ABSTRACT

This report is the sixth to present nationwide data on the well-being of U.S. children. The statistical portrait is based on indicators of child well-being and on contextual measures describing the changing population and family context. Part 1 of the report, "Population and Family Characteristics," presents information illustrating trends in eight key demographic measures, including children as a proportion of the population, racial and ethnic composition, and difficulty speaking English. Part 2, "Indicators of Children's Well-Being," presents data on 24 key indicators in the following areas: (1) Economic Security, including child poverty, family income, parent employment, housing problems, and health care access; (2) Health, including activity limitation, immunization, low birthweight, mortality rates, and adolescent births; (3) Behavior and Social Environment, including cigarette smoking, alcohol use, illicit drug use, and crime victimization; (4) Education, including family reading, early childhood education, achievement, high school completion, and youth neither enrolled in school nor working; and (5) Special Feature: children of at least one foreign-born parent. For each background measure or indicator, three types of information are presented: reasons the measure or indicator is important to understanding children's well-being, figures illustrating trends or population group differences, and highlights with information on current status,recent trends, and important population group differences. Additional indicators needed are also noted. The report's two appendices present

detailed data tables and data source descriptions. Among the key findings, the report notes that children are projected to remain a stable percentage of the total population, while the ethnic diversity of U.S. children continues to increase. The poverty rate for children living with family members reached a high of 22 percent in 1993 and has since decreased to its lowest rate since 1979. In 2000, the rate of births to adolescents was at a record low. Cigarette use among adolescents shows indications of decline. Bachelor's degree attainment remained at an all-time high, and in 2001, 19 percent of children had at least one foreign-born parent. (Contains 76 endnotes.) (EV)

America's Children: Key National Indicators of Well-Being 2002

Federal Interagency Forum on Child and Family Statistics

The Federal Interagency Forum on Child and Family Statistics was founded in 1994. Executive Order No. 13045 formally established it in April 1997 to foster coordination and collaboration in the collection and reporting of Federal data on children and families. Members of the Forum as of Spring 2002 are listed below.

Department of Agriculture
Food and Nutrition Service
Office of Analysis, Nutrition and Evaluation
Alberta C. Frost
Director

Department of Commerce
U.S. Census Bureau
Nancy Gordon
Associate Director for Demographic Programs

Department of Defense
Defense Manpower Data Center
Anita Lancaster
Assistant Director for Program Management

Department of Education
National Center for Education Statistics
Val Plisko
Associate Commissioner

Department of Health and Human Services
Administration for Children and Families
Wade Horn
Assistant Secretary

Agency for Healthcare Research and Quality
Lisa Simpson
Deputy Director

Maternal and Child Health Bureau
Peter van Dyck
Associate Administrator

National Center for Health Statistics
Edward Sondik
Director

National Institute of Child Health and Human Development
Duane Alexander
Director

Office of the Assistant Secretary for Planning and Evaluation
Don Winstead
Deputy Assistant Secretary for Human Services Policy

Department of Housing and Urban Development
Office of Policy Development and Research
Jeffrey M. Lubell
Division Director for Policy Development

Department of Justice
Bureau of Justice Statistics
Patsy Klaus
Statistician
Office of Research and Evaluation

National Institute of Justice
Thomas Feucht
Acting Director

Office of Juvenile Justice and Delinquency Prevention
J. Robert Flores
Administrator

Department of Labor
Bureau of Labor Statistics
Lois Orr
Acting Commissioner

Women's Bureau
Shinae Chun
Director

Department of Transportation
National Highway Traffic Safety Administration
William Walsh
Associate Administrator for Plans and Policy

Environmental Protection Agency
Office of Children's Health Protection
Ramona Trovato
Director

National Science Foundation
Science Resources Statistics Division
Mary Frase
Deputy Director

Office of Management and Budget
Statistical Policy Office
Katherine K. Wallman
Chief Statistician

Foreword

In 1994, the Office of Management and Budget joined with six other Federal agencies to create the Interagency Forum on Child and Family Statistics. Formally established in April 1997 through Executive Order No. 13045, the Forum was called upon to develop priorities for collecting enhanced data on children and youth, improve the reporting and dissemination of information on the status of children to the policy community and the general public, and produce more complete data on children at the State and local levels. The Forum, which now has participants from 20 Federal agencies as well as partners in private research organizations, fosters coordination, collaboration, and integration of Federal efforts to collect and report data on conditions and trends for children and families.

America's Children: Key National Indicators of Well-Being, 2002 is the sixth report in an annual series prepared by the Forum agencies. As in past years, readers will find here an accessible compendium of indicators—drawn from the most recent, most reliable official statistics—illustrative of both the promises and the difficulties confronting our Nation's young people. The report presents 24 key indicators on important aspects of children's lives, including their economic security, health, behavior and social environment, and education. These indicators are easy to understand by broad audiences, objectively based on substantial research connecting them to reliable data on child well-being, balanced so that no single area of children's lives dominates the report, measured regularly so that they can be updated to show trends over time, and representative of large segments of the population rather than one particular group. The report also presents data on eight contextual measures that describe changes in the characteristics of the population as well as in children's family settings and living arrangements.

The 2002 report updates information displayed in previous reports, while maintaining comparability with earlier volumes and incorporating several improvements. Most notably, improvements have been made to the child care measure and the food security indicator. In addition, an indicator reporting on the number of children of foreign-born parents is being introduced as this year's special feature; it will be incorporated as a regular background measure in the Population and Family Characteristics section of future reports.

By recognizing the gaps in our information, *America's Children* challenges Federal statistical agencies to do better. Forum agencies are meeting that challenge by working to provide more comprehensive and consistent information on the condition and progress of our Nation's children. Forum agencies will continue working to strengthen some indicators and to close critical data gaps, particularly in areas such as child disability, the role of fathers in children's lives, family structure and formation, and positive behaviors associated with improved child development.

The value of the *America's Children* reports and the extraordinary cooperation they represent reflect the Forum's innovative, determined spirit to advance our understanding of where our children are today and what may be needed to bring them a better tomorrow. The Forum agencies should be congratulated once again this year for joining together to address their common goals: developing a truly comprehensive set of indicators on the well-being of America's children and ensuring that this information is readily accessible in both content and format. Their accomplishments reflect the dedication of the Forum agency staff members who coordinate the assessment of data needs, evaluate strategies to make data presentations more consistent, and work together to produce important publications and provide these products on the Forum's website: *http://childstats.gov*. Last but not least, none of this work would be possible without the continued cooperation of millions of American citizens who willingly provide the data that are summarized and analyzed by staff in the Federal agencies.

We invite you to suggest ways in which we can enhance this annual portrait of the Nation's most valuable resource: its children. I applaud the Forum's collaborative efforts in producing this sixth annual report and hope that our compendium will continue to be useful in your work.

Katherine K. Wallman
Chief Statistician
Office of Management and Budget

Acknowledgments

This report reflects the commitment and involvement of the members of the Federal Interagency Forum on Child and Family Statistics. It was prepared by the Writing Subcommittee of the Reporting Committee of the Forum. This year, the committee was chaired by Kristin Smith, U.S. Census Bureau. Other committee members included Katherine Heck, Alisa Jenny, and John Kiely, National Center for Health Statistics; Dawn Aldridge, Food and Nutrition Service; James Colliver, National Institute on Drug Abuse; David Johnson, Bureau of Labor Statistics; Laura Lippman, Patrick Rooney, and Tom Snyder, National Center for Education Statistics; Janet Chiancone, Office of Juvenile Justice and Delinquency Prevention; Tracey Woodruff, Environmental Protection Agency; and Kathy Nelson, Department of Housing and Urban Development.

The Reporting Committee of the Forum, chaired by Kristin Smith, guided the development of the new indicators. Members of the Reporting Committee not represented on the Writing Subcommittee included Linda Gordon, Immigration and Naturalization Service; Laura Montgomery, Gloria Simpson, and Barbara Foley Wilson, National Center for Health Statistics; Robert Kominski, U.S. Census Bureau; Jeff Evans, National Institute of Child Health and Human Development; Meredith Kelsey, Office of the Assistant Secretary for Planning and Evaluation, Department of Health and Human Services; Woodie Kessel, Office of Disease Prevention and Health Promotion; Cathy Gotschall, National Highway Traffic Safety Administration; Russ Scarato and Stella Yu, Maternal and Child Health Bureau; and Richard Bavier and Susan Schechter, Office of Management and Budget.

Other staff members of the Forum agencies provided data, developed indicators, or wrote parts of the report. They include Joseph Dalaker, Deborah Dove, Jason Fields, Fred Hollmann, and Robin Levine, U.S. Census Bureau; Patsy Klaus and Michael Rand, Bureau of Justice Statistics; Howard Hayghe, Rowena Johnson, and Robert McIntire, Bureau of Labor Statistics; Ali Mokdad and Wayne Stephens, Centers for Disease Control and Prevention; Peter Basiotis and Mark Lino, Center for Nutrition Policy and Promotion; Gary Bickel, Food and Nutrition Service; Chris Chapman, National Center for Education Statistics; Robin Cohen, Cathy Duran, Lois Fingerhut, Donna Hoyert and Stephanie Ventura, National Center for Health Statistics; Barbara Allen-Hagen, Office of Juvenile Justice and Delinquency Prevention; and Mark Nord, Economic Research Service.

Other individuals who assisted with the report included Yupin Bae, Pinkerton Computer Consultants, Inc.; and DeeAnn Brimhall and Linda Shafer, Education Statistics Services Institute.

Westat, in support of the U.S. Census Bureau, assisted the committee in producing the report. Janice Kociol coordinated and managed the production of the report and was the initial copy editor. She also prepared files for agency updates and assisted the Reporting Committee. Christine Winquist Nord provided technical guidance. Alison Fields also provided substantive and technical guidance and reviewed all edits and data-related issues. Other Westat staff members who assisted in preparing the report included Laura Flicker and Denise Pinkowitz.

The following additional staff members made valuable contributions in their reviews of the report: Deborah Klein, Bureau of Labor Statistics; Steven Carlson, Food and Nutrition Service; Michael Kogan, Maternal and Child Health Bureau; Janis Brown, Shelley Burns, Arnold Goldstein, and Val Plisko, National Center for Education Statistics; Jennifer Madans, National Center for Health Statistics; and Jane Dye, U.S. Census Bureau.

Carole Benson of Westat edited the report. Design contributions came from Westat's Graphic Arts Department, who designed the cover and flag pages, produced and updated the report's tables and figures, and updated and laid out the text. The logo was developed by John Jeter of the National Center for Health Statistics. Gregory Carroll, U.S. Census Bureau, coordinated the printing of the report. The National Maternal and Child Health Clearinghouse distributed the report for the Forum.

America's Children: Key National Indicators of Well-Being, 2002 is the sixth annual report to the Nation on the condition of children in America. Eight contextual measures describe the changing population and family context in which children are living, and 24 indicators depict the well-being of children in the areas of economic security, health, behavior and social environment, and education. This year's report has a special feature on children of at least one foreign-born parent.

Part I: Population and Family Characteristics

- In 2000, there were 70.4 million children under age 18 in the United States, or 26 percent of the population, down from a peak of 36 percent at the end of the baby boom (1964). Children are projected to remain a substantial percentage of the total population, and are projected to comprise 24 percent of the population in 2020.

- The racial and ethnic diversity of America's children continues to increase. In 2000, 64 percent of U.S. children were white, non-Hispanic; 15 percent were black, non-Hispanic; 4 percent were Asian/Pacific Islander; and 1 percent were American Indian/Alaska Native. The number of Hispanic children has increased faster than that of any other racial and ethnic group, growing from 9 percent of the child population in 1980 to 16 percent in 2000.

- In 2001, 61 percent of children from birth through age 6 (not yet in kindergarten) received some form of child care on a regular basis from persons other than their parents.

- In 1997, nearly half of preschoolers (children under age 5) with working mothers were primarily cared for by a relative while their mother worked, while 22 percent were primarily cared for by nonrelatives in a home-based environment and another 22 percent were cared for in a center-based arrangement.

- Children were more likely to engage in some kind of organized before- or after-school activity as they aged. For example, in 2001, 27 percent of kindergarten through 3rd graders and 39 percent of 4th-through-8th graders participated in sports.

Part II: Indicators of Children's Well-Being

Economic Security Indicators

- The poverty rate for children living with family members has decreased substantially since 1993 when it reached a high of 22 percent. In 2000, 16 percent of children lived in families with incomes below the poverty threshold. This percentage, also observed in 1999, represents the lowest poverty rate among children since 1979.

- The decrease in poverty is apparent for children living in female-householder families and is more pronounced for black children. Among black children in female-householder families, about two-thirds lived below the poverty line from 1980 to 1993, and for the first time since 1980, fewer than half were living in poverty in 2000.

- The percentage of children who had at least one parent working full time, all year has steadily increased from 70 percent in 1980 to 80 percent in 2000. In 2000, 91 percent of children living in two-parent families had at least one parent working full time, all year. This percentage was lower for children living in single male-headed families and single female-headed families (67 percent and 50 percent, respectively).

- In 2000, 0.8 percent of children lived in households reporting child hunger, down from 1.0 percent in 1998. In 2000, 18 percent of children lived in households reporting any level of food insecurity, down from 20 percent in 1998. Children in families below the poverty line were nearly three times more likely to experience food insecurity and hunger than children in families with incomes above the poverty line.

- According to the Healthy Eating Index, the proportion of children ages 2 to 5 with good diets improved from 21 percent to 27 percent between 1996 and 1998, reversing the decline from 1995 and 1996. However, the diet quality of children ages 6 to 9 changed little between 1996 and 1998. Children in families living in poverty were less likely than higher-income children to have a diet rated as good. In 1998, for children ages 2 to 5, 22 percent of those living in poverty had a good diet, compared with 29 percent of those living above the poverty line.

Health Indicators

- ☐ Children living in poverty tend to be in poorer health than children living in higher-income families. Nevertheless, this gap narrowed between 1984 and 2000. In 1984, 62 percent of children living in poverty and 83 percent of children living at or above poverty were reported to be in very good or excellent health. By 2000, 70 percent of children living in poverty and 85 percent of children living at or above poverty were in very good or excellent health.

- ☐ While the infant mortality rate did not decline in 1998, there was a significant drop in 1999, to 7 deaths per 1,000 live births.

- ☐ Mortality for children ages 5 to 14 declined between 1998 and 1999. However, there was no significant change in mortality rates for children ages 1 to 4, or for adolescents ages 15 to 19.

- ☐ The birth rate for adolescents continued to decline in 2000 to 27 births per 1,000 females ages 15 to 17, representing the lowest rate ever recorded. The bulk of the drop in the adolescent birth rate occurred between 1991 and 2000, when it dropped by nearly one-third.

Behavior and Social Environment Indicators

- ☐ Cigarette use among adolescents shows continued indications of decline from 2000 to 2001. Daily smoking in the past month decreased from 14 percent to 12 percent among 10th-graders and from more than 7 percent to less than 6 percent among 8th-graders. Daily smoking rates did not change significantly for high school seniors from 2000 to 2001.

- ☐ Since 1993, the violent crime victimization rate for youth ages 12 to 17 has decreased by 63 percent, from 44 violent crimes per 1,000 youth in 1993 to 16 per 1,000 youth in 2000.

- ☐ Since 1993, the violent crime offending rate for youth ages 12 to 17 has decreased by 67 percent, from 52 violent crimes per 1,000 youth in 1993 to 17 per 1,000 youth in 2000.

Education Indicators

- ☐ Between 1999 and 2001, the percentage of children ages 3 to 5 who were read to daily by a family member increased from 54 percent to 58 percent. This percentage has fluctuated since 1993, ranging from 53 percent to 58 percent.

- ☐ In 2001, the percentage of high school graduates ages 25 to 29 who continued their education and received a bachelor's degree remained at the all-time high of 33 percent, which was achieved in 2000. The percentage of black, non-Hispanic high school graduates who earned a bachelor's degree increased from 14 percent in 1985 to 20 percent in 2001.

Special Feature

- ☐ The foreign-born population of the United States has increased dramatically over the past few decades. In 1994, 15 percent of children living in the U.S. had at least one foreign-born parent; by 2001 this had increased to 19 percent of children.

- ☐ The percentage of children whose parents have less than a high school diploma is much higher among children with a foreign-born parent. In 2001, 42 percent of foreign-born children with at least one foreign-born parent had a parent with less than a high school diploma, compared with 35 percent of native children with at least one foreign-born parent and 11 percent of native children with native parents.

Summary List of Indicators

Indicator Name	Description of Indicator	Previous Year of Data *Value (Year)*	New Data *Value (Year)*	Change Between Years
Economic Security				
Child poverty and family income	Percentage of related children under age 18 in poverty	16 (1999)	16 (2000)	NS
Secure parental employment	Percentage of children under age 18 living with parents with at least one parent employed full time all year	79 (1999)	80 (2000)	▲
Housing problems	Percentage of households with children under age 18 that report housing problems	35 (1999)	—	—
Food security and diet quality	Percentage of children under age 18 in households experiencing food insecurity reporting child hunger	0.7 (1999)	0.8 (2000)	NS
	Percentage of children ages 2 to 5 with a good diet	21 (1996)	27 (1998)	▲
Access to health care	Percentage of children under age 18 covered by health insurance	87 (1999)	88 (2000)	▲
	Percentage of children under age 18 with no usual source of health care	7 (1999)	7 (2000)	NS
Health				
General health status	Percentage of children under age 18 in very good or excellent health	83 (1999)	82 (2000)	NS
Activity limitation	Percentage of children ages 5 to 17 with any limitation in activity resulting from chronic conditions	7 (1999)	7 (2000)	NS
Childhood immunization	Percentage of children ages 19 to 35 months who received combined series immunization coverage	78 (1999)	76 (2000)	NS
Low birthweight	Percentage of infants weighing less than 5.5 pounds at birth	7.6 (1999)	7.6 (2000)	NS
Infant mortality	Deaths before the first birthday per 1,000 live births	7.2 (1998)	7.0 (1999)	▼
Child mortality	Deaths per 100,000 children ages 1 to 4	35 (1998)	35 (1999)	NS
	Deaths per 100,000 children ages 5 to 14	20 (1998)	19 (1999)	▼
Adolescent mortality	Deaths per 100,000 adolescents ages 15 to 19	71 (1998)	70 (1999)	NS
Adolescent births	Births per 1,000 females ages 15 to 17	29 (1999)	27 (2000)	▼
Behavior and Social Environment				
Regular cigarette smoking	Percentage of 8th-grade students who reported smoking daily in the previous 30 days	7.4 (2000)	5.5 (2001)	▼
	Percentage of 10th-grade students who reported smoking daily in the previous 30 days	14 (2000)	12 (2001)	▼
	Percentage of 12th-grade students who reported smoking daily in the previous 30 days	21 (2000)	19 (2001)	NS
Alcohol use	Percentage of 8th-grade students who reported having five or more alcoholic beverages in a row in the last 2 weeks	14 (2000)	13 (2001)	NS
	Percentage of 10th-grade students who reported having five or more alcoholic beverages in a row in the last 2 weeks	26 (2000)	25 (2001)	NS

Legend: NS = No significant change ▲ = Significant increase ▼ = Significant decrease — = not applicable

Indicator Name	Description of Indicator	Previous Year of Data Value (Year)	New Data Value (Year)	Change Between Years
Alcohol use (cont.)	Percentage of 12th-grade students who reported having five or more alcoholic beverages in a row in the last 2 weeks	30 (2000)	30 (2001)	NS
Illicit drug use	Percentage of 8th-grade students who have used illicit drugs in the previous 30 days	12 (2000)	12 (2001)	NS
	Percentage of 10th-grade students who have used illicit drugs in the previous 30 days	23 (2000)	23 (2001)	NS
	Percentage of 12th-grade students who have used illicit drugs in the previous 30 days	25 (2000)	26 (2001)	NS
Youth victims and perpetrators of serious violent crimes	Rate of serious violent crime victimizations per 1,000 youth ages 12 to 17	20 (1999)	16 (2000)	NS
	Serious violent crime offending rate per 1,000 youth ages 12 to 17	26 (1999)	17 (2000)	NS
Education				
Family reading to young children	Percentage of children ages 3 to 5 who are read to every day by a family member	54 (1999)	58 (2001)	▲
Early childhood care and education	Percentage of children ages 3 to 5 who are enrolled in early childhood centers	60 (1999)	56 (2001)	▼
Mathematics and reading achievement (0-500 scale)	Average mathematics scale score of			
	9-year-olds	232 (1999)	—	—
	13-year-olds	276 (1999)	—	—
	17-year-olds	308 (1999)	—	—
	Average reading scale score of			
	9-year-olds	212 (1999)	—	—
	13-year-olds	259 (1999)	—	—
	17-year-olds	288 (1999)	—	—
High school academic coursetaking	Percentage of high school graduates who completed high-level coursework in			
	mathematics	41 (1998)	—	—
	science	60 (1998)	—	—
	English	20 (1998)	—	—
	foreign language	13 (1998)	—	—
High school completion	Percentage of young adults ages 18 to 24 who have completed high school	86 (1999)	87 (2000)	NS
Youth neither enrolled in school nor working	Percentage of youth ages 16 to 19 who are neither in school nor working	8 (2000)	9 (2001)	NS
Higher education	Percentage of high school graduates ages 25 to 29 who have completed a bachelor's degree or higher	33 (2000)	33 (2001)	NS
Special Feature				
Children of at least one foreign-born parent	Percentage of children under age 18 by nativity of child and parents	—	19 (2001)	—

Legend: NS = No significant change ▲ = Significant increase ▼ = Significant decrease — = not applicable

About This Report

America's Children: Key National Indicators of Well-Being, 2002, developed by the Federal Interagency Forum on Child and Family Statistics, is the sixth annual synthesis of information on the status of the Nation's most valuable resource, our children. This report presents 24 key indicators of the well-being of children. These indicators are monitored through official Federal statistics covering children's economic security, health, behavior and social environment, and education. The report also presents data on eight key contextual measures and includes a special feature showing children of at least one foreign-born parent. The 20 agencies of the Forum have also introduced improvements in the measurement of several of the indicators presented last year.

Purpose of *America's Children: Key National Indicators of Well-Being*

This report provides the Nation with a broad annual summary of national indicators of child well-being and monitors changes in these indicators over time. The Forum hopes that this report will stimulate discussions by policy-makers and the public, exchanges between the data and policy communities, and improvements in Federal data on children and families. In so doing, the Forum hopes that this report will lead to improvements in the well-being of America's children.

The Federal Interagency Forum on Child and Family Statistics

The Forum is a formal structure for collaboration among 20 Federal agencies that produce or use statistical data on children and families. The members of the Forum are listed on the back of the cover page. Building on earlier cooperative activities, the Forum was founded in 1994. It was formally established by Executive Order No. 13045 in 1997 to foster the coordination and integration of the collection and reporting of data on children and families. The two major publications produced by the Forum are *America's Children: Key National Indicators of Well-Being* (produced annually since 1997) and *Nurturing Fatherhood: Improving Data and Research on Male Fertility, Family Formation and Fatherhood* (June 1998). The Forum's primary missions are to develop ways to improve consistency and enhance the collection of data on children, youth, and families and to improve the reporting and dissemination of information on the status of children and families to the policy community and the general public.

Structure of the report

America's Children: Key National Indicators of Well-Being, 2002 is intended to present information and data on the well-being of children in a nontechnical, user-friendly format. It is designed to complement other more technical or comprehensive reports produced by the Forum agencies. The report is divided into two parts.

The first part of the report, *Population and Family Characteristics*, presents data that illustrate the changes that have taken place during the past few decades in eight measures depicting the context of children's lives. These background measures provide a foundation for understanding the key indicators and the child population. They provide basic information about children in the United States and the social and demographic changes occurring in the child population. These data answer questions such as: How many children are there in the United States? What proportion of the population is under age 18? How racially and ethnically diverse are our children? How many have difficulty speaking English? In what types of families do they live? What is the quality of their environment?

The second part, *Indicators of Children's Well-Being*, contains data on key indicators of how well we are doing in providing economic security, educational opportunity, and a healthy and safe environment in which children can play, learn, and grow. Unlike the data presented in Part I of the report, which simply describe the changing context in which children live, the data in Part II offer insight into how well children are faring by providing information in four key areas of child well-being: economic security, health; behavior and social environment, and education.

For each background measure in *Part I: Population and Family Characteristics*, and each indicator in *Part II: Indicators of Children's Well-Being*, three components are presented:

- *Statements* about why the measure or indicator is important to understanding the condition of children;
- *Figures* showing important facts about trends or population groups; and
- *Highlights* with information on the current status, recent trends, and important differences by population groups noted.

In addition, *Appendix A: Detailed Tables* contains tabulated data for each measure and additional detail not discussed in the main body of the report. *Appendix B: Data Source Descriptions* contains descriptions of the sources and surveys used to generate the background measures and the indicators.

Aspects of child well-being depicted in this report

America's Children: Key National Indicators of Well-Being, 2002 covers four domains of child well-being: economic security, health, behavior and social environment, and education. The economic security indicators document poverty and income among children and the accessibility of basic necessities such as food, housing, and health care. The health indicators document the physical health and well-being of children by presenting information on their health status, immunization coverage, death rates, and teenage births. The behavioral and social environment indicators present information about young people's participation in illegal or high-risk behaviors, such as smoking, drinking alcohol, using illicit drugs, and engaging in serious violent crimes. Finally, the education indicators examine how well we are succeeding in educating our children, including preschoolers' exposure to reading and early education, measures of student achievement, rigorous coursetaking in high school, and indicators of how many young adults complete high school and college.

Special feature

At the end of Part II, *America's Children: Key National Indicators of Well-Being, 2002* presents data on one "special feature." Special features are an annual component of *America's Children*, presenting measures that are either not available with sufficient frequency to be considered as regular key indicators, or are new regular measures that the Forum believes merit special attention when first introduced into the *America's Children* report. In both cases, special features provide important information on child well-being. This year's special feature shows the increasing population of children of at least one foreign-born parent.

Changes since last year

America's Children: Key National Indicators of Well-Being, 2002 is similar to last year's report in both format and content. While most of the indicators presented last year have been included and updated, the Forum has worked to improve the report in a number of important ways. Some changes reflect improvements in the availability of data for certain key indicators. Some changes clarify the concept being measured or expand the indicator substantively. This year, improvements were made to the child care measure and the food security indicator. In addition, the special feature, children of at least one foreign-born parent, is being introduced and will subsequently be presented as a regular background measure in the *Population and Family Characteristics* section in future reports. The changes reflect the many helpful comments and suggestions for improvements that were received from readers and users of the previous reports.

Children included in this report

In order to convey a comprehensive understanding of child well-being, the report looks at the status of all children under age 18 living in the United States. A few indicators provide data on older youth and young adults (persons ages 18 to 29). In most cases throughout the report, the word "children" refers to any person under age 18 living in a civilian or noninstitutionalized setting in the United States. In some other cases, such as vital statistics, all children are included. When data are being presented only for specific age groups, this is indicated in the text (e.g., children ages 1 to 4). As is also noted in the text, some indicators examine only particular groups of children (e.g., children living in family settings, children living with parents, children in certain age groups or grade levels). For most of the indicators, the relevant information has been reported by an adult in the household or family and not directly by the children.

In many cases, we have also presented the data on children by race and Hispanic origin. In most cases, Hispanics have been separated from the white and black categories and "non-Hispanic" follows the race designation, such as "white, non-Hispanic." In some cases, data for Hispanics were not available or could not be separated from data for race groups. In these cases, data for race groups (white, black, American Indian/Alaska Native, Asian/Pacific Islander) include Hispanics.

Selection of the key indicators

America's Children: Key National Indicators of Well-Being, 2002 presents a selected set of key indicators of enduring interest that measure critical aspects of children's lives and are collected rigorously and regularly by Federal agencies. The Forum chose these indicators through careful examination of available data. In determining this list of key indicators, the Forum sought input from the Federal policymaking community, foundations, academic researchers, and State and local children's service providers. These indicators were chosen because they are:

- ☐ *Easy to understand* by broad audiences;
- ☐ *Objectively based* on substantial research connecting them to child well-being and using reliable data;
- ☐ *Balanced* so that no single area of children's lives dominates the report;

- ☐ *Measured regularly* so that they can be updated and show trends over time; and
- ☐ *Representative* of large segments of the population, rather than one particular group.

Data sources

Data for the key indicators are drawn primarily from national surveys and vital records. Federal agencies regularly survey the population on many issues. Some national surveys use interviewers to gather information on children through a variety of methods, including speaking directly, by telephone or in person, with families selected through rigorous sampling methods. Other surveys use questionnaires distributed directly to youth to ask about their behavior. In addition, some national data collection efforts directly assess students by giving them tests or by asking them to perform certain tasks. Federal agencies collect information on births and deaths from State health departments. These nationally representative surveys, along with data collected through vital statistics, provide the best available measures of the condition of U.S. children. Administrative data from social service agencies were not used for measures in this report. The availability and quality of such data can be affected by policy differences among agencies in various local areas and by resource constraints. Further information on data sources for this report is provided in *Appendix B: Data Source Descriptions.*

In the text of this report, percentages and rates are rounded to the nearest whole number, unless rounding would mask significant differences. The text discusses changes over time or between-group differences only when differences are statistically significant.

Additional data needed

America's Children: Key National Indicators of Well-Being, 2002 identifies critical gaps in the data available on children and youth. It challenges the Nation as a whole—and the Federal statistical agencies in particular—to improve the monitoring of important areas of children's lives. It also challenges Federal agencies to improve the timeliness with which information on children is made available to policymakers and the public.

At the end of *Part I: Population and Family Characteristics* and at the end of each section in *Part II: Indicators of Children's Well-Being*, the report presents a description of data and measures of child well-being in need of development. These lists include many important aspects of children's lives for which regular indicators are lacking or are in development, such as homelessness, long-term poverty, mental health, disability, neighborhood environment, and early childhood development. In some of these areas, the Forum is exploring ways to collect new measures and improve existing ones. In others, Forum agencies have successfully fielded surveys incorporating some new measures but they are not yet available on a regular basis for monitoring purposes.

For further information

There are several good places to obtain additional information on each of the indicators found in this report. First, for many of the indicators, *Appendix A: Detailed Tables* contains additional detail not discussed in the main body of the report. For example, some tables show additional breakouts by gender, race and Hispanic origin, or another category. Second, *Appendix B: Data Source Descriptions* contains information and descriptions of the sources and surveys used to generate the indicators as well as information on how to contact the agency responsible for collecting the data or administering the relevant survey. Third, numerous publications of the Federal statistical agencies provide additional detail on each of the key indicators included in this report, as well as on scores of other indicators. These reports include *Trends in the Well-Being of America's Children and Youth*, published annually by the Office of the Assistant Secretary for Planning and Evaluation in the U.S. Department of Health and Human Services; *The Condition of Education*, published annually by the National Center for Education Statistics; and *Health, United States*, published annually by the National Center for Health Statistics. Often these compendia contain additional details not reported in *America's Children. Appendix B: Data Source Descriptions* also contains a list of agency contacts who can provide further information on the relevant surveys and indicators. Finally, the Forum's website, *http://childstats.gov*, contains many links to Forum agency publications that often provide more detail about the indicators in this report.

America's Children on the Internet

The report can be found on the World Wide Web at *http:// childstats.gov*. The website version of the report contains data for years that are presented in the figures but not in the tables in this report. The Forum's website also contains information on the overall structure and organization of the Forum, as well as other reports, and news on current activities. Also found on the website are links to international comparative data and related reports of Forum agencies and other organizations providing more detailed data. The website addresses of the Forum agencies are found on the following page.

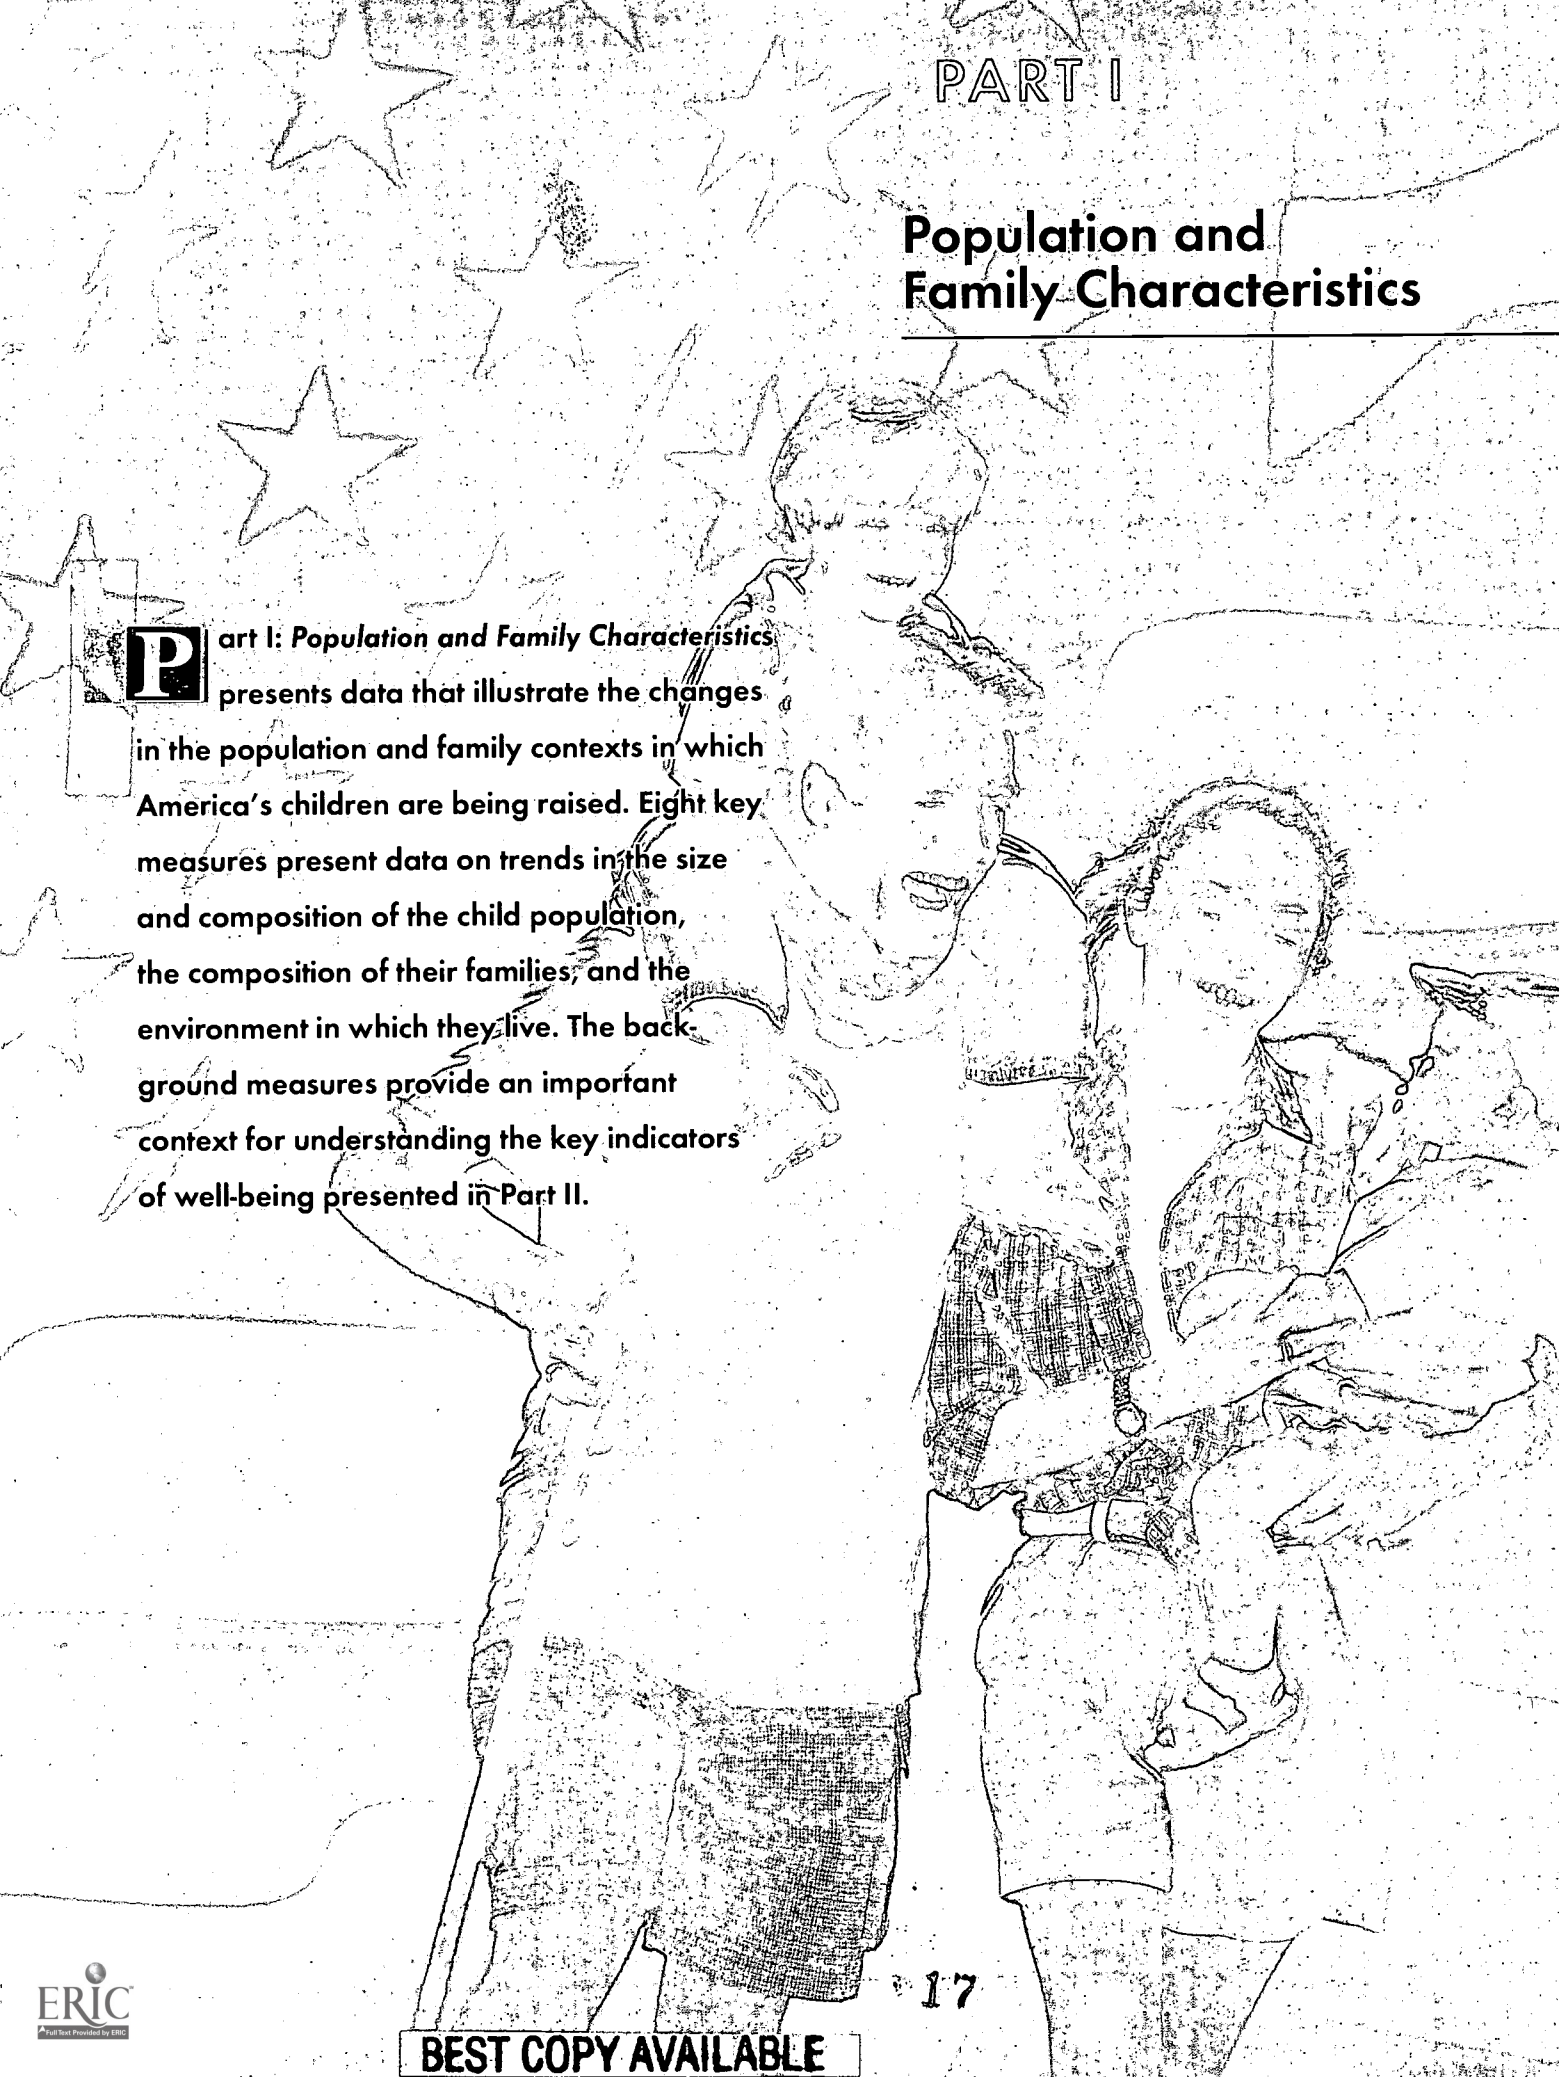
Table of Contents

PART I

Population and Family Characteristics



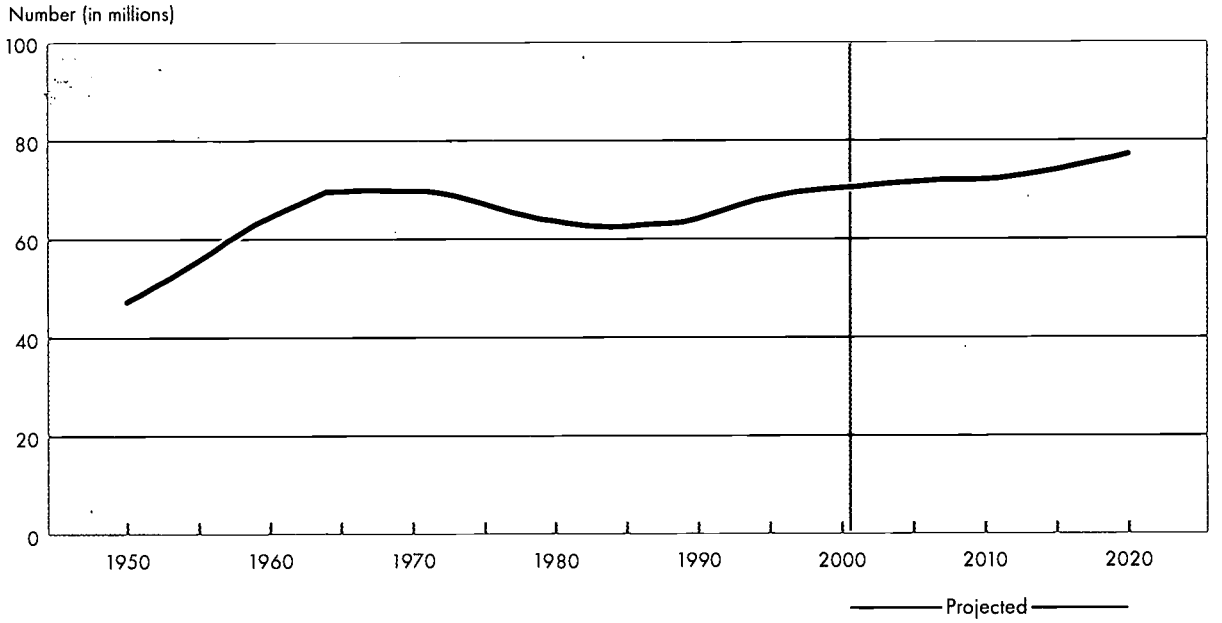
Part I: *Population and Family Characteristics* presents data that illustrate the changes in the population and family contexts in which America's children are being raised. Eight key measures present data on trends in the size and composition of the child population, the composition of their families, and the environment in which they live. The background measures provide an important context for understanding the key indicators of well-being presented in Part II.

Child Population

The number of children determines the demand for schools, health care, and other services and facilities that serve children and their families.

Figure POP1

Number of children under age 18 in the United States, 1950-2000 and projected 2001-20



NOTE: All population figures for the year 2000 shown here are estimates based on the 1990 Census; they do not reflect Census 2000 counts. Population figures for 2001-20 are projections.

SOURCE: U.S. Census Bureau, Population Estimates and Projections.

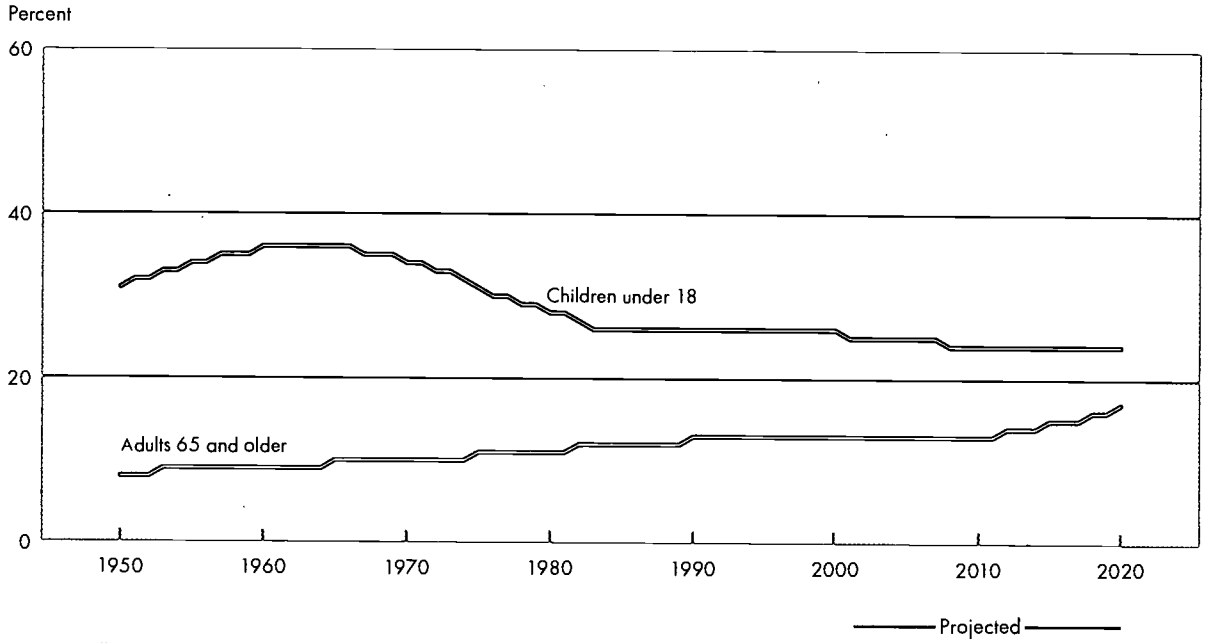
- In 2000, there were 70.4 million children in the United States, 200,000 more than in 1999. This number is projected to increase to 77.2 million in 2020.
- The number of children under 18 has grown during the last half-century, increasing about half again since 1950.
- During the "baby boom" (1946 to 1964), the number of children grew rapidly.
- During the 1970s and 1980s, the number of children declined and then grew slowly.
- Beginning in 1990, the rate of growth in the number of children increased, although not as rapidly as during the baby boom.
- In 2000, there were approximately equal numbers of children—between 23 and 24 million—in each age group 0 to 5, 6 to 11, and 12 to 17 years of age.

Bullets contain references to data that can be found in Table POP1 on page 70.

Children as a Proportion of the Population

Though children represent a smaller percentage of the population today than in 1960, they are nevertheless a stable and substantial portion of the population.

Figure POP2. **Children under age 18 and adults ages 65 and older as a percentage of the U.S. population, 1950-2000 and projected 2001-20**



NOTE: All population figures for the year 2000 shown here are estimates based on the 1990 Census; they do not reflect Census 2000 counts. Population figures for 2001-20 are projections.

SOURCE: U.S. Census Bureau, Population Estimates and Projections.

- In 2000, children made up 26 percent of the population, down from a peak of 36 percent at the end of the "baby boom."
- Since the mid-1960s, children have been decreasing as a proportion of the total U.S. population.
- Children are projected to remain a fairly stable percentage of the total population. They are projected to comprise 24 percent of the population in 2020.
- In contrast, senior citizens (adults ages 65 and older) have increased as a percentage of the total population since 1950, from 8 to 13 percent in 2000. By 2020, they are projected to make up 17 percent of the population.
- Together, children and senior citizens make up the "dependent population" (those persons who, because of their age, are less likely to be employed than others). In 1950, children made up 79 percent of the dependent population; by 2000, they made up 67 percent. This percentage is expected to continue to decrease, to 59 percent in 2020.

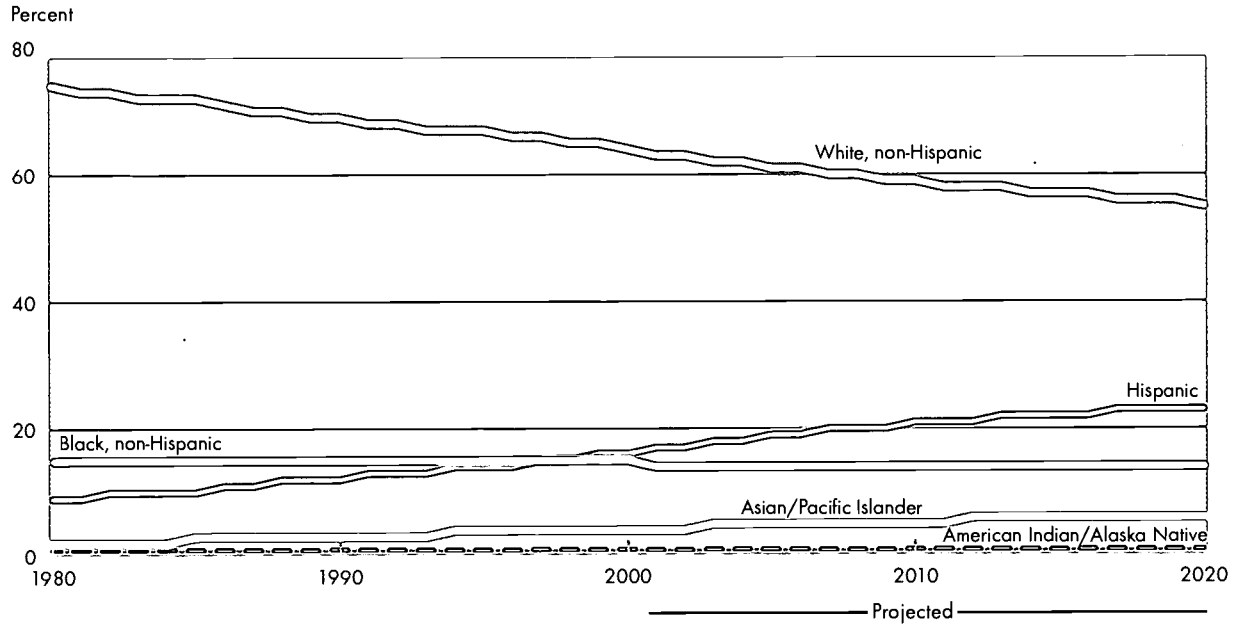
Bullets contain references to data that can be found in Table POP2 on page 70.

Racial and Ethnic Composition

Racial and ethnic diversity has grown dramatically in the United States in the last three decades. This increased diversity manifested itself first among children, and later in the older population. Diversity is projected to increase even more in the decades to come.

Figure POP3

Percentage of children under age 18 by race and Hispanic origin, 1980-2000 and projected 2001-20



NOTE: All population figures for the year 2000 shown here are estimates based on the 1990 Census; they do not reflect Census 2000 counts. Population figures for 2001-20 are projections.

SOURCE: U.S. Census Bureau, Population Estimates and Projections.

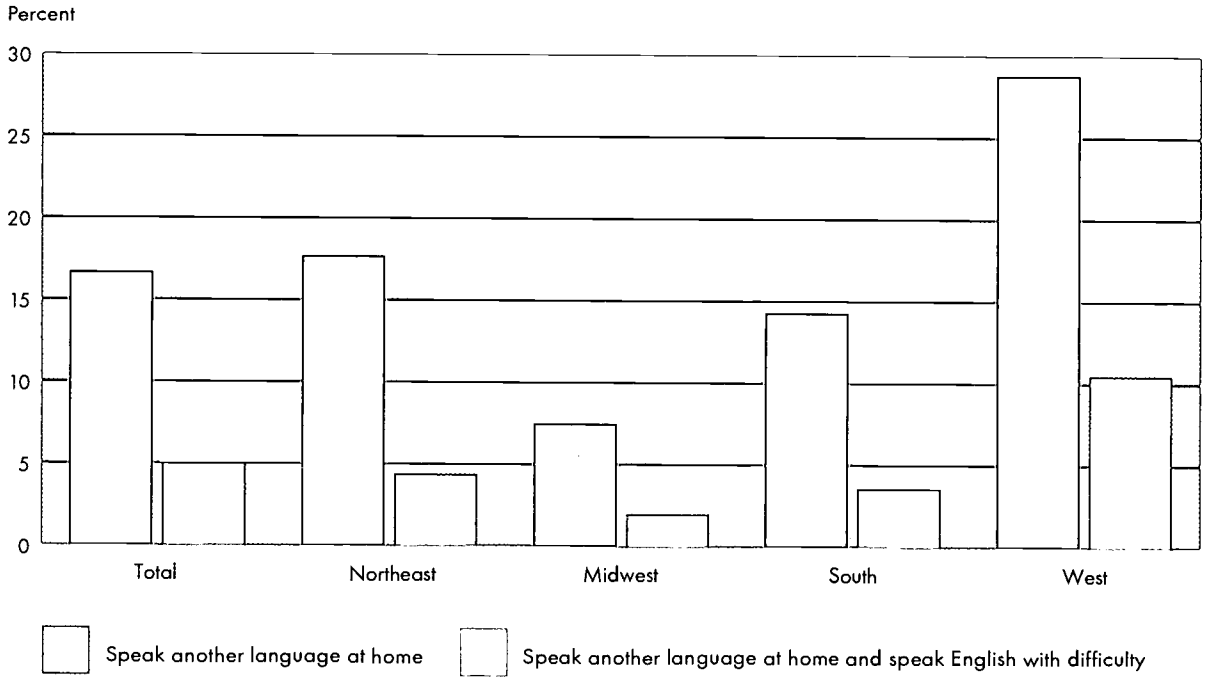
- In 2000, 64 percent of U.S. children were white, non-Hispanic; 16 percent were Hispanic; 15 percent were black, non-Hispanic; 4 percent were Asian/Pacific Islander; and 1 percent were American Indian/Alaska Native.
- The percentage of children who are white, non-Hispanic has decreased from 74 percent in 1980 to 64 percent in 2000.
- The percentages of black, non-Hispanic and American Indian/Alaska Native children have been fairly stable during the period from 1980 to 2000.
- The number of Hispanic children has increased faster than that of any other racial and ethnic group, growing from 9 percent of the child population in 1980 to 16 percent in 2000. By 2020, it is projected that more than 1 in 5 children in the United States will be of Hispanic origin.
- The percentage of Asian/Pacific Islander children doubled from 2 to 4 percent of all U.S. children between 1980 and 2000. Their percentage is projected to continue to increase to 6 percent in 2020.
- Increases in the percentages among Hispanic and Asian/Pacific Islander children reflect higher fertility and immigration rates than those of other groups. Much of the growth in the percentage of Hispanic children is due to the relatively high fertility of Hispanic women.

Bullets contain references to data that can be found in Table POP3 on page 71.

Difficulty Speaking English

Children who speak languages other than English at home and who also have difficulty speaking English[1] may face greater challenges progressing in school and, once they become adults, in the labor market. Once it is determined that a student speaks another language, school officials must, by law, evaluate the child's English ability to determine whether the student needs services (such as special instruction to improve his or her English) and provide these services if needed.

Figure POP4 **Percentage of children ages 5 to 17 who speak a language other than English at home and who have difficulty speaking English by region, 1999**



SOURCE: U.S. Census Bureau, October Current Population Survey. Tabulated by the U.S. Department of Education, National Center for Education Statistics.

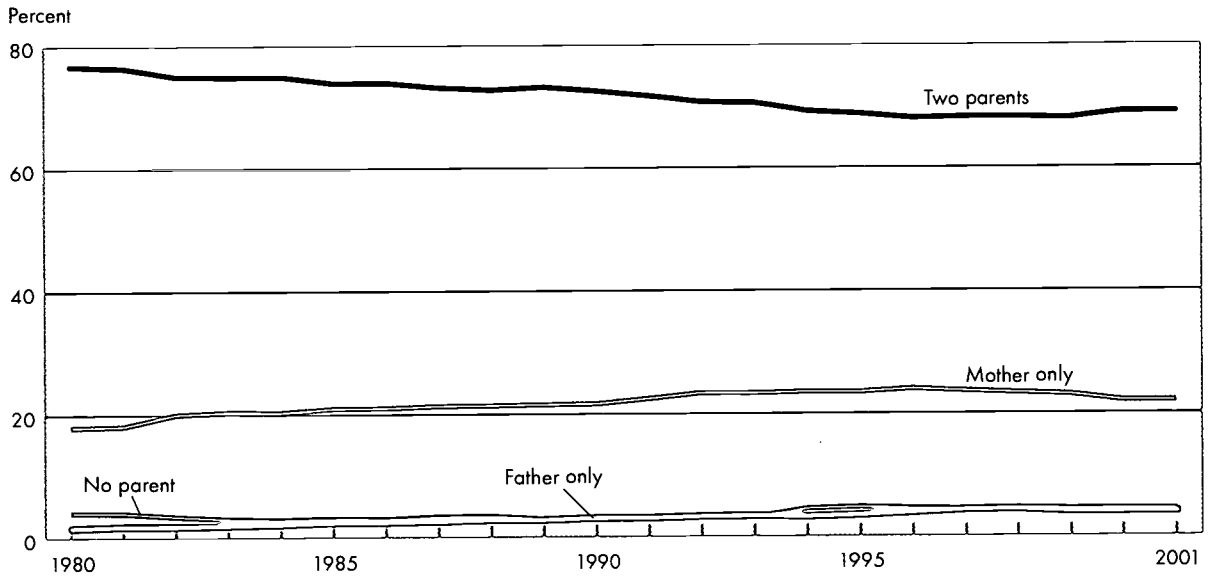
- The number of school-age children (ages 5 to 17) who spoke a language other than English at home and who had difficulty speaking English was 2.6 million in 1999, double the number (1.3 million) in 1979. This represented 5 percent of all school-age children in the United States in 1999.
- The percentage of children who have difficulty speaking English varies by region of the country, from 2 percent of children in the Midwest to 11 percent of children in the West.
- Likewise, the percentage of children who speak another language at home (with or without difficulty speaking English) varies by region of the country, from 8 percent of children in the Midwest to 29 percent of children in the West. This difference is due largely to differing concentrations of immigrants and their descendants in the regions.
- White, non-Hispanic and black, non-Hispanic children are less likely than children of Hispanic origin or other races to have difficulty speaking English. One percent of white, non-Hispanic and black, non-Hispanic children had difficulty speaking English in 1999, compared with 23 percent of children of Hispanic origin and 12 percent of children of other races.

Bullets contain references to data that can be found in Table POP4 on page 72. Endnotes begin on page 59.

Family Structure and Children's Living Arrangements

The number of parents a child lives with is strongly linked to the resources available to children and their well-being. Children who live in a household with only one parent are substantially more likely to have family incomes below the poverty line than are children who live in a household with two parents (biological, step, or adoptive).

Figure POP5 **Percentage of children under age 18 by presence of parents in household, 1980-2001**



SOURCE: U.S. Census Bureau, March Current Population Survey.

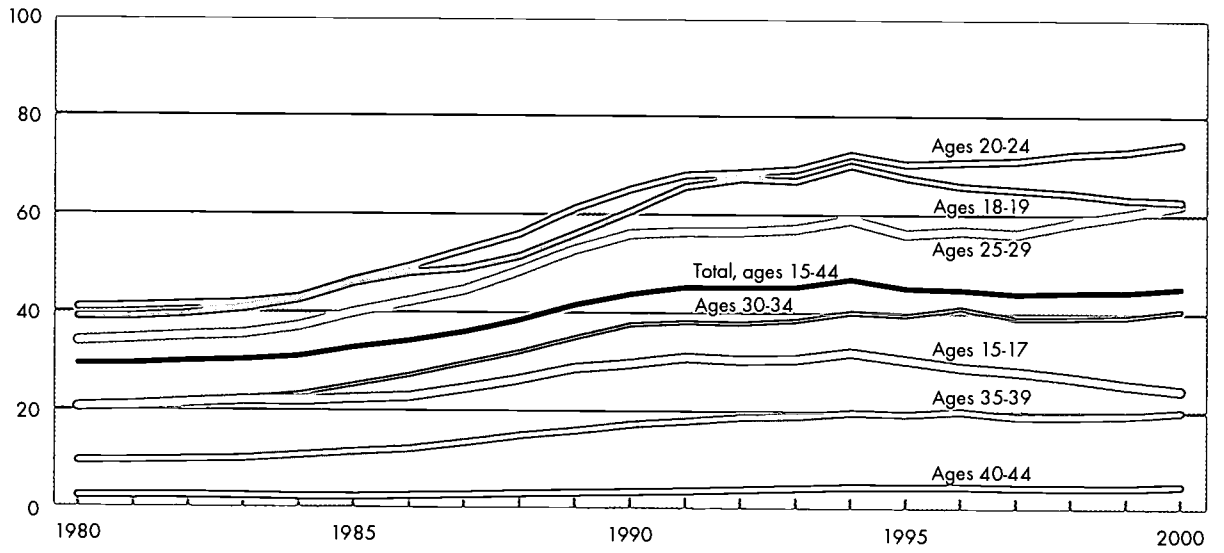
- In 2001, 69 percent of American children lived with two parents, down from 77 percent in 1980.
- In 2001, about one-fifth (22 percent) of children lived with only their mothers, 4 percent lived with only their fathers, and 4 percent lived with neither of their parents.[2]
- Since 1996, the percentage of children living with only one parent has not changed significantly.
- Among the factors associated with the change in the percentage of children living with just one parent between 1980 and 1996 is the percentage of births that were to unmarried mothers.[3]
- White, non-Hispanic children are much more likely than black children and somewhat more likely than Hispanic children to live with two parents. In 2001, 78 percent of white, non-Hispanic children lived with two parents, compared with 38 percent of black children and 65 percent of children of Hispanic origin.
- The measure of detailed living arrangements of children (POP5.B in *America's Children 2001*) has been removed from this year's report because more recent data are not yet available. For information on the detailed living arrangements of children, see last year's *America's Children* report and the following Census Bureau report: P70-74 *Living Arrangements of Children* available at http://www.census.gov/population/www/socdemo/child/la-child.html.

Bullets contain references to data that can be found in Table POP5 on page 73. Endnotes begin on page 59.

Births to Unmarried Women

Increases in births to unmarried women are among the many changes in American society that have affected family structure and the economic security of children.[3] Children of unmarried mothers are at higher risk of having adverse birth outcomes, such as low birthweight and infant mortality, and are more likely to live in poverty than children of married mothers.[4-8]

Figure POP6.A **Birth rates for unmarried women by age of mother, 1980-2000**

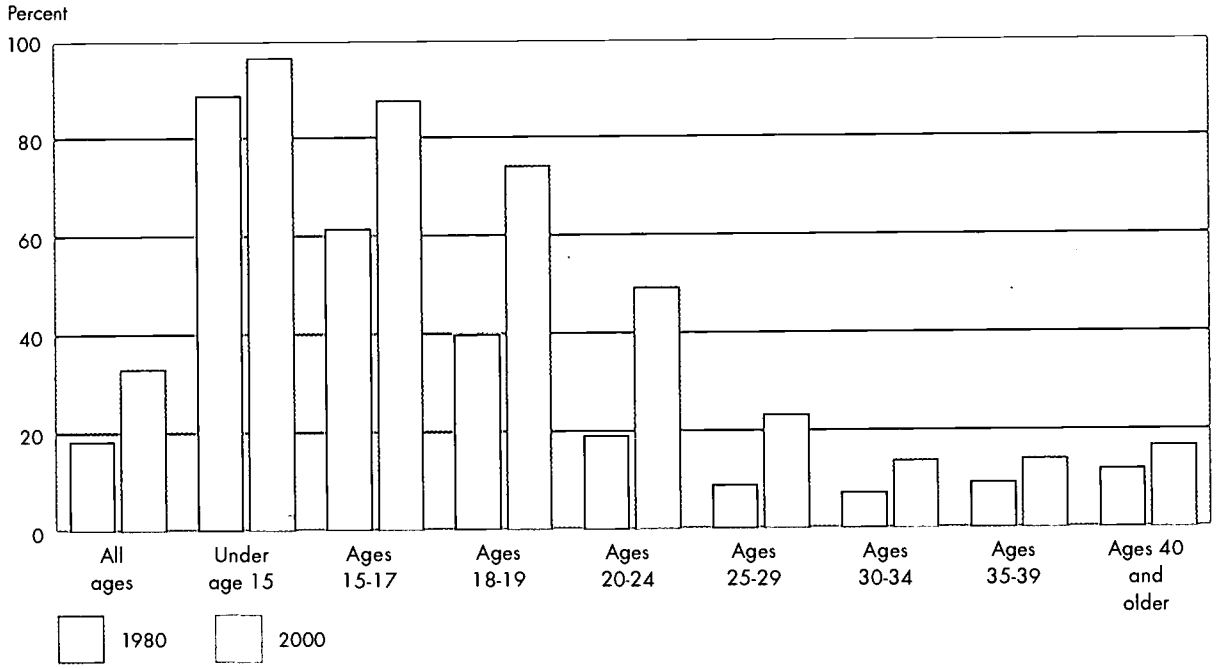


SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System.

- There were 45 births for every 1,000 unmarried women ages 15 to 44 in 2000.
- Between 1980 and 1994, the birth rate for unmarried women ages 15 to 44 increased from 29 to 47 per 1,000. Between 1994 and 1997-99 the rate fell slightly to 44 per 1,000, before rising to 45 in 2000.
- Between 1980 and 1994, birth rates increased sharply for unmarried women in all age groups. The birth rate for unmarried women ages 15 to 17 increased from 21 to 32 per 1,000, and the rate for unmarried women ages 18 to 19 rose from 39 to 70 per 1,000. The birth rate for unmarried women ages 20 to 24 increased from 41 to 72 per 1,000. Between 1994 and 2000, rates by age declined for all women under age 20, rose slightly for women in their twenties, and stabilized for women 30 and older.
- The long-term rise in the nonmarital birth rate between 1960 and 1994 is linked to a number of factors.[7] The proportion of women of childbearing age who are unmarried increased (from 29 percent in 1960 to 46 percent in 1994), concurrent with an increase in nonmarital cohabitation. About one in five unmarried women ages 25 to 34 was in a cohabiting relationship in 2000.[9] The likelihood that an unmarried woman will marry before the child is born declined steeply from the early 1960s to the early 1980s and continued to fall, although more modestly, through the early 1990s.[10] At the same time, childbearing within marriage declined: births to married women declined from 4 million in 1960 to 2.7 million in 1994, and the birth rate for married women fell from 157 per 1,000 in 1960 to 84 per 1,000 in 1994.[5-7] These measures stabilized in the mid-1990s, as the nonmarital birth rate also steadied, and then increased late in the decade.
- The pace of change in nonmarital birth rates slowed considerably beginning after 1994. Increases in nonmarital birth rates among women in their twenties became more modest, while teenage birth rates declined. [5,7]

Children are at greater risk for adverse consequences when born to a single mother because the social, emotional, and financial resources available to the family may be more limited.[4] The proportion of births to unmarried women is useful for understanding the extent to which children born in a given year may be affected by any disadvantage—social, financial, or health—associated with being born outside of marriage. The percentage of births to unmarried women is affected by several factors, including birth rates for married and unmarried women and the number of unmarried women.[11] Significant changes occurred in all these measures between 1980 and 2000.[6,7,12]

Figure POP6.B **Percentage of all births that are to unmarried women by age of mother, 1980 and 2000**



SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System.

- In 2000, 33 percent of all births were to unmarried women.
- The percentage of all births to unmarried women rose sharply from 18 percent in 1980 to 33 percent in 1994. From 1994 to 1997, the proportion was relatively stable at about 32 percent, and then increased slightly to 33 percent in 1998-2000.[5,7]
- Between 1980 and 2000, the proportions of births to unmarried women rose sharply for women in all age groups. Among teenagers, the proportions were high throughout the period and continued to rise, from 62 to 88 percent for ages 15 to 17 and from 40 to 74 percent for ages 18 to 19. The proportions more than doubled for births to women in their twenties, rising from 19 to 50 percent for ages 20 to 24 and from 9 to 23 percent for ages 25 to 29. The proportion of births to unmarried women ages 30 and older increased from 8 to 14 percent.[5,7]
- One-third of all births, including 4 in 10 first births, were to unmarried women in 2000. Nearly two-thirds of women under age 25 having their first child were not married.[13]
- The increases in the proportions of births to unmarried women, especially during the 1980s, are linked to sharp increases in the birth rates for unmarried women in all age groups during this period, concurrent with declines in birth rates for married women. In addition, the number of unmarried women increased by about one-fourth as more and more women from the baby-boom generation postponed marriage.[7,12]
- During the late 1990s, the pace of increase in the proportions slowed. The comparative stability is linked to a renewed rise in birth rates for married women.[5,7]

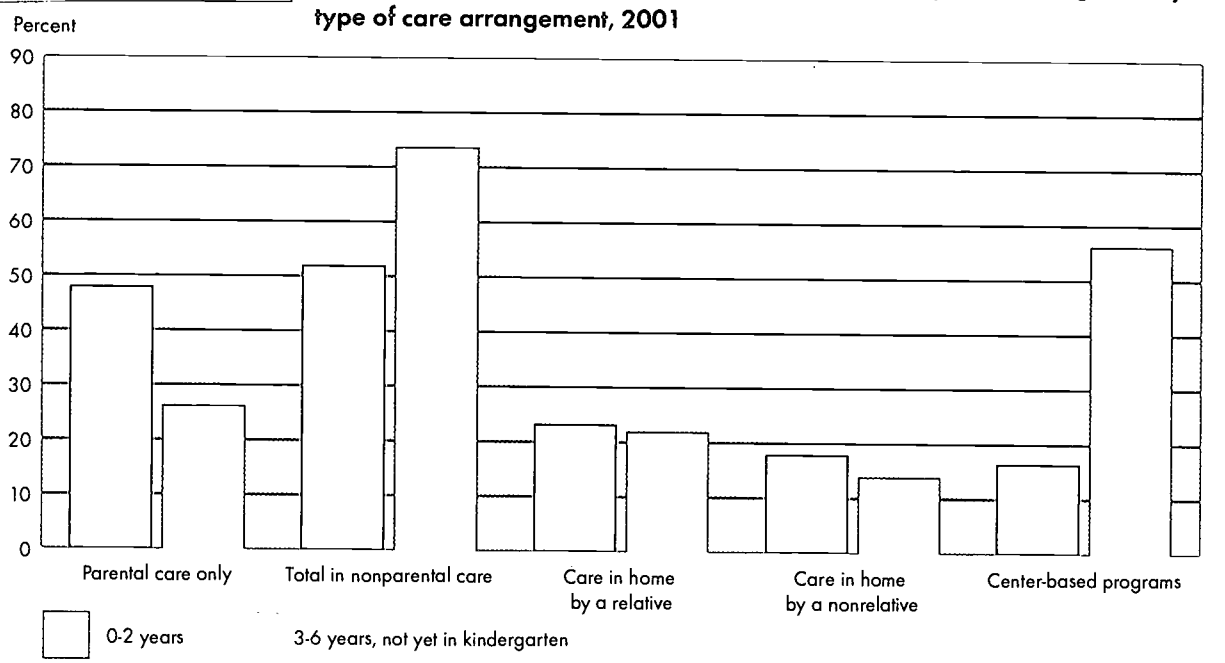
Bullets contain references to data that can be found in Tables POP6.A and POP6.B on page 74. Endnotes begin on page 59.

Child Care

Increasing proportions of children are spending substantial amounts of time in the care of a child care provider other than their parents. While researchers continue to assess the effects of child care on child development, it is important to monitor over time the way many children receive care. This measure presents two important aspects of child care usage for preschoolers: overall use of different provider types regardless of parents' work status (POP7.A) and a historical trend of the primary child care provider used by employed mothers for their preschoolers (POP7.B).[14]

Figure POP7.A

Percentage of children from birth through age six, not yet in kindergarten by type of care arrangement, 2001



NOTE: Some children participate in more than one type of arrangement, so the sum of all arrangement types exceeds the total percentage in nonparental care. Center-based programs include day care centers, prekindergartens, nursery schools, Head Start programs, and other early childhood education programs. Relative and nonrelative care can take place in either the child's own home or another home.

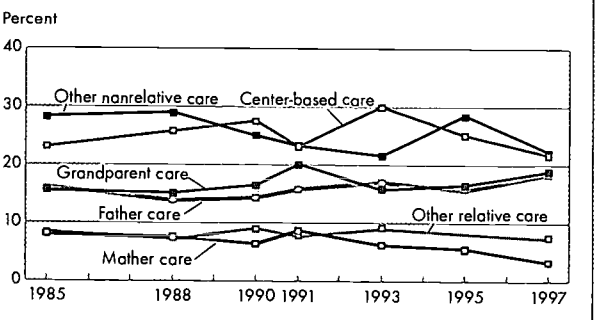
SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey.

Figure POP7.A

- In 2001, 61 percent of children from birth through age 6 (not yet in kindergarten) received some form of child care on a regular basis from persons other than their parents. This translates to approximately 12 million children and is about the same proportion of children in child care as in 1995.
- The type of child care received is related to the age of the child. Children from birth through age 2 were more likely to be in home-based care, either with a relative or nonrelative, than to be in center-based care. Children ages 3 to 6 who were not yet in kindergarten were more likely to be in a center-based child care arrangement (including nursery schools and other early childhood education programs) than in home-based care with either a relative or a nonrelative.

Figure POP7.B

Percentage of preschoolers (children under age 5) of employed mothers by primary child care arrangement, selected years 1985-97[15]

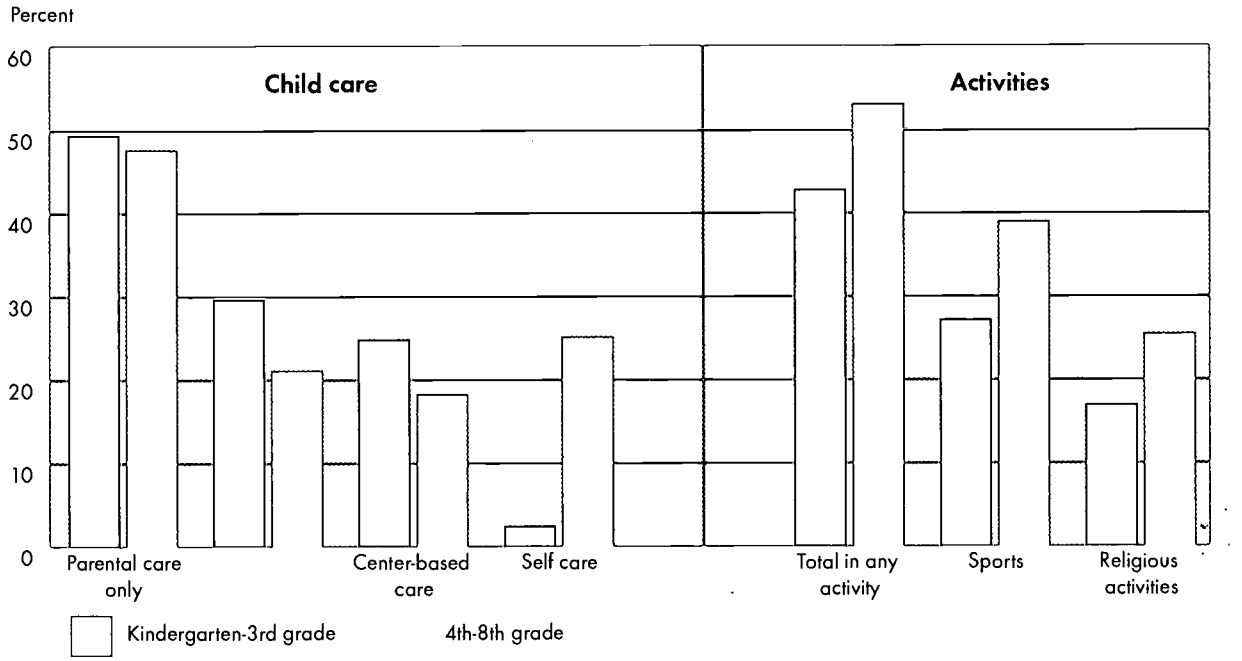


NOTE: The primary arrangement is the arrangement used for the longest number of hours per week while the mother worked.

SOURCE: U.S. Census Bureau, Survey of Income and Program Participation.

Concern for the well-being of grade-school-age children has drawn attention to their child care arrangements and out-of-school activities, including time spent unsupervised.[16] School-age children spend their weekday, nonschool time in child care arrangements but also engage in a variety of enrichment activities such as sports, arts, clubs, academic activities, community service, and religious activities. Some of these children also spend time caring for themselves without adult supervision. This measure presents the most recent data on how grade-school-age children spend their out-of-school time.

Figure POP7.C **Percentage of children in kindergarten through eighth grade by weekday care and activities, 2001**



NOTE: Some children participate in more than one type of care arrangement or activity. For self care, parents reported that their child is responsible for himself/herself before or after school on a regular basis. Parents reported on organized before- or after-school activities that are undertaken by their child on a regular basis. For a full listing of activities, see Table POP7.C.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey.

Figure POP7.B

- In 1997, nearly half of preschoolers (children under age 5) with working mothers were primarily cared for by a relative while their mother worked, while 22 percent were primarily cared for by nonrelatives in a home-based environment and another 22 percent were cared for in a center-based arrangement.
- For preschoolers with working mothers, primary care by home-based nonrelatives declined from 28 percent in 1985 to 22 percent in 1997, while center-based care has fluctuated between 22 and 30 percent.
- In 1997, 19 percent of preschoolers were primarily cared for by their fathers, up from 15 percent in 1988. In contrast, the percentage of preschoolers primarily cared for by a working mother while she was at work declined from 8 percent in 1985 to only 3 percent in 1997.
- In 1997, grandparents and other relatives were the primary child care provider for 18 percent and 7 percent of preschoolers of working mothers, respectively.

Figure POP7.C

- About half (51 percent) of children in kindergarten through third grade and those in grades four to eight (52 percent) received some nonparental child care in 2001.
- Older children were more likely to care for themselves before or after school than younger children. Three percent of children in kindergarten through third grade and 25 percent of children in fourth through eighth grade cared for themselves regularly either before or after school.
- Children in the higher grades were more likely to engage in some kind of organized before- or after-school activity than were children in the lower grades. Children from families in poverty were less likely to participate in activities than children whose families were at or above poverty. Children in kindergarten through eighth grade were more likely to participate in sports than in any other activity.

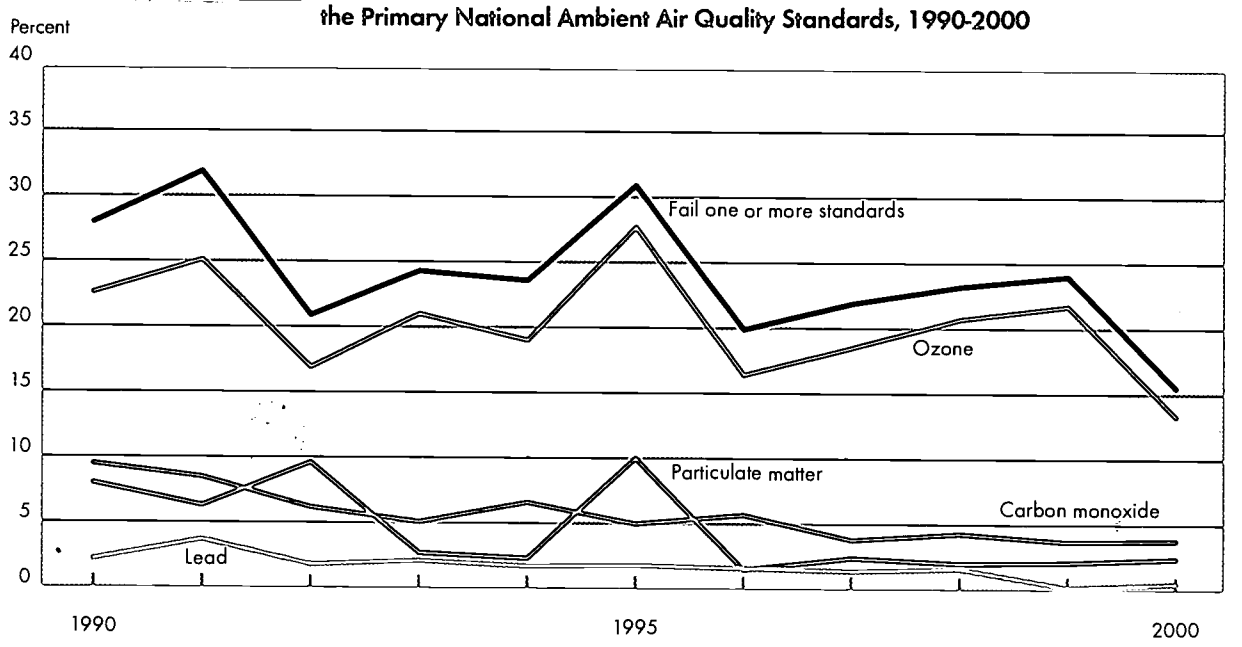
Bullets contain references to data that can be found in Tables POP7.A, POP7.B, and POP7.C on pages 75-77. Endnotes begin on page 59.

Children's Environments

The environment in which children live plays an important role in their health and development. Children need a clean, safe place in which they can grow and play. Children may be more vulnerable to environmental contaminants because of their increased potential for exposure to pollutants, since they eat, drink, and breathe more per body weight than adults. In addition, environmental contaminants in air, food, drinking water, and other sources are associated with a number of different ailments, and these contaminants may disproportionately affect children because they are still developing.[17-21] One important measure of environmental quality is the percentage of children living in areas that do not meet the National Ambient Air Quality Standards. Polluted air is associated with increased asthma episodes and other respiratory illnesses. While air pollution is one important measure of children's environments, further research is needed to develop a more complete measure of overall environmental quality for children.

Figure POP8

Percentage of children under age 18 living in areas that do not meet one or more of the Primary National Ambient Air Quality Standards, 1990-2000



NOTE: The U.S. Environmental Protection Agency has set national air quality standards for six principal pollutants: carbon monoxide (CO), lead (Pb), nitrogen dioxide (NO_2), ozone (O_3), particulate matter (PM), and sulfur dioxide (SO_2). Nitrogen dioxide and sulfur dioxide are not included in the graph because essentially all areas met the Primary National Ambient Air Quality Standards for these pollutants after 1991.

SOURCE: U.S. Environmental Protection Agency, Office of Air and Radiation, Aerometric Information Retrieval System.

- In 2000, 16 percent of children lived in areas that did not meet one or more of the Primary National Ambient Air Quality Standards, an improvement from 28 percent in 1990. The Clean Air Act established Primary National Ambient Air Quality Standards which are designed to establish limits to protect public health, including the health of sensitive populations such as children and individuals with asthma.
- In 2000, less than 1 percent of children lived in areas that did not meet the National Ambient Air Quality Standard for lead. High levels of lead are dangerous to children because they can lead to neurological and developmental problems.
- Figure POP8 does not reflect the new standards for particulate matter and ozone being implemented by the Environmental Protection Agency to better protect public health, including children's health.
- Ozone accounts for most of the areas that do not meet the Primary National Ambient Air Quality Standards. Both particulate matter and ozone can cause respiratory problems and aggravate respiratory diseases, such as asthma, in children. These problems can lead to increased emergency room visits and hospitalizations.

Bullets contain references to data that can be found in Table POP8 on page 78. Endnotes begin on page 59.

Population and Family Characteristics

Current data collection systems at the national level do not provide extensive detailed information on children's lives, their families and their caregivers. Certain topical databases provide some of this information, but data need to be collected across domains of child well-being regularly enough to discern trends in where, how, and with whom children spend their time. More data are also needed on:

- *Family interactions.* Information is needed about children's interactions with nonresident parents, particularly fathers. A subcommittee of the Federal Interagency Forum on Child and Family Statistics is currently working to improve data on family formation and fatherhood.
- *Time use.* A regular source of data is needed to track how and where children spend their time and how these patterns change over time. For example, valuable insights would be provided by data on how much time children spend in school, in day care, in after-school activities, using a computer, and interacting with one or both parents and how much time youth spend at work. Currently, Federal surveys collect information on the amount of time children spend on certain activities, such as watching television and on participation rates in specific activities or care arrangements, but no regular Federal data source examines time spent on the whole spectrum of children's activities. The inclusion in surveys of additional questions on time use by children and adults is currently being investigated by several member agencies of the Forum. The Bureau of Labor Statistics has plans to conduct a continuous time use survey, beginning in 2003, that will cover time invested in the care of children, as well as time spent in other labor market and non-labor market activities.
- *Children's environments.* Further data are needed to monitor the environments of children and their potential exposure to environmental contaminants. In particular, data are needed to describe children's potential exposure to contaminants in drinking water and food.

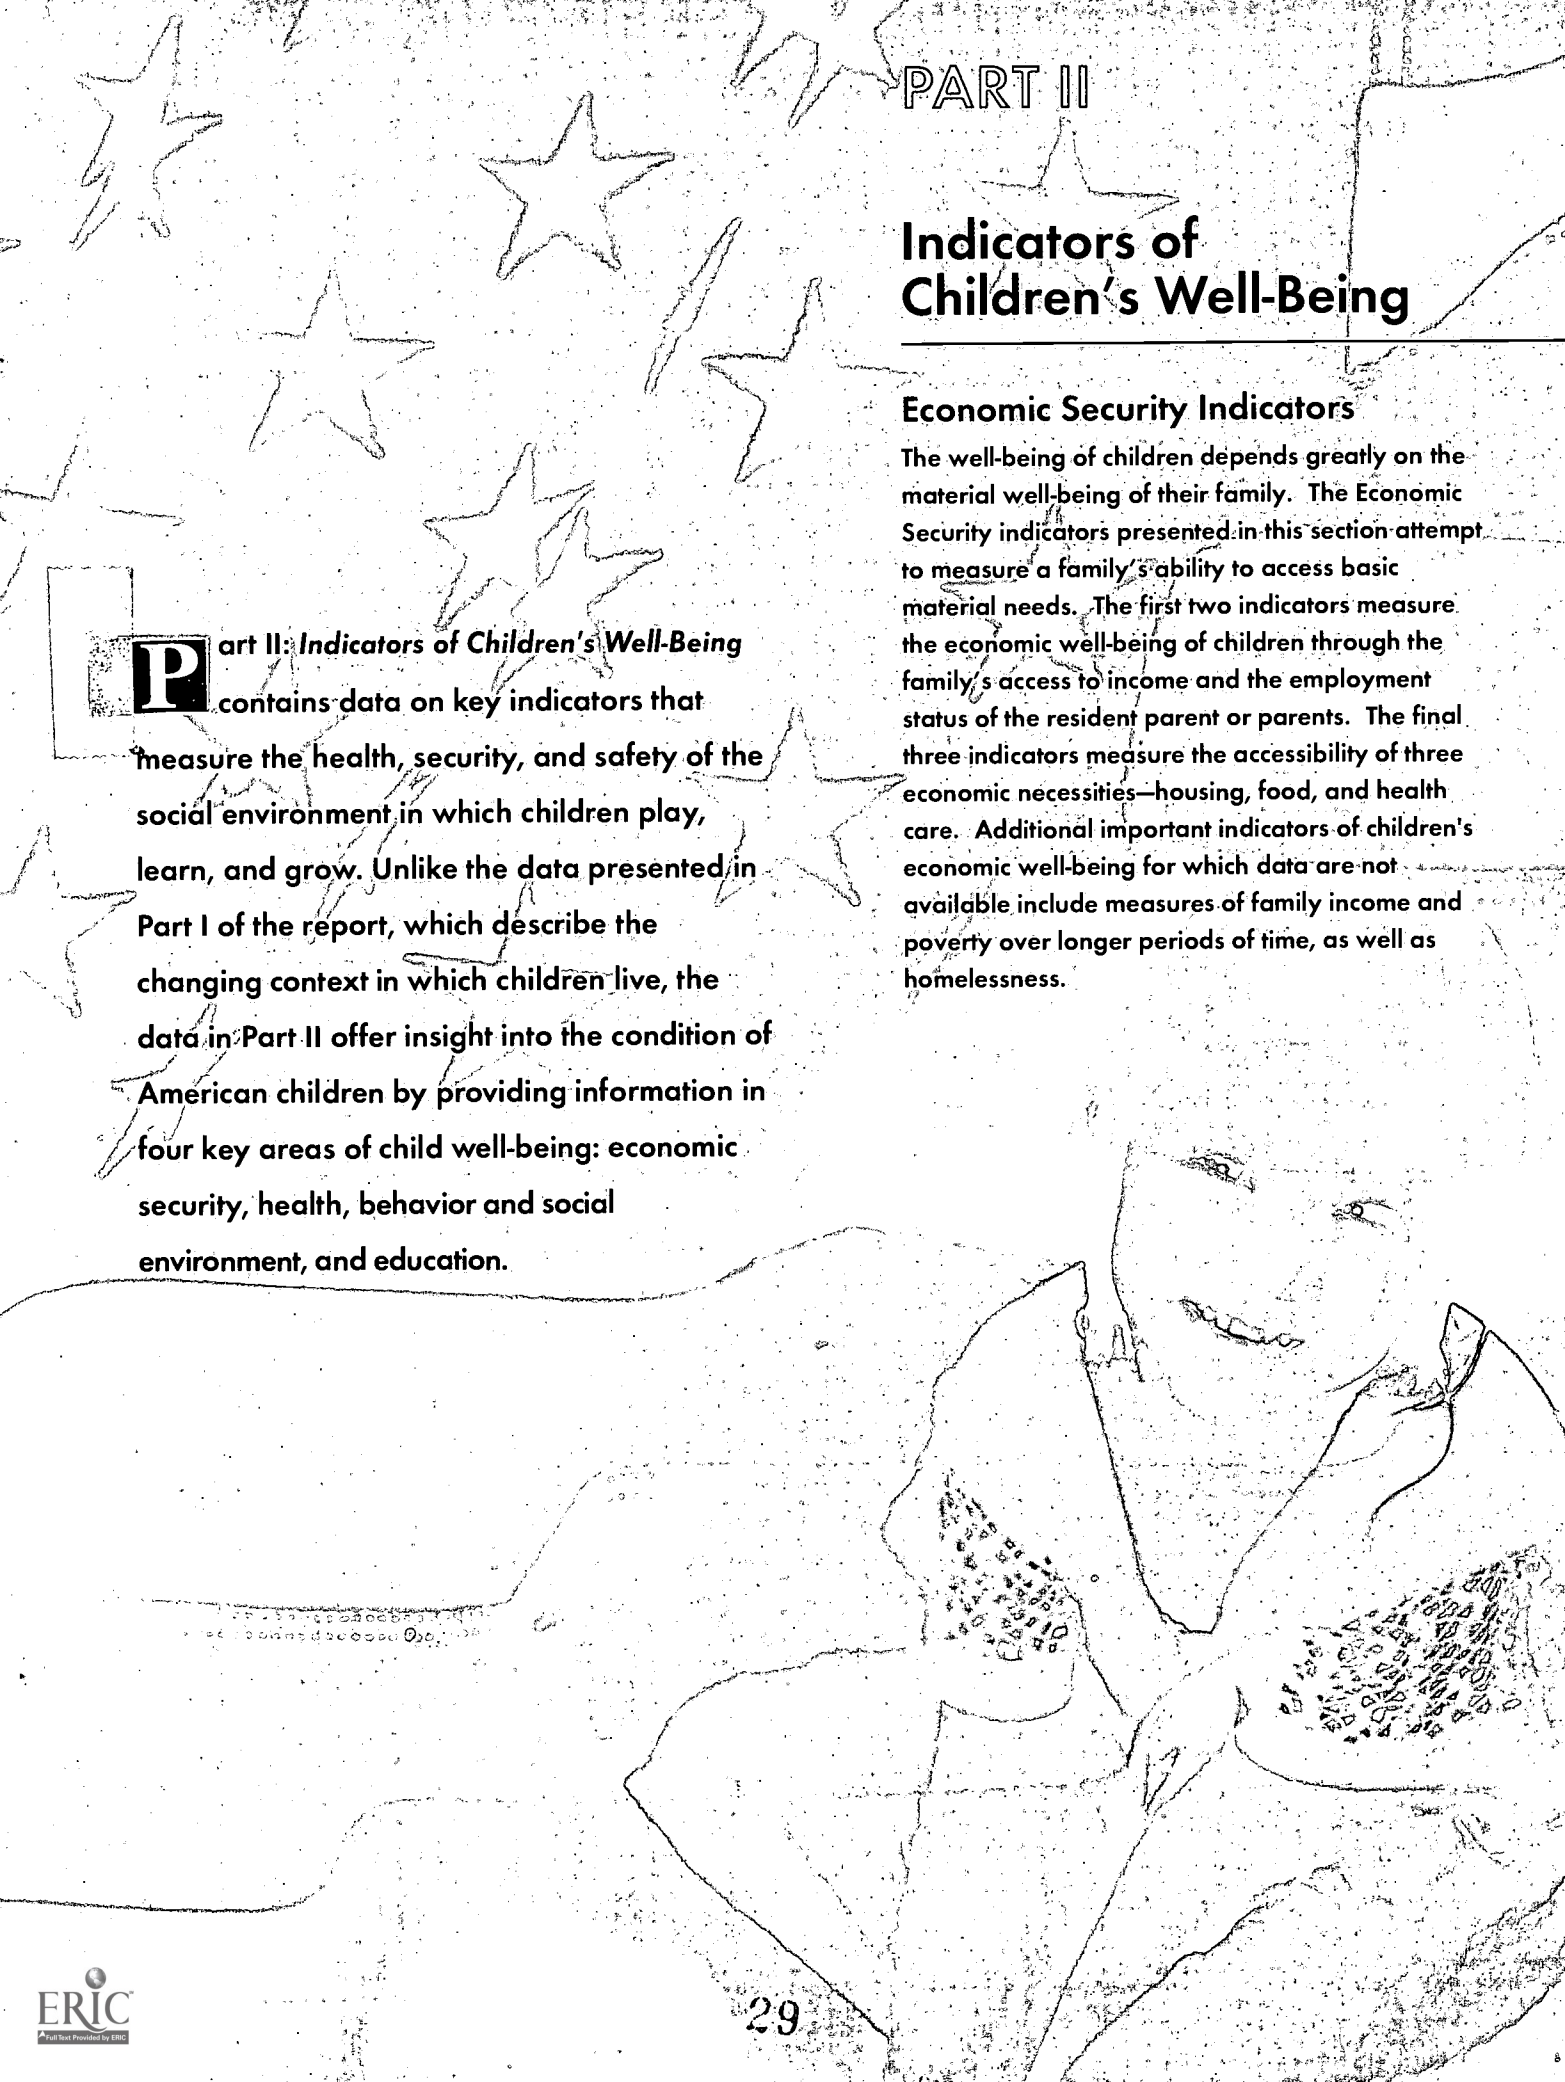
PART II

Indicators of Children's Well-Being

Part II: *Indicators of Children's Well-Being* contains data on key indicators that measure the health, security, and safety of the social environment in which children play, learn, and grow. Unlike the data presented in Part I of the report, which describe the changing context in which children live, the data in Part II offer insight into the condition of American children by providing information in four key areas of child well-being: economic security, health, behavior and social environment, and education.

Economic Security Indicators

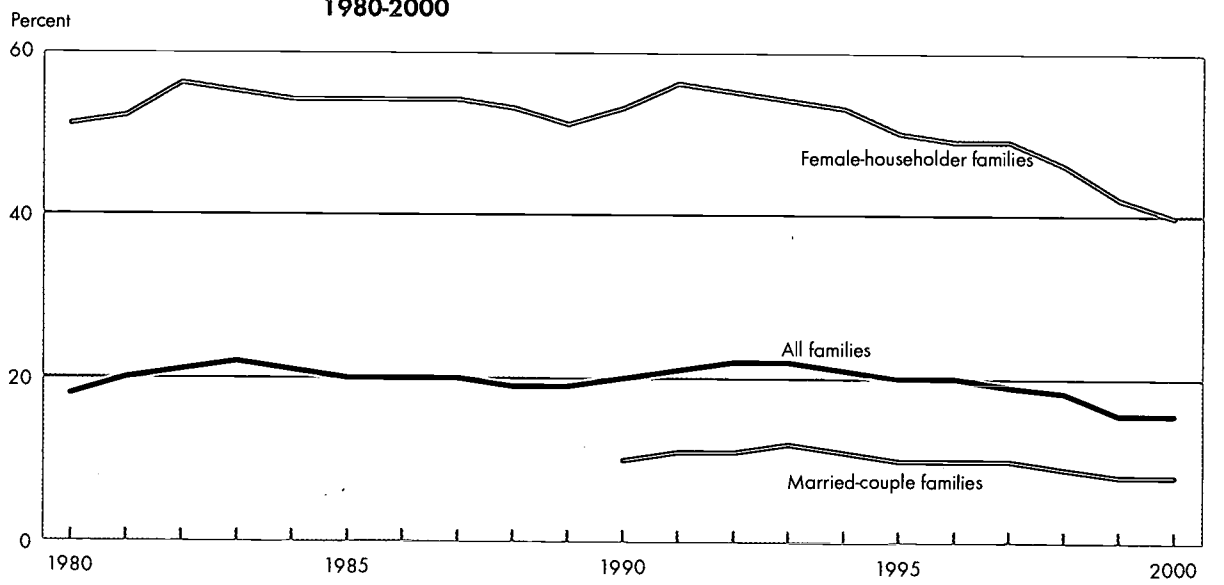
The well-being of children depends greatly on the material well-being of their family. The Economic Security indicators presented in this section attempt to measure a family's ability to access basic material needs. The first two indicators measure the economic well-being of children through the family's access to income and the employment status of the resident parent or parents. The final three indicators measure the accessibility of three economic necessities—housing, food, and health care. Additional important indicators of children's economic well-being for which data are not available include measures of family income and poverty over longer periods of time, as well as homelessness.



Child Poverty and Family Income

Childhood poverty has both immediate and lasting negative effects. Children in low-income families fare less well than children in more affluent families for many of the indicators presented in this report, including indicators in the areas of economic security, health, and education. Compared with children living in families above the poverty line, children living below the poverty line are more likely to have difficulty in school,[22] to become teen parents,[23] and, as adults, to earn less and be unemployed more frequently.[22] The child poverty rate provides important information about the percentage of U.S. children whose current circumstances make life difficult and jeopardize their future economic well-being.

Indicator ECON1.A **Percentage of related children under age 18 in poverty by family structure, 1980-2000**



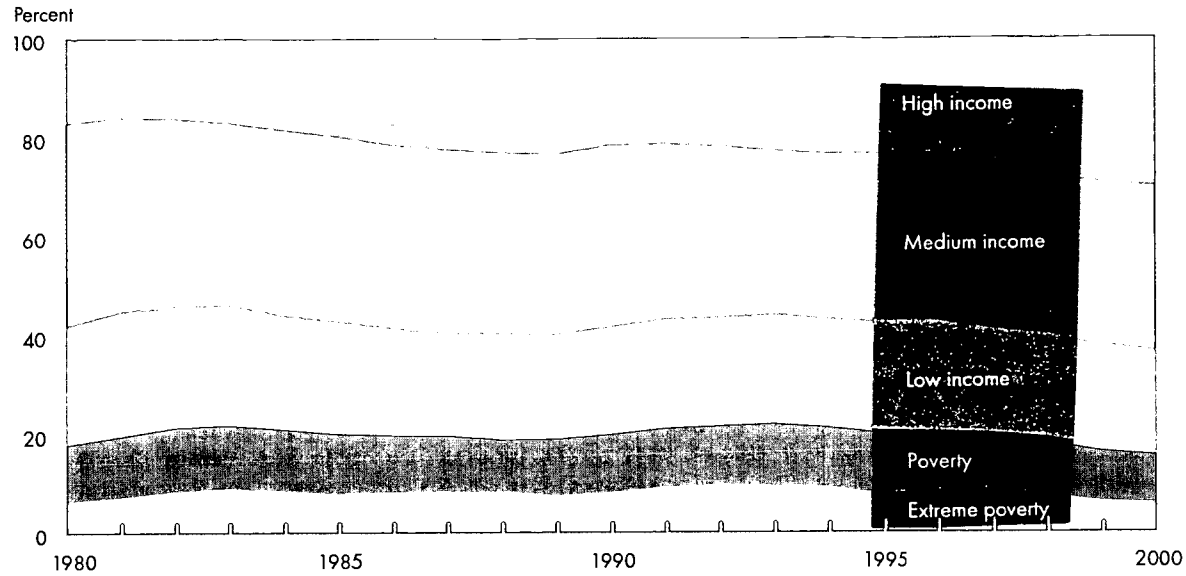
NOTE: Estimates refer to children who are related to the householder and who are under age 18. In 2000, the average poverty threshold for a family of four was $17,603 in annual income.

SOURCE: U.S. Census Bureau, March Current Population Survey.

- The proportion of children living in families with incomes below the poverty threshold was 16 percent in 2000. The official poverty rate for children has fluctuated since the early 1980s: it reached a high of 22 percent in 1993 and has since decreased to 16 percent, the lowest rate since 1979. In response to the National Academy of Science's recommendations, the Census Bureau is researching alternative poverty measures.[24]
- This decrease in the poverty rate is also apparent for children living in female-householder (no spouse present) families. In 1980, 51 percent of children living in female-householder (no spouse present) families were living in poverty; by 2000, this proportion had decreased to 40 percent. This change is even more pronounced for black children: the percentage of black children living in female-householder families in poverty wavered around 66 percent until 1993 and has since declined to 49 percent in 2000.
- Children under age 6 are more likely to be living in families with incomes below the poverty line than children ages 6 to 17. In 2000, 17 percent of children under age 6 lived in poverty, compared with 15 percent of older children.
- Children in married-couple families are much less likely to be living in poverty than children living only with their mothers. In 2000, 8 percent of children in married-couple families were living in poverty, compared with 40 percent in female-householder families.
- This contrast by family structure is especially pronounced among certain racial and ethnic groups. For example, in 2000, 8 percent of black children in married-couple families lived in poverty, compared with 49 percent of black children in female-householder families. Twenty-one percent of Hispanic children in married-couple families lived in poverty, compared with 48 percent in female-householder families.
- The poverty rate is much higher for black or Hispanic children than for white, non-Hispanic children. In 2000, 9 percent of white, non-Hispanic children lived in poverty, compared with 30 percent of black children and 27 percent of Hispanic children.
- In 2000, 6 percent of all children lived in families with incomes less than half the poverty level, or $8,802 a year on average for a family of four, while 26 percent of children lived in families with incomes less than 150 percent of the poverty level, or $26,405 a year on average for a family of four.

The full distribution of the income of children's families is important, not just the percentage of children living in poverty. The rise in the number of children living in affluent families tells us that a growing proportion of America's children live in households experiencing economic well-being. The growing gap between rich and poor children suggests that poor children may experience more relative deprivation even if the percentage of poor children is declining.

Indicator ECON1.B **Percentage of related children under age 18 by family income relative to the poverty line, 1980-2000**



NOTE: Estimates refer to children who are related to the householder and who are under age 18. The income classes are derived from the ratio of the family's income to the family's poverty threshold. Extreme poverty is less than 50 percent of the poverty threshold (i.e., $8,802 for a family of four in 2000). Poverty is between 50 and 99 percent of the poverty threshold (i.e., between $8,802 and $17,602 for a family of four in 2000). Low income is between 100 and 199 percent of the poverty threshold (i.e., between $17,603 and $35,205 for a family of four in 2000). Medium income is between 200 and 399 percent of the poverty threshold (i.e., between $35,206 and $70,411 for a family of four in 2000). High income is 400 percent of the poverty threshold or more (i.e., more than $70,412 for a family of four in 2000).[25]

SOURCE: U.S. Census Bureau, March Current Population Survey.

- In 2000, more children lived in families with medium income (34 percent) than in other income groups. Smaller percentages of children lived in families with low income and with high income (21 and 30 percent, respectively).
- The percentage of children living in families with medium income fell from 41 percent in 1980 to 34 percent in 2000, while the percentage of children living in families with high income rose from 17 to 30 percent.
- The percentage of children living in families experiencing extreme poverty was 7 percent in 1980. This percentage rose to 10 percent in 1992 and has gradually decreased to 6 percent in 2000. Concurrently, three times as many children lived in families with very high income in 2000 than in 1980 (13 and 4 percent, respectively).

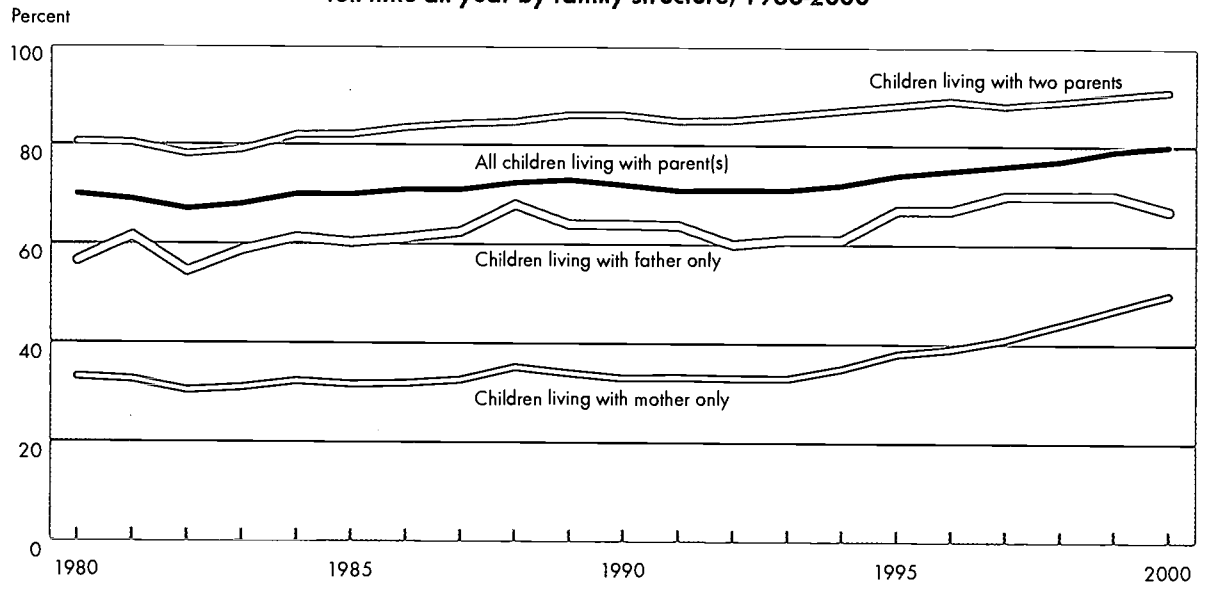
Bullets contain references to data that can be found in Tables ECON1.A and ECON1.B on pages 79-80. Endnotes begin on page 59.

Secure Parental Employment

Secure parental employment reduces the incidence of poverty and its attendant risks to children. Since most parents who obtain health insurance for themselves and their children do so through their employers, a secure job can also be a key variable in determining whether children have access to health care. Secure parental employment may also enhance children's psychological well-being and improve family functioning by reducing stress and other negative effects that unemployment and underemployment can have on parents.[26,27] One measure of secure parental employment is the percentage of children whose resident parent or parents were employed full time during a given year.

Indicator ECON2

Percentage of children under age 18 living with at least one parent employed full time all year by family structure, 1980-2000



SOURCE: U.S. Bureau of Labor Statistics, March Current Population Survey.

- Since 1990, the trend in secure parental employment has paralleled the overall trend in employment. The percentage of children who had at least one parent working full time all year continued to increase in 2000 to 80 percent from 79 percent in 1999.
- A disproportionate share of the increase in the percentage of children living with at least one parent employed full time all year was due to the increase in the percentage of children living with single mothers who are employed, which increased from 33 percent in 1993 to 50 percent in 2000.
- In 2000, 91 percent of children living in two-parent families had at least one parent who was a full-time, year-round worker. In contrast, 67 percent of children living with a single father and 50 percent of children living with a single mother had a parent who worked full time all year.
- Children living in poverty are much less likely to have a parent working full time all year than children living at or above the poverty line (35 percent and 89 percent in 2000, respectively). For children living with two parents, 59 percent of children living at or below the poverty line had at least one parent working full time all year, compared with 94 percent of children living above poverty.
- In recent years, however, children living below the poverty line have become increasingly likely to have one or two parents working full time all year. In 1993, 21 percent of children below poverty had at least one parent working full time all year. By 2000, this statistic had risen to 35 percent.
- Black, non-Hispanic children and Hispanic children were less likely than white, non-Hispanic children to have a parent working full time all year. However, the proportions of black, non-Hispanic children and Hispanic children with a parent employed full time all year have increased much faster than for white, non-Hispanic children. Between 1993 and 2000, the percentage of children who had a parent working full time all year increased from 49 percent to 69 percent for black, non-Hispanic children, and from 57 percent to 72 percent for Hispanic children. In comparison, the percentage of white, non-Hispanic children that had a parent working full time all year increased from 79 percent to 85 percent during the same period.
- During the past two decades, the percentage of children living in two-parent families in which both the mother and father worked full time all year has almost doubled, increasing from 17 to 33 percent.

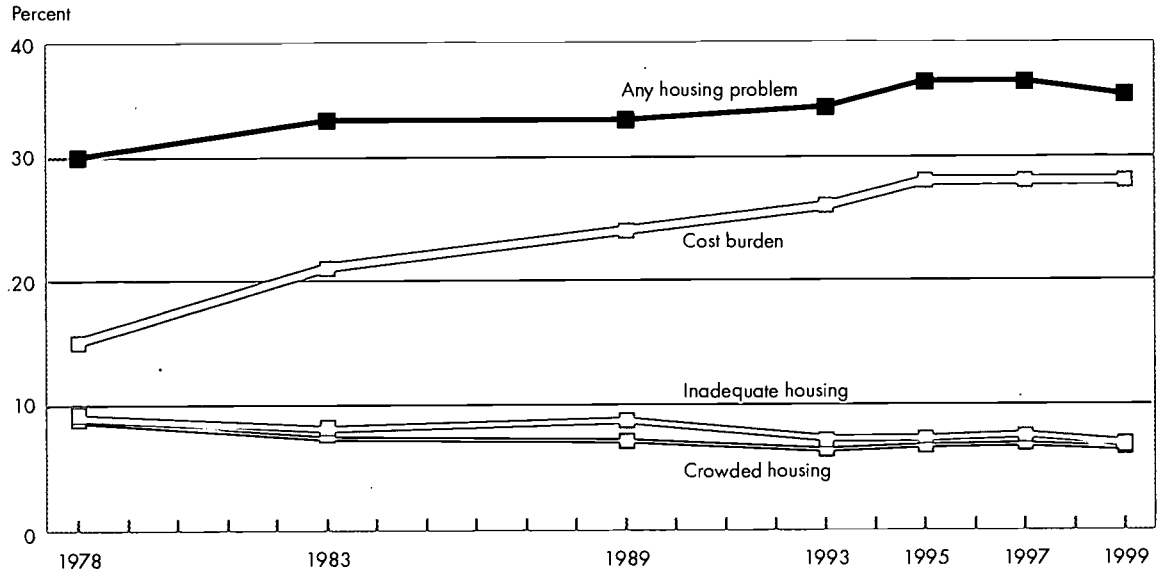
Bullets contain references to data that can be found in Table ECON2 on pages 81-82. Endnotes begin on page 59.

Housing Problems

Inadequate, crowded, or costly housing can pose serious problems to children's physical, psychological, or material well-being.[28] The percentage of households with children that report that they are living in physically inadequate,[29] crowded, and/or costly housing provides an estimate of the percentage of children whose well-being may be affected by their family's housing.

Indicator ECON3

Percentage of households with children under age 18 that report housing problems by type of problem, selected years 1978-99



NOTE: Data are available for 1978, 1983, 1989, 1993, 1995, 1997, and 1999.

SOURCE: U.S. Census Bureau and the U.S. Department of Housing and Urban Development, Annual Housing Survey and American Housing Survey. Tabulated by the U.S. Department of Housing and Urban Development.

- In 1999, 35 percent of U.S. households (both owners and renters) with children had one or more of three housing problems: physically inadequate housing, crowded housing, or housing that cost more than 30 percent of household income.[30]
- The share of U.S. households with children that have any housing problems rose between 1978 and 1995 and has since stabilized.
- Inadequate housing, defined as housing with severe or moderate physical problems, has become slightly less common. In 1999, 7 percent of households with children had inadequate housing, compared with 9 percent in 1978.
- Crowded housing, defined as housing in which there is more than one person per room, has also declined slightly among households with children, from 9 percent in 1978 to 7 percent in 1999.
- Improvements in housing conditions, however, have been accompanied by rising housing costs. Between 1978 and 1999, the percentage of households with children with a cost burden—that is, paying more than 30 percent of their income for housing—rose from 15 percent to 28 percent. The percentage with severe cost burdens, paying more than half of their income for housing, rose from 6 to 11 percent.
- Households that receive no rental assistance and have severe cost burdens or physical problems are defined as having severe housing problems.[31] In 1999, 11 percent of households with children had severe housing problems. Although the 1997 and 1999 data are not directly comparable to estimates for earlier years, severe housing problems increased from 8 percent in 1978 to 12 percent in 1995 because of a rise in the percentage of families reporting severe cost burdens.
- Severe housing problems are especially prevalent among very-low-income renters.[32] In 1999, 29 percent of very-low-income renter households with children reported severe housing problems, with severe cost burden the major problem. Although the percentage of these families having severe housing problems has fallen since 1978, the number with such problems grew from 1.4 million in 1978 to 1.8 million in 1999, again because the number of households with severe cost burdens rose.

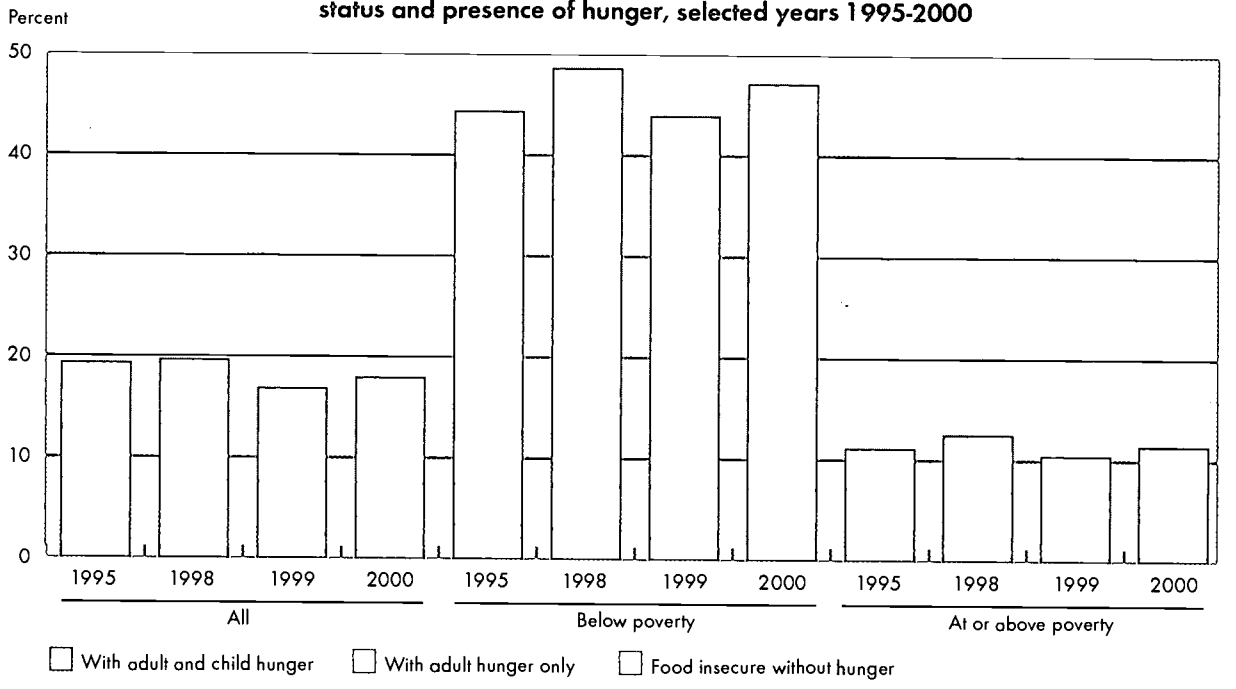
Bullets contain references to data that can be found in Table ECON3 on page 83. Endnotes begin on page 59.

Food Security and Diet Quality

Children's good health and development depend on a diet sufficient in nutrients and calories. A family's ability to provide for their children's nutritional needs is linked to the family's food security—that is, to its access at all times to enough food for an active, healthy life.[33] Food-insecure households report difficulty obtaining enough food, reduced diet quality, anxiety about their food supply, increased use of emergency food sources or other coping behaviors, and, sometimes, hunger. Previous reports of *America's Children* included the number of children in households where at least one member (either an adult or a child) experienced food insecurity or hunger. However, children—especially younger children—in such households are usually protected from substantial reductions in food intake. Thus, this report introduces an additional measure: the number of children in households where at least one child registered hunger at some time during the year because the household lacked sufficient money for food.[34]

Indicator ECON1.A

Percentage of children under age 18 in food-insecure households by poverty status and presence of hunger, selected years 1995-2000



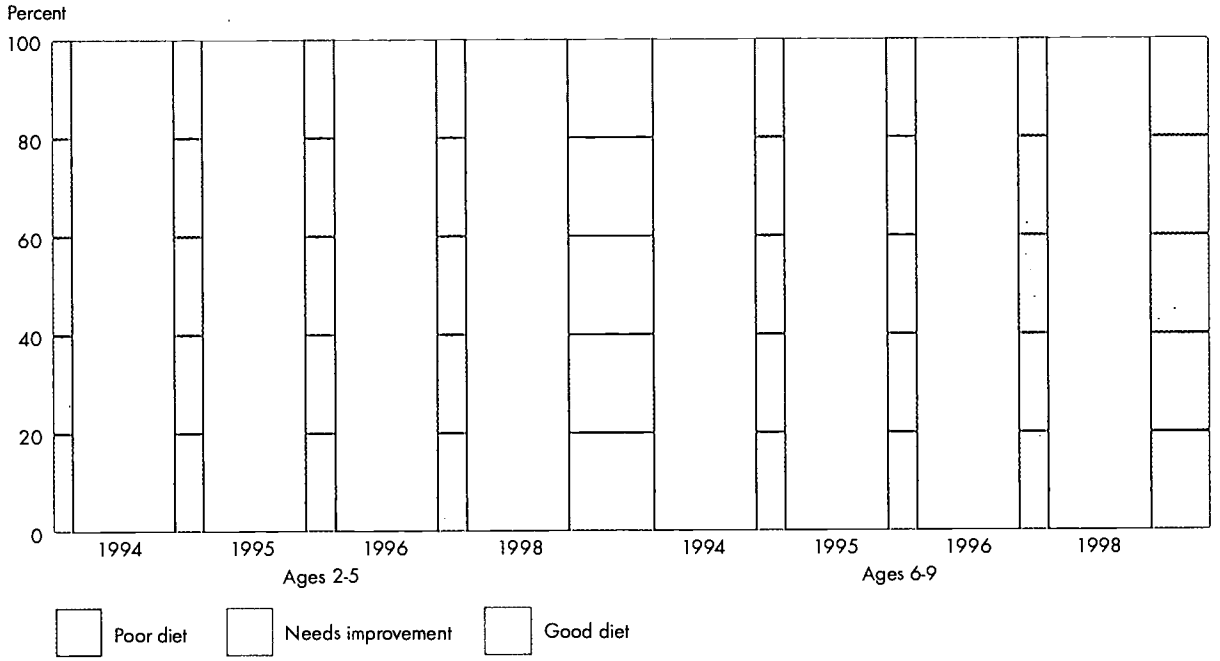
NOTE: These statistics are based on a new measure of hunger among children in U.S. households, replacing the measure previously reported in *America's Children*. Data are not shown for 1996 and 1997 because differences in screening procedures make them not comparable to the other years. Year-to-year deviations from a consistent downward trend include a substantial 2-year cycle that may result from a seasonal influence on reported prevalence rates. To avoid a potential bias related to season of survey, rates for 2000 are compared to 1998 throughout this report.

SOURCE: U.S. Census Bureau, Food Security Supplement to the Current Population Survey; U.S. Department of Agriculture, Economic Research Service and Food and Nutrition Service.

- Over half a million children (0.8 percent) lived in households with child hunger in 2000, down from 1.0 percent in 1998. In 2000, 4.1 percent of all children lived in households in which at least one person experienced food insecurity with hunger, down from 4.7 percent in 1998.
- Children living in households with incomes below poverty are much more likely than others to experience food insecurity and hunger. In 2000, about 2.2 percent of the children living in poverty were in households with hunger among children, compared with 0.5 percent of children living at or above poverty. In 2000, 11.9 percent of children living in poverty were part of households with hunger among adults or children, compared with 2.1 percent of children living at or above poverty.
- Most food-insecure households with children do not report hunger among household members. For example, although 18 percent of households were food insecure in 2000, less than 1 percent reported adult and child hunger.
- In 2000, 13.9 percent of all children and 35.3 percent of children in poverty lived in households classified as food insecure without hunger.

The diet quality of children and adolescents is of concern because poor eating patterns established in childhood usually transfer to adulthood. Such patterns are major factors in the increasing rate of child obesity over the past decades and are contributing factors to certain diseases. The Healthy Eating Index (HEI) is a summary measure of diet quality. The HEI consists of 10 components, each representing different aspects of a healthful diet. Components 1 to 5 measure the degree to which a person's diet conforms to the U.S. Department of Agriculture's Food Guide Pyramid serving recommendations for the five major food groups: grains, vegetables, fruits, milk, and meat/meat alternatives. Components 6 and 7 measure fat and saturated fat consumption. Components 8 and 9 measure cholesterol intake and sodium intake, and component 10 measures the degree of variety in a person's diet. Scores for each component are given equal weight and added to calculate an overall HEI score. This overall HEI score is then used to determine diet quality based on a scale established by nutrition experts.[35]

Indicator ECON1.B **Percentage of children ages 2 to 9 by age and diet quality as measured by the Healthy Eating Index, selected years 1994-1998**



NOTE: The maximum combined score for the 10 components is 100. An HEI score above 80 implies a good diet, an HEI score between 51 and 80 implies a diet that needs improvement, and an HEI score less than 51 implies a poor diet.

SOURCE: U.S. Department of Agriculture, Center for Nutrition Policy and Promotion, Continuing Survey of Food Intakes by Individuals.

- In 1998, most children had a diet that was poor or needed improvement, as indicated by their HEI score.
- The proportion of children ages 2 to 5 with good diets improved from 21 percent to 27 percent between 1996 and 1998, more than the reversing decline from 1995 to 1996.
- The diet quality of children ages 6 to 9 changed little between 1996 to 1998.
- As children get older, their diet quality declines. In 1998, among children ages 2 to 5, 27 percent had a good diet, 67 percent had a diet needing improvement, and 6 percent had a poor diet. For those ages 6 to 9, 13 percent had a good diet, 79 percent had a diet needing improvement, and 8 percent had a poor diet.
- The lower-quality diets of older children are linked to declines in their fruit and sodium consumption scores.
- Children in families below poverty are less likely than higher-income children to have a diet rated as good. In 1998, for children ages 2 to 5, 22 percent of those in poverty had a good diet, compared with 29 percent of those living above the poverty line.

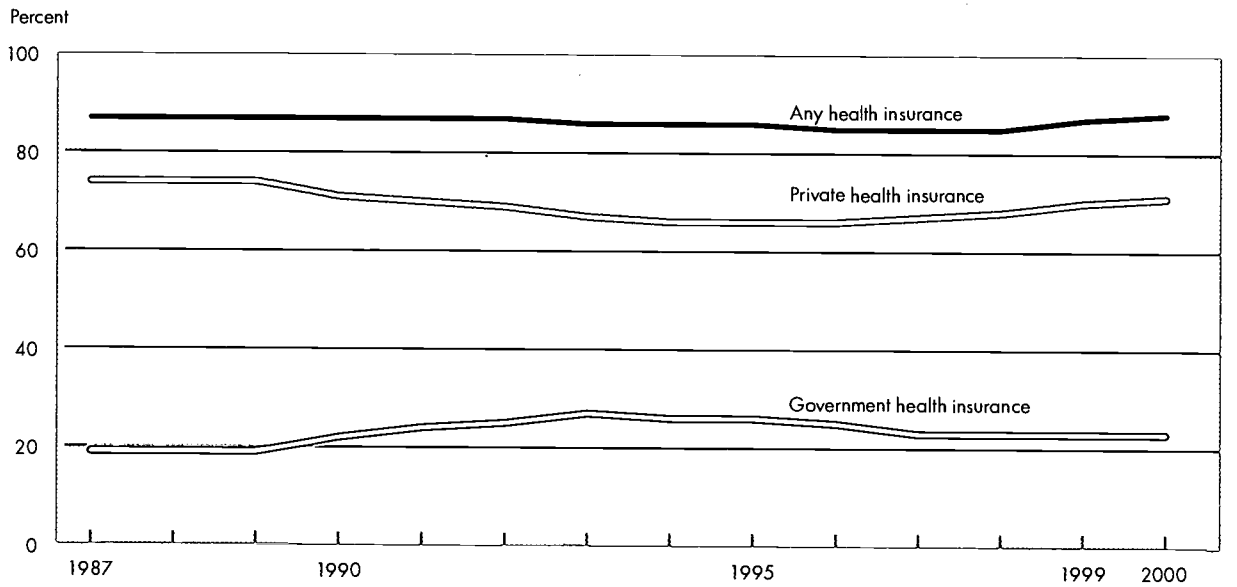
Bullets contain references to data that can be found in Tables ECON4.A - ECON4.D on pages 84-86. Endnotes begin on page 59.

Access to Health Care

Children with access to health care have reasonable assurance of obtaining the medical attention needed to maintain their physical well-being. Access involves both the availability of a regular source of care and the ability of the child's family, or someone else, to pay for it. Children with health insurance (government or private) are much more likely than children without insurance to have a regular and accessible source of health care. The percentage of children who have health insurance coverage for at least part of the year is one measure of the extent to which families can obtain preventive care or health care for a sick or injured child.

Indicator ECON1.A

Percentage of children under age 18 covered by health insurance by type of health insurance, 1987-2000



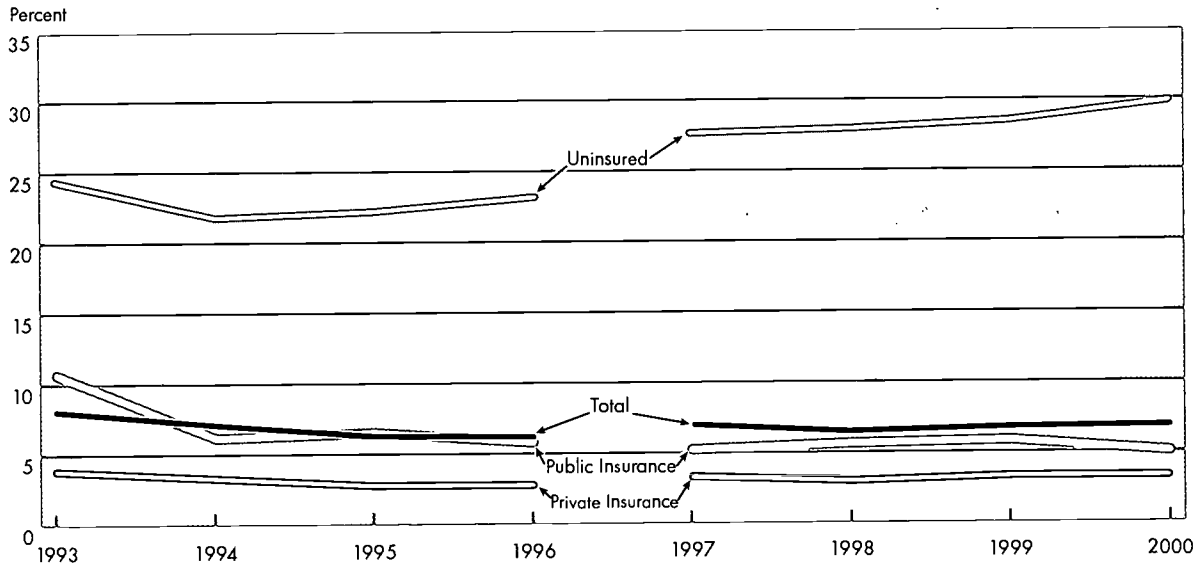
NOTE: Government health insurance for children consists primarily of Medicaid, but also includes Medicare, SCHIP (the State Children's Health Insurance Programs), and CHAMPUS/Tricare, the health benefit program for members of the armed forces and their dependents. Estimates beginning in 1999 include follow-up questions to verify health insurance status. Estimates for 1999 and 2000 are not directly comparable with earlier years, before the verification questions were added.

SOURCE: U.S. Census Bureau, March Current Population Survey.

- In 2000, 88 percent of children had health insurance coverage at some point during the year. Between 85 and 88 percent of children have had health insurance in each year since 1987.
- The number of children who had no health insurance at any time during 2000 was 8.4 million (12 percent of all children). This was significantly lower than the 1999 number and percent of 9.1 million and 13 percent.
- The proportion of children covered by private health insurance decreased from 74 percent in 1987 to 66 percent in 1994 and then increased to 71 percent in 2000. During the same time period, the proportion of children covered by government health insurance grew from 19 percent in 1987 to a high of 27 percent in 1993; it has since decreased to 23 percent in 1997 and has been fairly stable.[36]
- Hispanic children are less likely to have health insurance than either white, non-Hispanic or black children. In 2000, 75 percent of Hispanic children were covered by health insurance, compared with 93 percent of white, non-Hispanic children and 87 percent of black children.
- Overall rates of coverage do not differ by child's age. However, the type of insurance does vary by the age of the child: government-provided insurance decreases but private health insurance increases with age.

The health of children depends at least partially on their access to health services. Health care for children includes physical examinations, preventive care, health education, observations, screening, immunizations, and sick care.[37] Having a usual source of care—a particular person or place a child goes for sick and preventive care—facilitates the timely and appropriate use of pediatric services.[38,39] Emergency rooms are excluded here as a usual source of care because their focus on emergency care generally excludes the other elements of health care.[40]

Indicator ECON1.B **Percentage of children under age 18 with no usual source of health care by type of health insurance, 1993-2000**



NOTE: Emergency rooms are excluded as a usual source of care. A break is shown in the lines because in 1997, the National Health Interview Survey was redesigned. Data for 1997-2000 are not strictly comparable with earlier data.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Health Interview Survey.

- In 2000, 7 percent of children had no usual source of health care. Between 1993 and 2000, this overall percentage remained relatively stable.
- There are differences by health insurance coverage in the percentage of children having no usual source of care. In 2000, children with public insurance, such as Medicaid, were more likely to have no usual source of care than were children with private insurance (5 percent and 3 percent, respectively).
- Uninsured children are much more likely to have no usual source of care than are children who have health insurance. Children who were uninsured were nearly nine times as likely as those with private insurance to have no usual source of care in 2000.
- In 2000, 12 percent of children in families below the poverty line had no usual source of care, compared with 6 percent of children in higher-income families.
- Older children are slightly more likely than younger children to lack a usual source of health care. In 2000, 8 percent of children ages 5 to 17 had no usual source of care, compared with 5 percent of children ages 0 to 4.

Bullets contain references to data that can be found in Tables ECON5.A and ECON5.B on pages 87-88. Endnotes begin on page 59.

Economic Security

Economic security is multifaceted, and several measures are needed to adequately represent its various aspects. While this year's report provides some information on economic and food security, additional indicators are needed on:

- ☐ *Economic security.* Changes in children's economic well-being over time need to be anchored in an average standard of living context. Multiple measures of family income or consumption, some of which might incorporate estimates of various family assets, could produce more reliable estimates of changes in children's economic well-being over time.
- ☐ *Long-term poverty among families with children.* Although good Federal data are available on child poverty and alternative measures are being developed (see Indicator ECON1, Child Poverty and Family Income, and the discussion of alternative poverty rates on page 80), the surveys that collect these data do not capture information on long-term poverty. Long-term poverty among children can be estimated from existing longitudinal surveys, but changes to current surveys would be needed to provide estimates on a regular basis. Since long-term poverty can have serious negative consequences for children's well-being, regularly collected and reported data are needed to produce regular estimates.
- ☐ *Homelessness.* At present, there are no regularly collected data on the number of homeless children in the United States, although there have been occasional studies aimed at estimating this number.

Indicators of Children's Well-Being

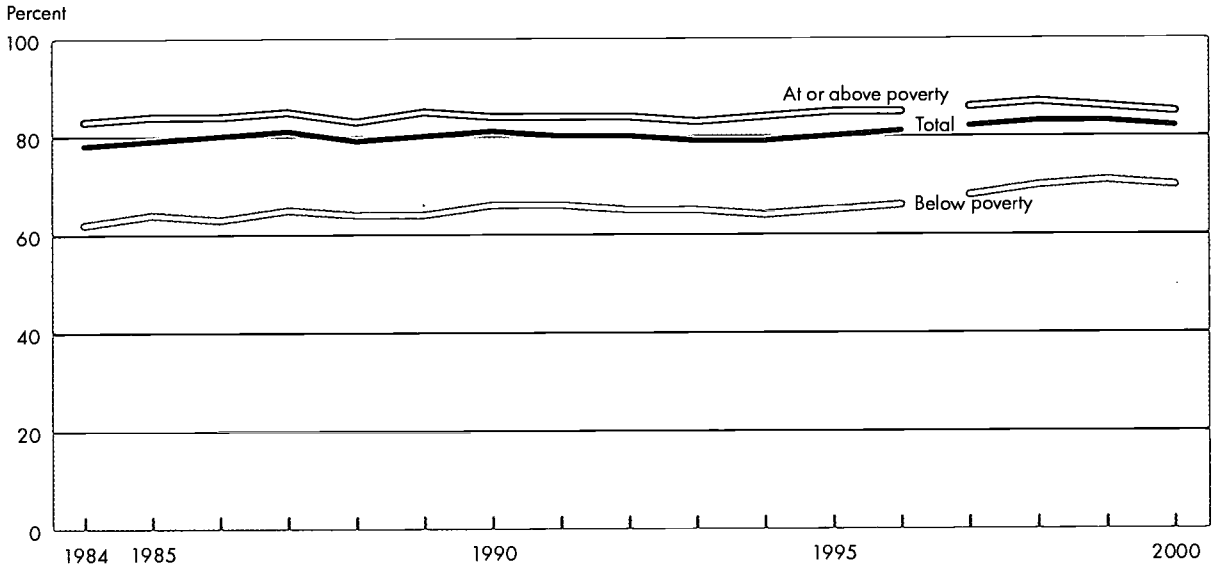
Health Indicators

The World Health Organization defines health as "a state of complete physical, mental, and social well-being, and not merely the absence of disease or infirmity." This section presents information on several important measures of child health. Data depicted include indicators of general health and chronic disease, a measure of birth outcomes (low birthweight), mortality rates, immunization rates, and rates of births to adolescents. Important measures for which data are not available include child abuse and neglect, mental health, and disability.

General Health Status

The health of children and youth is basic to their well-being and optimal development. Parental reports of their children's health provide one indication of the overall health status of the Nation's children. This indicator measures the percentage of children whose parents report them to be in very good or excellent health.

Indicator HEALTH1 **Percentage of children under age 18 in very good or excellent health by poverty status, 1984-2000**



NOTE: In 1997, the National Health Interview Survey was redesigned. Data for 1997-2000 are not strictly comparable with earlier data.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Health Interview Survey.

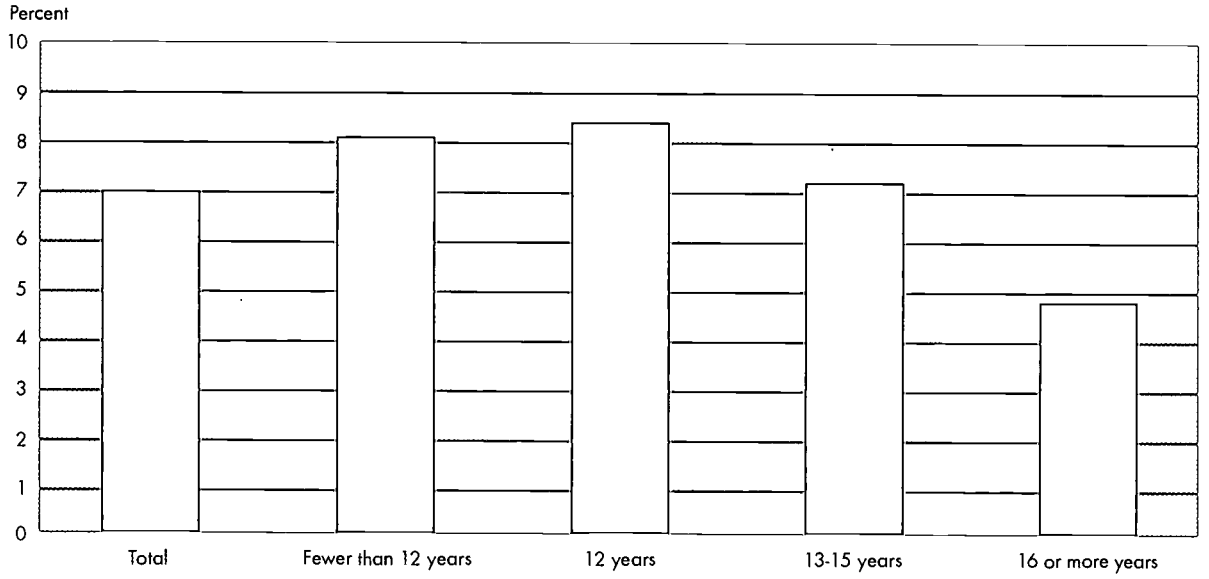
- In 2000, about 82 percent of children were reported by their parents to be in very good or excellent health.
- Children under age 5 are slightly more likely to be in very good or excellent health than are children ages 5 to 17 (85 and 81 percent, respectively).
- White, non-Hispanic children were more likely than black, non-Hispanic and Hispanic children to be in very good or excellent health. In 2000, 86 percent of white, non-Hispanic children were reported to be in very good or excellent health, compared with 74 percent of black, non-Hispanic children and 75 percent of Hispanic children.
- Child health varies by family income. Children living below the poverty line are less likely than children in higher-income families to be in very good or excellent health. In 2000, about 70 percent of children in families below the poverty line were in very good or excellent health, compared with 85 percent of children in families living at or above the poverty line.
- Each year, children at or above the poverty line were substantially more likely to be in very good or excellent health than were children whose families were below the poverty line. However, the health gap between children below and those at or above the poverty line decreased slightly between 1984 and 2000.

Bullets contain references to data that can be found in Table HEALTH1 on page 89. See indicator ECON1.A and ECON1.B on pages 16-17 for a description of child poverty.

Activity Limitation

Having chronic conditions can limit a child's ability to participate in activities such as going to school, playing, and any other activities of children. Children whose activities are limited by one or more chronic health conditions may need more specialized health care than children without such limitations. Their medical costs are generally higher; they are more likely to miss days from school; and they may require special education services.[41,42] Chronic conditions (such as asthma, hearing impairment, or diabetes) included in this measure usually have a duration of more than 3 months.

Indicator HEALTH2 **Percentage of children ages 5 to 17 with any limitation in activity resulting from chronic conditions by parental education level, 2000**



NOTE: Education categories are for the level of the most-educated parent in the household.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Health Interview Survey.

- In 2000, 7 percent of children ages 5 to 17 were limited in their activities because of one or more chronic health conditions, compared with 3 percent of children younger than 5. Children and youth ages 5 to 17 have much higher rates of activity limitation than younger children, partly because some chronic conditions are not diagnosed until children enter school and because the number of activities that children participate in increases with age.
- Children and youth in families of lower socioeconomic status (as measured by parental education and family income) have significantly higher rates of activity limitation than children in higher-status families. Among children and youth ages 5 to 17, 8 percent of children whose parents had less than a high school education had activity limitations due to chronic conditions in 2000, compared with 5 percent of children living with at least one parent who finished college.
- The difference in activity limitation by socioeconomic status is also present among preschool-age children. Children under age 5 in families below poverty had a higher rate of activity limitation than children in families at or above poverty.
- Males ages 5 to 17 were more likely than females in the same age group to have activity limitations (9 percent of boys compared with 5 percent of girls in 2000).

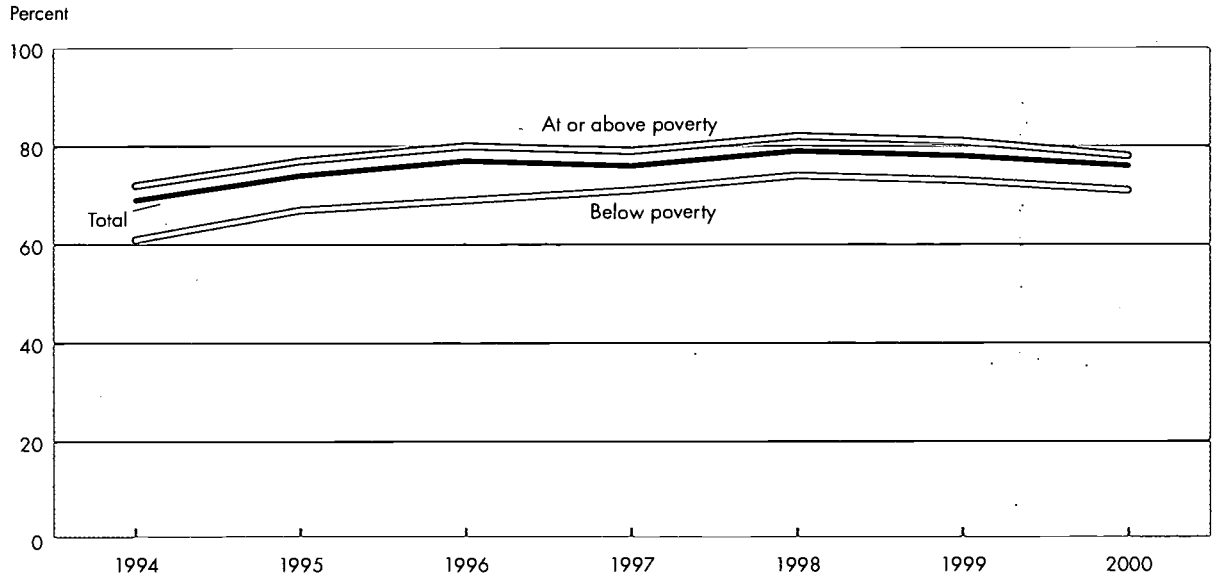
Bullets contain references to data that can be found in Table HEALTH2 on page 90. Endnotes begin on page 59.

Childhood Immunization

Adequate immunization protects children against several diseases that killed or disabled children in past decades. Rates of childhood immunization are one measure of the extent to which children are protected from serious vaccine-preventable illnesses. The combined immunization series (often referred to as the 4:3:1:3 combined series) rate measures the extent to which children have received the recommended doses of four key vaccinations.

Indicator HEALTH3

Percentage of children ages19 to 35 months with the 4:3:1:3 combined series of vaccinations by poverty status, 1994-2000



NOTE: Vaccinations included in the combined series are 4 doses of a vaccine containing diphtheria and tetanus toxoids (either diphtheria, tetanus toxoids, and pertussis vaccine [DTP] or diphtheria and tetanus toxoids vaccine [DT]), 3 doses of polio vaccine, 1 dose of a measles-containing vaccine (MCV), and 3 doses of *Haemophilus influenzae* type b (Hib) vaccine. The recommended immunization schedule for children is available at http://www.cdc.gov/nip/recs/child-schedule.pdf.

SOURCE: Centers for Disease Control and Prevention, National Immunization Program and National Center for Health Statistics, National Immunization Survey.

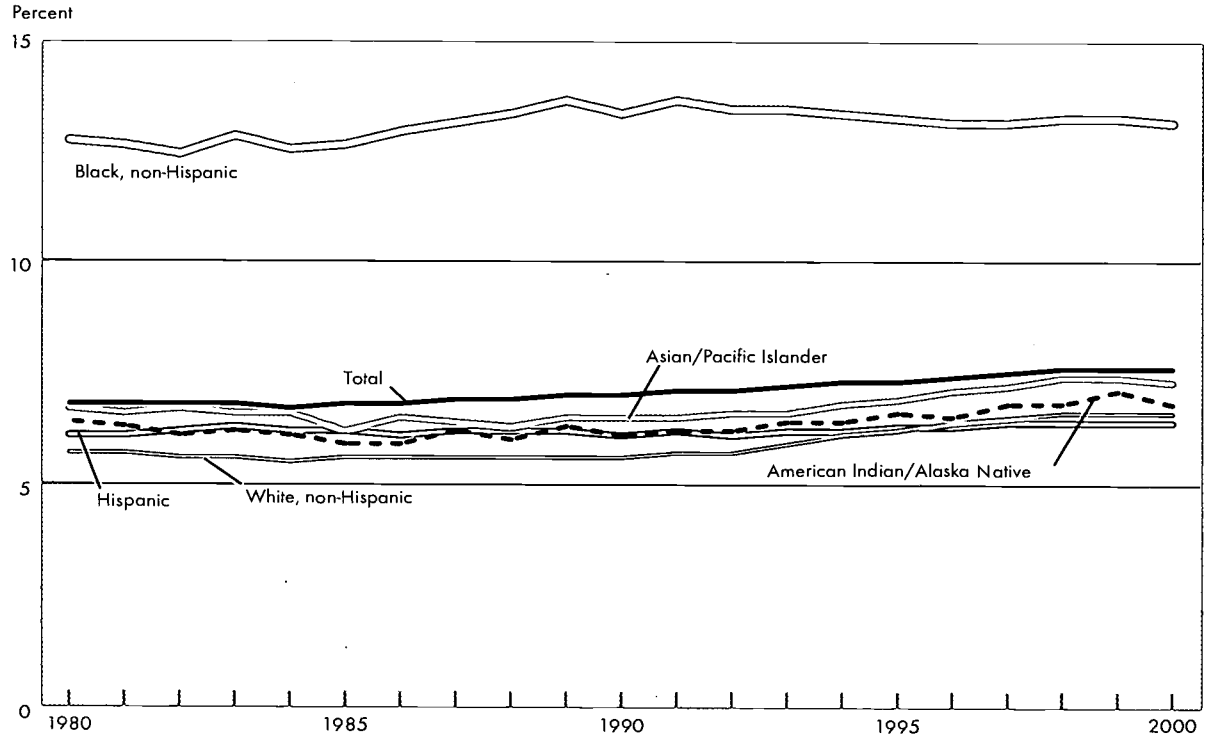
- In 2000, 76 percent of children ages 19 to 35 months had received the recommended combined series of vaccines (often referred to as the 4:3:1:3 combined series).
- Children with family incomes below the poverty level had lower rates of coverage with the combined series than children with family incomes at or above the poverty line—71 percent of children below poverty compared with 78 percent of higher-income children.
- Rates of coverage with the full series of vaccines (4:3:1:3)were higher among white, non-Hispanic children than among black, non-Hispanic or Hispanic children. Seventy-nine percent of white, non-Hispanic children ages 19 to 35 months received these immunizations compared with 71 percent of black, non-Hispanic children and 73 percent of Hispanic children.
- Overall and for children living above and below the poverty level, coverage with the combined series remained relatively stable between 1999 and 2000, as did the gap in coverage between children in families living above and below the poverty level.
- Coverage with three or more doses of Hib vaccine among children ages 19 to 35 months remained relatively stable at 93 percent.
- In addition to the combined series of vaccines, there are other important immunizations such as those for Hib and varicella (chicken pox). Coverage with three or more doses of hepatitis B vaccine among children ages 19 to 35 months increased from 88 percent in 1999 to 90 percent in 2000.
- Coverage with varicella (chicken pox) vaccine among children ages 19 to 35 months continued to increase from 58 percent in 1999 to 68 percent in 2000. Gains in coverage for varicella vaccine were seen among all children regardless of race or ethnicity and poverty level; however, children living at or above the poverty line had higher coverage levels.

Bullets contain references to data that can be found in Table HEALTH3 on page 91.

Low Birthweight

Low-birthweight infants (infants born weighing less than 2,500 grams, or about 5.5 pounds) are at higher risk of death or long-term illness and disability than are infants of normal birthweight.[43,44] Low birthweight results from an infant's being born preterm (before 37 weeks' gestation) or from being small for his or her gestational age.

Indicator HEALTH4: Percentage of infants born of low birthweight by mother's race and Hispanic origin, 1980-2000



SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System.

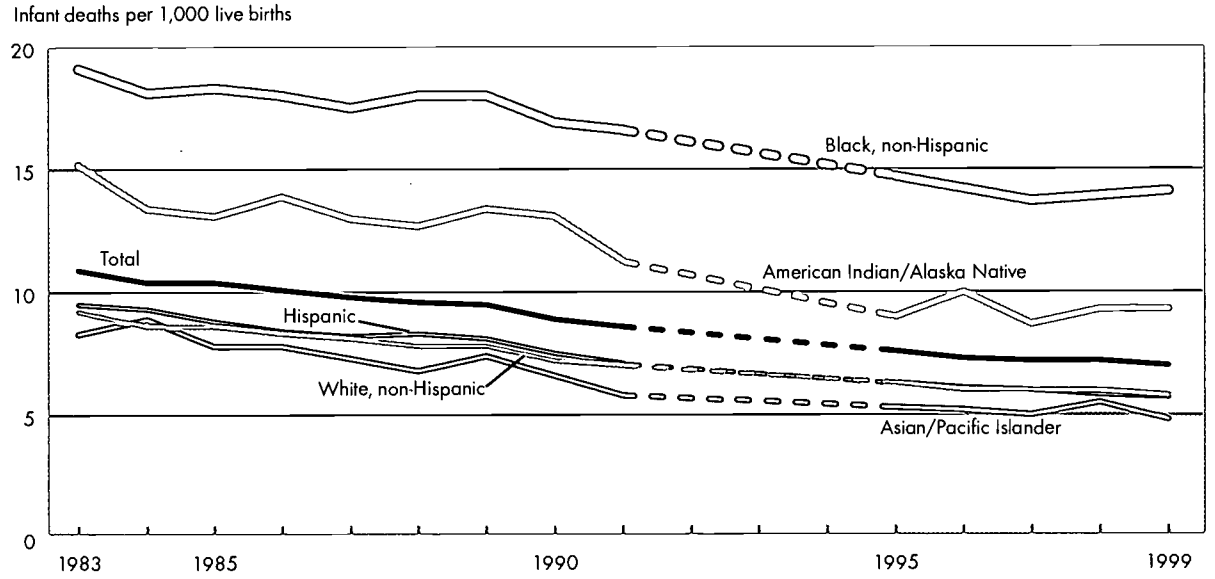
- The percentage of infants born of low birthweight was 7.6 from 1998-2000, up slightly from 7.5 percent in 1997. The low-birthweight rate has increased slowly but steadily since 1984. The rate from 1998-2000 was the highest since 1973.[5,13]
- The low-birthweight rate for black, non-Hispanic infants declined during the 1990s, to 13.1 percent in 1996-97, before rising slightly to 13.2 percent in 1998-99 and returning to 13.1 percent in 2000. The rate was still higher than levels reported for the early to mid-1980s. The low-birthweight rate rose for white, non-Hispanic infants, from 5.6 percent in 1990 to 6.6 percent in 1998-2000. Low birthweight among Hispanic infants remained at 6.4 percent from 1997 through 2000. The rate of low birthweight for American Indian/Alaska Native infants fell back to 6.8 percent in 2000, the same rate as in 1997-98, and the overall rate for Asian/Pacific Islander infants declined slightly to 7.3 percent in 2000, compared with 7.4 percent in 1998 and 1999.
- The percentage of low-birthweight births varies widely within Hispanic and Asian/Pacific Islander subgroups. Data for 2000 indicate that among Hispanics, women of Mexican origin had the lowest percentage of low-birthweight infants (6.0 percent) and Puerto Ricans the highest (9.3 percent). Among Asian/Pacific Islander subgroups, low birthweight was lowest for births to women of Chinese origin (5.1 percent) and highest for women of Filipino origin (8.5 percent).
- About 1.4 percent of infants were born with very low birthweight (less than 1,500 grams) in each year from 1996-2000, up from 1.3 percent in each year from 1989-95 and 1.2 percent in each year from 1981-88.
- One reason for the increase in low birthweight over the past several years is that the number of twin, triplet, and higher-order multiple births has increased.[5,13,44,45] Twins and other multiples are much more likely than singleton infants to be of low birthweight; 55 percent of twins and 93 percent of triplets, compared with 6 percent of singletons, were of low birthweight in 2000. However, even among singletons, there has been an increase in low birthweight.[5,13]

Bullets contain references to data that can be found in Table HEALTH4 on page 92. Endnotes begin on page 59.

Infant Mortality

Infant mortality is defined as the death of an infant before his or her first birthday. The infant mortality rate is an important measure of the well-being of infants, children, and pregnant women because it is associated with a variety of factors, such as maternal health, quality of access to medical care, socioeconomic conditions, and public health practices.[46] In the United States, about two-thirds of infant deaths occur in the first month after birth and are due mostly to health problems of the infant or the pregnancy, such as preterm delivery or birth defects. About one-third of infant deaths occur after the first month and may be influenced by social or environmental factors, such as exposure to cigarette smoke or access to health care.[47]

Indicator HEALTH5 **Infant mortality rates by race and Hispanic origin, selected years 1983-99**



NOTE: Data are available for 1983-91 and 1995-99.[48] Infant deaths are deaths before the child's first birthday.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Linked File of Live Births and Infant Deaths.

- The 1999 infant mortality rate for the United States was 7.0 deaths per 1,000 live births, a slight drop from the 1998 rate of 7.2.
- While infant mortality rates decreased for white, non-Hispanic, Hispanic, and Asian/Pacific Islander infants in 1999, the rate remained the same for American Indian/Alaska Native infants, and increased for black, non-Hispanic infants.
- Infant mortality has dropped for all racial and ethnic groups since 1983, but substantial racial and ethnic disparities remain. Black, non-Hispanic infants have consistently had a higher infant mortality rate than that of other race or ethnic groups. In 1999, the black, non-Hispanic infant mortality rate was 14.1 infant deaths per 1,000 live births and the American Indian/Alaska Native rate was 9.3, both significantly higher than the white, non-Hispanic rate of 5.8, the rate of 5.7 among Hispanic infants, or the rate of 4.8 among Asian/Pacific Islander infants.
- Infant mortality rates also vary within race and ethnic populations. For example, among Hispanics in the United States, the infant mortality rate ranged from 4.7 for infants of Cuban and Central/South American origins to a high of 8.3 for Puerto Ricans. Among Asians/Pacific Islanders, infant mortality rates ranged from 2.9 for infants of Chinese origin to 7.1 for Native Hawaiians.

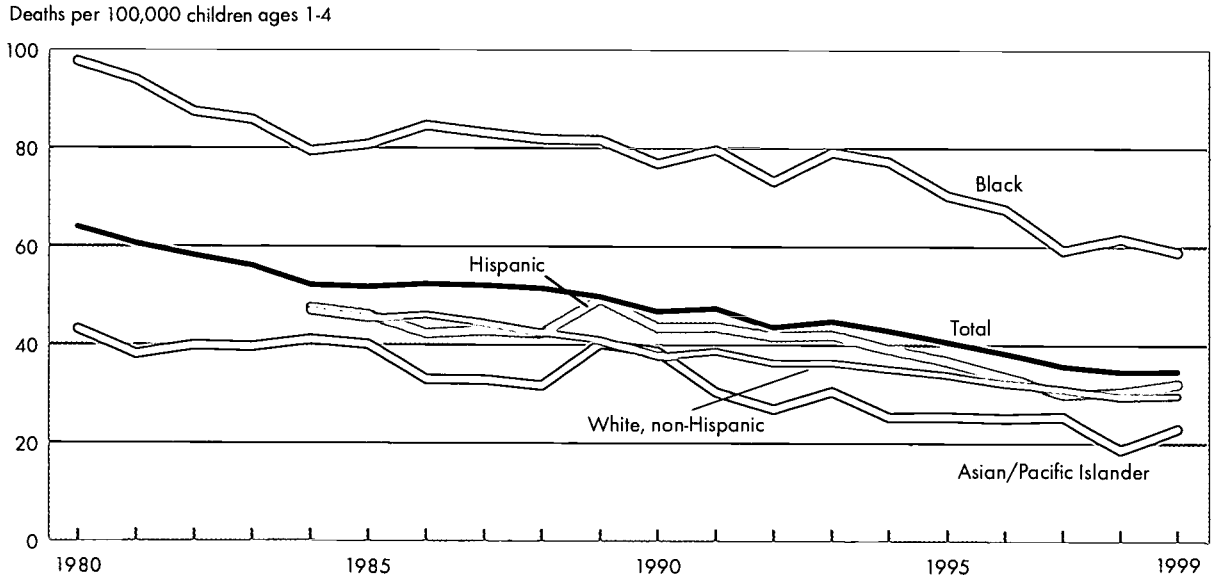
Bullets contain references to data that can be found in Table HEALTH5 on page 93. Endnotes begin on page 59.

Child Mortality

Child death rates are the most severe measure of ill health in children. These rates have generally declined over the past two decades. Deaths to children ages 1 to 4 are calculated separately from those for children ages 5 to 14 because causes and death rates vary substantially by age.

Indicator HEALTH6.A

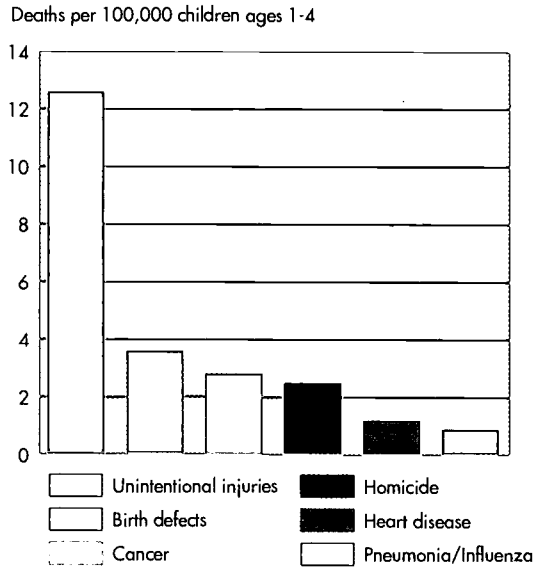
Death rates among children ages 1 to 4 by race and Hispanic origin, 1980-99



NOTE: Death rates for American Indians/Alaska Natives are included in the total but are not shown separately because the numbers of deaths were too small to calculate reliable rates.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System.

Death rates among children ages 1 to 4 by cause of death, 1999

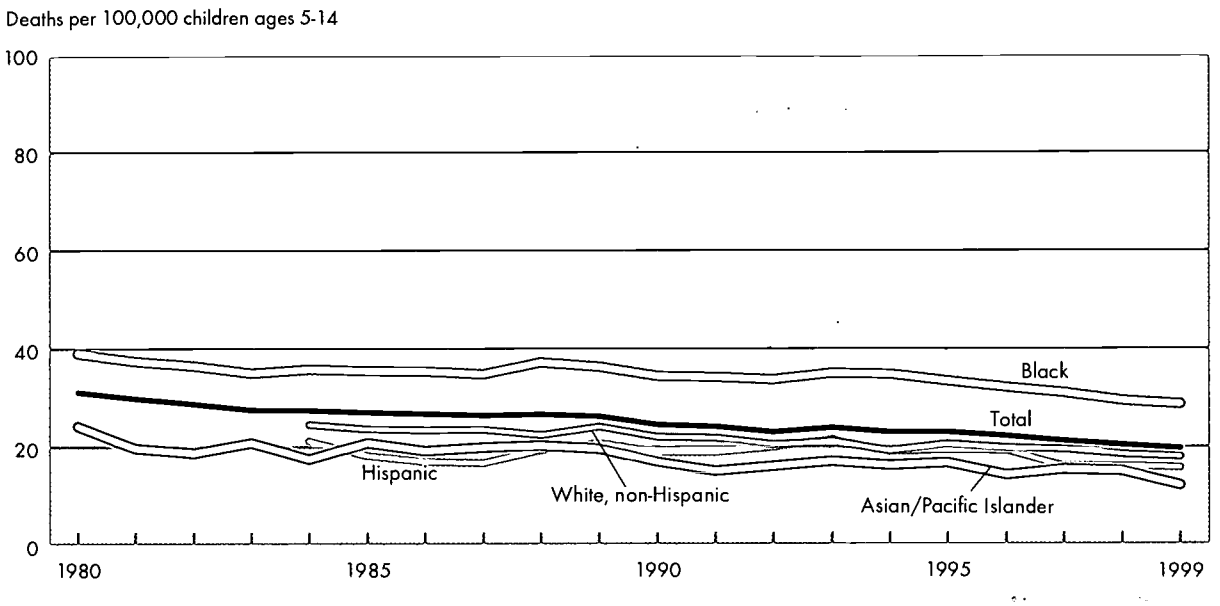


- In 1999, the death rate for children ages 1 to 4 was 35 per 100,000 children.
- Between 1980 and 1999, the death rate declined by almost half for children ages 1 to 4.
- Among children ages 1 to 4, black children had the highest death rate in 1999, at 59 per 100,000 children. Asian/Pacific Islander children had the lowest death rate, at 23 per 100,000.
- Among children ages 1 to 4, unintentional injuries were the leading cause of death at 13 per 100,000, followed by birth defects at 4 per 100,000 and cancer at 3 per 100,000 children.
- Most unintentional injury deaths among children result from motor vehicle traffic crashes. Use of child restraint systems, including safety seats, booster seats, and seat belts, can greatly reduce the number and severity of injuries to child occupants of motor vehicles. In 1999, 47 percent of child occupants ages 1 to 4 who died in crashes were unrestrained.[49]

Death rates for children ages 5 to 14 are lower than those for children under age 5. The leading cause of death for children at this age remains unintentional injuries, but some other causes of death, such as birth defects, are less common among children ages 1 to 4.

Indicator HEALTH6.B

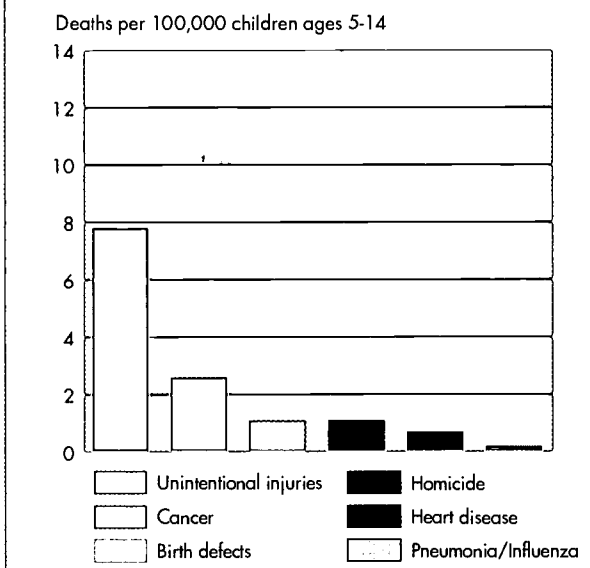
Death rates among children ages 5 to 14 by race and Hispanic origin, 1980-99



NOTE: Death rates for American Indians/Alaska Natives are included in the total but not shown separately because the numbers of deaths were too small to calculate reliable rates.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System.

Death rates among children ages 5 to 14 by cause of death, 1999



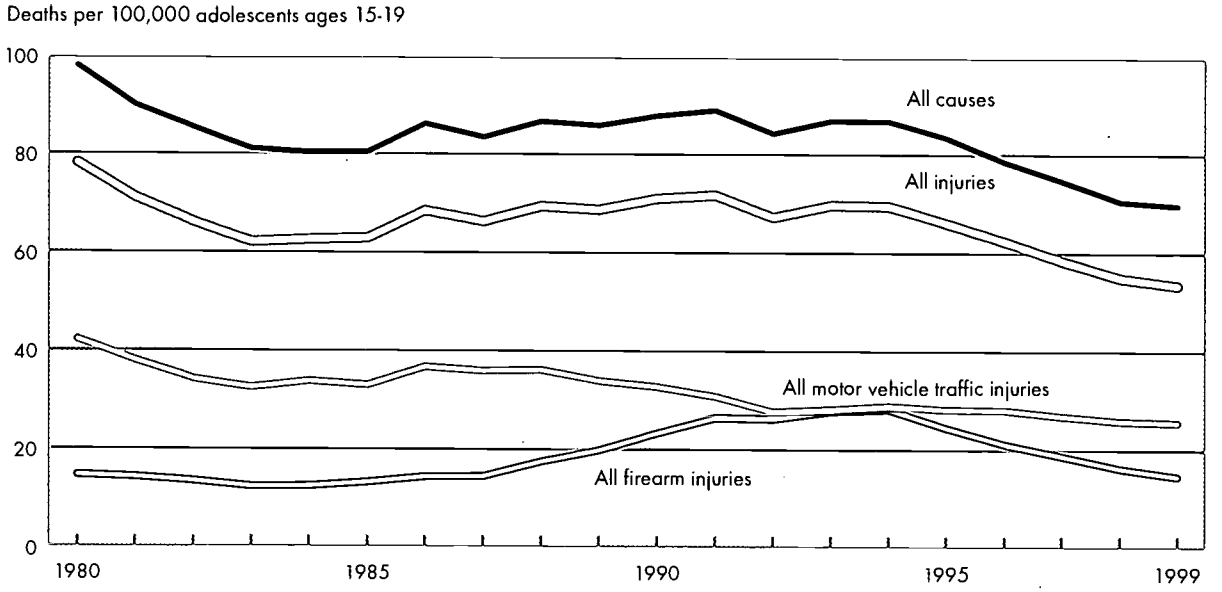
- The death rate in 1999 for children ages 5 to 14 was 19 per 100,000 children.
- Between 1980 and 1999, the death rate declined by almost one-third, from 31 to 19 deaths per 100,000 children ages 5 to 14.
- Similar to mortality patterns for children under the age of 5, among children ages 5 to 14, black children had the highest death rates in 1999 at 29 deaths per 100,000, and Asians/Pacific Islanders had the lowest death rate at 12 per 100,000.
- Among children ages 5 to 14, unintentional injuries were the leading cause of death, followed by cancer, birth defects, and homicides.
- The majority of unintentional injury deaths among children ages 5 to 14 result from motor vehicle traffic crashes. More than 65 percent of children ages 5 to 14 who died in traffic crashes in 1999 were not wearing a seatbelt or other restraint.[49]

Bullets contain references to data that can be found in Tables HEALTH6.A and HEALTH6.B on pages 94-95. Endnotes begin on page 59.

Adolescent Mortality

Compared with younger children, adolescents ages 15 to 19 have much higher mortality rates. Adolescents are much more likely to die from injuries sustained from motor vehicle traffic accidents or firearms.[50] This difference illustrates the importance of looking separately at mortality rates and causes of death among teenagers ages 15 to 19.

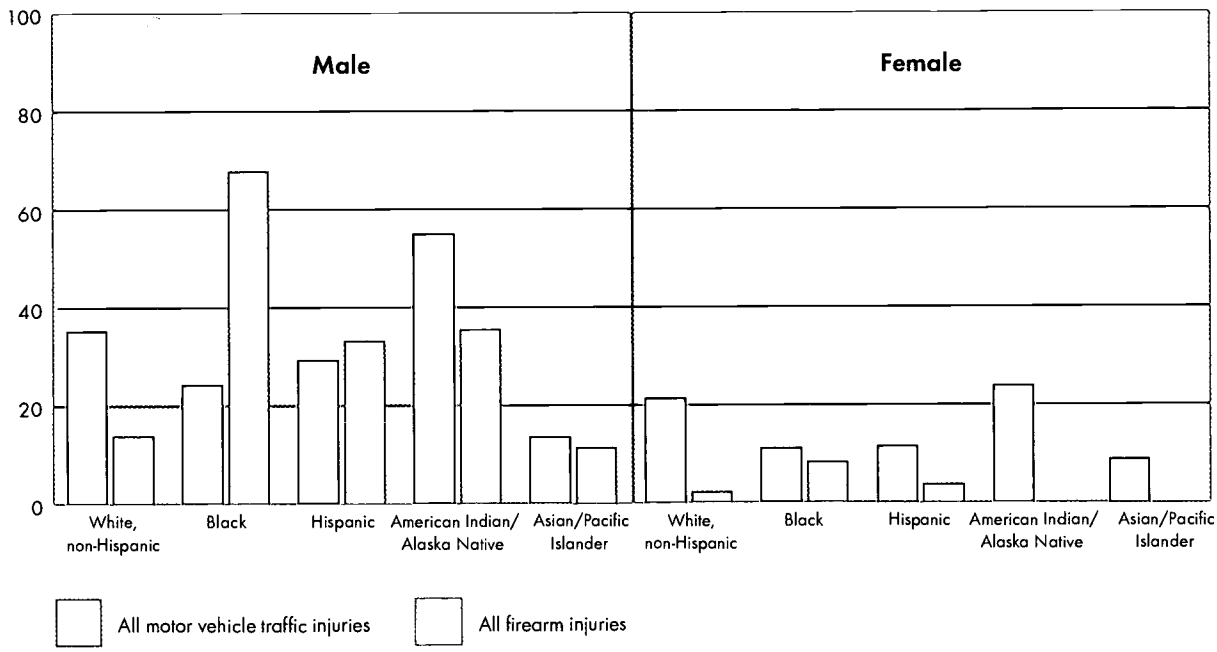
Indicator HEALTH7:A **Death rates among adolescents ages 15 to 19 by cause of death, 1980-99**



SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System.

- In 1999, the death rate for adolescents ages 15 to 19 was 70 deaths per 100,000. After increasing to 89 per 100,000 in 1991, the rate declined and continues to be substantially lower than the rate in 1980. Injury, which includes homicide, suicide, and unintentional injuries, continues to account for over 3 out of 4 deaths among adolescents.
- Injuries from motor vehicles and firearms are the primary causes of death among youth ages 15 to 19. Motor vehicle traffic-related injuries accounted for 37 percent of deaths in this age group in 1999, while injuries from firearms accounted for 21 percent.
- Motor vehicle injuries were the leading cause of death among adolescents for each year between 1980 and 1998, but the motor vehicle death rate declined by over one-third during the time period.
- In 1980, motor vehicle traffic-related deaths among adolescents ages 15 to 19 occurred almost three times as often as firearm injuries (intentional and unintentional). By 1999, motor vehicle traffic-related deaths were less than double that of firearm injuries.
- Motor vehicle traffic-related and firearm death rates have followed different trends since 1980. From 1980 to 1985, both rates declined; in the following years, however, the motor vehicle traffic death rate continued to decline modestly while the firearm death rate increased markedly. During the years 1992-94, the two rates differed only slightly. However, since 1994, the firearm death rate has decreased by nearly half while the motor vehicle death rate has decreased only slightly.
- Most of the increase in firearm injury deaths between 1985 and 1993 resulted from an increase in homicides. The firearm homicide rate among youth ages 15 to 19 more than tripled from 5 to 18 per 100,000 between 1983 and 1993. At the same time, the firearm suicide rate rose from 5 to 7 per 100,000. From 1994 to 1999, the firearm homicide rate declined by over one-half and the firearm suicide rate declined by nearly one-third.
- After injuries, additional leading causes of death for adolescents include cancer, heart disease, and birth defects.[13]

Indicator HEALTH7.B **Injury death rates among adolescents ages 15 to 19 by gender, race, Hispanic origin, and type of injury, 1999**



NOTE: There were too few firearm deaths to calculate a reliable rate for American Indian/Alaska Native females and Asian/Pacific Islander females.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System.

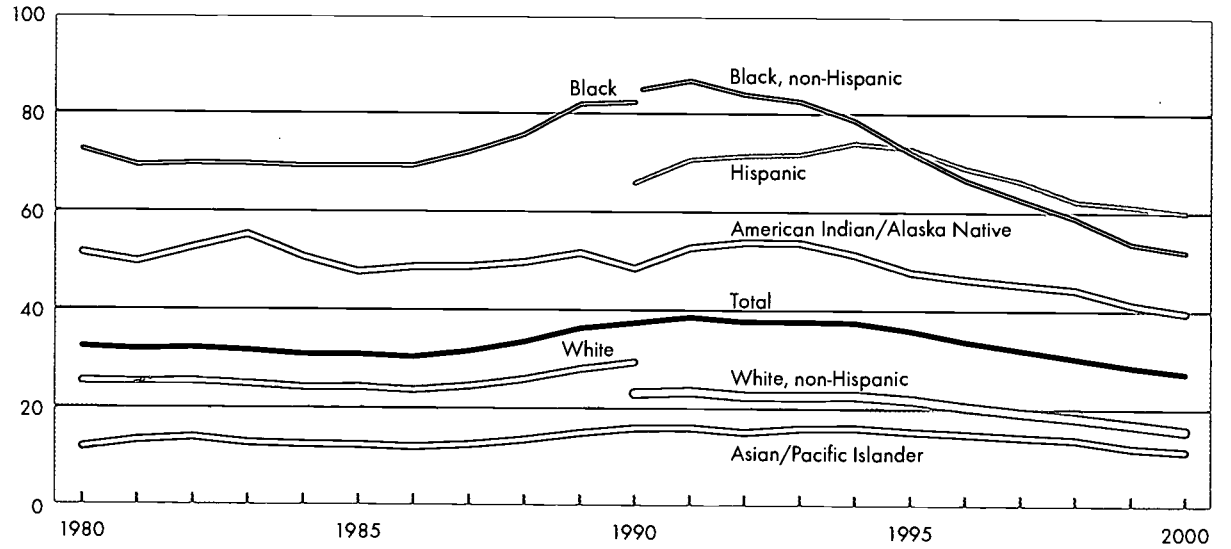
- Motor vehicle and firearm injury deaths were both more common among male than among female adolescents. In 1999, the motor vehicle traffic death rate for males was nearly twice the rate for females, and the firearm death rate among males was seven times that for females.
- Among adolescents in 1999, motor vehicle injuries were the most common cause of death among all females, as well as among white, non-Hispanic, American Indian/Alaska Native, and Asian/Pacific Islander males. Firearm injuries were the most common cause of death among black and Hispanic males. Black males were over twice as likely to die from a firearm injury as from a motor vehicle traffic injury.
- Deaths from firearm suicides were more common than deaths from firearm homicides among white, non-Hispanic adolescents and American Indian/Alaska Native adolescents.
- Deaths from firearm injuries among adolescents declined between 1994 and 1999, particularly among black and Hispanic males. From 1994 to 1999, the firearm homicide rates for Hispanic and black adolescent males declined substantially, from 131 to 57 per 100,000 for black males, and from 55 to 26 per 100,000 for Hispanic males.

Bullets contain references to data that can be found in Table HEALTH7 on pages 96-97. Endnotes begin on page 59.

Adolescent Births

Bearing a child during adolescence is often associated with long-term difficulties for the mother and her child. These consequences are often attributable to poverty and the other adverse socioeconomic circumstances that frequently accompany early childbearing.[51] Compared with babies born to older mothers, babies born to adolescent mothers, particularly young adolescent mothers, are at higher risk of low birthweight and infant mortality.[5,8,13,43] They are more likely to grow up in homes that offer lower levels of emotional support and cognitive stimulation, and they are less likely to earn high school diplomas. For the mothers, giving birth during adolescence is associated with limited educational attainment, which in turn can reduce future employment prospects and earnings potential.[52] The birth rate of adolescents under age 18 is a measure of particular interest because the mothers are still of school age.

Indicator HEALTH8 **Birth rates for females ages 15 to 17 by race and Hispanic origin, 1980-2000**



NOTE: Rates for 1980-89 are calculated for all whites and all blacks. Rates for 1980-89 are not shown for Hispanics; white, non-Hispanics; or black, non-Hispanics because information on the Hispanic origin of the mother was not reported on the birth certificates of most states.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System.

- In 2000, the adolescent birth rate was 27 per 1,000 young women ages 15 to 17. There were 157,209 births to these young women in 2000. The 2000 rate was a record low for the Nation.[5,13]
- The birth rate among adolescents ages 15 to 17 declined nearly one-third, from 39 to 27 births per 1,000, between 1991 and 2000. This decline follows a one-fourth increase between 1986 and 1991. The 2000 rate was a record low for young adolescents.[5]
- There are substantial racial and ethnic disparities in birth rates among adolescents ages 15 to 17. In 2000, the birth rate for this age group was 12 per 1,000 for Asians/Pacific Islanders, 16 for white, non-Hispanics, 40 for American Indians/Alaska Natives, 52 for black, non-Hispanics, and 60 for Hispanics.
- The birth rate for black, non-Hispanic females ages 15 to 17 dropped by two-fifths between 1991 and 2000, completely reversing the increase from 1986 to 1991. The birth rate for white, non-Hispanic teens declined by one-third during 1991-2000. In contrast, the birth rate for Hispanics in this age group did not begin to decline until after 1994; the rate fell by nearly one-fifth from 1994 to 2000.
- In 2000, 88 percent of births to females ages 15 to 17 were to unmarried mothers, compared with 62 percent in 1980 (See table POP6.B).
- The steepest decline in birth rates for ages 15 to 17 in the mid to late 1990s was for first births, which accounted for four-fifths of births to adolescents. Earlier in the decade, declines were much greater for second births to adolescents.[5,13,53]
- The pregnancy rate (the sum of births, abortions, and fetal losses per 1,000) declined by one-fifth for adolescents ages 15 to 17 during 1990-97, reaching a record low of 64 per 1,000 in 1997. Rates for births, abortions, and fetal losses declined for young adolescents in the 1990s.[54]

Bullets contain references to data that can be found in Table HEALTH8 on page 98 and Table POP6.B on page 74. Endnotes begin on page 59.

Health

National indicators in several key dimensions of health are not yet available because of difficulty in definitions and measurement, particularly using survey research. The following health-related areas have been identified as priorities for indicator development by the Federal Interagency Forum on Child and Family Statistics:

- *Disability.* The Forum is very interested in developing an improved measure of functioning that can be derived from regularly collected data. Such a measure is often referred to as a disability measure. The difficulties inherent in developing such a measure relate to the fact that disability is a complicated, multidimensional concept. Many definitions of disability are currently in use by policy-makers and researchers, but there is little agreement regarding which aspects of functioning should be included or how they should be measured. Disability is best thought of as an umbrella term that includes pathology, impairment, functional limitations, task limitations, and activity limitations as well as characteristics of the environment which can be either a barrier or a support to the activity of the individual. The measurement of functioning and disability in children is critically important, and the Forum is working on determining which aspects of disability should be reported in this volume, and on developing indicators that address these core aspects of health-related well-being.
- *Mental health.* An international panel of experts in the area of children's mental health has been working with staff at the National Institute of Mental Health, the Center for Mental Health Services in the Substance Abuse and Mental Health Services Administration, and Forum agencies to determine data needs and develop better measures to obtain data on children's mental health. As a result of this collaborative effort, new questions were recently added to the National Center for Health Statistics' annual National Health Interview Survey. Some data have been collected, and plans are being made to evaluate the data and conduct a validity study. These data may be available in 2003.
- *Child abuse and neglect.* Also needed are regular, reliable estimates of the incidence of child abuse and neglect that are based on sample surveys rather than administrative records. One estimate of child abuse and neglect was presented as a special feature in *America's Children, 1997.* Since administrative data are based on cases reported to authorities, it is likely that these data underestimate the magnitude of the problem. Estimates based on sample survey data could potentially provide more accurate information; however, a number of issues still persist, including how to effectively elicit this sensitive information, how to identify the appropriate respondent for the questions, and whether there is a legal obligation for the surveyor to report abuse or neglect.

Indicators of Children's Well-Being

Behavior and Social Environment Indicators

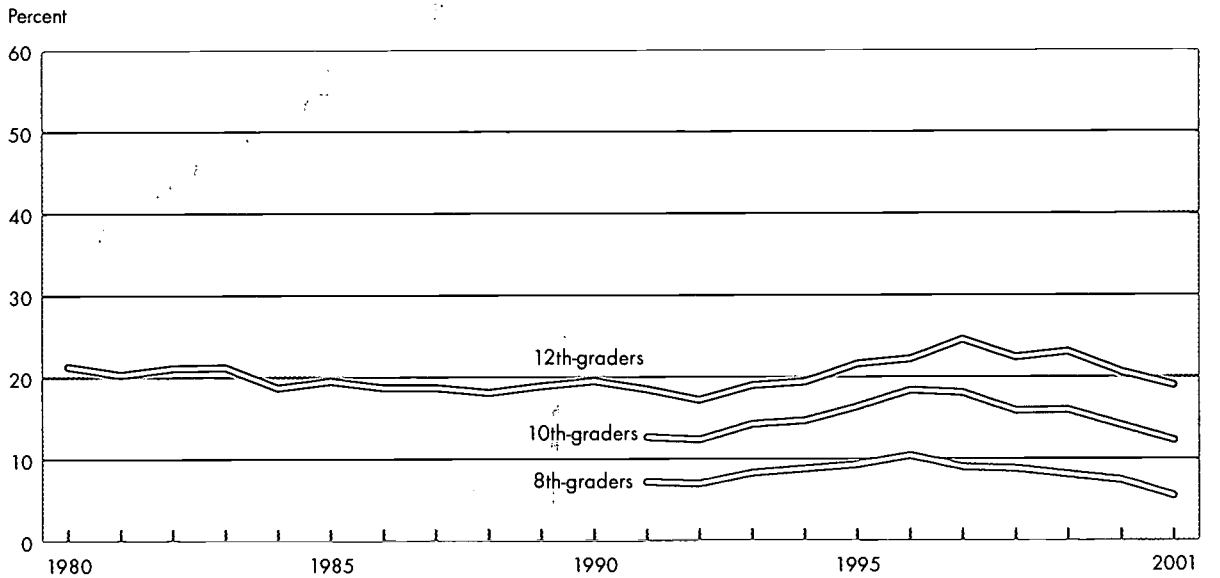
The indicators in this section present data on selected measures of young people's personal behavior and aspects of their social environment that may affect them. The indicators focus on illegal or high-risk behaviors, including smoking cigarettes, drinking alcohol, using illicit drugs, and involvement in serious violent crimes, either as offender or victim. In addition to these indicators, readers should consider positive behaviors of children, aspects of neighborhood environment, and other aspects of risk and problem behaviors in evaluating this dimension. Sources for some of these indicators are being sought.

Regular Cigarette Smoking

Smoking has serious long-term consequences, including the risk of smoking-related diseases and the risk of premature death, as well as causing increased health care costs associated with treating the illnesses.[55] Many adults who are addicted to tobacco today began smoking as adolescents, and it is estimated that more than 5 million of today's underage smokers will die of tobacco-related illnesses.[56] These consequences underscore the importance of studying patterns of smoking among adolescents.

Indicator BEH1

Percentage of students who reported smoking cigarettes daily in the previous 30 days by school grade, 1980-2001



SOURCE: National Institutes of Health, National Institute on Drug Abuse, Monitoring the Future Survey.

- Between 2000 and 2001, the rate of daily smoking in the past month decreased from 14 percent to 12 percent among 10th-graders and from 7 percent to 6 percent among 8th-graders. Recent peaks in daily smoking occurred in 1996 for 8th- and 10th-graders and in 1997 for 12th-graders. Rates have declined in all three grades since that time. The percentage of 8th- and 10th-graders reporting daily smoking in 2001 was the lowest in the 11 years data have been collected from students in those grades. For 12th-graders, the 2001 rate was the lowest since 1993.
- Long-term trends for high school seniors show that daily smoking declined from 21 percent in 1980 to 17 percent in 1992, increased to 25 percent in 1997, and declined to 19 percent in 2001.
- Males and females are similar in their rates of daily smoking. Among males, 6 percent of 8th-graders, 12 percent of 10th-graders, and 18 percent of 12th-graders reported daily smoking in the past 30 days in 2001; among females, the corresponding rates were 5 percent for 8th-graders, 12 percent for 10th-graders, and 19 percent for 12th-graders.
- Rates of smoking differ substantially between racial and ethnic groups. White students have the highest rate of smoking, followed by Hispanics and then blacks. Among high school seniors in 2001, 24 percent of whites reported daily smoking, compared to 12 percent of Hispanics and 8 percent of blacks.

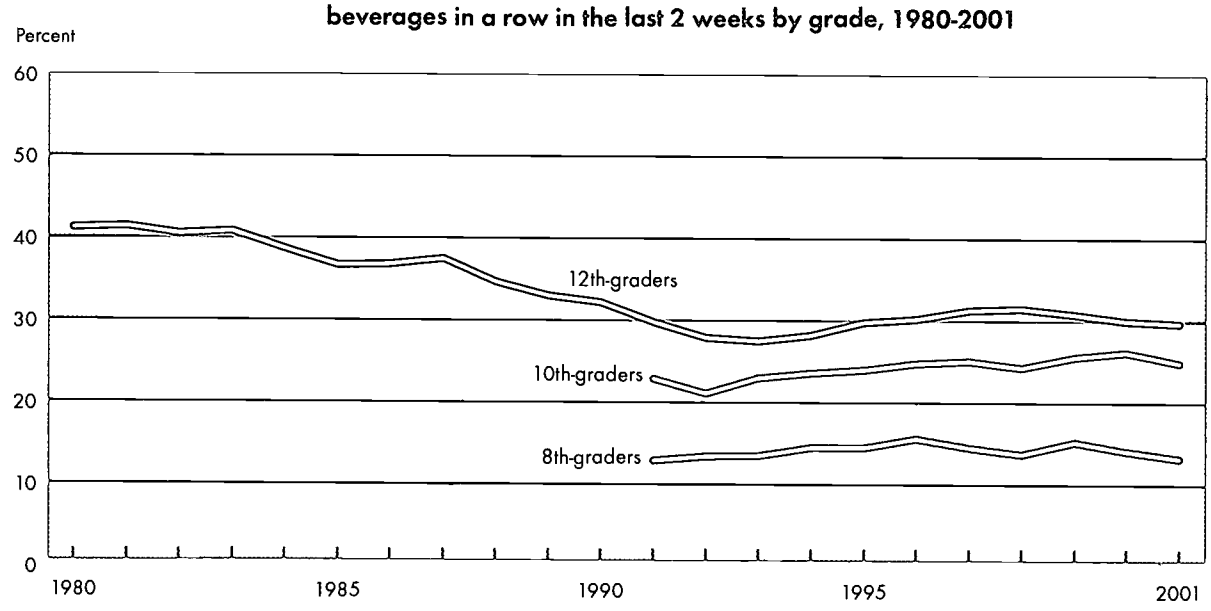
Bullets contain references to data that can be found in Table BEH1 on page 99. Endnotes begin on page 59.

Alcohol Use

Alcohol is the most commonly used psychoactive substance during adolescence. Its use is associated with motor vehicle accidents, injuries, and deaths; with problems in school and in the workplace; and with fighting, crime, and other serious consequences.[57] Early onset of heavy drinking may be especially problematic, potentially increasing the likelihood of negative outcomes.

Indicator BEH2

Percentage of students who reported having five or more alcoholic beverages in a row in the last 2 weeks by grade, 1980-2001



SOURCE: National Institutes of Health, National Institute on Drug Abuse, Monitoring the Future Survey.

- In 2001, rates of episodic heavy drinking remained largely unchanged from 2000, with 30 percent of 12th-graders, 25 percent of 10th-graders, and 13 percent of 8th-graders reporting heavy drinking (i.e., having at least five drinks in a row at least once in the previous 2 weeks).
- Long-term trends for high school seniors indicate a peak in 1981, when 41 percent reported heavy drinking. Over the next 12 years, the percentage of high school seniors reporting heavy drinking declined gradually to a low of 28 percent in 1993. Since 1993, the prevalence of this behavior has held fairly steady. The rate in 2001 was 30 percent.
- Among 10th- and 12th-graders, males are more likely to drink heavily than are females. In 2001, 36 percent of 12th-grade males reported heavy drinking, compared with 24 percent of 12th-grade females. Among 10th-graders, 29 percent of males reported heavy drinking, compared with 21 percent of females. As adolescents get older, the differences between males and females in this drinking behavior appear to become more pronounced.
- Heavy drinking is much more likely among white and Hispanic secondary school students than among their black counterparts. For example, among 12th-graders, 12 percent of blacks reported heavy drinking in 2001, compared with 35 percent of whites and 28 percent of Hispanics. Similarly, among 10th-graders, 13 percent of blacks reported heavy drinking, compared with 27 percent of whites and 28 percent of Hispanics.

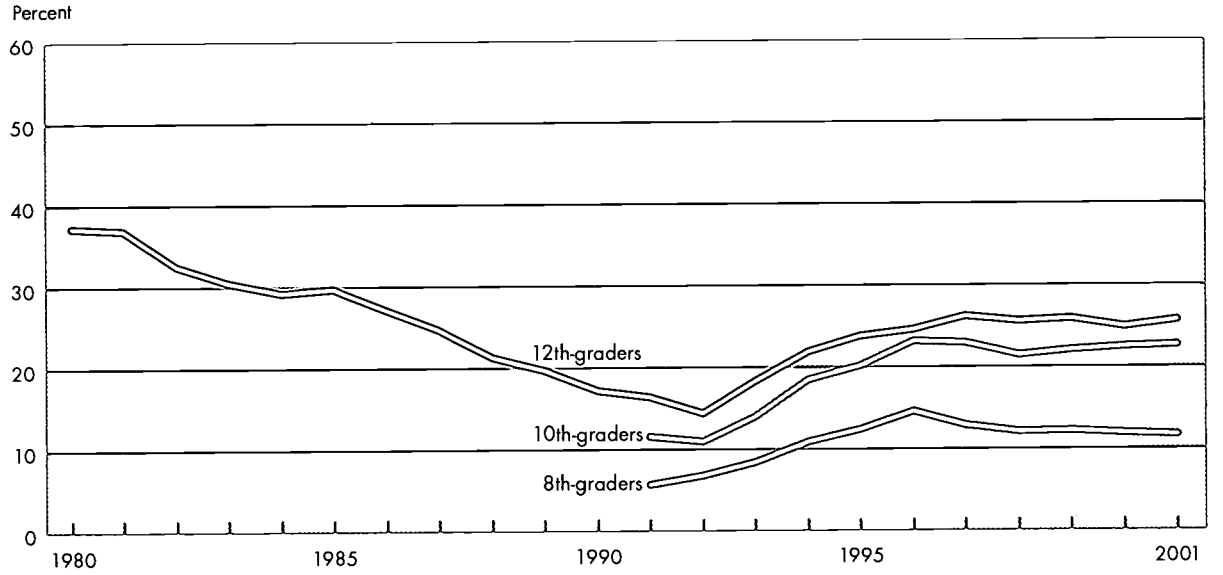
Bullets contain references to data that can be found in Table BEH2 on page 100. Endnotes begin on page 59.

Illicit Drug Use

Drug use by adolescents can have immediate as well as long-term health and social consequences. Cocaine use is linked with health problems that range from eating disorders to disability to death from heart attacks and strokes.[58] Marijuana use poses both health and cognitive risks, particularly for damage to pulmonary functions as a result of chronic use.[59,60] Hallucinogens can affect brain chemistry and result in problems with learning new information and memory.[61] As is the case with alcohol use and smoking, drug use is a risk-taking behavior that has serious negative consequences.

Indicator BEH3

Percentage of students who reported using illicit drugs in the previous 30 days by grade, 1980-2001



NOTE: Illicit drugs include marijuana, cocaine (including crack), heroin, hallucinogens (including LSD, PCP, and ecstasy (MDMA)), amphetamines (including methamphetamine), and nonmedical use of psychotherapeutics.

SOURCE: National Institutes of Health, National Institute on Drug Abuse, Monitoring the Future Survey.

- The percentage of 8th-, 10th-, and 12th-graders reporting illicit drug use in the past 30 days remained stable from 2000 to 2001. In 2001, illicit drug use in this time period was reported by 26 percent of 12th-graders, 23 percent of 10th-graders, and 12 percent of 8th-graders.
- Eleven-year trends for 8th- and 10th-graders show that illicit drug use in the past 30 days increased substantially from the early to mid-1990s, reaching a peak in 1996 at 15 percent for 8th-graders and 23 percent for 10th-graders. Since then, rates have remained stable for 10th-graders. For 8th-graders, rates have declined, ending at 12 percent in 2001.
- Longer-term trend data for high school seniors indicate that past-30-day illicit drug use was reported by 37 percent in 1980, declined gradually to 14 percent in 1992, and then rose sharply, reaching 26 percent in 1997. Since that time illicit drug use has remained stable among high school seniors.
- In 2001 males were more likely to use illicit drugs than were females in each grade. Among 12th-graders, 28 percent of males, compared to 23 percent of females, reported past month illicit drug use. For 10th-graders, the corresponding rates were 25 percent and 21 percent, respectively, and for 8th-grades, they were 13 percent for males and 10 percent for females.
- White and Hispanic students generally have higher average illicit drug use rates than do black students. For instance, among 12th-graders in 2001, 19 percent of blacks, 27 percent of whites, and 25 percent of Hispanics reported past-month illicit drug use.

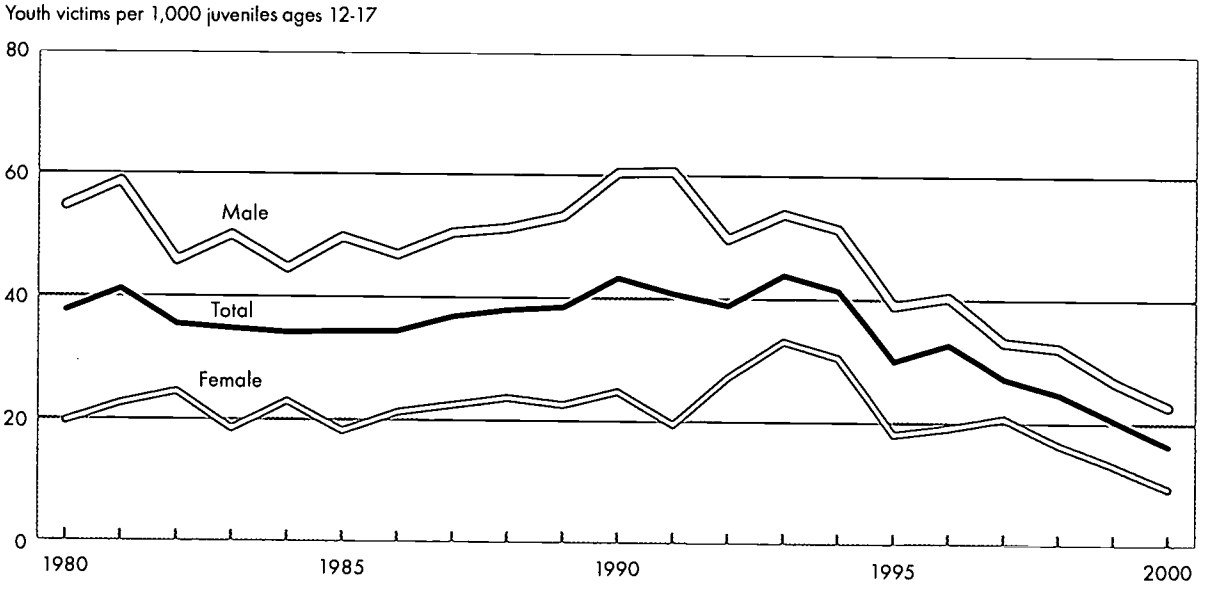
Bullets contain references to data that can be found in Table BEH3 on page 101. Endnotes begin on page 59.

Youth Victims and Perpetrators of Serious Violent Crimes

Violence affects the quality of life of young people who experience, witness, or feel threatened by it. In addition to the direct physical harm suffered by young victims of serious violence, such violence can adversely affect victims' mental health and development and increase the likelihood that they themselves will commit acts of serious violence.[62,63] Youth ages 12 to 17 are twice as likely as adults to be victims of serious violent crimes,[64] which include aggravated assault, rape, robbery (stealing by force or threat of violence), and homicide.

Indicator BEH4.A

Rate of serious violent crime victimization of youth ages 12 to 17 by gender, 1980-2000



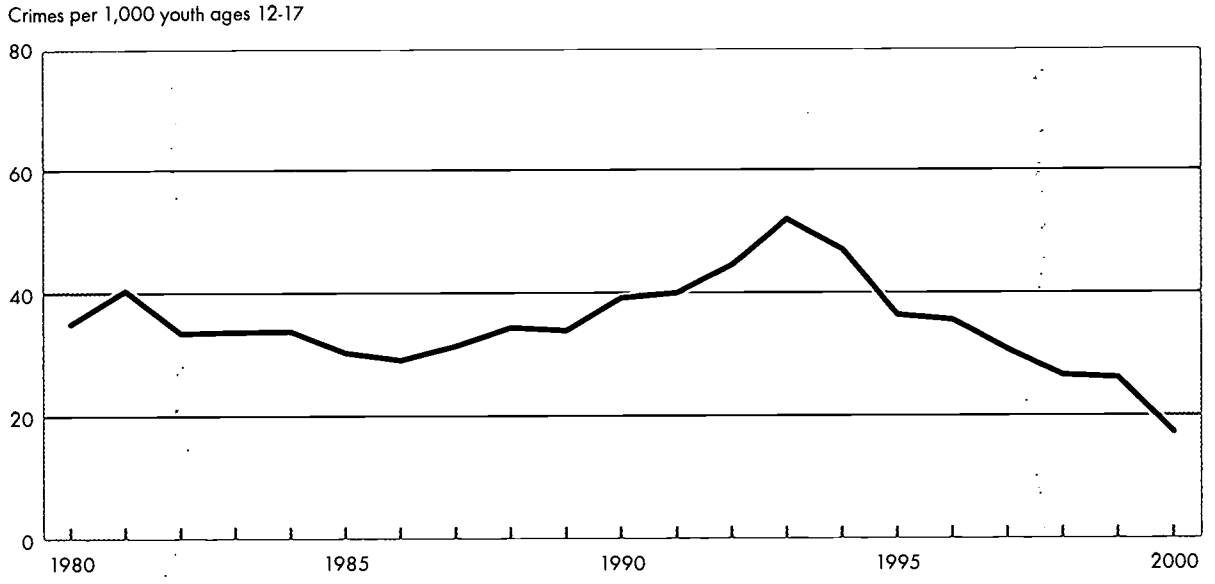
NOTE: Serious violent crimes include aggravated assault, rape, robbery (stealing by force or threat of violence), and homicide. Because of changes made in the victimization survey, data prior to 1992 are adjusted to make them comparable with data collected under the redesigned methodology. Numbers for 2000 are preliminary and do not contain final homicide estimates.

SOURCE: U.S. Department of Justice, Bureau of Justice Statistics, National Crime Victimization Survey. Federal Bureau of Investigation, Uniform Crime Reporting Program, Supplementary Homicide Reports.

- In 2000, the rate at which youth were victims of serious violent crimes was 16 crimes per 1,000 juveniles ages 12 to 17, totaling about 390,000 such crimes.
- The serious violent crime victimization rate fluctuated between 34 and 43 per 1,000 from 1980 to 1990 and peaked at 44 per 1,000 in 1993. Since 1993, the rate of serious violent crime against youth has decreased by 63 percent, down to 16 per 1,000 in 2000.
- Males are more than twice as likely as females to be victims of serious violent crimes. In 2000, the serious violent crime victimization rate was 23 per 1,000 male youth, compared with 10 per 1,000 female youth.
- In 2000, the serious violent crime victimization rate for youth dropped more for younger teens (ages 12 to 14) than for older teens (ages 15 to 17). In 2000, the rate for older teens dropped to 19 per 1,000 and for younger teens dropped to 14 per 1,000.

The level of youth violence in society can be viewed as an indicator of youths' ability to control their behavior, as well as the adequacy of socializing agents such as families, peers, schools, and religious institutions to supervise or channel youth behavior to acceptable norms. One measure of the serious violent crime committed by juveniles is the incidence rate of serious violent juvenile crime.

Indicator BEH4.B **Serious violent crime offending rate by youth ages 12 to 17, 1980-2000**



NOTE: This rate is the ratio of the number of crimes (aggravated assault, rape, and robbery; i.e., stealing by force or threat of violence) reported to the National Crime Victimization Survey for which the age of the offenders was known, plus the number of homicides reported to police that involved at least one juvenile offender perceived by the victim (or by law enforcement in the case of homicide) to be 12 through 17 years of age, to the number of juveniles in the population. Because of changes made in the victimization survey, data prior to 1992 are adjusted to make them comparable with data collected under the redesigned methodology. Numbers for 2000 are preliminary and do not contain final homicide estimates.

SOURCE: U.S. Department of Justice, Bureau of Justice Statistics, National Crime Victimization Survey. Federal Bureau of Investigation, Uniform Crime Reporting Program, Supplementary Homicide Reports.

- According to reports by victims, in 2000 the serious violent crime offending rate was 17 crimes per 1,000 juveniles ages 12 to 17, totaling 413,000 such crimes involving juveniles. This is a 67 percent drop from the 1993 high and the lowest rate recorded since the national victimization survey began in 1973.
- Reports by victims indicate that between 1980 and 1989, the serious violent juvenile crime offending rate fluctuated between 29 and 40 per 1,000, and then began to increase from 34 per 1,000 in 1989 to a high of 52 per 1,000 in 1993. Since then, the rate has steadily dropped, to 17 per 1,000 in 2000.
- Based on victims' reports, since 1980 the percentage of all serious violent crime involving juveniles has ranged from 19 percent in 1982 to 26 percent in 1993, the peak year for youth violence. In 2000, 19 percent of all such victimizations reportedly involved a juvenile offender.
- In more than half (59 percent) of all serious violent juvenile crimes reported by victims in 2000, more than one offender was involved in the incident. Because insufficient detail exists to determine the age of each individual offender when a crime is committed by more than one offender, the number of additional juvenile offenders cannot be determined. Therefore, this rate of serious violent crime offending does not represent the number of juvenile offenders in the population, but rather the number of crimes committed involving juveniles ages 12 to 17 in relation to the juvenile population.

Bullets contain references to data that can be found in Tables BEH4.A and BEH4.B on pages 102-103. Endnotes begin on page 59.

Behavior and Social Environment

A broader set of indicators than those presented in this section is needed to adequately monitor the social environment and behaviors of youth. Other behavior and social environment measures are needed on:.

- *Indicators of positive behaviors.* The participation of youth in positive activities and the formation of close attachments to family, school, and community have been linked to positive outcomes in research studies. Additional research needs to be conducted to strengthen our understanding of positive activities and the aspects of those activities that protect youth from risk. Then, regular sources of data that can be used to monitor trends in these important areas over time need to be developed. The child care background measure shows participation rates in extracurricular activities such as organized sports, clubs, arts, religious activities, and other school or community activities. In addition, the youth participation in volunteer activities measure was presented as a special feature in the *America's Children 2000* report. Forum agencies are also examining the measurement and influence of young people's feelings of closeness with their parents.
- *Neighborhood environment.* Research shows that growing up in distressed neighborhoods has an effect over and above that of individual or family background characteristics on child well-being. A survey is being implemented that would, for the first time, enable the monitoring of America's communities and neighborhoods over time and identify distressed neighborhoods in which children are living.
- *Youth violence.* According to victim reports, 19 percent of violent crimes in 2000 involved a youth offender between the ages of 12 and 17. Since crime data are reported by victims, not perpetrators, the indicator on serious violent crime offending by youth does not provide critical information on the number and characteristics of youthful offenders involved in serious crime. Additional work is needed to produce a more comprehensive and useful measure of the prevalence of violence among young people.

Indicators of Children's Well-Being

Education Indicators

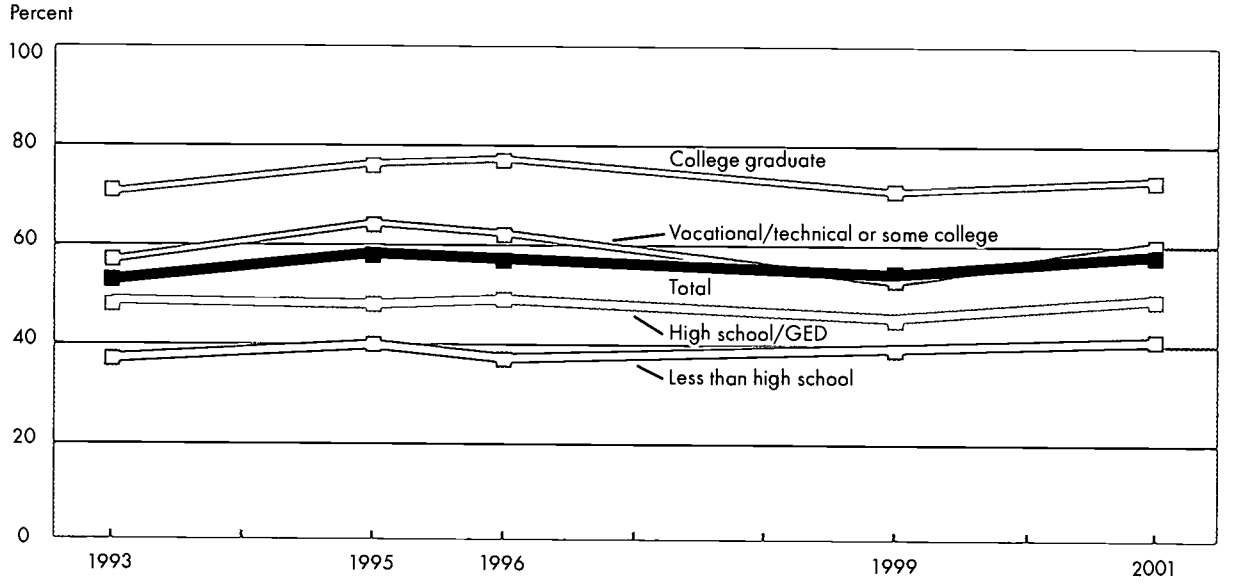
The education of children shapes their own personal development and life chances, as well as the economic and social progress of our Nation. This section presents key indicators of how well children are learning and progressing from early childhood through postsecondary school. Two indicators related to early childhood development are presented: family reading to young children and participation in early childhood care and education. Both measures are placeholders for a direct recurring assessment of what preschoolers know and can do, which is not yet available. Scores on national assessments of mathematics and reading for elementary, middle, and high school students are presented, followed by an indicator on advanced coursetaking. Completion rates for high school and college indicate the extent to which students have attained a basic education and are prepared for higher levels of education or the workforce. By contrast, the indicator on youth neither enrolled in school nor working tracks the extent to which youth are at risk of limiting their future prospects at a critical stage of their lives.

Family Reading to Young Children

Reading to young children promotes language acquisition and correlates with literacy development and, later on, with achievement in reading comprehension and overall success in school.[65] The percentage of young children read aloud to daily by a family member is one indicator of how well young children are being prepared for school. Mother's education is consistently related to whether children are read to by a family member.

Indicator ED1

Percentage of children ages 3 to 5 who were read to every day in the last week by a family member by mother's education, selected years 1993-2001



NOTE: Data are available for 1993, 1995, 1996, 1999, and 2001. Estimates are based on children ages 3 to 5 who have yet to enter kindergarten.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey.

- In 2001, 58 percent of children ages 3 to 5 were read to daily by a family member, a higher rate than in 1993. The percentage has fluctuated between 53 and 58 percent since 1993.
- In 2001, 73 percent of children whose mothers were college graduates were read to every day. In comparison, daily reading occurred for 60 percent of children whose mothers had some postsecondary education, 49 percent of children whose mothers had completed high school but had no further education, and 42 percent of children whose mothers had not finished high school.
- White, non-Hispanic children were more likely to be read to every day than either black, non-Hispanic or Hispanic children. Sixty-four percent of white, non-Hispanic children, 48 percent of black, non-Hispanic children, and 42 percent of Hispanic children were read to every day.
- Children in families with incomes below the poverty line were less likely to be read to every day than were children in families with incomes at or above the poverty line. Forty-eight percent of children in families in poverty were read to every day in 2001, compared with 61 percent of children in families at or above the poverty line.
- Children living with two parents were more likely to be read to every day than were children who live with one or no parent. Sixty-one percent of children in two-parent households were read to every day in 2001, compared with 48 percent of children living with one or no parent.

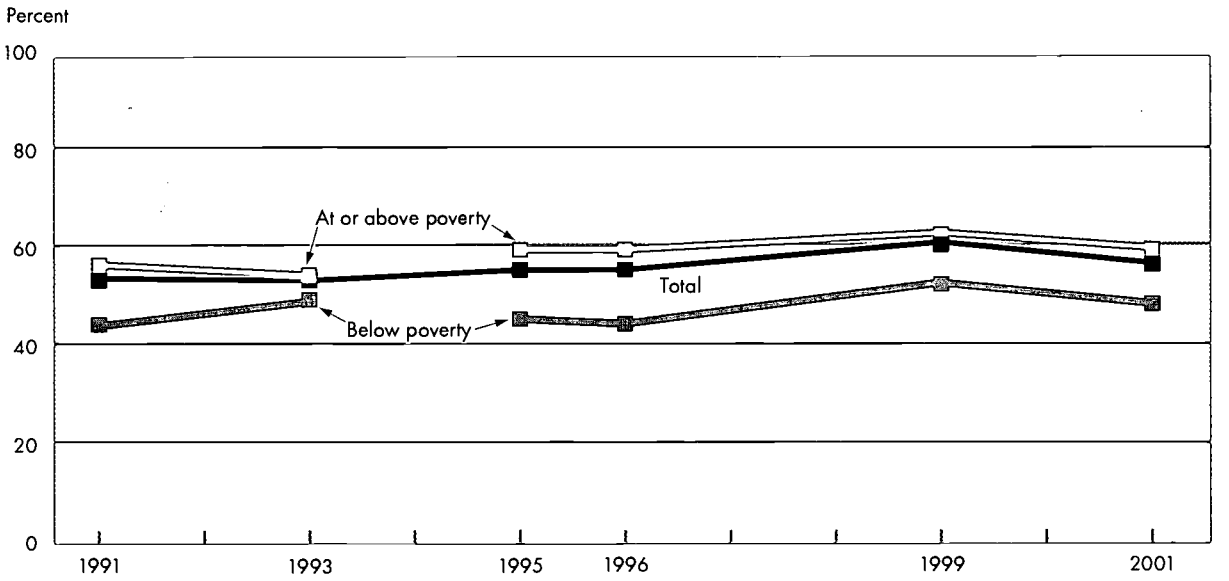
Bullets contain references to data that can be found in Table ED1 on page 104. Endnotes begin on page 59.

Early Childhood Care and Education

Like family reading, participation in an early childhood education program can provide preschoolers with skills and enrichment that can increase their chances of success in school. Studies have demonstrated that participation in high-quality early childhood education programs has short-term positive effects on IQ and achievement and long-term positive effects on low-income minority children's school completion.[66] Until an ongoing direct measure of preschoolers' cognitive, behavioral, and social skills is available for this monitoring report, this indirect indicator monitors the percentage of children who are exposed to a variety of early childhood education programs.

Indicator ED2

Percentage of children ages 3 to 5 who are enrolled in center-based early childhood care and education programs by poverty status, selected years 1991-2001



NOTE: Data are available for 1991, 1993, 1995, 1996, 1999, and 2001. Estimates are based on children who have yet to enter kindergarten. Poverty estimates for 1991 and 1993 are not comparable to those for later years.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey.

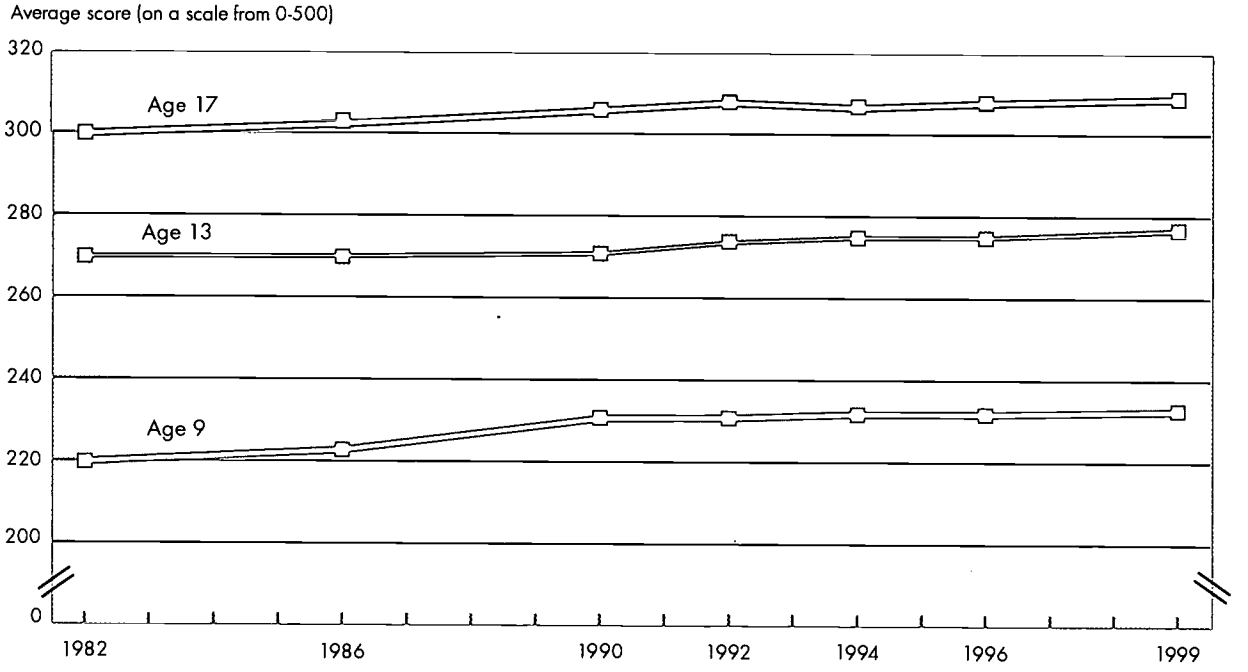
- In 2001, 56 percent of children ages 3 to 5 who had not yet entered kindergarten attended center-based early childhood care and education programs. These programs include day care centers, nursery schools, preschool programs, Head Start programs, and prekindergarten programs.
- Between 1991 and 2001, the percentage of children of this age attending early childhood programs varied between 53 and 60 percent.
- Children living in poverty were less likely to attend these programs than were those living in families at or above poverty in 2001 (47 percent compared with 59 percent).
- Children with more highly educated mothers are more likely to attend an early childhood program than other children. Seventy percent of children whose mothers had completed college attended such programs in 2001, compared with 38 percent whose mothers had less than a high school education.
- White, non-Hispanic and black, non-Hispanic children are more likely than Hispanic children to attend an early childhood program. In 2001, 59 percent of white, non-Hispanic and 64 percent of black, non-Hispanic children ages 3 to 5 attended such programs, compared with 40 percent of Hispanic children.
- Children with employed mothers are more likely to participate in early childhood care and education programs than children of mothers not in the labor force.

Bullets contain references to data that can be found in Table ED2 on page 105. Endnotes begin on page 59.

Mathematics and Reading Achievement

The extent and content of students' knowledge, as well as their ability to think, learn, and communicate, affect their ability to succeed in the labor market as adults. On average, students with higher test scores will earn more and will be unemployed less often than students with lower test scores.[67] Mathematics and reading achievement test scores are important measures of students' skills in these subject areas, as well as good indicators of achievement overall in school. To assess progress in mathematics and reading, the National Assessment of Educational Progress measures national trends in the academic performance of students at ages 9, 13, and 17.

Indicator ED3.A **Average mathematics scale scores for students ages 9, 13, and 17, selected years 1982-99**



NOTE: Data are available for 1982, 1986, 1990, 1992, 1994, 1996, and 1999. The mathematics proficiency scale ranges from 0 to 500, with the following skill levels associated with the corresponding scale score:

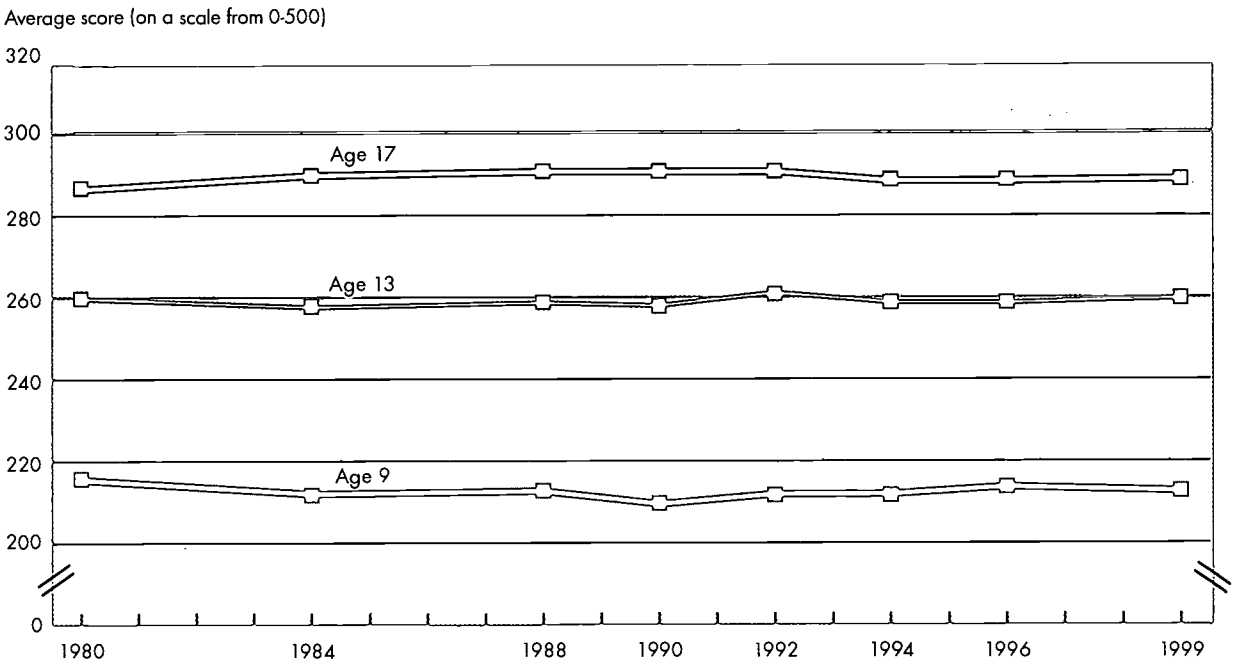
Level 150: Simple arithmetic facts
Level 200: Beginning skills and understandings
Level 250: Numerical operations and beginning problem solving
Level 300: Moderately complex procedures and reasoning
Level 350: Multi-step problem solving and algebra

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress.

- Average mathematics scores increased for all age groups between 1982 and 1999.
- Scores in 1999 did not improve significantly over the last assessment in 1996 in reading or mathematics or in any of the three age groups tested—ages 9, 13, and 17.
- White, non-Hispanic students have had consistently higher reading and mathematics scores than either black, non-Hispanic or Hispanic students at ages 9, 13, and 17. The gaps between non-Hispanic whites and blacks and between non-Hispanic whites and Hispanics decreased in each subject in some age groups during the 1980s and 1990s, but widened for others. Larger reductions in these gaps occurred during the 1970s because of gains in the scores of black, non-Hispanic and Hispanic students.

Indicator ED3.B

Average reading scale scores for students ages 9, 13, and 17, selected years 1980-99



NOTE: Data are available for 1980, 1984, 1988, 1990, 1992, 1994, 1996, and 1999. The reading proficiency scale ranges from 0 to 500, with the following skill levels associated with the corresponding scale score:

Level 150: Simple, discrete reading tasks

Level 200: Partial skills and understanding

Level 250: Interrelates ideas and makes generalizations

Level 300: Understands complicated information

Level 350: Learns from specialized reading materials

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress.

- Average reading scores have not improved among students ages 9, 13, or 17 since 1980.
- On average, students at ages 13 and 17 whose parents have completed more years of school have higher reading and mathematics scores than do their peers whose parents have had fewer years of education.[68]
- Girls had higher reading scores than boys at all three ages in 1999. In 1996, boys outperformed girls in mathematics at all three ages, but that gap was no longer significant in 1999. At ages 9 and 13, the differences between boys and girls were not significant for most years between 1980 and 1996.

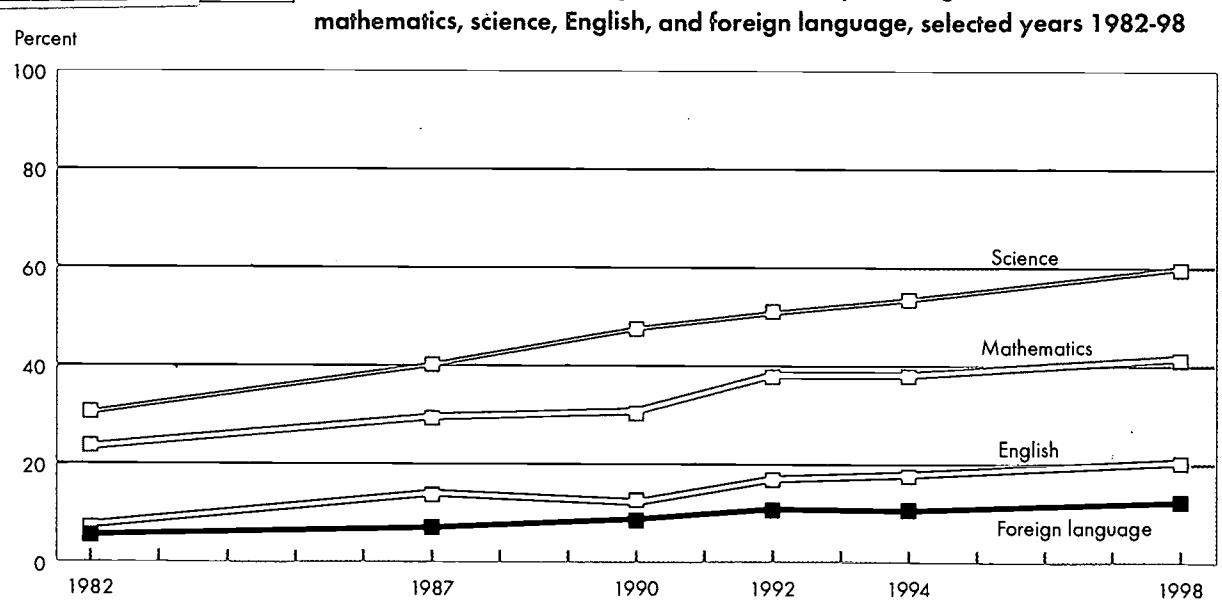
Bullets contain references to data that can be found in Tables ED3.A and ED3.B on pages 106 -107. Endnotes begin on page 59.

High School Academic Coursetaking

Since *A Nation at Risk* was published in 1983, school reforms have emphasized increasing the number of academic courses students take in high school. Research has shown a strong relationship between the level of difficulty of courses students take and their performance on assessments. For both college-bound and non-college-bound students, assessment scores increased more for students taking advanced courses than for students who did not take advanced courses.[69] Studies have also shown that students who take advanced coursework, such as Calculus, in high school are more likely to enroll in college and succeed beyond college.[70]

Indicator ED4

Percentage of high school graduates who completed high-level coursework in mathematics, science, English, and foreign language, selected years 1982-98



NOTE: Data are available for 1982, 1987, 1990, 1992, 1994, and 1998. High-level coursework includes the following: mathematics: courses above Algebra II; science: chemistry, physics, or both; English: 50 percent or more of courses at the honors level; and foreign language: fourth-year/advanced placement course. For a detailed listing of courses, see Tables ED4.A-ED4.D.

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Survey, National Education Longitudinal Study of 1988, and National Assessment of Educational Progress Transcript Study.

- Forty-one percent of 1998 high school graduates had taken at least one advanced mathematics course, (defined as a course above Algebra II), an increase from 26 percent of 1982 high school graduates. In addition, the percentage of 1998 high school graduates taking a nonacademic or low-level academic course as their most advanced course was 9 percent, compared with 24 percent for 1982 graduates.
- In science, more than half (60 percent) of all 1998 high school graduates had taken Physics I and/or Chemistry I or both, nearly doubling the percentage of 1982 graduates who had taken one or both courses (31 percent). In addition, the percentage of students who had taken a physical science course lower than biology, chemistry, and physics as their most advanced course dropped from 27 percent of 1982 graduates to 9 percent of 1998 graduates.
- Twenty percent of all 1998 high school graduates took the majority of their English courses at the honors level, an increase from 7 percent of 1982 high school graduates. Twenty nine percent of 1998 graduates took a mix of middle- and high-level English courses without taking any low-level courses, up from 13 percent in 1982.
- More high school students are taking foreign language courses. Thirteen percent of 1998 high school graduates had taken a 4th-year or advanced placement course, compared with 6 percent of 1982 graduates. Nineteen percent of 1998 high school graduates did not take any foreign language course, compared with 46 percent of 1982 high school graduates.

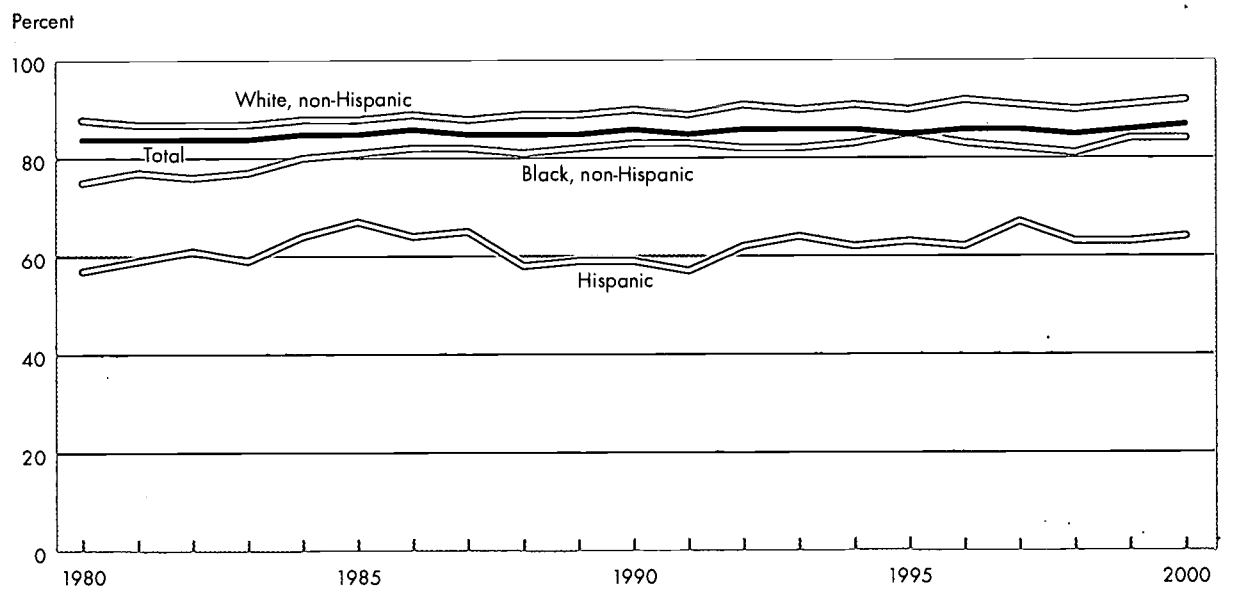
Bullets contain references to data that can be found in Tables ED4.A-ED4.D on pages 108 -109. Endnotes begin on page 59.

High School Completion

A high school diploma or its equivalent represents acquisition of the basic reading, writing, and mathematics skills a person needs to function in modern society. The percentage of young adults ages 18 to 24 with a high school diploma or an equivalent credential is a measure of the extent to which young adults have completed a basic prerequisite for many entry-level jobs as well as higher education.

Indicator ED5

Percentage of adults ages 18 to 24 who have completed high school by race and Hispanic origin, 1980-2000



NOTE: Percentages are based only on those not currently enrolled in high school or below. Prior to 1992, this indicator was measured as completing 4 or more years of high school rather than the actual attainment of a high school diploma or equivalent.

SOURCE: U.S. Census Bureau, October Current Population Survey. Tabulated by the U.S. Department of Education, National Center for Education Statistics.

- In 2000, 87 percent of young adults ages 18 to 24 had completed high school with a diploma or an alternative credential such as a General Education Development (GED) certificate. The high school completion rate has increased slightly since 1980, when it was 84 percent.
- The rate at which black, non-Hispanic youth completed high school increased markedly between 1980 and 1990, from 75 percent to 83 percent. It has fluctuated since then and was at 84 percent in 2000. Among white, non-Hispanics, the high school completion rate increased from 88 percent in 1980 to 92 percent in 2000.
- Hispanic youth have had a consistently lower high school completion rate than white, non-Hispanic and black, non-Hispanic youth. Since 1980, the high school completion rate for Hispanic youth has fluctuated between 57 and 67 percent and was at 64 percent in 2000.
- Most young adults complete high school by earning a regular high school diploma. Others complete high school by earning an alternative credential, such as a GED. Between 1990 and 1999, the diploma rate declined by 4 percentage points, falling from 81 percent to 77 percent. In comparison, the alternative credential rate increased by 5 percentage points, increasing from 4 to 9 percent.[71]

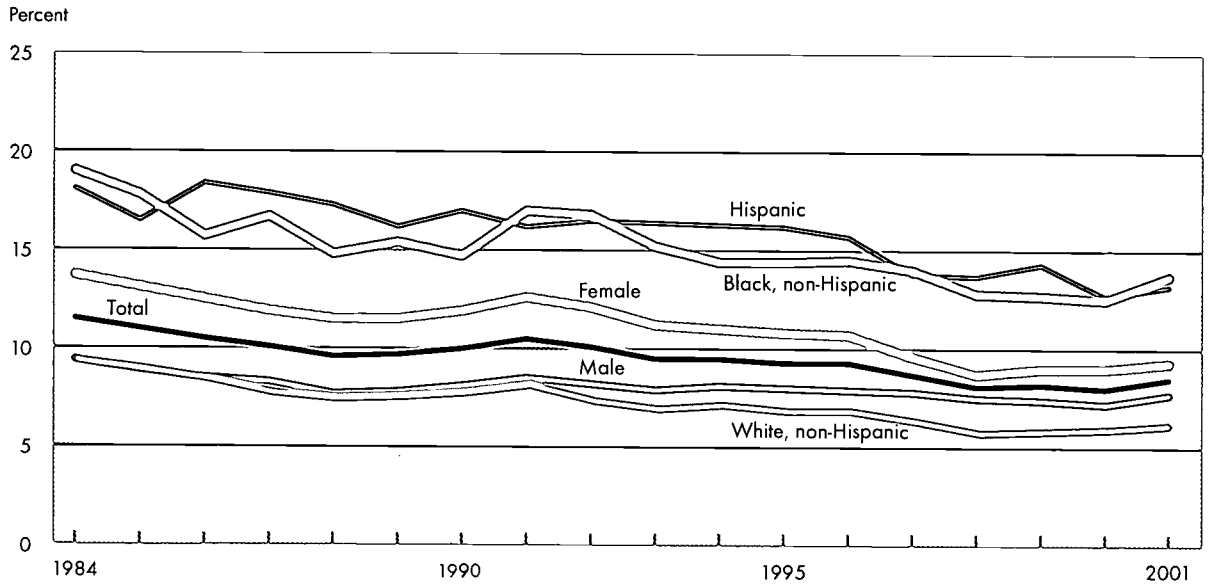
Bullets contain references to data that can be found in Table ED5 on page 110. Endnotes begin on page 59.

Youth Neither Enrolled in School Nor Working

The transition from adolescence to adulthood is a critical period in each individual's life. Youth ages 16 to 19 who are neither in school nor working are detached from both of the core activities that usually occupy teenagers during this period. Detachment from school or the workforce, particularly if this situation lasts for several years, puts youth at increased risk of having lower earnings and a less stable employment history than their peers who stayed in school and/or secured jobs.[72] The percentage of youth who are not enrolled in school and not working is one measure of the proportion of young people who are at risk of limiting their future prospects.

Indicator ED6

Percentage of youth ages 16 to 19 who are neither enrolled in school nor working by gender, race, and Hispanic origin, 1984-2001



SOURCE: Bureau of Labor Statistics, Current Population Survey.

- In an average week during the 2001 school year, about 9 percent of youth ages 16 to 19 were neither enrolled in school nor working.
- The proportion of youth neither enrolled nor working has been declining since 1991, when it was 11 percent. Most of the decline in the proportion of youth neither enrolled nor working occurred among young women. In 1991, 13 percent of young women were neither in school nor working. By 2001, this proportion had decreased to 9 percent. Nevertheless, young women continue to be more likely to be detached from these activities than young men.
- Black, non-Hispanic and Hispanic youth are considerably more likely to be detached from these activities than white, non-Hispanic youth. In 2001, 13 percent of Hispanic youth and 14 percent of black, non-Hispanic youth were neither in school nor working, compared with 6 percent of white, non-Hispanic youth.
- The proportion of black, non-Hispanic youth who are neither enrolled in school nor working has decreased from 19 percent in 1984 to 14 percent in 2001. The proportion of Hispanic youth who are neither enrolled in school nor working has also decreased, from 18 percent in 1984 to 13 percent in 2001.
- Older youth, ages 18 to 19, are three times as likely to be detached from these activities as youth ages 16 to 17. In 2001, 13 percent of youth ages 18 to 19 were neither enrolled in school nor working compared with 4 percent of youth ages 16 to 17.
- In contrast to the decrease in the percentage of youth who are neither enrolled in school nor working, the percentage of youth who are both enrolled and employed increased during this period. Between 1984 and 2001, the percentage of youth ages 16 to 19 who are both enrolled and employed increased from 25 to 28 percent.

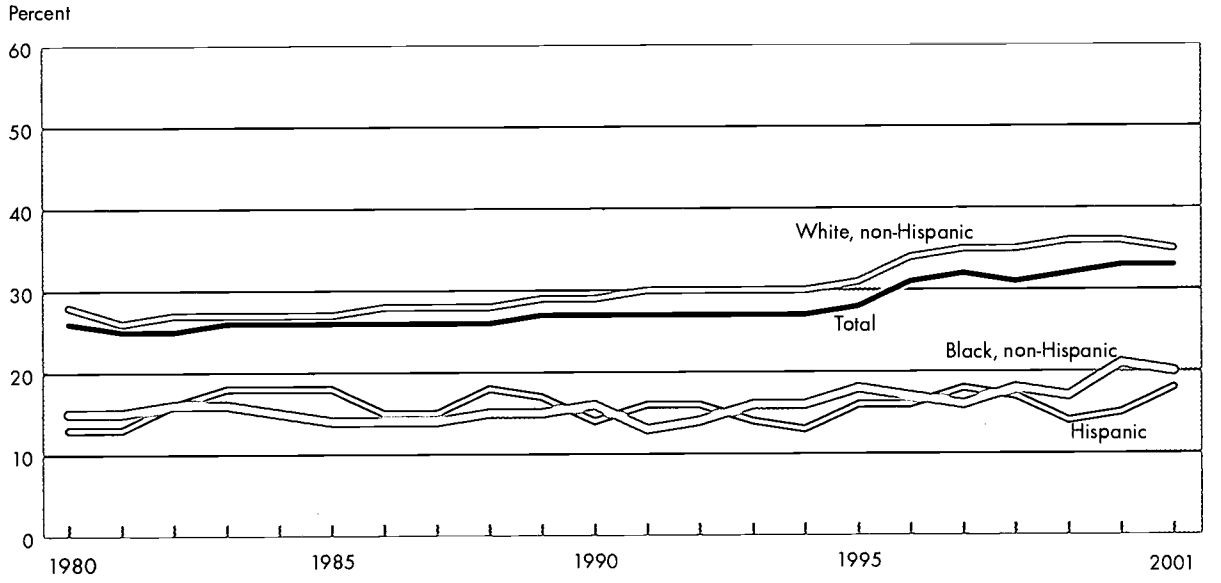
Bullets contain references to data that can be found in Tables ED6.A and ED6.B on pages 111-112. Endnotes begin on page 59.

Higher Education

Higher education, especially completion of a bachelor's or more advanced degree, generally enhances a person's employment prospects and increases his or her earning potential.[73] The percentage of high school graduates who have completed a bachelor's degree is one measure of the percentage of young people who have successfully applied for and persisted through a program of higher education.

Indicator ED7

Percentage of high school graduates ages 25 to 29 who have completed a bachelor's or more advanced degree by race and Hispanic origin, 1980-2001



NOTE: Prior to 1992, this indicator was measured as completing 4 or more years of college rather than the actual attainment of a bachelor's degree.

SOURCE: U.S. Census Bureau, March Current Population Survey. Tabulated by the U.S. Department of Education, National Center for Education Statistics.

- In 2001, 33 percent of high school graduates ages 25 to 29 had earned a bachelor's or a higher degree.
- This percentage increased between 1980 and 2001, from 26 to 33 percent; since 1996, the percentage has fluctuated between 31 and 33 percent.
- White, non-Hispanic high school graduates ages 25 to 29 were more likely than either black, non-Hispanic or Hispanic high school graduates in the same age group to have earned a bachelor's degree. In 2001, 35 percent of white, non-Hispanic, 20 percent of black, non-Hispanic and 18 percent of Hispanic high school graduates in this age group had earned a bachelor's degree or higher.
- The percentage of Hispanic high school graduates who earned bachelor's degrees or higher fluctuated between 13 percent in 1980 and 18 percent in 2001.
- The percentage of black, non-Hispanic high school graduates who earned a bachelor's degree increased from 14 percent in 1985 to 20 percent in 2001.
- In 2001, 10 percent of high school graduates ages 25 to 29 had earned an associate's degree but had not subsequently earned a bachelor's degree.

Bullets contain references to data that can be found in Table ED7 on page 113. Endnotes begin on page 59.

Education

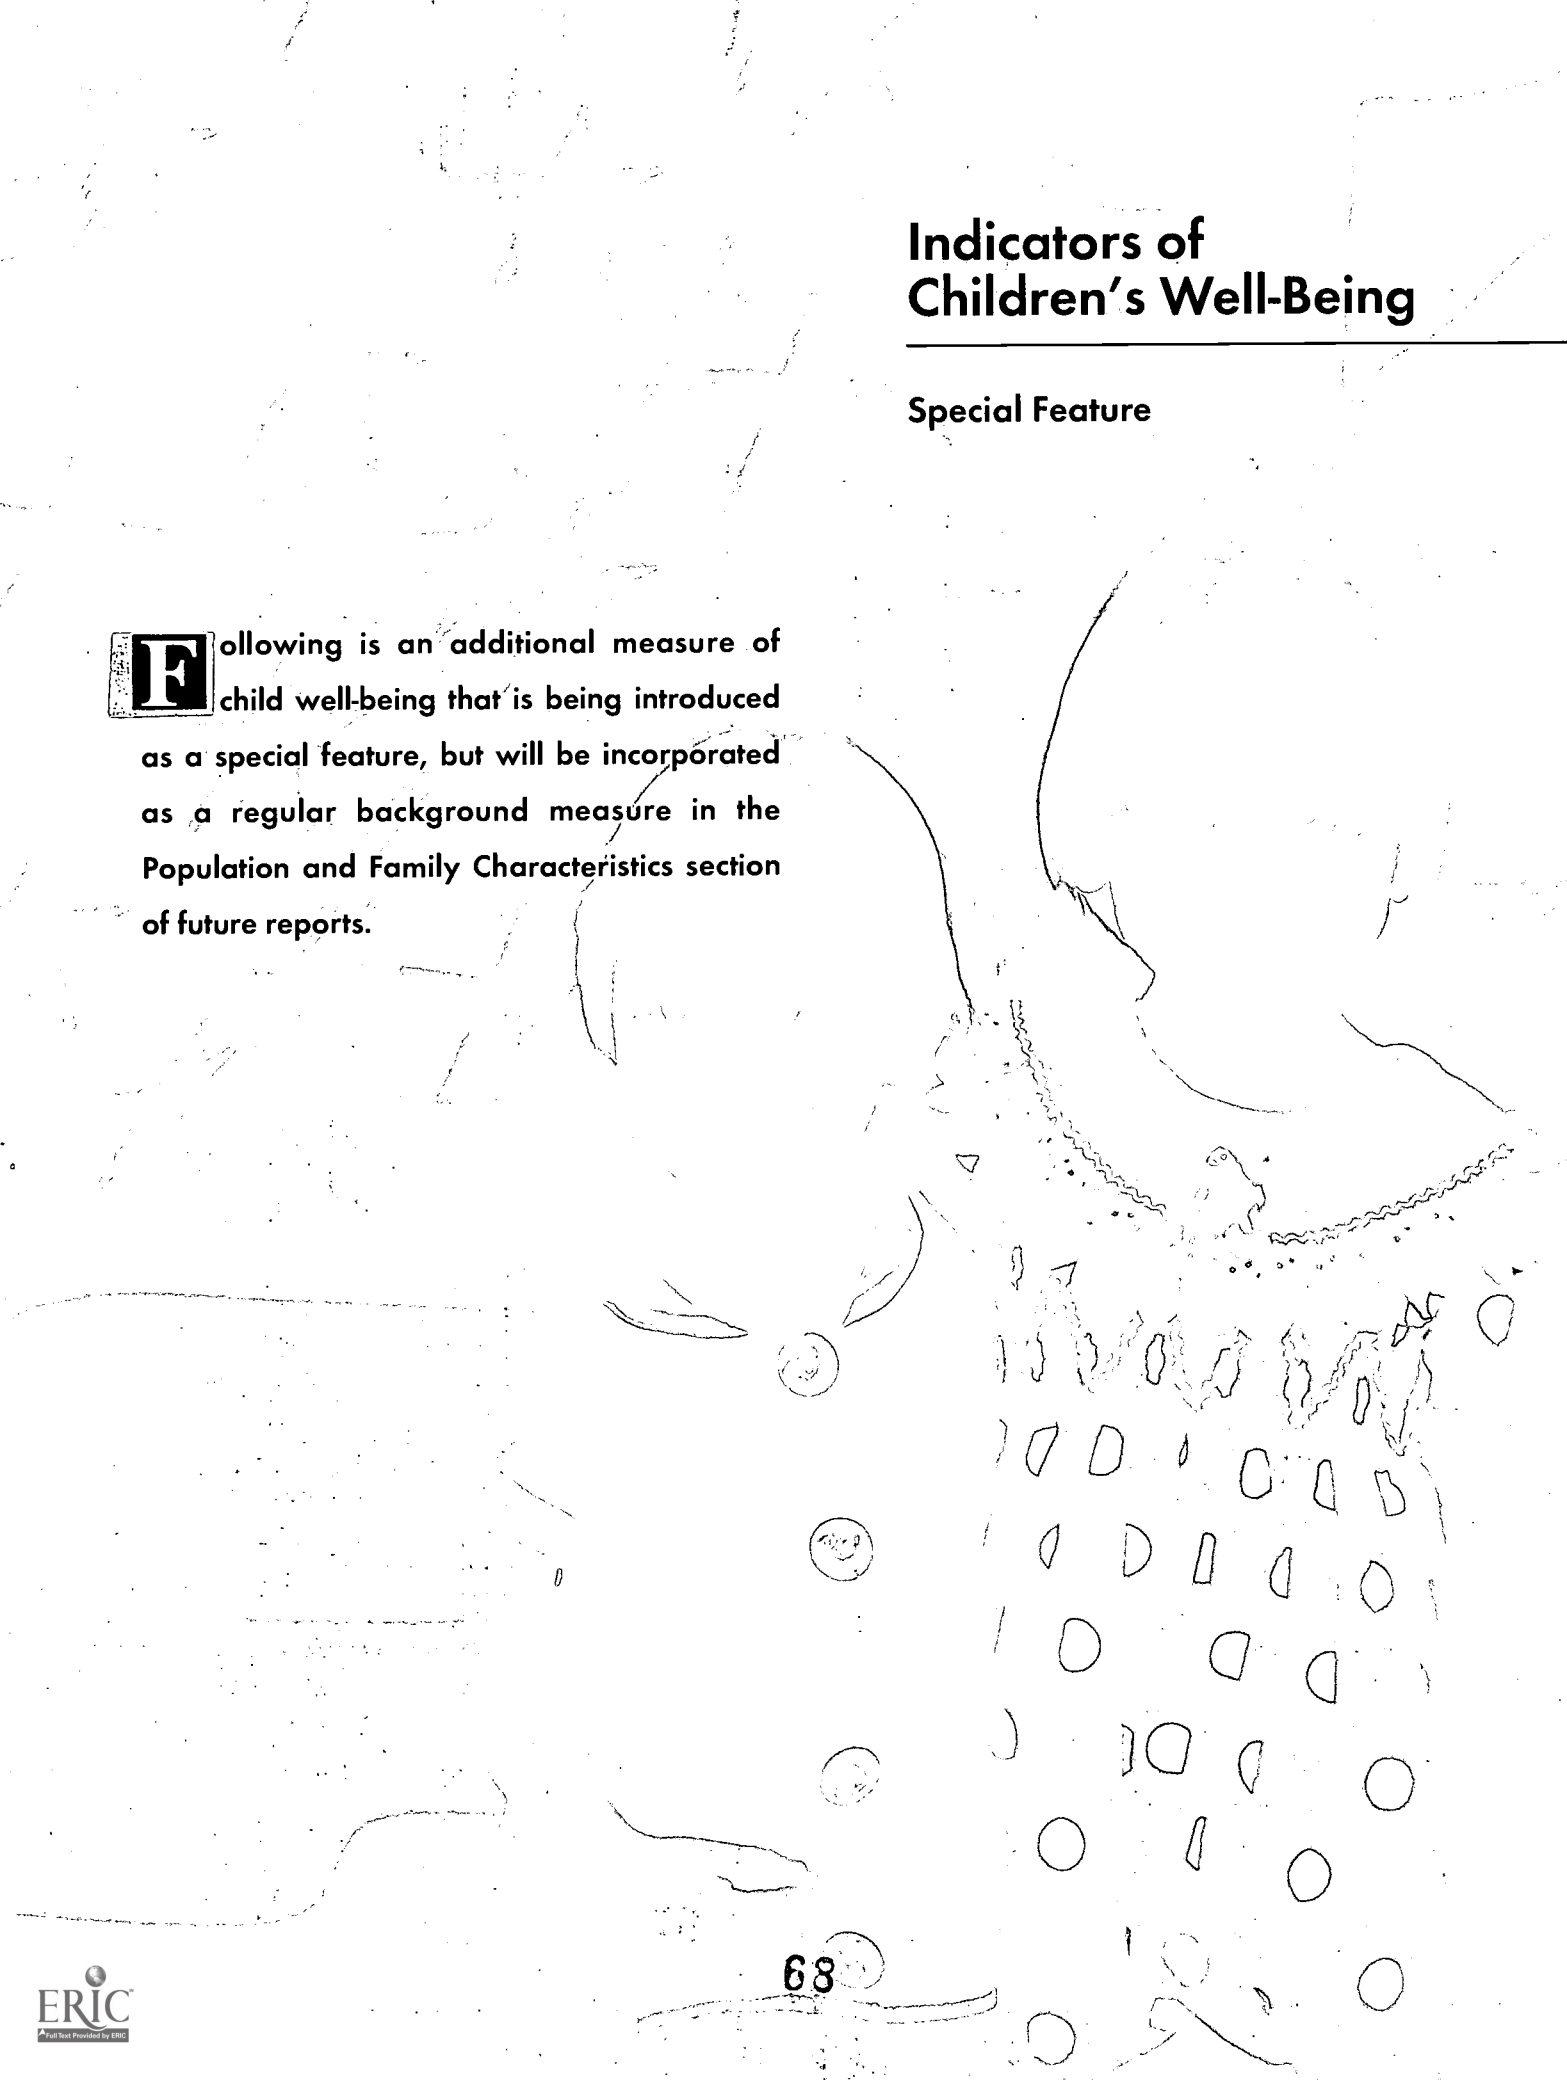
Regular, periodic data collections are needed to collect information on young children's cognitive, social, and emotional development.

- ☐ *Early childhood development.* Although this report offers indicators of young children's exposure to reading and early childhood education, a regular source of data is needed to monitor specific social, intellectual, and emotional skills of preschoolers over time. One assessment of kindergartners' skills and knowledge was presented as a special feature in *America's Children, 2000.* Another assessment of kindergartners' skills may be available in 2008.

Indicators of Children's Well-Being

Special Feature

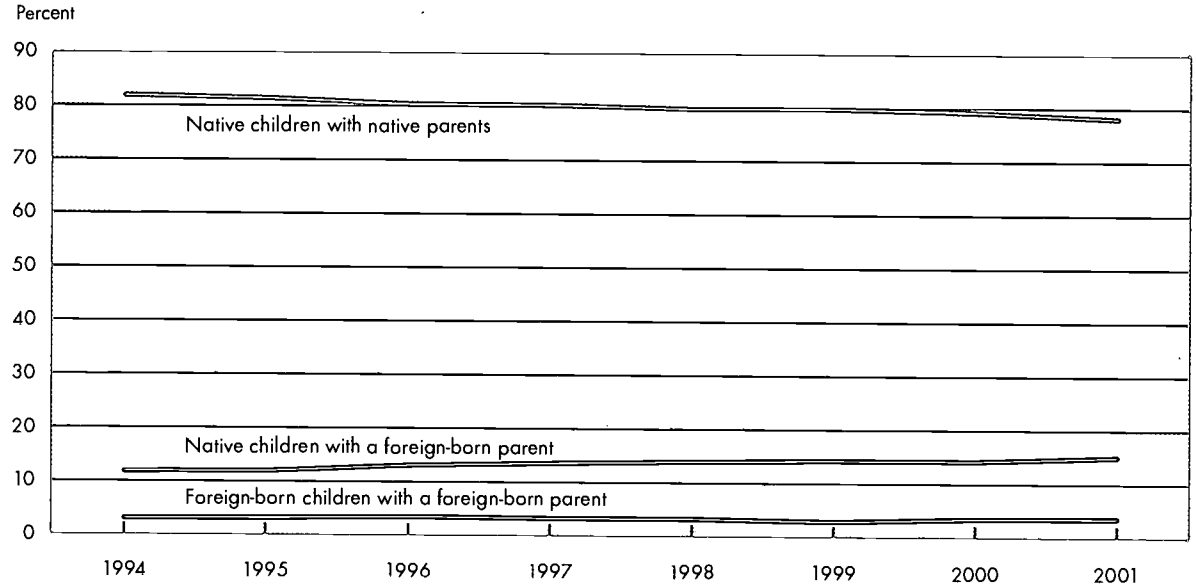
Following is an additional measure of child well-being that is being introduced as a special feature, but will be incorporated as a regular background measure in the Population and Family Characteristics section of future reports.



Children of at Least One Foreign-Born Parent

The foreign-born population of the United States has risen dramatically since 1970.[74] This increase in the past generation has largely been from Latin American and Asian areas, and represents an increase in the diversity of language and cultural backgrounds of children growing up in the United States.[75] As a result of language and cultural barriers confronting children and their parents, children with foreign-born parents may need additional resources both at school and at home to successfully progress in school and transition to adulthood. Data on the nativity of the population have been available from the Current Population Survey since 1994 and from the Decennial Census since 1850.[76]

Indicator SPECIAL **Percentage of children under age 18 by nativity of child and parents, 1994-2001**



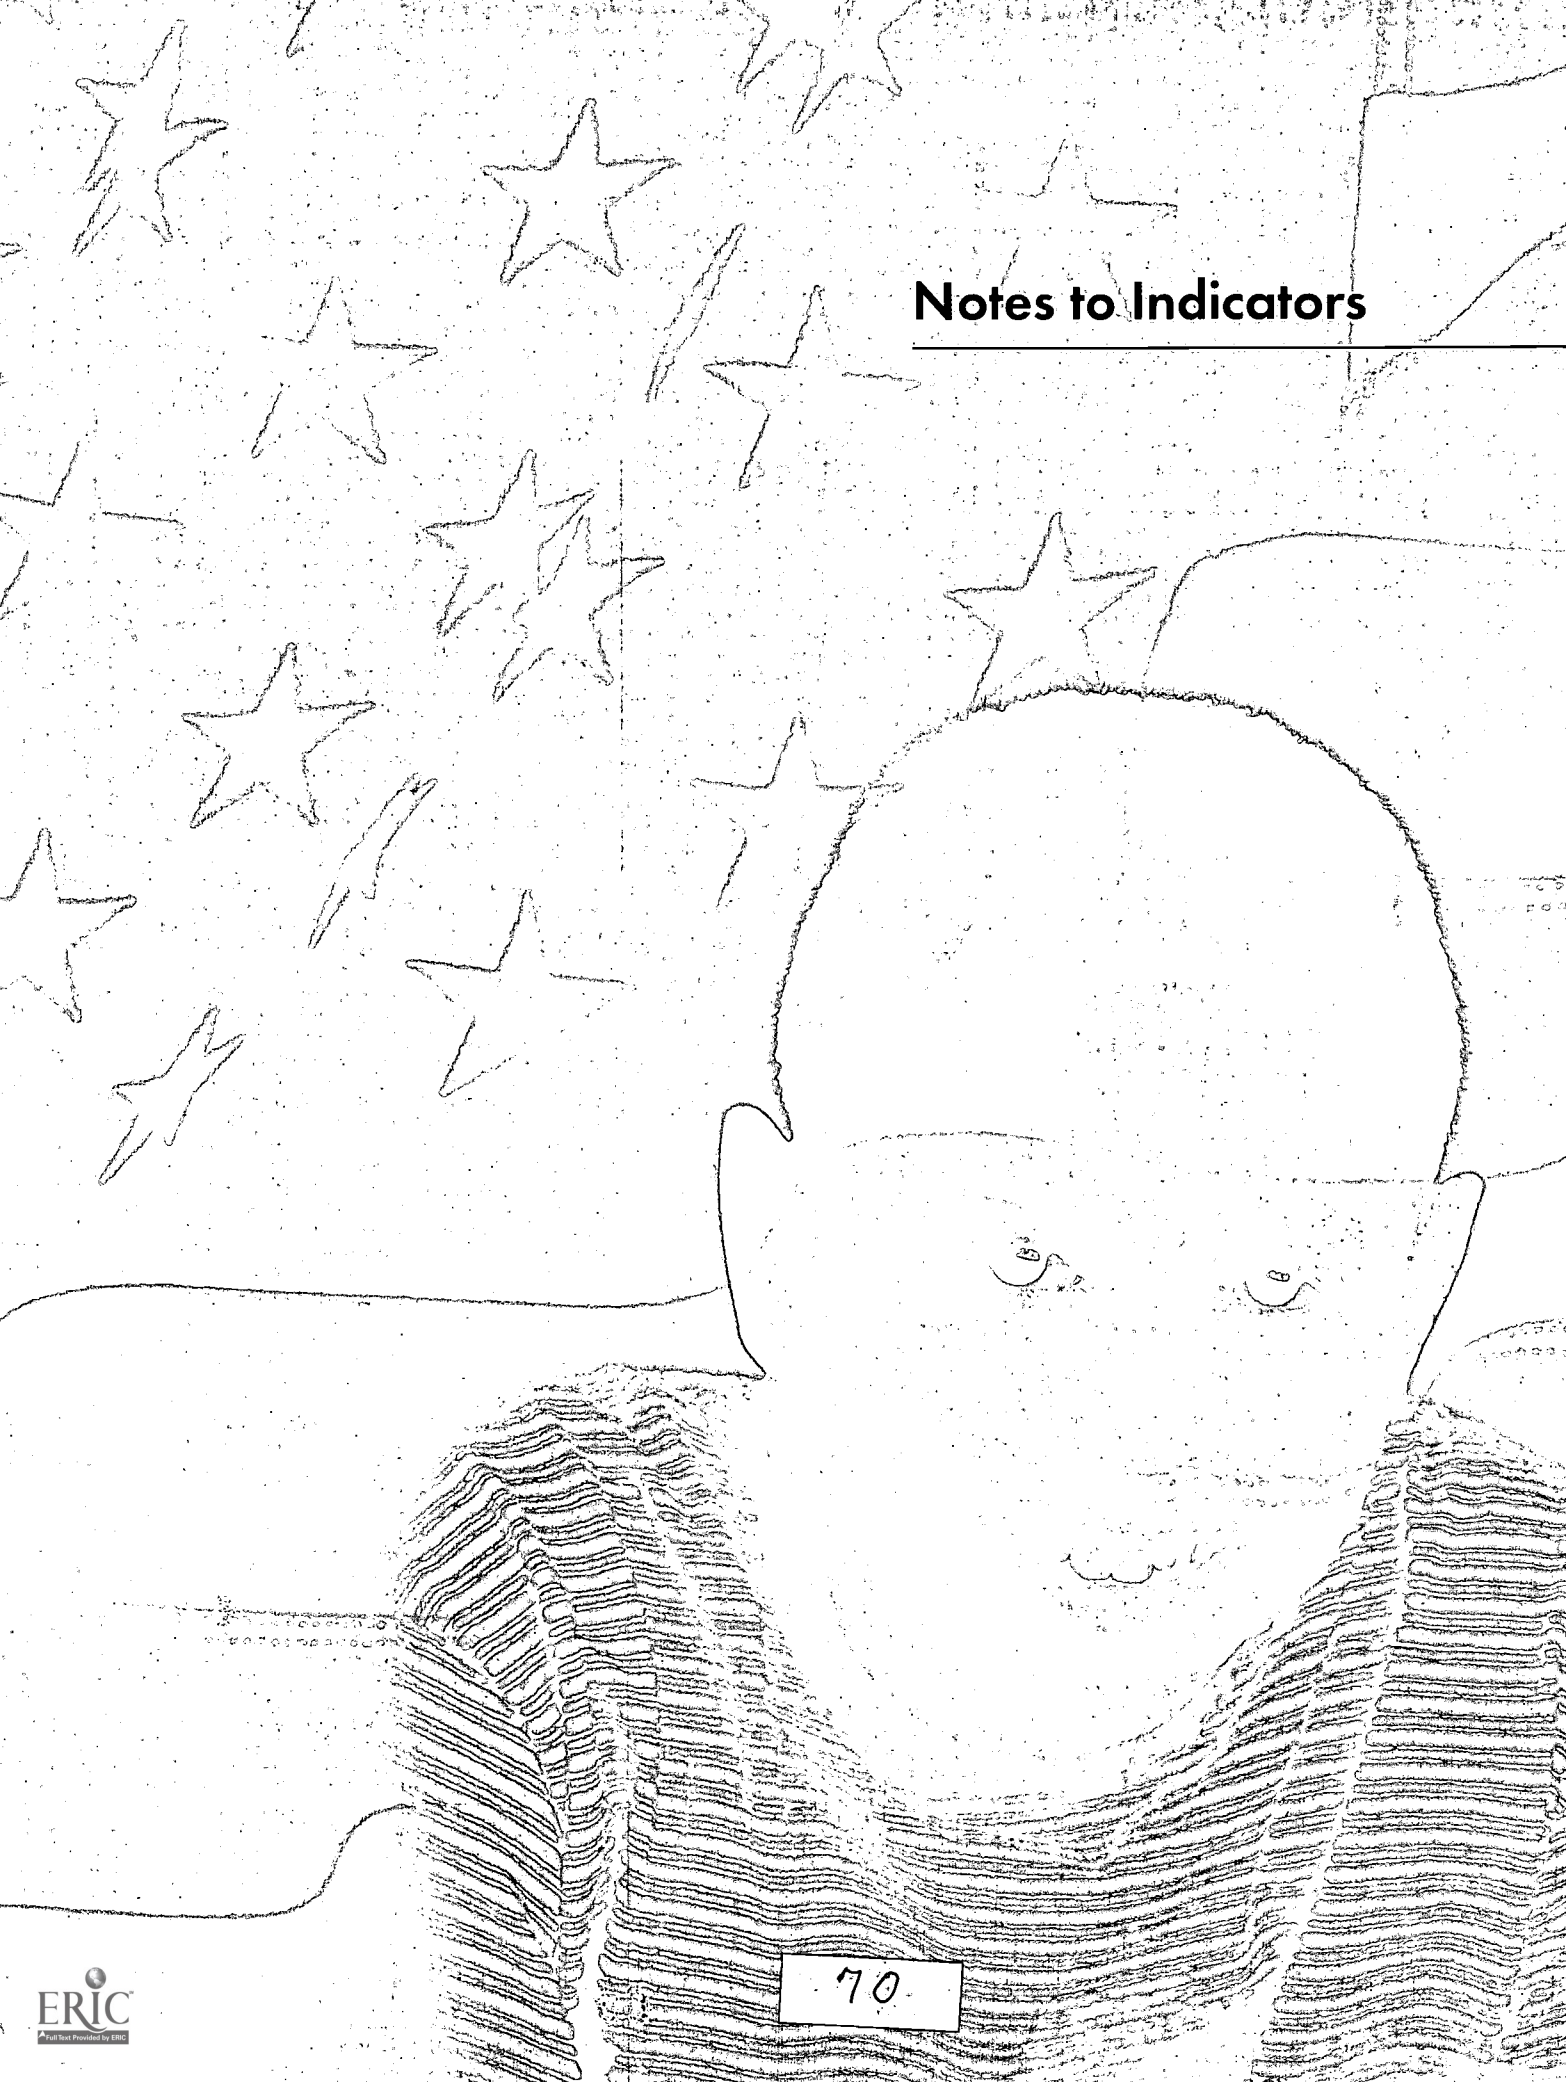
NOTE: Native parents means that all of the parents that the child lives with are native born, while foreign-born means that one or both of the child's parents are foreign-born. Anyone with United States citizenship at birth is considered native, which includes persons born in the U.S., in U.S. outlying areas, and persons born abroad with at least one American parent. Includes all children under age 18 except children in group quarters. Children living in households with no parents present are not shown in this figure, but are included in the bases for the percentages.

SOURCE: U.S. Census Bureau, March Current Population Survey.

- In 1994, 15 percent of children living in the U.S. lived with at least one parent who was foreign-born. In 2001, this percentage had increased to 19 percent.
- In 2001, 15 percent of children were native children with at least one foreign-born parent, and 4 percent were foreign-born children with at least one foreign-born parent.
- The percentage of children whose parents have less than a high school diploma is much higher among children with at least one foreign-born parent than among children with native parents. In 2001, 42 percent of foreign-born children with at least one foreign-born parent had a parent with less than a high school degree, compared with 35 percent of native children with at least one foreign-born parent and 11 percent of native children with native parents.
- In 2001, foreign-born children with foreign-born parents were more likely than native children with foreign-born parents to live below the poverty level, 28 and 20 percent, respectively.
- Children with a foreign-born parent more often live in central cities than children with native parents. In 2001, 47 percent of foreign-born children with a foreign-born parent lived in central cities, 41 percent of native children with at least one foreign-born parent lived in central cities, and only 25 percent of native children of native parents lived in central cities.
- Children with at least one foreign-born parent, regardless of their own nativity status, more often lived in households that included relatives who were not their parents. In 2001, about 32 percent of children with at least one foreign-born parent lived with any other adult relatives, compared with only 18 percent of children with native parents.

Bullets contain references to data that can be found in Table SPECIAL on page 114-115. Endnotes begin on page 59.

Notes to Indicators



[1] Adult respondents were asked if the children in the household spoke a language other than English at home and how well they could speak English. Categories used for reporting were "Very well," "Well," "Not well," and "Not at all." All those who were reported to speak English less than "Very well" were considered to have difficulty speaking English based on an evaluation of the English-speaking ability of sample children in the 1980s.

[2] The majority of children who live with neither of their parents are living with grandparents or other relatives. Some live with foster parents or other nonrelatives.

[10] Bachu, A. (1999). Trends in premarital childbearing: 1930 to 1994. *Current Population Reports,* P23-197. Washington, DC: U.S. Census Bureau.

[11] The *birth rate for unmarried women* is the number of births per 1,000 unmarried women in a given age group, for example, 20 to 24 years. The percentage of all births that are to unmarried women is the number of births occurring to unmarried women, divided by the total number of births. The *percentage of all births that are to unmarried women* is affected by the birth rate for married women, the birth rate for unmarried women (who account for nearly one-third of all births), and the proportion of women of childbearing age who are unmarried. The percentage of births to umarried women increased very slightly in recent years, because increases in the birth rate for unmarried women were offset by increases in births for married women.

[12] U.S. Census Bureau.(various years). Marital status and living arrangements (annual reports). *Current Population Reports* (Series P-20). (Beginning in 1995, reports are available on the U.S. Census Bureau website at http://www.census.gov/population/www/socdemo/ms-la.html.)

[13] National Center for Health Statistics. (2002). Unpublished tabulations.

[14] To provide a comprehensive picture of the child care arrangements parents use to care for their preschoolers, this indicator draws on the strengths of two different Federal data sets—the National Household Education Survey (NHES) and the Survey of Income and Program Participation (SIPP). Using NHES (POP7.A) data, the percentage of children in each type of arrangement is shown to provide total usage rates. Because some children are cared for by more than one type of provider, the numerator is the number of children in the particular arrangement and the denominator is all children. Using SIPP (POP7.B) data, the historical trend of the primary child care provider is

shown because there is an interest in the care arrangement that is used by employed mothers for the greatest number of hours each week. In this case, the numerator is the number of children of employed mothers who spend the greatest number of hours in the particular arrangement each week and the denominator is all children of employed mothers.

[15] Center-based care includes day care centers, nursery schools, and preschools. Other nonrelative care includes family day care providers, in-home babysitters, and other nonrelatives providing care in either the child or provider's home. Other relatives include aunts, uncles, and cousins. Mother care includes care by the mother while she worked.

[16] Since grade-school-age children differ from preschoolers in their development and have a greater need for structured activities and educational programs, the child care arrangements and enrichment activities for grade-school-age children are presented in a separate indicator.

Appendix A: Detailed Tables

Tables include data from 1950-2001, where available. Data from intervening years are available on the Forum's website at *http://childstats.gov*.

Detailed Tables

Table POP1

Child population: Number of children under age 18 in the United States by age, selected years 1950-2000 and projected 2001-20

Number (in millions)

	Estimates											Projected	
Age group	**1950**	**1960**	**1970**	**1980**	**1990**	**1995**	**1996**	**1997**	**1998**	**1999**	**2000**	**2010**	**2020**
All children	47.3	64.5	69.8	63.7	64.2	68.5	69.1	69.6	69.9	70.2	70.4	72.1	77.2
Age group													
Ages 0-5	19.1	24.3	20.9	19.6	22.5	23.6	23.3	23.1	22.9	22.8	22.8	24.0	26.3
Ages 6-11	15.3	21.8	24.6	20.8	21.6	22.6	23.0	23.4	23.8	24.0	24.1	23.4	25.6
Ages 12-17	12.9	18.4	24.3	23.3	20.1	22.4	22.7	23.1	23.2	23.4	23.5	24.6	25.2

NOTE: All population figures for the year 2000 shown here are estimates based on the 1990 Census; they do not reflect Census 2000 counts.

SOURCE: U.S. Census Bureau, *Current Population Reports,* Estimates of the population of the United States by single years of age, color, and sex: 1900 to 1959 (Series P-25, No. 311); Estimates of the population of the United States, by age, sex, and race: April 1, 1960, to July 1, 1973 (Series P-25, No. 519); Preliminary estimates of the population of the United States by age, sex, and race: 1970 to 1981 (Series P-25, No. 917); *Methodology and assumptions for the population projections of the United States: 1999 to 2100* (Population Division Working Paper No. 38); and unpublished vintage 1999 estimates tables for 1980-2000 that are available on the U.S. Census Bureau website.

Table POP2

Children as a proportion of the population: Persons in selected age groups as a percentage of the total U.S. population, and children under age 18 as a percentage of the dependent population, selected years 1950-2000 and projected 2001-20

	Estimates											Projected	
Age group	**1950**	**1960**	**1970**	**1980**	**1990**	**1995**	**1996**	**1997**	**1998**	**1999**	**2000**	**2010**	**2020**
Percentage of total population													
Ages 0-17	31	36	34	28	26	26	26	26	26	26	26	24	24
Ages 18-64	61	55	56	61	62	61	61	61	61	62	62	63	60
Ages 65+	8	9	10	11	13	13	13	13	13	13	13	13	17
Children under age 18 as a percentage of the dependent population[a]													
Ages 0-17	79	79	78	71	67	67	67	67	67	67	67	64	59

[a] The dependent population includes all persons ages 17 and under, and 65 and over.

NOTE: All population figures for the year 2000 shown here are based on the 1990 Census; they do not reflect Census 2000 counts.

SOURCE: U.S. Census Bureau, *Current Population Reports,* Estimates of the population of the United States by single years of age, color, and sex: 1900 to 1959 (Series P-25, No. 311); Estimates of the population of the United States, by age, sex, and race: April 1, 1960, to July 1, 1973 (Series P-25, No. 519); Preliminary estimates of the population of the United States by age, sex, and race: 1970 to 1981 (Series P-25, No. 917); *Methodology and assumptions for the population projections of the United States: 1999 to 2100* (Population Division Working Paper No. 38); and unpublished vintage 1999 estimates tables for 1980-2000 that are available on the U.S. Census Bureau website.

Table POP3: **Racial and ethnic composition: Percentage of U.S. children under age 18 by race and Hispanic origin, selected years 1980-2000 and projected 2001-20**

Race and Hispanic origin	Estimates									Projected	
	1980	1985	1990	1995	1996	1997	1998	1999	2000	2010	2020
White, non-Hispanic	74	72	69	67	66	66	65	65	64	59	55
Black, non-Hispanic	15	15	15	15	15	15	15	15	15	14	14
Hispanic[a]	9	10	12	14	14	15	15	16	16	21	23
Asian/Pacific Islander[b]	2	3	3	4	4	4	4	4	4	5	6
American Indian/ Alaska Native[b]	1	1	1	1	1	1	1	1	1	1	1

[a] Persons of Hispanic origin may be of any race.

[b] Excludes persons in this race group who are of Hispanic origin.

NOTE: All population figures for the year 2000 shown here are estimates based on the 1990 Census; they do not reflect Census 2000 counts.

SOURCE: U.S. Census Bureau, *Current Population Reports*, Estimates of the population of the United States by single years of age, color, and sex: 1900 to 1959 (Series P-25, No. 311); Estimates of the population of the United States, by age, sex, and race: April 1, 1960, to July 1, 1973 (Series P-25, No. 519); Preliminary estimates of the population of the United States by age, sex, and race: 1970 to 1981 (Series P-25, No. 917); *Methodology and assumptions for the population projections of the United States: 1999 to 2100* (Population Division Working Paper No. 38); and unpublished vintage 1999 estimates tables for 1980-2000 that are available on the U.S. Census Bureau website.

Table POP5

Difficulty speaking English: Children ages 5 to 17 who speak a language other than English at home, and who are reported to have difficulty speaking English[a] by race, Hispanic origin, and region, selected years 1979-99

Characteristic	1979	1989	1992	1995[b]	1999[b]
Children who speak another language at home					
Number (in millions)	3.8	5.3	6.4	6.7	8.8
Percentage	8.5	12.6	14.2	14.1	16.7
Race and Hispanic origin					
White, non-Hispanic	3.2	3.5	3.7	3.6	3.9
Black, non-Hispanic	1.3	2.4	4.2	3.0	4.5
Hispanic[c]	75.1	71.2	76.6	73.9	70.9
Other, non-Hispanic[d]	44.1	53.4	58.3	45.5	51.0
Region[e]					
Northeast	10.5	13.5	16.2	15.1	17.7
Midwest	3.7	4.9	5.6	5.9	7.5
South	6.8	10.7	11.1	11.7	14.3
West	17.0	24.2	27.2	26.4	28.8
Children who speak another language at home and have difficulty speaking English					
Number (in millions)	1.3	1.9	2.2	2.4	2.6
Percentage	2.8	4.4	4.9	5.1	5.0
Race and Hispanic origin					
White, non-Hispanic	0.5	0.8	0.6	0.7	1.0
Black, non-Hispanic	0.3	0.5	1.3	0.9	1.0
Hispanic[c]	28.7	27.4	29.9	31.0	23.4
Other, non-Hispanic[d]	19.8	20.4	21.0	14.1	11.7
Region[e]					
Northeast	2.9	4.8	5.3	5.0	4.4
Midwest	1.1	1.3	1.6	2.3	2.0
South	2.2	3.8	3.5	3.4	3.6
West	6.5	8.8	10.4	11.4	10.5

[a] Respondents were asked if the children in the household spoke a language other than English at home and how well they could speak English. Categories used for reporting were "Very well," "Well," "Not well," and "Not at all." All those reported to speak English less than "Very well" were considered to have difficulty speaking English based on an evaluation of the English-speaking ability of a sample of the children in the 1980s.

[b] Numbers in 1995 and after may reflect changes in the Current Population Survey because of newly instituted computer-assisted interviewing techniques and/or because of the change in the population controls to the 1990 Census-based estimates, with adjustments.

[c] Persons of Hispanic origin may be of any race.

[d] Most in this category are Asians/Pacific Islanders, but American Indian/Alaska Native children also are included.

[e] Regions: Northeast includes Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont. Midwest includes Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. South includes Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. West includes Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

NOTE: All nonresponses to the language questions are excluded from the tabulations, except in 1999. In 1999, imputations were instituted for nonresponse on the language items.

SOURCE: U.S. Census Bureau, October (1992, 1995, and 1999) and November (1979 and 1989) Current Population Surveys. Tabulated by the National Center for Education Statistics.

Table POP4 **Family structure and children's living arrangements: Percentage of children under age 18 by presence of parents in household, race, and Hispanic origin, selected years 1980-2001**

Race, Hispanic origin, and family type	1980	1985	1990	1995	1996	1997	1998	1999	2000	2001

– = not available

[a] Excludes families where parents are not living as a married couple.

[b] Because of data limitations, includes some families where both parents are present in the household but living as unmarried partners.

[c] Persons of Hispanic origin may be of any race.

NOTE: Family structure refers to the presence of biological, adoptive, and stepparents in the child's household. Thus, a child with a biological mother and stepfather living in the household is said to have two parents.

SOURCE: U.S. Census Bureau, Families and Living Arrangements, *Current Population Reports,* annual reports are available at (http://www.census.gov/population/www/socdemo/hh-fam.html). Detailed tables from1994-1998 are available on the U.S. Census Bureau website at (http://www.census.gov/population/www/socdemo/ms-la.html).

Table POP6.A

Births to unmarried women: Birth rates for unmarried women by age of mother, selected years 1980-2000

(Live births to unmarried women per 1,000 in specific age group)

Age of mother	1980	1985	1990	1995	1996	1997	1998	1999	2000
Total ages 15-44	29.4	32.8	43.8	45.1	44.8	44.0	44.3	44.4	45.2
Age group									
Ages 15-17	20.6	22.4	29.6	30.5	29.0	28.2	27.0	25.5	24.4
Ages 18-19	39.0	45.9	60.7	67.6	65.9	65.2	64.5	63.3	62.9
Ages 20-24	40.9	46.5	65.1	70.3	70.7	71.0	72.3	72.9	74.5
Ages 25-29	34.0	39.9	56.0	56.1	56.8	56.2	58.4	60.2	62.2
Ages 30-34	21.1	25.2	37.6	39.6	41.1	39.0	39.1	39.3	40.7
Ages 35-39	9.7	11.6	17.3	19.5	20.1	19.0	19.0	19.3	20.0
Ages 40-44	2.6	2.5	3.6	4.7	4.8	4.6	4.6	4.6	5.0

NOTE: Nonmarital birth rates for 1989-93 are somewhat understated because births to unmarried women were substantially underreported in Michigan and Texas; data since 1994 have been reported on a complete basis. Thus, the overall increase in nonmarital birth rates between 1980 and 1994 is accurately recorded here. However, the rates for 1989-93, if computed on the basis of complete data, would have been higher than the rates shown here, and the peak years for the rates would have occurred in the early 1990s rather than in 1994. Ventura, S.J., and Bachrach, C.A. (2000). Nonmarital childbearing in the United States, 1940-99. *National Vital Statistics Reports, 48* (16). Hyattsville, MD: National Center for Health Statistics.

College graduate	28	32	72	69	15	17	28	23	43	42
Mother's employment status[e]										
35 hours or more per week	12	15	88	85	33	33	32	26	39	42
Less than 35 hours per week	25	29	75	71	30	32	26	20	35	36
Looking for work	58	57	42	43	16	16	4	9	25	25
Not in the labor force	68	68	32	32	7	6	6	5	22	24

[a] Relative and nonrelative care can take place in either the child's own home or another home.

[b] Some children participate in more than one type of nonparental care arrangement. Thus, details do not sum to the total percentage of children in nonparental care.

[c] Center-based programs include day care centers, prekindergartens, nursery schools, Head Start programs, and other early childhood education programs.

[d] Persons of Hispanic origin may be of any race.

[e] Children without a mother in the home are excluded from estimates of mother's highest level of education and mother's employment status.

NOTE: Some children participate in more than one type of arrangement, so the sum of all arrangement types exceeds the total percentage in nonparental care. Center-based programs include day care centers, prekindergartens, nursery schools, Head Start programs, and other early childhood education programs. Relative and nonrelative care can take place in either the child's own home or another home.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey.

Table POP7.B **Child care: Percentage of preschoolers (children under age 5) of employed mothers by primary child care arrangement, selected years 1985-97**

Characteristic	1985	1988	1990	1991	1993	1995	1997
Type of child care (during mother's work hours)

Other[e]	–	0.0	–	0.1	0.0	2.8	8.0

– = not available

[a] Mother and father care includes care while the mother worked.

[b] Other relatives include aunts, uncles, and cousins.

[c] Center-based care includes day care centers, nursery schools, and preschools.

[d] Other nonrelative care includes family day care providers, in-home babysitters, and other nonrelatives providing care in either the child or provider's home.

[e] Other includes children in kindergarten/grade school, in a school-based activity, self care, or reported to have no regular arrangement.

NOTE: Data are available for 1985, 1988, 1990, 1991, 1993, 1995, and 1997. Poverty statistics exclude those with missing data.

SOURCE: U.S. Census Bureau, Survey of Income and Program Participation.

Table POP7.C

Child care and activities: Percentage of children in kindergarten through eighth grade by weekday care and before- and after-school activities by grade level, poverty, race, and Hispanic origin, 2001

Care arrangement or grade level and activity	Total	Poverty status		Race and Hispanic origin[a]			
		Below poverty	At or above poverty	White, non-Hispanic	Black, non-Hispanic	Hispanic	Other, non-Hispanic

Nonparental care	52.3	56.8	51.2	48.2	65.9	53.9	50.8
Home-based care[c]	21.2	25.0	20.2	19.0	28.7	23.6	15.6
Center-based care	18.1	22.6	16.9	13.9	28.2	22.2	21.3
Self care	24.5	24.6	24.5	23.5	30.4	21.3	24.7
Activities							
Any activity[b]	53.3	28.7	59.3	62.9	35.5	34.8	50.4
Arts[d]	22.9	9.6	26.2	27.1	16.6	11.8	25.1
Sports	39.0	15.8	44.7	47.3	24.2	23.4	35.3
Clubs	7.5	3.1	8.5	9.1	3.7	4.9	7.2
Academic activities[e]	9.3	7.1	9.8	8.9	11.6	6.5	12.7
Community services	11.4	5.0	12.9	13.5	6.8	7.1	13.1
Religious activities	26.5	13.5	29.7	31.7	17.5	17.0	22.0
Scouts	9.8	3.3	11.4	13.4	3.5	3.3	6.7

[a] Persons of Hispanic origin may be of any race.

[b] Children may have multiple nonparental child care arrangements, as well as be involved in more than one activity; thus the total of the three kinds of nonparental arrangements may not sum to the category, "Nonparental care category"; likewise, the seven activities listed may not sum to the category, "Any activity category." Activities include organized programs a child participates in outside of school hours that are not part of a before- or after-school program.

[c] Home-based care includes care that takes place in a relative or nonrelative's private home.

[d] Arts includes activities such as music, dance, and painting.

[e] Academic activities includes activities such as tutoring or math lab.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey.

Table POP8

Children's environments: Percentage of children under age 18 living in areas that do not meet one or more of the Primary National Ambient Air Quality Standards, 1990-2000

	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000

[a] A related child is a person under age 18 who is related to the householder by birth, marriage, or adoption, but is not the householder or the householder's spouse.

[b] Persons of Hispanic origin may be of any race.

[c] Includes children not related to the householder.

NOTE: Estimates refer to children who are related to the householder and who are under age 18. The poverty level is based on money income and does not include noncash benefits, such as food stamps. Poverty thresholds reflect family size and composition and are adjusted each year using the annual average Consumer Price Index level. The average poverty threshold for a family of four was $17,603 in 2000. The levels shown here are derived from the ratio of the family's income to the family's poverty threshold. For more detail, see U.S. Census Bureau, Series P-60, No. 214.

SOURCE: U.S. Census Bureau, March Current Population Survey, *Current Population Reports,* Consumer income, Series P-60, various years.

Table ECON1.B: **Income distribution: Percentage of related children under age 18 by family income relative to the poverty line, selected years 1980-2000**

Poverty level	1980	1985	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000

Low income	24.0	22.8	21.8	22.2	22.0	22.2	22.0	22.5	22.7	21.4	21.2	21.7	21.2
Medium income	41.4	37.7	37.0	35.7	34.9	33.4	33.7	34.5	34.0	34.4	33.5	33.0	33.6
High income	16.8	19.4	21.3	21.0	21.5	22.3	23.1	22.8	23.5	25.0	27.0	29.0	29.7
Very high income	4.3	6.1	7.4	7.0	7.3	8.4	9.1	8.9	9.2	10.1	11.2	12.4	13.0

NOTE: Estimates refer to children who are related to the householder and who are under age 18. The income classes are derived from the ratio of the family's income to the family's poverty threshold. Extreme poverty is less than 50 percent of the poverty threshold (i.e., $8,802 for a family of four in 2000). Poverty is between 50 and 99 percent of the poverty threshold (i.e., between $8,802 and $17,602 for a family of four in 2000). Low income is between 100 and 199 percent of the poverty threshold (i.e., between $17,603 and $35,205 for a family of four in 2000). Medium income is between 200 and 399 percent of the poverty threshold (i.e., between $35,206 and $70,411 for a family of four in 2000). High income is 400 percent of the poverty threshold or more (i.e., $70,412 or more for a family of four in 2000). Very high income is 600 percent of the poverty threshold and over (i.e., $105,618 or more for a family of four in 2000). [These income categories are similar to those used in the *Economic report for the President* (1998). A similar approach is found in Hernandez, D. J. (1993). *America's children: Resources from family, government, and the economy.* New York,NY: Russell Sage Foundation for the National Committee for Research on the 1980 Census, except that Hernandez uses the relationship to median income to define his categories. The medium and high income categories are similar for both methods.]

The Measurement of Poverty

The measurement of poverty used in this report is the official poverty measure used by the U.S. Census Bureau. A child is living below poverty if the child lives in a family with before-tax cash income below a defined level of need, called the poverty line. The official poverty line in use today was devised in the early 1960s based on the minimum cost of what was considered to be a nutritionally adequate diet. As originally defined, the poverty index signified the inability of families to afford the basic necessities of living, based on the budget and spending patterns of those Americans with an average standard of living. Since then, the poverty line has been updated annually for inflation using the Consumer Price Index for all urban consumers. The poverty line depends on the size of the family and the number of children in the family.

A 1995 report by the National Research Council[1] recommended changing the definition of both the poverty thresholds and the resources that are used to measure poverty. Its recommendations included the following:

Defining income: On the one hand, the definition of family income should be expanded to include other important resources of purchasing power, such as the earned income tax credit, food stamps, and housing subsidies. On the other hand, some necessary expenditures that reduce a family's resources available for basic consumption needs should be subtracted from income, such as taxes, necessary child care and other work-related expenditures, child support payments, and out-of-pocket medical expenditures.

Setting a threshold: Poverty thresholds should be adjusted to provide a more accurate measure of family income requirements. First, the consumption bundle used to derive thresholds should be based on food, clothing, and shelter, not food consumption alone. Second, thresholds should reflect regional variations in housing costs. Third, thresholds should be adjusted for family size in a more consistent way than is currently done. Finally, thresholds should be updated to reflect changes in expenditure patterns over time.

Recent U.S. Census Bureau reports[2] used key elements of the National Research Council proposal to estimate alternative poverty rates from 1990 to 1997. These estimates produced increases in child poverty from 1990 to 1993 similar to, and decreases in poverty from 1993 to 1997 somewhat larger than, those under the official measure. These changes reflect that the new measure more completely accounts for in-kind transfers, such as food stamps and housing benefits, and for work-related expenditures. As a result, the new measure tends to decrease the relative poverty rate of children who are more likely to live in families that receive in-kind transfers and to increase the relative poverty rate of children living with employed low-income persons with higher work-related expenses.

[a] Full-time, all-year employment is defined as usually working full time (35 hours or more per week) for 50 to 52 weeks.

[c] Persons of Hispanic origin may be of any race.

[d] Includes some families where both parents are present in the household, but living as unmarried partners.

SOURCE: U.S. Bureau of Labor Statistics, March Current Population Survey.

Table ECON3 **Housing problems: Percentage of households with children under age 18 that report housing problems by type of problem, selected years 1978-99**

Household type	1978	1983	1989	1993	1995	1997	1999
All households with children							
Number of households (in millions)	32.3	33.6	35.4	35.4	37.2	37.0	37.5
Percent with							
Any problems	30	33	33	34	36	36	35
Inadequate housing[a]	9	8	9	7	7	7	7
Crowded housing	9	8	7	6	7	7	7
Cost burden greater than 30 percent	15	21	24	26	28	28	28
Cost burden greater than 50 percent	6	11	9	11	12	12	11
Severe problems	8	12	10	11	12	11	11
Very-low-income renter households with children[b]							
Number of households (in millions)	4.2	5.1	5.9	6.6	6.5	6.4	6.2
Percent with							
Any problems	79	83	77	75	77	82	80
Inadequate housing[a]	18	18	18	14	13	16	15
Crowded housing	22	18	17	14	17	17	17
Cost burden greater than 30 percent	59	68	67	67	69	73	70
Cost burden greater than 50 percent	31	38	36	38	38	41	37
Severe problems	33	42	31	33	31	32	29
Rental assistance	23	23	33	33	33	31	31

[a] Inadequate housing refers to housing with "moderate or severe physical problems." The most common problems meeting the definition are lacking complete plumbing for exclusive use, having unvented room heaters as the primary heating equipment, and having multiple upkeep problems such as water leakage, open cracks or holes, broken plaster, or signs of rats.

[b] Very-low-income households are those with incomes at or below one-half the median income in a geographic area.

NOTE: Data are available for 1978, 1983, 1989, 1993, 1995, 1997, and 1999 (1978 data are based on 1970 Census weights; 1983 and 1989 data on 1980 weights; 1993, 1995, 1997, and 1999 data on 1990 weights). Moderate or severe physical problems: See definition in Appendix A of the American Housing Survey summary volume, American Housing Survey for the United States in 1999, *Current Housing Reports*, H150/99, U.S. Census Bureau, 2000. Cost burden: Expenditures on housing and utilities are greater than 30 percent of reported income. Rental assistance: Renters are either in a public housing project or have a subsidy (i.e., pay a lower rent because a Federal, State, or local government program pays part of the cost of construction, mortgage, or operating expenses). Severe problems: Cost burden is greater than 50 percent of income or severe physical problems among those not reporting housing assistance. Because of questionnaire changes, 1997 and 1999 data on assisted families, priority problems, and severe physical problems are not comparable to earlier data. See Office of Policy Development and Research, U.S. Department of Housing and Urban Development. (1998). *Rental housing assistance—the crisis continues: The 1997 report to Congress on worst case housing needs.* Washington, DC: U.S. Department of Housing and Urban Development.

SOURCE: U.S. Census Bureau and the U.S. Department of Housing and Urban Development, Annual Housing Survey and American Housing Survey. Tabulated by the U.S. Department of Housing and Urban Development.

Table ECON4.A **Food security: Percentage of children under age 18 in food-insecure households by poverty status and presence of hunger, selected years 1995-2000**

Characteristic	1995[a]	1998	1999	2000[b]
All children				
In food-insecure households	19.4	19.7	16.9	18.0
Food insecure with hunger, any member[c]	6.1	4.7	3.8	4.1
Food insecure with hunger, adult only	4.8	3.7	3.1	3.3
Food insecure with hunger, adult and child[d]	1.3	1.0	0.7	0.8
Below poverty				
In food-insecure households	44.4	48.7	44.0	47.2
Food insecure with hunger, any member[c]	15.6	14.2	11.8	11.9
Food insecure with hunger, adult only	12.2	11.2	9.6	9.7
Food insecure with hunger, adult and child[d]	3.4	3.0	2.2	2.2
At or above poverty				
In food-insecure households	11.2	12.6	10.5	11.5
Food insecure with hunger, any member[c]	3.0	2.3	1.9	2.1
Food insecure with hunger, adult only	2.4	1.8	1.5	1.6
Food insecure with hunger, adult and child[d]	0.6	0.5	0.4	0.5

[a] Data for 1995 are not precisely comparable to more recent years, due to a change in the method of screening CPS sample households into the Food Security Supplement. However, the effect for 1995 (a slight downward bias) is perceptible only for the broadest category of household food insecurity identified.

[b] Food insecurity and hunger among children in 2000 appear slightly higher than in 1999; however, this is due, in whole or in part, to variation in the data collection periods in adjacent years. Comparisons of 2000 to 1998, or of 1999 to 1995 are free of this seasonal effect and are therefore more accurate.

[c] In previous reports on America's Children this category was designated, "Food insecure with moderate or severe hunger." However, that designation failed to clarify that evidence of hunger referred to household members generally, and not specifically to the children.

[d] In previous reports on America's Children, the most severe level of food insecurity reported was designated "Food insecure with severe hunger," a range of severity in which hunger is evident for children as well as for adults and in which children's hunger is measured, indirectly and with some bias, by the household scale. The current more specific measure of children's hunger, based on the Children's Food Security Scale, supersedes the earlier measure.

NOTE: The food security measure (ECON4.A) is based on data collected annually in the Food Security Supplement to the Current Population Survey (CPS). The most severe level reported is based on the newly developed Children's Food Security Scale, while the less severe levels are based on the broader Household Food Security Scale. The three levels of severity reported are nested, in the sense that households experiencing more severe levels of insecurity are subsets of those households that experience less severe levels. The dividing lines, or designated thresholds, between the successive categories reflect a consensus judgment of an expert working group on food security measurement. For detailed explanations, see Food and Nutrition Service (2000). *Guide to measuring household food security.* Alexandria, VA: Food and Nutrition Service; Economic Research Service (2002). *Measuring the food security of children in U.S. households.* Washington, DC: Economic Research Service; and Economic Research Service (2002). *Household food security in the United States,* 2000. Needs improvement	67	78
Poor diet	7	8
1998		
At or below poverty		
Good diet	22	18[b]
Needs improvement	70	74
Poor diet	8	8[b]
Above poverty		
Good diet	29	12
Needs improvement	66	80
Poor diet	5	8[b]

[a] The 1994-96 HEI scores reflect an updated HEI methodology, therefore they are not directly comparable to previously published HEI scores.

[b] Sample size relatively small to make reliable comparisons.

NOTE: A Healthy Eating Index (HEI) score above 80 implies a good diet, an HEI score between 51 and 80 implies a diet that needs improvement, and an HEI score less than 51 implies a poor diet. See Table ECON4.D for a description of the HEI and average scores by age.

SOURCE: U.S. Department of Agriculture, Center for Nutrition Policy and Promotion, Continuing Survey of Food Intakes by Individuals.

Table ECON4.D

Healthy Eating Index: Overall and component mean scores and percentages for children, selected years 1994-96[a], 1998

Component	1994-96			1998		
	Ages 2-3	Ages 4-6	Ages 7-9	Ages 2-3	Ages 4-6	Ages 7-9
HEI score						
Overall	73.1	66.9	65.9	74.3	68.4	67.9
1. Grains	8.3	7.2	7.7	8.5	7.6	7.9
2. Vegetables	5.9	4.9	5.1	6.3	5.1	5.6
3. Fruits	7.1	5.4	4.4	7.4	5.8	5.0
4. Milk	7.2	7.3	7.6	7.4	7.7	7.6
5. Meat	6.3	5.3	5.5	6.6	5.6	5.9
6. Total fat	7.4	7.3	7.2	7.3	7.4	7.3
7. Saturated fat	5.4	5.6	5.6	5.4	5.7	6.2
8. Cholesterol	9.0	8.9	8.8	8.6	8.7	8.5
9. Sodium	8.8	8.1	6.9	8.7	7.5	6.1
10. Variety	7.7	7.0	7.2	8.0	7.5	7.7
Percentage of children meeting the dietary recommendations for each component						
1. Grains	54	27	30	57	31	34
2. Vegetables	30	16	20	35	19	22
3. Fruits	56	30	18	60	35	25
4. Milk	43	43	49	45	50	50
5. Meat	28	14	17	29	17	13
6. Total fat	40	37	35	39	38	38
7. Saturated fat	27	28	27	30	30	39
8. Cholesterol	84	83	81	82	81	78
9. Sodium	65	53	33	61	40	32
10. Variety	49	38	39	53	46	46

[a] The 1994-96 HEI scores reflect an updated HEI methodology, therefore they are not directly comparable to previously published HEI scores.

NOTE: The Healthy Eating Index (HEI) examines the diet of all Americans. The Index consists of 10 components, each representing different aspects of a healthful diet. Components 1 to 5 measure the degree to which a person's diet conforms to the U.S. Department of Agriculture's Food Guide Pyramid serving recommendations for the five major food groups: grains (bread, cereal, rice, and pasta), vegetables, fruits, milk (milk, yogurt, and cheese), and meat/meat alternatives (meat, poultry, fish, dry beans, eggs, and nuts). Component 6 measures total fat consumption as a percentage of total food energy (calorie) intake. Component 7 measures saturated fat consumption as a percentage of total food energy intake. Components 8 and 9 measure total cholesterol intake and total sodium intake, respectively. Component 10 measures the degree of variety in a person's diet. Each component of the Index has a maximum score of 10 and a minimum score of 0. Intermediate scores are computed proportionately. High component scores indicate intakes close to recommended ranges or amounts. The maximum combined score for the 10 components is 100. An HEI score above 80 implies a good diet, an HEI score between 51 and 80 implies a diet that needs improvement, and an HEI score less than 51 implies a poor diet.

Hispanic[c]	28	27	27	32	37	38	41	38	39	35	34	31	33	34

[a] Children are considered to be covered by health insurance if they had government or private coverage at any time during the year. Some children are covered by both types of insurance; hence, the sum of government and private is greater than the total.

[b] Estimates beginning in 1999 include follow-up questions to verify health insurance status. Estimates for 1999 and 2000 are not directly comparable with earlier years, before the verification questions were added.

[c] Persons of Hispanic origin may be of any race.

[d] Government health insurance for children consists mostly of Medicaid, but also includes Medicare, the State Children's Health Insurance Programs (SCHIP), and Civilian Health and Medical Care Program of the Uniformed Services (CHAMPUS/Tricare).

SOURCE: U.S. Census Bureau, unpublished tables based on analyses from the March Current Population Survey.

Table ECON5.B. **Usual source of care: Percentage of children under age 18 with no usual source of health care[a] by age, type of health insurance, and poverty status, 1993-2000**

[a] Excludes emergency rooms as a usual source of care.

[b] In 1997, the National Health Interview Survey was redesigned. Data for 1997-2000 are not strictly comparable with earlier data.

[c] Children with both public and private insurance coverage are placed in the private insurance category.

[d] As defined here, public health insurance for children consists mostly of Medicaid or other public assistance programs, including State plans. Beginning in 1999, the public health insurance category also includes the Children's Health Insurance Program (CHIP). It does not include children with only Medicare or the Civilian Health and Medical Care Program of the Uniformed Services (CHAMPUS/CHAMP-VA/Tricare).

[a] Chronic conditions usually have a duration of more than 3 months (e.g., asthma, hearing impairment, diabetes). Persons are not classified as limited in activity unless one or more chronic conditions are reported as the cause of the limitation.

[b] 1998 annual estimates for activity limitation are not shown due to an error in data collection for January-June.

[c] Persons of Hispanic origin may be of any race.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Health Interview Survey.

[a] The 4:3:1:3 combined series consists of 4 doses of diphtheria and tetanus toxoids and pertussis vaccine (DTP), 3 doses of polio vaccine, 1 dose of a measles-containing vaccine(MCV), and 3 doses of *Haemophilus influenzae* type b (Hib) vaccine.

[b] The 4:3:1 combined series consists of 4 doses of diphtheria and tetanus toxoids and pertussis vaccine (DTP), 3 doses of polio vaccine, and 1 dose of a measles-containing vaccine (MCV).

[c] Diphtheria and tetanus toxoids and pertussis vaccine.

[d] Respondents were asked about measles-containing vaccine, including MMR (measles-mumps-rubella) vaccines.

[e] *Haemophilus influenzae* type b (Hib) vaccine.

[f] The percentage of children 19 to 35 months of age who received 3 doses of hepatitis B vaccine was low in 1994, because universal infant vaccination with a 3-dose series was not recommended until November 1991.

[g] Recommended in July 1996. Administered on or after the first birthday, unadjusted for history of varicella illness (chicken pox).

[h] Persons of Hispanic origin may be of any race.

[a] Persons of Hispanic origin may be of any race.

NOTE: Excludes live births with unknown birthweight. Low-birthweight infants weigh less than 2,500 grams at birth, about 5.5 pounds. Very-low-birthweight infants weigh less than 1,500 grams, about 3.25 pounds. Trend data for births to Hispanic and white and black, non-Hispanic women are affected by expansion of the reporting area in which an item on Hispanic origin is included on the birth certificate as well as by immigration. These two factors affect numbers of events, composition of the Hispanic population, and maternal and infant health characteristics. The number of States in the reporting area increased from 22 in 1980 to 23 and the District of Columbia (DC) in 1983-87, 30 and DC in 1988, 47 and DC in 1989, 48 and DC in 1990, 49 and DC in 1991-92, and all 50 States and DC from 1993 forward. Trend data for births to Asian/Pacific Islander and Hispanic women are also affected by immigration.

* = number too small to calculate a reliable rate

[a] Beginning with data for 1995, rates are on a period basis. Earlier rates are on a cohort basis. Race-specific data for 1995-99 are weighted to account for unmatched records.

[b] Persons of Hispanic origin may be of any race.

[c] Trend data for Hispanic women are affected by expansion of the reporting area in which an item on Hispanic origin is included on the birth certificate, as well as by immigration. These two factors affect numbers of events, composition of the Hispanic population, and maternal and infant health characteristics. The number of States in the reporting area increased from 22 in 1980 to 23 and the District of Columbia (DC) in 1983-87, 30 and DC in 1988, 47 and DC in 1989, 48 and DC in 1990, 49 and DC in 1991, and all 50 States and DC from 1993 forward.

NOTE: Rates for race groups from the National Linked Files of Live Births and Infant Deaths vary slightly from those obtained via unlinked infant death records using the National Vital Statistics System because the race reported on the death certificate sometimes does not match the race on the infant's birth certificate. Rates obtained from linked data (where race is obtained from the birth, rather than the death, certificate) are considered more reliable, but linked data are not available before 1983 and are also not available for 1992-94.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics, National Linked Files of Live Births and Infant Deaths.

- = not available

[a] Total includes American Indians/Alaska Natives.

[b] Death rates for American Indians/Alaska Natives are not shown separately, because the numbers of deaths were too small for the calculation of reliable rates and American Indians are underreported on the death certificate.

[c] Trend data for Hispanics and white, non-Hispanics are affected by expansion of the reporting area in which an item on Hispanic origin is included on the death certificate, as well as by immigration. These two factors affect numbers of events, composition of the Hispanic population, and health characteristics. Tabulations are restricted to a subset of the States that include the item on the death certificate and that meet a minimal quality standard. The quality of reporting has improved substantially over time, so that the minimal quality standard was relaxed in 1992 to those areas reporting Hispanic origin on at least 80 percent of records. The number of States in the reporting area increased from 15 in 1984 to 17 and the District of Columbia (DC) in 1985; 18 and DC in 1986-87; 26 and DC in 1988; 44 and DC in 1989; 45, New York State (excluding New York City), and DC in 1990; 47, New York State (excluding New York City), and DC in 1991; 48 and DC in 1992; and 49 and DC in 1993-96; complete reporting began in 1997. The population data in 1990 and 1991 do not exclude New York City.

[d] Persons of Hispanic origin may be of any race.

[e] Cause-of-death information for 1980-98 is classified according to the Ninth Revision of the International Classification of Diseases. Cause-of-death information for 1999 is classified according to the Tenth Revision of the International Classification of Diseases.

[f] Includes deaths occurring on private property. Pedestrian deaths on public roads are included in the motor vehicle traffic-related category.

[a] Persons of Hispanic origin may be of any race. Trend data for Hispanic women are affected by expansion of the reporting area in which an item on Hispanic origin is included on the birth certificate, as well as by immigration. These two factors affect numbers of events, composition of the Hispanic population, and maternal and infant health characteristics. The number of States in the reporting area increased from 22 in 1980 to 23 and the District of Columbia (DC) in 1983-87, 30 and DC in 1988, 47 and DC in 1989, 48 and DC in 1990, 49 and DC in 1991-92, and all 50 States and DC from 1993 forward. Rates in 1981-88 were not calculated for Hispanics; black, non-Hispanics; and white, non-Hispanics because estimates for these populations were not available. Recent declines in teenage birth rates parallel but outpace the reductions in birth rates for unmarried teenagers (POP6.A). Birth rates for married teenagers have fallen sharply in the 1990s, but relatively few teenagers are married.

[a] Beginning in 1982, the question about stimulant use (i.e., amphetamines) was revised to get respondents to exclude the inappropriate reporting of nonprescription stimulants. The prevalence rate dropped slightly as a result of this methodological change.

[b] Estimates for race and Hispanic origin represent the mean of the specified year and the previous year. Data have been combined to increase subgroup sample sizes, thus providing more stable estimates.

[c] Persons of Hispanic origin may be of any race.

NOTE: Illicit drugs include marijuana, cocaine (including crack), heroin, hallucinogens (including LSD, PCP, and ecstasy (MDMA)), amphetamines (including methamphetamine), and nonmedical use of psychotherapeutics.

SOURCE: Johnston, L.D., O'Malley, P.M., and Bachman, J.G. (2001). *Monitoring the Future National Survey Results on Drug Use, 1975-2000 Volume I: Secondary School Students* (NIH Pub. No. 01-4924). NOTE: Serious violent crimes include aggravated assault, rape, robbery, and homicide. Aggravated assault is an attack with a weapon, regardless of whether or not an injury occurred, or an attack without a weapon when serious injury resulted. Robbery is stealing by force or threat of force. Because of changes in the victimization survey, data prior to 1992 are adjusted to make them comparable with data collected under the redesigned methodology. Victimization rates were calculated using population estimates from the U.S. Census Bureau's Current Population Reports. Such population estimates normally differ somewhat from population estimates derived from the victimization survey data. the rates may therefore differ marginally from rates based upon the victimization survey-derived population estimates. The preliminary data for 2000 do not include final homicide estimates. Revised numbers that reflect the final homicide estimates will be available at a later time on the Forum's website (*http://childstats.gov*). Rates may also be revised to reflect final U.S. Census Bureau population estimates for 1990-2000.

SOURCE: U.S. Department of Justice, Bureau of Justice Statistics, National Crime Victimization Survey. Federal Bureau of Investigation, Uniform Crime Reporting Program, Supplementary Homicide Reports.

Table BEH4.B **Serious violent juvenile crime rate: Number and rate of serious crimes involving youth ages 12 to 17, selected years 1980-2000**

Characteristic	1980	1985	1990	1995	1996	1997	1998	1999	2000
Rate per 1,000 youth ages 12-17									
Total	34.9	30.2	39.1	36.3	35.5	30.7	26.5	26.1	17.2
Number of serious violent crimes									
Total (in millions)	3.8	3.4	3.5	3.3	3.3	3.0	2.8	2.5	2.2
Number involving youth ages 12-17 (in thousands)	812	652	785	812	805	706	616	610	413
Percentage involving youth ages 12-17	21.3	19.4	22.4	24.7	24.7	23.2	22.2	24.1	18.8
Percentage of juvenile crimes involving multiple offenders	61.4	61.4	61.1	54.5	53.1	53.4	52.9	47.1	58.6

NOTE: This rate is the ratio of number of crimes (aggravated assault, rape, and robbery; i.e., stealing by force or threat of violence) reported to the National Crime Victimization Survey for which the age of the offenders was known or perceived to be 12 to 17 years of age, plus the number of homicides reported to police that involved at least one juvenile offender 12 to 17 years of age, to the number of juveniles in the population. Because of changes in the victimization survey, data prior to 1992 are adjusted to make them comparable to data collected under the redesigned methodology. Preliminary data for 2000 do not include final homicide estimates. Revised numbers that reflect the final homicide estimates will be available at a later time on the Forum's website (*http://childstats.gov*). Rates may also be revised to reflect final U.S. Census Bureau population estimates for 1990-2000.

[a] Estimates are based on children who have yet to enter kindergarten.

[b] Persons of Hispanic origin may be of any race.

[c] Poverty estimates for 1993 are not comparable to later years because respondents were not asked for exact household income.

[d] Children without mothers in the home are not included in estimates dealing with mother's education or mother's employment status.

[e] Unemployed mothers are not shown separately but are included in the total.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey.

Hispanic[c]	39	43	37	39	44	40
Other, non-Hispanic	53	51	57	45	66	61
Poverty status[d]						
Below poverty	44	49	45	44	52	47
At or above poverty	56	53	59	59	62	59
Family type						
Two parents	50	52	55	54	59	57
One or no parent	54	54	56	58	62	56
Mother's highest level of education[e]						
Less than high school graduate	32	33	35	37	40	38
High school graduate/GED	46	43	48	49	52	47
Vocational/technical or some college	60	60	57	58	63	62
College graduate	72	73	75	73	74	70
Mother's employment status[e]						
Worked 35 hours or more per week	59	61	60	63	65	63
Worked less than 35 hours per week	58	57	62	64	64	61
Looking for work	43	48	52	47	55	47
Not in labor force	45	44	47	43	52	47

[a] Estimates are based on children who have yet to enter kindergarten.

[b] Center-based programs include day care centers, Head Start programs, preschool, nursery school, prekindergarten, and other early childhood programs.

[c] Persons of Hispanic origin may be of any race.

[d] Poverty estimates for 1991 and 1993 are not comparable to later years because respondents were not asked for exact household income.

[e] Children without mothers in the home are not included in estimates dealing with mother's education or mother's employment status.

NOTE: Parents' level of education is the highest educational attainment of either parent. Data on parents' level of education are not reliable for 9-year-olds.

The reading proficiency scale has a range from 0 to 500:
- Level 150: Simple, discrete reading tasks
- Level 200: Partial skills and understanding
- Level 250: Interrelates ideas and makes generalizations
- Level 300: Understands complicated information
- Level 350: Learns from specialized reading materials

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), *NAEP 1999 trends in academic progress.*

Table ED4.A

High school academic coursetaking: Percentage distribution of high school graduates by the highest level of advanced mathematics courses taken, selected years 1982-98

Characteristic	1982	1987	1990	1992	1994	1998
Non- or low academic						
Total	23.9	19.6	17.2	12.5	11.9	9.3
Middle academic						
Total	48.8	49.9	51.6	49.1	49.3	48.5
Level I	30.6	26.8	25.4	22.7	22.4	20.8
Level II	18.2	23.1	26.2	26.4	26.9	27.7
Advanced academic						
Total	26.2	29.5	30.5	38.0	38.1	41.4
Level I	15.5	12.9	12.9	16.4	16.3	14.4
Level II	4.8	9.0	10.4	10.9	11.6	15.2
Level III	5.9	7.6	7.2	10.7	10.2	11.8

NOTE: Totals do not add to 100 because a small percentage of students completed no mathematics or only basic or remedial-level courses.

Mathematics academic levels are:
Nonacademic: General Mathematics I or II; Basic Mathematics I, II, or III; consumer mathematics; technical or vocational mathematics; and mathematics review.
Low academic: Pre-algebra; Algebra I (taught over 2 years); and Geometry (informal).
Middle academic I: Algebra I; plane geometry; plane and solid geometry; Unified Mathematics I and II; and pure mathematics.
Middle academic II: Algebra II and Unified Mathematics III.
Advanced academic I: Algebra III; algebra/trigonometry; algebra/analytical geometry; trigonometry; trigonometry/solid geometry; analytical geometry; linear algebra; probability; probability/statistics; statistics (other); and independent study.
Advanced academic II: Precalculus and introduction to analysis.
Advanced academic III: Advanced Placement calculus; calculus; and calculus/analytical geometry.

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond (1982); National Education Longitudinal Study of 1988 (1992); National Assessment of Educational Progress Transcript Study (1987, 1990, 1994, and 1998).

Table ED4.B

High school academic coursetaking: Percentage distribution of high school graduates by the highest level of advanced science courses taken, selected years 1982-98

Characteristic	1982	1987	1990	1992	1994	1998
Primary and secondary physical	27.2	15.8	12.9	9.8	10.1	9.4
Biology	40.0	43.2	39.0	38.9	35.9	30.5
Chemistry, physics, or both	30.6	40.2	47.5	51.1	53.5	59.6

NOTE: Totals do not add to 100 because a small percentage of students completed no science or only basic or remedial-level courses.

Science academic levels are: Primary and secondary physical: Physical science; applied physical science; earth science; college preparatory earth science; unified science; astronomy; geology; environmental science; oceanography; general physics; Basic Biology I; and consumer or introductory chemistry.
Biology: General Biology I; secondary life sciences (including ecology, zoology, marine biology, and human physiology); general or honors Biology II; and advanced placement biology.
Chemistry, physics, or both: Students completed one or more of the following: Chemistry I; Chemistry II; Physics I; or Physics II.

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond (1982); National Education Longitudinal Study of 1988 (1992); National Assessment of Educational Progress Transcript Study (1987, 1990, 1994, and 1998).

Table ED4.C High school academic coursetaking: Percentage distribution of high school graduates by the level of English courses taken, selected years 1982-98

Characteristic	1982	1987	1990	1992	1994	1998
Mix of low- and middle-level courses						
50 percent or more in low level	2.9	8.2	6.3	5.9	5.8	4.1
Less than 50 percent in low level, none in honors	7.0	14.0	13.4	12.0	11.8	9.6
Regular						
Regular[a]	77.2	56.9	61.2	58.1	57.8	57.4
Mix of middle- and high-level courses						
Less than 50 percent in honors, none in low level	5.7	7.2	6.5	7.1	7.1	8.6
50 percent or more in honors	7.1	13.7	12.7	16.9	17.6	20.3

[a] Consists of students whose English coursetaking did not fall into one of the other categories.

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond (1982); National Education Longitudinal Study of 1988 (1992); National Assessment of Educational Progress Transcript Study (1987, 1990, 1994, and 1998).

Table ED4.D High school academic coursetaking: Percentage distribution of high school graduates by the level of foreign language courses taken, selected years 1982-98

Characteristic	1982	1987	1990	1992	1994	1998
No foreign language	45.5	33.3	26.9	22.4	22.2	19.3
First-year course or less	20.4	22.6	21.2	19.9	19.8	19.2
Second-year course	19.5	24.9	30.2	32.0	32.1	31.5
Third-year course	8.9	11.9	12.9	14.8	15.0	17.4
Fourth-year/advanced placement course	5.7	7.3	8.8	10.9	10.9	12.6

NOTE: Foreign language coursetaking is based on students taking classes in Spanish, French, Latin, or German.

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond (1982); National Education Longitudinal Study of 1988 (1992); National Assessment of Educational Progress Transcript Study (1987, 1990, 1994, and 1998).

Table ED5

High school completion: Percentage of adults ages 18 to 24[a] who have completed high school by race, Hispanic origin, and method of completion, selected years 1980-2000

Characteristic	1980	1985	1990	1995[b]	1996[b]	1997[b]	1998[b]	1999[b]	2000[b,c]

Equivalent[f]	–	–	4	9	7	8	11	9	–

– = not available

[a] Excludes those enrolled in high school or below.

[b] Data for 1994 and subsequent years are not strictly comparable with data for 1980-93, because of major revisions in the Current Population Survey (CPS) questionnaire and data collection methodology and because of the inclusion of 1990 Census-based population controls in the estimation process.

[c] Method of high school completion is not reported for 2000 because of changes in General Education Development (GED) items in the October 2000 CPS School Enrollment Supplement, making the 2000 data not comparable to previous years.

[d] Percentages are not shown separately for non-Hispanic Asians/Pacific Islanders and American Indians/Alaska Natives, but they are included in the total.

[e] From 1980 to 1991, high school completion was measured as completing 4 years of high school rather than the actual attainment of a high school diploma or equivalent.

[f] Diploma equivalents include alternative credentials obtained by passing examinations such as the GED test.

[g] Persons of Hispanic origin may be of any race.

[a] Native parents means that all of the parents that the child lives with are native born, while foreign-born means that at least one of the child's parents is foreign-born. Anyone with United States citizenship at birth is considered native, which includes persons born in the U.S., in U.S. outlying areas, and persons born abroad with at least one American parent.

[b] The percent of all children is of all children under age 18, including those living with no parents and excluding children in group quarters.

[c] The poverty status groups are derived from the ratio of the family's income to the family's poverty threshold. Below 100 percent of poverty refers to children living below the poverty line, 100 percent to 199 percent of poverty refers to children living in low income households, and 200 percent of poverty and above refers to children living in medium and high income households. See ECON1.B for the income levels.

[d] An MSA is a Metropolitan Statistical Area. The United States Office of Management and Budget (OMB) defines metropolitan areas (MAs) according to published standards that are applied to Census Bureau data. The 1990 standards provide that each newly qualifying MSA must include at least: 1) one city with 50,000 or more inhabitants, or 2) a Census Bureau-defined urbanized area (of at least 50,000 inhabitants) and a total metropolitan population of at least 100,000 (75,000 in New England).

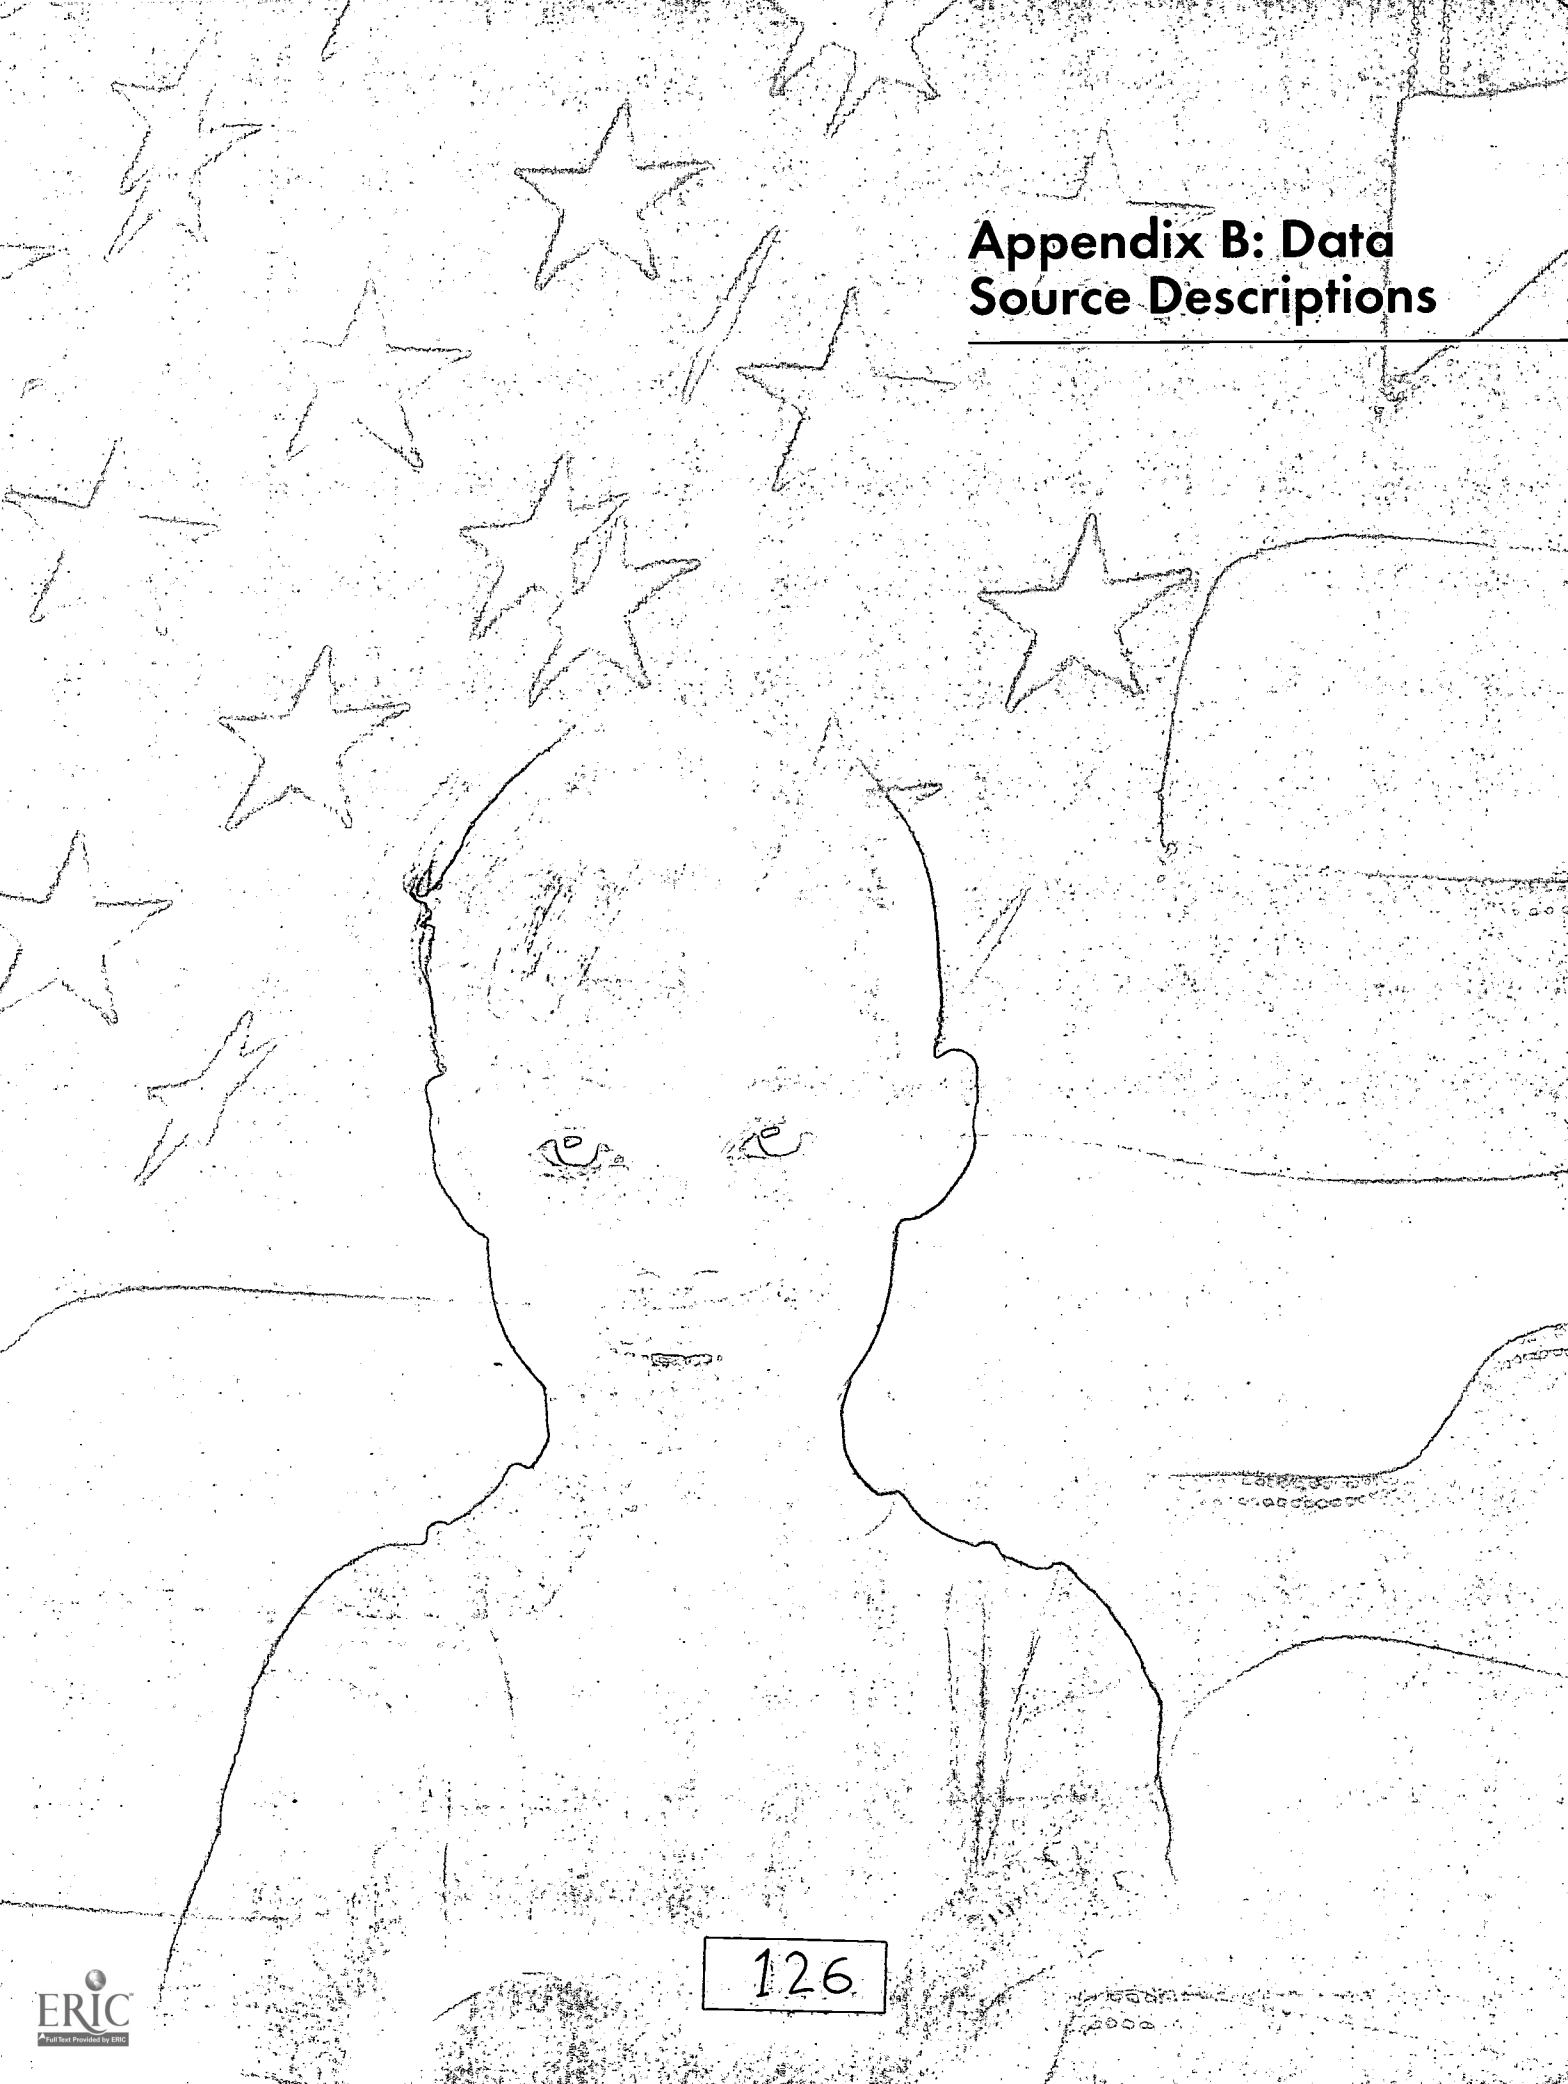
Appendix B: Data Source Descriptions



Aerometric Information Retrieval System

The Aerometric Information Retrieval System (AIRS) is a repository of information about airborne pollution in the United States and various World Health Organization (WHO) member countries. The system is administered by the U.S. Environmental Protection Agency (EPA), Office of Air Quality Planning and Standards (OAQPS), Information Transfer and Program Integration Division (ITPID), located in Research Triangle Park, North Carolina. Data on criteria pollutants consist of air quality measurements collected by sensitive monitoring equipment at thousands of sites across the Nation operated by State and local environmental agencies. Each monitor measures the concentration of a particular pollutant in the air. Monitoring data indicate the average pollutant concentration during a time interval, usually 1 hour or 24 hours.

Information on the AIRS system is available online at http://www.epa.gov/airs.

American Housing Survey

In this report, the analysis sample for the indicators that used HS&B high school transcript data consisted of all 1982 high school graduates with complete transcripts. The data come from a U.S. Census Bureau nationwide sample survey in odd-numbered years for national, regional, and metropolitan/non-metropolitan data and from surveys in 47 metropolitan statistical areas over a multi-year cycle. These data detail the types, size, conditions, characteristics, costs and values, equipment, utilities, and dynamics of the housing inventory; describe the demographic, financial, and mobility characteristics of the occupants; and give as well some information on neighborhood conditions. In 1997, the survey was conducted using computer-assisted personal interviewing for the first time, and questions on rental assistance and physical problems were also changed. Therefore, 1997 data on assisted families, priority problems, and severe physical problems are not comparable to earlier data.

Information about the American Housing Survey is available online at http://www.census.gov/hhes/www/ahs.html.

Continuing Survey of Food Intakes by Individuals

The Continuing Survey of Food Intakes by Individuals (CSFII) is designed to measure what Americans eat and drink. Uses of the survey include monitoring the nutritional adequacy of American diets, measuring the impact of food fortification on nutrient intakes, developing dietary guidance and related programs, estimating exposure of population groups to food contaminants, evaluating the nutritional impact of food assistance programs, and assessing the need for agricultural products. Individuals were asked to provide 3 consecutive days of dietary data. The 1994-96 CSFII also included individuals living in households and oversampling of the low-income population. In each of the 3 survey years, respondents were asked to provide, through in-person interviews, food intake data on 2 nonconsecutive days, with both days of intake collected by the 24-hour recall method. The 1998 sample of children ages 2 to 9 was designed as a supplement to the 1994-1996 CSFII. Dietary recall methods were the same in both samples. Intake data were provided for 3,937 children under 18 years of age in 1989-91, and 4,011 children ages 2 to 9 in 1998.

For more information on the CSFII 1989-91, see Tippett, K.S., Mickle, S.J., Goldman, J.D., et al. (1995). *Food and nutrient intakes by individuals in the United States, 1 day, 1989-91* (NFS Rep. No. 91-2). U.S. Department of Agriculture, Agricultural Research Service.

For more information on the CSFII 1994-96, see Tippett, K.S. and Cypel, Y.S. (Eds.). (1998). *Design and operation: The Continuing Survey of Food Intakes by Individuals and the Diet and Health Knowledge Survey, 1994-96* (NFS Rep. No. 96-1). U.S. Department of Agriculture, Agricultural Research Service.

Current Population Survey

Core survey and supplements. The Current Population Survey (CPS) is a nationwide survey of about 50,000 households conducted monthly for the Bureau of Labor Statistics by the U.S. Census Bureau. At present, there are 754 CPS sampling areas in the United States, with coverage in every State and the District of Columbia.

The CPS core survey is the primary source of information on the employment characteristics of the noninstitutionalized civilian population, ages 15 and older, including estimates of unemployment released every month by the Bureau of Labor Statistics.

In addition to the core survey, monthly CPS supplements provide additional demographic and social data. The March demographic supplement and the October school enrollment supplement provide information used to estimate the status and well-being of children. The March and October supplements have been administered every year since 1947. Every year, the October supplement to the CPS asks questions on school enrollment by grade and other school characteristics about each member of the household ages 3 and older. Data on the highest level of school completed or degree attained are derived from the March supplement to the CPS. The April food security supplement, introduced in 1995, is described in detail below.

In 1994, the CPS questionnnaire was redesigned, and the computer-assisted personal interviewing method was implemented. In addition, the 1990 Census-based population controls, with adjustments for the estimated population undercount, were introduced. For more information regarding the CPS, its sampling structure, and estimation methodology, see U.S. Department of Labor, Bureau of Labor Statisics. (1997). Explanatory notes and estimates of error. *Employment and Earnings, 44* (1), 225-242. A more comprehensive description of the CPS that incorporates the revisions and methodological changes introduced in 1994 may be accessed at http:// www.census.gov/prod/2000pubs/tp63.pdf.

Food security supplement. The food security supplement is a survey instrument developed through a long and rigorous process. The content of the supplement is based on material reported in prior research on hunger and food security. It was subjected to extensive testing by the U.S. Census Bureau. It reflects the consensus of nearly 100 experts at the 1994 Food Security and Measurement Conference convened jointly by the National Center for Health Statistics and the Food and Nutrition Service of the U.S. Department of Agriculture. The supplement was developed, tested, and refined further by the conferees, members of a Federal interagency working group, and survey methods specialists for the U.S. Census Bureau's Center for Survey Methods Research. The survey contains a systematic set of questions validated as measures of severity of food insecurity on both a 12-month and a 30-day basis. Data presented in this report are 12-month data from the CPS food security supplements. The respondents completing the supplement included households at all income levels, both above and below the Federal poverty threshold. Special final supplement sample weights were computed to adjust for the demographic characteristics of supplement non-interviews.

High School and Beyond

The High School and Beyond (HS&B) longitudinal survey was first administered in 1980 to a stratified, nationally representative sample of approximately 30,000 high school sophomores and 28,000 high school seniors from more than 1,000 high schools. Follow-up surveys were administered in 1982, 1984, 1986, and 1992. In-school waves (1980 and 1982) entailed the administration of a student questionnaire and a cognitive test battery. In the Base Year (1980), data were also collected from students' parents and school principals, while the teachers of sampled students were asked to complete a checklist on students' behavior and performance in class. As part of the First Follow-up, high school transcripts were collected for a probability subsample of nearly 18,500 members of the 1980 sophomore cohort. The sample design for the transcript study increased the representation of racial/ethnic minorities, private school students, dropouts, transfer students, early graduates, and students whose parents had previously completed a parent questionnaire. The mode of data collection for the out-of-school waves of the study was self-administered mail-back questionnaires in 1984 and 1986, and Computer Assisted Telephone Interviewing (CATI) in 1992. In addition, a postsecondary school transcript study was conducted of First and Second Follow-up senior cohort respondents and Third and Fourth Follow-up sophomore cohort respondents who reported attending postsecondary institutions in those waves of the study.

In this report, the analysis sample for the indicators that used HS&B high school transcript data consisted of all 1982 high school graduates with complete transcripts. Of the 15,941 students on the transcript file, 11,195 students were high school graduates with complete transcripts.

Information on the HS&B First Follow-up and the high school transcript study can be found in: Jones, C., et al. (1983). *High School and Beyond, 1980 Sophomore Cohort, First Follow-up (1982), Data File User's Manual.* Washington, DC: National Center for Education Statistics. Jones, C., et al. (1983). *High School and Beyond Transcripts Survey (1982), Data File User's Manual.* Washington, DC: National Center for Education Statistics.

Monitoring the Future

The Monitoring the Future (MTF) Study is a continuing series of surveys intended to assess the changing lifestyles, values, and preferences of American youth. Each year since 1975, high school seniors from a representative sample of public and private high schools have participated in this study. The 2001 survey is the eleventh to include comparable samples of eighth- and tenth-graders in addition to seniors. The study is conducted by the University of Michigan's Institute for Social Research (ISR) under a grant from the National Institute on Drug Abuse. The survey design consists of a multi-stage random sample where the stages include selection of geographic areas, selection of one or more schools in each selected area, and selection of a sample of students within each school. Data are collected in the spring of each year using questionnaires administered in the classroom by representatives from ISR. The 2001 survey included 13,304 high school seniors from 134 schools, 14,286 tenth-graders from 137 schools, and 16,756 eighth-graders from 153 schools (a total of 44,346 students from 424 schools).

National Assessment of Educational Progress

The National Assessment of Educational Progress (NAEP) is mandated by Congress to monitor continuously the knowledge, skills, and performance of the Nation's children and youth. To measure long-term trends in educational performance, NAEP has periodically assessed students ages 9, 13, and 17 in reading, mathematics, and science since the early 1970s. To ensure accurate measurement of trends, items and procedures have remained the same in each assessment. A variation of matrix sampling is used so that the results from a large number of items can be generalized to an entire population. Nationally representative samples of approximately 15,000 students were assessed in each subject in 1996, the last year for which results were available as of this printing. An estimated 10 percent of the school population is classified as having a disability or limited English proficiency. Nearly half of these students have been included in assessments, although the percentages

vary by grade and subject being assessed. In its short-term assessments described below, NAEP is starting to offer accommodations to disabled and limited English proficient students to remove barriers to their participation.

NAEP also conducts assessments in various academic subjects to measure short-term trends for periods of approximately 10 years. Data from many of these assessments are available for participating States as well as the Nation as a whole.

Students in public and nonpublic schools are sampled. A charter school could be sampled, since such schools are within the universe of public schools, but home-schoolers are not included.

Information about NAEP is available online at http://nces.ed.gov/nationsreportcard.

National Assessment of Educational Progress High School Transcript Studies

Conducted in association with NAEP, the High School Transcript Study (HSTS) provides coursetaking and demographic information for a nationally representative, stratified sample of high school seniors. Sample sizes have ranged from approximately 21,000 to 25,000 students in approximately 300 schools. The HSTS provides the Department of Education and other education policymakers with information regarding current course offerings and coursetaking patterns in the Nation's secondary schools. In addition, it provides information on the relationship of student coursetaking patterns to achievement as measured by NAEP. Excluded students were those who did not graduate from high school, had not received a "regular" or "honors" diploma, or did not have complete transcript data. For all transcripts and samples, a course identification code number, based on the Classification of Secondary School Courses (CSSC), was assigned to each course taken by a student. Courses were further classified into subject (e.g., mathematics) and program (e.g., academic) areas using a 1998 revision of the CSSC (Bradby, D. and Hoachlander, E.G. (1999). *1998 Revision of the Secondary School Taxonomy.* Washington, DC: National Center for Education Statistics).

More information about the NAEP HSTS can be found in U.S. Department of Education. National Center for Education Statistics. *The 1998 High School Transcript Study Tabulation: Comparative Data on Credits Earned and Demographics for 1998, 1994, 1990, 1987, and 1982 High School Graduates,* (NCES 2001-498) by Stephen Roey, Nancy Caldwell, Keith Rust, Eyal Blumstein, Tom Krenzke, Stan Legum, Judy Kuhn, Mark Waksberg, and Jacqueline Haynes.

National Crime Victimization Survey

The National Crime Victimization Survey (NCVS) is the Nation's primary source of information on criminal victimization. In earlier years, researchers obtained data from a nationally representative sample of roughly 49,000 households that include more than 100,000 persons ages 12 and older on the frequency, characteristics, and consequences of criminal victimization in the United States. In recent years, the sample size for the NCVS has been decreased. The sample for the most recent year, 2000, was 43,000 households and 80,000 persons ages 12 and older. The survey reports the likelihood of victimization by rape, sexual assault, robbery, assault, theft, household burglary, and motor vehicle theft for the population as a whole, as well as for segments of the population such as adolescents over age 11, women, the elderly, members of various racial groups, city dwellers, and other groups. Victims are also asked whether they reported the incident to the police and, in the instances of personal violent crimes, they are asked about the characteristics of the perpetrator. The NCVS provides the largest national forum for victims to describe the impact of crime and the characteristics of violent offenders. It has been ongoing since 1973 and was redesigned in 1992.

Information about the NCVS is available online at http:http://www.ojp.usdoj.gov/bjs/cvict.htm#Programs.

National Education Longitudinal Study of 1988

The National Education Longitudinal Study of 1988 (NELS:88) is a longitudinal study of the 8th-grade class of 1988 sponsored by the National Center for Education Statistics (NCES). The Base Year survey was administered to about 24,000 8th-graders in more than 1,000 schools with an 8th-grade class. The First, Second, Third, and Fourth Follow-up surveys revisited the same sample of students in 1990, 1992, 1994, and 2000 when most of the 1988 8th-graders were in 10th-grade, in 12th-grade, and then 2 and 6 years out of high school. For each in-school follow-up, the student sample was "freshened" to obtain a representative cross-sectional sample of 10th-graders (in 1990) and 12th-graders (in 1992). In-school waves entailed the administration of a student questionnaire and a battery of cognitive tests in the subject areas of mathematics, English, science, and social studies/history. Students' teachers, principals, and parents were also surveyed. In addition, as part of the Second Follow-up, high school transcripts were collected for (1) all students attending a subset of Second Follow-up schools selected for the transcript study; (2) all dropouts and dropouts attending alternative programs who had attended high school for a minimum of one term; (3) all early graduates; and (4) sample members with disabilities that prevented them from completing a questionnaire and cognitive test battery in the Base Year, First Follow-up, and Second Follow-up. Transcripts were coded using the Classification of Secondary School Courses updated for the 1990 National Assessment of Educational Progress, High School Transcript Study. Students were subsequently surveyed in the Third and Fourth Follow ups through Computer Assisted Telephone Interviewing (CATI).

In this report the analysis sample for indicators that used NELS:88 transcript data consisted of all 1992 high school graduates with complete transcripts. Of the 17,285 students on the transcript file, 13,506 students were high school graduates with complete transcripts.

Information on the NELS:88 Second Follow-up Survey and the Transcript Study can be found in Ingels, S.J., Dowd, K.L., Baldridge, J.D., Stripe, J.L., Bartot, V.H., and Frankel, M.R. (1994). *National Education Longitudinal Study of 1988 Second Follow-Up: Student Component Data File User's Manual* (NCES 94-374). Washington, DC: National Center for Education Statistics.

National Health Interview Survey

The National Health Interview Survey (NHIS) is a continuing nationwide sample survey of the noninstitutionalized civilian population in which data are collected during personal household interviews. Interviewers obtain information on personal and demographic characteristics, including race and ethnicity, by self-reporting or as reported by a member of the household. Investigators also collect data about illnesses, injuries, impairments, chronic conditions, activity limitation caused by chronic conditions, utilization of health services, and other health topics. Each year the survey is reviewed and special topics are added or deleted. For most health topics, the survey collects data over an entire year.

The NHIS sample includes an oversample of black and Hispanic persons and is designed to allow the development of national estimates of health conditions, health service utilization, and health problems of the noninstitutionalized civilian population of the United States. The response rate for the ongoing part of the survey has been between 94 and 98 percent over the years. In 1997, the NHIS was redesigned; estimates beginning in 1997 are likely to vary slightly from those for previous years. Interviewers collected information for the basic questionnaire on 100,618 persons in 2000, including 28,495 children.

Descriptions of the survey design, the methods used in estimation, and the general qualifications of the data are presented in:

Massey, J.T., Moore, T.F., Parsons, V.L., and Tadros, W. (1989). Design and estimation for the National Health Interview Survey, 1985-1994. *Vital and Health Statistics, 2* (110). Hyattsville, MD: National Center for Health Statistics.

Botman, S.L., Moore, T.F., Moriarity, C.L., and Parsons, V.L. (2000). Design and estimation for the National Health Interview Survey, 1995-2004. *Vital and Health Statistics, 2* (130). Hyattsville, MD: National Center for Health Statistics.

Additional background and health data for children are available in: Bloom, B. and Tonthat, L. (2002). Summary statistics for U.S. children: National Health Interview Survey, 1997. *Vital and Health Statistics, 10* (203). Hyattsville, MD: National Center for Health Statistics.

National Household Education Survey

The National Household Education Surveys Program (NHES), conducted by the National Center for Education Statistics (NCES), collects detailed information about education issues through a household-based survey using telephone interviews. The sample for the NHES is drawn from the noninstitutionalized civilian population in households having a telephone in the 50 States and the District of Columbia. In each survey, between 44,000 and 60,000 households are screened to identify persons eligible for one of the topics. Generally, each collection covers two topical surveys, and researchers conduct between 2,500 and 25,000 interviews for each survey. The data are weighted to permit nationally representative estimates of the population of interest. In addition, the NHES design samples minorities at a higher rate than nonminorities to increase the reliability of estimates for these groups.

The 1991 NHES included a survey on early childhood program participation. Investigators screened approximately 60,000 households to identify a sample of about 14,000 children, ages 3 to 8. They interviewed parents in order to collect information about these children's educational activities and the role of the family in the children's learning. In 1993, NCES fielded a school readiness survey in which parents of approximately 11,000 children age 3 through second grade were asked about their children's experiences in early childhood programs, developmental level, school adjustment and related problems, early primary school experiences, general health and nutrition status, home activities, and family characteristics, including family stability and economic risk factors. In 1995, NCES also fielded an early childhood program participation survey, similar to that of 1991. It entailed screening approximately 44,000 households and interviewing 14,000 parents of children from birth through third grade. In 1996, NCES fielded a survey of parent and family involvement in education, interviewing nearly 21,000 parents of children from age 3 through 12th grade. About 8,000 youth in grades 6 through 12 were also interviewed about their community service and civic involvement. The 1999 NHES was designed to collect end-of-the-decade estimates of key indicators collected in previous NHES surveys and also collected data from children and their parents about plans for the child's education after high school. Interviews were conducted with 24,000 parents of children ranging from newborns through 12th-graders, approximately 8,000 students in grades 6 through 12 in the youth interview, and nearly 7,000 adults.

Three surveys were fielded as part of the 2001 NHES. The Early Childhood Program Participation survey was similar in content to the 1995 collection and collected data about the education of 7,000 prekindergarten children ranging in age from bitth to 6. The Before- and After-School Programs and Activities survey collected data about nonparental care arrangements and educational and noneducational activities in which children participate before- and after-school. Data were collected for approximately 10,000 kindergarten through 8th graders. The third survey fielded in 2001 was the Adult Education and Lifelong Learning survey, which gathered data about the formal and informal educational activities of 11,000 adults.

Information about the NHES is available online at http://nces.ed.gov/nhes.

National Immunization Survey

The National Immunization Survey (NIS) is a continuing nationwide telephone sample survey of families with children ages 19 to 35 months. Estimates of vaccine-specific coverage are available for the Nation, the States, and 28 urban areas.

The NIS uses a two-stage sample design. First, a random-digit-dialing sample of telephone numbers is drawn. When households with age-eligible children (19-35 months) are contacted, the interviewer collects information on the vaccinations received by all age-eligible children. The interviewer also collects information on the vaccination providers. In the second phase, all vaccination providers are contacted

by mail. Providers' responses are combined with information obtained from the households to render estimates of vaccination coverage levels more accurately. Final estimates are adjusted for non-coverage of households without telephones.

Information about the NIS is available online at http://www.nisabt.org and on the NIS website at http://www.cdc.gov/NIP/coverage.

National Linked File of Live Births and Infant Deaths

The National Linked File of Live Births and Infant Deaths is a data file for research on infant mortality. Beginning with the 1995 data, this file is produced in two formats. The file is released first as a period data file and later as a cohort file. In the birth cohort format, it includes linked vital records for infants born in a given year who died in that calendar year or the next year, before their first birthday. In the period format, the numerator consists of all infant deaths occurring in one year, with deaths linked to the corresponding birth certificates from that year or the previous year. The linked file includes all the variables on the national natality file, as well as medical information reported for the same infant on the death record and the age of the infant at death. The use of linked files prevents discrepancies in the reporting of race between the birth and infant death certificates. Although discrepancies are rare for white and black infants, they can be substantial for other races. National linked files are available starting with the birth cohort of 1983. No linked file was produced for the 1992 through 1994 data years. Match completeness for each of the birth cohort files is about 98 percent.

For more information, see:

Prager, K. (1994). Infant mortality by birthweight and other characteristics: United States, 1985 birth cohort. *Vital and Health Statistics, 20* (24). Hyattsville, MD: National Center for Health Statistics.

National Vital Statistics System

Through the National Vital Statistics System, the National Center for Health Statistics (NCHS) collects and publishes data on births and deaths in the United States. NCHS obtains information on births and deaths from the registration offices of all States, New York City, and the District of Columbia.

Demographic information on birth certificates, such as race and ethnicity, is provided by the mother at the time of birth. Hospital records provide the base for information on prenatal care, while funeral directors and family members provide demographic information on death certificates. Medical certification of cause of death is provided by a physician, medical examiner, or coroner.

Information on Hispanic origin. The number of States gathering information on births to parents of Hispanic origin has increased gradually since 1980-81, when 22 States included this information on birth certificates. By 1993, the Hispanic origin of the mother was reported on birth certificates in all 50 States and the District of Columbia. Similarly, mortality data by Hispanic origin of decedent have become more complete over time. In 1997, there was complete reporting of deaths by Hispanic origin in all 50 states and the District of Columbia.

Preliminary data. NCHS continuously receives statistical records from the States' vital registration systems, providing preliminary data. Investigators weight individual records of births and deaths to independent counts of vital events registered in each State and reported to NCHS. These independent counts, aggregated for a 12-month period, serve as control totals and are the basis for the individual unit record weights in the preliminary file. For selected variables, unknown or not-stated values are imputed. The percentage not stated is generally 1 percent or less (except for prenatal care, which was 2.9 percent in 1999).

For more information on national natality and mortality data, see National Center for Health Statistics. Technical Appendix. *Vital Statistics of the United States, I (Natality) (1992),* (DHHS Publication No. (PHS) 96-1100), and *II (Mortality), Part A* (1996) (DHHS Publication No. (PHS) 96-1101). Washington, DC: Public Health Service.

Population Estimates

Decennial Census data serve as benchmarks for deriving national population estimates, which are also based on data from the following agencies: births and deaths (National Center for Health Statistics); immigrants (Immigration and Naturalization Service); Armed Forces (U.S. Department of Defense); net movement between Puerto Rico and the U.S. mainland (Puerto Rico Planning Board); and Federal employees abroad (Office of Personnel Management and U.S. Department of Defense). Similar data serve as the basis for State estimates, which are also derived from a variety of data series, including school statistics from State departments of education and parochial school systems. Current estimates are consistent with official Decennial Census figures and do not reflect estimated Decennial Census under enumeration.

After decennial population censuses, intercensal population estimates for the preceding decade are prepared to replace postcensal estimates.

For more information, see U.S. Bureau of the Census. (1998). U.S. population estimates by age, sex, race, and Hispanic origin: 1980-1997. *Current Population Reports* (PPL-91R),Washington, DC.

Information about population estimates is available online at http://www.census.gov/population/www/estimates/popest.html.

Population Projections

National population projections begin with recent population estimates by age, race, and Hispanic origin. These statistics are then projected forward to 2050, based on assumptions about fertility, mortality, and international migration. Low, middle, and high growth assumptions are made for each of these components. The current middle series assumptions are that:

- ☐ Fertility will see little change over time, with levels for each race/ethnic group converging to about 2.1 children per woman in the long run.
- ☐ Mortality will continue to improve, with life expectancy for each race/ethnic group converging to about 90 years by 2100.
- ☐ Net international migration will decline somewhat in the near term but increase after 2010, with a relatively larger portion from Asia and Africa and a relatively smaller portion from Latin America.

For more information, see U.S. Bureau of the Census. (1996). *Population projections of the United States by age, sex, race, and Hispanic origin* (1130, Series P25). Washington, DC: U.S. Bureau of the Census.

Information about population projections is available online at http://www.census.gov/population/www/projections/popproj.html.

Survey of Income and Program Participation

Core survey and topical modules. Implemented by the U.S. Census Bureau since 1984, the Survey of Income and Program Participation (SIPP) is a continuous series of national longitudinal panels, with a sample size ranging from approximately 14,000 to 36,700 interviewed households. The duration of each panel ranges from 2½ years to 4 years, with household interviews every 4 months.

The SIPP collects detailed information on income, labor force participation, participation in government assistance programs, and general demographic characteristics to measure the effectiveness of existing government programs, to estimate future costs and coverage of government programs, and to provide statistics on the distribution of income in America. In addition, topical modules provide detailed information on a variety of subjects, including health insurance, child care, adult and child well-being, marital and fertility history, and education and training. The U.S. Census Bureau releases cross-sectional, topical modules and longitudinal reports and data files.

In 1996, the SIPP questionnaire was redesigned to include a new 4-year panel sample design and the computer-assisted personal interviewing method.

Information about the SIPP is available online at http://www.sipp.census.gov/sipp.

Uniform Crime Reports

The Federal Bureau of Investigation's (FBI's) Uniform Crime Reports (UCR) Program, which began in 1929, collects information on the following crimes reported to law enforcement authorities: homicide, forcible rape, robbery, aggravated assault, burglary, larceny-theft, motor vehicle theft, and arson. Arrests are reported for 21 additional crime categories.

The UCR data are compiled from monthly law enforcement reports or individual crime incident records transmitted directly to the FBI or to centralized State agencies that then report to the FBI. In 1997, law enforcement agencies active in the UCR Program represented approximately 254 million U.S. inhabitants—94 percent of the total population. The UCR Program provides crime counts for the Nation as a whole, as well as for regions, States, counties, cities, and towns. This permits studies among neighboring jurisdictions and among those with similar populations and other common characteristics.

UCR findings for each calendar year are published in a preliminary release in the spring, followed by a detailed annual report, *Crime in the United States,* issued in the following calendar year. In addition to crime counts and trends, this report includes data on crimes cleared, persons arrested (age, gender, and race), law enforcement personnel (including the number of sworn officers killed or assaulted), and the characteristics of homicides (including age, gender, and race of victims and offenders, victim-offender relationships, weapons used, and circumstances surrounding the homicides). Other special reports are also available from the UCR Program.

Information about the UCR is available online at http://www.fbi.gov.
