ABSTRACT

This book offers guidance for parents of children with disabilities who are being educated in inclusive settings. It provides background information on how children learn and the specific difficulties experienced by children with learning problems. It suggests strategies for creating better learning environments at home and at school and for helping with reading, math, and writing skills. The book informs parents about ways to measure a child's learning progress through formal ways (standardized tests, report cards) and informal ways (teacher observation, assessment of daily work, and projects.) Individual chapters cover the following topics: (1) inclusive education as a shared responsibility of home and school; (2) principles of collaboration; (3) reasons for learning difficulties (including specific difficulties of students with various mental, emotional, or physical disabilities); (4) learning about the child as a student; (5) charting the child's progress; (6) creating a home environment for learning; (7) strategies for helping the child with homework; (8) parenting with results of recent brain research in mind; and (9) experiences, insights, and questions of parents. Appendices include 22 sample forms, a bibliography, a list of resources, and a glossary. (Contains 37 references.) (DB)

TABLE OF CONTENTS

PREFACE

This book was written to acknowledge all parents who support and nourish the learning efforts of their children. It was especially written for parents who have children identified as having a disability, which increases the challenge of learning for the child and adds additional responsibilities to parents.

The ideas presented in this book have come from being a parent of two children and from years of personal experience in both public and private schools as a teacher, counselor, and psychologist. The multitudinous contributions of the outstanding educators, dedicated parents, and insightful children of the Eden Prairie School District in Minnesota are responsible for the evolution of the thoughts and ideas represented in this book. I especially want to thank and acknowledge Peggy Hammeken, who encouraged me to write this book and without whose support it probably would not have happened.

The expertise and support of my editor, Jennet Grover, greatly assisted the writing and molding of this book into its present form.

I dedicate this book to my two children, Jane and John, who, from an early age, have given me invaluable insights about children and parenting.

INTRODUCTION

Inclusive schooling, the practice of educating children with and without disabilities together rather than separately, has emerged more and more as a common practice in schools throughout the United States. As schools are adopting this model of inclusion, parents and educators are being met with new challenges to meet the needs of students experiencing difficulties in learning due to various handicapping conditions. Children who have difficulty processing information and/or difficulty maintaining a reasonable attention span call for an educational and home atmosphere that integrates a creative approach and a strong commitment to addressing their learning requirements. This book is written for the purpose of helping parents face these challenges and providing new ways of assisting their children in the learning process.

Inclusion has provided the scenario that now allows and encourages parents, educators, and school staff to work together to better ensure success for children with disabilities.

Background information has been provided for parents about the way children learn. The specific difficulties children with learning disabilities and attention deficits encounter in the learning process are addressed, in addition to ways parents can learn more about how their particular child learns.

Several strategies have been provided for parents to use to help their children benefit to a greater degree from all learning experiences. These strategies can be applied to create better learning environments for children at home and at school by addressing specific ways to help children with their reading, math, and writing skills.

Ways are presented for parents to understand and monitor their individual child's learning progress through formal ways (standardized tests) and informal ways (teacher observation, assessment of daily work, etc.).

An overview of the latest brain research relative to parenting is provided in Chapter Eight. This will help all parents become more aware of new ways they can help their children be more successful learners.

Sample forms are included for parents to use with their child, and in communicating with educators. These may be reproduced for your use as needed.

A listing of some specific reference books and web sites has been provided that can enlarge your resource library and expand your awareness of learning styles, learning strategies, and other topics that are of interest to parents of children with disabilities. Also included is a listing of organizations that parents can contact for additional information about their child's disability. Some of these organizations may be a useful resource for parent advocacy.

After considerable thought, a decision was made to use the pronoun "he," as it complies with standard literary practice, instead of using both "he" and "she," which became extremely cumbersome for the reader. Unfortunately, until the literary community comes up with some reasonable facsimile that makes a less gendered alternative, we find ourselves forced to take the more traditional approach for the sake of clarity and simplicity.

This book has been written with a great deal of love for children and a deep respect for the role parents and educators play in a child's life. It is written as a resource for parents, to act as a catalyst for better understanding their child's learning and to suggest ways to support this learning. It is being successful as a learner that contributes to a child's positive feelings about himself. It is the responsibility of the parents and other adults in a child's life to encourage and support this success in learning. Herein lies our future.

CHAPTER ONE

Inclusive Education: A Shared Responsibility

All children can learn, given adequate resources. The question is "Under what conditions can each child learn best?" In the case of a child with a disability, can he learn best in the regular classroom setting with his peers, in a resource room setting with other children who have disabilities, or in a combination of the two? The practice of **inclusion** supports the regular classroom setting as providing the best learning environment for most children with a disability.

This chapter explores what inclusion is and its benefits for children who have difficulty learning as a result of one or more disabilities.

What is Inclusion?

Inclusion means teaching children with disabilities in regular education classrooms right beside children without disabilities. Inclusion means that the special education teacher goes to the child, rather than the child going to the special education teacher.

The idea of inclusive education dates back to the passage of the Education for All Handicapped Children Act of 1975. This law states that all students have a right to be educated in the least restrictive environment. Due to the term *least restrictive* initially being interpreted as *separate*, we

have often experienced a dual system of education-one for children with disabilities and one for children without disabilities.

After the passage of this law, children with disabilities attended regular classes part of the time but received all of their basic skills instruction in a *Resource Room.* They continued to get their basic skills instruction in reading, math, written language, speech, language development, etc. in this setting until their skill level was developed to a point where they could be integrated back into the regular classroom for those subjects (see Figure 1). For some children, this meant being out of their regular classroom for one or two hours; for children with more severe disabilities, it meant being out of the classroom the greater part of the school day.

In the early 1980's, especially from 1986 on, there has been a concentrated effort on the part of school districts to redefine placement practices. *Least restrictive environment,* as currently defined, means educating children with disabilities in the same classrooms as children without disabilities to the greatest extent possible. This movement to change the meaning of *inclusion* has been bolstered by recent research showing not only positive results in children's learning but, more importantly, in their *attitude* towards learning when they receive their special education services in the regular classroom.

The passage of the Individuals with Disabilities Act and Americans with Disabilities Act have further created a basis for a national policy that focuses on the inclusion, independence and empowerment of individuals with disabilities. Court decisions have continually upheld the right of each child to be educated in a public school in a regular classroom setting. As a result of these actions, there has been a new interpretation given to the concept of inclusion by many school districts. The model for educating children with disabilities now looks like this:

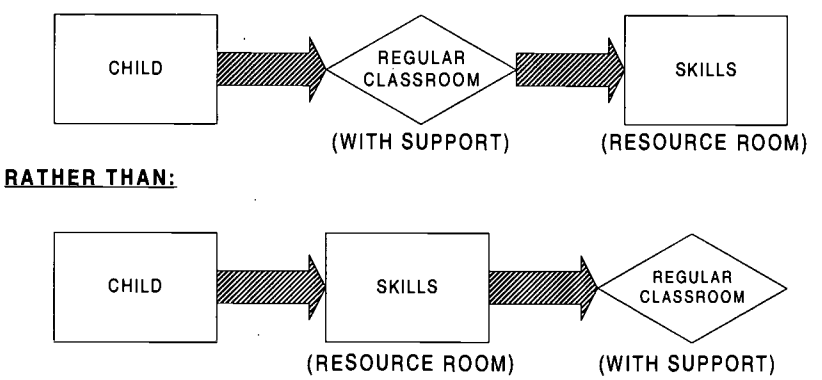

FIGURE 1

In the new model, your child receives all his services in the regular classroom setting. If your child does not make satisfactory progress with the support and modifications made in the classroom setting, consideration is given to have some of your child's needs met in the resource setting. A decision regarding this option comes only after you and your child's educational team meet to decide if this change is in the best interests of your child. Under the old model, your child would have started receiving his special education services in the resource room.

The previous two models show the two most common interpretations given to inclusion by school districts. The trend toward moving into the new model is becoming more predominant in schools across the United States. Important to note is that this model is based on a continuum of special education services. This is in contrast to some school districts which have chosen to move toward a *full inclusion* model. In a full inclusion model, all children with disabilities receive their special education services within the regular classroom setting only.

The New Model of Inclusion

What does inclusion look like based on the new model in Figure 1? First, special education teachers come into your child's regular classroom setting. Second, your child's special education teacher and regular education teacher set up a team approach to teaching your child in the classroom setting. Together, they plan lessons and deliver instructions that will meet your child's academic and social/emotional needs. They also share responsibility for assessing your child's learning progress and mastery of subject matter. Here are some possible ways for this to happen:

- One teacher teaches the large group while the other teacher circulates around the room, paying particular attention to the needs of the children with disabilities.

- The teachers divide the class into two parts, each teaching the same information to a select group.

- One of the teachers provides remediation (reteaching) for children who need it (those with disabilities and those without), while the other provides enrichment (further expansion of the subject matter) for the rest of the class.

- Both teachers teach the whole group at the same time, one modeling or demonstrating a skill while the other describes it.

In some schools, children with disabilities are clustered together in one or more classes at each grade level for subjects like reading, written language, and math. A special education teacher then comes into each of these classes every day to team teach with the classroom teacher.

If your child is placed in an inclusion setting for the first time, you will find it helpful to use Forms 1 and 2 in Appendix A to review each of your reactions to a regular classroom environment. This feedback can then be shared with your child's teachers or educational team.

The Benefits of Inclusion

Inclusion carried out in one or more of these ways increases the communication between regular education teachers and special education teachers. Through this communication, special education teachers develop a better understanding of classroom curriculum and regular education teachers develop a better understanding of the needs of children with disabilities. Both groups of teachers develop better ways to modify curriculum and develop reasonable expectations across all subjects where needed for your particular child. They can also, working together, develop more efficient and effective strategies for your child to use in acquiring skills. The combined expertise and resources of general education and special education programs and services maximize the learning benefits for your child.

Inclusion allows your child to exercise a basic right, the right to be educated with his peers. It emphasizes an unconditional acceptance of your child as a child, without undue focus put on his disabilities. Your child's school life becomes a holistic approach to learning by participating in all facets of school life rather than being fragmented into discrete parts based on needs that arise from his limitations. With the practice of inclusion, your child can feel like a *regular kid* and still get the special help he needs.

The need to feel that one belongs is a basic human need, according to Abraham Maslow's theory of psychology. Maslow pointed out that belonging was an essential and prerequisite human need that had to be met before one could achieve a sense of self-worth. For some children, a degree of this sense of self-worth can come from achievement. For children who

have difficulty learning, it becomes critical that this sense of belonging provides the basis for self-worth. In turn, a positive self-worth provides the motivation for a child to put more effort into his learning. Belonging also has a social context and implications for the child's future performance in society.

What is Needed for Inclusive Schooling

As more and more schools are adopting the practice of inclusive schooling, parents and educators are being met with new challenges. To meet these challenges, more creative approaches and collaborative efforts are necessary to meet the learning, and social and emotional needs of children with disabilities. Inclusion provides individualized care to children with disabilities, while forcing the teaching system to expand and be creative in order to meet the growing needs of the times.

CHAPTER TWO

Collaboration: Working Together

Inclusion is most successful for children when it is based on collaborative efforts between parents and educators. It is a team effort that should involve working together effectively and providing mutual support. A collaborative model for sharing ideas and making decisions is the foundation of inclusion.

Meeting the learning and social/emotional needs of children with disabilities in a regular educational setting challenges our creativity for adapting curriculum, developing appropriate teaching strategies, and structuring the learning environment. Success in meeting this challenge requires the joint cooperation of parents and educators on a continual basis through a team effort.

As a parent, keep in mind that you are a valuable member of your child's educational team (designated as a multidisciplinary team on your child's Individualized Education Plan). Your input is needed. You know your child best. You not only experience your child's feelings about school and learning on a day-to-day basis, but also know what learning has been like for your child on a year-to-year basis.

You know and understand your child's strengths and limitations. When your child feels good about learning, you feel good about your child's education. When things do not go well for your child, you want to find out why and want to know what changes need to be made to remedy the situation.

As a member of your child's team, you can communicate this information to the team members who are responsible for your child's progress in learning.

Educators bring their expertise about learning to the team. How your child is progressing in his particular learning is important information educators can provide. They also are an excellent resource on how children learn and how to create the best learning environment for your child at school.

Together, educators and parents can share ideas and make decisions as to the best ways to meet your child's needs. It then becomes the *school's* responsibility to teach and monitor your child's success in acquiring knowledge and skills. It becomes *your* responsibility to support your child and the school in this process. It is also important that *you* follow through with your child on his homework assignments and special projects.

When your child has a disability that interferes with his ability to acquire and maintain satisfactory progress, it takes more time, commitment, and involvement on your part to keep an open communication with the school. It continuously involves being in touch with your child's teachers, being in touch with your child's feelings, and knowing how to best support the efforts of your child and the school. Ways to be in touch with your child's feelings will be discussed in Chapter 4. Supporting the efforts of your child will be addressed in Chapters 6 and 7. The remainder of this chapter will be devoted to parents' involvement with the school community.

The School Community

Working collaboratively with the school community is dependent upon the sharing of information between parents and educators. There are three basic aspects to this sharing. One involves the information you can share about your child with your child's teachers. A second type of sharing is the information you can gain about your child from school staff. The third aspect of this sharing involves ways in which this information can be exchanged between parents and educators. Each of these three aspects will be discussed in the following paragraphs.

Parent's Knowledge of Their Child

Parents should attempt to share with educators relevant information regarding their child's:

- disability
- strengths and limitations, both as a person and as a learner
- interests and hobbies
- fears and concerns about learning and about school
- most favorite and least favorite school subjects
- health concerns
- feelings about self as a person and as a learner
- needs
- learning patterns and styles, if noticeable
- family traumas, transitions, etc.

[See Form 3 in Appendix A for ways to record this information.]

School's Knowledge of Your Child

Information you can get from educators about your child includes:

- how your child is performing in all areas of school, including learning content and work habits
- the results of any standardized testing that was completed for your child in the areas of achievement, intellectual ability, language development, motor development, etc.

- the results of informal testing on your child such as teacher-made tests and work samples in all subject areas, information about your child's areas of strengths as a person and as a learner

- identification and documentation of the problem areas your child is experiencing

- documentation about the degree of severity regarding your child's disability (from mild to severe)

- documentation of the reasons your child is having difficulty learning in one or more subjects (i.e., processing difficulties)

- if and what curriculum adaptations are being used to accommodate your child's disability

- the instructional strategies being used to help your child be successful in an inclusion setting

- what modifications in assignments are being made for your child, such as decreasing the number of assignments, modification of written work requirements, tests, etc.

[You may wish to document some of these items on Form 4, found in Appendix A.]

- the school's expectations for learning progress relative to your child's areas of disability

- grading practices and any modifications in grading being used to chart your child's progress

- observations regarding your child's learning patterns and learning style

- observations regarding your child's social and emotional development

- what you can do to support your child's learning needs at home

- other questions and information you need relative to your child's disability and educational needs

NOTE: Most of this information should be documented on your child's Individualized Education Plan and should be reviewed periodically.

Home/School Communication

There are several different ways for parents to communicate with the school community and be an active part of that community. Some of these are standard ways the school has set up for providing communication between parents and the school. Other ways are prescribed by Federal and State Guidelines for parents who have a child with a disability.

Other options include ways that you can initiate contact with school staff as needed. Some of the forms of communication are a one-way process meant as a matter of information for you. Other forms of communication require your acknowledgment of the information and/or more extensive interaction with school staff. The primary people you will be interacting with are your child's regular education teachers and your child's special education teachers.

Other school staff available to you include the principal, school psychologist, school social worker, school counselor, school nurse, and any other support personnel within your school district.

Two of the most common ways for schools to communicate a child's progress to parents are through the report card and through parent/teacher conferences. Report cards are issued up to four times a year, whereas parent conferences usually take place twice a year. Together, these two forms of communication give you a general sense of your child's progress.

For parents whose child has been identified as having a disability, a multi-disciplinary team (made up of your child's teachers and other key school staff involved with your child's learning) provides a format for ongoing communications. Initially, you are involved with this team when the decision is made to assess your child and/or when assessment results from testing your child are shared with you. At that time a decision is made as to your child's eligibility for program placement and how your child's needs will be met. This team format can provide you with much of the information mentioned previously.

Any questions you have about your child's disability and specific learning needs can be addressed at the initial meeting or at any other future meeting. This is also an opportunity for you to bring the information you feel is important for school staff to know about your child. The information shared and decisions made about your child at this team meeting will be

summarized and documented in your child's Individualized Education Plan. The team can be reconvened at your request or at the request of your child's teachers at any time to review the progress of your child and evaluate the effectiveness of the learning interventions being done.

This team is required to meet at least once a year (called a periodic review) in the event no one makes a request to meet sooner. A parent on his child's multidisciplinary team is considered a valuable member and has the same rights and responsibilities for educational decisions about his child as any other team member. As noted earlier, a collaborative process between you and school staff is the most effective method of bringing about positive results for your child.

A collaborative approach is especially important in cases where differing opinions occur between you and school staff or among the school staff itself. The collaborative process provides a means by which differences can be resolved by everyone contributing his ideas. These ideas are then combined into workable solutions that are in the best interest of your child.

It is important for you to be involved with your child's educational team when there is:

- a need for significant change to be made in your child's current placement or program.
- a need to add or delete a special education service.
- a change in the setting in which your child receives special education services.
- a modification needed in his IEP (Individualized Education Plan).
- a need to increase or decrease the number of special education services provided in order to meet your child's individual goals.

Sometimes a physician or agency outside the school community will make a recommendation regarding placement and program for your child. When this occurs, you should take this recommendation to your child's primary or homeroom teacher. In most cases, the teacher will then take this recommendation to your child's educational or multidisciplinary team. The team will then meet (with you present) to review the recommendation and determine the appropriateness of the recommendation relative to the school's data about your child.

If you find that your interactions with the communication systems of the school and your child's educational team are not sufficient for keeping current on your child's progress, you may initiate additional communication with school community members. This communication is generally initiated and planned with your child's regular education teachers in conjunction with your child's special education teachers.

Communications available to you generally involve a daily or weekly written report by a designated teacher. This can be in the form of a notebook or weekly folder. Your child should be given the responsibility to give this to you and return it to the designated teacher when this is appropriate. He should also know why this is being done and how it can help him.

Your child's level of involvement in his educational program is dependent upon age. Younger children can be involved at the level of participating in parent/teacher conferences, carrying communications between school and home, and sharing his feelings about school and about himself as a learner. Older children can and should be involved at all levels possible, including being present at their educational team meetings.

Collaboration works best when there is joint ownership and responsibility. Regular education and special education teachers share responsibility for your child's education. Parents share responsibility as an advocate for ensuring their child's success through communicating with educators and their child. Children should be involved in the planning of their education, as appropriate, and in sharing their successes and concerns with parents and educators. The total process is one of taking responsibility jointly for the input and outcome of the child's education. The 1997 version of IDEA, the law governing Special Education, provides increased support for parents and general education teachers involvement in the assessment, planning, and implementation of a program to meet your child's special needs.

The remainder of this book will be devoted to information that is organized to provide parents with a greater degree of understanding of their child as a learner, to help parents learn to chart their child's progress, and to show parents how to support their child in the learning process. As you read these pages, remember how much you already know about your child and how much support you are already giving your child.

CHAPTER THREE

Why Some Children Have Difficulty Learning

This chapter is concerned primarily with two different groups of children who *want* to learn, but find learning school subjects difficult and very frustrating. The first group includes those children who have been tested and found to have a **Learning Disability** in reading, math, and/or written language. The second group consists of children who have been diagnosed as having an **Attention Deficit Disorder**. Together, both groups of children make up about 8% - 12% of our school population.

When talking about these children, it is extremely important that we remember **first and foremost** that they are human beings and, secondly, that they have been diagnosed as having a learning difficulty and/or attention problem. We do not want to lose sight of the whole child when responding to his area of difficulty.

Information Processing

The academic subjects of reading, math, and writing will be our main focus for elaborating on skills and abilities involved in the learning process. Learning to read or reading to learn, doing math, and putting thoughts into written form are dependent upon a student's ability to pay attention and process information using several different skills or abilities.

Grouped together, these subject areas require the child to focus and pay attention to what is being presented, organize the information, process it, and then put the data into long-term memory, verbalize it, reproduce it in writing, or demonstrate it. The following is a model to illustrate this process.

The Information Processing System for Learning

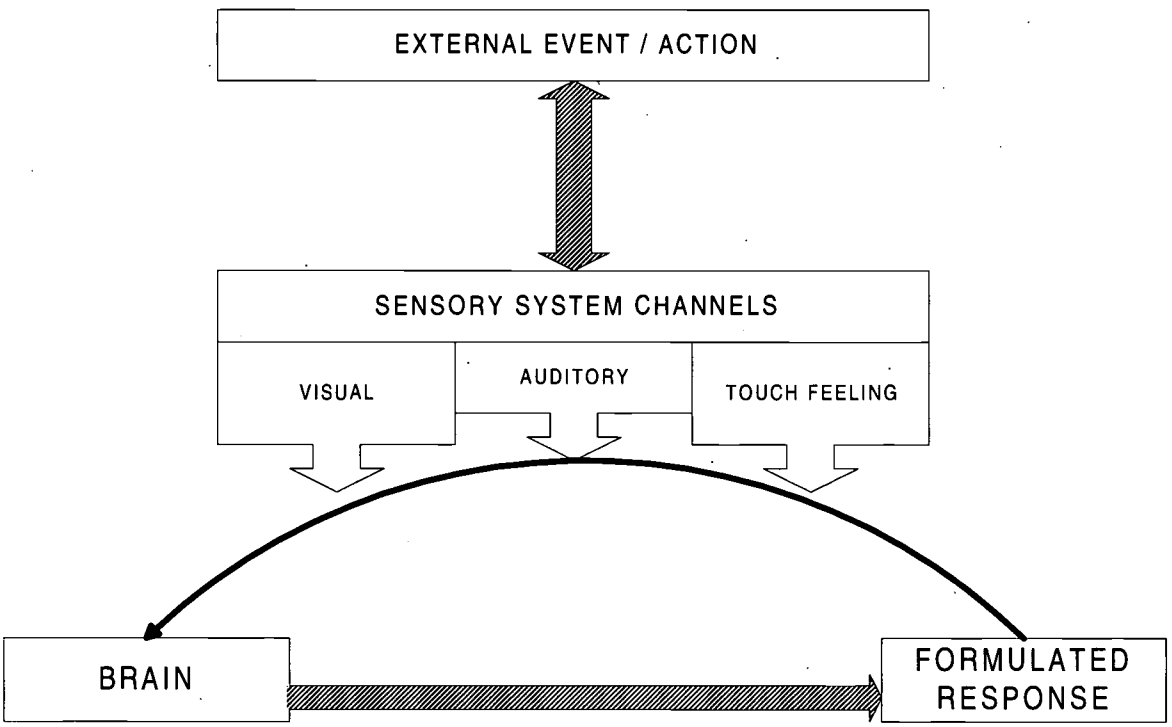

FIGURE 2

As noted in this model, an external event, such as a book or a teacher, activates one or more of the sensory system channels. This information is then transmitted to the brain. The brain receives, organizes, and acts on the information, using one or more of the psychological processes needed to mentally manipulate and make sense of the information received. After a period of time ranging from immediately to several seconds, the brain formulates a response. This response is fed into long-term memory or back to the sensory system channels, at which time the learner expresses the response either verbally or non-verbally.

For the average learner, the flow of information from one level to the other happens without interruption. For the child with a learning disability

and/or attention disorder, the flow is interrupted or broken at one or more points. These breaks in the learning process make it difficult for the child to acquire and process information at the same rate as his peers. Similarly, the lack of focus and the impulsiveness of children with attention problems break the flow of the learning process, thus contributing to their lack of success.

To further add to the complexity of the learning process, each level of information processing requires several skills on the part of the learner in order for him to achieve success. As many of these skills cannot be observed directly, we need to make inferences from a child's behaviors while working on specific tasks. We can also objectively record a child's responses to specific test items designed to measure processing skills. For parents whose child has been identified through testing as having a learning disability, there should be documentation on the child's assessment that helps identify what areas of processing difficulties exist.

To better understand a child who has a learning disability, it is important to keep in mind that learning involves all of the senses interacting with information and experiences. For purposes of understanding the child with a learning disability, it is the processing of information that will attract most of our attention. This is the key point. It is for this reason that children with a diagnosed learning disability have difficulty learning at a rate that is consistent with their measured intelligence. This is the result of having difficulty taking in information, doing something with it internally, and then sharing the information in some way. This, in turn, affects how well these children do on a day-to-day basis in school and, consequently, how well they do on tests. For the child who has been diagnosed as having an Attention Deficit Disorder, his difficulties in learning are due to an inability to focus on and sustain attention toward the information being presented.

Younger children who fall into one of these groups generally have the most difficulty learning to read. Some children have difficulty acquiring math skills, and some children have difficulty verbalizing what they have learned or being able to put what they have learned into writing. Older children with a learning disability have difficulty when the learning is dependent upon reading. Older children who have an Attention Deficit Disorder generally have a difficult time completing tasks.

The ability to do reading and math is initially affected by the learner's ability to focus, pay attention, and discriminate visually and auditorily. Also, the learner must be able to remember what he is seeing and/or hearing.

Memory

Remembering information involves three different types of memory. **Immediate memory** involves taking in information and spontaneously repeating it back to someone or putting in down on paper. **Working memory** involves holding information in one's memory bank for at least 30 seconds and then either repeating it back in the same form or using the information to solve a problem. An example would be if the subject were given the situation 5+4, and responded with 9. The third type of memory, **long-term memory**, is mainly needed at the levels of processing and output for mentally manipulating information and retrieving information from one's memory bank. This stored information is often needed for future learning.

Observed Behaviors

The following is a list of some of the most noticeable behaviors that a parent might see if their child is having attention, discrimination, and/or memory problems at the input level. He:

- has difficulty following directions (oral or written)
- does not seem to listen or pay attention
- gets frustrated easily or gives up easily
- has difficulty following a map or diagram
- has difficulty remembering instructions and routine tasks
- has difficulty remembering symbols and words

Once the brain has received information, it must do something with it. It must sort, organize, analyze, and/or combine the information in such a way that it is useful for the present or put it into storage for future use. Manipulating and storing information in the brain requires the learner to sustain attention, remember what was received, organize it, combine the information in different ways, and give meaning to the information.

The child who has difficulty with one or more of these internal processes exhibits some of the following behaviors. He:

- does not follow through with instructions/information
- takes longer to do some tasks than others
- often seems to show poor judgment and makes poor decisions
- needs concrete examples and demonstrations to understand concepts
- needs concrete examples and demonstrations to understand how to perform tasks
- has trouble relating previously learned information to similar new situations
- has difficulty retaining learned information for an extended period of time
- has difficulty memorizing a series of items
- has difficulty remembering sequences to problem solving
- has difficulty organizing work space
- has a poor concept of time
- does not plan a project in steps
- does not plan a project to be completed by a certain deadline
- has difficulty working independently
- is easily distracted from a task

Sharing Information

At the level of sharing information (or output level), a child must translate mental images, words, or symbols into a written form, describe them

verbally, or give a response using movement or gestures. Children who have difficulty at this level may feel especially frustrated because they know the response to what was asked but have problems expressing it. This may be due to difficulties in putting thoughts or ideas into words, visual/spatial difficulties and/or poor motor control for writing. For children with learning disabilities at this level, behaviors observed are that they:

- can tell you the answer but have difficulty writing the answer
- can respond with, "I know it, but cannot say it."
- can give a quick, brief answer or response but not elaborate
- are hesitant and show frustration when responding
- do not complete the task
- write illegibly
- take excessive time compared to similarly aged peers
- lose their work

[Form 5 in Appendix A provides you with a format to record these three sets of behaviors.]

Learning Disability

In attempting to understand and work with the child who has an identified learning disability, it is important for parents and educators to keep a few key points in mind. The first and perhaps most important point is that these children are not purposely causing their disabilities and, for this reason, patience is of the utmost importance. They would prefer to be considered normal, which is the purpose of this entire process. These children will require a great deal of love and support to get them through their schooling. Second, there are similarities in behaviors among children who have learning disabilities, yet each child has his profile of strengths and limitations. This

profile should serve as the framework for understanding and working with that particular child.

Children with learning disabilities also vary from mild to severe in the degree to which their processing difficulties impact their learning. A child with minimal problems at one level of information processing will require less modification of curriculum and expectations for learning than a child who has a combination of processing problems. In other words, the more breaks there are in the flow of information processing, the more negative the impact on a child's learning and the more modifications and strategies that will be needed for their success. Breaks in the flow of information processing have the potential to contribute to a child's inability to focus, pay attention, and sustain attention long enough to complete a task.

This situation should be distinguished from the difficulties exhibited by a child who has been diagnosed as having an Attention Deficit Disorder.

Attention Deficit Disorder

Children who are diagnosed as having an Attention Deficit Disorder fall into two types. One of these types includes the child who has an excessive amount of activity along with problems of sustaining attention. This group of children is given the diagnosis of **Attention Deficit Disorder with Hyperactivity (ADHD)**. Children who have attention problems without excessive activity levels are diagnosed as having a generalized **Attention Deficit Disorder (ADD)**. Since most children are diagnosed as ADHD, our discussion will be primarily limited to this group of children.

What is an **Attention Deficit Hyperactivity Disorder**? ADHD is considered to be a neuro-developmental disorder found in an increasingly greater number of school-age children. Estimates given recently by The Environmental Research Foundation ranged from 10% to 15% of all school children in the United States. It is classified as a *neuro-disorder*, as it relates to the brain's attending function, and *developmental* to indicate that the symptoms change as a person gets older. ADHD is generally accepted as a hereditary condition that affects more boys than girls (estimated ratios vary from 4:1 to 9:1). ADHD is not a disease; it is the way the brain works. As such, it cannot be cured, but it can be managed.

ADHD needs to be viewed as a multi-faceted condition in that it is considered to be a medical diagnosis, may be treated through use of medication in some children, but also has behavioral and psychological components which need to be addressed by parents and educators. Most often

the behavioral needs of these children are met by designing appropriate programs including self-management techniques. A psychological component is most often addressed through counseling.

The three primary types of behaviors associated with an ADHD diagnosis are inattentiveness, impulsiveness, and hyperactivity. Children who show a significant degree of inattentiveness, but not a significant degree of impulsiveness and hyperactivity are diagnosed as having **Attention Deficit Disorder (ADD)** rather than ADHD. Characteristic of ADHD and ADD behaviors is that they are seen in all of the child's environments. They are more pronounced when the child is required to sit still and do academic work, but are also present, usually to a lesser degree, at home, in the neighborhood, etc. This makes it imperative for strong collaborative efforts when a diagnosis is being considered. When medication is involved, the medical community, educators, and parents need to coordinate their efforts around the issue of managing the child's behaviors at home, school, and in the community. The child's learning progress also needs to be monitored carefully.

Behaviors associated with an ADHD diagnosis that are most often seen in the home and neighborhood environments include:

- being often "on the go" or often acting as if "driven by a motor"
- often fidgeting with hands or feet
- often having difficulty playing or engaging in leisure activities alone
- often talking excessively
- often running about or climbing excessively in situations when it is inappropriate (in adolescents or adults, this may be limited to subjective feelings of restlessness)
- often having difficulty awaiting their turn
- often interrupting or intruding on others (e.g., interrupts conversations or games)
- often avoiding, disliking, or being reluctant to engage in tasks that require sustained mental effort (such as homework)
- often distracted by what is happening around them

- difficulty organizing things and activities
- often not completing tasks or chores
- often missing details or making careless mistakes while doing something

[See Form 6 in Appendix A for a checklist of these behaviors.]

Children who have a *mild* Attention Deficit Disorder display some of the above behaviors, whereas children who have been diagnosed as having a severe ADHD disorder will display many of the above behaviors. It is these behaviors that interfere with the learning process for these children, as they often miss out on the initial instruction given by the teacher. This means that when it comes time to do the lesson on their own, they either have to guess, or ask someone else how to do it. Once they find out, they need to stay on task (sustain attention) long enough to complete the lesson. This tends to be more of a problem for younger children but can also cause difficulties for the older child.

Children who are impulsive in addition to being inattentive may act on the instruction before the teacher is finished or not listen to the complete directions. This behavior, in turn, often results in doing the work incorrectly. For a greater understanding of these children, it is important to remember that they are not choosing these behaviors to get us upset or angry at them but rather responding to the misfiring of the control system of the brain.

In addition to learning disabilities or Attention Deficit Disorders being reasons why some children have difficulty learning, there are several other disabilities that children can be diagnosed as having that also interfere with learning.

Emotional/Behavioral Disorder

A child with this disorder shows behavioral and emotional responses in school that are significantly different from and inappropriate compared to those of similarly aged peers. These behaviors or emotional responses, in turn, interfere to a significant extent with the child's learning and/or other children's learning. Children with this disorder often need counseling in addition to having specific structures and expectations set up in the school environment.

Speech/Language Impairment

A speech disorder exists when a child has a difficult time correctly reproducing spoken sounds and words, producing words in sequence smoothly and/or producing sounds and words equivalent to other children of similar age. A language disability exists when a child has difficulty expressing needs, ideas, or information. This situation is often accompanied by problems in understanding language as well as in the verbal expression of language. These children often get frustrated when they need to express themselves verbally, as they often know more than they can say in words.

Mental Impairment

Children with this disability have significantly lower intelligence for learning compared to similarly aged peers. Their slower rate of learning and capacity to learn academic subjects impacts the rate at which they acquire skills and the amount of material they can learn in a given time period. They also need to be taught at the concrete or "hands-on" level rather than the abstract level (the level of ideas and concepts).

Hearing Impairment

Most hearing impaired children are classified as hard-of-hearing rather than having total loss of hearing. Children who have a hard-of-hearing diagnosis cannot hear the spoken word clearly, but this can often be improved with hearing aids. Educational performance is almost always affected by a hearing impairment. These children need extra visual input compared to the average child their age.

Visual Impairment

A child who is totally blind must depend on his non-visual senses, primarily hearing and touch, to access information. A child with even a partial visual handicap has an impairment that means that even with correction, the child's educational performance will be compromised. A child with partial sight has a limited ability to see print, even with lenses. All written materials need to be adapted to accommodate these children. Since their senses, other

than sight, tend to be more highly developed, these senses should be incorporated into the instructional program to improve their success at learning.

Physical Impairment

A child with this disorder has a physical impairment that adversely affects the child's educational performance. An example of this disability is cerebral palsy. A physical impairment plays out differently for each child in terms of his ability to learn. Individualized programs are needed to accommodate a child's physical impairment.

Other Health Impairments

This refers to children who have limited strength or vitality due to chronic or acute health problems such as heart condition, rheumatic fever, asthma, cancer, diabetes, or Acquired Immune Deficiency Syndrome (AIDS). These conditions generally result in absenteeism from school which interferes with the child's learning progress. Often special programs and schedules need to be set up between the home and school so that these children can have continuity in their learning.

Autism

Autism is a developmental disorder that occurs during infancy or early childhood. It is a behaviorally defined syndrome characterized by quantitative and qualitative impairments in reciprocal social interactions and in verbal and/or non-verbal communication. These behaviors are often accompanied by a restricted repertoire of interests and activities.

There are many reasons other than the ones described in this chapter that may contribute to children's lack of success in school. These will not be elaborated on other than to suggest that many of the techniques outlined in the strategy chapters can be used for any child who is having difficulty learning.

CHAPTER FOUR

Learning About your Child As a Student

There are three basic ways for parents to gain information about their child as a learner. They can ask questions of their child directly, they can observe their child in relevant situations, and they can talk to others who work with their child. This chapter will discuss each of these ways and then give ideas for how parents can identify the strengths and learning patterns of their child.

The best starting point and often the best way a parent can learn about his child is to ask the child directly. This can take place using a natural conversation with the child that is based on some key questions and ideas. These questions should be modified and adjusted according to the age of the child. The following can be used by parents to create these conversations.

Questions About Learning

- What do you like about reading?
- What do you find the most difficult for you when reading?

- What do you enjoy about working with numbers?
- What parts of math do you find easy? What parts of math do you find difficult?

- Do you enjoy writing? Why?

- Is it easier to tell someone the answer to a question or to write down your answer? What makes it easier? What makes the other way harder?

- Do you like to write stories? Why?
- Do you like to write reports? Why?

[See Form 7 in Appendix A for recording your child's answers.]

This type of questioning should help you assess your child's attitude and feelings about learning. Your child's answers to these questions will let you know how your child feels about each of the basic tasks of school learning as well as giving clues about your child's learning strengths and limitations. It is common to find differences between these areas for most children. This is especially true if your child has been identified as having a learning disability which, in most cases, is in the area of reading and/or written language. Children who have been diagnosed as having an Attention Deficit Disorder often have difficulties across multiple academic subjects.

Comparing Self to Others

It is important for parents to know how their child sees himself as a learner compared to other children in the same grade level. To gain this information, a parent can ask a question directly or use a graph (Figure 3) as a starting point. If you use the direct verbal approach, appropriate questioning would be: "How do you think you are doing in reading, math, written work, on tests, etc. compared to the other kids in your class?"

For a visual approach, you can use the following graph.

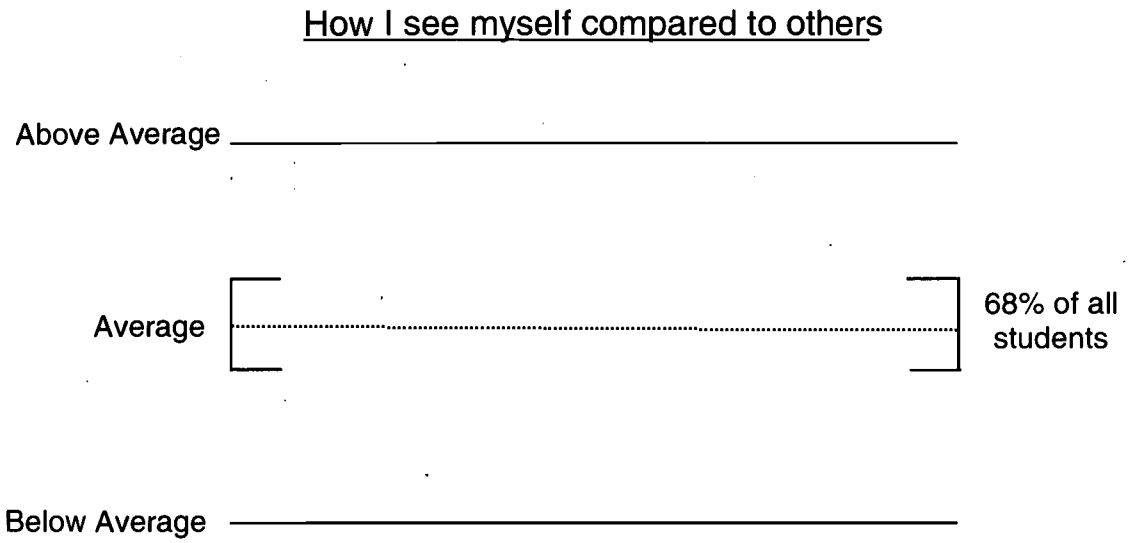

Figure 3

[This graph appears as Form 8 in Appendix A.]

Directions: Have your child put an "x" to show how he is doing in reading, math, written work, and any other school subject compared to other kids at the same grade level. When using this graph with your child, explain that most children and adults fall within the average range (dotted lines) for school subjects. Also explain that some children find it easier to learn and therefore do better at learning than other children, while some other children find it more difficult to learn. It is important to emphasize that all children *can* learn. It is a question of how much and how fast that differs among children.

For a child having difficulty in reading and written work, the completed graph might look like this:

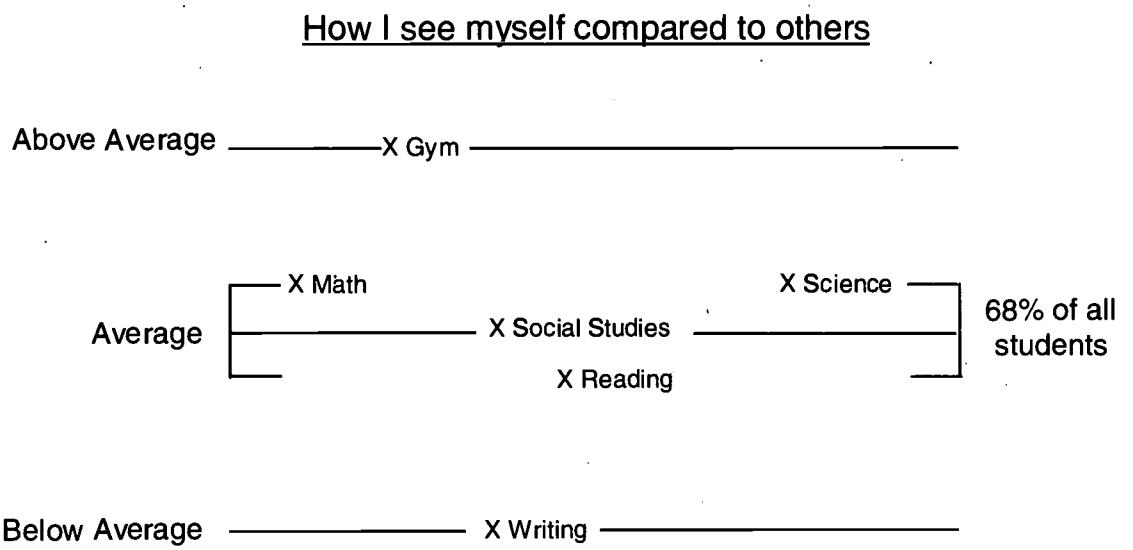

Figure 4

Discussion Points

Once a parent finds out how his child sees himself academically in reference to others, the parent can use the following statements and questions as discussion points:

- Tell me about your best subjects.
- Tell me about the subjects in which you feel you are not doing as well as the other kids.
- What changes would you like to make in any of these subjects? What ideas do you have? How can I help you?
- Do you have any ideas as to how your teachers can help you?

Questions such as these can give you a better idea of your child's degree of satisfaction with himself as a learner. It can also give you some sense of a child's own resources to change his learning pattern if he is not satisfied with how he is currently doing in one or more subject areas. You can use this information to plan how to help your child in the learning process. It would also be in your child's best interest to share this information with his teachers.

Observation

The second basic way for parents to gain information about their child as a learner is by observation. Since the "hows" and "whats" to look for vary considerably with the age of a child, this section is divided into two parts. The first part pertains to younger children (up to about age 12), and the second part to older children (13 and up).

Observation is an important way to learn about people as well as about objects and experiences. It is a skill that requires us to really pay attention. In the case of observing people, we not only need to pay attention visually, but also to put aside all judgment and assumptions, to just watch what someone is doing and make note of it. The condition of "no judgments" or "no assumptions" on the part of the observer, in this case the parent, applies to children of all ages. In both cases, it is best to simply jot down what you see and then evaluate what you observe relative to the reason for observing. For our purposes, the reason is to observe the child's approach to work and to the completion of a school task.

For younger children, a parent can observe from two perspectives. You can observe your child while he is working independently and you can observe your child's actions when you are working with him. Here are some behaviors to watch for when observing younger children:

- Attitude toward doing the task - positive/negative/indifferent?
- Organization of materials and work - does he have everything at hand to do the task - Y/N?
- Does your child know how to get started -Y/N?
- Does your child understand what he needs to do to finish the task - Y/N?
- Does your child stay with the task for an appropriate time period - Y/N?
- Does your child frequently ask for help - Y/N?
- Does your child seem to have the skills necessary to do the task successfully - Y/N?
- Does your child take an excessive amount of time to do the task - Y/N?

- Does your child give up easily and "shut down" before the task is completed Y/N?

- Does your child put down *any* answer just to finish the task - Y/N?

[These questions are also listed as Form 9 in Appendix A to provide you with a format to use while observing and working with your child.]

You may want to observe your child doing different kinds of tasks in various subject areas. It is also best to observe your child more than once doing the same type of task before drawing conclusions. Once you have done this, you can look at your *yes/no* responses to determine which behaviors of your child help in task completion and which behaviors may be interfering with your child's learning. Given this information, you can create a plan with your child to help him change the behaviors that interfere with learning. If it is a matter of not understanding what to do or not seeming to have the skills to do the work, you need to contact your child's teachers and get their support to increase your child's learning success at home.

For older children, observation of their homework habits is a challenge for parents. For this age group, you are limited to what you can observe from a distance and from the objective results of their efforts. For example, you can pay attention to where and under what conditions your child does his work. The "where" is a designated place in the home. The conditions have to do with whether your child works alone or with a classmate and whether the work is done in quiet, with the TV on, with music on, etc.

You can make note of these things until the results of your child's efforts are known via a report card or grade for the particular work done. If either of these is not satisfactory, you then can approach your child as to the possible changes that could be made to improve the results of his efforts.

Talking to Others

The third basic way a parent can gain information about his child is to ask other people who work with the child to share how they see the child doing in areas related to school learning.

For all children, regardless of age, a child's teachers are the best source of information. For younger children, daycare workers may also provide some insights for you. When conversing with any of these people, a general

question such as, "How is my child doing in _____?" plus some specific questions about work habits and learning progress will give you the most information.

Identifying Strengths

Unconditional love is the greatest gift parents and educators can give to children. Helping children identify, develop, and nurture their strengths and talents is also necessary. This not only recognizes and supports each child's individuality but also helps the child become who he was meant to be and to feel good about himself.

In helping your child identify his strengths and talents, it is imperative that you approach this process from the child's perspective so as not to impose your wishes and desires upon him. Recognizing and feeling good about one's strengths is especially needed for the child who has difficulty learning in one or more areas of school. There is a tendency for this child to get down on himself because he is not doing well in reading, math, or some other subject. If your child happens to be a perfectionist, he may tend to generalize this feeling to other areas of his life.

Information for identifying your child's strengths can come from a variety of sources. One source is from knowing and understanding the variety of intelligences children (and adults) can have. Currently, the intelligence most understood is the intelligence or ability to learn academic subjects in school. This type of intelligence (referred to as "IQ" by some), is based on one's capacity to learn and solve problems using words, numbers, and spatial patterns. This is the type of intelligence that is related to reading and math, as well as to any school subject that is dependent upon these abilities.

This type of intelligence can be divided into verbal abilities and visual/spatial abilities. These abilities can be measured by such well-known tests as the Wechsler Intelligence Scale for Children. For some children, their verbal abilities may be more highly developed as compared to their visual/spatial abilities. For other children, it is the reverse. Reading, for example, is more dependent upon a child's language development and verbal abilities than upon his visual/spatial abilities.

If your child has a strength in one or another of these abilities, it will show up in your child's interests and in what school subjects he performs best. Your child's teachers will have a strong sense as to whether your child has more highly developed verbal abilities or more highly developed visual/spatial abilities. For many children, there is no significant difference

between the two. In some cases, your child will prefer working either with words or with pictures. If your child appears to have a strength in one or the other, it is important to recognize this strength and help your child recognize it and use it to his advantage.

The work of Howard Gardner has expanded our idea of intelligence to include eight distinct forms of intelligences. Based on these forms, he defines intelligence as *"the capacity to do something useful in society."* Gardner's work not only expands on our view of intelligence but also puts it into the realm of application, making it useful to the individual and society. This simply means that all children and adults are intelligent when they contribute to society in a useful way.

According to Gardner's work, a person may excel in one or more of the following forms of intelligence: verbal-linguistic, mathematical-logical, spatial, kinesthetic (movement and physical agility), musical, personal, and naturalistic (a special interest in plants and animals). Personal intelligence can be of the type that relates to your child's social relationships (good with people) or of the self-understanding type. Even though, according to Gardner, society favors the mathematical-logical and linguistic (verbal) forms of intelligence, it is imperative that parents and educators recognize all forms of intelligence (the multiple intelligences view) and value them equally.

Parents are the critical link in helping their children identify their strengths from a "multiple intelligences" view rather than from the traditionalists' view (verbal and visual/spatial abilities only). In this way, parents can nurture their child and encourage the development of his particular abilities. This, in turn, helps in the development of the whole child, not just the development of the "academic child." Paying attention to the development of the whole child is important in the lives of all children, but it is critical in the lives of children who struggle with any part of the learning process.

How your child organizes and processes information is another way to identify your child's strengths. About 50% of our children are equally efficient (or have no preference) in how they organize and process information. Of the remaining 50%, 25% are more efficient when they can process information sequentially. The other 25% are more efficient learners when they can process information all at once or in random order. Children with a particular preference can also function the other way, but they will have more success with less effort when they operate through their preferred way.

What does this mean for your child? If your child can organize and process information both *sequentially* and *simultaneously* (randomly) equally

well, this is one of your child's strengths. If your child does best with a *sequential* ordering of information, this would be your child's strength. This would mean that your child approaches learning and is more successful when material is presented through a consecutive, step-by-step process. Time, order, and structure are important for this child's success. Since language is dependent upon these concepts, your child may prefer to work with words and verbal or written directions rather than pictures or models.

Children who have a preference for organizing and processing information *simultaneously* need to see the "big picture" before working with the individual parts of an idea or of a specific learning. For example, in math, this child would do better if he saw a model of the completed problem before doing the steps to reach the solution. When given something to put together, this child would tend to work from the picture of the model rather than the directions.

A few characteristics associated with each type of learner appear below.

The Sequential Learner:

- likes routine and order in the environment
- likes rules and clear expectations
- tunes into details
- responds well to verbal instruction
- is good at memorizing facts
- may be able to read words, but may have trouble comprehending their meaning
- likes structure both in time and in how to do things

The Simultaneous Learner:

- likes change and flexibility
- likes choices

- understands the big picture but may forget facts
- responds well to pictures and visual patterns
- has difficulty organizing materials and self
- is able to draw relationships of past learning to the present learning
- finds more value in what he is doing than in fulfilling a time-line or an expectation

[See Form 10 in Appendix A for recording this information.]

If you think your child has a preferential organizing and processing style, observe how your child organizes and responds to the everyday tasks and activities in the home. Observe how your child keeps his room and how he responds to your *verbal* directions versus *showing* him how to do something. This will begin to give you clues about your child's strengths in this area. Also, consult with your child's teachers for additional information.

Identifying a sequential or simultaneous processing strength in your child is especially important for younger children relative to their success in reading. However, it is important for a child of any age to gain a better understanding of how he learns and what learning strategies are best used to ensure his success in learning.

Learning Styles

Identifying a child's learning style is another way we can find out more about a child as a learner. One approach to learning style that has been applied to students and adults is the one developed by Anthony Gregorc. He combined the ideas of abstract and concrete thinking with sequential and random (simultaneous) ordering to create four different learning styles: abstract sequential, concrete sequential, abstract random, and concrete random. These four learning styles are most applicable to children aged 10 through adulthood, but can be used with discretion for younger, school-aged children.

Children and adults who learn and respond to the world from an abstract thinking position tend to do so from the realm of ideas, thoughts, and

symbols (non-physical ways). Learning and responding from a concrete level involves experiencing objects and events by a physical or "hands-on" type of approach. We need to be able to do both. However, if a particular child has a preferred way, given a choice, he would tend to interact according to his preferred way. Gregorc, by combining the ideas of the abstract/concrete and the sequential/random, addresses both the context for learning and ways of responding and ordering our interactions with the world around us. His approach to learning styles gives us a framework from which we can gain more information about a child as a learner.

The following is a brief description of each of Gregorc's four learning styles:

Abstract Sequential (AS):

Abstract Sequential children prefer to interact with the invisible world of ideas and knowledge that are ordered in a logical and structured way. These children rely on thinking to reach conclusions. Their approach to life tends to be serious and realistic. The type of environment in which these children work best is one which is ordered and mentally stimulating.

AS's prefer to function independently rather than have someone work with them or tell them what to do. Children with this dominant style do best in an environment where there are very few distractions. These children are often viewed as being serious and are sometimes referred to as "the little professor."

Concrete Sequential (CS):

A child or adult who is considered to be of the CS type, uses a "hands-on" approach to experiencing the world. Order and structure are also important to this type of learner. These children are interested in how things work. They like to have things organized and feel good when they have accomplished something. The application of knowledge is more important to these children than the knowledge itself.

A child or adult of this type likes rewards. He performs best in a quiet, ordered, and stable environment where there are clearly explained expectations for behavior and task completion.

Abstract Random (AR):

The "real world" for the dominant AR is the abstract, non-physical world of feelings and emotions (rather than ideas, like the AS). AR children concentrate their energy on relationships. The value of anything, including learning, is based on what has personal meaning for them.

These children do not always pay attention to time, often getting caught up in what they are doing at the moment. They function best in environments that are flexible and allow for freedom of choice and movement rather than those with restrictive rules and regulations.

Concrete Random:

Children of this dominant type are risk-takers, inventive, and flexible. They need to try out new ways of doing things. The real world for these children is the concrete, physical world, which becomes the starting point for carrying out their activities. Their ordering of the world is three dimensional, and not restricted to a step-by-step linear approach. These children are creative and love to explore and experiment as a way of learning. They like an environment in which a lot is going on and in which they are free to move about and make choices. These children often tend to get involved in the process of learning and are less concerned with the outcome.

Given these brief descriptions of the four types of learning styles developed by Gregorc, how can parents use this information?

After reading these descriptions, parents can sense if one or more of these types seems to fit how they see their child. [See Form 11 in Appendix A for a checklist to use.]

Keeping some of these characteristics in mind, parents can observe their child while doing schoolwork and other activities at home. This will help to confirm and expand their thoughts and ideas. It will also give parents a chance to look for patterns of behavior that may fit one style more than another.

The goal is for parents to gain a better understanding of how their child learns by how he interacts with the world around him This, in turn, should help a parent better understand his child as a learner and give insight into how he might help his child in the learning process. The goal is *not* to label a child as having one style or another but to better understand the child as a learner. In doing this, it is important to keep in mind that although some children

show dominance in one category, all children have characteristics from each of the four types.

In addition to parents *observing* their child relative to the four learning styles, they can talk to their child to see which style the child feels he is most like.

Several ways of gaining information about your child's strengths and patterns of learning have been highlighted in the above paragraphs. To help you use this information in developing strategies to support your child in the learning process, you are encouraged to record your observations about your child on Form 11 provided in Appendix A. Also, you may want to refer to the Resources section for additional information about Gardner's work and learning styles.

Limitations

Assuming you have identified several strengths that your child has relative to the learning process, it is time to move on to considering what limitations your child has. The identification of a child's limitations will be approached from the perspective of the demands placed on a learner to achieve academically. First, it is important to note that everyone has some limitations. It is a matter of identifying what they are and how severely they interfere with the learning process for a child.

The main focus of this section will be on the academic subjects of reading, math, and writing, as most other subjects are dependent upon reading and writing skills as well as sometimes the logical thinking required in solving math problems. Grouped together, these subject areas require the child to pay attention to what is being presented an then to organize the information, process it, and put the outcome into long-term memory, verbalize it, produce it in writing, or demonstrate it.

To be successful, a child must be able to sustain attention, remember what to do, retrieve information from previous learning, and complete a given task in a certain period of time. Children may experience difficulty with any one or more of these functions. Generally, for children who have been identified as having a learning difficulty, the limitation exists at the level of processing information. Some children with learning difficulties also experience limitations in paying attention. For the child who has been diagnosed as having an Attention Deficit Hyperactivity Disorder, the limitation lies at the focusing and attention levels. For parents who have children identified as having either of these difficulties, there should be documentation on the child's assessment records or diagnostic records that

identify what areas of difficulty exist for the specific child. A child's teachers will also have information regarding this issue. A parent's part becomes learning to understand his child's difficulty and to help his child be successful in learning, regardless of these limitations.

CHAPTER FIVE

Charting Your Child's Progress

Charting your child's learning progress is an essential part of his education. It is the part of your child's education that tells you how much your child is learning and the rate at which he is learning in all subject areas. This information gives you the opportunity to make two types of comparisons. First, you can compare your child's progress with his own past performance. Second, you can compare your child's performance to other children of the same age and grade level. In the case of children with disabilities that affect their learning, it is especially important for parents and teachers to keep in mind the progress a child makes compared to his past performance and the differences that occur among subject areas.

Ability, Achievement, and Performance

Collaborative efforts and communication between parents and their child's school are necessary for determining how a child is progressing in school. It is your right as a parent to know whatever the school knows about the abilities, achievements, and performance of your child. Your child's school staff has the obligation to share this information with you in an understandable way. Much of this information is communicated through your child's report card, parent/teacher conferences, and your child's Individual Educational Plan. When and if you need additional information, it is the school's responsibility to comply with your request to meet with your child's educational team for this purpose. As a part of this team, the school

psychologist should also be available to discuss any of this information with you.

Information About your Child

Cognitive ability or **intelligence** has to do with the thinking or problem-solving abilities of your child. It is an index of your child's capacity to learn. Children have varying capacities relative to how much and how fast they can learn academic subjects. The most widely used standardized test administered individually is the Wechsler Intelligence Scale for Children. Most children (68%), when compared by age, fall within the *average* range of intellectual functioning. Of the remaining 32%, 16% fall within the *above average* range of intellectual functioning and 16% fall within the *below average* range of intellectual functioning. Where your child falls within this continuum should be reported to you as a part of your child's assessment for special education, and should be documented on your child's Individual Educational Plan.

Your child's *ability* score is used to determine his eligibility for special education. Once your child is serviced by special education teachers, the ability score is used for setting expectations for your child's progress in learning.

Achievement tests measure what your child has learned from instruction and experience. It is what your child actually knows in any given subject at the point in time the test was given. In addition to the standardized tests given to your child in a group setting, your child is given an achievement test designed to be given on an individual basis. The Woodcock Johnson Tests of Achievement, the Kaufman Tests of Educational Achievement, and the Wechsler Individual Achievement Tests are among the most widely used individual achievement tests given at the current time.

Individual achievement tests are given to your child at the time he is referred for an assessment to determine eligibility for special education. After your child is placed in special education, an achievement test is given every three years to determine his progress in reading, math, and written language. Achievement tests are compared to your child's intelligence test score to determine the degree to which your child is learning compared to the expectation for his measured intelligence. [See Form 12 in Appendix A.]

Performance is the term used to indicate how your child is doing on a day-to-day basis. This is most often determined by how your child does on daily assignments and by the observations made by your child's teachers.

The three types of information just described are primarily concerned with your child's capacity to learn and the rate at which your child is acquiring academic skills. However, to honor the perspective of the whole child, you also need to pay attention to how your child is growing and developing emotionally, socially, and physically. This is necessary not only to keep these factors in balance with academic growth but also to recognize that there is a strong relationship between these aspects of your child and success in learning.

How Information is Reported

Most of the information about your child's progress is reported through the use of report cards, teacher observations, your child's work samples and projects, and test scores. Each has its place in giving you as complete a picture as possible about your child. Test scores should always be used in conjunction with what you and your child's teachers know about your child's daily performance and overall achievement. They should not be interpreted in isolation or given greater credibility than to the other types of information about your child.

Remember, any test is a sample of your child's learning behavior at a given point in time. Test scores should be compared to a child's daily work and teachers' observations to determine if there is a consistency among them. If not, the reason for the inconsistency should be explored to account for the differences.

The following information should be kept in mind when you chart your child's learning progress:

Information from Grades

Grades are generally assigned to your child on either an A-F basis or a rating basis such as Satisfactory, Needs Improvement, or Unsatisfactory. Some school districts have shifted to a mastery basis. This grading system lists the objectives a child needs to achieve and indicates whether the objective has been mastered or partially mastered.

In charting your child's progress, it is important for you to fully understand the system that is used for your child's report card. Also, you need to

know if your child is on a modified marking system for specific subjects and understand how this is indicated on the report card. You can get information about the report card system used for your child by referring to the code for marking that appears on the report card and by conversing with your child's teachers. An appropriate question to ask of your child's teachers is, "*What is the basis for my child's grade?*" If your child's report card system is based on mastery ask, "*What are the criteria for mastery?*"

Information from Work Samples, Projects, etc.

If you are a parent of a younger child, it is typical to have your child bring home his completed work every day. This gives you an ongoing opportunity to see how your child is performing in specific subjects on a daily basis. It is usually in the best interests of your child if you acknowledge the completion of the task, give positive praise for what he has learned, and ask if there are questions or items he would like to go over with you. This approach to work brought home fosters confidence in your child as a learner and recognizes his efforts. To spend time going over the items missed, unless your child or his teachers ask you to, reinforces any inadequate feelings your child has. Chances are that your child's teacher has already gone over these items, so there is no need to duplicate efforts.

The purpose of your child's daily work is twofold: one, to let you know what your child is working on, and, two, to give you feedback on the progress your child is making.

For parents whose child is at the secondary level, it is best to work out some arrangement with your child as to how this feedback will be communicated. A common practice at the secondary level is for teachers to notify parents if their child is doing unsatisfactory work at the halfway point of the marking period.

Information from Teachers' Observations

This information is generally shared with parents at parent/teacher conference time. Some report cards have a section for teachers to write comments based on their observations of your child. These comments focus on how your child is doing in each area of school learning, make statements about your child's work habits, and indicate any problems your child may be experiencing.

If your child is having difficulties in one or more of these areas, it is your option to set up a daily or weekly communication system with your

child's teachers to get more frequent feedback. Teachers are keen observers of children, making them an invaluable source of information for parents to log on their child's progress chart. Parents are also keen observers of their children. This makes their input an equally meaningful source of information to also include on their child's progress chart. Remember, teachers have the *comparative perspective*, which is a lot of knowledge about children your child's age relative to learning and development. *You,* as the parent, know your child's past history best.

Standardized Tests

Test scores come from several sources such as teacher-made tests, textbook company tests, statewide mastery tests, and standardized tests. Even though each of these tests has value for certain purposes, our discussion will be limited to the types of scores reported from the use of standardized tests.

Standardized tests are generally objective in that the items have a right response or a set of criteria from which to objectively score responses. Standardized tests are based on how sample populations of children of varying ages and grade levels across the United States performed. Scores from standardized tests, such as the Wechsler Intelligence Scale for Children, are most often reported as standard scores or percentile scores. Some achievement tests (another example of standardized tests) also use grade equivalency and age equivalency scores. Each of these scores is defined below:

Standard Scores

This way of reporting and communicating test results is the most reliable one to use. However, it is not as easy to understand as the other three types listed in this section. A standard score is a score that has been *normalized* on a group of children across age groups. A common number used to denote the midpoint of the *average* range is 100, give or take a few points for error in testing.

Any standard score that lies between 85 and 115 is considered to be within the *average* range. This includes 68% of the general population of children. Standard scores that are above 115 are considered above average and those below 85 are considered below average. Scores within these ranges can vary from somewhat above or below average to significantly above or below average.

Any test that has 100 as the midpoint of the average range and the same spread between 85 and 115 can be compared to others with that range. This is a distinct advantage when charting a child's progress and when needing to compare a child's score on an ability test to his score on an achievement test. This type of comparison is used to determine whether or not a child is achieving at a level that is consistent with his measured ability. For children with learning disabilities, this is one of the criteria to be considered for receiving special education services. [See Form 12 in Appendix A for an example.]

Percentile Scores

For every standard score, there is an equivalent percentile score ranging from < 1% to > 99%. Percentile scores tell you the number of children that scored above your child and the number of children who scored below your child when taking the same test. For example, if you were told your child scored at the 80% on a math test he took, it means he did as well as or better than 80% of the other children who took the same test. This also means that 20% of the children taking that test scored higher than your child. Put another way, if 100 children took this math test, your child would have scored the same or higher than 80 children and 20 children would have scored higher than your child. Given the fact that any percentile score between the 25% and the 75% is considered to be within the average range, your child's score at the 80% places him in the above average range on this math test. This means your child is doing well in math, based on this test. If, on the other hand, your child's score was at the 50% level, this means he scored at the midpoint of the average range, equivalent to a standard score of 100.

Percentile scores are easier to understand than standard scores but are not as accurate statistically. A further disadvantage of percentile scores is that they cannot be statistically added together to obtain an average of several combined scores.

A Typical Distribution of Standard and Percentile Scores

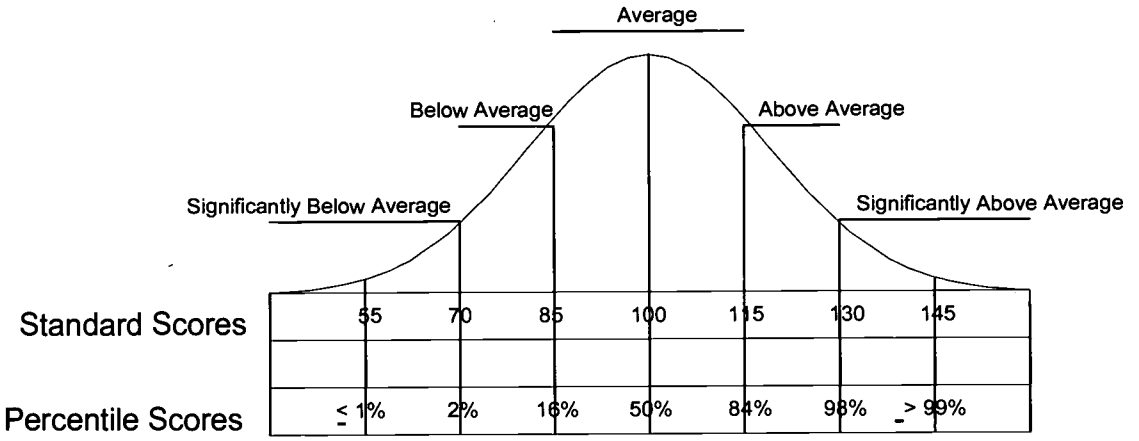

Figure 6

Grade Equivalent Scores

Grade equivalent scores are based on the performance of typical students at each grade level. These scores are expressed as a numerical grade level and the month of that grade level ranging from September (month 1) to June (month 9). Grade equivalents seem simple and easy to understand, but serious misunderstandings may result from their use. For example, on a test given in the sixth month of the fifth year, the child with a grade equivalent of 5.6 would be performing *at grade level.* If another child in the same fifth grade classroom attains a grade equivalent score of 7.3, this does not mean this child can do seventh grade work. What it means is that this child scored as well as a typical seventh grader would have in the third month of school - *on that fifth grade test.* In the same way, if your child attains a grade equivalent of 3.3 as a fifth grader, this does not suggest that your child has only learned material up to the third grade level. It simply means that your child did about the same as a third grader would on a fifth grade test. In other words, if your child obtains a higher grade equivalent score compared to the grade he is in, his skills are in the above average range compared to the expectation for his grade level. Similarly, if he got a grade equivalent score below the grade level he is in, his skills are below average for his grade level.

Because grade equivalents can so easily be misunderstood, their use is not recommended for the reporting of test scores. However, as many school districts report scores in this form to parents, it is important that you understand the meaning of grade equivalents. It is not recommended to use

these scores when charting your child's progress. It is better to use either your child's standard scores or percentile scores, as they give you a more accurate picture of your child's academic standing and progress.

Age Equivalent Scores

Age equivalent scores are based on the performance of typical students at each age level. These scores are expressed as a numerical value by year and month of a child's age. They are similar to grade equivalent scores in that they are easy to understand but open to misunderstanding. The use of these scores is not recommended for either ability tests or achievement tests. Also, these scores should not be used to chart your child's progress. If given these scores by your child's teacher or educational team members, ask for the equivalent standard score or percentile score.

Interpreting Test Scores

There are many cautions to consider when interpreting and charting a child's test scores. The first caution is not to use a single test or combination of test scores in isolation (as previously mentioned). A second caution has to do with the preciseness of measurement one can expect in test scores.

Since test scores are given in numbers, it is easy to interpret them as absolutes. Because of test error, testing conditions and the changing conditions of children, test scores should be interpreted as a number within a range rather than as a precise number. For example, if a child obtains a standard score of 100, his actual score could be at any point on a continuum between 95 and 105. For some tests, the range is larger than 10 points. You can obtain this information from the person who shared the test results with you. In turn, this information is important in measuring your child's progress, as growth needs to be based on a several-point difference between tests; it cannot be based on a 2 to 3 point difference.

Another caution to keep in mind when interpreting test results is the reading level of the test items compared to your child's reading ability. If your child's reading ability is less than the reading level required to read the test items, the test becomes more a test of your child's reading ability than a test of his knowledge.

Children with disabilities often find taking tests difficult. They may have trouble following directions, understanding what to do, expressing their answers in writing, etc. For these children, daily performance and mastery

testing on the subject matter they have been taught serve as better indicators of what they have learned.

Creating a Progress Chart

The information you have just read has been foundation material for creating a system for recording and charting your child's progress. The remainder of this chapter will focus on ways for doing this and examples of progress charts. To begin this process, you need to think about:

- what information you want to record and measure, i.e., your child's academic progress in each subject area or other information about his work completion, attitude toward each subject, emotional and social growth, etc.

- what indicators or measures to use for each type of information you decide to chart

- the best time to start and how often you are going to record each type of information

- how you want to approach this process so that you include your child in the process

- who is going to keep the chart and where it should be kept. In the case of older children, they may want full responsibility for this.

Keep this information in mind as you look at the examples of progress charts. Then decide what will work best for you and your child. Make it a fun project for both of you. The more involved your child is, the more he will participate and take responsibility for his chartings.

Progress Chart Examples

Example 1: An Appraisal of Your Child's School Performance

How I Am Doing in School

Name_____ **Date Completed**_____

Areas	Reading Yes / No		Math Yes / No		Writing Yes / No		Art Yes / No		Science Yes / No		etc.
I am doing satisfactory work											
I complete all my assignments											
I like this subject											
(Add more as needed)											

To complete this chart: [A similar chart is provided for you as Form 13 in Appendix A.]

1) Put aside time to meet with your child to discuss the purpose of the chart and to get the information from him.

2) Fill in all the subject areas your child is currently taking across the top of the chart. Have your child write them in (or you do the recording if your child prefers) in the order in which the child thinks of them. You may add other areas of school life, such as friends, if you wish.

3) Have your child answer each question for each area by putting a check in either the **YES** or **NO** column.

4) Highlight all the **YES**'s in each column with a colored (i.e., green) highlight pen.

5) Circle the **NO**'s in pencil for each column.

6) Use your child's most recent report card and information from your child's teacher to verify your child's perceptions about how he is doing. If any of

these are inaccurate, discuss the reasons with your child and change the response on the chart.

7) Make a list of the **NO**'s for each area on a separate sheet of paper.

8) Make a decision as to which **NO**'s are the most important to work on first. It is best to start out with no more than 2-3 areas and put the others on hold for a later time.

9) Circle the items chosen to be worked on. Have your child write a goal for each item relative to what he needs to do to move this item to the **YES** column on the original form he filled out.

10) For ease in charting, record the items and goals on a new form, such as the one below: [or use Form 14 in Appendix A.]

Areas I Will Work On											
	Goal	**Week 1**			**Week 2**			**Week 3**			**etc.**
		Yes	**P**	**No**	**Yes**	**P**	**No**	**Yes**	**P**	**No**	
Reading	Complete Assignment										
Math	Complete Assignment										
Writing	Complete Assignment										

Check your child's progress at the end of each week. If your child has achieved the goal, have him put a check in **YES** column. If he partially met his goal (3 of 5 days that week), put 3/5 in the **P** (partially met) column. If your child made no progress toward his goal, discuss ways to change his approach so he can make progress the next week.

11) As each goal is achieved, go back to the original chart, have your child erase the appropriate **NO** check, put a check in the **YES** column and highlight it with green.

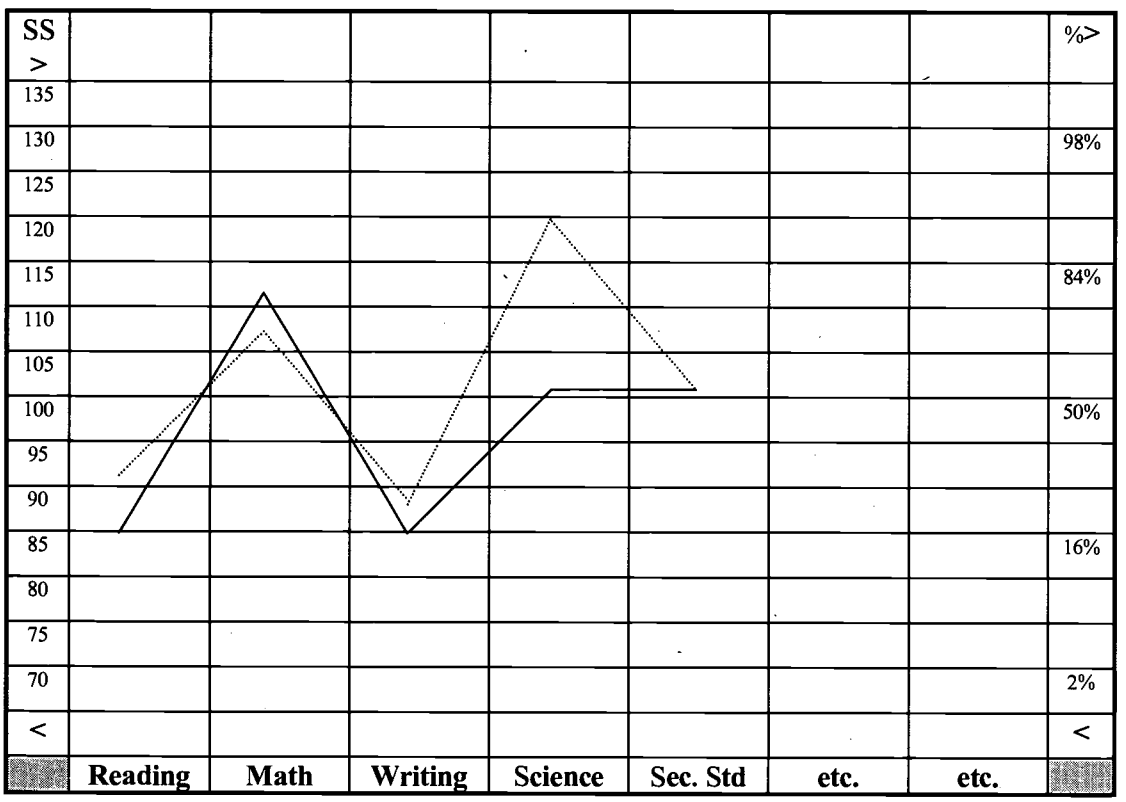
12) Repeat this process until all the **NO** checks have been erased and all checks are in the **YES** column highlighted by a green marker. It is important to praise your child on completion of each goal. When the chart is all green (or mostly green), have a special celebration with your child.

13) Each time your child receives his report card, start with # 1, revising and updating the information on your child's school performance as needed.

Example 2: Charting Your Child's Standardized Test Scores

Plot your child's most recent test scores on a chart similar to the following one: [Refer to Form 15 in Appendix A.]

Standardized Test Scores for Jerry



Note:

First Set of Scores _____
Second Set Scores _____ 59

Jerry, a fourth grade child, obtained the following standard scores:

	September, 1998	June, 1999
Reading	85	90
Math	110	106
Writing	84	87
Science	100	120
Soc. Studies	100	102

Jerry's scores have been plotted on the previous graph.

What do these two sets of test scores mean in relation to Jerry's academic progress (as measured by standardized tests) for the 1994-1995 school year? As recorded on the graph, the scores between the two sets of tests were all within (+) or (-) 5 points of each other except in science. This means that Jerry made exceptional progress in science compared to other children who took the same test and satisfactory progress in all the rest of the subject areas. The fact that his second set of test scores were similar to his first set, means he maintained a satisfactory rate of acquiring skills in those areas compared to his peers. If, in the second set of test scores, he had received a significantly lower score in any area, a follow-up would be necessary with Jerry's teachers to determine the consistency of the lower score with his daily performance. If inconsistent, the test score is most likely not reflecting the skills Jerry has acquired. If the score is consistent with his performance, an analysis of why Jerry is not making sufficient progress in that subject area should be explored.

For your child, record each set of test scores in a different color. Be sure to date each set of test scores. This type of chart will then give you a graphic representation of your child's progress as measured by standardized test scores.

The previous examples of charts can be used in the format they are given, or adapted to fit your child's needs.

[Refer to Forms 13, 14, and 15 in Appendix A for copies of each chart.]

CHAPTER SIX

Creating A Home Environment for Learning

Children at school, when engaged in the learning process, are expected to follow routines and complete assignments within certain time limits. Parents need to encourage routines and reasonable expectations for assignments or special projects at home. Parents are the key to enhancing the learning success of their children.

There are many aspects for parents to think about in providing appropriate learning environments for their children in the home setting. There is the physical space in which the child does the work and there are materials the child needs to have available and organized to do the various tasks. Times to work on the task need to be defined, and how a parent can best be involved with his child during learning times needs to be a consideration.

Work Space

All children, regardless of age or learning style, need to have a designated space set aside for doing their school assignments at home. It is best to have this space away from any traffic pattern of the household and separate from other members of the family. If a child has attention difficulties and is easily distracted by what he sees or hears, this is a must. If your child helps to choose the location and atmosphere of this study space, he will take more responsibility for making this space a successful place of work. In the

case of older children, it is best for them to do the choosing and planning of their work space themselves, as long as it is reasonable for the rest of the family and produces appropriate results.

Once the space is designated, let your child (with your help, in the case of younger children) plan how to best utilize the space and organize the materials needed for completing assignments and projects at home.

Work Materials

Work is done more easily and in less time if all the materials needed to do the task are available and organized. Younger children generally bring home a list of materials needed at school one of the first few days of the new school year. These are basically the same materials your child will need for completing assignments at home. [See Form 16 in Appendix A for a suggested list of materials.] Older children know what they need and can make a list to see if they have all of these materials in their study area. In either case, given a list of the materials needed, let your child make choices as to color, kind, etc. for each item. Also, take your child with you when you shop for these materials. If possible, take each of your children independently to shop, to make it a special event. The more you can do to help your child take ownership of his study space and materials, the more your child can take responsibility for his learning.

Work Time

Setting aside a specific time for doing homework is advisable. This, along with a specific space, helps cue a child's brain to the expectation for school work. The time set aside for homework will vary among children. Some children do best if they do their homework as soon as they come home from school. Others can work better if they have a break from their school day and do their homework after dinner. Occasionally, a child prefers to get up earlier in the morning and do homework before going to school. If your child attends a childcare setting after school, the best time could be between dinner and bedtime.

Discuss all the possibilities with your child. Use your child's ideas in making a decision about the best time to set aside for homework. For some families, this time can be relatively consistent. For other families, the time

will change depending upon the schedules of other family members. To help make study time a routine for your child, it is best to have a weekly written schedule that designates the block of time that will be set aside for homework each day. [See Form 17 in Appendix A.] If a child has no homework on a particular day, encourage your child to spend some time (varying by age) reading a book, having a story read by you, or engaging in some other type of thinking activity. How long should your child work at any one time? The length of time for homework is dependent upon your child's age. Younger children can be expected to work within a range of twenty minutes to forty-five minutes. Older children can be expected to work two or more hours steadily once they reach the high-school level.

The time block for homework is also dependent upon the total amount of homework your child brings home. If your child is in kindergarten or first grade, very little homework will be assigned. If your child brings home a lot of homework at these grade levels, it is best to check with your child's teachers to see how your child is using his time in school.

From third grade on, the amount of homework continues to be dependent upon how your child uses his time in school but also is affected by the rate at which your child processes information and the philosophy of your school system regarding the amount of time that should be spent doing homework for each grade level. However, there are two situations which you should check out:

1) if your child brings no homework home
2) if your child has to spend an excessive amount of time doing homework based on age and grade level guidelines

Individualizing Your Child's Learning Environment

The unique learning needs that emerge as a result of your child's disability are documented in your child's Individual Educational Plan provided by your child's school. You should find it helpful to refer to this plan to gain ideas for adapting your child's work space at home, to help organize your child's materials, and to plan your child's work time. You can supplement the information on your child's Individual Educational Plan by consulting with your child's teachers and educational team.

Children who have one or more disabilities generally have more difficulty in attending, organizing, planning, and using their time appropriately and efficiently compared to their peers. Therefore, it is

important to find out what your child's unique learning needs are in each of these areas.

The following are questions to help you do this.

Work Space

1) How quiet and free of distraction should the work space be? Is there a need for your child's work space to be in the quietest part of the house?

2) Should your child's work space consist of anything but a desk or table to work on, an appropriate chair to sit on, adequate lighting, and the materials needed to work with?

3) Who should have access to your child's work space?

Organization of Materials

4) What is the best way to have your child organize his materials based on what works best in the school setting?

5) What additional materials or aids will your child need to help in learning and in completing assignments?

Time Block

6) What time of day works best for your child to do his homework?

7) How much time should your child be expected to spend on homework each day? In which subject areas?

8) What is the longest period of time your child can work before taking a break?

9) What is the best way to help your child prioritize his assignments-difficult to easy, easy to difficult?

10) Will your child need more time to complete assignments than the average child his age? If so, how should assignments be adapted to keep homework time within reasonable limits?

[See Form 18 in Appendix A for a way to record your ideas.]

If your child has an observable or documented learning style, there are unique learning needs that will emerge as a result of this style. These needs can be interfaced with the needs that have emerged as a result of your child's disability. (Refer to Chapter 4 for the characteristics associated with the different learning styles).

Sequential learners, **concrete sequential** learners, **abstract sequential** learners, and **verbal** learners learn best when they have:

- a quiet, predictable environment to work in
- materials and study area organized neatly
- timelines to follow that are clearly stated
- an understanding of what to do and how to do it
- procedures for learning organized in a step-by-step manner
- assignments in which they can think and problem solve in words
- the use of lists, charts, outlines, and worksheets in their assignments
- consistency and structure in their learning environment
- consistency in expectations
- a goal to work toward
- a situation in which they can work alone
- a reward system and/or approval for the work they do

Simultaneous learners, **concrete random** learners, **abstract random** learners and **visual** learners learn best when they have:

- an environment that allows for flexibility and choice

- materials accessible, but having a choice for organizing them by color, shape, function, etc.
- blocks of time to work in which there are built-in breaks
- the "big picture" of what they are to do
- several pieces of information available to them at one time
- encouragement to make mental pictures of verbal information
- the opportunity to use pictures, charts, maps and other visual aids to use in thinking and problem solving
- a chance to make choices from two or more options
- flexibility in how they arrive at an answer or outcome
- the opportunity to share what they are doing with another person
- the opportunity to work with others

[A list of these strategies is given on Form 19 in Appendix A.]

Other Considerations

The attitude in which your child approaches the learning task can either contribute to or interfere with your child's learning success. This is especially important when your child has a disability. Having a disability generally means having to put more effort into learning to achieve the same results as someone else.

To help your child create a positive attitude about learning, you can teach your child a process by which he can approach his task. This process contains the following steps.

Step 1.

Before your child begins working on an assignment, have him make two or three positive statements about his ability to learn.
General statements may include:

- I can learn.
- I am able to do this work.
- I will remember what I am learning now.
- I can think clearly.
- I will be successful in doing this.
- I feel good about myself as a learner.

More specific statements may include:

- I can learn these _____ (colors, words, facts, etc.).
- I will know how to _____ (spell, write, say) these _____ (letters, numbers, words, etc.).
- I will finish this _____ (assignment, model, etc.) successfully.

Step 2.

Have your child formulate a statement about what it is he is to learn or do in the next 30 minutes or whatever time is appropriate for the age of the child and the task to be accomplished.

Step 3.

Have the child translate the words of this statement into a mental picture (a picture inside his head).

Step 4.

Have your child take a few minutes (with eyes closed) to relax by breathing deeply and rhythmically while mentally picturing himself successfully completing the task.

Step 5.

Have your child begin the task with the intention of completing it successfully.

Step 6.

If your child experiences stress or "blocks" while doing the task, have him repeat positive statements about his ability to learn. You may want to have him add such statements as: "It is okay to make mistakes while I am learning," and/or "This will get easier for me with more practice." Also, you may have your child listen to music, relax a few minutes, and again picture himself doing the task successfully. Some children are able to concentrate better if soothing music is playing in the background. Classical music is often used for this purpose.

Step 7.

After the time block or task is completed, *secure* your child's success by having the child summarize what he accomplished and the feelings connected with the experience. Emphasize the feelings that help your child feel good about learning. Have him repeat this process each time before beginning an assignment. Eventually, your child will be able to follow this procedure on his own, automatically.

Note: These steps may be adjusted in any way that works best for you and your child. The purpose in going through this type of process is to facilitate learning. This happens when children feel good about themselves as learners and are relaxed, allowing them to utilize all of their resources. This, in turn, results in being able to focus and concentrate on the learning at hand.

Encouragement and Independence

Children tend to feel more competent about themselves as learners if they feel they can rely on their own resources to complete assignments. This means that your child needs to develop as much independence as a learner as is appropriate for his age. To do this, your child needs encouragement through your words and actions to reinforce the fact that your child *can* learn. The words used to convey this message to your child need to be consistent with your actions, particularly when you observe your child getting frustrated and discouraged over an assignment. When this happens, reinforce your child's belief that he can be successful, work through the situation together,

and encourage your child to try the new solutions the next time a problem is encountered.

Providing continuous reinforcement of your child's abilities to learn and teaching your child how to get through frustrating times will result in your child feeling more confident that he is capable as a learner and has many resources *within himself* to solve problems. Independence developed during your child's earlier years of school will carry over to the later years when he reaches the secondary grades. Encouraging his independence as a learner is also a way to encourage your child to take ownership of his learning and responsibility for completing assigned tasks.

Children also need to get feedback from you about how they are doing. In giving this feedback, it is better to call attention to what the child has accomplished rather than what was left incomplete or done incorrectly. Then, together with your child, decide on a goal for next time.

Creating a positive learning environment at home for your child is both a challenge and an opportunity. It is a challenge from the standpoint of creating an environment that will support his success in learning. It is an opportunity to better know and understand him as a person and as a learner. It is also an opportunity for you to work closely with your child's teachers and educational team with the focus of providing the best possible learning environments for him.

"Every child," says Gardner Murphy in his book, *Personality*, "is in some ways like all other children. In some ways he is like some other children. And in some ways, he is like no other child." Herein lies our challenge and opportunity, to discover the uniqueness of each child and to provide the experiences that will address this uniqueness.

CHAPTER SEVEN

Strategies for Helping Your Child with Homework

Children need varying amounts of help with their homework. Our responsibility as parents is to give them the amount of help they need, but not to overdo it. The help they need may take many forms. It can be given in the form of emotional support and encouragement, as well as given directly in the form of help with specific subjects. The focus here will be on strategies parents can use with their children when helping them in the areas of reading, math, written language, and paying attention.

Parents are not expected to be their child's school teacher. What your child will need from you is occasional help to get him through a problem he does not quite understand. This is a follow-up to the teaching that has taken place for your child at school. You act as a reinforcer of this teaching.

It is in your child's best interests that you have an overview of what is being taught at your child's grade level. This information is often communicated in writing from your child's teachers at the beginning of each school year. Some school districts offer a "curriculum night" in which parents can get this information.

It is also important for you to know what modifications are being made for your child as a result of his disability. These modifications may be relative to the expectations set for your child, the content of subject matter, assignments, grading, and taking tests. Your child will benefit more from your help if there is a consistency between home and school concerning these issues.

As you work with your child, always give the message, in both words and actions, that he is a capable learner. It is important that your child understand his disability (the degree of understanding varies with age) but also know he *can* learn, sometimes in the same way as other children and sometimes in different ways. Your child may need to be reminded of this repeatedly until he gets to the point of believing it.

Emphasizing strengths is another way to help build your child's confidence as a learner. Overemphasis on your child's disability can lead a child to generalize his disability to the point of feeling that learning is too hard and something out of his reach. Your positive involvement in your child's learning and homework is a key to his success as a learner and to how he feels about himself as a learner.

General Guidelines

Positive involvement can be based on general guidelines for helping your child with his homework and strategies for working with your child on specific subjects. Each of these will be addressed separately.

First, here are some general guidelines to keep in mind.

1) Always have your child work in his "designated" place for doing homework.

2) Encourage your child to approach the task with a positive attitude.

3) Check to see if your child understands what to do. Have your child verbalize this or show you his homework notebook.

4) Check to see if your child understands how to do the assignment. Have him explain it to you or show you.

5) Have your child check to see if he has all the necessary materials in his work space to complete the assignments he will be working on.

6) Review the procedure for your child to ask you for help.

7) Have your child tell you what he needs to accomplish during this homework time. If your child has more than one assignment, have your child prioritize which task to approach first, second, etc.

8) Reinforce the idea to your child that he is a capable learner and can complete the assigned work successfully.

9) Remind your child that he can ask you for help and then leave him alone in his work space.

Note: These guidelines can be adapted so that they are comfortable for you, and so that they correctly correspond to the age of your child.

Helping with Reading

Reading is a complex process which places many demands on the child. Learning to read involves visual and auditory processing functions, associative functions, integrative functions, sequencing functions, memory functions, and motor functions. Initially, these functions are required to learn to read and later to access information through reading. When you help your child with reading, it is not necessary to fully understand each of these functions. However, being aware of the complexity of the reading process as you work with your child can give you some clues for ways you can help your child.

To make these functions more understandable, a brief explanation of each function follows:

Visual processing

Involves taking in information visually and giving meaning to it. The first phase of reading is a visual process - seeing letters, words, and sentences in printed form.

Auditory processing

Involves taking in information that is given verbally and making sense of it. In reading, all letters and groups of letters are assigned specific sounds and sound combinations. Reading orally and listening to stories involves auditory processing. All directions given verbally are dependent upon auditory processing.

Associative functions

Seeing how things go together. In reading, this is making associations between letters and their sounds, and printed words and their meanings. It also covers how previous learning fits with current learning.

Integrative functions

Combining one or more functions together, such as the integration of visual and auditory functions, eye and motor functions, etc. Reading initially involves attaching sounds to visual symbols in order to read the printed word. It also involves putting down on paper what you have read or reproducing in writing what you have seen.

Sequencing

Organizing and putting letters, words, sentences, etc. in correct order. Reading is very dependent on sequencing functions. Most sequencing functions are, in turn, dependent upon memory.

Memory

Required for the recall and storage of all learning. All aspects of reading are dependent upon visual and auditory memory as well as immediate, intermediate, and long-term memory.

Motor development

Motor development of the eyes is involved in reading words and sentences in sequence. Eye/hand coordination is involved in writing letters, words, sentences, etc.

Children who have difficulty learning to read and accessing information by reading have difficulty in one or more of these functions. The greater the degree of severity of a child's disability, the greater the likelihood of having processing difficulties in multiple functions. In cases of severe disability, a parent's primary task is to help keep the child motivated to learn. For this child, many tasks are arduous and discouragingly difficult to carry out at home. For more information about your child relative to these functions and the degree of disability present, refer to your child's Individual Educational Plan and consult with your child's educational team.

Strategies to Use with Each Reading Function

If your child's disability includes difficulties in visual processing:

1) Encourage your child to translate visual material into words. Have your child think in words and express these aloud as he is working.

2) When your child encounters a new word, have him try to say the word by sounding each part out rather than trying to recall the word from its pattern or visual image.

3) Encourage your child to recall previously learned words by making auditory images of the word. This involves remembering the sequence of sounds rather than seeing the sequence of letters in the word.

4) Have your child highlight letters and combinations of letters with different colors to help him pay visual attention to the letters in a word.

5) Help your child observe the visual details of reading by verbalizing what letters and words look like and which sounds go with each letter and combination of letters.

6) While reading a story and encountering a new word, have your child use the context of the phrase or paragraph to help access the meaning of the word. The context is the idea expressed by the words around the unfamiliar word.

If your child's disability includes difficulties in auditory processing:

1) Reduce the number of verbal explanations you use when working with your child. Shift as much as you can to demonstrating or showing your child what to do. An example or model of what something should look like when completed can be especially helpful for your child.

2) Slow down your rate of talking when explaining something to your child. Pause more often and emphasize important information by changing your tone of voice.

3) Use pictures and visual cues simultaneously with verbal material as much as possible.

4) Exclude as much background noise as possible when your child is working on his homework. TV should not be on if it is within your child's hearing distance while he is working.

5) If your child needs help reading a story or understanding information for science, social studies, etc., you can assist by reading the sentences aloud while your child reads the same sentences to himself. If needed, have the child read each sentence after you have read the sentence.

6) Be alert to whether your child gains a greater understanding of the material when reading aloud or when reading silently.

7) Encourage your child to access new information by pictures first, then words; pictures will often help give a child an initial understanding about the content of the information.

8) Encourage your child to make mental pictures as he is reading words to describe something or tell a story. Making mental pictures helps a child cue into the words and also gain a greater understanding of what is being said in words.

If your child's disability includes difficulties in associative and integrative functions:

1) Help your child link new information to familiar knowledge. The use of imagery is an effective way to encourage your child to do this, either auditorially or visually or by combining the two.

2) Help your child make associations between what he hears or sees with an action that might follow.

3) Simultaneously use pictures and words to help your child understand a new idea.

4) Have your child listen to text on a tape recorder while following along in a book. This helps your child hear and see the text simultaneously.

5) Use an approach called *shadow reading* when helping your child access information through reading. This involves you and your child reading together. You read simultaneously with your child, and when your child is reading confidently, you allow your voice to fade away to a shadow. Whenever your child falters, your voice comes in more strongly and maintains the pace, fading again as the child gains confidence. Continue this pattern as long as your child needs it. By use of this approach, your child at all times both sees the printed words and hears them pronounced correctly. This method also helps your child read more smoothly.

6) Have your child use a technique called *RAP* when he is reading a story or a textbook for content. The acronym *RAP* stands for:

Read the paragraph.
Ask yourself to recall the main idea and several details about what you have read.
Place the main ideas and important details into your own words.

If your child's disability includes difficulty in one or more types of memory (such as immediate, intermediate, long-term, visual, or auditory memory):

1) When working with your child, control the amount of new information that your child has to deal with. Help your child break his work into small segments and review what he has done before going to the next segment of work.

2) Encourage your child to use imagery as a learning tool to help him remember and recall information already learned. For example, when memorizing that the freezing point of water is 32 degrees Fahrenheit, your child can imagine an ice cube or frozen lake next to the number 32.

3) Have your child make flash cards of important facts he will need to know for future learning. Have your child review the facts at home before the new learning dependent on these facts is introduced at school. Encourage your child to spend a few minutes each day reviewing these facts. To make practice more fun, make duplicates of the flash cards and play the game *Concentration* with them.

4) Link or relate learning to the life experiences of your child. Your child will retain information better if it is meaningful to him. It also may make the recalling of information easier for your child.

5) Introduce your child to the use of mnemonics to assist his memory. Mnemonics is the process of creating rhymes, stories, acronyms, pictures, etc. to help your memory retain and recall information. The rhymes, etc. can be as outlandish and irrational as your child wishes to make them.

If your child's disability includes difficulties in oculo-motor (eye movements) or eye/hand coordination (both aspects of motor development), here are some suggestions to improve his learning skills:

1) If your child has trouble keeping his place on a page while reading, encourage the use of a bookmark for placement on the line being currently read or help your child make a *window* to use for reading. A *window* consists of a stiff piece of paper (large index card works well) in which a slot has been cut out. The slot can be large enough to expose one word at a time, several words, or a whole line, depending upon your child's optimal eye span. As your child gains better control over his eye movements, the visual span may be gradually increased by enlarging the size of the window to include more than one line of text.

2) Consult with your eye doctor to determine if your child can increase control over his eye movements by doing prescribed exercises.

Helping with Writing

Writing is part of the reading process whenever your child needs to put information on paper. This occurs most when your child is required to answer in written form rather than verbal form, to do worksheets to practice the skills associated with reading, to do a written summary of a story, etc. Even though writing is an integral part of the reading process, the strategies for difficulties in motor development relating to eye/hand coordination will be covered in the next section.

Children encounter difficulties in writing for several reasons. However, the primary reasons are delays in small-motor development and difficulties in expressing ideas in written form. If your child's disabilities include delays in small-motor development:

1) Help your child create a pencil grip out of adhesive tape for his pencil. If you prefer, you can purchase one at an office supply store.

2) Check with your child's teacher as to the size of the lined paper that works best for your child. Have your child work on the same size paper at home.

3) Provide an alphabet card or letter line at your child's work space so he can see how each letter is made.

4) Regardless of your child's age, be flexible in allowing him to either print or use cursive when working on assignments. A child generally knows which is the more efficient for him.

5) When your child needs to write a creative story or report, let him dictate the story to you so that his thoughts and ideas do not get lost in the mechanics of writing. Check with your child's teacher to see if the completed story or report needs to be recopied before turning it in. In either case, your child should be given credit for the *quality* of his ideas, rather than just his expression through writing.

6) When appropriate, encourage your child to learn to do his written assignments on computer.

If your child's disability includes difficulties in expressing himself on paper:

1) Before writing, have your child draw a picture to illustrate what he is going to be writing about. Then have your child start finding words to verbally describe what is in the picture. From there, have your child write the words into sentences and paragraphs.

2) Help or encourage your child to create a word bank (a list of words that are associated with a particular topic). Then have your child use this word bank to generate ideas for sentences to fit the topic.

3) Encourage your child to keep a collection of pictures available from which he can get ideas.

4) Develop a series of questions to help your child generate and organize his thoughts.

5) Have your child work from an outline for his story or topic.

6) Use *mind-mapping* or *webbing* as a technique for your child to use when he needs to write a story or a report. This technique involves starting with a theme or topic as a central point and then elaborating on that point using words or phrases that refer back to that topic. [See Figure 9.] After using this process, a child is better prepared to express his ideas in sentence and paragraph form.

[For examples other than Figure 9, see Form 20 in Appendix A.]

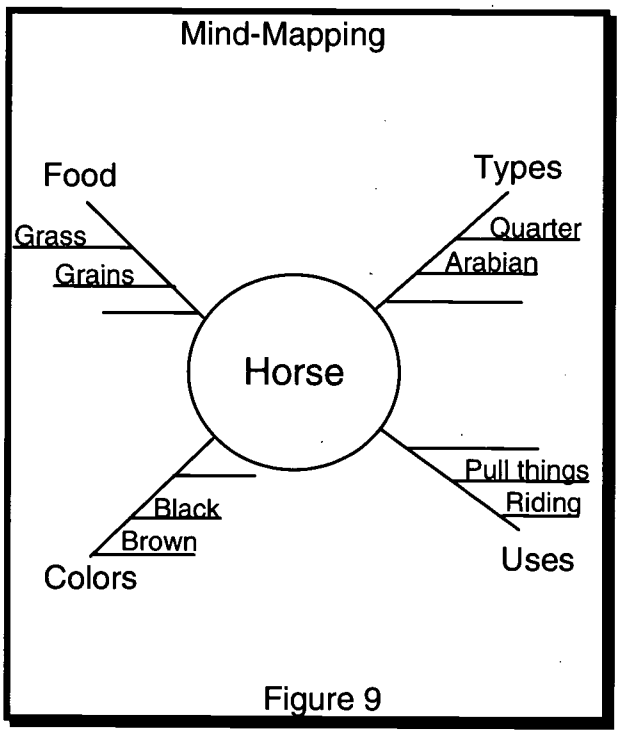


Figure 9

7) Have your child *tell* you what thoughts and ideas he has for his story. Having put thoughts and ideas into *verbal* form, it is easier to translate these thoughts and ideas into *written* form.

8) Whenever appropriate for the assignment and the expectations of your child's teacher, encourage your child to use alternative ways to share his knowledge. This could include making a video of the information, making a display, giving a talk, doing a demonstration, or making a model.

Helping with Math

Visual processing difficulties have a greater influence on the learning of mathematics than reading. Understanding visual relationships through the use of numbers is essential to math. Rote memory, required to memorize math facts, is also important for speed and efficiency in making math calculations.

Adequate eye-hand coordination is necessary for the accurate placement of numbers and columns of numbers as well as for the legibility of numbers in order to prevent unnecessary mistakes in calculation. Most math problems require multiple, sequential steps in order to produce correct answers.

If your child's disability includes difficulties in one or more of the above areas or other areas that impact the learning of math:

1) Have your child use a number line up to the number 30 on his table or desk to refer to for the correct way to write numbers and for the correct sequence of numbers.

2) Have your child have a box of small objects such as chips available in his workspace to use as counters when first learning the meaning of numbers. He can also use these for simple calculations before doing the problem on paper or to check his work.

3) Help your child attach personal meaning to math problems by giving examples of how math is used for different things in the home (its use in shopping, etc.).

4) Have your child use lined paper in a vertical rather than horizontal position (or graph paper) to help with the placement of numbers, if that is a problem for your child.

5) If your child has great difficulty copying math problems, check with your child's teacher to see if you can get a consumable math book for your child. This is a book in which the child can write, without having to duplicate the math problem on another sheet of paper.

6) Provide visual models of completed math problems for your child. Be sure the model clearly shows all of the steps needed for the solution of that type of problem.

7) Have your child construct a matrix of multiplication tables to keep in his workspace if he is having difficulty memorizing these.

8) Have your child make flash cards for the facts he is having difficulty remembering. These should be reviewed at least once a day.

9) Check to see if your child understands some of the basic words used in math such as: same, different, equal, more, less, etc. If your child does not easily comprehend some of these, have him work with objects of different colors, sizes, etc. until he understands what the concepts mean when doing math problems.

10) Check with your child's teacher regarding the use of a calculator for your child if he has spent more than adequate time trying to memorize math facts but is having very little success.

11) If your child has difficulty changing from one kind of problem (addition to subtraction, etc.) while working on a series of problems, have him glance through the worksheet and circle all the addition signs, subtraction signs, etc, in different colors before starting to solve the problems. This will call your child's attention to what process to use in solving each problem.

Helping with Attention Problems

Learning is dependent on paying attention. First, it involves focusing on the initial instruction that precedes any new learning, and second, it involves sustaining attention long enough to complete a task. Children who have been diagnosed as having an Attention Deficit Disorder have a very difficult time with both initial attention and sustained attention. Other children without this disorder may also experience some of these difficulties, but not to the same degree. Medication is often prescribed to help the child with an Attention Deficit Disorder. However, these children, along with the 25% who do not respond positively to medication, will need additional interventions to help them focus and learn. The following are some interventions and strategies parents can use at home to assist their children in completing their homework.

1) Whenever you speak to your child, be sure he has eye contact with you and appears to be ready to listen.

2) Help your child break tasks into shorter segments, allowing for more frequent breaks compared to the expectations for other children of similar age. A written schedule of work time and breaks will help structure this for your child.

3) Remind your child to have his work area free of visual distractions. Your child's workspace should be clear except for the materials needed for the immediate assignment.

4) Be sure all auditory distractions have been reduced as much as possible.

5) Have your child organize and label all the materials needed for homework into sections based on subject.

6) Have your child use different colored folders for keeping the homework papers for each subject.

7) Use a timer to help keep your child on task and working for the appropriate amount of time. Tell him ahead of time what he is to do during the time interval and then set the timer for a period of time that matches his attention abilities. If he engages in behavior that is incompatible with academic work, stop the timer, tell him what he *should* be doing, and reset the timer.

8) Encourage your child to think beyond the first answer that pops into his head. Often a second response is of better quality when your child is impulsive.

9) Encourage your child to *talk* himself through rote tasks, such as solving math problems or writing letters, to help him decrease impulsiveness and keep focused.

10) Present homework assignments and worksheets one at a time, rather than all at once. Upon completion of each assignment or worksheet, briefly check it and voice your approval before giving him the next one to work on.

11) Encourage the use of a homework notebook which contains two pocket folders: **Work To Be Done** (includes all homework, papers to be signed, etc.), and **Completed Work** (includes all completed work and signed papers to be returned to school). Your child should tape his assignment sheet on the inside of the notebook.

12) Check with your child's teacher to see if he can keep an extra set of books at home if your child repeatedly forgets to bring home the books necessary for completing his homework.

The strategies outlined in this chapter are meant to serve only as suggestions. As you work with your child, you will undoubtedly discover additional strategies. Encourage your child to think of new ways to approach his homework. It is important to get feedback from your child as to which strategies work best for him. Let your child take on as much responsibility as he is capable in applying these strategies. Support your child in his efforts and give as much positive, genuine praise as you can for both effort and accomplishment.

[See Form 21 in Appendix A for suggested words and phrases to use.]

CHAPTER EIGHT

Parenting with the Brain In Mind

President Bush declared the 1990's as the "Decade of the Brain." This declaration acted as a catalyst to engage the scientific, medical, and educational communities in studying the structure of the brain, its many functions, and this information's implications for learning. It is only during the last three to four years that the outcome of their research has been shared with the general public. There is currently an explosion of exciting information emerging that is challenging us all to translate this information into a meaningful format. This has made the future of learning dependent upon our willingness as parents, educators, and policymakers to transform our resistance toward change into opportunities for children. This also requires us to carefully peruse all of this new research to determine which knowledge is of most relevance to the learning process.

Brain/Mind/Body Research

Brain-imaging techniques and the physiological measurement of body responses to different types of stimuli have disclosed the interdependent nature of the mind and body. We can no longer fragment the human being into separate components and address each one in isolation from the other. If we do separate them for study and understanding, we need to reintegrate them relative to application.

We can no longer focus on one area of growth, such as that of academic development, to the exclusion of other areas, such as social,

emotional or physical development, without interfering with the development of the whole child. The importance of one's being in balance physically, emotionally, mentally, and spiritually to maximize mental clarity and concentration is being bolstered by various studies on an on-going basis. The child must be viewed as an integrated unit for the learning process to be successful.

Children with identified disabilities need special care and consideration as educators develop practices and curricula that reflect this new information. The differences in brain structure require that we as parents and educators commit extra resources to children's growth and learning. Parents are in the critical position of meeting the unique needs of the child in the home setting and of monitoring how these needs are being met in the school setting.

Basic Needs of the Brain/Body

The interdependence of the brain/mind and it's physical, mental, and emotional states is related to the fact that our body consists of a series of neural and communication pathways along which information is transmitted to all parts of the body electrically and chemically. To accomplish this task effectively, the body needs a regular intake of oxygen, water, nutrients, and sleep. When deprived of one or more of these, the brain/mind/body cannot function at its optimum capability. This, in turn, affects how children learn, how they get along with others, and how they behave in their various environments. To further the understanding of this concept, each of these four elements will be addressed separately.

Oxygen

The brain, which weighs about three pounds, consumes 20% of the body's oxygen. The brain needs adequate oxygen to carry out its assigned functions effectively. Lack of oxygen in the brain can affect our overall energy level, concentration, mental clarity, memory, and emotional state. Ways that parents can help to regulate their children's oxygen intake include:

1) Encouraging your child to get physical exercise and/or engage in some type of physical movement every day, as this helps take in the oxygen that will energize and feed the brain. Refer to the book *Brain Gym* (see

Appendix) for ideas, in addition to walking, playing physical games, etc.

2) Exploring the type of music that helps your child to relax and then encouraging your child to use this music to get into a more relaxed state and breathe more deeply.

3) Teaching your child to be aware of his breathing patterns so sufficient oxygen is taken in from the environment. Stress and overexertion results in shallow breathing. Relaxation encourages deeper breathing and a more natural pace of breaths per minute. Our best model for deep breathing is watching the stomach of a baby as he breathes when he is in a relaxed state.

Water

The body and brain needs to be hydrated well in order to carry out their assigned functions efficiently. Water aids in keeping our cells and muscles in a fluid state and removes toxins from the body. To nourish the body healthfully, water needs to be in as pure a state as possible. Chlorine and other chemicals are put into the public water supply systems to make it safe for drinking. Since some of these chemicals can be harmful to the body, it is best to drink bottled or filtered water rather than relying on the safety of a public water system.

To better address children's need for adequate and pure water, parents can:

1) Check their local water supply to determine the quality of the water being brought to the home. It is a parent's responsibility to see that the quality of the water they are drinking is healthful.

2) Educate their child about the importance of drinking good water.

3) Encourage their child to drink at least 8 glasses of water a day.

4) Help their child to substitute water for pop and other sweetened drinks as much as possible, making water a habit and pop an occasional treat.

Nutrition

Today there is a national concern for children's health. Recent articles the New York Post's, "Kids Ailing More and Learning Less" and "Kids Score C for Health" in *USA Today™* are but reminders of this concern. Recent studies regarding the relationship between nutrition and learning suggest that many children who have difficulty learning and/or who have attention difficulties have specific nutritional deficiencies. Correcting these deficiencies for some children has resulted in increased learning performance and concentration which, in turn, directly impacts their behavior. Good nutrition provided at regular intervals can assist the child's body to regulate itself in a steady, even manner, allowing the child's physical body to act as a support rather than a detriment to the learning process.

The body needs adequate amounts of protein and complex carbohydrates to maintain itself and to provide the necessary energy for learning and well-being. A beginning step is to make sure your child gets breakfast. Studies generally show that without breakfast, children have more trouble concentrating, and poorer speed and accuracy in retrieving information from memory, two very necessary components of learning. Children need a good lunch to continue learning well through the afternoon. If your child brings lunch, use the basic formula of combining some whole grain product (bread, pasta, crackers), some protein (lean meat, low-fat dairy, nuts), and some fruit or vegetables (or both). Involve your child in identifying foods he likes so he will eat these foods rather than trade them or throw them away.

Research at the Salk Institute and other facilities has discovered a link between Vitamin A and the memory and learning processes. Other vitamins and minerals are thought to be linked with the learning process as well. An adequate supply of vitamins and minerals is a key to appropriate body and brain growth and to insuring good health. Adding vitamins and mineral supplements to the child's diet can often have a positive effect on how a child feels physically, which results in good school attendance and more energy to put into the learning process.

Substances that sometimes interfere with the healthy functioning of the body and mind include processed sugar, caffeine, aspartame, MSG, and a variety of preservatives and dyes used in food products. Even children who are not generally sensitive to environmental stimuli can be greatly affected

by the presence of these substances, whether in large or small amounts. The preference is always for organic foods.

To address this issue, you as a parent can:

1) Talk with your child about the foods he eats and check to see what food groups these fall into. Follow up to determine which meals and what foods need to be changed and/or modified.

2) Engage your child in the process of planning meals eaten at home as well as lunch if your child takes his lunch to school. Children who have ownership in this process will cooperate more and learn while they are active in the process and its follow-through.

3) With your child and other family members, explore fun ways of including the necessary foods in your diet, that will maximize body and mind functions, (such as menu planning, or food preparation).

4) Review the vitamins and minerals necessary to your child's diet. If these are difficult to supply within the regular mealtimes, consult with your doctor or a nutritionist, and determine if supplements are needed.

Rest

The body needs sleep, rest, and a variety of activities to rejuvenate the mind and to consolidate the learning that has taken place during the day. This is important relative to meeting the next day with enough energy to accomplish the tasks at hand. Sufficient energy is necessary for long-term health and also helps children engage more thoroughly in what they are doing. Children who need to put more energy into the learning process due to learning difficulties especially need to meet their body's and mind's needs for rest and relaxation.

Rest comes in many forms: sleep, relaxation of the body and mind, being in a quiet atmosphere, and just plain doing nothing for a period of time. It is important to pay attention not only to the amount of sleep your child gets but also to the quality of sleep. Restful sleep is an essential part of a child's ability to pay attention and concentrate while awake. Children who have trouble falling asleep at night, sleep intermittently, or do not sleep in a relaxed state are not re-energizing their bodies for the next day's activities. If this becomes a chronic problem, memory, thinking, and concentration

skills are often diminished. If these problems persist, talk to your child about possible causes, such as whether he is worried about something.

These problems must be resolved *before* other disability issues can be successfully addressed.

Relaxation of the mind and body can be facilitated through the use of music based on about 60 beats per minute, taking a leisurely walk in nature, decreasing the amount of stimuli and distractions in the home, and other activities that have a calming effect on the child. Cutting down on the amount of time a child spends watching television and carefully selecting what the child watches are some of the ways to reduce the amount of stimuli in the home. Computer and television monitors both emit large amounts of radiation, which serves to overstimulate the viewer. Encourage the child to stay at least three to six feet from a monitor in order to lessen these effects. Replacing television viewing time with relaxing music or perhaps with creative family activities will create not only a more inclusive atmosphere within the home environment for the child, but also a more calming one. This will, in essence, synchronize the entire family at the same pace, and all will calm down in the process. This, in turn, can create better sleep patterns for all family members.

To extend these ideas into practice, you as a parent can:

1) Note how your child is when he first gets up in the morning. Does he seem rested, or is he tired or irritable, etc.? If there is a problem, have a discussion with your child to see what he can share with you about his pattern of falling asleep, how many times he awakened during the night, and the type of dreams he had. Where concerns surface, continue to dialogue to determine possible causes and consider how these might be corrected. Often, eating shortly before bedtime can cause disturbing sleep or dreams.

2) Make a chart of your family's television viewing to determine how many hours a day your TV is on and how many hours each family member is watching. If this seems out of proportion compared to involvement in other activities, look for ways to achieve a better balance. Playing video games should also be included on this chart.

3) Brainstorm ways to access more down time and relaxation for all family members and then list options for the types of things one can do to bring

more calming times into the family.

The Role of Emotions in Learning

Scientists at the Institute of HeartMath and elsewhere have provided us with new information about the effects of emotions on the physiological functioning of the brain and body as a whole. Emotions affect what we pay attention to, how good our concentration is, our clarity in decision-making, and our ability to remember what we have heard and studied. For children, all of these skills directly impact the learning process.

If children arrive at school feeling upset or angry because of something that happened at home or on the way to school, their attention will be directed more toward these feelings than on learning the tasks in front of them. The amount of energy available for thinking at any one time is dependent upon how much energy is being used to react to feelings generated by stressful circumstances. If children feel threatened emotionally or physically at some point during the school day, these events will then capture their attention, leaving little energy for engaging in learning tasks. In extreme cases, the thinking functions of the brain shut down until the emotional pathways that lead to the fight, flight, or freeze response are brought back into balance or a state of homeostasis.

Researchers have measured the effects of positive and negative emotions on heart rhythms. Positive emotions, such as joy, love, and feeling nurtured promote a heart rate that supports a state of balance that is the desired state for the body and mind to achieve optimal performance. Negative emotions, such as anger, fear, and frustration, activate the nervous system into a state of readiness that persists until the negative emotions are diffused or released. Prolonged stress caused by negative emotions depletes the body's immune system and keeps the body in a continuous state of anxiety. When the body is in this state of imbalance, the brain's capabilities are diminished. During this time the learner finds it more difficult to learn new material, access previously learned material, or put new material into his long-term memory bank.

Parents can help monitor the stress level in their child by:

1) Encouraging their child to share his feelings with them in a non-threatening atmosphere.

2) Teaching a variety of "feeling" words to their child to help him express his sentiments verbally. Using pictures from books and magazines will help facilitate this.

3) Sharing what the parent's day was like with the child to model how one can express his feelings.

4) Helping the child identify and list the people and activities that result in positive feelings and in negative feelings (define these words for younger children).

5) Encouraging their child to seek out those people and activities that are a positive experience for him and seeking ways to change those that are not.

6) Exploring what kind of music, movement, colors, and activities bring about a relaxed state for their child. Use these with him to help bring him into a state of mental, physical, and emotional balance.

Learning as an Active and Interactive Process

Learning is both an active and interactive process. The more a child is engaged as an active participant in what he does, the greater the degree of learning that takes place. Images of the human brain show that the more functions of the brain that are engaged while working on a task, the more capable the brain becomes. Activating more of the brain's functions results in establishing more pathways for future learning.

This also increases the child's ability to access information stored in long-term memory to facilitate new learning.

When learning is meaningful to a child, the child is more actively engaged. Learning also takes on more meaning for the child when he can see how what he learns can be used in his everyday life. Parents can play an important role in this process.

Learning becomes a more active process for a child when he can talk about what he is learning, draw it, and demonstrate it. Doing this cooperatively with another peer or small group or being able to dialogue

with an adult while learning new concepts and creating new ideas helps the child become more emotionally involved. This, in turn, enhances the child's memory to retain and later access the information learned.

Parents can encourage their child to share his knowledge with them by being available for the child at appropriate times. They can also encourage their child to seek out peers with whom they can work cooperatively on homework. On an on-going basis, parents can help by encouraging their child to use his new knowledge as it applies to everyday situations. This is important for the consolidation and integration of new learning to become a part of the child's development and growth.

Other ways a parent can help his child be an active and interactive learner are to:

1) Allow his child to make choices about his homework setting: the time, the place, the tools, the sound in the environment, etc.

2) Teach his child to take responsibility for his learning through encouragement and support rather than by directing and demanding. Work with his child's teacher to accomplish this when possible.

3) Plan family events that will encourage his child to use what he has learned.

4) Plan visits to science and art museums to expand his child's repertoire of knowledge and to build on the idea that learning occurs in many forms and places.

5) Spend as much time in nature as possible to allow his child to explore a variety of phenomena and to help expand his interests and knowledge about color, patterns, geometric shapes, animals, weather, etc.

6) Encourage his child to take breaks for physical movement, and/or to drink water and have a healthy snack to keep the brain nourished and balanced. This promotes better concentration and alertness for learning.

Encouragement for Children with Learning Disabilities

Increased technological advancements have given scientists access to descriptive images of the various functions of the brain. They are now able to view which portions of the brain are activated while a person performs a specific task. From this information they are better able to determine the specific functions of various parts of the brain as well as determining which parts are under- or over-aroused for specific individuals. A major breakthrough for understanding children with learning disabilities occurred when these non-invasive techniques became available. This made it possible for scientists to study the differences between healthy brains and the brains of children experiencing difficulties with learning. The new information emerging from studies using these techniques is laying the groundwork for more precise diagnosis of learning difficulties and opening up new options for working with children identified as needing more help to be successful learners.

There has been increased focus on the link between oxygen and nutrition to learning, the need for balancing the right and left hemispheres through the use of sound and movement, the interdependence of emotions and learning, and the impact of environmental stimulation on a child's development and learning. Approaches using one or more of these focal areas as an intervention for children with learning disabilities and other disorders have provided considerable encouragement for increased success for this population of children. In many cases, learning disabilities have been overcome as a result of using techniques such as changing a child's diet, encouraging deep breathing, using sound therapy, participating in kinesthetic activities, reducing stress through relaxation, and providing an enriched environment consistent with a child's level of development and readiness. In many cases, computer software programs such as "Earobics" and "Fast Forward" have been found to help children with language and reading difficulties. Specially designed music, such as that developed by Steven Halpern, by Don Campbell, and by the Institute of HeartMath help children concentrate when learning and learn to relax to reduce stress. Parents can explore these ideas further by seeking out information and resources through the websites and books listed in the Appendix and through contacting centers and people in their area which are involved in using computer software to help children with learning disabilities obtain greater degrees of success.

Encouragement for Children with Attention Difficulties

Children demonstrating attention problems have continued increasing in numbers each year. The number of boys having this difficulty is greater than that of girls, although this gap is steadily decreasing. This is partly due to the fact that more girls are surfacing with the diagnosis of ADD (an attention deficit without the hyperactivity component). Through the use of brain scans, scientists have been working to try to identify the specific areas of the brain involved and other underlying causes for attention problems. In the case of ADHD, the prefrontal lobe which, among other functions, helps to regulate attention and impulse control is one of the areas presently being studied. As more is learned about the differences between the organization and response of this part of the brain, more accurate and precise diagnosis and treatment can be made.

Currently, the drug Ritalin is the most common medical treatment for a significant number of children identified as having ADHD or ADD. Other options such as *neurofeedback*, a variation of biofeedback that focuses predominantly on behavior and learning difficulties, have come into more regular use in recent years. Many studies of the success of neurofeedback to reduce or eliminate the behaviors associated with ADHD are being documented and published. The success of this treatment provides a viable alternative for parents who are concerned about putting their child on medication. Other options that have been successful in treating children with attention problems include nutritional therapy, sensory-motor integration therapy, sound therapy, and chiropractic treatment. In most cases, self-management techniques need to be taught to children in addition to any other intervention they might be receiving.

As parents consider options for their children, they need to keep in mind that the success of any intervention should be linked to the underlying cause for the attention problem. In addition, even though there are common characteristics that exist among this group of children, each child will have his uniqueness that may lead to one option being a more successful approach over another one. Parents need to keep abreast of the new information and options emerging in this field by being in touch with organizations such as A.D.D.A. (Attention Deficit Disorder Association) and C.H.A.D.D. (Children and Adults with Attention Deficit Disorder).

It is equally important to stay tuned to the information emerging from the work of scientists and be alert to research that includes studies about the success of specific interventions for children with ADHD/ADD.

Encouragement for All Children

An initiative to study the brain that began in the early 1990's has resulted in more information about the workings of the brain than all other previous years combined. The scientific, medical, and educational communities are now actively involved in putting this information together for the benefit of children. At this point, several implications for parents are emerging that can be put into parenting practices to help children develop and activate their brain's capabilities to a greater degree. It is now a time for parents to become more aware of the new research findings about the brain and find ways to apply it for greater understanding of their children as learners. As starting points, parents need to access information about:

1) the interdependent nature of the body, mind, and spirit of both children and adults

2) the impact that environmental conditions and stimulation can have on the growth and development of children

3) how movement, music, and color can enhance children's well-being and learning

4) the availability of more options for helping children reach their potential

5) how to access the new information about the brain, backed up by research, that directly impacts parenting practices

6) how to put the new findings into everyday parenting practices

This is a large order for today's parents but worth the effort when one considers that our children, as our most valuable resource, will benefit both individually and collectively.

There is also much for educators to do as they find ways to work more cooperatively with parents in bringing the latest and best educational

practices into the entire life structure of the child.

It will be this cooperation that will put the focus on the well-being of the child in all areas of his development simultaneously rather than isolating any single aspect.

It has been my intent as a psychologist and parent to introduce some of the most current brain research discoveries. This information is meant to be a catalyst for you, as a parent, to pursue a fuller understanding of the learning process. Awareness is the first phase in seeking out any new learning. The next phase is to explore further the areas that most interest you and those which you think will most benefit your child. Verification of the information you discover is the next phase, and the last phase is to make this information part of your parenting practices. Involve your child in this process as appropriate. These are exciting times in which parents and the scientific, medical, and educational communities can work together for the benefit of all children. Remember to have fun as you engage in this process, which will be a rewarding learning for all.

CHAPTER NINE

Experiences and Insights

Experiences often provide us with invaluable insights that lead to better ways of performing. These insights, in turn, help us create new visions of what is needed in our work and in the rest of our lives. This chapter will review some of the experiences and insights I have gained over the past several years as a psychologist, a counselor, a teacher, and, most importantly, a parent.

Parents' Questions

In my work as a school psychologist, the most frequently asked question by parents having a child with a disability is, "Will my child outgrow the conditions of the disability and 'catch up' with his peers at some point in his school career?"

There is no single or universal answer to this question. The rate of academic progress a child with a disability can make is dependent upon many factors, the most prominent being the cause and conditions associated with the disability and the severity of the disability. It is also dependent upon the success of the interventions of the special education services provided by the school and the amount of involvement of the parents in their child's educational development.

The answer to this question is further complicated by the fact that any one disability plays out differently for each child. Although there are commonalities with other children having similar disabilities, each child's disability is unique. These factors interact to form the basis of a child's

progress. The success of the child's learning is the result of what the child brings into the situation and how the environment (parent, school staff, friends, etc.) responds to the child. All of these elements combined make it extremely difficult, if not impossible, to make any kind of prediction as to whether a child can and/or will "catch up." This is especially true for children who have been diagnosed as having a learning disability, language impairment, attention deficit disorder, or emotional/ behavioral disorder. For children who have multiple disabilities, limited intelligence, or severe disabilities, the possibility of "catching up" is not likely. However, because there are so many influential factors interacting, it is extremely difficult to predict how far a child will go in his learning.

Maximum progress can be made when the child is motivated to learn, and when the home and school actively work together for the benefit of the child. Intervention at the point the child first needs it is also a key factor.

It is in the child's best interest that we do not give a definitive answer to the "Will he ever catch up?" question. Instead, both parents and educators need to focus on what the child *can* do and chart the child's progress from that starting point. It serves no purpose to make a prediction that either *over*estimates or *under*estimates what a child can do. The most productive position is to take the child at his present level and plan interventions that will optimize the development of the child's capabilities. Just as it is important not to hold unrealistic expectations for a child, it is also imperative that we not give up on any child.

An example comes to mind of a boy named Jon who had rather severe memory and associative function difficulties. He was a non-reader until fourth grade. Every possible method of teaching reading was tried, but to no avail. Although Jon tested in the upper limits of the average range of intellectual functioning, he had been diagnosed with a learning disability in reading and written language toward the end of first grade.

The dynamics that ultimately led to Jon's the success included an excellent relationship between a special education teacher and an involved mother, and their belief that Jon could learn to read. They worked together, along with Jon's regular education teachers, continually exploring alternative ways of teaching Jon how to read. At the beginning of fourth grade, Jon started making progress in reading. At the mid-point of fourth grade, he stopped by my office to tell me that he "finally got the hang of reading." From that point on, he made steady progress. By end of tenth grade, his achievement in reading was consistent within the range of expectation for his measured ability, and he no longer needed the support of special education services.

Another frequently asked question by parents who have a child with a learning disability is "Should my child consider college?" or "Is college out of the question for my child?" Any child who has intellectual ability within the average range or above, who has the desire and motivation to succeed, and who needs a college education to fulfill his career goals should look at college as an option. Many colleges and universities have a center on the college campus that is designed to meet with and support the student who has a learning disability. [See bibliography for more information.] Modifications can often be made to course requirements to accommodate the needs of these students. Students with learning disabilities can also be given special consideration for the conditions under which they take college entrance exams such as the SAT's.

Parents who have a child with limited intelligence and/or multiple disabilities often ask, "Can the IQ (intelligence) score for my child change?" The type of intelligence the parent is referring to in this case is what we consider to be intelligence for academic learning.

Applying these factors to the question regarding whether an intelligence test score can change for a child, the answer would have to be based on the age of the child when the test was given, how the child responded to the test, and whether the test was an adequate sample of that child's thinking abilities. These guidelines should be used in viewing a child's intelligence score, which is a *general* estimate of a child's potential for learning academic subjects.

Test scores are less reliable and less stable for younger children than for older children. For pre-school children, this testing is less reliable than for older children; for children 5 through 8 years old, the score becomes more reliable; and for children 9 and older, the score usually remains within a range of 5 points on either side of an actual score 90% of the time. This is due to the fact that younger children go through various developmental stages and rates of growth that continually influence their learning abilities. For this reason, it is often difficult to rely on the testing done over any one short period of time. Also, there are only a limited number of test items that can be given to young children, so the sample of behavior tends to be more limited than it is for older children.

Exceptions to these guidelines may occur in cases where a child has a severe language deficit or severe limitations in visual/spatial abilities that are the result of delayed development at the time of testing. In these cases, changes that exceed the 5 point variance on either side of an actual score are due to the growth that has taken place as a result of an increased ability for verbal expression or an increased ability to manipulate objects. Most often this occurs between the ages of 6 and 10.

There is one caution in comparing intelligence test scores given at different times to a child. Be sure that the tests to be compared are the same. Do not compare two different intelligent tests, such as the Wechsler Intelligence Scale for Children and the Kaufman Assessment Battery for Children, as they measure different aspects of problem-solving ability.

Reflections

Over the past several years, there have been many changes in regular education and special education, some more productive than others. However, there are two core beliefs that underlie the success or failure of any change. One is that the change is made for the benefit of the child rather than for the benefit of the institution or any group within the institution. The second is the belief that all children have strengths, and even though a particular child's progress may be slow, we can never give up on that child. When a child does not make progress, we need to continually search for ways to help the child learn. The question we need to ask ourselves is, "Why is this approach not working for this child?" rather than "What is wrong with the child?"

One of the most powerful ways of teaching children social skills and age-appropriate behaviors is through the use of *modeling* the behaviors that are desirable for the child. Inclusion provides a setting for all children to observe age-appropriate social skills and behaviors being modeled in a natural setting. Adjustments can be made for the learning needs of children with disabilities in this setting with the cooperative efforts of regular classroom teachers, special education teachers, administrators, and additional support staff.

During my years in education, I have seen many examples that have demonstrated the positive effects that this modeling can have for children with disabilities. This has included children with a number of different types of disabilities and severity of disabilities. I have also observed many positive effects for the children without disabilities in these regular education classrooms.

When we look at a child first as a person and then take into consideration what adaptations need to be made to accommodate the child's limitation, we are better able to focus on the strengths of the child. For many children with disabilities, sensitivities and strengths develop that can be assets to everyone around them. Children have an innate capacity for caring, encouraging, and accepting a peer with or without a disability that we as adults can observe and learn from. For example, I have found that children

with limited intelligence can be among the most emotionally warm and caring individuals when interacting with others.

To focus on a child's strengths while taking into account his limitations encourages us as adults to foster and support a child's independence. I first learned this lesson when I was in junior high school. My mother took care of foster children in our home. Often these children had disabilities varying in type and degree of severity. She loved these children and really encouraged each child to stretch in order to do what she thought the child's capabilities would allow. I observed my mother caring for and working with two pre-school girls who were blind at birth. She carefully instructed them how to do a project and then waited patiently for the girls to attempt to do it. My first inclination was to help them, but my mother always reminded me that they could learn to do it, *and they did.* This was an invaluable lesson for me.

Encouraging independence is a necessary component for a child to gain a sense of competence and self-worth. These qualities, in turn, give a child the confidence he needs to engage in new activities and new learning. With the belief that he has the resources to be successful, a child can approach a task with a positive "I can do it" attitude.

I have found that teaching a child the steps to take to solve problems helps the child develop the skills necessary to find solutions to problems that he encounters in learning and in everyday living. Parents who have used this problem-solving process have also found success with it. This process can be taught to children of any age as long as the wording and types of solutions are adapted to the age of the child.

When first teaching this process, your involvement entails guiding the child through the process at least once or twice. As your child develops greater competency with the steps for problem-solving, he can do it more on his own until it becomes an automatic process.

The steps to use for problem solving are:

1) ***Identify the problem.***

Children sometimes need help with this, even after they have become very familiar with the process. You can help your child with this step by talking with him about what he thinks the problem is and then helping him sort out the main issue.

2) ***Identify the feelings associated with the problem.***

This is an important step. The goal is to acknowledge the feelings connected with the problem, put them aside, and then objectively look for a solution to the problem.

3) ***Brainstorm possible actions to take to resolve the problem.***

Brainstorming means first writing down as many ideas as possible without discussing them or making judgments as to whether they will work or not. Initially, include your ideas with the ideas your child provides.

4) ***Choose one of the actions from the brainstorming list.***

For most children, let them choose the action themselves. If your child is hesitant, narrow the choice to three actions and have him choose one of the three.

5) ***Discuss the probable results of the action.***

What can you expect to happen by taking this action to solve the problem?

6) ***Make a commitment to act on the decision.***

Have your child write down the action of his choice and a statement of what he will do to implement his decision.

7) ***Evaluate the results.***

Was the problem resolved? If not, go back to step 3. If your child was successful, congratulate him and encourage him to use this procedure when faced with the next problem. [Form 22 in Appendix A gives you these steps in a format that can be used for recording purposes.]

Communicating with their children on a regular basis is an essential part of every parent's responsibility. As parents and adults, we need to talk *with* children rather than talking *at* them.

In talking and interacting with children over the past several years, I have found them to have understandings and insights about themselves and others that far exceed our expectations. They can come up with ideas and solutions to problems that are creative and "right on" for them. For this to happen, however, I have found I really need to *listen* to children and *hear* what they are saying, not from *my* perspective as an adult but from *their* perspective as a child. To do this, I have had to put all my judgments, ideas, and expectations aside. For example, when one ten-year-old was asked if he had anyone at home that he could talk to, he answered, "I can talk to my mom. She listens but she doesn't really hear me because she's always doing the dishes or something else when I talk to her."

We need to *hear* children beyond their words. We need to pay attention to their body language and try to *feel* the emotions behind their

words. Often, especially with young children, we get *behaviors* instead of words and have to be creative in order to interpret what they are trying to tell us.

Children with disabilities need to know and understand their strengths and their limitations. This information is best shared with them by the person who feels the most comfortable in doing it. It could be either a parent or an educator. These children also need to know and understand that all people (even adults) can do some things well, yet have difficulty with other things and that we all need to work on building our strengths and finding ways to work with our limitations. Children should experience their parents and teachers working together to help them in this process. To do this, I encourage parents to include their children in parent/teacher conferences and, when older, in their educational team meetings.

Test scores can be shared with children in a number of ways. This can be done by using a graph such as the one on Form 8. As the child gets older, actual test scores may be shared once the child knows what test scores mean.

The sharing of test results becomes important once children reach about eight years of age. At this point, they begin comparing themselves to others and it is important for them to know and understand their own uniqueness and individuality both as learners and as people. Sharing of test results with a child, assuming the test results are valid and the sharing is done in a constructive way, can help a child come to a better understanding of himself as a student. However, there is another caution here. Remember that test results and academic learning are only one aspect of a child; there are also many other mental, emotional, social, spiritual, and physical qualities that define each child.

In most cases, it is best that educators share the test results with a child initially and then let the child share his understanding of the results with his parents. In this way, parents find out how their child perceives the results of the testing and can help to clear up any misunderstandings about his test scores. If there is a problem, the parent should contact the appropriate teacher and discuss the difficulty. Always remember, when test results are shared and discussed with children, it should be done with discernment.

In our work with children, we need to occasionally stop and reflect on what we are doing to determine if what is being done is in the best interests of the child. It is essential to also determine the effectiveness of what we are doing in helping children feel positive about themselves as people and as learners. Through our reflections, when we see the need for a change, we then need to decide what should be changed, implement the change, and after a period of time, evaluate its effectiveness.

Epilogue

There are many new and creative practices that are taking place for children with disabilities in our schools across the United States. The movement toward inclusion continues to grow as research is documenting the positive effects of this movement. However, there are several key issues that still must be considered.

Children need to be given a label consistent with the "approved" characteristics of their disability to receive funding for the special services provided by their local school district. In practice, we must go beyond a label in understanding children with disabilities and focus more on the individual child. As mentioned previously, there are overlapping characteristics among children with the same label, but there are often more *unique* characteristics for each child than *shared* characteristics. This factor must always be kept in mind as we assess children, decide on program placement, and customize individualized education plans to meet the needs of each child. In designing strategies to meet these needs, it is important to focus more on how their strengths can be used to facilitate their learning and teach them ways to cope with their limitations. Within these parameters, we must also retain the perspective of the "whole child."

The number of children being diagnosed and serviced under the categories of Attention Deficit Hyperactivity Disorder, Learning Disability, and Emotional/Behavioral Disorders has increased significantly over the last decade. We need to examine this increase to determine if it is "real" or if some of the increase is due to the lack of a comprehensive evaluation to determine the existence of a disability or disorder or is a misdiagnosis. Based on experience, I feel that Attention Deficit Hyperactivity Disorders are being overdiagnosed at this time due to inadequate evaluations and a misunderstanding of the dynamics associated with attention problems. It is imperative that a comprehensive evaluation of a child *precede* the diagnosis of ADHD.

There are many causes for inattentiveness, impulsiveness, and hyperactivity in children. Some of these are linked to what is happening to a child physically, emotionally, and situationally. If this is the case, to diagnose a child with ADHD is simply masking the real cause, which prevents the use of the proper corrective actions to effectively treat the problem.

A comprehensive evaluation of ADHD should include:

- an interview with the child
- an interview with the parent/s
- observation of parent-child interactions
- classroom observation
- parent and teacher behavior rating scales
- cognitive evaluations of sustained attention, selective attention, and impulse control with specific assessment tools such as the TOVA
- individual ability and achievement testing

Because ADHD has overlapping characteristics with other disorders, if ADHD is indicated (based on this evaluation), one needs to rule out learning disabilities, emotional disturbances, body chemistry imbalances, and neurological involvement before assigning this diagnosis.

Regarding the increase in other types of disabilities, such as learning disabilities and emotional/behavioral disorders, we need to take some time to evaluate how our schools are currently meeting the needs of children. This is necessary to rule out factors in school practices that may be contributing to this increase in learning and behavioral problems. Research findings from the latest brain and brain/heart research should help us move forward on this.

In measuring a child's progress, we need to increase our use of more informally gathered information, such as portfolios of the child's work, demonstrations before peers, and other observed applications of knowledge, in addition to the use of standardized tests. These provide a variety of perspectives that indicate the degree to which a child is assimilating his new knowledge. For children who have difficulty demonstrating what they know through the use of tests, this is particularly important.

For all children, and especially children with disabilities, we need to plan and implement curriculum and instructional strategies based on the concept of developmentally appropriate practices. These practices direct us to create materials and expectations that are appropriate for both the age and individual needs of the child. When implemented, these practices provide a sound basis for educating children from the perspective of what is correct for their age, and also for the adaptation of materials and expectations to meet the

individual and unique needs of each child. The National Association for the Education of Young Children, the Gesell Institute, and The Society for Developmental Education are organizations currently promoting and training parents and educators in this concept. [See Resources in Appendix A for additional organizations.]

Recent brain research has verified the important link emotions have in the learning process. This means more effort is needed on the part of everyone to make schools a safe place for children to learn and interact with others. Not only is physical safety required, but school environments and home environments need to be non-threatening emotionally and psychologically. To do this, school practices, curriculum, and expectations must reflect the readiness levels in which children can engage and be successful. Parent involvement and support of their children must be consistent with this.

There is a need to go beyond where we have been in education. That is, we need to expand our visions about what education *can* and *should* be for all children. It is essential to do this for children with disabilities. We must learn more about the conditions that affect learning by researching the presence and extent of various types of stimuli in the environment. We should pay attention to new ways of helping children learn, such as some of the ones listed in the bibliography section of this book.

To make this possible, more collaborative efforts are needed to help bridge the gap between parents and educators that currently occurs in far too many school systems. It takes everyone working together to create, organize, and implement educational practices that will benefit all children.

What we do today for children will be realized in their future. It is our responsibility as parents and educators to create learning environments that will make it possible for *all* children to realize their full potential.

Ω

APPENDIX A

Forms

PARENT SURVEY

1. What are your reactions to and feelings about your child's new placement?

2. How does your child feel about the new placement?

3. How is your child coping with the new academic demands of the classroom setting?

4. How would you rate your child's self-esteem in the new setting?

5. How do you feel your child interacts with his/her peers?

6. Have you noticed any changes (positive or negative) in your child since his/her new placement?

7. Can you suggest any ideas or strategies that may assist us in working with your child?

Additional Comments:

Form Two

STUDENT SURVEY

1. How do you feel about your new class placement?

2. How do you feel you are performing in the classroom?

3. Are you following the classroom rules?

4. Are the academic modifications to the curriculum helping you?

5. Are you receiving enough support in the classroom?

6. Are you able to complete the classwork and the homework assignments?

7. How do you get along with the other students in your classroom?

8. Are you involved in extracurricular activities? If the answer is NO, what type of extracurricular activities would you be interested in joining?

PARENT'S KNOWLEDGE OF THEIR CHILD

Directions: Answer the questions or statements on this form as completely as possible. Take this form to your child's first educational team meeting with your child's teachers.

1. My child's disability is: _____

2. The date my child was first diagnosed with this disability was: _____

3. My child's disability seems to interfere with learning in the following areas:
_____
_____

4. My child's disability affects his feelings about learning in the following ways:
_____
_____
_____

5. Other manifestations of my child's disability include:
_____
_____
_____

6. My child has the following strengths (including strengths both as a person and as a learner):
_____
_____
_____

7. My child's interests and/or hobbies are:
_____
_____

8. My child's favorite school subject is : _____

9. My child has expressed the following fears and concerns about learning and school:
_____
_____

10. My child seems to learn best under the following conditions or circumstances:

11. I have the following health concerns about my child:

12. Recent family events or changes that may affect my child's learning and/or behavior in school include:

13. Additional information that I would like teachers or other school staff to know about my child:

After you have completed this form, review it and circle the items you particularly want to discuss with your child's educational team.

List here the questions you want to ask at your child's meeting:

List here the information you wish to obtain from school staff:

SCHOOL MODIFICATIONS

Directions: Have the case manager of your child's educational team complete the following form. This form can then be used by you when helping your child with his homework.

Child's name _____
Grade _____ Date _____
Person completing the form_____

Modifications being used in the school setting. (For each type of modification, please indicate both the subject area and the types of modifications being made.)

Textbook modifications:

_____
_____
_____
_____
_____

Modifications in daily assignments:

_____
_____
_____
_____
_____

Modifications in written language:

_____
_____
_____
_____
_____

Modifications in organization of work space, materials and time:

_____
_____
_____
_____
_____

Form Four

Modifications in giving directions:

Modifications for testing and assessment:

Other areas (such as expectations, behavior, etc.) in which modifications are being made for this child at school:

Teachers observations regarding this child's learning style:

LEARNING DIFFICULTIES CHECKLIST

Directions: Check each behavior you have observed in your child.

- ❑ Has difficulty following verbal directions.
- ❑ Has difficulty following written directions.
- ❑ Does not seem to listen or pay attention.
- ❑ Gets frustrated easily.
- ❑ Gives up easily.
- ❑ Has difficulty following a map or diagram.
- ❑ Has difficulty remembering instructions and routine tasks.
- ❑ Has difficulty remembering symbols and words.
- ❑ Does not follow through with instructions/information.
- ❑ Takes longer to do some tasks than others.
- ❑ Often seems to show poor judgment and makes poor decisions
- ❑ Needs concrete examples and demonstrations to understand ideas and concepts
- ❑ Has trouble relating previously learned information for an extended period of time
- ❑ Has difficulty memorizing a series of items.
- ❑ Has difficulty remembering sequences in problem-solving.
- ❑ Has difficulty organizing work space.
- ❑ Has a poor concept of time.
- ❑ Does not plan a project in steps.
- ❑ Does not recognize deadlines for work completion.
- ❑ Has difficulty working independently.
- ❑ Is easily distracted from a task.
- ❑ Can tell you the answer but has difficulty writing the answer.

Form Five

- ❑ Can respond with, "I know it, but cannot say it".
- ❑ Can give a quick, brief answer or response but cannot elaborate.
- ❑ Is hesitant and shows frustration when responding .
- ❑ Does not complete his tasks.
- ❑ Writes illegibly.
- ❑ Takes excessive time compared to similarly aged peers.
- ❑ Loses his work.

Note: *Checks in the first seven items indicate potential problems in attention, discrimination and/or memory at the input level.*

Checks on the second set of fourteen items indicate potential difficulties in processing information.

Checks in the last set of eight items indicate potential difficulties at the output or sharing level.

ATTENTION DIFFICULTIES CHECKLIST

(BEHAVIORS ASSOCIATED WITH ADHD)

Directions: Check each behavior you have observed in your child.

- ❑ Being always "on the go" or often acting as if "driven by a motor."
- ❑ Often fidgets with hands or feet.
- ❑ Often has difficulty playing or engaging in leisure activities alone.
- ❑ Often talks excessively.
- ❑ Often runs about or climbs inappropriately (in adolescents or adults, this may be limited to restlessness).
- ❑ Often has difficulty awaiting his turn.
- ❑ Often interrupts or intrudes on others.
- ❑ Often dislikes or avoids engaging in tasks that require sustained mental effort (such as homework).
- ❑ Is often distracted by what is happening around him.
- ❑ Has difficulty organizing things and activities.
- ❑ Often does not complete tasks or chores.
- ❑ Often misses details or makes careless mistakes while doing something.

This information should be shared with your child's educational team and teachers to determine if these same behaviors are seen in the school setting and, if so, how frequently.

Form Seven

A CHILD'S VIEW OF WHAT LEARNING IS LIKE

Directions: Have your child respond to each question as completely as possible. For younger children and children who have difficulty writing, read the question to your child and write his response for him.

1. What do you like about reading?

2. What do you find the most difficult for you when reading?

3. What do you enjoy about working with numbers?

4. What parts of math do you find easy?/difficult?

5. Do you enjoy writing? Why?

6. Is it easier to tell someone the answer to a question or to write down your answer? What makes it easier?/harder?

7. Do you like to write stories? Why?

8. Do you like to write reports? Why?

9. Add any other questions you would find useful

Form Eight

HOW I SEE MYSELF COMPARED TO OTHERS

Directions: Have your child put an "x" to show how he is doing in reading, math, written work, etc., compared to other kids at the same grade level. Rather than using exact numerical scores with your child, use phrases such as "like most other kids" for placement with the average range, "not as well as other kids" for below average and "better than other kids" for above average. If your child understands the term "average," you can use the terminology on the graph.

How I see myself compared to others

Above Average _____

Average [_____] 68% of all students

Below Average _____

Once your child has completed the graph, use the following statements and questions to gain additional information about your child. This information can be used for setting goals and charting your child's academic progress.

1. Tell me about your best subjects.

_____

_____

_____

_____

2. Tell me about the subjects in which you feel you are not doing as well as the other kids.

3. What changes would you like to make in any of these subjects?

4. What ideas do you have for making these changes?

5. How can I help you to be successful in making these changes?

6. What ideas do you have about how your teachers can help you?

7. Do you have any other thoughts about your learning?

Form Nine

PARENT OBSERVATION OF WORK HABITS

*Directions: Record your observations of your child's work habits by checking next to **YES** or **NO** after each of the statements or questions listed below. You may choose to use a different form for each subject area.*

Subject Area _____ Date _____

❑YES ❑NO My child shows a positive attitude toward this subject.

❑YES ❑NO My child shows a negative attitude toward this subject.

❑YES ❑NO My child shows a neutral attitude toward this subject.

❑YES ❑NO My child has his materials ready and organized for working on this subject.

❑YES ❑NO My child knows how to get started on his assignment.

❑YES ❑NO My child understands what he needs to do to complete the work for this subject.

❑YES ❑NO My child sustains attention while working on this subject.

❑YES ❑NO My child frequently asks me for help.

❑YES ❑NO My child appears to have the skills necessary to successfully complete the work

❑YES ❑NO My child takes an excessive amount of time to complete the work for this subject

❑YES ❑NO My child gives up easily or "shuts down" before the work is completed.

❑YES ❑NO My child puts down any answer just to get the work finished.

These observations can be used to determine which of your child's work habits help and which ones interfere with his success. Goals can then be developed to help your child make changes in the work habits that limit his success.

INFORMATION PROCESSING

Directions: Check each behavior you have observed in your child.

My child seems to react to events and organizes materials and activities in these ways:

- ❑ Likes routine in his environment.
- ❑ Likes order in his environment.
- ❑ Likes rules to follow when doing something.
- ❑ Likes to know exactly what is expected of him.
- ❑ Notices and tunes in to details.
- ❑ Recalls details well.
- ❑ Responds well to verbal explanations.
- ❑ Is good at memorizing facts.
- ❑ Likes consistency from day to day.
- ❑ For any new experience, wants to know in advance what will take place.
- ❑ Wants facts.
- ❑ Likes to work in a step-by-step order in doing things.
- ❑ Uses a logical approach to problem-solving.
- ❑ Likes to verbalize his experience.
- ❑ Likes to learn from books.

- ❑ Likes change.
- ❑ Likes flexibility in what he does.
- ❑ Likes choices.
- ❑ Sees and understands the "big picture" of an event/story.
- ❑ Forgets facts and details.
- ❑ Likes to work with pictures.
- ❑ Likes and understands visual patterns.
- ❑ Has difficulty organizing his time.
- ❑ Has difficulty organizing materials.
- ❑ Likes to link current events to past events.
- ❑ Likes being involved with people.
- ❑ Likes music and movement.
- ❑ Works best when he can move around.
- ❑ Does more than one thing at a time.
- ❑ May do things for the fun of doing them rather than the outcome.
- ❑ Does not see the importance of time.
- ❑ Likes doing models.

See instructions on next page

Form Ten

To use this information, count the number of checks in each of the two sets of behaviors divided by the dotted line. If your child has a predominant number of checks in the top set, he may be more of a sequential learner than a simultaneous (random) learner. If there are many more checks in the bottom set of behaviors, your child is most likely more of a simultaneous or random learner than he is a sequential learner. If there are about an equal number of checks in each set, your child is most likely an integrated learner. That is, he can react, respond, and organize events in his world both ways and is equally proficient in both. This information can be further verified by your child's teachers.

Information about your child's learning style can be used to gain a better understanding of how your child experiences and structures his world. This information should also be taken into account in planning learning strategies and learning environments that will support a greater degree of success in learning for your child.

LEARNING STYLE CHECKLIST

(For children 10 and older)

Directions: Have your child check the behaviors that describe him.

A. *I see myself as someone who:*

- ❑ likes to be with people
- ❑ is sensitive to how others feel
- ❑ is creative
- ❑ likes to learn things that are meaningful to me
- ❑ likes to collect things and save them
- ❑ likes to have a lot of information about something at one time
- ❑ likes to work on my own time schedule
- ❑ makes decisions because they "feel" right
- ❑ enjoys learning in a group
- ❑ is concerned about fairness
- ❑ needs time balanced between play and work
- ❑ does not like conflict or disagreements
- ❑ likes to have time to think about things

_____ TOTAL

B. *I see myself as someone who:*

- ❑ likes to work with ideas and thoughts
- ❑ likes my work to be organized and neat
- ❑ prefers to work alone
- ❑ likes to have enough time to learn something thoroughly
- ❑ likes to debate or argue about ideas
- ❑ likes finding answers
- ❑ likes books
- ❑ likes things to be predictable
- ❑ likes to have things right
- ❑ judges the value or importance of something
- ❑ takes learning seriously
- ❑ is good at integrating information to form a new idea
- ❑ likes a quiet environment in which to work

_____ TOTAL

Form Eleven

C. I see myself as someone who:

- ❑ learns best through practical, hands-on ways
- ❑ likes to have rules to follow
- ❑ likes everything to be in its place and organized
- ❑ likes to work one step at a time
- ❑ wants to know what is expected of me
- ❑ likes to have a specific time for doing things
- ❑ likes to have a finished product for my efforts
- ❑ likes to work with details
- ❑ likes approval for my work
- ❑ likes to have a consistent way of doing things
- ❑ wants to create practical products
- ❑ likes things to be accurate and precise
- ❑ thinks about what I'm going to do before I do it

_____ TOTAL

D. I see myself as someone who:

- ❑ likes change
- ❑ sees the world as a laboratory to explore
- ❑ is very curious
- ❑ thrives on new experiences
- ❑ likes to be on "the go"
- ❑ likes to do several things at one time
- ❑ likes choices
- ❑ likes to do things on my own
- ❑ gets more involved in the process of doing than on the outcome
- ❑ is independent
- ❑ is flexible in how I do things
- ❑ likes to do the unusual
- ❑ gets so involved with what I am doing that I forget about time
- ❑ prefers to construct a model by looking at its picture rather than by reading the directions

_____ TOTAL

See instructions on next page

Form Eleven

This form has been divided into 4 sections, labeled A, B, C, and D, which will help you determine the most comfortable learning style of your child. If the totals are similar in each of the sections, your child is most likely an integrated learner who shows no particular preference in his learning style. If he has a majority of checks in category A, he shares characteristics with people who have an abstract random style of learning. Category B lists characteristics for abstract sequential learners; category C, concrete sequential learners; and category D, concrete random learners. A more complex learning style inventory should be taken for further verification.

Form Twelve

ABILITY, ACHIEVEMENT, AND PERFORMANCE RELATIVE TO LEARNING

Eligibility for Special Education Services for children with learning disabilities is based on the results of standardized test scores in addition to performance on school assignments. Standardized test scores include a child's score on an *ability* test (such as the Wechsler Intelligence Scale for Children) and a child's reading, math, and written language scores on an *achievement* test (such as the Woodcock Johnson Tests of Achievement).

To meet the criteria for special education placement, a child must have a *severe* discrepancy between his *ability* and *achievement* test scores and be performing at a level that is significantly below the expectation for his measured ability. What constitutes a severe discrepancy is generally defined by the Special Education section of the various state Departments of Education. The guidelines or mandates defined by each state's Department of Education are then implemented by the individual school districts within each state. The criteria for determining eligibility of a child for special education services can best be obtained from the child's school district.

The most common terms used in this assessment process are defined below:

Cognitive Ability or Intelligence: one's capacity to learn; one's proficiency in solving problems.

Achievement: what one has learned; skills one has acquired through learning and/or experience.

Performance: how one does on assignments or tasks.

EXAMPLE: Jerry, a fourth grader, had the following scores documented on his Individual Educational Plan.

His *cognitive ability* was a standard score of 109 +/- 5
(=73%, upper limits of the average range).

His *achievement* scores were:

reading:	a standard score of 83 (+/- 4) (=13%, below average range).
math:	a standard score of 108 (+/- 4) (=70%, upper limits of the average range).
written language:	a standard score of 90 (+/- 4) (=25%, lower limits of the average range).

Form Twelve

To determine if a severe discrepancy exists between Jerry's *ability* and *achievement* scores, one needs to compare each of the three subject areas to his score on the WISC-III. This can be accomplished by comparing the scores directly to the formula used by the school district. This comparison is plotted on the graph that follows.

DISCREPANCIES OF ABILITY/ACHIEVEMENT/PERFORMANCE

SS	Math			Written Language			Reading			%
	Ab	Ach	P	Ab	Ach	P	Ab	Ach	P	
125										95%
120										91%
115										84%
110										75%
105										63%
100										50%
95										37%
90										25%
85										16%
80										9%
75										5%

SS: Standard Scores	**%**: Percentile Scores
Ab: Cognitive Ability	**Ach**: Achievement
P: Performance (estimated by your child's teachers)	

According to the point difference between Jerry's *ability* and *achievement* scores in each of the three subject areas, one can see that no discrepancy exists between Jerry's *ability* score and his *achievement* score in math. His *performance* in this area also indicates he is doing well on his math assignments.

Jerry's *achievement* score and *performance* in written language is somewhat lower than his *ability* score but would probably not be considered severe enough to warrant the need for special education services. This example should be used for understanding only; it is not meant as criteria for eligibility.

In reading, Jerry scored significantly below the expectation for his *ability*. Generally, this degree of difference is considered a ***severe*** discrepancy. If Jerry is not making progress consistent with his *ability* due to *processing difficulties*, then he would be eligible to receive special services in the area of reading. This need is further supported because his daily *performance* in reading is also significantly lower than one would expect given average *ability*.

Form Thirteen

AN APPRAISAL OF YOUR CHILD'S SCHOOL PERFORMANCE

How I am Doing in School

Name_____ **Date Completed**_____

	Reading Yes / No	Math Yes / No	Writing Yes / No	Art Yes / No	Science Yes / No	etc.
I am doing satisfactory work						
I complete all my assignments						
I like this subject						
(Add more as needed)						

Directions:

1) Put aside time to meet with your child to discuss the purpose of the chart and to get information from him.

2) List the subject areas your child is currently taking across the top of the chart in the order in which the child thinks of them. Have your child do the writing (or you do it if your child prefers.) You may add other areas of school life, such as friends, if you wish.

3) Have your child answer each question for each area by putting a check in either the **Yes** or **No** column.

4) Highlight all the **Yes**'s in each column with a colored (i.e., green) highlight pen.

5) Circle the **No**'s in pencil for each column.

6) Use your child's most recent report card and information from your child's teachers to verify your child's perceptions about how he is doing. If any of these are inaccurate, discuss the reasons with your child and change the response on the chart.

7) Make a list of the **No**'s for each area on a separate sheet of paper.

Form Thirteen

8) Make a decision as to which **No**'s are the most important to work on first. It is best to start out with no more than 2 or 3 areas and put the others on hold for a later time.

9) Circle the items chosen to be worked on. Have your child write a goal for each item relative to what he needs to do to move this item to the **Yes** column on this chart.

10) For ease in charting, record the items and goals on a new form, such as Form 14 on the next page in this Appendix.

Form Fourteen

CHARTING MY PROGRESS

AREAS TO BE WORKED ON													
Name_____ Month_____													
Area	Goal	Week 1			Week 2			Week 3			Week 4		
		Y	P	N	Y	P	N	Y	P	N	Y	P	N

Y: Yes *P: Partially Met* *N: No*

Directions:

1). Check your child's progress at the end of each week. If your child has achieved his goal, have him put a check in the Yes column. If he partially met his goal (i.e., 3 of the 5 days that week), put 3/5 in the P (partially met) column. If your child made no progress toward his goal, discuss ways to change his approach so he can make progress the next week.

2). As each goal is achieved, go back to the "How I Am Doing" Chart (Form 13), and have your child erase the appropriate No check, put a check in the Yes column, and highlight it with green.

3). Repeat this process until all the **NO** checks have been erased and all checks are in the **YES** column highlighted by a green marker. It is important to praise your child on completion of each goal. When the chart is all green (or mostly green), have a special celebration with your child.

4). Each time your child receives his report card, start again with #1, revising and updating the information on your child's school performance as needed.

Note: You may want to put these charts in a special folder so you and your child can refer to them at the end of the current school year and save them for future reference.

Form Fifteen

CHARTING STANDARDIZED TEST SCORES

Directions: Obtain your child's standardized test scores from his Individual Education Plan (Assessment Section) or from your child's Case Manager. Plot your child's scores on the graph provided below. If quantitative scores are not available, use the general categories of Average (90 - 109), Below Average (= to or < 84), or Above Average (= to or > than 110).

SS >								%>
135								
130								98%
125								
120								
115								84%
110								
105								
100								50%
95								
90								
85								16%
80								
75								
70								2%
<								<
	Reading	**Math**	**Writing**	**Science**	**Sec. Std**	**etc.**	**etc.**	

SS: Standard Scores
%: Percentile Scores
<: Less than
>: More than

Each subsequent time your child is tested, record his scores on this graph. For each set of test scores, record the date the test was taken. Record each set in a different color or use different types of lines in the plotting of the scores. You can then use this graphic representation of your child's test scores to measure your child's academic progress as portrayed by standardized test scores. In doing this, it is important to remember this is only one picture of your child's progress.

Form Sixteen

HOMEWORK MATERIALS

Basic Materials Needed:

- ✓ Paper - including pads of paper, notebook paper, and paper without lines. Lined paper should vary in line size according to the age of the child. If a child has small motor difficulties, larger spaced lined paper is often best.
- ✓ Pencils - preferably #2 hardness.
- ✓ Crayons - colored pencils for older children
- ✓ Pens - have 3 or 4 different colors available
- ✓ Eraser
- ✓ Ruler - purchase one with larger numbers for younger children
- ✓ Folders of various colors
- ✓ Assignment notebook
- ✓ Scissors
- ✓ Notepads of varying sizes

Optional Materials:

- ✓ Chips for sorting and counting
- ✓ Number line and/or alphabet line
- ✓ Matrix for multiplication facts
- ✓ Calculator
- ✓ Protractor
- ✓ Pencil grip holder
- ✓ Dictionary

Form Seventeen

HOMEWORK SCHEDULE

Name_____ Week of _____

Directions: Block in the times available for homework. Designate one or two days of the week as free days. This can vary every week.

	MON.	TUES.	WED	THURS	FRI.	SAT	SUN
Morning							
Afternoon							
Evening							

Assignments to be Completed

Directions: Have your child list the specific homework to be completed for each day. The work should be listed and prioritized. Have your child estimate the time needed for each assignment. Mark when it is completed and go on to the next assignment.

Date _____ Day of the Week_____

What Needs to be Done	Approximate Time Needed	Completed

Note: You may wish to laminate this form rather than duplicate it.

Form Eighteen

LEARNING ENVIRONMENT NEEDS

Work Space

Degree of quietness needed: _____

Amount of distraction tolerable: _____

These people may have access to my child's designated work space:

_____

Organization of Materials

Degree of organization needed for materials: _____

Additional materials or aids my child needs for successful completion of assignments:_____

_____

Work Time

My child can be expected to do homework up to _____ minutes and/or hours per day.

The longest period of time my child can work before taking a break is ____

My child should prioritize his assignments from difficult to medium to easy and then decide which one he would prefer to start with_____

_____

Other Considerations

_____

_____

Note: These decisions should be changed and adjusted depending upon your child's success in completing his homework.

Form Nineteen

DETERMINING OPTIMUM ENVIRONMENTS FOR EACH LEARNING STYLE

Directions: Based on the information gathered from Forms 10 and 11 or other documentation you have, check each strategy below that specifically fits your child. It is best if you and your child fill out this form together. You may also want to consult your child's teachers for their input.

Sequential learners, concrete sequential learners, abstract sequential learners, and verbal learners learn best when they have:

- ❑ a quiet, predictable work environment
- ❑ materials and study area organized neatly
- ❑ timelines to follow that are clearly stated
- ❑ an understanding of what to do and how to do it
- ❑ procedures for learning organized in a step-by-step manner
- ❑ assignments in which they think and problem-solve in words
- ❑ consistency and structure in their learning environment
- ❑ consistency in expectations
- ❑ everything clearly defined by rules
- ❑ a goal to work toward
- ❑ a situation in which they can work alone
- ❑ a reward system and/or approval for the work they do

Simultaneous learners, concrete random learners, abstract random learners and visual learners learn best when they have:

- ❑ an environment that allows for flexibility and choice
- ❑ materials accessible but a choice of organizing by color, shape, function, etc.
- ❑ blocks of time in which to work where there are built-in breaks
- ❑ the "big picture" of what they are to do
- ❑ several pieces of information available to them at one time

- ❑ encouragement to make mental pictures of verbal information
- ❑ the opportunity to use pictures, charts, maps and other visual aids to use in thinking and problem-solving
- ❑ a chance to make choices from two or more options
- ❑ flexibility in how they arrive at an answer or an outcome
- ❑ the opportunity to share what they are doing with another person
- ❑ the opportunity to work with others

Note: This information can be integrated with the information on Form 18 and incorporated into a list of strategies that help your child to be more efficient when doing homework assignments and more successful in learning.

MIND-MAPPING

To create a mind map:

1) Start with an **object** word (such as *dog, house*, etc.) for younger children. For older children, start with a **concept** word (a word we use to mean some kind of idea or event, such as *animal, learning, parade, picnic, fireworks*, etc.

2) Have your child make a mental picture of the object or concept word in his head. Then you or your child *write down* all the words that come to mind when describing the chosen word or

3) *Make a list* of words that come to mind when you hear the object or concept word.

4) Put the object or concept word either in the center or on the top of the space you will be working on. Use **linking** words (*is, are, have*, etc.) to connect each word to the main word.

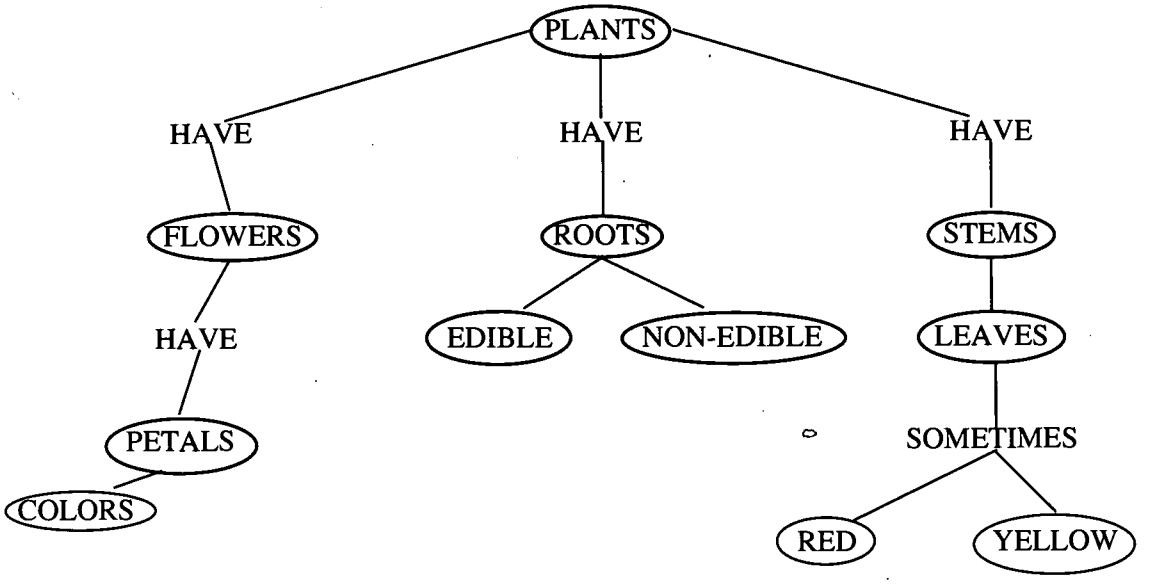
5) Have your child keep adding new words that come to mind until he has reached a sense of completion. You may use either linking words with the connecting lines or connecting lines only.

6) On completion, have your child verbalize the information generated by the mind map.

7) Have your child use the information from the mind map either to create a picture to convey the information or to put the information into narrative form.

Form Twenty

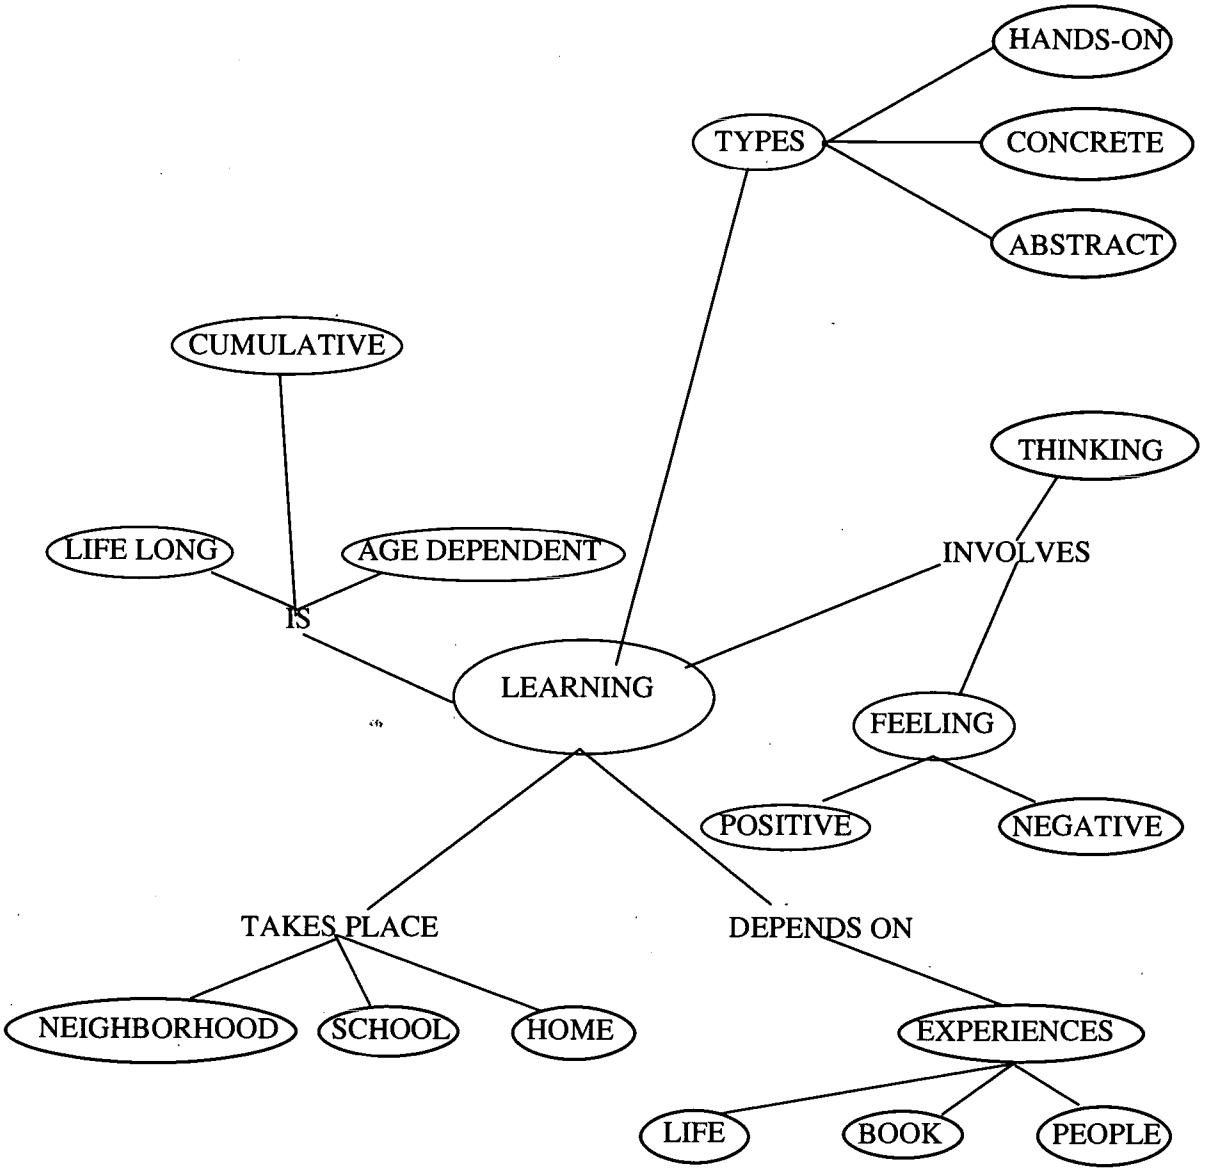
Mind-Mapping using **object** words:



Peytral Publications, Inc.

Form Twenty

Mind-Mapping using **concept** words:



Remember: Mind-mapping can act as a springboard for generating and creating limitless ideas. Have fun with the process and join in with your child when it is appropriate.

Form Twenty-one

SUPPORTIVE WORDS AND PHRASES

1. You did very well
2. Good for you!
3. You're on the right track
4. You're really improving
5. I knew you could do it
6. Good work
7. Awesome
8. Terrific!
9. Superb
10. Marvelous!
11. You're doing great
12. Outstanding!
13. That's coming along nicely.
14. You figured that out fast.
15. I'm proud of the way you worked today!
16. Tremendous!
17. You certainly did well today.
18. Perfect!
19. Nice going.
20. WOW!
21. Wonderful!
22. You're learning more every day.
23. Super!
24. You did a lot of work today!
25. Congratulations
26. Excellent!
27. Sensational!
28. You're doing beautifully
29. Way to go!
30. Good thinking
31. Fantastic!
32. Right on!
33. Great!
34. I knew you could do it!
35. Good job.
36. Good memory.
37. You really make this fun
38. It's coming.
39. You're almost there.
40. Let's celebrate!
41. You're doing just fine
42. You've figured it out!
43. Keep it up!
44. It's getting better.
45. Your work looks great!
46. That's quality work!
47. Dynamite!
48. Great accomplishment!

STEPS FOR PROBLEM-SOLVING

1. State the nature of the problem.

2. Identify the feelings associated with the problem.

3. Brainstorm possible actions to take to resolve the problem.

4. Choose one of the actions.

5. Discuss the probable results of the action.

6. Make a commitment to act on the decision. Put it in writing.

7. Evaluate the results. If the problem is resolved, celebrate. If not, go back to step 3.

APPENDIX D

Glossary

The words contained in this glossary are defined in the context in which they are found in this book. They are not meant to be complete definitions.

abstract thinking - that which involves the realm of ideas, thoughts, and symbols (the non-physical).

achievement - an accomplishment in learning or in the completion of a project.

ADD - see Attention Deficit Disorder

ADHD - see Attention Deficit Hyperactivity Disorder

age equivalent score - based on the average performance of children at a particular age level; expressed as a numerical value, first by year and then by month of a child's age.

attention - the ability to focus and remain focused on the task at hand.

auditory memory - that which is used to remember and recall verbal information.

auditory processing - the understanding and use of verbal information.

associative functions - the linking of similar types of information; those which bridge ideas or experiences, or ideas with experiences.

attention deficit disorder - a condition in which a child has difficulties in directing and maintaining attention to tasks. This behavior is significantly different from the behaviors of similarly aged peers.

attention deficit hyperactivity disorder - a condition in which a child has significant difficulties in focusing and sustaining attention, impulsiveness, and regulating his activity level.

collaboration - a team effort based on the idea of working together effectively and providing mutual emotional, mental, or physical support for one another.

cognitive ability - intelligence; one's proficiency in problem solving; one's capacity to learn.

disability - impairment of normal functioning.

discrimination - ability to differentiate between visual, auditory, tactual, or other sensory stimuli.

distractibility/distraction - the result of being easily influenced by external stimuli (such as visible objects and sound) that takes one's focus away from the task at hand.

small motor development (fine motor) - use of small muscle groups for specific tasks such as handwriting.

grade equivalent score - based on the performance of typical students at each grade level. This score is expressed as a numerical grade level and month of that grade level ranging from September (month 1) to June (month 9).

hyperactivity - excessive activity in relation to others of the same age and in similar situations, often expressed as non-stop body movements or excessive verbalization.

IDEA – see Individuals with Disabilites in Education Act

IEP - see Individualized Education Plan.

impulsivity/impulsiveness - reacting or responding quickly, without thinking.

inclusive schooling - the practice of educating children with and without disabilities together in the same classroom setting.

individualized education plan (IEP)- a written plan for the educational program of a child with disabilities. This plan is developed by the local school in accordance with rules adopted by the state and in accordance with the Individuals with Disabilities Act. An IEP is written for a 12 month period and must be reviewed and revised annually.

Individuals with Disabilities in Education Act (I.D.E.A.) – the law that governs Special Education which was reauthorized in 1997

information processing - the mental manipulation of words, symbols, and perceptions necessary to acquire knowledge and solve problems.

integrative function - the process of combining one or more functions together, such as the integration of visual and auditory functions, eye and motor functions, etc.

learning disability - a condition in which a child is achieving and performing at a level in reading, math, and/or written language that is significantly below the expectation for his measured intellectual ability. This discrepancy must be due to difficulties in information processing rather than for environmental or other reasons.

learning style - refers to the way a person organizes and responds to experiences and information.

least restrictive environment - an environment for children with disabilities which, to the greatest degree possible, approximates the learning conditions and learning environment of regular education students.

memory - the psychological process involved with remembering visual, auditory, and/or tactile stimuli.

working memory - involves the taking in of information and instantaneously repeating it back.

short-term memory - involves the holding of information in one's memory bank for at least 30 seconds and then either repeating it back in the same form using it to solve problems or storing it in long-term memory; working memory.

long-term memory - storing information in one's memory bank for future use; the length of time may vary from several minutes to an indefinite period of time.

modifications - adaptations made in the curriculum, presentation method, or the environment to provide support for the individual child.

mental image - the picture created in one's head of words, symbols, or pictures.

mnemonics - a technique to help one remember and retrieve information. It is the process of creating rhymes, stories, acronyms, pictures, etc. to help your memory retain and recall information.

motor development - involves the growth of large and small muscles in the body needed to perform tasks involving movement of the various body parts, eye movements and eye/hand coordination .

percentile score - a standard score that tells how a child scored compared to other children. This score tells how many children (expressed as a percentile) scored above and below a particular child.

periodic review - a review of a child's individual educational plan that is required by law to occur minimally on an annual basis.

psychological processes - mental functions involved with taking in information, organizing it, transforming it, storing it, and using it.

regular education classroom - a classroom for all children within a school setting.

resource room - a place designated as a classroom for students to go to in order to receive special education services.

sequential processing - taking in, organizing, and responding to information in a step-by-step, linear way where the order of the facts (information) is important in arriving at a solution.

simultaneous processing - taking in, organizing, and responding to information all at once; seeing and relating to the "big picture" where the information is randomly ordered.

standard deviation - a commonly used measure of the extent to which scores deviate from the mean (average).

standard score - a raw score (based on the number correct) that has been transformed to have a given mean (mid-point) and standard deviation from the mean. A common number used to denote the mid-point of the average range is 100 with a standard deviation of 15 points. Any test that has 100 at the mid-point and a standard deviation of 15 can be compared to one another.

standardized scores - raw scores that have been transformed to have a given mean and standard deviation based on a defined population used in the standardization sample.

strategies - techniques or tools to help one approach learning and problem solving in a systematic way.

team teaching - two teachers working together jointly to develop, plan and teach a lesson.

Test of Variable Attention (TOVA) – a computerized test used in evaluations to help confirm or rule out the existence of an ADD/ADHD disorder.

TOVA – See Test of Variable Attention

verbal abilities - the understanding, manipulation, and expression of information and ideas in words.

visual/spatial abilities - the understanding and manipulation of material presented through pictures, symbols, and models, and responding to their spatial placement.

visual processing - the understanding and use of information presented in pictures, symbols, or model forms.

The First Inclusion Series – Four Book Set

(Peytral Publications, Inc)

Inclusion: 450 Strategies for Success – 2nd edition

Peggy A Hammeken

This award winner has been revised and updated. This best seller commences with step-by-step guidelines to help develop, expand and improve the existing inclusive education setting. Hundreds of practical teacher tested ideas, and accommodations are conveniently listed by topic and numbered for quick easy reference. The reproducible forms save time, increase communication and help to effectively manage students with special needs in the classroom environment. Excellent resource for general and special education teacher, English as a Second Language teachers, Title I and students entering the field of education. P100 / $23.95

Inclusion: A Practical Guide for Parents – 2nd edition

Lorraine O. Moore, Ph.D.

This practical resource answers parent questions and provides the necessary tools to help parents promote and enhance their child's learning. Strategies, exercises, questionnaires, checklists and do-it-yourself graphs assist parents in helping their child benefit from learning experiences both at school and at home. This 2000 edition includes the latest brain research related to learning! Also included are many specific exercises assist with reading, math, writing and attention skills. Many reproducible checklists and forms. Recommended for parents, educators and psychologists. P 300 / $19.95

Inclusion: Strategies for Working with Young Children A Resource Guide for Teachers, Childcare Providers, and Parents

Lorraine O. Moore, Ph.D.

This exceptional resource is a gold mine of developmentally based ideas to help children between the ages of 3-7 or the older student who may have a developmental delay. The book commences with a synopsis of inclusive education and the future of learning. Subsequent chapters present hundreds of child focused strategies. Communication, large and small motor development, pre-reading, writing, and math are only a few of the topics covered. Reproducible activities to help children learn about feelings, empathy, resolving conflicts peacefully, and problem solving. Reproducible forms help to chart students' rate and frequency of behavior, modifications, child interviews and more! Practical and easy-to-use! Appropriate for early childhood, childcare providers, parents and K-2 general and special education teachers. P301 / $21.95

Inclusion: An Essential Guide for the Paraprofessional

Peggy A. Hammeken

This publication is written specifically for the paraprofessional and classroom assistants. The book commences with a simplified introduction to inclusive education, handicapping conditions, due process, communication, collaboration, confidentiality and types of adaptations. Included are more that 300 easy-to-use strategies, conveniently numbered and arranged by topic. Reproducible forms help increase collaboration and communication, define medical emergency procedures and discipline plans. This practical resource will be used daily.

P200 / $21.95

Additional Resources Available from Peytral Publications, Inc.

(Woodbine House Special Needs Collection and Edvantage Media)

3'R's for Special Education: Rights, Resources and Results
A Guide for Parents, A Tool for Educators

This excellent video provides a clear and informative overview of the current special education system and the critical process involved. The video covers the stages of the special education system, laws regarding the child's rights, design of IEPs, preparing for school meetings and planning for the future.
ED 100 / 50 minutes / VHS / $49.95

A New Idea for Special Education – Understanding the System and the New Law

Changes in IDEA '97 affect general and special educators, parents and students alike. This exceptional video covers the following: the new law; the referral process; the evaluation process of a child, creating an IEP, placement and related services, preparing for transitions, discipline mediation and standardized testing. Simple and easy to understand. ED101 / 50 minutes / VHS / $49.95

Children with Autism – A Parents' Guide

Edited by Michael D Posers, Psy.D
Recommended as the first book that parents should read, this guide provides a complete introduction to autism and how it may affect your childe through the first six years of life. It also discusses the impact of autism on family life and daily care, special education, advocacy and legal rights. WP300 $15.95

Children with Cerebral Palsy – A Parents' Guide

Edited by Elaine Geralis
This edition provides a complete spectrum of information and compassionate advice about cerebral palsy and its effect on development and education during a child's first six years. This book covers diagnosis, medical issues, family life, therapies treatment, special education and more. WP304 $16.95

Children with Fragile X Syndrome – A Parents' Guide

Edited by Jayne Dixon Weber
At last a comprehensive book on fragile X syndrome for parents. This comprehensive book provides a complete, sensitive in-depth look at the issues and concerns including: diagnosis; parental emotions; therapies and medications; development; early intervention; education; daily care; legal rights and advocacy. WP 310 $17.95

Children with Mental Retardation – A Parents' Guide
Edited by Romayne Smith, M.S., CCC-SLP

A book for parents of children with mild to moderate mental retardation, whether or note they have a diagnosed syndrome or condition. New parents can rely on this book to provide that solid foundation and confidence they need to help their child reach their highest potential. WP311 $15.95

Children with Spina Bifida – A Parents' Guide

Edited by Marlene Lutkenhoff, R.N., M.S.N.
This comprehensive publication provides easy-to-understand coverage of neurosurgery, physical therapy, emotional health education urological concerns, orthopedic concerns, childhood development and more. Birth to early elementary. WP302 $16.95

Children with Tourette Syndrome – A Parents' Guide

Edited by Tracy Haerle

This is an informative handbook for parents of children and teens. This book covers medical, educational, legal, family life, daily care emotional issues and more.

WP305 $16.95

Children with Visual Impairments – A Parents' Guide

Edited by M Cay Holbrook, Ph.D.

For families of children with visual impairments ranging from low vision to total blindness. This publication offers authoritative information and empathetic parental insight on diagnosis and treatment, orientation an mobility, literacy, legal issues and more. WP 303 $16.95

Choices in Deafness – A Parent's Guide to Communication Options

Edited by Sue Schwartz, Ph.D.

A useful and balanced aid in choosing the appropriate communication option for a child with a hear loss. Experts present the following communication options: Auditory-Verbal Approach, Bilingual-Bicultural Approach, Cued Speech, Oral Approach, and Total Communication. WP 312 / $17.95

Negotiating the Special Education Maze – A Guide for Parents and Teachers

Winifred Anderson, Stephen Chitwood, & Deidre Hayden

One of the best tools available to parents and teachers for developing an effective education program for their child or student. Every step is explained, from eligibility and evaluation to the IEP and beyond. This edition covers changes is disability laws, including the Americans with Disabilities Act (ADA) and Individuals with Disabilities Education Act (IDEA). It reviews early intervention services for children from birth to age three, and for those who have young adults with special needs, it also covers transitioning out of school. WP 314 / $17.95

Teenagers with ADD – A Parents' Guide

Inclusion: A Practical Guide for Parents
Tools to Enhance Your Child's Success in Learning
Lorraine O. Moore, Ph.D.

The education of students should be a collaborative effort between parents and educators. With inclusive education parents are asked to become actively involved in the direction and implementation of their child's individualized education plan. This can best be accomplished when parents view their children as maturing students and when they choose to work cooperatively with their educators.

This is an excellent resource for parents (and educators) of all school-aged children. This comprehensive publication provides parents with the tools necessary to enhance their child's learning experience both at home and in school.

Look inside to learn:

- why some children have difficulty learning
- how to identify your child's strengths and approaches to learning
  ways to chart your child's progress
- the value of a collaborative process between home and school
- the implications of the latest brain research for learning
- what inclusive education means for you and your child

You will also discover many strategies to help you:

- work effectively with the education system
- create a positive learning environment at home
- be more effective in working with your child in reading and writing
- know what to do when your child has attention difficulties
- work with your child to set goals and chart progress
- apply important brain research

Inclusion: A Practical Guide for Parents is a comprehensive, encouraging publication written for parents. This practical resource includes many easy-to-use worksheets, checklists and do-it-yourself graphs to help parents help their children benefit from learning experiences both at home an at school!
