## ABSTRACT

This 1996 update to "Connecticut's Children: Still at Risk" is the third annual report examining how children in the state are faring. The title of the report indicates that Connecticut's children are at tremendous risk of failing to become productive adults, and policy decisions in the past year give rise to concern that the situation will be exacerbated. As an update, the report does not repeat much of the general information from 1994's comprehensive look; instead, the update focuses on 14 measures of child well-being and two demographic measures, including poverty, family setting, birthweight, infant mortality, dropouts, child and teen deaths, child abuse referrals, and juvenile violent crime arrests. Each indicator is first presented as a separate table, comparing different cities and regions of the state. Regions with rates worse than the state-wide rate are highlighted. Indexes to the towns and regions, and a map of these regions, are included at the beginning of the section. The same information is then presented again, organized by region instead of by indicator. Where possible, the rate for the region is shown as a percentage better or worse than the state-wide rate. An explanation of terms and methodology used in both sections appears at the back of the report. (EV)

The Connecticut Association for Human Services (CAHS) is an independent nonprofit, research, public education and policy development organization committed to promoting the health and well-being of our state's residents — young and old alike. CAHS serves as a catalyst, working with diverse constituencies throughout the state to ensure the provision of human services that are of the highest quality, responsive to people's needs and cost-effective.

Founded in 1910 as the Conference on Charities and Corrections, the Association was reorganized in 1974 as CAHS. Our membership includes concerned citizens, religious leaders, corporations, labor leaders, human services professionals and organizations, educators, and policymakers. We welcome your membership and support.

Permission to copy, disseminate, or otherwise use information from this book is granted as long as *Connecticut's Children: Still At Risk, 1996 Update*, Connecticut Association for Human Services is credited.

*This book is dedicated to children everywhere —*

*To their parents, who are working so hard to raise them —*

*And to all of those people who have made it their life's work to help others.*

# Acknowledgments

First and foremost, I would like to thank the Annie E. Casey Foundation for the multi-year commitment it has made to supporting the development of this book and our entire KIDS 2000 initiative. In particular, thanks go to Doug Nelson, for his leadership, Betty King for her insight, and Jennifer Baratz and Bill O'Hare for their dedication to the KIDS COUNT mission.

Many people within the Connecticut Departments of Children and Families, Education, Public Health, Public Safety, and Social Services were incredibly helpful in their provision of data and technical advice. Special thanks go to them as well.

This book would not have been possible without the professional guidance and personal support of the staff at CAHS. They are the best group of people with whom one could ever hope to work. Their sense of humor, the depth of their caring for each other, and their commitment to making the world a better place is inspiring. Each of them has earned my undying admiration and gratitude. Extra special thanks go to Susan McClain who meticulously prepared the layout for the entire book.

On a personal note, Michael Doucette Cunningham, as my partner in all things, contributed greatly to this book through his patient support and good humor. Thank you for everything.

# Overview of Contents

The data part of this book is divided into two sections:

The **Child Well-Being Indicators** section is made up of 14 important indicators of the well-being of children and two demographic measures. Each indicator is a separate table, comparing different cities and regions of the state. Regions with rates worse than the statewide rate are highlighted. Indexes to the towns and regions, and a map of these regions, are included at the beginning of this section.

In the **Regional Indicators** section the same child well-being information is presented, but is organized by region instead of by indicator. Where possible, the rate for the region is shown as a percentage better or worse than the statewide rate. This section allows readers to see, at a glance, how well children are faring in their region of the state.

An explanation of the terms and methodology used in both sections appears at the back of the book.

# Introduction

The 1996 update to *Connecticut's Children: Still At Risk* is the third annual report in a series documenting how well children in our state are doing. In the first two years, there hasn't been a lot of good news in the answer. During the past year, there is wide concern that the policy directions in which government is heading are going to make the lives of children much worse.

Over the past year, we seem to have lost sight of an old axiom: we should take care of the present while investing in the future. Instead, we seem to be taking for granted that we can trash the present to build a future. I'm afraid that we are cutting apart the safety nets for children by failing to invest adequately in income support, housing, health care, child development, and education, and closing our eyes to those children who fall through the gaping holes we've left behind.

A fact of life in Connecticut is that many children live in poverty. Two-thirds of the households living in poverty include children, and the poverty "benefits" that are offered by government are provided for the benefit of these children.

Another fact of Connecticut life is that children living in poverty are often beset by acute and chronic health conditions that are bred by the poverty of their surroundings. These children need the support of more than just family to survive. For example, childhood asthma and lead contamination are two conditions more often seen in children who grow up in poverty than in children who are affluent. They are environmental health conditions that have nothing to do with how well they are being raised.

Still another fact of life in Connecticut is that poor children are more often victims of neighborhood violence, and that the constant bombardment of violence in the neighborhood breeds fear, anxiety, emotional and mental health problems as well. By failing to adopt strategies that protect children from this abuse, we pay as a society to treat the effects.

These facts of life are compounded by others: Connecticut's welfare reforms are not stimulating an improved economy, which in turn is not providing adequate jobs with good child care opportunities in either our urban or rural areas.

We may not like these facts of life, but they are the realities of children's lives in our state. When we hide from reality, it doesn't disappear — we just lose our opportunity to influence it.

When we face reality, on the other hand, we can change what we don't like about it. *Connecticut's Children: Still At Risk* and the *KIDS 2000* initiative of the *Connecticut Association for Human Services* is one of the efforts we are making to help those who want to face reality. It is not intended to paint an overly discouraging (or overly optimistic) picture of children's lives in Connecticut;

instead, it is intended to paint a realistic portrait of the kinds of challenges that soon will confront us all. We could choose to ignore the picture, but we prefer to challenge our readers to join with us in painting a new picture with brighter colors in the future.

Through welfare reform, federal and state governments have targeted children as a way of getting back at their parents. The ambition of radical reformers seems to be that if they squeeze children's benefits — through reductions in cash assistance, medical benefits, food benefits, day care benefits, and the like — then parents will be forced to step in and provide greater support to their children.

However, it doesn't happen that way. The effects of these radical changes in our human services infrastructure create more dependency; not less. They make it harder for children to succeed; not easier. They may initially push people to private charities, but the private charities will not have the capacity to fill the whole void. Ironically, the charities, businesses, neighborhoods, and communities affected will be forced to come back to the state to demand relief, and these effects will be felt in a real way by the very policymakers whose ambition was to shift the state's burden to individuals. Meanwhile, dependency and poverty — the twin enemies of children — grow. As illustrations, consider how the relatively conservative federal reforms of the early 1980s led to a dramatic increase in the demand for state appropriations for homeless shelters and soup kitchens, and consider how the precipitous state deinstitutionalization of mental health patients without establishing community supports in the 1970s led to a demand for millions of tax dollars to create community mental health services that to this day — a generation later — are still not fully in place.

As we all document the effects of welfare reform over time, we will attempt to call attention both to the effects of welfare reductions on children and their families, and to some of the consequences for future policy makers. The point, however, is simple. States that try to shift all public burdens to private charity shred the safety net; those who mortgage their children's future do not do so without cost.

*Connecticut's Children: Still At Risk* should rally us to respond today — to work together to insist that the people who represent us and our children, and who have responsibility for all our futures, do their jobs well.

But we must not fail to do ours, too. Where we can make a difference, we must. Our future depends on it.

Paul Gionfriddo  
Executive Director  
May 1996

# Our Vision for Connecticut's Children

Every child should have the opportunity to develop to his or her full potential. In order for this opportunity to be guaranteed to every child, the following broad goals must be met:

## **Economic Security**

Ensure that all children grow up in economically stable families and have the opportunity to learn the necessary skills for earning a living wage.

## **Health Care Access**

Provide affordable and timely health care so that all children are born healthy and grow up with quality medical care. This should include adequate nutrition, as well as health education and recreation programs to develop healthful lifestyles.

## **Excellence in Education**

Guarantee that children have the care and support they need to enter school ready to learn, and that they receive a quality, comprehensive education that ensures their ability to develop into young adults who are literate, skilled, knowledgeable, and socially responsible.

## **Emotional Well-Being**

Ensure that all children live in a safe home and neighborhood with stable, nurturing families who are knowledgeable about parenting and child development.

# Underlying Principles

In order to achieve this vision for Connecticut's children, every segment of society will have to do their part. We believe that:

**Families are the primary caregivers for children.** Families have the first responsibility for the physical and emotional well-being of children. Families, as first teachers, provide the most basic education for children, from early verbal language skills to values and ethics. But despite their best efforts, it is hard for some families to raise their children without help — particularly when a dramatic reshaping of our economy has changed the rules of the game for many parents. Given these new economic and social realities, some families will require more assistance than others.

**Communities are also responsible for the children in their midst.** Some entities within the community, such as schools, have clearly defined roles. Others, including churches and civic organizations, have a responsibility to help children directly and raise the consciousness of the whole community about children's needs. Of late, some employers and businesses have begun to consider children and family issues as they explore current and future workforce concerns.

**Government's responsibility for children is to be the bootstrap that guarantees equality of opportunity.** Recognizing that not all families and communities will be equally well equipped to provide for children, government at all levels (local state and federal) must help to balance the scales. The evidence is clear: investing in government programs that work for children can assure them all a fair start in life.

**Children must be given the opportunity to experience the richness of economic and ethnic diversity in their neighborhoods and in their schools.** Through government policies on housing and innovative efforts to promote school integration, we must begin to break down the barriers that separate children along ethnic, racial and economic lines.

# Children Receiving AFDC Benefits

There are few local measures of child poverty other than the national census conducted every ten years. The number of children who receive Aid to Families with Dependent Children (AFDC) benefits is the best measure available in Connecticut to supplement the poverty data from the 1990 census.

From the census we know that in Connecticut, children are almost twice as likely to be poor as adults and that Hartford has the sixth highest child poverty rate in the nation. Over the past 20 years, Connecticut has seen its children get poorer, while the income of its elderly has grown. We know that our youngest children are more likely to live in poverty than older children. We know that children living with only their mother are sixteen times more likely to be poor than those living with two parents.

Although Connecticut is considered to be a wealthy state, there are children in every town living below a subsistence level. Poverty in childhood places children at risk for many other problems, including poor mental and physical health, school failure, teenage childbearing, child abuse and neglect, crime, and delinquency. The data throughout this book is testament to the link between growing up in poverty and experiencing the other problems examined here, such as infant mortality, child deaths, teen violence and teen pregnancy. *Every year* we tolerate the current child poverty level will cost the nation an estimated \$36 billion to \$177 billion in reduced future worker productivity and employment according to the Children's Defense Fund.

On average, one in seven children in Connecticut relied on AFDC in 1994-95. These children were disproportionately concentrated in Connecticut's four largest cities — more than half of the AFDC caseload (53%) live in Hartford, New Haven, Bridgeport or Waterbury. The effects of the continuing recession can be seen in the rising number of children receiving AFDC benefits, which has increased 8.2 percent statewide from 1992 to 1995.

The more than 110,000 children supported by AFDC in Connecticut are living far below the poverty level. The average family of three on AFDC receives a basic grant of \$543 per month which is only half the federal poverty level of \$1,082 per month for family of three. Approximately one third of families receiving AFDC also get housing assistance, but even with food stamps and housing assistance, a family on public support is still living below the official poverty level.

Note: The numbers shown here are the total number of children receiving benefits on June 30th of that year. It is a snapshot in time and does not represent the total number of children who received benefits at any time during that year. The annual average number is calculated by adding the number of children receiving benefits on June 30th of each year, and dividing by two. The annual average rate is calculated by dividing the annual average number by the total number of children in that region. The number of children used to calculate the rates is based on applying the percentage of population under 18 for each region from the 1990 Census to the Connecticut Department of Health estimate of population by town for the years 1992 and 1994. The estimate of the costs of child poverty is based upon a direct estimate of the total impact of childhood poverty on future annual earnings including effects on work hours and unemployment and effects related to quality of schooling, poor health and other factors.

# Low Birthweight

In 1993, 6.9% of all babies born in Connecticut had a low birthweight (under 2,500 grams, about 5 1/2 pounds). This translates to 3,191 of the almost 47,000 babies born that year. During the last part of the 1980s, there was a steady worsening of this rate. After some improvement in 1990, the rate worsened again in 1991 and has held steady through 1993.

Low birthweight is a measure of the immediate risk to a newborn; low birthweight babies account for about 60% of all infant deaths. It is also a measure of future risks to the child; low birthweight babies who survive are about three times more likely to experience serious health and developmental problems, such as sight and hearing deficiencies, chronic respiratory problems and learning difficulties. These children may require special medical and educational services throughout their lives.

Although researchers do not know all the factors that cause low birthweight, the health of the mother and the care she receives when pregnant are the two most important factors for a healthy baby. Smoking, inadequate nutrition, alcohol or other drug use, and stress during pregnancy all increase the likelihood that a mother will have a low birthweight baby. Similarly, mothers who receive late or infrequent prenatal care are also much more likely to have a low birthweight baby.

In our state, black babies are more than twice as likely to be born at a low birthweight (12.5%) as white babies (5.5%), although the rate for black babies is improving. Hispanic babies also have a higher percentage of low birthweights (8.8%) than non-Hispanics (6.5%).

Note: The rates are calculated by dividing the number of low birthweight births by the total number of births in that region, then multiplying that by 1,000 to obtain a low birthweight rate per 1,000 births.

# Infant Mortality

The infant mortality rate compares the number of children who die before their first birthday with the number of live births. In 1993, the infant mortality rate was 7.1 per 1,000 live births (or 0.71%).

This continues a steady but slow decline from 1983, when the rate was 10 per 1,000 births. State officials attribute this increase to improvements in expensive medical technologies used to keep premature and low birthweight babies alive, as well as to improvements in access to preventive health care for infants and prenatal care for women of child-bearing age.

However, this progress has not been even across the state. When compared to five years ago, 22 of the 27 regions showed an improvement in infant mortality rates, but five regions became worse. The Central I region had the largest improvement during this time period, with a 52% decrease in rates.

Note: The annual average infant deaths shown here is the total number of babies who die before their first birthday over a three year period, divided by three. The annual average rate is the total number of infant deaths over three years, divided by the total number of live births over the same three years, then multiplied by 1,000 to obtain an infant mortality rate per 1,000 live births.

## Late or No Prenatal Care

One of every eight babies born in our state (12.5%) in 1993 were born to mothers who received late or no prenatal care (care beginning after the first three months, or trimester, of pregnancy). Yet early prenatal care is a cost-effective means to reduce problems later in life which are associated with early birth and health problems. The Institute of Medicine estimates that for every \$1 invested in prenatal care, \$3.38 will be saved in expenditures for the care of low birthweight babies in their first year of life.

The good news is that the percentage of babies receiving prenatal care is increasing. In 1989, one in six babies got late or no prenatal care, but in 1993, the rate had improved to one of every eight.

The babies of women who receive early prenatal care have lower risks of low birthweight, infant illness, and infant mortality. Women who do not receive routine care are approximately three times as likely to deliver low birthweight infants as those who do. The positive effects of early care are greatest for those women who are at the highest risk of poor birth outcomes: black women, women of Hispanic origin, poor women, very young women, and poorly educated women. Unfortunately, these women are also the least likely to receive that care. Barriers to seeking prenatal care include a lack of knowledge about the importance of care and a lack of health care insurance and access.

Note: The annual average number shown here is the total number of births with late or no prenatal care over a two year period, divided by two. The annual average rate is the total number of births with late or no prenatal care over two years, divided by the total number of births where the status of prenatal care has been determined.

## Births with Late or No Prenatal Care — 1989-90, 1992-93

## Births to Teenage Mothers

There are three important ways to look at teen pregnancy. One is to look at the absolute number of teen births. Another is to compare this number to the total number of births to mothers of all ages in that year — this would tell us something about the risks to that generation of babies. The third way to look at teen pregnancy is to compare the number of teen births to the number of teenage girls, the “teen birth rate” — this would tell us something about the sexual activity and risk of teen pregnancy among teenage girls.

The table on the right displays the first two of these measures, which focuses on the risk to our youngest generation. Research indicates that children of teen mothers are more likely to grow up poor, relying on public assistance. They are also at greater risk of lower intellectual and academic achievement, behavior problems, and early childbearing than are children of older mothers. Both the rate and the number of all births to teenage mothers have decreased over the past ten years, which shows some improvement for the generation of children being born today.

Children are more likely to be born to teen mothers in urban and poor rural areas in Connecticut. The percentage of all births that are to teen moms is also racially disproportionate, with 23% of all Hispanic births being to teenage mothers, 18% of all black births, and 4% of all white births.

The teen birth rate, that is the number of teen births compared to the number of teenage girls, is no longer increasing in Connecticut or the United States. Nevertheless, with 39 births for every 1,000 girls and a large increase in the number of teenagers over the next ten years, we can expect an increase in the total number of births to teen mothers in Connecticut in the near future.

The teen birth rate is a function of teens' capacity and motivation to prevent pregnancy. If girls believe they have alternative life options such as college or a career, they are much more likely to delay parenthood. Thus, being poor and without these hopes increases the likelihood of teen pregnancy. Teens who exhibit problem behavior in school are more likely to end up teen mothers; girls whose friends and siblings are already mothers are also more likely to become teenage mothers.

Note: The number of teen births shown here is the total number of babies born to mothers age 19 or younger. The rate is the total number of teen births divided by the total number of births, then multiplied by 100 to get a percentage. The percentage shown here measures the risks to the generation of babies being born today. The teen birth rate, which compares the number of teen births to the number of teenage girls, is not available at a local level. This is because of a lack of reliable data for the number of teenage girls to use as a denominator and estimates could not be made because of the narrow age range.

# Child Deaths

There are approximately 138 deaths each year to children ages 1-14. For every death, there are 41 hospitalizations. The majority of deaths to children between the ages of one and fourteen are due to injuries, most of them unintentional.

The primary causes are different for injury deaths and hospitalizations and vary by the age of the child. For children ages 1-4, pedestrian injuries (21%), burns (20%), and drowning (18%) account for most of the injury deaths, yet falls (30%), poisoning (27%), and burns (10%) account for most of the hospitalizations.

The three leading causes of injury deaths for children ages 5-9 are pedestrian injuries (27%), drowning (17%), and motor vehicle occupant injuries (10%), while falls (37%), bicycle injuries (14%), and pedestrian injuries (11%) account for the majority of hospitalizations.

For children ages 10-14, pedestrian injuries (16%), homicide (12%), and motor vehicle occupant injuries (11%) account for most of the injury deaths. Falls (26%), bicycle-related injuries (14%), and being struck by an object (12%) account for most of the hospitalizations for this preteen age group.

Note: The annual average number of child deaths shown here is the total number of deaths to children ages 1 to 14 over a three year period, divided by three. The annual average rate is the total number of child deaths over three years, divided by the total number of children ages 1-14 in 1992, then multiplied by 100,000 to get a rate per 100,000 children in that age group. The number of children used to calculate the rates is based on applying the percentage of population ages 1-14 for each region from the 1990 Census to the Connecticut Department of Health estimate of population by town for 1992.

## Connecticut Mastery Test Results - Above Goal

Connecticut tests students on their reading, writing, and mathematical skills in the 4th, 6th and 8th grades using the Connecticut Mastery Tests. One standard set by the State Department of Education to evaluate students' performance on these tests is the state goal; this is the level that ideally every student at that grade level is expected to achieve.

In the 1995-96 school year, 24% of Connecticut's sixth graders met the state goal on all three subject tests. This signifies that only a quarter of our sixth graders are learning everything expected of them.

Performance on these tests varies tremendously by region, and differences between poor and wealthy areas of our state continue. In Connecticut's four poorest cities, fewer than one in twenty students (5% or lower) met the state goal on all three tests. In twelve of the twenty-seven regions, the percentage of students meeting the state goal worsened in the past year.

Note: The Connecticut Mastery Test data shown here is displayed differently than in the *1995 Data Update* because additional data allows for a comparison to the previous year's scores for each measure. Therefore, the two Connecticut Mastery Test measures are shown on two separate tables.

## Connecticut Mastery Test Results - Below Remedial

The State Department of Education has set a minimum standard for Connecticut students' reading, writing, and mathematical skills for the 4th, 6th and 8th grades, similar to the table on the previous page. This lower-level measure is the remedial standard; a student performing below this level receives further diagnosis to determine if extra help is needed.

In the 1995-96 school year, 35% of Connecticut's sixth graders are below the remedial standard in one or more areas. This indicates that two-thirds of students are failing to learn the basics which are expected for their age group.

The differences between poor and wealthy areas of our state is particularly striking when looking at remedial education needs. In Connecticut's four poorest cities, more than two-thirds of sixth graders (65.7% or higher) are below remedial standards on at least one test, more than three times the rate of the wealthiest regions. Only eleven of the twenty-seven regions showed an improvement in this measure during the past year.

Note: The Connecticut Mastery Test data shown here is displayed differently than in the *1995 Data Update* because additional data allows for a comparison to the previous year's scores for each measure. Therefore, the two Connecticut Mastery Test measures are shown on two separate tables.

# High School Dropouts

Each year, one in every 20 students (4.9%) in Connecticut drops out of high school. Four cities have dropout rates that are almost twice as high as the state average — Bridgeport (9.3%), Waterbury (10.7%), New Haven (8.4%), and Hartford (15.2%).

The dropout rate worsened during the past two years, as shown on the table to the right. Fifteen of the twenty-seven regions also showed no improvement during this time.

Applying the state drop out rate for each grade level to a hypothetical class of 100 students entering ninth grade, only 82 would graduate from high school in a typical Connecticut town. In Hartford, only 52 would graduate.

Minorities are more likely to drop out of high school. One out of every twelve black students (8.8%) and one in eight Hispanic students (12.9%) dropped out of high school in the 1993-94 school year, compared to one in twenty white students (3.2%).

Similarly, boys are more likely to drop out than girls, 5.4% compared to 4.3% respectively. Combining these two factors shows tremendous differences between groups. For example, black young men had a 10.4% high school dropout rate, compared to white young women with a 2.9% rate.

The consequences of dropping out of high school can be severe. For example, compared to families headed by individuals who are high school graduates but have no further education, families headed by high school dropouts are twice as likely to have incomes below the federal poverty level.

Note: Dropout rates used here are only for high school students. They do not include the number of children who drop out of school before ninth grade. The calculation of dropouts of a typical class in Hartford paints an optimistic picture of the dropout problem in Hartford because it does not take into account the high dropout rate for students in grades 7 and 8. The dropout figures calculated by the State Department of Education include students who officially withdraw from school, those who enter a non-educational program (e.g. truck driving school or GED classes), and those whose status is unknown. Students transferring to another school are not counted as dropouts. These figures do not include the one percent of students who are enrolled in ungraded classes.

# Juvenile Violent Crime

Arrests of children under 18 make up more than one in five arrests for violent crimes in Connecticut. More than 80% of those arrested are boys. However, only a relatively small percentage of youths are violent. Less than one half of one percent of juveniles in the U.S. were arrested for a violent offense in 1992.

Juvenile crime is somewhat different than adult crime. Violent crimes committed by juveniles peak at the close of the school day and decline throughout the evening hours. In contrast, violent crimes committed by adults increases steadily from early morning through midnight. Similarly, juveniles are more likely to commit crimes in groups than are adults.

Most homicides committed by youth are committed with a firearm, occur during an argument, and occur among people who know each other. Although teenage boys have always had fights, the consequences of the violence have become more extreme. Guns turn what might have been a fist fight thirty years ago into a homicide today. In 1994, 873 arrests of people under the age of 18 were made in Connecticut on weapons charges, mostly guns. This represents a decrease of 94 arrests compared with the year before.

Overall, children are disproportionately the victims of violent crime. Other youth are the most likely victims of crimes committed by young people; juvenile offenders account for nearly half of violent crimes against youth. In contrast, juveniles are seldom the offender in crimes against older victims. The National Victimization Study shows that teenagers are more than twice as likely to be victims of all forms of crime than people age 20 or older, and more than three times as likely to be victims of violent crime than adults. Yet the vast majority of juvenile victimization is hidden from public view because only 20% of the crimes are reported to police.

Even children who are not direct victims of crime are still profoundly affected by it. Exposure to violence affects children's emotional stability, their ability to function in school, and their sense of hope about the future. A 1992 survey of sixth, eighth, and tenth grade students in New Haven found that over 40 percent had witnessed violence in the past year.

Note: Violent crimes include murder, rape, robbery and aggravated assault. Because of the large difference in the number of arrests each year, all three years' data are shown separately. The annual average number of arrests is a total for the two year period divided by two. The annual average rate is the annual average number divided by the number of children age 10-17, multiplied by 100,000 to get a rate per 100,000 children of this age group. The number of children used to calculate the rates is based on applying the percentage of population age 10-17 for each region from the 1990 Census to the Connecticut Department of Health estimate of population by town for the years 1992 and 1994. The number of arrests of children for violent crimes includes arrests made by local and state police. Unfortunately, the data is not reported identically for these agencies. Approximately 85% of all juvenile arrests for violent crimes are made by local police, and this data is reported by the town in which the arrest was made. The 15% of arrests made by the state police are reported by the town in which the child lives. State police arrests are important to include because many rural regions do not have municipal police departments, and the majority of the arrests in these regions are made by the state police. Therefore, one should exercise caution when using this data because the total number of juvenile arrests for each region includes data from these two sources. Despite these limitations, given the limited mobility of children ages 10-17, police experts believe that this data is still valid.

# Teen Deaths

The vast majority of teen deaths are caused by injury rather than disease. For teens age 15-19, injuries caused 72% of all deaths in 1993 (100 out of 138 deaths). In most regions of the state, these injuries are unintentional. They are mostly due to car crashes, the leading cause of death. This is not true, however, in Connecticut's three largest cities, where teen murder victims are more than twice as likely as deaths from unintentional injuries.

The risk of injury-related deaths increases with age — teens ages 15-19 are more likely to die of injuries than are children ages 1-14. Also, teen injury deaths are much more likely to be to teen boys than teen girls.

Homicide and suicide are the second and third single leading causes of death for 15 to 19 year olds in our state. In 1993, 34 teenagers were homicide victims, accounting for one-fourth of all deaths for this age group. Fourteen teens committed suicide in 1993.

Young males are more likely to be victims of homicide than females. Girls are more likely to attempt suicide than boys, but boys are more likely to be successful in their suicide attempts.

Guns play an increasing role in deaths of Connecticut children. Between 1988 and 1992, 219 youth under age 20 died of gunshot wounds. Of these, 68% were homicides, 25% were suicides, 13% were unintentional shootings, and 1% were of undetermined cause.

Note: Because of the small number of teen deaths in any given year, the chart shows only three-year total numbers of deaths by cause, not an annual average as in the other charts. For the same reason, rates could not be calculated by region.

# Child Abuse

Child abuse occurs in all socioeconomic groups and in all types of families. No town in Connecticut is left untouched. The number of children who are abused is considered to be substantially higher than the numbers which are reported to the authorities. In Connecticut, 3.7% of all children are found to be abused or neglected, yet officials estimate between 8% and 10% of all children may be seriously maltreated.

Child abuse has far ranging effects. The Department of Children and Families found that 60 to 75% of residents at Long Lane School, Connecticut's school for delinquent youths, have a history of being sexually abused.

People who are victims of child abuse or neglect are more likely than other adolescents or adults to get into trouble later in life. Being abused or neglected as a child increases the likelihood of arrest as a juvenile by 53%, as an adult by 38%, and for a violent crime by 38%. Research also suggests that the long-term consequences of childhood abuse includes poor educational performance, health problems, and low levels of achievement in adult life. Although most people who were abused as children do not grow up to abuse their own children, one characteristic that abusers have been found to share is a history of abuse in their own childhoods.

Although child abuse occurs in all racial, ethnic, cultural, and socioeconomic groups, physical abuse and neglect are more likely to occur among families living in poverty because of the additional stresses they face. Thus, because people from minority groups have higher rates of poverty, children from these groups enter the child protection system in disproportionately large numbers.

Note: The table to the right reflects different data than last year's child abuse information. This data shows the number of children who were confirmed as abused or neglected, meaning that their case was reported to DCF, investigated, and evidence of maltreatment found, although if a child were substantiated as abused twice in one year they have been counted twice. Even so, the number of children who are abused or neglected is higher than the numbers shown here — not every case of child abuse is reported, and sometimes those that are reported are not substantiated. The rate is the total number of children who have been abused between July 1, 1994 and June 30, 1995, divided by the total number of children ages 1-18 in 1994, then multiplied by 100 to get a percentage. The number of children used to calculate the rates is based on applying the percentage of population under 18 for each region from the 1990 Census to the Connecticut Department of Health estimate of population by town for 1994.

# Terms

## Children:

Throughout this book, we have used the term “children” to apply to persons younger than the age of 18. Where the available data uses a different age grouping, it is so noted.

## Race/ethnicity:

We have reported race and ethnicity using the categories established for the 1990 U.S. Census and used by state agencies providing the data. People of Hispanic origin may be of any race.

## Fiscal year data:

Most data presented here is for calendar years. Where data collected by state or federal authorities was available only by fiscal years, it is noted as SFY (state fiscal year, July 1 to June 30) or FFY (federal fiscal year, October 1 to September 30).

# Methodology

## Changes in the *1996 Data Update*:

There have been a number of changes in this year's data book, when compared to the *1995 Data Update*. As the collection of comparable data available at the local level grows, new analyses are possible. For example, this year we are able to show previous year's data for prenatal care, which was only a snapshot in time in last year's book. Also, changes in the data collection methods by the executive branch have made new local level data available. An improved measure of child abuse and neglect, for example, is available for the first time in the *1996 Data Update*. Unfortunately, we have also eliminated two measures which were included in last year's book, alcohol use and tobacco use, because the data was collected only once.

## Number:

For each indicator, we include the number of “events” for a given time period, for example, the number of high school students who dropped out during the 1991-92 school year.

#### Rate:

For 13 of the 14 child well-being indicator tables, we include rates as well as numbers. A rate is a measure of the likelihood of an event, and is calculated by dividing the number of events by the number of persons that are “eligible” for that event. For example, the high school dropout rate is the number of students who dropped out in a given year by the number of students enrolled. A percentage is a rate per 100. Other rates included here are per 1,000 or 100,000. Rates can be used to compare between regions for a specific indicator. Rates were not calculated if the number of “events” was less than 5. The regions with rates worse than the statewide rate are highlighted on each table. Meaningful rates can not be calculated for the teen deaths measure at the local level because of a lack of reliable data for the number of teenagers to use as a denominator and estimates could not be made because of the narrow age range. Therefore teen deaths are not included in the regional tables.

#### Rounding:

For the purpose of improving readability, percentages are rounded to the nearest whole number in the text, except in rare cases where smaller differences were deemed crucial. Some of the statistics cited in the text were only available rounded to the nearest whole number. Those who are interested in a particular statistic at a more detailed level should call CAHS for more information. Please note that because of this rounding, percentages may not always add up to exactly one hundred percent.

In the charts, all rates are calculated to the nearest tenth of a percent for greater accuracy. The percent change in rates over time are rounded to the nearest whole number.

#### Sources:

Sources for all data are listed on each page in the order in which they appear in the text.

#### Notes:

We have included technical information from the text as necessary as notes at the bottom of the page referenced. The formula used for calculating the data in the charts, and any limitations of the data, are included there as well.

#### Selection of indicators:

Many different indicators could have been used to measure the well-being of children. The compilation of these indicators for our first book was a function of 1) the results of a survey of members of the Children’s Future Panel (a group of more than forty individuals who are advising this project), 2) relation to national KIDS COUNT indicators, 3) how directly the indicator measured children’s well-being, and 4) availability of data.

### Regions:

For the purposes of this report, we have divided Connecticut into 27 regions (towns or groups of towns) based on the public use microdata areas established by the Census Bureau. The use of regions allowed us to calculate rates where the population would have been too small at the town level. Each region has a population of more than 100,000, and no town is split between two regions. The five largest cities, Bridgeport, Hartford, New Haven, Stamford, and Waterbury, are regions unto themselves. The raw data for the tables was collected originally for each town, and then towns were grouped into regions. Regional school districts sometimes enrolled students from more than one of the regions for the high school dropout data used in this report; a list of the regions to which these school districts were assigned can be found on page 11. Indexes to towns and regions and a map are located on pages 8-12.

### Comparing regions to state-wide rate:

On the regional tables, the rate for each indicator is shown as a percent better or worse than the state-wide rate. Because this percentage varies on the measure, one should look at the child well-being indicator tables to see how your region compared to others on that measure. For example, a region could have a high school dropout rate that is twice the statewide rate.

### Comparing regions to one another:

This report makes no attempt to combine indicators into an overall score for any region. Given the diversity of the indicators and their measurement, and the wide diversity of demographics across regions, we felt it best to view the indicators individually and form a more holistic view of how well children in each region were doing.

# REPRODUCTION RELEASE

(Specific Document)

## I. DOCUMENT IDENTIFICATION:

Title: Connecticut's Children: Still at Risk: 1996 Data Update	
Author(s): Michelle Doucette Cunningham	
Corporate Source:	Publication Date: 1996

## II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

The sample sticker shown below will be affixed to all Level 1 documents

The sample sticker shown below will be affixed to all Level 2 documents

Check here  
For Level 1 Release:  
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical) and paper copy.

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY

\_\_\_\_\_

\_\_\_\_\_

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 1

Check here  
For Level 2 Release:  
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical), but *not* in paper copy.

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN OTHER THAN PAPER COPY HAS BEEN GRANTED BY

\_\_\_\_\_

Sample

\_\_\_\_\_

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 2

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."

### III. DOCUMENT AVAILABILITY INFORMATION (FROM NON-ERIC SOURCE):

If permission to reproduce is not granted to ERIC, or, if you wish ERIC to cite the availability of the document from another source, please provide the following information regarding the availability of the document. (ERIC will not announce a document unless it is publicly available, and a dependable source can be specified. Contributors should also be aware that ERIC selection criteria are significantly more stringent for documents that cannot be made available through EDRS.)

Publisher/Distributor:

Connecticut Association for Human Services

Address:

110 Bartholomew Avenue, Suite 4030  
Hartford, CT 06106-2201

Price:

\$9.95

### IV. REFERRAL OF ERIC TO COPYRIGHT/REPRODUCTION RIGHTS HOLDER:

If the right to grant reproduction release is held by someone other than the addressee, please provide the appropriate name and address:

Name:

Address:
