ABSTRACT
               This report comprises a detailed evaluation of three
IBM microcomputer-based school information management systems:
Student Information and Records System (SIRS) by Management
Information Group, The School System (TSS) by Columbia Computing
Services, and Computer Educational Management Accounting System
(CEMAS) by Computerlib. These three systems were evaluated against
six major factors, each defined by a detailed and comprehensive set
of criteria: product scope and function, ease of use, technical
considerations, support and services, product qualifications, and
vendor. All evaluations were conducted in schools using real and full
school data, and all key system capabilities were tested as they
related to database creation and maintenance, prescheduling,
scheduling, transition to operational status (and semester turnover),
attendance recording and reporting, progress recording and reporting,
report generation, and utility functions. Each product evaluation
describes the testing environment and conditions, lists evaluation
results and observations, and summarizes the strengths and weaknesses
of the system. Results show that one system, The School System by
Columbia Computing Services, can effectively meet the needs of both
junior and senior high schools. Six appendixes are included: the
general questionnaire from which the criteria were derived, the
interview guide and detailed checklist, the detailed scoring
comparison form, SIRS user group member list, recent product
developments, and a full re-simulation of the relative suitability of
the three systems. (TE)

1.0 INTRODUCTION

Recent rapid advances in the computer technology and related fields have greatly increased the spectrum of opportunities for the application of computers. While increasing in power and performance, computers have also become more affordable and easier to use. Increasingly, educational administrators are seeking to apply the technology to the administration of schools. Many tasks which were once considered addressable only by large centralized mainframe computers can now be addressed by microcomputers. An example of such tasks is organization for instruction. School administrators are becoming increasingly interested in the local application of computer technology to school information management.

Among the computer based applications which exist for school administrators today are School Information Management Systems (SIMS) with a particular focus on student related information. These systems may be microcomputer or minicomputer based and, typically, incorporate four major modules which address school records, student scheduling, student attendance and marks or progress reporting. Usually, there is a high degree of integration between the modules which means, for example, that duplicate data bases are not required. In most cases, the cost of these software systems belies their complexity. Four thousand dollars buys multi-megabytes of software opportunity. In all cases, it is safe to assume that the cost of the software system itself will be the least impacting factor in any decision to apply it.

The purpose of the work which is reported on here was to evaluate the comparative suitability of two microcomputer based SIMS for use at the senior high school level. This endeavour was one component of a more global investigation of SIMS alternatives for high school use. In particular, Edmonton Public Schools and Alberta Education jointly funded the investigation of minicomputer based approaches to school information management as well. This initiative will be the focus of another report to be released in the near future. All investigations (of both mini and microcomputer based systems) were performed according to a thorough and objective evaluation process which was developed specifically for the purpose. The approach to evaluation is described in detail in a report entitled Selection Criteria for Integrated School Information Management Systems (available from Alberta Education).

In view of the extemely high general level of interest in this area, the scope of the project was widened (in two ways). Firstly, three systems were evaluated rather than two and secondly, the systems were evaluated for their suitability to junior high schools rather than just to the senior high schools.

The systems evaluated were

- o Student Information and Records System (SIRS) by Management Information Group
- o The School System (TSS) by Columbia Computing Services
- o Computer Educational Management Accounting System (CEMAS) by Computerlib

8

The evaluation of CEMAS began in October 1983 and was completed in October 1984. SIRS was evaluated in two phases - the first phase was between April 1984 and June 1984 while the second phase was between Oct 1984 and January 1985. The School System was evaluated between October 1984 and January 1985.

All the systems were evaluated on IBM Microcomputers.

3

2.0 APPROACH TO EVALUATION

2.1 Evaluation Criteria

The three systems under investigation were evaluated against six major factors. These major evaluation factors were:

o Product Scope and Function (what does it do and how well does it do it)
o Ease of Use (user friendliness)
o Technical Considerations (system design, structure, operation etc)
o Support and Services (after sales service)
o Product Qualifications (product credibility, history, etc.)
o Vendor (who stands behind the product)

Each of the six major evaluation factors was defined by a detailed and comprehensive set of criteria. Information gained from consultations with schools was paramount in the development of the criteria. The criteria were developed through a six step process as outlined below:

Step 1   A General Questionnaire (see Appendix 1), Interview Guide and Detailed Checklist (see Appendix 2) were developed for the gathering of information from the schools. These documents were developed using information gained through prior, extensive contact with schools in general, through the experiences of Information Services staff, and with a working knowledge of the characteristics of currently available systems. The general questionnaire was designed to determine which features and characteristics a SIMS should include and, in many cases, their relative importance. Where measures of the relative importance of a criterion or characteristic were required, the questionnaire featured a simple four point "must, "important", "optional" and "not required" scale for respondents to check.

Step 2   Eighteen district schools were identified as a representative sample through which detailed school information management needs and requirements would be confirmed. These schools were carefully chosen to reflect many of the key variables such as school level, size, programs, organization and operational style.

Step 3   The General Questionnaire was sent to the 18 identified schools together with a statement of its purpose and instructions for its completion. Participating schools were requested to give careful consideration to their responses to the questionnaire and to prepare for a follow-up interview. The questionnaire also allowed participants to respond to needs and requirements not specifically identified in the survey.

<u>St</u>   After allowing ample time for the completion of the questionnaire, follow-up interviews were conducted at each school using the Interview Guide and Detailed Checklist referred to previously. The purpose of this step was to clarify and confirm responses relative to the questionnaire. A key reason for the two stage information gathering process (questionnaire followed by the interview) was to allow the schools to first respond without external influence of any kind.

<u>Step 5</u>   Information gathered through the administration of the questionnaire and subsequent interviews was compiled and analyzed and used to determine the relative importance of selection criteria items. Particular attention was paid to the comments of participating schools since this sometimes led to the inclusion of additional criteria items which might otherwise have been missed.

<u>Step 6</u>   Simple qualitative and quantitative analysis of the questionnaire, its findings, and the results of the interviews led to the definition of the detailed criteria as well as to the determination of weighting factors. The Detailed Evaluation (or Selection) Criteria in tabular form and a description of the column entries are shown in the following pages.

The extreme left hand column of the tables shows the major evaluation
factors. The column immediately to the right of this displays the criteria
items. Major criteria items are underlined. Below each major criteria item
is a list of detailed criteria. The detailed criteria are of two types —
those against which the systems under evaluation will be scored and those
which are to provide context for the scoring process. Criteria provided for
context purposes are identified by a preceding hyphen. Those criteria against
which systems were scored can be identified by the presence of an entry in the
column marked WEIGHT (weighting factor).

The column entries for the Criteria Tables are defined as follows.

Evaluation Factor	- identifies a key area of evaluation and the beginning of a detailed criteria list for that particular factor.
Criteria Item	- identifies a feature, process or attribute associated with the factor. The Criteria item column also contains supplementary entries intended to provide an evaluator with a more complete spective on a particular criteria item being evaluated. Supplementary entries, which are identified by a preceding hyphen, do not have a weight assigned to them.
Weight	- is a measure of the relative importance of a criteria item to the user. Summing of weighting factors (or weights) gives a broad perspective of the relative importance of major areas or modules within the context of the entire evaluation. Weights are assignable at the discretion of the user.
Score	- is a measure of how well a given criteria is met by a particular alternative. It is suggested that scores be assigned on a simple 0 - 10 scale (or user defined equivalent). Only those items which have weighting factors should be scored.
Weighted Score	- this column entry is the product of the weight and the score and is a measure of how well the needs of a user are met on that particular item, area or module.
Maximum Weighted Score	- is the product of the weight and the maximum possible score. This would be the weighted score which implies a perfect fit to the needs of the user on a particular criteria item, set thereof, factor, etc.

Weighted Score/Max Weighted Score – this ratio gives a proportional measure of how well user needs are met on a particular item, set thereof, factor, etc.

For those evaluators who may wish to compare raw and weighted scores across product alternatives, a Detailed Scoring Comparison Form was also developed (see Appendix 3). This particular form is identical in format to the Detailed Evaluation Criteria Form but contains only those items which were scorable (i.e. it does not include context related items).

2.2 Evaluat⁻ Method

All evaluations were conducted in schools using real and full school data. Wherever possible, live or current school data was used. When this was not possible, data associated with a known reference point was used. While the actual testing was peformed by programmer/systems analysts, school administrators were maximally involved with the key decisions and judgements which guided the evaluations. This was one of the most important reasons why the evaluations were conducted in the schools. All key system capabilities were tested particularly as they related to:

- o Data base creation and maintenance
- o Pre-scheduling
- o Scheduling
- o Transition to operational status (and semester turnover)
- o Attendance recording and reporting
- o Progress recording and reporting
- o Report generation
- o Utility functions

It is not possible to list all evaluation considerations for all criteria in this report – some key performance considerations, however, were the quality of results achieved, completion times for major procedures and reports and inquiry response times.

During the course of the evaluations, each system was scored against each of the evaluation criteria using a zero to ten point scale. Scores were assigned as overall measures of "performance" against the criteria taking into account all considerations believed to be relevant by the evaluation team.

For example, consider the scheduling process. Both the timing and the quality of the result are critical evaluation considerations. Competitive systems might receive equivalently low scores if, while one produces a high quality result (e.g. high % students completely scheduled) in a very long time frame, the other produces a low quality result in a very short time frame.

In isolation, the mere presence of a particular feature, the sheer speed with which a process could be completed or the high quality of a particular result are not necessarily consistent with the awarding of high scores.

Testing and evaluation was supervised by three different project leaders on the Distributed Systems Team (of Edmonton Public Schools' Information Services). All software systems were evaluated in IBM microcomputer

environments. Every attempt was made to maximize objectivity. For examp1o, each system was evaluated by more than one project leader and frequent meetings were held to ensure cross referencing and the sharing of ideas and experiences. Despite this, of course, it is reasonable to expect some subjectivity to exist characteristic of the particular evaluator.

3.0 OVERVIEW OF SYSTEMS EVALUATED

Student Information and Records System (SIRS), developed by a small Alberta based company, underwent initial pilot testing in Redwater School in the County of Sturgeon. The system was initially developed as a pupil records system which included Alberta Education interfaces and with links to a financial information management system. The system evolved with the addition of a scheduler, the development of which was heavily based on the requirements of Redwater School. Close contact was maintained with at least one Edmonton Public School during this particular phase of SIRS' development.

SIRS was originally developed in RM COBOL to run on the NCR Tower Minicomputer and the multi-user ALTOS microcomputer. The system was converted to run on the IBM PC XT microcomputer.

Many of the programs which constitute SIRS have been re-written, particularly those relating to scheduling, to add more function and increase the speed of operation. SIRS is a system which integrates the basic functions relating to school records, student scheduling, attendance and progress tracking and reporting. A SIRS user's group was recently formed to provide input for future product enhancement and development. At the time that this report was produced, there were seven known installations of SIRS (see Appendix 4) all of which are in Alberta. SIRS, on the ALTOS and NCR Tower computers at least, is a multi-user system.

The School System was developed by Columbia Computer Services, a Vancouver based company. Columbia is a company which focuses exclusively on the education market and has almost two decades of design and development experience in student information management systems. The Company has a large North American customer base and has for a number of years (since 1968) offered services to schools (particularly scheduling) through a mainframe based service bureau approach (time sharing). Hundreds of North American schools are known to have subscribed to this service. Columbia is now in the process of phasing out its mainframe based services to customers in favour of a microcomputer based product which it has developed, called The School System. The School System features an integrated approach to school records, student scheduling, attendance and progress tracking and reporting. This multi-user system is written in the C language and was developed specifically to run on the IBM family of microcomputers. To date, The School System has been installed in more than 200 schools.

Computer Educational Management Accounting System was developed by a small Toronto based company called Computerlib. This product evolved from a product called EMAS which was developed to be marketed on the IBM System 34 Mini-computer. Initially, CEMAS ran on the Xerox microcomputer (and also, the Radio Shack microcomputer) and was subsequently converted, with some re-design and re-development, to run on the IBM PC and PC/XT. CEMAS, which was developed in a mixed language environment (including the PASCAL and C

Languages), was the first microcomputer based product that we evaluated. The IBM PC version of CEMAS was an immature product at the time of its evaluation by the Team. During the period of our involvement with CEMAS we became aware of only two or three other attempts to install the product operationally. We are not aware of the current number of installations of this product. As with SIRS and TSS, CEMAS addresses the four major functions of schools records, student scheduling, attendance and progress tracking and reporting. At the time of the evaluation, CEMAS did not offer multi-user capability.

Since completing the formal evaluations of the three microcomputer based SIMS in February 1985, there have been a number of product announcements and system enhancements. Appendix 5 provides an overview of major new developments that are known to us.

4.0 PRODUCT EVALUATIONS - SENIOR HIGH SCHOOL PERSPECTIVE

As stated previously, all products were evaluated in IBM microcomputer environments and at school sites. Though multi-user capability is considered to be important (particularly for the larger schools), testing of this capability was not included within the scope of these evaluations. From the product scope and function perspective, systems were evaluated in a stand-alone fashion. Two of the products offered multi-user capability at the time of evaluation notably SIRS and TSS. The developers of CEMAS indicated that multi-user capability was definitely included within the scope of their product development plans. It should be noted that scores of zero were used to indicate total absence of a capability or feature.

4.1 Evaluation of SIRS

4.1.1 Testing Environment and Conditions

The initial phase of testing was conducted using Jasper Place School - a school of about 1750 students which offers a wide variety of programs including vocational. An IBM PC XT complemented by a 10 Mb expansion unit and an Okidata Microline 84 printer were used for this phase. The second phase was conducted at Eastglen School - a school of 775 students. Second phase testing was conducted, using 2 different IBM personal computers, specifically, an IBM PC XT/370 with 10 Mb expansion unit and an IBM PC AT with a built in 20Mb hard disk. Two different printers, the Okidata Microline 84 and an Epson MX 80 were used.

It was a requirement that all systems evaluated be able to run on IBM microcomputers. With this condition clearly defined, MIG converted its NCR/Altos based system to run on the IBM microcomputer in order that it be included among the products to be evaluated. MIG advised the evaluation team that not all of the many programs which constituted SIRS were converted and that we might also expect performance degradation (particularly speed of execution) as a general consequence of the conversion to IBM format.

4.1.2 Evaluation Results and Observations

The following tables show the outcome of the quantitative evaluation of SIRS against the detailed criteria.

(21)

EVALUATION FACTOR	CRITERIA ITEMS	WEIGHT (W)	SCORE (S)	WEIGHTED SCORE (W X S)	MAX WT SCORE (W X S_{max})	WT SCORE/MAX WT SCORE

Observations

The following comments and observations are offered in support of the quantitative evaluation of SIRS.

(A) Scope and Function

School Records: Positive points include a 15 character identity field which facilitates the link to Edmonton Public School's mainframe based pupil records system; family linking capabilities which means only one contact for several students within a family; proper pre- and co-requisite checking with the capability to override this when necessary; good Alberta Education field for statutory reporting; existence of a link between student and course fees to an MIG financial system which includes student fee invoices.

Negative points include absence of user definable fields (considered to be very important); absence of some less important fields; absence of registration and feeder school confirmation; use of artificial numerical codes for student requests, probably introduced to accomplish course grouping or linking; use of numeric codes in areas such as the instructor file; no user defined reports.

Scheduling: The scheduling function is capable of working with both semestered and non-semestered versions of the same course using the same student request. In addition, good tally reports and conflict matrices are available; flexible class placement is possible anywhere within the period by day matrix; there is a capability to specify, for each request, preferred semester and alternate course information; quite acceptable class balancing is achieved with results obtained comparable to those achieved using the mainframe and minicomputers.

On the negative side, use of the artificial numeric code as a course request rather than the course code itself tends to complicate the scheduling process; there is a necessity to run several time consuming edit reports before each scheduling run; it is necessary to completely close scheduling before starting attendance and other general school functions: there is a long processing time when scheduling large schools; necessary information is not printed with partial schedules which could be used to resolve conflicts.

Attendance: The Attendance module is fairly acceptable with
                           flexible user defined codes which may be classified as
                           "accumulating" types and "non-accumulating" types for
                           attendance letter generation; there is the capability
                           of generating 8 different letters to parents which are
                           automatically prepared when attendance problems pass
                           certain levels; detailed period and class attendance
                           is intained for the whole year; generation of
                           attendance collection forms is good as are facilities
                           for data entry.

                           Negative points include too much detail on absences in
                           most reports; codes for absence reasons are numeric
                           rather than the more meaningful alphabetic codes used
                           in other systems; the generation of collection
                           registers could be slow for a large school especially
                           if class lists are to be alphabetic which seems to be
                           the norm.

Student Marks: The marks system is adequate with a structure
                           consistent with Alberta Education requirements and a
                           reflection of the current move towards departmental
                           exams; the format of student report data is consistent
                           with current EPSB reports; the required final marks
                           and attendance summary is automatically transferred to
                           the academic history segment for use in pre-requisite
                           checking.

                           Some poor features include the absence of automatic
                           marks entry; all marks are stored as percentage scores
                           even if awarded as pass/fail or A,B,C, etc; there are
                           no user definable marks storage nor calculation
                           modules which can store a large number of intermediate
                           marks required to calculate a report card mark.

Utility Functions: Backup and Restore are menu driven and are considered
                           normal and acceptable. Security was not present on
                           the evaluated system with the exception of access to
                           some technical system setup parameter files

(B) Ease of Use

                           The system is not flexible in the sense of user
                           defined fields, user defined reporting, user
                           controllable import and export capabilities. The user
                           is bound by a menu driven system which in itself does
                           not allow much diversion from system defined
                           procedures.

                           No help facilities are availble in SIRS.

(C) Technical Considerations

Hardware: The system was designed to run on an ALTOS multi-user
                   microcomputer, or an 'CR Tower minicomputer, hence the
                   performance and overall functionality of the package
                   was adversely affected after being converted to run on
                   the IBM PC family of computers.

Software: The software was written in RM COBOL and operates
                   through semi-interpreted object modules and a run-time
                   system.

                   There is extra information (JCL type statements on the
                   screen) which tends to "clutter" the screen and break
                   the fluid movement from screen to screen and menu to
                   menu.

(D) Support and Services

                   Positive points include the fact that the company and
                   product are local; there is a relatively small
                   customer base and the product is still in development
                   which means that the vendor is willing to support the
                   product well and customize; the vendor is very forth-
                   coming with respect to system capabilities and
                   explanations as to how functions are performed; there
                   is a willingness to write custom programs to allow
                   data downloading from central databases; the vendor
                   readily became involved with implementation plans for
                   testing purposes and responded rapidly to queries and
                   software problems.

                   On the negative side, documentation is very poor,
                   basically a collection of screen dumps with
                   practically no explanation; only very minimal formal
                   training was available - the philosophy seemed to be
                   to try to work with the system and the company will
                   help as problems arise; the small size of the company,
                   the limited number of installations of SIRS and the
                   potential impact of staff changes on product support
                   are considered significant reasons for concern.

(E) Product Qualifications

                   The package was developed for the Alberta market with
                   close contact with Alberta Education. Initial
                   implementation, testing and direction for
                   modifications and the development of the scheduling
                   module were influenced by at least one Edmonton Public
                   School.

66

The current development plans are based on ALTOS/NCR versions and revolve around:

- adding function and speed to the scheduling area (this is badly needed).

- interfacing with the NCS SENTRY 3000 form scanner.

- interfacing to "surveyor" type auto dialing systems.

The current user base includes seven Alberta installations based on information available in January 1985.

(F) Vendor

The vendor is a relatively small company with some local customers. The company is based in St. Albert and developed the system as an adjunct to a financial package. The vendor sells hardware as well as software and offers a good price structure on the SIRS system.

Unfortunately, the combination of small size and lack of good references works against the vendor. Similarly, limited staff and vendor stability are minus points.

67

4.1.3 System Performance, Strengths and Weaknesses - SIRS (MIG)

Key Performance Indicators

School Test Site	Parameter	IBM PC/XT	IBM PC/AT
astglen CHS	Scheduler - Time	-	2:30 hours
	Scheduler - Performance	-	62%
	Scheduler - Expected Perf.	-	65%
	Timetables	-	7:00 hours (list format)
	Conflict Matrix	4:10 hours	-
	Course Tally	0:50 hours	-
	Master Schedule	-	2:15 hours
	Class Lists	-	5:00 hours (non-alphabetic)
	Attendance Registers	-	:00 hours
	Marks Registers	-	6:20 hours
	Student Registers	-	1:00 hours
Jasper Place CHS	Scheduler - Time	46 hours	19 hours
	Scheduler - Performance	85%	85%
	Scheduler - Expected Perf.	85%	85%

Jasper Place CHS	1846 students
Eastglen CHS	775 students

(All timings are in hours: minutes)

<u>S.stem Strengt's:</u>

- Good prerequisite checking before and ·:ter scheduling, however these act as a warning only and do not affect loading, thus desired exceptions can be scheduled.

- Good fee information held at the student and course level for preparation of fee invoices.

- A convenient link to the mainframe database via the 15 character field for the Student. ID. #.

- Locally developed: thus changes in Albert. Education requirements should be more easily accommodated.

  - Changes might be more likely to be considered

  - A number of reports specifically designed for Alberta Education are present. (Possibly not a great advantage to those who report at the district level - rather than at the school level)

- Automatic generation of attendance letters (8 user defined types) based on user defined amount of absences.

- SIRS is known to run in a multiuser (non PC) environment and has print spooling capabilities.

<u>System Weaknesses:</u>

- Poor performance on IBM equipment (primarily speed).

- Screen organization and readability not as good as other systems. Frequent display of JCL type statements and difficulty in finding the appropriate field or menu selection.

- Lack of automated input on IBM equipment at this point in time.

- Use of a 3 digit request code for scheduling purposes causes user confusion and tends to make the scheduling process slow to edit and run.

- Lack of any user defined fields which will result in the need for continuing modifications at the vendor level.

69

4.2 Evaluation of TSS

4.2.1 Testing Environment and Conditions

Two separate project teams, each under a project leader, evaluated The School System at a number of senior high schools. In all cases, IBM PC/AT and IBM PC/XT computers were used for the work.

Team 1:
Initial testing was on an IBM PC/XT computer.

Final testing took place on IBM PC/AT computers on full sets of data for Jasper Place and W.P. Wagner schools.
The configuration of the IBM PC/AT system in each case was: 512 kb memory, 20 Mb hard disc, PC DOS 3.00 operating system.

All reports were printed on OKIDATA Microline 84 printers.

Team 2:
The School System was tested at three schools, 2 Senior High and cne Junior High (see section 6.0 for details of the Junior High School evaluation). At J. Percy Page school, an IBM PC connected onto the Davong Multilink network was used with a 5 Mbyte user volume and 448 kb memory. Printing was carried out on a General Electric Genicom (300 characters per second) printer.

At Victoria Composite High school, an IBM PC/AT was used with 20 Mb hard disk storage, 512 kbytes memory and an OKIDATA 84 printer.

4.2.2 Evaluation Results and Observations

The following tables show the outcome of the quantitative evaluation of Columbia's "The School System" against the detailed criteria. The results and the following observations are a consensus of information from the two teams which undertook the evaluations.

Observations

The following comments and observations are offered in support of the quantitative evaluation of TSS.

(A) Product Scope and Function

Pre-Registration: There is no distinct pre-registration function, rather, it is part of the enrolment function. Registration confirmation notices are not mailable. However, the pre-registration of a student, even though it requires two screens, can be done very expediently.

Detailed Data Items: Demographic data is good although the program does not handle middle names, the 15 character I.D., future year grade or academic history.

Instructor information is minimal – only name, I.D. number and alpha-numeric instructor code are provided. However, this information is sufficient for use by this system.

Course information is adequate and pre- and co-requisites are checked at scheduling time which makes for speedy data entry. There is no limit on the number of pre- and co-requisites. Some difficulties occur with courses that are offered in both full year and semesters.

Reports/Inquiries: The package lacks some reports especially student I.D. cards and fee sheets but overall has a very comprehensive repertoire. In addition, we were unable to obtain reports for names of students in alphabetical or numeric order. The (future release) Report Writer should alleviate most of these problems although it should be noted here that scores reflect the current status of the product.

Scheduling: On the positive side, the system provides both manual and automated entry of course selections. The only minor problem is that duplicate course requests are not detected.

Pre- and co-requisites are not checked in the academic history and they can only be over-ridden at scheduling time.

The Automatic Course selection feature provides a powerful tool for purposes such as:

- course blocking
- separation into male/female only sections
- withdrawing students from cancelled courses.

On the negative side, the conflict matrix is
presented in an unsatisfactory format and there is no
capability to automatically build a master
timetable. The package can deal only with certain
combinations of courses, for example no units smaller
than quarters, not both tri- and quarter-mesters.

Overall, Columbia provides excellent flexibility in
terms of the timetable rotation and tumble, and the
number of periods per day. There is a capability to
maintain both current and future year master
schedules and the ability to "roll over" future year
to current year is also provided. In addition, the
scheduling process runs extremely quickly and
produces excellent results although it does not allow
the user to define scheduling sequence, however grade
order can be specified (the algorithm used makes this
feature unnecessary).

The scheduler provides the capability to schedule
groups of students without affecting the timetables
of the remainder and it does provide the ability to
schedule any individual student.

Scheduling Reports: Student timetables are available in grid format
                       only. List timetables are not available in a form
                       suitable for distribution to students.

Attendance: Manual entry of attendance data requires the use of
                       two screens which is awkward. Automated entry of
                       attendance data is supported and is used currently at
                       one of the pilot sites, although no reason codes
                       (reasons for absence) can be entered from the scan
                       forms.

                       On the positive side, the system provides excellent
                       attendance history - full year in detail plus
                       cumulative totals. The attendance module is capable
                       of recording absence data daily, twice daily and
                       period by period.

                       The attendance reports available are quite
                       comprehensive. The Report Writer package under
                       development will enhance the reporting capability in
                       this area.

Student Marks: Manual and automated entry of marks data is supported
                       and the system allows up to 10 term marks, letter or
                       percentage grades or a mixture. Report cards are
                       produced reasonably quickly and seem adequate for
                       school needs.

No exam timetable facilities are provided and while basic reports are available, more detailed reports are required.

Utility Functions: The system provides a good backup and restore utility. It also provides an excellent user ID/password security system.

(B) Ease of Use

The system is very flexible allowing any timetable rotation and up to 4 semesters. It allows import and export of data to the main database using File Builder/Virtual Scan input.

All functions are driven from concise menus; there is consistent cursor control and function key handling. Screen response is fast and error messages are generally good.

On the negative side, there is no online help facility, but the documentation is excellent.

The documentation provides step by step descriptions of the functions which must be performed in order to run The School System.

(C) Technical Considerations

A multi-user version of the system is available. The master terminal is a PC/XT or PC/AT computer with dumb terminals for remaining stations. Two users can be supported on the IBM PC/XT and up to 6 users on the IBM PC/AT.

The School System is a modular, integrated system written entirely in "C" with extensive use of BAT batch files to control the flow of operations. It has a relatively open design with virtual scan forms and File Builder facilities to provide for various enhancements to the system.

(D) Support and Services

The company is based in Vancouver with excellent telephone support:

- calls are returned promptly
- the company is always willing to help whoever calls
- the company keeps in contact until a problem is solved.

97

In addition, the company seems capable of performing needed maintenance tasks.

The design of the system allows some user modification and the documentation is excellent with 4 high quality binders and few errors. There are particularly good descriptions of the use of the system. Clear instructions are provided for the installation of the system, requiring little knowledge of IBM PC microcomputers and PCDOS operating system software. The package provides the capability for in-house development of links with the IBM 4341 mainframe computers for downloading and uploading of data.

(E) Product Qualifications

The package is well tested and in production at a number of Canadian sites. Releases are made available to licensed users according to schedule and at regular intervals. The Company clearly has a well-defined and organized approach to product migration and enhancement.

(F) Vendor

The Vendor is a Canadian company with a strong background in Education Administration systems, starting with bureau time sharing services on mainframe computers. Contracts appear to be reasonable, although fairly rigid and the price is a little high.

4.2.3 System Performance, Strengths and Weaknesses – TSS (Columbia)

Key Performance Indicators

School Test Site	Parameter	IBM PC/XT	IBM PC/AT
Jasper Place CHS	Scheduler – Time		3:30 hours
	Scheduler – Performance		94%
	Scheduler – expected Perf.		94%
J. Percy Page CHS	Scheduler – Time	2:30-3:00 hours	
	Scheduler – Performance	100%	
	Timetables	5:00-6:00 hours	
	Master Schedule	0:30 hour	
	Class Lists/Atten. Reg.	5-7 min./class	
W. P. Wagner HS	Scheduler – Time	–	1:30 hours
	Scheduler – Performance	–	89%
	Timetables	–	11:00 hours
	Conflict Matrix	–	3:45 hours
	Course Tally	–	0:55 hours
	Master Schedule	–	1:00 hours
	Class Lists/Atten. Reg.	–	9:20 hours
	Marks Registers	–	9:20 hours
	Student Registers	–	1:00 hour
Victoria CHS	Scheduler – Time	–	2:10 hours
	Scheduler – Performance	–	98%
	Course Tally	–	0:35 hours
	Master Schedule	–	0:40 hours
	Class Lists/Atten. Reg.	–	2-3 min./class

Jasper Place CHS: 1846 students

J. Percy Page CHS: 463 students

W.P. Wagner HS: 975 students

Victoria CHS: 1598 students

(All times are in hours:minutes)

System Strengths:
- Meets its own specifications
- Well thought out data base
- State of the art software design
- Generally "clean running" system
- User definable data fields
- Surprisingly fast in all functions
- Very good and consistent data entry mechanisms
- Easy to install and learn
- Very well documented
- Flexible change/edit capability for student course requests re:

  - Mass changes (by sex, grade, program)
  - Semester preference
  - Teacher preference
  - Section preference
  - Individual and global alternates
  - Required course selection

- Fast, high integrity scheduler - remains "open"
- Excellent support, problem resolution - 1-800 hot-line
- Very good approach to enhancement, planned migration
- Open system design (facilitates future development)
- Automated data entry and multi-user facility
- Accomodates homeroom grouping
- Schedules any course in any combination or number of periods
- Accomodates any rotation tumble for any number of periods

System Weaknesses:
- Reporting limitations (format, range, common reports)
- Very limited instructor data
- Two screens required for attendance, registration
- Some important fields absent (e.g. EPSB I.D., middle name)
- No pre-requisite checking - can be honoured in scheduling process however
- Credits based on semester amount - need to use different course codes
- Student change transactions not captured
- Homeroom assignment by sequential allocation or random - not by course section

4.3 Evaluation of CEMAS

4.3.1 Testing Environment and Conditions

The evaluation approach was one of a simulation of a real life environment. The test data, used in the evaluation process, was the Jasper Place High School 1983-84 and 1984-85 real life data. The entire student body, course offerings, and student course selections formed the test data base. The data was input into the system via the data entry functions offered by CEMAS. In many instances, CEMAS offers alternative routes to get to the same point. Where it was feasible and/or important the alternate routes were explored to determine the optimum one for the future use of the system.

The hardware units used in the evaluation process represented, in our opinion, the minimum configurations that would be required for practical use.

All processes were simulated in their natural order of occurrence. The evaluation process took a considerably longer period of time than was originally anticipated due to circumstances beyond the control of the evaluation team.

The evaluation started on an IBM PC with a 35 Mb Tallgrass hard disk and a (General Electric 300 cps.) GENICOM printer. Since many processes in CEMAS run for 6 to 10 hours (close of scheduling runs 168 hrs) and make the system unavailable during this time, in order to speed up the evaluation a second unit (IBM PC XT with 10 Mb hard disk, and a 200 cps. OKIDATA printer) was added. A third unit was added later and installed in Steele Heights Junior High School in order to determine the applicability of CEMAS to the Junior High School environment.

4.3.2 Evaluation Results and Observations

The following tables show the outcome of the quantitative evaluation of CEMAS against the detailed criteria.

101

Observations

The following comments are offered in support of the quantitative evaluation of CEMAS.

(A) Product Scope and Function

Pre-Registration: The facility is good but there is no method of
                          producing the appropriate reports. There is an
                          excellent range of student demographic data but no
                          user defined fields. Particularly important
                          fields missing include: middle name, 15 character
                          EPSB I.D.

Detailed Data Items: Most important fields are present; again, the lack
                          of user-defined fields causes problems.

Instructor Information: The instructor information is good but is
                          restricted to numeric teacher codes and again no
                          user-defined fields.

Course Information: The data in this area is inadequate, for example:

                          - Credit range is 0.000 to 9.999 which is
                            insufficient for large courses which can have up
                            to 30 or more credits.

                          - It does not allow co-requisites.

                          - Only 2 pre-requisites per course are allowed.

Reports/Inquiries: There were numerous problems with reports:

                          - They do not always work for a range of values.

                          - They are very slow in most cases.

                          - Grid timetables do not recognize school
                            timetable "tumbles".

                          Many reports do not exist in the system and there
                          is no mechanism available for their derivation;
                          for example there is no Report Writer program.

126

Pre-Scheduling: The manual entry of course requests is slow and there is no facility for the automated entry of course requests. In addition, it is impossible to create academic history to test the ability to check pre-requisites from previous history; the package cannot check pre- and co-requisites of courses in the given year, i.e. it cannot force Chemistry 10 to be scheduled before Chemistry 20 if both are requested.

A potential conflict matrix can be produced but only for all courses; one cannot specify a range of courses.

Master Scheduler Builder:

An automatic schedule builder is provided but it does not work. The system, in this function area, can only handle full year and semestered courses, not quarter-mesters or tri-mesters. A mechanism exists for providing very simple timetable rotations but even this is not reflected in the student grid timetables, marks or attendance lists.

A mechanism also exists for maintaining current and future year master schedules but this does not work correctly.

Scheduling Process: The scheduling sequence cannot be directly specified, this can be achieved indirectly with "patching" tricks. The process itself is slow and cannot be restarted if aborted. Multiple passes are needed. The process does not work correctly; in some cases it puts students in two classes at the same time and ignores some sections of courses resulting in unbalanced classes.

Course blocking facilities are provided but do not work properly. Also, one cannot keep attendance until scheduling has been closed. Scheduling "close" ties up the system for an unacceptably long period of time (1 week at Jasper Place High School).

Scheduling Reports/Inquiries:

Scheduling reports are very slow and many do not work. There are no user definable reports.

127

Attendance: As described above, attendance cannot be kept
                         until scheduling is fully closed. There is no
                         mechanism for automated attendance data entry and
                         manual data entry is slow. In addition, there are
                         no user definable attendance type codes.

                         It was impossible to test the attendance history
                         function thoroughly since the attendance "aging"
                         function does not work properly.

                         Attendance reports are very slow and some options
                         do not work. There are no user-definable reports.

Student Marks: There is a function for automatically entering
                         marks data; manual entry is slow. An exam
                         timetable builder is provided but does not work.

                         The report cards function does not work due to the
                         absence of format specifications.

Utility Functions: Backup and Restore functions are not provided; the
                         standard utilities provided under PC DOS are
                         adequate for programmer use.

                         The security system is adequate although it does
                         not appear to function as stated in the
                         documentation.

                         The need to re-start the application package after
                         using utility functions i. annoying and would be
                         particularly difficult for a non technical user.

(B) Ease of Use:

                         CEMAS is not a flexible system - it can only
                         handle certain types of timetable rotations and it
                         only allows 2 semesters. Although menu-driven,
                         the function keys and cursor controls are not
                         consistent from screen to screen.

                         The online help facility simply lists sections of
                         the operating manual and error messages are often
                         cryptic or inappropriate with no explanations in
                         the documentation. Screen response is generally
                         slow.

                         The overall ease of use is negatively impacted by
                         poor system performance and poor functionality,
                         and the need to avoid functions that do not work.

(C)   Technical Considerations:

The system runs on an IBM PC/XT under PC DOS 2.00
or higher operating system version. CEMAS was
tested in a single user environment only. It is
unable to extract data from external files as no
information was given on file layout or content.

Overall, the CEMAS package is a closed system with
a non-modular design. This causes difficulties
for the vendor in making modifications; it is
impossible for the user to do this.

(D)   Support and Services:

The company is based in Toronto and is fairly
small, leaving doubts as to their ability to make
custom modifications. Telephone support is
poor.
For example:

- Calls were not returned
- We were frequently able to reach only the
  answering service
- There was a tendency to blame problems on user
  error rather than to admit the possibility of
  problems with the software
- The company was sometimes reluctant to talk to
  the Analyst/Programmer who called, they
  preferred to talk to the Project Leader only.

The design of the system does not lend itself to
user modification and there is no ability to set
up system data except by keypunch.

The documentation is poor in appearance and
substance. For example:

- There are many typographical errors
- There is no index
- There are no instructions given for installation
  of the system
- Descriptions of functions and their use are
  incomplete and poorly explained
- On-line help consisted of displaying the
  appropriate section of the printed documentation
- There was no explanation of error messages

129

(E) Product Qualifications:

During the course of the CEMAS investigation, many problems were encountered with both the product and with vendor support, which extended the evaluation process considerably. As a consequence, one very important conclusion which was drawn by the team is that CEMAS was a product which was still under active development. The frequency and nature of product updates has clearly supported this conclusion. Updates received during the course of the evaluation would be best described as fixes rather than product enhancements. Product updates were occasionally found to corrupt things which had previously worked. Up to and including the final days of practical testing of the product, it is the opinion of the evaluation team that CEMAS was not a mature or stable product.

We are unable to say how many production sites are currently using CEMAS.

F) Vendor

The vendor, which is also the developer - COMPUTERLIB, is based in Toronto. To date there is no known local support for CEMAS. Systems documentation is poor but was improving. The Distributed Systems Team was in frequent and close communication with the developers throughout the evaluation of CEMAS. The frequent problems which were encountered were communicated to Computerlib with expedience. Response to problem reporting was mixed at best, and problem resolution was less than acceptable. Lack of effective, local support for CEMAS should be considered a significant inhibitory factor to potential users and this factor becomes even more critical where District level support is unavailable.

130

4.3.3 System Performance, Strengths and Weaknesses - CEMAS (Computerlib)

Key Performance Indicators

School Test Site	Parameter	IBM PC/XT
Jasper Place	Timetables	doesn't work
	Conflict Matrix	6:00 hours
	Course Tally	3:00 hours
	Master Schedule Print	2:00 hours
	Class Lists	1-3 min/class
	Attendance	1-3 min/class
	Marks Registers	1-3 min/class
	Student Registers	1-3 min/class
	Course Requests	27.0 hours

	Scheduler - Time	19:30 hours
	Scheduler - Performance*	84%
	Scheduler - Expected Performance	85%

Jasper Place CHS: 1846 students

(All times are in hours: minutes)

* N.B. Subsequent runs corrupted previously achieved results

131

System Strengths:
- Comprehensive database with good data elements
- Easy to use creens
- Well integrated system; modules all fit together

System Weaknesses:
- System still under conversion and/or development
- Unavailability/non-existence of system documentation
- System does not use Miudle Name - link to mainframe not possible
- The scheduler may be limited to 8 periods per day
- Course credit format is N.NN; should be NN
- Unable to generate ad-hoc reports
- Benchmark tests (particularly scheduling) not complete
- Some functions not working (e.g. student request list)
- Report production time long - cannot be effectively suspended
- Many system functions are very slow
- Master schedule builder does not accomodate semester/non-semester mix
- Course translation not available
- Doesn't handle quarter-semester courses
- "Fatal" errors occur without warning
- Unstable paging condition during report production
- Instructor code presently numeric - needs at least to be alphanumeric
- References on installed IBM systems not available
- Hard coding of year into system
- Must enter area code with every telephone number

132

5.0   COMPARATIVE EVALUATION OF SIMS: SENIOR HIGH SCHOOL PERSPECTIVE

5.1   Comparison Summary and Review of SIMS Evaluation Data

The following tables show the quantitative evaluation data for the three microcomputer based information management systems which were evaluated.   Two mini-computer products were also tested in the same environment and will be the subject of another report.   The data is displayed on the Detailed Scoring Comparison Form which was referred to previously.   This form parallels the Detailed Evaluation Criteria Forms.   The Comparison Summary and Review forms differs from the Detailed Criteria Forms in that all (non-scorable) context related criteria are omitted and only the weighting factor, raw and weighted scores from the evaluation are displayed.   Various levels of totals are shown on the form the major purpose of which is to facilitate the quick and objective comparison of system performance.

5.2 Relative Suitability of SIMS to the Senior High Schools

The foregoing results, can now be used to determine the relative suitability of a particular product to a particular user's needs.

The following describes a method of determining this suitability relative to the six major evaluation factors.

Before determining the overall suitability of a system to the needs of the user, however, the user must first define the relative emphasis that he wishes to place on the major evaluation factors.

The following table shows the emphasis which the evaluation team believes is an appropriate emphasis to place on the major evaluation factors. The emphases are expressed as percentages and total to 100. While it can be clearly seen that product scope and function is the single most important evaluation factor, this importance is outweighed by the collective emphasis on the other five factors.

EVALUATION FACTOR	EMPHASIS (%)
PRODUCT SCOPE AND FUNCTION	45
EASE OF USE (OF PRODUCT)	10
TECHNICAL CONSIDERATIONS	10
SUPPORT AND SERVICES	15
PRODUCT QUALIFICATIONS	10
VENDOR	10

Relative suitability can be defined as a function of weighted score and relative emphasis in the following way.

$$\text{Relative Suitability} = (\% \text{ Emphasis}) \times \frac{(\text{weighted score})}{(\text{max. possible weighted score})}$$

The ratios of weighted score to maximum possible weighted score for the products evaluated are shown on the Detailed Evaluation Criteria Forms (sections 4.1.2, 4.2.2, and 4.3.2).

Applying the above formula to the evaluation data at hand gives the following result.

EVALUATION FACTOR	EMPHASIS (%)	RELATIVE PRODUCT SUITABILITY		
		TSS	SIRS	CEMAS
PRODUCT SCOPE AND FUNCTION	45	30	27	14
EASE OF USE	10	8	6	3
TECHNICAL CONSIDERATIONS	10	9	6	2
SUPPORT AND SERVICES	15	12	10	0
PRODUCT QUALIFICATIONS	10	9	6	0
VENDOR	10	8	7	1
TOTALS	100	7ᶜ	62	20

By using this process, entries in the columns identified by product names will be numbers less than or equal to the percent emphasis number. These numbers can be considered as scores out of the assigned percent emphasis numbers. Vertical totals of suitability for each product will be numbers less than or equal to 100 which can easily be compared across products.

The above table shows, for example, that CEMAS is considered to be very unsuitable to the needs as defined in the support and services area while, by contrast, Columbia's The School System scored 12 of a maximum possible 15 points for the same evaluation factor.

The suitabilities calculated according to the method described should be viewed as relative measures of the extent to which a product meets a particular user's needs. This suitability will vary according to the completeness of the criteria, user defined weighting factors, percent emphasis and, very obviously, on the scores assigned by the product evaluator. Within this context, therefore, it is very important to note that the evaluation process which has been developed and applied in this way is extremely flexible allowing the user complete discretion to decide which criteria will be used, the weighting factors and the relative emphasis. In short, all that a user of this process needs to depend on is the actual raw scores which were assigned as a result of the hands-on testing work.

To illustrate the flexibility of the process, two more examples of product suitability have been determined and are shown below. The reader will see that the percent emphasis distribution has been changed (while still totalling 100) in each case. In these examples, the individual criteria weighting factors were not changed (though they could have been) and thus the same ratios of weighted score to maximum weighted scores were applied.

(87) 148

As previously stated, the approach used to define relative suitability is very flexible and may be employed to meet the needs of a particular user. Appendix 6 shows a further simulation (use of the same evaluation data) in which not all of the evaluation criteria were used and in which the actual criteria weighting factors were changed to reflect a particular user perspective.

149

6.0 PRODUCT EVALUATIONS - JUNIOR HIGH SCHOOL PERSPECTIVE

Two of the three microcomputer - based systems - SIRS and The School
System were tested in a Junio High School in addition to the above tests
in Senior High Schools.

The Detailed Evaluation Criteria Forms show two specific requirements in
relation to the scheduling function which were considered to be of
special relevance to junior high school environments, notably:

- Homeroom grouping for core subjects
- Capability of scheduling any course in any combination and number of
  time periods

It war obviously impossible to retest these features and other junior
high specific features (such as morning/afternoon attendance) with an
existing senior high school database. For this reason the two above
systems were tested independently in a junior high school.

6.1 Evaluation of SIRS

The MIG SIRS package was evaluated at Steele Heights Junior High School
to determine its suitability in a junior high setting. Prior to starting
the evaluation a discussion with MIG indicated that upgrades to the
software would be needed in the "core subject" grouping area. These
upgrades were made about half-way through the evaluation but did not
significantly improve the overall result.

The evaluation spanned a period of one and a half months during which
time a number of scheduling simulations were made with improved results
on each occasion. Current schedules and student demographic data were
used with an expectation of achieving at least 95% fully scheduled
student course requests.

6.1.1 Testing Environment and Conditions

Steele Heights Junior High school has 646 students enrolled in grades 7, 8 and 9. It uses a strict 4 day, 6 period rotation schedule and operates attendance at the half-day reporting period level. The classes and subjects offered are very typical of other district junior high schools with a small number of ESL and vocational courses and a high correspondence to the Alberta Education course listings. Steele Heights uses homerooms of approximately 25 students each and has, in common with most other Junior High schools in the District, a large number of "core" periods for each student, that is, mandatory courses. Grade 7 and 8 students must take Physical Education, Computer Studies, Language Arts, Mathematics, Science and Social Studies. Grade 9 students do not have to take Computer Studies, but the other five courses apply.

The SIRS system was copied onto an IBM XT computer. The computer has a 10 Megabyte disc drive, a 360 kilobyte flexible disc drive (used mainly for loading data to and from other sources and backing up the SIRS database) an amber high-resolution monitor, 512 kilobytes of RAM (Random Access Memory) and an OKIDATA Microline 84 printer operating at about 160 characters per second. The system supports a single user with no option to upgrade to multiple users.

Data entry was entirely by keyboard for this test, although the senior high school test employed data loading from mainframe files (which were initially converted to text format).

The testing timescale was one and a half months which allowed time for the setting up of all demographic data, master schedule, course requests and school data (such as rooms, teachers, programs etc.). It also allowed time for 2 scheduling simulations for all students, a number of smaller simulation tests and limited testing of the marks and attendance software.

6.1.2 Evaluation Results and Observations

The following tables show the outcome of the quantitative evaluation of SIRS against the Detailed Evaluation Criteria.

Observations

The following comments and observations are offered in support of the quantitative evaluation of SIRS.

(A) Product Scope and Function

Pre-Registration: - is good and fast.

Detailed Data Items: - the package provides some of the key data items but does miss some of the most essential fields such as Feeder School, previous schools, religious denomination and certain medical information. Most importantly, there are no user defined fields. It is vital that schools have the flexibility to define their own student demographic data.

     - Instructor information is basic with again, no user defined fields. Course information is very limited and really falls short of minimum criteria.

Reports/Inquiries: - Inquiry facilities are virtually non-existent. Reporting is very limited and very poor in quality. During the test, a number of hand-written reports were needed to track the set up and development of data. No facilities exist for the generation of user-defined reports, there is no report generator and no data file layouts.

Scheduling: - Basic data entry and manual scheduling (ARENA) are acceptable and workable. Manual entry of course requests is confusing and tedious. There are no automated entry facilities.

     - Editing and validation of course requests involves a 2 stage batch process. There is no interaction with the user and the results are poorly presented and can be confusing.

     - Pre-scheduling reports are available, but fairly limited in their usefulness. Several of the reports, especially exception reports, in the selection criteria are not available.

     - The Master schedule builder produces a good manual schedule; there are no automatic schedule builder facilities. Some scheduling units can not be handled. Most essential features, such as rotation/tumble and different numbers of periods per day can be handled.

- The scheduling process is fairly poor in the areas of interaction and user parameters - these were "stripped" out for the IBM implementation. Scheduling of small groups of students is impossible as is the ability to keep scheduling open after the start of the school year. Most other features such as restart capability, blocking and section balancing are handled well but with no user control.

- Scheduling reports are poor; inquiries are virtually non-existent. Student timetables and "partials" can be generated. After running the load/Print batch process, class lists can be generated.

- Homeroom grouping is handled in a fashion although there is no user control over the actual students within each group. It is the fact that Junior High schools have large core subject groupings that causes the scheduler to produce such poor results. After filling the timetable from optional courses (which have fewer sections offered) it is very difficult to fit the 15 or 16 period core groups into the timetable.

Student Attendance:
- Attendance software was tested in outline and was found to be acceptable in most areas.

- Manual entry is fairly difficult due to the absence of key reports; there are no automated (scanner) facilities. There is a limited number of absence codes and attendance can be recorded at different intervals (most junior high schools record attendance at the half day level).

- Reporting is fairly poor with some key reports missing and layout on the working reports very poor. There are no user defined reporting facilities, an important requirement in this area.

Student Marks:
- This area was also tested in outline and was found to be reasonable in most functions.

- Manual entry of data was straight forward but tedious; there is no automated facility. Most marks data requirements were met, but student exam facilities were poor.

177

- Reports and Inquiries were acceptable in this
  area, but certain key reports were missing and
  inquiry facilities were minimal.

Utility Functions: Backup and Restore are handled through the IBM PC
                      DOS operating system utilities of the same
                      name: SIRS does not have its own backup/restore
                      software.

                      There were no security controls in the software
                      which was purchased for evaluation, although
                      there may be facilities of this kind on the
                      multi-user NCR or ALTOS systems.

(B) Ease of Use   The package is not easy to use despite the menu
                      facilities and the modularity of the code (built
                      as a series of COBOL objects).

                      Several menus lead to the wrong program or
                      facility; there are no "help" facilities; the
                      system is not flexible or adaptable.

(C) Technical Considerations:

                      The SIRS system runs on the IBM PC range of
                      microcomputers but does not take advantage of
                      many of the features of the machine - fast screen
                      painting, spooling, disk caching to memory, etc.

                      The RM COBOL system runs fairly well but slowly
                      under the PC DOS operating system: it doesn't
                      appear to have "hooks" into the operating system
                      directly.

                      Standard PC DOS Utilities were used throughout
                      the test and it would seem that the SIRS package
                      has no utilities.

                      No technical information or programmer
                      information was provided and we can only surmise
                      that the database management system is a standard
                      facility provided by Ryan McFarland (the vendor
                      of RM COBOL).

                      Networking (using a Local Area Network) was not
                      feasible and there were no user hooks provided
                      for the Junior High system. (Two RM COBOL
                      programs were provided for the Senior High system
                      for the loading of data). The system was modular
                      insofar that it was composed of a number of COBOL
                      modules.

178

(D) Support and Service :

There was basically no real support and minimal
training. Training consisted of a 1 hour session
where the software was copied onto the IBM XT and
started up.

One modification was produced - to allow up to 9
core subjects to be grouped - but there were no
general release plans announced.

Documentation is poor and untidy. There is no
"roadmap" and no startup list. A school
administrator would not be able to use the system
with the documentation provided.

There were no training or setup plans provided by
the vendor. Similarly there was no
implementation plan with the result that on a
number of occasions data was punched into the
wrong database file.

(E) Product Qualifications:

The package has been developed and maintained
since 1979 and is fairly stable with some new
releases planned. The vendor plans to recode
some of the programs in "C" and improve "core
grouping". There are only 7 installations, not
all of which are junior high schools, using the
package (some of these installations, for
example, Rocky Mountain House, have not yet used
the scheduler).

(F) Vendor: The vendor is locally based, in St. Albert, and
has installed a few SIRS systems within
Alberta. Vendor stability and corporate
information is poor and experiences tended to be
neutral. It is a small, local company and would
not be able to support multiple problems at
different sites.

6.1.3 System Performance, Strengths and Weaknesses - SIRS (MIG)

Key Performance Indicators

School Test Site	Parameter	IBM PC/XT
Steele Heights	Scheduler - Time	2·34 hours
	Scheduler - Performance	81%
	Scheduler - Expected Perf.	99%
	Timetables	2:00 hours
	Conflict Matrix	1:00 hour
	Course Tally	0:32 hour
	Master Schedule	2:15 hour
	Class Lists	2:00 hours
	Attendance Registers and Rpt	3:30 hours
	Marks Registers	42 min.
	Student Registers	2:00 hours

Steele Heights Junior High School: 646 students

(All times are in hours:minutes)

System Strengths:

Mainframe compatibility: Ryan McFarland, the producers of RM COBOL, have
developed a VM/CMS version of this package
which works on the IBM 4341 mainframe. Thus,
minor modifications to COBOL source and JCL
should result in a mainframe version of SIRS.

User friendly: The package is fairly interactive and at no
time did it give system errors or "abends".

Spooler function: While reports cannot be spooled to the printer
(in common with other micro-computer packages),
there is an option to spool to disk for later
printing.

Core subject grouping: SIRS provides facilities for grouping core
subjects together, thus forcing common sections
for groups of students. This is essential in
junior high Schools.

System Weaknesses:

Reports: The reports are very poor and not well
described in the menu programs. In most cases,
we are unable to get the information required
to verify data and proceed to the next stage of
development. Hand written forms had to be
designed and updated constantly.

Database files: SIRS appears to hold two sets of files with
some very confusing results. On two occasions
fairly large amounts of data were keyed into
the wrong file and had to be re-entered.

Logical steps: There were too many steps required in designing
the Class Master Schedule and running the
Scheduler. Each step was separated by long
periods of waiting to enter the next command
due to the absence of batch or indirect command
file control.

Scheduling results: The Load/Print and Simulation phases did not
provide clues as to what had caused classes to
conflict. In general, there were few audit
trails or details of errors.

Documentation: No guidelines explaining the sequence of
operations.

181

Specific Systems Problems:

No Section "forcing":   for example student #7107 requested two
                               sections of the Maths Support course but there
                               was no facility for specifying a particular
                               section or sections.

Current Grade: All students were entered as currently
                               operating within the school. When the
                               Scheduler Student/Request edit list was run,
                               all students were flagged as being in the wrong
                               grade and every record required editing.

No "Edit/Error only"   Student Requests and Marks/Attendance data
listings   entry did not have reports describing errors
                               only.

Request File: No summary listing of the Request File.

6.2 Evaluation of TSS

6.2.1 Testing Environment and Conditions

The same school, Steele Heights Junior High School, that was used for the
MIG SIRS tests was also used to pilot test The School System. The school
has 646 students enrolled in grades 7,8 and 9. It uses a strict 4 day, 6
period rotation schedule and operates attendance at the half-day
reporting period level.

The School System was tested on an IBM PC/XT with 10 Mbytes hard disc
storage 512 kb memory, an Okidata Microline 84 printer operating at
about 1) c.p.s and a 360 kb diskette drive. The system supports two or
more users but this feature was not tested.

Data entry was entirely by keyboard for this test although data loading
facilities from the mainframe computer can be accomplished using the
virtual scan input mechanism.

6.2.2 Evaluation Results and Observations

The following tables show the outcome of the quantitative evaluation of
TSS against the detailed evaluation criteria.

<u>Observations</u>

(A) Product Scope and Function

<u>Junior High Requirements</u>   The system allows homeroom grouping using
course relationships.

Enrolment of students in a group of classes is
allowed, for example, core classes. This is
achieved very quickly using the auto course
selection option.

Flexible timetable rotation allows scheduling
of any class in any combination of periods.

All other criteria observations are listed in section 4.2.2 for Senior
High schools and, in this case, are pertinent for the junior high school
evaluation.

6.2.3 <u>System Performance, Strengths and Weaknesses - TSS (Columbia)</u>

<u>Key Performance Indicators</u>

<u>School Test Site</u>	<u>Parameter</u>	<u>IBM PC/XT</u>
Steele Heights	Scheduler - Time (0:40 hours)	1:35 hours
	Scheduler - Performance	100%
	Scheduler - Expected Perf.	100%
	Timetables	7:30 hours
	Conflict Matrix	1:50 hours (extrapolated)
	Course Tally	0:15 hour
	Master Schedule	0:15 hour
	Class Lists	3:30 hours
	Attendance Registers	3:30 hours
	Marks Registers	3:30 hours
	Student Registers	1:30 hours

Steele Heights Junior High School: 646 students

(All times are in hours: minutes)

(122)

207

System Strengths: - capability of handling homeroom grouping
                                     - ability to schedule any course in any
                                       combination and/or number of periods
                                     - capability of handling with ease any rotation
                                       tumble for any number of periods.
                                     - Also see section 4.2.3

System Weaknesses: (see Senior High School descriptions in Section 4.2.3)

7.0 COMPARATIVE EVALUATION OF SIMS - JUNIOR HIGH SCHOOL PERSPECTIVE

7.1 Comparison Summary and Review of SIMS Evaluation Data

The following tables show the quantitative evaluation data for the two
microcomputer based SIMS which were evaluated in detail at the junior
high school level. As was the case of the senior high school
perspective, the Detailed Scoring Comparison Form has been used to
display the data. A third system, the School Administration System by
SIERRA was also evaluated at the junior high school level. This
particular system, which runs on the Digital Equipment Corporation's
(DEC) VAX family of computers, was evaluated using a VAX 11/725
minicomputer. In view of this, the outcomes of the evaluation are
included within a separate report. It should be noted, however, that
because the system runs on a smaller more affordable VAX computer called
the MICROVAX, the results of the evaluation may be of interest to schools
seeking a microcomputer based solution.

7.2 Relative Suitability of SIMS to the Junior High Schools

The relative suitability of SIMS to the junior high schools was determined using the same procedure and the same percent emphasis distribution as was used in the senior high school situation (see section 5). The outcome of this procedure is shown in the table below.

EVALUATION FACTOR	EMPHASIS (%)	RELATIVE PRODUCT SUITABILITY	
		TSS	SIRS
PRODUCT SCOPE AND FUNCTION	45	34	18

The following two tables parallel the simulations which were provided relative to the senior high school situation. Appendix 6 shows yet another simulation in which not all of the evaluation criteria were used and in which the actual criteria weighting factors were adjusted to the needs of a particular user. This particular simulation has been performed using senior high school data but the principles involved are equally applicable to the junior high school data.

8.0 COMMENTS AND CONCLUSIONS

The major objective of this evaluation project was to comparatively evaluate microcomputer based School Information Management Systems and, in the process, to determine the viability of their use by schools.

Three systems were evaluated against the same detailed set of criteria and in IBM Microcomputer environments. Initial experiences of the project team indicated that the application of microcomputers to school information management was not well established. Software products were not mature and the hardware environments in which they would run were not at all well defined. The School System by Columbia, for example, did not exist as a practical alternative when the project began During the course of the project, this application of the technology matured considerably to the point that not only are such applications possible now but there are alternatives from which to choose.

We are able to conclude from this project that at least one, and probably two, microcomputer based SIMS are available which allow a distributed approach to the school records, student scheduling, attendance and progress tracking and reporting functions. The results of this project further show that one system, notably, The School System by Columbia Computing Services, can effectively meet the needs of both the junior and senior high schools. This is a particular advantage to districts or jurisdictions which seek to recommend and support a single alternative for all high schools. From the senior high school perspective, The School System scored seventy six of one hundred suitability points compared to sixty two of one hundred points awarded to Management Information Group's Student Information and Records System. The project showed the relative suitability of The School System to the needs and requirements of the junior high schools to be even more pronounced.

The choice of systems, however, should be made only after very careful consideration. The software systems which were evaluated ranged in price from about four thousand to six and a half thousand dollars and are thus considered to be affordable. They can be effectively run on single user IBM microcomputers with hard disk drives which provide sufficient capacity to accommodate the needs of even the largest senior high schools. The two microcomputers which were found to be most appropriate were the IBM PC/XT and the IBM PC/AT with the latter clearly being the preferred choice. A typical IBM PC/AT configuration (single user) with a printer will cost a user of the order of seven or eight thousand dollars.

Those considering the implementation of one of the microcomputer based SIMS alternatives which were tested through this work should carefully examine the process for determining product suitability and re-apply it to the raw evaluation data from their particular perspective. Those who seek to identify another alternative are encouraged to apply the principles of this process to the maximum extent possible.

In closing, it is noted that the project reported on here is part of a more comprehensive evaluation of the distributed approach to school information management. A further report will address the viability of a minicomputer based approach to school information management.

APPENDIX 1

GENERAL QUESTIONNAIRE

This document was distributed to schools for completion
as an initial information gathering step in the process
to develop evaluation and selection criteria for school
information management systems.

GENERAL QUESTIONNAIRE

Background

The Distributed Systems Services Team has identified a short list of compu-
ter software packages specifically designed for the day-to-day student
administrative requirements of individual schools. In order to facilitate
the selection of the most suitable software alternative, for the EPSD from
a District-wide perspective, the attached questionnaire has been prepared
with a view of determining the relative importance of the type of inform-
ation, system functions and features needed by the school(s). In addition,
personal interviews will be conducted with each participating school in
order to determine each school's specific information requirements, review
the type and detail of data needed by the school to streamline its oper-
ations and identify any areas of concern.

The questionnaire has been divided into two parts. Part 1 deals with the
information needs of a STUDENT ADMINISTRATIVE SYSTEM and Part 2 addresses
other information requirements that the school(s) may have.

Part 1 - STUDENT ADMINISTRATIVE SYSTEM

Each item is to be weighted in accordance to its relative importance to the
specific institution completing the questionnaire, using the following rat-
ing scale.

NONE - Not required.

OPT - "Optional"   - a requirement not considered essential but
                       for which preference may be given

IMP - "Should"   - a requirement having a significant degree
       ("Desireable") of importance to the objectives of the
       ("Important")   Student Administrative/Information System

MUST - Mandatory   - a requirement that must be met in a sub-
                       stantially unaltered form in order for the
                       software package to meet the schools vital
                       information needs.

Part 2 - OTHER INFORMATION SYSTEMS

Applications should be ranked in accordance with the school's priority to
computerize other areas of its operations.

NAME OF SCHOOL (in full) _____

PART 1

STUDENT ADMINISTRATION SYSTEM - INFORMATION NEEDS

SECTION A -   School records, student records, attendance recording/
             reporting, student marking process and reporting
             requirements.

General Overview of the System's Objectives

A computerized student administrative system to resolve and streamline the collecting,
transcribing, maintaining and reporting of student data. It is to maintain student relat-
ed data, provide up-to-date information and prepare reports that are used by administra-
tors, counsellors, instructors, students and parents.

Information Need - Relative Rating Scale Legend:

		Relative Importance		
Column Heading	-	NONE	OPT	IMP	MUST
Degree of importance	-	Not required	Optional	Important	Mandatory

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

1) **Registration/Enrollment**

  -Entering a student into the school and
   creating the student record

  -Registration/Enrollment confirmation notice

  -Other information needs (specify):

2) **Student Records**

  -Demographic data e.g. name and address, pro-
   gram, type of instruction, medical, class(es),
   timetable, medical, parents, etc.

  -History i.e. academic achievements, marks,
   course attempts, etc.

  -Student coding e.g.
    - school ID#
    - EPSD & Alerta student ID #

  -Bus Information e.g. bus pass number, pick-
   up and drop off points, driver name, bus
   routes etc.

  -Interface/integration with your school's
   accounting system (in future)

  -Other (specify)

Application/Feature Descriptic	Relative Importance			
	NONE	OPT	IMP	MUST

3) **Student Attendance**

-Indicate the frequency that attendance is/
should be taken in your school e.g. every
period (by class) once per day, twice per
day, at homeroom time, etc.

_____

_____

-How often do you need attendance reports
e.g. daily, weekly, bi-weekly, etc.?

_____

_____

-How much detailed attendance history does
your school require to keep "on-line" for
parent, counsellor inquiries e.g. 5 days
history, 6 days history etc.?

_____

_____

-What types of attendance reports do you need?
e.g. by student, student by class/subject,
student by day, exception reports etc. and
how frequently do you require each report?

_____

_____

_____

_____

_____

4) **School Reports**

-Directories/class lists
-Labels (mailing)
-Student ID cards
-Schedules (student, teachers, rooms)
-Other reports (specify)

_____

_____

_____

_____

_____

_____

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

5) Instructor Records

-Personal and demographic information
-Courses taught
-Areas of specialty
-Certificate number
-Other (specify)

_____

_____

_____

_____

6) Student Marking Process

-Comprehensive editing and validation of student
 marks prior to report card preparation e.g. mark
 verification, identification of student with
 unassigned marks etc.
-Report card printing
-Type of reports e.g. GPA's, honour lists, etc.
 (Please specify):

_____

_____

_____

_____

_____

- other information needs (specify):

_____

_____

_____

_____

-What is the maximum number of marks per course
 maintained by your school for a student e.g.
 4 mid-term marks, 2 exams and a final mark?

_____

_____

_____

_____

_____

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

7) Student Exams

-Exam timetable builder
-Exam conflicts matrix
-Exam schedules
-Other (specify)

8) Courses

-Course number, short description, detailed
 description (for annual school handbook),
 credit values, prerequisites, etc.
-Other information requirements (specify):

SECTION B - STUDENT SCHEDULING

Course requests, prerequisite verfication, request confirmation, student curricular coun-
selling, computerized scheduling, school start up registration, automatic generation of
student fee   ?ts and printing of individual timetables.

THIS SECTION IS APPLICABLE TO HIGH SCHOOLS,

JUNIOR HIGH SCHOOLS AND ELEMENTARY-JUNIOR
HIGH SCHOOLS ONLY

SECTION B - STUDENT SCHEDULING

Course requests, prerequisite verification, request confirmation. student curricular counselling, computerized scheduling, school start up registration, automatic generation of student fee sheets and printing of individual timetables.

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

1) Pre-scheduling

-Comprehensive editing and validation of
course requests e.g. prerequisite checking
marks verification, identification of
students with no requests, insufficient/
excessive credits requested
-Prescheduling reports e.g. course tally
list, exception reports (students missing
mandatory,'compulsory courses)
-Scheduling conflicts matrix
-Other information needs (specify):

_____

_____

_____

-Other prescheduling reports (specify):

_____

_____

_____

_____

2) Master Schedule

-Master timetable builder

i) What course code would you prefer to
use e.g. a school course code, EPSD
course code or the Alberta course code

_____

ii) Please specify ALL of the scheduling
units used by your school, e.g. semester
full year, tricemester, six week section,
quartermester, etc.

_____

_____

_____

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

iii) Please specify the following:
    Rotation: _____
    Days per week: _____
    Periods per week: _____
    used in your school's master timetable.

3) Student Scheduling

	NONE	OPT	IMP	MUST
-Completion of the student scheduling process before the summer break	___	___	___	___
-Ability to preassign sections	___	___	___	___
-Ability for your school to assign scheduling priorities	___	___	___	___
-Automatic scheduling of an individual student i.e. mid-term transfer pupil	___	___	___	___
-Ability to schedule groups of students i.e. unregistered last minute arrivals	___	___	___	___
-Ability to 'UNSCHEDULE" a student or group of students i.e. no shows, students that move away during summer etc.	___	___	___	___
-Restart capabilities e.g. reset assignments for a student and/or course	___	___	___	___
-Course sequencing	___	___	___	___
-Course weighting i.e. ability of the computerized scheduler to distribute course loads evenly so that a student is not scheduled to take an overload of difficult courses in the first semester and a group of relatively easier courses during the second semester	___	___	___	___
-Blocking	___	___	___	___
-Class balancing	___	___	___	___
-Semester balancing	___	___	___	___
-Double room identity e.g. Physical Education all male/female class	___	___	___	___
-Double room identity for mixed classes e.g. Home Economics and Industrial Arts	___	___	___	___

i) What are your present scheduling priorities
   e.g. - lower grade students first and so
          on up to highest grade?

   _____

   e.g. - single section courses before
          multiple section courses?

   _____

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

e.g. -- mandatory/compulsory courses first
     followed by student preferences
     followed by options/alternatives?

<u>OR</u> indicate your priorities in the space
below:

_____
_____
_____
_____
_____

-Ability to run schedules from more than one
perspective e.g. single sections first then
mandatory courses etc. and mandatory courses
first and single sections last
-Other information needs (specify):

_____
_____
_____
_____
_____

Reports
-Student schedules
-Multiple conflicts matrix
-Partially scheduled students
-Other (specify):

_____
_____
_____
_____

4) School Start Up

-Generation of fee sheets
-Ability to schedule all new students (unexpect-
ed enrollments) only i.e. the schedules for all
previously registered students would not be
affected
-Preparation of timetables in grid format
(students, teachers and rooms)
-Class lists
-Other (specify):

_____
_____

THE FOLLOWING ITEMS ARE PERCEIVED TO BE APPLICABLE
TO SCHEDULING IN JUNIOR HIGH SCHOOLS ONLY

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

5) **Special Scheduling Requirements
of Junior High Schools**

-Blocking of course options
OR
Scheduling students requesting same group of
options into the same class or homeroom

-Blocking of 2-3 sections of the same course
in same time block e.g. Math or Language Arts

-Homeroom identity grouping for Language Arts,
Social Studies, Science, Math

-Ability to handle option courses with varying
lengths of instruction e.g. French as an option
requires four periods per week whereas other
options require three periods per week

-Back to back time tabling for double classes

-Ability to handle variable time slots by
course subject e.g. six periods of Language
Arts, five periods of Math, four periods of
Social Studies, etc.

-Other requirements or unique characteristics
associated with the scheduling process for
your school

Please specify any idiosyncracies in your
schools allocation of subject time e.g.
different/variable periods (standard period
= 40 minutes, course x has a period of
30 minutes, etc.)

235

PART 2 - OTHER INFORMATION SYSTEMS

Please rank the importance of each application in accordance with your schools priority to computerize other areas of its operations, e.g. 1, 2, 3 etc., from most important to least important. If an application is not perceived to be a requirement indicate a priority of "0" (zero) or "NIL".

Application/System or Sub-system	Implementation Priority
Accounts Payable	_____
Accounts Receivable	_____
Budgeting	_____
Computer Assisted Instruction (CAI, CAL, CML)	_____
Cost Accounting	_____
Financial (General Ledger and Financial Statements) - also indicate whether or not you require commitments to be included i.e. encumberance accounting Yes or No _____	_____
Fixed Assets	_____
Inventory Control	_____
Library Services	_____
Purchasing	_____
Word Processing	_____
Work Orders	_____
Other (Specify)	_____

APPENDIX 2

INTERVIEW GUIDE AND DETAILED CHECKLIST

This document was used to facilitate a follow-up
'nterview with surveyed schools to clarify and confirm
their responses to the general questionnaire.

EDMONTON PUBLIC SCHOOLS

COMPUTERIZED INFORMATION SYSTEMS NEEDS OF INDIVIDUAL SCHOOLS

INTERVIEW GUIDE AND DETAILED CHECKLIST

SECTION A -   School records, student records, attendance recording/
reporting, student marking process and reporting
requirements.

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

1) **Registration/Enrollment**

Use questionnaire.

2) **Student Records**

	NONE	OPT	IMP	MUST
-Personal/Demographic	___	___	___	___
-Courtesy name	___	___	___	___
-Academic	___	___	___	___
-Activities	___	___	___	___
-Medical	___	___	___	___
-Program	___	___	___	___
-Type of instruction	___	___	___	___
-Timetables	___	___	___	___
-Courses and classes	___	___	___	___

-Student history to include all courses/marks
while in the school
OR

Does the school want to include all marks the
student has achieved while in a similar level
of school e.g. High School, Grades 10-12;
Junior High, Grades 7-9 etc.
Specify level of detail needed below:

_____

-Complete history of each course that each
student attempts, including the number of
attempts

-Parent data up to a maximum of 2 parents
per student

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST
-Is a limit of 2 parents sufficient? Yes or No _____				
-Bus pass number	___	___	___	___
-Bus route(s)	___	___	___	___
-Driver name	___	___	___	___
-Pick-up and drop off points	___	___	___	___
-Student ID # (indicate whether the school has a preference for its own unique ID system or the EPSD ID #)	___	___	___	___
-Multiple ID's for cross referencing and interface with EPSD and Alberta	___	___	___	___

3) **Student Attendance**

Use questionnaire.

4) **School Reports**

Use questionnaire.

5) **Instructor Records**

Use questionnaire.

6) **Student Marking Process**

-Report cards prepared by school rather than ISB Yes or No _____ If Yes indicate level of importance

-Student marks proof listing for verification before production of report cards

-Student transcripts

7) **Student Exams**

Use questionnaire.

£33

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST
8) Courses				
-Term weight				
-Included/excluded from report card average				
-Pass/Fail mark				
-Other (specify):				
_____				
_____				
_____				

SECTION B - STUDENT SCHEDULING

N.B.   THIS SECTION SHOULD BE COMPLETED FOR HIGH SCHOOLS AND JUNIOR HIGH SCHOOLS ONLY

Application/Feature Description	Relative Importance			
1) Pre-scheduling				
-Student course/program/curriculum counselling list				
-Marks verification as part of prerequisite checking e.g. 49% in Math 10 is not acceptable for entry into Math 20 course but is acceptable for Math 23 In this case should the student be advised of his/her options <u>before</u> the scheduling simulation i.e. repeat Math 10 or opt for Math 23? Yes or No _____ ?				
-Ability for the individual student to identify his/her				
a) mandatory/compulsory courses				
b) preferred course requests				
c) preferred alternatives				

CONTINUED

Application/Feature Description	Rel ve Importance			
	NONE	(T	IMP	MUST
-Ability to conduct prerequisite checking for students from another school within the EPSD	___	___	___	___
-Ability to handle co-requisites	___	___	___	___
-Ability to add student records from another EPSD school into your microcomputer e.g. transfer student, graduate student from a feeder school etc.	___	___	___	___

2) Master Schedule

	NONE	(T	IMP	MUST
-Current Semester	___	___	___	___
-Current Year	___	___	___	___
-Future Semester(s)	___	___	___	___
-Other (specify):				
_____	___	___	___	___
_____	___	___	___	___
_____	___	___	___	___

3) Student Scheduling

	NONE	(T	IMP	MUST
-Access to scheduling alorithim e.g. logic, parameters, scheduling resolutions, options etc.	___	___	___	___
-"Teacher Link Courses" e.g. in the instance where a teacher is instructing English 10 and Social 10, a common core of students should be scheduled to this teacher for both courses (subjects)	___	___	___	___
-Arena scheduling	___	___	___	___
-Student section selection (preference)	___	___	___	___
-Student instructor selection (preference)	___	___	___	___
-Reduced term requests i.e. scheduling a student into, say, the second semester of a full year English course in order to improve his/her grade without repeating the first semester which he/she passed satisfactorily	___	___	___	___
-Specific term requests e.g. Biology 10 in first semester and Biology 20 in the second semester	___	___	___	___

CONTINUED

Application/Feature Description	Relative Importance			
	NONE	OPT	IMP	MUST

-Other requirements for an in-house computer-
ized scheduler:
- use data from questionnaire and interview

4) School Start Up

Use questionnaire.

**5) Special Scheduling Requirements
of Junior High Schools**

Use questionnaire.

ENSURE THAT THE JUNIOR HIGH SCHOOL IDENTIFIES
ITS UNIQUE NEEDS AND DEFINES ANY ITEMS OR
AREAS THAT DIFFER FROM THE NORM.

PART 2 - OTHER INFORMATION SYSTEMS

ACCOUNTS PAYABLE (A/P)

1) Open item or balance forward

2) Does the school issue its own A/P cheques?

   If Yes how many cheques does it issue per month on the average?

3) What is the average number of General Ledger distributions per vendor invoice?

4) If the school has indicated that the computerization of its Accounts Payable application is a need, obtain a general description of what the school expects from an automated system e.g. type of reports, statistical analysis, breakdown of A/P expenses (how?) etc.

5) Should the school's purchase orders be included in the A/P system to reflect commitments?

ACCOU..TS RECEIVABLE (A/R)

1) Open item or balance forward

2) How many invoices does the school issue per month?

3) Does the school issue monthly statements for unpaid accounts?

4) Why does the school want to automate its A/R application?
   e.g. expected resu`` `, type and frequency of reports, revenue analysis, etc.?

BUDGETiNG

If computerization of General Ledger and Financial Statements are a need identified by the school suggest that the Budgeting application should be included as an integral part of the former system.

1) What information and/or statistical breakdowns do we need for budgeting e.g.:

   -student count by category or program (ESL pupils, native children, etc.)

   -previous years financial statements by department, program, cost centre, etc.

FINANCIAL (GENERAL LEDGER AND FINANCIAL STATEMENTS)

1) Should commitments be included in the schools financial reports i.e. encumberance accounting in order to ensure that the school knows where it stands in relation to its budget?

For example:

Total budget   (actual expenditures + PO commitments) = the balance available in the budget

2) Does the school require any interface/integration between its financial and student administrative system?

3) What type of G/L coding structure does the school envision?

e.g. EPSD G/L code

or

The schools own G/L code

4) How many G/L accounts does the school now use?

5) What objectives is the school seeking through computerization of its financial inform-
ation i.e. type and frequency of reports, budget analysis etc.

6) How many different fund sources does the school have?

e.g.

EPSD funds (from provincial and municipal taxes)

TRIM funds (Text book rental, fees and instructional materials)

Special project funds derived from school initiatives i.e. car washes,
bottle drive etc., for field trips (glee club, band, soccer team)

Other

7) Does the school require separate financial statements for each fund it is responsible
for?

8) Are consolidated financial statements required by the school?

9) What other financial information does the school need?

COMPUTER ASSISTED INSTRUCTION

Obtain a general description of the schools needs and expectations in this area.

Cost Accounting

1) Could the schools requirements in this area be included in the general ledger financial statements. If not obtain a conceptual overview of the type of cost accounting information required by the school.

247

FIXED ASSETS

1) What general class of items does the school want to include in this application?

2) Are the school's fixed assets currently tagged with a permanent identifier?

3) Approximately how many items does the school estimate it would include in its automated fixed asset sysem?

4) Obtain a brief conceptual overview of what the school expects from a fixed asset system.

5) What type and frequency of reports does the school need from this system.

248

INVENTORY CONTROL

1) Does the school have a central storage facility?

2) What type(s) of inventory and how many items, issues and receipts does the school wish to control?

    e.g. Automotive shop

          Wood shop

          Home Economics, etc.

3) Does the school need to integrate its purchase orders with inventory control?

4) What does the school need in the way of an inventory control system? Describe briefly.

24ა

LIBRARY SERVICES

1) How many books does the school estimate to have in its library?

2) Computerized needs

   -Cross Reference by   Author?

                            Title?

                            Publisher?

                            Subject?

                            Key words?

   -Checkout/Renewal

   -Returns

   -Overview notices/lists

   -Fines

   -Other

3) Statistics e.g. usage?

4) Obtain a general conceptual overview of the schools needs in this area.

PURCHASING

General requirements, volumes and brief conceptual overview.

WORD PROCESSING

Estimated volumes, frequencies

Type of word processing needed i.e.

     personalized letters

     mass mailings

     reports

     general correspondence

Try to determine an estimate of the school's current work load.

251

WORK ORDERS

Estimated Volumes

How are they handled now?

Are W/O's costed out e.g.

      labour $

      material $

Are W/O's integrated into the financial system?

General conceputal overview and description of system needs.

253

MANAGEMENT INFORMATION GROUP

Appendix 5   Recent Product Developments

Since completing the formal evaluations of the three microcomputer based
packages in February 1985, there have been a number of product announcements
and system enhancements. The following sub-sections list important
developments that are known at the time of writing.

MIG SIRS

Core subject blocking:	Up to 9 classes can be blocked together to provide core subject sections for groups of students. For example, in a Junior High School, subjects such as Physical Education and Mathematics are compulsory and have to be blocked together for different homeroom groups.
Adding speed and function to the scheduler	The development plans call for an increase in the speed and function of the Scheduler by recoding parts of the software in "C" and reintroducting scheduling parameters.
Interface with the NCS SENTRY 3000 scanner:	Software is being developed to handle automatic scanning of course requests and other standard forms. This is very important for a large school. Edmonton Public School District is already using the SENTRY 3000 scanner with another software package.
Interface with the "Surveyor" auto dialing	This development will provide student home telephone numbers to the "Surveyor" system used to call parents when students are absent or late.

COMPUTERLIB CEMAS

Computerlib has been informed of the evaluation work and has been asked to
send information on recent developments. At this point in time we have
not received replies to our requests.

COLUMBIA TSS

Multi-user Facilities:	The School System supports 2 users on an IBM XT and up to 4 users on an IBM AT using the Multilink software package and suitable RAM memory boards.
File Builder:	The File Builder produces sequential text output files from the database. These can be used for data transfer to other computer systems.
Prepare to Schedule New Year:	After running the process, reports can be printed for the current scheduling year from the Student Scheduling system. The current and new school years can now be used concurrently and students can be enrolled.

267

Mark Averages: These are now calculated using the "include in
                        GPA" indicator in the Marks Directory.

Report Reprinting: Reports can now be reprinted after paper jams or
                        user requests for a second copy of the report.

Academic History: A simple academic history facility has been
                        provided but has not yet been tested by the
                        Distributed Systems Team.

Appendix 6   Relative Suitability of SIMS - Full Re-simulation

As has been previously stated, the evaluation process is extremely flexible allowing a single user or group of users to apply it from their particular needs/requirements perspective. The purpose of this appendix is to demonstrate this flexibility.

In all previous simulations (in the main body of this report), the full set of evaluation criteria was used and critiera weighting factors were kept constant - only the percent emphasis distribution was changed.

The following example assumes that products do not need to be evaluated against the complete set of criteria and further, that the weighting factors associated with those criteria which will be used should be changed.

For the purpose of this example, the Detailed Scoring Comparison Form has been used to represent the data and to illustrate the changes which have been made.

230

To remove a particular criteria (or set thereof) from consideration, the user simply sets the associated weighting factor to zero. This has the effect setting weighted scores to zero. The reader should note these changes by comparing the tables in this appendix to the tables shown in section 5.1. In this example, it can be seen that all weights associated with the SCHOOL RECORDS section have been set to zero, thus defining this particular feature to be irrelevant in determining product suitability. Similarly, the weighting factors associated with automated data entry within the context of scheduling, was also set to zero, thus implying that this particular feature is also irrelevant for evaluation purposes. Having eliminated certain criteria from consideration in this way, the relative importance of those which remain has been changed through adjustments to the weighting factors. For example, with the Pre-scheduling section, the reader will see that we have chosen to increase the importance of the user defined timetable rotation/tumble feature by changing its weighting factor from an (original) 10 to 30. Many other such changes have been made. Having done this, weighted scores have been re-calculated as shown and all totals appropriately adjusted. A summary of the important totals by major evaluation factors is shown in the table below together with the new ratios of weighted scores to maximum weighted scores.

PRODUCT	EVALUATION FACTOR	WEIGHTED SCORE	MAXIMUM WEIGHTED SCORE	(WEIGHTED SCORE) (MAX.WEIGHTED SCORE)
TSS	PRODUCT SCOPE AND FUNCTION	2300	2910	0.79
	EASE OF USE	480	600	0.80
	TECHNICAL CONSIDERATIONS	720	800	0.90
	SUPPORT AND SERVICES	560	700	0.80
	PRODUCT QUALIFICATIONS	720	800	0.90
	VENDOR	0	0	0.00
SIRS	PRODUCT SCOPE AND FUNCTION	2146	2910	0.74
	EASE OF USE	360	600	0.60
	TECHNICAL CONSIDERATIONS	480	800	0.60
	SUPPORT AND SERVICES	490	700	0.70
	PRODUCT QUALIFICATIONS	480	800	0.60
	VENDOR	0	0	0.00
CEMAS	PRODUCT SCOPE AND FUNCTION	995	2910	0.34
	EASE OF USE	180	600	0.30
	TECHNICAL CONSIDERATIONS	160	800	0.20
	SUPPORT AND SERVICES	0	700	0.00
	PRODUCT QUALIFICATIONS	0	800	0.00
	VENDOR	0	0	0.00

Relative suitabilities are now calculated in exactly the same way as before according to

Relative Suitability = % Emphasis X (weighted score) / (max weighted score)

and are shown in the table following

EVALUATION FACTOR	EMPHASIS (%)	RELATIVE PRODUCT SUITABILITY		
		TSS	SIKS	CKMAS
PRODUCT SCOPE AND FUNCTION	50	39	37	17
EASE OF USE	15	12	9	5
TECHNICAL CONSIDERATIONS	0	0	0	0
SUPPORT AND SERVICES	30	24	21	0
PRODUCT QUALIFICATIONS	5	4	3	0
VENDOR	0	0	0	0
TOTALS	100	79	70	22

A different percent emphasis distribution was used here which effectively removed Vendor and Technical Considerations from the evaluation. It is worth noting that removal of an entire major evaluation factor from consideration can be achieved by either setting all associated individual weighting factors to zero or by setting the percent emphasis to zero for that particular major evaluation factor to zero.

The results of the above application of the process on a narrower set of criteria can be compared with the table in section 5.2 of this report. It is important to note that this application of the process is based on a purely hypothetical user perception and was presented for illustration purposes only.

The final and most important point which must be made here is that, while weighting factors and percent emphases were changed to reflect user perspective, the actual raw scores remained unchanged. Raw scores reflect the results of hands-on testing and evaluation by the evaluation team whereas weights and emphasis are at the discretion of the user and reflect his/her biases.
