ABSTRACT

This comparative analysis updates the effects on school finance of the Delaware Legislature's passage of a new equalization law in 1984. The formula for allocation of equalization funds was modified by increasing the level of state support and by requiring greater local tax effort for districts to qualify for the funds. Analysis focuses on four variables as indicators of changes in finance: current expense tax rates; local current expense revenues; total current expenses from all revenue sources; and expenditures for salaries among districts. The degree of dispersion among the 16 regular districts before and after legislation is analyzed by comparing each variable in 1983-84 with recent data on the variable. A summary of data analyses includes the following findings: (1) state funding for equalization purposes over the 3-year phase increased 179 percent over funding in 1983-84; (2) increased funding is provided in large measure to "low wealth" districts; (3) the statute raised the local tax effort among lower paying districts; (4) the total amount of money available from the combined sources and the total current expenses per unit from all revenue sources are more equalized among districts; and (5) average teachers' salaries are more nearly equal among districts. Disparities among districts, on all variables analyzed, were therefore reduced. The statute's only negative effect is the difficulty in projecting local tax rates needed to qualify for full entitlement. The report contains 13 tables; 7 more are included in an appendix. (CJH)

PURPOSE

In June 1984, the Legislature passed and the Governor signed House Substitute 2 for House Bill 429 which significantly modified the formula for the allocation of State equalization funds, specified the level of State Support for this program over a three-year phase-in period, and nearly tripled the State funding of the program over its level in 1983-84, the last year of the old program. The formula change, in addition to increasing the level of State support, also required much greater local tax effort in order for districts to qualify for the State funds than was the case under the old formula.

This report is an update of a document on the same subject prepared a year ago to review the effects of the new statute. The analysis focuses on four variables as indicators of changes which have occurred in the school finance picture, changes which can be almost entirely attributed to passage of this significant change in the equalization law. The variables analyzed include: current expense tax rates, local current expense revenues, total current expenses from all revenue sources, and expenditures for salaries among the various districts.

PROCEDURES

The basic procedure throughout this analysis is to provide a comparison of each variable in 1983-84 with the most recently available data on that variable. The basic methodology involves the tabulation of each variable on a district-by-district basis so that an analysis of the degree of dispersion among districts before and after passage of the legislation can be made. In most cases the analysis is limited to the sixteen regular districts. Vocational districts are excluded because their tax rates are established by statute and their expenditure patterns given half-time students are not comparable to the regular districts. Similarly, special education schools have been excluded since their treatment under the equalization law is a special case and the local funds for their operation are raised by tuition tax rates which are set by local boards of education without the referenda requirements that apply to current expense tax rates in the regular districts.

Data were extracted from reports prepared annually by the Department of Public Instruction from data submitted by the local school district. The primary sources of data included the following:

- * Report of Educational Statistics for the fiscal years 1983-84 through 1985-86.
- * September Unit Allotment for the fiscal years 1983-84 through 1986-87.
- * Assessments & Tax Rates, Delaware Public Schools for the fiscal years 1983-84 through 1986-87.
- * Educational Personnel in Delaware Public Schools for the fiscal years 1983-84 through 1985-86. Personnel salary data were also drawn from a computerized personnel file of unpublished data which gives greater detail than that in the published report. This same source was also used to obtain salary data for 1986-87 which have not yet been published.

Mcst of the analyses are done on a per unit basis since that is the basic method of funding in Delaware. The use of units rather than pupils compensates for differences in program costs among districts which may result from differences in needs of pupils rather than differences in effort that local communities are willing to make.

DEFINITIONS

Current Expense Tax Rates - Tax rates on real estate are expressed throughout the report per \$100 of assessed value or full value. The rates on assessed value are the actual rates levied by the county tax offices based upon the assessed value of real estate in a district. However, because assessment practices vary greatly among the counties, the real estate tax rates based upon full value of real estate (i.e. the estimated market value of property) give a better measure of the relative effort being made by the various school districts.

Eight of the sixteen regular school districts also levy a capitation tax for current expense. These per capita taxes have been added to the revenues collectible from real estate taxes to obtain the total local revenues for current expense.

The total local tax revenues collectible have then been divided by the full value of real estate in each district to obtain a "combined tax rate." This would be the equivalent rate levied in each district, if all local taxes were applied to real estate and capitation taxes were eliminated. Thus, the "Combined Tax Rate per \$100 of Full Value" gives the best estimate of comparative local tax effort among the districts.

<u>Salaries</u> - Classroom teachers' salaries are used throughout the report as the measure of relative personnel salaries paid in each of the districts. Some tabulations are limited to salaries paid to teachers who receive funding only from State and local funds while other tables include all sources of funding. (Some teachers, for example, receive all or a portion of their salary from federal sources.)

<u>Mean</u> - As used in this report, the term "mean" is used to mean the unweighted average of the values for the sixteen regular school districts. It is obtained by simply summing the sixteen values for the districts and then dividing the sum by 16.

Standard Deviation - As used in this report, the term is the population value of this statistic. The "standard deviation" is a measure of the dispersion of the district values on any variable from the mean. The larger the standard deviation, the greater is the dispersion or variation among districts on that variable. The "standard deviation" may be thought of as the difference (plus or minus) between a typical district and the mean for all districts on a particular variable.

<u>Coefficient of Variation</u> - As used in this report, the term is the ratio of the standard deviation to the mean. It also provides a measure of dispersion or variation among districts on a particular variable. It may be thought of as the percentage difference (plus or minus) between a typical district's value and the mean for all districts on a particular variable.

STATE EQUALIZATION FUNDING

Table 1 provides a summary of the State funding per unit for equalization in each of the sixteen regular districts for the period 1983-84 through 1986-87. Also shown on the table is the full valuation of real estate per unit, i.e., the districts' per unit wealth, in 1986-87. Some highlights from the table are as follows:

- 1. The taxable real estate per unit ranges from a high of \$6,845,035 in Cape Henlopen to a low of \$1,347,567 in Lake Forest, a ratio of about 5 to 1.
- 2. Equalization per unit has increased dramatically from 1983-84 to 1986-87. For example, the funding per unit increased by \$6,707 in the Caesar Rodney School District from 1983-84 to 1986-87. This is the largest absolute increase in per unit funding among the regular school districts and represents a 274 percent increase in three years.
- 3. The largest percentage increase in per unit funding among the regular districts occurred in Woodbridge. The increase of \$6,316 per unit translates to a 345 percent change in three years.

- 4. Even wealthy school districts such as Cape Henlopen experienced significant percentage increases in funding on a per unit basis. The \$928 per unit increase in Cape Henlopen amounts to a 314 percent increase.
- 5. The four New Castle County school districts, which make up the School Tax District, qualified for an increase of \$976 per unit over the three-year period, an increase of 75 percent.
- 6. Correlations between district wealth, as measured by the full valuation of real estate per unit, and the State equalization funding per unit ranged from -.9681 in 1983-84 under the old formula to -.9129 in 1986-87. The slight decline in the absolute value of the correlation coefficient results from the guaranteed 30 percent and 10 percent increases in funding for 1984-85 and 1985-86, which were a part of HB 429, and from the fact that not all districts raised their required local share in 1986-87. Nonetheless, the large values of the coefficients indicate that the new statute is meeting its basic purpose of providing additional State support to districts with relatively low property tax bases.

Table 2 shows the total equalization funds allocated to districts for the years 1983-84 through 1986-87. The table indicates the following:

- The state's total contribution to public education through equalization funding increased by about \$13.9 million or 179 percent from 1983-84 to 1986-87.
- 2. The Caesar Rodney School District received the largest increase in total dollars, about \$1.8 million or 317 percent.
- 3. The smallest increase in total funding occurred in the Indian River School District. However, the increase of \$110,984 still represented a 57 percent change from 1983-84. The increase was small relative to other districts because of Indian River's relatively high wealth per unit and because the district did not provide its required local share. Funding will increase in 1987-88 and again in 1988-89, as the tax rate increases approved by voters in March 1986 are brought on-line.
- 4. The Brandywine School District, which has lost units during the period of implementation and qualifies for a relatively low per unit funding because of its per unit real estate wealth, received an increase of \$615,853 from 1983-84 to 1986-87. This represents nearly a 78 percent increase over the three-year, period. Similar increases occurred in the other New Castle County districts which are part of the School Tax District.

Table 3 provides a tabulation of the effort indices for each of the sixteen regular school districts in 1986-87. The effort index is computed by dividing the district tax rate per \$100 of full valuation by the statewide rate that a

district must raise to qualify for its full State share of equalization. The table indicates the following:

- 1. Eight of the sixteen regular school districts are currently levying high enough rates to qualify for full State funding, i.e., their effort indices are greater than or equal to 1.0000.
- 2. five districts have indices between .9000 and 1.0000, which means that they qualify for 90 percent or more of their State entitlement. In each of these cases, the districts held successful referenda, but because of changes in assessments or shifts in pupil units, the rates established were slightly less than needed in 1986-87 to qualify for full funding.
- 3. One district, Lake Forest, had an unsuccessfe? referendum and consequently qualified for only 85.9 percent of its equalization entitlement in 1986-87.
- 4. The two remaining districts, Cape Henlopen and Indian River, have held successful referenda, but the tax rates approved have not yet been fully implemented. Both districts will qualify for additional funding as the new rates are brought on-line in 1987-88 and 1988-89.
- 5. It should also be indicated, though not shown in Table 3, that the districts in Kent County which have indices below 1.0000 should move toward or above that point in 1987-88 as a result of reassessment which should result in increases in the tax rate per \$100 of rull value of about 10 percent.

LOCAL CURRENT EXPENSE TAXES

The new equalization law included a factor called the effort index which required most local districts to increase their local support for current operating expenses in order to qualify for the full share of the increased State equalization funding. At the time of passage of the legislation, the "amount authorized" for equalization, \$13,950 per unit in 1986-87, required an increased tax effort in all but five school districts—the four New Castle County school districts which share in the revenues from the School Tax District and the Capital School District—in order that each district would receive its full State share of equalization. Thus, one expected outcome of the new equalization statute was an increase in local tax rates and revenues. To see whether this expected outcome has occurred, a review was made of referenda, current expense tax rates and local revenue changes since passage of the equalization statute.

Referenda for Current Expenses

All twelve school districts (excluding the four New Castle County school districts) have held successful current expense tax referenda since 1982-83.* It is clear that some of the referenda passed during the 1983-84 school year were in anticipation of the passage of a new equalization law which would require increased local tax effort. Table 4 provides a cabulation, by district, of the current expense referenda held and passed beginning in 1983-84. The table provides the date of the referendum, the effective date of the additional rate, the change in tax rate, and the estimated additional current expense taxes collectible as a result of the referenda. (For purposes of consistency, the additional local revenues collectible are computed using 1986-87 assessments and capitations, except as otherwise noted.)

As shown in Table 4, the total increase in local current expense tax revenues in these twelve regular districts will amount to more than \$7.5 million each year once all of the approved increases are levied. Since these twelve districts levied current expenses tax rates which generated only \$10.0 million in 1983-84 (from Table 18: \$53.2 - \$43.2), these new levies will produce a 75 percent increase in local current expense revenues. Finally, only one current expense referendum in Kent or Sussex County plus the Appoquinimink School District has been defeated by the voters.

Local Current Expense Tax Rates

Tables 16 and 17 in the Appendix show the actual real estate tax rates for current operations and the capitation tax rates for each for the years 1983-84 through 1986-87, respectively. These tables indicate clearly the rate increases which have already been implemented. However, Table 5, which

^{*}In addition the Christina School District conducted a successful referendum but is not included in the taburtion since the rate increase was not required to meet a local match requirement under the equalization statute.

Total		•			\$7,503,605

- (a) Rates shown are based on assessed value of real estate; increases in capitation tax rates are noted by "Cap."
- (b) Estimated increase in taxes collectible is based upon assessments and numbers of capitations in 1986-87 except as noted.
- (c) These rates have been authorized but were not yet being levied at the time this report was prepared. The effective dates are based upon district plans at this time.
- (d) Based upon 1984-85 assessments.
- (e) Applies only to assessments in Kent County.

Source: Assessments & Tax Rates, Delaware Public Schools, for the fiscal

years 1983-84 through 1986-87.

Note: These data are derived by summing local tax revenues from both real estate and capitation taxes and then dividing the sum by the full value of real estate. Ratios of assessed to full value are from the Bureau of Census for all years except for New Castle County in 1985-86 and 1986-87 where the assessed values were used.

displays the combined tax rate for both real estate and capitations based upon the full value of real estate in each district, is of even more interest. The table indicates that the average tax rate has increased from about 25.6¢ per \$100 of full value in 1983-84 to about 33.6¢ per \$100 of full value in 1986-87, a 31.3 percent increase in three years. The standard deviation has declined from about 10.5¢ to about 8.1¢ and the coefficient of variation has dropped from 41.1 percent to 24.1 percent, indicating a greater equalization of local tax effort. The ratio indicates that the tax effort made by the districts comprising the New Castle County School Tax District was about 3.9 times as high as the effort being made by Indian River in 1983-84; this ratio was reduced to 2.3 by 1986-87. It should also be noted that these measures of variation would have declined even more, reflecting a further reduction in the dispersion among district tax rates, had not the reassessment of New Castle County occurred in 1985-86; the reassessment effectively raised the rates in the New Castle districts by 10 percent.

Based upon these data on referenda and combined tax rates, it is clear that the new equalization law has successfully met one of its objectives. The level of local tax effort in twelve of the sixteen districts has increased dramatically and the disparity in tax effort among the districts has been reduced. Further closure will occur as the new rates for Indian River become effective.

Local Current Expense Revenues & Equalization

The basic purpose of State equalization is to increase the equity in revenues available to school districts, i.e., to compensate for disparities among districts in their relative abilities to raise funds locally. Thus, another way of looking at the impact of the new statute is to analyze the combination of local current expense taxes collectible and the State equalization funds provided. The amounts of equalization funds allocated before and after the passage of the new statute were provided in Table 2. Table 18 in the Appendix provides a tabulation of the current expense taxes collectible in each district for the years 1983-84 through 1986-87. This latter table assumes 100 percent collection of both real estate and capitation taxes levied in each of the fiscal years shown.

Table 6 combines the local current expense taxes collectible with the State equalization provided for the period 1983-84 through 1986-87. The data indicate a statewide increase in funds available of about \$25.9 million from 1983-84 to 1986-87. The actual dollars available to each district are of interest, but the more important question is whether or not the new statute has had the effect of increasing the equity of resources available among the districts. In order to make such an analysis, the resources available must take into account the variation in the size of the districts.

Table 7 provides that comparison. The total local revenues plus State equalization given in Table 6 are divided by the number of Division I units in each district for each of the years displayed. Thus, Table 7 provides a comparison of the funds available from local taxes and equalization for each

unit of pupils enrolled. The basic assumption of HB 429 was that all districts would have at least \$13,950 per unit available in 1986-87. The data and the statistics at the bottom of the table show very clearly that the disparity in funding available has decreased significantly during the first three years of implementation of the new equalization law. Highlights from the table include the following:

- 1. Resources available statewide from these two sources of funding increased by nearly \$6,300 per unit (\$15,354 \$9,063) following implementation of the new statute.
- 2. Districts with the least total resources in 1983-84 made the largest gains by 1986-87. For example, Caesar Rcdney's funds per unit increased by \$9.072 (\$13.676 \$4.604) over three years, a 197 percent increase. Similar large percentage increases occurred in other "low-wealth" districts such as: Appoquinimink, Lake Forest, Smyrna, Laurel, and Woodbridge.
- 3. The standard deviation was reduced from \$5,045 to \$3,120 indicating nearly a \$2,000 decrease in the level of dispersion of revenues among the districts.
- 4. This effect is shown even more dramatically by the coefficient of variation which decreased from 55.7 percent to only 20.3 percent in three years.
- 5. The difference in funds available per unit among the districts decreased by nearly \$4,200 (\$13,036 \$8,869) from 1983-84 to 1986-87. Stated in other terms, the highest resource district in 1983-84 (Red Clay--\$17,640) had 3.83 times the funds available in the lowest resource district (Caesar Rodney--\$4,604). By 1986-87 the ratio had been reduced to 1.79.

Thus, it is clear that the combination of local current expense revenues and State equalization funds available is becoming more equitable than it was under the old statute. Furthermore, with the "amount authorized" for equalization scheduled to continue at \$13,950 and the increases in local tax rates scheduled for Cape Henlopen and Indian River to come on-line, the disparity should continue to close next year.

CURRENT EXPENDITURES

The previous section of the report dealt with resources available from local current expense taxes and from State equalization allocations. However, those two sources represent only a part of the total resources available to school districts. Another way of determining whether greater equity now exists among districts is to look at total current expenditures from all revenue sources on a per unit basis. Current expenditure data are available for only two years under the new equalization formula. The actual current expenditure data for 1983-84 through 1985-86 are given in Table 19 in the Appendix.

These total current expense data were divided by the number of Division I units in each district to obtain the data displayed in Table 8. Despite the fact that these data represent only the impact of the first two years of the new statute, the trend is quite clear. The data indicate the following:

- 1. Prior to the new equalization formula, the typical district expenditure per unit varied from the state average by \$6,891 or 13.5 percent. In the second year under the new law, the standard deviation dropped to \$6,542 meaning that the typical district varied from the state average by plus or minus 10.7 percent.
- 2. The range of expenditures per unit declined by \$266 per unit from \$20,192 in 1983-84 to \$19,926 in 1985-86.
- 3. In 1983-84 the highest spending district spent about \$1.46 for each \$1.00 spent by the lowest spending district on a per unit basis. In 1986-87 this ratio was reduced to about \$1.37 for the highest spending district in comparison to the \$1.00 spent in the lowest spending district.

Thus, the total current expenditure per unit data indicate that the new equalization statute has had the desired effect. The results are, however, confounded by an increase in current expenditures in the New Castle County districts apparently resulting from the reassessment which took effect in 1985-86. A better estimate of the real impact of the equalization law on this variable will be the 1986-87 current expenditures. These data will not be available until after the close of the current school year.

TEACHER SALARIES

The largest single expenditure for schools is for employee salaries. Prior to passage of the new equalization law, it was apparent that a large disparity existed among the various districts in the State in salaries paid to employees. Since much of the local tax revenues and the State equalization funds were and are being used to provide local salary supplements, it was an implied intent of the new statute to provide additional funds which could be used to raise salaries in the lower paying school districts.

Rather than reviewing salaries for all categories of employees, which would require a full report in itself, the determination was made to use classroom teachers' salaries as a proxy measure for all salaries, to determine if the statute had any significant impact on salaries. The decision was also made to use average salaries rather than comparing numerous points on the various salary schedules over a period covering four school years in order to simplify the analysis.

State and Local Salaries - The average salaries paid to classroom teachers from all sources of funding in each fiscal year from 1983-84 through 1986-87 are displayed in Table 20 in the Appendix. However, since the State portion of the salary paid to each teacher is dictated by the State salary schedule which is applied uniformly statewide, and since the primary interest is in the disparity in local salary supplements paid by the various districts, it is more useful to analyze only those salaries paid to teachers who are receiving a combination of state and local funds. This eliminates from the analysis those teachers who are paid wholly or in part with federal funds. Tables 9, 10, 11 and 12 provide data on this group of teachers, by school district, for the fiscal years 1983-84 through 1986-87, respectively. These tabulations indicate the following:

 The disparities in average teachers' salaries among the various school districts are not entirely the result of differences in local salary supplements. There are variations in the average State salary paid in the sixteen districts. These variations result entirely from differences in training and/or experience of the teaching staffs in the various districts. The range of salary differences due to this phenomena has been fairly consistent across the four years accounting for differences between the highest and lowest paying districts (Brandywine vs. Appoquinimink) of from \$2,063 for 1986-87 to \$2,536 in 1984-85. The standard deviations indicate that the typical district paid an average State salary within about \$600 to \$700 of the average for all districts during the four years analyzed. This stability is confirmed by the coefficient of variation which ranged from 4.3 percent in 1984-85 to 3.0 percent in 1986-87. (The next subsection of this report provides an analysis of the salaries paid to teachers after compensating for the training and experience differences.)

2. There are large differences in the <u>local supplements</u> paid to teachers among the sixteen districts; however, those differences are being reduced in both absolute terms and in terms of percentages. The difference between the highest and lowest average local supplement was reduced from \$6,945 in 1983-84 to \$5,258 in 1986-87. Furthermore, this reduction occurred during a period when the average local supplement increased by \$3,263 (\$7,133-\$3,870). Thus, the coefficient of variation in local supplements, which measures the percentage of variation of a typical district from the mean of all districts, dropped dramatically from 64.9 percent in 1983-84 to 22.1 percent in 1986-87. This change is due to large increases in local supplements in several of the districts that paid relatively low supplements in years prior to the passage of the new equalization law. Some examples are as follows:

District	1983-84	1986-87	<u>Change</u>
Appoquinimink Caesar Rodney	\$ 2,265 · 2,410	\$ 5.886 8.006	\$ 3,621 5,656
Capital	3,404	7,323	3,919
Delmar Laurel	1,857 2,106	6,130 5,942	4,273 3,836
Woodbr 1 dge	1,996	5,414	3,418

By way of contrast, the average local supplement in the highest paying district, Brandywine, increased by only \$1.482.

3. Due to the change in local supplements, the range of total average salaries paid by the various school districts closed significantly from 1983-84 to 1986-87. The difference in total average salary between the highest (Brandywine) and lowest (Smyrna) paying districts was \$3,669 in 1983-84. By 1986-87 the difference had declined to \$6,543. This reduction in the disparity is reflected in the coefficient of variation which was reduced from 16.3 percent in 1923-84 to 8.1 percent in 1986-87.

Adjusted Teacher Salaries — As noted previously, the average total salaries for all classroom teachers in all districts are given in Table 20. Those data indicate that the range, i.e. the difference between the highest and lowest total average salaries was \$8,476 in 1983-84. This difference was reduced to \$6,395 in 1986-87. However, as previously indicated a portion of that difference is due to differences in experience and/or training. In order to get a realistic estimate of the salary differences that would have existed or those that now exist among districts if the staffs in the various districts had equivalent training and experience, the data presented in Table 13 were prepared.

Table 9

Range (Highest - Lowest)	\$ 6,541	\$ 4,826	\$ 5,408	\$ 4,772

Sample Calculation for 1983-84:

Brandywine State Salary (Table 9) = \$16,273 = 1.1531 Approquinimink State Salary (Table 9) = \$14,113

1.1531 X (Appoquinimink Average Total Salary - Table 20) =

 $1.1531 \times \$16,454 = \$18,972$

The assumption is made that the district with the highest State salary (Brandywine in each year) has the staff with the highest experience and training. This results in a higher average State salary than all other districts. It also means that the average State salary and the average local supplement in any other district for a set of similarly trained teachers would be higher than that actually being paid. Thus, the data in Table 13 project an average total salary in each district in each of the last four years if the mix of training and experience of its staff had been the same as that in Brandywine. The data are estimates but indicate, for example, that the salary differentials are actually not as great as those presented in Tables 9, 10, 11, 12 or 20 if the training and experience factors are considered. The analysis indicates the following:

- 1. The range of average salaries was \$6,541 in 1983-84 after adjustment for training and experience. By 1986-87, the difference was reduced to \$4,772. Thus, the disparity closed by nearly \$1,800.
- Despite the fact that the average adjusted salary increased statewide by more than \$7,000 (\$27,399 - \$20,368) from 1983-84 to 1986-87, the standard deviation among the sixteen districts was reduced by \$1,017 (\$2,417 - \$1,400) in the same period.
- 3. The coefficient of variation was reduced from about 11.9 percent to about 5.1 percent. Thus, the typical district average salary now varies by plus or minus 5.1 percent from the mean for all districts.

SUMMARY

Based upon data and analysis presented in this report, it is clear that the new equalization statute has produced a number of desirable effects; the findings may be summarized as follows:

- State funding for equalization purposes has increased by about \$13.9 million over the three-year phase-in of the new statute, a 179 percent increase over funding provided in 1983-84.
- 2. The increased funding is being provided in large measure to the "low-wealth" school districts. For example, the Caesar Rodney School District qualified for \$1.8 million more in 1986-87 than it received under the old statute in 1983-84.
- 3. All regular school districts in Kent and Sussex County, as well as the Appoquinimink School District, have passed current expense tax referenda beginning in 1983-84 in order to qualify for increased State aid. Referenda approved through January 1987 will add about \$7.5 million to local revenues in these twelve districts once the approved new rates are actually levied. These rate increases will contribute an additional 75 percent in local revenues over those available in 1983-84. Thus, the new equalization statute has clearly met one of its primary objectives, i.e., raising the local tax effort among the lower paying districts in the State.

-26-

- 4. The total amount of money available from the combination of local tax revenues and State equalization has become more equalized among the various districts, on a per unit basis. For example, in 1983-84 the Red Clay District had \$17,640 per unit available while Caesar Rodney had only \$4,604 per unit, a ratio of 3.83 to 1.00. Three years later, in 1986-87, the range had been reduced from \$20,131 in Colonial to \$11,262 in Indian River, a ratio of 1.79 to 1.00. Furthermore, this range can be expected to close even further in 1987-88 and 1988-89 when referenda already approved are implemented.
- 5. Total current expenses per unit from all sources of revenue were more nearly equal among the districts in 1985-86 than they were in 1983-84 prior to passage of the new equalization law. For example, Red Clay spent \$64,126 per unit in 1983-84 compared to \$43,934 in Caesar Rodney. Thus, Red Clay spent \$1.46 for each \$1.00 spent by Caesar Rodney, on a per unit basis. After two years under the new equalization statute, this ratio of expenditures was reduced to \$1.37 to \$1.00 in Brandywine versus Milford. Further closure in this disparity of expenditures can be anticipated in 1986-87 and 1987-88.
- 6. Average teachers' salaries are more nearly equal among the sixteen regular districts than they were prior to the implementation of the new equalization law. Average local supplements in many downstate districts increased by \$3,500 to \$5,500 from 1983-84 to 1986~87. During the same period, the average local salary increase in Brandywine was \$1,482.
- 7. If adjusted for differences in the training and experience of the staff in each district, the difference in the total average salary paid by the highest paying district to the lowest paying district declined from \$6,541 to \$4,772 from 1983-84 to 1986-87. The coefficient of variation was halved from 11.9 in 1983-84 to 5.1 in 1986-87.

Thus, on all variables analyzed, the disparities among the sixteen regular districts have been reduced from 1983-84 when the new equalization statute was enacted.

The only negative effect of the new statute detected from this analysis is the difficulty districts have had in projecting the local tax rates needed to qualify for their full State entitlement. Because the new formula is particularly sensitive to changes in assessments and relative shifts in units among the districts, a number of districts have passed referenda that they believed sufficient only to find that the rates were a few percentage points lower than they needed. However, this one negative effect is small compared to the major positive changes which have occurred.
