#### ABSTRACT

The effect of the standardized test scores of transient students on the mean of the 9th, 10th, and 11th grade standardized test scores of a school was studied. The groups used in the study were grades 9, 10, and 11 at a new high school in Clarksburg (West Virginia). The study was conducted in the spring of 1998. Groups consisted of 204 9th graders, 219 10th graders, and 217 11th graders. The Basic Skills battery scores of the Scholastic Assessments Tests administered in April 1998 were used as raw data to determine if there was any significant difference in the achievement of the two groups, transfer and nontransfer, by performing t-tests. Two different comparisons were used to analyze the data for each class. First, the entire class mean was compared to the mean of the nontransfer students. Using analysis data derived from a t-test, no significant difference was found between the two means. Secondly, the mean of nontransfer students was compared to the mean of transfer students. Using a t-test for analysis, no significant difference was found between the two means. At the 0.05 level of significance, there was no significant difference in the groups. Results of this study seem to indicate that transient students did not have a significant effect on the school's scores, but this was possibly because only 50% of the school's transient students actually tested. The other 50% had moved to another school by test time. The transfer students' mean may also have been high since the school is new and serves as a magnet center attracting students desiring higher level classes not offered in all schools. The school had an open enrollment policy allowing students from surrounding counties admission. The school also hosted a number of foreign exchange students who tested. Three appendixes contain letters used in the study and test data for all students and transfer students. (Contains 6 tables and 64 references.) (Author/SLD)

#### Acknowledgments

I would like to express my appreciation to Dr. E. Gaby van der Giessen for her guidance during the preparation of this paper. A special debt of thanks to Bassha Weekley and Joshua Canfield for their computer assistance. Without their help this project could not have been completed.

#### **ABSTRACT**

Various studies have been conducted on the effects of transfer students on the classroom, but few have discussed the effects of transfer students on the standardized test results for a school, especially in a rural area. The purpose of this study was to examine the effect of transient students' standardized test scores on the mean of the ninth, tenth, and eleventh grade standardized test scores of a school. The groups used in this study were the ninth, tenth, and eleventh grade classes at a new high school in Clarksburg, West Virginia. The study was conducted in the spring of 1998. Groups consisted of 204 ninth grade students, 219 tenth grade students, and 217 eleventh grade students. The Basic Skills Battery scores of the SAT administered in April, 1998 were used as raw data to determine if there was any significant difference in the achievement of the two groups, transfer and non-transfer, by performing t-tests. Two different comparisons were used to analyze the data for each class:

- 1. The entire class mean was compared to the mean of the non-transfer students. Using analysis data derived from a t-test, no significant difference was found between the two means.
- 2. The mean of non-transfer students was compared to the mean of transfer students. Using a t-test data for analysis, no significant difference was found between the two means. At the .05 level of significance there was no significant difference in the groups.

5

The results of this study seemed to indicate that transient students did not have a significant effect on the school's score, but that was possibly because only 50% of the transfer students into the school actually tested. The other 50% had moved to yet another school by test time. The transfer students' mean may also have been high since the school is new and serves as a magnet center attracting students desiring higher level classes not offered in all schools. The school had an open enrollment policy allowing students from surrounding counties admission. The school also hosted a number of foreign exchange students who also tested.

#### CHAPTER ONE

#### INTRODUCTION

The purpose of this study was to investigate the effect of transient students' standardized test scores on the overall standardized test score mean of the ninth, tenth and eleventh grade.

State and national educational policy makers have increased pressure on schools and school districts to meet or exceed minimum standards as defined by the mean scores of one of a number of standardized tests. Testing results alone as the criteria for a school's success or failure must be examined in light of the pervasive effects of student mobility on learning outcomes (Beck, Kratzer, Isken, 1997; Kerbow, 1996; Ligon & Paredes, 1992).

Most systems for curriculum and instruction assume that students will be present for the entire learning sequence, whether it be a semester or an entire year. Remaining in the same school however, is no longer the norm for growing numbers of American students, a result of various changes in the students home life (Ligon & Paredes, 1992). Virtually all students' scores are included in the school mean, even if a student arrives the week of testing. Therefore, schools are being judged, at least in part, on the performance of students they did not teach (Beck,et al., 1997; Evans, 1996).

1

#### Research question

What would be the effect of transient students' Stanford Achievement Test scores on the overall ninth, tenth, and eleventh grade mean scores at a new, four year, magnet high school with approximately 1,100 students for the 1997-1998 academic year?

#### **Hypothesis**

H<sub>o</sub>: Transient students' standardized test scores would not affect the mean of the ninth, tenth, or eleventh grade standardized test scores.

H<sub>1</sub>: Transient students' standardized test scores would affect the mean of the ninth, tenth and eleventh grade standardized test scores.

#### Limitations

This study contained the following limitations:

- The sample was limited to ninth, tenth and eleventh grade students at a high school in rural West Virginia who took the Stanford Achievement Test, April 1-3, 1998.
- 2. The study was limited to one year's scores.
- 3. No incentive, such as a report card grade, was offered to encourage the students to do well on the test.

#### Definition of terms

The following terms were defined as they applied within the context of the study:

#### Transient, transfer or mobile student

Transient, transfer or mobile were used interchangeably to refer to a student who changed schools one or more times within an academic year (Bayer, 1982).

#### Stable student

A stable student remained in the same class or classes the entire semester or year, as the class warranted (Bayer, 1982).

#### Systemic transfer

Systemic transfer is a phrase coined by A.E. Bayer to describe a student who moved on schedule according to the system: i.e. elementary school to middle school to high school; a desegregation move to another school; or a school closing /consolidation (Bayer, 1982).

#### Individual transfer

Individual transfer is a phrase coined by A.E. Bayer to describe a student who moved from one school to another for any reason other than a systemic one (Bayer, 1982).

#### Migrant student

Public Law 93-380 defined a migrant student as the offspring of migrant agricultural workers who has to move with his family from one school district to another during the school year so that the family might become employed in the agricultural and fishing industry or in related food processing (Miller & Cherry, 1991).

#### Homeless student

A student whose family lost its permanent housing and lived in a public shelter, with friends or other family members or in some other, less than adequate shelter (Dohrn, 1991).

#### **Assumptions**

The following assumptions were made for the study:

- 1. The sample was adequate in size.
- 2. The students were enrolled at the high school during the standardized testing period.
- 3. The testing instrument was valid.
- 4. The time frame was adequate.

#### Importance of the study

This study was important to determine if transience affected overall school performance on the state mandated standardized testing in an 1100 student high school. The school itself is located in a small city in a predominately rural state. Much research has been carried out around large urban and suburban areas (Beck, et al., 1997; Brown, 1996; Cleveland Public Schools, 1989; Ingersoll, et al., 1989; Kerbow, 1996; Paredes, 1993; Vail, 1996), but little research was centered around a smaller, more rural population center (Adduci, 1990; Miller & Cherry, 1991).

#### **CHAPTER TWO**

#### LITERATURE REVIEW

This literature review will focus on school-aged children, kindergarten through grade 12, who change schools one or more times during the academic year and the emotional and academic effects of transition upon these children. The reasons for transfer are many (Hodges, 1986; Jalongo, 1985; Khlief, 1978; King-Stoops, 1980; Miller & Cherry, 1991), as are the corresponding effects (Adduci, 1990; Adler, 1975; Blakeman, 1993; Dohrn, 1991; General Accounting Office, 1994; Hauseman & Reed, 1991; Ingersoll, 1988; Steel, 1994).

#### Questions explored include:

Who moves?

What are the reasons for student mobility?

What is the impact of mobility upon the student academically?

What is the impact of mobility upon the student emotionally?

What is the impact of mobility upon schools?

What is the impact of mobility upon teachers and teaching?

What intervention measures have been proposed?

What are the public policy implications?

Americans are a mobile people. The United States General Accounting

Office Report (1996) indicated that annually one fifth of all Americans move.

Eight million school-aged children move each year. School-aged children who move can be labeled or defined as "transient" if they move even once to a new community and a new school, but particularly those children who make repeated moves (Allan & Bardsley, 1983). Yet,

A widely held view in education is that the longer a student is exposed to a program of instruction, the better the chance that the student will learn and acquire the skills necessary to succeed in society and the work force. In other words, schools need a consistent and continuous period of instruction before they can have a significant impact upon students. (Ligon & Paredes, 1992, p.1).

#### THE MOVERS

Bayer (1982) categorized types of student mobility in his pioneering work on the subject. Bayer's typology related to the mobile student's academic achievement in which he proposed two major types of moves: systemic and individual. Systemic moves include prescribed moves, as from elementary to middle school. Every student eventually becomes a systemic mover. Individual moves include all others: moves out of district whether two blocks or two hundred miles, magnet school enrollment, military moves, et cetera (Bayer, 1982). In their study, Warren-Sohlberg and Jason (1992) found a correlation between school

performed better academically than those who transferred individually; but all transfer students' grade point averages dropped the first grading period after the move regardless of the reason for moving (Warren-Sohlberg & Jason, 1992).

The Chicago, Illinois public schools as well as other urban area school systems are reeling from student instability. According to Kerbow (1996) more than 86 percent of all transfers in Chicago over the summer of 1993 were from one Chicago public school to another. During the academic year, 82 percent of all transfers were within Chicago also. Instability in the Chicago school system as well as other urban areas was not caused by an influx of new students, but from students moving from one local attendance area to another.

Mobile students tended to come from impoverished families as well as from families with non-traditional household compositions. They were potentially disadvantaged not only by an inconsistent educational experience due to frequent transfer, but also by the lack of resources in their home (Kerbow, 1996).

Like Kerbow's (1996) Chicago study, the Austin Public Schools study found black students to be the most mobile, Hispanic students fairly mobile, while white students in general the least mobile. Low-income students of any race comprised the most highly mobile category (Ligon & Paredes, 1992).

#### REASONS FOR STUDENT MOBILITY

#### Change in marital status

Divorce is a stressful event for children. Hodges (1986) noted the stress on children derived from parental conflict before, during, and after the divorce; parents' inability to offer emotional support to the children due to their own emotional turmoil; financial hardship after the divorce; and parental stress as it colored all interaction between parents and children. Two-thirds of children in the Wallerstein and Kelly (1980) study moved three or more times during the first three years after a divorce. In some families, a move was less disruptive and viewed more positively if it followed a remarriage by the custodial parent (Miller, 1991).

Divorce affects childhood development. Younger children are likely to act out aggression and exhibit other "acting out" behaviors while teenagers may exhibit withdrawal and depression (Hodges 1986). Children and teens may grieve over the loss of a parent and friends if they have to move, just as if a death had occurred (Lane & Dickey, 1988). To adolescents, their circle of friends is the most important support system available to them (Blakeman, 1993). These feelings of loss are intensified if a move is precipitated by divorce or separation of the parents (Neuman, 1988).

#### Migrant employment

Migrant children change schools on average three times per year. These children take three years to achieve learning levels non-migrant children average in a single year. On average, migrant students receive 7.7 years of schooling compared to 12.5 years of schooling for the general population of the United States. The dropout rate for migrant students is 50% (King-Stoops, 1980).

Migrant families come from diverse cultural backgrounds, often speak

English as a second language, or not at all. They may have a permanent home that
they return to or they may live a totally nomadic lifestyle (Miller & Cherry,
1991). Children of undocumented migrant workers who have come into this
country illegally are the most under-served students of all migrant school children.
Parental fears of deportation prevent these students from attending school or
seeking available assistance (Miller & Cherry, 1991).

#### Job market fluctuations

The fluctuating job market coupled with the scarcity of adequate low-income housing has dislocated hundreds of thousands of households, translating into frequent moves for families. Often students attend four or more schools in a year (Larrick, 1992).

#### Dissatisfaction with housing

Urban housing is largely rental and may offer short-term lease agreements to the tenant. If either the landlord or the tenant poorly maintains the property, it is relatively easy to either evict the tenant or to move out at will, often only a few blocks but possibly to another school attendance district. If Social Services pay rent voucher money directly to tenants instead of landlords, often the money is kept and the tenant "skips out", again not far, but to another school attendance district (Vail, 1996).

#### **Homelessness**

The Department of Education (1991) estimates that more than 450,000 homeless children live in the United States.

The acceptance of shelter accommodations is for most families a final and desperate act to keep their families together. Yet parents and children are humiliated for their efforts, infantalized, and all but stripped of their resourcefulness. Families and the women and children who lose their housing do not identify themselves publicly as homeless, furthering the invisible crisis.

When a child has lost his or her permanent housing and experiences the stress of a family crisis, the additional loss of a familiar school and its context may well be devastating (Dohrn, 1991, pg.4).

So says Bernardine Dohrn concerning children of homeless families in her report for the Legal Assistance Foundation of Chicago (1991). Yet a basic

educational need for children, especially during a crisis period is continuity and stability in schooling (Dohrn, 1991).

Most school principals interviewed by Dohrn were unaware that homeless children attended their schools, when in fact they did; nor did they know the rights of these children spelled out in the McKinney Act as amended in 1990 by the United States Congress.

More than two-thirds of the homeless parents interviewed by Dohrn indicated they would rather their children had continued in their home school. None of the parents had been offered the choice of continued enrollment (McKinney Act, sec. 722 (e) (3) (A)) and transportation assistance (McKinney Act, sec. 722 (e) (1) (G) (I) (9)), none had heard of the McKinney Act (42 U.S.C. § 11431-11432), or had been informed by school or shelter personnel of options provided in the Act.

The cumulative effects of school transfers on homeless students contribute to underachievement, possibly being retained in a grade, loss of continuity in learning, negative attitude in the student's academic performance, school attendance, and general outlook. Reading and math achievement suffer dramatically as well for homeless children (Rafferty, 1989).

#### New immigrants

"The child who changes culture and country as well as residence is more than a 'new kid' at school; he or she is an expatriate" (Jalongo, 1994-1995, pg.81). Culture shock is very real, especially if a language barrier is also present. Some immigrant children come to the United States with the security of the family, but more and more orphaned or abandoned foreign nationals are being adopted by American families. For those children old enough to understand, cultural differences can be overwhelming at first (Jalongo, 1994-1995).

#### Military personnel

Military children are not negatively affected by relocation (Miller & Cherry, 1991). The move is expected and the family is stable and intact. A sense of community prevails as many other families are moved at the same time. The curriculum is similar if students are enrolled in military base schools. Schools that are near a military base have many dependents enrolled, so a continuity and camaraderie that is not a common experience other transfer students enjoy exists among new and established students. Finally, on-base recreational facilities are geared to offer immediate social opportunities for the families involved (Marchant and Medway, 1987).

#### Dissatisfaction with previous school

School moves tend to occur within localized geographic boundaries. The median distance that students move between schools is 2.4 miles. Families who move their children because of dissatisfaction with the previous school do not generally search far for a new location (Kerbow, 1996).

#### Corporate moves

The financial cushion associated with a corporate move helps make the transition smoother. Thought can be given to the choice of neighborhood and school setting. Although the student must re-establish in a new setting, the family is not generally in crisis, making the stress of the move itself the only obstacle to overcome (Miller & Cherry, 1991).

#### ACADEMIC IMPACT UPON THE STUDENT

The rate of transience in the schools has alarming implications for the growth and education of millions of children (Dohrn, 1991). Homelessness, especially moving from shelter to shelter, has created a major crisis for schools, parents, teachers, and the educational system (Dohrn, 1991). The sheer numbers of transient students compounded by the number of times many of these individuals change schools between kindergarten and twelfth grade has the potential for deep and pervasive consequences for the students involved and more

broadly for the classrooms and schools they attend (Kerbow, 1996). Students may experience learning difficulties simply because their new class is at a decidedly different point in the curriculum than their previous schools. (Kerbow, 1996). Classroom instructional routines are often interrupted. Teachers may be forced to repeat material already taught to accommodate the newly arrived student rather than provide new materials to the rest of the class (Lash & Kirkpatrick, 1990). Stable students are affected as the forward progress of their learning is interrupted by unnecessary review. In a highly mobile school, even those students who do not move may get instruction that is approximately a year behind that of students in more stable schools (Kerbow, 1996). High mobility classrooms are plagued by behavioral problems. Teachers must continually reestablish rules and procedures since the makeup of the class is fluid and the psychological rewards of teaching are diminished for the teacher. "Teachers spend a great deal of time getting to know their students and understanding their learning styles. But just when they begin to see success with a child, the child moves away." (Vail, 1996, pg. 22).

Students who transfer between schools may actually miss exposure to key concepts that are prerequisites for higher order skills. The consequences may grow as the student progresses through the grades (Kerbow, 1996).

The opportunity to learn depends upon the pace new information is introduced into the curriculum. Pace for the mobile student can be influenced by the new classroom setting or by numerous other variables. The opportunity to

learn may be accelerated or reduced depending upon the circumstance (Good & Marshall, 1984; Kerbow, 1996).

A smooth transition into a new classroom is often dependent upon proper group placement, yet records establishing educational background and achievement rarely arrive with the student. Group placement then becomes "guess work" until records arrive or until the student can be tested (Cornille, Bayer & Smyth, 1983; Kerbow, 1996; Vail, 1996).

#### EMOTIONAL IMPACT UPON THE STUDENT

Each student reacts to relocation differently, depending upon the individual and the circumstance that precipitated the move. For example, a move due to spousal abuse would be viewed differently from an expected military move. Even when a child perceives a move as generally positive, the necessary adjustments are disruptive and create stress (Jalongo, 1985).

Relocation has been described as a "crisis" event in which the individual faces a new, problematic situation. The individual finds that the current levels of coping skills are not adequate and in a crisis, anxiety and confusion replace the sense of well being (Hausman & Reed, 1991). The adolescent's stress is magnified by transition as the student is also coping with adolescent development

as well as a move. Also, friends are tied to the adolescent self-identity. Leaving friends behind creates a crisis of sorts, as does the perceived and actual "loss of control" of the adolescent's circumstances (Arbetter, 1991; Kyrios & Prior, 1990; Stroh & Brett, 1988). All children are affected by a move, including the friends left behind (Field, 1984). Young children fear separation and abandonment more than anything else, while teens stated the primary reason for attending school is to see their friends (Goodland, 1984; Wolman, 1978). Children experience moving as loss of their natural habitat (Gabarino, 1987). It is estimated that a child needs at least a year to fully adjust to a single move (Current Health, 1985). In so far as school adjustment, Cornille, Bayer and Smyth (1983) found that on average, the new student in class needs twenty-three days to feel comfortable with his new peers. That translates into more than a month in school. Academic adjustment is accomplished on average in seventeen days, or a little more than three weeks. This period of newcomership can last from a week to a month (Khleif, 1978). For the student who moves several times during a single year, the period of adjustment is unending.

To further highlight the emotional crisis for children who move one should consider the following contentions. Children who move often do not perform well academically (Kerbow, 1996). Children with low academic achievement tend to be less well liked and interact less positively with peers than high achievers (Jason, 1992). Children who do poorly in school withdraw or become

disruptive, behavior typically disliked by other children (Jason, 1992). Children who do poorly academically tended to have lower self-esteem and were less likely to take risks easily (Jason, 1992).

#### IMPACT UPON THE ACADEMIC ACHIEVEMENT OF THE SCHOOL

Six million American families relocate yearly, forcing teachers to deal with staggering student turnover rates, especially in urban schools. Turnover rates of 40%, 50%, 75%, or more are not unheard of (Larrick, 1992; Vail, 1996).

Attempts to monitor school performance become meaningless if the student population tested one year has largely changed by the next (Evans, 1996).

Having a highly transient student body places a school at a disadvantage as test scores and other indicators of success are evaluated by state and district officials. School standardized test averages for institutions with high numbers of mobile students are routinely misleading and typically low. Many individuals whose scores make up the composite score have been at the site for only a short period of time, and their performance on any sort of assessment cannot validly reflect the quality of the instructional program of the school where they happen to be on testing days (Beck, Kratzer, & Isken, 1997, p.345).

Although moving once or twice during the public school years may not be harmful, most research suggests that high mobility lowers student achievement, particularly when students are from low-income, less-educated families (Ascher, 1991; Brent & DiObilda, 1993; Cleveland Public Schools, 1989; Ingersoll, 1988; Lash & Kirkpatrick, 1990; Mehana & Reynolds, 1995; US Department of

Education Research and Improvement, 1996; U.S. General Accounting Office, 1994). Students who move frequently are at greater risk to develop learning disorders, to fail one or more grades, for frequently occurring behavioral problems, for growth or developmental delays (Wood, Halfon, Scarlata, Newacheck, &Nessim, 1993).

Conversely, students who follow the prescribed elementary, middle, high school sequencing of a school district are likely to graduate (Olkowski & Parker, 1992). The most mobile population, migrant students, has the highest school failure and dropout rate (Lunon, 1986; Ascher, 1991).

Specifically, the Ingersoll Study (1988) compared achievement levels of transient students to more stable students in the Denver Public Schools, a multiethnic, urban system of 60,000 students. Achievement levels of three continuing groups of stable students and two groups of mobile students were compared and analyzed. The achievement levels of the stable groups were consistently higher than the achievement levels of the transfer (mobile) students. Student socioeconomic status did not alter the outcome correlation (Ingersoll, 1988).

Studies conducted by Adduci, in a small New Jersey city near New York (1990), by Vincent Paredes in the Austin, Texas Independent School District (1993), and by Dolores A. Evans in suburban Chicago (1996) concluded that mobility did not lower student achievement in their samplings, but did indicate

that mobility was a factor that could negatively affect learning. In another study by Ingersoll, Scamman, and Eckerling (1989) that correlated student mobility and standardized test scores, variables such as ethnicity, socioeconomic status and family stress were "also highly related to achievement and to mobility." (Ligon & Paredes, 1992, pg. 3; Jalongo, 1995).

According to the Department of Education Office of Educational Research and Improvement, "Students who change schools frequently, particularly students from low income families, are absent more often, are less likely to perform well in school, and are more likely to leave school without graduating than those who change schools infrequently or not at all." (DOE/OER&I, 1996, pg.1).

Mobile secondary students were almost twice as likely to drop out of school as those who remain in one secondary school were likely to graduate (Brown, 1996). In fact, migrant students, the most mobile of all, rank among those with the highest school failure and dropout rate (Evans, 1996).

Dolores Evans cites a Chicago Tribune article entitled "School Statistics Can Be Misleading" in which the author, Professor Robert Meyer of the Harris School of Public Policy at the University of Chicago, suggested caution when making any judgments about school improvement based on standardized testing results. Professor Meyer found that individual Chicago schools were making actual improvements in student learning but those gains were obscured on the standardized tests by outside factors including student mobility. Meyer observed

that in some cases reported standardized test scores indicated declining student achievement when in fact the school was having a very positive impact (Bryk & Easton, Jan.12, 1994). "Thus, mobility can be viewed as having a negative impact on student achievement as well as having a negative impact on schools when reporting and comparing test results." (Evans, 1996, pg. 6).

#### IMPACT ON TEACHERS AND TEACHING

Integrating new students into an established classroom interferes with classroom instruction for the students who did not move. Time utilized for new material introduction is reduced, necessitated by review for new students to be brought into the learning stream, and by non-teaching management tasks (Evans, 1996). The pacing of instruction is slowed for all students in the class, both mobile and stable (Kerbow, 1996). As the composition of the class changes by gaining or loosing students, time must be spent getting to know new students needs. It also becomes difficult to tailor long-range plans for the class. For example, if a teacher attempts to coordinate instruction with the previous teacher, the students in the fall class may well be different from the students in the previous spring term (Kerbow, 1996). Additionally, if transfer records are not received in a timely fashion, placement is at best "guess work" until records arrive. Too often, students have moved on to yet another school before records catch up, if at all (Cornille, et al., 1983; Kerbow, 1996; Vail, 1996).

#### INTERVENTIONS

To ease the transition for a student leaving his or her class the sending school can allow the student time to say good-bye to friends and to allow the students staying behind time to say good-bye also. Both those who leave and those who stay grieve (Miller & Cherry, 1991).

A packet including informal records can be sent with the student to help the receiving school make an appropriate placement until the records arrive (Kerbow, 1996).

While not widespread (Bracey, 1991), some receiving schools have programs in place to welcome students, whether through the school counselor, the library or the principal. Parent education programs and handbooks that acquaint the parents with the new school as well as the effects of moving benefit the student as well.

Summer student orientations, welcome packets, informal tours, reception committees, coaching the entire class in how to welcome new students, classroom buddies, and tutoring are all useful initiatives to integrate the transfer student into the new setting (Ascher, 1991; Beck et al., 1997; Jalongo, 1995; Marlett, 1993; Miller & Cherry, 1991; Steele, 1994).

In addition to school-wide programs, a school community representative and social workers could reach out to acclimate the entire family into the new community (Steele, 1994). The high school library is a logical welcome center/

refuge for transfer secondary students (Pawlowski & Troutman, 1993). School counselors can be the vital first link in successful student integration into the new school setting (Blakeman, 1993). New students may exhibit aggression, withdrawal, over-talkativeness among other indicators of stress (Neuman, 1988). When the classroom teacher cannot handle the behavior, the counselor can intervene.

Interventions on behalf of the homeless student could include a structured, secure, classroom setting; providing a private space for the child to store his things; and labeling the child's belongings, especially those things going with the child overnight. The teacher could break work into small manageable sections to insure success and provide outlets for physical and emotional energy. Training workshops dealing with homeless children would be valuable for the teacher (Gewirtzman & Fodor, 1987).

Practical help for the teacher might include strategies for quick, preliminary assessment of a new student's ability and strategies to develop a flexible curriculum. Teachers should be provided with professional development course training so that they are prepared to face the challenges inherent in both fluid class composition and the emotional turmoil of loosing students (Beck, et al., 1997).

#### **POLICY IMPLICATIONS**

Develop policies to decreasing the level of mobility between schools in the same system

Policies are needed to decrease the level of mobility between schools in the same district. Since moves are often local, flexibility in the attendance areas would allow students to remain in the same school even though the family changed dwellings (Kerbow, 1996; Vail, 1996). Also, some urban areas have a local public housing policy that allow families to live in public housing rent free for a limited period of time. Allowing families to live rent-free for the duration of the school year would dramatically cut mobility during the school year (Pogrow, 1992).

#### Develop a local, flexible transportation policy

Policies should be developed to provide transportation from each single neighborhood to various schools within the district. When the move is within an urban area, the cost of providing transportation to the home school is minimal compared to the cost of remediation (Kerbow, 1996; Vail, 1996).

### Develop policies to draw families into open and personal ties with the school

Policies should be developed to draw entire families into close, personal ties to the school, creating a vested interest. Then, when conflicts arise, it may be more possible to reach a satisfactory solution (Kerbow, 1996; Steele, 1994).

24

Encourage schools and local businesses to create "community," where parents and children can sense pride and belonging (Vail, 1996).

#### Enforce the McKinney Act provisions

As passed by the Congress of the United States, the McKinney Act (1990) assures that each homeless child be provided a free, appropriate public education in the mainstream school environment (sec. 721(1)). The law requires revision of residency requirements for homeless children. The law recognizes the need for continuity and stability in the child's education, provides that the child can remain in the home school (sec. 722 (e) (3) (B)) with transportation provided free to the child (sec. 722 (e) (1) (G) (I) (9)), or the child may attend a local school near where he is staying, whichever is in the best interest of the child (722 (e) (3) (B)). The law requires that states and local educational agencies make all necessary records available to the new school in a timely manner including immunization and academic records, birth certificates and past evaluations (sec. 722 (e) (6)), and to review, revise and remove any policy that might act as a barrier to the enrollment of a homeless child in school (sec. 722 (e) (9)). Further, a liaison is to be designated to ensure that the homeless child is enrolled and succeeds in school and receives all services including health, dental, and mental health services as needed (sec. 722(e) (8)). McKinney provides for homeless children to participate

in food programs and before and after school care programs (sec. 722 (e) (1) (D) (E)) as well.

#### Mount an aggressive campaign to hold students in their current school

Inform parents of the educational harm in moving their children when it is not absolutely necessary. Involve parents in the school to develop a vested interest in the school's success and especially the school's success with their child (Kerbow, 1996; Vail, 1996).

#### Develop initiatives to mediate the negative impact of student mobility on learning

Support school improvement efforts in general (Kerbow, 1996).

Interventions listed previously could be expanded, particularly year-round schooling for some students. In Buena Vista, Virginia, low-achieving students are required to attend year-round school. Currently, 1.6 million students attend 2,200 year-round schools. Four quarters are scheduled with three-week recesses between terms. Students enrolled in Buena Vista's pilot program, are transported to the school no matter where in the county the child moves, thus reducing mobility. The county hopes to expand the program to become a year-round magnet school (O'Connor, 1996). Similar initiatives have been established in Anaheim and Santa Ana, California to accommodate students transferring midyear (Vail, 1996).

#### Develop a portfolio for the student to carry to the new school

Each student who moves can carry an informal portfolio to his or her new school including records and classroom placement information (Kerbow, 1996).

#### Develop standardized curriculum

A standardized curriculum should be adopted within school districts as well as between districts that are plagued with large numbers of student transfers. For example, a thoroughly phonics-based reading program might exist in one district school while a neighboring school has a whole-language program. According to Kerbow, an occasional exchange of students between programs may be unproblematic. If the two schools experience multiple exchanges, the stress on the students as well as the individual programs might be quite troublesome, necessitating the complex work of restructuring a district or even a region to accommodate transience (Kerbow, 1996).

The American Federation of Teachers goes so far as to suggest a national curriculum, with the same texts in classrooms across the nation. The idea has not been embraced by legislators at the national level, but locally, some districts have standardized curriculum as in East Hartford, Connecticut (Vail, 1996).

#### Develop a national tracking system

Make student records available on-line through a secured Internet system, so schools can readily call up records for new enrollees (Vail, 1996; New Generation, 1996). The New Generation System is in place to transfer record between schools for the children of migrant workers and the concept could be expanded to include all students nationwide (New Generation, 1996). As this and other on-line tracking systems become available nationally, issues such as student privacy and school accountability for student records must be addressed. (Ascher, 1991)

#### Develop multiage classrooms

Multiage classrooms might be used to successfully remediate transient students without the stigma of retention (Vail, 1996). Several age levels and grade levels of children are blended into a single classroom so a variety of ages receive similar instruction. Ideally, students remain in multiage until the material is mastered (Vail, 1996).

#### **INITIATIVE AMALGAMATION**

Interestingly, an amalgamation of many of these initiatives has been successfully forged in Rochester, New York. Businessman David Schuler helped to lead his community and its schools back to stability.

Initially, Schuler was troubled by the large tenant turnover in his property and others nearby. He discovered the local elementary school had a staggering 72 percent student turnover rate. Upon investigation, Schuler found most tenants were moving only 15 to 20 blocks away, but to other attendance districts within Rochester. "People would leave in the middle of the night.... They were moving to escape something." said Schuler (Vail, 1996, pg. 23).

Schuler uncovered several entwined reasons for the area's transience.

Social Services offered cash payment to welfare clients in lieu of direct rent payment to the landlord, if the client chose it

This practice encouraged the client/tenants to keep the money and not pay the rent. Eviction or "skipping out" followed with regularity. Disputes with landlords could be difficult to resolve, leading to eviction or a move of choice.

Some parents moved because of unresolved problems at school. Some parents did not know the extent their child was hurt by constant moving (Kerbow, 1996; Vail, 1996).

Armed with facts, Schuler and others from the Apartment Owners

Association of Rochester (AOAR) convinced social services to drop the option of

cash payment in favor of direct payment of rent vouchers to landlords. This immediately stabilized the living accommodations of many families. The AOAR urged landlords to maintain their buildings and to enter into longer lease agreements, benefiting both the landlord and the tenant. Signs were posted showing the attendance area schools. Pamphlets were distributed to tenant/parents explaining the effects of frequent moving. Landlord-tenant dispute resolution offices, staffed by AOAR members and community volunteers, were set up in the schools. If families decided to move, the volunteers helped them find housing within the same attendance area.

Schuler encouraged the local school to market itself to the community, to create a vested interest in the community for the school to succeed. Community members voted on school mascot and colors, which helped to create a genuine sense of community ownership of the school. Finally, Schuler encouraged the school and local businesses to create a partnership for change.

With hopes of duplicating his success elsewhere, Schuler has founded a non-profit organization, the Center for School and Community Development to help other communities encourage stable schools and keep families in the same place (Schuler, 1990; Vail, 1996).

### CONCLUSION.

As politicians and parents push for school reform, some in the education community contend student transience makes reform impossible. Schools can not be held accountable for the academic performance of students they have not had a chance to teach (Vail, 1996; Beck, et al., 1997). Student transience must be identified as a legitimate problem not only affecting the mobile students themselves, but the stable students, teachers, the academic achievement of the entire school, and the community at large. Policy initiatives then can be implemented to address the problems. L. Scott Miller, an educational consultant interviewed by Kathleen Vail, assistant editor of The American School Board Journal (Vail, 1996, pg. 24) contends that "as attention is focused on minority achievement, mobility will come up again and again as a factor for failure." Miller is convinced that students must be allowed to stay in one place or the students and the schools will continue to suffer. "If you want these kids to perform like middle-class kids, you must treat them like middle-class kids. Says Miller, "Middle-class kids don't go to school where everyone is in motion."

#### CHAPTER THREE

#### METHOD

#### Subjects

The subjects for the study included 204 ninth grade students, 219 tenth grade students, and 217 eleventh grade students from a new, well equipped, magnet high school located in Harrison County in north central West Virginia.

One hundred fifty two of these students transferred into the school for grades nine through eleven between June 1997 and the April 1998 testing date. The school's total enrollment for ninth, tenth and eleventh grades was approximately 750. Fully 20% of that number transferred into the school during the 1997-1998 school year. Only 640 students completed the Basics Skills Battery of the Stanford Achievement Test. The study focus was on the SAT scores of these 640 students.

The high school, located in Clarksburg, West Virginia, drew from a combined Clarksburg/Nutter Fort urban population of 19,854 people according to the 1990 census. The school had an open enrollment policy and drew some students from other attendance areas in Harrison County and surrounding counties.

## <u>Design</u>

This research was quasi-experimental. The groups/grade level configurations were predetermined by school policy as to what students were tested. A total of 640 students were given the test in its standard format: 309 boys and 331 girls.

#### Procedure

The data were derived from the results of the Stanford Achievement Test (SAT), form S, administered by the high school faculty on April 1-3, 1998. The West Virginia Department of Education mandated testing for all students in West Virginia unless excused from standard testing by prior Individual Educational Plan (IEP) arrangement.

Permission was necessary to access the school's SAT scores as well as the list of students who had transferred into the school after the end of the spring term, 1996-1997 or entered at any time during the 1997-1998 year prior to testing. Permission was obtained from both Harrison County Schools via a letter to Mr. Carl Friebel, administrative head of the Department of Planning, Research and Evaluation for Harrison County Schools and the study high school via a letter to the principal, Mr. Leon Pilewski. Copies of both the letters and their replies are found in Appendix A.

During the summer of 1998 the 640 test scores were accessed from SAT records sent to the high school. The West Virginia Department of Education was responsible for scoring the tests.

Test data used in this study included Reading Vocabulary, Reading
Comprehension (also reported as Total Reading), Math, Language Mechanics and
Language Expression (also reported as Language). These five areas made up the
Basic Skill Battery of the test. Scoring was the same for all grades. Possible

correct scores for each battery section were:

Reading Vocabulary 30 Items Correct

Reading Comprehension 54 Items Correct

(Total Reading 84 Items Correct)

Math 48 Items Correct

Language Mechanics 24 Items Correct

Language Expression 24 Items Correct

(Total Language 48 Items Correct)

Total Basic Skills Battery 180 Possible Items Correct

The Basic Skills Battery was selected as the measure for the study. The West Virginia Department of Education also used the SAT as the standard measure in determining the success of each county school system in its mission to educate West Virginia's students.

Individual student percentiles presented a skewed picture of the test data.

A more realistic representation of actual student achievement was derived by dividing the number of questions answered correct by the total number of questions in the Basic Skills Battery. The subsequent answer was a straight percentage based on 100. Each percentage was carried to the fifth place after the decimal and then rounded to two places. Individual scores were arranged by class and again in categories: transfer and non-transfer.

A mean score was averaged for grade levels using the scores of every student in that level that took the test. Next, the scores for each student who had transferred into the school after spring term 1997 were removed and the remaining non-transfer students' scores were averaged. Different combinations of this data were applied to the appropriate t test formula.

## **Instrumentation**

The Stanford Achievement Test, form S, 1998 edition was used.

To quantify the raw data, descriptive statistics were derived from the data and comparisons were made using the hypothesis test for the mean of two independent samples (t-test).

#### CHAPTER FOUR

#### RESULTS

## Conversion of Data

The schools total enrollment for ninth, tenth and eleventh grades was approximately 750 students. Twenty percent of that number transferred into the school during the 1997-1998 school year. The influx of students into the study school is described in Table 1. The new students are categorized according to the location from which they transferred. The parenthetical numbers indicate the total number of students entering the study school. The non-parenthetical number indicates the number of those students who were tested.

Table 1

(Total Transfer Students) / Transfer Students Tested

(152 students transferred into the school) / 76 tested

9th, 10th, 11th Grades

Group	Private	In-County	Out-County	Out-State	Out-US
9th	(9) 7	(32) 15	(13) 4	(4) 3	(0) 0
10th	(5) 0	(19) 9	(10) 5	(5) 3	(0) 0
11th	(12) 9	(27) 8	(7) 5	(3) 2	(6) 6
All	(26) 16	(78) 32	(30) 14	(12) 8	(6) 6
% tested	61.53%	41.02%	46.67%	66.67%	100.00

The raw scores for the Basic Skills Battery of the SAT were converted into percentages for each student tested by dividing the reported number of correct items by the number possible (x/180). The students' scores may be found in Appendix B. Each student's score was categorized by grade, and within each grade further categorized as a transfer student's score or non-transfer student's score. Transfer student's scores may be found in Appendix C. The resultant percentages were used to perform a t-test to check for the homogeneity of two groupings within each grade. In order to find t, the following descriptive statistics were obtained for each grouping: sample size, the mean (x), standard deviation (s), variance (s²), and range. The computer performed the actual calculations using the Statdisk Elementary Statistics Program by Mario F. Triola (Password).

Table 2 provides the results of this treatment of the raw data. Sample size was large in all but the transfer categories, yet all nine categories had a surprisingly similar mean. At every grade level the mean of non-transfer students was slightly higher than the mean of the transfer students. The range again was similar in all but one category, varying for the most part 30 to 35 points above or below the mean. Standard deviations, the average that sample scores vary from the mean, were very much the same for all groups. The largest differences were found in the transfer groups. Variance magnified these differences by squaring the standard deviation values.

Table 2
Sample Descriptive Statistics Results

Group	Sample	Mean	Variance	St. Dev.	Range
9 All	204	64.570	190.11	13.788	66.110
9 No Trans	172	65.120	184.68	13.620	65.550
9 Transfers	32	62.117	215.69	14.686	61.110
10 All	219	62.113	200.99	14.177	67.770
10 No Trans	200	62.214	196.22	14.008	67.770
10 Transfers	19	61.053	263.56	16.235	59.440
11 All	217	61.055	177.90	13.338	70.000
11 No Trans	189	61.144	191.14	13.825	70.000
11 Transfers	28	60.456	91.85	9.584	40.550

## **Hypothesis Testing**

In order to analyze the data in Table 2 to determine if transient students' standardized test scores did affect the mean of the ninth, tenth, or eleventh grade standardized test scores, six t-tests were performed. These hypothesis tests for the mean of two independent samples (two-tailed t-test) provided all of the following results: test statistic t, critical t, and p value.

### Ninth Grade Hypothesis

The first t-test statistically compared the scores of all ninth grade non-transfer students to the scores of all 9th grade transfer students. The level of significance used in this study was alpha = .05. Since the score obtained on the t-test was t = 1.0740, less than the critical t of 1.9600, the null hypothesis that transient students' standardized test scores did not affect the mean of the ninth grade standardized test scores was accepted. The p-value of 0.2828 indicated a 28.28% probability the study findings were random. These findings are far beyond the predetermined .05 level of significance established at the beginning of the study.

The second t-test statistically compared the scores of the entire ninth grade with the scores of just the ninth grade non-transfer students. The level of significance was .05. The score obtained on the t-test was t = 0.3879, less than the critical t of 1.9600. The p-value of 0.6981 or 69.81% probability of randomness greatly exceeded the .05 level. Thus, both tested comparisons failed to reject the null hypothesis that transient students' standardized test scores did not affect the mean of the ninth grade standardized test scores.

Table 3

Results of Hypothesis Tests for the Mean of Two Independent Samples

9thGrade

Group	Sample	Mean	St Dev	t	Critical t	p-Value
9 No Transfers	172	65.120	13.620			
9 Transfers	32	62.117	14.686			
Both				1.0740	1.9600	0.2828
9 All	204	64.570	13.788			
9 No Transfers	172	65.120	13.620			
Both				0.3879	1.9600	0.6981

## Tenth Grade Hypothesis

The first t-test statistically compared the scores of all 10th grade non-transfer students to the scores of all 10th grade transfer students. The level of significance used in this study was alpha = .05. Since the score for this comparison obtained from the t-test was t = 0.3404, less than the critical t of 1.9710, the null hypothesis that transient students' standardized test scores did not affect the mean of the tenth grade standardized test scores stood. The p-value of 0.7339 indicated a 73.39% probability the study findings were random. These findings were far beyond the predetermined .05 level of significance established

for the study.

The second t-test statistically compared the scores of the entire tenth grade class with the scores of just the tenth grade non-transfer students. The level of significance was .05. The score obtained on the t-test was t = 0.0130, again less than the critical t of 1.9600. The p-value was 0.9896 indicating a 98.96% probability that these results were random. These findings greatly exceeded the .05 level of acceptability. Thus, both tested comparisons failed to reject the null hypothesis.

Table 4

Results of Hypothesis Tests for the Mean of Two Independent Samples

10th Grade

•						
Group	Sample	Mean	St Dev	t	Critical t	p-value
10 No Transfers	200	62.214	14.008			
10 Transfers	19	61.053	16.235			
Both				0.3404	1.9710	0.7339
<u>·</u>						
10 All	219	62.113	14.177			
10 No Transfers	200	62.214	14.008			
Both				0.0130	1.9600	0.9896

#### Eleventh Grade Hypothesis

The first t-test statistically compared the scores of all 11th grade non-transfer students to the scores of all 11th grade transfer students. The level of significance used in this study was alpha = .05. Since the score for this comparison obtained from the t-test was t = 0.3321, less than the critical t of 2.0518, the null hypothesis that transient students' standardized test scores did not affect the mean of the eleventh grade standardized test scores was accepted. The p-value of 0.7424 indicated a 74.24% probability the study findings were random. These findings were far beyond the predetermined .05 level of significance established at the beginning of the study.

The second t-test statistically compared the scores of the entire eleventh grade class with the scores of the eleventh grade non-transfer students. The level of significance was .05. The score obtained on the t-test was t = 0.0658, again less than the critical t of 1.9600. The p-value of 0.9476 or a 94.76% probability that these results were random greatly exceeded the .05 level of acceptability. Thus, both tested comparisons failed to reject the null hypothesis.

Table 5

Results of Hypothesis Tests for the Mean of Two Independent Samples

11th Grade						
Group	Sample	Mean	St Dev	t	Critical t	p-value
11 No Transfers	189	61.144	13.825			
11 Transfers	28	60.456	9.583			
Both				0.3321	2.0518	0.7424
11 All	217	61.055	13.338			
11 No Transfers	189	61.144	13.825			
Both				0.0658	1.9600	0.9476

Since all six t-test comparisons failed to reject the null hypothesis that transient students' scores did not affect the mean of the ninth, tenth, or eleventh grade standardized test scores, there was no purpose in comparing the combined mean scores of the entire tested populations.

#### CHAPTER FIVE

#### SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

#### Summary

The purpose of this study was to examine the effect of transfer students' standardized test scores on the total standardized test scores of a school. Two different comparisons were used to analyze the data for each class:

- 1. The entire class mean was compared to the mean of the non-transfer students. Using a t-test for analysis no significant difference was found between the two means.
- 2. The mean of the non-transfer students was compared to the mean of the transfer students. Using a t-test for analysis no significant difference was found between the two means.

The groups used in this study were the ninth, tenth, and eleventh grade classes at a new high school in Clarksburg, West Virginia. The study was conducted in the spring of 1998. The groups consisted of 204 ninth grade students, 219 tenth grade students, and 217 eleventh grade students.

The Basic Skills Battery scores of the SAT administered in April, 1998 were used as raw data to determine if there was any significant difference in the achievement of the two groups, transfer and non-transfer, by performing t-tests. At the .05 level of significance there was no significant difference in the groups.

#### Conclusions

There have been various studies conducted on the effects of transfer students on the classroom but few on transfer students' effects on the standardized test results for a school, especially in a rural area. The results of this study seemed to indicate that there was no significant effect, but that was possibly because only 50% of the students who transferred into the subject school actually took the SAT. The other 50% had moved to yet another school by test time. The transfer students' mean may also have been high since the school is new and serves as a magnet center, attracting students desiring higher level classes not offered in all schools. The school's open enrollment policy allowing students from surrounding counties admission, might have effected the mean. Also, the school hosted twelve foreign exchange students during 1997-1998. Six of the exchange students were in eleventh grade. All six of the exchange students took the SAT.

#### Recommendations

The following recommendations are made for any further study:

- 1. Perform the study using scores from other area high schools that are not magnet centers.
- 2. Using hypothesis means testing, compare other Harrison County high schools' standardized test scores with those of this study.
- 3. Study a specific set of transfer students' (i.e. institutionalized, multiple transfers in-county, military dependent, etc.) standardized test scores from

45

kindergarten through eleventh grade to ascertain pattern or change.

4. Study the socioeconomic situation of students who transfer into this school in order to address their particular educational needs.

## APPENDIX A

Rt. 3 Box 760 Clarksburg, WV 26301 May 19, 1998

Mr. Friebel,

To fulfill the requirements for a Master's Degree program at Salem Teikyo University, I am preparing a thesis studying the effect of student transfers into a school on the overall achievement of that school as measured by standardized testing. Specifically, I wish to determine the impact that transfer students have on the overall SAT scores at Robert C. Byrd High School. To do this I need permission to access the current year's SAT scores for the ninth, tenth and eleventh grades and a listing of all students in those grades who transferred into the school after the first school month of the 1997-1998 academic year. I will make my findings available for your use after my study is complete.

I am employed by the Harrison County Board of Education as a teacher at Washington Irving Middle School.

Sincerely,

Carolyn S. Hill

Ms. Carolyn S. Hill Rt. 3, Box 760 Clarksburg, WV 26301

Dear Ms. Hill,

Thank you for your letter of May 19 in which you outlined your desire to conduct a research project for completion of your Masters degree from Salem-Teikyo University. Requests such as yours require special consideration since you are intending to use student data in your research.

In your letter there was no mention about how confidentiality of student data will be maintained. Therefore, before granting permission for conducting your study, I need to have an assessment of how confidentiality will be maintained along with a written assurance from you that the following terms will be met:

- 1. that student data be accessed only through the principal at Robert C. Byrd High School, or his designee,
- 2. that all student data will be kept confidential,
- 3. that all data collected be expressed as group data and that no individual data be reported, and
- 4. that we have the option, at any time, to rescind permission to conduct your project should proper confidentiality fail to be maintained.

You also need to understand that once permission is granted from this office for your research project, participation is ultimately at the discretion of Mr. Leon Pilewski, principal of Robert C. Byrd High School.

In your letter, please provide me with the name, address, and phone number of your advisor at Salem-Teikyo University for my records.

May 27, 1998 CAROLYN S. HILL Page 2

I appreciate your willingness to meet our standard requirement of providing my office with a copy of your research paper immediately upon its completion.

Upon receipt and review of the above, I will be most happy to give further consideration to your request. I shall await hearing from you.

Sincerely,

Carl H. Friebel, Jr.

Administrative Assistant

Carl H. Friebel, Jr. Harrison County Schools PO Box 1370 Clarksburg, WV 26301

Dear Mr. Friebel

Thank you for your timely reply as to the possibility of using SAT scores from Robert C. Byrd for analysis in my Master's Thesis. I have received permission from Mr. Leon Pilewski, principal of Robert C. Byrd to use student data contingent upon your approval. I will access the information for Byrd through the school and only in the manner and the place directed by Mr. Pilewski. I will keep the information confidential as a matter of personal integrity. So far as my thesis is concerned, blind data is all that is required. Students' names will not appear in any phase of the paper's preparation. I also understand that your permission can be rescinded at any time.

My advisor at Salem-Teikyo University is:

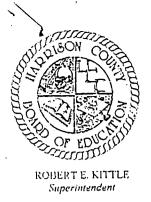

Dr. Eva G. van der Giessen Education Department Salem-Teikyo University Salem, WV 26426

I hope I have answered all of your questions.

Sincerely

Carolyn S. Hill

Ms. Carolyn S. Hill Rt. 3, Box 760 Clarksburg, WV 26301

Dear Ms. Hill,

Thank you for your letter of June 3 in which you satisfactorily addressed my questions about how confidentiality will be maintained during your research project.

Given the assurances that we have established, I am happy to grant permission for you to conduct your research project at Robert C. Byrd High School. I am also pleased to learn that Mr. Leon Pilewski, principal of Robert C. Byrd High School, has agreed to facilitate your research request.

Please let me know if there is any way that my office might be of assistance, and best wishes for success with your research project.

Sincerely,

Carl H. Friebel, Jr.

Dear Ms. Hill:

LEP/lg

Thank you for your letter of May 19, 1998. Permission is granted for you to study student transfers and the effect on overall school achievement as measured by standardized tests. Please make all necessary arrangements with our guidance counselors Mrs. Altman and Mr. Nadelli.

Thank you for your request. I will be most interested in the results of your study. Best wishes.

Sincerely,

Leon E. Pilewski

Principal

## West Virginia Department of Education Statewide Assessment Program General Interpretation Guidelines

The Stanford Achievement Test, Ninth Edition provides a measure of student achievement. However, it should not be viewed as the only indicator of student performance. Scores from the SAT-9 provide a picture of student performance at a particular time and under a given set of conditions.

Nationally-normed achievement tests such as the SAT-9 generate scores that can be used for limited comparisons among student groups. Students who took the test are compared to a sample of students who took the test in 1995-96 as part of a "norming" procedure.

The most commonly reported scores from the SAT-9 are "national percentiles" which indicate how well our current students performed in comparison to the 1995-96 norm group. The national percentile indicates the percent of students in the original norm group who obtained scores lower than the current group of students. For example, if a group of sixth grade students score at the 55th percentile in science, then this group of students has scored higher than 55 percent of those students who took the sixth grade science test as part of the 1995-96 norm group.

NOTE:

Percentiles are not interval data and therefore are susceptible to distortion if mathematical operations (addition, subtraction, multiplication, division) are attempted on them.
