ABSTRACT

This Michigan Kids Count data book for 1994 describes the condition of children in each of Michigan's 83 counties. The first part of the report presents discussions of economic security, housing, child care, education, and health care, addressing the state and national experience for families and children, critical issues, and policies and programs with the potential to affect outcomes for children. The second part of the report presents a more detailed picture for each county in five (1) economic security (the geographic distribution of poverty within counties); (2) 10-year trends in risky births using three health indicators: teenage mothers with inadequate prenatal care; low birthweight babies; births to teens without a high school diploma; (3) education outcomes as reflected in the basic skills test results (Michigan Education Assessment Program scores) for 4th, 5th, 7th, 8th, 10th and 11th grades; (4) trends in rate changes over time for each county on eight key indicators of child well-being (inadequate prenatal care, low birth-weight babies, births to teens with no diplomas, infant mortality, child deaths, teen violent deaths, serious (index) crime arrests, and high school dropouts (1993); and (5) county trends compared to statewide trends. The report notes that, overall, the majority of Michigan's children are adequately housed and nurtured. However, there is a growing share of the state's children who are not being reared with these supports. These children can be found in urban, suburban, and rural communities. The report's appendix presents annual data for ten indicators for the state and counties. (AA)

KIDS COUNT in Michigan is part of a broad national effort to measure the well-being of children at the state and local levels, and use that information to shape efforts which can improve the lives of children. Funding is provided through the Annie E. Casey and Skillman Foundations. The partners in the Michigan project include:

- Michigan's Children, a statewide, multi-issue, independent, broad-based advocacy group which works with policy-makers, other organizations and the public to improve the quality of life for children and their families
- Michigan League for Human Services, a statewide citizens' organization which seeks to improve human services through research, information dissemination, advocacy and support services to the state's charitable organizations
- Michigan State University, the state's major land-grant university, has four contributing entities:
 - *Michigan State University Extension*, an educational outreach unit, which trains community leaders to access, interpret, and present data relevant to families and local communities
 - *Department of Family and Child Ecology* in the College of Human Ecology which trains statewide audiences in the use and interpretation of data and has been involved in research and programming focused on youth at-risk
 - *Institute for Public Policy and Social Research* which houses demographic, economic and social databases for all counties, cities and townships within Michigan
 - *Institute for Children, Youth and Families*, which has a major research and programming agenda focused upon youth at-risk

acknowledgments

The KIDS COUNT in Michigan 1994 Data Book was greatly enhanced by the expertise and support of the members of the KIDS COUNT in Michigan Advisory Board. Their commitment to improving the well-being of children in Michigan is invaluable.

KIDS COUNT in Michigan wishes to acknowledge the support of the Annie E. Casey and Skillman Foundations which has made possible the development of Michigan's third annual data book.

The *KIDS COUNT in Michigan* 1994 Data Book was developed by Jane Zehnder-Merrell and Jo Weth of the Michigan League for Human Services, Pat Sorenson of Michigan's Children, Mary Lou McPherson of Michigan State University Extension, and Bettie Landauer-Menchik of Michigan State University's Institute for Public Policy and Social Research, with guidance from the *KIDS COUNT in Michigan* Steering Committee.

Special recognition is accorded the assistance and perseverance of Dollie LeVeque of Michigan State University Extension, and Rosella Garddecki of Michigan State University's Institute for Public Policy and Social Research, and Michele Robotham, Jackie Benson, Gail Duncan, Phyllis Killips, Tillie Kucharek, and Mary Logan of the Michigan League for Human Services.

The collection and organization of county data could not have been accomplished without the patient assistance of:

- Susan Anderson, *Food and Nutrition Services, Michigan Department of Education;*
- Ki-Suck Chung, *Office of Research and Information, Michigan Department of Education;*
- Susan Hall, *Food and Nutrition Program, Michigan Department of Social Services;*
- Kathy Humphreys, *Center for Health Statistics, Office of the State Registrar, Michigan Department of Public Health;*
- Debbie McClung, *Data Center, Michigan State Police;*
- Linea Nicholls, *Applications Programming, Michigan State University;*
- Glenda Rider, *Financial Management Services, Michigan Department of Education;*
- Lewis Ruddock, *Michigan Department of Education;*
- Gene Schneider, *Children's Protective Services, Michigan Department of Social Services;*
- Bill Torrance, *Bureau of Information Systems, Michigan Department of Social Services;*
- Ching Li Wang, *State Demographer, Michigan Department of Management and Budget.*

Appreciation is also extended to Andrea Bohlig and Kwok-fai Ting of the Kenan Institute of Private Enterprise at the University of North Carolina for data regarding "distressed neighborhoods" in Michigan, Dr. William P. O'Hare, *KIDS COUNT* Coordinator at the Annie E. Casey Foundation, for consultation, and Jessica Beels, Children's Express editor in chief, for her permission to print excerpts from interviews with Michigan youth.

Foreword

The 1994 *KIDS COUNT in Michigan* Data Book marks the third year in which child well-being in Michigan has been documented by *KIDS COUNT in Michigan*. This annual profile of the economic, health, safety and educational status of the state's children has, in many ways, served as a catalyst for a heightened sense of urgency about the need to safeguard and improve the lives of Michigan's children.

Across the state, in rural as well as urban areas, measurements of child well-being show disturbing trends in areas such as economic security, educational performance and health outcomes. If we are to reverse these trends, effective strategies must be developed in every arena and at every level. More public and private sector responses must be forged which will make a critical difference in the lives of children as they make their way from infancy to adulthood.

The *KIDS COUNT in Michigan* project has garnered the collective dedication and expertise of three entities – Michigan's Children, the Michigan League for Human Services, and Michigan State University – to provide community groups and policy makers with information – an important tool to shape solutions. Our children can thrive, but only with our help.

KIDS COUNT in Michigan

KIDS COUNT in Michigan through its annual databooks has established a framework for ongoing review of the well-being of children state-wide and in Michigan's 83 counties. A full description of the indicators used in each section of the book can be found in the Data Notes, beginning on page xx. This discussion of the elements on the state and county profiles will assist readers in locating information.

1. Economic Security: Poverty

This map of the county is shaded to reflect the percent of children in poverty in cities and townships within each county.

- 0.0 - 9.9 means that between 0 and 10 percent of children in this city or township were in families living below the poverty line in 1989.
- 10.0 - 19.9 means that between 10 and 20 percent of the area's children live in poverty.
- 20.0 - 29.9 means that between 20 and 30 percent of the area's children live in poverty.
- 30.0+ means that at least 30 percent of the area's children live in poverty.

Information about economic security is presented in two other parts of the book. Each county's share of near-poor children (those living at 185 percent poverty) is included in the discussion of economic security in section one (pages 8-11). In addition, a measure of economic security can be found in the percentage and numbers of children receiving free and reduced price lunch, since children in families with incomes below 185 percent poverty are eligible for such assistance (see appendix).

2. Health: Risky Births

This graph depicts the yearly changes of three indicators which pose risks to babies remaining healthy after birth. County rates of teens receiving inadequate prenatal care, babies born at low-weight, and births to teens without a high school diploma. These three indicators, while not ensuring future failures, do represent risks to later health and success of infants and children.

Rates for eleven consecutive years are graphed — from 1982 to 1992 — to illustrate yearly variation in the indicators; such variation could be masked by the three-year averages and trends over time used in the Changes in Child Well-Being bar chart. (Trend lines in smaller counties may fluctuate a great deal because of the large influence a small number of incidences can have on the rate.)

For these indicators, the average number and rate for the most recent three years, as well as the percentage change in rate since 1980-82 are on the change bar chart. Yearly rates from 1988 through 1992 are presented in the appendix, as are the actual number of occurrences for each county for 1988 and 1992.

3. Education: 1993-94 MEAP Tests

This table presents the number and percent of public school students who have scored at a satisfactory level on the Michigan Education Assessment Program (MEAP) tests which are given in the fall of 4th and 5th grade, 7th and 8th grade, and 10th and 11th grade. Three subject areas are tested: reading, math and science.

The percentage of students scoring at a "satisfactory" level in the various subjects is indicated by grade level, with only the number of students represented by those percentages in parentheses below. For example, in the state, of the tenth grade students who took the reading test, 42.5 percent or 43,082 achieved a satisfactory score

4. Changes in Well-being of Children: Trends

This composite picture of child well-being gives a view of the overall status of children in recent years and over time. Annual rates are provided in the appendix.

Percent Change

The percent change in an indicator is displayed as either a percent better or percent worse on the bar graph. The change compares rates, based on three-year averages, usually over ten years.

The state change for each indicator is shadowed on each county graph. Change in the high school dropout rates for the state has been excluded because of the large amounts of missing data.

Caution should be used in reading the percent change in rates: changes in small numbers of occurrences may result in large variations in the trends in some counties. Percentage changes over 100 are indicated by an arrow outside the chart.

Recent Average Number

This is the average number of children or youth affected by this indicator. The numbers for the first six indicators represent the average of the three most

Indicators and Number of Counties Ranked

Indicator	# Counties Ranked
Teen Births with Inadequate Prenatal Care	78
Low-Weight Births	83
Births to Teens, no Diploma	82
Infant Mortality	74
Child Deaths	66
Teen Violent Deaths	64
Serious (index) Crime Arrests	83
High School Dropouts	66

For the indicators highlighted above, annual rates for 1988 through 1992 can be found in the Appendix, beginning on page 137.

recent years (1990, 1991, and 1992) while serious (index) crime arrests of juveniles uses an average of 1991 through 1993. (Annual numbers are available in the appendix for 1988 and 1992 for the first six indicators on the chart.)

Recent Average Rate

Rates represent a number of incidence compare to a total population. Rates are expressed as a rate per 100 (a percentage), per 1,000 or per 100,000.

Different indicators use different base populations; for example, low birth-weight babies are compared to all live births, while teens with inadequate prenatal care are compared to all teen mothers. (The Data Notes provide the populations used for

the ranking for an indicator. Due to small numbers in some instances not all counties are ranked. (The chart at left gives the number of counties ranked for each indicator.) For example, for teen violent deaths only 64 of Michigan's 83 counties were ranked; therefore a county receiving a ranking of 64 means that county's children are doing worse on that indicator than any other county.

Appendix

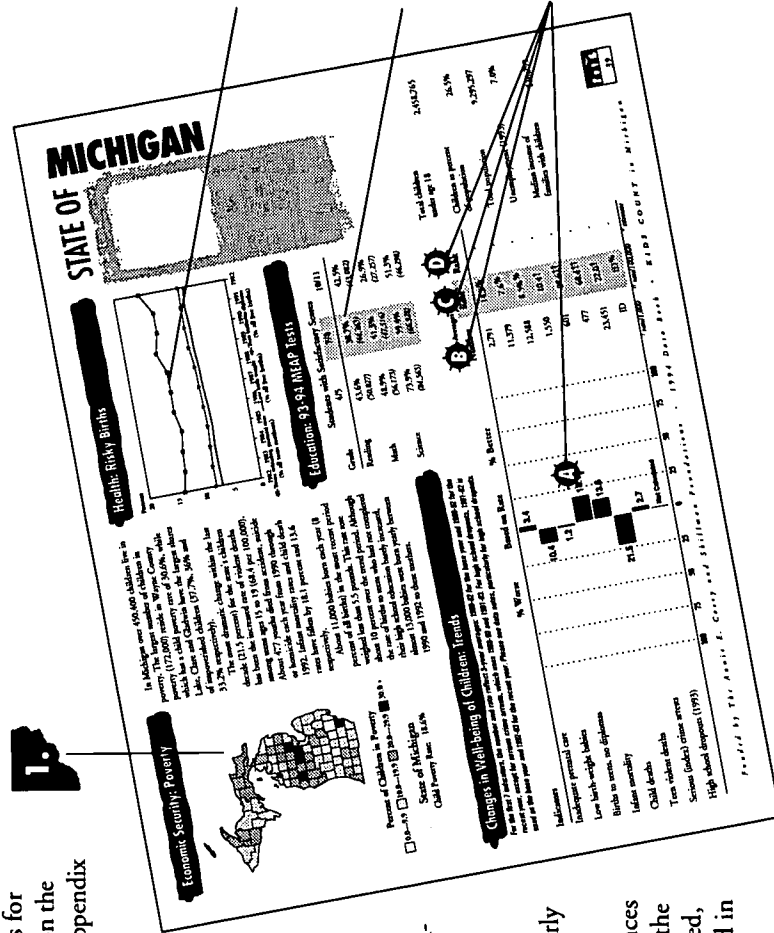

In the appendix data are not averaged, they provide "point in time" information for the five most recent years available. For county profile indicators, rates from 1988 through 1992 are provided. School lunch, out-of-home placement, child abuse, and juvenile arrest rates from 1989 through 1993 will be found in the appendix. Actual numbers of children for the earliest and latest year are presented. Percentage changes in rates over the last year and the five year period are also included.

each indicator.) Yearly rates for the indicators highlighted on the chart are presented in the appendix beginning on page 137.

Ranking

Ranking reflects how the county rate for a particular indicator compares to those of other counties in the state. A ranking of 1 indicates children in the county are doing comparatively well on that indicator, while a ranking of 83 indicates the children in that county are doing poorly on that indicator.

If the number of occurrences averaged less than one or the rate could not be calculated, the county is not included in

A Year* in the Life of Michigan's Children

*1992 - 1993

- 10,826 infants were born weighing less than 5.5 pounds.
- 1,460 babies died before their first birthday.
- 612 children died before they turned fourteen.
- 440,082 children lived in families with very low incomes.
- 462,160 children received nutritional support through school meals programs.
- 19,522 children were victims of abuse or neglect.
- 15,164 youngsters lived in foster care.
- 2,912 teen mothers received inadequate prenatal care.
- 22,584 youngsters dropped out of high school.
- 23,452 juveniles were arrested for serious crimes.
- 485 teens died from suicide, homicide or accidents.

The pages that follow present the picture of child well-being in Michigan that could be painted with the information available in 1994. Core indicators for measuring the status of Michigan children's health, safety, economic security and education are revisited, and trends carefully tracked.

Overall, the majority of Michigan's children are adequately housed and nurtured. They have access to health care and wholesome recreation. They are receiving an education which will develop their potential and the skills necessary to function in the twenty-first century.

Offsetting this positive projection for Michigan's future is the growing share of the state's children who are not being reared with these supports. These children can be found in urban, suburban and rural communities across the state - communities where there is little economic development, few enrichment programs, and little hope for a better life. The 1994 KIDS COUNT book tells their story - in data, charts and graphs. It remains for the reader to see a child's face in each fact and figure.

Measures of economic security, housing, child care, education and health care often fail to reflect the complex dimensions of the needs of children and their families. In the next section, discussions of these five basic need areas address the state and national experience for families and children, critical issues, and policies and programs which carry the potential to impact outcomes for children. Child well-being and development is inextricably linked to that of family and community and their combined ability to meet the child's basic needs.

As in previous editions of the data book, profiles of child well-being for each county are featured. In the second section, county profiles focus on five areas: 1) economic security (the geographic distribution of poverty within counties); 2) ten year trends in three risky birth indicators; 3) K-12 education outcomes as reflected in the basic skills test results (Michigan Education Assessment Program scores); 4) trends in rate changes over time for each county on eight key indicators of child well-being and 5) the county trends as compared to the statewide trends.

Comparison of Michigan and Other Great Lakes States

by Selected Child/Youth Well-Being Indicators

National Composite Rank	MN	WI	OH	IN	MI	IL

in this edition, the appendix presents annual data for ten indicators for the state and counties. Rates for each year in a five year period are given, as well as precise numbers of children affected in the first and last year and the percentage change over five years and one year. This section allows yearly comparisons and provides updated information on indicators previously included on county profiles, such as child abuse/neglect, children in out-of-home care, juvenile arrests and children receiving free or reduced price lunches.

Michigan is compared with the other Great Lakes States on the ten national indicators, including its status on the community well-being measure, severely distressed neighborhoods. Since Michigan has more children in such neighborhoods than all but three states in the nation, some characteristics of these communities at-risk in the various counties are examined.

The well-being of children in Michigan compares poorly to surrounding states.

Each year the national KIDS COUNT data book provides the opportunity to compare the experience of Michigan's children with that of the nation as a whole and of other states. Michigan's peer states within the Great Lakes region – Illinois, Indiana, Minnesota, Ohio and Wisconsin – in their economic and demographic mix reflect patterns similar to Michigan.

Compared to all other states, Michigan has relatively high shares of children and youth affected by the negative outcomes measured by the KIDS COUNT indicators. (The 1994 national KIDS COUNT data book reviewed indicators between 1985 and 1991.) Compared to the other five peer states in the Great Lakes region, Michigan ranks at or near the bottom on eight of ten indicators, and ranks above only one state, Illinois, in its composite ranking of 38th among the 50 states and the District of Columbia.

Michigan's best rank among peer states was in its share of all births that are to single teens, where its 9.1 percent rate ranked it

third behind only two states – Minnesota with 6.6 percent and Wisconsin with 8.3 percent. In Michigan, roughly a third of births to mothers under age 20 are to school-aged mothers under 18 years of age; two-thirds are to mothers aged 19 and 20. (Babies born to teens who have not completed a high school education are considered more at risk because of the relatively low probability of the mother completing school and finding well-paid employment.) At the same time unmarried teens represent a shrinking share of all unmarried mothers. Because rates of births to unmarried women of all ages are rising in the country, by 1991 only a third of births to unmarried women were to teen mothers, compared to half in 1970.

Births to unmarried women and rising divorce rates have led to increasing numbers of single-parent families throughout the

nation. One baby in 20 was born to an unmarried mother in 1960; almost 6 in 20 were born to a single mother by

1990. Among never-married mothers between 18 and 44 years old, roughly a third had not completed high school, while 40 percent had only a high school diploma. In most of the Great Lakes

states, the percent of children in single-parent families has been rising steadily. In its share of children in such families (27.5%) Michigan ranks fourth: Wisconsin, Minnesota and Ohio all have smaller shares of children affected. One of the major concerns related to this trend is the high incidence of poverty for children in this family structure with only one wage earner available – about five times the rate for two-parent families.

On five indicators – children in poverty, infant mortality, child death rates, low birth weight babies and arrests of juveniles for violent crimes – Michigan's rates exceeded all other Great Lakes states except one. Its percentage of children in poverty at 20.5 percent was slightly better than that of Illinois, but significantly higher than Wisconsin's 12.7 percent, which was the best rate in its peer group. Michigan's infant mortality rate of 10.4 per 1,000 births was also slightly better than that of Illinois, but compared

Share of Children Being Raised in At-Risk Communities

Great Lakes States, 1990

State	Rate %	Rank
Minnesota	2.0	1
Indiana	3.0	2
Wisconsin	5.4	3
Ohio	8.1	4
Illinois	9.5	5
Michigan	11.5	6

National Average: 6.2%

poorly to the best rate - Minnesota's 7.5, and the national rate of 8.9. Its infant mortality rate placed Michigan 42nd nationally among all states and the District of Columbia, the state's second worst ranking on the national core indicators.

While Michigan's child death rate of 32.1 per 100,000 children between 1 and 14 years of age provided its best national rank of 30, this rate still exceeded those of all other Great Lakes States except Illinois. Roughly half of child deaths in Michigan in 1992 resulted from accidents and the rest from health problems, many considered preventable. Michigan and Illinois, with 7.8 percent of their babies born with a low birth-weight (under 5 1/2 pounds), suffer from rates almost 50 percent higher than Minnesota's 5.3 percent. The steadily rising percentage of low birth-weight babies among all Great Lakes states causes great concern since these babies face increased risk of health problems and sudden infant death syndrome.

Larger shares of Michigan's teens are at risk compared to peer states. In violent (homicide, forcible rape, robbery or aggravated assault) crime arrests of juveniles, Michigan's rate was better than only one state's - Indiana: 373 compared to 421 per 100,000 youth aged 10 to 17. Minnesota's rate was roughly half that of Michigan's. On another three indicators - teen violent deaths, percentage of teens not in school nor in the labor force, and share of students graduating from high school on time - Michigan ranked lowest among the six Great Lakes states. Its teen violent death rate of 77.0 (per 100,000 teens aged 15 to 19) contrasts to Minnesota's 49.3. While this indicator, which reflects deaths from homicides, suicides and accidents, worsened throughout the nation, Michigan exceeded the national average of 71.1.

The state's 6.6 percent of teens between 16 and 19 years old who are not in school nor in the labor force is triple the Wisconsin rate. Michigan's percentage worsened by roughly 40 percent between 1985 and 1991, compared to a 7 percent improvement in the nation as a whole. The 69.4 percent of Michigan teens graduating from high school on time remained essentially the same over the five years while the national percentage, which at 68.8 is slightly better than Michigan's, worsened slightly. Almost

Distressed Neighborhoods - Average	31.8	42.2
All Neighborhoods, All Counties - State Average	13.1	18.2%

*Using the example of Berrien County, this table can be understood to mean that one or more neighborhoods/communities of 4,000 people each in Berrien County have an average poverty rate among all residents of 54.4% and a poverty rate among children of 66.1%. Source: 1990 U.S. Census.

percentage points separate Michigan's rate from the best rate among its peer states: 88.3 percent in Minnesota.

The key well-being indicator explored in the 1994 national *KIDS COUNT* data book reflected at-risk neighborhoods and communities in which children were growing up. On this indicator, the share of Michigan's children living in distressed communities placed the state last among its comparator states with its rate of 11.5 percent versus the average of the other Great Lakes States of 5.6 percent. Michigan had more than twice the share of its children living in at-risk communities than its peer group of neighboring states.

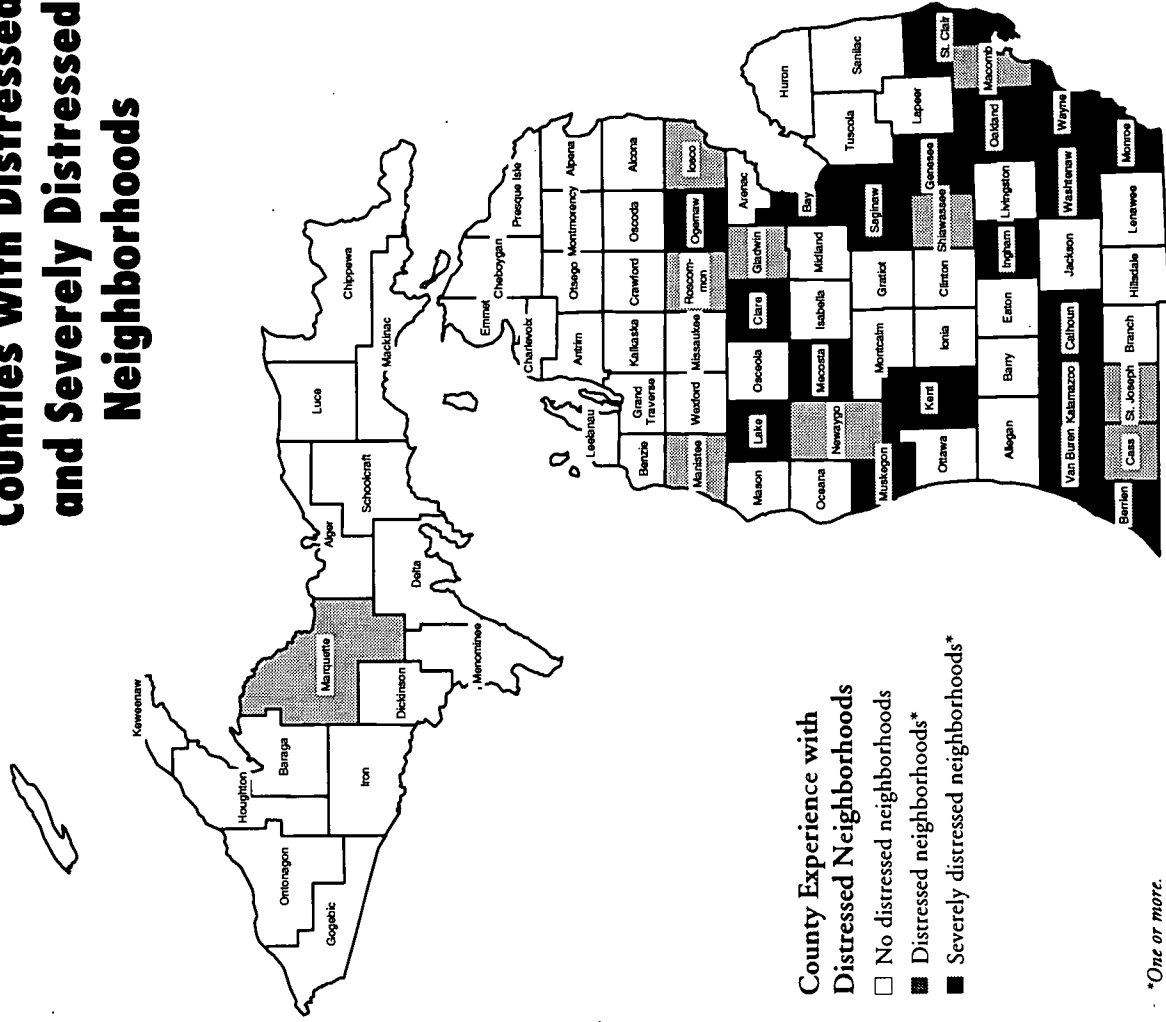

In thirty counties, children are reared in at-risk communities.

To provide a community framework for the measurement of child well-being, *KIDS COUNT* reviewed the characteristics of troubled communities and neighborhoods in the affected counties. According to the last U.S. Census, every ninth child in Michigan lives in an at-risk community – a geographic area in which more than one in three residents are mired in poverty and one in two men have only part year employment; where one in three neighbors rely on low public assistance income for basic needs; where the mother is the only caregiver in half the homes; and where one in five youngsters drops out of high school before graduation.

Such at-risk communities – distressed or very distressed, depending upon the concentration of these stress factors in their neighborhoods – number more than 400 in Michigan and are spread across the state in thirty counties. They provide the physical, economic and social environment in which 380,000 Michigan children and youth are being reared; children whose well-being is jeopardized by these troubled neighborhoods.

For the children who live within their boundaries, these at-risk communities and neighborhoods negatively affect their personal safety, the quality of their housing and education, their access to constructive recreation, and the jobs available to them. Their communities offer them too few chances to succeed and too many chances to fail.

Communities at Risk: Counties with Distressed and Severely Distressed Neighborhoods

Reinforcing this view, a recent study by Michigan's Institute for Social Research, which monitored 1,700 children over a 21 year period, reports that the chances that children will drop out of school would be reduced by 52 percent if the community could provide "good" neighborhoods for all of the children being raised in "bad" neighborhoods. (In the study, a "bad" neighborhood is characterized as one with a high number of school dropouts and children being reared by a single mother, and with very low numbers of people in professional or managerial jobs). The analysts noted that frequent changes in housing, which impoverished families experience, may threaten children's educational success as well. According to this study, the probability that children will drop out of school would be cut by one-half if their housing remained stable during their school-age years, rather than changing an average of four times. Stability during their growing-up years would also likely push the nonmarital birth rate for teens down by 31 percent.

Policy analysts suggest that improving the chances of children in Michigan's at-risk communities to become healthy, skilled and productive adults will take not only an investment in these especially vulnerable children and their fragile families, but also in their troubled communities.

As can be seen by this overview, the picture of the well-being of children in Michigan reveals a bleak future for many youngsters. Growing up without many basic needs being met in their formative years, their individual potential is stunted and social contribution thwarted. The section which follows will examine five issues which bear directly on the potential for positive outcomes for the next generation. A better understanding of critical issues related to economic security, housing, child care, education and health can provide the context needed for addressing the multiple challenges which are raised by this year's data.

Dimensions of Michigan's At-Risk Communities: Male Unemployment of More Than 50 Percent

SECTION I: Children and Their World: Five Critical Needs

The five over-arching needs — economic security, housing, child care, education and health — selected this year for discussion are all closely related to those indicators which have been measured at the county level. Although many aspects of these need areas cannot be reported on a county basis, the discussions provide a context for reviewing the information in the county profiles which focus on health, education and economic security.

The discussion of economic security — the basic resources available to families so they can provide for the needs of their children — encompasses the poor and the near-poor (the so-called “working poor”) who often do not have benefits to augment their incomes. Low-income families have been particularly affected by cutbacks in low-cost housing programs, undoubtedly having an impact on the many children who live in these families. Information about housing for children and their families is not readily available, yet the adequacy and stability of housing defines a child’s physical, emotional and social environment. As housing costs take a larger share of income, many low-income families struggle to provide safe and stable housing for their children.

With more mothers employed outside the home, the need for child care has increased. Although information is limited and the issues complex, the accessibility, affordability and quality of that care must be monitored. Many more toddlers and infants spend most of their day outside the home on a regular basis so a large share of this generation will be affected by the child care system.

Second only to the family in shaping a child’s future, the education system plays a key role in the lives of the state’s children. Dropout rates and results of standardized tests are the traditional measures of its effectiveness, but they do not adequately reflect the range of issues affecting children. Increasing numbers of poor children with health and nutrition needs place heavy demands on the schools.

While several health indicators are reviewed annually in KIDS COUNT data books, some important health data for many aspects of this vital dimension of a child’s life are not readily available. Estimates vary on the share of children without coverage or access to health care services. Children without consistent quality health care, especially preventative services, such as immunization, can be severely hampered in their growth and development. In several areas of health care, such as mental health and dental care, as well as coverage and access issues, and the overall health status of children, county-level information across the state is not available.

conomic security

In 1994, the lack of economic security or adequate income continues to be a problem for many Michigan families with children. Insufficient income hampers the ability of parents to provide for the basic needs of their children, such as housing, food, health care and safety. Inadequacies in these basic needs have long-term and profound effects on their children's future opportunities.

Economic security for families has diminished.

Economic security is becoming increasingly elusive for many families with children, both nationally and in Michigan. In 1990 dollars, the median incomes of U.S. families with children headed by an adult under 30 fell by one-third between 1973 and 1990, from \$27,765 to \$18,844. Nationwide in 1991, nearly a fourth of young families headed by an adult between 25 and 34 years of age had income below the poverty line. In Michigan, the percent of the state's families with children under five years of age with incomes below the poverty level increased 48 percent in the decade between 1980 and 1990.¹

This erosion in the income available to Michigan families is attributable to several factors, including economic and labor market changes, changes in family structure and stagnation of benefit levels in the primary public program which provides cash support to families – the Aid to Families with Dependent Children Program (AFDC).

In Michigan, manufacturing jobs that have paid family-supporting wages continue to decline in number: over 110,000 such jobs were lost during the 1980s alone. Workers losing manufacturing jobs often do not have the skills, or access to the education or training needed to compete for service sector jobs which pay comparable wages. Further, many more jobs now provide only temporary or part-time employment. Consequently, even though unemployment has fallen and more people in the state are working, many families are earning less.

This recent phenomenon has been exacerbated by the fact that inflation continues to erode the value of the minimum wage. In 1992, a family of three with one parent working full-time at minimum wage would have an income equal to roughly 80 percent of the poverty level. In 1994, this same family's minimum wage earnings represent only 75 percent of the poverty level. Economic analysts report fully one in five full-time workers in the state has annual earnings below the poverty level.

Changes in family structure erode economic security for children.

Changes in family structure have contributed significantly to the economic insecurity experienced by many families. The only families to experience income gains in the 1980s were married-couple families with children and families without children; much of the stability in the incomes of married-couple families with children is based on the entry of a second parent into the labor force. In 1990, the average income of married couple families with children was 324 percent higher than the income of single female headed families (\$49,958 compared to \$15,419). These figures are particularly disturbing since one of every two American children is likely to live with a single parent, usually the mother, at some point. In 1990, about one in ten children in the nation lived with a divorced parent; another 7.7 percent lived with a single never-married parent – usually the mother.

This trend suggests that the next generation of children will be increasingly dependent on mechanisms outside the household for economic support in their growing-up years. Given this likelihood, the effectiveness of the nation's child support collection system takes on added significance.

More children now depend on the child support collection system than on any other public institution except the public schools. Between 1982 and 1993, the number of child support cases in Michigan almost doubled: from nearly 578,000 to 1,160,000, according to a recent report by the Children's Defense Fund.²

Although the number of custodial parents – mostly mothers – who receive child support has risen, the gains have occurred mostly for children in divorced families, compared to the separated or never-married. During 1989, slightly over half of divorced single mothers received some support payments, compared with less than a third of separated mothers, and less than 15 percent of never-married mothers.³ Obviously, the potential for payment of child support increases when the absent parent has a well-paying steady job.

Michigan's child support collection system ranks high on several measures compared to other states in the nation. The state establishes paternity in 71 percent of cases compared to the national median of 42 percent, earning it a rank of seventh in the nation in this area.⁴ In establishing support orders, Michigan also ranks high: it institutes support orders in nearly two of every three cases, compared to one of three nationally. The state's relatively stable, and historically well-paying, labor market has helped to yield a high average annual amount collected per case – a measure in which Michigan also ranks in the top ten states.

In spite of Michigan's good performance in these areas, in 1992 four-fifths of Michigan children with support due received no income from their non-custodial parent during the entire year.⁵ Currently, roughly \$2.5 billion is owed in unpaid child support to 750,000 Michigan families with court-ordered support, according to the Office of Child Support of the State Department of Social Services.

When no other support is available, the AFDC program serves ultimately as the safety net which assures that children's basic needs are met. Most AFDC families are single-parent, although a growing share, 12 percent of AFDC families, have two parents in the home. Yet, the effectiveness of this income support program in providing adequately for families' needs has been diminished as a result of inflation and retrenchment in government expenditures

on programs for the poor. The 430,000 Michigan children who depend upon the AFDC program and food stamps for their basic needs are supported at a level 30 percent below poverty. More than three-quarters of the AFDC grant of \$459 a month for most families is expended on shelter. A family with shelter costs at Fair Market Rent level would have only \$98 left to pay for food not covered by the food stamp allotment, clothing, school supplies, personal care and cleaning supplies, and transportation.⁶ In Michigan, inflation has reduced the purchasing power of AFDC grants by 20.4 percent since 1985, with the actual grant level now at its lowest level since 1987.

One in three Michigan children is poor or near-poor.

The alarming scope of child poverty in Michigan results from changes in the economy and reductions in public support programs. One of every five children and youth now lives in poverty. Children are almost twice as likely as any other group to be in poverty; they comprise only one quarter of the state's population but represent 40 percent of all those living in poverty. Child poverty rates for African-American and Latino/Hispanic children are significantly higher than those of other ethnic/racial groups (46 percent and 24 percent respectively).

Of particular concern is the fact that poverty rates among the state's most vulnerable group – young children under five years of age – increased 44 percent during the 1980s, compared to a national increase of 26 percent.⁷ Michigan has two of the nation's cities with the highest percentages of young children in poverty: Detroit with a 50 percent young child poverty rate and Flint with 47 percent. The 29 percent poverty rate among young children in the state's capital city, Lansing, matches that of New York City.

Larger numbers of children live in economic insecurity than is apparent from statistics about poverty. The poverty level for a family of four in 1989 was a gross annual income below \$12,674 (\$14,800 in 1994). Near-poor families with incomes of up to 185 percent of poverty (\$23,446 for a family of four in 1989; \$27,380

in 1994) may still lack sufficient resources to provide for the basic needs of their children. Although policy and program analysts continue to rely on federal poverty guidelines as a national measure of economic well-being, many agree that it is based on an outdated formula and does not take into account wide variations in the cost of living or sizeable out-of-pocket expenses for necessities such as child care or health care which are experienced by many families with young children.

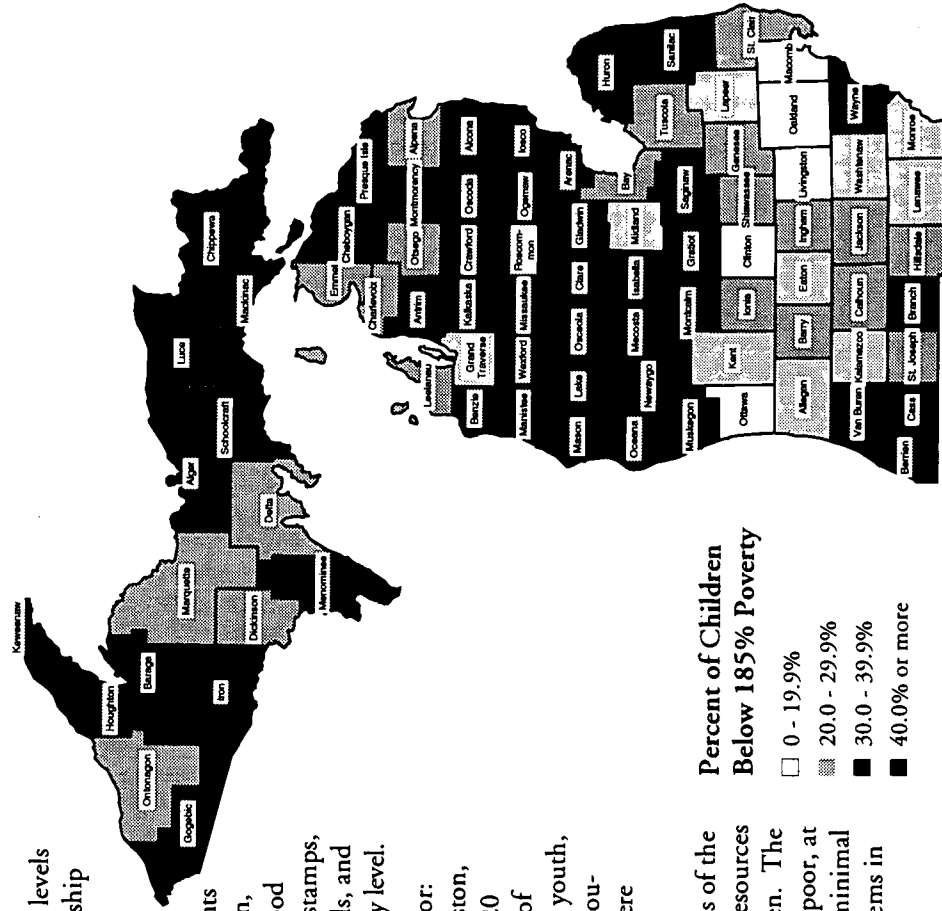

In an industrialized state such as Michigan, family income levels below 185 percent of poverty clearly signal economic hardship given current costs of housing, transportation, health care, child care and food. In recognition of the needs of individuals and families classified as "near-poor," many programs, especially for health and nutrition, use increments above the poverty level to establish eligibility. The Women, Infants and Children program (the special supplemental food program for pregnant women, infants and toddlers), food stamps, free and reduced price lunch programs in the public schools, and Medicaid all use income eligibility standards above the poverty level.

In Michigan 813,707 children were either poor or near-poor: one of every three children. In only five counties - Livingston, Ottawa, Macomb, Oakland and Clinton - were less than 20 percent of the county's children poor or near-poor. In 47 of Michigan's 83 counties, at least 40 percent of children and youth, or two of every five, were poor or near-poor. Even more troubling, in 17 Michigan counties at least half of the children were poor or near-poor.

Economic and social trends have placed increasing numbers of the state's children at risk. Families with children have fewer resources in an era where the costs of providing for children have risen. The fact that almost one of every three children is poor or near-poor, at income levels where health care, decent housing and even minimal nutrition may be a problem, signals the potential for problems in many other areas related to a child's well-being.

Housing provides psychological as well as physical shelter for children. When stable, it offers a secure space with familiar faces, friends, routines and possessions, and provides a base for connection to family and community. Although housing is a critical component in child well-being, the adequacy of the housing which shelters Michigan's children cannot be easily assessed because data on housing issues for families with children are not readily accessible. Available information suggests that for many low-income families, housing has become synonymous with disrepair, high rents, and unsafe environments. Retrenchment in federal housing subsidies, abandonment and gentrification of housing in urban areas, the downward pressure on earnings, and a decline in the purchasing power of both the minimum wage and state assistance to families have all contributed to the housing problems which confront an increasing number of the state's families.

Affordability and suitability are the two most critical dimensions of housing. Affordability can be assessed by reviewing the proportion of families who spend a disproportionate share of their income on their housing costs and examining trends in the rate of home ownership. Housing suitability issues include physical and structural inadequacies and overcrowding. The affordability and suitability of their housing affects all families with children, with poor families the most likely to be unable to resolve their problems satisfactorily.

Many families with children, particularly renters and low-income families, cannot afford adequate housing.

Affordable housing is becoming more difficult to obtain, particularly for families with children and limited economic resources. Housing is considered affordable by the U.S. Department of Housing and Urban Development (HUD) if it consumes less than 30 percent of household income. In 1991, about 8.8 million of the nation's families with children — one family in eight — lived in housing which was not "affordable." Families with income below the poverty level represented over 40 percent of these families. Renter families with children were twice as likely to spend over 30 percent of their income on housing as owner families with children.

Even more troubling, in 1989 three million of the nation's families with children spent more than half their incomes for housing; two-thirds of these families — 2.2 million — were renters. One in five families with children who rent spend over half their income on housing compared to only one in 17 such families who own their own homes. The large proportion spent on rent was not the result of these families' paying higher rents: families spending over half their incomes for housing had only slightly higher average rent payments of \$463, compared to \$438 for all renters.

In Michigan, as in the nation, the problem of housing affordability is particularly acute among renters. In 1991, a Michigan family needed \$19,600 in income to pay the "fair market rent" (FMR) of \$490 for a two-bedroom unit. (Fair market rent is the cost of rent and utilities for a modest but adequate unit.) At this required income level, which at \$9.42 an hour represents more than double the current minimum wage, almost half of the state's renters were unable to afford such a unit.

The roughly half million Michigan children supported by Aid to Families With Dependent Children (AFDC) in any given month are a particularly vulnerable group among renter families. The high proportion of the average public assistance grant consumed by housing costs places these families in continuing financial crisis. A three-person family receiving the maximum monthly AFDC grant in Michigan would only have \$35 left from their monthly grant for all their children's other needs after paying the fair market rent for a two-bedroom unit. In 1989, only one of every four Michigan AFDC renters received in their grant a shelter allowance adequate to cover their actual rental costs.

A substantial portion of Michigan's renter households spent a disproportionate share of their income for housing in 1990:

- 80 percent of all households with incomes below \$10,000 spent more than 30 percent of their scarce resources on housing; one-third of these households had children;
- In only two counties — Iosco and Keweenaw — were renters better situated with fewer than 60 percent of households spending a disproportionate share of income on housing; and
- At higher income levels (between \$10,000 and \$19,000 per year) the burden is less, with 60 percent of households spending more than a third of their income on housing.

One-quarter of all Michigan families with children rent their housing. Statewide, half of them spend more than 30 percent of their income on housing; however, wide variations occur among counties:

- In Lake County, more than 70 percent of families with children spend a disproportionate share of their income on housing;
- In Genesee, Luce, Roscommon and Saginaw counties, more than 60 percent of families with children have housing costs at this level;
- In only 18 counties were less than 40 percent of families with children experiencing this housing burden; and
- The smallest percentage of families with children spending a disproportionate share of their income on housing was found in Ottawa County where only 33 percent of such families were in this situation.

Subsidized housing in Michigan has not offered the same support to families with children as it has in other parts of the nation. Compared to national averages, Michigan AFDC families are far less likely to live in public housing (2% of families, compared to 9.5% in the nation); to have rent subsidized by HUD (7.5% compared to 11.5%); or to have a rent free housing unit (4.7% compared to 6.8%). In comparable states in the Midwest, the proportions of public assistance recipients in subsidized housing are much higher: Ohio has eight times as high a share of its poorest citizens in supported housing; Indiana four times; Illinois six times. Seventy percent of Michigan's poorest children live in private housing with no subsidy, compared to 60 percent in Ohio and Indiana and only 40 percent in Minnesota.

Fewer families today are able to look forward to eventually owning their own home. Nationally, by 1991, the homeownership rate for families with children had dropped to 61 percent, down from 70 percent in 1978, and middle income families experienced the most significant declines in homeownership rates. In Michigan, homeownership for families with children ages 3-17 at 73 percent is higher than the national average, but varies by county. For example, a third or more of families with children are renters in several counties with large populations of children such as Calhoun, Genesee, Ingham, Marquette, Washtenaw, and Iosco. In Wayne County, 40 percent of families with children rent their housing.

Data from the Home Mortgage Disclosure Act (HMDA) have demonstrated that African-Americans and Latino/Hispanics face an additional barrier to home ownership in that they are twice as likely to have their loan applications rejected as their white counterparts at the same income level. According to the 1990 U.S. Census, in Michigan, two of every three white households owned their housing compared to about one in two African-American, Native American, Asian and Latino/Hispanic families.¹

The housing problems of low-income families have been exacerbated by a shortage of low-income housing units. Nationally, HUD's low-income rental subsidies dropped from an average of 290,000 low-income households added each year between 1977 and 1980, to only 78,000 additional per year between 1981 and 1991. Retrenchment also occurred in the Farmers Home Administration (FHA) programs which assist rural home purchasers; the average number of additional households helped each year in these publicly subsidized programs was cut by more than half between the late 1970s and the 1980s. The supply of low-rent housing in the nation's private market has declined as well. In 1973, there were approximately 4.8 million low rent (less than \$250 per month) unsubsidized units available; by 1989, the number of units had dropped to 2.8 million—a decline of 41 percent in 16 years. Abandonment, gentrification of neighborhoods, upgrading of rental housing units and high energy costs all contributed to this decline.²

In Michigan, low-income rental units are also in short supply. In Detroit alone, the number of low-income renter households exceeded the number of low-income rental housing units by more than two to one in 1989. Between 1974 and 1989, the shortage of affordable housing in the Detroit area more than tripled as the number of low income renters expanded, and the inventory of low-rent housing contracted. Affordable housing in the Detroit metropolitan area was so limited that 81 percent (88,200) of poor renter households spent at least half their income on housing costs in 1989.³

The growing number of low income families, plus a shortage of available units, has relegated many families to substandard and overcrowded housing.

The absence of a state minimum standard code for housing contributes to problems of unsafe and unfit housing which confront low-income families. The lack of standards particularly

Fewer families today are able to look forward to eventually owning their own home. Nationally, by 1991, the homeownership

rate for families with children had dropped to 61 percent, down from 70 percent in 1978, and middle income families experienced the most significant declines in homeownership rates.

By this standard, 12,251 children in Michigan are living in substandard housing.⁵

The American Housing Survey assesses the physical condition of homes including maintenance issues such as water leaks, peeling or lead-based paint, broken plaster, holes in the floors or walls and exposed wiring. In 1991, an estimated 3.1 million of the nation's children lived in housing with such problems. More than one in every 10 renter families with children (11%) and 7 percent of owner families with children lived in such housing. Low-income families were the most vulnerable: among families in housing with severe or moderate problems, 49 percent of renters and 21 percent of owners had incomes below poverty. Among the renter families with children, minority families were more likely to be affected: 21 percent of African-American families lived in housing with physical problems and 16 percent of Latino/Hispanic families, compared to 9 percent of white families.

Overcrowding is another important indicator of substandard housing and is defined by the U.S. Census as more than one person per room. Families with children occupy almost all (95%) of the 2.5 million overcrowded housing units in the nation; a quarter of a million Michigan children — almost one in ten of the state's children — live under such adverse conditions.⁶ Among renters, over half — 57 percent — of crowded families live in central cities. Overall about 16 percent of central city renter families with children live in overcrowded housing. Minorities are also disproportionately affected by overcrowded housing: nationally, Latino/Hispanic children are twice as likely as African-Americans and six times as likely as whites to live in overcrowded conditions.⁷

More families with children have become homeless.

Children in families which bear severe cost burdens for housing are more likely to experience episodic or long-term homelessness. Some are on the streets and in shelters; others are living with friends or relatives. In 1993, the U.S. Conference of Mayors' annual homelessness survey of 26 cities found that children were the fastest growing population among the homeless — they now represent 43 percent of all homeless persons, up from 32 percent in 1992.⁸ Another survey of 19 cities by the National Law Center

on Homelessness and Poverty (NLCHP) found that almost three-quarters of the shelter programs surveyed did not have enough space for families seeking help. Among the homeless population, shelter overcrowding as well as age and gender restrictions sometimes separate children from their parents or siblings. A survey in Omaha by NLCHP found that 75 percent of women seeking shelter had at some point turned the care of their children over to the foster care system, relatives or friends due to a lack of affordable housing. Many homeless parents fear having their children removed from their care because they are unable to provide suitable housing.

In Michigan as elsewhere, the number of homeless children is difficult to estimate, but some data are available on the number of families and children served by shelters. In Oakland County, children in shelters increased by 40.9 percent between 1992 and 1993. According to the Michigan Department of Education, approximately 140,000 children were homeless during the 1993-94 school year.

Many analysts maintain that the problem of homelessness among children has been exacerbated by state and federal policies which have not acknowledged inflation in setting minimum wage levels and public assistance grant levels. In 1992, the federal minimum wage was 23 percent below its average value during the 1970s. Further, the purchasing power of the average AFDC benefit in Michigan has declined by over 20 percent since 1985; the maximum AFDC grant, with full use of food stamps is now 30 percent below the federal poverty level. Policies which support temporary rather than permanent solutions to the housing crises faced by many families with children will not adequately address this important aspect of well-being for children.

Information about housing for families with children, which is such a critical component of child well-being, should be more readily available for state and local communities. The increased numbers of homeless children, the rising costs of housing as a proportion of income and the poor quality of housing, particularly for low-income and minority families, signal disturbing trends in the provision of providing secure and stable housing for children.

Number and Percent of Renter Households Paying Over 30% Income for Housing

The manner in which children are raised varies over time to reflect societal norms and changes in family structure. Despite these changes, the importance of raising children remains constant. As growing numbers of children are cared for, at least in part, by persons other than their parents, the nature and quality of that care has serious implications for their well-being.

One of the most important social, demographic and economic changes occurring in recent decades is the increase in labor force participation of women with children. Rising divorce rates and marriages delayed or foregone have resulted in more single parents raising children and working out of economic necessity. Two-thirds of mothers in the labor force are single, widowed, divorced or married to a man earning less than \$15,000 a year.¹ Additionally, working parents, mothers and fathers, often return to work prior to their infant's first birthday. This speedy return is required to maintain income, a foothold in the labor force, or a place on a career path.

Demographic and economic changes have also been accompanied by a change in social attitudes about women and work. For the poorest families with children – those receiving support from the public assistance system – state and federal welfare policies increasingly encourage the earliest possible entry into the paid labor force or enrollment in programs to prepare for work.

Access to affordable, quality child care is particularly limited for low- and moderate-income and single-parent families.

While trying to provide for themselves and their children economically, parents often either cannot find child care services or face prohibitive costs. The average annual cost for a full year of child care for one child in Michigan is nearly \$4,500, ranging from a low of \$2,925 in Lake County to a high of \$5,873 in Washtenaw. Child care costs for one child full-time consume 9 percent of the average income for married couple families and nearly 30 percent (28.7) of that of single-parents in the state.² When additional children need care, costs rise proportionately. Low-income families nationwide devote roughly one-quarter of their income to child care.

According to the National Child Care Survey, seven of ten families with incomes over \$50,000 purchased non-relative care for their children, compared to only four of ten families with incomes below \$15,000. Poor or near-poor parents are much more likely to rely on relatives rather than pre-school or child care center programs. While state child care reimbursement rates for AFDC and low-income working parents are paid at the 75th percentile or market rate, parents often experience a shortfall because the state reimburses by the hour and most child care programs charge by the day or the week. Lack of transportation also limits child care choices.

Low-wage workers often have jobs that are unstable, temporary and require nontraditional work hours. Further, young families – usually with younger children – are typically less financially secure than more established families at the very time when they must purchase costly infant care. Infant care, care for children with special needs, and services for those not working a traditional schedule are in short supply at any cost; the dual problems of cost and supply present a major barrier to the affected families.

Low compensation rates paid to child care workers have a direct impact on high staff turnover and indirectly on the stability of care. While the cost of child care is a concern for parents, compensation for child care providers is low compared to other occupations. A national staffing study comparing data collected in 1988 and 1992 found that the hourly wage for entry-level child care providers in metro Detroit had actually declined from \$4.60 per hour to \$4.52 per hour. Additionally, most child care workers received few or no benefits. Over the same period, 7 of every 10 people employed in child care had left the profession.³

The supply of regulated child care does not match the demand.

Although the child care market is constantly changing, the number of child care spaces licensed by the State of Michigan at any point in time falls far short of the need.

Over 440,000 Michigan children under the age of six have some need for on-going child care due to parental employment. This total does not include children of parents seeking care to look for work, for initial or continued participation in education or training programs, or for social enrichment for their children. According to the Michigan Department of Social Services, there are fewer than 280,000 regulated child care slots in centers and family and group day care homes in Michigan; this number could accommodate less than 60 percent of all children under six whose custodial parents are working.⁴

When examined at a county level, licensed care capacity is spread disproportionately across the state. Some counties are able to serve higher shares of children in regulated facilities. In Emmet, Ingham and Midland counties, for example, less than 20 percent of children under six years old with both or single parent(s) in the labor force would not have access to licensed care. In nineteen

counties, however, over 60 percent of children under six with both parents or a single parent in the labor force would not find licensed child care.

Other family members, including grandparents, often play a role in the care of children. In a national sample of parents in 1989, 75 percent said they preferred having relatives care for their young children.⁵ Relative care is chosen for a variety of reasons, not necessarily related to the quality of care. Many families — particularly those with young parents or limited incomes — use lower cost relative care when it is available, due to a trust in relatives, a distrust of other care providers, or lack of sufficient income to pay for other higher cost care arrangements.

Changes in family structure have resulted in the increasing isolation of nuclear families, causing fewer parents to have the option of relative care, thereby limiting their care provider choices.

An additional 1,027,000 Michigan children between the ages of 6 and 17 also have working parents and may require some form of care or supervision before or after school. Changes in hours of classroom participation, due to staff development or other activities, often complicate the care arrangements for school-age children. In a national study, it was found that although three-quarters of children ages 5 to 14 were in school most of the hours their mothers worked, and

another 11 percent were cared for in their own home — usually by their father — only 3 percent were involved in a school-based activity during the remaining hours that their parent(s) worked, routinely leaving roughly 4 percent of 5- to 11-year olds and over 16 percent of 12- to 14-year olds unsupervised for periods of time each day. Far more may be left unsupervised periodically.⁶

* 1992 Survey of Local Costs by Michigan Child Care Coordinating Council
Source: 1990 U.S. Census.

Public supports fail to ensure access to quality care for all children.

The Dependent Care Tax Credit, the largest federal child care support program, has expanded substantially since the early 1980s. Families that incur child care

expenses in order for a parent to work outside the home can receive this credit which reduces their federal tax liability.

The credit varies with family income; lower income families receive a slightly larger credit. This credit, however, offers

little benefit to poor families who have little or no federal income tax liability and cannot afford the out of pocket costs of ongoing child care.

Several federal programs currently provide direct child care assistance to low-income families: the AFDC/JOBS Child Care and Transitional Child Care for Aid to Families with Dependent (AFDC) and former AFDC families; At-Risk child care; and programs funded through the Child Care Development Block Grant for low-wage working families. Head Start services are also available to a small number of eligible low-income families.

Michigan has consolidated state and federal funds to help low-income parents pay for child care directly through the Unified Child Care program administered through the Michigan Department of Social Services (MDSS). Despite this commitment to additional coordination of programming, Michigan is one of only two states which fail to invest sufficient state resources to access all of the appropriated federal match funds for the At-Risk Child Care program.

Child care assistance is available through the MDSS for four groups: 1) low-income working parents who meet income eligibility criteria; 2) recipients of AFDC who are in approved training and education programs; 3) families which need services for family preservation; and 4) families in transition from welfare to work. This unified system serves roughly 26,000 families in Michigan, subsidizing care for 41,000 children.⁷

The major federal initiative to increase opportunities for low-income children to participate in developmental preschool programs is Head Start. Head Start is a comprehensive child care and early childhood

development program primarily serving children in families with incomes below the federal poverty level (currently \$14,800 per year for a family of four). Approximately 75,000 three to five-year old children are eligible for the Head Start Program in Michigan yet only 41 percent of those eligible — just over 30,000 children — were served by Head Start in 1993.⁸ An increased federal commitment to the Head Start program in recent years has resulted in more children being served and more programs being provided than in earlier periods. Despite these expansions, the majority of programs operate for half a day, four days a week, and do not meet the child care needs of most working parents.

Other public programs are available to special populations of preschool aged children and are coordinated through the Michigan Department of Education. Michigan's state-funded Preschool Initiative for At-Risk 4-Year Olds serves children at risk of school failure due to language deficiency, developmental problems, or chronic illness. Due to this broad definition of the program's target population, it is difficult to assess the potential need for program slots, but it currently serves an estimated 13,000 Michigan four-year olds. Further, over 4,500 Michigan children are enrolled in the federal Chapter 1 preschool program for educationally disadvantaged children, and nearly 19,000 impaired or developmentally delayed preschoolers receive special education services through local or intermediate school districts.⁹

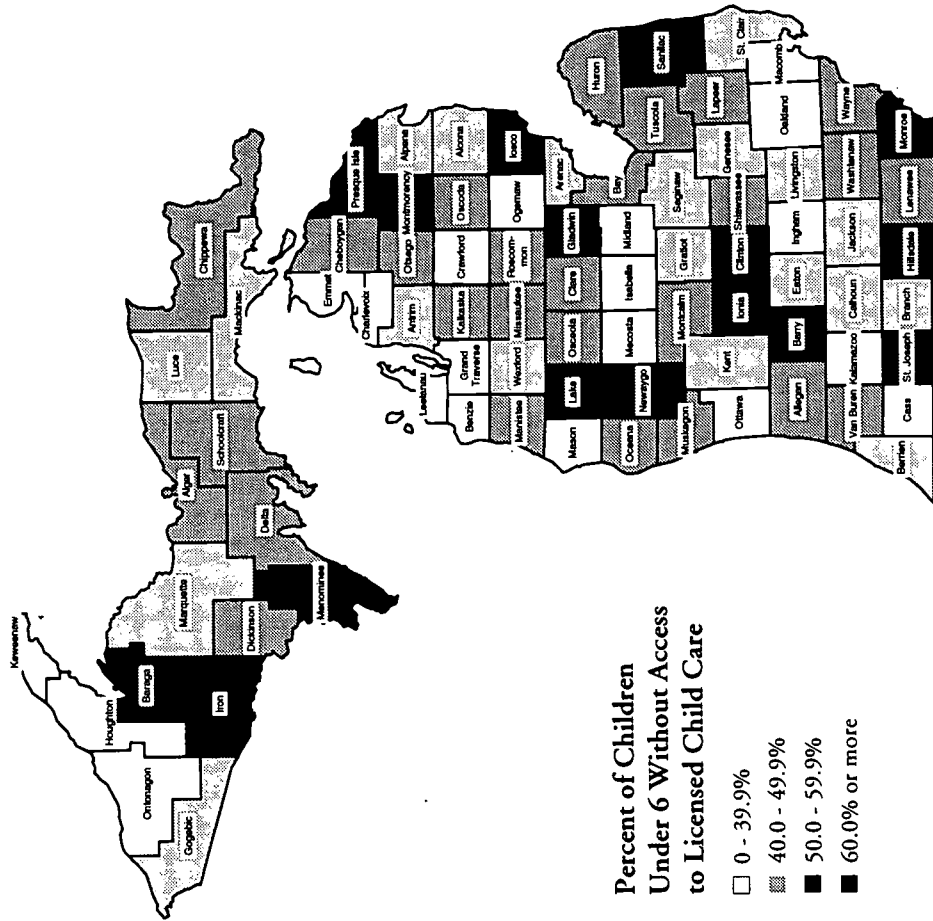

These public programs, as well as many employer-sponsored or otherwise privately funded programs, allow some of the state's families with lower incomes to reduce the share of their income committed to the cost of care and expand the range of child care options available to them. When such public and private subsidies for families with low- and moderate-incomes are supported with adequate funding and access, they can protect against a two-tiered system of care in the state based on family income.

The issue of child care and early childhood education is increasingly linked to the state's economic well-being. Child care helps families remain self-sufficient and productive. Further, a strong body of evidence supports the assumption that quality child care and early childhood education improves social and educational outcomes for children, particularly those from low-income or otherwise disadvantaged families.

Potential Licensed Child Care Coverage* for Young Children with Working Parents

*1992 Survey of Local Costs by Michigan Child Care Coordinating Council.
Source: 1990 U.S. Census.

At the turn of the century about one in ten youngsters graduated from high school, and most youth did not attend high school at all. Although the institutional structure remains essentially the same, all youth are now expected to continue their education through high school graduation. Fewer and fewer options exist for the "dropout." At the same time, schools are increasingly asked to provide for needs previously met by other institutions, such as the family and church as well as neighborhood and community groups, and still ensure that students who graduate have basic skills. Further, many changes such as state-endorsed diplomas, extended school years, core curriculum development, accreditation, use of advisory councils, and maintenance of student portfolios are being legislated in Michigan. The state's educational system, already struggling under great pressure to change and adapt to meet the challenges of ensuring successful outcomes for all children, must address the heightened needs of children as well as requirements for demonstrable outcomes.

Increased numbers of at-risk children place additional burdens on school systems.

Increasing numbers of school-age children in the nation are poor, racially and ethnically diverse, and at risk of school failure. While nationally the total school-age population declined by 5 percent (2.3 million) in the 1980s, the national poverty rate for school-aged children increased from 15.3 to 17.2 percent over the same period. In Michigan, the percentage of school-aged children in poverty increased at nearly twice the national rate of increase, from 13.4 percent to 16.7 percent of all students — a total of 288,577 children in the state's K-12 public school system at risk due to their family's inadequate income.

In twenty-one of the state's districts at least half of all school lunches served are fully subsidized, underscoring the large num-

bers of children who are poor and in need of school-based nutritional support. Poverty creates other barriers and problems: poor children are more likely to suffer from poor health and nutrition, change schools frequently, fall behind their grade level, and have higher rates of absenteeism, according to a 1994 report by the General Accounting Office.¹ Studies point to a major contributing factor: they indicate that children who change schools frequently are at extreme risk — almost twice as likely to read below grade level and eventually drop out. Several Michigan counties also have concentrations of at least 5 percent or high numbers (at least 500) of their school-age children with Limited

English Proficiency (LEP). Since these children are often poor, their problems in school are compounded. Should these groups of children experience academic failure in the late elementary grades, they are at increased risk of drug abuse, delinquency, teen pregnancy and school drop out.² Inadequately addressing the needs of at-risk children within schools and communities will leave many of them vulnerable to negative outcomes in adolescence, future joblessness and a lifetime of struggle with insufficient income.

High concentrations of children in poor families create tremendous pressure on affected school districts and individual schools within those districts. Frequently communities whose residents have the least resources available to them also have the highest proportions of at-risk students. Although education is accepted as the most successful vehicle which transports individuals up the socio-economic ladder, schools in actuality have been more likely to function within constraints which are very similar to those faced by their student populations. In Michigan schools, children of color — who comprise more than a fifth (21.9 percent) of K-12 public school enrollment — are also relatively concentrated: half of the state's children of color attend school in districts where 90 percent of the children are also non-

white.³ In an era of increased recognition of the value of multiculturalism, this situation limits the opportunities for most of the state's children and youth to experience diversity in their formative years. High levels of racial and ethnic segregation previously associated only with the largest old urban settings also now typify many smaller urban areas throughout the state.

Schools currently provide special services to many vulnerable groups of children such as those who are physically disabled or emotionally impaired, severely handicapped or medically fragile, or learning disabled. Students from families with low-incomes, including children under five years of age, also qualify for special services. Some of these populations have increased, even while total school enrollment is dropping. For example, between 1980 and 1992 the special education population increased 10 percent, mainly driven by a 72 percent increase in learning disabled (LD) students.⁴ (Some debate exists, however, about whether increases in numbers of children diagnosed to be in need of services are due to an increased incidence of problems or increased recognition of special needs.) Although all school meals are partially supported by federal funds, in 1993-94 they were provided free or at a reduced price in Michigan to nearly 462,160 eligible youngsters whose family income was below 185 percent of poverty – 29.6 percent of all K-12 students. Throughout these special support programs, male children, low-income children, children of color, and students with limited English proficiency tend to be over-represented.

The ability of some school districts to provide services to at-risk students has been hindered by funding inequities. In 1994, a new school finance system in Michigan was approved which changes the distribution of funding among Michigan's 558 school districts, where per pupil spending has varied by as much as three to one (Bloomfield Hills schools spent \$10,358 per pupil in the 1993-94 school year compared to Onaway's \$3,277). With the previous system based primarily on property taxes, per pupil spending in districts within a county ranged almost as dramatically as between counties. For example, per-pupil spending in Berrien County ranged from \$3,552 to \$6,779; in Charlevoix County from \$3,381 to \$7,608; in Gogebic County from \$3,668 to \$8,080; in Mackinaw County from \$3,665 to \$7,863; and in Oakland

County from \$4,144 to \$9,040 (1991-92 school year). The new school finance system provides for a foundation level for per-pupil spending of \$4,200 in 1994-95 with \$5,000 per pupil to be instituted in the 1998-99 school year, substantially increasing the revenue available to very low spending districts.

Some districts have voiced concern, however, about the potential instability of the revenue base for the new system and the continued funding inequities in per pupil spending between districts. Although compensatory funding for at-risk students will be distributed (some of which is to be used to expand the School Breakfast Program), traditionally well-funded districts will maintain their higher levels of per-pupil spending by a margin similar to previous levels.

School dropouts face problems with employment and income, reinforcing the importance of school success for all children.

Overall the percentage of Michigan students entering the ninth grade and graduating from high school four years later has remained at roughly 70 percent from 1985 through 1991 according to the Population Reference Bureau.⁵ Successful completion of high school provides a key indicator to future economic and social well-being for youth. In 1992, the 11.4 percent unemployment rate of those without a high school diploma was almost double that (6.8 percent) of their peers with a diploma.⁶ When non-graduates get a full-time job, they typically receive only half the pay rate of graduates. Further, communities with high dropout rates often find social and economic development hampered by a lack of skilled workers and educated and involved residents.

Michigan school districts commonly use an annual dropout rate, which reports the number of high school-age youth dropping out of school each year. The actual scope of the dropout problem, however, is potentially higher than any measure suggests because those who drop out prior to entering the ninth grade are not included.

Dropout rates vary dramatically for youth by income or race/ethnicity. Almost one in four youngsters from low-income families are status dropouts, compared to one in ten from middle-income and one in forty from high-income families. (The "status" rate reflects the percentage of youth between 16 and 24 years old not graduated from high school, nor enrolled in high school or a high school completion program.) Among Latino/Hispanics, national dropout rates reach 29.4 percent, while those of African-American youth stand at 13.7 percent and white youth at 7.7 percent. Annual dropout rates in Michigan in 1986 by racial-ethnic group (the last year such data were collected) reveal percentages of 10.9 for Latino/Hispanics, 12 for African-Americans, and 4.5 for whites.⁷

High school diplomas are now linked to basic skills tests in response to a heightened interest in accountability.

At the same time that public schools are trying to respond to the needs of a broader range of students, successful outcomes continue to be defined by standardized testing. As accountability for the education of students has become a priority, policy makers have created legislation that links results of such tests to endorsements on a high school diploma. The graduates of 1994 were the first to receive endorsements on their diplomas. In 1988, Michigan legislators instituted an endorsement procedure which has used the scores from the high school tests of the Michigan Education Assessment Program (MEAP) to award endorsements until new tests could be developed.

MEAP tests, which measure basic skills in three areas — math, reading and science, were designed to indicate high needs schools and inequalities in educational opportunities between school districts. The tests have also been used as a tool for evaluating teacher and student performance. The graduating class of 1997 will take the new proficiency tests as juniors in the fall of 1995. Endorsements will be awarded for three subject areas: math, science and communication arts. Communication arts will consist of two parts: reading and writing. Students will be able to retake these new proficiency tests three times before graduation.

Seniors who will graduate in 1995 could obtain the endorsements with a satisfactory or moderate score on the MEAP reading test and 50 percent correct on the mathematics and the science tests. Based on scores from their first MEAP test, less than half of the students from the Class of 1995 would be eligible for a math endorsement on their diploma in 19 of the state's counties.

The share of the Class of 1995 scoring at endorsement level on the math test as tenth graders is the lowest of the three subject areas: ranging from a low of 29.6 percent in Montmorency County to 72.7 in Houghton County, well below the shares qualifying on reading and science. In reading, over half of these students in all counties scored adequately on the initial test with a range of 55.6 percent of students in Lake County to 81.6 in Houghton County. In fact, in six counties — Benzie, Otsego, Grand Traverse, Clinton, Gogebic and Houghton — eight of ten students who will graduate this spring passed the initial reading test at the required level for endorsement. In every county except Gratiot, over three-quarters of this year's seniors who took the science test in the fall of 1993 scored at the required level for endorsement. In 23 counties at least 90 percent of students scored at the endorsement level in science.

With the current tests, students who did not attain endorsement level scores on the initial tests may retake the math and reading tests five times and the science test three times. Statewide, among the 15,972 eleventh graders who retook the math test last spring, only 30 percent attained endorsement level scores. About two-fifths of the 7,415 reading retesters who will graduate this spring will now receive that endorsement, and only half (52.9%) of 6,480 retesters will receive the science endorsement in 1995. At the state level, there is no information available about the availability of tutoring in local districts and the numbers of students seeking such instruction to improve their chances for success on these tests.

As success in school increasingly defines individual futures, the education system has significantly expanded services to respond to a broader range of students. At the same time, a larger share of students who are in poverty or near-poverty are at risk of school failure, and current measures inadequately reflect the extent of the dropout problem. High concentrations of at-risk students severely burden some school districts. Recent changes in the state's school finance system will narrow but not remove funding inequities among the state's school districts. With the establishment of the state-endorsed diploma, student success continues to be framed in traditional measures. Its implementation has expanded local discretion. While the value of a non-endorsed diploma is unclear at this time, the pursuit of post-secondary education or training will eventually depend on an endorsed exit from high school.

Potential Number and Share of Students Qualifying for Endorsements on their Diploma in 1995.

Class of 1995: Potential Share of Students Not Qualifying for Math Endorsement on High School Diploma*

Meeting the health care needs of children is a critical complement to satisfying their other basic needs for nurturance, education, safety, food, stability and shelter. Meeting all of these needs is widely acknowledged as necessary to a child's physical, cognitive, social and emotional development. Adequately providing for the physical and mental health of children, however, requires a unique partnership between the public and private service sectors which functions in the best interests of children in their family and community settings.

Michigan's public and mental health departments are working toward improvements in the health of children, particularly among low-income families. The state has also opted to include many more pregnant women and children of low and moderate income in its Medicaid program. In terms of private insurance provision, the shift to managed care with its increasing emphasis on prevention and primary care services bodes well for children, as does the effort within the insurance industry to reimburse for such services within traditional insurance coverage.

Progress is being made in some areas of child health; other areas need attention.

The four indicators of child health which *KIDS COUNT* publishes each year at the county level reveal that progress in some areas is being made. Infant mortality rates, as the most basic indicator of the health status of pregnant women and infants, have been inching down in Michigan as well as across the country. Nationally the rate declined by 16 percent between 1985 and 1991; Michigan's rate dropped 9 percent over the same period. It appears to be decreasing even further as a result of the outreach and supports currently being provided to the state's at-risk mothers. Health care policy analysts caution, however, that significant improvements in the infant death rate are not necessarily attributable to an increase in available primary care, but rather may be largely due to the sophisticated technology used by medical practitioners and hospitals to care for very small and severely ill infants.

Progress in infant mortality is also attributed to the decrease in inadequate prenatal care for young mothers – an area in which the state has made a major effort to intercede in a timely manner. The state's effort is bearing some fruit as the rate of inadequate prenatal care for teens has declined by 3.4 percent over the last decade.

A large share of births in Michigan are to families eligible for prenatal care assistance: of the 144,000 births in Michigan in 1992, roughly 45 percent were to mothers with family income below 185 percent of the poverty line (compared to 33 percent of all children living in households at this level).¹ These data suggest that a large share of the state's mothers and infants are eligible for public health care services during pregnancy, and could be using these services if a sufficient number of prenatal care providers are made available and a comprehensive strategy to reach young mothers through outreach teams is maintained by state and local health departments. On a hopeful note, the 13 counties identified as having a high rate of infant deaths and illness will all have such outreach teams deployed by 1995.

The share of babies born weighing less than 5 1/2 pounds is an additional child well-being indicator which can be regularly measured and used to help shape public and private sector efforts to improve children's chances. Michigan has not enjoyed the same progress in this area as in others surrounding the state's newborns: almost one in ten infants was born with low birth-weight between 1989 and 1991 – a rate which escalated 10.4 percent over the 1980s.

For children attaining their second birthday, one measure of adequate prevention services has received significant recent attention: on-time immunizations against preventable diseases and the deaths which can result from them. In Michigan, up to one-third of children under two are estimated to be under-immunized. Up to two-thirds of Detroit's toddlers are at risk, with the city's on-time immunization rate of 29 percent representing the second lowest in the nation (1991-1992); only the city of Houston's rate was lower. Closer to home, Cleveland and

Milwaukee had on-time immunization rates of 44 and 40 percent respectively. Across the nation, roughly half of all two year olds were appropriately immunized. Among poor children, no more than 38 percent were up to date with their shots. However, children above the poverty level were not well protected either — only six in ten had received age appropriate immunizations.²

On-time immunizations become the focus of expanded state efforts.

The potential economic impact of these estimates of under-immunized children is enormous given that every \$1 spent on childhood immunizations is judged to save \$10 in later costs for medical care of the under-immunized child. This means that of the 144,000 Michigan children born in 1992, up to 47,500 may be under-immunized by the end of 1994. Analysts project that if the state invested an additional \$16.9 million in general funds for vaccines and service provision in fiscal 1995, a potential savings of \$167 million in health care costs could be achieved over the lifetimes of the affected children in this group. Each year that the state's children are under-immunized at the current estimated level could exact similar additional costs in future years. Taking note of this situation, the Michigan Department of Social Services has established a goal for its immunization services of 90 percent coverage of all Medicaid enrollees under age two by 1996.³ The state's Public Health Department has as its goal the immunization of 90 percent of all children by the year 2000.

Despite the state's less than adequate child immunization rates, the death rate among children between one and fourteen contin-

ues to decline; this drop in rates was almost 14 percent over the 1980s, considerably better than the nation's improvement on this well-being measure. Since a recent study showed almost half of Michigan's child deaths were attributable to diseases, analysts project that adequate access to primary and prevention services would significantly reduce the state's rate. Most of Michigan's decline in its child death rate occurred between 1985 and 1991 — 14 percent to the nation's 9 percent.

Adequacy of mental health services for children is difficult to measure.

The mental health needs of the state's children — and an appropriate response to them — is much more difficult to measure than the child death rate. Further, when it is considered that children's mental health is as important to their development as their physical health, identifying these needs takes on added significance. Studies show that approximately 12 percent of all children and adolescents, or 8 million of the nation's children, have a diagnosable mental or emotional disorder and that approximately 3 to 5 percent of children suffer from severe mental disorders.⁴ The share of children in foster and juvenile justice facilities are judged to have a significantly higher rate of mental or emotional disorders. According to the Department of Mental Health, in June 1994 there were an estimated 300,000 emotionally disturbed children in Michigan (12% of all children). Nationwide, experts maintain that such children have no assurance that their illnesses will be identified or treated — only about one-third of such needy children receive any services; national analysts further point out that often the services provided are not the most appropriate but rather those which can generate a reimbursement from public or private health care coverage programs.⁵

In Michigan, the share of public and private mental health care devoted to children is not easily ascertained. At the front end of

ie, a small number of infant mental health specialists (90) provide services in 34 of the state's 83 counties to families with infants who are at risk of bonding difficulties, developmental delays, and child abuse. Through community mental health boards, 38 home-based intensive services programs provide services to children and families requiring access to the continuum of mental health services. Such home-based services became a reimbursable Medicaid benefit in October 1993.

Twenty-nine mental health boards have or will shortly initiate "wrap-around" services, a set of intensive individualized therapeutic interventions for children at risk of out of home care. Respite care to support families with special needs is being piloted by nine mental health boards, with rapid expansion expected in 1994 and 1995. Overall, in 1993 the state devoted roughly 10 percent of an almost \$1 billion mental health budget to community based and inpatient services for children and adolescents who comprise roughly 17 percent of community mental health clients (1992).⁶ The share of private resources going to children's services is largely unknown, but Blue Cross Blue Shield of Michigan (BCBSM) reports that roughly 24.7 percent of its reimbursements for mental health services, including substance abuse, were for those provided to children and youth in 1993-94. (Children represent approximately 28 percent of BCBSM's members covered by traditional insurance.)

The importance of dental care for children is often overlooked.

Access to dental care for the state's children is an area of health care needing further exploration. Maintaining the dental health of children is extremely important to their self image and self confidence, particularly as they grow into adolescence when consciousness of appearance heightens. And while it is more commonly understood that maintaining the dental health of children is necessary for eating and speaking purposes, its strong relationship to a youngster's psychological health is often overlooked.

The state's children enrolled in Medicaid (a monthly average of 500,163 children in 1993) have dental care coverage, but their access to care and prevention services is not assured. To turn dental coverage into access to dental care requires that practitioners will accept the level of payment which follows the child — from both the third party payer and the parents' available resources. (The Medicaid program spent an average of \$31 on dental care, per enrolled child in 1993; for the 40 percent of children who received a service, the outlay was \$83.)⁷

Access also requires an adequate number of caregivers within reasonable geographic reach of the family. Turning coverage into access may also be an issue for privately insured children — an estimated 483,000 in Michigan — particularly when they reside in the state's more rural areas. Overall, an estimated 983,000 children, or 40 percent of all children in the state, are judged to have public or private dental insurance coverage; how many of them have actual access to dental care is not easily determined with available data. For many of the approximately 1.5 million children with no dental insurance coverage, access to care may be considerably more difficult.

While it is more commonly understood that maintaining the dental health of children is necessary for eating and speaking purposes, its strong relationship to a youngster's psychological health is often overlooked.

Measures are not readily available to assess the health status of Michigan's children.

While measures to assess the overall health status of the state's children are either unavailable or imprecise to determine the share who regularly receive primary and preventive health care services, Medicaid's Early Periodic Screening Diagnosis and Treatment (EPSDT) program should provide a window on the health status of the state's most vulnerable youngsters. EPSDT is an initiative which regularly provides comprehensive screening of children, including hearing and vision screening, through county health departments or the child's primary sponsor physician or HMO. Problems are identified, diagnosed, and referred for appropriate treatment.

For a combination of reasons – both family- and provider-centered – in fiscal year 1993, only 20 percent of the state's eligible children received EPSDT screening services at the federally required time intervals (121,826 of 609,022 eligible children). The federally mandated screening level in that year was 65 percent of eligibles. Many observers at the state and national level are concerned that the shift in Michigan and elsewhere to assign all Medicaid children to a "gatekeeper" system in which a primary sponsor physician, a group practice or an HMO provides or approves all non-emergency medical services – including EPSDT screening – may be making it more difficult for the states to monitor the degree to which the screening required under these managed care contracts is being provided. Previously, when such screening services were primarily being provided through county health departments, they could be more easily monitored and quantified.

Thousands of children are without coverage and ongoing access to primary care.

The obvious answer to maintaining healthy children is to provide both coverage and access to comprehensive health care services through a coordinated mix of public and private programs which meet their service potential. Yet, far too many children are

Michigan's Programs for Health Care Coverage of Children in Low Income Families

without coverage or access – or both. Determining the number of children in Michigan who are without full-year public or private health care coverage, however, presents a challenge. According to the Current Population Surveys undertaken by the U.S. Census Bureau, between 1988 and 1992 an average of 6.1 percent of the state's children were uncovered by public or private programs for the entire year (150,000 children).⁸ However, when the unduplicated number of children covered by Medicaid in 1993 (722,000) is compared to an average of 500,000 children who

are estimated to be enrolled each month of that year,⁹ it becomes clear that many children are enrolled for episodes of illness and through periodic family coverage, and may not have ongoing year round access to primary care and prevention services. When this dimension of children's coverage through the public program is considered, there is the potential that in addition to the 150,000 Michigan children uninsured year round, another 220,000 are uncovered for part of the year. This means that the potential rate of the state's children without ongoing year round care is 15.0 percent, even without consideration of the number of children covered by private insurance for only part of the year – a number which cannot be reached with available data. This partial coverage of so many of the state's children may be contributing to some of the negative outcomes which the *KIDS COUNT* project monitors.

In Michigan, the goal of providing access to care should be relatively easy to accomplish – prevention services for children are neither costly nor difficult to provide. The Medicaid experience reflects very low costs for children – in Michigan in 1993, while children between one and five years of age represented 20 percent of the enrollees, they only accounted for 8 percent of Medicaid payments. Similarly, children between six and fourteen represented 20 percent of enrollees but accounted for an even lower share of Medicaid costs – 5 percent. Only with older youngsters in the 15 to 20 age bracket did their representation among enrollees in any way approximate their costs – 10 percent of enrollees to 6 percent of payments.¹⁰ Nationally, while one-half of the new Medicaid enrollees between 1988 and 1991 were children, they accounted for only 11 percent of the growth in costs.¹¹

Comparison of Health Status of Medicaid Demonstration Project Participants

Poor- and Near-Poor Children in the U.S. and Selected States

	Excellent	Good	Fair	Poor
All Low Income Children	41.5%	53.6%	4.1%	0.5%
Florida Healthy Kids Program	41.3	50.7	7.6	0.5
Maine Health Program for Kids	49.8	43.6	6.0	0.3
Michigan Caring Program for Children	34.3	52.2	12.5	1.0

Source: Abt Associates, Washington, D.C. (1994)

The difficulties in providing both coverage and access to health care for Michigan's children, however, do relate to costs — many providers of medical and dental services find state reimbursements for low-income children significantly below their regular fees and choose not to participate in the Medicaid program. Compounding this problem, is the lack of care providers in many rural and urban areas of the state.

From a public policy perspective, the low cost/high return nature of children's health services is an incentive to the state to actively pursue universal access for its young. Recognizing this, a structure has been put in place which should cover most uninsured children (see chart showing the potential coverage of the combined Caring Program for Children and Medicaid programs). The vast majority should qualify for coverage either through the state's major public intervention — the Medicaid program, or the public-private partnership initiated to serve the children of other low and moderate income families — the Caring Program for Children administered by BCBSM, with its goal the coverage of outpatient services for children in working poor families which have incomes below 185 percent of poverty. The Caring Program has been in existence since November 1991, primarily funded by private donations and federal funds and, more recently, an investment of

state funds. The typical child enrolled is 11 years old, comes from a family of four with an annual income of \$17,450, visits the doctor's office 4 times a year with a sore throat or respiratory or ear infection, and uses the hospital emergency room only for accident-related medical care.

It would thus appear that Michigan has the programs in place to provide health care services to most of its children. In reality, Medicaid fails to cover thousands of the state's eligible children primarily because their families don't know that their children are eligible — an effective government outreach program to such families is lacking. While the state has progressively expanded the categories of children eligible for Medicaid services — the latest expansion being one which extends coverage to children up to 16 years of age with family income up to 150 percent of the poverty line — too few potentially eligible families may be aware of the opportunity for coverage.

Medicaid expansion efforts over the past several years have meant that the state and the nation have prevented the number of uninsured children from rising even more sharply: nationally, the Medicaid program has been expanded to enroll 21.4 percent of all children; Michigan has a similar rate — 20.3 percent in 1993 of all children under 18. Despite this impressive record and the state's extension of Medicaid coverage to new groups of children, fully 27 percent of the children of working poor families who make application to the Caring Program for Children are actually eligible for Medicaid and not enrolled. This rate of Medicaid eligibles among the Caring Program's applicants has held constant over the two years of the program's existence; BCBSM's outreach effort has identified and referred almost 5,000 eligible children to the Medicaid program.¹²

If the Caring Program for Children's experience with the share of children in near poor families who are eligible but not enrolled for ongoing Medicaid services is applied to all children estimated to be uncovered by any health insurance program (other than the episodic care coverage they may receive through a public program), Michigan holds approximately 100,000 children who

*Children in families with income below 185% of poverty are presented here as a reference point only, and should not be viewed as the number of children who are eligible and should be enrolled in the Medicaid or CPC program; the KIDS COUNT analysis suggests that an estimated 220,000 of these children had part year coverage in the Medicaid program.

**The number of Medicaid enrollees represents an estimate of the average monthly number of children enrolled in the program in Fiscal Year 1993; CPC participants as of November 1, 1994.

Sources: 1990 U.S. Census; Program Statistics, Fiscal Year 1993, Michigan Department of Social Services, Pub. 170, Tables 6, 15 and 43; Second Year Evaluation of the Caring Program for Children, Blue Cross Blue Shield of Michigan Planning and Development Services, July 1994. Calculations by KIDS COUNT in Michigan.

should be enrolled full-time in the Medicaid program and receiving the ongoing primary and prevention care the program can provide. Instead, it can be fairly assumed that large numbers of them are not receiving such care as their parents struggle to meet the family's other basic needs on very limited incomes.

The potentially extensive underutilization of the Medicaid program could be contributing to poor health status among Michigan's children – particularly those in near poor families. Abt Associates, commissioned by the federal Health Care Financing Administration to evaluate the three Medicaid Extension Demonstration Projects in Maine, Florida and Michigan (the Caring Program), they found that Michigan's program enrollees reported poorer health overall than the other demonstration projects' participants. Their experience also compared unfavorably with that of persons surveyed in the National Health Interviews Study (NHIS), an ongoing survey of the U.S. population which gathers information on demographics and a number of health-related issues including health status. The Michigan program's families also reported limited access to routine care for their children who were much more likely to have been without health care in the year prior to enrollment than the Maine and Florida families in those states' demonstration projects.¹³ (See Table on page 31.)

The programs to provide health care to Michigan's vulnerable population of children appear to be in place in the unique mix of public and private programs which exist in the state. With strengthened and continuing outreach, cultivation of sufficient numbers of care-givers in all geographic areas, and a renewed effort to remove other barriers to access, no child needs to miss out on a healthy start.

How Michigan Children Are Doing

Trends in the State and Counties

KIDS COUNT Indicator ¹	State Trends	County Trends*
Teens with inadequate prenatal care	3.4% Better	58 (of 78) Counties Better
Low birth-weight babies	10.4% Worse	41 Counties Worse
Births to teens without high school education	1.2% Worse	32 Counties Worse
Infant mortality rate (per 1,000 live births)	18.1% Better	62 Counties Better
Child death rate ages 1-14 (per 100,000 children)	13.6% Better	57 (of 82) Counties Better
Teen violent death rate ages 15-19 (per 100,000 children)	21.5% Worse	39 (of 81) Counties Worse
Serious crime arrests of juveniles ages 10-17 (per 1,000 youths)	2.7% Better	41 Counties Better
High school dropouts	Not Calculated	32 (of 58) Counties Worse

*83 counties unless otherwise indicated. (Some counties had missing data for some indicators.)

¹Indicators, unless otherwise noted, are percentages.

I just graduated from high school. I live in one of the better neighborhoods in the city. But every neighborhood has its problems, whether it's drugs, racism or whatever. My childhood consisted of being in a single-parent home. I have to do things a little bit better than those coming from the two-parent homes, simply because the finances aren't always there.

My childhood consisted of going to school and being one of the few blacks in the class. My mother, she's my mentor, as far as steering me in the right direction. My brother doesn't live with us. He's 24 years old. His choices, as far as success in high school, in grades and honors, he didn't get that. His mistakes, his trials, made me a stronger person, because I had to deal with them as a brother. And ridicule towards him also hurt me. And I didn't look down on him at all. He's still my brother. I love him. That's how it is.

Armon, Children's Express 1993

Urban Michigan

County Profile Summary and Findings

Over the trend period, some gains in child well-being have been made in Michigan. On four of the eight child well-being indicators reported by KIDS COUNT in Michigan a change for the better has occurred; on three the situation has worsened.¹ The most dramatic improvements are in the areas of rates of infant and child deaths—the infant mortality rate is down by almost 20 percent; the child death rate by roughly 14 percent. Improvements were minimal over the ten years on two indicators—teen births with inadequate prenatal care and arrests of juveniles for serious crimes.

Of the three indicators which worsened, the teen violent death rate climbed by over 20 percent and the percent of low birth-weight babies by about 10 percent while births to teens without a high school education increased slightly.² (Because of large amounts of missing data, the high school dropout rate for the state could not be reliably calculated.)

KIDS COUNT in Michigan indicators reflect as closely as possible those of the national project. Indicators are selected to include diverse aspects of a child's life, such as health, education and the stages of development from prenatal care through adolescence. Each measure, however, must be available for all Michigan counties. Indicators satisfying these criteria were grouped into three key areas highlighted in the county profiles this year: 1) economic security, 2) risky births and 3) education outcomes.

- Economic security focuses on the share of county children in poverty within cities and townships
- The three health indicators displayed in a line graph reflect risky births in their annual rates for eleven years. Teenage mothers who experience late or no prenatal care, low birth-weight babies, and births to teens without a high school diploma are featured
- This year's education outcomes are presented as county percentages and numbers of students performing satisfactorily on the Michigan Education Assessment Program (MEAP) tests at the six grade levels where the tests are administered—the 4th, 5th, 7th, 8th, 10th and 11th grades.

The discussion which follows will examine how the rates for the child well-being indicators vary from county to county and will highlight the ranges in the rates and those counties with the highest and lowest rates. To explore the urban and rural experience of children in the state, data are averaged within five general areas grouped according to county population; the three major metropolitan counties in Southeast Michigan (Macomb, Oakland and Wayne) are reviewed separately rather than as a group.

Economic security for children varies dramatically within counties.

Because economic security affects every aspect of a child's life including health, education, housing and safety, the geographic concentrations of children in poverty within each county provide a template for reviewing other indicators. On all well-being indicators, poor children are much more likely to suffer negative outcomes. Despite traditionally high wages and incomes, Michigan's child poverty rate of 20.5 percent in 1991 was near the national average.

Percentages of children in poverty vary dramatically among counties and smaller political divisions within counties. Among counties, for example, Lake County with 37 percent has the largest share of children in poverty while Livingston County has the lowest with 5 percent, a spread of about 32 percentage points. Even wider variation occurs within counties, the spread extends to 50 percentage points. In ten of the state's counties, a difference this large separates localities in their shares of children who are impoverished. Another eleven counties have a range of at least 40 percentage points between the localities with the lowest and highest concentrations of children in poverty. For example, in Keweenaw County, 90 percent of children in Sherman Township live below poverty compared to none in Grant Township; within Berrien County, 71 percent of children in Benton Harbor live in poverty compared to 2 percent in Royalton Township; in Genesee County, only 3 percent of children in Gaines Township live in poverty compared to 45 percent of children in the city of Flint. (Rates or percentages are used throughout the data book because the proportionate impact would be similar whether these children live in a large city or a small town.)

While it is helpful to review the rates of child poverty in Michigan communities, it is important to note that more densely populated areas can experience lower rates but have much larger numbers of children experiencing poverty. Although Oakland County's child poverty rate is not among the highest, the county holds the second highest number of poor children at 21,650 due to its large population.

Risky Births

I took a [pregnancy] test and it was positive. I had my friends tell my mom and dad because I was scared to. My mom was upset because I wasn't the one to tell her. I went home and we talked about it. I got to the doctor's right away and made sure everything was all right.

Then one day I went to the doctor's when I was about seven and a half months pregnant, and I had high blood pressure, protein in the urine and water retention. My life was at risk so they put me in the hospital. I was in there for 11 days, and my weight kept going up, like three pounds a day. The doctor decided to make me go into labor because the ultrasound showed my baby weighed about five pounds so he had a good chance of surviving.

My baby was born weighing four pounds, twelve ounces. He lost weight and had a lot of problems at first. I was really scared. He wouldn't eat, and they had to put him in an incubator. He had a whole bunch of wires on him. Then he started eating a little bit by little bit. Once he got back to his birth weight, they let me take him home.

He was really quiet, and we had to wake him up every three hours to feed him. You had to tap the top of the bottle to make him suck. He's doing real good now. I was going to go to night school at first, but we found a babysitter so I stayed in regular day school. It's a lot harder than I expected because you can't do anything at night. It's hard to find babysitters because lots of my friends have babies too. You can't do nearly as much stuff as you used to be able to do because you have to think of the baby before anybody else.

Sharon, Children's Express 1994
Rural Michigan

About one of every ten Michigan children begins life with a risky birth.

Three indicators signal a risky beginning for children — births to teens with inadequate prenatal care, births to teens without a high school diploma and low birth-weight babies. Risky beginnings can have long-term consequences for infants. Medical intervention and program initiatives among human service agencies have assisted to mitigate these risks.

Teens With Inadequate Pre-Natal Care

(Percent of All Teen Mothers)

98

and Washtenaw County with 23.6 percent. Washtenaw County's rate also worsened most dramatically among the counties, doubling over the trend period, while Presque Isle and Oscoda counties, with relatively small numbers of occurrences, cut their rates in half.

When the counties are grouped by population, Very Rural Counties show the most improvement on this indicator and, at 8.8 percent of such teen births, have the lowest collective rate of the eight county groupings. Conversely, Oakland County, which boasted the lowest of the grouped rates in the early 1980s, nearly doubled that rate to 16.9 percent in the most recent period; it is now second only to Wayne County.

Low Birth-Weight Babies

Birth weight also indicates a child's potential for survival and successful physical and mental development. The share of babies born weighing less than five and a half pounds (considered low weight) increased by 10.4 percent in Michigan over the ten year period to 7.6 percent of all live births.

Such fragile babies are often born to mothers who lack adequate prenatal care or engage in unhealthy practices during pregnancy. These infants often require 20 to 40 times the hospital resources of normal weight babies.

Of Michigan's 83 counties, Mackinac and Schoolcraft counties had the lowest shares of their babies born with a low birth-weight—2.5 and 3.7 percent of all live births, compared to 9.3 percent in Saginaw County and 11.1 percent in Wayne County. In the trend period, Baraga County's rate on this indicator tripled, while Mackinac County's fell by half. (The numbers of occurrences for these counties are relatively low.) This rate worsened for all county groups for the state's second largest change for the worse.

Teen Mothers without a High School Diploma

Children born to teen mothers without a high school diploma often face formidable barriers to their long-term success: they are more likely to live in poverty and become teen parents themselves.

99

Roughly one of every eleven Michigan babies born each year between 1990 and 1992 was born to a teen without a high school education. These young mothers often have difficulty in completing their schooling and acquiring the skills necessary to secure employment which can assure their economic well-being and that of their child. About half never obtain a high school diploma or its equivalent.

Worsening slightly over the decade, the share of all Michigan births occurring in recent years to teens with less than a high school education rose to 8.5 percent. The lowest county percentages were in Livingston and Macomb counties with 3.3 and 3.5 percent respectively; the highest were in Berrien and Crawford counties at 13.8 percent. Wexford County's rate improved the most dramatically, by almost two-fifths over the trend period, while Leelanau County's worsened by almost two-thirds.

Among the county groupings, Wayne County and Counties with Metropolitan Areas saw increases in their share of births to teen mothers who had not yet completed high school (by 10% and 6% respectively), while the rest of the state improved. Oakland and Macomb counties improved the most over time (about 21% and 27%, respectively), but Rural Counties and Counties with Small Cities also saw significant improvement (11.6% and 8.6%).

While death rates for infants and children have improved, violent deaths among teens have risen by over 20 percent.

Over the century, untimely deaths of infants, children and youth have lessened considerably, due to improvements in disease prevention and treatment. The steady improvement which has continued to occur for infants and children makes the rising rates of violent death among youth particularly poignant.

Infant mortality

Michigan's relatively high infant mortality rate of 10.4 per 1,000 live births reflects an improvement of almost 20 percent in the last ten years. According to the state Department of Public Health, this decline occurred mostly due to reductions in the death rate for infants under a week old. In 1980, the rate of deaths for day-old infants was 5.4 per 1,000 live births; by 1991 it dropped to 4.4. At the same time the rate for infants between 1 and 6 days old dropped by almost half from 2.1 to 1.2.³ While the infant death rate for other racial ethnic groups has remained above the rate for white infants in all but five of the last twenty-two years, the mortality rate by 1991 of 21.7 for African-American infants was almost three times the 7.5 rate for white infants.

Of the 1,554 infant deaths in 1991, half were attributed to three causes: 279 resulted from disorders related to short gestation and unspecified low birth-weight; 258 from congenital anomalies; and 240 from sudden infant death syndrome. For white infants, 37 percent of all deaths were caused by congenital anomalies and sudden infant death syndrome; while 43 percent of African-American infant deaths

were related to short gestation, low birth-weight and respiratory distress syndrome or other respiratory conditions.¹ Statewide, over half of infant deaths in 1992 resulted from conditions originating in the perinatal period.

Among the 74 ranked counties in Michigan, the infant death rate ranged from highs of 31.1 per 1,000 live births in Lake County and 16.4 in Mecosta County, to 2.5 in Iosco County and 3.6 in Alpena County.

While infant mortality rates dropped among county groups: Macomb County cut its rate of infant mortality nearly in half over time. Although Wayne County's rate remains the highest, it realized more improvement (7%) than did the Counties with a Metropolitan Area (about 2%).

Child deaths

The child death rate in Michigan improved by 13.6 percent over the ten year period. The leading cause of death for children ages 1-14 was accidents: they accounted for about 40 percent of the deaths for all ages and races. Younger children are also more at risk than older children: the death rate of 53.2 in 1991 for young children between 1 and 4 years old was more than double the 23.5 rate for children 5 through 14 years old.

Child death rates in counties ranged from lows of 15.6 per 100,000 children in Delta County and 17 in Marquette County to highs of 101.4 per 100,000 in Oscoda County and 103.1 in Luce County. (These rates reflect a very small number of affected children). When the counties are grouped by population, all except Wayne County improved. Rural Counties and Counties with Small Cities improved by about 10 percent, all other groupings cut their rates by over 20 percent.

Rates for African-American children remain a concern and the causes of these deaths raise troubling issues. In 1991, the child death rate for African-American children between 1 and 14 years of age was 49.5 per 100,000 youngsters compared to 29 for white children. Homicide was the second leading cause of death in both 1991 and 1992 for African-American girls between 1 and 4 years

of age and African-American boys ages 5 to 14. In 1992, homicide became the second cause of death for African-American boys (1 to 4 years old) and older African-American girls (5 to 14). Although the occurrences are relatively small, these patterns raise critical concerns about the safety of young children.

Teen Violent Deaths

The teen violent death rate of 68 per 100,000 was the indicator which worsened most dramatically in Michigan in the ten-year period. An average of 477 youths between 15 and 19 years of age lost their lives as a result of accidents (including automobile accidents), homicides or suicides each year between 1990 and 1992. The lowest county teen violent death rates were 17 youth deaths in Marquette County and 30 in Grand Traverse County, compared to highs of 169 in Missaukee County and 165 in Antrim County. Among county groups the rate of teen violent death dropped in five county groupings. It climbed by 14 percent in Very Rural Counties, by 31 percent in Counties with Metropolitan Areas, and 91.1 percent in Wayne County.

In the period between 1990 and 1992, however, homicides accounted for a third of all violent deaths among teens, compared to 17 percent in 1980. Homicide rates vary dramatically by gender and race/ethnicity. African-American males represented about three-quarters of all homicide victims in this age group. African-American youth, in general, are over 20 times as likely to be homicide victims as their white counterparts in this age group. The rate of teen deaths due to homicide for African-American males averaged 199 per 100,000 and females 21.9, compared to 6 for white males and 3.4 for females.

My brother Daniel choked to death when he was one year and three months old. I was in the fifth grade. I mourned quite a long time. The most severe part was about a week-and-a-half to two weeks. It was to the extent where I didn't even go to school for the whole time.

First, I thought it was my fault because I wasn't there. Then, I started working it out and talking to people. I started taking CPR and first aid classes, and tried to learn as much I could about life saving through all the stages, all the way up to adulthood.

I'm more careful. I've been trained as a lifeguard and when I'm at the beach, I can't swim and enjoy myself anymore. When a lot of kids are around, I watch kids. And if I'm in a group area, I always watch for the accidents. I don't have that much fun. I always have in the back of my mind that I'm looking for an accident to happen.

Randy, Children's Express 1993
Rural Michigan

Risk of high school dropout among youth increased, while serious (index) crime arrests have decreased.

Risk factors for adolescents are reflected by two other indicators: serious (index) crime arrests of juveniles and high school dropouts. While serious (index) crime arrests have decreased, the level of violence among young people has, in fact, increased. Safety concerns affect schools and other areas where youth congregate. Youth who fail in school because of behavior or academic problems face limited choices. Current dropout rates fail to reflect the numbers of youth who do not make the successful transition through middle grades.

Serious (Index) Crime Arrests of Juveniles

The rate of serious crime arrests of Michigan juveniles between 10 and 17 years old decreased slightly over the ten-year period to 22 per 1,000 youth. This rate encompasses arrests for all eight serious or index crimes: murder, forcible rape, robbery, aggravated assault, burglary, larceny-theft, motor vehicle theft and arson. *KIDS COUNT in Michigan*, unlike the national project, uses all eight serious crimes, not just the first four or violent crimes as a measurement for this indicator.

In 1992 in Michigan, the share of juveniles arrested for a violent crime represented 16 percent of all juvenile serious crime arrests; the overwhelming majority (66%) of serious crime arrests were for larceny. Although the numbers of arrests of juveniles for serious crimes, as well as all arrests of juveniles, dropped slightly over the trend period, the share of all arrests that

were serious increased about 6 percent. In the nation and the state in 1992, youth under 18 accounted for 29 percent of all serious crime arrests. In the nation over the ten year period between 1982 and 1992, juvenile arrests as a share of all arrests for serious crimes fell slightly—from 31 to 29 percent.

In Michigan the counties with the lowest juvenile arrests rates for serious crimes were Leelanau County with 2.1 per 1,000 and Midland County with 4.4; the highest rates; which were roughly double the state average, were 50.2 in Kalamazoo County and 46.3 in Berrien County. While the serious crime arrest rate for juveniles remained relatively stable over time in all areas of the state, Counties with Metropolitan Areas and Counties with Medium-sized Cities had the highest rates (31.3 and 24, respectively). Youth in Rural Counties also experienced slightly increased rates, but their rate remains below Wayne County (19.6 in Rural Counties compared to 22.1 in Wayne County). Wayne and Oakland counties and Counties with Small Cities, experienced slight decreases in their serious crime arrests for juveniles, while in Macomb County such arrests declined by almost a third.

In the most recent time period, about four of every ten juvenile arrests in the state were for a serious crime. Among the counties, Alpena County had by far the highest share of serious crime arrests among juveniles as a share of all juvenile arrests: eight of every ten juvenile arrests were for serious crimes; Oscoda, Arenac and Iosco counties had about six of ten. Branch and Grand Traverse counties with about three serious crime arrests of every ten juvenile arrests had the lowest share. (See the appendix for the rate of all arrests of juveniles which was included in previous editions of the data book.)

These arrest data should be used with caution, however, because the ways juveniles are treated by the court systems in each county vary quite significantly. The number of juveniles petitioned (that is, charged with an offense), would provide a more accurate count of youth involved in the criminal justice system, but such information is available only from individual county probate courts.

High School Dropouts

Career and education options are limited for youth who do not complete high school. With increasing numbers of youth who do have a diploma, those without one are severely disadvantaged in the competition for jobs. The long-term economic liability means that a male dropout will earn \$260,000 less in his lifetime than a male high school graduate, according to figures released by the U.S. General Accounting Office.

In Michigan the overall dropout rate is not readily available because of insufficient data. In fact, the percentage change in the dropout rate could not be calculated for almost a third of the counties (25 of the 83) because of missing or incomplete data in either the 1991-92 or the 1992-93 school year. The state 1992-93 dropout rate of 5.9 percent released by the Department of Education would suggest a worsening trend of 21.2 percent, when compared to the 4.9 percent dropout rate in 1991-92.

Among counties the dropout rate ranged from .1 percent in Macomb County and .6 percent in Gogebic County to highs of 14.0 percent in Crawford County and 17.7 percent in Iosco. (Since several of these rates are based on estimated numbers, they should be viewed with caution. Analysis of county groupings was not conducted because of the large numbers of counties without data.)

Endnotes

- ¹ Insufficient data are available to compute high school dropouts for the state as a whole.
- ² All indicators are compared for a ten-year period with three-year averages for the base and most recent year except for juvenile serious (index) crime arrests which uses 1988-90 as the base year.
- ³ Michigan Health Statistics 1991. Lansing, Michigan: Office of the State Registrar and Center for Health Statistics, Michigan Department of Public Health (June 1993).

I haven't been to school for three months. I did go to the Alternative High School, but they closed it at the beginning of the school year. I did have a job for like a month, but they cut my hours down to four hours a week and that's like barely any money. On top of that, my car broke down so I couldn't get to work anyways. It's so hard to find jobs, and most people want college students or high school students that do attend school and get good grades.

I don't feel there's enough alternatives for those people who made mistakes in their life, in their past, and they're trying to get back and go to school. And I really am for alternative education because I've been to seven different high schools and no one's really cared as much as they have.

As for the future, there's going to be so many people and so much competition for work that I think it's going to be really difficult to find a job. Even people coming out of universities right now can't find work. But I know that I'm going to be something in life, whether I have a high school diploma or not.

I never say I'm a dropout. I do think I'm an intelligent person. People think that dropouts are losers, but it depends on the person.

My friends graduated this year, and that makes me feel sad. There's no way to go back now. I really need to move on. You can't just sit around: the longer you sit around and don't do anything, you get caught up in that and you won't be anything in your life. So you have to have a plan or a goal.

State of Michigan

Child Poverty Rate: 18.6%

In Michigan over 450,400 children live in poverty. The largest number of children in poverty (172,000) reside in Wayne County which has a child poverty rate of 30.6 percent, while Lake, Clare and Gladwin have the largest shares of impoverished children (37.7%, 36.0% and 33.2% respectively).

The most dramatic change within the last decade (21.5%) for the state's children has been the increased rate of violent deaths among teens ages 15 to 19 (68.4 per 100,000). About 477 youths died from accident, suicide or homicide each year from 1990 through 1992. Infant mortality rates and child death rates have fallen by 18.1 percent and 13.6 percent respectively.

About 11,000 babies born each year (8% of all births) in the most recent period weighed less than 5.5 pounds. This rate rose about 10 percent over the trend period. Although the rate of births to teens who had not completed their high school education barely increased, almost 13,000 babies were born yearly between 1990 and 1992 to these mothers.

Changes in Well-being of Children: Trends

For the first 7 indicators, the number and rate reflect 3-year averages: 1980-82 for the base year and 1990-92 for the recent year, except for serious crime arrests, which uses 1988-90 and 1991-93. For high school dropouts, 1991-92 is used as the base year and 1992-93 for the recent year. Please see data notes, particularly for high school dropouts.

In Alcona County about 580 children live in poverty. The largest numbers of impoverished children live in Greenbush and Curtis Townships (83 in each); the area with the highest percentage of children in poverty is Millen Township (55.6%).

County rates reflecting births to teens without a high school diploma have improved over 13 percent during the trend period, resulting in a rate of 9.2 percent of all births in the county. Despite improvement in that area, Alcona ranks in the bottom quarter of the 82 counties ranked.

The county experienced a large increase in the rate of index crime arrests for teens over the trend period, but even with this worsening, Alcona ranked 19th of the 83 counties.

The rate of low weight births has worsened to an average rate of 5.3 percent.

* The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

Alger County

Child Poverty Rate: 19.2%

In Alger County more than 420 children live in poverty. The largest numbers of impoverished children live in the city and township of Munising (103 and 104 respectively); the area with the highest proportion of child poverty is Limestone Township (32.1%).

The county's rate of low weight births improved by almost 12 percent over the trend period. This rate gives the county its best rank (11) among the indicators.

The rate of births to teens with no high school diploma grew worse to an average rate of 8.6 percent, ranking 51st among the 82 counties ranked.

The county's rate of index crime arrests for youth (13.4 per 1,000) has not changed. During the three most recent years, an average of 14 arrests occurred a year for this population.

* The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

Allegan County

Child Poverty Rate: 11.9%

In Allegan County over 3,100 children live in poverty. The largest number of children in poverty reside in Lee Township (427), which also has the highest percentage of children in poverty (46.3%).

The county's rate of infant mortality improved by nearly half over the trend period to 6 infant deaths per 1,000 live births.

The rate of births to teens receiving inadequate prenatal care worsened by over 40 percent in the same time period. Absence of adequate care for the teenage population has resulted in the county's worst ranking: 48th of 78 counties ranked.

The county's child death rate (18.9 per 100,000) has improved. This rate provided its best rank for an indicator: 5th among 66 ranked counties. Between 1990 and 1992 an average of four (a relatively small number) such deaths occurred each year.

* The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

Alpena County
 Child Poverty Rate: 17.0%

In Alpena County over 1,300 children live in poverty. The largest numbers of impoverished children live in the city of Alpena (485); Ossineke Township, however, has the highest percentage of children in poverty (28.7%).

The county rate of births to teens who have not received adequate prenatal care has improved by nearly one-fifth over the trend period, resulting in an average 9 percent of all teen births.

In the 1992-1993 school year, roughly 9 percent of the county's 9-12th graders dropped out of school, increasing the prior year's rate by nearly 40 percent.

The county's rate of index crime arrests for youth has worsened by 9 percent over the trend period to give the county its lowest rank: in the bottom 5 of the 83 counties. During the three most recent years, an average of 159 such arrests occurred each year for this population.

** The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.*

In Eaton County over 2,200 children live in poverty. The largest number of children in poverty (301) reside in Eaton County's portion of Lansing. The cities of Olivet and Lansing have the highest percentages of child poverty (25.6% and 21.0% respectively).

Although the county's rate of serious crime arrests for youth (18.5 per 1,000) has improved by 36.2 percent over the trend period, it ranked in the bottom half of the 83 counties. Between 1991 and 1993 an average of 216 such arrests occurred each year among that population.

Although small in number (an average of 6 per year), the incidence of teen violent deaths has worsened by over 35 percent.

The rate of low weight births has worsened over time in the county; its average rate of 6 percent of babies born at this low weight ranks it 45th of the 83 counties ranked.

* The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

Emmet County
 Child Poverty Rate: 10.3%

In Emmet County roughly 680 children live in poverty. The largest number of children in poverty (183) reside in the township of Littlefield. Cross Village Township has the highest percentage of child poverty (62.1%).

The county's rate of low weight births improved by more than 20 percent over the trend period; the average rate of 4.6 percent ranked in the top fifth of the 83 counties.

In the 1992-1993 school year, an estimated 5 percent of the county's 9-12th graders dropped out of school, resulting in a worsening of the county's rate by nearly 15 percent.

The rate of teens giving birth without having received adequate prenatal care has improved by over 50 percent to a rank of 11th among the 78 counties ranked. In the most recent three-year period, a relatively small average number of such births (2) occurred each year.

* The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

COUNTY IONIA

Health: Risky Births

In Ionia County nearly 2,400 children live in poverty. The largest number of children in poverty (412) live in the city of Ionia, which also has the highest percentage of child poverty (23.4%).

The county rate of births to teens who have not received adequate prenatal care has improved by nearly 30 percent over the trend period, resulting in an average of 10 percent of all teen births.

Rates of child deaths have worsened in the county to an average incidence of 7 such deaths annually. The county's rate (54.2 per 100,000) ranked in the bottom five of the 66 counties ranked on this indicator.

An improvement of nearly one-quarter in the county's serious crime arrest rate among youth has resulted in a rank in the top fifth of the 83 counties ranked.

** The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.*

Iron County

Child Poverty Rate: 23.3%

In Iron County roughly 700 children live in poverty. The largest number of children in poverty (164) live in the city of Iron River, which also has the highest percentage of child poverty (40.5%).

Despite improvement for the state as a whole, the county's rate of serious crime arrests for youth has worsened by nearly two-fifths over the trend period. With an annual average of 40 arrests for this population over the trend period, the county's rate has resulted in its lowest ranking; 68th of the 83 counties ranked.

The rate of low weight babies nearly doubled over time, to an average of 5.6 percent of all live births in the county.

Although the dropout rate worsened over the prior year, less than one percent of the county's 9-12th graders dropped out of school in the 1992-1993 school year, resulting in a rank in the top 5 of the 66 counties ranked.

Child Poverty Rate: 14.5%

In Shiawassee County over 2,800 children live in poverty. The largest number of children in poverty (1,035) live in the city of Owosso, which also has the highest percentage of child poverty (23.2%).

The county rate of teen births to young women receiving inadequate prenatal care has improved by nearly 14 percent over the trend period, resulting in an average of 10 percent of all teen births.

Although the numbers (an average of 6 per year) are relatively small, the county's rate of teen violent deaths more than doubled over the trend period, ranking 51st of the 64 counties ranked.

The county's rate of babies born at low weight worsened by over 20 percent to an average 6 percent of all live births.

*The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

Tuscola County
 Child Poverty Rate: 17.2%

In Tuscola County nearly 2,700 children live in poverty. The largest number of children in poverty (406) live in Indianfields Township, while the township of Kingston has the highest percentage of child poverty (30.0%).

The county rate of infant mortality has improved by nearly 40 percent over the trend period, exceeding the improvement made statewide.

Although there were small numbers (an average of 4 per year) of occurrences, the rate of deaths among children worsened by roughly 25 percent. During the same time period, the state as a whole improved.

The rate of serious crime arrests among youth improved by over 20 percent to rank 3rd among the 83 counties ranked. During the three most recent years, an annual average of 5 arrests occurred per 1,000 youth.

* The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

Van Buren County

Child Poverty Rate: 21.0%

In Van Buren County over 4,200 children live in poverty. The largest number of children in poverty (368) live in the city of South Haven, while the township of Covert has the highest percentage of child poverty (51.8%).

Although small in number (an average of 7 per year), the county's rate of child deaths has improved by over two-fifths during the trend period. Despite the improvement, the county ranked 52nd of the 66 counties ranked.

The county's rate of infant deaths (11 deaths per every 1,000 live births) worsened by nearly 34 percent, while the state's rate improved.

While remaining relatively stable over time, the rate of births to teens without a high school diploma remained high and ranked 77th of the 82 counties ranked.

** The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.*

Students with Satisfactory Scores

In Washtenaw County roughly 6,500 children live in poverty. The largest number of children in poverty (2,026) live in Ypsilanti Township, while the city of Ypsilanti has the highest percentage of child poverty (31.5%).

During the 1992-1993 school year, 3 percent of the county's 9-12th graders dropped out of school, an improvement from the prior year's rate.

The share of teen births in which the young mother received inadequate prenatal care more than doubled over the trend period to nearly one-quarter of all teen births. This high rate ranked at the bottom of the 78 counties ranked.

The county rate of teen violent deaths improved over time and represented the county's best rank; 4th of the 64 counties ranked. During the three most recent years, the county averaged 8 such deaths a year.

* The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

Wayne County

Child Poverty Rate: 30.6%

In Wayne County over 171,600 children live in poverty. The largest number of children in poverty (138,242) live in the city of Detroit, while the city of Highland Park has the highest percentage of child poverty (54.7%).

The county's share of births to teens who had not accessed adequate prenatal care has improved by nearly 15 percent over the trend period to an average of 17.6 percent of all births to teens.

The rates of teen violent deaths (107.2 per 100,000 youth) nearly doubled in the county over the time period. The county averaged over 170 deaths a year among that population.

The percent of babies born at low weight in the county worsened to a rate of 11 percent of all live births. This average rate results in a ranking of last among the 83 counties.

** The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.*

Wexford County

Child Poverty Rate: 20.1%

In Wexford County roughly 1,500 children live in poverty. The largest number of children in poverty (600) live in the city of Cadillac, while the city of Manton has the highest percentage of child poverty (35.5%).

County rates of births to teens without a high school diploma have improved by nearly two-fifths over the trend period to an average of 7 percent of all live births in the county. This rate ranked 29th of the 82 counties ranked.

Although the numbers are small (an average of 2 per year), the rate of teen violent deaths (92.9 per 100,000) has increased over the trend period.

While the county rate of serious crime arrests among youth improved, it ranked in the bottom tenth: 75th of the 83 counties ranked. During the three most recent years, an average of 107 such arrests a year occurred.

* The discussion does not usually highlight changes with small numbers which may result in very large variations in percent change.

data Notes, Definitions, and Sources

County Trends Bar Chart

All rates and numbers for the indicators on the Changes in Well-Being chart at the bottom of each county page reflect three-year averages, 1980-82 for the base year and 1990-92 for the recent year, except for serious (index) crime arrests and high school dropouts. Serious (index) crime arrests uses three-year averages of 1988-90 as base and 1991-93 for recent year. The high school dropouts indicator is an annual rate; the percentage change compares 1991-92 and 1992-93. (Indicators described on this page are included in the appendix with annual rates for the five most recent years and numbers for 1988 and 1992.)

(The indicators are listed in the order they appear on the bar chart.)

Teen Mothers with Inadequate Prenatal Care

Inadequate prenatal care, as defined by the Kessner Index, fails to begin within the first trimester, and (b) include an average of at least one additional prenatal visit per month of gestation. The percent reflects the total of all teen mothers (ages 13-19). Rates and numbers on the county trends bar chart reflect an average of 1980-82 for the base year and 1990-92 for the most recent year.

Source: Center for Health Statistics, Office of the State Registrar, Michigan Department of Public Health (1980-1992).

Low Birth-Weight Babies

Babies of low birth-weight weigh less than 2,500 grams (approximately 5 lbs. 8 oz.) at birth. Low weight birth percentages reflect the number of resident low weight births per 100 resident live births. Rates and numbers with the county trends bar chart reflect an average of 1980-82 for the base year and 1990-92 for the most recent year.

Source: Center for Health Statistics, Office of the State Registrar, Michigan Department of Public Health (1980-1992).

Births to Teens with Less than High School Education

Births to teens with less than a high school education represents the number of females 13 to 19 years of age who had children before planned date of high school graduation. The percent of births to teens with less than high school education is per all live births. Rates and numbers with the county trends bar chart reflect an average of 1980-82 for the base year and 1990-92 for the most recent year.

Source: Center for Health Statistics, Office of the State Registrar, Michigan Department of Public Health (1980-1992).

Infant Mortality

This rate shows the number of deaths of infants under one year of age per 1,000 live births. Rates and numbers with the county trends bar chart reflect an average of 1980-82 in the base year and 1990-92 for the most recent year.

Source: Center for Health Statistics, Office of the State Registrar, Michigan Department of Public Health (1980-1992).

Child Deaths Ages 1 to 14

The child death rate is the number of deaths from all causes per 100,000 children between the ages of 1 and 14, using the 1990 Census of Population and Housing. Rates and numbers with the county trends bar chart reflect an average of 1980-82 in the base year and 1990-92 for the most recent year.

Source: Center for Health Statistics, Office of the State Registrar, Michigan Department of Public Health, (1980-1992).

Teen Violent Deaths

Teen violent deaths are all deaths from accidents, homicides and suicides of teenagers ages 15 through 19, per 100,000 youth. Percentages and numbers with the county trends bar chart represent an average of the three-year period 1980-82 and 1990-92, respectively. (Rates from this year's book may vary considerably from last year's data book, where annual data were compared rather than an average of three years for the base and most recent year.)

Source: Center for Health Statistics, Office of the State Registrar, Michigan Department of Public Health, (1980-1992).

Serious (Index) Crime Arrests of Juveniles

For the Uniform Crime Reports, the Michigan State Police Department tabulates the number of arrests for all crimes. The eight index crimes include: murder, rape, robbery, aggravated assault, larceny, motor vehicle theft, burglary and arson. The rate is based on the total number of index crime arrests per 1,000 children age 10-17 in the 1990 Census of Population and Housing. Rates and numbers reflect three-year averages of 1988-90 as the base year and 1991-93 for recent year.

Source: Uniform Crime Reports, Criminal Justice Data Center, Michigan State Police (1988-1993).

High School Dropouts

Michigan's annual dropout rate is calculated on the number of students enrolled in grades 9 through 12 in public schools in a given year and the number enrolled in grades 10 through 12 in the next year, adjusted for graduating students and transfers in and out of districts. The rate represents one year only. The calculation does not reflect those who return to complete their diploma requirements or those who drop out prior to the ninth grade.

For the recent number on the table with the county trends bar chart, an asterisk (*) notes the number and rate are estimates because there were missing or inaccurate data although numbers affected were less than 15 percent of the county's graduates. Data about dropouts are not provided for 25 counties because they were not available (NA); missing or inaccurate (ID) for more than 15 percent of the graduates in the county; or not calculated because of missing data or a 0 value in either the base or most recent year. The total number of dropouts and the 5.94 percent dropout rate for the state were published by the Department of Education.

Because of the relatively large amount of missing data for this indicator, however, the percentage change was not displayed on the trend graph for the state. The estimated state average dropout rate of 5.94 percent should be viewed with caution because many large school districts are not included.

Source: Retention Dropout Information, Michigan Department of Education (1992 and 1993).

Other Indicators on the County Profiles

Children in Poverty

The poverty rate for children, presented as part of the Census Bureau's table for Persons Below Poverty, was determined for all persons under 18 years of age. Institutionalized children, children in military group quarters and in college dormitories are excluded.

Previous editions of KIDS COUNT in Michigan databooks reported child poverty figures for "related children" which include only the family head's children by birth, marriage or adoption, and other persons under age 18 related to the family head. In the 1980 census, information on child poverty was only for related children, so this measure was also used for 1990 to ensure accurate trend data. The difference between the number of persons in poverty and the related children in poverty is the 15-17 year old unrelated individuals who are not counted in the related poverty variable. These are the children in foster care, group homes, and non-institutionalized places. (Poverty thresholds are applied on a national basis and are not adjusted for regional, state or local variations in the cost of living).

Source: Census of Population and Housing, Bureau of the Census, Persons by Age in Poverty, STF3A (1990).

MEAP Tests

Michigan Educational Assessment Program (MEAP) is a statewide testing program to provide information to identify educational needs. Tests measure selected essential performance objectives in the subject areas of reading, mathematics and science. Tests are administered for reading and math in grades 4, 7, and 10 and for science in grades 5, 8, and 11. (Additional information about how to interpret and use MEAP scores is available in the Michigan Educational Assessment Program Handbook.)

Grade-level data on the county pages reflect only the percentages and numbers of students performing at a satisfactory level on each test, not the total numbers of students taking the tests. Although these tests were offered in past years, the forms are continually reviewed and refined (most recently, 1989 for reading, 1991 for mathematics and 1986 for science) so that test score comparisons are not appropriate.

Source: MEAP Scores, Michigan Educational Assessment Program, Michigan Department of Education (1993-1994).

Children under 18 Years of Age/Children as a Percentage of Total Population/Total Population

Data on age groups have been calculated by adding together several age breakdowns from STF1A files of the Census of Population and Housing for 1990.

Source: *Census of Population and Housing, Bureau of the Census, STF1A (1990)*.

Median Income of Families with Children Less Than 6 and Less Than 18

The median divides the income distribution into two equal parts, one having incomes above the median and the other having incomes below the median. For families, the median income is based on the distribution of the total number of families including those with no income.

Source: *Socioeconomic Characteristics of Michigan's Population, Census of Population and Housing, published reports, 1990*.

Unemployment Rate

The unemployment rate reflects the number of unemployed persons divided by the total Civilian Labor Force times 100. The Civilian Labor Force includes both employed and unemployed persons. Persons 16 and older are classified as unemployed if they were (1) not working (temporarily or laid off) during the reference week, (2) looking for work during the prior four weeks, and (3) available to accept a job. Persons working part-time are considered employed, whether they are working a few hours a week or are working part-time because they cannot find full-time employment.

Source: *Area Labor Statistics, Michigan Department of Labor (1993)*.

Indicators from Charts on Issue Pages

Children at 185 Percent of Poverty

Since the poverty level currently in use by the federal government does not meet all the needs of data users, data reflecting 185 percent of poverty are presented. This calculation is obtained by multiplying the income level established by the Office of Management and Budget by the appropriate factor. For example, the income level for a family of four persons at 185 percent of poverty level was \$23,447 ($\$12,674 \times 1.85$) in 1989.

Source: *Census of Population and Housing, Bureau of the Census, STF4A, Table PB101, Age-by-Ratio of Income in 1989 to Poverty Level*.

Students Eligible for State-Endorsed Diploma (based on 10/11 Grade MEAP)

Eligibility for a state-endorsed diploma requires scores of satisfactory or moderate performance on the reading test, and a 50 percent score on the mathematics and science tests administered through the Michigan Education Assessment Program (MEAP). The numbers and percentages do not reflect those students who have retaken the tests.

Source: *MEAP Scores, Michigan Educational Assessment Program, Michigan Department of Education (1992-93; 1993-1994)*.

Indicators Only in Appendix

Annual rates for the five most recent years as well as the numbers for the first and last year are provided for all indicators on the county Changes in Well-Being chart except for serious (index) crime arrests and high school dropouts. The appendix also includes annual rates (1989-93) for four other indicators: child abuse and neglect victims, children in out-of-home care, juvenile crime arrests, and children receiving free or reduced price lunches. (These four indicators appear only in the appendix.)

Child Abuse and Neglect Victims

Child abuse and neglect victims reflect an unduplicated count of children who are confirmed as victims of abuse or neglect. The state defines abuse as "harm or threatened harm to a child's health and welfare, occurring through nonaccidental physical or mental injury; sexual abuse, sexual exploitation or maltreatment."¹

Child neglect includes "harm or threatened harm to a child's health and welfare by a parent, legal guardian or persons with custodial care occurring through either (1) negligent treatment; or (2) placing the child at an unreasonable risk or by failure of the caretaker to intervene when possible to remove that risk."²

The rate is the number of child abuse and neglect victims per 1,000 divided by the children under age 18 in the 1990 Census of Population and Housing.

Source: Report PS-31D, *Victims by Category of Abuse/Neglect, Children's Protective Service Management Information, Health and Welfare Data Center, Michigan Department of Social Services (1980-1993)*.

Children in Out-of-Home Care

Children in out-of-home care include only those children in facilities or placements supervised by the Department of Social Services (DSS) or the courts. Children in the following living arrangements supervised by the DSS are included: family foster care, including the homes of relatives; foster homes or foster group homes; institutional care, including any care provided in an institutional setting, such as training schools and residential programs; and other care arrangements, including halfway houses; other staffed group homes not licensed as foster homes; DSS-

supervised group or family shelter homes; detention; jail; and out-of-state placements. (Since children in mental health facilities or out-of-home placements supervised by the Department of Mental Health are not included, these numbers are viewed as an undercount of children in out-of-home care.)

Source: Report PS-315, *Children's Protective Services Management Information, Health and Welfare Data Center, Michigan Department of Social Services (fiscal years 1987-1993)*.

Children Receiving Free/Reduced Price School Lunches

This indicator includes the percentage of all public school students receiving free or reduced price school lunches in school years from 1989-90 through 1993-94. Students from families reporting income below 185 percent of the federal poverty line are eligible for reduced price meals, while children from families with incomes below 130 percent of poverty are eligible for a fully subsidized or free meal. The rate reflects the number of children who are receiving free or reduced price meals divided by total school enrollment during that school year.

Source: Report of School Program Operations (FNS-10), *Food and Nutrition Services, Office of Nutrition, Michigan Department of Education (fiscal years 1989-1994)*.

Juvenile Arrests

Juvenile arrests include all arrests for any crime of youths under the age of 18. Crimes include index and non-index, as well as statutory, such as runaway and curfew violations. The rate reflects the total number of arrests per 1,000 youths ages 10-17. There are several limitations to the arrest data: certain crimes are not reported; police have considerable discretion in filing reports and categorizing crimes; and, if multiple crimes are committed, only the most serious of multiple crimes committed is reported.

Introduction to Appendix

Information in the appendix provides annual rates for ten indicators; six from this year's county profiles, as well as four included in previous editions of the data book. While the county profiles present average rates and numbers, in the appendix five years of rates are presented for each indicator, as well as the numbers of occurrences for the first and last year of each five year set. Shorter trends are also provided (one and five years). For comparison purposes, the state composite rates for each of the ten indicators appear along the bottom of every page.

The six indicators from the county profiles include: infant mortality, child deaths, teen violent deaths, births to teens with inadequate prenatal care, births to teens without a high school education, and low birth-weight babies. (No additional data for juvenile serious crime arrests and high school dropouts are in the appendix.) For these six indicators, annual rates for the years 1988-1992 are presented.

Additionally, four indicators from previous editions of *KIDS COUNT* data books are updated in the appendix: juvenile arrests (including index or serious, as well as non-index and status arrests); children receiving free- or reduced-priced lunches; children in out-of-home care; and victims of child abuse and neglect.

Percentage changes are given for five and one year trends, based on the difference between a base year rate and the most recent year rate. The percentage changes are calculated by subtracting the base year rate from the most recent year rate and then dividing by the base year rate. (See example in box.)

CALCULATING THE PERCENTAGE CHANGE OF RATE

	Year	Infant Mortality Rate	Formula Code
Base Year	1988	11.0	A
Most Recent Year	1992	10.2	B

(B-A) divided by A = $(10.2 - 11.0)$ divided by $11.0 = -7.3\%$ change

The change in rate will be either a positive or negative number. A negative number reflects a decrease in the rate, while a positive percent change number shows an increase. (In the example, the -7.3% change from the base year rate of 11.0 represents a decrease in the infant mortality rate.) A decrease usually means the situation is getting "better" for the state's children; in the example, a decrease in the rate of infant mortality would be viewed as an improvement.

County	Infant Mortality Rate per 1,000		Child Deaths (Ages 1-14) Rate per 100,000		Teen Violent Deaths (Ages 15-19) Rate per 100,000		Children in Out- of-Home Care Four Quarter Average		Child Abuse and Neglect Rate per 1,000

REPRODUCTION RELEASE

(Specific Document)

I. DOCUMENT IDENTIFICATION:

Title: <i>Rids Count in Michigan 1994 Data Book</i>	
Author(s):	
Corporate Source: <i>Michigan League for Human Services</i>	Publication Date: <i>Dec 1994</i>

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

The sample sticker shown below will be affixed to all Level 1 documents

The sample sticker shown below will be affixed to all Level 2 documents

Check here
For Level 1 Release:
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical) and paper copy.

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 1

Check here
For Level 2 Release:
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical), but not in paper copy.

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN OTHER THAN PAPER COPY HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 2

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."
