ABSTRACT

The relationship between the educational character of Philadelphia's public schools (Pennsylvania) and the communities in which they are embedded was studied using information from the 1990 Federal Census and the city's police and health departments. The characteristics of the city's neighborhoods are described, and schools are located in their social and economic contexts by identifying the specific neighborhoods associated with student populations. The characteristics of the neighborhoods represented in each school are summarized for each school and related to the academic success of the students. The major finding is the straightforward conclusion that Philadelphia is a city of extremes. It is residentially segregated by race and class. Some areas of the city are the home of affluent families. They are relatively healthy and safe places to live. In contrast, other areas are characterized by high rates of poverty, drug offenses, violent crimes, and epidemics of disease. The public schools embedded in these different communities exhibit different levels of educational success. Much of this difference may be attributed to the differences in the communities in which schools are embedded. (Contains 9 tables, 4 illustrations, and 21 maps.) (SLD)

Neighborhoods, Troubles, and Schooling:
The Ecology of Philadelphia's Public Schools

by William L. Yancey, Salvatore J. Saporito, and Raj Thadani

The National Center on
Education in the Inner Cities

The research reported herein was supported in part by the Office of Educational Research and Improvement (OERI) of the U.S. Department of Education through a grant to the National Center on Education in the Inner Cities (CEIC) at the Temple University Center for Research in Human Development and Education (CRHDE). The opinions expressed do not necessarily reflect the position of the supporting agencies, and no official endorsement should be inferred.

UD031493

This is a report of the results of research designed to examine the relationship between the educational character of Philadelphia's public schools and the communities in which they are embedded. Using information derived from the 1990 federal census and the city health and police departments, we describe the character of the city's neighborhoods. We then locate schools in their social and economic context by identifying the specific neighborhoods associated with student populations. The characteristics of the neighborhoods represented in each school are then summarized for each school and related to the academic success of students.

Data Sources and Methods

We have used three principal sources of information to describe neighborhoods (census tracts) in Philadelphia. First are demographic, social and economic data from the 1990 federal census. Second are data from the Health Department which include incidents of several diseases across the city's census tracts, as well as information derived from birth records--including the age and marital status of mothers, the adequacy of prenatal care they received, and the birth weight of their babies. Finally, the Police Department has provided individual records of all criminal arrests and reported offenses in 1992. The addresses where each reported offense occurred and the residences of arrested persons have been assigned to the appropriate census tracts. We have limited this analysis to crimes involving violence or drugs.

For each of the variables used, we have computed rates of their occurrence given the population living in each census tract in 1990. These rates were generated for the 316 census tracts with more than 1000 persons. The remaining 49 census tracts have been eliminated from our analysis.

We have generated a series of maps showing the city's distribution of demographic and socio-economic characteristics based on the 1990 U.S. Federal Census, as well as maps of rates of crime, disease, and access to health care. These maps illustrate the correlations between these characteristics. For example, communities with high rates of syphilis, are also characterized by high rates of violence, tuberculosis, inadequate prenatal care, and low birth-weight babies.

In addition to the single indicators of disease and crime we have combined these separate measures into an overall index: *Trouble*. The creation of this index is accomplished through a statistical technique known as "factor analysis," which examines the degree to which the individual measures are inter-correlated. The strength of these correlations suggests that there is a common underlying factor to which the separate indicators of health and safety are related. The strength of the relationship between individual measures and the common underlying factor, reflected by correlation coefficients, are used as the basis for weighting individual measures into the overall index. We have followed the

convention of including only those specific measures whose correlations with the underlying factor was greater than .70.

Table I shows the correlations between the separate indicators of neighborhood health and crime and the overall index of *Trouble*.

As can be seen, the strongest contributors to the overall index are the rates of arrests for violent crimes and syphilis rates.

Correlations between the *Trouble* index and rates of drug and violent offenses were lower than .70; thus, they were not included in the overall index.

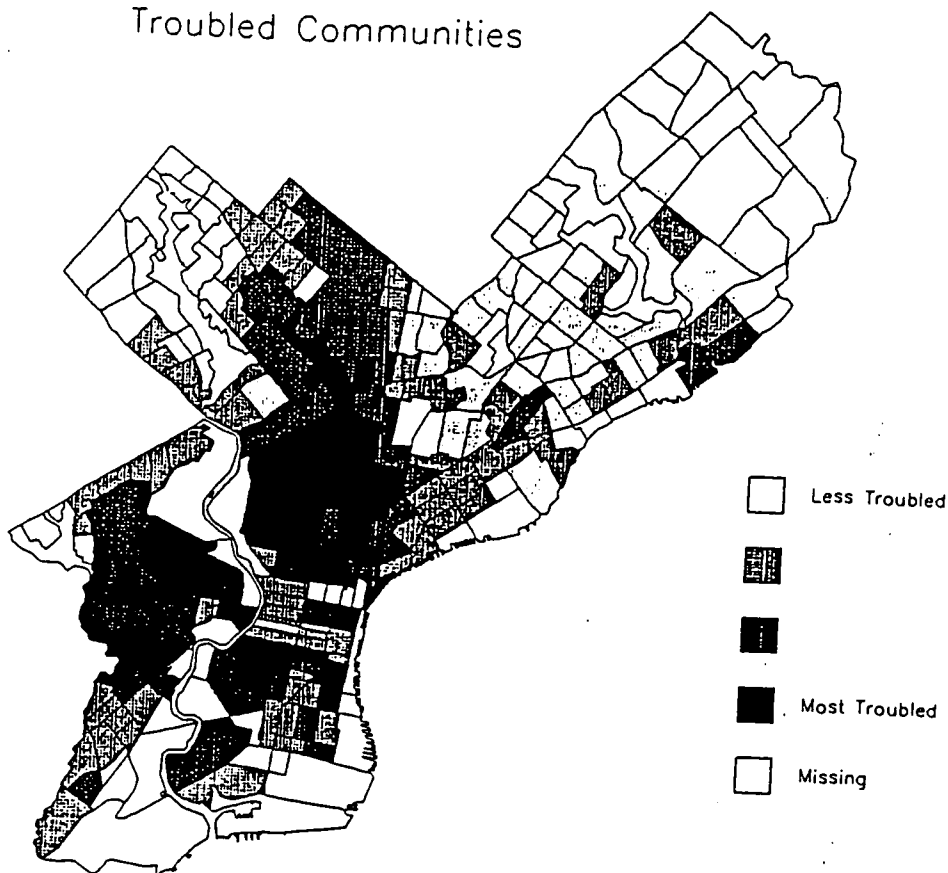

Table 1: Correlations Between Measures of Health and Crime and the Underlying Factor Index: "*Trouble*"

| | Factor Loading |
|--|-------------------|
| Rate of Arrests for Violent Crimes | .916 |
| Rate of Syphilis per 10,000 | .906 |
| Percent of Babies Born to Teenage Mothers | .886 |
| Percent of Babies Born with Low-Weight | .836 |
| Rate of Arrests for Drugs | .791 |
| Tuberculosis Rate per 10,000 | .776 |
| Pct Mothers with Inadequate Prenatal Care | .767 |
| <u>Rate of Reported Lead Poisoning 1878-81</u> | <u>.752</u> |
| Rate of Drug Offenses* | .670 |
| Rate of Violent Criminal Offenses* | .489 |
| *Not included in overall index. | |

Illustration 1 is a map showing the distribution of the combined index of *Trouble* across the city.

Troubled Communities

4

Schools and Communities

In order to analyze the relationship between schools and communities, it is necessary to obtain information describing each school's community and to integrate that data with information describing schools and students. The critical issue is how does one define and operationalize a school's community. One approach might have been to use data from census tracts in the vicinity of the school to describe the geographic areas which surrounded each school. We have chosen a somewhat different path. We make the assumption that the areas where students live, not necessarily the immediate neighborhood surrounding the school, comprise the community relevant for a given school. Thus, to

describe each school it is necessary to know where its students live and to summarize information describing their residential areas.

This task was made possible by what is known as the "Pupil Directory File." The "PDF" is a data base which includes all students enrolled in the public schools. Among other things, it identifies the school each student attends and the census tract in which each student resides. Using a computer matching program, data describing each student's census tract were attached to the student's record. These data were then "aggregated," or summarized, for each school according to the average characteristic of tracts represented by the students in each school. Thus, if a school draws students from several different census tracts and we are attempting to characterize the rates of poverty among children between the ages of 5 and 17 years, we would multiply the poverty rates of each tract by the number of students living there. These products are then summed across the tracts represented in the school and divided by the total number of students. This creates a weighted average of the poverty rates in the neighborhoods represented in the school. This aggregation procedure has been completed for information derived from the federal census, as well as each of the separate measures of health and crime, and overall index of *Trouble*. These data are summarized in Table 2. Shown are the averages for the city's census tracts and the average characteristics of tracts represented in all public schools.

Table 2: Social, Economic, Health and Crime across
City Neighborhoods and Schools

| <u>SCHOOL COMMUNITY CHARACTERISTICS</u> | <u>City Average (316 tracts)</u> | <u>Public School Average</u> |
|---|--|--------------------------------------|
| <i>1990 Census</i> | | |
| Pct. Latinos in Community | 5.3 | 8.1 |
| Pct. African Americans in Community | 41.3 | 55.2 |
| Pct. Renters | 40.0 | 38.6 |
| Mean Household Income | 24506.4 | 21314.0 |
| Pct. in Poverty | 21.1 | 27.3 |
| Pct. Youth in Poverty | 26.5 | 35.6 |
| Pct. Single Parent Household | 41.0 | 51.8 |
| Pct. Private School Attendance | 32.5 | 18.9 |
| Pct. Households Larger Than 4 | 12.8 | 16.0 |
| <i>Health Data</i> | | |
| Pct. of Children Lead-poisoned 1978-81 | 1.0 | 1.3 |
| Syphilis Rate | 1.5 | 2.1 |
| TB Rate | 20.4 | 24.2 |
| Pct. Births to Mothers Under 19 | 6.8 | 9.0 |
| Pct. of Births of Low Weight | 10.0 | 11.5 |
| Rate of Inadequate Prenatal Care | 10.1 | 18.3 |
| <i>Crime Data</i> | | |
| Reported Drug Offense Rate per 1000 | 3.8 | 6.2 |
| Drug Arrests per 1000 | 6.1 | 9.5 |
| Reported Violent Crime Rate per 1000 | 11.6 | 14.5 |
| Arrests for Violent Crimes per 1000 | 6.4 | 10.7 |
| Scale of Neighborhood Troubles | 0.0 | 2.3 |

There are important differences between these summaries. Note first the percent of the school age population that attends non-public schools. Across the entire city 33% of the school age population attends private or parochial schools. Yet among the census tracts representative of public school students this rate is but 19%. *Communities which have high rates of private school attendance are under-represented in the public schools.*

The consequence of some students opting not to attend public schools reverberates through the remaining comparisons between

the characteristics of the city as a whole and the characteristics of tracts representative of public school students. By every measure of socio-economic status, disease, crime or the overall index of *Trouble*, the census tracts representative of public school students are less affluent and more troubled.

These data, describing the social and economic characteristics of the communities represented in each school, were then merged with data describing characteristics of the schools and students. The school and student information was taken from the 1990 report of the Philadelphia School District's Management Information Center. We extracted information describing the average test scores, average daily attendance rates, pupil turnover, busing and transportation assistance, the percent of students receiving free or reduced price lunches, and the percent of students who were African-American or Latino.

On the pages which follow the series of maps are reports of the characteristics of each school and its community. In addition to information describing each specific school and its community context, for comparative purposes, the averages for the city as a whole and the average for all schools are also given. Similar reports are provided which summarize the characteristics of the schools and communities comprising each of the 22 Clusters of schools now being organized.

Segregation, Community Troubles and Educational Outcomes

The Philadelphia metropolitan area exhibits the characteristic pattern of increasing concentration of minorities and the poor within the central city. Since 1950 the proportion of the metropolitan area population that is Black or Hispanic increased from thirteen to twenty-four percent. With the exodus of the white population from the central city, the percent of the city's population that is Black or Hispanic has increased from less than twenty percent in 1950 to over forty five percent in 1990.

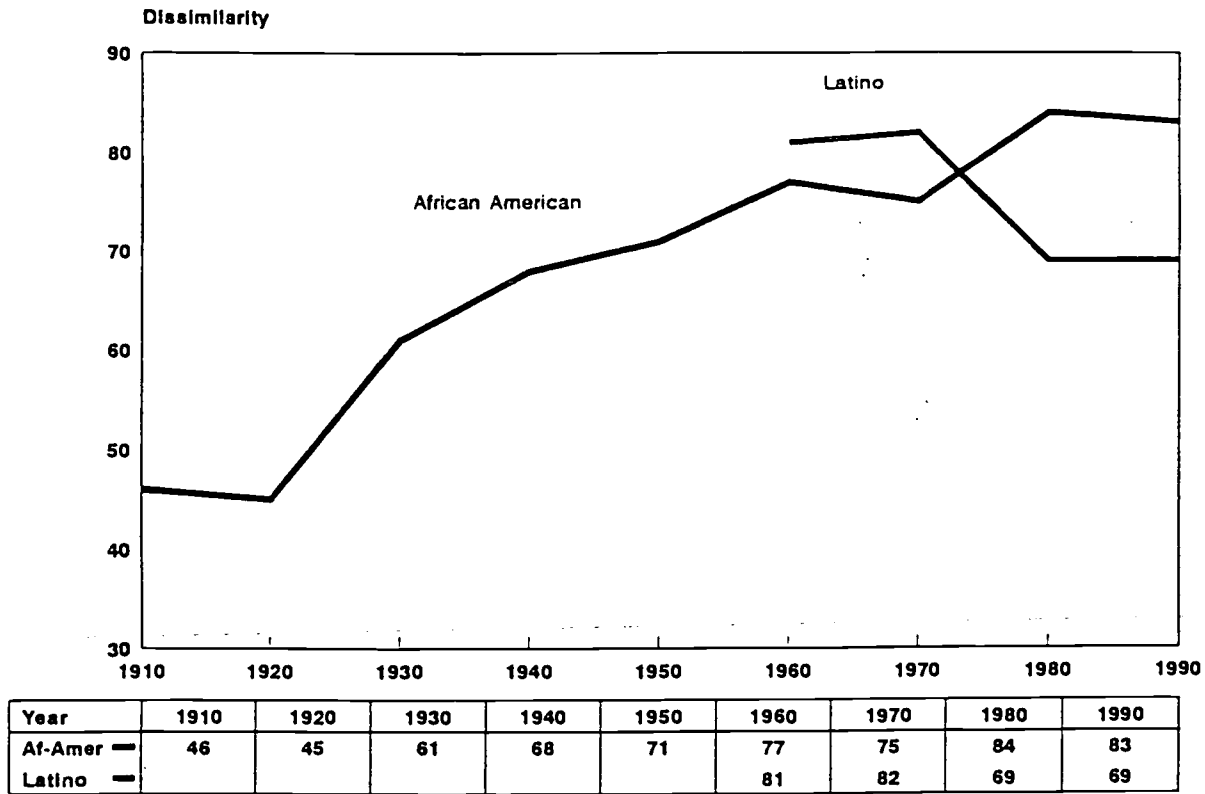

Philadelphia is racially segregated. The level of segregation between African-Americans and whites steadily increased since the turn of the century. It reached an all time high in 1980 when the index of dissimilarity¹ between blacks and whites was 84. Between Hispanics and whites it was 69. In 1990 black/white dissimilarity was 83. Hispanic/white dissimilarity was 74. (See Illustration 2).

The city's households are also segregated by social and economic status. The poor are heavily concentrated in North and West Philadelphia. With the exception Center City, which contains

¹. The index of dissimilarity reflects the difference in the distribution of two groups across a series of nominal categories. In the case of residential segregation it reflects the difference in the percentage distributions of two groups across census tracts. One interpretation of dissimilarity is that it reflects the proportion of either group that would have to move from census tracts which they now dominate to other tracts in order to balance the two distributions. Thus in 1990 83 percent of whites would have to change census tracts in order to achieve racial integration.

several relatively affluent neighborhoods, there is the familiar pattern of declining rates of poverty as one moves to the city's periphery.

Illustration 2:
Residential Segregation in Philadelphia 1910-1990

Poverty rates are higher among African Americans (29%) and Latinos (45%) than among whites (11%). As a consequence of racial and socio-economic segregation in the city, minorities who are poor live in communities which have high concentrations of poverty. In 1990 an average white person who was poor lived in a

census tract in which 20 percent of the households were also poor. By contrast, African Americans who were poor lived in census tracts in which 35% of the households were also poor; Latinos who were poor lived in census tracts in which 47% of the households were poor. Thus, there is a substantial correlation between the percent of a census tract's population that is African-American or Hispanic and the percent of the households whose income in 1990 was below the poverty line ($r=.628$).

Rates of poverty in the city increased from 18.2 in 1989 to 25.6 in 1993. Perhaps most striking is the fact that *in 1989 25.1 percent of the city's children lived in households which were below the poverty line. Four years later (1993), this had increased to 38.2%.²*

Comparisons of the maps showing the distribution of poverty across the city, with the maps showing the distribution of crime and disease reveal the strong association between these community characteristics. Table 3 presents correlations between rates of poverty among the total population, and the school age population, with the specific measures of health and crime and the overall index of *Trouble*. These correlations point to the centrality of poverty as a principal antecedent of crime and

² Scott R. Snyder, "Poverty Trends in Philadelphia and the U.S." Social Science Data Library, Temple University, Philadelphia: 1995

disease. Indeed, these correlations provide a partial portrait of poverty in the city. To be poor and live in a community which is poor, not only means that one has a limited income, it also means that you are likely to live in a neighborhood that is characterized by high rates of arrests for violent crimes and drugs, where syphilis, tuberculosis, and lead-poisoning are epidemic, and where babies are born to young mothers without adequate access to health services.

Table 3: Correlations Between
Health, Crime and Poverty
Across Census Tracts.

| | Total Population in Poverty | Percent of School-Age Population in Poverty |
|---|-----------------------------------|--|
| Rate of Arrests for Violent Crimes | .803 | .788 |
| Percent of Babies Born to Teenage Mothers | .776 | .767 |
| Rate of Arrests for Drugs | .765 | .728 |
| Rate of Syphilis per 10,000 | .696 | .681 |
| Rate of Drug Offenses | .679 | .636 |
| Pct Mothers with Inadequate Prenatal Care | .654 | .634 |
| Tuberculosis Rate per 10,000 | .635 | .616 |
| Percent of Babies Born with Low-Weight | .624 | .606 |
| Rate of Reported Lead Poisoning 1878-81 | .548 | .538 |
| Rate of Violent Criminal Offenses | .456 | .340 |
| Crime and Disease Index: <i>Trouble</i> | .818 | .796 |

Given the correlations across census tracts between rates of poverty and rates of crime and disease, it is not surprising that we find similar correlations between these characteristics after they have been aggregated and summarized for schools. Indeed, the correlations between the index of *trouble* and rates of poverty found among school age children is higher (.854) across schools than it is across census tracts (.796).

Illustration 3 shows a scatterplot of the relationship between rates of poverty and the overall index of *Trouble*. In order to identify schools whose students live in communities with the highest levels of children in poverty and the highest levels of disease and crime, we have divided schools into five groups as they are ranked along these two dimensions. The dotted lines crossing the regression line illustrate this classification of schools into five groups (of approximately 50 schools each) ranging from those in the most favorable communities to those embedded in the worst communities.

**Illustration 3:
Schools by Levels of Trouble and Poverty
in Their Communities**

Illustration 4 shows the tract locations of elementary schools by levels of *Trouble*. The specific schools included in each of these five groups listed in Table 5.

Illustration 4

Elementary Schools in Troubled Communities

The differences in the ecological community contexts in which schools are embedded are associated with their academic success. This can be seen in Table 4 which shows the correlations between rates of poverty and *Trouble*, and the average daily attendance, rates of student turnover, and average reading test scores. At

all levels, rates of poverty or rates of crime and disease observed in the communities in which schools are embedded are related to the character of schools. The results are clear: schools whose students are drawn from poor and troubled communities have lower rates of attendance, higher rates of student turnover and lower achievement scores than do schools drawing students from more affluent and less troubled communities.

Table 4: Correlations between Poverty, *Trouble* and Characteristics of Schools

| <u>High Schools</u> | <u>Poverty</u> | <u>Trouble</u> |
|---------------------------|----------------|----------------|
| Daily Attendance | -.707 | -.625 |
| Student Turnover | .510 | .430 |
| <u>Middle Schools</u> | | |
| Daily Attendance | -.257 | -.248 |
| Student Turnover | .479 | .463 |
| Average Reading Score | -.643 | -.623 |
| <u>Elementary Schools</u> | | |
| Daily Attendance | -.502 | -.355 |
| Student Turnover | .393 | .317 |
| Average Reading Score | -.670 | -.658 |

Conclusion

The major conclusions of this investigation are straight forward. Philadelphia is a city of extremes. It is residentially segregated by social class and race. Some areas of the city are the home of affluent families; they are relatively healthy and safe places to live. By contrast there are other communities

characterized by high rates of poverty, drug offenses, violent crimes, and epidemics of disease. Public schools embedded in these different communities exhibit different levels of educational success. Much of the variation in educational success may be attributed to the differences in the communities in which schools are embedded.

The success of the children achieving agenda depends in part on the degree to which educational reforms include changes in the ecological/community contexts within which schooling takes place.

THE NATIONAL CENTER ON EDUCATION IN THE INNER CITIES

The National Center on Education in the Inner Cities (CEIC) was established on November 1, 1990 by the Temple University Center for Research in Human Development and Education (CRHDE) in collaboration with the University of Illinois at Chicago and the University of Houston. CEIC is guided by a mission to conduct a program of research and development that seeks to improve the capacity for education in the inner cities.

A major premise of the work of CEIC is that the challenges facing today's children, youth, and families stem from a variety of political and health pressures; their solutions are by nature complex and require long-term programs of study that apply knowledge and expertise from many disciplines and professions. While not forgetting for a moment the risks, complexity, and history of the urban plight, CEIC aims to build on the resilience and "positives" of inner-city life in a program of research and development that takes bold steps to address the question, "What conditions are required to cause massive improvements in the learning and achievement of children and youth in this nation's inner cities?" This question provides the framework for the intersection of various CEIC projects/studies into a coherent program of research and development.

Grounded in theory, research, and practical know-how, the interdisciplinary teams of CEIC researchers engage in studies of exemplary practices as well as primary research that includes longitudinal studies and field-based experiments. CEIC is organized into four programs: three research and development programs and a program for dissemination and utilization. The first research and development program focuses on the *family* as an agent in the education process; the second concentrates on the *school* and factors that foster student resilience and learning success; the third addresses the *community* and its relevance to improving educational outcomes in inner cities. The focus of the *dissemination and utilization* program is not only to ensure that CEIC's findings are known, but also to create a crucible in which the Center's work is shaped by feedback from the field to maximize its usefulness in promoting the educational success of inner-city children, youth, and families.

CEIC Senior Associates

Margaret C. Wang
Director, CEIC and CRHDE
Professor of Educational Psychology
Temple University

Aquiles Iglesias, Associate Director, CEIC
Associate Professor and Chair,
Speech-Language-Hearing
Temple University

Lascelles Anderson
Professor and Director,
Center for Urban
Educational Research and
Development
University of Illinois
at Chicago

H. Jerome Freiberg
Professor of Curriculum
and Instruction
University of Houston

Maynard C. Reynolds
Professor Emeritus of
Educational Psychology
University of Minnesota

Hersholt C. Waxman
Associate Dean for
Research and Associate
Professor of Curriculum
and Instruction
University of Houston

David Bartelt

Geography and Urban
Studies and Director,
Institute for Public
Policy Studies
Temple University

Michael Goetz
Associate Professor
of Economics
Temple University

Leo Rigsby
Associate Professor
of Sociology
Temple University

Kenneth Wong
Associate Professor
Department of Education
and Social Sciences
University of Chicago

William Boyd
Professor of Education
Pennsylvania State
University

Geneva Haertel
Senior Research Associate
CRHDE
Temple University

Judith Stull
Associate Professor of
Sociology
La Salle University

William Yancey
Professor of Sociology
Temple University

Gayle Dakof
Visiting Assistant
Professor of
Counseling Psychology
Temple University

John Kovach
Director of Outreach
and Dissemination
CEIC

William Stull
Professor and Chair,
Department of Economics
Temple University

Andrea Zetlin
Associate Professor
Special Education
California State
University, Los Angeles

Howard Liddle
Professor of Counseling
Psychology
Temple University

Ronald Taylor
Associate Professor of
Psychology
Temple University

Herbert J. Walberg
Research Professor
of Education
University of Illinois
at Chicago
