ABSTRACT

This Kids Count data book examines national and statewide trends in the well being of the nation's children. Statistical portraits are based on 10 indicators of well being: (1) percent of low birth weight babies; (2) infant mortality rate; (3) child death rate; (4) rate of teen deaths by accident, homicide, and suicide; (5) teen birth rate; (6) percent of teens who are high school dropouts; (7) percent of teens not attending school and not working; (8) percent of children living in families where no parent has full-time, year-round employment; (9) percent of children living in poverty; and (10) percent of families with children headed by a single parent. Following an essay on the high cost of being poor, the bulk of the data book is comprised of national and state profiles. These profiles include information on demographics, education, economics, child health, children in low-income working families, trend data, and national rankings for each indicator. Among the findings, the data indicate that (1) two indicators, percent of low birthweight babies and percent of families with children headed by a single parent, have changed for the worse nationally; the child death rate has improved among each racial and ethnic group; (3) accidents continue to account for at least three times as many teen deaths as any other source; and (4) growth in the ranks of poor children over the past few decades has not been due to an increase in the number of welfare-dependent families but rather an increase in the number of working poor families. The report's three appendices provide standard scores and national rankings, multi-year trend data for Kids Count indicators, and multi-year national composite ranks. Definitions, data sources, criteria for selecting Kids Count indicators, and contacts for specific state projects conclude the data book. (HTH)

DATA BOOK

The Annie E. Casey Foundation

BEST COPY AVAILABLE

This *KIDS COUNT Data Book* could not be produced and distributed without the help of numerous people. The publication was assembled and produced under the general direction of Dr. William P. O'Hare, KIDS COUNT Coordinator at the Annie E. Casey Foundation, with help from Megan Reynolds.

Most of the data presented in the *Data Book* were collected and organized by the staff at the Population Reference Bureau (PRB). We owe a special debt of gratitude to Kelvin Pollard and Kerri Rivers of PRB, who worked tirelessly assembling, organizing, checking, and rechecking the figures seen here.

A special thanks goes to Rowena Johnson and her staff in the Office of Employment and Unemployment Statistics in the Bureau of Labor Statistics for providing tabulations of the Current Population Survey microdata files.

We also owe a special thanks to Martye T. Scobee of the Urban Studies Institute at the University of Louisville for providing data on the number and percent of children under age 6 in paid child care while parents work; the percent of children without Internet access at home; and the percent of children living in families where no parent has full-time, year-round employment.

Special thanks are also due Beth Clawson, Beverley Hunter, Mike Joosse, Sam Shelton, and Jenny Skillman of KINETIK Communication Graphics, Inc., who were responsible for the design of the book; Jayson Hait of eye4detail for proofreading and copyediting; and Eugenie Divine, Darcy Sawatzki, and Polly Dement at Hager Sharp Inc. for providing assistance in the promotion and dissemination of the *Data Book*.

Finally, we would like to thank the state KIDS COUNT projects listed on page 213 and the dissemination partners listed on page 222 for distributing the *Data Book* to national, state, and local leaders across the country.

Permission to copy, disseminate, or otherwise use information from this *Data Book* is granted as long as appropriate acknowledgment is given.

To obtain additional copies of this publication, call 410.223.2890 or write to the Annie E. Casey Foundation, Attn: *KIDS COUNT Data Book*, 701 St. Paul Street, Baltimore, MD 21202.

The 2003 *KIDS COUNT Data Book* can be viewed and ordered on the Internet at www.kidscount.org.

The award-winning KIDS COUNT website is designed to be the most comprehensive and user-friendly resource on the Web for data and analyses of critical issues affecting children and families. Our dynamic system allows users to search and manipulate data from KIDS COUNT Data Books, the 2000 Census, and a vast inventory of state and county administrative sources. Users of all skill levels can create tables, graphs, and maps specific to their state.

The screenshot shows the homepage of the KIDS COUNT website. At the top, there is a navigation menu with links for Home, About AECF, Initiatives & Projects, KIDS COUNT Publications, and Search. The main header features the KIDS COUNT logo and the text 'The Annie E. Casey Foundation'. Below the header, there are several content sections:

- KIDS COUNT**: A section with a 'KIDS COUNT' logo and a brief description of the organization's mission.
- 2003 data book**: A section highlighting the release of the 2003 Data Book, which includes state-by-state and national indicators of child well-being.
- online data**: A section providing information on how to access the online data tools, including a link to the '2003 Rights Start-Online'.
- kids count news**: A section with three news items:
 - KIDS COUNT announces the release of the CLKS report**: A report on the status of children in the U.S. by providing policymakers and citizens with benchmarks of child well-being.
 - Right Start 2003 online data is now live**: A report on the 2003 online data tools, which are now available for use.
 - KIDS COUNT Census Data Online first to provide 10th Congressional District data**: A report on the first release of 10th Congressional District data.
- kids count state network**: A section providing information on the state network of KIDS COUNT projects.

At the bottom of the page, there is a search bar and a footer with contact information for The Annie E. Casey Foundation.

KIDS COUNT CLIKS System Online

More Local Detail

The newest feature of our site brings together data on the well-being of children collected by KIDS COUNT network partners from state and local sources. The unique system allows users to access state-specific inventories of data from such local sources as health departments, human services agencies, and schools. We believe that CLIKS can be a powerful new tool for those who want to take a closer look at the local factors that affect the lives of children and families.

Our State Partners

Like the rest of the KIDS COUNT website, CLIKS presents the best available data on kids and families. However, with CLIKS, the Casey Foundation's website becomes a portal to finding data that are available only from local sources. A local partner maintains each state's site. With the support of the Casey Foundation, these partners have been publishing KIDS COUNT books in their states for many years.

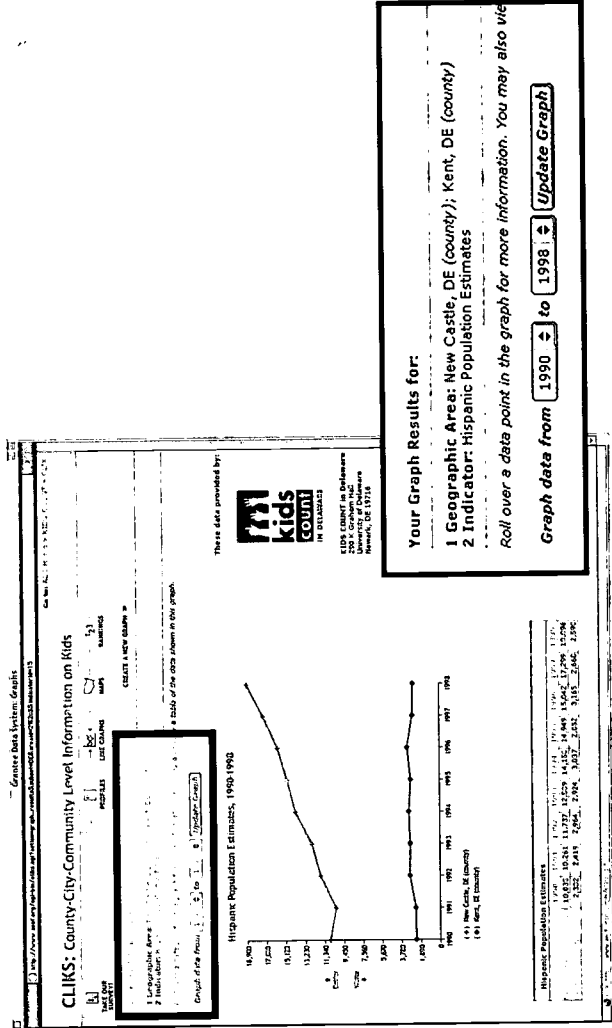

Map Local Issues

Color-coded maps tell the story of how kids are doing within each state. Make easy-to-understand maps that represent how counties or towns in *your* state are doing, relative to one another, on a number of important indicators.

Graph Local Trends

The interactive features of the CLIKS system supply Web users of all skill levels with an error-proof way to create graphs. Visitors to the site can chart the progress of a single county or select several to compare.

KIDS COUNT Census Data Online

The largest database on the KIDS COUNT website is our online census data system. We have compiled indicators of child and family well-being from the 2000 U.S. Census and organized them in a user-friendly interactive database. Visitors to our site can search for data beyond just the state level. Options also include counties, congressional districts, metropolitan areas, and New England towns. This section includes profiles, rankings, and raw data.

THE HIGH COST OF BEING POOR

Another Perspective on Helping Low-Income Families Get By and Get Ahead

Since 1990, the Annie E. Casey Foundation's *KIDS COUNT Data Book* has been a steady reminder of the risks that our nation's poorest kids face. Each year, it confirms the fundamental link between poverty and a range of negative outcomes—illness, academic failure, early pregnancy—outcomes that can powerfully diminish a child's chances of adult achievement and success. For us at Casey, it also reinforces our long-held conviction that, in general, the best way to reduce negative child outcomes is to strengthen our nation's most vulnerable families and, in particular, to increase their ability to provide some real economic security for their kids.

Much progress has been achieved on this front. Most significant, social policy reforms have helped almost 2.5 million parents transition from welfare into the workforce; and a range of important social policy investments are helping them succeed in this important transition.¹

Today, more low-income parents are holding down jobs and bringing home paychecks than at any other time in recent memory. Like all parents, they believe that their hard work and sacrifice will translate into a better life for themselves and for their children.

At the same time, even with this good news, far too many low-income parents still find severe obstacles blocking their path out of poverty. Despite their best efforts to succeed in the workplace, many find it nearly impossible to build the savings and assets that are critical for all families to achieve genuine economic security. Even though low-income parents are working harder and longer, too many continue to find it exceedingly difficult to get by and get ahead.

Clearly, many recognize and accept the importance of helping low-wage workers build the skills required to advance to higher paying jobs, particularly since many enter the labor force with limited educational credentials. However, even the best skill-building and job-advancement efforts may not be enough to move these workers to economic security unless we also address another critical—and largely ignored—issue: the very high cost of being poor in America.

The simple fact is that many low-income families, especially those living in high-poverty communities, end up paying far too much for many of life's necessities: food, shelter, transportation, credit, and financial services. Not only are the prices they pay routinely more costly, but they are often downright predatory as well. Compounding this problem is the fact that many low-income families still see their income excessively "taxed" as a result of lost or diminished financial benefits due to improved job earnings. Combined, these factors make it tough for many low-income parents to translate their increased work efforts into the economic security that they and their kids so desperately need.

In the following pages, we examine this serious issue—The High Cost of Being Poor—in greater depth and, in the context of a Casey-proposed framework, highlight how states and communities are implementing numerous programs to address the problem.

Buying and owning a car can be extremely expensive for low-income workers in poor communities—not only because they have less money to pay for a reliable car, but also because they are likely to incur excessive fees and interest rates to finance and insure their purchase.

welfare recipients found that nearly all of them lived within a quarter mile of a bus stop or subway train, yet less than one-third of potential employers were located within a quarter mile of a public transit destination.²

In rural areas public transportation is rarely an option since available jobs, especially those paying above the minimum wage, are located in distant communities. In one study, almost 98 percent of rural working families relied on personal cars for all of their local transportation.³

However, buying and owning a car can be extremely expensive for low-income workers in poor communities—not only because they have less money to pay for a reliable car, but also because they are likely to incur excessive fees and interest rates to finance and insure their purchase. Many low-wage workers, particularly those transitioning from welfare to work, have no credit or poor credit histories. Consequently, they're less attractive to mainstream lenders affiliated with franchise dealers than they are to subprime financing companies that charge much higher rates. Subprime lending refers to loans made outside the low-priced so-called prime market that serves consumers who have well-established and unblemished credit histories. Those who don't qualify for even these subprime lenders resort to "buy here/pay here" dealers who sell less costly (and often less reliable) used cars and offer initial financing to their customers at interest rates that are commonly very high.

These options often are quite costly. In general, interest rates on subprime finance company car loans are about double or triple the interest of prime-rate new car loans. For a 5-year loan with an initial principal balance of \$10,000, the difference between 6 percent

How the Poor Pay More: A Closer Look at the Issues

The High Cost of Going to Work

All working Americans face some built-in costs associated with "going to work"—transportation, child care, payroll taxes, work clothes. Although these costs are incidental for many workers, they constitute a real employment disincentive for scores of low-wage workers.

Simply getting to work, for example, can be much more expensive. For many inner-city families, owning a car is a necessity because so many jobs have moved from cities to suburban locations unconnected to public transportation systems. For example, a 1998 study of Boston

interest and 20 percent interest translates into monthly payments of about \$195 versus \$265—a significant amount of grocery money. Over the life of a 5-year loan, the extra interest totals \$4,200.⁴

Added transportation costs also result from the comparatively high price of auto insurance in low-income communities. Research indicates that drivers from inner-city neighborhoods are consistently charged higher rates, despite state laws barring car insurance redlining. For example, based on a report from Consumers Union and Public Advocates, Inc., a driver from South Central Los Angeles would pay almost five times more for car insurance than a resident of a suburb such as San Luis Obispo would pay—even if the drivers, driving records, and cars were identical in every other respect.⁵

The costs of child care—a necessity for working single moms and parents who have multiple jobs to make ends meet—also can be tough to absorb on modest earnings. Child care averages \$4,000 to \$6,000 per year in cities and states around the country, and families with younger children or with more than one child in care face even greater costs. To put this in perspective, the average annual cost of child care for a 4-year-old in an urban area center is more than the average annual cost of public college tuition in all but one state.⁶

Low-income working families have the most difficulty covering the costs of child care. Consider the example of a two-parent family with both parents working full-time jobs at minimum wage (\$21,400 a year before taxes). According to a recent survey, even if they managed to budget 10 percent of their income for child care (nonpoor families, on average, budget about 7 percent), they still would be

several thousand dollars short of what they need to afford *average-priced* child care, much less the higher prices that many better quality centers and family child-care homes charge.⁷ Although many families qualify for subsidy support through the federally funded, state-administered Child Care Development Fund, it's estimated that only 1 in 10 eligible families actually receives help.⁸

In addition to the high cost of participating in the workforce, low-income workers frequently end up paying a lot more for family health care costs than higher paid workers who are covered by their employers. In a 2002 annual survey by the U.S. Census Bureau, 83 percent of people earning \$75,000 or more reported that their employers offered health insurance, compared with only 26 percent of those earning \$25,000 or less.⁹ Low-income rural workers and their families are particularly likely to be uninsured. Nearly one-quarter of rural people under age 65 were not covered by any type of insurance.¹⁰ Many low-income families do get medical coverage, but surprising and growing percentages do not and end up buying high-cost coverage or paying out-of-pocket. The out-of-pocket costs paid by the uninsured averaged \$420 for each uninsured member of the family.¹¹ Medical coverage issues become even more significant for the 54 percent of low-wage parents who have neither paid sick leave nor vacation leave, since these workers also face potential loss of income due to family illness.¹² Low-income parents who do not have public insurance often must make difficult financial trade-offs between getting health care for themselves and their children and buying groceries, paying rent, or paying for car repairs. Even workers on Medicaid can find themselves in a quandary because if they earn too much,

then they no longer qualify for coverage.

For many uninsured workers and those who have gaps in insurance, medical *care* can quickly become medical *debt*. The Commonwealth Fund's 2001 Health Insurance Survey found that half of the uninsured have problems paying for their medical care, and a significant portion of those had been contacted by collection agencies.¹³ The average amount of medical debt was about \$9,000; however, the amount owed by those surveyed ranged from less than \$1,000 to more than \$100,000.¹⁴ For a lot of families, these medical debts become a lifetime obstacle to ever accumulating any real assets or savings.

But higher prices for transportation, child care, and health care are not the only ways the working poor end up paying more. Many of these workers also confront an "earning tax": the reduction of needs-based assistance—such as Temporary Assistance for Needy Families (TANF), child-care help, housing subsidies, and Medicaid—after they reach a certain level of income. Thus, many who previously have benefited from these support programs actually wind up losing income by working.

For example, research on welfare reform indicates that for many families in transition, benefit loss can cancel out the increased earnings derived from salaries. For example, MDRC's 6-year evaluation of Connecticut's Jobs First program¹⁵ found that the program's group's higher earnings and gains from the Earned Income Tax Credit (EITC) were largely offset by reduced welfare and Food Stamps, and increased payroll taxes. As a result, though they worked hard, their average income was about the same as when they were fully dependent on welfare. Similar findings emerged from MDRC's 6-year evaluation of Florida's Family Transition Program (FTP).¹⁷

The poor also face barriers to income-building due to income and asset restrictions associated with some supplemental government benefits that, ironically, originally were designed to move them out of poverty. For example, until recent changes to the federal rules, families seeking Food Stamps were penalized for acquiring or possessing such basic family assets as a car or savings account. Under federal rules, a family owning a vehicle worth more than about \$4,500 could be denied assistance based on the value of that asset.¹⁸

Complicating this problem was the fact that Medicaid, child care, energy assistance, and other programs applied different, and sometimes contradictory, asset and income rules.

Working parents also incur considerable costs—such as transportation, child care, and lost wages—simply applying for and attending to often complicated and redundant certification and recertification procedures. As a result, too many needy families choose not to apply for the financial help that they need. For example, more than 40 percent of households who should be eligible for Food Stamps were not receiving them in 2000.

In the end, these complicated, fragmented, and time-consuming rules can frustrate families and weaken the power of social policy reforms that promote the value of work as the most viable road to economic security.

Paying More for Basic Needs

Because many low-income families live in economically or geographically isolated neighborhoods, shopping near home means paying more for food, clothing, furniture, or any of the myriad items that all families need. Small-scale local businesses do make some essential goods

available to residents in low-income neighborhoods, yet these retailers must operate outside the economies of scale that enable larger mainstream businesses to offer more and charge less. Rural merchants' greater distance from wholesalers entails higher costs so they must charge more to cover costs and make a modest profit.

For example, families in low-income rural communities who lack access to supermarket chains pay 17.5 percent more and inner-city families pay up to 22 percent more than the U.S. Department of Agriculture-recommended budget for basic food items.¹⁹ Even when residents in low-income communities do have access to neighborhood supermarkets, they're likely to pay higher prices for similar items sold in more affluent locations. In Baltimore, a city that lost 15 percent of its supermarkets between 2000 and 2002, residents in the poorest neighborhoods sometimes pay twice as much as suburban shoppers.²⁰

Although mainstream retailers may steer clear of poor neighborhoods for a variety of reasons, exploiters often are quick to jump into the void. For example, low-income neighborhoods are flooded with "rent-to-own" outlets that have prospered in the marketplace by targeting families at the bottom third of the economic ladder. According to a recent Federal Trade Commission survey, there are more than 8,000 rent-to-own stores serving an estimated 3 million customers.²¹

The rent-to-own industry offers credit to consumers for a variety of merchandise, such as furniture and home electronics, for weekly or monthly payments that can be applied toward ownership. Rent-to-own customers routinely pay two to three times what merchandise would cost if they could afford to pay cash.

Yet, according to the industry's own figures, only about one-fourth of its customers achieve their goal of ownership.²² These outlets avoid regulation under usury laws because the customer always has the option of returning the merchandise, if, after months or even years of keeping up with the inflated rental costs, they find that they can no longer make the payments.²³

For many low-income consumers, one alternative to exploitive rent-to-own payment plans is a retail merchant-issued credit card. But the costs still can outweigh the benefit. These cards typically carry interests rates that average 21 percent, about 3 percentage points higher than bankcards, although rates vary by state.²⁴

Housing also can carry very high comparative costs for poor families, particularly for those who must rent. Although low-income people constitute the majority of renters in this country, most private market-rate rents are far higher than these families can afford. Put simply, there is no housing market in the country where a family earning today's full-time minimum wage can afford a modest two-bedroom rental, without far exceeding the accepted standard of paying 30 percent of one's income toward housing. According to the U.S.

Department of Housing and Urban Development (HUD), more than 5.4 million renter families either spend more than half of their income for housing, or live in severely distressed housing.²⁵ In the growing number of "expensive" cities, like Oakland and Boston, a family would have to earn a full-time wage of more than \$25 an hour in order to afford a two-bedroom apartment at HUD's 2003 fair market rent.²⁶

Even where affordable rental housing does exist, the demand far exceeds the supply.

Although mainstream retailers may steer clear of poor neighborhoods for a variety of reasons, exploiters often are quick to jump into the void. For example, low-income neighborhoods are flooded with "rent-to-own" outlets that have prospered in the marketplace by targeting families at the bottom third of the economic ladder.

A shortage of affordable housing, including rental housing, is an increasing problem particularly in rural America. A quarter of rural families, 5.5 million, pay more than 30 percent of their income on housing.²⁷ According to estimates, there are only about 4.8 million assisted-housing units currently available for the 13.3 million renter households earning 50 percent or less of the area median income.²⁸ One recent report estimated that in 1999, there were only 39 available and affordable units for every 100 poor renter households.²⁹

The high cost of utilities also makes it difficult for low-wage workers to stretch their incomes to meet family needs. In 2000–2001, low-income families spent almost 20 percent of their annual income on energy bills. For all other consumers, the proportion was about 4 percent. In winter, particularly in regions such as the Northeast and Midwest, the energy burden on poor families is even higher. Despite programs designed to help keep the power on for low-income families, many find themselves simply unable to pay the bill. Most states do not have regulations prohibiting utility shutoffs other than during 24-hour periods where the temperature remains below freezing. During the winter of 1997, more than 1.1 million low-income families had their heat shut off for 10 days or more because they could not pay their utility bills.³⁰

Paying More to Get Ahead

For any family, real financial security is dependent on their ability to build savings, accumulate assets, and protect themselves from emergencies and risks. Yet, for a variety of reasons, low-income families have fewer opportunities to take advantage of the basic

financial mechanisms—such as savings plans and reasonable credit—that most Americans take for granted.

One critical factor is that low-income consumers are not well served by the mainstream financial institutions that commonly provide savings and asset-building mechanisms. The fact is that low-income communities are more isolated from institutions like banks and credit unions and more likely to be served by subprime and predatory financial outlets. Between 1985 and 1995, the number of bank branches per capita declined slightly nationwide, but branches in low- and moderate-income communities accounted for most of the decline.³¹ Rural areas also have seen steep declines in mainstream banking services. In 2000, almost one in four of nonmetropolitan counties was served by two or fewer banks.³²

The Federal Reserve estimates that about 13.2 percent of American households don't have a checking account and that about 9.5 percent of American households don't have any type of bank account. As one recent report detailed, the demographics of the “unbanked” are striking. The unbanked are disproportionately poor, minority, younger, and less educated than the general population.³³

As mainstream financial institutions pulled out of poor urban and rural communities, check-cashing outlets, payday lenders, and other fringe industries often moved in. Clearly, many unbanked residents appreciate these services because they provide convenient ways to cash paychecks, make payments, and draw cash in an emergency. In addition, checks clear without a waiting period so customers get their money immediately. However, the high fees and business practices of these outlets,

For any family, real financial security is dependent on their ability to build savings, accumulate assets, and protect themselves from emergencies and risks. Yet, for a variety of reasons, low-income families have fewer opportunities to take advantage of the basic financial mechanisms—such as savings plans and reasonable credit—that most Americans take for granted.

which tend to strip rather than build consumer wealth, can counterbalance these conveniences.

The alternative financial service industry has grown dramatically, and the check-cashing industry, in particular, has exploded in scale and profitability in recent years. In many low-income communities, it's much easier to find a check-cashing outlet than a bank. In Chicago's poorest neighborhoods, the ratio of check-cashing outlets to banks is nearly 10:1.³⁴ One study found that about 11,000 check-cashing stores were in business in 2000, almost double the number 5 years before.³⁵

Although low-income consumers can cash checks without the maintenance fees and minimum balances required by many banks, they may end up paying much more, piecemeal, than if they had a bank account. For a worker who takes home \$16,000 a year, for example, average check-cashing fees (2.34 percent of face value) add up to about \$374 a year.³⁶ In other words, lots of low-wage workers spend 2 percent to 3 percent of their income simply to get their salary. Immigrants who also send significant portions of their income to family abroad incur additional costs in wire and transfer fees, typically around \$15 for \$200 (the usual monthly amount, for example, sent by Latino immigrants who earn less than \$25,000 a year).³⁷

Another burgeoning wealth-stripping business gaining ground in many poor neighborhoods is expensive professional tax-preparation services that help eligible families navigate the complex EITC application process and get a quick electronic refund. This expedited refund is actually a "refund anticipation loan" (RAL) with a very high annualized interest rate, ranging from 67 percent to close to 800

percent.³⁸ In reality, the average \$200 fee enables claimants to receive their money only about 8 to 10 days sooner; and error rates across these services are about the same as when consumers complete the application themselves. Overall, in 1999, at least \$1.75 billion in EITC benefits to poor families were used to pay for these preparation and quick-refund services.³⁹

Due to the absence of available and affordable mainstream credit options, the payday loan industry also dominates low-income financial markets by providing services for high fees. In the 1990s, the number of payday lenders expanded from about 300 stores to more than 8,000 stores.⁴⁰ Payday loans are small cash advances based on a personal check held by the lender for future deposit (alternatively, the lender may require electronic access to a consumer's bank account). These loans range from \$100 to \$500 and are due in full on the borrower's next payday or within 14 days.⁴¹ The problem arises when the borrower cannot make the repayment on time—a common scenario, given that these loans are targeted to consumers living paycheck-to-paycheck, often with no reserve. In these instances, the loan is rolled over again and again, so that the borrower ends up in perpetual debt, sometimes paying an average Annual Percentage Rate of 470 percent.⁴²

For example, if a borrower takes a loan for \$200, the payday lender holds their personal check in the amount of \$200 plus fees for a total of \$230. If, at the end of 2 weeks, the overextended borrower cannot repay the loan, then they are faced with two options: allow the check to bounce, or pay to extend the loan. The first option carries with it the

threat of “bad” check charges or prosecution—which can add to already poor credit histories. The second option will cost the borrower an additional fee of \$30 each time the loan is carried forward. If it takes 3 months to repay the principal, then the borrower will pay a total of \$180 in fees for a \$200 loan.

Insufficient access to mainstream credit, however, can have its most dramatic effect when low-income consumers try to make the type of asset purchases that build long-term equity, such as homes. Homes constitute an important source of wealth for all Americans and the most important one for homeowners in lower income brackets. Among homeowners with incomes under \$20,000, half held nearly 72 percent of their wealth in home equity.

Homeownership constitutes an even greater share of personal wealth for minorities than for white Americans: Home equity represents more than 80 percent of the net worth for African-American and Hispanic homeowners.⁴³ Not only does equity provide homeowners with a relatively stable investment, but it also gives them an asset that can be leveraged to survive crises (such as illness or unemployment), or to help themselves or their children get ahead (for example, by financing a college education, or buying the car needed to drive to a better job).

A lot of low-income families, however, find the path to home ownership filled with pitfalls—not because real estate prices in poor neighborhoods are so high, but because of the often-scandalous credit rates they’re required to pay. Inner-city neighborhoods have become the favored market for subprime lenders who offer loans that can cost a borrower up to \$20,000 more in interest than, for example,

a Fannie Mae loan. Increasing numbers of rural low-income families are being pushed into mobile homes. Since such homes must be financed as personal property, they are more expensive to finance and do not appreciate in value. Subprime lenders market aggressively in low-income communities, steering otherwise qualified borrowers away from prime loans and into the high-cost market.

The difference between a prime and subprime loan for the borrower’s pocketbook is substantial. For example, a homebuyer paying a subprime 13 percent mortgage interest rate on a loan of \$107,500 will owe \$514 a month more than the homebuyer holding a prime 7 percent mortgage. Over the life of a 30-year mortgage, the holder of the subprime loan will pay \$184,997 more than the prime-rate borrower of the same amount.⁴⁴

Particularly since the early 1990s, lenders who take advantage of borrowers by inducing them to agree to mortgages with terms that they cannot realistically meet increasingly have targeted low-income homebuyers and refinancers. These “predatory lenders” differ from the legitimate subprime lenders who provide access to credit to genuinely high-risk borrowers on honest terms. In contrast, predatory lenders exploit the flexibility allowed in the largely unregulated subprime market and zero-in on customers who have limited information and experience in the area of credit and banking. These victims, including many borrowers who actually could qualify for prime interest rate loans, are sold high-interest loans hedged with crippling conditions—including excessive fees and balloon payments—that can strip them of cash and equity and ruin borrowers in the long term.

Too many Americans pay more because their incomes are low. They pay more to participate in the workforce; they pay more to provide the basics for their families; and they pay more for the basic financial mechanisms that families need to save, build assets, and get ahead.

According to the Mortgage Bankers Association, in the 3 months that ended in June 2002, creditors across the country began foreclosures on 134,885 mortgaged homes, or about 4 in every 1,000—the highest rate in the 30 years that the association has been monitoring mortgages. The backlog of foreclosed homes reached 414,772, another record.⁴⁵ In the city of Baltimore alone, foreclosure rates rose 400 percent between the early 1990s to the end of the decade, as a result of corruption and predatory lending in FHA-insured mortgages, conventional loans, and refinancing.⁴⁶

Foreclosures among the 26.4 million families with conventional loan terms are relatively rare, but among those with subprime rates and especially those with “predatory” terms, the rate is dreadfully high. On average, consumers with subprime mortgages, which were rare 5 years ago but are commonplace now, were eight times more likely to lose their home in default than those with prime, conventional mortgages.⁴⁷ For those who do not lose their homes to default, there are still very high costs in the forms of hefty fees, penalties, and inflated interest rates. The costs of predatory lending practices (equity stripping, rate-risk disparities, and excess foreclosures) to American consumers top \$9 billion a year.⁴⁸

Overall, the amount of money lost to low-income families and to communities themselves as a result of income-stripping financial services and predatory practices is enormous. The Fannie Mae Foundation put the total annual costs of fees paid from four high-cost financial service industries at more than \$5.45 billion.⁴⁹

Low-income families are commonly one crisis away from economic catastrophe. Even in the best of times, they can't leverage their earnings into real, lasting prosperity for themselves and their kids. Lack of assets means entrenched, intergenerational poverty for millions of Americans, no matter how hard they work.

The Implications of the High Cost of Being Poor
Too many Americans pay more because their incomes are low. They pay more to participate in the workforce; they pay more to provide the basics for their families; and they pay more for the basic financial mechanisms that families need to save, build assets, and get ahead. They have less to spend and have to work even harder to get the most value for their money. Above all, they are least able to develop an economic cushion to help them through tough times.

The modesty of their earnings, combined with the failures of their local markets and public policy, leave low-wage workers and their families in a state of asset poverty. They can't save enough to acquire assets because a disproportionate share of their income goes into paying for subsistence. And, they frequently can't borrow to acquire assets because the business practices of the credit industry—both mainstream institutions and predatory lenders—work against them.

As a result, low-income families are commonly one crisis away from economic catastrophe. Even in the best of times, they can't leverage their earnings into real, lasting prosperity for themselves and their kids. Lack of assets means entrenched, intergenerational poverty for millions of Americans, no matter how hard they work. In the end, despite their efforts, far too many low-income workers find themselves with few options that can help them build the economic security that they aspire to and that their families desperately need. Given this, it's easy to understand why so many hard-working, low-income Americans feel more vulnerable to crises and less confident of ever getting ahead.

Leveling the Playing Field for Low-Income Families

Clearly, a range of issues contribute to why the poor pay more to participate in the workforce, provide for their families, and build the assets they need. All help to create an unequal economic playing field for those who require the most help.

Consequently, we believe that it's important to tackle this affordability problem on several fronts. In the following pages, we propose a four-part platform that we hope can serve as a model for stimulating new thinking and action. In addition, we discuss an array of promising efforts that we believe are moving in the right direction. For more information, see the 2003 KIDS COUNT Resource Kit.

Encourage Quality Retailers to Locate in Low-Income Communities

If low-income consumers living in economically and geographically isolated neighborhoods are to make the most of scarce resources, then they need greater access to the affordable retail goods that most American families enjoy.

One way to achieve this is to help mainstream businesses see the market potential in low-income neighborhoods. At least three major studies in the past few years suggest that low-income urban markets remain underserved because retailers base their business decisions on research that significantly underestimates the potential profitability of inner-city customer bases. Mainstream retailers themselves acknowledge the widespread perception that inner-city neighborhoods lack the purchasing power and customer concentration they need to do business.⁵⁰

Much of this stems from commercial marketing analysis that is driven by an emphasis on average individual household income. Recently, a number of tools and techniques that use new data compilation, analysis, and forecasting models are helping to paint a more accurate and very different portrait of inner-city markets by focusing on the concentrated buying power of densely populated urban neighborhoods, rather than average income. Work done by MetroEdge (Chicago), the Crossroads Research Center (Minneapolis), Social Compact (Washington, DC), and the Employment and Training Institute (University of Wisconsin, Milwaukee) shows that the aggregate buying power of many neighborhoods matches or surpasses that of more prosperous, but sparsely settled, suburban locales.

In addition to new research tools, there are projects that work directly with community-based groups, helping them use new marketing techniques to promote the economic viability of their neighborhoods. The Initiative for a Competitive Inner City's Neighborhood Business Development Methodology, for example, enables local nonprofits to assess and map neighborhood assets and strengths and then market these in ways that can attract new neighborhood business activity more successfully. This model and others are bringing together residents and local businesses to help lay the foundation for increased investment in ongoing, community-based, retail development strategies.

New York City's Economic Development Corporation (EDC) works directly with private developers to revitalize vacant or underused urban-core land. The EDC recently developed Peartree Square, a shopping center that

BEST COPY AVAILABLE

has brought a number of mainstream retailers, including a major supermarket, to an underserved city neighborhood. Similarly, Baltimore, using almost \$14 million in state, city, and private funding, recently broke ground on one of the few supermarkets to come to the city in several years. The project was a collaborative effort among the city, the business community, and surrounding neighborhoods and will create 150 new jobs and develop adjacent retail space.

Targeted public/private initiatives also can help promote inner-city business development. Examples can be found in state efforts designed to develop or expand the Community Development Financial Institutions (CDFI) industry. CDFIs are financial institutions—community development banks, credit unions, loan funds, venture capital funds, and microenterprise loan funds, among others—that have community development as a primary mission. To accomplish this goal, CDFIs make loans and provide services to individuals, businesses, and organizations that may be considered risky by conventional industry standards. As of 2001, 12 states had taken steps to promote a state CDFI industry.²¹

For example, in Illinois, a nonprofit organization (the Illinois Facilities Fund) recently took the lead to establish a coalition of financial institutions, nonprofit organizations, and employment projects that influenced state lawmakers to create a statewide program for strengthening and expanding the CDFI industry. Illinois has since approved a state-based CDFI that will attract additional federal funds; provide financing, grants, and technical assistance to CDFIs; foster partnerships with the private sector; and support CDFI expansion and services throughout Illinois.

Cities and states that do not have a strong CDFI network also can work to ensure that existing financial institutions better meet the financial service needs of low-income and minority communities by complying with and even exceeding the requirements of the Community Reinvestment Act. For example, in Milwaukee, the city comptroller annually evaluates financial institutions operating in the city by developing a report card that includes scores for performance in lending to minority communities. Only those that receive a high grade are eligible to receive city financial deposits.

Provide Consumers With the Tools They Need: Financial Education, Access to Basic Financial Services, and Opportunities to Build Credit

For many low-income consumers, using retail and financial markets that operate on the fringe is commonplace. Many living on the economic edge are induced to accept fees that are far too excessive, credit terms that are unnecessarily burdensome, and payment terms that are unreasonable—particularly when they're packaged in marketing schemes that make them sound too good to refuse. Given this, it is critical that low-income consumers have the tools to succeed: financial education that provides information to help them make sound decisions; greater access to fair financial services; and opportunities to build credit so that they can move beyond the grasp of predators and begin acquiring assets.

Financial Education

There are numerous good financial literacy programs nationally that help families avoid common and costly mistakes when buying a home, securing a consumer loan, or starting

More mainstream banks need to tailor their fee structures and services to customers who need ready access to cash from their paychecks, are likely to keep very low levels of deposits in their accounts, and are unfamiliar with or distrustful of traditional banking services.

Financial literacy and a greater range of available mainstream financial services certainly can help low-income families spend and save more shrewdly. However, real asset development will depend on their ability to build a positive credit history and access fair and affordable borrowing opportunities.

27

a savings plan. Although financial literacy programs vary in their approach and curricula, all aim to empower families with good information about how to evaluate the costs and benefits of financial transactions—including those found only in the fine print—and to help them achieve better financial management. It is widely acknowledged that one way to attract families to financial literacy education programs is to tie participation to the conditions of using a particular financial service. The following examples illustrate this approach:

- The Corporation for Enterprise Development (CFED) is the leading national group in the field of Individual Development Accounts (IDAs), savings plans in which consumer contributions are matched and used for expenditures such as education and home purchases. The CFED has found that one key to successful IDA programs is effective and mandatory financial literacy training. Families enrolling in IDA programs have strong motivation to learn to save in order to maximize the benefit of the matching dollars deposited in these certified accounts. The CFED and partner organizations have developed a curriculum that provides each new enrolling family with credit counseling and credit repair. They also require families to commit to a reasonable spending plan and set up savings accounts outside the IDA.
- Several community credit unions are now promoting financial literacy. By tying low-cost loans (that serve as alternatives to payday loans) to participation in financial literacy programs, they're servicing the short-term financial needs of their customers while ensuring that at the end of the loan term, families have improved credit ratings, active checking

accounts, and small savings accounts.

- Government agencies also are encouraging financial institutions to offer financial literacy training, especially to those consumers without a previous relationship with a bank. The Federal Deposit Insurance Corporation runs a national Money Smart Program that provides a curriculum and training to collaborative ventures between banks and local nonprofits. Taking part in Money Smart can help banks fulfill part of their Community Reinvestment Act obligations.
- Some employers are incorporating financial literacy into the workplace for the benefit of their employees. In January 2000, United Parcel Service (UPS) launched a financial education program. Those eligible for this opportunity include 42,000 full-time managers, specialists, and nonunion administrative employees. The program will deliver more than 1,500 workshops over a 2-year period, and employees will be allowed to attend on company time.

Financial Services

While financial literacy training is an effective way to help consumers make more prudent choices, low-income consumers also need practical, wealth-building financial products from which to choose. More mainstream banks need to tailor their fee structures and services to customers who need ready access to cash from their paychecks, are likely to keep very low levels of deposits in their accounts, and are unfamiliar with or distrustful of traditional banking services. Community banks whose mission is service may lead the way in developing technology-enabled, cost-effective services for these customers.

Some banks already have opened neighborhood-based "outlets" that provide check-

cashing services, money orders, and savings accounts. Union Bank of California has pioneered such an approach with 12 "Cash & Save" outlets, which began operating in 1993. They offer a creative combination of check-cashing and banking services in the same location. Among the banking services are low-cost, modified savings accounts designed to help check-cashing customers build savings.⁵²

Other mainstream banks have begun to tailor their services to the needs of high-poverty rural populations. The Southern Development Bancorporation, a \$350 million development bank holding company, now serves the Arkansas and Mississippi Delta with a full line of financial products and development services, including bank credit, housing development, small-business assistance, workforce training, asset building, and advocacy.

Credit unions also are devising alternatives to high-cost financial services for low-income families. The Landmark Credit Union in Milwaukee, for example, has a pilot program to steer borrowers away from payday lenders and toward longer term, lower interest loans that are packaged with financial education and a credit union savings account.⁵³ Overall, Community Development Credit Unions (CDCUs) offer financial products that meet the immediate needs of low-income customers and simultaneously build their credit and assets.⁵⁴ CDCUs provide short-term loans that are structured to compete favorably with the high-cost payday loan industry, offering these loans to borrowers at 20 percent to 40 percent of the cost of standard payday loans.

The Latino Credit Union, a project of the Center for Community Self-Help in North Carolina, is a unique financial institution that

has designed services that meet the needs of low-income working families. They helped pioneer the use of ATM cards to streamline and reduce the cost that immigrants must pay to send money home to family members.

Philanthropies also are investing in efforts aimed at providing better financial services to low-income communities. For example, the Casey Foundation recently deposited \$1 million into the Harbor Bank of Maryland to support low-income community development and revitalization in East Baltimore. The money enables the minority-owned Harbor Bank (which serves communities largely ignored by commercial financial institutions) to become even more active in revitalizing low-income neighborhoods by increasing the number of loans to residents, businesses, and nonprofits. Harbor Bank also will conduct economic literacy seminars that offer low-income residents consumer, credit, and banking information, with incentives to open accounts.

Finally, employers also are beginning to fill the financial services gap, with some offering a wide spectrum of benefits, including payment and payroll deduction options. Many are responding to the strong economic payoff that results from providing these benefits to low-wage workers. According to American Payroll Associates, the average payroll check costs employers \$1.07 to process, whereas direct deposit costs about 5 cents per employee.⁵⁵ Some employers, like Sears, Ruth's Steakhouse, and WHSmith booksellers, are reducing administrative costs through payroll debit cards. Under this program, an employee's salary can be transmitted to the card each pay period. The card can be used to withdraw funds from an ATM or as a method of payment.

Another recently introduced employer financial benefit is the employer-backed line of credit. For example, the “Clear Card” is an employer-provided credit line being used by, among others, **Reliance Standard Life Insurance** and **Whirlpool**.⁵⁶ Employees receive a credit line of 2.5 percent of their annual salary that they can repay through payroll deductions spread over the year, without ever facing interest or late fees.

Corporate Voices for Working Families, a national coalition of 32 corporate leaders, advocates corporate programs that provide employer-based work supports and access to affordable, nonpredatory financial services for low-income workers. This group offers good evidence that many large employers view these investments as contributing to a “dual bottom line” that benefits both employers and employees.

Credit Building

Financial literacy and a greater range of available mainstream financial services certainly can help low-income families spend and save more shrewdly. However, real asset development will depend on their ability to build a positive credit history and access fair and affordable borrowing opportunities. Otherwise, their chances to invest in homes, transportation, business, and education—investments with the asset-building potential that can advance family economic security and help halt the spiral of intergenerational poverty that permeates so many communities—will be severely compromised.

Currently, credit-reporting systems focus almost exclusively on the failures of low-income families to pay their bills on time; such systems ignore other evidence of regular, responsible payment. Thus, a delinquent utility

fee can permanently damage a family’s credit rating, but no amount of consistent, timely payment can be recorded as positive credit behavior in the existing system.

One promising idea to address this issue is the **Pay Rent, Build Credit Data Network**, which will function as a consumer reporting agency under the Fair Credit Reporting Act and make rental payment data available to authorized subscribers. The potential value of this effort is significant, since rental histories are overlooked as predictors of future ability to pay a mortgage, despite the fact that rents often are as high or higher than monthly mortgage payments. It’s been shown that good payment habits can reduce interest rates by 25 to 30 basis points and save a low-income family \$30,000 over the life of a typical home loan.⁵⁷

Another approach, which also helps guard against potential discrimination toward low-income borrowers, is the use of advanced, computerized risk-assessment technology (automated underwriting). Although they don’t totally eliminate income and racial bias, technological advances in mortgage lending have demonstrated that the risk of default among low-income borrowers is nowhere near as widespread as lenders traditionally have supposed. Automated underwriting uses a much broader range of variables to evaluate a loan applicant’s credit worthiness; income is only one among many other factors. Since the mid-1990s, this process has enhanced lenders’ ability to identify good and bad credit risks in their applicant pool, and loan approval rates have risen for low-income and minority customers.

For example, tests of automated underwriting demonstrate that this system can increase loan approvals substantially for many

low-income and minority loan applicants compared to manual systems.³⁸ However, this innovation can help only a limited sector of low-income borrowers because the data source that fuels the assessment program is bank records. This is one more reason why it is critical to help the “unbanked” connect to mainstream financial institutions and products.

Promote Regulatory Reforms That Protect Low-Income Consumers

In addition to promoting financial literacy and access to quality financial products, it's also clear that stronger regulatory reforms are required to combat predatory practices that strip wealth and prevent asset development, especially in high-poverty communities.

The Community Reinvestment Act (CRA), passed in 1977, has been the nation's most important regulatory tool for ensuring that financial institutions fairly serve the credit needs of low- and moderate-income families. However, since the 1970s, the business of banking and mortgage lending has evolved dramatically, limiting the efficacy of an increasingly outdated CRA. Currently, less than 30 percent of home purchase loans are subject to intensive review under CRA. In some metropolitan areas, this share is below 10 percent.³⁹

This lack of review translates into a lack of reliable and relevant data to assess the application of fair lending principles and effectively regulate practice. For example, data from the Home Mortgage Disclosure Act neither reflect annual interest rates nor fully capture the points and fees that lenders must pay. The result is that regulators can consider only the number of loans that banks originate to low- and moderate-income borrowers, not their quality. In

fact, the regulatory function of the CRA actually may reward banks that make high-cost or predatory loans by tracking only the number of loans that they make to less affluent consumers. This insufficient regulation at the federal level sometimes has allowed predatory practices to proliferate. Fortunately, a number of states and cities around the country have responded to the growing problems in federal regulations by passing their own, more effective, ordinances to curb these exploitive practices in their jurisdictions.

North Carolina, with the support of a broad coalition of banks, credit unions, mortgage industry representatives, and consumer advocates, has enacted the nation's first state law to curb predatory lending. The law was driven by research indicating that more than one-third of all subprime home loans had predatory features that actually stripped equity or imposed hidden costs on borrowers.⁴⁰ In 1999, the reform saved the state's homeowners an estimated \$232 million by prohibiting predatory practices and ensuring that borrowers have relevant information.

Cities and community-based organizations also have launched efforts to protect their neighborhoods from predatory practices. The following examples illustrate such initiatives:

- In one low-income neighborhood in Des Moines (part of Casey's *Making Connections* initiative), a local nonprofit, *Citizens for Community Improvement (CCI)*, reached out to residents to uncover widespread predatory practices. CCI worked with neighborhood leaders, government officials, financial institutions, and housing advocates to pass a city ordinance enacting new protections for homebuyers trapped by “contract sales”—unregulated

One appropriate mechanism for combating predatory lending on a national scale would be to draw on the FHA's support and resources to promote regulations that protect borrowers and neighborhoods from the effects of predatory lending.

31

BEST COPY AVAILABLE

“rent-to-own” transactions fraught with inflated and hidden costs and heavy penalties for non-payments. CCI formed a Predatory Lending Task Force, which negotiated a groundbreaking agreement with one company to halt their predatory practices and restructure existing loans to eliminate predatory features. The task force also helped enact a moratorium on all Iowa foreclosures until questionable loans were reviewed. CCI plans to press other finance companies to sign similar agreements. Meanwhile Fannie Mae has committed \$3 million to a pilot program launched by CCI to help refinance predatory home loans.⁶¹

- In Baltimore, grass-roots community organizers from ACORN (Association of Community Organizations for Reform Now) with Casey support, built the largest community-union coalition in recent Baltimore history and sought legal and regulatory redress from city and state officials. HUD established Baltimore as a laboratory to demonstrate how mortgage fraud and predatory lending can be prevented and how families and communities can recover their losses.⁶² The efforts of the Baltimore City Flipping and Predatory Lending Task Force, a coalition of consumer advocates, industry representatives, and government agencies, generated intense publicity on predatory lending that has resulted in numerous criminal convictions, revocations of real estate licenses, and major concessions from key financial institutions (such as agreements to restructure bad loans, halt foreclosures, and increase prime lending).
- Similarly, New York City passed an ordinance in late 2002 that prohibits the city from doing business with institutions that engage, directly or indirectly, in predatory lending practices and that regulates the participation of home

improvement contractors in the home-loan market. Under this new legislation, financial institutions that practice unfair lending cannot receive city contracts, deposits of city funds, or subsidies of any kind from the city.⁶³

Beyond tax credits, low-income workers also would gain a significant boost through subsidies aimed at core areas that tend to take the biggest bite out of already scant paychecks and savings: food, housing, and child care.

Local reforms do provide concrete examples of ways to improve the functioning of credit markets; however, predatory lenders operate outside the bounds of individual jurisdictions. They exploit victims even in jurisdictions with strong protections, simply by basing their operations in a different state, county, or city with weaker laws. For example, although some states have tried to protect consumers from payday lenders through usury laws and small-loan rate caps that prohibit triple-digit interest, lenders have found creative ways to circumvent these laws, even to the point of obtaining exemptions by partnering with out-of-state federally regulated depositories.

Therefore, national reform is necessary to control and eradicate predatory lending—provided that these reforms strengthen, rather than override, local ordinances geared to local practices and conditions. One appropriate mechanism for combating predatory lending on a national scale would be to draw on the FHA’s support and resources to promote regulations that protect borrowers and neighborhoods from the effects of predatory lending.

In addition to more effective prohibitions against predatory lending, low-income workers, in particular, would benefit from more prudent regulation of tax-preparation services that prey on families filing for the Earned Income Tax Credit and other refundable credits that successfully have bolstered income for millions of working families. Tax-preparation services

often bypass state usury laws (when they exist) by partnering with financial institutions that have federal charters and are, therefore, not subject to local regulations. Several states, including Wisconsin, California, New Mexico, and Massachusetts, are now taking a hard look at these practices and moving toward efforts to provide more protection to consumers.

Finally, revisions to the Fair Credit Reporting Act are needed. While current regulations require credit-reporting agencies to convey accurate and complete information to creditors and to inform the consumer if his or her application for credit has been denied, they do not require creditors to report when a customer actually pays their debts on time.⁶⁴ The credit-reporting system focuses exclusively on the payment failures of low-income families and ignores other evidence of regular, responsible payment, thereby denying consumers the opportunity to demonstrate evidence of positive credit behavior.

Reinforce the Financial Benefits of Work

If low-income families—like all families—are simultaneously to provide basic necessities, respond to emergencies, and still build a nest egg for the future, then we must not only level the consumer playing field, but also help them bolster and stretch their income and earnings.

One approach is through refundable tax credits for workers whose earnings are so low that they currently have little or no income tax liability. The Earned Income Tax Credit, for example, has lifted almost 2.5 million children out of poverty since 1998. Given this success, it makes sense to protect and expand the EITC and other important tax credits such as the Child Tax Credit and the Child and Dependent Care Tax Credit. Similar to tax deductions for

businesses and more affluent workers, these credits provide a concrete strategy for bolstering income and enhancing the value and payoff of work. We also need to extend their reach. One way is to simplify and consolidate the credit for the EITC, the Child Tax Credit, and the Additional Child Credit, plus other family tax benefits. This would encourage more eligible workers to apply, help discourage reliance on professional tax services, and minimize errors that potentially delay refunds.⁶⁵

An additional tax credit opportunity would be to expand the “Savers Credit” (which extends the federal match for IRA contributions to families that earn too little to owe income taxes) and make it refundable. Analysis indicates that this could have a major impact in helping low-income families build assets.⁶⁶

Beyond tax credits, low-income workers also would gain a significant boost through subsidies aimed at core areas that tend to take the biggest bite out of already scant paychecks and savings: food, housing, and child care.

Promote Greater Use of Food Subsidies

Although a family of three, in which a parent works 30 hours per week for the minimum wage, qualifies for up to \$247 worth of Food Stamps, only about half of all eligible families actually receive this benefit. In the fall of 2002, the federal government, under the latest Farm Bill, passed a number of new state options designed to help the Food Stamp program reach more eligible families. These options reward states that have more effective outreach efforts and that provide better service to families in need.⁶⁷ They also promote simplified applications and recertifications, waivers for unemployed childless adults, and the restoration of eligibility

to legal immigrants and align the asset and vehicle test in the Food Stamp program with TANF and Medicaid. Several states are actively taking advantage of this new opportunity.

For example, last November, Massachusetts streamlined application and reporting requirements, expanded immigrant eligibility, provided exemptions for child support payments and deductions for home utility costs, raised the asset cap for cars and savings, and automated transitional Food Stamp eligibility for families leaving welfare for work.⁶⁸ The state also initiated the Coordinated Food Stamp Outreach Program, and applications from families eligible for Food Stamps doubled in Boston one month after this campaign began.⁶⁹ In addition to Massachusetts, other states that are moving forward in this area include Pennsylvania, Washington, Illinois, and Wisconsin.

Put Affordable Housing Within Reach

The cost of housing has climbed, and the supply of affordably priced housing has shrunk, yet subsidies to assist low-income renters have not kept pace. The number of new federal housing vouchers funded in FY 2002 was lower than the number funded in any year between 1983 and 1994.⁷⁰ We believe that it is critical to address this pressing need, particularly given the growing body of research linking housing subsidies to employment and job retention. According to one study, subsidized families are 16 percent less likely to return to the welfare rolls in the following year than families without housing assistance.⁷¹ The link between housing subsidies and improved employment outcomes has been demonstrated in studies conducted in several states, including Minnesota, Massachusetts, Georgia, Ohio, Michigan, California, Oregon,

and Oklahoma, as well as in some cities and counties (Milwaukee and Los Angeles County).

In addition to direct subsidies, some states, like Indiana and Michigan, are providing renters with tax deductions to compensate for some rental costs. New Jersey requires landlords to give tenants a portion of any property tax rebate on a unit. In Minnesota and New Jersey, employers receive incentives to develop affordable housing for employees.⁷²

Help Working Parents Get Needed Child Care

In recent years, both the need and the demand for low-cost, high-quality child care have increased, particularly as greater numbers of low-income parents have moved from welfare to work. States have recognized that access to quality child care is critical to help low-income working families get by and get ahead. As caseloads have declined, states are allocating significant TANF funds to child care. TANF funds and the Child Care Development Fund (CCDF) are the two main sources of federal assistance for low-income child care. The number of children served through federal programs has increased from 1 million in FY 1996 to an estimated 2.45 million in FY 2000.

Despite increases in funding for subsidies, demand always has outstripped supply, and states have been faced with many unmet needs for affordable, quality child care, even at the height of economic boom. In 2004, states will be less able to address the funding gap, as both TANF caseloads and CCDF funding level out, and states face budget deficits projected to range from \$70 billion to \$85 billion for FY 2004. Increasingly, states are placing families on waiting lists, raising income eligibility

The cost of housing has climbed, and the supply of affordably priced housing has shrunk, yet subsidies to assist low-income renters have not kept pace. The number of new federal housing vouchers funded in FY 2002 was lower than the number funded in any year between 1983 and 1994.

restrictions for assistance, raising parent fees, and reducing investments in quality care.⁷³

With declining federal subsidies and intense budgetary pressure, states must find ways to meet the needs of increasing numbers of working parents. As welfare caseloads level off, it will be essential to compensate for the decline in redirected TANF funds by ensuring that all eligible parents make use of CCDF subsidies. Many parents are either unaware of their eligibility, or overwhelmed by the complex application process. Enhancing outreach efforts and assistance to these parents is crucial, as it becomes even more essential to make maximum use of scarce funds.

Moreover, as states strive to do more with less, they should give high priority to turning back the tide on rising eligibility requirements. In order to help low-income families meet their obligations as both workers and parents, we believe it's prudent that states consider expanding income eligibility for child-care assistance up to 75 percent of the state median income. In addition, we recommend that parent co-pays for child care remain below 10 percent of family income (low-income families pay an average of 14 percent of earnings, compared to 7 percent for higher-income families) and that co-pays be waived for families below the poverty line.

Reduce the Hidden Tax on Going to Work
Although subsidies can help make the difference between getting by and getting ahead, their impact often is undermined by government rules and regulations. For example, former welfare recipients who might have depended on housing subsidies, Medicaid health insurance, child-care assistance, and Food Stamps actually could become more financially disadvantaged

when they find work because their increased job earnings are cancelled out by reduced program benefits. In effect, we're financially punishing some low-income families who turn to work, rather than welfare, to meet their needs because their overall income drops, even though their work hours and employment earnings rise.

Clearly, penalizing work effort or ambition is neither the intention nor the policy of any of these social programs. Rather, families earning their way off public benefits are caught up in a frustrating tangle of regulations that govern a patchwork of fragmented programs. The cumulative impact of these regulations on families is left out of the often complex calculation, with sometimes tragic effects. Although unfortunate, this situation is not surprising. However, a number of innovations are underway that can help policymakers and agencies collect the data and predict the effects of rising earnings and falling benefits on overall family income, help smooth the financial transition to independence, and ensure that work pays.

One project currently underway at the National Center for Children in Poverty (NCCP) will help policymakers get the information they need to align regulations with the goal of promoting economic self-sufficiency. NCCP has developed a method for analyzing the interaction among earnings, benefits, and taxes on family income and calculating for each state the potential resources available to families as their earnings change. Now being piloted in Illinois, Alabama, Maryland, Connecticut, and Georgia, the project may be expanded to 25 states over the next 3 to 5 years.

Even with better data about the potential effect of earnings on critical family subsidies, states need the flexibility to develop strategies

**Clearly, if we are to level the
"affordability" playing field for

32

that can address these issues. Given this, we believe that it makes sense for the federal government to allow states to waive, on a limited basis, rules that restrict the amount of income that workers can earn before subsidy eligibility and benefit levels for federal programs are negatively affected. This practice already is in effect for TANF and will soon be permitted for Food Stamps, under the 2002 Farm Bill. States' success in moving parents from welfare to work suggests that many would use such an opportunity to develop creative pro-work policies that simultaneously protect earnings and provide families with the supports they need.

Finally, we need strategies to reduce the high cost of compliance with agency requirements. One approach is to "package" supports for working-poor families. A few states have begun to address this issue by implementing an application process that reduces the previously mentioned costs by allowing working families to apply or recertify for the Food Stamp program, Medicaid/state Child Health Insurance Programs, and other programs at the same time. These strategies become increasingly possible as states realign their eligibility criteria and lengthen their certification periods (sometimes for up to 12 months) for many of these programs. Helping more states to adopt this strategy also might reverse the trend in declining participation rates for these programs.

38 Conclusion

Clearly, if we are to level the "affordability" playing field for our most vulnerable families, much needs to be done. The good news, as indicated by the range of efforts taking place

nationally, is that many are recognizing that paying more simply because your income is low is a practice that is out of sync with our country's core values. At the same time, we believe that the complex issues behind this problem require responses that go beyond anything currently being done.

The federal government, states, cities, and local communities are addressing various dimensions of this issue yet, to date, none has put into action the comprehensive responses required. If we are truly to deliver on the fundamental promise that hard work, self-sacrifice, and prudent investment are the building blocks of economic security, then we must promote approaches that demonstrate a new national seriousness about leveling the cost of living for low-income families. None of the proposals advanced in this essay is strong enough by itself to help America's most vulnerable working families become economically self-sufficient. Taken together, however, we believe that they offer a more powerful, realistic, and rational approach to addressing this critical national goal.

Meeting this challenge will require unprecedented public *and* private commitment; national, state, and local collaboration; and policies, programs, and resource allocations that are both complementary and reinforcing. Though difficult, we believe that it can be done. Over the past decade, our nation mustered the will, policies, and resources to move millions of parents into the workforce. Now let's apply that same level of determination and focus to the challenge of moving them—and their kids—out of poverty and closer to real financial security.

SUMMARY & FINDINGS

BEST COPY AVAILABLE

The broad array of data we present each year in the *KIDS COUNT Data Book* is intended to illuminate the status of America's children and to assess trends in their well-being. By updating the assessment every year, *KIDS COUNT* provides ongoing benchmarks that can be used to see how states have advanced or regressed since 1990. Readers also can use *KIDS COUNT* to compare the status of children in their state with those in other states across several dimensions of child well-being.

Although the 10 measures used in *KIDS COUNT* to rank states can hardly capture the full range of conditions shaping kids' lives, we believe these indicators possess three important attributes: (1) They reflect a wide range of factors affecting the well-being of children (such as health, adequacy of income, and educational attainment). (2) They reflect experiences across a range of developmental stages—from birth through early adulthood. (3) They permit legitimate comparisons because they are consistent across states and over time. (For more information about the criteria used to select *KIDS COUNT* indicators, see p. 212.) While the 10 indicators used to rank states are clearly related to each other, statistical analysis indicates that each of the 10 adds an independent assessment of child well-being.⁷⁴

The annual presentation of *KIDS COUNT* data allows us to make incremental improvements as new data become available and methods are refined. As the *KIDS COUNT Data Book* has developed over time, some of the indicators used to rank states have changed. Consequently, comparing rankings in the 2003 *Data Book* to rankings in past *Data Books* does not provide a perfect assessment of change over time. However, Appendix 3 shows how states would have ranked in past years if we had employed the same 10 measures used in the 2003 *Data Book*.

The 10 indicators used to rank states reflect a developmental perspective on childhood and underscore our goal to provide a world where pregnant women and newborns thrive; infants and young children receive the support they need to enter school prepared to learn; children succeed in school; adolescents choose healthy behaviors; and young people experience a

DOLLARS AND SENSE

Figures in this year's *KIDS COUNT Data Book* reflect significant improvement in child well-being in the U.S. during the 1990s. Table 1 shows that 8 of the 10 indicators used to rank states improved during the 1990s and that improvement was widespread. Every state improved on at least 4 measures, and 43 of the 50 states and DC improved on at least 6 of the 10 measures.

Part of the improvement is undoubtedly due to the strong economy of the late 1990s, but numerous programs were implemented or expanded during the 1990s that were designed to prevent some of the negative outcomes that are the focus of the *KIDS COUNT Data Book*.

As state lawmakers across the nation struggle with difficult budget decisions this year, it is important that we do not make hasty program cuts that reverse the improvements in children's lives that we witnessed during the 1990s. Prevention programs cost money in the short run, but they typically save money in the long run. Investments in children are usually cost effective because they lead to a lifetime of benefits.

It is important to recognize that there are costs associated with failure to prevent some of the negative outcomes documented in this publication. The negative outcomes and risks outlined in the following pages affect all of us, not just the children and families reflected in these numbers. All of us will end up bearing some of the costs associated with these problems, and the costs are not trivial.

For example, babies born weighing less than 5.5 pounds almost always require special attention at birth and often require additional attention during development. The annual costs for underweight babies are estimated at roughly \$25,000 per child (in 2003

dollars), from birth through age 18.⁷⁵ Consequently, the 307,030 low-birthweight babies born in 2000 are likely to require \$7.6 billion during their childhood. If we could reduce the number of low-birthweight babies by 10 percent, we could save \$755 million.

Teenage childbearing is another costly problem. One oft-cited study concluded, "Based on the most highly controlled measures of the consequences of adolescent childbearing, each adolescent mother in this country costs U.S. taxpayers an average of \$2,831 a year that could be saved if her childbearing had been delayed until age 20 or 21."⁷⁶ Each year the federal government alone spends about \$40 billion to help families that began with a teenage birth.⁷⁷ States and localities, as well as parents and friends, also provide support for teen-headed families.

There are clearly costs when a teenager drops out of high school. Several studies indicate it costs the nation \$200 billion to \$250 billion for each class of high school dropouts.⁷⁸ Costs include lost earnings, lost tax revenue, and increased spending for social support programs. For example, studies⁷⁹ indicate that over 80 percent of prisoners are high school dropouts and that the average cost of housing a prisoner is roughly \$25,000 each year.⁸⁰ Furthermore, it is easy to understand that having a death of young people who are adequately prepared for the workplace can slow economic development in a state.

This evidence supports the notion that prevention programs are likely to save money in the long run. Through concerted and targeted efforts during the 1990s the country made significant progress in improving the lives of American children, and it would be shortsighted to lose those gains through hasty budget cutting.

successful transition into adulthood. In all of these stages of development, young people need the economic and social assistance provided by a strong family and a supportive community.

KIDS COUNT State Indicators

In the pages that follow, the most recent figures are compared with corresponding data from 1990 to assess the trends in each state during the 1990s. To provide a fuller picture of children's lives and a framework for better understanding the 10 indicators of child well-being used to rank states, several background measures are included for each state.

The 10 key indicators of child well-being used here are all from federal government statistical agencies and reflect the best available state-level data for tracking yearly changes in each indicator. However, many of the indicators used here are derived from samples, and like all sample data, they contain some random error. Other measures (the Infant Mortality Rate and the Child Death Rate, for example) are based on relatively small numbers of events in some states and may exhibit some random fluctuation from year to year. Therefore, we urge readers to focus on relatively large differences—both across states and over time within a state. Small differences may simply reflect random fluctuations rather than real changes in the well-being of children.⁸¹

We include data for the District of Columbia in the *Data Book*, but we do not include those data in our state rankings. The District is so different from any state that the comparisons are not meaningful. It is more useful to look at changes in the District of Columbia over the 1990s, or to compare the District with other large cities.⁸²

TABLE 1

Changes in Key Indicators of Child Well-Being: 1990-2000 and National Totals: 2000

Indicators*	National Change		State Changes			National Totals: 2000
	W O R S E	B E T T E R	Worse	Unchanged	Better	
Percent low-birthweight babies	9		47	2	1	307,030 births
Infant mortality rate (deaths per 1,000 live births)		25	2	0	48	28,035 deaths
Child death rate (deaths per 100,000 children ages 1-14)		29	2	0	48	12,392 deaths
Rate of teen deaths by accident, homicide, and suicide (deaths per 100,000 teens ages 15-19)		28	4	0	46	10,290 deaths
Teen birth rate (births per 1,000 females ages 15-17)		27	0	0	50	157,209 births
Percent of teens who are high school dropouts (ages 16-19)	40	10	10	14	26	1,525,000 teens
Percent of teens not attending school and not working (ages 16-19)		20	6	6	38	1,327,000 teens
Percent of children living in families where no parent has full-time, year-round employment		20	6	5	39	17,618,000 children
Percent of children in poverty (data reflect poverty in 1989 and 1999)		15	3	2	45	12,280,300 children
Percent of families with children headed by a single parent	17		46	2	2	9,476,000 families

*See Definitions and Data Sources, page 200.

The data on the following pages present a rich but complex picture of American children. Some dimensions of well-being improved, some worsened, and some showed little change. At the national level, eight of the indicators of child well-being showed that conditions improved between 1990 and 2000, while child well-being worsened on two other indicators. Table 1 provides a summary of results from this year's *KIDS COUNT Data Book*. Naturally, the portrait of child well-being varies between states, and state-level measures often mask important differences within a state.

By comparing the 2000 figures with those from 1990, we assess overall changes during the 1990s. For some measures, the changes between 1990 and 2000 reflect a constant trend over the decade. But for other measures, trends changed over the course of the 1990s. For example, the child poverty rate increased by 15 percent between 1990 and 1994, but fell by 26 percent between 1994 and 2000. The teen birth rate increased by 3 percent between 1990 and 1994, but fell by 29 percent between 1994 and 2000. Readers need to understand that the trends identified between 1990 and 2000 don't necessarily reflect the most recent trends. Yearly data are presented in Appendix 2, to help readers examine the year-by-year changes.

The *KIDS COUNT Data Book* utilizes rates and percentages because that is the best way to compare states to each other and to assess changes over time within a state. However, our focus on rates and percentages may mask the magnitude of some of the problems that are examined in this report. Table 1 shows the number of events or number of people reflected in each of the national rates for the

10 key indicators used to rank states. This table underscores the fact that despite the positive trends in the 1990s, thousands of children die every year, and millions are at risk because of poverty, family structure, lack of parental employment, or risky behavior. As we look at some of the favorable trends during the 1990s, it is important that we remember the millions of children whose futures are in jeopardy because their lives are filled with risks. Similar state-level data about the numbers of events and people behind the state rates appear in Appendix 2.

Each of the 10 indicators is discussed separately below.

Percent Low-Birthweight Babies

Babies weighing less than 2,500 grams (about 5.5 pounds) at birth have a high probability of experiencing developmental problems.

Therefore, the Percent Low-Birthweight Babies reflects a group of children who are likely to have problems as they move through the growth stages.

Some of the risks faced by low-birthweight babies have been captured in data linking information from birth and death certificates.⁸³ Although low-birthweight babies comprised only 7.6 percent of all births in 2000, they accounted for 65 percent of infant deaths that year. The risk of dying during the first year of life for low-birthweight babies (59.4 deaths per 1,000 births) is 24 times that for babies of normal birthweight (2.5 deaths per 1,000 births).

Nationally, 307,030 babies were born weighing less than 2,500 grams in 2000. Low-birthweight babies were 7.6 percent of all births in 2000, compared to only 7.0 percent in 1990. This represents a 9 percent increase over the 1990–2000 period.

TABLE 2

State Rankings on Per Capita Income and KIDS COUNT Child Well-Being Index: 2000

State	Per Capita Income	Per Capita Rank	Child Well-Being Overall Rank	State	Per Capita Income	Per Capita Rank	Child Well-Being Overall Rank
Connecticut	\$28,766	1	6	Kansas	\$20,506	26	19
New Jersey	\$27,006	2	4	Indiana	\$20,397	27	20
Massachusetts	\$25,952	3	9	North Carolina	\$20,307	28	39
Maryland	\$25,614	4	16	Arizona	\$20,275	29	45
Colorado	\$24,049	5	26	Missouri	\$19,936	30	31

Vermont	\$20,625	25	8	Mississippi	\$15,853	50	50

SOURCES: Income data are from the 2000 Census; child well-being data are from KIDS COUNT Data Book: 2003.

Given the close relationship between family income and good child outcomes, it would be easy to surmise that state income levels drive the differences in child outcomes across the states. To examine this hypothesis, we prepared a table showing how states rank on per capita income and child well-being (based on the 10 KIDS COUNT measures).

Is income an important determinant of child well-being? Yes and no. In general, states with higher incomes have better child outcomes. The average rank on child well-being for the 10 states with the highest incomes is 14, and the average rank for the bottom 10 states is 35. But a closer examination of the data reveals that the relationship is not always straightforward.

Many states have very similar income levels, but very different child outcomes. For example, Alabama and Utah have virtually identical per capita incomes (\$18,189 in Alabama and \$18,185 in Utah), but Utah ranks 3rd best on child well-being and Alabama ranks 48th. Similar disparities can be found in other pairs of states. For example, compare per capita income and child well-being in Minnesota and Delaware, or in Texas and Iowa, or in North Dakota and Oklahoma.

It is clear that income can be important, but it is not the only factor involved in determining the well-being of children in a state. Other factors that affect child outcomes are state and local policies that improve child well-being, especially those that strengthen high-risk families and communities.

FIGURE 1
Percent Low-Birthweight Babies by Race and Hispanic Origin: 2000*

* Persons of Hispanic origin may be of any race.
SOURCE: National Center for Health Statistics, 2002. "Births: Final Data for 2000," by Joyce Martin, Brady E. Hamilton, Stephanie J. Ventura, Fay Menacker, and Melissa M. Park, National Vital Statistics Reports, Vol. 50, No. 5 (August 28), Tables 24 and 25.

The increase in the share of births weighing less than 2,500 grams is related to the increase in multiple births. The number of twins, triplets, and higher-order multiple births increased from 96,893 (2.3 percent of all births) in 1990 to 126,241 (3.0 percent) in 2000.⁸⁴ According to the National Center for Health Statistics, 57 percent of multiple-birth babies are low birthweight compared to 6 percent of single-birth babies.

The rise in multiple births is linked to two other trends.⁸⁵ First, efforts to enhance fertility (such as fertility drugs, in vitro fertilization, and other procedures) are more widespread than ever before. A recent study found that 56 percent of infants born as a result of assisted reproductive technologies (ARTs) were multiple births, compared with 3 percent of all births.⁸⁶ Second, women are having children at older ages. Women in their 30s are more likely to have a multiple birth than women in their 20s.

While an increase in multiple births related to new fertility treatments may explain much of the increase in low-birthweight babies being born between 1990 and 2000, it does not explain the racial differentials on this measure (see Figure 1). The National Institutes of Health has asserted that "unraveling the underlying reasons for ethnic variations in LBW and preterm delivery" is one of the greatest current challenges to research.⁸⁷ In 2000, 6.6 percent of births to non-Hispanic whites were of low birthweight, compared to 13.1 percent of births to non-Hispanic blacks, 6.4 percent of births to Hispanics, 7.3 percent of births to Asians and Pacific Islanders, and 6.8 percent of births to American Indians (see Figure 1). The high rate of low-birthweight babies among blacks is not related to multiple births.

Income differences by themselves cannot account for the high rate of low-weight births among blacks. A variety of studies have found little difference in birthweight distribution among African-American infants across income levels. In fact, differences in low-birthweight rates between black and white infants are even wider at the upper end of the socioeconomic spectrum than at the lower end.⁸⁸ Differences in where blacks and whites live may provide part of the answer. Some research suggests that the risk of having low-birthweight babies among African-American mothers is significantly higher in areas with a high degree of residential segregation.⁸⁹ This reinforces the notion that people who live in isolated neighborhoods—and who are disconnected from access to mainstream support services—experience a wide range of disadvantages and negative outcomes.

Another reason for the racial differentials may involve access to health insurance and medical care. According to the U.S. Census Bureau,⁹⁰ nearly one-fifth of all African Americans (19 percent) did not have health insurance in 2001. In addition, data show that 23 percent of women of childbearing age (ages 15 to 44) living in central cities lacked health insurance, compared to 16 percent of those living in the suburbs. These percentages are higher among minority women in central cities—40 percent of central-city Hispanic women of childbearing age lacked health insurance in 2001, compared to 23 percent for non-Hispanic blacks and 14 percent for non-Hispanic whites.⁹¹

In 2000, there were 307,030 low-birthweight babies born in the United States. Between 1990 and 2000, the percentage of births that were of low birthweight increased in

Summary and Findings

47 states, stayed the same 2 states, and decreased in Georgia. The percentage of low-birthweight babies in the District of Columbia dropped by 2.1 percent between 1990 and 2000. Among the states, the incidence of low-birthweight babies in 2000 ranged from a low of 5.6 percent in Alaska, Oregon, and Washington to a high of 10.7 percent in Mississippi.

Infant Mortality Rate

Since the first year of life is more precarious than later years of childhood, negative social conditions (such as poverty and an unhealthy physical environment) have a bigger impact on newborns. The number of children who die before their first birthday is reflected in the Infant Mortality Rate, defined as the number of deaths to persons less than 1 year old per 1,000 live births during the year.

Reduction in infant mortality in the United States is clearly a success story. The fact that the Infant Mortality Rate has dropped steadily and declined virtually everywhere suggests that there may be some lessons that could be applied to other areas of child well-being. However, it is important to note that even though the Infant Mortality Rate in the United States is currently at an all-time low, the nation's infant survival rate remains worse than that of most other industrialized nations.⁹² Even the best performing states have higher rates than several other industrialized countries. Clearly we can do better.

Children born into families with fewer advantages are more likely to experience serious health problems and death at an early age. The Infant Mortality Rate for children born into poor families was more than 50 percent higher than that for children born into families

with incomes above the poverty line.⁹³ The link between poverty and infant mortality helps explain why the Infant Mortality Rate of African Americans remains more than twice that of whites (see Figure 2). The poverty rate for blacks is about three times that for whites, and the Infant Mortality Rate for non-Hispanic blacks was 13.6 compared to 5.7 for non-Hispanic whites (see Figure 2). However, the Infant Mortality Rate for Hispanics, who have a poverty rate as high as blacks, was 5.6, almost the same as that for non-Hispanic whites. This suggests that the link between poverty and infant mortality may be more complicated than it first appears. Further complicating the picture is the fact that a black/white differential persists at all ages, incomes, and educational levels.⁹⁴

The Infant Mortality Rate in America's largest cities (8.0 deaths per 1,000 live births) is significantly higher than the rate for the nation as a whole.⁹⁵ However, the problem of infant mortality varies among individual cities, and recent evidence indicates that neighborhood conditions can have a big impact on infant mortality rates.⁹⁶ Communities where there is a confluence of several problems, such as poverty, unemployment, and illiteracy, tend to have higher infant mortality rates. One reason for the high Infant Mortality Rate in low-income neighborhoods is that residents are less likely to have easy access to neonatal intensive care.⁹⁷

During 2000, 28,035 infants under age 1 died in the United States. The U.S. Infant Mortality Rate declined from 9.2 deaths per 1,000 live births in 1990 to 6.9 deaths in 2000. This improvement was reflected in the District of Columbia and every state but two, Hawaii and North Dakota. In 2000, the Infant

SOURCE: Innocenti Research Center, 2001, Child Deaths by Injury in Rich Nations, United Nations Children's Fund, UNICEF, Florence, Italy, p. 6, Figure 1, February.

Mortality Rate ranged from a low of 4.6 in Massachusetts to a high of 10.7 in Mississippi.

Child Death Rate

The Child Death Rate (deaths per 100,000 children ages 1 to 14) has fallen steadily for the past several years, due in large part to advances in medical care. The general decrease in deaths from motor vehicle accidents, which accounted for nearly one-fifth of all child deaths in 2000, also has contributed to a declining Child Death Rate.

This measure improved among each racial and ethnic group, although the 2000 rates for African-American children (34 deaths per 100,000) and American Indian children (31 deaths per 100,000) were much higher than the rates for children in other groups.⁸⁸ The risk of child injury and death is much higher for children in poverty. One prominent study concluded, "Poverty's starkest and most unmistakable health effects are those leading to death. Poor children in the United States are more likely to die at every age and from every cause. Their risk of death ranges from 1.1 times greater for cancer to 5 or more times greater for infectious diseases and parasites."⁸⁹

While the Child Death Rate in the United States has been declining, it is still much higher than that in most other wealthy countries.

Figure 3 shows that compared to 25 other relatively developed countries, the United States ranks 23rd in terms of children's deaths due to injuries—a major cause of death among kids. This may reflect the fact that U.S. children are much more likely to be involved in automobile accidents and that too many are not wearing seatbelts. In 1999, 47 percent of children ages 1 to 4 who died in traffic crashes were not

Summary and Findings

wearing a seatbelt or other restraint.¹⁰⁰ And deaths by injury are just the tip of the iceberg. One study found that for each death from an injury, 160 children were admitted to a hospital for an injury and about 2,000 children visited emergency departments because of injuries.¹⁰¹

In 2000, 12,392 children between the ages of 1 and 14 died in the United States. This amounts to 22 out of every 100,000 children in this age range, down from 31 deaths per 100,000 in 1990. Between 1990 and 2000, the Child Death Rate decreased in 48 states and the District of Columbia and increased in 2 (Montana and West Virginia). Among the states, the Child Death Rate in 2000 ranged from a low of 13 in Vermont to a high of 37 in Mississippi.

Rate of Teen Deaths by Accident, Homicide, and Suicide

The Rate of Teen Deaths by Accident, Homicide, and Suicide reflects deaths among 15- to 19-year-olds (per 100,000 teens in this age group) from these three causes. Deaths from these three sources accounted for three-quarters of all deaths in this age group in 2000.

Accidents continue to account for at least three times as many teen deaths as any other source, including homicide (see Figure 4). Most of the lethal accidents are automobile accidents. However, many states have started graduated licensing, where young people slowly get full driving privileges, and this seems to be reducing teen automobile deaths.¹⁰²

The numbers of accidents, homicides, and suicides all were lower in 2000 than they were in 1990: The number of teen deaths due to accidents fell by 10 percent, the number due to homicide fell by 37 percent, and the

FIGURE 4
Number of Teen Deaths by Accident, Homicide, and Suicide: 1990-2000

■ Teen deaths by accident. □ Teen deaths by homicide. ■ Teen deaths by suicide.

SOURCE: Centers for Disease Control and Prevention, National Center for Health Statistics.

number due to suicide fell by 18 percent (see Figure 4). The declining number of teen deaths during the 1990s is even more impressive in light of the fact that the number of 15- to 19-year-olds increased from 17.8 million in 1990 to 20.2 million in 2000.

In 2000, 10,290 Americans ages 15 to 19 died from accidents, homicide, or suicide. This amounts to about 28 deaths per day, and all of these can be seen as preventable deaths.

The Rate of Teen Deaths by Accident, Homicide, and Suicide fell from 71 deaths per 100,000 teens in 1990 to 51 deaths per 100,000 in 2000—a drop of 28 percent. This measure improved among all racial and ethnic groups during the period, but the rate remains significantly higher for African-American and American Indian teens.

During the 1990s, the rate of teen deaths from these three causes declined in 46 states and the District of Columbia and increased in only 4 states (Alaska, Delaware, Iowa, and Rhode Island). In 2000 the Rate of Teen Deaths by Accident, Homicide, and Suicide ranged from a low of 25 in Massachusetts to a high of 128 in Alaska.

Teen Birth Rate

Teenage childbearing is problematic because it often diminishes the opportunities of both the child and the young mother. Births to females under age 18 are particularly troublesome because most of these young mothers are unmarried and have not completed high school. Eight to 12 years after birth, a child born to an unmarried, teenage, high school dropout is 10 times as likely to be living in poverty as a child born to a mother with none of these three characteristics.¹⁰³

Most teenage mothers are not settled in a job or career, and many young fathers are not in a position to provide financial help.

According to recent estimates, only about one-third of teen mothers go on to receive a high school diploma.¹⁰⁴ Data from the U.S. Census Bureau show that only 52 percent of males ages 16 to 19 had any earned income in 2001 and that the average annual income for those who worked was slightly less than \$5,900.

Given this situation, it is not surprising that only 7 percent of 15- to 17-year-old mothers received child support payments in 1999.¹⁰⁵

Children born to teenage mothers are less likely to receive the emotional and financial resources that support their development into independent, productive, and well-adjusted adults. The vast majority of young teens who have a child are unmarried, and research shows that children born to single mothers “are twice as likely to drop out of high school, twice as likely to have a child before age twenty, and one and one-half times as likely to be ‘idle’—out of school and out of work—in their late teens and early twenties.”¹⁰⁶ Thus, babies born to young teens reflect a group of children who will have to overcome high odds to thrive.

Although teenage childbearing is usually denoted by the age of the mother, many of the fathers of these babies are not teenagers. Slightly more than half (51 percent) of the fathers of children born to girls under age 18 were in their 20s.¹⁰⁷ If programs to prevent teen pregnancy focus solely on teenagers, then they may miss an important segment of the population involved in this problem. Furthermore, although data remain scattered and preliminary, there seems to be growing evidence that the births experienced by many young teens

The state-level figures shown in the *KIDS COUNT Data Book* mask enormous variations within states. Data recently made available from the 2000 Census allow us to calculate teen birth rates for cities. Teen birth rates for the 50 largest cities are shown in Table 3, along with the average for the largest 50 cities and the U.S. as a whole. Note that the figures in Table 3 are based on 15- to 19-year-olds, not the 15- to 17-year-olds shown in the *Data Book*.

Data in this table reveal the following:

- Teen birth rates in most large cities are above the national rate; only 9 of the 50 largest cities had a Teen Birth Rate lower than the national average.
- Teen birth rates in most large cities fell during the 1990s; 45 of the 50 largest cities experienced a decrease in the Teen Birth Rate during the 1990s.
- Teen birth rates fell more rapidly in large cities than in the country as a whole; teen birth rates in large cities fell by 26 percent compared to only 20 percent in the country as a whole.
- There is enormous variation in the Teen Birth Rate among these large cities; the Teen Birth Rate in Miami (174) is six times that in San Francisco and Seattle (28).

may be the result of nonvoluntary sex.¹⁰⁸ To the extent that teen births are a result of nonvoluntary sex, prevention models that focus solely on choice may be neither appropriate nor effective.

Teen birth rates have been falling for two simple reasons: Fewer teens are having sex, and more teens who do have sex are using contraception. The Youth Risk Behavior Surveillance System found that 46 percent of the nation's high school students reported having ever had sex in 2001, compared to 54 percent in 1991.¹⁰⁹ Moreover, 58 percent of the students who did have sex reported using condoms, compared to only 46 percent in 1991. Researchers attribute the recent trends in teen sexual activity and contraceptive use to a variety of factors.¹¹⁰

- There has been a greater public emphasis on delaying sexual activity.
- Teenagers seem to have taken more responsible attitudes about casual sex and out-of-wedlock childbearing.
- There is an increased fear of sexually transmitted diseases (STDs), especially Acquired Immune Deficiency Syndrome (AIDS).
- Long-lasting contraceptive methods, such as the implant (Norplant) and the injected (Depo-Provera) options, have become increasingly popular.
- More restrictive criteria for obtaining public assistance may have caused some teenagers to rethink the costs and benefits of becoming a parent.
- A stronger economy in the 1990s created better job prospects for young people and perhaps provided options that were neither available nor evident in the past.

Analysis of the National Longitudinal Study on Adolescent Health found that “enhancing the connections of teenagers to their family and home, their school, and their community is essential for protecting teenagers from a vast array of risky behaviors, including sexual activity.”¹¹¹ The Casey Foundation’s Plaintalk initiative also demonstrated the importance of better communication in promoting healthy behavior among teens.¹¹²

Nationally, the Teen Birth Rate fell from 37 births per 1,000 females ages 15 to 17 in 1990 to 27 births per 1,000 females in this age range in 2000. This decline was reflected among every major racial and ethnic group. Moreover, the birth rate among 18- and 19-year-olds also declined during the period—for all racial and ethnic groups.

Although the recent decline in teen births is welcome news, it is important to recognize that the Teen Birth Rate in the United States is still well above that of other developed countries. Research comparing teen sexual behavior in the United States and Europe found several important differences between American teens and their European counterparts. While the study found virtually no differences in levels of sexual activity, they found that American teens were significantly less likely to use contraceptives.¹¹³ For example, 20 percent of sexually active U.S. teens reported using no birth control, compared to only 4 percent in Great Britain.

In 2000, there were 157,209 babies born to females ages 15 to 17. Every state and the District of Columbia echoed the national decrease in teenage childbearing between 1990 and 2000. The Teen Birth Rate in 2000 ranged from a low of 10 births per 1,000 females ages

Summary and Findings

15 to 17 in New Hampshire and Vermont to a high of 44 births per 1,000 in Mississippi.

Percent of Teens Who Are High School Dropouts

Graduating from high school is critical for both obtaining post-secondary education and getting a good job. In many school systems around the country, especially those in wealthy suburbs, a high percentage of students stay in school and graduate on time with a good education. However, many students, especially those living in troubled inner-city areas, attend schools where graduating on time with a solid education is more the exception than the rule.

Teens who drop out of high school will find it difficult to achieve financial success in life. A report from the U.S. Department of Education notes, "In terms of employment, earnings, and family formation, dropouts from high school face difficulties in making the transition to the adult world."¹⁴ As America moves further into the 21st century, when advanced skills and technical knowledge will be required for most good-paying jobs, the prospects for those who have not completed high school will be even more dismal. A recent report from the U.S. Census Bureau shows that the average income for full-time, year-round workers with a high school degree (\$30,400) is about 30 percent higher than that for a person without a high school degree (\$23,400).¹⁵

Ongoing changes in the U.S. economy have increased the financial costs of dropping out of high school. Between 1973 and 2001, for example, the average hourly wage (adjusted for inflation) of high school dropouts fell 19 percent.¹⁶ The deterioration of wages among

poorly educated workers has hit the youngest workers the hardest, and this factor often is implicated in the deterioration of family formation and family stability among young adults.¹⁷

Nationwide in 2000, approximately 1.5 million teens between the ages of 16 and 19 were not in school and had not graduated from high school. The dropout rate in 2000 (9 percent) reflects a decrease of 10 percent from 1990. However, the degree of change during this period varied across the states. The dropout rate fell in 26 states and the District of Columbia between 1990 and 2000, rose in 10 states, and was unchanged in 14 others. It should be noted, however, that many of these changes were quite small and probably are not statistically significant. In 2000 the high school dropout rate ranged from a low of 4 percent in North Dakota to a high of 17 percent in Arizona.

Percent of Teens Not Attending School and Not Working (Idle Teens/Disconnected Youth)

During late adolescence, young people make some critical choices that affect their transition to adulthood. The Percent of Teens Not Attending School and Not Working (sometimes referred to as "idle teens" or "disconnected youth") reflects young people ages 16 to 19 who are not engaged in either of the core activities that usually occupy people during this crucial period in their lives. While those who have dropped out of school are clearly vulnerable, many young persons who have finished school but are not working also belong to a marginalized group. Work experience at this point in life is critical, and people who spend a large share of their young adult years unemployed have a hard time finding and keeping a job later in life.

In 2000, 1.3 million teens between the ages of 16 and 19 were neither enrolled in school nor working. Nationwide there was a decline in the share of idle 16- to 19-year-olds, from 10 percent in 1990 to 8 percent in 2000. Yet, African-American and Hispanic youth were twice as likely as white youth to be disconnected in 2000.

The share of idle teens fell in 38 states and the District of Columbia during this period, while increasing in 6 states and remaining unchanged in 6 others. Among the states, the Percent of Teens Not Attending School and Not Working in 2000 ranged from a low of 4 percent in Iowa and Minnesota to a high of 13 percent in West Virginia.

Percent of Children Living in Families Where No Parent Has Full-Time, Year-Round Employment

In 2000, 17.6 million children had no parent in the household who worked full-time, year-round. This measure is sometimes referred to as “lack of secure parental employment.” In addition to a high probability of being poor, these children are much more likely to lack access to the health and family benefits that a stable job provides. Many parents who cannot find regular employment end up working at temporary or part-time jobs that do not provide enough money to support a family; that fail to offer benefits (such as health insurance or sick leave); that are often at odd hours requiring unusual child-care arrangements; and that offer little overall stability.

Two trends in this indicator are worth noting. First, much of the decline in the percentage of children living in families with no securely-employed parent is attributable to the large increase in the percentage of single

mothers working full-time, year-round. In 2000, half of single mothers who headed families worked full-time, year-round, compared to just one-third in 1993.¹¹⁸

Second, secure parental employment increasingly offers no guarantee that a family can move above the poverty line. According to the Federal Interagency Forum on Child and Family Statistics, “Children living below the poverty line have become increasingly likely to have one or two parents working full-time, all year. In 1993, 21 percent of children below poverty had at least one parent working full-time, all year. By 2000, this number had risen to 35 percent.”¹¹⁹

It is important to recognize that the problems associated with this situation go beyond the effects of poverty. Since a working parent offers a strong positive role model for children, those growing up in a family without a regularly employed parent do not experience the positive effects that such a parental figure offers. Also, some scholars note that the routinization of household schedules that typically accompanies full-time work is beneficial for children. Additionally, secure parental employment reduces the negative psychological effects associated with the stress of both underemployment and unemployment.

Nationally, the Percent of Children Living in Families Where No Parent Has Full-Time, Year-Round Employment declined from 30 percent in 1990 to 24 percent in 2000—a 20 percent improvement. During that period, this measure improved in 39 states and the District of Columbia, worsened in 6 states, and was unchanged in 5 others. Among the states, the 2000 figures ranged from a low of 16 percent in Minnesota to a high of 32 percent in Louisiana and West Virginia.

Summary and Findings

Percent of Children in Poverty

The Percent of Children in Poverty is perhaps the most global and widely used indicator of child well-being. This is partly due to the fact that poverty is closely linked to a number of undesirable outcomes in areas such as health, education, emotional welfare, and delinquency.¹²⁰

The data shown here are based on the official poverty measure as determined by the U.S. Office of Management and Budget. The official poverty measure consists of a series of thresholds based on family size and composition. The poverty line in 2001 was \$14,269 for a family of one adult and two children. However, a number of researchers have been critical of the official poverty measure.¹²¹ Some analysts believe that the current standard underestimates real poverty, and others believe that it overstates poverty. During the past several years, the U.S. Census Bureau has published a set of experimental poverty measures that incorporate many of the changes called for in a study by the National Academy of Sciences, but there has been no change yet in the official definition of poverty.¹²²

Growth in the ranks of poor children over the past few decades has not been due to an increase in the number of welfare-dependent families; rather, it is because the ranks of the working poor have been growing. Between 1976 and 2001, the number of poor children living in families totally dependent on welfare has actually fallen from 2.8 million to 960,000 while the number of poor children living in families with income from earnings, but no income from public assistance, increased from 4.4 million in 1976 to 6.9 million in 2001.¹²³

It is also noteworthy that a large segment of children in poverty do not receive benefits from the government's major cash assistance programs, such as Temporary Assistance for Needy Families (formerly called Aid to Families With Dependent Children) and/or Supplemental Security Income. U.S. Census Bureau data indicate that only 22 percent of poor families with children reported receiving cash public assistance in 2001.

Despite the enormous wealth in the United States, our child poverty rate is among the highest in the developed world. One study that examined child poverty rates in 22 countries indicates that the child poverty rate in the United States was the second highest among all the countries studied (see Figure 5). Only Mexico had a higher child poverty rate than the U.S. This finding was reinforced by a recent United Nations study that found that among industrialized nations, only Russia has a higher child poverty rate than the United States.¹²⁴ The gap in the child poverty rate between the United States and other developed countries is partly a product of differences in private-sector income, but enormous differences in governmental efforts to alleviate child poverty greatly accentuate the disparities. Given the connections between childhood poverty and poor preparation for adult work roles, the lack of investment in our children will put us at a competitive disadvantage in the international marketplace of the 21st century.

The state measure of child poverty used in this year's *Data Book* differs from the one used in *Data Books* prior to 2000. This year—like the past 3 years—we use information from the U.S. Census Bureau's Small Area Income and Poverty Estimates (SAIPE) series that provides

53

annual estimates of child poverty for states. The Bureau developed this estimate series to help the U.S. Department of Education distribute roughly \$8 billion each year in Title I funds. These estimates also are used to monitor changes in child poverty in connection with the 1996 welfare reform legislation.

While the most recent state-level data from the SAIPE program reflect poverty through 1999, national-level data are available for each year through 2001 from the U.S. Census Bureau's Current Population Survey. Examination of figures for the past decade reveals that the poverty rate for children under age 18 fell dramatically during the mid- to late-1990s. The 2001 child poverty rate of 16.3 percent was up slightly from 2000, the first increase since 1992-93 (see Figure 6). These figures suggest that the benefits of the robust economy of the late 1990s finally reached many, but not all, low-income workers. Despite all of the gains during the 1990s, one out of every six children was poor at the end of the decade, and the child poverty rate actually inched upward between 2000 and 2001.

According to the SAIPE estimates, 17 percent of children were poor in 1999, down slightly from 20 percent in 1989. During that same period, the child poverty rate fell in 45 states, rose in 3 states and the District of Columbia, and was unchanged in 2 other states. In Louisiana, Mississippi, New Mexico, and the District of Columbia, more than 25 percent of all children were poor in 1999. Among the states, the child poverty rate for 1999 ranged from a low of 8 percent in New Hampshire to a high of 26 percent in Louisiana, Mississippi, and New Mexico.

Summary and Findings

Percent of Families With Children Headed by a Single Parent

The Percent of Families With Children Headed by a Single Parent has risen steadily over the past few decades and is a growing concern among policymakers and the public. The number of families headed by a single parent rose from 7.9 million in 1990 to 9.5 million in 2000.

Much of the public interest is linked to the fact that children growing up in single-parent households typically do not have the same economic or human resources available as those growing up in two-parent families. About two-fifths (39 percent) of children in female-headed families were poor in 2001, compared to 8 percent of children in married-couple families. Only about one-third (36 percent) of female-headed families reported receiving any child support or alimony payments in 2000. Beyond poverty, children in divorced and single-parent families are at increased risk for "low measures of academic achievement (repeated grades, low marks, low class standing); increased likelihood of dropping out of high school; early childbearing; and increased levels of depression, stress, anxiety, and aggression."¹²⁵

In general, research suggests that children benefit when both parents are active in their lives, regardless of marital status.¹²⁶ Efforts to encourage the active involvement of divorced and unmarried fathers with their children might benefit from recognizing that many so-called "Dead-Beat Dads" are more fairly characterized as "Dead-Broke Dads." According to an Urban Institute study, nearly 30 percent of the 2.5 million poor noncustodial fathers are incarcerated, while the remainder are either unemployed or earn an average of just \$5,600 a year.¹²⁷

Research by Manpower Demonstration

Research Corporation has found that nearly two-thirds of poor noncustodial fathers had child support orders for an amount more than half of their monthly income.¹²⁸ Results of small-scale pilot programs designed to reach out to these fathers and alleviate the problems of huge child support arrears debt have shown increases in both the dollars received by custodial mothers and the time spent by these fathers with their children.¹²⁹

While it is certainly true that the poverty rate for children in single-parent families is much higher than for those in married-couple families, many of the poor children of single parents would remain in or near poverty even if their parents were to marry. Because, on average, unmarried parents are younger and have less education than their married counterparts, research from the Princeton Fragile Families survey has found that even if the unmarried couples with young children in that study were to marry and both partners were to work outside the home, 28 percent would remain at or below 150 percent of the federal poverty level.¹³⁰

It is also important to recognize that marriage is not always a panacea for kids. Stepchildren in married-couple families experience negative child outcomes at about the same rate as children in single-parent families. Therefore, in terms of child outcomes, there is a critical distinction between children growing up in a married-couple family with two biological parents and those growing up in a married-couple family with stepparents. In 2001, 22 percent of children lived with their mother only; 4 percent lived with their father only; and 4 percent lived with neither parent.¹³¹

A couple of recent signs suggest, however, that the long-term increase may be coming to

FIGURE 7

Percent of Births to Unmarried Women in the United States: 1990-2001

SOURCE: National Center for Health Statistics, 2002. "Birth: Final Data for 2001," National Vital Statistics Reports, Vol. 51, No. 2, Table C.

an end. The divorce rate (number of divorces per 1,000 population) has been falling steadily for more than a decade, and the percent of births occurring to unmarried women nearly stabilized between 1994 and 2001 (see Figure 7). The share of births occurring to unmarried women rose from 28.0 percent in 1990 to 32.6 percent in 1994, but the rate has increased by less than 1 percentage point since 1994.

Implementing governmental efforts to reduce the number of single-parent families continues to be among the most fiercely debated components of social policy, in general, and the welfare reform agenda, in particular. The administration's plans for reauthorization of the welfare reform act include a requirement that states report specifically their activities to promote marriage. Some policy experts propose putting more money into funding experimental programs to encourage marriage for poor parents.¹³² Opponents of these provisions cite concern that such incentive programs and media campaigns divert funds from direct support of poor families.

In 2000, there were 9.5 million single-parent families with children. Nationwide, the Percent of Families With Children Headed by a Single Parent increased from 24 percent in 1990 to 28 percent in 2000. During this period, only 2 states—Colorado and Indiana—recorded a decrease in the share of single-parent families. (Maryland and Minnesota showed no change.) At the other end of the spectrum, the share of single-parent families increased by 25 percent or more in 18 states. In 2000, the Percent of Families With Children Headed by a Single Parent ranged from a low of 17 percent in Utah to a high of 36 percent in Louisiana.

Demographic Change

Number of Children: 1990 and 2000

	1990	2000	NUMBER CHANGE	PERCENT CHANGE
Total	[63,604,432]	[72,293,812]	8,689,380	14%
Urban*	[48,651,099]	[58,288,110]	9,637,011	20%
Rural*	[14,953,333]	[14,005,702]	-947,631	-6%

Background Information

Economic Conditions of Families

Median income of families with children: 2000	[\$50,000]
Children in extreme poverty (income below 50% of poverty level): 2000	[7%]
Female-headed families receiving child support or alimony: 2000	[36%]
Children under age 6 in paid child care while parents work: 2000	[26%]

Child Health

Children without health insurance: 2000	[12%]
2-year-olds who were immunized: 2001	[79%]

* Based on Metropolitan Statistical Areas. For more information, see page 206.

Neighborhood Characteristics

Children in neighborhoods with a high poverty rate (above 18.6%): 2000	[23%]
Children in neighborhoods with a high rate of males not in the labor force (above 38.1%): 2000	[14%]
Children in neighborhoods with a high rate of female-headed families (above 35.2%): 2000	[17%]
Children in neighborhoods with a high rate of high school dropouts (above 14.7%): 2000	[25%]

Technology/Isolation

Children without Internet access at home: 2000	[52%]
Children without a telephone at home: 2001	[3%]
Children without a vehicle at home: 2001	[7%]

Education

3- and 4-year-olds enrolled in nursery school, preschool, or kindergarten: 2000	[49%]
4th grade students who scored below basic science level: 2000	[36%]

Reducing the Cost of Being Poor

Number of households with children receiving Earned Income Tax Credit: 2000 [15,251,000]

Average Earned Income Tax Credit for recipient households with children: 2000

Households eligible for Food Stamps, but not receiving them: 2000

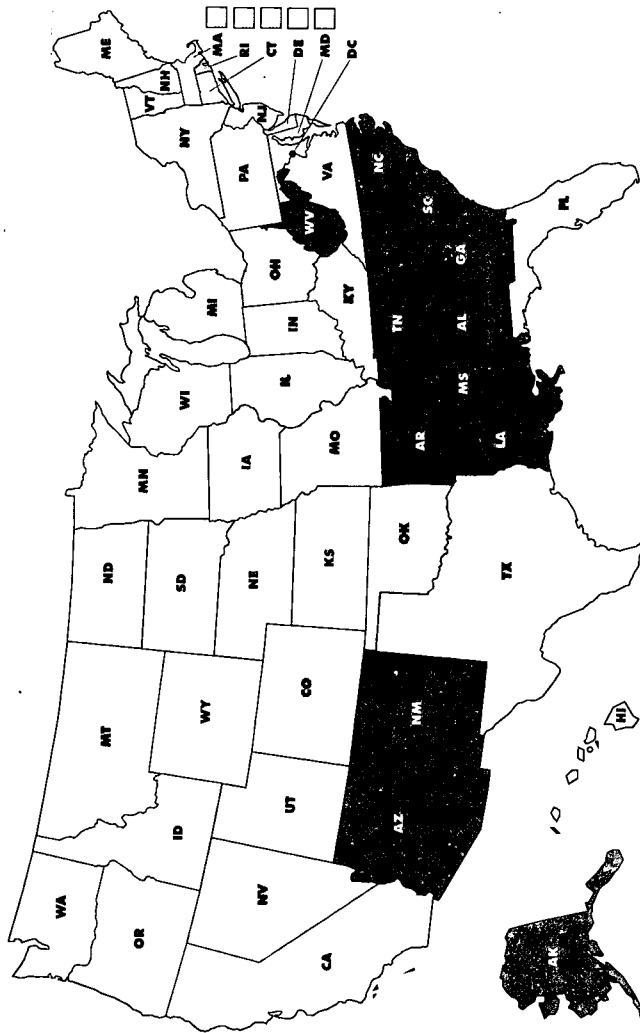

Low-income households with children where housing costs exceed 30% of income: 2001

Overall Rank: 2003

Rank	State	Rank	State
1	Minnesota	27	New York
2	New Hampshire	28	Ohio
3	Utah	29	Michigan
4	New Jersey	30	Illinois

26	Colorado		

N.R.=Not Ranked.

A state's Overall Rank is determined by the sum of a state's standing on each of 10 measures of the condition of children arranged in sequential order from highest/best (1) to lowest/worst (50). The measures are as follows: percent low-birthweight babies; infant mortality rate; child death rate; rate of teen deaths by accident, homicide, and suicide; teen birth rate; percent of teens who are high school dropouts; percent of teens not attending school and not working; percent of children living in families where no parent has full-time, year-round employment; percent of children in poverty; and percent of families with children headed by a single parent.

National Indicator Maps: State Rates

Percent low-birthweight babies: 2000*

- More than 20% better than state median (6.0 and lower)
- Up to 20% better than state median (6.1 to 7.5)
- Up to 20% worse than state median (7.6 to 9.0)
- More than 20% worse than state median (9.1 and higher)

* Babies weighing less than 2,500 grams (5.5 pounds) at birth.

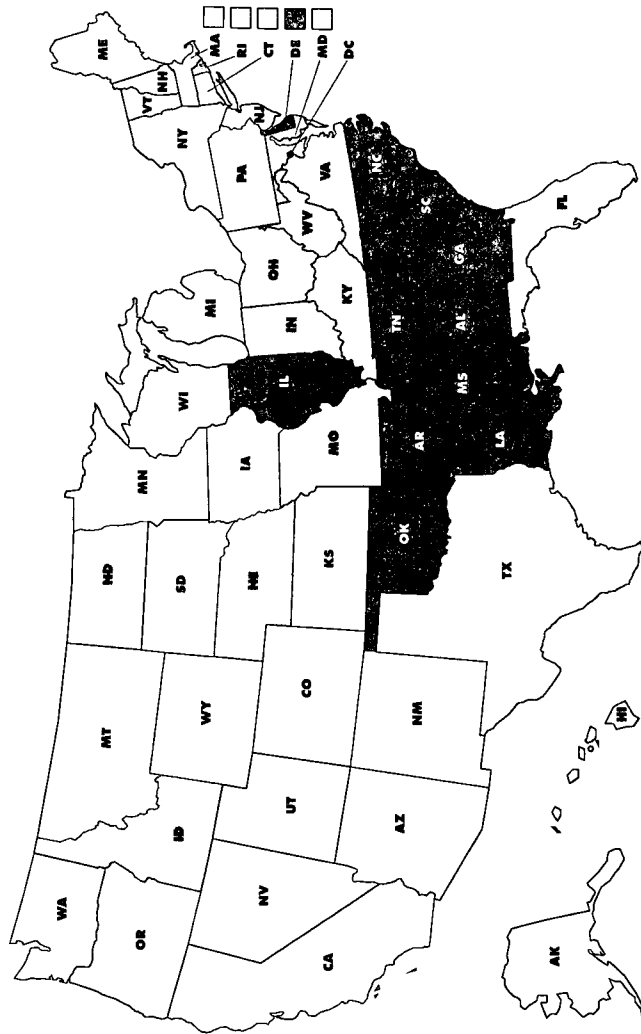

Rank	State	Rate	Rank	State	Rate

KIDS COUNT Standard Scores and Overall Ranks

This chart assists readers in comparing states' performance based on the 10 KIDS COUNT measures of child well-being used to rank states. In addition to showing whether a state ranks higher or lower overall than another state, this chart shows the differences among states based on the sum of their standard scores. If a state had the exact state mean on each indicator, then the sum of the standard scores for that state would be zero. We have inverted the vertical axis in this graph to reflect the fact that negative scores indicate better conditions for children. States are highly clustered near the middle of the distribution, as evidenced by the large number of states in the shaded area.

This chart assists readers in comparing states' performance based on the 10 KIDS COUNT measures of child well-being used to rank states. In addition to showing whether a state ranks higher or lower overall than another state, this chart shows the differences among states based on the sum of their standard scores. If a state had the exact state mean on each indicator, then the sum of the standard scores for that state would be zero. We have inverted the vertical axis in this graph to reflect the fact that negative scores indicate better conditions for children. States are highly clustered near the middle of the distribution, as evidenced by the large number of states in the shaded area.

Multi-Year Trend Data for KIDS COUNT Indicators

This chart provides the rate for each of the 10 KIDS COUNT indicators used to rank states for the years between 1990 and 2000 and the raw data behind the most recent rate. In addition, this chart includes a state's rank by indicator for each year. Raw data based on estimates from the Current Population Survey (CPS) are rounded to the nearest 1,000. Because the estimates for child poverty are more accurate than the CPS-based estimates, they are rounded to the nearest 100.

Indicators

Percent low-birthweight babies	Rate Rank	2000 raw data
Infant mortality rate (deaths per 1,000 live births)	Rate Rank	2000 raw data
Child death rate (deaths per 100,000 children ages 1-14)	Rate Rank	2000 raw data
Rate of teen deaths by accident, homicide, and suicide (deaths per 100,000 teens ages 15-19)	Rate Rank	2000 raw data
Teen birth rate (births per 1,000 females ages 15-17)	Rate Rank	2000 raw data
Percent of teens who are high school dropouts (ages 16-19)	Rate Rank	2000 raw data

The *KIDS COUNT Data Book: 2003* is the 14th annual profile of child well-being produced by the Annie E. Casey Foundation. However, the indicators of child well-being have changed each year, making year-to-year comparisons of state ranks problematic. This chart provides Overall Ranks for 1990, 1994, 1996, 1997, 1998, 1999, and 2000 using a consistent set of indicators—namely, those used to derive the 2000 Overall Ranks. The Overall Ranks for the *KIDS COUNT Data Book: 2003* are based on data from 2000 (the most recent available year). Data on child poverty needed to produce Overall Ranks for 1991, 1992, 1993, and 1995 are not available.

2-Year-Olds Who Were Immunized: 2001 is derived from the National Immunization Survey (NIS), which provides state estimates of vaccination coverage levels among children ages 19 months to 35 months. The survey data were collected for calendar year 2001. The figures given here reflect the percentage of children who have “4:3:1 Series Coverage”; that is, four or more doses of Diphtheria and Tetanus Toxoids and Pertussis Vaccine, three or more doses of oral Poliovirus vaccine, and one or more doses of Measles-Mumps-Rubella vaccine. The figures were derived from a national sample of 23,551 children with a minimum of about 300 children in each state.

SOURCE: Centers for Disease Control and Prevention, “National, State, and Urban Area Vaccination Coverage Levels Among Children Aged 19–35 Months—United States, 2001,” *Morbidity and Mortality Weekly Report*, Vol. 51, No. 30 (August 2, 2002), pp. 664–666.

3- and 4-Year-Olds Enrolled in Nursery School, Preschool, or Kindergarten: 2000 is the share of children ages 3 and 4 enrolled in nursery school, preschool, or kindergarten during the fall school term. “Nursery school” and “preschool” include any group or class of institution providing educational experiences for children during the years preceding kindergarten. Places where instruction is an integral part of the program are included, but private homes that primarily provide custodial care are not included. Children enrolled in programs sponsored by federal, state, or local agencies to provide preschool education to young children—including Head Start programs—are considered as enrolled in nursery school or preschool.

SOURCE: Population Reference Bureau, analysis of data from the U.S. Census Bureau, *Census 2000 Summary File 3 (SF 3) Sample Data*, Table PCT23.

4th Grade Students Who Scored Below Basic Science Level: 2000 is the percentage of 4th grade public school students failing to reach the Basic proficiency level in science, as measured by the National Assessment of Educational Progress (NAEP), which is conducted by the U.S. Department of Education.

The science assessment measures characteristic elements of knowing and doing science, such as conceptual understanding, scientific investigation, and practical reasoning. The NAEP uses three proficiency categories: Advanced, Proficient, and Basic. Fourth grade students at the Basic level showed some of the knowledge and reasoning required to understand the three major science fields (earth, physical, and life sciences) at a level appropriate for grade 4. For example, they could perform simple experiments and read basic graphs and diagrams. In addition, they demonstrated a preliminary understanding of classification, simple relationships, and energy.

Scores on this measure are reported for 39 states. Ten states (Alaska, Colorado, Delaware, Florida, Kansas, New Hampshire, New Jersey, Pennsylvania, South Dakota, and Washington), along with the District of Columbia, did not participate in the 2000 NAEP science assessment for 4th grade students. Another state (Wisconsin) did not meet public school participation guidelines for the 4th grade science assessment, so its score was not reported. In addition, the data for 13 states (California, Idaho, Illinois,

Definitions and Data Sources

Indiana, Iowa, Maine, Michigan, Minnesota, Montana, New York, Ohio, Oregon, and Vermont) were published by the National Center for Education Statistics and are shown here, even though they did not meet all of the NAEP participation rate guidelines.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *The Nation's Report Card: Science 2000*, NCEES 2003-453, by C. Y. O'Sullivan et al. (Washington, DC: 2003), Table B.17.

Average Earned Income Tax Credit for Recipient Households With Children: 2000 is the average dollar amount of Earned Income Tax Credit (EITC) that households with children claimed for the tax year 2000 when filing their taxes. Only those tax filers for whom the data indicate the number of children in the household are included in this analysis. In 2000, 3.4 percent of EITC claims were unclassifiable as to the number of children in the household. Those data were not included in these calculations. Nationwide, the average credit was \$1,555 for a household with one child; \$2,373 for a household with two or more children; and \$207 for a taxpayer with no children. The EITC is a federal program that operates through the tax system. It allows low-income workers to keep more of their earnings.

Child Death Rate (deaths per 100,000 children ages 1-14) is the number of deaths to children between ages 1 and 14, from all causes, per 100,000 children in this age range.

The data are reported by place of residence, not place of death.

SOURCES: Death Statistics: Centers for Disease Control and Prevention (CDC), National Center for Health Statistics (NCHS). 2000 data: CDC, NCHS, Division of Vital Statistics, "Deaths by 10-Year Age Groups: United States and Each State, 2000," available at www.cdc.gov/nchs/data/dvs/vs00100.TABLE23B_2000.pdf (accessed January 10, 2003). 1999 data: CDC, NCHS, Division of Vital Statistics, "Deaths From 358 Selected Causes, by 5-Year Age Groups, Race and Sex: U.S. and Each State, 1999," available at www.cdc.gov/nchs/data/vs00199.TABLEIII.PT1.pdf (accessed October 23, 2001). 1998 data: CDC, NCHS, Division of Vital Statistics, "Deaths From 282 Selected Causes, by 5-Year Age Groups, Race and Sex: U.S. and Each State, 1998," available at www.cdc.gov/nchs/data/1997.pdf (accessed July 26, 2000). 1997 data: CDC, NCHS, Division of Vital Statistics, "Deaths From 282 Selected Causes, by 5-Year Age Groups, Race and Sex: U.S. and Each State, 1997," available at www.cdc.gov/nchs/data/97gm3_01.pdf (accessed October 27, 1999). 1996 data: Special tabulations available through CDC WONDER at wonder.cdc.gov (accessed January 5, 1999). 1990 through 1995 data: Special tabulations by CDC, NCHS, Division of Vital Statistics, "Deaths From 282 Selected Causes, by 5-Year Age Groups, Race and Sex: U.S. and Each State," for each year from 1990 through 1995. Population Statistics: U.S. Census Bureau. 2000 data: *Census 2000 Summary File 1 (SF 1) 100-Percent Data*, Table P14. 1990 through 1999 data: Data from Population Division.

Children in Extreme Poverty (income below 50% of poverty level): 2000 is the percentage of children under age 18 who live in families with incomes below 50 percent of the U.S. poverty threshold, as defined by the U.S. Office of Management and Budget. In calendar year 2000, a family of two adults and two children fell in this category if their income fell below \$8,732. Poverty status is not determined for people in military barracks or institutional quarters, or for unrelated individuals under age 15 (such as foster children).

The figures shown here represent 3-year averages of data from 1999 through 2001. We label these as 2000 estimates because 2000 is the midpoint of the 3-year period. For any given year, the income data needed to determine poverty status actually are collected in March of the following year.

The March 2002 Current Population Survey (CPS) file incorporated a significant sample expansion—from about 50,000 to 78,000 interviewed households—compared to the 2000 and 2001 surveys. While done primarily to produce better state-level estimates of the number of children without health insurance, estimates for other variables also improved. In addition, the March 2002 CPS file introduced population controls based on data from the 2000 Census. (Population controls for earlier survey years are based on the 1990 Census.) In analyzing these changes, the U.S. Census Bureau concluded that the effects were minor. Detailed analyses are available at www.bls.census.gov/cps/ads/adsmain.htm (sample expansion) and www.bls.census.gov/cps/tp/rp63.htm (2000 Census population controls).

SOURCE: Population Reference Bureau, analysis of data from the U.S. Census Bureau,

Current Population Survey (March supplement), 2000 through 2002.

Children in Neighborhoods With a High Poverty Rate (above 18.6%): 2000 is the share of children under age 18 who live in census tracts where more than 18.6 percent of all persons live in families with annual incomes below the U.S. poverty threshold in 1999, as defined by the U.S. Office of Management and Budget (OMB). The federal OMB poverty definition consists of a series of thresholds based on family size and composition, but it does not take into account geographic differences in the cost of living. In 1999, the poverty threshold for a family of two adults and two children was \$16,895. All children in tracts with high poverty rates (that is, above 18.6 percent) are included in the figures shown here, even if the children themselves do not live below the poverty level. The threshold of 18.6 percent represents 1.5 times the national poverty rate, which the 2000 Census reported to be 12.4 percent.

SOURCES: Population Reference Bureau, analysis of data from U.S. Census Bureau, *Census 2000 Summary File 1 (SF 1) 100-Percent Data*, Table P12; and *Census 2000 Summary File 3 (SF 3) Sample Data*, Table P87.

Children in Neighborhoods With a High Rate of Female-Headed Families (above 35.2%): 2000 is the share of children under age 18 who live in census tracts where more than 35.2 percent of family households with related children are headed by a woman without a husband present in the home. "Related children" include the householder's children (including stepchildren and adopted children), as well as other persons under age 18 who

are related to the householder (such as nieces or nephews). The threshold of 35.2 percent represents 1.5 times the national share of female-headed families, which the 2000 Census reported to be 23.5 percent.

SOURCE: Population Reference Bureau, analysis of data from the U.S. Census Bureau, *Census 2000 Summary File 1 (SF 1) 100-Percent Data*, Tables P12 and P35.

Children in Neighborhoods With a High Rate of High School Dropouts (above 14.7%):

2000 is the share of children under age 18 who live in census tracts where more than 14.7 percent of persons ages 16 to 19 are not enrolled in school and are not high school graduates. (Persons who have a GED are considered high school graduates in this measure.) The threshold of 14.7 percent represents 1.5 times the national dropout rate for 16- to 19-year-olds, which the 2000 Census reported to be 9.8 percent.

SOURCES: Population Reference Bureau, analysis of data from the U.S. Census Bureau, *Census 2000 Summary File 1 (SF 1) 100-Percent Data*, Table P12; and *Census 2000 Summary File 3 (SF 3) Sample Data*, Table P38.

Children in Neighborhoods With a High Rate of Males Not in the Labor Force (above 38.1%): 2000 is the share of children under age 18 who live in census tracts where more than 38.1 percent of males ages 16 to 64 have no ties to the work force. In addition to men who are not looking for employment, this includes men who are actively seeking work, but who have not found it. The threshold of 38.1 percent represents 1.5 times the national level of labor force detachment for working-age men, which the 2000 Census reported to be 25.4 percent.

Definitions and Data Sources

SOURCES: Population Reference Bureau, analysis of data from the U.S. Census Bureau, *Census 2000 Summary File 1 (SF 1) 100-Percent Data*, Table P12; and *Census 2000 Summary File 3 (SF 3) Sample Data*, Table PCT35.

Children Under Age 6 in Paid Child Care

While Parents Work: 2000 is the percentage of children under age 6 who spent some time during the calendar year in paid child care while their parent(s) worked. This measure includes children in preschool and nursery school, but not those in kindergarten and elementary school. The figures shown here are 3-year averages of data from 1999 through 2001. We label these as 2000 estimates because 2000 is the midpoint of the 3-year period. For any given year, data on child care actually are collected in March of the following year.

Responses to this item in the March 2001 and March 2002 Current Population Survey (CPS) files were edited by the U.S. Census Bureau, but the March 2000 CPS file had to be edited by the staff of the Urban Studies Institute (USI) at the University of Louisville. Editing of the March 2000 CPS was done according to editing specifications provided by the U.S. Census Bureau; however, the allocation procedures used by USI staff were slightly different. Therefore, the numbers provided here are slightly different from those that would have been produced by the U.S. Census Bureau if the Bureau had edited the March 2000 CPS file, but the differences are likely to be minor.

The March 2002 CPS file incorporated a significant sample expansion—from about 50,000 to 78,000 interviewed households—compared to the 2000 and 2001 surveys. While done primarily to produce better

state-level estimates of the number of children without health insurance, estimates for other variables also improved. In addition, the March 2002 CPS file introduced population controls based on data from the 2000 Census. (By contrast, population controls for earlier survey years are based on the 1990 Census.)

In analyzing the effects of these changes, the U.S. Census Bureau concluded that the general effects were minor. More detailed analyses are available at www.bls.census.gov/cps/ads/adsmain.htm (sample expansion) and www.bls.census.gov/cps/tp/tp63.htm (2000 Census population controls).

SOURCE: Urban Studies Institute at the University of Louisville, analysis of data from the U.S. Census Bureau, Current Population Survey (March supplement), 2000 through 2002.

Children Without a Telephone at Home: 2001 is the share of children under age 18 living in households without a telephone in their home at the time of the interview. During the interview, respondents were asked whether there was a telephone in the house and, specifically, whether this telephone was in working order and with service to make and receive calls.

The data for this measure come from the 2001 Supplementary Survey, a special nationwide survey of 700,000 households that the U.S. Census Bureau conducted monthly during calendar year 2001, using the questionnaire and methodology developed for the American Community Survey (ACS). The ACS, when fully implemented, is designed to provide annually updated social, economic, and housing data for states and communities. (Such local-area data currently are collected once every 10

years in the long form of the Decennial Census.) The data for this variable, like all data from the Supplementary Survey and the ACS, reflect annual averages of monthly data.

SOURCE: Population Reference Bureau, special tabulations of data from the U.S. Census Bureau, 2001 Supplementary Survey.

Children Without a Vehicle at Home: 2001 is the share of children under age 18 living in households without a vehicle at the time of the interview. Vehicles include passenger cars, vans, and trucks that are kept at home and are available for use by household members.

The data for this measure come from the 2001 Supplementary Survey, a special nationwide survey of 700,000 households that the U.S. Census Bureau conducted monthly during calendar year 2001, using the questionnaire and methodology developed for the American Community Survey (ACS).

The ACS, when fully implemented, is designed to provide annually updated social, economic, and housing data for states and communities. (Such local-area data currently are collected once every 10 years in the long form of the Decennial Census.) The data for this variable, like all data from the Supplementary Survey and the ACS, reflect annual averages of monthly data.

SOURCE: Population Reference Bureau, special tabulations of data from the U.S. Census Bureau, 2001 Supplementary Survey.

Children Without Health Insurance: 2000 is the percentage of children under age 18 who were not covered by health insurance at any point during the year. Health insurance includes private-sector insurance generally

provided through work, as well as insurance provided through the public sector, such as Medicare and Medicaid. Children receiving health insurance through a variety of new state Child Health Insurance Programs (sCHIP) are counted as having health insurance. The figures shown here are 3-year averages of data from 1999 through 2001. We label these as 2000 estimates because 2000 is the midpoint of the 3-year period. For any given year, data on health insurance status actually are collected in March of the following year.

The March 2002 Current Population Survey (CPS) file incorporated a significant sample expansion—from about 50,000 to 78,000 interviewed households—compared to the 2000 and 2001 surveys. While done primarily to produce better state-level estimates of the number of children without health insurance, estimates for other variables also improved. In addition, the March 2002 CPS file introduced population controls based on data from the 2000 Census. (By contrast, population controls for earlier survey years are based on the 1990 Census.) In analyzing the effects of these changes for health insurance, the U.S. Census Bureau concluded that the effects were minor. More detailed analyses are available at www.bls.census.gov/cps/ads/adsmain.htm (sample expansion) and www.bls.census.gov/cps/tp/tp63.htm (2000 Census population controls).
SOURCE: Population Reference Bureau, analysis of data from the U.S. Census Bureau, Current Population Survey (March supplement), 2000 through 2002.

Children Without Internet Access at Home: 2000 is the share of children under age 18

who live in households where there was no Internet access available at the time of the survey. The figures shown here reflect a 3-year average of data from December 1998, August 2000, and September 2001. We label these as 2000 estimates because 2000 is the midpoint of the 3-year period.

It should be noted that this measure indicates how many children have access to the Internet at home—as opposed to a measure indicating how many children have regular access to the Internet. According to the U.S. Census Bureau report, “Home Computers and Internet Use in the United States: August 2000,” school was the most common place for children to access the Internet.

SOURCE: Urban Studies Institute at the University of Louisville, analysis of data from the U.S. Census Bureau, Current Population Survey (December 1998, August 2000, and September 2001 supplements).

Definitions and Data Sources

Female-Headed Families Receiving Child Support or Alimony: 2000 is the percentage of families headed by an unmarried woman (living with one or more of her own children under age 18) receiving either child support or alimony payments during the previous calendar year. (Editions of the *KIDS COUNT Data Book* prior to 1998 referred to this measure as Percent of Mother-Headed Families Receiving Child Support or Alimony.) “Own children” include never-married persons under age 18 who are the sons or daughters of the household-er (head of the household). The household’s stepchildren and adopted children also are counted as “own children.” Families categorized as receiving child support or alimony include those receiving partial payment, as well as

Definitions and Data Sources

those receiving full payment. It also should be noted that there is no child support award in place in many of these families. Nationally, only 62 percent of all female-headed families had a child support award in place in 1999.

The figures shown here represent 3-year averages of data from 1999 through 2001. We label these as 2000 estimates because 2000 is the midpoint of the 3-year period. For any given year, income and poverty data actually are collected in March of the following year.

The March 2002 Current Population Survey (CPS) file incorporated a significant sample expansion—from about 50,000 to 78,000 interviewed households—compared to 2000 and 2001. While done primarily to produce better state-level estimates of the number of children without health insurance, estimates for other variables also improved. In addition, the March 2002 CPS file introduced population controls based on data from the 2000 Census. (By contrast, population controls for earlier survey years are based on the 1990 Census.) In analyzing the effects of these changes for income, poverty, and health insurance, the U.S. Census Bureau concluded that the general effects were minor. More detailed analyses are available at www.bls.census.gov/cps/ads/admain.htm (sample expansion) and www.bls.census.gov/cps/tp/tp63.htm (2000 Census population controls).

SOURCE: Population Reference Bureau, analysis of data from the U.S. Census Bureau, Current Population Survey (March supplement), 2000 through 2002.

Households Eligible for Food Stamps, But Not Receiving Them: 2000 is the percentage of households estimated to be eligible to

receive Food Stamps, but not participating in the Food Stamp program (FSP).

The U.S. Department of Agriculture (USDA) estimates the number of eligible households with a model that uses March Current Population Survey (CPS) data to simulate the Food Stamp participation rate in September of the previous calendar year. In the simulation procedure, FSP eligibility guidelines that were in effect in September of the previous calendar year are applied to each household in the CPS. The FSP guidelines include unit formation rules, asset limits, and income limits. Because several types of information needed to determine FSP eligibility are missing from the CPS data, the USDA imputes some information to improve the model estimates of the number of eligible households.

SOURCE: U.S. Department of Agriculture, Food and Nutrition Service, *Reaching Those in Need: State Food Stamp Participation Rates in 2000* (December 2002).

Infant Mortality Rate (deaths per 1,000 live births) is the number of deaths occurring to infants under 1 year of age per 1,000 live births. The data are reported by place of residence, not place of death.

SOURCES: Centers for Disease Control and Prevention, National Center for Health Statistics. 2000 data: "Deaths: Final Data for 2000," *National Vital Statistics Reports*, Vol. 50, No. 15 (September 16, 2002), Table 36. 1999 data: "Deaths: Final Data for 1999," *National Vital Statistics Reports*, Vol. 49, No. 8 (September 21, 2001), Table 29. 1998 data: "Deaths: Final Data for 1998," *National Vital Statistics Reports*, Vol. 48, No. 11 (July 24, 2000), Table 31. 1997 data: "Deaths: Final

Low-Income Households With Children

Where Housing Costs Exceed 30% of Income: 2001 is the share of low-income households with children where, at the time of the interview, more than 30 percent of the monthly income was spent on rent, mortgage payments, taxes, insurance, and/or related expenses. Low-income households are households with incomes less than 200 percent of the federal poverty level, as defined by the U.S. Office of Management and Budget. In 2001, a family of two adults and two children fell

in this category if their annual income was less than \$35,920. The 30 percent threshold for housing costs is based on research on affordable housing by the U.S. Department of Housing and Urban Development (HUD). According to HUD, households that must allocate more than 30 percent of their income to housing expenses are less likely to have enough resources for food, clothing, medical care, or other needs. Because they must deal with relatively scarce resources to begin with, low-income households are particularly vulnerable.

The data for this measure come from the 2001 Supplementary Survey, a special nationwide survey of 700,000 households that the U.S. Census Bureau conducted monthly during calendar year 2001, using the questionnaire and methodology developed for the American Community Survey (ACS). The ACS, when fully implemented, is designed to provide annually updated social, economic, and housing data for states and communities. (Such local-area data currently are collected once every 10 years in the long form of the Decennial Census.) The data for this variable, like all data from the Supplementary Survey and the ACS, reflect annual averages of monthly data. **SOURCE:** Population Reference Bureau, special tabulations of data from the U.S. Census Bureau, 2001 Supplementary Survey.

Median Income of Families With Children: 2000 is the median annual income for families with related children under age 18 living in the household. "Related children" include the household's (head of the household) children by birth, marriage, or adoption; as well as other persons under age 18 (such as nieces or nephews) who are related to the householder

and living in the household.

The median income is the dollar amount that divides the income distribution into two equal groups—half with income above the median, half with income below it. The figures shown here represent 3-year averages of data from 1999 through 2001 and are expressed in 2000 dollars. We label these as 2000 estimates because 2000 is the midpoint of the 3-year period. All figures are rounded to the nearest \$100. Income data for a given year actually are collected in March of the following year.

The March 2002 Current Population Survey (CPS) file incorporated a significant sample expansion—from about 50,000 to 78,000 interviewed households—compared to the 2000 and 2001 surveys. While done primarily to produce better state-level estimates of the number of children without health insurance, estimates for other variables also improved. In addition, the March 2002 CPS file introduced population controls based on data from the 2000 Census. (By contrast, population controls for earlier survey years are based on the 1990 Census.) In analyzing the effects of these changes for income, the U.S. Census Bureau concluded that the effects were relatively minor. More detailed analyses are available at www.bls.census.gov/cps/ads/adsmain.htm (sample expansion) and www.bls.census.gov/cps/tp/tp63.htm (2000 Census population controls). **SOURCE:** Population Reference Bureau, analysis of data from the U.S. Census Bureau, Current Population Survey (March supplement), 2000 through 2002.

Number of Children: 1990 and 2000 is the total resident population under age 18 in metropolitan (urban) and nonmetropolitan

Definitions and Data Sources

(rural) areas—including dependents of Armed Forces personnel stationed in the areas—as of April 1 of each year. These data come from the Decennial Censuses of 1990 and 2000.

According to the U.S. Office of Management and Budget (OMB), a metropolitan area consists of a county containing one or more central cities with a combined population of 50,000, plus other counties with economic and social ties to the central city or county. (In the six New England states, cities and towns, not counties, form the basis for defining a metropolitan area.) As of June 30, 1999, nearly 850 of the nation's 3,141 counties and county equivalents were part of metropolitan areas, and the remainder were outside metropolitan areas (that is, were considered nonmetropolitan).

Urban Children are those who live in metropolitan areas, and Rural Children are those who live in nonmetropolitan areas, as defined by the OMB. For 1990, the numbers of Urban and Rural Children reflect the metropolitan area definition of June 1990.

For 2000, the numbers reflect the definition of June 1999. As a result, some of the changes in the numbers of Urban and Rural Children between 1990 and 2000 were due to the reclassification of counties (cities and towns in New England) during that period—mostly from nonmetropolitan to metropolitan.

In late 2000, the OMB announced revisions of the metropolitan area standards—to take effect no later than June 30, 2003. Details are contained in the *Federal Register* (Vol. 65, No. 249, December 27, 2000), which is available at www.census.gov/cao/www/fedreg/2000/00-32997.pdf.

SOURCES: Population Reference Bureau, analysis of data from the U.S. Census Bureau

and the Annie E. Casey Foundation. 1990 data: U.S. Census Bureau, *1990 Summary Tape File 1 (STF 1) 100-Percent Data*, Table P011, available at factfinder.census.gov (accessed October 2001); Annie E. Casey Foundation, KIDS COUNT census data, available at www.aecf.org/kidscount/census (accessed October 2001); and U.S. Census Bureau, "Metropolitan Areas and Components, 1990 With FIPS Codes," available at www.census.gov/population/estimates/metro-city/90mfips.txt (accessed September 2001). 2000 data: U.S. Census Bureau, *Census 2000 Summary File 1 (SF 1) 100-Percent Data*, Table P12, available at factfinder.census.gov (accessed October 2001); Annie E. Number of Households With Children Receiving Earned Income Tax Credit: 2000 is the total number of households with children where the Federal Earned Income Tax Credit (EITC) was claimed when filing their taxes. Only those tax filers for whom the data indicate the number of children in the household are included in this analysis. In 2000, 3.4 percent of EITC claims were unclassifiable as to the number of children in the household. Those data were not included in these calculations. The EITC is a federal program that operates through the tax system. It allows low-income workers to keep more of their earnings.

SOURCE: Center on Budget and Policy Priorities, analysis of data from the Internal Revenue Service, *Supplemental Earned Income Report, Tax Year 2000* (December 26, 2001).

Overall Rank for each state was obtained in the following manner. First, we converted the 2000 numerical values for each of the 10 indicators into standard scores. We then summed those standard scores to create a total standard score for each of the 50 states. Finally, we ranked the states on the basis of their total standard score in sequential order from highest/best (1) to lowest/worst (50). Standard scores were derived by subtracting the mean score from the observed score and dividing the amount by the standard deviation for that distribution of scores. (Because we did not rank the District of Columbia, we did not include data for the District in our calculations of standard scores. See page 36 of the *Data Book* for an explanation of why we did not rank the District.) All measures were given the same weight in calculating the overall standard score. In other words, no attempt was made to judge the relative importance of each indicator.

Percent Change Over Time Analysis was computed by comparing the 2000 data for each of the 10 indicators with the data for the base year (1990). To calculate percent change, we subtracted the value for 1990 from the value for 2000, then divided that quantity by the value for 1990. The results are multiplied by 100 for readability. The percent change was calculated on rounded data, and the "percent change" figure has been rounded to the nearest whole number.

Percent Low-Birthweight Babies is the share of live births weighing less than 2,500 grams (5.5 pounds). The data are reported by place of mother's residence, not place of birth. Each year there are a small number of births in which the weight of the newborn is not recorded, and births of unknown weight are not included in these calculations. In 2000, 4,841 births were of unknown weight.

SOURCES: Centers for Disease Control and Prevention, National Center for Health Statistics. **2000 data:** "Births: Final Data for 2000," *National Vital Statistics Reports*, Vol. 50, No. 5, (February 12, 2002), Table 46. **1999 data:** "Births: Final Data for 1999," *National Vital Statistics Reports*, Vol. 49, No. 1, (April 17, 2001), Table 46. **1998 data:** "Births: Final Data for 1998," *National Vital Statistics Reports*, Vol. 48, No. 3, (March 28, 2000), Table 46. **1997 data:** "Births: Final Data for 1997," *National Vital Statistics Reports*, Vol. 47, No. 18, (April 29, 1999), Table 46. **1996 data:** "Advance Report of Final Natality Statistics, 1996," *Monthly Vital Statistics Report*, Vol. 45, No. 11, Supplement (June 30, 1998), Table 46. **1995 data:** "Advance Report of Final Natality Statistics, 1995," *Monthly Vital Statistics Report*, Vol. 45, No. 11, Supplement (June 10, 1997), Table 16. **1994 data:** "Advance Report of Final Natality Statistics, 1994," *Monthly Vital Statistics Report*, Vol. 44, No. 11, Supplement (June 24, 1996), Table 16. **1993 data:** "Advance Report of Final Natality Statistics, 1993," *Monthly Vital Statistics Report*, Vol. 44, No. 3, Supplement (September 21, 1995), Table 16. **1992 data:** "Advance Report of Final Natality Statistics, 1992," *Monthly Vital Statistics Report*, Vol. 43, No. 5, Supplement

(October 25, 1994), Table 16. **1991 data:** "Advance Report of Final Natality Statistics, 1991," *Monthly Vital Statistics Report*, Vol. 42, No. 3, Supplement (September 9, 1993), Table 14. **1990 data:** "Advance Report of Final Natality Statistics, 1990," *Monthly Vital Statistics Report*, Vol. 41, No. 9, Supplement (February 25, 1993), Table 14.

Percent of Children in Poverty is the share of children under age 18 who live in families with incomes below the U.S. poverty threshold, as defined by the U.S. Office of Management and Budget. The federal poverty definition consists of a series of thresholds based on family size and composition. In 1999, the poverty threshold for a family of two adults and two children was \$16,895. Poverty status is not determined for people in military barracks or institutional quarters, or for unrelated individuals under age 15 (such as foster children).

Since the 2000 *Data Book*, we have used information from the Small Area Income and Poverty Estimates (SAIPE) series of the U.S. Census Bureau, which provides annual state-level estimates of income and poverty (including child poverty). This series was developed to help the U.S. Department of Education distribute roughly \$8 billion each year in Title I funds. It is also now used in connection with the federal welfare reform legislation passed in 1996.

The SAIPE program uses a model-based estimation technique to create annual state- and county-level income and poverty estimates, as well as income and poverty estimates for school districts in odd-numbered years. State-level estimates currently are available for 1989, 1993, and each year from 1995 through 1999. (County-level estimates also are available for

Definitions and Data Sources

each of the years listed above *except* 1996.)

We used the most recent SAIPE estimate for child poverty, 1999, in our calculation of the Overall Rank this year—even though this year's overall ranking is based on 2000 data for the other nine indicators.

SOURCE: U.S. Census Bureau, Small Area Income and Poverty Estimates Program, data available at www.census.gov/hhes/www/saipe.html (accessed January 10, 2003).

Percent of Children Living in Families Where No Parent Has Full-Time, Year-Round Employment is the share of all children under age 18 living in families where no parent has regular, full-time employment. This measure is very similar to the measure called "Secure Parental Employment," used by the Federal Interagency Forum on Child and Family Statistics in its publication *America's Children: Key National Indicators of Well-Being*.

For children living in single-parent families, this means the resident parent did not work at least 35 hours per week, at least 50 weeks in the previous calendar year. For children living in married-couple families, this means neither parent worked at least 35 hours per week, at least 50 weeks in the previous calendar year. Children living with neither parent also were listed as not having secure parental employment because those children are likely to be economically vulnerable. The figures shown here reflect 3-year averages; for example, the figure for 2000 reflects an average of data from 1999 through 2001. We label this figure as a 2000 estimate because 2000 is the midpoint of the 3-year period. For any given year, employment data are collected in March of the following year.

The March 2002 Current Population

Survey (CPS) file incorporated a significant sample expansion—from about 50,000 to 78,000 interviewed households—compared to the surveys from 1990 through 2001. While done primarily to produce better state-level estimates of the number of children without health insurance, estimates for other variables also improved. In addition, the March 2002 CPS file introduced population controls based on data from the 2000 Census. (By contrast, population controls for most of the earlier survey years are based on the 1990 Census.) In analyzing the effects of these changes for income, poverty, and health insurance, the U.S. Census Bureau concluded that the general effects were minor. More detailed analyses are available at www.bls.census.gov/cps/ads/adsmain.htm (sample expansion) and www.bls.census.gov/cps/tp/tp63.htm (2000 Census population controls).

SOURCE: Urban Studies Institute at the University of Louisville, analysis of data from the U.S. Census Bureau, Current Population Survey (March supplement), 1990 through 2002.

Percent of Families With Children Headed by a Single Parent is the percentage of all families with own children under age 18 living in the household, headed by a person—male or female—without a spouse present in the home. "Own children" include never-married persons under age 18 who are the sons or daughters of the householder (head of the household). The householder's stepchildren and adopted children also are counted as "own children."

This measure is based on analysis of the 12-month Current Population Survey (CPS) file maintained by the U.S. Bureau of Labor Statistics. Questions regarding family type are collected for all family households each month.

A yearly average was calculated based on responses for the 12 months in the calendar year. The figures shown here represent 3-year averages. For example, the figure for 2000 represents an average of data from 1999 through 2001. We label this figure as a 2000 estimate because 2000 is the midpoint of the 3-year period.

Families with either spouse in the military are not included in this analysis because their inclusion would introduce a small bias in our estimate. The CPS sample does not include families where the only adult in the family is in the military, but it does include military families where one of the spouses is in the civilian labor force. Therefore, the only military families included in the CPS are two-parent families where one spouse is in the civilian labor force and one is in the military. This discrepancy would introduce a slight downward bias in the estimate of the percent of children in single-parent families if military families were included.

Like all estimates derived from samples, these figures contain some amount of random error. The Bureau of Labor Statistics suggests that state rankings based on these figures should be used with caution.

SOURCE: Special tabulations of 1989–2001 Current Population Survey microdata prepared by the U.S. Bureau of Labor Statistics.

Percent of Teens Not Attending School and Not Working (ages 16-19) is the percentage of teenagers between ages 16 and 19 who are not enrolled in school (full- or part-time) and not employed (full- or part-time).

This measure is based on analysis of the 12-month Current Population Survey (CPS) file maintained by the U.S. Bureau of Labor Statistics. Each month the CPS asks respondents in

about 50,000 households nationwide questions regarding their activities related to the labor force and education. Questions regarding school enrollment and employment are asked of all 16- to 19-year-olds in the sample each month. A yearly average was calculated based on responses for the 9 months students typically are in school (September through May). The figures shown here represent 3-year averages. For example, the figure for 2000 represents an average of data from 1999 through 2001. We label this figure as a 2000 estimate because 2000 is the midpoint of the 3-year period.

Like all estimates derived from samples, these figures contain some amount of random error. The Bureau of Labor Statistics suggests that state rankings based on these figures should be used with caution.

SOURCE: Special tabulations of 1989–2001 Current Population Survey microdata prepared by the U.S. Bureau of Labor Statistics.

Percent of Teens Who Are High School Dropouts (ages 16–19) is the percentage of teenagers between ages 16 and 19 who are not enrolled in school and are not high school graduates. Those who have a GED or equivalent are included as high school graduates in this measure. The measure used here is defined as a “status dropout” rate by the National Center for Education Statistics (NCES) as shown in their publication *Dropout Rates in the United States: 2000* (p. 2). We used data from the Current Population Survey (CPS) because it provides systematic information for all states. Currently, only 37 states and the District of Columbia have submitted event dropout data to the NCES that meet quality and comparability levels needed to justify publishing estimates

(see NCES, *Dropout Rates in the United States: 2000*, p. 8). For the measure presented here, we focus on teens ages 16 to 19 rather than young adults ages 16 to 24 (which is the focus of *Dropout Rates in the United States: 2000*) because a large share of 18- to 24-year-olds migrate across state lines each year. The high interstate migration rates of 18- to 24-year-olds confound the connection between state policies and programs and state dropout rates.

This measure is based on analysis of the 12-month CPS file maintained by the U.S. Bureau of Labor Statistics. Each month the CPS asks respondents in about 50,000 households nationwide questions regarding their activities related to the labor force and education. A yearly average was calculated based on responses for the 9 months students typically are in school (September through May). The figures shown here represent 3-year averages. For example, the figure for 2000 represents an average of data from 1999 to 2001. We label this figure as a 2000 estimate because 2000 is the midpoint of the 3-year period.

Like all estimates derived from samples, these figures contain some amount of random error. The Bureau of Labor Statistics suggests that state rankings based on these figures should be used with caution.

SOURCE: Special tabulations of 1989–2001 Current Population Survey microdata prepared by the U.S. Bureau of Labor Statistics.

Rate of Teen Deaths by Accident, Homicide, and Suicide (deaths per 100,000 teens ages 15–19) is the number of deaths from accidents, homicides, and suicides to teens between ages 15 and 19, per 100,000 teens in this age group. (Editions of the *Data Book* prior to 1997 called

Definitions and Data Sources

this measure the Teen Violent Death Rate.) The data are reported by place of residence, not the place where the death occurred.

Beginning with data for 1999, causes of death have been reclassified to be consistent with the Tenth Revision of the *International Classification of Diseases* (ICD-10), which replaces the Ninth Revision (ICD-9) that had been used for 1979–1998 data. To facilitate better comparability over time, accident, homicide, and suicide data for 1990 through 1998 were retabulated using the new ICD-10 codes. The effect the new classification had on this measure is to remove deaths due to “adverse effects” (such as bad reactions to medication) from the “accident” category and to remove deaths as a result of legal intervention (such as executions) from the “homicide” category. (“Adverse effects” and “legal intervention” account for less than 1 percent of all deaths from accident, homicide, and suicide. For more on the effects of the new ICD revision, please see Centers for Disease Control and Prevention, National Center for Health Statistics, “Comparability of Cause of Death Between ICD-9 and ICD-10: Preliminary Estimates,” *National Vital Statistics Reports*, Vol. 49, No. 2, May 18, 2001.)

SOURCES: Death Statistics: 2000 data: Centers for Disease Control and Prevention (CDC), National Center for Injury Prevention and Control (NCIPC), special tabulations available at webapp.cdc.gov/sasweb/ncipc/mortrate.html (accessed January 17, 2003).

1999 data: CDC, National Center for Health Statistics (NCHS), Division of Vital Statistics, “Deaths From 358 Selected Causes, by 5-Year Age Groups, Race and Sex: U.S. and Each State, 1999,” available at www.cdc.gov/nchs/

Rural Children: 1990 and 2000 (See “Number of Children: 1990 and 2000” on page 206.)

Teen Birth Rate (births per 1,000 females ages 15–17) is the number of births to teenagers between ages 15 and 17 per 1,000 females in this age group. Data reflect the mother’s place of residence, rather than place of birth. This measure of teenage childbearing focuses on the fertility of all females ages 15 to 17, regardless of marital status.

We focus on births to 15- to 17-year-olds rather than the broader age range of 15- to 19-year-olds because there is a strong consensus that births to females ages 15 to 17 are more problematic. We omitted births to females under age 15, since less than 5 percent of teen births occurred to females in that age group. The inclusion of females under age 15 in the denominator would dramatically lower the rate, providing an unrealistic assessment of the true risk being faced by 15- to 17-year-old females.

Urban Children: 1990 and 2000 (See “Number of Children: 1990 and 2000” on page 206.)

Over the past several years, a set of criteria has been developed to select the statistical indicators used in the national *KIDS COUNT Data Book* to measure change over time and to rank the states. These criteria are described below.

1. **Data must be from a reliable source.** All of the indicator data used in this book come from U.S. government statistical agencies. Most of the data have been published or released to the public in some other form before we use them.

2. **The statistical indicator must be available and consistent over time.** Changes in methodologies, practices, or policies may affect year-to-year comparability. Program and administrative data are particularly vulnerable to changes in policies or program administration, resulting in data that are not comparable across states or over time.

3. **The statistical indicator must be available and consistent across all states.** In practical terms, this means data collected by the federal government or some other national organization. Much of the data collected by states may be accurate and reliable, and may be useful for assessing change over time in a single state, but unless all of the states follow the same data collection and reporting procedures, the statistics are not likely to be comparable across states.

4. **The statistical indicator should reflect a salient outcome or measure of well-being.** We focus on outcome measures rather than programmatic or service data (such as dollars spent on education or welfare costs), which are not always related to the actual well-being of children.

5. **The statistical indicator must be easily understandable to the public.** We are trying to reach an educated lay public, not academic scholars or researchers. Measures that are too complex or esoteric cannot be communicated effectively.

6. **The statistical indicator must have a relatively unambiguous interpretation.** If the value of an indicator changes, then we want to be sure there is widespread agreement that this is a good thing (or a bad thing) for kids.

7. **There should be a high probability that the measure will continue to be produced in the near future.** We want to establish a series of indicators that can be produced year after year in order to track changes in the well-being of children. Data collected only at one point in time don't serve this purpose.

Primary Contacts for State KIDS COUNT Projects

The Annie E. Casey Foundation funds a nationwide network of KIDS COUNT projects that provide a more detailed, community-by-community picture of the condition of children.

KIDS COUNT, a project of the Annie E. Casey Foundation, is a national and state-by-state effort to track the status of children in the United States. By providing policymakers and citizens with benchmarks of child well-being, KIDS COUNT seeks to enrich local, state, and national discussions concerning ways to secure better futures for all children. At the national level, the principal activity of the initiative is the publication of the annual *KIDS COUNT Data Book*, which uses the best available data to measure the educational, social, economic, and physical well-being of children. The Foundation also funds a nationwide network of state-level KIDS COUNT projects that provide a more detailed, community-by-community picture of the condition of children.

The Annie E. Casey Foundation is a private charitable organization dedicated to helping build better futures for disadvantaged children in the United States. It was established in 1948 by Jim Casey, one of the founders of United Parcel Service, and his siblings, who named the Foundation in honor of their mother. The primary mission of the Foundation is to foster public policies, human-service reforms, and community supports that more effectively meet the needs of today's vulnerable children and families. In pursuit of this goal, the Foundation makes grants that help states, cities, and communities fashion more innovative, cost-effective responses to these needs.
