ABSTRACT

The study investigated the social and vocational adjustment of 25 learning disabled young adults who received services in a Specific Learning Disability program during their elementary or secondary school years. Personal interviews were conducted using a 32-item questionnaire. Among firdings were that 56% were living in their parents' homes; 60% had completed high school with a traditional diploma; and 12% had completed 2 to 3 years of college. Forty-eight percent reported no involvement with the law, 4% had been arrested, and 4% convicted of a felony. In terms of jobs, 32% were currently employed in clerical, 24% in semi-skilled, 4% in professional positions; the majority reported finding their job through a relative or close friend. The majority (52%) indicated they liked their job "very well" and only 4% reported not liking their job at all. Hourly wages ranged from \$3.35 to over \$8.00. The vast majority reported absence from work of zero to 2 days within the past year. Twenty-four percent had kept their first job, 28% indicated they had had two jobs, and 16% had had three jobs. Reasons for job changes included going back to school (16%), conflicts with the boss (12%), and layoffs (8%). The majority displayed independent living skills: driver's licenses (100%), voting registration (64%), checking accounts (48%), and credit cards (24%). Seventy-+.o percent said they were currently dating. The population surveyed appeared to be heterogeneous, with overall adequate adjustment despite indications that this group tended to be underemployed and somewhat dependent on family, relatives, and close friends for decision making. The study instrument and response data are appended. (CL)

Survey of the Post-Secondary Years of Students Identified as Learning Disabled

Since its beginning in the early 1960s, professionals in the field of learning disabilities have focused their attentions on the elementary school population. According to Koppitz (1971), the vast majority of learning disabled programs are located in the elementary school only and do not make provisions for older children with learning problems.

Presently, these learning disabled (LD) students are trying to cope with their disabilities in society as they reach adulthood. Samuel Kirk (1983) addressed the problems of learning disabled adults. Kirk's special attention to the learning disabled adult is indicative of the growing emphasis on the future outlook for the LD adult.

Previously, educators and other professionals concerned with learning disabilities thought that, with therapy and remediation, the difficulties experienced by this group would disappear. According to Cruickshank, Morse, Williams and Johns (1980), "these youths do not cease to live or to struggle as they approach eighteen years of age" (p. 239). The authors emphasize that any text on adolescents with learning disabilities must concern itself with the post-school years and young adulthood.

Because of the limited amount of research with young adults with learning disabilities, references will be made to pertinent studies involving younger LD students. Koppitz (1971) conducted a five year follow-up study on 177 LD students, ages six to twelve. Results

"catch-up" with their normal peers, but that the students learned to compensate for these problems. Further proof that learning disabilities do not really "go away." but rather, are compensated for, can easily be observed when an LD pupil is under stress. Many LD pupils function quite well in the small special classes but regress when they are placed into large, less-structured classes, or when they are upset, ill, or under stress (Koppitz, 1971).

Public awareness through extensive media coverage on television and in magazines in the past decade have made the layman more aware of the nature and the effects of learning disabilities. As a result, young adults have recognized that their life adjustment problems may be related to a specific learning disability (Kirk & Gallagher, 1983). The plight of the young LD adult is described by Cruickshank et al. (1980).

The fact is that many are equipped for nothing; they cannot read and cannot fill out a job application; most cannot gain entrance to or compete in college; some cannot manage their lives or even organize themselves to seek assistance. They do not understand their own differences, and they have no applicable vocational skills (p. 195).

The lack of research on the young LD adult may be the result of the relative newness of programs at the secondary level. For this reason, experience and research are lacking to support the LD programs at the secondary level (Lerner, 1981). According to Cruickshank et al. (1980), "the literature is sparse in material focusing on the secondary LD pupil. There is little in the body of reported research or even clinical studies to clarify our picture of the LD adolescent" (p. 193).

Cox (1977) echoed this view by noting that the professional literature on the LD adult is nearly nonexistent.

Patton and Polloway (1982) suggested that professionals dealing with learning disabled adolescents conduct follow-up studies of their former students to assist overall adjustment in the adult world. This recommendation appears logical in that they would have access to the information necessary for finding and interviewing these LD students, even years after being taught. In this study, the investigator has attempted to carry out this suggestion.

The purpose of this study was to investigate the present social and occupational status of young learning disabled adults who were screened eligible and received services in a Specific Learning Disability (SLD) program during their secondary or elementary and secondary school years.

Twenty-five cubjects comprised the study. Twenty former LD students of the investigator were located through the use of the telephone directories for Yazoo, Hinds, and Rankin Counties in Mississippi. Five additional subjects were referred by a colleague. All students contacted were personally interviewed by the investigator. The interview time ranged from 20 to 80 minutes. The majority of the interviews were initiated by telephone conversations. The location of the interview was as convenient as possible for the interviewee. Students were interviewed at their place of employment, restaurants, malls, libraries, stores, and in their personal homes. All interviews were conducted on a one-to-one basis in an environment conductive to

conversation.

Each former LC student was told that the purpose of the research project was to collect data as a part of the investigator's education. The role of the interviewee and the means whereby the interviewee's name was obtained was explained. Care was taken to assure the subject that the data would be presented in tabular form and his/her name or other identifying information would remain confidential. All students who ere contacted agreed to be interviewed.

The interview format was varied to meet the interests and attitudes of the subjects. There was some variation in the order and context of the questions, but the structure of the interview remained intact.

Rapport was easily established with the students, and the subjects volunteered information without monetary or other incentives. Twenty-four of the 25 subjects answered all of the 32-item questionnaire. One student was unable to answer the questions on employment because that student had never held a job.

Measurement

Data were obtained through personal interviews by the investigator using a 32-item questionnaire (See Table 1). The data were collected and reported in terms of percentages and group means. No statistical tests were performed as the study was descriptive in nature.

Results

As can be seen in Table 2, the LD adults displayed the following social and occupational competencies:

Residence-The majority of young LD adults tend to live with their parents. Fifty-six percent of the surveyed population were living in the residence of their biological parents.

Educational Level--Sixty percent of the surveyed population had completed high school with a traditional diploma. An additional 16% had received a high school certificate of completion. In contrast, 24% had dropped out of school with neither a diploma nor a certificate. Of these six dropouts, hree entered a vocational program, and two obtained the GED.

Higher Education--Twenty-four percent of the sample stated that they had received no additional training or education beyond high school. An additional 24% attended between one to two years of college, while another 12% had completed between two and three years of college.

Twelve percent had taken from one course to one semester of college work.

Involvement With the Law--Forty-eight percent of the sample stated that they had had no involvement with the law. An additional 44% had minor traffic violations, 4% had been arrested, and another 4% had been convicted of a felchy.

Employment Status--Thirty-two percent of the population were currently employed in a clerical occupation. An additional 24% described their occupation as semi-skilled. Other occupational descriptors included unskilled (12%), service related (16%), professional (4%), military (4%), and miscellaneous (8%). The majority

of the respondents reported finding their job through a relative or close friend, 40% and 36% respectively. Twelve percent worked for their fathers.

Job Satisfaction--Fifty-two percent of the respondents reported that they liked their job "very well". An additional 20% stated that their job was "all right". Only four percent stated that they did not like their job at all.

<u>Salary</u>--The hourly wage ranged between \$3.35 or below to a high of more than \$8.00. The LD adults' salaries were distributed quite equally within this range.

Hours Worked-The majority of the LD adults stated that they worked approximately 40 hours a week (48%). An additional 24% worked between 41 and 50 hours per week. One former student worked 82 hours per week at three jobs.

Absenteeism--The vast majority of the surveyed population stated that they were absent from work between zero to two days within the last year. An additional 12% had been absent between three and five days, while 8% reported being absent nine or more days within the last year.

Job Changes--Twenty-four percent of the sample stated that they had retained their first job. An additional 28% reported having two jobs, while 16% had had three jobs. Sixteen percent also reported having between five and six jobs.

Reasons for Job Change--Sixteen percent of the sample changed jobs to go back to school. Twelve percent reported not getting along with

the boss, 12% reported finding a better job, and eight percent were laid off.

Independent Living Skills-One hundred percent of the LD adults possessed driver's licenses, 76% owned their own cars, 64% were registered to vote, 64% had savings accounts, 48% had checking accounts, and 24% used credit cards. Seventy-two percent stated that they were currently dating. Also, the majority of the sample were very involved with a variety of hobbies.

In summary, the LD young adult population surveyed appears to be a very heterogeneous population. Overall adjustment appears quite adequate with some indication that this group tends to be "underemployed" and somewhat dependent on family, relatives, and close friends for decision making and support. As a group, these young adults appear to be law abiding citizens with wide variance in productivity. A surprising number have attained additional training and/or education and are well integrated into society.

The investigator plans to survey this group at a later date to see if the social and occupational adjustment found in this study continues on a long term basis.
