ABSTRACT

This Kids Count data book examines statewide trends in the well-being of Connecticut's children. The report first examines how well children have faired during the past 100 years in terms of economics, education, health and safety, and race relations, and how they are doing at the start of the 21st century. This section also outlines the state's objectives or vision for children and the underlying principles of this vision. Following demographic information, the bulk of the report provides a statistical portrait of Connecticut's children based on 17 indicators of well-being: (1) family setting; (2) children in families receiving welfare benefits; (3) children receiving free or reduced-price school meals; (4) high school employment; (5) births to teen mothers; (6) low birthweight; (7) infant mortality; (8) late or no prenatal care; (9) physical fitness tests; (10) preschool experience; (11) performance on Connecticut Mastery Test; (12) performance on Connecticut Academic Performance Test; (13) high school dropout rates; (14) child abuse/neglect; (15) child deaths; (16) preventable teen deaths; and (17) juvenile violent crime arrests. Among the findings, the report indicates that the number of families receiving welfare benefits has decreased; the number of high school students working in excess of 16 hours per week has increased; births to teen mothers have decreased but the number still remains large; infant mortality has decreased as has the problem of late or no prenatal care; and the rate of high school dropouts has improved, as have child abuse/neglect rates. The number of juvenile violent crime arrests has increased. The remaining section of the report provides the child well-being information organized by region rather than indicator. Data

CAHS

The Connecticut Association for Human Services (CAHS) is an independent nonprofit, research, public education and policy development organization committed to promoting the health and well-being of our state's residents—young and old alike.

CAHS serves as a catalyst, working with diverse constituencies throughout the state to ensure the provision of human services that are of the highest quality, responsive to people's needs and cost-effective.

Founded in 1910 as the Conference on Charities and Corrections, the Association was reorganized in 1974 as CAHS. Our membership includes concerned citizens, religious leaders, corporations, labor leaders, human services professionals and organizations, educators, and policy makers. We welcome your membership and support.

Acknowledgments

First and foremost, I would like to thank the Annie E. Casey Foundation for the multi-year commitment it has made to supporting the development of this book and our entire KIDS 2000 initiative. In particular, thanks go to Doug Nelson, for his leadership and Jennifer Baratz and Bill O'Hare for their dedication to the KIDS COUNT mission.

Many people within the Connecticut Departments of Children and Families, Education, Public Health, Public Safety, and Social Services were incredibly helpful in their provision of data and technical advice. Special thanks go to them as well.

This book would not have been possible without the professional guidance and personal support of the staff at CAHS. They are the best group of people with whom one could ever hope to work. Their sense of humor, the depth of their caring for each other, and their commitment to making the world a better place is inspiring. Each of them has earned my undying admiration and gratitude. Special thanks go to Judy Demarest, Galia Ozni and Melinda Uccello, all of whom helped with the layout and design of this book. Thanks also go to Erin Bongard, *intern extraordinaire*, for her patience and help with research and data entry.

— *Michelle Doucette Cunningham*
Author

How to Use This Book

1. On pages 2-7, read the overview "Connecticut's Children: A New Century's Promise" to understand how well kids have done during the past 100 years.
2. On page 5, analyze the well-being of Connecticut's children in recent years.
3. Locate your town or city on the index and map on pages 12-13 and identify your local region.
4. Use the Child Well-Being Indicators section (pages 11-42) to compare your region to other regions and to the state overall on specific measures of child well-being.
5. Find your region in the Regional Profiles section (using the regional table of contents on page 43) to look at all the measures for your region, and compare how well your region is doing to the state overall.

Every attempt has been made to make the data easy to understand and adaptable for use in a variety of activities including public information and education, media coverage, publication in professional journals and newsletters, speeches, workshops and conferences, and proposal writing.

Connecticut's Children: A New Century's Promise

Introduction

We've come to the end of the century, and the beginning of a new millennium. It is fascinating and informative to look back 100 years and consider both the harsh realities of that time, and the promise that the new century held.

In 1900, when people looked around, they saw a world of true believers in the almost magical powers of science and technology. They saw waves of poor immigrants settling into new neighborhoods with the hope for a better life. They found a booming economy, built on cheap labor — soon to be organized into collective bargaining forces.

When the same people speculated on what the twentieth century would bring them, they could have guessed that revolutions in travel and communications were about to change the face of the world. They would have predicted — correctly in most instances — that these changes would lift more people to prosperity. What they could not have foreseen, however, was that the issues with which they were dealing — poverty too high, access to health care too limited, and educational systems that weren't meeting the needs of all children — were the same as those that would face their grandchildren and great-grandchildren in the year 2000.

Now, as then, improvements in communications and technology, it seems, come almost daily with the high tides. Now, as then, we have faith in the ability of our sciences to lift more of us to prosperity. Now, as then, however, while there is a great optimism about the future, the problems facing many of society's people with the greatest needs seem to be getting worse. Now, as then, the economy is booming, and yet the disparity between rich and poor has never been greater.

Could it be that 100 years from now, in the year 2100, the very same story will be told again? Or will we have finally solved some of the more plaguing problems of poverty and inequality of opportunity that so many of today's children and their families face?

At the turn of this century, we think it appropriate to take stock of where we are, where we've been, and where we're going. This book attempts to do just that, taking as its points of reference indicators of the well-being of Connecticut's children. Today's children will set the tone for this new century. Are they ready to meet the challenges that await? Are they well-educated, well-fed, and in good health? Are they safe? What kind of legacy have we adults left them?

11A

How were our children faring at the beginning of the past century?

While many of the issues we are facing today are similar to those our forebearers faced one hundred years ago, many changes in our state, nation and world have occurred since then. Tremendous progress has been made at improving the quality of life of the average American, children included. Let's look specifically at where we were . . .

Economics

Immigration, urbanization, industrialization and poverty characterized life for the majority of people in 1900. It was a time of great change in America with large numbers of people leaving the farm to move to American cities where expanding industry offered economic opportunity to unprecedented numbers of people, many of them immigrants. Factories and cities appeared almost overnight. In 1860, approximately 80 percent of the people lived in rural areas, but by 1920 nearly 60 percent lived in cities.

Yet this apparent economic opportunity left many people living in squalor, even with an average 52-hour work week. Approximately 40 percent of Americans were poor in 1900, with growing inequities between rich and poor. A national census taken in the summer of 1900 counted more than 76 million Americans — including four thousand millionaires. Turn of the century urban households spent half or more of their money on food.

Some of the greatest economic abuses centered on child labor. Hunger and poverty pulled children from the schools into the factories. In 1900, 40 percent of 14-18 year-old males and 18 percent of females the same age worked full-time. Even 18 percent of children ages 10-15 had full-time jobs. Children were considered property of their parents, with the child's earnings being the property of the parents as well.

Education

High school enrollment at the turn of the century was approximately 8 percent. While school attendance was compulsory in most places for younger children, school facilities were often badly lighted, poorly heated, and unsanitary. A class size of sixty was all too common.

The status of child care was even worse. While fewer women worked outside the home one hundred years ago (only 5 percent of married white women worked outside the home), the women who did so were often destitute, deserted by their husbands, and unable to turn to friends or relatives for aid. It was common for the youngest children of impoverished families to be locked in at home, in the care of only slightly older siblings, while their mothers worked. Privately funded "day nurseries" were just starting, but there were only about 200 of them in the entire United States at the turn of the century.

Health and Safety

Health status was substantially worse one hundred years ago. The medical profession as we know it did not exist. It was a time of snake oil salesmen offering to "cure whatever ails you." For the urban poor, public clinics might provide free care, but many people felt that they did more harm than good. Because there was no such thing as employer-sponsored health insurance, most families could not afford to see a private physician. Both poor access to care and poor care affected life expectancy. A child born in 1900 could expect to live only to the age of 47. Life expectancy was so low in part because infants and young children suffered so much from inadequate care. Out of every 1,000 babies born, 140 would die before their first birthday.

In terms of child safety, corporal punishment by parents and teachers was common. Children had no rights to protect themselves from abusive parents. Many youths ran away; many others were left to their own devices when their parents died. Orphanages were common throughout the U.S.

Racism

Even though slavery was dead, racism was growing at the turn of the century. The difference in the well-being of children of different races was staggering. Services of all types were segregated: schools, health care, orphanages, etc. While the "system" did little to help African-American children, the black community struggled to save its own. Nowhere was the issue of race more explosive than in the South, which was home to nine out of ten black Americans at the time. Although some progress was made after the Civil War, blacks saw many gains stripped away by poll taxes, literacy tests, and lynchings.

But racism was not only directed toward African-Americans. The turn of the century saw huge waves of immigrants — over a half-million people — arriving in the United States, most of whom were discriminated against in housing, employment, and education.

How are Connecticut's kids doing at the beginning of the twenty-first century?

On the surface, Connecticut's children appear to be much better off today than they were one hundred years ago. The infant mortality rate is down from 140 to six per thousand, an astounding improvement attributable both to improved public health practice and to outstanding neonatal intensive care. Families need to spend far less of their disposable income — about 20 percent — on food than the 50 percent they spent in 1900. Life expectancy for newborns has grown to 76 years, nearly thirty years longer than was the case 100 years ago.

While these improvements are truly dramatic, below the surface there are other stories to be told. In 1900, 40 percent of Americans were poor. In 2000, over half of Hartford's children live in poverty. What wealth there was in 1900 was more evenly distributed than it is in Connecticut today. The state has experienced the fastest growing disparity between rich and poor of any in the nation over the past twenty-five years. Children aged 10 to 15 are

no longer forced to work; yet today one-third or more of Connecticut's teenagers drop out of school in Connecticut's poorest cities, without ever attaining the promise of a decent job at a living wage. One-third of Connecticut's high school juniors and seniors work more than 16 hours per week which, when added to their school responsibilities, totals four hours more than the average 52-hour workweek of the youth one hundred years ago.

A fairer statement of comparison about the two centuries may then be the following: The scope and nature of the problems of poverty have changed during the last 100 years, but the problems still remain. The underlying question, therefore, is the same today as it was then: In light of all the issues confronting our children, families and communities, are we preparing today's children to be tomorrow's leaders?

In this book, we attempt to answer that question by looking at measures of economic security, health, education, and safety for regions across Connecticut. What we find is that in many ways, Connecticut is still failing to provide the basics that children need.

- In terms of economic security, Connecticut includes some of the wealthiest families and the poorest families in the nation, often living only miles of each other. One in four Connecticut students is considered low-income (e.g., a family of three earning less than \$25,000 a year.) The rising tide of prosperity is *not* lifting all boats, as many in Connecticut struggle to meet the basic need both to house and feed their families.
- Children's health in Connecticut has been improving in recent years for our youngest, but their physical well-being is still of great concern. With one in five children severely overweight, and fewer than one in three kids meeting basic physical fitness levels, we need to invest more in keeping our kids healthy, and in preventing the chronic diseases from which they will suffer as adults. The rate of low-weight births has been increasing steadily for the past fifteen years from

How Well Are Connecticut Children Doing Now?

Juvenile Violent Crime Arrests per 100,000 children ages 10-17, avg. 1996-98	1,440	451.1 per 100,000	Worse	42

* Number too small to calculate meaningful rate. ** This data is a summary of the data presented in the rest of the book. The statewide trends shown here are for the most recent time period, most commonly five years. Please refer to the Child Well-Being Indicators section, pages 18-42 for more detail.

6.4% of all births in 1983 to 7.3% in 1997. If this pattern continues, infant mortality will likely begin to climb again. We need to provide more services to pregnant women if we are to offset this trend. We need to do more, also, to reduce the large gap between children who grow up in low-income households without access to health care, and those in wealthier homes who benefit from quality preventive care.

- Connecticut's education system is one of the best in the nation overall, but many schools do not have the facilities and resources they need to serve kids well. Classrooms are still too crowded and teachers are still struggling to help children learn. Most disturbing is the large difference in student achievement between wealthy suburban schools and poorer urban schools. While progress is being made in addressing these issues, the picture painted by the statistics in this book is very disturbing: More than one in five (22.9%) sixth graders scored below remedial on either reading, writing or mathematics in 1998. In four of Connecticut's largest cities, the picture is more bleak: More than half of the sixth graders in these cities scored below remedial levels.

- The safety of all children remains an area of great concern. While great strides have been made over the past century at safeguarding children from harm, one preventable injury or death is one too many. Each year, thousands of children across the state become victims of child abuse and neglect, die of preventable causes, or commit violent crimes. Each instance is a heartbreaking door closed to a once bright future. It is essential that we keep our children safe from harm if efforts to improve the other measures of health, education or economic security are to have any meaning at all.

Some Good News and Some Bad....

Perhaps the best news to be found among the data in this book is that Connecticut is improving on all six measures of our children's educational well-being. Academic achievement on the Connecticut Mastery Tests and Academic Performance Tests has improved, with more students learning the basics, and more of them meeting high academic goals. Fewer students are dropping out of high school and more children regularly attend preschool.

Not all of these gains are equally shared across regions of the state, however, and there remains much work to be done by 21st century policy makers to assure equal educational opportunity for all students in the state. While the educational system in Connecticut still has serious flaws — especially noted in the tremendous gaps in student achievement between affluent and impoverished schools — we are at least headed in the right direction.

The worst news we have to share is in the striking difference in outcomes between children growing up in wealth and those in poverty in our state. The five largest cities in Connecticut scored worse than the statewide average on almost every single indicator, in many cases doing more than twice as poorly. Their poor outcomes on many of these indicators are linked directly to child poverty, and because poverty is concentrated in urban areas, these areas will see significantly worse rates than average. When this book combines the data for many smaller cities with their surrounding suburbs for the purposes of creating approximately equivalent regions, it may gently mask an important truth: Many small cities have problems similar to those of Connecticut's largest cities. Whether large or small, the reality of 2000 is that there are not enough local resources to deal with these problems in Connecticut cities of any size.

When the 2000 census data are released, we will have a better measure of poverty at the local level. Yet, based on currently-available information, statewide figures show that while welfare

15A

15

rolls are decreasing, it appears that child poverty was actually increasing in the latter half of the 1990's. An extensive survey of emergency food sites and their clients conducted by CAHS last year found that the need for emergency food was rising, especially among children and working adults. Donations to soup kitchens and food pantries were level or down, but demand was up. In addition, the need for food among these working families and others went beyond a one-time emergency need. Many reported needing ongoing food assistance, signaling the existence of a chronic problem of food insecurity in Connecticut. It is known that hungry children are also at risk of other educational and health problems as a consequence of their hunger. Are these problems about to get worse in Connecticut?

The number of students who are eligible to receive free or reduced-price school meals is the best available local level measure of the economic security of Connecticut families. At the start of the new century, one-quarter of Connecticut's children qualify for these meals. In the wealthiest state in the world's wealthiest nation, this number is startling.

As we enter the new millennium . . .

We can and must do better by our children if we are to prepare them to lead us into the next millennium. At the close of the nineteenth century, newspapers and magazines predicted marvelous things for the next hundred years: Great airships would fly across the seas, wireless telephones would span the world, people would watch moving images in their own homes. Anything seemed possible. With ingenuity, hard work, and plenty of government support, these things happened.

At the beginning of the twentieth century, there were even predictions that the next hundred years would witness an end to poverty and war. For a variety of reasons, these things didn't happen.

Now, at the beginning of the 21st century, we have a choice. We can invest in our children the way we invest in our technology, or we can ask our children to make it on their own. With so many technological advances having come to pass, is it so hard to believe that we can make our children more prosperous too?

What will be the measures of our success in the 21st century? While it is too soon to know them all, we know today that one measure must be a healthy start to life and a secure childhood for every child. We have a long way to go to meet that goal. We hope that this book will help set the foundation upon which we must build.

Our Vision for Connecticut's Children

Every child should have the opportunity to develop to his or her full potential. In order for this opportunity to be guaranteed to every child, the following broad goals must be met:

Security

All children deserve a secure future and to grow up in an economically stable family.

Health

All children deserve to be free from hunger and preventable disease and to receive regular health care.

Education

All children deserve an education that prepares them for the future and inspires them to achieve their potential.

Safety

All children deserve to grow up in nurturing families free from abuse, violence and the devastation of alcohol and other drugs.

Underlying Principles

In order to achieve this vision for Connecticut's children, every segment of society will have to do its part. We believe that:

Families are the primary caregivers for children. Families have the first responsibility for the physical and emotional well-being of children. Families, as first teachers, provide the most basic education for children, from early verbal language skills to values and ethics. But despite their best efforts, it is hard for some families to raise their children without help — particularly when a dramatic reshaping of our economy has changed the rules of the game for many parents. Given these new economic and social realities, some families will require more assistance than others.

Communities are also responsible for the children in their midst. Some entities within the community, such as schools, have clearly defined roles. Others, including churches and civic organizations, have a responsibility to help children directly and raise the consciousness of the whole community about children's needs. Of late, some employers and businesses have begun to consider children and family issues as they explore current and future workforce concerns.

Government's responsibility for children is to be the bootstrap that guarantees equality of opportunity. Recognizing that not all families and communities will be equally well equipped to provide for children, government at all levels (local, state and federal) must help to balance the scales. The evidence is clear: Investing in government programs that work for children can assure them all a fair start in life.

Children must be given the opportunity to experience the richness of economic and ethnic diversity in their neighborhoods and in their schools. Through government policies on housing and innovative efforts to promote school integration, we must begin to break down the barriers that separate children along ethnic, racial and economic lines.

Security

Our Vision:

All children deserve a secure future and to grow up in an economically stable family.

Children Receiving Welfare (TFA)

Definition

The Temporary Family Assistance (TFA) program provides cash assistance to impoverished families with children who meet certain criteria. This is the program most commonly thought of as "welfare" in Connecticut. The number shown here is the number of children receiving benefits in June of 1997 and 1998.

Size of the problem

There are 52,218 children receiving TFA benefits in Connecticut (7.0% of the child population) a decrease of more than a quarter from the year before. However, because not every child who is poor receives TFA benefits, it is only a measure of program participation and cannot be used as a complete measure of child poverty. Other measures (see next page) show that more than twice as many children who get TFA are eligible for free lunches, a more accurate measure of the economic security of school-age children.

Impact

Children are poor because they live with adults who are poor. Education, race, age and marital status are the factors that most affect family income. Children living in poverty are more likely to have learning disabilities, emotional and behavioral problems, experience school failure, and be at risk for teenage childbearing, child abuse and neglect, crime and delinquency.

Solutions

More living wage jobs, job training opportunities, improved transportation and availability of quality child care, and increased availability of substance abuse treatment programs will reduce the need for welfare. Continuing to improve child support collections will help children while reducing government expenditures in the future.

Source: Connecticut State Department of Education = Worse than state-wide rate.

Note: The 1998-99 school year was the first year which data was collected for eligibility for free or reduced-price school meals, as opposed to program participation. Therefore this data is not comparable to previous years' data, and region to region comparisons should be made with caution.

Definition

Students whose families earn less than 130% of the federal poverty level (FPL), or \$21,710 for a family of four, are eligible for free school meals. Students whose families earn between 130% and 185% of the FPL (\$30,895 for a family of four) are eligible for reduced-price meals. These data are shown as a percentage of total school enrollment for the 1998-99 school year.

Size of the problem

One-quarter (110,771 or 25.3%) of all Connecticut students were eligible to receive free or reduced-price school meals. Although not truly a measure of child poverty, this indicator is the most accurate measure of the number of school-age children living in low-income families that is available annually on a local level in Connecticut.

Impact

In addition to the causes of poverty listed under the "Children Receiving Welfare" heading, it is important to note that most low-income families have at least one parent working full-time. This shift toward "working but poor" is one of the most striking changes in Connecticut family poverty in the past thirty years.

Although not every child eligible for free meals can be classified as poor, children living in poverty are more likely to have learning disabilities, emotional and behavioral problems, experience school failure, and be at risk for teenage childbearing, child abuse and neglect, crime and delinquency.

Solutions

In addition to improved job training opportunities and child support collections, increasing the minimum wage would help many of Connecticut's low-income families raise their children. In addition, there are many changes to Connecticut's tax code which would help lower-income working parents. Availability of quality child care, including before- and after-school care, is also crucial if struggling parents are going to be able to stay employed.

High School Employment

Definition

The number of high school juniors and seniors who work more than 16 hours per week, shown as a percentage of students who responded to the survey.

Size of the problem

Almost one-third (31.3%) of all high school juniors and seniors reported working more than 16 hours per week.

Impact

Work experiences during the teen years are often very positive introductions into the world of work, teaching young people responsibility and money management. However, a consequence of employment is often a decline in school performance. The primary job of high school students should be to complete their education, yet many jeopardize their school success by working long hours at jobs to earn money.

High school students work excessive hours (here defined as more than 16 hours per week) primarily because they need the income, either to help maintain their household, save for college or a car, or for spending-money for clothes and recreation. However, their ability to work also requires that there be jobs available and that the youth have transportation to and from work.

Solutions

Any steps to increase family economic security would likely allow students to focus more on their school work rather than earning money.

☐ = Worse than state-wide rate.

Definition

This indicator tracks the number of babies born to women age 19 or younger, and is expressed as a percentage of all live births.

Size of the problem

There were 3,578 babies born to teenage mothers in 1997.

Impact

Two primary factors are involved in teen births: the number of teenage girls who get pregnant, and the number of teens who choose to carry the fetus to term. Studies suggest that as many as 85% of teen pregnancies are unintended.

Being poor without the hope of alternative life choices increases the likelihood of teen pregnancy. Teens who exhibit problem behavior in school are more likely to end up teen mothers. Girls whose friends and siblings are already mothers are also more likely to become teenage mothers. Lack of information and access to birth control also increases the likelihood of unintended pregnancy.

Children are more likely to be born to teen mothers in urban and poor areas of Connecticut. Black and Hispanic teens are disproportionately represented. Twenty-three percent of all Hispanic births and 18% of all black births are to women age 19 or younger while only 4% of all white births are in that same age group.

Research indicates that children of teen mothers are more likely to grow up poor and rely on public assistance. They are also at a greater risk of lower intellectual and academic achievement, behavior problems and early child bearing than children of older mothers.

Solutions

There are numerous successful teen pregnancy prevention programs in Connecticut. These programs must be better funded and new programs created if we are to reduce the rate of births to teen mothers.

Health

Our Vision:

All children deserve to be free from hunger and preventable disease and to receive regular health care.

Low Birthweight

Definition

Low birthweight, defined as under 5½ pounds (2,500 grams), is a major factor in infant mortality. It is reported as a rate per 1,000 live births.

Size of the problem

3,136 babies were born in Connecticut in 1997 who weighed less than 5½ pounds. This translates to 73.4 per 1000 births or 7% of all births. The percentage of all infants who are born too small has increased over the past decade. Connecticut ranks 21st in the nation on this measure.

Impact

Nearly two-thirds of low-weight births are caused by cigarette smoking during pregnancy, low maternal weight gain and low maternal weight before pregnancy. Teenagers and women living in poverty are at greater risk of experiencing low-weight births.

Despite being a fraction of all births, low-weight births account for more than one-third of all dollars spent on health care for infants. In their first year, low-weight infants on average have health costs which are six times greater than those of normal weight infants.

Solutions

Increasing the number of healthy pregnancies will have the greatest impact on low-weight births. Strategies should include promoting positive prenatal lifestyles, specifically smoking cessation during pregnancy, and increasing access to quality prenatal care that includes early risk assessment and health promotion.

 * Number too small to calculate meaningful rate.
 ☐ = Worse than state-wide rate.

Definition

The infant mortality rate provides a general measure of Connecticut's maternal and child health status. It is reported as the number of infants deaths (under one year of age) per 1,000 live births.

Size of the problem

In Connecticut, 310 infants died in 1997 before their first birthday. Recent decreases in the rate of infant deaths continues an improving trend over the last decade. Nationally, Connecticut ranks 16th on this health measure.

Impact

Birth defects, sudden infant death syndrome, low birthweight, premature birth, and respiratory distress syndrome are the leading causes of infant deaths. Infant mortality rates are higher for teenage mothers, mothers with fewer years of education, unmarried mothers and mothers who smoked during pregnancy.

Each infant death is a tragedy for parents, siblings and other family members, and represents a great cost to families and society in terms of lost potential and productivity. Direct medical costs include charges for physician care of infants suffering birth complications and rehospitalization.

Solutions

Policies that emphasize healthier pregnancies and reduce low-weight births and premature deliveries — such as universal access to quality prenatal care and substance abuse counseling — will lower the infant mortality rate. Continued advances in medical care will also improve the survival rates of at-risk infants.

Late or No Prenatal Care

Definition

Late prenatal care is defined as medical care that begins after the first three months or trimester of pregnancy. These data represent the number of births receiving late or no prenatal care, and are shown as a percentage of all births.

Size of the problem

One out of every ten (4,342) babies received late or no prenatal care in 1997. This is an improvement over recent years.

Impact

Lack of health insurance, transportation issues, and lack of education as to the benefits of early prenatal care all contribute to this problem. Poor women, very young women and poorly educated women are least likely to receive prenatal care in their first three months of pregnancy. The Black and Hispanic communities are disproportionately affected by this problem.

Babies born to women who receive early prenatal care are less at risk of low birthweight, sickness, or dying in their first year. Women who do not receive routine care during their pregnancies are approximately three times as likely to deliver low birthweight infants as those who do. Early prenatal care is a cost-effective means to reduce problems later in life which are associated with early birth and health problems. The National Institute of Medicine estimates that for every dollar invested in prenatal care, \$3.38 will be saved for the care of low birthweight babies in their first year of life.

☐ = Worse than state-wide rate.

Solutions

Strategies should include increasing access to health insurance, culturally-sensitive public education about the importance of early and regular medical care during pregnancy, and decreasing barriers such as transportation.

Physical Fitness Tests

Size of the problem

Twenty-eight percent (28.3%) of the students in grades 4, 6, 8 and 10 met the national physical fitness standards on all four subtests in 1997. This is up slightly from 25% in 1993. In all four grades, boys scored higher than girls, with the largest difference in scores occurring among tenth grade students, where one in five girls passed the tests (20.4%) compared to one in three boys (36.2%).

Impact

Surveys suggest that 15 to 25 percent of children in the U.S. are obese. Sedentary habits are in part to blame. Poor physical health can affect a person's ability to function throughout his or her lifetime. Although many health problems associated with inactivity and obesity, such as diabetes, hypertension and heart disease, do not usually develop until adulthood, the process of atherosclerosis begins early in life. Obese children tend to have higher blood pressure and higher blood cholesterol levels which can develop into health problems down the road.

Solutions

The development of a healthy lifestyle should start at a young age and be reinforced in school by health and physical education programs. Yet some Connecticut schools do not have adequate physical education facilities or adequate funding for health and athletic programs to help promote physical well-being. Increased access to after-school recreation programs would also improve students' overall physical fitness.

Definition

The number shown here is that of students in grades 4, 6, 8 and 10 who met national age and sex standards on all four components of the national physical fitness test during school year 1997-98: sit-and-reach, sit-up, pull-up, and mile run tests. The rate is calculated as a percentage of all students in those grades who took the tests.

Education

Our Vision:

All children deserve an education that prepares them for the future and inspires them to achieve their potential.

Preschool Experience

Definition

Many Connecticut children start kindergarten not ready to learn. The "school readiness" measure used by the state Department of Education is the number of students enrolled in kindergarten who regularly attended a Head Start program, licensed family day-care home, nursery school, licensed day-care center or public preschool program the previous year. It is expressed as a percentage of all students enrolled in kindergarten that school year. This is an approximate measure, however, because children who do not attend these programs can have the types of experiences at home that prepare them for school.

Size of the problem

Twenty-eight percent of all kindergarteners in 1998-99 had not participated in some form of preschool on a regular basis. However, this measure has consistently shown improvement over the past five years. Poorer regions in Connecticut show the lowest levels of participation in preschool programs.

Impact

The way children function, from the preschool years through adolescence and into adulthood, hinges in large part on their experiences before they start school. In high-quality care, kids can become emotionally secure, intellectually curious and capable, and socially competent, all qualities necessary for school readiness. High quality child care is one way to ensure that young children have the types of experiences they need to build a sound foundation for success later in life.

Regular attendance at full-day child care is a necessity for many families where both parents work. Most quality child care programs include an educational component and prepare children to enter kindergarten ready to learn.

Solutions

Making preschool affordable for any family who wants it will help to ensure that children get the types of experience they need to succeed. Additional attention to increasing the quality of care provided in all types of child care settings will improve the experiences of children cared for outside the home.

Meeting Connecticut Mastery Test Goal

Size of the problem

During the 1998-99 school year, 33.8% of Connecticut 6th graders were able to meet or exceed this goal, up significantly from 23.8% five years earlier. The improvements in Connecticut cities were even more pronounced than the state average, yet in the four poorest cities fewer than one in twelve students (8.2% or lower) met the state goal on all three subtests.

Impact

In poll after poll, Americans cite education as one of their top concerns for the nation. Certainly the nation's economic and social progress depends on having well-educated citizens. For individuals, academic achievement is the foundation for success later in life.

While Connecticut has much to be proud of, many students are not achieving at the levels we want. An achievement gap exists between urban and suburban schools and even within each school. The gap between those students who are succeeding and those who need more support tells us that there is still much more to be done to make our educational system work for everyone.

Solutions

There are many ways in which Connecticut could decrease the inequalities in student achievement. One of the most promising solutions is to decrease class size thus providing more personal attention and individualized instruction for every student. At a very basic level, we must ensure that school facilities are adequate for teaching and learning, and we must operate under the assumption that all children can perform at high levels. By involving broad community resources we can strengthen home/school connections.

Definition

The Connecticut Mastery Test consists of reading, writing and mathematical subtests. Ideally, every student would achieve the high-level academic performance goal established by the state. This table shows the number of sixth grade students who achieved the goal on all three subtests.

Below Connecticut Mastery Test Basic Level

Definition

The Connecticut Mastery Test consists of reading, writing and mathematical subtests. The state has established basic performance levels below which students are considered in need of remedial help. This table shows the number of sixth grade students who scored below the remedial standard on one or more subtests.

Size of the problem

During the 1998-99 school year, 22.9% of Connecticut sixth graders scored below this remedial level on one or more of the subtests. This measure shows a significant improvement over five years earlier, down from 34.1% of all students, yet in Connecticut's four poorest cities more than half of all sixth graders scored below the remedial level on one or more of the three subtests.

Impact

In poll after poll, Americans cite education as one of their top concerns for the nation. Certainly the nation's economic and social progress depends on having well-educated citizens. For individuals, academic achievement is the foundation for success later in life.

While Connecticut has much to be proud of, many students are not achieving at the levels we want. An achievement gap exists between urban and suburban schools and even within each school. The gap between those students who are succeeding and those who need more support tells us that there is still much more to be done to make our educational system work for everyone.

Solutions

There are many ways in which Connecticut could decrease the inequalities in student achievement. One of the most promising solutions is to decrease class size thus providing more personal attention and individualized

Definition

The Connecticut Academic Performance Test consists of four major subtests: language arts, mathematics, science and an interdisciplinary task that involves writing an explanation in addition to multiple choice questions. Ideally, every student would achieve the high-level academic performance goal established by the state. This table shows the number of tenth grade students who achieved the goal on all four subtests.

Size of the problem

In the 1998-99 school year, only one in seven Connecticut tenth graders (15.3%) was above the mastery level on all four subtests. Fewer than 2% of the students in Connecticut's four poorest cities were above mastery in all four areas.

Impact

In poll after poll, Americans cite education as one of their top concerns for the nation. Certainly the nation's economic and social progress depends on having well-educated citizens. For individuals, academic achievement is the foundation for success later in life.

While Connecticut has much to be proud of, many students are not achieving at the levels we want. An achievement gap exists between urban and suburban schools and even within each school. The gap between those students who are succeeding and those who need more support tells us that there is still much more to be done to make our educational system work for everyone.

Solutions

There are many ways in which Connecticut could decrease the inequalities in student achievement. One of the most promising solutions is to decrease class size thus providing more personal attention and individualized instruction for every student. At a very basic level, we must ensure that school facilities are adequate for teaching and learning, and we must operate under the assumption that all children can perform at high levels. Source: Connecticut State Department of Education = Worse than state-wide rate.

Definition

This measure shows the number of high school students who leave school prior to graduation in any one school year, and is expressed as a percentage of the total high school enrollment. Those students who leave school before the ninth grade are not counted in this measure.

Size of the problem

Every year almost five thousand students (3.5%) drop out of high school. Three cities have dropout rates that are more than double the state average. Waterbury's dropout rate is 8.6%, Bridgeport's is 7.6%, and Hartford's is 9.6%, yet these cities show dramatic improvement over the past five years.

Impact

High school dropouts are three times as likely to slip into poverty than those who finish high school. During their adult lives, dropouts will earn half the income of high school graduates and less than a third of college graduates. Real wages for high school dropouts have declined by 23 percent since 1973. About one-half of the U.S. prison population consists of high school dropouts.

Declining grades, teenage pregnancy, lack of school success and a dislike for school are the most often cited reasons for dropping out. Characteristics common to dropouts include making poor grades, repeating a grade, being overage for their grade, or being absent frequently.

Solutions

Promising practices that help students stay in school include incentives for improved performance, tutoring or mentoring, transfer to different schools, and links with appropriate community agencies to address personal or family difficulties.

Child Abuse/Neglect

Definition

Many Connecticut children are threatened by physical injury, sexual abuse, psychological or emotional harm, and neglect. The data presented here include the number of children whose cases have been substantiated as child abuse or neglect shown as a rate per 1,000 children under age 18 during the state fiscal year, from July 1 through June 30.

Size of the problem

More than 16,705 children were confirmed as abused or neglected in Connecticut between July 1, 1998 and June 30, 1999 by the Department of Children and Families. That translates to 22 out of every 1,000 children.

Impact

Child abuse or neglect usually results from a combination of factors related to the parents' background and behavior, external crises and stresses, and the child's background and behavior. Parents who were abused, have a history of criminal activity, mental illness or substance abuse, suffer from low self-esteem, social isolation or depression, or have poor coping or problem-solving skills, are more likely to abuse or neglect their children. A parent's reaction to external stresses often increases the risk that a parent will abuse.

In addition to the consequences suffered by child victims of abuse or neglect, direct costs related to child maltreatment include child welfare services for investigations, in-home services, and placement. Indirect long-term costs of failing to prevent abuse or neglect include teen pregnancy, substance abuse treatment, income maintenance programs, medical assistance, job training, and police and prison expenses.

Solutions

In addition to improving the general welfare of children, Connecticut must commit to providing sufficient resources for two types of programs: those that identify children and families at risk, and those that assist families in crisis.

 [Shaded Box] = Worse than state-wide rate.
 * Number too small to calculate meaningful rate.

Definition

The child death rate is the number of deaths from all causes — including both illness and injury — per 100,000 children ages 1 - 14.

Size of the problem

More than 120 children died in Connecticut each year since 1993, resulting in a rate of 24.1 deaths per 100,000 children. Connecticut's child death rate ranks 16th nationally.

Impact

More children die from accidents than all contagious diseases added together. Motor vehicle crashes account for more of the deaths than other types of accidents. Other major causes of fatal accidents include falls, poisoning, and drowning. Abuse and neglect also play a role in the child death rate.

Injury rates are greatest among poor children and higher for boys than girls. The risk of childhood injury depends on the developmental level of the child, his or her exposure to dangers, protective measures taken and the level of adult supervision.

Child deaths represent lost potential. Non-fatal injuries leave children temporarily or permanently disabled, result in time lost from school, decrease children's ability to participate in activities and increase burdens on the health care system.

Solutions

The child death rate could be improved through increased prevention efforts such as those promoting wider use of bicycle helmets, car seats, and similar safety devices. Reducing the number of motor vehicle crashes would address the number one cause of child deaths in Connecticut.

50

Preventable Teen Deaths

Definition

This indicator shows the number of deaths to teens ages 15-19 years old that result from accidents, suicides, or homicides (which includes police intervention). No rate is calculated due to the low numbers recorded at the regional level.

Size of the problem

During 1997, 55 youths died from accidents, 9 died from suicide, and 18 died from homicide. Preventable teen deaths make up 60% of all deaths to Connecticut teens.

Impact

Motor vehicle crashes are the primary cause of preventable teen deaths. Causes of teen violence include easy access to handguns, alcohol and drugs, poverty and unemployment, negative peer and family influences, the lack of positive role models and the media's glamorization of violence.

Teenagers as a group are more likely to take risks, less likely to use safety belts, and more susceptible to the effects of alcohol. Teens who have a history of substance abuse, psychiatric disorders, exposure to violence (including other teen suicides), or who feel isolated are at greatest risk for suicide.

Solutions

Policies that increase seat belt usage and limit teens' access to alcohol will decrease the number of teen deaths from accidents. Successful teen violence prevention efforts include teaching alternatives to aggression, mentoring programs, targeted media messages, and individual and group counseling. Suicide prevention begins with closer parent-child relationships and alertness to changes in behavior. Stricter gun control laws would make teen violence less lethal, as well as reduce the number of suicides.

Definition

The juvenile violent crime arrest rate tracks arrests of juveniles for the crimes of murder, rape, robbery or aggravated assault. It is reported as arrests per 100,000 youths aged 10 through 17.

Size of the problem

Juveniles accounted for 1,216 violent crime arrests in 1998, down from a high of 1,609 in 1996, resulting in a three-year rate of 451.1 per 100,000 youths. Almost two-thirds (63%) of the arrests were for aggravated assault, and 29% were for robbery. One-third of the arrests occurred in Hartford, Bridgeport and New Haven.

Impact

Drug abuse, the increasing availability of weapons and the growth of gangs have contributed to the increase in juvenile violence. In addition, the number of children at risk for becoming delinquent continues to increase.

Research shows that most juvenile crimes occur in the late afternoon, when teens are often unsupervised. Children are more likely to be delinquent when they have friends who get into trouble, do poorly in school, live in high-crime neighborhoods, have weak family attachments, or are not consistently disciplined or supervised. When a child is physically abused or neglected early in life, he or she is at greater risk to become a violent juvenile offender.

Solutions

Connecticut must commit to a serious prevention effort if it wants to deter juvenile crime. More resources for alternative schools, juvenile probation officers, after-school programs, juvenile justice intervention programs and safe school measures could prevent much of the tragedy that results from juvenile crime.

Percent Under 18, 1990
Race/Ethnicity, 1990
Family Setting: Two Parent Families,
Single-Parent Families, and
Children Living in Other Situations

Child Well-Being Indicators:

Below CAPT Basic Level

The Connecticut State Department of Education uses the Connecticut Academic Performance Tests (CAPT) to evaluate tenth grade students in four areas: language arts, mathematics, science and an interdisciplinary task. The rates are calculated by dividing the number of students who scored below the remedial standard on any one of the four tests by the total number of students taking the tests.

Sources: Connecticut State Department of Education, *Connecticut Academic Performance Test Results, 1996-97 and 1998-99*.

Below CMT Basic Level

The Connecticut State Department of Education uses the Connecticut Mastery Tests (CMT) to evaluate sixth grade students on their reading, writing, and mathematical skills. The rates are calculated by dividing the number of students who scored at or above goal on all three tests by the total number of students taking the tests.

Sources: Connecticut State Department of Education, *Connecticut Mastery Test Results, 1994-95, and 1998-99*.

Births to Teen Mothers

The number of teen births is defined as the total number of babies born to mothers age 19 or younger. The rate is the total number of teen births divided by the total number of births, then multiplied by 100 to get a percentage. The percentage shown here measures the risks to the generation of babies being born today. The teen birth rate, which compares the number of teen births to the number of teenage girls, is not available at a local level because of a lack of reliable data for the number of teenage girls to use as a denominator.

Sources: Connecticut Department of Public Health, unpublished data, and *Registration Reports, 1987, 1992 and 1997*.

Child Abuse/Neglect

The rate is the total number of children who have been confirmed by the Connecticut Department of Children and Families as neglected or abused in the state fiscal year (between July 1 and June 30), divided by the estimated number of children ages 1-18, then multiplied by 100 to get a percentage. The number of children used to calculate the rates is based on applying the percentage of population under 18 for each region from the 1990 Census to the Connecticut Department of Public Health estimate of population for 1996 and 1998.

Sources: Connecticut Department of Children and Families, unpublished data, state fiscal year 1996-97 and 1998-99.

Child Deaths

The annual average number of child deaths shown here is the total number of deaths to children ages 1 to 14 over a five year period, 1993-1997, divided by five. The annual average rate is the total number of child deaths over five years, divided by five, divided by the estimated number of children ages 1-14, then multiplied by 100,000 to get a rate per 100,000 children in that age group. The number of children used to calculate the rates is based on applying the percentage of population ages 1-14 for each region from the 1990 Census to the Connecticut Department of Public Health estimate of population for 1997.

Sources: Connecticut Department of Public Health, unpublished data, 1993-1997.

Children Receiving Welfare (TFA)

The numbers shown here are the total number of children receiving welfare benefits (TFA) in June of that year. It is a snapshot in time and does not represent the total number of children who received TFA at any time during that year. The rate is calculated by dividing the number of children receiving TFA by the estimated number of children in that region. The total number of children used to calculate the rates is based on applying the percentage of population under 18 for each region from the 1990 Census to the Connecticut Department of Public Health estimate of population for the years 1997 and 1998.

Sources: Connecticut Department of Social Services, unpublished data, 1997 and 1998.

Free or Reduced-Price School Meals

Schools report to the Connecticut State Department of Education the number of children who are eligible for free and reduce-price meals. Income guidelines for this program are 130% of the federal poverty level (FPL) for free lunches and 185% of the FPL for reduced-price meals. Charter and magnet schools by their very nature draw students from across regional boundaries; data for these schools has been included as a separate row on the table on page 20. The 1998-99 school year was the first year which data was collected based on eligibility, as opposed to program participation. For this reason, the 1998-99 data is not comparable to previous years' data and region to region comparisons should be made with caution.

Source: Connecticut State Department of Education, unpublished data, 1998-99.

High School Dropouts

Dropout rates used here are only for high school students and only include the number of youths who dropped out of school in the given year. They do not include the number of children who drop out of school before ninth grade. The dropout figures include students who officially withdraw from school, those who enter a non-educational program (e.g. truck driving school or GED classes), and those whose status is unknown. Students transferring to another school are not counted as dropouts. These figures do not include the one percent of students who are enrolled in ungraded classes. Please note that the data is only for a single year, and is *not* a cumulative rate as is sometimes reported.

Source: Connecticut State Department of Education, *Dropout Data Analysis on Public School Districts in Connecticut, 1992-93, 1997-98.*

High School Employment

To obtain this percentage, the number of juniors and seniors who reported working for pay 16 or more hours during a typical week was divided by the number of juniors and seniors reported as employed or unemployed. Cooperative work experience during normal school hours and volunteer work were excluded.

Source: Connecticut State Department of Education, unpublished data, 1997-98 and 1998-99.

Infant Mortality

The annual average infant deaths shown here is the total number of babies who die before their first birthday over a three year period, divided by three. The annual average rate is the total number of infant deaths over three years, divided by the total number of live births over the same three years, then multiplied by 1,000 to obtain an infant mortality rate per 1,000 live births.

Sources: Connecticut Department of Public Health, unpublished data, and *Registration Reports, 1985 through 1997.*

Juvenile Violent Crime Arrests

Violent crimes include murder, rape, robbery and aggravated assault. Because of the large difference in the number of arrests each year, three year averages are shown. The annual average number of arrests is a total for the three year period divided by three. The annual average rate is the annual average number divided by the estimated number of children age 10-17, multiplied by 100,000 to get a rate per 100,000 children of this

age group. The number of children used to calculate the rates is based on applying the percentage of population age 10-17 for each region from the 1990 Census to the Connecticut Department of Public Health estimate of population for the years 1992 and 1997. The number of arrests of children for violent crimes includes arrests made by local and state police. Unfortunately, the data is not reported identically for these agencies. Approximately 85% of all juvenile arrests for violent crimes are made by local police, and this data is reported by the town in which the arrest was made. The 15% of arrests made by the state police are reported by the town in which the child lives. State police arrests are important to include because many rural regions do not have municipal police departments, and the majority of the arrests in these regions are made by the state police. Therefore, one should exercise caution when using this data because the total number of juvenile arrests for each region includes data from these two sources. Despite these limitations, given the limited mobility of children ages 10-17, police experts believe that this data is still valid.

Sources: Connecticut Department of Public Safety, *Crime in Connecticut, 1991 - 1998 Annual Reports*, and unpublished data.

Late or No Prenatal Care

The rates are calculated by dividing the total number of births with late or no prenatal care by the total number of births where the status of prenatal care has been determined.

Sources: Connecticut Department of Public Health, unpublished data, and *Registration Reports*, 1992, 1997.

Low Birthweight

The rates are calculated by dividing the number of low birthweight births by the total number of births, then multiplying that by 1,000 to obtain a low birthweight rate per 1,000 births.

Sources: Table data from the Connecticut Department of Public Health, unpublished data, and *Registration Reports*, 1987, 1992, and 1997.

Meeting CAPT Goal

The Connecticut State Department of Education uses the Connecticut Academic Performance Tests (CAPT) to evaluate tenth grade students in four areas: language arts, mathematics, science and an interdisciplinary task. The rates are calculated by dividing the number of students who

scored at or above goal on all four tests by the total number of students taking the tests.

Sources: Table data from the Connecticut State Department of Education, *Connecticut Academic Performance Test Results, 1996-97 and 1998-99*.

Meeting CMT Goal

The Connecticut State Department of Education uses the Connecticut Mastery Tests (CMT) to evaluate sixth grade students on their reading, writing, and mathematical skills. The state goal is the level that ideally every student at that grade level is expected to achieve. The rates are calculated by dividing the number of students who scored at or above goal on all three tests by the total number of students taking the tests.

Sources: Connecticut State Department of Education, *Connecticut Mastery Test Results, 1994-95, and 1998-99*.

Physical Fitness Tests

Schools report to the Connecticut State Department of Education the number of students who met national age and sex standards on the sit-and-reach, sit-up, pull-up and mile-run tests. Percentages are calculated by dividing this by the number of students taking all four tests.

Sources: Connecticut State Department of Education, unpublished data, 1997-98.

Preschool Experience

This data shows the number of students enrolled in kindergarten in the fall of the given year, who regularly attended a Head Start program, family day care center, nursery school, licensed day care center or public preschool program in the previous year.

Sources: Connecticut State Department of Education, unpublished data, 1997-98, 1998-99.

Preventable Teen Deaths

Because of the small number of teen deaths in any given year, this book reports only five-year total number of deaths by cause, not an annual average as in the other charts.

Sources: Connecticut Department of Public Health, unpublished data, 1993-1997.

Demographic data:

Total Population, 1998

Sources: Connecticut Department of Public Health, *Estimates of Town Population, 1992-1998*.

Population Under 18, 1998

Estimates of the number of children are calculated by applying the percentage of the total population ages 1-14 for each region from the 1990 Census to the Connecticut Department of Public Health population estimates for 1998.

Sources: Connecticut Department of Public Health, unpublished data, 1998.

Percent Under 18, 1990

Sources: U.S. Bureau of the Census, *Census of Population and Housing, 1990*.

Race/Ethnicity, 1990

We have reported race and ethnicity using the categories established for the 1990 U.S. Census and used by state agencies providing the data. People of Hispanic origin may be of any race.

Sources: U.S. Bureau of the Census, *Census of Population and Housing, 1990*.

Family Setting: Two Parent Families, Single-Parent Families, and Children Living in Other Situations

Sources: U.S. Bureau of the Census, *Census of Population and Housing, 1990*.

Methodology

Number:

For each indicator, we include the number of "events" for a given time period, for example, the number of high school students who dropped out during the 1997-98 school year.

Rate:

For 17 of the 18 child well-being indicators, we include rates as well as numbers. A rate is a measure of the likelihood of an event, and is calculated by dividing the number of events by the number of persons that are "eligible" for that event. For example, the high school dropout rate is the number of students who dropped out in a given year by the number of students enrolled. A percentage is a rate per 100. Other rates included here are per 1,000 or 100,000. Rates can be used to compare between regions for a specific indicator. The regions with rates worse than the statewide rate are highlighted on each table. Meaningful rates can not be calculated for the teen deaths measure at the local level because of a lack of reliable data for the number of teenagers to use as a denominator.

Rounding:

In the charts, all rates are calculated to the nearest tenth of a percent. The percent change in rates over time are rounded to the nearest whole number. (Please note that because of this rounding, percentages may not always add up to exactly one hundred percent.)

Selection of indicators:

Many different indicators could have been used to measure the well-being of children. The compilation of these indicators for our first book was a function of 1) the results of a survey of members of the Children's Future Panel (a group of more than forty individuals who are advising this project), 2) relation to national KIDS COUNT indicators, 3) how directly the indicator measured children's well-being, and 4) availability of data.

Regions:

For the purposes of this report, we have divided Connecticut into 27 regions (towns or groups of towns) based on the public use microdata areas established by the Census Bureau. The use of regions allowed us to calculate rates where the population would have been too small at the town level. Each region has a population of more than 100,000, and no town is split between two regions. The five largest cities, Bridgeport, Hartford, New Haven, Stamford, and Waterbury, are regions unto themselves. The raw data for the tables was collected originally for each town, and then towns were grouped into regions. Regional school districts sometimes enrolled students from more than one of the regions for the high school dropout data used in this report; a list of the regions to which these school districts were assigned can be found on page 15. Indexes to towns and regions and a map are located on pages 12-13.

In April 1994, CAHS released *Connecticut's Children: Still At Risk*, the first comprehensive report on the status of Connecticut's children in ten years. As a companion piece, *Someone Cared* presented six compelling profiles of families beating the odds and the people and programs that turned their lives around.

What they've been saying about *Connecticut's Children: Still At Risk* and *Someone Cared*:

"These books are an essential guide to understanding the problems that plague today's kids."

—Hon. Christopher J. Dodd, United States Senate

"*Connecticut's Children: Still At Risk* and *Someone Cared* are 'must reads' for any policy maker . . . they are compelling, concise, and challenging."

—Hon. Jack Thompson, Connecticut General Assembly

"CAHS is skilled in working with diverse constituencies and in disseminating information that can inform public policy. *Connecticut's Children* is just such information."

—David M. Nee, William Caspar Graustein Memorial Fund

"As advocates for children, this publication provides us with an essential base of information from which to address the myriad array of problems children are facing everyday."

—Martha Stone, Children's Advocacy Center
