ABSTRACT

This report is an annual compilation of state higher education appropriations summarized and placed in a historical context with analysis of short-term and long-term trends. The data were first reported monthly in "The Grapevine," a publication of the Center for Higher Education at Illinois State University. The first section offers an overview and the central analysis. This covers a look at the last three decades, a retrospective of Fiscal Year 1993, current trends in 2-year gains, a look at 10 "Metgastates," regional analysis, revenue variations, and sector variations. A conclusion to this section highlights the precipitous and negative change in state funding for higher education in fiscal years '92 and '93 after several decades of increases. In contrast, support for student financial aid was strong and recent tax increases and other events may signal a return to increased support. National tables and comparative measures in three tables show percentages of 2-year gains for all states, state appropriations for the most recent 3 years, and state tax appropriations per capita and per \$1,000 of personal income along with national rankings. A final section offers state-by-state appropriations for higher education from tax revenues for individual institutions for 1991-92 and 1992-93. (Contains 25 references.)

Preface

One of several strengths of Ed Hines' annual compilation of state appropriations data is its timeliness. Reported monthly in *Grapevine* from Illinois State University and summarized each fall by the *Chronicle of Higher Education*, these data are then updated and placed in a historical context by the author in this final report by SHEEO. This report, distributed early in the calendar year, serves as the document of record on state support for higher education. The author's analysis of the short-term and long-term trends adds to the usefulness of the report. Another strength of this report is its consistency over a long period of time in capturing what could be called "total state tax effort" aimed at higher education operations.

In many ways, Hines' report on state appropriations has become a kind of barometer of the financial health of public higher education. Judging from the results of the past two years, we apparently have an ailing patient. But the reader is cautioned to look beyond the data here and to extend his or her assessment to other important factors affecting the *total* resources available to a state and its institutions. Many factors affect the financial health of public higher education, but two — enrollment trends and tuition increases — are especially relevant in the current environment. Many states, including some of those reporting the greatest declines in tax-based support, have allowed institutions to increase tuition significantly. In some cases, tuition increases have made up most, if not all, of the cutbacks in state appropriations. In other states, various pressures have contained tuition, leaving institutions to absorb the state cuts.

In order to fully understand the health of a public higher institution or system, one also needs to know what has happened to enrollment. States with growing enrollment and declining appropriations are providing less per-student support than states with stable or declining enrollments. Several public higher education systems are capping enrollment, either directly or indirectly, in response to state cutbacks. Other systems, out of commitment to access

or political pressure, are absorbing these additional students.

These two factors — enrollment and tuition — represent the principal policy levers that states have to mitigate the effects of declines in state support. The third factor, of course, primarily under the influence of institutions, is productivity improvement. (While much anecdotal information exists on productivity improvements, no data exist to quantify its impact.)

Over the past several years, the *Grapevine* Advisory Committee, formed by Ed Hines, has made technical improvements to the data. We have attempted to put our state appropriations data in the broader context of both enrollment and tuition changes (as well as changes in other sources of revenue). To date, we have not found a solution to our dilemma — at least one which does not compromise our first objective: to provide *timely* data on state support.

While this might be interpreted as a limitation, we recognize that we are not the only source of information and analysis on the financing of higher education. And we urge readers to combine use of this data with other reports. Readers will find, for example, that Kent Halstead provides an analysis of a variety of factors affecting the total per-student support available in the public sector. His data also include a 15-year historical base. Halstead's report is published by Research Associates of Washington and entitled *State Profiles: Financing Public Higher Education*. For the most recent data on tuition, we recommend the annual report by Jacquelin Johnson of the Washington Higher Education Coordinating Board entitled, *Tuition and Required Fees: A National Comparison*.

It is our hope that this report on state appropriations, combined with other national sources of data, will provide the latest information available for our readers. We welcome your comments and suggestions for improvement.

James R. Mingle
Executive Director

Acknowledgments

This publication relies upon a nationwide network of higher education and state government officials in the 50 states. These individuals report legislative appropriations for operating expenses of higher education which are published in monthly issues of *Grapevine*, published at the Center for Higher Education at Illinois State University, and summarized in an October issue of *The Chronicle of Higher Education*.

This book-length publication is the most complete and accurate compilation of these appropriations data which reflect total state tax effort for all of higher education. The publication of this material relies upon the material furnished by individuals in the states, and their contributions are acknowledged with appreciation. Gwen B. Pruyne, managing editor of *Grapevine*, prepared the statistical tabulations in this publication and provided editorial assistance. Sara Wills, doctoral candidate in Higher Educational Administration at Illinois State, devoted much of her assistantship to this effort.

The many contributions of the *Grapevine* Advisory Committee, whose names are listed below, are recognized with gratitude. This group meets annually as part of the Inservice Program of the State Higher Education Finance Officers' annual meeting. In 1992, this meeting was held in Washington, D.C.

State Higher Education Appropriations: 1992-93

State support for higher education in the 1993 fiscal year showed a distinctly negative pattern for the second consecutive year. One year ago, for the first time on record, state governments appropriated less to higher education than in the preceding year. But in late 1992, state governments had appropriated less to higher education for FY93 than in either FY92 or FY91, effectively turning back the total amount appropriated nationally to the FY90 level.

In order to provide a context for these most recent two years, which by any measure have been extraordinary, this report looks briefly at the recent history of state appropriations for higher education, followed by a retrospective of fiscal year 1993.

Background: The Last Three Decades

Higher education has benefited from several decades of state tax support which annually has exceeded inflation levels, with few exceptions. During the 1950s, higher education support lagged behind inflation only in 1981 and 1983.* As the 1980s drew to a close, there was a short-lived surge in state tax support for higher education in FY90. But 1991 began the current downward cycle. In FY91, levels of state support plummeted to the point where there was a negative one-year percentage change for higher education between FY91 and FY92. This loss, since it initially appeared, has improved to a gain of .2% because of state supplemental appropriations, causing revisions in state tax appropriations figures published in this report last year. In FY93, the initial round of state legislative appropriations reflected declines from both FY91 and FY92, causing the first one-year and two-year declines ever recorded in the history of this data collection. In a dismal observation, the National Conference of State Legislatures noted that: "What was largely a regional crisis a year ago is now nationwide."

From Expansion to Slowed Growth. The 1960s and '70s were periods in which the federal government initiated major policies for higher education, including the Higher Education Act of 1965 and the Educa-

*The Higher Education Price Index was used to calculate constant dollars.

tion Amendments of 1972. The growth of higher education and the vital role of government in that growth were unprecedented, leading to a description of the 1960s as a decade of "fast acceleration of growth" (Carnegie Foundation, 1975). Indeed, this period ended what the Carnegie Foundation described as three major shifts in the support of higher education: (1) from higher education as a relatively small, largely private enterprise to a sizeable societal institution with greater institutional and educational costs; (2) from private to public financial sources; and (3) from local support toward greater federal support. By the 1970s, there were shares of equal magnitude between state/local governmental support and federal support (Carnegie Foundation, 1976). This transitional period led to a slowing of government support in the '80s which Clark Kerr had correctly predicted would become known as "a state period" in the initiation of higher education policies (Kerr, 1980).

A number of events slowed the rate of growth in higher education. The nationwide "tax revolt," which began in California in 1978, was followed by a 24% reduction in constant dollars in federal student aid to higher education from 1981 to 1990 (Benjamin, 1992). From 1978 to 1989, there was a 13% reduction in constant dollars in federal financial support to the states, due particularly to cuts in federal block grants and in revenue sharing. The effect of this so-labeled "New Federalism," initiated by President Ronald Reagan, was simultaneously to reduce the level of federal dollars to the states while increasing the number of federal regulations which states were expected to follow and enforce. These various regulations dealt with health, safety and elementary/secondary education (Tolchin, 1990). The largest cuts in federal aid occurred in the early 1980s, after the 1981 enactment of Reagan's "New Federalism." The response in many states was to increase taxes.

The majority of states increased personal income and/or sales taxes either in 1982 or in 1983, amounting to the largest volume of tax increases ever enacted (Gold, 1987). A cycle of taxation then occurred which was followed by reductions in 1984 and 1985, and by major structural changes in federal

tax policy in 1986 and redefinitions of marginal tax rates beginning in 1988.

The Nineties and Higher Education. By 1990, states increasingly were in an untenable position. The national and regional economies had slowed as the federal government imposed spending requirements on states as part of legislation designed to reduce the federal debt (Pear, 1990). By 1991, most economists openly admitted that the nation had entered a recession. The November 1990 elections demonstrated that the public was voting against politicians who pledged new or additional taxes. In fact, taxes were the major issue in 14 states where voters elected governors of the opposite party. The 74% success rate of incumbent governors was considerably less than the 97% success rate for U.S. senators and representatives (Hinds, 1990).

As the rate of increase in state tax appropriations slowed during the 1980s, the price of tuition charged to students by campuses and systems of higher education began to rise. Two researchers commented on the inverse, causal relationship between tuition and state tax appropriations: "During the last ten years, institutions in many states increased tuition when appropriation increases were lower and instituted smaller tuition increases when appropriations were higher" (Wittstruck and Bragg, 1988). Evangelauf (1990) observed that for 10 consecutive years, tuition increases had outpaced the increase in inflation, although one year later the rate of tuition increases had slowed somewhat. Responding to complaints about excessively high tuition charges, the Congressional Select Committee on Children, Youth, and Families heard testimony in 1992 from consumers and higher education experts about, as the phenomenon came to be termed, why students were paying more but getting less.

In 1991 and 1992, numerous regional and national news sources published articles about the crisis in higher education. For example, claiming that universities were "grop[ing] for lost image," a *New York Times* analyst quoted former New Jersey Governor Thomas Kean, who said: "Our ivory tower is under siege" because "people are questioning our mission and questioning who we are. They claim we cost too much, spend carelessly, teach poorly, plan myopically and when we are questioned, we act defensively" (DePalma, 1992a). The *Times* earlier had noted that "universities have gotten the message," but predicted that by the 21st century "large research universities

like Yale and Columbia will shrink and become more specialized Teachers at elite private institutions and state-supported ones alike will be handling more courses Tuition will be substantially higher and financial aid scarcer" (DePalma, 1992b). News articles citing serious and widespread funding problems appeared ironically as colleges and universities reported record-high enrollments (*Campus Trends*, American Council on Education, 1992). Campuses were dealing with regular mid-year budget reductions and recisions and their effects — tuition increases, increased class sizes, fewer course sections, hiring freezes and spending reductions on libraries and construction (El-Khawas, 1992).

One forecast about the early '90s had particular relevance for higher education. Steven Gold of the Center for the Study of the States, Nelson A. Rockefeller Institute of Government, described what the early 1990s would look like, especially regarding prospects for revenue and education. Increases in tax revenue, he predicted, will outpace personal income because of increased spending; economic growth will slow because of productivity problems and slow growth in the labor force; intergovernmental competition for economic development will intensify; Medicaid and prisons, major areas of state government spending, likely will require greater state spending, as will spending on elementary and secondary education (Gold, 1991).

These bleak prospects did not go unnoticed by higher education leaders who increasingly spoke out in favor of tax reforms and tax increases to benefit education (Lively, 1992a). However, the general budgetary "squeeze" promised to affect higher education for the foreseeable future. Deep cuts occurred in California as well as in a number of other states. Clearly, state lawmakers were taking a renewed interest in "accountability," demonstrated by a number of states studying faculty productivity with an eye on the possibility of increasing faculty teaching loads; examining graduation rates to learn why such a high percentage of students take longer than four years to earn a bachelor's degree; and measuring the extent to which investment in higher education stimulates economic development and improves the work force (Lively, 1992b).

By late 1992, the recession appeared to be coming to an end. Tax collections, especially in personal income and sales taxes, rose toward the end of 1992. While corporate income tax revenues declined in 21

states, the broadening of the tax base and the lack of political backlash to the large number of tax increases in 1991 and in 1992 may signal a more optimistic future for higher education (Gold and McCormick, 1992). As the outgoing president of Columbia University remarked:

Almost alone among contemporary institutions, we take the long view [in higher education]. The crisis of the moment must be managed, but we measure our success over generations. We are struggling to preserve our endowments precisely because our vision of service encompasses not just today's students but tomorrow's as well. In an era characterized by the evanescent—the quick buck and the empty political promise—the hallmark of America's universities remains the enduring (Sovern, June 13, 1992).

A Retrospective of Fiscal Year 1993

In FY93, state governments appropriated \$30.4 billion to higher education, representing a gain of 62% over the most recent 10-year period. (The changes in both dollars and percentages gained from 1983 to 1993 are shown in **Table 1**. See also **Figure 1**.) This gain represents a clear slowing of growth compared to previous 10-year periods. For instance, from FY80 to FY90, there was a dollar gain of 104% or more than double, from \$19.2 billion to \$39.1 billion. Another way to examine **Table 1** is to consider the magnitude of the annual gain in dollars. From FY83 to FY93, the annual dollar gain exceeded \$2 billion five times, specifically in 1985, 1986, 1988, 1989 and 1990. The dollar gain was between one and two billion dollars in 1983, 1984 and 1987. How-

ever, the dollar gain fell to \$500 million in 1991, \$100 million in 1992, and in FY93 the change was negative — an actual decline of \$300 million from the previous year.

Current Trends in Two-Year Gains

Table 2 lists the two-year percentage gains of the 50 states in descending order, from Nevada at 27% to Virginia at -13%. Prior to the 1990s, few states ever demonstrated a negative percentage, representing an actual decline over the previous two years. However, in 1991, three states (Massachusetts, New Jersey and Rhode Island) had negative two-year changes. In FY92, 12 states had negative changes over two years, and 21 states had negative changes over one year. In FY93, 19 states had either negative changes or no change over two years, and 23 states had either negative changes or zero change over one year.

Table 3 identifies the states that showed an increasing, decreasing or identical two-year percentage gain compared to the preceding year. In FY93, 11 states reported two-year gains that were greater than the percentage gains they reported in FY92. Of these 11 states, six reported negative changes in FY92, but only three states (Massachusetts, New York and Rhode Island) were in the negative category in FY93. Out of 50 states, 39 reported negative changes or no change in two-year percentage gain in FY93, compared with 43 states in FY92.

The "Megastates"

The "megastates" are a group of highly populated, industrialized states having sizeable numbers of colleges and universities. The term was coined by Neal Peirce in *The Megastates of America* (1972), refer-

ring to the 10 most populous states which were "tied together by bonds of economics, culture and attitude as strong as any geographic area." Nine of the 10 megastates described by Peirce are identical to the 10 megastates identified herein. In this report, the term "megastate" designates a state that annually appropriates more than \$1 billion dollars for operating expenses of higher education. As recently as FY91, there were 12 such megastates, but in FY92 Minnesota and Virginia dropped out of the category when their appropriations fell below \$1 billion dollars.

The megastates represent more than half of the total amount appropriated to higher education by state governments, as shown in **Table 4** (see page 7). Of the 10 megastates, California had the largest appropriation of nearly \$5 billion, followed by Texas at \$2.8 billion and New York at \$2.7 billion. The remaining seven states — Illinois, North Carolina, Michigan, Florida, Pennsylvania, Ohio and New Jersey — appropriated less than \$2 billion. In percentages of two-year gain, only four of the 10 states were in the positive category this year, led by New Jersey at 10%; Texas, 9%; and North Carolina and Michigan at 4%. Six states had a negative two-year

Table 3

Texas	8	9				Illinois	1	-1	Pennsylvania	8	0						
Utah	9	13				Indiana	11	2	South Carolina	4	-1						
*The percentages of gain for FY92 are those which were reported last year, without taking into account revisions which have occurred since November 1, 1991. This is justified by the fact that, almost without exception, the differences between the two-year percentage gains are so great that even revisions to appropriations would not significantly change the groupings of states.						Iowa	7	3	Virginia	-5	-13						
						Kentucky	17	2	Washington	13	6						
						Louisiana	9	6	West Virginia	10	3						
						Maine	8	-7	Wisconsin	9	7						
						Maryland	-2	-3	Wyoming	8	-2						
												(Continued in next column)					

gain, beginning with Pennsylvania and Illinois, followed by New York, Ohio, Florida and California, with California having the largest decline at -12% over two years.

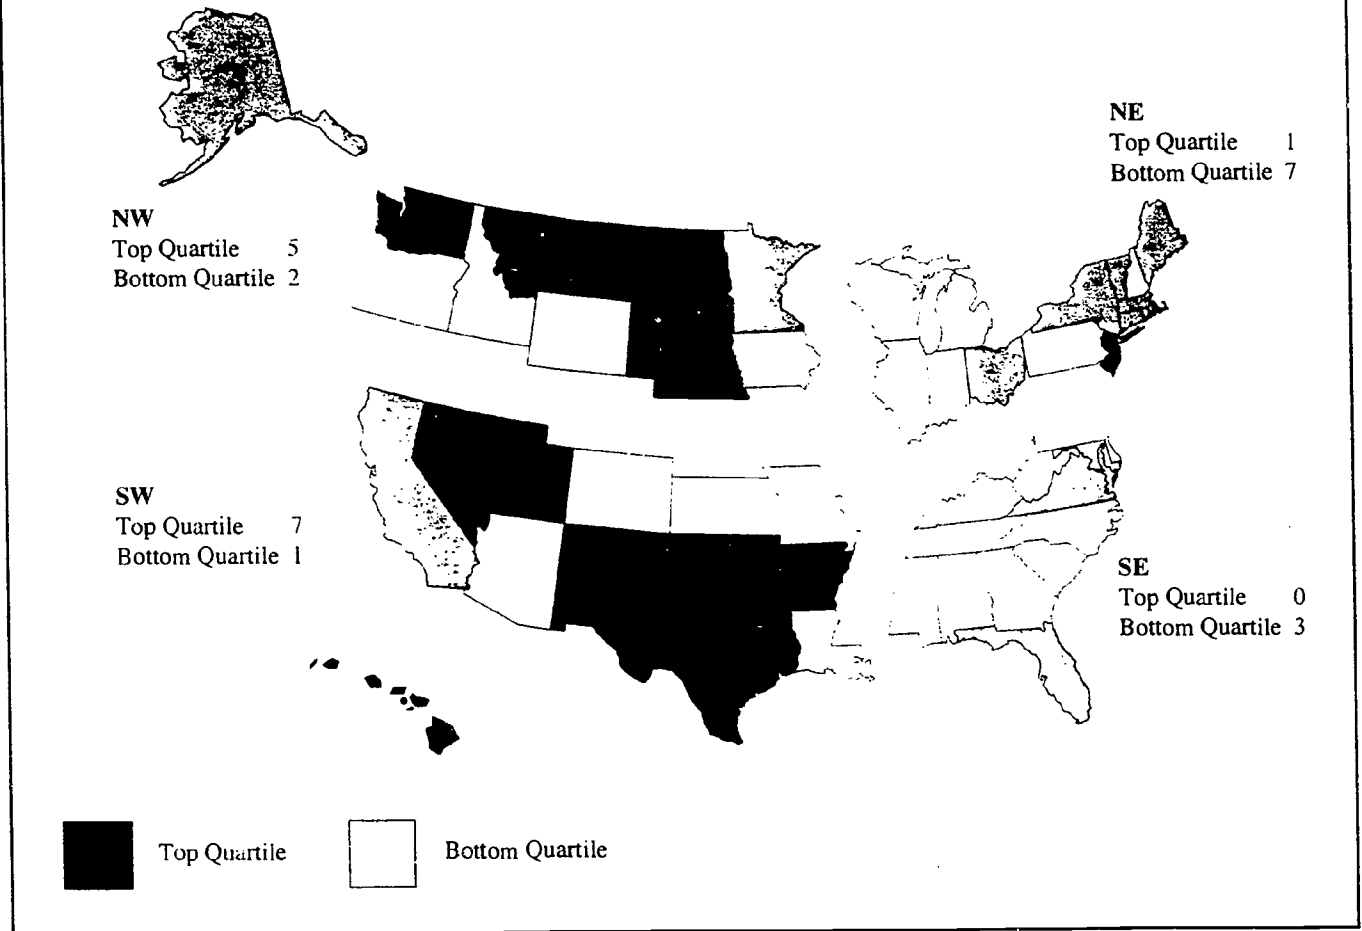

The impact of these 10 megastates on the national total is substantial. If California is removed from the calculation, for instance, the national two-year gain increases from -1% to +1.3%. If both California and New York, states with the largest higher education appropriations, are omitted from the calculation, the national two-year gain moves upward to +2%. When six of the 10 megastates are in the negative category, the national total is adversely affected. In FY93, this effect was especially significant, resulting in both two-year and one-year negative percentage changes.

A Regional View

A regional view of state higher education support takes into account geographic quadrants and statistical quartiles, as shown in Figure 2. The 50 states were divided into four quartiles, based on descending order of two-year percentage gains. The nation was divided into four quadrants, using the northeast corner of Missouri as a center point. The Mississippi River divides East from West, and the Ohio River and southern border of Pennsylvania divide Northeast from Southeast. Alaska is placed with the Northwest, and Hawaii is placed with the Southeast.

The quartiles included three groupings of 13 states, and one, the third quartile, of 11 states because of natural "breaks" between quartiles. Usually the top

Figure 2
 Quartile Map — Two-Year Changes

quartile includes states expected to have greater than 20% two-year gains. This year, only two states exceeded 20% over two years (Nevada and Arkansas). Five states clustered in the "teens" (Oregon, South Dakota, Utah, North Dakota, Oklahoma), and the remaining six states had either 8% or 9% gains over two years. The second quartile included 13 states showing two-year gains between 3% and 7%. The third quartile, five states had two-year gains of 1% or 2%, and the remainder of the states, including the entire bottom quartile states, were in the negative. Two states had two-year losses greater than -10% (California, -12%; Virginia, -12.5%).

Regionally, the states west of the Mississippi River did far better than states east of the Mississippi, with 12 of the 13 states in the top quartile. Seven states

had two-year gains greater than 10%, including four in the Southwest and three in the Northwest. Only four of the 19 states in the negative change category were located in the West: Wyoming, -2%; Minnesota, -4%; Alaska, -7%; and California, leading the nation at -12%.

Of the four quadrants, the Northeast demonstrated the worst performance, with only three of 14 states in the top half and 11 states in the bottom half. Only one state was in the top quartile (New Jersey, 10%). Seven Northeast states were in the bottom quartile, and all seven demonstrated two-year losses.

The Southeast quadrant did not fare much better, having no states in the top quartile and three in the bottom quartile. All but eight of the 26 states east of

the Mississippi River were in the bottom half, with 10 of these 26 states in the bottom quartile.

The Northwest and Southwest told a far more positive story with 18 of 24 states in the top half and only six of 24 states in the bottom half.

Regional Variations

Geographically based differences in levels of state government support of higher education provide convenient bases for observations about these data. In the late '70s and early '80s, many assertions were made about an economically vigorous "Sunbelt" reaching generally across the South from Southern California to Texas to Florida, versus the so-called "Rustbelt" of the industrialized upper Midwest, Mid Atlantic and Eastern Seaboard.

More recently, the obvious phenomenon has been East versus West, with numerous states east of the Mississippi River experiencing significant economic difficulty and many western states demonstrating comparatively stronger economic recovery. Comparing FY93 to FY91, all states in the lowest quartile were east of the Mississippi except Alaska, California and Minnesota. Conversely, virtually all states in the top quartile were located west of the Mississippi with strong groupings of top-quartile states located in the Northern and Southern Plains regions.

It was only a few years ago, in the mid-'80s, when many eastern states experienced an economic resurgence. Along with economic growth, demands on state treasuries — including funding for higher education — began to increase. States were able to increase support of services because economic activity was vigorous and fiscal resources were plentiful. That positive scenario changed abruptly with the convergence of the recession, contracting markets and increasing demands for state services. Those

Megastate	FY90-91	FY91-92	FY92-93	Percentages of Gain	
				1-Year	2-Year
California	\$5,498,886	\$5,652,148	\$4,841,606	-14	-12
Florida	1,548,285	1,443,318	1,415,262	-2	-9
Illinois	1,742,428	1,712,913	1,718,849	0	-1

Pennsylvania	1,395,732	1,483,318	1,388,920	-6	0
Texas	2,579,342	2,821,806	2,802,348	-1	9
Totals	\$21,107,904	\$21,408,765	\$20,491,827	-4	-3
National Totals/Gain	\$39,644,034	\$39,748,026	\$39,407,111	-1	-1

pressures were greatest in the East, which suffered more severe economic problems than were experienced in the West. The future of higher education will depend largely on the strength of the underlying economies in the states and on financial resources available to higher education as well as to all other areas of public service.

Revenue Variations

In order for states to support higher education or, for that matter, other areas of public service and education, they must have the ability to raise revenue through appropriate systems of taxation. This is a measure of revenue capacity which, for the purpose of this analysis, is defined by the projected percentage increase in state general revenue funds from the preceding to the current fiscal year. **Table 5** reflects revenue capacity in the first column of statistical data.

The next variable used in this analysis is labeled "lawmaker willingness," defined by the apparent willingness of state legislators to support public ser-

Table 5
**Comparison of Revenue Capacity, Willingness
 and Higher Education Effort, Percentage Increase, FY92-93**

Top 10 One-Year Gainers				Bottom 10 One-Year Gainers			
States	General Revenue Increase* (Capacity)	State Appropriations Increase* (Willingness)	Higher Education Increase (Effort)**	States	General Revenue Increase* (Capacity)	State Appropriations Increase* (Willingness)	Higher Education Increase (Effort)**

**Grapevine

vices funded from general tax revenues. Lawmaker willingness is operationally defined by the percentage of projected increase in state government expenditures from the general revenue fund from the previous to the current fiscal year. In **Table 5**, the variable of lawmaker willingness is found in the middle column of data.

The third and final variable used is specific effort for higher education, as measured by the percentage increase in appropriations for higher education from the preceding to the current fiscal year. The measure of higher education effort is taken directly from state appropriations data (published monthly in *Grapevine*, Illinois State University), collected as state legislatures made decisions regarding higher education support levels for the current fiscal year.

Table 5 displays these variables — revenue capacity, lawmaker willingness and higher education effort — for the 10 top and 10 bottom states, based on one-year percentage gains for higher education. Contrasting the top and bottom states, there were significant differences between the two groups of states in all three areas. The top states exhibited significantly greater revenue capacity with a mean one-year gain of 7.8%, compared to a mean one-year gain of 3.6% for the bottom states. The top states also were willing to appropriate resources for public services. The top states had a one-year gain of 7.0% in total state appropriations (lawmaker willingness), compared to a mean of 1.6% for the bottom states and an 8.4% one-year gain for higher education effort, compared to -4.6% among the bottom states.

The long-term decline in higher education's share of state spending is well documented (Research Associates, 1992). But what Table 5 demonstrates is the direct link between economic growth and higher education appropriations. As the economy goes, so goes higher education. This fact suggests that the more optimistic projections of revenue collections in FY93 bode well for higher education appropriations next year, provided this projected growth is realized.

Sector Variations

There are similarities and differences in specific sectors of higher education support, such as student financial aid, community colleges and principal public universities. The purpose of collecting state tax appropriations data is to display data and conduct aggregate analyses at the state level, not to focus on more discrete areas. Nonetheless, it is possible to identify areas of interest in most states. Three such areas are isolated for analysis: appropriation amounts for student financial aid, for community colleges and for principal or flagship public universities.

Student financial aid includes state tax funds appropriated to state scholarship commissions for distribution to students who attend either public or private colleges and universities. These funds do not include federally based student aid funds and campus-based student aid, such as college work-study and institutionally funded aid programs. In 40 of the 50 states, it was possible to identify state tax appropriations destined for distribution in student aid. There was a mean two-year gain of 14% for these student aid programs, which was many times larger than the national two-year gain of -.6% for all of higher education. Such a large effort in the support of student financial aid demonstrates significant sensitivity of state lawmakers to tuition levels and the need for increasing support for student aid. Two-year gains for student aid exceeded 10% in 15 states: Arkansas, Colorado, Florida, Kentucky, Maryland, Nebraska, New Jersey, New Mexico, New York, Ohio, North Dakota, Pennsylvania, South Dakota, Virginia and Wisconsin.

Public community colleges are funded either principally by state governments or by a state-local combination of resources, which include state taxes and local tax appropriations along with student tuition. In recent years, community colleges have been supported at levels exceeding aggregate levels of either

state support or the national weighted mean of state support of higher education. In FY93, the national two-year percentage gain for state support of community colleges was virtually identical to the national weighted mean of state higher education support of -.6%. However, in 31 of the 41 states where state support to community colleges could be identified, the two-year gains in state support to community colleges slightly exceeded state support to higher education generally, although this amount was quite small, less than one percentage point. In only seven states were two-year percentage gains to community colleges less than two-year percentage gains to higher education.* The increased support for community colleges may be accounted for by increasing enrollment in this sector as students shift to lower-cost institutions.

Appropriations to principal state universities or the flagship campuses of public-sector institutions is a third area of interest. Principal state universities were identified in all states except New York. In the 49 states where principal state universities were identified, there was a mean two-year gain of 1.4%. This modest percentage gain compared quite favorably with the national weighted mean of -.6%. So, these principal state universities exhibited a stronger two-year percentage gain than did higher education in general. Given the higher-than-average support for student aid, community colleges and flagship campuses, state support to other entities — in some cases, regional universities and private institutions — suffered a somewhat larger share of cutbacks.

Conclusion

After several decades of consistent increases in state support for the operating expenses of higher education, FY92 and FY93 marked a precipitous and negative change. As this report graphically shows, there

*In calculating national average scores, weighted means are used by adding all of the appropriations, then calculating percentage changes. If, however, arithmetic means are calculated by averaging all of the percentages of gain for the individual states, then the two-year gain for community colleges increases to 9.8%. The magnitude of the difference between weighted and arithmetic means is accounted for by the effect of a few states that appropriate large amounts to community colleges, but which exhibit negative percentage changes in FY93. Most notably, this included California, Florida, New York and Virginia.

[REDACTED]

were record declines and slowing of growth in state higher education support during the two most recent fiscal years.

On the positive side, state support for student financial aid was especially strong, undoubtedly serving as a means of compensating for continued increases in student tuition which occurred as state support was on the decline. Interest in providing support to community colleges and to principal state universities continues, as measured by percentage gains in

these areas, compared to lesser percentage increases for higher education as a whole.

Recent tax increases, combined with a possible turnaround in revenue capacity and the willingness to support public services and education, provide some optimism for the future. It may be that FY92 and FY93, two extraordinarily negative years of state support for higher education, will stand out as the low point in state higher education support for the decade.

National Tables and Comparative Measures

This section contains three tables of nationwide scope. A national map (below) shows percentages of two-year gains for all states.

Table 6 shows the states in alphabetical order with appropriations amounts for the most recent three years, as well as percentage changes for one-year, two years and 10 years.

Finally, a second 50-state table (Table 7) shows state tax appropriations per capita and per \$1,000 of personal income along with national rankings. These two measures are widely used by analysts and researchers when comparing the effort made by states for higher education. The per-capita measure enables comparisons to be made among states having different numbers of resident population. Otherwise, total appropriations amounts are skewed by demographic figures reflecting the size of the population served. The income measure reflects the basic

wealth or economic capacity of a state using a standard indicator of personal income. Both the per-capita and personal income measures reflect state effort, in this case total state tax effort for higher education.

Caution needs to be used in interpreting these comparative measures. The principal limitation is that only state tax revenue is used to calculate the measures. Were local taxes, student tuition and federal revenue included, a different picture of higher education support likely would emerge. A more complete analysis would need to include more revenue measures than only state taxes. However, as the principal source of funds for the public sector and as an important revenue source for the private sector, these measures using only state taxes are of value if interpreted with these limitations in mind.

State-by-State Appropriations

Nature of the Data

The individual state tables in this section reflect decisions made by legislatures in the 50 states about the amount of state taxes to be appropriated in Fiscal Year 1993 for operating expenses of colleges and universities. State tax appropriations are a major source of revenue and are the focus of this report. Excluded are local taxes, federal funds and student tuition. These data sometimes are referred to as *total state tax effort* for higher education. Thus, funds are included if legislatures made appropriations to higher education using state taxes as the revenue source. These figures include not only campus operating funds, but also amounts for state scholarship programs, even if the funds go to students attending private or independent institutions; to private or independent colleges and universities if appropriated from state tax funds; to statewide coordinating and governing boards; and to state agencies as long as the funds are destined to be allocated to higher education. See the next section, "What the Figures Are Intended to Mean," which are the instructions sent to each state for the purpose of clarifying data collection and reporting.

Major Data Characteristics

These state tax appropriations data have fundamental characteristics which help define their nature and use. In states having community colleges funded by local taxes, rather than or in addition to state taxes, these data reflect only the state's share, not the local tax share or the share represented by student tuition. In the 1980s, the level of student tuition charged by public colleges and universities began to rise rapidly, after decades of a typically low-tuition policy in the

public sector in most states. In fact, the rate of rising tuition levels in the public sector in the mid- to late-1980s outpaced the rate at which tuition increased at private colleges and universities. This caused considerable anxiety among students, parents and state lawmakers who became concerned about tuition increases, resulting in legislative hearings on student tuition at both state and federal levels.

Another fundamental characteristic is that these data represent appropriations and not expenditures. Appropriations data reflect legislative decisions and include revisions to the extent that revisions represent appropriations, rather than expenditures. Expenditures generally are made at the campus level after legislative appropriations. Expenditure data are used in the U.S. Government publication entitled *State Higher Education Profiles*. Expenditure data generally are not available until approximately three years after appropriations data are published.

After the initial legislative decisions are made for higher education, supplementary decisions may be made either by a legislature or by a governor. These later decisions are

termed *data revisions*, and, if reported by states to the *Grapevine* monthly research report, they are included in this publication. Two columns of data appear in each state table: one column reflects legislative decisions made in the previous year, and the other column contains legislative decisions in the current fiscal year. The designation of an "(R)," following the heading for FY91-92, indicates that a revision was made in the initial legislative decision.

When states report these higher education appropriations to the *Grapevine* monthly research report, they include campus figures as well as amounts allocated to agencies and organizations other than individual

campuses. These agencies include statewide coordinating boards, also known as state higher education agencies, as well as governing boards for individual campuses or for systems of higher education, such as consolidated systems and multicampus systems. State tax funds which are allocated to state scholarship programs and agencies are included in these figures, regardless of whether the funds are disbursed to students attending public campuses or private institutions. These state tax dollars may be appropriated by the legislature to another state agency, such as the state treasurer or state health department, and may be designated for higher education for faculty and staff fringe benefits or funds for medical and health education.

These appropriations data also include sums destined for agricultural extension and for research. The keys in definition include whether or not funds are expended by colleges and universities as part of their campus operating budgets. Also considered is whether or not the students being educated are ranked at higher and postsecondary education levels for the purposes of enrollment, versus enrollment at other education levels such as a vocational-technical program which educates students at levels below the 13th grade.

In spite of all of these definitions, exclusions and caveats, it must be recognized that there are budgeting and accounting practices unique to some states and not others. Therefore, in reflecting total state tax effort, these data only begin to approach comparability. True comparability, such as deriving instructional expenditures per credit hour, are very dissimilar to these state tax appropriations data. These data, however, are timely because they are published as soon as possible after legislative decisions are made. These data are also accurate because they include revisions, and they are comprehensive because they reflect the total amount of state taxes which are either appropriated or destined for the operations of colleges and universities.

What the Figures Are Intended To Mean

The ground rules used to achieve uniform reporting are enumerated below. Diversities of practices among the 50 states make it impossible to eliminate all inconsistencies and to accomplish absolute comparability among states and institutions. We

emphasize that comparisons are useful only if the data are correctly interpreted.

1. Report only *appropriations*, not actual expenditures.
2. Report only sums appropriated for annual *operating expenses*.
3. For the state tax appropriations in complex universities, set out separately the sums appropriated for (or allocated to) the main campuses, branch campuses and medical centers (even if on the main campus). The medical center item should include operation of colleges of medicine, dentistry, pharmacy, nursing and teaching hospitals, either lumped as one sum or set out separately as preferred.

4. *Include:*

- Sums appropriated for state aid to local public community colleges and for operation of state-supported community colleges, and for vocational-technical two-year colleges or institutes which are predominantly for high school graduates and adult students.
- Sums appropriated to statewide coordinating boards or governing boards, either for board expenses or for allocation by the board to other institutions or both.
- Sums appropriated for state scholarships or other student financial aid.
- Sums destined for higher education but appropriated to some other state agency. Examples: funds intended for faculty fringe benefits may be appropriated to the state treasurer and disbursed by that office; certain funds for medical and health education may be appropriated to the state department of health and disbursed from that department. Sometimes these sums have to be estimated because the exact amount disbursed cannot be known until after the end of the fiscal period.
- Appropriations directed to private institutions of higher education at all levels.

5. *Exclude:*

Appropriations for capital outlays and debt service.
Appropriations of sums derived from federal sources, student fees, auxiliary enterprises and other non-tax sources.

State Tables

ALABAMA

State tax-fund appropriations for the operating expenses of higher education for fiscal years 1991-92 and 1992-93 in Alabama (in thousands of dollars).
