ABSTRACT

A total of 137 knowledgeable representatives in the field of special education (including federal, state, and local administrators; technical assistance providers; members of professional organizations; university professors; and selected private practitioners) used a modified Delphi process to respond to almost 200 statements concerning the future of special education. This report consists of a brief description of the process and respondents, a report of overall results, results in 14 topical domains, and a discussion of implications for the future. Overall trends include: critical shortages of special education personnel will occur at all levels, resulting in more important roles for paraprofessionals and provision of services for students with mild disabilities in the regular classroom; related services will continue to expand in type, quantity, and variety, creating a drain on resources; outcomes for students with severe disabilities will address functional life skills rather than isolated academic skills; and advances in technology will reduce functional limitations of persons with disabilities. Specific results are organized into the following 14 areas: assessment, curriculum and instruction, family involvement, finance, interagency coordination, least restrictive environment, personnel, policy and governance, reform and restructuring, research, service monitoring, societal values, technology, and transition from school to work. Appendices contain a statistical summary and a Delphi instrument used in soliciting the second round of responses. (JDD)

The Federal Resource Center for Special Education at the University of Kentucky is funded by the Office of Special Education Programs, US Department of Education through Contract #HS91004001. The contents of this report do not necessarily represent the opinions of the Department of Education or the University and the reader should not assume endorsement by the federal government of any products or organizations mentioned herein.

Acknowledgments

This report is based on responses from 137 representatives of the field of special education who thoughtfully reacted to the almost 200 predictive statements and comments of their peers. In addition, ten members of this group contributed by serving in the pilot round as reviewers of the data collection process and instrument. They provided many helpful suggestions to improve the instructions and clarify the actual predictive statements. Included in this group were A. Edward Blackhurst, Eugene Edgar, James J. Gallagher, Gladys Clark-Johnson, M. C. Martinson, Debra Spotts Merchant, Ken Olsen, Judy Smith-Davis, and Jo Thomason.

James Wolf, University of Kentucky Survey Research, and his staff analyzed data from both rounds. Jim also provided helpful suggestions on instrument development and data collection. A. Edward Blackhurst gave considerable additional assistance on survey methodology and uses of the Delphi process in the field of special education. His suggestions streamlined the process and increased responsiveness.

Development of the final report was the responsibility of Federal Resource Center staff. Rene Hales served as manager of the process and first author. Laurance Carlson was second author on the manuscript; Barbara Burcham assisted in contacting respondents and provided ongoing encouragement for the effort; guidance and suggestions for editing and formatting was given by Sandra Challman; and Judy Collins assisted throughout with data entry, mailing, and communication with field representatives.

Developing the process and writing the report was a rewarding task. It is hoped that the final product will encourage continued thoughtful consideration of the future of special education and positively affect services for children and youth with disabilities and their families.

117

Special Education: A Predicted Future

The future exists today in the form of our children.

Margaret Mead

What is the future of special education as we move into the 21st century? In order to answer this question, the Federal Resource Center queried knowledgeable representatives of the field including federal, state, and local administrators, technical assistance providers, members of professional organizations, university professors, and selected private practitioners (e.g., advocates, and national education project representatives). A modified Delphi process was used to get reactions to almost 200 predictive statements. Predicted trends impacting special education over the next 20 years are reported below based on mean likelihood ratings.

Overall Trends

- ◆ There will be critical shortages of special education personnel at all levels (teachers, administrators, and ancillary personnel). In an effort to deal with these personnel shortages, paraprofessionals will have an increasingly more important role in service delivery and will provide more direct instruction. Also, in an effort to meet the need for services, regular educators will be trained and acquire the skills necessary to serve students with mild disabilities thus blurring the borderline between special and regular education.
- ◆ Related services will continue to expand in type, quantity, and variety, creating a drain on resources. This coupled with the ambiguity among medical, related services, and instructional services will have an increasing fiscal impact on the system.
- ◆ Increased longevity will create expanded services for older citizens with disabilities. Outcomes for students with more severe disabilities will address functional life skills rather than isolated academic skills. High school diplomas or certificates of completion will be awarded to students with disabilities who satisfactorily complete their IEP goals.
- ◆ Advances in technology will substantially reduce functional limitations of persons with disabilities.

<u>Assessment</u>

- There will be a move toward more authentic assessment of abilities; not limited to pencil-and-paper tests.
- Prereferral and referral strategies will continue to be used to ensure that only students with disabilities are served in special education programs.

Curriculum and Instruction

- ◆ Instruction of children and youth with disabilities will occur in natural environments, and content will focus on individualized instructional objectives rather than the student's particular diagnosed disability.
- ◆ The use of cooperative leaning approaches for students with and without disabilities will become standard practice.
- As appropriate, students with disabilities will be included on IEP development teams to represent their own interests and desires for educational services.

Family Involvement

◆ Parents will play a more significant role in the special education decision making process, and school systems will adopt numerous nontraditional methods for involving parents in their children's special education program.

Finance

- ◆ States will cut special education funding as more students are served in regular education.
- ◆ Funding for assistive technology will increase and come from a variety of funding sources.

Interagency Coordination

◆ Community agencies will deliver their services in local neighborhoods, and when multiple agencies provide services for a child or family, a single plan will be developed involving all caregivers.

Least Restrictive Environment

◆ Children with mild disabilities will be served in the general classroom as an alternative to pull-out programs such as resource room configurations, and children and youth with severe and low incidence disabilities will be served in inclusive schools.

Personnel

♦ Children with severe disabilities needing special education services will more than double due to increased social problems, drug exposure, AIDs infections, and medical and technological advances. Due to this increased demand for services and growing personnel shortages, states will implement alternative routes to special education certification.

Policy and Governance

- Federal and state regulations will be reworked in IDEA and Chapter I to allow for the blending of special education and Chapter I funding and instruction.
- ◆ Policy changes will occur to make health care universally available for families of young children with disabilities.

Reform and Restructuring

- ◆ Special education will function as a support to regular education programs and personnel, rather than as an alternative education for learners with disabilities. Team teaching with special and regular educators in the classroom working together will be prevalent.
- ♦ The educational system will become more able to fully utilize the techniques, expertise, and specialized knowledge of the field of special education, and services for students with disabilities will become the joint responsibility of special and regular educators.

Research

- ◆ Increased research efforts will focus on early identification and diagnosis of emotional problems in infants and toddlers.
- ◆ There will be significant growth in research that focuses on the cost effectiveness and efficacy of various instructional strategies in educating children and youth with disabilities.

7

Service Monitoring

- ◆ Outcome measures for special education services will be better defined thus enhancing their use for teacher and school system evaluation, and states will expand follow-up data collection efforts in order to monitor the effectiveness of special education.
- Special education will be held accountable for a high level of quality in programs for students with exceptional needs and improved outcomes resulting from services provided.
- ◆ Federal monitoring will be increasingly focused on the state's ability to carry out the monitoring of the delivery of special education services by local agencies and state operated facilities.

Societal Values

- ◆ There will be increased knowledge and understanding of the contributions persons with disabilities can realistically make to society, and their potential economic contributions will be valued by policymakers.
- ♦ Special education professionals will become sensitive to specific learning and interpersonal styles of children with disabilities from diverse cultural, racial, linguistic, and ethnic backgrounds and adapt their service delivery approaches accordingly.

Technology

◆ Technological advances in information storage and retrieval will enable parents and educators to access one data source about services and materials needed to serve individuals with disabilities.

Transition from School to Work

 An emphasis on life-long learning and employment will force greater integration of services between schools and human service agencies for people with disabilities 18 years and beyond.

8

Introduction

As a part of the Federal Resource Center (FRC) Task 3 objectives, the Center sought input from identified experts in the field of special education to develop a report of issues and trends. Representatives from the field were asked to share their perspectives on the future of educational services for students with disabilities through a modified Delphi process.

The report consists of a brief description of the process and respondents, followed by an overall report of results, as well as results in 14 topical domains covered by the instrument. Next, a discussion and implications for the future are provided followed by selected appendices. Appendix A gives a complete listing of data including number of respondents, mean, median, standard deviation scores, and range for each item on likelihood and desirability for Round II. Finally, the Round II instrument including comments from Round I is provided in Appendix B.

Purpose

This Task 3 activity was undertaken to assist the Office of Special Education Programs (OSEP) in developing a systematic method for identifying critical issues and trends related to providing quality educational programs that ensure a free appropriate public education and improved outcomes for children and youth with disabilities. It is anticipated that accurate and early identification of trends would allow the OSEP to be more efficient since constructive and proactive responses often require long lead times, especially where new policies, procedures, and methods are required (Teige, Harman, & Schwartz, 1977).

FRC Follow-up Activities

The FRC Task 3 includes three major objectives for providing assistance to the OSEP. This report is a part of but one of the objectives designed to facilitate long-range planning and thus enhance the consistency of technical assistance content and strategies. Follow-up activities will include the development of issue briefs or papers and small group meetings to address the identified issues.

Procedures

Method

A modified Delphi technique (Dalkey & Helmer, 1963; Delbecq, Van de Ven, & Gustafson, 1975) was employed to identify the issues and trends in special education. This method attempts to arrive at a forecast by generating a consensus about the shape of the future as perceived by those who will play a role in shaping it. The Delphi process involves soliciting opinions from well-informed individuals through several rounds of structured input. This method avoids problematic aspects of face-to-face decision making, such as the strong biasing influences of individual personalities on the judgments of others. Other strengths of the Delphi techniques are that

(a) participants need not be in the same geographic location to participate in the process, (b) feedback to participants can be controlled, and (c) statistical analysis of the responses is possible.

The Delphi technique has been used successfully in the past by Reynolds (1973) as part of the Council for Exceptional Children's project on Professional Standards and Guidelines and by Putnam and Bruininks (1986) for the purpose of clarifying major issues and identifying trends in deinstitutionalization and education. The methodology used by Reynolds (1973) provided considerable guidance for the FRC investigation.

The FRC employed an iterative process consisting of one pilot and two subsequent rounds to obtain the results included in this report. The process took approximately 15 months to complete and involved over 250 field experts from a broad-base of educational levels.

Sample

Recruitment Process

Potential respondents were selected by FRC staff to be representative of the following seven groups: federal administrators, state and local education agency administrators, representatives of professional organizations, OSEP-funded technical assistance providers, higher education faculty, and others. The "others" category consisted of anyone not included in one of the first six categories and was made up of representatives from many professions, such as, private consultants, staff of Regional Education Laboratories, advocates, etc. In addition to these broad categories, efforts were made to include parents, consumers, and those with expertise in meeting the

2

educational needs of students from diverse cultural, racial, linguistic, and ethnic backgrounds. In all 254 persons were selected for inclusion in the Delphi process. The potential respondents were sent a letter of recruitment that described the activity and the commitment required of participants. One hundred thirty-seven (53.94%) agreed to participate.

The results of the recruitment process are shown in Table 1. The table includes the number recruited by participant group, responses returned and their percent of the total, number of respondents agreeing to participate, and the percent of participants that committed to completing the process. OSEP-funded technical assistance providers had the highest percent of commitment to participation while those labeled "other" had the lowest. Over half (53.94%) of all potential participants agreed to complete two rounds of the Delphi instrument on issues and trends in special education.

Table 1
Recruitment Results by Group

	N	N	 %	N	%
Group	Recruited	Returned	Returned	Agreeing	Agreeing
Federal administrators	11	10	90.91%	5	45.45%
State administrators	66	46	69.70%	32_	48.48%
Local administrators	62	48	77.42%	40	64.52%
Professional organization representatives	26	20	76.92%	14	53.85%
OSEP-funded technical assistance project representatives	29	21	72.41%	20	68.97%
Representatives of IHEs	37	33	89.19%	19	51.35%
Others	23	13	56.52%	7	30.43%
Total	254	191	75.20%	137	53.94%

Two rounds of information gathering were conducted between December 1991 and June 1992. Respondents by group are reported for both rounds in Table 2. This table includes the number of instruments sent, number returned, and percent returned for each round. The last column shows the percent of potential return by group for the entire process. In Round I over 85% of the 137 respondents returned a completed form; 94 completed both rounds of the Delphi process. Rate of return for all groups was considered excellent; ranging from a low in the first round of 71.43% for others to a

high of 100% for federal administrators in the second round. Percent of potential return for the entire process was 68.61% ranging from a low of 57.14% for both others and professional organization representatives to a high of 80% for federal administrators and OSEP-funded technical assistance project representatives.

Table 2 Round I and Round II Respondents by Group

		Round I		Round II			Both Rounds	
Group	N Sent	N Returned	% Returned	N Sent	N Returned	% Returned	% of Potential Return	
Federal administrators	5	4	80.00%	4	4	100.00%	80.00%	
State administrators	32	29	90.63%	29	21	72.41%	65.63%	
Local administrators/ educators	40	33	82.50%	33	27	81.82%	67.5%	
Professional organization representatives	14	11	78.57%	11	8	72.73%	57.14%	
OSEP-funded technical assistance project representatives	20	18	90.00%	18	16	88.89%	80.00%	
Representatives of IHEs	19	17	89.47%	17	14	82.35%	73.68%	
Others	7	5	71.43%	5	4	80.00%	57.14%	
Total	137	117	85.40%	117	94	80.34%	68.61%	

Table 3 provides a breakdown of groups by percent of total respondents for both rounds. Local administrators made up the largest percent of the total in both rounds; 28.21% in the first round and 28.72% in the second round. Percent of the total remained relatively stable for all groups over both rounds.

Table 3
Percentage of Total Respondents by Group

	Rou	nd I	Round II		
Group	N Returned	% of Total Returned	N Returned	% of Total Returned	
Local administrators/ educators	33	28.21%	27	28.72%	
State administrators	29	24.79%	21	22.34%	
OSEP-funded technical assistance project representatives	18	15.38%	16	17.02%	
Representatives of IHEs	17	14.53%	14	14.89%	
Professional organization representatives	11	9.40%	8	8.51%	
Federal administrators	4	3.42%	4	4.26%	
Others	5	4.27%	4	4.26%	
Total	117	100%	94	100%	

Delphi Instrument

The Federal Resource Center staff conducted a review of special education literature, obtained needs assessment reports from the six Regional Resource Centers (RRCs), and solicited federal monitoring reports from the OSEP. These three sources were used to develop the initial predictive statements for the pilot round of the issues and trends instrument. The Round I instrument consisted of 146 items.

Ten of the original 254 member pool of identified national experts were recruited to review the instrument and respond to the pilot round. The instrument was revised based on pilot round input and mailed to the 137 participants. Respondents were asked to project the likelihood over the new 20 years of all predictive statements. They also were asked to rate the statements on their desirability, make comments on the items, and add additional predictive statements for the next round. One hundred fifteen completed responses were returned in time to be included in the initial data analysis (117 total were eventually received). Comments on items in Round I and 41 new predictive statements (labeled with N and a number) suggested by respondents were included in the Round II instrument. A few items were edited by FRC staft based on

the comments by participants and one item was deleted as it was considered by respondents to be redundant. (See Appendix B for a copy of the Round II instrument.)

Definition of Terms

The following terms and definitions are used to categorize level of likelihood and desirability:

Values observed	"Likelihood" terms	"Desirability" terms
6-7	Very likely	Highly desirable
5 - 5.99	Likely	Desirable
4.5 - 4.99	Somewhat likely	Somewhat desirable
3.5 - 4.49	Noncommitted	Noncommitted
3 - 3.49	Somewhat unlikely	Somewhat undesirable
2-2.99	Unlikely	Undesirable
1 - 1.99	Very unlikely	Very undesirable

The measure of dispersion of responses is the standard deviation. In looking at differences of opinion or dispersion among individual responses, the following conventions are used:

Standard Deviation	Descriptor
Above 1.5	Greatly variable
1.0 to 1.5	Quite variable
.50 to .99	Slight variation
Below .50	Good agreement

Orientation

The entire Delphi process conducted by the FRC was oriented to the future. It was not meant to provide a picture of areas of consensus, but to give a prediction of what the field of special education might look like 20 years in the future. An overall picture is provided by describing the results in terms of high likelihood and desirability items

and discrepancies between likelihood and desirability. In addition, results for 14 topical domains are summarized. These domains include the following arranged in alphabetical order:

- Assessment
- Curriculum and Instruction
- Family Involvement
- Finance
- Interagency Coordination
- Least Restrictive Environment
- Personnel
- Policy and Governance
- Reform and Restructuring
- Research
- Service Monitoring
- Societal Values
- Technology
- Transition from School to Work

Results: Round II

Overall Results

In order to provide an analysis of the results from Round II, first, findings across all items will be discussed under the four classifications listed below. Then results in the 14 topical domains will be presented.

- Items showing highest likelihood.
- Items showing highest desirability.
- Items showing highest desirability-likelihood discrepancy (D>L).
- Items showing highest likelihood-desirability discrepancy (L>D).

High Likelihood Items

Table 4 provides predictions by participants on the top 15 ranked items of what is likely to happen in special education over the next 20 years. Good agreement (SD < .50) was not achieved on any of the predictive statements. In fact only half of the items in the top 15 were in the slight variation range (SD .50 - .99) Respondents agreed most on Item 59–expansion of services for older citizens with disabilities.

Within the next 20 years according to respondents, paraprofessionals will play an increasingly more important role in providing direct services to students with disabilities. Related service costs will increase significantly and have increasing fiscal

implications. In addition, these services will expand and providers of related services (e.g., OTs, PTs, psychologists, etc.) will be in such short supply that there will be a crisis in service delivery. This same lack of certified personnel will also be felt in the teacher ranks.

Respondents predict that the boundary between special and regular education will become increasingly obscured with regular educators receiving training to enhance their ability to serve students with mild disabilities. Expanded services will be provided for older citizens with disabilities while technological advances will substantially reduce functional limitations for those with disabilities. For students with more severe disabilities, outcomes will be focused on functional skills; assessment will move away from pencil-and-paper methods; and meeting objectives on IEPs will be used as one criteria for acceptable high school completion.

The 15 items rated highest on likelihood are listed and characterized briefly in Table 4. The likelihood rank is provided in the first column. The item number is shown in the next column (new item numbers preceded by N) and number of respondents is reported in column three. The mean likelihood is listed in the fourth column, followed by a brief statement of the item content in column five. Mean scores on likelihood range from 5.56 to 6.34. Only two items were judged to be very likely to occur; receiving a mean score greater than 5.99. The 13 other high likelihood items were judged to be likely (5.00 - 5.99).

Table 4
Round II: Ranked High Likelihood Items

Kouna II	: Ranked I			
Rank	Item #	N	Mean L	Brief Statement of Item
1	N19	89	6.34	Paraprofessionals will have an increasingly important role in service delivery.
2	N40	91	6.00	Costs for related services will increase significantly.
3	N41	87	5.98	The ambiguity among, medical, related services, and instructional services will have increasing fiscal implications.
4	N6	92	5.95	"Related services" will continue to expand in type, quantity, and variety creating a drain on funding resources.
5	N39	91	5.84	Related service [personnel] shortages will increase significantly.
6	N14	94	5.81	The shortage of special education teachers and therapists (OT, PT, psychologists, etc.) will reach a crisis level.
6	59	94	5.81	Increased longevity will create expanded services for older citizens with disabilities.
8	29	93	5.74	Outcomes for students with more severe disabilities in special education will address functional life skills, rather than isolated academic skills.
8	N32	91	5.74	Paraprofessionals will assume a more direct role in the instruction of children with disabilities.
10	N37	90	5.73	The borderline between special and regular education's responsibilities will become increasingly obscure.
11	91	92	5.72	High school diplomas or certificates of completion will be awarded to students with disabilities who satisfactorily complete their IEP goals in the 12th grade or at age 21.
12	112	92	5.67	There will be an insufficient number of certified special educators.
13	90	94	5.66	Advances in technology will substantially reduce functional limitations of persons with disabilities.
14	N29	94	5.63	Training of regular educators will expand to include skills necessary to serve students with mild disabilities.
15	47	93	5.56	There will be a move toward assessment of abilities that are not simply pencil-and-paper tests.

High Desirability Items

The 28 items receiving the highest desirability ratings are shown in Table 5. These items represent what respondents would *like* to see happen in special education over the next 20 years. Twenty-eight items are included in this listing since there was little difference (.04 to .01) in item means and all are greater than 6.49.

A discussion of the top ten items is provided; readers are referred to the table for a brief statement of the other 18 items. There was good agreement by respondents on the desirability of the top six items with standard deviations ranging from 0.18 for Item 33 to 0.47 for Item 126.

It would appear that a very highly desirable world for persons with disabilities as judged by the respondents would include virtually no discrimination in employment, public agency services, accommodations, and access to communication services. In this vision of the world, the public would understand and acknowledge the contributions that individuals with disabilities can make to society. Regular educators would understand and accept their role in serving children and youth with mild disabilities and training would include skills necessary to serve these students. In addition, preparation for all education majors would include training in special education.

Resources would be available to provide early intervention services, the gap between high school completion rates of students with disabilities and students without disabilities would be reduced, and a coordinated system of services would replace the current fragmented service delivery system. Access to life-long learning opportunities would be available; technological advances would substantially reduce functional limitations; and health care would be universally available.

As stated earlier, the differences between mean scores on the high desirability items are so small that readers are encouraged to take note of the full list of 28 items in Table 5 to get a complete picture of the world respondents envision as desirable for individuals with disabilities. In the table, rank is provided in column one, followed by item number, number of respondents, and mean desirability rating.

Table 5
Round II: Ranked High Desirability Items

			esirability It	
Rank	Item #	N	Mean D	Brief Statement of Item
1	. 33	92	6.97	Discrimination on the basis of disability will be virtually eliminated.
2	N15	92	6.91	Knowledge and understanding of the contributions persons with disabilities can make to society will increase.
3	N29	94	6.90	Training of regular educators will include skills necessary to serve students with mild disabilities.
4	N9	93	6.87	Higher education will include special education training for all education majors.
5	N2	93	6.84	Regular education will understand and accept their role in serving children and youth with mild disabilities.
6	126	92	6.77	States will be able to appropriate sufficient resources to make early intervention services available.
7	30	93	6.73	The gap between high school completion rates of students with disabilities and rates for non-disabled students will be reduced.
8	%	93	6.72	The fragmented services provided by different agencies will be transformed into a coordinated system designed to meet the needs of children and youth with disabilities.
8	106	93	6.72	Access to life-long learning opportunities will be available.
10	90	94	6.71	Advances in technology will substantially reduce functional limitations of persons with disabilities.
10	95	93	6.71	Health care will be made universally available.
12	N8	92	6.68	Special education services for students with disabilities will be the joint responsibility of special and regular education.
12	32	91	6.68	Special education professionals will be sensitive to learning and interpersonal styles of children with disabilities from diverse cultural, racial, linguistic, and ethnic backgrounds.
14	39	93	6.67	Adult service programs will be expanded to fully meet the needs of students with disabilities exiting school programs.
15	80	94	6.65	As a result of advances in assistive technology, employment options for persons with disabilities will increase significantly.

:3 :

Table 5
Round II: Ranked High Desirability Items (Continued)

Kouna II		High D	esirabuity ii	tems (Confinued)
Rank	Item #	N	Mean D	Brief Statement of Item
16	139	92	6.64	Equitable residential, social, and community options will become available to virtually all individuals with disabilities.
16	N37	92	6.64	The borderline between special and regular education's responsibilities will become obscure.
18	N25	85	6.62	Teacher certification will equate to teacher skill.
19	131	93	6.61	Statutory and fiscal reform will occur and drastically reduce interagency barriers and constraints to transition from school to work.
20	N20	93	6.59	Vo-tech and community colleges will become community service centers.
20	8 5	93	6.59	Life-long learning and employment will bring about integration of services between schools and human service agencies.
22	N18	91	6.58	Team teaching with special and regular education in the classroom will be prevalent.
23	47	93	6.57	There will be a move toward assessment of abilities that are not simply pencil-and-paper tests.
24	127	93	6.53	As appropriate, students with disabilities will be included on IEP development teams.
24	129	90	6.53	Funding models will support the provision of special education and other services in the neighborhood school.
26	61	92	6.52	Medical advances will prevent many disabilities.
26	62	94	6.52	The techniques, expertise, and specialized knowledge of special education will be more fully utilized by the regular education system.
28	16	94	6.51	The federal government will fund 40% of the extra costs associated with special education.
28	66	94	6 <i>5</i> 1	Mental health services will be integrated in the school setting and provide on-site support for children, parents and teachers.

High Desirability-Likelihood Discrepancies

Items in Table 6 are listed by rank according to what respondents would like to see happen, but did not see as likely to occur. These items could be interpreted as providing a potential action agenda for the special education field based on the discrepancy between desirability likelihood rating (D > L).

The most highly discrepant item is the desire for, but unlikelihood of, the federal government funding 40% of the extra costs associated with special education. Another quite discrepant item (#N25) is concerned with teacher skill being equated with teacher certification. These two items were by far the most discrepant; 4.63 and 4.26 respectively.

Discrepancies for other items range from a low of 2.53 to a high of 3.65 and include the delivery of quality education consistent with state validated criteria and a decline in litigation. The respondents rating of the desirability of the decline in litigation was quite variable (SD = 1.23). Respondents acknowledged in their comments that litigation can be a force for positive change in the system as has been documented historically.

Three of the items with high desirability and low likelihood relate to fiscal issues. Respondents feel it is desirable for research and development funds in the *America* 2000 plan to include special education as a priority; for states to appropriate sufficient resources to make early intervention services available; and that inclusive programs will generate increased funding. Issues related to cultural diversity were also highly ranked by respondents on desirability-likelihood discrepancies. The discrepancy between the number of teachers from minority groups and the students served needs to be reduced and special educators should reflect the cultural, racial, linguistic, and ethnic mix of the communities they serve.

In this potential agenda for special education, adult services need to be expanded to meet the needs of students exiting school programs, fragmented services need to be transformed into a coordinated system, and local school districts need to self-monitor to establish standards. Work also needs to be done to enable the regular education system to accept their role in providing services for children and youth with mild disabilities. The field heartily supports the intent of the *Americans with Disabilities Act* feeling that discrimination on the basis of disability needs to be eliminated and that equitable residential, social, and community options should be available to virtually all individuals with disabilities.

ننىن

In the table, the rank is given in the first column, the item number is in the second column, the mean discrepancy is in column three, and a brief statement of the item is reported in the last column.

Table 6
Round II: Item Desirability-Likelihood Discrepancies

Round II: Item Desirability-Likelihood Discrepancies						
		Mean D				
		minus				
Rank	Item #	Mean L	Brief Statement of Item			
1	16	4.63	The federal government will fund 40% of the extra costs associated with special education.			
2	N25	4.26	Teacher certification will equate to teacher skill.			
3	N26	3.65	Schools will be able to deliver quality education consistent with what the state has validated.			
4	97	3.48	Special education litigation will decline.			
5	19	3.38	Private sector funds for research and development in the <i>America</i> 2000 plan will include special education as a priority.			
6	126	3.35	States will be able to appropriate sufficient resources to make early intervention services available.			
7	76	3.18	The discrepancy between the proportion of teachers and students served with diverse cultural backgrounds will decrease significantly.			
8	39	3.14	Adult services will be expanded to fully meet the needs of students with disabilities exiting school programs.			
9	139	3.13	Equitable residential, social, and community options will become available to virtually all individuals with disabilities.			
10	N31	2.96	Inclusive programs will generate increased funding.			
11	33	2.79	Discrimination on the basis of disability will be virtually eliminated.			
12	31	2.71	Special education service providers will reflect the cultural, racial, linguistic, and ethnic mix of the community.			
13	N4	2.61	Local school districts will self-monitor to establish standards.			
14	N2	2.59	The regular education system will accept their role in serving children and youth with mild disabilities.			
15	96	2.53	The fragmented services provided by different agencies will be transformed into a coordinated system designed to meet the needs of children and youth with disabilities.			

High Likelihood-Desirability Discrepancies

Items in Table 7 present the inverse picture of Table 6. This is a listing of items that are judged by respondents to be most likely but least desirable (L > D). Again they are items for action since these are potential outcomes that the field would not like to see occur.

The 18 items with high likelihood and low desirability clustered primarily in two areas—fiscal efforts and personnel issues. Over the next 20 years, respondents feel the costs for related services will increase and create an undesirable drain on funding resources. The lack of distinction between medical, related services, and instructional services also will have adverse fiscal implications. Costs associated with special education will increase and a backlash reaction to special education expenditures will severely limit fiscal resources. Respondents predict that states will cut funding for special education, teacher preparation, and services for at-risk infants and toddlers.

In the personnel area, respondents feel it is undesirable, but likely that shortages of teachers, ancillary personnel providing related services, and administrators will reach crisis levels. There will not be a sufficient number of certified special educators and those entering college programs will be less qualified than in the past.

Respondents feel that students with severe disabilities will increase and that through reform efforts special education will become the general remedial arm of the education system. The remaining items with high likelihood and low desirability are concerned with increasing dropout rates and decreasing employment opportunities for students served in special education. In addition an increase in the mismatch between skills of graduates and the requirements of tomorrow's jobs will continue to widen. Those who made comments felt this mismatch in skills also would hold true for general education graduates. This premise is substantiated by Cetron and Gayle (1990) as one of the major overall trends facing public education.

In the table, item rank is reported in column one, item number is in column two, the difference between the mean likelihood score and the mean desirability score is in column three, and the predictive statement in a brief form is listed in column four.

Table 7

Round II: Item Likelihood-Desirability Discrepancies

Kouna II:	item Lik		esirability Discrepancies
		Mean L minus	
Rank	Item #		Brief Statement of Item
i	N40	4.72	Costs for related services will increase significantly.
2	N14	4.38	The shortage of special education teachers and therapists (OT, PT, psychologists, etc.) will reach a crisis level.
3	N39	4.33	Related service [personnel] shortages will increase significantly.
4	60	4.08	Children with severe disabilities will more than double.
5	112	4.03	There will be an insufficient number of certified special educators.
6	N6	3.39	"Related services" will continue to expand in type, quantity, and variety creating a drain on funding resources.
7	N41	3.37	The ambiguity among, medical, related services, and instructional services will have increasing fiscal implications.
8	74	3.30	A mismatch between graduate skills and requirements of tomorrow's jobs will continue to grow.
9	113	3.23	There will be an insufficient number of qualified special education administrators.
10	145	2.98	A backlash reaction to special education expenditures will severely limit fiscal resources.
11	41	2.95	Education and human services curricula will attract less qualified college entrants.
12	20	2.94	Budget and funding problems will reduce services to at-risk infants and toddlers.
13	146	2.81	The costs associated with special education will double.
14	7 5	2.62	The number of special education students dropping out of school will double.
15	N13	2.47	States will cut special education funding as more students are served in regular education.
16	55	2.25	Under "reform activities" special education will become the general remedial arm of the education system.
17	67	2.20	Employment opportunities for people with disabilities will decrease.
18	14	2.14	State funding for special education teacher preparation programs will be severely cut.

Convergence on Likelihood-Desirability Items

Since one of the features of the Delphi process is its potential for increasing consensus through the sharing of earlier results, the FRC looked at convergence trends on "likelihood" and "desirability" items. Convergence was shown when standard deviations on the seven-point scales decreased for Round II responses. Of the 146 items included in Rounds I and II, only one did not show convergence in likelihood; eight did not show convergence in desirability; and one item showed greater variability on both dimensions. The lack of convergence on both dimensions for this one item might have been due to editing and changing the time span from three-to-five years to from five-to-ten years. Respondents felt that this made correction of problems too long term. Items with lack of convergence are listed in Table 8.

Table 8
Items with Larger SDs on Round II

Dimensions	Item	Statement of Item
Both	9	The efficacy of special education services will be determined five to ten years after students leave school and will be based on outcomes in work, school, leisure, success in postsecondary education, and competitive employment.
Likelihood	76	The discrepancy between the proportion of teachers and students served with diverse cultural backgrounds will decrease significantly.
Desirability	24	Parents will participate as full decision making partners on policy issues at local and state levels.
	34	Federal monitoring will be increasingly focused on the state's ability to carry out the monitoring of the delivery of special education services by local agencies and state operated facilities.
	73	States will be required to develop new family-centered services, such as athome crisis intervention and specially-trained foster families to meet the needs of children who are seriously emotionally disturbed.
	90	Advances in technology will substantially reduce functional limitations of persons with disabilities.
	95	Health care will be made universally available.
	128	Community service agencies (health care, mental health, social services) will deliver their services in neighborhoods.
	130	Transition and post school planning for students with disabilities will begin at the elementary level instead of during adolescence.
	139	Equitable residential, social, and community options will become available to virtually all individuals with disabilities.

Item Variability

Many items showed substantial variation on both likelihood and desirability. These items would appear to be those associated with the most controversy among respondents and the least consensus of opinion. These would be items for potential discussion of the varying view points they engender. Items showing great variability (SDs larger than 1.5) on Round II are listed in Table 9.

Table 9
Items with SDs > 1.5 on Round II

Dimensions	Item	Statement of Item
Likelihood Items:	N4	Local school districts will self-monitor to establish standards.
	N11	Mildly disabled students will be provided with increasing amounts of ancillary or related services (e.g., OT, PT, counseling, etc.).
	1	State run institutions serving individuals with severe and low incidence disabilities will be closed.
	N25	Teacher certification will equate to teacher skill.
Desirability Items:	N11	Mildly disabled students will be provided with increasing amounts of ancillary or related services (e.g., OT, PT, counseling, etc.).
	N38	OT and PT will no longer be legal guarantees of special education.
	. N30	Special categorical funding will exist but only for certain categories of disability that are so low in prevalence they could be lost in the shuffle and lose big.
	N5	Public law 94-142 will be rewritten to take out legalized aspects.
	10	Special education services will be limited to meeting the needs of students with moderate to severe disabilities.
	N1	Private for profit group homes for children and youth with severe and low incidence disabilities will take the place of state institutions.
	92	Certificates of completion for students with disabilities not in the diploma track will be considered a satisfactory means of meeting the National Educational Goal of graduating at least 90 percent of high school students.
	1	State run institutions serving individuals with severe and low incidence disabilities will be closed.
	115	Parents will have the power to veto IEPs.

- N10 Funding mechanisms will change to allow services for students with mild disabilities to become the exclusive responsibility of regular education.
- 118b Teachers (special and regular educators) will hire personnel to carry out administrative functions.
 - 12 SEAs will contract with external agencies or businesses for full compliance monitoring services.
- N31 Inclusive programs will generate increased funding.
 - 77 States will implement alternative routes to special education certification as a solution to teacher shortages.
 - 17 Management and funding for health and education services delivered to children and youth with disabilities will become consolidated under one federal department.
 - Parents of children with disabilities will have the right to exercise school choice and school systems will have to provide a free appropriate education at the school the parent has chosen.
 - 72 Special education placement will be determined using computerized decision-making (expert) systems as an aid to placement teams.
- 26b Most children with moderate disabilities will be retained in the general classroom as an alternative to pull out programs such as self-contained and resource room configurations.
- N32 Paraprofessionals will assume a more direct role in the instruction of children with disabilities.

New Items

Forty-one new items (labeled N) were submitted by Round I respondents for inclusion in the Round II instrument. Over one fourth of the new items (27%) focused on some aspect of the role or responsibility of regular educators in serving children and youth with disabilities. These ranged from a unitary education and training system to potential collaborative or team teaching roles regular and special educators could play in educating all children.

Another area generating a high number of new items was related services. Seven items were added-17% of the new items. These included shortages in personnel, increased costs, and lack of adequate funding. Indicators of high school completion also generated three new items. Respondents predicted that diplomas might be replaced by a competency list or documentation of learning experiences and performance of skills. Two items were added related to the future roles of paraprofessionals. Both of these

items were rated among the 15 most likely to occur. High school completion and paraprofessional items made up seven and five percent of the new items respectively.

Topical Results

Predictive statements were sorted into topical areas by FRC staff. This categorization resulted in the identification of 14 topical domains covered in the Delphi process. They ranged in number from a high of 33 dealing with personnel issues to a low of four in the technology domain. Some items could have been included in more than one domain and decisions as to topical area pleacement were somewhat arbitrary. Results by domain are discussed below. Since all topics are considered important, they are reported alphabetically.

Assessment

Five predictive statements (46, 47, 50, 124, and 125) related to assessment issues were included in Round I of the Delphi process; one new item (N22) was added for Round II. Items in this domain focused on the use of assessment for eligibility and instructional planning.

Respondents felt it was highly desirable and likely that education move away from reliance on pencil-and-paper tests as measures of ability. Other highly desirable items (124 and 125) related to the use of testing for eligibility determination. Based on the ratings of these two items, respondents would like to see assessment focused more on instructional planning and be performance based rather than the current focus on eligibility determination and the use of discrepancy formulas. However, comments from both rounds acknowledged a need for both types of tests—determination of eligibility and ongoing assessment for instructional planning. Perhaps the current focus of testing is the issue, with it appearing that the preponderance of assessment resources are used to determine eligibility not plan instruction.

Respondents felt it was likely that there would be continuing emphasis on prereferral strategies, though this intervention should not act as a barrier or delaying tactic when students are eligible and in need of services. The one, new item predicted the use of curriculum-based assessment for determination of eligibility rather than standardized tests. This item was rated as desirable by respondents (Mean = 5.46) though likelihood fell in the noncommitted range. Comments on this item generally supported a desire for this type of assessment, though a move toward more authentic "standardized" models was considered a distinct possibility by one respondent.

20

Concern also was expressed about the ongoing need for ensuring that standardized tests be validated on the appropriate population.

Curriculum and Instruction

In the curriculum and instruction domain, respondents were asked to react to 11 items (28, 42, 53, 54, 79, 89, 127, 134, 135, 141, and 144) in Round I. A new item (N17) was added and item 134 was edited based on recommendations from participants and was split into items 134a and 134b for Round II. Another item was added in the second round; it predicted the use of Individual Family Service Plans for eligible children 3 through 5 years of age receiving special education services.

Predictions in this domain focused on what, where, and how instruction will occur and on the development and use of IEPs. Six of the items were in the highly desirable range. None of the items were rated as very likely though five fell in the likely range.

Respondents rated item 127 as the 24th most desirable, acknowledging that as appropriate, students with disabilities should be included on IEP development teams to represent their own interests. One respondent expressed the belief that students even at the elementary level should participate and have an opportunity to express their interest and desires. The IEP process was seen as an authentic means for becoming more self-directed and independent. Replacing IEPs with individual service plans developed by multiagency teams (141) was also rated as highly desirable. This statement suggested that the plan not only include skill/instructional objectives, but incorporate community supports needed by the individual student and his or her family. A few respondents questioned whether schools would be the appropriate mechanism to bring this about.

Universal availability of vocational education for all youth with disabilities (79) was rated as highly desirable (Mean = 6.47). Other highly desirable items included instruction in natural environments (89) and the availability of alternative curriculum options (144). Respondents felt it was highly desirable for cooperative learning approaches to become standard practice for students with and without disabilities (Mean = 6.24). All of these highly desirable items had only slight variation in ratings.

Family Involvement

In the first round of the Delphi process, nine items (21, 24, 36, 37, 70, 73, 83, 114, and 115) were related to parent or family involvement in the education of children with disabilities. One new item (N16) was added and included in the second round. The items in this area focused on three distinct subtopics: decision-making, service delivery, and the training of parents.

Decision-making. Respondents found increased parental decision making both desirable and likely over the next 20 years. However, parental participation as policy makers was not as highly desirable or likely. Parents as primary determiners of placement and services was judged to be noncommitted on both likelihood and desirability. Respondents felt participation was important, but in a team context and not as primary determiners and a "meaningful role" was considered to be a more appropriate descriptor. An item dealing with IEP veto power for parents was somewhat undesirable and in the noncommitted range on likelihood. The likelihood rating was interesting since many comments stated parents already have this power. Another respondent expressed the view that decisions on placement should be made as a form of partnership between parents and the interdisciplinary team. An item dealing with school choice for parents of children with disabilities fell in the noncommitted range on both dimensions and was in the greatly variable range on desirability.

Comments on one item ranged all the way from the feeling that parents should be key decision makers, to the idea that parents are just too busy surviving to be worried about what is going on at school. Several respondents felt that parents would need training and that not all parents are in a position to make appropriate decisions for their children.

In conclusion, family involvement is highly desirable, but there is little consensus as to the level or role parents should play in the process. Based on respondent comments, team membership and involvement in decision making, but not in policy development, seem to be the more acceptable levels of participation. Technical assistance providers as a group appear to be somewhat more favorable than other respondents toward parents and students as primary determiners of placement and services, equating this with self-determination and empowerment principles.

Service models. Two items describing service delivery for families were rated as highly desirable. These items called for adopting nontraditional methods for involving parents in their children's special education program, and services oriented to family and child need and not toward disciplinary interests and service traditions. One item rated as desirable focused on the development of family centered services, such as athome crisis intervention and specially-trained foster families to meet the needs of children who are seriously emotionally disturbed (SED).

Comments on these items supported the need for schools to do whatever was necessary to increase parental involvement. The item on SED services reflected the need for interagency coordination and involvement to bring this about. One responder felt this would not be accomplished as a state education initiative since it goes beyond

the realm of educational issues and services. References were also made by respondents about larger societal issues that impact the family (e.g., underemployment, poverty, etc.). Item 83 was considered to be an indictment of the special education profession by one respondent–implying that the needs of the family and child are not treated with primary importance. Another respondent expressed the view that we put too much effort into preserving organizational control rather than liberating the field to try new directions.

Parent training. The item (21) on training of parents of children with disabilities by state departments of education was rated as desirable, but noncommitted in likelihood. This type of training was considered by some respondents as more appropriately the purview of the local education agency, with funds coming from the state level.

Finance

In the finance domain, 16 items (13, 14, 15, 16, 20, 22, 57, 58, 64, 98, 105, 126, 129, 138, 145, and 146) were included in the first round. Respondents added seven items (N6, N10, N13, N30, N31, N40, and N41) to be rated in Round II. The 2nd, 3rd, and 4th most likely items (N40, N41, and N6) were related to finance issues; three items from this domain were in the top 28 most desirable items (126, 129, and 16).

Eight of the items in this domain were among the top 18 in the likelihood-desirability discrepancy ratings. These included the prediction that; costs for related services will increase significantly (L>D rank 1); related services will continue to expand in type, quantity, and variety creating a drain on resources (L>D rank 6); the ambiguity among medical, related services, and instructional services will have increasing fiscal implications (L>D rank 7); and states will cut special education funding as more students are served in regular education (L>D rank 15). Respondents making comments generally agreed that the drain on fiscal resources would be undesirable, but that the appropriate services must be available. One respondent reported a trend toward the use of matrix organizations and a spreading of the responsibility/ cost liability across a number of service providers as a partial solution to these funding problems.

Other items that were rated likely but undesirable predicted that; resources will be severely limited due to a backlash reaction to special education expenditures (L>D rank 10; services for at-risk infants and toddlers will be reduced due to funding difficulties (L>D rank 12); costs associated with special education will double (L>D rank 13), and; state funding for special education teacher preparation programs will be severely cut (L>D rank 18).

 $\{\xi\}$

Three highly desirable but unlikely items were also in this domain. They include the desire for the federal government to fund 40% of the extra costs associated with special education (D>L rank 1st); sufficient funding for providing early intervention services (D>L rank 6th); and that inclusive programs will generate increased funding. (D>L rank 10th). Respondents felt it was desirable that funding models support the provision of special education and other services in neighborhood schools, provide interaction with age appropriate peers and participation in the local community (ranked 24th).

Interagency Coordination

All five items (66, 86, 96, 128, and 131) related to interagency coordination were ranked in the highly desirable range by respondents to the Delphi process. In addition, there was only slight variation in consensus ratings (SD 0.62 to 0.76) for these items. However, none of these predictions were considered likely to occur. One new item was added in the second round and was not rated. The additional item predicted an increase in the development and use of local interagency coordinating councils to plan and coordinate special education and related services.

The 8th highest item in desirability and 15th on the desirability-likelihood discrepancy rankings predicted the transformation of currently fragmented services into a comprehensive, multidisciplinary, interagency system. This item would then be one that is seen as highly desirable, but not likely and could become part of an action agenda for the field. This is particularly true since there was only slight variation (SD = 0.65) on the desirability rating.

Two other items falling in the highly desirable range (ranked 19th and 28th) called for statutory and fiscal reform to drastically reduce interagency barriers and constraints in transition from school to work and the integration of mental health services into school settings. Respondent comments identified some of the barriers to interagency coordination that contributed to the low likelihood ratings as "turfism," "current funding systems," and "bureaucracy."

The remaining two items (86 and 128), that were also highly desirable but below a mean of 6.5, called for the development of a single service delivery plan even when multiple agencies were involved in service provision, and the delivery of services (health care, mental health, social services) in local neighborhoods. The definition of "neighborhoods" was considered problematic by some respondents particularly given the sparse population in some areas and lack of identifiable neighborhood boundaries in cities.

Least Restrictive Environment

In the first round of the Delphi process, four items (1, 2, 3, and 26) were included in the least restrictive environment domain. For the second round, one new item was added (N1). In addition, one item (26) was edited based on comments made by respondents and became items 26a and 26b in the second round.

Two items in this domain (2, and 26a) were rated as highly desirable. According to results, respondents want a full range of program options for students with severe and low incidence disabilities in neighborhood schools. Likelihood ratings on this item were quite variable (SD = 1.32) and its likelihood rating fell in the noncommitted range. Respondents also hoped that children with mild disabilities would be retained in the general classroom as an alternative to pull-out programs though there was little consensus on this item (SD = 1.13).

Two items (1 and N1) had great variability in ratings of desirability (SDs larger than 1.5). Item 1 was also greatly variable on likelihood ratings. These items dealt with the closing of state run institutions and the replacement of state run institutions by private, for-profit group homes to serve children and youth with severe and low incidence disabilities. There appears to be little agreement by the field in this area, at least on the statements developed by the FRC. Both of these items received many comments by respondents. Comments included the need for a "full continuum of services" and the possibility of "replacement of large institutions by small group homes . . . in communities."

Personnel

The personnel domain consisted of the most predictive items (27 31, 40, 41, 60, 65, 68, 76, 77, 99, 100, 103, 104, 109, 111, 112, 113, 116, 117, 118, 121, and 122); 22 in the first round and nine new items (N9, N19, N14, N25, N29, N32, N33, N35, and N39) in Round II. In addition two items were edited and became items 27b and 118b in the second round for a total of 33 items.

According to respondents, it is likely that paraprofessional will have an increasingly important role in service delivery (ranked 1st) and that they will play a more direct role in the instruction of children with disabilities (ranked 8th). It is both likely (ranked 14th) and desirable (ranked 3rd) that training of regular educators expand to include skills necessary to serve students with mild disabilities. The 4th most desirable item (N9) was also in the personnel domain and predicted that higher education will include special education as part of the preparation program for all education majors.

Three other items were rated as desirable, but not likely and were among the ranked items on the desirablility-likelihood discrepancy ratings. These included predictions that teacher certification will equate to teacher skill (ranked 2nd); that the discrepancy between the proportion of teachers providing services and students served with diverse cultural backgrounds will decrease significantly (ranked 7th); and that special education service providers will reflect the cultural, racial, linguistic, and ethnic mix of the communities they serve (ranked 12th).

Six items in this domain were considered by respondents to be likely, but not desirable and were ranked on the likelihood-desirability discrepancy ratings. These items predicted personnel shortages for teachers (ranked 2nd), related service providers (ranked 3rd), certified professionals (ranked 5th), and administrators (ranked 9th). In addition to these critical shortages in personnel, respondents also predicted that less qualified applicants will be attracted to education and human services preparation programs (ranked 11th)and that children with severe disabilities needing services will double (ranked 4th). It would appear that these critical shortages in personnel coupled with an increase in those requiring services and the lack of ability of future trainees will put a strain on the entire service delivery system.

Policy and Governance

The Delphi process included 11 first round items (17, 18, 38, 56, 81, 82, 95, 97, 101, 102, and 108) related to policy and governance of special education. Five new items (N3, N5, N11, N23, and N38) were added for second round ratings.

Item 95 was rated as the 10th most desirable. It predicted policy changes to make health care universally available for families of young children with disabilities. Three other items were also rated as highly desirable. These included the reworking of regulations in IDEA and Chapter I to allow for the blending of funding and instruction (N23); the reduction of grade retention in elementary and middle grades (108); and the decline of special education litigation (97). However, this last item was the 4th ranked item on the desirability-likelihood discrepancy rankings. Comments by respondents indicate that this item is only desirable if it occurs because the rights of individuals with disabilities are being upheld and appropriate services are available. In fact, the value of litigation as a means for effecting positive change was acknowledged by respondents.

Reform and Restructuring

In the first round, the reform and restructuring domain consisted of 16 items (10, 11, 19, 48, 49, 51, 52, 55, 62, 84, 107, 110, 119, 120, 142, and 143). Eight new items (N2, N7, N8, N12, N18, N34, N37, and N38) were added by respondents for Round II. One item (N37)

was rated as the 10th most likely and five items were in the top 28 on desirability ratings. In addition, item N2 ranked 14th on desirability-likelihood discrepancy ratings and item 55 was 16th on the likelihood-desirability discrepancy ratings.

The 5th most desirable item (N2) in the Delphi process predicted that the regular education system would understand and accept their role in serving children and youth with mild disabilities. This item was not considered to be very likely to occur in fact it was 14th on desirability-likelihood discrepancy ratings. Based on comments, respondents felt this change could not occur unless there was a dramatic increase in training and collaboration between regular and special education.

Item 55 was ranked 16th on likelihood-desirability discrepancy ratings. Respondents felt it was likely, but not desirable, that as schools become more sensitized to the student who is not progressing under "reform activities," there would be growing pressure for special education to become the general remedial arm of the educational system. This is not the role respondents want to play. Respondents would like for special education services to be the joint responsibility of special and regular education and for the borderline between the two to become more obscure. Team teaching with special and regular educators in the classroom was highly desirable (ranked 22nd) and a codependency between the two systems where techniques, expertise, and specialized knowledge of special education are used by all (ranked 26th).

Research

The first round of the Delphi process, included seven items (25, 35, 61, 63, 69, 93, and 94) related to research. One new item (N24) was added. Two items were rated as highly desirable while three fell in the desirable range.

Respondents felt research (genetic engineering and other medical advances) and prevention of disabilities were highly desirable, but they feared that advances might not be available to all and, since more individuals with disabilities will be living longer, that the overall numbers of those needing services would not decrease. The other highly desirable item predicted increased research efforts on early identification and diagnosis of emotional problems in young children. However, those choosing to comment on this item were generally negative (e.g., "SED infants and toddlers?"). One respondent hoped that research in this area also would focus on ameliorating and preventing problems associated with emotional disturbance. This item's rating might be a reflection of the understanding by a majority of respondents that delayed intervention with this group of children is not generally effective. Interestingly this

same item had the highest likelihood rating of any in the research domain (Mean = 5.02).

None of the items related to predicting the focus of research or methods for developing a research agenda fell in the highly desirable or likely range. In fact, most items in this domain were in the noncommitted range on likelihood.

Service Monitoring

Thirteen items (4, 5, 7, 8, 9, 12, 29, 34, 71, 87, 88, 136, and 137) were included in Round I of the Delphi process in this domain. Two new items (N4 and N26) were added by respondents for inclusion in the second round. Two thirds of the items fell in the highly desirable range (Means from 6.01 to 6.46); item 29 was ranked as the 8th most likely by respondents. Items in this domain focused on two areas—outcomes and accountability.

Outcomes. Respondents felt it was likely (Mean = 5.74) that outcomes for students with disabilities will address life skills rather than isolated academic skills. This item (29) was also rated as the most desirable in this domain. A highly desirable future in service monitoring would include in addition to item 29, a better definition of outcome measures; the incorporation of outcome data collection within the total educational assessment effort—not separate from general education; expanded collection and use of follow-up data; and a shift from monitoring processes to the monitoring of outcomes. However respondents, who added written comments, felt that both of these factors (processes and outcomes) were important parts of a comprehensive monitoring system.

Accountability. Respondents felt that compliance, access, and inclusion would no longer be satisfactory measures of effectiveness, instead; special education would be held accountable for a high level of quality programs and improved outcomes resulting from services provided; schools would be able to deliver quality education consistent with what states have validated; and a single monitoring system would be developed for evaluating each special education student's progress across different service delivery systems. In addition, the efficacy of special education services would be determined five-to-ten years after students have left school and would be based on outcomes in work, leisure, postsecondary education, and competitive employment. This last item, concerned with when efficacy of services would be determined, decreased in consensus from Round I to Round II. This might be due in part to an editorial change in the timelines from three-to-five year in the first round to five-to-ten years in the second round. One respondent pointed out that while five years might be too short a time

period for measuring successful adult integration, too many intervening variables come into play to confidently relate student success to the efficacy of special education services when the time is increased to ten years. It was also felt that problem identification and resolution might be delayed under this extended timeline. Other comments on this item were related to the difficulty and expense associated with collecting follow-up data.

Societal Values

In the societal values domain, six items (23, 32, 33, 123, 139, and 140) were included in round one. One new item (N15) was added for Round II reaction. Six of the seven items were rated as highly desirable and the other as desirable.

Elimination of discrimination in employment, in the provision of services by public agencies, in public accommodations, and in access to telecommunications on the basis of disability was the most highly desired item in the entire Delphi process. This item also had the highest level of agreement by the respondents, but the likelihood of achieving this was rated considerably less. In fact, this item was the 11th highest on desirability-likelihood discrepancy. Another highly desirable (ranked 16th) but not likely item (139) was very similar. It predicted the availability of equitable residential, social, and community life options for individuals with disabilities and ranked ninth on desirability-likelihood discrepancy ratings. The field strongly desires the elimination of discrimination but is pessimistic about achieving this degree of acceptance over the next 20 years.

The 2nd most highly desirable item (N15) expressed a hope for increased knowledge and understanding of the contributions persons with disabilities can make to society. This item also had good agreement (SD = 0.33) in ratings. The 12th most desirable item (32) focused on the need for special education professionals to be sensitive to specific learning and interpersonal styles of children with disabilities from diverse cultural, racial, linguistic, and ethnic backgrounds and adapt their service delivery approaches accordingly. Some respondents felt that special educators are somewhat more sensitive in this regard, but others observed that this is not the case and that all educators should develop this sensitivity. One respondent emphasized the belief that this change would not be likely unless preparation programs and those doing the preparation also changed.

Technology

Four items (72, 80, 90, and 133) related to technology issues were included in the Delphi process. Three of the four fell in the highly desirable range. Respondents felt it was highly desirable (ranked 10th) and likely (ranked 13th) that technology would substantially reduce functional limitations of persons with disabilities. Also highly desirable (ranked 15th) was the prediction that assistive technology would provide more employment options. Item 133 was rated as highly desirable (Mean = 6.34) though it was not in the top ranked items. This item predicted improved information storage and retrieval to enable parents and educators to access data about available services and materials to meet the needs of individuals with disabilities. This item was rated as somewhat likely to occur.

Item 72 predicting the use of expert systems as an aid to making placement decisions engendered much comment. These ranged from "feed the IQ in and print out the street address of the building" to "given the 50% error rate in LD placements the present system is inhumane and incompetent—we need all the help we can get." There was a great deal of sentiment expressed about keeping decisions in the hands of humans, not machines. This item was not judged to be likely even though two comments described the current availability of this technology.

Transition from School to Work

This topical domain, transition from school to work, included 15 items (30, 39, 43, 44, 45, 59, 67, 74, 75, 78, 85, 91, 106, 130, and 132) in Round I. Four new items (N20, N21, N27, and N28) were added for the second round of the Delphi process. Of the items in this domain, five ranked in the top 20 on desirability ratings and two were in the top 15 in likelihood. One item was 8th on the desirability-likelihood discrepancy ratings.

The most likely of the transition items predicted that increased longevity would demand the expansion of services and additional support for older citizens with disabilities (59) and ranked 6th. This item was also rated as highly desirable (Mean = 6.24) The 11th most likely item (91) predicted that high school diplomas or certificates of completion will be awarded to students with disabilities who satisfactorily complete their IEP goals in the 12th grade or at age 21.

Other highly desirable items were number 30 (ranked 7th), number 106 (ranked 8th) and numbers 85 and N20 tied for 20th. These items depict a desirable future where the gap between high school completion rates for students with disabilities and for non-disabled students will be reduced; access to life-long learning opportunities will be universally available; life-long learning and health services will be provided through

vo-tech and community colleges; and one could expect greater integration of services between schools and human service agencies for people with disabilities 18 and older due to a greater emphasis on life-long learning and employment.

The 14th ranked item on desirability was not felt to be very likely. This item calls for the expansion of adult services to fully meet the needs of students with disabilities exiting school programs. Part of the pessimism about this item takes into consideration the lack of funding and the belief that our economy will not support this as an entitlement. Apparently respondents see expansion of services and support as likely, but not the availability or programs and services that fully meet the individual needs of those exiting school.

Discussion and Implications

Predicting the future is an essential activity since the future is shaped by our ideas. The future becomes our invention since it does not now exist (Cornish, 1977). In the process conducted by the FRC, representatives of the field of special education rated predictive statements on likelihood and desirability. So a Utopian future, as well as, a predicted future was derived from the results. Perhaps more importantly, the discrepancies between these two views of the future were explored as potential areas for action. As a result of this investigation, three major challenges emerged–personnel shortages, personnel training, and funding. These must be considered as we envision the future of special education.

First, we are faced with a lack of sufficient qualified personnel to fulfill instructional, support, and administrative functions necessary to providing a quality education to all students with disabilities and their families. New and more effective methods of recruiting professionals and retaining those we have must be developed. We must also develop better ways of accurately determining supply and demand. The FRC is currently collaborating with the OSEP to implement better methods of assessing shortages and developing a National Agenda in Personnel Preparation. This initiative not only focuses on the need for more and better trained personnel, but on the recruitment and training of individuals from culturally, racially, ethnically and linguistically diverse backgrounds to work at all levels in the educational system.

Several potential solutions to personnel shortages were predicted through the Delphi process. One projected enlarging the role paraprofessionals play to include direct instruction. Another potential solution predicted a blurring of the boundaries between special and regular education, with increased instructional responsibilities for

the education of students with mild disabilities being fulfilled by general education. This might occur through more collaborative or team teaching configurations for service delivery. Finally, respondents predicted the implementation of alternative routes for certification of professionals

Secondly, these potential solutions to personnel shortages have serious implications for personnel preparation. If indeed the roles of paraprofessionals do expand, at issue is who will provide the training. This could become the responsibility of universities, community colleges, or public schools working collaboratively or separately. In addition to training paraprofessionals for their new roles, professional service providers' roles and responsibilities will change. They too will have to be trained in how to work effectively within this service delivery model.

Increasing the responsibilities and enlarging the role of general educators in instructing students with mild disabilities also will have implications for personnel preparation. Respondents felt regular and special educators would be working more closely through consultative or team teaching models. Preparation programs would need to incorporate these skills into existing or new courses and school systems would need to provide inservice training for current practitioners. Preservice training could continue to be provided in separate preparation tracts with all teachers taking courses from both areas or the specialized knowledge from both fields could be integrated into courses that prepare teachers to work with wide ranges of student need in inclusive classrooms. Respondents in this study felt that specialized skills would be shared across teacher preparation programs though the method for accomplishing this was not specified..

A third challenge to providing appropriate services to children and youth with disabilities is inadequate funding. It was predicted by respondents that students with more severe disabilities and the need for related services would increase while funding remains the same or decreases. Respondents were particularly concerned that this could reduce the availability of early intervention services. Special education would need to either use the funds available more effectively or increase funding sources. With the current economic situation and pessimism about economic recovery, additional funds from current sources does not seem likely in the short run. Participants in the Delphi process hoped that the national emphasis on education might provide additional funds for children with disabilities through some of the *America 2000* initiatives, but they did not see this as likely. The field will be challenged to develop strategies to increase the likelihood of this occurring. Another potential means of increasing the funding pool would be through increased interagency and

program collaboration (e.g., special education and Chapter I). Respondents hoped that regulations would be reworked in these programs to allow a blending of funds and instructional services.

There are indeed challenges to be met in our field as we move into the 21st century. It will take creative and dedicated individuals to meet these challenges and improve our educational system for all students.

One respondent provided the following thoughtful comments that seem to aptly summarize the difficulties ahead: As I completed the survey instrument, I became aware of how much decisions are influenced not by what is possible or desirable but by power, control, and territoriality at all levels. In addition, I am concerned by the little spent on education in this country and the movement away from the human factor between teachers and students toward mechanical solutions. Politics involved at all levels and the glacial movement toward change in our educational system and agencies saddens me. We need experimental programs to demonstrate what works. Special education needs to become less special and education needs to become special for all children. We need one capable comprehensive instructional support system for all students.

These views seem to parallel, at least in part, Rodney King's lament and our most serious question for the future might be—Can we all work together?

Appendix A: Statistical Summary

Appendix A: Statistical Summary

Appendix B provides a summary data table for Round II results. The item number is listed in column one and the number (N) of usable responses is in columns two and seven. Item numbers preceded by the letter "N" indicate new items added by participants in Round I. These items were inserted as close in proximity as possible to where the originator listed them on the Round I instrument. Item numbers followed by an "a" or "b" indicate an item that was split into two separate items due to suggestions or lack of clarity as identified by Round I participants. The mean is reported in column three for likelihood and column eight for desirability. Column four is the standard deviation (SD) for likelihood and column nine the standard deviation for desirability. The median (Med) for likelihood is in column five and column ten for desirability; while the range for each item on likelihood and desirability is reported in columns six and eleven respectively.

Appendix B: Round II Delphi Instrument

Appendix B: Round II Delphi Instrument

The following instrument was used in Round II of the issues and trends identification process conducted by the Federal Resource Center. For Round II, the mean, standard deviation, and number of respondents for each item on likelihood and desirability was provided for each item. In addition the approximate mean value was marked on the 1 to 7 value rating scale for the items. The Round II instrument also included new items identified with N and a number. New items were inserted as close in proximity as feasible to the point were they were suggested by respondents. If the new items were rated by the participants these values were also included. Comments from Round I were reported on each item so that they could be used by respondents in making their assessment of likelihood and desirability for Round II.

THE FEDERAL RESOURCE CENTER IN COOPERATION WITH THE OFFICE OF SPECIAL EDUCATION PROGRAMS PROJECT ON IDENTIFICATION OF TRENDS AND ISSUES IN SPECIAL EDUCATION

Name:	 	 	
Code:	 		

DELPHI SURVEY: ROUND II

Instructions:

Please provide ratings on the likelihood and the desirability of trends or changes which would be of importance in the field of special education should they occur by responding to each of the items on the following pages. The time frame for the predictions is "within the next 20 years."

Please read the summary of Round I responses before you begin Round II. This will provide you with information on the Round I results. Numerical data (item mean, standard deviation, and number of respondents) are provided with each item directly on the rating sheet for Round II as well as in the summary information package.

As in the first round, statements predicting particular changes or trends are given in the column on the left side of the form. Your responses should go directly on the form to the right of each of the predictive statements. Please draw a circle around a number in the continuum from (1) to (7) which best represents your view of each predictive statement's likelihood and its desirability. You may wish to pace yourself by taking occasional breaks.

You will note that on "likelihood" the continuum ranges from "unlikely" to "likely." On "desirability" the continuum ranges from "undesirable" to "desirable." Comments from Round I are provided in the column on the left of the form. New items have been added by participants and have an "N" as part of their item number. Mean (X), Standard Deviation (SD), and Number of respondents (N) are provided for each item for likelihood and desirability. In addition, the mean is marked with a line on the seven point scale. Please treat each item independently and keep in mind that the time frame used is "within the next 20 years."

Based on comments by participants some of the original items have been edited or split into two different items for this round. Strikethru was used to indicate words deleted from an item and underline indicates new words added. Split items are numbered with an "a" and "b" (e.g., 121a, 121b).

Note: The term "categorical" as used in this survey refers to categories of children-such as mental retardation, visually impaired, or seriously emotionally disturbed, -as sometimes used in the field of special education.

•			
Predictive Statement	Likelihood: What is the likelihood this change will occur in the next 20 years? (Circle One)	Desirability: Should this change occur? (Circle One)	Additional Comments
1 State run institutions serving individuals with severe and low incidence disabilities will be closed.	Unlikely Likely 1 2 3 4 5 6 7 X=4.47 SD=1.59 N=114	Undesirable Desirable 1 2 3 4 5 6 7 X=4.99 SD=1.82 N=114	
Comments on Item 1: This option on the continuum she child are such that this option. There will always be children where needs. Only if alternative placements are Not large institutions but small Small segment of the population Critical by law to provide a full Medical concerns preclude public Will still exist but dramatically and Closed - reopened by then. Very likely and desirable for instance from communities and family programs for S. and L. are hig Very desirable—but we have not Institutionalization needs to be a few states are already moving Some forms of disability are so a nology, the ability to serve su Large residential institutions, yet Depends more on federal/ state p Schools for deaf will be with us Under 4 beds. Increased pressures on LEAs. There will still be a need for ins Currently in my state, this is rea Unless statutes change a continue Most will close, but there will shall proportion of children will the need to differentiate between populations. State run programs.	sed only when the needs of the severe medical and physical totally it hurts rural areas. ese cases. al sense of custodial and away munity integrated family es. In existing knowledge and techdan an institutional setting, persist. of cosed. In care. In unity is very influential.		
N1 Private for profit group homes for children and youth with severe and low incidence disabilities will take the place of state institutions.	Unlikely Likely 1 2 3 4 5 6 7 X=6.0 SD=0.0 N=1		

Predictive Statement	Likelihood: What is the likelihood this change will occur in the next 20 years? (Circle One)	Desirability: Should this change occur? (Circle One)	Additional Comments
2 A full range of program options and services will be available for students with severe and low incidence disabilities in their neighborhood schools.	1 2 3 4 5 6 7 X=4.67	Undesirable Desirable 1 2 3 4 5 6, 7 X=6.33 SD=1.06 N=115	

Desirability tempered by the fact that a fair number of families prefer out of community placements.

We will become better skilled at inclusion and integration.

Exceptions will be rural, western districts, (i.e., a district with 70 students).

The economic situation would need to change a lot for all low incidence disabilities to be in their neighborhood schools.

Will need to balance quality-particularly issue of availability of personnel.

As related services increase (as required by law) finding qualified bodies to provide services particularly in the poverty stricken rural areas becomes difficult.

Dependent upon student numbers and teacher availability and training in general ed.

This might not be really possible in geographical areas with low density populations.

		Uni	Unlikely					cely	Undesirable				Desirable		
3	Children and youth with severe and low incidence disabilities will be fully integrated into regular classrooms served in inclusive schools.	SD		3	t ⁴	5	6	7	SD	2 4.88 ≔1.6 :115	3 7	4	,5	6	7

Comments on Item 3

LRE must be met as appropriate for each child-assuming this is good for all is a false assumption. As appropriate...

Appropriate use of LRE meets needs of children.

At least for part of the school day.

Full day may not be advantageous to these students and youth with severe and low incidence disabilities.

Must not ever mandate a service delivery-look at each child's needs.

Case-by-case but definitely greater possibility.

Desirability contingent on inservice.

Integrated and then segregated.

Full integration in all classes makes little sense. The criterion for placement should be other than more integration.

"Fully integrated" can mean different things to different people.

Do we really know what "fully integrated" means for this population?

Mixing severe and low incidence makes this prediction difficult.

If "regular" means appropriate training and resources for the teachers to individualize need integration.

Integrated fully? The desire is there but reality????

"Fully integrated" is not a standard term.

Challenges with SED pop. as well as Deaf/HI.

While philosophically it is "right" to fully integrate the low incidence populations, we need to be cognizant of the support needed for the regular classroom teacher.

At what level?

"Fully integrated"-is it synonymous with full inclusion.

Desirable Yes! but fully integrated? Depends upon definition beyond "placement."

This is an idealistic goal which I do not feel is realistic.

Predictive Statement	Likelihood: What is the likelihood this change will occur in the next 20 years? (Circle One)	Desirability: Should this change occur? (Circle One)	Additional Comments
N2 The regular education system will understand and accept their role in serving children and youth with mild disabilities.	Unlikely Likely 1 2 3 4 5 6 7 X=3.0 SD=0.0 N=1	Undesirable Desirable 1 2 3 4 5 6 7 X=7.0 SD=0.0 N=1	
4 Regulation of special edu- cation services will shift from monitoring processes to monitoring outcomes.	Unlikely Likely 1 2 3 4 5 6 7 X=5.03 SD=1.43 N=115	Undesirable Desirable 1 2 3 4 5 6 7 X=6.03 SD=1.60 N=115	
Comments on Item 4: Predictability of success has so a Although much depends on what Should not shift, but should do a Monitoring process and outcome both is desirable. Highly likely—Need some of both False dichotomy. Wayne Morsestance (outcomes)." This is a difficult question: procevery desirable knowing some at I see a combination rather than a It would be wonderful. Move toward outcomes. Unclear. If monitoring is for conwill it be desirable.			
5 Current federal monitoring processes will be shifted to the states.	Unlikely Likely 1 2 3 4 5 6 7 X=4.15 SD=1.47 N=113	Undesirable 1 2 3 4 5 6 7 X=4.66 SD=1.78 N=114	
Comments on Item 5: A Federal presence helps to provide States should play a major role, not likely that it will shift to There needs to be a federal over For some states this would wor't don't know about this one. The current federal process is not Effective tool to assure appropriation in the true now-I don't unders Given my answer to #6, I have toring process.). Both processes and outcomes we This implies a totality that is unrate. Both state and federal monitoring Unclear. If monitoring is for conwill it be desirable.

For which group – the answers a For those students that can perfect if "special education" means see Poor statement. Has little means	may change? orm sufficiently in the vere/ profound then of	e academic sl bservationi	cills, should receive the skills.		

Poor statement. Has little meaning Re: the individual stud

I don't know what "isolated academic skills" means!

We must do this.

Outcomes must be student specific.

Particularly important for children with significant disabilities. Kids with M/M disabilities will need academic competency but not "isolated" skills. Emphasis must be on integrating academic competency and life skills.

By integrating content with the basic skills, much can be achieved academically. In some respects sp. ed. teachers are not trained well enough to teach language arts, etc. effectively. Outcome, however, is somewhat realistic if we deal with the moderately and severely disabled.

Depends on learner needs.

Isolated? Academic skills needed for functional life skills will be important.

	Unlikely		Likel	y Un	desira	able		D	Desir	rable
30 The gap between high school completion rates of students with disabilities and rates for non-disabled students will be drastically reduced.	1 2 3 X=4.50 SD=1.45 N=114	4 1 5	6	SD	2 -6.64 -=0.80 :114	3	4	5	6	1 ⁷

Comments on Item 30:

Emphasis must also be on keeping nondisabled in school.

Reduced, yes. 2 questions dramatic reductions.

That would be great.

"Completion rate" is.

Depends on what that means! Simply passing them through is a great disservice!

Like the word completion rather than graduation.

We will improve-highly desirable!

Single parent/ poverty/ disability are intertwined in the completion rate-not likely.

102 Categorical delivery of services will be abolished in favor of none egorical programs (excluding students y sensory impairments mild, moderate, and servere levels of disability	at- ith for	Undesirable Desirable 1 2 3 4 5 6 7 X=5.08 SD=1.83 N=115	

Comments on Item 102:

I agree with the noncategorical programs, but do not wish to see students further segregated/ classified.

This needs to occur.!!

Especially visually and hearing impaired as well as multi-sensory impaired.

Desirable for LD, ED, LI, etc. Still need for categories in Deaf, VI, DB due to uniqueness of skills. Think of a different "label" or none. Think of the service rather than the label of the student.

Who cares? This kind of stuff is an administrative shell game that does nothing to improve instruction!

Can't eliminate all categories because some instruction (e.g., sensory impaired) really IS different. There is a real technology of instruction not practiced by "reg. ed. teachers."

Individualized instruction is necessary—the labels mild, mod. severe are potentially very dangerous. Categorical services are not desirable.

We should not do away with categorical programs completely.

Not sure I really like this one.

There will continue to be categorical areas in vision, hearing, and speech.

	Unlikely	Likely Undesirable	Desirable
103 Categorical certification in special education will be replaced with generic certification which will allow a teacher to serve children with mild to moderate levels of disability (excluding sensory impairments).	X=4.87 SD=1.32 N=115	6 7 1 2 3 4 X=5.27 SD=1.75 N=115	5, 6 7

Comments on Item 103:

There are pluses and minuses both ways-some students.

This needs to occur!!

What about severe-again VI, HI, and MSI need specific training-not desirable

Who cares? This kind of stuff is an administrative shell game that does nothing to improve instruction!

Can't eliminate all categories because some instruction (e.g., sensory impaired) really IS different. There is a real technology of instruction not practiced by "reg. ed. teachers."

But speciality training is highly necessary!

Current system in my state-it does not need to drive service delivery-but can if allowed.

Speech would have a hard time with this.

Already happening.

Yes, but don't do away with completely.

Mild etc. is not correct division-specific instructional needs of students and skills or teachers are better.

Certification range is too great to be realistic.

There will continue to be categorical areas in vision, hearing, and speech.

paramount!

This would allow for "real world" preparation of special educators-very desirable.

All teacher preparation schools should be lab schools.

There is a trend toward site-managed inservice, ...certification, but I doubt schools will ever grant

Certification protection from litigation will not allow this.

Some is ok, all is bad.

Not desirable-of course practical fellowships, internships etc need to be in the public school A strong partnership between higher ed. and the schools/ interagency collaboration.

Higher ed, lobby is too strong!!

Not just special education but all of education's teacher training programs. Instructors should be practitioners and this statement indicates that this would be so (to me).

Would welcome a return to a lab school model for teacher preparation.

It would be good if we could be sure they can do an adequate job of teacher training at the institution before they simply transport crummy programs to the schools. Crummy is crummy, whether on campus or in a public school building.

Strong internship programs should be developed if resistance to this idea occurs.

	Likelihood: What is the likelihood this change will occur in the next 20 years?	Desirability: Should this change occur? (Circle One)	
Predictive Statement	(Circle One)		Additional Comments
N33 Entrance to teacher preparation programs will begin at the post baccalaureate level and will consist of at least two years of specialized training; the last being a year long residency (internship) at a school site.	Unlikely Likely 1 2 3 4 5 6 7	Undesirable Desirable 1 2 3 4 5 6 7	
Special education teachers as a part of site-based management teams will assume new responsibilities for education and will have control of building-based curriculum, funds, and the methods and means of instruction.	Unlikely Likely 1 2 3 4 5 6 7 X=3.54 SD=1.43 N=115	Undesirable Desirable 1 2 3 4 5 6 7 X=4.37 SD=1.56 N=115	
Comments on Item 117: Teachers should be part of proces with assistance from regular education. Will be consistent with education Teams. They have this now in many part of site-based management will proceed they are they should be part of site-base. By themselves? Change to site-base management ity. With their gen. ed. counterparts. Then they wouldn't be teachers. I don't see much control of the them presently. In collaboration with regular ed. New responsibilities in education.
