ABSTRACT

This report surveys data from various Kentucky state government agencies and provides an assessment of economic problems in Kentucky's Appalachian region. A profile of the region and overview of the effectiveness of implemented programs are presented. Interviews with Area Development District Directors show a concern for the image of Appalachia. The data indicate that Kentucky has a division in its economic structure, where prosperity and high employment are primarily concentrated in certain metropolitan centers such as the Louisville-Covington-Newport area in the north-central part of the state. The western counties also have problems, but none as serious as those in the eastern Appalachian counties, which are in critical economic condition. The report raises the question, "Is there a more equitable way to distribute Kentucky's tremendous wealth?" This report and accompanying data may be useful to educational planners and policymakers in assessing training needs and economic trends that affect education. Suggestions for additional research to address the issue are listed. This report contains six tables and seven indices that list data relating to income, employment, and trends for Area Development Districts and individual counties. (ALL)

HIGHLIGHTS

OVERALL

From 1980 to 198. fewer new plants located in Kentucky's 49 Appalachian counties, compared with the rest of the state. As expected, most new jobs were created in the three Metropolitan Statistical Areas of Louisville, Lexington, and Covington-Newport, which are tied to the Cincinnati, OH area. Appalachia's new and expanded plants tended to be smaller and employed fewer workers than those located elsewhere.

NEW PLANTS

No new manufacturing plants were located in 23 Kentucky counties during the seven-year period. Of these counties, 11 were in Appalachia. Eleven Appalachian counties received between one and 50 jobs from new plants. Only one county, Russell, ended up with more than 1,000 jobs, and the vast majority of those came from one plant, opened in 1980. Most new plants were located along the western edge of the region, which received about 21 percent of jobs created by new plants. Appalachia holds more than 29 percent of the state's population.

PLANT EXPANSIONS

The bulk of new manufacturing jobs in the Appalachian region came from plant expansions. These helped brighten the picture substantially.

EMPLOYMENT

Twenty-one mountain counties suffered from decreases in the civilian labor force. Most of these losses appeared to be a result of changes in mining/quarrying operations. Seventeen Appalachian counties showed declines in mining/quarrying employment; four showed slight gains between 1980 and 1985. Declines generally offset gains in employment resulting from new and expanded plants.

POPULATION

Thirty-two Appalachian counties exceeded the state's average population increase of 1.9 percent during the 1980-1986 period; 13 counties grew by more than 4 percent. The greatest increases were concentrated in the Lake Cumberland area.

INTRODUCTION

Appalachia. The word conjures up many images -- some true, some myths. Appalachia is a geographical region, but its borders are fuzzy. Appalachia also is a concept, and, like all ideas, has various shades of meaning for different people; it is difficult to apply the idea to the "real world."

Appalachia. The region has been discussed and analyzed at length, especially in the 1960s and early '70s. During the mid '60s, the federal government set up the Appalachian Regional Commission (ARC) after well-publicized reports of deep poverty. ARC gave the region an "identity" of sorts; the enabling legislation designated counties in states that were to be considered as "Appalachian." In Kentucky, 49 counties in the eastern half of the state were included. ARC still gathers data on the region and oversees a limited number of federal programs geared toward economic development to fight the deeply entrenched poverty.

Despite government aid, the efforts of church workers and volunteers from across the country, and, most importantly, the diligence of the Appalachian people themselves, much of the region still lags behind the rest of the country. Tickamyer and Tickamyer (1987:[i]) make the point abundantly clear:

* The poverty rate in Central Appalachia is nearly twice the national average.

* Central Appalachia, like the rest of the country, has large and growing numbers of persons living just above the poverty line (the near-poor), who are highly vulnerable to any disruption in their economic lives.

* Based on 1980 figures, Central Appalachia's rural counties experience much higher poverty rates when compared with national figures; 22.7 percent of all people, and 19.2 percent of all families of the region were living in poverty, compared with 12.4 percent of all people and 9.6 percent of all families for the rest of the country.

* Many nationally vulnerable populations such as female-headed households, blacks, and single persons are at even higher risk for poverty in Central Appalachia, even though they are proportionately underrrepresented. Because of this underrepresentation, their presence cannot be used to explain the region's high poverty rates.

* Sources of poverty in the region are extremely complex, but three factors play a key role:

    -- Lack of employment opportunity in weak, single-industry labor markets.

    -- An underskilled, educationally disadvantaged work force.

    -- Historical and cultural factors related to economic, political, and social development.

Much has changed since the first Appalachian programs were developed in the 1960s. Since, then, a world economy based on transnational corporations has been built. Businesses are willing and able to move operations where costs, especially labor, are lowest. In addition, there have been tremendous technological advances and the fundamental change of the U.S. economy from industry- to service-oriented. These changes pose a myriad of problems for residents of Appalachia.

Blakely (1987:6) addresses these issues for communities in general and points out some of the difficulties, based on his interpretation of Peter Drucker's analysis of "uncoupling," which amounts to a loss of local and regional control over economic factors affecting the lives of people. These ideas can be applied to Appalachia as well:

* Primary products and goods production, which before were the goal and measure of development, have been "uncoupled" from the industrial economy.

* There has been an "uncoupling" of the traditional relationships among industries, employment, and community.

* Capital movement is "uncoupled" from productive capacity resulting in an alteration between work and economic well-being.

* Local economies, particularly large metropolitan systems, have "uncoupled" from the national economic system, resulting in communities as global market places.

* There has been an "uncoupling" of general community economic growth and local/community development.

During the past 20 years or so, a tremendous amount of effort has gone into improving the quality of life in the mountains. And in some ways, things are much better: Health care has improved; new highways and bridges have made many areas accessible. But some things have remained the same: Educational levels remain lower than the rest of the nation; unemployment and poverty levels are much higher. While Appalachia has been moving, the rest of the country has been moving, too.

OBJECTIVE

The persistence of economic pain in significant parts of Appalachia strongly suggests the need to take a new look at the rea. More than 25 of years of hard work have made a major difference in parts of the region, but other areas continue to suffer.

The objective of this report is to survey data from Kentucky state government agencies to provide a preliminary assessment of problem areas in the region. In addition, we interviewed directors of selected Area Development Districts across the state to learn about their attitudes toward Appalachia. (Appendix 1)

County-level data to be reviewed include:

* Per-capita income.
* Population changes.
* Labor force statistics.
* Employment changes resulting from locations of new and expanding industries, industrial shutdowns, and changes in mining and quarrying in select counties.

We will make suggestions for additional research and some general recommendations for policy geared toward easing the plight of the region.

PER-CAPITA INCOME

A quick look at Map 1 reveals the disparity between the Appalachian region and most of the rest of the state in terms of per-capita income. (See Table 1 for a detailed breakdown.) Twenty of the region's 49 counties are below $7,000 a year, with 17 more between $7,000 and $7,999.

Only Boyd County in the Ashland Metropolitan Statistical Area (MSA) is in the $11,000-and-up range. The next highest county in the region, Clark, in the Lexington MSA, is in the $10,000-to-$10,999 bracket. These are the only two counties in the top two income tiers.

Outside of the Appalachian region, there is a cluster of seven nonmetropolitan counties in the Lincoln Trail and Barren River ADD's with annual per-capita income below $8,000. Generally, nonmetropolitan counties throughout the western part of the state have lower per-capita income than metropolitan counties, but it is still higher than almost all mountain counties.

Much of the wealth is concentrated in metropolitan areas and contiguous counties. Four areas stand out, three of which form

Map 1: Per-Capita Income in Kentucky Counties, 1984

the corners of the so-called "Golden Triangle" of Louisville, Lexington, and Cincinnati, OH-Covington-Newport:

1) Two counties in the Louisville MSA -- Jefferson and Oldham -- are in the $11,000-and-up category. Shelby, also in the MSA, is among the second-level counties, with annual per-capita income of between $10,000 and $10,999.

2) In the Lexington MSA, there are three top-level counties -- Fayette, Woodford, and Bourbon. Franklin County, which is not part of the MSA designation, also is contiguous and in the highest category. Scott and Clark counties are MSA counties in the second level; Clark also is an ARC county. Anderson County also is second-level and is contiguous to the region.

3) The three Kentucky counties in the Cincinnati, OH-Covington-Newport MSA -- Boone, Kenton, and Campbell -- are in the top category.

4) In the central western section of the state, there are five counties in a rich agricultural area with coal mining and heavy industry along the Ohio River in the $11,000-and-up level. Two counties are in MSA's--Henderson in Evansville, IN, and Daviess in Owensboro, KY. In addition, three counties -- Hancock, McLean, and Muhlenberg -- are in the $10,000-$10,999 range.

POPULATION CHANGES

The majority of the 49 Appalachian counties increased in population from 1980 to 1986, according to the University of Louisville's Urban Studies Center. (Kaiser, 1987). As Map 2 shows, 32 Appalachian counties exceeded the state's average population increase of 1.9 percent; 13 mountain counties have grown by more than 4 percent. (See Table 2 for a full breakdown.) The largest population gain was around Lake Cumberland, which state officials say is the result of an influx of retirees; Russell, Pulaski, Laurel, and Whitley counties exceeded the national population gain of 6.4 percent. Two other counties, Powell and Garrard, also grew faster then the nation as a whole.

Only 11 counties in the region had population declines. Two, Boyd and Greenup, which are MSA counties, were among the greatest losers of population during the period.

Population dropped in 40 of the state's 120 counties. The mostly nonmetropolitan western end of the state lost population or showed minimal gains. Fulton County's 10.7-percent population drop was highest statewide.

The state's 19 MSA counties areas grew just 1.1 percent between 1980 and 1986, up 18,100 persons, but nonmetropolitan

areas grew 2.5 percent, an increase of 49,900 persons. Among MSA counties, Jefferson and Campbell counties lost population; the largest population gainers included Fayette, Woodford, Jessamine, Bullitt, Oldham, and Boone.

LABOR FORCE

Unemployment generally has been rising for a number of years in Kentucky (Appendix 2), and the situation in the Appalachian region is particularly grim (Map 3). Average figures for 1986 show that 34 counties had unemployment rates of 12 percent or greater, and 20 of those were at 15 percent or more. Only Madison and Cumberland counties can be considered to have had even relatively healthy unemployment rates.

The nonmetropolitan counties in the western part of the state were not much better off; there was a belt of high unemployment that extends from Livingston and Marshall counties in the Pennyrile ADD to Metcalfe at the western edge of the Appalachian region in the Barren River ADD. Calloway, Christian, Simpson, Hardin, Larue, and Taylor counties could be considered to be in relatively good shape.

Conditions were just the opposite in the Louisville-Lexington-Covington-Newport region. Eleven counties were under

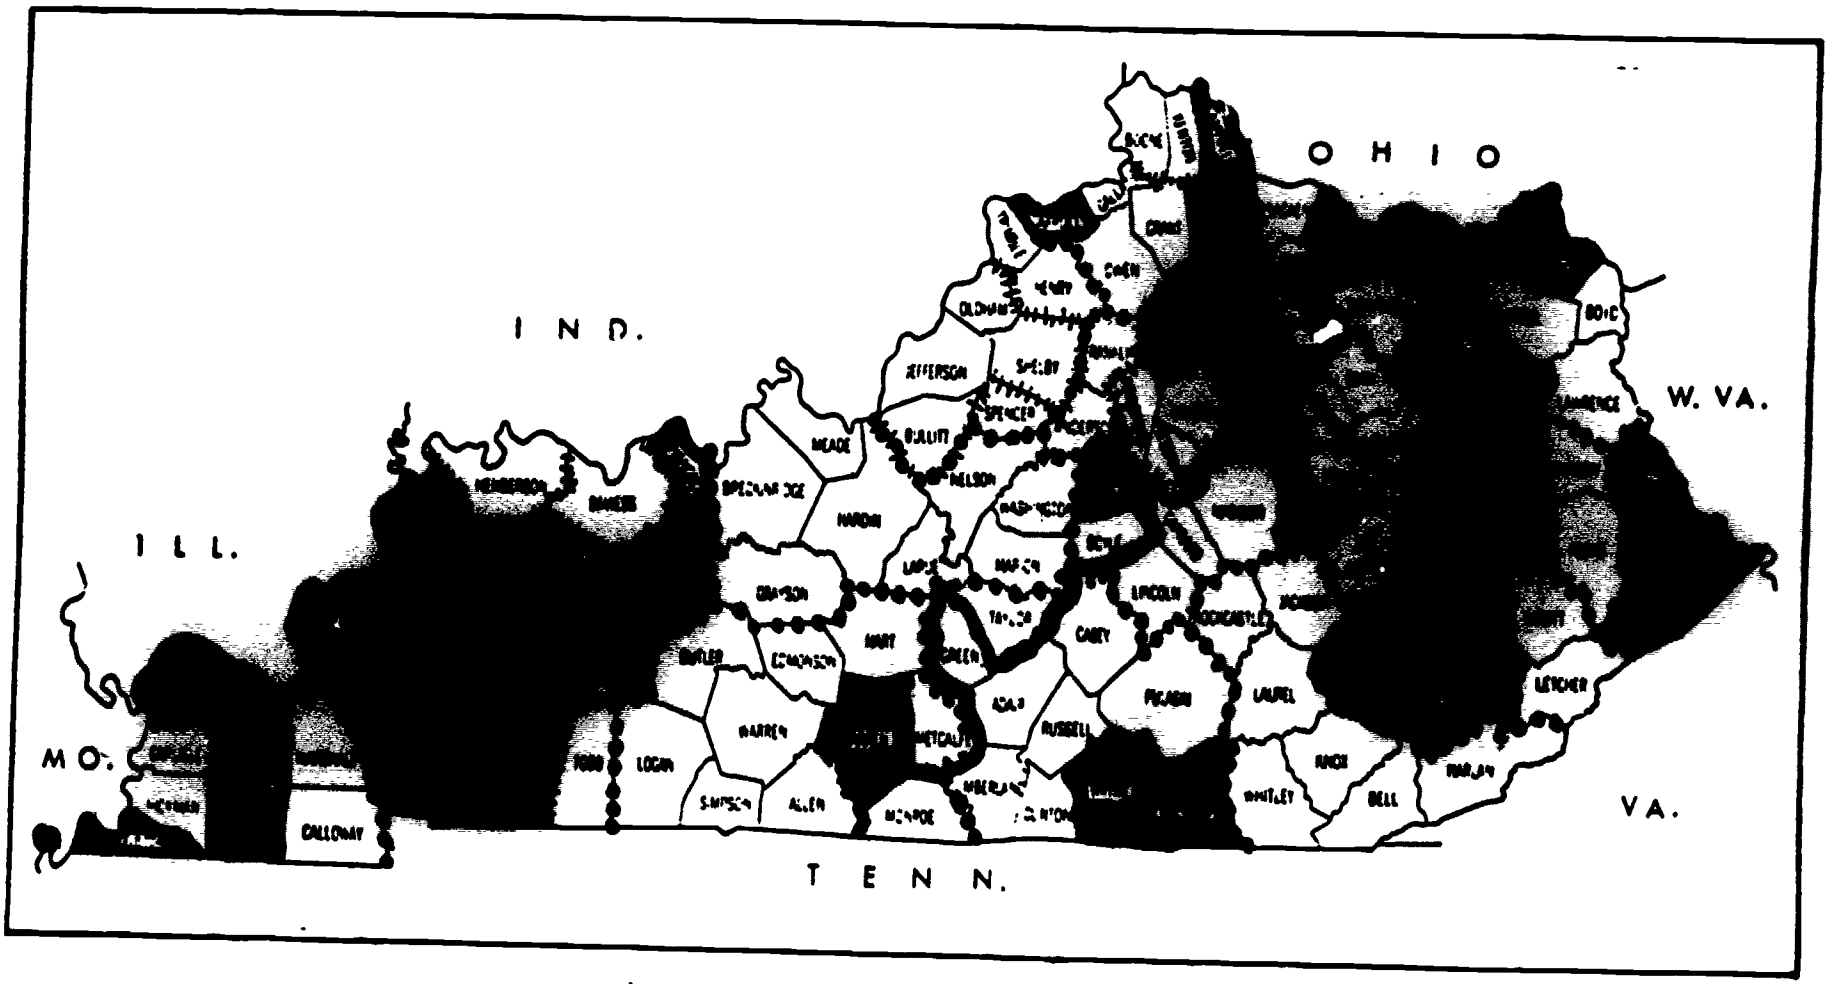
the state average of 7 percent, and ten were in the 7-percent to 7.9-percent range. There were no counties in that area with an unemployment rate of 12 percent or more.

Another way to picture the economic health of counties is by looking at what has happened to the civilian labor force (Map 4). Between 1980 and 1986, 47 counties in the state lost workers -- 21 in Appalachia and 26 outside of the region. In Appalachia, there is a band of 10 counties from Lewis and Greenup in the north through the center of the region to Clay and Leslie counties. Two more counties, Wayne and McCreary, are in the Lake Cumberland area, and two -- Pike and Martin -- in the extreme eastern part of the state. Two more Appalachian counties are at the south end of a string of seven counties that begins with Campbell in the north and ends with Estill in the south.

In the western part of the state, there is a substantial block of 17 counties in the Purchase, Pennyrile, and Green River ADD's where the labor force declined during the study period. (For a statewide breakdown of unemployment and labor force figures, see Table 3.)

MAP 4: Kentucky Counties Where Civilian Labor Force Declined, 1980-1986.



INDUSTRIAL DEVELOPMENT

From 1980 to 1986, Kentucky's Appalachian counties received the fewest new jobs from new plant locations, compared with the rest of the state (Map 5). As expected, most new jobs were created in the three Metropolitan Statistical Areas of Louisville, Lexington, and Covington-Newport, in the Cincinnati, OH, MSA. Appalachia's new and expanded plants tended to be smaller and employed fewer workers than those located elsewhere.

No new manufacturing plants were located in 23 Kentucky counties during the seven-year period. Among these counties, 11 were in Appalachia. Eleven Appalachian counties received between one and 50 jobs from new plants. Eighteen counties placed in the middle range, where new plants created between 51 and 400 jobs.

A number of Appalachian counties -- Boyd and Clark, both MSA counties; Madison, Jackson, Knox, Wayne, Monroe, and Casey -- placed in the second-tier position of 401 to 999 jobs during the seven-year period; all of these are in the western half of the region, and four are along the ARC dividing line. Only one county, Russell, ended up with more than 1,000 jobs, and the vast majority of those came from one plant, opened in 1980. Most new plants were located in counties along the western edge

of the region. As a whole, the mountain counties garnered about 21 percent of jobs created by new plants; Appalachia holds more than 29 percent of the state's population. (According to state tabulations, both Mason and Boyd counties would have appeared in higher categories, but substantial portions of new jobs listed in these counties came as a result of plant reopenings. The state considers the reopening of any plant closed for more than a year as a new site. For a full breakdown of new plant sitings, see Table 4.)

The central section of the state received the most jobs as a result of new plant locations; these are concentrated in contiguous MSA counties of Boone, Kenton, and Campbell; Scott and Fayette; and Jefferson and Shelby. Counties in the center of the "Golden Triangle" have relatively low levels of new plant sitings. Seven counties in the northern area received no new plants. Three -- Bracken, Robertson, and Nicholas -- are non-metropolitan counties located between the Ohio River and the edge of Appalachia. Two -- Owen and Trimble -- are in the middle of the region, and two -- Spencer and Washington, are on the southern edge.

Other counties in the 1,000-plus jobs category are Nelson and Warren. In between, there is a widespread dispersion of 10 counties in the 401-to-999-jobs classification. These are mostly in the south-central section of the state.

Two other counties -- Meade and Breckinridge, along the Ohio River -- received no new jobs. Edmonson, Larue and Allen counties fared poorly, receiving fewer than 50 jobs.

In the west, four counties in the Purchase ADD are in the top third of new plant sitings. They are Calloway, Marshall, Graves, and Fulcon. Three counties in the region received no new plants, while most of the counties are in the 201-to-400-job range.

By developing a composite of all new jobs from new plants, expansions, and businesses that serve industries, and then subtracting losses from plant closings during the seven-year period, it is possible to give a relatively complete picture of manufacturing development in Kentucky. (Map 6. Table 5. Table 4 and Appendices 3-5 are basis for the data used in compiling this map.)

Most new manufacturing jobs in the Appalachian region are the result of plant expansions. Certain mountain counties appear to be doing well, especially Greenup and Boyd in the Ashland MSA; Clark, in the Lexington MSA, and Madison and Powell, which are contiguous; Rockcastle, Laurel, and Whitley along Interstate 75 in the Cumberland Valley ADD; Russell, Pulaski, and Wayne, in the Lake Cumberland ADD; and Monroe, in the Barren River ADD.

SOURCE: Kentucky Commerce Cabinet

But even in the composite, there are numerous trouble spots, mostly in the eastern half of the region. Twelve counties have actually lost jobs during the years studied. Six more have gained fewer than 50. Twelve counties fall into the lower middle range of 51 to 200 jobs.

In the central part of the state, only nine counties have gotten 50 or fewer jobs between 1980 and 1986. Fourteen have gotten more than 1,000. Thirteen are in the 401-to-999-job category.

The western region of Purchase, Pennyrile, and Green ADD's is spotty, but certainly relatively healthy. Five counties have ended up with a net job loss, while three have gained 50 or fewer jobs. Three counties are in the 1,000-and-up category, and six are in the 400-to-999 range.

The above data indicate that the state's policy of attracting new industries plus expansions of existing operations have had a positive impact on wide sections of the state, including parts of Appalachia. But the picture for the region looks worse after coal/quarrying employment, which is the basis of the economy in many mountain counties, is sketched into the scene.

It is common knowledge that the number of miners has been

falling sharply in recent years. In selected counties where employment in mining/quarrying operations totals about 10 percent or more of a county's industrial labor force (Department of Commerce, various years), the number of mining/quarrying jobs lost between 1980 and 1985 more than offsets any gains made with new and expanded plants minus jobs lost in shutdowns between 1980 and 1986. Losses probably would be worse if 1986 coal employment data were available.

Table 5 shows that five Appalachian counties -- Breathitt, Harlan, Leslie, Morgan, and Pike -- lost industrial jobs between 1980 and 1986. One western county, Muhlenberg, suffered a similar fate. But if losses in coal/quarrying employment added, 17 Appalachian counties show employment losses during the period (Map 7, Table 6). Six counties in the region gained. In the western part of the state, two counties -- Daviess and Hopkins -- were positive; two -- Muhlenberg, Ohio, and Union -- were negative.

DISCUSSIONS WITH AREA DEVELOPMENT DISTRICT DIRECTORS

Perceptions about Appalachia present a major problem. Discussions with Area Development District (ADD) directors were helpful in suggesting how some view the region.

T. Jack Eversole is executive director of the Barren River ADD, which has only one Appalachian County as defined by the Appalachian Regional Commission -- Monroe. Eversole sees politics as one problem Appalachians face.

"Western (flat-land) Kentuckians are more likely to work for a "`win-win,'" he says, adding that there is more of a realization among western Kentucky political people that your enemy in one election will be your ally in the next. They are not as apt to hold long grudges.

Other perceived difficulties, which Eversole says also are common outside of Appalachia, include: convincing children to stay in school. Use of Forward in the Fifth (Congressional District) program is one step toward easing dropout rate. Another part of program includes urging employers to hire high school graduates instead of dropouts.

Eversole says another barrier is the lack of people with ideas for new businesses; there is a need to teach people creative thinking.

Eversole does not think the state is ignoring Appalachia. He cites, for example, the Highlands Tourism Program.

One common image of Appalachia centers on problems with the work force. ADD directors from the region are quick to point out the quality of Appalachian workers. One, Roger Recktenwald of the Big Sandy ADD, puts up a strong defense:

He says the work force is productive and has the entrepreneurial skills, too. As a log truck drove by the office, he cited the gutsiness of the operator, who probably had borrowed the money and bought one truck, willingly taking the risk. "They're scrappin' and they're hustling more than most," he says. "There's a helluva lot of local initiative here."

Kentucky River ADD Director R. Percy Elkins points to the false perception of violence of the United Mine Workers that dates back 50 or 60 years.

In addition, the region just can't keep up with changes in the rest of the world, Elkins says. Twenty years ago, the area had problems competing because of poor roads. Now that the road system is in place, jobs have been moved offshore. Now, there's nationwide abundance of labor. During coal boom, the area's population grew 20 percent. With tough times in the mountains and elsewhere, people can't move to Dayton or Cincinnati as they did during '50s and '60s.

His ADD has been touched by jobs moving offshore, Elkins says. In Campton, Control Data had a profitable computer plant, but decided the work could be done more cheaply overseas. The firm sold the plant to local management, which resulted in loss of 30 jobs, although the company is still in business.

"We aren't losing our jobs to people who are educated," he says. We're losing our jobs to people who are willing to work for less."

The loss of employment in the coal industry has caused tremendous problems. "That's a hard lesson to learn," Recktenwald says, adding that there has been a "recognition of this fact only in the past two or three years. [That] still doesn't bring an I-64 in your direction."

Nor does it bring manufacturing jobs. The only non-coal related manufacturing concern in the Big Sandy ADD is American Standard. Recktenwald says someone in the ADD had a personal relationship with an individual in the upper levels of the company. The availability of low-cost labor also was a plus in attracting the firm, which assembles and warehouses plumbing fixtures.

Kentucky River ADD also has been hurt by the loss of coal jobs and has benefited little from development of new industry. Elkins says the eight-county district has fewer than 1,000 manufacturing jobs and has lost 4,000 coal-mining jobs since 1978. And miners, who once earned between $10 and $13 an hour, are now working for minimum wage.

The region has gained 750-1,000 manufacturing jobs in the past 15 years. Elkins calls this "a pittance." Despite incentive packages designed to attract new industries, the area has not had much success.

Wayne Spencer, assistant director of the Purchase ADD, suggested that physical limitations of topography and drainage create many problems for the Appalachian region. He also sees transportation as a difficulty. But he points out that the region's natural beauty makes it ideal for tourism.

In the Kentucky River ADD, Elkins' picture of jobs in the future is bleak, unless the state offers incentives to help develop the tourism industry. Tourism is the "best future" for the area, he says. The region has natural beauty, and people like to come to the mountains, but there is a need for facilities to keep families occupied. This can only be done with state incentives to help people invest, he adds.

Elkins says coal operators and bankers have the money, but will not use it in region without state aid. They would rather, under current conditions, invest it out of the region in things such as horse farms. With incentives from the state to help lessen the risks, coal operators and bankers might invest their profits in job-creating enterprises, he says.

The changing economic picture is causing many ADD's to re-evaluate their activities and to begin to direct more help toward small businesses. John L. Bruner II, director of the Cumberland Valley ADD, says in the past, this group of businesses has received only "lip service."

Because of the number of small businesses across the state, some ADD officials say it is difficult to offer help because there is not enough staff to go around. But they also agree that small businesses form the backbone of the economy. Bruner says his ADD is beginning to focus more on small businesses with loan programs, a proposed business incubator to nurture small businesses for up to two years, and technical assistance. He expects this emphasis to increase in the future.

"There isn't any reason to get out smokestack chasing anymore," he says. And since 1980, there has been an increased emphasis on business expansions, which, in his ADD, has been

creating perhaps 10 times as many jobs as new plants.

Bruner says Appalachia's problems are similar to those of other rural areas, but are concentrated because of the population density. "We've got a lot more people than we have economy to support them, unless coal is good," he says. When coal is down, people can either reduce their standard of living or leave the area, because there isn't a farm economy or anything else to support them, he says.

"Unless we have an economy in Appalachia that will trade on goods and products, Appalachia is always going to lag behind the rest of the nation," he says. "The salvation for Appalachia is small business."

Officials in the Big Sandy ADD are trying to find new ways to build the economy of the area, with an emphasis on small businesses. Recktenwald says the region needs to develop a local base for its economy in order to provide some type of employment. He continues the story:

"Because of the [coal] industry, there've been a helluva lot of skills learned here; a helluva lot of new technology has been designed right here by the people who do it on a daily basis and

have had the better idea and put it into practice and have been sucked up by the industry and patented by somebody else. And you name it. In terms of applied technology, you're in the seed bowl right here. Metal fabrication . . . Electronic controls -- air, water, chemicals, soft or hard materials, liquid materials, dust up to lumps . . . hydraulics . . . electricity -- conversion, transformers, storage.

"So, we've got all of these skills. They've been brought to us because of our experience with the energy industry -- gas, oil, and coal. . . . We've got an incredible array of skills. We've got a work force here that works. Consequently, how do we put these things together? We have been going, ourselves, through a frustrating and exhausting process of rethinking the same old thoughts again. Everything we do is related to an interstate. . . . [But] technology has allowed us to develop roads through the sky. We can put up a satellite. We can suck in anything that's out there. We could have the Hartford Company locate in beautiful downtown Prestonsburg."

All of this amounts to a plan which will, "in a sense, re-industrialize this area," Recktenwald says. The plan is in its preliminary stages, but is far-reaching in its implications.

Recktenwald continues: "And what we are going to do is we

are going to replace coal. . . . We're going to be replacing it with a whole array of products [using] the skills that we've developed using coal and gas and oil. . . . We are going to find products for these companies to make . . . so that the people can stay here, so that the workers can stay here, and the industries can stay here. We'll use whatever transportation's available.

". . .We're putting a marketing scheme together. We're going to the companies around here, and we're talking to them specifically . . . They cannot afford to have sales people . . . [We go to these three brothers, for example, and say:] `You can't afford to put a man on the road with a valise and tie to sell your products, or to sell your capacities or abilities, whatever it is. . . . We will get somebody -- whether it's a company or individual -- who can [carry in a briefcase] your portfolio. . . and join four or five of these companies together and let them each participate on a dollar basis."

Recktenwald already has enlisted help from the Appalachian Regional Commission and a local bank to help finance the adventure, which he admits is only a start: "It's very small. It's a very primitive step at this point, but I . . . believe that it's the only thing that makes sense, that is reasonable and that typically reasonable people can understand at first

blush. We're not going to get a Toyota here. . . . We couldn't support it if we got it.

". . . If we [succeed with this shared sales force] we're still going to end up with a minuscule number of jobs in relationship to what coal will have at that point. We're not trying to do anything to inhibit coal by a long stroke. What we're trying to do is accommodate what coal has not been able to with regard to employment. . . And quite honestly, that's about the only step that has been taken -- it's in the process right now."

. . . DIVIDED WE FALL: CONCLUSIONS

We are a state divided.

The state seal shows a mountaineer shaking hands with an aristocrat under the motto: "United We Stand. Divided We Fall." This preliminary report points to strong indications of divisions in the economic structure of Kentucky, divisions where wealth is continually concentrated in certain areas.

To those who know the state, this is not news; it is a problem that has grown over the generations. Metropolitan areas are growing richer, while the nonmetropolitan and especially Appalachian counties remain poor -- despite more than 25 years of efforts to improve conditions.

This report contains seven vignettes that reveal information about Kentucky's economic health. When viewed together, the vignettes reveal a fairly clear picture of a state facing serious economic problems. Many of the difficulties are external to the state, the result of changing national and world economies.

But there are places where state policymakers can and should exert control. In fact, there has been some movement in that direction. But a major problem facing the state is the outflow of Appalachian wealth and the continuing misery of many residents there. In the large view, the western part of the state is pitted against the eastern part.

But this polarization is not completely clear cut; obviously, there is uneven development in western Kentucky, too. There can be little doubt about the economic dominance of the "Golden Triangle," which is in good to excellent economic condition. While other metropolitan centers are relatively healthy in many respects, the northern region is by far the healthiest. This prosperity tends to spread to the whole central region of the state, and even into some Appalachian counties. The economic health of the western part of the state, while better than that of Appalachia, is spotty.

Among the Appalachian counties, there are some places where industrial development has occurred, such as the Lake Cumberland area and along Interstate 75. But eastern counties of the region are in critical economic condition. And what little economic development is going on there does not come anywhere near offsetting declines in coal and quarrying employment. These are clear signs of deep economic polarization in the state.

This finding forces a question: Is there a more equitable way to distribute Kentucky's tremendous wealth? A preliminary report cannot answer that question. In the next section, we offer some suggestions for additional research to address the issue.

SUGGESTIONS FOR FURTHER RESEARCH

* APPALACHIAN STUDY -- One of the major functions of Area Development Districts is to collect and keep data. All ADD's recently completed annual reports to the state; while the data are still "fresh," directors whose ADD's contain Appalachian counties should meet to begin work to develop a larger regional assessment of strong and weak points. This assessment needs to be followed by a plan of action to lift the region out of its economic depression.

* SMALL BUSINESSES -- It is important to more closely study the state's economy to compare the impact of new plants versus plant expansions. What assistance can the state give to existing locally owned and operated small businesses, especially those in Appalachia, which traditionally have been tied to the coal industry? Would it be better for the state to devote more resources to this endeavor?

* APPALACHIAN IMAGE -- There appears to be a high frustration level on the part of ADD directors concerning what apparently are widespread problems with the image of Appalachian workers. The directors agree that many workers already have the skills necessary for a variety of jobs.

The state Commerce Cabinet should survey management of existing companies, especially those which have expanded, and prospective businesses to learn about management perceptions of workers in the region. If there are problems, this study would give the state clues about how to deal with them. In addition, the state needs to review its own industrial marketing efforts regarding Appalachian development.

ACTION STEPS

We do not pretend to have easy or immediate solutions to the deeply rooted problems of Appalachia. But, as residents of the

region, we are deeply aware of the devastating effects these problems have on those who live in the region. There is a need for radical redistribution of wealth to the poor. In the interim, we strongly recommend two steps as starting points:

1) That the people of Appalachian Kentucky hold "town meetings" to outline problems and begin to develop solutions based on local needs. Organizers of these meetings must go out of their way to make sure that the voices of those outside the normal power structure -- the poor and unemployed, women, and minorities -- will be heard. But there also should be representation from small businesses, farmers, religious workers, and government.

2) That the candidates for governor develop plans for mitigating the poverty, hunger, unemployment, and other problems of the region. Whoever is elected governor should pledge to listen to and work with the people of the region to meet their needs.

Kentucky is only as strong as its weakest region. When there is as wide a discrepancy in wealth as there is, that can only mean there is division. Our state's founders understood this. East and west must reach out so they can stand united.

EXPLANATION OF CODE FOR TABULATIONS: yyy(n)x, where yyy equals number of new jobs created, according to state figures; (n) equals number of sites; an x means state did not provide number of jobs created at one or more sites; number of x sites is included in (n). For example: Simpson County, 1986: 137(2)x--137 jobs were created at 2 sites; state did not give total number of jobs at one site.

EXPLANATION OF CODE FOR TABULATIONS: yyy(n)x, where yyy equals number of new jobs created, according to state figures; (n) equals number of sites; an x means state did not provide number of jobs created at one or more sites; number of x sites is included in (n). For example: Simpson County, 1986: 137(2)x--137 jobs were created at 1 site; state did not give total number of jobs at 1 site.

* Metropolitan Statistical Area county.
+ Appalachian Regional Commission county.

EXPLANATION OF CODE FOR TABULATIONS: yyy(n)x, where yyy equals number of new jobs created, according to state figures; (n) equals number of sites; an x means state did not provide number of jobs created at one or more sites; number of x sites is included in (n). For example: Calloway County, 1980: 204(6)x--204 jobs were created at 6 sites; state did not give total number of jobs at at least one site.

* Metropolitan Statistical Area county.

APPENDIX 7: New Manufacturing Operations, Plant Closings, 1980-1986 -- Estimated Number of Jobs Created or Lost, Number of Communities, and Investment.

1980
NEW OPERATIONS

New Manufacturing Plants.....51
Number of Communities.....54
Estimated Employment.....5,815
Investment.....$354,734,500

Manufacturing Expansions.....549
Number of Communities.....124
Estimated Employment.....6,614
Investment.....$950,171,843

Support Businesses..... 5
Number of Communities.....5
Estimated Employment.....68
Investment.....$2,682,000,00

ESTIMATED TOTAL NEW JOBS.....13,109

PLANT CLOSINGS

Plants Closed..... 86
Number of Communities.....58
Estimated Jobs Lost.....6,835

Net Gain or Loss of Jobs.....+ 6,274

APPENDIX 7: New Manufacturing Operations, Plant Closings, 1980-1986 -- Estimated Number of Jobs Created or Lost, Number of Communities, and Investment.

1981
NEW OPERATIONS

New Manufacturing Plants.....81
Number of Communities.....54
Estimated Employment.....5,510
Investment.....$1,079,767,690

Manufacturing Expansions.....432
Number of Communities.....124
Estimated Employment.....7,947
Investment.....$603,270,883

Support Businesses..... 7
Number of Communities.....5
Estimated Employment.....122
Investment.....$256,875,000

ESTIMATED TOTAL NEW JOBS.....13,579

PLANT CLOSINGS

Plants Closed..... 69
Number of Communities.....44
Estimated Jobs Lost.....2,760

Net Gain or Loss of Jobs.....+10,819

APPENDIX 7: New Manufacturing Operations, Plant Closings, 1980-1986 -- Estimated Number of Jobs Created or Lost, Number of Communities, and Investment.

1982
NEW OPERATIONS

New Manufacturing Plants.....75
Number of Communities.....52
Estimated Employment.....5,472
Investment.....$138,094,500

Manufacturing Expansions.....455
Number of Communities.....133
Estimated Employment.....5,832
Investment.....$487,360,996

Support Businesses.....11
Number of Communities.....9
Estimated Employment.....295
Investment.....$9,738,000

ESTIMATED TOTAL NEW JOBS.....11,599

PLANT CLOSINGS

Plants Closed..... 89
Number of Communities.....52
Estimated Jobs Lost.....6,139

Net Gain or Loss of Jobs.....+5,460

APPENDIX 7: New Manufacturing Operations, Plant Closings, 1980-1986 -- Estimated Number of Jobs Created or Lost, Number of Communities, and Investment.

1983
NEW OPERATIONS

New Manufacturing Plants.....65
Number of Communities.....42
Estimated Employment.....3,436
Investment.....$77,006,750

Manufacturing Expansions.....249
Number of Communities.....95
Estimated Employment.....6,887
Investment.....$868,793,660

Support Businesses.....19
Number of Communities.....17
Estimated Employment.....1,057
Investment.....$16,650,000

ESTIMATED TOTAL NEW JOBS.....11,380

PLANT CLOSINGS

Plants Closed.....106
Number of Communities.....60
Estimated Jobs Lost.....6,410

Net Gain or Loss of Jobs..... .+4,970

APPENDIX 7: New Manufacturing Operations, Plant Closings, 1980-1986 -- Estimated Number of Jobs Created or Lost, Number of Communities, and Investment.

1984
NEW OPERATIONS

New Manufacturing Plants.....107
Number of Communities.....54
Estimated Employment.....10,308
Investment.....$230,172,555

Manufacturing Expansions.....381
Number of Communities.....113
Estimated Employment.....9,798
Investment.....$858,376,304

Support Businesses.....16
Number of Communities.....12
Estimated Employment.....1,903
Investment.....$141,950,000

ESTIMATED TOTAL NEW JOBS.....22,009
