ABSTRACT

A survey was conducted to determine the extent to which public libraries have made computer hardware and software available to their patrons. In December 1984, guestionnaires were distributed to a stratified national probability sample of 900 public library systems. Results, based on a response rate of 99%, indicate that: (1) 42% of the systems serving large populations (100,000 or more) had computers for patron use, compared with 26% for medium-sized populations (10,000-100,000), and 13% for small populations (fewer than 10,000); (2) an estimated 3,300 computers were available for use in the nation's libraries; three-fourths were situated inside the library while one-fourth could be checked out for loan; (3) about half of all computers were purchased primarily with state or local funds, and one-third were obtained through gifts; (4) patrons used computers inside public libraries for a total of 52,000 hours a week, or about 23 hours per computer per week; (5) 71% of the patrons using computers inside libraries were under 18 years old, but only 30% of outside users were; (6) the typical loan period allowed for computers taken outside the library was one week (67% of systems); (7) 9 out of 10 library systems that provided computers also had computer software for use inside or outside the library; and (8) about one-half of the library systems with computers offered training or orientation sessions. Libraries also indicated a high priority for initiating or increasing hardware and software availability and the number of staff trained to assist patrons. Ten data tables and a copy of the questionnaire are provided. (JB)

R

PATRON USE OF COMPUTERS IN PUBLIC LIBRARIES

In winter 1984-85, about 15 percent of all public library systems in the Nation had computers for patron use inside the library, and 4 percent had computers for loan or use outside the library. In all, 18 percent of the systems had computers for patron use (e.g., for instruction, word processing, games) either inside or outside the library." These are some of the findings from a recent survey of public library systems conducted by the Center for Statistics (CS) through its Fast Response Survey System.

Number of Library Systems with Computers

Douglas A. Wright

(202) 254-7230

For this survey, a library system was defined as a main library with its branches, if any, administered by a single director under a unified budget. Of the 8,500 public library systems in the Nation, most systems (84 percent) consist of a single library, while the remaining library systems contain one or more branches--a total of 15,000 main and branch libraries.² Most of the data presented in this report pertain to library systems as a whole; some data are reported separately for main and branch libraries. For additional information on the universe of public library systems, see table 9. All statements of comparison made in the text are significant at the 90 percent confidence level or better (table 10).

In library systems, computer availability for patron use varied by size of the population served³ (table 1): 42 percent of the systems serving large populations (100,000 or more people) had computers for patron use, compared with 26 percent of the systems serving medium-sized populations (10,000 -100,000 people) and 13 percent of the systems serving small populations (fewer than 10,000 people), hereafter called large, medium-sized, and small systems, respectively. While large systems were more likely than smaller systems to have at least one computer, main and branch libraries in large systems were no more likely to have computers than were main and branch libraries in smaller systems (table 1). For example, only 12 percent of the main and branch libraries in large systems had computers for use inside the library. This proportion was similar to those for main and branch libraries in medium-sized systems (13 percent) and small systems (10 percert).

Number of Computers Available

An estimated 3,300 computers were available for patrons' use in the Nation's public libraries in winter 1984-85. Three-fourths were available for use inside the library, while one-fourth could be checked out of the library for loan (table 2). About half of all computers were in medium-sized library systems; the remainder were divided almost evenly between small and large systems.

Library systems with computers had an average of 2.1 patron-use computers: 62 percent had one computer, 27 percent had two or three, and only 12 percent had four or more (percents are rounded). The average number of patron-use computers ranged from 1.3 in small systems to 4.6 in large systems. The size difference disappeared for computers available inside libraries when branch libraries were included (1.1 to 1.6 computers per main and branch library with computers).

Sources of Computers

About half of all computers for patron use were purchased primarily with State or local funds, and one-third were obtained through gifts. Federal funds or grants were used to purchase 10 percent, while the remaining 10 percent were either leased, loaned, or obtained by other means (table 3). Small library systems obtained 60 percent of their patron-use computers through State or local funds, whereas large systems obtained 32 percent of their computers in that way

Characteristics of Patron Use of Computers

Data were collected on: the length of time patrons were allowed to use computers; charges, if any, for computer use; the amount of computer usa_3 per week; and the percent of patrons 18 years old or over. These data were obtained separately for computer use inside and outside the library. Data on computers for loan are based on a small number of library systems and, therefore, are subject to large sampling variability. For this reason, only national estimates are reported.

Patron Use Inside the Library

Patrons used computers inside public libraries for a total of 52,000 hours a week (not shown in tables), or about 23 hours per computer per week (table 4). This usage varied greatly among library systems: in about onefifth, computers were used 5 hours a week or less, while in another one-fifth, usage averaged 35 hours or more (not shown in tables). Computers in mediu.sized and large library systems were more heavily used (25 and 25 hours per week) than those in small systems (17 hours).

Nationally, 71 percent of the patrons using computers inside libraries were under 18 years old (table 4). Proportionately more patrons under 18 used computers in small systems (81 percent) than in medium-sized (66 percent) and large systems (56 percent).

Generally, patrons could schedule computer use for an hour at a time (72 percent of systems).⁴ Most libraries (77 percent) did not charge for computer use; those that had a fee charged an average of \$1.70 per hour (not shown in tables).

Patron Use Outside the Library

The typical loan period allowed for computers taken outside the library was 1 week (67 percent of systems).⁴ Three-fourths of the computers for loan were checked out once a week, and 12 percent were checked out twice a week on the average. As with computer use inside libraries, most library systems (83 percent) did not charge for computer loan (not shown in tables).

The data show a striking age difference between users in and outside the library. While 71 percent using computers in the library were under 18, only 30 percent of outside users were. This finding may be a result of libraries' loan policies requiring that only adults can check out computers.

Availability of Computer Software

Nine out of 10 library systems that provided computers also had computer software for use inside or outside the library. In addition, a small number of systems without computers had software for loan (not shown in tables). Nationally, 17 percent of the systems had computer software: 15 percent for use inside the library and 4 percent for loan.⁵ As with computer hardware, proportionately more large systems provided software than did medium-sized or small systems (table 5).

The most available types of software were (table 5):

- Instruction or instructional games (other than basic skills) for persons under 18 years old (78 percent of library systems with software);
- Skill training and personal use, e.g., accounting and word processing (77 percent);
- Introduction to computer concepts and computer science (71 percent); and
- Basic skills (reading, writing, math) for persons under 18 years old (61 percent).

Video games for entertainment, adult literacy software, and software for searching free data bases were less available. In addition, librarians in three-fourths of the systems with software reported that patrons used their own software.

When available in library systems, video games were heavily used or borrowed (table 6): 56 percent of the systems reported heavy usage and 30 percent reported moderate usage. However, only one-third of the library

3

systems with software stocked video games. Instructional software (other than basic skills) for persons under 18 years old was also in demand: 36 percent of the systems with this software reported heavy usage; 48 percent, moderate usage.

Training Sessions

About half the library systems with computers for patron use offered training or orientation sessions in 1984 (table 4). Library systems with training sessions provided an average of 35 such sessions, each lasting about an hour. Proportionately more large systems provided training sessions than did small systems. Large systems also offered more training sessions.

Plans for 1985

To foster their patrons' use of computers, between 17 and 26 percent of the library systems placed a high or moderate priority on initiating or increasing (table 7):

- o The number and variety of software (26 percent);
- o Efforts to promote patron use of computers (22 percent);
- o The number of computers for patron use (20 percent);
- o Training sessions on the use of computers (18 percent); and
- The number of staff trained to assist patrons with computers (17 percent).

A greater proportion of large systems than medium-sized or small systems gave each plan a moderate or high priority.

Library systems with computers placed a higher priority on initiating or increasing computer-related services as compared with library systems that had no computers (table 8). For example, 34 percent of the library systems with computers planned to increase their number of computers, while 17 percent of those without computers planned to start providing computers for patron use.

The findings presented above provide a snapshot of patron use of computers in public libraries in winter 1984-85. If all systems with moderate or high priority plans for initiating such use actually implement these plans, the public will have access to computers in 32 percent of all library systems.

Survey Background

The purpose of this survey was to gather information on the extent to which public libraries have made computer hardware and software available to the public. The findings will assist public libraries in their efforts to initiate or expand their computer-related services to the public.

This survey was performed through a contract with Westat, a research firm in Rockville, Maryland, using the Fast Response Survey System (FRSS). FRSS was established to collect small quantities of cata, needed for education planning and policy formulation, quickly and with minimum burden on respondents.

In December 1984, the survey form (a copy of which is attached) was mailed to a stratified national probability sample of 900 public library systems. The sample was drawn with probability proportional to the square root of population served from the universe of 8,537 public library systems in the Nation. Data collection was completed in February 1985 with a response rate of 99 percent. The data were adjusted for questionnaire nonresponse and weighted to national totals. Standard errors for selected items are presented in table 10 as a general guide to the precision of numbers in the tables.

The following people contributed to this study: Elizabeth Farris (Westat); Jeanette Goor (consultant); Robert L. Thomas (CS); Dorothy Kittel and Milbrey Jones (Center for Libraries and Education Improvement).

For More Information

For information about this survey or the Fast Response Survey System, contact Douglas Wright, Center for Statistics, Office of Educational Research and Improvement, Washington, D.C. 20208, telephone (202) 254-7230. For single copies of this bulletin, contact the Information Office, at the same address, or telephone (202) 254-6057.

<u>Notes</u>

- ¹Computers were defined as mainframes, microcomputers or personal computers, and terminals. Less than 2 percent of library systems had computers for use both inside and outside the library (percents have been rounded).
- ²The source for the number of library systems was the U.S. Department of Education, National Center for Education Statistics, LIBGIS file for 1981. The number of main and branch libraries was estimated from the survey.
- ³Survey data were analyzed by size of population served, metropolitan status (urban, suburban, and rural), and region. Estimates based on size and metropolitan status are similar because these characteristics are related. For example, three-fourths of the library systems serving 10,000 people or fewer are rural, while almost two-thirds of the systems serving 100,000 or more people are in urban areas. In this report, findings are reported by size of population served, although estimates by metropolitan status and region are included in tables. A few regional differences occurred, e.g., computers were used less frequently in the Southeast than in other regions; however, no consistent pattern emerged.
- ⁴About 6 percent of the library systems with computers for use inside the library and 2 percent of those with computers for loan reported no time limit for computer usage.

⁵Two percent had software for use inside the library and for loan.

Large library systems	4.6	.5
ercent of all patron-use computers obtained:		
Through State or local library funds	46.7	4.2
As gifts	33.9	4.2
As gifts	10.0	2.8
verage number of hours of use per computer per week:		
All library systems	23.3	1.6
Smell library systems.	16.9	2.5
Large library systems	25.2	2.7
verage percent of pstrons using computers inside libraries who are 18 years old or over:		
All library systems	28.9	1.8
Smell library systems.	18.5	3.1
Large library systems.	43.9	3.2
Percent of library systems with computers for patron use providing training sessions on the use of computers.	47.7	4.2
Average number of training sessions offered	34.9	5.9
Percent of library systems with software for pstron use inside or outside the library	17.1	1.5
Percent of library systems with software providing pstrons with:		
Other instructional software for persons under 18		5.0
veers old.	77.7	5.0
Basic skills (resding, writing, msth) for persons under 18 years old	60.9	4.5
under 18 vers old	30.8	4.2

NOTE.--Statistics used in this report are subject to sampling variability. The estimated standard error of a statistic (s measure of the variation due to sampling) can be used to examine the precision obtained in a particular sample. If all possible samples were surveyed under similar conditions, intervals of 1.645 standard errors below to 1.645 standard errors above s particular statistic would include the average result of these samples in approximately 90 percent of the cases. For example, for the first item in the table (percent of all library systems having computers for patron use), a 90 percent confidence interval is from 15.6 to 20.8 (18.2 + 1.645 times 1.6). If this procedure were followed for every possible sample, about 90 percent of the intervals would include the average from all possible samples.
