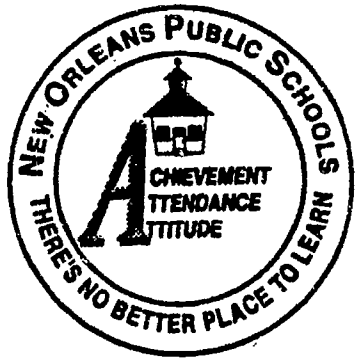
IDENTIFIERS	California Achievement Tests; Education Consolidation Improvement Act Chapter 1; *New Orleans Public Schools LA

ABSTRACT

The California Achievement Test (CAT) has been administered in Orleans Parish (Louisiana) annually each spring to gauge performance of New Orleans Public Schools students since 1989. In 1992, the CAT was given to students in kindergarten and grades 3, 5, and 8. With few exceptions, median percentiles for New Orleans students were below the 40th percentile, although dividing students into low-risk and high-risk groups gives a clearer picture of what the schools accomplish. Test results must be related to major student factors such as retention, Chapter 1 participation, absenteeism, suspensions, expulsions, free lunch status, welfare, etc., to gain a more meaningful understanding of true achievement. Retention does not seem to have any beneficial effect on students retained at the first grade level. The long-term benefits of Chapter 1 and prekindergarten experiences are questionable and merit further study. Absenteeism is a serious problem in the New Orleans schools, and it, along with instructional variables, must be examined for its relationship to test results. The tendency to associate low socioeconomic status automatically with poor scores must be reexamined to avoid stereotyping these students. The school district must begin to develop a student database management system to improve further research. Sixteen tables present test results, and nine figures make comparisons possible. Six appendixes provide additional details about test results. (SLD)

NORM-REFERENCED TEST RESULTS OF THE NEW ORLEANS PUBLIC SCHOOLS:

A COMPREHENSIVE REPORT ON THEIR RELATIONSHIP TO MAJOR STUDENT CHARACTERISTICS



PREPARED BY

EXECUTIVE SUMMARY

The results presented in this report are more comprehensive than previous analyses of test data by this department in terms of scope, depth and implications for policy and program development. They highlight the need for the District to focus less on test score results and more on those precursor conditions which result in the majority of our students performing poorly on standardized tests. The results also provide major baseline data which must be utilized by the District and schools in developing strategic plans for improvement. These plans should incorporate reasonable and meaningful expectations, standards of performance, measurable outcomes of student performance, as well as procedures to periodically assess the effectiveness of strategies.

A. MAJOR POLICY AND PROGRAMMATIC IMPLICATIONS OF REPORT

1. Test results must be related to major student factors such as retention, Chapter I participation, absenteeism, suspensions, expulsions, free lunch status, AFDC status, etc., to gain a more meaningful understanding of the District's true achievement patterns.

2. Retention does not seem to have any beneficial effect on students retained at the first grade level. The District should assess current programs designed to assist retained youngsters for effectiveness and/or experiment with alternatives to the practice of retention at early grade levels. It has been demonstrated that students retained at early grade levels are prime contenders for dropping out of school. Furthermore, it costs at least twice as much to educate a retained than a non-retained student.

3. The long-term beneficial impact of Chapter I is questionable as measured by mandated standards of expected performance. In order to provide more meaningful feedback to District and program personnel, the District should provide appropriate resources to expand the scope of evaluation of this thirty million dollar, federally funded program beyond the currently mandated evaluation process. Process evaluation procedures which assess the extent and quality of program implementation should be established and supported. Presently, the State's minimum evaluation requirements are too limited for meaningful and timely decision making. In addition, other outcome measures should be used to assess program effectiveness, e.g., decrease in retention, decrease in absenteeism, etc.

4. Student absenteeism is a serious problem in terms of the adverse impact it has on achievement. Improvement will only occur through concerted efforts on the part of the parents, District, city government and the community-at-large to develop, implement and monitor strategies that are designed to reinforce attendance and improve achievement.

5. The tendency to associate low socioeconomic status automatically with poor achievement must be reexamined. The results presented here merit further investigation and seriously question any attempt to stereotype these students.

6. The long-term benefical impact of pre-K experiences is questionable. Systemwide programs and practices should be designed and implemented to reinforce the positive effects of pre-K experiences. Standards of performance and expectations should be established for former pre-K youngsters as they move through the system. Such indicators would significantly facilitate any evaluation efforts to ascertain the long-range impact of pre-K training. Evaluation efforts should be approached from both the quantitative and qualitative perspectives.

7. The District and school sites should begin to systematically assess the relationship between test results and instructional variables, e.g., teacher absenteeism, the degree to which students are exposed to the content of the curriculum, time on task, the quality of instructional delivery systems, etc.

8. The District should provide the resources, leadership and direction necessary to develop a student database management information system which will make it possible to relate or link data from other files, i.e., personnel, budget, local testing, state testing, academic grades, AFDC, free lunch, suspension and expulsion, dropouts, etc., in order to expand the capabilities of addressing questions related to all facets of the academic performance of students.

B. MAJOR RESULTS OF REPORT

Analysis of 1992 aggregated CAT results showed that, with the exceptions of Grades K and 1 in reading and Grades 1 and 6 in mathematics, the median percentiles were below the 40th percentile. These results were similar to what has been obtained since 1989. However, these aggregated results do not clearly depict the District's accomplishments or its challenges. In order to provide more in-depth information about the District's achievement patterns, test results were related to a number of important student variables: retention, Chapter I participation, student absenteeism, free lunch and of pre-K experiences.

In order to study the effects of retention and Chapter I participation on achievement and other student variables, students were divided into either Low Risk or High Risk groups in Grades K-6 for purposes of analysis. Low Risk students had never been retained and had never received Chapter I services. High Risk students had either been retained or had received Chapter I services for at least one school year. The results showed that at each grade level analyzed, the average level of performance of Low Risk students was at or above the national norm, i.e., 50th percentile, whereas that of the High Risk students was below the norm.

An analysis of student absenteeism showed that the average number of days absent by the Low Risk students at each grade level was less than that of the High Risk group. Excessive absenteeism was categorized as absenteeism greater than 18 days and existed in both groups. However, High Risk students exhibited excessive absenteeism almost twice as much as did the Low Risk students.

Data were analyzed from students who were identified as eligible to receive free lunch. In order to study the relationship between this SES variable and achievement, students were divided into Low and High Risk groups. Low Risk students performed consistently better than their High Risk counterparts in both reading and mathematics. Although the average performance of Low Risk students on free lunch was somewhat poorer in reading as compared to the average performance of all Low Risk students studied, it was still better than the general aggregated results for all students Districtwide. However, Low Risk students on free lunch scored above the national norm in mathematics at each grade level analyzed.

Longitudinal comparisons of High Risk and Low Risk students showed that the performance of High Risk students on achievement tests deteriorated over time while the performance of Low Risk students tended to be stable over time with the average performance exceeding the national norm each year. The percentage of students in the Low Risk group scoring at or above the 50th percentile decreased slightly over time in reading while increasing when these students were at the 6th grade level. In mathematics, the performance tended to fluctuate from year to year. However, the percent of students scoring at or above the 50th percentile always remained above 50% for each year analyzed, showing that Low Risk students maintained a level of performance above the national norm throughout their elementary school years.

Finally, a descriptive analysis of former pre-K students showed that the performance pattern of these students was similar to that of the District when CAT scores were related to risk categories and other measures. With the exceptions of Grades 2 and 4 in reading, the average grade level performance of former pre-K, Low Risk students was above the national norm in both reading and mathematics while the High Risk group's performance was considerably below the norm. The percentage of former pre-K students who fell into the High Risk group tended to increase the longer the students were in the system.

I. INTRODUCTION

The California Achievement Test (CAT, Forms E & F) has been administered in Orleans Parish each spring to gauge the academic performance of New Orleans Public Schools students since 1989. It replaced the Comprehensive Test of Basic Skills (CTBS, Form U) which had been previously used by the District since 1984. In 1992, Grades K-3, 5 and 8 were administered the CAT, Form E, as part of the local, norm-referenced, achievement testing program. Grades 4, 6 and 9 were administered CAT, Form F, as part of the norm-referenced segment of the Louisiana Educational Assessment Program (LEAP).

In general, test results are reported in percentiles for Total Reading and Total Mathematics. Total Reading is a composite of the Vocabulary and Comprehension subtest scores of CAT while Total Mathematics is the composite of the Computation, and Concepts and Applications subtest scores. These composite scores will subsequently be referred to as simply reading and mathematics scores.

In addition to the traditional presentation of aggregated test results, results are also analyzed with respect to a number of different student characteristics in order to provide more in-depth information about the District's achievement patterns. Consequently, test results are descriptively analyzed from the following perspectives:

a. analysis of results as a function of retention, Chapter I participation, student absenteeism, and free lunch status;

b. analysis of longitudinal achievement data with respect to the long-term impact of retention or participation in Chapter I; and

c. analysis of achievement data with respect to previous pre-kindergarten experiences.

This report attempts to quantify much of the anecdotal evidence and assumptions about achievement in this District. A descriptive analysis of this type enables the District to ascertain the magnitude of performance differences among groups of students and to better focus on the needs of those students through the development of program prevention and/or intervention strategies.

II. TRADITIONAL ANALYSIS OF TEST RESULTS

Table 1 presents the median national percentiles obtained from the 1992 administration of CAT in Grades K-9. The median percentile is defined as the middle score, i.e., fifty percent of the scores fall above this score and fifty percent fall below it. With the exceptions of Grades K and 1 in reading and Grades 1 and 6 in mathematics, the median percentiles of aggregated Districtwide scores were below the 40th percentile. Table 2 shows that, in general, these results are similar to those that have been obtained each year since 1989. Grade K is the only grade level that has maintained or increased progress in reading since 1989. However, the average performance still remains below the national norm, i.e., 50th percentile. In general, the median percentiles at other grade levels still remain below that of the national norm and have not shown any meaningful pattern of sustained increases or decreases since 1989.

8	31	34	30	28	37	35	36	32
9	32	32	34	31	36	35	35	35

Table 3 presents the percent of students who scored at or above the 50th and those who scored below the 25th percentiles. These measures have been used for the past four years to assess progress toward accomplishing the achievement targets developed jointly in 1986 by the previous administration and community groups for the District's original strategic plan. Examination of this table also shows that the District has continued to remain more or less stable on these measures since 1989. For an examination of the historical performance at each school, see Appendices A and B.

Percent Below 25th	36.4	35.9	36.3	36.9	34.6	34.8	34.3	34.4

III. DISAGGREGATION OF 1992 CAT RESULTS

A. Retention and Chapter I Participation - Risk Determinants

In 1991, the Department of Educational Accountability presented an analysis of testing data that showed the extent to which information about Districtwide achievement was enhanced when results were disaggregated.[1] In order to expand the scope and depth of the previous analysis, a special data file was created that contained 1989-92 CAT data and an additional three years of test data from the archival CTBS files encompassing 1986 to 1988. In addition, this data file also contained information on retention, Chapter I participation, student absenteeism and free lunch status which was extracted from the student database.

This data file enabled the department to relate current and historical test data to different student characteristics from different age cohorts from 1986 to 1992. The term "age cohort" is used to refer to a group of students who entered kindergarten in the same year. For example, the 1986 age cohort included all students who entered kindergarten in 1985 and were still enrolled in the system during the spring of 1992. Students in Grades K through 6th were included in a cohort if the following criteria were met:

1. coded as a kindergarten student on the student database in the spring of 1986, 1987, 1988, 1989, 1990, 1991 or 1992; and

2. had a grade level indicator each year on the data file from the year that they were coded as a kindergarten student to the 1991-92 school year.

Approximately 32,000 or 76% of the 42,362 students tested in Grades K-6 met the cohort selection criteria.

---

[1] "Summary Report of the California Achievement Test Results: 1989-91", 1991, Department of Educational Accountability, New Orleans Public Schools - Internal Report

Retention and Chapter I participation are highly interrelated. In order to study the effects of retention and/or Chapter I participation on achievement, the age cohorts were further subdivided into risk groups based upon the following operational definitions:

1. **High Risk:** Those students in each age cohort who had either been retained or had received Chapter I services for at least one full school year as indicated by the codes on the data file.[2,3]

2. **Low Risk:** Those students in each age cohort who had not been retained and had not received Chapter 1 services as indicated by the codes on the data file.

Of the K-6 students included in the analysis, 48% were categorized as Low Risk and 52% were categorized as High Risk. Many of the students excluded from selection probably were in the system continuously since kindergarten. However, information on the data file indicated that their scores were not available every year from kindergarten through the 1992 testing period. Finally, it should be noted that the factors used to define these risk categories were not intended to preclude the use of other factors in defining risk but were intended to empirically determine the extent to which retention or Chapter I participation impact achievement in the District.

---

2 Chapter I refers to Chapter I of the 1981 Education Consolidation and Improvement Act. This funding source provided supplemental instruction and support services to children in our economically depressed areas in kindergarten through 5th in 1991-92. Funds are also available to support preschool programs in the District.

3 Students were categorized as retained if their grade level was the same for two consecutive years. Codes which indicated Chapter I participation were obtained from schools.

Table 4 presents general demographic characteristics for students in the two risk groups. It will be noted that the percentage of black students increases from 82% in the Low Risk group to 96% in the High Risk group. This is to be contrasted with the other race/ethnic groups that have a higher percentage representation in the Low Risk group. Finally, the majority of the Low Risk students are female while the majority of the High Risk students are male.

TABLE 4

GENERAL DEMOGRAPHIC CHARACTERISTICS OF STUDENTS IN RISK CATEGORIES

RISK CATEGORY	N	SEX		RACE/ETHNICITY				
		M	F	BLACK	WHITE	ASIAN	HISPANIC	OTHER
Low Risk	15378	45%	55%	82%	13%	4%	1%	*
High Risk	16551	54%	46%	96%	2%	1%	*	*

* = Less than 1%

Tables 5 and 6 present the grade level, median national percentiles in reading and mathematics for the two risk groups respectively. These results clearly show that the average performance in reading for students in the Low Risk group equaled or exceeded the national norm at all grade levels. However, the average grade level performance for students in the High Risk group was considerably below that of the national norm and approximately 29 percentile points below that of the Low Risk group. In mathematics, similar patterns were observed at each grade level between these groups. The average performance of the Low Risk group exceeded the national norm at each grade level tested, while that of the High Risk group was below that of the national norm and approximately 33 percentile points below that of the Low Risk group. These results complement those that were reported by this department in 1991. Appendix C presents the percentage distribution of High and Low Risk students by school. Appendices D and E present profiles of school by risk category for reading and mathematics, respectively.

TABLE 5

COMPARISON OF 1992 MEDIAN NATIONAL PERCENTILES

IN MATHEMATICS BY RISK CATEGORY

GRADE	ALL STUDENTS IN RISK CATEGORIES			
	LOW RISK		*HIGH RISK*	
	N	MEDIAN PERCENTILE*	N	MEDIAN PERCENTILE*
1	3026	59	3128	27
2	2196	58	2903	21
3	1644	64	2945	26
4	1554	59	2566	26
5	1264	63	2042	30
6	1207	62	815	36

*Percentiles based upon students with scores

Although Tables 5 and 6 are informative in depicting the magnitude of the differences between these two groups, the data are restricted to a presentation of composite results that mask actual performance on the individual subtests in each content area of the CAT. The first and fifth grades were chosen to highlight the differences between Low Risk and High Risk students on the skills measured by these subtests. Consequently, this analysis compares the percent of students who mastered the objectives for each skill measured by the reading content areas of Vocabulary and Comprehension in comparison to the norm group and provides instructional leaders more detailed feedback as to the performance of students. The skills measured in these areas are as follows:

GRADE	READING CONTENT AREA	SKILLS
1st	Vocabulary	Categories/Words Definitions/Words Synonyms Words in Context
	Comprehension	Sentence Meaning Passage Details Stated Main Idea Character Analysis Interpreting Events
5th	Vocabulary	Synonyms Antonyms Homonyms Affixes Words in Context
	Comprehension	Passage Details Character Analysis Central Thought Interpreting Events Forms of Writing Writing Techniques

Figures 1 and 2 present the results from first grade students in the Low and High Risk groups as well as results from the national norming sample. Figures 3 and 4 present the same information for the 5th grade. The percent of Low Risk first grade students mastering objectives in each category of skills measured by Vocabulary and Comprehension exceeded that of the norming sample in all but one skill area. However, the percent of High Risk students mastering objectives in each set of skills was considerably and consistently lower than that of either the Low Risk or norm group. A similar pattern of performance was observed for 5th graders in Figures 3 and 4. For a complete listing of performance on these skills at each grade level, see Appendix F.

B. Student Absenteeism

Student absenteeism has traditionally been a concern because of its adverse impact on instruction and achievement. A descriptive analysis was conducted to examine the relationship between this variable and achievement. Table 7 presents the average or mean number of days absent during the school year by those students scoring below the 50th and at or above the 50th percentile.[4] On the average, students scoring at or above the 50th percentile were absent less frequently than those scoring below the 50th at every grade level. The average number of days absent by students scoring below the 50th percentile ranged from 11 to 14 days while the range for students scoring at or above the 50th was 7 to 11 days. It is again interesting to note that the highest mean number of days absent for both groups occurred at the kindergarten level.

TABLE 7

COMPARISON OF AVERAGE NUMBER OF DAYS ABSENT BY STUDENTS SCORING BELOW AND AT OR ABOVE 50TH PERCENTILE IN READING

GRADE	AVERAGE NUMBER OF DAYS ABSENT FOR STUDENTS SCORING BELOW 50TH PERCENTILE	AVERAGE NUMBER OF DAYS ABSENT FOR STUDENTS SCORING AT OR ABOVE 50TH PERCENTILE
K	14 (N=2422)	11 (N=2384)
1	13 (N=2767)	8 (N=2540)
2	11 (N=2940)	7 (N=1468)
3	11 (N=2707)	7 (N=1330)
4	11 (N=2644)	7 (N=1047)
5	11 (N=2112)	7 (N=844)
6	11 (N=1050)	7 (N=813)

[4] These results are based upon records from students who were enrolled at the tested school for 177 days during 1991-92. Consequently, this criterion excluded students from Moton and Lockett who were enrolled for 220 days because of the year-round school program.

The relationship between risk category and absenteeism was also examined. Table 8 presents a comparison of the average number of days absent by students in each risk group by grade level. Students in the Low Risk group were absent on the average less frequently than High Risk students. The average number of days absent ranged from 8 to 11 for the Low Risk students and 11 to 16 for the High Risk students. These results clearly demonstrate the extent and consistency that absenteeism is associated with poor achievement at each grade level.

TABLE 8

COMPARISON OF AVERAGE NUMBER OF DAYS ABSENT
BY GRADE AND RISK CATEGORY

GRADE	LOW RISK	HIGH RISK
K	**11** (N=3415)	**16** (N=1437)
1	**9** (N=2740)	**13** (N=2619)
2	**8** (N=2034)	**12** (N=2434)
3	**8** (N=1541)	**11** (N=2531)
4	**8** (N=1470)	**11** (N=2258)
5	**8** (N=1194)	**11** (N=1769)
6	**8** (N=1142)	**12** (N=721)

Table 9 shows the distribution of the total number of days absent by students in each risk category. A larger percentage of Low Risk students was absent for 5 days or less as compared to the High Risk students. Excessive absenteeism, i. e., 18 or more days, was present in both groups. However, the High Risk group exhibited excessive absenteeism almost twice as much as the Low Risk group. It should be noted that 18 days of absenteeism during a 177 day school year is equivalent to 90% attendance. A breakdown of average number of days absent for each school by each risk group is presented in Appendices D and E.

TABLE 9

PERCENT DISTRIBUTION OF STUDENTS BY NUMBER OF DAYS ABSENT

	N	0 - 5	6 - 11	12 - 17	18 +
Low Risk	13536	46%	25%	17%	12%
High Risk	13769	35%	25%	20%	21%

NOTE: District considers 18 or more days absent as excessive absenteeism

C. Free Lunch

It is popularly believed that low socioeconomic status (SES) is associated with poor achievement. This is especially significant for this District since the vast majority of the students are eligible to receive free lunch, a major SES variable.[5] However, this variable, like others analyzed in this report, has not been systematically studied with respect to its specific relationship to achievement test scores in the District. To gain a better understanding of this relationship, 1992 CAT results were analyzed from students for whom free lunch indicators were available on the department's data file. Approximately 28,000 or 94% of the approximately 38,000 elementary students receiving free lunch in 1991-92 were identified in all cohorts from Grades K-6. In order to study one aspect of this relationship systematically, students with free lunch codes were divided into Low Risk and High Risk groups.

[5] Free lunch is used here to refer to those students eligible for free or reduced lunch.

Tables 10 and 11 present CAT reading and mathematics results for those free lunch students who met the defined risk criteria. With the exceptions of Grades K and 6, the vast majority of free lunch students were classified as High Risk. Consistent with previous analyses, the Low Risk group performed consistently better than High Risk group at every grade level analyzed. Although the average performance of the Low Risk students was somewhat poorer in reading than the average performance all of the Low Risk students studied in this report (See Table 5), it was still better than the average performance of aggregated results for all students Districtwide (See Table 1). Only Grades 1, 3 and 6 had median percentiles greater than the national norm. However, the performance in mathematics was quite different. The average performance of Low Risk students was above the national norm at every grade level tested and considerably higher than their counterparts in the High Risk group.

TABLE 10

IV. LONGITUDINAL ANALYSIS OF ACHIEVEMENT ON CAT AND CTBS

The results presented thus far depict the extent to which retention and/or Chapter I participation had an impact on achievement in 1992. However, these results give only a "snapshot" of the 1992 performance on CAT and do not show the historical relationship of these factors to achievement. A longitudinal assessment was conducted to ascertain the long-term impact of retention and Chapter I participation on norm-referenced, test results, i.e., CTBS and CAT. It is important to emphasize that direct comparisons of performance on these two tests are not valid since they are different tests with different national norms. The results from the two tests are presented to compare only the relative performance of students on each standardized test.

One of the first objectives of this analysis was to assess the historical achievement profile of Low Risk students, i.e., those students who had never been retained and had never participated in Chapter I. Figures 5 and 6 present the historical reading and mathematics achievement profiles respectively for 1986 age cohort students who met these criteria. Basically, the majority of these students have performed above the level of the national norm on both norm-referenced tests in reading and mathematics since kindergarten to the present. They have maintained a level of performance that has been consistently above the 50th percentile although annual fluctuations have occurred.

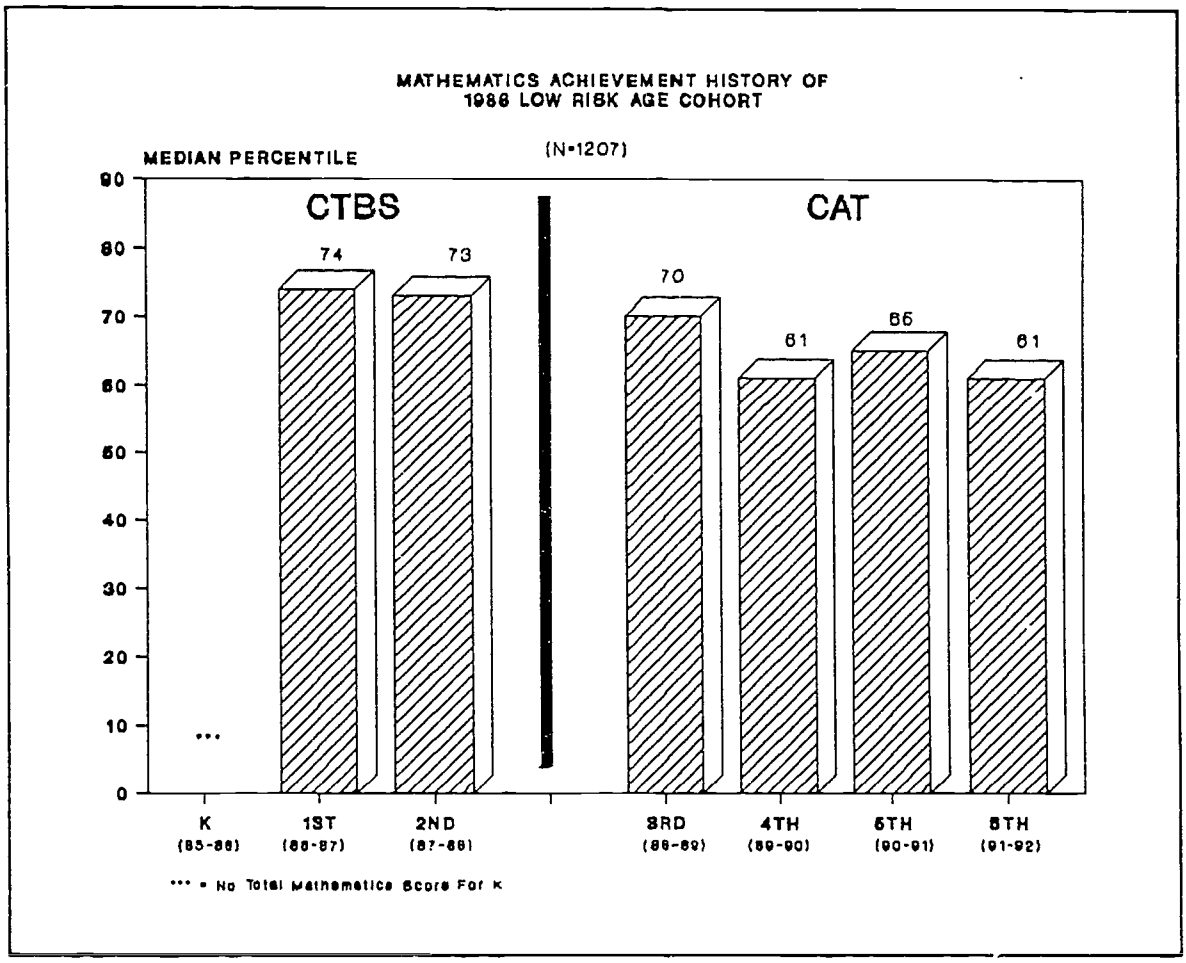

FIGURE 6

A. Long-Term Impact of Retention

First grade has historically had one of the highest rates of retention in this District. This practice is generally reinforced by the belief that if students are to be retained, it is better to retain them at early grade levels rather than at higher grade levels (Tomchin, E. M. and Impara, T. C., 1992). Retention is generally viewed as "beneficial" and results in students "catching up" at some point later in time (Mantzicopoulas, P. et. al., 1989; Smith, M. L. and Shepard, L.A. 1988). However, the effects of this practice have not been systematically studied in this District with respect to its subsequent impact on achievement.

Figure 7 presents a comparison between achievement of High Risk students who were only retained in first grade and those who had been retained in first as well as at other grade levels. With the exception of 1988, when an apparent "improvement" was observed on the CTBS for both groups, performance of students who had been retained once continued to deteriorate annually on CAT from 1989 to 1992, i.e., the percentage of students scoring at or above the 25th percentile continued to decrease. By 1992, these students were performing as poorly as those students who had been retained more than once.

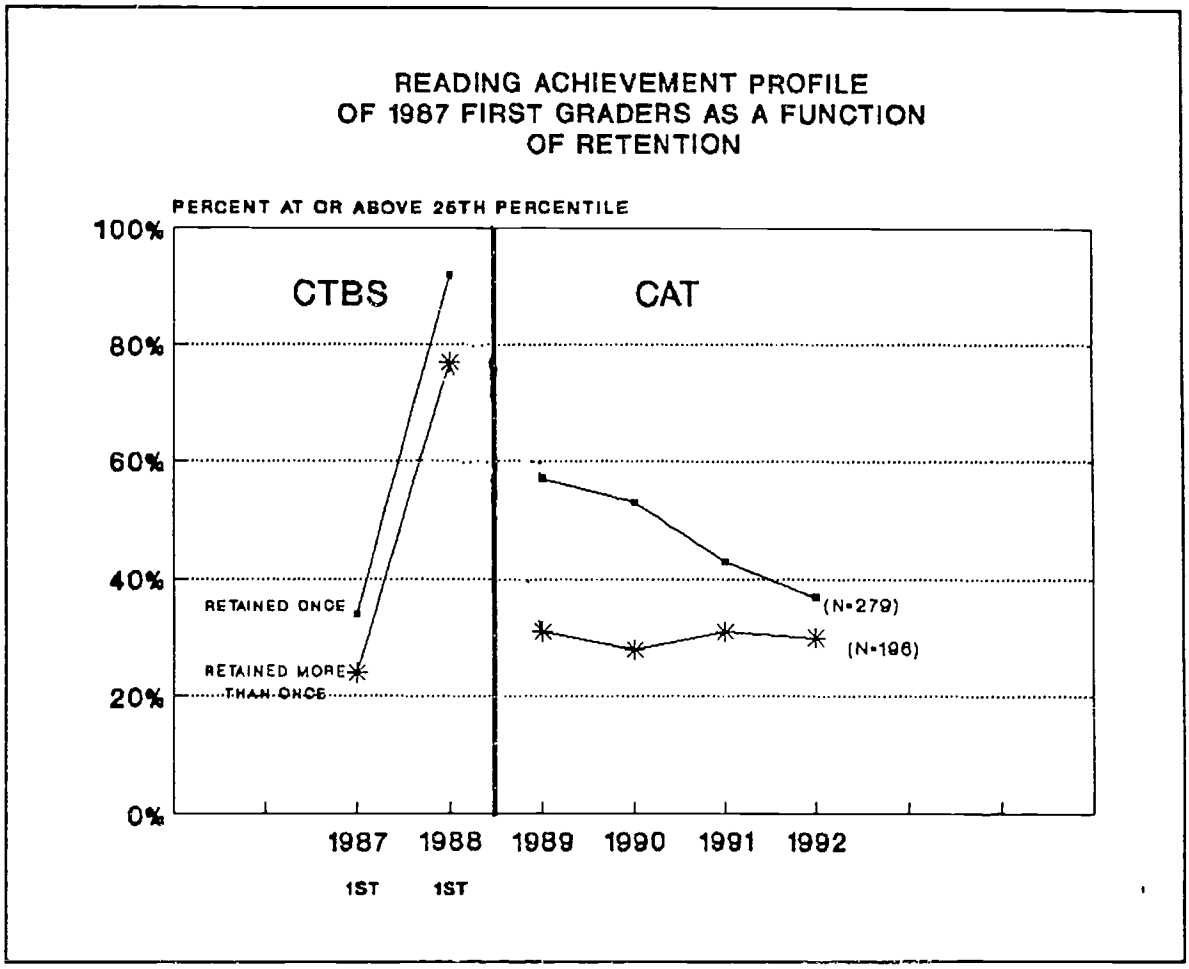

FIGURE 7

Table 12 presents the 1991-92 status of students from different cohorts who were retained as first graders. These results show that these students tended to be retained again the longer that they were in the system with concomitant deterioration observed in achievement. In addition, a substantial number of these students also subsequently received Chapter I services after first grade.[6]

TABLE 12

1991-92 STATUS OF STUDENTS RETAINED AS FIRST GRADERS

		PERCENT RETAINED AFTER FIRST GRADE	PERCENT SERVICED BY CHAPTER I AFTER FIRST GRADE	PERCENT BELOW 25TH PERCENTILE IN READING	PERCENT AT OR ABOVE 50TH PERCENTILE IN READING
545	1986-87	41%	80%	66%	6%
688	1987-88	32%	74%	60%	9%
621	1988-89	24%	74%	60%	12%
656	1989-90	13%	65%	58%	11%
747	1990-91	3%	63%	39%	37%

[6] Students were chosen based upon whether they had been retained in first grade regardless of Chapter I status. Therefore, many of these students probably were also in Chapter I as first graders.

One interesting pattern observed in Figure 7 was the apparent improvement in the performance of the retained students, i.e., decrease in the percentage of students scoring below the 25th percentile from 1987 to 1988. These retained students were tested with the same level of the CTBS in 1987 and 1988. One possible explanation is that this was a test-retest or practice effect of retained students who took the same level of the test while they were still first graders. Another is that these students were more mature than they were a year earlier. To further investigate this effect, longitudinal achievement results from 1989 retained students in Grades K through 3 were analyzed. Figure 8 presents a profile from 1989 to 1992 of students who were retained in Grades K, 1, 2, and 3 respectively in 1989. As can be observed, the median reading percentile of these students increased when the same level of CAT was administered the following year to these retained students. However, the performance declined with subsequent administrations of CAT at different grade levels. This "retention effect" is supported by similar findings in the literature with respect to its significance on pre-post gains in compensatory programs, i.e., Chapter I (Elligett and Tocco, 1983; Slavin and Madden, 1991). It is also interesting to note that while the average performance of these students was higher in 1992 than in 1989, it was still below the District's average at each of the respective grade levels in 1992.

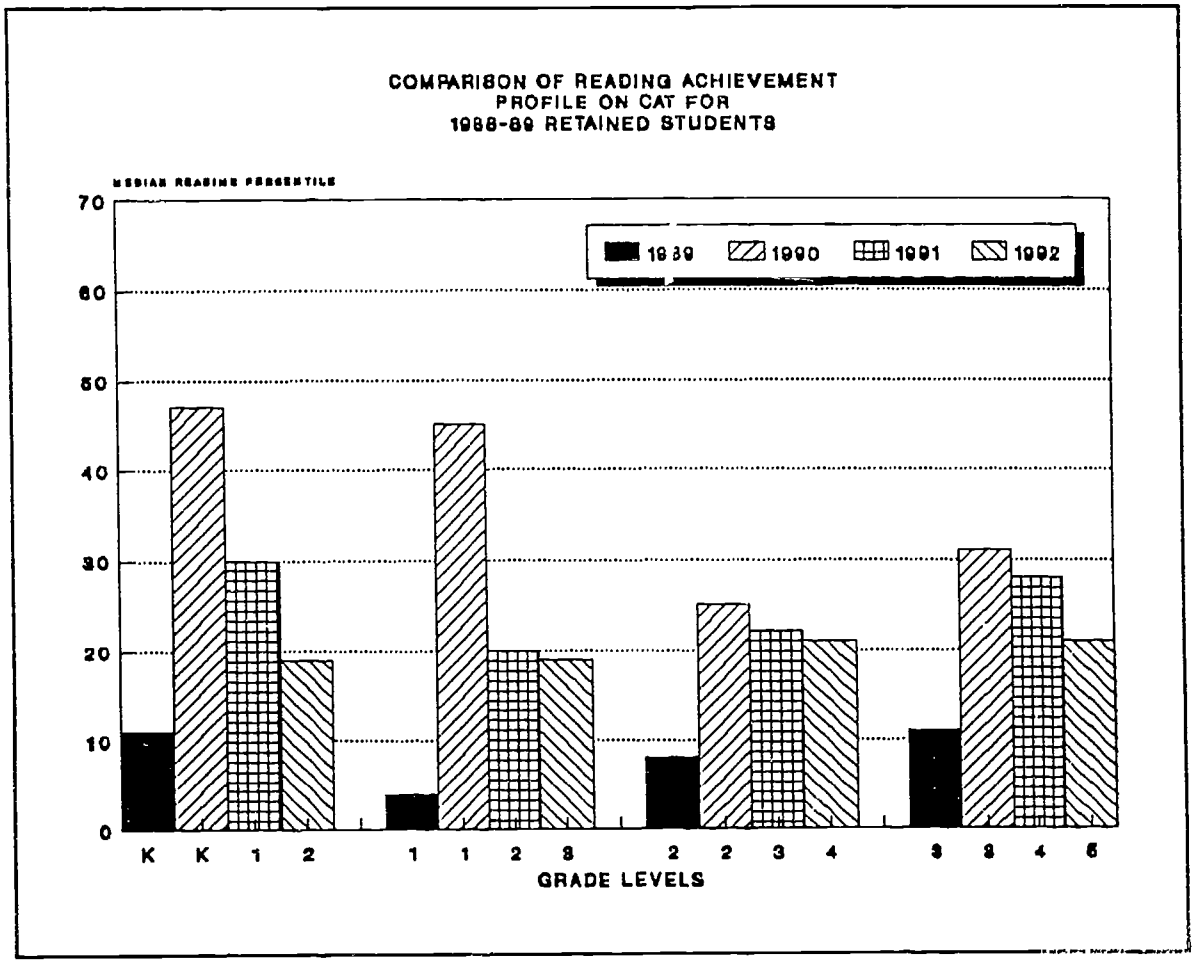

FIGURE 8

B. Long-Term Impact of Chapter I Participation

With the exception of evaluation reports submitted to the State Department of Education by this department, there has been little systematic study of the long-term impact on achievement as a function of receiving Chapter I services in the District.[7] The results reported here expand the scope and depth of what has previously been reported to the State Department of Education.

---

7 "Sustained Effects Evaluation Report: 1990-91 Chapter I", 1991, Department of Educational Accountability, New Orleans Public Schools - Report to State Department of Education

Figure 9 presents a comparison of reading achievement over three years for three different groups of first grade students from the 1989-90 school year. These groups differed from each other in terms of the number of consecutive years for which Chapter I services were received. Although fluctuations in the median national reading percentile occurred in some groups during the three year period, the performance of each group of students when they were third graders was lower than it was when they were first graders. Another interesting observation in Figure 9 is that although the performance observed in the group with only one year of Chapter I declined over three years, it was generally considerably higher than that of the other two groups. This result merits further investigation as to its significance since additional internal analyses of other first grade cohorts showed that these results are not atypical.

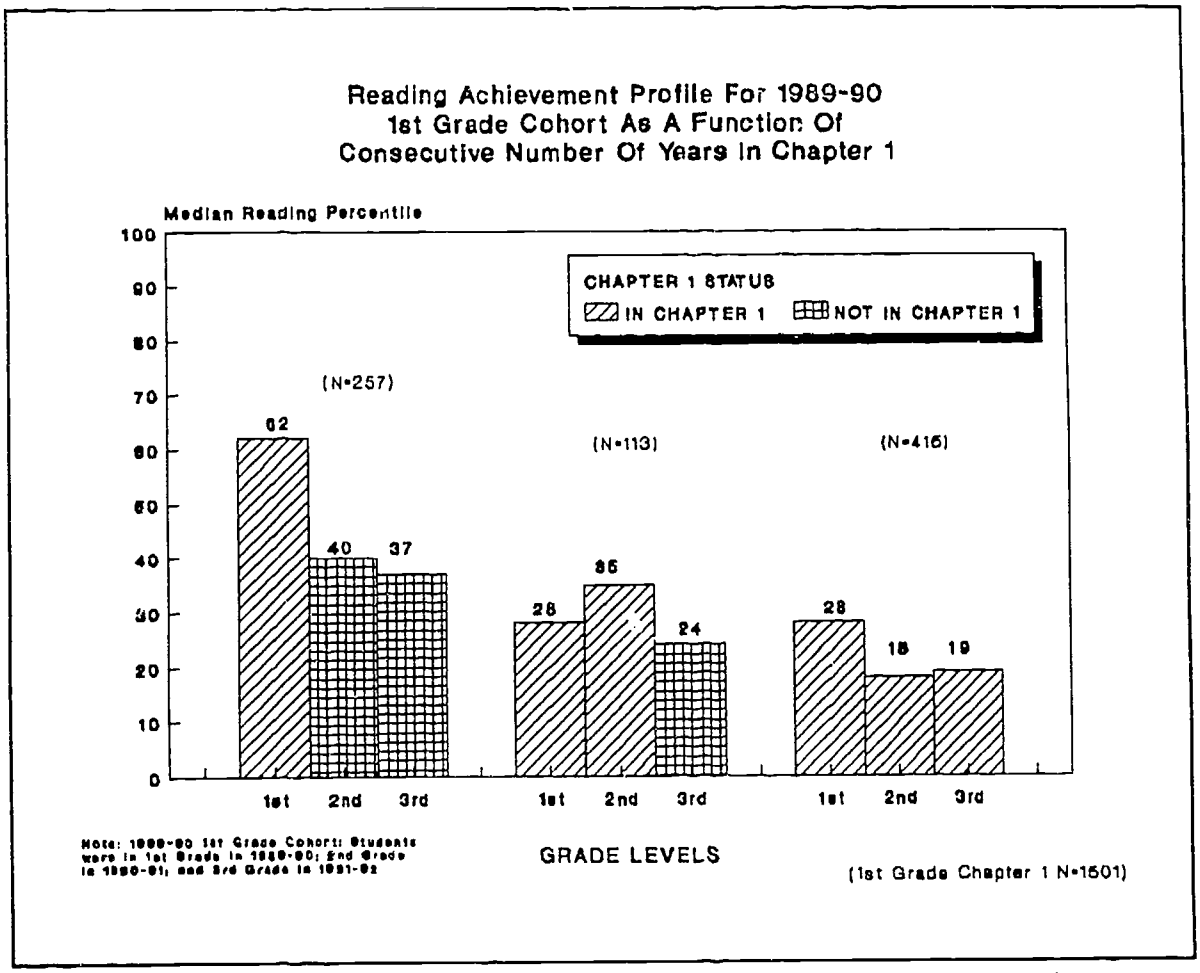

FIGURE 9

Table 13 presents the 1991-92 status of students from different cohorts who participated in Chapter I as first graders. These results show that the vast majority of these students received additional Chapter I services after first grade. These results also indicate that the longer these students remain in the system, the worst the achievement becomes while their chances of being retained increase.[8]

TABLE 13

1782	1990-91	62%	11%	50%	20%

[8] Students were chosen based upon whether they had received Chapter I services in first grade regardless of their retention status. Therefore, many of these students were probably also retained as first graders.

V. LONG-TERM IMPACT OF PRE-KINDERGARTEN EXPERIENCES

Much attention has been given to the importance of pre-K experiences. However, there has been little systematic effort to date to study long-term impact of pre-kindergarten experiences in this District. During the 1987-88 school session, coding procedures were developed which enabled the District to track former pre-K students in the system. The students tracked were primarily those who had former pre-K experiences in local, state or federally funded programs. Although, these students have performed quite well on measures used to assess the effectiveness of the pre-K experiences at the end of the school year in which they were in pre-K, little information exists Districtwide about their subsequent achievement performance as they move through the regular school program.[9,10] Recently, the State Department of Education reported positive effects of pre-K experiences with respect to preparation for the regular school program. This conclusion was based upon teacher observations of performance in the major early childhood developmental areas from a statewide sample of former pre-K students, i.e., cognitive development, degree of independence, social development, receptive communication, expressive communication, fine motor development, and gross motor development. These students participated in the State's program for high-risk four year olds in which this District participates annually.[11] The analysis presented here is different and more focused using the performance on the CAT, retention and Chapter I participation as the major indicators. In keeping with the established paradigm, data were analyzed from cohorts who were former pre-K students. These students were in Grades K-4 during the 1991-92 school session. Table 14 presents the grade distribution of these students and their general profile with respect to retention, Chapter I

11 "1990-92 State Funded Program for High-Risk Four-Year-Olds Evaluation Report", 1991, Bureau of Evaluation, Office of Research and Evaluation, Louisiana State Department of Education

participation and achievement. As can be observed, the percent of students receiving Chapter I services increased with their length of time in the system. Similarly, the percent of students retained also increased. This profile also shows that the longer they were in system, the worst they performed on CAT as a group. These results were also associated with an increase in the percent of these students who were classified as High Risk.

In order to examine these students further, their achievement results were analyzed as a function of risk group identification. Tables 15 and 16 present the general achievement profile in reading and mathematics with respect to their risk group identification. With the exception of kindergarten, there are considerably more students in the High Risk group than in the Low Risk at each grade level. The average performance of students in the Low Risk group exceeded the national norm with the exceptions of Grades 2 and 4 in reading. In mathematics, the average performance of the Low Risk groups exceeded the national norm at all grade levels. The average grade level performance of students in the High Risk group was below that of the national norm at all grade levels in both reading and mathematics and approximately 25 percentile points below that of the Low Risk group in reading and 32 percentile points below in mathematics.

VI. CONCLUSIONS AND RECOMMENDATIONS

The findings in this report demonstrate the extent to which the achievement profile of this District is masked through the presentation of test data that are not disaggregated and associated with other student data variables. Unlike previous reports issued from this department, the results reported here have numerous policy and programmatic implications for the District. The results showed that there are students in the District, i.e., Low Risk, whose average performance on standardized tests was well above the national norm in 1992. In fact, the average performance of these students has consistently been above the national norm since their entrance into the system. However, the average performance of the majority of students, i.e., High Risk, was below that of the national norm and has been consistently so. Their performance on this measure tended to deteriorate the longer they were in the system.

Student absenteeism is of special concern because of its negative impact on achievement. Excessive absenteeism was observed for each risk group at every grade level. Any strategy developed must involve not just the District or school site but parents, city government and the community at large working in concert to increase student attendance and achievement.

The results seriously question the efficacy of the current practice of retention, especially for first graders. Such a practice is controversial in the literature, with much of the evidence questioning the effectiveness of retention on achievement of students (Holmes, 1989; Reynolds, 1992; Shepard and Smith, 1989). Our results show that students retained in the first grade were also likely to be retained a second time with the likelihood of retention increasing the longer they were in the system. Associated with this, of course, was the continued deterioration of performance on the CAT. These results highlight the need for a closer examination of existing programs that are designed to assist retained students during their second year at the same grade level. Unless schools and/or District have clearly defined and effective programs to assist such youngsters, these students will continue to be exposed to the same conditions that precipitated their retention. The results also force one to ask whether this District should explore alternatives to retention, at least at the early grade levels. This is especially important to consider if all

schools are not implementing specific programs to assist students to "benefit" from retention. If the practice of retention is to be continued, then it behooves the District and/or schools to carefully offer and monitor special services to students who have been retained at the early grade levels since it has been demonstrated that they may be prime contenders for dropping out school (Grissom and Shepard, 1989). Finally, one must also question the costs associated with retention since it costs twice as much to educate retained as compared to non-retained students (Reynolds, 1992).

Just as these results question to the long-term effectiveness of retention, they also question long-term effectiveness of participation in Chapter I. The major purpose of Chapter I is to "...enable low-achieving students to catch up and keep up...by helping [them] succeed in the regular school program, retain grade-level proficiency, and improve achievement in both the basic and the more advanced skills that all students are expected to master..."(Le Tendre, 1991). Although Chapter I has been successful in demonstrating small gains over time, it has yet to show effectiveness in closing the gap between Chapter I students and their peers (Heid, 1991). The Districtwide results submitted by this department to the State Department of Education on sustained effects of Chapter I experiences raise questions as to the long-term impact on achievement resulting from Chapter I participation. The results presented here also support the sustained effects results from a different perspective. The performance of the High Risk students who received Chapter I services in the first grade deteriorated over time with progressively more students scoring below the 25th percentile each year they were in the system while fewer scored at or above the 50th percentile.

Individual schools may have experienced success by assessing their programs with other outcome measures or using other standards of performance in addition to those mandated measures. Such practices are encouraged and should be continued. However, at the present time, it must be emphasized that the success of Chapter I is still judged by norm-referenced, test results. The results presented here question the extent that this success has occurred, leading one to also question the effectiveness of existing programs or the reasonableness of the current national Chapter I goals and the measurement techniques currently required to assess the

accomplishment of these goals. The results presented here suggest that one major alternative goal for Chapter I, as well as the District as a whole, would be to reduce the percentage of students who are retained annually. Decreases in retention should be associated with a decrease in the number of students in need of Chapter I services as well as an increase in achievement. Of course, safeguards would have to be built into guard against "social promotion". In addition, schools could also focus on decreasing student absenteeism since results presented showed that high absenteeism was associated with low achievement on the average.

It is strongly recommended that the District expand the scope of the current evaluation requirements of Chapter I beyond the minimum State requirements and to provide those resources needed to intensively assess the adequate implementation and quality of various components of Chapter I, especially the delivery of instruction and how it is implemented in the regular classroom. To accomplish this, a strong process evaluation module should be included in any future Chapter I design. Districtwide tracking of these students is essential to fully appreciate Chapter I's long-term impact. In order to accomplish this accurate coding of Chapter I students is essential. Finally, it must be cautioned that the current model used to assess grade level effects of Chapter I, i.e., pre- post gain scores, is limited and is also sensitive to "contamination" that can possibly result in spurious gains made by students who have been retained and whose pre and post test scores come from the same level of the assessment test. This has special significance for Chapter I schools involved in program improvement.

Although relating test results descriptively to the variables or student characteristics presented in this report goes far in providing a better understanding of achievement in this District, the results are still limited. It is still not clear what the relationship is among these variables and the instructional process. The full effects of Chapter I participation, retention, student absenteeism or an SES variable such as free lunch cannot be truly understood until the relationship between achievement and instructional variables is understood. The results of performance on mastery of those skills measured by CAT for High and Low Risk students suggest that systematic differences may exist at the classroom level. Clearly, one has to ask why are the High and Low Risks groups so different for each cohort analyzed at every grade level.

Are students in the High Risk groups provided with the same coverage of grade level skills and concepts as the Low Risk students? Are all students exposed equally to the same curriculum content with the same emphasis and time on task to master these skills? Are adequate instructional delivery procedures implemented for all?

It is necessary that we begin to examine the relationship between student performance outcomes and the questions raised above. An examination of instructional variables (content coverage, content exposure, content emphasis, and quality of instructional delivery) must be conducted to explore what has been referred to in the literature as the "opportunity-to-learn" (Stevens, 1991). Assessing "opportunity-to-learn" remains a valid consideration for all measures of student performance using norm-referenced tests, criterion-referenced tests, or even alternative assessment techniques. Only with a clear understanding of the relationship between "opportunity to learn" and performance outcomes can strengths and weaknesses at the instructional level be identified. This information, in turn, is what must be acted upon to improve any outcome which measures student performance.

Analysis of data from students receiving free lunch questions the belief that low SES status is associated with poor achievement. Achievement and free lunch status have to be also assessed with respect to risk status as defined in this report. Disaggregation of the test results of these students forces one to ask why are some free lunch students who are Low Risk at or near the national norm while other free lunch students in the High Risk group performing far below. Again, to gain a better understanding of these difference, analysis of instructional variables, whether quantitative or qualitative will have to be conducted at the classroom level. Similar achievement profiles, not yet released by this department, have also been obtained from preliminary analysis of test data from AFDC students. [12]

[12] AFDC - Aid to Families with Dependent Children

The pre-K results presented show that these children fall into the same pattern of achievement as the District overall. Why there should be differences between the two pre-K, risk groups is not clear at this time considering the nature and purpose of their previous pre-K experiences and is a question that merits further investigation. However, before any conclusions can be drawn as to the efficacy of pre-K with respect to its long-term effects, any programs designed to sustain the effects of pre-K must be carefully examined and refined by schools and/or District. "Chapter I pre-K education is designed for prevention and not remediation. The goal is to provide services before children fall so far behind that it is difficult for them to catch up" (LeTendre, 1991, p. 329). The effects of pre-K alone don't seem to "inoculate" against or prevent future academic problems. Maintenance mechanisms must be provided by the District (Hebbeler, 1985). It is recommended that the District institutionalize sustaining or reinforcing practices, programs, etc. at all schools where these youngsters attend from the time they enter kindergarten. Otherwise, we risk wasting an investment of time, money and human resources. It is strongly advised that resources be made available to conduct quantitative as well as qualitative assessments to measure the long-term effects of pre-K experiences. In order to accomplish this assessment, specific standards of performance or expectations must be developed for students as they move through the system.

Finally, one last concern involves the present status of the student database system in the District. The procedures used to produce this report are not the ideal way to track students but are the most feasible given the available resources and time constraints. Ideally, a mainframe, student database, management information system should be developed which contains current and archival student information that is linked to other files or other databases in the system, such as the personnel, budget, current and archival testing files, etc. At the present time, this system does not exist except for a subset of the archival student data and testing data files managed by Educational Accountability and the data management and statistical software it uses to access and analyze information from them. It is strongly recommended that the District develop such a student database management information system that is driven by state-of-the-art database software if it wishes to track students longitudinally for evaluation or general reporting purposes. Such a system would facilitate the information and management needs of schools as

well as large programs such as the District's and State's testing programs, free lunch programs, and Chapter I. In addition, it is strongly recommended that the District develop a process to insure accuracy of student information collected. In the meantime, specific data files should be created by the system which would permit data in other files to be linked to each other in order to address major questions on student academic performance.

The results reported here raise many more questions then they answer. School site personnel are encouraged to use the paradigms developed here as a starting point for program design and evaluation. Without viable quantitative and/or qualitative evaluation procedures we will have to rely upon anecdotal evidence of success or failure. It is also very important to emphasize that the separation of students into different risk groups does not suggest that there are different expectations for these students, nor does it preclude the use of other factors that are also important in identifying at-risk students. It is expected that these terms, or the manner in which they are defined, will add to the arsenal of predictors of school success and identify students for whom special programs are needed. These results should highlight the need for this District to move away from its "obsession" with test scores to a determination to focus more on those precursor conditions which annually result in the majority of our students performing poorly on standardized tests. Finally, it is expected that these results will assist the District and schools in developing strategic plans that will guide the direction of change for this District. Such plans should have reasonable expectations, standards of performance and measurable outcomes for student performance and procedures to periodically assess effectiveness of strategies. Without such direction that has true "buy-in" by <u>all</u> major stakeholders, we can expect to see the same patterns repeat themselves in the future, starting with the first graders who were either retained or participated in Chapter I during the last school session of 1991-92.

APPENDIX F

PERCENT OF STUDENTS MASTERING CAT OBJECTIVES

IN THE READING CONTENT AREA

TABLE F-0

PERCENT OF KINDERGARTEN STUDENTS MASTERING CAT OBJECTIVES
IN THE READING CONTENT AREA

TESTED SUBJECT	CATEGORY OBJECTIVES	NORM GROUP	LOW RISK GROUP	HIGH RISK GROUP
Vocabulary	Categories/Pictures	69	77	68
	Definitions/Pictures	91	89	78
	Words in Context/Pictures	91	87	77
Comprehension	Sentence Meaning/Oral	96	96	93
	Passage Details/Oral	52	65	55
	Passage Analysis/Oral	61	67	57

TABLE F-1

PERCENT OF FIRST GRADE STUDENTS MASTERING CAT OBJECTIVES
IN THE READING CONTENT AREA

TESTED SUBJECT	CATEGORY OBJECTIVES	NORM GROUP	LOW RISK GROUP	HIGH RISK GROUP
Vocabulary	Categories/Words	75	71	44
	Definitions/Words	64	73	42
	Synonyms	32	45	22
	Words In Context	86	89	65
Comprehension	Sentence Meaning	90	91	70
	Passage Details	34	47	24
	Stated Main Idea	37	55	32
	Character Analysis	35	52	31
	Interpreting Events	36	48	26

TABLE F-2

PERCENT OF SECOND GRADE TUDENTS MASTERING CAT OBJECTIVES
IN THE READING CONTENT AREA

TESTED SUBJECT	CATEGORY OBJECTIVES	NORM GROUP	LOW RISK GROUP	HIGH RISK GROUP
Vocabulary	Synonyms	49	54	22
	Antonyms	39	52	24
	Words in Context	58	73	43
Comprehension	Passage Details	61	68	31
	Character Analysis	70	70	34
	Central Thought	60	58	27
	Interpreting Events	64	59	26

TABLE F-3

PERCENT OF THIRD GRADE STUDENTS MASTERING CAT OBJECTIVES
IN THE READING CONTENT AREA

TESTED SUBJECT	CATEGORY OBJECTIVES	NORM GROUP	LOW RISK GROUP	HIGH RISK GROUP
Vocabulary	Synonyms	61	74	36
	Antonyms	68	80	44
	Homonyms	34	52	28
	Words in Context	86	90	64
Comprehension	Passage Details	71	81	46
	Character Analysis	56	65	35
	Central Thought	61	69	32
	Interpreting Events	62	73	36
	Forms of Writing	78	93	66

TABLE F-4

PERCENT OF FOURTH GRADE STUDENTS MASTERING CAT OBJECTIVES
IN THE READING CONTENT AREA

TESTED SUBJECT	CATEGORY OBJECTIVES	NORM GROUP	LOW RISK GROUP	HIGH RISK GROUP
Vocabulary	Synonyms	68	73	31
	Antonyms	54	56	19
	Homonyms	48	47	17
	Affixes	53	55	19
	Words in Context	44	44	12
Comprehension	Passage Details	63	73	30
	Character Analysis	52	58	17
	Central Thought	42	43	11
	Interpreting Events	45	46	12
	Forms of Writing	54	63	20
	Writing Techniques	35	35	12

TABLE F-5

PERCENT OF FIFTH GRADE STUDENTS MASTERING CAT OBJECTIVES
IN THE READING CONTENT AREA

TESTED SUBJECT	CATEGORY OBJECTIVES	NORM GROUP	LOW RISK GROUP	HIGH RISK GROUP
Vocabulary	Synonyms	63	77	40
	Antonyms	56	60	25
	Homonyms	57	60	26
	Affixes	39	48	23
	Words in Context	62	50	15
Comprehension	Passage Details	69	79	44
	Character Analysis	67	69	38
	Central Thought	57	62	27
	Interpreting Events	56	61	23
	Forms of Writing	51	62	22
	Writing Techniques	48	42	12

TABLE F-6

PERCENT OF SIXTH GRADE STUDENTS MASTERING CAT OBJECTIVES
IN THE READING CONTENT AREA

TESTED SUBJECT	CATEGORY OBJECTIVES	NORM GROUP	LOW RISK GROUP	HIGH RISK GROUP
Vocabulary	Synonyms	53	55	16
	Antonyms	26	27	7
	Homonyms	45	43	12
	Affixes	48	50	14
	Words in Context	53	54	13
Comprehension	Passage Details	42	47	12
	Character Analysis	55	55	14
	Central Thought	23	36	7
	Interpreting Events	43	54	14
	Forms of Writing	52	63	19
	Writing Techniques	37	36	8
