#### ABSTRACT

PUB TYPE

This publication presents indicators of social and economic conditions in Arkansas highlighting urban and rural differences. Initial information includes a discussion of the definition of "rural" and a display of classification schemes used to describe the regions of Arkansas. The remainder of the document contains data for 1990, state rank, and rural/urban comparisons for: (1) population trends; (2) economic trends, including changes in employment, per capita income, types of jobs, earnings, personal income, transfer incomes (retirement pensions, social security, and medical payments), retail sales, transportation, and construction; (3) poverty, in terms of percentage of persons below the poverty level, income distribution, and changes in number of recipients of Aid to Families with Dependent Children; (4) local government, entailing types of municipalities and property taxes; (5) education, focusing on expenditures per student and educational attainment; and (6) health status, consisting of the infant mortality rate and access to health care. Appendices contain extensive data tables by county in each of these categories. Also included are many graphs and maps. (KS)

### Rural Profile of Arkansas 1993

A Look at Economic & Social Trends Affecting Rural Arkansas

January 1993

### Foreword

The State of Arkansas' Office of Rural Advocacy (ORA) and the Arkansas Rural Development Commission (ARDC) were created by the legislature through the "Arkansas Rural Development Program Act" (Act 302) of 1991.

The ORA is dedicated to serving as a single contactpoint for local governments, state and federal agencies and other (public, private, and nonprofit sector) organizations and individuals with an interest in the rural policies and programs of the state. By striving to promote a cooperative and integrated effort among the various entities that are designed to address rural issues in Arkansas, the ORA attempts to treamline the bureaucratic process for small communities and make state government more "user friendly."

In addition, the ORA serves as a clearinghouse of information related to rural development; assists rural Arkansans in applying to state and federal agencies; provides technical assistance to organizations formulating and implementing rural services; analyzes proposed longrange plans that could affect rural areas; and attracts outside funds to the state for the purposes of rural enhancement.

The ORA is overseen by the ARDC. The commission consists of 11 regular members representing rural areas: four legislators and seven citizens-at-large. The President Pro Tempore of the Senate and the Speaker of the House also serve on the ARDC in a non-voting, exofficio capacity.

In conjunction with the ORA, the ARDC strives to bring together diverse

groups from all regions of the state to work for the betterment of rural Arkansas. Its mission, along with the ORA, is to enhance the quality of rural life (including cultural and material standards of living) without sacrificing individual freedoms or responsibilities.

In working toward this goal, it became evident to the ORA, the ARDC, and others that a common understanding of current economic and social trends that affect rural Arkansas would be beneficial. Therefore, it was decided that a resource tool that could provide this information and help unite rural developers in Arkansas was absolutely essential for future success and action.

The Rural Profile of Arkansas, 1993 is the result of this process. Using the most up-to-date census data available, the University of Arkansas' Agricultural Experiment Station and Cooperative Extension Service have produced a topnotch publication to assist rural Arkansas with development and revitalization efforts.

Obviously, a report of this magnitude would not have been possible without the support of the many private and public sector partners who contributed toward this endeavor. Thanks to their commitment to Arkansas and their financial assistance, this publication has become a reality for all to use and enjoy.

We trust that you will find the *Rural Profile* to be informative and helpful for your planning and development as well as for rural policy efforts.

#### The Larger Context

The last ten years brought new pressures on rural areas in Arkansas. Financial, product, and labor markets are becoming increasingly intricate and international--a trend that affects the ability of rural economies to attract new capital, expand markets for local products and retain jobs for local workers. Businesses and workers in rural Arkansas communities find themselves competing with businesses and workers in unfamiliar, laces with unfamiliar names on the other side of the globe.

Federal policy and the rising federal deficit have also affected rural communities, shifting more responsibility on local governmental agencies to design and deliver public services previously provided by federal agencies. Unfortunately, the financial resources available to these local governments have not been able to keep pace with growing demands.

In addition to these external pressures, Arkansas' rural areas face equally serious problems from within. The lack of a well-trained labor force makes it difficult to attract highly skilled, well-paying jobs to rural areas; high levels of poverty and poor health continue the cycle of a weak labor force and strong demand on the public service systems; and an aging population together with the out-migration of people in their prime wage-earning years have resulted in a declining tax base in many rural communities.

It is difficult to know what the future will bring. However, the outcome of important debates about two multi-national trade agreements--GATT (General Agreement on Trade and Tariffs) and NAFTA (North American Free Trade Agreement) can be expected to have their greatest impacts on the agricultural and manufacturing sectors --two sectors that are especially important in rural areas. The future of rural Arkansas depends, to a large extent, on how quickly we are able to anticipate these impacts and to develop appropriate responses. It is within this shifting context that the key features of rural Arkansas are described.

# Highlights 4 1 2 1

#### **Rural Arkansas**

- \* Arkansas is still a very rural state, with nearly half of its population living in rural areas, compared to about 25% for the United States, and with nearly 60% of its population in non-metropolitan counties, compared to about 23% for the United States (p. 6).
- \* The population structure of rural areas is different from that of urban areas, containing a much larger percentage of the state's "dependent" persons--children and elderly people (p. 9).
- \* Rural jobs grew by 14% between 1980 and 1990, compared to 23% in urban areas (p. 11).
- \* Rural per capita income grew slightly faster than did urban income (20% compared to 18%). However, rural areas in Arkansas continued to have lower per capita incomes than urban areas (p. 11).
- \* During the 1980s, rural Arkansas experienced significant declines in natural resource-based industry jobs. In most of the regions, these lost jobs were replaced with jobs in the manufacturing, transportation and trade, and service sectors (p. 12).
- \* The new jobs paid about the same as the lost jobs: earnings per job in rural areas increased by \$840 between 1980 and 1990 (in constant dollars) (p. 13).
- \* Rural Arkansans derived less of their total personal income from earnings and more from transfer payments than did their urban counterparts (p. 15).
- \* Despite conventional stereotypes of transfer payments as welfare relief, the vast majority of rural transfer income (between 85% and 92%) fell into the category of retirement pensions, social security and medical payments, not into the income maintenance category (p. 15).
- \* Per capita retail sales (in constant dollars) in rural Arkansas counties declined an average of 22% from 1977 to 1987 (p. 15).
- \* The poverty rate of rural Arkansas is 66% higher than that of the nation (21.1% vs. 14.2%) while the 14.6% poverty rate for Arkansas' urban areas is only slightly higher than the national rate (p. 17).
- \* The rural Delta counties of Lee, Phillips, and Chicot have the highest poverty rate (47%, 43% and 40%, respectively) (p. 17).

, 9

# <u> Highlights</u>

- \* When compared to the state's urban areas, rural Arkansas has a higher percentage or families with an annual income of less than \$10,000 and a lower percentage of families with incomes above \$50,000 (p. 18).
- \* Rural counties have a higher rate of recipients of Aid for Families with Dependent Children (AFDC) than urban counties (p. 19).
- \* While the AFDC recipient rate has declined for both rural and urban counties in the last decade, the decrease has been smaller for rural areas (p. 19).
- \* Nearly 39% of Arkansas' population lives outside incorporated places. Another 24% lives in the 460 cities and towns of less than 10,000 people. Thus, a total of 63% of Arkansas' population is completely dependent upon county and/or small-town government for basic services (p. 20).
- \* Although property taxes are the single greatest source of revenue for many county governments, Arkansans pay less in property taxes than residents in most other states (p. 20).
- \* Many local governments are using the sales tax to increase their revenue from local sources (p. 21).
- \* Significant progress has been made in overall expenditures per student in Arkansas, moving from 49th to 46th position in two years (p. 22).
- \* There is significant variation in expenditures per student from county to county and in the source of school funds. Pulaski County contributes the most from local sources and still receives more than the average from state sources. The Highlands receives the least from state sources. The Delta contributes the least from local sources (p. 22).
- \* Educational attainment levels are relatively low in Arkansas, due in part to the outmigration of educated young people, particularly from rural areas (p. 23).
- \* Infant mortality rates for the five years of 1986-1990 in the four regions of the state ranged from a high of 11.6 infant deaths per 1,000 live births in the Delta to a low of 9.0 in the Highlands. The Coastal Plains and urban areas had rates of 10.6 and 10.5, respectively. The national infant mortality rate was 9.7 in 1989 (p. 24).

### What is "Rural"?

It is not easy to find acceptable definitions of what is meant by *urban* and *rural*. The underlying idea refers to population density and isolation as well as to potential differences in occupational and socio-cultural aspects of society. It is a continuum, rather than two clearly defined categories. Although the most common breaking point is not easy to find, two are widely used:

Census Bureau Rural: The U.S. Census Bureau does not define rural but rather defines urban as any place with 2,500 or more residents. Thus, rural is a residual of the urban definition, i.e., what is left over once all urban people are accounted for. Nationally, 24.8% of the population was rural in this sense as of the 1990 Census. Arkansas, however, was 46.5% rural and ranked eleventh in the nation. Even though this definition includes nearly half of the state's population, it still excludes much of Arkansas that seems to be very rural in nature. Therefore, this Rural Profile uses the "non-metropolitan" breaking point instead to define what is rural.

Non-metropolitan: Another method in use by federal statistical agencies defines as metropolitan all of those counties that include a total population of at least 50,000, or an urbanized area of at least 50,000 with a total population of at least 100,000. Using these criteria, the U.S. Office of Management and Budget designated 10 Arkansas counties in six Metropolitan Statistical

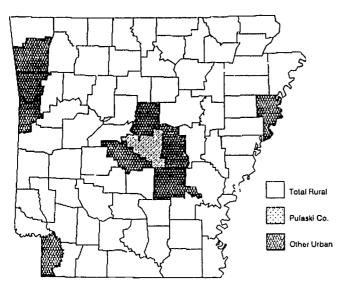

Areas (MSA) in 1983. These six MSA are: Fayetteville-Springdale (Washington), Fort Smith (Crawford and Sebastian), Little Rock-North Little Rock (Faulkner, Saline, Pulaski, Lonoke), Pine Bluff (Jefferson), Memphis (Crittenden), and Texarkana (Miller). According to this definition, 59.9% of Arkansas' population would have been designated as non-metropolitan in 1990, ranking eighth in the nation.

This definition is by no means perfect. It classifies as non-metropolitan some areas, such as Jonesboro, Hot Springs and Batesville, that have prominent urban characteristics and includes in the metropolitan category very rural portions of MSA counties. And, in looking at historical trends since 1900, data are more readily available according to the Census Bureau definition. However, the non-metropolitan definition has one distinct advantage: since it is based upon county units, much more extensive data are available to make current comparisons between rural and urban Arkansas.

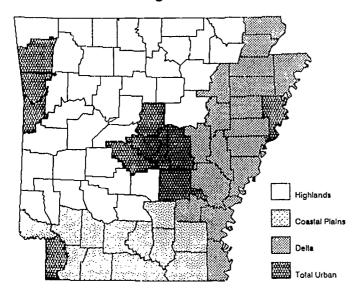

This publication presents indicators of social and economic conditions for rural and urban areas and further divides the urban and rural areas to highlight differences. We use the term *urban* to denote the metropolitan counties, and *rural* includes the non-metropolitan counties.

# Regions of Arkansas

#### Rural and Urban Areas of Arkansas

Rural Regions of Arkansas

Arkansas Agricultural Experiment Station Bulletin 915

The maps on the left show the two classification schemes used in this publication. The first scheme (see map at top) presents data in three categories: Rural, Pulaski County and Other Urban Counties. Pulaski County displays characteristics more typical of major urban areas in the U.S. and is, therefore, presented separately.

In the second scheme, shown in the bottom map, we use another classification that further divides the rural areas into three regions: Coastal Plains, Delta and Highlands. This classification groups rural counties that have similarities in economic activity, history, physical setting, settlement patterns and culture.

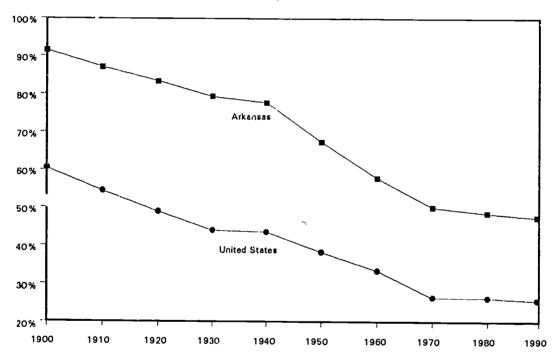

. . .

## **Population**

Using Census data briefly to examine past trends, it is clear that the percentage of Arkansans living in rural areas has historically been significantly higher than the national average, and continues to be so up to the present. In 1900, 91.5% of Arkansas residents lived in rural areas, compared to 60.4% of the U.S. population as a whole. From 1900 to 1990, the percentage of the popula-

tion living in rural areas declined dramatically in both Arkansas and the U.S. However, even in 1990, nearly half (46.5%) of all Arkansans continued to live in rural areas, compared to 24.8% of the total U.S. population. Using the nonmetropolitan definition of rural for the year 1990, the discrepancy is even greater: 59.9% of Arkansans lived in rural areas, compared to 22.5% in the U.S.

#### Percentage Rural Population, 1900 to 1990

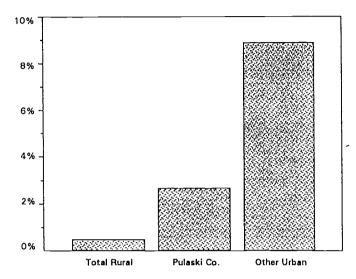

Note: Rural is defined as persons living in places of less than 2,500 population.

# <u>Population</u>

#### Population Change, 1980 to 1990 Rural and Urban Areas of Arkansas

Rural Regions of Arkansas

U.S. Bureau of the Census

Rural areas of the United States have grown at a slower rate than have urban areas. This was certainly the case for the state of Arkansas during the 1980s (see top graph). From 1980 to 1990, the state grew by 2.8%. Pulaski County grew at about the overall state rate However, the largest (2.7%). growth rates were experienced by the other urban counties of the state (8.9% growth), while rural counties hardly grew at all (0.5%) and thus continued to lose their percentage share of the state's population.

Population growth also varied sharply across geographic regions within the state (see bottom graph). Against the backdrop of 2.8% growth for the state as a whole, the eastern counties of the Arkansas Delta lost 6.2% of their population, while the southern counties of the Coastal Plains lost 4.8%. The major growth areas in the state were the Highlands (6.2% growth) and the metropolitan counties (which, when Pulaski County is included, grew by 6.5%).

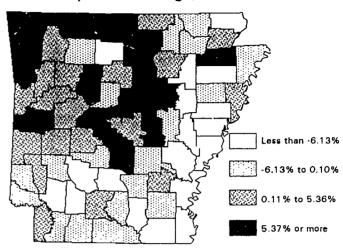

# **Population**

The map at right shows the way in which population growth from 1980 to 1990 varied across counties within the state. Growth rates ranged from highs of over 20% in Faulkner, Benton and Saline counties to losses of 15% or more in Desha, Woodruff, Lee, Phillips and Monroe counties. Clearly, the Delta and Coastal Plains regions are losing population while the Highlands, generally, is gaining.

Natural increase (the excess of births over deaths) and migration. which have different effects on the population structure, vary greatly among the rural regions of the state and the urban counties. Pulaski County and the other urban counties have the highest rates of natural increase due to the large proportion of people of child-bearing age. The Delta, on the other hand, experienced the greatest degree of outmigration from 1980 to 1990. Outmigration was also high for the Coastal Plains and for Pulaski County.

Population Change, 1980 to 1990

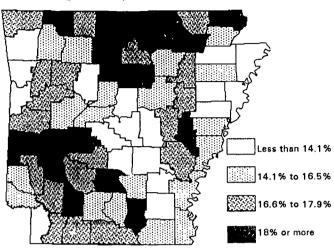

Components of Population Change, 1980 to 1990								
County Types								
Rural:								
Coastal Plains	-4.8	3.2	-8.1					
Delta	-6.2	5.4	-11.7					
Highlands	6.2	1.9	4.3

State Total	29.6	55.5	14.9	2,350,725				

May not sum due to rounding

U.S. Bureau of the Census

The map on the left shows the way in which elderly population varies among counties within the state. Retirement settlements contribute to the relatively high percentage of the population 65 and older in the Highlands.

The percentage of the population 65 and older ranges from a high of 29.2% in Baxter County to lows of 10.6% and 10.7% in Crittenden and Faulkner counties. Pulaski County is near the bottom of the range at 11.5%.

In contrast to the 1970's, when Arkansas experienced 18% in-migration overall and very significant in-migration of elderly persons, there was no net in-migration of elderly people in the state as a whole in the 1980's. Five counties in the Highlands (Baxter, Benton, Cleburne, Garland, and Van Buren) still had net in-migration of elderly people of 10% or more. Thirteen others had net in-migration of elderly up to 10%.

The population structure of rural areas is different from that of urban areas, containing proportionately more children and more elderly people. This is especially true of the rural Delta counties, which have the largest percentage of children (31.7%), result-

ing from both high rates of natural increase and high rates of selective out-migration. In the retirement-destination counties of the Highlands, retirement in-migration has led to a large proportion of elderly people (18.3%). Baxter, Sharp and Izard counties are the highest (29.2, 27.2 and 25.9%, respectively). Of course, this leaves the urban areas, especially Pulaski County, with the largest proportion of "active" population aged 20 to 64 (59.5%). Thus the rural areas of Arkansas clearly carry the heavier burden of caring for "dependent" populations, especially for the education and health care of children.

# **Economy**

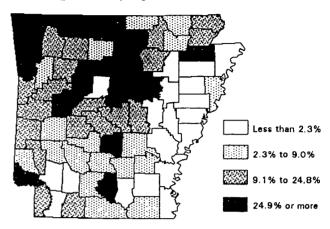

Concerns about the "Economy" reached the top of the priority list for many people in the 1990s. This concern involved more than short-term worries about the recent recession. Rapid changes in the structure of the economy and increasing competition for jobs between U.S. and foreign workers during the 1980s heightened the sense of insecurity many people felt about what the future would bring.

#### Performance of the Arkansas Economy During the 1980s

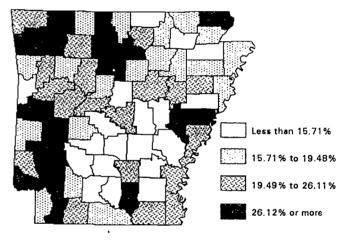

Despite both short-run problems and long-term structural changes in the national economy, Arkansas' economy, as a whole, performed relatively well during the past decade. Job growth in the state between 1980 and 1990 was 18%--a rate higher than in 21 of the other 49 states and the District of Columbia. Per capita incomes grew by 20% during the same period--the 20th fastest in the nation.

Some areas of Arkansas, however, performed better than others. For example, 16 counties (all of them rural and 12 of them in the Delta) experienced a net loss of jobs during the decade. And per capita incomes grew by less than 10% in 5 counties (again all rural).

#### Job and Income Growth in Rural Areas of Arkansas

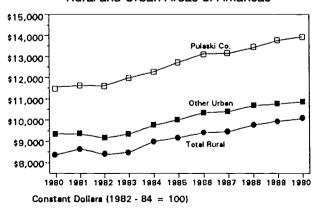

In terms of jobs, rural areas of Arkansas did not grow as fast as did urban areas. Rural jobs grew by 14% between 1980 and 1990, compared to 23% in urban areas. Within the rural economy, jobs grew significantly faster in counties in the Highlands than in the Coastal Plains or Delta region.

We do not find the same overall rural/ urban discrepancy when we look at growth in per capita incomes. Rural per capita income actually grew slightly faster than did urban incomes (20% compared to 18%). However, the regional discrepancies among rural areas remain. Per capita income grew fastest in the rural Highlands and slowest in the rural Delta.

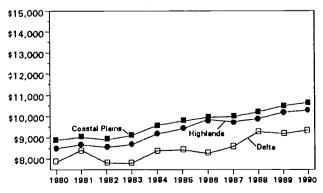

Income and job growth do not tell the whole story, however. The future facing rural Arkansans depends, to a large extent, on the types of jobs and the levels and sources of income in the area.

## **Economy**

#### The Job Base in Rural Arkansas Counties

Historically, rural economies have been more dependent on natural resource-based industries (agriculture, forestry, fisheries, and mining) and on goods-producing industries (manufacturing and, to a lesser extent, construction) than have been urban economies.

In Arkansas, the same historical pattern has continued into the 1990s. Natural resource-based jobs make up over 10% of the jobs in rural areas compared to only 3% in urban areas; and the goodsproducing sector contains almost 29% of total rural jobs, compared to 21% of urban jobs. This economic specialization has made many rural economies particularly vulnerable to broader structural changes taking place in the national and international economies.

The natural resource-based industrial sector, especially agriculture, has experienced tremendous productivity gains throughout the 20th century. Technological advances and capital in-

vestments in farming have contributed to a greater diversity as well as to quality improvements in our food and fiber system--with a reduced number of workers.

In the manufacturing sector, automation (including computerization) has also meant that increasingly fewer workers are required to produce the same goods. At the same time, rural workers in the U.S. increasingly find themselves competing with foreign workers for the more routine production manufacturing jobs.

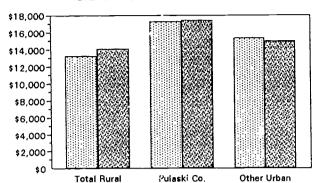

As a result of these trends, rural areas, including many in Arkansas, have seen their traditional economic base eroding. During the 1980s, all three rural regions in Arkansas experienced significant declines in natural resource-based jobs. The greatest losses, however, occurred in the Delta--a loss of more than 8,500 jobs. Moreover, the Delta was the only region in Arkansas that did not gain any new goods-producing jobs during the last decade. The Highlands region, in contrast, lost over 6,000 resource-based jobs but was remarkably successful in

	Change in Jobs by Major Industry Sector, 1980 to 1990								
County Types	Total	Natural Resource- Based	Goods- Producing	Transpor- tation & Trade	Service- Producing	Government

Bureau of Economic Analysis, U.S. Dept. of Commerce

replacing those jobs with more than 17,000 new jobs in manufacturing, 25,500 new ones in transportation and trade, and more than 26,000 jobs in the service sector.

For the most part, these new jobs pay about the same as the lost jobs. Earnings per job in rural areas increased by \$840 between 1980 and 1990 (in constant dollars). Interestingly, despite their more rapid job growth, urban areas fared worse with an average increase of only \$122 per job in Pulaski County and a decline of \$122 in the other urban counties.

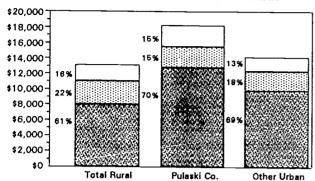

Among the three rural regions, the slow-growing Delta counties had the largest increase in earnings per job (\$1,079) while the rapidly growing Highland counties increased their earnings per job by \$842, and the Coastal Plains counties increased by only \$530.

## <u>Economy</u>

#### Sources of Personal Income, 1990

Rural and Urban Areas of Arkansas

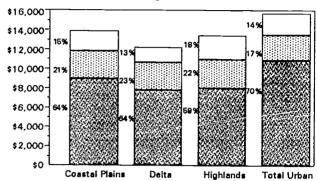

Bureau of Economic Analysis, U.S. Dept. of Commerce

#### Levels and Sources of Income in Rural Arkansas Counties

In large part because of their job base, rural areas throughout the U.S. tend to have lower per capita incomes than urban areas. In addition, because of their older and poorer populations, rural areas generally derive less of their total personal income from earnings and more from transfer payments.

In Arkansas, these differences are most obvious when we compare Pulaski County with the rural areas of the state.

#### Rural Regions of Arkansas

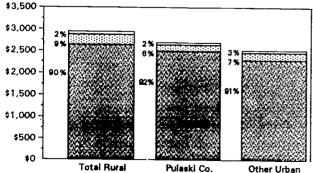

Earnings Transfer Payments Dividends, Interest, Rent Percentages may not add to 100 due to rounding

Per capita income in 1990 was 38% higher than in the rural counties as a whole and 49% higher than per capita income in the Delta. The income gap between the rural counties and the other urban counties is much smaller--in absolute terms, only \$1,000. These rural/urban disparities in per capita incomes did not change significantly during the 1980s.

Rural Arkansans earn a notably smaller portion of their incomes from their jobs than do their urban counter-

#### Retail Sales Per Capita, 1987 Rural and Urban Areas of Arkansas

Change in Retail Sales, 1982 to 1987

Constant dollars (1982 - 84 = 100)

Census of Retail Trade - Geographic Area Series, U.S. Bureau of the Census

parts. They also derive a larger share of their income from dividends, interest and rent. In the rural Highlands, earnings (wages and salaries plus proprietors' incomes) constitute less than 60% of total personal income, while dividends, interest and rent combine to make up another 18%, compared to more than 70% from earnings and only 15% from dividends, interest and rent in Pulaski County.

Also consistent with national rural/urban differences, rural Arkansans rely more on transfer payments than do urban Arkansans. Despite conventional stereotypes of transfer payments as welfare relief, the vast majority of transfer incomes (between 85% and 92%) fall into the category of retirement pensions, social security and medical payments, not into the income maintenance category. Even in the Delta, where income maintenance payments are the highest (\$346 per capita in 1990), they constitute less than 3% of total personal incomes.

#### **Growth in Retail Sales**

Another important measure of economic performance is growth in retail sales. Throughout the nation, many rural communities are losing retail and service sales to metropolitan areas. Again, we find the same is true in Arkansas. Per capita retail sales (in constant dollars) in rural Arkansas counties declined an average of 22% from 1977 to 1987. From 1982 to 1987, 41 counties had declining per capita retail sales. The average per capita retail sales of urban counties in 1987 was \$6,113, compared to \$4,057 for rural counties.

### Beonomy

Shopping malls and the large "discount" stores operated by mass merchandisers have attracted consumers from large distances. Often other factors have contributed to the decline in retail sales, including failure to keep abreast of changing demands for goods and services.

Some rural communities have succeeded in maintaining a strong retail sector. Sharp County, for example, reversed the typical rural trend in retail sales, moving from a per capita decline of 45% from 1977 to 1982 to an increase of 25% in the period from 1982 to 1987.

#### **Transportation**

Arkansas' low population density requires a high per capita expenditure on highways. In 1988/89 Arkansas ranked thirty-second in the nation in per capita highway spending with each Arkansan paying approximately \$15.69 out of every \$1,000 of personal income for highways. As a percentage of total state and local general spending, Arkansas ranked twenty-fifth nationally in highway spending.

There are 82,684 miles of roads, streets and highways in Arkansas of which 77,177 are public roads. Sixty-four percent of the public roads are maintained by counties, 21% by the state and only 2% by the federal government. In sparsely populated rural areas, good roads are needed not only to obtain raw materials and transport commodities to market, but also for the many Arkansans who travel a great distance to and from work. Nineteen percent of Arkansas workers travel outside their county of

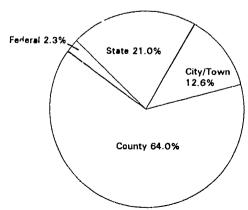

residence to their job. Twenty-two percent of workers spend 30 or more minutes to get to work, and 4% spend 60 or more minutes to get to work. Without access to public transportation, good roads are vital for these rural residents.

#### Construction

Urban areas account for more than 70% of the new construction value in the state. In 1988 as much as 70% of residential construction and 72% of non-residential construction occurred in urban areas. The state total for construction permit value was over \$600 million in 1989. More money was spent in residential construction than in non-residential contruction.

Government	Miles
State	16,228
County	49,429
Federal	1,760

### <u>Poverty</u>

#### Percentage of Persons Below Poverty Level, 1989

Rural and Urban Areas of Arkansas

**County Distribution** 

U.S. Bureau of the Census

The poverty rate of rural Arkansas is 66% higher than the U.S. average (21.1% vs. 14.2%). On the other hand, have approximates that of the nation (14.6% vs. 14.2%).

The poverty rate varies greatly among rural areas and is the highest in the Delta, where the poverty rate of 27% is nearly twice the national average. The three Delta counties of Lee, Phillips and Chicot have the highest poverty rates in the state (47%, 43% and 40%, respectively).

The map showing percentage of persons in poverty in 1989 dramatically illustrates the concentration of poverty in two regions of the state: the Mississippi Delta has by far the largest concentration, followed by the most rural counties of northwest Arkansas. Economic development during the 1980s has reduced some of the rural poverty of northwest Arkansas. But in the Delta, conditions of poverty persist, as this region continues to adjust to the dramatic changes that have occurred in the agriculture sector since World War II.

## **Poverty**

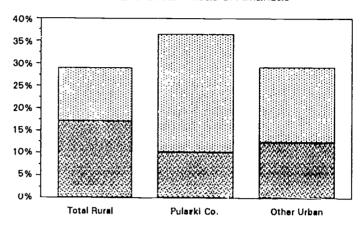

#### **Income Distribution**

When compared to the urban areas of Arkansas, rural areas have a higher percentage of families that have an annual income of less than \$10,000 and a lower percentage of families that have incomes above \$50,000. These differences are even more striking when rural areas are compared to Pulaski County alone. When rural Arkansas is considered on a regional basis, the Delta displays the greatest inequality in income distribution.

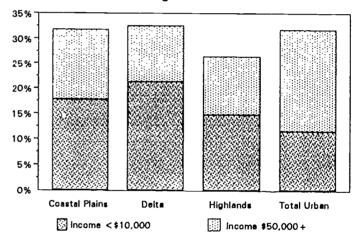

This situation is, in large part, the result of the dramatic transformation that has occurred in the economy of Arkansas, especially in that of eastern Arkansas. Agriculture has undergone a transformation from a relatively prosperous, labor-intensive activity to a highly mechanized, high-technology activity. This transformation has displaced thousands of farm laborers, most of them African-American, in a very short time. These laborers have had to leave or depend upon transfer payments.

## **Poverty**

#### AFDC Recipients Per 1,000 Population, 1990

Change in AFDC Grants Per Capita, 1980 to 1990

Constant dollars (1982 - 1984 = 100)

The number of recipients of Aid to Families with Dependent Children (AFDC) per 1,000 population is much higher in Arkansas than for the U.S. Clearly, the state has many children living in poor households. As shown in the top chart, the greatest number of recipients per 1,000 population is found in rural parts of the state. Pulaski County and the other urban counties are approximately equal in the AFDC recipient rate.

In terms of change, the number of AFDC recipients per capita has been dropping statewide, as shown in the bottom chart. This change may be a consequence of improved economic conditions during the 1980s, cutbacks in funding, and/or specific efforts by the state to move welfare mothers into the workforce whenever possible. Whatever the source of the change, the chart at left indicates that the rural areas of the state have experienced a smaller decline than either Pulaski County or the other urban areas.

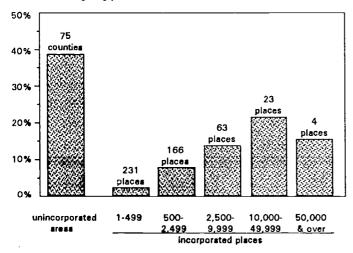

### Local Government

Arkansas is an unusually rural and small-town state, with 75 county governments, 322 school districts and 487 incorporated towns and cities as of 1990, most of which are very small. Nearly 39% of the population lives in the unincorporated areas and is dependent upon county government for all basic governmental services. Another 24% of the population resides in the 460 towns and cities with less than 10,000 inhabitants.

The remaining 37% of Arkansans live in the 27 places with a population of more than 10,000. A total of 15.6% live in the four places with 50,000 or more inhabitants (Little Rock, Fort Smith, North Little Rock and Pine Bluff).

The large number of persons living in unincorporated areas and in small towns places an unusually heavy burden of providing basic services upon local governments. By necessity, these local government offices are usually managed by amateurs, with very limited financial and institutional resources. However, this situation provides extensive opportunity for involvement in local affairs.

Percentage of Arkansas Population by Type and Size of Place, 1990

U.S. Bureau of the Census

20

During the 1980s many local governments were put (and still are) in financial straits. Federal and state policies are transferring more of the burden of paying for public services to local governments. At the same time many rural areas in Arkansas have a declining tax base.

The federal revenue sharing program was abolished September 1, 1987, reducing federal funding for local public services. Additional responsibilities that are being passed to local governments include enforcement and collection of child support payments, new regulations for disposing of solid waste and responsibility for meeting new jail standards and providing expanded incarceration facilities.

Property tax is the single largest local revenue source of county governments. The ability to raise revenue from this source varies greatly among counties. Using per capita assessed value of property as an indicator of the potential to raise property tax revenue, we find that differences exist among and within regions. Of the rural regions, the Coastal Plains has the highest assessed value per capita while the Delta counties have the lowest. The Delta has considerably lower per capita assessed values than other rural and urban areas. However, the greatest variation in per capita assessed value is among counties, ranging from \$3,873 to \$10,369 (1991 figures).

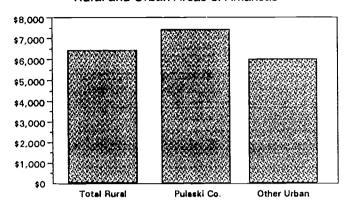

Or.

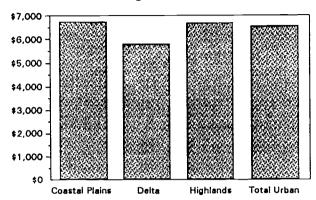

### Local Government

#### Local Property Assessment Per Capita, 1991

#### Rural and Urban Areas of Arkansas

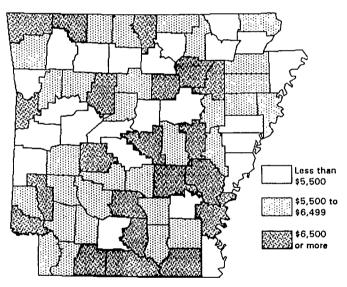

#### **Rural Regions of Arkansas**

Note: Per capita calculations used 1990 population.

#### County Distribution

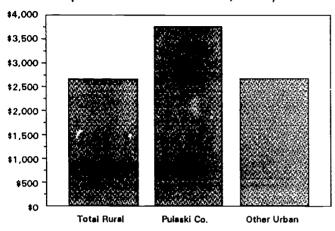

While the potential to raise property tax revenue varies greatly among counties. Arkansas raises less per capita and per \$1,000 of personal income from property tax income than most states. In 1986 Arkansas ranked 46th in total property tax revenue per \$1,000 of personal income and 47th in per capita dollars raised from the property tax. The trend is to raise revenue from other sources. Many counties have passed a 1% sales tax to raise revenue to fund ongoing and mandated public services. In some counties the sales tax has replaced the property tax as the single largest source of local revenue. In 1988 the sales tax generated about 16% of local county revenue compared to 36% generated by the property tax. As of October 1992, 58 of the 75 counties had a 1% sales tax.

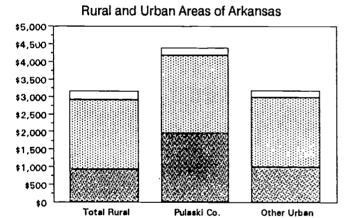

### Education

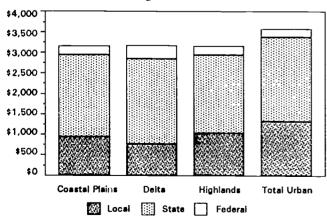

#### Expenditures Per Student, 1990/91

Receipts Per Student, by Source, 1990/91

**Rural Regions of Arkansas** 

Note: Number of students is determined by the average daily attendance.

Arkansas Department of Education

A skilled, knowledgeable and versatile work force is essential in today's international economy. Much of the employment growth in recent years has been in fields that require college degrees, and even relatively low-paying jobs require basic literacy skills. Thus, improving the educational system has become increasingly important to Arkansas. Arkansas ranks 46th in the nation in current expenditures per pupil for public elementary and secondary schools, having moved up from 49th only two years ago. Still, like other rural states, Arkansas allocates a very large proportion of its state and local expenditures to education.

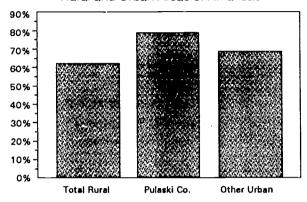

Expenditures per student are substantially higher in Pulaski County (\$3,754) than in the other urban and rural areas of the state. where expenditures range roughly from \$2,300 to \$3,100. Receipts for public education come from local. state and federal sources with the state contributing the most. This is especially true in rural areas. The relative distribution of these sources of income does not vary much on a per-student basis, except that the Delta receives somewhat more from the state and the federal government and somewhat less from local sources, and Pulaski County contributes nearly twice as much from local sources (\$1,960) as do the rural areas (\$940). The rural Highlands receive the least from state sources (\$1.895).

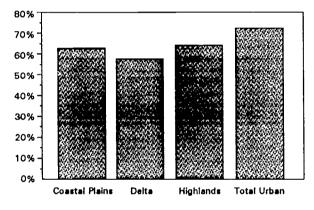

### Education

#### Persons 25 and Older Having Completed High School, 1990

Rural and Urban Areas of Arkansas

Rural Regions of Arkansas

U.S. Bureau of the Census

Even though improvements are being made, educational attainment levels in Arkansas are still relatively low. For the state as a whole in 1990, about 66% of the population aged 25 and over had completed high school. High school completion rates range from 39% and 44% in Franklin and Lee counties to 73% and 79% in Washington and Pulaski counties. Generally, educational levels are low the Delta, where only about 58% of the population had received a high school diploma in 1990.

The relatively low proportions of adults who have completed high school in Arkansas, especially in rural areas, result to a significant extent from selective out-migration. The state as a whole, and especially the rural areas of the state, lose disproportionate numbers of young people, particularly the more highly educated young people who migrate to urban areas.

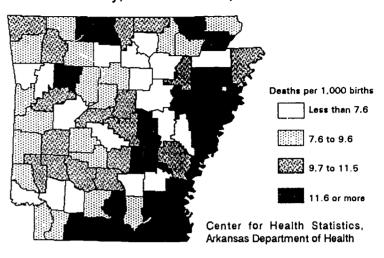

, ; ; ;

### Health

Good health is essential for a person to be a productive citizen. Poor health is both a cause and an effect of low income. Therefore, health is critical to discussions on economic development.

The infant mortality rate is a reflection of the health status of a population. The 1989 infant mortality rate for the nation was 9.7 infant deaths per 1,000 live births. The infant mortality rates for the four regions of Arkansas range from a low of 9.0 infant

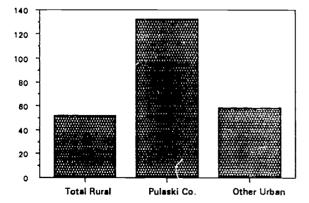

Infant Mortality, Five-Year Rate, 1986 to 1990

deaths (per 1000 live births) in the Highlands to a high rate of 11.6 in the Delta. The Coastal Plains and Total Urban areas fall in between at 10.6 and 10.5, respectively. As can be seen in the accompanying map, this general pattern is clearly evident when individual county data are considered.

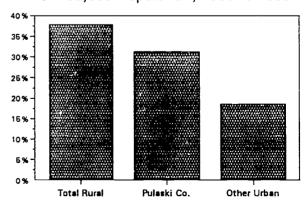

Access to health care, measured by the number of primary care physicians, is better in urban areas, particularly in Pulaski County. There are 133 primary care physicians for every 100,000 people in Pulaski County as compared to an average of 52 in rural areas. However, there has been a significant increase in the number of primary care physicians in rural areas since 1980. The number of primary care physicians per 100,000 population has increased 37%, from 38 to 52.
