ABSTRACT

This report summarizes some selected characteristics of the feed manufacturing industry based on the results of a mail survey of U.S. feed manufacturing establishments to obtain information about structural characteristics of the industry in 1984. These characteristics are compared with those reported earlier from the 1975 survey to provide insights about structural changes in the industry between 1975 and 1984. One section discusses structural characteristics that apply to all formula feed production, including number of feed mills and location, size of operation, ownership structure, methods of distribution, and transportation. The next section discusses specific characteristics of formula feed production, including primary and secondary production, type of livestock feed, kinds of primary feed, form of feed, and feed ingredients used to manufacture primary feed. Labor productivity is briefly covered in the final section. Appendix tables 1-16 contain comparative statistics at the regional level. Tables 17-53 cover state details for the 1984 survey. (YLB)

SELECTED CHARACTERISTICS OF THE U.S. FEED MANUFACTURING INDUSTRY, 1984.
Mark Ash, William Lin, and Mae Dean Johnson, Commodity Economics
Division, Economic Research Service, U.S. Department of Agriculture,
Staff Report No. AGES880121.

ABSTRACT

This report summarizes results obtained from a major, nationwide survey of the feed manufacturing industry for 1984. The number of U.S. feed mills had declined from about 7,920 at the beginning of the 1970's to 6,720 in 1984. Formula feed production totaled 110 million tons, up from 105 million in 1975, and continued to center in the Corn Belt, Southern Plains, Lake States, Pacific, and Northern Plains. Primary feed production has been trending upward, reaching 71 percent of the total feed tonnage. Despite the importance of complete feed, the use of all supplements and premixes increased in 1984. Primary feed production was classified by type of livestock feed: poultry feed 35 percent, dairy feed 22 percent, beef and sheep feed 2 percent, hog feed 15 percent, and other feeds 7 percent.

Keywords: formula feed, primary feed, secondary feed, complete feed, supplements, premix, and feed ingredients.

PREFACE

The feed manufacturing industry was surveyed in late 1985 and 1986 to obtain data in structure, production trend, distribution, feed ingredients, and processing functions. These data complement similar statistics collected on the industry for 1969 and 1975. More comprehensive analyses and reportings of these data will be forthcoming in the near future.

No report of this survey would have been possible without the basic data supplied by the individual feed mills and companies operating in the industry. The authors express appreciation to George Allen who made contributions in the early phase of the survey. Assistance in computer programming of the survey tables and in processing survey data from Philip Friend and Pat Bailey, respectively, was invaluable. A special note of appreciation is due the Economic and Market Research Committee, American Feed Industry Association, for its consultation during the course of this study and in preparing this report. In addition, assistance received from the Agricultural Stabilization and Conservation Service in conducting telephone follow-up is gratefully acknowledged. Marcia Fletcher and Terri Walker helped type the report.

SUMMARY

The U.S. feed manufacturing industry has undergone significant structural changes during the last decade. The number of feed mills had declined from about 7,920 at the beginning of the 1970's to 6,720 in 1984. Formula feed production totaled 110 million tons, up from 105 million in 1975.

Formula feed production has become more heavily centered in the Corn Belt, Southern Plains, and Pacific regions since 1975. The Corn Belt continued to lead U.S. formula feed production by manufacturing over 20 million tons of commercially prepared feed, or 18.6 percent of total production. The top four regions accounted for 55 percent of the national total.

U.S. feed mills manufactured an average of 16,300 tons of formula feed per mill in 1984, comparable to the 16,500 tons in 1975. The size of mills in terms of annual production tonnage grew most rapidly in the Southeast, reaching 29,900 tons per mill. The nearly 25-percent increase in size over 1975 was largely in response to rapid growth in the broiler industry. Larger feed mills with an annual capacity of 75,000 tons or more made up 5 percent of the total number of mills but accounted for 46 percent of nationwide production.

In 1984, corporations accounted for 58.5 percent of total feed milling establishments, up from 51.0 percent in 1975. Formula feed manufactured by these corporate mills accounted for 71.1 percent of U.S. production in 1984, up from 66.6 percent in 1975. Farmer cooperatives comprised 28.5 percent of U.S. feed mills and manufactured 21.8 percent of the total formula feed tonnage.

Over 30 percent of the formula feed was consumed by the mill's own livestock, up from a quarter in 1975. Due to the expanding broiler industry which is highly vertically integrated, nearly 70 percent of formula feed was fed to the mill's own animals in the Southeast and Delta regions. Wholesale distribution also rose modestly from 24.1 percent in 1975 to 28.8 percent in 1984.

Inshipments of feed ingredients to mills continued to be largely carried by trucks, although a larger portion was hauled by rail than in the 1970's. Like the 1975 survey, virtually all outshipments of formula feed were transported by company-owned, customer-owned, or other trucks. The distance that a ton of feed was hauled by trucks averaged 58 miles.

In 1984, the number of mills manufacturing only primary feed showed a marked increase from 29 percent of all mills in 1975 to 58 percent. Primary feed production altogether accounted for 87 percent of all formula feed manufactured in the United States, up from 72 percent in 1975.

Primary feed production had the following breakdown by type of livestock feed: poultry 35.3 percent, dairy 22.0 percent, beef and sheep 21.2

percent, hogs 15.0 percent, and others 6.5 percent. Although complete feeds are still by far the predominant kind of primary feed manufactured, there was a considerable increase in the production of supplements and super concentrates in 1984. Supplements and super concentrates in 1984 totaled 21.7 percent of primary feed tonnage, up from 13.7 percent in 1975.

Pelleted feeds became more popular due to a higher efficiency in converting feed into meat products. In 1984, pelleted feeds accounted for 51.7 percent of U.S. primary feed, compared with 41.7 percent in 1975.

Feed grains comprised 49 percent of the ingredient tonnage used to manufacture formula feeds (excluding shrinkage), down from 53.4 percent in 1975. Oilseed meals and grain and animal proteins have all risen proportionally to 19.9, 12.7, and 5.7 percent, respectively. Minerals and microingredients (vitamins, drugs, and premixes) comprised 5.3 and 1.1 percent, respectively.

The number of production workers averaged 5.4 per establishment in 1984, down from 7.5 in 1975. Productivity, measured in terms of tons of manufactured feed per production employee, has improved significantly. Output per production worker averaged 5,274 tons in 1984, more than double the 2,238 tons in 1975.

Selected Characteristics of the U.S. Feed Manufacturing Industry, 1984

INTRODUCTION

Feed purchases historically have been the single largest item of farm production expenditures, surpassing rent, interest, fertilizer, and energy expenses. In 1984, feed purchases totaled \$18.3 billion, or 14.3 percent of total farm production expenses. Over 50 percent of the \$18.3 billion total feed expenses were made for the purchase of commercially prepared or formula feeds. The rest were for grains, hays and forages, pasture and grazing livestock, and other feed additives (4).^{1/}

Despite the lead role that the feed manufacturing industry plays, little information about the changing structure of the industry has been available since 1975 when the last survey of the industry was completed. To fill this data void, the Economic Research Service (ERS) of USDA conducted and completed a mail survey of U.S. feed manufacturing establishments to obtain information about structural characteristics of the industry in 1984. This survey was designed to gather statewide data on production, number and size of U.S. feed mills, ownership structure, distribution, milling and storage capacity, form of end products, ingredient use, employment, transportation, energy use, and type of livestock feed manufactured.

This report summarizes some selected characteristics of the feed manufacturing industry based on the survey results and compares them with those reported earlier from the 1975 survey to provide insights about structural changes in this industry between 1975 and 1984. Appendix tables 1-16 contain comparative statistics at the regional level while the remaining tables cover State details for the 1984 survey.

METHODOLOGY

In late 1985, survey questionnaires were sent to all known or suspected feed manufacturing establishments in the United States. To be included in the survey, feed mills had to meet two criteria: (1) be involved in grinding and mixing at least two feed ingredients, and (2) have a normal weekly production capacity of 25 tons or more. The establishments could

^{1/} Underscored numbers in parentheses refer to items listed in the References at the end of the report.

manufacture feed for sale, for use in their own feeding operation, or for custom grinding and mixing operations. Data were collected from such large enterprises as cattle feedlots, poultry farms, hog-feeding operations, dairy farms, and commercial mills. The number of such establishments totaled about 8,300 according to a list of feed manufacturers maintained by the Agricultural Stabilization and Conservation Service (ASCS). Like the 1975 survey, the current survey was not mandatory.

Nonrespondents to the first mailing were contacted by ASCS county offices nationwide and urged to cooperate with the survey after receiving the questionnaire for the second time. A telephone follow-up was undertaken by ERS analysts after the first and second mailings to resolve data quality problems including inconsistencies, errors in measurement units, or misinterpretations of questions. About 1,700 feed mills were discovered to be out-of-business or retail stores, or undeliverable at their last address, 660 were unusable, and about 1,700 were usable for summary purposes. The number of U.S. feed manufacturers actually in business at the time of this survey was determined to be about 6,720.

Data obtained from the nearly 1,700 usable survey forms were expanded into estimates of the population universe for the entire formula feed industry. Expansion factors were developed by State and by annual capacity size for 13 size classes ranging from less than 1,000 tons to 250,000 tons and over. The factors were derived by comparing the number of establishments on the ASCS list with the number of usable survey forms.^{2/} A smaller expansion factor means a higher response rate while a larger expansion factor means a lower response rate. For example, an expansion factor of 2.0 means the response rate is 50 percent while an expansion factor of 5.0 means only a 20-percent response rate in terms of the number of establishments.

Overall, the response rate totals about 43 percent in terms of feed tonnage. Table 1 displays expansion factors for computing formula feed production in the Corn Belt.

Table 1--Expansion factors for computing formula feed production in the Corn Belt

State	Annual capacity (1,000 tons)							Total
	Less than 1	1-10	10-25	25-50	50-75	75-100	over	
Illinois	1.19	7.77	3.80	3.29	1.94	1.93	--	4.59
Indiana	3.30	10.05	8.49	3.43	1.62	--	3.81	4.92
Iowa	4.05	3.48	3.33	2.51	2.48	1.63	1.00	2.71
Missouri	3.36	5.46	11.11	4.41	2.43	1.00	1.00	2.99
Ohio	1.50	10.94	6.45	6.34	1.94	--	16.20	5.67
Corn Belt	2.75	6.06	5.10	3.16	2.13	2.11	1.55	3.56
<hr/> -- = No response								

^{2/} Mean capacity of respondents was generally found to be only slightly larger than that for all mills.

Despite all efforts to minimize problems with the data, inaccuracies in some tables may still exist. The sources of these irregularities in the data are due to: (1) nonresponse bias, where surveys received from respondents may not be representative of the remaining population, (2) reporting errors, caused by misinterpretation of questions on the survey regarding units of measurement, and (3) errors in data entry which have not been corrected. We believe that the level of bias is small for most of the major feed producing States. However, in States where feed production is more concentrated and survey response was low, the expansion may significantly vary from feed production level indicated by animal numbers. For instance, we received no data on premix manufacturing in New Jersey, which was a major center of premix production and would bias our premix totals downward. In addition, we adjusted the total feed production for California to conform with the dairy feed production indicated by milk cow numbers and the State feed tonnage report.

GENERAL STRUCTURAL CHARACTERISTICS

This section discusses structural characteristics that apply to all formula feed production including number of feed mills and location, size of operation, ownership structure, methods of distribution, and transportation. Specific characteristics relating to kinds of formula feed production and ingredients used to manufacture primary feed are discussed in the next section.

Number of Mills and Location

The survey identified a total number of U.S. feed mills at 6,723 in 1984, compared with 6,340 reported for 1975 and 7,920 in 1969 (2). The numbers may not be directly comparable due to a more complete ASCS list in 1984. As in 1975, the Corn Belt continued to claim the largest share (29.5 percent) of all mills (fig. 1).^{3/} The Lake States region ranked second in number of feed mills, with its share up from 13.7 percent in 1975 to 17.3 percent in 1984. The Northern Plains ranked third and maintained its share of all mills at 13.7 percent. Regional distribution of U.S. feed mills in 1984 showed patterns similar to 1975 although the share in the Southeast and Pacific was down by over 1 percentage point.

In 1984, the Corn Belt continued to lead U.S. formula feed production by manufacturing over 20 million tons of commercially prepared feed, or 18.6 percent of total production (fig. 2). The Southern Plains and Lake States ranked second and third, due to large-scale feedlot operations in the former region and poultry, dairy, and hog operations in the latter. The Pacific closely followed the Lake States as the fourth largest region in manufacturing formula feed due to dairy, poultry, and large-scale feed lot operations. These four regions altogether produced 55 percent of U.S. formula feed in 1984, with the Lake States region expanding its share since 1975 by 2 percentage points. By contrast, the Northeast and Mountain regions both showed a modest decline in their share of formula feed production. U.S. formula feed production in 1984 totaled 109.6 million tons, nearly a 5-percent increase since 1975.

^{3/} See (3) for an article detailing the feed mill survey results in the Corn Belt.

Figure 1
Regional Distribution of Feed Establishments, 1984

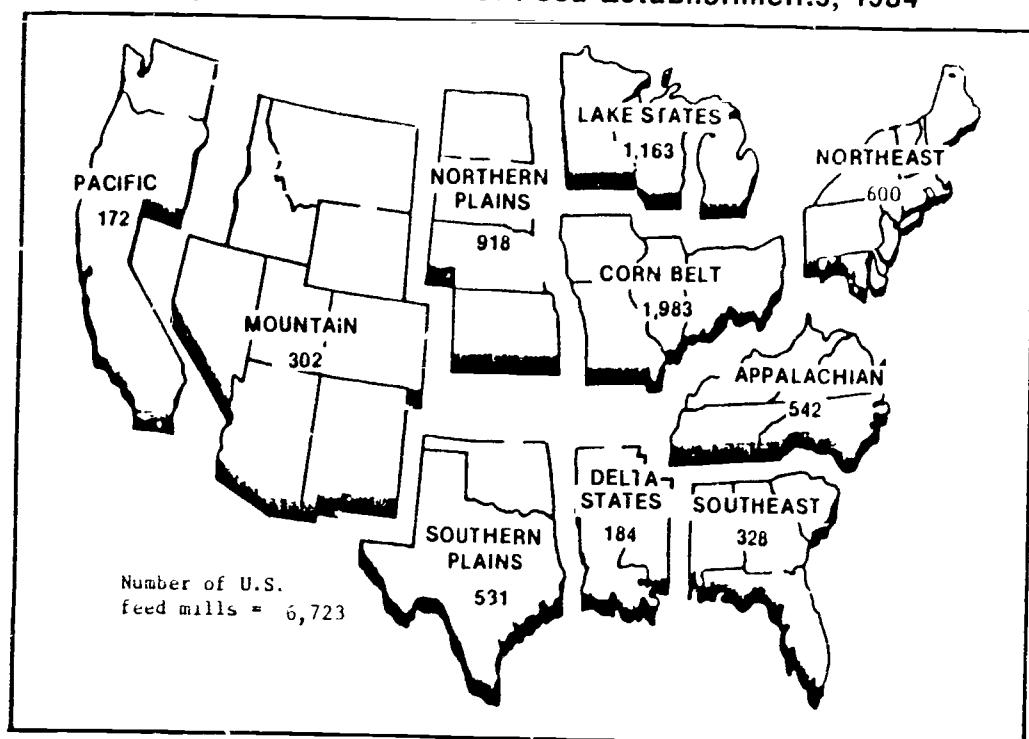

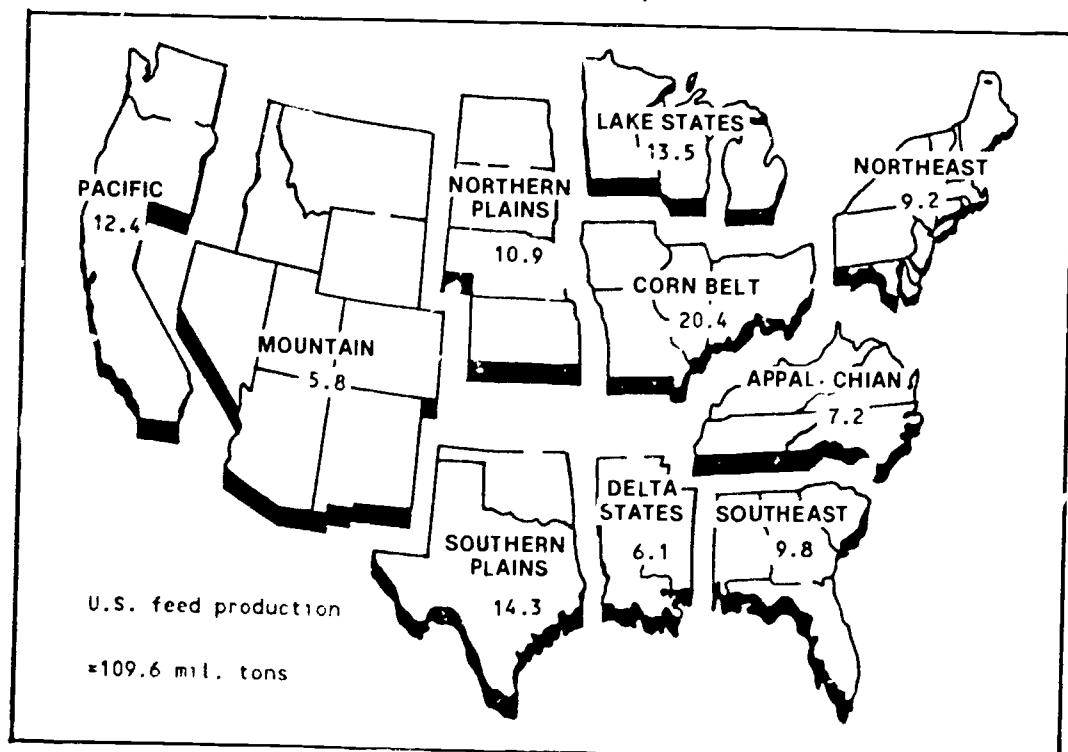

Figure 2
Regional Distribution of Feed Production, 1984
(million tons)

Size of Operation

U.S. feed mills manufactured an average of 16,300 tons of formula feed per mill in 1984, comparable to the 16,500 tons in 1975. The size of mills in terms of annual production tonnage grew most rapidly in the Southeast, which averaged 29,900 tons per mill, nearly 25 percent larger than in 1975 (fig. 3). The rapid growth in the broiler industry from 885 million head in 1975 to 1,327 million in 1984 was the key factor contributing to the rapid expansion in the size of feed mills in this region. Feed mills in the Corn Belt, Northern Plains, and Lake States tended to be smaller, averaging an annual production from 10,300 to 11,900 tons (app. table 1).

In 1984, about three-quarters of U.S. feed mills had an annual capacity to produce formula feed between 1,000 and 25,000 tons. However, this typical size group accounted for only 27.5 percent of U.S. formula feed production. By contrast, larger feed mills with an annual capacity of 75,000 tons or more made up about 5 percent of the total number of mills, but accounted for 46.3 percent of nationwide production (app. tables 2 and 3).

Production concentration of the industry was found to be especially pronounced in the Pacific, Southeast, and Delta regions. For example, the 27 largest feed mills (with an annual capacity of 100,000 tons or more) made up 8.3 percent of all mills in the Southeast, but accounted for 63.4 percent of formula feed production in this region.

Ownership Structure

Corporations are still by far the dominant ownership type in the feed industry and account for the bulk of feed manufactured. In 1984, corporations accounted for 58.5 percent of total feed milling establishments, up from 51.0 percent in 1975 (fig. 4). Formula feed manufactured by these corporate mills accounted for 71.1 percent of U.S. production in 1984, up from 66.6 percent in 1975 (app. table 4).

The role of farmer cooperatives in the formula feed industry has been accentuated since the last survey. In 1984, farmer cooperatives comprised 28.5 percent of U.S. feed mills, up from 25.6 percent in 1975. Formula feed manufactured by these cooperatives accounted for 21.8 percent of the total tonnage, up from 19.6 percent in 1975. Partnerships and sole proprietorships have become even less common in the feed manufacturing industry since 1975. Their share of U.S. feed mills declined from 23 percent in 1975 to about 13 percent in 1984. Similarly, their share of formula feed production decreased from nearly 14 percent in 1975 to 7.1 percent in 1984 (app. table 4).

In 1984, corporations were relatively more common in every production region (fig. 5). Figure 6 shows the proportion of formula feed manufactured by corporations was higher except in the Southeast, Appalachia, and Mountain regions. Farmer cooperatives remained more common in the Northeast, Lake States, Corn Belt, and Northern Plains. Farmer cooperatives became relatively more popular in the Southeast in part because of the influence of farmer cooperatives in poultry operations.

Like the 1975 survey, corporations remain more common in the size groups from 25,000 to 100,000 tons (app. table 6). Farmer cooperatives

Figure 3--Average mill size by region
thousand tons

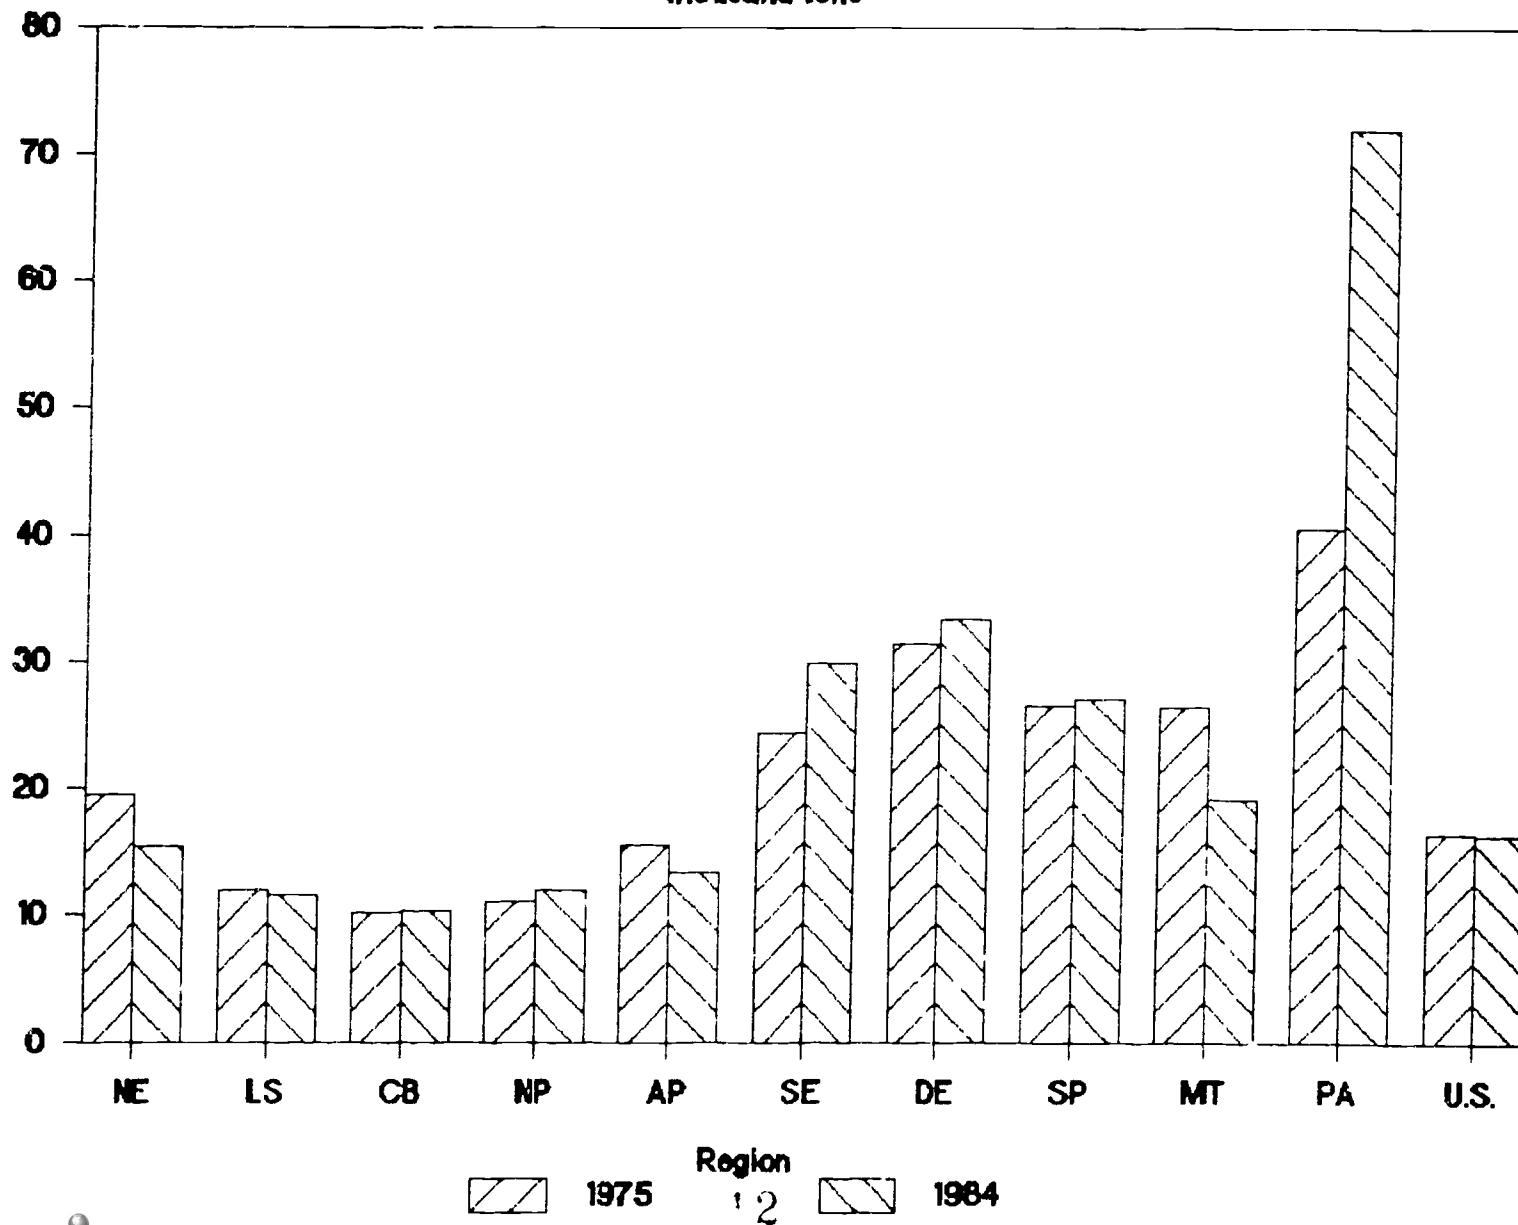

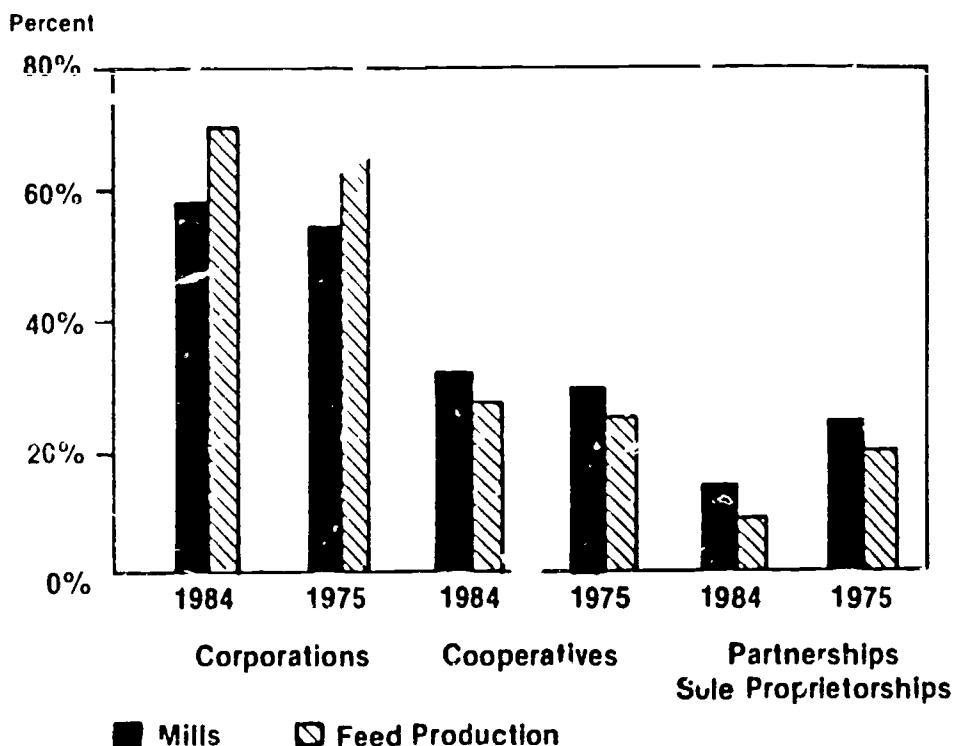

Figure 4
Feed Mill Ownership vs. Production

comprised about 30 percent of smaller mills with an annual capacity of less than 25,000 tons, and a fifth of the largest mills with an annual capacity over 100,000 tons and more. Sole proprietorships accounted for 6-12 percent of smaller U.S. feed mills with an annual capacity or 25,000 tons or less (app. table 6).

Methods of Distribution

Formula feed is distributed by the following methods: wholesale, retail, feeding own livestock, custom feeding, and custom grinding and mixing. The percentage of feed production being fed to own livestock was narrowly ahead of wholesale and retail sales in '75 (fig. 7). By 1984, this gap had widened, with over 30 percent of the formula feed consumed by the mill's own livestock, compared with one-quarter in 1975.

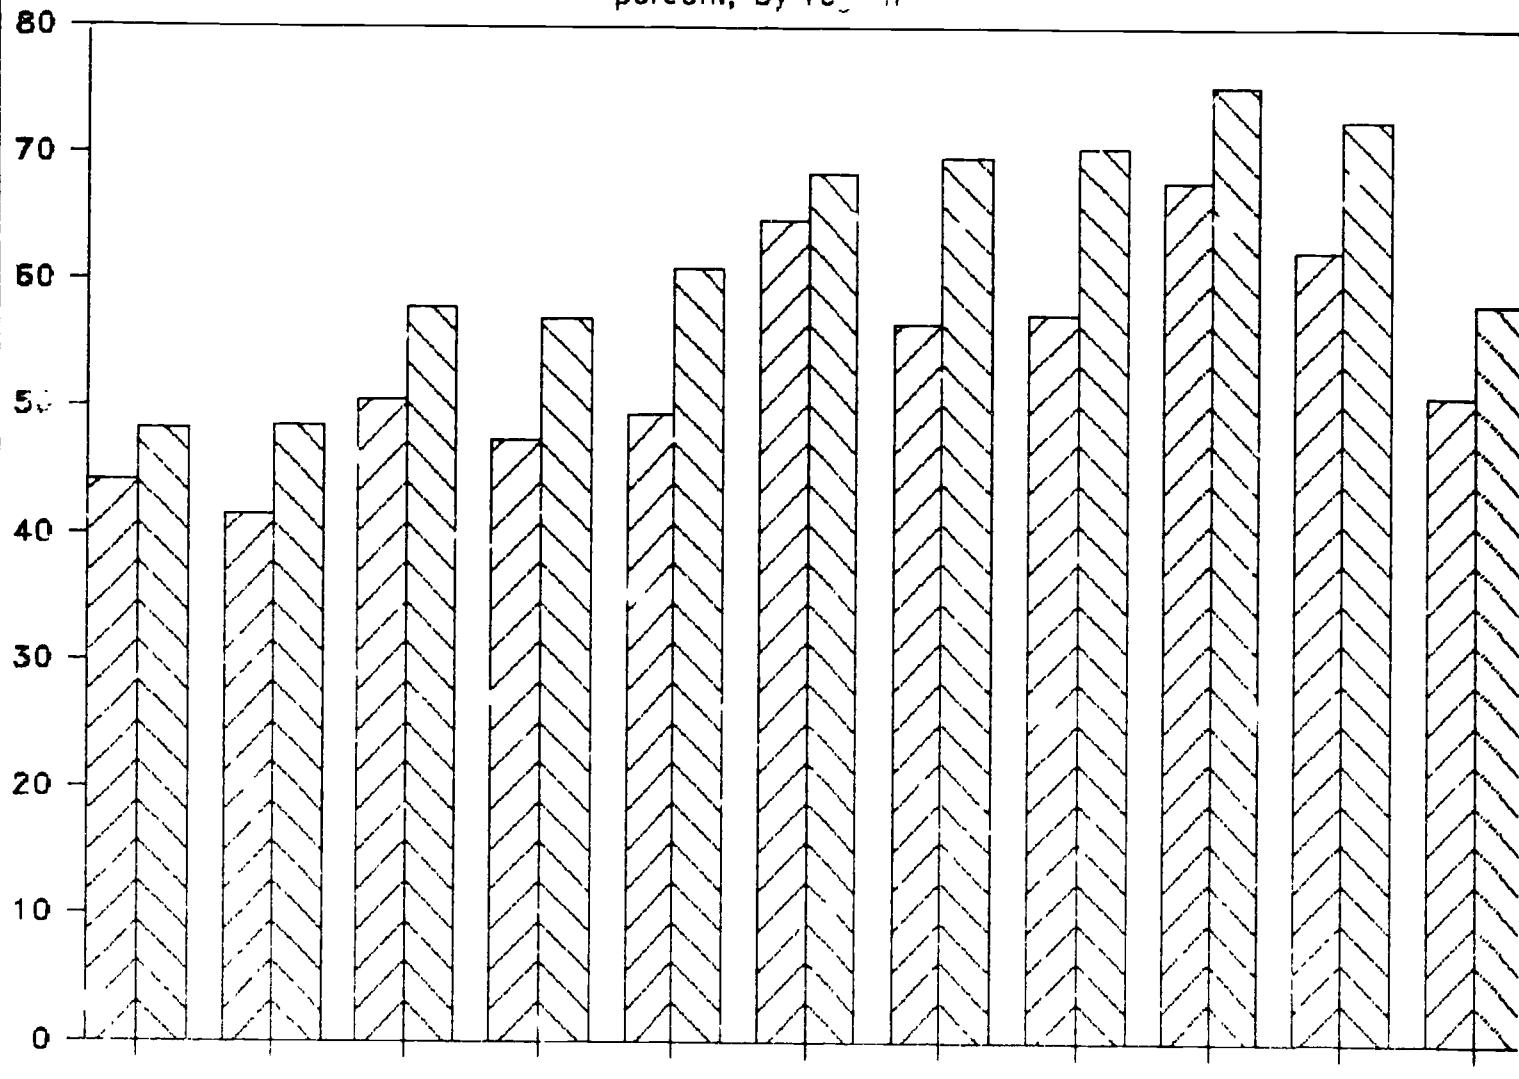

Much of this is undoubtedly due to the expanding broiler industry which is highly vertically integrated. As a result, nearly 70 percent of formula feed was fed to the mill's own animal in the Southeast and Delta.

Wholesale distributions rose modestly from 24.1 percent in 1975 to 28.8 percent in 1984. Over half of the Corn Belt production is currently marketed in this manner. Retail sales have risen slightly as a percentage of production. Both custom feeding and custom grind and mix operations have declined in importance.

Since wholesale and fed-to-own livestock operations tend to be concentrated in the over 50,000-ton size class, we may expect that as the industry becomes more heavily represented in mills of these large sizes

Figure 5--Mills owned by corporations,

these distribution methods would become more prevalent. Conversely, custom feeding and custom grind and mix establishments are generally in the smallest capacity classes. Declines for custom feeding in the Northern Plains, Southern Plains, Mountain, and Pacific regions, and custom grinding and mixing in all areas have been reported. These latter mills also tend to be owned by partnerships and sole proprietors, both of which are relatively fewer in number and production.

Transportation

Inshipments of feed ingredients to mills continued to be largely carried by trucks, although a larger portion was hauled by rail than in the 1970's. Deregulation of the trucking and rail industries in 1980 contributed to these changes in transportation methods. In 1975, 16 percent of feed ingredients were received by rail. By 1984, this proportion more than doubled to 38 percent, mostly at the expense of company-owned trucks. Trucks owned by independent firms still carried over half of all inshipments of feed ingredients. The most dramatic turnabout has occurred in the Southeast region, where rail shipments increased from 28 percent in 1975 to 64 percent in 1984. Truck shipments were still the predominant form of transportation in the grain surplus regions including the Lake States, Corn Belt, and Northern Plains because of the shorter distance involved in the shipments.

In the 1975 survey, virtually all outshipments of formula feed were transported by company-owned, customer-owned, or other trucks. Rail and barge transportation accounted for only 2.4 percent of the formula feed hauled, compared with 1.7 percent in 1975. Slightly more feed tonnage was hauled by company-owned and other trucks versus customer-owned trucks.

The distance that a ton of feed was hauled by trucks averaged 58 miles, compared with 69 miles in 1975. Distance of shipments ranged from 35 miles in the Pacific region to 83 miles in the Mountain region.

CHARACTERISTICS OF FORMULA FEED PRODUCTION

This section discusses specific characteristics of formula feed production including: (1) primary and secondary production, (2) type of livestock feed, (3) kinds of primary feed, (4) form of feed, and (5) feed ingredients used to manufacture primary feed.

Primary and Secondary Production 4/

In 1984, almost 58 percent of U.S. feed mills engaged only in primary feed production, 21 percent only in secondary feed production, and 21 percent in both primary and secondary feed production. The number of mills manufacturing only primary feed shows a marked increase from 29 percent of all mills in 1975 to 58 percent in 1984 while the number manufacturing secondary feed dropped markedly.

4/ Primary feed is feed which is processed and mixed from individual ingredients, although a premix is sometimes used at the rate of less than 100 pounds per ton of finished feed. Secondary feed is manufactured by mixing one or more grains and ingredients with a formula feed supplement at a rate of 100 pounds or more per ton of finished feed.

Primary feed production altogether accounted for 87 percent of all formula feed manufactured in the United States, up from 72 percent in 1975 (fig. 8). Primary feed production was especially dominant in the Appalachian, Southeast, Delta States, Mountain, and Pacific regions (app. table 8).

Primary feed production was also more common in larger mills with an annual capacity of 25,000 tons or more. A marked decline in secondary feed production was reported in 1984 for the smaller mills with an annual capacity of less than 25,000 tons (app. table 9).

Type of Livestock Feed

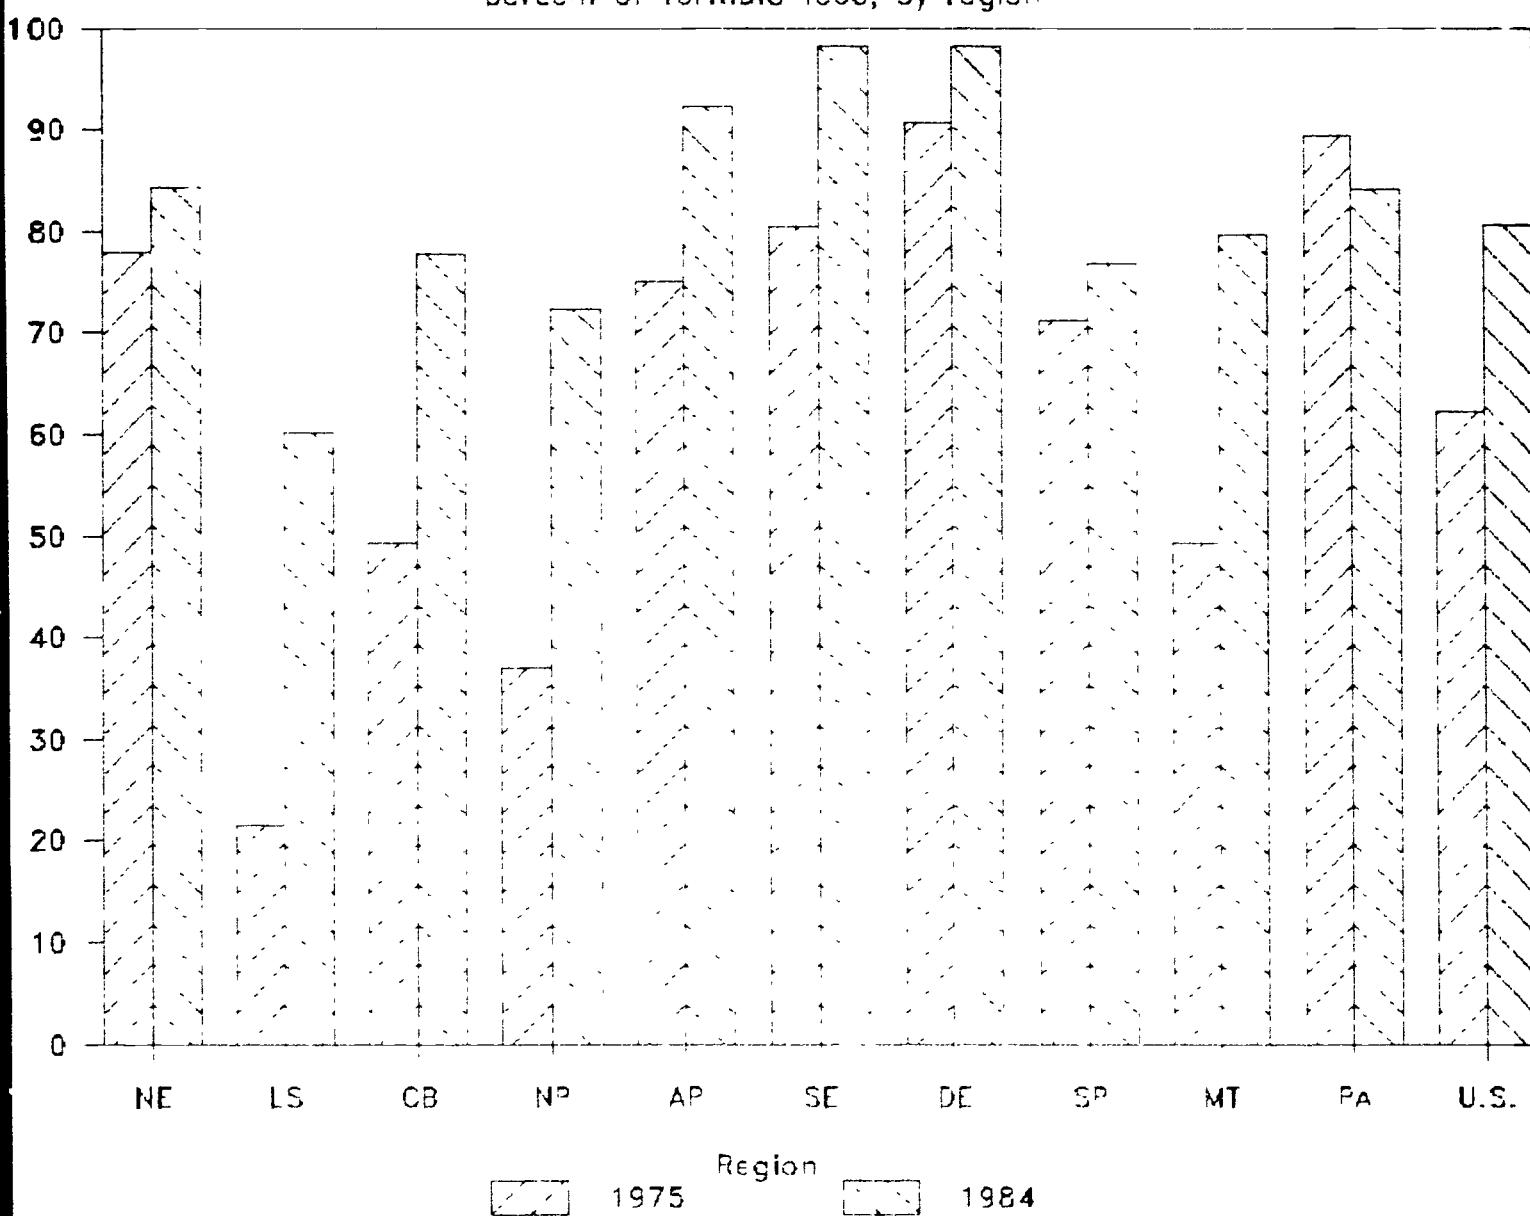

The amount of livestock feed produced for poultry, dairy, beef, and swine mirrors the changes in livestock numbers since 1975. Grain-consuming animal units during 1975-84 increased about 10 percent (5). Total concentrates fed to livestock and poultry in 1984 were slightly over 20 percent higher than the 1975 level. The number of cattle on feed increased by 19 percent, which is consistent with a 17-percent increase in primary beef and sheep feed tonnage. Swine (based on number slaughtered), broiler, and turkey numbers rose by 23, 45, 46, and 38 percent, respectively, as feed consumption per head was up 7 percent for swine, down 9 percent for broilers, and no change for turkeys. The number of dairy cows and layers in 1984 remained essentially at the 1975 level, although annual milk production was up from 10,400 to 12,600 pounds per cow, and egg production per layer went up from 232 to 245 a year.

Despite the increase in grain consuming animal units, formula feed tonnage in 1984 was held down by improvement in feed conversion efficiency since 1975, and a marked increase in the proportion of supplement feeds as a result of expanded onfarm feed mixing. Feed conversion efficiency, for example, has improved since 1975 by nearly 3 percent for broilers, reducing feed requirements to some extent. Supplement feeds tonnage more than doubled during 1975-84 and accounted for about 22 percent of primary production, up from 14 percent in 1975. Accordingly, the 5-percent increase in all formula feed production from 1975 to 1984 identified by the survey appears to be reasonable.

In 1984, poultry feed accounted for 35 percent of all primary feed production (5.4 million tons), down from 38 percent in 1975 (fig. 9). The significance of poultry feed tonnage was most noticeable in the Southeast where it accounted for 70 percent of all primary feed product on, up from 63 percent in 1975. The share of beef cattle and sheep feed also declined, from 23 percent in 1975 to 19 percent in 1984. By contrast, the share of dairy and hog feed rose by 3 and 2 percentage points, respectively, from the 1975 level. The share of formula feed for all other animals (pet food, catfish feed, and others) remained at 4 percent (app. tables 11 and 12).

While the general pattern of formula feed tonnages for various animal feeding activities is consistent with animal inventory numbers, there are a few cases where the results were not expected.

Figure 8--Primary feed production,
percent of formula feed, by region

Region

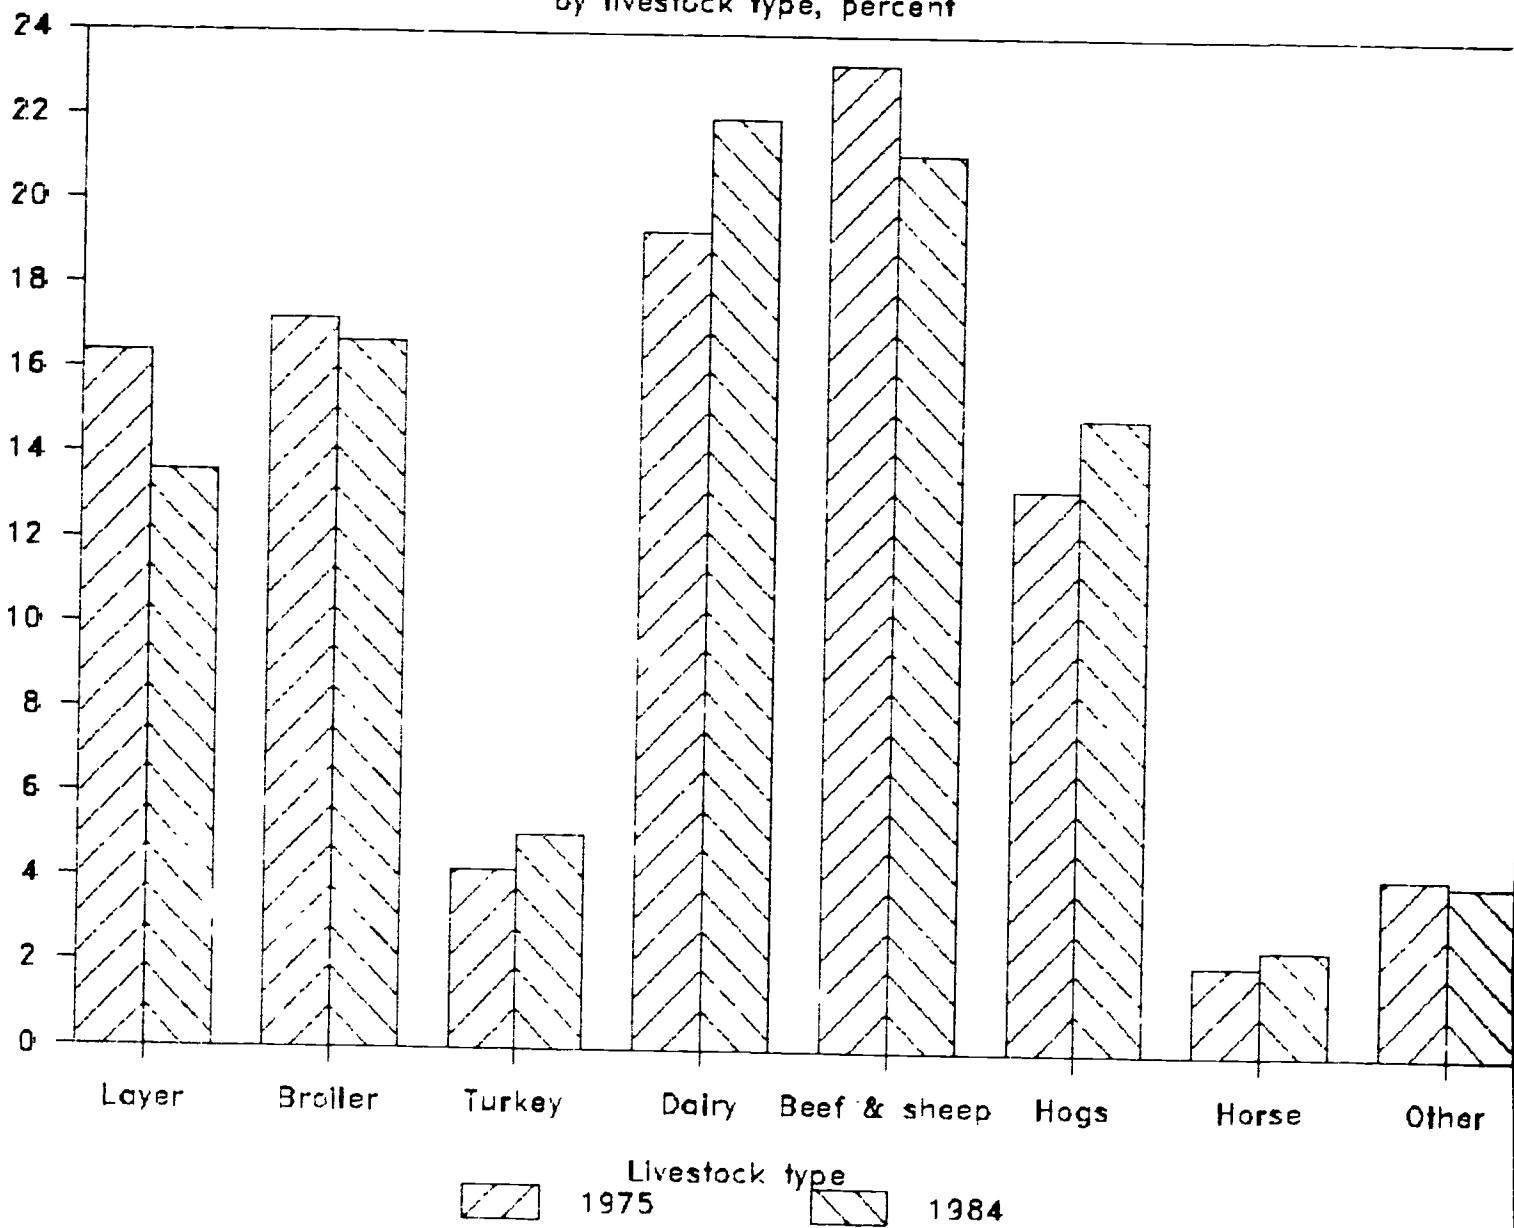

1975

1984

Figure 9--U.S. primary feed production,
by livestock type, percent

Kinds of Primary Feed

Although complete feeds are still by far the predominant kind of primary feed manufactured, there was a considerable increase in the production of supplements and super concentrates in 1984 (fig. 10).^{5/} Supplements and super concentrates in 1984 totaled 21.7 percent of the U.S. primary feed tonnage, compared with 13.7 percent in 1975.

The greatest relative changes in supplement use have occurred with beef, dairy, and swine. Demand for nutritionally complete feeds has declined as livestock producers substitute high-protein supplements and vitamin and minerals premixes that are mixed with their own grains on the farm. Many feeders have their own mixers and, as a consequence, have cut heavily into the market once held by custom grind and mix operations.

Form of Feed

Primary feed is categorized into five different forms: meal, pellets and crumbles, cubes, blocks, and liquid feed. In 1975, 55.5 percent of the primary feed production was ground into a meal or mash form. However, mounting evidence of the nutritional benefits to livestock from consuming pelleted feeds has resulted in a substantial increase in their use. By 1984, pelleted feeds made up 51.7 percent of U.S. primary feed production, compared with 41.7 percent in 1975 (fig. 11). This trend has prevailed in all production regions. Poultry accounts for much of this change, as both poultry numbers and the share of pelleted feed for poultry have increased. Cubes, blocks, and liquid feeds are still relatively minor as a percentage of total U.S. production. However, modest increases have occurred in certain regions. Cubes, as well as liquid feeds, are significantly more important in the Mountain region.

Feed Ingredients^{6/}

Feed grains comprised 49 percent of the the ingredient tonnage used to manufacture formula feeds (excluding shrinkage). This proportion is down from 53.4 percent in 1975 (fig. 12). Oilseed meals and grain and animal proteins have all risen proportionally to 19.9, 12.7, and 5.7 percent, respectively. Minerals and microingredients (vitamins, drugs, premixes), which constituted 3.8 and 1.1 percent of total ingredients tonnage in 1975, were 5.3 and 1.1 percent, respectively, in 1984.

5/ Definitions of supplement, super concentrate, and premix are:

Supplement -- a formula feed which requires the addition of grain and sometimes protein to make a complete ration. Used at the rate of approximately 200 pounds or more (usually more than 300 pounds) per ton of complete feed.

Super concentrate -- Differs from supplement in that it contains only part of the animal's protein requirements. It is added with grain and other high-protein ingredients at the rate of 100 pounds or more per ton to make a balanced ration.

Premix -- A combination of one or more microingredients with a carrier. Used at the rate of less than 100 pounds per ton of finished feed.

6/ See (1) for an article on feed ration composition for the poultry sector.

U.S. primary feed, percent

1975

1984

Corn accounted for 69.4 percent of feed grains used in formula feeds, which is little changed from 70 percent in 1975. Wheat grain has increased its share from 2 percent to 6.1 percent during this timespan. However, wheat prices were very favorable for feeding relative to other grains in 1984. Soybean meal has increased its share of the oilseed market at the expense of cottonseed meal, rising from 87 percent to 90.6 percent. The 17.2 million tons of soybean meal and 1.05 million tons of cottonseed meal survey total use compare closely with the official USDA 1983/84 domestic disappearance of 17.6 and 1.13 million tons, respectively. Wheat millfeeds remained the principal grain byproduct, accounting for 49.8 percent, up from 44 percent in 1975. Meat and bone meal was down from 56.4 percent in 1975 to 54.5 percent of the animal proteins. Poultry byproducts meal and feather meal have grown from 16.9 to 17.8 percent. Calcium constituted 41 percent of the total minerals used in 1975, but rose to 44 percent by 1984.

In the Corn Belt, the percentage of corn to all feed grains has dropped from 86.4 to 76.7 percent, while sorghum has increased from 0.2 to 10.0 percent. A similar pattern exists for the Southeast and Delta States, but in the Pacific region the corn to sorghum ratio increased from 2:1 to 14:1. Oats use appears to have declined in most regions and wheat use was higher in all regions. Soybean meal has increased relative to cottonseed and other oilseed meals in every region except the Northern Plains, where it has declined from 92.5 to 77.3 percent of total oilseed meals.

LABOR PRODUCTIVITY

Employees involved in feed production activities increased from 2.2 employees per mill in the smallest size class to 16.3 production workers in mills exceeding 100,000 tons. The average was 5.4 per establishment in 1984, which was down from 7.5 per establishment in 1975. Fewer production workers were being used in most regions and size intervals than in 1975. Corporations typically have a higher number of employees on average since they are more heavily represented among the higher producing size classes. Average output was highest in the Pacific region, and lowest in the Corn Belt.

Productivity, measured in terms of tons of manufactured feed per production employee, has improved significantly. Output per production worker averaged 5,274 tons in 1984, more than double the 2,238 tons in 1975. This trend holds for all regions and size classes. Average output was highest in the Pacific region, and lowest in the Corn Belt.

Employment in other nonproduction activities (maintenance, warehouse, trucking, office and management, and sales) has increased at most feed mills, averaging 14.5 per establishment. As a consequence, average output per all employee has risen much less than the output per production worker.
