Undergraduate Study

IDENTIFIERS *Oregon State System of Higher Education

ABSTRACT

This report focuses on key educational and employment areas that might be correlated with efforts to achieve and maintain racial and ethnic diversity in the Oregon State System of Higher Education. Specifically, the report highlights Oregon high school students' college aspirations, estimated high school graduation patterns and college participation, enrollment and degrees awarded by educational level, educational outcomes in terms of high school and college freshman year academic performances, a profile of students receiving financial support, and the employment distribution of faculty, professional staff, and administrators. Also, where possible, national data are presented for comparative purposes. Observations and conclusions include the following: (1) 81 percent of Oregon's 1992 high school graduates plan on postsecondary education; (2) the cost of attending colleges and universities will continue to be a dominant factor for all students planning postsecondary education; (3) there is a lack of progress in recruiting and retaining minority group students at the graduate level; and (4) minority group undergraduate degree awards will increase due to better academically prepared students enrolling in the State System. It is noted that while the State System has made progress in lowering or eliminating barriers to enhancing racial and ethnic diversity, there needs to be a greater effort in achieving a climate of support within the institutions. Thirty-four tables and graphs present detailed data. Contains 11 references. (GLR)

Introduction

Reports to the State Board of Higher Education on the status of minority groups in the State System, particularly regarding students, have highlighted areas for improvement and defined strategies for bringing about those improvements. The Board approved Minority Student Enrollment Initiative in May, 1987 provided a basis on which campuses could implement focused and intensive recruitment efforts to enroll qualified, first-time freshman underrepresented minority students: African Americans, American Indians, and Hispanics (including Latinos). Also, institutions were to provide student services and academic programs to enhance retention among underrepresented minority students. In January, 1990, the Board approved a reorganized fee remission program to be implemented in the 1990-91 academic year. The purposes of the reorganized fee program structure were to (1) improve the overall academic quality and diversity of the System's enrollment, and (2) attract Oregon residents based on academic merit and achievement. The revised fee remission policy consists of three major programs: the Oregon Student Minority Enrollment Initiative, the Oregon Laurels Program, and the International Cultural Service Program.

In November, 1989, the Board accepted staff recommendations that each president develop and present to the Chancellor by April, 1990, comprehensive plans for minority group recruitment and retention of students and employees (OAR 580-10-003). In December, 1990 and June, 1991, the Board received two reports on the status of campus efforts to develop and implement comprehensive plans. The plans included recruitment and retention of both minority group students and faculty/staff. As of Fall, 1991, campuses were to have comprehensive plans in place for implementation. Also, campuses appointed a senior campus administrator to be accountable for implementation of the comprehensive plan. These senior administrators meet on an ad hoc basis with OSSHE Academic Affairs staff to discuss diversity related issues having System implications.

This report focuses on key educational and employment areas that might be correlated with efforts to achieve and maintain racial and ethnic diversity in the State System. Specifically, the report highlights Oregon high school students' college aspirations, estimated high school graduation patterns and college participation, enrollment and degrees awarded by educational level, educational outcomes in terms of high school and college freshman year academic performances, a profile of students receiving financial support, and the employment distribution of faculty, professional staff, and administrators. When possible, national data and information have been presented to place the State System's trends in a comparative context.

College Aspirations and Estimated Graduation Patterns of High School Students

Each year the State System surveys Oregon high school juniors on their post-high school plans. The latest report surveyed the high school graduating class of 1992, with 69 percent responding. Among those high school juniors surveyed, 81 percent planned to pursue further education after high school [Table A-1]. Furthermore, when considering racial/ethnic group aspirations, Asian Americans and African Americans aspired to further their education at a higher rate than the total class.

On the first choice of colleges, African American students ranked out-of-state public colleges higher than any single in-state college. For Asian Americans, the top three college choices were all State System universities. When considering all rankings by types of educational institution, about 47 percent of all students, regardless of race or ethnicity, listed a State System college or university as their first choice. Asian/Pacific Islander and Hispanic students gave the State System the highest rankings (52 percent and 50 percent respectively). As a result, almost half of each year's graduating class, regardless of race/ethnicity, typically view attending a State System institution as their first choice for further education after high school. Many African Americans, however, if given their first choice of a type of college, would prefer to attend an out-of-state public or private college or university.

The pattern of college choices change significantly when observing the actual fall college enrollment following high school graduation. For example, when contrasting the post-high school plans of juniors in the State System's survey to actual Fall, 1990 college enrollment (assuming the enrollment patterns persist to Fall, 1992), the following comparisons can be made: while about half of those in the survey typically indicate a plan to enroll in the State System institutions, only about 19 percent of the graduating class actually enroll. In contrast, only 16 percent of the students in the plans survey indicated a preference for the Oregon community colleges, but about 23 percent actually enrolled in them. For the Oregon independent colleges, the almost 4 percent showing a preference for them in the survey increased to just over 4 percent of all college enrollees in the fall. And lastly, almost 26 percent preference rate for out-of-state colleges in the survey decreased to about 10 percent in actual enrollment.

In citing the three most important factors in selecting their first choice colleges, all students in the survey emphasized academic reputation, academic program choices, and size/type/location as the three most important factors, with cost ranking only slightly behind size/type/location as the fourth most important criteria. By ethnic/racial group, however, there were two differences of note in the overall survey response.

- All the minority groups ranked cost as a more important factor than size/type/location, with the American Indian/Alaskan Native and African American groups giving student's educational cost the highest importance in selecting a college.
- African Americans were the only minority group to rank social reputation as one of the top three
 factors in making a first choice of college. As with this group's preference for out-of-state
 colleges, the high ranking of social reputation may be related to the importance to minority
 group students, especially African Americans, of a perceived positive and supportive social and
 cultural climate when selecting a college.

In Oregon, the top three preferred college majors for all students regardless of ethnicity were accounting, law enforcement, and psychology.

Within minority groups, Asian/Pacific Islanders and African Americans show a similar preference for pre-medicine, and American Indian/Alaskan Natives and Hispanics show a common preference for fine and applied arts. But in contrast to Hispanics, American Indian/Alaskan Native, and White students who indicated a high preference for law enforcement, African American students show a high preference for pre-law.

In the post-high school plans survey, students who selected a community college as a first, second, or third choice were also asked to indicate their educational plans at the community college. Overall, 53.3 percent of the students planned to pursue a college transfer program; 32 percent planned to pursue an occupational program of some kind; and 14.6 percent cited personal interest/self-improvement. Across all ethnic/racial groups, a majority of students planned to pursue a college transfer program that leads to a baccalaureate degree. Asian/Pacific Islanders and African Americans had the highest preference for a college transfer program at 59 percent and 57.4 percent, respectively. American Indian/Alaskan Natives and Hispanics fell below the average rate for all students at 39.7 percent and 48.2 percent, respectively.

The college aspirations of Oregon's 1992 graduating class are comparable to the 80 percent college aspiration rate reported in the national *High School and Beyond* survey of 1980 high school seniors. In terms of criteria for choosing a college, the *High School and Beyond* study showed that 1980 seniors gave similar responses to Oregon's 1992 class: 70 percent of respondents considered the "availability of specific courses and curriculum" as most important. The next more frequently reported criteria were "reputation of the college in academic areas" (55 percent), and two items describing the net cost of college to students: availability of financial aid (38 percent) and college expenses (36 percent). The relative importance of these criteria varied by race and ethnicity; for African Americans (72 percent), American Indians (52 percent), and Hispanics (56 percent), the availability of financial aid was more often cited as "very important" in choosing a college to attend than it was for Whites (33 percent) and Asian Americans (34 percent) [Table I].

Table I

Percentage of 1980 College Bound High School Seniors Who Consider Various Criteria as "Very Important" in Choosing a College, by Racial/Ethnic Group

	I	Racial/Ethnic	Group			
College Selection Criteria	African American	Am Indian/ AK Native	Asian American	Hispanic/ <u>Latino</u>	White	<u>Total</u>
Availability of specific course or curriculum	72%	80%	70%	64%	70%	70% ·
Reputation of the college in Academic areas	54%	63%	57%	51%	55%	55%
Availability of Financial Aid	72%	52%	34%	56%	33%	38%
College Expenses	60%	39%	36%	47%	32%	36%
Social Life at the College	35%	31%	31%	28%	27%	28%
Able to live at Home	26%	29%	23%	36%	18%	20%
Reputation of College Athletic Program	21%	24%	9%	16%	10%	12%

Source: National Center for Education Statistics "High 5 hool and Beyond: A National Longitudinal Study for the 1980s." Washington, D.C., 1981, p. 38.

The number of Oregon high school graduates decreased by almost 13 percent during the 1980s, but is projected to increase dramatically during the 1990s by about 35 percent. As a result, the State System, in light of surveyed high school students' college aspirations and preference, could have its greatest opportunity to enroll the most racial and ethnically diverse student population by the year 2000.

- In Oregon, high school minority group graduates are estimated to average 9 percent of all state high school graduates between 1985-90 [Table A-2]. Among minority groups, Asian Americans have the highest percentage of graduates (3.1 percent) followed by Hispanic/Latinos (2.4 percent), African Americans (1.8 percent) and American Indians (1.5 percent). The 1990 census data for Oregon 18 to 24 year-old residents show Asian Americans and Whites having a larger percentage of high school graduates than their representation in the age group population: Asians represent 2.9 percent of the total 18 to 14 year old population, but were 3.1 percent of all high school graduates. Likewise, Whites represent 85.7 percent of the population but had 91.2 percent of the high school graduates. By comparison, Hispanic/Latinos represent 5.4 percent of the population but accounted for only 2.4 percent of high school graduates; and African Americans represented 2.1 percent of the population but only 1.8 percent graduated from high school. American Indians represented 1.6 percent of the population and 1.5 percent of high school graduates.
- This pattern of representation holds when comparing college participation or representation by racial and ethnic groups. Asian Americans and Whites are represented at higher percentages for first-time freshmen at 4-year and 2-year colleges and universities than their percentage of all 18 to 24 year-olds in Oregon. Conversely, African Americans, Hispanics, and American Indians are underrepresented in colleges and universities when compared to their population representation. Whites have participated at a higher rate (86.5 percent) among first-time freshman and at a lower rate (82.2 percent) among all resident undergraduates in 1990 than their representation among the 18 to 24 year-olds (85.7 percent) in Oregon. With the exception of African American students, the State System enrolls a higher percentage of resident minority group students at the undergraduate level than the corresponding enrollment percentage shown for all colleges and universities in Oregon [Table A-2].

Table II

U.S. Public High School Graduates by Race and Ethnicity:
Rate of Percent Change to 1994-95 (Projected)

Race/Ethnicity	Percent change
African American	- 2.6%
American Indian	+ 11.4%
Asian American	+ 58.0%
Hispanic	+ 52.3%
White	- 10.1%

Source: Western Interstate Commission for Higher Education, July, 1991.

• Nationally, minority group students are projected to make up a larger percentage of the nation's high school graduates by the mid-1990s. The number of public high school graduates will have declined 35 percent from 1985-1986 to 1994-95 primarily due to a decrease among Whites. The number of White high school graduates is projected to drop 10.1 percent by 1995. Also, in contrast to Oregon's trend, African Americans nationwide are expected to decline 2.6 percent by 1995. Nationally, the number of Hispanic high school graduates will increase by 52.3 percent, while Asian American high school graduates will net a 58.0 percent increase, and American Indians, an 11.4 percent gain [Table II]. However in Oregon, Hispanic high school graduate rates will increase by 54 percent, which is the largest increase for any racial or ethnic group. This will be followed with a 16 percent increase for Asians; 11 percent for African Americans; and 6 percent for American Indians. Whites are the only group expected to decline by 1995 at 2.3 percent [Table A-2].

U.S. Public High School Graduates by Race and Ethnicity:
Percent of Graduates 1985-86 to 1994-95 (Projected)

Race/Ethnicity	<u>1985-86</u>	<u>1994-95</u>	Percent Chang
African American	13.2%	13.4%	+ 1.5%
American Indian	0.7%	0.8%	+ 14.3%
Asian American	2.6%	4.3%	+ 65.4%
Hispanic	5.9%	9.2%	+ 55.9%
White	77.6%	72.3%	- 6.8%

Source: Western Interstate Commission for Higher Education, July, 1991.

• In the 1990s, the Asian/Pacific Islander population will experience the fastest growth in the United States with 65.4 percent in the percent of high school graduates (followed by 55.9 percent for Hispanics, 14.3 percent for American Indians, 1.5 percent for African Americans and a decline of 6.8 percent for Whites) [Table III]. Already in terms of high school attainment, 1980 census data show more than 70 percent of Asian American men and 80 percent of Asian American women over 25 years of age had finished high school. However, aggregate data for Asian Americans mask different experiences by Asian subpopulations. Census data reported lower high school completion rates for students from Southeast Asia and the Philippines than for students of Japanese and Chinese ancestry. Also, while 1980 census data show that 67 percent of Asian Americans graduated from high school, only 22.3 percent of the Hmong American population, and 31.4 percent of the Laotian Americans graduated from high school (WICHE). Current racial/ethnic group classifications usually do not distinguish among subpopulations of Asians and Pacific Islanders. Educational institutions need to (1) improve the collection of racial/ethnic data from K-12 through graduate school, and (2) explore new definitions of racial/ethnic classifications that more accurately define the subgroups of multi-racial and multiethnic populations.

8

Profile of Student Enrollment in the State System

The State System in 1990-91 had a minority group student enrollment 25 percent greater than in 1980-81 [Table A-3]. During this period Hispanic students had the greatest enrollment increase among minority group students at 86 percent. American Indians had the second greatest increase of 21 percent, followed by Asian Americans at 17 percent, and African Americans at 4 percent. Non-resident aliens, defined as foreign students who are non-immigrant and who have temporary visas, had an 86 percent increase, tying with Hispanics for the largest growth in enrollment.

When comparing minority group representation to overall enrollment in the State System, there has been little change in the percentage of representation -- African Americans (797 in 1981 and 827 in 1990), and American Indians (610 in 1981 and 740 in 1990) remain at 4 percent of total head count enrollment. There was a modest gain for Asian Americans from 4 percent (2,623 students) in 1981 to 5 percent (3,062 students) in 1990; and Hispanics moved from 1 percent (655 students) in 1981 to 2 percent (2,216) in 1990 of total enrollment. Enrollment of White students decreased by 9 percent, going from 84 percent (52,832) in 1981 to 75 percent (48,014) in 1990 [Table A-3].

Nationally, the total enrollment in institutions of higher education is projected to increase by 13 percent between 1990 and the year 2000. By race/ethnicity, enrollment in institutions of higher education will vary across groups by the year 2000. The enrollment of Whites is projected to increase by 8 percent; American Indians by 12 percent; African Americans by 19 percent; Asian Americans/Pacific Islanders by 38 percent; and Hispanics by 43 percent. The enrollment of Nonresident Aliens is projected to increase by 11 percent [Table IV].

Table IV

Percent Change in Higher Education Enrollment in U.S. by Race/Ethnicity: 1980-90 and 1990-2000 (Projected)

		1980-1990			<u>1990-2000</u>	
Race/Ethnicity	<u>Men</u>	Women	<u>Total</u>	<u>Men</u>	Women	Total
African American	19%	12%	15%	13%	24%	19%
American Indian	11%	22%	17%	7%	16%	12%
Asian American	99%	73%	83%	41%	3 5%	38%
Hispanic	56%	44%	50%	35%	51%	43%
White	3%	15%	9%	3%	12%	8%
Non-resident Alien	19%	43%	26%	8%	17%	11%
Total	9%	21%	15%	8%	17%	13%

Source: National Center for Education Statistics, December, 1991.

Although difficult to explain at this time, there was an 80 percent increase among students for whom race or ethnicity could not be classified: in 1981, 5 percent (3,070) and in 1990, 9 percent (5,528). Possible reasons may be that there is greater reluctance or inability to identify with a particular racial or ethnic group, in addition to a predictable number of individuals who give incomplete responses to surveys. This phenomenon is comparable to concerns about accounting for differences within racial and ethnic groups where there is a growing number of students with multiracial and multi-ethnic backgrounds or subpopulations. In some cases, a high percentage of students in the Unknown/Decline category can influence the overall conclusions that might be reached from data analysis. As a result, the increased number of students in this category may require further examination of the racial and ethnic classification options available to students (and employees).

A more detailed profile of enrollment by racial and ethnic group follows:

• First-Time Freshman Enrollment by Racial/Ethnic Group and Residency: Overall, first-time freshman minority group students increased by 44 percent between Fall, 1981 and Fall, 1990. First-time freshman minority students were 12 percent of the total in 1990, compared to 7 percent in 1981. In contrast, White students declined by 16 percent. Non-resident Alien first-time freshman enrollment declined by 6 percent. The greatest change was in Unknown/Decline to Respond category where a 106 percent increase occurred (4 percent of 1990 enrollment were Unknown/Decline to Respond compared to 2 percent in 1981); the nonresident students represented a 225 percent increase in this category.

Within minority groups, Hispanic students showed the greatest increase in resident and nonresident categories when comparing 1990 to 1981. Hispanic first-time freshman enrollment increased by 164 percent between 1981-1990, with resident students increasing by 174 percent and nonresident students increasing by 132 percent. Although Hispanics made the greatest gains, Asian American students still had the largest first-time freshmen enrollment. Asian Americans increased by 32 percent overall, with 33 percent resident, and 28 percent nonresident. Asian Americans represented 6 percent of the 1990 first-time freshmen compared to 3 percent for Hispanics, 2 percent for American Indians, and 1 percent for African Americans. American Indians also made some gains, improving by 57 percent overall; although there was a 35 percent decline for nonresident students, resident students increased by 112 percent. African Americans were the only group to experience an overall decline in first-time freshman enrollment (17 percent), primarily due to a 54 percent decline in nonresident students. Resident African Americans, by comparison, increased 9 percent [Table A-4].

• Racial/Ethnic Enrollment by Gender: In terms of enrollment by gender, the pattern of enrollment for African-Americans showed a modest decline for men at the undergraduate and graduate levels (430 undergraduate/79 graduate in 1981, and 423 undergraduate/68 graduate in 1990), and showed enrollment gains of women at both levels (235 undergraduate/53 graduate in 1981 and 279 undergraduate/57 graduate in 1990). Experience within the State System is similar to national level. However, what is significantly different is that within the State System, African American men continue to outnumber women at both undergraduate and graduate levels. Asian American/Pacific Islanders had a similar enrollment pattern by gender with more men than women attending at the undergraduate and graduate levels both in 1981 and 1990 (men, 1,502 in 1981 compared to 899 for women; and men, 1,379 in 1990 compared to 1,295 women).

In contrast, American Indian/Alaskan Native men had a higher enrollment than women at the undergraduate level in 1981 (294 undergraduates for men -- 248 undergraduates for women); however, by 1990, women attended State System institutions in greater numbers than men at the undergraduate levels (299 for men and 351 for women). Women continue on to graduate school in greater numbers than men, but men have made the greatest gain in representation (28 men in 1981 compared to 42 in 1990, and 40 women in 1981 compared to 48 in 1990). Like American Indians, undergraduate Hispanic men (269) attended in greater numbers than women (260) in 1981, but by 1990 the reverse had happened with men (533) attending in slightly smaller numbers than women (540). Hispanic men attended graduate school in slightly greater numbers (78 in 1980, and 80 in 1990) than women (48 in 1981, and 63 in 1990) [Table A-5].

Nationally, the enrollment of women is expected to increase faster than that for men between 1990-2000, except for Asians/Pacific Islanders. For Whites, the enrollment of women is projected to grow by 12 percent, while enrollment for men will increase by a moderate 3 percent. Over the projection period, the enrollment of African American women will rise by 24 percent, double the 12 percent increase experienced between 1980-90, while the enrollment of African-American men is expected to increase by 13 percent. For Hispanics between 1990 and 2000, the enrollment of women is projected to increase by 51 percent, the enrollment of men, by 35 percent. In contrast, among Asians/Pacific Islanders, the enrollment of men is projected to increase faster than that of women -- 41 percent for men, compared to 35 percent for women. Among American Indians, the enrollment of women is expected to rise by 16 percent, while the enrollment of men is projected to increase by 7 percent. Among Nonresident Aliens, the number of women enrolled is projected to increase by 17 percent between 1990-2000, compared to 8 percent for men [Table IV].

- Undergraduate Enrollment by Race/Ethnic Group and Residency in the System. Fall, 1981 Compared to Fall, 1990: Overall, nonresident students increased at a higher rate than resident students (25 percent for nonresident and 1 percent for resident) when comparing Fall 1981 to Fall 1990 enrollment. The difference appears to be tied to the increase in Nonresident Alien (50 percent change), Other/Unknown nonresident (173 percent change) and Hispanic nonresident (114 percent). African Americans had the smallest increase in enrollment of any group at 6 percent (7 percent resident and 1 percent nonresident. Overall, White students were the only group to show an overall decline of 5 percent, where there was a drop of 7 percent for residents and an increase of 12 percent for nonresident. Asian/Pacific Islanders were the only group to experience a decline in nonresident students (-8 percent) [Table A-6].
- Graduate Level by Racial/Ethnic Group: Minority groups experienced a 14 percent graduate enrollment drop between 1981 and 1990 which included nonresident enrollment declining by 56 percent. Groups experiencing a decline in enrollment include: African American (-5 percent: -2 percent resident/ -13 percent nonresident); Asian/Pacific Islander (-28 percent: -19 resident/ -71 percent nonresident); and White (-24 percent: -21 percent resident/ -34 percent nonresident). Groups experiencing an increase include American Indian/Alaskan Native (32 percent -- 35 percent resident/ 23 percent nonresident); Hispanic (13 percent: 23 percent resident/ -12 percent nonresident); Other/Unknown (24 percent: 22 percent resident/ 34 percent nonresident). The greatest change was an increase in the percentage of Nonresident Alien who were 7 percent of the total enrollment in Fall 1981 and increased to 17 percent in Fall 1990. This translated into a 143 percent change in the Nonresident Alien students attending State System graduate level programs [Table A-7].

Educational Outcomes Among Students in the State System: Academic Performance and Degrees Awarded

Academic Performance of First-Time Freshmen by Racial/Ethnic Group

First-time freshmen from minority groups entered the State System in 1989 with better high school grade point averages (HSGPAs) than they had in 1982. Asian American/Pacific Islander men had a slight decline in HSGPAs with a 3.21 HSGPA average in 1982 and a 3.13 HSGPA average in 1989. Asian American women HSGPAs increased from a 3.27 in 1982 to 3.33 in 1989. Overall, Asian Americans had a slight HSGPA decline, with a 3.23 HSGPA average in 1989, compared to 3.24 HSGPA in 1982 [Table A-8]. Minority group students' SAT scores have improved by 13 points in math and 24 in verbal categories. In contrast, scores for White students increased by 9 points in math and 4 points in verbal categories. Although the gap closed between minority group students and Whites, White students on average scored higher than minority groups combined (in 1989 minority groups scored 482 math/ 409 verbal, and Whites 497 math/ 456 verbal). Although Asian/Pacific Islanders scored higher than any other group in math at 501 in 1989, this score was 11 points lower than their average math score in 1982 [Table A-9].

During the first year of enrollment, the performance of minority group freshmen in selected college courses (English composition, foreign language, math, and science) was comparable to that of Whites -- within 0.10 of the average grades received by Whites and new freshmen overall. Within minority groups, Asian Americans had the highest overall grade point average of any minority group in 1982 and 1989 [Table A-10]. In general, women's freshman year GPAs were higher than men in all subject areas except for science; this was true for all student groups regardless of race and ethnicity. Asian American/Pacific Islanders (2.64) and Hispanic (2.61) freshman GPAs for all subjects were comparable to the average grades for all new freshmen (2.66) and Whites (2.67) [Table A-10]. Black/African American and American Indian/Alaskan Native students enrolled in mathematics courses generally received lower grades than did other groups. Most of the students from these two groups take the first two mathematics courses -- intermediate algebra and college algebra [Table A-11].

Minority Group Graduates by Degree Levels and Institutions in Selected Years: 1980-81 Through 1990-91

In general, when comparing the average number of degrees awarded in selected years (1983-1990) to 1980-81 as a base year, the percentage of degrees awarded to minority group students increased by 33.7 percent: the greatest increase was 54.9 percent for all bachelors received by minority group students. The percentage of graduate level degrees declined by 6.1 percent for masters and 32.4 percent for doctoral degrees [Table A-12].

However, when comparing 1990-91 to 1980-81 in terms of graduate and professional degrees awarded to minority group and to white students, there was a modest increase in the percentage of masters (2.9 percent) and a substantial percentage increase in professional degrees (84.2 percent) awarded to minority groups. At the same time, there was a decline in the number of doctoral degrees (58.0 percent) awarded to minority group students. In contrast, white students had modest declines in the

percentage of masters degrees awarded (3.8 percent) and professional degrees awarded (9.8 percent). Overall, there was a drop in the percentage of graduate and professional degrees awarded to both minority group (5.8 percent) and White (3.5 percent) students [Table V].

Table V

Graduate Degrees Awarded

	Mir	ority Group	s		White	
	1980-81	1990-91	% Change	19 80-8 1	1990-91	% Change
Masters	104	107	2.9%	1,821	1,752	-3.5%
Doctoral	50	21	-58.0%	244	260	6.6%
Professional	19	35	84.2%	305	275	-9.8%
Total Graduates	173	163	-5.8%	2,370	2,287	-3.5%

All minority groups had gains at the bachelors degree level, with Asian Americans, 75 percent; Hispanics, 62.8 percent; African Americans, 6.7 percent. At the masters level, only Asian Americans experienced a gain (14 percent). African Americans declined -44 percent; American Indians, -27.8 percent; and Hispanics, 1.8 percent. At doctoral level, Asian Americans broke even, averaging 30 degrees between 1980-81 and 1990-91. However, a substantial drop was experienced by African Americans, (-68 percent); American Indians, (-51.5 percent); and Hispanics, (-47.2 percent) [Table A-12].

• OSSHE Bachelor's Degrees Awarded in Selected Fields by Racial/Ethnic Group: 1980-81 Compared to 1990-91

An area of concern in terms of an indicator of educational outcome is the declining number of degrees awarded to underrepresented minority students. No degrees were awarded to African Americans and Hispanics in computer science; to African Americans and American Indian/Alaskan Natives in math; or to African Americans in physical sciences. Only one degree was awarded to a student from a minority group in the following areas: agriculture and forestry (African American); architecture (African American, Native American, Hispanic); biological sciences (Native American); communications/ journalism (African American); health sciences (African American); math (Hispanic); physical sciences (Hispanic) [Table A-13].

Between 1980-91 and 1990-91, the proportion of minority group degree recipients increased in every academic field except agriculture/forestry and communications/journalism (Table A-14). Overall, the proportion of bachelors degrees awarded to mi orities increased from 5.5 percent in 1980-81 to 7.9 percent in 1990-91. In comparison, proportionately fewer bachelors degrees were awarded to Whites (89.1 percent in 1980-81 compared to 79.7 percent in 1990-91) [Table A-14].

· Graduate and Professional Degree Awards by Racial/Ethnic Group

- Minority groups represented 4.2 percent of all masters degrees awarded, both in 1980-81 and in 1990-91. Overall, the number of minority group students receiving masters degrees has not changed significantly 104 degrees awarded in 1980-81 and 107 awarded in 1990-91. Within minority groups, the greatest changes occurred with increases in business (5.8 percent in 1980-81 to 15.0 percent in 1990-91); and health sciences (1.0 percent in 1980-81 to 6.5 percent in 1990-91); and decreases in agriculture/forestry (5.8 percent in 1980-81 to 0.9 percent in 1990-91); and humanities/fine arts (9.6 percent in 1980-81 to 2.8 percent in 1990-91 [Table A-15]. Proportionately fewer masters degrees were awarded to White students (73.8 percent in 1980-81 compared to 69.5 percent in 1990-91). African Americans, American Indians, and Hispanics each received no more than 0.7 percent of the total masters degrees awarded both in 1980-81 and in 1990-91. Masters degrees awarded to Asian Americans improved from 2.0 percent in 1980-81 to 2.4 percent in 1990-91. Nonresident Aliens made the greatest improvement in masters degrees awarded, going from 12.6 percent in 1980-81 to 15.8 percent in 1990-91 [Table A-16].
- ▶ Every minority group experienced a decline in the number of students receiving a doctoral degree between 1980-81 and 1990-91. Even in the area of education where African Americans have mostly pursued a graduate degree, there were no doctoral degrees awarded in 1990-91, compared to 9 awarded in 1980-81. No doctoral degrees were awarded to a minority group student in either 1980-81 or 1990-91 in the areas of architecture, communications/journalism, computer science, or math. In contrast, the number of doctoral degrees awarded to Whites and Nonresident Aliens increased over the ten year period [Table A-17].
- ▶ The proportion of doctoral degrees awarded to minorities declined in agriculture/forestry, biological sciences, education, and physical sciences. The proportion increased slightly in business, health sciences, humanities/fine arts, and social sciences. In 1980-81 each minority group received at least 2.0 percent of all doctoral degrees. In 1990-91, only Asians at 2.5 percent received at least 1.0 percent of all doctoral degrees. Overall, minority group students received 12.9 percent of all doctoral degrees in 1980-81; however, in 1990-91, that percentage had declined to 4.8 percent [Table A-18].
- The overall awarding of degrees in professional fields to students from minority groups is relatively low; however, the number of degree recipients has nearly doubled from 19 (5.6 percent of professional degrees) in 1980-81 to 35 (10.6 percent of professional degrees) in 1990-91. In contrast, the number of professional degrees awarded to Whites dropped from 90.5 percent of all professional degrees in 1980-81 to 83.6 percent in 1990-91 [Table A-19]. Although the percentage of minority students receiving law degrees, compared to other professions, declined from 73.7 percent in 1980-81 to 45.7 percent, nevertheless, law remains an area where the largest number of degrees are awarded to minority group students. Asians had the greatest gain in the number of professional degrees awarded, going from 9 degrees in 1980-31 to 26 degrees in 1990-91. Professional degrees awarded to African Americans increased by 1 degree award. American Indians had no change; Hispanics had a decline of 2 degree awards [Table A-20].

Financial Support for Students Enrolled in the State System

State financial support can be divided into three major categories for students enrolled in the State System: (1) fee remission awards, (2) financial aid, and (3) graduate assistantships. As noted in the review of student aspirations, the financial cost of college ranks closely behind curriculum availability, institutional reputation, and size, type, and location for all students in deciding on a college. For underrepresented minority group students in the State System, cost of college is an especially important factor in selecting a college or pursuing further education in general. The long term objective of the minority fee remission programs is to establish a foundation upon which the State System could promote and sustain resident and underrepresented minority enrollment and graduation. Also, successes with recruitment and retention of underrepresented minority students at the undergraduate level are expected to translate into increases in the enrollment and graduation of minority students at the graduate and professional school levels.

Fee remission programs along with financial aid have given the campuses the advantage of addressing both academic merit and financial need at the undergraduate level. Although research fellowships and personal support in the form of loans are available at the graduate level, graduate assistantships represent the primary area of support for students.

A general profile of the effect of the three major sources of financial support on students is described as follows:

- 1990-91 Fee Remission Awards by Racial/Ethnic Groups: Fee remission programs under the Minority Student Enrollment Initiative include:
 - ▶ The Underrepresented Minority Achievement Scholarship Program (UMASP) for freshmen, which was initiated in Fall, 1987, has the objectives of (1) increasing the college participation rate and enrollment of Oregon's resident, underrepresented minorities, and (2) improving the provision of academic support to enhance retention and graduation.
 - ▶ The Underrepresented Minority Achievement Scholarship Program (UMASP) for juniors, started in 1989-90, recognizes meritorious achievement of underrepresented minority students in reaching junior-level status and emphasizes campus support to increase underrepresented minority group enrollment and retention through graduation from a baccalaureate program. Although this program applies to all resident minority students from any college or university, it especially targets minority students in Oregon's community colleges.
 - ▶ The Portland Teacher Program (PTP), started in 1989-90, is a cooperative effort of the Portland Public Schools, Portland Community College, and Portland State University. The PTP will increase the number of underrepresented minority students entering the teaching profession.
 - ▶ The OHSU Minority Program, established in 1989-90, is an effort to increase the number of underrepresented minority students enrolling in and graduating from the health professions.
 - The policy goal for the Freshman Minority Program is to increase and maintain the collegeparticipation rates for Oregon's underrepresented minorities to the same level as the

participation rate for students overall by racial/ethnic group. Since the program began in Fall, 1987 enrollment for the three underrepresented groups has increased, but unevenly, e.g., new freshman enrollment of African American students increased by 58 percent in contrast to the 133 percent and 104 percent increases for American Indian/Alaskan Natives and Hispanics, respectively [Table VI]. Overall, from 1986 to 1990, resident underrepresented minority freshman enrollment increased by 97%, while overall resident freshman enrollment decreased by 9%. As of Fall, 1990, the freshman college participation rate of African Americans was 13 percent, while the same rate was at 16 percent for American Indians and Hispanics. The new freshman college participation rate of resident White students and students overall by racial/ethnic group was 15 percent. In sharp contrast, Asian Americans had the highest participation rate at 26 percent.

Table VI

Percent Change of Enrollment of Resident Underrepresented

Minority Freshmen: 1986-1990

Racial/Ethnic Group	Percent Change
African American	58%
American Indian	133%
Hispanic	104%
Total	97%

Table VII

State System Freshman Participation Rate* by Racial/Ethnic Group
for Oregon High School Graduates: Fall 1990

Racial/Ethnic Group	Participation Rate*
African American	13%
American Indian	16%
Asian American	26%
Hispanic	16%
Whites	15%
Totals	15%

Participation rate for racial/ethnic groups is defined as their State System Fall term enrollment expressed as a percentage of that racial/ethnic group's Oregon high school enrollment in the fall of the senior year.

► Collectively, for all fee remission programs, the three underrepresented minority groups represent 45 percent of the total number receiving fee remission awards, 38 percent of the dollars awarded, and represent 4 percent of all enrollment. Within the Oregon Laurels Program, which is restricted to U.S. citizens, resident and nonresident students, underrepresented minorities receive 21 percent of the award dollars and represent 4 percent of all enrollment. Minority-specific awards represent nearly 80 percent of all awards received by students from minority groups. American Indian/Alaskan Natives receive 10 percent of the awards, 8 percent of the dollars awarded, and represent 1 percent of enrollment; African Americans receive 13 percent of the awards, 11 percent of the dollars awarded, and represent 1 percent of enrollment; and Hispanics receive 22 percent of the awards, 19 percent of the award dollars, and represent 2 percent of the enrollment. Conversely, Asian/Pacific Islanders and White students receive fee remission awards at rates below their level of enrollment. Asian/Pacific Islanders receive 3 percent of the awards, 3 percent of the dollars awarded, and represent 5 percent of the enrollment; and, White students receive 27 percent of the awards, 20 percent of the dollars awarded, and represent 75 percent of all enrollment. And like underrepresented minority students receiving awards at rates greater than their enrollment, Nonresident Alien or international students receive 18 percent of the awards, 30 percent of the dollars awarded, and represent only 7 percent of the enrollment [Table A-21].

• Financial Aid Awards by Racial/Ethnic Groups for 1991-92:

- ▶ As of Winter quarter, 1992, \$129 million had been awarded to 26,357 individual students (undergraduates and graduates), which was about 45 percent of the System's total enrollment. When comparing the enrollment and financial aid representation rates of the three underrepresented groups. Hispanics appear to have the highest level of need, followed by African Americans, then American Indian/Alaskan Natives. Hispanics receive 4 percent of the aid and represent just over 2 percent of all enrollment; African Americans receive 3 percent of aid and represent 1.5 percent of all enrollment; and American Indian/Alaskan Natives receive 1.6 percent of aid and represent 1.2 percent of all enrollment. A possible explanation for this difference in regard to American Indian/Alaskan Natives is that they may receive types of federal, state and tribal aid not collected or reported through the System's financial aid offices. Nevertheless, underrepresented students as a group appear to have a higher level of financial need than does the overall student population. In contrast, Asian/Pacific Islanders and White students received financial aid at about the same level of their representation in overall enrollment. White students receive almost 80 percent of the aid and regresent about 75 percent of all enrollment; Asian/Pacific Islanders receive just over 6 percent of the aid and represent just under 6 percent of the enrollment.
- ▶ Within types of financial aid, all minority students received federal and state grant aid in a proportion much higher than their proportion of total enrollment. White students receive grant aid in almost exactly the same proportion as their overall proportion of total enrollment. For the State System surcharge waiver program, Asian/Pacific Islander students are represented at a level that is almost 4 percent higher than their enrollment representation. Whites receive more institutional scholarships than any other group at 76 percent. All students are borrowing at a significant level to pay for college [Table A-22].

• Financial Support For Graduate Study:

- ▶ Students from minority groups receive 130 out of 2,880 graduate assistantships allocated in OSSHE Fall, 1990 (not including EOSC and OIT) representing 4.5 percent. Non-resident Alien students received 30.3 percent of the assistantships or 83.7 percent total [Table A-23].
- ▶ Nationally, while colleges and universities were the primary source of graduate school support for the majority (54.4 percent) of Asian Ph.D.s in 1990, personal sources (including loans) were cited by 62.7 percent of African Americans, 59.5 percent of American Indians, and 47.5 percent of Hispanics [Table A-24].
- Nationally, the groups with the highest frequencies of indebted Ph.D.s in 1990 were Hispanics (69.0 percent) and African Americans (61.8 percent) - compared with approximately 55 percent of Asian Americans and American Indians. In addition, more than one-third of Hispanic Ph.D.s owed over \$10,000 by the time they graduated, as did about one-fourth of the other minorities. Hispanic social scientists reported the largest proportions of Ph.D.s with debt and owing more than \$10,000. Because education and social sciences are the areas in which Hispanics and African Americans are most concentrated, their high percentages in these fields convert to significant numbers of indebted Ph.D.s. Variations among the groups can be largely explained by the field preferences of Ph.D.s: Asian Americans tended to cluster in science and engineering fields where university support is most abundant, while the other groups were more concentrated in non-science areas where university support is less available. What is interesting is that the pattern of differences between "with debt" and "without debt" for underrepresented minority groups is maintained even for disciplines where there is greater opportunity for university and federal support, e.g., the physical sciences, engineering, and life sciences. However, the difference narrows or remains about the same for Asian Americans and Whites in these categories [Table A-24].

Distribution of Employment in the State System

Faculty in the State System by Racial/Ethnic Groups

Overall, 5.2 percent of the faculty in the State System are from minority groups [Table B-1]. Asian faculty represent the greatest number of minority group faculty at each faculty rank. Overall Asian faculty were 3.5 percent of faculty in 1990-91 compared to 2.1 percent in 1980 [Table B-3]. All other minority groups totaled 1.4 percent in 1980-81 compared to 2.1 in 1990-91. More than 80 percent (126) minority faculty are located at the three universities — UO, OSU, and PSU. The number of minority group members may be greater at PSU since 12.5 percent are in the Unknown/Decline category. A confounding factor is the 48 faculty members who are located in the Decline/Unknown category for assistant professors. In 1990-91, 2.7 percent of the faculty are in the Decline/Unknown category compared to 0.5 percent in 1980-81. The percent of white faculty declined from 96 percent in 1980-81 to 91.7 percent in 1990-91. However, White faculty still represented the overwhelming majority of faculty with only a modest change over a ten year period [Table B-2].

Just under half (49.2 percent) of minority group faculty were at the full professor and associate professor ranks in 1990-91, compared to 52.4 percent in 1980-81. Two-thirds (67 percent) of White faculty were at the full and associate professor ranks in 1990-91, with about the same proportion (68.9 percent) at those ranks in 1980-81.

The distribution of faculty by rank in each racial/ethnic group varies widely. For example, the largest percentage of African American faculty in 1990-91 was at the full professor rank (40 percent) in 1980-81, that figure was 15.4 percent. At the other extreme, only 12.5 percent of the American Indian faculty were full professors in 1990-91, compared to 42.9 percent in 1980-81. American Indian faculty also show a disproportionately large number at the assistant professor rank, and small percentages at both full and associate professor ranks. Small percentages of Hispanic faculty are at the full professor rank, although the percentage increased slightly between 1980-81 and 1990-91 (from 7.7 percent to 8.3 percent). Much larger percentages of Hispanic faculty were in the associate and assistant professor ranks. The distribution of Asian/Pacific Islander faculty is similar to that of White faculty, with somewhat higher percentages of Asian faculty at the assistant professor rank [Table B-3].

The largest concentration of minority faculty can be found in Humanities/Fine Arts (8.5 percent), Education (6.7 percent), and High Market disciplines (6.6 percent). High market disciplines include engineering, computer science, business, and law. Of the 25 minority group faculty in this category, 20 are Asian/Pacific Islander [Table B-4].

Nationally, according to ACE reports, hiring and promotion practices in the 1980s had little effect on increasing the representation of African Americans in senior faculty in colleges and universities. In 1989, 2.4 percent of full professor positions and 4.1 percent of associate positions were held by African Americans. These figures represent minimal gains when compared to 1979 figures when 1.2 percent of full professor and 3.2 percent of associate professor positions were held by African Americans. Hispanics held only 1.3 percent of all full professors and 1.7 percent of all associate professor positions. During the 1980s, American Indian professor participation within all faculty ranks was only 0.3 percent. Although the actual number of American Indian faculty increased by 41.9 percent between 1979 and 1989, this gain did not increase their overall representation among faculty. In 1989, Asian Americans were the largest minority faculty group, holding 4.7 percent of all full-time faculty positions. As a footnote, the American Council on Education (ACE) reports that 50.4 percent of Asian American faculty are non-U.S. citizens. As a result, only 2.8 percent of all higher education positions are U.S. born or naturalized Asian Americans. In 1989, 3.9 percent of all full professors and 3.5 percent of all associate professors were Asian American men, compared to White men who represented 79.6 percent of full professors and 66.7 percent of associate professors. Asian American female faculty, like other minority groups, are more likely to be assistant professors, lecturers, or instructors. In 1989, 10.9 percent of all Asian American female faculty with rank were full professors, and 29.9 percent were associate professors [Table B-5].

Compared to other minority groups nationally, more Asian American faculty held positions in engineering (3.9 percent), the social sciences (12.3 percent), the physical sciences (11.6 percent) and mathematics and statistics (11.5 percent). The largest portion of African American faculty were employed in education (15.2 percent), social sciences (15.2 percent), business (9.8 percent), and health related departments (8.8 percent). For Hispanics, the greatest number of faculty were in the social sciences (17.6 percent), the humanities (13.5 percent), education (10.8 percent) and health related departments. The numbers for American Indians were too small to be meaningful. However, most

American Indian faculty were in health sciences, natural sciences, and social science departments [Table B-6].

Selected Administrators and Professional Staff by Racial/Ethnic Group

Administrative positions selected for this study include chancellor and presidents; vice chancellors; associate and assistant vice chancellors; vice presidents; associate and assistant Vice Presidents; deans; associate and assistant deans; directors; and other administrators such as budget directors, chief business officers, chief facilities managers, and registrars. In 1991-92, minority group administrators held 5.8 percent of all selected administrative positions. No person of color holds a president or vice chancellor/vice president position in the State System [Table C-1]. The largest concentration of minority group administrators were in administration (50 percent). Minority group representation of selected administrators ranges from one each at the Chancellor's Office, WOSC, EOSC, OIT to two each at OSU, SOSC, OHSU; three at UO; and five at PSU. Of the professional staff in the system, 6.9 percent (104 out of 1,510 positions) are from minority groups. Within minority groups, Asians represent 42.3 percent of the total (44 out of 104 positions) [Table C-2].

Nationally, minority group employees in full-time administrative positions went from 10.1 percent in 1979 to 12.7 percent in 1989. African Americans held a larger share of administrative and management positions than faculty positions -- 8.6 percent in administration and 4.5 percent in full-time faculty in 1989. Women had the gains in administrative and management positions, increasing from 2.9 percent in 1979 to 4.2 percent in 1989. In contrast, men remained about the same with 4.5 percent in 1979 compared with 4.4 percent in 1989. Colleges and universities across the nation made some gains in the number and percentage of Hispanic administrators during the 1980s. While the number of Hispanic administrators and managers nearly doubled, their overall representation in academic administration edged up from 1.4 percent in 1979 to 2.3 percent in 1989. As with other racial and ethnic groups, nationally, American Indian women are more concentrated in non-faculty and nonadministrative positions than their male counterpart: 83 percent of women compared to 65.7 percent of men work in these types of positions. American Indians share of administrative and management positions remained relatively unchanged during the 1980s. In 1979, American Indian administrators held 9.3 percent of all administration and management positions. Ten years later, 0.4 percent of all full-time administrators are American Indians. In the 1980s, Asian Americans made sizeable gains in most higher education employment areas. Between 1979 and 1989, the number of Asian Americans employed in higher education administration nearly doubled, increasing their share of full-time positions from 0.4 percent to 1.5 percent [Table C-3].

The employment growth for Asian Americans was the largest for any racial and ethnic group in higher education and outpaced growth in the total higher education labor force. In 1989, Asians were 56.8 percent men and 43.2 percent women. Asians are the only racial and ethnic group where there are more men than women employed in higher education. Among women, nearly 79 percent are employed in non-management and non-faculty positions. Although there were significant gains for Asian Americans during the 1980s, their representation in administration and management positions is considerably low. In 1989, only 1.4 percent of all higher education and administrators were Asian American. Ten years prior, their share of administrative and management positions was at 0.9 percent.

17

Conclusion: Summary Statements

This report focused on key educational and employment areas that might be correlated with efforts to achieve and maintain racial and ethnic diversity in the State System. Oregon high school students' college aspirations and their estimated high school graduation patterns, their rate of college participation, enrollment and degrees awarded by educational level, educational outcomes in terms of high school and college freshman year academic performances; the impact of available financial support on students; and the employment distribution of faculty, professional staff, and administrators were emphasized. National data and information have been presented to place the State System's trends in a comparative context.

Observations and conclusions from the report include the following:

- In the State System's survey of post-high school plans, among Oregon's graduating class of 1992, 81 percent indicated aspirations of continuing their education beyond high school. When considering the choice of college, almost half of all students listed State System institutions among their top choices. American Indian and Hispanic students gave the State System the highest percentage ranking (52 percent and 50 percent respectively). However, if given their top college choice, African American students are the only group that would prefer to attend a college outside the state of Oregon. Presently, with the exception of African Americans, the State System enrolls a higher percentage of resident undergraduates by race and ethnicity than the corresponding percentage shown for all Oregon colleges and universities. Given the high preference for State System institutions among Oregon residents, and an estimated 35 percent increase among Oregon's high school graduates, particularly Asian Americans and Hispanics, the State System has an opportunity to enroll the most racially and ethnically diverse student population by the year 2000.
- The cost of attending colleges and universities is and will continue to be a dominant factor for all students with aspirations of attending college. However, it is clear from the post-high school plans survey and financial support data that students from minority groups see costs as more important than size, type, and location of an institution and these students appear to have a greater need for financial aid. The fee remission programs are one of the most effective means of attracting students to State System institutions. On average, 30 percent of each underrepresented minority group receive a fee remission award. Continued success in maintaining diversity, particularly for African American and American Indian students who show the least improvement in areas of recruitment and degree acquisition, is dependent on fee remission and other types of financial support remaining in place.
- There has been lack of progress in recruiting and retaining minority group students at the graduate level. The number of graduate degrees awarded in the State System between 1980-81 and 1990-91 to minority groups has declined, primarily at the doctoral level. The decline was particularly evident for underrepresented minority students. National data show that students who go on to graduate school must rely more on personal support (which includes loans) than they do on university and federal support (which includes research and graduate assistantships). As a result, the minority group students are discouraged from attending graduate school in light of the potential for greater debt. In Oregon, while data on debt and goals beyond baccalaureate graduation are not available, we do know that students from minority groups receive only 4.5 percent of graduate assistantships. Currently, there are no State System financial support

programs to encourage minority students to attend graduate school. However, the three universities use some fee remission award allocations from the Oregon Laurels Program to identify undergraduate minority group students with interest and promise in continuing on to graduate school. Also, campuses can now use some UMASP Junior allocations to support minority group students who want to pursue graduate study at their institution. A financial support structure to promote minority group doctoral study in the State System should be an objective.

- At the undergraduate level, the number of degrees awarded to minority group students is likely to increase with better academically prepared students currently enrolling in the State System. Minority group students entering the State System in Fall, 1989 as first-time freshmen, received higher SAT scores and competitive grades in most subjects when compared to the White student cohort. A fundamental weakness remains in minority group students' academic performance in mathematics. From a pipeline perspective, campuses must continue or initiate partnerships with high schools to help minority groups receive greater exposure to math and science (technical) areas of curricula. Furthermore, the agenda for minority group student retention should include a review of type and level of financial (and staff) support available to monitor student progress and institutional diversity and the effectiveness of these resources.
- The categories for classifying students by race and ethnicity require immediate attention. Students classified in Unknown/Decline category grew at a faster rate than any group of students except Nonresident Aliens. This problem exists for faculty and staff as well. A significant number of students, faculty, and staff whose background is unknown, could make a difference in determining campus progress in achieving diversity. More importantly, it raises concern as to whether or not the classification schemes commonly used nationally and within the State System adequately reflect the range of choices for individuals from multi-ethnic and multi-racial backgrounds. An ad hoc committee of campus registrars and admissions representatives might be appointed to develop recommendations in this area.
- The pattern of employment of faculty in the State System by racial and ethnic groups is somewhat different than the national patterns. Oregon, on a percentage basis, has a greater number of minority faculty at associate and full professor ranks than at assistant and instructor levels. Nationally, most minority group faculty are at the assistant professor and instructor ranks. Asian faculty are represented in greater numbers within the State System and nationally, than any other minority group. Asians have a greater representation in the State System than nationally. Also, White faculty have a higher percentage representation in the State System at 91.7 percent, compared to 88 percent nationally. However, it should be noted that the percentage of White faculty has declined by 5 percent since 1980-81. Conversely, African American, American Indian, and Hispanic faculty showed modest and uneven changes at State System institutions during the same period. The relatively small number of underrepresented minority group faculty must remain a concern. Faculty development, faculty exchanges, and new hiring are areas where State System initiatives continue to be needed.
- The proportion of professional staff and administrators from minority groups is somewhat higher than the proportion for faculty. This pattern is comparable to the national data. The largest percentage of representation by minority groups in these positions are in non-supervisory or professional support areas. No comparative data are available to show if there have been gains or losses within the employment categories. Campuses actively pursue affirmative action

procedures when recruiting all employees. However, further information should be developed on the career patterns of individuals in professional staff and non-supervisory management positions. The information will clarify the extent to which professional development can help move qualified minority staff and administrators to supervisory and line authority positions.

In conclusion, progress has been made in lowering or eliminating many barriers to enhancing racial and ethnic diversity in the State System. The challenge for the State System in the next five years will be to move to what the National Task Force for Minority Achievement in Higher Education (1990) has termed the third stage to achieving fair outcomes. The third stage follows removing barriers and establishing a climate of support. Achieving fair outcomes, as a goal, involves making fundamental changes in institutional procedures and group relations, pedagogical approaches, and curricular development. To assist campuses in bringing about these changes, policies for improving minority group degree acquisition, particularly at the graduate level, increasing the number of underrepresented faculty, and providing better opportunities for professional staff and administrative advancement will need to be prominent among the State System's key priorities in the 1990s.

Note: Percentages are based on the number of Ph.D.s with known primary support. "Personal" includes loans as well as own earnings and contributions from the spouse/family. Federally funded research assistantships (RAs) are grouped under "University" because recipients of such support may not be aware of the actual source of funding. It is believed that many of these Ph.D.s are reporting their support as university RA instead of federal RA. "Other" support includes U.S. nationally competitive fellowships, business/employer funds, foreign government, and other nonspecified sources.

Source: National Research Council, 1990 Summary Report: Doctorate Recipients From United States Universities, Washington, D.C.: National Academy Press, 1991, p.42

Because of the small number of Native Americans (a total of 93 Ph.D.s in 1990), percentages in fields other than education and social sciences are not very meaningful.

[†] Includes mathematics and computer sciences.

^{*} Includes regular faculty with academic rank, both 9- and 12-month appointments, and employed full-time at the institution (.90 FTE or greater) with at least .50 FTE in an instructional department (for OHSU, any instructional FTE) as reflected on the October 31 payroll file. Faculty on sabbatical leave are included. For OSU, data include regular full-time faculty homed in Agricultural Experiment Station, Forest Research Laboratory, and OSU Extension, and any full-time faculty homed in OSU instructional accounts (regardless of the FTE budgeted in the instructional account).

Source: OSSHE Institutional Research Services.

^{** &}quot;High market disciplines" include engineering, computer science, business, and law.

[@] Includes faculty homed in Agricultural Experiment Station, Forest Research Laboratory, and OSU Extension.
