ABSTRACT

One of a series, this report presents information on the receipt by women of support payments, both those which follow divorce and separation and those for children of never-married women. The report includes information on the award and actual receipt by women of child support and alimony. The report also provides data concerning receipt and type of property settlement for women who have been divorced at some point. Information included in the report is based on advance findings from the 1986 survey conducted by the Bureau of the Census through questions supplementing the April 1986 Current Population Survey. All women 18 years of age and older were within the sampling universe for the supplemental questions. In addition to 11 text tables, the report provides five detailed tables. Appendices include definitions and explanations of terms and computations, and technical information concerning the source and reliability of estimates. A newsletter summarizing the findings is included with the report. (RH)

Child Support and Alimony: 1985

(Advance Data from March-April 1986 Current Population Surveys)

U.S. Department of Commerce BUREAU OF THE CENSUS

Acknowledgments

This report was prepared by Ruth Armfield Sanders of the Income Statistics Branch of Population Division. Mary F. Herison contributed to the preparation and statistical review of the text. The report was prepared under the general direction of John F. Coder, Chief of the Income Statistics Branch. Sampling review was conducted by Louis E. Williams of the Statistical Methods Division. Overall direction was provided by Gordon W. Green, Jr., Assistant Division Chief (Socioeconomic Statistics Programs), Population Division.

Data collection was conducted by Bureau of the Census interviewers under the overall direction of Stanley D. Matchett, Chief, Field Division. Publication planning, design, composition, editorial review, and printing planning and procurement were provided by the staff of Publications Services Division, Walter C. Odom, Chief.

The Office of Child Support Enforcement of the Department of Health and Human Services co-sponsored the survey on which the findings in this report are based.

Child Support and Alimony: 1985 (Advance Report)

NOTE

The child support, alimony, and property settlement data as well as data on income and poverty status presented in this report, from the 1986 Current Population Survey (CPS), are the first estimates based entirely on households selected from the 1980 census-based sample design. By contrast, the data from the 1984 CPS, presented in the previous report, were based entirely on households selected from the 1970 census-based sample design. The change in the sample design and its possible effects on the estimates should be kept in mind when comparing the data from this report to data from previous years.'

INTRODUCTION

This report presents information on the receipt by women of support payments following divorce and separation and of support payments for children of never-married women. The report includes information on both the award and actual receipt of child support by women on behalf of their children and on alimony for their own support. The report also provides additional data concerting receipt and type of property settlement for ever-divorced women.

The Bureau of the Census, under joint sponsorship with the Department of Health and Human Services, first conducted a survey specifically designed to obtain data on child support and alimony in the spring of 1979. The survey, with minor modifications, was subsequently conducted in the springs of 1982, 1984, and 1986 by the Bureau of the Census and sponsored, in part, by the Office of Child Support Enforcement, Department of Health and Human Services. Data from the earlier surveys were presented in Current Population Reports,

Series P-23, Nos. 112, 140, and 148, respectively.² Advance findings from the 1986 survey are presented in this report.

AWARD AND RECEIPT OF CHILD SUPPORT PAYMENTS

- As of spring 1986, 8.8 million women were living with children under 21 years of age whose fathers were not living in the households; 61 percent or about 5.4 million of these women had ween awarded child support payments as of the survey date. (See table A.)
- Of the 5.4 million women awarded child support, 4.4 million women were supposed to receive child support for their children in 1985. (The remaining 1 million mothers did not have payments due them in 1985.) Of those due payment, about half received the full amount due. The remaining

Table A. Award and Recipiency Status of Women—Child Support Payments in 1985 and 1983

Award status as of spring 1986 or 1984.

^{&#}x27;See the section, "Revised Survey Procedures." For a detailed description of the changes to the survey between 1986 and 1984, see the section, "Changes in the April CPS Survey."

²For a comparison of the 1982 and 1979 surveys, and the 1984 and 1982 surveys, see Current Population Reports, Series P-23, Nos. 140 and 148, respectively, the sections entitled "Changes in the Survey."

women were equally split between those receiving partial payment and those receiving no payment at all (26 percent each).

- The child support award rate reported in 1986 (61 percent) increased from that of 1984 (58 percent). However, the proportion of women receiving payments in 1985 (74 percent) showed no significant change from that of the previous survey (76 percent).
- Of those mothers awarded child support for their children, 45 percent had health insurance included in the award. About half of White mothers had health insurance included in the awards for their children, compared with only about one-fourth of Black and Hispanic mothers. (See table B.)
- Of the 8.8 million mothers with children present from absent fathers, 3.4 million, or 39 percent, were never awarded child support for their children as of spring 1986. About one-half of the women without awards reported that they wanted awards but were unable to obtain them. About 37 percent of the women reported that they did not want child support awards for their children. For the remaining mothers (about 15 percent), awards were either pending or another arrangement (joint custody or a property settlement) was made.³ (See table C.)

Excludes a small number of currently widowed women whose previous marriage ended in divorce.

³Hispanic women may be of any race.

³Due to a change in questionnaire design in the 1986 survey, the reader should use care in comparing the data on reason for non-award from this survey with non-award data from the 1984 survey. For more details, see the section, "Changes in the April CPS Survey."

²Remarried women whose previous marriage ended in divorce.

- The mean amount of child sup; ort for air women who
 received some payment in 1985 was \$2,220.4 After
 adjusting for inflation during the 1983 to 1985 period, child
 support payments showed a decrease in real terms. (See
 table D.) During the same period, the average income of
 men increased, from \$19,630 in 1383 to \$20,650 in 1985.
- The proportion of women that had been awarded child support payments as of 1986 was higher for Whites (71 percent) than for Blacks (36 percent) or those of Hispanic origin (42 percent). (The percent difference between Black women and Hispanic women was not significant.) (See table E.)
- Women with 4 or more years of college were more likely to have been awarded support payments (77 percent) than women with 4 years of high school (63 percent). There was also some evidence that women with 4 or more years of college (82 percent) were more likely to receive

^{&#}x27;Agreement not sought or reached because of inability to locate father, establish paternity, or some other reason.

³Remarried women whose previous marriage ended in divorce.

⁴Hispanic women may be of any race.

^{&#}x27;Mean income figures in the text are rounded to the nearest \$10.

Income figures for males can be found in table 12 of Current Population Reports, Series P-60, No. 154. Information on income of absent fathers was not available from the survey. If mean income of all males is used as a proxy for mean income of absent fathers, for a meaningful comparison to be made, it must be assumed that the average income of all males was also representative of the average income of absent fathers.

²Excludes a small number of currently widowed women whose previous marriage ended in divorce.

payments than women with a high school education (74 percent).

- The award rate for never-married women (18 percent) was well below that of other women (74 percent) Also nevermarried women who were awarded child support for their children were less likely to have health insurance included in their awards (24 percent) than were others (46 percent). (See table B.)
- Of women with children from an absent father as of spring 1986, about 32 percent (2.8 million) had incomes below

the poverty level in 1985. (See table E.)

- About 40 percent of these women below the poverty level with children from an absent father had been awarded child support, compared with 61 percent for all women.
- Only about 905,000 women below the poverty level were due payments in 1985, and only 66 percent of these women received some amount of payment.
- The mean child support payment received in 1985 by women below the poverty level was \$1,380, about twothirds of the average payment received by all women.

THE DEFICIT IN CHILD SUPPORT PAYMENTS

 For the 4.4 million women due child support payments in 1985, the mean amount of child support (including the 1.1 million who did not receive any amount) was \$1,640. If the full amount of payment due had been made to all women, the mean amount would have been \$2,500. (See table F.)

Table F. Mean Child Support Payments to Women Due Child Support in 1985, by Type of Arrangement

(Numbers in thousands. Women with own children under 21 years of age present from absent fathers as of spring 1986)

Type of arrangement	Number	Percent distri- bution	Mean child support income received ¹	Mean child support income due
All payments ²	4,381	100.0	\$ 1,640	\$ 2,495
Court ordered Voluntary	2,751 1,441	62.8 32.9	1,345 2,187	2,393 2,706

¹Mean amount based on all women due payments, whether or not payments were received.

 Of the women due child support in 1985, 63 percent had court-ordered payments, while 33 percent had a voluntary agreement. (The remaining 4 percent had some other type of arrangement.)

- For women with court-ordered payments, the mean payment due was \$2,390, but the mean amount received was only \$1,350; therefore, women with court orders received only 56 percent of the amount they were due. In contrast, women with voluntary written agreements received 81 percent of the amount they were due, and their mean child support payments due (\$2,710) and received (\$2,190) were higher.
- The aggregate amount of child support payments due in 1985 was \$10.9 billion, but actual payments received amounted to only about \$7.2 billion. Thus, 66 percent of the total amount due was paid in 1985.6

AWARD AND RECEIPT OF ALIMONY PAYMENTS

- Of the 19.2 million ever-divorced or currently separated women as of spring 1986, 15 percent were awarded alimony payments. (See table G.)
- Of the 840,000 women due alimony payments in 1985,
 73 percent received at least some portion of their award.
- Neither the alimony award rate in 1986 (15 percent) nor the recipiency rate in 1985 (73 percent) showed a significant change from that reported in 1984.

Table G. Award and Recipiency Status of Women—Alimony Payments in 1985 and 1983

(Numbers in thousands. Ever-divorced and currently separated women as of spring 1986 and 1984)

¹Award status as of spring 1986 or 1984.

²Includes a small number of women whose arrangement type was "other," not shown separately.

^{*}Aggregate child support payments due and received are derived from table 3. The aggregate payments due refer only to the total due for the income year 1985 based on the information reported by the women in the survey; arrearages are not included in the aggregate figure.

 The mean amount of alimony received by women in 1985 was \$3,730, not significantly different from the 1983 figure, either before or after adjusting for inflation. (See table H.)

. The alimony award rate for White women (16 percent) was

twice that of Black women (8 percent). (There was no statistically significant difference in award rates between Hispanic women and either White or Black women.) (See table I.)

AWARD OF PROPERTY SETTLEMENTS

- Of the 16.5 million ever-divorced women as of spring 1986, 5.9 million, or about 36 percent, were awarded a property settlement, showing no change from the percentage reported in the 1984 survey. (See table J.)
- About 26 percent of women with a property settlement as of spring 1986 received a "one-time" cash payment as at least part of the settlement. (See table K.) About 22 percent received only a cash payment, while about 4 percent received both a cash payment and other property.
- Of women awarded a property settlement, about 25 percent also received some form of support payment in 1985.
 Of ever-divorced women without a property settlement, about 14 percent received support payments in 1985. (See table 5.)

 The average total income of women with property settlements (\$14,970) was higher than those without settlements (\$11,850).

BRIEF DESCRIPTION OF THE SURVEY

The data on child support and alimony were collected in a special supplement to the April 1986 Current Population Survey (CPS). All women 18 years of age and older were within the universe for the supplemental questions. The presence of own children under 21 years of age whose father did not live in the same household determined whether or not a woman was eligible for the questions on child support. Marital status and divorce history determined whether or not a woman was eligible for the questions on alimony and property settlements. The supplemental questions were placed on the April CPS so that this information could be combined with information previously collected in the March CPS on annual work experience, income, and poverty status.

REVISED SURVEY PROCEDURES

The note at the beginning of this report indicates a revision to survey procedures for the CPS. This revision was the change from the 1970 sample design to a sample design based on the 1980 census.

During the period from April 1984 through June 1985, the Bureau of the Census systematically introduced a new sample design for the Current Population Survey. The purposes of this new sample design were to update the sampling frame to the 1980-census base, to improve survey efficiency, and to improve the quality of the survey estimates. The new sample design may have small effects on estimates of income, including income from child support and alimony payments.

²Other property (e.g., house, other real estate, cars, or furnishing).

Remarried women whose previous marriage ended in divorce.

^{*}Widowed women whose previous marriege ended in divorce. *Hispanic women may be of any race.

CHANGES IN THE APRIL CPS SURVEY

In an attempt to improve reporting and the useability of the data, a minor modification was made to one question from the previous survey. (See Current Population Reports, Series P-23, No. 148, appendix C.)

The change was made to the item which ascertains the reason for non-award for those women with children present from absent fathers who were not awarded child support for their children. In the previous survey, women interviewed were asked to indicate the reason for non-award, either by specifying one of the six response categories or by indicating there was "some other reason." In the 1984 survey, if the respondent indicated that there was "some other reason," she was not asked to specify what that reason was. A substantial portion of those responding to this item simply indicated that there was "some other reason" for non-award.

For the 1986 CPS, the same individual response categories from the 1984 CPS were retained; however, the requirement was added that when a respondent answered "some other reason," the interviewer was to ask the respondent to specify what that reason was.

Likely as a result of the change, a lower proportion of women interviewed in 1986 responded that the reason for non-award

was "other" than did those interviewed in 1984. The proportion of women identifying one of the six specified categories as the reason for non-award was thereby increased from that of the previous survey. Thus, when comparing the data from 1986 on reason for non-award to the data collected in 1984, the reader should keep in mind the effect on the data of the change in the wording of that item.

CHANGES IN THE MARCH CPS SURVEY

The Census Bureau made a revision to the March CPS income supplement questionnaire in an effort to adapt to continually rising levels of annual income. Beginning with the March 198S CPS, the question which covers the amount of earnings received from the employer or own business for which the respondent worked the longest during the previous calendar year was modified to permit coding of earnings amounts to a maximum of \$299,999. Prior to March 1986, procedures allowed for coding of amounts to a maximum of \$99,999. This change in the questionnaire causes a break in the time series for some income measures. For detailed information on this change, see Current Population Reports, Series P-60, No. 154, "Revisions to the Earnings Question on the March 1986 CPS."

¹Detail does not add to total because some ever-divorced women received neither child support nor aimony, not shown separately.

2A one-time cash settlement.

3Other property (e.g., house, other real estate, cars, or furnishings).

4Remaried women whose previous marriage ended in divorce.

4Widowed women whose previous marriage ended in divorce.

4Hispanic women may be of any race.

Appendix A. Definitions and Explanations

Child support. Data on award of child support payments were collected from women 18 years or older with children under 21 years of age whose father was not living in the household as of spring 1986. Information on recipiency and amount of payments was obtained from women who reported that they were awarded or had agreements to receive child support payments in 1985. For ever-married women, payment amounts were limited to only those from the last divorce or separation.

Alimony. Data on the award of alimony or maintenance payments were collected from women 18 years or older who were ever-divorced or currently separated as of spring 1986. Information on recipiency status and payment amounts was obtained from those women who reported that they were awarded or had agreements to receive alimony payments in 1985. The data are limited to payments received from the most recent divorce or separation.

Property settlements. Data on property settlements were collected from women 18 years or older who were ever-divorced as of spring 1986. For the purposes of this survey, a property settlement consists of a one-time cash settlement or other property (i.e., house, other real estate, car, or furniture) or a combination of both.

Age. The age classification is based on the age of the woman at her last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes American Indians, Asian and Pacific Islanders, and any other race except White and Black.

Women of Hispanic origin. Hispanic women were identified by a question that asked for self-identification of the women's origin or descent. Respondents were asked to select their origin (and the origin of other househuld members) from a "flash card" listing ethnic origins. Women of Hispanic origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Hispanic origin. It should be noted that Hispanic women can be of any race.

Years of school completed. Data on years of school completed were derived from the combination of answers to questions concerning the highest grade of school attended by the woman and whether or not that grade was finished. The questions on educational attairment apply only to progress in "regular" schools. Such schools include graded public and —ivate elementary and high schools (both junior and senior gh), colleges, universities, and professional schools, whether

day schools or night schools. Thus, regular schooling is that which may advance a woman toward ar elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Marital status. The marital status classification refers to the status at the time of enumeration. Women classified as "married" or "widowed" consist of those who remarried after having been divorced. Women classified as separated are either legally separated or otherwise absent from their spouse because of marital discord. Women in common-law marriages are classified as married, and women who are single or whose only marriage was annulled are classified as never married.

Year of divorce or separation. The year of divorce or separation reflects the year of marital dissolution. For women who were divorced or separated more than once, it is the year of most recent divorce or separation. For divorces that require a formal (legal) separation, the year reflects the year the actual divorce took place.

Children from an absent father. Children from an absent father are a woman's sons and daughters (including adopted children) whose father was not living in the same household. The questionnaire was designed to count children from an absent father only when at least one such child in the household is under 21 years of age.

Money income. Income distributions and income summary measures (such as medians and means) shown in this report are limited to money income before payment of Federal, State, local, or Social Security (FICA) taxes and before any other types of deductions, such as union dues and Medicare premiums. Total money income is the sum of the amounts received from wages and salaries, self-employment income (including losses), Social Security, Supplemental Security Income, public assistance, interest, dividends, rent, royalties, estates or trusts, veterans' payments, unemployment and workers' compensations, private and government retirement and disability pensions, child support, alimony, and any other source of money income which was regularly received. Capital gains (or losses) and lump-sum or one-time payments such as life insurance settlements are excluded.

Poverty definition. Families and unrelated individuals are classified as being above or below the poverty level using the poverty index originated at the Social Security Administration in 1964 and revised by Federal Interagency Committees in 1969 and 1980. The poverty index is based solely on money income and does not reflect the fact that many low-income persons receive food stamps, Medicaid, and public housing.

The index is based on the Department of Agriculture's 1961 Economy Food Plan and reflects the different consumption requirements of families based on their size and composition. It was determined from the Department of Agriculture's 1955 Survey of Food Consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index (CPI). The average poverty threshold for a family of four was \$10,989 in 1985. Weighted average poverty thresholds by size of family are shown in table A-1. For further details, see Current Population Reports, Series P-60, No. 152.

Table A-1. Weighted Average Poverty
Thresholds in 1985

Size of family unit	Threshold
One person (unrelated individual)	\$ 5,469
15 to 64 years	5,593
65 years and over	5,156
Two persons	6,998
Householder 15 to 64 years	7,231
Householder 65 years and over	6,503
Three persons	8.573
Four persons	10,989
Five persons	13,007
Six persons	14,696
Seven persons	16,656
Eight persons	18,512
Nine persons or more	22,083

Computation of constant dollar means. The adjustment for price change was made by converting the mean income for women in 1983 into 1985 dollars on the basis of the change

in the Consumer Price Index. The indices used to make the constant dollar conversions are shown in table A-2.

Table A-2. Consumer Price Index (CPI): 1977 to 1985

	(1977 :	= 100)	
Year	СРІ	Year	CPI
1977	100.0	1981 1982	 50.1
1979	119.8 136.0	1983 1984	 64.4 71.4

Source: Department of Labor, Bureau of Labor Statistics

The Consumer Price Index (CPI) is an index designed to measure changes in purchasing power. While the CPI is a good measure of the changes in prices, it is not necessarily a good measure of the changes in prices faced by consumers of different characteristics and income levels. Furthermore, the housing component of the CPI has been criticized for contributing to unduly large increases in the CPI over the past several years. These limitations should be noted when comparing income figures adjusted to constant dollars using the CPI since the same index was used for all women and all income levels.

Underreporting. As in most household surveys, the estimates of the number of money income recipients and the total amount of money income derived from the March CPS are somewhat less than comparable estimates derived from independent sources, such as the Bureau of Economic Analysis, Social Security Administration, and Veterans Administration. The difference between the survey estimate and the independent estimate is generally termed "underreporting." Underreporting tends to be more pronounced for income sources such as public assistance and welfare, unemployment compensation, and property income (interest, dividends, and net rental income). Estimates of income from wages and salaries tend to have less underreporting than most income types.

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

The estimates of child support and alimony in this report are based on data obtained in March and April 1986 from the Current Population Survey (CPS) conducted by the Bureau of the Census and from supplementary questions to the CPS. The present CPS sample was selected from the 1980 census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. The current sample is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions in the Nation.

In the March sample, approximately 60,500 occupied households were eligible for interview. Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

Questions relating to labor force participation are asked about each member in every sample household. In addition, in March 1986 supplementary questions were asked about income, and in April 1986 supplementary questions were asked about child support and alimony for previously divorced, currently separated, and never-married women. The CPS has eight rotation groups being interviewed in a month. In March, all eight rotations were asked income questions. in April, only the six rotations that were the same as in March were used to identify eligible women for the April supplement. About 42,200 of the households interviewed in March were interviewed again in April. Women 18 years of age and older were asked supplemental questions regarding child support and alimony payments. Of the 43,091 eligible women interviewed in March, 37,671 were matched to women interviewed in April. Child support and alimony information was imputed for the other 5,420 eligible women. Table B-1 gives the sample sizes and imputation rates by marital status.

CPS Estimation Procedure

The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, sex, and Hispanic/non-Hispanic categories. These independent estimates are based on statistics from the 1980 decennial census; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces.

The estimates in this report are also based on revised Hispanic weighting procedure for persons of Hispanic origin.

In previous years, the estimation procedures used in this survey involved the inflation of weighted sample results to independent estimates of the noninstitutional population by age, sex, and race. There was, therefore, no specific control of the survey estimates for the Hispanic population. During the last several years, the Bureau of the Census has developed independent population controls for the Hispanic population by sex and detailed age groups and has adopted revised weighting procedures to incorporate these new controls. It should be noted that the independent population estimates include some, but not all, illegal immigrants.

The estimation procedure for the data in the report also involves a further adjustment so that husband and wife of a household receive the same weight.

RELIABILITY OF ESTIMATES

Since the CPS estimates were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The accuracy of a survey result depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differ .nces between estimates. The standard errors provided for the CPS estimates primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but they do not measure any systematic hiases in the data. (Bias is the difference, averaged over all possible samples, between the estimate and the desired value.)

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of the respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the 1980 decennial census, is about 7 percent. It is known that CPS under-

covering varies with age, sex, and race. Generally, undercoveringe is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race-Hispanic group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.

In these tabulations, the nonsampling error due to imputing values for missing data may be particularly severe. This is because the imputation rates for divorced and separated women are over 20 percent. Imputation procedures are intended to reduce nonsampling error due to missing data, but with such high imputation rates the procedures lose some effectiveness. Therefore, particular caution should be used in interpreting the data in these tabulations.

In most cases, the questionnaire entries for income are based on the memory or knowledge of one person. The most common respondent for this report was the female householder. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding as to the scope of the income concept. See also the section entitled "Underreporting of Income" of an earlier report (Series P-60, No. 151.)

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, An Error Profile: Employment as Measured by the Current Population Survey, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978, and Technical Paper 40, The Current Population Survey: Design and Methodology, Bureau of the Census, U.S. Department of Commerce.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals, ranges that would include the average results of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

- Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.
- Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors

above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the characteristics are different when, in fact, they are identical.

To perform the most common test, let x and y be sample estimates for two characteristics of interest. Let the standard error on the difference x-y be SDIFF. If the ratio R = (x-y)/SDIFF is between -2 and +2, no conclusion about the difference between the characteristics is justified at the 0.05 level of significance. If, however, this ratio is smaller than -2 or larger than +2, the observed difference is significant at the 0.05 level. In this event, it is commonly accepted practice to say that the characteristics are different. Of course, sometimes this conclusion will be wrong. When the characteristics are, in fact, the same, there is a 5-percent chance of concluding that they are difference between characteristics is between 1.6 and 2.0 times the standard error of the difference.

Note when using small estimates. Summary measures such as medians, means, and percentages are shown only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers of persons are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding summary measures. These smaller estimates are provided primarily to permit such combinations of the categories as serve each data user's needs.

Comparability of data. Data obtained from the CPS and other sources are not entirely comparable. This is due in large part to differences in interviewer training and experience and in differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Table B-1. Sample Sizes and Imputation Rates

		Imputation	on

26

Standard error tables and their use. In order to derive standard errors that would be applicable to a larger number of estimates and which could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in table B-2 are approximations to the standard errors of various estimates of levels for women in the United States. To obtain the approximate standard error for a specific characteristic, the appropriate standard error in tables B-2 and B-3 must be multiplied by the factor for that characteristic given in table B-4. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of the sample design and the estimating procedure on the value of the characteristic.

Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table B-4. These parameters were used to calculate the standard errors in tables B-2 and B-3 and to calculate the factors in table B-4. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Methods for computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, S_{χ} , of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$S_{y} = fs$$
 (1)

Table B-2. Standard Errors of Estimated Numbers of Women: 1985

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
10	5 14 26 37 52 74 90 103	6,000 7,000 8,000 9,000 10,000 11,000 12,000 13,000 15,000 17,000	125 134 142 150 157 164 170 176 187

Note: For a particular characteristic, see table B-4 for the appropriate factor to apply to the above standard errors. For reference, the standard errors in tables B-2 and B-3 were calculated using a \approx -0.000030 and b \approx 2.769.

where f is the appropriate factor from table B-4, and S is the standard error on the estimate obtained by interpolation from table B-2. Alternatively, the standard error may be approximated by formula (2), from which the standard errors in table B-2 were calculated. Use of this formula will provide more accurate results than the use of formula (1) above.

$$S_{x} = \sqrt{ax^{2} + bx}$$
 (2)

Here, x is the size of the estimate, and a and b are the parameters in table B-4 associated with the particular characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage computed, using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the

numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters from table B-4 indicated by the numerator. The approximate standard error, $S_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$S_{(x,p)} = fs \tag{3}$$

In this formula, f is the appropriate factor from table B-4 and S is the standard error on the estimate from table B-3. Alternatively, the standard error may be approximated by the following formula, from which the standard errors in table B-3 were calculated. Use of this formula will give more accurate results than use of formula (3) above.

$$S_{(x,p)} = \sqrt{(b/x) (p) (100-p)}$$
 (4)

Here, x is the size of the subclass of women which is the base or the percentage, p is the percentage ($0 \le p \le 100$), and b is the parameter in table B-4 associated with the particular characteristic in the numerator of the percentage.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$S_{(x-y)} = \sqrt{S_x^2 + S_y^2}$$
 (5)

where S_X and S_Y are the standard errors of the estimates x and y, respectively. The estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

- Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.
- (2) Add to and subtract from 50 percent the standard error determined in step (1).

Table B-4. "a" and "b" Parameters and "f" Factors for Calculating Approximate Standard Errors of Estimated Numbers and Percentages of Women: 1985

	Paramet	er	
Characteristic	а	b	f factor
INCOME			
Women			
Total or White	-0.000030 -0.000243 -0.000839	2,769 3,165 5,334	1.00 1.07 1.39
Families			
Total or White	-0.000028 -0.000212 -0.000731	2,527 2,755 4,643	0.96 1.00 1.29
Women Below the Poverty Level			
Total or White	-0.000141 -0.000985 -0.003404	12,834	2.15 2.15 2.79
NONINCOME			
Number of Women with Children Whose Fathers are Absent			
Marital status: Total or WhiteBlack	-0.000066 -C.000658 -0.002272		1.47 1.76 2.28
Selected characteristics of women: Educational attainment Employment Unemployment	-0.060034 -0.000025 -0.000032	3,075 2,294 2,934	1.05 0.91 1.03
Selected characteristics of families: Tenure	-0.000026	2,365	0.92

Note: The f factor must be multiplied by the standard error obtained in tables B-2 and B-3 for the characteristic of interest. To obtain standard error parameters by residence, multiply the above parameters by a factor of 1.0 for metropolitan residence, 1.5 for nonmetropolitan residence, 0.75 for Northeast; 0.92 for Midwest; 1.03 for South; 1.07 for West; and 0.91 for the North and West combined.

'Hispanic women may be of any race.

- (3) Using the distribution of the characteristic, calculate the 68-percent confidence interval by calculating the values corresponding to the two points established in step (2).
- (4) Once the limits of the 68-percent confidence interval are computed, the standard error of a median can be computed by the formula

$$S_{\text{median}} = \frac{U - L}{2}$$

where

U = Upper limit of the 68-percent confidence interval. L = Lower limit of the 68-percent confidence interval.

Standard error of an estimated arithmetic mean. The standard error of an arithmetic mean can be approximated by formula (6) below. Because of the approximations used in developing formula (6), an estimate of the standard error of the mean obtained from that formula will generally underestimate the true standard error. The formula used to estimate the standard error of a mean is

$$S_{\overline{X}} = \sqrt{(b/y) S^2}$$
 (6)

In this formula, y is the size of the base of the distribution, and b is a parameter which depends on the sample size, the sample design, the estimation procedure, and the characteristic. The values of b are given in table B-4. The variance, s², is given by the following formula:

$$S^{2} = \sum_{i=1}^{C} p_{i} x_{i}^{2} - \bar{x}^{2}$$
 (7)

where \overline{x} is the mean of the distribution estimated by the expression

$$\bar{x} = \sum_{i=1}^{c} p_i x_i$$

- c is the number of groups; i indicates a specific group, thus taking on values 1 through c;
- p_i is the estimated proportion of women whose values, for the characteristic (x-values) being considered, fall in group i.
- $\overline{x_i} = (Z_{i-1} + Z_i)/2$ where Z_{i-1} and Z_i are the lower and upper interval boundaries, respectively, for group i. This is assumed to be the most representative value for the characteristic for women in group i. Group c is open-ended, i.e., no upper interval boundary exists. For this group an approximate average value is $x_c = \frac{3}{2} Z_{c-1}$
