CHAPTER VII

STATISTICS OF PRIVATE COMMERCIAL AND BUSINESS SCHOOLS, 1932-33

This bulletin is the eighth compilation of statistics on private commercial and business schools made by the Office of Education since 1900. The seventh, or preceding report, on this field of education was published for the year 1929.

SUMMARY OF THE MORE SIGNIFICANT DEVELOPMENTS

The effect of the economic situation on private commercial and business schools has been to reduce their enrollments, attendance, and activities by 1933 to the general level they were in 1905, a matter of 29 years ago.

A drop in day enrollments of about 52 percent since 1929, with a drop of only 20 percent in teachers, has the apparent advantage for the students of giving a ratio of 1 teacher to every 18 students instead of 28 students as in 1929.

Of the list of 1,826 schools canvassed in 1933, this report includes data for 651 schools, or 35.5 percent of the total.

At least 275 schools went out of existence from 1929 to 1933 and 147 were organized. Schools seem to be most stable in cities of from 30,000 to 100,000 population.

The level of the educational background of students entering private commercial and business schools is higher than in 1929. Only 66 percent had graduated from high school in 1929, whereas 77 percent had reached this level or beyond in 1933.

SOURCE OF DATA FOR PRESENT STUDY

A list comprising 1,826 schools was used for the purpose of this study. Of the 1,826 schools addressed by questionnaire, 661 schools in 45 States and the District of Columbia, as well as 7 schools in the outlying parts of the United States (Hawaii, the Philippines, and Puerto Rico), responded with data which could be used. Ten of the six hundred and sixty-one responses were received too late for inclusion in the State tables. However, all of these 10 are included in table 11 of this study, as each had a minimum enrollment of 100 students.

In addition to the 661 responses enumerated, 275 questionnaires were returned with indications that the school addressed had discontinued operations sometime during the interval since June 1929, when this Office previously gathered these statistics. Thus it will be seen that of the 1,826 schools canvassed by questionnaire, 936, or 51 percent of the list number, have been accounted for in this

bulletin. While the data for 1932-33 as presented by this study are as comprehensive in their scope as those offered by any of the previous periodic compilations made by the Office of Education since 1920, it is pertinent to remark that the value of these data could be substantially enhanced were it possible to secure a greater percentage of returns from private commercial and business schools. Only through a wider cooperation on the part of these schools will it be possible for the Office of Education to gather and present the statistics that may be used to gage the extent of the movements in this field of education.

SCHOOLS DISCONTINUED SINCE 1929

The reported mortality of 275 schools, or 15 percent of the total list, represents in all likelihood only a portion of the actual number discontinued since June 1929. As a matter of fact, it may be stated in connection with this list of schools that its chief tendency over the past 30 years has been largely one of change in its general character. Consequent wide fluctuations in the statistics in this field are revealed clearly by the comparative data reviewed in table 1, and by the 4 charts of figure 1 which supplement this table with a graphic description in terms of percentages of the expansion and contraction of various items as compared for the eight periods in the history of these schools since 1900.

Moreover, these comparative data, marking regular intervals since 1900, not only reflect the vicissitudes of the private commercial and business schools for the first third of the present century, but reflect as well the progress of the movement made by the public-school systems of the United States in recognizing the need for commercial and business courses and in adding such to the curricula.

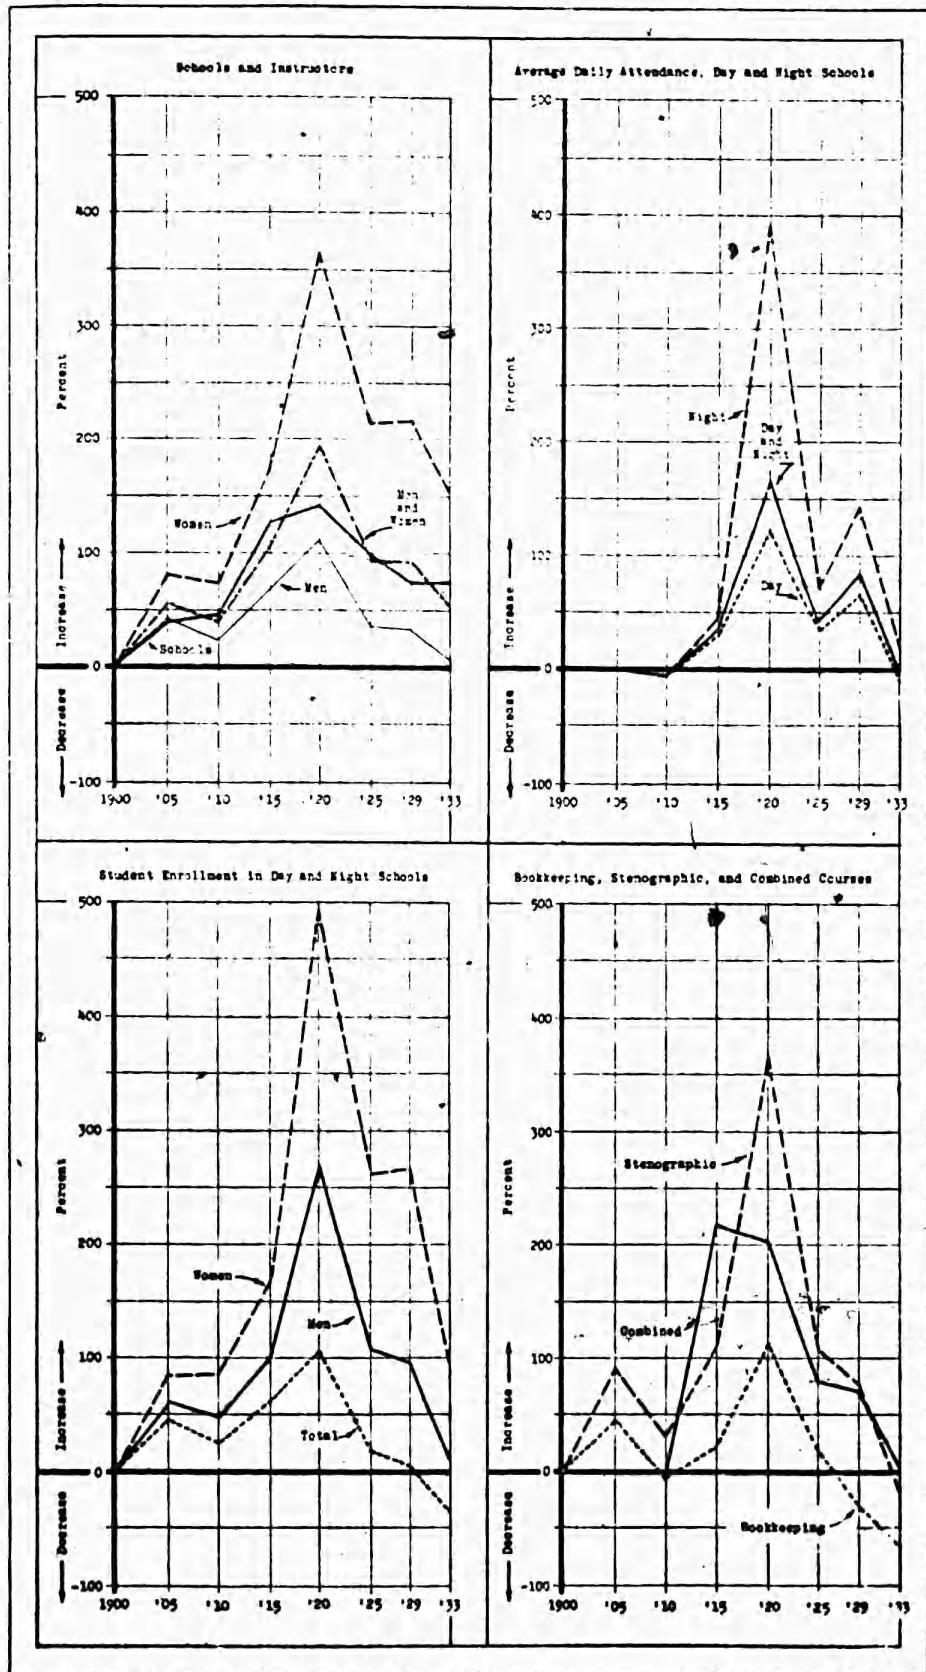

COMPARISONS OF 1933 WITH 1929

That the past 4 years have been difficult ones indeed for this type of institution is all too plainly shown by the comparison between the figures given for 1929 and 1933 on the various items in table 1. By coincidence, the number of schools reporting complete data for each of these periods is 651, and of this number, 504, or 77.4 percent, had reported also for the 1928-29 period. Thus, by reason of this circumstance, material has been furnished for both periods by a sufficiently large group composed of the same schools to permit an interesting and valid contrast between the beginning and the end of this critical 4-year period. In 1933 the total student enrollment dropped from 179,756 to 102,286, a 43-percent decrease, and the total average daily attendance figures went from 115,399 to 60,629, a 47.5-percent reduction from that reported for 1929.

Despite this drastic decline in total student enrollment for 1933, the number of instructors reported showed a reduction of only 843, or but

COMMERCIAL AND BUSINESS SCHOOLS

3

Statistical changes in percentages since 1900 on various items concerning the private, commercial, and business schools.

20 percent of the 1929 total of 4,074 instructors. The figures on this item of instructors have been given without any allowance having been made for the presence of part-time instruction. However, since the part-time factor has not entered into these compilations, the figures are comparable on the item of instructors for all or any two of the periods reviewed by table 1. On this basis, therefore, the average pupil-teacher ratio for 1933 was 18 students to a teacher, which represented 10 students less per teacher than in 1929.

In 1932-33 it will be noted from figure 1, that all the data on items of personnel, attendance, and enrollments with the exceptions of numbers of women instructors, and of women students enrolled for both day and night schools made recessions to points below those shown for 1905. In other words this field of education, in the matter of personnel, student enrollment, attendance, and other factors, as reported by 651 schools in 1932-33, has dropped back to the position it held 29 years ago. Only in one item as a total, namely, the percent of students enrolled attending daily, has it preserved any of the gain shown to have been made over this period of 29 years. This item fell off but 4 percent since 1929, and the 63 percent of the 95,457 students enrolled in the schools reporting average daily attendance for 1932-33 contrasts favorably with the 67 percent of the 171,862 shown for 1928-29, and is a considerably higher percentage than that for 1920 or 1925 of 52 and 51 percent, respectively. In what degree this general decline in the 1932-33 figures is due to the deleterious effects of the depression years, or to the influence of the addition of commercial and business courses by the public-school systems of the United States would be difficult to determine. However, it is logical to assume that both share responsibility in the matter, along with those constant factors of supply and demand in the business world which would exert so large an influence on the number enrolling for the training offered by this type of school.

COMPARISONS BY SIZE OF CITY

As shown by table 2, of the 936 questionnaires returned, 147, or 15.7 percent, came from schools which had been organized since June 1929, and 275, or 29.4 percent, were from schools discontinued during the past 4 years. This table presents by States, in three groups according to size of city, the number of schools reporting enrollment increases and decreases, as well as the number of schools which reported either their organization or discontinuance since June 1929. The permanency of the private commercial school seems closely related to the size of the city in which it is located. The greatest stability for the operation of this type of school seems to exist in cities of from 30,000 to 100,000 population, group II. Of the 47 schools in all groups reporting increases in student enrollment, only 6 or 12.7 percent were in group II,

as compared with 18 or 38.3 percent in group I cities, population 100,000 and more, and 23 schools or 49 percent in group III, population 30,000 and fewer.

Of the total of 297 schools reporting decreases in student enrollment since June 1929, group I reported 108 schools, or 36.4 percent; group II, 82 schools, or 27.2 percent; and group III, 107 schools or 36 percent of the total of 297 schools involved. Only in the number of schools organized since June 1929 is there found any variation from the even middle course which data on schools of the group II cities follow generally. In number of schools organized there are more schools reported in group II than in group I. Of the 147 organized since 1929 for the three groups, group I reports 43, or 29.3 percent; group II, 47, or 31.9 percent; and group III, 57, or 38.8 percent of the total. Of the 275 schools discontinued since June 1929, group I accounts for 99, or 36 percent; group II for 56, or 20.4 percent; and group III for 120 schools, or 43.6 percent of the total. All of these data point quite definitely to the fact that the greatest stability is found among schools located in the group II cities, and the largest instability exists for schools in cities of group III.

SCHOOLS EXISTING BEFORE 1929

Of the 936 schools involved in this study, 514, or approximately 56 percent, were organized previous to June 1929 and were still operating in June 1933. Of these 514 schools, 47, or 9.1 percent, showed increased enrollments since June 1929, while 297, or about 54 percent, reported a decrease in enrollment.

ENROLLMENTS—TOTAL

The 651 private commercial and business schools reporting enrollments to the Office of Education in June 1933 had a total enrollment of 102,286, of which 39,402 were men, and 62,884 were women. The States having the largest total enrollment for the schools reporting are New York with 17,521, Pennsylvania with 9,260, and Ohio with 7,239. California with 6,375 follows closely in fourth place. These are also the States having the largest number of schools, New York with 71, Pennsylvania with 53, California with 44, and Ohio with 38. An enumeration of these data for each State reported is given in table 5.

ENROLLMENTS—DAY VERSUS NIGHT SCHOOLS

The total enrollment in day schools as reported on this item by 637 institutions was 76,240, of whom 27,638, or 36.3 percent, were men and 48,602, or 63.7 percent, were women; while for night schools 457 institutions reported a total enrollment of 26,046 students, of whom 11,764, or 45.2 percent, were men, and 14,282, or 54.8 percent, were

women. The day-school enrollment was 74.5 percent of the total day- and night-school enrollment, while the night-school enrollment was 25.5 percent of the total enrollment and only 34.2 percent of the day-school enrollment.

ENROLLMENTS—DAY VERSUS NIGHT COURSES

The differences between day and night schools in enrollment for the various courses is markedly in favor of the day schools, for in no instance does the enrollment in any night-school course equal that for the corresponding day-school course. The closest any of the night-school courses come to approaching an equality with day-school courses is in the enrollment of men for the accountancy courses. In this course the enrollment for men in the night school is 86.5 percent of the day-school enrollment of men in this course. However, for women in accountancy the night-school enrollment is only about 16 percent of the day-school enrollment for women in this course. The greatest differences found between day- and night-school enrollments by courses are for teacher training and salesmanship. For the teacher-training course only 2.1 percent as many women were enrolled in the night classes as in the day classes, and for the salesmanship course only 8.4 percent as many men were enrolled in the night school as in the day school. For the secretarial course only 8.8 percent as many women were enrolled at night as in the day time.

Compared with the distribution by sex of day-school enrollments there are relatively more men than women enrolled for each course in night schools. Evidently more men than women are attending night schools for supplementary training with a view to preparing for advancement in their particular line of work. With the exception of the enrollments in the courses of bookkeeping and salesmanship, women outnumber men both in day- and night-school enrollments. The greater enrollment, however, in each course is found in day schools for both men and women.

EDUCATIONAL BACKGROUND OF STUDENTS

The distribution of students in both day and night schools who reported their educational background upon entering commercial school is presented in table 3, according to the course in which they are enrolled. Approximately 10 percent of the students in these private commercial and business schools have had only an eighth-grade education or less, about 13 percent have had some high-school work 64 percent have graduated from high school, and about 13 percent have had some college training. As compared with the percentages with various educational backgrounds in 1929, there has been a considerable gain, as 77 percent have had a full high-school course or more in 1933 as against only 66 percent in 1929. The bookkeeping and

commercial course had the greatest number and percentage of students, and the teacher-training course the least number and percentage of students for both the total enrollment and for those with each type of educational background.

A distribution of enrollments by school courses classified according to the amount of the students' previous education, given in table 4, shows that the course in accountancy has the largest percentage of students who have completed high school only; the teacher-training course has enrolled the largest percentage of students with some college training; the course in business administration has the largest percentage of those with some high-school training; and salesmanship has the largest percentage of students who have had only the eighth-grade education or less.

The teacher-training course also has the least percentage of students enrolled with any educational background of less than some college training while the subject of machine operation, as shown by table 4, has the least number of students enrolled absolutely and relatively, who have had some college training. It is interesting to note that for every 3 students enrolled in the secretarial courses who had had some high-school work but were not high-school graduates, 4 were enrolled who had had some college training. This ratio was 5 to 4 in 1929.

In connection with the educational background of students in these private commercial schools in 1933 and 1929, as shown in table 4, columns 11 and 12, it is worth noting that the percentage of students who had some college training is greater in 1933 than in 1929. Only one-eighth was included in the group classified as having had "some high-school work" in 1933, but almost a fourth were in this group in 1929. Of the 1933 group almost two-thirds had completed high school while only slightly more than a half had reached this level in 1929. More than 13 percent of the 1933 group had some college training while only 11 percent of the 1929 students had received this much previous education. Less than a fourth of the students in 1933 had not completed high school, but more than a third of the students in 1929 were without a complete high-school background.

LENGTH OF COURSE

Of the 343 schools offering day courses in bookkeeping, 292, or 85 percent, have courses varying from 6 to 12 months in length. For stenography and typewriting 255 schools, or 90 percent, of the 282 reporting have the same range for this course, as have 180, or 66 percent, of the 269 schools giving the combined course. The length of the night-school courses in the different subjects varies widely, but in general is from one and one-half to three times that of the day courses.

TABLE 1.—SUMMARY OF STATISTICS OF ALL PRIVATE COMMERCIAL AND BUSINESS SCHOOLS REPORTING, 1900 TO 1933
