## ABSTRACT

This Kids Count data book for 1999 examines statewide and county level trends in the well-being of Michigan's children, featuring available data on young adolescents, ages 10 to 14. The statistical portrait is based on 15 indicators of well-being: (1) child poverty; (2) free and reduced price lunch; (3) inadequate prenatal care; (4) low birthweight infants; (5) infant mortality; (6) child deaths; (7) children in families investigated for abuse or neglect; (8) substantiated victims of abuse or neglect; (9) children in out-of-home care; (10) births to teens, ages 15 to 17; (11) teen deaths by accident, homicide, or suicide; (12) index crime arrests; (13) high school dropouts; (14) students enrolled in special education; and (15) students with inadequate mathematics skills. Section 1 of the report discusses young adolescent well-being with regard to community connections, health, and education, and notes that many communities have adopted a proactive approach to youth development. Section 2 summarizes the latest state trends and includes a state map with county child poverty estimates. Section 3 reviews the background indicators of child population, childcare and early education, family support programs, childhood lead poisoning, and immunization. Section 4 analyzes each trend indicator. Section 5, the bulk of the report, presents state and county profiles. Data indicate that there have been improvements in indicators related to adolescents. However, economic security indicators have shown declines, and there have been mixed results in child health, child safety, and education. (KB)

# Acknowledgments

The *Kids Count in Michigan, 1999 Data Book* was developed by Jane Zehnder-Merrell of the Michigan League for Human Services (MLHS) with support from Michele Corey of Michigan's Children.

A special thanks for review of drafts to: MLHS staff Ann Marston and Sharon Parks; Pat Sorenson at Michigan's Children; Kari Schlachtenhaufen of the Skillman Foundation; Beverley McDonald from the Advisory Committee; and Dereth Glance, intern from James Madison College at Michigan State University.

Thanks also to Michelle Schellenberg who secured and compiled the data and the partners in W.K. Kellogg Foundation's Michigan Middle Start for their contribution.

## The collection and analysis of data were accomplished with the assistance of the following:

<b>Michigan Department of Community Health</b> <i>Division for Vital Records and Health Statistics</i>	<b>Michigan Department of Education</b> <i>Information Services</i>	<b>Michigan Department of the Treasury</b> <i>Office of Revenue and Tax Analysis - Dan Kitchell</i>	<b>Michigan State Police</b> <i>Central Records Division</i>
• Michael Beebe	• Linda McDaniels	• Karlene Ohler	• Sharon Saites
• Sharon Crawford	• Michael Ward	<b>Michigan Family Independence Agency</b>	<b>Michigan Community Coordinated Child Care Association - Mark Sullivan</b>
• Kathy Humphrys	<i>Special Education Services - James Nuttal</i>	<i>Children's Protective Services</i>	<i>U.S. Census, Small Area Income and Poverty Estimate Program - Paul Siegel</i>
<i>Childhood Lead Poisoning Prevention</i>	<b>Michigan Department of Management and Budget</b> <i>Michigan Information Center</i>	• Lee Hunsberger	
• Mary Scoblic	• Ching-Li Wang	• Gene Schneider	
• Bob Scott	• Kenneth J. Darga	• Julie Tubbs-Lott	
<i>Immunization</i>	• Therese Cody	• Paul Spata	
• Nancy Fasano		<i>Policy Analysis Division - Terry Drum</i>	
• Harry McGee			

Thanks also to the members of the *Kids Count in Michigan* Advisory Committee, who provided their time and expertise in shaping the book and planning other project activities.

We also extend our thanks to the national Kids Count project staff, Bill O'Hare and Jennifer Baratz Gross, for their sustained support and technical assistance.

## Special recognition is accorded support staff at the Michigan League for Human Services:

- Tillie Kucharek for her creativity and painstaking care in the production of the county pages
- Jackie Benson, Bonnie Chisolm, Phyllis Killips, Mary Logan and Melanie Burnell for their assistance on other aspects of the project

*Funding is provided by the Annie E. Casey, Skillman, Frey, and Blue Cross Blue Shield of Michigan Foundations, as well as the corporate fund of Blue Cross Blue Shield of Michigan.*

# Contents

*Kids Count in Michigan* is part of a broad national effort to measure the well-being of children at the state and local levels, and use that information to shape efforts to improve the lives of children. The partners in the Michigan project include:

- **Michigan League for Human Services**  
A statewide citizens' organization which seeks to improve human services through research, information dissemination, advocacy, and support services to the state's charitable associations. (For further information, call 517/487-5436 or toll free 800/837-5436)
- **Michigan's Children**  
A statewide, multi-issue, independent, broad-based advocacy group which works with policy-makers, other organizations and the public to improve the quality of life for children and their families.  
(To contact the Community Advocacy project, call 517/485-3500 or toll free 800/330-8674.)

The 1999 Data Book is available for \$15 (plus tax).

# Foreword

This year's *Kids Count in Michigan* data book has prepared a special focus on young adolescents, ages 10-14, that can inform and enlighten community members, decision makers and the general public about the circumstances and needs of youngsters in this age group. A growing number of policies that have an impact on these young people are emerging at the state and federal level.

A focus on this particular age group recognizes the pivotal role this stage of life plays in shaping individual futures. During these years youngsters begin the transition from childhood to adulthood. Without positive adult support and guidance in exploration and experimentation, they are vulnerable to many negative pressures and influences. The report discusses these factors and highlights the ways Michigan communities are involved in assessing and implementing ways to foster positive youth development, including innovative education approaches.

Educators are recognizing the importance of improving teaching and learning for youth in the middle grades. For example, Michigan Middle Start, an initiative funded by the W.K. Kellogg Foundation, has demonstrated that research-based strategies in middle grades schools that promote academic excellence, developmental responsiveness and social equity can make a difference, particularly for low income students.

This report represents the ongoing effort of the *Kids Count in Michigan* project to inform public policy and spur community action with the most current and reliable information available. We hope you will join us in this endeavor by using this information to make a difference in lives of the state's children and their families.

Sincerely,

Deborah Strong, Chair  
Advisory Committee

# Introduction

*Young adolescence is a time of hope and promise, anxiety and depression—often all at the same time. It is a challenge to parents and communities to assist youth as they begin the transition to adulthood. During this stage, children become less insulated by their families and more vulnerable to the social and economic dimensions of their communities.*

## Young Adolescents (Section One)

This year's annual Michigan data book features available data about Michigan's young adolescents, ages 10-14. In the first section these indicators are reviewed, and county data on several indicators are included in each county profile.<sup>1</sup> Available indicators, mostly about risk factors, necessarily shape the discussion; the purpose is to present the current measures to assess the well-being of this age group. Indicators are grouped for discussion into three areas: community, health and education.

Rather than trying to "fix" problems of risk, many communities in the state have adopted a proactive approach to youth development with a focus on building "assets" in youth, their families and communities. For communities, this strategy involves creating opportunities for youth to have caring relationships with adults and participate in engaging and meaningful activities that build skills and a sense of competency. Research has shown that young people with such "assets" are more likely to make a successful transition to adulthood.

This asset strategy is echoed on each county's profile pages, which feature ways individuals and communities can participate in this process. The state profile highlights the importance of staying informed as

citizens about the progress on the common agenda to improve the well-being of children and their families. Youth at highest risk are the least likely to have access to asset-building opportunities. As individual members of local, state and national communities, state residents can advocate for strategies to reduce risks attached to living in poverty and dropping out of high school and increase the assets of all youth by improving access to quality health care, adequate housing, after-school programs and developmentally appropriate middle grades education.

## Overview of the Book (Sections Two through Five)

As in previous books, this year's report includes a summary of the latest child well-being state trends across the key trend indicators grouped in the five domains of child well-being: economic security, child health, child safety, education and adolescence. This summary, a state map with the latest county child poverty estimates and the daily outcomes for the state's children ("Every Day in Michigan") comprise the second section.

The third section presents a review of the background indicators, such as population and child care. Also included is a summary of the current status of immunization rates for the state and regions. Since this information was available for only a few large counties, it was not presented in the county profiles.

The fourth section provides analysis of each trend indicator. They are discussed in the order presented on the trend chart in the county profiles. The fifth section contains the two-page state and county profiles. For detailed information about the source of the numbers, readers may review the Data Notes and Sources at the end of the book.

While indicators are arranged in the various domains of child well-being, such an arrangement does not illustrate the significant connection among many of these outcomes. For example, the depth and length of family and child poverty significantly affects the likelihood of low birth-weight babies, child deaths, child neglect, arrests, and high school dropouts. Some measures could also be listed in other categories; for example, high school dropout could be grouped under education rather than adolescence.

Readers are cautioned that some measures may be difficult to interpret, but they provide citizens, advocates, and decision makers trend information that they can compare to other measures and localities. For example, the numbers and rates of children served by the child protective services system, arrested, or participating in special education may not accurately reflect the level of the underlying problem in the state or a particular county. Changes in these indicators may have more to do with alterations in funding or policies than shifts in the actual population at risk.

1. The numbers of incidences and not the rates are presented in the county profiles since incidences for most counties on these indicators were below the level for a statistically reliable rate.

# Young Adolescents Community

Communities have a critical role to play in the well-being of their young adolescents. One of the most striking findings of a recent survey of Michigan middle graders revealed that almost half of them spend three or more days alone at home after school on a regular basis.<sup>1</sup> Even more critically, recent analysis has shown that those Michigan middle-graders who spend three hours or more home alone on a regular basis have significantly higher levels of depression and behavior problems than those home alone regularly for less than three hours.<sup>2</sup> (These outcomes occurred independent of family income level.) The percentage of Michigan middle-graders home alone for three or more hours on a regular basis increases from 22 to 42 percent between sixth and eighth grade.<sup>3</sup>

Research has also demonstrated that being unsupervised after school doubles the risk that youth will smoke, drink or abuse drugs.<sup>4</sup> Arrests for violent crimes and other misbehavior also peak during afterschool hours before 6 p.m. Conversely, meaningful participation in group activities outside school hours not only occupies youth during these hours, it can provide positive interaction and relationships with peers and adult mentors. Available data suggest that a majority of Michigan youth do not enjoy many positive bonds to their community, such as support from three or more non-parent adults or a perception of being valued community members. Community members have a role to play in all four youth development asset areas outlined by the Search Institute: 1) support; 2) empowerment; 3) articulation of boundaries and expectations; and 4) constructive use of time.<sup>5</sup>

**Chart 1.1 Positive connections to community decline on several measures between 7th and 9th grade for youth in a typical Michigan community.**

Note: Other adult relationships involve adults other than parents.  
Source: Search Institute, 1997

While local community attitudes and policies clearly shape such institutions as schools, they also affect the way youth are treated by local law enforcement and the courts. Local officers exercise meaningful discretion in arrest policies. Of the roughly 6,400

index crime arrests of Michigan young adolescents, ages 10-14, in 1997, most involved theft.<sup>6</sup> Two-thirds of these arrests were classified as larceny, usually shoplifting, and the next largest share (14%) were burglary.

In some communities youth are more likely to be diverted into a remediation program for minor theft than formally arrested. Concerns about violence and an increase in the number of officers may lead to arrests for behavior that would have occasioned a reprimand or warning in an earlier era. Responding to problem behaviors at an early stage is also viewed as one aspect of community responsibility in setting clear boundaries for acceptable behavior. Communities differ in defining the appropriate response.

5. The Search Institute has constructed one of the more widely used methods for assessment and implementation of asset-building in youth, their families and communities as a strategy for positive youth development.
6. These counts represent arrests, not youth. A youth could be arrested more than once in a given year.

**Chart 1.2 Two of three index crime arrests of Michigan youth, ages 10-14, involve larceny, primarily shoplifting.**

Source: Michigan State Police

## Some Approaches to Building Assets in Youth

The assets or "strength-based" approach changes the way agencies and communities think about improving outcomes for children and families. It shifts the focus from "solving" youth and neighborhood problems to mobilizing individuals and communities to create and support programs and action for positive youth development. A number of organizations and initiatives have been developed to accomplish the following:

### To promote volunteerism on behalf of children

**America's Promise** is a national initiative chaired by retired General Colin Powell. The Alliance for Youth is the organization formed to follow up on the commitments made at the Presidents' Summit for America's Future.<sup>1</sup> (<http://www.americaspromise.org>).

**Michigan's Promise** provides encouragement and technical assistance to the state's 20 "Communities or Tribes of Promise."<sup>2</sup> The "promise" initiative seeks to mobilize communities to provide the following five resources to America's children and youth:

- ongoing relationships with caring adults
- safe places and structured activities during nonschool hours
- a healthy start for a healthy future
- marketable skills through effective education
- opportunities to serve.

### To mobilize communities for youth development

- **Search Institute** undertakes surveys of middle and high school students in school districts across the country to assess the level of assets and risks among students.<sup>3</sup> The Institute has defined 40 assets in young people that encourage positive outcomes. The report can mobilize adults and communities to create and foster more assets in more youth. With the expansion of assets, school success, affirmation of diversity, educational aspirations and prosocial behavior increase. ([www.search-institute.org](http://www.search-institute.org) or

800/888-7828) *About thirty school districts in Michigan conducted this survey in the 1997-98 school year.*<sup>4</sup>

- **Communities That Care (CTC)** is a community planning process that involves key leaders and a community-wide positive youth development board to mobilize commitment and action. Based on the work of Drs. J. David Hawkins and Richard F. Catalano, researchers from the University of Washington, the process includes assessment to identify priorities and remedy gaps in resources to reduce risk and promote protective factors to nurture youth. (Social Development Research Group, University of Washington, 9724 3<sup>rd</sup> Avenue NE, Suite 401, Seattle, Washington 98115; telephone 206/685-1997)
- *Starting in 1995, grants to support this process were dispersed through the Office of Juvenile Justice and Delinquency Prevention of Michigan's Family Independence Agency. Roughly 32 Michigan communities are actively involved.*

### To develop communities

Kretschmann and McKnight from the University of Chicago define community and individual resources and suggest using those to build connections—between adults and youth, organizations and individuals, and between organizations. For more information about this model, see *Building Communities from the Inside Out: a Path toward Find and Mobilizing a Community's Assets*, or contact the Asset-Based Community Development Institute at 847/491-8711.

Source: *BEST PRACTICE BRIEF No. 2, The Assets/Strength-Based Approach to Programming, issued by Outreach Partnerships at Michigan State University. For subscription information, call 517/432-2500.*

### Other Resources

- **Michigan Model for Comprehensive School Health Education** is a curriculum to help students learn basic healthy decision-making skills, such as

peaceful conflict resolution, as well as resistance to negative peer pressure and relationship skills. The objectives have been correlated with the 40 assets identified by Search Institute.

- **Outreach Partnerships at Michigan State University** provides training and technical assistance in translating Search Institute reports into community action. Staff are currently working intensively with three Michigan communities. A conference—*Getting from Assets to Outcomes: Youth, Family and Community Development*—is scheduled for September 9-10, 1999. For more information call 517/432-2500 or email: [adsatmsu@pilot.msu.edu](mailto:adsatmsu@pilot.msu.edu).

- **The Michigan Assets Strategies Team (MAST)** is an informal coalition of agencies and programs interested or already involved in asset-building initiatives. MAST is developing an information packet describing the various asset-building initiatives. For more information, call Luanne Beaudry 800/968-4968.

# Young Adolescents Health

The health of young adolescents, ages 10-14, is affected by a number of factors, including personal behaviors, social relationships, their physical environment, economic status and access to medical care. The economic status of a family directly influences many dimensions in the child's physical and social environment, as well as access to services, such as medical care and afterschool programs.

Several available outcomes provide some insight into the overall health and well-being of this age group: the number of substantiated victims of abuse and neglect; the incidence of pregnancy and births; prevalence of tobacco use; the levels of treatment for substance abuse; and the causes of death.

## Victims of Abuse or Neglect

Data on the number of confirmed victims of child abuse and neglect provide some indication of the number of children whose physical, emotional and social well-being has been substantially compromised. Although young children, particularly infants, are at the highest risk of abuse or neglect, roughly 5,000 young adolescents, ages 10-14, were confirmed victims of abuse or neglect in Fiscal Year 1997.<sup>1</sup> Among confirmed victims, girls and boys were at about equal risk of being victimized.

In the broad categories of abuse and neglect, the number of victims generally declined slightly as young adolescents got older—with the numbers of fourteen-year-old victims (1,020) lower than those ten-years-old (1,104).<sup>2</sup> Patterns differ by gender: confirmed abuse of girls increases with age. The number of confirmed

female victims rose steadily at each age level, with fourteen-year-old girls at highest risk. The numbers of girls who are confirmed victims of abuse as fourteen-year-olds is almost as high or higher as youth confirmed as victims of neglect.

**Chart 1.3 Incidence of abuse increased for Michigan girls over early teen years.**

Source: Michigan Family Independence Agency, Report PS-31C, FY 1997.

Note: The relatively small numbers of victims substantiated for both abuse and neglect are not included on this chart. Such victims represent roughly 6 percent of the total.

## Birth and Pregnancy Rates

The incidence of pregnancy and birth among girls, ages 10-14, is a matter of grave concern because these children are not developmentally ready for pregnancy and parenthood. The younger the adolescent is at time of first birth, the greater the likelihood of a repeat birth before age 20.

Trends in pregnancy and births among Michigan's girls, ages 10-14, have improved in the 1990s. In 1997 these girls were 23 percent less likely to give birth than in 1986, and 45 percent less likely to become pregnant. In 1986 roughly three of every 1,000 girls, ages 10-14, became pregnant compared to fewer than one per 1,000 in 1997.

**Chart 1.4 The pregnancy rate for Michigan's girls, ages 10-14, dropped by 45 percent between 1986 and 1997.**

Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health.

## Tobacco Use, Substance Abuse and Treatment

Tobacco use increases steadily during the middle grade years, and most of the state's high school smokers report having started to smoke at age 13. A sizeable share of Michigan eighth graders (17%) smoke more than a pack a month.<sup>3</sup>

Michigan youth report use of alcohol and marijuana at roughly the same rates as national averages.<sup>4</sup> When surveyed, roughly one of every four Michigan ninth graders reported binge drinking within the last 30 days, and one of every three reported using marijuana within the last 30 days.<sup>5</sup> One in eight Michigan high school students reported trying marijuana for the first time before the age of 13, and 43 percent of ninth graders had their first full drink of alcohol before age 13.<sup>6</sup>

**Chart 1.5 Cigarette use increases over the middle grades in Michigan.**

Source: Center for Prevention Research and Development, University of Illinois.

Despite these early ages on initiation, only a small number of young adolescents may be receiving treatment through public clinics. (No data are available for youth receiving treatment through private insurance.) In Fiscal Year 1996-97, just under 1,000 of the state's youth, ages 0-14, received substance abuse treatment at public clinics—a 44 percent decline in youth receiving services when compared to FY 1993.

Over that same period national data suggest rising substance use among these youth with a steady increase in binge drinking (13.5 to 14.5%) and daily use of marijuana (.4 to 1.1%) among eighth graders.<sup>7</sup>

**Chart 1.6 The number of Michigan youth, ages 0-14, treated in public facilities for substance abuse dropped by 44 percent between FY 1993 and FY 1997.**

Source: Michigan Department of Community Health.

Among all youth under age 21 treated at public clinics, most were male (74%), white (80%) and received outpatient services (83%). The primary drug used by youth given treatment was marijuana/hashish (49%) or alcohol (38%).

**Causes of Death**

Young adolescents are more like younger children than older adolescents in the numbers and patterns of their deaths. In 1997, 168 young adolescents lost their lives compared to 169 children, ages 1-4, and 158 children, ages 5-9. The deaths among youth also reflect the patterns of their younger counterparts in the roughly even balance between male and female deaths and between disease and injury as a cause of death.

**Chart 1.7 Most injury deaths for Michigan's young adolescents, ages 10-14, result from an accident.**

Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health.

Suicide and homicide become more likely causes of death, however, for this age group. Nonetheless most of the 83 Michigan youth, ages 10-14, who perished as a result of an injury in 1997 were involved in an accident, that is a non-intentional injury. Roughly six of ten accidents were related to motor vehicles.

1. 2,088 infants under age 1 were confirmed victims of neglect or abuse in FY 1997.
2. Abuse includes the categories: Physical Abuse, Sexual Abuse and Mental Injury. Neglect includes: Physical Neglect, Medical Neglect, Abandonment, Improper Supervision, and Failure to Protect.
3. Michigan Middle Grades survey data (1996-97) compiled by the Center for Prevention Research and Development at the University of Illinois.

7. Table 1c from Monitoring the Future Study ([www.isr.umich.edu/src/mf/pr981c.html](http://www.isr.umich.edu/src/mf/pr981c.html)). Michigan data for this time period are not available, but the state tends to reflect national trends.

# Young Adolescents Education

Early adolescence is effectively the last stage in life where a single institution—the education system—has access to the majority of young people. Although Michigan youth cannot drop out of school before age 16, research consistently shows that the decision to leave school often occurs during the middle grades. Limited information exists about how young adolescents are faring in the educational system beyond the four standardized tests from the Michigan Education Assessment Program (MEAP) used by the state to assess the quality of teaching and learning in the middle grades. Recent data about expulsions reveal that policies instituting automatic penalties disproportionately affect this age group. As concern grows about the importance of retaining young people in school through grade 12, initiatives such as Michigan Middle Start have formed to increase the possibility for more young adolescents to succeed in school.

## MEAP

Michigan middle graders have been improving on the math and reading MEAP tests in the 1990s. The share of seventh graders with satisfactory performance on the math test almost doubled between 1991 and 1998—from 32 percent to 61 percent.<sup>1</sup> Even more encouraging, the share of students with “low” scores dropped from 38 percent to 15 percent. Reading performance has also improved, although not so dramatically—moving from a third of students with satisfactory performance in 1989 to almost half in 1998.

## Seventh Grade

**Chart 1.8** The share of Michigan seventh graders with satisfactory math skills has increased.

Source: Michigan Department of Education

Note: The seventh grade tests for 1997 for math and reading were administered in winter 1998 rather than fall 1997 so trends should be interpreted with caution.

## Eighth Grade

**Chart 1.10** Most Michigan eighth graders perform at novice level in MEAP science test.

Source: Michigan Department of Education

**Chart 1.9** The share of Michigan's seventh graders achieving satisfactory scores on MEAP reading grew.

**Chart 1.11** Most Michigan eighth graders demonstrate proficiency on MEAP writing test.

On the two more recent tests—writing and science—administered in the last three years, the share of eighth graders with satisfactory scores has been relatively stable. Unlike the other tests, in science the largest share of the state’s eighth graders demonstrated novice (60 percent) rather than proficient skill levels; less than a quarter performed at a proficient level. Among the four tests, the writing test was the one on which the largest share of Michigan middle graders performed successfully: 69 percent demonstrated proficiency.

The share of students scoring adequately on MEAP math and reading tests varies most dramatically among school districts in the middle-grade years. This pattern suggests that disparities in these skills increase between the fourth and seventh grades. On the science test, the share of fifth graders performing at proficient levels rose from 27 to 40 percent between 1996 and 1998, while the share of eighth graders (22%) remained essentially the same in 1998 as 1996. Also troubling is the fact that students’ academic expectations decline over the middle-grades years, according to data from Middle Start.

In an attempt to address these trends, initiatives like Michigan Middle Start (see page 15) have assisted schools to institute strategies to create “small communities where students and teachers establish respectful and caring relationships” in order to enhance student success.<sup>2</sup> In the context of a comprehensive school improvement plan and focused professional development, Middle Start grantee schools with highly implemented interdisciplinary teacher “teams” reflected the largest student achievement gains over a two-year period.<sup>3</sup> (Teams participated in professional development that allowed them to use the shared planning time in student-centered ways. Teams work as a group with the same students for a significant part of the school day.) Schools with teams also reported higher levels of student adjustment, improved student behavior, more contact with parents, and greater staff satisfaction.

### School Safety

Children must feel safe and protected on their way to and from school, as well as in the school building. Violent incidents at school are particularly troubling, yet despite highly publicized episodes, schools remain a safe place for the vast majority of Michigan’s young adolescents. Roughly 90 percent of the Michigan middle graders surveyed in 1997 through the Michigan Middle Start program reported that they had never experienced violence at school.

**Chart 1.12 Most middle grade students in Michigan do not experience violence in school.**

Source: Center for Prevention Research and Development, University of Illinois.

### Expulsion and Suspension

Within the last several years legislation has been passed at the state and federal level mandating expulsion of those students who perpetrate violence or bring weapons to school. While less than one percent of K-12 students are expelled from Michigan schools in a given year, young adolescents are at high risk. Over the middle grade years, the number of children expelled rises with each grade level, peaking in the ninth grade, often the transition year to high school.<sup>4</sup> Roughly a third of all K-12 students expelled in 1995-96 were removed because of concealed weapons (mostly knives), 16 percent for drugs and 15 percent for assault, according to a survey of Michigan schools conducted by the Michigan Department of Education.<sup>5</sup> Middle graders represented about two of every five of these expelled students.

For students expelled under Michigan’s mandatory expulsion law (MCLA 380.1311), the length of the expulsion has been defined by legislation.<sup>6</sup> Despite the fact that the penalty doubles between grade five and grade six—from one-half to a full school year, the incidence of expulsions precipitately rises after grade six. This trend suggests the severity of the penalty may have little dampening effect.

Many expelled students have no access to an alternative program; such programs were not mandated by state law or rule. Middle grades students are particularly vulnerable because very few of the available programs are offered at their level. Once expelled, these youth are at high risk of never completing their education. Recent evidence suggests that fewer than half of expelled youth (40%) petition for reinstatement; and fewer than half of those ever reenter school.<sup>7</sup> Questions have been raised about the arbitrariness of the decisions to expel or reinstate, the lack of due process, and the long-term effect of these policies on students, their families and communities.<sup>8</sup>

# Young Adolescents Education (contd)

Expulsion policies disproportionately affect low income children. Michigan middle graders who qualify for free or reduced price meals through the School Lunch Program are more likely to be referred for discipline by the principal and suspended from school.<sup>9</sup> Roughly 22 percent of low income youth reported being expelled at least once, compared to 10 percent of more affluent youth. Low income youth are also more likely to be concentrated in schools with limited resources and inexperienced teachers.<sup>10</sup>

**Chart 1.13 Expulsions for all causes, as well as for weapons, climb during the middle grades for Michigan students.**

Source: MI Dept of Education (all) 1995-96 & MI Family Independence Agency (weapons) 1995-98 for districts making referrals to FIA.

## Support Services

The support available to schools to address the educational barriers associated with poverty and other disadvantages declines during the middle grades. Over 100,000 Michigan middle graders receive nutritional support at school through free and reduced prices for school meals.

While young adolescents are experiencing the most intense physical development since infancy and good nutrition is critical for their growth, participation in this essential support actually declines over the middle grades years. Participation by nearly 40 percent of elementary school children shrinks to less than 30 percent of middle-graders and only 18 percent of high schoolers. This steady deterioration is reflected in the 54 percent drop in participation between elementary and high school in 1997-98. Although this decrease may result from increasing stability in family income as children get older (often offset by the increased cost for older children), it is also significantly influenced by the perceived or real stigma attached to receiving the support, about which younger adolescents show great sensitivity.

Old buildings, insufficient instructional supplies, and less access to computers, calculators and advanced technology also compromise the quality of education for many youth in the state's older rural and urban areas where low income students are concentrated. Schools with larger shares of low income students in Michigan also tend to have larger class sizes: middle grade schools with over 60 percent of low income students are more than twice as likely to have in excess of 30 students in a class than schools with less than 40 percent of their students coming from low income families.<sup>11</sup>

Without the investment needed to provide more equity in schooling, the educational system amplifies rather than remedies disadvantage, especially at this critical juncture as youth begin to build their adult identity.

1. The dramatic improvement in the 1997-98 MEAP performances for reading and math may be influenced by the fact that the tests were administered halfway through the school year rather than in the fall, as in previous years.

### Michigan Middle Start

Michigan Middle Start is an initiative to improve teaching and learning in the middle grades. Funded by the W.K. Kellogg Foundation, the initiative launched activities in 1994. Schools participating in the first phase of the initiative (1994-99) demonstrated positive outcomes for students in all three goal areas: academic excellence, developmental responsiveness and social equity. Beginning in summer 1999, additional schools will receive funding to participate in the second phase of Middle Start from the Michigan Department of Education's Comprehensive School Reform Demonstration program.

Schools participating in Middle Start

- conduct a self-study to assess the quality of their teaching and learning,
- undertake comprehensive school reform and
- participate in focused professional development in areas such as reading, mathematics, parent involvement and service learning.

The school self-study, administered by the Center for Prevention Research and Development at the University of Illinois, involves students, teachers, and administrators. School staff, administrators and other partners also participate in the initiative's summer institutes and local, state and national networks. Michigan Middle Start has involved over 150 middle-grades schools throughout the state.

The Michigan Middle Start Partnership provides technical assistance and professional development for schools. The Partnership includes: Central Michigan University, Eastern Michigan University, Michigan Coalition of Essential Schools, Northern Michigan University, Detroit Public Schools Office of School Transformation and other Michigan-based and national organizations and programs. The Michigan League for Human Services has been a partner since 1995, working with the initiative to inform the public about middle-grades educational reform.

# Child Well-Being in Michigan: How Are We Doing?

## Economic Security - Worse

Economic security weakened for the state's children during the 1990s despite the state's thriving economy and low unemployment rates.

### Child poverty increased between 1989 and 1995.

- Michigan's child poverty rate in the early 1990s climbed slightly: 20 percent of the state's children lived below poverty level in 1995 compared to 19 percent in 1989. Michigan's share of poor children was larger than those in 29 other states in the nation in 1996.<sup>1</sup>
- Even more disquieting, child poverty among the state's youngest children, ages 0-4, rose from 21 percent to 24 percent in the mid-1990s.
- Since 1995, trends in the share of students receiving meals at free and reduced prices in the School Lunch Program suggest continued increase in economic insecurity among Michigan families with children: free and reduced price participation rates continued to rise through the 1997-98 school year.

## Parental employment does not always protect children from poverty.

- Almost a third of the state's children (31%) lived in families where at least one parent did not have full-time, year-round employment.<sup>2</sup> Michigan's share of such children was larger than any other state in the Midwest.<sup>3</sup>
- Employment provided no guarantee against poverty in the mid-1990s as more Michigan workers tried to support families in the service and retail sectors.

## Child Health - Mixed

### Mortality rates for all ages of children dropped between 1986-88 and 1995-97.

- Mortality rates dropped by 20 to 27 percent among all age groups.
- Michigan's 1996 mortality rates for teens and children ranked in the top half of the states while the state's infant mortality rate in 1996 remained in the lower half of national rankings.<sup>4</sup>

### The state's immunization rate climbed to 79 percent of toddlers fully immunized in 1998.

(Rates in the high 80s are considered adequate for most diseases.)

### The incidence of low birth-weight babies was 8 percent higher than ten years ago.

- Roughly 10,300 low birth-weight babies were born in Michigan each year between 1995 and 1997.

### While 92 percent of children in Michigan have health insurance, indicators of preventive care suggest access to services may be a problem.

- In Michigan only 8 percent of children are without health insurance, compared to 14 percent in the nation.<sup>5</sup>
- Among the state's Medicaid children, the share receiving preventive care decreased between 1995 and 1997: from 47 percent to 35 percent.

- Only 8 percent of the state's young children, ages 0-3, were tested for lead poisoning although a third of the state's housing may pose a hazard and about a quarter of the state's young children lived in poverty, which increases risk.

## Child Safety - Mixed

### On two of three indicators of child maltreatment, rates have increased between Fiscal Years 1988 and 1997.

- Children were 32 percent more likely to be involved in an investigation of abuse or neglect and 10 percent more likely to be removed from their homes.

### The state's children were 20 percent less likely to be confirmed as a victim of abuse or neglect.

Since many incidents of child maltreatment are not reported, the actual level of child maltreatment is difficult to assess.

## Adolescence - Better

### Trends for Michigan's adolescents improved on four of five indicators: juvenile arrests for index and violent index crimes, teen injury deaths and teen births.

- Michigan trends on adolescent indicators also compared favorably among the nation's states: all the state's "teen" indicators ranked in the top half of the states.<sup>6</sup>
- The teen birth rate ranked 22nd of the 50 states and the District of Columbia, and the rate of teen injury deaths ranked 23rd (with "1" being the best rate).<sup>7</sup>

### The high school dropout rate increased by 9 percent between 1990-91 and 1996-97.

- In the 1997-98 school year, roughly 28,000 young people left the educational system prior to graduation.

Education - Mixed

Although dropout rates have increased in the trend period, progress has been made at the county level on improving performance on the math MEAP for both fourth and seventh graders. (Some improvement would be expected in any comparison with the first year a test is administered: as the curriculum becomes aligned with the tests, more students should do better.)

The share of children with *inadequate* math skills as measured by the Michigan Educational Assessment Program (MEAP) dropped substantially for both fourth and seventh graders between 1993-94 and 1997-98.

- The share of students with unsatisfactory scores dropped by 50 percent among fourth graders and 38 percent among seventh graders with improvement occurring across all counties except one.

A quarter of fourth graders and two-fifths of seventh graders still did not demonstrate mastery of math skills at a satisfactory level in the 1997-98 school year.

Fifteen percent more children received Special Education services in 1996-97 than ten years previously.

- No data were available on the level of need. The trend could be perceived as "better" in that more children in need received services or "worse" in that more children needed such services.
- Funding struggles between the districts and the state suggest that many students in need of services may not be served because the high cost of providing services had fallen to districts.

# Every Day in Michigan..

## 366 babies are born

- One child is born to a young adolescent mother, ages 10-14
- 16 children are born to teen mothers, ages 15-17
- 143 children are born into families with an income below 185 percent of the poverty line
- 32 children are born who have received inadequate prenatal care

**Three infants die before their first birthday**  
**One child, ages 1-14, dies from disease or injury**

**One youth, ages 15-19, dies from an accident, homicide, or suicide**

**404 children live in families under suspicion of abuse or neglect**

- 57 children are confirmed as victims of abuse or neglect
- 43 children are placed in foster care

**Ten children are placed in out of home care for delinquency**

**157 youth drop out of high school<sup>1</sup>**

**55 juveniles, ages 10-17, are arrested for an index crime**

**Nine juveniles, ages 10-17, are arrested for a violent index crime**

**One child of five, ages 0-17, lives: (517, 850)**

- One child in every seven receive (369,534)
- One child in every eleven dependent from the Family Independence
- One child in every five is insured (546,609)

**One in every four young children lives in poverty (171,203)**

**More seventh graders than first demonstrate inadequate math**

- One fourth grader out of four demonstrates inadequate math skills (28,679)
- One seventh grader out of three demonstrates inadequate math skills (43,933)

**87 of a possible 1,078 children, ages 0-3, are screened for lead poisoning<sup>2</sup>**

- Eight of these children test positive for lead poisoning

**One child in seven lives in a family with a high risk profile which significantly compromises his or her future<sup>3</sup> (358,000)**

1. For the 180 days of the school year.
2. 1,078 equals the total child population, ages 0-3, divided by 365 days.
3. Children living in families with four or more of the following characteristics are considered "high risk": child is not living with two parents, head of household is a high school dropout, family income is below the poverty line, parent(s) do not have steady, full-time year-round employment, family is receiving welfare

45

# Child Population

Children in Michigan live in widely diverse communities, from small rural areas in the northern and Upper Peninsula counties to the densely populated urban area of southeastern Michigan. In most Michigan counties (42) in 1997, the child population totaled less than 10,000 children, whereas in five counties it exceeded 100,000: Genesee, Kent, Macomb, Oakland and Wayne. Two counties, Wayne and Oakland, had significantly larger child populations than all other counties—Wayne with over half a million children and Oakland with over a quarter of a million.

In the state as a whole in 1997, roughly one in four residents was a child (ages 0-17). Among the state's counties Allegan had the largest share of children in its total population—almost 29 percent. In another eight counties, children represented over 28 percent of the population. Keweenaw County had by far the smallest number and percentage of child population: its 392 children represented only 19 percent of total population. While those counties with smaller shares of child population were generally located in northern counties and the Upper Peninsula, some larger southern counties also had relatively small shares of children. Washtenaw County children comprised about 21 percent of the population; those in Macomb County represented 23 percent.

## Racial Diversity

While almost a quarter of the state's child population were ethnic or racial minorities, racial diversity was concentrated in relatively few counties, mostly in the large urban areas, except for American Indians. In the state as a whole, the almost half a million African American children at 17 percent of the total were by far the largest minority group. Hispanic children comprised roughly 4 percent of total children, Asian about 2 percent and American Indian roughly 1 percent. African American children represented almost half the children in Wayne County and about a quarter of the child population in Genesee, Saginaw and Berrien counties. Almost two-thirds of all the state's African American children lived in Wayne County.

The largest numbers of the state's Hispanic children lived in three large urban counties: Wayne (21,000), Oakland (9,000), and Kent (8,000).<sup>1</sup> Although 40 percent of the total Hispanic children lived in these counties, they represented a relatively small share of these large county child populations (3-5%). In three counties—Oceana, Lenawee and Saginaw—Hispanic children comprised over 10 percent of the child population.

Among Michigan counties, Oakland had the largest concentration of Asian children—almost 11,000, but only Washtenaw County had more than 5 percent of Asian children in its child population, followed closely by Ingham and Oakland counties with close to 4 percent.

Although the largest numbers of American Indian children were concentrated in the urban counties, with Wayne having the largest number—roughly 2,300—the second largest concentration (1,500) of American Indian children resided in the Upper Peninsula's Chippewa County. American Indian children concentrated most heavily in Upper Peninsula counties, representing 23 percent of all children in Mackinaw County and more than 15 percent in Chippewa and Baraga counties.

1. These numbers were calculated from the numbers of children, ages 0-17, and the racial and ethnic percentages children among ages 0-19, provided by the U.S. Census Bureau.

Chart III.1 Roughly one in four of the children in Michigan was an ethnic/racial minority in 1997.

Source: U.S. Census Bureau.

# Child Care and Early Childhood Education

Many of the state's children need care while their parents work outside the home or attend school. In some families, the other parent or another adult in the household can provide care, but many single parents do not have that option. In Michigan more than one of every four families with children is headed by a single parent.<sup>1</sup>

An ever-increasing number of parents juggle work schedules and child care needs with available family financial and human resources to meet the demands of parental and employment responsibilities. Low-income parents may have much more limited choices in terms of work flexibility and access to child care options.

During the mid-1990s, almost two-thirds of Michigan's young children under the age of 6 (523,000) lived in families with both or the only parent working.<sup>2</sup> Most, about 70 percent, of these parents worked more than 30 hours a week. Among the state's school-aged children under age 13, almost half a million (47%) lived in a family where the only parent or both parents worked at least 30 hours a week.<sup>3</sup> Many of these children also need care after school and during school vacations.

## Regulated Slots

In Michigan an estimated 343,000 child care slots would have been available in regulated or licensed child care and early education facilities in 1998 if all these facilities had operated at capacity. Since almost two-thirds of these slots were located in centers and

about a third of centers provide only half-day care, much of this care would not meet the needs of parents with full-day work or inflexible schedules.<sup>4</sup>

Regulated slots are available in registered family homes or licensed group family homes and child care centers. Such facilities are approved by the Department of Consumer and Industry Services. Between 1996 and 1998 the total number of available regulated child care and early education slots grew by about 7 percent.

While not all parents seek care for their children in a regulated or licensed setting, the state oversees child care facilities to ensure basic health and safety standards, as well as monitor group sizes and staff ratios for child safety.

Chart III.2 Almost two of every three regulated child care slots in Michigan are in a child care center.

Source: Michigan Department of Consumer and Industry Services. August 1998.

## Endnotes for Regulated Slots

1. *KIDS COUNT DATA BOOK 1998: State Profiles of Child Well-Being*. Baltimore, Maryland: The Annie E. Casey Foundation, p. 85.
2. *Ibid.*, p. 84.
3. *Ibid.*
4. Many of these half-day programs are cooperative nurseries or preschools which require parental participation.

## Cost of Child Care

The average cost of full-time child care represented a significant share of a family budget in 1998. Weekly costs of such care in Michigan's licensed facilities averaged \$99.65 for one child. At this average rate, a single parent who needed to purchase full-time care for two children and earned roughly \$18,000 or over \$8 an hour (130% of poverty level) would have to spend almost half of gross income on child care.<sup>1</sup>

Even for a two-parent family with income at 185 percent of poverty level, the cost of full-time care for two children would consume more than a third of gross income. (The state subsidy for child care is phased out at the 185% poverty level income.) It is clear that families have to make critical compromises in order to manage child care and available financial resources.

Table III.1 Regulated Child Care Facilities in Michigan: Capacity by Type

Type of Facility	Number of Children	Number	Slots
Family homes	0-6 children	13,307	79,065
Group family care	7-12 children	3,486	41,631
Child care centers	20-250+	4,673	221,641
Total		21,493	342,337

Source: *Child Day Care Licensing Reports CT-200, CT-430, CT-070, August 1998*

Notes: The average number of children in Michigan child care centers is 47.

Number of regulated slots indicates the maximum number of children that could be served by this type of care. Many facilities do not operate at capacity.

At full capacity, Michigan had at most 19 regulated slots for every 100 children ages 0-12 in 1998. National standards suggest a minimum of 25 such slots per 100 children. Only eleven counties had a regulated child care slot ratio adequate to ensure such minimal access. Most of these counties were in the Grand Traverse area, led by Grand Traverse County with 37 slots for every 100 children. Baraga County had the lowest ratio, six slots per 100 children. Among the large counties, Wayne had one of the lowest access ratios (14), and Kalamazoo one of the highest with 25 per 100 children.

Child care costs varied widely among Michigan's counties, ranging from an average weekly cost of \$73 in Hillsdale County to \$124 in Oakland County. At the same time the median hourly wages of child care workers and preschool teachers averaged \$6.85 an hour, a little over half the average wage for all Michigan workers, and many providers go out of business each year. High turnover significantly compromises quality of care.

**Chart III.3 Costs for two children in full-time care consumed a third of income for two-parent families at 185 percent poverty in Michigan.**

Source: Cost data from Michigan Community Coordinated Child Care Association, October 1998 survey.  
Note: 185% poverty represents \$30,433.

**Endnotes for Cost of Child Care**

1. Since many parents at incomes eligible for child care subsidies do not secure them for a number of reasons, this calculation does not reflect any subsidy.

**Chart III.4 The number of Michigan families obtaining a subsidy for child care expanded dramatically between FY 1995 and 1998.**

Source: Michigan Family Independence Agency

**Endnotes for Subsidized Child Care**

1. Three-person families with incomes under \$22,170 qualify for 95 percent reimbursement.
2. FY 2000 Executive Budget: Child Day Care Services. Lansing, Michigan: Michigan Family Independence Agency, April 1999. Testimony to House Appropriations Subcommittee for the Family Independence Agency (Wednesday, April 21 1999).
3. These rates reflect Shelter Area IV which includes Wayne County. Rates, which are based on market surveys, vary slightly among the six shelter areas. The highest overall rates are paid in Shelter Area VI where payments for all types of care are at \$2.50 per hour with an additional 45 cents for children under age 2 1/2 in center care.

**Subsidized Child Care and Early Education**

The care for roughly 63,600 children was supported by a subsidy in Fiscal Year 1998. The state's investment in child care to allow parents in low-income families to work has grown exponentially in the 1990s. (Almost all subsidies—96%—support parental employment.) The number of families assisted by a child care subsidy stood at roughly 14,000 in 1991. It doubled to about 28,000 by 1996, and doubled again by 1998.

Three-person families with incomes below \$26,071 and with children in regulated or "legally exempt" care qualify for a graduated state subsidy up to 185 percent of poverty level income. "Legally exempt care" is provided by relatives or in-home care aides who go through a formal enrollment process, which basically involves a criminal record check.

Almost three-quarters (72%) of child care subsidies in Michigan support children in "low income" families who are not receiving cash assistance through the Family Independence Program. Most (78%) of these families have incomes low enough to qualify for 95 percent reimbursement of their hourly child care costs.

Delays in subsidy payments and stagnating payment levels have hampered this support. While the average cost of licensed care increased by over 11 percent between 1996 and 1998, the subsidy level has continued to be based on 1994 market rates. Maximum subsidy levels are \$2.25 per hour for a child in center care with an additional \$.60 for children under age 2 1/2. A flat \$2.00 per hour is paid for care of children of all ages in family, group and relative homes and \$1.60 for in-home aides. No premium is added for infants or children with special needs or after-hour care. In Michigan, the subsidy is calculated on an hourly basis rather than the standard half-day or whole-day fee used by most providers.

# Family Support

Three key programs assist low-income families with children to meet their basic needs for nutrition, shelter and health care:

- the Food Stamp Program
- the Family Independence Program (FIP), the state cash assistance program that replaced Aid to Families with Dependent Children
- Medicaid, a public health insurance program

## Food Stamps

Of the roughly 690,000 individuals receiving Food Stamp assistance in Michigan in June 1998, the majority (370,000) were children. This program thus contributes significantly to child well-being in promoting adequate nutrition to ensure healthy development. Key nutrients available in food supplies increased by 20 to 40 percent in households using food stamps according to Department of Agriculture research.<sup>1</sup> Low-income families not participating in the program may have greater difficulty affording food while paying other bills such as rent and utilities. For example, a study at Boston's Children's Hospital found admissions of infants with nutrition-related illnesses increased following months of cold weather (and high utility costs).<sup>2</sup>

The federally funded Food Stamp Program, initiated in 1964, is designed to provide low-income households with roughly *two-thirds* of the food purchasing power to sustain a nutritionally adequate diet, based on the "Thrifty Food Plan."<sup>3</sup> Households with gross cash income at or below 130 percent of poverty (\$17,745 for a family of three) qualify for the program.

The average Michigan participant received about \$64 a month in food stamps in Fiscal Year 1997. Unlike FIP cash assistance, food stamps are adjusted for inflation,

although this protection was diminished by changes authorized by the federal Personal Responsibility and Work Opportunity Reconciliation Act.

Similar to national trends, the percent of children receiving food stamps dropped by 16 percent in Michigan between 1996 and 1998. A recent study suggests the national decline in single-parent families using food stamps cannot all be explained by the strong economy and may have resulted from welfare policy changes.<sup>4</sup> The most recent analysis of Food Stamp participation among low-income households with earnings showed that just over half (55.2%) of those eligible participated in the program.<sup>5</sup>

Although roughly 15 percent of the state's children received Food Stamp benefits in June 1998, participation ranged from less than 2 percent in Livingston County to 29 percent in Wayne County. In almost half the counties (39) less than 10 percent of children participated in the program. These levels of participation that are well below the share of children in poverty in Michigan's counties reflect large numbers of eligible families and their children not receiving this nutritional support.

**Chart III.5 Children represented the majority of food stamp recipients in Michigan in 1998.**

## Endnotes for Food Stamps

1. Mary von Euler. *Food Stamps: The Remains of the Safety Net*. (Washington, D.C.: Americans for Democratic Action Education Fund, 1998) p. 10.
2. Sharon Parrott and Stacy Dean. *Food Stamps can help low-income working families put food on the table*. (Washington D.C.: Center on Budget and Policy Priorities. March 31, 1999) p.5.
3. The Thrifty Food Plan presupposes a family can buy in bulk for maximum economy but many poor families lack the financial resources, storage areas, or shelter stability to implement such a strategy. It also assumes families can buy at stores offering the most competitive prices, but this option is not available to many families in low-income urban or rural areas, where prices tend to be higher rather than lower than the average cost for an item. Food "clubs" and "warehouses" tend to be located in the suburbs.

5. Parrott, *Food Stamps can help low-income working families*, p.7.

## Family Independence Program (FIP)

To qualify for FIP, the state's cash assistance program, a family cannot have earnings above 73 percent of poverty level. For example, a Wayne County family of three with gross earnings of \$775 per month would not qualify for FIP. Families reaching that level of income in a given month no longer can receive cash assistance.

The maximum monthly cash assistance payment for a family of three was \$459 in 1998, roughly 42 percent of poverty level. This amount barely covers the cost of shelter in most Michigan counties. For some of the largest counties in the state such as Oakland, Genesee, Ingham, Macomb, the current full grant is *less* than the 1998 Fair Market Rent, calculated by the U.S. Department of Housing and Urban Development.<sup>1</sup> Needing much of the grant to obtain shelter, many families may have difficulty finding the cash required to supplement their food stamps, which are calculated to provide only *two-thirds* of a "thrifty" food supply. Earned income may not be sufficient in families where parents remain underemployed because of disabled or chronically ill children or an inability to secure full-time work.

anticipation in FIP ranged from a low of roughly 1 percent of all children in Livingston and Ottawa counties to a high of 22 percent in Wayne County. The Wayne County rate was significantly higher than the roughly 15 percent of children dependent on the program in Saginaw and Genesee counties, which had the next two highest shares. Of the roughly 238,000 children in the program in December 1997, roughly half (110,000) lived in Wayne County. Over half those children (56%) were under the age of thirteen. The relatively low supply of regulated child care slots in that county (14 of every 100 children, ages 0-12, compared to the national access standard of 25) would significantly hamper the ability of many of these parents to take advantage of employment opportunities.

**Chart III.6 Roughly three of five people receiving cash assistance in Michigan are children.**

**Children Insured by Medicaid**

Almost half a million children (547,000) in Michigan depended on publicly provided Medicaid for their health insurance in 1997. (This number does not include children enrolled in the state MICHild program that was authorized by Public Act 54 in 1998.)<sup>1</sup> Medicaid is a public health insurance program jointly financed by the federal and state governments. Children are eligible for Medicaid based on their age and family income. In Michigan, the Medicaid program for children is known as "Healthy Kids," and children up to age 19 in families with incomes at or under 150 percent of poverty level income qualify.

With the change to capitated cost managed care for families insured by Medicaid, access to services appears to have decreased for children. The share of children receiving Early and Periodic Screening Diagnosis and Treatment (EPSDT), a program created to ensure all children insured by Medicaid receive necessary preventive screenings and follow-up care, has fallen significantly. Between 1995 and 1997, the

share of eligible children screened dropped from 47 percent to 35 percent.<sup>2</sup> (The federal participation goal is 80%.) Other preventive initiatives, such as Maternal Support Services and Infant Support Services, have also been sharply curtailed in the transition to managed care. To strengthen delivery of these services and EPSDT, advocates have recommended that the state develop a reimbursement system based on the actual delivery of preventive and follow-up services.

While almost 22 percent of all the state's children were insured by Medicaid in 1997, only 5 percent of children in Livingston County depended on the program, compared to 42 percent in Lake County. Although less than 10 percent of children were on Medicaid in three other Michigan counties—Missaukee, Ottawa and Clinton—over a quarter of children depended on the program in a total of 24 counties. The policies and procedures implemented in this program affect large numbers of children in the state and its counties in one of their most basic needs—access to health care.

**Chart III.8 Share of Medicaid children receiving preventive care fell between 1995 and 1997 in Michigan.**

Source: Health Care Financing Administration

**Endnotes for Medicaid**

1. MICHild offers public-funded health insurance to children in families with incomes between 150 and 200 percent of the federal poverty level. As of May 1999, approximately 10,680 children of the roughly 61,000 applicants in the state had been enrolled in the MICHild program.
2. Health Care Financing Administration

# Childhood Lead Poisoning, Ages 0-3

An estimated 38,000 of children in Michigan suffer from lead poisoning, a totally preventable health problem.<sup>1</sup> Yet only 8 percent of the state's most susceptible children, those under age three, were tested between July 1, 1997 and June 30, 1998, according to the Michigan Department of Community Health (DCH).

Children under the age of three are at particular risk of lead poisoning because of their rapidly developing nervous systems and their tendencies to put their hands and toys in their mouths. Since children exhibit few symptoms even with relatively high levels of lead in their systems, a blood test is the only reliable way to ascertain the level of lead in a child's body.

**Chart III.9 Few Michigan toddlers under age three were tested for lead in 1997-98 although many were at risk.**

Source: Michigan Department of Community Health

About 2,800 of the roughly 32,000 young children screened in Michigan in 1997-98, almost 9 percent, were confirmed as having blood lead levels at or above 10 micrograms per deciliter (mcg/dL)—the threshold of childhood lead poisoning set by the national Centers

for Disease Control and Prevention. Even relatively small amounts of lead can have detrimental effects on a child's development. Lead exposure during childhood increases the risk of developmental and cognitive deficits.

Children insured by Medicaid are three times as likely to be lead-poisoned as other children—roughly 9 percent have tested as poisoned compared to 3 percent of non-Medicaid children. In 1997 at least 150,000 of the state's children under the age of three were covered by Medicaid and thus entitled to an annual lead screening as a part of their mandated preventive health care.

The more than one of every four of the state's young children who are poor more likely reside in poorly maintained older housing and lack the nutrients that protect against the absorption of lead. Over a million of the state's housing units, roughly a third, were constructed before 1950 and pose a potential danger.

In response to the low levels of testing for lead among Medicaid children among the states, in November 1998 the Health Care Financing Administration issued a bulletin reiterating the long-standing requirement that all Medicaid-enrolled children must receive a screening blood lead test at 12 months and 24 months of age and articulating a new policy that children between three and six years old must receive a blood lead test if they have not been previously screened for lead poisoning.

With a portion of the \$5 million approved by voters in the Proposal C Environmental Bond in the fall of 1998, advocates have urged mounting a targeted prevention program with grants to local health departments to identify, monitor and follow-up with children at greatest risk of lead exposure. These funds could also boost screening efforts in sites where Head Start, WIC<sup>2</sup> and other programs serve low-income children.

## County Trends

Among Michigan's 83 counties, Schoolcraft and Luce had the largest shares of their very young children, under age three, tested for lead: 36 and 34 percent respectively. Kent County screened more than twice as

many children as any other large urban county. In almost half the counties, less than 4 percent of all children in this age group were tested, and in eleven counties less than 1 percent.

Among counties screening at least 8 percent of this age group, Wayne, Muskegon and Berrien counties found the largest shares of lead-poisoned children, between 11 and 15 percent. Such rates are significantly affected by whether counties target their most at-risk children for screening.

1. Estimate from the Michigan Department of Community Health
2. The federal government's Special Supplemental Nutrition Program for Women, Infants and Children. The 27-year-old program provides federal grants to states for supplemental foods, health care referrals and nutrition information for low-income children under age 5, their mothers and pregnant women.

# Immunization

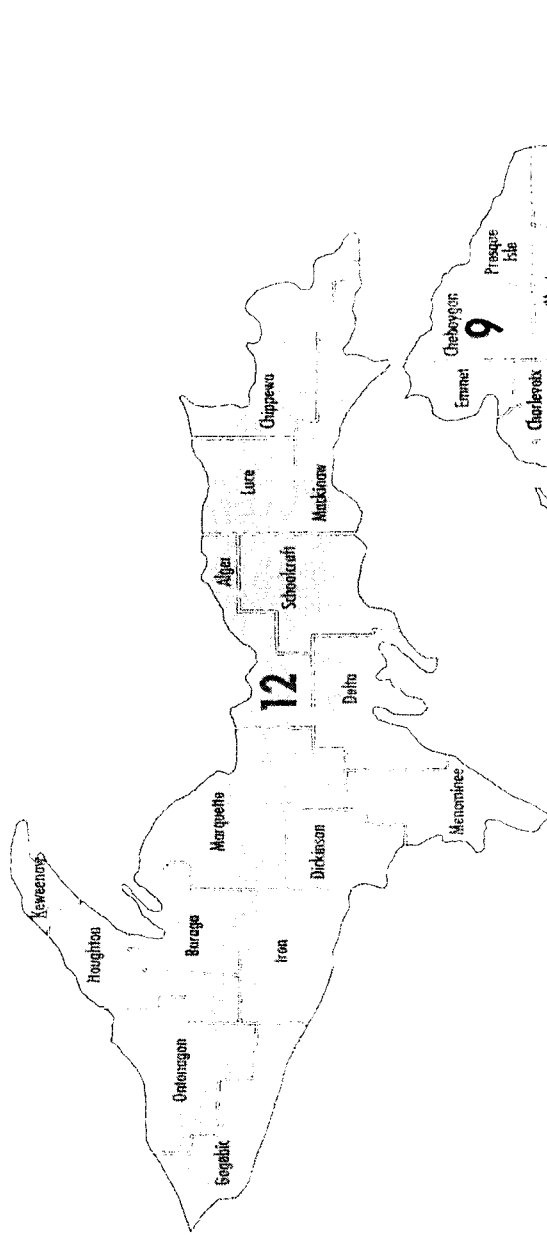

In the summer of 1998, almost four of five of Michigan's toddlers, between 19 and 35 months of age, were fully immunized.<sup>1</sup> According to the 1997 National Immunization Survey administered by the Centers for Disease Control and Prevention, Michigan's immunization rate now compares favorably with those of neighboring states and the national average of 78 percent.

Within the state, immunization rates varied significantly across localities. Over 87 percent of toddlers in Ingham County and the northern counties of the Lower Peninsula (Region 9) had received their full immunizations, while only 66 percent were fully immunized in the city of Detroit. In over half of Michigan's survey regions and large counties immunization rates would still not be considered adequate.

Immunization rates in the high 80s for most diseases are considered adequate protection against preventable diseases in a community. These diseases, such as measles, whooping cough and *Haemophilus influenzae* type b (Hib), result in unnecessary illness, expenditures on expensive health resources, disability or even death. Generally, immunizations can be completed in five visits.

Data from the Michigan Childhood Immunization Registry (MCIR), launched in 1995 by the Michigan Department of Community Health, will soon replace surveys as a way of tracking immunization rates throughout the state. The MCIR allows health providers to know immediately the current immunization status of a child. Accessible to both private and public health providers, the registry contains birth records for all the state's children born in Michigan on or after January 1, 1994. Health providers are mandated to submit immunization information unless a parent or guardian objects.

1. Full immunization includes four doses of DTP, three doses of polio and one dose of MMR - referenced as 4:3:1. The DTP dose immunizes against diphtheria, pertussis (whooping cough) and tetanus; the MMR prevents measles, mumps and rubella.

Region	Counties or Regional Groups	% Immunized

# Child Poverty

*Includes all children in households with incomes under poverty level, adjusted for the number of people in the household.*

Michigan's families with children experienced growing rates of poverty in the 1990s despite the state's thriving economy and low unemployment rates. In 1989, roughly 19 percent of the state's children lived in families with incomes below poverty compared to 20 percent in 1995.<sup>1</sup> Over half a million of the state's children (518,000) were living at these income levels. Michigan's child poverty rate ranked 30th of the 50 states and the District of Columbia in 1996.<sup>2</sup> (Number 1 is the best or lowest rate.)

**Chart IV.1 Child Poverty, especially for young children (ages 0-4), persisted in the mid-1990s in Michigan.**

Source: U.S. Census Bureau

Poverty grew more—by about 10 percent—among the state's young children, ages 0-4, than among school children. In 1995 young child poverty had risen to 24 percent compared to 21 percent in 1989. In the same period poverty increased slightly among school children, ages 5-17, rising from 17.2 percent to 17.7 percent.

This increase in young child poverty causes particular concern in light of recent findings from neuro-research. Such studies show that approximately 90 percent of brain growth occurs during the first three years of life. During these critical years connections or synapses form within the brain at higher rates than at any other life stage. Poverty imperils optimal brain development by curtailing access to adequate nutrition, preventive health care, quality child care and secure shelter.

While parental work outside the home has been perceived as the remedy to child poverty, employment was no guarantee against poverty in Michigan in the mid 1990s, according to a recent study of working poor families.<sup>3</sup> The majority of the state's poor families with able-bodied adults had one or more workers, many employed full-time year-round. With a shift in the state's economy to growth in low-wage service and retail jobs, more Michigan workers are now trying to support their families with such employment.

Almost a third of the state's children (31%) lived in families with parents who do not have full-time, year-round employment.<sup>4</sup> Michigan had a larger share of such children than 36 other states in the nation. Many parents who cannot secure full-time employment work at temporary or part-time jobs that offer little stability, no fringe benefits, and difficult schedules for securing child care.<sup>5</sup>

Michigan tax policies further erode spendable income for poor families who bear a disproportionate share of the tax burden relative to their total income, in addition to paying income taxes at incomes well below the poverty level. The state has the tenth lowest tax threshold in the nation, imposing income tax on families with two children with incomes at just over half the poverty level.<sup>6</sup>

Federal policies that froze the minimum wage over the 1980s also adversely affected Michigan's low-income families. During the 1960s and most of the 1970s, a full-time minimum wage income lifted a three-person family above poverty level; even with the increase in 1997, it now represents only 81 percent of poverty level.<sup>7</sup>

While official poverty guides allow an assessment of family income trends, many experts believe they underestimate the income necessary to meet a family's basic needs. For that reason, families qualify for many assistance programs at income levels above poverty. For example, children in families with incomes at almost double poverty level income (185% poverty) qualify for the WIC program, child care subsidies and reduced price school lunch.

**Table IV.1 1998 Federal Poverty Guidelines\***

Family Size	Poverty Level	130% Poverty	150% Poverty	185% Poverty
2	\$10,850	\$14,105	\$16,275	\$20,073
3	\$13,650	\$17,745	\$20,475	\$25,253
4	\$16,450	\$21,385	\$24,675	\$30,433

\*Poverty "guidelines," derived from poverty "thresholds," are used to determine eligibility for public assistance programs. Poverty "thresholds," updated annually by the percentage change in the Consumer Price Index, are used to assess the size of the low-income population. Income includes only cash income; non-cash benefits such as food stamps are not included.

In contrast, to qualify for assistance through the Family Independence Program (FIP), a family cannot have earnings above 73 percent of poverty level. For example, a Wayne County family of three with gross earnings of \$775 per month would not qualify for cash supplements.

**County Trends**

Child poverty varied widely among Michigan's counties: children living in Lake County were six times more likely to be poor than those in Livingston County. Among Michigan's 83 counties, Livingston County had the lowest child poverty rate with 6 percent of all children in this situation, compared to 36 percent in Lake County. The northern central counties of Clare, Ogemaw, Gladwin and Roscommon all reflected child poverty rates above 28 percent. The metropolitan counties of Genesee, Saginaw and Wayne with large numbers of children also suffered from relatively high poverty rates—above 26 percent.

Child poverty deepened in 59 of the state's 83 counties in the trend period. Although Macomb and Barry counties still had some of the lowest child poverty rates in the state, they sustained the largest increases—over a third higher between 1989 and 1995. The biggest drop in child poverty by far occurred in Lake County where the rate dropped by a third from 53 percent to 35 percent. The second largest decline (18%) occurred in Oscoda County where child poverty dropped from 33 to 27 percent.

Poverty among young children, ages 0-4, ranged from a low of 8 percent in Livingston and Ottawa counties to 43 percent in Wayne County. In half of Michigan's counties, one in four young children lived in families with incomes below poverty.

1. The most recent child poverty rates available for counties are 1995 estimates developed by the U.S. Census for the U.S. Department of Education to distribute Title I funds to school districts for programs to aid disadvantaged children.

# Children Receiving Free and Reduced Price School Lunches

*Percentage of all children in K-12 public schools receiving free or reduced price school lunches. Students from families with incomes below 130 percent of poverty income qualify for a fully subsidized lunch; those with family incomes between 130 and 185 percent of poverty qualify for a reduced price lunch.<sup>1</sup>*

With the incomes of many families with children falling at or near the poverty level, the share of the state's K-12 public school students receiving free and reduced price meals through the School Lunch Program maintained its steady ascent in the 1997-98 school year. The share of free and reduced price participation increased by 37 percent between the 1989-90 and 1997-98 school years. Although the 1997-98 rate rose only slightly from the previous year—from 31.5 percent to 31.7—the fact that it continued its upward direction while the state enjoyed a record low level of unemployment is troubling.

In the 1997-98 school year, roughly 521,000 Michigan K-12 public school students received free or reduced price school lunches. In the 1989-90 school year,

less than one-quarter of all students participated at free or reduced price rates; by 1997-98, almost one-third did. Most of these children qualified for a fully subsidized lunch.

With more and more of the state's children qualifying for free or reduced price meals in the School Lunch Program during the school year, the fact that only 7 percent (34,991) were able to participate in a summer food program in 1997 causes concern.<sup>2</sup> The federal Summer Food Service Program, which was created in 1969, provides funds to eligible sponsoring organizations to serve nutritious meals to needy children under age 18 during the summer months. (Needy children are defined as those eligible for free or reduced prices in the School Lunch Program during the school year.) Emergency food requests have escalated in local communities during the summer months when children can go hungry because of a lack of volunteers and sites.<sup>3</sup>

Although sites offering the program expanded in the state in 1998, fewer meals were served than in 1997. In fact, total lunches served during the summer have dropped by 14 percent in Michigan since 1990 while the share of eligible students has expanded by a third.

**Chart IV.3 Only 7 percent of Michigan's eligible children participated in a Summer Food Program in 1997.**

Source: Midwest Regional U.S. Department of Agriculture, Chicago

Among the state's 83 counties, only 54 had a Summer Food Program site in 1997, and almost half of them (24) served fewer than one in 20 eligible children. Only seven counties served more than 10 percent of eligible children. The counties most successful at serving eligible children were Schoolcraft and Oceana counties, which reached 42 percent and 34 percent respectively.

## County Trends

In the trend period, 76 of the state's 82 counties that contain school districts experienced an increase in student participation in the School Lunch Program at free or reduced price rates, with Macomb County sustaining the largest jump; its rate almost doubled—from roughly 9 percent of its students participating in the program in 1989-90 to 17 percent by the 1997-98 school year.

The need for school meal subsidies among marginal families seems to be increasing in the counties that have had the lowest child poverty rates and counties with large child populations. Program participation rates in the prosperous counties of Ottawa and Livingston swelled by about half. The counties of Wayne and Oakland with their large numbers of children experienced similar increases. (Almost one in three of the state's children lives in these two counties.)

Lake County reflected the largest decrease, dropping back by 7 percent, from its high of 85 percent participation in 1989-90 to 79 percent in 1997-98,—still the highest rate among the 82 counties and significantly above the second highest rate of participation (51%) in Oscoda County. The lowest rate of program participation was reported in Livingston County at 8 percent, roughly half of the next lowest rate in Clinton County—15 percent.

1. In 1998 family income at 130 percent of poverty was \$21,385 for a family of four; at 185 percent of poverty was \$30,433.

# Inadequate Prenatal Care

Women classified as having received inadequate care according to the Kessner Index include those who:

- began care in the last three months of their pregnancy
- experienced fewer than five prenatal visits during a 34-week pregnancy (fewer visits are considered adequate for shorter pregnancies)

The locality reflects the mother's place of residence, not necessarily the place of the infant's birth.

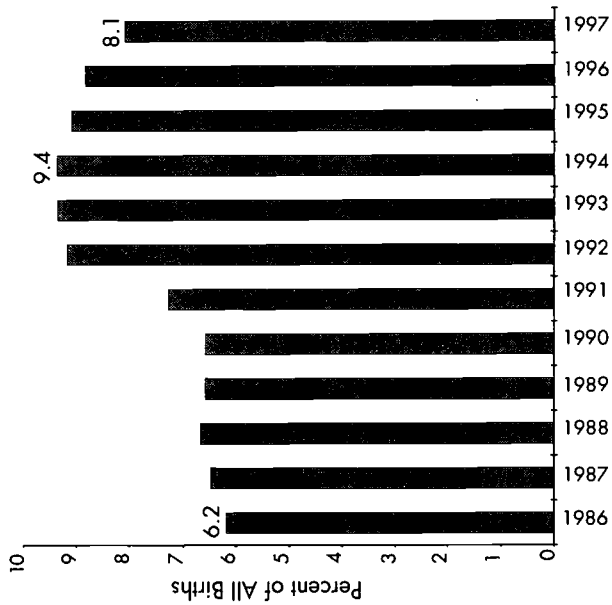

Over the trend period the level of inadequate prenatal care worsened by 59 percent in Michigan. Between 1986-88 and 1995-97, the rate of inadequate prenatal care rose from roughly 5 percent of all births to almost 9 percent. In 1995 through 1997 approximately 11,600 babies were born each year to Michigan mothers who had received inadequate prenatal care.

Mothers who fail to receive early and regular prenatal care are at higher risk of delivering low birth-weight infants and having their infants die before their first birthday. Nearly 80 percent of women at risk of having a low birth-weight baby can be identified during the first prenatal visit.<sup>1</sup> During prenatal care, expectant mothers receive information about health and nutrition, and providers can make an early diagnosis and treatment of any medical problems. Comprehensive care also links expectant mothers to other support programs and community services.

Early and continuous prenatal care is one of the most effective strategies for ensuring the birth of a healthy baby. Inadequate prenatal care can lead to increased costs from extended hospital stays and medical treatment for critically ill babies, lifetime medical care

and special services for children with developmental problems cause by low birth-weight, and lost productivity from parents coping with seriously ill babies or children with disabilities.

Chart IV.4 Rates of inadequate prenatal care in Michigan began to drop in 1995.

Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health

Despite expansion of Medicaid to eliminate the financial barriers to care for expectant mothers with family income up to 185 percent of the poverty level (\$25,253 for a family of three), many qualifying women still do not receive adequate prenatal care. Significant other barriers persist at the social, environmental and psychological level, according to a recent survey of low-income urban mothers.<sup>2</sup>

The most frequently cited reason for not seeking care involved feeling depressed or unhappy about the pregnancy. Women who did not want their families and friends to know about their pregnancy were nearly five

times more likely to have received inadequate care. The clinic or office environment, particularly those with long waiting times, crowded waiting rooms and non-existent evening or week-end hours, also deterred expectant mothers, especially those with young children.

## County Trends

Among the 66 Michigan counties with rates of inadequate care rates calculated for the recent year, rates ranged from 2 percent in Midland to almost 17 percent in Wayne—almost one in five expectant mothers.

Jackson County also recorded a relatively high rate of inadequate care (16%). All other counties had rates below 11 percent.

Despite the worsening trends in the rate of inadequate prenatal care for the state as a whole over the trend period, 38 counties experienced improvements in their rates, and another ten no longer had enough incidences of inadequate care to calculate a rate in the recent year. The northeastern counties of Benzie, Cheboygan, Grand Traverse, and Leelanau reflected the most dramatic improvements—the rates dropped by more than 60 percent.

Some of the counties with the highest rates also reflected the biggest increases over the trend period. Among the 27 counties experiencing increased rates, Wayne County sustained the largest jump—a 150 percent increase. Rate increases of over 100 percent also occurred in Macomb, Jackson, St. Clair and Iosco counties.

# Low Birth-Weight Babies

*The percentage of newborns weighing under 2,500 grams (approximately five and a half pounds). The locality reflects the mother's residence, not necessarily the place of birth.*

Michigan's rate of low birth-weight babies remained roughly 8 percent higher in 1995-97 than in 1986-88. Of all the babies born in the recent period, 7.7 percent of them weighed less than 2,500 grams (approximately five and half pounds) compared to 7.2 percent in 1986-88. At this rate a total of 10,300 low birth-weight infants were born each year in Michigan between 1995 and 1997. Michigan's rate of low birth-weight babies was higher than 30 other states in 1996.<sup>1</sup>

On a year-to-year basis between 1995 and 1997, the low birth-weight rate has remained unchanged despite significant declines in births among mothers at highest risk. The state's teen birth rate and the share of women receiving inadequate prenatal care both fell in those years. The percent of Michigan mothers who smoked during pregnancy also declined steadily between 1990 and 1996, dropping by 22 percent, to a low of 17.6 percent in 1996.

Low birth-weight is related to many factors, including inadequate prenatal care, deficient nutrition, teen child-bearing, excessive use of alcohol or other substances, and smoking. Several other factors such as household income may be linked; for example, low income women are more susceptible to deficient nutrition and also more likely to receive inadequate prenatal care. Some racial and ethnic groups, such as Asian Indians and African Americans, suffer from higher incidences of low birth-weight even without these factors involved.<sup>4</sup>

Premature infants or those born at low birth-weight are more vulnerable to adverse conditions in their environment and often suffer from several medical

problems. These fragile infants experience higher incidence of developmental delay, disease, and death. The National Public Health Service estimates that almost 60 percent of the infant deaths each year result directly from low birth-weight.

**Chart IV.5 Michigan mothers-to-be receiving inadequate prenatal care were also more likely to have low birth-weight babies.**

Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health

## County Trends

The rate of low birth-weight babies among the 76 Michigan counties ranked on this indicator ranged from 3.4 percent in Oceana County to 10.3 percent in Lake County. The lowest rates occurred in counties with relatively small numbers of newborns, while the large metropolitan counties, such as Genesee, Saginaw and Wayne had the highest rates—over 9 percent of all infants were born weighing less than five and a half pounds. Counties with the largest shares of low birth-weight babies also had some of the highest rates of inadequate prenatal care<sup>2</sup> and child poverty.

Most counties (55) experienced increased rates of low birth-weight babies between 1986-88 and 1995-97. Iron County sustained the largest jump—almost 73 percent higher—rising from 4.7 percent of all births to 8.2 percent. Sanilac and Missaukee counties also saw their rates expand by over 50 percent in the trend period. Of the 18 counties where the rate improved, the largest drop by far—37 percent—occurred in Oceana County, which also had the lowest rate.

1. 1999 *KIDS COUNT DATA BOOK: State Profiles of Child Well-Being*. (Baltimore, Maryland: The Annie E. Casey Foundation, 1999) p. 87.
2. Inadequate prenatal care, according to the Kessner Index, is defined as care that begins in last trimester of pregnancy and involves fewer than five prenatal visits for a full-term pregnancy of 34 weeks.

# Infant Mortality

*The number of infants who die before their first birthday. The locality reflects the infant's residence, not necessarily the place of death.*

Over the last ten years the infant mortality rate in Michigan has improved dramatically. With the three-year averages used to calculate trends, Michigan's infant mortality rate registered a 27 percent decline in the trend period. In the years 1995-97, roughly eight of every 1,000 Michigan infants died in their first year, compared to eleven in 1986-88. Despite this dramatic improvement, Michigan's infant mortality rate remained higher than those of 35 other states in the nation in 1996.<sup>1</sup>

In year-to-year trends, however, the state's 1997 infant mortality rate reversed its decline for the first time since 1989. The rate rose slightly to 8.1 deaths per 1,000 infants from 8.0 in 1996—reflecting increases for both white and African American infants. In the state as a whole, African American infants died at rates almost three times higher than white infants: 17.6 deaths among every 1,000 African American infants, compared to 6.1 deaths among white infants.

For the state's African American infants, the 1997 rate represented the third year of a worsening trend, rising slightly but steadily from 17.3 to 17.6. Michigan counties *outside* Wayne County accounted for this increase, climbing from 16.8 deaths among every 1,000 births in 1995 to 19.1 in 1997 — roughly a 14 percent increase. Over the same three years, mortality rates for African American infants in Wayne County declined by almost 6 percent, from 17.6 deaths per 1,000 births to 16.7.

Infant mortality is widely used as an indicator of "quality of life." The overall Michigan infant mortality rate has been consistently higher than the national rate, and the national rate ranks as one of the worst among the industrialized countries of the world.<sup>2</sup> For example, the 1993 infant mortality rate per 1,000 births in was 4.4 in Japan, 5.8 in England and Wales, and 6.8 in France, compared to 8.4 in the U.S.

Many factors affect the life expectancy of infants: poverty, the emotional and physical health of the mother, the involvement of the birth father, the strength of the health care system, the level of access to health and infant care, availability of supportive services for mothers and infants, and community safety. According to national studies, poverty is a key factor: the mortality rate for children born into poor families is 50 percent higher than that of children born into families with incomes above the poverty line.<sup>3</sup>

## County Trends

Among the 26 Michigan counties ranked on this indicator, Lenawee County reflected the lowest infant mortality rate—roughly five of every 1,000 infants. Genesee County had the highest rate, at 12 deaths for every 1,000 infants. The next highest infant mortality rates were 11 per 1,000 in Tuscola and Wayne counties.

Infant mortality trends in these three counties were very different. While rates in Tuscola and Genesee counties dropped by less than 7 percent, Wayne County experienced a 29 percent decline. In only one of the 25 counties for which rates were available in both trend years, did the infant mortality rate increase over the trend period—by 8 percent in Bay County. The largest rate decreases, by more than 40 percent, occurred in Calhoun and Midland counties.

In ten more counties, the number of infant deaths dropped below six incidences in the most recent year, so no rate was calculated. In the recent years, several of these counties had a much lower number of incidences, which would suggest improvement on this indicator.

**Chart IV.6 Infant mortality rates for African Americans worsened in Michigan counties outside Wayne between 1995 and 1997.**

# Child Deaths

*The number of deaths from all causes to children ages 1 through 14, per 100,000 children. The locality reflects the place of the child's residence, not necessarily the place of death.*

The child death rate in Michigan dropped 24 percent in the trend period. Each year in 1986-88, an average of 34 deaths had occurred among every 100,000 children, compared to 26 such deaths each year between 1995-97. On a year-to-year basis the child death rate in Michigan has steadily declined since 1991. The state's child death rate ranked 22nd among the 50 states and the District of Columbia in 1996; the rate was lower in 21 other states that year.<sup>1</sup>

An average of 510 of the state's children in this age group lost their lives each year between 1995 and 1997 from all causes, including diseases and injuries from accidents, homicide and suicide.

Roughly one of every two child deaths resulted from an injury in 1997, with almost half of all injury deaths involving a motor vehicle. The other two major causes of injury deaths for this age group were fire (33 deaths) and homicide (32).

Poverty significantly increases a child's risk of death. Poor children are seven times more likely to die in a fire than children with higher household income, four times more likely to be a homicide victim, and three times more likely to die from a disease.<sup>2</sup>

Despite pervasive use of car seats to protect children in the event of a collision, a recent study revealed some children may still be at risk, and most Michigan toddlers, ages 1-3, may not be placed in car seats on a regular basis.<sup>3</sup> Design flaws in the seats, parental mistakes in installation, lax governmental regulation of seat manufacturers, and widely variable car seat belt systems all compromise child safety in cars.<sup>4</sup>

Although a large majority (76%) of infants are placed in car seats, only 41 percent of toddlers, ages 1 to 3, involved in car accidents in Michigan in 1997 were in car seats.<sup>5</sup> Small children in adult seat belts can suffer severe abdominal and spinal cord injuries in an crash.

While the state's rate of child deaths has declined, no reliable data are available on the numbers of children escaping death but suffering from a significant disability or chronic health condition from disease or injury.

**Chart IV.7 Half of deaths among children, ages 1-14, in Michigan resulted from injury in 1997.**

Total deaths=495

## Injury Deaths

Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health

## County Trends

Only the 17 counties that averaged more than five child deaths between 1995 and 1997 were ranked on this indicator. Among those ranked, Ingham County had the lowest child death rate (11 deaths among every 100,000 children), and Calhoun County the highest with 38 such deaths. Ingham County's rate was considerably lower than all other ranked counties; Washtenaw County's second lowest rate reflected 18 deaths per 100,000 children.

All but three of the seventeen counties experienced an improvement over the trend period. Ingham County's child death rate dropped by far the most drastically, falling by 67 percent—from 38 such deaths in 1986-88. Those counties showing the least improvement were Berrien and Jackson counties where rates dropped by less than 10 percent. Among the three counties where rates rose, the largest jump—23 percent—occurred in St. Clair County.

# Children in Investigated Families for Abuse or Neglect

*Children in families that are investigated for suspected abuse or neglect may be counted more than once in a given year if more than one allegation is examined.*

Roughly 148,000 of the state's children lived in a family involved in an investigation of abuse or neglect in 1997. Between 1988 and 1997, the rate of children involved in investigations in Michigan increased by more than a third—from 44 children per 1,000 (ages 0-17) to 59. Since 1988, the rate has increased steadily every year.

An investigation is initiated based on reports of child abuse or neglect received by the Child Protective Services Program at the local Family Independence Agency. Such reports have been increasing: between 1993 and 1997 the annual number of reports of abuse or neglect rose by about 8 percent, reaching roughly 125,000 in Fiscal Year 1997. In determining whether to launch an investigation of a report, caseworkers first assess whether the reported incident fits the legal definition of child abuse or neglect. About half the reports were "referred for an investigation" in 1997.

In more than half of investigated cases of alleged abuse or neglect closed in 1997, the evidence was not considered adequate to determine whether abuse or neglect had occurred. In slightly less than a quarter of cases, the caseworker concluded there was no evidence

of abuse or neglect. About 19 percent of the total investigated cases were substantiated or confirmed by available evidence.

Funding for services to prevent child maltreatment and help families who become involved with child protective services is much more limited than funding for foster care.<sup>1</sup> In a recent survey of organizations providing child abuse prevention services in counties throughout the state, 95 percent reported needing more funding and 82 percent reported needing more staff to address the level of need among families in their communities.<sup>2</sup>

**Chart IV.8 In roughly 80 percent of Michigan's investigated cases of child abuse or neglect in 1997, reports were not substantiated, mostly because of insufficient evidence.**

Source: Michigan Family Independence Agency

Among all agencies surveyed, respite care was the most pressing need identified and the service least likely to be offered.<sup>3</sup> Respite care provides temporary care to children so their parents can get a break. Respite care is usually offered to at risk families with limited human and financial resources such as single parents or teen mothers and those with children with special needs or chronic illness.

## County Trends

The rates of children involved in investigations of abuse or neglect varied widely among Michigan's 83 counties. A child was eight times more likely to be involved in such an investigation in Iron or Oscoda counties than in Keweenaw or Alger. In Keweenaw County 15 of every 1,000 children were involved in an investigation of child abuse or neglect compared to 127 of every 1,000 children in Iron County. Another five counties—Calhoun, Newaygo, Montmorency, Crawford and Oscoda—also had over 100 children of every 1,000 children involved in an investigation of abuse or neglect in 1997.

Most Michigan counties saw their rates of children involved in abuse and neglect investigations rise over the trend period. Of the 57 counties experiencing increases, six sustained doubling and tripling of rates. Oscoda County, with one of the highest rates, also had by far the most dramatic increase—312 percent. The rate dropped most dramatically in Schoolcraft County—by 60 percent.

2. Jesse Donohue. *Children's Trust Fund Needs Assessment Study*. (Lansing, Michigan: The Children's Trust Fund, December 1998) pp. 26-28.
3. Ibid.

# Substantiated Victims of Abuse or Neglect

*An unduplicated count of children who were confirmed as victims of abuse and neglect after an investigation was conducted.*

In Michigan a total of 20,654 children were confirmed as victims of abuse or neglect—roughly eight of every 1,000 children—in 1997.

This rate represented a decrease of almost 20 percent compared to fiscal year 1988, when the rate was about 10. Since 1994 the rate of confirmed child victims has fallen slightly each year. In contrast, over the past nine years the number of investigations of child abuse and neglect in the state has climbed steadily.

In 1997 investigators were able to secure enough evidence to determine that almost 10,000 of the state's children were physically neglected, and another 4,400 physically abused. Most victims (70%) were classified in these two categories. The third largest number of child victims (2,164) were determined to be improperly supervised.

The numbers of victims suffering Physical Injury remained steady between 1993 and 1998 at roughly 4,500. Trends in the category of Physical Neglect, which includes the largest number of victims, are difficult to assess because the numbers in three other categories eliminated after 1995 were combined under Physical Neglect. Of the other two categories in place since 1993, identified Sexual Abuse victims declined roughly 27 percent, from 2,000 to 1,500 children in 1998 while Abandoned children rose by 48 percent, from 764 children in 1993 to 1,136 in 1998.

In fiscal year 1995, to reflect changes in state law four new categories were introduced: Mental Injury, Medical Neglect, Improper Supervision and Failure to Protect. (See box for definitions.)

## County Trends

Substantiation rates for child abuse or neglect ranged from fewer than two of every 1,000 children in Livingston County to 28 in Ogemaw County. Missaukee and Houghton counties also had relatively low rates, roughly two of every 1,000 children. Crawford and Wexford counties, in contrast, reflected rates ten times as high—more than 20 confirmed victims per 1,000 children.

Most Michigan counties (58) witnessed decreased rates of substantiated child abuse and neglect in the trend period. The largest decline occurred in Missaukee County with a drop of 90 percent in its rate, from 22 to two victims per 1,000 children. Montcalm and Emmet counties also reflected declines of over 75 percent in their rates. The rate rose most dramatically in Alcona County where it jumped by 192 percent over the trend period, rising from four confirmed abuse or neglect victims per 1,000 children to 12.

## "New" Categories of Child Abuse and Neglect — As of Fiscal Year 1995

**Mental Injury:** a psychological condition caused by physical or verbal acts, omissions (including the denial of appropriate treatment), or maintaining an environment by a parent or person responsible for the child's health or well-being which renders the child chronically anxious, agitated, depressed, socially withdrawn, psychotic, or in reasonable fear that his or her life and/or safety or that of another family member is threatened; chronically interferes with the child's ability to accomplish age-appropriate tasks.

**Medical Neglect:** the failure to seek, obtain, or follow through with medical care for the child, with the failure resulting in or presenting a substantial risk of death, disfigurement or bodily harm or an observable and material impairment to the growth, development or functioning of the child.

**Chart IV.9 The largest share of identified child victims of abuse or neglect in Michigan suffered from physical neglect in 1997.**

Source: Michigan Family Independence Agency, FY 1997

**Failure to Protect:** knowingly allowing another person to mistreat or abuse the child without taking appropriate measures to stop such mistreatment or abuse and prevent it from recurring when the person is able to do so and has, or should have had, knowledge of the treatment. (Child must be at "imminent risk" of serious or immediate harm.)

**Improper Supervision:** placing or failing to remove the child from a situation that a reasonable person would realize requires judgment or actions beyond the child's level of maturity, physical condition, or mental abilities and that results in bodily injury or a substantial risk of immediate harm to the child.

Summarized from *Services Manual: Children and Youth-Protective Services Program*. (Lansing: State of Michigan Family Independence Agency Issued 7/14/98) Item 712. pp. 11-13.

# Children in Out-of-Home Care

*A count of children removed from their homes because of abuse, neglect or delinquency and placed in foster or institutional care under the supervision of the Family Independence Agency. Children who are placed in the homes of relatives are not included in this count.*

In fiscal year 1997 the out-of-home placement rate for children in Michigan was 10 percent higher than it had been in 1988—rising from 5.7 children of every 1,000 children to 6.3. Roughly 15,700 children were living in out-of-home care in fiscal year 1997 compared to 14,000 in 1988.

While the rate of abused or neglected children placed in out-of-home care increased only slightly between fiscal years 1988 and 1997 (rising 7.5 percent), larger numbers of substantiated victims are being placed with relatives in "kinship care." Not included in the count of children in out-of-home care, these relative placements swelled by 43 percent between 1988 and 1997, rising from 3,000 to 4,300 children. While this increased kinship placement may be less disruptive to a child's social universe than moving in with strangers, the circumstances leading to removal from "home" still represent a significant trauma.

In 1997 the rate of children placed for delinquency rose 52 percent—from 1.0 of every 1,000 children to 1.4. African American youth were significantly overrepresented in both numbers and length of time in residential placements and were more likely to be placed at younger ages.<sup>1</sup>

Most delinquent youth in institutional care (62%) in Michigan resided in private residential treatment facilities. Many of these facilities were not effectively monitored by the Family Independence Agency,

according to a recent audit.<sup>2</sup> Auditors also concluded these private facilities sometimes were not identifying and providing appropriate services to these youth during their residency, nor were appropriate community reintegration services provided after their release. Relatively few youth in non-metropolitan counties even received these services.<sup>3</sup>

**Chart IV.10 The growing numbers of children placed with relatives are not reflected in the out-of-home care count in Michigan.**

Source: Michigan Family Independence Agency

## County Trends

Among the 78 Michigan counties with rates calculated for their 1997 out-of-home placement, Livingston County had only about one of every 1,000 children in such care, compared to Wayne with almost 13 of every 1,000 children placed out of their homes. Both counties had significantly lower/higher rates than the next lowest/highest counties. The four other counties with some of the lowest rates—Barry, Lapeer, Gladwin and Shiawassee—placed about an average of two of every 1,000 children in out-of-home care. Lake County with the second highest rate in the state placed 10 of every 1,000 children.

While the state overall experienced an increase in its rate of out-of-home care, more counties (45) saw their rates decline rather than rise. The biggest declines

occurred in northwestern counties, with the Charlevoix County rate plunging by 82 percent, from almost 14 of every 1,000 children placed in out-of-home care in 1988 to fewer than three of every 1,000 in 1997.

Missaukee and Emmet counties both experienced decreases of roughly 69 percent.

Rate increases in some of the state's most populous counties affected large numbers of children. With a jump of 150 percent, Macomb County experienced the biggest increase in its rate, from fewer than two of every 1,000 children being placed in care in 1988 to four such children in 1997. Menominee, Iosco, Washtenaw and Sanilac counties also experienced out-of-home care rate increases of over 100 percent.

## Delinquency Placement Trends

The state's rise in delinquency placements mainly reflected increases in the large urban counties—Calhoun, Washtenaw, Kalamazoo, St. Joseph and Wayne. These counties sustained rate increases of over 90 percent. In Calhoun County 67 children were placed for delinquency in 1997 compared to 10 in 1988. This trend may reflect a lack of community-based treatment or expanded capacity at state facilities.

Of 62 counties ranked on their out-of-home placement rate for delinquency, Schoolcraft County had the highest—five of every 1,000 children. Wayne County, with the second highest rate of almost four of every 1,000, represented almost 2,000 of the total 3,600 children placed in the state. In contrast, the rate of delinquency placements in out-of-home care was fewer than one child per 1,000 in 26 counties. In fact, the rate rose above two per 1,000 children in only 13 counties.

# Births to Teens, Ages 15-17

*Rates of births to teens, ages 15 to 17, reflect the number of births per 1,000 girls in that age group in a locality, based on the mother's residence.*

The 1995-97 birth rate for teens, ages 15-17, in Michigan has dropped to slightly below (0.3% lower) the 1986-87 average rates—27.9 births for every 1,000 female teens, compared to 27.8. In the latest years roughly 5,800 Michigan teens in this age group gave birth each year compared to 6,200 annually in 1986-88. The state's birth rate for teens, ages 15-17, was higher than only 21 other states in the nation in 1996.<sup>1</sup>

Between 1990 and 1997, the pregnancy rate among teens in this age group dipped from 58 pregnancies of every 1,000 teens to 41, and abortion rates from 14 of every 1,000 to 10.

Michigan's rate dropped nearly twice as steeply as the national average between 1991 and 1996.<sup>2</sup> It fell by 22 percent compared to 13 percent in the nation.

This improvement has continued into 1997. Between 1996 and 1997, the birth rate among the state's younger teens, ages 15-17, registered a drop of 10 percent—the largest annual decline since the rate started to fall in 1991.

These encouraging trends result primarily from teens' choosing more effective contraceptive practices and methods, as well as broad-based efforts to promote more responsible sexual decision-making among teens, according to national experts.<sup>3</sup> Sexually active teenagers have started using long-lasting hormonal contraceptives such as the implant called Norplant and the injectable Depo-Provera, which only became available in the early 1990s.<sup>4</sup>

**Chart IV.11 The biggest annual improvement in Michigan's younger teen birth rate (ages 15-17) occurred in 1997.**

## County Trends

Of the 70 counties ranked on this indicator, Livingston County had by far the lowest rate, about eight of every 1,000 female teens in the 15-17 age group gave birth each year in 1995-1997, compared to 49 of every 1,000 in Lake County. Five other counties also had rates above 40: Berrien, Oscoda, Calhoun, Muskegon and Wayne. Houghton County was the only other county with a birth rate for this age group that fell below ten of every 1,000. Nine counties, including two with large child populations—Macomb and Oakland—had young teen birth rates below 15 of every 1,000.

Although overall the state teen birth rate for 15-17 year-olds in 1995-97 dropped below 1986-87 levels, most counties experienced higher rates. Cheboygan and Arenac counties sustained the largest increases with at least 75 percent.

In the 27 counties that saw their teen birth rates drop, Gogebic County experienced the largest decline, dropping by almost a third, from 24 of every 1,000 teens to 16. The large counties of Wayne and Oakland, as well as Washtenaw and Saginaw, influenced the statewide decline with their falling rates.

# Teen Deaths by Accident, Homicide, or Suicide, Ages 15-19

*The number and rate of teen deaths, per 100,000 youth in this age group. The locality reflects the place of residence, not necessarily the place of death.*

Late adolescence poses serious peril to young people. Youth in this age group are almost three times as likely to die as their younger counterparts. With increasing freedom from adult supervision, some youth take risks that put themselves and others in mortal danger.

Similar to the state's other mortality rates, the teen injury death rate in the trend period dropped by about 20 percent, declining slightly less than infant and child mortality. Roughly 75 of every 100,000 youth died each year from an accident, homicide or suicide in the 1986-88 period compared to an average of 61 such deaths occurring each year in the 1995-1997 period. The state's teen death rate from accident, homicide or suicide was higher than 22 other states in 1996.<sup>1</sup>

Teens are much more likely to die from an injury, as opposed to disease, than younger age groups. Injury deaths represented almost 80 percent of all deaths for older teens in 1997, compared to about 50 percent for children, ages 1-14.

Overall, an average of 566 Michigan youths died from an injury each year in 1986-88, compared to 426 each year in 1995-97. Well over half of injury deaths (241) in 1997 resulted from an accident: four of every five accidental deaths involved a motor vehicle. Another 103 of the state's youth lost their lives through homicide, and 76 by suicide.

One of the most effective ways to reduce traffic fatalities would be more widespread use of seat belts, according to the National Transportation Safety Board.<sup>2</sup> Almost one of five Michigan youth report rarely or never using a seat belt as a passenger.<sup>3</sup> Also at risk are the 17 percent of Michigan youth who report driving under the influence of alcohol at least once within the last thirty days.<sup>4</sup>

Most youth who are injured do not die. Some find their lives altered significantly by an injury that greatly reduces their life possibilities. Many incidents of injury death involve substance abuse (mostly alcohol), anger or depression. Prevention activities addressing violence and responsible choices have been introduced in many communities, and the graduated licensing system for young drivers, which took effect in April 1997, may further reduce teen injury and fatality rates.

## County Trends

Of the 20 Michigan counties ranked on this indicator, Washtenaw County had the lowest rate with 28 deaths per 100,000 teens. Kalamazoo County also had a relatively low rate with 30 such deaths. St. Joseph County had the highest rate, roughly 118 deaths per 100,000 teens, although Berrien and Clinton counties also had rates above 100.

Among the sixteen counties for which a reliable percentage change could be calculated, almost all registered a decline in their teen death rates; only two experienced an increase. Kalamazoo and Livingston counties witnessed the biggest rate declines, by over 40 percent. Rates in both Berrien and Muskegon counties worsened by about 20 percent.

**Chart IV.12 Eight of ten deaths among older Michigan teens resulted from an injury.**

# Juvenile Arrests for Index Crimes, Ages 10-17

*The number of arrests of youths, ages 10 through 17, for the eight index crimes: murder, forcible rape, robbery, aggravated assault, larceny, burglary, motor vehicle theft and arson.<sup>1</sup> The locality represents the place where the arrest occurred, not necessarily the residence of the juvenile.*

The rate of juvenile arrests for index crimes in Michigan dropped by roughly 23 percent between 1986-88 and 1995-97, from 22 of every 1,000 youth to 17 for such arrests. Roughly 19,600 arrests were recorded each year between 1995 and 1997 compared to about 24,700 in 1986 through 1988. Over the years the rate of juvenile arrests for index crimes in Michigan has reflected a steady decline, particularly since 1994.

The juvenile arrest rate for violent index crimes (murder, rape, robbery and aggravated assault) also fell during this trend period—but by about half as much—11 percent. The rate dropped from 3.2 arrests of every 1,000 youth to 2.9. A total of 3,300 such arrests occurred each year in the 1995-1997 period compared to 3,600 in 1986-1988.

Arrest rates in counties may be significantly affected by policies and programs for juveniles in local jurisdictions, as well as law enforcement practices and county prosecutor policies. Some counties routinely arrest and prosecute juveniles in the formal system, others divert offenders into preventive or remedial programs.

## County Trends

Among the 80 counties ranked on their rate of juvenile arrests for index crimes, Cass and Eaton counties had the lowest with roughly four arrests for every 1,000 youth. Nineteen other counties had fewer than ten arrests for every 1,000 youth. The highest rates, 41 and 38 arrests, occurred in the counties of Wexford and Kent. Arrest rates for index crimes exceeded 30 in four other counties—Mackinac, Marquette, Berrien and Roscommon.

**Chart IV.13 Juvenile arrest rates for index and violent index crimes in Michigan have dropped in recent years.**

Source: Michigan State Police

Over the trend period Eaton County experienced the biggest drop in arrest rates—by 86 percent, dropping from 30 arrests for index crimes among every 1,000 youth in 1986-88 to four in 1995-97. Significant declines also occurred in the urban counties of Calhoun and Jackson where rates dropped by about 70 percent. In Calhoun County the rate dropped from 25 such arrests per 1,000 youth to 7. Sanilac County suffered the largest increase with the rate climbing

from 6 to 9 arrests per 1,000 youth. The northeastern counties of Montmorency and Iosco also sustained significant increases in their arrests of juveniles for index crimes, rising by at least 75 percent in the trend period.

## Arrests for Violent Index Crimes

About half of Michigan's counties (43) had rates of juvenile arrests for violent index crimes that could be ranked in the most recent year. The rates ranged from a low of less than one arrest for every 1,000 youth in five counties to a high rate of six such arrests in Kent County. Wayne and Ingham counties also had rates of five or more violent crime arrests for every 1,000 youth. A total of 27 of the ranked 43 counties had rates with fewer than two such arrests for every 1,000 youth.

The biggest drop in these arrest rates occurred in Jackson County where the rate fell 74 percent from almost four such arrests in 1986-88 to one in 1995-97. In Calhoun, Macomb and Kalamazoo counties these arrest rates also dropped significantly, by about half during the trend period. Three counties—Bay, Ottawa, St. Clair—sustained a doubling of rates.

1. The first four of these crimes are considered "violent." The incidence by county for arrests for violent crimes for the trend years is also available in the county profiles.

# High School Dropouts

*The annual number of high school students (grades 9 through 12) who do not return to school the following year and have not graduated or formally transferred to another school.*

In the 1996-97 school year, roughly 28,000 of the Michigan's 423,000 public high school students dropped out of school. The state's dropout rate worsened by about 9 percent between 1990-91 and 1996-97, rising from 6 percent of enrollment to 6.5 percent.

Some students face significant challenges that place them at greater risk of dropping out of school prior to graduation. Inability to read at grade level, frequent truancy, low grades, behavior problems, substance abuse, and pregnancy all place students at particular risk of being retained in a grade, and eventually dropping out.

Some educators believe that traditional high schools are becoming less tolerant of risky behaviors, such as smoking and truancy, at the same time that increasing numbers of youth are exposed to more occasions of serious and multiple risk-taking. In response, some local districts have created alternative structures to serve a small number of youth at risk of dropping out. Alternative programs in Michigan served roughly 23,000 full-time-equivalent students in 369 programs located in 270 different school districts in September 1997. Roughly half these programs were concentrated in the state's largest counties: Wayne, Oakland, Macomb, Genesee and Kent. While males and females were evenly distributed in these programs, African American, Hispanic and Native American youth were over-represented.

86

The majority of the students served by these programs were 16 years old or older (84 percent), but some programs offered services to students as young as eleven. Youth were enrolled in alternative programs for a variety of reasons, most often for attendance or academic problems, or because the student had already chosen to drop out of their original school.

**Table IV.2 Reasons for Referrals to Alternative Education Programs in Michigan**

Reason for Enrollment	% of Students
Attendance Problems	31.6
Chose Alternative Setting	26.4
Poor Academic Performance	23.7
Discipline Problems	12.8
Teen Parent	11.0
Court Ordered Attendance	6.3
Expulsion	4.9
Expulsion for Weapons	0.9

Note: Total percentage will exceed 100 because some students were couniled in more than one category

Source: 1998 Status Study of Michigan Alternative Education, Michigan Department of Education

## County Trends

Among Michigan counties, the 1996-97 dropout rates ranged from a low of 1.4 percent in Roscommon County to 14.6 percent in Wayne County. This low rate in Roscommon County represented its lowest throughout the 1990s, falling from 6 percent the previous year. Iron, Schoolcraft, Oceana, and Alger counties also reported dropout rates of less than 2 percent in the most recent year. As in prior years, most of the counties with the lowest dropout rates represent the state's less populous areas.

In the 78 counties where a percentage change could be calculated, most counties (53) experienced some increase in their average rates. Nine counties saw their annual dropout rates at least double. Eaton County

experienced the largest increase, moving from a rate of only 2 percent in 1990-91 to nearly 6 percent in 1996-97. Ogemaw, Livingston, Dickinson, Crawford, Huron, Manistee, St. Clair and Montmorency also sustained dramatically increased dropout rates.

Of the 25 counties experiencing an improvement in their dropout rates over the trend period, Roscommon County's rate fell the most—over 85 percent. Other counties with improvements of over 30 percent included Alger, Clare, Lenawee, Mackinaw, Midland, and Oceana.

## School Districts

Dropout rates often vary significantly within counties with more than one school district. The vast majority of districts experienced a lower dropout rate than the state average (398 of the 524 districts reporting), with 21 districts reporting no high school dropouts at all and another 114 reporting a rate of less than 2 percent.

Among all the school districts in the state, the local school districts of Eau Clair, Inkster and Detroit had the highest dropout rates—representing over 20 percent of the high school enrollment in the 1996-97 school year. Thirty other districts reported annual dropout rates of over 10 percent.

*"What's been lost in the current discussions about education is ... that if you're going to have a democratic society, you have to have an educated populace. And an educated populace not only needs to know how to read, write, add, and subtract, but they have to know how to live together and to recognize that as a value."*

Patricia Albjerg Graham,  
president of the Spencer Foundation  
Education Week (April 21, 1999) p. 29

1. Alternative education programs are funded and operated as a subdivision of the regular K-12 program, but often administered by adult or community education. They often include expanded services such as counseling and child care.
2. Gerry Geik and Ken Walsh. 1998 Study of the Status of Alternative Education in the State of Michigan. Executive Summary. (January 1999.) page 4.

# Special Education

*Public school students identified and diagnosed with a mental or physical condition resulting in their eligibility for special education services as required by state and federal laws.*

The share of Special Education students in K-12 public schools in Michigan rose by 15 percent over the ten year period. In the 1987-88 school year 11 percent of students were served by a Special Education program, compared to almost 13 percent in 1997-98. This rate reflects the numbers being served by the program; no measure is available of the size of the population of children with disabilities who need such services in a given county or school district.

All children require educational resources, but children who have additional needs due to a physical disability, or mental or developmental impairment often require increased levels. Since the federal enactment of what is now called the Individuals with Disabilities Education Act (IDEA) in 1975, the share of Michigan K-12 public school children receiving special education services has increased steadily from 7.1 percent in the 1975-76 school year to 12.5 percent in the 1997-98 school year.

Significant gender differences occur in special education diagnoses. Overall, two-thirds of all special education students were male. Some diagnostic categories included an even larger proportion of males, for example over three-quarters of all emotionally impaired students were male. Vision, hearing, and those with mental or multiple impairments had more balanced gender distribution, with roughly 45 percent female students.

The age of the child has also been a significant factor in special education diagnoses. The most prevalent special education diagnosis in early elementary school students had to do with speech and language difficulties. Among early adolescents (the middle grades), who experience rapid growth and behavioral changes, the

diagnosis of mental and emotional impairments increased and diagnosed learning disabilities escalated sharply. These diagnoses tapered off among high school students.

**Chart IV.14 The most common Special Education diagnoses varied dramatically by age group in Michigan.**

Source: Michigan Department of Education

National studies report that youth with reported disabilities are more likely to drop out of school (14.6% vs. 11.8%). The disability itself may lead youths to leave school, or the disability may indirectly contribute to lower achievement levels and thus a higher likelihood of school failure. The increased risk varies according to disability, with youths with mental or emotional disabilities at the highest risk of dropping out. Youth with a learning disability coupled with another disability are also at high risk.<sup>1</sup>

## County Trends

Among Michigan counties, the share of K-12 students who were receiving special education services in the 1997-98 school year ranged from 19.2 percent in Lake County to 7.1 percent in Mackinaw County. Ten counties experienced special education participation

rates that exceeded 15 percent of total enrollment: Lake, Gratiot, Mecosta, Clare, Oceana, Muskegon, Monroe, Saginaw, Isabella, and Schoolcraft—all of which have had consistently high shares of their K-12 population receiving special education services. In only eight counties did less than 10 percent of students receive special education services.

All but seven counties experienced increases in the share of students who were served through Special Education programs. While the state sustained only a 15 percent increase over the last decade, some counties showed much more rapid growth. Eleven counties saw increases of more than 50 percent, with the most dramatic being Oscoda County where roughly 3 percent of students were in Special Education in 1986-87 compared to 15 percent in 1997-98.

1. Marilyn M. McMillen, Phillip Kaufman, and Steve Klein. *Dropout Rates in the United States: 1995*. (Washington, DC: U.S. Department of Education, National Center for Education Statistics, NCES 97-473, 1997.)

# Students with Inadequate Math Skills

*Math skills are measured by the Michigan Educational Assessment Program (MEAP) in the fourth and seventh grades.*

Average test scores on the math MEAPs improved substantially for both fourth and seventh graders in Michigan between 1993-94 and 1997-98. Improvement was most dramatic for fourth graders where the share scoring unsatisfactorily fell by half—from 51 percent to 26 percent. The share of seventh graders not meeting math achievement standards dropped by about a third—from 59 percent to 38 percent.

The MEAP tests were initiated in the 1970s as a way to evaluate children at various grade levels across the state, and enable state and local educators to make informed adjustments in curriculum and teaching support. In the early 1990s, the content of the math tests moved from basic skills to what were termed "essential skills" requiring more complex math ability. This change led to temporarily lower scores as school systems continued to implement new teaching methods and materials to reflect changing expectations.

Michigan students' MEAP scores on all tests, including math, have been improving since the readjustments. This trend indicates improved basic skills of students and, perhaps, increased school investment in test preparation. It is problematic for parents and communities when the only measurement of the success or failure of school systems and students is a standardized test such as the MEAP.

National experts suggest that a child who does not master the foundations of mathematics by the middle grades is less likely to take more challenging math courses in high school, resulting in less preparation for college studies and jobs that require technological skills.

**Chart IV.15 Larger shares of middle grades students in Michigan performed below satisfactory level on math MEAP test.**

Source: Michigan Department of Education, 1997-98

## Fourth Graders

Given the importance of mastering math skills, it is heartening that the share of fourth graders performing below satisfactory levels fell in all 82 Michigan counties with school districts. Despite this overall improvement in the trend period, a substantial share (over 40 percent) of the fourth grade students in three counties—Baraga, Lake and Presque Isle—failed to receive satisfactory scores. Marquette County showed the most improvement and the lowest share of fourth graders not meeting math performance standards—dropping from 47 percent of students to 12 percent.

## Seventh Graders

The share of seventh graders performing unsatisfactorily on the MEAP math test fell in all counties except Crawford. Although average MEAP scores have tended to decline during the middle grades, some counties witnessed dramatic improvement. The share of students not demonstrating mastery shrank by over 50 percent in seven counties—Missaukee, Emmet, Leelanau, Mason, Delta, Ottawa and Dickinson. Many other counties are still struggling with large shares of students scoring poorly; for example, less than half of the seventh graders in six counties—Lake, Montmorency, Luce, Wayne, Jackson and Arenac—obtained a satisfactory math score.

## School Districts

Average test scores improved in virtually all of the state's 555 local school districts over the trend period. In the 1997-98 school year, nonetheless, 43 districts in Michigan still experienced over half their fourth graders scoring unsatisfactorily on the math MEAPs. For seventh grade math results, the overall achievement was worse, with nearly 100 districts (97) with half their students scoring unsatisfactorily. These low-performing districts educate nearly one quarter of all the seventh graders in the state. The share of unsatisfactory MEAP scores varies most dramatically by school district in the middle grade years, ranging from just under one percent scoring poorly to over 90 percent in one of Michigan's school districts.

## Gender

MEAP scores also varied significantly by gender. Girls did not score as well as boys on the math MEAPs in fourth grade, and by the seventh grade the gender gap in scores widened slightly more—by almost two percentage points.

**What we can do for kids in our communities ...**  
Hold elected officials responsible by letting them know support will go to candidates who improve the lives of children.

## BACKGROUND

### Childhood Lead Poisoning, Ages 0-3

June 1997-July 1998

Children Ages 0-3	Screened for Lead #	%	% Lead Poisoned
611	19	3.1	5.3

Note: Children at high risk of lead poisoning live in pre-1950s housing or are poor. Counties that test these children may have a larger share of children confirmed as lead poisoned.

Source: Michigan Department of Community Health

### Population (1997)

- ✧ Total population 15,451
- ✧ Total child population 4,397
- Ages 0-5 1,274
- Ages 6-12 1,825
- Ages 13-17 1,298

- African American 0.2%
- American Indian 0.9%
- Asian/Pacific Islander 0.4%
- Hispanic 1.3%
- White (Non-Hispanic) 97.4%
- ✧ Total births 196

### Employment

- ✧ Unemployment rate 6.5%
- ✧ Median household income (1995) \$30,073

### Child Care and Early Education (1998)

- ✧ Regulated slots<sup>1</sup> 621
- Per 100 children, ages 0-12<sup>2</sup> 20
- ✧ Children in publicly subsidized care (FY97) 226
- ✧ Average weekly cost (full-time) \$87.88

### Family Support (Dec. 1997)

	Number	% of All Children
✧ Children receiving food stamps (June 1998)	378	8.6
✧ Children receiving FIP assistance <sup>3</sup>	145	3.3
—Ages 0-5	56	4.4
—Ages 6-12	67	3.7
—Ages 13-17	14	1.1
✧ Children insured by Medicaid	1,037	23.6

<sup>1</sup>Each slot accommodates one child in a licensed child care center, or group family day care home or in a registered family day care home. Not all slots provide full-day care.

<sup>2</sup>National standards suggest a minimum of 25 regulated slots per 100 children to insure basic access.

<sup>3</sup>FIP is the Family Independence Program, formerly Aid to Families with Dependent Children (AFDC).

## BACKGROUND

### Population (1997)

- ✦ Total population 11,113
- ✦ Total child population 2,719
  - Ages 0-5 779
  - Ages 6-12 1,053
  - Ages 13-17 887
- African American 0.1%
- American Indian 23.3%
- Asian/Pacific Islander 0.2%
- Hispanic 0.7%
- White (Non-Hispanic) 75.8%
- ✦ Total births 114

### Employment

- ✦ Unemployment rate 10.2%
- ✦ Median household income (1995) \$27,567

### Child Care and Early Education (1998)

- ✦ Regulated slots<sup>1</sup> 402
  - Per 100 children, ages 0-12<sup>2</sup> 19
- ✦ Children in publicly subsidized care (FY97) 66
- ✦ Average weekly cost (full-time) \$87.76

### Family Support (Dec. 1997)

- ✦ Children receiving food stamps (June 1998)
- ✦ Children receiving FIP assistance<sup>3</sup>
  - Ages 0-5 36
  - Ages 6-12 36
  - Ages 13-17 20
- ✦ Children insured by Medicaid 419

<sup>1</sup>Each slot accommodates one child in a licensed child care center, or group family day care home or in a registered family day care home. Not all slots provide full-day care.

<sup>2</sup>National standards suggest a minimum of 25 regulated slots per 100 children to insure basic access.

<sup>3</sup>FIP is the Family Independence Program, formerly Aid to Families with Dependent Children (AFDC).

## BACKGROUND

### Childhood Lead Poisoning, Ages 0-3

June 1997-July 1998

♦ Total population	13,682
♦ Total child population	3,916
—Ages 0-5	1,158
—Ages 6-12	1,695
—Ages 13-17	1,063
—African American	0.0%
—American Indian	0.8%
—Asian/Pacific Islander	0.5%
—Hispanic	1.1%
—White (Non-Hispanic)	97.8%
♦ Total births	173

### Employment

♦ Unemployment rate	6.5%
♦ Median household income (1995)	\$28,605

### Child Care and Early Education (1998)

♦ Regulated slots <sup>1</sup>	403
—Per 100 children, ages 0-12 <sup>2</sup>	12
♦ Children in publicly subsidized care (FY97)	181
♦ Average weekly cost (full-time)	\$82.01

### Family Support (Dec. 1997)

♦ Children receiving food stamps (June 1998)	540	13.8
♦ Children receiving FIP assistance <sup>3</sup>	250	6.4
—Ages 0-5	99	8.5
—Ages 6-12	105	6.2
—Ages 13-17	31	2.9
♦ Children insured by Medicaid	249	6.4

Note: Children at high risk of lead poisoning live in pre-1950s housing or are poor. Counties that test these children may have a larger share of children confirmed as lead poisoned.

Source: Michigan Department of Community Health

<sup>1</sup>Each slot accommodates one child in a licensed child care center, or group family day care home or in a registered family day care home. Not all slots provide full-day care.

<sup>2</sup>National standards suggest a minimum of 25 regulated slots per 100 children to insure basic access.

<sup>3</sup>FIP is the Family Independence Program, formerly Aid to Families with Dependent Children (AFDC).

### Free/Reduced Price Lunch (1997-98)

Note: All buildings that serve young adolescents, except K-12 and elementary schools, were considered "middle grades."

Source: Michigan Department of Education

## BACKGROUND

### Childhood Lead Poisoning, Ages 0-3

June 1997-July 1998

Children Ages 0 - 3	Screened for Lead #	%	% Lead Poisoned
259	3	1.2	0.0

Note: Children at high risk of lead poisoning live in pre-1950s housing or are poor. Counties that test these children may have a larger share of children confirmed as lead poisoned.

Source: Michigan Department of Community Health

### Population (1997)

◇ Total population	8,117
◇ Total child population	1,831
—Ages 0-5	511
—Ages 6-12	698
—Ages 13-17	622
—African American	0.1%
—American Indian	2.0%
—Asian/Pacific Islander	0.5%
—Hispanic	1.0%
—White (Non-Hispanic)	96.6%
◇ Total births	66

### Employment

◇ Unemployment rate	13.0%
◇ Median household income (1995)	\$27,856

### Child Care and Early Education (1998)

◇ Regulated slots <sup>1</sup>	216
—Per 100 children, ages 0-12 <sup>2</sup>	10
◇ Children in publicly subsidized care (FY97)	76
◇ Average weekly cost (full-time)	\$94.37

### Family Support (Dec. 1997)

	Number	% of All Children
◇ Children receiving food stamps (June 1998)	261	14.3
◇ Children receiving FIP assistance <sup>3</sup>	130	7.1
—Ages 0-5	44	8.6
—Ages 6-12	52	7.4
—Ages 13-17	18	2.9
◇ Children insured by Medicaid	470	25.7

<sup>1</sup>Each slot accommodates one child in a licensed child care center, or group family day care home or in a registered family day care home. Not all slots provide full-day care.

<sup>2</sup>National standards suggest a minimum of 25 regulated slots per 100 children to insure basic access.

<sup>3</sup>FIP is the Family Independence Program, formerly Aid to Families with Dependent Children (AFDC).

## Free/Reduced Price Lunch (1997-98)

Note: All buildings that serve young adolescents, except K-12 and elementary schools, were considered "middle grades."

Source: Michigan Department of Education

## Childhood Lead Poisoning, Ages 0-3

June 1997-July 1998

Children Ages 0 - 3	Screened for Lead #	%	% Lead Poisoned
10,006	376	3.8	2.9

Note: Children at high risk of lead poisoning live in pre-1950s housing or are poor. Counties that test these children may have a larger share of children confirmed as lead poisoned.

Source: Michigan Department of Community Health

## Population (1997)

✧ Total population	220,403
✧ Total child population	62,855
—Ages 0-5	20,500
—Ages 6-12	25,389
—Ages 13-17	16,966
—African American	0.8%
—American Indian	0.4%
—Asian/Pacific Islander	2.6%
—Hispanic	6.8%
—White (Non-Hispanic)	89.7%
✧ Total births	3,356

## Employment

✧ Unemployment rate	2.8%
✧ Median household income (1995)	\$49,688

## Child Care and Early Education (1998)

✧ Regulated slots <sup>1</sup>	10,628
—Per 100 children, ages 0-12 <sup>2</sup>	16
✧ Children in publicly subsidized care (FY97)	1,236
✧ Average weekly cost (full-time)	\$100.07

## Family Support (Dec. 1997)

	Number	% of All Children
✧ Children receiving food stamps (June 1998)	1,898	3.0
✧ Children receiving FIP assistance <sup>3</sup>	585	0.9
—Ages 0-5	246	1.2
—Ages 6-12	243	1.0
—Ages 13-17	94	0.6
✧ Children insured by Medicaid	4,529	7.2

<sup>1</sup>Each slot accommodates one child in a licensed child care center, or group family day care home or in a registered family day care home. Not all slots provide full-day care.

<sup>2</sup>National standards suggest a minimum of 25 regulated slots per 100 children to insure basic access.

<sup>3</sup>FIP is the Family Independence Program, formerly Aid to Families with Dependent Children (AFDC).

## BACKGROUND

### Population (1997)

- ◇ Total population 58,087
- ◇ Total child population 16,022
  - Ages 0-5 4,487
  - Ages 6-12 6,445
  - Ages 13-17 5,090
- African American 0.6%
- American Indian 0.8%
- Asian/Pacific Islander 0.6%
- Hispanic 3.6%
- White (Non-Hispanic) 94.5%
- ◇ Total births 684

### Employment

- ◇ Unemployment rate 5.3%
- ◇ Median household income (1995) \$34,982

### Child Care and Early Education (1998)

- ◇ Regulated slots<sup>1</sup> 1,400
  - Per 100 children, ages 0-12<sup>2</sup> 33
- ◇ Children in publicly subsidized care (FY97) 322
- ◇ Average weekly cost (full-time) \$91.09

### Family Support (Dec. 1997)

- ◇ Children receiving food stamps (June 1998) 1,331
- ◇ Children receiving FIP assistance<sup>3</sup> 591
  - Ages 0-5 265
  - Ages 6-12 248
  - Ages 13-17 68
- ◇ Children insured by Medicaid 2,819

### Childhood Lead Poisoning, Ages 0-3

June 1997-July 1998

Children Ages 0 - 3	Screened for Lead #	%	% Lead Poisoned
2,169	90	4.1	0.0

Note: Children at high risk of lead poisoning live in pre-1950s housing or are poor. Counties that test these children may have a larger share of children confirmed as lead poisoned.

Source: Michigan Department of Community Health

<sup>1</sup>Each slot accommodates one child in a licensed child care center, or group family day care home or in a registered family day care home. Not all slots provide full-day care.

<sup>2</sup>National standards suggest a minimum of 25 regulated slots per 100 children to insure basic access.

<sup>3</sup>FIP is the Family Independence Program, formerly Aid to Families with Dependent Children (AFDC).

# Data Notes and Sources

## Background Indicators

(in order of appearance on state/county profiles)

### Population

#### Total Population/ Total Child Population by Age and Race of Children

Population estimates are calculated using such information as birth and death certificates, net migration rates and changes in group quarters. Projected age/race/sex distributions are based on an analysis of historic fertility, mortality and migration trends. The estimated racial distribution of the child population includes youth ages 18 and 19.

Source: Michigan Information Center, Michigan Department of Management and Budget and the U.S. Department of the Census. (September 1998)

#### Total Births

Birth statistics are limited to events occurring during the year. The data are based on place of residence of the mother. Births occurring to nonresidents of the United States or to citizens outside the U.S. are excluded.

Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health. 1997.

### Employment

#### Unemployment Rate

The unemployment rate reflects the number of unemployed persons as a percent of the total civilian labor force, which includes employed and unemployed persons. Persons ages 16 and older are classified as unemployed if they were: 1) not working during the reference week; 2) looking for work during the prior

four weeks; and 3) available to accept a job. Also included as unemployed are persons who did not work at all during the reference week and were waiting to be called back to a job from which they had been laid off. Persons working part time are considered employed, regardless of whether they are only working a few hours a week, or working part time only because they cannot find full-time employment. Unemployment data from counties may not add up to the totals due to rounding.

Source: Michigan Jobs Commission, Employment Service Agency, Labor Market Analysis Section. Detroit, MI (April 28, 1998).

#### Median Household Income

The amount of income from earnings, unemployment or workers' compensation, social security or supplemental security income, public assistance, veterans' payments, survivor or disability benefits, pension or retirement income, interest or dividends, rents, royalties, estates or trusts, educational assistance, alimony, child support, and any other financial assistance or income from outside the household for all people occupying a single housing unit. The median represents the dollar amount at which half the households have incomes above and half below.

Source: Small Area Income and Poverty Estimates Program. Bureau of the Census. File EST95\_MI.dat, February 1999.

### Child Care

#### Regulated Slots

Each slot accommodates one child in a licensed child care center or group family day care or registered family day care home. This count is inflated because it includes slots with providers who may not fill all "available" slots, as well as part-day programs. Regulated but "legally exempt" slots, where care is provided by relatives or in-home aides to children whose families qualify for child care subsidy, are not included in this count.

Source: Child Day Care Licensing Reports CT-200, CT-430, CT-070 dated August 1998. Division of Child Day Care Licensing, Department of Consumer and Industry Services.

### Per 100 children

This rate was obtained by dividing the number of child slots available in a licensed or regulated child care center, group family day care or family day care home by the number of children, ages 0-12.

### Children in Subsidized Child Care

This number represents the average monthly number of children in child care whose parents were receiving a subsidy payment from the state in Fiscal Year 1997. Eligibility for child care subsidies is based on family participation in the Family Independence Program or earnings below qualifying income levels (roughly 185% of poverty level). Payments are only extended to regulated child care providers or legally exempt care, such as relatives or in-home care aides registered with the state. Subsidies range from 100 to 5 percent of an appropriate rate determined by the agency. Combined totals for six counties (Alger/Schoolcraft, Ionia/Montcalm, Missaukee/Wexford) were divided by child population ratios.

Source: Program Statistics, Fiscal Year 1997. State of Michigan, Family Independence Agency. (FIA Pub 170)

### Average Weekly Cost

The average cost of full-time child care (45 hours a week) as reported by providers in 1) child care centers, 2) group family day care, and 3) family day care homes for all ages of children—infants, toddlers, preschoolers and school-age children. The cost of infant care or toddler care may well be higher than the average. In general, the cost of care in child care centers also tends to be higher.

Source: Provider files from an October 1998 survey of the regional Community Coordinated Child Care agencies by the Michigan Community Coordinated Child Care Association.

## Family Support

### Children Receiving Food Stamps

The monthly number of children receiving food stamps includes those in families receiving other forms of public assistance, as well as those receiving no income assistance. The percent is based on the 1997 child population estimates.

Source: *Michigan Family Independence Agency, Policy Analysis Division, Report EY-180 for June 1998.*

### Children in Family Independence Program (FIP)

In 1997 this program replaced Aid to Families with Dependent Children (AFDC) as a cash assistance program to needy families.

Source: *Assistance Payment Statistics (FIA Publication 67, December 1997, Special Table), supplemented by Report # AM-080, Lansing, MI: Family Independence Agency.*

### Children Insured by Medicaid:

Families with children under age 20 qualifying for Medicaid in December 1997 would have had incomes below 150 percent of poverty—\$24,013 for a family of three. Pregnant women and infants are income eligible at incomes below 185 percent of poverty level. These numbers do not include children participating in the MICHild (“my child”) program, a separate state-designed program that expanded public health insurance for children in families with incomes between 150 and 200 percent of poverty.

Source: *Michigan Family Independence Agency, Report EY-180 for December 1997.*

### Childhood Lead Poisoning

#### Screened for Lead

Data reflect only blood test results reported by laboratories to the Michigan Department of Community Health (MDCH) in the year between June 30, 1997 and July 1, 1998. The total population for this age group is based on 1997 estimates. Since data reflect only tests

reported to MDCH, more tests for Michigan children may have been conducted but not reported. (Laboratories have been required to report all blood lead test results for Michigan residents to the MDCH since October 1997.)

#### % Lead Poisoned

The percentage reflects the number of children screened as a share of all children under the age of three. Children with lead levels at or above 10 micrograms per deciliter of blood (mcg/dL) are considered “lead poisoned” by the Centers for Disease Control and Prevention.

Source: *Childhood Lead Poisoning Prevention Program, Michigan Department of Community Health, 1998.*

**Percentage Change** is calculated by dividing the difference between the recent and base year rates by the base year rate: (Recent rate-base rate)/base rate. Rising rates indicate worsening conditions for children for most indicators. (Changes in rates of arrests and substantiation of abuse or neglect may reflect state or local policies or staffing levels.) Percentage change is calculated using unrounded rates so calculations with the published rounded numbers may not reflect the same change. Caution should be used in reviewing trends based on small numbers as they have limited use in comparison or prediction.

**Rank** is assigned to a county indicator based on the rate of the most recent year, often the average of the three most recent years. A rank of 1 is the “best” rate. Only counties with a rate in the most recent year could be ranked on a given indicator.

**Rates** are calculated when an average of more than five incidents occur in a county. Rates based on small numbers of events and small populations can often vary dramatically and cannot be considered statisti-

# Data Notes and Sources Trend Indicators

(in order of their appearance on state/county profiles)

## Economic Security

### Children in Poverty, Ages 0-4 and Ages 5-17

The poverty rate for children includes all children while poverty for school-aged children includes only “related” children—those “related” to the head of the

family. Data are generally more reliable for projecting trends or considering impact. All rates were based on the appropriate year of population estimates available from the Office of the State Demographer or the Census Bureau. The only exception was the 1998 data, where 1997 population estimates were used.

**Standard measures** are used for the various indicators:

- **Percentages** for child poverty, participation in free or reduced price lunch, low birth-weight babies, high school dropout, inadequate prenatal care, students in Special Education and students with inadequate math skills
- **Per 1,000** for infant mortality, children in investigated families, substantiated victims of abuse or neglect, children in out-of-home care, births to teens, juvenile index and violent index crime arrests
- **Per 100,000** for teen deaths by accident, homicide and suicide and child deaths

family by birth, marriage or adoption, and other persons under age 18 related to the family head. Poverty rates for children, ages 0-4, were not included in the Census estimates, but were calculated by subtracting school-aged children in poverty from all children in poverty and dividing by the difference in the poverty universe. Poverty thresholds are applied on a national basis and are not adjusted for regional, state or local variations in the cost of living.

The 1995 school district and county child poverty estimates by the Census Bureau are based on combining results of the 1994 March Current Population Survey and data derived from federal income tax returns, food stamp participation and 1990 decennial census figures.

*Source: Small Area Income and Poverty Estimates Program. Bureau of the Census. File EST95\_Mi.dat, February 1999.*

### Children Receiving Free/Reduced Price School Lunches

This indicator includes the percentage of all public school students receiving free or reduced price school lunches in school years from 1989-90 and 1997-98. Students from families reporting income below 185 percent of the federal poverty line are eligible for reduced price meals, while children from families with incomes below 130 percent of poverty are eligible for a fully subsidized or free meal. National estimates indicate that about 17 percent of children eligible for free or reduced price school meals do not apply. The rate reflects the number of children who are receiving free or reduced price meals divided by total school enrollment during that school year.

In order to capture participation by young adolescents, ages 10-14, in this program, school building data were used. Buildings included were: middle schools, junior high schools, combination junior high/high schools and K-12 buildings.

*Source: Report of School Program Operations (FNS-10), Food and Nutrition Services, Office of Nutrition, Michigan Department of Education. Building level data from electronic files BFRL9596 and BFRL9798.*

**Three-year averages** are presented for most health indicators because they are less likely to be distorted. Rates are calculated for the average number and average population base. Many Michigan counties have small numbers of events for several indicators and small population bases.

### Infant Mortality

This rate shows the number of deaths of infants under one year of age per 1,000 live births. Although infants who died in a given year, such as 1997, may have been born in the previous year, death rates are based on the number of live births in the year of death. This rate also does not reflect the quality of life for those who have survived life-threatening disease or injury.

*Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health (Calendar years 1986-1997).*

### Child Deaths, Ages 1 to 14

The child death rate is the number of deaths from all causes per 100,000 children between the ages of 1 and 14.

*Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health (Calendar years 1986-1997). Population estimates from the Michigan Information Center (1986-88) and U.S. Census Bureau (1995-97).*

### Child Health

#### Mothers with Inadequate Prenatal Care

As defined by the Kessner Index, inadequate prenatal care occurs when no care was received, if care began during the third trimester, or fewer than five visits occurred when the length of gestation was 34 weeks or more. (When the length of gestation was less than 34 weeks, fewer visits are considered adequate.) The percentage of births to women who had inadequate prenatal care represents the share of all mothers giving live birth. This indicator does not reveal the quality of care, and inadequate prenatal care per se does not cause poor birth outcomes.

*Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health (Calendar years 1986-1997).*

#### Low Birth-Weight Babies

Babies of low birth-weight weigh less than 2,500 grams (approximately 5 lb. 8 oz.) at birth. Low birth-weight percentages reflect the number of resident low weight births per 100 resident live births.

*Source: Division for Vital Records and Health Statistics, Michigan Department of Community Health (Calendar years 1986-1997).*

**Fiscal Years** begin on the previous October 1st and end on September 30th. For example, Fiscal Year 1997 began on October 1, 1996, and ended on Sept 30, 1997. Data from the Family Independence Agency such as child abuse and neglect and out-of-home care are reported in fiscal years.

### Child Safety

#### Children in Investigated Families

These children are in families where a preliminary or field investigation was conducted after a complaint of suspected child abuse or neglect was received by the Child Protective Services Division of the Family Independence Agency. Families may be investigated more than once in a given year, so these numbers represent a duplicated count.

Source: Report PS-315, *Referrals Studied, Children's Protective Services (Fiscal Years 1988 and 1997)*. Population estimates from the Michigan Information Center (1988) and U.S. Census Bureau (1997).

### Substantiated Victims of Abuse or Neglect

These victims reflect an unduplicated count of children in a given fiscal year where alleged abuse or neglect is confirmed after an investigation. The state defines abuse as "harm or threatened harm to a child's health and welfare, occurring through nonaccidental physical or mental injury, sexual abuse, sexual exploitation or maltreatment." Child neglect includes "harm or threatened harm to a child's health and welfare by a parent, legal guardian or persons with custodial care occurring through either (1) negligent treatment; or (2) placing the child at an unreasonable risk or by failure of the caretaker to intervene when possible to remove that risk." The operational definitions for child abuse and neglect are found in the *Services Manual of the Family Independence Agency*.

The rate is the number of child abuse and neglect victims per 1,000 divided by the children under age 18 using annual population estimates.

Source: Report PS-31D, *Victims by Category of Abuse/Neglect, Children's Protective Service Management Information, Health and Welfare Data Center, Michigan Family Independence Agency (Fiscal Years 1988-1997)*. Population estimates from the Michigan Information Center (1988) and U.S. Census Bureau (1997).

### Children in Out-of-Home Care

Children in out-of-home care includes a count of all children in facilities or placements supervised by the Family Independence Agency (FIA) or the courts. Children receiving aftercare services in their own homes or those placed with a relative or guardian are not included. Data for four quarters are used to calculate an annual average. The total number of children in out-of-home care will exceed the foster care for child victims of abuse or neglect and children adjudicated delinquent because court-supported out-of-home care for neglect or delinquency care is not included. Since

children in mental health facilities or out-of-home placements supervised by the Department of Mental Health are not included, these numbers are viewed as an under-count of children in out-of-home care.

Source: Report PS-315, *Children's Protective Services Management Information, Health and Welfare Data Center, Michigan Family Independence Agency (Fiscal Years 1988-1997)*. Population estimates from the Michigan Information Center (1988) and U.S. Census Bureau (1997).

### Adolescence

#### Births to Teens, Ages 15-17

Rates are based on population estimates for an incidence per 1,000 women in this age group.

Source: *Division for Vital Records and Health Statistics, Michigan Department of Community Health (Calendar years 1986-1997)*. Population estimates from the Michigan Information Center (1986-88) and U.S. Census Bureau (1995-97).

#### Deaths by Accident, Homicide or Suicide of Teens, Ages 15-19

Teen death rates from accidents, homicides and suicides for ages 15 through 19 are calculated for every 100,000 youth.

Source: *Division for Vital Records and Health Statistics, Michigan Department of Community Health (Calendar years 1986-1994)*. Population estimates from the Michigan Information Center (1986-88) and U.S. Census Bureau (1995-97).

#### Index Crime Arrests and Violent Index Crime Arrests of Juveniles, Ages 10-17

The Uniform Crime Reports of the Michigan State Police tabulates the number of arrests for eight index crimes: murder, rape, robbery, aggravated assault, larceny, motor vehicle theft, and arson. The first four are considered *violent* index offenses. The arrest count reflects numbers of arrests not youth; repeated arrests of the same individual for different offenses are counted each time. Although in Michigan's criminal justice system seventeen year-olds are not considered "juveniles," they are included in national statistics as juveniles. They are included here for comparability to

national data. The rate is based on the number of index crime or violent index arrests per 1,000 children ages 10-17.

Source: *Uniform Crime Reports, Criminal Justice Data Center, Michigan State Police (1986-1997)*. Population estimates from the Michigan Information Center (1986-88) and U.S. Census Bureau (1995-97). As these data are periodically updated, electronic information, particularly for more recent years, may differ from the data presented here.

### High School Dropouts

Michigan's annual dropout rate is calculated on the number of students enrolled in grades 9 through 12 in public schools in a given year and the number enrolled in grades 10 through 12 in the next year. This difference, which reflects the students who left school and did not return during the following school year, is then adjusted for graduating students and transfers in and out of the district or the state. The rate represents one year only. The calculation does not reflect those who return to an adult education program to complete their diploma requirements or those who drop out prior to the ninth grade. Districts with negative dropout rates were not included. If such districts represented more than 15 percent of the total county adjusted enrollment, county totals were not presented. For the 1990-91 school year, two counties were so affected; in 1996-97 no districts reported negative rates.

Source: *Retention Dropout Information, Michigan Department of Education (1990-91 and 1996-97 school year)*. (Released October 12, 1998) As these data are periodically updated, electronic information, particularly for more recent years, may differ from the data presented here.

**Students in charter schools**, also known as public school academies, have not been included in the enrollment or population base to calculate the following indicators: participation in free or reduced price lunch, achievement (as measured by the Michigan Educational Assessment Program) or high school dropout. Many of these schools have not been required to comply with reporting requirements. Although their enrollment has increased, they still encompass a small share of all K-12 public education students. In the 1997-98 school year, the roughly 21,000 charter school students represented 1.2 percent of all Michigan's K-12 students compared to less than one percent (.3 percent) in 1995-96. In 1997-98 Charlevoix and Emmet counties had the largest share of their students enrolled in charter schools—5.9 and 5.2 percent respectively. The majority (49) of the state's counties have no charter schools; Wayne County has the largest number with 32, and their total enrollment represented 2.1 percent of that county's public school students.

### Education

#### Students in Special Education

This figure represents the percent of the enrolled public school students who are diagnosed with a mental or physical condition resulting in their eligibility for special education services. Local school districts report this information to the Michigan Department of Education. The county numbers represent the children served by local and intermediate school districts within the county. Children in programs operated by the Michigan Departments of Corrections, Community Health, or the Family Independence Agency are not included.

Source: Students by Diagnostic Category Source Form SE-4568-School Years 1987-88 and 1997-98. Michigan Department of Education.

#### Students with Inadequate Math Skills

Grade-level data on the county pages reflect only the percentages and numbers of students performing at a less than satisfactory level (moderate or low scores) on the Michigan Educational Assessment Program (MEAP) math tests. This percentage represents the share of all students in that grade in that county taking the test. Scores are rated as satisfactory, moderate and low. The MEAP is a statewide testing program to provide information to identify educational needs. (Additional information about how to interpret and use MEAP scores is available in the *Michigan Educational Assessment Program Handbook*.)

Source: MEAP Scores, Michigan Educational Assessment Program, Michigan Department of Education (School years 1993-94 and 1997-98).

Selected photographs are from VOICES, an 18-month program coordinated by the Kalamazoo Institute of Arts and The Boys and Girls Clubs of Greater Kalamazoo for youth to participate in the arts and cultural opportunities.

Photographs that appear in the data book were acquired independently and have no relationship to the discussion or indicator with which they appear.

## Design

Cies & Associates of East Lansing, Michigan

## Printing

Lawson Printers, Inc. of Battle Creek, Michigan - a "Michigan Great Printer" participating in a pollution prevention project sponsored by the Michigan Environmental Council, Printing Industries of Michigan and the Michigan Department of Environmental Quality

## **MISSION STATEMENT**

To improve the status of  
children, youth, and families,

Kids Count in Michigan  
collects and disseminates  
data as a basis for public  
policy development and  
community action.
