ABSTRACT

This report presents a summary of the 1990-91 results of the national Survey of Earned Doctorates conducted each year since 1958. Organized into three sections, the report first presents an analysis of trends in the numbers of doctorate recipients including data with regard to doctoral fields, gender, citizenship status, race and ethnicity, time-to-degree, and post-graduation plans. A second section on financial supports examines primary sources of support (personal, university, federal or other) and indebtedness (by gender, citizenship status and race). The final section discusses the increasing participation of women in U.S. doctoral education, with attention to trends in numbers and proportions of doctorates, fields of doctorate, degree-granting institutions, sources of support (personal, university, federal, debt), postdoctoral plans, and employment sector. Four appendixes present basic tables, trend tables for 1981 to 1991, technical notes, and the survey instrument. (JB)

Summary Report 1991

Doctorate Recipients from United States Universities

The Survey of Earned Doctorates is conducted for the following agencies of the U.S. government:

National Science Foundation
U.S. Department of Education
National Institutes of Health
National Endowment for the Humanities
U.S. Department of Agriculture

Paula Ries Project Manager

Delores H. Thurgood Research Associate

OFFICE OF SCIENTIFIC AND ENGINEERING PERSONNEL NATIONAL RESEARCH COUNCIL

NATIONAL ACADEMY PRESS Washington, D.C. 1993

NOTICE: The project that is the subject of this report was approved by the Governing Board of the National Research Council, whose members are drawn from the councils of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine. The survey project is part of the program of the Office of Scientific and Engineering Personnel (OSEP).

This report has been reviewed by a group of persons other than the author according to procedures approved by a Report Review Committee consisting of members of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine.

The National Academy of Sciences is a private, nonprofit, self-perpetuating society of distinguished scholars engaged in scientific and engineering research, dedicated to the furtherance of science and technology and to their use for the general welfare. Upon the authority of the charter granted to it by the Congress in 1863, the Academy has a mandate that requires it to advise the federal government on scientific and technical matters. Dr. Frank Press is president of the National Academy of Sciences.

The National Academy of Engineering was established in 1964, under the charter of the National Academy of Sciences, as a parallel organization of outstanding engineers. It is autonomous in its administration and in the selection of its members, sharing with the National Academy of Sciences the responsibility for advising the federal government. The National Academy of Engineering sponsors engineering programs aimed at meeting national needs, encourages education and research, and recognizes the superior achievements of engineers. Dr. Robert M. White is the president of the National Academy of Engineering.

The Institute of Medicine was established in 1970 by the National Academy of Sciences to secure the services of eminent members of appropriate professions in the examination of policy matters pertaining to the health of the public. The Institute acts under the responsibility given to the National Academy of Sciences by its congressional charter to be an adviser to the federal government and, upon its own initiative, to identify issues of medical care, areas of research, and topics for education. Dr. Kenneth I. Shine is president of the Institute of Medicine.

The National Research Council was organized by the National Academy of Sciences in 1916 to associate the broad community of science and technology with the Academy's purposes of furthering knowledge and of advising the federal government. Functioning in accordance with general policies determined by the Academy, the Council has become the principal operating agency of both the National Academy of Sciences and the National Academy of Engineering in providing services to the government, the public, and the scientific and engineering communities. The Council is administered jointly by both Academies and the Institute of Medicine. Dr. Frank Press and Dr. Robert M. White are the chairman and vice-chairman, respectively, of the National Research Council.

This report is based on research conducted by OSEP with the support of the National Science Foundation (NSF), the National Institutes of Health (NIH), the National Endowment for the Humanities (NEH), the U.S. Department of Education (U.S. Dept. of Ed.), and the U.S. Department of Agriculture (USDA) under NSF Contract No. SRS-8517008. Opinions, findings, conclusions, or recommendations expressed in this publication are those of OSEP and do not necessarily reflect the views of the sponsoring agencies.

PREFACE AND ACKNOWLEDGMENTS

This report presents a summary of the results of the 1990-91 Survey of Earned Doctorates (SED), which has been conducted each year since 1958 by the National Research Council's Office of Scientific and Engineering Personnel (OSEP) and its predecessor organizations. Questionnaires, distributed with the cooperation of the graduate deans of U.S. universities, are filled in by graduates as they complete requirements for their doctoral degrees. The doctorates are reported by academic year (from July 1 of one year through June 30 of the following year) and include research and applied-research doctorates in all fields. Professional degrees such as the M.D., D.D.S., O.D., D.V.M., and J.D. are not covered by this survey. A full list of included degrees can be found inside the back cover. For convenience throughout this report, "Ph.D." is used to represent any of the doctoral degrees covered by the survey.

This Summary Report is the twenty-fifth in an annual series of reports that began in 1967. Trend data from earlier periods can be found in the book A Century of Doctorates: Data Analyses of Growth and Change (National Academy of Sciences, 1978). All survey responses become part of the Doctorate Records File (DRF), a virtually complete data bank on doctorate recipients from 1920 to 1991. More than 85 percent of the 1,024,487 records now in the DRF have come from results of the 1958-1990 surveys. For doctorates granted during the 1920-1957 period, information was compiled from commencement bulletins, registrars' records, and other published material.

The conduct of the SED, the maintenance of the resulting data file, and the publication of this report are funded jointly by the National Science Foundation (NSF), the National Institutes of Health (NIH), the National Endowment for the Humanities (NEH), the U.S. Department of Education (U.S. Dept. of Ed.), and the U.S. Department of Agriculture (USDA). Susan Hill (NSF) serves as the project officer for the agencies, and her counsel is appreciated. In addition, constructive reviews of the design and analysis of the survey by Mary Golladay (NSF), David Chananie (NIH), Jeffrey Thomas (NEH), Linda Zimbler and Nancy Schantz (U.S. Dept. of Ed.), and K. Jane Coulter and Charles Baldwin (USDA) increased the survey's relevance to national policy issues. We also express deep appreciation to the graduate deans in the doctorate-granting institutions for their continuing interest in and assistance to this project. It is through their cooperation that the DRF continues to serve as a useful resource for monitoring developments in graduate education in the country.

The 1990-91 Survey of Earned Doctorates was conducted under the administrative supervision of Joanne M. Weinman. Paula Ries, Ms. Weinman's successor as project

manager, and Delores H. Thurgood collaborated on the development of this report. Ms. Ries analyzed the survey results and drafted all text in the body of the report. Ms. Thurgood drafted the technical notes, supervised the production of tables and figures, and reviewed the manuscript for accuracy. George Orvis generated much of the data used in the report from the Doctorate Records File and also verified the accuracy of the explanatory and technical notes in the appendixes. Julie Clarke produced the cameraready copies of all tables and figures presented in the body of the report and assisted in the verification of numbers and percentages contained therein. Martha Bohman prepared all appendix tables and finalized the manuscript for publication. Special appreciation is also expressed to the following people: Eileen Milner, who supervised the coding and editing of the data, and her staff who provided proficient support in the collection and processing of the survey: Walter Fox, Abraham Gedamu, John Hines, and Mary Wanyoike. Thanks are also expressed to George Boyce, manager of OSEP's Data Processing Section, and to Joseph Finan and Maren Herman, who were responsible for the computer programming and processing.

The work of this project was overseen by the Advisory Committee for Studies and Analyses of the Office of Scientific and Engineering Personnel, which is concerned with those activities of the National Research Council that contribute to the effective development and utilization of the nation's scholars and research personnel. During the development of this report, Alan E. Fechter, Executive Director of OSEP, provided helpful guidance, as did Pamela Ebert Flattau, who served as OSEF's Director of Studies and Surveys. Suggestions for improvement of the content or format of the report, other comments, and questions are welcome and may be directed to the Project Manager, Paula Ries.

INTRODUCTION

Summary Report 1991 is the 25th in a series of reports on doctorates awarded by U.S. colleges and universities. Like its predecessors, it presents trends in doctorate production in the United States, describing the broad fields in which Ph.D.s are earned and the general demographic characteristics of doctorate recipients. Summary Report 1991 differs noticeably in format from its most recent predecessors. Selected trend data are presented in tables and charts along with a brief narrative describing key findings.

The special analysis section profiles the 1991 cohort of U.S. female Ph.D.s. Supplementary tables on 1991 doctorates are displayed in Appendix A, and 1981-1991 data are presented in Appendix B. Technical notes are in Appendix C, and the survey questionnaire is included in Appendix D.

Seven broad fields are profiled in the text of Summary Reports. Readers should note that these fields may differ from those reported by federal sponsors of the survey. "Major" fields are the subfields that make up the broad fields (e.g., biological sciences as a part of life sciences or psychology as a part of social sciences). For a list of these subfields, see the inside back cover of this report and the specialties list in Appendix D.

*** IMPORTANT NOTICE ***

Because of recent increases in response rates, the data on citizenship and race/ethnicity for 1990 and 1991 are not comparable to data for earlier years.

Although the Survey of Earned Doctorates maintains an unusually high response rate, the percentage of self-reported questionnaires declined throughout the 1980s, falling from 96.2 percent in 1980 to a low of 91.4 percent in 1989. This downward trend was reversed in 1990 when the response rate increased nearly two percentage points. It rose yet another point in 1991, reaching 94.3 percent.

Item response rates showed a parallel improvement—a natural consequence of the increase in the overall survey response but also partially because of questionnaire revisions and follow-ups for missing pieces of information. New follow-up procedures instituted in 1990 had an especially strong impact on citizenship and racial/ethnic data for that year. However, since the responses to the follow-ups were not received until after closure of the 1990 survey, they were not included in the data presented in Summary Report 1990. The updated 1990 numbers reflecting follow-up responses are shown in Appendix Table B-2 in this year's report (page 98). The most significant adjustment was to the numbers of black Ph.D.s—an increase of 8.3 percent among those who were U.S. citizens and 4.7 percent among temporary residents. The data for 1991 will likewise be subject to some revision over the next year. It is important, therefore, for readers to keep in mind that fluctuations in response rates affect numerical trends and that 1990 and 1991 data on citizenship and race/ethnicity, in particular, are not comparable to earlier data.

TRENDS IN DOCTORATE RECIPIENT PRODUCTION

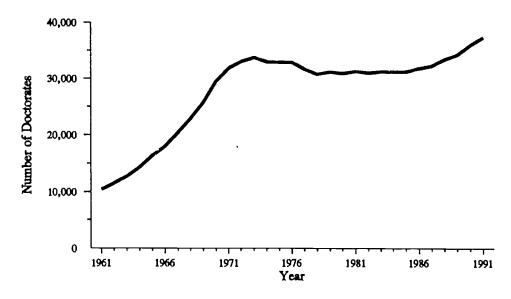

Number of Doctorates by Selected Characteristics

TABLE 1 Doctorates Awarded by U.S. Colleges and Universities, 1961-1991

Year	Number	Year	Number	Year	Number	Year	Number
1961	10,413	1969	25,743	1977	31,716	1985	31,297
1962	11,500	1970	<u> </u>	1978	30,875	1986	31,895
1963	12,728	1971	31,867	1979	31,239	1987	32,363
1964	14,325	1972	33,041	1980	31,020	1988	33,489
1965	16,340	1973	33,755	1981	31,357	1989	34,318
1966	17,949	1974	33,047	1982	31,111	1990	36,057
1967	20,403	1975	32,952	1983	31,282	1991	37,451
1968	22,936	1976	32,946	1984	31,337		

In 1991, a record number of doctorates—37,451—were awarded by U.S. co¹¹eges and universities. As **Table 1** and **Figure 1** show, Ph.D. production declined during the mid-1970s, remained steady through most of the 1980s (increasing less than two percent annually), and then began to accelerate toward the end of the decade. Since 1987, the pace has picked up, with the number of doctorates awarded increasing between two and five percent annually.

FIGURE 1 Doctorates awarded by U.S. colleges and universities, 1961-1991.

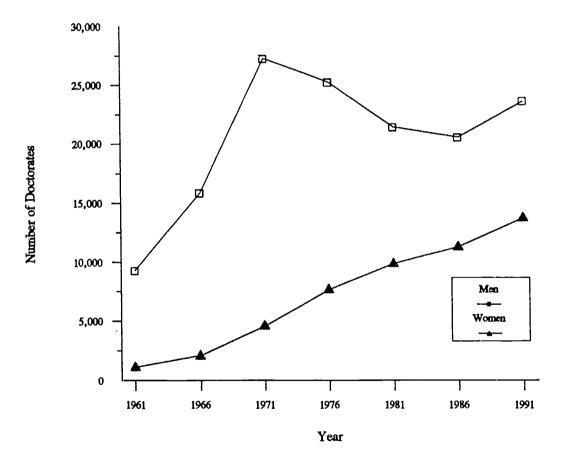

NOTE: See Table 1 for numbers of doctorates.

Since 1961, the number of women earning doctorates has increased twelvefold, rising from 1,128 in 1961 to 13,765 in 1991 (Figure 2). Women currently account for 36.8 percent of all Ph.D.s, up 26 percentage points since 1961. The number of Ph.D.s awarded to men peaked in the early 1970s and, despite recent growth, the 1991 numbers—23,686—were still below the record numbers reached in the early 1970s (see Table 4 for the number of doctorates earned by women and men).

FIGURE 2 Doctorate recipients, by gender for selected years, 1961-1991.

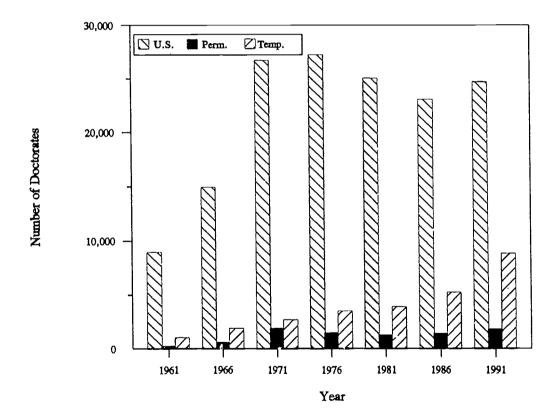

NOTE: See Table 4 for numbers of Ph.D.s.

Doctorate recipients in 1991 were much more likely to be foreign than their counterparts thirty years ago (Figure 3). The number of doctorates awarded to non-U.S. citizens (permanent and temporary residents) has increased steadily from 1,196 in 1961 to 10,666 in 1991, rising particularly sharply during the 1980s. Temporary residents comprised the majority (83.0 percent) of non-U.S. citizens in 1991. Readers should note that nonresponse to citizenship status has increased overall in the last 10 years, rising from 3.4 percent in 1981 to 6.6 percent in 1986, and then falling to 5.5 percent in 1991. This increase may understate the growth in non-U.S. citizens and overstate the decrease in U.S. citizens earning Ph.D.s during this period (see Table 5 for numbers of Ph.D.s by citizenship).

FIGURE 3 Doctorate recipients, by citizenship for selected years, 1961-1991.

NOTE: See Table 5 for numbers of Ph.D.s. See technical notes in Appendix C for rates of nonresponse to the question on citizenship status.

The 30 countries that send the greatest numbers of students to the United States to earn doctorates are listed in **Table 2**. In 1991, the People's Republic of China led all other nations in the number of doctorate recipients from U.S. universities, followed closely by the Republic of Korea and Taiwan. These three countries and India accounted for half (49.9 percent), whereas Canada and Mexico (the United States' closest neighbors) constituted 6.1 percent of all foreign Ph.D.s.

TABLE 2 Top 30 Countries of Origin of Non-U.S. Citizens Earning Ph.D.s at U.S. Colleges and Universities, 1991 (ranked on number of Ph.D.s)

Cou	ntry	Number	Country	Number
1.	People's Republic of China*	1,710	16. Nigeria	120
2.	Republic of Korea†	1,333	17. Israel	112
3.	Taiwan, Republic of China*	1,280	18. Italy	111
4.	India	883	19. Philippines	109
5.	Canada	484	20. France	104
6.	Iran	239	21. Turkey	101
7.	England	193	22. Indonesia	99
8.	Germany	175	23. Pakistan	99
9.	Greece	175	24. Spain	98
10.	Japan	157	25. Saudi Arabia	91
11.	Mexico	154	26. Malaysia	86
12.	Hong Kong	145	27. Australia	78
13.	Brazil	142	28. Argentina	71
14.	Thailand	141	29. Chile	65
15.	Egypt	133	30. Sri Lanka	64

NOTE: See technical notes in Appendix C for rates of nonresponse to the country of citizenship question.

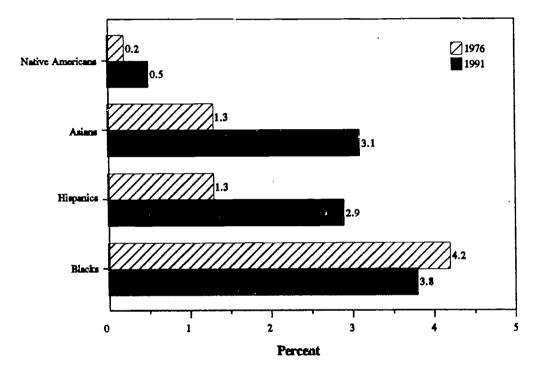

^{*}An additional 153 Ph.D.s indicated "China as their country of citizenship, but a more specific origin could not be determined. Thus, data for these recipients were excluded from the table.

[†]Includes "Korea, unspecified." The Democratic People's Republic of Korea (North Korea) does not permit its citizens to study in the United States.

In the last 15 years, U.S. "minorities" (e.g., Asians, blacks, Hispanics, and Native Americans) have increased their overall share of doctorates (Figure 4). However, in 1991, minorities constituted just over 10 percent of Ph.D.s awarded to U.S. citizens, and since 1976, the proportion of U.S. blacks earning Ph.D.s actually declined (reliable racial/ethnic data were not available before 1975).

FIGURE 4 Percentage of doctorates earned by U.S. minorities, 1976 and 1991.

NOTE: Percentages are based on the number of U.S. citizen Ph.D.s with known race/ethnicity. See Appendix Table B-2 for numbers of Ph.D.s; see technical notes in Appendix C for rates of nonresponse to citizenship and race/ethnicity.

Over two-thirds of all doctorates awarded in 1991 were spread broadly across four fields: life sciences (18.5 percent); education (17.1 percent); physical sciences (16.8 percent); and social sciences (16.4 percent) (**Table 3**). Engineering accounted for 13.9 percent and humanities constituted 10.9 percent of 1991 Ph.D.s.

Among the science fields during the late 1980s, life sciences replaced social sciences as the number one producer of Ph.D.s (Figure 5). Although the number of Ph.D.s in physical sciences declined during the 1970s, this field's popularity resurged in the mid-1980s. Currently the field produces slightly more Ph.D.s than social sciences.

Although engineering accounted for just 14 percent of all Ph.D.s awarded in 1991, it nonetheless experienced the greatest increase of any broad field since 1961. The growth of physical sciences and engineering is primarily a result of increasing numbers of non-U.S. citizens earning doctorates in these fields (see Table 5 for numbers of non-U.S. citizen doctorate recipients).

The number of Ph.D.s awarded in humanities and education has declined during the last 15 years, although 1991 showed an increase for humanities. In contrast, the number of doctorates in professional/other fields has risen steadily during this time, driven largely by business and management Ph.D.s which accounted for nearly half of all professional/other doctorates in 1991.

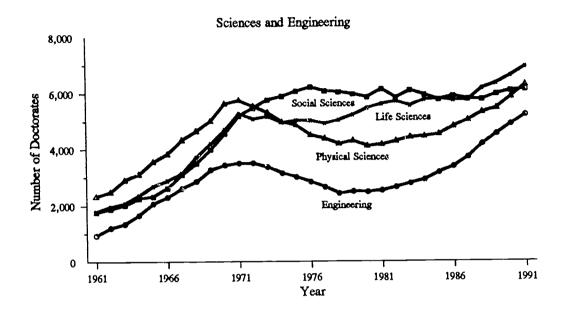

TABLE 3 Major Doctorate Field for Selected Years, 1961-1991

Field	1961	1966	1971	1976	1981	1986	1991

FIGURE 5 Doctorate recipients, by broad field, 1961-1991.

Humanities, Education, and Professional/Other Fields

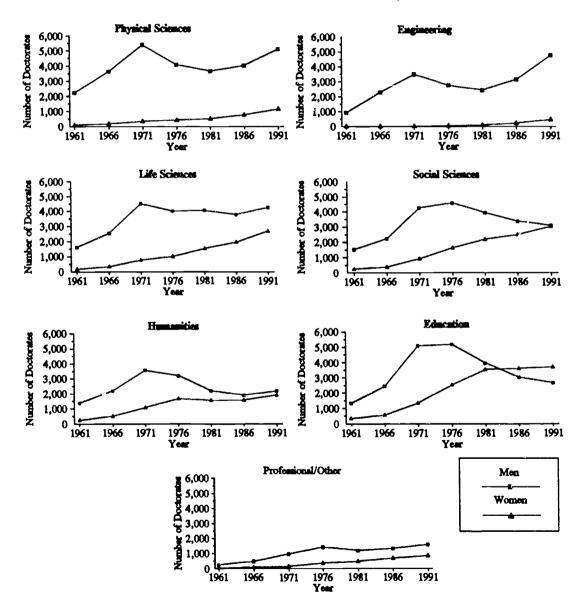

NOTE: See Table 3 for numbers of doctorates in selected years, 1961-1991.

During the last 30 years, women have steadily increased their representation in all the fields shown in **Figure 6**. The fields that showed the greatest growth in female Ph.D.s during this time period are physical sciences, engineering, professional/other fields, and life sciences.

The increasing numbers of female doctorates have been offset by decreasing numbers of men earning Ph.D.s in education, humanities, and social sciences.

FIGURE 6 Doctorate recipients, by gender and broad field for selected years, 1961-1991.

NOTE: See Table 4 for numbers of Ph.D.s.

Table 4 shows that despite significant increases in the numbers of female Ph.D.s since 1961, women currently outnumber men in only one field—education (58.1 percent)—and have achieved near parity in social sciences (49.4 percent) and humanities (46.5 percent). They earned over one-third of all doctorates in life sciences (38.6 percent) and professional/other fields (34.6 percent). Women continued to account for small proportions of Ph.D.s in engineering (8.7 percent) and physical sciences (18.4 percent). U.S. women will be discussed more fully in the special analysis section, beginning on page 29.

Women	45	88	128	350	470	671	837

^{*}Includes mathematics and computer sciences.

In the last thirty years, foreign students (permanent and temporary residents) have steadily increased their share of doctorates awarded by U.S. institutions in all fields, particularly in engineering and physical sciences (**Table 5**). In 1961, non-U.S. citizens earned just 22.4 percent of doctorates in engineering; by 1991 this figure had more than doubled to 59.1 percent. Physical sciences saw a similar increase, growing from 14.2 percent in 1961 to 42.3 percent in 1991.

NOTE: See technical notes in Appendix C for rates of nonresponse to the question on citizenship status.

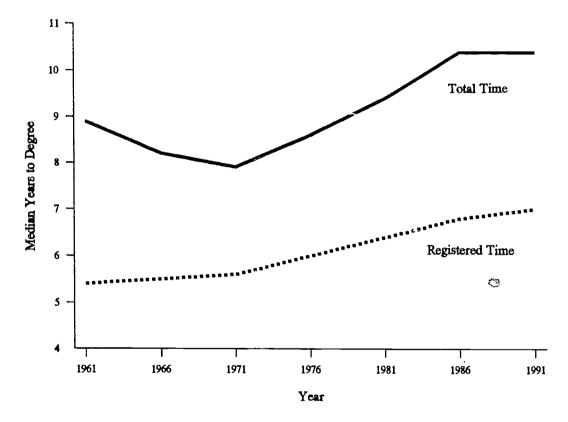

^{*}Includes mathematics and computer sciences.

Time-to-Degree

The time graduate students take to complete their Ph.D.s ("time-to-degree") was shortest in the late 1960s, but has increased steadily since the 1970s (Figure 7). Registered time-to-degree (RTD) measures the amount of time students spend in graduate school (including time spent working on a master's or enrolled in a nondegree program). Total time-to-degree (TTD) gauges not only the amount of time spent in graduate school but also the number of years that have elapsed between earning the baccalaureate and entering graduate school (as well as any time spent out of school after the first graduate school entrance). Consequently, TTD is longer than RTD.

FIGURE 7 Median years to degree for doctorate recipients, all fields combined, 1961-1991.

NOTE: See Table 6 for median years to degree for all fields combined. See technical notes in Appendix C for rates of nonresponse to the applicable questions. A different method of computing TTD using baccalaureate-year cohort is discussed in Bowen, W., G. Lord, and J.A. Sosa, "Measuring Time to the Doctorate: A Reinterpretation of the Evidence," published in *The Proceedings of the National Academy of Sciences* (Vol. 88, pp. 713-717, February 1991, Washington, D.C.).

Since 1961, time-to-degree (both RTD and TTD) has increased by approximately 1.5 median years (**Table 6**). However, time-to-degree is quite field dependent. Humanities saw the greatest increase in RTD (2.6 median years) since 1961 and had the longest RTD (8.4 median years) in 1991. Physical sciences and engineering had the smallest increase (1.2 median years), and in 1991, engineering had the shortest RTD (6.1 median years). TTD increased the most in education (5.4 median years) and the least in physical sciences in the last 30 pears. In 1991, education had the longest (18.4 median years) and physical sciences the shortest (7.8 median years) TTD.

*Includes mathematics and computer sciences.

In addition to field, time-to-degree also varies by gender, citizenship status, and race (Table 7). For example, women's RTD is just over 0.5 year (0.6 median years) longer than men's. Yet, examining the data by field and gender shows that this gap narrows considerably in physical and life sciences, engineering, and education. Similarly, although they have higher overall TTDs than non-U.S. citizens, U.S. citizens have the shortest TTD in physical sciences, engineering, and life sciences.

NOTE: Medians are based on the number of individuals who have provided complete information about their postbaccalaureate education. Medians were computed wherever there were five or more Ph.D.s with known time-to-degree. See technical notes in Appendix C for rates of nonresponse to the applicable questions.

^{*}Includes mathematics and computer sciences.

Financial Support

In 1991, the type of financial support doctorate recipients listed as the primary source for their graduate studies varied by field, gender, citizenship status, and race/ethnicity (Table 8). University support was more common among Ph.D. recipients in physical sciences, engineering, and life sciences, whereas personal resources were more typical in social sciences, education, and professional/other fields. In humanities, Ph.D. recipients' primary source of support was split evenly between personal resources and university support.

Overall, men were more likely than women to list university support as their primary financial resource. When the data are disaggregated by field, however, there is near parity between the sexes in receipt of university support in physical sciences and engineering—two fields with few women—and in humanities and education. However, in life sciences (where women have made inroads in the last decade) and in social sciences (which has almost equal numbers of men and women), women were less likely than men to receive university support.

In all fields combined, non-U.S. citizens were more likely than U.S. citizens to list university support as the primary financial resource for their studies. Among the various U.S. racial/ethnic groups, receipt of university support varied by field. For example, in engineering, Asians and whites had higher proportions than the other racial/ethnic groups listing university sources as their primary financial support. In humanities, blacks and Hispanics were the likeliest of all racial/ethnic groups to receive university support.

Reliance on personal resources was most common in social sciences, education, and professional/other fields. Similar proportions of women and men listed personal resources as their primary source of support except in life sciences, social sciences, and professional/other fields. Non-U.S. citizens (permanent and temporary residents) were less likely than U.S. citizens to utilize personal resources as a primary financial support mechanism, because of their concentration in fields (e.g., physical sciences and engineering) in which university support was most common.

Among U.S. racial/ethnic groups, there was no clear pattern in the use of personal resources as the primary source of support for graduate studies. For example, in engineering, similar proportions of Asians, blacks, Hispanics, and whites utilized personal resources for their graduate studies. On the other hand, in education, Asians were the most likely and Native Americans the least likely to have utilized their own resources during graduate school.

NOTE: Numbers represent those Ph.D.s with known primary support; percentages are based on these numbers. "Personal" loans comprise loans, federal included, as well as own earnings and contributions from the spouse/family. Federally funded research assistantships (RAs) are grouped under "University" because recipients of such support may not know the actual source of funding. For further definition of "Federal" support, see item 17 on the survey questionnaire in Appendix D. "Other" support includes U.S. nationally competitive fellowships, business/employer funds, foreign government, state government, and other nonspecified sources. See technical notes in Appendix C for rates of nonresponse to this question.

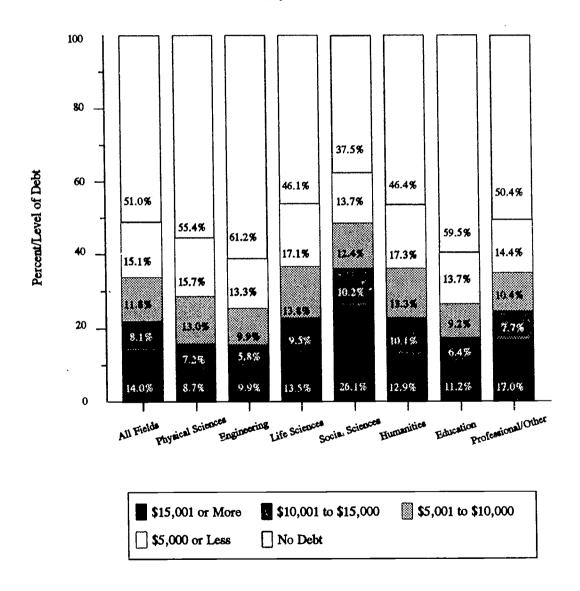

29

^{*}Includes mathematics and computer sciences.

19

The level of doctorate recipients' educational debt (funds borrowed to finance undergraduate and graduate education) varied considerably by field in 1991 (Figure 8). More than 50 percent of Ph.D.s in life sciences, social sciences, and humanities completed their graduate studies with some kind of debt. Recipients in engineering and education were the least likely and those in social sciences the most likely to have incurred debt; and social scientists had the highest proportion with debt greater than \$15,000.

FIGURE 8 Cumulative debt related to education, by broad field, 1991.

NOTE: See technical notes in Appendix C for rates of nonresponse to the question on cumulative debt.

20 Financial Support

Level of educational debt is also related to citizenship status and race/ethnicity (Table 9). In 1991, U.S. citizens were much more likely than non-U.S. citizens to finish their doctorate in debt. However, among only those with debt, U.S. citizens had a slightly smaller proportion with debt greater than \$15,000 than did non-U.S. citizens.

Among U.S. racial/ethnic groups, blacks, Hispanics, and Native Americans were more likely than Asians and whites to have debt. They also tended to have the highest levels of debt (more than \$15,000).

Table 9 shows temporary residents with the smallest percentage of Ph.D.s owing more than \$15,000. However, when only those Ph.D.s with debt are examined, similar proportions of temporary residents, U.S. blacks and U.S. Hispanics reported debt greater than \$15,000.

TABLE 9 Cumulative Debt Related to Education, by Demographic Group, 1991 (in percent)

								U.	S. Citi	zens

\$10,001 to \$15,000	8.1	8.2	2 8.0	10.0	6.3	3.2	10.9	8.6	13.4	9.4	9.9
\$15,001 or more	14.0	13.8	3 14.3	15.7	12.5	9.5	16.2	23.4	22.2	21.1	15.1

NOTE: Numbers include recipients whose debt status is unknown; percentages are based on the num'er who resnonded to the question. Percentages for "with" and "without" debt add to 100.0. Percentages for levels of debt add to the total percentage of Ph.D.s "with debt." See technical notes in Appendix C for rates of nonresponse to this question.

Postgraduation Plans

Since 1971, declining proportions of Ph.D. recipients in all fields had postgraduation work plans while increasing proportions had postdoctoral study plans (**Table 10**). Ph.D. recipients in education, professional/other fields, and humanities had the highest proportions with employment plans. Among the sciences, social scientists were the most likely and life scientists the least likely to have work plans; in the latter fields, plans for postdoctoral study are the norm.

1991	27.5	48.5	21.0	62.4	17.4	7.3	3.9	2.9

NOTE: Only Ph.D.s with definite commitments are included. Numbers include recipients who reported definite commitments but not type of plans (employment or study). Percentages are based on the number of Ph.D.s whose specific plans are known. See technical notes in Appendix C for rates of nonresponse to the applicable questions and for further explanation of postgraduation plans.

^{*}Includes mathematics and computer sciences.

Doctorate recipients in 1991 were much more likely than their counterparts 20 years earlier to have postdoctoral study commitments (Table 11). This was particularly true for men, who constitute the majority of Ph.D.s in physical and life sciences—two fields where postdoctoral appointments are common. Although the proportion of women with definite job commitments has declined since 1971, they were still more likely than men to have definite employment commitments, probably because of their specialization in education where postgraduation work plans are the norm. Among the various U.S. racial/ethnic groups, blacks were the most likely to have work commitments whereas Asians were the most apt to have study commitments. The different postgraduation plans of these two groups is largely a result of high concentrations of blacks in education and high proportions of Asians in life sciences.

Percentages are based on the number of Ph.D.s whose specific plans are known. See technical notes in Appendix C for rates of nonresponse to the applicable questions and for further explanation of postgraduation plans.

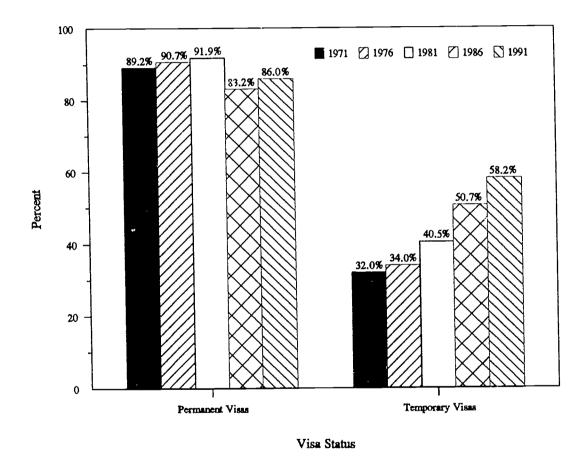

*Race/ethnicity was not available in 1971.

Postgraduation Plans 23

Non-U.S. citizens with permanent visas have always been more likely than those with temporary visas to remain in the United States after earning the doctorate (Figure 9). However, increasing proportions of temporary residents planned to either study or work in the United States after graduation.

FIGURE 9 Percentage of non-U.S. citizen doctorate recipients with definite commitments who plan to remain in the United States after graduation, by visa status for selected years, 1971-1991.

NOTE: Only Ph.D.s with definite commitments are included; see Table 11 for numbers of non-U.S. citizens with commitments. See technical notes in Appendix C for rates of nonresponse to the applicable questions.

In 1991, most foreign students planned to remain in the United States after earning the doctorate (**Table 12**). Permanent residents were more likely than temporary residents to have definite U.S. work commitments, and nearly equal proportions of each group had plans to study in the United States.

NOTE: Only Ph.D.s with definite commitments are included; see Table 11 for numbers of non-U.S. citizens with commitments. Percentages are based on the number of Ph.D.s with known postgraduation plans and location in each field. See technical notes in Appendix C for rates of nonresponse to these questions and for further explanation of postgraduation plans.

^{*}Totals include other fields not shown.

In 1991, doctorate recipients were much less likely to have academic employment plans than their counterparts 20 years ago (Table 13). In 1971, over half of Ph.D. recipients in all fields, except engineering, planned to work in academe. By 1991, this was true only for doctorate recipients in life sciences, humanities, and professional/other fields (and for just 50 percent of social scientists). To which other sectors have doctorate recipients gone? In 1991, physical scientists and engineers were most likely to have employment plans in industry or to be self-employed. Although half of social scientists had academic commitments in 1991, they were much more likely to have employment plans in industry or "other" sectors (e.g., K-12 schools and nonprofit organizations) than their counterparts in 1971.

TABLE 13 Employment Sector of Doctorate Recipients with Postgraduation Commitments in the United States, by Broad Field for Selected Years, 1971-1991 (U.S. citizens and permanent residents, in percent)

NOTE: Only Ph.D.s with definite commitments for employment are included. Foreign locations are excluded. Numbers include recipients whose employment sector is unknown; percentages are based on the number of Ph.D.s who reported employment sector. See technical notes in Appendix C for rates of nonresponse to this question.

^{*}Includes mathematics and computer sciences.

[†]Academe includes two- and four-year colleges and universities, and medical schools. Elementary and secondary schools are included in "Other."

^{‡&}quot;Other" is mainly composed of elementary and secondary schools and nonprofit organizations.

26

As shown in Table 13, the employment sector of Ph.D.s depends a great deal on their field of specialization. Because men tend to specialize in physical sciences and engineering, they were more likely than women to have definite work commitments in industry/self-employment, although the proportion of female Ph.D.s (U.S. citizen and permanent residents) with work plans in this sector increased fivefold in the last twenty years (Table 14).

Among the different racial/ethnic groups (U.S. citizen and permanent residents), blacks and Hispanics were the most likely to have academic work commitments. Close to half of all Asians planned to work in industry/self-employment, largely due to their specialization in engineering.

In 1991, temporary residents were slightly more likely than U.S. citizens to have academic work commitments and significantly more likely to have employment plans in industry/self-employment (38.7 percent vs. 18.6 percent). The latter is a result of the preponderance of temporary residents in engineering. U.S. citizens were much more likely than permanent or temporary residents to work in government or other sectors (e.g., K-12 schools and nonprofit organizations).

NOTE: Only doctorates with definite commitments for employment are included. Foreign locations are excluded. Numbers include recipients whose employment sector is unknown; percentages are based on the number of Ph.D.s who reported employment sector. See technical notes in Appendix C for rates of nonresponse to this question.

^{‡&}quot;Other" is mainly composed of elementary and secondary schools and nonprofit organizations.

^{*}Race/ethnicity was not available in 1971.

[†]Academe includes two- and four-year colleges and universities and medical schools. Elementary and secondary schools are included in "Other."

U.S. CITIZEN FEMALE DOCTORATES

(SPECIAL SECTION)

The nature of the economic base [of the United States] presents a growing need for skilled workers, for knowledge workers, for intellectual talent, and for ingenuity. Since the new entrants to the work force by the year 2000 will be predominantly women and minorities...there is an important opportunity to meet the nation's needs for scientists and engineers by increasing the numbers of women and minorities receiving advanced preparations in those fields.¹

In recent years different strategies—particularly at the postsecondary level—have been designed and implemented to attract women to and maintain their presence in science and engineering fields as well as other doctoral programs. This section examines women's attainment of the doctorate in sciences, engineering, humanities, education, and professional/other fields in 1991. The following questions frame this special analysis section: How many women earned doctorates? What fields do most women choose? What types of undergraduate and graduate institutions do they attend? How long does it take women to complete the doctorate? What types of financial support do they receive? What are their postdoctoral employment or study plans?

Since 1976, women have accounted for an increasing proportion of U.S. doctorate recipients and although this section sketches some broad gender differences (such as numbers and field distribution), the primary focus is U.S. female doctorate recipients in 1991.² This section presents the data by race/ethnicity as well as gender because the overwhelming numbers of white women mask interesting variations in the data among the various U.S. racial/ethnic groups. Because a study of the factors influencing women's attainment of the doctorate is beyond the scope of this technical report, descriptive rather than analytic statistics are presented and discussed. The following six sections provide data on U.S. female Ph.D.s by race/ethnicity: 1) Trends in Numbers

¹ Dix, L.S., and M. L. Matyas, eds., 1992. Science and Engineering Programs: On Target for Women, Washington, D.C.: National Academy Press.

² A total of 2,320 non-U.S. women were excluded from these analyses. Comparison tables for U.S. men are found in Appendix B Tables on pages 101-103.

and Proportions of Doctorates; 2) Field of Doctorate; 3) Degree-Granting Institutions; 4) Time-to-Degree; 5) Financial Support (and Debt); and 6) Postgraduation Plans. Tables referred to in the text are found at the end of the special analysis section. The time period covered in this section begins in 1976 because reliable racial/ethnic data are not available before 1975.

The five racial/ethnic groups discussed are Asians, blacks, Hispanics, Native Americans, and whites. Ethnicity takes precedence over race in this analysis; respondents claiming Hispanic heritage are designated as Hispanic regardless of racial identification (see items 9 and 10 on the survey form in Appendix D, page 125). Only U.S. citizens (native and naturalized) are included in this discussion.

Trends in Numbers and Proportions of Doctorates

Between 1976 and 1991, the number of U.S. women earning doctorates increased steadily from 6,842 to 10,836, whereas the number of U.S. men earning Ph.D.s decreased from 20,427 to 13,885 (Table S-1 and Appendix Table B-2). There were nearly 60 percent more female Ph.D. recipients in 1991 than in 1976 compared with 32 percent fewer men. Although the numbers of women earning Ph.D.s increased across all racial/ethnic groups, this was not the case for men. Since 1976, the number of U.S. men earning doctorates decreased 41 percent among blacks and 33 percent among whites; Asian, Hispanic, and Native American groups all saw increases in men obtaining Ph.D.s. In 1991, women constituted 43.8 percent of U.S. doctorate recipients.

Female representation among U.S. doctorate recipients varied considerably by race/ethnicity (Table S-1). Totaling 9,495 in 1991, white women constituted by far the majority of U.S. female doctorates (88.4 percent), followed by black women (5.1 percent), Hispanic women (3.3 percent), Asian women (2.7 percent), and Native American women (0.5 percent). Nonwhite women constituted 5.1 percent and white women 38.9 percent of all doctorates awarded to U.S. citizens in 1991. Examining the data by race/ethnicity shows that among some groups, Ph.D.s are just as likely to be women as men. In 1991, nearly three-fifths of all blacks and one-half of Hispanics were female, whereas white, Native American, and Asian doctorate recipients continued to be predominately male (Table S-1).

³ In 1991, 74 percent of U.S. Hispanic women were white, 20.9 percent were of unknown race, 2 percent were black, 1.7 percent were Native American, and 1.4 percent were Asian. U.S. Hispanic men had a virtually identical racial distribution.

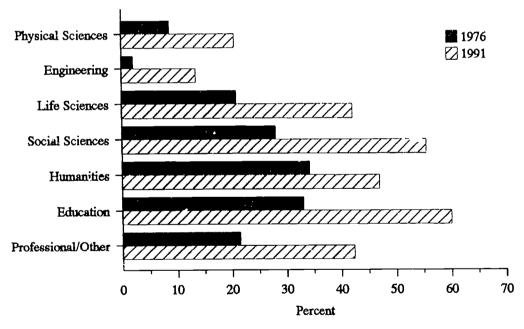

Field of Doctorate

Field Composition

Between 1976 and 1991, the number of U.S. women earning doctorates increased in all broad fields except for humanities (Table S-2). Women made their greatest gains in engineering, rising from 34 in 1976 to 267 fifteen years later, an increase of nearly 700 percent. In 1991, U.S. women outnumbered men in two fields—social sciences and education—and achieved near parity in humanities (Figures S-1 and S-2). However, their numbers remained small in physical sciences and engineering. The one traditionally male field where women have made inroads is life sciences, which was 42 percent female in 1991, compared with 21 percent in 1976 (Table S-2 and Appendix Table B-3). It is interesting to note that only among U.S. blacks did women outnumber men in life sciences in 1991 (47 vs. 38).

FIGURE S-1 Percentage of doctorates awarded to U.S. women in each broad field, 1976 and 1991.

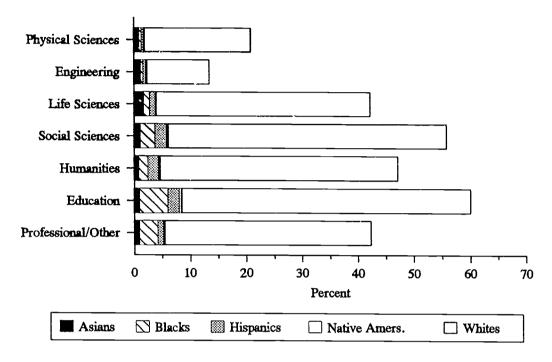

NOTE: Percentages are based on the number of doctorates awarded to U.S. citizens in each field. See Table S-2 for numbers of U.S. women in each field; see technical notes in Appendix C for rates of nonresponse to citizenship and race/ethnicity.

^{4 &}quot;Broad" field refers to the seven fields the NRC profiles in Summary Reports and most standard tables. Readers should note that these fields may differ from those reported by federal sponsors of the survey. "Major" fields are the subfields that constitute the broad fields (e.g., biological sciences as a part of life sciences or psychology as a part of social sciences). For a list of these subfields, see the inside back cover of this report and the specialties list in Appendix D.

FIGURE S-2 Percentage of doctorates awarded to U.S. women in each broad field, by race/ethnicity, 1991.

NOTE: Percentages are based on the number of doctorates awarded to U.S. citizens in each field. See Table S-2 for numbers of U.S. women in each field. Recipients with unknown race/ethnicity are excluded from the computations. See Table S-3 for numbers of U.S. women in each field by race/ethnicity; see technical notes in Appendix C for rates of nonresponse to citizenship and race/ethnicity.

Field Selection

Although there were far fewer U.S. women than men in physical and life sciences and engineering in 1991, female Ph.D.s were much more likely to specialize in these fields today than 15 years ago, particularly in life sciences (Table S-2 for women and Appendix Table B-3 for men). In 1976, just over 12 percent of all women earned a doctorate in life sciences, but by 1991 this had increased to 18 percent. In contrast to these gains in life sciences, the proportion of women earning degrees in the combined fields of physical sciences and engineering remained quite small—under 10 percent for women of all racial/ethnic groups except Asians. Asian women were twice as likely as the other groups to have earned Ph.D.s in physical sciences and engineering.

Ranking the top three fields of U.S. female Ph.D.s shows that many continued to earn their degrees in traditionally female fields. In 1991, education was the top choice, followed by social sciences, and then humanities for three-quarters of all black, Hispanic, and Native American women. Asian and white women deviated from this pattern slightly. Two-thirds of Asian women chose either life sciences, education, or social sciences as Ph.D. fields. Well over two-thirds of white women also chose these

fields although the ranking differed slightly with education first, social sciences second, and life sciences third.

The popularity of certain fields for U.S. female Ph.D.s has shifted considerably in the last 15 years (Table S-2). Since 1976, black, Hispanic, and Native American women have been much less likely to obtain education doctorates and much more likely to specialize in social sciences. In 1991, smaller proportions of white and Asian women pursued humanities than did in 1976. This decline was offset by increased Ph.D. production in all of the other fields listed in Table S-2, notably in engineering and physical sciences among white women and in engineering and professional/other fields among Asian women.

Examining the major field distribution of U.S. women doctorates reveals some interesting patterns (Table S-3 for women and Appendix Table B-4 for men). Biological sciences largely accounted for the unprecedented numbers of women earning Ph.D.s in life sciences. In 1991, over two-thirds of Ph.D.s awarded to women in life sciences were in biological sciences. Asian women were the most likely and black women the least likely to earn degrees in these fields. Black women's life sciences degrees were almost evenly divided between biological and health sciences. Of the health sciences doctorates awarded in 1991, nursing degrees were very common for all groups.

Much of the increase in female doctorates in social sciences since 1976 came from psychology. In 1991, over two-thirds of the 2,498 U.S. women earning Ph.D.s in social sciences specialized in psychology, particularly whites (1,568), blacks (75), and Hispanics (63). Further, a majority (63.0 percent) of all female psychology Ph.D.s specialized in clinical fields, especially blacks and whites.⁵

Degree-Granting Institutions

The next series of tables (S-4, S-5, and S-6) list the baccalaureate and doctorate institutions of U.S. female doctorate recipients by race/ethnicity and Carnegie Classification. The Carnegie Classification groups academic institutions into four broad categories based on the level of degree offered, the amount of federal monies awarded for research, and the comprehensiveness of mission: research universities; doctorate-granting universities; comprehensive universities and colleges; and liberal arts colleges.⁶

Briefly, research universities offer a broad range of undergraduate and graduate degree programs, place a premium on research, and annually receive between \$12.5 and \$33 million in federal research funds. Doctorate-granting institutions offer degrees from the baccalaureate to the Ph.D., but with a narrower scope and a weaker research

⁵ Throughout this section, statistics for Native American women are presented. However, because of their small numbers (55 Ph.D. recipients in 1991), these statistics may not provide robust or useful measures of Native American women's behavior, particularly for time series analyses.

⁶ From the Carnegie Classification of Institutions of Higher Education, The Carnegie Foundation for the Advancement of Teaching, 1987.

emphasis than research universities. Comprehensive universities and colleges generally have undergraduate and graduate programs through the master's degree. These institutions award over half of their undergraduate degrees in professional programs such as business or engineering. Finally, liberal arts colleges are primarily undergraduate, four-year colleges that award over half of their baccalaureates in the arts and sciences.⁷

Nearly 94 percent of all U.S. women earned their Ph.D.s at either research universities or doctorate-granting institutions (Table S-4 and Appendix Table B-5). However, the proportion of women earning their Ph.D.s at research universities has declined since 1976 for all but Hispanic and Native American women. Asian women were the most likely to have earned doctorates at research universities (78.8 percent), followed by white women (71.2 percent) and Hispanic women (69.7 percent). Whereas more than 60 percent of black and Native American women earned Ph.D.s at research universities, about 30 percent attended doctorate-granting institutions, which have a weaker research emphasis (as measured by federal research dollars awarded) than research universities. Only 14.3 percent of Asian women, 20.9 percent of Hispanic women, and 22.5 percent of white women earned Ph.D.s at doctorate-granting institutions.

Which institutions produce the most U.S. female Ph.D.s? Tables S-5 and S-6 list the leading baccalaureate and doctoral institutions of women who earned doctorates between 1987 and 1991. Asian and white women were the most likely to have earned their undergraduate and graduate degrees at research universities. Of the undergraduate institutions listed in Table S-5, all of those for white women and all but two of those for Asian women were research universities. In contrast, two-thirds of the leading undergraduate institutions of Native American women and one-half of those of Hispanic women were research universities. For U.S. black women earning doctorates between 1987 and 1991, nearly three-fourths of the leading baccalaureate institutions were comprehensive colleges and all but one of the institutions listed (Wayne State) were "Historically Black Colleges and Universities" (HBCUs).8

At the doctoral level, nearly all of the leading doctoral institutions of U.S. women were either research universities or doctorate-granting institutions (Table S-6). However, black, Hispanic, and Native American women had more doctorate-granting institutions on their lists than did white or Asian women. And lastly, two of the leading doctoral institutions of black female Ph.D.s were HBCU's (Clark Atlanta and Howard University).

⁸ By definition, HBCUs are the 106 institutions founded in the late 1800's and 1900s for the specific purpose of educating blacks. Baccalaureates are awarded by 90 of these schools.

⁷ The "other" category in the tables showing Carnegie Classifications are a diverse group of schools ranging from two-year colleges to professional schools such as law schools and business schools.

Time-to-Degree

As discussed in the front section of this report, the time graduate students take to complete their doctorates has risen steadily since 1961. For U.S. women, the last 15 years have been no different; since 1976, registered time-to-degree (RTD) has increased 1.4 median years and total time-to-degree (TTD) has increased 3.5 years (Table S-7).

Time-to-degree is significantly longer when measured by TTD than when gauged by RTD; this is largely due to the different behaviors they measure. RTD gauges how long women take to complete their doctorate once they are registered in graduate school (it also includes time spent working on a master's—related or not to the Ph.D.—or enrollment in a nondegree program). TTD, on the other hand, measures the time between completion of the baccalaureate and completion of the doctorate (this also includes all calendar time a student is not enrolled in a university between the baccalaureate and doctorate). The following discussion of time-to-degree will be restricted to RTD because of its exclusive focus on time spent enrolled in graduate school.

The amount of registered time required to complete the Ph.D. is clearly related to field of specialization (Table S-8). U.S. women in physical sciences took the shortest amount of time (6.1 median years) to complete their degrees, whereas those pursuing humanities doctorates required the longest amount of time (8.8 median years). Because they were most likely to specialize in fields with short RTDs (e.g., physical sciences), Asian women had the shortest overall RTD (7.1 median years). Conversely, black women had the longest RTD (8.0 median years) because of their concentration in humanities and education. However, the difference in RTD between these two groups of women was small—less than one year.

Disaggregating the data by race/ethnicity and field reveals some interesting variations. The difference among racial/ethnic groups in RTD in physical sciences and engineering is quite small, no more than half a year. Hispanic women had the shortest RTD in physical sciences and black women had the shortest RTD in engineering (6.0 median years in both fields). The difference among groups widened in life sciences, social sciences, humanities, education, and professional/other fields. These differences ranged from less than one year between Hispanic (7.3) and black (8.1) women in professional/other fields to a nearly three-year difference between Hispanic (8.1) and Native American (11.0) women in humanities.

Examining variations in RTD across fields and by racial/ethnic groups shows that Hispanic women completed their doctorates in the shortest amount of time in over half of the broad fields presented in Table S-8. They had the shortest RTD in physical sciences, life sciences, humanities, and professional/other fields. Asian women, on the other hand, had the shortest RTD in social sciences and education and black women had the shortest RTD in engineering.⁹

⁹ Statistics pertaining to black women with Ph.D.s in engineering must be interpreted cautiously because of their small numbers (8 in 1991).

Financial Support

Question 17 on the survey form (asking respondents to indicate their primary source of support during graduate study) allows us to assess what kinds of financial support were most common for U.S. female Ph.D.s in 1991.¹⁰ The type of primary financial support varies by field of specialization (Table S-9). University support was much more common in physical sciences, engineering, and life sciences, whereas personal resources were more typical in social sciences, humanities, education, and professional/other fields. Federal support was not the norm in any field listed in Table S-9 but was most commonly found in life sciences. However, the data reveal interesting differences among women within the same fields.

Personal Sources

More than half of all U.S. women who earned doctorates in 1991 relied on personal finances as the primary source of funding for their graduate studies. This is largely because of women's concentration in fields (such as education) where other types of financial support were less common. However, use of personal resources to finance graduate education varied by women's race/ethnicity. For example, although there were few black and Native American women Ph.D.s in physical sciences, they had the highest likelihood of using personal resources to finance their graduate studies in a field where university support was the norm. Another interesting racial/ethnic difference is found in the field of education. Although U.S. Asian women were the least likely overall of any racial/ethnic group to utilize personal sources, they had the highest percentage listing this type of support to finance their doctorate in education. In engineering, social sciences, and professional/other fields, white women were the most likely to rely on personal resources while pursuing the doctorate.

University Funding

Overall, 34.5 percent of U.S. female doctorate recipients reported university support as their primary source of support. Female Ph.D.s in physical and life sciences and engineering relied on university support as the primary financial resource, although this was less true in life sciences than in the other two fields. U.S. Asian women were the most likely (41.6 percent) to list this type of support as a primary source (due to their relatively high concentrations in the above-mentioned fields), followed by whites (34.9 percent) and Hispanics (32.3 percent). Native American and black women were the least likely to list this as their primary source of support (24.4 percent and 23.3 percent, respectively).

As with personal resources, not all U.S. women were as likely to receive university support in fields where this type of support is common. For example, of the small numbers of Hispanic women who earned engineering doctorates in 1991, only 30 percent reported university support as their primary financial resource compared with 75

¹⁰ The following discussion is limited to those U.S. women who provided this information (see technical note 11 for response rates to this question).

percent of Asian women. Thus, even when women specialized in fields where university support is common, receipt of this type of financial support was not uniform across the various racial/ethnic groups.

"Experience indicates that successful programs [for women] at the graduate level...are characterized by substantial faculty or mentor commitment." Since university support is one mechanism institutions can utilize to attract women to and retain them in doctoral programs, it is interesting to examine the different types of university support. University funds allocated in the form of research and teaching assistantships can, in theory, provide students a close working relationship with faculty members. On the other hand, graduate students who rely on fellowships may complete their studies without ever having had substantial contact or interaction with faculty.

Table S-10 lists the types of university support U.S. female Ph.D.s received in 1991. Overall, teaching assistantships were most common (42.7 percent), followed closely by research assistantships (39.3 percent). Fellowships, work-study, and other institutional sources were much less common (12.0 percent, 0.5 percent, and 5.5 percent, respectively). As with the broader categories of support, the type of university support varied by field and race/ethnicity. Research assistantships were more common in physical and life sciences and engineering; teaching assistantships were more typical in social sciences, humanities, education, and professional/other fields. Fellowships were not the main source of university support in any field but were more common in social sciences, humanities, and professional/other fields than in the other broad fields.

In 1991, U.S. Asian women were more likely than those in other groups to have reported university support as the primary source of support; research assistantships were the main type of university support for Asians. This is hardly surprising given their specialization in the fields where research assistantships are most common (e.g., physical and life sciences and engineering).

For U.S. black women, fellowships were the most common type of university support. These Ph.D.s were more likely than any other group to have received fellowships in all but two fields (life sciences and social sciences, where they came in second behind Hispanic women). And, in two fields where research assistantships are the norm—physical sciences and engineering—black women were significantly more likely than any other group of women to have received fellowships.

Overall, teaching assistantships were the most common form of university support for U.S. Hispanic and Native American female Ph.D.s because of their concentrations in humanities where teaching assistantships were most common. However, in fields where research assistantships are common (namely, engineering and life sciences), these groups of women tended to have research rather than teaching assistantships. For the majority of white female Ph.D. recipients, university support consisted of teaching

¹¹ Dix, L.S., and M. L. Matyas, eds., 1992. Science and Engineering Programs: On Target for Women? Washington, D.C.: National Academy Press.

¹² University support consists primarily of teaching assistantships, research assistantships (including federal research assistantships), and fellowships.

assistantships (43.3 percent), followed closely by research assistantships (39.9 percent). The type of assistantship for white women was clearly related to field. For these Ph.D.s, research assistantships were most common in physical and life sciences and engineering, whereas teaching assistantships were more typical in social sciences, humanities, education, and professional/other fields.

Federal Support

Only 6.3 percent of U.S. women listed federal resources as the primary source of support for graduate studies.¹³ Federal support was more common as a primary source of support for U.S. women in life sciences and engineering than in the other broad fields. As a result, in 1991, U.S. Asian women were more likely than any other group to have listed federal support as the primary financial resource while pursuing the doctorate. However, there were some variations by race/ethnicity within broad fields. For example, although black women were the least likely to have earned Ph.D.s in physical sciences, they were the most likely to have received federal support in this field. They were also the most likely to have had federal support in social sciences and professional/other fields.

The data indicate that the types of financial support U.S. women received in 1991 varied not only by their field of specialization but by their race/ethnicity as well. Many women relied on personal funds to finance their graduate studies and, as a result, may not have had the routine faculty contact and interaction characterized by research and teaching assistants. Of the one-third of female Ph.D.s who reported university sources as the primary financial support for graduate studies, teaching assistantships were the most common form. Although teaching assistantships give students contact with faculty, they do not provide the research skills helpful in completing a dissertation. Research assistantships were the next most typical form of university support but were prevalent only in those fields where most women do not earn degrees (physical and life sciences and engineering). Finally, only for black women were fellowships the predominant source of university support. Although fellowships may give women the luxury of not having to work while studying, this type of support may preclude them from establishing the important mentor relationships with faculty found in teaching and research assistantships.

Debt

Over half of all U.S. women with doctorates in 1991 graduated with debt related to some part of their postsecondary education (Table S-11). Indebtedness was more prevalent among blacks, Hispanics, and Native Americans, over 60 percent of whom completed their Ph.D.s with debt in 1991. Asian and white women were slightly less likely to have incurred debt during postsecondary studies, 52.1 percent and 53.1 percent, respectively. Although one-quarter of all women had debts of \$10,000 or more, this proportion was higher for Hispanics (35.0 percent), blacks (31.6 percent), and Native

¹³ Federal support includes fellowships, traineeships, the GI bill, and "other" unspecified resources from federal agencies.

Americans (27.3 percent). This may be related to the fact that for some of these women, notably blacks and Native Americans, personal resources (including loans) were the primary means by which they financed their graduate studies.

Disaggregating these data by field reveals some interesting patterns. For example, in education, which has the lowest debt rate of all the broad fields, significantly higher proportions of Native Americans (66.7 percent), Hispanics (58.5 percent), and blacks (50.6 percent) reported debt than did Asians (37 percent) or whites (36.3 percent). In addition, black women were more likely than other women to complete their studies with debt in all but three fields—engineering (where white women were the most likely) and life sciences and education (where Native Americans were the most likely).

Postgraduation Plans

What were the employment plans of U.S. women who earned doctorates in 1991? It is only possible to provide a snapshot in time of their potential postdoctoral employment or study plans because this question is asked when students file their dissertations. Thus, some do not yet know their postdoctoral status. However, of those U.S. female Ph.D.s who reported postgraduation plans in 1991, nearly three-quarters indicated definite commitments for either employment or study (Table S-12). Women with humanities doctorates were less likely than those in other fields to have definite postgraduation commitments. Among the various racial/ethnic groups, Native American women were the least apt to have definite postgraduation commitments in 1991 (68.5 percent compared with 73.5 percent for all women).

Most women who had definite postgraduation commitments planned to work (79.8 percent). Although trend data on U.S. female Ph.D.s with definite postgraduation commitments show a decline in employment commitments, more than three-quarters of women in every racial/ethnic group except Asians had definite employment commitments in 1991 (Table S-13). Asian women were less likely than other women to have postgraduation employment plans because of their high concentrations in life sciences, a field where postdoctoral study is common (Table S-14).

Of the U.S. female Ph.D.s in humanities, education, and professional/other fields, whites were the most likely to be employed, while in physical and life sciences, blacks had the highest proportion with definite employment plans. Women with life sciences degrees, as mentioned, were more likely to pursue postdoctoral study than employment. This held true for women in every racial/ethnic group except blacks, who were much more likely than other life sciences Ph.D.s to have postgraduation work commitments.

¹⁴ Although Native American women were the most likely to be employed in professional/other fields, due to their small numbers in this field (N=3), this percentage distribution may not be very meaningful.

Employment Sector

Academe and "other" sectors were the top two choices for women Ph.D.s with definite postgraduation employment commitments, with some variation by field and race/ethnicity (Table S-15).¹⁵

Over half of all U.S. women reported employment commitments in academe in 1991, although this is down since 1976, when more than two-thirds planned to work in this sector. It is important to note that although the proportion of women planning to work in academe has decreased, their absolute numbers in this sector increased between 1976 and 1991. And while academe was the main work sector for most female Ph.D.s in 1991 (except for physical scientists and engineers), industry/self-employment and "other" sectors showed the largest increase during the last 15 years.

Disaggregating the data by field and race/ethnicity reveals that in 1991, U.S. women with humanities or professional/other degrees were the most likely to have plans to work in academe, followed next by those with life sciences Ph.D.s (Table S-16). In 1991, over 90 percent of women with humanities Ph.D.s, in every racial/ethnic group but whites, planned to work in this sector. In professional/other fields, the proportion of women with academic employment plans ranged from a low of 66.7 percent for Native Americans to a high of 90 percent for Asians. Finally, among women with life sciences doctorates, Asians were notably less likely and blacks were significantly more likely than other women to have employment commitments in academe.

The numbers of U.S. women with Ph.D.s reporting definite employment commitments in "other" sectors, such as elementary and secondary schools or nonprofit organizations, has risen since 1976 (Table S-15). This increase was largely driven by the influx of white women into this sector during the early 1980s. For example, the proportion of U.S. black women with employment commitments in "other" sectors actually declined from 30.6 percent in 1981 to 27.9 percent in 1991. Similarly, the proportion of Hispanic women who planned to work in "other" sectors peaked at 20.3 percent in 1986 and declined to 17.9 percent in 1991. ¹⁶

Female doctorate recipients in social sciences and education were much more likely than those in any other field to have work commitments in "other" sectors in 1991 (Table S-16). Compared with other racial/ethnic groups, black female Ph.D.s in education had the highest proportion with work commitments in "other" sectors (recall that black women were more likely than other women to specialize in education).

In 1991, U.S. female Ph.D.s, particularly Hispanic women, were less likely than their predecessors in 1981 to have had government employment commitments (Table S-15). In fact, for all women, employment commitments in this sector were highest in 1981 and 1986, ranging from 14.2 percent for Hispanics in 1981 to 15.9 percent for this same group in 1986. In 1991, Asian women were the most likely to have government employment commitments (10.9 percent), followed by whites (8.1 percent), blacks (7.2

¹⁶ Because of the small numbers of Native American women represented in Table S-16 (ranging from 4 in 1976 to 29 in 1991), the validity of their percentage distributions is limited.

^{15 &}quot;Other" includes elementary and secondary schools and nonprofit organizations.

percent), and Hispanics (5.4 percent). Among U.S. women Ph.D.s in 1991, those with degrees in engineering (17.8 percent) were the most likely, whereas those in humanities were the least likely (1.6 percent), to plan work in government (Table S-16).

The proportion of U.S. female Ph.D.s with commitments to work in industry/self-employment nearly tripled during the last 15 years (Table S-15). In 1991, Asian women were significantly more likely than other women to have work commitments in industry because of their concentration in physical sciences and engineering, fields with high levels of industrial/self-employment commitments (Table S-16).

Summary

The data from the 1991 Survey of Earned Doctorates show that, as a whole, women have made impressive gains in doctoral education since 1976. Yet, women are not a monolithic group and there are notable differences by race/ethnicity regarding field of specialization, median time-to-degree, financial support, and postgraduation plans. In spite of these differences, however, the 1991 cohort of U.S. female Ph.D.s can be characterized as follows:

- In 1991, 10,836 women obtained Ph.D.s, constituting 43.8 percent of U.S. doctorate recipients. Although unprecedented numbers of U.S. women earned doctorates, minority women accounted for a small proportion (5.1 percent) of all Ph.D.s awarded to U.S. citizens.
- In 1991, U.S. women outnumbered men in two of the seven broad fields—education and social sciences—but have made minimal progress into traditionally male-dominated fields such as physical sciences and engineering fields.
- In 1991, the top three fields for all U.S. female Ph.D.s were education, social sciences, and life sciences. However, humanities replaced life sciences for blacks, Hispanics, and Native Americans.
- The time it takes U.S. women to complete the Ph.D. (as measured by RTD) varied by field in 1991. Doctorate recipients in physical and life sciences and engineering took the shortest amount of time, whereas those in humanities and education took the longest.
- In 1991, most women listed personal resources as their primary sources of support, although this varied substantially by field and race/ethnicity. University support was most common in physical and life sciences and engineering fields, and was most prevalent among Asian female Ph.D.s, because of their specializations in those fields.

- In 1991, more than half of all U.S. female doctorate recipients reported that they had incurred debt related to their postsecondary studies. Black, Hispanic, and Native American women had the highest rate of indebtedness.
- Nearly three-quarters of all U.S. women had definite postgraduation commitments in 1991. Of these women, four out of five had definite employment commitments. Ph.D.s in education and professional/other fields were the most likely to have work plans (approximately 97 percent), whereas those in life sciences were the most likely to have postdoctoral study plans (about 56 percent).
- The employment sector of U.S. female Ph.D.s varied by their field of specialization. Women with doctorates in humanities, professional/other fields, and life sciences were more likely than those in other fields to have academic work plans, whereas women in physical sciences and engineering were most likely to have definite employment commitments in industry or for self-employment.

TABLE S-1 U.S. Female Ph.D.s, by Race/Ethnicity for Selected Years, 1976-1991

Unknown Race/Ethnicity	3.0	0.0	0.0	5.3	0.0	0.0	0.0	16.7

NOTE: Numbers represent those Ph.D.s whose primary support is known. Percentages are based on these numbers. Percentages may not be meaningful in fields where the number of Ph.D.s is very small; this is particularly true for Native Americans. "Personal" includes loans as well as own earnings and contributions from the spouse/family. Federally funded research assistantships (RAs) are grouped under "University" because recipients of such support may not be aware of the actual source of funding. It is believed that many of these Ph.D.s are reporting their support as university RA instead of federal RA. "Other" support includes U.S. nationally competitive fellowships, business/employer funds, foreign government, state government, and other nonspecified sources. See technical notes in Appendix C for rates of nonresponse to this question.

^{*}Includes mathematics and computer sciences.

1991	20.2	34.9	11.5	18.7	18.9	20.3	20.3

NOTE: Only Ph.D.s with definite commitments are included. Numbers include recipients who reported definite commitments but not type of plans (employment or study). Percentages are based only on the number of Ph.D.s whose specific plans are known. See technical notes in Appendix C for rates of nonresponse to the applicable questions and for further explanation of postgraduation plans.

NOTE: Only Ph.D.s with definite commitments are included. Numbers include recipients who reported definite commitments but not type of plans (employment or study). Percentages are based only on the number of Ph.D.s whose specific plans are known and may not be meaningful in fields where the number of Ph.D.s is very small; this is particularly true for Native Americans. See technical notes in Appendix C for rates of nonresponse to the applicable questions and for further explanation of postgraduation plans.

^{*}Includes mathematics and computer sciences.

APPENDIX A: The Seven Basic Tables, 1991

Appendix A includes the following seven tables:

- A-1 Number of Doctorate Recipients, by Gender and Subfield, 1991
- A-2 Number of Doctorate Recipients, by Citizenship, Race/Ethnicity, and Subfield, 1991
- A-3 Statistical Profile of Doctorate Recipients, by Major Field, 1991
- A-4 Statistical Profile of Doctorate Recipients, by Race/Ethnicity and Citizenship,
- A-5 Sources of Graduate School Support for Doctorate Recipients, by Broad Field and Gender, 1991
- A-6 State of Doctoral Institution of Doctorate Recipients, by Broad Field and Gender,
- A-7 Institutions Granting Doctorates, by Major Field, 1991

*** IMPORTANT NOTICE ***

Because of recent increases in the survey response rate, data on citizenship and race/ethnicity for 1990 and 1991 are not comparable to data for earlier years. During the 1980s, response to the Survey of Earned Doctorates fell from 96.2 percent to 91.4 percent. (Note: These rates represent the proportion of questionnaires completed by doctorate recipients; forms completed by either the doctoral institution or NRC staff are not included in the overall response rate because they contain minimal information.) The downward trend was reversed in 1990 when response rose nearly two percentage points above the 1989 rate. It increased yet another point in 1991, reaching 94.3 percent.

Item response rates showed a parallel improvement—a natural consequence of the increase in the overall survey response but also partially because of questionnaire revisions and follow-ups for missing pieces of information. New follow-up procedures instituted in 1990 had an especially strong impact on citizenship and racial/ethnic data for that year. However, since responses to the follow-ups were not received until after closure of the 1990 survey, they were not included in the data presented in Summary Report 1990. The updated 1990 numbers reflecting follow-up responses are shown in Appendix Table B-2 (page 98) in this year's report. The most significant adjustment was to the numbers of black Ph.D.s—an increase of 8.3 percent among those who were U.S. citizens and 4.7 percent among temporary residents. The data for 1991 will likewise be subject to some revision over the next year, and any adjustments will be presented in next year's report. Readers should keep in mind that fluctuations in response rates affect numerical trends and that 1990 and 1991 data on citizenship and race/ethnicity, in particular, are not comparable to earlier data.

TABLE A-1 and TABLE A-2: These tables display data for the most recent year by subfield of doctorate. The subfields correspond to the fields on the questionnaire's Specialties List located at the back of this report. Field groupings may differ from those in reports published by federal sponsors of the Survey of Earned Doctorates (SED). See inside the back cover for a description of field groupings as reported in these tables. The "general" field categories—e.g., "chemistry, general"—include individuals who either received the doctorate in the general subject area or did not indicate a particular specialty field. The "other" field categories—e.g., "chemistry, other"—include individuals whose specified doctoral discipline was not among the specialty fields.

Table A-1 presents data by doctoral specialty and gender. Table A-2 displays doctoral specialty by citizenship and race/ethnicity. See the explanatory note on Table A-4 for a detailed description of the racial/ethnic variable. See the shaded box on page 63 for important information on recent increases in response rates and their impact on time-series data.

TABLE A-3: Table A-3 is composed of three two-page tables. The first table includes data on *all* doctorate recipients from the most recent year; the other two tables present the same data by gender. Field groupings may differ from those in reports published by federal sponsors of the SED. See inside the back cover for a description of field groupings as reported in these tables; see the questionnaire's Specialties List at the back of the report for the names and codes of the subfields included. Terms requiring definition are as follows:

- Median Age at Doctorate: One-half received the doctorate at or before this age. A recipient's age is derived by subtracting the year of birth from the calendar year of doctorate. Months are not included in the computation.
- Percentage with Master's: The percentage of doctorate recipients in a field who received a master's degree in any field before earning the doctorate.
- Median Time Lapse: "Total Time" refers to total calendar time elapsed between the year of baccalaureate and the year of doctorate; "Registered Time" refers to the total time registered in a university between baccalaureate and doctorate. Enrollment includes years of attendance not related to a recipient's doctoral program. Months are excluded from the computations because they are often not reported by the recipient.

Each year's doctorate recipients provide information on postgraduation employment or study plans in response to items 20 and 21 on the survey form. Since the questionnaire is filled out around the time the doctorate is awarded, a recipient's plans are subject to change. However, comparisons with the longitudinal Survey of Doctorate Recipients have shown these data to be reasonable predictors of actual employment status in the year following the doctorate (see the discussion of postgraduation plans on page 112 of Appendix C). The postgraduation plans of doctorate

recipients are grouped as follows: "Postdoctoral Study Plans" (fellowship, research associateship, traineeship, other), "Planned Employment" (educational institution, industry, etc.), or "Postdoctoral Plans Unknown." These categories include recipients who were still negotiating or seeking positions at the time of survey completion, as well as those whose plans were definite. The sum of these lines equals 100 percent for each column, with allowance for rounding: for example, 51.4 percent of all chemists had postdoctoral study plans, 41.0 percent planned to be employed, and 7.6 percent did not report their postgraduation plans, totalling 100.0 percent. The study and employment rows are further subdivided. The data on study plans show that 24.0 percent of all chemists planned to pursue postdoctoral fellowships; 26.2 percent, research associateships; 0.5 percent, traineeships; and 0.7 percent, some other form of postdoctoral study. These percentages sum to 51.4 percent, which is the proportion of chemists who reported plans for postdoctoral study. The employment row is similarly subdivided; the percentages, listed by type of employer, show that a total of 41.0 percent planned employment. The category for educational institutions includes elementary and secondary schools as well as colleges and universities, and the category for government includes military service.

The four lines of data beginning with "Definite Postdoctoral Study" distinguish between individuals who had definite postgraduation plans at the time of survey completion (item 20: "Am returning to, or continuing in, predoctoral employment" or "Have signed contract or made definite commitment") and those who were still seeking employment or postdoctoral study (item 20: "Am negotiating with one or more specific organizations," "Am seeking position but have no specific prospects," or "Other"). These four lines, when added to the prior line, "Postdoctoral Plans Unknown," total 100 percent with allowance for rounding. The two lines, "Definite Postdoctoral Study" and "Seeking Postdoctoral Study," add to give the percentage for "Postdoctoral Study Plans"; the two lines, "Definite Employment" and "Seeking Employment," add to give the percentage for "Planned Employment After Doctorate."

Percentages showing the distribution of doctorate recipients by postdoctoral work activity and region of employment are based only on the number of recipients who had definite employment commitments at the time they completed the questionnaire. These percentages exclude recipients who planned postdoctoral study (as described above) and recipients who were still seeking employment at the time they completed the questionnaire. (Note that the rows on postdoctoral study and employment plans discussed in the preceding paragraph include individuals whose plans were not definite). Unfortunately, questionnaire revisions beginning in 1990 appear to have resulted in higher rates of nonresponse to the item on work activity than in previous years. The nonresponse rate in 1991 was 13.9 percent, compared with only 6.2 percent in 1989. Nonresponse was especially high among recipients planning to work in educational institutions, thereby affecting the percentages in teaching and administration.

TABLE A-4: Table A-4 contains data by race/ethnicity (first included in *Summary Report 1973*) and by citizenship for selected variables from Tables A-3 and A-5. Field groupings may differ from those in reports published by federal sponsors of the SED.

See inside the back cover for a description of field groupings as reported in these tables; refer to the questionnaire's Specialties List at the back of the report for the names and codes of the subfields included. See the shaded box on page 63 for important information on recent increases in response rates and their impact on time-series data.

The racial/ethnic question has undergone several revisions over the years. In 1977, it was modified to correspond to a standard question format recommended by the Federal Interagency Committee on Education and adopted by the Office of Management and Budget (OMB) for use in federally sponsored surveys; an explanation of the effect of these changes is detailed on page 13 of Summary Report 1977. (Note: Changes in the OMB guidelines prompted the moving of persons having origins in the Indian subcontinent from the white category to the Asian category.) In 1980, the item was further revised in two ways: (1) the Hispanic category was subdivided into Puerto Rican, Mexican American, and "other" Hispanic to provide more detail for users of the racial/ethnic data, and (2) respondents were asked to check only one racial category. (Before 1980, doctorate recipients could check more than one category to indicate their race. However, when the data were compiled, all persons who checked American Indian, Asian, or Hispanic and also checked white were included in the minority group category. Those who checked black and any other category were designated as black.) The item was modified again in 1982 to separate the questions on race and ethnicity. Since then, respondents have been asked to first check one of the four racial group categories (American Indian, Asian, black, or white) and to then indicate whether or not they are Hispanic. In this table, Ph.D.s who reported Hispanic heritage, regardless of their racial designation, are included in one of three Hispanic groups: Puerto Rican, Mexican American, or Other Hispanic. The remaining survey respondents are then counted in the respective racial groups. (Note: Doctorate recipients who checked the category "American Indian or Alaskan Native" are identified as Native American in this report.)

In the section on "Graduate School Support," a recipient counts in more than one category if support was received from multiple sources. Because a student counts once for each source of support, the vertical percentages sum to more than 100 percent. See the explanatory note on Appendix Table A-5 for further detail. (Data on the *primary* source of support for doctorate recipients are presented in the body of the report.)

The other sections of Table A-4 correspond to many of those in Appendix Table A-3. The reader is referred to the explanatory note on Table A-3 for additional information.

TABLE A-5: Table A-5 displays data reported in item 17 on sources of financial support received during graduate school, by broad field and gender. Field groupings may differ from those in reports published by federal sponsors of the SED. See inside the back cover for a description of field groupings as reported in this table; see the questionnaire's Specialties List at the back of the report for the names and codes of the subfields included.

In this table, a recipient counts in more than one category if support was received from multiple sources. Because a student counts once for each source of support, the

vertical percentages sum to more than 100 percent. (Data on the *primary* source of support for doctorate recipients are presented in the body of the report.)

As in last year's report, federal research assistantships (RAs) are aggregated with university RAs and shown under "university." Consequently, percentages for university support appear higher and federal support lower than in reports before 1990, making it inadvisable to compare results from the 1990 and 1991 surveys with those from earlier years. The inconsistency of trend data on federal RAs may be caused by a lack of awareness on the part of many Ph.D.s as to the true source of their RA funding, which then results in the missreporting of this type of support as university rather than federal.

The data should be interpreted as follows: 156 male doctorate recipients in the physical sciences in 1991 reported financial support from federal fellowships or traineeships during graduate school. This number is 3.2 percent of the male physical sciences doctorates who answered the question and 13.6 percent of the males in all fields who reported federal fellowship or traineeship support.

TABLE A-6: This table shows, by broad field and gender, the number of persons receiving a doctorate in the most recent year from institutions in each of the 50 states, the District of Columbia, and Puerto Rico. Field groupings may differ from those in reports published by federal sponsors of the SED. See inside the back cover for a description of field groupings as reported in this table; see the questionnaire's Specialties List at the back of the report for the names and codes of the subfields included.

TABLE A-7: This table displays data by doctorate-granting institution and major field. It includes all institutions in the United States (the 50 states, the District of Columbia, and Puerto Rico) that awarded doctoral degrees in the most recent year. Field groupings may differ from those in reports published by federal sponsors of the SED and from departmental designations at institutions. See inside the back cover for a description of field groupings as reported in this table; see the questionnaire's Specialties List at the back of the report for the names and codes of the subfields included.

NOTE: Field groupings may differ from those in reports published by federal sponsors of the Survey of Earned Doctorates. See inside the back cover for a description of fields as reported in this table. Physical Sciences includes Mathematics and Computer Sciences, as well as Physics/Astronomy, Chemistry, and Earth/Atmospheric/Marine Sciences. Refer also to the explanatory note about this table in front of Appendix A.
*Includes 2-year, 4-year, and foreign colleges and universities, medical schools, and elementary/secondary schools. Includes only recipients with definite employment plans. Revisions to the survey form in 1990 appear to have resulted in a higher rate of nonresponse to the item on work activity than in previous years. The nonresponse rate in 1991 was 13.9% compared to 6.2% in 1989 and was especially high among recipients planning to work in educational institutions, thereby affecting the percentages in teaching and administration.
‡Includes only recipients with definite employment plans.

NOTE: Field groupings may differ from those in reports published by federal sponsors of the Survey of Earned Doctorates. See inside the back cover for a description of fields as reported in this table. Physical Sciences includes Mathematics and Computer Sciences, as well as Physica/Astronomy, Chemistry, and Earth/Atmospheric/Marine Sciences. Refer also to the explanatory note about this table in front of Appendix A.

*Includes 2-year, 4-year, and foreign colleges and universities, medical schools, and elementary/secondary schools.
†Includes only recipients with definite employment plans. Revisions to the survey form in 1990 appear to have resulted in a higher rate of nonresponse to the item on work activity than in previous years. Among men, the nonresponse rate in 1991 was 14.6% compared to 6.8% in 1989 and was especially high among recipients planning to work in educational institutions, thereby affecting the percentages in teaching and administration.

‡Includes only recipients with definite employment plans.

NOTE: Field groupings may differ from those in reports published by federal sponsors of the Survey of Earned Doctorates. See inside the back cover for a description of fields as reported in this table. Physical Sciences includes Mathematics and Computer Sciences, as well as Physica/Astronomy, Chemistry, and Earth/Atmospheric/Marine Sciences. Refer also to the explanatory note about this table in front of Appendix A.

*Includes 2-year, 4-year, and foreign colleges and universities, medical schools, and elementary/secondary schools.

*Includes only recipients with definite employment plans. Revisions to the survey form in 1990 appear to have resulted in a higher rate of nonresponse to the item on work activity than in previous years. Among women, the nonresponse rate in 1991 was 13.0% compared to 5.3% in 1989 and was especially high among recipients planning to work in educational institutions, thereby affecting the percentages in teaching and administration.

‡Includes only recipients with definite employment plans. 91

NOTE: Field groupings may differ from those in reports published by federal sponsors of the Survey of Earned Doctorates. See inside the back cover for a description of fields as reported in this table. Refer also to the explanatory note about this table in front of Appendix A for a discussion of past changes in the survey question on race/ethnicity.

^{*}Includes individuals who did not report their citizenship at time of doctorate.
†In this table, a recipient counts once in each source category from which he or she received support. Since students indicate multiple sources of support, the vertical percentages sum to more than 100 percent. (Data on the "primary" source of support for doctorate recipients are presented in the body of the report.)
‡Because federal support obtained through the university cannot always be determined, no distinction is made between federal and university research assistants in this table. Both types of support are grouped under "University Research Assistant." Federal loans are counted in the categories for loans.
§Includes 2-year, 4-year, and foreign colleges and universities, medical schools, and elementary/secondary schools.

NOTE: In this table, a recipient counts once in each source category from which he or she received support. Since students indicate multiple sources of support, the vertical percentages sum to more than 100 percent. (Data on the "primary" source of support for doctorate recipients are presented in the body of the report.) Field groupings may differ from those in reports published by federal sponsors of the Survey of Earned Doctorates. See inside the back cover for a description of fields as reported in this table. Refer also to the explanatory note about this table in front of Appendix A.

^{*}V denotes vertical percentage; H denotes horizontal percentage.
†Because federal support obtained through the university cannot always be determined, no distinction is made between federal and university research assistants in this table. Both types of support are grouped under "University Research Assistant." Federal loans are displayed separately in the categories for loans.
‡The 2,346 Ph.D.s who did not report sources of support are omitted from this total. Percentages are based only on known responses.

APPENDIX B: Trend Tables, 1981-1991

Appendix B includes the following five tables:

- B-1 Number of Doctorate Recipients, by Subfield, 1981-1991
- B-2 Number of Doctorate Recipients, by Gender, Race/Ethnicity, and Citizenship, 1976 and 1981-1991
- B-3 Broad Field Selection of U.S. Male Ph.D.s, by Race/Ethnicity for Selected Years, 1976-1991
- B-4 Major Field Selection of U.S. Male Ph.D.s, by Race/Ethnicity, 1991 (in percent)
- B-5 Doctorate-Granting Institutions of U.S. Male Ph.D.s, by Race/Ethnicity of Recipient and Carnegie Classification of Institution for Selected Years, 1976-1991 (in percent)

*** IMPORTANT NOTICE ***

Because of recent increases in the survey response rate, data on citizenship and race/ethnicity for 1990 and 1991 are not comparable to data for earlier years. During the 1980s, response to the Survey of Earned Doctorates fell from 96.2 percent to 91.4 percent. (Note: These rates represent the proportion of questionnaires completed by doctorate recipients; forms completed by either the doctoral institution or NRC staff are not included in the overall response rate because they contain minimal information.) The downward trend was reversed in 1990 when response rose nearly two percentage points above the 1989 rate. It increased yet another point in 1991, reaching 94.3 percent.

Item response rates showed a parallel improvement—a natural consequence of the increase in the overall survey response but also partially because of questionnaire revisions and follow-ups for missing pieces of information. New follow-up procedures instituted in 1990 had an especially strong impact on citizenship and racial/ethnic data for that year. However, since responses to the follow-ups were not received until after closure of the 1990 survey, they were not included in the data presented in Summary Report 1990. The updated 1990 numbers reflecting follow-up responses are shown in Appendix Table B-2 (page 98) in this year's report. The most significant adjustment was to the numbers of black Ph.D.s—an increase of 8.3 percent among those who were U.S. citizens and 4.7 percent among temporary residents. The data for 1991 will likewise be subject to some revision over the next year, and any adjustments will be presented in next year's report. Readers should keep in mind that fluctuations in response rates affect numerical trends and that 1990 and 1991 data on citizenship and race/ethnicity, in particular, are not comparable to earlier data.

92 Appendix B

TABLE B-1: Table B-1 presents data for the most recent decade by subfield of doctorate. In general, the subfields correspond to the fields on the questionnaire's Specialties List located at the back of this report; some, however, do not appear on the current Specialties List because they are no longer included in the survey taxonomy. Field groupings may differ from those in reports published by federal sponsors of the Survey of Earned Doctorates (SED); see inside the back cover for a description of field groupings as reported in these tables. The "general" field categories—e.g., "chemistry, general"—include individuals who either received the doctorate in the general subject area or did not indicate a particular specialty field. The "other" field categories—e.g., "chemistry, other"—include individuals whose specified doctoral discipline was not among the specialty fields.

The seven tables in Appendix A present additional information on the most recent cohort of Ph.D.s by field of doctorate.

TABLE B-2: Table B-2 displays data on the race/ethnicity of doctorate recipients for 1976 and the last decade by gender and citizenship. (1976 is included because it serves as the earliest year of comparison for racial/ethnic data presented in the body of the report.) Table B-2 contains three panels, each displayed on a separate page. The first panel includes all doctorates; the others disaggregate the data by gender.

Because of late questionnaire returns and responses to follow-ups for missing information, data are subject to revision in the year after survey closure. The reader should note that numbers in Table B-2 have been revised since publication of Summary Report 1990. New follow-up procedures instituted in 1990 resulted in significant adjustment to the racial/ethnic data for that year. The greatest change was in the number of black Ph.D.s—an increase of 8.3 percent among those who were U.S. citizens and 4.7 percent among temporary residents. Table B-2 in this year's report displays the updated numbers for 1990. See the shaded box on page 91 for additional information on recent increases in response rates and their impact on time-series data.

The racial/ethnic question has undergone several revisions over the years. In 1977, it was modified to correspond to a standard question format recommended by the Federal Interagency Committee on Education and adopted by the Office of Management and Budget (OMB) for use in federally sponsored surveys; an explanation of the effect of these changes is detailed on page 13 of Summary Report 1977. (Note: Changes in the OMB guidelines prompted the moving of persons having origins in the Indian subcontinent from the white category to the Asian category.) In 1980, the item was further revised in two ways: (1) the Hispanic category was subdivided into Puerto Rican, Mexican American, and "other" Hispanic to provide more detail for users of the racial/ethnic data, and (2) respondents were asked to check only one racial category. (Before 1980, doctorate recipients could check more than one category to indicate their race. However, when the data were compiled, all persons who checked American Indian, Asian, or Hispanic and also checked white were included in the minority group category. Those who checked black and any other category were designated as black.) The item was modified again in 1982 to separate the questions on race and ethnicity. Since then, respondents have been asked to first check one of the four racial group categories (American Indian, Asian, black, or white) and to then indicate whether or not

Appendix B 93

they are Hispanic. In this table, Ph.D.s who reported Hispanic heritage, regardless of their racial designation, are included in one of three Hispanic groups: Puerto Rican, Mexican American, or Other Hispanic. The remaining survey respondents are then counted in the respective racial groups. (Note: Doctorate recipients who checked the category "American Indian or Alaskan Native" are identified as Native American in this report.)

Tables A-2 and A-4 in Appendix A present additional information on the most recent cohort of Ph.D.s by race/ethnicity.

TABLE B-3: Table B-3 shows the broad field selection of U.S. male Ph.D.s, by race/ethnicity of recipient, for the years 1976, 1981, 1986, 1991. (Table S-2 on page 44 provides comparable data on U.S. women.) Data are also included for those recipients whose race/ethnicity is unknown. This group constituted 4.3 percent of all U.S. male Ph.D.s in 1976, 4.6 percent in 1981, 2.2 percent in 1986, and 1.7 percent in 1991. Refer to the explanatory note on Table B-2 for a detailed description of the racial/ethnic variable; see the shaded box on page 91 for important information on recent increases in response rates and their impact on time-series data.

TABLE B-4: Table B-4 further disaggregates the field data presented in Table B-3; only U.S. men who earned doctorates in 1991 are included. (Table S-3 on page 45 displays comparable data on U.S. women.) Because the special section of this report focuses on female Ph.D.s, the subfields displayed in Table B-4 are those in which women tend to concentrate. The same fields are included in both Table B-4 and Table S-3 for comparative purposes. Thus, many of the fields in which men are likely to specialize are not shown (e.g., subfields within physical sciences and engineering).

Percentages in this table are based on the total number of U.S. male Ph.D.s in each racial/ethnic group. Data are also included for those recipients whose race/ethnicity is unknown (1.7 percent of all U.S. male Ph.D.s in 1991). Refer to the explanatory note on Table B-2 for a detailed description of the racial/ethnic variable; see the shaded box on page 91 for important information on recent increases in response rates and their impact on time-series data.

TABLE B-5: Table B-5 displays data on the doctorate-granting institutions of U.S. men by race/ethnicity of recipient, for the years 1976, 1981, 1986, and 1991. (Table S-4 on page 46 presents comparable data on U.S. women.) The institutions are grouped by Carnegie Classifications (see explanation beginning on page 33 of the special section). Percentages are based on the number of U.S. men in each racial/ethnic group whose doctoral institutions were assigned Carnegie Classifications in 1987—the case for virtually all Ph.D.s. In 1991, only 24 U.S. men received Ph.D.s from institutions that did not exist in 1987 and, hence, could not be classified. Refer to the explanatory note on Table B-2 for a detailed description of the racial/ethnic variable; see the shaded box on page 91 for important information on recent increases in response rates and their impact on time-series data.

NOTE: Percentages are based on the number of Ph.D.s whose doctorate institution had a 1987 Carnegie Classification. Institutions which did not exist at that time cannot be classified. In 1991, a total of 24 U.S. men received doctorates from 2 unclassified schools—Walden University and Mayo Graduate School. Walden University awarded Ph.D.s to 2 Asians, 1 black, and 15 whites. Mayo Graduate School granted degrees to 1 black, 1 Hispanic, and 4 whites. Refer to the explanatory note about this table in front of Appendix B. See Table S-4 for comparable data on U.S. women.

SOURCE: National Research Council, Survey of Earned Doctorates.

APPENDIX C: Technical Notes

IMPORTANT NOTICE: Because of recent increases in response rates, the data on citizenship and race/ethnicity for 1990 and 1991 are not comparable to data for earlier years. Please refer to the shaded boxes on pages 106 and 109 for further explanation.

The tables and figures in this report display percentages that are based only on the number of doctorate recipients who responded to the applicable survey questions; recipients who did not respond are excluded. For the most part, the technical notes provide the rates of nonresponse to questions covered in the report. Presented first is a table showing the overall nonresponse rates for various data items in 1991. Then follows a series of notes pertaining to specific tables and figures that appear in the body of the report. These notes provide nonresponse rates for selected populations and years, as well as additional descriptive explanation of the data as needed.

In 1991, 94.3 percent of new recipients completed the survey questionnaire; this percentage is referred to as the "self-report" rate. For the remaining 5.7 percent of recipients, "skeletal" survey forms were created using information from doctorategranting institutions or commencement programs. Whether or not individuals completed the survey questionnaire, the following four data items were available for all recipients: gender, Ph.D. institution, Ph.D. field, and Ph.D. year. The nonresponse in a tabulation is dependent on the combination of selected variables. Higher nonresponse rates will always occur when any of the four above-mentioned variables is crossed with another variable (e.g., debt level) because the universe comprises the entire doctoral cohort. This means that the 5.7 percent of Ph.D.s who did not respond to the survey are included, even though their records contain minimal information. Nonresponse will be much lower when citizenship or race/ethnicity is cross-tabulated with a variable such as debt level because the population is restricted to a group (e.g., U.S. citizens) that is largely drawn from self-reported forms and, thus, more likely to include responses to debt level. To be more precise, the nonresponse rate for debt level in 1991 was only 1.3 percent for U.S. citizens, 2.8 percent for permanent residents, and 3.6 percent for temporary residents; nonresponse was low because information on both citizenship and debt is mostly obtained from self-reported forms. Nonresponse was much higher when

BEST COPY AVAILABLE

¹Appendix Tables A-3 and A-4 are exceptions. Because these tables include categories for "unknown" responses, percentages are based on the total doctoral cohort.

106

debt level was crossed with gender (7.8 percent for men and 6.0 percent for women) because the 5.7 percent of Ph.D.s who were not self-reporting and for whom there is minimal information were included in the population.

*** IMPACT OF INCREASED RESPONSE RATES ***

Although the Survey of Earned Doctorates has typically exhibited a high response rate, the percentage of self-reported questionnaires declined throughout the 1980s, falling from 96.2 percent in 1980 to a low of 91.4 percent in 1989. This downward trend was reversed in 1990 when the response rate increased nearly two percentage points. It rose yet another point in 1991, reaching 94.3 percent.

Item response rates showed a parallel improvement—a natural consequence of the increase in the overall survey response but also partially because of questionnaire revisions and follow-ups for missing pieces of information. New follow-up procedures instituted in 1990 had an especially strong impact on citizenship and racial/ethnic data for that year. However, since the responses to the follow-ups were not received until after closure of the 1990 survey, they were not included in the data presented in Summary Report 1990. The updated 1990 numbers reflecting follow-up responses are shown in Appendix Table B-2 in this year's report (page 98). The most significant adjustment was to the numbers of black Ph.D.s-an increase of 8.3 percent among those who were U.S. citizens and 4.7 percent among temporary residents. The data for 1991 will likewise be subject to some revision over the It is important, therefore, for readers to keep in mind that fluctuations in response rates affect numerical trends and that 1990 and 1991 data on citizenship and race/ethnicity, in particular, are not comparable to earlier data.

BEST COPY AVAILABLE

The 1991 nonresponse rates for items discussed in this report are given below.

ITEM NONRESPONSE RATES: 1991

Data Item	Nonresponse Rate (%)
Baccalaureate field	8.1
Baccalaureate institution	5.0*
Baccalaureate year (for time-to-Ph.D.)	6.0
Birth year (for age)	5.3
Citizenship	5.5
Country of citizenship	2.1 (of non-U.S. citizens)
Cumulative debt	7.2
Doctorate field	0.0
Doctorate institution	0.0
Doctorate year	0.0
Gender	0.0
Marital status	8.7
Master's institution	21.8 (includes non-M.A.s)
Postdoctoral employer type	5.1 (of employed Ph.D.s)
Postdoctoral location	10.6
Postdoctoral plans (employment vs. study)	8.1
Postdoctoral status (definite vs. seek)	8.7
Race/ethnicity	6.5
Sources of graduate school support	6.3
Years not enrolled from (for time-to-Ph.D.):	
Baccalaureate to graduate entrance	11.1
Graduate entrance to doctorate	16.4

NOTE: In 1991, 94.3 percent of new doctorate recipients completed the survey form. The item nonresponse rates in this table include the 5.7 percent of recipients who were not self-reporting. Basic information for the missing group was obtained from the doctorate-granting institutions or commencement programs. Field, institution, and year of doctorate are available for all recipients, as is gender.

^{*} The nonresponse rate to this item is less than the overall nonresponse rate of 5.7 percent because baccalaureate institution is sometimes available from commencement programs.

1. Figure 3 (page 4), Table 2 (page 5), and Table 5 (page 13): Percentages in Figure 3 are based on the number of doctorate recipients who reported their citizenship status. Nonresponses are excluded from the computations (see below).

Citizenship Status: Nonresponse Rates (%)

	1961	1966	1971	1976	1981	1986	1991
All Ph.D.s	1.4	2.4	1.6	2.0	3.4	6.6	5.5
Physical Sciences	1.6	2.7	1.5	1.4	2.7	6.3	4.7
Engineering	0.6	3.6	0.9	2.6	4.5	8.2	7.3
Life Sciences	1.1	1.5	1.9	2.5	2.5	5.4	4.0
Social Sciences	1.7	2.7	1.5	1.6	3.8	7.1	6.8
Humanities	2.5	2.9	1.4	1.8	3.8	7.3	4.7
Education	0.4	1.0	0.6	2.0	3.4	5.7	5.0
Professional/Other	2.1	4.6	10.6	3.0	4.6	8.5	7.5

Note: See Table 5 for total numbers of Ph.D.s in each field. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

Table 2 lists the leading countries of origin of non-U.S. Ph.D.s. Of the 10,666 non-U.S. Ph.D.s in 1991, 223 (or 2.1 percent) did not report their country of citizenship. Table 5 displays the numbers of Ph.D.s in each citizenship group. See the table above for rates of nonresponse to the question on citizenship status.

2. Figure 4 (page 6): Figure 4 compares the representation of minorities among U.S. citizen Ph.D.s in 1991 with their representation in 1976. Nonresponses are excluded from the percentage computations. The nonresponse rate among U.S. citizens to the question on race/ethnicity was 4.0 percent in 1976 and 1.3 percent in 1991. (See Appendix Table B-2 for total numbers of U.S. Ph.D.s; see technical note 1 for rates of nonresponse to citizenship status.) A historical discussion of the racial/ethnic question and important information on recent adjustments to racial/ethnic data are presented below and on the next page.

Although the item on race/ethnicity was first introduced to the Survey of Earned Doctorates in 1973, over 25 percent of recipients in 1973 and about 13 percent in 1974 either completed superseded questionnaires or provided unusable responses. Since 1975, the racial/ethnic data have been more reliable, with response rates ranging between 91 and 95 percent. The information on race/ethnicity presented in this report is limited to the period 1976 to 1991.

The racial/ethnic question has undergone several revisions over the years. In 1977, it was modified to correspond to a standard question format recommended by the Federal Interagency Committee on Education and adopted by the Office of Management and Budget (OMB) for use in federally sponsored surveys; an explanation of the effect of these changes is detailed on page 13 of Summary Report 1977. (Note: Changes in the OMB guidelines prompted the moving of persons having origins in the Indian

109

2. Figure 4 (continued)

subcontinent from the white category to the Asian category.) In 1980, the question was further revised in two ways: (1) the Hispanic category was subdivided into Puerto Rican, Mexican American, and "other" Hispanic to provide more detail for users of the racial/ethnic data, and (2) respondents were asked to check only one racial category. (Before 1980, doctorate recipients could check more than one category to indicate their race. When the data were compiled, however, all persons who checked American Indian, Asian, or Hispanic and also checked white were included in the minority group category. Those who checked black and any other category were designated as black.) The item was modified again in 1982 to separate the questions on race and ethnicity. Since then, respondents have been asked to first check one of the four racial group categories (American Indian, Asian, black, or white) and to then indicate whether or not they are Hispanic. In this report, Ph.D.s who reported Hispanic heritage are classified as "Hispanic" regardless of their racial designations; Ph.D.s who checked the category "American Indian or Alaskan Native" are identified as "Native American"; and Ph.D.s from 1976 to 1979 who indicated that they were both white and a minority are included with the minority group.

*** ADJUSTMENTS TO 1990 RACIAL/ETHNIC DATA ***

Readers should note that the racial/ethnic data for 1990 and 1991 are not comparable to data collected in earlier years because of procedural changes and recent improvements in the survey's overall response rate.

New follow-up procedures instituted in 1990 have resulted in adjustments to racial/ethnic data since publication of Summary Report 1990. This was especially true for black doctorates in 1990, for whom there was a 8.3 percent increase among U.S. citizens and a 4.7 percent increase among temporary residents. Appendix Table B-2 in this report presents the updated 1990 numbers. Any adjustments to the 1991 data will be presented in next year's report.

3. Figure 7 (page 14), Table 6 (page 15), and Table 7 (page 16): Total elapsed time from baccalaureate to doctorate (TTD) can only be computed for individuals whose baccalaureate year is known (note: BA year is often obtained from commencement programs or doctorate institutions when not reported by the recipient). Registered time (RTD) is the time actually enrolled in a college or university between receipt of the baccalaureate and the doctorate; RTD cannot be computed for individuals who have not provided all years of college attendance after earning the baccalaureate. Enrollment includes years of attendance not related to a recipient's doctoral program. Months are excluded from the computations because they are often not reported by the respondent. Nonresponse rates for time-to-doctorate are presented on the next page.

Humanities	2.1	8.0	1.7	9.8	3.4	13.5	4.9	14.9
Education	0.0	4.7	0.6	6.3	2.6	12.7	4.6	16.7
Professional/Other	1.1	7.0	8.4	15.0	4.6	13.8	6.8	17.9

Note: See Table 3 for total numbers of Ph.D.s in each field. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

Time-to-Doctorate: Nonresponse Rates by Demographic Group in 1991 (%)

(Table 7)	1991 TTD	1991 RTD
All Ph.D.s	6.0	16.4
Men	6.8	16.9
Women	4.7	15.5
U.S. Citizens	0.7	9.6
Permanent Residents	5.4	15.2
Temporary Residents	4.8	17.2
(U.S. Citizens)		
Asians	1.0	10.8
Blacks	0.9	12.6
Hispanics	1.6	13.1
Native Americans	0.0	7.8
Whites	0.6	9.2

Note: For total numbers of Ph.D.s, see Table 4 (gender), Table 5 (citizenship), and Appendix Table B-2 (race/ethnicity). Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

4. Table 8 (page 18): Percentages in Table 8 are based on the numbers of doctorate recipients in 1991 who reported their *primary* source of support in graduate school. Because many recipients who answered the question on sources of support did not designate a *primary* source, nonresponse was quite high (see table below). The numbers shown in Table 8 represent only those Ph.D.s whose primary support is known, not the total cohort of Ph.D.s for that year.

Primary Source of Support: Nonresponse Rates in 1991 (%)

	All Fields	Phys. Sci.	Engr.	Life Sci.	Soc. Sci.	Hum.	Educ.	Prof.
All Ph.D.s	22.5	19.9	21.6	20.4	23.7	25.9	24.4	23.9
Men	23.1	20.5	22.3	21.5	25.2	25.8	25.6	25.2
Women	21.6	16.9	14.4	18.7	22.2	26.1	23.5	21.5
U.S. Citizens	16.1	12.1	9.5	15.1	16.2	21.0	19.2	16.1
Permanent Res.	26.7	18.7	18.6	28.9	32.7	34.3	40.8	20.5
Temporary Res.	22.1	22.0	20.0	21.1	24.0	25.5	28.2	23.3
(U.S. Citizens)								
Asians	21.1	21.7	13.0	21.5	22.6	36.4	23.5	30.8
Blacks	25.6	15.0	16.3	23.5	30.7	20.9	26.0	29.5
Hispanics	25.7	23.8	14.9	23.7	26.7	27.3	28.2	28.6
Native Amers.	27.3	28.6	33.3	31.6	19.0	20.0	39.8	16.7
Whites	14.9	10.9	8.4	14.2	14.6	20.2	17.9	14.4

Note: For total numbers of Ph.D.s in each field, see Table 4 (gender), Table 5 (citizenship), and Appendix Table B-2 (race/ethnicity). Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

5. Figure 8 (page 19) and Table 9 (page 20): Percentages are based on the numbers of doctorate recipients who reported the cumulative level of debt related to their undergraduate and graduate education. Nonresponses are excluded from the percentage computations (see table on next page).

5. Figure 8 and Table 9 (continued)

Cumulative Educational Debt: Nonresponse Rates in 1991 (%)

	Rate		Rate
All Fields	7.2	Men	7.8
Physical Sciences	6.2	Women	6.0
Engineering	9.6	U.S. Citizens	1.3
Life Sciences	6.0	Permanent Res.	2.8
Social Sciences	8.3	Temporary Res.	3.6
Humanities	6.0	U.S. Asians	0.9
Education	6.2	Blacks	1.5
Professional	9.1	Hispanics	2.0
		Native Amers.	0.0
		Whites	1.2

Note: For total numbers of Ph.D.s, see Table 4 (field and gender), Table 5 (citizenship), and Appendix Table B-2 (race/ethnicity). Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

6. Tables 10-14 and Figure 9 (pages 21-27): The question on postgraduation status asks recipients to indicate whether they have made a "definite" commitment, are in the process of "negotiating" with one or more organizations, or are seeking a position but with no prospects. Because Ph.D.s sometimes complete the survey form months ahead of graduation, it is not possible to determine the final plans of many recipients. It is quite likely, however, that some individuals who check "negotiating" or "seeking" have obtained positions by the time of graduation. Because all outcomes are not known, data on postgraduation plans in this report are restricted to the group of Ph.D.s who reported "definite" plans.² See pages 113 and 114 for rates of nonresponse to the question on postgraduation status and for the proportions of Ph.D.s with "definite" plans.

² Comparisons with the most recent longitudinal Survey of Doctorate Recipients (SDR) have shown the data on 'definite" postgraduation plans to be a reasonable predictor of the actual employment status of new Ph.D.s in the year following receipt of the doctorate. (The SDR, also conducted by the National Research Council, is a follow-up employment survey of a sample of doctorate recipients in science, engineering, and humanities fields.) According to the 1989 SDR, 97.2 percent of the 1987-1988 Ph.D.s who had indicated "definite" employment plans in the United States at the time of graduation were in the U.S labor force as of February 1989, and most were working in the sector reported on their survey forms. Among non-U.S. citizens, the percentages were also quite high: 98.5 percent of permanent residents and 94.8 percent of temporary residents were still working in the United States a year after graduation.

6. Tables 10-14 and Figure 9 (continued)

Postgraduation Status: Nonresponse Rates (%)

	1971	1976	1981	1986	1991
All Fields	4.8	5.9	8.6	9.9	9.2
Physical Sciences	4.5	4.9	7.1	10.7	8.8
Engineering	3.9	5.8	9.4	12.8	12.5
Life Sciences	5.0	5.6	8.7	8.6	7.8
Social Sciences	5.3	5.7	9.1	10.1	10.0
Humanities	5.8	8.1	9.6	10.9	7.9
Education	2.9	5.5	8.2	8.1	8.0
Professional/Other	12.8	6.9	9.2	10.4	10.3
Men	4.5	5.7	8.4	10.6	9.9
Women	6.7	6.9	9.2	8.6	7.8
U.S. Citizens	3.2	4.1	4.9	2.7	2.8
Permanent Residents	3.8	4.6	7.9	7.1	6.6
Temporary Residents	4.5	5.9	8.7	7.3	7.1
(U.S. & Perm. Res.)	3.2	4.1	5.1	3.0	3.1
Asians	N/A	4.4	7.7	7.8	6.1
Blacks	N/A	3.8	5.7	3.3	5.4
Hispanics	N/A	3.6	4.9	4.0	4.0
Native Americans	N/A	2.5	3.5	3.0	3.1
Whites	N/A	2.4	3.8	2.5	2.6

Note: N/A=not available. For total numbers of Ph.D.s, see Table 4 (field and gender), Table 5 (citizenship), and Appendix Table B-2 (race/ethnicity by citizenship). Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

The proportions of Ph.D.s with "definite" commitments are given in the next two tables. These percentages are based on the number of Ph.D.s who responded to the question on postgraduation status (see table above for rates of nonresponse to this question):

Year	% Definite	Year	% Definite
1971	78.7	1986	74.1
1976	72.6	1991	70.8
1981	76.4		

Note: See Table 1 for total numbers of Ph.D.s. See Table 10 for numbers of Ph.D.s with definite commitments.

6. Tables 10-14 and Figure 9 (continued)

The table below displays the proportions of Ph.D.s with "definite" commitments in 1991 by field and demographic group, and the range of proportions for the five years included in Tables 10-14 and Figure 9 (i.e., 1971, 1976, 1981, 1986, 1991).

	% Definite		_% Definite
•	Range (1991)		Range (1991)
All Fields	71-79 (70.8)	Men	71-80 (70.5)
Physical Sciences	71-81 (70.5)	Women	67-72 (71.3)
Engineering	63-78 (62.6)	U.S. Citizens	74-80 (74.2)
Life Sciences	75-79 (74.5)	Permanent Res.	58-67 (57.5)
Social Sciences	70-83 (70.3)	Temporary Res.	64-73 (63.5)
Humanities	61-81 (64.7)	U.S. & Perm. Res.	73-79 (73.1)
Education	75-78 (74.9)	Asians	62-71 (62.1)
Professional	79-88 (78.6)	Blacks	69-73 (68.9)
		Hispanics	69-75 (68.7)
		Native Amers.	56-76 (68.3)
		Whites	74-78 (74.2)

Note: For total numbers of Ph.D.s, see Table 4 (field and gender), Table 5 (citizenship), and Appendix Table B-2 (race/ethnicity by citizenship). See Tables 10 and 11 for numbers of Ph.D.s with definite commitments in each year.

Table 10 (page 21) and Table 11 (page 22): These tables present data on the type of plans (employment or study) for only those Ph.D.s who reported definite postgraduation commitments and, thus, do not reflect the entire Ph.D. population. (See page 113 and the table above for nonresponses to the question on postgraduation status and the proportions of Ph.D.s with definite commitments.)

Nonresponses to the question on type of postdoctoral plans (employment or study) are excluded from percentage calculations in Tables 10 and 11. As is evident from the table on the next page, rates of nonresponse were very low in every year and for all fields and demographic groups.

6. Tables 10-14 and Figure 9 (continued)

Employment/Study Plans of Ph.D.s with Definite Commitments: Nonresponse Rates (%)

	1971	1976	1981	1986	1991
All Fields	0.9	1.0	0.4	0.7	0.6
Physical Sciences	0.5	0.5	0.5	0.5	0.2
Engineering	0.3	0.6	0.4	0.4	0.5
Life Sciences	0.5	0.9	0.4	0.5	0.4
Social Sciences	0.9	0.9	0.2	0.9	0.4
Humanities	1.6	1.8	0.6	1.3	0.9
Education	1.0	1.3	0.3	0.7	1.0
Professional/Other	1.1	1.2	0.4	0.3	0.5
Men	0.8	1.0	0.4	0.6	0.6
Women	i.2	1.3	0.3	0.8	0.6
U.S. Citizens	0.8	1.0	0.3	0.5	0.5
Permanent Residents	1.4	0.8	0.5	0.5	1.2
Temporary Residents	1.3	1.1	0.9	1.3	0.7
(U.S. & Perm. Res.)	0.8	1.0	0.3	0.5	0.5
Asians	N/A	0.5	0.4	1.1	0.9
Blacks	N/A	2.8	0.3	1.3	1.6
Hispanics	N/A	2.3	0.5	0.0	0.2
Native Americans	N/A	4.5	0.0	1.6	0.0
Whites	N/A	0.9	0.3	0.5	0.5

Note: N/A=not available. See Tables 10 and 11 for total numbers of Ph.D.s with definite commitments. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

Figure 9 (page 23): Figure 9 shows the proportions of non-U.S. citizens who reported plans to stay in the United States after graduation. Only Ph.D.s who reported definite commitments are included (see page 113 for rates of nonresponse to the question on postgraduation status). Nonresponses to the question on postdoctoral location are excluded from the percentage calculations in Figure 9 (see table on next page).

6. Tables 10-14 and Figure 9 (continued)

Postdoctoral Location of Non-U.S. Citizen Ph.D.s with Definite Commitments: Nonresponse Rates (%)

	1971	1976	1981	1986	1991
Permanent Residents	3.2	4.0		9.4	2.6
Temporary Residents	4.1	3.6		8.0	3.2

Note: The lower nonresponse in 1991 was largely a result of a questionnaire revision that allowed the recipient to check a box for "U.S." or "non-U.S." instead of naming a specific state or foreign country. See Table 11 for total numbers of non-U.S. Ph.D.s with definite commitments. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

Table 12 (page 24): This table presents data on the postdoctoral location and type of plans (employment or study) for only those non-U.S. citizens who reported definite commitments (see page 113 for nonresponses to the question on postgraduation status). Percentages in Table 12 are based on the number of non-U.S. Ph.D.s who reported both postdoctoral location and type of plans. Nonresponse rates for these questions are given below.

Postdoctoral Location/Type of Plans of Non-U.S. Citizens with Definite Commitments: Nonresponse Rates in 1991 (%)

	Permanent Residents	Temporary Residents
All Fields	3.7	3.8
Physical Sciences	2.2	4.7
Engineering	4.4	3.6
Life Sciences	3.9	4.2
Social Sciences	7.4	2.1
Humanities	3.0	2.6
Education	4.1	4.8
Professional/Other	0.0	2.8

Note: Numbers of Ph.D.s not reporting both postdoctoral location and type of plans were small: a total of 36 permanent residents (ranging from 3 in education to 9 in social sciences) and 199 temporary residents (ranging from 8 in humanities to 63 in physical sciences). See Table 11 for total numbers of non-U.S. Ph.D.s with definite commitments. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the combination of selected variables.

6. Tables 10-14 and Figure 9 (continued)

Table 13 (page 25) and Table 14 (page 27): As with the other tables on postgraduation plans, Tables 13 and 14 do not include data on the entire Ph.D. cohort. Instead, they display the type of employer (i.e., sector) for only those Ph.D.s who reported definite commitments in the United States. (See pages 113 to 115 for rates of nonresponse to the questions on postgraduation status and type of plans.)

The table below shows the proportions of all Ph.D.s with definite commitments who reported employment plans in the United States.

	U.S. Citizens and	Temporary
	Permanent Residents	Residents
1971	81.6	15.9
1976	79.9	16.4
1981	79.3	22.9
1986	75.6	23.5
1991	73.1	29.4

Note: See Table 11 for total numbers of Ph.D.s with definite commitments. See Table 14 for numbers of Ph.D.s with employment commitments in the United States.

Nonresponses to the question on *employment sector* are excluded from the percentages in Tables 13 and 14. As can be seen in the tables below and on the next page, nonresponse was very low in all years.

Employment Sector of Ph.D.s with Definite Plans to Work in the United States by Field: Nonresponse Rates (%)

(Table 13)	1971	1976	1981	1986	1991
All Fields	0.9	0.5	0.6	1.0	1.0
Physical Sciences	0.5	0.3	0.3	0.1	0.5
Engineering	1.0	0.6	0.4	0.6	0.2
Life Sciences	0.8	0.7	0.2	0.4	0.8
Social Sciences	0.9	0.5	0.6	1.5	1.6
Humanities	0.7	0.3	0.8	0.9	0.8
Education	1.5	0.7	1.1	1.3	1.3
Professional/Other	0.6	0.3	0.0	0.4	0.8

Note: N/A=not available. See Table 13 for total numbers of Ph.D.s with employment commitments in the United States. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

6. Tables 10-14 and Figure 9 (continued)

Employment Sector of Ph.D.s with Definite Plans to Work in the United States by Demographic Group: Nonresponse Rates (%)

(Table 14)	1971	1976	1981	1986	1991
U.S. Citizens	0.9	0.5	0.6	1.0	1.0
Permanent Residents	1.8	0.9	1.2	0.8	0.7
Temporary Residents	0.0	0.0	0.0	0.0	0.6
(U.S. & Perm. Res.)	0.9	0.5	0.6	1.0	1.0
Men	0.9	0.5	0.5	0.7	0.8
Women	1.5	0.6	1.0	1.4	1.3
Asians	N/A	0.8	1.2	1.2	1.0
Blacks	N/A	1.0	1.6	3.2	1.2
Hispanics	N/A	0.0	1.3	1.5	0.7
Native Americans	N/A	0.0	1.8	2.3	0.0
Whites	N/A	0.5	0.5	0.8	1.0

Note: N/A=not available. See Table 14 for total numbers of Ph.D.s with employment commitments in the United States. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

U.S. FEMALE DOCTORATES (special section)

7. Figure S-1 (page 31): Percentages in this figure are based on the number of doctorates awarded to U.S. citizens in each field. See technical note 1 for overall rates of nonresponse to the citizenship question. See the table below for nonresponse among women. (Note: Although Figure S-1 shows data for only 1976 and 1991, nonresponse rates are also provided for 1981 and 1986 because these years are included in most of the tables and figures presented in the special section.)

Citizenship Status of Women: Nonresponse Rates (%)

Year	Rate
1976	1.9
1981	3.3
1986	5.6
1991	4.4

Note: See Table 4 for total numbers of female Ph.D.s.

8. Figure S-2 (page 32), Table S-1 (page 43), Table S-2 (page 44), and Table S-3 (page 45): Percentages are based on the number of U.S. citizen Ph.D.s with known race/ethnicity. Refer to technical note 1 for rates of nonresponse to the question on citizenship status among all Ph.D.s; refer to technical note 7 for nonresponse among women. See technical note 2 for important information on the racial/ethnic variable; see below for nonresponse rates to race/ethnicity among U.S. women.

Race/Ethnicity of U.S. Women: Nonresponse Rates (%)

	1976	1981	1986	1991
All Fields	3.1	3.4	1.4	0.9
Physical Sciences	2.0	3.8	1.7	0.8
Engineering	2.9	7.5	2.1	1.9
Life Sciences	2.8	3.7	1.1	1.2
Social Sciences	2.7	2.6	1.5	0.6
Humanities	4.9	3.4	1.6	1.1
Education	2.5	3.6	1.3	0.6
Professional/Other	2.9	3.8	1.1	1.2

Note: See Table S-2 for total numbers of U.S. female Ph.D.s. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

9. Table S-5 (page 47): Only baccalaureate institutions located in the United States are included in this table. The proportions of each racial/ethnic group reporting U.S. versus foreign institutions are shown below, along with nonresponse rates for each group.

Baccalaureate Institution of U.S. Female Ph.D.s, 1987-1991 (aggregate): Response and Nonresponse Rates (%)

	All U.S. omen (N)	U.S. Instn.	Foreign Instn.	No BA	Non- resp.
Asians	1,065	73.3	25.3	0.4	1.0
Blacks	2,539	98.9	0.6	0.1	0.4
Hispanics	1,523	94.7	4.0	0.3	1.0
Native Americans	239	99.6	0.0	0.0	0.4
Whites	44,609	98.5	1.0	0.2	0.3

Note: 93.7 percent of Asians who held foreign baccalaureates were naturalized citizens, as were 86.7 percent of blacks, 75.4 percent of Hispanics, and 51.1 percent of whites.

10. Table S-7 (page 49) and Table S-8 (page 50): Total elapsed time from baccalaureate to doctorate (TTD) can be computed only for individuals whose baccalaureate year is known (note: BA year is often obtained from commencement programs or doctorate institutions when recipients do not provide it). Registered time (RTD), the time actually enrolled in college between receipt of the baccalaureate and the

10. Tables S-7 and S-8 (continued)

doctorate, cannot be computed for individuals who do not provide all years of college attendance after earning the baccalaureate. Enrollment includes years of attendance not related to a recipient's doctoral program. Months are excluded from the computations because they are often not reported by the respondent.

Time-to-Doctorate for U.S. Women: Nonresponse Rates (%)

	1976 TTD	1976 RTD	1981 TTD	1981 RTD	1986 TTD	1986 RTD	1991 TTD	1991 RTD	
All Fields Physical Sciences Engineering Life Sciences Social Sciences Humanities Education Professional/Other	0.3 0.7 2.9 0.1 0.0 0.8 0.1 0.6	7.6 4.6 2.9 4.6 6.2 9.5 8.7 8.4	0.5 1.1 0.0 0.5 0.5 0.9 0.3 0.5	8.4 6.5 11.3 5.8 6.9 10.4 9.4 10.1	1.9 2.3 1.4 1.7 1.8 2.2 2.0 1.4	8.3 6.2 8.5 6.3 6.9 7.9 11.0 6.8	0.7 0.4 0.4 0.9 0.6 0.5 0.8 0.3	10.4 6.0 6.0 10.7 8.5 10.6 13.1 9.4	ı
Asians Blacks Hispanics Native Americans Whites			(Tab	le S-8)			1.0 0.9 1.7 0.0 0.6	11.3 14.1 12.9 7.3 10.0	

Note: See Table S-2 for total numbers of U.S. women in each racial/ethnic group and in each field. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

11. Table S-9 (page 51): Percentages in this table are based on the numbers of U.S. female Ph.D.s in 1991 who reported their primary source of support in graduate school. Because many recipients who answered the question on sources of support did not designate a primary source, nonresponse was quite high (see table on next page). The numbers shown in Table S-9 represent only those Ph.D.s whose primary support is known, not the total cohort of Ph.D.s for that year.

11. Table S-9 (continued)

Primary Source of Support for U.S. Women: Nonresponse Rates in 1991 (%)

	All U.S. Women	Asians	Blacks	•	Native Amers.	Whites	Unkn. R/E
All Fields	16.8	24.6	23.2	27.4	25.5	15.6	30.5
Physical Sciences	9.6	17.6	7.7	13.3	33.3	8.4	66.7
Engineering	6.7	23.1	0.0	0.0	50.0	5.1	0.0
Life Sciences	14.2	27.2	19.1	22.7	33.3	13.2	20.8
Social Sciences	16.4	24.5	29.1	28.4	20.0	15.0	25.0
Humanities	21.4	32.1	21.6	31.7	14.3	20.6	37.5
Education	19.0	18.2	21.9	30.9	25.0	18.0	40.0
Professiona'/Other	16.9	37.5	30.0	25.0	33.3	14.8	25.0

Note: Unkn. R/E = Unknown Race/Ethnicity. See Table S-2 for total numbers of U.S. women in each racial/ethnic group and in each field. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

12. Table S-11 (pages 54-55): Percentages in this table are based on the numbers of U.S. women who reported the cumulative level of debt related to their undergraduate and graduate eduration. Nonresponses are excluded from percentage computations.

Cumulative Educational Debt of U.S. Women: Nonresponse Rates in 1991 (%)

	All U.S. Women	Asians	Blacks	•	Native Amers.	Whites	Unkn. R/E
All Fields	1.3	1.0	1.3	2.0	0.0	1.2	7.4

Engineering	1.1	3.8	0.0	0.0	0.0	0.9	0.0
Life Sciences	0.9	0.0	0.0	0.0	0.0	0.9	8.3
Social Sciences	1.3	0.0	0.9	2.1	0.0	1.3	0.0
Humanities	1.5	0.0	0.0	1.7	0.0	1.5	6.3
Education	1.4	1.8	2.2	3.6	0.0	1.2	10.0
Professional/Other	1.2	0.0	0.0	0.0	0.0	1.4	0.0

Note: Unkn. R/E = Unknown Race/Ethnicity. Numbers of U.S. women not reporting debt level were small: 3 Asians, 7 blacks, 7 Hispanics, 112 whites, and 7 of unknown race/ethnicity. See Table S-11 for total numbers of U.S. women in each field. Refer to the second paragraph on page 105 for an explanation of how non-response in a tabulation is affected by the *combination* of selected variables.

122

13. Tables S-12 to S-16 (pages 56-60): Only U.S. women who responded to the question on postgraduation status (definite commitment, negotiating, or seeking) are included in these tables. Nonresponse rates for this question are given below. For additional information on postgraduation plans data, see technical note 6.

Postgraduation Status of U.S. Women: Nonresponse Rates (%)

	All U.S. Women	Asians	Blacks	_	Native Amers.	Whites	Unkn. R/E
1976	5.1	6.7	4.5	4.6	0.0	3.4	51.7
1981	5.9	8.7	5.8	3.7	6.9	5.0	28.2
1986	2.9	5.5	3.4	3.0		2.6	16.8
1991	3.0	8.5	3.8	5.1	1.8	2.7	5.3
Physical Sciences	2.0	8.8	0.0	0.0		1.7	0.0
Engineering	2.6	7.7	0.0	0.0	0.0	2.3	0.0
Life Sciences	2.5	6.2	2.1	2.3	0.0	2.2	8.3
Social Sciences	3.1	5.7	5.5	2.1	0.0	3.0	0.0
Humanities	4.3	17.9	2.0	6.7	0.0	3.9	6.3
Education	3.3	12.7	4.8	10.0	4.2	2.7	10.0
Professional/Othe	r 1.5	0.0	0.0	0.0	0.0	1.7	0.0

Note: Unkn. R/E = Unknown Race/Ethnicity. See Table S-2 for total numbers of U.S. women in each racial/ethnic group and in each field. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

Table S-12 (page 56): This table displays, for 1991, the percentages of U.S. female Ph.D.s who reported definite postgraduation commitments by race/ethnicity and field. See the table above for rates of nonresponse to the question on postgraduation status.

Table S-13 (page 57) and Table S-14 (page 58): These tables present data on the type of plans (employment versus study) for only those U.S. women with definite postgraduation commitments and, thus, do not reflect the entire U.S. female Ph.D. population. The proportions of women who indicated such commitments were 67.8 percent in 1976, 72.3 percent in 1981, 73.0 percent in 1986, and 73.5 percent in 1991. (Note: Table S-12 provides proportions of U.S. women with definite commitments by race/ethnicity and field for 1991). Refer to technical note 6 for additional information on postgraduation plans data.

Nonresponses to the question on type of postdoctoral plans (employment or study) are excluded from percentage calculations in Tables S-13 and S-14. The table on the next page shows that rates of nonresponse were very low for all racial/ethnic groups. Nonresponse by field in 1991 (applicable only to Table S-14) was also low. The highest rates were in humanities (1.1 percent; N=10) and education (0.9 percent; N=21); nonresponse in all other fields was under 0.5 percent.

13. Tables S-12 to S-16 (continued)

Employment/Study Plans of U.S. Women with Definite Commitments: Nonresponse Rates (%)

	1976	1981	1986	1991
All U.S. Women	1.3	0.2	0.8	0.5
Asians	1.7	0.0	0.9	0.0
Blacks	3.4	0.0	1.7	1.0
Hispanics	3.2	0.7	0.0	0.4
Native Americans	0.0	0.0	3.3	0.0
Whites	1.1	0.2	0.7	0.5
Unknown Race/Ethnicity	0.0	0.7	0.0	0.0

Note: Numbers of U.S. women not reporting type of postdoctoral plans were small: 56 in 1976, 13 in 1981, 51 in 1986, and 41 in 1991. See Table S-13 for total numbers of U.S. women with definite commitments by race/ethnicity. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

Table S-15 (page 59) and Table S-16 (page 60): As with the other tables on postgraduation plans, Tables S-15 and S-16 do not include the entire cohort of U.S. female Ph.D.s. Rather, they display the type of employer (i.e., sector) for only those U.S. women who reported definite employment commitments in the United States. (See page 122 and the table above for rates of nonresponse to the questions on postgraduation status and type of plans; see technical note 6 for additional information on postgraduation plans data.)

Of U.S. women with definite commitments, the proportions reporting employment plans in the United States were 83.4 percent in 1976, 83.3 percent in 1981, 80.1 percent in 1986, and 78.3 percent in 1991. The percentages of blacks, Hispanics, and Native Americans with such commitments ranged from 70 to 95 percent over the years, while those of whites (78 to 83 percent) and Asians (59 to 69 percent) were somewhat lower. The smaller proportions for whites and Asians were most likely a result of their greater concentrations in science fields where postdoctoral study is common.

Nonresponses to the question on *employment sector* are excluded from the percentages displayed in Tables S-15 and S-16. Rates of nonresponse were very low in all years (see table on next page). Nonresponse by field in 1991 (applicable only to Table S-16) was also low. The highest rate was in social sciences (2.1 percent; N=28), followed by professional/other fields (1.8 percent; N=9) and education (1.4 percent; N=31).

13. Tables S-12 to S-16 (continued)

Employment Sector of U.S. Women with Definite Commitments to Work in the United States: Nonresponse Rates (%)

	1976	1981	1986	1991
All U.S. Women	0.6	0.9	1.4	1.3
Asians	0.0	1.5	0.0	0.8
Blacks	0.7	1.5	3.5	1.2
Hispanics	0.0	0.8	2.1	1.6
Native Americans	0.0	0.0	0.0	0.0
Whites	0.6	0.8	1.2	1.3
Unknown Race/Ethnicity	1.7	2.5	4.9	2.0

Note: Numbers of U.S. women not reporting employment sector were small: 23 in 1976, 46 in 1981, 76 in 1986, and 79 in 1991. See Table S-15 for total numbers of U.S. women with employment commitments in the United States. Refer to the second paragraph on page 105 for an explanation of how nonresponse in a tabulation is affected by the *combination* of selected variables.

APPENDIX D SURVEY OF EARNED DOCTORATES 1990-91

Form Approved OMB No. 3145-0019 Approval Expires 6/91

This form is to be returned to the GRADUATE DEAN for forwarding to

The Appendix tables present data according to the following field classifications. Appendix Tables A-1 and A-2 and Appendix Table B-1 display all subfields that are on the survey Specialties List. Appendix Tables A-4, A-5, and A-6 show data by seven broad fields only. Appendix Tables A-3 and A-7 include the additional field groupings indicated below.

SCIENCES

Physical Sciences (400-599)

Physics and Astronomy (500-505, 560-579)
Chemistry (520-539)
Earth, Atmosphene and Marine Sciences
(510-519, 540-559, 580-599)
Mathematics (420-499)
Computer Sciences (400-410)
Combined in Table A-7

Engineering (300-399)

Life Sciences (000-299)

Biological Sciences (100-199)
Biochemistry (100)
Other Biological Sciences (105-199)
Health Sciences (200-299)
Agricultural Sciences (000-099)

Social Sciences (600-699)

Psychology (600-649)
Economics and Econometrics (666, 668)
Anthropology and Sociology (650, 686)
Political Science and International Relations (674, 678)
Other Social Sciences (652-662, 670, 682, 690-699)

NONSCIENCES

Humanities (700-799)

History (700-719)
English and American Language and Literature (732-734)
Foreign Languages and Literature (740-769)
Other Humanities (720-729, 736-739, 770-799)

Combined in Table A-7

Education (800-899)

Professional and Other Fields (900-999)

Business and Management (900-939) Other Professional Fields (940-989) Other Fields (999)

NOTE: Doctorate recipients indicate their fields of speciality.
Their choices may differ from departmental names.

Combined in Table A-7

TITLES OF RESEARCH DEGREES INCLUDED IN THE SURVEY OF EARNED DOCTORATES

DA/DAT	Doctor of Arts/Arts in Teaching	DMSc	Doctor of Medical Science
DArch	Doctor of Architecture	DNSc	Doctor of Nursing Science
DAS	Doctor of Applied Science	DPA	Doctor of Public Administration
DBA	Doctor of Business Administration	DPE	Doctor of Physical Education
DChem	Doctor of Chemistry	DPH	Doctor of Public Health
Denem	bottor or enumery		
DCJ	Doctor of Criminal Justice	DPS	Doctor of Professional Studies
DCL	Doctor of Comparative Law/Civil Law	DrDES	Doctor of Design
DCrim	Doctor of Criminology	DRE	Doctor of Religious Education
DED	Doctor of Environment 1 Design	DRec/DR	Doctor of Recreation
DEng	Doctor of Engineering	DSc/ScD	Doctor of Science
DEnv	Doctor of Environment	DScD .	Doctor of Science in Dentistry
DESc/ScDE	Doctor of Engineering Science	DScH	Doctor of Science and Hygiene
DF	Doctor of Forestry	DScVM	Doctor of Science in
DFA	Doctor of Fine Arts		Veterinary Medicine
DGS	Doctor of Geological Science	DSM	Doctor of Sacred Music
	_		
DHL	Doctor of Hebrew Literature/Letters	DSSc	Doctor of Social Science
DHS	Doctor of Health and Safety	DSW	Doctor of Social Work
DHS	Doctor of Hebrew Studies	EdD	Doctor of Education
DIT	Doctor of Industrial Technology	JCD	Doctor of Canon Law
DLS	Doctor of Library Science	JSD	Doctor of Juristic Science
DM	Doctor of Music	LScD	Doctor of Science of Law
DMA	Doctor of Musical Arts	PhD	Doctor of Philosophy
DME.	Doctor of Musical Education	RhD	Doctor of Rehabilitation
DMin/DM	Doctor of Ministry	SJD	Doctor of Juridical Science
DML	Doctor of Modern Languages	STD	Doctor of Sacred Theology
DMM	Doctor of Music Ministry	ThD	Doctor of Theology

NATIONAL ACADEMY PRESS

The National Academy Press was created by the National Academy of Sciences to publish the reports issued by the Academy and by the National Academy of Ligaricering the Institute of Medicine, and the National Research Council, all operating under the charter; raised to the National Academy of Science by the Council, at the Laured Science.
