ABSTRACT

The purpose of this study was to determine how public two-year colleges in Tennessee internally budgeted and expended their unrestricted educational and general (E&G) funds from fiscal years 1988-89 through 1997-98. The E&G budget is comprised of seven major functional categories that include instruction, public service, academic support, student services, institutional support, operation and maintenance of plant (O&M) and scholarships and fellowships. In 1989, 21% of revenue sources were from student fees, while 73% came from state appropriations. In 1998, 30% of revenue came from student fees and 66% from state appropriations. The paper presents nine conclusions. Highlights include: (1) expenditures on direct instruction were slightly higher in 1997-98 than in 1988-89 (65% versus 64.5%); (2) institutional size had some bearing on the percentage of funds allocated for direct instructional support; (3) technical colleges expended a greater proportion of their budget on direct instruction than did the community colleges; and (4) in comparison with national data, the financial trends relative to the Tennessee schools are favorable in terms of efficient operations if these operations are measured in terms of direct instructional resource allocation. The report makes five recommendations, as well as additional recommendations for future study. (Includes 63 tables.) (NB)

An Analysis of Functional Budget and Expenditure Patterns and Revenue Sources of Tennessee's Public Community Colleges from 1988-89 through 1997-98

allocated to institutional support for general administration.

In spite of a reduction in the share of state appropriations provided to higher education during the past decade, the TBR community colleges apportioned a larger percentage of their budgets for instructional cost in 1997-98 than in 1988-89. Conversely, these colleges expended a smaller portion of their budgets for administration at the end of the ten-year period.

In conclusion to this study, recommendations are made to more effectively inform public policymakers and the general public as to the efficiency of Tennessee's public community colleges regarding the allocation of financial resources. Comparisons with national and Southern Regional Education Board data are also desirable. Public policymakers are encouraged to more critically examine the long-range benefits of an educated population and the forecast for technical skills required of the workforce in the 21st century.

DEDICATION

I dedicate this dissertation to my wife and children. My wife, Nadine, supported me unceasingly in this endeavor for the past four and one-half years. She always offered encouragement and support. My daughter, Dr. Kim Jordan Absher, provided the encouragement and stimulus to consider enrolling in the doctoral program. Chris in his own quiet way motivated me to fulfill this goal.

My boss, mentor, and friend Dr. Jack Campbell made this trip possible. He has encouraged and motivated me by serving as an exemplary example for the past 30 years. Dr. Bill Locke has been a friend and confidant. He always provided words of wisdom with encouragement.

The Walters State cohort was there from beginning to end. Visitors to Walters State positively refer to the family and open environment as one of the unique aspects of the college. No where is this culture more obvious than with this cohort. Thank each of you for your assistance and friendship. Gary, Lynn, and Rosemary have provided needed assurance, motivation, and encouragement during the highs and lows throughout the program. A special thanks is due to each of these friends.

ACKNOWLEDGEMENTS

Appreciation is extended to the faculty of the Department of Educational Leadership and Policy Analysis at East Tennessee State University for making the doctoral cohort program accessible. You have truly nurtured the philosophy of "life long learning." You are a caring but persistent and demanding faculty. You are a faculty who commands respect by your actions.

I wish to thank the members of my committee, Dr. Terrence Tollefson, Dr. Louise MacKay, Dr. Norma MacRae, and Dr. Russell West. Each one has provided encouragement and unselfishly shared their insight and knowledge. You have most graciously accommodated the schedules of working adults. Dr. Tollefson, your caring and warmth as an educator is unsurpassed. You unselfishly gave of your time and energies whenever assistance was needed. You are blessed with the ability to filter through volumes of material and readily discern fact. You have the gift of a teacher. I am proud that you served as my chairman and to know you as a friend.

A special note of appreciation is due to Melissa Shelton. Without her assistance and gentle prodding, this document would not have been completed. She is the most

faithful and dedicated assistant with which one could ever
be associated.

CHAPTER 1

INTRODUCTION

In a presentation to the Legislative Select Oversight Committee at its October 8, 1997 meeting, Chancellor Charles Smith of the Tennessee Board of Regents (TBR) remarked that the public was no longer interested in knowing how many books are in libraries or the average ACT scores of students. "They want to know what public institutions do with their resources (Smith, 1997, p. 7)." As colleges and universities have confronted growing financial constraints over the past 15 years, the importance of understanding the factors associated with higher education finance and the allocation of resources has increased dramatically (Miller & Salem, 1995). A public outcry has occurred because of the escalating costs of higher education. Numerous reports note that for the past 10 to 15 years, student fees have increased at a rate faster than household income and the Consumer Price Index (CPI) (Klinger, 1996). Paying for a college education ranks as one of the most costly investments for an American family according to a report prepared by the U.S. General Accounting Office (Klinger, 1996).

The importance of studying factors associated with higher education finance has increased significantly in

recent years (Miller & Salem, 1995). Even with a public outcry for more accountability, however, very little research has occurred relative to financial issues and trends in higher education. The majority of publications on higher education finance are practice-driven, with little attention devoted to budget evaluation systems and legislative relations (Miller & Salem, 1995). According to Burd (1998), colleges may even be to blame for increased public suspicions that they are overcharging students. Institutions share so little information about their finances that few people realize that college costs significantly exceed what students pay (Burd, 1998). Cvancara (as cited in Tollefson, in press) reported that the American Council on Education conducted a national survey in July of 1996 in which the respondents perceived the cost of student fees at public community colleges to be five times greater than actual costs.

The National Commission on the Cost of Higher Education was established by Public Law 105-18 in 1997 (Report of the National Commission, 1998). This 11-member commission was established as an independent advisory body and was assigned to conduct an extensive review of college costs and prices. The commission warned that colleges risk "an erosion of public trust (p. 1)" if their charges continue to soar.

Commission members suggested that if public concern continues, and if colleges do not take steps to reduce costs, policymakers at both the federal and state levels will intervene.

Halstead (1991) noted that the only universal trend in the analysis of higher education finance was a gradual increase in administrative costs. Cohen (1993) observed that between 1977 and 1989, administrative costs for community colleges increased on the average from 45% to 50% while instructional expenditures decreased from 52% to 43%.

It is evident that public perceptions regarding higher education costs and the allocation of its resources, coupled with accountability issues, have deteriorated in recent years. Based on 30 years experience as an instructor, admissions officer, and chief business officer in two community college systems, I believe that an analysis of budgeting and expenditure patterns can resolve many of these issues. As a chief business officer in the Tennessee Board of Regents system (TBR) for 24 years, I have observed numerous improvements to enhance budget consistency relative to the classification of accounts, personnel, and expenditures. These efforts have been directed to ensure that governing bodies and public officials receive consistent and accurate data and to strengthen system-wide

accountability. A committee within the TBR, comprised of college and university business officers, recently completed an analysis of the institutions' budgets. Having served as chairperson of this committee, I observed classification changes that were made to institutions budgets, resulting in a higher degree of budget consistency. My personal observations are also supported by the experience of having served as a committee member, as well as chair, of the Southern Association of College and University Business Officers' (SACUBO) Two-Year College Committee. While improvements have been made relative to classification issues, very little research regarding budgeting processes and costs factors has been conducted. Since the budget process is but one means to achieve improvement in the delivery of services, more research relative to higher education budgeting is needed to produce a higher degree of effectiveness in the allocation of resources in an attempt to control costs and ameliorate certain public criticisms.

Statement of the Problem

Public perception of higher education has eroded over the past decade, at least in part, because of the rising costs of student fees at a rate in excess of the Consumer Price Index (CPI) (Klinger, 1997). Public and elected

officials have demanded accountability, and this outcry for accountability has resulted in elected officials often making funding decisions without sufficient data. Since limited research and published data exist regarding the internal distribution of budgeted funds and expenditures for institutions of higher education, there is an absence of historical evidence to change this public perception (Miller & Salem, 1995). One way for elected officials in Tennessee to learn more about funding issues relative to higher education is to learn more about how institutions expend their funds (James, 1991).

Purpose of the Study

The purpose of this study was to determine how public two-year colleges in Tennessee internally budgeted and expended their unrestricted educational and general (E&G) funds from fiscal years 1988-89 through 1997-98. The E&G budget comprises seven major functional categories that include instruction, public service, academic support, student services, institutional support, operation and maintenance of plant (O&M), and scholarships and fellowships.

Significance of the Study

During the 1990s, nationally higher education has received a smaller portion of state government revenues than was the case in the early and mid-1980s. This reduction in state appropriations was due, in large part, to declining or stagnant economic conditions and to revenue estimates that were simply unrealistic (Hossler, Lund, Ramin, Westfall, & Irish, 1997). During this time, more competition for state allocations from K-12 education, Medicaid, and state correctional and transportation departments resulted in a reprioritization of some funds previously directed to higher education.

Results of this study include analyses of expenditure patterns of Tennessee's public two-year colleges regarding the internal distribution or allocation of the unrestricted E&G budget by examining questions such as: What actually happened to the internal allocation of funds when full-time equivalent (FTE) enrollments increased by moderate or high amounts; were there any changes in the allocation of funds among the seven major functional categories for institutions with small, medium, or large FTE enrollments during the ten-year period of this study; did institutions increase or decrease staffing ratios relative to FTE enrollments; did an analysis of the data provide evidence that the two-year

colleges in Tennessee operated more efficiently regarding resource allocations over time; and, specifically, at the end of the study period, did the four major sources of revenues change and was there a reduction in the % of revenue comprised of general fund state appropriations over the ten-year period of the study?

This study utilizes financial data for each of the 14 TBR two-year colleges over a ten-year period from the 1988-89 fiscal year through the 1997-98 fiscal year. Analyses were performed on the data for each year of the study. An analysis was also made comparing the TBR institutions with a sample of community colleges across the nation regarding the allocation of funds among the major functional categories for the 1993-94, 1994-95, and 1996-97 fiscal years. Since TBR institutions have the opportunity to make functional budget adjustments at two specified intervals throughout the year, actual expenditure data at the end of each fiscal year were used for this study. Functional adjustments during the interim of a budget year are common due to factors such as the ability to re-budget carry-over funds from the prior fiscal year, increases or decreases in student fee revenues based on actual rather than projected enrollments, and changes in institutional priorities. Fonte (1993) observed that some local autonomy in budgeting flexibility was noted

as a high priority among two-year colleges. He further observed that institutions need authority to change line-item expenditure budgets in order to respond to local needs. "Excessive limitations on budgeted dollars or positions undermine responsiveness (Fonte, 1993, p. 13)."

If the general welfare of educational institutions is to be promoted effectively, college leaders must realistically relate to public policymakers (Martorana, 1992). If public two-year colleges in Tennessee are to receive a larger portion of state funds, then elected officials need to understand and approve of the ways these institutions expend their funds. Analysis of expenditure patterns of the public two-year colleges in Tennessee over the past decade can facilitate this understanding.

Limitations of the Study

This study focuses on the public two-year institutions in Tennessee and excludes expenditure data of public universities. While this quantitative study analyzes historical financial data to facilitate understanding of college operations, it does not explore innovative approaches for increasing operating effectiveness, such as alternative revenue sources and improved leadership practices. In addition, although this research acknowledges

the need to change public opinion of higher education regarding both quality and fiscal matters, it does not address the process for communicating significant conclusions relative to expenditure patterns to public policymakers.

Definitions

1. The Tennessee Board of Regents (TBR) : The TBR serves as the governing board for all institutions of public higher education in Tennessee, with the exception of The University of Tennessee (UT) system, which has a separate governing body. The TBR system represents six universities, 14 two-year colleges, and 26 technology centers strategically located across the state (T.C.A. 49-8-101, 1972).

2. The Tennessee Higher Education Commission (THEC) : The THEC serves as the coordinating board for all institutions of public higher education in Tennessee. This commission is responsible for coordinating operating budget requests, capital outlay requests, and academic program offerings. The commission is also responsible for recommending to the Legislature the need for and location of new higher education facilities (T.C.A. 49-4201, 1967).

3. Full-time-equivalent-student enrollment (FTE) : FTE student enrollment per semester is calculated by dividing

the total number of student semester credit hours produced by 15 (i.e. 1,500 student credit hours equal 100 FTE). Annual operating appropriations for TBR institutions are based on fall and summer term FTE enrollments, plus a number of other factors including but not limited to square footage of the physical plant, performance indices, federal student financial aid award notices, etc.--(THEC Enrollment Reporting Requirements for Fall, 1997).

4. Fiscal Year (FY): The fiscal year for the State of Tennessee is July 1 through June 30. A fiscal year represents a 12-month period of time for recording and reporting financial transactions (TBR Budget Guidelines, 1998).

5. Function: The functional recording and reporting of financial data provides for the classification of expenditures based on the purpose of the expenditure. It is a homogeneous classification by purpose (National Association of College and University Business Officers - NACUBO - Financial Accounting and Reporting Manual for Higher Education, 1990).

The seven major functional areas for recording expenditures examined in this study are:

Instruction: The instruction category includes expenditures for all activities that are part of an

institution's instructional program. These include expenditures for general academic instruction, vocational/technical instruction, special session instruction, community education, and preparatory/remedial instruction. It includes both credit and noncredit courses.

Public Service: The public service category includes funds expended for activities established primarily to provide noninstructional services beneficial to individuals and groups external to the institutions. These include activities for community service, cooperative extension service, and public broadcasting services.

Academic Support: The academic support category includes funds expended to provide support services for the institution's primary missions of instruction, research, and public service. (Research is not part of the defined mission of public two-year colleges in Tennessee and is therefore not subject to further reference). The services include libraries, museums/galleries, educational media productions, academic computing support, ancillary support, academic administration, academic personnel development, and course and curriculum development.

Student Services: The student services category includes funds expended for offices of admissions, records, registrars, and enrollment development. It includes

expenditures for student activities, cultural events, student newspapers, intramural athletics, counseling and career guidance, student financial aid administration, and student health services. Intercollegiate athletics is also budgeted in this function unless it operates at a point where revenues equal or exceed expenses. All public two-year colleges in Tennessee budget for intercollegiate athletics in the student services function since this activity is not operated as a self-supporting unit such as the college bookstore.

Institutional Support: The institutional support category includes expenditures for central executive management activities and long-range planning for the entire institution. It includes expenditures for offices of the chief executive officer, chief academic officer, chief business officer, chief student affairs officer, fiscal operations, employee personnel and records, general administrative and logistical services such as purchasing, security, communication services, printing, transportation services, and community and alumni relations, including fund raising.

O&M: The operation and maintenance of physical plant category includes all expenditures of current operating funds for the operation and maintenance of the physical

plant. It includes expenditures for physical plant administration, building maintenance, custodial services, utilities, facilities rent, and landscape and grounds maintenance.

Scholarships and Fellowships: The scholarships and fellowships category includes expenditures for grants-in-aid, trainee stipends, and student fee waivers awarded to undergraduate students. For Tennessee's public colleges, this category includes expenditures for the various fee waiver options that permit state employees and dependents of certified public school teachers to enroll in classes with a fee discount. An expense for the amount of the discount is recorded in this function. Expenses for TBR and UT system employees including their spouses and dependent children are also budgeted in this function. Federal funds such as Pell grants are classified as restricted expenditures in an agency grouping since these are "pass-through" funds and are awarded directly to students at the institutions.

6. Unrestricted Funds: Unrestricted current funds are resources received by an institution that have no limitations or stipulations placed on them by external agencies. Student fee revenue and state appropriations are examples of revenue sources received as unrestricted current funds (NACUBO, 1990).

7. Educational and General (E&G): Educational and general expenditures include funds expended through the seven primary functions including instruction, public service, academic support, student services, institutional support, O&M, and scholarships and fellowships (NACUBO, 1990).

8. Public Community College: Public community colleges include those institutions that are publicly controlled and accredited to award the associate in arts or the associate in science as the highest degree. This definition includes the comprehensive two-year colleges as well as many of the technical institutes. It eliminates most of the publicly supported area vocational schools and adult education and technical centers (Cohen & Brawer, 1989).

9. Student Fees: Student fees, also referred to as tuition and fees in various publications, are charges to students enrolled in credit courses. This is an enrollment or registration fee that is based on the number of credit hours for which students enroll. Student fees also include other miscellaneous charges assessed in conjunction with registration, such as technology access fees, activity fees, and parking fees. The TBR uses the term "maintenance fees" for the registration fee assessment for student credit hours for in-state students, and the term "tuition" as an

additional credit-hour assessment for out-of-state students. The reference to student fees in this study relates to all registration-related charges assessed to in-state students (TBR Guidelines Manual, 1998).

10. Budgetary Efficiency: Budgetary efficiency, or efficiency, is used in this study to reference the percentage of budgeted E&G funds allocated to direct instructional support, to include the functions of instruction, public service, and academic support. It also references the percentage of allocation to the institutional support function for general administrative support services. A higher degree of efficiency is associated with an increased allocation to direct instruction and a decrease in allocation to institutional support. This is a specialized definition for purposes of this study only.

Overview

The importance of studying factors associated with higher education finance has increased dramatically over the past decade according to various researchers such as Gage (1991), James (1991), Kapraum and Heard (1991), and Burstein (1996). As the public continues to demand higher levels of accountability, the study of historical budget data is important to foster correct perceptions among public

policymakers as these elected officials enact public policy and determine funding levels for public entities. The following chapters address historical and social issues affecting the allocation of resources among higher education institutions.

Chapter two reviews the origin and history of Tennessee's public two-year colleges and trends and issues relative to enrollments, student fee rates, and other financial matters impinging on higher education. It addresses public perceptions that both directly and indirectly affect funding and budgeting processes for all public institutions of higher education.

Chapter three presents questions as to how public two-year colleges in Tennessee internally allocated and expended their unrestricted E&G budgets over the past decade. It addresses the functional allocation of funds between Tennessee's public two-year colleges and the national median data from the NACUBO and the Integrated Postsecondary Education Data System's (IPEDS) survey. It also presents questions relative to staffing patterns as compared with FTE student enrollments, increases in student fees as compared with the CPI, and changes in major revenue sources.

The fourth chapter includes data tables relative to internal budget allocations and expenditures, staffing,

enrollments, and fees for each of the 14 public two-year colleges for each year of the study. Details of the analysis are presented through table format, graphs, and narrative exposition.

Chapter five includes a summary of the quantitative analysis and draws certain conclusions as to efficiency of operations from a financial perspective for the two-year colleges in Tennessee. Recommendations for further research are also included.

CHAPTER 2
REVIEW OF THE LITERATURE

Very little research has been conducted as to how public two-year colleges internally allocate and expend their E&G unrestricted budgets. Since public policymakers are now questioning rising costs associated with student fees and are demanding increasing levels of accountability, it is important for the public to know why costs are increasing. A review of the history of budget and expenditure patterns for Tennessee's public two-year colleges is one way to understand the financial complexities of higher education budgeting. This literature review is divided into four major categories: (1) brief history of public two-year colleges with an emphasis on the history of two-year colleges in Tennessee, (2) trends and issues relative to higher education finance and public two-year colleges in particular, (3) public perception of higher education, and (4) funding and budgeting processes.

Brief History of Public Two-Year Colleges

National: The origin of the American community college can be traced to the mid and late 1800s and the early 1900s. Around 1851, Henry Tappan espoused teaching the 13th and 14th years of education at the high school level, a model he

patterned after the German system (Vaughan, 1982). The modern American community college, with its broad mission and open door philosophy, received impetus from the Servicemen's Readjustment Act. This act is more commonly known as the GI Bill and was passed by Congress in 1944. In 1947, a study on higher education for America, previously authorized by President Truman, was published. This study, informally known as the "Truman Commission Report," supported the establishment of a network of community colleges. If America was to fulfill its role as the leading advocate for a democratic society, then the nation needed to find a way to educate the masses. Two-year colleges were judged as the best vehicle to accomplish this vision of educating the masses. These institutions were to charge little or no fees, offer a comprehensive curriculum including technical and general education, be locally controlled, and blend in with their state-wide system of education.

In the 1960s, relatively open access to higher education was achieved. Veterans began to utilize vouchers afforded by the GI Bill, and minority groups and women enrolled in postsecondary educational institutions. In 1965, the Higher Education Act was passed by Congress with the

resulting benefit that it was now possible for virtually every American to attend college (Vaughan, 1982).

State of Tennessee: The origin of public two-year colleges in Tennessee closely paralleled the national scenario. Specifically, in Tennessee, the origin can be traced to a study authorized by the state's general assembly. The study, entitled Public Higher Education in Tennessee, was initiated in 1955 and completed in 1957, and came to be known as the Pierce-Albright Report. This report generated significant interest in the need to expand public higher education in the state. The Pierce-Albright Report noted that most of the state's population resided within a 50 mile radius of the existing seven public four-year colleges and universities (Pierce & Albright, 1957). The three major metropolitan areas not located within a 50 mile radius included Chattanooga, Pulaski-Columbia, and Jackson. While adding four-year colleges was originally envisioned to meet the state's educational needs in these three areas, the existing upper-level institutions exerted political pressure not to add competing four-year colleges. The national climate at this time favored establishment of all-purpose two-year colleges, as evidenced by federal legislation, especially the Higher Education Facilities Act of 1963 (Nicks, 1979). This act provided partial funding for

construction of the two-year colleges. And finally, the citizens of south-central Tennessee, in conjunction with the State Board of Education, wanted a multi-purpose institution. The community leaders were interested in an institution that would be accessible not only to recent high school graduates but to older adults. These leaders also envisioned a comprehensive regional institution with a low fee structure. Thus the junior college movement in Tennessee was born (Nicks, 1979).

In 1963, newly-elected Governor Frank G. Clement appointed J. Howard Warf as Commissioner of Education. At the State Board of Education meeting in August, 1963, Commissioner Warf was authorized to appoint five members of the board to a committee to make preliminary plans for a state college to be located in the south-central portion of the state (Nicks, 1979). At its February, 1964 meeting, the State Board of Education adopted a progress report from the committee that was presented at the August meeting. This committee became known as the "Committee for a Junior College in South-Central Tennessee." The committee subsequently recommended the establishment of three junior colleges in Tennessee, one in each of the three "grand divisions" of the state, at the Board of Education meeting on June 22, 1965. The first three community-junior colleges

were to be located in Cleveland, Columbia, and Jackson.

Between 1967 and 1969, six additional junior colleges were authorized, and the existing postsecondary regional training school in Chattanooga was converted to junior college status, bringing the total junior college authorization level to ten (Nicks, 1979).

The State Board of Education was the governing body for K-12 and all public postsecondary institutions, with the exception of the University of Tennessee until 1972. The University of Tennessee had its own governing board and operated somewhat independently of the state board.

Commensurate with the expansion of the two-year colleges in the state, the 85th General Assembly authorized a coordinating agency for public higher education in 1967 (TCA 49-50-1002, 1967). This agency, The Tennessee Higher Education Commission (THEC), became operational in the fall of 1967. The THEC was granted primary authority to determine the locations of new colleges, to coordinate funding requests, and to approve program offerings for public higher education.

In 1972, the State University and Community College System of Tennessee was established with the State Board of Regents as the governing body for the six-four-year institutions, all of which had gained university status by

this time, and the ten two-year colleges (TCA 49-8-101, 1973). Thus, the THEC was responsible for coordination and oversight of two systems of higher education in the state: the University of Tennessee and the State Board of Regents. In 1963, legislation had also authorized the establishment of 26 area-vocational technical schools to provide non-collegiate postsecondary training, and four technical institutions. The 26 vocational technical schools and the four technical institutes (Memphis, Nashville, Knoxville, and Tri-Cities) were governed by the State Board of Education until they were moved under the auspices of the State Board of Regents system in 1983 (Consacro & Rhoda, 1996). Today, 14 public two-year community colleges and technical colleges are governed by the TBR, formerly the State Board of Regents.

Amidst a national public outcry regarding higher education issues including quality and specifically cost, Governor Don Sundquist of Tennessee appointed a Council on Excellence in Higher Education in April, 1997 (Report, 1999). Governor Sundquist charged the council with developing plans to move the level of Tennessee's public higher education forward in the nation's ranks. The council's draft report, for its January, 1999 meeting, had numerous recommendations, but one specific recommendation

created considerable concern among a number of the community college leaders across the state. This recommendation called for a separate board to govern the 14 community colleges and the 26 area technology centers. The Chancellor of the Tennessee Board of Regents, President of the University of Tennessee System, and Executive Director of the THEC collaborated in support of efforts to change the draft report's recommendation regarding governance. The leaders were successful in their efforts to the extent that the Council's final report to the Governor will reportedly leave the governance of higher education in this state intact (Sharp, 1999). The council is recommending that the THEC be given more authority to oversee the UT and TBR systems. Whereas the THEC has had authority to recommend funding for both systems, it is being recommended that this body also have authority to coordinate spending as well as to terminate academic programs. A majority of community college leaders support the recommendation to leave the current organization structure intact because it facilitates articulation efforts and mitigates the potential of increased competition between two and four-year institutions for funding and enrollments. As of July 1, 1999, the governor had not yet made public his position on the report.

Trends and Issues Relative to Finance of Higher Education
and Public Two-Year Colleges in Particular

Two-year colleges across the nation experienced burgeoning enrollments, and budgets flourished during the 1960s and for most of the 1970s. Higher education institutions in general and two-year colleges in particular expanded facilities, purchased extensive amounts of instructional equipment and materials, and added faculty and staff to accommodate increasing enrollments. Financial planners were not concerned as to whether budgets would increase in subsequent years, but rather they were involved in predicting the incremental level of increase. By the 1980s, however, they were faced with new challenges.. Enrollment patterns began to moderate and in some instances enrollment actually declined. State appropriations, heavily driven by enrollment in most state formulas, also fluctuated with enrollments (Leslie & Ramey, 1986). Instability was characteristic during this period, and planning and budget processes were fraught with uncertainty. Social scientists were inconsistent in their forecasts of enrollments and the availability of state revenues to support public higher education. Community colleges faced increasing difficulty in acquiring adequate financial resources to support their comprehensive mission (Wattenbarger & Mercer, 1985). Authors

differed in their opinions as to whether higher education had a bright or a dismal future (Zammuto, 1986). Overall, however, higher education made progress during the decade of the 1980s, in that the nation's economy grew, and although the share of states' budgets allocated to institutions decreased, the base level of appropriations actually increased (Andersen, 1994).

According to Andersen (1994), during a 12-year period from 1980 to 1992, states' appropriations to higher education grew by 110%. During this same period, total states' revenues increased even more rapidly, by 157%. As measured in constant dollars, state appropriations to higher education increased by only 24% during this 12-year period, while total state revenues increased by a more robust rate of 53%. In 1980, appropriations to higher education represented 11.3% of total state revenues. By 1992, this distribution had dropped to 9.2% of state revenues. This reduction in the share of states' budgets apportioned to higher education did lead to concern that public policymakers and the nation's citizenry were beginning to downgrade the importance of higher education (Andersen, 1994).

According to Layzell and Lyddon (1990), "for many states, the 1980s were a watershed with regard to funding

higher education, (p.2)." In the state of Tennessee between 1980 and 1990, appropriations for public higher education institutions increased by 119%, from \$335,600,000 to \$727,500,000. This increase ranked as the 19th largest among the 50 states. Layzell and Lyddon (1990) also noted that "state governments bear the principal responsibility in budgeting for higher education and that the budget is the link between present choices and future options (p. 5)." A state's budget summarizes the values and policy preferences within the culture of the state and of its policymakers.

By the early 1990s, state revenues failed to keep up with budget projections (Hossler, Lund, Ramin, Westfall, & Irish, 1997). Kapraun and Heard (1991) stated "during the decade of the 1990's, financing will become a primary concern for most community colleges (p. 78)" due to declining economic conditions that began in the late 1970s. Many community colleges are faced with the dilemma of rapid enrollment growth and declining state financial support. "Despite the increase in enrollment, many lawmakers appear reluctant to reduce funding at four-year colleges and thus risk eroding their academic programs. Thus, community colleges are having to absorb more than their share of budget reductions (Gage, 1991, p. 17)."

In 1990 and 1991, the nation's economy was in the midst of a recession and state coffers did not have an abundance of financial resources to allocate to higher education. Competition for these limited resources escalated. Competition from K-12 public education, Medicaid, transportation and correction departments resulted in states redirecting funds from higher education to these other sectors of public need (Cohen, 1993; Duderstadt, 1997; Gage, 1991; & Hossler et al., 1997). In just a five-year period, from 1987 until 1992, the proportion of state funds allocated to Medicaid surpassed the amount allocated to higher education and was second only to the funding level provided to K-12 education (Hossler et al., 1997). Zemsky and Wegner (1997) also reported that, beginning in 1990, Medicaid surpassed higher education as the second largest component of state spending and was second only to elementary and secondary education. Between 1987 and 1995, Medicaid's share of state appropriations increased from 10 to 19% while higher education's share dropped from 12 to 10% (Zemsky and Wegner, 1997).

Since state appropriations represented the major source of revenue for public two-year colleges, alternative sources of revenue were needed to avoid fiscal calamity. The alternative revenue of choice for most of these institutions

was student fees, as this generally represented the second major revenue source for colleges and universities (Wattenbarger & Vader, 1986). Fee increases became an annual operating necessity. Student fee revenue was judged to be the best source of income to offset the revenue shortfall resulting from the decline in the proportion of state funding. Between 1981 and 1993, student fee increases exceeded the increase in the CPI by an average of five % (Hossler et al., 1997). "From 1980 to 1990, state revenues more than doubled, increasing by 131% (Andersen, 1994, p. 3)." During this same period, state appropriations increased at a lesser rate of 105%. Nationally, the percentage of state appropriations to higher education decreased from 11.3% in 1980 to 10% in 1990 (Andersen, 1994). Thus, increasing student fees became a common practice to ameliorate the reduction in state appropriation. Table 1 depicts changes in average student fees for private and public two-year and four-year colleges and universities from 1980 to 1990.

Table 1

Average Student Fees, 1980 to 1990 for Private and Public
Colleges and Universities in Current and Constant Dollars

	Current Dollars			Constant (1998) Dollars		
	1980	1990	% Chg.	1980	1990	% Chg.
Private Two-Year	\$2,413	\$4,990	107%	\$4,546	\$6,081	34%
Public Two-Year	\$391	\$884	126%	\$737	\$1,077	46%
Private Four-Year	\$3,617	\$9,340	158%	\$6,814	\$11,382	67%
Public Four-Year	\$804	\$1,908	137%	\$1,515	\$2,325	53%

Source: The College Board, Trends in College Pricing, 1998.

Student fee rates increased at double-digit levels for the first two years of the 1990s at public colleges and universities. Student fee increases for 1990 and 1991 were 12 and 10%, respectively, and this was three times greater than the inflation rate (Evangelauf, 1992). By the mid to late 1990s, student fee increases at public two-year and four-year institutions had leveled off to between a 5 and 6% average on an annual basis as noted in Table 2.

Table 2

National Average Student Fees, 1994 to 1998 for Private and
Public Colleges and Universities In Current Dollars

	1994	1998	% Change
Private Two-Year	\$6,128	\$7,333	20%
Public Two-Year	\$1,310	\$1,633	25%
TBR Two-Year	\$966	\$1,130	17%
Private Four-Year	\$11,719	\$14,508	24%
Public Four-Year	\$2,705	\$3,243	20%
TBR Four-Year	\$1,616	\$1,906	18%

Source: The College Board, Trends in College Pricing, 1998
(Data from the TRB finance and research offices).

A number of significant trends took place in the early 1990s and some of these placed extreme demands on states to meet the funding needs of higher education (Hossler, et al., 1997). The most consequential of these trends relative to higher education included competing demands for state funds, a decline in the federal commitment to student financial aid, sluggish or stagnant state economies, a decline in personal disposable income, and increased demand for postsecondary education (Hossler, et al., 1997). During 1990

and 1991, the nation experienced a mild but broad and widespread recession (Andersen, 1994; Klinger, 1995; Report: National Association of State Budget Officers, 1992). Between 1980 and 1990, federal revenues grew by 87%, with an average biennial growth of 18%. During the same period, state revenues grew by an even more robust rate of 131%. However, between 1990 and 1992, federal revenues grew at a much slower rate, with a biennial average of only 11%, and growth in state revenues slowed by about one-third (Andersen, 1994). Thus, the trend of increasing student fees that began in the 1980s became more prevalent and continued with an even sharper upward spiral.

With a declining share of state budgets allocated to higher education, institutions were forced to internally reallocate resources. According to Bruegman (1994) higher education has successfully reallocated its resources over the past two decades to support its mission and to support high-priority programs.

Public Perception of Higher Education

Have policymakers and the public lost confidence in higher education? The answer is yes and no. Lenhardt (1997) summarized as follows: "the public no longer considers higher education a sacred entity whose actions it blindly

accepts (p. 38)." College students, their parents, and elected officials have asked why student fees are increasing at a faster rate than personal income (Mullen, 1988). Mullen noted that individuals who do not understand states' policies regarding higher education are confused and frustrated. Dale Parnell (1990) noted that higher education had developed a reputation of being overpriced and viewed as "unaffordable" by some parents. Between 1980 and 1990, student fees increased by 234%, while household income rose only 82% and inflation, as measured by the cost of consumer goods, grew by only 79% (Klinger, 1996). "In the period from 1980 to 1994, the cost of higher education outpaced the cost of automobiles by 500%, overall inflation by 400%, and even medical care by 70% (Roherty, 1997, p. 21)."

In the mid-to-late 1980s, President Ronald Reagan's secretary of education made a number of public statements criticizing higher education and alleging that colleges and universities were overpriced (Trachtenberg, 1997). "The large number of institutions reporting student fee increases is alarming and should not be considered apart from the institution's admission policy (Collins, Leitzel, Morgan, & Stalcup, 1994, p. 41)." Some educational leaders are viewing student fee increases as a means to limit enrollments and to control costs.

There is a tension at the very heart of community colleges: With their ambitious and broad institutional mission to meet the varied educational needs of their constituents, community colleges must reconcile limited resources with open door admissions policies. This tension has been exacerbated by America's economic difficulties in the late 1980s and early 1990s (Burstein, 1996, p. 1).

To meet the goals of their mission statements, colleges have had to cut back on services and programming while adjusting to diminishing levels of state funding.

The National Commission on the Cost of Higher Education was established by Public Law 105-18 in 1997 (Report of the National Commission, 1998). This 11-member Commission, established as an independent advisory body, called for an extensive review of college costs and prices. The Commission warned that colleges risk "an erosion of public trust" if their charges continue to soar (Report of the National Commission, 1998 p. 1). Commission members indicated that if public concern continues, and if colleges do not take steps to reduce costs, policymakers at both the federal and state levels will intervene. The Commission's report recommended a shared responsibility to (1) strengthen institutional cost control; (2) improve market information and public accountability; (3) deregulate higher education; (4) rethink accreditation; and (5) enhance and simplify federal student

aid. The report emphasized that public anxiety had risen as student fees had escalated.

State legislators and elected officials no longer regard higher education as "untouchable" or as the "sacred cow." State officials are becoming more sophisticated in their knowledge about higher education. They are less in awe and more willing to ask questions about higher education and its value (Layzell & Lyddon, 1990). Public concerns exist relative to a lack of perceived productivity as costs have increased, as outcomes have become harder to measure, and as goals have not been clearly articulated. Governors are taking more of a lead in setting policy agendas for higher education as these are played out in the budget process (Layzell & Lyddon, 1990). By 1992, higher education nationally ranked as the fifth category among state budgets to be considered as a program exempted from budget cuts. Categories ranked ahead of higher education for preferential treatment for budget status included Medical Aid to Families with Dependent Children (AFDC), K-12 education, Medicaid, and corrections, in descending order (Report: National Association of State Budget Officers, 1992).

Governor Don Sundquist of Tennessee, along with governors in most other states, is taking more of a lead in setting policy agendas for higher education. Issues

regarding higher education have become extremely political. In November, 1996, Governor Sundquist's appointees to the THEC Board terminated the employment of their executive director, reportedly for political differences (Chronicle of Higher Education, 1997). In January, 1999, the Governor's Council on Excellence in Higher Education in Tennessee released a draft report calling for major changes in the governance structure for all public postsecondary education in the state. The draft was subsequently modified in substantial form and now recommends changes relative to the THEC's level of authority in allocating funds to the two systems in the state. State officials in Tennessee, as well as across the nation, have become increasingly sophisticated in their knowledge about higher education (Layzell and Lyddon, 1990). In conjunction with this increase in sophistication among elected officials regarding their knowledge of higher education, public attitudes in general seem to be shifting from what is of value to society to what is of value to the individual. This latter cultural shift allegedly has resulted in a level of complacency regarding the relative importance in terms of public funding for higher education.

In a recent survey initiated by the American Council of Education, 71% of the respondents said that college is too

expensive for most Americans (Reisberg, 1998). Minorities, including 83% of blacks and 79% of Hispanics, believe college is not affordable. Just as significant is the fact that 85% of those surveyed think that colleges make a profit. Survey respondents overestimated the cost of tuition by as much as three times the actual cost. The cost of a college education as a matter of parental concern ranked higher than concern about the potential that their siblings would become crime victims, health care, or the quality of public schools. The only concern of more significance than the cost of college, as expressed by these parents relative to their children, was the use of illegal drugs. The report concluded that the public knew far less about college costs and operations than college officials ever envisioned (Reisberg, 1998).

On the other side of this issue, many states are once again placing a high priority on higher education, and on community colleges in particular (Consacro & Rhoda, 1996). The community college movement has a rich tradition of meeting the needs of the American public. Frances (1998) noted that community colleges enrolled 39% of the nation's students, including both public and private colleges enrollments in 1995. Significant is the fact that these two-year schools enrolled 48% of the students attending public

colleges and universities during that year. Known as the "people's colleges," community colleges are viewed favorably and valued by the general public. Data presented by Frances (1998) indicate that community colleges have a bright future and should become an even more dominant force in shaping the future and in meeting work-force needs, as their enrollments increased at a higher rate than for the four-year public institutions between 1990 and 1995. According to Nespoli and Gilroy (1998) "community colleges have fared well in recent state budgets (p. 11)." Legislators and the business community are looking to community colleges to meet a variety of educational and training needs.

College officials expressed optimism for improved funding in the latter stages of the 1990s, because states had an average budget surplus of six % at the close of the 1997 fiscal year (Healy & Schmidt, 1998). After losing out in competition with other state agencies for general operating appropriations in recent years, it appears colleges are gaining ground in the late 1990s. Schmidt (1998) recounted that after years of losing ground, higher education is at least holding its own in competition with other public service agencies for state funding. Community colleges are seeing a strong improvement in appropriations for fiscal year 1999. Schmidt (1998) noted that state

general funds appropriations for higher education should increase at a faster rate than spending on prisons and Medicaid in the immediate future, and state appropriations for welfare are expected to decline significantly. Public elementary and secondary education appear to be the only sector leading higher education for state funding increases the last two years of this decade. State support for public higher education as a budget priority represents a dramatic turnaround from the first half of the 1990s. Consacro and Rhoda (1996) stated that "higher education in Tennessee is growing at a time when state revenues are decreasing (p. 583)." Most families feel that for their own children college is still the best route to follow (Trachtenberg, 1997).

Since public policymakers and the general public have expressed mixed feelings and emotions regarding higher education, a proactive approach must be followed to either achieve or sustain a positive public image (Gage, 1991). Again, for the past two decades the public has demanded increasing levels and evidence of accountability (Miller & Salem, 1995). Community colleges in Tennessee have been fiscally accountable, and particularly so, over the past decade (Consacro & Rhoda, 1996). Yet, a large segment of the public is unaware of this increased accountability, in part

because of a lack of research and published data (James, 1991). In addition to the public sector, colleges have a responsibility to keep faculty, staff, and students informed as to the internal allocation of financial resources (Hyatt, Shulman, & Aurora, 1984). This study was intended to provide data that could be utilized to improve the image of community colleges in Tennessee.

Much of the legislative and administrative intervention in higher education is due to economic and political concerns, rather than a desire to improve education (Klinger, 1996). Community college administrators can deal with the aspect of political concerns. Utilization of proper financial controls and budgeting techniques coupled with appropriate analyses will allow college officials to explain the internal allocation of financial resources and expenditure patterns to their respective constituency. If college leaders intend to change the attitudes and perceptions of public policymakers, then we all need to learn more about how institutions expend their funds through an analysis of internal expenditure patterns (James, 1991). "Community college leaders must improve their public relations and ensure that policymakers and the general public are aware of their past accomplishments, future potential, and needs (Gage, 1991, p. 18)." Understanding

financial trends is a necessity to assess the health of an institution. Comparative analysis of financial data over time will depict areas of strengths and weaknesses (Lapovsky, 1991). The public two-year colleges in Tennessee need to document their strengths to public policymakers and prescribe remedies for their weaknesses.

Funding and Budgeting Processes

Funding and budgeting processes have a direct relationship to the internal allocation of funds for colleges and universities. Economic conditions and environmental factors play a major role in the determination of how much money is appropriated by states to higher education. As the relative funding level increases, a larger percentage of dollars is allocated to full-time faculty positions, public service activities, libraries, maintenance of the physical plant, and for faculty and staff development activities (Burstein, 1996; & James, 1991). These are also the first areas to be curtailed during periods of financial retrenchment. Consequently, as economic conditions and environmental factors improve, the portion of higher education budgets allocated to public services, libraries, and maintenance of physical plants generally increases.

Layzell and Lyddon (1990) concluded that there were four environmental factors and conditions that affected state budgets and their allocations to higher education:

1. Historical factors, including past practices and the past share of state's budgets, have been important in determining allocation patterns to various public segments. Political culture and tradition were also important historical factors.

2. Such political variables as changes in political parties and their relative strengths were consistently related to changes in the proportions of budgets allocated to higher education. Individual citizens generally do not seem to be concerned with overall issues regarding higher education but are concerned about specific matters such as fee rates and availability of financial aid. However, public policymakers are now expressing more interest in overall funding because of continuing fee increases and the amount of competition for state dollars.

3. Economic variables, such as the overall wealth of a state, are directly related to state appropriations for higher education. Wealthier states obviously have a greater ability to pay for services and, historically, appropriation levels for higher education have increased during periods of economic prosperity.

4. Demographic variables are probably the least significant of the four factors, in terms of direct influence relative to higher education funding. The most important demographic variable is enrollment. Of lesser importance are factors such as population density and age.

College officials can do little to directly and immediately influence the economic conditions of a state. They can, however, have an impact upon the political culture and relations with public policymakers. While much has been written and said about the rising costs of college, the American higher education system is clearly superior when compared with that of other nations (Kerr, 1993). Kerr (1993) indicated that higher education officials would begin to pursue more aggressively an increase in resources, but would be required to demonstrate more efficient utilization of these resources. Publication of appropriate budget data depicting efficient utilization of financial and human resources can influence officials and legislators who are responsible for determining allocation patterns of states' budgets. Collins (1996) stated "In order to win support from the legislators, higher education administrators must take active steps to make them aware of their needs" (p. 33). The key is to inform public officials of accountability

measures that produce quality outcomes and document efficiency.

Most states use a formula approach to determine allocation of funds to colleges and universities. Most of these formulas are enrollment driven, and the majority of funding is derived from the number of FTE students. Five basic types of formulas are as follows: (1) enrollment-based, (2) staff-based, (3) marginal cost, (4) performance incentive, and (5) composite (Miller, 1995). Enrollment-based formulas provide funding in accordance with FTE enrollments. This can be based on an average expenditure per FTE or a differential funding level in accordance with variances in actual program costs (Wattenbarger & Mercer, 1985). Staff-based funding is similar to enrollment-based and is generally computed on a faculty-to-student ratio. Marginal cost funding is based on a rate or allocation factor for incremental increases and decreases in enrollment levels. Marginal cost is the real cost of one additional student and this usually is less than the average cost per student because of economies of scale (Layzell & Lyddon, 1990). One advantage of marginal cost funding is that it mitigates the effects of a funding loss during periods of enrollment decline because the change in funding is less than the average cost. Significant is the fact that this

funding approach gained popularity during periods of rapidly increasing enrollment, because incremental increases in funding were less than average costs. Composite-based funding represents the utilization of more than one of the five formula types. The type of funding formula employed by a state can influence the internal allocations of institution's budgets.

Tennessee, like most other states, uses a formula to determine funding allocations for its public institutions. The funding mechanism uses a cost-based program funding approach that is primarily enrollment driven. That is, enrollment by course taxonomy or field and by degree level in conjunction with a student to faculty ratio is multiplied by an average peer institutional faculty salary level to produce the bulk of instructional funding. In 1977, Tennessee was the first state to link funding to performance criteria (Smith, 1997). One recent study found that up to five % of an institution's state funding could be derived from performance factors such as program accreditation, retention, student and alumni satisfaction, job placement rates, and fund raising (Mayes, 1995).

Even though the Tennessee formula provides considerable flexibility to institutions regarding the actual internal distribution of funds, it does mandate minimum expenditure

levels for designated functions or sub-categories. It stipulates a minimum expenditure level for operation and maintenance of the physical plant function, centers of excellence, and desegregation (TBR budget guidelines, 1998). The TBR also previously mandated a minimum expenditure level for the remedial and developmental sub-category in the instruction function for community colleges. Unlike many states, Tennessee does allow its public institutions to carry unexpended general operating funds forward to a subsequent fiscal year. Capital outlay funds for new facilities construction and major maintenance projects are normally funded from general obligation bonds approved to be issued for major projects. Capital outlay appropriations are separate from general operating funds appropriations and, as such, remain on deposit with the state treasurer, and warrants for expenditures are drawn in accordance with progress on construction. Priorities for capital budgets are determined in accordance with a sophisticated formula and are made without bias to the TBR or UT system and without regard for the level of institution, either two-year or four-year institution (Consacro and Rhoda, 1996). General operating appropriations are distributed to institutions on a monthly allotment schedule.

Tennessee's public colleges have the flexibility to shift funds within a function over the course of a budget year. Interfunctional shifts are authorized at two revised budget intervals, October and April, annually. Institutions do operate with a personnel position cap or ceiling for the total number of positions as well as categorically in terms of faculty, clerical and supporting, professional non-faculty, and administrative staff. Requests for new positions can be made in conjunction with the proposed budget for the beginning of a new fiscal year in July and with the first revised budget submission as of October (TBR Budget Guideline, 1998).

Community colleges in Tennessee, as are their counterparts in most other states, are able to exercise considerable local control relative to employment practices and the internal allocation of funds. Unlike most states, however, Tennessee's community colleges do not receive local appropriations and, thus, are not subject to local governing boards. One other unique aspect relative to these institutions relates to the governance structure. The TBR governs the 14 community colleges and six regional universities. This structure facilitates collaboration on curriculum development and on academic standards between the community colleges and the universities. This also

facilitates articulation and transfer efforts between these two levels of institutions and avoids unwarranted program duplication (Consacro and Rhoda, 1996).

According to Miller (1995), budgeting strategies typically can be classified into two paradigms, incremental and rational. Incremental strategies involve across-the-board or percentage increases. Rational strategies involve a more selective process for the internal allocation of funds based on the setting of institutional priorities. Incremental budgeting involves the internal allocation of funds based on past performance or a specified amount or percent change by line item. The rationalist approach utilizes a zero based concept that does not regard previous funding levels. In other words, decisions are made in accordance with program planning and institutional objectives.

Lenhardt (1997) noted that "higher education budgets are prepared using either a cost-based or a revenue-based approach (p. 39)." Cost-based budgeting involves examining what it will cost to operate the next year and determines the revenue sources needed to fund these operations. Revenue-based budgeting requires scrutinizing the total funding level available and prioritizes expenses according to the available resources. Most institutions have used the

revenue-based approach during the 1990s. Regardless of the type of budgeting strategy employed, flexibility to amend the budget at the local level is necessary to meet current priorities that continually change. If a community college is to meet the priorities of its community orientation successfully, local flexibility to make internal budget modifications must be provided by the governing body (Fonte, 1993).

Cost analysis or cost study of higher education finance involves three components: (1) cost accounting, (2) cost effectiveness, and (3) cost comparison (Halstead, 1991). Cost accounting collects and organizes data by program or unit. Cost effectiveness attempts to discover the degree to which desired goals or specified outcomes are achieved. Cost comparison is concerned with developing and reviewing unit cost data to determine trends and discover variations warranting additional analysis. Cost comparison is judged to be the most effective of the three cost analysis components, because it can better be used to evaluate and change practices where appropriate. The basic advantage of cost comparison is to conduct a comparative cost analysis as a means to identify possible problem areas. Costs reflect institutions' objectives and management skills in resource utilization and the allocation prerogatives of management.

(Halstead, 1991). A cost comparison approach has been employed in this study to review the functional internal budget allocations of the public two-year colleges in Tennessee. It was useful in examining the prerogatives exercised by college officials over the past decade.

Halstead (1991) noted that the only universal trend in higher education finance analysis was a gradual increase in administrative costs. Similarly, Cohen (1993) observed that between 1977 and 1989, administrative costs for community colleges increased on the average from 45 to 50%, while instructional expenditures decreased from 52 to 43%. During this same period, the proportion of funds allocated to scholarships increased from three % to seven %. This study involved a similar but expanded analysis for the public two-year colleges in Tennessee from 1988-89 through 1997-98 to determine internal allocation patterns.

The National Association of Collegiate and University Business Officers (NACUBO) recommends that colleges and universities use a functional approach for the allocation of budgets and classification of expenditures (NACUBO, 1990). The functional approach classifies expenditures according to the primary purpose. It provides for the highest degree of comparability of data among institutions. This study analyzed expenditure data among the 14 two-year colleges in

Tennessee according to functional patterns to maximize comparability. This study examines primarily the unrestricted current operating funds E&G budget.

Functions within the E&G budget presented in this study include expenditures associated with the primary mission of a community college. These include the instruction and related academic support functions, student service activities, general administrative support, operation and maintenance of the physical plant, and institutionally awarded scholarships and fellowships. The E&G budget excludes auxiliary enterprise units such as the college bookstore, and cafeteria and vending food services.

Auxiliary service units must be self-supporting and are not eligible to receive any portion of state or local appropriations or student fee allocations. Sales from auxiliary operations must be sufficient to cover all operating expenses and general overhead. Overhead includes cost allocations for space, utilities, maintenance services, and administrative and fiscal support. The unrestricted budget is representative of funds received that have no restrictions placed on them by external agencies. For community colleges, these funds are made up primarily of state appropriations, student fees, and sales and services of educational departments. Restricted funds have

limitations or stipulations placed on them by external agencies. These include federal grants and contracts as well as private gifts designated for specific uses. Pell grants and federal Job Training Partnership Act funds are the primary restricted sources for Tennessee's public community colleges. Since the amount of restricted funds may vary significantly from year to year, since the purpose or intended use is determined by external sources, and since these funds may not relate to the college's primary mission, they are not included in the analysis of this study. The current operating budget includes funds allocated for a given fiscal year and that are expended for personnel salaries and benefits, travel, operating supplies and materials, and equipment. The current operating budget excludes funds expended for capital outlay projects such as new construction and major renovations.

The budget process should be a means to improvements in both policy outcomes and in the delivery of services to ones constituency (Layzell & Lyddon, 1990). More research on budgeting is needed to improve it. The next chapters seek to address this matter through research on internal budget allocation patterns of public two-year colleges in Tennessee.

CHAPTER 3
RESEARCH DESIGN AND METHODOLOGY

Introduction

A primary objective of an expenditure analysis is to show how comparative data are used to aid in the decision-making process. The purpose of this study is to determine how public two-year colleges in Tennessee internally budgeted and expended their unrestricted E&G funds over a ten-year period from 1988-89 through 1997-98. This study applied some of the basic concepts from a National Association of College and University Business Officers (NACUBO) comparative financial analysis of community colleges. Whereas the NACUBO analysis examined selected expenditure data for only five functional categories, this study examines unrestricted expenditure data for all seven of the E&G functions. The seven major functional areas include instruction, public service, academic support, student services, institutional support, operation and maintenance (O&M) of physical plant, and scholarships and fellowships. Some of the budget analysis is based on constant 1989 dollars. Both expenditure data and general-fund state appropriation are viewed in current or nominal dollars as well as in constant dollars. Data is contrasted in terms of current and constant dollars to determine real

dollar growth in excess of inflation, as measured by the Consumer Price Index (CPI). Other analyses of this study include expenditures per FTE enrollment, staffing patterns relative to FTE, rates of increase in student fees as compared with the CPI, and changes in the relative portion of the four major revenue sources.

Questions

The following questions directed the study:

1. Do the public two-year colleges in Tennessee expend a larger percentage of their unrestricted E&G budget for administrative and related support services and a smaller percentage for instruction and academic related functions at the end of the period, as compared with the base year of the study?
2. What is the real gain in the level of budgeted expenditures for the unrestricted E&G budget over the ten-year period of the study after adjusting for inflation as measured by the CPI?
3. Is there a difference among the public two-year colleges in Tennessee with small, medium, or large FTE enrollments relative to their expenditures of unrestricted E&G budgets, in terms of expenditures per full-time-equivalent student?

4. Is there a difference among the public two-year colleges in Tennessee with small, medium, or large FTE enrollments regarding the percentage apportionment of their unrestricted E&G budgets among the seven major functional areas of instruction, public service, academic support, student services, institutional support, O&M, and scholarships and fellowships?

5. Are there differences between the ten community colleges and the four technical community colleges/institutes regarding the percentage apportionments of their unrestricted E&G budgets by functional area?

	<u>Community Colleges</u>	<u>Technical Institutes</u>
- Instruction / E&G	% Apportioned	% Apportioned
- Public Service / E&G		
- Academic Support / E&G		
- Student Services / E&G		
- Institutional Support / E&G		
- O&M / E&G		
- Scholarships and Fellowships / E&G		

6. Are there differences in the percentage of the unrestricted E&G budget allocations per functional area between the public two-year colleges for those institutions with moderate FTE enrollment increases, compared with those

institutions with high FTE enrollment increases during the period of the study?

	<u>Institutions With Moderate FTE Growth</u>	<u>Institutions with High FTE Growth</u>
- Instruction / E&G	% Apportioned	% Apportioned
- Public Service / E&G		
- Academic Support /E&G		
- Student Services / E&G		
- Institutional Support / E&G		
- O&M / E&G		
- Scholarships and Fellowships / E&G		

7. Are there differences in how public two-year colleges in Tennessee apportioned by functional area the additional (incremental) E&G funds received between the base fiscal year and the final fiscal year of the study, as compared by total budget allocations?

	<u>\$ Change</u>	<u>% Allocation</u>
- Instruction Incremental Change (IC) / E&G IC		
- Public Service IC / E&G IC		
- Academic Support IC/ E&G IC		
- Student Services IC / E&G IC		
- Institutional Support IC / E&G IC		

- O&M IC / E&G IC
- Scholarships & Fellowships
IC / E&G IC

8. Are there differences in the percentage of the internal allocation of unrestricted E&G budgets in the five functional areas listed below between the public two-year colleges in Tennessee and the national median data from the NACUBO survey for the 1993-94 and 1994-95 fiscal years? (The NACUBO survey limits the collection of data to five functional areas). Also, are there differences in the functional allocations between the TBR community colleges and the national average according to the IPEDS survey in the seven major functional categories for the 1996-97 fiscal year?

	TBR System		NACUBO Median	
	1993-94	1994-95	1993-94	1994-95
- Instruction / E&G				
- Academic Support / E&G				
- Student Services / E&G				
- Institutional Support / E&G				
- O&M / E&G				

9. Are there changes in the ratio of personnel by the three major employee categories of faculty, administrative

staff, and support staff to FTE students for the public two-year colleges in Tennessee between the base fiscal year and the final fiscal year of the study?

1988-89

1997-98

- Faculty / FTE
- Administrative Staff / FTE
- Support Staff / FTE

10. Are there differences in the rate of increase in student fees for public two-year colleges in Tennessee as compared to the rate of increase in the CPI for each year of the study?

11. What is the real increase in general-fund state appropriation over the ten-year period of the study as compared to the rate of inflation as measured by the CPI?

12. Are there changes in the relative portion of gross receipts in the four major revenue sources of student fees, state appropriation, sales and services of educational departments, and other sources for the public two-year colleges in Tennessee between the base year and the final year of the study?

	% of <u>1988-89 Total</u>	% of <u>1997-98 Total</u>
- Student Fees		
- State Appropriation		
- Sales & Services of Educational Departments		
- Other Sources		
Total		

Model Design

"Because of differences in local conditions and accounting practices, there is great diversity in community college operating statistics (Morrison, 1989 p. 25)." Such diversity could invalidate a cost comparison. This study, however, focused on the 14 public two-year colleges in Tennessee that are governed by the TBR. These 14 institutions have adopted the expenditure and revenue classifications advocated by the NACUBO. The NACUBO classifications provide for a general grouping of like expenses and revenues and are consistent with generally accepted accounting principles. The TBR, however, provides additional guidance relative to the classification of financial data as well as to employee classification. The TBR institutions are subject to audit by the Division of State Audit on a biennial basis, and these reviews examine compliance with board and institutional policies in addition

to ensuring compliance with generally accepted accounting practices. Each two-year institution also is required to employ one auditor, and this position reports to the president to ensure appropriate independence. The person in this position is responsible for conducting internal audits and compliance reviews that entail analyses relative to the classification of financial data according to commonly accepted accounting standards. Therefore, classification of financial data among the public two-year colleges in Tennessee should be generally consistent, and to a much higher degree than could be expected of a regional or national study.

This was a quantitative research project and, as previously stated in Chapter 2, it used a cost comparison approach because of its inherent simplicity and its conduceveness to determining trends and discovering variations warranting further study or policy change. The nature of the data examined readily lent itself to a cost comparison for percentage and trend analysis and to the determination of desirable and undesirable changes in internal resource allocation patterns over time. Since the data themselves were classified as interval and ratio, percentage comparisons were made to analyze data. Graphs and charts were used to visually depict expenditure and revenue

patterns and to aid in depicting data changes. Line charts were used to determine if linear relationships existed, and if so, too visually depict the strengths of these relationships.

The study compared internal budget allocations for each of the 14 public two-year colleges in Tennessee and for the system as a composite unit for each fiscal year (July-June) from 1988-1989 through 1997-1998. The apportionment of expenditures by function was examined over time to determine if the community colleges were allocating more or less of the budget to administrative and related support categories in lieu of instruction and academic services. Analyses were performed relative to expenditures per FTE student and the apportionment by percent of the E&G budget by major functional category. Comparisons were made among classifications based on small, medium, and large FTE enrollment levels. An analysis of the ten community colleges was made in comparison with the four technical colleges/institutes to determine if differences existed in the internal budget allocation patterns between these two groups. The question as to whether the four original technical institutes apportioned a greater percent of their operating budgets to the functions of instruction and O&M was addressed. This question is important because the

technical institutes have been in existence for a much longer period of time and have older physical facilities than do the community colleges. This study compares budget allocation patterns to determine if differences existed between two sub-group classifications based on colleges with (1) moderate-FTE enrollment growth, and (2) high-FTE enrollment growth. Because the manner in which institutions apportion incremental resources was indicative of current priorities to meet long-term goals, an analysis was performed as to how Tennessee's two-year colleges apportioned by functional area incremental increases in E&G revenue from the base year to the final year of the study.

A modified version of the NACUBO comparative financial analysis model of community colleges is used in this study. The NACUBO analysis presented data collected from community colleges across the country that elected to participate on a voluntary basis. Typically, only seven or eight of the 14 Tennessee public community colleges participated by submitting data for the analysis in any one year. Apparently due to a low national participation rate, the NACUBO analysis was discontinued after the 1994-95 fiscal year. A NACUBO representative indicated, however, that the analysis was being reinstated for the 1997-98 fiscal year, but these most recent data were not available for this study.

A comparison with the NACUBO data was made for the 1993-94 and 1994-95 fiscal years for each of the five functional areas for which selective comparative data was collected. The NACUBO data includes unrestricted and restricted funds but excludes federal Pell Grants and other restricted scholarships. In addition to the NACUBO data, a comparison was made with data collected by the Integrated Postsecondary Education Data System (IPEDS). This comparison was made for the 1996-97 fiscal year, the most recent year for which detailed financial data could be obtained. The IPEDS comparison includes all seven of the major functional areas. The IPEDS data contains both unrestricted and restricted expenditures, including federal Pell Grant and restricted scholarship funds. IPEDS provided data on approximately 1,060 community colleges. All 14 of the TBR community colleges responded to the IPEDS survey for the 1996-97 fiscal year. Total expenditures for the Tennessee colleges ranged from \$11.9 million to \$33.4 million. Therefore, the comparison was made with the 384 colleges participating in the survey that had total expenditures within the same range as the Tennessee colleges.

Since the major portion of a college's budget is allocated to personnel costs, the ratio of faculty, administrative staff, and support staff to FTE enrollments

was calculated for each year to determine if the institutions were operating with less staff per student at the end of the study as compared with the base year. With continued interest expressed relative to the cost of higher education, the rate of increase in student fees is compared with the CPI for each year of the study to determine how much more fees had increased as compared to the rate of inflation. Also, the change in general-fund state appropriation in terms of current dollars is compared to the CPI for each year of the study. Finally, the four major revenue sources for Tennessee's two-year colleges were analyzed over the ten-year period of the study to determine if any important shifts in revenue patterns were evident.

Data Collection

Financial data were collected from the Tennessee Board of Regents central office in Nashville. This office provided access to financial records for each of the 14 two-year colleges in the TBR System. The data were in hard copy format and available for each year by institution. Although this study referenced "budget" data, these data are actually representative of the final expenditures by budget category and functional area for each fiscal year of the study. Utilization of final expenditures eliminated a potential

discrepancy between interim budget forecast and actual disbursements over the planning cycle of one fiscal year. Each public college in Tennessee prepared an annual operating budget in the spring for the forthcoming fiscal year. The major revenue component for Tennessee's public colleges was state general-fund appropriations. The level of state appropriation for both the TBR and UT systems was recommended by the governor and approved by the legislature. Each college projected other revenue sources, such as student fees and sales and services of educational departments. Student enrollment data were representative of fall term FTEs for each year. Staff member Mr. Brian Douglas provided the NACUBO data in hard copy format. The IPEDS data was electronically transmitted in Excel spreadsheet format by Dr. Lee Johnson.

Any changes in accounting practices and operating procedures within an individual institution or a consolidated system such as the TBR will typically be less dynamic over time than will changes among institutions (Morrison, 1989). Changes in accounting practices within a system such as the TBR also will be more homogenous than would be the case in either a regional or national comparison when the same institutions are examined over time. The data elements used in this study were relatively

consistent. For example, during the period of this study, the basis for determining FTEs did not change and no major changes occurred in accounting practices affecting the classification of expenditure data.

Data entry for financial, staffing, and enrollment numbers were verified for each institution and for system totals for each year of the study. Excel spreadsheets were used to record the TBR data made available at the central office on hard copy. Comparisons between the TBR institutions and national medians for community colleges were made from data collected by the NACUBO in their annual "comparative financial statistics" survey for the two referenced years and with the IPEDS "institutional characteristics survey" data for 1996-97.

The study of the 14 public community colleges in Tennessee reviewed unrestricted E&G data, and restricted funds were excluded from the analysis with the exception of the comparison with the IPEDS survey. Most restricted funds, often referred to as "soft" money, contained in the Tennessee public two-year colleges' budgets, represent federal grants and contracts; therefore, these restricted funds, with the exception of Pell grants, federal work-study scholarship moneys, and other restricted scholarships, have no direct impact on enrollments. Significant is the fact

that in support of this exclusion, seven of the 14 two-year colleges serve as administrative entities for the Federal Job Training Partnership Act grant program and spend between one and six million dollars a year for job-related training. This expenditure pattern would result in a significant distortion of data, if used, between the colleges serving as administrative entities and those colleges not serving in this capacity. The exclusion of this federal grant means that personnel employed through federal funds are also excluded from ratio computations, thus rendering a more homogeneous analysis.

Analysis

A limited portion of the study was conducted using a constant-dollar valuation based on 1988-89 base-year actual expenditures. Subsequent years' budgets were adjusted using the CPI as the basis. Constant dollar accounting is a method of reporting financial data in dollars that have the same purchasing power when measured over time (Gleim & Delaney, 1990). These authors note that the adjustment of nominal or current dollar data is facilitated by the use of the CPI and is made according to the following formula:

$$\text{Nominal dollars} \times \frac{\text{Price level adjusted to}}{\text{Price level adjusted from}} = \text{Constant dollars}$$

Since 1988-89 is the base year of the study, current dollars are multiplied by the quotient of the CPI for the year for which an adjustment is being made divided by the CPI for 1988-89 to convert dollars for the year in question to constant 1988-89 dollars. This CPI data was calculated, is maintained by the U.S. Department of Labor, Bureau of Labor Statistics, and is available on the internet at <http://www.bls.gov/news.release/cpi.toc.htm>. Presently, data are available by month for each year from 1913 through 1998. A fiscal year average of the CPI was calculated for each of the ten years under review in this study.

The NACUBO as well as numerous other researchers use a specially constructed Higher Education Price Index (HEPI) instead of the CPI to adjust financial data in terms of constant dollars. The HEPI was constructed using weights for different expenditures of colleges and universities for a research university in 1972 (Frances, 1990). Frances noted that components of the HEPI include salaries and employee benefits, which account for about 80% of the base weights. The remaining 20% are based on cost increases for supplies, materials, library holdings, and equipment typically purchased by a higher education institution. The HEPI often lags about one year behind fluctuations in the CPI (Halstead, 1991). The CPI is weighted for housing, food,

transportation, clothing, medical services, and entertainment expenses common to a typical US household (Morrison, 1989). "It measures prices incurred by the average family unit (Halstead, 1991, p. 11)." This study utilized the CPI for comparison purposes based on the belief that this unit of measurement may be more readily acceptable by public policymakers and lay citizens who would not have an understanding of or interest in the HEPI. Also, these same individuals are measuring the cost of attending college by personal standards and not by how much library books and instructional equipment increased in cost.

Research questions one and three through ten were examined by using current dollars in the respective data tables. Research questions two, 11, and 12 were examined by the use of both current and constant 1988-89 dollars and percent allocations in the data table. Classification of the 14 institutions by small, medium, and large size was made based on fall term 1997 FTE. Enrollment ranges for classification were:

small = less than 2,500

medium = 2,500 through 3,999

large = 4,000 and above

This enrollment classification is similar to the one previously used by the NACUBO, and it also provided for an

equal distribution in terms of the number of institutions per category which is five, five, and four, respectively. The TBR provided employment data in terms of the number of authorized full-time positions and the number of filled positions for each of the three broad employee classifications as of the annual October revised budget period. Since, in most instances, the number of authorized (maximum number of approved positions by employee category) positions exceeded the actual number of personnel employed, the decision was made to use "filled" positions in calculating student to employee ratios for the purpose of consistency and comparison. Each of the seven institutions categorized in the moderate-FTE-growth group had an aggregate enrollment increase of 44% or less for the ten-year period of the study. Each of the seven institutions categorized in the high-FTE-growth group had an aggregate enrollment increase of between 57 and 156%.

Conclusion

Financial reports in higher education use mostly descriptive statistics that summarize and classify data by groups of measurements. Since many decisions affecting higher education finance take place within internal and external political settings where emotions and perceptions

influence decisions, it is important to foster correct perceptions (Jenny, 1993). One benefit of analyzing historical financial data is the data's depiction of both regular and erratic financial patterns as well as the severity of irregular patterns. The use of comparative financial analysis assists leaders in their ability to forecast and control the future. In an effort to understand and appreciate financial decisions affecting approximately 80,000 students annually, Chapter 4 analyzes the financial data and staffing patterns among the 14 public two-year colleges in Tennessee over the past decade.

CHAPTER 4

ANALYSIS OF DATA

Chapter 4 provides an analysis of the data that were compiled. The purpose of this study is to determine what actually happened to internal expenditure patterns in the unrestricted E&G budget for the public community colleges in Tennessee during a selected ten-year period. The study also examined staffing patterns relative to FTE enrollment, changes in revenue patterns, and student fee increases. Some of the financial data were measured in terms of constant dollars so as to compare real increases in expenditures and revenues after adjustment for inflation as measured by the CPI. The study sought to determine whether there was a positive shift in the internal budget allocations among functions during a period in which state general-fund appropriations increased at lesser rates than did general inflation. It also sought to determine the effects of a declining proportion of state appropriations on actual staffing and FTE enrollment ratios in community colleges during the specified ten-year period.

The analysis examined the total population of all 14 public community colleges in Tennessee. The data are presented and discussed in order of the research questions. The tables presented in Chapter 4 are summaries of the data

collected for the research period from 1988-89 through 1997-98. These data are presented as totals for the 14 colleges for each of the ten years. The appendices contain detailed data relative to each college for each year of the research period. Appendix A contains data tables relative to the budgeted expenditure analysis; Appendix B presents tables associated with staffing and FTE enrollment ratios; and, Appendix C presents data relative to the revenue analysis. Some of the data tables use abbreviations for the colleges.

Budgeted Expenditure Analysis

Questions 1 and 2 - Apportionment by Percentage and by Function in Current and Constant Dollars: The data for question one document only minor shifts in the allocation of funds among functions between fiscal years 1988-89 and

1997-98. The three direct academic-related functions are instruction, public service, and academic support. These functions include expenditures for all academic departments and programs, conferences and institutes, libraries, faculty development and academic administration. Between the base year and final year of the study, the percentage of funds allocated to these functions collectively increased by only one-half of one percentage point, from 64.5% to 65%. Allocations for campus-wide administration and support services or the institutional support function actually declined by 1.3 percentage points from 13.8% to 12.5%. The relative portion of the budget for maintenance of the physical plant was virtually unchanged, while the student services and scholarship functions received very modest gains. These data are presented in Table 3. Figure 1 displays E&G functional expenditure patterns for the instruction, academic support, and institutional support categories.

The use of a constant dollar adjustment factor in question 2 depicts that for the ten-year period, cumulative unrestricted E&G expenditures declined in real value by approximately \$318,900,000. The percentage of annual decline over the ten-year period of the study for all 14 of the

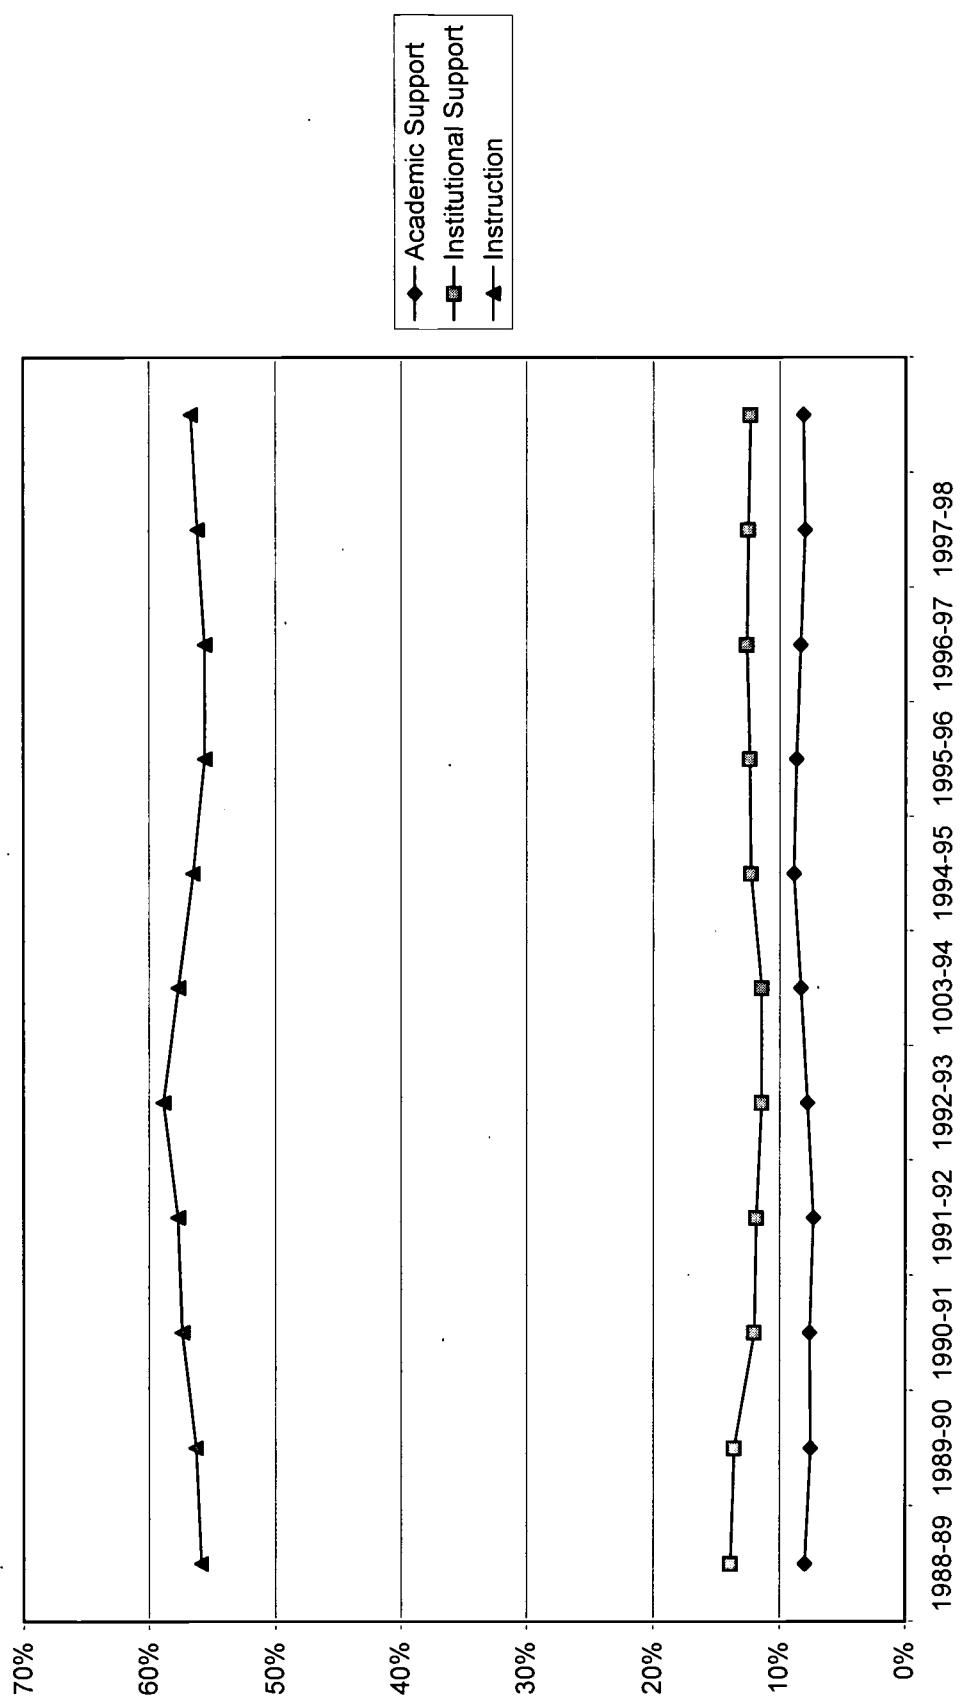

Figure 1. Unrestricted Educational and General Expenditure Patterns by Function, TBR Community Colleges, Fiscal Years 1988-89 Through 1997-98

community colleges ranged from minus 5% to minus 25%. This analysis indicates that in fiscal year 1997-98, the TBR community colleges lost \$60 million in purchasing power, as measured by the CPI. This indicates significant erosion in purchasing power due to inflation. The constant dollar calculations are displayed in Table 4.

Question 3 - FTE Enrollment Budget Allocations Based on Size of Institution: Figure 2 displays enrollment trends for the TBR community colleges over the research period. Table 5 depicts FTE enrollment by college and year for each year from 1988-89 through 1997-98. These data are sorted by college in alphabetical order. Table 6 depicts the institutional classifications by small, medium, and large FTE enrollment with enrollment classification based on: small < 2,500 FTE; medium = 2,500 to 4,000 FTE; and, large = 4,000 FTE and above. The data in Table 7 reflect that colleges classified in the medium enrollment level spent more per FTE student than did those with smaller and larger enrollments. Institutions with small enrollments spent more per-FTE than did those with the largest enrollments. Based on an average FTE expenditure for the ten-year period, the amounts were \$4,569, \$4,650, and \$4,386 per-FTE student,

respectively, for the small, medium, and large colleges as measured by enrollment.

The average expenditure per FTE for the study period for all colleges was \$4,523. The FTE expenditure patterns were generally consistent over the study period for each institutional classification. Each of the three groups expended more in fiscal year 1997-98 than in 1988-89. The largest gain in per-FTE expenditures was experienced by the colleges in the large enrollment category, with a net increase of \$900. The other two categories demonstrated increases between \$415 and \$579 per student.

Question 4 - Percentage Apportioned by Function Based on Size of Institution: Table 8 reveals that institutions in the large-FTE enrollment classification expended more dollars per full-time student in the instruction function and less for general administration within the institutional support function than did the smaller classifications. The average percentage distribution apportioned to the instruction function for each of the three classifications during the study period was 55.1%, 54.6%, and 59.7%, respectively, for the small, medium, and large institutional groups. Conversely, the percentage apportioned to the

NOTE: Enrollment Classification -- Small FTE < 2,500; Medium FTE = 2,500--3,999; and Large FTE = 4,000 and above.

institutional support function was 13.7%, 12.8%, and 11.2%, indicating there were some budgetary efficiencies relative to institutional size. The larger institutions were able to expend a higher percentage of their budgets for instruction and a smaller portion for general administration than were the smaller colleges.

Significant is the fact, however, that the largest institutional classification, based on FTE enrollments, apportioned a smaller percentage of their budgets to instruction in 1997-98 than in 1988-89. There was a slight but steady decline in the portion allocated to instruction over the ten-year study period for institutions in the largest classification. On the other hand, colleges in both the small and medium institutional classifications had a slight increase in the portion of funds allocated to instruction during this period. The small and medium institutional classifications also apportioned more of their budgets to the functions of student services and physical plant than did the large enrollment group.

Question 5 - Comparison Between the Ten Community Colleges and the Four Technical Institutes/Colleges Regarding Percentage Apportionment: This question was of interest since the four technical institutes/colleges were established a decade earlier than the community colleges. Of

special interest was whether the technical institutes expended a larger percentage of their budgets in the functions of instruction and O&M than did the community colleges. Table 9 summarizes the percentage allocations of budget funds between the community colleges and the technical institutes. The technical institutes did apportion a larger percentage of their budgets to the function of instruction than did the community colleges. The average allocation to instruction for the ten-year period for the technical institutes was 59.4%, whereas the community colleges allocated 55.5% to instruction in the same period. It is important to note that the technical institutes apportioned a larger percentage of their funds to this function during each of the ten years. Both types of institutions demonstrated only a modest increase of less than 1 percentage point in the allocation to this function between fiscal years 1988-89 and 1997-98. The community colleges on the other hand, with more recently constructed facilities, apportioned a larger percentage of their budgets (9.9% versus 8.1%) to the O&M function than did the technical institutes. The community colleges also expended 1

122

121

percentage point more in the institutional support function. There was little change in the apportionment to the institutional support function by the community colleges during the study period; however, the technical institutes had an impressive decline in this apportionment of 3.1 percentage points, from 14.4% in 1988-89 to 11.3% in 1997-98.

Question 6 - Comparison of the Percentage of Budget Allocations Between Colleges with Moderate and with High FTE Enrollment Growth: Table 10 displays FTE growth from 1988-89 through 1997-98 by institution sorted in ascending order by rate of increase. Seven institutions had FTE growth rates of between 18% and 44% and were classified in the moderate-growth category. Seven institutions with enrollment growth rates from 57% to 156% were classified in the high-growth range. Table 11 depicts functional expenditure patterns between institutions classified as moderate-growth and those classified as high-growth over the research period. Over the ten-year span, the high-growth institutions averaged expending 57.3% in the instruction function, as compared with 56.4% for the moderate-growth group. The moderate-growth institutions showed a 1 percentage point decline in

the proportion of allocation to instruction over the study period and the high-growth institutions had a 2 percentage point increase. Both categories expended approximately the same proportion in institutional support. The moderate-growth category did expend 0.7% more for scholarships than did the high-growth institutions. Expenditure patterns in the public service, academic support, and student services functions were generally consistent over the period.

Question 7 - Apportionment by Functional Area of the Incremental E&G Budget: The incremental change was computed by subtracting amounts in the base year from amounts in the final year of the study. The changes or incremental amounts were analyzed to determine if the additional (incremental) monies were expended in the same proportion as were the total budgets. An increased percentage of resource allocation to a function (the incremental change) indicates a higher priority for that area over the time period under examination. The apportionment by functional area of the unrestricted E&G budget and the incremental dollar change between fiscal years 1988-89 and 1997-98 was generally consistent, with three exceptions. The percentage of the incremental budget expended for student services increased by 1.2 percentage points over the average expenditure for the ten-year period in this function. The percentage of the

incremental change expended for scholarships increased by 0.5 of a percentage point and there was a 1.5 percentage point reduction in the institutional support function as compared with the functional averages. There were no perceptible changes in the other functional categories. There was only a (0.2%) change in instruction and a (0.1%) change in academic support. The O&M function had a 0.1 percentage point increase. The expenditure patterns relative to the additional resources were consistent with the average percentage expenditures by function during the study period with only the three referenced exceptions. A recapitulation of these data is displayed in Table 12.

Question 8 - Comparison of the E&G Functional Budget Allocations Between the TBR Community Colleges and National Median Data per the NACUBO Survey and the IPEDS Survey:

Table 13 depicts the relationship in the percentage of the E&G functional budget allocations between the 14 TBR community colleges and the median data for community colleges in accordance with the NACUBO national survey for the 1993-94 and 1994-95 fiscal years. The NACUBO data excludes federal Pell Grants and other restricted

Academic Support	9%	8%
Student Services	11%	10%
Institutional Support	12%	15%
Operation and Maintenance of Plant	9%	10%

Note: National Association of College and University Business Officers (NACUBO)

scholarship expenditures. This exclusion makes the NACUBO data more comparable with the unrestricted budgets of the Tennessee community colleges. The TBR colleges expended a significantly higher percentage of their budgets in the instruction and public service functions versus the national average. The TBR colleges expended 8% and 9% more than the national community college average on this function for the two years, respectively. The Tennessee institutions also allocated a significantly smaller percentage of their budgets for administrative support services via the institutional support function by the amounts of 4% and 5% in each of the two years. The Tennessee community colleges, however, expended 1% less than the national average in each of the two years for maintenance of the physical plant.

Table 14 presents a comparison of the functional budget allocations between the TBR community colleges and community colleges with comparable budgets via data obtained from the Integrated Postsecondary Education Data System (IPEDS) survey for the 1996-97 fiscal year. The IPEDS data included both unrestricted and restricted expenditures for all seven of the E&G functions. The IPEDS data was compiled from 384 colleges across the nation that had total E&G expenditures between \$11.9 million and \$33.4 million, which is the

Table 14

Comparison of Educational and General Percentage Budget Allocations by Function Between

Expenditures Include Unrestricted and Restricted Funds

	<u>TBR</u>	<u>IPEDS</u>
<u>1996-97 Fiscal Year</u>		
Instruction	47%	44%
Public Service	8%	3%
Academic Support	7%	8%
Student Services	9%	10%
Institutional Support	10%	14%
Operation and Maintenance of Plant	7%	9%
Scholarships	12%	12%

Note: Integrated Postsecondary Education Data System (IPEDS)

expenditure range for the TBR colleges for the 1996-97 fiscal year. Since the IPEDS data includes Pell Grants and restricted scholarship expenditures, the percentage allocation to the scholarships function is significantly larger than what is reported in the other tables in this research document. The average percentage allocation to the scholarships function was 12% for all institutions reviewed, including the community colleges in Tennessee. Nevertheless, this table reflects that the TBR institutions allocated 3% more to instruction and 5% more to the public service functions than did the institutions with comparable budget levels. The Tennessee institutions also allocated 4% less to institutional support than did the other colleges (10% versus 14%). The TBR community colleges expended 1% less in student services and 2% less in the maintenance functions than did the other colleges included in the analysis.

Personnel and FTE Enrollment Analysis

Question 9 - Changes in the Ratio of Personnel to FTE Enrollment: As could be expected with general-fund state appropriations declining as a percentage of total E&G revenue, there was a corresponding increase in the ratio of FTE students to faculty and other staff during the study period. Tables 15, 16, 17, and 18 show the ratio of students

to faculty, administrative/professional non-faculty, clerical/support staff, and total personnel. From 1988-89 to 1997-98, the ratio of FTE students to faculty increased from 26.8 to 29.3 for an approximate 10% change. The ratio for professional/administrative staff increased from 54.4 to 63.0 or a 16% change. For clerical/support staff the increase was from 28.6 to 36.5 or a 28% increase. The ratio of students to total personnel increased from 11.0 to 12.9, for an average increase of 17%.

Student Fees Analysis

Question 10 - Rate of Increase in Student Fees Compared to the CPI Rate Change: From fiscal year 1988-89 to 1997-98, student fees increased by 51.7% from \$716 to \$1,087. During this same period, the CPI rate of increase was 35.7%. The percentage change in student fees exceeded the rate of increase in the CPI by 16 percentage points. These data are displayed in Table 19.

Revenue Analysis

Question 11 - Increase in State General-Fund Appropriation Compared to Inflation as Measured by the CPI: Table 20 reflects the change in state appropriation over the

1988-89 to 1997-98		63.5%		22.3%	

total dollar increase of approximately \$63.2 million. The increase in total state appropriations, adjusted for inflation and measured in constant dollars, was only 22.3%, or a total dollar increase of approximately \$22.2 million. The 22% increase in constant dollars is considerably less than the 56% increase in FTE enrollment.

Question 12 - Changes in the Four Major Revenue

Sources: Table 21 is a recapitulation of the four major revenue sources from 1988-89 through 1997-98 in current and constant dollars. In constant dollars, the net increase in student fees was approximately \$25.2 million or an 87% increase. This compares with a current dollar increase of 150%. Table 22 depicts the percentage distribution changes in the major revenue sources from 1988-89 to 1997-98. State general-fund appropriations for the 14 public community colleges in Tennessee declined as a percent of total E&G revenue from 73% in 1988-89 to 66% in 1997-98. This decline was offset by a commensurate increase in student fees, from 21% to 30% of total expenditures. There was no change in the relative position of sales and services of educational departments during the study period; there was, however, a 2 percentage point decrease in other sources of revenue, which includes items such as private gifts and interest income. Chapter 5 presents conclusions and a discussion of the data included in this chapter. It also contains recommendations for further consideration and study.

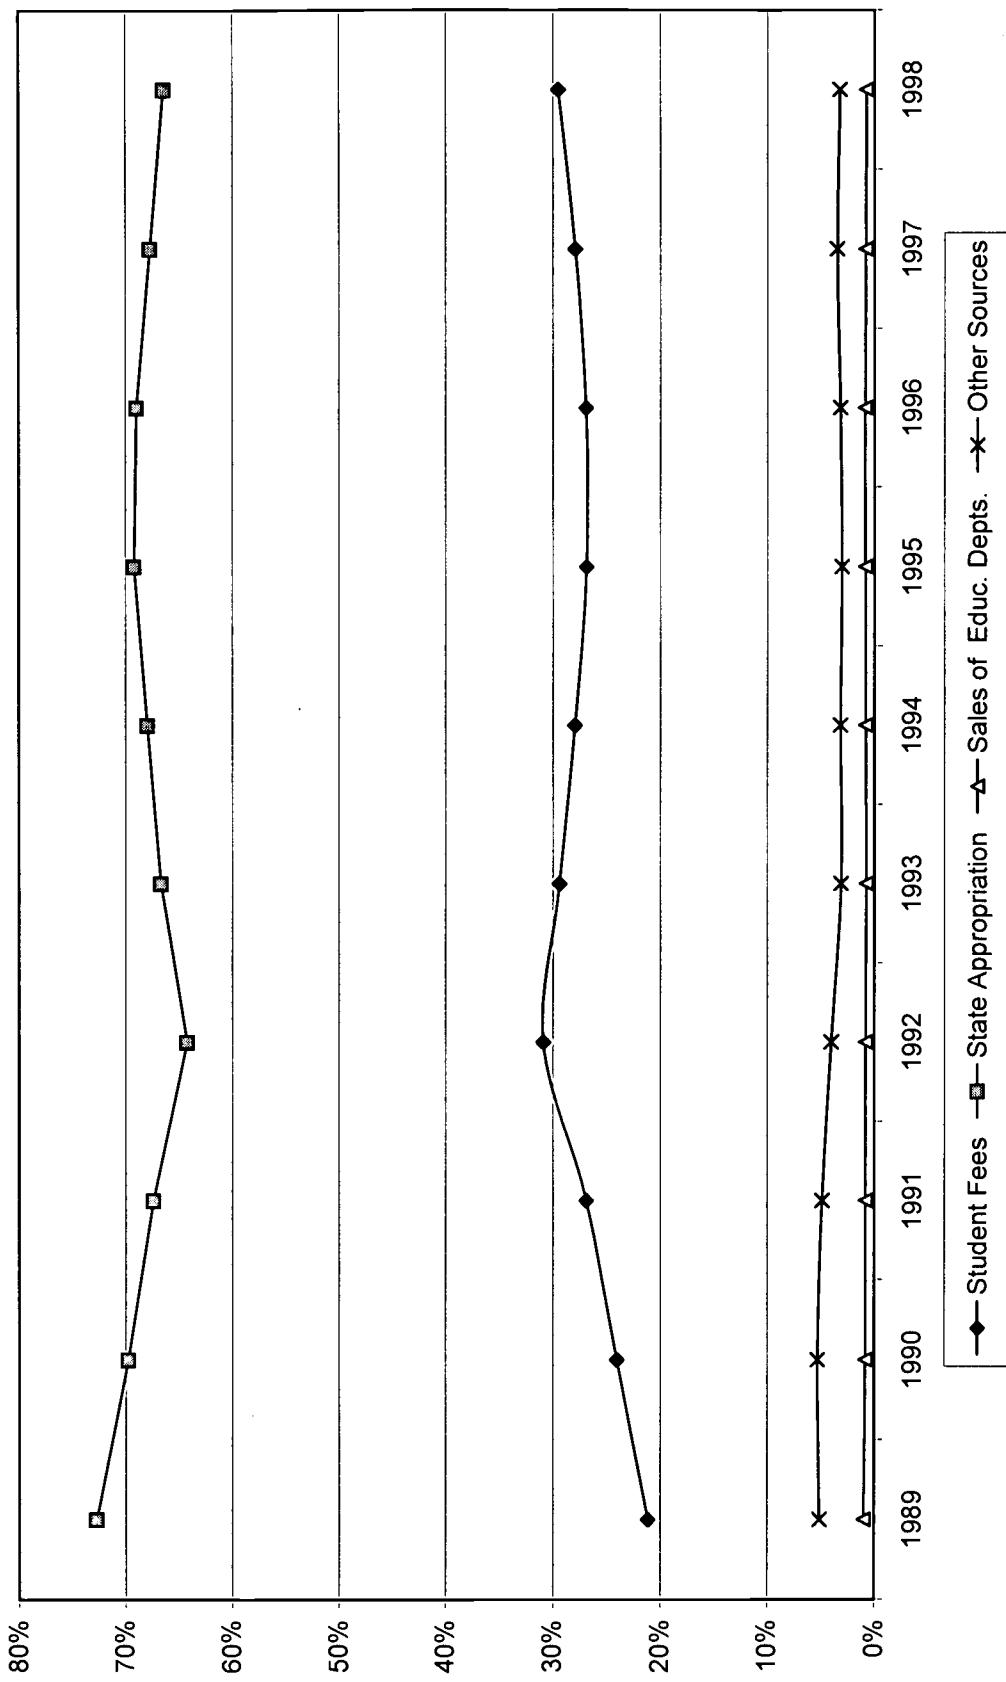

Figure 3. Unrestricted Current Fund Revenue Trends, TBR Community Colleges, Fiscal Years 1988-89 Through 1997-98.

CHAPTER 5

CONCLUSIONS AND RECOMMENDATIONS

The purpose of this study was to determine how public two-year colleges in Tennessee internally budgeted and expended their unrestricted E&G funds for a ten-year period. Chapter 4 reported the results of the data analysis relative to the internal expenditure patterns in the unrestricted E&G budget for the public community colleges in Tennessee from fiscal years 1988-89 through 1997-98. It also reported the results of staffing patterns relative to FTE enrollment and changes in revenue patterns, and it examined student fee increases. This chapter provides the conclusions derived from the data analysis addressed in Chapter 4. Finally, it presents recommendations that might be considered by community college leaders to help assuage concerns expressed by public policymakers regarding the escalating cost of attending college and the accountability of public higher education. Recommendations for future study are presented in conclusion of this research project.

Conclusions

Conclusion One: Public community colleges in Tennessee expended a slightly larger percentage of their budget for

direct instruction which includes the functions of instruction, public service, and academic support, in fiscal year 1997-98 than they expended in 1988-89 (65% versus 64.5%). This is significant considering the fact that state general-fund appropriation decreased in proportion to total resources received during the study period. The two-year institutions were able to generate a slight increase in instructional related expenditures, in part, because they apportioned a lesser percentage of their budget for general administrative support services at the end of the period reviewed. The allocation to the institutional support category decreased by 1.3 percentage points (13.8% to 12.5%) over the study period. It is important to note, however, that this allocation was approximately 11.5% during the early 1990s, prior to deterioration in the level of state appropriation provided to higher education in Tennessee. During the last three fiscal years of the study, the total state appropriation for the community colleges increased on average 1.8 percentage points per year in terms of current dollars. The average change in constant dollars was a decrease of 0.01 percentage points per year. There was a slight increase in the percentage of the budget allocated to the functions of

student services and scholarships. The allocation for operation and maintenance of physical plant remained relatively constant. These expenditure patterns indicate that the community colleges were operating more efficiently at the end of the study period in terms of the allocation of financial resources. The educational priorities emphasized instruction, student scholarships, and student services.

Conclusion Two: Institutional size had some bearing on the percentage of funds allocated for direct instructional support. The small institutions expended 60.7% at the beginning of the period and 62.9% at the end of the study period for direct instruction. The medium-sized institutions expended 63.4% and 63.5% at the beginning and end of the period, respectively. The large institutions apportioned 68.1% in fiscal year 1988-89 and 67.6% in fiscal year 1997-98. The medium-sized institutions actually had a larger expenditure per FTE student, although not significantly larger, than did the small and large institutions. One possibility for this difference may be that the state appropriation was slightly more per FTE for the medium-sized institutions than it was for the other two classifications. Since a major portion of the appropriation

is based on student enrollment, and since there is an enrollment range for which funding does not change, it is possible that the larger colleges were at the top of their range and did not receive an incremental adjustment in appropriation commensurate with the medium-sized institutions. Another reason for this slight difference is that the increase in state appropriation lags one year behind actual enrollment. Consequently, if the large institutions were experiencing a more rapid enrollment increase, their adjustment in state appropriation would occur in a year or years succeeding the enrollment increase. Also, since the decade of the 1990s was not favorable regarding increases in state appropriations, institutions with steady enrollment increases had to manage their budgets in some manner other than with incremental increases in state funds.

The reasons are less certain as to why the small institutions expended less per FTE than did the medium or large colleges. This difference in per-FTE expenditures can probably be attributed to the funding formula and the organizational support structures. A multiplicity of factors such as appropriation for facilities square footage, rent appropriated for off-campus facilities, and

the amount of student fees generated relative to average class size could result in some minor differences in per-FTE expenditures. The larger institutions may have had higher class size averages which would in turn generate more net revenue from student fees and, consequently, the capacity to expend slightly more per student. Additional study may be needed to determine why there are differences in FTE expenditures for institutions of different size.

Conclusion Three: The research data clearly indicate that the four original technical institutes expended a larger portion of their budgets for direct instruction than did the ten community colleges. Since the appropriations formula has lower student-faculty ratios for technology programs than for general academic programs, the technical institutes likely received more funding per FTE than did the community colleges. As an example, the current average funding ratio for most technical education programs is one faculty per 18.9 FTE, and one faculty per 21 FTE for humanities and biological sciences. These differences in ratios would generate more funding per student for the technical institutes through the funding formula. The community colleges probably had a higher percentage of faculty and professional staff with the doctorate to

accommodate proportionately more students in university parallel/transfer curriculums, but this does not mean they had a higher average salary base for faculty. Faculty in the technical institutes have specific certifications and technical skills that may require salaries equal to or greater than faculty members with doctorates in humanities or social sciences, due to the law of supply and demand. Also to be considered is the fact that technical programs are more expensive to operate, in terms of expenditures for equipment and instructional materials, than are general education programs. The technical institutes averaged expending 1 percentage point less for general administrative support services than did the community colleges. The technical institutes expended more on student scholarships but less in the student services function than did the community colleges. Understood is the fact that with a higher percentage of the budget allocated to instruction, then only a smaller portion is available to be allocated to other functional categories.

Even though the technical institutes have older buildings on average than do the community colleges, they expended a smaller portion of their budgets in the O&M function. Since the funding formula designates a minimum

expenditure level in this function, the only plausible explanation for the percentage allocation difference is that the community colleges have more square footage per FTE and/or rent more instructional facilities off-campus and, consequently, receive a higher percentage of appropriation designated for this function. It is unlikely that any of the two-year colleges expended significantly more than the designated appropriation in this function based on the fact that the formula has been funded at between only 82% and 94% for most of the 1990s. This would leave little discretion to expend funds beyond the level mandated for maintenance of the physical plant.

Conclusion Four: Expenditure patterns between the institutions classified as moderate-FTE enrollment growth and high enrollment growth were generally consistent over the study period. Both classifications averaged the same percentage of budget allocation for the institutional support category; however, the high-growth institutions allocated approximately 1.5 percentage points less for administrative services at the end of the period and the moderate-growth colleges expended only 0.2 of a percentage point less. The high-growth institutions also expended a larger portion of their budget for instruction at the end

of the study period. These data suggest that there were some budgetary efficiencies associated with institutional size. Some of the efficiencies were likely necessitated by the declining level of state appropriation during the 1990s. This would mean that the high-growth institutions likely used a higher percentage of adjunct faculty to accommodate enrollment increases, and they were not able to afford the employment of additional support personnel in non-academic functions commensurate with the incremental enrollment growth. These budgetary efficiencies allowed the high-growth institutions to prioritize a larger percentage of their budgets for direct instructional support.

Conclusion Five: Apportionment of the incremental budget was generally consistent with the base allocations during the study period. This was of interest to determine if the priorities relative to additional resources over the ten-year period were consistent with priorities concerning allocation of the base budget. This question assumed that priorities could be measured in terms of how new or additional financial resources were allocated. Accordingly, the priorities appeared to be in terms of student scholarships and student services support at the expense of general administrative support services.

Conclusion Six: The TBR community colleges have a very favorable internal budget allocation pattern as compared with other two-year colleges across the nation for the three fiscal years reviewed. There was a significantly higher percentage of the TBR budget allocated for direct instruction as compared with national averages, 67% to 59% in 1993-94 and 67% to 57% in 1994-95 based on the NACUBO data. These data were less impressive when compared with the IPEDS survey, but still an impressive difference in favor of the Tennessee colleges at 62% versus 55% allocated for direct instruction. Also, there was an equally impressive dispersion in the allocation for administrative support services, with the TBR colleges expending 3 to 4 percentage points less in this category than did other colleges across the nation. These data support the fact that Tennessee's public community colleges are operating efficiently and are mission-sensitive regarding the internal allocations of their budget assuming efficiency is measured on the basis of an increased allocation of funds for instruction.

Conclusion Seven: It is difficult to make an inference regarding efficiency relative to FTE student and faculty/staff ratios. The fact that student-to-faculty,

student-to-professional staff, and student-to-support staff ratios all increased during the study period may be attributed to a decline in the financial resource base, especially in regard to state support. An increase to 30 students per full-time faculty member as an average at the end of the study period represents a major concern. This is one trend that needs close examination and cannot continue without jeopardizing instructional quality. Students and their parents have every right to be concerned with escalating student fees, coupled with larger class-size averages or fewer classes taught by full-time faculty. A similar case can be made for student and professional/support staff ratios. Higher education institutions cannot provide the needed support services without appropriate staff to administer financial aid awards, provide counseling services, academic advising and placement services, and the myriad functions necessary to accommodate student needs.

Conclusion Eight: Numerous articles have been written expressing public concern relative to the cost of higher education and annual increases in student fees. In some sectors of the country, this public concern has been more of a public outcry pertaining to these costs. Students and

their parents do not understand why college costs have outpaced the rate of inflation for at least two decades. During the ten-year period of this study, fee increases at TBR community colleges exceeded the rate of increase in inflation by 16 percentage points. However, this was less than the national average. In Tennessee, as in other states, student fee increases were necessary to offset a declining level of state support. During the 1988-89 fiscal year, state appropriations accounted for 73% of total E&G revenues, and student fees accounted for 21%. By the 1997-98 fiscal year, the ratios had changed to 66% and 30%, respectively. Thus, the effects of a 7 percentage point decrease in state appropriation were mitigated by a 9 percentage point increase in student charges. Community colleges do not have another ready source of revenue to make up for a shortfall in state appropriation other than from student fees.

The relative decline in state support occurred at a time in which enrollment increased by 56%. In current dollars, the state appropriation did increase by 64% over the ten-year period, but the real dollar increase, after allowing for inflation, was only 22%. Considering that state appropriation and student fees represent 94% to 96%

of the total revenue base for public community colleges in Tennessee, one can surmise that limited alternatives are currently available to subsidize a shortfall in public support other than with student payments. It becomes a matter of who pays, society in general or the individual user and direct recipient of educational services.

Conclusion Nine - Summary: Given the reduction in the relative level of state appropriation, it may be deduced that the TBR community colleges were operating more efficiently in 1997-98 than in 1988-89. The community colleges apportioned a larger percentage of their financial resources for instructional cost and less for administrative cost. They are serving 56% more full-time-equivalent students with fewer full-time faculty and staff per student. In comparison with national data, the financial trends relative to the Tennessee schools are favorable in terms of efficient operations if these operations are measured in terms of direct instructional resource allocation. Even though student fees constituted 30% of operating revenue in fiscal year 1997-98, this is still generally consistent with national norms. For the 1994-95 fiscal year, NACUBO data documents that the "median" college collected 24% of its operating revenue

from student fees, as compared with 27% for the Tennessee colleges. Cohen (1993) observed that between 1977 and 1989, instructional expenditures decreased from 52% to 43% for community colleges. Halstead (1991) noted that the only universal trend in the analysis of higher education finance was a gradual increase in administrative costs. The public community colleges in Tennessee have demonstrated the ability to resist these national trends at a time in which public financial support has eroded. Even with the fee increases over the past ten years, the public community colleges in Tennessee charged \$500 less per year for student fees in 1997-98 than the national average for public two-year colleges.

Recommendations

The following recommendations are offered based on analysis of the research data and the resulting conclusions:

Recommendation One: The TRB report card, introduced after the 1996-97 year, was very effective in promoting measures of demonstrated accountability for both community colleges and universities. A financial fact-sheet, in summary form, should be considered to support programmatic

information presented in the report card. Public policymakers and the general public should be apprised as to the efficiency of Tennessee's public community colleges regarding the allocation of financial resources.

Tennessee's financial data should be compared with national and the Southern Regional Education Board (SREB) data to demonstrate existing accountability standards and to emphasize the priority afforded instructional services in this state. Presentation of the internal allocation of budgeted expenditures, expenditures per FTE student, student to faculty and staff ratios, the rate of student fees, and revenue patterns should be made readily available to the public.

Recommendation Two: Consideration should be given to determine the best means for funding public higher education. This determination should consider past and present trends, and long-range prospects in terms of funding potential. Comparable financial data should be presented to legislators for the purpose of persuading these officials to strongly consider the cost benefits associated with increasing appropriations for higher education. Legislators must be reminded that student access and the quality of educational services can be increased

with a commensurate improvement in financial public support if the colleges continue to exercise financial prudence as evidenced during the past decade.

Recommendation Three: Higher education leaders need to review and study financial data and remain cognizant of the need to make priority decisions to strengthen programs and services based on the availability of financial resources. There is an urgent need for sensitivity to the cost of student fees. The THEC, at its June 16, 1999 meeting, recommended that the TBR increase fees 8% for the 1999-2000 school year ("THEC," 1999). Charles Smith, TBR Chancellor, indicated he would recommend that the board increase fees by only 5 to 7% because there is a matter of credibility to be maintained. At the TBR meeting on June 25, 1999, the board voted to increase fees 8% at the University of Memphis and 6% at the system's 45 other schools (State board of regents approves tuition increase, 1999). Student fees should be increased only to the extent necessary to remain financially viable for the purpose of affording the highest quality of educational services.

Recommendation Four: The trend of an increasing student-to-faculty ratio should be reversed. It is

incumbent that educational leaders find a way to employ more full-time faculty to accommodate current enrollment.

Recommendation Five: Higher education leaders should cultivate more partnerships with local business and industrial firms and private individuals that have sufficient financial resources to contribute to college endowment funds. Endowments for the support of instructional programs and student scholarships are likely to become increasingly important in the 21st century as competition for limited state resources continues.

Recommendations for Future Study

1. The recent report of the Council on Excellence in Higher Education in Tennessee noted that access was a major concern. According to the report, Tennessee has fewer college graduates in the workforce than do most other states. Further study should be made to determine the affects of a declining level of state support on student access. Does increasing student fees to offset reductions in the level of state support restrict student access? What socioeconomic levels are most impacted by increasing student fees? What are the state's long-range goals in terms of increasing the percentage of working adults who

have a post-secondary degree? Answers to these and similar questions need to be determined to be able to provide appropriate rationale to public policymakers to influence their decisions regarding funding.

2. Consideration of the value added by utilizing more full-time faculty to teach students needs further review. The issue of how student outcomes are impacted by using more full-time and fewer adjunct faculties needs close scrutiny.

3. We know that public institutions are being asked to solicit more donations from businesses and individuals on behalf of public education. What are the long-term effects of increasing these donations, and will this level of private support be expected to supplant public support? What will be the impact if increased funding comes from the private sector, and will such support allow public officials to increase allocations to other public agencies at the expense of higher education?

4. We have heard, all too often, that unfunded state and federal mandates place an undue burden on administrative cost for higher education. Additional study is needed to determine these impacts, and public policymakers need to be apprised of the real costs in

advance of adopting legislation, or they need to be persuaded to provide funding sufficient to comply adequately with the stipulated requirements.

5. The TBR staff should consider a study as to why FTE expenditures differed among institutions of different size. Is it possible that these differences were due to budgetary efficiencies or were they attributed to differences in the funding formula and its methodology? If these differences were due to the funding mechanism, should the formula be modified and, if so, how?

6. The TBR staff should consider studying why the technical institutes were able to allocate larger percentages of their budgets to instruction and smaller percentages to institutional support than did the community colleges. A review of average salary data for the 1997-98 fiscal year indicated that the community colleges had higher average faculty salaries of \$900 and higher professional non-faculty staff salaries of \$1,400 as compared with the technical institutes (TBR Data). However, these differences were not of sufficient magnitude to warrant the dispersion in percentage allocation patterns among functions as previously reported.

7. Most predictions regarding future workforce requirements indicate that workers will be required to possess highly technical skills. Employees in the service sector, as well as manufacturing, reportedly will be required to read and interpret technical literature. These future employees will be required to possess highly technical computer application skills in order to interpret technical literature and to perform a variety of work assignments (Carnevale, Gainer, & Meltzer, 1990). Are we providing enough financial resources to fund technical education to prepare tomorrow's workforce?

REPRODUCTION RELEASE

(Specific Document)

I. DOCUMENT IDENTIFICATION:

Title: **Dissertation: An Analysis of Functional Budget and Expenditure Patterns and Revenue Sources of Tennessee's Public Community Colleges from 1988-89 through 1997-98**

Author(s): **C. Julian Jordan**

Corporate Source:

Publication Date:

August 1999

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic media, and sold through the ERIC Document Reproduction Service (EDRS). Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following three options and sign at the bottom of the page.

The sample sticker shown below will be
affixed to all Level 1 documents

PERMISSION TO REPRODUCE AND
DISSEMINATE THIS MATERIAL HAS
BEEN GRANTED BY

TO THE EDUCATIONAL RESOURCES
INFORMATION CENTER (ERIC)

1

Level 1

•

 X

The sample sticker shown below will be
affixed to all Level 2A documents

PERMISSION TO REPRODUCE AND
DISSEMINATE THIS MATERIAL IN
MICROFICHE, AND IN ELECTRONIC MEDIA
FOR ERIC COLLECTION SUBSCRIBERS ONLY,
HAS BEEN GRANTED BY

TO THE EDUCATIONAL RESOURCES
INFORMATION CENTER (ERIC)

2A

Level 2A

The sample sticker shown below will be
affixed to all Level 2B documents

PERMISSION TO REPRODUCE AND
DISSEMINATE THIS MATERIAL IN
MICROFICHE ONLY HAS BEEN GRANTED BY

TO THE EDUCATIONAL RESOURCES
INFORMATION CENTER (ERIC)

2B

Level 2B

•

Check here for Level 1 release, permitting
reproduction and dissemination in microfiche or other
ERIC archival media (e.g., electronic) and paper copy.

Check here for Level 2A release, permitting reproduction
and dissemination in microfiche and in electronic media
for ERIC archival collection subscribers only

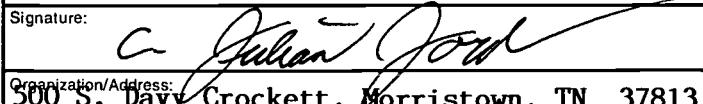

Check here for Level 2B release, permitting
reproduction and dissemination in microfiche only

Documents will be processed as indicated provided reproduction quality permits.
If permission to reproduce is granted, but no box is checked, documents will be processed at Level 1.

I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries.

III. DOCUMENT AVAILABILITY INFORMATION (FROM NON-ERIC SOURCE):

If permission to reproduce is not granted to ERIC, or, if you wish ERIC to cite the availability of the document from another source, please provide the following information regarding the availability of the document. (ERIC will not announce a document unless it is publicly available, and a dependable source can be specified. Contributors should also be aware that ERIC selection criteria are significantly more stringent for documents that cannot be made available through EDRS.)
