ABSTRACT

The American Welding Society (AWS) Education Grant Committee was organized in 1993 to unite employers, trade unions, educators, technical specialists, welding equipment manufacturers, and AWS members in efforts to develop national skills standards for training and certifying entry-level, advanced, and expert welders. Data were collected through the following activities: survey of industry and education representatives in all 50 states (20% of the 9,733 survey instruments distributed were returned); comparison of the survey findings with past AWS studies; and task analyses for all three welding skill levels. The survey and analysis results were used to develop the national standards, curriculum guidelines, and certification programs for all three welding skill levels. Fourteen related products/programs were also produced, including the following: specifications for the qualification/certification for the different skill levels, training guides, career guidance videotape, three certification programs, and program for schools willing to commit to using the curriculum guidelines and certificationi process. (Contains the following: summative evaluations of the efforts to develop standards and certification for all three welding skill levels; names/addresses of the 169 organizations from 36 states that participated in the project; brochure presenting the case for world-class standards; and transparency masters listing the standards.) FINAL PERFORMANCE REPORT

GRANT V 244-B-30006

The reporting requirements for vocational and adult education projects funded under the Business and Education Standards Programs (84.244) are clearly presented in **EDGAR**, 34 CFR 74.84. Each project is required to submit a final performance report, a final financial status report (Standard Form 269), and a final external evaluation report. These three reports are due within ninety (90) days of the grant's ending date (including any no-cost extension period).

This final performance report has been formatted to incorporate the following sections:

- 1. Overview of the work performed during the thirty-six (36) months of implementation.
- 2. Deliverables produced under the grant.
- 3. Dissemination of deliverables.
- 4. Marketing of deliverables
- 5. Comparison of actual accomplishments to the objectives contained in the approved application.
- 6. Review of the schedule of accomplishments and their target dates contained in the approved application, and reasons for slippage in those cases where established objectives were not met. Corrective measures taken to correct slippage will also be presented.
- 7. Number and characteristics of project participants who completed planned project activities, and of those who did not, and the outcomes achieved by participants who completed project activities.
- 8. Evaluation activities conducted under the grant.

- 9. Changes in key personnel assigned to the project.
- 10. Project summary.
- 11. Companion documents and materials.
- 12. Closing statement.

SECTION 1

OVERVIEW

On June 2, 1993, the American Welding Society (AWS) was awarded a grant through the U.S. Department of Education to develop, organize and operate a business-labor-education committee, the AWS Education Grant Committee (EGC), that was to participate in the preparation of a skills standard and curriculum guideline leading to the certification of individuals as "entry level welders." The project title was "Business and Education Standards Program - Development of Standards and Certification for Entry Level Welders." Later, on December 20, 1994, an extension was awarded by the same grantor to also prepare similar materials for Level II - Advanced Welder, and Level III - Expert Welder. All three levels are incorporated into this report, as well as the activities and implementation performed during the total of thirty-six (36) months of the grant.

Education Grant Committee. The personnel invited to form this committee were a consortium of AWS members representing the interests of the following sectors:

- * Business Community The employers of welders.
- * Trade Unions The representatives of the welders.
- * Educators The trainers of welders.
- * Technical The intellectual leaders of welders.
- * Welding Equipment Manufacturers Providers of tools and equipment used by welders.
- * American Welding Society A professional organization representing the welding industry.

The process of developing the national skills standards, curriculum guidelines and certification program involved a combined effort on the part of industry-education, the AWS committee-AWS staff, and the following areas of occupational task analysis:

Needs Assessment. Two needs assessment instruments were developed to collect data concerning the job requirements for the three levels. These instruments consisted of a two part, two hundred and three item, direct mail survey to obtain industry and education feedback regarding handson skills, welding related knowledge, qualification testing, and foundation skills, such as reading, writing, math and listening-oral communication. From AWS membership roles, an original mailing list was developed. The total number of survey instruments distributed equaled 4,233 for Level I and 5,500 for Levels II and III. Return respondents equaled twenty percent, which were sufficient to validate the survey and allow the committee to continue working on the project. Our mailing sort was based on a 5:1 ratio of Experienced Welders/Supervisors (Foremen)/Technicians to all other job classifications included in the Standard Industry Code (SIC) for the survey. A broad range of industries and educational settings were included. This range reflected the overall membership of the American Welding Society. The mailing was done on a national basis, with respondents representing the fifty states, all types of businesses, all job classifications and all industrial or educational areas.

Needs Analysis. Data collected from the survey instruments was analyzed and compared against past American Welding Society studies to determine industry's requirements for employment at the three different levels. These additional studies included staff work related to welder skills and a DACUM (design a curriculum) facilitation consisting of a panel of experienced welding professionals who identified welder skills. Survey items were analyzed by comparing job classification group responses. Data was compared according to rank order of training scale assignment, and established mode and mean scores. Mode scores identified the highest number of responses to a particular rating. Mean scores identified the numerical average of all responses to an item, and established a location of this average on the rating scale. This information was then compared across groups, and any disparity of 0.50 or more between the mean and the mode range required further item analyzation. Once disparity issues were resolved, each survey item was assigned a numerical rate based on rating scale information.

As a result of the analysis conducted, a profile of each elder level emerged. Industry also revealed what we had already expected, that besides hands-on training and qualifications, a written test of welding related knowledge, welding procedures and safety was required.

Task Analysis. Expanding upon the information generated through the industrial surveys and the three welder profiles, a task analysis was performed for each skill level. The analysis process involved two stages: occupational data collection, and conversion to programmatic materials. The purpose of the individual task analysis was to establish the basis for developing a competency based training program for each of the three levels, and the preparation of knowledge- and performance-related activities for a given training objective. A typical task analysis identified the following information:

Occupational Data (from the workplace)

- * Occupational description
- * Occupational conditions
- Work area listing

- * Occupational specialties (e.g., Arc Welding)
- * Occupational subspecialties (e. g., Shielded Metal Arc Welding)
- * Task listings (associated with the specialties and subspecialties)
- * Performance steps of a task
- * Standards of performance (when the task is done)
- * Related information topics
- * Workplace skill requirements
- * Training materials, equipment and tools

Programmatic Materials (conversion to certification and training)

- * Program title
- * Course titles
- Unit titles
- * Learning objectives (performance conditions, desired behavior, evaluation criteria)
- * Recommendations for support personnel
- * Recommendations for facility planning
- Reference material listing

Curriculum and Standard Development. The information identified during the task analysis for each individual level then went through a transition, which produced the corresponding Qualification and Certification document which is the Skills Standard. These requirements were established by voluntary consensus of the AWS Education Grant Committee. Once the standard was defined, the training needs were determined and the Curriculum Guideline for each of the three levels was produced.

SECTION 2

DELIVERABLES

The approved application required three products to be delivered for each of the three welder skills levels, and they are the following:

- * National Standard for each of the three levels Entry, Advanced, and Expert.
- * Curriculum Guideline for training of each of the three levels.
- Certification Program for each of the three levels.

The American Welding Society has provided more deliverables than those required by the project. We have delivered the following:

1. AWS QC 10, Specification for the Qualification and Certification for Level I - Entry Level Welder.

- 2. AWS QC 11, Specification for the Qualification and Certification for Level II Advanced Welder.
- 3. AWS QC 12, Specification for the Qualification and Certification for Level III Expert Welder.
- 4. AWS EG 2.0, Guide for the Training and Qualification of Welding Personnel Level I Entry Level Welder.
- 5. AWS EG 3.0, Guide for the Training and Qualification of Welding Personnel Level II Advanced Welder.
- 6. AWS EG 4.0, Guide for the Training and Qualification of Welding Personnel Level III Expert Welder.
- 7. Three Certification programs are also in place, one for each level, and these are part of the existing Certification programs that cover the Certified Welding Inspector, Certified Welding Educator, and others generated before this grant.

In addition to the deliverables in the approved application, AWS has also produced the following deliverables at no cost to the grantor:

- 8. Catalog of AWS Publications for Welding Educators.
- 9. Brochure on the Program and Application for Registration and Entry into the National Registry of Participating Organizations.
- 10. Career guidance videotape cassette entitled *Heavy Metal*, *Hot Careers in Welding*, produced by the Miller Electric Mfg. Co.
- 11. Schools Excelling through National Standards Education S. E. N. S. E. program for schools that are willing to commit to the use of the Curriculum Guidelines and Certification process.
- 12. AWS EG 2.0, Guide for the Training and Qualification of Welding Personnel Level I Entry Level Welder has been translated into the Spanish language and published as AWS EG 2.0 SP.
- AWS has sponsored the formation of a Welding Honor Society with Chapters to be established at all educational centers participating in the S. E. N. S. E. program. The AWS Honor Society was named Alpha Upsilon Sigma, and will have its first group of candidates for initiation in April of 1997.

14. AWS produced a document under the title of Guide to AWS Level I - Entry Level Welder, Level II - Advanced Welder, Level III - Expert Welder, Qualification and Certification.

SECTION 3

DISSEMINATION

As defined in the approved application, the grantee published and printed ten thousand (10,000) copies of each of the first six items listed under DELIVERABLES, as well as the videotape. These were mailed to educational centers and educators in the United States. A copy of the total listing as generated from the data base, was sent to the grantor, together with copies of all the materials listed. As understood by the grantee, dissemination means getting information about the project and its products and processing out to all potential stakeholders, users, interested parties, and others. The mailing out of the 60,000 documents proved to be an excellent activity and to date, we are still receiving requests for additional copies of the subject documents.

SECTION 4

MARKETING

The first skills standard developed by AWS was made public in 1979. At that time we believed that industry-driven skills standards applied in the workplace can promote continuous improvement toward the desired goal of high performance workers and workplace. This has not changed since 1979. What is starting to change is the acceptance of the skills standards by the stakeholders and the Federal Government. The change is to some degree due to the continuing marketing effort of interested parties such as the grantee.

The responsibility for the development and management of the marketing plan for the skills standards was assigned to the AWS staff. Following the social marketing ideas and early models developed by Seymour H. Fine and published under the title Social Marketing, Promoting the Causes of Public and Nonprofit Agencies, the AWS staff developed their program with a few more than the original 4 P's of marketing (product, promotion, place and price).

The needs analysis done within our industry promoted the need for the standards being developed and the data generated defined the current needs of the industry workforce. By assessing the needs, we were able to establish a pool of potential participants, investors, users and sellers of the process. The Education Grant Committee represented a large number of the main stakeholders and they, too, were part of the dissemination process that leads to creating the market for the product. Many of the stakeholders started incorporating the skills standards into their industries as they became available. The promotional strategy utilized included trade press, in-house organs, skills standards

newsletters, conferences and meetings, to name a few. Using the data base of the AWS sponsored International Society of Welding Educators, special promotional pieces on the skills standards Curriculum Guidelines were circulated, and the educators became very interested at an early point in the process.

As part of the marketing program we tried to provide products and services to the standards customers and the following are representative:

- * Standards documents.
- * Curriculum guidelines and audit materials.
- * Certification information and requirements.
- * Training programs geared to the Skills Standards.
- * Assessment materials.
- * Quality assurance systems and mechanisms.
- * Feedback mechanisms for updating of the Standards.
- * Guidelines for resource opportunities.

To encourage the adoption of the three standards, AWS organized the School Excelling through National Standards Education - S. E. N. S. E. - Program. Participating educational centers are enrolled in the AWS National Registry and receive a complete welding educator's library, and Institutional Membership in the American Welding Society. At present, there are over 180 schools in the program in thirty states of the nation.

SECTION 5

ACCOMPLISHMENTS

In this section of the report, the author will compare the actual accomplishments attained to the objectives contained in the approved application.

Objective. The American Welding Society (AWS) proposed to utilize its almost 75 years of technical, educational and standard developing experience in partnership with the Department of Education (DOE) to develop, organize and operate a business - labor - education - technical committee which will propose national standards and skills certification system for competency in the welding industry.

Accomplishments. The approved objective was met by the grantee and the following list of achievements highlight the results:

1. Invitation letters to the potential members of the committee were mailed out on June 15, 1993, fourteen days before the initiation date of the project.

- 2. The Education Grant Committee (EGC) held its first meeting on August 12, 1993, at the Marriott Casa Marina Hotel in Key West, Florida, starting at 8:30 AM.
- 3. EGC membership included two representatives from each of the following sectors: Business, Trade Unions, Education, Technical, Welding Equipment Manufacturers and the American Welding Society. The Executive Director of the American Welding Society was elected to serve as Chairman of the EGC.
- 4. EGC had twelve meetings between August 1993, and December 1994; nine additional meetings were held between January 1995 and April 1996. In other words, EGC met 21 times during the life of the project. Minutes of each meeting were circulated to the grantor following the formal meetings.
- 5. The committee developed the three skills standards, three curriculum guidelines and the certification system, together with the test bank now in use.
- 6. In addition the EGC developed the additional products listed in the **Deliverables** section of this report.
- 7. Individual members of the EGC interacted with industry leaders to promote the use of the skills standards developed by the grant. Many of them also met with local educational centers to interest them in becoming part of the S.E.N.S.E. program
- 8. EGC and staff members presented the skills standards at conferences, seminars and international meetings as part of the strategy to communicate with our peers in the industry.
- 9. Members of EGC and of the staff developed articles, white papers and editorials which were published in the Welding Journal, State Directors, The Standards Bearer, USA Today, and other publications with a national circulation.
- 10. The Governor of the State of Oklahoma awarded AWS a Commendation for its outstanding contributions to vocational education as a result of schools in the State joining the S. E. N. S. E. program.
- 11. The State of Florida has made it mandatory that all welding instructors be AWS Certified Welding Educators.
- 12. Vocational Industrial Clubs of America (V ICA) has incorporated parts of the handson tests required by the skills standards into their annual welding competition.

SECTION 6

SCHEDULE

The approved application contained a detailed schedule which we called *Education Grant Milestones*. This schedule was updated on a monthly basis and the Project Director included it in his monthly report to the U. S. Department of Education Program Director and the Grants and Contracts Division. During the life of the project, all objectives were met and the schedule showed no slippage. Only at the end, were we in need of requesting a no-cost extension of sixty days to allow time for the printing and distribution of the last of the three standards and curriculum guidelines.

Schedules were maintained and deadlines met due to the Program Management System that was designed and presented in the approved application document. A Program Manager was assigned to the project in July of 1993, and he was given overall responsibility and authority to manage the cost and schedule performance of the project team. The Project Manager prepared the task work orders, cost budget and work schedules using the Statement of Work (SOW), the Work Breakdown Structure (WBS) and the Education Grant Milestones schedule presented to the grantor in the approved application. Following the work orders, the responsible departments and personnel executed the work and reported progress to the schedule and budget on a weekly basis at the team performance review meeting. The Advisory Board, chaired by the Recipient Project Director, met monthly with the Project Manager to assess the program, review and advise relative problems while providing quality control feedback to the program team. When needed, this Board was empowered to act on behalf of the Executive Director and assign special assistance for problem solution.

The monthly reports presented by the Recipient Project Manager indicate that schedules were maintained, deadlines met and goals achieved in a timely manner. The only slippage was at the end of the program when a two month no-cost extension was requested to allow time for the printing and circulation of the third standard. The delay in part was due to the fact that bids for the printing of the products, at 10,000 units each, took longer than anticipated and as a result, the printing schedule was delayed. The corrective action taken was to request a no-cost extension from the grantor.

SECTION 7

PROJECT PARTICIPANTS

As presented in the outline, in this section we will identify the number and characteristics of the project participants who completed planned project activities, and of those who did not, and the outcomes achieved by participants who completed project activities. The project participants included both permanent members of the staff of the American Welding Society, as well as volunteer members of the Society. In selecting the participants, the Executive Director of AWS and the Recipient Project Director were certain to comply with all Federal statutes relating to nondiscrimination; these include, but are not limited to, discrimination on the basis of race, color, national origin, sex, age or handicaps.

Society Volunteers. There were sixteen volunteers that were involved in the project during the thirty-six months of implementation. Many others were indirectly involved as voting members of AWS Committees, Councils and the Board of Directors. Of the sixteen that formed the Education Grant Committee, all but three were voting members and the three were ex-officio members. The sixteen were representative of the welding industry and came from all areas of the nation. Two were females, one was black, two were from labor unions, one had a Ph.D., and one is a resident alien. Professional employment and titles cover welding supervisor, quality assurance manager, welding inspector, community college professor, university professor, director of training, chief welding engineer, qualification and certification, and others.

The volunteers in the Education Grant Committee operated as a team, so it is not possible to identify who completed project activities and who did not, because the team completed the activities on time and on budget. Some members were more active than others, and at times would be calling staff between meetings to clear up questions or to provide additional information. It would be unfair to say that some completed planned activities and some did not; as a matter of fact, the minutes of the meeting show that attendance was at all times above 90%. The volunteers working as educators, company administrators or technical staff were dedicated to the skills standards concept because in most cases, they were already involved in the implementation and usage of some of the other skills standards developed by AWS before this grant. The union representatives have implemented the skills standards into their apprenticeship programs and are making full use of the available material. As indicated earlier the educators were very effective in presenting the program to other educators and as a result we have this rather large number of schools in the S. E. N. S. E. program.

The Education Grant Committee participants formed the volunteer committee to create the subject standards. This is not a novel idea and the American Society for Testing Materials (ASTM), adopted the consensus principle in the development of standards in 1910. The American National Standards Institute (ANSI), a private membership organization that coordinates the U. S. voluntary consensus system does not create standards, but serves as a catalyst for standards development. The American Welding Society, as an ANSI member, follows the consensus principles of this organization and the Education Grant Committee members complied with all of the requirements. Because of this, it is very difficult to identify the work performed by the individuals, as all was done as a team project.

Society Staff. At least 50% of the staff participated in this project at one time or another during the 36 months of activity. Participation may range from a few hours to months of activity. There were four staff members on the Education Grant Committee (nonvoting) and an additional five on the project management team. The nine principal staff persons were all male, with professional backgrounds in administration, education, management, certification, finance, electronic data processing, and project design, to list a few. Most of the members are college graduates and two have Ph.D.s.

Following the generic phases of operating a system based on collaboration as defined by B. Gray in the book, *Collaborating*, staff tried to provide guidance in three areas as follows:

- 1. Problem Setting: Defining the problem, identifying stakeholders, gaining commitment, ensuring legitimacy of participants, identifying convener and securing resources.
- Direction Setting: Setting goals, establishing ground rules, planning activities, establishing timetables and schedules, organizing work, developing delivery systems, and exploring options.
- 3. Implementation and Promoting: Setting up accountability mechanisms, identifying responsibilities, allocating resources, obtaining feedback, establishing evaluation and marketing mechanisms.

Under these generic phases, staff was able to provide a framework for the volunteers dedicated to the development of the skills standards. The members of the staff have worked together for many years, so it was very natural for them to become a team and perform as one. Again it would be unfair to indicate any individual as not having completed a planned project activity, but it is an indication of performance that most of the participating staff members hold high positions within the system and have been with the Society ten or more years.

In working with the volunteers, staff also tried to assist them in meeting the principles that state that standards must be developed to:

- 1. Respond to changing technologies and market structures.
- 2. Be benchmarked to world class levels of industry performance.
- 3. Be free from bias or discriminatory practice.
- 4. Be tied to measurable competence based outcomes.
- 5. Be developed in cooperation with a wide range of stakeholders in their industries.
- 6. Be useful for qualifying new hires, as well as upgrading the skills of employees.
- 7. Include basic reading, writing and critical thinking skills.

The products developed and presented in the Deliverables section meet the principles presented above.

SECTION 8

EVALUATION

In the approved application, the grantee listed three evaluation activities for the project as follows:

- 1. The rules of operation for the Committee incorporate interim formative evaluation by assuring balanced inputs into the standard-developing process. A public review period, wherein any interested party can review an inherent formative evaluation.
- 2. A Beta Test of the curriculum guideline and other educational materials as part of the development of these products.
- 3. A summative evaluation to be conducted by an independent third party.

All three of the evaluation activities were conducted during the implementation of the project; the first two were done as part of the development and the third was done at the end of the project. The summative evaluation (Level I and Level II and III) was conducted by Dr. Joyce L. Winterton under contract to AWS. The following highlights are offered at this time:

Conclusions - Level I

- 1. The project was soundly supported by industry and education.
- 2. The AWS project has reached the objective and met the commitment outlined in the proposal.
- 3. The project was well managed and implemented.
- 4. A broad dissemination plan to educators was implemented.
- 5. The project utilized a very thorough and specific process
- 6. The initial response from organizations to S. E. N. S. E., the entry level welder standard and certification, has been extremely positive.

Recommendations - Level I

1. The process used by AWS for developing the standards and certification for Entry Level Welder should be used as a model for other standards projects.

- 2. AWS should continue the National Register of certified entry level welders and review whether or not the one year is ample time to be on the register.
- 3. AWS should work with industry to evaluate and document the success of the certification program in providing entry level welders who are better prepared to work and respond to industry's needs. If such documentation is possible, the employers in the industry should be encouraged to reflect this success in increased starting salaries.
- 4. Replicate the beta test of the curriculum with additional students to further document its benefits.
- 5. AWS should proceed with the development of standards and certification for other welding skills.

Conclusions - Level II and III

- 1. The project was soundly supported by industry and education.
- 2. The AWS project met the objective and achieved the outcomes outlined in the proposal.
- 3. The project was well managed and implemented.
- 4. The project utilized a proven process that can be used as a model for standards and certification development.
- 5. A broad dissemination plan to schools and institutions was implemented.
- 6. The National Registry established for Level II-Advanced Welder and Level III-Expert Welder can assist employers in hiring skilled welders. It will also benefit employees in marketing their welding skills.
- 7. The standards and certification assist in providing a *career path* for welders who want to improve their skills and advance in their employment.

Recommendations - Level II and Level III

- 1. The process used by AWS for developing the standards and certification for Level II and III Welders should be used as a model for other standards projects.
- 2. AWS should provide information on the results and benefit of maintaining a National Registry of certified advanced and expert welders to interested organizations.

- 3. AWS should work with industry to evaluate and document the success of the certification program in providing highly skilled, productive advanced and expert welders. If such documentation is possible, the employers in the industry should be encouraged to reflect this success in increased salaries.
- 4. The standards and certification should be revised every five (5) years as recommended by representatives of industry and education to keep it current with changing technology.
- 5. The American Welding Society should continue to implement strategies to inform industry and education about the national standards and certification and how to utilize them.
- 6. The AWS standards and certifications provide a framework that can be used to articulate secondary, postsecondary and industry welding programs.

SECTION 9

KEY PERSONNEL

The key personnel came from the AWS staff and were listed in the approved application under the title of Program Management Team. The original listing was as follows:

AWS Executive	Director
and Chairman of	f the EGC

Dr. F. G. DeLaurier

Project Director and Vice

Chairman of EGC

Dr. N. C. Wall

Program Manager

C. R. Fassinger *

Needs Assessments

Dr. W. R. Oates *

Standards Certification and Test

L. P. Connor

Curriculum Development and Test

D. R. Grubbs *

Data Base

W. W. Wetmore *

Administrative System Support

R. J. Miedzialko

Of the eight key positions, the four marked with an (*) were changed during the thirty-six months of the project, and the reasons for these changes are as follow:

- C. R. Fassinger. This person was moved to the position of Managing Director of the Technical Department and his new duties did not allow him time to continue working on the project.
- Dr. W. R. Oates. He was promoted to the position of Editor of the Welding Handbook and again, due to his new duties, he had to give up his work on the project.
- D. R. Grubbs. Resigned from the Society and went to work with another organization in Texas.
- W. W. Wetmore. He too resigned from the Society and went to work with an organization in Miami.

The vacant positions were replaced with other senior members of the staff, as follows:

- R. L. O'Brien, Managing Director of the Technical Department, took over the position of Managing Director Professional Services and replaced C. R. Fassinger.
- D. Cantelope was hired to provide the project with the skills needed to conduct the needs assessment and to replace W. R. Oates.
- R. V. Reeve was hired to fill the vacancy of Director of Education created by the resignation of D. R. Grubbs.
- J. Cilli was also a new hire to fill the vacancy created by the resignation of W. W. Wetmore.

The EGC, in partnership with the key personnel and the AWS support staff, implemented this project and completed the eleven major tasks in the approved application, together with the formative and summative evaluation, as well as this final report.

SECTION 10

PROJECT SUMMARY

The sixteen projects funded by the U. S. Department of Education have used different approaches to define the knowledge, skills and abilities required to perform a job. These projects also demonstrated great diversity in terms of purpose, goals, products, development processes, coalition management, and decision making. The following project summary may be of assistance to anyone attempting to compare the sixteen projects:

Project Period

5 July 1993 - 4 September 1996

Federal Funding Source

U. S. Department of Education

Federal

\$ 1,059,626

American Welding Society

1,383,764

Total

\$ 2,443,390

Occupational Areas

Entry Level Welder (a semiskilled, production worker

requiring close supervision).

Advanced Welder (a worker with skills and capacity to perform proceduralized tasks under general supervision).

Expert Welder (a worker with skills and demonstrated capacity for self-directed application as an autonomous

worker).

Status

AWS QC 10, Standard for Entry Level Welder was published

in March 1995.

AWS QC 11, Standard for Advanced Welder was published

in April 1996.

AWS QC12, Standard for Expert Welder was published

August 1996.

Standards

Each of the three standards establishes the basis for

administering the individual program and defines the

certification requirements.

Curriculum Guidelines

Each of the three curriculum guidelines contain learning

objectives, performance conditions, desired behavior, evaluation criteria and learning activities necessary to accomplish training as a participating organization under the

individual program.

Partners

The ESAB Group, Inc., Pacific Northwest Ironworkers, The Ohio State University, Miller Electric Mfg. Co., Moraine Valley Community College, Ingalls Shipbuilding, H&M Steel, Inc., Valmet Paper Machinery, National Training Fund, Oak Ridge National Laboratory, Dresser-Rand, Inc., Welding

Engineering Supply Company, Bartley and Associates, NWF Consultants and the staff of the American Welding Society.

SECTION 11

COMPANION DOCUMENTS

The following documents are attached to this report. All of them have been circulated as they were produced, but by making them companion documents to the report, the reader will not have to search for them:

AWS QC 10, Specification for the Qualification and Certification for Level I - Entry Level Welder.

AWS QC 11, Specification for the Qualification and Certification for Level II - Advanced Level Welder.

AWS QC 12, Specification for the Qualification and Certification for Level III - Expert Level Welder.

AWS EG 2.0, Guide for the Training and Qualification of Welder Personnel - Entry Level Welder.

AWS EG 3.0, Guide for the Training and Qualification of Welder Personnel - Advanced Level Welder.

AWS EG 4.0, Guide for the Training and Qualification of Welder Personnel - Expert Level Welder.

Career guidance videotape entitled Heavy Metal - Hot Careers in Welding.

Roster of schools that have joined the School Excelling through National Standards Education, S. E. N. S. E.

Summative Evaluation Level I - Entry Level Welder by Dr. Joyce L. Winterton.

Summative Evaluation Level II - Advanced Welder and Level III-Expert Level Welder by Dr. Joyce L. Winterton.

SECTION 12

CLOSING STATEMENT

Welding has become a very sophisticated and technical science, requiring not only mental application but also hands-on abilities. From the production in leading-edge industries to pioneering

research in modern laboratories, careers in welding continue to offer a very wide range of opportunities. According to the U. S. Department of Labor, Bureau of Labor Statistics, by the year 2005 the United States will need 352,000 welders, 80,000 welding machine operators, and 244,000 sheet metal workers. Welding as an enabling technology is used in the production of more than 50% of the gross national products in manufacturing. The future calls for competent welders and, as the need is recognized, the prompt acceptance of the skills standards and curriculum guidelines will greatly assist the training and educational process of the new generation of welders

The Recipient Project Director wishes to thank the volunteers and their companies for the assistance and cooperation that they provided. The support of the participating companies was a key factor in the implementation of this program. At the same time, he wishes to thank the staff of the American Welding Society for their contribution and dedication. The success of the project is due to the team effort of all the participants and their total support to the Recipient Project Director.

The American Welding Society thanks the U. S. Department of Education for this opportunity, and we look forward to continuing our work with the Federal Government and our industry.

Respectfully submitted,

Dr. Nelson C. Wall

Recipient Project Director

DEVELOPMENT OF STANDARDS AND CERTIFICATION FOR ENTRY LEVEL WELDERS

INTRODUCTION

The U.S. Department of Education was given authority under the Carl D. Perkins Applied Technology and Vocational Education Act to fund projects on a competitive basis to develop voluntary industry skill standards. Subsequently, the U.S. Department of Labor became committed to the concept of developing industry standards and expanding the development of the SCANS (Secretary's Commission on Achieving Necessary Skills) employability skills. Thus a collaborative effort was developed by the U.S. Departments of Education and Labor to facilitate the development of voluntary skill standards for various industries. In 1992 and 1993, these two departments funded twenty-two pilot projects (16 Education and 6 Labor) to develop voluntary skill standards covering some nineteen major industrial areas.

AWS STANDARDS AND CERTIFICATION

The American Welding Society (AWS) has almost 75 years of technical, educational and standard development experience. The 41,000 members of AWS represent all facets of the welding industry from hands-on welders to vocational instructors to industrial end-user companies and their engineering staffs. Both trade union members and management are represented within the Society. AWS is a technical standards producing organization with worldwide recognition. A system based on the American National Standards Institute (ANSI) "Procedures for the Development and Coordination of American National Standards" is used by AWS. These methods have been used to develop accepted standards for the training and certification of Welding Inspector and Welding Educator presently in use.

The American Welding Society submitted a proposal to the U.S. Department of Education to develop voluntary skill standards and certification for "Entry-Level" Welders. An Education Grant Committee was formed to guide and implement the project. The Committee members represented the following (refer to the appendix for a list of the members):

- · Business Community employers of welders such as fabricators, shipbuilders, aerospace
- Trade Unions pipefitters, boilermakers, automotive
- Educators vocational training instructors, post-secondary, college faculty
- Technical Community welding engineers, designers, researchers, manufacturers of welding equipment and products.

SUMMATIVE EVALUATION PLAN

The summative evaluation was conducted by an independent evaluator, Dr. Joyce L. Winterton, through Winterton Associates. The evaluation assessed the effectiveness of the results of the standards development grant and its relevance and usefulness for both industry and education. Dr. Winterton has extensive experience working with industry and education as well as evaluation of projects.

The summative evaluation included five basic areas:

- 1. The results of the standards project in relation to the objectives outlined in the proposal including any modifications and the reasons for them.
- 2. The level of involvement of industry and employee/labor representatives in the development and verification of the standards.
- 3. The acceptability of the standards and certification to industry and their perceptions that the standards can be used to assess incoming employees and be adopted for current workers.
- 4. The level of involvement of education representatives in the standards development process and the acceptability of the standards for developing programs, curriculum and determining the proficiency of students through a beta test of the curriculum.
- 5. Unexpected findings or results that could be beneficial to other organizations developing standards and certification.

The Summative Evaluation included a survey of the Education Grant Committee and a random sample of respondents to the entry level welders documents. Dr. Winterton provided recommendations on ways to improve the skill standards process and outcomes. The data was analyzed and utilized for the summative report.

The summative evaluation compared the results and impact of the project to the framework and principles provided by the U.S. Departments of Education and Labor. The framework includes seven phases:

- 1. Development and solidification of the coalition of all industry partners—industry members, labor organizations, worker representatives, educators, student welders and state and Federal governments into a project management structure which will guide development, testing and implementation of industry standards and certification;
- 2. Identification of broadly-based occupations within the industry for which standards generally do not apply at present;

- 3. Development and validation of skill standards within the industry for the identified occupations.
- 4. Identification of appropriate training delivery mechanisms and processes for approving and accrediting appropriate training providers which would enable existing workers and new entrants to develop the skills to meet the industry standard;
- 5. Development and validation of methodology to assess new entrants and existing members of the workforce who wish to demonstrate their mastery of the industry standards;
- 6. Establishment of certification arrangements for recognition of achievement of the skill standards that will be recognized by employers within the industry, by relevant state and Federal government bodies and by the vocational and higher education systems; and
- 7. Establishment of implementation and marketing strategies to ensure:
 - a. the adoption and utilization of the industry standards and certification at the individual employer, state, local and community college level;
 - b. that processes are in place for the continuation of the project beyond the initial award to include all major non-baccalaureate degree occupations not covered in the initial pilot project and;
 - c. that processes are in place to continuously update the industry-based occupational standards and to maintain the integrity of the skills assessment system and certifications processes.

The following principles were outlined to guide the standard projects' development:

- 1. Responsive to readily changing work organizations, technologies and market structures and based on broadly defined occupational categories within industries;
- 2. Benchmarked to world-class levels of industry performance and free from any gender, racial or other form of bias or discriminatory practice;
- 3. Based on a relatively simple structure to make the system readily understandable to users and tied to measurable, competency-based outcomes that can be readily assessed;
- 4. Developed cooperatively by all stakeholders and be comparable across industries, similar occupations and states;
- 5. Developed independently of any single training provider or type of training provider but applicable to a wide variety of education and training service providers, both work and

school-based.

- 6. Useful for qualifying new hires and for continuously upgrading the skills of employees; and
- 7. Include basic reading, writing and critical thinking (i.e. SCANS-type) skills.

The AWS Skill Standards project was highly successful in completing the phases as outlined in the framework. The principles identified to guide the Skill Standards project were also adhered to as much as possible.

EVALUATION OF IMPLEMENTATION

Meeting

Teleconference

Meeting

Project Organization

8/12/93 -

12/9/94 -

2/23/95 -

The project was organized with specific timelines, major milestones, management plan, committee and staff responsibilities that have basicly stayed on target. The Education Grant Committee remained actively involved throughout the project as evidenced by their meeting and teleconference schedule:

9/8/93	-	Teleconference
10/30/93	-	Meeting
12/14/93	-	Teleconference
2/10/94	-	Meeting
3/3/94	-	Teleconference
4/8/94	-	Meeting
5/11/94	-	Teleconference
6/3/94	-	Meeting
7/8/94	-	Meeting
10/31/94	-	Meeting

The project staff also attended the following meetings conducted by the U.S. Department of Education for all the standards projects:

9/29/93	-	Washington, D.C.
1/11/94	-	Washington, D.C.
7/12/94	-	Washington, D.C.

Project Objectives

The overall objective of the American Welding Society project "Development of Standards and Certification for Entry-Level Welders" was to operate a business/labor/education technical committee which would propose national standards and skills certification system for competency in the welding industry. The project proposal outlined three products to be developed:

- · National Standards for Entry Level Welders
- Curriculum for Training Entry Level Welders
- · Certification Program for Entry Level Welders

The process to develop the standards and certification included the following components:

- Determination of the competencies through DACUM surveys: Industrial; Education
- Preparation of Standards
- Development of Curricula
- · Preparation of Certification Information and Tests
- · Development of Test Bank
- · Certification of Students
- Development of Skill Update Methods
- · Development and Maintenance of Skill and Certification Data Base
- Dissemination Distribution

The plan projected that the DACUM survey would identify the duties and specific tasks of an Entry Level Welder, the general knowledge and skills required; the worker traits and attitudes needed; the recommended tools; equipment, supplies and materials needed; and appropriate formative evaluation techniques.

Modifications/Adjustments

The 1988 DACUM study "Occupational Analysis of Welder: Entry Level" was used as the basis for the survey. The plan was to send out 4,000 surveys with a projected 5 to 10% return. The actual mailing was to 4,233 using a ratio of 5:1 experienced welders /supervisors (foreman) /technicians to other job classifications included in the Standards Industry Code (SIC). A broad range of industries and educational settings were included. There were 857 or 20% of the surveys completed and returned. The results were used to develop a profile of the Entry Level Welder. The industry recommended that in addition to hands-on training and qualification, a written test of welding related knowledge and safety was required.

The Education Grant Committee developed the following definition of the Entry Level Welder:

An individual who possesses a prerequisite amount of knowledge, attitude, skills and habits required to perform routine, predictable, repetitive, proceduralized tasks involving motor

skills and limited theoretical knowledge while working under close supervision.

The standards were utilized to develop the curriculum for training entry-level welders. AWS conducted a one cycle Beta test of the training curriculum in order to identify procedural weaknesses, and correct and refine the curriculum. Arrangements were made with Dade County Florida Public Schools to assist with the training following the curriculum guidelines set by the Education Grant Committee. The original plan was to have 25 students complete the Beta test; however, due to challenges of scheduling and students' ability to complete the curriculum four students actually completed the test. An evaluation survey completed by the students indicated that they felt positive about their training experience. A summary of the students' feedback is included in the Appendix.

Summary

National standards and certification for entry level welders did not previously exist. According to AWS, welders are important because the permanently join metals in an efficient and economic way. It is estimated that weldments produced account for up to 50% of the United States GNP—including almost everything we use in our daily life, from coffee pots to nuclear reactors. Overall the AWS project implemented the proposal as it was designed with a limited number of modifications. The implementation plan was ambitious, but was achieved due to the previous experience of AWS with standards, the dedicated staff and the active involvement of the industry.

The business, labor and education technical committee, the Education Grant Committee, successfully developed the National Standards and Certification system for Entry Level Welders. Both the standards and curriculum were disseminated to 10,000 schools and institutions. The certification program is well on its way to full implementation. Guidelines for schools to participate in the "Schools Excelling Through National Standards Education" (S.E.N.S.E) were developed and included in the materials disseminated. Schools complete a letter of commitment and agree to abide by all the requirements of the "Specification for Qualification and Certification" and the "Guide for the Training and Qualification of Welding Personnel". Participating organizations may agree to be training-and-testing or testing only facilities. To date, 50 organizations have applied to participate. In addition, the state of Oklahoma has adopted the standards state-wide. The states of Kentucky and Ohio are also pursuing a state-wide adoption. Individuals who are certified from the organizations will be listed in the National Registry of Entry Level Welders for one year.

As a result of the project following the implementation plan, the guideline are very specific concerning the standards and the certification. In addition, the training curriculum provides a uniform implementation process. A site visit by AWS representatives can be used to monitor the compliance of the training and testing facilities.

EVALUATION OF PROJECT OUTCOMES

Project Outcomes

The evaluation responses from the Education Grant Committee (EGC) agreed that the standards do reflect the needs of the industry. They also agreed that it is important to have the training curriculum for the standards. The EGC was asked to rate the importance of the outcomes and benefits of the entry-level welders standards project. The three most important outcomes based on the Committee's ratings were:

- 1 Commitment from major user groups (industry & education) that they accept and will support the standards.
- 2 The standards are developed, produced and disseminated.
- 3 Verification of potential employees abilities.

The most important benefits of the AWS Standards and Certification to industry were rated as:

- 1 Will help guarantee that the persons they hire are trained to start working.
- 2 Will help to move industry to a "high performance work organization" with high productivity.
- 3 Develop an industry standardized measurement of employee skills for entry-level welders.

The importance of the benefits of the AWS standards to education were rated as:

- 1 Increase the understanding of industry needs.
- 2 Provide a training curriculum.
- 3 Establish goals and measurements for classes, students, and for success.

In February 1995, the EGC rated the progress of the AWS project in achieving the following outcomes (using a scale of 5 successfully produced the outcome to 1 did not produce the outcome). The average responses are as follows:

3.4 Commitment from major user groups (industry & education) that they accept and will support the standards.

- 3.9 The standards are developed, produced and disseminated.
- 4.0 Verification of potential employees abilities.
- 4.0 The standards are easy to understand.

The three proposed products were developed during the project including the:

- National Standards for Entry Level Welders
- Curriculum for Training Entry Level Welders
- · Certification Program for Entry Level Welders

When these products were disseminated, a random sample of 100 organizations who had received the AWS standards and certification materials were surveyed. In addition, 17 organizations who had signed up to participate in the standards and certification were surveyed. The response rate for the surveys was 29%. Four questions on the survey dealt with the process and outcomes of the project. Refer to the appendix for the summary of the evaluation forms

Summary

Based on the surveys, respondents agreed that the standards were easy to understand and that they did identify the skills and knowledge for entry level welders. In addition, they agreed that the standards were developed for the appropriate sequential levels. The majority of respondents did agree that the standards should be revised every 5 years.

EVALUATION OF PROJECT IMPACT

Summative Evaluation Survey Results

Summative evaluation instruments were developed and administered at the following Education Grant Committee Meetings:

October 31, 1994 - Miami, Florida February 23, 1995 - Key West, Florida

The summary of the evaluation instruments is included in the Appendix. Overall the responses from the Grant Committee members were positive about the project, its progress and the potential impact of the project.

In addition, a summative instrument was mailed to 100 recipients of the "American Welding Society Information Kit for Entry-Level Welders" and 17 organizations that had agreed to

participate as training or testing facilities. The first mailing was sent on May 23, 1995 and a second mailing on July 24, 1995. The random survey instrument included 16 questions that dealt with the potential impact of the entry level welder standards and certification.

Potential Impact

According to a comment on an evaluation form from an EGC member, this project is one of the most worthwhile in which AWS has participated. It has tremendous potential to improve the skill level of the entry level welder and to make it more uniform across the country. Another EGC member stated that the standards and certification could eventually eliminate the need to test the skills of all welders when they are hired.

Based on the mailed surveys of summative evaluation, the majority of respondents agree (mean response of 4.0 to 5.0) that the standards project did have potential for a positive impact in the following areas:

- · Help to improve the skills of entry level welders.
- · Offer a reference mark for employers.
- Improve the respect of entry level welders.
- The training curriculum will improve the quality of education programs for entry level welders.
- Upgrade the skills of instructors.
- · Help provide uniform training for welders.
- Provide industry with a better prepared welder.
- School administrators will have a tool to judge their welding programs.
- Employers will have a universal measure for existing and new employees.
- My organization will utilize the standards and certification.
- The development of national voluntary skill standards/certification is a beneficial effort.
- It is worthwhile to commit to the SENSE (School Excellence Through National Standards Education).

The survey respondents agree that there was also a potential for a positive impact in the following areas but not unanimously (mean response of 3.0 to 3.9):

- Improve the communications between industry and education.
- Implementing the standards and certification will challenge and motivate students.
- Through the standards and curriculum, students will be encouraged to become welders.
- The standards and curriculum will help parents understand that welding is a viable occupation.

Summary

Based on the review of the materials and feedback from industry and education the AWS

project has been well worth the investment. Even though it was one of the more ambitious of the standards project, it has met and at times exceeded the proposed plan. The impact of the entry level welders, as perceived by EGC and education organizations, will be substantial. The expected benefits will likely be achieved. The evaluator commends AWS for their foresight and for the quality of the work completed.

CONCLUSIONS

- 1. The project was soundly supported by industry and education.
- 2. The AWS project has reached the objective and met the commitments outlined in the proposal.
- 3. The project was well managed and implemented.
- 4. The project utilized a very thorough and specific process.
- 5. A broad dissemination plan to educators was implemented.
- 6. The initial response from organizations to SENSE, the entry level welder standards and certification has been extremely positive.

RECOMMENDATIONS

- 1. The process used by AWS for developing the standards and certification for Entry Level Welders should be used as a model for other standards projects.
- 2. AWS should continue the National Register of certified entry level welders and review whether or not the one year is ample time to be on the register.
- 3. AWS should work with industry to evaluate and document the success of the certification program in providing entry level welders who are better prepared to work and respond to industry's needs. If such documentation is possible, the employers in the industry should be encouraged to reflect this success in increased starting salaries.
- 4. Replicate the beta test of the curriculum with additional students to further document its benefits.
- 5. AWS should proceed with the development of standards and certification for Level II and III welders.

SUMMATIVE EVALUATION

"SUMMARY OF EDUCATION GRANT COMMITTEE RESPONSES"

STANDARDS AND CERTIFICATION FOR ENTRY-LEVEL WELDERS

SUMMATIVE EVALUATION SUMMARY

SURVEY FOR THE EDUCATION GRANT COMMITTEE

10/31/94

Please respond to the following statements by circling the appropriate answer and filling in the blank where requested.

A. Reaction to the Process

	•	Disagre	e	Agree		ongly gree
1.	I am satisfied with the results of the project thus far.	0	0	1	4	4
2.	The standards will have broad acceptance by industry.	o	0	. 2	3	4
3.	I am satisfied with the verification process (survey).	o	1	1	6	1
4.	The process involved industry, education and labor.	o	0	1	2	6
5.	The process involves an appropriate dissemination plan.	0	1	0	3	5

B. The AWS Draft Skills Standards

		Disagree	_	Agree	Stroi <u>A</u>	<u>iree</u>
1.	The skills are representative of skills needed by entry-level welders.	0	1	1	2	5
2.	The Basic Education Skills are appropriate for entry-level skills.	0	0	2	2	5
3.	The AWS draft Skill Standards are useful for developing training curriculum.	0	0	1	3	5
4.	The Beta Test is an appropriate method to verify the training curriculum.	1	1	1	3	3

Strongly

C. Testing and Certification

		Disagre	е	Agree	A	gree
1.	I can see the value of a voluntary national generic test for entry-level welders.	0	0	0	3	6
2.	Certification will improve the skills of entry-level welders.	0	0	2	2	5
3.	I would consider a person with these skills as a good prospect for employment in industry.	0	0	0	4	5

D. Objectives of the AWS Project

Rate the <u>progress</u> of the AWS Standards Project in meeting the following objectives on a scale of 1 to 5 (5 very effectively met the objective, 3 met the objective and 1 did <u>not</u> meet the objective).

- 4.2 1. Validated industry needs statement for an entry level welder competency standards.
- 4.0 2. Determining the competencies for "entry level welders".
- 4.3 3. Preparing and developing standards for "entry level welders".
- <u>4.2</u> 4. Developing students' curriculum.
- 3.5 5. Preparing certification requirements and tests.
- 2.8 6. Development of test bank.

E. Outcomes of the AWS Standards and Certification

Rank the importance of the outcomes of the AWS Skill Standards (1 being most important and 5 being least):

- 2 The standards are developed, produced and disseminated.
- Commitment from major user groups (industry & education) that they accept and will support the standards.
- 4 The standards are easy to understand.
- <u>3</u> Verification of potential employees abilities.
- ___ Other (please list):

F. Benefits of the AWS Standards and Certification

Rank the importance of the benefits of the AWS standards to industry (1 being most important, 6 being least important):

- 3 1. Develop an industry standardized measurement of employee skills for entry-level welders
- 5 2. Identify national standards to build upon.
- 3. Will help guarantee that the persons they hire are trained to start working.
- 4. Will help to move industry to a "high performance work organization" with high productivity.
- 4 5. Establish training curriculum.
- ___ 6. Other (please list):

Rank the importance of the benefits of the AWS standards to education (1 most important, 5 least important:

- 2 1. Provide a training curriculum.
- 1 2. Increase the understanding of industry needs.
- 3. Establish goals and measurements for classes, students, and for success.
- 4. Help with instructor development and certification.
- ___ 5. Other (please list):

Positive Comments:

I think this project is one of the most worthwhile AWS has participated in. It has tremendous potential to improve the skill level of the entry level welder, to make it more uniform across the country. This will (hopefully) eliminate the need to test all of our new welders: if they are certified as an entry level welder.

Good input from industry, education and labor.

Excellent discussions from labor, education and industry. Rapid development of educational material and training standard.

Should improve working relationships between industry and education. Will reduce training time by industry.

Keep up the good work.

I believe that eliminating oxy-fuel gas welding from the curriculum for Entry Level Welders is an important step.

Excellent program to develop and make work. Much needed in schools and industry today.

Eventually, may eliminate the need to test skills of all welders hired.

Suggestions for Improvement:

Need to get started on 2nd and 3rd tiers of welder skill levels.

What industry wants in an entry level welder and what they are willing to pay for maybe different things. Should have broken entry level down into smaller segments.

The fact that industry helped determine the curriculum should be emphasized to the students. This should help them understand that what they are learning is meaningful.

Focus on important over-all development with all levels. Not word-smith each part. Don't slow progress, think of the overall goals and get on with the program!!!

Other:

Training improves skills, certification only confirms that a minimum level of skill is present.

D. Outcomes of the AWS Project

Rate the <u>progress</u> of the AWS Standards Project in achieving the following outcomes on a scale of 1 to 5 (5 successfully produced the outcome, 3 produced the outcome and 1 did <u>not</u> produce the outcome).

- 3.4 Commitment from major user groups (industry & education) that they accept and will support the standards.
- 3.9 The standards are developed, produced and disseminated.
- 4.0 Verification of potential employees abilities.
- 4.0 The standards are easy to understand.

E. What are the three most important benefits of the Standards Project?

- 1. Industry had an input to training subjects.
- 2. The curriculum was beta tested
- 3. Students were challenged and motivated
- 1. Develop competent man power
- 2. Industry understanding of entry level.
- Excellent source for training for industry.

- 1. A benchmark for all welder training in the U.S.A.
- 2. A certification program to effect their skills
- 3. Coordination of industry labor and education for the betterment of the student and their instructors.
- 1. Entry level welders all trained the same.
- 2. Will actually up-grade some instructors.
- 3. Will assist industry in knowing what they are getting from schools.
- 1. Set a standard for entry level welder's
- 2. Upgrade training.
- 3. Better workers.
- 1. Definition of requirements of an entry level welder by industry groups.
- 2. Communication between industry and education.
- 3. Develop the opportunity for performance certification for the individual.
- 1. Verification of employers abilities.
- 2. Reference mark for employers.
- 3. Reflect the needs of industry.
- 1. Identification of skills.
- 2. Identification of curricula guidelines.
- 3. Dissemination of curricula.
- 1. Standardization.
- 1. Industry driven.
- 2. Standard training system.
- 3. Acceptance by industry.
- 1. Status of entry level welders.
- 2. Reference for employers.
- 3. Improved training.
- 1. Establish standards for welders.
- 2. Establish education standards.
- 3. Industry will have a better welder coming in this door.
- 1. Standardized curriculum.
- 2. Establish entry level goal.
- 1. Employer has universal measure for existing and new employees.
- 2. School administrators have a tool to judge their welding programs by.
- 3. Variation in training programs may be potentially less.
- It provides a uniform training curriculum for entry level welders.
- It enables employers to have a standard level of competence/ability to expect from entry level welders.

- 1. Uniform curriculum transferable nationally.
- 2. Allows entry level welders to be placed nationally.
- 3. Gives industry a medium to tell education what is needed.
- 1. A benchmark to encourage schools and students to attain.
- 2. A method of helping to upgrade the profession.
- 3. A method of "serving notice" of the deleterious effects of disregarding the technical importance of welding and the part incorrect welding or failure to adhere to good welding precepts can have on the success of soundness of the structure.
- 1. Baseline for training and expected results
- 2. Standard format for education and qualification of entry level personnel.
- 3. Availability of materials for entry level training that has not been available in this quantity nor quality.
- F. At the conclusion of the Standards Project it will be viewed successful if (complete the statement):
- The students who completed the course get a job. Instructors follow the curriculum when they teach.
- It is used and trains people go to work.
- Every state adopts it for their welder training programs.
- Most schools will use the standards.
- The program is instituted by the state's Dept. of Education Individuals participate in the program. Industry employs the graduates.
- They are used by industry.
- A significant number of educational institutions adopt it.
- Used.
 - Industry accepts them and employs individuals certified by this process.
 - Accepted by industry.
- Industry and education will work to a standard to improve the welding.
- Training facilities use the standards and employers look for the successful completion of training as a selection criteria.

Certification to this standard starts showing up on job applications in employment ads, and as part of customer-fabricator contracts. Schools start advertising certification as an outcome of their programs.

Training centers adopt it and use it. The welders who become certified have a higher level of skill than the current entry level welders. Industry recognizes and rewards/compensates these certified entry level welders accordingly.

Adopted by the educational system looked upon favorably by industries hiring. Changes the way secondary schools do business (more emphasis on training with work related basic skills).

If students and employers use the program to ensure they have qualified welding personnel.

After this material is disseminated to 10,000 institutions, it is really used and industry holds the trainers to preparing entry level personnel to this standards.

Other Positive Comments:

The workmanship samples are an indication of the results that can be expected when the curriculum is followed.

Creates an excellent guide, workmanship standards to train for industry needs.

Will raise the overall level of welder skill training in our nation.

I feel this has been something that will help industry and educators throughout the entire nation. This will give welding instructors pride in what they are actually teaching.

Keep up the good work.

The interaction between the committee members was often dynamic and resulted in an excellent program.

Meets education 2000 goals and provides a guidelines for welding educators

This standard is long overdue but finally here. Will provide a national level of acceptability and ease training in different schools/states.

Staff conducted project professionally. Organization and presentation by staff to DoE clear, professional and led to further work.

It was a great project.

As beta test developer and trainer the transformation of students into beginning welders

I was very pleased to be part of an impressive and diverse group of people who are sincerely interested in improving the science and application of welding. It is always a pleasure to work with intelligent, skilled, hard-working people. Staff worked very hard and did a super job.

Prepare this material to be available both nationally and internationally.

Suggestions for Improvement:

Make sure that we have what we think and hope we have created - ie. training and testing proves our efforts are sound. The students really learned well, performed the skills and ready and able to do a good job in industry.

Needs to be monitored and updated with heavy input from industry. Must not let academics modify.

GO FOR IT!

The process of standards/guidelines development would have been facilitated by balloting the draft documents at an earlier stage. Almost 3 months of time could have been saved.

Follow-up with contacts in industry and education to sell project.

Continue and develop levels 2 and 3.

I personally think that the levels required by this standard and the training curriculum are too difficult for the student.

Lets get going on levels 2 and 3.

Stronger mandatory items in the standard. ie. certified welding educators tighten control of testing.

There is no way to force all schools to accept the program. I just hope our "salesmanship" will be successful.

More field testing to ensure that the curriculum and standards have the ability of being supported. Suggest all appropriate resources to teach the level and not just AWS standards. Provide suggestions or teaching tips on how best to use the guide and standards.

SUMMATIVE EVALUATION

STANDARDS AND CERTIFICATION FOR ENTRY-LEVEL WELDERS

SUMMATIVE EVALUATION SUMMARY

SURVEY FOR BETA TEST STUDENTS AMERICAN WELDING SOCIETY - ENTRY LEVEL WELDERS TRAINING

Please rate the following factors by circling the appropriate answer and filling in the blank where requested:

A. Entry Level Welder Training

Strongly

y - y	<u>Disagr</u>	ree	Agree	A	gree
 The training program has been helpful. 	.0	0	0	1	3
The training program was challenging.	0	0	0	0	4
 I am qualified to be hired as an entry level welder. 	0	0	0	0	4
 The entry level welder test was appropriate. 	0	0	0	0	4
5. I was well prepared for the test.	0	0	0	0	4
I would recommend the training program to my friends.	0	0	0	0	4

Please complete the following:

I would improve the training program by:

The program should end earlier in the evening because most the students are working.

More classroom time.

No changes.

The best part about the program was:

Dan's commitment at the shop and Bob Reeve was very knowledgeable.

The teachers had real life experience thereby passing on this information.

Everything was just fine.

Additional Comments:

Having all this knowledge I got a job making \$11.00 per hour. That was 2 months ago and now I have a dollar raise. I suggest you credit for this program

MEMORANDUM

TO:

Recipients of American Welding Society Information Kit

for Entry Level Welders

FROM:

Joyce L. Winterton, Ph.D., Evaluator

Nelson Wall, Project Director, AWS

DATE:

May 23, 1995

PURPOSE:

Evaluation and Feedback on the Standards and Curriculum

Guide for Entry Level Welder

Recently you received a package of information from the American Welding Society. It included the following:

 Specification for the Qualification and Certification for Entry Level Welders (AWS QC10)

 Guide for the Training and Qualification of Welding Personnel - Entry Level Welders (AWS EG2.0)

The project to develop national voluntary skill standards for entry level welders was partially funded by the U.S. Department of Education with matching funds from industry. An independent evaluation is required as part of the standards grant. Please take 10 to 15 minutes to complete the survey and return it in the enclosed envelope be <u>JUNE 16, 1995</u>. Your feedback is essential to the success of the standards project.

Thank you for your assistance.

SUMMATIVE EVALUATION SUMMARY

Entry Level Welders Skill Standards & Certification

"Mail Survey Responses"

Positive Comments

The program is good, long overdue but good. The obstacle now is to get existing educators motivated and qualified to present the material. If we as a nation do not implement this program, we're all going to see an increasing number of half-way trained welders.

Seem to be on track. My students are very alerted to this enhancement of the Welding Society and they are eager to complete and then be certified.

Push certification!!

I like having an organized format. I think there should be a section on employability skills. It will do us no good to train a student if we cannot get them a job and then they can keep it.

Carefully thought out and organized. Certification exam information is very helpful.

The Career Center's Welding Advisory Committee agrees with the standard for entry-level welder. We ar anxious to review the forthcoming standards for "skilled and journeyman/master" welder. Upon reviewing S.E.N.S.E. the immediate school administration was very positive toward implementation.

The standardization and qualification of welding personnel is long overdue. The "shade-tree" welder not only degrades this sophisticated technical science, but drive up the product liability insurance cost for the entire welding community. It's great to see the day of a welder being thought of in a negative way as disappearing. Please let's not stop with qualification and registration—let's move toward a formal license to practice our "art" of science and technology.

Good job!

Industry should be made aware nationally of the entry level welders skill standards and certification program.

I received great cooperation from the AWS office. The information received will surely assist us in putting together a viable and realistic educational experience in welding technology, up to and including an associate degree program. With ever expanding technology we must identify and propagate pertinent information for educational training. Both entry level and continuing education could and should be our common goal because of continual revisions to technology and codes and standards.

We needed to do this years ago and also all related trades.

Local industry are very supportive of our institution becoming qualified to certify graduates at the entry level as welders.

We are currently using these standards to write state curriculum with assistance from James Ivey.

This is a positive step in establishing a standard that can be used to improve welder training and testing nationwide. Those of us that have incorporated AWS codes and standards in our curriculum and welder testing programs will find this program easy to implement.

Suggestions

Mandatory CWE's/local school vo-tech directors must make CWE a pre-requisite for instructor's, while AWS should require C.E.U.'s and offer them for educators to continue their certification in the education areas, i.e. processes, new technology, industry/educator discussion forums. Industry must be willing to pay the wages for the better trained individuals. The salary structure for welders has either stayed the same or declined over the past 10-12 years.

These entry level welding standards are good. They establish a uniform standard for entry into the welding field. Given the scope of the standards and the amount of instruction, learning, and practice time involved, I believe it will be extremely difficult to implement these standards in a vocational high school setting. Even in a state such as Massachusetts which has a system which allows up to 1500 hours for vocational training over a 3 year period, it will be practically impossible. Instructors will probably want to use some of the material for their programs, but I think it is unlikely that the entire program would be implemented.

Curriculum does not motivate students. In fact active learning programs and accountability through testing threatens those students who do not work hard. These loafers will complain loudly when an attempt is made to force them to work. A strategy must be in place to handle the complaints that will be forthcoming from students who wish to be entertained rather than learn.

Business and industry needs to tell education this is what they expect. Then business and industry need to go about seeing schools provide the high level of training the "Guide" outlines.

The accompanying tape "Heavy Metal" is somewhat sexist and will not help to expand the interest of young women in the career area. You may want to re-look at the P.R. piece.

Due to Federal and State laws the "screening process" is a major hold point. It appears that only if a program has a large student population can a selection process be viable. The pool of students varies year to year and it is doubtful that there will be enough interest generated for this to take place. After all, welding is an elective type course and is not mandated as with

English, Math, History, etc. If there is a way to circumvent this issue, please let me know immediately.

I hope there will be an effort to develop higher levels i.e. 2, 3, master. I feel this will encourage students to stay in the field if they know a person can progress their whole career.

The availability of these standards were somewhat premature. I am still unsure if all the necessary documents and educational materials have been received. Also, it is unclear if and when future information and information should be received.

I will hold suggestions for a later date. We want to work with the program before we evaluate and make suggestions.

DEVELOPMENT OF STANDARDS AND CERTIFICATION FOR ENTRY LEVEL WELDERS

INTRODUCTION

The U.S. Department of Education was given authority under the Carl D. Perkins Applied Technology and Vocational Education Act to fund projects on a competitive basis to develop voluntary industry skill standards. Subsequently, the U.S. Department of Labor became committed to the concept of developing industry standards and expanding the development of the SCANS (Secretary's Commission on Achieving Necessary Skills) employability skills. Thus a collaborative effort was developed by the U.S. Departments of Education and Labor to facilitate the development of voluntary skill standards for various industries. In 1992 and 1993, these two departments funded twenty-two pilot projects (16 Education and 6 Labor) to develop voluntary skill standards covering some nineteen major industrial areas.

AWS STANDARDS AND CERTIFICATION

The American Welding Society (AWS) has almost 75 years of technical, educational and standard development experience. The 41,000 members of AWS represent all facets of the welding industry from hands-on welders to vocational instructors to industrial end-user companies and their engineering staffs. Both trade union members and management are represented within the Society. According to AWS, welders are important because they permanently join metals in an efficient and economic way. It is estimated that weldments produced account for up to 50% of the United States GNP—including almost everything we use in our daily life, from coffee pots to nuclear reactors.

AWS is a technical standards producing organization with worldwide recognition. A system based on the American National Standards Institute (ANSI) "Procedures for the Development and Coordination of American National Standards" is used by AWS. These methods have been used to develop accepted standards for the training and certification of Welding Inspector and Welding Educator presently in use.

The American Welding Society submitted a proposal to the U.S. Department of Education to develop voluntary skill standards and certification for "Entry-Level" Welders. Subsequently, AWS proposed to the U.S. Department of Education to develop two additional levels of standards and certification, one for Welder Level II and Welder Level III.

An Education Grant Committee was formed to guide and implement both projects. The Committee members represented the following (refer to the appendix for a list of the members):

1

- · Business Community employers of welders such as fabricators, shipbuilders, aerospace
- · Trade Unions pipefitters, boilermakers, automotive
- Educators vocational training instructors, post-secondary, college faculty
- Technical Community welding engineers, designers, researchers, manufacturers of welding equipment and products.

The Education Grant Committee (EGC) first met on August 12, 1993 and met frequently during the projects.

SUMMATIVE EVALUATION PLAN

The summative evaluation was conducted by an independent evaluator, Dr. Joyce L. Winterton, through Winterton Associates. The evaluation assessed the effectiveness of the results of the standards development grant and its relevance and usefulness for both industry and education. Dr. Winterton has extensive experience working with industry and education as well as evaluation of projects.

The summative evaluation included five basic areas:

- 1. The results of the standards project in relation to the objectives outlined in the proposal including any modifications and the reasons for them.
- 2. The level of involvement of industry and employee/labor representatives in the development and verification of the standards.
- 3. The acceptability of the standards and certification to industry and their perceptions that the standards can be used to assess incoming employees and be adopted for current workers.
- 4. The level of involvement of education representatives in the standards development process and the acceptability of the standards for developing programs, curriculum and determining the proficiency of advanced welders.
- 5. Unexpected findings or results that could be beneficial to other organizations developing standards and certification.

The Summative Evaluation included a survey of the Education Grant Committee and observation of the Committee process. A questionnaire was sent to a random sample of employers who responded to the AWS survey in the Fall of 1995 to determine a consensus of welder skills and competencies required for individuals seeking to continue the development of their welding skills. In addition, a survey was sent to respondents who received the Welder Level II and III documents. Responses from the survey cards mailed by AWS with the documents were also reviewed. Dr. Winterton provided recommendations on ways to improve

2

the skill standards process and outcomes. The data was analyzed and utilized for the summative report.

The summative evaluation compared the results and impact of the project to the framework and principles provided by the U.S. Departments of Education and Labor. The framework includes seven phases:

- 1. Development and solidification of the coalition of all industry partners—industry members, labor organizations, worker representatives, educators, student welders and state and Federal governments into a project management structure which will guide development, testing and implementation of industry standards and certification;
- 2. Identification of broadly-based occupations within the industry for which standards generally do not apply at present;
- 3. Development and validation of skill standards within the industry for the identified occupations.
- 4. Identification of appropriate training delivery mechanisms and processes for approving and accrediting appropriate training providers which would enable existing workers and new entrants to develop the skills to meet the industry standard;
- 5. Development and validation of methodology to assess new entrants and existing members of the workforce who wish to demonstrate their mastery of the industry standards;
- 6. Establishment of certification arrangements for recognition of achievement of the skill standards that will be recognized by employers within the industry, by relevant state and Federal government bodies and by the vocational and higher education systems; and
- 7. Establishment of implementation and marketing strategies to ensure:
 - a. the adoption and utilization of the industry standards and certification at the individual employer, state, local and community college level;
 - b. that processes are in place for the continuation of the project beyond the initial award to include all major non-baccalaureate degree occupations not covered in the initial pilot project and;
 - c. that processes are in place to continuously update the industry-based occupational standards and to maintain the integrity of the skills assessment system and certifications processes.

3

The following principles were outlined to guide the standard projects' development:

- 1. Responsive to readily changing work organizations, technologies and market structures and based on broadly defined occupational categories within industries;
- 2. Benchmarked to world-class levels of industry performance and free from any gender, racial or other form of bias or discriminatory practice;
- 3. Based on a relatively simple structure to make the system readily understandable to users and tied to measurable, competency-based outcomes that can be readily assessed;
- 4. Developed cooperatively by all stakeholders and be comparable across industries, similar occupations and states;
- 5. Developed independently of any single training provider or type of training provider but applicable to a wide variety of education and training service providers, both work and school-based.
- 6. Useful for qualifying new hires and for continuously upgrading the skills of employees; and
- 7. Include basic reading, writing and critical thinking (i.e. SCANS-type) skills.

The AWS Skill Standards project was highly successful in completing the phases as outlined in the framework. The principles identified to guide the Skill Standards project were also adhered to as much as possible.

EVALUATION OF IMPLEMENTATION

Project Organization

The project was organized with specific timelines, major milestones, management plan, committee and staff responsibilities that have basicly stayed on target. The Education Grant Committee remained actively involved throughout the project. The project staff also attended meetings conducted by the U.S. Department of Education for all the standards projects:

Project Objective and Products

The overall objective of the American Welding Society project "Development of Standards and Certification for Welder Level II and Level III" was to operate a business/labor/education technical committee which would propose national standards and skills certification system for competency in the welding industry. The project proposal outlined three products to be

4

developed for each of the two additional welder competency levels (Welder II and Welder III):

- National Standards for Level II and III Welders
- · Curriculum for Training Level II and III Welders
- · Certification Program for Level II and III Welders

It was projected that these six products (three per Welder Level) would provide a standardized industrial-education methodology for the career training of welders and a process of certification to a National Standard that is representative of the voluntary consensus of business, labor and education. It was anticipated that the additional work would create a three-level system of Skill Standards that provides the individual with the following:

- Portability: Ability to move from one job to another and use a portable credential, the "Certification Card."
- Additive: The process starts in the classroom and continues to the workplace.
- Trust: The users, industry, and others have over the years learned to trust AWS certification and the Society has credence.

The process to develop the standards and certification included the following components:

- Determination of the competencies (data from the DACUM survey conducted for Welder Level I were utilized)
- Preparation of Standards
- · Development of Curricula
- Preparation of Certification Information and Tests
- · Development of Test Bank
- · Certification System
- · Development of Skill Update Methods
- · Development and Maintenance of Skill and Certification Data Base
- Dissemination Distribution

The AWS project identified the following benefits of developing the National Skill Standards and Certification:

- Provides a proven framework for generating valid and reliable Skill Standards, assessment and certification system.
- Establishes a set of common levels of qualification for career entry and progression within the welding workforce.
- Provides criteria and recognition procedures for other organizations interested in developing standards.
- Creates a procedure for disseminating Skill Standards for employers, education and training providers, assessment systems and most importantly the individual.
- Presents a system that ensures easy access to the produced standards.
- · Offers a "career path" to the candidate that allows for schooling and time in the workplace.

5

Summary

The AWS project "Development of Standards and Certification for Welder II and Level III" successfully utilized the business, labor and industry technical committee (Education Grant Committee) to develop the National Standards, Curriculum and Certification program as proposed. Overall the AWS project implemented the proposal as it was designed. The implementation plan was ambitious, but was achieved due to the previous experience of AWS with standards, the dedicated staff and the active involvement of the industry.

The standards and curriculum were disseminated to 10,000 schools and institutions (postsecondary, vocational training and adult education) and interested parties. The certification program is well on its way to full implementation. Use of the National Skill Standards is voluntary. Participating organizations may qualify and certify Level II - Advanced Welders and Level III - Expert Welders if they are registered as an AWS Participating Organization. Welder performance qualification tests are administered based on AWS guidelines and are conducted at AWS Accredited Test Facilities. For each successful Level II and Level III Welders, the participating organizations prepare a report on the results of the written examination, the safety portion of the written examination, and the performance qualification tests. The participating organization sends the report to AWS at which time the data is entered into the Level II or Level III Welder databases. The databases serve as the National Registry for Level II - Advanced and Level III - Expert Welders. The training curriculum provides a uniform implementation process. A site visit by AWS representatives can be used to monitor the compliance of the training and testing facilities.

EVALUATION OF PROJECT OUTCOMES

Project Outcomes

The Education Grant Committee (EGC) completed a survey at their April 20, 1996 meeting in Chicago, Illinois. The evaluation responses from the Education Grant Committee (EGC) agreed that the standards reflect the skills needed by Level II and III Welders and that certification would improve the skills of welders. They also strongly agreed that a person with the skills would be a good prospect for employment in the welding industry. However, the Committee was less optimistic that educators would utilized the standards and certification. The EGC was also asked to rate the progress in meeting the project objectives. The following reflects the average response of the Committee members:

Objectives of the AWS Project

Rate the <u>progress</u> of the AWS Standards Project in meeting the following objectives on a scale of 1 to 5 (5 very effectively met the objective, 3 met the objective and 1 did <u>not</u> meet the objective).

- 4.5 1. Determining the competencies for level II and III welders".
- 4.2 2. Validated industry standards for level II and III welder competency standards.
- 4.4 3. Preparing certification requirements and tests.
- 4.0 4. Developing students' curriculum.
- 3.4 5. Development of test bank.

The Education Grant Committee members were also asked to rate the importance of the outcomes projected by the AWS project. The average responses are indicated below:

Outcomes of the AWS Standards and Certification

Rate the importance of the outcomes of the AWS Skill Standards (1 being most important and 5 being least):

- 2.0 Commitment from major user groups (industry & education) that they accept and will support the standards.
- 2.1 Verification of potential employees abilities.
- 2.2 The standards are easy to understand.
- 2.3 The standards are developed, produced and disseminated.
- 2.3 Establish training curriculum.
- 2.4 Help with instructor development and certification.

Summary

The summary of the evaluation instrument is included in the Appendix. Overall the responses from the Grant Committee members were positive about the project, its progress, the projected outcomes and the potential impact of the project. One committee member stated, "There has

been an excellent exchange of ideas between the various industries and schools related to welder training and certification. The AWS project provided a product that has been required by industry and education for many years."

EVALUATION OF PROJECT IMPACT

Summative Evaluation Survey Results

Summative evaluation instruments were mailed to a random sample of 100 employers who had responded in the fall of 1995 to the AWS survey designed to determine the competencies required for welders seeking to continue the development of their welding skills. The response rate for the employer survey was 44%. A second evaluation instrument was sent to a random sample of 100 educators who received the "American Welding Society Information Kit for Level II and Level III Welders". The response rate for the educators survey was 23%. The mailings were sent on August 30, 1996. The survey instruments included 15 to 18 questions that dealt with the potential impact of the Level II and Level III Welder Standards and Certification.

Potential Impact

Employer Survey Results

Based on the employer mail survey, the majority of respondents agree (mean response of 4.0 to 5.0) that the standards project did have potential for a positive impact in the following areas:

- · Improving the communications between industry and education or training.
- · Improving the skills of welders moving from entry level to advanced levels.
- Encouraging employers to hire a welder who is certified for Level II or III.
- Providing a tool for education and training organizations to judge their welding programs.

The survey respondents also agreed to the following statements, but not unanimously (mean response of 3.0 to 3.9):

- The is a need for national standards and certification of advanced welders.
- The survey process used by AWS will identify the skills and knowledge required for Level II and III Welders.
- The standards will offer a benchmark for employers.
- The standards should be revised every 5 years.
- The standards and certification will improve the respect for advanced and master welders
- Implementing the standards and certification will challenge and motivate welders who want to advance their skills.

R

- The standards and certification will help provide uniform training for welders.
- The standards and certification will provide industry with a better technically prepared advanced welder.
- Employers will have a universal measure for the skills of welders.
- The development of national voluntary skill standards/certification is a beneficial effort.
- AWS has provided a valuable role in developing standards and certification for advanced welders.

Educators Survey Results

Based on the educators mail survey, the majority of respondents agree (mean response of 4.0 to 5.0) that the standards project did have potential for a positive impact in the following areas:

- · Improving communication between industry and education or training.
- · Improving the skills of welders moving from entry level to advanced levels.
- Improving the respect for advanced and master welders.
- Improving the quality of education programs for advanced welders through use of the training curriculum.
- · Encouraging welders to advance their skills.
- · Promoting a better understanding of the importance of welding in industry.
- · Upgrading the skills of instructors.
- · Improving the uniformity of training for welders.
- Providing industry with a better technically prepared advanced welder.
- Providing education and training organizations a tool with which to judge their welding programs.
- · Providing employers with a universal measure for the skills of welders.

The education respondents also agreed to the following:

- The standards are easy to understand.
- The standards identify the skills and knowledge required for Level II and III welders.
- It is important to have standards and verification for Level II and III welders.
- The standards should be revised every 5 years.
- · My organization will utilize the standards and certification.
- The development of national voluntary skill standards/certification is a beneficial effort.
- It is worthwhile to commit to School Excellence Through National Standards Education (SENSE).

A response card was mailed by AWS with the information kit for Level II and Level III welders. The initial responses reinforced the positive attitude of educators towards the standards. Based on the first 48 returned cards, 90% of the respondents said they anticipated using the Level II and Level III welders materials. The majority also agreed (98%) that they would use a workbook developed to support the AWS welding handbook.

9

Summary

Based on the review of the materials and feedback from industry and education the AWS project has been well worth the investment. Even though it was one of the more ambitious of the standards project, it has met and at times exceeded the proposed plan. The impact of the Level II - Advanced Welders and Level III - Expert Welders, as perceived by the Education Grant Committee, employers and education organizations, will be substantial. The expected benefits will likely be achieved. The evaluator commends AWS for their foresight and for the quality of the work completed.

CONCLUSIONS

- 1. The project was soundly supported by industry and education.
- 2. The AWS project met the objective and achieved the outcomes outlined in the proposal.
- 3. The project was well managed and implemented.
- 4. The project utilized a proven process that can be used as a model for standards and certification development.
- 5. A broad dissemination plan to schools and institutions was implemented.
- 6. The National Registry established for Level II Advanced Welders and Level III Expert Welders can assist employers in hiring skilled welders. It will also benefit employees in marketing their welding skills.
- 7. The standards and certification assist in providing a "career path" for welders who want to improve their skills and advance in their employment.

RECOMMENDATIONS

- 1. The process used by AWS for developing the standards and certification for Level II and III Welders should be used as a model for other standards projects.
- 2. AWS should provide information on the results and benefit of maintaining a National Registry of certified advanced and expert welders to interested organizations.
- 3. AWS should work with industry to evaluate and document the success of the certification program in providing highly skilled, productive advanced and expert welders. If such documentation is possible, the employers in the industry should be encouraged to reflect this success in increased salaries.
- 4. The standards and certification should be revised every 5 years as recommended by representatives of industry and education to keep it current with changing technology.
- 5. The American Welding Society should continue to implement strategies to inform industry and education about the national standards and certification and how to utilize them.
- 6. The AWS standards and certifications provide a framework that can be used to articulate secondary, postsecondary and industry welding programs.

SUMMARY OF EDUCATION GRANT COMMITTEE RESPONSES

EDUCATION GRANT COMMITTEE

Skill Standard and Certification for Welders Level II and III

SUMMATIVE EVALUATION

Please respond to the following statements by circling the appropriate answer and filling in the blank where requested.

A. Development of the Standards and Certification

		Disagre	ee	Agree		ongly Agree
1.	I am satisfied with the results of the project thus far. (4.3)	0	0	4	3	9
2.	The standards will have broad acceptance by industry. (3.6)	o	2	5	6	3
3.	I agree with the process used to develop the standards and certification. (4.6)	0	0	1	5	10
4.	The process involved a broad scope of the industry. (4.6)	0	o	2	3	1.1
5.	The process involves an (4.4) appropriate dissemination plan.	0	o	1	8	7
6.	The skills are representative of those needed by level II and III welders. (4.1)	0	0	2	8	4
7.	Certification will improve the skills of level II and III welders. (4.3)	0	0	0	10	5
8.	I would consider a person with these skills as a good prospect for employment in industry. (4.7)	0	O	0	5	11
9.	Educators will utilized the standards and certification. (3.4)	0	3	6	5	2
10	. The process used by AWS for the development of standards and certification could be used by other industries. (4.4)	0	0	3	3	10

B. Objectives of the AWS Project

Rate the <u>progress</u> of the AWS Standards Project in meeting the following objectives on a scale of 1 to 5 (5 very effectively met the objective, 3 met the objective and 1 did <u>not</u> meet the objective).

- 4.5 1. Determining the competencies for level II and II welders".
- 4.2 2. Validated industry standards for level II and II welder competency standards.
- 4.4 3. Preparing certification requirements and tests.
- 4.0 4. Developing students' curriculum.
- 3.4 5. Development of test bank.

C. Outcomes of the AWS Standards and Certification

Rate the importance of the outcomes of the AWS Skill Standards (1 being most important and 5 being least):

- 2.3 The standards are developed, produced and disseminated.
- 2.0 Commitment from major user groups (industry & education) that they accept and will support the standards.
- 2.2 The standards are easy to understand.
- 2.1 Verification of potential employees abilities.
- 2.3 Establish training curriculum.
- 2.4 Help with instructor development and certification.
- ___ Other (please list):

EDUCATION GRANT COMMITTEE

Skill Standard and Certification for Welders Level II and III

SUMMATIVE EVALUATION

Positive Comments:

"Keep up the Good work"

"Excellent exchange of ideas between the various industries and schools related to welder training and certification. Provided a product that has been required by industry and education for many years"

"Very Organized"

"Program was carried out very expeditiously and in a businesslike manner. A big step forward for the welding industry"

"The process used was excellent"

"It was a very positive personal experience. This work will be incorporated into our present training and upgrading program for Journeymen welders"

"The group was extremely diverse and came from many different areas. This meant that there was a very diverse group, with many ideas. These differences were resolved extremely well. They came up with a better standard because of this diversity"

"Well pleased with being a part of both grants, and seeing the input that all members and AWS staff have shown. Everyone openly expressed their ideas / concerns and yet helped to develop the document. I think that schools who teach carefully and completely will prepare students who will be employable"

"Will help schools across the U.S. It will up-grade instructors and students"

"As an Aerospace representative, I feel the project results were outstanding. As time goes on, other industries will implement these standards"

Suggestions for Improvement:

- "It is expensive and somewhat inflexible. Skills in this program are not uniform through the industry"
- "I have felt that we are expecting too much in all areas, and that we may have to allow specialization sometime in the future"
- "Timing was very tight. Need to receive the more complex information 1 month prior to meeting for proper review and networking"
- "Need feedback from schools on effectiveness of program training curriculum. Need feedback from industry on acceptance or improvement of skills in welders. Need evaluation/confirmation on cost savings in industry, either by reduced testing, a shorter learning curve or less in-house training of new hires for graduates of Welder II or III programs"
- "Perhaps representatives from the public education sector"
- "Sell Administrators within the schools on the program. This would probably have to take place through the U.S. Department of Education"

Other:

- "In retrospect there is much more information/requirements in Level I than would have been, had we known that 3 levels would be developed at the very beginning, i.e. Level I is heavy and Level III is very sparse"
- "Can you get information from this school on GTAW processes with the material of nickel, copper, magnesium and titanium? What do they think of this? Can they get it or will they have to pay for it from the industry? Will or can they use GMAW-P?"
- "I have worked with many groups, but none quite so diverse. The idea sharing and cooperation was impressive"

Non-respondents = 0	Non-respondents as % of total forms = 0.00

AWS Survey for Level II and III Welders Skills & Certification - Employers August 30, 1996 Page 2

Positive Comments:

- I think it's a great idea to make a standard for welders and wish you every success in your endeavors.
- I believe that these standards are definitely needed and will help a large portion of industry. Although I am not sure about the length of time that this will take to happen (to filter down to the manufacturer level).
- Questions 1, 5, 6, 7 and 13 have value; the rest are left to opinion and conjecture without basis.
- I feel that this is really a good program.
- I believe a standardized test will help me become a better welder by giving me a guideline of my skills. A test for certification would let me know what my strengths are and what I need to study to improve my weaknesses.
- Any benchmark to determine the skill and training of a welder is a benefit.
- Welding is an art—technical skills are one of the major aspects.
- Industry and technology have progressed to the level whereby there must be a standard or specification to evaluate performance.
- The AWS, the city county of Los Angeles and most employers all have the
 requirement to certify. This is good. But, if a welder could be certified under one
 code and be certified for other employers, the boilermakers have "comon arc" that
 the employers sign so if you certify with one, that has signed with "comon arc", you
 are certified with the other companies that signed with "comon arc." Thank you for
 your time.
- This endeavor by the AWS was long in coming, but it will benefit all in the welding trade as to getting the many individuals who make a living at this trade, the recognition they deserve. "Welding Holds our World Together."
- You are headed in the right direction! Keep going and good luck!
- A "benchmark" for employers and the insurance industry are the most positive
 results of these advancements. In the next five years, the influx of non-skilled
 welders and those welders that have been in the industry need these advancements
 to show their competency and knowledge that sets them apart from the lesser skilled
 welders.
- I sure would like the results of this survey. We have been trying to set up a welder
 qualification system where I work for a couple of years now and have not been too
 successful yet.
- I am a CWI and CWE—the AWS standards and codes are my guidelines. I think AWS is doing great in making companies more aware of the importance of codes and standards in welding. Codes are really starting to be enforced in my area. Being a certified welder also, I see the importance of AWS, the companies and contractors in our area, through codes and standards, are realizing you can't take anybody off the street and in a week or so claim he or she is a welder.
- I agree in context for this effort. However, I do feel many employers will be reluctant to support such a program. It needs to be pushed aggressively in the schools to where the next generation of welders will be setting the standard.
- These certifications will help to raise the level of recognition toward welders in the construction field.

both this and the common arc program are great for ASME accredited, Union shops
that hire out of the hall, but so far our company has not been able to utilize the
benefits of the AWS programs. Granted, we are a small contractor (approx. 20
employees and 5 certified welders), but would like to use the AWS and its programs
to our benefit. Please contact me if there is any guidance to be offered.

Suggestions:

- The only problem I see in trying to accomplish a work like this is that with every company, there is so much difference in welding processes used. It makes it very hard to make a common standard that all could use.
- Offer an overview or consolidated outline of the results of your survey or program along with a questionnaire such as this one to get a true consensus or opinion from your sampling. These questions are being answered blindly.
- Teaching of logical thinking—problem solving and communication techniques would also benefit both employer and employee.
- Your efforts are appreciated by the manufacturing industry; continue on.
- We as a society, have to convince our educational institutions that the world will
 always require people who are proud of what they do for a living, and provide these
 individuals with the knowledge required by all our national industries to maintain
 our country as a world leader.
- Welding certifications should be retested on a yearly basis to maintain quality control. Because AWS can now maintain these records for welders and should be the testing facilities for the industry!
- That employers be notified of available certification programs.

AWS Survey for Level II and III Welders Skills & Certification- Educators August 30, 1996

Page 2

Positive Comments:

- None, well written.
- My feeling is this can be a great asset to our programs.
- Industry and education need this connection for proof of training from education to industry. I have not received Level III, would like to.
- As a welder with 35 years in the trade and 6 years as an instructor, we feel that this program is long overdue! The AWS Syracuse, NY section is working very hard to implement the entry level welder program in the area schools. My problem is my school has accepted the standards, but will not allow us the time to do it. Re: 910 hours per course vs AWS standards are 1300 hours.
- This is a very worthwhile program. It should be used throughout the U.S. by both schools and industry.
- The state of Idaho Welding Instructors, both secondary and post-secondary have just adopted the Level I as official state curriculum. This will help in articulation of high schools and college programs, plus it will allow for a uniform number system which will allow for transfer within the state. Perhaps we could do this on a national level?
- We are currently using the entry level standards and curriculum guide and when used with Hobarts programmed audio visual training system, we believe it to be the best instructional package available. I have reviewed the standards and curriculum guide for Level II and III welders. I find them to be of the same excellent quality as the entry level program. Unfortunately, being a secondary school with time limitations we will probably not reach this level.
- Gives a standard to teach to plus skill and written tests.
- It's about time education and industry work towards a common goal! It is 1996, and we are part of a world market!
- A real plus for training institutions, with the cooperation with industry.
- We are on the entry level I program and we love it. Level II and III should be used at the post secondary programs but we can't get them to use it.
- A review period of 5 years minimum will insure coverage for technical advances. I believe that basic process mastery is still the key to preparing students.

Suggestions:

- Who will employ Level II and III welders above \$15/hr? No one. Who will employ them at \$12/hr? No one. The standards and qualifications are for Certified Welding Inspectors or Engineers, not welders that I see everyday. The type of employer I deal with wants a qualified welder, not a CWI and will not pay the hourly rate graduates of Level II or III might expect.
- As of September 17, 1996, no information has been received. Only this survey. AWS never sent kit to me. If received after September 17, not enough time to review.
- Keep purchase price as low as possible, because budgets are not what they should
- Add some form of oxygen-fuel welding maybe in the Level I.
- We need people who can go to the top and suggest to the proper people the benefits and sell the plan. Money, money, money is the bottom line.

- A vocational welding instructor is certified by the State Dept of Ed in the state that he teaches. The AWS should take that into consideration and give him credit (in other words, give him accreditation for that).
- This is my first year for using AWS Welder I. I teach in an area center and only have students 3 hours per day for two years—this means that a student that attends class every day will only get about 1000 hours of instruction. I don't know if I can get everything finished with high school students in this amount of time.
- Being an instructor at the community college level, we are still having problems
 with education requiring higher math skills than are actually needed for entry level
 as outlined in the AWS curriculum. I would love to elaborate if you are interested!
- Keep up the good work!
- A vehicle that would allow educational institutions an easier path to performing AWS certified testing.

American Welding Society

EDUCATING TO WORLD CLASS STANDARDS

The Case for National Skills Standards

To help address the skills gap situation, the U.S. Departments of Labor and Education funded 22 national skills standards. The goal is the development and establishment of national, voluntary industry-based standards for a number of occupations that currently employ over 40% of the U.S. work force.

Most experts agree that national standards without accompanying credentials will have little influence with industry and education. Such credentials would act as existing standards that define the level of knowledge and skills individuals

are expected to achieve by the time they complete an educational program.
Credentials also serve as informal entrance standards for individuals before they enter employment or training.

Diane Ravitch,

chief architect of

national education standards in the Bush administration, remains an advocate of the idea. "Americans...expect strict standards to govern construction of buildings, bridges, highways, and tunnels; shoddy work would put lives at risk...They expect stringent standards to protect their drinking water, the food they eat, and the air they

breathe...
Standards are
created because
they improve the
quality of life.

Ravitch recognizes that education is different from bridges and water. She notes that when George Bush, Bill Clinton and other political leaders established the first set of national goals for education in 1989 and 1990, "they did not realize that educators were divided about what competency is and how it should be demonstrated, about which subjects should be taught to which students, and about the value of challenging students with higher standards." understood these things only too well, she insisted that standards were needed. She still thinks so even though she is dissatisfied with some of the standards that have begun to Standards appear. can improve achievement, she believes, "by clearly defining what is to be taught and what kind of performance is expected." To those who fear that the standards movement mav contribute to inequality, she contends that an "essential purpose of standards is to ensure that students in all schools have access to equally challenging programs and courses of study."

Because Ravitch

The Competitiveness Policy Council in its Report of the Education Subcouncil, March 1994, states:

"Our Subcouncil was particularly impressed, and troubled, by how unsystematic and directionless our education system is and by how basic issues of teaching and learning have been neglected in this nation. We believe the key to turning this around consists of the following strategy: Adopt clear and high standards for what students should know and be able to do as a result of their schooling; develop the capacity of schools to teach to high standards and the capacity of youngsters to achieve results."

Report on National Vocational Education

This long awaited federal report recommends classes that are rigorous, based on high industryoriented skills standards, assessed by reliable methods, and that lead to portable credentials.

Welding has been selected as a field suitable for skills standardization. After analysis by the General Accounting Office (GAO) welding, as an occupation, met all the following criteria:

- high employment or growth
- has a national credential
- is industry driven

- growth in certification seekers
- has individual certification options

Welding is one of the 22

FINANCIA

There are over 95,000 standards in the U.S., but only 22 national skills standards.

The American Welding Society was awarded a grant from the Department of Education to prepare national skills standards for welders.

Welders are important because they permanently join metals in an efficient and economic way. They make almost everything we use in our daily life, from coffee pots to nuclear reactors. The impact of welding cannot be fully measured. There is no way to determine the value of weldments produced, but experts estimate that up to 50% of the GNP of the United States is produced by welding.

There are many factors that will require more and better trained welders. New higher strength materials are being introduced that require special welding procedures. New codes and specifications are being adopted that require higher quality welds. There is also the new concept in manufacturing that requires welds to be of the highest quality. New government regulations and personal safety requirements dictate stricter codes and more products require certified and qualified welders to weld them.

It Just Makes SENSE

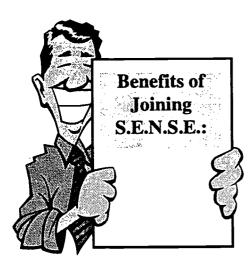

According to AWS Director of Education Bob Reeve, for schools looking to increase the hiring rate of their students, it makes sense to consider adopting a national skills standard. "The emphasis is on education that produces employable graduates. By employable I mean a student who has shown a certain level of competency in the right skills," offers Reeves. "AWS has produced one of the first truly national skills standards in EG2.0-95, Guide for the Training and Qualification of Welding Personnel: Entry Level Welder. Now we have the next step; the Level II-Advanced Welder."

The Level II-Advanced Welder standard Reeve referenced was developed from input provided by industry, educators, and government under the strict ANSI rules that ensure a consensus document. It's formally called EG3.0-96, Guide for the Training and Qualification of Welding Personnel: Level II-Advanced Welder.

To encourage adoption of the standards, which ultimately will have three levels, AWS has organized Schools Excelling through National Standards Education - S.E.N.S.E. At present, this innovative program offers the Entry Level Welder skills standard Level II-Advanced Welder skills standard, the level II advanced welder standard, complete curriculums, enrollment of participating organizations in the AWS National Registry, a complete welding educator's library, and Institutional Membership in the American Welding Society itself.

Schools that are willing to commit to the provisions of the program's Quality Assurance Manual are eligible to join S.E.N.S.E. With a one-time fee and registration, or an upgrade to pursue the higher levels, S.E.N.S.E. participating organizations are entitled to select three professionals for individual AWS memberships, begin receiving the industry recognized AWS Connection Newsletter, and are provided a handsome membership certificate.

On a per fee basis, AWS provides final exams and grading for students attending S.E.N.S.E. participating organizations. Students passing final exams receive the Entry Level Welder and/or Level II-Advanced Welder Certificates and are enrolled in the AWS National Registry for one year. They may also test to become AWS Certified Welders at an AWS Accredited Test Facility. Most educators agree that a portable certificate attesting to a skill level is essential.

Level I

- QC10-95 Qualification & Certification Standard
- EG2.0-95 Curriculum Guide
- Quality Assurance Manual
- National Registry as Level I Participating Organization
- AWS Educational Institution Membership Application
- First Part of Welding Educator's Library
- Students AWS Certified Entry Level Welder
- Level I Final Examinations (3 sets)

Cost:

\$500 Level I.

- National Registry as Level II. Participating Organization
- Second Part of Welding Educator's Library
- Students AWS Certified Level II Advanced Welders
- Level II Final Examination

Cost:

\$600 Level I and Level II \$100 Upgrade from Level I

American Welding Society

The American Welding Society, founded in 1919, is a multifaceted, nonprofit organization whose major goal is advancing the science, technology and application of welding and related joining disciplines. From factory floor to high-rise construction, from military weaponry to home products, AWS has led the way in supporting welding education and technology development to ensure a strong, competitive and comfortable way of life for America and its people.

If this special Skills Standard Package does not contain all of the following, please call toll free (800) 443-WELD, Ext. 229.

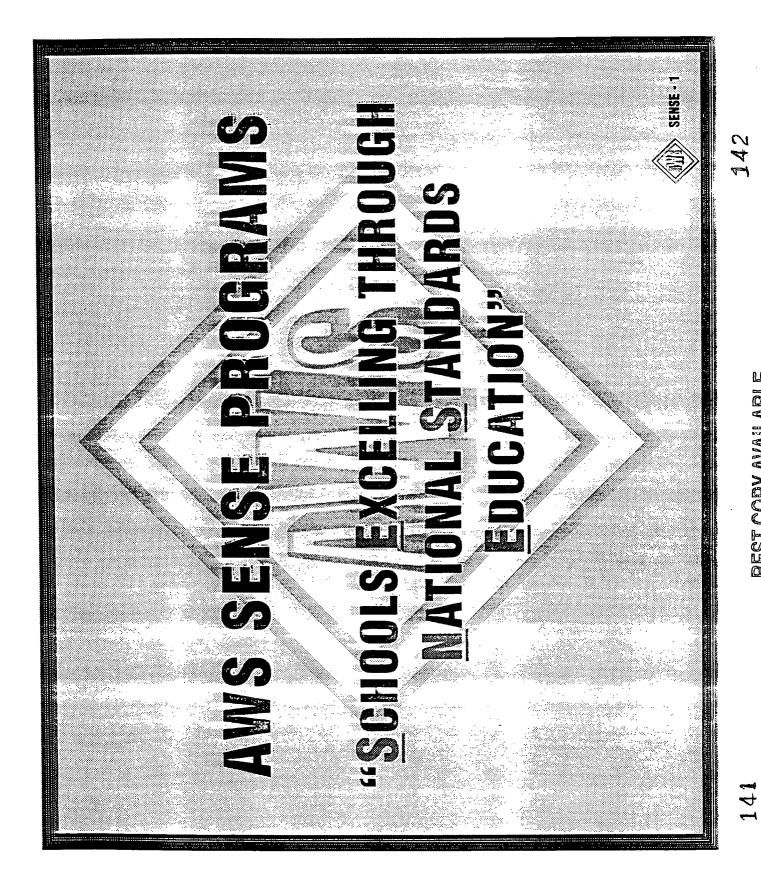

- 1. AWS QC11-96, Specification for Qualification and Certification for Level II Advanced Welders
- 2. AWS EG3.0-96, Guide for the Training and Qualification of Welding Personnel Level II Advanced Welder
- 3. AWS Report on Fulfilling National Skills Standards for the U.S. Department of Education
- 4. Catalog: AWS publications for Welding Educator's Library
- 5. Application: Schools Excelling through National Standards Education
- 6. Brochure and Application: AWS Educational Institution Membership
