EDRS PRICE MF01/PC08 Plus Postage.

DESCRIPTORS Adolescents; Child Abuse; *Child Health; *Child Welfare; *Counties; Demography; Dropout Rate; Dropouts; Early Parenthood; Educational Attainment; Elementary Secondary Education; Minority Groups; Mortality Rate; Poverty; Pregnancy; Social Indicators; *State Surveys; Statistical Data; Tables (Data)

IDENTIFIERS *West Virginia

ABSTRACT

This report provides information on 12 indicators of child and adolescent health, education, and economic status in West Virginia at the state and county level. The report includes a state profile, a minority profile, and 55 county profiles. Each of the indicators is discussed on a state-wide basis. The bulk of the report consists of 1-page county profiles, each of which contains a chart showing the percentage increase or decrease in each of the 12 indicators from 1980 to 1992, actual rates in each period, state rate, and county rank, as well as tables outlining county demographic and family income data. The data indicate that between 1980 and 1992, fewer children were dying before the first birthday, fewer teenagers were dropping out of school, more eligible children were enrolled in Head Start, and fewer teenagers were dying from injuries. On the negative side, a greater percentage of West Virginia's babies were born with low birth-weight, a greater percent of unmarried teenagers were having babies, and a greater number of children received free or reduced-price school meals. Appendixes provide information about indicator definitions, methodology, and sources, along with the raw data for each county. (MDM)

Acknowledgements

This data book could not be produced and distributed without the help of numerous people. Most importantly, WV KIDS COUNT is grateful to the Annie E. Casey Foundation, which created KIDS COUNT and funds WV KIDS COUNT and KIDS COUNT in 47 other states.

Contributions of the following individuals and organizations were invaluable: Ron Althouse, Jenny Sundra and Leigh Belton of the West Virginia University Survey Research Center, for collecting and analyzing the data; Lee Beaumont formerly of the West Virginia University Survey Research Center, who coordinated the data collection; Susan Derk with the Center for Rural Emergency Medicine at West Virginia University, who assisted with data analysis; Gary Thompson with Epidemiology and Health Promotion at West Virginia Department of Health and Human Resources; Randy Childs, Bureau of Business Research at West Virginia University; Sharon Lewis, Doris White and Larry White of the West Virginia Department of Education; and Bob Eggleton and Tracey Hodges of the West Virginia Supreme Court, for their assistance providing data, collecting it and analyzing it. KIDS COUNT is also indebted to the following individuals for providing data including: Rita Schwartz and Paul Vicinanza, both with the Administration for Children and Families of the U.S. Department of Health and Human Services; Jeffrey Derk with the Child Nutrition Division of the U.S. Department of Agriculture; Jim Gilbert of the West Virginia Department of Education, Office of Child Nutrition; Jennifer Green and Judy Lucas with the Department of Health and Human Resources; and Alex Lubman with Health Services Research.

WV KIDS COUNT is inspired by KIDS COUNT projects across the country and owes much to all of them for ideas and guidance. We are also grateful to the many advocates who identify ways to help KIDS COUNT including California Now and Margaret Brodtkin.

Special thanks to the wonderful children in the photos on our cover and inside pages: Virginia Adams; Forrest Carter; Jane Francke; Sarah Francke; and Garrett Shreve.

Margie Hale
Executive Director
West Virginia
KIDS COUNT Fund

KIDS COUNT is also grateful for the support of: Phil Evans with Phil Evans Designs, Inc., who designed the layout of the book and its cover; Rick Lee, for his stunning photos; Dolores Kinder, Sam Bonasso, Jenny Sundra, Leigh Belton, Judith Weitz, Mary Hughes and Bill O'Hare for help with both analysis and preparation of the findings; thanks also to Donna Reed for the generous contribution of her time to organize the Dissemination Partners; and thanks for the numerous WV KIDS COUNT Dissemination Partners for helping get the data book into the hands of community leaders across West Virginia; thanks also to John Gale with Gale Consulting, for technical support in the production of the book.

KIDS COUNT is also indebted to the faithful service of its Research Committee, Marketing Committee and its Leadership Collaborative. Their names are identified on page 86 of this report.

Special recognition is given to Lynn Divjak, Executive Assistant, West Virginia KIDS COUNT Fund, who coordinated the editing of the book and whose keen editorial eye is as unforgiving as a computer; and to Jennifer Reed, Communications Coordinator of the West Virginia KIDS COUNT Fund, who coordinated the overall production of this report and its marketing plan and strategy with faithfulness and creativity; to Judy Combs who is Lynn Divjak's unerring editorial assistant; and to Jenny Sundra at the West Virginia University Survey Research Center, who worked tirelessly and patiently to coordinate the data collection and its presentation.

Permission to copy, disseminate or otherwise use information from the data book is granted as long as appropriate acknowledgement is given. Additional copies are available for \$5.00 postage included from West Virginia KIDS COUNT Fund, 1031 Quarrier Street, Suite 313 Atlas Building, Charleston, WV 25301.

Foreword

The 1994 WV KIDS COUNT Data Book is the third annual profile of the condition of West Virginia's children. A project of the WV KIDS COUNT Fund in collaboration with the West Virginia University Survey Research Center, WV KIDS COUNT brings together the best available data to measure the health, economic, educational and social well-being of children in West Virginia.

In 1989, the Annie E. Casey Foundation and the Center for the Study of Social Policy launched KIDS COUNT. This initiative is premised on the belief that the more the public and policy-makers know about the status and needs of children, the greater the likelihood those needs will be addressed.

Funded in 1991, WV KIDS COUNT is one of 47 similar projects in other states.

The 1994 WV KIDS COUNT Data Book measures twelve indicators of child and adolescent health, education and economic status. It also includes background information for each county, including demographic and family income data.

This year's WV KIDS COUNT Data Book uses the same indicators of child well-being as last year's book. A new feature this year is a display of five maps called "West Virginia Families At Risk". These depict the status of counties on five indicators. The maps vividly portray the risks for West Virginia families. The maps also well illustrate a cluster of counties that repeatedly show up in the worst third of the state.

"Families At Risk" is made up of the following indicators: Percent Births To Unmarried Teens; Percent Births To Mothers With Less Than A 12th Grade Education; Percent Low Birth-Weight Babies; Median Family Income (1990 Dollars); and Percent of High School Dropouts. The maps are located on pages 8 and 9.

County level information on the percentage of children in poverty and the percentage of single-parent families is not updatable in 1992 because this data is from the census and is updated by county every ten years.

KIDS COUNT believes this data is very important to understanding how our families and children are faring, and so this and other 1990 demographic data is included.

Last year's WV KIDS COUNT Data Book inspired community action for at-risk children and helped many communities secure funding for programs targeted to at-risk youth. The print and broadcast media has increased its reportage on kids. There is more editorial commentary on children and more people see the connection between at-risk children and our future.

WV KIDS COUNT is forging partnerships between business, human services and the religious community. WV KIDS COUNT Mini-Grants also helped support community action and will continue to do so in the coming year. Making KIDS COUNT in West Virginia is a shared enterprise. Consider how you might join in the support of the children of West Virginia. We all need to do more. To join a constituency for children and become part of the solution, call 1-800-834-8323.

**WV KIDS COUNT Fund is the new name of the West Virginia Task Force on Children, Youth and Families founded in 1989.*

Overview and Key Findings

West Virginia is a small rural state with 1.8 million people including nearly half a million children living in 55 diverse counties. Folks are proud of their homes, their families and their place. West Virginia has no cities; its largest town is the state capitol with a population of about 65,000. The transformation of West Virginia's economy from manufacturing to services has made it poorer and more sparsely populated. West Virginia's families and children fare much better than its economic status would indicate. West Virginians create success in adversity and will continue to do so.

Data collected for the 1994 KIDS COUNT Data Book shows that despite gains in some indicators of child well-being, there is much to be done to improve the lives of families and children in our state.

The good news is that over the last 12 years fewer of our children are dying before their first birthday, fewer teens are dropping out of school, more eligible children are enrolled in Head Start and fewer teens are dying from injuries.

These improvements tell us much about what works. We can build on these successes. The improvements in infant mortality and the high school dropout rate are good illustrations. In each case, a substantial commitment to reform was made by key public and private institutions.

Prevention programs, policies and strategies were developed and implemented and both the public and private sectors were actively involved in creating the solutions.

WV KIDS COUNT Indicator	State Trends 1980-1992	County Trends 1980-1992
Percent low birth-weight babies	4.4% Worse	29 Counties Worse
Infant mortality rate (per 1,000 live births)	33.5% Better	43 Counties Better
Child death rate (ages 1-14 per 100,000 children)	32.2% Better	38 Counties Better
Teen birth rate (ages 15-19 per 1,000 females)	17.1% Better	48 Counties Better
Percent births to unmarried teens (ages 10-19)	62.6% Worse	52 Counties Worse
Percent high school dropouts	38.3% Better	53 Counties Better
Teen injury death rate (ages 15-19 per 100,000 teens)	18.7% Better	40 Counties Better
Percent births to mothers with less than a 12th grade education	20.2% Better	53 Counties Better
Percent children in poverty (1980-1990)	40.0% Worse	47 Counties Worse

Overview And Key Findings, continued

West Virginia should also be proud of its overall improvement in child well-being over the last four years. According to the National KIDS COUNT Data Books, the state's ranking improved from 38 in 1990 to 27 in 1994.

The bad news is that a greater percent of West Virginia's babies are born with low birth-weight. Low birth-weight is associated with immediate and future risks to a newborn infant, as well as learning problems when they reach school. A greater percent of unmarried teens are having babies - a sure predictor of economic hardship for both the infant and the teen mother. The percent of births to mothers with less than a high school education remains alarmingly high at 25 percent of all births. An increasing number of children are receiving free or reduced-priced school meals reflecting increased financial distress among West Virginia families.

The counties with the greatest concentration of high risk factors are the southern counties. Unfortunately, this is also where many of our children live and where most of our unmarried teens are having babies. Children in McDowell, Raleigh, Logan and Lincoln Counties are particularly at risk. Each of these counties has at least three indicators in the bottom third of the state. Boone, Fayette, Logan, McDowell, Mingo, Raleigh and Summers Counties all have a seriously high percentage of high school dropouts. Boone, Fayette, Logan, McDowell and Raleigh Counties have very high rates of unmarried teens having babies. High numbers of low birth-weight babies are also concentrated in Raleigh, Logan and Lincoln Counties.

Of great concern in the south as well is the high incidence of births to mothers with less than a high school education. Interestingly, only McDowell of these southern counties is in the bottom third of the state in terms of median family income. We are challenged to understand why these counties fare so poorly for children and to act on this understanding for both the children and our future.

The capacities of families and the well-being of children are linked to the well-being of the communities in which they live. Thousands of West Virginia's children are growing up in distressed communities.

When whole communities have high unemployment, high poverty, high numbers of single-parent families and high numbers of families on welfare, individual and family-centered approaches by themselves are not enough. Teen pregnancy, low birth-weight babies, child abuse and delinquency cannot be addressed successfully unless there is also an investment in communities. Individual lifestyles and capacities matter. However, people are also affected by the environment in which they live, by the choices that environment gives them. For instance, whether there are jobs with family benefits in a community directly influences family choices. Whether there are safe parks and whether churches and community centers have programs for kids affects how young people spend their time.

To reverse this decline of communities requires an investment to enable community institutions, like religious organizations, service providers, lodges and clubs, to become more powerful resources for the neighborhoods and people they serve. We need to

create opportunities for these groups and residents and businesses to come together to influence and participate in efforts to achieve community goals. Building the capacity of distressed communities will take time and patience. We are challenged to find ways to empower our communities to assess their strengths and needs and devise strategies.

As in past years, WV KIDS COUNT hopes that communities and counties will use the data as a barometer to show our progress and success and to provide early indications of negative trends affecting our children. It is the hope of WV KIDS COUNT that its numbers and trends by county will help create solutions that will offer a better chance and a brighter future for the children of West Virginia.

Status Of Children by Indicator

PERCENT LOW BIRTH-WEIGHT BABIES

Low birth-weight babies are those babies weighing less than 2,500 grams, or 5.5 pounds, at birth. Low birth-weight is associated with immediate and future risks to a new-born infant. Low birth-weight babies are 40 times more likely to die during the first month of life than normal weight babies. Infants of low birth-weight account for approximately 60 percent of all infant deaths during the first year of life. Surviving low birth-weight infants, particularly those of very low birth-weight, are about three times more likely to experience severe health problems. These problems are costly for children and their families and our health and education programs.

There were 1,580 low birth-weight babies born in West Virginia in 1992 and 1,985 born in 1980. **The percent of all West Virginia births in 1992 that were low birth-weight was 7.1 percent, a 4.4 percent increase over the 1980 rate of 6.8 percent.** While the number of low birth-weight births decreased, the percentage increased because the number of overall births declined.

Geographically, all of the Eastern Panhandle has a percentage of low birth-weight babies that is at or better than the state average. **Most of the southern half of the state, except for Wyoming and Greenbrier Counties, has a high or very high percent of low birth-weight babies.**

Babies most likely to be at risk for low birth-weight are those born to young, single or low-income mothers, and also those less likely to receive early, quality prenatal care. Reducing the number of low

birth-weight babies will continue as the numbers of mothers receiving prenatal care increases and when the risks of smoking, alcohol, drugs and poor nutrition are reduced.

INFANT MORTALITY RATE (per 1,000 live births)

Infant mortality refers to all deaths that occur to infants under one year of age. The infant mortality rate is regarded as a basic quality of life indicator for a community. It reflects the health of both the pregnant woman and the infant; it also reflects the conditions in which a child lives during his/her first year of life and the parenting the child receives.

Over the last 12 years, the number of babies dying before their first birthday has decreased. In 1980, 398 babies died before age one; in 1992, the number of infant deaths dropped to 202. In terms of rates, these numbers translate into a 1980 infant mortality rate of 13.6, decreasing to 9.0 in 1992, a 33.5 percent decrease.

The African-American infant mortality rate was much higher than the white infant mortality rate in both 1980 and 1992; 23.7 deaths for every 1,000 live births in 1980 and 13.8 deaths in 1992. However, **over the 12-year period, the African-American infant mortality rate improved by 41.8 percent, a rate greater than either the white infant mortality rate or the state infant mortality rate.** White rates went from 11.3 to 8.9, an improvement of 21.2 percent.

In 31 of 55 counties, the infant mortality rate is lower than the state rate of 9.0 deaths per 1,000 births.

Geographically, both the Northern and Eastern Panhandles' infant death rates are at or below the state average. Generally speaking, the areas with high and very high rates of infant mortality tend to be more rural and less populated areas, with the exception of Monongalia and Cabell Counties. Because many of our counties are sparsely populated, the actual numbers of infant deaths are small, and just one death can inflate the county rate or trend data.

West Virginia has made consistent progress over the decade in reducing the number of babies who die before their first birthday. Much of the progress is the result of both medical technology and improved access to health care for both mothers and babies. Medical technology has contributed to the increased survival rates of low birth-weight babies who otherwise would have died. Improved access to health care has contributed to improved infant mortality rates.

Eligibility for Medicaid to pregnant women and infants up to 150 percent of poverty, \$18,486 for a family of three, has made a contribution to improving access to care and therefore, reducing infant deaths. West Virginia still lags behind the nation, however, and the United States lags behind most industrial nations including Japan, Hong Kong, Spain, Belgium and Ireland.

Increasing the availability of WIC is also important to improving infant mortality rates. WIC is

Status Of Children By Indicator, continued

Family Risk in West Virginia

Percent Births To Mothers With Less Than A 12th Grade Education

- 7 counties, home to 9.9 percent of West Virginia's children, have a **very high** percent of births to mothers with less than 12 years of education (from 33.2 percent to 55.1 percent).
- 19 counties, home to 35.6 percent of West Virginia's children, have a **high** percent of births to mothers with less than 12 years of education (from 25.8 percent to 33.2 percent).
- 29 counties, home to 54.5 percent of West Virginia's children, have a percent of births to mothers with less than 12 years of education **at or below** the state average of 25.8 percent.

Percent Low Birth-Weight Babies

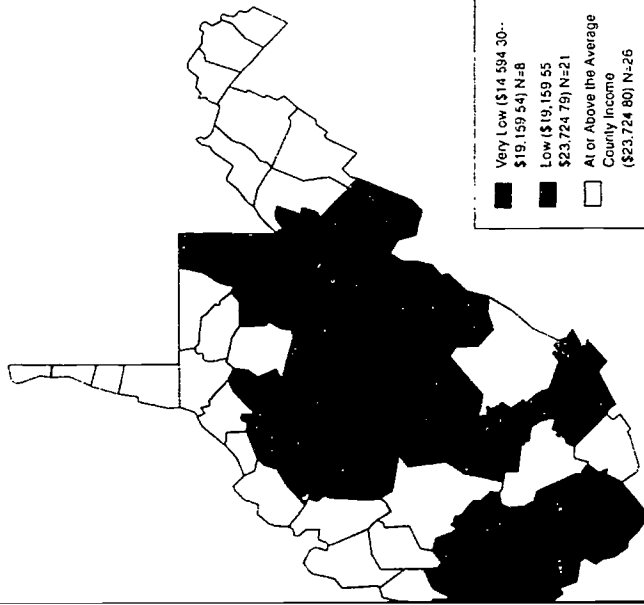

- 8 counties, home to 12.4 percent of West Virginia's children, have a **very high** percent of low birth-weight babies (from 8.2 percent to 10.5 percent).
- 17 counties, home to 43.6 percent of West Virginia's children, have a **high** percent of low birth-weight babies (from 7.0 percent to 8.2 percent).
- 30 counties, home to 44 percent of West Virginia's children, have a percent of low birth-weight babies **at or below** the state average of 7.0 percent.

Percent Births To Unmarried Teens

- 7 counties, home to 17.3 percent of West Virginia's children, have a **very high** percent of births to unmarried teens (from 11.5 percent to 16.0 percent).
- 20 counties, home to 49.2 percent of West Virginia's children, have a **high** percent of births to unmarried teens. (from 9.3 percent to 11.5 percent).
- 28 counties, home to 33.5 percent of West Virginia's children, have a percent of births to unmarried teens **at or below** the state average of 9.3 percent.

Status Of Children By Indicator, continued

Median Family Income (1990 Dollars)

- 8 counties, home to 7.7 percent of West Virginia's children, have a **very low** median family income (from \$14,594.30 to \$19,159.54)
- 21 counties, home to 26.5 percent of West Virginia's children, have a **low** median family income, (from \$19,159.55 to \$23,724.79).
- 26 counties, home to 65.8 percent of West Virginia's children, have a median family income **at or above the state average** of \$23,724.80.

Percent High School Dropouts

- 11 counties, home to 23.8 percent of West Virginia's children, have a **very high** percent of high school dropouts (from 19.2 percent to 27.2 percent).
- 16 counties, home to 33.1 percent of West Virginia's children, have a **high** percent of high school dropouts (from 15.2 percent to 19.2 percent).
- 28 counties, home to 43.1 percent of West Virginia's children, have a percent of high school dropouts **at or below the state average** of 15.2 percent.

Family Risk in West Virginia

- Almost 4,000 teenagers had babies in 1992, mothers who are still children themselves. An increasing number of these are unmarried.
- About 4,000 teenagers dropped out of school in 1992 at a time when most well-paying jobs require at least a high school education.
- About 1,600 babies were born low birth-weight, and 5,632 babies were born to mothers with less than a 12th grade education.
- Not all these families will fail. However, each indicator puts a family at even greater risk of dependence and instability.

Status Of Children By Indicator, continued

the federal nutrition program for low-income pregnant women, infants and children. According to a recent government study, babies born to women who participate in WIC have a better chance of surviving their first year of life than babies born to non-participating low-income women.

CHILD DEATH RATE (ages 1-14 per 100,000 children)

The child death rate is the number of deaths from all causes of children between the ages of 1 and 14, per 100,000 children of the same age. The child death rate tells us about risks to children and how much of this risk has resulted in death. Risks include health problems, exposure to hazardous conditions, preventable injuries, accidents and child abuse and neglect. Deaths in childhood from illness and injury may be the result of a combination of factors related to child care in the home, the community or the local service system.

There were 95 child deaths in West Virginia in 1992, 79 less than in 1980. The 1992 child death rate for West Virginia children ages 1 to 14 was 27.6 per 100,000 children. This was a 32.2 percent improvement over the 1980 state child death rate of 40.8 (174 child deaths).

The 1980 child death rate for whites (46.2) was much higher than that of African-Americans (20.2). **By 1992, however, African-American children were more likely than white children to die between their first and 15th birthday.** By 1992, the child death rate for African-American children was 36.8, an 82.2 percent increase over the

1980 rate, while the white child death rate was 27.5, an improvement of 31.6 percent.

Geographically, there are strong regional patterns which reflect clusters of counties falling into either a low rate of child death or a high/very high rate of child death. **A cluster of counties in the central region and at the southern tip of the state all have high or very high rates of child death. The highest child death rates occur in the less populated, more rural areas.** However, Mercer, Marion and Berkeley Counties are the three counties with urban centers that do have a high or very high rate of child death. Because many of our counties are sparsely populated, the actual numbers of infant deaths are small, and just one death can inflate the county rate or trend data.

Most fatal injuries to children occur in predictable patterns and are therefore preventable. The younger the child, in fact, the higher the probability that the death could have been prevented. Strategies to prevent illness include insuring that children are immunized early enough and receive the full series of inoculations. Recent studies by the West Virginia Health Department indicate that only 48.1 percent of West Virginia's two year-olds are fully immunized. Greater access to health care can also reduce the incidence of fatal illnesses. Injury prevention can be accomplished through policies and programs that address safety at home and in the community.

PERCENT OF ELIGIBLE CHILDREN SERVED BY HEAD START (ages 3-4)

The Head Start program is based on the premise that early child development and health

programs can make a lasting difference in the lives of children, including school readiness. This benchmark is one measure of educational opportunity in West Virginia; the degree to which one program is reaching the children and families it was designed to assist. Eligibility for Head Start is based on family income.

In 1994, almost half (46.5 percent) of all eligible West Virginian 3 to 4 year-olds, or 6,217 children, were enrolled in Head Start. The rate at which eligible West Virginian children participate in Head Start surpasses the national rate which is 37.9 percent. Twenty-four of 55 counties had a rate of participation higher than the state rate.

Generally speaking, the highest proportion of eligible children that are served by Head Start are in the Eastern Panhandle and in the southern border counties. All of the urban areas have a low percent, between 22.3 percent and 52.3 percent, of children served.

For all its benefits, the Head Start program has never had the funding needed for all of the children who are eligible. West Virginia became the first state to have Head Start in every school district. Studies show that graduates of programs such as Head Start are more likely to stay in school, earn more money, own homes and cars and are less likely to be arrested. Support for Head Start must continue so that we may serve all those at-risk children who need a head start.

Status Of Children By Indicator, continued

PERCENT CHILDREN APPROVED FOR FREE AND REDUCED SCHOOL MEALS (Grades K-12)

Children are approved for free or reduced-priced meals in school based on their family's income. Free school meals are provided to children who apply whose family income is at or below 130 percent of poverty; reduced-priced meals are provided to those who apply whose family income is at or below 185 percent of poverty. The 1993 federal poverty level for a family of three at 130 percent is \$16,021; at 185 percent, it is \$22,799.

WV KIDS COUNT is using this benchmark as an indicator of the economic vulnerability of children in our counties. Unfortunately, county-by-county income data are not available except every ten years through the census. This school meal participation measure undercounts the number of financially vulnerable children in West Virginia because not all families apply for reduced-priced or free meals even though they are eligible and financially stressed.

While the percent of children approved for school meals is not one to celebrate, it may mean the difference between a poor child who is attentive in class and learning and one who is falling behind.

In 1993, 134,952 children in West Virginia were approved for free or reduced-priced school meals. This represents 42.5 percent of all school children from kindergarten through 12th grade. This percentage is very alarming because it is an undercount of financial distress. Nationally, 38.1

percent of all school children were served by this program, a rate lower than the state rate.

The county serving the fewest children was Hancock at 23.2 percent. The county serving the highest number of children was Clay County at 72.3 percent of school children served.

Geographically, the Northern Panhandle and the western border counties along the Ohio River appear to be less financially distressed, serving a percentage of children free and reduced school meals that is at or below the state average. All counties with urban centers, with the exception of Mercer County, are serving free and reduced lunches at a low percent. The central counties and those counties below the Eastern Panhandle are serving a high or very high rate of students.

Children who live in poverty are more likely to have health problems at birth, lack health care as they grow, have limited educational opportunities and live in inadequate housing or dangerous neighborhoods. Many children overcome these odds to live healthy and productive lives, but many do not.

The National Commission on Children recommends a number of programs to assist income security: (1) a refundable tax credit for all children; (2) providing the Earned Income Credit as an incentive for low-income parents to enter the paid work force; (3) improvement of child support enforcement and creation of a government-insured minimum benefit when absent parents do not meet their support obligations; (4) providing essential transitional supports and services to aid families moving from

welfare to work; (5) offering community employment opportunities to poor parents who are willing and able to work but unable to find a job on their own; and (6) reorienting Aid to Families with Dependent Children as a short-term income support for families experiencing economic hardship.

CHILD ABUSE/NEGLECT RATE (per 100,000 children)

Children who are victims of child abuse and neglect may suffer lasting physical as well as emotional problems. While not conclusive, abused and neglected children are more likely to become child abusers themselves and have an increased chance of becoming runaways and juvenile delinquents. At a minimum, they need immediate treatment for physical injuries and emotional traumas. Sometimes they need to be removed from their home for protection.

In 1992, 2,005 new cases of child abuse and neglect were substantiated for further investigation by child abuse authorities. In terms of a rate, 452.0 cases of child abuse or neglect were substantiated for every 100,000 West Virginia children. This rate is a decline from last year's rate of 541.3. The number of substantiated cases is often a reflection of system capacity, and in West Virginia, county budgets for child protective service workers are very limited.

Currently, a new data system for collecting and tracking child abuse and neglect information is being implemented by the entire state. Inconsistent forms of reporting, as well as underreporting, have produced numbers which tend to underestimate the

Status Of Children By Indicator, continued

births. This represents a 62.6 percent increase between 1980 and 1992. The 1992 national percent of all births to unmarried teens was 9 percent; slightly lower than the state percent of babies born to unmarried teens.

The south central counties have a high or very high rate of births to unwed teen mothers. **In general, those counties which have high or very high rates of births to unmarried teens also have high or very high dropout rates and high or very high percent births to mothers with less than a 12th grade education.**

Experts suggest that changes in the teen birth rate are the result of interrelated factors. Social and economic status and economic opportunity impact a teen's motivation for and success in delaying child-birth. Cultural, religious and family attitudes toward sexuality, contraception, family planning and the acceptability of childbearing at an early age also exert a strong influence on teens. Public policy in the areas of education, economic development, jobs and family planning is likely to play a significant role as well. Teenagers need support and information that will give them the ability and the motivation to delay childbearing. They also need access to quality prenatal care if they do become pregnant and educational and support services once they begin parenting.

PERCENT HIGH SCHOOL DROPOUTS

A high school dropout is one who leaves high school before graduation without transferring to another school. Children who do not complete high school are more likely to have health, economic and

The counties with the very highest rates of teen birth, with the exception of Berkeley County, are rural counties. The majority of counties throughout the central region of the state stretching from the southeastern tip through Randolph, Barbour and Harrison Counties all have high or very high rates of teen birth. The counties in the Northern Panhandle and those bordering the Ohio River all have teen birth rates at or below the state average.

In the United States, 80 percent of teenagers report their pregnancies as unintentional. The difficulties many teenagers have obtaining family planning services appear to influence the rate of teenage pregnancies. Pregnant teens are also less likely to start prenatal care within the first trimester. The principal focus should be on prevention to reduce the incidence of teen pregnancies. Efforts to bolster the motivation and capacity of teens to prevent too-early pregnancy include a range of non-academic opportunities for success: jobs, work-related skill building; education and strong basic skills; and family life education and life planning.

PERCENT BIRTHS TO UNMARRIED TEENS (ages 10-19)

This indicator measures the percent of all births that are to teens ages 10 to 19 who are unmarried at the time of the baby's birth.

In 1992, 2,172 births or 9.7 percent of all births in West Virginia were to unmarried teens. The percent of babies born to unmarried teens has grown between 1980 to 1992 from 6.0 percent (1,751 births) of all births to 9.7 percent (2,172 births) of all

actual amount of child abuse/neglect that occurs. In addition, the actual numbers of cases substantiated are limited by county budgets. When counties cannot afford to employ enough CPS workers, the needs of the local families cannot be fully met.

Research has shown that intensive family-based services, including home visiting and support and parent education, reduce the incidence of abuse and neglect. A focus on prevention at the community level with support of both government and the private sector is vital to reversing the rising abuse and neglect of West Virginia's children.

TEEN BIRTH RATE (ages 15-19 per 1,000 females)

The teen birth rate is the number of live births to female teens ages 15 to 19 years old per 1,000 female teens of the same age. The teen birth rate includes all births to both married and unmarried teenage girls.

There were 3,953 births to teens in West Virginia in 1992; a rate of 57.1 births per 1,000 female teens ages 15 to 19. **Since 1980, West Virginia's teen birth rate decreased by 17.1 percent.** In 1980, there were 5,921 babies born to teen mothers equaling a teen birth rate of 68.9. The 1992 national teen birth rate was 60.7, a rate slightly higher than the West Virginia rate. While the teen birth rate is decreasing, the percentage of these births to unmarried teens has grown. In 1980, 31 percent of the teen births were to unmarried teens; in 1993, 60 percent of the teen births were to unmarried teens.

Status Of Children By Indicator, continued

social problems. High school dropouts are less likely than high school graduates to find employment and have less earning potential than graduates. Dropping out of high school increases the risk for poverty. Families headed by high school dropouts are more likely to have incomes below the federal poverty level.

West Virginia has made tremendous progress over the last 12 years in reducing its number of high school dropouts. In 1992, 3,915 teenagers dropped out of high school or 15.8 percent. By contrast, in 1980, 8,094 teenagers dropped out or 25.6 percent. The 1992 rate is 38.3 percent lower than the 1980 rate.

Between 1980 and 1992, the high school dropout rate improved in almost every West Virginia county; in 53 of our 55 counties.

The Northern Panhandle has a dropout rate at or below the state mean. The counties with the highest percent of high school dropouts are primarily in the tip of the Eastern Panhandle and in the southeastern region of the state.

The progress West Virginia has made over the decade in reducing the number of high school dropouts teaches us what works to improve child well-being. Efforts include public discussion of the issues; implementation of community-based programs, such as mentoring; and involving the whole community in tackling the problem. The county and state level high school dropout rates are widely known and discussed. The problem and its negative consequences are well understood, and there has been a sense of urgency to keep kids in school to complete their high school education. A wide variety of

community-based dropout prevention programs have been implemented; and both public and private resources have been brought to bear, including the well-respected business school partnerships, as well as outreach to at-risk teens.

JUVENILE DELINQUENCY CASE RATE (ages 10-19 per 1,000 youths)

The juvenile delinquency case rate is the number of reported delinquency cases per 1,000 youths ages 10 to 19. The juvenile delinquency case rate reflects upon how well our families and communities care for their youth. It measures the risk to children and all members of a community.

West Virginia added 8,669 new youths to the juvenile justice system in 1992, equaling a juvenile delinquency case rate of 31.3 per 1,000 youths. Most of these youth are from the state's urban centers including Charleston, Huntington, Martinsburg, Princeton, Beckley and Parkersburg.

The juvenile delinquency case rate in 1991 for West Virginia was 32.4 per 1,000. **West Virginia's delinquency rate consistently remains much lower than the national average.** The most current national rate is 49.6.

TEEN INJURY DEATH RATE (ages 15-19 per 100,000 teens)

The teen injury death rate measures rates of death, for youth ages 15 to 19, from unintentional injuries, homicides or suicides. Unintentional injuries, such as auto accidents, are the leading causes of teen deaths.

In 1992, there were 101 injury-related deaths to 15 to 19 year-old teens in West Virginia. This is a death rate of 70.9. **Over the last 12 years, the teen injury death rate decreased from 87.2 (152 deaths) in 1980 to 70.9 in 1992, a decrease of 18.7 percent.**

The white teen death rate was much higher than the African-American teen death rate in both 1980 and in 1992. **However, as the white teen injury death rate decreased, the African-American teen injury death rate increased.** In 1980, the white teen death rate was 92.6, and for African-Americans, it was 55.8. In 1992, the white rate was 69.6 and for African-Americans it was 63.2. In 1980, the African-American rate was lower than the white rate by 36.8 percentage points, and in 1992, it was lower by only 6.4 percentage points. Over the 12-year period, the teen death rate for whites decreased by 24.8 percent while the African-American teen injury death rate increased by 13.3 percent.

Those counties with the very highest rate of teen injury death are all rural, sparsely populated counties. Almost all of the counties along the Virginia border have either a high or very high rate of teen death. Because many of our counties are sparsely populated, the actual number of teen injury deaths is small, and one death can inflate a county's teen injury death rate.

Research shows that when teens die violently, there are often significant gaps in the supports and opportunities that had been available to them. Efforts to involve teens in productive community activities, mental health services, substance abuse programs,

Status of Children By Indicator, continued

organized after-school activities, support groups and mentor programs are often lacking. Communities that fill in these gaps can help West Virginia continue to improve in its overall reduction in the number of teens who die violently each year.

PERCENT BIRTHS TO MOTHERS WITH LESS THAN A 12TH GRADE EDUCATION

Parent education is the best predictor of child well-being, particularly concerning academic achievement. Nationwide, about one child in every five is born to a mother with less than a high school education. In West Virginia, about one child in every four is born to a mother with less than a high school education.

There were 5,632 births to mothers with less than a high school education in West Virginia in 1992. This represents one quarter or 25.1 percent of all West Virginia births. In 1980, there were 9,248 births to mothers with less than a high school education, representing 31.5 percent of all births. **Between 1980 and 1992, the birth rate to low-educated mothers improved by 20.2 percent.** Nationally, the 1992 percent of births to mothers with less than a 12th grade education was 23.2 percent. This rate is lower than the state rate.

Fifty-three of our 55 counties saw improvements in their situation over the 12-year span. The most improved county was Monongalia County, which improved its birth rate to low-educated mothers by 43.8 percent over its 1980 rate of 20.2 percent.

With the exception of Berkeley and Hampshire Counties and the southern counties from Cabell through Mercer, all of the border counties have a low rate of births to mothers with less than a 12th grade education. Those counties with the very highest rates of births to low-educated mothers are rural counties.

Generally, the counties with the highest numbers of children in poverty and highest percent of all births to unmarried teens have the highest percent of births to mothers with less than a high school education. These counties face a special challenge of educating more disadvantaged children and improving the educational level of all parents. This requires continuing education for adults - "life-long learning", parent support and parent education programs, as well as job training and job placement. Improving the prevention of teen pregnancy and support to keep teens who do get pregnant in school will be necessary to continue the state's improvement on this measure of child well-being.

WV KIDS COUNT Scores And Composite County Rankings

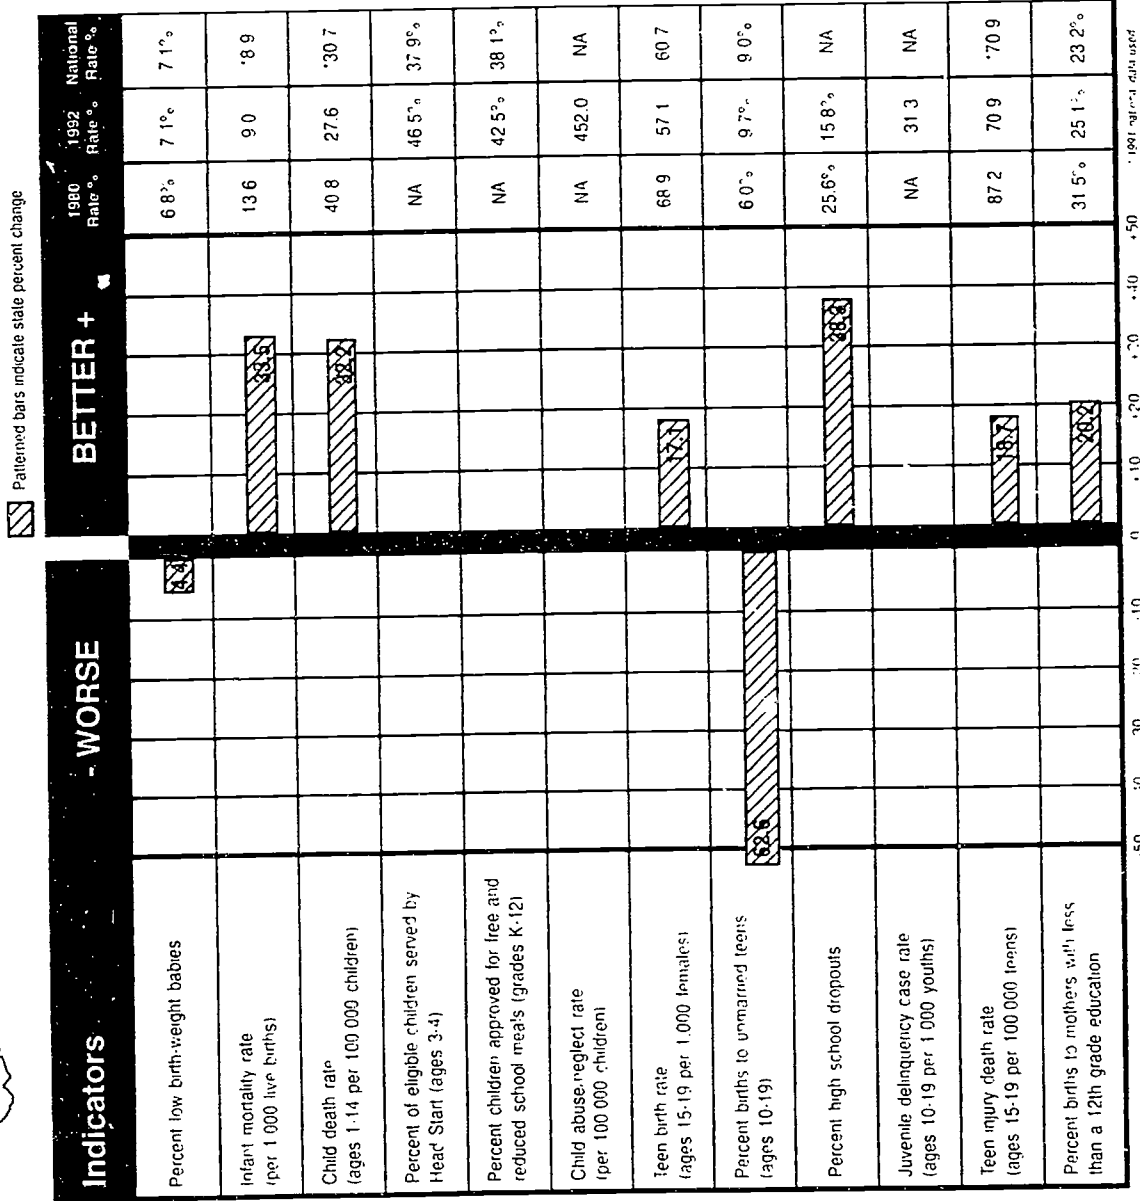

Scores and county rankings give some indication as to whether or not child well-being is better or worse than in other counties and by how much. The Scores and Composite Rankings chart provides a means of comparing the county's total performance based on 10 WV KIDS COUNT indicators of child well-being.

Definitions, Methodology And Sources

How an indicator or background factor was constructed is only presented when staff at the Survey Research Center performed calculations to determine rates or percentages.

Indication on background factor clarification is provided for those variables needing some explanation about the data; this does not apply to every variable.

Data sources are the same for both state and county unless otherwise specified. When the national data source was different from the state or county source, there are headings specifying different state and national sources; again, county sources are the same as state sources, unless otherwise specified.

CHILD ABUSE/NEGLECT RATE (per 100,000 children)

Indicator:
The number of substantiated abuse and neglect cases "opened" during fiscal year 1992-93 for further servicing by a social worker per 100,000 children.

How is it Constructed?

At the state and county level, this indicator is a rate per 100,000 children based on 1992-1993 fiscal year data. The rate is calculated as 100,000 times the number of children under 18 having "open" substantiated abuse and neglect cases divided by the total number of children under 18.

Indicator Clarification:

No trend data has been calculated for this indicator due to the unavailability of 1980 data. The number of children under 18 is based on 1990 census data. Differences in the reporting procedures of individual counties will affect the individual county rates and therefore, limits the comparison of rates across counties.

Data Sources:

State (1992) WV Department of Health and Human Resources, Child Protective Services, Fiscal Year beginning July 1, 1992 and ending June 30, 1993.

CHILD DEATH RATE (ages 1-14 per 100,000 children)

Indicator:

The number of deaths due to all causes, of children between the ages of 1-14 years per 100,000 children.

How is it Constructed?

At a state and county level, this variable is a rate per 100,000 children based on a three-year average (1978, 1979 and 1980 for 1980; and 1990, 1991 and 1992 for 1992). The rate is calculated as 100,000 times the number of child deaths due to all causes divided by the total number of children ages 1-14.

Indicator Clarification:

Due to the small number of child deaths on the county level, a small change in the actual number from the period 1980 to 1992 may result in a large percentage change for trend data. The number of children 1-14 years old is based on 1990 census data. 1992 national data is not available at this time, therefore, 1991 national data have been utilized.

Data Sources:

State (1980, 1992) WV Department of Health And Human Resources, Bureau of Public Health, Office of Epidemiology and Health Promotion, Health Statistics Center, Charleston, WV, **National (1991)** National Center for Health Statistics, Advance Report of Final Mortality Statistics, 1991, MonthlyVital Statistics Report: Vol. 42, No. 2, Suppl. Hyattsville, MD: Public Health Service, 1993.

EDUCATION EXPENDITURES PER PUPIL (1992 Dollars)

Background Fact:

Current per pupil expenditures based on average daily attendance for public school programs pre-kindergarten through 12th grade expressed in 1992 constant dollars.

How is it Constructed?

For comparison purposes, educational expenditure data for 1980-1981 were converted into 1992 dollars; a deflator of .562 was provided by the National Center for Education Statistics.

Data Sources:

(1980) WV Department of Education: 1980-1981 Educational Statistics Summary Annual Report, Page 137. **(1992)** WV Department of Education: Per Pupil Expenditure for Current Expense 1992-1993.

INFANT MORTALITY RATE (per 1,000 live births)

Indicator:

The number of deaths of infants under one year of age per 1,000 live births.

How is it Constructed?

At a state and county level, this variable is a rate per 1,000 live births based on a three-year average (1978, 1979 and 1980 for 1980; and 1990, 1991 and 1992 for 1992). The rate is calculated as 1,000 times the number of infant deaths due to all causes divided by the number of total births.

Indicator Clarification:

Due to the small number of deaths to infants under one year of age on the county level, a small change in the

Definitions, Methodology And Sources, continued

actual number from the period 1980 to 1992 may result in a large percentage change for trend data. 1992 national data is not available at this time, therefore, 1991 national data have been utilized.

Data Sources:

State (1980, 1992) WV Department of Health and Human Resources, Bureau of Public Health, Office of Epidemiology and Health Promotion, Health Statistics Center, Charleston, WV; **National (1991)** National Center for Health Statistics, Advance Report of Final Mortality Statistics, 1991, Monthly Vital Statistics Report, Vol. 42, No. 2, Suppl. Hyattsville, MD: Public Health Service, 1993.

JUVENILE DELINQUENCY CASE RATE (ages 10-19 per 1,000 youths)

Indicator:

The number of delinquency cases reported per 1,000 youths ages 10-19. These cases include children accused of status offenses, misdemeanors and felonies.

How is it Constructed?

This variable is a rate per 1,000 youths based on the reporting period of July 1, 1992 through June 30, 1993. The rate is calculated as 1,000 times the number of reported delinquency cases for youths ages 10-19 divided by the total number of children ages 10-19.

Indicator Clarification:

No trends are calculated for this indicator due to the unavailability of data in 1980. The number of 10-19 year-olds is based on 1990 census data. National data is not available at this time. The same child can be the subject of more than one case over the reporting year. This case rate reflects the number of juvenile delin-

quency cases that were reported as being handled statewide; it is not an adjudication rate.

Data Sources:

State (1992) WV Supreme Court of Appeals, Juvenile Justice Committee, Juvenile Delinquency in West Virginia, Annual Report, July 1, 1992 to June 30, 1993. Juvenile Justice Data Base, Table IV, Page 14

MEDIAN FAMILY INCOME (1990 Dollars)

Background Fact:

That family income at which fifty percent of all families have a higher income and fifty percent of all families have a lower income. Both 1980 and 1990 median family incomes are expressed in constant 1990 dollars.

How is it Constructed?

The median family income is based on census data. To arrive at the 1980 median family income in 1990 dollars, the 1980 median family income was divided by a deflator of .65.

Background Fact Clarification:

Data for this variable is not updatable for 1992 on the state or county levels and is therefore presented as 1990 data on these levels

Data Sources:

(1980) Bureau of the Census, Census of Population and Housing, 1980; Summary Tape File 3C, Table 744/Prepared by the Bureau of the Census, -Washington; The Bureau (WV University Office of Health Services Research), 1992 **(1990)** Bureau of the Census, Census of Population and Housing 1990; Summary Tape File 3C, (Table 107A)/Prepared by the Bureau of the Census, -Washington; The Bureau (WV University of Health Services Research), 1992.

PERCENT ALL FAMILIES WITH RELATED CHILDREN WHO ARE AFDC RECIPIENTS

Background Fact:

The percentage of families with related children who receive public assistance under the Aid to Families with Dependent Children (AFDC) or Aid to Families with Dependent Children-Unemployed Program (AFDC-U). Eligibility for this program is income-based

How is it Constructed?

To arrive at the percentage, the total of AFDC and AFDC-U cases are divided by the number of families with related children. Families with related children are comprised of married couples with related children, female heads with related children and male heads with related children. At a state and county level, this background fact is a percentage based on a three-year average (fiscal year 78-79, 79-80 and 80-81 for 1980; and fiscal year 90-91, 91-92 and 92-93 for 1992.)

Background Fact Clarification:

The number of families with related children is based on 1990 census data.

Data Sources:

(1980) WV Department of Health and Human Resources, Fiscal Year 78-79, 79-80 and 80-81; unpublished annual bulletin from Office of Audits, Research and Analysis **(1992)** WV Department of Health and Human Resources, Fiscal Year 90-91, 91-92 and 92-93; unpublished annual bulletin from Office of Audits, Research and Analysis.

Definitions, Methodology And Sources, continued

PERCENT BIRTHS TO MOTHERS WITH LESS THAN A 12th GRADE EDUCATION

Indicator:

The percentage of all births to mothers with less than a 12th grade education.

How is it Constructed?

At a state and county level, this indicator is based on a three-year average (1978, 1979 and 1980 for 1980; and 1990, 1991 and 1992 for 1992). The numerator is number of births to mothers "with less than a 12th grade education" divided by the number of total births. The national figure is calculated in the same way as state and county figures, but is based on data from one year, 1992.

Indicator Clarification:

The base population is all births to mothers, regardless of age.

Data Sources:

State (1980, 1992) WV Department of Health and Human Resources, Bureau of Public Health, Office of Epidemiology and Health Promotion, Health Statistics Center, Charleston, WV. **National (1992)** Advance Report of Final Natality Statistics, 1992. Monthly Vital Statistics Report; Vol. 43 No. 5, Suppl. Hyattsville, MD: National Center for Health Statistics, 1994.

PERCENT BIRTHS TO UNMARRIED TEENS (ages 10-19)

Indicator:

At a state and county level, this indicator is the percentage of live births which are to unmarried women ages 10-19. At a national level, the percentage represents live births which are to unmarried women

PERCENT BIRTHS WITH EARLY PRENATAL CARE

Background Fact:

The percentage of live births that are to women who began prenatal care in the first three months of their pregnancy.

How is it Constructed?

At a state and county level, this indicator is a percentage, based on a three-year average (1978, 1979 and 1980 for 1980; and 1990, 1991 and 1992 for 1992). The numerator for the variable is number of mothers with first trimester care; the denominator is all births with known prenatal care. National data is based on the number of mothers with first trimester care in 1992 divided by the total births with known prenatal care during the same period.

Background Fact Clarification:

Live births to women who did not report the month in which prenatal care was started were excluded from the computation. This indicator does not tell us anything about the quality, frequency or consistency of care that the mother received during this time. Lack of early prenatal care does not in and of itself cause poor birth outcomes.

Data Sources:

State (1980, 1992) WV Department of Health and Human Resources, Bureau of Public Health, Office of Epidemiology and Health Promotion, Health Statistics Center, Charleston, WV. **National (1992)** Advance Report of Final Natality Statistics, 1992. Monthly Vital Statistics Report; Vol. 43 No. 5, Suppl. Hyattsville, MD: National Center for Health Statistics, 1994.

under 20 years of age.

How is it Constructed?

At a state and county level, this indicator is based on a three-year average (1978, 1979 and 1980 for 1980; and 1990, 1991 and 1992 for 1992). The numerator is the number of births to unmarried teens ages 10-19; the denominator is the total number of births. National data is calculated by dividing the number of births to unmarried teens under age 20 by the total number of births. National data is based only on 1992 data.

Indicator Clarification:

Due to the small number of births to unmarried teens in some counties, a small change in the actual number from the period 1980 to 1992 may result in a large percentage change for trend data. The base population for this indicator is the births to all mothers, regardless of age.

Data Sources:

State (1980, 1992) WV Department of Health and Human Resources, Bureau of Public Health, Office of Epidemiology and Health Promotion, Health Statistics Center, Charleston, WV. **National (1992)** Advance Report of Final Natality Statistics, 1992. PERCENT CHILDREN APPROVED FOR FREE AND REDUCED SCHOOL MEALS (grades K-12)

Indicator:

The percent of all enrolled children in grades K-12 who have applied and been approved for free or reduced school meals.

How is it Constructed?

At a county and state level, this variable is a percentage based on 1993-1994 fiscal year data. The numerator is the number of submitted and approved applications for free or reduced-price school meals in grades K-12; the denominator is the total student enrollment in grades K-12.

Indicator Clarification:

No trend data has been calculated for this indicator. The number of children who are eligible for free and reduced school meals is thought to be undercounted since not all eligible persons return the application form. It is estimated that approximately 17% of income eligible nationally do not apply for free or reduced school meals. While this indicator is being used in lieu of the "Percent Children in Poverty," the actual percentage receiving free or reduced school meals will be higher since eligibility for free school meals is at 130% of poverty and reduced is at 185% of poverty.

Data Sources:

State (1993) W V Department of Education, Office of Child Nutrition, Charleston, WV. WV Child Nutrition Programs, Percentage of Needy Students, October Fiscal Year 1993-1994. **National (1993)** United States Department of Agriculture: Child Nutrition Division.

Food and Nutrition Service, Monthly Program Report, October Fiscal Year 1993-1994.

PERCENT CHILDREN IN POVERTY

Background Fact:

The percentage of children under 18 years of age who live in poverty as defined by the U.S. Bureau of the Census. The poverty threshold for a family of four persons was \$13,360 in 1990.

How is it Constructed?

To arrive at the percent children in poverty, the total number of children below the poverty level are divided by the total number of children under age 18.

Background Fact Clarification:

Data for this variable is not updatable at the state or county levels for 1992 and is therefore presented as 1990 data.

Data Sources:

State (1980) Bureau of the Census, Census of Population and Housing, 1980; Characteristics of the Population, Chapter D, Detailed Population Characteristics, United States Summary (PC80-1-D1-A), Table 304, Washington: Bureau of the Census (WV University Office of Health Services Research), 1984. **(1990)** Bureau of the Census, Census of Population and Housing, 1990: Summary Tape File 3C, (Table P117)/Prepared by the Bureau of the Census. -Washington: The Bureau (WV University Office of Health Services Research), 1992. **National (1980)** Bureau of the Census, 1980 Census of Population, Characteristics of the Population, Chapter B, General Population Characteristics, PC80-1-B1, Bureau of the Census, 1983. **(1990)** Bureau of the Census, Census of

Population and Housing 1990: Summary Tape File 3C (Table P126)/Prepared by the Bureau of the Census. -Washington: The Bureau (WV University Office of Health Services Research), 1992. (National data for this variable is not presented in tabular form; it is referred to in the text.)

PERCENT CHILDREN IN SINGLE-PARENT FAMILIES

Background Fact:

The percentage of "own" children under age 18 who live in families headed by a person without a spouse present in the home. "Own" children include the family head's children by birth, marriage or adoption.

How is it Constructed?

To arrive at the percent children in single-parent families, the total number of children in single-parent families were divided by the total number of children under age 18. Single parents are comprised of female-headed families and male-headed families with no spouse present. Numbers for this formula were based on census data.

Background Fact Clarification:

Data for this variable is not updatable at the state or county level and is therefore presented as 1990 data at these levels.

Data Sources:

State (1980) Bureau of the Census, Census of Population and Housing, 1980: Summary Tape File 2 (WV), (Tables B12 and B13)/Prepared by the Bureau of the Census. -Washington: The Bureau (WV University Office of Health Services Research), 1992. **(1990)** Bureau of the Census, Census of Population and

Definitions, Methodology And Sources, continued

PERCENT LOW BIRTH-WEIGHT BABIES

Indicator:

The percentage of live births recorded as low birth-weight. Babies of low birth-weight are those who weigh under 2,500 grams (5.5 pounds) at birth.

How is it Constructed?

At a state and county level, this indicator is a percentage based on a three year average (1978, 1979 and 1980 for 1980; and 1990, 1991 and 1992 for 1992). The numerator for this variable is number of low birth-weight babies; the denominator is total births for all ages. National data is the number of low birth-weight babies in 1992 divided by the total births for all ages in 1992.

Indicator Clarification:

While the low birth-weight indicator encompasses two levels of birth-weight, those of moderately low weight and very low weight, it is those surviving infants of very low birth-weight who research has shown to have notably higher odds of impaired development; this fact can be masked when looking at the two levels of low birth weight in combination.

Data Sources:

State (1980, 1992) WV Department of Health and Human Resources, Bureau of Public Health, Office of Epidemiology and Health Promotion, Health Statistics Center, Charleston, WV. **National (1992)** Advance Report of Final Natality Statistics, 1992, Monthly Vital Statistics Report, Vol. 43, No. 5, Suppl. Hyattsville, MD: National Center for Health Statistics, 1994.

PERCENT MINORITY POPULATION

Background Fact:

The percentage of the total population that is identified as minority.

How is it Constructed?

To arrive at percent minority population, the minority population has been divided by the total population. Numbers for this formula were based on 1980 and 1990 census data.

Background Fact Clarification:

Data for this variable is not updatable at the state or county level for 1992 and is therefore presented as 1990 data at these levels.

Data Sources:

(1980) Bureau of the Census, Census of Population and Housing, 1980; Summary Tape File 1C, (Table 7)/ Prepared by the Bureau of the Census, -Washington: The Bureau (WV University Office of Health Services Research), 1992. **(1990)** Bureau of the Census, Census of Population and Housing, 1990; Summary Tape File 1C, (Table P6)/Prepared by the Bureau of the Census, -Washington: The Bureau (WV University Office of Health Services Research), 1992.

PERCENT MINORITY POPULATION UNDER AGE 18

Background Fact:

The percentage of the population under age 18 identified as a minority.

How is it Constructed?

To arrive at the percent minority population under age 18, the total minority population under 18 was divided

Housing, 1990; Summary Tape File 1C, (Table P21) Prepared by the Bureau of the Census, -Washington: The Bureau (WV University Office of Health Services Research), 1992. **National (1980)** Bureau of the Census, 1980 Census of Population, Characteristics of the Population, Chapter B, General Population Characteristics, PC 80-1-B1, Bureau of the Census, 1983. **(1990)** *1992 Kids Count Data Book, State Profiles of Child Well-Being*, Center for the Study of Social Policy, Suite 503, 1250 Eye Street, N.W., Washington, D.C. 20005. (While national data for this variable is not presented in tabular form, it is referred to in the text.)

PERCENT HIGH SCHOOL DROPOUTS

Indicator:

The percentage of all students who leave a public school before graduation without transferring to another school.

How is it Constructed?

At a state and county level, this indicator is based on a three year average of school years (1978, 1979, 1979, 1980 and 1980, 1981 for 1980; and 1990, 1991, 1991, 1992 and 1992, 1993 for 1992). This percent is based on the number of dropouts divided by the number of dropouts plus the number of graduates. The number of dropouts is based on grades 7-12 while the number of graduates is for 12th grade only.

Data Sources:

State (1980, 1991) WV Department of Education, School year 1978, 1979, 1979, 1980, 1980, 1981 and 1980, 1990, 1990, 1991 and 1991, 1992 data unpublished special tabulations by the WV Department of Education, Charleston, WV

Definitions, Methodology And Sources, continued

by the total population under 18. Numbers for this formula were based on census data.

Background Fact Clarification:

Data for this variable is not updatable for 1992 on the state or county level and is therefore presented as 1990 data at these levels.

Data Sources:

(1980) Bureau of the Census. Census of Population and Housing, 1980: Summary Tape File 1C (Table 12)/Prepared by the Bureau of the Census. -Washington: The Bureau (WV University: Office of Health Services Research), 1992. (1990) Bureau of the Census. Census of Population and Housing, 1990: Summary Tape File 1C, (Table P12)/Prepared by the Bureau of the Census. -Washington: The Bureau (WV University Office of Health Services Research) 1992.

PERCENT OF ELIGIBLE CHILDREN SERVED BY HEAD START (ages 3-4)

Indicator:

The percentage of all eligible 3-4 year-olds who are participating in Head Start.

How is it Constructed?

At the state, county and national level, this variable is a percentage based on 1994 data. The numerator for this indicator is the number of 3-4 year-olds served by Head Start; the denominator is the estimated number of 3-4 year-olds in poverty.

Indicator Clarification:

This indicator is based on data from 1994; no trend data has been calculated for this indicator. Data for Cabell, Fayette, Harrison, Kanawha, Logan, Marion,

Mercer, Monongalia, Ohio and Raleigh Counties are based on projections.

The reader will also notice that in some counties, the percentage of 3-4 year-olds served by Head Start exceeds the percentage of children in poverty; this is due to the fact that guidelines for the program allow up to 10 percent of those children enrolled in Head Start to exceed the income level.

While the data indicates that a only a certain percentage of eligible children are served by Head Start, one should not assume that full funding of the program for all children would result in 100 percent participation since some that are eligible may choose not to participate or already be participating in some other program. While this data is presented as the percentage of 3-4 year-olds in poverty served by Head Start, this is not meant to imply that 3-4 year-olds are the target group for Head Start.

Data Sources:

State (1994) Department of Health and Human Services, Region III. Administration for Children and Families, Office for Community Programs, Philadelphia, Pennsylvania. **National (1994)** Raw numbers including the number of children in poverty, who are three to four years old, were supplied by the Head Start Bureau, Administration of Children, Youth and Families, Health and Human Services. The percentage of 3-4 year-olds served by Head Start was calculated by Survey Research Center staff.

PERCENT POPULATION UNDER AGE 18

Background Fact:

The percentage of the total population under age 18.

How is it Constructed?

To arrive at the percent population under 18, the population under 18 has been divided by the total population. Numbers for this formula were based on 1980 census data for 1980 and 1990 census data for 1990.

Background Fact Clarification:

Data for this variable is not updatable for 1992 on the county level and is therefore presented as 1990 data at this level.

Data Sources:

(1980) Bureau of the Census. Census of Population and Housing, 1980: Summary Tape File 1C, (Table 10)/Prepared by the Bureau of the Census. -Washington: The Bureau (WV University of Health Services Research), 1992. (1990) Bureau of the Census. Census of Population and Housing, 1990: Summary Tape File 1C, (Table P12)/Prepared by the Bureau of the Census. -Washington: The Bureau (WV Office of Health Services Research), 1992.

TEEN BIRTH RATE (ages 15-19 per 1,000 females)

Indicator:

The number of live births to teens ages 15-19 per 1,000 females ages 15-19 years.

How is it Constructed?

At a state and county level, this indicator is a rate per 1,000 females ages 15-19 based on a three-year average

Definitions, Methodology And Sources, continued

(1978, 1979 and 1980 data for 1980; and 1990, 1991 and 1992 for 1992). The rate is calculated as 1,000 times the number of teen births to females ages 15-19 divided by the total number of females ages 15-19. National data is calculated in the same manner except that it is based on 1992 data and not on a three-year average.

Indicator Clarification:

The base population for this indicator is the total number of females ages 15-19.

Data Sources:

State (1980, 1992) WV Department of Health and Human Resources, Bureau of Public Health, Office of Epidemiology and Health Promotion, Health Statistics Center, Charleston, WV. **National (1992)** Advance Report of Final Natality Statistics, 1992, Monthly Vital Statistics Report, Vol. 43, No. 5, Suppl. Hyattsville, MD: National Center for Health Statistics, 1994.

TEEN INJURY DEATH RATE: (ages 15-19 per 100,000 teens)

Indicator:

The number of deaths from homicides, suicides and unintentional injuries to teens ages 15-19 years per 100,000 teens.

How is it Constructed?

At a state and county level, this indicator is a three-year average (1978, 1979 and 1980 for 1980, and 1990, 1991 and 1992 for 1992). Each component of the teen injury death rate (homicide, suicide and unintentional injuries) is divided by the number of youths ages 15-19 and then multiplied by 100,000. To arrive at the overall teen injury death rate, the three component rates are summed.

Indicator Clarification:

Like the infant mortality and child death rates, this rate does not tell us anything about the quality of life for those teens surviving life-threatening injuries. Due to the small number of teen deaths on the county level, a small change in the actual number from the period 1980 to 1991 may result in a large percentage change for trend data. 1992 National data is not available at this time, therefore, 1991 data have been utilized. The number of youths between 15-19 years old is based on 1990 census data.

Data Sources:

State (1980, 1991) WV Department of Health and Human Resources, Bureau of Public Health, Office of Epidemiology and Health Promotion, Health Statistics Center, Charleston, WV. **National (1991)** National Center for Health Statistics Advance Report of Final Mortality Statistics, 1991, Monthly Vital Statistics Report, Vol. 42, No. 2 Suppl. Hyattsville, MD: Public Health Service, 1993.

TOTAL JOBS IN HIGH-PAYING INDUSTRIES Background Fact:

The percentage change in the number of jobs in high-paying industries which a county has gained or lost from 1980 to 1992. Jobs in the mining, manufacturing, construction, transportation and financial sectors are classified as "high" paying professions.

Data Sources:

(1980) U.S. Department of Commerce, Bureau of Economic Analysis, Table CA25, April, 1991. **(1992)** U.S. Department of Commerce, Bureau of Economic Analysis, Table CA25, May, 1994.

TOTAL JOBS IN LOW-PAYING INDUSTRIES

Background Fact:

The percentage change in the number of jobs in low-paying industries which a county has gained or lost from 1980 to 1992. Jobs in agricultural services, wholesale and retail trade and services sectors are considered as "low" paying professions.

Data Sources:

(1980) U.S. Department of Commerce, Bureau of Economic Analysis, Table CA25, April, 1991. **(1992)** U.S. Department of Commerce, Bureau of Economic Analysis, Table CA25, May, 1994.

TOTAL POPULATION

Background Fact:

The total population as reported in the census.

Data Sources:

(1980) Bureau of the Census, Census of Population and Housing, 1980; Summary Tape File 1C, Table 11/ Prepared by the Bureau of the Census, Washington; The Bureau (WV University Office of Health Services Research), 1992. **(1992)** U.S. Bureau of the Census and Regional Research Institute, WV University, July 1992. **National (1992)** U.S. Bureau of the Census, "Census and You," Vol. 28, No. 1, January, 1993.

TOTAL POPULATION UNDER AGE 18

Background Fact:

The total population under age 18 as reported in the 1980 and 1990 census.

Background Fact Clarification:

Data for this variable is not updatable for 1992 on the county level and is therefore presented as 1990 data at that level.

Definitions, Methodology and Sources, continued

HOW TO USE THIS BOOK

Data Sources:

(1980) Bureau of the Census. Census of Population and Housing, 1980: Summary Tape File 1C. (Table 10) Prepared by the Bureau of the Census. Washington. The Bureau (WV University Office of Health Services), 1992. (1990) Bureau of the Census. Census of Population and Housing, 1990: Summary Tape File 1C. (Table P11) Prepared by the Bureau of the Census Washington. The Bureau (WV University Office of Health Services Research, 1992).

UNEMPLOYMENT RATE:

Background Fact:

The number of people who are actively looking for work but are unemployed as a percentage of the civilian labor force.

How is it Constructed?

This variable is a percentage based on the West Virginia Labor Force Statistics annual average, 1992, to calculate the unemployment rate; the total number of unemployed persons is divided by the number of persons in the civilian labor force.

Data Sources:

(1980) Bureau of Employment Programs, Prepared by Labor and Economic Research, (BLS series): unpublished special tabulations. (1992) U.S. Bureau of the Census. Statistical Abstract of the United States: 1993 (113th edition) Washington D.C., 1993.

The 1994 WV KIDS COUNT Data Book consists of a state profile, a minority profile and 55 county profiles, all of which document the status of children in West Virginia. Most of the indicators and background facts are expressed as percentages or rates. Indicators and Background Facts presented as actual numbers include: Total Population, Population Under 18, Education Expenditures Per Pupil (1992 dollars), Total Jobs in High-Paying Industries, Total Jobs in Low-Paying Industries and Median Family Income (1990 dollars). The raw numbers used to calculate the percentages and rates appear in the Actual Numbers section of the book.

Trend data is based on the change between 1980 and 1992 in some cases, including Percent Low Birth Weight Babies, Infant Mortality Rate, Child Death Rate, Teen Birth Rate, Percent Births to Unmarried Teens, Teen Injury Death Rate and Percent Births to Mothers with Less Than a 12 Grade Education, the 1980 value is the average of 1978, 1979, and 1980, and the 1992 value is the average of 1990, 1991, and 1992. The 1980 Percent High School Dropouts is the average of three school years: 1978-79, 1979-80 and 1980-81, figures for the 1992 value is the average of 1990-91, 1991-92 and 1992-93 school years. Trend data is not available on four of the indicators. In this year's KIDS COUNT Data Book Child Abuse/Neglect data are from FY 1992-93, Percent of Eligible Children Served By Head Start data are from 1994, Juvenile Delinquency Case Rate data are based on 1991-1992, and Percent Children Approved for Free and Reduced School Meals are based on 1993-94 data.

A composite county rank appears in the upper right corner of each county profile. It was derived by converting the county rates and percentages on the indicators to z scores and then adding the z scores together for each indicator. This was done in order to give each indicator equal weight. The composite z scores were then ranked 1=best, 55=worst.

The indicators' z scores summed to achieve the composite rank include: Low Birth Weight, Infant Mortality Rate, Child Death Rate, Free & Reduced Meals, Teen Birth, Unwed Teen Births, High School Dropout, Juvenile Delinquency, Teen Injury Death Rate, Births to Mothers with Less Than a 12 Grade Education. This year's WV KIDS COUNT Data Book counts both Percent of Eligible Children Served by Head Start and Child

Abuse/Neglect Rate from the composite score. Therefore, comparisons between 1991, 1992, and 1993 composite county rankings should not be made.

Each of the 12 indicators is also ranked in sequential order from best (1) to worst (55). The ranking was obtained by simply ranking the rate or percentage from best to worst. These individual indicator rankings appear on each of the county pages under the county rank column and are based on 1992 data (except for Head Start (1993 data), and Free and Reduced Lunch (1994 data).

Whenever there was a tie of two or more counties for the individual indicator rank, they were all assigned the same rank, e.g., if four counties tied at ranking position 1, they were all assigned a ranking position of 1, then the next county was ranked 5.

Caution should be used in interpreting the results of the rankings. Some indicators - child death rate, for example - document relatively rare events. For example, the county that is ranked 3rd for a particular indicator may have a value of 2%, while the county that is ranked 25th may have a value of 4%.

"N/A" indicates that data was not available. "NM" is used when the 1980 data is zero and 1992 data is any value above zero because a percent change from zero cannot be calculated. When the 1980 data is any value above zero and the 1992 data is zero, the percent change shown is always 100 percent.

Mapping: The indicator maps are based on standard deviation breakdowns which allow for meaningful comparisons across counties. The dark colored counties are those counties with 1992 rates or percents that are two or more standard deviations above the state average of those counties which are doing most poorly on the particular indicator. The medium colored counties are counties with 1992 rates or percents that are one standard deviation above the state average of those counties which are not doing well on the particular indicator. The light colored counties represent counties with 1992 rates or percents that are at or below the state average. These counties have the lowest rates or percents in the state and are doing well in terms of the indicator.

Actual Numbers

COUNTY	Low Birth Weight Babies		Infant Deaths		Child Deaths		Kids in Head Start		Kids Approved For Free/Reduced Meals		Teen Births		Unwed Teen Births		High School Dropouts		Juv Del Cases		Teen Injury Deaths

WV KIDS COUNT Fund

The WV KIDS COUNT Fund was formed in February of 1989 to begin a partnership between government and the private sector to support solutions for West Virginia's children. The mission of the KIDS COUNT Fund is to improve the lives of West Virginia's children by mobilizing the private and public sector to create prevention and early intervention programs, policies and strategies. Members of the KIDS COUNT Fund are among the state's most influential and respected business, labor, community and religious leaders.
