ABSTRACT

The Bureau of Labor Statistics projects national employment to grow by almost 26.4 million over the 1992-2005 period. The majority of these new jobs will be in higher-paying occupations. Entry requirements of the new jobs in occupations having above-average earnings will range from no more than a high school education to a bachelor's degree or higher. Occupations in which the most common entry requirement is a bachelor's degree or higher are projected to have the greatest increase of jobs with above-average earnings. Jobs for college graduates with above-average earnings will comprise more than 30 percent (nearly 8.1 million) of the new jobs. Nearly one-quarter of the new jobs that require at least a four-year college degree will be in just five occupations: accountants and auditors, systems analysts, and elementary, secondary, and special education teachers. Occupations that most commonly require some postsecondary training less than a bachelor's degree are also expected to have significant growth of jobs with above average earnings. Nearly half of these new jobs with higher earnings will be in only four occupations: food service and lodging managers, licensed practical nurses, registered nurses, and radiologic technologists and technicians. Although the share of jobs that require only a high school education is projected to decline in the years ahead, more than half of the total job growth over the 1992-2005 period will occur in these occupations. Jobs in occupations with above-average earnings in this education groups are projected to increase by almost 4.3 million--more than 28 percent of the economy's total job growth.

### Growth of Jobs With Above Average Earnings Projected at All Education Levels

The Bureau of Labor Statistics (BLS) projects the Nation's employment to grow by almost 26.4 million over the 1992-2005 period. The majority of these new jobs will be in higher paying occupations. Entry requirements of the new jobs in occupations having above average earnings will range from no more than a high school education to a college bachelor's degree or even higher. The BLS projections of occupational employment are part of a comprehensive series of economic projections that also encompasses growth in the labor force, real gross domestic product by major component, and industry output and employment.

Occupations where the most common entry requirement is a bachelor's degree or higher are projected to have the greatest increase of jobs with above average earnings (see chart). Jobs for college graduates with above average earnings will comprise over 30 percent—nearly 8.1 million—of the new jobs. Nearly one-quarter of the new jobs that require at least a 4-year college degree will be in just five occupations: Accountants and auditors, systems analysts, and elementary, secondary, and special education teachers.

Occupations that most commonly require postsecondary training less than a bachelor's degree are also expected to have significant growth of jobs with above average earnings. Jobs in this group are projected to increase by nearly 2.8 million, over 10 percent of the new jobs. Nearly half of the new jobs with higher earnings that will require postsecondary training less than a bachelor's degree will be in only four occupations: Food service and lodging managers, licensed practical nurses, registered nurses, and radiologic technologists and technicians.

The majority of all jobs in 1992 were in occupations that do not require education beyond high school. Although the share of jobs that require this level of education is projected to decline in the years ahead, more

than half of the total job growth over the 1992-2005 period will, nevertheless, occur in these occupations. Job growth among occupations that most commonly require a high school education or employer training is expected to be greatest in occupations with below average earnings. Jobs in occupations with above average earnings in this education group are also projected to increase by almost 4.3 million, over 28 percent of the economy's total job growth.

Across the three education groups, over 57 percent of the Nation's total job growth is expected to be in occupations that had above average earnings in 1992. The table

below lists for the three groups the occupations with above average earnings projected to have the greatest net employment change over the 1992-2005 period.

The latest BLS projections were presented in detail in the November 1993 issue of the *Monthly Labor Review* and in *The American Work Force: 1992-2005* (BLS Bulletin 2452).
