THE MICHIGAN CONTEXT AND PERFORMANCE REPORT CARD

— PUBLIC ELEMENTARY & MIDDLE SCHOOLS, 2019 —

By Ben DeGrow & Ronald Klingler

The Mackinac Center for Public Policy is a nonpartisan research and educational institute dedicated to improving the quality of life for all Michigan residents by promoting sound solutions to state and local policy questions. The Mackinac Center assists policymakers, scholars, businesspeople, the media and the public by providing objective analysis of Michigan issues. The goal of all Center reports, commentaries and educational programs is to equip Michigan residents and other decision makers to better evaluate policy options. The Mackinac Center for Public Policy is broadening the debate on issues that have for many years been dominated by the belief that government intervention should be the standard solution. Center publications and programs, in contrast, offer an integrated and comprehensive approach that considers:

All Institutions. The Center examines the important role of voluntary associations, communities, businesses and families, as well as government.

All People. Mackinac Center research recognizes the diversity of Michigan residents and treats them as individuals with unique backgrounds, circumstances and goals.

All Disciplines. Center research incorporates the best understanding of economics, science, law, psychology, history and morality, moving beyond mechanical cost-benefit analysis.

All Times. Center research evaluates long-term consequences, not simply short-term impact.

Committed to its independence, the Mackinac Center for Public Policy neither seeks nor accepts any government funding. The Center enjoys the support of foundations, individuals and businesses that share a concern for Michigan's future and recognize the important role of sound ideas. The Center is a nonprofit, tax-exempt organization under Section 501(c)(3) of the Internal Revenue Code. For more information on programs and publications of the Mackinac Center for Public Policy, please contact:

Introduction

This publication marks the fourth edition of the Context and Performance Report Card for Michigan elementary and middle schools, published every two years since 2013.* The goal is to compare Michigan schools' relative performance by factoring in the role student poverty plays in affecting academic achievement. While this report card provides a valid approach to assessing school quality, it should not be seen as the ultimate or exclusive dimension for making such judgments.

The CAP Report Card uses multiple years of student achievement data so that a single year's results do not significantly influence a school's grade. The past two editions each relied on three years of academic performance data — based exclusively on either the old Michigan Educational Assessment Program, or MEAP, or the current Michigan Student Test of Educational Progress, or M-STEP. The 2019 report card relies on four full years of data, making use of the fact that students consistently took the same M-STEP tests over the period covered for this analysis.

The CAP Report Card stands apart from standard measures of academic performance. It controls for the differences at each school in students' socioeconomic status. This provides a more accurate appraisal of a school's performance than simply comparing raw test scores, because student poverty rates are strongly associated with academic achievement — the less affluent the student body, the lower the test scores, generally. Without this needed adjustment, school report cards could overrate the effectiveness of schools serving relatively affluent student populations or underrate the effectiveness of schools serving large groups of low-income students.

CAP Report Card scores are relative; they are based entirely on comparing schools to each other. The report card does not create a benchmark for a "good school." A high CAP Score means only that a school performs well compared to its peers. The data from standardized tests used in this report card is but one measure to assess school performance; there are many others that parents and taxpayers may care about.

* Some language contained in this report may have been used in previous Mackinac Center publications.

Data and Methods

The research methodology used for this report card is based on a 2006 University of Arkansas study and previously published Mackinac Center report cards (see Appendix A for more detail). It uses regression analysis to predict how well each school would perform given the socioeconomic makeup of their students and given the average test scores of other schools. Schools are then ranked by how well they actually performed on state standardized tests relative to their predicted performance.

Identifying Students' Socioeconomic Status

This report measures student socioeconomic status by using data collected for the federal National School Lunch Program. The percentage of students who qualify to receive lunch assistance due to family income, as reported by the Michigan Department of Education, informs the analysis that generates each CAP Score. In 2019, a student from a family of four with an annual household income of \$33,475 or less would qualify for a federally subsidized free lunch.*

Of eight different data points covering student demographics and other characteristics, none associated nearly as much with performance on state standardized tests as did free lunch rates (see Appendix B). Thus, only the percentage of students eligible for a free lunch was included in the statistical analysis in order to keep the model both as simple and consistent as possible.

This report uses grade-level data on free lunch status to generate an expected score for each subject test at each grade level. A school's average scale score in fifth-grade mathematics was regressed against the share of free lunch students counted in the school's fifth-grade student population, not the share of the student body as a whole. Though imperfect, these grade-level measures of student poverty are the best proxy available to researchers for determining the socioeconomic status of student test-takers.

Measuring Schools' Average Academic Achievement

The four most recent years of Michigan standardized test results for grades three through eight — assessing student academic performance from 2016 through 2019 — were used to generate this publication's CAP Scores. A school's total CAP Score is an average of the CAP Scores earned each year. Each grade level was equally weighted to determine a yearly CAP Score, regardless of the different number of tests administered at certain grade levels.

Through 2018, the M-STEP program tested Michigan students in both mathematics and English language arts in all grades, science in grades four and seven, and social studies in grades five and eight. But in 2019, state officials changed the official eighth grade math and ELA assessments from M-STEP to the College Board's Preliminary Scholastic Aptitude Test, or PSAT.† M-STEP remains in place for all tests in grades three through seven, as well as for eighth grade social studies.

* Federal Register, Vol. 84, No. 54 (U.S. Government Printing Office, March 20, 2019), 10297, <https://perma.cc/MZ2Y-SDAD>.

† For a demonstration of the validity of using both M-STEP and PSAT scores over different years to measure the academic achievement of eighth-grade students, see "Appendix C: Incorporating PSAT Tests into CAP Scores."

A school's overall CAP Score incorporates as many as 60 test scores over the four-year period. Depending on the grade levels of students served in the school, up to 16 different individual test results may factor into the 2016 and 2017 CAP Scores and up to 14 results for 2018 and 2019. This is because state officials decided to withhold the release of the fourth- and seventh-grade science test results for the past two years "because they say the exam is a sample test that does not yet measure student proficiency."^{*}

Graphic 1: M-STEP Tests Used for CAP Scores

Year	ELA	Mathematics	Science	Social Studies	Total
2016	Grades 3-8	Grades 3-8	Grades 4, 7	Grades 5, 8	16
2017	Grades 3-8	Grades 3-8	Grades 4, 7	Grades 5, 8	16
2018	Grades 3-8	Grades 3-8	N/A	Grades 5, 8	14
2019	Grades 3-7	Grades 3-7	N/A	Grades 5, 8	14

Schools do not need to have a state-reported score for all 60 tests to qualify for the report card. Many schools do not serve students in all grades three through eight. For a given test in a given year, the state may not report an average scale score if a school has fewer than the minimum number of student test-takers. In order to be included in the sample, a school must have a minimum of two average scale scores in at least three of the tested years and have been open to administer state tests in the spring of 2019. While the number of tests per school may have varied, 98% of schools had testing results available from all four years. Schools designated as "alternative education" schools, or those that primarily and exclusively serve students with special needs, were left out of the sample.

To generate a score, subject tests were first normalized for each grade and subject test in each year. The CAP Scores for each individual test in a given year were averaged to determine grade-level scores, which each were averaged together to create a yearly CAP Score. The three or four individual yearly CAP Scores were then averaged together to generate a school's overall CAP Score.

A CAP Score of 100 indicates that a school performed exactly as expected, given the socioeconomic status of its student population. A score greater than 100 means a school exceeded expectations, while a score less than 100 means a school achieved below expectations. See Appendix A for additional details about how the scores were determined.

Classifying Schools

A total of 2,203 Michigan public elementary and middle school schools received an overall CAP Score for this edition. The number is down slightly from the previous report card. However, the breakdown by school type remains very similar. Of the cohort, 88% are conventional schools operated by 511 of the state's 537 geographically based school districts. These schools are the default assignments for students, based on where they reside, who enroll in public school.

Most of the remainder, 11.5%, are charter public schools that operate independently through a contract with a public authorizing agency and are often operated by private management companies. Like conventional schools, charters must serve all students who apply, but students must actively enroll to fill

^{*} Jennifer Chambers, "Michigan to Withhold Science Test Scores for Two Years" (*The Detroit News*, Aug. 22, 2018), <https://perma.cc/Z693-ZVRG>.

available slots. The list is rounded out by 10 district-operated schools with selective admission policies that require students to demonstrate a required level of academic performance in order to enroll.

Graphic 2: Types of Public Elementary and Middle Schools

School Type	Number of Schools	Percentage of Schools
Conventional	1,939	88.02%
Charter	254	11.53%
Selective	10	0.45%
Total	2,203	100%

Source: Authors calculations based on analysis of MDE data.

As in previous editions, schools that receive CAP Scores have been broken down by geographic “locale codes.” These codes indicate whether a school is located in an urban, suburban, town or rural area, as assigned by the federal National Center for Education Statistics. Specific descriptions of each locale category can be found in “Appendix D: Locale Codes.”

Continuing the trend from previous report cards, a greater share of schools in the cohort can be found in urban or suburban locales — more than 64%. In particular, suburban schools represented 35% of the sample in the original 2013 CAP Report Card, compared to nearly 40% today. The proportion of rural schools receiving grades has dropped from 29% to 23% over the same period.

Graphic 3: Public Elementary and Middle Schools by Locale

Locale	Number of schools	Percentage of Total
City: Large	134	6.08%
City: Midsize	143	6.49%
City: Small	264	11.98%
City: Total	541	24.56%
Suburb: Large	687	31.18%
Suburb: Midsize	102	4.63%
Suburb: Small	86	3.90%
Suburb: Total	875	39.72%
Town: Fringe	97	4.40%
Town: Distant	89	4.04%
Town: Remote	86	3.90%
Town: Total	272	12.35%
Rural: Fringe	175	7.94%
Rural: Distant	238	10.80%
Rural: Remote	102	4.63%
Rural: Total	515	23.38%

2019 Selected Results

The following tables show selected results from this report card, including the top- and bottom-scoring 100 public elementary and middle schools. It is not feasible to list all 2,203 ranked schools in this publication; however, interested readers can find an online database of all schools at <http://www.mackinac.org/CAP2019>.

Top 100 Public Elementary and Middle Schools

Michigan's third-largest school district, Dearborn Public Schools, once again distinguished itself on the CAP Report Card. For the second straight edition, the district had five of the state's top 10 scoring schools, and more than half of its schools — 17 of 29 — finished in the top 100. By comparison, the state's only two larger districts — Detroit and Utica — each placed only one school on this list. Behind only Dearborn, West Michigan's Kentwood Public Schools landed four out of its 13 schools in the top 100. A pair of smaller districts along the shores of Lake Michigan each saw both of their schools finish on this list: Covert Public Schools and Frankfort-Elberta Area Schools. No other district with multiple schools analyzed placed them all in the top 100.

For the second consecutive time, Hamtramck Academy earned the top CAP Score in the state. The Detroit-area charter school has earned a place among the highest 1% in the rankings on all four editions. In all, 26 of this year's top 100 CAP Scores went to public charter schools, up from 23 in 2017. More than twice as many charters achieve one of the top rankings as would be expected based on their share of the cohort. This success is driven primarily by charters located in the city of Detroit, which make up 2.8% of all schools but record 12 of the top 100 scores.

Schools that selectively admit students understandably are overrepresented, with nine of the 10 in the sample making the top 100. This represents a slight improvement back toward an earlier norm. The lowest any selective school finished on earlier versions of this report card was 38th, until three selective schools landed outside the top 100 in 2017.

Following the pattern from earlier reports, a true majority of the top 100 schools (51) are located in cities, even though city schools as a group have the lowest average CAP Score. This strongly suggests urban areas have a wide variation in school performance. On the other hand, schools in towns have the highest average CAP Score but only four cracked the top 100, despite making up nearly one-eighth of the sample.

The Bottom 100 Public Elementary and Middle Schools

The lowest-rated entry on the 2019 CAP Report Card is STEAM Academy at MLK in Benton Harbor Area Schools. All three of the troubled district's schools in the analysis show up in the bottom 100, including one other ranked the sixth-lowest. Benton Harbor has faced extra scrutiny from state officials in recent months over concerns about the district's deep academic and financial struggles.*

For the third consecutive edition of the report card, more than 40 conventional district schools in Detroit have finished in the bottom 100. This year nearly 60% of eligible schools operated by the Detroit Public Schools Community District received the negative distinction, a reflection of poor performance even after adjusting for student poverty. However, while conventional Detroit schools received 16 of the 20 lowest CAP Scores in 2017, that number dropped to nine in the current edition. The bottom 100 did include multiple showings from smaller nearby metro districts: Wayne-Westland (four of its 14 schools), East Detroit (two of its three schools) and Hazel Park (two of its four schools).

The number of charter schools in the bottom 100 matched the 2017 total of 23. This includes three of the six charters located in Pontiac, and both of the schools that represent the Muskegon Heights Public School Academy System — a converted former conventional school district that was appointed an emergency manager in 2012.

As in 2017, 90 of the lowest 100 CAP Scores come from either urban or suburban schools. Yet those located specifically in cities only comprise 65 in this edition, down from 74 in 2017. Only one town school and nine rural schools rated in the bottom 100.

Long-Term Trends in CAP Scores

First introduced in the previous edition of the Elementary and Middle School Context and Report Card, two analyses of longer-term achievement trends were also conducted. A comparison with the data used to compile CAP Scores for earlier report cards can point to schools that have substantially improved or declined in their relative academic performance. It can also help to highlight schools that have sustained high or low levels of academic performance over a longer period of time.*

Most Improved and Largest Declines

This analysis compares schools' prior adjusted performance to that achieved on the current edition of the Elementary and Middle School Report Card. Included in the analysis were all of the 2,203 schools which also have at least four unique yearly CAP Scores between 2009 and 2015. The resulting sample of 2,075 left out more recently opened schools, as well as those with insufficient reported data due to smaller test-taking cohorts. The consolidation and grade reconfiguration of schools in some locations also may have omitted others, as only scores from schools with a consistent building code number from the Michigan Department of Education were used. However, the sample does include schools that changed district

* In smaller schools, with fewer students taking the test, we can expect the average of that test to fluctuate more from year to year. This plays out, as we identified a negative correlation (-0.1092) between school size and absolute value of change in CAP Scores as measured in this analysis. That means smaller schools are more likely to appear among those with the largest identified CAP Score changes. Sixty-six of the 100 most improved schools, and 61 of the schools with the largest declines, had smaller student enrollments than the sample's median enrollment size for the 2018-19 school year.

affiliations while maintaining a consistent building code — notably, former district schools converted to charter management or those once operated under the state’s Education Achievement Authority.

A simple method for tabulating change in school performance over time was retained from the 2017 report card. The difference is measured between a school’s overall CAP Score, as reported above, and an average of the calculated yearly CAP Scores between 2009 and 2015. For instance, Bauer Elementary School in Hudsonville earned a 105.88 CAP Score in this edition of the report card. The average of its seven annual CAP Scores from 2009 to 2015 was 105.38. Therefore, Bauer Elementary recorded a 0.5-point improvement.

It is important to observe that each year’s individual tested CAP Scores are normalized to the sample of all test results for that grade and subject available in the sample. This helps address concerns about the impact that changes to these tests may have had on the ability to measure such long-term trends.

100 Most Improved Public Elementary and Middle Schools

Only 39 schools, less than 2% of the total sample, improved average CAP Scores by 10 points or more. Topping the list of most improved schools was Caniff Liberty Academy, one of three Hamtramck charter schools, with a net gain of 19.56 points on its CAP Score. In all, public charter schools made up 29 of the 100 most improved, though they comprise only 10% of the sample. Certain cities saw large proportions of their charter schools make the greatest improvements. Half of Flint’s six charter schools and two of the three charter schools in Taylor landed in the top 100. Nearly one-third (15 of 54) of Detroit charters made the list.

Two districts in Wayne County had particularly distinguished showings in the top 100: Garden City Public Schools had two of its three schools make the list and Woodhaven-Brownstown School District saw three of its seven do the same. As a whole, city schools are overrepresented, with 37 of the 100 most improved schools.

100 Largest Declines Among Public Elementary and Middle Schools

For the second straight edition of the CAP Report Card, Thirkell Elementary in the Detroit Public Schools Community District recorded the biggest decline. Thirkell received the highest score on the original 2013 report card. Detroit district schools were less overrepresented among the 100 biggest CAP Score declines — 17 this time, compared to 31 identified in the 2017 report. In Macomb County, both Mt. Clemens district schools and two of the four from the Clintondale School District landed in the bottom 100, as well as three out of four from Hazel Park Schools in Oakland County.

Farther north, three out of five Pontiac charter schools recorded some of the 100 largest declines in CAP Scores. At number 11, Lansing's El-Hajj Malik El-Shabazz Academy experienced the biggest decline among charter schools. Overall, half as many charters placed in the bottom 100 as were among the 100 most improved, though they were overrepresented on both lists.

Long-Term Performance

This analysis measures sustained performance over a longer period of time. The cohort was made up of all 2,203 schools featured in the new report card with consistent building codes that produced at least seven unique yearly CAP Scores between 2009 and 2019. In order to determine the long-term CAP Score for each of the 2,112 eligible schools, all available yearly CAP Scores were averaged together to generate a comprehensive score for the 11-year period.

Sustained High Performance: Top 100 Public Elementary and Middle Schools

Iris Becker Elementary School in Dearborn Public Schools recorded the highest long-term performance score. More than half of the conventional schools in Dearborn joined Iris Becker on the top 100 list. In all, 71 of the 100 schools with the highest levels of long-term performance also finished among the top 100 overall on this current report card.

Interestingly, two schools ranked in the top 100 for long-term performance, but also registered some of the biggest declines: DPSCD's Davison Elementary-Middle School and North Godwin Elementary in Kent County's Godwin Heights Public Schools. Both the other eligible Godwin Heights schools also rated among the top 100 for long-term performance, with one of them also among the 100 most improved.

More than half of those recording the top 100 scores for long-term performance are schools located in cities. A total of 19 charter schools graced the top 100, with eight of the nine selective-admission schools in the sample also appearing on the list. Schools marked in bold also appear in the Top 100 list in this report card.

Sustained Low Performance: Bottom 100 Public Elementary and Middle Schools

Schools operated by the Detroit Public Schools Community District still outnumber all others on the list of sustained low CAP Score performance, registering 41 of its 71 eligible schools among the 100 lowest. Other districts with a majority of their schools on this list include Pontiac (four of six) and East Detroit (two of three). Charter schools were again overrepresented on this list, with 23 landing in the bottom 100 in long-term performance. At the very bottom of the list is the Macomb Montessori Academy, a charter school in Warren.

Similar to the Top 100 list, 60 of the Bottom 100 in long-term performance recur from the lowest 100 on the current CAP Report Card. These schools appear in bold. Two-thirds of this group also are experiencing declining CAP Scores. Yet there are a few noteworthy signs of improvement. Four of the lowest long-term performers rank among the most 50 improved: two Detroit charter schools, the Flat River Academy Middle-High School in Greenville and DPSCD's Nolan Elementary and Middle School.

* Will Carleton Charter School Academy reports that it does not participate in the National School Lunch Program and the number of students it reports to the state who are eligible for a free lunch based on their household income may not be an accurate depiction of the socioeconomic status of its student body. This would lower the school's CAP Score as a result.

About the Authors

Ben DeGrow is the Mackinac Center’s education policy director. He has years of experience researching and writing about education policy issues in multiple states. DeGrow graduated summa cum laude with a bachelor’s degree in history from Hillsdale College, and went on to receive a master’s degree in history from the Pennsylvania State University. Ben’s experiences in the classroom include service as a university graduate assistant and as a substitute teacher in Michigan public schools. He also spent nearly a year on the editorial staff of the Hillsdale Daily News.

Ronald Klingler is a data and technology consultant. He graduated cum laude in 2015 with a bachelor's degree in mathematics and economics and completed his master's degree in economics in 2016, both at Central Michigan University.

Appendix A: Calculating CAP Scores and Letter Grades

Calculating CAP Scores

The purpose of CAP Scores is to gauge the performance of schools on standardized tests, given the economic status of their respective student bodies. The scores are generated from the M-STEP and PSAT scores from 2016 through 2019.

The first step in creating the scores is standardizing all the test results by subject, grade and year. Each test is given a mean of 100 and a standard deviation of 15. This creates an adjusted performance score, which is represented by the following formula:

$$\text{Adjusted Performance} = 100 + 15 \left[\frac{(\text{Test Avg.} - \text{State Avg.})}{\text{S. D. of State Avg.}} \right]$$

The adjusted performance scores for each test are then compared to a predicted performance. The predicted performance is the score one would expect given the economic status of the students taking the tests. To get this predicted performance, the adjusted performance score for each year is modeled against the percentage of students being tested who qualify for a free lunch. Then the regression equation is used to generate the predicted performance. The regression equation is as follows:

$$\text{Adj}_{\text{Perf}_i} = \beta_0 + \beta_1(\text{FREE})_i + \mu_i$$

where $\text{Adj}_{\text{Perf}_i}$ is the average test score at school i ;

β_0 is a constant and is the predicted score of a school without any students eligible for a free lunch;

β_1 is the estimated impact of the student population's free lunch eligibility rate on a school's average score;

FREE_i is the number of students eligible for free lunch divided by the total student population;

and μ_i is the error term.

A unique equation is generated for each test, and that equation produces a predicted performance for each test, school and year. The ratio of the actual and predicted score, multiplied by 100, produces the final CAP Score for that test.

$$\text{CAP Score} = 100 \times \frac{\text{Adjusted Performance}}{\text{Predicted Performance}}$$

As an example, Lewis Maire Elementary School's fifth grade class in 2019 scored very well on their social studies test with an adjusted score of 133.6401. They were over two standard deviations above the mean for that test. Given that approximately 10% of their students qualified for free lunch, their predicted performance on that test comes to: $123.4792 - (.106383) \times (46.1592) = 118.5686$. Using the CAP Score equation above, the classes' CAP Score for that test comes to about 112.71, meaning that the class exceeded expectations.

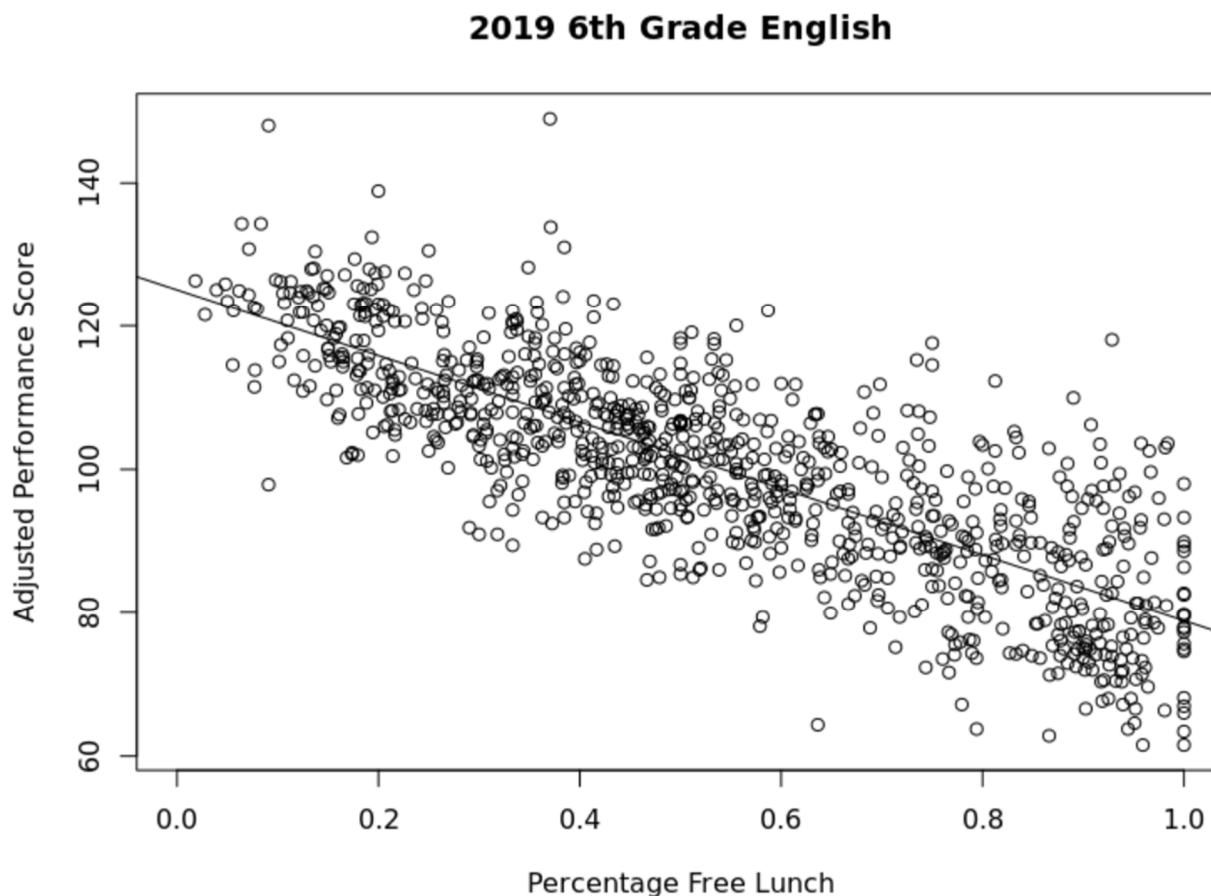

All subject scores for each grade are averaged together, and then all these average grade-level scores are again averaged to produce the CAP Score for a given school in a given year. The overall CAP Score for a school is the average yearly score from 2016 to 2019. Averaging together these scores over multiple years provides a general picture of how well the school is performing and works to smooth out year-to-year variation.

Letter grades based on CAP Scores are issued on a curve. The top 10% of schools received an A, the next 20% a B, the middle 40% a C, the next 20% a D and the bottom 10% an F. This distribution is consistent with all prior editions of the Context and Performance Report Card.

Appendix B: Assessing Other Predictive Variables

The creation of CAP Scores is a simple endeavor, and intentionally so. The goal is to use an easy-to-understand metric to indicate the economic situation of a school’s student population, and then see how a school’s test results look given that situation. Taking the free lunch percentage of a school’s students and plotting them against the test results (adjusted performance score, see Appendix A) produces a remarkably linear relationship. Below is one example which is typical of all test types, grades and years:

Graphic 4: Linear Regression of 2019 Sixth Grade English M-STEP Scores and Free Lunch Status

Consistently across years, grades and subjects, free lunch percentage maintains a high amount of predictive power for a school’s standardized test scores. Below is a table containing the r-squared values and free lunch percentage coefficient t-values for all of the 2019 tests:

Graphic 5: Statistics from CAP Score Regression Analysis

Grade	Test	R-Squared	T-Value
3	English	0.6309	-50.99
3	Math	0.5901	-46.79
4	English	0.6372	-51.31
4	Math	0.6207	-49.51
4	Science	0.6657	-54.65
5	English	0.6631	-52.78
5	Math	0.6256	-48.65
5	Science	0.6712	-53.75
6	English	0.6342	-40.79
6	Math	0.671	-44.24
7	English	0.621	-37.58
7	Math	0.6686	-41.65
7	Science	0.684	-43.27
8	English	0.7237	-47.82
8	Math	0.707	-45.9

In each case, the free lunch percentage is highly significant and explains the majority of the variance in the test scores by itself. This consistent relationship allows us to generate a value which is very intuitive: how far above, or below, that relationship line does a school perform? That is the essential value of a CAP Score.

Including Additional Variables

Still, an important question lingers: Why not add other variables? It is a valid consideration, and it can be useful to periodically test other variables commonly thought or demonstrated in other contexts to be associated with standardized test score performance. The results of these tests are described in this section.

The number of potentially useful variables is large, but the pool is narrowed to publicly available student data, which mostly covers demographics and some assorted metrics related to behavioral characteristics.* However, many of these variables are not available at a level as granular as the free lunch data. For many interesting variables, all that exists is information at the school level rather than the grade level.

To get around this problem for the purpose of the current testing, an aggregated score was created using all the standardized test scores from a given school. The adjusted performance scores for all tests and grades for a given school are averaged together with equal weighting, and this average test score is then used as the dependent variable for testing. All eight of the eligible variables are then put through an AIC Stepwise selection process, the result of which is displayed in the table below:

Graphic 6: Statistics from Regression Analysis of Other Variables

Variable	Estimate	T-Value
Intercept	127.4457	58.399
Total Mobility Rate	-20.6017	-5.382
Chronic Absence Rate	-19.9256	-13.615
Retention Rate	19.8184	3.708
Male Percentage	-7.0352	-1.660
White Percentage	1.3111	2.039
Spec. Education Percentage	-19.8638	-6.267
Free Lunch Percentage	-34.0045	-37.536
English Language Learner Percentage	5.6279	5.009

* All publicly available data was collected from the Center for Educational Performance and Information, <http://www.mischooldata.org>.

The model yielding the regression results in the table above has an r-squared value of 0.7824. When the free lunch percentage is removed, the r-squared drops to 0.6248. Yet when the regression is run just against the free lunch rate, the r-squared is 0.7253. This suggests that the free lunch rate for schools explains the greater part of the variance of test scores and retains this greater part even when other variables are added into the equation. So, while it would be possible to marginally improve the predictive power of the model with additional variables, it is the opinion of the authors that the simplicity of the CAP Score calculation is not worth sacrificing for negligible increases in model accuracy.

Appendix C: Incorporating PSAT Tests into CAP Scores

In 2019, eighth grade students began to be tested using the PSAT, rather than the M-STEP, to measure achievement in mathematics and English language arts. This calls into question whether we can use the two types of tests in conjunction with each other to create an aggregated CAP Score. It is possible that the tests are different enough that aggregating them would bias CAP Scores in some way.

Generally, a school's standardized test results from the prior year are a good predictor of the scores for the current year. Schools do change their place in the rankings, but on the whole they remain fairly consistent. The assumption made here is that if the PSAT scores are well predicted by the prior year's M-STEP scores, they are unlikely to create a bias. In other words, if prior year M-STEP scores can predict PSAT scores as well as prior year M-STEP scores can predict other M-STEP scores on average, we can feel confident that the score results can be aggregated together.

The table below gives the year-over-year regression results for 2016 through 2019. Each row shows how well a prior year M-STEP test score could predict the following year's subject test score listed in the table. The last two rows show the results of the new PSAT tests.

Graphic 7: Statistics from Regression of PSAT and M-STEP Test Results

Subject	Years	Constant (t)	Coefficient (t)	R-squared

Math	2017-2018	9.39060 (6.476)	0.90944 (63.686)	0.834
ELA-PSAT	2018-2019	14.32481 (7.335)	0.85684 (44.563)	0.711
Math-PSAT	2018-2019	10.6500 (6.538)	0.8942 (55.895)	0.7947

As can be seen in the table, each year's test scores are closely associated with the prior year's test scores. In both cases of the 2018 M-STEP scores predicting the PSAT, the results of the regressions were within the bounds of the results among M-STEP tests from prior years. This gives us confidence that the PSAT tests can be included in the CAP Score calculation.

Appendix D: Locale Codes

The locale codes used in this paper come directly from the National Center for Education Statistics. Locale codes represent how far away a particular school is from an urbanized area, and are based on a school's physical street address.* According to the NCES, the geographic information used to create locale codes is updated for about one-third of communities every year.

Definitions of each locale code category are below, taken directly from the NCES: †

Locale Code	Definition
City: Large	Territory inside an urbanized area and inside a principal city with population of 250,000 or more.
City: Midsize	Territory inside an urbanized area and inside a principal city with population less than 250,000 and greater than or equal to 100,000
City: Small	Territory inside an urbanized area and inside a principal city with population less than 100,000.
Suburb: Large	Territory outside a principal city and inside an urbanized area with population of 250,000 or more.
Suburb: Midsize	Territory outside a principal city and inside an urbanized area with population less than 250,000 and greater than or equal to 100,000.
Suburb: Small	Territory outside a principal city and inside an urbanized area with population less than 100,000.
Town: Fringe	Territory inside an urban cluster that is less than or equal to 10 miles from an urbanized area.
Town: Distant	Territory inside an urban cluster that is more than 10 miles and less than or equal to 35 miles from an urbanized area.
Town: Remote	Territory inside an urban cluster that is more than 35 miles from an urbanized area.
Rural: Fringe	Census-defined rural territory that is less than or equal to 5 miles from an urbanized area, as well as rural territory that is less than or equal to 2.5 miles from an urban cluster.
Rural: Distant	Census-defined rural territory that is more than 5 miles but less than or equal to 25 miles from an urbanized area, as well as rural territory that is more than 2.5 miles but less than or equal to 10 miles from an urban cluster
Rural: Remote	Census-defined rural territory that is more than 25 miles from an urbanized area and is also more than 10 miles from an urban cluster.

The Mackinac Center for Public Policy is dedicated to improving the understanding of economic and political principles among citizens, public officials, policymakers and opinion leaders. The Center has emerged as one of the largest and most prolific of the more than 50 state-based free-market “think tanks” in America. Additional information about the Mackinac Center and its publications can be found at www.mackinac.org.

Additional copies of this report are available for order from the Mackinac Center.

For more information, call 989-631-0900, or see our website, www.mackinac.org.

Ben DeGrow is the Mackinac Center’s education policy director. DeGrow joined the Center in 2015 after a long stint at Colorado’s Independence Institute, where he provided expert analysis on school choice, school finance, collective bargaining and education employment policies. He authored numerous policy reports and opinion-editorials for various newspapers and other publications, and regularly appeared on radio and television and before legislative committees.

Ronald Klingler is a data and technology consultant. He graduated cum laude in 2015 with a bachelor’s degree in mathematics and economics and completed his master’s degree in economics in 2016, both at Central Michigan University.
