ABSTRACT

The development of individualized educational programs (IEPs) has become a burden for many secondary school systems. The primary objective of the project described in this report was to develop a computer system that would help in the development of IEPs for all 15,000 handicapped and/or disadvantaged students enrolled in Pennsylvania's vocational programs. Collection of tests and their criteria used in IEP development was the method used to obtain data, using a 10% sampling of school districts. The Singer Vocational Evaluative System and the Vocational Interest Assessment Survey were incorporated in the program. Information was put in the proper computer syntax, and logic sequence models for data usage were constructed. The instrument was tested using data appropriate for handicapped students enrolled in the programs. The system performs the following operations: (1) locates discrepancies and results of intelligence quotient (IQ) tests; (2) classifies the IQ score; (3) compares achievement and IQ standardized results; (4) classifies isolated IQ results into educational terms; and (5) offers some guidelines related to a student's probable academic abilities. The following factors may affect the results offered by the program: physical limitations of the student; basing decision on aptitude or interest results as isolated test scores; and evaluator errors--these may be eliminated by reviewing test procedures. (Five appendices forming the bulk of the document are: (1) list of professional contacts and organizations; (2) sampling of special needs students' assessment instruments; (3) users' guide--IEP assessment aid; (4) sample computer assessment output; and (5) computer programmed information.) (NLA)

Development and Testing of an Expert System to Assist in Evaluating Handicapped Vocational Students for IEPs

INTRODUCTION

"Mainstreaming" and "normalization" are terms frequently used throughout our educational system. They refer to program planning and implementation for the special needs student.

Frequently, special needs students are placed in a mainstream classroom in order to meet normalization criteria. Mainstream placement occurs to achieve the most appropriate and least restrictive educational environment. Unfortunately, the mainstream classroom teacher is often inadequately prepared to meet the educational requirements of the special needs student. Learning how to identify, appropriately assess and program for the student requires additional time and training, not often provided the normal classroom teacher.

In the high school setting in particular, guidance counselors are often busy attempting to assist the college bound student with placement ideas. School psychologists, who often have adequate training and background information related to the special needs student, spend hours attempting to appropriately assess students and interpret their standardized test results to determine appropriate student placement within the system. Because of these factors, both of these resources become unavailable to assist the classroom teacher with development of an appropriate educational strategy, tailored to meet the needs of the special needs student.

Breakdowns in educational background and support services for the classroom teacher often result in the development of a meaningless court mandated individualized educational program (IEP) for the student. Plans are often developed purely to meet regulations, but offer no true meaning related to the student's progress and educational needs.

RATIONAL

The development of individualized educational programs has become a real burden and task for many secondary school systems. Such special care and consideration for our special needs population was mandated by law many years ago. The impact of this federal legislation is being felt in all grade levels. Prior to the passage of legislation dealing with the education of the handicapped, school officials had little trouble working with the "regular" students. IEP teams did not exist and therefore no man-hours were required. With the passage of Public Law 94-142, The Education of All Children Act (1975), special care had to be taken in providing services to this population. Specifically, P.L. 94-142 required that an IEP be developed for each and every handicapped student and that these individuals will be educated in a *least restrictive environment*.

With the passage of The Carl D. Perkins Act of 1984, the requirements of an IEP for all handicapped students was reiterated. Additionally, this new act required that IEPs be completed for disadvantaged students as necessary. It is not uncommon to find schools where the process of writing IEPs takes the entire year. *School officials, especially those concerned with IEP development, are swamped with meetings and paperwork dealing with developing appropriate and effective IEPs for handicapped students.*

Conversations with school officials throughout the Commonwealth have revealed complaints about the time consuming task of writing IEPs. This was especially true in the Philadelphia area. There, school officials indicated that the process of writing appropriate IEPs is a year-round activity. Officials in the Harrisburg area had similar kinds of comments. In the 1985-86 academic school year, there were more than 15,840¹ handicapped students in vocational programs alone that required IEPs. Another 1,952

¹ 1985-86 Vocational Education Management Information System, Pennsylvania Department of Education.

handicapped students were enrolled in specially funded programs. Governor Casey² stated that "we must be certain that our schools meet these students' needs or we will doom many our young people to lives of limited opportunity"(p. 27).

Using an Expert System

An Expert system is a method of using the expertise of professionals to solve problems, similar to how we use consultants. Expert systems go a step further by adding the knowledge of experts to a computer system and utilizing that knowledge in the same way as the expert does. Thus, it is possible to use this knowledge and make the same decisions as if the one were conversing with the consulting expert. J. R. Quinlan³ (1986) stated that the technology of building knowledge-based systems by inductive inference from examples has been demonstrated successfully in several practical applications. Expert system has been very effective in climatology especially in the hurricane season to predict hurricane incidents. Quinlan advocates more extensive use of this technology in other areas as well. Expert system and artificial intelligence are sometimes used interchangeably. Machines that think or machines who think have been a topic of reflection and debate according to Kurzweil (1985). However, artificial intelligence differs in that expert system uses a knowledge based from which conclusions are made and does not generate or attempt to generate new information as does the former. *Rulemaster*⁴ provides the most appropriate shell for the development of an expert system in education. It is easily used and is available on the Cooperative Extension Computer Network.

OBJECTIVES

The primary objective of this project was to develop an computer system that would aid in the development of IEPs for handicapped and/or disadvantaged students. This

² You've Got a Future in Casey—The Casey-Singel Education Plan for Pennsylvania, 1986.

³ J. R. Quinlan, Centre for Advanced Computing Science, New South Wales Institute of Technology, Sydney, Australia

⁴ Radian Corporation, Austin Texas

computer system used the same information, clues, and patterns used by experts in the field. It is anticipated that this system would benefit all (15,000) handicapped students enrolled in vocational programs in the Commonwealth.

PROCEDURES

A. An advisory committee was be established to provide guidance for this project. The committee was composed of persons responsible for IEP development throughout the Commonwealth and special efforts was made to include at least one representative from a large urban area. This committee met approximate five times through the span of this project. The committee met every two months starting August 1987.

An advisory committee was established to help determine the most appropriate assessment tools to be incorporated into this system, and to monitor the ongoing progress of this project. The committee members, who met throughout the development of this system, include Dr. John Salvia, Professor of Special Education, Mr. William Moore, Program Coordinator, IU#8, Ms. Colleen Heally, Psychologist, Mrs. Janet Scanlon, Teacher and Parent Advocate, and Ms. Kathleen Banski, Project Assistant.

The advisory committee adopted the following objectives:

1. To identify those students whose standardized achievement and intelligence scores vary markedly from the norm.
2. To identify those students whose standardized achievement and intelligence scores vary markedly based on that particular student's results.
3. To offer general suggestions related to further assessment and programming for the student, based on standardized scores and academic programming.
4. To identify those areas of a student's vocational aptitude and interest survey results are most similar.

B. Collection of tests and their criteria used in IEP development. A 10% sampling of school districts throughout the Commonwealth will be accomplished to obtain this data. This data was summarized and then evaluated by the advisory committee. A graduate assistantship was gather this materials under the direction of the project director.

In conjunction with advisory committee members' input, a 10% sampling of school districts (See Appendix A for more details.) throughout the Commonwealth revealed that the WRAT (Wide Range Achievement Test) and the WISC or WISC-R (Wechsler Intelligence Scale for Children/Revised) are the most frequently utilized screening instruments for determining students' general achievement and intelligence abilities (See Appendix B for other assessment instruments being used). This system utilizes both of these instruments. Sampling procedures also revealed that assessment tools utilized to determine students' vocational interest and aptitude abilities vary markedly.

Vocational evaluators often employ non-formal assessment procedures. In addition, formal vocational assessment tools are infrequently normed for special populations. Program plans which couple students' vocational interest with their aptitude results are considered the most appropriate educational strategy to employ when attempting to guide students towards reaching their vocational potential. In addition, research indicates that vocational evaluative tools which utilize work sample procedures appear most effective in determining students' vocational abilities. For these reasons, this project has incorporated the use of the Singer Vocational Evaluative System and the Vocational Interest Assessment Survey into its program.

The Singer Vocational Evaluative System (VES)

The VES is composed of a series of job samples that are individually complete. There is not a prescribed sequence of administration, nor is it necessary to complete a specific number of jobs. Selection of the most appropriate set of job samples to be administered should be based on the individual needs of the participant, availability of jobs and/or training, and time available for occupational work sampling. The job samples may be administered in any order, although it is suggested that job samples related to an individual's vocational interests be employed first. Administration time varies, but generally requires 2-2 1/2 hours per sample. All forms, equipment and materials are

furnished within the VES. The VES includes an audiovisual format to ensure a standardized presentation of job samples. Job samples may be repeated by the subject. Repetition may be advantageous when the subject expresses a desire to attempt to improve his or her performance. Repetition may also permit an evaluator to measure learning while concomitantly demonstrating to a subject that he or she can learn new skills. The evaluator should become familiar with the contents of the VES manual and should complete the job sample, prior to administering the VES, regardless of the skills the evaluator may possess related to the job sample area.

Vocational Interest Assessment Survey (VIAS)

The VIAS is a unique interest assessment device. The inventory utilizes an audio-visual format instead of verbal statements and emphasizes affective cognitive as opposed to verbal processes; it is designed primarily to tap affective responses.

The purpose of the VIAS is to help an individual identify areas of potential occupational exploration and training based on the participant's responses to work scenes. The VIAS attempts to breakdown career stereotyping and is particularly useful when used by individuals with academic difficulties. It eliminates the need for any special reading skills. This is beneficial for use, not only with populations such as the handicapped or academically disadvantaged, but also those whose native language is not English.

Occupations presented pictorially in the VIAS help to minimize the effect of verbal stereotyping. The VIAS is directed towards those individuals whose career decisions are likely to involve occupational training and attempts to minimize jobs which would require advanced academic skills and training. The occupational clusters presented by the survey represent careers which training is generally available in most communities. Career clusters are broad, but are composed of many related occupations.

C. Collection of clues and cues that experts in IEP development used in making decision about handicapped or disadvantaged students relative to educational planning.

This information was be put in the proper syntax for entering into the computer. The project director with the assistance of the graduate assistant accomplished this procedure.

INTERPRETATION OF RESULTS

A discrepancy of ± 15 points in any tested area, indicated the need for further review of students' test scores and evaluative procedures. Discrepancies may be attributed to student performance or an error made by the evaluator at the time of testing.

A discrepancy of ± 30 points in any tested area indicates the need for further review of scores and testing procedures. ± 30 points indicates a significant student deviation from standardized test norms. Therefore a more thorough and specific evaluation of a student's abilities is warranted.

It is suggested that the vocational evaluator review the graph information presented by the system. It is recommended that the evaluator further pursue either assessment or programming procedures in those areas represented by the graph, which projects a students results to be most similar. For example, a student who demonstrates a score of 100% interest in the area of :

INTEREST RESULTS	APTTITUDE RESULTS	ASSESSMENT AREA
100%	80%	Agriculture*
100%	60%	Metal
50%	80%	Cosmetology
80%	80%	Food Services*

A student who demonstrates a score of 100% interest result, with an 80% aptitude result in Agriculture* might benefit from programming and training related to this career area, as opposed to a Metal area where the aptitude result suggests a larger discrepancy from the interest result.

A student who demonstrates a score of 80% aptitude result, with an 80% interest result in Food Services* might benefit from programming and training related to this career area, as opposed to a Cosmetology area where the interest result suggest a larger discrepancy from the aptitude result.

D. Construction of logic sequence (deductive and inductive models) for data usage via the computer. The Rulemaster program required a special sequence of data entry in order for the expert system to arrive at appropriate outcomes. The advisory committee decided against the use of Rulemaster because of its lack of availability to schools and IEP teams. The committee suggested that a more practical method be used and recommended the electronic spreadsheets.

Initially, the project intended to use an expert system titled Rulemaster. However, per the advisory committees' recommendations, a system which would be less cumbersome to use was chosen. This program works via the Apple Macintosh's EXCEL program and can be loaded into an IBM personal computer using Lotus 1-2-3.

E. Testing the expert system utilizing real data appropriate for handicapped students enrolled in vocational programs. The output from this procedure was reviewed by the advisory committee to ascertain the appropriateness and accuracy of the output.

OUTPUT DESCRIPTIONS

Achievement Results

The system will automatically convert raw score information to a standard score equivalent. Recommendations of WRAT results are based on sub-tests standardized score comparisons. The system will locate discrepancies and results will be indicated based on the following:

± 15 points between Spelling or Reading or Math sub-test scores indicates the need for further review of sub-test results and procedures. Further student assessment in the specified sub-test areas may be required. A curriculum which incorporates individualized educational programming may be beneficial.

± 30 points between Spelling or Reading or Math sub-test scores indicates a marked discrepancy in student performance. A review of sub-test results and procedures is necessary. Further student assessment in the specified sub-test areas may be

required. A curriculum which incorporates individualized educational programming is indicated.

Intelligence Results

The system performs three operations related to IQ testing results. These are:

1. The system classifies the IQ score, in isolation, based on standardized

interpretations:

<u>SCORE RANGES</u>	<u>CLASSIFICATION</u>
130 and up	Very Superior
120-129	Superior
110-119	High Average
90-109	Average
80-89	Low Average
70-79	Borderline
60 and below	Deficient

2. The system compares achievement and IQ standardized results. The system identifies discrepancies and results are indicated based on the following:

± 15 points between any sub-test and IQ score indicates the need to review sub-test results and IQ testing procedures. Further student evaluation may be required.

Individualized educational programming may be beneficial.

± 30 points between any sub-test and IQ score indicates the need to review sub-test and IQ testing procedures. Further student evaluation is required. Individualized educational programming is indicated.

3. The system classifies *isolated* IQ results into educational terms and offers some guidelines related to a student's probable academic abilities. For example, a student achieving an IQ score of 75 is termed Educationally Mentally Retarded (EMR). It is suggested that this student can "learn skills to approximately the 6th grade level by late

teens. The student cannot learn general high school subjects, without special programming or intervention. The student will need special education, particularly at high school levels."

Vocational Results

This system performs two operations related to vocational interests and aptitude results. The system converts raw score information of aptitude evaluative information into a percentile equivalent. The system compares percentile information of aptitude and interest assessments, and creates an easy to interpret graph representation of the results.

F. Modifications were made as appropriate to the expert system program and retesting took place.

ASSUMPTIONS

Results suggested in this program should be interpreted in consultation with an expert in the educational programming field. This program is designed only as a guideline in evaluating student performance based on selected standardized tests. The following factors may affect the results offered by this program:

1. Physical limitations of the student should be considered (ie auditory or visual impairments). Limitations may effect the student's ability to effectively respond during testing procedures. Therefore, a careful review of testing procedures and student responses is required prior to team decisions regarding individualized educational programming strategies.
2. This program offers suggestions based on comparisons and discrepancies between test results. Therefore, caution should be taken not to base programming decisions on isolated test score results.
3. When discrepancies are noted, the program recommends a review of testing procedures. Reviewing procedures will help to insure that errors were not made on the part of the evaluator. In addition, reviews may help the evaluator to identify specific problem

areas noted through review of the test responses, and thus help to determine the appropriate follow-up evaluative tool to be used.

4. When making decisions related to vocational programming, evaluators must be cautious not to put weight on either aptitude or interest results in isolation, but attempt to offer students guidance in areas where their interest and aptitude results are most similar.

LEVELS OF ADAPTIVE BEHAVIOR FOR THE MENTALLY RETARDED

LEVEL	EDUCATIONAL LABEL	IQ SCORE	SCHOOL AGE: 6-21 YEARS
Moderate Retardation	EMR	50-75	Can learn skills to approximately 6th grade level by late teens. Cannot learn general high school subjects, without special programming and or intervention. Needs special education, particularly at high school levels.
Moderate Retardation	TMR	35-49	Can learn functional academic skills to approximately 4th grade level by late teens if given special education.
Severe Retardation	SMR	20-34	Can talk and learn to communicate; Can be trained in elemental health habits; cannot learn functional academic skills; profits from systematic habit training.
Profound Retardation	PMR	Below 20	Some motor development present; cannot profit from training in self-help skills; needs total care.

EMR - Educationally Mentally Retarded
 TMR - Trainable Mentally Retarded
 SMR - Severely Mentally Retarded
 PMR - Profoundly Mentally Retarded

IEP ASSESSMENT AID FOR SPECIAL NEEDS STUDENTS

USERS GUIDE

IEP ASSESSMENT AID FOR SPECIAL NEEDS STUDENTS

OVERVIEW

"Mainstreaming" and "normalization" are terms frequently used throughout our educational system. They refer to program planning and implementation for the special needs student. Frequently the special needs student is placed in a mainstream classroom in order to meet normalization criteria. Mainstream placement occurs in order to achieve the most appropriate and least restrictive classroom environment. Unfortunately, the mainstream classroom teacher is often inadequately prepared to meet the educational requirements of the special needs student. Learning how to identify, appropriately assess and program for the student requires additional time and training, not often provided the normal classroom teacher.

RECOMMENDED USE

This program will be utilized by school psychologists as a screening device of standardized score results. Its purpose is to compare a student's achievement and intelligence scores in an attempt to identify those students who may benefit from further assessment and possibly a more individualized education program. The program will screen achievement sub-test scores to determine if there exists a marked discrepancy between spelling, reading and mathematics areas. Discrepancies in these areas will influence program planning for the vocational-agricultural student in regards to academic as well as vocational training.

In addition, this program will screen vocational aptitude and interest survey results of the student. Its purpose is to compare the student's percentile ranking results in vocational

areas, in an attempt to identify those vocational areas a student is most likely to succeed in, given the proper instruction and guidance.

It is proposed that by reducing the time factor required by the school psychologist to compare and interpret standardized scores, the school psychologist will be more readily available to offer the classroom teacher assistance with appropriate individualized assessment and program development.

OBJECTIVES

1. To identify those students whose standardized achievement and intelligence scores vary markedly from the norm.
2. To identify those students whose standardized achievement and intelligence scores vary markedly based on that particular student's results.
3. To offer general suggestions related to further assessment and programming for the student, based on standardized scores and academic programming.
4. To identify those areas of a student's vocational aptitude and interest survey results are most similar.
5. To offer general suggestions related to further assessment and programming for the student related to vocational training.

Description of Vocational Assessment Tools

The Singer Vocational Evaluative System(VES)

The VES is composed of a series of job samples that are individually complete. There is not a prescribed sequence of administration, nor is it necessary to complete a specific number of jobs. Selection of the most appropriate set of job samples to be administered should be based on the individual needs of the participant, availability of jobs and/or training, and time available for occupational work sampling. The job samples may be administered in any order, although it is suggested that job samples related to an individual's vocational interests be employed first. Administration time varies, but generally requires 2-2 1/2 hours per sample. All forms, equipment and materials are furnished within the VES. The VES includes an audiovisual format to ensure a

standardized presentation of job samples. Job samples may be repeated by the subject. Repetition may be advantageous when the subject expresses a desire to attempt to improve his or her performance. Repetition may also permit an evaluator to measure learning while concomitantly demonstrating to a subject that he or she can learn new skills. The evaluator should become familiar with the contents of the VES manual and should complete the job sample, prior to administering the VES, regardless of the skills the evaluator may possess related to the job sample area.

Vocational Interest Assessment Survey (VIAS)

The VIAS is a unique interest assessment devise. The inventory utilizes an audio-visual format instead of verbal statements and emphasizes affective cognitive as opposed to verbal processes; it is designed primarily to tap affective responses.

The purpose of the VIAS is to help an individual identify areas of potential occupational exploration and training based on the participant's responses to work scenes. The VIAS attempts to breakdown career stereotyping and is particularly useful when used by individuals with academic difficulties.

VIAS eliminates the need for any special reading skills. This is beneficial for use, not only with populations such as the handicapped or academically disadvantaged, but also those whose native language is not English.

Occupations presented pictorially in the VIAS help to minimize the effect of verbal stereotyping. The VIAS is directed towards those individuals whose career decisions are likely to involve occupational training and attempts to minimize jobs which would require advanced academic skills and training. The occupational clusters presented by the survey represent careers which training is generally available in most communities. Career clusters are broad, but are composed of many related occupations.

SYSTEM REQUIREMENTS

You will need the following:

1. An Apple Macintosh computer (Mac Plus recommended) with two disk drives. (one disk drive if Microsoft Excel is loaded on a hard disk.
2. An Imagewriter or LaserWriter printer.
3. Microsoft Excel Program
4. The Interpretation of *PDE Project Disk* and instructions (available through the Agricultural and Extension Education Department, PSU).

SUPPORT CONTACTS

If you have any questions or problems, please contact one of the following for help:

Technical Assistance

Dr. Connie D. Baggett
Department of Agricultural Education and Extension
The Pennsylvania State University
(814) 863-3824

Ms. Kathleen Banski

MANAGEMENT PROCEDURE

1. Make a backup copy of the original *PDE Project IEP Disk* before starting.
See Appendix for backup instructions. Use the backup copy for entering data.
Keep the original disk in a safe location-do not put any data on it.
2. Insert the disk labeled *PDE Project IEP Disk* in the internal drive. Then insert the *Microsoft Excel Program Disk* in the external drive.
3. Double-click on the icon named *PDE Project IEP Disk* to open it.
4. Double-click on the icon named *Special Student Evaluation* to open it.
5. Enter Inputs (This program is automatically calculated).

INPUT DESCRIPTIONS

1. Go to cell AU3

2. Enter student's name, press the RETURN key and enter address.
3. Enter student's age in years and months (use whole numbers) in cell AV6 and 7.
4. Enter student's WRAT raw scores for each subtest area (use whole numbers).
5. Enter student's IQ score (use whole numbers) in the labeled cells.
6. Enter student's Vocational Interest Survey Results in the labeled cells.
7. Enter student's Vocational Aptitude scores in the labeled cells.

OUTPUT DESCRIPTIONS

Achievement Results

The system will automatically convert raw score information to a standard score equivalent. Recommendations of WRAT results are based on subtests standardized score comparisons. The system will locate discrepancies and results will be indicated based on the following:

± 15 points between Spelling or Reading or Math subtest scores indicates the need for further review of subtest results and procedures. Further student assessment in the specified subtest areas may be required. A curriculum which incorporates individualized educational programming may be beneficial.

± 30 points between Spelling or Reading or Math subtest scores indicates a marked discrepancy in student performance. A review of subtest results and procedures is necessary. Further student assessment in the specified subtest areas may be required. A curriculum which incorporates individualized educational programming is indicated.

Intelligence Results

The system performs three operations related to IQ testing results. These are:

1. The system classifies the IQ score, in isolation, based on standardized

interpretations:

<u>SCORE RANGES</u>	<u>CLASSIFICATION</u>
130 and up	Very Superior
120-129	Superior
110-119	High Average
90-109	Average
80-89	Low Average
70-79	Borderline
60 and below	Deficient

2. The system compares achievement and IQ standardized results. The system identifies discrepancies and results are indicated based on the following:

±15 points between any subtest and IQ score indicates the need to review subtest results and IQ testing procedures. Further student evaluation may be required. Individualized educational programming may be beneficial.

±30 points between any subtest and IQ score indicates the need to review subtest and IQ testing procedures. Further student evaluation is required. Individualized educational programming is indicated.

3. The system classifies *isolated* IQ results into educational terms and offers some guidelines related to a student's probable academic abilities. For example, a student achieving an IQ score of 75 is termed Educationally Mentally Retarded (EMR). It is suggested that this student can "learn skills to approximately the 6th grade level by late teens. The student cannot learn general high school subjects, without special programming or intervention. The student will need special education, particularly at high school levels."

Vocational Results

This system performs two operations related to vocational interests and aptitude results. The system converts raw score information of aptitude evaluative information into

a percentile equivalent. The system compares percentile information of aptitude and interest assessments, and creates an easy to interpret graph representation of the results.

INTERPRETATION OF RESULTS

A discrepancy of ± 15 points in any tested area, indicated the need for further review of students' test scores and evaluative procedures. Discrepancies may be attributed to student performance or an error made by the evaluator at the time of testing.

A discrepancy of ± 30 points in any tested area indicates the need for further review of scores and testing procedures. ± 30 points indicates a significant student deviation from standardized test norms. Therefore a more thorough and specific evaluation of a student's abilities is warranted.

It is suggested that the vocational evaluator review the graph information presented by the system. It is recommended that the evaluator further pursue either assessment or programming procedures in those areas represented by the graph, which projects a students results to be most similar. For example, a student who demonstrates a score of 100% interest in the area of :

INTEREST RESULTS	APTITUDE RESULTS	ASSESSMENT AREA
100%	80%	Agriculture*
100%	60%	Metal
50%	80%	Cosmetology
80%	80%	Food Services*

A student who demonstrates a score of 100% interest result, with an 80% aptitude result in Agriculture* might benefit from programming and training related to this career area, as opposed to a Metal area where the aptitude result suggests a larger discrepancy from the interest result.

A student who demonstrates a score of 80% aptitude result, with an 80% interest result in Food Services* might benefit from programming and training related to this career area, as opposed to a Cosmetology area where the interest result suggest a larger discrepancy from the aptitude result.

ASSUMPTIONS

Results suggested in this program should be interpreted in consultation with an expert in the educational programming field. This program is designed only as a guideline in evaluating student performance based on selected standardized tests. The following factors may affect the results offered by this program:

1. Physical limitations of the student should be considered (ie auditory or visual impairments). Limitations may effect the student's ability to effectively respond during testing procedures. Therefore, a careful review of testing procedures and student responses is required prior to team decisions regarding individualized educational programming strategies.

2. This program offers suggestions based on comparisons and discrepancies between test results. Therefore, caution should be taken not to base programming decisions on isolated test score results.

3. When discrepancies are noted, the program recommends a review of testing procedures. Reviewing procedures will help to insure that errors were not made on the part of the evaluator. In addition, reviews may help the evaluator to identify specific problem areas noted through review of the test responses, and thus help to determine the appropriate follow-up evaluative tool to be used.

4. When making decisions related to vocational programming, evaluators must be cautious not to put weight on either aptitude or interest results in isolation, but attempt to offer students guidance in areas where their interest and aptitude results are most similar.

APPENDIX

Using Microsoft Excel Software

Backup Instructions

To make a backup copy of an Excel program, you must copy the entire contents of the original (startup) disk to another disk. To backup the original disk:

1. Insert the disk containing the Master program into the internal disk drive. The disk icon is usually labeled with an abbreviated form of the program title. Example: *SpEd Eval* for the *Special Student Evaluation* program.
2. Insert a blank or "to-be-copied-over" disk into the external drive. Initialize it if necessary.
3. Select and drag the Master disk icon over the top of the new disk icon until the new disk icon turns black.

Example: Start-up (internal drive) disk icon- "PDE IEP Project".

New Disk (external drive) disk icon-"Blank".

An alert box will ask: Completely replace contents of "Blank" (external drive) disk with contents of "PDE IEP Project" (internal drive)? Click on the OK button.

4. When done copying, eject the original disk and store it in a safe place. Type in a new name for the backup disk icon (if desired). Use the backup copy for entering data.

Saving Data

1. Decide if you will save data on disk before you start.

It is recommended that you do not save data on this disk, rather you should save a printout of the calculated program with input data. If you desire to save the data to be inputted on the disk, make a copy of the entire disk before you start to input data. It is necessary to make a copy of the entire disk because each Excel program consists of

multiple documents, all of which are necessary for the operation of the program in the manner outlined in the MANAGEMENT PROCEDURE of the user guide.

2. Do not use "Save As"

The Excel program has two unique characteristics: The "Save As" command under the pull down menu "FILE" will allow you to change the name of your document and/or save the document to a different location, i.e. to the external drive.

3. Use the "Save" or "Quit" commands.

If you use the "Quit" commands from the Excel File menu, the computer will ask if you wish to save changes before quitting. If answer yes, it will save changes to the file you have been working with. If you wish to save changes to another file name, you must answer no and then click on then follow procedure two above.

4. Properly identify disks with saved data.

Mark the external (paper) label of the disk to indicate the exact contents. For example: *Special Student Evaluation*

Miss Smith - 4/23/88

Excel startup Disk

You may also change the name of the disk icon. The name of the disk icon can be an abbreviation of the name of the original disk, may have client identification, date run, etc. For example, *Special Student Evaluation...-Smith, SpEd Eval-Smith-4/88, Scores-Smith-1988.*

Changing Print Quality

Excel programs print at medium speed and quality, if you are using a dot matrix printer, i.e. ImageWriter II. If you should desire to change the quality of printing, use the following procedure:

1. Go to the Excel File menu and choose Print command. Click on the print quality button that you desire. Click on the OK button.

2. The printer will begin, so as soon as you see the dialog box displaying the message "To cancel printing hold down the Command key and type a period (.)," do so.
3. When quitting do not save this print quality change since others that use the disk may not prefer the speed and/or quality that you have chosen.

Interrupting the Printing Process

If you wish to interrupt a printing process started with the use of an Option-Command-letter combination, use the following procedure:

1. As soon as you see the dialog box displaying the message "To cancel printing hold down the command key and type a period (.)", do so.
2. Click on the halt button.
