and 1982-83.

There were 23,770,897 students enrolled in public elementary schools last year and 15,602,579 students in secondary schools.

Enrollments actually went up in twenty-six states in the last year—nine of them continuing the upward trend of the year before and seventeen states reversing the trend of decreasing enrollments of previous years.

Only seven states, all in the South and West, increased their enrollments in the decade between 1972-73 and 1982-83. These seven states still lead the pack in rates of growth in enrollments. Alaska had the sharpest enrollment increase last year over the year before-5 percent after a 2.4 percent increase for the decade between 1972-73 and 1982-83. Arizona followed at 3.8 percent after a decade growth of 4.4 percent. The remaining five states with continuing growth in enrollments since 1972-73 are: Utah, 3.1 percent increase in enrollment over the last year after a 20.7 percent jump for the earlier decade; Wyoming, 2.2 percent

over the last year and 18.9 percent for the earlier decade; Idaho, 2.1 percent in the last year and 11.0 percent for the earlier decade; Texas, 2.1 percent and 5.3 percent; and Nevada, 0.2 percent last year following a 14.7 percent jump in enrollment from 1972-73 to 1982-83.

Three states showed a marked increase in enrollments after years of decline: Louisiana, up 3.5 percent last year over the year before and an 6.5 percent drop from 1972-73 to 1982-83; North Dakota, up 3.0 percent in the last year after a 17.6 percent decrease for the earlier decade; and Minnesota, up 2.5 percent following 2 decade decrease of 21.0 percent.

The remaining sixteen states that showed increased enrollments last year over the year before with their rates of change for the latest year and for the decade from 1972-73 to 1982-83 are shown in Table 9.

Public Elementary School Enrollment Trends

Thirty states increased their public elementary school enrollments last year, twenty of them reversing downward trends since 1972-73. With the exceptions of Delaware, Michigan, New York, Rhode Island, Vermont and Wisconsin, they are all located in the South and West (Table 10).

States registering the largest increases (3.5 percent or 1 'e) in elementary school enrollments over the past year with their enrollment changes for each of the last two years, and for the decade from 1972-73 to 1982-83 can be found in Table 11.

Twenty states and the District of Columbia showed a decrease in elementary school enrollments from 1983-84 to 1984-85, three of them actually reversing an increase in the year before—Nevada, New Mexico and Oklahoma. Nevada's public elementary school enrollment dropped 2.8 percent last year after increasing 12.2 percent between 1972-73 and 1982-83 and increasing 0.1 percent from 1982-83 to 1983-84. New Mexico's dropped 5.3 percent last year after increasing 0.9 percent the year before and 3.8 percent in the preceding decade. Oklahoma registered a 3.0 percent decline in elementary school enrollment last year over the previous year

14

after showing an increase of 0.3 percent from 1982-83 to 1983-84 and a 0.1 percent decrease for the decade earlier.

With the exceptions of New Mexico, North Carolina, Oklahoma, Tennessee, Virginia, and West Virginia, states having decreased enrollments in public elementary schools are in the Northeast and North Central regions.

What we are seeing is a slight breakdown in regional barriers regarding public elementary school enrollment trends. As indicated above, six states in the Northeast and North Central regions showed increases in enrollments at the elementary school level and six states in the South and West registered decreases in elementary enrollments. The baby boomlet of the late 70s was not regional.

Public Secondary School Enrollment Trends

As predicted, school enrollments at the secondary levels continue to fall. Last year, secondary enrollments dropped 1.1 percent following a 1.5 percent decline the year before and a 17.9 percent decrease from 1972-73 to 1982-83 (Table 12).

Only six states had an increase in secondary school enrollments in the decade from 1972-73 to 1982-83. Four of them continue to enroll more students in their public secondary schools. Two of them are now enrolling fewer secondary school students than they did two years ago. These six states, with their percentage change over the last year and change in the earlier decade are: Alaska, 6.8 percent and 14.1 percent; Arizona, 4.6 percent and 10.1 percent; Nevada, 3.9 percent and 17.9 percent; Utah, 1.8 percent and 4.0 percent; Vermont, -2.3 percent and 5.7 percent; and Wyoming, -0.3 percent and 5.6 percent.

Nearly half (24) of the states and the District of Columbia showed a decrease in secondary school enrollments in 1984-85 over 1983-84, compared with 36 that had declines in secondary enrollments from 1982-83 to 1983-84.

Ten of the states that had a decrease in secondary enrollments in both of the last two years showed a greater rate of decrease in the latter year—Alabama, Delaware, Kansas, Mississippi, Nebraska, New Jersey, New Mexico, Oregon, Pennsylvania, and Wisconsin.

An additional five states had a decrease in enrollment last year showing an increase the year before—Georgia, Rhode Island, Vermont, West Virginia, and Wyoming.

Racial and Ethnic Composition of Public Elementary and Secondary Schools

The rate of growth among minorities is the biggest contributing factor to increased excollments in schools. The new baby boomlet hitting the schools this fall is disproportionately non-white. There were 400,000 fewer white children under five years old in 1982 than in 1970—which had the highest number in a decade—but there were 280,000 more black children.

Since 1970, the population of white children under five decreased 2.7 percent while the population of black children in this age group increased 12 percent. Numbers of white children five to thirteen years old decreased 20 percent and numbers of black children of elementary school age decreased only 10 percent in the last fifteen years. White high school age children (ages fourteen to seventeen) decreased 9 percent, compared with a 7 percent increase for black children in this age group. 18

The fastest growing minority populations in the United States are Hispanics. While Hispanics make up 6.4 percent of the total population, they make up 8.0 percent of public school enrollment.

Minorities represented almost 14 percent of the total population in 1980 and 26.7 percent of public elementary and secondary school enrollment. By the year 2000, minorities are expected to make up 17 percent of the total United States population and well over a third of school enrollments.

Between 1972 and 1981 (the latest year for which state-by-state data is available), public elementary and secondary school enrollments declined, but the minority proportion of a diminishing pool of students increased—from 21.7 percent in 1972 to 26.7 percent in 1981 (Table 13).

Some states are experiencing dramatic increases in minority enrollments, whereas others have very small numbers of minorities in their schools. The range is from 96.4 percent minority enrollment in the District of Columbia, 57.0 percent in New Mexico and 51.6 percent in Mississippi to a low of 0.9 percent in Maine.

In seven states and the District of Columbia, more than 40 percent of students enrolled in school were minority students in 1981: Hawaii, 75.2 percent minority; California, 42.9 percent; the District of Columbia, 96.4 percent;

Louisiana, 43.4 percent; Mississippi, 51.6 percent; New Mexico, 57.0 percent; South Carolina, 43.5 percent; and Texas, 45.9 percent.

In seven states, less than 5 percent of all enrolled students were members of minorites in 1981: Iowa, 4.1 percent minority enrollment; Maine, 0.9 percent; New Hampshire, 1.3 percent; North Dakota, 3.5 percent; South Dakota, 7.9 percent; Vermont, 1.0 percent; and West Virginia, 4.3 percent.

California sed the states in increases in minority enrollment between 1972 and 1981 (15.3 percent increase), followed by Alaska (12.1 percent), then New Mexico (9.7 percent), Maryland (8.7 percent), Texas (7.9 percent) and New Jersey (6.8 percent).

CHAPTER III

Numbers of Public School Teachers

After dropping at both the elementary and secondary levels from 1982-83 to 1983-84, the total number of teachers in the United States increased last year—by 1.1 percent in elementary schools and by 1.6 percent in secondary schools for a total increase of 1.3 percent (Table 14).

There were 2,145,542 teachers employed in the nation's public schools in 1984-85—1,184,337 in elementary schools and 961,205 in secondary schools. These numbers represent a net increase of 13,284 elementary school teachers and 15,201 secondary school teachers representing a total of 28,485 more teachers last year than the year before.

One-third of the 2.14 million public school teachers in the United States teach in just five states--California, Illinois, New York, Pennsylvania, and Texas. New York, California and Illinois rank in the top ten in average teacher salary. Pennsylvania ranks eighteenth and Texas fourteenth in average salary for teachers.

Sixty percent of all teachers are employed by only thirteen states, each of which employed 50,000 teachers more last fall than it did in fall 1983. These states are: Florida, Georgia, Massachusetts, Michigan, New Jersey, North Carolina, Ohio, and Virginia in addition to the above-mentioned five states.

Massachusetts increased its teaching force by 16.8 percent last year over the previous year, 8,066 teachers—6,899 at the secondary level (a 24.4 percent increase) and 1,167 at the elementary level (a 5.8 percent increase).

Michigan had 6,945 additional teachers—4,734 at the elementary level (a 12.7 percent increase) and 2,211 at the secondary level (a 6.3 percent increase). California increased its total teaching force by 2.7 percent (4,700 teachers) which

represented an actual decrease in the number of elementary school teachers (1,456 or 1.3 percent fewer) and a 10.0 percent increase (6,156 teachers) in secondary schools.

F)orida, another big growth state, employed a total of 3,149 more teachers in 1984-85 than it had in 1983-84-1,751 at the elementary level (a 3.8 percent increase) and 1,398 in secondary schools (a 3.8 percent increase).

Noteworthy also in this story of increasing numbers of teachers is the fact that many teachers who had been teaching two years ago were not teaching last year. The National Center for Education Statistics estimates that the annual rate of turnover (teachers leaving) is 6 percent.

Thirty-five states and the District of Columbia increased the number of teachers in their public elementary and secondary schools last year over the previous year, compared with eighteen states and the District of Columbia that increased their numbers of teachers from 1982-83 to 1983-84.

Twelve states and the District of Columbia added teachers in both of the last two years, four of them reversing a trend of fewer teachers in 1982-83 than in 1972-73 (Table 15).

It is important to note that states that added a lot of teachers two years ago may not have added very many additional teachers last year and vice-versa—states that increased their rolls of teachers in 1984-85 may have decreased their numbers

of teachers from 1982-83 to 1983-84. For example, Massachusetts had the largest drop in number of teachers from 1982-83 to 1983-84 (7.1 percent) but had the biggest rate of increase in number of teachers the following year (16.8 percent).

Fifteen states had fewer teachers last year than they had the year before and thirty-two had fewer teachers in 1983-84 than they had in 1982-83.

Nine states dropped teachers in both the 1983-84 and 1984-85 school years. These states with their percentage changes in numbers of teachers from 1983-84 to 1984-85, from 1982-83 to 1983-84 and from 1972-73 to 1982-83 are listed in Table 16.

It is noteworthy that all of these states experienced declines in their public elementary and secondary school enrollments over the past two years, except North Dakota which had an increase in elementary enrollments both years and an increase in secondary enrollment last year.

In addition to North Dakota, five states decreased their numbers of teachers last year even though their enrollments went up. It makes more sense to analyze these data separately for elementary schools and for secondary schools since the overall trend reflects an increase at the elementary level and a decrease at the secondary level.

TABLE 16. States that decreased numbers of teachers in 1983-84 and 1984-85

State	Percentage change	Percentage change	Percentage change
	1983-84 to 1984-85	1982-83 to 1983-84	1972-73 to 1982-83

Numbers of Public Elementary School Teachers

With elementary school enrollments on the rise it is no surprise that the number of elementary school teachers is on the ascendant. Thirty-one states and the District of Columbia added more teachers for their elementary schools last year. The year earlier, 1983-84, when enrollments were still on the wane, only sixteen states and the District of Columbia added teachers at the elementary school level (Table 17).

Six states decreased their numbers of elementary school teachers last year even though they had an increase in elementary enrollments. These states' percentage changes in numbers of teachers and in school enrollments, respectively, at the elementary level are: Alabama, a 6.5 percent drop in teachers and 1.8 percent increase in enrollment; California, 1.3 percent drop in teachers and 0.7 percent increase in enrollment; Mississippi, 0.5 percent drop in teachers and 0.8 percent increase in enrollment; North Dakota, 2.1 percent drop in teachers and 2.8 percent increase in enrollment; Vermont, 4.1 percent drop in teachers and 1.8 percent increase in enrollment; and Wisconsin, 3.8 percent drop in teachers and 1.0 percent increase in enrollment.

Eighteen states had increases in both elementary school enrollments and numbers of teachers in 1984-85 over the previous year. An additional nine states and the District of Columbia added teachers even though their elementary school enrollments went down last year. Four states maintained the same number of teachers in 1984-85 as they had in 1983-84.

Numbers of Public Secondary School Teachers

Secondary schools employed more teachers last year even though their enrollments continued to drop. The most obvious explanation is the demand for more secondary school teachers in mathematics, science and English following the increased number of courses required in the subjects for high school graduation in many states (Table 18).

Nine states whose secondary school enrollments dropped last year over the year before actually added more teachers last year: Hawaii, Illinois, Maryland,

Missouri, Nebraska, Oregon, South Carolina, Vermont, and West Virginia.

The most noticeable increases in the number of additional secondary school teachers in 1984-85 over the previous year occurred in Massachusetts which increased its stable of teachers in secondary schools by 24.4 percent (6,899 in number), followed by California which increased its secondary teachers by 10.0 percent (6,156); then Ohio by 9.3 percent (3,64.1); North Carolina by 6.5 percent (1,430); Michigan by 6.3 percent (2,211); and Florida by 3.8 percent (1,398).

Noteworthy about these six states is the fact that, with the exception of Florida, they all had a decrease in the number of secondary school teachers from 1982-83 to 1983-84. Massachusetts showed a 6.1 percent drop and California a 4.0 percent drop in secondary school teachers ring that period. Ohio's secondary school teachers dropped 2.9 percent, Michigan's secondary school teachers decreased 5.4 percent, and North Carolina's by 0.9 percent two years ago.

At the secondary level, seven states decreased the number of teachers while registering higher enrollments in secondary schools. Their teacher and enrollment percentage changes last year over 1983-84 are: Alaska, -27.8 percent and 6.8 percent (Alaska went from 3,173 secondary school teachers in 1983-84 to 2,290 in 1984-85); Arizona, -1.3 percent (from 7,319 to 7,220) and 4.6 percent; Connecticut, -1.8 percent (from 13,813 to 13,560) and 0.4 percent; Louisiana, -6.4 percent (from 15,110 to 14,140) and 1.3 percent; Maine, -3.9 percent (from 4,500 to 4,323) and 2.2 percent; Oklahoma, -1.8 percent (from 17,011 to 16,700) and 5.1 percent; and Tennessee, -0.3 percent (from 14,872 to 14,816) and 0.3 percent.

Projected Shortage of Teachers

If the latest projections by the National Center for Education Statistics hold up, the teacher-shortage picture could be a lot grimmer than it has already been painted.

NCES is now projecting we will need to hire 1.65 million additional public and private elementary and secondary school teachers between fall 1985 and fall 1993 to meet demand. That's more than two-thirds of the 2.40 million teachers in classrooms today. Due to retirements, leaving for other jobs or simply quitting, many of the current teachers will no longer be teaching eight years from now. NCES estimates there will be a total of 2,737,000 public and private elementary and secondary teachers in 1993 (Table 19).

NCES bases its teacher supply and demand estimates on a constant annual 6 percent rate of attrition (teachers leaving due to retirements or whatever), enrollments rising and teacher-pupil ratios improving only slightly.

More than two-thirds (68 percent) of the 1,651,000 additional teachers needed by 1993 will be elementary school teachers. NCES projects we will need 1,118,000 elementary school teachers and 533,000 teachers for secondary schools between 1985 and 1993. These figures represent 139 percent of the elementary school teachers and 27 percent of the secondary school teachers we have in this nation now. That means nearly one and a half times as many elementary school teachers as we currently have will have to be hired within the next eight years to meet demand.

Broken down by public and private school teachers, the nation will need 1,395,000 additional public school teachers (65 percent of the current public school

teaching force) by 1993. By that time, it will also need an additional 256,000 teachers to accommodate the demands of a rapidly burgeoning private elementary and secondary school system. That's 98 percent of the estimated 267,000 teachers in private schools today.

In other words, in just eight years, private schools could be employing twice as many teachers as they do today. This is no small threat to an already threatened public school system. Even though exact numbers are not available, it is a well known fact that many public school teachers leave and go into private schools—usually taking pay cuts—because, they argue, the schools are better managed, offer greater autonomy for teachers, and the parents are more involved in their children's education.

Supply of New Teachers

The National Center for Education Statistics further estimates that, by 1993, the supply of new teacher graduates will be less than two-thirds (63 percent) of demand. The Center projects that supply will be 92.4 percent of demand in fall 1985.

Data collected from a survey of colleges and universities that have teacher education programs in spring and summer of 1984 by the National Center for

Education Information (NCEI) substantiate NCES' findings that demand for teachers is exceeding supply. The NCEI data showed a 53 percent drop in the number of new teacher graduates between fall 1973 and fall 1983. 19

Results of the NCEI survey indicated there were approximately 135,000 graduates of teacher education programs in 1983. The estimate of graduates of teacher education programs in 1973 was approximately 289,000. These findings are consistent with estimates from both the National Center for Education Statistics and the National Education Association. NCES estimates there were 284,000 newly qualified graduates in 1970 and 143,000 in 1982.

According to the NCEI survey, an estimated 688,000 students were enrolled in undergraduate teacher education programs in 1973. By 1983, there were 115 more institutions in the business of teacher education, but the total number of students enrolled dropped to 444,000—35 percent fewer than in 1973 (Table 20).

NCEI's estimated number of persons admitted into teacher education programs in fall 1983 was 110,000. NCEI also found in its survey that approximately 80 percent of all students admitted into teacher education programs graduate. NCES estimates that only about 80 percent of those who do graduate apply to teach and that only about 80 percent of those who apply become teachers.

These combined statistics paint a very dismal picture. If only 110,000 persons entered a teacher education program in 1983 and only 80 percent graduate, that takes the number down to 88,000. If only 80 percent of them apply to teach, the number drops further to 70,400. Lastly, if the estimated 80 percent of these wind up in the classroom with teaching jobs, it means that out of a class of 110,000 new entrants into teacher education programs in 1983, only 56,320 will become teachers around 1986. NCES projects a demand for 165,000 additional teachers in fall 1986—More than 100,000 more than the crop of people enrolled in college today studying to be teachers will produce.

Many educators are counting on a big "reserve pool" of teachers to meet the projected demands. This reserve pool is composed of all the people certified to teach who got laid off or never got hired in the first place in the years when enrollments plummeted and the supply of teachers exceeded demand. There were

about twice as many new teacher graduates than were in demand as recently as 1971, according to NCES. If every teacher graduate who was not needed between 1970 and 1982, because supply exceeded demand in that period, applied for a job today, there would be 861,000 additional teachers.

However, there is no evidence that people who got certified to teach and make up this reserve pool ever go into teaching. For one thing, certification rules change so frequently in most states that one's certification to teach can quickly become outdated.

Projections Versus Reality

Checking NCES' projections against what actually happened in numbers of teachers in the last year shows that more teachers were actually added than NCES projected would be needed. There were 2,117,057 teachers employed in the nation's public elementary and secondary schools in 1983-84 and 2,145,542 in 1984-85. If 6 percent of the teachers in 1983-84 left due to retirement, other jobs or whatever, 127,023 teachers would have had to be hired just to replace them. NCES projected 127,000 additional teachers would be needed in 1984-85 to meet demand. It turns out there were 28,485 more teachers in 1984-85 than there were in 1983-84 which implies that as many as 155,508 new teachers were hired last year—28,485 plus 127,023 (the number needed to replace the 6 percent who left).

Doing the same arithmetic for elementary and secondary schools shows that

there were 2,547 more elementary school teachers and 18,961 more secondary school teachers hired last year than NCES projected would be needed.

Several things could be happening, not the least of which is that teachers aren't leaving at the predicted 6 percent attrition rate. Also, raising standards, requiring more science, math, and English courses for high school graduation could very well account for the 36 percent more high school teachers added last year than NCES estimated would be needed.

But the big unanswered question is: Where are they coming from? It's an indisputable fact that the number of new teacher graduates in 1983-84 wasn't over 146,000.

Research further shows that a rather large proportion of people who get education degrees and are qualified to teach never do. Approximately one-third of the recent bachelor's degree recipients newly qualified to teach in 1979-80 were not teaching full-time in May 1981. Of these 48,400 qualified-to-teach, but not teaching, 38 percent did not even apply for a teaching position. Ninety percent of those who did not apply said they simply did not want to teach. In addition, 27 percent of those newly qualified to teach in 1979-80 who taught in 1980 were no longer teaching in May 1981. 20

It's a confusing set of facts. Maybe there is something to the concept of "reserve pool" of teachers, but I suspect there is a lot more to be told about emergency certificates being issued all over the place.

Salaries of Teachers

Salaries of teachers have been outstripping the inflation rate since 1981-82, reversing decades of lagging behind inflation. The average salary of public school teachers rose from \$19,270 in 1981-82 to \$20,715 in 1982-83, representing a 7.5 percent increase. Teachers' salaries climbed to \$22,019 in 1983-84, for a 6.2 percent increase and on to \$23,546 in 1984-85 for a 6.9 percent increase over the year before. The inflation rate was 6.1 percent in 1982, 3.2 percent in 1983 and 4.3 percent in 1984.

Teachers earned 22.2 percent more last year, on the average, than they did just three years ago.

The debate about whether or not teachers get paid enough is a tough one. Joe Q. Public certainly seems to think they don't, and of course, the teachers' unions argue teachers are underpaid.

A survey conducted by the Gallup Organization for the National Education Association in summer 1985 indicated that 59 percent of the public thought its local school system was having a hard time getting good teachers because teachers' salaries were low. In response to the question, "If there is a teacher shortage in the coming years, what things do you think should be done to recruit teachers?" 61 percent responded, "Increase pay." The next highest response was 12 percent who said "Increase professional responsibilities and status of teachers" followed by 10 percent who said, "Improve working conditions." 21

When asked how much they thought a full-time high school teacher and a full-time elementary school teacher who have graduated from college and have about fifteen years' experience should be paid per year, the public suggested about

\$29,000 for a high school teacher and about \$27,000 for an elementary school teacher. ²²

The average salary of a high school teacher in 1984-85 was \$24,276 and for an elementary school teacher was \$23,092. The median experience for teachers is about fifteen years. But teachers get paid on a nine or ten-month basis. Using the ten-month figure and converting the average salaries for teachers to a full twelve-month year takes them up to \$29,131 for high school teachers and \$28,255 for elementary school teachers which is certainly in line with what the public says they should be paid.

Many say you can't do the arithmetic this way. They argue that teachers work nine or ten months, and that their annual salary is what they get for working ten-twelfths of a year. The average teacher works 180 days a year. The average number of working days in a year is 250.

The 1984 survey of American teachers conducted by Louis Harris and Associates for the Metropolitan Life Insurance Company revealed that the median household income of the average teacher is comparable to that of college graduates in general. Both groups had a median household income of about \$30,000 in 1983 (Table 21).

It is also interesting that 67 percent of the teachers had household incomes between \$20,000 and \$50,000 compared with 53 percent of total college graduates. Only 4 percent of teachers, compared with 16 percent of total college graduates, had household incomes of \$15,000 or less in 1983. But, at the other end of the scale, one-fifth (20 percent) of college graduates had household incomes of \$50,000 or more, compared with 13 percent of teachers.

Of course, the fact that <u>any</u> teacher has a household income of \$50,000 or more may come as a shock to many, much less that about 275,000 of them do. And they can't all be in Alaska! (Alaska paid its teachers, on the average, \$36,564 in 1983-84—the year it employed a total of 6,387 teachers.)

These statistics support three things we already know about teachers. First, there are relatively few "new" teachers, and secondly, teachers' salaries have a lower "cap" than those of the general working public; and thirdly, 74 percent of teachers are married and, consequently, are likely to be in two-income households.

TABLE 21. Percentage distribution of teachers and college graduates by household income: 1983

^{*} Household income of college graduates from U.S. Bureau of the Census, <u>Statistical Abstract of the United States</u>, 1984 edition.

SOURCE: The Metropolitan Life Survey of the American Teacher, 1984, p. 17.

In the general population, 60 percent of all households are married-couple households.

Only 8 percent of the teaching force has been teaching less than five years, compared with 16 percent of the total working public who have been employed less than five years. Even so, it is worth noting that while 16 percent of college graduates had a household income of \$15,000 or less, and 8 percent of teachers have been teaching less than five years, only 4 percent of teachers are in households making \$15,000 or less (Table 22).

Starting, Average, and Peak Salary Comparisons

The average starting salary for a teacher with a bachelor's degree was around \$14,000 and for a teacher with a master's degree about \$16,000 in 1982.

Starting salaries in 1982 for selected other occupations that usually require a bachelor's degree were: accountants—\$18,700; architects—\$12,000; chemists—\$21,000; computer programmers—\$16,700; psychologists (federal)—\$14,550; public relations specialists—\$11,500; and reporters—\$18,750 (Table 23).

Average salaries for these occupations in 1982 were: teachers—\$20,715; accountants—\$24,850; architects—\$21,000; chemists—\$29,000; computer programmers—\$23,000; psychologists (federal)—NA; public relations specialist—\$21,000; and reporters—\$24,650.

Another comparison between teachers' salaries and those of other professionals is in the area of peak salaries. The National Education Association says the peak salary range for teachers was \$28,000 to \$35,000 in 1982. The Bureau of Labor Statistics says the peak salary for a reporter in 1982 was \$38,350, for a chemist with a Ph.D.—\$42,000, for an architect—\$40,000+, and for a computer programmer—\$27,250.

Salaries of Teachers Compared with State and Local Government Employees

Teachers generally make more than state and local government employees. The average salary of teachers has risen faster than that of government employees in the last two years. Both have outstripped the inflation rate for the period.

State and local government employees earned an average of \$20,136 in 1983, an increase of 5.7 percent from the previous year. Teachers got paid an average of \$22,019 that year, up 6.2 percent from the year before. Inflation rose only 3.2 percent.

From 1981 to 1982, state and local government employees' average salary rose 8.4 percent and the average salary for teachers increased 7.5 percent, while inflation grew by 6.1 percent. From 1981 to 1983, teachers' salaries gained, on the

average, 15 percent and state and local government employees' salaries grew by 14.6 percent.

The variation from state to state in comparisons of gains from 1981 to 1983 between teachers' salaries and those of state and local government employees is noteworthy. Michigan, for example, increased its average salary for teachers 29.2 percent between 1981 and 1983 and its government employees' average salary by 10.8 percent for the period. Louisiana, on the other hand, raised its government salary average 10.4 percent while raising its teachers' average salary only 3.2 percent—the smallest two-year gain for teachers in the nation between 1981 and 1983 (Table 24).

Average Salaries for Teachers State-by-State

Average teachers' salaries ranged from a high of \$39,751 in Alaska and \$29,000 in New York to a low of \$15,971 in Mississippi in 1984-85 (Table 25). Analyzing changes in average salaries of teachers requires taking into account several variables in addition to the face dollar amount. The way teachers are paid in every state in this nation is determined by two major factors: 1) How many years they have been teaching and 2) How many college courses they accumulate. (In most states the only requirement for getting a teaching certificate renewed is to acquire additional college credits.)

The increases in average salaries of teachers may be largely due to the fact that the current teaching force is composed of persons who have been teaching a relatively long time, and consequently, have more college courses to their credit since that is the only way they could keep their certificates to teach.

Some states, however, have taken significant steps to raise the salaries of all their teachers. These are reflected in noticeable jumps in their average salary figures in the last two years.

Arkansas heads the list of such states. Arkansas, which ranked fiftieth in average teacher salary in 1982-83, increased its average salary for teachers by 12.6 percent the following year (the highest rate of change of all the states) and by an additional 11.8 percent last year. Arkansas added teachers in both of the last two

years, which would tend to bring the average down since new teachers usually get paid less.

Mississippi, which ranked fifty-first in 1982-83 in average teachers' salary, raised its average by 10.9 percent the following year and an additional 0.4 percent last year. Mississippi still ranks fifty-first in average salary for teachers.

Eleven states showed a greater than 10 percent jump in average salaries for teachers last year over the year before. Five states registered a greater than 10 percent increase in their average teachers' salaries between 1982-83 and 1983-84. These states, with their changes in numbers of teachers for the two years are shown in Table 26.

Only seven of these fifteen states (Arkansas is on both lists) increased their number of teachers both years. The remaining eight dropped teachers in at least one of the last two years. Illinois, Mississippi, North Dakota, and Vermont had a decrease in number of teachers in both years.

Four states—California, Michigan, Nevada, and North Dakota—showed a decrease in their average salary for teachers in 1984-85 from the year before. With the exception of North Dakota, which did increase its average teachers' salary by 10.7 percent the year before, these states all added teachers. New teachers usually cost less, so adding teachers at lower salaries than the average is likely to bring down the average.

The states whose average salary for teachers decreased in 1984-85 over 1983-84 did add teachers in that period. California increased its teaching force by 2.7 percent (4,700 teachers), and its average salary for teachers went down 0.3 percent last year, having gone up 9.8 percent the year before when the number of teachers declined from 173,270 to 170,435.

Michigan's average salary for public school teachers declined 1.6 percent last year, having risen 8.7 percent the year before. Michigan had 6,945 more teachers in 1984-85 than it had in 1983-84 representing a 9.6 percent jump. Interestingly enough, from 1982-83 to 1983-84, the year the average salary for teachers went up 8.7 percent, Michigan went from 76,837 teachers down to 72,955.

Nevada follows the pattern of a decrease in average salary following an

addition of more teachers. North Dakota, on the other hand, breaks the mold. North Dakota decreased its teaching force both years, which should have driven up the average salary of its teachers (and did from 1982-83 to 1983-84). However, the average salary of North Dakota's teachers went down by 2.2 percent last year, and its number of teachers dropped from 7,385 to 7,300 (1.1 percent).

Comparisons Between Elementary and Secondary School Teachers' Salaries

Secondary school teachers still make more, on the average, than their elementary school counterparts. However, the gap is closing. Salaries of elementary teachers are gaining faster than those of teachers in secondary schools (Tables 27 and 28).

The average salary of an elementary school teacher in 1984-85 was \$23,092, compared with \$24,276 for secondary teachers. The rates of increase in average salary for elementary teachers in each of the last two years were 6.1 percent for 1983-84 and 7.6 percent for 1984-85 and for the decade ending in 1982-83, 102.9 percent. For secondary teachers, the rates of increase were slightly lower-6.0 percent, 7.0 percent and 101.0 percent, respectively.

Florida and Georgia paid their elementary school teachers more, on the average, than they paid their teachers in secondary schools in 1984-85.

The states having the greatest increases in salaries for elementary teachers also had the largest jumps in average secondary teachers' salaries (Table 29).

TABLE 27. Elementary teachers' salaries

CHAPTER VI

Teachers and Schools in the Context of the Overall Economy

It doesn't make sense to talk about salaries of teachers outside the context of school expenditures in general, and it doesn't make sense to discuss either salaries or school expenditures without understanding how they fit into the overall economy of each state.

Mississippi's average salary for teachers is lowest in the nation. But so is Mississippi's per capita income, and its per pupil expenditure ranks second last. The cost of living in Mississippi is right at the bottom. The proportion of Mississippi's population that lived below the poverty level in 1979 (the latest year for which state-by-state data are available) was 23.9 percent—the highest in the nation that year when the national average was 12.4 percent.

The same relationship holds in the state with the highest average alary for teachers, Alaska. Alaska pays its teachers an average of \$39,751—\$10,751 more than the next highest state, New York. Alaska has the highest per capita income of any state in the United States and spends more per pupil enrolled in its schools than any other state.

But, once away from the extremes, some interesting comparisons show up. Michigan, for example, has the fourth highest average teacher salary in the nation but ranks twenty-third in per capita income and twentieth in per pupil expenditure. New Jersey, on the other hand, ranks third in per pupil expenditure, fourth in per capita income, and twelfth in average teacher salary. One more example: California has the sixth highest per capita income in the country, yet the state ranks twenty-sixth in per pupil expenditure but seventh in average salary for teachers (Tables 30 and 31).

TABLE 30. Average teachers' salaries, per pupil expenditures, rank of per pupil expenditures, per capita income, rank of per capita income: 1985

Teacher Salaries as Percentage of Total School Expenditures

Regardless of any state's economy; every state in the union is still spending less than fifty cents of every education dollar on salaries for its teachers.

Teachers' salaries, as a proportion of total expenditures for elementary and secondary schools, dropped to 36.6 percent in 1984-85—down from 36.7 percent in 1983-84, 37.2 percent in 1982-83 and 41.9 percent in 1972-73.

Twenty-four states have increased their proportion of total school expenditures that goes to teachers' salaries since 1982-83. Ten of them have steadily increased the share of total school expenses for teachers' salaries in both of the last two years—Arizona, Arkansas, Connecticut, Idaho, Maryland, Minnesota, Missouri, New Hampshire, New York, North Dakota, Rhode Island, Utah, and Virginia.

However, a mere ten states increased the share of the pie that goes to teachers in the form of salary between 1972-73 and 1982-83 and only two (Idaho and Maryland) have gotten that piece larger than it was in 1972-73.

Thirteen states have continued to cut the share of school spending going to teachers' salaries smaller and smaller since 1982-83—Colorado, Georgia, Indiana, Kentucky, Louisiana, Montana, New Mexico, Pennsylvania, South Dakota, Texas, Washington, Wisconsin and Wyoming. These states spend less than forty cents on the education dollar for teachers' salaries.

With the exceptions of South Dakota and Texas, all of these states decreased their teaching force in either one or both of the last two years. Except for Georgia and Texas in the last year, these states did not raise their average teachers' salaries dramatically in comparison with the national averages. However, all of them, except Indiana and Louisiana, spent noticeably more per student enrolled in their public schools in either one or both of the last two years than they had the year before (Table 32).

Total Expenditures for Public Elementary and Secondary Schools

Public education for the nation's 39,373,841 elementary and secondary students cost \$138,117,496 last year—up 8.8 percent (nearly twice the inflation rate) from

TABLE 32. States continuing to cut share of school expenditures going for teachers salaries

SOURCE: Compiled by the National Center for Education Information. Basic data from the National Education Association, Estimates of School Statistics, selected years.

1983-84. School expenditures rose 6.5 percent from 1982-83 to 1983-84 when the rate of inflation averaged 3.2 percent (Table 33).

Three states spent less last year for their public elementary and secondary schools than they did in 1983-84—Hawaii (6.8 percent less), North Dakota (down 2.0 percent) and Oklahoma (down 0.4 percent). All three of these states also spent less per student enrolled in 1984-85 than they did the year before. Oklahoma's per capita income also dropped 2.3 percent.

Expenditures Per Pupil

Probably the best simple indicator of a state's effort to support education is how much it spends on each pupil. Per pupil expenditure in average daily attendance is computed by comparing total current expenditures with total number of pupils in average daily attendance (ADA) for the school year. The ADA formula is about 92 percent of fall enrollment.

Per pupil expenditures rose 22.5 percent, after adjusting for inflation, between 1972-73 and 1982-83. This was the decade in which per capita income increased 6.5 percent and the average salary for a teacher decreased 12.2 percent in real terms.

Spending per pupil continues to increase above the rate of inflation. Public

schools spent an average of \$3,429 to educate each child enrolled in 1984-85. That was 8.0 percent more than the \$3,173 spent the year before which was 7.7 percent more than the \$2,944 spent in 1982-83.

One reason per pupil expenditures may have outdistanced inflation is that states have been effective in keeping their total budgets for education up, or at least stable, at a time when enrollments were falling steadily. This could all change as enrollments in most states start back up this fall when the first wave of six-year-olds from the baby boomlet of the late 1970s starts to school.

Since the per pupil expenditure amount is usually tied directly to a state's economy and enrollment patterns, changes in spending per student that have occurred in the last few years are more significant than how a state ranks in per pupil expenditures.

Besides, rank hasn't changed much. Eight of the top ten states in spending per student in 1982-83 made the top ten in 1984-85. Likewise, all but three of the states that ranked in the bottom ten in 1982-83 were in the bottom ten two years later (Table 34).

Texas brought itself from thirty-ninth in 1983-84 to twenty-seventh last year by increasing its per pupil expenditure by 23.1 percent in just one year. Texas also led all the states last year in the rate of increase in total school expenditures (27.8 percent) and in school revenue receipts (17.7 percent).

By comparison, per capita income and personal income in Texas increased only 8.1 percent and 9.9 percent, respectively, last year.

Three states that rank in the bottom ten in per pupil expenditures have made significant efforts to raise their spending per student in the last two years—Georgia, Mississippi, and Arkansas.

Georgia spent 16.5 percent more per student enrolled in its public schools last year than it did in 1983-84 taking its rank from forty-fifth to forty-second. Georgia's average salary for its teachers also increased 10.7 percent in the same year and ranked thirty-fourth in the nation in 1984-85 after ranking forty-first the year before.

Mississippi went from last in both 1982-83 and 1983-84 to second from the

bottom in per pupil expenditures last year by raising the amount it spends per student by 12.3 percent—4.3 percentage points higher than the increase in national average (8.0 percent).

Arkansas increased its spending per student by 11.4 percent the year before last (between 1982-83 and 1983-84) taking it from forty-eighth to forty-six. That was also the year Arkansas raised its average salary for teachers 12.6 percent taking it from fiftieth to forty-ninth. Last year Arkansas continued the upward swing in salaries for teachers, raising the average another 11.8 percent and moving the state up to forty-sixth on the salary measure. Per pupil expenditures, on the other hand, increased 3.8 percent last year in Arkansas putting the state forty-seventh in spending per student in 1984-85.

In addition to these three states, nineteen states have increased their spending per student by more than 10 percent in either or both of the last two years. Joining Texas in raising per pupil expenditures more than 20 percent in the last year are Massachusetts (22.4 percent) and Vermont (20.1 percent).

Massachusetts took its per pupil expenditures from twenty-fourth in 1982-83 and in 1983-84 to thirteenth last year. Massachusetts' enrollment went down slightly (0.1 percent) and its revenue receipts for education rose 15.6 percent in 1984-85 over 1983-84. The state's per capita income increased 9.9 percent from 1983 to 1984.

Vermont's 20.1 percentage increase in spending per pupil took the state from twenty-fifth in 1983-84 to fifteenth last year. Revenue receipts for education increased 9.7 percent and per capita income by 7.3 percent in the state during the same year. Enrollment dropped slightly (0.1 percent).

Personal Income and Per Capita Income

Total personal income in the United States reached the \$3 billion mark in 1984—up 9.7 percent over the year before which was up 6.3 percent from 1982. Personal income rose 17.8 percent, after adjusting for inflation, between 1972 and 1982 (Table 35).

Since total personal income in a state is tied to population, it is more relevant for purposes of this report to look at changes in each state's per capita income.

Per capita income increased 8.7 percent in 1984 over 1983 and 5.2 percent between 1982 and 1983, having risen 145 percent (6.5 percent in real terms) in the decade from 1972 to 1982.

As was the case with per pupil expenditures, states with the highest per capita incomes now were also the ones with the highest last year, the year before and in 1972. Alaska still heads the list even though the state's income per capita decreased slightly last year. The nine states following Alaska plus the District of Columbia in descending order of per capita income amount in 1984 are: 2, District of Columbia; 3, Connecticut; 4, New Jersey; 5, Massachusetts; 6, California; 7, New York; 8, Maryland; 9, Colorado; 10, Illinois; and 11, Delaware (Table 36).

Only Wyoming dropped out of the top ten states in per capita income since 1982. Wyoming is now twenty-first having been eighth two years ago.

With the exception of North Carolina, the bottom ten states in per capita income in 1984 were the same ones in 1982. Montana dropped from thirty-fifth in 1982 to forty-fourth in 1984. Mississippi still ranks last. The states having the ten lowest per capita incomes in 1984 were: 51, Mississippi; 50, Utah; 49, Arkansas; 48, West Virginia; 47, Alabama; 46, South Carolina; 45, Idaho; 44, Montana; 43, New Mexico; and 42, Kentucky.

Per Pupil Expenditures as Percentage of Per Capita Income

Per pupil expenditures as a percentage of per capita income varied in 1984-85 from a high of 40 percent in Alaska to 22 percent in several states. The gap seems to be narrowing. The range was from nearly 44 percent in Alaska to 18 percent in Alabama just two years ago.

The average on this measure has not changed in the last two years. The average for both 1982-83 and for 1984-85 was 26 percent, having risen from 23 percent in 1972.

Public Elementary and Secondary School Revenue Receipts

Total revenue receipts for public elementary and secondary education in the United States in 1984-85 came to an estimated \$137.6 billion-7.8 percent higher than the year before and \$544 million less than the total expenditures for schools in the

same year. An additional \$4 billion in non-revenue receipts—the amount received by local education agencies from the sale of bonds and real property and equipment, plus loans and proceeds from insurance adjustments—brought total receipts to \$141.6 billion in 1984-85 (Table 37).

Six states had a decrease in school revenue receipts last year over the year before—Hawaii, Iowa, Michigan, North Dakota, Oklahoma, and South Dakota. Hawaii, North Dakota and Oklahoma had had a big jump in revenue receipts the year before (1983-84). These same three states—Hawaii, North Dakota, and Oklahoma—also had a decline in total and per pupil expenditures in 1984-85. Only Iowa had a drop in enrollment.

The four states continuing the downward spiral of declining enrollments (New Jersey, New Mexico, Tennessee and West Virginia) all increased their school revenue receipts, total school expenditures and spending per student in 1984-85 (Table 38).

Sources of Revenue for Public Elementary and Secondary Schools

Financing public education in this country varies greatly from state to state and within states. One of the most significant changes in the decade between 1972-73 and 1982-83 was the shift from local sources to state sources for financing public education. All but eight states showed a decrease in k cal share of education costs and an increase in state share in that decade.

The trend was reflected in the national averages. In 1972-73, states

TABLE 38. States continuing decreases in enrollments with changes in revenue receipts, school expenditures, per pupil expenditures, and numbers of teachers.

Percent Change from 1983-84 to 1984-86

SOURCE: Compiled by the National Center for Education Information. Basic data from the National Education Association, Estimates of School Statistics, selected years.

contributed 40.6 percent of public elementary and secondary revenue receipts. Local and "other" sources came up with 51.5 percent, and the federal government, 7.9 percent. By 1982-83, the proportion of total revenue receipts from states for public elementary and secondary schools had increased to 50.3 percent. From local sources, it had decreased to 42.3 percent. The federal share dropped to 7.4 percent in 1982-83.

However, this trend seems to be slowing. In both 1983-84 and 1984-85, the state share of revenue receipts for public elementary and secondary education dropped to 49.0 percent. The local share for these two years rose slightly from 42.3 percent in 1982-83 to 44.5 percent in 1983-84 and 44.8 percent in 1984-85.

Federal Share of Revenue Receipts for Public Elementary and Secondary Education The most noticeable change in revenue receipts for education in the last couple of years has been the diminishing federal share. The federal contribution to total revenue receipts for public elementary and secondary education dropped from 7.9 percent in 1972-73 to 7.4 percent in 1982-83. The federal share dropped a whole percentage point in the following year. In 1983-84, the federal government contributed 6.4 percent of the total \$127.6 oillion in revenue receipts for public elementary and secondary education. The federal share dropped to 6.2 percent of the total \$137.6 billion in 1984-85 (Table 39).

The federal share for education decreased in thirty-two states in the decade between 1972-73 and 1982-83 and has continued to drop in fifteen of them. Pennsylvania shows the most dramatic cut in federal share of its revenue receipts for public elementary and secondary education. After experiencing only a 0.3 percent drop in federal share for education in the decade between 1972-73 and 1982-83, Pennsylvania recorded a decrease in federal share from 7.5 percent in 1982-83 to 4.3 percent in 1983-84 to 3.2 percent in 1984-85—second lowest in the nation for that year.

Six states and the District of Columbia have received more than 10 percent of their revenue receipts for public elementary and secondary education from the federal government in each of the last three years. All of them are located in the South—Alabama, Arkansas, Kentucky, Mississippi, New Mexico, and North Carolina

SOURCE: Compiled by the National Center for Education Information. Basic data from the National Education Association, Estimates of School Statistics, selected years.

However, with the exception of New Mexico, the share contributed by the federal government has diminished steadily in the last three years in each of these states.

New Jersey and New Mexico are the only states that have had a steady increase in federal share of their revenue receipts for public elementary and secondary education in the last three years. However, eight states showed an increase from 1982-83 to 1983-84 followed by a drop in 1984-85—California, Colorado, Connecticut, Florida, Kansas, Montana, Ohio, and West Virginia. With the exception of Florida, the changes in share of revenue receipts for education contributed by the federal government in these states were ever so slight in the last three years.

States whose federal share of school revenue receipts went down from 1982-83 to 1983-84 but back up the following year are: Alaska, Arizona, Georgia, Iowa, Louisiana, Maryland, Massachusetts, Oklahoma, South Dakota, Texas, Utah, Vermont and Wyoming. The District of Columbia gets added to this list too. Again, only half of these states showed any appreciable increase in federal share of revenue receipts for public elementary and secondary schools—Arizona, the District of Columbia, Louisiana, Massachusetts, South Dakota, Texas, and Wyoming.

It is noteworthy that the state that pays its teachers the most and spends the greatest amount on each pupil enrolled in its schools receives the smallest share of revenue receipts from the federal government. Alaska got only 2.9 percent of its money for public elementary and secondary education from Uncle Sam in 1984-85, having received only 1.3 percent the year before. Alaska, on the other hand, did receive 15.2 percent in 1972-73 and 5.7 percent in 1982-83 from the federal government.

State Share of Revenue Receipts for Public Elementary and Secondary Education
The range of state share of revenue receipts for public elementary and secondary
education is from a high of 90.8 percent in Hawaii to a low of 8.0 percent in New
Hampshire (Tables 40 and 41).

TABLE 41. Local and other revenue receipts (percentage)

Twenty-one states recorded a greater than 10 percent increase in state share of education revenue receipts between 1972-73 and 1982-83. Seven of them experienced a greater than 20 percent increase for the decade—California, Idaho, Indiana, Montana, Neveda, North Dakota, and Washington. Six of these seven states decreased their piece of the pie in both of the last two years. Idaho did not. Only five of the twenty states have continued to increase their share of total revenue receipts for public elementary and secondary education in the last two years, Idaho being one of them. The other four states are: Connecticut, Maine, Massachusetts, and North Dakota.

The move toward the states contributing an ever increasing share of revenue receipts for public elementary and secondary schools seemed to have peaked in 1983-84 for some states. Nine of the forty-two states that increased their share in the decade between 1972-73 and 1982-83 continued to do so the following year but pulled back on their share of revenue receipts for their public elementary and secondary schools last year—Alaska, Colorado, Georgia, Kentucky, Missouri, Nebraska, Ohio, Oklahoma, and South Carolina.

Twelve states have decreased their share of school revenue in both of the last two years. Only eight states recorded a decrease in their share of money for public education in the decade between 1972-73 and 1982-83.

Local and "Other" Sources of Revenue for Public Elementary and Secondary Education

The local and "other" contribution to revenue receipts for public elementary and secondary education is increasing again after a decade of getting smaller. The local and "other" share diminished from 51.5 percent in 1972-73 to 42.3 percent in 1982-83 and has increased to 44.5 percent in 1983-84 and on up to 44.8 percent in 1984-85.

The greatest contribution by local and "other" sources is in the state of New Hampshire (88.8 percent). The lowest is in Hawaii (0.3 percent).

The local share of total revenue receipts for public elementary and secondary education decreased in thirty-seven states, plus the District of Columbia, in the decade between 1972-73 and 1982-83, but has turned around and been increasing steadily the last two years in fourteen of those states.

Three of the thirteen states that recorded an increase in local share of revenue receipts for the decade from 1972-73 to 1982-83 continue to show an increase—Michigan, North Carolina, and Pennsylvania.

CHAPTER VII

Who Is Going into Teaching?

The news about who's been going into teaching the last several years has not been good. It is well known by now that the number of persons studying to become teachers has dropped steadily since the peak year 1972. That the academic caliber of persons intending to be teachers has been going down also has been widely publicized.

However, we may be seeing a turn-around in both of these trends. The data hasn't been collected in any hard way yet, but some college of education deans are saying their enrollments were up last fall after years of decline.

And, what could be even better news, the Scholastic Aptitude Test (SAT) scores of high school students who say they intend to major in education when they get to college are rising faster than the national average SAT scores. The gap between the national average and the intended education majors' average has narrowed from 80 points in 1982 to 70 points in 1985. Furthermore, the greatest increases in scores of students intending to major in education are occurring in states that project the biggest demand for new teachers—the South and West.

Numbers of Teacher Education Students

A survey conducted by the National Center for Education Information in spring and summer 1984 showed that the number of new teacher graduates dropped 53 percent from 1973 to 1983, that enrollment in teacher education programs decreased by a third, and that persons newly admitted into teacher education decreased 44 percent during this period. ²³

Data from the National Center for Education Statistics shows that the

108,309 bachelor's degrees conferred in education in 1980-81 were 44.2 percent fewer than the number conferred in 1972-73.²⁴

NCES data further show that there was a 57.4 percent drop in the number of elementary education degrees granted from 1970-71 to 1980-81. The demand for new teachers for the next few years is at the elementary school level. Demand is also high for science and mathematics. The number of persons getting a degree in mathematics education dropped from 2,217 in 1970-71 to 798 in 1980-81 (a 64 percent decline). The number of science education degrees conferred decreased from 891 to 597 (33 percent) for the period.

The proportion of first-time, full-time freshmen indicating teaching as a probable career occupation plummeted from 19.3 percent in fall 1970 to 4.7 percent in fall 1982.

NCES's High School and Beyond Studies and National Longitudinal Studies of High School Seniors of 1972 showed that the proportion of high school seniors who intended to major in education in college dropped from 12.0 percent in 1972 to 7.0 percent in 1980. The proportion of female high school seniors intending to major in education decreased from 20.1 percent to 11.0 percent for whites, from 9.3 percent to 5.6 percent for blacks, and 14.1 percent to 9.9 percent for Hispanics. For male high school seniors, the corresponding percentages by race are: white males, from

6.0 percent to 3.4 percent; black males, 4.7 percent to 3.9 percent; and Hispanic males, from 9.8 percent in 1972 to 3.0 percent in 1980 (Table 43).

These data are further substantiated by information produced by Scholastic Aptitude Test (SAT) takers. The proportion of SAT-takers who said they might major in education when they got to college decreased from 11.0 percent in 1972 to 4.6 percent in 1984.

Academic Caliber of Education Majors

Nothing raises the ire of people in the business of educating, certifying, and hiring teachers more than statements indicating that the academic caliber of persons going into teaching has been declining. The bottom line of this issue has yet to be written, because nobody to date has come up with hard data about the academic caliber of persons who pass through a teacher education program, get certified, and go on to become teachers.

The National Center for Education Information, in its survey last year of colleges and universities that have teacher education programs, attempted to collect data on SAT and ACT scores, high school grade point averages, class rank and high school courses taken in mathematics, science and foreign language for persons newly admitted into teacher education and for students who finish teacher education programs.

SCURCE: The National Center for Education Statistics, The Condition of Education, 1983, p. 220.

Eighty-two percent of the NCEI respondents said they do not consider SAT or ACT scores when admitting students into teacher education. Most of the institutions preparing teachers don't keep any high school information about their teacher education students. They argue they don't accept students into teacher education programs until their sophomore or junior year of college. The average college grade point average required to get into a teacher education program in 1983 was 2.29 on a 4.0 scale. ²⁶

Some isolated institutions have come up with data that says their teacher education students have grade-point averages that are about the same as liberal arts majors in their universities. These data cannot be extrapolated to the universe of all teacher education students nor do they provide contrary evidence that the academic caliber of persons studying to be teachers is lower than it was fifteen years ago.

SAT Scores of High School Students Intending to Major in Education

It may be true that all of those high school students who take the SAT and check a box saying they intend to major in education when they get to college don't wind up doing so, much less become teachers. But many of them do, and their SAT scores tell us something about their academic aptitude in comparison with other students.

The SAT scores of intended education majors were lower than those of almost every other intended major in 1973 and continued to fall faster than the deciining national average until 1983 when SAT scores started edging back up. In 1973, the average SAT score was 937 and, for intended education majors, 878—59 points lower. In 1982, the national average SAT score was 893 and the intended education majors' score was 813—80 points under. In 1985, the average SAT score rose to 906 for the nation and to 836 for intended majors in education, thus narrowing the gap slightly to 70 points.

For SAT-verbal scores, the gap between the national average and the average score for high school students who say they might major in education in college is even narrower. In 1985, the national average verbal score was 431, and for intended education majors, it was 404-27 points less. For math, the scores

were: national average, 475 and intended education majors, 432-43 points lower.

Even though the gaps are narrowing, it's still a fact that, without exception in all fifty states and the District of Columbia, the SAT scores of those intending to major in education fall below the state's average SAT score (Tables 44, 45, and 46).

Thirteen states and the District of Columbia showed dramatic increases in SAT-verbal scores of those intending to major in education between 1982 and 1984: Arkansas (+47 points), the District of Columbia (+26 points), Idaho (+22 points), Michigan (+22 points), Mississippi (+57 points), Missouri (+13 points), Montana (+13 points), Nevada (+30), New Mexico (+23), South Dakota (+24), Tennessee (+12), Utah (+65), West Virginia (+28) and Wyoming (+80).

Ten states showed a significant positive turn-around, having had decreases in SAT-verbal scores between 1978 and 1982. It is noteworthy that all of these states are located in regions of the country that are experiencing the greatest demands for new teachers—in the South and West (Table 47).

Fifteen states also showed a big jump in SAT-math scores of their intended education majors between 1982 and 1984. Those states with their corresponding SAT-verbal score changes, state average math and verbal score changes and changes between 1978 and 1982 can be found in Table 47.

With the exception of Michigan, these states, too, are all located in the South and West.

Thirteen states showed a decrease in average SAT-math scores and thirteen had a decline in average SAT-verbal scores (not necessarily the same thirteen states), compared with seven states that showed a decrease in SAT-math scores and eight a decline in SAT-verbal scores for intended education majors.

The states that had a decline in both average SAT-verbal and average SAT-math scores between 1982 and 1984 were: Alaska, Arizona, Georgia, Idaho, Minnesota, North Dakota, and Washington. Of these states, only Alaska and Arizona showed a decrease in scores of intended education majors, and those were only for the math portion.

The five other states that had a decline in SAT-math scores for students intending to major in education were: Montana, Nebraska, North Carolina, South

Carolina and Vermont. Of these, Montana, Nebraska and Vermont had state averages in math that dropped too.

The eight states that showed a drop in SAT-verbal scores for intended education majors in 1984 over 1982 were: Kentucky, Louisiana, Minnesota, Nebraska, New Hampshire, New York, Oklahoma and Texas. Minnesota's and New York's average SAT-verbal scores also declined between these two years.

Teacher Education and Certification

Nothing about teaching causes more concern than the ways teachers are educated and certified in this country. The diversity of requirements alone defies imagination. There are some 1,287 institutions of higher education now in the business of educating teachers—115 more than there were a decade ago when there were 33 percent more students enrolled in teacher education programs and 53 percent more prospective teachers graduating from them (Table 48).

The National Center for Education Information survey of teacher education programs last summer revealed that more education courses are required to complete teacher education programs now than were required a decade ago for prospective elementary, secondary and special education teachers. In 1983, colleges and universities required their teacher candidates to have, on the average, five more semester hours of clinical experience (student teaching/practicum, classroom observation) than they required in 1973. They are demanding that students take an additional four semester hours of education courses. 27

Currently, a person studying to be a elementary school teacher has to take an average of sixty-two semester hours of general studies, thirty-six hours of professional studies and seventeen semester hours of clinical experience. A prospective secondary school teacher is required to take an average of sixty-four semester hours of general studies, twenty-five hours of professional education courses and fifteen hours of clinical experience (Table 49).

Only 47 percent of the respondents to the NCEI survey last year said they required passage of an exit test of any kind for completion of their teacher education programs. Only 5 percent demand that prospective teachers completing their programs pass a content-area test. 28

Changes are occurring rapidly in testing teachers, so it is highly likely that, by now, many more institutions are requiring passage of one or more types of tests

before a person exits from a teacher education program with their stamp of approval.

Certification of Teachers

The process of certifying teachers in the United States is like a moving target. Each state has its own rules. Certification requirements within states are everchanging and vary widely from state to state.

A person certified to teach United States government in one state would not be certified to teach American history in that state, but that same teacher could not only teach American history but also political science in another state. A person could meet all the requirements for a license to teach every elementary grade in one state and only certain grades in another state. Some states give broad certificates that allow a person to teach several different grades and subjects. Other states give certificates that are very specific concerning which grades and what subjects one can teach. And, as a matter of fact, most states permit people to teach who don't meet all the requirements anyway by giving them emergency credentials. 29

NS--not specified NA--not available AP--approved program C--clock hour

SCURCE: National Center for Education Information, Teacher Certification Survey, 1985, unpublished data.

a Kentucky requires 150 clock hours clinical experience plus 12 weeks student teaching for elementary and secondary candidates and 200 clock hours clinical experience plus 12 weeks student teaching for special education candidates

b Massachusetts requires a "sound arts and "ciences program" in general studies

c Nebraska requires of all teaching candidates that general studies comprise one-fourth to one-half of the total B.A. program and that professional studies comprise one-sixth. The clinical experience requirement is 240 clock hours.

d Washington requires of all teaching candidates that general and professional studies meet the "minimum generic standard" and requires eight weeks of student teaching.

Forty-eight states use what is called the "approved program" route for certifying teachers. This simply means that a person who graduates from a college or university teacher education program that was approved by the state automatically qualifies for a teaching certificate.

Some states offer an alternative to the approved program route. They all require a baccalaureate degree, but the credit hours demanded in general studies, professional education courses and clinical experience vary from state to state.

Initial teaching certificates last longer in some states than in others. The range is all the way from one year in Oklahoma and Tennessee to "life" in Massachusetts, Missouri, New Jersey and Texas. The requirements for getting a teaching certificate renewed are also quite specific and quite different from state to state. Renewals are also valid for different periods of time.

Simplification of certification requirements and procedures could be long in coming. "Each state has the exclusive responsibility for the quality and content of its own professional preparation/certification programs in that state. This responsibility may be vested in or shared by the State Education Agency, a State Standards Commission, or a State Board of Education. Regardless of title, the state agency is the only legally accountable agency in matters concerning approval/accreditation of programs. The individual state cannot abrogate its legal responsibility; nor should any state ignore its obligation to protect the 'public interest' and the independence and integrity of the state and its institutions." 30

Certification Requirements State by State

The National Center for Education Information conducted a survey of state directors of teacher education and certification in both the summers of 1984 and 1985 to determine what is going on in the states regarding certification of teachers. In addition, the NCEI survey collected data on numbers of institutions of higher education that have teacher education programs in each state, how many prospective teachers graduated from them in the last two years, projected shortages by grade level and subject area, numbers of emergency certificates being issued, and changes in the offing for certifying teachers.

The results confirm the widely held view that the hoops one has to jump through to become a teacher aren't particularly threatening but may be just too bothersome, thus turning off potential candidates for teaching who simply don't see the point of it all.

The range in number of college credits required in general studies, professional education courses and clinical experience varies widely from state to state for each type of teaching certificate. To get a certificate to teach in elementary schools in California, for example, one must take about eighty-four semester hours in general studies, twelve in education courses and acquire twelve hours in clinical experiences. In Mississippi, on the other hand, to qualify for an elementary teaching certificate, one must have forty-two hours of general studies, fifty-four hours of professional education courses and six hours of clinical experiences (Table 50).

Changes in Certification Requirements in the Last Two Years

All but twenty-one states changed their requirements for teacher certification within the last two years. Most of the changes were intended to make standards more rigorous. Ten states introduced some sort of testing for teacher certification, and for nine of these, the testing includes a fundamental basic skills test. These nine states are: California, Colorada, Connecticut, Indiana, Kansas, Nebraska (effective 1986, BST), New Hampshire, and Pennsylvania. The tenth, New Jersey, requires the National Teacher Examination (NTE) General Test Core Battery of elementary teaching candidates and the NTE Speciality Tests of its secondary teaching candidates (Table 51).

New Jersey also introduced the most radical and most widely publicized change in certifying teachers in the last year. It passed a law that allows a person to get a teaching certificate without ever having gone through a teacher education program. What New Jersey's alternative to the traditional approved-program route for teacher certification does is allow a person who has a baccalaureate degree to become certified after a year of supervised practical experience in the classroom and passage of the NTE general test for elementary teachers and an NTE subject specialization test for secondary teachers.

New Jersey had over 1,000 applicants for the alternative program in 1984-85. Thirty-six had been hired by the end of July 1985. New Jersey anticipates hiring more but could not say how many as of July 30, 1985.

Only Colorado and Oklahoma reported changing their teacher certification requirements within the last two years to include more experience in the classroom prior to getting a license to teach.

Teacher Testing

Testing teachers has become one of the most controversial issues surrounding teaching. There are those who would like to see passage of a national proficiency examination similar to the bar examination for lawyers and the CPA examination for accountants, a requirement for certification to teach. There are others who would like to see each state develop its own test.

While there is disagreement on what should be tested and who should administer the test, there is unprecedented agreement that teachers should be tested before they enter the profession. The public is in favor of it, the teachers themselves are in favor of competency testing for teachers, and probably most important of all, the unions that represent teachers (the National Education Association and the American Federation (Teachers) are stepping into the forefront to carry the banner for teacher testing.

A real proficiency test for teachers would be a far cry from the basic skills tests being introduced in many states. It would go beyond testing fundamental literacy to assessing knowledge of subjects to be taught and pedagogical knowledge.

As of summer 1985, twenty-four states require passage of some kind of paper-pencil test for teacher certification. Twelve of these states require that their prospective teachers pass a simple basic skills test (Table 52).

Emergency Certification

The availability of emergency certificates has been the boondoggle in raising standards for teacher certification. Every time a state faces a shortage of teachers, it simply issues emergency certificates to people who want to teach.

These emergency, substandard or limited certificates, as they are variously called, usually carry with them a stipulation that the person take education courses and do a variety of other things, such as pass a test, in order to become fully certified someday (Table 53).

All but two states issue substandard, limited or emergency credentials to people who don't meet all of the criteria for a real bonafide teaching certificate. Half of the states will give a substandard credential to people who have less than a bachelor's degree. Wyoming and Virginia do not issue any type of substandard credential. In Idaho, a non-certified person can teach with a letter of authorization. Massachusetts lets non-certified people teach on a one-year waiver.

Respondents to the NCEI survey of state teacher education and certification directors indicate a wide range in numbers of people teaching without full certification. It is no surprise that the majority of states reporting the largest numbers of noncredentialed teachers are states in the South and West where enrollments are surging and in states with large urban areas where discipline problems are greatest and people are not anxious to teach (Table 54).

Interestingly, very few states reported having any people teaching in their states who did not have <u>any</u> kind of teaching credential. Thirty-nine states said they didn't have anybody teaching without a credential; seven reported 1 percent or fewer; two said they didn't know, and three states reported from 2 percent in Massachusetts to 10 percent in Montana to nearly 16 percent in Louisiana. We really don't know how many teachers are working without certification.

Summary and Conclusions

Seldom before in American education, if ever, has more attention been paid to teachers. And rightly so. The quality of our educational system is determined, to a very large extent, by the people who choose to teach.

Many reports in the last three years have shown that both the quality and quantity of those becoming teachers have been on the decline. Numerous critics have objected that publishing such "negative" information would only make matters worse, and even heighten the difficulty of attracting the best qualified minds into teaching. Others, especially those of us producing the disturbing data, felt these studies would bring to the attention of the public—and to all who might be thinking about teaching as a career—the realities of what has been going on in this noble occupation, and would dramatize that we had better be doing something about attacking the problem before it becomes monumental.

An analysis of the data in the last two years, over a wide range of teacherrelated issues, dramatically demonstrates that all the brouhaha over teaching is paying off in slow, but steady, progress.

Salaries of teachers have outstripped the rate of inflation in each of the last two years. After losing in purchasing power by 12.2 percent between 1972 and 1982, teachers' salaries rose 6.9 percent in 1984-85 and 6.2 percent in 1983-84. The inflation rate in 1983 was 3.2 percent and in 1984 was 4.3 percent. The average salary for teachers increased 13.7 percent in the last two years—from \$20,715 in 1982-83 to \$23,546 in 1984-85. The median household income for teachers is the same as that for all college graduates. Both had a median income of about \$30,000 in 1983. Four percent of the current teaching force (about 85,000 teachers) has a household income of \$15,000 or less, compared with 16 percent of the working public. Thirteen percent of teachers (about 275,000), compared with 20 percent of the working

public, are in a household earning \$50,000 or more. Teachers' salaries are higher than those of state and local government employees, and both are outstripping the inflation rate. Yet, a smaller and smaller portion of ever-increasing school spending goes for teachers' salaries.

- The SAT scores of prospective teachers are edging up faster than the national averages. The gap between the SAT scores of high school students who say they are going to major in education when they get to college and the national average SAT score narrowed from 80 points in 1982 to 70 points in 1985. While the average SAT score rose from 893 in 1982 to 906 in 1985, the average score for intended education majors climbed from 813 to 836 in the three years. The biggest gains in SAT scores of prospective teachers occurred in states in the South and West where there is the greatest demand for new teachers. While the gaps are narrowing, it is still a fact that, without exception in all fifty states and the District of Columbia, the SAT scores of high school students who say they might go into education fall considerably below the state's average SAT score.
- o More people seem to be going into teaching than was predicted. Estimates of a pending teacher shortage have been grim. The National Center for Education Statistics' latest projections call for 1.65 million additional teachers between fall 1985 and fall 1993. That's two-thirds of the 2.40 million public and private elementary and secondary school teachers in classrooms today. Sixty-eight percent of the 1,651,000 additional teachers needed will be elementary school teachers. NCES projects we will need an additional 1,118,000 elementary teachers and 533,000 secondary school teachers by 1993. These figures represent 139 percent of the elementary school teachers and 27 percent of the secondary school teachers currently employed. An analysis of NCES projections and numbers of teachers in 1984-85 showed that states actually employed more teachers than NCES estimated they would need that year. The number of teacher graduates in 1983 was smaller than the

estimated number of additional teachers needed in 1984-85. The additional teachers being hired are coming from a "reserve pool" of certified teachers, accumulated in the years when supply exceeded demand, and/or from issuing an emergency certificate to anybody who wants to teach. In any event, classrooms were filled with teachers last year even though demand was expected to exceed supply.

- New Demands Are Being Made on Teachers. The changing demographics of school-age children is such that teachers will be facing far greater numbers of poor children and children from many different racial and ethnic backgrounds in the next few years. Today, 13 million of the 62 million children under eighteen years old live in poverty, compared with 10 million of the 69 million children in 1970. Minority children made up 14.8 percent of all children under eighteen in 1970. They now comprise 18.3 percent of all children. Minority enrollment in public elementary and secondary schools nationwide rose from 21.7 percent in 1972 to 26.7 percent in 1981. It is expected to reach a third by the mid-90s.
- Most states have made numerous changes in how they educate and certify teachers, but in many cases, these changes have failed to produce necessary reform. It is no secret that adding more education courses, as many states have done, does not get to the heart of the problem of getting quality teachers into classrooms. Nor does requiring passage of a basic skills test insure that a teacher is competent to teach. The biggest problem in teacher education and certification may be that the process is too cumbersome and cries out for simplification.
