

THE MICHIGAN PUBLIC HIGH SCHOOL CONTEXT AND PERFORMANCE REPORT CARD

By Michael Van Beek, Daniel Bowen and Jonathan Mills

The Mackinac Center for Public Policy is a nonpartisan research and educational institute dedicated to improving the quality of life for all Michigan citizens by promoting sound solutions to state and local policy questions. The Mackinac Center assists policymakers, scholars, businesspeople, the media and the public by providing objective analysis of Michigan issues. The goal of all Center reports, commentaries and educational programs is to equip Michigan citizens and other decision makers to better evaluate policy options. The Mackinac Center for Public Policy is broadening the debate on issues that have for many years been dominated by the belief that government intervention should be the standard solution. Center publications and programs, in contrast, offer an integrated and comprehensive approach that considers:

All Institutions. The Center examines the important role of voluntary associations, communities, businesses and families, as well as government.

All People. Mackinac Center research recognizes the diversity of Michigan citizens and treats them as individuals with unique backgrounds, circumstances and goals.

All Disciplines. Center research incorporates the best understanding of economics, science, law, psychology, history and morality, moving beyond mechanical cost-benefit analysis.

All Times. Center research evaluates long-term consequences, not simply short-term impact.

Committed to its independence, the Mackinac Center for Public Policy neither seeks nor accepts any government funding. The Center enjoys the support of foundations, individuals and businesses that share a concern for Michigan's future and recognize the important role of sound ideas. The Center is a nonprofit, tax-exempt organization under Section 501(c)(3) of the Internal Revenue Code. For more information on programs and publications of the Mackinac Center for Public Policy, please contact:

Guarantee of Quality Scholarship

The Mackinac Center for Public Policy is committed to delivering the highest quality and most reliable research on Michigan issues. The Center guarantees that all original factual data are true and correct and that information attributed to other sources is accurately represented.

The Center encourages rigorous critique of its research. If the accuracy of any material fact or reference to an independent source is questioned and brought to the Center's attention with supporting evidence, the Center will respond in writing. If an error exists, it will be noted in an errata sheet that will accompany all subsequent distribution of the publication, which constitutes the complete and final remedy under this guarantee.

Executive Summary*

* Citations provided in the main text.

Assessing a high school’s effectiveness is not straightforward. Comparing a school’s standardized test scores to those of other schools is one approach to measuring effectiveness, but a major objection to this method is that students’ test scores tend to be related to students’ “socioeconomic” status — family household income, for example, or parents’ educational background. These factors, however, are outside a school’s control.

The Michigan Public High School Context and Performance Report Card is an attempt to provide a better “apples-to-apples” comparison of public high schools by adjusting their students’ average standardized test scores to account for disparities in the socioeconomic status of their student populations.

Socioeconomic status in the Context and Performance (“CAP”) Report Card is measured by the percentage of a school’s students who qualify for a free or reduced-price lunch under the federal government’s National School Lunch Program. The standardized tests used in the report card are from the Michigan Merit Examination — including the ACT® test — taken by the schools’ 11th-graders from 2008 through 2011.

We used regression analysis to measure the relationship between student test results and subsidized-lunch counts in Michigan’s general education public high schools (schools focused on special education or alternative education were excluded from our analysis). We then determined whether each school’s student population performed better or worse than projected based on the school’s subsidized-lunch counts.

The resulting “CAP Score” for a school was above 100 if the school exceeded its projected performance and below 100 if the school fell short (the statewide average CAP Score was set at 100). Grades were assigned using a standard bell curve, with 10 percent of the schools receiving an A, 20 percent receiving a B, 40 percent receiving a C, 20 percent receiving a D and 10 percent receiving an F.

Star International Academy, a public charter school in Dearborn Heights, received the state’s highest CAP Score at 140.8 (an A), while Detroit’s Finney High School had the lowest CAP Score at 70.8 (an F). North Huron School had the highest CAP Score among conventional district-run high schools: 123.3 (an A). City Middle/High School in Grand Rapids received the highest CAP Score — 130.5 (an A) — among schools that use a selective admissions policy.

Following guidelines established by the U.S. Census Bureau and the National Center for Education Statistics, the high schools were divided into four major “locales”: city, suburb, town and rural. Public high schools located in towns had the highest average CAP Score among the four locale groups — 101.5. They were followed by rural (101), suburban (100) and city (98.9) high schools.

It is important to remember that these CAP Scores and grades are relative. Each high school is assessed based on its performance compared to other high schools in the state; CAP Scores do not indicate how well these high schools compare to those in other states or countries. Moreover, CAP Scores do not adjust for every factor that may lie outside a school's control. Nevertheless, by accounting for a major factor that is substantially related to student achievement and outside a school's control, the CAP Report Card improves the quality of information publicly available to Michigan parents, taxpayers, school officials and policymakers.

Introduction

There are many stakeholders concerned about the performance of Michigan's public high schools. Parents of children attending these schools desire to know how their schools compare to others, especially since an increasing number of parents appear to be taking advantage of public school choice options.¹ Moreover, high school is their children's last stop before entering the workforce or starting college. High school education will have a significant impact on a child's future.

Many taxpayers also desire some level of accountability over how well schools spend their resources, and public schools are Michigan's largest single state government expenditure.² Policymakers have similar reasons to be interested, as do school district officials and employees themselves, since high schools are typically the most expensive schools in the district.

Unfortunately, judging high school performance is not a straightforward task. There are many ways to measure it, including graduation rates, college acceptance rates and standardized test results. Some of these data are not publicly available, while others are not standardized in a way that allows reliable comparisons between schools.³ Further, an individual high school's performance can be impacted by a number of variables largely outside the school's control, such as parental involvement and the achievement of the school's students in their previous "feeder schools."⁴

This report card measures academic performance by using publicly available average scores on the ACT® and the Michigan Merit Examination, two standardized tests that all public high schools in Michigan are required to administer every year. While the report card does not capture all the variables that might impact high school performance, it does control for what is typically found to be a key variable: student "socioeconomic status."

A student's socioeconomic status typically refers to such factors as his or her family's household income and parents' educational background. Students from low-income families or homes where the parents have not completed high school tend to have lower levels of academic achievement than those from well-educated, high-income households.⁵

This disparity is a major — and legitimate — reason many people resist the idea of comparing schools based solely on standardized test scores: One school may

1 The percentage of Michigan students enrolled in a public school other than the one assigned to them by the state grew from 6.3 percent in 2002 to 11.4 percent in 2008. Andrew Saultz and Kathryn Summers, "Explaining School Choice" (Michigan Senate Fiscal Agency, 2009), 4, <http://goo.gl/KrGvL> (accessed Jan. 11, 2011).

2 According to Michigan's Senate Fiscal Agency, about 41 percent of state appropriations were spent on K-12 public schools in fiscal 2012. Authors' calculations based on: "State Spending From State Resources Appropriation History," (Michigan Senate Fiscal Agency, 2012), <http://goo.gl/MGISF> (accessed April 10, 2012); "School Aid Fund Appropriation History," (Michigan Senate Fiscal Agency, 2012), <http://goo.gl/2WdXZ> (accessed April 10, 2012).

3 Examples of nonstandardized data are school grade point averages and graduation rates. A high average GPA could be the result of a school's low standards, rather than its students' actual achievements.

4 For more information on the relevance of these variables, see: Eric Hanushek, "The Impact of Differential Expenditures on School Performance," *Educational Researcher* 18, no. 4 (1989); James Griffith, "Relation of Parental Involvement, Empowerment, and School Traits to Student Academic Performance," *The Journal of Educational Research* 90, no. 1 (1996); Endya B. Stewart, "School Structural Characteristics, Student Effort, Peer Associations, and Parental Involvement: The Influence of School- and Individual-level Factors on Academic Achievement," *Education and Urban Society* 40, no. 2 (2008).

5 For more information on the relevance of these variables, see: Pamela E. Davis-Kean, "The Influence of Parent Education and Family Income on Child Achievement: The Indirect Role of Parental Expectations and the Home Environment," *Journal of Family Psychology*, 19, no. 2 (2005); Sean F. Reardon, "The Widening Academic Achievement Gap Between the Rich and the Poor: New Evidence and Possible Explanations," in G. Duncan & R. Murnane (eds.), *Whither Opportunity? Rising Inequality and the Uncertain Life Chances of Low-Income Children*, New York: Russell Sage Foundation Press (2011); Bethanne M. Schlee, Ann K. Mullis, and Michael Shriner, "Parents social and resource capital: Predictors of academic achievement during early childhood," *Children and Youth Services Review*, 31, no. 2 (2009).

outperform another simply because its student population has a higher average socioeconomic status, not because the school is actually better at educating students. With this report card, we adjust the performance of a school's students on standardized tests to recognize the school's socioeconomic disadvantages.

We call the results the "Context and Performance Report Card." It is designed to be simple and straightforward, relying on the best publicly available data. This study explains and presents the report card; it does not attempt to make policy recommendations or draw policy conclusions.

Like other school report cards, the Context and Performance Report Card will not provide an exhaustive or perfect measure of high school performance. We believe, however, that it does improve the quality of information that school officials, taxpayers, policymakers and parents have available to judge the performance of Michigan's public high schools.

Why Another Report Card?

The Michigan Department of Education already measures and produces several different reports on school performance. Assessments include the federal "adequate yearly progress"⁶ measure, Education YES! — A Yardstick for Excellent Schools,⁷ Michigan School Report Card⁸ and the "Persistently Lowest Achieving Schools" top-to-bottom school ranking.⁹

Unfortunately, these assessments have several limitations. First, most of these school assessments are difficult to understand. For instance, it requires 29 pages to explain how schools are graded on the Michigan School Report Card. The Education YES! assessment comes with a 97-page description of the 40 different indicators it uses to measure school effectiveness.¹⁰

Second, some assessments rely heavily on subjective measures. For example, the 40 performance indicators used by the Education YES! assessment are self-reported by local school officials.¹¹ Similarly, there is evidence that even the state school assessments based on standardized test results have not been particularly meaningful: Until recently, the "cut scores"¹² chosen by state officials to determine whether a school's performance would be graded as "adequate" appear to have been far too low.¹³

For instance, 91 percent of Michigan's general education schools¹⁴ made "adequate yearly progress" based on their students' state exam scores,¹⁵ and among the schools receiving a letter grade on the Michigan School Report Card,

9 "2011 Persistently Lowest Achieving Schools," (Michigan Department of Education, 2011), <http://goo.gl/xqmRJ> (accessed July 13, 2012).

10 "2011-2012 Guide to Reading the Michigan School Report Cards," (Michigan Department of Education, 2012), <http://goo.gl/PH8T7> (accessed July 13, 2012). "Michigan School Improvement Framework Rubrics," (Michigan Department of Education), <http://goo.gl/UNMnP> (accessed April 5, 2011).

11 Tom Gantert, "State Gives Failing Schools Perfect Grades for Paperwork," (Michigan Capitol Confidential, 2010), <http://goo.gl/VmDP6> (accessed Mar. 1, 2012).

12 Cut scores are the boundaries for each achievement classification. For example, for the 2011 Michigan Merit Examination in mathematics, a score between 1089 and 1099 means a student is "partially proficient," and a score between 1100 and 1127 means a student is "proficient." "Michigan Merit Examination (MME): Score Categories and Scale Score Ranges," (Michigan Department of Education, 2011), <http://goo.gl/2qil9> (accessed March 1, 2012).

13 State officials have in fact recognized the problem of low cut scores, and in 2011 the State Board of Education raised the cut score for passing state standardized exams from 39 percent to 65 percent. See "State Board Gives Nod to Improved Standards for State Assessment Scores," (Michigan Department of Education, 2011), <http://goo.gl/Snpzr> (accessed June 26, 2012).

14 Does not include "alternative" or "special education" schools.

15 "Adequate yearly progress" is a measure created by the U.S. No Child Left Behind Act in 2002. An individual school's AYP status is determined by its students' performance on English language arts and mathematics standardized tests, as well as attendance and graduation rates. For more information, see: "Purpose of AYP," (Michigan Department of Education, 2011), <http://goo.gl/gKHqn> (accessed March 29, 2011).

97 percent achieved an A, B or C in 2010.¹⁶ Only three of these schools — 0.1 percent — were labeled “unaccredited,” the equivalent of an “F.”¹⁷ Further, a study by the National Center for Education Statistics showed that fourth- and eighth-grade students labeled “proficient” in reading and math in Michigan ranked among the worst in the nation on national assessments.¹⁸

In addition to these shortcomings, none of these assessments adjusts for student socioeconomic status, which education researchers have consistently shown to have a significant impact on student achievement on standardized tests.¹⁹ This factor explains more variation among schools than any other variable, including per-pupil spending, pupil-teacher ratios, teacher salaries and teacher credentials.²⁰

The Michigan Public High School Context and Performance Report Card is relatively easy to understand and controls for the impact student socioeconomic status has on standardized test scores. This allows for fairer comparisons among Michigan high schools, since a key factor outside the schools’ influence is taken into account.²¹

Data and Methods

The research methodology used for the CAP Scores is based on a 2006 University of Arkansas study.²² The Arkansas study used a regression analysis that enabled researchers to predict how well each school would perform given the socioeconomic makeup of their students.²³ Schools were then ranked by how well they did relative to their predicted performance.

To capture the socioeconomic differences among Michigan high schools, we used headcounts of enrolled high school students who were eligible for free or reduced-price school lunches²⁴ through the federal National School Lunch Program.²⁵ FRL counts are commonly used as a proxy for

16 Authors' calculations based on state data. “2011 Adequate Yearly Progress (AYP) Results: Excel file of all 2011 AYP data,” (Michigan Department of Education, 2011), <http://goo.gl/bpkEr> (accessed July 2, 2012).

17 Ibid.

18 Michigan's “proficient” students ranked 45th out of 48 states in fourth-grade reading, 36th out of 48 states in eighth-grade reading, 46th out of 48 states in fourth-grade math and 38th out of 47 states in eighth-grade math. Victor Bandeira de Mello, Charles Blankenship, and Don McLaughlin, “Mapping State Proficiency Standards Onto NAEP Scales: 2005-2007,” (National Center for Education Statistics, 2009), 17, 20, <http://goo.gl/eGMkV> (accessed April 5, 2011). Additionally, Michigan received an “F” in math and a “D” in reading on its fourth- and eighth-grade proficiency standards in an Education Next study. Paul E. Peterson and Carlos Xabel Lastra-Anadon, “State Standards Rise in Reading, Fall in Math,” *Education Next* 10, no. 4 (2010) <http://goo.gl/4QWFO> (accessed June 28, 2012).

19 The foundational study on this subject is James S. Coleman et al., *Equality of Educational Opportunity* (Washington, D.C.: United States Government Printing Office for the National Center for Education Statistics, 1966). Laura B. Perry and Andrew McConney summarize the research this way: “It is well established in the research literature that socioeconomically disadvantaged students and schools do less well on standardized measures of academic achievement compared with their more advantaged peers.” Laura B. Perry and Andrew McConney, “Does the SES of the School Matter? An Examination of Socioeconomic Status and Student Achievement Using PISA 2003,” *Teacher College Record* 112, no. 4 (2010).

20 For a summary of the research on this point, see: Eric Hanushek, “The Failure of Input-Based Schooling Policies,” *The Economic Journal* 113, (February 2003), <http://goo.gl/AyQhs> (accessed April 10, 2012).

21 We tested other publicly available variables, including sex and ethnicity. These variables did not significantly improve the model. See “Appendix A: Notes on Testing Other Variables and Data Integrity” for more information.

22 Jay P. Greene et al., “The School Performance Index in Arkansas,” (University of Arkansas, 2006), <http://goo.gl/OGlrQ> (accessed March 1, 2012).

23 The Arkansas study tested several variables that are not incorporated in our model. These variables include measures of race, ethnicity, student population size and several additional district-level variables. Only a few of these variables were ultimately incorporated into the Arkansas model, however; the others were found to be statistically insignificant. For further discussions of the variables used and excluded in drawing up our model, see “Appendix A: Notes on Testing Other Variables and Data Integrity.”

24 These data can be found through the Center for Educational Performance and Information: “Free and Reduced Lunch Counts,” (Michigan Department of Education, 2011), <http://goo.gl/tpCJf> (accessed May 15, 2012).

25 Currently, students from families with incomes equal to or below 185 percent of the federal poverty level are eligible for the program. “Eligibility Manual For School Meals,” (U.S. Department of Agriculture, 2008), <http://goo.gl/4uEXS> (accessed March 22, 2011). For more information about the program, please see: “National School Lunch Program,” (United States Department of Agriculture), <http://goo.gl/7YtpI> (accessed March 22, 2011).

socioeconomic status in education research.²⁶

Consistent with past studies of student achievement, the statistical results from our analysis show that FRL counts are negatively correlated to average academic achievement.²⁷ In other words, the higher the percentage of a high school's students eligible for a free or reduced lunch, the lower that high school's average score on standardized tests tends to be.

Note that students qualifying for free lunches were weighted more heavily than students qualifying for reduced-price lunches in order to better capture disparities in socioeconomic status. This differential weighting did in fact improve the statistical model's explanatory power.²⁸

Academic performance was measured by average high school scores from the 2008 through 2011 Michigan Merit Examinations. State law requires that the MME be administered to all 11th-graders enrolled in public schools as a condition of receiving state aid.²⁹ The MME is made up of five different subject tests and the ACT® test, a college admissions exam created by ACT Inc., an independent, nonprofit organization.³⁰

Both the MME subject tests and ACT® test assess student achievement in math, reading, writing and science. The ACT® test also produces English, "English+Writing" and an overall composite score.³¹ The MME also includes subject tests in social studies, but does not produce an overall average composite score.³²

There is a strong correlation between a high school's average scores on MME subject tests and ACT® subject tests in math, reading, writing and science. For this reason, and in the interest of simplifying the model, we used only average ACT® composite scores³³ and average MME subject scores in math, reading, science, writing and social studies.

Each school's actual academic performance was compared to its predicted performance in the ACT® composite and in each of the five MME subject areas for each of the four years. The 24 results from these calculations were then averaged to produce an overall score for each school. These scores were multiplied by 100 to produce an easily comparable "Context and Performance Score" for each of the 592 high schools for which data were available. Through the remainder of the text, we will refer to this overall measure as the "CAP Score."

Hence, a CAP Score below 100 indicates that a high school's average score is below its predicted level based on FRL counts, while a CAP Score above 100 means a high school's average score exceeds its predicted level based on FRL counts.³⁴

34 Even if a school's overall average CAP Score was below 100, it's possible that its CAP Score in some subject areas exceeded the predicted achievement based on the socioeconomic makeup of its students.

26 One note concerning free and reduced-price lunch counts: It is theoretically possible that certain high schools are more successful at identifying and reporting students as being eligible for the National School Lunch Program. If these schools also systematically tend to perform differently from other high schools, the inclusion of FRL eligibility in our model may lead to classification bias. The extent to which this happens is unknown. Ultimately, we chose FRL eligibility because it is the best available proxy for student socioeconomic status available.

27 Estimated coefficients range between -0.28 and -0.32. See Graphic 18 in "Appendix D: Regression Results."

28 The weighting for students eligible for free lunches was double that for students eligible for reduced-price lunches. This approach is not firmly established in the research literature, but it does have advantages over an unweighted count of FRL students, since an unweighted count effectively assigns equal weights to students from households that may have significantly different income levels. See "Appendix C: Free and Reduced-Price Lunch Weights" for more information.

29 MCL § 388.1704b. Districts must also administer the MME to 12th-graders who did not take the test as 11th-graders.

30 For more information, see: "History of ACT," (ACT Inc., 2012), <http://goo.gl/A4tjC> (accessed April 10, 2012).

31 "Writing Test Scores," (ACT Inc., 2012), <http://goo.gl/yKW8E> (accessed July 13, 2012); "Understand your scores," (ACT Inc., 2012), <http://goo.gl/NMt2j> (accessed July 13, 2011).

32 "Michigan Merit Examination: Guide to Reports," (Michigan Department of Education, 2011), 8-9, <http://goo.gl/0U8Cg> (accessed April 8, 2011).

33 The ACT composite score is an average of a student's English, mathematics, reading and science scores. "Understand your scores," (ACT Inc., 2011), <http://goo.gl/NMt2j> (accessed April 8, 2011).

Letter grades were assigned to each overall CAP Score. The letter grades were based on a standard bell curve distribution, with 10 percent of the schools receiving A's, 20 percent receiving B's, 40 percent receiving C's, 20 percent receiving D's and 10 percent receiving F's.³⁵

These grades and CAP Scores are relative — in other words, they are not based on an absolute standard of academic performance. Instead, they indicate how each high school compares to other high schools on standardized tests given the schools' respective student populations. By definition, the average of the scores for all of the public high schools in the state will be 100, corresponding to a C.

Finally, a percentile rank was also calculated for each CAP Score. This rank shows what percentage of high schools had lower CAP Scores than any particular school. This, too, provides an easy method for comparing high schools.

Classifying Schools

As noted in the previous section, FRL counts are a significant predictor of a high school's average academic performance. Nevertheless, a school's "locale" — urban, suburban, town or rural — may be related to its performance. Hence, in the tables below, each school's locale is included, and the four locale classifications are further subdivided into three subgroups apiece: large cities, midsize cities and small cities; large suburbs, midsize suburbs and small suburbs; fringe towns, distant towns and remote towns; and fringe rural, distant rural and remote rural.³⁶ The use of these locale classifications will help indicate any systematic achievement gaps that may arise among schools based on their type of community.

Some public high schools in Michigan use selective admissions policies that require students to meet certain academic requirements in order to enroll. Average test scores from these selective schools are often higher than those from schools without such policies. The names of such selective public high schools are listed as "selective" in our CAP Score tables.

Charter public high schools, known legally as public school academies, operate somewhat differently from conventional district-run high schools. Charter schools are individually managed and rely entirely on parents to choose to enroll their children there, rather than at conventional high schools.³⁷ Charter public high schools are labeled "charter" in our CAP Score tables. Conventional district-run high schools, in contrast, are labeled "conventional."

Not all high schools have four years of data publicly available in each standardized test subject. Average CAP Scores were still calculated for these schools, but their names are marked with a dagger.

35 For more discussion of the process of calculating CAP Scores and letter grades, see "Appendix B: Calculating CAP Scores and Letter Grades."

36 The locale codes are based on U.S. Census Bureau classifications and assigned by the National Center for Education Statistics. See "Appendix F: Locale Code Definitions" for more information. Tai Phan and Mark Glander, "Documentation to the NCES Common Core of Data Local Education Agency Locale Code File: School Year 2005-06" (National Center for Education Statistics, 2007), <http://goo.gl/xYuiY> (accessed Feb. 22, 2011).

37 There are several other differences between charter public schools and district-run schools. Charter schools can operate any grade configuration from kindergarten through 12th grade. They are often managed by private contractors and are exempt from the state's requirement to grant teachers tenure.

Selected Results

The CAP Scores for 684 Michigan public high schools appear in the next section (see “The Complete Report Card”), where the schools are listed first alphabetically, then by score and then by locale. Note that the results listed in that section — as throughout this study — exclude public high schools that focus on special education or alternative education.

Immediately below are tables displaying selected results from the analysis. These results are generally the highest- and lowest-performing schools based on CAP Score.

Graphic 1 lists the public high schools with the 20 highest CAP Scores in the state. Public charter schools and district-run selective admissions schools account for 12 of the top 20. Although city high schools had the lowest average CAP Scores among the locale groups, 11 of the top 20 public high schools are located in cities. Conversely, only one town high school made the list of the top 20 CAP Scores, despite the fact that town high schools had the highest average CAP Scores of the four locale groups.

Graphic 1: Top 20 Public High Schools Based on 2008-2011 Overall CAP Score

Rank	High School	School Type	District or Municipality	Locale	Overall CAP Values		
					Score	Percent Rank	Grade
1	Star International Academy	Charter	Dearborn Heights	Suburb: Large	140.8	100.0	A
2	Cesar Chavez High School	Charter	Detroit	City: Large	135.4	99.8	A

19	Classical Academy†	Selective	Flint	City: Midsize	114.2	97.0	A
20	Calumet High School	Conventional	Calumet	Town: Remote	114.2	96.8	A

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

The list of the 20 lowest CAP Scores is disproportionately populated by city high schools — 17 of the 20 (see Graphic 2). More than half of the bottom 20 are in Detroit. Suburban, town and rural locales each had only one high school among the 20 lowest performers. Six of the lowest-performing high schools were charter public schools.

Graphic 2: Bottom 20 Public High Schools Based on 2008-2011 Overall CAP Score

Rank	High School	School Type	District or Municipality	Locale	Overall CAP Values		
					Score	Percent Rank	Grade

[†] Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

[‡] As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

Graphic 3 displays the top 25 CAP Scores among conventional public high schools — that is, public high schools excluding charter schools and selective schools. Three of the top 10 are located in cities, and six in rural areas. Only three town high schools made the top 25, and no suburban high school made the list.

Graphic 3: Top 25 Conventional Public High Schools Based on 2008-2011 Overall CAP Score

[†] Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

[‡] As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

Graphic 5 displays the top 10 CAP Scores for charter public high schools. A town high school appears on the list, even though only four of Michigan’s charter public high schools are located in town and rural areas. There is a significant difference between CAP Scores of the top three charters and the next three, with a difference of 10.5 points in CAP Scores between the third- and fourth-best performing charter public high schools. Nevertheless, the top four charter schools had higher CAP Scores than any conventional public high school. Four of the top six charter public schools did not have a full four years of data, however.

Graphic 5: Top 10 Charter Public Schools Based on 2008-2011 Overall CAP Score

Rank	High School	School Type	District or Municipality	Locale	Overall CAP Values		
					Score	Percent Rank	Grade

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

Graphic 6 shows the 10 lowest CAP Scores among charter public high schools. Note that four of the schools on the list lacked the full four years of data.

Just as with the list of the top CAP Scores for charter schools, the list of lowest CAP Scores includes one of the four charter high schools located in town and rural areas. The charter public high schools with the six lowest CAP Scores were among the lowest-scoring public high schools overall (see Graphic 2).

Graphic 6: Bottom 10 Charter Public Schools Based on 2008-2011 Overall CAP Score

Rank	High School	School Type	District or Municipality	Locale	Overall CAP Values		
					Score	Percent Rank	Grade

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

We identified only 11 selective public high schools — that is, schools that admit only those students who meet certain academic standards. The CAP Scores of these selective schools are listed in Graphic 7 below. These scores are among the highest in the state. Given the schools’ selective policies, this may be unsurprising; at the same time, however, the CAP Score attempts to correct for any socioeconomic advantage these schools may have gained through their selective admissions policies.

Based on CAP Scores, six charter public high schools and 31 conventional public high schools outperformed the 10th-best selective admissions school. Nine of the 11 selective public high schools are in city areas; only two are suburban schools; and none are located in towns or rural areas.

Graphic 7: 2008-2011 Overall CAP Scores for Selective Public High Schools

Rank	High School	School Type	District or Municipality	Locale	Overall CAP Values		
					Score	Percent Rank	Grade
1	City Middle/High School	Selective	Grand Rapids	City: Midsize	130.5	99.5	A
2	International Academy	Selective	Bloomfield Hills	Suburb: Large	127.2	99.3	A

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

The remaining tables in the main text — Graphic 8 through Graphic 16 — discuss the CAP Scores of public high schools based on their locale. Of the four major locale groups, town high schools had the highest average CAP Score, followed closely by those in rural areas (see Graphic 8). On average, high schools in both of these locale groups exceeded their predicted performance based on their students' socioeconomic status, while those in suburban and city locales did not.

Public high schools in remote rural areas had the highest average CAP Scores among the 12 locale subgroups, followed by remote town high schools. Although city public high schools had the lowest average CAP Score of these four groups, public high schools in small and midsize cities had average CAP Scores that exceeded not only their predicted performance (100), but the CAP Score averages for any of the suburban locale subgroups as well.

Graphic 8: Average 2008-2011 Overall CAP Score by Locale Group

Locale	Number of Schools	Overall CAP Score
City: Large	35	92.2
City: Midsize	22	103.0
City: Small	47	102.0
City: All	104	98.9
Suburb: Large	132	100.1
Suburb: Midsize	18	99.3
Suburb: Small	12	99.8
Suburb: All	162	100.0
Town: Fringe	16	98.2
Town: Distant	35	101.5
Town: Remote	28	103.3
Town: All	79	101.5
Rural: Fringe	92	100.3
Rural: Distant	110	100.5
Rural: Remote	38	103.9
Rural: All	240	101.0

Graphic 9 lists the top 10 percent of CAP Scores for city public high schools. Ten of these 13 schools are located in small or midsize cities. However, the top two schools are both in the only classified large city: Detroit. Both charters and selective admissions schools are more likely to be located in cities, and these types of schools dominate the top 10 percent of city high schools.

Graphic 9: Top 10 Percent of City Public High Schools Based on 2008-2011 Overall CAP Score

Rank	High School	School Type	District or Municipality	Locale	Overall CAP Values		
					Score	Percent Rank	Grade
1	Cesar Chavez High School	Charter	Detroit	City: Large	135.4	99.8	A

13	Pontiac High School	Conventional	Pontiac	City: Small	81.3	3.0	F

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

‡ As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

Graphic 11 shows that just as with city public high schools, the suburban public high schools with the highest CAP Scores were charter schools and selective admissions schools. Three-quarters of the top 10 percent are in large suburbs, but 81 percent of suburban public high schools are in large suburbs, so this outcome is not surprising. The top three CAP Scores among suburban public high schools stand out compared to the CAP Scores of their peers: They are at least 12 points higher than those of any other suburban public high school.

Graphic 11: Top 10 Percent of Suburban Public High Schools Based on 2008-2011 Overall CAP Score

Rank	High School	School Type	District or Municipality	Locale	Overall CAP Values

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

Public high schools in remote towns made up half of the top 10 percent of town public high schools based on CAP Scores (see Graphic 13). One of the two town charter high schools was among the top eight in the graphic. The Midland school district had two high schools among the top 10 percent of town public high schools based on CAP Scores.

Graphic 13: Top 10 Percent of Town Public High Schools Based on 2008-2011 Overall CAP Score

Rank	High School	School Type	District or Municipality	Locale	Overall CAP Values

8	Carson City-Crystal High School	Conventional	Carson City-Crystal	Town: Distant	95.2	20.5	D

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

As Graphic 15 shows, there was a healthy mix of the three different locale subgroups among the best performing rural public high schools based on CAP Scores. Seven among the top 10 percent of rural public high schools were located in fringe rural areas; eight were in distant rural areas; and nine, in remote rural areas. Within this mix, remote rural schools were disproportionately represented; nearly a quarter of them made the top 10 percent of rural public high schools based on CAP Scores.

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

Unlike the list of rural public high schools with high CAP Scores in Graphic 15, the list of rural public high schools with the lowest CAP Scores is dominated by fringe and distant rural schools (see Graphic 16). Only one remote rural high school made the list.

The Complete Report Card

Below are the CAP Scores for all of Michigan's general education public high schools for which data were publicly available. The schools are listed in alphabetical order.

Recall that CAP Scores above 100 indicate schools that have performed better than projected on standardized tests given their student population's socioeconomic status; CAP Scores below 100 indicate schools that have performed worse than projected. Also recall that a school's "percent rank" indicates the percentage of other schools that scored lower, and that grades were assigned to the schools' CAP Scores based on a standard bell curve.

* Indicates not enough data were publicly available to include the school in the model.

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

‡ As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

* Indicates not enough data were publicly available to include the school in the model.

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

‡ As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

* Indicates not enough data were publicly available to include the school in the model.

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

‡ As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

‡ As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

* Indicates not enough data were publicly available to include the school in the model.

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

‡ As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

* Indicates not enough data were publicly available to include the school in the model.

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

‡ As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

* Indicates not enough data were publicly available to include the school in the model.

† Denotes schools that have less than four years of data publicly available, but still have enough publicly available data to be included in the model.

‡ As noted in Appendix E, several schools were erroneously listed in government tables as general education high schools and thus were originally included in the model. The subsequent removal of these schools from our graphics means that the percent rank of the school with the lowest CAP Score is not zero.

Appendix A: Notes on Testing Other Variables and Data Integrity

The ideal model is simple and has strong explanatory power. As discussed in the main text, the model's primary variable is a scaled free-and-reduced-price-lunch count ("FRL"), which serves as a proxy for socioeconomic status. We did, however, consider other demographic variables.

For instance, female students have been found to outperform male students on some standardized tests.³⁸ Accordingly, we tested a variable representing a school's percentage of female students, but found that the variable did not add significantly to the model's explanatory power (see Graphic 17).

In addition, studies have documented achievement gaps between white and black students and between white and Hispanic students (though these gaps may be narrowing).³⁹ We therefore tested a variable that represented a school's percentage of white students. As with the variable for the percentage of female students, we found that accounting for the percentage of white students did not add significantly to the model's explanatory power. We found the same for a variable representing the percentage of white female students.⁴⁰

We also tested a school size variable. School size presents an interesting variable because the relationship to student achievement would likely be nonlinear: Larger schools may have more resources with which to improve performance; smaller schools, on the other hand, may be better able to adapt to the learning needs of individual students. We tested to see if there was a significant nonlinear relationship between school size and performance. After controlling for the school's FRL ratio, we found limited significant relationships.

As found in columns (1) through (5) of Graphic 17, the inclusion of the additional regressors based on sex, race and school size improves the model's predictive power, and an examination of the significance levels of the additional regressor coefficients shows some variables are significant at the 5 percent level. Nevertheless, the improvements in predictive power are marginal, and including the additional variables would have only increased the model's complexity for little measurable gain. Hence, we excluded these variables from the model. FRL is the dominant variable in any case.⁴¹

39 *The Black-White Test Score Gap*, eds. Christopher Jencks and Meredith Phillips (The Brookings Institution, 1998).

40 Another demographic variable that is sometimes considered is the percentage of "English Language Learners." See, for instance, Grover J. Whitehurst and Michelle Croft, "The Harlem Children's Zone, Promise Neighborhoods, and the Broader, Bolder Approach to Education," (The Brookings Institution, 2010), <http://goo.gl/aeJwC> (accessed June 27, 2012). ELL data are not publicly available for individual Michigan high schools, however. ELL is also an administrative categorization that may be prone to subjective biases from school to school.

41 As shown in Graphic 17, our model produced an average adjusted R-squared value of 0.64 using just FRL counts. Full regression results are available on request.

The Arkansas study also included several other variables: the median household income of families with school-age children in a school district; the percentage of school district residents over the age of 25 with at least a high school diploma; the percentage of school district residents over the age of 25 with at least a bachelor's degree; and the percentage of married parents among the district's families with school-age children.⁴² Although some of these variables were found to have a statistical relationship to student performance in the Arkansas study,⁴³ we were unable to test them in Michigan because these data are not available.

The Arkansas study also tested whether per-pupil district operating expenditures affected student performance. No statistically significant relationship was found.⁴⁴ This result is consistent with most findings in the research literature.⁴⁵ Hence, we did not test this variable.

In the end, we adopted a simplified model that includes only the FRL index as a primary explanatory variable.

Regarding data integrity: All unavailable records were set either with “unknown” values (when data were not reported due to small sample size) or with “missing” values when missing. The distributions of the various variable values were then examined for outliers and potentially impossible values. None of the variables used in this study exhibited any issues.

Appendix B: Calculating CAP Scores and Letter Grades

Calculating CAP Scores

The CAP Score provides an indicator of school performance while controlling for characteristics of the high school. In our analysis, we use both average student performance on the ACT® and Michigan benchmark exams as our primary indicators of student achievement. The various exams have different distributions, and therefore we first adjust the distribution of each exam for each year such that it has a mean of 100 and a standard deviation of 15. More specifically:

$$\text{Adjusted Performance} = 100 + 15 \left[\frac{(\text{School Avg.} - \text{State Avg.})}{\text{Std. Dev. of State Avg.}} \right]$$

The CAP Score is a measure intended to control for the performances of schools while controlling for its characteristics with the use of a regression model (Greene et al, 2006). We control for the proportion of students that qualify for free or reduced price lunch (FRL), allowing us to assess the performance of a high school given its demographics. In order to do this, we run ordinary least squares regressions with schools' test scores as the dependent variable and an FRL index as the independent variable:

$$\text{Adj_Perf}_{s,t} = \beta_0 + \beta_1 \text{FRL}_{s,t} + \mu_{s,t} \quad (1)$$

where $\text{Adj_Perf}_{s,t}$ is the average test score at school s in year t ,

β_0 is a constant,

β_1 is the estimated impact of FRL index on a school's average score,

$\text{FRL}_{s,t}$ is an index that weights FRL student counts according to the percentage of students eligible for free lunch and reduced-price lunch at school s in year t ,⁴⁶ and

$\mu_{s,t}$ is the error term.

The regression outlined in (1) allows us to control for the contribution that FRL percentage has on school achievement. For example, if the coefficient on the FRL index is 0.01, the score for a school with a 100 on the FRL index is on average one point lower than the score for a school with a 0 on the FRL index. If a school with a 100 FRL index obtains a score that is the same as the statewide average, then it would have a residual score of +1.0, since this school scored one point higher than predicted based on the regression coefficient for FRL. After obtaining the coefficient estimates from these regressions, we compare a school's actual performance relative to the performance "predicted" by the regression.

46 See "Appendix C: Free and Reduced-Price Lunch Weights" for more detail.

A school’s CAP Score is determined by dividing the school’s actual performance by its predicted performance and multiplying by 100:

$$CAP\ Score = 100 * \frac{Actual\ Performance}{Predicted\ Performance}$$

Therefore, schools that have a CAP Score over 100 perform better than predicted relative to other schools, and schools that score lower than 100 perform worse than predicted relative to other schools. A school’s average CAP Score for a given test (e.g., the ACT®) is its average CAP Score across years of available data.

Assigning Letter Grades

High schools are assigned letter grades for each test based on average CAP Scores across years. CAP Scores are based on performances relative to predicted expectations, and the regression coefficients and residuals are affected by the schools’ performances relative to other schools. Therefore, high school grades are assigned based on a bell curve:

Grade	Percentage of Schools
A	10
B	20
C	40
D	20
F	10

CAP Scores for test levels are then averaged across years. High schools are assigned a letter grade for average scores based on the same bell curve provided in the table above. For example:

School	Year	Test	CAP Values	
			Score	Grade
A.D. Johnston Jr/Sr High School	2008	ACT®	101.3	C
A.D. Johnston Jr/Sr High School	2009	ACT®	110.8	A
A.D. Johnston Jr/Sr High School	2010	ACT®	105.3	B
A.D. Johnston Jr/Sr High School	2011	ACT®	100.7	C
A.D. Johnston Jr/Sr High School	Average	ACT®	104.5	B

Finally, an overall grade is assigned to each high school for its average of average test levels.⁴⁷ For example:

School	Test	CAP Values	
		Score	Grade
A.D. Johnston Jr/Sr High School	ACT®	104.5	B
A.D. Johnston Jr/Sr High School	MME Math	107.2	B
A.D. Johnston Jr/Sr High School	MME Reading	106.1	B
A.D. Johnston Jr/Sr High School	MME Science	108.7	B
A.D. Johnston Jr/Sr High School	MME Writing	102.0	C
A.D. Johnston Jr/Sr High School	MME Social Studies	102.0	C
A.D. Johnston Jr/Sr High School	Average	105.1	B

47 A school's overall grade simply averages all available test scores. In some instances, schools are missing an average score for a given test in a given year. Missing data are largely the result of small testing samples. In these cases, the overall grade is based solely on the test scores available.

Appendix C: Free and Reduced-Price Lunch Weights

We have created a new FRL measure that takes advantage of the fact that the data include both free- and reduced-lunch school head counts. The new measure reweights the counts by multiplying free-lunch eligible students by 2 and reduced-lunch eligible students by 1.⁴⁸

Specifically:

New FRL Index =

$$100 * \frac{[2 * (Free-Lunch Eligible) + 1 * (Reduced-Lunch Eligible)]}{Total School Head Count}$$

Whereas the original FRL percentage variable ranges from 0 to 100, the New FRL Index ranges from 0 to 200, where a school that is 100 percent composed of free-lunch eligible students has a value of 200.

To see the benefit of this measure, consider two hypothetical schools:

School	Free-lunch %	Reduced-lunch %	FRL %	New FRL Index
School A	0	75	75	75
School B	75	0	75	150

Whereas School A and School B look identical by the FRL percentage measure, the FRL Index highlights that School B is serving a more disadvantaged student body. The regression results indicate that this new measure improves the model’s explanatory power. Results with the alternative, more traditional measure of FRL percentage are available on request.

48 This methodology is also used here: "2011 Arkansas Benchmark Test Results: District by District Scores," (University of Arkansas: Office for Education Policy, 2011), <http://goo.gl/Sz910> (accessed July 2, 2012).

Appendix D: Regression Results

To calculate the CAP Scores, we made use of a linear regression that predicts school performance while controlling for a school’s percentage of students eligible for free or reduced-price lunches under the National School Lunch Program. In general, our regression results indicate a statistically significant negative relationship between the percentage of FRL-eligible students and standardized test scores for 11th-graders. This process allows us to adjust a high school’s performance to account for the socioeconomic status of its student population.

Graphic 18 shows the coefficient estimates for the model. In general, the model does a better job of explaining the variations in the data after 2008 (see the adjusted R-squared values).⁴⁹

49 This period from 2008 through 2011 corresponded to a 24 percent increase in the percentage of Michigan public school students who (according to the public school districts in which they were enrolled) qualified for an NSLP free or reduced-price lunch. Authors’ calculations based on “Free and Reduced Lunch Counts.” (Center for Educational Performance and Information, 2012), <http://goo.gl/Lf21Y> (accessed July 9, 2012). Since the relationship between FRL and performance remained stable, the higher proportion of FRL-eligible students may explain the increases in the explanatory power of the model.

* Denotes significance at the 1 percent level.

Notes: Robust standard errors are presented in parentheses.

Appendix E: Filtering the List of Michigan Public High Schools

In developing the Context and Performance Report Card, we attempted to include only those Michigan public high schools whose primary purpose was providing general education. We attempted to exclude high schools that served, for example, only students with disabilities or students at risk of dropping out of school. Including data from such specialized high schools would compare too many “apples to oranges” and weaken the results for the statistical model.

Data from the National Center for Education Statistics were used initially to identify and exclude schools that were not primarily engaged in general education.⁵⁰ Of the 967 public high schools for which there were 2011 MME scores, 714 had a “school type” labeled “regular school.” Schools labeled “alternative/other school,” “vocational school” and “special education school” were removed from the data set. We also removed another eight schools that were not labeled as “alternative/other school” by NCES, but were easily identifiable as such.

50 “Common Core of Data: Build a Table,” (U.S. Department of Education: National Center for Education Statistics), <http://nces.ed.gov/ccd/bat> (accessed May 15, 2012).

After these adjustments, we counted 706 “regular” public high schools in Michigan. We then re-examined the NCES dataset and removed 22 more high schools that had identified their “school emphasis” as either “alternative education” or “special education.”

Of the remaining 684 schools, 92 did not have enough data from 2008 to 2011 to be used in the statistical model. Upon review, and after phoning some of these 92 schools, we concluded that 17 of them are alternative high schools. These 17 schools are not listed in the CAP Report Card in Appendix A, while the other 75 high schools are, though they are identified as having insufficient data to receive CAP Scores. In the end, while 667 public high schools appear in Appendix A, only 592 were included in the statistical model for the CAP Report Card.

After examining the results of the model, we called a number of schools whose names suggested their primary focus was not general education. Of these, seven schools were later confirmed by school officials themselves to be special education or alternative schools, even though they were not identified as such in the NCES data. The seven schools were: AdvancePath Academy, Battle Creek Area Learning Center, Butcher Community Center, Community Middle/Community High School, Schools of Choice, Southfield Regional Academic Campus and Trillium Academy.

The results for these seven schools, although included in the model, are not displayed in the CAP Report Card. Hence, with all filtering complete, the CAP Report Card displays results for 585 public high schools.

Appendix F: Locale Code Definitions⁵¹

The National Center for Education Statistics assigns a school a particular “locale code” based on a formula created by the United States Census Bureau.

The Census Bureau’s “urban-centric” locale codes categorize urban and suburban areas into subgroups based on their size; towns and rural areas are categorized based on their distance from urbanized areas and urban clusters. Distances are determined using straight-line or “Euclidean” distance. NCES concedes this methodology “does not account for the presence or absence of road networks that may offer point-to-point drive time estimates,” but the agency justifies it by pointing out that accounting for transportation infrastructure modifications could produce “significant fluctuations.” The agency also notes that its methodology “provides data users with a simple and familiar concept that is analytically useful and relatively easy to implement.”⁵²

The verbatim definitions of the 12 different locale codes appear in Graphic 19.

Graphic 19: NCES Locale Code Definitions (Verbatim From Original)⁵³

Locale Code	Definition
City: Large	Territory inside an urbanized area and inside a principal city with population of 250,000 or more
City: Midsize	Territory inside an urbanized area and inside a principal city with population less than 250,000 and greater than or equal to 100,000
City: Small	Territory inside an urbanized area and inside a principal city with population less than 100,000
Suburb: Large	Territory outside a principal city and inside an urbanized area with population of 250,000 or more
Suburb: Midsize	Territory outside a principal city and inside an urbanized area with population less than 250,000 and greater than or equal to 100,000
Suburb: Small	Territory outside a principal city and inside an urbanized area with population less than 100,000
Town: Fringe	Territory inside an urban cluster that is less than or equal to 10 miles from an urbanized area
Town: Distant	Territory inside an urban cluster that is more than 10 miles and less than or equal to 35 miles from an urbanized area
Town: Remote	Territory inside an urban cluster that is more than 35 miles [from] an urbanized area
Rural: Fringe	Census-defined rural territory that is less than or equal to 5 miles from an urbanized area, as well as rural territory that is less than or equal to 2.5 miles from an urban cluster
Rural: Distant	Census-defined rural territory that is more than 5 miles but less than or equal to 25 miles from an urbanized area, as well as rural territory that is more than 2.5 miles but less than or equal to 10 miles from an urban cluster
Rural: Remote	Census-defined rural territory that is more than 25 miles from an urbanized area and is also more than 10 miles from an urban cluster

51 Some of this language also appears in a previously published Mackinac Center study. See Michael Van Beek, "Revenues and Spending of Michigan's Urban, Suburban, Town and Rural School Districts: 2004-2010," (Mackinac Center for Public Policy, 2011), <http://goo.gl/SUoij> (accessed June 18, 2012).

52 Tai Phan and Mark Gander, "Documentation to the NCES Common Core of Data Local Education Agency Locale Code File: School Year 2005-06," (National Center for Education Statistics, 2007), 7-8, <http://goo.gl/xYuiY> (accessed Feb. 22, 2011).

53 Ibid., 3-4

NCES uses the following definitions to clarify the terms contained in Graphic 19 (verbatim from original):⁵⁴

54 Ibid., 9-10.

Principal City: Principal cities are large places that serve as the primary population and employment centers within a county or counties associated with at least one core area of 10,000 or greater population, or “Core Based Statistical Area.”⁵⁵

55 “Metropolitan and Micropolitan Statistical Areas,” (U.S. Census Bureau, 2010), <http://goo.gl/msvre> (accessed Feb. 23, 2011).

Urban (urbanized area and urban clusters): An urban area is a densely settled core of Census Bureau-defined census block groups and census blocks that meet minimum population density requirements. A core area that contains a population of 50,000 or more is classified as an “urbanized area,” and a core area with a population between 2,500 and 50,000 is classified as an “urban cluster.”

Rural: All population and territory not included in an urbanized area or urban cluster.

About the Authors

Michael Van Beek is director of education policy at the Mackinac Center for Public Policy, where he oversees the Center's education research and publications. His analysis and commentary has been published in *The Wall Street Journal*, *The Detroit News*, the *Detroit Free Press*, *The Grand Rapids Press* and *The Oakland Press*, among other newspapers. Van Beek obtained his Master of Arts in American history in 2005 from Purdue University, where he also held teaching assistantships. He received his Bachelor of Arts in 2003 from Hope College.

Daniel Bowen is a Ph.D. candidate in education policy and a distinguished doctoral fellow at the University of Arkansas. Bowen received his Bachelor of Arts in political science and Master of Education from the University of Notre Dame. He has published and presented research on school accountability, school choice and the value of noncore school subjects and extracurricular activities.

Jonathan Mills is a doctoral academy fellow studying education policy at the University of Arkansas. Mills received his Bachelor of Science and Master of Arts in economics from the University of Missouri.

Acknowledgments

The authors would like to acknowledge the following people for their assistance:

- Marc Holley, Ph.D., evaluation unit director, Walton Family Foundation
- Dr. Matthew Ladner, senior advisor of policy and research, Foundation for Excellence in Education
- Jay P. Greene, Ph.D., endowed chair and head of the Department of Education Reform, University of Arkansas
- Andrew J. Coulson, director of the Center for Educational Freedom, Cato Institute, and adjunct scholar, Mackinac Center for Public Policy
- Lindsey Dodge, assistant editor, Mackinac Center
- Audrey Spalding, education policy analyst, Mackinac Center
- Christina Bolema, Mackinac Center communications intern
- Victoria Hechtman, Mackinac Center communications intern
- Evan Burgess, Mackinac Center graphics intern

Although these individuals helped significantly with this study, any errors in the report are the responsibility of the authors alone.

MACKINAC CENTER
FOR PUBLIC POLICY

The Mackinac Center for Public Policy is dedicated to improving the understanding of economic and political principles among citizens, public officials, policymakers and opinion leaders. The Center has emerged as one of the largest and most prolific of the more than 50 state-based free-market “think tanks” in America. Additional information about the Mackinac Center and its publications can be found at www.mackinac.org.

Additional copies of this report are available for order from the Mackinac Center.

For more information, call 989-631-0900, or see our website, www.mackinac.org.
