ABSTRACT

This report provides an overview of the Oklahoma School Testing Program (OSTP) and summarizes students' average writing assessment scores from 1987 through 1993. In 1992, the Stanford Writing Assessment replaced the MAT-6 Writing Test as the instrument for measuring writing achievement for 7th and 10th graders in Oklahoma. Student papers were hand scored through holistic and analytic approaches to assess different aspects of composition skills. The combination of the two approaches provides teachers with a variety of performance data that can be used to assess student writing skill strengths. Comparison of students' holistic scores with the national average for the past 7 years indicates continued above average performance at both grades tested. The majority of the 1993 7th and 10th graders scored closer to the national average than their predecessors, although Oklahoma students continued to perform at or above the national norm of the 50th percentile. Use of the newly normed unimodal prompts of the new 1992 assessment has resulted in scores that are closer to the national average. Seven tables and eight figures present test results and allow comparison with national scores and Oklahoma scores from preceding years. Four appendixes present additional information in table form about the percent of scores under the normal curve and the performance of students in both grades. (SLD)

June 24, 1993

To the Citizens of Oklahoma:

This report provides an overview of the Oklahoma School Testing Program (OSTP) and summarizes students' average writing assessment scores from 1987 through 1993. The Writing Assessment Component of the OSTP was implemented in compliance with Title 70 O.S. Supp. 1985, /1210.510 et. seq. (Senate Bill 426, 1986).

Oklahoma has completed its seventh consecutive year of administering a direct writing assessment to students in tenth grade, and our sixth year of administering such a test to seventh-grade students. During the first five years of this program, writing in a combination of the narrative and descriptive modes was measured through use of the *MAT-6 Writing Test* (*The Psychological Corporation--TPC*).

In 1992, the State Board of Education adopted the *Stanford Writing Assessment*, Second Edition (TPC's newly normed writing test). This test introduced a more rigorous measure of writing skills, with scoring methods based on student expectations which include (1) directly addressing the topic of a *unimodal* prompt; (2) writing consistently within the specified mode; and (3) exhibiting a level of writing skill expertise which can reasonably be expected of students in the grade levels tested. The 1992 test elicited writing in the *descriptive mode*.

Use of the *Stanford* in the 1993 OSTP Writing Assessment represented the state's first test of students' applied writing skills in the *expository mode*. Writing in this mode requires students to provide an *explanation* of a concept, procedure, principle, or position (e.g., as on an issue).

The majority of the 1993 seventh- and tenth-grade students scored closer to the national average than their predecessors who responded to narrative and descriptive writing assessment prompts. However, Oklahoma students continued to perform at levels above the national norm of the 50th Percentile Rank. Our teachers and administrators are to be commended for providing quality writing instructional programs.

The State Department of Education appreciates the cooperation of all public school educators in the local management of the OSTP. In addition, we appreciate parents' assistance in preparing their children mentally, physically, and emotionally for participation in this program. It is only with such a spirit of school and community cooperation that we can successfully obtain a measure of our students' best efforts to reveal evidence of their accumulated knowledge and academic skills.

Sincerely,

A handwritten signature in cursive script that reads "Sandy Garrett".

FIRST BY THE TWENTY-FIRST

OKLAHOMA SCHOOL TESTING PROGRAM (OSTP)

WRITING ASSESSMENT COMPONENT

1993 ANNUAL REPORT: EXECUTIVE SUMMARY

The *Stanford Writing Assessment* was administered to Oklahoma's seventh- and tenth-grade students in February, 1993. Students' papers were hand-scored through use of two different procedures--holistic and analytic scoring. These procedures are designed to measure different aspects of composition skills. By using the combination of the two scoring procedures, we are supplying teachers with a variety of performance data that can be used to assess students' writing skill strengths, determine areas of skill reinforcement need, and provide focus for the most beneficial instructional methods for each student.

Holistic scores provide an overview of the general quality of composition skills demonstrated by each student in response to a verbal writing prompt. Holistic Raw Scores range from 2 to 12, and are converted to normative scores to provide a comparison of student performance with that of the national norm group.

The average Holistic Score Percentile Ranks for Grades 7 and 10 were 57 and 51, respectively. A Percentile Rank of 50 is considered the "national average." A score of 57, for example, means that the average seventh-grade student in Oklahoma scored as well as or better than 57% of the students in the national norm group who were administered this same prompt.

Analytic Scores are given on a scale of one to four, with four being the highest performance level. The analytic scoring procedure for 1993 was designed to evaluate the six specific areas of writing skills listed below. (Figure 1, pages 20-21, provides further delineation of these skills. The table provided on page v describes Oklahoma's 1993 Analytic Score performance in terms of the skill area, performance level within each skill area, and the percent of students scoring in each performance level.)

| II. Organization, Unity, and Coherence | V. Grammar and Usage |
| III. Word Choice | VI. Mechanics |

Comparisons of Oklahoma students' Holistic Scores with the national average during the past seven years indicate continued above-average performance at both grades tested. During the first five years of this program, students were asked to respond to a combination picture/verbal prompt which elicited writing in narrative, descriptive, or a blend of these two modes. In 1992, a new test was introduced which is different in a number of ways, the most important of which include the following:

- the prompts are strictly verbal (i.e., no pictures accompany the verbal portion);
- the prompts are *unimodal* (i.e., elicit writing in only *one writing mode*);
- scoring is more stringent in that the student is expected to (a) address the topic of the prompt throughout the discourse; (b) consistently write within the specified mode elicited by the prompt; and (c) use writing skills generally expected at the grade levels tested; and
- national norms are newer, yielding more difficult standards with which to compare scores of individual students and groups.

Oklahoma students were administered *unimodal prompts* eliciting *descriptive writing* (1992) and, for the first time in OSTP history, *expository writing* (1993). Expository prompts differ greatly from narrative and descriptive ones in that such prompts require students to write an explanation of a concept, procedure, principle, or position (i.e., as on an issue).

Prompts which elicit different writing modes are not statistically equated; therefore, scores on *descriptive* and *expository* writing assessments are not comparable. Use of the newly normed *unimodal* prompts has resulted in scores that are closer to national average performance. The shift to the new test with different writing and scoring procedures--along with an increased national level of writing achievement (especially at the high school grades, as indicated by the norms)--are possible reasons for differences seen in the 1993 and previous Oklahoma writing assessment performance comparisons with national norms.

**SUMMARY REPORT FOR THE
OKLAHOMA SCHOOL TESTING PROGRAM (OSTP)
WRITING ASSESSMENT COMPONENT--1993**

I. Introduction

Beginning in 1986, Oklahoma Law mandated that a standardized, norm-referenced direct writing assessment be administered to students in specified grades. This program--referred to as the *Writing Assessment Component of the OSTP*--began with administration of writing tests to students in Grade 10 in 1987. The program was expanded in 1988 to include assessment at Grade 7.

The measurement instruments utilized to achieve an assessment of students' writing skills are obtained through the state bid system. Such instruments achieve this measure by providing a writing prompt to which students respond with an essay. Students' writing is hand-scored by three professional raters who apply two different procedures with each paper--*holistic scoring* and *analytic scoring*. Use of the former method results in a judgment of the paper's overall merit as compared with exemplary papers written during the national standardization of the tests, and yields the *normative data* required by law. Employment of the analytic scoring method yields performance estimates on six areas of specific writing skills. Both scoring methodologies are fully explained later in this report.

The measurement instruments adopted by the State Board of Education for this program include the MAT-6 Writing Test (1987-1991) and the Stanford Writing Assessment Program (1992-93), both of which are published by The Psychological Corporation. While both test series assess students' actual writing skills, they differ in their philosophical bases and resulting methodologies. These differences will be discussed at length in a subsequent section of this report.

The following report describes the inception, implementation procedures, assessment instruments and results of this program. District level data are reported for the 1993 assessment, and state level data are provided for the writing assessments conducted in 1987 through 1993. In addition, guidelines are provided for analysis and interpretation of the test results.

A. Inception of the OSTP and the Writing Assessment Component: Legislation

Oklahoma House Bill 1480, enacted in 1984, required the State Department of Education to develop a plan for statewide assessment of student achievement in the basic skills. This plan was submitted to the Legislature on January 1, 1985. In 1985, the Oklahoma School Testing Program Act (§ 1210.505 through 1210.511 of Title 70 of the Oklahoma Statutes) mandated the administration of a standardized, norm-referenced achievement test to students in Grades 3, 7,

and 10 (House Bill 1466). The subject and skill areas measured in this assessment include reading, language arts, mathematics, science, and social studies. Data resulting from the OSTP are reported annually to the Oklahoma Legislature and the State Board of Education.

The Oklahoma School Testing Program Act further required the State Department of Education to submit a plan for administering a direct writing assessment to Oklahoma's public school students. Submitted to the Oklahoma Legislature on January 1, 1986, this plan addressed (1) definitions of the various components of the writing assessment; (2) estimated costs; (3) timelines and procedures for implementation; (4) suggested tests to be utilized to provide consistent data; (5) reporting procedures; and (6) anticipated benefits to be achieved through the program.

Oklahoma Senate Bill 426 (1986) created the Writing Assessment Component of the OSTP, mandating that a standardized, norm-referenced direct writing test be administered to tenth-grade students during the 1986-87 school year. This law further stated that, based on the availability of funds, the program would be expanded in 1987-88 to include Grade 7 and expanded again in 1988-89 to include Grade 3. (Subsequent legislation [i.e., Senate Bill 183, enacted in 1989] deleted any reference to adding Grade 3; therefore, the program has been maintained at Grades 7 and 10 only.)

Based on Senate Bill 426, the purpose of the writing assessment is to obtain a measure of students' actual writing performance; its function is to achieve improvement in the state public education system. Furthermore, "the State Board of Education shall seek to ensure that data yielded from the test is utilized at the school district level to prescribe skill reinforcement and/or remediation by requiring school districts to develop and implement a specific program of improvement based on the test results" (70 O.S. Supp., 1210.508). In addition, this bill stated that "the State Department of Education shall provide inservice training for local school personnel who administer the test."

The legislation required that reports of test results be provided to local school districts by the contracting test company. Individualized results of the test "shall be made available by the local school district to the classroom teachers in the area tested" ...and "the Department will provide test results to appropriate public officials as required by law."

Oklahoma House Bill 1110 (1987) expanded the Writing Assessment Component of the OSTP--with the same requirements--to include administration of a direct writing test to both seventh- and tenth-grade students. Subsequent legislation has maintained the current program.

Senate Bill 426 and House Bill 1110 further stated that students who have Individualized Education Plans (IEPs) pursuant to Public Law 101-476 shall not be required to participate in the Oklahoma School Testing Program. Due to effects of Federal Law (Section 504 of the Rehabilitation Act of 1973, 29 U.S.C. 706, regarding the prevention of discrimination against the handicapped), the State Department of Education issued the following procedural directive to all public school superintendents annually through the school year 1988-89:

"Based on Oklahoma Law, students who have Individualized Education Plans (IEPs) pursuant to Public Law 101-476 shall not be required to participate in the Oklahoma School Testing Program. However, the right of these students to participate in the OSTP cannot be denied. Parents must be given the opportunity to sign a form indicating their desire to have their children take the tests. The form to be used is the 'IEP Program SDE Form 9' which is employed during the IEP Conference with parents. Please make sure that parents respond to the question on this form regarding their children's participation in the OSTP."

Senate Bill 183 (Section 1210.511 B.), enacted in May of 1989, contained the following change in language regarding testing students with IEPs:

"A student whose education is subject to the provisions of an individualized education plan (IEP) pursuant to Public Law 101-476 as amended, shall be tested pursuant to the provisions of the Oklahoma School Testing Program Act, Section 1210.505 et seq. of this title, only to the extent specified by the student's individualized education plan."

With this change, the decision to test such students became a function of the IEP Team, of which the student's parent is a standing member. The "IEP Program SDE Form 9" continued to be utilized as the documentation of the team's decision in regard to whether or not the student would be administered the tests.

Regulations were adopted by the State Board of Education in 1987 and 1989 to specify test exemptions for students who have IEPs and those who are considered as Limited English Proficient (LEP) based on the definition issued by the U.S. Secretary of Education. (A summary of the OSTP Regulations is found on pages 10 and 11 of this report.) According to Regulation, students who are considered as LEP can be exempted from OSTP participation at local district option (1) if such students meet the definition; (2) if these students have been counted as LEP for accreditation reporting purposes at the time that tests are administered; and (3) if parental permission for exemption from testing is obtained in writing and on file in the school.

B. Combining Assessment Methodologies in the OSTP

Two methods are available to measure writing and related skills--indirect and direct. Implementation of the OSTP Writing Assessment Component benefits teachers and students by providing data from both kinds of measurement.

Indirect measurement is conducted through the administration of multiple-choice test items which consist of correct and incorrect optional answers illustrating the application of writing-related skills (e.g., word usage, sentence structure, punctuation, capitalization, grammar, and spelling). In such an assessment, the student must read the test item, decide which of the options is correct, and mark a machine-scorable answer blank to indicate his or her choice. The resulting scores do not indicate the student's ability to write; instead, scores indicate the student's ability to apply knowledge of writing-related skills to printed sentences and phrases and choose the correct option. Students' strengths and deficiencies in skill knowledge/application are indicated by the number of correct choices made in the measurement of each skill. Such data are reported on the language achievement tests administered as part of the OSTP.

Direct writing assessment is conducted through the provision of a stimulus or prompt to which the student responds by writing a story, description, explanation, or other form of discourse designed to address the topic suggested by the prompt. Students' compositions are rated by professional graders. Rating of students' papers is based on predetermined criteria which represent specific writing skills and the level at which each is applied in the discourse. The direct assessment, therefore, provides an illustration of the student's actual ability to express his or her thoughts while demonstrating writing skills.

The major purpose of the OSTP is to provide data with which to determine the status of students' skill achievement levels. Its function is "to improve all phases of the state public educational system" (House Bill 1466). It is believed that tandem use of results from both components of the OSTP will ultimately function to increase the potential for improvement in public school writing programs.

C. Use of the Standardized Writing Assessment Instrument: Benefits and Limitations

A standardized writing test is one which has been constructed in accordance with detailed specifications as to kind and difficulty of prompt, time limits needed to complete the written response, and criteria utilized for scoring. In developing such tests, prompts are carefully constructed, field-tested with random samplings of students nationwide, and determined to be appropriate

in difficulty and discriminating power. The data resulting from standardization of such tests are used to establish a national "norm" or average against which students' scores at the individual, class, building, and state levels can be compared. Analysis of such test data reveals strengths and deficiencies in students' skills. Results of writing test score analyses can be employed in planning for instructional program improvement at all levels.

1. Benefits

The benefits derived from use of the standardized writing test include the following:

- A special phenomenon transpires in communities and schools when use of standardized tests expands from the local, district-controlled level to that of statewide assessment. In regard to writing skills--the last of the "basic skills" to be assessed with standardized instruments--there is a renewed interest in (a) the skills being assessed; (b) the status of students' writing performance levels; (c) the need and desire for improvement; and (d) the methodology needed to achieve desired instructional goals. This interest--pursued with positive action--results in renewed motivation of teachers and students, more appropriate instruction at all relevant grade levels, initiation of interim evaluation at the classroom level, and subsequent progress achieved with improvement of students' skills.
- The standardized writing test is administered using the writing process method within a timed format, thus providing an estimate of the student's ability to organize and record thoughts in response to a specific stimulus. Considered as one of the "survival" skills, writing is applied in many situations throughout an individual's life. Such applications include written class assignments for which time is limited; teacher-constructed essay tests; job applications which require a timed impromptu autobiography, discussion of job-related goals, and/or description of leisure-time pursuits; and the on-the-job creation of correspondence, reports, and other business communications. Use of the standardized writing test and its results can reawaken the educator's awareness of the student's need for success in such realistic applications. Reorientation to this factor often encourages educators to refocus instructional programs on students' specific skill needs, thus increasing the potential for long-range program improvement.
- Use of the standardized writing test encourages educators to provide test-preparation sessions for students--a factor which helps individuals become more comfortable with test-taking. As teachers (a) help students learn to budget time; (b) counsel individuals privately on test results and their meaning for current needs and future success; and (c)

reassure students through sharing progress reports periodically, each is motivated to take ownership in the testing situation and its outcomes. As students assume greater responsibility for their own learning, their efforts to improve the quality of their performance begin to increase--a factor which contributes to a more comfortable testing situation.

2. Limitations

Due to the structure of the standardized test and the specifications within which each is constructed, administered, and scored, there are certain limitations which need to be considered in the analysis and use of resulting data:

- Standardized test results represent estimates of the student's demonstrable achievement level only at the time the test was given and for a few weeks thereafter. With the passage of time, accumulation of additional knowledge and practice in writing, students' test scores can improve to a measurable degree. Therefore, neither individual students, school buildings, nor school districts should be labeled nor judged on a single test administration.
- Failure to control certain necessary standardized test conditions can yield invalid results. Conditions which need to be controlled during test administration include (a) physical environment (room temperature, lighting, noise level, and overcrowding of students); (b) emotional environment (diminishing test anxiety and motivating students through positive attitudes on the part of parents, teachers, and school administrators); and (c) test administration procedures (giving directions accurately, observing strict timing of tests, and monitoring students' test-taking behaviors). Appropriate precautions regarding the control of all conditions mentioned above are discussed in the Pretest Inservice Training Sessions (and manual) provided for test administrators prior to testing.
- It is neither equitable, meaningful, nor appropriate to compare the performance of individual schools nor school districts with one another without considering certain demographic factors which are known to exert influence on test results (Jenks, 1972; White, 1976). These factors include socioeconomic level of the community, median income, and median educational levels of community members. In addition, where small numbers of children are tested, the abilities of one or two students can affect the average score of any grade level of students in that district.

Furthermore, the transient nature of our society can have an effect on the overall performance level of the school district. This factor--often referred to as student mobility rate, or population turnover rate--tends to exert a greater influence on scores of schools which enroll smaller numbers of students.

In general, the higher the socioeconomic level of the community, the greater the median income (factors which correlate with educational level); and the higher the median educational level of the community is, the more likely the students in that school district are to score higher on tests.

Within the time limitation imposed on the reporting of the enclosed results, the test data contained in this document could not be treated statistically to equalize the effects of those factors listed above. Under these conditions, it is both meaningless and inappropriate to compare the performance of students in specific schools or school districts to determine the effects of instructional programs.

- Knowledge of test-taking skills can enhance the student's ability to perform on standardized tests. Such skills affecting the direct writing assessment include practice in responding to a writing prompt under timed conditions, learning to organize the response before beginning to write, and editing/revising a piece of discourse either during the writing or immediately afterward.

Current instructional theory advocates the use of the "process-writing" approach which includes the following steps: (1) pre-writing (organization and outlining of ideas); (2) writing the draft; (3) revising and editing; and (4) publishing. A search of the literature on writing instruction reveals that, for the past 15 to 20 years, this method has been proven to be a highly successful approach.

The Stanford Writing Assessment Program, (Second Edition), adopted for Oklahoma's 1992 assessment, is designed to encourage students to utilize "process-writing" skills during the examination. Since this is a series of standardized, norm-referenced writing assessments, the tests are timed. Following directions in the manual, the test administrator guides students through a schedule which includes five minutes for the pre-writing stage; 20 minutes for the writing stage; and the last 10 minutes for the revising and editing stage.

While the test administrator provides oral directions to guide students through the timing of these three writing stages, students may elect to use the 35 minutes allowed for the test to construct the essay according to their own schedule. Performing well on such an assessment is often

largely dependent on the degree to which the student has learned the "process-writing" skills and can apply them in this context.

Teachers are encouraged to base daily instruction on the "process-writing" method, intensifying such instruction to the point of successful writing skill application by students. In addition, teachers are encouraged to provide frequent practice for students in prompt-initiated, timed writing sessions. The use of such methods--coupled with encouragement of an "ownership" attitude in students regarding writing practice and writing assessment--should serve to increase students' writing proficiencies.

II. Implementation and Maintenance Procedures (1986-1993)

A. Program Objectives

Objectives for accomplishing the successful implementation of the Writing Assessment Component included the following:

- To obtain a test which meets the specifications outlined by Oklahoma law.
- To provide a system whereby tests remain secure.
- To provide pretest inservice training for test administrators as outlined in the law.
- To provide a system for dissemination, return, and accounting of test materials.
- To provide a system for rating students' compositions--one which yields both normative data as well as data with which students' specific skill strengths and deficiencies can be determined--and for reporting of results to local schools.
- To analyze, interpret, and report statewide results to the State Board of Education and the Legislature.
- To provide posttest inservice training on the interpretation and use of test results to improve instructional programs at the local school level.
- To assist school personnel in incorporating the use of test scores in their School Improvement Plans.

B. Procedures Utilized to Accomplish the OSTP Objectives

1. Obtaining a Standardized, Norm-Referenced Direct Writing Test through the State Bid System
 - In compliance with Oklahoma Law, a Request for Proposals (RFP) was developed and released to test publishers nationwide. This document provides a full description of the review and selection process to be employed; the major products and services for which bids are being requested; timelines for delivery of materials and services; scoring systems which would provide the kind of data needed to enhance instructional improvement; and all other attachments required by law.
 - A "mandatory attendance" Pre-Bid Conference is held within two weeks after release of the RFP. All bidders' questions received prior to this conference and the Department's responses are submitted in writing to participants in this conference. All requirements of the Writing Assessment Component of the OSTP are discussed and bidders are allowed to clarify any misconceptions regarding bid requirements.
 - The test review process is designed to obtain an objective evaluation of all companies' bids for products and services in terms of the manner in which the following requirements--either the Department's or those of the law--will be met: (1) test specifications; (2) scoring criteria and methodologies utilized; (3) security of test materials and individual students' score reports; (3) SDE staff training for pretest and posttest inservice programs; (4) provision of inservice materials (i.e., in terms of quality, quantity, and deadlines); and (5) customization of formats designed for testing and reporting in a manner that best meets the need for instructional program improvement.

Evaluation forms consisting of more than 100 criteria are utilized by review/evaluation committees to judge the appropriateness of products and services bid by companies. One form is completed by each reviewer to indicate his or her evaluation of each company's set of proposals and test instruments submitted.

For evaluation of writing test bids, more than thirty (30) junior high and high school composition teachers, counselors, school administrators, testing experts from public schools, and university professors having expertise in either tests and measurements and/or writing instruction serve as the evaluation committee. During the evaluation process, committee members spend at least 2.5 hours studying the proposals and tests bid, after which company representatives conduct two-hour presentations that include answering all questions raised by reviewers.

One of the major factors the review committee is asked to consider is the degree to which the tests submitted by bidders measure Oklahoma's Suggested Learner Outcomes (SLOs) for composition. Considered as equally important is the degree to which scoring criteria and techniques (1) reflect measurement of the SLOs, and (2) provide information with which teachers can determine and remediate students' specific writing skill deficiencies. (Section III-C of this report [Figures 2 & 3, page 25-26] describes the match of measurement techniques with Oklahoma's SLOs and the manner in which such techniques produce results which relate to each of the measurable Learner Outcomes. Section III-C of this report describes the specific scoring criteria used to rate Oklahoma's students' compositions [holistic scoring, pages 15-18; analytic scoring, page 19.]

Responses on the evaluation forms are tallied, revealing the committee's recommendation. The State Board of Education considers all proposals, studies the evaluation committee's recommendation, and adopts the appropriate program.

2. Providing for Maintenance of Test Security

Maintenance of test security has become a major issue--both nationally and in Oklahoma. The test security measures previously outlined in State Board Regulations were greatly enhanced during the 1989-90 school year. Additional security measures implemented in 1989-90 and maintained throughout 1993 are outlined as follows:

- The test form being utilized is embargoed by the test publisher so that no person living in Oklahoma can obtain a copy other than through standard OSTP distribution at the time of testing.
- Test booklets are delivered to schools in sealed envelopes which are to be opened at the beginning of the test session only by students who are to be administered the test. All unused tests are to remain in sealed envelopes.
- Test materials are to remain locked in a secure area until test administration begins, during all hours between test sessions, and until such documents are returned to the test publisher for inventory, scanning, and scoring.
- An adult monitor other than the test administrator is required to witness the test administration and securing of test materials. Selection of monitors is subject to the approval of the district superintendent, elementary superintendent, or building principal.

- Security forms are provided for school superintendents, principals, building and district test coordinators, test administrators, and monitors. These forms state that, to the best of the participants' knowledge, the specified test security measures were followed. All forms are to be signed by the appropriate OSTP participants and returned with answer documents. An accounting of these signed forms is documented by the State Department of Education.
- Adult participants in the OSTP are directed to refrain from overtly or covertly exposing students to the test items and/or answers to test items.
- Violations of test security are to be reported to the State Department of Education, investigated, and proven incidents can result in such action by the Board as invalidation of the school's test scores and/or revocation of the perpetrator's teaching, counseling, or administrative certificate(s).

3. Providing Awareness and Instruction for Local School Personnel (1986-93)

- Announcements of legislation regarding the implementation and maintenance of the Writing Assessment Component of the OSTP are accomplished through notices placed in the *Administrative Focus* and the *Results In-Class* in late Spring or early Fall semesters. Such notices delineate the legislation and its intent; describe the kind of test which will be administered; announce test dates and the options offered to school superintendents for choosing available dates; specify the population to be tested and provide guidelines for testing Limited English Proficient (LEP) students and those with Individualized Education Plans (IEP); and announce the Department's plan for offering pretest inservice training for all schools.
- A letter is distributed to all school superintendents early in the Fall semester each year. Test dates and procedures are again delineated. Accompanying this letter is a survey to obtain data on the number of students to be tested, the number of test administrators, the names of building and district test coordinators, and the proposed test dates for each school district.
- Pretest inservice training sessions are conducted for all school districts during January and early February each year. Topics for instruction include (1) description of the program; (2) implementation procedures and policies--with emphasis on maintaining test security; (3) specification of test environmental conditions necessary to maintaining test validity; (4) test administration procedures; (5) scoring procedures and criteria; (6) descriptions of report formats; and

(7) procedures for handling test materials (inventory, distribution, coding, packaging, mailing, etc.). All inservice participants receive a procedural manual which includes specific instructions for building and district test coordinators and test administrators.

4. Providing Materials and Services

Test materials are distributed to school superintendents by The Psychological Corporation. Such materials include test booklets, teachers' manuals for test administration, and the district test coordinators' kits containing all materials and instruction for packaging and returning of materials to The Psychological Corporation.

5. Administering the Tests

Tests are administered on a Tuesday, Wednesday, or Thursday, based on each local school superintendent's choice of date selected from three specified weeks in February. Students' test booklets and other materials are returned to The Psychological Corporation immediately following administration of the tests.

6. Scoring and Reporting

- Students' papers are hand-scored by a minimum of three professional raters per paper at The Psychological Corporation's Writing Scoring Center in San Antonio, Texas. Part II (pages 15-23; 61) of the *Manual for Interpreting* describes the procedures used to train raters and score Oklahoma's papers. A copy of this manual may be obtained from the Student Testing Section, State Department of Education (405) 521-3341.
- Results of the tests are distributed to school superintendents in April each year. Part III (pages 25-44, *Manual for Interpreting*) provides information on interpreting test results.

III. Description of Materials; Testing, Scoring, and Reporting Methods; and Related Services

A. Materials and Related Services

The Stanford Writing Assessment Program is a nationally normed direct writing test. The format focuses on an exclusively verbal prompt which elicits writing in one of four writing modes: narrative, descriptive, expository or persuasive. The *expository writing mode* was selected for use in Oklahoma for the 1993 assessment.

Test materials include (1) a separately sealed page containing the writing prompt; (2) a student response booklet which contains one nonscorable page for prewriting activities such as planning and/or outlining, and four lined pages for writing; and (3) a test administrator's manual containing directions for the examiner to read orally to students. Based on HB 1946, enacted in 1990, these materials are not distributed to test administrators until the morning of the day testing begins. As the test session begins, student test materials are distributed, and each student unseals the writing prompt page, listens to directions, and begins writing.

A District Test Coordinators' Kit is distributed approximately two weeks before the test materials are received. This kit contains all materials and instructions necessary for efficient management of the testing program in the local school.

Pretest inservices are held during the month before testing for every school district in the state. State Board Regulations require that at least one representative from each school district attend these inservices, and manuals are distributed with oral instructions for conducting the assessment according to the standardization practices utilized to norm the tests.

Posttest inservices are conducted throughout the year for all individuals or groups who request these services. These sessions focus on interpretation and use of test scores to improve instructional programs at the individual, class, building, and district levels. A copy of the *Manual for Interpreting* is provided for each person who attends such inservices; two copies are distributed to each school district superintendent with the score reports.

B. Testing Methods

Standardization procedures require that students begin the testing session with at least two sharpened #2 pencils with erasers. Students are not allowed to have extra paper on their desks when the test begins. However, if students need additional paper for completing an essay, the teacher is allowed to supply the amount of paper needed upon the student's request.

Materials are distributed, and students complete the school, district and student identification information on the front of the response booklet. Students then open the sealed prompt. The test administrator--following directions *verbatim* in the official Test Administration Manual--reads the prompt orally to the class (two times) while students read the prompt silently. Students are then guided through a schedule which permits five minutes for prewriting (i.e., planning, outlining); 20 minutes for writing; and 10 minutes for revising and editing.

This method of testing is different from that utilized in the MAT-6 Writing Test which Oklahoma administered from 1987 through 1991. In using the MAT-6, students were given directions and then allowed 20 minutes to complete an impromptu-writing exercise. With the Stanford, students are tested in a manner that applies the writing process, the instructional method most strongly advocated in research during the past 15-20 years. The writing process as an instructional method is advocated in Oklahoma's Suggested Learner Outcomes published in 1983 and in the newly mandated Learner Outcomes published in 1991-92. This method features pre-writing organizational strategies, writing, revising, editing procedures and publishing.

The *timed impromptu writing* and *timed process-writing* methods of assessment and instruction each serve a distinct purpose which fulfills writing skills needed both in school and in the work place. However, the assessment procedure used in the Stanford supports a writing method which assists students in learning to organize information before writing, and to edit/review their draft copies to eliminate errors. The learning and application of such skills results in improved discourse created for any writing purpose.

C. Scoring Methods and Reporting Services

Students' essays are scored by professional writing assessment raters at The Psychological Corporation. Scoring of each paper is conducted through use of two methods--*holistic and analytic*. These methods are designed to evaluate different (but complimentary) aspects of students' writing skills.

Each response booklet contains an identification number which is associated with the student's name. Before scoring is conducted, the page containing the student's name is removed from the remainder of the response booklet. Therefore, raters who score the papers are not aware of students' names, gender, or any other identifying information.

To assure a high level of reliability and validity in scoring students' papers, *rater reliability statistics* are established throughout the scoring process. The scores assigned papers by each rater are recorded on a computer as each rater completes a set of 25 papers. Each hour, the rater is checked for accuracy by having another trained rater validate the scores being assigned by that person. If a rater's quality level begins to fall short of an established criterion, the rater ceases his or her work for the day. Use of this form of quality control results in strong reliability estimates--a factor which is necessary to the production of comparable scores.

Both holistic and analytic scores are reported to school districts at the individual student, school site, and district level. A separate report is

provided for the parents or guardians of each student. In addition, the State Department of Education is provided with group level aggregated scores for school sites, districts, and the state. The State Department of Education refrains from collecting or filing any OSTP test data which has a student's or teacher's name attached.

The following scoring methods are used to rate each student's essay:

1. A *holistic scoring rubric* which focuses on the overall merit of the paper is utilized to rate each essay. The major factors considered in holistic scoring include (a) how well the paper is organized (i.e., does it have a good beginning, development, and conclusion); (2) how well the concepts introduced are clarified and supported; (3) attention to audience in terms of appropriateness of language and content; and (4) fluency--the extent to which the writer uses syntax, word choice, and mechanics to help the ideas flow smoothly from beginning to end.

During the standardization (or national norming) of the tests, sets of *anchor papers* were selected. Anchor papers demonstrate characteristics typical of a particular score point for a specific prompt. These anchor papers were written by students in the grades for which each prompt was being normed and represent examples of the quality of writing expected for a paper to be assigned each of the scores in the holistic scale. Anchor papers are then utilized for comparisons during the rating of papers to assure consistency in assigning the various scores.

The Stanford Writing Assessment was normed with the use of writing skill standards (or expectations) established at four levels of schooling. As one would expect, the *standards* are dependent on the writing mode elicited by the prompt.

The expository mode was used in Oklahoma in 1993 at both 7th and 10th Grades. The standards used in the holistic scoring of papers written in this mode are described as follows: (excerpted from *The Manual for Interpreting*, The Psychological Corporation, 1993)

Standard I, Grades 3 and 4

Especially at the lower grade levels, students generally are not expected to produce an impressive amount of expository text. This realistic expectation is based on two important considerations. First of all, third and fourth graders have not had a great deal of experience in exposition. Second, the abstract nature of the task requires more reflection than some other types of writing do. Therefore, it is not surprising that students present only a moderate number of reasons and supporting details.

The most obvious feature of exposition at these levels is its list-like quality. This characteristic is not limited to the least successful papers. Many of the more competent responses consist of a glorified list of reasons. In addition, as students try to structure their ideas, they sometimes add extraneous material from another mode (usually narrative).

In terms of organization, third and fourth graders tend to generate loosely joined content. For example, a paper in the middle range in this mode may not have a well-defined organizational strategy. It may simply demonstrate some logical structure in presenting a number of reasons. Transitions are usually weaker and less varied than in the expository prose of older and more mature students.

At the upper score points in particular, writers generally use some specific rather than only general words. However, specificity in this mode (and in persuasion) does not always possess the "physical concreteness" found in other modes. A student presentation that seems rather vague may, in fact, be an informationally rich sequence of ideas linked by cause and effect.

Students also occasionally use subordinate clauses that are appropriate to the task. Third and fourth graders may be relatively unfamiliar with exposition as a type of writing, but most students naturally employ "because" clauses in their everyday speech. This practical knowledge of syntactical complexities can help a great deal in a mode whose challenges students have just begun to explore.

Standard II, Grades 5 and 6

In terms of both intellect and experience, most fifth and sixth grade writers are able to generate a respectable quantity of expository text. Therefore, while the tendency to list by no means disappears, a higher percentage of students present details that flesh out assertions. In addition, the amount of off-task information decreases, especially at the upper score points. In papers that earn the highest scores, students stay on course as they attempt to amplify their ideas.

A number of students in the upper elementary grades have been exposed to the rudiments of expository structure. They have learned how to state their thesis in an opening paragraph, explain their reasons in the body of the paper, and conclude with several lines that re-emphasize the composition's controlling idea. As a result of such instruction and of a growing ability to think abstractly, fifth and sixth graders are usually more in control of the presentation than younger students are. Some degree of disorganization is seen in some papers at the lower score points, but all

better-than-average essays exhibit an organizational strategy. The best papers use temporal transitions ("when," "after"), logical connectives ("first," "finally") or an appropriate combination of both. Students in fifth and sixth grades also respond with a greater degree of specificity. However, a significant percentage of writers at these grade levels continue to have difficulty with a sustained specific discussion. For this reason, quite a bit of the information is general. Superior pieces, however, contain a few concrete examples and/or detailed reasons that are precise illustrations of cause and effect. A corresponding increase of syntactic subtlety, particularly in the use of complex sentences, is also seen. Such complicated structures are usually necessary to express sophistication of thought.

Standard III, Grades 7 and 8

It is at the middle school level that students develop a flexibility in writing. Still very much at home in the world of immediate experience, they are fairly secure in the realm of abstraction as well. They understand in a much more comprehensive way than younger students the relationship between complex ideas. In addition, they are capable of a passionate commitment to a position that is rare at the lower grade levels. These cognitive developments, plus continued practice in the expository mode, allow for developmental leaps in expectations at Grades 7 and 8.

More so than at earlier grades, writers begin to be able to sort out wheat from chaff. That is, they select content that is relevant to the task. The "inventory" approach so characteristic of younger composers begins to recede. Essays receiving top scores contain extended discussions of major points. Successful writers flesh out examples in greater detail and/or carry *if-then* reasoning a step or two further.

Evidence of organizational strategy extends even into the lower score points. Extremely disorganized papers are not common. Highly successful student writers are sure-handed from start to finish. In order to create a tightly woven piece, authors sometime employ a variety of temporal transitions and logical connectives.

Specificity is increasingly important as students attempt to expand the presentation. Of course, some generality is expected. However, lengthy and fluent responses without specificity are not usually seen at the higher score point ranges. In terms of syntax, simple sentences are used sparingly and effectively. As writers struggle with the intricacies of why and why not, of implication and example, the skillful coordination and subordination of ideas become crucial.

Standard IV, Grades 9 Through 12

High school students are well prepared to meet the rigors of exposition. Their conceptual powers have increased tremendously since middle school, and most have had opportunities to write in the expository mode. Many of the earlier obstacles to effective expression have been removed. Therefore, students at these grade levels do not generally produce chunks of extraneous material or retreat from the task by giving a list of reasons with only a few supporting details. Writers typically generate a significant amount of expository text.

For example, even a paper in the middle score-point range contains some development. That is, it offers a sustained discussion of at least one key point. Presenting layers of illustration and relentless logic, the most competent authors state their case in a definitive, adult-like fashion.

Writers at these grade levels organize their papers tightly. Most high school students have been taught the basic structure of the five-paragraph essay. They know both how to establish a clear direction and how to employ different kinds of transitions that help the reader move from idea to idea. At the upper score points, only occasional lapses are evident. Some of the best writers employ original organizational strategies.

An increase in verbal and syntactic sophistication is common as well. Some precision is evident even at the lower score points, and the best papers exhibit a high degree of specificity. Candidates for the highest scores are adept at using varied sentence structure that is appropriate to the subtleties of cogent reasoning.

Holistic scoring is conducted by two raters who independently read students' essays, each assigning a score of one through six. Neither rater knows the score assigned to a given paper by another rater. The scores are recorded on a computer and those scores on a given paper which are more than one score point apart are identified. Each such identified paper is rated by a third person who, by design, is not aware of the scores assigned by the first two raters. Scores are again compared, and, at this point, if there are not two resulting adjacent scores, the paper is rated by another resolution reader. The final assigned raw score of 2-12 represents the sum of the two adjacent scores assigned the paper.

The holistic score scale is utilized to establish normative data (i.e., percentile ranks, stanines, and normal curve equivalent scores). It is the score with which an individual's or group's performance can be compared with a national and/or state norm. In addition, local district normative scores are provided for school districts which enroll more than 2200 students in grades K-12.

2. An *analytic scoring rubric* is also used to rate each essay. Analytic scores focus on six specific categories of writing skill: Ideas and Development; Organization, Unity, and Coherence; Word Choice; Sentences and Paragraphs; Grammar and Usage; and Mechanics. Raters assign a score of one through four within each category to indicate the relative strength of the student's specific writing skills. Figure 1 on pages 20-21 of this report displays the specific skill levels associated with the scores assigned within each of the analytic score categories.

FIGURE I
ANALYTIC SCORING GUIDELINES

AREA I: Ideas and Development

- 4 Extensive development of several ideas (or one, main important idea) with extension and elaboration on all or most of the points. Look for uniqueness, interest to audience, and strong supporting details. Can be exceptional writing or extremely thorough.
- 3 Good development of idea with many details extended and elaborated. Ideas are fairly well supported. May be an extensive list with little or no elaboration.
- 2 Adequately supported ideas with some details extended or elaborated.
- 1 Weak ideas minimally supported with little or no extension of details.

AREA II: Organization, Unity, and Coherence

- 4 Completely organized with smooth flow from one idea to the next through the use of transitions and sequencing. Unity is strongly evident with no wandering from primary theme or plan.
- 3 Fairly well organized with good unity of plan. Some transitions may be used. Little or no digression from main ideas or writing mode.
- 2 Small amount of organization. Weak plan that may not be well unified. Ideas may be only minimally connected. May frequently wander from expected writing mode.
- 1 Lack of plan or coherence.

AREA III: Word Choice

- 4 Precise, appropriate, accurate, and specific word choices that convey the correct meaning and appeal to the audience. May be vivid and imaginative.
- 3 Word choices that are appropriate and specific. May lack "sparkle," but meaning is clear.
- 2 Fair use of words. May be specific but have little variety. May be simplistic and occasionally vague, but generally effective.
- 1 Very simplistic. Meaning may be unclear or inappropriate.

FIGURE 1

ANALYTIC SCORING GUIDELINES (continued)

AREA IV: Sentences and Paragraphs

- 4 Excellent control and formation of sentences. Variety of sentence structure, type, and length contribute to fluency and interest. Paragraphs used where appropriate. Few, if any, errors.
- 3 Adequate control of sentence formation. Some mix of sentence types, lengths, and structures. May contain a small number of errors that do not interfere with fluency. May have some attempt at paragraphing.
- 2 Most sentences constructed correctly. May have little variety in type, length, or structure. May be somewhat monotonous or choppy. May contain several errors or lack control. May have no attempt at paragraphing.
- 1 Poor sentence structure with many errors that inhibit fluency or clarity. Lacks control.

AREA V: Grammar and Usage

- 4 Error free or very few errors in approximate proportion to length of paper.
- 3 Good grammar and word usage. Errors that do not detract from overall quality of the paper.
- 2 Fair grammar and usage. Errors may interfere with meaning. May be simplistic.
- 1 Poor grammar and word usage with frequent or serious errors.

AREA VI: Mechanics

- 4 Error free or very few errors in approximate proportion to the length of the paper.
- 3 Most punctuation, capitalization, and spelling correct. Errors do not interfere with communication.
- 2 Some errors in punctuation, capitalization and/or spelling that may interfere somewhat with communication.
- 1 Frequent and/or serious errors in mechanics that interfere with communication assigned within each of the analytic score categories.

Raters who conduct the analytic scoring look for certain characteristics of good writing within each of the categories of skills listed above. The rater looks not only for correctness, but also for complexity, sophistication, and a variety of writing techniques. The following descriptions are excerpted from the *Manual for Interpreting* (The Psychological Corporation, 1993) which will be used as Oklahoma's posttest inservice manual:

- **Area I: Ideas and Development**

In this category, readers pay close attention to the amount of quality information that the student presents. Has the writer added layers of detail that enrich the discussion of key points to the essay? Is there a minimum of bare assertion (statements that receive very little, if any, clarification)? Are the ideas interesting, original, and tailored to the audience, whether generalized or specific?

- **Area II: Organization, Unity, and Coherence**

Raters scoring papers in this category look for evidence of an overall organizational pattern. Is the student in control of the presentation from start to finish? Are transitions used effectively to connect ideas both within and between paragraphs? Does the writer stay on course by avoiding redundancy and out-of-order material?

- **Area III: Word Choice**

Within the category of Word Choice, raters look for the kind of specific and vivid vocabulary that makes writing come alive. Is there a sustained attempt on the students' part to use active verbs and precise modifiers that go beyond bland generalities like "get," "nice," and "fun"? Does he or she offer on occasion a figure of speech (such as a metaphor or simile) that adds a poetic touch to the description?

- **Area IV: Sentences and Paragraphs**

As readers score responses in this category, they look for complex sentence structures that enhance meaning. Are sentences structurally complete, smoothly written, and clear? Do sentences vary in length and complexity? Is a variety of sentence patterns used?

- **Area V: Grammar and Usage**

In this category, readers look for the correct application of grammatical principles. Does the writer use correct subject-verb agreement and logical pronoun reference? Does he or she continue to use the tense established in the beginning of the essay? Is every variance from the

tense appropriate? Does the student show an adequate knowledge of typical problems (such as the use of "them" instead of "those")?

- **Area VI: Mechanics**

When evaluating student writing in this category, readers look for consistently correct capitalization, punctuation, and spelling. Is a variety of capitalization and punctuation skills used correctly? Is the student occasionally successful in using such risk-taking techniques as ellipses and dashes to show complexity of thought? Does correct spelling enable raters to move smoothly from sentence to sentence?

Analytic score results are provided for parents and teachers on the score report. Such information is useful in providing appropriate instruction for specific writing skill improvement, and assists teachers in fulfilling the intent of Oklahoma law.

Holistic and *analytic* scoring are conducted for different purposes--the former, to provide an overall rating of the paper, and the latter, to provide a view of the strengths and weaknesses of a student's specific writing skills. While the two methods produce different views of writing skill, there is a relationship shared by the two methods. This relationship is discussed in Section IV of this report.

D. The Match with Oklahoma's Suggested Learner Outcomes (1983 ed.)

As stated previously, one of the major criteria used in selecting an instrument for the Writing Assessment Component of the OSTP is the manner in which the test measure Oklahoma's Suggested Learner Outcomes (SLOs) for composition. Figures 2 and 3 (pages 25-26) illustrate the match of SLOs in grades 7 and 10, respectively. Information contained in Figures 2 and 3 is explained as follows:

- Each Suggested Learner Outcome is given in its full text as worded in the SLO Guide. Codes in the extreme left column match the coding of each outcome within the SLO Guide.
- Listed in the column labeled "HOLISTIC" are indications of whether or not each SLO is measured by the holistic grading procedure. "Yes" indicates that the SLO was measured; "NA" indicates that the SLO could not be measured by this method.
- Listed in the column labeled "ANALYTIC" are indications of whether or not each SLO is measured by the analytic scoring procedure. "Yes" indicates that the SLO was measured by this method; "NA" indicates that measurement of a given SLO was not applicable.

- Provided in the extreme right column of Figures 2 and 3 is an explanation regarding the manner in which measurement of a given SLO is addressed by each of the rating methods.

FIGURE 2
**CORRELATION OF OKLAHOMA'S SUGGESTED LEARNER OUTCOMES
FOR COMPOSITION AT GRADE SEVEN WITH THE STANFORD WRITING ASSESSMENT**

CODE	SUGGESTED LEARNER OUTCOME	HOLISTIC	ANALYTIC	EXPLANATION
C007.4	The student will use expression in dialogue, poetry, tall tales, science fiction, fables, myths, essays, reports, letters, short stories, songs, or ballads.	Yes	Yes	The <i>Stanford</i> prompts elicit either narrative, descriptive, expository, or persuasive writing. The prompt used in 1993 in Oklahoma was expository. The holistic scoring method takes into account all factors relevant to good writing. The analytic raters consider all facets of the six skill areas listed on page 16 of this report.
C007.5	The student will develop a paragraph using a pre-writing, writing, revising, and editing process.	Yes	Yes	The <i>Stanford</i> is an assessment of timed process writing. Test directions given orally by the test administrator guide students through five minutes of pre-writing, planning, and/or outlining; 20 minutes of essay development (i.e., actual writing); and 10 minutes of revising and editing.
C007.6	The student will paraphrase information from written and oral materials.	Yes	Yes	Students responding to the <i>Stanford Writing Assessment</i> interpret an exclusively verbal prompt, developing their essays according to the directive provided. The holistic raters consider all aspects of the student's written interpretation of the prompt and the analytic raters look more closely at the student's ability to put the message into his or her own words when rating Sentence Formation, Word Usage, and Content Development.
C007.7	The student will take notes from written, oral, and other forms of media.	NA	NA	The <i>Stanford</i> applies note-taking skills during the prewriting phase of the test. During this five-minute period, students engage in pre-writing activities which include noting initial ideas, organizing those ideas, and outlining. While the "notes" are not scorable, the effects of using this skill for organizing the discourse are.

Reprinted with permission of The Psychological Corporation, May 1993

Figure 3
**CORRELATION OF OKLAHOMA'S SUGGESTED LEARNER OUTCOMES
FOR COMPOSITION AT GRADE TEN WITH THE STANFORD WRITING ASSESSMENT**

CODE	SUGGESTED LEARNER OUTCOME	HOLISTIC	ANALYTIC	EXPLANATION
C010.1	The student will recognize the characteristics of all four types of essays: narrative, descriptive, expository, and argumentative.	Yes	Yes	The student responds to a unimodal prompt which is scored as mode-specific; he or she is therefore practicing direct application of this skill as the essay is being planned, written, and revised.
C010.2	The student will then write informal essays.	Yes	Yes	The <i>Stanford Writing Assessment</i> is a direct method of writing assessment which tests the student's ability to write informal essays.
C010.3	The student will expand paragraph writing skill to include various organizational skills: spatial, cause and effect, classification, and induction.	Yes	Yes	One universal quality of good writing is logical organization, whether it be spatial, cause and effect, classification, deduction, induction, or any other organizational method. When an essay is holistically scored, the raters are trained to consider logical development, as well as other factors of good writing, when assigning a score. In addition, development-the student's ability to logically organize his or her essay or paragraph-is one of the specific features that receives a separate analytic score.
C010.4	The student will use parallel structures and transitional devices (i.e., words, sentences, phrases) in written work.	Yes	Yes	Other qualities considered essential to good writing are effective sentence structure (parallel structure, subject-verb agreement, variety of sentence formation and length, etc.) and proper word choice (appropriate vocabulary, use of transitional words and phrases, etc.). Since these are features that help to make a paragraph or essay effective on the whole, they are considered by the raters during holistic scoring and analyzed separately and more closely during the analytic scoring of Sentence Formation and Word Usage.
C010.5	The student will write a short report documented with a bibliography which requires use of three sources found in the library.	NA	NA	
C010.6	The student will revise and edit paragraphs, essays, and other written materials specifically eliminating errors in grammar, punctuation, spelling, semantics, and syntax.	Yes	Yes	Editing and revising are directed activities in the <i>Stanford Assessment</i> . Evidence of the choices made by the writer in his attempt to eliminate errors in grammar, punctuation, spelling, semantics, and syntax can be seen by the raters who score the <i>Stanford Writing Assessment</i> . The holistic scoring procedure holds the writer accountable (within reason) for making these changes to eliminate errors. In addition, the analytic features of Mechanics, Word Usage, and Sentence Formation allow for a more careful analysis and rating of each.
C010.7	The student will write effective responses to essay test questions (i.e., restate the question, mention author and title of work, and use concrete details).	Yes	Yes	<i>Restatement of the question</i> is closely related to the student's providing an introductory sentence or paragraph that states the central idea. <i>Use of concrete details</i> is a requirement of the descriptive mode assessed by the test.
C010.8	The student will write a composition using an introductory paragraph.	Yes	Yes	Effective paragraph and essay writing using any of the rhetorical modes requires the writer to include a logical beginning, middle, and end. For this reason, use of an introductory paragraph is a universal feature of good writing that is automatically considered by the holistic scorers reading each essay. Further, this characteristic is more closely considered by analytic scorers when they rate the Content Development feature of the essay.

IV. Understanding and Using the Data

A. The Comparison of Holistic Scores with National Norms

Oklahoma's group scores are reported in terms of the AVERAGE score for a specific group of students (i.e., building, district, or state). The holistic scores are converted to national norms (e.g., National Percentile Ranks, Stanines, and Normal Curve Equivalents [NCE]) to provide a comparison of our students' performance levels with those of the national norm group.

The national norm group is comprised of students whose selection is based on a scientific random sampling. The goal of such sampling is to achieve grade level groups, with each group representing a cross-section of the United States regarding an appropriate balance of geographic areas, socioeconomic levels, ethnic groups, urban/rural locations, and other critical factors.

The norming (or standardization) process involves the administration of appropriate test forms to students comprising each grade level national norm group. Each group's average raw score on a given test at a particular grade level becomes the "norm" with which performance of individuals or groups of students in the same grades can be compared. (Example: the average raw score of students in the national norm group is represented by the 50th Percentile Rank, the 50th NCE, or a Stanine of 5 on a particular test. If Oklahoma's 7th grade students' average score is at the 57rd Percentile Rank on a particular test, it can be stated that the "average" 7th grade student in Oklahoma is performing at a level that is equal to or better than 57% of the students who comprised the national norm group for that test.)

The Stanford Writing Assessment Program was normed concurrently with the Stanford Achievement Test Series, Eighth Edition. Norming took place in the spring and fall of 1988. Data were collected on both forms, J and K, at each of the nine levels of the Stanford Writing Assessment Program. Equating studies linking forms and levels of the assessment were also carried out during standardization. Within a mode only, prompts may be compared with one another across grades/levels (e.g., Advanced 1, Grade 7 - TASK 2, Grade 10) and within a grade/level (e.g., Form J - Form K). The demands on the writer of the different modes are great enough that cross-mode comparisons are not recommended.

Oklahoma's seventh-grade students were administered the Advanced 1 level, Form K of the Stanford Writing Assessment; a level specifically designed for the spring of grade 7. The tenth-grade students were administered the TASK 2 level, Form K of the Stanford. Form K was used at both grade levels because this form is secure.

The Stanford Writing Assessment offers writing prompts at each level that elicit the four major types of writing: Narrative, Descriptive, Expository, and Persuasive. In 1993, Oklahoma students at Grade 7 and at Grade 10 responded to a expository writing prompt.

There are several features of the new Stanford Writing Assessment that distinguish it from the MAT-6 Writing Test used previously. Figure 4 (page 29) compares the two writing tests.

Figure 4

**A COMPARISON OF MAJOR FEATURES OF THE
MAT-6 Writing Test and the Stanford Writing Assessment**

FEATURE	MAT-6 Writing Test	Stanford Writing Assessment
<u>Establishment of National Norms</u>	1985	1988
<u>When Used in Oklahoma</u>	Grade 7: 1988-1991 Grade 10: 1987-1991	Grades 7 and 10: 1992 and 1993
<u>Type of Writing Prompt</u>	Combination verbal and picture	Exclusively verbal
<u>Writing Method Measured</u>	Timed impromptu	Timed, modified "process" writing, with teacher instructions guiding students through the various steps of the writing process.
<u>Time Allowed for Testing (not including distribution of papers and giving directions)</u>	20 minutes	35 minutes
<u>Writing Modes Elicited in the Tests</u>	Each prompt elicits a combination of narrative and descriptive writing.	Each prompt is mode-specific; available in narrative, descriptive, expository, and persuasive modes.
<u>Mode(s) Used in Oklahoma</u>	Narrative/Descriptive in 1987-1991	Exclusively descriptive (1992) Exclusively expository (1993)
<u>Holistic Scoring</u>	Allows for either or both modes to be used	Mode-specific (any writing not in the specified mode elicited is not considered for holistic scoring).
<u>Holistic Scoring Scale</u>	Scored 1 through 8, yielding raw scores of 2 through 16.	Scored 1 through 6, yielding raw scores of 2 through 12.
<u>Scoring Ranges (re: Holistic only)</u>	Use of one scoring standard for both 7th and 10th grades.	Use of different developmental writing stage <i>standards</i> --one for 7th grade and one for 10th grade. Provides for more accurate comparisons of writing within smaller age/grade ranges.
<u>Analytic Scoring</u>	Four skill areas; four performance levels for each skill area.	Six skill areas; four performance levels for each skill area.

There are three features of the Stanford Writing Assessment that are new for Oklahoma and have a direct impact on the holistic scores and the national norm-referenced scores earned by students:

1. The entirely verbal prompt on the Stanford is scored in a *mode-specific* way. In 1993, Oklahoma students responded to an expository prompt. Unlike the MAT-6 Writing Test that would score any mode of writing the student produced that was related to the prompt, the Stanford requires an expository writing to an expository prompt in order for the writing to be scored. This scoring requirement for mode-specific writing means that a lengthy essay which has, for example, long unrelated narrative or descriptive sections, would receive a holistic score based *only* on the expository sections of the essay. Mode-specific scoring applies in each of the four writing modes tested by the Stanford.
2. The Stanford Writing Assessment rates each essay on a holistic scale that ranges from 1 (low) to 6 (high). Two readers independently rate each essay and their scores are added together. Thus, the final score for a paper can range from 2 to 12. This contrasts with the MAT-6 Writing Test scoring in which each essay was rated on a scale from one to eight, yielding a raw score from two readers that could range from 2 to 16. The shorter Stanford scale is accurate and is more like that used across the nation. It also means that a greater range of percentile rank points are tied to each raw score point on the Stanford, than on the MAT-6.
3. On the MAT-6 Writing Test there was one set of rules for judging the holistic (overall merit) scores for seventh and tenth grade papers. On the Stanford, there are four sets of rules or scoring standards for each type of prompt; one each for primary (Grades 3-4), intermediate (Grades 5-6), junior high school (Grades 7-8), and high school (Grades 9-12). Oklahoma's seventh grade students' papers were judged using the standard appropriate for junior high school students. This means that on the Stanford, writing is judged against developmentally appropriate standards.

National norms are available only for comparing students' holistic scores, as this scoring technique was the one used in establishing norms during the standardization study. The specific criteria used to apply the analytic scoring method to Oklahoma students' papers were customized for use in Oklahoma's program. This was accomplished to satisfy Oklahoma's request for data to use in (1) identifying students' writing skill needs; and (2) planning and implementing appropriate programs to accomplish the desired writing skill improvement. Therefore, subsequent discussion of "norms" in this report have reference only to students' holistic score averages.

As explained earlier in this report, two raters independently rated Oklahoma students' papers on a holistic scale of 1-6. If the scores given by two raters were more than one point apart from each other, a third rater (a seasoned team leader called a *resolution rater*) scored the paper. Each of the original scores was then compared with the third score, and the two closest scores were added to yield the holistic raw score (provided that the two closest scores were no more than one point apart). Thus the range of possible holistic raw scores was 2-12.

Tables 1 and 2 on page 32 detail the raw scores, scaled scores and derived norm-referenced scores for each grade level tested in Oklahoma.

TABLE 1

Percentile Ranks, Stanines, Normal Curve Equivalents,
and Scaled Scores Corresponding to the Holistic Raw Scores for the
Stanford Writing Assessment Program, Level: Advanced I
Form K, for Spring of 1993, Grade 7*

HOLISTIC RAW SCORES	PERCENTILE RANKS	STANINES	NORMAL CURVE EQUIVALENTS	SCALED SCORES
12	99	9	99.0	676
11	98	9	93.3	666
10	95	8	84.6	656
9	87	7	73.7	646
8	74	6	63.5	636
7	57	5	53.7	626
6	40	5	44.7	616
5	25	4	35.8	606
4	13	3	26.3	596
3	5	2	15.4	586
2	2	1	6.7	576

TABLE 2

Percentile Ranks, Stanines, Normal Curve Equivalents,
and Scaled Scores Corresponding to the Holistic Raw Scores for the
Stanford Writing Assessment Program, Level: Task 2
Form K, for Spring of 1993, Grade 10*

HOLISTIC RAW SCORES	PERCENTILE RANKS	STANINES	NORMAL CURVE EQUIVALENTS	SCALED SCORES
12	98	9	93.3	682
11	93	8	81.1	671
10	83	7	70.1	660
9	69	6	60.4	650
8	53	5	51.6	640
7	36	4	42.5	630
6	23	4	34.4	621
5	14	3	27.2	612
4	6	2	17.3	603
3	2	1	6.7	593
2	1	1	1.0	582

* Administered to Oklahoma's seventh and tenth-grade students in February 1993.

Tables 1 and 2 illustrate the effect of spreading a narrow range of scores (such as the holistic Raw Score Scale of 2-12) over a larger range of scores (such as the Percentile Rank and Normal Curve Equivalent score scales of 1-99). In applying such conversions to real scores, (using the Percentile Rank scale as an example), it becomes obvious that the small difference produced by earning one additional Raw Score point can make a large difference in the Percentile Rank increase--especially in the "middle" of the raw score range. For example, look at the Percentile Rank associated with a Raw Score of 7 for Grade 7, and compare it with the Percentile Rank associated with a Raw Score of 8. At this point on the scale, a difference of one Raw Score point means a difference of 14 Percentile Rank points. Differences in individuals' or groups' norm-referenced scores that are in the middle of the scale often appear to be greater than the one or two raw score points would indicate. To avoid the harmful effects of such distorted implications, we strongly recommend that viewers of test results refrain from comparing scores of individual students, school sites, and/or school districts.

B. The Analytic Scoring Guidelines: Relationship of Analytic to Holistic Scores

As was described in Figure 1 (page 20), the Analytic Scoring Guidelines included six categories of writing skills to be considered: Ideas and Development; Organization, Unity and Coherence; Word Choice; Sentences and Paragraphs; Grammar and Usage, and Mechanics. Within each of these categories of skills were evaluation criteria representing four levels of student performance, with 4 being the highest level.

Analytic scores are reported (1) at the individual student level by his or her performance of 4, 3, 2, or 1 within each of the six categories of skills; and (2) at the group level by number and percent of students performing in the 4, 3, 2, and 1 performance levels within each skill category.

The purpose of the analytic scoring technique is to provide data which will assist the classroom teacher in determining students' strengths and deficiencies in each of the categories of writing skills being measured. These data, used in combination with other evidence gathered in regard to students' specific needs, will provide a focus for planning writing skill improvement programs for individuals and groups of students.

Guidelines for appropriate interpretation and use of analytic scores are listed as follows:

- Scores for six skill categories are provided (i.e., Ideas and Development; Organization, Unity, and Coherence; Word Choice; Sentences and Paragraphs; Grammar and Usage; and Mechanics). During the analytic scoring of Oklahoma's papers, each category of skills was considered as

independent of the others. Therefore, in their use, scores for the six categories are neither to be added to obtain a total score nor averaged to determine a mean analytic score.

- The user of analytic scores is advised to refrain from comparing either the individual student's or group's actual performance levels from one skill category to another. For example, performance on Sentences and Paragraphs should be judged separately to determine (1) the student's actual performance level; (2) the deficiencies in skills indicated by that performance level (i.e., the existing need); and (3) the instructional techniques, activities, and materials necessary to accomplish skill improvement.

Failure to examine performance in each category separately could result in ignoring a child's need for additional instruction in a given skill area. This error--applied at the group instructional planning level--can result in overteaching in one skill category at the expense of instruction in another.

- Holistic and analytic scoring are designed to describe the quality of student writing achievement in very different, but complementary ways. The holistic readers make a single judgement of the *overall merit* of the essay. This overall merit judgement is based mainly on its organization and its content (development of ideas and specific word choice). Spelling, writing mechanics, and grammar can influence the holistic score if they make the student's writing difficult to understand.

The analytic reader looks for evidence of skill and writing proficiency in six *specific features* of the essay. Teachers and parents can use the analytic scores for guidance about which aspects of a student's writing are strong and which aspects can be improved through instruction. However, because the "whole [holistic] is greater than the sum of its parts [analytics]", one will not find a perfect relationship between the two scores.

Nevertheless, there is a positive correlational relationship between the six analytic features and the holistic score of students' essays. A study of this relationship by The Psychological Corporation obtained the correlations presented in Table 3 on page 35.

TABLE 3
OKLAHOMA SCHOOL TESTING PROGRAM
DIRECT WRITING ASSESSMENT

Correlation of Holistic and Analytic Scores for the
Stanford Writing Assessment Program. Second Edition

ANALYTIC AREA	GRADE 7	GRADE 10
I. Ideas and Development	.77	.77
II. Organization, Unity and Coherence	.71	.71
III. Word Choice	.57	.53
IV. Sentences and Paragraphs	.49	.44
V. Grammar and Usage	.41	.40
VI. Mechanics	.41	.36

These correlations show that the first three analytic features (Areas I, II, and III) are more strongly related to students' holistic scores than the final three analytic features (Areas IV, V, and VI). This pattern exists at both the seventh and tenth grade. The magnitude of the correlations is slightly higher at grade 7.

A stronger relationship of analytic areas I, II, and III to the holistic scores was expected. These three analytics deal with the content of the essay and its organization and development. The high positive correlations validate the contribution of these features to the holistic score. It is also clear that none of the first three analytic features totally explains the global holistic rating. The final three analytic features (IV, V and VI) are more weakly related to the holistic score because these features are of less importance than the first three in explaining the overall merit of the essay.

Another way of viewing the relationship between holistic and analytic scores is shown in Tables 4 and 5 (page 37). At each grade level, we have plotted the average holistic score earned by students who received an analytic score of 4, 3, 2, or 1. There is a separate graph for each analytic area. (See Figures 5 and 6 on pages 38 and 39).

analytic scores of 4 and 3 compared with those earning analytic scores of 2 and 1; and (2) a wider range of average holistic scores within analytic areas I, II, and III, compared with analytic areas IV, V and VI. Both results were expected.

In a small number of cases, score inconsistencies did occur. For example, it was possible for a student to receive a relatively high holistic score and a low analytic score in one or more areas. Conversely, it was possible for a student to receive a middle or low holistic score and a high analytic score in one or more areas.

Each student's essay is unique and must be judged on its individual merits; one must be very cautious about generalizations. Nevertheless, when inconsistencies occurred, most often one of the following conditions applied:

High holistic score/low analytic score. These papers had high overall merit (usually the paper was written in a manner that addressed the topic and consistently remained "on-topic and within the mode of writing" throughout, complete with supporting details; exhibited good organization and development; etc.), but the paper may have been lacking in one or more of the last three analytic areas (sentence variety, structure and length; grammar; capitalization, punctuation, and spelling).

Middle or low holistic score/high analytic score. A paper with these characteristics could be a simple reversal of the paper just described--poor content development and organization, but excellent use of writing mechanics, grammar, and sentence structure. Another possibility is that the paper earned a low holistic score because most of the essay was not in the correct mode ("off task"). At the same time, several analytic scores could be quite high because analytic scoring considers *everything* that is written, not just the parts written in the correct mode. In fact, analytic scores are given to papers written to a different topic ("off-topic") as well as "off-task" papers. Overall, the holistic and analytic scores of the Stanford Writing Assessment show the expected relationship to each other, and give the user important information about different qualities of student writing.

TABLE 4

Mean Holistic Raw Score for Each Analytic Score Point
in Each Analytic Area: Grade 7

ANALYTIC AREA	ANALYTIC SCORES			
	4	3	2	1
I. Ideas and Development	9.92	7.43	5.35	3.17
II. Organization, Unity and Coherence	10.05	7.58	5.85	3.89
III. Word Choice	9.19	7.38	5.74	3.56
IV. Sentences and Paragraphs	8.85	7.35	6.04	5.10
V. Grammar and Usage	8.36	7.06	6.10	5.11
VI. Mechanics	8.42	7.19	6.19	5.27

V. Summary of Results and Interpretation of the Data

A. Document Returns

Answer documents from all school districts which serve seventh and tenth grade students were returned for scoring. State norms were developed based on this return.

B. Number Enrolled Versus Number Tested

Not all students in Grades 7 and 10 were tested due to the following factors:

- Students who have Individualized Education Plans (IEPs) pursuant to Public Law 94-142 were eligible for exemption from OSTP participation (see page 3 of this report for a discussion of this issue). If all IEP students are exempted from participation in the OSTP, this number can constitute up to 12% of the total enrollment.
- Local school district option was offered in regard to testing students who are considered as Limited English Proficient (LEP). If all LEP students are exempted from participation in the OSTP, this number can constitute up to 2.8% of the total enrollment.
- Makeup tests were not given to students who were absent during the test administration. The average daily absence in Oklahoma schools is 5.5%.
- Student enrollment is reported on September 15th of each school year. These figures can decrease measurably for a number of reasons, especially at the high school grades. It is apparent that--beginning at 10th grade--dropouts may account for many of the school leavers.

Examples of this enrollment phenomenon are provided as follows: The Fall 1991 enrollment for Grade 10 was 40,096; the Fall 1992 enrollment for this same statewide class of students as 11th graders was 37,011--for a total loss of 3,085 students, or 7.7% of the class. The actual dropout rate reported for the 10th grade during the 1991-92 school year (i.e., the most recent data available) is 5.2%, or 2,076 students.

An illustration with less pronounced results is found in the comparison of Fall 1991 enrollment at Grade 7 (i.e., 44,792) with the Fall 1992 enrollment figures for this same class of students in 8th Grade (i.e., 44,163). The decrease in enrollment of this class is 629 students, or 1.4%. No dropout data are available specifically for 7th Grade.

We will not know how many *school leavers* are accounted for in the difference observed in Fall 1992 10th Grade enrollment and number of

students tested in the OSTP Writing Assessment until the Fall 1992 enrollment and dropout figures are in. However, a certain percent of this difference can be attributable to students who are no longer enrolled in Oklahoma schools when the tests are administered.

The differences existing in enrollment figures as compared with number of students for whom test results are given in this report are indicated as follows:

<u>Grade Level</u>	<u>Student Enrollment</u> <u>Fall, 1992*</u>	<u>Number of</u> <u>Students Tested**</u>	<u>% of Student</u> <u>Enrollment Tested</u>
7	46,537	39,661	85.2%
10	42,189	33,517	79.4%

*Source: State Department of Education Accreditation Reports--Fall 1992

**Source: Maximum number of students reported on the Master List of Test Results Summary. (See Appendices B-3 and B-4)

C. Summary of State Level Results

Copies of state level reports will be found in Appendix B (Master List of Test Results Summary: 1987-1993) and Appendices C and D (List of Averages--District Level Results). Each of these reports is printed in its entirety. The school districts with deleted scores in the List of Averages is due to the testing of less than six students. This was done to protect the privacy of those students.

On the whole, the results indicate that Oklahoma's 7th and 10th Grade students' writing skill performance levels are estimated to be above the national norm. Due to the irrelevance of comparing group level holistic and analytic scores, the summary and interpretation of these data are discussed categorically as follows:

1. Normative Data: Holistic Score Summary

The holistic score average for Oklahoma's 7th grade students who were administered the Stanford Writing Assessment was equivalent to a 57th national percentile rank. This means that the average 7th grade student in Oklahoma performed at a level which was equivalent to and/or better than 57% of the students in the national norm group.

The average holistic score for Oklahoma's 10th grade students was equivalent to the 51st national percentile rank. The average 10th grade student performed at a level that was equal to or better than 51% of the students in the national norm group. Table 6 provides a comparison of national norms with Oklahoma students' performance at Grades 7 and 10.

TABLE 6
Comparison of Oklahoma Students' Performance
with National Norms-1993

Type of Score	GRADE 7		GRADE 10	
	National Norm	Oklahoma's Performance	National Norm	Oklahoma's Performance
Scaled Score	622.00	625.5	639.00	638.8
Normal Curve Equivalent	50.00	53.9	50.00	50.7
Percentile Rank	50.00	57	50.00	51
Stanine	5.00	5	5.00	5

Each year there are a number of papers that are considered non-scorable due to four possible conditions. These conditions, along with codes assigned to each, are described as follows: (NS = non-scorable)

NS - 1 = Not scorable because the student refused to write or the student's essay had insufficient information, was blank, inappropriate, or a copy of the prompt.

NS - 2 = Non scorable because the student's essay was off-topic (i.e., did not address the topic of the prompt) or off-task (i.e., was not written in the appropriate writing mode).

NS - 3 = Not scorable because the student's essay was written in a foreign language.

NS - 4 = Not scorable because the student's essay was illegible or incomprehensible.

The 1993 results indicate that in Grade 7, there was a total of 389 non-scorable papers; this sum for Grade 10 was 279. The number occurring in each of the non-scorable categories and the percent of total students tested represented by the sum of non-scorable papers received are provided as follows:

Grade Level	Non-Scorable Category Designation	Number of Papers Occurring in this Category	% of Papers Represented by Total
Grade 7	NS - 1	76	
	NS - 2	307	
	NS - 3	1	
	NS - 4	5	.010%
Grade 10	NS - 1	58	
	NS - 2	219	
	NS - 3	1	
	NS - 4	1	.008%

Table 7 illustrates the distribution of Oklahoma students' scores by providing the number and percent of students whose scores occurred in each quarter of the percentile rank scale. A comparison with national norms is offered to illustrate the difference in "average" performance and Oklahoma students' performance. (Appendix A--Percent of Scores Under the Normal Curve--illustrates the distribution of "average" group performance.)

TABLE 7
Comparison of Oklahoma Students' Performance in
Each Quartile With That Expected Based on the Normal Curve

Percentile Rank	% of Scores	OKLAHOMA STUDENTS' PERFORMANCE	
		Grade 7-1993	Grade 10-1993
# of Scores	% of Scores	# of Scores	% of Scores
99	25%		
:			
76	25%	8,609	22%
75			
:			
51			
50	25%	13,731	35%
:			
26	25%	9,024	23%
25			
:			
1	25%	5,532	17%
1		7,908	20%
		7,935	24%

An analysis of the holistic scores indicates that the overall writing performance of Oklahoma's students appears to be at levels above the average. Our school administrators and teachers are to be commended on the provision of instructional programs which produce such results.

2. Analytic Score Summary

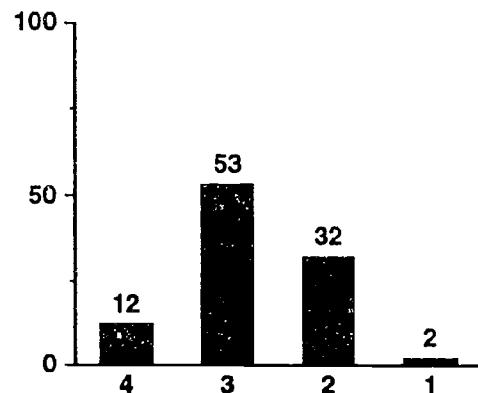

Figures 7 and 8 (pages 45 through 48) illustrate the performance levels of Oklahoma students within each of the categories of writing skills measured. Definitions of performance level criteria are provided for each skill category with corresponding percentages of students who scored in each of the respective performance levels.

It appears that the majority of students were able to demonstrate knowledge and use of basic writing skills as measured by the Stanford Writing Assessment. In all, 55%-69% of seventh grade students' compositions and 62%-77% of tenth grade students' compositions demonstrated capabilities within the two highest levels of performance among the various writing skill categories.

The provision of analytic score data at the individual student level will indicate the writing skill area needing the greatest instructional focus and practice. Working together with the knowledge base provided by such data, parents and teachers can create opportunities for students to become more proficient writers.

At the classroom and building levels, such data can indicate areas of strength and deficiency in specific writing skill instruction based on the number and percent of students scoring at each of the performance levels within each of the skill categories. Such knowledge--put into practice--should serve to identify program needs and aid to provide a focus for fulfilling these needs.

D. Observations

It appears that, based on the results of the Stanford Writing Assessment, Oklahoma's 7th and 10th Grade students were able to organize and construct essays in the expository writing mode in a manner that compares favorably with the performance of the national norm group.

For most students, it takes many years to develop high quality writing skills. This requires quality instruction and ample practice in writing. It appears that Oklahoma's students are receiving a good measure of both.

The analytic score scale was neither designed nor normed to establish the expectation that 25% of all students would score in each of the levels (1-4) within each analytic score area. However, the four performance levels do represent varying degrees of writing expertise--from 1 (low) to 4 (high). It is therefore desirable for students to earn one of the two highest analytic scores (i.e., either a 4 or 3) in each of the six analytic score areas.

The following table displays Oklahoma students' analytic scores in terms of the combined percent of students earning the analytic scores of 4 and 3 in each of the six analytic score areas:

Combined Percent of Students Earning
Analytic Scores of 4 and 3

<u>Analytic Score Area</u>	<u>Grade 7</u>	<u>Grade 10</u>
I - Ideas & Development	65%	70%
II - Organization, Unity, & Coherence	55%	65%
III - Word Choice	65%	77%
IV - Sentences & Paragraphs	61%	70%
V - Grammar & Usage	69%	62%
VI - Writing Mechanics	65%	73%

Comparisons of Stanford Writing Assessment scores earned by the 1992 and 1993 Oklahoma student groups are only relevant in regard to *how each group scored relative to national norm group's average (i.e., 50th National Percentile Rank) for each prompt utilized.* In addition, the *descriptive* and *expository* prompts used for the 1992 and 1993 assessments, respectively, were not equated during the national norming. Therefore, performance of group scores from one prompt to another is not directly comparable.

A study of Oklahoma's 1993 writing assessment data indicates that the 10th grade students did not perform as well as (1) the 1993 seventh-grade group; or (2) their predecessors (who took the Stanford in 1992) when comparing their holistic score means with those of their respective national norm groups. However, the analytic score performance of the 10th grade class shows a greater comparative proficiency in *Word Choice; Sentences and Paragraphs; and Writing Mechanics.* Performance of the 1993 tenth-grade students was equivalent to that of their 1992 peers in the *Organization, Unity, and Coherence* writing skill area.

The 1993 writing assessment holistic score data indicates that the 7th grade students did not perform as well as the 1992 seventh-grade group on the Stanford. However, the analytic score performance of these groups indicates that the 1993 7th grade class has a greater comparative proficiency in *Organization, Unity, and Coherence; Word Choice, and Sentence and Paragraphs.*

These results support the recency of Stanford norms as a possible reason for the mean holistic score performance level of this year's tenth grade's being so much closer to the national average than were their predecessors' scores. The newer norms on this test indicate a higher performance average across the nation in terms of *overall writing*--i.e., the ability to organize thoughts and apply specific writing skills to produce essays that, *considered as a whole*, represent high quality. It appears that Oklahoma's 1993 tenth grade students are being compared with a national average that is more difficult to exceed.

As illustrated above, the 1993 tenth grade scores exhibit good performance in each of the six analytic score areas, meaning that Oklahoma students are applying each of the specific writing skills well. The level of writing skills demonstrated by this analytic score performance will enable our students to seize the opportunity for improvement in holistic scores.

VI. Directions for the Future

Oklahoma law requires that the writing assessment data be used to improve instructional programs in schools throughout the state. The State Department of Education will continue to provide a variety of services to aid with this process.

A. Posttest Inservice Training Program

A posttest inservice training program will be offered throughout the 1993-94 school year for all teachers, building and district test coordinators, and school administrators serving middle, junior high, and secondary level students. Sessions conducted on-site in each school district will include the following topics:

- Interpretation of the Test Data Reports
- Analysis of Test Results to Determine Needed Changes (methodology)
- Specific Teaching Techniques and Activities for Writing and Skill Reinforcement
- Assistance with determining needed changes and innovations in the School Improvement Plan

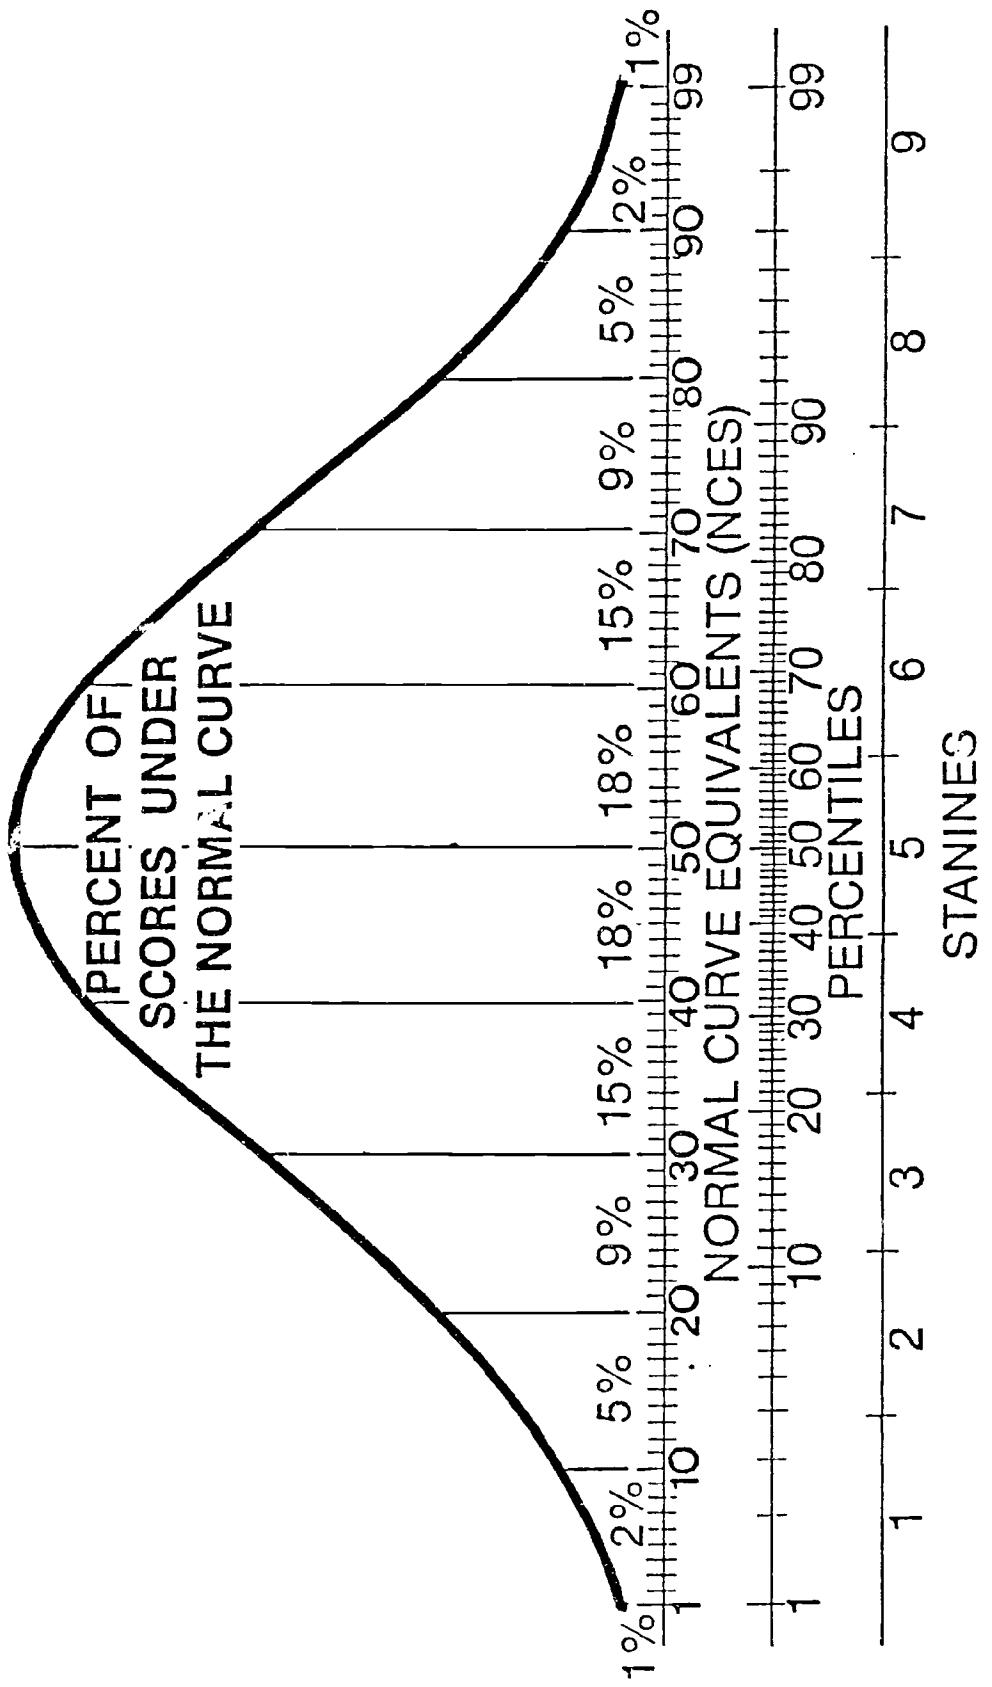

To prepare for this inservice program, The Psychological Corporation has developed materials which are customized to the specific needs of the Writing Assessment Component of the OSTP and the follow-up work which will take place at the local school level. Such publications include the *Manual for Interpreting* and additional inservice materials which are designed to aid schools in using test data at the local level. These materials will be provided for each inservice participant.

B. Follow-up Services Provided for Schools

At the request of local school administrators, the Department will provide assistance to schools based on the stated needs of each faculty. Since the implementation of the OSTP (Fall semester, 1985) the number of such requests has increased. It is anticipated that a similar interest in use of the writing assessment data will be exhibited throughout the 1993-94 school year.

Analytic Scoring Guidelines

Area I-Sentence Formation

- 4 Controlled and varied sentence structure. Few, if any, sentence formation errors.
- 3 Basically adequate sentence structure with little variety in length and form. Few sentence formation errors.
- 2 Some Errors in sentence formation.
- 1 Frequent and/or serious errors in sentence formation.

Area II-Word Usage

- 4 Vocabulary carefully and imaginatively used. Few, if any, errors in grammar.
- 3 Vocabulary acceptable and appropriate, but somewhat simplistic. A few errors in grammar.
- 2 Appropriate, but limited vocabulary. Some errors in grammar.
- 1 Vocabulary limited and at times incorrect or unsuitable.

Area III-Content Development

- 4 Well-planned content. Clearly elaborated, well-organized, controlled ideas.
- 3 Several clear and specific details, with a few problems in either organization or development.
- 2 Vague and sketchy details, often poorly organized. Problems with repetition of ideas and lack of unity.
- 1 Weak ideas and random thoughts, poorly planned. Few details included in a very brief response.

Area IV-Writing Mechanics

- 4 No errors in mechanics, or few errors with some attempt at advanced techniques
- 3 Few errors in mechanics; little risk-taking.
- 2 Many errors in mechanics.
- 1 Frequent and/or serious errors in mechanics, interfering with communication.

HOLISTIC SCORING

The Holistic Raw Score is the sum of two independent raters using a 6-point scoring scale, with 6 being the highest. The score range, therefore, is 2 to 12.

ANALYTIC SCORING

The Analytic scores are six separate scores, one for each of six areas: Ideas and Developments; Organization, Unity, and Coherence; Word Choice; Sentences and Paragraphs; Grammar and Usage; and Mechanics. A 4-point scoring scale is used for each area, with 4 being the highest.

ABBREVIATIONS USED:

N, %	= NUMBER, PERCENT	RS	= RAW SCORE
NAT'L	= NATIONAL	S	= STANINE
NCE	= NORMAL CURVE EQUIVALENT	SS	= SCALED SCORE
PR	= PERCENTILE RANK		

FOOTNOTES:

¹ = Statistics do not include students with non-scorable essays.

NA = Analytic score is not available because the student's essay was not scorable.

NA1 = Not available because no derived scores can be reported for non-scorable essays.

NS1 = Not scorable because the student refused to write or the student's essay had insufficient information, was blank, inappropriate, or a copy of the prompt.

NS2 = Not scorable because the student's essay was off-topic or off-task.

NS3 = Not scorable because the student's essay was written in a foreign language.

NS4 = Not scorable because the student's essay was illegible or incomprehensible.

APPENDIX C

LIST OF AVERAGES--DISTRICT LEVEL RESULTS:

Grade 7 - 1993

GRADE 7

NOTE: Appendix C of this report offers district level test results. Deleted from these reports were scores from school districts in which five or fewer students were tested at any given grade level. This was done to protect the privacy of individual students in those school districts.

LIST OF AVERAGES

FOR

OKLAHOMA

HOLISTIC SCORING

The Holistic Raw Score is the sum of two independent raters using a 6-point scoring scale, with 6 being the highest. The score range, therefore, is 2 to 12.

ANALYTIC SCORING

The Analytic scores are six separate scores, one for each of six areas: Ideas and Development; Organization, Unity, and Coherence; Word Choices; Sentences and Paragraphs; Grammar and Usage; and Mechanics. A 4-point scoring scale is used for each area, with 4 being the highest.

ABBREVIATIONS USED:

N, %	=	NUMBER, PERCENT	RS	=	RAW SCORE
NAT-L	=	NATIONAL	S	=	STANINE
NCE	=	NORMAL CURVE EQUIVALENT	SS	=	SCALED SCORE
PR	=	PERCENTILE RANK			

FOOTNOTES:

- 1 = Statistics do not include students with non-scoreable essays.
NA = Analytic score is not available because the student's essay was not scorables.
NA1 = Not available because no derived scores can be reported for non-scorable essays.
NS1 = Not scoreable because the student refused to write or the student's essay had insufficient information, was blank, inappropriate, or a copy of the prompt.
NS2 = Not scoreable because the student's essay was off-topic or off-task.
NS3 = Not scoreable because the student's essay was written in a foreign language.
NS4 = Not scoreable because the student's essay was illegible or incomprehensible.

APPENDIX D
LIST OF AVERAGES--DISTRICT LEVEL RESULTS:
Grade 10 - 1993

GRADE 10

NOTE:

Appendix D of this report offers district level test results. Deleted from these reports were scores from school districts in which five or fewer students were tested at any given grade level. This was done to protect the privacy of individual students in those school districts.

LIST OF AVERAGES
FOR
OKLAHOMA

HOLISTIC SCORING

The Holistic Raw Score is the sum of two independent raters using a 6-point scoring scale, with 6 being the highest. The score range, therefore, is 2 to 12.

ANALYTIC SCORING

The Analytic scores are six separate scores, one for each of six areas: Ideas and Development; Organization, Unity, and Coherence; Word Choice; Sentences and Paragraphs; Grammar and Usage; and Mechanics. A 4-point scoring scale is used for each area, with 4 being the highest.

ABBREVIATIONS USED:

N, %	= NUMBER, PERCENT	RS	= RAW SCORE
NAT'L	= NATIONAL	S	= STANINE
NCE	= NORMAL CURVE EQUIVALENT	SS	= SCALED SCORE
PR	= PERCENTILE RANK		

FOOTNOTES:

- 1 = Statistics do not include students with non-scorable essays.
NA = Analytic score is not available because the student's essay was not scorable.
NA1 = Not available because no derived scores can be reported for non-scorable essays.
NS1 = Not scorable because the student refused to write or the student's essay had insufficient information, was blank, inappropriate, or a copy of the prompt.
NS2 = Not scorable because the student's essay was off-topic or off-task.
NS3 = Not scorable because the student's essay was written in a foreign language.
NS4 = Not scorable because the student's essay was illegible or incomprehensible.
