 IDENTIFIERS *Schools and Staffing Survey (NCES)

ABSTRACT

The Schools and Staffing Survey (SASS), initiated in 1987-88, was conducted in 1990-91 to provide data on the nation's elementary and secondary school teaching force, aspects of teacher supply and demand, teacher workplace conditions, characteristics of school administrators, and school policies and practices. The sample for the 1990-91 survey comprised 9,500 public schools and 56,000 public school teachers; and 3,000 private schools and 9,000 private school teachers. This report highlights some state-by-state statistics that can be produced from SASS data. Items selected for this publication can inform policy, funding, and program issues. Tables and graphs of this report illustrate a state's current status relative to other states. Sections include: (1) school and student characteristics by state; (2) teacher and principal characteristics by state; (3) preparation of teachers by state; and (4) conditions for teaching by state. Five appendixes contain supplemental and technical information about survey administration and analysis. Thirty-four figures and 34 tables present survey data. (SLD)

Acknowledgements

The idea for the *SASS by State* report developed from discussions of the SASS Review Board with NCES staff. Previous work by Horizon Research, Inc. and the Council of Chief State School Officers on reporting education statistics for policymakers and educators contributed to the design for this publication. NCES strongly supported this new publication as a method of improving the dissemination and utilization of SASS data at the state level. Staff of the National Science Foundation also assisted in the planning and development of the project.

The authors appreciate the helpful comments and suggestions of a number of people. A task force of state education representatives provided very important advice on the design and organization of the publication: Ronald Danforth, New York; Linda Harageones, Florida; Roger Hummel, Pennsylvania; Dori Nielson, Montana; Peter Prowda, Connecticut; Diane Schnelker, Iowa; and Lynn Cornett, Southern Regional Education Board. Reviewers of drafts of the publication were: Dan Kasprzyk and Steve Kaufman, Special Surveys and Analysis Branch, NCES; Susan Gross and Larry Suter, Research, Evaluation and Dissemination Division, Education and Human Resources Directorate, National Science Foundation; and Marilyn Miles McMillen, Senior Statistician, Elementary and Secondary Education Statistics Division, NCES.

For More Information

We are interested in your reaction to the information presented here about the Schools and Staffing Survey. We welcome your recommendations for improving our surveys and methods of reporting the results. If you have suggestions or comments or want more information about this report, please contact:

List of Tables

1. School and Student Characteristics by State

- 1.1 Percentage of Public Schools by Community Type, by State: 1990-91
- 1.2 Percentage of Public School Students by Community Type, by State: 1990-91
- 1.3 Percentage of Public School Students by Race/Ethnicity, by State: 1990-91
- 1.4 Percentage of Public School Students Who Are Minority by Community Type, by State: 1990-91
- 1.5 Average Size of Public Elementary, Middle, and High Schools, by State: 1990-91
- 1.6 Public School Student/Teacher Ratio, by State: 1990-91
- 1.7 Percentage of Minority Students, Teachers, and Principals in Public Schools, by State: 1990-91
- 1.8 Percentage of Public Elementary and Secondary Schools Providing and Students Receiving Chapter 1 Services, by State: 1990-91
- 1.9 Percentage of Public Elementary and Secondary Schools and Students Participating in Free or Reduced Price Lunch Programs, by State: 1990-91

2. Teacher and Principal Characteristics by State

- 2.1 Percentage of Public Schools With Different Proportions of Minority Teachers and Percentage with Minority Principal, by State: 1990-91
- 2.2 Percentage of Grades K-6 Public School Teachers Who Are Female or Minority, by State: 1990-91
- 2.3 Percentage of Public Elementary School Teachers by Age, by State: 1990-91
- 2.4 Percentage of Public Secondary School Teachers by Age, by State: 1990-91
- 2.5 Percentage of Grades 9-12 Public School Science and Mathematics Teachers Who Are Female or Minority, by State: 1990-91
- 2.6 Percentage of Public School Teachers Who Are Newly Hired and Percentage Who Are First-Time Teachers, by State: 1990-91
- 2.7 Percentage of Public School Teachers by Their Plans to Remain in Teaching, by State: 1990-91
- 2.8 Percentage of Public School Principals by Their Plans to Remain as Principals, by State: 1990-91
- 2.9 Average Salaries of Full-Time Public School Teachers and Principals, by State: 1990-91
- 2.10 Average Salaries of Full-Time Public School Teachers by Years of Teaching Experience, by State: 1990-91
- 2.11 Percentage of Public School Principals by Sex and Race/Ethnicity, by State: 1990-91

3. Preparation of Teachers by State

- 3.1 Percentage of Grades 9-12 Public School Science and Mathematics Teachers With a Major in Field, by State: 1990-91
- 3.2 Percentage of Grades 9-12 Public School English and Social Studies Teachers With a Major in Field, by State: 1990-91
- 3.3 Percentage of Grades K-8 Public School Teachers with Pre-Elementary or Elementary Education Majors and With Education Beyond a Bachelor's Degree, by State: 1990-91

- 3.4 Average Years of Teaching Experience and Percentage of Public School Teachers by Years of Teaching Experience, by State: 1990-91

4. Conditions for Teaching by State

- 4.1 Grades K-6 Average Class Size, by State: 1990-91
- 4.2 Grades 9-12 Science and Biology Class Size, by State: 1990-91
- 4.3 Grades 9-12 Mathematics Class Size, by State: 1990-91
- 4.4 Grades 9-12 English and Vocational Education Class Size, by State: 1990-91
- 4.5 Average Hours per Week That Grades 1-3 Public School Teachers in Self-Contained Classes Spent Teaching Core Subjects, by State: 1990-91
- 4.6 Average Hours per Week That Grades 4-6 Public School Teachers in Self-Contained Classes Spent Teaching Core Subjects, by State: 1990-91
- 4.7 Percentage of Principals Who Thought Various Groups Had a Great Deal of Influence on Establishing the School Curriculum, by State: 1990-91
- 4.8 Percentage of Principals Who Thought Various Groups Had a Great Deal of Influence on Hiring Full-Time Teachers, by State: 1990-91
- 4.9 Percentage of Principals Who Thought Various Groups Had a Great Deal of Influence on Setting a Discipline Policy, by State: 1990-91
- 4.10 Percentage of Public School Teachers Who Think They Have a Great Deal of Influence on Certain Issues, by State: 1990-91

List of Figures

1. School and Student Characteristics by State

- 1.1A Percentage of Public Schools in Central Cities, by State: 1990-91
- 1.1B Percentage of Public Schools in Rural Areas, by State: 1990-91
- 1.3 Percentage of Public School Students Who Are Minority, by State: 1990-91
- 1.4A Percentage of Public School Students in Central Cities Who Are Minority, by State: 1990-91
- 1.4B Percentage of Public School Students in Urban Fringes or Large Towns Who Are Minority, by State: 1990-91
- 1.5A Average Size of Public Elementary Schools, by State: 1990-91
- 1.5B Average Size of Public High Schools, by State: 1990-91
- 1.6 Public School Student/Teacher Ratio, by State: 1990-91
- 1.7 Difference Between the Percentages of Public School Students and Teachers Who are Minority, by State: 1990-91
- 1.9 Percentage of Public Elementary School Students Receiving Chapter 1 Services and Free or Reduced Price Lunches, by State: 1990-91

2. Teacher and Principal Characteristics by State

- 2.1A Percentage of Public School Teachers Who Are Minority, by State: 1990-91
- 2.1B Percentage of Public Schools With Fewer than 1% Minority Teachers, by State: 1990-91
- 2.1C Percentage of Public School Principals Who Are Minority, by State: 1990-91
- 2.2 Percentage of Grades K-6 Public School Teachers Who Are Female, by State: 1990-91
- 2.3A Percentage of Public Elementary School Teachers Under 30, by State: 1990-91
- 2.3B Percentage of Public Elementary School Teachers Aged 55 or Older, by State: 1990-91
- 2.4A Percentage of Public Secondary School Teachers Under 30, by State: 1990-91
- 2.4B Percentage of Public Secondary School Teachers Aged 55 or Older, by State: 1990-91
- 2.5A Percentage of Grades 9-12 Public School Science Teachers Who Are Female, by State: 1990-91
- 2.5B Percentage of Grades 9-12 Public School Mathematics Teachers Who are Female, by State: 1990-91
- 2.6A Percentage of Public School Teachers Who Are Newly Hired, by State: 1990-91
- 2.6B Percentage of Newly-Hired Public School Teachers Who Are First-Time Teachers, by State: 1990-91
- 2.7 Percentage of Public School Teachers Who Plan to Stay in Their Position as Long as They Are Able, by State: 1990-91
- 2.8 Percentage of Public School Principals Who Plan to Stay in Their Position as Long as They are Able, by State: 1990-91
- 2.9A Average Salary of Full-Time Public School Teachers, by State: 1990-91
- 2.9B Average Salary of Public School Principals by State: 1990-91
- 2.10A Average Salaries of Public School Teachers with 1-2 Years of Experience by State: 1990-91
- 2.10B Average Salaries of Public School Teachers with More Than 20 Years of Experience by State: 1990-91
- 2.11 Percentage of Female Public School Principals by State: 1990-91

3. Preparation of Teachers by State

- 3.1A Percentage of Grades 9-12 Public School Teachers With Science as Their Main Assignment Who Have a Major in a Science or Science Education, by State: 1990-91
- 3.1B Percentage of Grades 9-12 Public School Teachers With Mathematics as Their Main Assignment Who Have a Major in Mathematics or Mathematics Education, by State: 1990-91
- 3.2A Percentage of Grades 9-12 Public School Teachers With English as Their Main Assignment Who Have a Major in English or English Education, by State: 1990-91
- 3.2B Percentage of Grades 9-12 Public School Teachers With Social Studies as Their Main Assignment Who Have a Major in a Social Science or Social Studies Education, by State: 1990-91
- 3.3 Percentage of Grades K-8 Public School Teachers With a Major in Pre-Elementary or Elementary Education, by State: 1990-91
- 3.4A Percentage of Public School Teachers With 1-2 Years of Experience, by State: 1990-91
- 3.4B Percentage of Public School Teachers With More than 20 Years of Experience, by State: 1990-91

4. Conditions for Teaching by State

- 4.1 Grades K-6 Average Class Size, by State: 1990-91
- 4.2 Average Size of Grades 9-12 Public School Science Classes, by State: 1990-91
- 4.3 Average Size of Grades 9-12 Public School Mathematics Classes, by State: 1990-91
- 4.4A Average Size of Grades 9-12 Public School English Classes, by State: 1990-91
- 4.4B Average Size of Grades 9-12 Public School Vocational Education Classes, by State: 1990-91
- 4.6A Average Hours per Week That Grades 4-6 Public School Teachers in Self-Contained Classes Spent Teaching Arithmetic/Mathematics, by State: 1990-91
- 4.6B Average Hours per Week That Grades 4-6 Public School Teachers in Self-Contained Classes Spent Teaching Science, by State: 1990-91
- 4.6C Average Hours per Week That Grades 1-3 & 4-6 Public School Teachers in Self-Contained Classes Spent Teaching Core Subjects, by State: 1990-91
- 4.9A Percentage of Public School Principals Who Thought Each Group Had a Great Deal of Influence on Various Decisions: 1990-91
- 4.9B Percentage of Public School Principals Who Thought They Had a Great Deal of Influence on Hiring Full-Time Teachers, by State: 1990-91
- 4.10A Percentage of Teachers Who Thought They Had a Great Deal of Influence on Certain Issues: 1990-91
- 4.10B Percentage of Public School Teachers Who Thought They Had a Great Deal of Influence on Establishing the School Curriculum, by State: 1990-91

INTRODUCTION

Schools and Staffing Survey

In the 1987-88 school year, the National Center for Education Statistics (NCES) launched a new survey with the goal of obtaining comprehensive, reliable data on the characteristics and condition of the nation's elementary and secondary schools and the teachers and administrators in the schools. The "Schools and Staffing Survey" (SASS) is conducted through questionnaires mailed to teachers, principals, and district administrators in a sample of the nation's public and private schools. It was conducted again in 1990-91 and 1993-94, and will be conducted again in 1997-98.

The Schools and Staffing Survey is designed to provide data on the Nation's elementary and secondary teaching force, aspects of teacher supply and demand, teacher workplace conditions, characteristics of school administrators, and school policies and practices. A major purpose of SASS is to provide comparable, reliable state-level statistics on the characteristics of schools and educators. The sample is designed to provide national estimates of schools, districts, teachers, and principals, and state-level estimates for public schools, districts, teachers, and principals. In the 1990-91 school year, SASS was administered for the second time. The sample for the 1990-91 survey comprised 9,500 public schools and principals, 5,400 school districts, and 56,000 public school teachers. The sample also included 3,000 private schools and 9,000 private school teachers. The survey sample was representative of public schools and teachers in each state. The average state sample was 183 schools and 939 teachers. (See the Technical Notes in Appendix D for more information on the SASS design.)

Purpose of SASS by State

With the completion of the second round of SASS in the 1990-91 school year, NCES officials recognized a need to better inform the states about the uses of the survey results at the state level. Some of the data collected through the SASS questionnaires are reported by NCES, and the data files are further analyzed by education researchers. However, many policymakers and educators are not aware of the potential of SASS for informing education issues at the state level.

SASS by State highlights some state-by-state statistics that can be produced from the SASS data. The specific survey items were selected for this publication to illustrate how SASS can provide data to inform policy, funding, and program issues faced by many state and local education decision-makers. *SASS by State* demonstrates the range of data collected through SASS, but note it highlights only a subset of the data that are available. The tables and graphs were designed to illustrate a state's current status relative to other states. These examples of analyses with SASS may suggest further analyses with other combinations of SASS items.

For states, one of the strengths of SASS is the capacity to report and analyze cross-tabulations of multiple variables, such as the percentage of math teachers who are female, and to compare a state's percentage with other states and the nation. The graphs and tables included in *SASS by State* display a variety of cross-tabulations of SASS items from the Teacher, School, Administrator, and District surveys.

The introduction to each of the four chapters summarizes data available from SASS and highlights specific data displayed in *SASS by State*. The bar graphs and maps following each table can be copied as overhead transparencies or hand-outs for presentations comparing a state's data with other states or the nation. They illustrate state statistics reported in the corresponding table.

The Appendices provide state estimates from SASS used to produce the statistics in the tables; standard errors for tables; and background information on the SASS sample, data collection, and definitions.

Because all of the statistics in the tables and figures are based on responses from a sample of teachers or administrators, the standard error tables should be consulted by the reader to determine the degree of confidence that can be placed on any given statistic. See the Technical Notes in Appendix D for further explanation of standard errors.

1. SCHOOL AND STUDENT CHARACTERISTICS IN EACH STATE

Decisions about issues concerning education funding, reform initiatives, and staffing require good information about the key dimensions of education systems, and how systems differ. Because the U.S. is large and very diverse in geography and population density, educators and administrators are often asked about variation across states both in the number of schools and school districts and in demographic characteristics of the schools and districts.

Examples of SASS Analyses by State

State systems of education differ significantly not only by size of enrollment, but also by the number of schools and the size of the schools. For example, some small enrollment states have a relatively large number of districts and schools. Tables 1.1 and 1.2 illustrate that in some states, almost all students are in rural schools, while in others a large majority of students are in urban schools. In Table 1.5, the average size of schools are arrayed by state for three school levels: Elementary (high grade 6 or lower, no grade above 8, or ungraded); Middle Level (Low grade 4 to 7, high grade 4 to 9); and High School (grade 12, low grade 9). The data from SASS allow state and local decision-makers to compare the size and locale of their schools to the schools in other states.

SASS data can also be used to assess the characteristics of students in their state in relation to other states and the nation. For example, Table 1.3 shows state student populations by race/ethnic composition and Table 1.4 illustrates minority student enrollments by community type. State-level data from SASS can also be used to compare student minority enrollments with the minority composition of the teaching force and principals, as shown in Table 1.7. State-level data from SASS can also be used to estimate the proportion of students enrolled in federal programs such as Chapter 1 (Table 1.8), and to examine by state the number of disadvantaged students and the availability of Chapter 1 services (Figure 1.9).

Other Data Available in SASS

SASS by State only highlights some of the state-level from SASS. Other characteristics of the schools in each state can be obtained from the Schools and Staffing Survey results, including: staffing patterns, teacher hiring and turnover, length of school day and year, student-teacher ratios, school services and programs (e.g., bilingual education, English as a second language, remedial reading and math, programs for handicapped students, and after school programs), and high school graduation and college application rates. SASS results can also be used to obtain statistics on the career history and experience of teachers and the background of newly hired teachers in each state.

2. TEACHER AND PRINCIPAL CHARACTERISTICS BY STATE

Many of the statistics from the Schools and Staffing Survey can be used at the national and state levels to obtain a comprehensive picture of the teaching force in elementary and secondary schools. One of the tasks of the National Center for Education Statistics is producing data for studying teacher supply and demand. Data on the demographic characteristics of current teachers, the number of teachers leaving and being hired, and current conditions and incentives for teaching contribute to understanding teacher supply and demand.

Examples of SASS Analyses by State

The tables and graphs in this section highlight state-by-state differences in the gender, race/ethnicity, and age of teachers and principals, as well as variation by state in staff salaries and recent hiring patterns of teachers. Table 2.1 and accompanying Figures show the distribution of minority teachers and principals across schools in each state. Tables 2.2-2.5 and accompanying Figures illustrate state differences in the age, gender, and race/ethnicity of teachers by grade level and in science and mathematics. Table 2.6 highlights state-by-state data on the percentage of "newly hired" in 1990-91 and the percentage of teachers who were "new, first-year teachers." The plans of teachers and principals to remain in education are presented in Tables 2.7 and 2.8, and variation in average salaries by state are highlighted in Tables 2.9 and 2.10. Table 2.11 illustrates state differences in gender and race/ethnicity of principals.

Other Uses of SASS Staffing Data

These data on teachers in public schools can be used by states to analyze specific aspects of teacher supply and demand, such as the number of new, first-year teachers in urban vs. suburban vs. rural schools. States could identify the proportion of mathematics and science teachers who are approaching retirement. Data on the demographic characteristics of teachers can also be tabulated according to school conditions, such as school size, average class size, or rate of teacher turnover.

Other state-level statistics on characteristics of teachers can be produced from SASS, including the numbers of teachers assigned to subject areas (e.g., English, social studies, science, math, vocational, bilingual education, special education), grade levels of assignments, teacher workload, job mobility, and non-education employment. Characteristics of classes taught by elementary teachers and secondary teachers can also be analyzed.

Characteristics of school principals can also be analyzed by state with data from the SASS school administrator survey. Data are available on principal age, experience, employment history and education, and opinions and attitudes. The data derived from this survey provide insight into qualifications of school administrators, school problems administrators perceive as serious, and how administrators perceive their influence on school policy.

3. PREPARATION OF TEACHERS BY STATE

In addition to better data on the demographic characteristics of teachers, education decision-makers need better information on the qualifications of our teachers. As education reform is proceeding in states, more emphasis is being placed on improving the knowledge and skills of teachers for teaching specific subject areas and grade levels. Many decision-makers are likely to want valid statistical indicators of how well prepared teachers are for their specific teaching assignments.

Many states do not have data systems that can efficiently inform decision-makers on the extent of preparation of teachers in specific subjects or grades. SASS provides several useful, reliable state-level indicators of teacher preparation.

Examples of SASS Analyses by State

In the SASS Teacher Questionnaire, teachers report the subjects and grade levels they are assigned to teach. Teachers' subject assignments can be cross-tabulated with measures of the extent of preparation of teachers in their teaching fields. First, SASS data provide a state-by-state indicator of the proportion of teachers who hold a degree in the field in which they are currently teaching. Tables 3.1 and 3.2 and accompanying graphs illustrate state-level statistics on the percentages of high school teachers in mathematics, science, social studies, and English who have a major in their respective teaching fields. Table 3.3 shows the percentage of elementary teachers with a major in elementary education and the percentage with a degree beyond the bachelor's level.

Another measure of teacher preparation is the number of years of teaching experience. Research has demonstrated that teacher experience is positively related to student outcomes, particularly at the aggregate level of a state, district, or school. Table 3.4 shows the average years of teacher experience by state, as well as the percentage of teachers at several levels of experience.

Other Data Available in SASS

The SASS teacher survey also collects data on other possible measures of preparation. State-by-state data are available on type and field of teacher certification. The percentage of teachers with advanced degrees can be reported, as well as the number of continuing education credits teachers have earned.

4. CONDITIONS FOR TEACHING BY STATE

SASS data aggregated by state provide information about conditions within schools that affect teaching and learning. Data about school conditions such as class size, teaching time per subject, and teacher participation in decision-making may help state and local policymakers to analyze various issues such as teacher attrition, support for or resistance to reform initiatives, and plans for reorganizing staff in schools. Combining information about schools and teachers also allows decision-makers to examine how school and district factors affect movement in and out of the teaching profession.

Examples of SASS Analyses by State

Class size varies widely within and between states. Tables 4.1-4.4 provide state averages for number of students in elementary classrooms and class size of high school science, mathematics, English, and vocational education classes. Figures accompanying each table illustrate the degree of variation in class size.

In SASS, elementary teachers report on the characteristics of their classes, such as the amount of class time spent in the past week on each academic subject as shown in Tables 4.5 and 4.6. Teachers and principals report their perceptions of a variety of school conditions. Teachers' responses concerning their influence in determining discipline policy, curriculum, ability grouping, and the content of in-service programs are shown in Table 4.10, while principals views on who (teachers, principal, district level) have important roles in making decisions on curriculum, hiring, and discipline policy are shown in Tables 4.7-4.9.

Other Data Available in SASS

Elementary teachers reported on the class structure (e.g., self-contained vs. team teaching) and characteristics of the students (high vs. low ability vs. mixed). Secondary teachers reported information on each class they taught, including data on course difficulty, student achievement level, and student gender and race/ethnicity.

Teachers and principals also responded to questions on their views about problems such as absenteeism, violence in school, and student alcohol and drug use. Teachers reported their attitudes about a range of school issues that may affect teaching, such as staff collegiality, administrative support, appropriate teaching assignments, and student motivation.

APPENDIX C

Definitions

Community Type

Community type is derived from the seven-category "urbanicity" code (locale) developed by Johnson.¹ The locale code is based on the school's mailing address matched to Bureau of the Census data files containing population density data, Standard Metropolitan Statistical Area (SMSA) codes, and a Census code defining urban and rural areas. For this report, the locale codes are aggregated into four community types:

Central City. A large central city (a central city of an SMSA with population greater than or equal to 400,000 or a population density greater than or equal to 6,000 per square mile) or a mid-size central city (a central city of an SMSA, but not designated as a large central city).

Urban fringe/large town. Urban fringe of a large or mid-size city (a place within an SMSA of a large or mid-size central city and defined as urban by the U.S. Bureau of the Census) or a large town (a place not within an SMSA, but with a population greater than or equal to 25,000 and defined as urban by the U.S. Bureau of the Census).

Small Town. Town not within an SMSA and with a population less than 25,000 and greater than or equal to 2,500 people.

Rural. A place with less than 2,500 people or a place having a ZIP Code designated rural by Census.

Minority

A person is considered a member of a racial-ethnic minority if they are American Indian or Alaska Native; Asian or Pacific Islander; Hispanic, regardless of race (Mexican, Puerto Rican, Cuban, Central or South American, or other culture or origin); Black (not of Hispanic origin).

Public School

A public school is defined as an institution that provides educational services for a least one of grades 1-12 (or comparable ungraded), has one or more teachers to give instruction, is located in one or more buildings, receives public funds as primary support, has an assigned administrator, and is operated by an education agency. Schools in juvenile detention centers and schools located on military bases and operated by the Department of Defense are included.

¹F. Johnson, *Assigning Type of Locale Codes to the 1987-88 CCD Public School Universe*. Technical Report, Data Series: SP-CCD-87118-7,4, CS 89-194 (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, 1989).

Elementary. A school that has grade 6 or lower, or “ungraded” and no grade higher than the 8th.

Middle Level. A school that has low grade 4 to 7 and high grade 4 to 9.

High School. A school that has grade 12 and no grade lower than grade 9.

Teacher

For the purposes of SASS, a teacher is any full- or part-time teacher whose primary assignment is to teach in any of grades K-12. Part-time teachers are those who reported working less than full time as a teacher at their school. Itinerant teachers and long-term substitutes who are filling the role of a regular teacher on an indefinite basis are also included. An itinerant teacher is defined as a teacher who taught at more than one school. The following individuals are not considered teachers: short-term substitutes, student teachers, nonteaching specialists (such as guidance counselors, librarians, nurses, psychologists), administrators, teacher’s aides, or other professional or support staff.

Teachers are classified as elementary or secondary on the basis of the grades they teach rather than the schools in which they teach. An elementary school teacher is one who, when asked for the grades taught, checked:

- Only “ungraded” and is designated as an elementary teacher on the list of teachers provided by the school; or
- 6th grade or lower, or “ungraded” and no grade higher than 6th; or
- 6th grade or lower and 7th grade or higher, and reported a primary assignment of prekindergarten, kindergarten, or general elementary; or
- 7th and 8th grades only, and reported a primary assignment of prekindergarten, kindergarten, or general elementary; or
- 6th grade or lower and 7th grade or higher, and reported a primary assignment of special education and is designated as an elementary teacher on the list of teachers provided by the school; or
- 7th and 8th grades only, and reported a primary assignment of special education and is designated as an elementary teacher on the list of teachers provided by the school.

A secondary school teacher is one who, when asked for the grades taught, checked:

- “Ungraded” and is designated as a secondary teacher on the list of teachers provided by the school; or

- 6th grade or lower and 7th grade or higher, and reported a primary assignment other than prekindergarten, kindergarten, or general elementary; or
- 9th grade or higher, or 9th grade or higher and “ungraded”; or
- 7th and 8th grades only, and reported a primary assignment other than prekindergarten, kindergarten, general elementary, or special education; or
- 7th and 8th grades only, and reported a primary assignment of special education and is designated as a secondary teacher on the list of teachers provided by the school; or
- 6th grade or lower and 7th grade or higher, or 7th and 8th grades only, and is not categorized above as either elementary or secondary.

Newly Hired Teachers. Newly hired teachers are teachers who were newly hired by the school district for the 1990-91 school year. It includes teachers returning from unpaid leave of absence of one school year or more, but does not include substitute teachers.

New First-Time Teachers. New first-time teachers are newly hired teachers who taught for the first time in 1990-91.

APPENDIX D

Technical Notes

SAMPLE SELECTION¹

For the Schools and Staffing Survey (SASS), schools were selected first. Each one selected received a school questionnaire and an administrator questionnaire. Next, a sample of teachers was selected within each school, and each received a teacher questionnaire. A "Teacher Demand and Shortage" (TDS) questionnaire was sent to the local education agency (LEA) associated with each selected school. Also, an additional sample of public school districts not associated with schools received the TDS questionnaire.

The public sample for the SASS conducted during the 1990-91 school year included 9,586 schools and administrators, 56,051 teachers, and 5,515 local education agencies. To improve estimates of change between 1988 and 1991, the sample selection process controlled the amount of overlap between the 1988 and 1991 school samples, setting it at 30 percent for public schools.

The SASS was designed to provide national and state estimates for public schools; state elementary, state secondary and national combined estimates for public schools; national and state estimates of change from 1988 to 1991 in school-level characteristics; and national estimates for schools with greater than 25 percent American Indian student enrollment. The teacher survey was designed to support national comparisons between new and experienced teachers. Comparisons between bilingual and non-bilingual teachers are possible at the national level.

Selection of Schools

The public school sample of 9,586 schools was selected primarily from the 1988-89 school year Common Core of Data (CCD) file. The CCD is based on survey data collected annually by NCES from all state education agencies, and is believed to be the most complete list of public schools available. The frame includes regular public schools, BIA schools, Department of Defense operated military base schools, and nonregular schools such as special education, vocational, and alternative schools. The public schools in the sampling frame were stratified first into one of four types: A) BIA (Bureau of Indian Affairs) schools; B) American Indian schools (schools with 25 percent or more Native American students); C) schools in Delaware, Nevada, and West Virginia (where it was necessary to implement a different sampling strategy to ensure that at least one school from each LEA in the state was included); and D) all other schools. Type A schools were stratified by Arizona, New Mexico, South Dakota, and all other states; Type B schools were stratified by Arizona, North Dakota, Oklahoma, and all other states (except Alaska, since most Alaskan schools have high Native American enrollment); type C schools were stratified by state first and then by LEA; and Type D schools were stratified by state (all states and the District

¹The discussion is limited to the public school components of SASS. For a detailed description of the sample design, see Steven Kaufman and Hertz Huang, *1991 Schools and Staffing Survey: Sample Design and Estimation*, Technical Report, NCES 93-449 (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, 1993).

of Columbia except Delaware, Nevada, and West Virginia). The next level of stratification was by grade level (elementary, secondary, or combined).

Before sampling, non-BIA schools were sorted within each stratum by state, LEA urbanicity (seven categories), LEA zip code (first three digits), CCD LEA ID number (a unique number assigned to each school district by NCES), school percent minority enrollment (four categories), highest grade in school, school enrollment, and CCD School ID. Schools were systematically selected with probability proportional to the square root of the number of teachers within a school as reported on the CCD file. BIA schools were selected in a similar manner, but by using the square root of the enrollment rather than the number of teachers.

Selection of Teachers

All 56,051 public school teachers in the teacher sample were selected from the sample of public schools. The average number of teachers selected per school were 3.49, 6.98, and 5.23 teachers for public elementary, secondary, and combined schools, respectively. Each sample school provided a list that included all full- and part-time teachers, itinerant teachers, and long-term substitutes. Within each school, teachers were stratified into one of five teacher types in the following hierarchical order: 1) Asian or Pacific Islander; 2) American Indian, Aleut, or Eskimo; 3) bilingual/ESL; 4) new teachers (those who were in their first, second, or third year of teaching); and 5) experienced teachers. Within each teacher stratum, elementary teachers were sorted into general elementary, special education, and "other" categories; and secondary teachers were sorted into mathematics, science, English, social studies, vocational education, and "other" categories. When combined schools had both elementary and secondary teachers, the teachers were sorted by grade level/primary field of teaching.

Within each school and teacher stratum, teachers were selected systematically with equal probability. The numbers in the strata were as follows: 1,475 Asian or Pacific Islander teachers; 1,259 American Indian, Aleut, or Eskimo teachers; 1,957 bilingual teachers; 5,970 new teachers, and 45,390 experienced teachers. Teachers were allocated to schools on the basis of the school's weighted measure of size over all schools in the school stratum.

Selection of LEAs

All LEAs that had at least one school selected for the school sample were included in the LEA sample for the TDS Survey. Each Bureau of Indian Affairs and Department of Defense school was defined to be an LEA. Some LEAs do not have schools, but hire teachers who teach in schools in other LEAs. To ensure representation of these teachers, a sample of LEAs without eligible schools was selected. Only 14 of the 135 were actually in scope (that is, were an operating public school agency that reported hiring teachers). All LEAs in Delaware, Nevada, and West Virginia were included to reduce high standard errors in these states. The total LEA sample was 5,515.

Changes in the SASS Design from 1987-88 to 1990-91

Based on an evaluation of the 1987-88 SASS, the following changes were made in the 1990-91 sample design:

In 1990-91, the CCD school file was used as the frame for public schools rather than the QED file, which was used in 1987-88. This change was implemented to help make SASS school estimates consistent with those of the CCD. The CCD defines a school as an administrative unit with a principal, while the QED defines a school as a physical location. Because a single location sometimes has multiple units, the QED list has fewer schools than the CCD. Consequently, the SASS estimate of the number of schools was less than the CCD estimate in 1987-88.

The school sample was reallocated to produce separate state estimates at the elementary and secondary levels. The 1987-88 sample was designed to be reliable only in the aggregate at the state level.

To improve the precision of the estimates of change from 1987-88 to 1990-91, a 30 percent overlap of the public school sample was built into the 1990-91 design. In the 1987-88 survey, bilingual and new teachers were oversampled. In 1990-91, Native American teachers and Asian and Pacific Islander teachers as well as bilingual and new teachers were oversampled.

In 1990-91, schools with 25 percent or more Native American enrollment were oversampled. In addition, a large sample of schools run by or affiliated with the Bureau of Indian Affairs was included.

In 1990-91, the TDS, school, administrator, and teacher files were imputed for missing data. In 1987-88, only the TDS and school files were imputed. The impact on estimates of change between 1987-88 and 1990-91 is unknown and dependent on the variable of interest.

To make the 1990-91 SASS estimated teacher counts from the school and teacher files consistent, the teacher file weights were adjusted so that they equaled the teacher estimate (head count) from the school file. In 1987-88, the teacher counts on the teacher file were smaller than those on the school file.

DATA COLLECTION PROCEDURES

The data were collected for the National Center for Education Statistics (NCES) by the U.S. Bureau of the Census. Questionnaires were mailed to school districts and administrators in December 1990 and to schools and teachers in January and February 1991. Six weeks later, a second questionnaire was sent to each nonrespondent. A telephone follow-up of nonrespondents was conducted between March and June.

WEIGHTING

Weights of the sample units were developed to produce national and state estimates for public schools, teachers, administrators, and LEAS. The basic weights were the inverse of the probability of selection, and were adjusted for nonresponse and to adjust the sample totals (based on responding, nonresponding, and out of scope cases) to the frame totals in order to reduce sampling variability.

STANDARD ERRORS

The estimates in these tables are based on samples and are subject to sampling variability. The standard errors were calculated using the REPTAB program developed by MPR Associates, which uses a Balanced Repeated Replications method to calculate standard errors based upon complex survey designs. A version of this program is available from NCES upon request. The standard errors reported take into account the complex sample design, they are generally higher than standard errors calculated under the assumptions of simple random sampling. The standard errors indicate the accuracy of each estimate. If all possible samples of the same size were surveyed under the same conditions, an interval of 1.96 standard errors below to 1.96 standard errors above a particular statistic would include the universe value in approximately 95 percent of the cases. Note, however, that the standard errors do not take into account the effects of biases due to item nonresponse, measurement error, data processing error, or other possible systematic error. Standard errors for all tables are included in Appendix B.

ACCURACY OF ESTIMATES

The accuracy of any statistic is determined by the joint effects of nonsampling and sampling errors. Both types of error affect the estimates presented in this report.

Sampling Error

Sampling error occurs when members of a population are selected (sampled), and only sample members respond to survey questions. Estimates that are based on a sample will differ somewhat from the data that would have been obtained if a complete census of the relevant population had been taken using the same survey instruments, instructions, and procedures. The estimated standard error of a statistic is a measure of the variation due to sampling and can be used to examine the precision obtained in a particular sample.

Nonsampling Error

Both universe and sample surveys are subject to nonsampling errors, which are difficult to estimate. Nonsampling errors are of two kinds- nonobservation error and measurement error.

Nonobservation error may be due to noncoverage, which occurs when members of the population of interest are excluded from the sampling frame, and therefore are not included in the survey sample. Nonobservation error also occurs when sampled units (for example, schools, teachers, or students) refuse to answer some or all of the survey questions. These types of errors are referred to as questionnaire nonresponse (where the entire questionnaire is missing) and item nonresponse (where only some items of the questionnaire are missing). Weighting and imputation procedures were used to compensate for nonresponse.

Measurement error occurs when mistakes are made when data are edited, coded, or entered into computers (processing errors), when the responses that subjects provide differ from the "true" responses (response errors), and when measurement instruments such as tests or questionnaires fail to measure the characteristics they are intended to measure. Sources of response errors include differences in the ways that respondents interpret questions, faulty memory, and mistakes that respondents make when recording their answers. Because estimating the magnitude of these various types of nonsampling errors would require special experiments or access to independent data, information on these magnitudes is seldom available.

RESPONSE RATES AND IMPUTATION

The final weighted questionnaire response rates were as follows:

	Public
Teacher Demand and Shortage	93.5
Administrator	96.7
School	95.3
Teacher*	90.3

*The response rates for public school teachers do not include the 5 percent of the public schools that did not provide teacher lists. The effective response rate for public schools was 85.8 percent.

The table below summarizes the item-response rates. These rates are unweighted, and do not reflect additional response loss due to complete questionnaire refusal. The basic weights were adjusted to take into account non-response.

Survey	Range of Item-Response Rates	Percent of Items With a Response Rate of 90% or More	Percent of Items With a Response Rate of Less Than 75%	Items With a Response Rate of Less Than 75%
<i>LEA Survey</i>				
Public	85-100%	95%	0%	None
<i>Administrator Survey</i>				
Public	90-100%	100%	0%	None
<i>School Survey</i>				
Public	56-100%	77%	1%	31 a-i (part time) 33d(3)-(9)
<i>Teacher Survey</i>				
Public	76-100%	84%	0%	None

Values were imputed for items with missing data by 1) using data from other items on the questionnaire or a related component of the SASS (a school record, to impute district data, for example); 2) assigning data from the sample file, such as the CCD or 3) assigning data from a respondent with similar characteristics.

STATISTICAL PROCEDURES

In order to make proper inferences and interpretations from the statistics, several points must be kept in mind. First, comparisons resulting in large *t* statistics may appear to merit special note. However, this is not always the case, because the size of the *t* statistic depends not only on the observed differences in means or the percentages being computed, but also on the standard error of the difference. Thus a small difference between two groups with a much smaller standard error could result in a large *t* statistic, but this small difference is not necessarily noteworthy. Second, when multiple statistical comparisons are made on the same data, it becomes increasingly likely that an indication of a population difference is erroneous. Even when there is no difference in the population, at an alpha level of .05, there is still a 5 percent chance of concluding that an observed *t* value representing one comparison in the sample is large enough to be statistically significant. As the number of comparisons increases, so does the risk of making such an error in inference.

To guard against errors of inference based upon multiple comparisons, the Bonferroni procedure to correct significance tests for multiple contrasts should be used. This method corrects the significance (or alpha) level for the total number of contrasts made with a particular classification variable. For each classification variable, there are $(K*(K-1)/2)$ possible contrasts (or nonredundant pairwise comparisons), where *K* is the number of categories. For example, because race-ethnicity has five categories (black, non-Hispanic; white, non-Hispanic; Hispanic; Asian and Pacific Islander; and Native American), *K* = 5 and there are $(5*4)/2 = 10$ possible comparisons among the categories. The Bonferroni procedure divides the alpha level for a single *t* test (for example, .05) by the number of possible pairwise comparisons in order to provide a new alpha that is corrected for the fact that multiple contrasts are being made.

The formula used to compute the t statistic was as follows:

$$t = \frac{P_1 - P_2}{\sqrt{se_1^2 + se_2^2}}$$

where P_1 and P_2 are the estimates to be compared and se_1 and se_2 are their corresponding standard errors. This formula is valid only for independent estimates. When the estimates are not independent (for example, when comparing the percentages of students in different age groups), a covariance term should be added to the denominator of the test formula. Because the actual covariance terms are not known, the most conservative assumption is that the estimates are perfectly negatively correlated. Consequently $2*(se_1*se_2)$ should be added to the denominator of the t-test formula.

APPENDIX E

NCES Publications

163

NCES PUBLICATIONS

NCES products include a video, *America's Teachers: Profile of a Profession*, which presents data from six different surveys on public school teachers. This video may be ordered for \$12 plus \$3 shipping and handling by writing to the following address:

**National Archives Fulfillment Center, 8700 Edgeworth Drive,
Capital Heights, MD 20743-3701**

- A 184-page report, *America's Teachers: Profile of a Profession* (NCES 93-025), is available for \$13 from the Government Printing Office at the address below. Ask for stock number 065-000-00567-1.
- *Schools and Staffing in the United States: A Statistical Profile, 1990-91* (NCES 93-146) is available for \$14. Ask for stock number 065-000-00581-6.
- *Schools and Staffing in the United States: A Statistical Profile, 1987-88* (NCES 92-120) is available for \$12. Ask for stock number 065-000-00508-5.

**Superintendent of Documents
P.O. Box 371954, Pittsburgh, PA 15250-7954**

Other released reports include:

Copies of these publications can be obtained by calling 1-800-424-1616.

SASS DATASETS

Results from the first two survey cycles of SASS and TFS are also available on public use data tapes. Each dataset includes the responses to one survey from all participants in both public and private sectors. The following datasets may be purchased from:

**U.S. Department of Education, OERI/EIRD/Data Systems Branch
555 New Jersey Avenue, NW, Rm. 214
Washington, DC 20208-1847
(202) 219-1522 or 219-1847**

- **Public and Private School Survey (1987-88)**
- **Public and Private School Administrator Survey (1987-88)**
- **Public and Private School Teacher Survey (1987-88)**
- **Public and Private School Teacher Demand and Shortage Survey (1987-88)**
- **Public and Private School Teacher Followup Survey (1988-89)**
- **Public and Private School Survey (1990-91)**
- **Public and Private School Administrator Survey (1990-91)**
- **Public and Private School Teacher Survey (1990-91)**
- **Public and Private School Teacher Demand and Shortage Survey (1990-91)**
- **Public and Private School Teacher Followup Survey (1991-92)**

Public and private school datasets are available for each survey at a cost of \$175 for the first dataset and \$75 for each additional data set. All five datasets from a single cycle may be purchased for \$475. The entire collection of datasets from the two cycles may be purchased for \$850.

Restricted use data tapes are available after approval of a site licensing agreement. Information about a site licensing is available from:

**Associate Commissioner
Statistical Standards and Methodology Division, NCES/OERI
U.S. Department of Education
555 New Jersey Avenue, NW
Washington, DC 20208**

Data from the Schools and Staffing Survey of 1987-88 are available on CD-ROM. The data can be accessed using SAS or SPSS-PC software, or any program that uses ASCII files. Copies of the public use CD-ROMs are available from the Government Printing Office at the address below. The stock number is 065-000-00513-1 and the price is \$14 for a disk containing all five datasets. CD-ROMs for the 1990-91 SASS will be available in 1994.
