## ABSTRACT

This study surveyed 337 mothers residing in New York City homeless shelters regarding their backgrounds and experiences, comparing those who were teen mothers to homeless mothers who had children later in life. Two groups of homeless families emerged: those with a foundation for advancement and those deprived of opportunities by the early burden of parenthood. Many homeless teen mothers grew up in unstable environments, with 61 percent reporting negative relationships with their parents and half stressing the absence of positive family role models. Most of these women sought companionship elsewhere and became sexually active very young. They demonstrated a profound lack of knowledge or interest regarding birth control. Homeless mothers who were not teen parents were more knowledgeable about sexual activity. Being a teen mother perpetuated the cycle of teen motherhood. Teenage families experienced significantly more episodes of homelessness than did non-teenage families. While minority groups represented half of the city's overall population, they comprised 91 percent of all homeless families in shelters, with African Americans overrepresented by two to one. Shelters can help break the cycle of pregnancy, poverty, and homelessness by coordinating efforts with policymakers to provide support to women at the greatest risk of becoming, or who already are, teen mothers. A nurturing environment can also be grounded in education. (SM)

# Children Having Children: Teen Pregnancy and Homelessness in New York City

APRIL 2003

A REPORT OF THE INSTITUTE FOR CHILDREN AND POVERTY

While the national teenage birth rate has declined to just 5% in the last ten years, within the homeless population it is on the rise.<sup>1</sup> Almost half of homeless heads of household in New York City shelters were teenage mothers. In the last year alone, the number of these women residing in the shelter system increased from 37% to 47%.<sup>2</sup> But why is that important? Because it is these young mothers who appear to be least equipped to deal with the everyday challenges of parenting, childcare, education, and employment, let alone finding and keeping a permanent home. In fact, 32% were homeless before age 18, and 42% have been homeless more than once (See Figure 1).

In response, the Institute for Children and Poverty surveyed 337 mothers residing in homeless shelters in New York City to better understand their backgrounds and experiences and compare those who were teen mothers to homeless mothers who had children later in life. What unfolds are two groups of homeless families—those with a foundation for advancement and those deprived of opportunities by the early burden of parenthood.

## The Facts

Many homeless teen mothers grew up in unstable environments: forty-one percent (41%) were removed from parental care; 39% witnessed domestic violence as a child; and one in four (25%) were actually abused as children themselves (See Figure 2).<sup>3</sup> In addition, 61% report negative relationships with their parents, and half stressed the absence of a positive role model within their family (See Table 1). Perhaps as a result of having little or no guidance, most of these women sought companionship elsewhere and became sexually active

at a very young age. In fact, over three-quarters (80%) first had intercourse before the age of 17, and over one third (36%) by age 15. Sixty-five percent (65%) of those gave birth to their first child within one year of becoming sexually active. But why? When asked, these women demonstrated a profound lack of knowledge or lack of interest regarding birth control. Half did not believe birth control was important, 37% did not know how to obtain it, and 42% did not know how to use it. Moreover, 41% did not even know they were pregnant until their second trimester (See Table 1).

Teen mothers are more likely to be homeless at a younger age and homeless more often when compared to homeless adult mothers. In 2002, teen mothers were 75% more likely to have reported being homeless more than once, and they were over 3 times more likely to have first become homeless before the age of 18.

Homeless teen mothers experience higher rates of abuse and violence than homeless adult mothers. When compared, they were 32% more likely to have been abused as a child, and 34% more likely to have reported witnessing domestic violence in their homes.

Figure 3: Effects of Adolescent Childbearing on Children: Homelessness and Foster Care

Children of teen mothers are more likely to experience chronic homelessness and foster care compared to children of adult mothers. They were nearly three times more likely to have been homeless more than once, and a significantly higher percent have already been placed into foster care.

In comparison, homeless heads of household who did not have children in their teens appear more knowledgeable about sexual activity. In fact, 55% of those who had abortions did so in order to terminate their first pregnancy. Three-quarters (75%) of these older mothers knew about birth control, thought it was important, and practiced it.

### The Children

Being a teenage mother also appears to perpetuate the cycle of teenage motherhood. Fifty-three percent (53%) of the teenage mothers residing in shelters were themselves the product of adolescent childbearing. This would appear to place their children at greater risk of doing the same.

Already, homeless children born into these families seem to struggle with increased difficulties. These families are three times more likely to be homeless more than once (17% vs. 6%); the children are 60% more likely to be removed from parental care (16% vs. 10%); and virtually none of them receive any emotional or financial support from their absentee

Figure 4: School Days Missed by Homeless Children: Teen Mothers vs. Adult Mothers

Children of teen mothers miss more days of school than children of adult mothers. Three times as many children of teen mothers miss one month of school or more.

Figure 5: Racial Profile of New York City Families: All Families and Homeless Families

The homeless population in New York City is disproportionately made up of African-American and Hispanic families. In 2000, African-Americans were over-represented in the homeless population by 136%.

fathers (See Figure 3). In addition, these children are more prone to chronic school absences. Seventy-five percent (75%) of homeless children who miss four or more weeks of school come from families headed by former teenage mothers (See Figure 4).

In comparison, non-teenage families experience significantly fewer episodes of homelessness; only 6% have been homeless more than once, only 10% had their children removed from parental care, and only 25% of children who miss four or more weeks of school come from families headed by mothers who had their children as adults.

### Race, Homelessness and Teen Pregnancy

While minorities represent 52% of the City's overall population, they comprise 91% of all homeless families in shelters, with African-Americans over-represented by two to one (See Figure 5). A closer look at these mothers reveals significant variations in birth control practices and childhood histories when controlling for ethnicity (See Table 2).

Table 2: Profile of Homeless Teen Mothers by Race

Hispanic teens were more likely to become pregnant younger and less likely to practice birth control when compared to African-American teens. Forty-two percent (42%) of these teen mothers became pregnant by age 15, almost twice as many as their African-American counterparts (23%) (See Figure 6). Moreover, half of Hispanic teen mothers did not have an abortion, and of those, 100% said the reason was moral and/or religious (See Figure 7). Possibly, it was these early births that limited both their education and employment opportunities. Fewer Hispanic teen mothers completed high school than African-American teen mothers (20% vs. 44%), and they were 23% less likely to have ever held a job (58% vs. 75%) (See Figure 8).

In contrast, African-American teen mothers were 73% more likely to have witnessed domestic violence in their homes as children (45% vs. 26%), and 68% more likely to have been placed in foster care (47% vs. 28%) (See Figure 8).<sup>4</sup> Despite this upbringing, these mothers were 35% more likely to have known where to get birth control as teenagers (69% vs. 51%), and 43% more likely to use it (50% vs. 35%). Furthermore, African-American teen mothers were twice as likely to have had an abortion before the birth of their first child (30% vs. 17%), indicating more of a willingness to use abortion as a method of postponing motherhood. Even still, while both groups of mothers have on average two children, more African-American teen mothers have had children with more than one man (73% vs. 46%).

### Pregnancy Prevention Among The Homeless

The relationship between teen pregnancy and poverty in the United States is strong and well-documented. In fact, rates of teen sex are similar across all economic groups, yet birth rates for low-income teens are nearly five times that of high-income teens (40% vs. 7%) (See Figure 9).<sup>5</sup> This is an indication that varying degrees of sexual activity are not responsible for the prevalence of teen births among low-income families. Rather, teen births among these women are most likely related to unsuccessful pregnancy prevention.

With this in mind, how do we break the cycle of teen pregnancy and homelessness? Since shelters appear to be where these young families are ending up, part of the answer may begin there. The cycle of teen pregnancy, poverty, and chronic homelessness can be broken through a coordinated effort by policy makers and shelter providers to reach the women who were teen mothers, and the teens that are at greatest "risk" of becoming young mothers themselves.

As we have seen, many of these women grew up surrounded by violence and abuse rather than support and guidance. Having little or no direction may have contributed to their early sexual encounters, and ultimately childbearing. As a result, these young women were deprived of the opportunity to learn critical parenting and life skills, and it is here that

Figure 6: A Comparison of the Ages African-American and Hispanic Teen Mothers are Becoming Pregnant

Hispanic teen mothers tend to have children earlier in their teens than African-American homeless teen mothers. They were nearly twice as likely to have given birth by age 15 while African-American teen mothers were 33% more likely to have been at least 16 years old.

Figure 7: Reasons For Not Having an Abortion Among African-American and Hispanic Teen Mothers

100% of Hispanic teen mothers cited morals as the reason why they never had an abortion. African-American mothers, however, cited various reasons for not having an abortion, including the high cost, they did not know where to go, and their boyfriend would not let them.

Figure 8: Differences in Childhood and Adult Experiences: African-American vs. Hispanic Teen Mothers

When compared to their Hispanic counterparts, African-American teen mothers were more likely to have experienced certain childhood difficulties. Nineteen percent more reported having witnessed violence in their homes and having been placed into foster care. At the same time, more than twice as many African-American teen mothers completed high school and 17% more reported having held a job.

Figure 9: Differences in Sexual Behavior and Childbirth by Income Level

Source: The Alan Guttmacher Institute  
 Economic status clearly has a greater effect on when a woman gives birth than on when a woman first becomes sexually active. All teens have sex at similar rates, yet high income women are 83% less likely to give birth than low income women.

shelters can play a role. Perhaps by learning from shelter programs, these mothers can develop and practice the art of healthy interpersonal connections and relationships through workshops and role modeling. Their time at a shelter could be spent developing the skills that may then positively influence their own children's future decisions about sexual behavior. In this way, the shelter becomes a real turning point for both parent and child.

This nurturing environment can also be grounded in education. In demonstrating the value of an education, their children could be able to identify life alternatives, other than motherhood, before reaching their teens. By giving them the means to better position themselves, and helping them identify options, a shelter community can represent the guidance and support they may have missed. Programs can educate about birth control, reproductive health, family planning, and interpersonal skills. They should be structured in a way that allows children to explore and develop their potential and talents. Only then will these potential "mothers to be" see and believe in the slew of alternatives that exist for them.

What this environment essentially becomes is the kind of community these families never had. A "community of opportunity": a place that teaches them how to develop and maintain personal connections. If shelters continue to be looked at as temporary placements, these women and their children will continue to live without support and guidance—depriving them both of the chance to move in a new direction. Shelter providers must initiate and enhance programs that address both the educational and life-skill deficiencies that adolescent childbearing denied these women.<sup>6</sup> In this way, shelters turned community have the chance to prevent the downward spiral of teenage parenting from befalling another generation of children.

THE AMERICAN FAMILY INN STANDARD

Homes for the Homeless (HFH) is a private, non-profit organization based in New York City that operates American Family Inns. Since 1986, HFH has worked to break the cycle of poverty and dependence among homeless families through education-based services.

The Institute for Children and Poverty is an independent research and policy think tank that works in close association with Homes for the Homeless. Through the development of effective public policy initiatives and the dissemination of quantitative research findings, the Institute examines and offers unique strategies to combat the impact of homelessness and poverty on the lives of children and their families.
