#### ABSTRACT

In 1992, 27 Illinois community college districts (38 colleges) participated in a national ransfer study conducted by the Center for the Study of Community Colleges (CSCC). The purpose of the study was to test a model for calculating transfer rates which used as its cohort group those students entering a community college in fall 1986 with no prior college experience who had earned at least 12 college-level semester credit hours. Included in the study were those 45,795 students who initially had enrolled in baccalaureate/transfer, occupational, and general associate degree programs at Illinois's community colleges. Using the CSCC transfer model, the overall transfer rate for Illinois was 24.1%. However, determining multiple rates based on distinct pools of students more realistically depicted the nature of transfer. For example, the rate for students from baccalaureate/transfer programs was 32.6%, while the rate for students who indicated that they intended to transfer was 40.4%. Ascertaining multiple rates also revealed differences in course-taking and transfer behavior among racial/ethnic groups. Asians had the second highest percentage of students earning at least 12 credit hours (50.2%) and the highest transfer rate (29.3%). For baccalaureate/transfer students, the difference between the highest transfer rate for White students (35.6%) and the lowest for Black students (18.5%) was 17.1 percentage points. Percentages of students earning the 12 credit hour minimum and transfer rates differed significantly among community colleges as well. Overall, the percentage of students earning the credit minimum ranged from 67.4% (Clney Central) to 17.5% (City Wide), with the statewide figure at 47%. Transfer rates ranged from 35% (Kishwaukee) to 8% (Malcolm X), with the statewide rate for the participating colleges at 24.1%. Data tables are provided. (JMC)

## Illinois Community College Board

## FALL 1986 FIRST-TIME COMMUNITY COLLEGE STUDENT TRANSFER STUDY

Over the past few years, there has been significant interest in the development of a consistent methodology to calculate transfer rates for community colleges. Currently, at the national level there are two predominant models being examined. One of these uses students who have left the community college as the population base for calculating the rate and takes into account the intentions of the students. The other model developed by the Center for the Study of Community Colleges at the University of California-Los Angeles uses students who have earned at least 12 semester college-level credit hours at a college as the population base.

Recently, 27 Illinois community college districts (38 colleges) participated in a national transfer study conducted by the Center for the Study of Community Colleges at University of California-Los Angeles. The purpose of the study is to test the second model for calculating transfer rates. This study examined the number of students entering a community college in the fall of 1986 with no prior college experience who earned at least 12 college-level semester credit hours before transferring to a four-year college or university. The premise behind the 12-hour criteria is to establish a reasonable distinction between students who are taking occasional courses and those who are pursuing a longer term education goal.

Included in the study were students who in fall 1986 were enrolled in baccalaureate/transfer, occupational, or general associate degree programs. Twenty-nine senior colleges and universities provided usable data for the study including the 12 public Illinois universities, nine private Illinois colleges and universities, and eight out-of-state institutions. Additionally, three out-of-state institutions participated but had no transfers from Illinois that met the 12-hour minimum requirement for inclusion in the study. The Illinois Community College Board coordinated the data collection efforts for the participating Illinois colleges and generated reports for UCLA and the participating institutions.

While 83,866 students from the participating colleges enrolled in all program areas for the first time in 1986, the decision was made to limit the UCLA study to those 45,795 students who initially enrolled in baccalaureate/transfer, occupational, and general associate degree programs. This decision was based on the small number of students in other program areas (general studies, vocational skills, remedial, adult basic and adult secondary) who earned at least 12 semester college-level credit hours and the low percentage of these who transferred. Such enrollment patterns are understandable since these program areas serve students whose goals are primarily to take courses aimed at meeting their individual needs rather than pursuing higher-level degrees. See Table 1 for an analysis of the various program areas.

Table 1
DISTRIBUTION OF FIRST-TIME ENROLLMENT BY PROGRAM AREA

DISTRIBUTION OF FIRST-TIME ENROLLMENT BY PROGRAM AREA									
2.以代表的经验证据	GenAssc	Trans	Occup	G.S.	Rem	<u>VocSk</u>	ABE	ASE	
First Time	3253	22901	19641	7844	740	8853	17089	3545	
12 Hrs. % of first- time earnin 12 hrs.	1015 31.2 g	11947 52.2	8551 43.5	679 8.7	90	553 6.2	479 2.8	217 6.1	
Transfers % of those meeting 12 hr. minimum who transfe		3892 32.6	1002 11.7	44 6.5	8 8.9	51 9.2	14 2.9	8 3.7	

In all, of the 45,795 first-time baccalaureate/transfer, occupational, and general associate students from the participating colleges, 21,513 (47.0 percent) earned at least 12 semester college-level credit hours. Of those earning 12 credit hours, 5,174 (24.1 percent) transferred to at least one of the 29 participating four-year institutions.

The remainder of this report will focus on the latter group of students. In addition to using the basic UCLA model for calculating transfer rates, the report will examine methods of enhancing the model by incorporating components of the other national model such as student intent. Additionally, it will include factors such as the student's initial program of study.

## Analysis by Program

Baccalaureate/transfer degree programs in community colleges are designed to provide the first two years of a baccalaureate degree program. In the fall of 1986, 22,901 students enrolled for the first time in these programs. Approximately one-half (52.2 percent) continued at the college earning at least 12 hours. Of these, 3,892 (32.6 percent) transferred to four-year institutions. Of the three program areas under study, this was the highest percentage of transfers. Seventy-five percent of the students who transferred began their college careers in baccalaureate/transfer programs. (See Figure 1.)

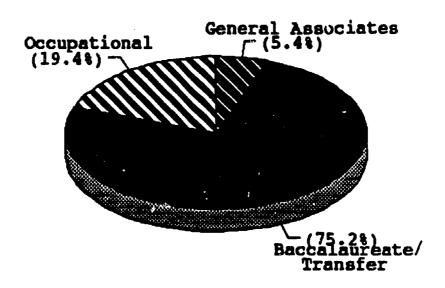

Figure 1. Percentage of fall 1936 students with 12 or more credits who transferred to a cooperating university by fall 1990

Occupational programs are designed primarily to prepare students to enter the job market immediately after their community college experience; yet, a substantial number of students from occupational programs do transfer to four-year institutions. Of the 19,641 students entering as occupational students in fall 1986, over 43 percent carned at least 12 hours and 1,002 (11.7 percent) of these students transferred.

General associate degree programs are those which are individually designed by mutual agreement between the student and his/her college-appointed advisor to meet the student's educational intent. Typically, the curriculum contains both baccalaureate/transfer and occupational courses. As is the case with occupational programs, while the general associate degree programs are not designed for transfer, a substantial number of students from these programs do continue their studies. In fact, 416 (12.8 percent) of the 3,253 first-time general associate degree students transferred prior to earning 12 hours at the community college. Of the 1,015 (31.2 percent) students who earned at least 12 hours, 280 (27.6 percent) transferred.

## Analysis by Intent

Upon initial enrollment at a community college, students are asked to indicate why they are attending the college. They are given a choice of eight intention categories:

to prepare for a new or first occupational career;

to improve present occupational skills;

to explore courses to decide on a career;

to prepare for transfer to a four-year college or university;

to remedy basic skill deficiencies;

to pursue noncareer, personal interests;

to prepare for high school diploma equivalency test; or other/unknown.

Table 2 presents information on the number of first-time students indicating their intent, the percentage in each category earning at least 12 college-level semester credit hours, and the percentage transferring to four-year institutions.

Of all the intent areas, preparation for transfer had the highest percentage of students who earned 12 hours or more (63.8 percent). Among students meeting the credit hour minimum, 40.4 percent transferred. Nearly half (49.8 percent) of the general associate degree students, 41.9 percent of the baccalaureate/transfer, and 29.1 percent of the occupational students whose intent was to transfer did so. Approximately one-fourth of the students had said their intent was to prepare for transfer (23.0 percent). Nearly 36 percent of the baccalaureate/transfer students indicated this was their intent compared with 8.6 percent of the occupational students and 20.9 percent of the general associate degree students.

The largest number of first-time students in fall 1986 earning at least 12 hours indicated their intent was to prepare for a new occupation (39.3 percent). As anticipated, this percentage was higher for occupational students (52.3 percent) than for baccalaureate/transfer (29.6 percent) or general associate degree (29.1 percent) students. Overall, 47.5 percent of these students earned 12 or more hours and of these, 14.6 percent transferred (23.5 percent of the baccalaureate/transfer, 8.8 percent of the occupational, and 14.5 percent of the general associate students). Students enrolled in an occupational program indicating their attendance was to prepare for a career were least likely to transfer.

Although a smaller number of students indicated their reason for attending was to take courses to explore careers, this group of students had the third largest percentage of students earning at least 12 hours (45.9 percent) and the second highest percentage of those transferring (24.5 percent).

Interestingly, the third highest transfer rate came from the group of students indicating they were attending college to pursue personal interests. While a smaller percentage of these students (25.1 percent) actually earned 12 hours or more, 22.6 percent of those who did transferred. Within the program areas, these percentages were: 27.9 percent of the general associate, 25.9 percent of the baccalaureate/transfer, and 14.9 of the occupational students.

## Analysis by Race/Ethnicity

It is important to understand the racial/ethnic distribution of the three major community college student populations in the study: first-time students, those earning 12 hours or more, and those White students made up 70.9 percent of the firsttransferring. time students, 75.8 percent of those who earned 12 hours, and 81.8 percent of those who transferred. The second largest group, black students, represented 19.3, 15.7, and 3.5 percent, respectively. Hispanics comprise the third largest population, representing 4.1, 3.8, and 3.3 percent, respectively. Asians represent 2.8, 3.0, and 3.6 percent, respectively. American Indians and nonresident aliens comprise less than 1 percent of the total population in any of the three categories. The number of students in the lesser represented racial/ethnic groups become relatively small, thus impacting the This fact, along with the general percentages of transfers. distribution of the population, should be kept in mind as one reviews the analyses of each group that follows.

The data show differences in course taking and transfer behavior among racial/ethnic groups. While white students account for three-quarters of the students in these three programs and Asians comprise just 3 percent, the two groups exhibited similar course taking and transfer behavior. Table 3 presents the number of students by race/ethnicity, the percentage of students earning at least 12 hours, and the percentage of the latter who transferred. Percentages of students transferring by race/ethnicity and intent are presented in Table 4.

Asian students had the second highest percentage of students earning at least 12 hours at the community college in which they first enrolled (50.2 percent) and the highest transfer rate (29.3 percent) of any of the six racial/ethnic groups. One-third of Asian students indicated that their intent was to transfer. Of these students, 44.8 percent transferred.

White students had the second highest transfer rate (25.9 percent) and an identical percentage of students earning 12 hours or more (50.2 percent) as Asians. Over one-third (34.6 percent) of the white students had indicated they planned to transfer. Of those thus indicating, 41.1 percent did so.

Slightly over 21 percent of the Hispanic students who completed 12 hours or more transferred to four-year institutions. Two hundred ten (25.6 percent) of the 820 Hispanic students indicated an intention to transfer. Of these, 40.0 percent did so.

Black students had a transfer rate of 15.4 percent. Among blacks, 18.2 percent indicated an intent to transfer. Of those who had said they were preparing to transfer, 31.3 percent attended one or more of the participating four-year colleges and universities.

There was a relatively small number of American Indian students entering community colleges in the fall 1986. Of the 202 American Indian students in the three program areas under study, 83 (41.1)

percent) earned at least 12 hours. Only eight (9.6 percent) of these students indicated their intent was to transfer although 11 (13.3 percent) actually transferred.

## Analysis by College

Information on transfers is presented for each of the participating community colleges in Table 5. A matrix showing where students transferred from and to is presented in the Appendix. Community colleges with the largest number of transfers included Moraine Valley Community College (547), Triton College (371), Parkland College (280), and Oakton Community College (253). Three of these

colleges are geographically located in Chicago's suburbs and Parkland in a university community. These four community colleges provided 28.2 percent of all community college transfers in the study.

				======

Universities receiving the largest number of transfers were Illinois State University (783), Northern Illinois University (629), Southern Illinois University-Carbondale (568), and University of Illinois-Chicago (547). These four public universities accounted for nearly half of all community college transfers. Although geographically isolated, Southern Illinois University at Carbondale had students from the largest number of community colleges with students from 37 of the participating 38 colleges. University of Illinois at Urbana/Champaign accepted students from 35 of the participating colleges while Eastern Illinois University and Illinois State University each had students from 33 colleges.

Transfer Rates. The percentages of students earning the credit hour minimum and the transfer rates differed among the community colleges. Overall, the percentage of students earning at least 12 semester hours ranged from 67.4 percent at Olney Central College to 17.5 at City-Wide College. Statewide, this figure was 47.0 percent. Twenty-two of the 38 colleges exceeded this statewide percentage.

Transfer rates for the students who had taken at least 12 hours, ranged from highs of 35.0 percent at Kishwaukee College, 32.7 percent at Moraine Valley Community College, 33.1 percent at Oakton Community College, 32.6 percent at McHenry County College, and 30.1 percent at Lincoln Land Community College to lows of 8.0 percent at Malcolm X College, 9.5 percent at State Community College, and 12.3 percent at Kennedy-King College. Location in the Chicago suburbs or a nearby university correlated with higher transfer rates. The statewide rate for the participating colleges was 24.1 percent. Eighteen of the 38 colleges exceeded this figure.

Analysis by Colleges at the Program Level. In the baccalaureate/transfer area, percentages also differed among the colleges. The percentage of students earning 12 or more semester college-level credit hours ranged from 87.9 percent at Highland Community College to 15.9 at City-Wide College. Transfer rates ranged from highs of 53.0 percent at Black Hawk College-East, 45.5 percent at Kishwaukee College, and 44.1 percent at John A. Logan College to lows of 9.3 at Malcolm X College and 12.2 at State Community College.

Variation among the colleges transfer rates for occupational students was much less provinced. Colleges with the highest transfer rates for occupation is students were Harold Washington College (23.1 percent), Will Wright College (25.2 percent), and Moraine Valley Community College (25.2 percent). At the lower end were Frontier Community College that had no occupational students transferring and Olney Central College where only 2.9 percent transferred.

As indicated earlier, the general associate program area is relatively small compared with the baccalaureate/transfer and occupational program areas. Only 5 percent of the transfers came from the general associate area with almost 70 percent being former City Colleges of Chicago students. Because of the very small number of students at most colleges, it is not appropriate to examine the range of transfer rates except within City Colleges of Chicago. There, transfer rates ranged from 68.0 percent at City-Wide College to 13.3 percent at Kennedy-King College. The only other community college with a significant number of general associate degree students was Parkland College where the transfer rate was 24.0 percent.

#### SUMMARY

The calculation of transfer rates is a topic of considerable discussion in American higher education. The Illinois community college system is playing an active role in this discussion.

This study has provided an alternative approach to calculating transfer rates. Using the UCLA model where all students who have earned at least 12 semester college-level credit hours are considered as the cohort group, the transfer rate would be 24.1. However, as demonstrated in this report, there are multiple rates that more realistically reflect transfers from community colleges to senior institutions. Transfer rates vary based on the pool of students being studied. For example, if one focuses only on students from baccalaureate/transfer programs the rate is 32.6. The rate for students who indicated they intended to transfer is 40.4, and the rate for students from baccalaureate/transfer

programs who indicated they intended to transfer is 41.9. While there is simplistic appeal to having only one rate, the complexity of community colleges calls for multiple measures on transfers. This becomes even more important at the college level because the programmatic composition differs from institution to institution.

If transfer rates are to be used as a measure of accountability, then it is important that they reflect as accurately as possible what is actually occurring at various colleges. A diverse student body requires multiple measures of success.

The study also demonstrates that transfer rates vary for different racial/ethnic groups even when student intent is taken into account. There was a 16 percentage point difference between the transfer rate of 'Asians, who had the highest rate, and American Indians, a very small group of students who had the lowest rate, when all students are included in the calculation. For baccalaureate/transfer students, the difference between the highest transfer rate for white students (35.6) and the lowest for black students (18.5) was 17.1 percentage points. Although the difference was not as great when intent was taken into consideration (13.5 points), the difference in transfer rates between Asians' 44.8 rate and blacks' 31.3 rate is troublesome.

It is also noteworthy that the percentages of American Indian (9.6), black (18.2), and Hispanic (25.6) students who intended to transfer are below that of white students (34.6).

One of the Illinois Community College Board's major objectives is to initiate activities that facilitate successful transitions for students. Since the time that the students in the study entered college in 1986, a number of major activities have occurred to enhance transfer and articulation. Transfer Centers have been established at 23 community colleges across the state. The Board has adopted recommended models for the Associate in Arts ar Associate in Science degree programs. Recommendations from a 19 report on articulation issues are being or have been implemented Extensive reviews of the general education component of the transfer degree programs have been initiated. The community colleges and public universities have established a combined computer file of enrollment and graduation data which will proadditional information on the transfer phenomena in Illinois.

During this past year, a document describing the status of transfer articulation activities at each of the public universities in Illinois has been developed, articulation agreements have been examined, and a statewide conference of community college and university faculty has been held to address articulation issues. The Board also adopted a policy on the establishment of community college guarantees in March 1992 which should have a major impact on transfer and articulation.

Page 16

During the next few months, the Illinois Community College Board staff will be reviewing all of these activities including the study reported herein in anticipation of developing recommended policies on transfer and articulation.
