This work was produced in whole or in part with funds from the Office of Educational Research and Improvement (OERI), U.S. Department of Education, under contract number RJ96006101. The content does not necessarily reflect the position of OERI or the Department of Education, nor does mention of trade names, commercial products, or organizations imply endorsement by the federal government.

## **INTRODUCTION**

### **Purpose**

This study was designed to provide schools, districts, and states with a means for identifying the knowledge and skills that are most important for students to learn for the subject areas of language arts, mathematics, and science. The standards and benchmarks in this document reflect the subject-area content consistently identified in documents from a handful of states that have been highly rated by national organizations for the quality of their standards. It is hoped that this material will assist those who are attempting to reduce the amount of content identified as important to a manageable level.

In recent years, it has frequently been observed that all of the knowledge and skills identified as important by national organizations cannot be addressed in the classroom given the time available in the school day. Education researcher Chester Finn, after reviewing documents produced by many standards-setting groups, asserted that “the professional associations, without exception, lacked discipline. They all demonstrated gluttonous and imperialistic tendencies” (in Diegmueller, 1995, p. 6). A similar perspective can be found in the report of the Third International Mathematics and Science Study (TIMSS), a large-scale, cross-national comparative study of math and science curricula. In addressing the relatively poor performance of U.S. students, the report’s authors note that our “preoccupation with breadth rather than depth, with quantity rather than quality, probably affects how well U.S. students perform in relation to their counterparts in other countries” (Schmidt et al., 1997). Researchers Marzano and Kendall (1999) show that at least by one measure, attempting to address all the content identified in standards documents would mean that “schooling would have to be extended from kindergarten to grade 21” (p. 104). It appears evident that practitioners and others could find this report to be of some use if they seek to ensure that as they reduce content to a manageable amount, they retain the most significant knowledge and skills.

### **Method for Selecting the Top State Documents**

Five state standards documents were selected to represent the exemplary content in each subject area. In order to select these documents, we analyzed the critical reviews of state documents conducted by three national organizations: the American Federation of Teachers, the Fordham Foundation, and the Council for Basic Education. For the areas of language arts and mathematics, all three organizations have published such reports, which provide a rating or ranking based on selected criteria. For the area of science, the American Federation of Teachers and the Fordham Foundation have each published such a report.

### **Selection of State Documents by Subject Area**

For each of the three subject-areas — language arts, mathematics, and science — we ranked the states according to how well they fared in the national reviews. With few exceptions, the top states were easily distinguished, ranking high in all reports. States that fared unevenly across the

reports were ranked after determining their relative merits within each report. In the rare instances in which a “tie” occurred, the selection was resolved based on review criteria developed by McREL researchers as a result of the extensive document reviews they have conducted for more than a half-dozen state departments of education and numerous school districts across the United States. A complete discussion of the ranking process appears in the introduction to each subject-area section.

### **Method of Identification and Synthesis**

Once the five state documents were selected for a given subject area, the next step was to identify and classify the content found in these documents. In order to account for all content, we mapped most of the content we identified during the review process against the standards and benchmarks identified in *Content Knowledge: A Compendium of Standards and Benchmarks for K–12 Education* (Kendall & Marzano, 1999). The *Compendium* represents McREL’s synthesis of 116 significant curriculum and standards documents across 14 subject areas. Knowledge and skills identified in the *Compendium* are presented in each subject area as overarching categories (or *standards*) under which the knowledge and skills appropriate for students at particular grade ranges (*benchmarks*) are organized. We selected the *Compendium* as a cataloguing tool because it represents a synthesis of major documents in each subject area and thus very likely identifies most, if not all, of the significant content in each subject area.

The next step of the process involved identifying and organizing all of the similar content in the selected state documents. Briefly, the method consisted of identifying each description of knowledge or skill in the state documents and matching that content to the *Compendium* benchmark that addressed the same, or closely related, knowledge or skill. If necessary, the *Compendium* benchmark was rewritten in order to more accurately reflect the content described in several state documents. Alternatively, when information in a state document did not explicitly match a benchmark but the pairing seemed a fair inference, the content was matched to the benchmark, but identified as having been implied in the document, rather than explicitly stated. Infrequently, when sufficient representation warranted it, new benchmarks were created that were not present in the *Compendium*. These new benchmarks were placed under the *Compendium* standard most suited to them. This approach is compatible with our use of the *Compendium* as a convenient organizing device, rather than a selection device or filter.

When the five state documents had been analyzed, the resulting product was a master document that organized all of the knowledge and skills identified in the five state documents, as well as information indicating where that content was found. This information is preserved in this report by a set of codes, called a *citation log*, which appears just above each benchmark — for example, BP (A2I;CA1;M22II;V,62), is the citation log for the K–2 benchmark “Uses complete sentences in written work,” found under language arts standard #3. A key for the citation logs appears at the bottom of each page so that readers can locate the original material.

In addition to this basic document information, each citation log also includes a code that designates the cognitive character of each benchmark as either *declarative* knowledge or *procedural* knowledge. Simply put, declarative knowledge (identified in the log as *BD*) describes information — facts, events, episodes, generalizations, and the like — that students should know. Procedural knowledge (indicated by *BP*) describes the skills or processes — such as reading a map, editing, or adding — that students should be able to perform. (A more complete description of declarative and procedural knowledge can be found in the *Compendium*, pages 22–24). The citation log also sometimes includes an asterisk (\*), to indicate that the content represents material not found in the *Compendium*, and/or a lowercase *i*, to indicate that the content was inferred from a state benchmark rather than that it was directly stated in the document.

### **Selection of Criteria for Reduction**

The original intention was to provide a report that identified only that content that was common to all five documents. However, once the process was completed, it became clear that using such a method resulted in the identification of very few benchmarks. If we had selected only the content that was common to all five of the documents for any one subject area, the number of items, or benchmarks, that would have resulted would have been so small as to be of limited usefulness (as our preliminary analysis determined). This was the case whether the subject area was language arts, mathematics, or science. On the other hand, if we had selected content that was common to only *three* of the five state documents, the result would have been the identification of nearly as many, if not more, benchmarks than were found in the *Compendium*. We found, however, that if we selected benchmarks that were common to any *four* of the top five documents, the result was neither so small as to be not useful nor so large that it did not appear to serve the purpose of winnowing down the amount of content. Thus, for each content area, the standards and benchmarks identified in this study represent content that was found to be present in any *four of the five* standards documents selected for review.

### **Product and Caveat**

The product of this study is a set of standards and benchmarks identified in three subject areas and at four grade bands: K–2, 3–5, 6–8, and 9–12. The benchmarks represent concepts and skills identified for student learning by at least four of the five states whose documents have been rated highly for, among other things, the clarity, specificity, and appropriateness of their standards. It should be noted that the technique described and used here is not designed to produce a clearly sequenced set of content. Further, this document should not be mistaken for a well-planned set of standards and benchmarks. Each document that we analyzed might well have possessed either an implicit or explicit design and scaffolding. Our technique was designed not to identify a scope and sequence, but, rather, to identify the concepts and skills that were most common to the five documents for each subject area. Thus, users of this document are encouraged to consider it as identifying knowledge and skills that across these documents, at least, could be considered essential.

## LANGUAGE ARTS

### Identification of National Reports

For the subject area of language arts, three evaluation reports were used to help select the state documents analyzed in this study. One report we used was the American Federation of Teachers' (AFT) *Making Standards Matter* (1998), which includes ratings of the state standards in terms of specificity and clarity. Another perspective on state standards was available from the Fordham Foundation in the report *State English Standards: An Appraisal of English Language-Arts/Reading Standards in 28 States* (Stotsky, 1997). Finally, the Council for Basic Education evaluated language arts documents across the states in *Great Expectations: Defining and Assessing the Rigor in State Standards for Mathematics and English Language Arts* (Berman & Joftus, 1998).

### Selection of Reference Documents

As we noted in the Introduction to this report, five state documents were selected for review for each subject area covered in this report. The selection of the top five state documents for language arts was determined by comparing information found in the three evaluation reports just described. Specifically, those states that received a "B" or above in the Fordham report were compared with those states identified in the AFT's *Making Standards Matter* report as having clear and specific standards and those states that were rated highly by the Council for Basic Education. As a result of this process, the following state documents were used for the analysis of language arts content:

*English-Language Arts Content Standards for California Public Schools, Kindergarten Through Grade Twelve* (1998), by the California Department of Education

*Language Arts Standards* (1999), by the Arizona Department of Education

*Standards of Learning for Virginia Public Schools: English Standards of Learning* (1995, June), by the Board of Education, Commonwealth of Virginia

*The English Language Arts Curriculum Framework* (1997, February), by the Massachusetts Department of Education

*Wisconsin's Model Academic Standards for English Language Arts* (1999), by the State of Wisconsin, Department of Public Instruction

It should be noted that although the Fordham Foundation rated the California language arts document highly (Olson, 1999), their review of this document was not available at the time of our selection process.

## **Findings**

The standards and benchmarks that resulted from our synthesis of state standards follows this introduction. Unlike the findings in the areas of mathematics and science, no significant issues emerged as a result of the process of identification used for this study.

### **Summary of State Benchmarks for Language Arts**

Table 1 provides a listing of the benchmarks developed by national groups which are included in the state standards document for at least four of the five top rated states in Language Arts. The state benchmarks are organized around the following eight Language Arts standards:

1. Demonstrates competence in the general skills and strategies of the writing process
2. Demonstrates competence in the stylistic and rhetorical techniques in writing
3. Uses grammatical and mechanical conventions in written compositions
4. Gathers and uses information for research purposes
5. Demonstrates competence in the general skills and strategies of the reading process
6. Demonstrates competence in the general skills and strategies for reading a variety of literary texts
7. Demonstrates competence in the general skills and strategies for reading a variety of informational texts
8. Demonstrates competence in speaking and listening as tools for learning

**Table 1. Summary of State Language Arts Benchmarks**

<b>1. Demonstrates competence in the general skills and strategies of the writing process</b>	
<i>Grades K-2</i>	<ul style="list-style-type: none"> <li>• Uses strategies to generate ideas for written work (e.g., brainstorming, webbing, mapping, drawing, discussing, selecting a focus) BP(A1I;CA1;M19II;V,62;WB4)</li> <li>• Uses strategies to draft and revise written work (e.g., focuses on one topic; groups related ideas and maintains consistent focus; uses elements of a specific genre; checks for clarity, content, organization, and relevant, descriptive details; adds information; accepts comments from classmates; improves sequence) BP(A1I;CA2;M21II,V,62,63;WB4)</li> <li>• Uses strategies to edit and publish written work (e.g., edits for grammar, punctuation, capitalization, spelling, sentence structure; shares final copy with others; uses own standards or judgments of quality; uses available technology to publish written work) BP(A2I;CA1;M22II,25II;V,61,62,63;WB4)</li> <li>• Uses strategies to organize written work (e.g., includes beginning, middle, and end; uses a logical sequence of events) BP(A2I;CA2;M19II;V,63;WB4)</li> <li>• Uses a variety of strategies (e.g., drawing pictures, using letters or phonetically spelled words, telling, narrative or expository writing) to describe experiences, people, objects, events, places, and story elements BP(A1K;CAK,1,2;V61,62;WB4)</li> <li>• Uses a variety of forms or genres for writing (e.g., stories, friendly letters, memos, invitations, explanations, personal experience narratives) BP(A2I;CA2;M20,II;V,63;WB4)</li> </ul>
<i>Grades 3-5</i>	<ul style="list-style-type: none"> <li>• Uses a variety of strategies to generate ideas for written work (e.g., develops a plan, groups related ideas, organizes information according to type and purpose of writing) BP (A2II;CA,3;M19II;V,64,67;WB4)</li> </ul>

## MATHEMATICS

### Identification of National Reports

For the subject area of mathematics, three evaluation reports were used to help select the state documents analyzed in this study. One report we used was the American Federation of Teachers' (AFT) *Making Standards Matter* (1998), which includes ratings of the state standards in terms of specificity and clarity. Another perspective on state standards was available from the Fordham Foundation in the report *State Mathematics Standards: An Appraisal of Math Standards in 46 States, the District of Columbia, and Japan* (Raimi & Braden, 1998). Finally, the Council for Basic Education evaluated mathematics documents across the states in *Great Expectations: Defining and Assessing the Rigor in State Standards for Mathematics and English Language Arts* (Berman, et al., 1998).

### Selection of Reference Documents

As we noted in the Introduction to this report, five state documents were selected for review for each subject area covered in this report. The selection of the top five state documents for mathematics was determined by comparing ratings and evaluation information in the three reports just described. Specifically, those states that received a "B" or above in the Fordham report were compared with those states identified in the AFT's *Making Standards Matter* report as having clear and specific standards and those states that were rated highly by the Council for Basic Education. As a result of this process, the following state documents were used for the analysis of mathematics content:

*The California Mathematics Academic Content Standards* (Prepublication Ed.) (1998, February 2), by the California State Board of Education

*Core Curriculum Standards: Mathematics* (1994), by the Utah State Office of Education

*Mathematics Standards of Learning for Virginia Public Schools* (1995, June), by the Board of Education, Commonwealth of Virginia

*Model Competency-Based Mathematics Program* (1990, November), by the Ohio Department of Education, Division of Elementary and Secondary Education

*West Virginia Programs of Study: Instructional Goals and Objectives* (1995, June), by the West Virginia Department of Education

## Findings

The standards and benchmarks that resulted from our synthesis of state standards follows this introduction. For the area of mathematics, at least one observation may be of interest.

It became clear that at least a few topics recommended in *Curriculum and Evaluation Standards for School Mathematics* (National Council of Teachers of Mathematics, 1989) did not survive the process of identification for this study; that is, some concepts were not identified in at least four of the five state documents under review. In the area of statistics and probability, in particular, no benchmarks related to the concepts of *sampling* or *outliers* will be found. Similarly, although the idea of probability (i.e., the likelihood of something happening) *does* appear at the 3–5 and 6–8 grade bands, it *does not* appear at the K–2 or 9–12 grade band. In part these apparent anomalies are the result of the fact that two of the states identified for this study did not address statistics and probability in significant depth, and the material in a third state document did not treat the topic at a significant level of detail.

Thus, as indicated in the Introduction to this report (see Product and Caveat section), some caution is in order for those who intend to use this material. On the other hand, the presence or absence of material in this study on mathematics does reflect the content that commonly appears in highly rated standards documents.

## Summary of State Benchmarks for Mathematics

Table 2 provides a listing of the benchmarks developed by national groups which are included in the state standards document for at least four of the five top rated states in Mathematics. The state benchmarks are organized around the following nine Mathematics standards.

1. Uses a variety of strategies in the problem-solving process
2. Understands and applies basic and advanced properties of the concepts of numbers
3. Uses basic and advanced procedures while performing the processes of computation
4. Understands and applies basic and advanced properties of the concepts of measurement
5. Understands and applies basic and advanced properties of the concepts of geometry
6. Understands and applies basic and advanced concepts of statistics and data analysis
7. Understands and applies basic and advanced concepts of probability
8. Understands and applies basic and advanced properties of functions and algebra

**Table 2. Summary of State Mathematics Benchmarks**

<b>1. Uses a variety of strategies in the problem-solving process</b>	
<i>Grades K-2</i>	
• Justifies the process he or she used to solve a numerical problem	BP(CAK;O,40;UK,02-4;W,53)
• Makes organized lists, tables, or charts to solve a problem	BP(CA2;);27;V,7;W,57)
• Uses whole number models (e.g., pattern blocks, tiles, or other manipulative materials) to solve problems	BP(CAK;UK,02-1;V,4;W49)
• Uses “guess and check” to solve problems	BP(CAK;UK,01-2;V,4;W,49)
<i>Grades 3-5</i>	
• Uses a variety of strategies to solve problems (e.g., generalizes strategies from known solution process, states or restates problems in own words, discusses problem with peers)	BP (CA3;O28;U3,01-3;W61)
• Justifies the methods and reasoning behind a solution	BP (CA3;O,28;U3,03-2;W,61)
<i>Grades 6-8</i>	
• Uses a similar problem type to solve a problem	Understands how to break a complex problem into simpler parts or use
• Uses a variety of strategies to understand problem-solving situations and processes (e.g., considers different strategies and approaches to a problem, restates problem from various perspectives)	BP (CA6;O,32;V,15;W,96)
• Uses a variety of strategies to understand problem-solving situations and processes (e.g., considers different strategies and approaches to a problem, restates problem from various perspectives)	BP (CA6;O,31;U6,01-1;W,96)

**Grades 9-12**

- [insufficient evidence to support benchmarks at this level]

**8. Understands and applies basic and advanced properties of functions and algebra**
*Grades K-2*

- Recognizes regularities in a variety of contexts (e.g., events, designs, shapes, sets of numbers)
- BP (CAK;O,17;UK,03-4;V,5;W,50)
- Extends simple patterns (e.g., of numbers, physical objects, geometric shapes)
- BP (CAK;O,17;UK,13-1;V,6;W,56)

*Grades 3-5*

- Recognizes a wide variety of patterns (e.g., basic linear patterns such as [2, 4, 6, 8 . . .]; simple repeating and growing patterns) and the rules that explain them
- BP (CA3;O,28;U3,13-1;V,9;W,68)
- Knows that a variable is a letter or symbol that stands for one or more numbers
- BD (CA4;O,66;U5,09-1;V,12;W,94)
- Solves simple open sentences involving operations on whole numbers (e.g.,  $_ + 17 = 23$ )
- BP (CA4;O,65;U5,09-5;V,12;W,94)

*Grades 6-8*

- Knows that an expression is a mathematical statement using numbers and symbols to represent relationships and real-world situations (e.g., equations and inequalities with or without variables)
- (CA6,O,69;U6,09-1;W,99)
- Understands various representations (e.g., tables, graphs, verbal descriptions, algebraic expressions, Venn diagrams) of patterns and functions and the relationships among them
- BD (CA7;O,21;U6,09-1;V,16;W,99)
- Understands the basic concept of a function (i.e., a function describes how changes in one quantity or variable result in changes in another)
- BD (O,68;U6,08-3;V,16;W,99)
- Solves linear equations using concrete, informal, and formal methods (e.g., using properties, graphing ordered pairs, using slope-intercept form)
- BP (CA6;O,69;U609-3;V,14;W,99)
- Uses the rectangular coordinate system to model and to solve problems
- BP (CA7;O,69;U6,05-5;V,16;W,98)

## SCIENCE

### Identification of National Reports

For the subject area of science, two evaluation reports were used to help select the state documents analyzed in this study. One report we used was the American Federation of Teachers' (AFT) *Making Standards Matter* (1998), which includes ratings of the state standards in terms of specificity and clarity. Another perspective on state standards was available from the Fordham Foundation in the report *State Science Standards: An Appraisal of Science Standards in 36 States* (Lerner, 1998).

### Selection of Reference Documents

As we noted in the Introduction to this report, five state documents were selected for review for each subject area covered in this report. The selection of the top five state documents for science was determined by a simple comparison of the two evaluation reports just described. Specifically, those states that received a "B" or above in the Fordham report were compared with those states identified in the AFT's *Making Standards Matter* report as having clear and specific standards. Six states were found to be highly rated in both reports. As five states had been established as the limit for this study, the lowest scoring state was dropped. The following state documents were used for the analysis of science content:

*Rhode Island Science Framework* (1996, August 14), by the Rhode Island Department of Education

*Science Content Standards Grades K–12* (Prepublication Ed.) (1998, February 2), by the California State Board of Education

*Science Curriculum Framework* (1998, March), by the Connecticut State Department of Education, Division of Teaching and Learning

*Science Language Arts Curriculum Framework* (1995, June), by the Delaware Department of Education)

*Science Standards* (1998, August 24), by the Arizona Department of Education

### Findings

The standards and benchmarks that resulted from our synthesis of state standards follows this introduction. For the area of science, several observations should be noted.

First, it became clear that at least a few topics addressed in the national science documents (such as the National Research Council's *National Science Education Standards*, 1996, and *Project 2061's Benchmarks for Science Literacy*, 1993) received little or no attention in the state documents

under review. Such topics appear, for example, under the *Compendium* standard “Understands the nature of scientific knowledge.” This standard has as its focus basic concepts regarding the importance of replication in scientific experiments, the criteria for valid scientific explanations, and how scientific knowledge changes and accumulates over time. Little in the state documents under review addressed this particular area.

Second, as mentioned in the Introduction to this report (see Product and Caveat section), it became clear that the process of content reduction resulted in the loss of any scope and sequence present in the documents. In part, this side effect was caused by the considerable amount of “declarative knowledge” that is typically addressed in science curricula.

*Declarative knowledge*, a category of knowledge that encompasses facts, events, episodes, principles, generalizations, and the like, is contrasted with procedural knowledge, which is “how to” knowledge. *Procedural knowledge* includes knowing how to apply algorithms or other processes that are composed of steps, whether the steps must be taken in specific order (such as the steps involved in hitting a golf ball) or can be taken in a number of ways (such as the process for reading a map). We have observed that declarative knowledge especially, in the form of observations or statements about the world, is frequently organized in science curricula in a manner designed to help students connect earlier, simpler ideas as they come to understand larger generalizations or principles. Because the power of overarching ideas is that they can organize a number of ideas and connect many facts, it should not be surprising that different states might choose different facts as building blocks for these ideas. For example, some state curricula might determine that a precursor notion to fully understanding the rock cycle might be the understanding that rocks vary by size and shape; another state might focus on the fact that rocks contain evidence of the past, such as fossil remains, which in part gives a clue to the formation of rocks over time. In either case, these concepts can be unified under a more general understanding of the cycle through which rocks are formed and reformed. As content was compared across documents in this study, however, such “building blocks” did not appear across enough states to warrant their inclusion in this synthesis. However, it should be noted that such larger concepts as the rock cycle, found in at least four of the five state documents under review, will be found here. This result, the identification and presentation of the most significant information found across highly rated state standards, was the purpose of this study.

### **Summary of State Benchmarks for Science**

Table 3 provides a listing of the benchmarks developed by national groups which are included in the state standards document for at least four of the five top rated states in Science. The state benchmarks are organized around the following fifteen Science standards:

## **Earth and Space**

1. Understands basic features of the Earth
2. Understands basic Earth processes
3. Understands essential ideas about the composition and structure of the universe and the Earth's place in it

## **Life Sciences**

4. Knows about the diversity and unity that characterize life
5. Understands the genetic basis for the transfer of biological characteristics from one generation to the next
6. Knows the general structure and functions of cells in organisms
7. Understands how species depend on one another and on the environment for survival
8. Understands the cycling of matter and flow of energy through the living environment
9. Understands the basic concepts of the evolution of species

## **Physical Sciences**

10. Understands basic concepts about the structure and properties of matter
11. Understands energy types, sources, and conversions, and their relationship to heat and temperature
12. Understands motion and the principles that explain it
13. Knows the kinds of forces that exist between objects and within atoms

## **Nature of Science**

14. Understands the nature of scientific inquiry
15. Understands the scientific enterprise

**Table 3. Summary of State Science Benchmarks**

<b>Earth and Space</b>	
<b>1. Understands basic features of the Earth</b>	
<i>Grades K-2</i>	
<ul style="list-style-type: none"> <li>Understands that water can be made to go back and forth between liquid forms and solid forms and gradually disappears if left uncovered (e.g., mud puddles, clothes drying on a clothes line)</li> <li>Understands that short-term weather conditions can change daily but that each season is characterized by general weather patterns; these changes in weather influence plant, animal, and human activities</li> <li>Uses simple weather instruments (e.g., thermometer, wind vane, rain gauge) to measure and record changes in weather from day to day and over seasons</li> </ul>	BD (CAK, CT129I, D5I, R5I) BD (A6I, CAK, CT131I, D5I, R5I) BP (A6I, CA1, CT131I, D5I)*
<i>Grades 3-5</i>	
<ul style="list-style-type: none"> <li>Knows that water exists in the air in different forms (e.g., clouds, fog, rain, snow, hail)</li> <li>Knows that the night and day cycle is caused by the Earth's rotation on its axis</li> </ul>	BD (A6IIi, CA5, CT129I, D5II) BD (A6IIi, CT134II, D4II, R5II)
<i>Grades 6-8</i>	
<ul style="list-style-type: none"> <li>Knows the composition and structure of the Earth's atmosphere (e.g., temperature and pressure in different layers of the atmosphere, circulation of air masses, fronts) and its role in weather patterns</li> <li>Knows how the tilt of the Earth's axis and the Earth's revolution around the Sun affect seasons and day length (i.e., the amount of solar energy that hits the Earth's surface varies with time of year and location)</li> <li>Knows various factors that affect weather patterns (e.g., pressure, heat, humidity, oceans and other large bodies of water, mountain ranges, cities)</li> </ul>	BD (A6III, CA9-12, CT131II, D5III) BD (A6III, CT132IV, D4II, R5III) BD (A6III, CA6, CT132III, D5III)*
