ABSTRACT

The tables contained in this document present data on the characteristics of men and women who received a bachelor's or master's degree in a science or engineering field from academic institutions in the U.S. during the 1992-93 and 1993-94 academic years. The data were collected in 1995 and 1996 and reflect the status of individuals as of April 1995. In addition to the demographic characteristics of recent college graduates with science and engineering degrees, the data may be used to understand the employment experiences of recent graduates such as the extent to which recent graduates entered the labor force, whether they were able to find employment, and the attributes of that employment. Results are presented separately for bachelor's and master's degree recipients as well as for graduates of the two graduating class years. This report contains three sections: (1) technical notes in Section A contain information on survey methodology, coverage, concepts, definitions, and sampling error; (2) detailed tabulations from the computer-assisted telephone interviews and mail questionnaire surveys are presented in Section B; and (3) Section C contains a copy of the mail questionnaire used. ACKNOWLEDGMENTS

John Tsapogas of the Division of Science Resources Studies (SRS) of the National Science Foundation (NSF) had overall responsibility for conducting the survey and producing this report. Mary Collins was Study Director and Lucinda Gray of Westat was the Assistant Study Director. During the early stages of the survey, Margaret Cahalan served as Study Director.

Linda P. Hardy of SRS and J. Michael Brick of Westat provided valuable statistical advice that greatly enhanced the accuracy of the estimates presented in this report. Comments, reviews, and consultations were provided by Carlos Kruytbosch, Program Director of the Science and Engineering Personnel Program, SRS, and Alan R. Tupek, Deputy Division Director, of SRS. This report was edited by Anne M. Houghton, Publications Manager, and Julia H. Harriston, Assistant Publications Manager, of SRS.

NSF expresses its appreciation to the recent graduates who contributed their time by responding to this survey. NSF also extends its sincere appreciation to college administrators and other college officials who contributed their time and effort to this survey; their willingness to participate in the survey greatly enhanced the quality of this report.

GENERAL NOTES

These tables present data on the characteristics of men and women who received a bachelor's or master's degree in a science or engineering field from U.S. academic institutions during the 1992–93 (1993) and 1993–94 (1994) academic years. The data were collected in 1995 and 1996 and reflect the status of individuals as of April 1995. In addition to the demographic characteristics of recent college graduates with science and engineering degrees, the data may be used to understand the employment experiences of recent graduates such as the extent to which recent graduates entered the labor force, whether they were able to find employment, and the attributes of that employment.

Results of this survey are presented separately for bachelor's and master's degree recipients, and also separately for graduates of the two graduating class years.

This report contains three sections. The technical notes in section A contain information on survey methodology, coverage, concepts, definitions, and sampling errors. Detailed tabulations from the survey are presented in section B. Although data were collected using both Computer-Assisted Telephone Interviews (CATI) and mail questionnaires, we have only included a copy of the mail questionnaire in section C.

SECTION A. TECHNICAL NOTES

These technical notes include information on sampling and weighting, survey methodology, sampling and nonsampling errors, and data comparisons to previous National Survey of Recent College Graduates (NSRCG) cycles and Integrated Postsecondary Education Data System (IPEDS) data. For a more detailed discussion of survey methodology, readers are referred to the NSRCG:95 Methodology Report.

OVERVIEW

The NSRCG:95 is sponsored by the National Science Foundation (NSF), Division of Science Resources Studies (SRS). The NSRCG is one of three data collections covering personnel and graduates in science and engineering. The other two surveys are the National Survey of College Graduates (NSCG) and the Survey of Doctoral Recipients (SDR). Together, they constitute the NSF's Scientists and Engineers Statistical Data System (SESTAT). These surveys serve as the basis for developing estimates and characteristics of the total population of scientists and engineers in the United States.

The first NSF-sponsored NSRCG (then known as New Entrants) was conducted in 1974. Subsequent surveys were conducted in 1976, 1978, 1979, 1980, 1982, 1984, 1986, 1988, 1990, 1993, and 1995. The initial survey collected data on only bachelor's degree recipients, but all subsequent surveys included both bachelor's and master's degree recipients.

For the NSRCG:95, a sample of 275 colleges and universities was asked to provide lists of eligible bachelor's and master's degree recipients. From these lists, a sample of 21,000 graduates (13,893 bachelor's and 7,107 master's recipients) was selected. These graduates were interviewed between May 1995 and March 1996. Computer assisted telephone interviewing (CATI) served as the primary means of data collection. Mail data collection was used only for those who could not be reached by telephone. The unweighted response rate for institutions was 97 percent, and the

unweighted response rate for graduates was 86 percent. The weighted response rates were 94 and 83 percent, respectively.

The NSRCG questionnaire underwent few revisions for the 1995 survey. All revisions were done in coordination with similar revisions to the other SESTAT surveys. Topics covered in the survey include:

- Educational experience before and after obtaining the sampled degree;
- Graduate employment characteristics including occupation, salary, unemployment, underemployment, and post-degree work-related training;
- Relationship between education and employment, and
- Graduate background and demographic characteristics.

Sample Design

The NSRCG used a two-stage sample design. In the first stage, a stratified nationally representative sample of 275 institutions was selected with probability proportional to size. There were 102 self-representing institutions, also known as certainty units. For each institution, the measure of size was a composite related to both the number of graduates and the proportion of these who were black or Hispanic. The 173 noncertainty institutions were implicitly stratified by sorting the list by type of control (public, private), region, and the percentage of degrees awarded in science or engineering. Institutions were then selected by systematic sampling from the ordered list.

The second stage of the sampling process involved selecting graduates within the sampled institutions by cohort. Each sampled institution was asked to provide

lists of graduates for sampling. Within graduation year (cohort), each eligible graduate was then classified into one of 42 strata based on the graduate's major field of study and degree level. However, due to the small numbers of Native Americans, all Native Americans who were identified on the graduate lists were put into one stratum for each cohort and sampled with certainty. While race was not an explicit stratification variable, black and Hispanic graduates were assigned a measure of size equal to three, while non-black/ non-Hispanic/non-Native American graduates were assigned a measure of size equal to one. This method had the same effect as oversampling black and Hispanic graduates by a factor of three. Table 1 lists the major fields and the corresponding sampling rates by cohort and degree. These rates are overall sampling rates for the major field, and include the institution's probability of selection and the within-institution sampling rate. To achieve the within-institution sampling rate, the overall rate was divided by the institution's probability of selection. The sampling rates by stratum were applied within each eligible. responding institution, and resulted in sampling 23,771 graduates.

SUBSAMPLING OF NONRESPONDENTS

Using the sampling rates in Table 1, a total of 23,771 graduates were sampled, rather than the 21,000 that were planned. Therefore, a subsample was selected to reduce the sample to the target of 21,000. Since at the time of subsampling most of the sampled graduates had been processed to some extent and many had completed interviews, the subsample was selected from the cases that were currently nonrespondents and in tracing to find a telephone number or address. All tracing cases were eligible except for bachelor's degrees with major fields of Other Physical Sciences and Aero/Astro Engineering. The sample sizes in these fields were substantially less than what was originally targeted, so they were excluded from the subsampling process. There were 7,971 cases eligible to be subsampled and the target sample size was 5,200. Thus, 2,771 cases were not subsampled, and data collection on these cases ceased immediately. The file of cases eligible for subsampling was sorted by cohort, degree, major sampling category, and school; the same sorting procedure used in the full sample. An equal probability sample was selected. Table 2 provides the final sample sizes after subsampling.

NOTE: Cohort, degree, and major are those reported by institutions at the time of sampling and may not match data reported by the respondents on the survey.

SOURCE: National Science Foundation/SRS, National Survey of Recent College Graduates, 1995

GRADUATE ELIGIBILITY

To be included in the sample, the graduates had to meet all of the following criteria:

- They received a bachelor's or master's degree in an eligible major from the college or university from which they were sampled;
- They received their degree within the two academic years in the study. For the 1995 study, there were two academic years (July 1992 through June 1993, and July 1993 through June 1994);
- They were under the age of 76 and living during the week of April 15, 1995 (the reference week); and
- They lived in the United States during the reference week.

DATA COLLECTION AND RESPONSE

Prior to graduate data collection, it was first necessary to obtain the cooperation of the sampled institutions that provided lists of graduates. The unweighted response rate for the institutional list collection was 97.4 percent. Table 3 shows the list collection response status and rates.

Table 3. Number of sampled institutions by response status and list collection response rate					
Total sampled institutions	275				
Response status Complete list provided	266 2				
Nonresponse List collection response rate 2/ Unweighted Weighted	97.4% 94.2				

- 1/ The ineligible institutions are those that did not award any eligible degrees within the eligible time period.
- 2/ The list collection response rate is calculated as: Complete / (Total – Ineligible).

Graduate data collection took place between May 1995 and March 1996, with computer assisted telephone interviewing as the primary means of data collection. Flyers were sent to all graduates announcing the study and asking for the phone numbers at which they could be reached during the survey period. Extensive tracing of graduates was required to obtain the desired response rate. Tracing activities included computerized telephone number searches, national change of address searches (NCOA), school alumni office contacts, school major field department contacts, directory assistance, military locators, post office records, personal referrals from parents or others who knew the graduate, and the use of professional tracing organizations.

Table 4 gives the response rates by cohort, degree, major, type of address, gender, and race/ethnicity. The overall unweighted graduate response rate was

86 percent. The weighted response rate was 83 percent. As can be seen from Table 4, response rates varied somewhat by major field of study and by race/ethnicity. Rates were lowest for those with foreign addresses

WEIGHT CALCULATIONS

To produce national estimates, the data were weighted. The weighting procedures adjusted for unequal selection probabilities, for nonresponse at the institution and graduate levels, and for duplication of graduates on the sampling file (graduates in both cohorts). In addition, a ratio adjustment was made at the institution level using the number of degrees awarded as reported in IPEDS for specified categories of major and degree. The final adjustment to the graduate weights adjusted for responding graduates

Not reported	5,917	4,421	519	977	83.5	80.1	

^{1/} The 1,630 ineligibles include the following: graduates living outside of the U.S. during the week of April 15, 1995 (780); graduates who reported an ineligible major field for their sampled degree (469); those who did not receive a bachelor's or master's degree from the sampled school within the correct time frame (307); duplicates (35); deceased (21); those who did not receive a bachelor's or master's degree (12); those who did not attend the sampled school (2); over the age of 75 in April 1995 (1), and other ineligible (3).

^{2/} The graduate response rate is calculated as (R – I)/[(R – I) + (N * p)] where R = Response (complete plus ineligible), I = Ineligible, N = Nonresponse, p = Proportion of response found inscope calculated as (R – I)/R.

^{3/} The cohort, degree, major, and race codes are those reported by institutions at the time of sampling and may not match data reported by the respondents on the survey.

^{4/} This reflects the type of address provided by the institution at the time of sampling. Additional address information may have been provided by the alumni office during data collection. Graduates from whom both a U.S. and a foreign address were provided are included in the foreign address category.

^{5/} Gender codes were obtained from four sources: those reported by institutions, those reported on the survey, coded from first or middle name; and imputation. Imputation was done on 143 nonrespondents where gender could not be coded from the name.

who could have been sampled twice. For example, a person who obtained an eligible bachelor's degree in 1993 could have obtained an eligible master's degree in 1994 and could have been sampled for either degree. To make the estimates from the survey essentially unbiased, the weights of all responding graduates who could have been sampled twice were divided by 2. The weights of the graduates who were not eligible to be sampled twice were not adjusted.

The weights developed for the NSRCG:95 comprise both full sample weights for use in computing survey estimates and replicate weights for variance estimation using a jackknife replication variance estimation procedure.

DATA EDITING

Most editing checks were included within the CATI system, including range checks, skip pattern rules, and logical consistency checks. Skip patterns were controlled by the CATI system so that inappropriate items were avoided and appropriate items were not missed. For logical consistency check violations, CATI screens appeared that explained the discrepancy and asked the respondent for corrections. Some additional logical consistency checks were added during data preparation. All of the edit checks discussed above were rerun after item nonresponse imputation.

IMPUTATION OF MISSING DATA

Missing data occurred if the respondent cooperated with the survey but did not answer one or more individual questions. The item nonresponse for this study was very low (typically about 1 percent) due to the use of CATI for data collection and of data retrieval techniques for missing key items. However, imputation for item nonresponse was performed for each survey item to make the study results simpler to present and to allow consistent totals to be obtained when analyzing different questionnaire items. "Not applicable" responses were not imputed since these represented respondents who were not eligible to answer the given item.

Imputation was performed using a hot-deck method. Hot-deck methods estimate the missing value of an item by using values of the same item from other record(s) in the same file. Using the hot-deck procedure, each missing questionnaire item was imputed separately. First, respondent records were sorted by items thought to be related to the missing item. Next, a value was imputed for each item nonresponse recipient from a respondent donor within the same subgroup. The results of the imputation procedure were reviewed to ensure that the plan had been followed correctly. In addition, all edit checks were run on the imputed file to be sure that no data inconsistencies were created by imputation.

ACCURACY OF ESTIMATES

The survey estimates provided in these tables are subject to two sources of error: sampling and nonsampling errors. Sampling errors occur because the estimates are based on a sample of individuals in the population rather than on the entire population and hence are subject to sampling variability. If the interviews had been conducted with a different sample, the responses would not have been identical; some figures might have been higher, while others might have been lower.

The standard error is the measure of the variability of the estimates due to sampling. It indicates the variability of a sample estimate that would be obtained from all possible samples of a given design and size. Standard errors can be used as a measure of the precision expected from a particular sample. Tables 5 to 8 contain standard errors for key statistics included in the detailed tables.

If all possible samples were surveyed under similar conditions, intervals within plus or minus 1.96 standard errors of a particular statistic would include the true population parameter being estimated in about 95 percent of the samples. This is the 95 percent confidence interval. For example, suppose the total number of 1993 bachelor's degree recipients majoring in engineering is 58,400 and the estimated standard error is 2,700. The 95 percent confidence interval for the statistic extends from:

 $58,400 - (2,700 \times 1.96)$ to $58,400 + (2,700 \times 1.96) = 53,108$ to 63,692

SOURCE: National Science Foundation/SRS, National Survey of Recent College Graduates, 1995

This means that one can be confident that intervals constructed in this way contain the true population parameter for 95 percent of all possible samples.

Estimates of standard errors were computed using a technique known as jackknife replication. As with any replication method, jackknife replication involves constructing a number of subsamples (replicates) from the full sample and computing the statistics of interest for each replicate. The mean square error of the replicate estimates around their corresponding full sample estimate provides an estimate of the sampling variance of the statistic of interest. To construct the replicates, 86 stratified subsamples of the full sample were created. Eighty-six jackknife replicates were then formed by deleting one subsample at a time from the full sample. WesVarPC, a public use computer program developed at Westat, was used to calculate direct estimates of standard errors for a number of statistics from the survey.

GENERALIZED VARIANCE FUNCTIONS

Computing and printing standard errors for each estimate from the survey is a time-consuming and costly effort. For this survey, a different approach was taken for estimating the standard errors of the estimates included in this report. First, the standard errors for a large number of different estimates were directly computed using the jackknife replication procedures described above. Next, models were fitted to the estimates and standard errors and the parameters of these models were estimated from the direct estimates. These models and their estimated parameters were used to approximate the standard error of an estimate from the survey. This process is called the development of generalized variance functions.

Models were fitted for the two types of estimates of primary interest: estimated totals and estimated percentages. It should be noted that the models used to estimate the generalized variance functions may not be completely appropriate for all estimates.

SAMPLING ERRORS FOR TOTALS

For estimated totals, the generalized variance function applied assumes that the relative variance of the estimate (the square of the standard error divided by the square of the estimate) is a linear function of the inverse of the estimate. Using this model, the standard error of an estimate can be computed as:

$$se(y) = \sqrt{ay^2 + by} \tag{1}$$

where se(y) is the standard error of the estimate y, and a and b are estimated parameters of the model. The parameters of the models were computed separately for 1993 bachelor's and master's recipients and for 1994 bachelor's and master's recipients, as well as for other important domains of interest. The estimates of the parameters are given in Table 9.

The following steps should be followed to approximate the standard error of an estimated total:

- 1) obtain the estimated total from the survey,
- 2) determine the most appropriate domain for the estimate from Table 9,
- 3) refer to Table 9 to get the estimates of a and b for this domain, and
- 4) compute the generalized variance using equation (1) above.

For example, suppose that the number of 1993 bachelor's degree recipients in engineering who were currently working in a engineering-related job was $40,000 \ (y = 40,000)$. The most appropriate domain from Table 9 is engineering majors with bachelor's degrees from 1993 and the parameters are a = 0.006357 and b = 19.377. Approximate the standard error using equation (1) as:

$$se(40,000) = \sqrt{.006357(40,000)^2 + 19.377(40,000)}$$

= 3,309

Sampling Errors for Percentages

The model used to approximate the standard errors for estimates of percentages was somewhat less complex. The generalized variance for estimated percentages assumed that the ratio of the variance of an estimate to the variance of the same estimate from a

KEY: *DFFF = Design effect			1.0]				

KEY: *DEFF = Design effect

SOURCE: National Science Foundation, National Survey of Recent College Graduates, 1995

^{** =} Estimates not reported because the specified model resulted in R-square values too small to report.

simple random sample of the same size was a constant. This ratio is called the design effect and is often labeled the DEFF. Since the variance for an estimated percentage, p, from a simple random sample is p(100-p) divided by the sample size, the standard error of an estimated percentage can be written as:

$$se(p) = \sqrt{DEFF(p)(100 - p)/n}$$
 (2)

where n is the sample size or denominator of the estimated percentage. DEFF's were computed separately for 1993 bachelor's and master's recipients and for 1994 bachelor's and master's recipients, as well as for other important domains of interest. The median or average value of the DEFF's from these computations are given in Table 9.

The following steps should be followed to approximate the standard error of an estimated percentage:

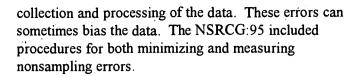

- 1) obtain the estimated percentage and sample size from the survey,
- 2) determine the most appropriate domain for the estimate from Table 9,
- 3) refer to Table 9 to get the estimates of the DEFF for this domain, and
- 4) compute the generalized variance using equation (2) above.

For example, suppose that the percentage of 1993 bachelor's degree recipients in engineering who were currently working in a engineering-related job was 60 percent (p = 60) and the number of engineering majors from the survey (sample size, n) was 1,653. The most appropriate domain from Table 9 is engineering majors with bachelor's degrees from 1993 and the DEFF for this domain is 1.8. Approximate the standard error using equation (2) as:

$$se(60\%) = \sqrt{1.8(60)(100 - 60)/1,653} = 2.6\%$$

Nonsampling Errors

In addition to sampling errors, the survey estimates are subject to nonsampling errors that can arise because of nonobservation (nonresponse or noncoverage), reporting errors, and errors made in the

Procedures to minimize nonsampling errors were followed throughout the survey. Extensive question-naire design work was done by Mathematica Policy Research (MPR), NSF, and Westat. This work included focus groups, expert panel reviews, and mail and CATI pretests. This design work was done in conjunction with the other two SESTAT surveys.

Comprehensive training and monitoring of interviewers and data processing staff was conducted to help ensure the consistency and accuracy of the data file. Data collection was done almost entirely by telephone to help reduce the amount of item non-response and item inconsistency. Mail questionnaires were used for cases difficult to complete by telephone. Nonresponse was handled in ways designed to minimize the impact on data quality (through weighting adjustments and imputation). In data preparation, a special effort was made in the area of occupational coding. All respondent-chosen codes were verified by data preparation staff using a variety of information collected on the survey and applying coding rules developed by NSF for the SESTAT system.

While general sampling theory can be used to estimate the sampling variability of a statistic, the measurement of nonsampling error is not easy and usually requires an experiment be conducted as part of the data collection, or that data external to the study be used. On the NSRCG:95, two quality analysis studies were conducted: (1) an analysis of occupational coding; and (2) a CATI reinterview.

The occupational coding report included an analysis of the CATI autocoding of occupation and the best coding operation. During CATI interviewing, each respondent's verbatim occupation description was autocoded by computer into a standard SESTAT code whenever possible. Autocoding included both coding directly to a final category and coding to an intermediate code-selection screen. If the description could not be autocoded, the respondent was asked to select the appropriate occupation category during the interview. For the primary occupation, 22 percent of the responses were autocoded to a final category and 19 percent were autocoded to an intermediate screen. The results and timings of the occupation autocoding were

examined and the process was found to be successful and efficient.

For the best coding operation, an occupational worksheet for each respondent was generated and reviewed by an experienced occupational coder. This review was based on the work-related information provided by the graduate. If the respondent's self-selected occupation code was inappropriate, a new or "best" code was assigned. A total of 17,894 responses were received to the three occupation questions. Of these, 25 percent received updated codes during the best coding process, with 16 percent being recoded from the "other" category and 9 percent recoded from the "non-other" categories. This analysis indicated that the best coding activity was necessary to ensure that the most appropriate occupation codes were included on the final data file.

The second quality analysis study involved a reinterview of a sample of 800 respondents. For this study, sampled respondents were interviewed a second time and responses to the two interviews were compared. This analysis found that the questionnaire items in which respondents were asked to provide reasons for certain events or behaviors had relatively large index of inconsistency values. Examples include reasons for not working during the reference week and reasons for working part-time. High response variability is typical for items that ask about reasons and beliefs rather than behaviors, and the results were not unusual for these types of items. Some of the other differences between the two interviews were attributed to the time lag between the original interview and reinterview. Overall, the results of the reinterview study did not point to any significant problems with the questionnaire.

Since the 1995 and 1993 NSRCG cycles used a very similar questionnaire and survey methodology, the results of the quality studies conducted during the 1993 cycle can also be used as an indication of data quality for the 1995 study. For the NSRCG:93, two data quality studies were completed: (1) an analysis of interviewer variance, and (2) a behavioral coding analysis of 100 recorded interviews. The interviewer variance study was designed to measure how interviewer effects might have impacted on the precision of the estimates. The results showed that interviewer effects for most items was minimal and thus had a very limited effect on the standard error of the estimates. Interviewer variance was highest for openended questions.

The behavioral coding study was done to observe the extent to which interviewers were following the structured interview and the extent to which it became necessary for them to give unstructured additional explanation or comment to respondents. As part of the study, 100 interviews were taped and then coded on a variety of behavioral dimensions. This analysis revealed that, on the whole, the interview proceeded in a very structured manner with 85 percent of all question and answer "dyads" being "asked and answered only." Additional unstructured interaction/discussion took place most frequently for those questions in which there was some ambiguity in the topic. In most cases this interaction was judged to have facilitated obtaining the correct response.

For both survey cycles, results from the quality studies were used to identify those questionnaire items that might need additional revision for the next study cycle. Debriefing sessions concerning the survey were held with interviewers, and this information was also used in revising the survey for the next cycle.

COMPARISONS OF DATA WITH PREVIOUS YEARS' RESULTS

A word of caution needs to be given concerning comparisons with previous NSRCG results. During the 1993 cycle, the SESTAT system underwent considerable revision in several areas, including survey eligibility, data collection procedures, questionnaire content and wording, and data coding and editing procedures. For a detailed discussion of these changes, please see the 1993 Report on Characteristics of Recent Science and Engineering Graduates, Technical Notes.

The changes made for the 1995 cycle were less significant. Among the important changes from the 1993 cycle to the 1995 cycle that may impact comparisons with previous years' survey results are the following:

Changes in the major fields represented.
 Certain majors excluded in the 1993 cycle were included in the NSRCG:95 cycle. These majors were: educational psychology; clinical psychology; counseling psychology; school psychology; archeology; criminology; and area

and ethnic studies. The appendix presents a listing of eligible and ineligible majors for the 1995 cycle with a cross-reference to the Department of Education's standard Classification of Instructional Programs (CIP) code.

- Changes in the salary question. In the NSRCG:93, the respondent was given the choice to answer in hours, weeks, months, years, or academic years. In the NSRCG:95, the respondent first was asked to give an annual salary, and if he/she was unable to do so, the interviewer prompted the respondent for an amount per hour, week, month, year, or academic year. Annual income was then calculated for all respondents.
- Changes in the hours and weeks worked questions. In the NSRCG:93, the graduate was asked if the salary reported was based on working full time. In the NSRCG:95, two questions were asked. The first, B29, asked how many hours the respondent worked during a typical week. The second, B29PAID, asked for how many hours during a typical week the respondent was paid. In addition, the respondent was asked in B29WEEKS whether their salary was based on a full year (52 weeks) or fewer than 52. If fewer, the interviewer then asked on how many weeks per year the respondent's salary was based (B29A).
- coding. During data collection, several changes in occupational coding were incorporated into the best coding process. For the NSRCG:93, first line supervisors and managers in sales and marketing occupations were classified in the same category as the workers they supervised. Following new NSF guidelines, in the NSRCG:95 they were coded as 203, other marketing and sales occupations. Recreational workers were coded as social workers (240) and athletes as artists, etc. (010) in the 1993 cycle, but both were classified as other occupations (500) in the 1995 cycle.

COMPARISONS WITH IPEDS DATA

The National Center for Education Statistics (NCES) conducts a survey of the nation's postsecondary institutions, called IPEDS. The IPEDS Completions Survey reports on the number of degrees awarded by all major fields of study, along with estimates by gender and race/ethnicity.

Although both the NSRCG and IPEDS are surveys of postsecondary education and both report on completions from those institutions, there are important differences in the target populations for the two survevs that directly affect the estimates of the number of graduates. The reason for the different target populations is that the goals of the surveys are not the same. The IPEDS estimates of degrees awarded are intended to measure the output of the educational system. The NSRCG estimates are intended to measure the supply and utilization of a portion of graduates in the years following their completion of a degree. These goals result in definitions of the target population that are not completely consistent for the two surveys. Other differences between the estimates can be explained to a very large extent by a few important aspects of the design or reporting procedures in the two surveys. The main differences between the two studies that affect comparisons of estimates overall and by race/ethnicity are listed below.

- The IPEDS Completions data file represents a count of degrees awarded, whereas the NSRCG represents graduates (persons). If a person receives more than one degree, institutions are instructed to report each degree separately in IPEDS. In the NSRCG, each person is counted only once.
- The NSRCG includes people who were residing in the United States during the reference week for the survey (the week of April 15 of the survey year). People who received degrees during the years covered by the survey, but resided outside the U.S. during the reference week appear in IPEDS counts, but not in NSRCG counts.
- The NSRCG includes only major fields of study that meet the specific SESTAT system definition of science and engineering (S&E),

while IPEDS includes all fields. The SESTAT field codes were designed to map directly to the 6-digit Classification of Instructional Program (CIP) codes used in IPEDS. However, published reports from the two studies may group the specific field codes differently for reporting purposes. Therefore, when comparing the NSRCG estimates in this report to IPEDS, care must be taken to select and group the IPEDS estimates according to the NSRCG field definitions shown in the appendix. For example, the NSRCG reporting category of Computer and Information Sciences does not include computer programming or data processing technology, but these fields are included in this category in NCES's Digest of Education Statistics. In addition, several NSRCG reporting categories include fields classified as multi/interdisciplinary studies in IPEDS. The NSRCG reporting category of Social and Related Sciences has the most differences in definition from IPEDS.

- The IPEDS data reflect information submitted by institutions from administrative records, whereas the NSRCG represents reports of individual graduates collected in interviews.
 Often, estimates differ when the mode of data collection and sources of data are different.
- Whereas the IPEDS is a census of postsecondary institutions, the NSRCG is a sample survey. As a result, NSRCG estimates include the sampling error that is a feature of all sample surveys.
- There is an additional consideration for estimates by race/ethnicity. Prior to the 1994–95 academic year, IPEDS collected race/ethnicity data only by broad 2-digit CIP code fields, not by the specific 6-digit CIP fields needed to identify the S&E fields as defined on NSRCG. Thus, it is not possible to obtain IPEDS race/ethnicity data that precisely match the S&E population as defined by NSRCG for the academic years included in this report. For example, the 2-digit CIP for Social Sciences and History includes history, which is not an S&E field, and does not include fields such as agricultural economics and public policy analysis that are S&E.

Despite these factors, the NSRCG and IPEDS estimates are consistent when appropriate adjustments for these differences are made. For example, the proportional distributions of graduates by field of study are nearly identical, and the numerical estimates are similar. Further information on the comparison of NSRCG and IPEDS estimates is available in the report, A Comparison of Estimates in the NSRCG and IPEDS, available in the SRS website at http://www.nsf.gov/sbe/srs/stats.htm.

OTHER EXPLANATORY INFORMATION

The following definitions are provided to facilitate the reader's use of the data in this report.

Coverage of tables: The tables in this report present information for four groups of recent graduates. These four groups consist of the two degree levels of bachelor's and master's, and the two academic years of 1992–93 and 1993–94.

Major field of study: Derived from the survey major field category most closely related to the respondent's degree field. Exhibit 1 gives a listing of the detailed major field codes used in the survey. Exhibit 2 gives a listing of the summary major field codes developed by NSF and used in the tables. The appendix lists the eligible and ineligible major fields within each summary category.

Occupation: Derived from the survey job list category most closely related to the respondent's primary job. Exhibit 3 gives a listing of the detailed job codes used in the survey and Exhibit 4 gives the summary occupation codes developed by NSF and used in the tables.

Labor force: The labor force includes individuals working full or part time as well as those not working but seeking work or on layoff. It is a sum of the employed and the unemployed.

Unemployed: The unemployed are those who were not working on April 15 and were seeking work or on layoff from a job.

Type of employer: This is the sector of employment in which the respondent was working on his or her primary job held on April 15, 1995. In this categorization, those working in 4-year colleges and

universities or university-affiliated medical schools or research organizations were classified as employed in the "4-year college and university" sector. Those working in elementary, middle, secondary, or 2-year colleges or other educational institutions were categorized in the group "other educational." The other sectors are private, for profit, self-employed, nonprofit organizations, Federal Government, and state or local government. Those reporting that they were self-employed but in an incorporated business were classified in the private, for-profit sector.

Primary work activity: This refers to the activity that occupied the most time on the respondent's job. In reporting the data, those who reported applied research, basic research, development, or design work were grouped together in "research and development (R&D)." Those who reported teaching were given the code "teaching." Those who reported accounting, finance or contracts, employee relations, quality or

productivity management, sales and marketing, or managing and supervising were grouped into "management, sales, administration." Those who reported computer applications were placed in "computer applications." Those who reported production, operations, maintenance, professional services or other activities were given the code "other."

Full-time salary: This is the annual income for the full-time employed who were not self-employed (either incorporated or not incorporated), whose principal job was not less than 35 hours per week, and who were not full-time students on the reference date (April 15, 1995). To annualize salary, reported hourly salaries were multiplied by the reported number of hours paid per week, then multiplied by 52; reported weekly salaries were multiplied by 52; reported monthly salaries were multiplied by 12. Yearly and academic yearly salaries were left as reported.

24

Exhibit 1. List A: Education codes

This EDUCATION CODES list is ordered alphabetically. The titles in bold type are broad fields of study. To make sure you have found the BEST code, please review ALL broad categories before making your choice. If you cannot find the code that BEST describes your field of study, use the "OTHER" code under the most appropriate broad field in bold print. If none of the codes fit your field of study, use Code 995.

Exhibit 3. List B: Job codes

This JOBS CODES list is ordered alphabetically. The titles in bold type are broad job categories. To make sure you have found the BEST code, please review ALL broad categories before making your choice. If you cannot find the code that BEST describes your job, use the "OTHER" code under the most appropriate broad category in bold print. If none of the codes fit your field of study, use Code 500.

Page 1 of 3

010	Artists, Broadcasters, Editors, Entertainers,
	Public Relations Specialists, Writers

Biological/Life Scientists

- 021 Agricultural and food scientists
- 022 Biochemists and biophysicists
- 023 Biological scientists (e.g., botanists, ecologists, zoologists)
- 024 Forestry, conservation scientists
- 025 Medical scientists (excluding practitioners)
- 026 Technologists & technicians in the biological/
- 027 OTHER biological/life scientists

Clerical/Administrative Support

- 031 Accounting clerks, bookkeepers
- 032 Secretaries, receptionists, typists
- 033 OTHER administrative (e.g., record clerks, telephone operators)

040 Clergy & Other Religious Workers

Computer Occupations (Also see 173)

- *** Computer engineers (See 087, 088 under Engineering)
- 051 Computer programmers (business, scientific, process control)
- 052 Computer system analysts
- 053 Computer scientists, except system analysts
- 054 Information systems scientists or analysts
- 055 OTHER computer, information science occupations
- *** Consultants (select the code that comes closest to your usual area of consulting)
- 070 Counselors, Educational & Vocational (Also see 236)

Engineers, Architects, Surveyors

- 081 Architects
- *** Engineers (Also see 100-103)
- 082 Aeronautical, aerospace, astronautical
- 083 Agricultural
- 084 Bioengineering & biomedical
- 085 Chemical
- 086 Civil, including architectural & sanitary
- 087 Computer engineer—hardware
- 088 Computer engineer—software
- 089 Electrical, electronic
- 090 Environmental
- 091 Industrial
- 092 Marine engineer or naval architect
- 093 Materials or metallurgical
- 094 Mechanical
- 095 Mining or geological
- 096 Nuclear
- 097 Petroleum
- 098 Sales
- 099 Other engineers
- *** Engineering Technologists and Technicians

- 101 Drafting occupations, including computer drafting
- 102 Surveying and mapping
- 103 OTHER engineering technologists and technicians
- 104 Surveyors

110 Farmers, Foresters & Fishermen

Health Occupations

- 111 Diagnosing/Treating Practitioners (e.g., dentists, optometrists, physicians, psychiatrists, podia trists, surgeons, veterinarians)
- 112 Registered nurses, pharmacists, dieticians, therapists, physician assistants
- 113 Health Technologists & Technicians (e.g., dental hygienists, health record technologist/technicians, licensed practical nurses, medical or laboratory technicians, radiologic technologists/technicians)
- 114 OTHER health occupations
- 120 Lawyers, Judges
- 130 Librarians, Archivists, Curators

Managers, Executives, Administrators (Also see 151-153)

- 141 Top and mid-level managers, executives, administrators (people who manage other managers)
- *** All other managers, including the self-em ployed—Use the code that comes closest to the field you manage

Management-Related Occupations (Also see 141)

- 151 Accountants, auditors, and other financial specialists
- 152 Personnel, training, and labor relations specialists
- 153 OTHER management related occupations

Mathematical Scientists

- 171 Actuaries
- 172 Mathematicians
- 173 Operations research analysts, modelling
- 174 Statisticians
- 175 Technologists and technicians in the mathematical sciences
- 176 OTHER mathematical scientists

Physical Scientists

- 191 Astronomers
- 192 Atmospheric and space scientists
- 193 Chemists, except biochemists
- 194 Geologists, including earth scientists
- 195 Oceanographers
- 196 Physicists
- 197 Technologists and technicians in the physical sciences
- 198 OTHER physical scientists
- *** Research Associates/Assistants (Select the code that comes closest to your field)

Sales and Marketing

- 200 Insurance, securities, real estate, & business services
- 201 Sales Occupations—Commodities Except Retail (e.g., industrial machinery/equipment/ supplies, medical and dental equip/supplies)
- 202 Sales Occupations—Retail (e.g., furnishings, clothing, motor vehicles, cosmetics)
- 203 OTHER marketing and sales occupations

Service Occupations, Except Health (Also see 111-114)

- 221 Food Preparation and Service (e.g., cooks, waitresses, bartenders)
- 222 Protective services (e.g., fire fighters, police, guards)
- 223 OTHER service occupations, except health

Social Scientists

- 231 Anthropologists
- 232 Economists
- 233 Historians, science and technology
- 234 Historians, except science and technology
- 235 Political scientists
- 236 Psychologists, including clinical (Also see 070)
- 237 Sociologists
- 238 OTHER social scientists

240 Social Workers

Teachers/Professors

- 251 Pre-Kindergarten and kindergarten
- 252 Elementary
- 253 Secondary—computer, math, or sciences
- 254 Secondary—social sciences
- 255 Secondary—other subjects
- 256 Special education—primary and secondary
- 257 OTHER precollegiate area
- *** Postsecondary
 - 271 Agriculture
 - 272 Art, Drama, and Music
 - 273 Biological Sciences
 - 274 Business Commerce and Marketing

DETAILED TABLES

Table		Page
1993	BACHELOR'S DEGREE RECIPIENTS	·
B-1	Number of 1993 science and engineering bachelor's degree recipients, by sex, race/ethnicity, and field of degree: April 1995	55
B-2	Number of 1993 science and engineering bachelor's degree recipients, by race/ ethnicity, by sex, and field of degree: April 1995	56
B-3	Number of 1993 science and engineering bachelor's degree recipients, by age and field of degree: April 1995	57
B-4	Number of 1993 science and engineering bachelor's degree recipients residing in the United States who are U.S. citizens, foreign born, and number who attended a foreign high school, by field of degree: April 1995	58
B-5	Number of 1993 science and engineering bachelor's degree recipients residing in the United States who are native-born or naturalized U.S. citizens, and number who are permanent or temporary residents, by field of degree: April 1995	59
B-6	Number of 1993 science and engineering bachelor's degree recipients (sampled degree only) who received financial support from various sources for 1993 bachelor's degree, by field of degree: April 1995	60
B-7	Number of 1993 science and engineering bachelor's degree recipients who have taken additional courses since most recent degree and enrollment status on April 15, 1995, by field of degree: April 1995	61
B-8	Number of 1993 science and engineering bachelor's degree recipients who have not taken courses since most recent degree, and likelihood they will take additional courses, by field of degree: April 1995	62
B- 9	Number of 1993 science and engineering bachelor's degree recipients who took courses between completing most recent degree and April 15, 1995, and type of degree sought, and number who took courses since April 15, 1995, by field of degree: April 1995	63
B-10	Number of 1993 science and engineering bachelor's degree recipients who are employed, employed full time and part time counting all jobs, employed full time and part time at principal job only, and number who have a second job, by field of degree: April 1995	64
B-11	Number of 1993 science and engineering bachelor's degree recipients who are employed, unemployed, and not in the labor force, by field of degree: April 1995	65

Page

B-12	Number of 1993 science and engineering bachelor's degree recipients who are not full-time students, and number of non-full-time students who are not in the labor force, in the labor force, employed, and unemployed, by field of degree: April 1995	66
B -13	Number of 1993 science and engineering bachelor's degree recipients who are not working, and reasons for not working, by field of degree: April 1995	
B-14	Number of employed 1993 science and engineering bachelor's degree recipients, by occupation and field of degree: April 1995	68
B-15	Number of employed 1993 science and engineering bachelor's degree recipients who are licensed or certified in their occupation, by sex and field of degree: April 1995	69
B-16	Number of 1993 science and engineering bachelor's degree recipients who have had a career path job since being awarded most recent degree, and number not having career path job who are seeking one, by sex and field of degree: April 1995	70
B-17	Number of employed 1993 science and engineering bachelor's degree recipients having job closely, somewhat, and not related to degree, by field of degree: April 1995	71
B-18	Number of employed 1993 science and engineering bachelor's degree recipients, by sex, race/ethnicity, and occupation: April 1995	72
B- 19	Number of employed 1993 science and engineering bachelor's degree recipients, by age and occupation: April 1995	73
B-2 0	Number of employed 1993 science and engineering bachelor's degree recipients, by sector of employment and occupation: April 1995	74
B-21	Number of employed 1993 science and engineering bachelor's degree recipients, by sector of employment and field of degree: April 1995	75
B-22	Number of employed 1993 science and engineering bachelor's degree recipients, by primary work activity and field of degree: April 1995	7 6
B-23	Number of employed 1993 science and engineering bachelor's degree recipients, by primary work activity and occupation: April 1995	77
B-24	Number of employed 1993 science and engineering bachelor's degree recipients whose work is supported by federal government, and agency giving support, by field of degree: April 1995	78
B-25	Median salary of full-time employed 1993 bachelor's degree recipients, by sex, race/ethnicity, and field of degree: April 1995	7 9

B-91	Number of 1994 science and engineering master's degree recipients who have taken additional courses since most recent degree and enrollment status on April 15, 1995, by field of degree: April 1995	145
B-92	Number of 1994 science and engineering master's degree recipients who have not taken courses since most recent degree, and likelihood they will take additional courses, by field of degree: April 1995	146
B-93	Number of 1994 science and engineering master's degree recipients who took courses between completing most recent degree and April 15, 1995, and type of degree sought, and number who took courses since April 15, 1995, by field of degree: April 1995	147
B-94	Number of 1994 science and engineering master's degree recipients who are employed, employed full time and part time counting all jobs, employed full time and part time at principal job only, and number who have a second job, by field of degree: April 1995	148
B-95	Number of 1994 science and engineering master's degree recipients who are employed, unemployed, and not in the labor force, by field of degree: April 1995	149
B-96	Number of 1994 science and engineering master's degree recipients who are not full-time students, and number of non-full-time students who are not in the labor force, in the labor force, employed, and unemployed, by field of degree: April 1995	150
B-97	Number of 1994 science and engineering master's degree recipients who are not working, and reasons for not working, by field of degree: April 1995	151
B-98	Number of employed 1994 science and engineering master's degree recipients, by occupation and field of degree: April 1995	152
B- 99	Number of employed 1994 science and engineering master's degree recipients who are licensed or certified in their occupation, by sex and field of degree: April 1995	153
B-100	Number of 1994 science and engineering master's degree recipients who have had a career path job since being awarded most recent degree, and number not having career path job who are seeking one, by sex and field of degree: April 1995	154
B-101	Number of employed 1994 science and engineering master's degree recipients having job closely, somewhat, and not related to degree, by field of degree: April 1995	155
B-102	Number of employed 1994 science and engineering master's degree recipients, by sex. race/ethnicity, and occupation: April 1995	

Table		Page
B -103	Number of employed 1994 science and engineering master's degree recipients, by age and occupation: April 1995	157
B- 104	Number of employed 1994 science and engineering master's degree recipients, by sector of employment and occupation: April 1995	158
B- 105	Number of employed 1994 science and engineering master's degree recipients, by sector of employment and field of degree: April 1995	159
B -106	Number of employed 1994 science and engineering master's degree recipients, by primary work activity and field of degree: April 1995	160
B -107	Number of employed 1994 science and engineering master's degree recipients, by primary work activity and occupation: April 1995	161
B-108	Number of employed 1994 science and engineering master's degree recipients whose work is supported by federal government, and agency giving support, by field of degree: April 1995	162
B-1 09	Median salary of full-time employed 1994 master's degree recipients, by sex, race/ethnicity, and field of degree: April 1995	163
B- 110	Median salary of full-time employed 1994 master's degree recipients, by sex, race/ethnicity, and occupation: April 1995	164
B-111	Median salary of full-time employed 1994 master's degree recipients, by broad sector of employment and field of degree: April 1995	165
B-112	Median salary of full-time employed 1994 master's degree recipients, by broad sector of employment and occupation: April 1995	166

SECTION C. SURVEY INSTRUMENT

OMB No.: 3145-0177

Expires: April 30, 1996

1995 National Survey of Recent College Graduates

This information is solicited under the authority of the National Science Foundation Act of 1950, as amended. All information you provide will be treated as confidential and used only for research or statistical purposes, analyzing data, and preparing scientific reports and articles. Any information publicly released (such as statistical summaries) will be in a form that does not personally identify you. Your response is entirely voluntary and failure to provide some or all of the requested information will not in any way adversely affect you.

Conducted by:

Westat, Inc. Rockville, MD

for the National Science Foundation Arlington, VA

INSTRUCTIONS

Thank you for taking the time to complete this important questionnaire. Directions for filling it out are provided with each question. Because not all questions will apply to everyone, you may be asked to skip certain questions.

- In order to get comparable data, we will be asking you to refer to the week of April 15, 1995 (i.e., April 9-15, 1995) when answering most questions.
- Follow all "SKIP" instructions <u>after</u> marking a box. If no "SKIP" instruction is provided, you should continue to the <u>next</u> question.
- Either a pen or pencil may be used.
- When answering questions that require marking a box, please use an [X].
- If you need to change an answer, please make sure that your old answer is either completely erased or clearly crossed out.
- You may notice that some question numbers are not consecutive. This was done to maintain consistency with previous survey cycles. Please answer questions in the order they are printed except when following a "SKIP" instruction.

Thanks again for your help. We really appreciate it.

	PART A: EDUCATION	A4X.	Do you have a 2-year associate's degree?	
A1.	In what year did you receive your high school	7	ı□ Yes	
	diploma or high school equivalency certificate?		2□ No	
	19 OR Did not finish YEAR high school	A5.	When you FIRST entered college to begin working on a bachelor's degree, in what field of study did you want to major?	
A2.	in what state or foreign country did you last attend high school?		MARK THIS BOX (X) IF YOU WERE UNDECIDED AND THEN SKIP TO A7	
	State:OR Foreign Country:		Major Field of Study:	
A3.	Have you EVER taken courses at a community	A6.	Using the EDUCATION CODES (pp. 18-19) choose the code that BEST describes your first intended major.	
	college? 1□ Yes		CODE: II_I (NOTE: Education codes go from 601 to 995)	
	2□ No → SKIP TO A4X	A7.	Using a 4-point scale, what was your overall UNDERGRADUATE grade point average (GPA)?	
↓ A4.	(IF YES) For which of the following reasons have you taken courses at a community college?		If you have <u>more than one</u> bachelor's degree: Give your overall grade point average for your <u>first</u> bachelor's degree.	
	MARK (X) YES OR NO FOR EACH YES NO		_	
	b. As part of a high school advanced		MARK (X) ONE 1□ 3.75 - 4.00 GPA (Mostly A's)	
	placement (AP) program 1 2		2□ 3.25 - 3.74 GPA (About half A's/half B's)	
	c. To prepare for college/increase chances of being accepted into college 1 2		3□ 2.75 - 3.24 GPA (Mostly B's)	
	d. To complete an associate's degree 1 2		4□ 2.25 - 2.74 GPA (About half B's/half C's)	
	e. To complete credits toward a		s□ 1.75 - 2.24 GPA (Mostly C's)	
	bachelor's degree		d□ 1.25 - 1.74 GPA (About half C's/half D's)	
	f. To gain further skills or knowledge in		7□ Less than 1.25 (Mostly D's or below)	
	your academic or occupational field 1 2		∗□ Have not taken courses for which grades were given	
	g. To change your academic or occupational field			
	h. To increase opportunities for promotion/advancement/higher salary 1 2	A10.	How many college or university degrees do you	
	i. For leisure/personal interest 1□ 2□		have at the bachelor's level or higher?	
	j. Financial reasons (e.g., 4-year college too expensive, needed the money for other priorities)		II NUMBER	
	k. Other (Specify):			
	1□ 2□			
_		+		

- Starting with your MOST RECENT college or university degree, please provide the following information for each degree you have at the bachelor's level or higher.
 - If more than 3 relevant degrees, complete the grid for your two most recent degrees and your first bachelor's degree.

LIST B: JOB CODES

This JOB CODES list is ordered alphabetically. The titles in bold type are broad job categories. To make sure you have found the BEST code, please review ALL broad categories before making your choice. If you cannot find the code that BEST describes your job, use the "OTHER" code under the most appropriate broad category in bold print. If none of the codes fit your job, use Code 500.

010 Artists, Broadcasters, Editors, Entertainers, Public Relations Specialists, Writers

Biological/Life Scientists

- 021 Agricultural and food scientists
- 022 Biochemists and biophysicists
- 023 Biological scientists (e.g., botanists, ecologists, zoologists)
- 024 Forestry, conservation scientists
- 025 Medical scientists (excluding practitioners)
- 026 Technologists & technicians in the biological/life sciences
- 027 OTHER biological/life scientists

Clerical/Administrative Support

- 031 Accounting clerks, bookkeepers
- 032 Secretaries, receptionists, typists
- 033 OTHER administrative (e.g., record clerks, telephone operators)

040 Clergy & Other Religious Workers

Computer Occupations (Also see 173)

- *** Computer engineers (See 087, 088 under Engineering)
- 051 Computer programmers (business, scientific, process control)
- 052 Computer system analysts
- 053 Computer scientists, except system analysts
- 054 Information systems scientists or analysts
- 055 OTHER computer, information science occupations
- *** Consultants (select the code that comes closest to your usual area of consulting)
- 070 Counselors, Educational & Vocational (Also see 236)

Engineers, Architects, Surveyors

- 081 Architects
 - Engineers (Also see 100-103)
 - 082 Aeronautical, aerospace, astronautical
 - 083 Agricultural
 - 084 Bioengineering & biomedical
 - 085 Chemical
 - 086 Civil, including architectural & sanitary

- *** Engineers (continued)
 - 087 Computer engineer hardware
 - 088 Computer engineer software
 - 089 Electrical, electronic
 - 090 Environmental
 - 091 Industrial
 - 092 Marine engineer or naval architect
 - 093 Materials or metallurgical
 - 094 Mechanical
 - 095 Mining or geological
 - 096 Nuclear
 - 097 Petroleum
 - 098 Sales
 - 099 Other engineers
- ** Engineering Technologists and Technicians
 - 100 Electrical, electronic, industrial, mechanical
 - 101 Drafting occupations, including computer drafting
 - 102 Surveying and mapping
 - 103 OTHER engineering technologists and technicians
- 104 Surveyors

Executives, Managers, Administrators (Also see

- 141 Top and mid-level managers, executives, administrators (people who manage other managers)
- All other managers, including the self-employed Use the code that comes closest to the field you manage
- 110 Farmers, Foresters & Fishermen

Health Occupations

- 111 Diagnosing/Treating Practitioners (e.g., dentists, optometrists, physicians, psychiatrists, podiatrists, surgeons, veterinarians)
- 112 Registered nurses, pharmacists, dieticians, therapists, physician assistants
- 236 Psychologists, including clinical
- 113 Health Technologists & Technicians (e.g., dental hygienists, health record technologist/ technicians, licensed practical nurses, medical or laboratory technicians, radiologic technologists/technicians)
- 114 OTHER health occupations
- 120 Lawyers, Judges
- 130 Librarians, Archivists, Curators

LIST B: JOB CODES (CONTINUED)

Management-Related Occupations (Also see 141)

- 151 Accountants, auditors, and other financial specialists
- 152 Personnel, training, and labor relations specialists
- 153 OTHER management related occupations

Mathematical Scientists

- 171 Actuaries
- 172 Mathematicians
- 173 Operations research analysts, modelling
- 174 Statisticians
- 175 Technologists and technicians in the mathematical
- 176 OTHER mathematical scientists

Physical Scientists

- 191 Astronomers
- 192 Atmospheric and space scientists
- 193 Chemists, except biochemists
- 194 Geologists, including earth scientists
- 195 Oceanographers
- 196 Physicists
- 197 Technologists and technicians in the physical sciences
- 198 OTHER physical scientists

Research Associates/Assistants

(Select the code that comes closest to your field)

Sales and Marketing

- 200 Insurance, securities, real estate, & business services
- 201 Sales Occupations Commodities Except Retail (e.g., industrial machinery/equipment/supplies, medical and dental equip/supplies)
- 202 Sales Occupations Retail
- (e.g., furnishings, clothing, motor vehicles, cosmetics)
- 203 OTHER marketing and sales occupations

Service Occupations, Except Health (Also see 111-114)

- 221 Food Preparation and Service (e.g., cooks, waitresses, bartenders)
- 222 Protective services (e.g., fire fighters, police, guards)
- 223 OTHER service occupations, except health

Social Scientists

- 231 Anthropologists
- 232 Economists
- 233 Historians, science and technology
- 234 Historians, except science and technology
- 235 Political scientists
- 236 Psychologists, including clinical (Also see 070)
- 237 Sociologists
- 238 OTHER social scientist

240 Social Workers

Teachers/Professors

- 251 Pre-Kindergarten and kindergarten
- 252 Elementary
- 253 Secondary computer, math, or sciences
- 254 Secondary social sciences
- 255 Secondary other subjects
- 256 Special education primary and secondary
- 257 OTHER precollegiate area or teaching at non-educational institution
- Postsecondary
 - 271 Agriculture
 - 272 Art, Drama, and Music
 - 273 Biological Sciences
 - 274 Business Commerce and Marketing
 - 275 Chemistry
 - 276 Computer Science
 - 277 Earth, Environmental, and Marine Science
 - 278 Economics
 - 279 Education
 - 280 Engineering
 - 281 English
 - 282 Foreign Language
 - 283 History
 - 284 Home Economics
 - 285 Law
 - 286 Mathematical Sciences
 - 287 Medical Science
 - 288 Physical Education
 - 289 Physics
 - 290 Political Science
 - 291 Psychology
 - 292 Social Work
 - 293 Sociology
 - 294 Theology
 - 295 Trade and Industrial
 - 296 OTHER health specialties
 - 297 OTHER natural sciences
 - 298 OTHER social sciences
 - 299 OTHER Postsecondary

Other Professions

- 401 Construction trades, miners & well drillers
- 402 Mechanics and repairers
- 403 Precision/production occupations

(e.g., metal workers, woodworkers, butchers, bakers, printing occupations, tailors, shoemakers, photographic process)

404 Operators and related occupations

(e.g., machine set-up, machine operators and tenders, fabricators, assemblers)

405 Transportation/material moving occupations

500 Other Occupations (Not Listed)
