ABSTRACT

This report uses data from the U.S. Census Bureau's March 2001 Current Population Survey to examine health insurance coverage. The number and percentage of people covered by employment-based health insurance rose significantly in 2000, driving the overall increase in health insurance coverage. Among the entire population age 18-64 years, workers were more likely to have health insurance than nonworkers. The proportion of uninsured declined in 2000. For poor people, the uninsured rate declined in 2000, though the rate for the near-poor increased. Hispanics were less likely than White non-Hispanics to have health insurance. The coverage rate for Blacks in 2000 did not differ statistically from the coverage rate for Asians and Pacific Islanders. American Indians and Alaska Natives were less likely to have health insurance than any other racial group. Males were less likely than females to have health insurance. The foreign-born population was less likely than the native population to be insured. Among all adults, the likelihood of being insured increased as the level of education rose. Young adults were less likely than any other age group to have health insurance. The uninsured rate for children dropped from 12.6 percent in 1999 to 11.6 percent in 2000. The highest uninsured rate for children was among those of Hispanic origin (24.9 percent). Some states had higher uninsured rates than others. (SM)

Health Insurance Coverage: 2000

Consumer Income

Issued September 2001

P60-215

An estimated 14.0 percent of the population were without health insurance coverage during the entire year in 2000, down from 14.3 percent in 1999. Similarly, the number of people without health insurance coverage declined in 2000, to 38.7 million, down 0.6 million from the previous year.

The estimates in this report are based on the March 2001 Current Population Survey (CPS), conducted by the U.S. Census Bureau. Respondents provide answers to the best of their ability, but as with all surveys, the estimates may differ from the actual values. A facsimile of the CPS March Supplement questionnaire is available electronically at www.census.gov/apsd/techdoc/cps/cps-main.html.

Other highlights:¹

- The number and percentage of people covered by employment-based health insurance rose significantly in 2000, driving the overall increase in health insurance coverage.
- Mirroring what happened for the total population, the proportion of uninsured

children declined in 2000, from 12.6 percent in 1999 to 11.6 percent. The number of uninsured children declined from 9.1 million to 8.5 million.

Revised Health Insurance Coverage Estimates for 1999

In March 2000, the Current Population Survey (CPS) added experimental follow-up questions for people who responded "no" to all questions about specific types of health insurance coverage in order to verify whether these people were actually uninsured. Several other national surveys that collect health insurance information have had good success with the addition of such questions. Testing and evaluation by Census Bureau staff indicated that including follow-up verification questions results in more complete and accurate estimates of the population covered by health insurance.¹

Accordingly, the Census Bureau revised the estimates of the number of people covered and not covered by health insurance in 1999. As a result, the health insurance estimates for 1999 presented in this report differ from those published last September in Series P60-211, *Health Insurance Coverage: 1999*. These estimates are not directly comparable with CPS estimates from earlier years, before the health insurance verification questions were added. The technical appendix presents estimates for 1999 and 2000 without using the verification questions. This report and future releases of CPS health insurance estimates will be based on answers to questionnaires that have the verification questions. The changes in health insurance coverage from 1999 to 2000 are statistically the same with or without using the verification question.

- For poor people, the uninsured rate also declined in 2000 — from 31.1 percent to 29.5 percent. Although medicaid insured 12.4 million poor people, 9.2 million poor people still had no health insurance in 2000.

- Compared with the previous year, health insurance coverage rates increased for those with household incomes below \$50,000, decreased for those with household incomes between \$50,000 and \$75,000, and were unchanged for those with \$75,000 and higher household incomes.

- Hispanics (68.0 percent) were less likely than White non-Hispanics (90.3 percent) to be covered by health insurance.² The coverage rate for Blacks in 2000 (81.5 percent) did not differ statistically from the coverage rate for Asians and Pacific Islanders (82.0 percent).

- American Indians and Alaska Natives were less likely to have health insurance than other racial groups, based on a 3-year average (1998-2000) — 73.2 percent, compared with 80.5 percent of Blacks, 81.2 percent of Asians and Pacific Islanders, and 89.9 percent of White non-Hispanics. However, they were more likely to have insurance than were Hispanics (67.2 percent).³

- Among the entire population 18 to 64 years old, workers (both full- and part-time) were more likely to have health insurance (83.8 percent) than nonworkers (76.4 percent), but among the poor, workers were less likely to

²Hispanics may be of any race.

³The difference in health insurance coverage rates between Blacks and Asians and Pacific Islanders was not statistically significant.

Figure 1.

Type of Health Insurance and Coverage Status: 1999 and 2000

(In percent)

*Statistically significant at the 90-percent confidence level.

¹Military health care includes CHAMPUS (Comprehensive Health and Medical Plan for Uniformed Services)/Tricare, CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), Veterans', and military health care.

Note: The estimates by type of coverage are not mutually exclusive; people can be covered by more than one type of health insurance during the year.

Source: U.S. Census Bureau, Current Population Survey, March 2000 and 2001.

be covered (54.5 percent) than nonworkers (63.4 percent).

- The foreign-born population was less likely than the native population to be insured — 68.4 percent compared with 88.1 percent in 2000.
- Young adults (18 to 24 years old) were less likely than other age groups to have health insurance coverage — 72.7 percent in 2000 compared with 84.3 percent of those 25 to 64 and, reflecting widespread medicare coverage, 99.3 percent of those 65 years and over.
- The male population was less likely than the female population to have health insurance coverage — 85.1 percent compared with 86.9 percent in 2000.

Employment-based insurance, the leading source of health coverage, drove the increase in insurance coverage rates.⁴

Most people (64.1 percent) were covered by a health insurance plan related to employment for some or all of 2000, an increase of 0.6 percentage points over the previous year. The increase in private health insurance coverage largely reflects the increase in employment-based insurance, which increased 0.3 percentage points to 72.4 percent in 2000 (see Figure 1).

The government also provides health insurance coverage, but that coverage rate did not change between 1999 and 2000. Among the

⁴Employment-based health insurance is coverage offered through one's own employment or a relative's.

¹Hispanics may be of any race.

²All numbers are derived from unrounded numbers. Some numbers and percentages may therefore appear to be slightly higher or lower than those computed with rounded figures from other columns.

Source: U.S. Census Bureau, Current Population Survey, March 2000 and 2001.

entire population, 24.2 percent had government insurance, including medicare (13.4 percent), medicaid (10.4 percent), and military health care (3.0 percent). Many people carried coverage from more than one plan during the year; for example, 7.6 percent of people were covered by both private health insurance and medicare.

While the uninsured rate for the poor decreased between 1999 and 2000, the uninsured rate for the near poor increased.

Despite the medicaid program, 9.2 million, or 29.5 percent, of the poor had no health insurance of any kind during 2000. This percentage — more than double the rate for the total population — did, however, drop from 31.1 percent for the previous year. The uninsured poor comprised 23.8 percent of all uninsured people.

Medicaid was the most widespread type of health insurance among the poor, with 39.8 percent (12.4 million) of those in poverty covered by medicaid for some or all of 2000. This percentage did not change statistically from the previous year.⁵

Among the near poor (those with a family income greater than, but less than 125 percent of, the poverty level), 26.9 percent (3.3 million people) lacked health insurance in 2000. This percentage increased significantly from 1999, from 24.7 percent. Private health insurance coverage among the near poor (40.3 percent) and government health insurance coverage (44.6 percent) did not change significantly from 1999.

⁵Changes in year-to-year medicaid estimates should be viewed with caution. For more information, see the Technical Note on page 9.

Key demographic factors affect health insurance coverage.

Age - People 18 to 24 years old were less likely than other age groups to have health insurance coverage, with 72.7 percent covered for some or all of 2000. Because of medicare, almost all people 65 years and over (99.3 percent) had health insurance in 2000. For other age groups, health insurance coverage ranged from 78.8 percent to 88.4 percent (see Figure 2).

Among the poor, people 18 to 64 years old had a markedly lower health insurance coverage rate (59.0 percent) in 2000 than either people under 18 (78.5 percent) or 65 years and over (97.6 percent).

Race and Hispanic origin - The uninsured rate declined significantly in 2000 for Blacks and White non-Hispanics — for Blacks, from 19.6 percent to 18.5 percent and for White non-Hispanics, from 9.9 percent to 9.7 percent. Among Asian and Pacific Islanders, the apparent decline in the uninsured rate from 19.0 percent in 1999 to 18.0 percent in 2000 was not statistically significant.⁶ The uninsured rate among Hispanics (32.0 percent in 2000) also did not change significantly from 1999.⁷

⁶The Asian and Pacific Islander population consists of many distinct groups that differ in socioeconomic characteristics, culture, and recency of immigration. Because of differences among them, data users should exercise caution when interpreting aggregate data for this population.

⁷Because Hispanics may be of any race, use caution in comparing data for Hispanics and data for racial groups such as Blacks (3.1 percent of whom were Hispanic in 2000) and Asians and Pacific Islanders (1.9 percent of whom were Hispanic in 2000). Furthermore, the Hispanic population consists of many distinct groups that differ in socioeconomic characteristics, culture, and recency of immigration. Because of differences among the individual groups, data users should exercise caution when interpreting aggregate data for this population.

⁸The difference in health insurance coverage rates between Blacks and Asians and Pacific Islanders was not statistically significant.

The Current Population Survey, the source of these data, samples 50,000 households nationwide and is not large enough to produce reliable annual estimates for American Indians and Alaska Natives. However, Table C displays 3-year averages of the number of American Indians and Alaska Natives, their 3-year average uninsured rate, and 3-year average uninsured rates for other race groups. The 3-year average (1998-2000) shows that 26.8 percent of American Indians and Alaska Natives were without coverage, compared with 19.5 percent for Blacks, 18.8 percent for Asians and Pacific Islanders, and 10.1 percent for White non-Hispanics.⁹ However, the 3-year average uninsured rate for Hispanics (32.8 percent) was higher than the uninsured rate for American Indians and Alaska Natives.¹⁰

Nativity - In 2000, the proportion of the foreign-born population without health insurance (31.6 percent) was more than double that of the native population (11.9 percent).¹¹ Among the foreign born, noncitizens were more likely than naturalized citizens to lack coverage — 41.3 percent compared with 15.9 percent.

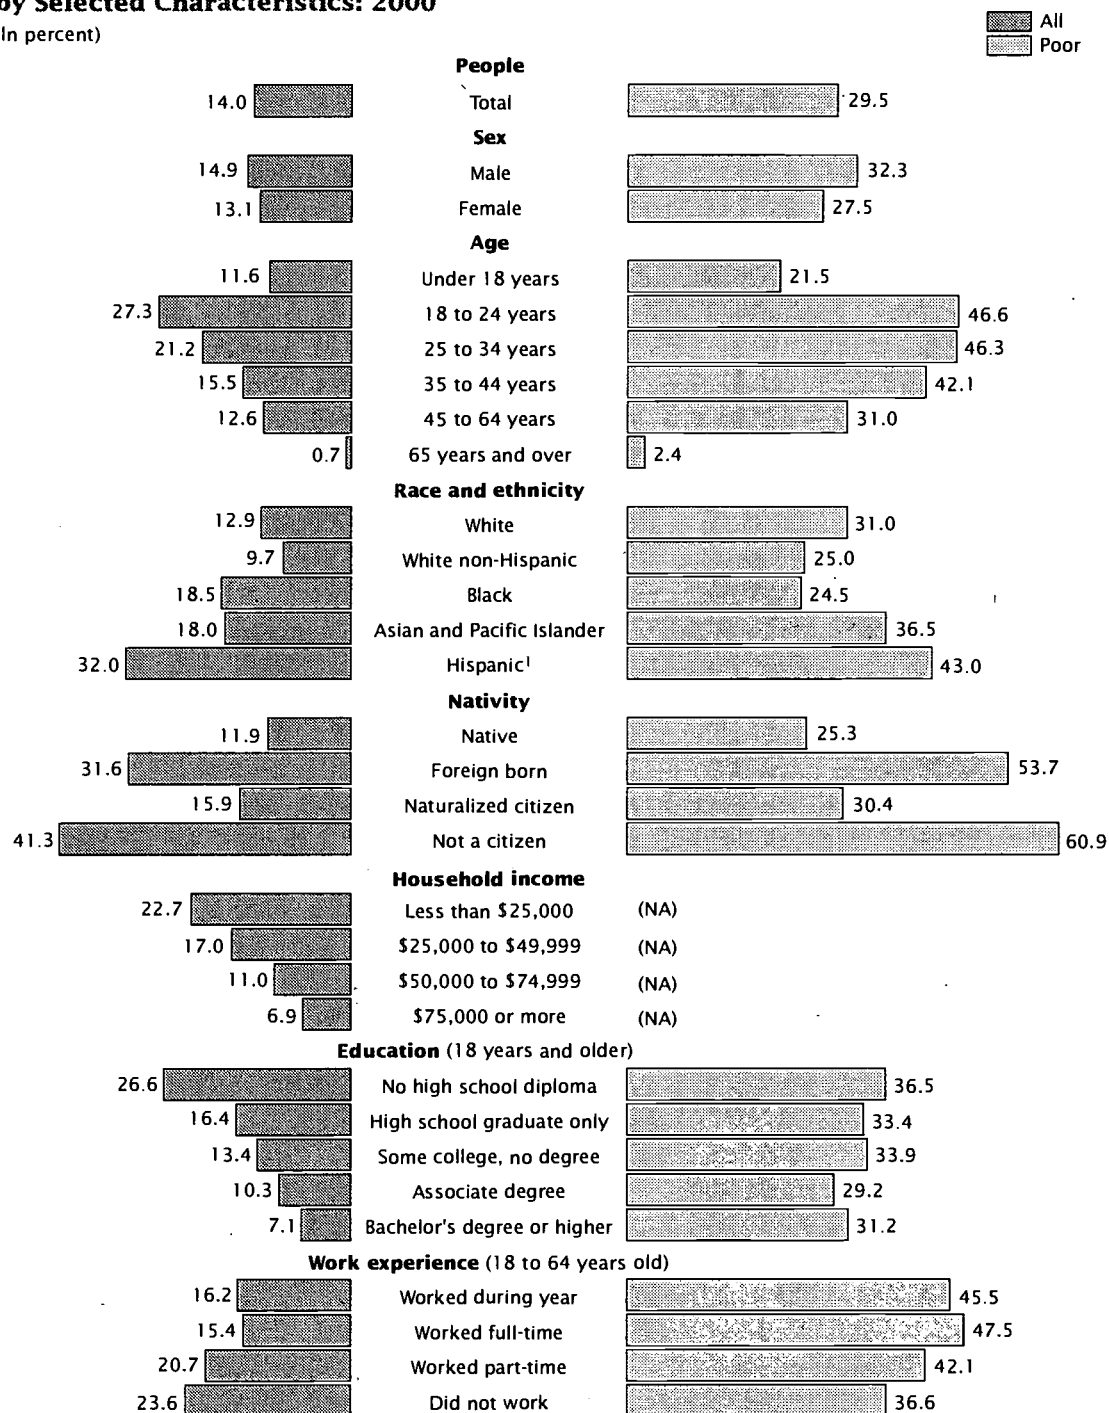

⁹Data users should exercise caution when interpreting aggregate data for American Indians and Alaska Natives (AIAN) because the AIAN population consists of groups that differ in economic characteristics. Data from the 1990 census show that economic characteristics of those American Indians and Alaska Natives who live in American Indian and Alaska Native areas differ from the characteristics of those who live outside these areas. In addition, the CPS does not use separate population controls for weighting the AIAN samples to national totals. See Accuracy of Estimates on page 9 for a further discussion of CPS estimation procedures. Finally, proportional adjustment was used for the 1998 estimates to account for the verification questions added this year.

¹⁰The difference in health insurance coverage rates between Blacks and Asians and Pacific Islanders was not statistically significant.

¹¹Natives are people born in the United States, Puerto Rico, or an outlying area of the United States, such as Guam or the U.S. Virgin Islands, and people who were born in a foreign country but who had at least one parent who was a U.S. citizen. All other people born outside the United States are foreign born.

Figure 3.
Workers Age 18 to 64 Covered by Their Own Employment-Based Health Insurance by Firm Size: 2000

(In percent)

Note: For discussion of significant differences between groups, see text.
Source: U.S. Census Bureau, Current Population Survey, March 2001.

Educational attainment - Among all adults, the likelihood of being insured increased as the level of education rose. For the poor, however, health insurance coverage rates did not differ across the education groups.

Economic status affects health insurance coverage.

Income - The likelihood of being covered by health insurance rises

with income. Among households with annual incomes of less than \$25,000, the percentage with health insurance was 77.3 percent; the level rises to 93.1 percent for those with incomes of \$75,000 or more (see Figure 2).

Compared with the previous year, the coverage rate for those with household incomes below \$50,000 increased 0.3 percentage points to 80.5 percent, while for those with

household incomes of \$50,000 to \$75,000, the coverage rate decreased 0.7 percentage points to 89.0 percent. Coverage rates remained the same for those with \$75,000 and higher household income.

Work experience - Of those 18 to 64 years old in 2000, full-time workers were more likely to be covered by health insurance (84.6 percent) than part-time workers (79.3 percent), and part-time workers were more likely to be insured than nonworkers (76.4 percent).¹² However, among the poor, nonworkers (63.4 percent) were more likely to be insured than workers (54.5 percent). While poor full-time workers appear to be less likely than poor part-time workers to have coverage, the difference was not statistically significant.

Firm size - Of the 140.4 million workers in the United States who were 18-64 years old, 57.1 percent had employment-based health insurance policies in their own name (see Figure 3). The proportion generally increased with the size of the employing firm — 31.6 percent of workers employed by firms with fewer than 25 employees and 69.8 percent for workers employed by firms with 500 or more employees were insured, for example. (These estimates do not reflect the fact that some workers were covered by another family member's employment-based policy).

The uninsured rate for children decreased between 1999 and 2000.

The percentage of children (people under 18 years old) without health insurance in the United States dropped from 12.6 percent in 1999 to 11.6 percent in 2000. The

¹²Workers were classified as part time if they worked fewer than 35 hours per week in the majority of the weeks they worked in 1999.

increase in employment-based insurance accounted for most of the change; no change occurred in government health insurance coverage.

Among poor children, 21.5 percent (2.5 million children) had no health insurance during 2000. This percentage did not change statistically from the previous year. The percentage of poor children with government health insurance or employment-based coverage also did not change. Poor children made up 29.6 percent of all uninsured children in 2000.

Among near-poor children, the proportion without health insurance was 21.9 percent (0.9 million children) in 2000, statistically unchanged from 1999.¹³ For this group, private health insurance coverage decreased from 45.2 percent to 38.6 percent, but government health insurance coverage did not change.

The likelihood of health insurance coverage varies among children.

- Children 12 to 17 years old were more likely to be uninsured than those under 12 — 12.3 percent compared with 11.3 percent.
- The uninsured rate declined significantly in 2000 for Hispanic, White non-Hispanic, and Black children — from 26.3 percent to 24.9 percent for Hispanic children, from 7.8 percent to 7.3 percent for White non-Hispanic children, and from

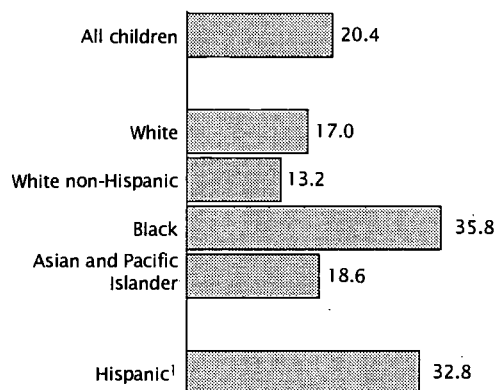

¹³The difference in health insurance coverage rates between poor children and near-poor children was not statistically significant.

Figure 4.

16.4 percent to 13.6 percent for Black children. The uninsured rate for Asian and Pacific Islander children in 2000 was 14.2 percent, statistically unchanged from 1999 (see Figure 4).¹⁴

- While most children (70.5 percent) were covered by an employment-based or privately purchased health insurance plan in 2000, one in five (20.4 percent) was covered by medicaid.
- Black children had a higher rate of medicaid coverage in 2000 than children of any other racial or ethnic group — 35.8 percent, compared with 32.8 percent of Hispanic children, 18.6 percent of Asian and Pacific Islander children, and 13.2 percent of White non-Hispanic children (see Figure 5).
- Children living in single-parent families in 2000 were less likely to be insured than children living in married-couple families — 84.6 percent compared with 90.3 percent.

Some states had higher uninsured rates than others.

The proportion of people without health insurance ranged from 6.9 percent in Rhode Island to 22.6 percent in New Mexico, based on 3-year averages for 1998, 1999, and 2000 (see Table D). Although the data presented suggest that New Mexico had the highest uninsured rate, its rate was not statistically different from the rate for Texas. Conversely, the uninsured rate for Minnesota, though seemingly the second lowest, was not statistically different from Iowa,

¹⁴The difference in health insurance coverage rates between Black children and Asian and Pacific Islander children was not statistically significant.

Pennsylvania, New Hampshire, or Missouri.

Comparisons of 2-year moving averages (1998-1999 and 1999-2000) show that the proportion of people without coverage fell in 18 states: Alabama, Arizona, Arkansas, California, Connecticut, Delaware, Georgia, Maryland, Michigan, Mississippi, Nevada, New Hampshire, New Jersey, North Dakota, Pennsylvania, Rhode Island, Texas, and Wisconsin. Meanwhile, the proportion of people without coverage rose in eight states: Alaska, Kansas, Nebraska, New Mexico, Ohio, Oklahoma, Vermont, and Washington (see Figure 6).

ACCURACY OF THE ESTIMATES

Statistics from surveys are subject to sampling and nonsampling error. All comparisons presented in this report take sampling error into account and meet the Census Bureau's standards for statistical significance. Nonsampling errors in surveys may be attributed to a variety of sources, such as how the survey was designed, how respondents interpret questions, how able and willing respondents are to provide correct answers, and how accurately answers are coded and classified. The Census Bureau employs quality control procedures throughout the production process — including the overall design of surveys, the wording of questions, review of the work of interviewers and coders, and statistical review of reports.

The Current Population Survey employs ratio estimation, whereby sample estimates are adjusted to independent estimates of the national population by age, race, sex, and Hispanic origin. This weighting partially corrects for bias due to undercoverage, but how it

affects different variables in the survey is not precisely known. Moreover, biases may also be present when people who are missed in the survey differ from those interviewed in ways other than the categories used in weighting (age, race, sex, and Hispanic origin). All of these considerations affect comparisons across different surveys or data sources.

For further information on statistical standards and the computation and use of standard errors, contact Jeffrey Stratton of the Demographic Statistical Methods Division on the Internet at dsmd_s&a@census.gov.

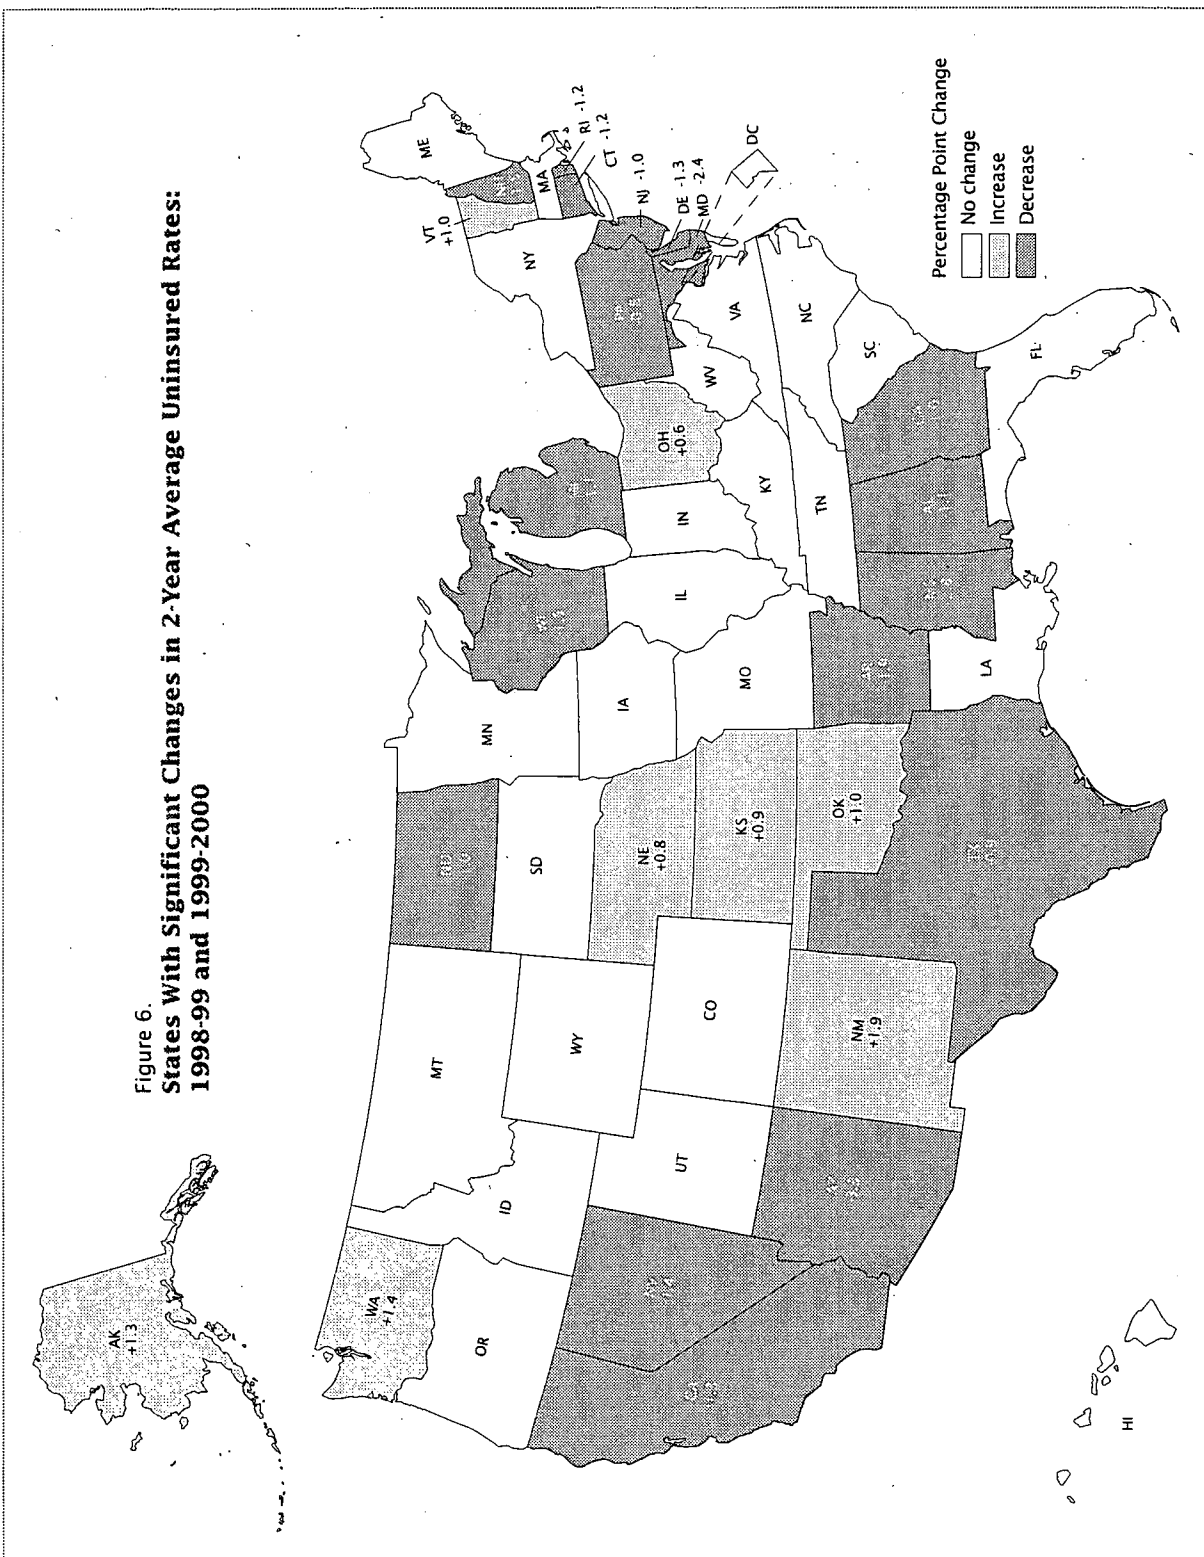

Technical Note

This report presents data on the health insurance coverage of people in the United States during the 2000 calendar year. The data, which are shown by state and selected demographic and socioeconomic characteristics, were collected in the March 2001 Supplement to the Current Population Survey (CPS).

Treatment of major federal health insurance programs

The Current Population Survey (CPS) underreports medicare and medicaid coverage compared with enrollment and participation data from the Center for Medicare and Medicaid Services (CMS), formerly the Health Care Financing Administration (HCFA).¹⁵ A major reason for the lower CPS estimates is that the CPS is not designed primarily to collect health insurance data; instead, it is largely a labor force survey. Consequently, interviewers receive less training on health insurance concepts. Additionally, many people may not be aware that they or their children are

¹⁵CMS is the federal agency primarily responsible for administering the medicare and medicaid programs at the national level.

covered by a health insurance program if they have not used covered services recently and therefore fail to report coverage. CMS data, on the other hand, represent the actual number of people who enrolled or participated in these programs and are a more accurate source of coverage levels.

Changes in medicaid coverage estimates from one year to the next should be viewed with caution. Because many people who are covered by medicaid do not report that coverage, the Census Bureau assigns coverage to those who are generally regarded as "categorically eligible" (those who received some other benefits, usually public assistance payments, that make them eligible for medicaid). Since the number of people receiving public assistance has been dropping, the relationship between medicaid and public assistance has changed, so that the imputation process has introduced a downward bias in the most recent medicaid estimates.

As a result of consultation with health insurance experts, the Census Bureau modified the definition of the population without health insurance in the March 1998 Current Population Survey. Previously, people with no coverage other than access to Indian Health Service

were counted as part of the insured population. Beginning with the 1997 Health Insurance Coverage report, however, the Census Bureau counts these people as uninsured. The effect of this change on the overall estimates of health insurance coverage is negligible.

CPS health insurance verification questions

Prompted by findings in other national household surveys, the Census Bureau added experimental health insurance questions in the CPS March 2000 Supplement to ascertain whether people who responded "no" to a broad series of standard questions on health insurance were actually insured. Research indicated that when follow-up questions were used, about 8 percent of those previously classified as not having health insurance were in fact insured. Moreover, the most common type of coverage reported in the verification questions was private coverage. Based on their economic status, people covered through the verification questions resembled covered people more closely than uninsured people, and the results of verification were consistent with its effect in other surveys. Overall, the results indicate that the verification questions work well, resulting in a more complete and

accurate estimate of the population covered by health insurance. This report and future releases of CPS health insurance estimates will be based on answers to questionnaires that include the verification questions. Had this methodology been used last year, the number of people without health insurance in 1999 would have been 39.3 million, down from the 42.6 million published in September 2000. The technical appendix presents estimates for 1999 and 2000 without using the verification questions.

CPS sample expansion

The number of households interviewed using the March 2001 CPS was expanded from March 2000. Estimates in this report, however, are based on a subsample consistent with the March 2000 CPS. The Census Bureau will release a report this winter discussing the impact of the sample expansion on health insurance estimates. For further information, see www.bls.census.gov/cps/ads/data_dissem_letterng.html.

¹Includes CHAMPUS (Comprehensive Health and Medical Plan for Uniformed Services)/Tricare, Veterans', and military health care.

²These estimates reflect the results of follow-up health insurance verification questions. ³Beginning with the March 1998 CPS, people with no coverage other than access to Indian Health Service are no longer considered covered by health insurance; instead, they are considered to be uninsured. The effect of this change on the overall estimates of health insurance coverage is negligible; however, the decrease in the number of people covered by medicaid may be partially due to this change. ⁴Health insurance questions were redesigned. Increases in estimates of employment-based and military health care coverage may be partially due to questionnaire changes. Overall coverage estimates were not affected. ⁵Data collection method changed from paper and pencil to computer-assisted interviewing. ⁶Implementation of 1990 census population controls. ⁷Implementation of a new March CPS processing system.
