ABSTRACT

This report profiles undergraduates enrolled in postsecondary education for the academic year 1992-93. It relies on data from the 1992-93 National Postsecondary Student Aid Study, third in a series conducted by the Department of Education. The report begins with an essay that explores the extent to which undergraduates have outside responsibilities and enrollment patterns that increase their risk of not attaining a degree or postsecondary certificate. Following the essay, a compendium of tables provides comprehensive information about enrollment patterns, programs of study, student characteristics, financial aid receipt and employment, students' educational aspirations, and their community service participation. Not since the 1970s has the typical postsecondary student been a recent high school graduate enrolled full-time at a four-year school, and working toward a Bachelor's degree. On the contrary, such students represented only about one-third of undergraduates enrolled in 1992-93. The first section of the compendium contains detailed risk factor tables, and the remaining sections are marked to highlight topic findings. (Contains 9 text tables, 8 figures, and 58 tables in the compendium.) (SLD)

Foreword

This report profiles undergraduates enrolled in postsecondary education for the academic year 1992–93. It relies on data from the 1992–93 National Postsecondary Student Aid Study (NPSAS:93), the third in a series of surveys conducted by the U.S. Department of Education. The NPSAS surveys are designed to represent all postsecondary students enrolled during the survey year and to provide detailed information about postsecondary students' financial aid and educational expenses.

The report begins with an essay that explores the extent to which undergraduates have outside responsibilities and enrollment patterns that increase their risk of not attaining a degree or postsecondary certificate. Following the essay is a compendium of tables that provides comprehensive information about enrollment patterns, programs of study, student characteristics, financial aid receipt and employment, undergraduates' educational aspirations, and their community service participation. The first section of the compendium contains detailed risk factor tables, and the remaining sections are prefaced with a series of bullets that highlight the findings for that topic.

The estimates presented in the report were produced using the NPSAS:93 Data Analysis System (DAS). The DAS is a microcomputer application that allows users to specify and generate their own tables from the NPSAS:93 data. This software system produces design-adjusted standard errors necessary for testing the statistical significance of differences shown in the tables. For more information about the DAS, readers should consult appendix B of this report.

Acknowledgments

The authors wish to thank all those who contributed to the production of this report. At MPR Associates, Stephanie Cuccaro-Alamin provided valuable assistance in reviewing and summarizing the literature; Susan Choy reviewed the report and provided helpful criticism. Thanks also to Andrea Livingston and Karen Singson who edited the report, and Lynn Sally who was responsible for all the word processing, formatting, and graphics presentation.

We would like to acknowledge the guidance of Andrew Malizio and C. Dennis Carroll at NCES throughout the production of this report. Also at NCES, Marilyn McMillen, and Robert Burton provided helpful criticism of the draft report. Other reviewers who gave us constructive feedback include Richard Apling (Congressional Research Service, Library of Congress); David Bergeron (Office of Postsecondary Education, U.S. Department of Education); Jay Noell (Congressional Budget Office); Kent Phillippe (American Association of Community Colleges); and Beth Young (Pinkerton Computer Consultants). Thanks to all these reviewers who strengthened the final report.

Undergraduates at Risk

Not since the 1970s has the typical student in postsecondary education (PSE) been a recent high school graduate enrolled full time in a 4-year college or university, working toward a bachelor's degree. On the contrary, these students represented about one-third of undergraduates enrolled in 1992–93. During that academic year, about the same proportion of undergraduates were enrolled in 2-year institutions as were enrolled in 4-year colleges and universities (figure 1). In addition, about 6 percent of undergraduates were enrolled in less-than-2-year institutions (primarily private, for-profit trade schools) that typically offer programs of short duration (e.g., less than a year), resulting in a vocational certificate in such fields as cosmetology and administrative/secretarial skills.

Figure 1—Percentage distribution of undergraduate enrollment according to the highest award offering of institution, by age: 1992-93

NOTE: The numbers at the top of the bars are the percentages of all undergraduates enrolled at that type of institution. The patterns inside the bars are the proportions of younger and older students within the institution type.

1.0

¹Approximately 46 percent of undergraduates attended 4-year colleges or universities, and about 68 percent of these students were under the age of 24. Thus, overall about one-third (48 percent of 68 percent) of undergraduates were "traditional" students.

²This report refers to institutions that offer 2- to 3-year programs (less than a bachelor's degree) as 2-year institutions, and colleges that offer bachelor's degrees or higher as 4-year institutions. The term *level* refers to the highest offering of the institution.

While so called traditional students represent a minority of undergraduates currently enrolled in postsecondary education, they are more successful in attaining bachelor's degrees than their less traditional peers. Traditional students are often better prepared academically to enter college,³ and they generally have adequate financial support from their families and financial aid programs.⁴ Such resources allow these students to concentrate on their studies full time, freeing them from the financial and time constraints often imposed on less traditional students.

As the undergraduate population has expanded to include more women, older students, minorities, and students from low income families, so has the number of students at risk of not completing their educational program.⁵ Such students may encounter a range of economic, social, or cultural barriers to persistence and attainment in postsecondary education attendance. Often they have families to support, they may work full time while the are enrolled, and some have to commute long distances either to their jobs or to school. These and other external constraints may conflict with postsecondary education attendance and persistence. And for the students affected, services such as affordable child care and flexible class schedules are a necessity. In fact, researchers such as Bean and Metzner have argued that alleviating environmental stress factors plays a more important role in helping nontraditional students realize their educational goals than it does for more traditional students (i.e., those who enroll immediately in colleges or universities and who attend full time for the duration of their enrollment). These same researchers also point out that such assistance may compensate for nontraditional students' poor academic preparation or lack of social integration—key variables related to traditional students' persistence and attainment as illustrated in Tinto's model of attrition.

In addition to the financial and social problems less traditional students may encounter, they often have postsecondary education enrollment patterns known to reduce the chances of completing a degree—more specifically, the decision to delay their postsecondary education and, once enrolled, to attend on a part-time basis. However, it is also true that these enrollment choices may be the only feasible option for students either lacking the time or resources to attend full time, or the academic preparation needed to immediately enroll in postsecondary education. In addition, part-time enrollment in low cost institutions, such as community colleges, offers a wide range of opportunities for both personal and professional growth. Nevertheless, while such attendance may offer educational opportunities to

individuals who might not attend otherwise, part-time attendance does increase students' chances of not completing their postsecondary program.

To design appropriate programs and services for undergraduates likely to be at risk of leaving postsecondary education, it is important to know how many students are affected and where they are enrolled. It is also important to determine how risk factors are interrelated, first, because many students may face multiple risks, and second, because the ways in which these risks are interrelated may affect the kinds and amount of support students need.

Finally, it should be noted that the notion of "risk" in this report refers only to students' risk of not completing a postsecondary program. This does not mean that postsecondary education offers no benefits to students who do not complete a degree. Indeed, students may benefit in many ways that improve their quality of life. Nevertheless, the evidence is clear and compelling that students who complete a college degree, especially a bachelor's degree, experience greater occupational and economic benefits than students who do not attain a degree.

Purpose and Organization of Report

This report profiles all undergraduates enrolled in U.S. postsecondary institutions in 1992–93 and the essay that follows focuses on undergraduates with risk factors and enrollment patterns known to adversely affect persistence and attainment. Data from the 1992–93 National Postsecondary Student Aid Study (NPSAS:93) were used for this study. This survey is designed to represent students enrolled in all postsecondary institutions and to provide detailed information about postsecondary students' financial aid and educational expenses.

For this analysis, the NPSAS:93 variables used as indicators of risk included not enrolling in postsecondary education the same year as graduating from high school (i.e. delayed enrollment); attending part time; being financially independent of parents (as defined by financial aid regulations); having dependents other than a spouse (either children or elders); and working full time while enrolled in postsecondary education. Since the NPSAS survey has a postsecondary focus, variables that measure students' academic preparation for postsecondary education are not available with the exception of whether or not they graduated from high school with a traditional high school diploma. In this report, we also examine this relatively small, but not insignificant, group of undergraduates who were not traditional high school graduates.

This essay addresses students at risk of attrition in a number of ways: first, by examining the prevalence of each risk factor individually and determining where students affected are enrolled (figure 2 shows the distribution of undergraduates with each risk factor according to the level of institution in which they were enrolled); second, by determining how risk factors are interrelated and which students have multiple risk factors (as illustrated in table 1, the risk factors are strongly interrelated and most students have more than one); and third, by examining the association between risk factors and 1-year persistence rates.

⁹For a comprehensive review, see E. Pascarella and P. Terenzini, *How College Affects Students* (San Francisco: Jossey-Bass, 1991).

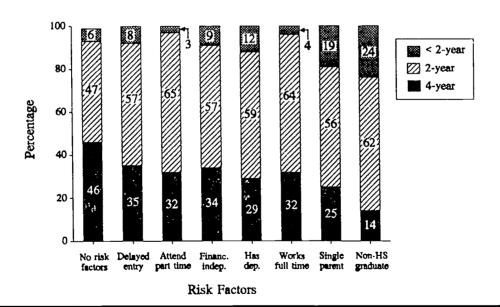

Table 1—Percentage of undergraduates with specific risk factors, by risk factor and level of institution: 1992-93

	Delayed enrollment	Enrolled part time	Financially independent	Has dependents	Works full time	Single parent	Not a high school grad.

Not a high							
school grad.	65.8	62.5	79.6	44.0	40.9	21.2	100.0
Level of institution							
Less-than-2-year	67.4	30.2	73.6	42.0	29.9	23.3	26.1
2-year	52.1	73.6	62.5	28.0	46.7	8.9	8.4
4-year	30.9	36.5	38.5	13.7	27.4	4.2	1.9

NOTE: The total row shows the percentage of all undergraduates with each risk factor (i.e., 42.7 percent of undergraduates delayed enrollment). For each risk factor under the total row (row categories), the table shows the percentage of undergraduates with that risk factor who had each of the other risk factors. For example, the row labeled "Delayed enrollment" should read: Among undergraduates who delayed their enrollment, 63.6 percent enrolled part time; 73.4 percent were financially independent; 32.1 percent had dependents; and so on.

Individual Risk Factors

Delayed Enrollment

The timing of enrollment clearly affects the benefits of postsecondary education. To the extent that postsecondary education increases long-range earning potential and social status, the sooner students attend, the sooner they can realize these economic and social advantages. Delaying postsecondary education, however, does more than just postpone the benefits afforded by such education, it also increases the risk of dropping out. Studies have found that even among students with similar educational goals and those enrolled in the same types of institutions, those who delay their enrollment are substantially less likely to earn a bachelor's degree than students who enter immediately after high school.

Among undergraduates enrolled in postsecondary education in 1992–93, about 43 percent experienced some delay (table 2). Delaying enrollment varied according to attendance status and the degree program students were pursuing. Students who attended part time during any period of their enrollment were more likely to have delayed their enrollment than students enrolled full time for a full academic year (at least 9 months). Undergraduates pursuing shorter term awards, including certificates or associate's degrees, were more likely to have delayed their enrollment than students enrolled in a bachelor's degree program.

Consistent with the patterns observed for degree programs was the association between delayed enrollment and the highest offering of an institution: students attending less-than-2-year institutions were more likely to have delayed their enrollment (67 percent) than were students in 2-year institutions (52 percent); in turn, students in 2-year institutions were more likely to have delayed than those in 4-year colleges and universities (31 percent).

Whether or not students delayed their enrollment was also related to their family obligations, financial resources, and having disabilities. For example, students who were married delayed more often than those who never married, and students with dependents were more likely to delay than those without dependents. Students with disabilities delayed more often than nondisabled students, ¹³ and those in the lower income quartile were more likely to delay than students in the upper income quartile.

¹³Students were asked if they had "any of the following disabilities: hearing impairment; speech disability or limitation; orthopedic or mobility limitation; specific learning disability; vision impairment that cannot be corrected by glasses or legally blind; or any other type of limitations, disabilities, or handicaps."

.

¹¹See, for example, U.S. Department of Education, National Center for Education Statistics, *High School and Beyond: 1992 Descriptive Summary of 1980 High School Sophomores 12 Years Later* (Washington, D.C.: 1995). ¹²For this analysis, students who delayed deform high were defined as those who did not enroll in postsecondary

education the same year as they graduated from high school, making the assumption that high school graduation occurs in May or June.

Part-Time Attendance

In the last 25 years, part-time attendance in postsecondary education has increased dramatically. The number of part-time undergraduates more than doubled between 1970 and 1990, from 2.1 million to 5 million students. If In contrast, full-time enrollment increased by only one-third during this same time period. As a proportion of total enrollment, part-time enrollment increased from 28 percent to 42 percent during this period. Most of the growth, however, occurred between 1970 and 1980; thus, part-time students have been a stable part of the undergraduate population for more than 10 years. The growth in part-time enrollment has paralleled that of older students who are much more likely to attend part time than traditional college-age students. Is

While part-time attendance expands the educational opportunities of students who either lack the resources or the time to attend full time, it also increases the time required to earn a degree as well as the risk of dropping or stopping out. ¹⁶

In 1992–93, attending full time was still predominant in 4-year colleges and universities (figure 3). On the other hand, the majority of students in 2-year institutions (74 percent) attended part time, and these students accounted for about two-thirds of all part-time undergraduates. Part-time attendance was relatively evenly distributed between students attending part time for a full academic year (at least 9 months) and those attending part time, part year (26 and 28 percent, respectively) (table 3). 18

As would be expected, part-time attendance (both full- and part-year, but especially part-year) was most common among students with outside demands on their time. Married students, those with dependents, and students working full time while enrolled were particularly likely to attend on a part-time basis.

On the other hand, even though women enrolled in postsecondary education tended to be older than men and were almost twice as likely to have dependents (29 percent versus 16 percent), 19 they were only marginally more likely to attend part time (e.g., 27 percent compared with 24 percent attending part time for a full year). This pattern reflects the fact

¹⁹See compendium table 4.2b for the relationship between gender and age and text table 5 for the relationship between gender and dependents.

¹⁴For a detailed description of part-time students, see U.S. Department of Education, National Center for Education Statistics, *Profile of Part-Time Undergraduates in Postsecondary Education: 1989–90* (Washington, D.C. 1995)

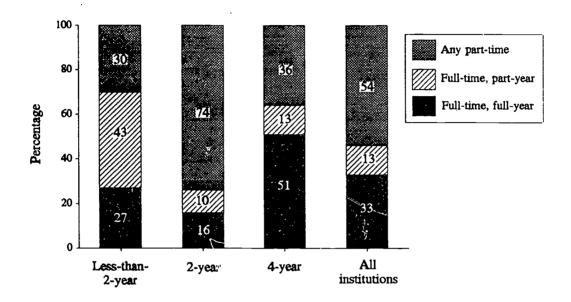

¹⁵See U.S. Department of Education, National Center for Education Statistics, *Profile of Older Undergraduates:* 1989–90 (Washington, D.C.: 1995) and *Profile of Part-Time Undergraduates* 1989–90 (Washington, DC: 1995) for a discussion of these two groups of students.

¹⁶High School and Beyond: 1992 Descriptive Summary of 1980 High School Sophomores 12 Years Later (1995). ¹⁷See compendium table 2.2a: 61 percent of part-time, full-year students and 69 percent of part-time, part-year students attended 2-year institutions. It should be noted that part-time attendance for this analysis is based on attendance throughout students' enrollment between July 1, 1992 and June 30, 1993. Thus these estimates of part-time attendance may appear higher than those based on IPEDS data, which are reported by institutions at the beginning of the fall term.

¹⁸Note that those attending part time for a full year may include those who had mixed full-time, part-time attendance.

that women were more likely than men to attend private, for-profit institutions, which tend to offer short, concentrated (full-time) programs (9 percent versus 6 percent).²⁰

Figure 3—Percentage distribution of undergraduates' attendance status, by highest award offering of institution: 1992-93

NOTE: Students in less-than-2-year institutions who are enrolled full time, part year include those who may have completed programs lasting less than 1 year.

SOURCE: U.S. Department of Education, National Center for Education Statistics. 1992-93 National Postsecondary Student Aid Study (NPSAS:93), Undergraduate Data Analysis System.

Because most part-time students were enrolled in less-than-4-year institutions, they were primarily pursuing vocational certificates or associate's degrees (which can be vocational or academic). For example, 52 percent of students attending part time for a full year were pursuing associate's degrees, and about 12 percent were pursuing vocational certificates (figure 4). Among part-time, part-year students, 55 percent and 15 percent, respectively, were pursuing associate's degrees and vocational certificates.

Financial Independence

Whether or not a student is financially dependent on his or her parents is determined when assessing the student's need for financial aid. Parents of dependent students are expected to pay a portion of their child's education; the amount is based on their income and assets as well as the cost of attendance. Parents of independent students, on the other hand, are not required to pay any educational costs, though some parents do provide financial assistance.

In 1992-93, roughly half of the undergraduate population (52 percent) was considered independent (table 4). Because the main criterion for independence is age (students 24 or older are automatically considered independent), most independent students were older.

²¹See appendix A for a complete definition of dependency status. Note that the term *financial dependence* refers to the federal financial aid requirement stipulating that the parents of dependents must pay for a portion of their children's education. This requirement is based on a number of factors, including the student's age, marital status, military status, and so on. It does not reflect the student's financial circumstances.

However, 13 percent of students 23 or younger were also independent. Younger independent students are often married and have dependents of their own. 22 Added to these responsibilities, younger independent students might find it particularly difficult to meet their educational expenses since they often have less employment experience than their older peers and usually receive less parental financial support than dependent students of the same age.

Whether or not undergraduates were independent varied according to the length of the degree program offered by the institutions: the shorter the program, the higher the percentage of independent students. Furthermore, in addition to a higher proportion of independent students among those attending less-than-2-year institutions, the independent students were much more likely to be under the age of 24.²³

Because female undergraduates were more likely to be older and to have dependents in 1992–93 than their male counterparts, they were also more likely to be independent (56 percent versus 48 percent). Among racial—ethnic groups, nearly 70 percent of American Indians/Alaskan Natives were independent, more than any other racial—ethnic group (41 percent to 59 percent).

Table 4—Percentage of undergraduates according to dependency status, by selected student and institutional characteristics: 1992-93

²³For example, 40 percent of independent students in less-than-2-year institutions were under age 24, compared with 15 percent in 2-year institutions and 9 percent in 4-year institutions (NCES NPSAS:93 undergraduate DAS).

²²If a student under the age of 24 is married or has dependents and the student's parents did not claim the student as dependent for tax purposes, the student is considered financially independent.

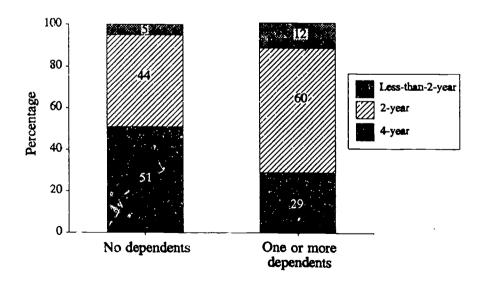

Undergraduates with Dependents; Single Parents

Students often enter or return to postsecondary education in order to increase their earning potential so that they can better support their families. At the same time, family responsibilities often conflict with attendance and persistence. A sick child, for instance, can result in the parent missing classes or, in some cases, having to withdraw temporarily from school. Such absences may undermine the parents' ability to complete their postsecondary education.

About one-fifth of 1992–93 undergraduates (22 percent) were responsible for dependents other than a spouse (table 5). Moreover, students with serious academic limitations (i.e., those who were not traditional high school graduates) were more likely to have dependents than traditional high school graduates. Furthermore, undergraduates with disabilities were more likely to have dependents than those with no disabilities.

Because of the level of commitment required to attend postsecondary education and care for dependents, it may not be surprising to see students who are responsible for dependents in shorter term postsecondary programs more often than those without dependents (figure 5). For example, 60 percent of students with dependents, compared with 44 percent of those without dependents, attended 2-year institutions. Similarly, 12 percent of students with dependents, compared with 5 percent without dependents, were enrolled in less-than-2-year institutions.

SOURCE: U.S. Department of Education. National Center for Education Statistics, 1992-93 National Postsecondary Student Aid Study (NPSAS:93), Undergraduate Data Analysis System.

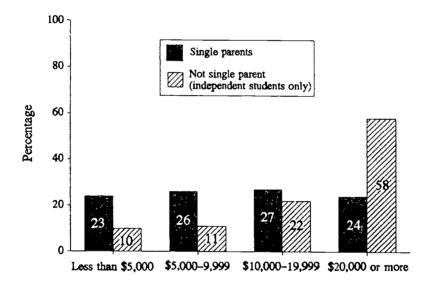

Undergraduates with perhaps the greatest obstacles to their postsecondary education are single parents. The problems encountered by students with dependents are compounded for those with no spousal support. Approximately 8 percent of undergraduates reported being single parents; and women were much more likely to be single parents than men (11 percent versus 3 percent) (table 5). Among racial—ethnic groups, black, non-Hispanic and American

Indian/Alaskan Native students were more likely to be single parents than either white, non-Hispanic or Asian/Pacific Islander students.

Single parents were particularly likely to have very low incomes: 23 percent had incomes under \$5,000, and an additional 26 percent had incomes under \$10,000 (figure 6). In addition, single parents were about four times more likely than other students to choose short-term vocational postsecondary programs. For example, about 19 percent of single parents were enrolled in less-than-2-year institutions, compared with 5 percent of other independent students.

Figure 6—Percentage distribution of single parents and independent nonsingle parents, by income level: 1992-93

Students Working Full Time While Enrolled

Students who work full time may do so for a variety of reasons. For example, they may be employed in career-level jobs and are seeking to enhance their skills. Alternatively, they may not yet have a career job but need to work full time in order to support their families and pay for their education. Whatever reasons students may have for working so much, combining full-time work and postsecondary education may increase their risk of attrition. ²⁵

²⁵D. Stern and Y. Nakata, "Paid Employment Among U.S. College Undergraduates," *Journal of Higher Education* 62 (1990).

²⁴See compendium table 2.2b. Note all single parents are, by definition, independent.

In 1992–93, nearly 40 percent of undergraduates reported working full time during some period of their enrollment (table 6). Because of the close association between working full time and attending school part time—about 80 percent of students working full time attended part time (see table 3)—the patterns seen for the former parallel the latter. Therefore, students enrolled in 2-year institutions were more likely to work full time than those in either less-than-2-year or 4-year institutions (47 percent, compared with 30 percent and 27 percent, respectively). Likewise, students 24 or older and students with dependents were more likely to work full time than younger students or shose without dependents.

Students may also work full time to reduce their need for education loans. That is, net of their financial aid grants, students may make the decision to work more hours rather than incur additional (or any) debt to pay for their education. Among 1992–93 undergraduates, independent students working full time were about half as likely as students working part time to receive any financial aid (25 percent versus 47 percent). At the same time, these students were only about one-third as likely as students working part time to borrow (7 percent versus 25 percent) (figure 7). This finding suggests that some students may have chosen full-time work in lieu of borrowing. 27

Table 6—Percentage distribution of undergraduates according to the number of hours worked per week while enrolled, by selected student and institutional characteristics: 1992-93

	Not employed	Worked 1–20 hours	Worked 21–34 hours	Worked 35 hours or more

Students Who Did Not Graduate from High School

About 6 percent of undergraduates enrolled in 1992–93 were not traditional high school graduates; most of these students were GED recipients (table 7). While this may seem like a small proportion of undergraduates, the fact that they are not as successful as traditional high school graduates in the labor market makes their success in postsecondary education all the more important.²⁸ Moreover, in addition to their disadvantaged position in the labor market, undergraduates who were not traditional high school graduates were far more likely than traditional high school graduates to be single parents (e.g., 20 percent of GED recipients compared with 7 percent of high school graduates).²⁹

Due to the open admission policies in most less-than-4-year institutions, students who did not graduate from high school were enrolled almost exclusively in these institutions (figure 8). For example, most of the GED recipients were enrolled in the 2-year sector (65 percent). Among students with no high school credential, 42 percent were enrolled in less-than-2-year institutions and 54 percent attended 2-year institutions.

Multiple Risk Factors

Many of the risk factors identified in this analysis are highly correlated, and most students had more than one (see table 1 for examples). To measure the extent to which undergraduates were affected, each student was assigned a score from 0–7 representing the sum of seven possible risk factors each had. For example, all single parents are, by definition, independent and have dependents. Thus, these students have a minimum of three risk factors (table 8). Similarly, almost all students who work full time also attend postsecondary education on a part-time basis, giving them at least two risk factors. While no attempt was made to weigh each risk factor (clearly, the individual impact of some are greater than others), 30 the association of the risk factors makes them cluster together in multiples. For example, only about one-fifth of undergraduates had just one risk factor. These included about 18 percent of students attending part time (i.e., attending part time was the only risk factor associated with these students), 13 percent who delayed enrollment, 7 percent who worked full time, 5 percent who were independent, and 4 percent who were GED recipients (table 8). In contrast, the vast majority of GED recipients, students with dependents, and single parents had at least four risk factors (70 percent, 77 percent, and 92 percent, respectively).

One of the most compelling results of this analysis is that the proportion of students with four or more risk factors is almost identical to that of students with no risk factors (22 percent versus 24 percent). Thus, undergraduates with considerable outside responsibilities that may seriously impede their progress in school are as numerous as those with no such responsibilities. Moreover, students with multiple risk factors were concentrated in less-than-4-year institutions. For example, about one-third of students enrolled in either less-than-2-year or 2-year institutions had four or more risk factors. The same was true for only 13 percent of undergraduates enrolled in 4-year institutions. In contrast, about 10 percent of students in less-than-4-year institutions had no risk factors, compared with 39 percent of those in 4-year colleges or universities.

There was also a difference in the number of risk factors among students who had attained a bachelor's degree, compared with those at the same class level who had not attained this degree. That is, among students who were seniors in 1992–93, those who attained their bachelor's degree that year were more likely than seniors who had not yet attained their degree to have no risk factors (35 percent versus 24 percent), and they were about one-half as likely to have four or more risk factors (9 percent versus 17 percent). Additionally, among students enrolled in 4-year colleges, those in institutions that do not grant doctorate degrees (either public or private, not-for-profit) were more likely to have four or more risk factors than students in doctorate-granting institutions.

Women were more likely than men to have four or more risk factors (26 percent versus 18 percent), as were students with disabilities (31 percent versus 25 percent). American Indian/Alaskan Native and black, non-Hispanic students were more likely to have four or more risk factors (35 percent and 31 percent, respectively) than either white, non-Hispanic

³⁰Because students with no high school credentials are precluded from entering many colleges, the impact of this risk factor is far greater than the others. Therefore, these students (about 1.9 percent of undergraduates) are not included in the analysis of multiple risk factors.

students (22 percent) or Asians/Pacific Islanders (14 percent). Asians/Pacific Islanders were less likely than any other racial—ethnic group to have four or more risk factors.

Risk Factors and Persistence in 1992-93

The NPSAS:93 survey covers only 1 year (1992–93). Therefore, determining degree attainment for participants is not possible. However, persistence within an academic year can be an important determinant of a student's eventual attainment.³¹ In order to examine

³¹For an analysis of how these risk factors affect persistence and attainment over a 5-year period, see U.S. Department of Education, National Center for Education Statistics, Educational Persistence and Attainment of 1989-90 Beginning Postsecondary Students as of 1994 forthcoming.

persistence within the 1992–93 academic year, the sample was limited to students who were enrolled in the fall of 1992 and who indicated that they planned to be enrolled in the following academic year (1993–94). In this way, students enrolled in postsecondary education to take a class or two and those who were finishing their programs (and, therefore, attending for only one term) should have been eliminated from this group. Students who planned on attending the following year would be expected to attend for the entire academic year. It is this "expected persistence" that is measured in this analysis.

Among all of those enrolled in the fall who also planned to attend the following year, 81 percent were enrolled for at least 8 months of 1992–93 (table 9). Almost all the risk factors identified in this study were associated with lower 1-year persistence rates (attended at least 8 months). For example, 76 percent of students who delayed entry into postsecondary education were enrolled for at least 8 months, compared with 84 percent who did not delay. A similar pattern was seen for independent students (75 versus 86 percent), students with dependents (75 percent versus 83 percent), and students who worked full time (71 percent versus 81 percent or higher).

Having more than one risk factor was strongly associated with lower rates of 1-year persistence (table 9). However, the magnitude of the differences appeared to level off after two risk factors. For example, 93 percent of students with no risk factors persisted for 8 months, compared with 83 percent of those with one risk factor and 76 percent of students with two risk factors. On the other hand, the differences between persistence rates for students with two risk factors, compared with those with three or four, were not statistically significant (76 percent compared with 74 percent and 73 percent, respectively). Nevertheless, it is still apparent that having two or more risk factors substantially reduced students' chances of attending for a full academic year.

21

³²It should be noted, however, that students with multiple risk factors were more likely to enroll in nonfall terms than those with few or no risk factors; therefore, because only students enrolled in the fall could be included in the analysis, the persistence rates for undergraduates with three or more risk factors may have been overestimated.

Summary and Conclusions

It is clear from this analysis that a majority of 1992–93 undergraduates had substantial outside responsibilities or enrollment options that put them at risk of not finishing their postsecondary education. About three-quarters of undergraduates were affected by at least one of the factors examined in this study—delaying postsecondary education enrollment, attending part time, being independent, having dependents, being single parents, and not graduating from high school. Moreover, the proportion of students who had four or more risk factors was the same as the proportion who had none (about 23 percent). Students with no risk factors are those historically considered traditional (i.e., started postsecondary education immediately after high school and attended full time). Thus, for every traditional student identified in this analysis, there was one with multiple risk factors.

Students who had any risk factors usually had more than one. That is, if they worked full time, they almost always attended part time; if they had dependents, they often worked full time and attended part time, and so on. In fact, among undergraduates who had any risk factors, only one-quarter had one. (One risk factor was almost always associated with either attending part time or delaying enrollment.) However, even the presence of one risk factor was associated with lower persistence rates for a full academic year in 1992–93, when compared with having none. In addition, among students who were seniors in 1992–93, those who attained a bachelor's degree were more likely to have no risk factors and were less likely to have four or more, compared with seniors who had not completed their degree.

If one examines the distribution of students according to the length of program offering of institutions, for almost every risk factor examined, the percentage of students affected went up as the length of the program went down. For example 23 percent of students enrolled in less-than-2-year institutions were single parents, contrasted with 9 percent in 2-year institutions and 4 percent in 4-year colleges and universities. A similar pattern was seen for students who did not graduate from high school. Students who either worked full time or attended part time (or both), on the other hand, were more concentrated in the 2-year sector than they were in less-than-2-year institutions.

Finally, given the increased likelihood that undergraduates with individual risk factors attended less-than-4-year institutions, one would also expect that those with multiple risk factors would be concentrated in this sector as well. This was indeed the case: a bout one-third of undergraduates enrolled in either less-than-2-year or 2-year institutions had four or more risk factors, compared with 13 percent in 4-year institutions. In contrast, students in 4-year institutions were about four times more likely to have no risk factors (about 40 percent) than those in less-than-4-year institutions.

Section 2 Enrollment Characteristics

Institution Control

- In 1992–93, about three-quarters of all undergraduates were enrolled in public institutions; 16 percent were enrolled in private, not-for-profit institutions; and the remaining 8 percent attended private, for-profit institutions (table 2.1a).
- Undergraduates with greater financial resources (i.e., those in the highest income quartile versus students in the middle and lower quartiles) were more likely to attend private, not-for-profit institutions (primarily independent 4-year colleges and universities); however, those with fewer financial resources (students in the lowest income quartile) were more likely to attend private, for-profit institutions (primarily less-than-2-year trade school programs) (table 2.1b).
- Racial—ethnic differences (also related to differences in income levels) were found relative to institution control: black, non-Hispanic and Hispanic students were about twice as likely as white, non-Hispanic students to attend private, for-profit institutions (16 percent and 11 percent versus 6 percent) (table 2.1b).

Level of Institution (Highest Offering)

- In 1992–93, undergraduates were equally likely to be enrolled in 2-year or 4-year institutions (47 percent and 46 percent, respectively) (table 2.2a). However, younger undergraduates were more commonly enrolled in 4-year institutions, while older students tended to be concentrated in 2-year institutions. For example, 57 percent of undergraduates 23 or younger were enrolled in 4-year institutions, compared with 30 percent of students age 30 or older; in contrast, 62 percent of students 30 or older were enrolled in 2-year institutions, compared with 38 percent of students 24 or younger (table 2.2b).
- While male and female undergraduates were equally likely to attend 2-year institutions, men were somewhat more likely to attend 4-year institutions (49 percent versus 45 percent), and women were more likely to attend less-than-2-year institutions (8 percent versus 4 percent) (table 2.2b).
- Black, non-Hispanic and white, non-Hispanic undergraduates were equally likely to attend 4-year institutions (45 percent and 47 percent, respectively); however, a greater proportion of black, non-Hispanic undergraduates were enrolled in less-than-2-year institutions than were white, non-Hispanic students (14 percent versus 5 percent) (table 2.2b).

• American Indian/Alaskan Native undergraduates were much less likely to be enrolled in 4-year institutions than were white, non-Hispanic students (32 percent versus 47 percent) (table 2.2b).

Level and Control of Institution

- In 1992–93, about 44 percent of undergraduates attended public 2-year institutions; 31 percent attended public 4-year colleges and universities (both doctorate-granting and nondoctorate-granting); and 14 percent were enrolled in private, not-for-profit 4-year colleges and universities (table 2.3a).
- While there was a relatively small difference in the proportion of younger and older undergraduates attending public nondoctorate-granting institutions (e.g., 15 percent of students 23 or younger, compared with 10 percent of those 30 or older), students under 24 were three times more likely to attend public doctorate-granting institutions as were students 30 or older (24 percent versus 8 percent) (table 2.3b).

Section 3 Degree Program and Field of Study

- As would be expected given the even distribution of undergraduates attending 2-year and 4-year institutions, similar proportions of students were enrolled in associate's and bachelor's degree programs (39 percent and 43 percent, respectively). About 14 percent of undergraduates were in programs leading to a vocational certificate (table 3.1a).
- Racial—ethnic group differences in degree programs followed the patterns found for the type of institutions undergraduates from different racial—ethnic backgrounds commonly attended. Thus, both black, non-Hispanic and Hispanic undergraduates (who were more likely to attend less-than-2-year institutions) were more likely to be enrolled in vocational certificate programs than were white, non-Hispanic students (table 3.1b).
 - Hispanic students (who were less likely to attend 4-year institutions) were less likely than white, non-Hispanic students to be pursuing a bachelor's degree. The proportion of black, non-Hispanic students enrolled in bachelor's degree programs, on the other hand, did not differ significantly from that of white, non-Hispanic students (table 3.1b).
 - As might be expected, younger undergraduates tended to be concentrated in bachelor's degree programs (e.g., 53 percent of students age 23 and younger were enrolled in bachelor's degree programs, compared with 26 percent of students age 30 and older); however, older students were more likely to be pursuing an associate's degree (table 3.1b).
 - Business-related fields were the most common majors among 1992–93 undergraduates, with 23 percent reporting a business-related field of study; health and humanities were the next most commonly reported fields of study (14 percent and 11 percent, respectively) (table 3.2a).
 - Stereotypical gender differences in fields of study were also observed. For example, women were much less likely than their male classmates to be studying computer science and engineering, and much more likely to be majoring in education and health fields (table 3.2b).
 - Female undergraduates tended to have higher cumulative grade point averages than males: one-quarter had a cumulative GPA of 3.5 or higher, compared with 19 percent of males (table 3.3b)

Section 4 Student Characteristics

Gender

- In 1992–93, more women than men were enrolled in postsecondary education (55 percent and 45 percent, respectively). However, the gender distribution varied according to the length of the program offering of the institution: the shorter the program offering, the higher the proportion of women. For example, 69 percent of undergraduates in less-than-2-year institutions were women, compared with 56 percent in 2-year institutions and 53 percent in 4-year institutions (table 4.1a).
- Among older undergraduates (i.e., age 30 or older), nearly two-thirds (63 percent) were women. Similarly, among independent students (most of whom, by definition, are age 24 or older), 59 percent were women, compared with 51 percent of dependent students (table 4.1b).
- Given the age differences between male and female undergraduates, students with characteristics associated with being older, such as having been married and having dependents, were also more likely to be women (table 4.1b).
- Undergraduates with the least educated parents (i.e., neither parent graduated from high school) were more likely to be women than were students whose parents had more education (table 4.1b).

Age

- Slightly more than half of 1992–93 undergraduates (55 percent) were age 23 or younger, while more than one-quarter (28 percent) were age 30 or older (table 4.2a).
- Given the family and work responsibilities associated with being older, it is not surprising to see that undergraduates in institutions with short-term program offerings (i.e., those in 2-year and less-than-2-year institutions) were more commonly age 30 or older (36 percent and 34 percent, respectively), compared with students in 4-year institutions (18 percent were age 30 or older). Similarly, students pursuing vocational certificates and associate's degrees were more likely to be older than those in bachelor's degree programs (table 4.2a).
- Women undergraduates were much more likely than men to be age 30 or older (32 percent versus 23 percent) (table 4.2b).
- Racial—ethnic group differences were also apparent relative to age. For example, about twice the percentage of American Indian/Alaskan Native undergraduates were age 30 or older (34 percent) than were Asian/Pacific Islanders (17 percent) (table 4.2b).
- Undergraduates with the least educated parents also tended to be older: 55 percent of students whose parents had less than a high school diploma were age 30 or older, compared with 17 percent of students whose parents were college graduates (table 4.2b).

Income³³

- In 1992-93, the percentage of students in the low income quartile was similar for public and private, not-for-profit institutions (24 percent). In contrast, 44 percent of students in private, for-profit institutions were in the lowest income quartile (table 4.3a).
- Undergraduates in public institutions, on the other hand, were more likely than those in private, not-for-profit institutions to be in the middle income quartile (52 percent versus 42 percent), and less likely to be in the higher income quartile (24 percent versus 34 percent) (table 4.3a).
- Racial—ethnic group differences were also found according to income distribution: black, non-Hispanic; Hispanic; and Asian/Pacific Islander students were all more likely to be in the lowest income quartile than were white, non-Hispanic students (the sample for American Indians/Alaskan Natives was too small to find statistical significance) (table 4.3b).
- Approximately 18 percent of dependent students attending private, for-profit institutions were from families with incomes under \$10,000, compared with about 6 percent in either public or private, not-for-profit institutions with the same income (table 4.4a).
- Amon dependent undergraduates, black, non-Hispanic and Hispanic students were about three times as likely to be from families with incomes under \$10,000 than were white, non-Hispanic students (table 4.4b).
- Single parents were also particularly likely to have low incomes: nearly one-quarter (23 percent) had incomes under \$5,000, compared with 10 percent of other (independent) students (table 4.5b).

Race-Ethnicity, Citizenship

- Approximately one-quarter of 1992–93 undergraduates were non-white or Hispanic students, including 10 percent black, non-Hispanic; 8 percent Hispanic; 4 percent Asian/Pacific Islander; and about 1 percent American Indian/Alaskan Native (table 4.6a).
- Students in less-than-2-year institutions were about twice as likely as those in 4-year institutions to be black, non-Hispanic (22 percent versus 10 percent) (table 4.6a).
- Undergraduates with the most limited financial resources (i.e., those in the lowest income quartile) were three times as likely to be black, non-Hispanic and about twice as likely to be Hispanic, compared with students in the highest income quartile (table 4.6b).
- In 1992–93, approximately 6 percent of undergraduates were not U.S. citizens, but most were permanent residents (4 percent) (table 4.7a).

³³Income percentile rankings are calculated separately for dependents (using parents' income) and independents (using students' income).

Marital Status

- About three-quarters of 1992–93 undergraduates had never been married. Students in less-than-4-year institutions (who are more likely to be older) were more likely to be married (about 30 percent) than were students in 4-year colleges or universities (18 percent) (table 4.8a).
- Due in part to their being older, it was more common for women undergraduates to be married (or to have been married in the past) than it was for men (table 4.8b).

Local Residency

- In 1992–93, most undergraduates (59 percent) lived off campus, not with their parents or relatives; 13 percent lived on campus; and 28 percent lived with their parents or relatives (table 4.9a).
- Students in 4-year private, not-for-profit institutions were more likely to live on campus than students in public 4-year institutions. For example, 38 percent of undergraduates in private, not-for-profit doctorate-granting universities lived on campus, compared with 23 percent of those in public doctorate-granting universities (table 4.9a).

Section 5 Financial Aid, Employment

Dependent Student Financial Aid

- Approximately 42 percent of dependent undergraduates received financial aid, and the average amount they received was about \$4,800. About one-third (31 percent) of dependent undergraduates received federal financial aid (table 5.1a).
- Grants were a more common form of aid for dependent students than loans: 34 percent were grant recipients (averaging about \$3,100), while about 22 percent of dependent students received financial aid in the form of student loans (averaging about \$3,000) (table 5.1a).
- It was more common for dependent students attending private, for-profit institutions (who are more likely to have lower incomes) to receive federal financial aid (63 percent) than it was for dependents in either public or private, not-for-profit institutions (25 percent and 47 percent, respectively) (table 5.1a).
- Dependent students in private, not-for-profit institutions were more likely to receive grants (which include institutional aid) than were students in private, for-profit institutions (56 percent and 44 percent, respectively). However, the proportions of dependent students receiving loans at private, not-for-profit and for-profit institutions did not differ significantly (46 percent and 40 percent, respectively) (table 5.1a).
- As would be expected, dependent undergraduates from low income families were more likely to receive financial aid than those from higher income families: for example, 79 percent with incomes under \$10,000 received aid, compared with 33 percent with incomes between \$40,000 and \$50,000 (table 5.1b).
- Consistent with their lower incomes (as shown in table 4.6b), a significantly higher proportion of black, non-Hispanic undergraduates were aid recipients (59 percent) than were white, non-Hispanic students (39 percent) (table 5.1b).

Independent Student Financial Aid

- Approximately 41 percent of financially independent undergraduates received financial aid, and the average amount they received was about \$3,500. More than one-third of independent students (36 percent) received grants (averaging about \$2,000), and 18 percent received loans (averaging \$3,500) (table 5.2a).
- Nearly 70 percent of independent students in private, for-profit institutions received federal financial aid, compared with 41 percent in private, not-for-profit institutions and 25 percent in public institutions (table 5.2a).

• Consistent with their lower incomes, financially independent black, non-Hispanic students were more likely to receive financial aid than were white, non-Hispanic students (51 percent versus 40 percent) (table 5.2b).

Employment

- As shown in tables 1.5a and 1.5b, a majority of undergraduates (79 percent) worked during some period of their enrollment in 1992–93, and about 38 percent worked full time during part or all of their enrollment.
- About 32 percent of undergraduates worked in professional occupations; 25 percent worked in the wholesale/retail industry; and 15 percent worked in a business occupation such as finance, real estate, or business support (table 5.3a).
- As might be expected, independent students (who are older) were more likely to work in professional occupations (38 percent) than were dependent students (25 percent) (5.3b).
- With regard to their plans for the coming year (1993–94), nearly 30 percent of undergraduates planned to attend school full time and also work full time or part time, and 26 percent planned to work full time and attend school either full time or part time (table 5.4a).
- Not unexpectedly, a greater proportion of younger students (under age 23) planned to be in school and not to work while enrolled than did older students; on the other hand, it was more common for older students to report plans to work full time and to be in school full time or part time (table 5.4b).

Table 5.1a—Percentage of financially dependent undergraduates receiving financial aid for postsecondary education and the average amount of financial aid awarded to aid recipients, by selected institution and education characteristics: 1992-93

NOTE: The percentage of undergraduates receiving financial aid and the maximum amounts received refer to the 1992-93 award year. Several changes have occurred in federal financial aid programs since 1992-93.

Sample size is too small for a reliable estimate.

*Risk factors included delayed enrollment, part-time attendance, being financially independent, having dependents. being a single parent, working full time, and being a GED recipient.

Section 6 Postsecondary Education Aspirations and Community Service

- In 1992–93, undergraduates had high educational aspirations, with 57 percent aspiring to an advanced degree as their ultimate degree goal. Even among students who were currently in short-term vocational programs (i.e., in private, for-profit institutions), 34 percent aspired to a bachelor's degree, and 28 percent aspired to an advanced degree (table 6.1a).
- There was little variation in educational aspirations among racial—ethnic groups. Regardless of racial—ethnic identity, a majority (from 52 to 64 percent) aspired to an advanced degree (table 6.1b).
- Variation according to age, however, was found in relation to educational goals: younger students were more likely than older students to aspire to an advanced degree and less likely to aspire to an associate's degree or vocational certificate (table 6.1b).

Community Service

- Overall, nearly one-third (31 percent) of undergraduates were involved in community service in 1992–93 (table 6.2a).
- It was more common for undergraduates in bachelor's degree programs to be engaged in community service (about 37 percent) than it was for students pursuing associate's degrees or vocational certificates (27 percent and 24 percent, respectively) (table 6.2a).
- Women undergraduates were more likely to volunteer their time than men, and the same was true for students who were 30 or older compared with younger students (table 2.6b).
- Higher incomes were also associated with volunteer work: undergraduates from the highest income quartile were more likely to volunteer their time than those from either the middle or bottom quartiles (table 6.2b).

Appendix A

Glossary

This glossary describes the variables used in this report in the order that they first appear. The variables were taken directly from the NCES NPSAS:93 Undergraduate Data Analysis System (DAS), an NCES software application that generates tables from the NPSAS:93 data. A description of the DAS software can be found in appendix B. The labels in parentheses correspond to the names of the variables in the DAS.

The glossary is organized into five sections: a description of the risk factors identified in this study, other institution/education-related variables, student background characteristics, financial aid, and employment variables. The following is a list of variables that appear in this report and the glossary page number on which they can be found.

Risk Factors 150	Students Characteristics 155			
Delayed postsecondary enrollment 150	Gender of student			
Attendance patterns 1992-93 150	Race-ethnicity of student 155

Cumulative grade point average 155	1992–93			

Risk Factors

Delayed postsecondary enrollment (DELAYENR)

Student delayed enrollment into postsecondary education. Immediate enrollment is defined as entry into PSE the same calendar year as graduating from high school or receiving a GED. The assumption is that high school graduation takes place in May or June and entry into PSE takes place that summer or fall.

Did not delay Student entered PSE the same calendar year as high school

graduation or GED receipt.

Delayed Student entered PSE sometime after the year of high school

graduation or GED receipt. Note that in the remote case a high school student graduated in December and entered PSE the following January or later, he or she would be considered a

delayed entrant.

Attendance patterns 1992-93 (ATTNST3)

Composed of attendance status (full or part time) reported by the institution and the number of months a student was enrolled during the year. Students were considered to have enrolled for a full year if they were enrolled at least 9 months between July 1992 and June 1993. Months did not have to be contiguous, and students did not have to be enrolled for a full month in order to be considered enrolled for that month.

Full-time, full-year Students were enrolled full time for at least 9 months out of 12.

Full-time, part-year Students were enrolled full time for less than 9 months and

never attended part time.

Part-time, full-year Students were enrolled part time or a combination of full

time/part time for at least 9 months.

Part-time, part-year Includes students who were neither full time, full year or part

time, full year.

Note when discussing full-time and part-time attendance with no reference to the time enrolled, the full-year and part-year groups were aggregated.

Dependency status in 1992 (DEPEND)

Students were considered independent if 1) the institution reported that they were independent, or 2) they met one of the following seven criteria:

Student was 24 years old or older as of 12/31/92;

Student was a veteran;

Student was an orphan or ward of the court;

Student had legal dependents other than spouse;

Student was married and not claimed by parents as a tax exemption in 1992; or

Student was a graduate student and not claimed as a tax exemption by parents in 1992;

Student was a single undergraduate, not claimed as a tax exemption by parents in either 1990 or 1991, and was self-sufficient for 2 years prior to receiving any federal aid.

160

Number of dependents (RDEPENDS)

Number of dependents reported by student not including spouse. Dependents include any individuals, whether children or elders, for whom the student was financially responsible.

No dependents

One or more dependents

Single parent status (SINGLPAR)

Students who had dependents but were not married.

Note that in the remote case a student was caring for dependents who were not the student's children (e.g., elderly parents or relatives) and the student was not married, the student was identified as a single parent.

Not single parent

Single parent

Average number of hours worked per week while enrolled in 1992-93 (EMWKHR):

The average number of hours worked per week while enrolled (including work set v). If the student reported being employed during the month, the average number of hours worked per week was derived based on the starting and ending dates and the hours reported for each job during the survey interview. Note that this variable only represents the average hours a student worked while working and enrolled. Thus, if a student worked an average of 20 hours per week while enrolled for 6 months and then did not work for the remaining 3 months of enrollment, the average hours would still be 20 hours per week.

Not employed Student reported no hours of work during

enrollment.

1–20 hours/week Student worked 1–20 hours/week while enrolled.

21–34 hours/week Student worked 21–34 hours/week while enrolled.

35 hours or more/week Student worked full time while enrolled.

High school degree or equivalency status (HSDEG)

Form in which high school degree or equivalent was received.

High school diploma Student graduated from high school.

GED or high school equivalent Student did not graduate from high school but passed

the General Educational Development (GED) exam or high school equivalent, administered by the

American Council on Education.

No high school credential Student neither graduated from high school nor

earned a GED.

Multiple risk factors index (RISKINDX)

Represents an index of risk from 0-7 for seven characteristics that may adversely affect persistence and attainment. These characteristics include delayed enrollment, part-time

enrollment, financial independence, having dependents other than spouse, being a single parent, working full time while enrolled in school, and being a GED recipient. (For this last variable students who did not have a high school credential (1.9 percent) were excluded because they are limited to enrolling in postsecondary institutions that accept high school dropouts).

None

Student had no risk factors.

One

Student had one risk factor.

Two

Student had two risk factors.

Three

Student had three risk factors.

Four or more

Student had four or more risk factors.

Institutional and Education-Related Variables³⁴

Control of institution (CONTROL)

Source of revenue and control of operations.

Public

A postsecondary education institution, which is supported primarily by public funds and operated by publicly elected or appointed officials who control the programs and activities.

Private,

not-for-profit

A postsecondary institution that is controlled by an independent governing board and incorporated under section 501(c)(3) of the

Înternal Revenue Code.

Private, for-profit

A postsecondary institution that is privately owned and operated as a profit-making enterprise. Includes career colleges and

proprietary institutions.

Level of institution (LEVEL)

Highest award offering of institution.

Less-than-2-year

At least one of the programs offered at the institution is 3 months long or longer, and produces a terminal award or certificate. In addition, no program at the institution lasts longer than 2 years.

2- to 3-year

Institution that does not confer bachelor's degrees, but does provide 2-year programs that result in certificates or an associate's degree, or 2- to 3-year programs that fulfill part of the requirements for a bachelor's degree or higher at 4-year institutions.

4-year or higher

Four-year institutions that can award bachelor's degrees or higher; includes institutions that can award bachelor's and master's degrees but not doctorates or first-professional degrees, and institutions that award doctorate degrees and first-

³⁴For undergraduates who were enrolled in more than one institution at the time of the NPSAS survey, the institutional characteristics defined here refer to the NPSAS sampled institution.

professional degrees. These include chiropractic, pharmacy, dentistry, podiatry, medicine, veterinary medicine, optometry, law, osteopathic medicine, and theology.

Note in the report, 2- to 3-year institutions are referred to as "2-year" and 4-year or higher institutions are referred to as "4 years or more."

Institutional level and control (SECTOR_B)

Institution type by level and control. Institution level concerns the institution's highest offering (length of program and type of certificate, degree, or award), and control concerns the source of revenue and control of operations.

Public, less-than-2-year	Public less-than-2-year institution
Public, 2- to 3-year	Public 2- to 3-year institution
Public, 4-year nondoctorate-granting	Public 4-year institution not offering doctorate degrees
Public, 4-year doctorate-granting	Public 4-year institution offering doctorate degrees
Private, not-for-profit, less-than-2-year	Private independent less-than-2-year institution
Private, not-for-profit, 2- to 3-year	Private independent 2- to 3-year institution
Private, not-for-profit, 4-year non-doctorate-granting	Private independent 4-year institution not offering doctorate degrees
Private, not-for-profit, 4-year doctorate-granting	Private independent 4-year institution offering doctorate degrees
Private, for-profit, less-than-2-year	Private, for-profit less-than-2-year institution
Private, for-profit, 2 years or more	Private, for-profit 2-year or more institution

Note in this report, public 2- to 3-year and public less-than-2-year institutions were sometimes combined and referred to as "public less-than-4-year institutions."

Undergraduate class level (YEAR_R)

Year in school. A function of level determined from institutional data for first and last term, year in college from financial aid forms, student-reported data for first and last term, or sampling stratum.

Freshman (1st year undergrad)	Student's level was freshman or first year.
Sophomore (2nd year undergrad)	Student's level was sophomore or second year.
Junior (3rd year undergrad)	Student's level was junior or third year.
Senior (4th/5th year undergrad)	Student's level was senior or fourth/fifth year.
Undergraduate (level unknown)	Student's undergraduate level was unknown.

Undergraduate class level including graduation status (YEAR_R2)

Same as YEAR_R described above with the exception that seniors are broken out according to whether or not they attained their bachelor's degree in 1992-93.

Undergraduate degree program (PROGRAM)

Degree program in which student is enrolled as reported by the institution.

Vocational certificate Student pursuing a certificate or formal award other than

an associate's or bachelor's degree

Associate's degree Student pursuing an associate's degree

Bachelor's degree Student pursuing a Bachelor of Arts or Bachelor of

Science degree

Other undergraduate Student is not in any of the above programs

Highest level of education ever expect to complete (ANYHILVL)

The highest level of education students reported they hoped to achieve.

Certificate/other award Student expected to earn a vocational certificate or

license, or to attend college, but not to earn a bachelor's

degree.

Associate's degree Student expected to earn an associate's degree, but not a

bachelor's degree.

Bachelor's degree Student expected to earn a bachelor's degree, but not an

advanced degree.

Advanced degree Student expected to earn a master's, doctorate, or first-

professional degree.

Major field of study (MAJORS3)

Humanities English, liberal arts, philosophy, theology, art, music,

speech/drama, art history/fine arts, area studies, African American studies, ethnic studies, foreign languages, liberal studies, women's studies, religious studies,

commercial art, design.

Social/behavioral science Psychology, economics, political science, American

civilization, clinical pastoral care, social work, anthropology/archaeology, history, sociology.

Life sciences Natural resources, forestry, biological science (including

zoology), botany, biophysics, geography, interdisciplinary studies, including biopsychology, environmental

studies.

Physical sciences Physical sciences including chemistry, physics.

Mathematics Mathematics, statistics.

Computer/information

Computer/information science, computer programming. technology

154

Engineering

Electrical, chemical, mechanical, civil, or other engineering; engineering technology; electronics.

Education

Early childhood, elementary, secondary, special, or physical education; other education; leisure studies;

library/archival sciences.

Business/management

Accounting, finance, secretarial, data processing, business/management systems, public administration, marketing/distribution, business support, international

relations.

Health

Nursing, nurse assisting, community/mental health, medicine, physical education/recreation, audiology, clinical health, dentistry, veterinary medicine, health/hospital, public health, dietetics, other/general health.

Vocational/technical

Mechanic technology including transportation, protective services, construction, air/other transportation, precision

production.

Other technical

Agriculture, agricultural science, architecture, professional

city planning, journalism, communications,

communications technology, cosmetology, textiles, military science, dental/medical technology, home economics, vocational home economics including child

care, law, paralegal, basic/personal skills.

Cumulative grade point average (GPA)

The cumulative grade point average (GPA) was reported by the institution and converted to a 4.0 scale. If the cumulative GPA was not available, the most recent GPA was used instead.

Under 2.0

Student had lower than a C average.

2.1 - 2.9

Student had a C to C+ average.

3.0 - 3.49

Student had a B to B+ average.

3.5 or higher

Student had a B+ to A average.

Student Characteristics

Gender of student (GENDER)

Male

Female

Race-ethnicity of student (RACE)

Asian/

Pacific Islander

A person having origins in any of the original

peoples of the Far East, Southeast Asia, the Indian Subcontinent, or Pacific Islands. This includes people from China, Japan, Korea, the Philippine Islands, Samoa,

India, and Vietnam.

Black, non-Hispanic

A person having origins in any of the black (al groups

of Africa, not of Hispanic origin.

Hispanic

A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin,

regardless of race.

American Indian/ Alaskan Native A person having origins in any of the original peoples of North America and who maintains cultural identification through tribal affiliation or community recognition.

White, non-Hispanic

A person having origins in any of the original peoples of Europe, North Africa, or the Middle East (except those of Hispanic origin).

Age as of 12/31/92 (AGE)

23 years or younger

Student was 23 years old or younger as of 12/31/92.

24-29 years

Student was between 24 and 29 years old as of 12/31/92.

30 years or older

Student was 30 or older as of 12/31/92.

Marital status in 1992 (SMARITAL)

Student's marital status as of NPSAS interview date.

Never married

Married

Divorced/widowed/separated

Income and dependency status (INCOME)

The source of income for dependent students is their parents or guardians; the source of income for independent students is their own assets or earnings including those of their spouse if they are married. Incomes in NPSAS:93 were derived from three sources: institutional records, parental reports, and student reports (in priority order).

Dependent students

Less than \$10,000	Income of less than \$10,000 in 1991
\$10,000-\$19,999	Income between \$10,000 and \$19,999 in 1991
\$20,000-\$29,999	Income between \$20,000 and \$29,999 in 1991
\$30,000–\$39,999	Income between \$30,000 and \$39,999 in 1991
\$40,000–\$49,999	Income between \$40,000 and \$49,999 in 1991
\$50,000-\$59,999	Income between \$50,000 and \$59,999 in 1991
\$60,000–\$69,999	Income between \$60,000 and \$69,999 in 1991
\$70,000-\$79,999	Income between \$70,000 and \$79,999 in 1991
\$80,000–\$99,999	Income between \$80,000 and \$99,999 in 1991
\$100,000 or more	Income \$100,000 or more in 1991

Independent students

Less than \$5,000	Income less than \$5,000 in 1991
\$5,000-\$9,999	Income between \$5,000 and \$9,999 in 1991
\$10,000-\$19,999	Income between \$10,000 and \$19,999 in 1991
\$20,000-\$29,999	Income between \$20,000 and \$29,999 in 1991
\$30,000-\$49,999	Income between \$30,000 and \$49,999 in 1991
\$50,000 or more	Income \$50,000 or more in 1991

Income percentile ranking (PCTALL)

Equal to the proportion of the sample who had an income lower than that recorded for the student in question. Calculated separately for dependent and independent students; each ranking thus compares the student only to other students of the same dependency status. Uses parents' income if student is dependent, and student's own income if student is independent.

Lowest quartile Income falls at or below the lowest 25th percentile of

undergraduate's income distribution.

Middle quartiles Income falls between the 25th percentile and 75th

percentile of undergraduate's income distribution.

Highest quartile Income falls at or above the 75th percentile of

undergraduate's income distribution.

Parent's education (PAREDUC)

The highest level of education completed by the student's parent (mother or father, whoever had the highest level).

Less than high school
diploma

Neither parent graduated from high school or received a
GED (General Educational Development) certificate.

High school diploma or GED One or both parents graduated from high school or received a GED certificate.

Postsec. ed., less than a bachelor's degree on both parents had some postsecondary education, less than a bachelor's degree, including an associate's

degree.

Bachelor's degree One or both parents earned a bachelor's degree as their

highest award.

Advanced degree One or both parents earned an advanced degree including

a master's degree, Ph.D., M.D., etc.

Student-reported disabilities (DISABLTY)

Student's response to the question, "Do you have any of the following disabilities: hearing impairment, speech disability or limitation, orthopedic or mobility limitation, specific learning disability, vision impairment that cannot be corrected with glasses, or you are legally blind, or have any other type of disabilities or handicaps." Note that a student with a hearing or speech disability too severe to participate in the survey could not be included.

Not disabled Student reported having none of the above disabilities.

Disabled Student reported having one or more of the above

disabilities.

Local residency (LOCALRES)

Campus housing Institution-owned living quarters for students. These are typically on-campus or off-campus dormitories, residence

halls, or other facilities.

Off campus

Student lived off campus in noninstitution-owned housing

but not with her or his parents.

With parents

Student lived at home with parents.

Financial Aid Variables³⁵

Total aid amount (TOTAID)

Total amount of financial aid received by a student in 1992-93. Includes grants, loans, or work study as well as loans under the PLUS program. Students receiving aid were identified by the TOTAID variable having a positive value.

Total federal aid amount (TFEDAID)

Total amount of aid received by a student in 1992-93 from all federal aid programs. Positive values on this variable was also used to identify the percentage of student who received this category of aid.

Total grant amount (TOTGRT)

Total amount of grant aid received by a student in 1992-93. Grants are a type of student financial aid that does not require repayment or employment. At the undergraduate level it is usually (but not always) awarded on the basis of need, possibly combined with some skills or characteristics the student possesses. Grants are more frequently awarded on a merit basis at the graduate level. Grants include scholarships and fellowships. The percentage of students with grants is the percentage with positive amounts recorded for this variable.

Total loan amount (TOTLOAN)

Total amount of loan aid received by a student in 1992-93. This includes all loans through federal, state, or institutional programs except PLUS loans (which are made to parents). Loans are a type of student financial aid that advances funds and that are evidenced by a promissory note requiring the recipient to repay the specified amounts under prescribed conditions. The percentage of students with loans is the percentage with positive amounts recorded for this variable.

Employment and Community Service Variables

Future employment and enrollment plans (FUTRPLAN)

This variable is a combination of two variables that ask students to characterize themselves with regard to their next 12 months of school attendance (i.e., 1993-94) and employment plans.

Enrolled in school only

Full- or part-time student, with no plans to work

during enrollment.

Working at a job only

Plans to work full time or part time but not be in school.

³⁵The percentage of undergraduates receiving financial aid and the maximum amounts received refer to the 1992–93 award year. Several changes have occurred in federal financial aid programs since 1992-93.

158

Full-time student and working Full-time student who will work full time or part

time.

Part-time students and working Part-time student who will work full time or part

time.

Full-time worker and in school Will work full time and take classes.

Part-time worker and in school Will work part time and take classes.

Job industry in which student is employed (STUIND1)

Classification of job industry for the job held the longest during the 1992-93 year reported by the student.

Agriculture, mining, construction Includes jobs in agriculture, forestry, fisheries,

mining, and construction.

Manufacturing Durable and non-durable goods.

Transportation, communication, Transportation, communications, and utilities.

utility

Wholesale, retail Wholesale trade and retail trade industries.

Finance, insurance, real estate Finance, insurance, and real estate industries.

Personal, entertainment, recreation Personal services, entertainment, and recreation

services.

Professional, public administration Professional and related services, and public

administration.

Hours of community service in 1992-93 (COMSERHR)

Hours per week of community service students reported performing between July 1, 1992 and June 30, 1993.

None Student did not perform community service.

1–2 hours Student performed 1 to 2 hours per week of

community service.

3–4 hours Student performed 3 to 4 hours per week of

community service.

5 hours or more Student performed 5 hours or more per week of

community service.

Appendix B

Technical Notes and Methodology

The 1992–93 National Postsecondary Student Aid Study (NPSAS:93)

The need for a nationally representative database on postsecondary student financial aid prompted the U.S. Department of Education to conduct the National Postsecondary Student Aid Study (NPSAS), a survey conducted every 3 years beginning in 1987. The NPSAS sample was designed to include students enrolled in all types of postsecondary education. Thus, it included students enrolled in public institutions; private, not-for-profit institutions; and private, for-profit institutions. The sample included students at 4-year and 2-year institutions, as well as students enrolled in occupationally specific programs that lasted for less than 2 years.

NPSAS:93 included a stratified sample of approximately 66,000 students (about 52,000 of whom were undergraduates) from about 1,100 institutions. Students were included in the sample if they attended a NPSAS institution; were enrolled between July 1, 1992 and June 30, 1993; and were enrolled in one or more courses or programs including courses for credit, a degree or formal award program of at least 3 months' duration, or an occupationally or vocationally specific program of at least 3 months' duration. Regardless of their postsecondary status, however, students who were also enrolled in high school were excluded. In addition, all students who received a baccalaureate degree between July 1, 1992 and June 30, 1993 were included and used as the base sample for the NPSAS:93 longitudinal component survey (Baccalaureate and Beyond).

For each student included in the NPSAS sample, there were up to three sources of data. First, institution registration and financial aid records were extracted. Second, a Computer Assisted Telephone Interview (CATI) was conducted with each student. Finally, a CATI designed for the parents or guardians of a subsample of students was conducted. Data from these three sources were synthesized into a single system with an overall response rate of about 85 percent. (Table B1 shows response rates for students in each type of institution.) For example, the variable age was determined by first checking student responses. If a student did not provide this information, age was taken from the institutional record abstract.

For more information on the NPSAS survey, consult Methodology Report for the 1992-93 National Postsecondary Student Aid Study (Longitudinal Studies Branch, Postsecondary Education Statistics Division, Washington, D.C.: U.S. Department of Education, National Center for Education Statistics (NCES), 1995).

Accuracy of Estimates

The statistics in this report are estimates derived from a sample. Two broad categories of error occur in such estimates: sampling and nonsampling errors. Sampling errors occur because observations are made only on samples of students, not on entire populations. Nonsampling errors occur, on the other hand, not only in sample surveys but also in complete censuses of entire populations.

Nonsampling errors can be attributed to a number of sources: inability to obtain complete information about all students in all institutions in the sample (some students or institutions refused to participate, or students participated but answered only certain items); ambiguous definitions; differences in interpreting questions; inability or unwillingness to give correct information; mistakes in recording or coding data; and other errors of collecting, processing, sampling, and estimating missing data.

160 178

Data Analysis System

The estimates presented in this report were produced from the NPSAS:93 Undergraduate Data Analysis System (DAS). The DAS software makes it possible for users to specify and generate their own tables from postsecondary data sets. With the DAS, users can recreate or expand upon the tables presented in this report. In addition to the table estimates, the DAS calculates proper standard errors³⁶ and weighted sample sizes for these estimates. For example, tables B2a and B2b present the standard errors that correspond to selected tables in the text, and the weighted sample sizes appear in B3. If the number of valid cases is too small to produce an estimate (i.e., less than 30), the DAS prints the message "low-N" instead of the estimate.

In addition to tables, the DAS will also produce a correlation matrix of selected variables to be used for linear regression models. Included in the output with the correlation matrix are the design effects (DEFT) for all the variables identified in the matrix. Since statistical procedures generally compute regression coefficients based on simple random sample assumptions, the standard errors must be adjusted with the design effects to take into account the NPSAS-stratified sampling method.

For more information about the 1993 NCES Data Analysis System, contact:

Aurora D'Amico NCES Longitudinal Studies Branch 555 New Jersey Avenue, NW Washington, D.C. 20208-5652 (202) 219-1365 Internet address: AURORA_D'AMICO@ED.GOV

Statistical Procedures

The 1992–93 NPSAS survey, while representative and statistically accurate, was not a simple random sample. Instead, the survey sample was selected using a more complex three-step procedure with stratified samples and differential probabilities of selection at each level. First, postsecondary institutions were initially selected within geographical strata. Once institutions were organized by zip code and state, they were further stratified by control (i.e., public; private, not-for-profit; or private, for-profit) and offering (less-than-2-year, 2- to 3-year, 4-year nondoctorate-granting, and 4-year doctorate-granting). Sampling rates for students enrolled at different institutions and levels (undergraduate or other) varied, resulting in better data for policy purposes, but at a cost to statistical efficiency.

The comparisons described in the report have all been tested for statistical significance to ensure that the differences are larger than those that might be expected due to sampling variation. The following two types of comparisons have been made in the report:

Differences in two estimated percentages. The paired comparisons were tested using Student's t statistics. Comparisons based on the estimates of the proportions include the estimates of the probability of a Type I error, or significance level. The significance levels were determined by calculating the Student's t values for the differences between each pair of means or proportions and comparing these with published tables of significance levels for two-tailed hypothesis testing. Student's t values may be computed for comparisons using these tables' estimates with the following formula:

³⁶The NPSAS sample is not a simple random sample, and therefore simple random sample techniques for estimating sampling error cannot be applied to these data. The DAS takes into account the complexity of the sampling procedures and calculates standard errors appropriate for such samples. The method for computing sampling errors used by the DAS involves approximating the estimator by the linear terms of a Taylor series expansion. The procedure is typically referred to as the Taylor series method.

$$t = \frac{E_1 - E_2}{\sqrt{se_1^2 + se_2^2}}$$

where E_1 and E_2 are the estimates to be compared and se_1 and se_2 are their corresponding standard errors. Note that this formula is valid only for independent estimates. When the estimates were not independent (for example, when comparing the percentages across a percent distribution in this report—a row in a table—a covariance term was added to the denominator of the *t*-test formula).

There are hazards in reporting statistical tests for each comparison. First, comparisons based on large t statistics may appear to merit special attention. This can be misleading since the magnitude of the t statistic is related not only to the observed differences in means or percentages but also to the number of students in the specific categories used for comparison. Hence, a small difference compared across a large number of students would produce a large t statistic.

A second hazard in reporting statistical tests for each comparison is making multiple comparisons among categories of an independent variable. For example, when making paired comparisons among different levels of income, the probability of a Type I error for these comparisons taken as a group is larger than the probability for a single comparison. When more than one difference between groups of related characteristics or "families" are tested for statistical significance, one must apply a standard that assures a level of significance for all of those comparisons taken together.

Comparisons were made in this report only when $p \le .05/k$ for a particular pairwise comparison, where that comparison was one of k tests within a family. This guarantees both that the individual comparison would have $p \le .05$ and that when k comparisons were made within a family of possible tests, the significance level of the comparisons would sum to $p \le .05$.

For example, in a comparison of the percentages of males and females who enrolled in postsecondary education, only one comparison is possible (males v. females). In this family, k=1, and the comparison can be evaluated with a Student's t test. When students are divided into five racial—ethnic groups and all possible comparisons are made, then k=10 and the significance level of each test must be $p \le .05/10$, or .005. The formula for calculating family size (k) is as follows: k=j*(j-1)/2, where j is the number of categories for the variable being tested. In the case of race—ethnicity, there are five racial—ethnic groups (American Indian/Alaskan Native; Asian/Pacific Islander; black, non-Hispanic; Hispanic; and white, non-Hispanic), so k=5*(5-1)/2=10.

³⁷The standard that $p \le .05/k$ for each comparison is more stringent than the criterion that the significance level of the comparisons should sum to $p \le .05$. For tables showing the t statistic required to ensure that $p \le .05/k$ for a particular family size and degrees of freedom, see Olive Jean Dunn, "Multiple Comparisons Among Means," *Journal of the American Statistical Association* 56: 52–64.

Table B1—Response rates for students included in the NPSAS:93 analysis file, by selected institution and student characteristics

	Unweighted response rate	Weighted response rate	Weighted effective response rate [†]
All students	83.4	79.5	85.0
Institution type			
Less-than-2-year	. 76.7	80.0	86.0
2-year	75.7	73.2	79.9
4-year, nondoctorate-granting	83.7	80.8	85.6
4-year, doctorate-granting	86.2	84.9	89.1
Institution control			
Public	83.2	78.4	84.2
Private, not-for-profit	84.3	83.2	87.7
Private, for-profit	82.2	82.4	87.0
Level and control			
Public			
Less-than-2-year	65.3	78.9	85.0
2-year	73.6	72.5	79.3
4-year, nondoctorate-granting	79.7	76.7	81.6
4-year, doctorate-granting	86.7	85.5	89.7
Private, not-for-profit			
Less-than-4-year	72.5	78.5	84.2

Student Level			
Undergraduate	82.6	78.5	84.3
Graduate	86.4	85.4	89.5
First-professional	86.8	87.4	90.4

NOTE: The overall weighted response rate for the student telephone interviews was 67.8 percent.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1992-93 National Postsecondary Student Aid Study (NPSAS:93).

 $^{^{\}dagger}$ The effective response rate is R = R1 + (1-R1)R2, where R1 is the Phase 1 response rate and R2 is the response rate achieved among the students selected for the nonresponse follow-up subsample.

Table B2a—Standard errors for table 2.2a—Percentage distribution of undergraduate enrollment according to level of institution, by selected institution and education characteristics: 1992-93

	Less-than-2-year	2-year	4 years or more
Total	0.71	1.54	1.40
Undergraduate class level			
1st year-freshman	1.27	1.80	1.28
2nd year-sophomore	0.41	1.86	1.81
3rd year-junior	0.23	1.58	1.58
4th year-senior	0.18	1.11	1.11
Level unknown	2.63	3.32	1.93
Control of institution			
Public	0.62	1.81	1.67
Private, not-for-profit	0.19	1.91	1.91
Private, for-profit	4.07	3.20	3.21
Cumulative grade point average			
Less than 2.0	1.16	2.12	2.06
2.0–2.9	0.57	1.75	1.67
3.0-3.49	0.49	1.77	1.68
3.5 or higher	0.92	1.92	1.64
Delayed postsec. enrollment			
Did not delay	0.34	1.50	
Delayed	1.10	1.75	1.45 1.51
Number of risk factors*			
None	0.22	1.07	
One	0.33 0.53	1.27	1.28
Two	1.04	1.69	1.62
Three		1.78	1.55
Four or more	0.72	1.80	1.59
rout of more	1.01	1.98	1.67
Attendance patterns 1992-93			
Full-time, full-year	0.64	1.34	1.39
Full-time, part-year	1.89	2.12	1.97
Part-time, full-year	0.66	1.76	1.59
Part-time, part-year	().75	1.81	1.51
Undergraduate program			•
Vocational certificate	3.74	4.25	1.75
Associate's degree	0.00	0.97	0.97
Bachelor's degree	0.00	0.00	0.00
Other undergraduate	3.44	4.70	3.32
Educational aspirations			
Certificate/other award	3.35	3.42	0.74
Associate's degree	2.15	2.32	0.67
Bachelor's degree	0.73	1.79	1.58
Advanced degree	0.18	1.47	1.47

^{*}Risk factors included delayed enrollment, part-time attendance, being 'inancially independent, having dependents, being a single parent, working full time, and being a GED recipient.
