ABSTRACT
        This edition is the 23rd report in a series begun in
1964. It includes projections for enrollment, graduates, classroom
teachers, and expenditures to the year 2004. Projections reflect the
1990 Census, with the incorporation of 1992 estimates and assumptions
for fertility rate, net immigration, and mortality rate. The report
also contains a section on methodology, describing models and
assumptions used to develop the national projections, which are based
on an age-specific enrollment rate model, exponential smoothing
models, and econometric models. Most of the projections include three
alternatives, based on different assumptions about growth paths.
Although the first alternative set of projections in each table is
deemed to represent the most likely projection, the low and high
alternatives provide a reasonable range of outcomes. Chart 1 provides
an overall summary of forecast assumptions. Total enrollment for
public and private elementary and secondary education and for higher
education is projected to increase to 55.7 million over the
projection period, with increases in the numbers of high school and
college graduates, the numbers of teachers, and total expenditures.
Data are presented in 62 graphs and 44 tables. Five technical
appendixes about methodology contain an additional 35 tables.

Foreword

This edition of *Projections of Education Statistics to 2004* is the 23rd report in a series begun in 1964. This report provides revisions of projections shown in *Projections of Education Statistics to 2003* and includes statistics on elementary and secondary schools and institutions of higher education at the national level. Included are projections for enrollment, graduates, classroom teachers, and expenditures to the year 2004.

The projections presented in this report reflect the 1990 census. The revised population projections developed by the Bureau of the Census reflect the incorporation of the 1992 estimates and latest assumptions for the fertility rate, net immigration, and mortality rate.

The report also contains a methodology section describing models and assumptions used to develop the national projections. The projections are based on an age-specific enrollment rate model, exponential smoothing models, and econometric models. The enrollment model uses population estimates and projections from the Bureau of the Census.

The exponential smoothing models are based on the mathematical projection of past data patterns into the future. The econometric models use projections of exogenous variables from DRI/McGraw-Hill, an economic forecasting service. Therefore, assumptions regarding the population and the economy are the key assumptions underlying the projections of education statistics.

Most of the projections include three alternatives, based on different assumptions about growth paths. Although the first alternative set of projections (middle alternative) in each table is deemed to represent the most likely projections, the low and high alternatives provide a reasonable range of outcomes.

In the forecast summary, key demographic and economic assumptions appear in chart 1 and selected education statistics are shown in figure 1. A summary of the projections is available in a pocket-sized folder, *Pocket Projections 2004*.

Roger A. Herriot, Associate Commissioner for
Statistical Standards and Methodology

Acknowledgments

Forecast Summary

Chart 1.—Summary of forecast assumptions

Variable	Middle alternative	Low alternative	High alternative
Demographic Assumptions			
Population	Projections are consistent with the Census Bureau middle series estimates, which assume a fertility rate of 2.15 births per woman by the year 2050, a net immigration of 880,000 per year, and a further reduction in the mortality rate.	Same as middle alternative	Same as middle alternative
18-24 year-old population	Average annual decline of 0.9% to 1997; average annual growth rate of 1.7% through 2004.	Same as middle alternative	Same as middle alternative
25-29 year-old population	Average annual decline of 1.2%	Same as middle alternative	Same as middle alternative
30-34 year-old population	Average annual decline of 1.2%	Same as middle alternative	Same as middle alternative
35-44 year-old population	Average annual growth rate of 0.7%	Same as middle alternative	Same as middle alternative
Public Elementary Enrollment	Average annual growth rate of 0.9%	Same as middle alternative	Same as middle alternative
Public Secondary Enrollment	Average annual growth rate of 1.8%	Same as middle alternative	Same as middle alternative
Undergraduate Enrollment	Average annual growth rate of 0.8%	Average annual growth rate of 0.4%	Average annual growth rate of 1.2%
Graduate Enrollment	Average annual growth rate of 0.2%	Average annual decline of 0.1%	Average annual growth rate of 0.7%
First-professional Enrollment	Average annual decline of 0.1%	Average annual decline of 0.4%	Average annual growth rate of 0.6%
Full-time-equivalent Enrollment	Average annual growth rate of 0.8%	Average annual growth rate of 0.4%	Average annual growth rate of 1.2%
Economic Assumptions			
Disposable Income per Capita in Constant Dollars	Annual percent changes range between 0.7% and 1.4% with an annual compound growth rate of 0.9%.	Annual percent changes range between -1.3% and 1.2% with an annual compound growth rate of 0.6%.	Annual percent changes range between 0.7% and 3.9% with an annual compound growth rate of 1.3%.
Education Revenue Receipts from State Sources per Capita in Constant Dollars	Annual percent changes range between 0.7% and 4.4% with an annual compound growth rate of 1.6%.	Annual percent changes range between 0.0% and 2.4% with an annual compound growth rate of 1.0%.	Annual percent changes range between 0.8% and 5.4% with an annual compound growth rate of 2.1%.
Inflation Rate	Inflation rate ranges between 2.9% and 4.0%.	Inflation rate ranges between 4.0% and 5.2%.	Inflation rate ranges between 2.5% and 3.7%.
Personal Taxes and Nontax Receipts to State and Local Governments per Capita in Constant Dollars	Annual percent changes range between 1.3% and 5.3% with an annual compound growth rate of 2.6%.	Annual percent changes range between 1.5% and 4.1% with an annual compound growth rate of 2.4%.	Annual percent changes range between 1.5% and 8.7% with an annual compound growth rate of 3.1%.
Indirect Business Taxes and Tax Accruals (Excluding Property Taxes) to State and Local Governments per Capita in Constant Dollars	Annual percent changes range between -0.1% and 3.0% with an annual compound growth rate of 0.8%.	Annual percent changes range between -1.2% and 2.7% with an annual compound growth rate of 0.5%.	Annual percent changes range between 0.0% and 3.9% with an annual compound growth rate of 1.2%.
Unemployment Rate (Ages 16 to 19)	Remains between 19.2% and 20.2%.	Same as middle alternative	Same as middle alternative

Higher education current-fund expenditures: 52.0 / 37.5

K-12 public current expenditures: 31.2 / 35 9

K-12 public Annual salaries classroom teachers: 12 4 / 13.1

Higher education enrollment: 25 8 / 9.2

K-12 enrollment: 3.0 / 15.9

High school graduates: -19.7 / 24.5

☐ 1978-79 to 1991-92   ■ 1991-92 to 2003-2004
NOTE: Data for 1991-92 expenditures are estimated using past data   All financial statistics are in constant dollars.

9

Highlights

Enrollment

- **Total public and private elementary and secondary enrollment is projected to increase to 55.7 million over the projection period.** From 1979 to 1984, total enrollment in public and private elementary and secondary schools decreased from 46.7 million to 44.9 million, a decrease of 4 percent. After 1984, total enrollment reversed its decline and increased to an estimated 48.0 million in 1992, an increase of 7 percent from 1984. Total enrollment is projected to continue to increase to 51.8 million by 1996, surpassing the peak level of 51.3 million attained in 1971. Total enrollment is projected to increase further to 55.7 million by the year 2004, an increase of 16 percent from 1992 (table 1).

- **Over the projection period, enrollment in grades K–8 and grades 9–12 will continue to increase.** Between 1979 and 1984, enrollment in grades K–8 fell from 31.7 million to 31.2 million, a decrease of 2 percent. Then, this number increased to 35.2 million in 1992, an increase of 13 percent from 1984. Enrollment in grades K–8 is projected to increase to 39.7 million by the year 2004, an increase of 13 percent from 1992. Enrollment in grades 9–12 decreased from 14.9 million in 1979 to 12.5 million in 1990, a decrease of 16 percent. It then increased to 12.9 million in 1992. By the year 2004, enrollment in grades 9–12 is projected to continue to rise to 16.0 million, an increase of 24 percent from 1992 (table 1).

- **Enrollment in institutions of higher education is projected to increase from an estimated 14.6 million in 1992 to 15.9 million by the year 2004.** Between 1979 and 1983, higher education enrollment increased from 11.6 million to 12.5 million, an increase of 8 percent. In 1984 and 1985, higher education enrollment dropped to 12.2 million. Then, it increased from 12.5 million in 1986 to an estimated 14.6 million in 1992, an increase of 16 percent from 1986. Higher education enrollment is projected to increase to 15.9 million by the year 2004, an increase of 9 percent from 1992. Under the low and high alternatives, higher education enrollment is projected to range between 15.1 million and 16.7 million by the year 2004 (table 3).

- **Women are expected to continue to be the majority of college students over the projection period.** Enrollment of women increased from 5.9 million in 1979 to an estimated 7.9 million in 1992, an increase of 34 percent. Under the middle alternative, this number is projected to increase to 8.7 million by the year 2004, an increase of 10 percent from 1992. Under the low and high alternatives, enrollment of women is projected to range between 8.3 million and 9.1 million by the year 2004. From 1979 to 1990, enrollment of men has fluctuated between 5.6 million and 6.3 million. In 1992, it was estimated at 6.7 million. Under the middle alternative, this number is projected to increase to 7.2 million by the year 2004, an increase of 8 percent from 1992. Under the low and high alternatives, enrollment of men is expected to range between 6.8 million and 7.6 million by the year 2004 (table 3).

High School Graduates

- **The number of high school graduates is projected to increase by 2003–2004.** The number of high school graduates from public and private high schools decreased from 3.1 million in 1978–79 to 2.6 million in 1985–86. It then rose to 2.8 million in 1987–88. Next, it decreased to 2.5 million in 1991–92. Over the projection period, the number of graduates is projected to rise to 3.1 million by 2003–2004 (table 26).

- **Graduates of both public and private high schools are projected to increase by 2003–2004.** The number of public high school graduates is projected to increase from 2.2 million in 1991–92 to 2.8 million by 2003–2004. The number of private high school graduates, which were estimated at 256,000 in 1991–92, is projected to be 319,000 by 2003–2004 (table 26).

Earned Degrees Conferred

- **Over the projection period, the number of bachelor's degrees is projected to fluctuate within a narrow range before rising to 1.3 million by 2003–2004.** Between 1978–79 and 1991–92, the number of bachelor's degrees increased from 921,000 to about 1,120,000. Under the middle alternative, this number is expected to fluctuate and increase to 1,278,000 by 2003–2004. Under the low and high alternatives, bachelor's degrees are projected to range between 1,208,000 and 1,354,000. The number of bachelor's degrees awarded to men declined from 477,000 in 1978–79 to 470,000 in 1980–81. Then, this number increased most years to about 518,000 in 1991–92. Under the middle alternative, this number is expected to fluctuate over most of the projection period and then increase to 598,000 by 2003–2004. Under the low and high alternatives, bachelor's degrees awarded to men are expected to range between 552,000 and 635,000. The number of bachelor's degrees awarded to women increased from 444,000 in 1978–79 to about 602,000 in 1991–92. Under the middle alternative, this number is expected to

increase over the projection period to 680,000 by 2 003–2004. Under the low and high alternatives, bachelor's degree awarded to women are projected to range between 656,000 and 719,000 by 2003 2004 (table 28).

* **The number of doctor's degrees awarded to women is projected to increase over the projection period.** The number of doctor's degrees increased from 32,700 in 1978–79 to about 40,100 in 1991 92. Under the middle alternative, doctor's degrees are expected to increase to 41,400 by 2003–2004. Under the low and high alternatives, the number of doctor's degrees is projected to range between 39,900 and 47,300. Under the middle alternative, the number of doctor's degrees awarded to men is projected to decrease gradually from 25,200 in 1991–92 to 21,200 in 2003–2004. Under the low and high alternatives, doctor's degrees awarded to men are projected to range between 19,800 and 27,000. Under the middle alternative, the number of doctor's degrees awarded to women is expected to increase from 14,900 to 20,200 over the projection period. Under the low and high alternatives, doctor's degrees awarded to women are projected to range between 20,100 and 20,300 (table 30).

Classroom Teachers

* **The number of classroom teachers is projected to rise over the projection period.** Between 1979 and 1981, classroom teachers in public and private elementary and secondary schools decreased from 2.46 million to 2.44 million. Then, this number increased to about 2.81 million in 1992. Under the middle alternative, this number is expected to increase to 3.30 million by the year 2004. Under the low and high alternatives, the number of classroom teachers is expected to range between 3.22 million and 3.42 million by the year 2004 (table 32).

* **Both elementary and secondary teachers are projected to increase over the projection period.** Elementary classroom teachers increased from 1.38 million in 1979 to about 1.74 million in 1992. Under the middle alternative, this number is projected to increase to 1.95 million by the year 2004. Under the low and high alternatives, elementary teachers are projected to range between 1.90 million and 2.04 million by the year 2004. Secondary classroom teachers decreased from 1.08 million in 1979 to 1.04 million in 1981. Then this number increased to about 1.08 million in 1992. Under the middle alternative, secondary classroom teachers will increase to 1.35 million by the year 2004. Under the low and high alternatives, secondary teachers are projected to range between 1.32 million and 1.39 million by the year 2004 (table 32).

* **Under the middle alternative, the pupil-teacher ratios in elementary and secondary schools are projected to rise and then fall over the projection period.** Since 1979, the pupil-teacher ratio in elementary schools has decreased from 20.5 to 18.4 in 1989. Then, the ratio increased to about 18.5 in 1992. Under the middle alternative, this ratio is projected to continue to increase to 19.0 in 1994, and then decline to 18.4 by the year 2004. Under the low and high alternatives, this ratio is expected to range between 17.6 and 18.9 by the year 2004. For secondary schools, the pupil-teacher ratio decreased from 17.0 in 1979 to 14.3 in 1990. Then, it increased to an estimated 14.8 in 1992. Under the middle alternative, this ratio will increase to 15.0 in 1993, fluctuate, and then decrease to 14.7 by 2004. Under the low and high alternatives, the pupil-teacher ratio in secondary schools is projected to range between 14.3 and 15.0 (table 33).

Expenditures

* **Current expenditures for public elementary and secondary schools are forecast to continue increasing through 2003–2004.** Current expenditures are estimated to have increased 31 percent in constant dollars, between 1978-79 and 1990–91. (1990-91 is the last year for which there are actual data.) With the increasing enrollments projected for this period, this trend of increasing current expenditures is expected to continue. Under the middle alternative, a 37-percent increase is projected for the period from 1990 91 to 2003 2004. Under the low alternative, current expenditures are projected to increase by 29 percent; under the high alternative, current expenditures are projected to increase by 44 percent (table 34).

* **Increases in current expenditures per pupil are also forecast to continue increasing for the period 1990–91 to 2003–2004.** The period from 1978-79 until 1990-91 saw current expenditures per pupil in average daily attendance (ADA) increase an estimated 33 percent in constant dollars. Under the middle alternative, current expenditures per pupil are forecast to increase another 15 percent between 1990-91 and 2003-2004. Under the low and high alternatives, the increase in current expenditures is projected to range between 9 and 21 percent. Current expenditures per pupil are forecast to increase less rapidly than total current expenditures due to the increase projected for the number of pupils (table 34).

* **Further increases in teacher salaries are forecast.** After a period of declining salaries (teacher salaries in constant dollars fell 7 percent from 1978–79 to 1980–81), teacher salaries rose constantly from 1981–82 to 1989-90. During that time, teacher salaries in constant

11

dollars grew an estimated 21 percent. With the present slowdown in the economy, teacher salaries are estimated to have increased less than 1 percent in real terms from 1989-90 to 1992-93. As the current trend of increasing enrollments continues and as the economy begins to grow again, it is forecast that teacher salaries will also begin increasing. Teacher salaries are projected to increase 12 percent between 1992-93 and 2003-2004 under the middle alternative. An 8-percent increase is projected under the low alternative and a 16-percent increase is projected under the high alternative (table 36).

- **Current-fund expenditures are projected to increase in both public and private institutions.** Current-fund expenditures in institutions of higher education rose 47 in constant dollars percent from 1978-79 to 1990-91. (1990-91 is the last year for which there are available data.) During that time, current-fund expenditures rose 41 percent in public institutions and 60 percent in private institutions. A further 42-percent increase is projected for the period from 1990-91 to 2003-2004 under the middle alternative for all expenditures (table 37).

Introduction

Guide to This Edition

This edition of *Projections of Education Statistics to 2004* provides projections for key education statistics. This edition includes statistics on enrollment, graduates, classroom teachers, and expenditures in elementary and secondary schools and institutions of higher education. The tables, figures, and text contain data on enrollment, teachers, graduates, and expenditures for the past 14 years and projections to the year 2004. These projections reflect estimates and population projections based on the 1990 census. Appendix A describes the methodology and assumptions used to develop the projections. Appendix B contains tables of supplementary data. Data sources are presented in appendix C. Appendix D is a glossary of terms.

Exclusions

Some of the projections contained in previous editions of *Projections of Education Statistics* are not provided in this edition. The Schools and Staffing Survey (SASS) of the National Center for Education Statistics now provides data on teacher attrition and sources of teacher supply. Therefore, the previous practice of using various assumptions to develop projections of the demand for new hiring of classroom teachers has been discontinued, and the SASS data will be used for future analyses of this variable. However, data from SASS are currently available for only one time period and are thus an insufficient basis for projections. This does not affect the projections of total demand for classroom teachers, which are included.

Also excluded from this edition are projections of instructional faculty, higher education enrollment by race/ethnicity, and state projections of public elementary and secondary enrollment and public high school graduates. Projections of instructional faculty require the development of new time series from existing and new NCES data sources, and that development is not yet complete. Projections of higher education enrollment by race/ethnicity are under development. Projections of public school enrollment and public high school graduates by state cannot be included because the 1990 census-based population projections by state, which are necessary to update these projections, are not yet available.

Limitations of Projections

Projections of time series usually differ from the reported data due to errors from many sources. This is because of the inherent nature of the statistical universe from which the basic data are obtained and the properties of projection methodologies, which depend on the validity of many assumptions. Therefore, alternative projections are shown for most statistical series to denote the uncertainty involved in making projections. These alternatives are not statistical confidence limits, but instead represent judgments made by the authors as to reasonable upper and lower bounds. Alternative projections are presented for higher education enrollment, classroom teachers, earned degrees conferred, and expenditures of public elementary and secondary schools and institutions of higher education.

1

Chapter 1

Elementary and Secondary Enrollment

Between 1992 and the year 2004, enrollment will increase in elementary and secondary schools. The primary reason for the increase is the rising number of annual births since 1977—sometimes referred to as the baby boom echo (figure 2). As a result, increases in the 3- to 5-year-old population are projected through 1996 and increases in the school-age populations are expected over the next 12 years (figures 3, 4, and 5). In 1993 and beyond, increases in the 5- to 13-year-old population, which began in the mid-1980s, are expected to continue the growth in elementary enrollment. The increase in the 14- to 17-year-old population, which started in 1991, will continue the growth in secondary enrollment over the projection period.

Elementary and Secondary Enrollment

Reflecting the decline in the 5- to 17-year-old population, total enrollment in public and private elementary and secondary schools decreased from 46.7 million in 1979 to 44.9 million in 1984, a decrease of 4 percent (table 1 and figure 6). After reaching a low of 44.9 million in 1984, total enrollment reversed its downward trend in response to an increase in the 5- to 17-year-old population and rose to 48.0 million in 1992, an increase of 7 percent from 1984. Total enrollment is projected to continue to increase to 51.8 million in 1996, surpassing the peak level of 51.3 million attained in 1971. Total enrollment is projected to increase further to 55.7 million by the year 2004, an increase of 16 percent from 1992.

Enrollment, by Control of School

Enrollment in public elementary and secondary schools decreased from 41.7 million in 1979 to 39.2 million in 1984, a decrease of 6 percent (figure 7). Since then, enrollment in public schools has increased to an estimated 42.7 million in 1992, an increase of 9 percent from 1984. Enrollment in public schools is projected to increase to 49.5 million by the year 2004, an increase of 16 percent from 1992.

Since the mid-1970s, enrollment in private elementary and secondary schools has fluctuated between 5.0 million and 5.7 million. A sample survey of private schools conducted by NCES in 1992 estimated that 5.4 million students were enrolled in private elementary and secondary schools. Enrollment in private schools is projected to increase to

around 6.2 million by the year 2004, an increase of 15 percent from 1992.

Projections of enrollments in public elementary and secondary schools are based on projected grade retention rates. The retention rates for grades 2 through 10 are all close to 100 percent. Rates for grade 6 to grade 7 and grade 8 to grade 9 are significantly over 100 percent. Traditionally, these are the grades in which large numbers of private elementary students transfer to public secondary schools. The retention rates for grades 11 to 12 are about 90 percent. The grade retention rates are assumed to be constant throughout the projection period.

Projections of private school enrollment were derived using public school enrollment data for 1992. The ratio of private school enrollment to public school enrollment was calculated for grades K–8 and grades 9–12. These ratios were held constant over the projection period and applied to projections of public school enrollment for grades K–8 and 9–12 to yield projections of private school enrollment. This method assumes that the future pattern in the trend of private school enrollment will be the same as that in public school enrollment. However, a number of factors could alter the assumption of constant ratios over the projection period.

Enrollment, by Grade Group

Between 1979 and 1984, enrollment in grades K–8 fell from 31.7 million to 31.2 million, a decrease of 2 percent. Then, this number increased to 35.2 million in 1992, an increase of 13 percent from 1984. Enrollment in grades K–8 is projected to increase to 39.7 million by the year 2004, an increase of 13 percent from 1992. Enrollment in grades 9–12 decreased from 14.9 million in 1979 to 12.5 million in 1990, a decrease of 16 percent. It then increased to 12.9 million in 1992. By the year 2004, enrollment in grades 9–12 is projected to continue to rise to 16.0 million, an increase of 24 percent from 1992. Since enrollment rates for the school-age populations are nearly 100 percent for elementary grades and junior-high grades and close to 90 percent for high school grades, the historical and projected patterns of decline and growth in enrollment in grades K–8 and grades 9–12 reflect changes in the sizes of the 5- to 13-year-old population and the 14- to 17-year-old population.

Enrollment by grade group in public elementary and secondary schools shows trends similar to those of total enrollment. Enrollment in grades K–8 of public schools decreased from 28.0 million in 1979 to 26.9 million in

3

1984, a decrease of 4 percent. It then increased to 30.9 million in 1992. Enrollment in grades K–8 of public schools is projected to increase to 34.9 million by the year 2004, an increase of 13 percent from 1992. Enrollment in grades 9–12 of public schools decreased from 13.6 million in 1979 to 11.3 million in 1990, a decrease of 17 percent. Then, it increased to 11.7 million in 1992. Thereafter, 9–12 enrollment is expected to increase to 14.6 million by the year 2004, an increase of 24 percent from 1992.

Enrollment by grade group in private elementary and secondary schools will show patterns similar to trends in enrollment in public schools over the projection period by virtue of the private school enrollment projection methodology. The methodology assumes that private school enrollment will reflect trends in public school enrollment. Enrollment in grades K–8 of private schools is projected to increase from 4.2 million in 1992 to 4.8 million by the year 2004, an increase of 13 percent. Enrollment in grades 9–12 of private schools is projected to increase from 1.2 million in 1992 to 1.4 million by the year 2004, an increase of 24 percent.

Enrollment, by Organizational Level

Enrollments may also be aggregated by the level of school attended by students. The reported enrollment in elementary schools is smaller than enrollment in kindergarten through grade 8 because it excludes enrollment in grades 7 and 8 in secondary schools. Enrollment in elementary schools decreased from 28.2 million in 1979 to 28.0 million in 1983, a decrease of 1 percent (table 2). This number increased by 15 percent to 32.1 million in 1992. Enrollment in elementary schools is expected to continue to increase to 36.1 million in the year 2002, before declining to 35.9 million by the year 2004, an increase of 12 percent from 1992. Enrollment in secondary schools, including 7th and 8th graders in secondary schools, decreased from 18.4 million in 1979 to 15.3 million in 1990, a decrease of 17 percent. Then, this number increased by 4 percent to 15.9 million in 1992. Enrollment in secondary schools is projected to rise to 19.8 million by the year 2004, an increase of 24 percent from 1992.

Chapter 2

Higher Education Enrollment

Enrollment in institutions of higher education* is expected to rise between 1992 and the year 2004. The growth is due in part to the rising enrollment rates of most age cohorts. Changes in college-age populations will also affect enrollment levels over the next 12 years (figures 8 and 9). Over the projection period, the 25- to 29-year-old population is projected to decrease by 13 percent, and the 30- to 34-year-old population will also decline by 13 percent. However, during the projection period, the 18- to 24-year-old population will begin to increase beginning in 1998, rising by 12 percent by the end of the projection period. On the other hand, the 35- to 44-year-old population will increase by 9 percent over the projection period despite a slight decrease between 2000 and 2004. The increases in the youngest and oldest populations are expected to offset the loss of students from the 25- to 29-year-old and 30- to 34-year-old populations, thereby contributing to the increases in college enrollment levels in 1993 and beyond.

Higher education enrollment projections were based on projected enrollment rates, by age and sex, which were then applied to population projections by age and sex developed by the Bureau of the Census. The middle series population projections, which assume middle fertility and net immigration, were used. The enrollment rates were projected by taking into account the most recent trends, as well as the effects of economic conditions and demographic changes on the enrollment rates of the younger age cohorts.

Three alternative projections of enrollment in institutions of higher education were developed to indicate the range of possible outcomes. The middle alternative assumes that the enrollment rates of most of the 18- to 24-year-olds will increase over the projection period, while those for older age groups are expected to remain constant at levels consistent with the most recent enrollment rates or increase slightly. In particular, the part-time enrollment rate of 18-year-old men was projected as a function of unemployment rate and disposable income per capita. The part-time enrollment rate of 20-year-old men was projected as a function of disposable income per capita. The part-time enrollment rate of 18-year-old women was projected as a function of disposable income per capita. The low alternative assumes that age-specific enrollment rates will either equal the middle alternative or change at a slower rate, based on past trends. Under the high alternative, the age-specific

enrollment rates are projected to equal the middle alternative or increase at a faster rate, based on past trends for most age groups.

Total Higher Education Enrollment

In 1979, there were 11.6 million students enrolled in institutions of higher education. In the late 1970s and early 1980s, older students, primarily women and part-time students, began to enroll in greater numbers. As a result, college enrollment increased to 12.5 million in 1983. In 1984 and 1985, enrollment declined to 12.2 million. By 1992, it had risen to an estimated 14.6 million, exceeding its previous level attained in 1983 by nearly 2.1 million students (table 3 and figure 10). Under the middle alternative, college enrollment is projected to rise to 15.9 million by the year 2004, an increase of 9 percent from 1992. This will represent an average annual growth rate of 0.7 percent over the projection period, less than the growth rate of 1.8 percent during the 1979-92 period. Moreover, the greatest growth will occur toward the end of the projection period. Between 1992 and 1998, college enrollment is projected to increase at an average annual growth rate of 0.6 percent. Between 1998 and 2004, it will grow at an average annual growth rate of 0.8 percent (figure 11). Although the 18- to 24-year-old population is projected to decline until 1997, a decrease of 4 percent from 1992, this population will increase 12 percent by the year 2004. According to the Bureau of the Census, 58 percent of all college students were 18- to 24-years old in 1991. This increase in the younger population, along with enrollment rates remaining above 1992 levels and the continued increases in the number of older students, is expected to offset the decline in the number of 25- to 34-year-olds enrolled in college.

Under the low alternative, college enrollment is projected to increase from an estimated 14.6 million in 1992 to 15.1 million by the year 2004. This will represent an average annual growth rate of 0.3 percent, for an increase of 4 percent over the projection period. This alternative assumes that enrollment rates will either remain the same as the middle alternative or increase at a slower rate.

Under the high alternative, college enrollment is expected to increase from an estimated 14.6 million in 1992 to 16.7 million by the year 2004. This will represent an average annual growth rate of 1.1 percent, for an increase of 15 percent over the projection period. This level is expected to be maintained during 1993 and beyond if the enrollment rates remain well above their 1992 levels.

---

* This term applies mainly to those institutions that provide study beyond secondary school and that offer programs terminating in an associate, baccalaureate, or higher degree.

11

For key enrollment statistics, the following tabulations show: (1) the average annual rate of growth (in percent) for 1979–92 and alternative projected rates of change for 1992–2004 and (2) growth rates for 1979–86 and 1986–92 and the middle alternative projected rates of change for 1992–98 and 1998–2004.

Enrollment, by Sex of Student

Women played a major role in the increase of enrollment between 1979 and 1992. The enrollment of women in college increased from 5.9 million in 1979 to an estimated 7.9 million in 1992, representing an average annual growth rate of 2.3 percent, for a 34-percent increase over the period (figure 12). Under the middle alternative, enrollment of women is expected to increase to 8.7 million by the year 2004, an increase of 10 percent from 1992. This will represent a growth rate of 0.8 percent per year, considerably less than the growth rate of 2.3 percent for the 1979–92 period. The rate of growth will be higher during the first half of the projection period (1992–98) than during the second half (1998–2004), 0.8 percent per year versus

0.7 percent per year (figure 13). As a share of total college enrollment, women were 54 percent of all college students in 1992 compared with 51 percent in 1979. Women are expected to increase their share slightly to 55 percent of college enrollment in the year 2004. Under the low and high alternatives, enrollment of women is projected to range between 8.3 million and 9.1 million by the year 2004, representing growth rates of 0.4 percent and 1.1 percent, respectively.

Despite fluctuations in enrollment to 1985, the enrollment of men in college has since increased from 5.9 million in 1986 to an estimated 6.7 million in 1992. Over the 1979–92 period, the growth rate of 1.2 percent per year for men was slightly more than half of the rate for women. Under the middle alternative, enrollment of men is expected to increase to 7.2 million by the year 2004, an 8-percent increase from 1992, for an average annual growth rate of 0.7 percent. The growth rate of enrollment of men will be lower in the first half of the projection period than in the second half, 0.4 percent per year versus 1.0 percent per year. Under the low and high alternatives, the number of men enrolled in college is projected to range between 6.8 million and 7.6 million by the year 2004, representing growth rates of 0.2 percent and 1.2 percent, respectively.

Enrollment, by Attendance Status

Full-time enrollment increased from 6.8 million in 1979 to an estimated 8.1 million in 1992 (figure 14). This is an average annual growth rate of 1.4 percent, for an increase of 20 percent over the period. Under the middle alternative, full-time enrollment is expected to increase another 12 percent to 9.1 million by the year 2004, representing an average annual growth rate of 0.9 percent. Over the projection period, the growth rate for the 1992–98 period will be lower than the growth rate for the 1998–2004 period, 0.4 percent per year versus 1.4 percent per year (figure 15). This is probably due to the increased enrollment of 18- to 24-year-olds, who will tend to be enrolled full-time. Under the low and high alternatives, full-time enrollment is projected to range between 8.6 million and 9.6 million by the year 2004.

Part-time enrollment increased from 4.8 million in 1979 to an estimated 6.4 million in 1992. This is an average annual growth rate of 2.3 percent, for an increase of 34 percent over the period. Under the middle alternative, part-time enrollment is expected to increase at an average annual growth rate of 0.5 percent and reach 6.8 million by the year 2004, for an increase of 6 percent over the projection period. Unlike full-time enrollment, the growth rate for part-time enrollment during the 1992–98 period will be more than the growth rate for the 1998–2004 period, 0.9 percent versus 0.1 percent. Under the low and high alternatives, part-time enrollment is projected to range between 6.5 million and 7.1 million, representing growth rates of 0.1 percent and 0.9 percent, respectively.

Enrollment, by Control of Institution

Enrollment in public institutions grew from 9.0 million in 1979 to an estimated 11.4 million in 1992, increasing at an average annual rate of 1.8 percent, for an increase of 26 percent over the period (figure 16). Under the middle alternative, public enrollment is expected to increase to 12.4 million, rising by an average annual growth rate of 0.7 percent, for an increase of 9 percent over the projection period. During the projection period, enrollment in public institutions is projected to increase at an average annual growth rate of 0.7 percent during the 1992–98 period and 0.8 percent during the 1998–2004 period (figure 17). Enrollment in public 4-year institutions is projected to increase from an estimated 6.1 million in 1992 to 6.7 million by the year 2004. Enrollment in public 2-year institutions is expected to increase from 5.2 million in 1992 to 5.7 million by the year 2004.

Under the low and high alternatives, enrollment in public institutions is expected to range between 11.8 million and 13.1 million by the year 2004. For the low alternative, this is a projected average annual growth rate of 0.3 percent over the projection period. For the high alternative, it will be a growth rate of 1.2 percent.

Enrollment in private institutions increased from 2.5 million in 1979 to an estimated 3.2 million in 1992, increasing at an average annual growth rate of 1.8 percent, for an increase of 26 percent over the period. Under the middle alternative, private enrollment is expected to increase to 3.5 million, rising by an average annual growth rate of 0.7 percent, for an increase of 9 percent over the projection period. During the projection period, enrollment in private institutions is projected to increase at an annual growth rate of 0.5 percent during the 1992–98 period and 0.9 percent during the 1998–2004 period. Enrollment in private 4-year institutions is expected to increase from an estimated 2.9 million in 1992 to 3.2 million by the year 2004. Enrollment in private 2-year institutions is projected to increase from an estimated 260,000 in 1992 to 289,000 by the year 2004.

Under the low and high alternatives, enrollment in private institutions is expected to range between 3.3 million and 3.6 million by the year 2004. For the low alternative, this is a projected average annual growth rate of 0.3 percent over the projection period. For the high alternative, it will be a growth rate of 1.1 percent.

Enrollment, by Type of Institution

Enrollment in 4-year institutions increased from 7.4 million in 1979 to an estimated 9.1 million in 1992, increasing at an average annual growth rate of 1.6 percent, for a 23-percent increase over the period (table 4 and figure 18). Under the middle alternative, enrollment in 4-year institutions is expected to rise to 9.9 million by the year 2004, increasing at an average annual growth rate of 0.7 percent, for a 9-percent increase over the projection period. During the projection period, enrollment in 4-year institu-

tions is projected to increase at an annual growth rate of 0.5 percent during the 1992–98 period and 1.0 percent during the 1998–2004 period (figure 19).

Under the low and high alternatives, enrollment in 4-year institutions is expected to range between 9.4 million and 10.4 million by the year 2004. For the low alternative, this is a projected average annual growth rate of 0.3 percent over the projection period. For the high alternative, it will be a growth rate of 1.2 percent.

Enrollment in 2-year institutions rose from 4.2 million in 1979 to an estimated 5.5 million in 1992, increasing at an average annual growth rate of 2.1 percent per year, for a 30-percent increase over the period (table 5). Under the middle alternative, enrollment in 2-year institutions is expected to rise to 6.0 million by the year 2004, increasing at an average annual growth rate of 0.7 percent, for a 9-percent increase over the projection period. During the projection period, enrollment in 2-year institutions is projected to increase at an annual growth rate of 0.8 percent during the 1992–98 period and 0.6 percent during the 1998–2004 period.

Under the low and high alternatives, enrollment in 2-year institutions is expected to range between 5.7 million and 6.3 million by the year 2004. For the low alternative, this is a projected average annual growth rate of 0.3 percent over the projection period. For the high alternative, it will be a growth rate of 1.1 percent.

Enrollment, by Level

Undergraduate enrollment increased from 10.0 million in 1979 to an estimated 12.4 million in 1992, increasing at an average annual growth rate of 1.7 percent, for a 25-percent increase over the period (table 14 and figure 20). Under the middle alternative, undergraduate enrollment is expected to increase to 13.7 million by the year 2004, at a growth rate of 0.8 percent per year, for a 10-percent increase over the projection period. During the projection period, undergraduate enrollment is projected to increase at an annual growth rate of 0.7 percent during the 1992–98 period and 1.0 percent during the 1998–2004 period (figure 21).

Under the low and high alternatives, undergraduate enrollment is expected to range between 13.0 million and 14.4 million by the year 2004. For the low alternative, this is a projected average annual growth rate of 0.4 percent over the projection period. For the high alternative, it will be a growth rate of 1.2 percent.

Graduate enrollment rose from 1.3 million in 1979 to an estimated 1.8 million in 1992, at an average annual growth rate of 2.4 percent, for a 37-percent increase over the period (table 17 and figure 22). Under the middle alternative, graduate enrollment is expected to increase to 1.8 million by the year 2004, increasing at an average annual growth rate of 0.2 percent, for a 2-percent increase over the projection period. During the projection period, graduate enrollment is projected to increase at an annual growth rate of 0.5 percent during the 1992–98 period

and decrease at a rate of 0.1 percent during the 1998–2004 period (figure 23).

Under the low and high alternatives, graduate enrollment is expected to range between 1.8 million and 1.9 million by the year 2004. For the low alternative, this is a projected average annual decline of 0.1 percent over the projection period. For the high alternative, it will be a growth rate of 0.7 percent.

First-professional enrollment increased from 263,000 in 1979 to an estimated 318,000 in 1992, an average annual growth rate of 1.5 percent, for a 21-percent increase over the period (table 20 and figure 22). Under the middle alternative, first-professional enrollment is expected to increase to 329,000 in 1994 and decline gradually to 314,000 by the year 2004, declining at an average annual rate of 0.1 percent over the projection period, for a 1-percent decrease from 1992. During the projection period, first-professional enrollment is projected to decline at an average annual rate of 0.2 percent during the 1992–98 period and 0.1 percent during the 1998–2004 period (figure 23).

Under the low and high alternatives, first-professional enrollment is expected to range between 304,000 and 340,000 by the year 2004. For the low alternative, this is a projected average annual decline of 0.4 percent over the projection period. For the high alternative, it will be a growth rate of 0.6 percent.

Full-Time-Equivalent Enrollment

Full-time-equivalent enrollment increased from 8.5 million in 1979 to an estimated 10.5 million in 1992, increasing at an average annual rate of growth of 1.6 percent, for a 23-percent increase over the period (table 23 and figure 24). Under the middle alternative, full-time-equivalent enrollment is expected to increase to 11.5 million by the year 2004, increasing at an average annual growth rate of 0.8 percent, for a 10-percent increase over the projection period. During the projection period, full-time-equivalent enrollment is projected to increase at an annual growth rate of 0.5 percent during the 1992–98 period and 1.1 percent during the 1998–2004 period (figure 25).

The full-time-equivalent of undergraduate enrollment in 4-year institutions, which was an estimated 5.9 million in 1992, will be 6.6 million by the year 2004. The full-time-equivalent of undergraduate enrollment in 2-year institutions, which was an estimated 3.2 million in 1992, will be 3.5 million by the year 2004.

In public institutions, full-time-equivalent enrollment, which was an estimated 7.9 million in 1992, will be 8.7 million by the year 2004. In private institutions, full-time-equivalent enrollment, which was an estimated 2.6 million in 1992, will be 2.8 million by the year 2004.

Under the low and high alternatives, full-time-equivalent enrollment in all institutions is expected to range between 10.9 million and 12.1 million by the year 2004. For the low alternative, this is a projected average annual growth rate of 0.4 percent over the projection period. For the high alternative, it will be a growth rate of 1.2 percent.

Enrollment, by Age

The alternative projections of higher education enrollment by age, sex, and attendance status are shown in table 6 (middle alternative), table 7 (low alternative), and table 8 (high alternative). These projections are based on age-specific enrollment data from the Bureau of the Census and enrollment data from NCES.

Under the middle alternative, the period from 1984 to 2004 will be one of change in the age distribution of college students. The enrollment of students who are 18- to 24-years old increased from 7.1 million in 1984 to an estimated 7.8 million in 1992, an increase of 10 percent (figure 26). This number is expected to increase to 9.1 million by the year 2004, an increase of 17 percent from 1992. As a result, the proportion of students who are 18- to 24-years old, which fell from 57.8 percent in 1984 to 53.6 percent in 1992, is projected to be 57.3 percent by the year 2004.

On the other hand, the enrollment of students who are 25 years old and over increased from 4.9 million in 1984 to an estimated 6.6 million in 1992, an increase of 34 percent. This number is projected to remain around 6.6 million by the year 2004. The projected stability in the enrollment of students 25 years old and over is due, in part, to the declines in the 25- to 29-year-old population and the 30- to 34-year-old population over the projection period. However, the 35- to 44-year-old population will continue to increase for most of the projection period, contributing to the stable enrollment during this period. Over the projection period, the proportion of students 25 years old and over rose from 40.2 percent in 1984 to 45.4 percent in 1992. This proportion is projected to be 41.5 percent by the year 2004.

Under the low and high alternatives, the college enrollment of students 18- to 24-years old is projected to range between 8.4 million and 9.5 million by the year 2004. The college enrollment of students 25 years old and over is expected to range between 6.5 million and 7.0 million by the year 2004.

Chapter 3

High School Graduates

The number of high school graduates is projected to increase each year through 2003–2004. This increase in the number of high school graduates reflects the overall change in the 18-year-old population during the same period (figure 29). Increases in the number of graduates are expected for both public and private schools.

The tabulations below provide the following information about trends in the number of high school graduates: (1) the average annual rate of change (in percent) for 1978–79 to 1991–92 and the projected growth rate for 1991–92 to 2003–2004 and (2) the rates of change for 1978–79 to 1985–86 and 1985–86 to 1991–92 and the projected growth rates for 1991–92 to 1997–98 and 1997–98 to 2003–2004.

Average annual rate of change (in percent)

	1978–79 to 1991–92	Projected 1991–92 to 2003–2004
Total	-1.6	1.8
Public	-1.7	1.8
Private	-1.2	1.9

Average annual rate of change (in percent)

	1978–79 to 1985–86	1985–86 to 1991–92	Projected 1991–92 to 1997–98	1997–98 to 2003–2004
Total	-2.3	-0.9	2.4	1.3
Public	-2.4	-1.0	2.4	1.3
Private	-2.0	-0.3	2.4	1.3

Total High School Graduates

The number of high school graduates from public and private schools decreased from 3.1 million in 1978–79 to 2.6 million in 1985–86 (table 26 and figure 30). After 1985–86, this number increased to 2.8 million in 1987–88. Then, it decreased to about 2.5 million in 1991–92, a decrease of 19 percent from 1978–79, or an average annual rate of decline of 1.6 percent. Over the projection period, the total number of high school graduates is expected to remain around 2.5 million in 1992–93 and 1993–94. Thereafter, it is projected to rise to 3.1 million by 2003–2004, an increase of 25 percent from 1991–92, or an average annual growth rate of 1.8 percent. During the projection period, the growth rate will be higher in the first half of the projection period (1991–92 to 1997–98) than the growth rate in the second half (1997–98 to 2003–2004), 2.4 percent per year versus 1.3 percent per year.

High School Graduates, by Control of Institution

The number of graduates of public high schools decreased from 2.8 million in 1978–79 to 2.4 million in 1985–86 (figure 31). Then, it increased to 2.5 million in 1987–88 before declining to about 2.2 million in 1991–92, a decrease of 20 percent from 1978–79, or an average annual rate of decline of 1.7 percent. Over the projection period, public high school graduates are projected to increase to 2.8 million by 2003–2004, an increase of 25 percent from 1991–92, or an average annual growth rate of 1.8 percent. During the projection period, the growth rate will be higher in the first half of the projection period (1991–92 to 1997–98) that the growth rate in the second half (1997–98 to 2003–2004), 2.4 percent per year versus 1.3 percent per year (figure 32).

The number of graduates of private high schools is projected to increase from 256,000 in 1991–92 to 319,000 by 2003–2004, an increase of 25 percent, or an average annual growth rate of 1.9 percent. During the projection period, the growth rate will be higher in the first half of the projection period (1991–92 to 1997–98) than the growth rate in the second half (1997–98 to 2003–2004), 2.4 percent per year versus 1.3 percent per year.

Chapter 4

Earned Degrees Conferred

The historical growth in enrollment of women in institutions of higher education led to an increase in the number of earned degrees conferred. Between 1978–79 and 1991–92, the number of degrees awarded to women rose at all levels. Degrees conferred on men at the associate, bachelor's, master's, and doctor's levels also showed increases over 1978–79. In 1991–92, women earned the majority of associate, bachelor's, and master's degrees, and nearly two-fifths of doctor's and first-professional degrees. Over the projection period, the number of degrees awarded to women will continue to rise at most levels. With the exception of doctor's degrees, the number of degrees awarded to men will increase over the projection period.

Three alternative projections of earned degrees by level and sex were developed. In general, the number of degrees was related to college-age populations and higher education enrollment by level enrolled and attendance status.

Associate Degrees

Between 1978–79 and 1979–80, the number of associate degrees decreased from 403,000 to 401,000 and then increased to 456,000 in 1982–83, before declining to 435,000 in 1987–88. Since then, it increased to an estimated 485,000 in 1991–92 (table 27 and figure 33). Under the middle alternative, this number is expected to increase to 560,000 by 2003–2004, an increase of 15 percent from 1991–92. Under the low and high alternatives, the number of associate degrees is projected to range between 536,000 and 586,000 by 2003–2004. The number of associate degrees awarded to men decreased from 192,000 in 1978–79 to 184,000 in 1979–80. Thereafter, it rose to 207,000 in 1982–83 and then decreased to 186,000 in 1988–89, before rising to an estimated 204,000 in 1991–92 (figure 34). Under the middle alternative, this number is projected to increase to 233,000 by 2003–2004, an increase of 14 percent from 1991–92. Under the low and high alternatives, the number of associate degrees awarded to men is expected to range between 218,000 and 243,000 by 2003–2004. The number of associate degrees awarded to women increased from 211,000 in 1978–79 to 283,000 in 1990–91. In 1991–92, this number is estimated to be 281,000. Under the middle alternative, this number is projected to increase to 327,000 by 2003–2004, an increase of 16 percent from 1991–92. Under the low and high alternatives, the number of associate degrees awarded to women is projected to range between 318,000 and 343,000 by 2003–2004.

Bachelor's Degrees

The number of bachelors degrees increased from 921,000 in 1978–79 to an estimated 1,120,000 in 1991–92, an increase of 22 percent (table 28 and figure 35). Under the middle alternative, this number is expected to rise to 1,214,000 in 1995–96, decrease slightly to 1,190,000 in 1999–2000, and then increase to 1,278,000 by 2003–2004, an increase of 14 percent from 1991–92. Under the low and high alternatives in 2003–2004, the number of bachelor's degrees is projected to range between 1,208,000 and 1,354,000. The number of bachelor's degrees awarded to men declined from 477,000 in 1978–79 to 470,000 in 1980–81. Then, this number increased to 486,000 in 1985–86 and declined for two more years, before rising to an estimated 518,000 in 1991–92 (figure 36). Under the middle alternative, this number is expected to increase to 598,000 by 2003–2004, an increase of 15 percent from 1991–92. Under the low and high alternatives, the number of bachelor's degrees awarded to men is projected to range between 552,000 and 635,000 by 2003–2004. The number of bachelor's degrees awarded to women increased from 444,000 in 1978–79 to an estimated 602,000 in 1991–92, an increase of 36 percent. Under the middle alternative, this number is expected to increase to 680,000 by 2003–2004, an increase of 13 percent from 1991–92. Under the low and high alternatives, the number of bachelor's degrees awarded to women is projected to range between 656,000 and 719,000 by 2003–2004.

Master's Degrees

The number of master's degrees decreased from 301,000 in 1978–79 to 284,000 in 1983–84, before rising to an estimated 349,000 in 1991–92, an increase of 23 percent from 1983–84 (table 29 and figure 37). Under the middle alternative, this number is expected to increase to 389,000 in 1996–97, before decreasing to 363,000 by 2003–2004. Under the low and high alternatives, the number of master's degrees is projected to range between 347,000 and 379,000 by 2003–2004. The number of master's degrees awarded to men decreased from 153,000 in 1978–79 to 141,000 in 1986–87. Then, it increased to an estimated 163,000 in 1991–92 (figure 38). Under the middle alternative, this number is projected to increase to 194,000 in 1996–97, before decreasing to 170,000 by 2003–2004. Under the low and high alternatives, the number of master's degrees awarded to men is projected to range between 163,000

53

and 177,000 by 2003-2004. The number of master's degrees awarded to women decreased from 148,000 in 1978-79 to 147,000 in 1979-80. Then, it rose to 150,000 in 1981-82 and declined to 141,000 in 1983-84. Since then, it increased to an estimated 186,000 in 1991-92. Under the middle alternative, this number is expected to increase to 193,000 by 2003-2004, an increase of 4 percent from 1991-92. Under the low and high alternatives, the number of master's degrees awarded to women is projected to range between 184,000 and 202,000 by 2003-2004.

Doctor's Degrees

The number of doctor's degrees increased from 32,700 in 1978-79 to about 40,100 in 1991-92, an increase of 23 percent (table 30 and figure 39). Under the middle alternative, this number is expected to increase slightly to 41,400 in 2003-2004, an increase of 3 percent from 1991-92. Under the low and high alternatives, the number of doctor's degrees is projected to range between 39,900 and 47,300 by 2003-2004. The number of doctor's degrees awarded to men decreased from 23,500 in 1978-79 to 21,900 in 1982-83. Then, it increased to 22,100 in 1983-84 before decreasing to 21,700 in 1984-85. Thereafter, it increased to an estimated 25,200 in 1991-92. Under the middle alternative, this number is expected to fall to 21,200 by 2003-2004, a decrease of 16 percent from 1991-92 (figure 40). Under the low and high alternatives, the number of doctor's degrees awarded to men is projected to range between 19,800 and 27,000 by 2003-2004. The number of degrees awarded to women rose from 9,200 in 1978-79 to an estimated 14,900 in 1991-92, an increase of 62 percent. Over the projection period, this pattern is expected to continue. Under the middle alternative, the number of doctor's degrees awarded to women is projected to climb to 20,200 by 2003-2004, an increase of 36 percent from 1991-92. Under the low and high alternatives, the number of doctor's degrees awarded to women is projected

to range between 20,100 and 20,300 by 2003-2004. The share of doctor's degrees awarded to women, which was 28 percent in 1978-79 and 37 percent in 1991-92, is projected to climb to 49 percent by 2003-2004.

First-Professional Degrees

The number of first-professional degrees awarded rose from 68,800 in 1978-79 to 75,100 in 1984-85. Then, it decreased to 70,700 in 1987-88. Thereafter, it increased to 71,900 in 1990-91 before declining slightly to an estimated 71,600 in 1991-92 (table 31 and figure 41). Under the middle alternative, this number is expected to increase to 75,300 in 1995-96 and then decrease to 74,000 by 2003-2004, a decrease of 2 percent from 1995-96. Under the low and high alternatives, the number of first-professional degrees is projected to range between 72,000 and 77,000 by 2003-2004. The number of first-professional degrees awarded to men decreased from 52,700 in 1978-79 to about 43,200 in 1991-92, a decrease of 18 percent (figure 42). Under the middle alternative, this number is projected to increase to 44,200 in 1995-96, before decreasing to 43,400 by 2003-2004. Under the low and high alternatives, the number of first-professional degrees awarded to men is projected to range between 42,500 and 44,300 by 2003-2004. The number of first-professional degrees awarded to women increased from 16,200 in 1978-79 to an estimated 28,400 in 1991-92, an increase of 75 percent. Under the middle alternative, this number is expected to increase to 30,600 by 2003-2004, an increase of 8 percent from 1991-92. Under the low and high alternatives, the number of first-professional degrees awarded to women is projected to range between 29,500 and 32,700 by 2003-2004. The women's proportion of first-professional degrees rose from 24 percent in 1978-79 to 40 percent in 1991-92. By 2003-2004, this proportion is expected to be 41 percent.

Chapter 5

Classroom Teachers

Between 1992 and 2004, the number of classroom teachers in elementary and secondary schools is projected to rise. primarily due to the increase in school enrollment during this period. Increases are expected in the numbers of both elementary and secondary teachers. The number of secondary teachers will increase at a faster rate than the number of elementary teachers. Public and private teachers are projected to grow at similar rates.

Three alternative projections of the numbers of classroom teachers were developed to indicate a range of possible outcomes. These alternatives are based on different assumptions about the growth paths for two of the key variables in the teacher model—disposable income per capita and education revenue receipts from state sources per capita. Under the middle alternative, disposable income per capita is projected to increase by 12 percent between 1992 and 2004. while education revenue receipts from state sources per capita will rise by 19 percent during this period. The low alternative assumes that disposable income per capita and education revenue receipts from state sources per capita will increase by 8 percent and 12 percent, respectively. The high alternative assumes that disposable income per capita and education revenue receipts from state sources per capita will increase by 16 percent and 25 percent, respectively. The third variable in the teacher model, enrollment by organizational level, is the same for all three alternatives.

For classroom teachers, the following tabulations show: (1) the average annual rate of change (in percent) for 1979–92 and the three alternative projected rates of change for 1992–2004 and (2) the rates of change for 1979–86 and 1986–92 and the middle alternative projected rates of change for 1992–98 and 1998–2004.

Average annual rate of change (in percent)

	1979–92	1992–2004		
		Low	Middle	High
Total	1.0	1.1	1.3	1.6
Elementary	1.8	0.7	1.0	1.3
Secondary	-0.0	1.7	1.9	2.1
Public	0.9	1.1	1.3	1.7
Private	2.1	1.0	1.2	1.6

Average annual rate of change (in percent)
(Middle alternative projections)

	1979–86	1986–92	Projected	
			1992–98	1998–2004
Total	0.7	1.4	1.7	1.0
Elementary	1.4	2.2	1.2	0.7
Secondary	-0.1	0.1	2.4	1.3
Public	0.4	1.5	1.7	1.0
Private	3.4	0.7	1.5	0.9

Elementary and Secondary School Teachers

The number of classroom teachers in elementary and secondary schools decreased from 2.46 million in 1979 to 2.44 million in 1981, a decrease of 1 percent (table 32 and figure 43). Thereafter, this number increased steadily to about 2.81 million in 1992, an increase of 15 percent from 1981. Under the middle alternative, the number of classroom teachers is projected to increase to 3.30 million by the year 2004, increasing at an average annual growth rate of 1.3 percent, for a 17-percent increase over the projection period. The growth rate will be higher in the first half of the projection period (1992–98) than in the second half (1998–2004), 1.7 percent per year versus 1.0 percent (figure 44). Under the low and high alternatives, the number of classroom teachers is projected to range between 3.22 million and 3.42 million by the year 2004. For the low alternative, this will be an average annual growth rate of 1.1 percent. For the high alternative, this will be a growth rate of 1.6 percent.

Classroom Teachers, by Organizational Level

While elementary enrollment decreased from 1979 to 1983. the number of elementary teachers rose slightly, from 1.38 million in 1979 to 1.43 million in 1983 (figure 45). Then, the number continued to increase to about 1.74 million in 1992, an increase of 26 percent from 1979. Under the middle alternative, the number of elementary teachers is projected to increase to 1.95 million by 2004. an increase of 12 percent from 1992; this increase represents an average annual growth rate of 1.0 percent per year. During the projection period, the growth rate in the 1992–

65

98 period will be 1.2 percent, while the growth rate in the 1998–2004 period will be 0.7 percent (figure 46). Under the low and high alternatives, elementary teachers are projected to range between 1.90 million and 2.04 million by the year 2004. For the low alternative, this will be an average annual growth rate of 0.7 percent. For the high alternative, this will be a growth rate of 1.3 percent.

The number of secondary classroom teachers decreased from 1.08 million in 1979 to 1.04 million in 1981. Then, the number of secondary classroom teachers increased to about 1.08 million in 1992, an increase of 4 percent from 1981. This moderate increase in the number of secondary teachers occurred even though secondary enrollment decreased for most years between 1981 and 1992. Under the middle alternative, the number of secondary teachers is projected to increase from 1.08 million in 1992 to 1.35 million by the year 2004, resulting in an increase of 25 percent. This increase will represent an average annual growth rate of 1.9 percent over the projection period. During the projection period, the growth rate in the 1992–98 period will be 2.4 percent, while the growth rate in the 1998–2004 period will be 1.3 percent. Under the low and high alternatives, secondary teachers are projected to range between 1.32 million and 1.39 million by the year 2004. For the low alternative, this will be an average annual growth rate of 1.7 percent. For the high alternative, this will be a growth rate of 2.1 percent.

Classroom Teachers, by Control of School

The number of classroom teachers in public elementary and secondary schools decreased from 2.18 million in 1979 to 2.13 million in 1981. Then, the number of public school teachers increased to about 2.45 million in 1992, an increase of 15 percent from 1981 (figure 47). Under the middle alternative, the number of public school teachers is projected to increase to 2.88 million by the year 2004, resulting in an increase of 17 percent from 1992. This increase will represent an average annual growth rate of 1.3 percent. During the projection period, the growth rate in the 1992–98 period will be 1.7 percent, while the growth rate in the 1998–2004 period will be 1.0 percent (figure 48). Under the low and high alternatives, public school teachers are projected to range between 2.81 million and 2.99 million by the year 2004. For the low alternative, this will be an average annual growth rate of 1.1 percent. For the high alternative, this will be a growth rate of 1.7 percent.

The number of classroom teachers in private elementary and secondary schools was about 363,000 in 1992. This number is projected to increase to 420,000 by the year 2004, an increase of 16 percent from 1992. This increase will represent an average annual growth rate of 1.2 percent. During the projection period, the growth rate in the 1992–98 period will be 1.5 percent, while the growth rate in the 1998–2004 period will be 0.9 percent. Under the low and high alternatives, private school teachers are projected

to range between 411,000 and 437,000 by the year 2004. For the low alternative, this will be an average annual growth rate of 1.0 percent. For the high alternative, this will be a growth rate of 1.6 percent.

Pupil-Teacher Ratios

A broad relationship between the number of pupils and teachers can be described by the pupil-teacher ratio. The pupil-teacher ratios were computed based on elementary and secondary enrollment by organizational level and the number of classroom teachers by organizational level.

The pupil-teacher ratio in elementary schools decreased from 20.5 in 1979 to 18.4 in 1989 (table 33 and figure 49). Then, the pupil-teacher ratio increased to 18.5 in 1990 and held steady through 1992. Under the middle alternative, this ratio is projected to increase to 19.0 in 1994, before declining to 18.4 by the year 2004. Under the low and high alternatives, the pupil-teacher ratio in elementary schools is expected to range between 17.6 and 18.9 by the year 2004.

For public elementary schools, under the middle alternative, the pupil-teacher ratio is projected to increase from 18.9 in 1992 to 19.4 in 1994 and then decline to 18.8 by the year 2004 (figure 50). Under the low and high alternatives, the pupil-teacher ratio in public elementary schools is projected to range between 18.0 and 19.3 by the year 2004. For private elementary schools, under the middle alternative, the pupil-teacher ratio is projected to increase from 16.2 in 1992 to 16.7 in 1994 and then decline to 16.3 by the year 2004. Under the low and high alternatives, the pupil-teacher ratio in private elementary schools is expected to range between 15.6 and 16.7 by the year 2004.

For secondary schools, the pupil-teacher ratio decreased from 17.0 in 1979 to 14.3 in 1990. Then, it increased to about 14.8 in 1992. Under the middle alternative, this ratio is projected to increase to 15.0 in 1993, fluctuate in a narrow range, and then fall slightly to 14.7 by the year 2004. Under the low and high alternatives, the pupil-teacher ratio in secondary schools is projected to range between 14.3 and 15.0 by the year 2004.

For public secondary schools, under the middle alternative, the pupil-teacher ratio is projected to increase from 15.2 in 1992 to 15.4 in 1993. Then, the ratio will fall to 15.0 in 1993, fluctuate in a narrow range, and then rise slightly to 15.1 by 2004. Under the low and high alternatives, the pupil-teacher ratio in public secondary schools is expected to range between 14.7 and 15.4 by the year 2004. For private secondary schools, under the middle alternative, the pupil-teacher ratio is projected to increase from 11.3 in 1992 to 11.5 in 1993, fluctuate in a narrow range, and then fall to 11.2 by the year 2004. Under the low and high alternatives, the pupil-teacher ratio in private secondary schools is projected to range between 10.9 and 11.5 by the year 2004.

Although private school classroom teachers represented 13 percent of total classroom teachers in 1992, private school enrollment was 11 percent of total enrollment. This indicates that private schools have more teachers for a given number of students than do public schools; that is, private school pupil-teacher ratios are smaller than public school pupil-teacher ratios.

Chapter 6

Expenditures of Public Elementary and Secondary Schools

Current expenditures are projected to increase by 36.7 percent and average annual teacher salaries in public elementary and secondary schools are projected to increase by 12.9 percent between school years 1990–91 and 2003–2004 in the middle set of projections presented in this chapter. These projections are based on assumptions concerning economic growth and assistance by state governments to local governments; these assumptions are discussed in this chapter. Other sets of projections, based on alternative economic scenarios, are also discussed. No projections for private schools are presented as there are no regular data collections for private school expenditures.

Current Expenditures

Past Trends

Current expenditures, which had already been in a period of growth, have continued to increase since 1978–79. Current expenditures, in constant 1991–92 dollars, amounted to $159.4 billion in 1978–79. These expenditures reached $208.0 percent in 1990–91, an increase of 30.5 percent, and are estimated to reach $211.9 billion in 1992–93, an estimated increase of 33.0 percent from 1978–79 (table 34 and figure 51). From 1978–79 to 1990–91, current expenditures per pupil in average daily attendance rose 32.7 percent to $5,413 (table 34 and figures 52 and 53). Current expenditures per pupil in average daily attendance increased an estimated 31.3 percent from 1978–79 to 1992–93. Current expenditures per pupil in fall enrollment (table 35) increased 34.7 percent from 1978–79 to 1990–91.

Historically, education expenditures have followed a path similar to general economic trends. For most of the period since 1978–79, the economy has been rising. Current expenditures have also been rising during that period. (See figure 54 for a comparison of the growth rates of current expenditures per pupil and one major indicator of the state of the economy, disposable income per capita.)

The amount that local governments spend on education is also historically associated with the amount of state education aid to local governments. There was also a rapid rise in state education aid to local governments during the period from 1978–79 to 1990–91. (See figure 55 for a comparison of the growth rates of current expenditures per pupil and revenue receipts from state sources per capita).

The only time in the past 15 years in which current expenditures decreased was from 1978–79 to 1981–82. The following three events may account for part of that decline. First, disposable income per capita and state education aid per capita were in periods of either slow growth or decline at that time. Second, this was the period of the "tax revolt," when many voters expressed their displeasure at the spending habits of state or local governments by voting for measures that would limit taxes or spending. It was also a period of high inflation, when state and local governments may have had difficulty anticipating the rapid rise in school costs.

Current expenditures have increased each year since 1981–82. The percent increase has not been constant over that time however. Most of the largest of the percent increases occurred from 1984–85 to 1988–89. That was the period when disposable income per capita and state education aid per capita were also increasing most rapidly. Since 1988–89, current expenditures have not been increasing as rapidly. Disposable income per capita and state education aid per capita have been increasing at lower rates than in the mid-1980s as well.

The percentage of total disposable income spent on public elementary and secondary school current expenditures is virtually the same in 1990–91 as it was in 1978–79 (4.9 percent in both years). This percentage was not stable during this period however. It fell from 4.9 percent in 1978–79 to 4.3 percent in 1983–84 before beginning to rise again. The year 1983–84 is also important because average daily attendance that year reached its lowest level since 1962–63 and has been increasing annually since then.

Continuing an earlier trend, current expenditures per pupil as a percentage of disposable income per capita rose from 27.9 percent in 1978–79 to an estimated 31.8 percent in 1990–91.

Alternative Projections

The level of spending on elementary and secondary education has followed a path similar to the economic climate of the nation and the amount of revenue receipts provided by state governments to local governments for education. Regression equations were used to develop the forecasts for current expenditures, with a measure of the state of the economy (disposable income per capita) and the amount of revenue receipts from state sources for

education used as two factors associated with current expenditures. Several plausible growth paths for disposable income per capita and revenue receipts from state sources were used to produce alternative sets of projections for current expenditures. Hence, the forecasts for current expenditures depend on the forecasts for these inputs. Another important factor is that the relationships that have existed among the variables in the past continue throughout the projection period.

Three sets of projections are presented for current expenditures in this chapter. These sets of forecasts are based on alternative projections for disposable income per capita and local government revenue receipts from state sources per capita. The U.S. Quarterly Model of the economic consulting firm DRI/McGraw-Hill (DRI) was used in developing forecasts of both disposable income per capita and revenue receipts from state sources. The assumptions underlying each set of alternative projections for current expenditures are described briefly. For more information about these assumptions and about the methodology used to compute these forecasts, see appendix A5. The values of disposable income per capita and local government revenue receipts from state sources per capita are shown in Appendix B.

The middle alternative projections are based on the assumptions that disposable income per capita will increase at rates between 0.7 and 1.4 percent during the period from 1993–94 to 2003–2004 and that revenue receipts from state sources per capita will increase at rates between 0.7 percent and 4.4 percent.

The low alternative projections are based on the assumptions that disposable income per capita will change at rates between -1.3 and 1.2 percent and that revenue receipts from state sources per capita will increase at rates between 0.0 percent and 2.4 percent.

The high alternative projections are based on the assumptions that disposable income will increase at rates between 0.7 and 3.9 percent and that revenue receipts from state sources will increase at rates between 0.8 percent and 5.4 percent.

A third factor influencing the growth in current expenditures in these projections is the ratio of enrollment (as measured by average daily attendance) to the population. The same projections for enrollment and the population are used in the production of all sets of projections for current expenditures presented in this chapter.

Enrollments are projected to increase steadily during the forecast period. With enrollments rising, communities should have less money to spend per pupil than if enrollments had remained unchanged. However, this expected increase in enrollment should also have a strong positive effect on total expenditures. With enrollments expected to rise, total expenditures should grow at a higher rate than expenditures per pupil.

The projections in this chapter are presented in both constant 1991–92 dollars and in current dollars. The projections were developed in constant dollars and then placed in current dollars using projections for the Consumer Price Index (CPI). Three alternative sets of projections for the

CPI were developed, one for each of the alternative sets of projections for current expenditures. These three alternative sets of projections for the CPI were developed simultaneously with the alternative sets of projections for disposable income per capita using the U.S. Quarterly Model. Since the set of projections for the CPI developed for use with the low alternative projections is rising at the fastest rate and that developed for use with the high alternative projections is rising at the slowest rate, it will frequently be the case that the current dollar projections from the low alternative set of projections are higher than those from the other two alternative sets of projections.

In the middle alternative projections, current expenditures in constant 1991–92 dollars are projected to grow slowly at first, as the economy comes out of the downturn of the early 1990s, and then continue to rise thereafter, reaching $284.4 billion in 2003–2004. This is an increase of 36.7 percent over the 1990–91 level, and a 34.2 percent over the estimated level for 1992–93.

Current expenditures per pupil in average daily attendance are projected to increase by 14.9 percent to $6,218 from 1990–91 to 2003–2004 (table 34 and figures 51 and 51). The projected rate of increase is not steady from 1990–91 to 2003–2004. With the slow economic growth of the early 1990s, current expenditures per pupil is estimated to have dropped slightly from 1990–91 to 1992–93. Current expenditures per pupil is projected to increase each year after that. As mentioned above, due to the increases projected for enrollments, total current expenditures are projected to increase more rapidly than expenditures per pupil.

In the middle alternative projection, total current expenditures as a percentage of total disposable income are projected to increase from 4.9 percent in 1990–91 to 5.3 percent in 2003–2004. One cause of this projected increase is the 19.0-percent increase in enrollment projected for this period.

Current expenditures per pupil as a percentage of disposable income per capita are also projected to increase, from 31.8 percent to 32.7 percent. This increase is smaller than that which occurred from 1978–79 to 1990–91. The rapid increase projected for enrollment compared with the increase projected for the population (19.0 percent for enrollment, 13.4 percent for the population) is one cause of this relatively small increase.

In the low alternative projections, both disposable income per capita and revenue receipts from state sources are projected to increase more slowly than in the middle set of projections. As a result, both current expenditures and current expenditures per pupil are projected to increase more slowly than in the middle set of projections. Current expenditures are projected to increase by 29.1 percent from 1990–91 to 2003–2004 reaching $268.6 billion at the end of the forecast period. Current expenditures per pupil in average daily attendance are projected to increase by 8.5 percent to $5,874.

In current dollars, current expenditures are projected to reach $317.9 billion dollars in 1997–98 using the low alternative projections. This is greater than the amount

projected for 1997–98 using the middle set of alternative projections. This happens because the set of projections for the Consumer Price Index (CPI) used to place the low set of projections for current expenditures into current dollars is rising at a faster rate than the set of CPI projections used to place the middle set of projections for current expenditures into current dollars.

In the high alternative projections, both disposable income per capita and revenue receipts from state sources are projected to increase more rapidly than in the middle set of projections. Current expenditures are projected to increase by approximately 43.8 percent to $299.2 billion in 2003–2004. Current expenditures per pupil in average daily attendance are projected to increase by 20.9 percent to $6,543.

When examined in current dollars, the current expenditures projections for 1997–98 from the high alternative projections are less than those from the low alternative projections because the 1997–98 projection for the CPI is so much lower for the high alternative set of projections for current expenditures.

Teacher Salaries

Past Trends

The period from 1978–79 to 1992–93 has been dominated by three different patterns for teacher salaries in constant dollars (table 36 and figures 56 and 57).

Teacher salaries, already in a period of decline, fell 7.1 percent from 1978–79 to 1980–81, from $30,340 to $28,171 (average annual salary) in constant 1991–92 dollars. The period of greatest decline coincided with the period when the decline in enrollments was greatest. (See figure 58 for a comparison of the growth rates for teacher salaries and average daily attendance.) It also coincided with the period when the economy and current expenditures were falling. (See figure 59 for a comparison of the growth rates for teacher salaries and current expenditures per pupil.)

After this period of decline, teacher salaries entered a period of steady and relatively rapid growth. From 1980–81 to 1986–87, teacher salaries increased 17.2 percent, from $28,171 to $33,011. During this period, the revenues of state governments were increasing rapidly. It was during that period when enrollment, which had also been in a period of steady decline, began increasing again.

Since 1986–87, teacher salaries increased only 4.0 percent, with a 0.2 percent decline occurring from 1989–90 to 1991–92. Since 1986–87, the economy and revenues of state and local governments have not been increasing as rapidly as in the middle of the 1980s.

In the 1970s, the number of people preparing to become teachers was much greater than the number of openings for newly qualified teachers. The drop in teacher salaries during this time may be attributed, in part, to excess supply. Then the number of people preparing to become teachers

dropped, and eventually, the decline in teacher salaries stopped. Some of the increase in teacher salaries that occurred during the 1980s may be a result of the reforms enacted to encourage more people to enter the teaching profession.

Alternative Projections

As with current expenditures, a multiple linear regression model was developed for teacher salaries. Teacher salaries are seen as being related to current expenditures and enrollments. (See appendix A5.) Also like current expenditures, these projections depend on the projections of these inputs, and assume that the relationships that have existed among the variables in the past will continue throughout the projection period.

Three sets of alternative projections of teacher salaries—middle, low, and high—have been developed. Each alternative is based on one of the alternative sets of projections for current expenditures presented earlier in this chapter.

The projections for average daily attendance were produced by using the growth rates of the projections for fall enrollment presented in chapter 1. The same projections for average daily attendance were used for each of the three sets of projections for teacher salaries. Enrollments are projected to increase throughout the projection period, with the greatest percent increase occurring in the early and mid-1990s.

As with current expenditures, the three alternative sets of projections for the Consumer Price Index (CPI) developed using the U.S. Quarterly Model were used to place the constant dollar projections into current dollars. As the set of projections for the CPI developed for use with the low alternative projections is rising at the most rapid rate and that developed for use with the high alternative projections is rising at the slowest rate, in some years, the current dollar teacher salary projections from the low alternative set of projections are higher than those from the other two alternative sets of projections.

In the middle alternative projections, the average teacher salary in constant 1991–92 dollars is projected to reach $38,572 in 2003–2004 (table 36 and figure 56). This is a 12.4-percent increase from the level estimated for 1992–93. The greatest percent increases in salaries are projected to occur from 1993–94 to 1996–97. One reason for this is that this period is when the most rapid increases in enrollments are projected (figure 56).

In the low alternative projections, teacher salaries are projected to rise slowly throughout the projection period. The average salary is projected to reach $37,121 in 2003–2004, an increase of about 8.2 percent from 1992–93. (See figure 57 for a comparison of the growth rates for the alternative sets of projections.)

In the high alternative projections, the average teacher salary is projected to reach $39,939 in 2003–2004, an increase of about 16.4 percent.

Chapter 7

Expenditures of Institutions of Higher Education

The steady growth in higher education expenditures that has marked the 1980s is expected to continue throughout the 1990s. Key assumptions behind these projections are that the economy continues to grow at a steady rate, that inflation rates remain near current levels, and that enrollments increase as in the middle alternative projections presented in chapter 2. Projections based on alternative economic scenarios are discussed below.

The higher education system is examined by both control of institution (public versus private) and by type of institution (4-year versus 2-year). For each of these sectors of higher education, two different types of expenditures—current-fund expenditures and educational and general expenditures—are examined. All expenditure data have been adjusted for inflation. Since the historical trends and the projections of current-fund expenditures and educational and general expenditures are very similar, emphasis is given to current-fund expenditures.

Past Trends

Following a well-established trend, current-fund expenditures have increased significantly since 1978–79 (table 37 and figure 60). In real terms, current-fund expenditures increased 47.3 percent from 1978–79 to 1990–91. (1990–91 is the last year for which there are actual data.) From 1978–79 to 1992–93, current-fund expenditures are estimated to have increased 56.1 percent. The rate of increase in current-fund expenditures during this period has not been consistent. There have been years of rapid growth and slow growth, and even decline. Factors that can be associated with current-fund expenditures during these periods include: (1) the economy as a whole, and, for public institutions, the economic situation of state and local governments; (2) the inflation rate; and (3) enrollments.

Current-fund expenditures grew slowly from 1978–79 to 1981–82. During that period, current–fund expenditures increased 0.9 percent. from $102.4 billion to $103.3 billion in constant 1991–92 dollars. The economy was in a period of slow growth at that time. One measure of the state of the economy, disposable income per capita, rose only 1.5 percent. Inflation was also increasing rapidly. The average annual inflation rate for that period was over 10 percent as measured by the Consumer Price Index.

Current-fund expenditures have risen steadily since 1981–82. From 1981–82 to 1990–91, current-fund expenditures increased 45.9 percent.

The greatest increases occurred from 1981–82 to 1986–87, when current–fund expenditures rose 27.2 percent. The economy was increasing steadily during that period with disposable income per capita rising 11.1 percent.

Much of the 14.7 percent increase that occurred from 1986–87 to 1990–91 was due to the rapid increase in enrollments that occurred during that time. The number of students as measured by full-time-equivalent enrollment rose 10.1 percent. From 1981–82 to 1986–87, full-time-equivalent enrollment rose by 0.6 percent.

While current-fund expenditures in both public and private institutions rose, they did not rise at the same rate. From 1978–79 to 1990–91, current-fund expenditures increased 40.9 percent in public institutions and 59.9 percent in private institutions.

For the period under examination, educational and general expenditures have been an almost constant percentage of current-fund expenditures (about 78 percent). Hence, the trend for educational and general expenditures is virtually identical to that for current-fund expenditures (table 38 and figure 61). Total educational and general expenditures in constant dollars increased 46.5 percent from 1978–79 to 1990–91. There was a 38.4 percent increase in educational and general expenditures in public colleges from 1978–79 to 1990–91 and a 64.6 percent increase in private colleges.

Since the trends of current-fund expenditures for the different sectors show some differences, the data are examined separately for each sector, except private 2-year institutions. Expenditures are examined both as a total and per student in full-time-equivalent (FTE) enrollment.

The trend for private 2-year projections is not shown separately because there have been significant additions to the universe of private 2-year institutions since 1978–79. Private 2-year institutions comprise the smallest of the higher education sectors. In 1990–91, they accounted for only 0.9 percent of total current-fund expenditures and 2.0 percent of FTE enrollment.

Public 4-Year Institutions

The trend for current-fund expenditures in public 4-year institutions is very similar to that for all institutions (table 39). The period from 1978–79 to 1981–82 saw

current-fund expenditures falling 0.1 percent. Since then, current expenditures have increased steadily. From 1981-82 to 1990-91 current-fund expenditures increased 42.3 percent. As with the trend for all institutions, the most rapid growth occurred from 1981-82 to 1986-87 when current-fund expenditures rose 25.0 percent. During that time, full-time-equivalent enrollment increased by only 2.1 percent.

When current-fund expenditures are examined on a per student basis, a somewhat different pattern emerges. With the slowing down of the economy, the rise in inflation, and the increase in enrollment, current-fund expenditures per student fell 5.2 percent from 1978-79 to 1981-82. As with total current-fund expenditures, current-fund expenditures per student rose each year from 1981-82 to 1990-91. Almost all of the increase occurred from 1981-82 to 1986-87 when current-fund expenditures per student rose 22.5 percent. From 1986-87 to 1990-91, when FTE enrollment rose 10.3 percent, current-fund expenditures per student only rose 3.1 percent.

The trend for educational and general expenditures (table 40) is similar to that for current-fund expenditures.

Public 2-Year Institutions

Public 2-year institutions show a similar trend to public 4-year institutions (table 41). There was a 1.2 percent decrease in current-fund expenditures in public 2-year institutions from 1978-79 to 1981-82. This was followed by an 18.3 percent increase from 1981-82 to 1986-87. A further 15.8 increase occurred from 1986-87 to 1990-91, when enrollments rose 13.5 percent.

As with public 4-year current-fund expenditures, a somewhat different pattern emerges when public 2-year current-fund expenditures are placed in per student terms. With total current-fund expenditures falling 1.2 percent and enrollments rising 12.7 percent, current-fund expenditures per student fell 12.3 percent from 1978-79 to 1981-82. Between 1981-82 and 1986-87, current-fund expenditures per student rose 22.6 percent. From 1986-87 to 1990-91, current-fund expenditures per student rose only 2.0 percent.

The trend for educational and general expenditures (table 42) is similar to that for current-fund expenditures.

Private 4-Year Institutions

From 1977-78 until 1981-82, current-fund expenditures in private 4-year institutions rose 3.0 percent. Like public institutions, current-fund expenditures rose rapidly throughout the rest of the 1980's. From 1981-82 to 1990-91, current-fund expenditures rose 55.5 percent (table 43).

With the increase in the number of students and the slowdown in the economy, expenditures per student fell 2.3 percent from 1977-78 to 1981-82. Since then, current-fund expenditures per student have been rising. From 1981-82 to 1986-87, current-fund expenditures per student rose 31.9 percent. After that, as enrollments increased, current expenditures per student have continued to increase, but

not at as rapid a rate. From 1986-87 to 1990-91, current expenditures per student rose 7.9 percent.

The trend for educational and general expenditures (table 44) is similar to that for current-fund expenditures.

Alternative Projections

Projections have been prepared for each of the sectors of higher education. With the exception of the private 2-year sector, these projections have been developed using regression models. In most cases, expenditures per student are seen as being related to the state of the economy (as measured by either disposable income per capita or the revenues of state and local governments per capita), the inflation rate, and enrollments. (For more details, see appendix A6.) Hence, the forecasts for higher education expenditures depend on the forecasts for these three types of inputs. Another important factor is that the relationships that have existed among the variables in the past continue throughout the projection period.

Three sets of projections are presented in this chapter. Each is based on an alternative set of assumptions for the state of the economy, specifically, a different growth path for either disposable income per capita or the revenues of state and local governments per capita. These alternative scenarios for the state of the economy were developed using the U.S. Quarterly Model developed by DRI/McGraw-Hill.

The middle alternative projections are based on the assumption that the economy continues to grow at a steady rate (disposable income per capita increases each year at a rate between 0.7 and 1.4 percent and the revenues of state and local governments per capita increase at rates between 0.6 percent and 3.9 percent.) Two alternative sets of projections were developed to show the impact of various economic scenarios. In the low alternative, the economy grows at a lower rate than in the middle alternative set of projections. The growth rate of disposable income per capita varies between -1.3 and 1.2 percent and that for the revenues of state and local governments per capita varies between 0.2 and 3.1 percent. In the high alternative, the economy enters a period of rapid growth and disposable income grows at rates between 0.7 and 3.9 percent and the revenues of state and local governments per capita grow at rates between 0.7 and 5.7 percent.

The three alternative sets of projections are also based on alternative projections for the inflation rate. The projections for the inflation rate were also developed using the U.S. Quarterly Model. For the forecast period, they range from 2.9 percent to 4.0 percent for the middle alternative, 4.0 percent to 5.2 percent for the low alternative, and 2.5 percent to 3.7 percent for the high alternative. The projections of the enrollment are those for the middle alternative projections for full-time-equivalent enrollment presented in chapter 2.

The projections in this chapter are presented in both constant 1991-92 dollars and in current dollars. The projections were developed in constant dollars and then

placed in current dollars using projections for the Consumer Price Index (CPI). Three alternative sets of projections for the CPI were developed, one for use with the middle alternative projections, one for use with the low alternative projections, and one for use with the high alternative projections. These three alternative sets of projections for the CPI were developed using the U.S. Quarterly Model. As the set of projections for the CPI developed for use with the low alternative projections is rising at the most rapid rate and that developed for use with the high alternative projections is rising at the slowest rate, it is frequently the case that the current dollar projections from the low alternative set of projections are higher than those from the other two alternative sets of projections.

Due to the short time series of consistent data, only one set of projections was produced for private 2-year institutions. This was included in each of the alternative projections. The set of projections for private 2-year institutions is not examined separately.

All of the alternative projections indicate an increase in current-fund expenditures throughout the remainder of the century. In the middle alternative projection, current-fund expenditures are projected to reach $214.0 billion in 2003–2004. This is a 41.9 percent increase from 1990–91, the last year for which there are actual data. In the low alternative projection, current-fund expenditures are projected to increase to $211.9 billion. In the high alternative projection, the figure for 2003–2004 is $216.6 billion.

A similar pattern is seen for educational and general expenditures. In the middle alternative projection, educational and general expenditures are projected to be $162.9 billion in 2003–2004, a 38.3 percent increase from 1990–91. In the low alternative projection, educational and general expenditures are projected to increase to $160.9 billion. In the high alternative projection, the figure for 2003–2004 is $165.5 billion.

Public 4-Year Institutions

There are only small differences in the trends among the various sectors of higher education. In public 4-year institutions, current-fund expenditures are projected to reach $112.3 billion in the middle alternative projection

in 2003–2004 (table 40). This is a 41.9 percent increase from 1990–91 to 2003–2004. In the low alternative projection, the value for 2003–2004 is $111.7 billion and in the high alternative projection, it is $113.3 billion.

Since full-time-equivalent (FTE) enrollment is projected to increase by 13.9 from 1990–91 to 2003–2004, the rate of increase for expenditures is lower on a per student basis. In the middle alternative projection, a 24.6 percent increase is projected for the period from 1990–91 to 2003–2004 compared with 23.9 percent for the low alternative projection and 25.7 percent for the high alternative projection. The most rapid increases are projected to occur from 1994–95 to 1997–98, when the declines in FTE enrollments are projected.

Public 2-Year Institutions

Expenditures are also seen as increasing in public 2-year institutions. For instance, in the middle alternative projection, current-fund expenditures are projected to reach $21.8 billion in 2003–2004 and expenditures per student are projected to increase to $6,711. When the low alternative projection is used, with its lower growth path for revenues of state and local governments per capita, lower values for current expenditure are found. When the high alternative projection is used, with its higher growth path for revenues of state and local governments per capita, higher values are found. The most rapid increases for expenditures per student are projected to occur from 1994–95 to 1996–97, when the slowest growth in FTE enrollments is projected.

Private 4-Year Institutions

The trends for private 4-year institutions exhibit the same patterns as other types of institutions. Total current-fund expenditures are seen as increasing each year. In the middle alternative projection, from 1990–91 to 2003–2004, they are projected to increase 46.3 percent. Current-fund expenditures per student are projected to increase 26.9 percent during the same time. The most rapid growth for expenditures per student is projected to occur from 1994–95 to 1996–97, when FTE enrollments are projected to decline.

Projection Methodology

The general procedure for *Projections* was to express the variable to be projected as a percent of a "base" variable. These percents were then projected and applied to projections of the "base" variable. For example, the number of 18-year-old college students was expressed as a percent of the 18-year-old population for each year from 1972 through 1991. This percent was then projected through the year 2004 and applied to projections of the 18-year-old population from the Bureau of the Census.

Enrollment projections are based primarily on population projections. Projections of classroom teachers, high school graduates, earned degrees conferred, and expenditures are based primarily on enrollment projections.

Single exponential smoothing, double exponential smoothing, and multiple linear regression are the three major projection techniques used in this publication. Single exponential smoothing is used when the historical data have a basically horizontal pattern. On the other hand, double exponential smoothing is used when the time series is expected to change linearly with time. In general, exponential smoothing places more weight on recent observations than on earlier ones. The weights for observations decrease exponentially as one moves further into the past. As a result, the older data have less influence on projections. The rate at which the weights of older observations decrease is determined by the smoothing constant selected.

$$P = \alpha X_t + \alpha(1-\alpha)X_{t-1} + \alpha(1-\alpha)^2 X_{t-2} + \alpha(1-\alpha)^3 X_{t-3} + \ldots$$

Where:

P = projected constant

α = smoothing constant $(0 < \alpha < 1)$

X_t = observation for time t

This equation illustrates that the projection is a weighted average based on exponentially decreasing weights. For a high smoothing constant, weights for earlier observations decrease rapidly. For a low smoothing constant, decreases are more moderate. Projections of enrollments and public high school graduates are based on a range of smoothing constants $(\alpha = 0.2 \text{ to } 0.9)$.

In general, the projections in this publication are based on fairly high smoothing constants. The farther apart the observations are spaced in time, it is more likely that there are changes in the underlying social, political, and economic structure. Since the observations are on an annual basis, major shifts in the underlying process are more likely in the time span of just a few observations than if the observations were available on a monthly or weekly basis. As a result, the underlying process tends to be unstable from one observation to the next. Another reason for using high smoothing constants for some time series is that most of the observations are fairly accurate, because most observations are population values rather than sample estimates. Therefore, large shifts tend to indicate actual changes in the process rather than noise in the data.

Multiple linear regression was also used in making projections, primarily in the areas of teachers, earned degrees, and expenditures. This technique was used when it was believed that a strong causal relationship existed between the variable being projected (the dependent variable) and independent causal variables. However, this technique was used only when accurate data and reliable projections of the independent variables were available.

The functional form primarily used was the multiplicative model. When used with two independent variables, this model takes the form:

$$Y = aX_1^{b_1}X_2^{b_2}$$

This equation can easily be transformed into the linear form by taking the natural log(ln) of both sides of the equation:

$$\ln Y = \ln(a) + b_1\ln X_1 + b_2\ln X_2$$

The multiplicative model has a number of advantages: it is a reasonable way to represent human behavior. Constant elasticities are assumed; this says that a 1 percent change in ln X will lead to a given percent change in ln Y. This percent change is equal to b_1. And it lends itself easily to "a priori" analysis because the researcher does not have to worry about units of measurement when specifying relationships. In fact, the multiplicative model is considered the standard in economic problems. For additional information, see *Long-Range Forecasting: From Crystal Ball to Computer* by J. Scott Armstrong (John Wiley and Sons, 1978, pp. 180–181).

Caveats

Because projections are subject to errors from many sources, alternative projections are shown for some statistical series. These alternatives are not statistical confidence

intervals, but instead represent judgments made by the authors as to reasonable upper and lower bounds for each projected series. Alternative projections were developed for higher education enrollment, classroom teachers, earned degrees conferred, and expenditures in public elementary and secondary schools and institutions of higher education.

Assumptions

All projections are based on underlying assumptions, and these assumptions determine projection results to a large extent. It is important that users of projections understand the assumptions to determine the acceptability of projected time series for their purposes. In each chapter, there are descriptions of the primary assumptions upon which the projections of time series are based.

For most projections, low, middle, and high alternatives are shown. These alternatives reveal the level of uncertainty involved in making projections, and they also point out the sensitivity of projections to the assumptions on which they are based.

Many of the projections in this publication are demographically based. Bureau of the Census middle series projections of the population by age were used. These middle series population projections are based on the 1990 census. The future fertility rate assumption, which determines projections of the number of births, is the key assumption in making population projections. The middle series population projections assume an ultimate complete cohort fertility rate of 2.15 births per woman by the year 2050 and a net immigration of 880,000 per year. This assumption plays a major role in determining population projections for the age groups enrolled in nursery school, kindergarten, and elementary grades. The effects of the fertility rate assumption are more pronounced toward the end of the projection period.

For enrollments in secondary grades and college, the fertility assumption is of no consequence, since all students enrolled at these levels were already born when the population projections were made. For projections of enrollments in elementary schools, only middle series population projections were considered. Projections of high school graduates are based on projections of the number of high school graduates expressed as a percent of grade 12 enrollment. Projections of associate, bachelor's, master's (women), doctor's (women), and first-professional (women) degrees are based on projections of college-age populations and higher education enrollment, by sex, attendance status and level enrolled by student, and by type of institution. Many of the projections of classroom teachers and expenditures of public elementary and secondary schools and institutions of higher education are based on projections of disposable income per capita and various revenue measures of state and local governments. Disposable income per capita projections were obtained from DRI/McGraw-Hill. Therefore, the many assumptions made in projecting disposable income per capita also apply to those projections based on projections of disposable income per capita.

A1. Enrollment

Enrollment projections were based on projected enrollment rates, by age and sex, which were applied to population projections by age and sex developed by the Bureau of the Census. These enrollment rates were projected by taking into account the most recent trends, as well as the effects of economic conditions and demographic changes on a person's decision to enter college. The enrollment rates were then used in an interactive forecasting model (IFMOD), which consists of age-specific rates by sex and by enrollment levels (nursery school through college). The model has 5 stages. See figure 62.

The first stage of IFMOD is an age-specific enrollment model in which enrollment rates are projected and applied to age-specific population projections. This stage, which is used separately for each sex, includes the following categories: (1) nursery and kindergarten, (2) elementary grades 1-8, (3) secondary grades 9-12, (4) full-time college enrollment, and (5) part-time college enrollment. For each of these enrollment categories, enrollment rates were projected by individual ages 3 through 24 and for the age groups 25 to 29, 30 to 34, and 35 years and over.

Enrollments by age and age groups from the Bureau of the Census were adjusted to NCES totals to compute enrollment rates for 1972 through 1991. Different assumptions were made to produce low, middle, and high alternative projections of enrollment rates to the year 2004.

Elementary Grades 1-8

Projections of elementary enrollment rates were considered for ages 5 through 21. Elementary enrollments are negligible for the remaining ages. Because most elementary enrollment rates have been fluctuating at levels close to 100 percent from 1972 to 1991, alternative enrollment rate projections were not computed. The only set of enrollment rate projections computed was based on the assumption that rates will remain constant through the year 2004 (table A1.1). Several of the rates in table A1.1 exceed 100 percent, as a result of several factors. The enrollment data by age were prorated to agree with NCES totals. The Bureau of the Census does not revise enrollment estimates by age, but population estimates are revised regularly.

Secondary Grades 9-12

Projections of secondary enrollment rates were considered for ages 12 through 34. Secondary enrollments are negligible for the remaining ages. Secondary enrollment rates have fluctuated within a narrow range from 1972 to 1991. Therefore, alternative enrollment rate projections were not calculated. The only set of projections computed was based on constant enrollment rates (table A1.2).

College Full-Time and Part-Time Enrollment

Projections of full-time and part-time college enrollments were considered only for ages 16 and over. (College enrollment is negligible for earlier ages.) Three alternative projections were made using various assumptions. Table A1.3 shows enrollment rates for 1991 and low, middle, and high alternative projected enrollment rates for 1999 and 2004.

Table A1.4 shows the equations used to project enrollment rates for 18-year-old men enrolled part-time and 20-year-old men enrolled part-time. Table A1.5 shows the equation used to project enrollment rates for 18-year-old women enrolled part-time.

Enrollment in Public Elementary and Secondary Schools, by Grade Group and Organizational Level

The third stage of IFMOD projects public enrollment in elementary and secondary schools by grade group and by organizational level. Public enrollments by age were based on enrollment rate projections for nursery and kindergarten, grade 1, elementary ungraded and special, secondary ungraded and special, and postgraduate enrollment. Grade retention rate projections were used for grades 2 through 12. Table A1.6 shows the public school enrollment rates and table A1.7 shows the public grade-retention rates for 1991 and projections for 1999 and 2004. The projected rates in tables A1.6 and A1.7 were used to compute the projections of enrollments in elementary and secondary schools, by grade, shown in table 1.

College Enrollment, by Sex, Attendance Status, and Level Enrolled; and by Type and Control of Institution

The fourth stage of IFMOD projects enrollments in institutions of higher education, by sex, attendance status, and level enrolled by student and by type and control of institution. For each age group, the percent that enrollment by age, attendance status, level enrolled, and by type of institution was of total enrollment was projected. These projections are shown in tables A1.8 and A1.9, along with actual values for 1991. For all projections, it was assumed that there was no enrollment in 2-year institutions at the postbaccalaureate level (graduate and first-professional).

The projected rates in tables A1.8 and A1.9 were then adjusted to agree with the projected age-specific enrollment

120

rates in the first stage of IFMOD. The adjusted rates were then applied to the projected enrollments by age group, sex, and attendance status from the first stage of IFMOD to obtain projections by age group, sex, attendance status, level enrolled, and type of institution.

For each enrollment category—sex, attendance status, level enrolled, and type of institution—the percent that public enrollment was of total enrollment was projected. These projections are shown in table A1.10, along with actual percent for 1991 and projections for 1999 and 2004. The projected rates shown were then applied to the projected enrollments in each enrollment category to obtain projections by control of institution.

For each enrollment category by sex and enrollment level, and by type and control of institution, the percent that graduate enrollment was of postbaccalaureate enrollment was projected. Actual rates for 1991 and projections for 1999 and 2004 are shown in table A1.11. The projected rates in table A1.11 were then applied to projections of postbaccalaureate enrollment to obtain graduate and first-professional enrollment projections by sex and attendance status, and by type and control of institution.

Full-Time-Equivalent Enrollment, by Type and Control of Institution and by Level Enrolled

The fifth stage of IFMOD projects full-time-equivalent enrollment, by type and control of institution and by level enrolled. For each enrollment category by level enrolled and by type and control of institution, the percent that the full-time-equivalent of part-time enrollment was of part-time enrollment was projected. Actual percents for 1991 and projections for 1999 and 2004 are shown in table A1.12.

These projected percents were applied to projections of enrollment by level enrolled and by type and control of institution from the fourth stage of IFMOD. The projections of the full-time-equivalent of part-time enrollment were added to projections of full-time enrollment (from the previous stage) to obtain projections of full-time-equivalent enrollment.

Projection Accuracy

An analysis of projection errors from the past ten editions of *Projections of Education Statistics* indicates that the mean absolute percentage errors (MAPEs) for lead times of 1, 2, 5, and 10 years out for projections of public school enrollment in grades K–12 were 0.4, 0.6, 1.1, and 2.3 percent, respectively. For the 1-year-out prediction, this means that one would expect the projection to be within 0.4 percent of the actual value, on the average. For projections of public school enrollment in grades K–8, the MAPEs for lead times of 1, 2, 5, and 10 years were 0.6, 0.9, 1.1, and 3.6 percent, respectively, while

those for projections of public school enrollment in grades 9–12 were 0.6, 0.6, 1.2, and 3.5 percent for the same lead times.

For projections of enrollment in higher education, an analysis of projection errors based on the past seven editions of *Projections of Education Statistics* indicates that the MAPEs for lead times of 1, 2, and 5 years were 1.8, 3.8, and 4.1 percent, respectively. For the 1-year-out prediction, this means that one would expect the projection to be within 1.8 percent of the actual value, on the average.

Basic Methodology

The notation and equations that follow describe the basic models used to project public elementary and secondary enrollment.

Public Elementary and Secondary Enrollment

Let:

i = Subscript denoting age

j = Subcript denoting grade

t = Subscript denoting time

K_t = Enrollment at the nursery and kindergarten level

G_{jt} = Enrollment in grade j

G_{1t} = Enrollment in grade 1

E_t = Enrollment in elementary special and ungraded programs

S_t = Enrollment in secondary special and ungraded programs

PG_t = Enrollment in postgraduate programs

P_{it} = Population age i

RK_t = Enrollment rate for nursery and kindergarten

RG_{1t} = Enrollment rate for grade 1

RE_t = Enrollment rate for elementary special and ungraded programs

RS_t = Enrollment rate for secondary special and ungraded programs

RPG_t = Enrollment rate for postgraduate programs

EG_t = Total enrollment in elementary grades (K–8)

SG_t = Total enrollment in secondary grades (9-12)

R_{jt} = Retention rate for grade j: the proportion that enrollment in grade j in year t is of enrollment in grade j-1 in year t-1.

Then:

$$EG_t = K_t + E_t + \sum_{i=1}^{8} G_{it}$$

$$SG_t = S_t + PG_t + \sum_{i=9}^{12} G_{it}$$

Where:

K_t = $RK_t(P_{5t})$

G_{it} = $R_{it}(G_{i-1,t-1})$

$$E_t = RE_t \left(\sum_{i=5}^{13} P_{it} \right)$$

G_{it} = $RG_{it}(P_{6t})$

$$S_t = RS_t \left(\sum_{i=14}^{17} P_{it} \right)$$

PG_t = $RPG_t(P_{18t})$

Higher Education Enrollment

For institutions of higher education, projections were computed separately by sex and attendance status of student. The notation and equations are:

Let:

i = Subscript denoting age except:

i = 25: ages 25-29

i = 26: ages 30-34

i = 27: ages 35 and over for enrollment (35-44 for population)

t = Subscript denoting year

E_{it} = Enrollment of students age i

P_{it} = Population age i

R_{it} = Enrollment rate for students age i

T_{it} = Total enrollment for particular subset of students: full-time men, full-time women, part-time men, part-time women

Then:

$$T_{it} = \sum_{i=16}^{27} E_{it}$$

Where:

E_{it} = $R_{it}(P_{it})$

Methodological Tables

The tables in this section give the rates used to calculate projections of enrollments, basic assumptions underlying enrollment projections (table A1.13), and methods used to estimate values for which data are not available (table A1.14).

Private School Enrollment

Projections of private school enrollment were derived in the following manner. For 1992, the ratio of private school enrollment to public school enrollment was calculated by grade level. These 1992 ratios were then held constant over the projection period. These ratios were then applied to projections of public school enrollment by grade level to yield projections of private school enrollment. This method assumes that the future pattern in the trend of private school enrollment will be the same as that in public school enrollment. The reader is cautioned that a number of factors could alter the assumptions of constant ratios over the projection period.

Table A1.4.—Equations for selected college enrollment rates of men, by age and attendance status

Equation	R^2	Durbin-Watson statistic [1]	Estimation technique
RTPT18M $=$ $-0.019 + 0.00109UR1619 + 0.00000205PCI92$ (3.3) (4.4)	0.70	2.4	OLS [2]
RTPT20M $=$ $-0.0167 + 0.000004PCI92$ (7.0)	0.68	1.7	OLS [2]

$R^2 =$ Coefficient of determination.

[1] For an explanation of the Durbin-Watson statistic, see J. Johnston, *Econometric Methods*, New York: McGraw-Hill, 1972, pages 251–252.

[2] OLS equals Ordinary Least Squares.

Where:

RTPT18M	= Enrollment rate of 18-year-old males enrolled part-time
RTPT20M	= Enrollment rate of 20-year-old males enrolled part-time
UR1619	= Unemployment rate of 16- to 19-year-olds
PCI92	= Disposable income per capita in 1991-92 dollars

NOTE: Numbers in parentheses are t-statistics. The time period of observations used in the equations is from 1967 to 1991.

Table A1.5.—Equation for selected college enrollment rates of women, by age and attendance status

Equation	R^2	Durbin-Watson statistic [1]	Estimation technique
RTPT18W = -0.0108 + 0.0000036PCI92 (6.3)	0.63	1.7	OLS [2]

R^2 = Coefficient of determination.

[1] For an explanation of the Durbin-Watson statistic, see J. Johnston, *Econometric Methods*, New York: McGraw-Hill, 1972, pages 251-252.

[2] OLS equals Ordinary Least Squares.

Where:

RTPT18W = Enrollment rate of 18-year-old females enrolled part-time

PCI92 = Disposable income per capita in 1991-92 dollars

NOTE: Numbers in parentheses are t-statistics. The time period of observations used in the equations is from 1967 to 1991.

Table A1.6.—Enrollment rates in public schools, by grade level

Grade level	Population base age	1991	Projected	
			1999	2004
Kindergarten	5	99.0	97.3	97.3
Grade 1	6	96.6	96.7	96.7

Table A1.11.—Graduate enrollment as a percent of total postbaccalaureate enrollment, by sex and attendance status, and by type and control of institution

Enrollment categoy	Men			Women		
	1991	1999	2004	1991	1999	2004
Full-time, 4-year, public	77.6	71.1	76.1	81.4	80.6	80.6
Part-time, 4-year, public	98.8	98.9	98.9	99.5	99.5	99.5
Full-time, 4-year, private	58.3	57.1	57.1	66.5	65.1	65.1
Part-time, 4-year, private	91.6	91.7	91.7	95.5	95.6	95.6

Table A1.12.—Full-time-equivalent of part-time enrollment as a percent of part-time enrollment, by level enrolled and by type and control of institution

Enrollment category	1991	1999	2004
Public, 4-year, undergraduate	40.0	40.1	40.1
Public, 2-year, undergraduate	33.6	33.6	33.6
Private, 4-year, undergraduate	40.0	39.8	39.8
Private, 2-year, undergraduate	39.0	39.4	39.4
Public, 4-year, graduate	36.2	36.2	36.2
Private, 4-year, graduate	38.1	38.1	38.1
Public, 4-year, first-professional	60.0	57.1	57.1
Private, 4-year, first-professional	54.2	56.1	56.1

Table A1.13.—Enrollment (assumptions)

Variables	Assumptions	Alternatives	Tables
Elementary and Secondary enrollment	Age-specific enrollment rates will remain constant at levels consistent with the most recent rates.	Middle (no alternatives)	1, 2
	Public enrollment rates and public grade retention rates will remain constant at levels consistent with the most recent rates.	Middle (no alternatives)	1, 2
	The percentage of 7th and 8th grade public students enrolled in school organized as secondary schools will remain constant at levels consistent with the most recent rates.	Middle (no alternatives)	2
College full-time and part-time enrollment, by age			
Men	Age-specific enrollment rates for the younger age cohorts will increase over the projection period, while those for the older age groups are expected to remain constant at levels consistent with the most recent rates or increase slightly.	Middle	3-5 9-16
	Age-specific enrollment rates will equal the middle alternative rate or change at a slower rate.	Low	3-5 9-16
	Age-specific enrollment rates will either equal the middle alternative or increase at a faster rate, based on past trends.	High	3-5 9-16
Women	Age-specific enrollment rates for the younger age cohorts will increase over the projection period, while those for the older age groups are expected to increase slightly.	Middle	3-5 9-16
	Age-specific enrollment rates will equal the middle alternative rate or change at a slower rate.	Low	3-5 9-16
	Age-specific enrollment rates will either equal the middle alternative or increase at a faster rate, based on past trends.	High	3-5 9-16
College enrollment, by sex, attendance status, and level enrolled by student, and by type of institution	For each group and for each attendance status separately, enrollment by sex and level enrolled by student, and by type of institution as a percent of total enrollment, will follow past trends through 2004. For each age group and attendance status category, the restriction that the sum of the percentages must equal 100 percent was applied.	High, middle, and low	3-5 9-16
College enrollment, by control of institution	For each enrollment category, by sex, attendance status, and level enrolled by student, and by type of institution, public enrollment as a percent of total enrollment will remain constant at levels consistent with the most recent rates.	High, middle, and low	3-5 9-16
Graduate enrollment	For each enrollment category, by sex and attendance status of student, and by type and control of institution, graduate enrollment as a percent of postbaccalaureate enrollment will remain constant at levels consistent with the most recent rates.	High, middle, and low	17
Full-time-equivalent of part-time enrollment	For each enrollment category, by type and control of institution and level enrolled by student, the percent that full-time-equivalent of part-time enrollment is of part-time enrollment will remain constant at levels consistent with the most recent rates.	High, middle, and low	23-25

Table A1.14.—Enrollment (estimation methods)

Variables	Years	Estimation method	Tables
Enrollment in private elementary and secondary schools, by level	1988 1989 1990	Grade-by-grade data for private elementary, secondary, and combined schools were aggregated to estimate private school enrollment by grade level.	1 2
Enrollment in institutions of higher education, by age and attendance status	1984 1989 1992	For each sex, enrollment data from the Bureau of Census by individual ages and by attendance status for 2-year age groups were combined by assuming that within the 2-year age groups, age and attendance status were distributed independently. The resultant enrollment estimates by age and attendance status were then adjusted to NCES enrollment counts by attendance status.	6 7 8

A2. High School Graduates

Projections of public high school graduates were developed in the following manner. The number of public high school graduates was expressed as a percent of grade 12 enrollment in public schools for 1972 to 1991. This percent was projected using single exponential smoothing and applied to projections of grade 12 enrollment to yield projections of high school graduates in public schools. (The dropout rate is not related to this percent. This percent does not make any assumptions regarding the dropout rate.) The grade 12 enrollment was projected based on grade-by-grade retention rates and population projections developed by the Bureau of the Census. This percent was assumed to remain constant at levels consistent with the most recent rates. This method assumes that past trends in factors affecting graduation will continue over the projection period.

Projections of private high school graduates were derived in the following manner. For 1991–92, the ratio of private high school graduates to public school graduates was calculated. The ratio for 1991–92 was held constant over the projection period. It was then applied to projections of public high school graduates to yield projections of private high school graduates. This method assumes that the future pattern of private high school graduates will be the same as that of public high school graduates. The reader should be aware that a number of factors could alter the assumption of a constant ratio over the projection period.

Projection Accuracy

An analysis of projections from models used in the past ten editions of *Projections of Education Statistics* indicates that the mean absolute percentage errors (MAPEs) for projections of public high school graduates were 0.6 percent for 1 year ahead, 1.1 percent for 2 years ahead, and 1.9 percent for 5 years ahead. For the 2-year-ahead prediction, this means that one would expect the projection to be within 1.1 percent of the actual value, on the average.

134

A3. Earned Degrees Conferred

Projections of associate and bachelor's degrees by sex and master's, doctor's, and first-professional degrees for women were based on demographic models that relate degree awards to college-age populations and college enrollment by level enrolled and attendance status. Projections of master's, doctor's, and first-professional degrees for men were based on the author's evaluation of past and most recent changes in the historical data and the likely impact these changes would have on future trends.

Associate Degrees

Associate degree projections by sex were based on undergraduate enrollment by attendance status in 2-year institutions. Results of the regression analysis used to project associate degrees by sex are shown in table A3.1.

Bachelor's Degrees

Bachelor's degree projections by sex were based on the 18- to 24-year-old population, 25- to 34-year-old population, and undergraduate enrollment by attendance status in 4-year institutions. Results of the regression analysis used to project bachelor's degrees by sex are shown in table A3.2.

Master's Degrees

Master's degree projections for women were based on the 35- to 44-year-old population and part-time graduate enrollment in 4-year institutions. Results of the regression analysis used to project master's degrees for women are shown in table A3.3. Projections of master's degrees awarded to men were calculated as the average of the low and high alternatives. (The low alternative assumes that master's degrees awarded to men will increase by 3,000 degrees through 1995-96, decrease by 3,000 degrees through 2001-2002, and then hold steady through 2003-2004. The high alternative assumes that master's degrees awarded to men will increase by 9,000 degrees through 1995-96, decrease by 9,000 degrees through 2001-2002, and then hold steady through 2003-2004.)

Doctor's Degrees

Doctor's degree projections for women were based on the 35- to 44-year-old population, graduate enrollment by attendance status in 4-year institutions, and a time trend variable. Results of the regression analysis used to project doctor's degrees for women are shown in table A3.4. Projections of doctor's degrees awarded to men were cal-

culated as the average of the low and high alternatives. (The low alternative assumes that doctor's degrees awarded to men will decrease by 1,400 degrees per year through 2003-2004. The high alternative assumes that doctor's degrees awarded to men will remain around 27,000 degrees over the projection period.)

First-Professional Degrees

First-professional degree projections for women were based on first-professional enrollment by attendance status in 4-year institutions. Results of the regression analysis used to project first-professional degrees for women are shown in table A3.5. Projections of first-professional degrees awarded to men were calculated as the average of the low and high alternatives. (The low alternative assumes that first-professional degrees awarded to men will decrease by 100 degrees through 1998-99 and hold steady through 2003-2004. The high alternative assumes that first-professional degrees awarded to men will increase by 300 degrees through 1995-96, fall by 100 degrees through 1998-99, and then decrease by 200 degrees through 2003-2004.)

Methodological Tables

These tables describe equations used to calculate projections (tables A3.1 through A3.5), and basic assumptions underlying projections (table A3.6).

Projection Accuracy

An analysis of projection errors from similar models used in the past eight editions of *Projections of Education Statistics* indicates that mean absolute percentage errors (MAPEs) for bachelor's degree projections were 2.2 percent for 1 year out, 3.5 percent for 2 years out, and 4.2 percent for 5 years out. For the 1-year-out prediction, this means that one would expect the projection to be within 2.2 percent of the actual value, on the average. For first-professional degrees, the MAPEs were 2.6, 2.6, and 1.6 percent, respectively. For doctor's degrees, based on the past seven editions of *Projections of Education Statistics*, the MAPEs were 2.8, 4.6, and 3.3 percent, respectively. MAPEs for master's degrees, based on the past six editions of *Projections of Education Statistics*, were 2.7, 5.0, and 4.7, respectively. MAPEs for associate degrees, based on the past four editions of *Projections of Education Statistics*, were 1.5 percent for 1 year out, 2.7 percent for 2 years out, and 5.6 percent for 3 years out.

Table A3.1.—Equations for associate degrees

		Equation		R^2	Durbin-Watson statistic[1]	Estimation technique
Men	ASSOCM	=	$16{,}056.2 + 180.2\text{UGFTM2} + 21.4\text{UGPTM2}$ (6.0) (2.2)	0.86	1.7	OLS[2]
Women	ASSOCW	=	$-1{,}773.3 + 281.9\text{UGFTW2}$ (42.6)	0.99	1.3	OLS[2]

R^2 = Coefficient of determination.

A4. Classroom Teachers

Public Classroom Teachers

Numbers of public elementary and secondary classroom teachers were projected using a model similar to that used in *Projections of Education Statistics to 2003*, only the coefficients were re-estimated. The number of public school teachers was projected separately for the elementary and secondary levels. The elementary teachers were modeled as a function of disposable income per capita, local education revenue receipts from state sources per capita, and elementary enrollment. Secondary teachers were modeled as a function of disposable income per capita, education revenue receipts from state sources per capita (lagged 3 years), and secondary enrollment. Both disposable income per capita and local education revenue receipts from state sources were in constant 1991–92 dollars.

The equations in this section should be viewed as forecasting rather than structural equations, as the limitations of time and available data precluded the building of a large-scale, structural teacher model. The particular equations shown were selected on the basis of their statistical properties, such as coefficients of determination (R^2s), the t-statistics of the coefficients, the Durbin-Watson statistic, and residual plots.

The multiple regression technique used yields good projections only if the relationships that existed among the variables in the past continue throughout the projection period.

The public elementary classroom teacher model is:

$$ELTCH = b_0 + b_1 PCI92 + b_2 SGRANT + b_3 ELENR$$

where:

ELTCH is the number of public elementary classroom teachers.

PCI92 is disposable income per capita in 1991–92 dollars;

SGRANT is the level of education revenue receipts from state sources per capita in 1991–92 dollars; and

· ELENR is the number of students enrolled in public elementary schools.

Each variable affects the number of teachers in the expected way. As people receive more income, the state spends more money on education, and as enrollment increases, the number of elementary teachers hired increases.

The public secondary classroom teacher model is:

$$SCTCH = b_0 + b_1 PCI92 + b_2 SGRANT3 + b_3 SCENR$$

where:

SCTCH is the number of public secondary classroom teachers;

PCI92 is disposable income per capita in 1991–92 dollars;

SGRANT3 is the level of education revenue receipts from state sources per capita in 1991–92 dollars, lagged 3 years, and;

SCENR is the number of students enrolled in public secondary schools.

Each variable affects the number of teachers in the expected way. As people receive more income, the state spends more money on education, and as enrollment increases, the number of secondary teachers hired increases.

Table A4.1 summarizes the results for the elementary and secondary public teacher models.

Enrollment is by organizational level, not by grade level. Thus, secondary enrollment is not the same as grade 9–12 enrollment because some states count some grade 7 and 8 enrollment as secondary. The distribution of the number of teachers is by organizational level, not by grade span.

Private Classroom Teachers

Projections of private classroom teachers were derived in the following manner. For 1992, the ratio of private school teachers to public school teachers was calculated by organizational level. These 1992 ratios were held constant over the projection period. The ratios were then applied to projections of public school teachers by organizational level to yield projections of private school teachers. This method assumes that the future pattern in the trend of private school teachers will be the same as that for public school teachers. The reader is cautioned that a number of factors could alter the assumption of constant ratios over the projection period.

The total number of public school teachers, enrollment by organizational level, and education revenue receipts from state sources used in these projections were from the Common Core of Data (CCD) survey conducted by NCES. The proportion of teachers by organizational level was taken from the National Education Association and then applied to the total number of teachers from CCD to produce the number of teachers by organizational level. The number of private classroom teachers was obtained

127

from "Public and Private Elementary and Secondary Education Statistics: School Year 1992–93," *Early Estimates.*

Disposable income was obtained from DRI/McGraw-Hill and population data were from the Bureau of the Census.

Projection Accuracy

An analysis of projection errors from the past ten editions of *Projections of Education Statistics* indicated that the mean absolute percentage errors (MAPEs) for projections of classroom teachers in public elementary and secondary schools were 0.9 percent for 1 year out, 1.4 percent for 2 years out, 3.2 percent for 5 years out, and 2.6 percent for 10 years out. For the 2-year-ahead prediction, this means that one would expect the projection to be within 1.4 percent of the actual value, on the average.

Table A4.1.—Equations for public elementary and secondary classroom teachers

		Equation	R^2	Durbin-Watson statistic [1]	Estimation technique
Elementary	ELTCH	$= -312.3 + 0.044PCI92 + 0.5SGRANT$ (7.1) (2.6) $+ 0.03ELENR$ (10.6)	0.99	1.0	OLS [2]
Secondary	SCTCH	$= -221.3 + 0.03PCI92 + 0.2SGRANT3$ (8.7) (2.2) $+ 0.04SCENR$ (21.9)	0.98	1.7	OLS [2]

$R^2 =$ Coefficient of determination.

[1] For an explanation of the Durbin-Watson statistic, see J. Johnston. *Econometric Methods*, New York: McGraw-Hill, 1972, pages 251–252.

[2] OLS equals Ordinary Least Squares.

Where:

ELTCH   =Number of public elementary classroom teachers
SCTCH   =Number of public secondary classroom teachers
PCI92   =Disposable income per capita in 1991–92 dollars

SGRANT   =Education revenue receipts from state sources per capita
SGRANT3   =Education revenue receipts from state sources per capita lagged 3 years
ELENR   =Number of students enrolled in public elementary schools
SCENR   =Number of students enrolled in public secondary schools

NOTE: Numbers in parentheses are t-statistics. The time period of observations used in the equation for elementary teachers is from 1960 to 1992. The time period used in the equation for secondary teachers is from 1965 to 1992.

A5. Expenditures of Public Elementary and Secondary Schools

Econometric techniques were used to produce the projections for current expenditures and average teacher salaries. The equations in this chapter should be viewed as forecasting, rather than structural, equations. The limitations of time and available data precluded the building of large-scale, structural, models. The particular equations shown were selected on the basis of their statistical properties, such as coefficients of determination (R^2's), the t-statistics of the variables, the Durbin-Watson statistic, and residual plots.

The multiple regression technique used yields good forecasting results only if the relationships that existed among the variables in the past continue throughout the projection period.

The Elementary and Secondary School Current Expenditure Model

There has been a large body of work, both theoretical and empirical, on the demand for local public services such as education. The elementary and secondary school current expenditure model is based on this work.

The model that is the basis for the elementary and secondary school current expenditure model has been called the median voter model. In brief, the theory states that spending for each public good in the community (in this case, education), reflects the preferences of the "median voter" in the community. This individual is identified as the voter in the community with the median income and median property value. Hence, the amount of spending in the community reflects the price of education facing the voter with the median income, as well as his income and tastes. There are competing models in which the level of spending reflects the choices of others in the community, such as the "bureaucrats." The median voter model was chosen as the basis of the elementary and secondary school current expenditure model as it has been the one most thoroughly studied.

There have been many empirical studies of the demand for education expenditures using the median voter model. In most instances, researchers have used cross-sectional data. The elementary and secondary school current expenditure model was built on the knowledge gained from these cross-sectional studies and was adapted from them for use in a time series study.

In a median voter model, the demand for education expenditures is typically linked to four different types of variables: 1) measures of the income on the median voter; 2) measures of intergovernmental aid for education going indirectly to the median voter; 3) measures of the price to the median voter of providing one more dollar

of education expenditures per pupil; and 4) any other variables that may affect one's tastes for education. The elementary and secondary school current expenditure model contains variables reflecting the first three types of variables. The model is:

$$\ln(CUREXP) = b_0 + b_1\ln(PCI) + b_2\ln(SGRANT) + b_3\ln(ADAPOP)$$

where:

ln indicates the natural log;

CUREXP equals current expenditures of public elementary and secondary schools per pupil in average daily attendance in constant 1991–92 dollars;

PCI equals disposable income per capita in constant 1991–92 dollars;

SGRANT equals local governments' education revenue receipts from state sources, per capita, in constant 1991–92 dollars; and

ADAPOP equals the ratio of average daily attendance to the population.

The model was estimated using a method for correcting for autocorrelation —the maximum likelihood search procedure of the program Regression Analysis of Time Series (RATS). This was done because the test statistics were significantly better than those from the ordinary least squares (OLS) estimation, and the Durbin-Watson statistic was in the inconclusive region when the model was estimated using OLS. This is the second edition of *Projections of Education Statistics* in which this method of estimation, rather than OLS, was used. Ordinary least squares was used in the previous four editions of *Projections of Education Statistics*. The sample period was from 1959–60 to 1990–91. All variables were placed in log form, as the test statistics were superior for that form and there is some evidence from the cross-sectional studies that the log form is superior.

There are potential problems with using a model for local government education expenditures for the nation as a whole. Two such problems concern the variable SGRANT. First, the amount of money which local governments receive for education from state government varies substantially by state. Second, the formulas used to apportion state moneys for education among local governments vary by state.

Beginning in 1988–89, there was a major change in the survey form used to collect data on current expenditures.

This new survey form produces a more complete measure of current expenditures: therefore, the values for current expenditures are not completely comparable to the previously collected numbers. In a crosswalk study, data for a majority of states were also collected for 1986–87 and 1987–88 that were comparable to data from the new survey form. A comparison of these data with those from the old survey form suggests that the use of the new survey form may have increased the national figure for current expenditures by approximately 1.4 percent over what it would have been if the survey form had not been changed. When the model was estimated, all values for current expenditures before 1988–89 were increased by 1.4 percent.

The results for the model are shown in table A5.1. Each variable affects current expenditures in the direction that would be expected. As people receive more income, either directly (PCI) or from the state government (SGRANT), the level of spending increases. As the number of pupils increases relative to the population (that is, as ADAPOP increases), the level of spending per pupil falls.

From the cross-sectional studies of the demand for education expenditures, we have an estimate of how sensitive current expenditures are to changes in PCI and ADAPOP. We can compare the results from this model v 1 those from the cross-sectional studies. For this model, an increase in PCI of 1 percent, with SGRANT and ADAPOP held constant, would result in an increase of current expenditures per pupil in average daily attendance of approximately 0.52 percent. With PCI and SGRANT held constant, an increase of 1 percent in ADAPOP would result in a decrease in current expenditures per pupil in average daily attendance of approximately 0.37 percent. Both numbers are well within the range of what has been found in other studies.

The results from this model are not completely comparable with those from the previous editions of *Projections of Education Statistics*. That is because there was a change in the definition of the disposable income.

Projections for total current expenditures were made by multiplying the projections for current expenditures per pupil in average daily attendance by projections for average daily attendance. The projections for total current expenditures were divided by projections for fall enrollment to produce projections of current expenditures per pupil in fall enrollment. Current-dollar projections were produced by multiplying the constant-dollar projections by projections for the Consumer Price Index.

Three alternative sets of projections for current expenditures are presented: the middle alternative projections: the low alternative projections: and the high alternative projections. The alternative sets of projections differ because of varying assumptions about the growth paths for disposable income and revenue receipts from state sources.

The alternative sets of projections for the economic variables including disposable income were developed using variations of three economic scenarios developed by DRI for use on its U.S. Quarterly Model. The U.S. quarterly model is an econometric model of the U.S.

economy developed by DRI for the personal computer which projects more than 1,200 economic concepts. Periodically, DRI supplies alternative economic scenarios of the economy, including long-term scenarios. Users have the option of either producing projections directly from the scenarios supplied by DRI or first altering some of the underlying assumptions of the scenarios and then producing the projections. The most recent series of long-term scenarios (February 1993) was used as bases for the three sets of alternative economic projections used here, although there were some changes in the underlying assumptions.

DRI's trend scenario was used as a base for the middle alternative projections of the economic variables. DRI's trend scenario depicts a mean of possible paths that the economy could take over the forecast period, barring major shocks. The economy, in this scenario, evolves smoothly, if unspectacularly. The only change from DRI's trend scenario was that the most recent middle set of population projections as developed by the Bureau of the Census was substituted for DRI's population projections.

DRI's pessimistic scenario was used as a base for the low alternative projections. As with the middle set of projections, the Bureau of the Census' recent middle set of population projections was substituted for DRI's population projections. For the low alternative projections, some changes were made in some of DRI's assumptions concerning personal income that resulted in lower projections for disposable income.

Similarly, DRI's optimistic scenario was used as a base for the high alternative projections. The Bureau of the Census' recent middle set of population projection was substituted for DRI's population projections and some changes were made in some of DRI's assumptions concerning personal income that resulted in higher projections for disposable income.

Hence, using DRI's U.S. Quarterly Model and their February 1993 long-term scenarios, three sets of projections, the middle alternative projections, the low alternative projections, and the high alternative projections, were developed for the economic variables.

In the middle alternative projections, disposable income per capita rises each year from 1993–94 to 2003–2004 at rates between 0.7 and 1.4 percent. In the low alternative projections, disposable income per capita ranging between -1.3 and 1.2 percent and in the high alternative projections disposable income per capita rises at rates between 0.7 and 3.9 percent.

Projections for revenue receipts from state sources were produced using two different methods. For the middle alternative projections and high alternative projections, projections for revenue receipts from state sources were produced using an econometric model. The low alternative projections were produced by using the same method used to produce the low projections presented in the previous edition of *Projections of Education Statistics*.

The model for revenue receipts from state sources is:

$$\text{SGRANT} = b_0 + b_1 \text{PERTAX1} + b_2 \text{BUSTAX1} + b_3 \text{ADAPOP} + b_4 \text{ININCR}$$

where:

SGRANT equals local governments' education revenue receipts from state sources, per capita, in constant 1991–92 dollars;

PERTAX1 equals personal taxes and nontax receipts to state and local governments, per capita, in constant 1991–92 dollars lagged one period;

BUSTAX1 equals indirect business taxes and tax accruals, excluding property taxes, to state and local governments, per capita, in constant 1991–92 dollars lagged one period;

ADAPOP equals the ratio of average daily attendance to the population; and

ININCR equals the rate of change in the inflation rate measured by the Consumer Price Index.

This equation was estimated using ordinary least squares for the sample period from 1960–61 to 1990–91. The results for the model are shown in table A5.1.

The values of the coefficients in this model follow expectations. As state governments receive more revenue (higher PERTAX1 and BUSTAX1), they have more money to send to local governments for education. As the enrollment increases relative to the population (higher ADAPOP), so does the amount of aid going to education. Finally, in years with rapidly increasing inflation (higher ININCR), the real dollar values of revenue receipts from state governments to local governments would fall, other things being equal.

Two alternative projections were produced for SGRANT using this model. Each is based on a different set of projections for personal taxes, business taxes, and the rate of change in the inflation rate. The middle set of projections was produced using the values for these variables from the middle set of alternative projections. The high set of projections was produced using the values from the high set of alternative projections. In the middle set of projections, personal taxes and nontax receipts increase at rates between 1.3 and 5.3 percent and indirect business taxes and tax accruals increase at rates between -0.1 and 3.0 percent. In the high set of projections, personal taxes and nontax receipts increase at rates between 1.5 and 8.7 percent, and indirect business taxes and tax accruals increase at rates between 0.0 and 3.9 percent.

A third scenario was produced using an alternative method: revenue receipts from state sources are assumed to increase at a rate equal to the growth rate of state and local purchases of goods and services as forecast by the low set of alternative projections. As elementary and secondary education's share of all state and local government expenditures has been steadily increasing, this method may result in an underestimate.

In the middle set of projections, revenue receipts from state sources increase at rates between 0.7 and 4.4 percent

for the period from 1993–94 to 2003–2004. In the low set of projections, they increase at rates between 0.0 and 2.4 percent. In the high set of projections, they increase at rates between 0.8 and 5.4 percent.

The Elementary and Secondary Teacher Salary Model

Most studies conducted on teacher salaries, like those on current expenditures, have used cross-sectional data. Unlike current expenditures models, however, the models for teacher salaries from these existing cross-sectional studies cannot easily be reformulated for use with time-series data. One problem is that we do not have sufficient information concerning the supply of qualified teachers who are not presently teaching. Hence, the elementary and secondary salary model contains terms that measure the demand for teachers in the economy.

The elementary and secondary teacher salary model is:

$$SALARY = b_0 + b_1 CUREXP + b_2 ADAPOP + b_3 DIFADA1$$

where:

SALARY equals the average annual salary of teachers in public elementary and secondary schools in constant 1991–92 dollars;

CUREXP equals current expenditures of public elementary and secondary schools per pupil in average daily attendance in constant 1991–92 dollars;

ADAPOP equals the ratio of average daily attendance to the population; and

DIFADA1 equals the change in average daily attendance lagged 1 period.

The model was estimated using the period from 1959–60 to 1990–91 as a sample period. To estimate the elementary and secondary teacher salary model, a method for correcting for autocorrelation—the maximum likelihood search procedure of the program RATS—was used. This was done because the test statistics were significantly better than those from the OLS estimations, and the Durbin-Watson statistic was in the inconclusive region when the model was estimated using OLS. The Durbin-Watson statistic, however, is still in the inconclusive range, suggesting that there still maybe a problem with autocorrelation.

Due to the effects caused by the change shown in survey forms, the values for current expenditures for 1959–60 to 1987–88 were increased by 1.4 percent.

The results for this model are also shown in table A5.1.

There is no literature for comparing the sizes of the coefficients. However, the direction of the impact each variable has on salaries is as expected: As the level of spending per pupil increases (higher CUREXP), more

teachers can be hired, so demand for teachers increases and salaries increase; as the number of students increases (higher ADAPOP and DIFADA1), demand for teachers increases, so salaries increase.

As for current expenditures, three different scenarios are presented for teacher salaries. The same projections for ADAPOP and DIFADA1 are used for each alternative projection; the sole difference between the projections is in the projection for current expenditures. The middle alternative projection for salaries uses the middle alternative projection for current expenditures. The low alternative projection for salaries uses the low alternative projection for current expenditures. The high alternative projection for salaries uses the high alternative projection for current expenditures.

Current expenditures, average teacher salaries, and the number of teachers are interrelated. Hence, an exercise was conducted to see whether the projections of these three time series were consistent.

The number of teachers was multiplied by the average salary and then divided by current expenditures for every school year from 1978–79 until 2003–2004 (using the middle alternative projection for teachers, salaries, and current expenditures). The resulting value shows the portion of current expenditures that is spent on teacher salaries. The portion of current expenditures that goes toward teacher salaries has been in a slow downward trend, with the teacher salary share falling from 42.0 percent in 1978–79 to 39.4 percent in 1990–91. With the projected values, the portion of current expenditures that go toward teacher salaries continues to fall slowly, falling to 39.4 percent in 2003–2004.

The results of this exercise indicate that the projections of these three time series are consistent.

Projection Accuracy

This is the sixth consecutive year in which *Projections of Education Statistics* has contained projections of current expenditures and teacher salaries. The actual values of current expenditures and teacher salaries can be compared with the projected values in the previous editions to examine the accuracy of the models.

The projections from the various editions of *Projections of Education Statistics* were placed in 1981–82 dollars using the Consumer Price Indices that appeared in each edition.

The projections for current expenditures presented in *Projections of Education Statistics to 1997–98* were produced by a model slightly different from the model used for the projections presented in this edition: calendar year data, rather than school year data, were used for disposable income, the population, and the Consumer Price Index. The independent variables used in *Projections of Education Statistics to 2000, Projections of Education Statistics to 2001: An Update, Projections of Education Statistics to 2002*, and *Projections of Education Statistics to 2003* were the same as those used in this edition. With this edition,

however, there was a change in the definition of disposable income. In *Projections of Education Statistics to 2003* and in the present edition, a method for correcting for autocorrelation was used to estimate the model. In the earlier four editions, ordinary least squares was used to estimate the model.

Mean absolute percentage errors (MAPEs) were calculated for current expenditures and current expenditures per pupil. The MAPEs for projections of current expenditures were 1.7 percent for the 1-year-ahead projections, 2.6 percent for the 2-years-ahead projections, 2.5 percent for the 3-years-ahead projection, 2.1 percent for the 4-years-ahead projection, and 0.6 percent for the 5-years-ahead projection. The MAPEs for current expenditures per pupil were 1.3 percent (1-year-ahead), 1.9 percent (2-years-ahead), 1.7 percent (3-years-ahead), 1.5 percent (4-years-ahead), and 0.8 percent (5-years-ahead).

Some of the differences between the actual values and the projected values for current expenditures and current expenditures per pupil are due to the change in the survey form for current expenditures that took place in 1988–89. The results of the crosswalk study suggest that values for current expenditures as presently collected are approximately 1.4 percent higher than they would have been if no change had been made. If the projections for 1988–89, 1989–90, and 1990–91 which appeared in *Projections of Education Statistics to 1997–98, Projections of Education Statistics to 2000, Projections of Education Statistics to 2001: An Update*, are increased by 1.4 percent, the MAPEs decrease. When this adjustment was made, the MAPEs for current expenditures were 1.0 percent (1-year-ahead), 1.6 percent (2-years-ahead), 1.2 percent (3-years-ahead), 0.7 percent (4-years-ahead), and 0.8 percent (5-years-ahead), and the MAPEs for current expenditures per pupil were 0.6 percent (1-year-ahead), 1.1 percent (2-years-ahead), 1.2 percent (3-years-ahead), 0.3 percent (4-years-ahead), and 0.6 percent (5-years-ahead).

Projections for teacher salaries also appeared in the four most recent editions of *Projections of Education Statistics*.

The projections of teacher salaries presented in the earlier editions were produced using a similar set of independent variables. The same set of independent variables was used to produce the projections in *Projections of Education Statistics to 2000*. In the other three editions of *Projections of Education Statistics* in which projections of teacher salaries appear, an additional variable, the change in average daily attendance lagged two periods, was also included. The projections presented in *Projections of Education Statistics to 1997–98* were produced by using calendar year data, rather than school year data, for the population and the Consumer Price Index.

The MAPEs for projections of teacher salaries were 1.2 percent (1-year-ahead), 2.0 percent (2-years-ahead), 2.4 percent (3-years-ahead), 4.0 (4-years-ahead), and 6.8 (5-years-ahead).

Sources of Past and Projected Data

Numbers from several different sources were used to produce these projections. In some instances, the time series used were made by either combining numbers from various sources or manipulating the available numbers. The sources and the methods of manipulation are described here.

The time series used for current expenditures was compiled from several different sources. For the school years ending in even numbers from 1959–60 to 1975–76, the numbers for current expenditures were taken from various issues of *Statistics of State School Systems*, published by NCES. The numbers for the school years ending in odd numbers during the 1960s were taken from various issues of the National Education Association's *Estimates of School Statistics*. For the school years ending in odd numbers during the 1970s, up to and including 1976–77, the numbers were taken from various issues of *Revenues and Expenditures for Public Elementary and Secondary Education*, published by NCES. For the school years from 1977–78 until 1990–91, the numbers were taken from the NCES Common Core of Data survey and unpublished data.

For 1974–75 and 1976–77, expenditures for summer schools were subtracted from the published figures for current expenditures. The value for 1972–73 was the sum of current expenditures at the local level, expenditures for administration by state boards of education and state departments of education, and expenditures for administration by intermediate administrative units.

Note that although the data from the different sources are similar, they are not entirely consistent. Also, the NCES numbers beginning with 1980–81 are not entirely consistent with the earlier NCES numbers, due to differing treatments of items such as expenditures for administration by state governments and expenditures for community services.

For most years, the sources for the past values of average daily attendance were identical to the sources for current expenditures. For 1978–79, the number was taken from *Revenues and Expenditures for Public Elementary and Secondary Education*.

Projections for average daily attendance for the period from 1991–92 to 2003–2004 were made by multiplying the projections for enrollment by the average value of the ratios of average daily attendance to the enrollment

from 1981–82 to 1990–91; this average value was approximately 0.93.

The values for fall enrollment from 1959–60 to 1977–78 were taken from issues of the NCES publication *Statistics of Public Elementary and Secondary Schools*. The 1978–79 value was taken from the *NCES Bulletin* of October 23, 1979, "Selected Public and Private Elementary and Secondary Education Statistics." The values from 1979–80 to 1991–92 were taken from the NCES Common Core of Data survey. The number for 1992–93 was taken from the 1992–93 *Early Estimates*. The projections for fall enrollment are those presented in Chapter 1.

For 1959–60 to 1990–91, the sources for revenue receipts from state sources were the two NCES publications *Statistics of State School Systems* and *Revenues and Expenditures for Public Elementary and Secondary Education* and the NCES Common Core of Data survey. The methods for producing the alternative projections for revenue receipts from state sources are outlined above.

The numbers for average teacher salaries were taken from various issues of the National Education Association's *Estimates of School Statistics*.

The projected values for disposable income, personal taxes and nontax receipts to state and local governments, and indirect business taxes and tax accruals to state and local governments, were developed using DRI/McGraw-Hill's U.S. Quarterly Model. Projected values of the Bureau of Labor Statistic's Consumer Price Index for all urban consumers, which was used for adjusting current expenditures, teacher salaries, revenue receipts from state sources, and the state revenue variables, were also developed using the U.S. Quarterly Model. DRI/McGraw-Hill supplied the historic values for these variables.

Both the historic and projected values for the population were supplied by the U.S. Bureau of the Census.

The values of all the variables from DRI were placed in school-year terms. The school-year numbers were calculated by taking the average of the last two quarters of 1 year and the first two quarters of the next year.

The Elementary and Secondary School Price Index was considered as a replacement for the Consumer Price Index for placing current expenditures and teacher salaries in constant dollars. As projections of the price index are required for placing the forecasts into current dollars, and as there are no projections of the Elementary and Secondary School Price Index, the Consumer Price Index was used.

Table A5.1.—Equations for current expenditures per pupil in average daily attendance, average annual salaries of teachers, and education revenue receipts from state sources

Dependent variable	Equation	$\bar{R}^2$	Durbin-Watson statistic	Estimation technique[*]	Rho
Current expenditures per pupil	$\ln(\text{CUREXP}) = -1.145 + 0.521\ln(\text{PCI}) + 0.651\ln(\text{SGRANT})$ $\quad\quad (-0.83)\quad (2.11)\quad\quad\quad (4.75)$ $\quad\quad - 0.374\ln(\text{ADAPOP})$ $\quad\quad (-2.91)$	0.997	1.886	AR1	0.368 (1.97)
Average annual salaries	$\text{SALARY} = -9429.4 + 4.22\text{CUREXP} + 134308\text{ADAPOP}$ $\quad\quad (-3.17)\quad (17.82)\quad\quad (10.27)$ $\quad\quad + 0.00082\text{DIFADA1}$ $\quad\quad (4.06)$	0.984	1.490	AR1	0.721 (4.71)
Education revenue receipts from state sources per capita	$\text{SGRANT} = -126.1 + 0.27\text{PERTAX1} + 0.31\text{BUSTAX1}$ $\quad\quad (-4.35)\quad (3.09)\quad\quad (1.93)$ $\quad\quad + 688\text{ADAPOP} - 13.6\text{ININCR}$ $\quad\quad (3.11)\quad\quad\quad (-3.49)$	0.992	1.965	OLS	

[*] OLS = Ordinary Least Squares. AR1 is an estimation procedure for correcting the problem of first-order autocorrelation. Specifically, the maximum likelihood procedure of the statistical program RATS was used to estimate rho. For a general discussion of the problem of autocorrelation, and the methods to correct it, see Johnston (1972), chapter 8. For a discussion of the method used to forecast in the presence of autocorrelation, see G. Judge, W. Hill, R. Griffiths, H. Lutkepohl, and T. Lee, *The Theory and Practice of Econometrics*, New York: John Wiley and Sons, 1985, pages 315-318.

NOTES: The sample size for revenue receipts from state sources is 31. The sample size for current expenditures and teacher salaries is 32. Numbers in parentheses are t-statistics. $\bar{R}^2$ = Coefficient of determination, adjusted for degrees of freedom. For an explanation of the Durbin-Watson statistic, see J. Johnston, *Econometric Methods*, New York: McGraw-Hill, 1972, pages 251–252. (This table was prepared June 1993.)

A6. Expenditures of Institutions of Higher Education

A total of eight higher education expenditure models was estimated: one current-fund expenditure model and one educational and general expenditure model for each of the four types of higher education institutions—public 4-year; public 2-year; private 4-year; and private 2-year. For all the sectors, except private 2-year, econometric techniques were used. Due to the lack of a consistent database for private 2-year schools, exponential smoothing, which requires fewer observations, was used.

The higher education econometric models were selected on the basis of their statistical properties, such as the coefficients of determination (R^2), the t-statistics of the variables, the Durbin-Watson statistic, and residual plots. These econometric models will yield good forecasting results only if the relationships that existed among the variables in the past continue throughout the projection period.

Higher Education Institutions Expenditure Models

Similar econometric models were developed for three types of institutions. While there has been significantly less work by economists studying the factors influencing higher education finance data than those influencing elementary and secondary finance data, there have been some valuable studies. This body of work was used in building these models.

In Chapter 7, some of the factors that are historically associated with the level of expenditures were discussed. These were: (1) the state of the economy; (2) the inflation rate; and (3) enrollments. Each of the models presented here contains variables measuring at least two of these three factors. Either disposable income per capita or revenues of state and local governments per capita was used to measure the state of the economy. Two measures of the inflation rate were considered: the rate of change in the inflation rate; or a dummy for years with inflation rates greater than 8 percent. In each equation, an enrollment variable was included.

For each dependent variable, a number of alternative specifications were examined. In each case, the choice of the final specification was made after considering such factors as the coefficients of determination, the t-statistics of the variables, residual plots, and ex-post mean absolute percent errors. The final specification of each model has the dependent variables and some of the independent variables as first differences. Linear and log-linear specifications were also examined.

The Public 4-Year Institutions Expenditure Models

The public 4-year institutions current-fund expenditure model is:

$$DPUTCUR4 = b_0 + b_1 DSTREV1 + b_2 DPUFTE4 + b_3 DUMMY$$

where:

DPUTCUR4 is the change in current-fund expenditures per student in full-time-equivalent (FTE) enrollment in public 4-year institutions in constant 1991–92 dollars;

DSTREV1 is the change in the sum of personal tax and nontax receipt: to state and local governments and indirect business taxes and tax accruals, excluding property taxes, to state and local governments, per capita, in constant 1991–92 dollars lagged one year;

DPUFTE4 is the change in FTE enrollment in public 4-year institutions; and

DUMMY is a dummy variable equaling 1 when the inflation rate is greater than 8 percent and 0 otherwise.

This model and the other econometric models were estimated using a sample period from 1968–69 to 1990–91. Ordinary least squares was used to estimate all the public institution models.

The results for this model are on table A6.1. Each variable affects current-fund expenditures in a logical fashion. The more revenues that state and local governments receive, the more expenditures they can make for public institutions of higher education. In a year with high inflation (DUMMY equals 1), current-fund expenditures in constant dollars are lower than they would have been otherwise. The more students in public 4-year institutions, the less money to be spent per student.

Three projections were produced: the middle alternative set of projections, the low alternative set of projections, and the high alternative set of projections. Each set of projections was based on a different set of assumptions for the revenues of state and local governments per capita. The projections for revenues of state and local governments per capita and the other economic variables used to produced the higher education expenditure projections were produced using the U.S. Quarterly Model of DRI/McGraw–Hill's (DRI). The development of these alternative sets of projections is discussed in Appendix A5.

In the middle set of alternative projections, the revenues of state and local governments per capita increase at rates

between 0.6 and 3.9 percent. In the low set of alternative projections, the revenues of state and local governments per capita increase at rates between 0.2 and 3.1 percent. In the high set of alternative projections, the revenues of state and local governments per capita increase at rates between 0.7 and 5.7 percent.

Projections for total current-fund expenditures were made by multiplying the projections for current-fund expenditures per student in FTE enrollment by projections for FTE enrollment. Current dollar projections were produced by multiplying the constant dollar projections by projections for the Consumer Price Index. All the higher education total expenditure projections and all the current dollar projections were calculated in similar fashion.

A model for educational and general expenditures of public 4-year institutions was developed using the same variables as the current-fund expenditure model. The model is:

$$DPUED4 = b_0 + b_1 DSTREV1 + b_2 DPUFTE4 + b_3 DUMMY$$

where:

DPUED4 is the change in educational and general expenditures per student in FTE enrollment in public 4-year institutions in constant 1991–92 dollars.

As with current-fund expenditures, each variable affects expenditures in the expected way.

The Public 2-Year Institutions Expenditure Models

The public 2-year institutions current-fund expenditure model has a form similar to the public 4-year institutions current-fund expenditure model except that the public 2-year institutions model does not contain any inflation variables. The model is:

$$DPUTCUR2 = b_0 + b_1 DSTREV1 + b_2 DPUFTE2$$

where:

DPUTCUR2 is the change in current-fund expenditures per student in FTE enrollment in public 2-year institutions in constant 1991–92 dollars; and

DPUFTE2 is the change in FTE enrollment in public 2-year institutions.

The results for this model are on table A6.1. Again, the DSTREV1 has the expected positive effect on expenditures and the FTE enrollment variable has the expected negative impact.

The public 2-year institutions educational and general expenditure model is virtually identical to its current-fund expenditures counterpart. It is:

$$DPUED2 = b_0 + b_1 DSTREV1 + b_2 DPUFTE2$$

where:

DPUED2 is the change in educational and general expenditures per student in FTE enrollment in public 2-year institutions in constant 1991–92 dollars.

The Private 4-Year Institutions Expenditure Models

The private 4-year institutions current-fund expenditure model is:

$$DPRTCUR4 = b_0 + b_1 DPCI + b_2 DPRFTE4 + b_3 ININCR$$

where:

DPRTCUR4 is the change in current-fund expenditures per student in FTE enrollment in private 4-year institutions in constant 1991–92 dollars;

DPRFTE4 is the change in FTE enrollment in private 4-year institutions to the population; and

ININCR is the rate of change in the inflation rate measured by the Consumer Price Index.

The model was estimated using a method for correcting for autocorrelation—the maximum likelihood search procedure of the program Regression Analysis of Time Series (RATS).

The three alternative sets of projections for current-fund expenditures were produced using varying assumptions about the growth paths for disposable income and the rate of change in the inflation rate measured by the Consumer Price Index. These disposable income and inflation rate projections were also developed using the U.S. Quarterly Model of DRI/McGraw-Hill.

In the middle set of projections, disposable income per capita rises each year from 1993–94 to 2003–2004 at rates between 0.7 and 1.4 percent. In the low set of projections, disposable income per capita increases at rates between -1.3 and 1.2 percent. In the high set of projections, disposable income per capita increases at rates between 0.7 and 3.9 percent.

In the middle set of projections, the inflation rate varies between 2.9 percent and 4.0 percent. In low set of projections, it varies between 4.0 percent and 5.2 percent, and in the high set of projections, it varies between 2.5 percent and 3.7 percent for the high alternative.

The private 4-year institutions educational and general expenditure model is:

$$DPRIED4 = b_0 + b_1 DPCI + b_2 DPRFTE4 + b_3 ININCR$$

DPRIED4 is the change in educational and general expenditures per student in FTE enrollment in private 4-year institutions in constant 1991–92 dollars.

The Private 2-Year Institutions Expenditure Models

Unlike the other higher education variables, econometric methods were not used for either private 2-year current-fund expenditures or private 2-year educational and general expenditures. This was due to a change in the sample universe for private 2-year institutions. The period for which the private 2-year universe is relatively consistent, from 1982–83 to 1990–91, has only nine observations. This is too short a period for econometric techniques, so another means of projecting private 2-year institution expenditures was required. Hence, exponential smoothing, which can operate with only nine observations, was used.

Both current-fund expenditures per student and educational and general expenditures per student were modeled using single exponential smoothing. To do this, the forecasting package Forecast Pro was used. For current-fund expenditures per student, a smoothing constant of 0.97 was used and for educational and general expenditures per student a smoothing constant of 1.00 was used.

Projection Accuracy

This is the third time in the past ten years that *Projections of Education Statistics* has contained projections of higher education expenditure data. The other two editions were the *Projections of Education Statistics to 2003* and *Projections of Education Statistics to 2000*. The projected values for 1990–91 that appeared in *Projections of Education Statistics to 2003* and the projected values for 1986–87 through 1990–91 which appeared in *Projections of Education Statistics to 2000* can be compared to the actual values. The projections that appeared in *Projections of Education Statistics to 2003* were developed using the same methodology as those presented here. Those that appeared in *Projections of Education Statistics to 2000* were produced using different models.

The projections for 1990–91 that appeared in *Projections of Education Statistics to 2003* were within one percent of the actual values. For total current-fund expenditures, the projected value was 0.1 percent higher than the actual value. For public 4-year institutions, the projection for current-fund expenditures was 0.6 percent higher than the actual value. For public 2-year institutions, the projection was 0.8 percent lower than the actual value. For private 4-year institutions, the projection was 0.5 percent lower than the actual value.

The projections that appeared in *Projections of Education Statistics to 2000* were not as close to the actual values as those that appeared in the more recent edition.

For all institutions in total, the projection for current-fund expenditures that appeared in *Projections of Education Statistics to 2000* was 3.6 percent lower than the actual value for 1986–87, 3.5 percent lower than the actual value for 1987–88, 2.5 percent lower than the actual value for 1988–89, 5.6 percent lower than the actual value for 1989–90, and 6.5 percent lower than the actual value for 1990–91.

For public 4-year institutions, the projection for current-fund expenditures was 3.6 percent lower than the actual value for 1986–87, 2.2 percent lower than the actual value for 1987–88, 1.1 percent lower than the actual value for 1988–89, 4.4 percent lower than the actual value for 1989–90, and 5.2 percent lower than the actual value for 1990–91.

For public 2-year institutions, the projection for current-fund expenditures was 2.1 percent higher than the actual value for 1986–87, 5.2 percent higher than the actual value for 1987–88, 4.3 percent higher than the actual value for 1988–89, 0.8 percent higher than the actual value for 1989–90, and 0.4 percent lower than the actual value for 1990–91.

For private 4-year institutions, the projection for current-fund expenditures was 5.0 percent lower than the actual value for 1986–87, 7.7 percent lower than the actual value for 1987–88, 6.6 percent lower than the actual value for 1988–89, 9.4 percent lower than the actual value for 1989–90, and 10.4 percent lower than the actual value for 1990–91.

Sources of Data

The current-fund expenditure data and the educational and general expenditure data are from the "Financial Statistics of Institutions of Higher Education" and the Integrated Postsecondary Education Data System (IPEDS), "Finance" surveys of the National Center for Education Statistics (NCES). One manipulation of the educational and general expenditures numbers was required. From 1968–69 to 1973–74, student-aid expenditures were a separate component of current-fund expenditures. From 1974–75 on, scholarships and fellowships have been a component of educational and general expenditures. Hence, for the period 1968–69 to 1973–74, student aid was added to the published numbers for educational and general expenditures.

The full-time-equivalent (FTE) enrollment data are from the "Fall Enrollment in Colleges and Universities" surveys of NCES. The FTE enrollment figures for 1968–69, 1969–70, and 1970–71 were estimated using part-time and full-time enrollment data. Full-time equivalent enrollment was derived by adding one-third of the part-time students to the number of full-time students.

The projected values for disposable income and the revenues of state and local governments per capita were developed using DRI/McGraw-Hill's U.S. Quarterly Model. Projected values of the Bureau of Labor Statistic's Consumer Price Index for all urban consumers, which were used for adjusting the higher education finance data, and the implicit price deflator for personal consumption expenditures, which was used for adjusting disposable income per capita, were also developed using the U.S.

Quarterly Model. DRI/McGraw-Hill supplied the historic values for these variables.

Both the historic and projected values for the population were supplied by the U.S. Bureau of the Census.

The Higher Education Price Index was considered as a replacement for the Consumer Price Index for placing the higher education expenditures in constant dollars. As projections of the price index are required for placing the forecasts into current dollars, and as there are no projections of the Higher Education Price Index, the Consumer Price Index was used.

The values of all of the variables from DRI were placed in academic-year terms. The data were available in quarterly format so the academic-year numbers were calculated by taking the average of the last 2 quarters of 1 year with the first 2 of the next year.

Table A6.1.—Equations for current-fund expenditures per student in full-time equivalent enrollment and educational and general expenditures per student in full-time equivalent enrollment in public 4-year institutions, public 2-year institutions, and private 4-year institutions

Dependent variable	Equation	R^2	Durbin-Watson statistic	Estimation technique*	Rho

2004	45,727	246,822	285.1	0.160

[1] Projections of average daily attendance were made by multiplying the forecasts for enrollment reported earlier in this publication by the average value of the ratio average daily attendance to the enrollment from 1982 to 1991, approximately 0.93 percent.

[2] Average daily attendance is estimated on the basis of past data.

[3] Projected.

Appendix C

Data Sources

Sources and Comparability of Data

The information in this report was obtained from many sources, including Federal and state agencies, private research organizations, and professional associations. The data were collected by many methods, including surveys of a universe (such as all colleges) or of a sample, and compilations of administrative records. Care should be used when comparing data from different sources. Differences in procedures, such as timing, phrasing of questions, and interviewer training mean that the results from the different sources are not strictly comparable. More extensive documentation of one survey's procedures than of another's does not imply more problems with the data, only that more information is available.

Accuracy of Data

The accuracy of any statistic is determined by the joint effects of "sampling" and "nonsampling" errors. Estimates based on a sample will differ from the figures that would have been obtained if a complete census had been taken using the same survey instruments, instructions, and procedures. Besides sampling errors, both surveys, universe and sample, are subject to errors of design, reporting, processing, and errors due to nonresponse. To the extent possible, these nonsampling errors are kept to a minimum by methods built into the survey procedures. In general, however, the effects of nonsampling errors are more difficult to gauge than those produced by sampling variability.

Sampling Errors

The standard error is the primary measure of sampling variability. It provides a specific range—with a stated confidence—within which a given estimate would lie if a complete census had been conducted. The chances that a complete census would differ from the sample by less than the standard error are about 68 out of 100. The chances that the difference would be less than 1.65 times the standard error are about 90 out of 100. The chances that the difference would be less than 1.96 times the standard error are about 95 out of 100. The chances that it would be less than 2.58 times as large are about 99 out of 100.

The standard error can help assess how valid a comparison between two estimates might be. The standard error of a difference between two sample estimates that are uncorrelated is approximately equal to the square root of the sum of the squared standard errors of the estimates. The standard error (se) of the difference between sample estimate "a" and sample estimate "b" is:

$$se_{a-b} = (se_a^2 + se_b^2)^{1/2}$$

Note that most of the standard errors in subsequent sections and in the original documents are approximations. That is, to derive estimates of standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, most of the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

Nonsampling Errors

Both universe and sample surveys are subject to nonsampling errors. Nonsampling errors are of two kinds—random and nonrandom. Random nonsampling errors may arise when respondents or interviewers interpret questions differently, when respondents must estimate values, or when coders, keyers, and other processors handle answers differently. Nonrandom nonsampling errors result from total nonresponse (no usable data obtained for a sampled unit), partial or item nonresponse (only a portion of a response may be usable), inability or unwillingness on the part of respondents to provide information, difficulty interpreting questions, mistakes in recording or keying data, errors of collection or processing, and overcoverage or undercoverage of the target universe. Random nonresponse errors usually, but not always, result in an understatement of sampling errors and thus an overstatement of the precision of survey estimates. Because estimating the magnitude of nonsampling errors would require special experiments or access to independent data, these magnitudes are seldom available.

To compensate for suspected nonrandom errors, adjustments of the sample estimates are often made. For example, adjustments are frequently made for nonresponse, both total and partial. An adjustment made for either type of nonresponse is often referred to as an imputation, that is, substitution of the "average" questionnaire response for the nonresponse. Imputations are usually made

separately within various groups of sample members that have similar survey characteristics. Imputation for item nonresponse is usually made by substituting for a missing item the response to that item of a respondent having characteristics that are similar to those of the nonrespondent.

Although the magnitude of nonsampling errors in the data used in this *Projections of Education Statistics* is frequently unknown, idiosyncrasies that have been identified are noted on the appropriate tables.

Federal Agency Sources

National Center for Education Statistics (NCES)

Common Core of Data

NCES uses the Common Core of Data (CCD) survey to acquire and maintain statistical data on the 50 states, the District of Columbia, and the outlying areas from the universe of state-level education agencies. Information about staff and students is collected annually at the school, LEA (local education agency or school district), and state levels. Information about revenues and expenditures is also collected at the state level.

Data are collected for a particular school year (July 1 through June 30) via survey instruments sent to the states by October 15 of the subsequent school year. States have 2 years in which to modify the data originally submitted.

Since the CCD is a universe survey, the CCD information presented in this edition of *Projections of Education Statistics* is not subject to sampling errors. However, nonsampling errors could come from two sources—nonreturn and inaccurate reporting. Almost all of the states submit the six CCD survey instruments each year, but submissions are sometimes incomplete or too late for publication.

Understandably, when 57 education agencies compile and submit data for over 85,000 public schools and approximately 15,000 local school districts, misreporting can occur. Typically, this results from varying interpretation of NCES definitions and differing recordkeeping systems. NCES attempts to minimize these errors by working closely with the Council of Chief State School Officers (CCSSO) and its Committee on Evaluation and Information Systems (CEIS).

The state education agencies report data to NCES from data collected and edited in their regular reporting cycles. NCES encourages the agencies to incorporate into their own survey systems the NCES items they do not already collect so that those items will also be available for the subsequent CCD survey. Over time, this has meant fewer missing data cells in each state's response, reducing the need to impute data.

NCES subjects data from the education agencies to a comprehensive edit. Where data are determined to be inconsistent, missing, or out of range, NCES contacts the education agencies for verification. NCES-prepared state summary forms are returned to the state education agencies for verification. States are also given an opportunity to revise their state-level aggregates from the previous survey cycle.

Early Estimates System. The early estimates system is designed to allow NCES to report selected key statistics early in the school year. The information is collected through contact with public school state education agencies and a sample of private schools. Details of the two systems follow.

The source of universe statistical information about public elementary and secondary education is the Common Core of Data (CCD)—data collected annually by NCES from state education agencies. These data are reported to NCES in March, undergo NCES and state editing, and become available for publication in September—full year after the beginning of the school year. High school graduate and fiscal data are reported a year later than student and teacher data. In contrast, the estimates included in this report are made in December of the school year to which they apply.

Forty-two states, the District of Columbia, and three outlying areas participated in the public school early estimates survey in 1992. The estimates reported here were provided by state education agencies and represent the best information on public elementary and secondary schools available to states at this early stage of the school year. They are, however, subject to revision. The estimates for the remaining eight states and three outlying areas were imputed by NCES.

The source of universe statistical information on private schools in the United States is the Private School Survey. The private school universe consists of a diverse population of schools, including those with a religious orientation (for example, Catholic, Lutheran, and Jewish) as well as nonsectarian schools that include programs ranging from regular to special emphasis and special education. The private school early estimates is one reporting component of the universe collection. The basic statistical information included in this data system is collected from all private schools in the NCES universe, and the early estimates are based on a subsample of that universe.

NCES is continuing to examine and evaluate various methodologies to obtain better estimates and improve the data collection system for public and private elementary and secondary education. In the fall of 1992, the private school early estimates data were collected using Computer Assisted Telephone Interviewing, or CATI. This technique helps reduce errors in the data due to reporting or keying

error, and provides an on-line editing system that enables interviewers to verify inconsistent responses.

Questions concerning the Early Estimates System can be directed to:

Frank Johnson
Elementary/Secondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208

Private School Early Estimates System: 1988–89. The private school early estimates are the first reporting component of the Private School Universe data collection system. In subsequent years, the statistical information will be collected from all private schools in the NCES universe, and the early estimates will be based on a subsample of that universe.

Early in October 1988, questionnaires were mailed to a national probability sample of 1,167 private elementary and secondary schools from a universe of approximately 30,000 private schools. Telephone followup of nonrespondents was initiated in late October, and data collection was completed in late November. The overall response rate was 94 percent: 978 of the 1,035 eligible schools. Some 132 of the original 1,167 schools in the sample were determined to be out of scope. While this survey was not designed specifically to yield an estimate of the number of private schools, the number of out-of-scope schools identified in this survey resulted in a weighted estimate of approximately 26,300 private schools.

The sampling frame used for the survey was composed of two nonoverlapping frames: the NCES list frame of approximately 24,000 eligible schools, and an area frame developed by the Census Bureau for 75 Primary Sampling Units (PSUs). The area frame yielded a sample size of 523 schools for the Schools and Staffing Survey (SASS). The private school early estimates area sample was drawn from the SASS area sample. The sample from the area frame was sorted by level of school, by religious orientation class within school level, then by PSU within religious orientation class, and finally by student membership within PSU.

The sample from the list frame was stratified by level of school (elementary, secondary, combined, and other) and religious orientation (Catholic, other religious, and nonsectarian), and within strata, schools were further sorted by Office of Education regions, and by student membership size within region. Each school in the sorted frame was assigned a sampling measure of size equal to the square root of student membership, and samples were selected with probabilities proportionate to size from each orientation/level stratum.

The survey data were weighted to reflect the sampling rates (probability of selection) and were adjusted for nonresponse. Estimates of standard errors were computed using a variance estimation procedure for complex sample survey data known as jackknife. The standard errors for private school early estimates for school years 1987–88 and 1988–89 are shown in the table below.

Students (1988–89)	Teachers (1988–89)	Graduates (1987–88)
96,779.9	7,624.7	9,605.4

Nonsampling errors may include such things as differences in the respondents' interpretation of the meaning to the questions, differences related to the particular time the survey was conducted, or errors in data preparation. During the design of the survey and survey pretest, an effort was made to check for consistency of interpretation of questions and to eliminate ambiguous items. The questionnaire was pretested with respondents like those who completed the survey, and the questionnaire and instructions were extensively reviewed by NCES and representatives of private school associations attending the NCES private school data users meeting. Manual and machine editing of the questionnaires was conducted to check the data for accuracy and consistency. Extensive telephone followup was conducted for missing or inconsistent items; data were keyed with 100-percent verification.

Undercoverage in the list and area frames is another possible source of nonsampling error. The area frame was used to complement the list frame through the identification of schools missing from the list frame. As the Early Estimates System and the Private School Universe data collection system develop, efforts will be directed toward updating the universe list and identifying and minimizing sources of undercoverage in both the list and area frames.

Questions concerning the Private School Early Estimates System can be directed to:

Marilyn M. McMillen
Elementary/Secondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208

Private School Early Estimates System: 1989–90. This is the second in a series of early estimates for private elementary and secondary education. These early estimates are key statistics reported early in the school year and include the numbers of teachers, students, and high school graduates for private elementary and secondary schools. In subsequent years, the statistical information will be collected from all private schools in the NCES universe, and the early estimates will be based on a subsample of that universe.

Early in October 1989, questionnaires were mailed to a national probability sample of 1,169 private elementary and secondary schools from a universe of approximately 27,000 private schools. Telephone followup of nonrespondents was initiated in late October, and data collection was completed in late November. The overall response rate was 95 percent: 986 of the 1,042 eligible schools. Some 127 of the original 1,167 schools in the sample were determined to be out of scope. While this survey was not designed specifically to yield an estimate

of the number of private schools, the number of out-of-scope schools identified in this survey resulted in a weighted estimate of approximately 26,645 private schools.

The sampling frame used for the survey was composed of two nonoverlapping frames: the NCES list frame of approximately 24,000 eligible schools, and an area frame developed by the Census Bureau for 75 Primary Sampling Units (PSUs). The area frame yielded a sample size of 523 schools for the Schools and Staffing Survey (SASS). The private school early estimates area sample was drawn from the SASS area sample. The sample from the area frame was sorted by level of school, by religious orientation class within school level, then by PSU within religious orientation class, and finally by student membership within PSU.

The sample from the list frame was stratified by level of school (elementary, secondary, combined, and other) and religious orientation (Catholic, other religious, and nonsectarian), and within strata, schools were further sorted by Census regions, and by student membership size within region. Each school in the sorted frame was assigned a sampling measure of size equal to the square root of student membership. The sample design for the list frame was similar, differing in two ways from the design for the area frame. First, stratification by level of school yielded four, rather than three categories: elementary, secondary, combined, and other. Second, the measure of size was simply the square root of student membership.

The survey data were weighted to reflect the sampling rates (probability of selection) and were adjusted for nonresponse. Estimates of standard errors were computed using a variance estimation procedure for complex sample survey data known as balanced repeated replication. The standard errors for private school early estimates for school years 1988–89 and 1989–90 are shown in the table below.

Students (1989–90)	Teachers (1989–90)	Graduates (1988–89)
117,830.9	8,636.1	13,305.6

Nonsampling errors may include such things as differences in the respondents' interpretations of the meaning to the questions, differences related to the particular time the survey was conducted, or errors in data preparation. The survey instrument used in the 1989–90 Early Estimates data collection was developed based on the experiences of the 1988–89 Early Estimates data collection. The form was modified as needed to accommodate one data collection instrument for both the Early Estimates and Universe components of the Private School data collection system. The content of the survey was developed in consultation with representatives of private school associations attending NCES private school data users meetings. The questionnaire and instructions were extensively reviewed by NCES staff. Manual and machine editing of the questionnaires was conducted to check the data for accuracy and consistency. Data were keyed with 100-percent verification.

Undercoverage in the list and area frames is another possible source of nonsampling error. The area frame was

used to complement the list frame through the identification of schools missing from the list frame. As the Early Estimates System and the Private School Universe data collection system develop, both the list and area frames will be updated periodically. For the 1989–90 Early Estimates data collection, 1,000 private schools were added to the universe list.

Questions concerning the Private School Early Estimates System can be directed to:

Marilyn M. McMillen
Elementary/Secondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208

Private School Early Estimates System: 1990–91. Early in September 1990, questionnaires were mailed to a national probability sample of 1,167 private elementary and secondary schools. Telephone collection of the data began in early October and was completed in mid-October. The overall response rate was 98 percent: 1,098 of the 1,119 eligible schools. Some 48 of the original 1,167 schools in the sample were determined to be out of scope. After adjusting for out-of-scope schools, the weighted estimate of private schools is 24,553.

The sampling frame used for the survey was composed of two nonoverlapping frames: the NCES Private School Survey list of approximately 20,584 eligible schools (the universe list), and an area frame developed by the Census Bureau, consisting of 923 schools identified in 123 sampled geographic areas (Primary Sampling Units or PSUs). The list frame was stratified by level of school (elementary, secondary, combined, other, and unknown) and religious orientation (Catholic, other religious, and nonsectarian); within strata, schools were further sorted by Census region and by student membership size within region. Each school in the sorted frame was assigned a sampling measure of size equal to the square root of student membership.

The area frame is constructed from a sample survey designed to capture those schools not included in the universe list. The 923 schools identified in the sampled areas are weighted to a national estimate of the number of private schools not included in the universe list. This weighted number is then added to the universe count to produce an estimate of the total number of private schools in the United States. For the early estimate, the area frame was stratified by level of school (elementary, secondary, and other) and religious orientation (Catholic, other religious, and nonsectarian). Within strata, schools were further sorted by FIPS (Federal Information Processing Standards) state code, by FIPS county code within states, and by student membership within counties. Samples were selected with probabilities proportionate to size from each stratum. The measure of size used for this purpose was the square root of student membership multiplied by the inverse of the probability of selection of the PSU in which the school is located.

A new estimation procedure was used to produce the 1990 private school early estimates. This procedure used

the estimates obtained from the entire universe of private schools in the Private School Survey of 1989 and adjusted these estimates for the change reflected in the 1990 early estimates data collections. The steps of this procedure were: (1) obtain Private School Survey (PSS) universe estimates for the data elements desired; (2) adjust PSS estimates for partial and total nonresponse; (3) collect 1990 early estimates data for the data elements; (4) weight the early estimate sample to reflect the sampling rates (probability of selection) and to adjust for total nonresponse separately by the sampling strata and by enrollment; (5) measure the change for these data elements between the PSS and the early estimates data collection for those schools that were in the early estimates sample and had the appropriate data for both 1989 and 1990; and (6) apply the change calculated in step 5 to the data from all of the schools in the PSS universe. Numbers in the tables and text have been rounded. Ratios have been calculated on the actual estimates rather than the rounded values. The 1990 early estimates were adjusted to account for both total and partial nonresponses.

Sample survey data, such as the private school estimates data, are subject to error due to variations in sampling. The standard error is a measure of the variability due to sampling when estimating a statistic. Estimates of standard errors were computed using a variance estimation procedure for complex sample survey data known as balanced repeated replication. The standard errors for private school early estimates for school years 1989–90 and 1990–91 are shown in the table below.

Students (1990–91)	Teachers (1990–91)	Graduates (1989–90)
96,270.9	7,341.5	15,850.2

Survey estimates are also subject to errors of reporting and errors made in the collection and processing of the data. These errors, called nonsampling errors, can sometimes bias the data. Nonsampling errors may include such things as differences in the respondents' interpretations of the meaning to the questions, differences related to the particular time the survey was conducted, or errors in data preparation. The survey instrument used in the 1990–91 private school early estimates data collection was revised as a result of the experiences of the 1989–90 private school early estimates data collection. The content of the survey was developed in consultation with representatives of private school associations attending NCES meetings for users of private school data. The questionnaire and instructions were reviewed extensively by NCES staff. Manual and machine editing of the questionnaires was conducted to check the data for accuracy and consistency. Data were keyed with 100-percent verification.

Undercoverage in the list and area frames is another possible source of nonsampling error. The area frame was used to complement the list frame through the identification of schools missing from the list frame. As the Private School Early Estimates System and the Private School

Survey (the universe data collection) system develop, both the list and area frames will be updated periodically.

Questions concerning the Private School Early Estimates System can be directed to:

Sharon A. Bobbitt
Elementary/Secondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208

Private School Early Estimates System: 1991–92. Early in September 1991, questionnaires were mailed to a national probability sample of 1,163 private elementary and secondary schools. Telephone collection of the data began in early October and was completed in mid-October. The overall response rate was 96.5 percent: 1,064 of the 1,103 eligible schools. Some 60 of the original 1,163 schools in the sample were determined to be out of scope. After adjusting for out-of-scope schools, the weighted estimate of private schools is 24,284.

The sampling frame used for the Private School Early Estimates Survey was the 1989–1990 NCES Private School Survey (PSS). This survey collected information on the number of teachers and students in private schools, by school religious orientation and level as well as actual and projected counts of high school graduates. The PSS, and therefore the early estimates survey, uses two nonoverlapping frames: the list frame of approximately 21,515 eligible schools (the universe list), and an area frame developed by the Census Bureau, consisting of 933 schools identified in 124 sampled geographic areas (Primary Sampling Units or PSUs). The area frame is constructed from a sample survey designed to capture those schools not included in the universe list and is repeated every 2 years. The 933 schools identified in the sampled areas are weighted to a national estimate of the number of private schools not included in the universe list. This weighted number is then added to the universe count to produce an estimate of the total number of private schools in the United States.

For the early estimates, the list frame was stratified by level of school (elementary, secondary, combined, other, and unknown) and religious orientation (Catholic, other religious, and nonsectarian); within strata, schools were further sorted by Census region and by student membership size within region. Each school in the sorted frame was assigned a sampling measure of size equal to the square root of student membership.

The area frame was stratified by level of school (elementary, secondary, and other) and religious orientation (Catholic, other religious, and nonsectarian). Within strata, schools were further sorted by FIPS (Federal Information Processing Standards) state code, by FIPS county code within states, and by student membership within counties. Samples were selected with probabilities proportionate to size from each stratum. The measure of size used for this purpose was the square root of student membership multiplied by the inverse of the probability of selection of the PSU in which the school is located.

The list and area samples for the 1991 early estimates were the same as the 1990 early estimate samples.

The estimation procedure used the estimates obtained from the NCES frame of private schools (1989 Private School Survey) and adjusted those estimates for the change reflected in the 1991 early estimates data collections. The steps of this procedure were: 1) obtain Private School Survey (PSS) frame estimates for the data elements desired, adjusting for both partial and total nonresponse; 2) collect 1991 early estimates data for the data elements; 3) weight the early estimate sample to reflect the sampling rates (probability of selection), adjusting for total nonresponse separately by the sampling strata and by enrollment; 4) for each of the data elements, compute the weighted ratio of the 1991 early estimates data and the 1989 PSS data for those schools that reported for both time periods (the change from 1989 to 1991); and 5) multiply the change calculated in step 4 by the appropriate PSS estimate in step 1. Numbers in the tables and text have been rounded. Ratios have been calculated on the actual estimates rather than the rounded values. The 1990 early estimates were adjusted to account for both total and partial nonresponse.

Sample survey data, such as the private school estimates data, are subject to error due to variations in sampling. The standard error is a measure of the variability due to sampling when estimating a statistic. Estimates of standard errors were computed using a variance estimation procedure for complex sample survey data known as balanced repeated replication. The standard errors for private school early estimates for school years 1990–91 and 1991–92 are shown in the table below.

Students (1991–92)	Teachers (1991–92)	Graduates (1990–91)
80,031.0	8,320.1	13,062.3

Estimates of standard errors were computed using a variance estimation procedure for complex sample survey data known as balanced repeated replication (BRR)—a technique that splits the sample into several different half-samples. Weight adjusted estimates are computed from the half-samples. Finally, the standard error of the half-sample estimates is used as an approximation for the full-sample standard error.

Survey estimates are also subject to errors of reporting and errors made in the collection and processing of the data. These errors, called nonsampling errors, can sometimes bias the data. While general sampling theory can be used to estimate the sampling variability of an estimate, nonsampling errors are not easy to measure and usually require either an experiment to be conducted as part of the data collection procedure or use of data external to the study.

Nonsampling errors may include such things as differences in the respondents' interpretation of the meaning of the questions, differences related to the particular time the survey was conducted, or errors in data preparation. The content of the survey was developed in consultation with representatives of private school associations attending

NCES meetings for users of private school data. The questionnaire and instructions were reviewed extensively by NCES staff. Manual and machine editing of the questionnaires was conducted to check the data for accuracy and consistency. Data were keyed with 100-percent verification.

Undercoverage in the list and area frames is another possible source of nonsampling error. The area frame was used to complement the list frame through the identification of schools missing from the list frame. The area frame represents approximately 20 percent of the total number of private schools. The estimates in this report do not take into account newly opened private schools. As a result, the estimates of students, teachers, and graduates may be biased and lower than the actual numbers. The 1991–92 list and area frame updates to the PSS will be reflected in next year's early estimates, and so new schools will be included in those new estimates. As the Private School Early Estimates System and the Private School Survey (the universe data collection) system develop, both the list and area frames will be updated periodically.

Questions concerning the Private School Early Estimates System can be directed to:

Sharon A. Bobbitt
Elementary/Secondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208

Private School Early Estimates System: 1992–93. Early in September 1992, advance questionnaires were mailed to a national probability sample of 1,167 private elementary and secondary schools. Telephone collection of the data began in early October and was completed in mid-October. The telephone data collection used Computer Assisted Telephone Interviewing (CATI) technology to collect the data and perform preliminary edits. The overall response rate was 93.31 percent: 1,045 of the 1,120 eligible schools. Some 47 of the original 1,167 schools in the sample were determined to be out-of-scope. After adjusting for out-of-scope schools, the weighted estimate of private schools is 26,011.

The sampling frame used for the Private School Early Estimates Survey was the 1991–92 NCES Private School Survey (PSS). This survey collected information on the number of teachers and students in private schools, by school religious orientation and level as well as actual and projected counts of high school graduates. The PSS, and therefore the early estimates survey, uses two nonoverlapping frames: the list frame of approximately 24,000 eligible schools (the universe list), and an area frame developed by the Census Bureau, consisting of 355 schools identified in 124 sampled geographic areas (Primary Sampling Units or PSUs). The area frame is constructed from a sample survey designed to capture those schools not included in the universe list and is repeated every 2 years. The 355 schools identified in the sampled areas are weighted to a national estimate of the number of private schools not included in the universe list. This weighted number is then added to the universe count to

produce an estimate of the total number of private schools in the United States.

For the early estimates, the list frame was stratified by level of school (elementary, secondary, and combined) and religious orientation (Catholic, other religious, and nonsectarian). Within strata, schools were further sorted by Census region (Northeast, Midwest, South, and West), by urbanicity (urban, suburban, and rural) within region, and by student membership size within urbanicity. Each school in the sorted frame was assigned a sampling measure of size equal to the square root of student membership.

The area frame was stratified by level of school (elementary, secondary, and combined) and religious orientation (Catholic, other religious, and nonsectarian). Within strata, schools were further sorted by FIPS (Federal Information Processing Standards) state code, by PSU within state, and by student membership within PSU. Samples were selected with probabilities proportionate to size from each stratum. The measure of size used for this purpose was the square root of student membership multiplied by the inverse of the probability of selection of the PSU in which the school is located.

The estimation procedure is a two-step process. The first step is to produce estimates based on the NCES frame for private schools (1991-92 Private School Survey). These estimates are adjusted for total school nonresponse, as well as item nonresponse. The second step is to update the PSS based estimates, using the data collected in the 1992 Early Estimates Survey (EES). This EES update is a ratio estimate of the 1992 estimate from EES divided by the 1991 estimate based on the 1991 PSS data for the EES sample. The estimates in the tables are the PSS based estimates time the EES update. The early estimates in this report incorporate the relevant estimates from the PSS and update then using data collected in the EES.

The private school early estimates are based on a sample; these estimates may differ somewhat from figures that would have been obtained if a complete census of private schools had been taken using the same questionnaire and procedures. The standard error indicates the magnitude of the sampling error, the variability due to sampling when estimating a statistic. It indicates how much variance there is in the population of possible estimates of a parameter for a given sample size. Standard errors can be used as a measure of the precision expected from a particular sample. If all possible samples were surveyed under similar conditions, intervals of 1.96 standard errors below to 1.96 standard errors above a particular statistic would include the true population parameter being estimated in about 95 percent of the samples. This is a 95 percent confidence interval. For example, for the ratio of private school pupils to private school teachers in 1992-93, the estimate for all private schools is 14.9 and the standard error is 0.2. The 95 percent confidence interval for this statistic extends from 14.9 - (0.2 times 1.96) to 14.9 + (0.2 times 1.96) or from 14.5 to 15.3. The standard error for the 4,964,258 students in private schools is 116,612. The 95 percent confidence interval for this statistic extends from 4,735,698 to 5,192,818.

Estimates of standard errors were computed using a variance estimation procedure for complex sample survey data known as balanced repeated replication (BRR)—a technique that splits the sample into several different half-samples. Weight adjusted estimates are computed from the half-samples. Finally, the standard error of the half-sample estimates is used as an approximation for the full-sample standard error. The standard errors for private school early estimates for school years 1991-92 and 1992-93 are shown in the table below.

Students (1992-93)	Teachers (1992-93)	Graduates (1991-92)
116,612.2	8,714.8	6,071.4

Survey estimates are also subject to errors of reporting and errors made in the collection and processing of the data. These errors, called nonsampling errors, can sometimes bias the data. While general sampling theory can be used to estimate the sampling variability of an estimate, nonsampling errors are not easy to measure and usually require either an experiment conducted as part of the data collection procedure or use of data external to the study.

Nonsampling errors may include such things as differences in the respondents' interpretation of the meaning of the questions, differences related to the particular time the survey was conducted, or errors in data preparation. The content of the survey was developed in consultation with representatives of private school associations attending NCES meetings for users of private school data. The questionnaire and instructions were reviewed extensively by NCES staff. The CATI instrument provided on-line internal consistency checks (i.e., totals equal sum of parts) as well as consistency checks with 1991 data for the sample school. Interviewers resolved discrepancies with the school during the course of the interview. Machine editing of the questionnaires was conducted to check the data for accuracy and consistency. Data inputs into the CATI system were transferred directly to processing, avoiding potential keying errors.

Undercoverage in the list and area frames is another possible source of nonsampling error. The area frame was used to complement the list frame through the identification of schools missing from the list frame. The area frame represents approximately 10 percent of the total number of private schools. The 1991-92 list and area frame updates to the PSS were reflected in this year's early estimates, and so schools newly opened since 1989 are included in those new estimates.

Integrated Postsecondary Education Data System

The Integrated Postsecondary Education Data System (IPEDS) surveys all postsecondary institutions, including universities and colleges, as well as institutions offering technical and vocational education beyond the high school level. This survey, which began in 1986, replaces and supplements the Higher Education General Information Survey (HEGIS).

The IPEDS consists of several integrated components that obtain information on who provides postsecondary education (institutions), who participates in it and completes it (students), what programs are offered and what programs are completed, and both the human and financial resources involved in the provision of institutionally based post-secondary education. Specifically, these components include: "Institutional Characteristics," including institutional activity; fall enrollment, including age and residence; fall enrollment in occupationally specific programs; completions; finance; staff; salaries of full-time instructional faculty; and academic libraries.

The higher education portion of this survey is a census of accredited 2- and 4-year colleges, while data from the technical and vocational institutions are collected through a sample survey. Thus, some portions of the data will be subject to sampling and nonsampling errors, while some portions will be subject only to nonsampling errors.

Prior to the establishment of IPEDS in 1986, HEGIS acquired and maintained statistical data on the characteristics and operations of institutions of higher education. Implemented in 1966, HEGIS was an annual universe survey of institutions listed in the latest **NCES Education Directory, Colleges and Universities.**

The information presented in this report draws on IPEDS surveys that solicited information concerning institutional characteristics, enrollment, degrees, and finances. The higher education portion of this system is a census of accredited 2- and 4-year colleges. Since these surveys cover all institutions in the universe, the data are not subject to sampling error.

However, they are subject to nonsampling error, the sources of which vary with the survey instrument. Each survey will therefore be discussed separately. Information concerning the nonsampling error of the enrollment and degrees surveys is drawn extensively from the HEGIS Post-Survey Validation Study conducted in 1979.

Institutional Characteristics. This survey provided the basis for the universe of institutions presented in the *Education Directory, Colleges and Universities.* The universe comprised institutions that met certain accreditation criteria and offered at least a 1-year program of college-level studies leading toward a degree. All of these institutions were certified as eligible by the U.S. Department of Education's Division of Eligibility and Agency Evaluation. Each fall, institutions listed in the previous year's *Directory* were asked to update a computer printout of their information.

Fall Enrollment. This survey has been part of the IPEDS or HEGIS series since 1966. The enrollment survey response rate was relatively high; the 1991 response rate was 86.6 percent. Major sources of nonsampling error for this survey were classification problems, the unavailability of needed data, interpretation of definitions, the survey due date, and operational errors. Of these, the classification of students appears to have been the main source of error. Institutions had problems in correctly classifying first-time freshmen, other first-time students, and unclassified students for both full-time and part-time categories. These problems occurred most often at 2-year institutions (private and public) and private 4-year institutions. In the 1977–78 HEGIS validation studies, the classification problem led to an estimated overcount of 11,000 full-time students and an undercount of 19,000 part-time students. Although the ratio of error to the grand total was quite small (less than 1 percent), the percentage of errors was as high as 5 percent for detailed student levels and even higher at certain aggregation levels.

Beginning with fall 1986, the survey system was redesigned with the introduction of the Integrated Postsecondary Education (IPEDS) (see above). The new survey system comprises all postsecondary institutions, but also maintains comparability with earlier surveys by allowing HEGIS institutions to be tabulated separately. The new system also provides for preliminary and revised data releases. This allows the Center flexibility to release early data sets while still maintaining a more accurate final data base.

Completions. This survey was part of the HEGIS series throughout its existence. However, the degree classification taxonomy was revised in 1970–71 and 1982–83. Collection of degree data has been maintained through the IPEDS system.

Though information from survey years 1970–71 through 1981–82 is directly comparable, care must be taken if information before or after that period is included in any comparison. Degrees-conferred trend tables arranged by the 1982-83 classification were added to *Projections of Education Statistics* to provide consistent data from 1970–71 to 1988–89. Data in this edition on associate degrees are not comparable with figures for earlier years. The nonresponse rate did not appear to be a significant source of nonsampling error for this survey. The return rate over the years was high, with the response rate for the 1989–90 survey at 92.3 percent. Because of the high return rate, nonsampling error caused by imputation was also minimal.

The major sources of nonsampling error for this survey were differences between the NCES program taxonomy and taxonomies used by the colleges, classification of double majors and double degrees, operational problems, and survey timing. In the 1979 HEGIS validation study, these sources of nonsampling were found to contribute to an error rate of 0.3 percent overreporting of bachelor's degrees and 1.3 percent overreporting of master's degrees. The differences, however, varied greatly among fields. Over 50 percent of the fields selected for the validation study had no errors identified. Categories of fields that had large differences were business and management, education, engineering, letters, and psychology. It was also shown

that differences in proportion to the published figures were less than 1 percent for most of the selected fields that had some errors. Exceptions to these were: master's and Ph.D. programs in labor and industrial relations (20 percent and 8 percent); bachelor's and master's programs in art education (3 percent and 4 percent); bachelor's and Ph.D. programs in business and commerce, and in distributive education (5 percent and 9 percent); master's programs in philosophy (8 percent); and Ph.D. programs in psychology (11 percent).

Financial Statistics. This survey was part of the HEGIS series and has been continued under the IPEDS system. Changes were made in the financial survey instruments in fiscal years (FY) 1976, 1982, and 1987. The FY 76 survey instrument contained numerous revisions to earlier survey forms and made direct comparisons of line items very difficult. Beginning in FY 82, Pell Grant data were collected in Federal restricted grants and contracts revenues and restricted scholarships and fellowships expenditures. The introduction of the Integrated Postsecondary Education Data System (IPEDS) in the FY 87 survey included several important changes to the survey instrument and data processing procedures. While these changes were significant, considerable effort has been made to present only comparable information on trends in this report and to note inconsistencies. Finance tables for this publication have been adjusted by subtracting the largely duplicative Pell Grant amounts from the later data to maintain comparability with pre-FY 82 data.

Possible sources of nonsampling error in the financial statistics include nonresponse, imputation, and misclassification. The response rate has been about 85 to 90 percent for most of the years reported. The response rate for the FY 1989 survey was 83.5 percent.

Two general methods of imputation were used in HEGIS. If the prior years' data were available for a nonresponding institution, these data were inflated using the Higher Education Price Index and adjusted according to changes in enrollments. If there were no data for the previous four years, current data were used from Peer institutions selected for location (state or region), control, level, and enrollment size of institution. In most cases, estimates for nonreporting institutions in IPEDS were made using data from peer institutions.

Beginning with FY 87, the new system (IPEDS) comprises all postsecondary institutions, but also maintains comparability with earlier surveys by allowing 2- and 4-year HEGIS institutions to be tabulated separately. The finance data tabulated for this publication reflect totals for the HEGIS or higher education institutions only.

To reduce reporting error, NCES used national standards for reporting finance statistics. These standards are contained in *Financial Accounting and Reporting Manual for Higher Education* published in 1990 by the National Association of College and University Business Officers. Definitions and formats in the survey, wherever possible, are consistent with those in this text.

Bureau of the Census

Current Population Survey

Current estimates of school enrollment, as well as social and economic characteristics of students, are based on data collected in the Census Bureau's monthly survey of about 60,000 households. The monthly Current Population Survey (CPS) sample consists of 729 areas comprising 1,973 counties, independent cities, and minor civil divisions throughout the 50 states and the District of Columbia. The sample was initially selected from the 1980 census files and is periodically updated to reflect new housing construction.

The monthly CPS deals primarily with labor force data for the civilian noninstitutional population (i.e., excluding military personnel and their families living on post and inmates of institutions). In addition, on October of each year, supplemental questions are asked about highest grade completed, level of current enrollment, attendance status, number and types of courses, degree or certificate objective, and type of organization offering instruction for each member of the household.

The estimation procedure used for the monthly CPS data involves inflating weighted sample results to independent estimates of characteristics of the civilian noninstitutional population in the United States by age, sex, and race. These independent estimates are based on statistics from decennial censuses that include statistics on births, deaths, immigration, and emigration and statistics on the population in the armed services. Generalized standard error tables are in the *Current Population Reports*. The data are subject to both nonsampling and sampling errors.

More information is available in the *Current Population Reports*, Series P-20, or by contacting:

Education and Social Stratification Branch
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

School Enrollment. Each October, the Current Population Survey (CPS) includes supplemental questions on the enrollment status of the population 3 years old and over. The main sources of nonsampling variability in the responses to the supplement are those inherent in the survey instrument. The question concerning educational attainment may be sensitive for some respondents who may not want to acknowledge their lack of a high school diploma. The

question of current enrollment may not be answered accurately for various reasons. Some respondents may not know current grade information for every student in the household, a problem especially prevalent for households with members in college or in nursery school. Confusion over college credits or hours taken by a student may make it difficult to determine the year in which the student is enrolled. Problems may occur with the definition of nursery school (a group or class organized to provide educational experiences for children) where respondents' interpretations of "educational experiences" vary.

Questions concerning the CPS "School Enrollment" survey may be directed to:

Other Sources

National Education Association

Estimates of School Statistics

The National Education Association (NEA) reports teacher, revenue, and expenditure data in its annual publication, *Estimates of School Statistics*. Each year, NEA prepares regression-based estimates of financial and other education statistics and submits them to the states for verification. Generally, about 30 states adjust these estimates based on their own data. These preliminary data are published by NEA along with revised data from previous years. States are asked to revise previously submitted data as final figures become available. The most recent publication contains all changes reported to the NEA.

Some expenditure projections use revised estimates of financial data prepared by NEA because this organization was the most current source. Since expenditure data reported to NCES must be certified for use in Department of Education formula grant programs (such as Chapter I of the Education Consolidation and Improvement Act), NCES data are not available as soon as NEA estimates.

Further information on NEA surveys can be obtained from:

National Education Association—Research

Appendix D

Glossary

Data Terms

Associate degree: A degree granted for the successful completion of a subbaccalaureate program of studies, usually requiring at least 2 years (or the equivalent) of full-time college-level study. This term includes degrees granted in a cooperative or work–study program.

Average daily attendance (ADA): The aggregate attendance of a school during a reporting period (normally a school year) divided by the number of days school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered days in session.

Average daily membership (ADM): The aggregate membership of a school during a reporting period (normally a school year) divided by the number of days school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered as days in session. The average daily membership for groups of schools having varying lengths of terms is the average of the average daily memberships obtained for the individual schools.

Bachelor's degree: A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or the equivalent) of full-time college-level study. This term includes degrees granted in a cooperative or work–study program

Classroom teacher: A staff member assigned the professional activities of instructing pupils in self-contained classes or courses, or in classroom situations. Usually expressed in full-time equivalents.

Class size: The membership of a class at a given date.

Cohort: A group of individuals that have a statistical factor in common, for example, year of birth.

College: A postsecondary school that offers a general or liberal arts education, usually leading to an associate, bachelor's, master's, doctor's, or first-professional degree. Junior colleges and community colleges are included in this term.

Constant dollars: Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Consumer Price Index (CPI): This price index measures the average change in the cost of a fixed market basket of goods and services purchased by consumers.

Current dollars: Dollar amounts that have not been adjusted to compensate for inflation.

Current expenditures (elementary/secondary): The expenditures for operating local public schools, excluding capital outlay and interest on school debt. These expenditures include such items as salaries for school personnel, fixed charges, student transportation, school books and materials, and energy costs.

Current expenditures per pupil in average daily attendance: Current expenditures for the regular school term divided by the average daily attendance of full-time pupils (or full-time-equivalency of pupils) during the term. See also *current expenditures* and *average daily attendance*.

Current-fund expenditures (higher education): Money spent to meet current operating costs, including salaries, wages, utilities, student services, public services, research libraries, scholarships and fellowships, auxiliary enterprises, hospitals, and independent operations. Excludes loans, capital expenditures, and investments.

Current Population Survey: See Appendix C, Data Sources.

Disposable income: Current income received by persons less their contributions for social insurance, personal tax, and nontax payments. It is the income available to persons for spending and saving. Nontax payments include passport fees, fines and penalties, donations, and tuitions and fees paid to schools and hospitals operated mainly by the government. See also *personal income*.

Doctor's degree: An earned degree carrying the title of doctor. The Doctor of Philosophy degree (Ph.D.) is the highest academic degree and requires mastery within a field of knowledge and demonstrated ability to perform scholarly research. Other doctorates are awarded for fulfilling specialized requirements in professional fields, such as education (Ed.D.), musical arts (D.M.A.), business administration (D.B.A.), and engineering (D.Eng. or D.E.S.). Many doctor's degrees in both academic and

167

professional fields require an earned master's degree as a prerequisite. First-professional degrees, such as M.D. and D.D.S., are not included under this heading.

Educational and general expenditures: The sum of current funds expenditures on instruction, research, public service, academic support, student services, institutional support, operation and maintenance of plant, and awards from restricted and unrestricted funds.

Elementary school: A school classified as elementary by state and local practice and composed of any span of grades not above grade 8. A preschool or kindergarten school is included under this heading only if it is an integral part of an elementary school or a regularly established school system.

Elementary and secondary scnools: As used in this publication, includes only regular schools, that is, schools that are part of state and local school systems and also most not-for-profit private elementary and secondary schools, both religiously affiliated and nonsectarian. Schools not included in this term are subcollegiate departments of institutions of higher education, American residential schools for exceptional children, federal schools for Indians, and federal schools on military posts and other federal installations.

Enrollment: The number of students registered in a given school unit at a given time, generally in the fall of a year.

Expenditures: Charges incurred, whether paid o, unpaid, that are presumed to benefi' the current fiscal year. For elementary and secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For institutions of higher education, these include current outlays plus capital outlays. For government, these include charges net of recoveries and other correcting transactions other than for retirement of debt, investment in securities, or extension of credit. Government expenditures include only external transactions, such as the provision of perquisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions.

Expenditures per pupil: Charges incurred for a particular period of time divided by a student unit of measure, such as average daily attendance or average daily membership.

First-professional degree: A degree that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree usually is based on a program requiring at least 2 academic years of work before entrance and a

total of at least 6 academic years of work to complete the degree program, including both prior required college work and the professional program itself. By NCES definition, first-professional degrees are awarded in the fields of dentistry (D.D.S or D.M.D.), medicine (M.D.), optometry (O.D.), osteopathic medicine (D.O.), pharmacy (D.Phar.), podiatric medicine (D.P.M.), veterinary medicine (D.V.M.), chiropractic (D.C. or D.C.M.), law (LL.B. or J.D.), and theological professions (M.Div. or M.H.L.).

First-professional enrollment: The number of students enrolled in a professional school or program that requires at least 2 years of academic college work for entrance and a total of at least 6 years for a degree. By NCES definition, first-professional enrollment includes only students in certain programs. (See *first-professional degree* for a list of programs.)

Full-time enrollment: The number of students enrolled in higher education courses with total credit load equal to at least 75 percent of the normal full-time course load.

Full-time-equivalent (FTE) enrollment: For institutions of higher education, enrollment of full-time students, plus the full-time equivalent of part-time students as reported by institutions. In the absence of an equivalent reported by an institution, the FTE enrollment is estimated by adding one-third of part-time enrollment to full-time enrollment.

Full-time worker: In educational institutions, an employee whose position requires being on the job on school days throughout the school year at least the number of hours the schools are in session; for higher education, a member of an educational institution's staff who is employed full time.

Graduate: An individual who has received formal recognition for the successful completion of a prescribed program of studies.

Graduate enrollment: The number of students who hold the bachelor's or first-professional degree, or the equivalent, and who are working toward a master's or doctor's degree. First-professional students are counted separately. These enrollment data measure those students who are registered at a particular time during the fall. At some institutions, graduate enrollment also includes students who are in postbaccalaureate classes but not in degree programs.

High school: A secondary school offering the final years of high school work necessary for graduation, usually including grades 10, 11, and 12 (in a 6-3-3 plan), or grades 9, 10, 11, and 12 (in a 6-2-4 plan).

Higher education: Study beyond secondary school at an institution that offers programs terminating in an associate, baccalaureate, or higher degree.

Higher education institutions (traditional classifications):

4-year institution: An institution legally authorized to offer and offering at least a 4-year program of college-level studies wholly or principally creditable toward a bachelor's degree. A university is a postsecondary institution that typically includes one or more graduate professional schools.

2-year institution: An institution legally authorized to offer and offering at least a 2-year program of college-level studies that terminates in an associate degree or is principally creditable toward a baccalaureate.

Higher Education Price Index: A price index which measures average changes in the prices of goods and services purchased by colleges and universities through current-fund education and general expenditures (excluding expenditures for sponsored research and auxiliary enterprises).

Instructional staff: Full-time-equivalent number of positions, not the number of individuals occupying the positions during the school year. In local schools, it includes all public elementary and secondary (junior and senior high) day-school positions that are in the nature of teaching or the improvement of the teaching–learning situation. Includes consultants or supervisors of instruction, principals, teachers, guidance personnel, librarians, psychological personnel, and other instructional staff. Excludes administrative staff, attendance personnel, clerical personnel, and junior college staff.

Master's degree: A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree, including the Master of Arts degree (M.A.) and the Master of Science degree (M.S.) is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline and demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work, or an M.P.A. in public administration. A third type of master's degree is awarded in professional fields for study beyond the first-professional degree, for example, the Master of Laws (LL.M.) and Master of Science in various medical specializations.

Part-time enrollment: The number of students enrolled in higher education courses with a total credit load of less than 75 percent of the normal full-time credit load.

Personal income: Current income received by persons from all sources minus their personal contributions for social insurance. Classified as "persons" are individuals (including owners of unincorporated firms), nonprofit institutions serving individuals, private trust funds, and private noninsured welfare funds. Personal income includes transfers (payments not resulting from current production) from government and business such as social security benefits, military pensions, and so forth, but excludes transfers among persons.

Postbaccalaureate enrollment: The number of graduate and first-professional students working toward advanced degrees and students enrolled in graduate-level classes but not enrolled in degree programs. See also *graduate enrollment* and *first-professional enrollment*.

Private institution: A school or institution that is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government; that is usually supported primarily by other than public funds; and the operation of whose program rests with other than publicly elected or appointed officials.

Property tax: The sum of money collected from a tax levied against the value of property.

Public school or institution: A school or institution controlled and operated by publicly elected or appointed officials and deriving its primary support from public funds.

Pupil–teacher ratio: The enrollment of pupils at a given period of time, divided by the full-time-equivalent number of classroom teachers serving these pupils during the same period.

Revenues: All funds received from external sources, net of refunds and correcting transactions. Noncash transactions such as receipt of services, commodities, or other receipts "in kind" are excluded, as are funds received from the issuance of debt, liquidation of investments, or nonroutine sale of property.

Revenues receipts: Additions to assets that do not incur an obligation that must be met at some future date and do not represent exchanges of property for money. Assets must be available for expenditures.

Salary: The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

School: A division of the school system consisting of students in one or more grades or other identifiable groups and organized to give instruction of a defined type. One school may share a building with another school or one school may be housed in several buildings.

Secondary instructional level: The general level of instruction provided for pupils in secondary schools (generally covering grades 7 through 12 or 9 through 12)

181

and any instruction of a comparable nature and difficulty provided for adults and youth beyond the age of compulsory school attendance.

Secondary school: A school including any span of grades beginning with the next grade following an elementary or middle school (usually 7, 8, or 9) and ending with or below grade 12. Both junior high schools and senior high schools are included.

Senior high school: A secondary school offering the final years of high school work necessary for graduation.

Student: An individual for whom instruction is provided in an educational program under the jurisdiction of a school, school system, or other educational institution. No distinction is made between the terms "student" and "pupil," although "student" may refer to one receiving instruction at any level while "pupil" refers only to one attending school at the elementary or secondary level. The term "student" is used to include individuals at all instructional levels. A student may receive instruction in a school facility or in another location, such as at home or in a hospital. Instruction may be provided by direct student-teacher interaction or by some other approved medium, such as television, radio, telephone, or correspondence.

Tax base: The collective value of objects, assets, and income components against which a tax is levied.

Total expenditure per pupil in average daily attendance: Includes all expenditures allocable to per pupil costs divided by average daily attendance. These allocable expenditures include current expenditures for regular school programs, interest on school debt, and capital outlay. Beginning in 1980-81, expenditures for administration by state governments are excluded and expenditures for other programs (summer schools, community colleges, and private schools) are included.

Unclassified students: Students who are not candidates for a degree or other formal award, although they are taking higher education courses for credit in regular classes with other students.

Undergraduate students: Students registered at an institution of higher education who are working in a program leading to a baccalaureate or other formal award below the baccalaureate, such as an associate degree.

Statistical Terms

Auto-Correlation: Correlation of the error terms from different observations of the same variable. Also called *serial correlation.*

Degrees of freedom: The number of free or linearly independent sample observations used in the calculation of a statistic.

Dependent variable: A mathematical variable whose value is determined by that of one or more other variables in a function. In regression analysis, when a random variable, y, is expressed as a function of variables $x_1, x_2,...,$ plus a stochastic term, the y is known as the "dependent variable."

Double exponential smoothing: A method that takes a single smoothed average component of demand and smoothes it a second time to allow for estimation of a trend effect.

Durbin-Watson statistic: A statistic testing the independence of errors in least squares regression against the alternative of first-order serial correlation. The statistic is a simple linear transformation of the first-order serial correlation of residuals and, although its distribution is unknown, it is tested by bounding statistics that follow R. L. Anderson's distribution.

Econometrics: The quantitative examination of economic trends and relationships using statistical techniques, and the development, examination, and refinement of those techniques.

Estimate: A numerical value obtained from a statistical sample and assigned to a population parameter. The particular value yielded by an estimator in a given set of circumstances or the rule by which such particular values are calculated.

Estimating equation: An equation involving observed quantities and an unknown that serves to estimate the latter.

Estimation: Estimation is concerned with inference about the numerical value of unknown population values from incomplete data, such as a sample. If a single figure is calculated for each unknown parameter, the process is called point estimate. If an interval is calculated within which the parameter is likely, in some sense, to lie, the process is called interval estimation.

Exogenous variable: Variables for which the values are determined outside the model but which influence the model.

Exponential smoothing: A method used in time series to smooth or to predict a series. There are various forms, but all are based on the supposition that more remote history has less importance than more recent history.

Ex-Ante forecast: When forecasting a dependent variable for some time period t using a model with at least one independent variable, the forecast of the dependent variable is an ex-ante forecast if the values for the independent variables for time period t are themselves not known.

Ex-Post forecast: When forecasting a dependent variable for some time period t using a model with at least one independent variable, the forecast of the dependent variable is an ex-post forecast if the values for the independent variables for time period t are the actual values. Ex-post forecasts are often used in forecast evaluation.

First-Order serial correlation: When errors in one time period are correlated directly with errors in the ensuing time period. Also called *auto-correlation.*

Forecast: An estimate of the future based on rational study and analysis of available pertinent data, as opposed to subjective prediction.

Forecasting: Assessing the magnitude which a quantity will assume at some future point in time: as distinct from "estimation," which attempts to assess the magnitude of an already existent quantity.

Forecast horizon: The number of time periods into the future which are forecasted. Forecasts for next year are said to have a 1-year forecast horizon.

Function: A mathematical correspondence that assigns exactly one element of one set to each element of the same or another set. A variable that depends on and varies with another.

Functional form: A mathematical statement of the relationship among the variables in a model.

Independent variable: In regression analysis, when a random variable, y, is expressed as a function of variables $x_1, x_2,...,$ plus a stochastic term, the x's are known as "independent variables."

Lag: An event occurring at time $t + k$ $(k > 0)$ is said to lag behind an event occurring at time t, the extent of the lag being k. An event occurring k time periods before another may be regarded as having a negative lag.

Maximum likelihood estimation: A method of estimating a parameter or parameters of a population by that value (or values) that maximizes (or maximize) the likelihood of a sample.

Mean absolute percentage error (MAPE): The average value of the absolute value of errors expressed in percentage terms.

183

Model: A system of postulates, data, and inferences presented as a mathematical description of a phenomenon such as an actual system or process. The actual phenomenon is represented by the model in order to explain it, to predict it, and to control it.

Ordinary least squares (OLS):   The estimator that minimizes the sum of squared residuals.

Parameter: A quantity that describes a statistical population.

Projection: In relation to a time series, an estimate of future values based on a current trend.

R^2:   The coefficient of determination: the square of the correlation coefficient between the dependent variable and its OLS estimate.

$\bar{R}^2$(also called the adjusted R^2):   The coefficient of determination adjusted for the degrees of freedom.

Regression analysis: A statistical technique for investigating and modeling the relationship between variables.

Rho: A measure of the correlation coefficient between errors in time period t and time period t minus 1.

Serial correlation: Correlation of the error terms from different observations. Also called *auto-correlation*.

Standard error of estimate: An expression for the standard deviation of the observed values about a regression line. An estimate of the variation likely to be encountered in making predictions from the regression equation.

Time series: A set of ordered observations on a quantitative characteristic of an individual or collective phenomenon taken at different points in time. Usually the observations are successive and equally spaced in time.

Time series analysis: The branch of quantitative forecasting in which data for one variable are examined for patterns of trend, seasonality, and cycle.

Variable: A quantity that may assume any one of a set of values.
