#### **ABSTRACT**

The Youth Risk Behavior Surveillance Systems monitor six categories of priority health risk behaviors among youth and young adults: (1) behaviors that contribute to intentional or unintentional injuries; (2) tobacco use (3) alcohol and other drug use; (4) sexual behaviors that contribute to unintended pregnancy and sexually transmitted diseases; (5) unhealthy dietary behaviors; and (6) physical inactivity. This report summarizes results from the national survey; 24 state surveys; and nine local surveys conducted among high school students during February through May 1993. Results include: 72% of all deaths among school-age youth and young adults are from four causes: motor vehicle crashes, other unintentional injuries, homicide, and suicide; 22.1% of youth had carried a weapon during the 30 days preceding the survey; 8.6% had attempted suicide during the 12 months preceding the survey; 53% of high school students had had sexual intercourse; 30.5% of high school students had smoked cigarettes during the 30 days preceding the survey; and only 15.4% had eaten five or more servings of fruits and vegetables on the day preceding the survey. The document includes a list of report s published in CDC surveillance summaries since January 1, 1985, 25 tables of data, and an appendix of state and local youth risk behavior surveillance system coordinators. #### Abstract

**Problem/Condition:** Priority health risk behaviors that contribute to the leading causes of mortality, morbidity, and social problems among youth and adults often are established during youth, extend into adulthood, and are interrelated.

Reporting Period: February through May 1993.

Description of System: The Youth Risk Behavior Surveillance System (YRBSS) monitors six categories of priority health risk behaviors among youth and young adults: behaviors that contribute to unintentional and intentional injuries, tobacco use, alcohol and other drug use, sexual behaviors, dietary behaviors, and physical activity. The YRBSS includes a national, school-based survey conducted by CDC and state and local school-based surveys conducted by state and local education agencies. This report summarizes results from the national survey, 24 state surveys, and nine local surveys conducted among high school students during February through May 1993.

Results and Interpretation: In the United States, 72% of all deaths among school-age youth and young adults are from four causes: motor vehicle crashes, other unintentional injuries, homicide, and suicide. Results from the 1993 YRBSS suggest that many high school students practice behaviors that may increase their likelihood of death from these four causes: 19.1% rarely or never used a safety belt, 35.3% had ridden with a driver who had been drinking alcohol during the 30 days preceding the survey, 22.1% had carried a weapon during the 30 days preceding the survey, 80.9% ever drank alcohol, 32.8% ever used marijuana, and 8.6% had attempted suicide during the 12 months preceding the survey. Substantial morbidity and social problems among adolescents also result from unintended pregnancies and sexually transmitted diseases, including human immunodeficiency virus (HIV) infection. YRBSS results ndicate that in 1993, 53.0% of high school students had had sexual intercourse, 52.8%

of sexually active students had used a condom during last sexual intercourse, and 1.4% ever injected an illegal drug. Among adults, 67% of all deaths are from three causes: heart disease, cancer, and stroke. In 1993, many high school students practiced behaviors that may increase the risk for these health problems: 30.5% of high school students had smoked cigarettes during the 30 days preceding the survey, only 12.4% had eaten five or more servings of fruits and vegetables during the day preceding the survey, and only 34.3% had attended physical education class daily.

Actions Taken: YRBSS data are being used nationwide by health and education officials to improve school health policies and programs designed to reduce risks associated with the leading causes of mortality and morbidity. At the national level, YRBSS data are being used to measure progress toward achieving 26 national health objectives and one of eight National Education Goals.

#### INTRODUCTION

In the United States, 72% of all deaths among school-age youth and young adults 5-24 years of age are from only four causes: motor vehicle crashes (30% of all deaths in this age group), other unintentional injuries (12%), homicide (19%), and suicide (11%) (1). Substantial morbidity and social problems also result from the approximately 1 million pregnancies that occur among adolescents (2) and the more than 10 million cases of sexually transmitted diseases (STD) that occur each year among young persons 15-29 years of age (3). In the United States, 67% of all deaths and substantial morbidity among adults ≥25 years of age are from only three causes; heart disease (35% of all deaths in this age group), cancer (25%), and stroke (7%) (1). Therefore, six categories of behaviors contribute to the leading causes of morbidity and mortality that affect the nation: behaviors that contribute to unintentional and intentional injuries; tobacco use; alcohol and other drug use; sexual behaviors that contribute to unintended pregnancy and STD (including human immunodeficiency virus [HIV] infection); unhealthy dietary behaviors; and physical inactivity. These behaviors, which frequently are interrelated, often are established during youth and extend into adulthood.

To monitor the priority health risk behaviors in each of these categories among youth and young adults, CDC developed the Youth Risk Behavior Surveillance System (YRBSS) (4). The YRBSS includes national, state,\* and local school-based surveys of high school students. National surveys were conducted in 1990, 1991, and 1993.<sup>†</sup> Comparable state and local surveys were first conducted in 1990, during which time 24 states and eight large cities participated. In 1991, 29 states and 10 cities conducted surveys, as did 43 states and 13 cities in 1993. This report summarizes the results from the 1993 national school-based survey and from selected state and local school-based surveys.

୪

<sup>\*</sup>U.S. territories are included as states.

<sup>&</sup>lt;sup>†</sup>The school-based components of the YRBSS were implemented in 1990 and 1991 and then biennially during odd-numbered years thereafter.

#### **METHODS**

#### Sampling

The 1993 national school-based survey employed a three-stage cluster sample design to produce a nationally representative sample of students in grades 9–12. The first-stage sampling frame contained 1,928 primary sampling units (PSUs), consisting of large counties or groups of smaller, adjacent counties. From the 1,928 PSUs, 50 were selected from 16 strata formed on the basis of the degree of urbanization and the relative percentage of black\* and Hispanic students in the PSU. The PSUs were selected with probability proportional to school enrollment size. At the second sampling stage, 199 schools were selected with probability proportional to school enrollment size. To enable separate analysis of black and Hispanic students, schools with substantial numbers of black and Hispanic students were sampled at relatively higher rates than were all other schools. The third stage of sampling consisted of randomly selecting one or two intact classes of a required subject (e.g., English or social studies) from grades 9–12 at each chosen school. All students in the selected classes were eligible to participate in the study.

A weighting factor was applied to each student record to adjust for nonresponse and for the oversampling of black and Hispanic students. Numbers of students in other racial/ethnic groups were too small for meaningful analysis. The weights were scaled so that the weighted count of students was equal to the total sample size and so that the weighted proportions of students in each grade matched national population proportions. SUDAAN was used to compute 95% confidence intervals (5). The national data are representative of students in grades 9–12 in public and private schools in the 50 states and the District of Columbia.

The 1993 state and local school-based surveys employed a two-stage cluster sample design to produce representative samples of students in grades 9–12 in their jurisdiction. In most states and cities, the first-stage sampling frame consisted of all public schools containing any of grades 9–12. Schools were selected with probability proportional to school enrollment size. At the second sampling stage, intact classes of a required subject or a required period (e.g., second period) were randomly selected. All students in the selected classes were eligible to participate in the study. Some states and cities modified these procedures to meet their individual needs. For example, in some states and cities classes were selected as the first stage of sampling, or all schools, rather than a sample of schools, were selected to participate.

The data sets from the 24 state and nine local surveys with an overall response rate of at least 60% and appropriate documentation were weighted (Table 1). Weighted data from most of these states and cities can be generalized to all public school students in grades 9–12 in the jurisdiction. The unweighted data from eight state and four local surveys apply only to the students participating in the survey. Surveys from Louisiana and New York excluded students from New Orleans and New York City, respectively.

For the national survey, the school response rate was 78%, and the student response rate was 90%, for an overall response rate of 70% (Table 1). A total of 16,296 questionnaires were completed in 155 schools. For the state and local surveys, school response rates ranged from 48% to 100%, student response rates ranged from 47% to

<sup>\*</sup>In this report, black refers to black, non-Hispanic students.

91%, and overall response rates ranged from 41% to 86%. Sample sizes ranged from 507 to 4,522. In the national, state, and local surveys, students were evenly distributed across grades and between sexes (Table 1).

Incidence rates for two variables were calculated to provide data for monitoring relevant year 2000 national health objectives. For weapon-carrying, students who replied that they carried a weapon 2 or 3 days were assigned a weapon-carrying frequency of 2.5; 4 or 5 days, 4.5; and  $\geq$ 6 days, 6.0. For physical fighting, students who reported fighting two or three times were assigned a fighting frequency of 2.5; four or five times, 4.5; six or seven times, 6.5; eight or nine times, 8.5; 10 or 11 times, 10.5; and  $\geq$ 12 times, 12.0.

#### **Data Collection**

Survey procedures were designed to protect the students' privacy by allowing for anonymous participation. The self-administered questionnaire was administered in the classroom during a regular class period. Students recorded their responses directly on a computer-scannable booklet or answer sheet. The core questionnaire contained 84 multiple-choice questions. State and local education agencies added or deleted items to meet individual needs. Local parental consent procedures were followed before survey administration.

#### **RESULTS**

## **Behaviors that Contribute to Unintentional Injuries**

## Safety-Belt Use

Nationwide, 19.1% of students rarely or never used safety belts when riding in a car or truck driven by someone else (Table 2). White\* male students (22.6%) were significantly more likely than white female students (11.5%) to rarely or never use safety belts, and 11th- and 12th-grade male students (25.1% and 24.9%, respectively) were significantly more likely than 11th- and 12th-grade female students (12.9% and 13.5%, respectively) to rarely or never do so. Black students (30.3%) were significantly more likely than white or Hispanic students (17.3% and 19.5%, respectively) to report this behavior. The prevalence rate of rarely or never using safety belts among the state surveys varied nearly eightfold from 6.3% to 48.3% (median: 26.9%) (Table 3). Among the local surveys, the prevalence rate varied nearly sevenfold from 8.4% to 57.0% (median: 33.4%).

## Motorcycle-Helmet Use

Nationwide, 26.7% of students had ridden a motorcycle during the 12 months preceding the survey. Of these students, 40.0% rarely or never wore a motorcycle helmet (Table 2). Male and female Hispanic students (58.3% and 62.3%, respectively) were significantly more likely than male and female white students (37.4% and 36.3%, respectively) to rarely or never wear a motorcycle helmet. The prevalence rate of rarely or never wearing a motorcycle helmet ranged from 16.0% to 70.0% (median: 42.1%) among the state surveys and from 30.4% to 68.9% (median: 42.2%) among the local surveys (Table 3).

#### Bicycle-Helmet Use

Nationwide, 75.3% of students had ridden a bicycle during the 12 months preceding the survey. Of these students, 92.8% rarely or never wore a bicycle helmet (Table 2). Black male students (97.6%) were significantly more likely than white male students (90.8%) to rarely or never wear a bicycle helmet. The prevalence rate of rarely or never wearing a bicycle helmet ranged from 82.0% to 98.0% (median: 95.7%) among the state surveys and from 71.2% to 98.4% (median: 95.5%) among the local surveys (Table 3).

### Riding with a Driver Who Had Been Drinking Alcohol

During the 30 days preceding the survey, approximately one third (35.3%) of students nationwide had ridden with a driver who had been drinking alcohol (Table 2). Hispanic male students (45.1%) were significantly more likely than white male students (34.7%) to report this behavior. Riding with a drinking driver was significantly more likely among 12th trade male students (42.5%) than among 9th- and 10th-grade male students (30.0% and 33.0%, respectively). State survey prevalence rates ranged from 22.6% to 51.9% (median: 36.4%), and local survey prevalence rates ranged from 23.9% to 45.7% (median: 32.0%) (Table 3).

#### Behaviors that Contribute to Intentional Injuries

### Carrying a Weapon

Nearly one fourth (22.1%) of students nationwide had carried a weapon (e.g., a gun, knife, or club) during the 30 days preceding the survey (Table 4). An estimated 92.0 weapon-carrying incidents occurred monthly per 100 students. Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to have carried a weapon. Weapon-carrying was significantly more likely among black female students (18.9%) than among white and Hispanic female students (6.9% and 11.5%, respectively). Prevalence rates ranged from 16.2% to 33.0% (median: 24.4%) among the state surveys and from 19.1% to 35.3% (median: 23.7%) among the local surveys (Table 5).

Nationwide, 7.9% of students had carried a gun during the 30 days preceding the survey (Table 4). Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to have carried a gun. Black male and black female students (20.9% and 3.8%, respectively) were significantly more likely to have done so than were white male and white female students (12.0% and 1.2%, respectively). State prevalence rates ranged threefold from 5.8% to 17.4% (median: 10.2%), and local prevalence rates ranged more than twofold from 6.6% to 14.0% (median: 10.0%) (Table 5).

## Engaging in a Physical Fight

Among students nationwide, 41.8% had been in a physical fight during the 12 months preceding the survey, and 4.0% had been treated by a doctor or nurse for injuries sustained in a physical fight during the same time period (Table 6). An estimated 136.8 physical fighting incidents occurred per 100 students per year. Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to have been in a physical fight. Participation in a physical fight was significantly more likely to have occurred among black female students (41.8%) than

among white female students (29.5%) and among 9th-grade students (50.4%) than among 10th- (42.2%), 11th- (40.5%), and 12th- (34.8%) grade students. Black male students (8.5%) were significantly more likely than black female students (4.3%) and white male students (4.2%) to have been injured in a physical fight. Among the state surveys, the prevalence rate of physical fighting ranged from 29.8% to 60.8% (median: 40.0%), and the prevalence rate of injurious physical fighting ranged from 2.4% to 12.2% (median: 4.4%) (Table 7). Among the local surveys, the prevalence rate of physical fighting ranged from 35.2% to 51.4% (median: 42.9%), and the prevalence rate of injurious physical fighting ranged from 4.5% to 9.3% (median: 6.3%).

#### School-Related Violence

Nationwide, 4.4% of students had missed at least 1 day of school during the 30 days preceding the survey because they felt unsafe at school or felt unsafe traveling to or from school (Table 8). Both Hispanic and black male and female students were significantly more likely than white male and female students to miss school because they felt unsafe, and 9th-grade female students (6.4%) were significantly more likely than 12th-grade female students (2.7%) to miss school for this reason. Ninefold differences were observed in the prevalence rates from the state surveys, which ranged from 2.5% to 23.1% (median: 5.4%) (Table 9). Nearly threefold differences were observed in the prevalence rates from the local surveys, which ranged from 6.8% to 17.5% (median: 10.5%).

The prevalence of weapon-carrying on school property during the 30 days preceding the survey was 11.8% nationwide (Table 8). Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to have carried a weapon on school property. Black female students (11.9%) were significantly more likely than Hispanic female (6.6%) or white female (3.4%) students to have done so. Prevalence rates among the state surveys ranged from 7.9% to 19.3% (median: 12.3%) (Table 9). Prevalence rates among the local surveys ranged from 8.3% to 22.5% (median: 11.7%).

Nationwide, the prevalence of students who were threatened or injured with a weapon on school property during the 12 months preceding the survey was 7.3% (Table 8). White male students (8.1%) and black female students (9.8%) were significantly more likely than white female students (4.4%) to have been threatened or injured with a weapon. Male students in grades 10–12 (9.1%, 9.5%, and 7.6%, respectively) were significantly more likely than female students in the same grades (5.4%, 4.8%, and 3.3%, respectively) to have experienced this. Prevalence rates among the state surveys ranged from 5.8% to 15.2% (median: 8.3%) (Table 9). Prevalence rates among the local surveys ranged from 8.9% to 16.3% (median: 10.8%).

Nationwide, 16.2% of students had been in a physical fight on school property during the 12 months preceding the survey (Table 8). Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to have been in a physical fight on school property. Black n. and female students (28.6% and 15.5%, respectively) were significantly more likely than white male and female students (22.5% and 6.8%, respectively) to have experienced this. Male and female students in grade 9 (33.2% and 12.7%, respectively) were significantly more likely to have been in a physical fight on school property than those in grades 11 (20.0% and 7.0%, respectively) and 12 (16.5% and 6.1%, respectively). Among the state surveys,

the prevalence rate ranged from 12.5% to 39.1% (median: 16.1%) (Table 9). Among the local surveys, the prevalence rate ranged from 13.3% to 22.5% (median: 17.7%).

Nationwide, approximately one third of students (32.7%) had property (e.g., a car, clothing, or books) stolen or deliberately damaged on school property during the 12 months preceding the survey (Table 8). Across all racial/ethnic and grade subgroups (except Hispanic students), male students were significantly more likely than female students to have had property stolen or damaged. Male and female 9th-grade students (41.3% and 33.0%, respectively) were significantly more likely than male and female 12th-grade students (33.2% and 24.2%, respectively) to have experienced this. Prevalence rates ranged from 20.8% to 59.3% (median: 33.0%) among the state surveys and from 23.0% to 38.7% (median: 32.5%) among the local surveys (Table 9).

#### Suicide Ideation and Attempts

Nearly one four? (24.1%) of students nationwide had seriously considered attempting suicide during the 12 months preceding the survey (Table 10). Across all racial/ethnic subgroups, female students were significantly more likely than male students to have considered attempting suicide. Hispanic female students (34.1%) were significantly more likely than black and white female students (24.5% and 29.7%, respectively) to have considered this. Prevalence rates ranged from 13.8% to 29.3% (median: 25.1%) across the state surveys and from 18.9% to 25.7% (median: 22.7%) across the local surveys (Table 11).

More serious suicide ideation was observed among the 19.0% of students nation wide who had made a specific plan to attempt suicide during the 12 months preceding the survey (Table 10). Across all racial/ethnic and grade subgroups (except black students and 11th-grade students), female students were significantly more likely than male students to have made such a plan. Hispanic female students (26.6%) were significantly more likely than black female students (19.5%) to have made a plan to attempt suicide. Prevalence rates among the state surveys ranged from 11.8% to 29.1% (median: 20.3%). Prevalence rates among the local surveys ranged from 15.0% to 22.2% (median: 17.1%).

Nationwide, 8.6% of students had actually attempted suicide during the 12 months preceding the survey, and 2.7% reported an attempt that resulted in an injury, poisoning, or overdose that had to be treated by a doctor or nurse (Table 10). Across all racial/ethnic and grade subgroups, female students were significantly more likely than male students to have attempted suicide. Suicide attempts were significantly more likely among Hispanic male students (7.4%) than among white male students (4.4%) and among Hispanic female students (1.7%) than among white and black female students (11.3% and 11.2%, respectively). Ine percentage of students attempting suicide ranged from 7.8% to 26.3% (median: 10.2%) across the state surveys and from 9.6% to 13.5% (median: 10.8%) across the local surveys (Table 11). Across all racial/ethnic and grade subgroups (except black students and students in grades 9 and 12), female students were significantly more likely than male students to have made a suicide attempt that required subsequent medical attention (Table 10). The prevalence of injurious suicide attempts ranged from 1.9% to 9.4% (median: 3.1%) across the state surveys and from 2.3% to 4.7% (median: 3.6%) across the local surveys (Table 11).

#### **Tobacco Use**

#### Cigarette Use

Nationwide, 69.5% of students had ever tried cigarette smoking (Table 12). Students in grades 11 and 12 (73.3% and 73.9%, respectively) were significantly more likely than students in grades 9 and 10 (62.8% and 66.9%, respectively) to have done so. Prevalence rates among the state surveys ranged from 46.4% to 76.8% (median: 69.4%); among the local surveys, prevalence rates ranged from 59.3% to 69.7% (median: 64.7%) (Table 13).

Nearly one third of students (30.5%) nationwide had smoked cigarettes on ≥1 of the 30 days praceding the survey (i.e., current cigarette use) (Table 12). White and Hispanic male and female students were significantly more likely than black male and female students to report current cigarette use. Prevalence rates among the state surveys ranged from 17.4% to 38.9% (median: 30.9%); among the local surveys, prevalence rates ranged from 12.9% to 25.9% (median: 20.1%) (Table 13).

Nationwide, 13.8% of students had smoked cigarettes on ≥20 of the 30 days preceding the survey (i.e., frequent cigarette use) (Table 12). White students (16.1%) were significantly more likely than Hispanic and black students (7.7% and 4.6%, respectively) to report frequent cigarette use. Students in grades 11 and 12 (15.3% and 17.8%, respectively) were significantly more likely than students in grade 9 (8.8%) to do so. Prevalence rates among the state surveys ranged from 8.2% to 19.9% (median: 14.1%); among the local surveys, prevalence rates ranged from 3.0% to 10.5% (median: 6.1%) (Table 13).

Nearly one fourth (24.7%) of high school students had ever smoked at least one cigarette every day for 30 days (i.e., regular cigarette use) (Table 12). White students (28.4%) were significantly more likely than Hispanic and black students (18.6% and 9.2%, respectively) to report regular cigarette use, and Hispanic students were significantly more likel, than black students to report regular cigarette use. Students in grades 11 and 12 (27.2% and 28.4%, respectively) were significantly more likely than students in grade 9 (20.9%) to have done so. A tenfold variation was observed in prevalence rates across state surveys, which ranged from 3.1% to 32.4% (median: 24.7%). Prevalence rates among the local surveys ranged from 7.2% to 18.8% (median: 15.1%) (Table 13).

#### Smokeless Tobacco Use

Nationwide, more than one in 10 students (11.5%) had used smokeless tobacco during the 30 days preceding the survey (Table 12). Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to use smokeless tobacco. White male students (26.0%) were significantly more likely than Hispanic or black male students (8.0% and 4.7%, respectively) to do so. A twelvefold variation in prevalence 1 ites was observed across the state surveys, which ranged from 1.8% to 24.0% (median: 11.9%) (Table 13). A fourfold variation was observed across the local surveys, which ranged from 1.5% to 8.4% (median: 2.8%).

#### **Alcohol and Other Drug Use**

#### Alcohol Use

Nationwide, 80.9% of students had had at least one drink of alcohol during their lifetime (Table 14). Students in grades 11 and 12 (84.9% and 87.6%, respectively) were significantly more likely than students in grades 9 and 10 (72.9% and 76.8%, respectively) to have had at least one drink of alcohol. The prevalence of alcohol use across the state surveys ranged from 45.7% to 86.1% (median: 77.6%) (Table 15). The range across the local surveys was 60.5% to 79.0% (median: 73.4%).

Nationwide, nearly half of a'l students (48.0%) had had at least one drink of alcohol during the 30 days preceding the survey (i.e., current alcohol use) (Table 14). This behavior was significantly more likely among black male students (48.2%) than among black female students (37.1%) and among male students in grade 12 (60.5%) than among female students in grade 12 (52.0%). White female students (48.6%) were significantly more likely than black female students (37.1%) to report current alcohol use, as were male students in grades 11 and 12 (53.6% and 60.5%, respectively) compared with male students in grade 9 (40.2%). Female students in grade 12 (52.0%) were significantly more likely to engage in this behavior than female students in grade 9 (40.5%). Prevalence rates across the state surveys ranged from 26.0% to 61.2% (median: 47.3%), and across the local surveys, from 32.9% to 46.4% (median: 41.4%).

Nationwide, 30.0% of students had had five or more drinks of alcohol on at least one occasion during the 30 days preceding the survey (i.e., episodic heavy drinking) (Tab. 3 14). Across all racial/ethnic and grade subgroups (except 9th- and 10th-grade students), male students were significantly more likely than female students to report episodic heavy drinking. This behavior was significantly more common among white and Hispanic male (35.6% and 39.4%, respectively) and female (29.3% and 27.6%, respectively) students than among black male (25.1%) and female (13.3%) students; this behavior also was more common among male students in grades 11 and 12 (37.1% and 45.0%, respectively) than among those in grades 9 and 10 (24.0% and 27.2%, respectively). Female students in grade 12 (33.0%) were significantly more likely than female students in grades 9–11 (19.7%, 25.3%, and 25.1%, respectively) to report episodic heavy drinking. A more than fourfold variation was observed in prevalence rates across the state surveys, which ranged from 9.3% to 44.3% (median: 28.8%) (Table 15). Across the local surveys, prevalence rates ranged from 14.1% to 24.7% (median: 19.4%).

## Marijuana Use

Nearly one third (32.8%) of students nationwide had used marijuana during their lifetime, and 17.7% had used marijuana at least once during the 30 days preceding the survey (i.e., current marijuana use) (Table 14). Black male students were significantly more likely than black female students to report lifetime (41.1% and 26.3%, respectively) and current marijuana use (24.3% and 13.0%, respectively). Hispanic male students (41.5%) were significantly more likely than Hispanic female students (29.5%) to report lifetime marijuana use. Lifetime and current use was significantly more likely among male and female students in grade 12 than among male and female students in grade 9 were significantly more likely than female students in the same grade to report lifetime (28.8% and 19.7%, respectively) and current (16.3% and 9.7%, respectively) marijuana use. Male students in grade 12 (45.5%) were

significantly more likely than female students in the same grade (35.8%) to report lifetime marijuana use. Lifetime marijuana use ranged from 16.3% to 40.0% (median: 27.9%) across the state surveys and from 23.8% to 40.5% (median: 29.5%) across the local surveys (Table 15). Current marijuana use ranged from 7.4% to 22.0% (median: 14.1%) across the state surveys and from 11.8% to 22.7% (median: 17.8%) across the local surveys.

#### Cocaine Use

Nationwide, 4.9% of students had used cocaine during their lifetime, and 1.9% had used cocaine at least once during the 30 days preceding the survey (i.e., current cocaine use) (Table 16). Hispanic male and female students were significantly more likely than white and black male and female students to report lifetime and current cocaine use. White male and female students (5.3% and 3.9%, respectively) were significantly more likely than black male and female students (1.9% and 1.2%, respectively) to report lifetime cocaine use. A fourfold variation in lifetime and current cocaine use was observed across the state and local surveys (Table 17). Lifetime cocaine use ranged from 2.0% to 9.7% (median: 5.1%) among the state surveys and from 1.4% to 8.8% (median: 3.8%) among the local surveys. Current cocaine use ranged from 0.7% to 4.4% (median: 2.2%) among the state surveys and from 0.4% to 4.3% (median: 1.9%) among the local surveys.

Nationwide, 2.6% of students had used crack or freebase forms of cocaine during their lifetime (Table 16). Hispanic male (7.1%) and female (5.5%) students were significantly more likely than white and black male (2.6% and 1.6%, respectively) and female (2.0% and 0.6%, respectively) students to have used these drugs. A fivefold variation in crack or freebase use was observed across the state surveys, which ranged from 1.1% to 5.6% (median: 3.4%); a sevenfold variation was observed across the local surveys, which ranged from 0.7% to 5.0% (median: 2.0%) (Table 17).

#### Steroid Usa

Nationwide, 2.2% of students had used steroids without a doctor's prescription during their lifetime (Table 16). White and black male students and male students in grades 11 and 12 were significantly more likely than female students in the same subgroups to have used steroids. Lifetime steroid use ranged from 1.8% to 5.4% (median: 3.5%) across the state surveys and from 1.6% to 3.8% (median: 2.8%) across the local surveys (Table 17).

## Injected-Drug Use (IDU)

Nationwide, 1.4% of students had injected illegal drugs during their lifetime\* (Table 16). White male students (1.8%) and male students in grade 12 (1.9%) were significantly more likely than white female students (0.7%) and female students in grade 12 (0.4%) to have reported IDU. Prevalence rates for IDU ranged from 1.0% to 3.8% (median: 2.2%) across the state surveys and from 0.5% to 2.6% (median: 1.5%) across the local surveys (Table 17).

<sup>\*</sup>Students were classified as injecting-drug users only if they a) reported injecting-drug use not prescribed by a physician and b) answered "one or more" to any of these questions: "During your life, how many times have you used any form of cocaine including powder, crack, or freebase?"; "During your life, how many times have you used any other type of illegal drug such as LSD, PCP, ecstacy, mushrooms, speed, ice, heroin, or pills without a doctor's prescription?"; or "During your life, how many times have you taken steroid pills or shots without a doctor's prescription?"

#### Tobacco, Alcohol, and Other Drug Use on School Property

Nationwide, 13.2% of students had smoked cigarettes on school property during the 30 days preceding the survey (Table 18). White and Hispanic students (14.6% and 11.1%, respectively) were significantly more likely than black students (5.9%) to have done so. Across the state surveys, 8.2%–19.9% (median: 13.5%) of students had smoked cigarettes on school property (Table 19). Across the local surveys, the prevalence rates ranged from 4.0% to 17.0% (median: 9.7%).

11

Smokeless tobacco use on school property during the 30 days preceding the survey was reported by 6.8% of students nationwide (Table 18). Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to have used smokeless tobacco on school property. White male students (16.0%) were significantly more likely to have engaged in this behavior than black and Hispanic male students (2.8% and 4.4%, respectively). A fourfold variation was observed across the state surveys, which ranged from 3.8% to 16.2% (median: 7.4%) (Table 19). A threefold variation was observed across the local surveys, which ranged from 0.7% to 2.6% (median: 1.1%).

Nationwide, 5.2% of students had had at least one drink of alcohol on school property during the 30 days preceding the survey (Table 18). Male students in grade 12 (7.5%) were significantly more likely than female students in the same grade (3.5%) to have engaged in this behavior. Prevalence rates across the state surveys ranged from 4.1% to 12.3% (median: 6.2%) and across the local surveys from 4.1% to 12.2% (median: 6.2%) (Table 19).

Nationwide, 5.6% of students had used marijuana on school property during the 30 days preceding the survey (Table 18). Across all racial/ethnic subgroups, male students were significantly more likely than female students to have engaged in this behavior. Prevalence rates ranged from 1.8% to 8.1% (median: 4.5%) across the state surveys and from 4.6% to 9.3% (median: 5.8%) across the local surveys (Table 19).

Nearly one fourth (24.0%) of students had been offered, sold, or given an illegal drug on school property during the 12 months preceding the survey (Table 18). Among white and Hispanic students, male students were significantly more likely than female students to have been offered, sold, or given an illegal drug. Hispanic male and female students were significantly more likely than white and black male and female students to have experienced this. Prevalence rates across the state surveys ranged from 11.0% to 31.4% (median: 22.0%) and across the local surveys from 12.8% to 36.7% (median: 21.3%) (Table 19).

## Sexual Behaviors that Contribute to Unintended Pregnancy and STD

#### Sexual Intercourse

Nationwide, more than half (53.0%) of all students had had sexual intercourse during their lifetime (Table 20). Black, Hispanic, and 9th-grade male students were significantly more likely than female students in the same subgroups to have done so. Black male and female students (89.2% and 70.4%, respectively) were significantly more likely than white male and female students (49.3% and 47.4%, respectively) and Hispanic male and female (63.5% and 48.3%) students to have had sexual intercourse, and Hispanic male students (63.5%) were significantly more likely than white male students (49.3%) to have done so. Among female students, the prevalence rates increased significantly from grades 9–12; among male students the prevalence rates

increased significantly from grades 10–12. Prevalence rates ranged from 43.0% to 69.0% (median: 54.5%) across the state surveys and from 39.6% to 79.2% (median: 60.6%) across the local surveys (Table 21).

The percentage of students nationwide who had had sexual intercourse during their lifetime with four or more sex partners was  $i\bar{s}.\bar{s}\%$  (Table 20). Black and Hispanic male students and 9th- and 10th-grade male students were significantly more likely to have had four or more sex partners than were female students in the same subgroups. This behavior was significantly more likely among black male and female students (58.8% and 27.2%, respectively) than among Hispanic male and female students (26.3% and 11.0%, respectively) and white male and female students (15.2% and 13.3%). This behavior also was significantly more likely among male and female students in grades 11 (23.1% and 16.3%, respectively) and 12 (30.7% and 23.2%, respectively) than among male and female students in grades 9 (15.4% and 6.2%, respectively) and 10 (18.9% and 12.8%, respectively). Prevalence rates across the state surveys ranged from 11.4% to 30.1% (median: 19.3%) and across the local surveys from 14.8% to 45.3% (median: 25.9%) (Table 21).

More than one third (37.6%) of students nationwide had had sexual intercourse during the 3 months preceding the survey (i.e., current sexual activity) (Table 20). Black male students (65.1%) were significantly more likely than black female students (53.2%) to be currently sexually active. This behavior was significantly more likely among black male and female students (65.1% and 53.2%, respectively) than among white male and female students (32.9% and 35.2%, respectively) and Hispanic male and female students (40.7% and 37.9%, respectively); current sexual activity also was significantly more likely among male and female students in grade 12 than among male and female students in grades 9–11. Prevalence rates among the state surveys ranged from 28.5% to 50.6% (median: 38.4%) (Table 21). Prevalence rates among the local surveys ranged from 28.5% to 61.2% (median: 42.0%).

#### Condom Use

Among currently sexually active students nationwide, 52.8% reported that they or their partner had used a condom during last sexual intercourse (Table 20). Across all racial/ethnic and grade subgroups (except 9th-grade students), male students were significantly more likely than female students to have reported that a condom was used. White and black female students (46.1% and 47.8%, respectively) were significantly more likely than Hispanic female students (36.9%) to have reported condom use. This behavior was reported significantly more often by female students in grade 9 (59.2%) than by female students in grade 12 (41.2%) and by male students in grade 11 (64.8%) than by male students in grade 12 (51.5%). Prevalence rates across the state surveys ranged from 27.6% to 59.6% (median: 52.0%) and across the local surveys from 47.4% to 65.0% (median: 59.8%) (Table 21).

#### Birth Control Pill Use

Among sexually active students nationwide, 18.4% reported that they or their partner had used birth control pills during last sexual intercourse (Table 20). Black female students (20.6%) were significantly more likely than black male students (10.5%) to have reported use of birth control pills. This behavior was significantly more likely to have been reported by white female students (24.0%) than by Hispanic female students (15.3%) and by male and female students in grade 12 than by male students in

grades 9–11 and female students in grades 9–10. A sixfold variation in prevalence rates was observed across the state surveys, which ranged from 4.8% to 31.3% (median: 17.9%) (Table 21). More than a twofold variation was observed across the local surveys, which ranged from 7.8% to 18.8% (median: 11.5%).

#### **Dietary Behaviors**

#### Perceived Overweight

One third (34.3%) of all students nationwide thought they were overweight (Table 22). Across all racial/ethnic and grade subgroups, female students were significantly more likely than male students to identify themselves as being overweight. White and Hispanic female students (47.5% and 45.4%, respectively) were significantly more likely than black female students (32.2%) to consider themselves overweight. Hispanic male students (32.0%) were significantly more likely than white and black male students (23.9% and 20.8%, respectively) to identify themselves as being overweight. Prevalence rates across the state surveys ranged from 21.7% to 40.8% (median: 33.4%) and across the local surveys from 22.0% to 32.5% (median: 28.1%) (Table 23).

#### Attempted Weight Loss

Nationwide, 40.3% of students were attempting weight loss (Table 22). Across all racial/ethnic and grade subgroups, female students were significantly more likely than male students to have been attempting to lose weight. Attempted weight loss was significantly more likely among white and Hispanic female students (61.3% and 61.4%, respectively) than among black female students (44.0%). Hispanic male students (32.8%) were significantly more likely than white and black male students (22.3% and 19.9%, respectively) to have been trying to lose weight. Prevalence rates ranged from 28.7% to 47.3% (median: 41.5%) across the state surveys and from 28.5% to 40.5% (median: 36.4%) across the local surveys (Table 23).

#### Fruits and Vegetables

Nationwide, 15.4% of students had eaten five or more servings of fruits and vegetables\* during the day preceding the survey (Table 22). White male and 9th-grade male students (18.4% and 20.8%, respectively) were significantly more likely to have eaten five or more servings than were white female and 9th-grade female students (13.5% and 15.5%, respectively), and white male and female students (18.4% and 13.5%, respectively) were significantly more likely than black male and female students (11.0% and 7.2%, respectively) to have done so. Prevalence rates across the state surveys ranged from 7.6% to 21.4% (median: 14.6%) and across the local surveys from 10.0% to 21.2% (median: 12.5%) (Table 23).

## Foods Typically High in Fat Content

Two thirds (66.2%) of students nationwide had eaten two or fewer servings of foods typically high in fat content<sup>†</sup> during the day preceding the survey (Table 22). Across all racial/ethnic and grade subgroups, female students were significantly more likely than male students to have eaten two or fewer servings of such foods. White and Hispanic female students (77.1% and 79.0%, respectively) were significantly more likely to have

<sup>\*</sup>Fruit, fruit juice, green salad, and cooked vegetables.

Hamburgers, hot dogs, or sausage; french fries or potato chips, and cookies, doughnuts, pie,

done so than were black female students (63.2%), and Hispanic male students (66.2%) were significantly more likely than white and black male students (56.4% and 54.5%, respectively) to have done so. Across the state surveys, prevalence rates ranged from 58.4% to 89.9% (median: 63.2%), and across the local surveys, the prevalence rates ranged from 56.9% to 77.0% (median: 69.5%) (Table 23).

#### **Physical Activity**

#### Vigorous Physical Activity

Nearly two thirds (65.8%) of students nationwide had participated in activities that made them sweat and breathe hard for at least 20 minutes on ≥3 of the 7 days preceding the survey (i.e., vigorous physical activity) (Table 24). Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to report vigorous physical activity. Vigorous physical activity was significantly more likely among white female students (58.8%) than among black or Hispanic female students (48.8% and 50.0%, respectively), and significantly more likely among male and female students in grade 9 (81.2% and 67.5%, respectively) than among those in grades 11 (71.4% and 52.7%, respectively) and 12 (69.8% and 45.4%, respectively). Prevalence rates of vigorous physical activity ranged from 51.7% to 73.3% (median: 64.4%) across the state surveys and from 44.8% to 68.6% (median: 57.0%) across the local surveys (Table 25).

#### Stretching Exercises

Nationwide, 54.5% of students had done stretching exercises (e.g., toe touching, knee bending, and leg stretching) on ≥3 of the 7 days preceding the survey (Table 24). White female students (55.6%) were significantly more likely than black and Hispanic female students (43.2% and 46.8%, respectively) to have done stretching exercises. Male and female students in grade 9 (62.9% and 65.9%, respectively) were significantly more likely than those in grades 11 (53.3% and 48.4%, respectively) and 12 (52.6% and 41.1%, respectively) to have done so. Across the state surveys, prevalence rates ranged from 23.7% to 48.8% (median: 39.7%); across the local surveys, prevalence rates ranged from 24.8% to 51.6% (median: 33.8%) (Table 25).

## Strengthening Exercises

Approximately half (51.9%) of students nationwide had done strengthening exercises (e.g., push-ups, sit-ups, and weight lifting) on ≥3 of the 7 days preceding the survey (Table 24). Across all racial/ethnic and grade subgroups, male students were significantly more likely than female students to have done strengthening exercises. This activity was significantly more frequent among white female students (44.0%) than among black female students (33.3%) and among male and female students in grade 9 (69.1% and 52.2%, respectively) than among those in grades 11 (58.5% and 37.5%, respectively) and 12 (54.7% and 34.3%, respectively). Prevalence rates ranged from 21.8% to 43.6% (median: 35.7%) across the state surveys and from 25.0% to 38.4% (median: 31.2%) across the local surveys (Table 25).

## Participation in Physical Education (PE) Class

Nationwide, about half (52.1%) of students were enrolled in a PE class (Table 24). Black male students (62.8%) were significantly more likely than black female students

(48.7%) to have been enrolled in a PE class. Enrollment in a PE class was significantly more likely among male and female students in grade 9 than among those in grades 10–12. The percentage of students enrolled in PE ranged from 21.6% to 94.9% (median: 52.4%) across the state surveys and from 37.4% to 92.6% (median: 58.5%) across the local surveys (Table 25).

Approximately one third (34.3%) of students nationwide had attended PE daily (Table 24). Black male students (48.6%) were significantly more likely than white male students (34.8%) to have attended PE daily, and male and female students in grades 9 (52.7% and 52.7%, respectively) and 10 (43.6% and 35.9%, respectively) were significantly more likely than those in grades 11 (26.7% and 20.9%, respectively) and 12 (28.4% and 17.1%, respectively) to have attended PE daily. Wide variation was observed across the state surveys, where prevalence rates ranged from 9.5% to 69.4% (median: 35.7%), and across the local surveys, where prevalence rates ranged from 9.8% to 80.5% (median: 39.8%) (Table 25).

#### DISCUSSION

These results indicate that many high school students throughout the United States practice behaviors that place them at risk for serious health problems. Considerable variation occurs from state to state and from city to city for some priority health risk behaviors. For example, among the state surveys, a fivefold variation or greater was identified for not using safety belts, not attending school because of concerns about safety, injurious physical fighting, injurious suicide attempts, regular cigarette smoking, smokeless tobacco use, current cocaine use, birth control pill use, and not attending PE class daily. Among the local surveys, a similar level of variation was found for safety belt use, lifetime cocaine use, current cocaine use, lifetime crack use, and daily attendance in a PE class. This variation may be attributable to differences in state and local laws and policies, enforcement practices, access to illegal drugs, available intervention programs, and prevailing norms and practices. For example, among the states, the percentage of students who attended PE class daily ranged from 9.5% in New York to 69.4% in Illinois, where high school students are required by state mandate to attend a PE class daily; among the cities, such attendance ranged from 9.8% in Boston to 80.5% in Chicago.

The median prevalence rates for the state surveys and for the local surveys were similar for all categories of behavior except for tobacco use. Whereas the median prevalence rates for having ever tried cigarette smoking were similar for both types of surveys (69.4% vs. 64.7%, respectively), the median prevalence rates for all other tobacco-related behaviors (i.e., current, frequent, and regular cigarette use and smokeless tobacco use) were significantly higher in the state surveys than in the local surveys. These findings suggest that although high school students throughout the nation try cigarette smoking at similar rates, those living in larger cities are apparently less likely to continue use than are their peers who live in smaller cities and towns.

These data, which include the differences between subgroups, are consistent with results from other national school-based surveys (6–8). In general, male students were most likely to report injury-related behaviors, smokeless tobacco use, and various types of drug use (e.g., binge drinking, marijuana use, steroid use, and IDU) and female students were most likely to report suicide-related behaviors and weight loss attempts. White students were most likely to report tobacco use and some types of

physical activity (vigorous physical activity and strengthening exercises); black students were most likely to report weapon-carrying, physical fighting, and sexual behaviors; and Hispanic students were most likely to report current alcohol use, binge drinking, and cocaine and crack use. Weapon-carrying, physical fighting, condom use, and participation in physical activities occurred most frequently among students in grades 9–10, whereas cigarette smoking, alcohol and marijuana use, and sexual behaviors (except condom use) occurred most frequently among students in grades 11–12. These sex, grade, and race/ethnicity findings can assist in identifying groups with higher prevalences of risk behaviors. However, the underlying causes (e.g., education levels, economic factors, or cultural influences) for within-subgroup differences could not be addressed in this analysis.

The YRBSS is the first school-based surveillance system to monitor priority health risk behaviors among representative samples of students at the national, state, and local levels. Since the system was implemented in 1990, the number of participating states and cities has increased by 44%. YRBSS data increasingly are being used by health and education officials to improve school health policies and programs. For example, in Massachusetts, YRBSS data were used to support the passage of a new excise tax on tobacco products. The increased revenue is being provided to local schools to support health education programs. In San Diego, YRBSS data are being used to develop a countywide strategic plan for child and adolescent health care. Once the plan is implemented, YRBSS data will be used to help monitor program impact. In South Dakota, YRBSS updates are provided annually to the state legislature to help establish priorities for relevant legislation. In New Mexico, YRBSS results have been distributed to every school district in the state to help districts develop or select programs to best meet student needs. At the national level, YRBSS data are being used to measure progress toward achieving 26 national health objectives (9), YRBSS data also are being used to measure one of the eight National Education Goals, which states, "By the year 2000, every school in the U.S. will be free of drugs, violence, and the unauthorized presence of firearms and alcohol and will offer a disciplined environment conducive to learning," (10).

New components are being added to the YRBSS to help monitor both youth who do not attend school and youth who attend college. In 1992, a national household-based survey of persons 12–21 years of age was conducted as part of CDC's National Health Interview Survey (11,12). Because youth who were not attending school were oversampled, the health risk behaviors practiced by this group nationwide could be systematically examined for the first time. A national survey of undergraduate college students is being conducted during Spring 1995. These new components of the YRBSS will provide the additional data needed for prevention programs to address these other groups of adolescents and young adults.

\*Ever tried cigarette smoking, even one or two puffs.

†Smoked cigarettes on ≥1 of the 30 days preceding the survey.

§Smoked cigarettes on ≥20 of the 30 days preceding the survey.

¶Ever smoked at least one cigarette every day for 30 days.

\*\*Used chewing tobacco or snuff during the 30 days preceding the survey.

55 U.S. territories are included as states. tt Not available.

MSurvey did not include students from the state's largest city.

they consumed a particular type of food "once only" were assigned a frequency of 1.0; and students who replied that they consumed a particular type of food "twice or more" were assigned a frequency of 2.0. The number of servings of fruits and vegetables ranged from 0 through 8. The number of servings of food typically high in fat content ranged from 0 through 6. Students who replied that they did not consume a particular type of food were assigned a frequency of 0; students who replied that

Hamburgers, hot dogs, or sausage; french fries or potato chips; and cookies, doughnuts, pie, or cake. Fruit, fruit juice, green salad, and cooked vegetables.

Ninety-five percent confidence interval.

TABLE 23. Percentage of high school students who thought they were overweight, were attempting weight loss, ate five or more servings of fruits and vegetables, and ate no more than two servings of foods typically high in fat content during the day preceding the survey,\* by sex — selected sites, United States, Youth Risk Behavior Surveys, 1993

The Morbidity and Mortality Weekly Report (MMWR) Series is prepared by the Centers for Disease Control and Prevention (CDC). The data in the weekly MMWR are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business each Friday; compiled data on a national basis are officially released to the public the following Friday, inquiries about the MMWR Series and material to be considered for publication should be addressed to Editor, MAWR Series, Maliston C.O. CDC. 1800 Ciliton Road, N.E., Atlanta, GA 30333; telephone (404) 332-4555.

The MMWR is available on a paid subscription basis for paper copy and free of charge in electronic format. For information about paid subscriptions, contact the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402; telephone (202) 783-3238. For electronic copy, send an e-mail message to lists@list.cdc.gov --- the body content should read subscribe mmwr-toc. Electronic copy also is available from CDC's World-Wide Web server at http://www.cdc.gov/ or CDC's file transfer protocol server at ftp.cdc.gov.

All material in the MMWR Series is in the public domain and may be used and reprinted without permission; citation of source, however, is appreciated.
