The results of the statistical data analysis of the questionnaire survey allow us to judge that among the different forms of exercise practice, the most practiced are with physical trainer (42% women, 38% men) and with online/mixed trainer (40% women, 38% men) (see Figure 5). Here we note the fact of close homogeneity of the indices in both groups of respondents, and the value of the rating of the form of organisation, in our opinion, is due to the specificity of the process as a professionally pedagogically organised activity under the leadership of the specialist in the field.

- individual (12% women, 22% men);
- other forms (4% women, 2% men).

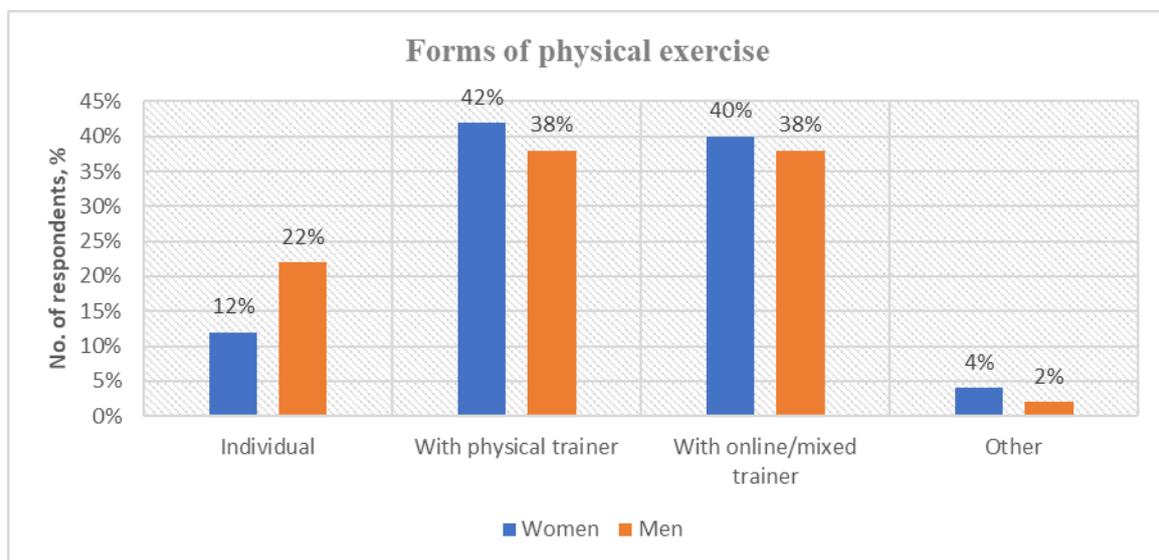

Figure 5. Respondents' answers on their preferred form of exercise

At the same time, the significant values of the "individual form" indicators allow us to see that this form is more preferential for men (22%) and less for women (12%), which can be explained by the greater inclination of women towards group communication.

In this socio-pedagogical study, we also established the main factors that motivate the need for systematic exercise (see Figure 6).

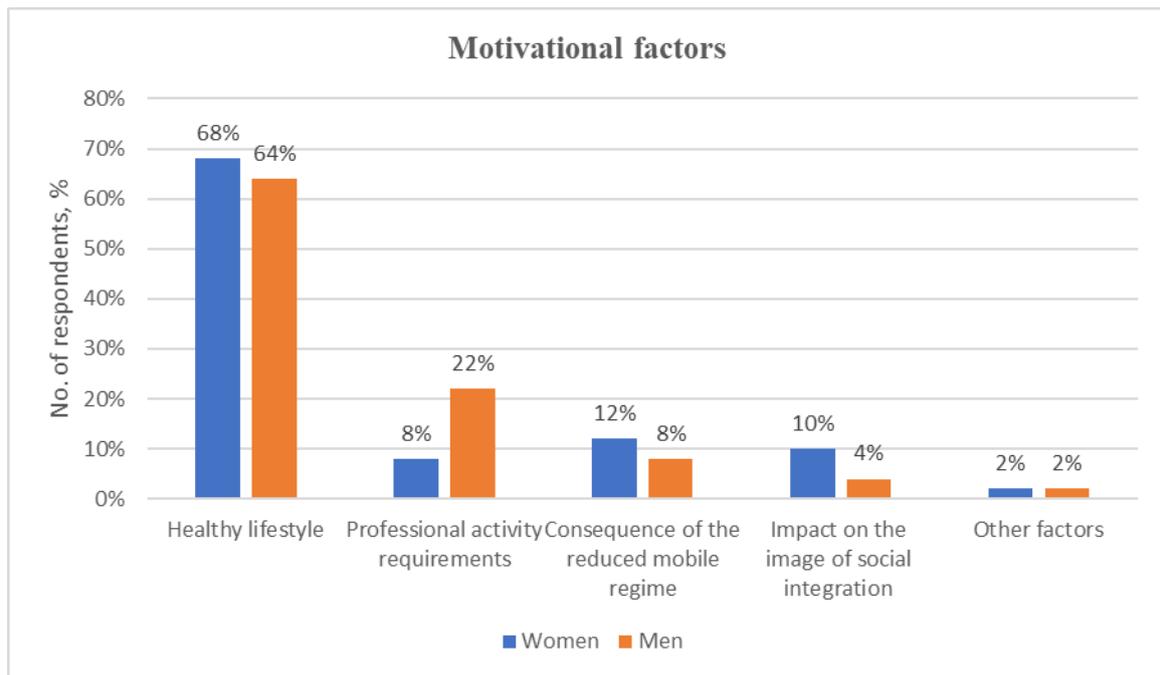

Figure 6. Sample responses on determining motivational factors for exercise

Analysing the data illustrated in Figure 6, we can mention that the main factor motivating respondents to exercise is the factor of a healthy lifestyle, as one of the most important conditions for maintaining health and achieving success in any kind of psycho-social and professional activity, which ensures a higher level of quality of life in an integral context. In this specific case we note the homogeneity of the value indices of the answers of the women's group with those of the men's group (68% and 64% respectively).

It is worth noting that for men, one of the most significant motivational factors listed is "Job requirements" (22%), while for women it ranks second to last (8%) of all options presented. This distribution can be explained by the fact that, in general, men work mostly in professional fields where their activities are associated with some physical effort, unlike women. For women, this position is confirmed by the second most important factor among those represented "Consequence of reduced mobility regime" (12%) and less significant at the same time for men (8%), which can be explained by the specificity of female professions that are not associated with intense physical effort and multiple movements.

It should also be noted that for women the factor "As impact on images of social integration" (10%) is at the same level, which can be explained by their desire to improve and maintain body harmony as a factor of social significance. While for men this option is one of the least significant (4%).

Thus, it can be stated that for men, of all the factors presented, only two of them are significant, while for women, the significance of all the factors is evenly distributed, which can be explained both by the specifics of the professions and by differences in the psychosocial status of women and men.

Conclusions

- The phenomenon of Olympism is one of the most important factors that actualize and stimulate the motivation to value and practice motor activities as an integral part of the active personality;
- The main sources of information that have determined the importance of physical exercise for the formation of physical culture of personality and healthy lifestyle in adults are the educational content of the subject "Physical Education" and conventional mass media;
- The main forms of organised motor activities in the early adult population are fitness clubs and "at home", practiced under the guidance of the physical trainer and the online/mixed trainer in order to maintain a healthy lifestyle, general work capacity and eliminate the consequences of a reduced dynamic regime.

The Use of Cultural Elements in Primary School Textbooks Towards Reshaping Their Attitudes in Learning English: Malaysian Primary Pupils' Perception

Noor Iylia Abu Bakar

Chinese Primary School Lawan Kuda Baru, Gopeng, Perak, Malaysia

Hanita Hanim Ismail

Faculty of Education, Universiti Kebangsaan Malaysia

Abstract: The adaption of the Common European Framework Reference (CEFR) as a guideline in Malaysian English language education has led the Ministry of Education to replace locally-developed English textbooks with a selection of imported titles. While considering the significance of intercultural skills in the English curriculum, there is a need to look into the aspect of relevance in using imported texts to suit local cultural demands. This study is dual focal in nature; it investigated not only the impacts of cultural elements embedded in imported textbooks on Malaysian students' attitude but also gathered their perception on the aspect through survey research. For the purpose of this study, it specifies on the use of English Plus 1 – an imported textbook, published by Oxford University Press. A questionnaire which was adopted from Xiao (2010), was then distributed to 39 Malaysian pupils of suburban Chinese-type primary schools in Perak who were selected using a convenience sampling technique. The findings indicated that the use of English Plus 1 has impacted pupils' attitude where it was observed that their perception towards learning English became more negative due to the focus of the textbooks inclines towards a culture that was not familiar to Malaysians. The implications derived from this study suggest teachers' flexibility at adopting a range of teaching approaches that might also need to be creative in its nature in order to impart cultural information to the young learners. Simultaneously, a more pro-active solution could be taken at the administrative level by carefully scrutinizing the cultural elements embedded in imported texts to adopt cultural suitability for young learners.

Keywords: Cultural elements in textbooks, ESL textbooks, language acquisition, learners' attitude and perception, primary school pupils.

Introduction

As a *lingua franca*, English remains as one of the widely spoken languages across the globe that creates a dynamic spectrum between the native and other types of language users (i.e. second/foreign/international) at many levels. At one level, these language learners would probably understand a link between language and culture. In general, language serves as a vehicle that carries the culture(s) during any language learning experience (Duranti, 1997). A language is not taught without its culture (Byram, 1988); they are intertwined (Kramsch, 2013) because individuals use language not only to present facts and ideas but also to reflect their attitudes, which are gradually evolved through the way they live in societies. Although the importance of culture in teaching English as a second language (ESL) is widely acknowledged, new issues have emerged in the teaching and learning process (e.g. the categories of culture, the culture of the target users, and the scope of culture that the target learners should learn in the language classroom). As such, integrating target-native culture should be an essential part of language acquisition. This is especially important with the current evolving framework of English at the worldwide level. Language teachers must continue to associate this importance with the main roles of second language cultural learning, which are global cultural consciousness and intercultural citizenship. As such, Shin et al. (2011) argued that diverse voices and cultural opinions should be included in ESL textbooks to allow language learners to understand the diversity of cultural values and ethics. These ESL materials should include the target language culture along with the multiple foreign cultures, since this will likely assist learners in negotiating knowledge about both values – the native and target language speakers' in developing solidarity (Nguyen, 2011). An absence of either contributors would not accurately reflect the present English linguistic landscape (Jenkins, 2014; Seidlhofer, 2011). Based on Smith's (1976) definition of international language which is a language that allows people who do not have a common native language to communicate, McKay (2002) identified four characteristics in English presented as an international language. The characteristics of an international language are as follows: First, the international language is in need due to the advancement of global integration, which includes economic, scientific, cultural, and intellectual life. Second, it coexists with other languages in multilingual situations. Third, people from all strata of society study it. Fourth, it spreads through a large number of people learning the language rather than through speaker migration. As an international language, an essential function of English is to allow speakers to express their ideas and culture with others from a range of language and cultural backgrounds. These four characteristics support the pedagogical notion of English learning that English language learning should focus on increasing learners' capacity to comprehend cultures, including their own, and to communicate with individuals from different cultures successfully, called Intercultural Communicative Competence (ICC). It is this competence that allows successful and appropriate communication with culturally and linguistically different individuals (Savignon, 1997). Learning about various cultures helps learners become more open-minded about international understanding, improve communication with people from different cultures, and better understand his own culture by comparing it to other societies.

Recognizing the significance of English language proficiency within the current global learning challenges, the

Ministry of Education (MoE) devised the Malaysian Education Blueprint (2013-2025), which aims to reform the education system. Since 2013, MoE has incorporated the use of the Common European Framework of Reference for Languages (CEFR) into the English language curriculum, resulting in adjustments to the syllabus, assessment, and materials to align with the global reference set. This has led to the use of English Plus 1 published by Oxford University Press – a foreign textbook, to replace the prior local textbooks for Year 5, starting 2021. Under the national identity aspect in the Malaysian Education Blueprint (2013-2025), every child is identified as a Malaysian regardless of his ethnicity, religion, culture or socioeconomic status. Yet, some teachers observe that students are unable to fundamentally understand Malaysian culture at a satisfactory level based on the required criteria in the curriculum. This links to a possible reason for the given exposure. In one case, the adopted textbook focuses on the target culture, instead of source cultures. At times, students were sometimes unable to finish a discourse regarding local cultural information. This problem shows a mismatch between the curriculum objectives and students' actual performance on source culture understanding in Malaysia.

Culture and language learning is a broad concept that encompasses many variables, such as students and teaching materials (Tajeddin & Bahrebar, 2017). According to Gardner et al. (1985), an effort is linked with a desire to achieve the purpose of language acquisition and positive attitudes about language learning. The primary function of teaching materials in the foreign language classroom is to facilitate language acquisition where textbook contents appear to have a major impact on students. In some cases, textbooks may either directly or indirectly convey cultural values, known as 'hidden curriculum' (Cunningsworth, 1995). Most English teachers regard the textbook as essential references for their teaching, where the students are required to spend time in the classroom using them. This is because these imported textbooks were viewed to be connected with the CEFR goals for linguistic communicative proficiency (Chin & Rajaendram, 2017). Past studies on locally written English textbooks have indicated that these textbooks have broader cultural relevance with more inclination at fulfilling intercultural objectives, as compared to imported ones (e.g. Zawiah, 1999; Rahim & Manan, 2013; Hajar & Jalalian Daghig, 2019). In fact, the cultural content of imported ELT textbooks focuses primarily on target and foreign contexts, frequently neglecting learners' own cultures (Chao, 2011; Shin et al., 2011; Tajeddin & Teimournezhad, 2015). An interesting exploration over the relevance of choosing between foreign-based and local-based texts was issued by Haja Mohideen et al (2020) arguing a deficit in engagement if foreign texts are used in Malaysian language learning settings. Gray (2002) also asserted that ESL foreign textbooks have a particularly negative impact on learners in the outer and expanding circle settings, who rely on familiar contexts to connect their reality with the world of English, to comprehend 'the role of the local in the global.' Although numerous studies on foreign textbooks and culture are obtainable worldwide, the students' perspectives on incorporating cultural aspects in their English textbooks have yet to be explained in the Malaysian context, especially at the primary school. To date, little to no previous study has been conducted to analyze Malaysian students' perceptions of cultural aspects in English Plus 1. This research investigated the status of reference to various cultural categories in the ESL textbook currently in use, as well as students' views of cultural components in the textbook and students' attitudes toward learning English by asking three questions:

- (1) What are the students' perceptions on the use of foreign cultural elements in English Plus 1?
- (2) How do cultural elements in the textbook affect students' attitudes towards learning English?

Literature Review

Language and culture

Language serves a human technique of conveying thoughts, feelings, and desires via deliberately generated symbols (Sapir, 1921) that is non-instinctive and plays an important role in cognitive development, especially during the formative language competence development phase (Vygotsky, 1962). In fact, it is social in nature where it is subsequently internalised and becomes an important instrument in the moulding of cognitive processes related to creating the abstract symbolic system that would allow the child to organise thinking. Many experts believe that language and culture are inextricably linked (e.g. Kramsch, 2014) since they are both essential aspects of human existence for communicating. Language and culture are inextricably linked and form a human experience of communicating. According to Jiang (2000), language is a mirror of culture in the sense that individuals can observe a culture via its language. Language and culture can have a variety of connections, according to Wardhaugh (2002). One possibility is that social structure influences or determines language structure and/or behaviour. A second possibility is diametrically opposed to the first. Linguistic structure and/or behaviour can affect or be determined by social structure or worldview. Certain suggested language changes are based on this belief: if we alter the language, we can influence social behaviour. A third possibility is that the impact is bidirectional: language and society may affect one another. Certain language reforms can also be viewed as dependent on this viewpoint; the reforms are implemented in response to changes in societal norms. A fourth possibility is to believe that there is no link between linguistic structure and social structure and that one is completely independent of the other. Linnel (2001) stated that language is a recognised system of arbitrary vocal symbols that plays a critical role in preserving meaning and experience, as well as developing, elaborating, and transmitting acquired and shared ideas, values, practises, and behaviours as a culture. This is not the only vital purpose of language; it is also a tool for social adaptation, assimilation, and self-expression (Sitidoan, 1984). Language is vital in human life since it always facilitates the development of culture. In brief, there is a strong and essential link between culture and language. Culture affects and moulds language, and the latter serves as a main platform of spreading culture.

Language is not only a cultural product, but it is also a cultural symbol (Gleason, 1961) where it is a taught set of values, beliefs, and/or standards shared by a group of people (Greey, 1994). Kuo and Lai (2006) echoed this, claiming that cultural knowledge is essential for acquiring linguistic competency because a society's culture can evolve based on the language spoken. Language should be conceived and incorporated as a component of a society's and culture's identity. Lado (1957) proposed that if specific components of a second language differ significantly from those of the learner's native language, the student is likely to struggle. Because languages differ in grammar, pronunciation, and structure, it may be presumed that learning a second language is enhanced if there are parallels between that language and the learner's mother tongue. Perhaps the diversity of languages

can be addressed and students' learning pressures alleviated through cultural assistance and understanding. Learners will get long-term advantages from their language learning experience if culture is included in language study (Omaggio & Hadley, 1986). Children who are provided cultural information, entrenched in a culturally rich setting, and exposed to culturally fundamental content may acquire a second language more easily because their prior knowledge of the second-language culture makes understanding easier. Culture must be explicitly included as a component of second language learning and teaching. Students will be successful in their target language acquisition only when cultural problems are included in the language curriculum and learning. Crozet and Liddicoat (1997) claimed that culture must be included in the teaching of language knowledge and abilities in order for students to learn to speak and write in culturally acceptable ways.

Many academics define culture in diverse manners. Condon (1973) stated that culture can be thought of as a way of life. There are several elements to culture. It encompasses the ideas, customs, skills, arts, and tools that define a group of people at a particular moment; it also includes the beliefs, values, and tangible items that shape our way of life. Culture creates a foundation for each individual's cognitive and affective activity. It impacts individual assessment and attitudes and practical areas of life, such as the activities people are interested in doing in life. Culture is also a matter of routine, and it is routine that gives rise to tradition, which gives rise to culture. Locals begin with regular acts and progress to the formation of shared preconceptions. Condon went on to say that stereotypes give group traits to individuals only based on their cultural affiliation. People's thoughts, words, actions, and interactions are all influenced by cultural stereotypes. Anthropologists describe culture as "a people's or group's entire way of life." According to this definition, culture is a specific system that incorporates all social activities that bind a group of people together and subsequently differentiates them from others. Thanasoulas (2001) defines culture as all the accepted and regular modes of conduct of a specific group. It is that aspect of human existence that people learn as a product of belonging to a certain group; it is that aspect of learnt behaviour shared with others. This definition provides an understanding that culture is anything that is gained or learnt and handed down from one generation to the next. Culture is thought to be concerned with the tangible products from which a group of people defines itself, but the definition emphasises people's knowledge, ideas, and attitudes. As a result, foreign language acquisition is linked to culture learning, and culture has been implicitly taught in the foreign language classroom. Culture in language acquisition, according to Kramsch (1993), is constantly in the background in classrooms when language learners are seeking excellent communicative skills and pushing their capacity to make sense of the world around them. Over the years, the notion of culture learning has evolved for English language teaching and learning.

Grammar-translation was the dominant tendency in language instruction in the 1950s. During that time frame, foreign language instruction focused on grammar, vocabulary, and reading in the target language. As a result, evaluation took the shape of translation tasks, vocabulary lists, dictations, and fill-in-the-blank activities intending to measure language improvements. Instead of communicative and sociolinguistic ability, the emphasis was on cognitive comprehension and rote replicating language norms. Culture learning was incorporated into foreign language education in the 1960s. The pedagogical innovation of the time resulted in a greater emphasis on building students' practical language abilities, which could be employed in language

classroom instruction. Through this sense, culture was taught in foreign language teaching through the words and acts of daily people in everyday life (Kramsch, 1998). Many foreign language theorists proposed including culture in a foreign language course in the 1970s and 1980s because English learners should gain knowledge based on culture content in order to use a foreign language, and points of contact would improve students' ability to communicate appropriately in language use situations (Lado, 1957). According to Seelye (1984), when students are armed with this "super aim" for the teaching of culture, they will be able to establish perceptions and behaviours necessary to communicate within a society that speaks the target language. Since the 1990s, Intercultural Communicative Competence (ICC) seems to be the dominant trend in language teaching. According to Byram (1997), ICC necessitates the promotion of specific attitudes, knowledge, and skills to complement linguistic, sociolinguistic, and discourse competence. Curiosity and openness are mentioned, as well as "readiness to suspend scepticism about some of the other cultures and belief about one's own" (Byram, 1997). According to Lund's (2006) study, the above-mentioned perspectives within the literature have led us to the conclusion that foreign language acquisition consists of different aspects, comprising grammatical competence, communicative competence, language proficiency, and attitudes toward cultural competence.

The role of textbook in language learning

Textbooks play a crucial role in the classroom and help to equip students for future education. Richard (2001) stated that textbooks are a key component of most language instruction and, in many cases, serve as the foundation for the input language. Textbooks are the most common source of learning materials for students. In addition to instruction, teachers provide critical impact on students' learning, which can assist them develop in acquiring the language. According to Roger (1989), the function of a textbook is to foster the learner's interest in books as well as the habit of utilising textbooks to enhance knowledge and look for information. According to Pearson (2014), an influential textbook was a combination of non-native teachers' teaching expertise and actual user feedback from the native tongue. When looking for source material, we must evaluate the collaboration between native and non-native perspectives. Given the justifications for incorporating culture into ESL learning, a consideration of textbooks is necessary. The various components in the textbooks serve in assisting the second language teaching and learning process in the classroom, emphasizing the importance of textbooks.

The textbook, according to Cortazzi and Jin (1999), "could be a teacher, a map, a resource, a trainer, an authority, a de-skinner, and an ideology". Aside from offering linguistic and subject contents that genuinely represent the ideology embedded in the ESL environment of a particular circle, the textbook may be a significant source of cultural components. Textbooks from around the world have varying cultural orientations, depending on whether they are based on source cultures, target cultures, or worldwide target cultures (Abdullah, 2009). Johar and Aziz (2019) claimed that using a foreign textbook as the primary English textbook may be a bit overwhelming, given its extensive cultural content, lexical density, layout, and a few other factors to consider. Global textbooks, according to Hooi and Knight (2015), are "irrelevant, culturally unsuitable, incompatible with the newest teaching technique, of mixed levels, and just generally fail to fit the various demands of their wide range of audience". Ahmadi and Derakhshan (2016) commented that the textbook's lack of cultural material of

Malaysia makes it detrimental since it gives students with inappropriate cultural knowledge, which ultimately fails to provide contextualised language practices and sufficient discourse competence. It is possible to infer that textbooks do play an essential role in English teaching and learning. The usage of textbooks may be helpful and productive for both students and teachers in a variety of ways. However, owing to teachers' and students' reliance on textbooks and the foreign textbooks used in Malaysia, the cultural elements of textbooks have a significant impact on students.

Students' attitudes towards learning language

Attitude, both good and bad, is assumed to significantly influence students' performance in language learning. A student's attitude has repeatedly been recognized to be an essential element in second language acquisition methodology. Learning a second language is a reasonably major educational challenge that students encounter during their high focus in certain situations, while it is a direct path to bilingualism in others. Researchers appear to accept from both situations that "affective factors such as attitudes influence language learning" (Masgoret & Gardner, 2004). According to Karahan (2007), "positive language attitudes allow learners to have a positive perspective toward learning English". A positive attitude is also regarded as assisting foreign language acquisition, whereas a negative attitude works as a psychological obstacle (Dörnyei & Csizér, 2002). Empirical data supporting these hypotheses. Nikolov (2001), for example, discovered that students' unfavourable attitudes against Russia or Russians were to blame for their inability to learn or retain the language. Gardner and Lambert (1972) also show in their vast research that good attitudes about language improve competence. Many studies claim that attitudes are composed of cognitive, emotional, and behavioural components (Wenden, 1991). Beliefs or perceptions about the social phenomena associated with the attitude comprise the cognitive component. The emotional component refers to one's sentiments and emotions about an item, such as 'likes' or 'dislikes,' 'with' or 'against'. Because of the behavioural component, various attitudes tend to drive learners to adopt specific learning behaviours. Rahimi and Hassani (2012) stated that in second language acquisition, researchers have primarily focused on two types of attitudes: attitudes toward language learning and attitudes toward the target language community. The first set of attitudes is educational in nature, whereas the second is more social in nature.

Attitudes toward language acquisition appear to be linked to the environment in which learning occurs (Krashen, 1997). It is fundamental for students to have a strong desire and a good attitude toward the target language when studying a second language. This is since many linguists have revealed that motivation and attitude are inextricably linked in influencing the effectiveness of second language acquisition (Gardner & Lambert, 1972). Language learners who are more motivated and have a good attitude will be more successful, and conversely. According to Brown (2000), favourable views regarding oneself, one's native language, and one's target language group improve second language competency. He says that a good attitude assists a language learner and that a bad attitude can lead to a decline in motivation, input, and interaction, which leads to poor proficiency achievement.

Methodology

Research Design

This research intended to discover the suitability of cultural elements embedded in the textbook. However, to appropriate the applicability of the questionnaire, a study was administered to ensure the validity of the translated version of the questionnaire (Ruel et al., 2015).

Textbook analysis

Content Analysis was employed to study on the cultural elements in the textbooks, where these elements were related to the pupils' perception on learning English. The cultural elements were analysed based on 2 types: (1) Culture Origin: 1) Target culture (UK, US), (2) Source culture (Malaysia), (3) international culture (other than UK, US and Malaysia), and (2) Big C and little c. Big C includes music, literature, Art. (politics, economy, history, literature, geography, science) whereas little c concerns daily routines (food, holiday, living style, values).

Questionnaire

A questionnaire was self-developed and administered for this study. Prior research was carried out to build the questionnaire where the researchers reviewed past studies on the function of cultural learning, types of culture, categories of culture, and learners' cultural implementation in English teaching and learning areas in the past. These concepts were used to develop the questionnaire items. The questionnaire adopted a three-pronged approach, including the development of a 5-point Likert scale answer option, rank order questions and an open-ended response.

The questionnaire consisted of 3 main parts (28 items): Part 1 consists of 20 items investigating students' attitudes towards culture learning and English Plus 1 and their perception about the culture in the textbook. The respondents were required to express their opinions using the rating scale ranging from 5 (Strongly Agree) to 1 (Strongly Disagree). Meanwhile, Part 2 is made up of 5 items related to the importance of cultural aspects which requires the respondents to rank the options according to the degree of their perceived importance. Part 3 contains 3 open-ended questions concerning their expectations on cultural learning in terms of categories of culture and their attitudes towards learning English. They were also required to give reasons and support for their choices.

In order to facilitate better understanding about the questions in the questionnaire, dual language statements (English and Chinese) were provided. All items were first constructed in English and upon receiving approval from the supervisory committee to ensure content validity, the researchers then translated the items into Chinese. The translation was then thoroughly checked by three Chinese English teachers for the purpose of translation and content validity.

Sampling for the Questionnaire

This study employed 39 Year 5 students (M=20; F=19) from a Chinese Primary school at Lawan Kuda as its respondents. Lawan Kuda is a small town in Gopeng, Perak – in the west coast of Malaysia, where the population is mostly made up of a more elderly community where the younger generation have relocated for better working opportunities in the bigger cities (e.g. Kuala Lumpur or Singapore). At present, the main economic activities are farming, plantation and animal husbandry, leaving the only available economic opportunity in small shop lots, food courts and farming.

The respondents can be classified into two different classes of a similar age. 38 of them are Chinese by race where Chinese is their main language spoken at home while one respondent is an Indian who speaks Indian at home. They were selected using a convenience sampling strategy. Their English proficiency was rated as weak to intermediate. In October of 2021, all the students will complete the English Plus 1. Upon selection, the respondents were given a briefing about the questionnaires.

Data Analysis Procedures

Textbook analysis

To answer the first and second research questions, the data from the textbook analysis were categorised into culture free categories, big "C" and little "C" cultures under target, source, and international culture, and further quantified using frequencies and percentages to provide support in answering research questions one and two. Quantitative statistics focused on the amount (percentage and frequency) of cultural material provided in the textbook. The qualitative data in the textbook focused on the kind (categories and types) of cultural material and the variations (themes) of big C and little C cultures.

Questionnaire

To answer the second and third research questions, data from the completed questionnaire was analysed using the Statistical Package for Social Science (SPSS) v.20. To answer both Research Question 2 (*What are the students' perceptions on the use of foreign cultural elements in English Plus 1?*) and Research Question 3 (*How do cultural elements in the textbook affects students' attitudes towards learning English?*), descriptive statistics was used to compute the frequency, average scores and standard deviations. To facilitate data analysis of both Research Question 2 and 3, an interpretation was provided to provide an understanding of the means (Table 1).

Table 1. Interpretation of Means

1.00-1.80	Strongly disagree
1.81 -2.60	Disagree

2.61-3.40	Moderately agree
3.41-4.20	Agree
4.21-5.00	Strongly agree

In addition, the rank order scores on individual items were calculated to determine their relative importance as perceived and expected by students. The data responding to the open-ended questions was also transcribed. Then, the information was analysed and summarized.

Findings

Students' perception towards learning English

The questionnaire enabled an early projection of responses regarding the respondents' perception on learning English. The findings in Table 2 answer the first research question on the students' perception on the use of foreign cultural elements in English Plus 1. As shown in Table 2, the majority of the respondents (95%) specified their preference of learning English. This analysis section is divided into 3 themes: (1) learning English within Malaysian context only, (2) learning English about Malaysia and other countries, and (3) learning English about other countries only.

Table 2. Students' perception on the use of foreign cultural elements and learning English

Items	Students' perception on the use of foreign cultural elements in English Plus 1 and learning English	Strongly disagree (%)	Disagree (%)	Agree (%)	Strongly agree (%)
1	I love learning English.	0	2 (5.1)	20 (51.3)	17 (43.6)
2	I love other subjects more than English.	5 (12.8)	15 (38.5)	15 (38.5)	2 (5.1)
3	I like to learn about Malaysia and Malaysia's culture.	0	4 (2.6)	20 (51.3)	15 (38.5)
4	I like to learn about other countries.	2 (5.1)	2 (5.1)	25 (2.6)	10 (25.6)
5	I like to learn about other countries more than Malaysia and Malaysia's culture.	0	9 (23.1)	20 (51.3)	10 (25.6)
6	I prefer to learn English with content	0	29	5	5

	about Malaysia only.		(74.4)	(12.8)	(12.8)
7	I prefer to learn English with content about other countries only.	12 (30.8)	20 (51.3)	7 (17.9)	0
8	I prefer to learn English with content about Malaysia and other countries.	0	0	30 (76.9)	9 (23.1)
9	I don't understand English lessons when the topic is about Malaysia.	5 (12.8)	30 (76.9)	4 (2.6)	0
10	I don't understand English lessons when the topic is about other countries.	2 (5.1)	7 (17.9)	25 (64.1)	5 (12.8)
11	I understand English lessons better when the topic is about Malaysia only.	0	10 (25.6)	24 (61.5)	5 (12.8)
12	I understand English lessons better when the topic is about other countries only.	7 (17.9)	25 (64.2)	7 (17.9)	0
13	I understand English lessons better when the topic is about Malaysia and other countries.	0	3 (7.7)	29 (74.4)	7 (17.9)

Based on *Item 3*, the majority of the respondents (51.3% agreed and 38.5% strongly agreed) like to learn about Malaysia and its culture and only 4 (2.6%) stating their lack of preference to learn about the country and its culture. Other than that, 61.5% agreed and 12.8% strongly agreed that they understand English lessons better when the topic is about Malaysia only (*Item 11*). Similarly, the bigger percentage indicated their learning English about Malaysia and other countries, where only 7.7% disagreed (*Item 13*). It is also worth noting that all the respondents agreed that they prefer to learn English with content about Malaysia and other countries rather than just learn English with content about Malaysia only (*Item 8*). However, 74.4% did not prefer to learn English with content about Malaysia only (*Item 13*), thus the suggestion of combining both local and international culture in learning English.

Table 3. Mean scores of students' perception

Item	Students' perception	Mean scores	Level of agreement
1	I love learning English.	3.38	Strongly Agree

2	I love other subjects more than English.	2.38	Agree
3	I like to learn about Malaysia and Malaysia's culture.	3.28	Strongly Agree
4	I like to learn about other countries.	3.10	Strongly Agree
6	I prefer to learn English with content about Malaysia only.	2.38	Agree
7	I prefer to learn English with content about other countries only.	1.87	Disagree
8	I prefer to learn English with content about Malaysia and other countries.	3.23	Strongly Agree
9	I don't understand English lessons when the topic is about Malaysia.	1.97	Disagree
10	I don't understand English lessons when the topic is about other countries.	2.85	Agree
11	I understand English lessons better when the topic is about Malaysia only.	2.87	Agree
12	I understand English lessons better when the topic is about other countries only.	2.00	Agree
13	I understand English lessons better when the topic is about Malaysia and other countries.	3.10	Strongly Agree

Table 3 lists down the mean score of the levels of agreement about the perception of cultural contents in English Plus 1. Based on the data from the questionnaire, the results can be divided into 3 themes: (1) learning English within Malaysian context only, (2) learning English about Malaysia and other countries, and (3) learning English about other countries only. It is in Items 3,6 and 11 which concern the learning English within Malaysia context only. Respondents strongly agreed with Item 3 (*I like to learn about Malaysia and Malaysia's culture*) with the mean score of 3.38, that they could relate their preference to learn English when the topic is about Malaysia and its culture. For Item 6 (*I prefer to learn English with content about Malaysia only*), with the mean score of 2.38, students agreed that they prefer to learn English with content about Malaysia only. With a mean score of 2.87, the respondents indicated that they understand English better when the topic is about Malaysia only. Items 4,7,10 and 12 are about learning English in other countries only. Students strongly agree with item 3 that they like to learn about other countries. However, in Item 7 (*I prefer to learn English with content about other countries only*), the respondents disagreed that they prefer to learn English about other countries only. They also agreed that they did not understand the English lesson when it included a discussion on other countries. With the mean score of 2.00, some of the respondents agreed that they understand the English lesson better when the topic is about other countries only (*Item 12*). The theme of learning English about Malaysia and other countries can be found in Item 8 (*I prefer to learn English with content about Malaysia and other countries*) and Item 13 (*I understand English lessons better when the topic is about Malaysia and other countries*) where the respondents strongly agreed that they prefer to learn English with content about Malaysia and other countries.

The respondents also strongly agreed that they understand English lessons better when the topic is about Malaysia and other countries. There was a significant difference between *Items 11,12* and *13*. For *Item 11 (I understand English lessons better when the topic is about Malaysia only)* and *Item 12 (I understand English lessons better when the topic is about other countries only)*, students agreed with the statements there but students strongly agreed with *item 13*. Students strongly agree that they understand English lessons better when the topic is presented by combining Malaysia and other countries. Majority of the respondents prefer to learn English with content about Malaysia and other countries, echoing that they understand English lessons better when the topic combines a discussion on both Malaysia and other countries. This is consistent with Lado (1957), arguing that if a second language's particular components deviate greatly from the learner's original language, learning is liable to incur, which explains for students' better understanding of English lessons when the content that they can easily relate with, which is in this case, cultural relatedness (Haja Mohideen et al., 2020). When students can relate with the content in the textbook, this makes learning easier to grasp which enables a closer engagement with their daily life. In some countries, English is a second language while in others, it is regarded as a third language where students need to learn in school. They are not able to associate with the culturally-embedded vocabulary and the usage of words in the sentences. Thus, it is important to enable students with a linkage of what they learn in the class with their prior knowledge or familiar contextual knowledge since English Plus 1 is a foreign textbook that is used for Malaysian primary Year 5.

Since most of the content in the textbook is not related to Malaysian content, it can be concluded that this type of content has affected students' perception in learning English. As indicated *Item 10* (Table 2), 76.9% did not understand the English lesson when the topic is about other countries, contradicting when the content of the lesson is about Malaysia where 92.3% respondents understand the lesson better. This result is aligned with Johar and Aziz's (2019) study on the usage of foreign textbooks in Malaysia where they concluded that a high percentage that making use of a foreign textbook as the fundamental English textbook might be intimidating due to its substantial cultural content, vocabulary size, layout, and a few other variables to consider. 92.3% of the respondents agreed that they understand English lessons better when the topic is about Malaysia and other countries compared to students that understand the English lesson better when the topic is about Malaysia only with 74.3% of the respondents agreed to it. Students did not want to learn just about Malaysia but they wanted the mix of Malaysia contents and other countries' contents. This finding is, to some extent, consistent with Brown's (2000) that stated the positivity toward oneself, one's native language, and one's target language group improves second language proficiency. Hence, it is important to have native content and target content in one textbook to ensure that students can learn English with what they have learned and at the same time, learn about other cultures.

Students' Attitudes on learning English

In order to investigate the students' attitudes towards learning English when using English Plus, they were asked to answer a section that consists of 10-items, which is divided into two themes. The first theme (*Item 1-6*) elicited responses regarding the importance of learning different cultures from students' perspectives. The

second theme (*Item 7-10*) investigated whether the cultural content in the textbook affects students' attitudes towards learning English. Table 4 shows the findings.

Table 4. Students' attitudes towards learning English

Items	Attitudes	Strongly disagree (%)	Disagree (%)	Agree (%)	Strongly agree (%)
1	It Is very important for me to know Malaysian culture.	0	0	17 (43.6)	22 (56.4)
2	It is very important for me to know the culture of English-speaking countries such as England and America.	5 (12.8)	11 (28.2)	10 (25.6)	13 (33.3)
3	It is very important for me to know the culture of non-English-speaking countries such as Thailand, Japan, Brazil, etc.	10 (25.6)	15 (38.5)	10 (25.6)	4 (10.3)
4	It is very important for me to know about daily living and cultural patterns such as food, holidays, lifestyles, and customs in Malaysia.	0	7 (17.9)	17 (43.6)	15 (38.5)
5	It is very important for me to know about daily living and cultural patterns such as food, holidays, lifestyles and customs in English-speaking countries such as England and America.	6 (15.4)	18 (46.2)	10 (25.6)	5 (12.8)
6	It is very important for me to know about daily living and cultural patterns such as food, holidays, lifestyles and customs in non-English-speaking countries such as Thailand, Japan, Brazil, etc.	9 (23.1)	20 (51.3)	6 (15.4)	4 (10.3)
7	I love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in Malaysia only.	4 (10.3)	14 (35.9)	19 (48.7)	2 (5.1)
8	I love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in English-speaking countries such as England and America only.	5 (12.8)	19 (48.7)	15 (38.5)	0

9	I love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in non-English-speaking countries such as Thailand, Japan, Brazil, etc.	20 (29)	14 (35.9)	5 (7.3)	0
10	I love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in Malaysia and other countries.	0	2 (5.1)	20 (29)	17 (44)

In general, all respondents acknowledged the importance of knowing Malaysian culture. Yet, when it comes to knowing another culture, only 25.6% agreed and 33.3% strongly agreed that it is important to know the culture of English-speaking countries (e.g. the United Kingdom or United States of America) (*Item 1*). Meanwhile, only 35.9% valued the importance of knowing the culture of non-speaking English countries (*Item 7*). Here, we can observe a hierarchical ranking of importance over cultural importance; knowing Malaysian culture is far more significant than others. There is a range of opinions when it comes to knowing about other countries' cultures; some even disagreed. Thus, this reiterates the importance of inserting some Malaysian cultural elements into the textbook so as to motivate learning engagement. It was also indicated in the findings that 48.7% strongly disagreed (*Item 8*) that they love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in English-speaking countries such as England and America only. This indicated dissociation between learners' familiar culture to those that they can make connection with. 43.6% disagreed with participating in the activities during English lessons when the topic is about English-speaking countries only (*Item 4*). Only one student agreed with the statement that they like to participate in English learning activities when the topic is about non-English speaking countries.

Table 5. Mean scores of students' attitudes

Items	Students' attitudes	Mean scores	Level of agreement
1	It Is very important for me to know Malaysian culture.	3.56	Strongly Agree
2	It is very important for me to know the culture of English-speaking countries such as England and America.	2.79	Agree
3	It is very important for me to know the culture of non-English-speaking countries such as Thailand, Japan, Brazil, etc.	2.21	Agree
4	It is very important for me to know about daily living and cultural	3.21	Strongly

	patterns such as food, holidays, lifestyles, and customs in Malaysia.		Agree
5	It is very important for me to know about daily living and cultural patterns such as food, holidays, lifestyles and customs in English-speaking countries such as England and America.	2.36	Agree
6	It is very important for me to know about daily living and cultural patterns such as food, holidays, lifestyles and customs in non-English-speaking countries such as Thailand, Japan, Brazil, etc.	2.13	Agree
7	I love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in Malaysia only.	2.49	Agree
8	I love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in English-speaking countries such as England and America only.	2.26	Agree
9	I love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in non-English-speaking countries such as Thailand, Japan, Brazil, etc.	1.62	Disagree
10	I love to learn English when the topic is about daily living and cultural patterns such as food, holidays, lifestyles, and customs in Malaysia and other countries.	3.38	Strongly Agree

Table 5 displays the mean score for the levels of agreement about students' attitudes towards learning English. Items 1, 4 and 7 identified respondents' attitudes towards learning English when the topic of lesson is about Malaysian culture. With the mean score range from 3.56 (*Item 1*) to 2.49 (Table 7), responses from the participants indicated good on those statements asking about Malaysian culture in the English lesson. The participants agreed that it is important for them to know about Malaysian cultures through English lessons. They also agreed that they love to learn English when the topic is about daily living, cultural patterns and customs in Malaysia. Items 2, 5 and 8 discussed the participants' attitudes about the Target culture elements in the textbook towards their English learning. The participants agreed for all the 3 items with mean scores ranging from 2.26 to 2.79. Items 3, 6 and 9 discussed International Culture. The participants agreed with Items 3 and 6 that it is important to learn about International Culture. However, students disagreed with the statements that they love to learn English when the topic is about International Culture. Students strongly agree with the mean score of 3.38 that they love to learn English when the topic has the integration about Malaysian and other countries. This finding implies consistency with those of Brown's (2000) on attitudes towards learning English and the cultural content in the textbook.

Brown (2000) asserts that positive attitudes about oneself, his native language, and his target language group promote second language ability. Students feel motivated to participate in learning English when they feel confident and know about the topic. Since students are more familiar with the Malaysian context where they have prior knowledge about the topic, this will likely boost their confidence to engage in the lesson. This is supported by the statement from *Item 10* (that asks the students whether they like to learn English using English Plus 1 in the class. 77.9% of the respondents did not like to use English Plus 1 to learn English. Some of the responses received stated that they cannot relate the topic that discusses other countries with their prior knowledge. This might probably be because the participants believe that it is challenging to understand the meaning of the sentences and at the same time, they need to imagine the settings of the topic. These factors affect students' attitude towards learning English. Obviously, cultural elements in foreign textbooks affect students' attitude towards learning English. This supports the arguments that native elements and foreign elements should blend in a textbook. A good textbook cannot be solely presented in foreign cultural elements only or in native culture only.

The textbook must be presented with the combination of different cultures. Students feel comfortable to learn something that they are familiar with but at the same time they also want to learn new things and cultures they have never experienced before. The data from both textbook analysis and questionnaire responses may lead to the conclusion that somehow the target culture was the primary concern of cultural teaching and learning, while the source culture and foreign culture got only a little fraction of events. Despite their belief that target culture has been the most significant element for their English subject, this group of students showed a desire to learn regarding source culture in the English classroom. It has become worth mentioning that 100 percent of survey respondents said Malaysian culture (source culture) was highly important in their Language classroom. Students also expressed a desire to actually learn about Malaysian culture and expressed a willingness to do so in the English classroom. This confirmed the results of Zhang and Ma (2004), who revealed that more than 50% of local students favoured having cross culture in instructional materials, encompassing source and foreign culture, rather than only target culture.

Findings from the present study contradicts arguments forwarded by Crystal (1997) and McKay (2002), declaring that ESL learning should be altered and foreign culture should play a larger role in promoting students' International Communicative Competence (ICC). In the current era of globalization, English has become one of the worldwide languages due to political, economic, military, scientific, technical, and cultural connections with all nations across the globe Crystal (1997). In this modern global trend, English has been changed into a variety of Englishes, which play a significantly higher role in communications between non-native English speakers than native speakers in terms of frequency, quantity, and importance. According to McKay (2002), the relevance of cultural classroom instruction is to help students to appreciate the variety that abounds within all cultures, especially in this globalised day where tourism and migration are far more common than in the past. Consequently, Hatoss (2004) states that one of the specifications of intercultural communicative competence is that language learners develop a conscience of their own cultural context in an attempt to see it as a benchmark for acknowledging the paramount perspectives of target language speakers. According to student rebuttals, this

group of students is unfamiliar with their own cultural identity, but they recognise the crucial function that source culture helps in creating comprehensible input. Unfortunately, the results of the textbook evaluation and the students' questionnaire replies indicate that the textbook may not meet students' requirements in terms of source culture elements, since the textbook only contains 3.1 percent of source cultural components. According to Hatoss (2004), a major worry with language textbooks is that students are expected to characterise cultural distinctions with no intentional effort on the part of teachers to motivate them to recognise their cultural knowledge or improve their view of their own culture. One of the prerequisites for dealing with cultural material in a foreign language classroom is emphasised by McKay (2002). She emphasised the need of tailoring educational materials to help students to consider their own culture in relation to others, so supporting them in establishing a sense of intercultural conversation. One advantage of this notion is that it may induce cultural content in teaching materials to emphasise students' source culture, as well as the target culture and globalized society, in promoting the awareness of intercultural competence.

How doable would it be to discover source culture contents in foreign language textbooks, given that commercial textbooks are frequently written for global markets and frequently do not portray the desires and concerns of students in a specific country or area (Richards, 2001), particularly when it comes to cultural contents? One of the long-term goals of a commercial textbook is to be widely relevant in order to gain a good retail coverage rate. Through this general framework, a commercial textbook is unavoidably heavy on Target culture and potentially competent at showing worldwide cultures, but it is usually hard to provide a typical source culture specifically suited for one country. As a result, it stands to reason that locally-created textbooks authored by Malaysian educators should include more source cultural information than commercial textbooks published by English native speakers. We might also assume that one of the benefits of locally produced English textbooks is the exposure of source cultural materials. Because such textbooks, unlike commercial textbooks, may provide the source cultural materials more genuine and relevant for local learners. It is not to argue that local textbooks should be developed with all source cultures in mind while neglecting other sorts of culture. It is just to suggest that locally created textbooks may have advantages in terms of assisting English learners in learning how to speak about their source culture in English while studying language skills and the target culture. Up to this point, the target textbook discusses the cultures of big "C" and small "c," but given the respondents' need for additional cultural information, this may not be sufficient. Furthermore, given the strong linkages between small "c" culture and English fluency the focus on big "C" culture in English Plus 1 may need to be reassessed and acknowledged in order to develop students' interpersonal communication awareness.

Conclusion and Recommendations

This research analysed a English Plus 1 primary Year 5 textbook in Malaysia to see what type of culture were covered in terms of target, source, and foreign cultures, as well as what sorts of culture were emphasized on in terms of big "C" and small "c" cultures. The target cultural contents were found to have a much greater frequency than the source culture and foreign culture. Based on the much greater proportion of target culture, it

is clear that the structuring of cultural materials is primarily aimed to improve students' awareness of the cultures of English-speaking nations. One of the 16 themes, "Holiday," for example, was observed by providing subjects such as summer vacation, Christmas holiday and winter break. The research also discovered that a preference for big "C" culture comprised education, social norms, history, and geography. There was a low proportion of cultural material with the small "c." It is possible to deduce that such limited provision of discussion on small "c" culture may be inadequate for the students to attain the goal of foreign language proficiency. The research's second goal is to examine students' perceptions of cultural elements stated in the textbook. The students were mostly in agreement that the culture of English-speaking nations was the central topic of English Plus 1. Meanwhile, they disputed that the emphasis in English Plus 1 was mostly on Malaysian culture and that of non-English-speaking nations. In terms of students' attitudes on the significance of culture and cultural and English learning, the findings revealed that the majority of students were eager to study both target and source cultures. As per the students' reasons, they viewed target cultural learning to be the most valuable part of their English, whereas source cultural learning was advantageous for them to understand Malaysian culture, allowing them to present Malaysia to foreigners in an intercultural competence context. Unfortunately, the majority of students were uninterested in learning about other people's cultures. In other words, the students did not regard foreign culture as an important component of their English subject.

The outcomes of this research may provide useful information for language classroom teaching and learning, as well as for producing instructional materials. The present study's results reveal students' preferences for both target and source cultures. However, the activity in the textbook contains just a limited amount of Malaysian culture. International authors of instructional materials should consider including cultural variety in textbooks as a way to address current lack of learning engagement, as those experienced by Malaysian students. At the same time, local textbook publishers should feel compelled at expediting Malaysian English learners' skills to express Malaysian culture by including more local cultural knowledge in textbooks. Furthermore, textbooks should give guidelines and explanatory explanations to teachers on how to impart cultural topics. As a consequence, instructors will be more conscious of the importance of cultural materials, and students will be introduced to the cultural information communicated by this affidavit. Because there was a limited percentage present in small "c" culture, writers of course resources should re-evaluate the proportion and mix of kinds of culture, with a focus on building students' language competence. In terms of topics, it was assumed that textbook writers should pay more attention to subject areas such as values, norms, holidays, gestures/body language in order to improve students' social skills, such as sociolinguistic competence and thinking skills. Special attention should be paid to the teachers' teaching approaches in order to impart cultural information to their students, as well as assist students in analysing and eliminating any barriers to cultural learning. It is critical that teachers make an extra effort to motivate pupils to learn about and become more aware of their own culture. As a result, the students are able to acquire a self-awareness of their own culture, allowing them to utilize the source culture as a basis for evaluating the contrasts and variety that exist within all cultures.

The current research looked at the English Plus 1 Year 5 English Textbook for primary Year 5 students in Perak, Malaysia. Even though research revealed some findings about the cultural contents of the big "C" and small "C"

under focus, as well as source and international culture, the conclusions on cultural orientation were based on just one textbook. To acquire a better and more complete perspective, a whole sequence of English textbooks from Year 1 to Year 6 should be explored to get a better picture of the English education journey for primary school in Malaysia. Other varieties of textbooks, such as local textbooks and commercial textbooks, should also be evaluated. In terms of cultural categories and types, it would be useful to study the cultural contents offered in commercial textbooks and local textbooks. The findings might be useful in the field of textbook editing for cultural teaching and learning. Another topic of research is the content of textbooks from the perspectives of cultural, context, and linguistics. It is argued that regardless of whether textbooks are developed to allow students to use the language in real-life situations, students must also comprehend the difference between language, context, and culture, as well as function with and delve deeper through some of the elements of setting that play a role in situations of language use (Kramersch 1993).

As this study targets a specific Year 5 primary kids from one school in Perak, Malaysia, it is hard to generalise or make inferences about comparable attitudes and perceptions across other Malaysian Year 5 primary students. The questionnaire answers may give restrained and constrained recommendations from such a tiny group. Thus, it would be beneficial to do a comparable study with a bigger number of subjects from different levels of students to see if students with different levels of English proficiency have different attitudes and views about culture learning and cultural materials in textbooks.

Abstract: This article discusses some features of online learning in a personality-oriented aspect in the system of formation of Kazakh patriotism of adolescents on the basis of national values within the scientific project "Scientific and methodological foundations for the formation of Kazakh patriotism among adolescents on the basis of national values", funded by the Abai Kazakh National Pedagogical University since the beginning of 2022. A new understanding of the main scientific categories (learning activities, learning environment, learning tasks) in the conditions of modern technologized education is clarified. The diagnostic tool included one questionnaire, developed by the research team to identify the degree of awareness, personal attitude of teaching staff to the problem of patriotic education of young students and, accordingly, the level of quality of work to develop the desired personal characteristic in them. The author's questionnaire "Ideas about Kazakh patriotism" was validated by a specialist. The sample consisted of 106 respondents in random order, regardless of the age and pedagogical experience of the participants, as well as the academic disciplines taught. Of the presented 15 questions of the questionnaire (1, 5, 6, 7, 8, 9, 10, 11, 13, 14, 15) when rounded gave a value of 0.7 (Cronbach's Alpha: 660927 and Standardized. Alpha: 669767), which corresponds to the required norm and confirms the validity and reliability. The result of the study is also the highlighted relationship of patriotism with the formed

level of spiritual and moral culture and social experience of the individual, underlying civic behavior. Highlighted as a result of observation, as an initial method of empirical knowledge, psycho-pedagogical, methodological features of e-Learning at present will allow teachers and students to adjust their activities in time to achieve their goals in the system of learning the formation of Kazakhstan patriotism based on national values.

Key words: modern conditions of learning, person-centered learning, technologization of education, distance learning, e-Learning, youth education, national values, patriotic education, Kazakhstani patriotism of teenagers.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 769-778), Cappadocia, Turkiye. ISTES Organization.

Introduction

Modern society is dynamically developing, constantly involving the man himself in its mechanisms, placing new demands on him. At the present stage of development of modern Kazakhstan, the problem of patriotic education of teenagers is one of the priorities, since the development of the nation and the state as a whole depends on the level and nature of civic position and civic consciousness of the younger generation. Patriotic education, as a complex purposeful process of forming a high sense of patriotism, patriotic consciousness, a sense of loyalty to their homeland, its historical heritage, as well as a willingness to perform civic duty, is currently an important internal mobilizing resource for the development of society, the active civic position of the individual.

Today, for our society, patriotic education is one of the main tasks, as there is an alienation of young people from the national culture, the fall of spiritual and moral values, the loss of patriotism as one of the spiritual values of our people. Therefore, in the conditions of the modern system of education "patriotic education should become the main idea, such a core, within the framework of which high, socially significant feelings, principles, values and aspirations of the younger generation are formed" (Bakhtin, 2014). Besides, formation of patriotism, in our opinion, assumes purposeful education and consecutive development of a whole complex of positive personal qualities of the modern teenager.

The very system of the formation of Kazakh patriotism is a systematic and purposeful activity of public authorities, social institutions, including the family, to educate citizens with high patriotic consciousness, a sense of loyalty to their homeland, culture and language.

The formation of patriotism, on the one hand, is aimed at fostering such values as people, family, social

equality, justice, health, life, but at the same time is completely based on the same values.

As we know, the purpose of patriotic education is to educate a person's patriotic consciousness and behavior, which are based on universal moral and ethical values and principles of the people. We believe that it is on the basis of national values and possible formation of the Kazakh patriotism of a modern citizen, that is, a teenager. The relevance of the problem of scientific research is due to the general state of development of the issue of patriotism in the domestic and foreign scientific space and the very degree of importance of Kazakhstan patriotism for a full harmonious life of citizens in the modern world. It is well known that the main priority of the national ideology of Kazakhstan is to promote the state power to pursue a policy of implementation of the main strategic constitutional task - "to assert itself as a democratic, secular, legal and social state, the highest values of which are the person, his life rights and freedoms" (Akorda).

Kazakh patriotism as an actual problem of formation of a full healthy personality of a citizen is considered by us in the aspect of national values. In this regard, we initiated a focused comprehensive study of Kazakh patriotism of adolescents in the framework of the scientific project "Scientific and methodological foundations for the formation of Kazakh patriotism among adolescents on the basis of national values", funded by the Abai Kazakh National Pedagogical University since the beginning of 2022. This publication presents the results of the theoretical part of the study, as the initial stage is assumed, first of all, a scientific-theoretical justification of the relevance of the research problem.

It is well known that in modern scientific education in recent years more and more attention is paid to the connection between knowledge and issues of social importance. In world practice, social-science problems (SSI) - complex, often controversial issues related to the development of science and technology, the development of society as a whole - are widely recognized as an important area of the educational program, contributing to the academic and scientific literacy of students. For example, scholars L.Chen and S.Xiao have identified that today's educators partially understand the principles of teaching based on sociological problems; they lack clear strategies for dealing with various problems; and collaboration among stakeholders is necessary to support pedagogical practice (Chen et al, 2021). Therefore, these identified facts are very important to consider, especially for educational policy makers and professionals, also educators at all levels of the education system facing collaborative learning SSI.

The process of technologization of modern education also becomes relevant, which leads to an increase in patriotic feelings of students in the new IT realities. At the same time, a special role in this process is played by innovations - technologies, methods, new forms and methods of independent work, focused on independence and creativity (Knissarina et al, 2018). Thus, in foreign scientific literature the concept of "Technology-Enhanced Learning" (TEL), which means in translation "technologized learning", is increasingly used. And, according to H. Beetham, R. Sharp, technology-enhanced learning is learning with technology, including information and communication technology (ICT), virtual reality, the Internet, mobile technology, etc. (Beetham, et al, 2019). The design of active learning in technology-enhanced contexts depends on learning

activity theory to inform the development of a model of technology-enhanced learning design practice.

Therefore, the purpose of this research work is to highlight the features of e-Learning implementation in a personality-oriented aspect in the system of formation of Kazakh patriotism of adolescents on the basis of national values.

Literature review

A scientific-theoretical analysis of the literature showed the existence of several theoretical and methodological approaches to defining the concepts of "patriotism" and "Kazakh patriotism".

In the definition of the concept "Kazakh patriotism" we cite the opinion of B. Abdygaliev "Kazakh patriotism, which can be formed on the basis of respect for the state, respect for the history, traditions, culture and language of the Kazakh ethnos itself, should be at the heart of Kazakh patriotism in the opinion of Kazakh researchers" (Abdygaliev).

Thus, in the State program on patriotic education of citizens of Kazakhstan for 2006-2008 "Kazakh patriotism" is defined as the conscious responsibility of each citizen for the fate, security, and future of his homeland (Program, 2006). Within the framework of this concept only a person brought up in the spirit of patriotism can build a healthy society and a strong state. Therefore, it must be a unique individual, ready to contribute to the building of a state of law and civil society.

The very notion of patriotism (from the Greek *Pathis* - fatherland) means a moral and political principle inherent in a citizen. Therefore, the formation of patriotism should be based on the heroic history of its own people, contributing not only to the moral development of the individual, but also to the formation of citizenship. Reliance on the traditions and achievements of our ancestors creates effective conditions for the development of the nation into the future, and in this process the role of education as the main tool for educating the next generation is great.

It is known that many famous scientists, outstanding teachers, talented writers, philosophers and publicists in their works paid special attention to patriotic education. The theme of patriotism is found in the works of Abai Kunanbaev, Mukhtar Auezov, Ibray Altynsarin, Chokan Valikhanov and many other Kazakh figures. According to the philosopher Abay Kunanbayev, true patriotism is a trinity of such factors as faith in one's people combined with fearlessness, love for one's people accompanied by real sympathy and compassion for their actions, and real practical assistance to their people. Mukhtar Auezov says the following: "Soviet patriotism is a deep thoughtful work for all peoples of their homeland, for all future generations, for fathers, for mothers" (Auezov, 1995).

M.Kozybayev has grounded his views on the role of historical science in formation of civil patriotism in

connection with formation of national idea: "As national idea which should provide normal functioning of society, the idea of strengthening of civil peace and international consent, the idea of national and all-national, all-Kazakhstan patriotism was put forward. Comprehensively emphasizing the idea of national patriotism, in our opinion, it is necessary to investigate the sources of Kazakh national patriotism, which has become an integral part of the mentality of the people. We especially emphasize this aspect because the Kazakh people have a special responsibility in the formation of pan-Kazakh patriotism, the nationwide idea of strengthening civil peace and interethnic harmony" (Kozybayev, 2000).

And according to a domestic scientist, "Patriotic education is aimed at the formation and development of a personality with the qualities of a citizen and patriot and capable of successfully performing civic duties in peacetime and wartime" (Nurligenova, 2017).

A huge contribution to patriotic education was made by Nursultan Abishevich Nazarbayev, the first President of the Republic of Kazakhstan: "Kazakhstan began the third twelve years of Independence with a great spiritual modernization. Within the framework of my program article large-scale work has begun in all regions of the country. One of the important projects being implemented on the basis of the «Рухани жаңғыру» — «Туған жер». The land on which a person was born will always be in his heart. We are all proud of our native land, miss it and take care of it. Love for the native land continues in love for the homeland, care for the native land - in care for the homeland", - said the head of state (Nazarbayev, 2017).

The specificity of our research is caused, first of all, by the necessity of studying the formation of Kazakhstan patriotism among teenagers on the basis of national values from the integrative point of view at the interface of philosophy, culturology, history, sociology, psychology and pedagogy.

Methods

As it is known, pedagogy is a powerful influence on human education, so pedagogy should actively use in practice the education of patriotism. Since the object of our study is to highlight the features of e-Learning in a personality-oriented aspect in the system of formation of Kazakhstani patriotism among teenagers, it is necessary to clarify the meaning and content of the very concept of e-Learning. So, in recent years, one of the developing educational technologies is distance learning, fully based on information and communication technologies. The ability to gather a learning audience at a distance despite spatial and temporal boundaries is undoubtedly the main advantage of distance learning.

In contrast to distance learning, e-Learning or online learning, which implies a direct connection between the learner and the teacher using modern Internet technologies, has become very popular and even necessary.

According to the definition given by the specialists of UNESCO, e-Learning is learning with the help of the

Internet and multimedia. This means that students participate in online lectures, online classes (SPL, SROP), online seminars, i.e. all interaction with the university and teachers takes place in "online" mode, via the Internet. And e-Learning classes are defined as "the process of learning interaction in real time (video conferencing, by means of Internet messaging, negotiations by telephone)" (Academic Policy, 2020).

Particular attention should be paid to the processes of education and pedagogy as a means of personal formation. The tool which we had to test included one questionnaire which purpose is revealing of degree of awareness, personal attitude to a problem of Kazakhstan patriotism at teenagers and accordingly level of quality of work on development of the searched personal characteristic at them. The questionnaire "The ideas about Kazakh patriotism" for the pedagogical staff of the local schools was specially developed by the research group in the Kazakh and Russian languages in the framework of the ongoing research project in 2022.

The author's questionnaire "Representations of Kazakhstan patriotism" was validated and tested for reliability. A total of 106 respondents from among the teachers of different schools in the city of Almaty were questioned with the help of the online service Google Forms. The results of data of following questions out of submitted 15 questions of questionnaire (1, 5, 6, 7, 8, 9, 10, 11, 13, 14,15) when rounded gave the value of Alpha Cronbach's - 0.7 (Alpha Cronbach's: 660927 and Standardized Alpha: 669767), which corresponds to required norm.

To the question "What forms of classes are most effective in acquiring knowledge?" the following answers were offered: a) lectures; b) conversations; c) business games; d) discussions; e) others. What is distinctive, only a small number of respondents in the option "other" indicated types and forms of training in online form as the most effective. From this we made the relevant conclusion that our teachers are not yet aware of the value and benefits of e-Learning. Perhaps many educators haven't had time to take advantage of and try out interactive types of work online? Or at an insufficient level of awareness of the available possibilities of Internet applications and e-Learning in general, i.e. it indicates a low level of competence and skills of teachers in the field of IT technologies. For the 14th question on determining the "leading factors affecting the successful formation and development of Kazakhstani patriotism in teenagers" out of 100% of respondents chose: 54% - "the content of the educational process"; 27% - "the nature of educational work in school and family"; 10% - "inner psychological characteristics of personality"; 8% - "specificity of leisure and cultural activities". We believe that the preferences of respondents in the choice of the dominant factor are quite predictable and justified, because the final expected learning outcomes depend on the educational content, which is the essence and specificity of the learning process.

To the question "Who is the main role in the formation and development of Kazakhstani patriotism in adolescents?" the following was determined: 49% of respondents chose "family"; 28% of respondents gave their votes to "teachers"; 12% - to "school management"; 11% - to "the learner himself". These results demonstrate the liberal attitude of respondents-teachers towards the very process of developing Kazakhstani patriotism in adolescents, as they believe that the main role in this belongs to the family, the style and examples of upbringing, values and traditions.

Results and Discussion

Analysis of the obtained data leads us to the idea that, in general, teachers are quite aware of the issue of shaping Kazakhstani patriotism in adolescents, are competent enough in choosing effective methods and forms of developing the studied personality quality, but they lack specific knowledge and clear guidelines for purposeful professional Kazakhstani patriotism in adolescents. Therefore, we will agree with the results of the study of his foreign colleague that educators have a common understanding of "Kazakhstani patriotism": "they felt that they were prepared for this role through meetings on a special curriculum, were not properly prepared for their role..." (Roofe, 2018).

In the educational process of pedagogical interest is also the relationship of "Kazakh patriotism" with national values, with the formed cultural and social experience of the individual, whose direct connection is obvious.

Undoubtedly, the logical consequence of the intensive development of digital technologies in all spheres of activity is the growing interest of researchers in the construction of digital citizenship (DC) in various disciplinary areas. We believe that it is necessary to expand the subject areas of study and application of e-Learning tools in order to obtain the necessary information and knowledge in the study of various scientific problematic issues.

What features of online learning have we already noticed and highlighted for ourselves? The results of the observation of teachers during the learning process in the "e-learning" mode during the quarantine associated with the pandemic 2020-2021: the lack of taking into account the work of regulation and evaluation of teachers of E-Learning, lack of understanding of the role of a teacher in the E-Learning environment, insufficient level of educational competence of teachers when implementing distance learning, not provided with the necessary ICT resources, etc.

Considering the problem of teachers' clarification in e-Learning, it should be noted that many teachers perceived E-Learning as a process of transferring electronic learning materials through the Internet. However, without this misperception, as learners need guidance from educators, as "pedagogy places the responsibility on the teacher to guide the learner toward a specific and productive goal" (Beetham, et al, 2019). Thus, e-Learning distance learning at our university is defined as "the process of interactive interaction of learning participants with each other and with the learning environment through a variety of multimedia technologies (Academic Policy, 2020). The main psychological feature of online learning in the technologized format of learning activities is the content of education itself. In this regard, only the learning activities of students and the results of their activities are important for the whole educational process (Kalinin, 2015). The need to choose an effective design of active learning in the person-centered aspect of modern education has emerged, because now there is an intensive technologization of the educational process (ICT, distance learning, virtual reality, Internet, mobile technologies, etc.). We clarified the very concept of "learning activity" in the aspect of its technologization - "concrete interaction of learners with other people through special tools and resources focused on specific

results" (Beetham et al, 2019). And we also defined important concepts such as "learning environment" - "features of the physical and virtual environment, tool resources and products given in context" and "learning tasks" - "intended outcomes of activities derived from the context" (Beetham et al, 2019).

It should be noted as a psychological feature of modern learning under the conditions of its technologization the categorical characteristic of the design of learning outcomes approved by the Bologna Process as the "basic building blocks" of higher education in the European Community (Gholson et al, 2006). Because the huge variety of knowledge, concepts, values, activities require that the available digital capabilities are properly framed in learning outcomes. And the analysis of foreign scholars has shown that all digital technologies are sufficient to achieve outcomes that do not imply a right/wrong solution.

According to foreign scholars (Laurie E.C.Delnoij, Kim J.H.Dirx, José P.W.Janssen, Rob L.Martens), incomplete higher education is a persistent problem in higher online education. The results of their study showed that learning strategies, academic self-efficacy, academic goals and objectives, institutional adjustment, employment, a supportive network, and faculty-student interaction are modifiable consistent predictors of incompleteness. And coaching, therapeutic teaching, and peer mentoring are ways to address incomplete higher education (Delnoij et al, 2020). Therefore, our primary concern as school educators is to bring the learning process itself to its logical conclusion, regardless of the accompanying educational or social goals.

Highlighting the features of online learning in the aspect of personality-centered approach in the context of systemic work on the formation of Kazakhstani patriotism in adolescents is due, above all, the need to achieve improvement in the quality of educational services.

Conclusions

So, the first important feature of e-Learning in the aspect of personality-centered approach in the system of Kazakh patriotism in teenagers is related to the ability to choose the right way to distinguish learners from each other in learning: subject experience, knowledge and competence of learners; learning motives and expectations of learners; previous learning experience; social and interpersonal skills; digital and informational literacy of learners, etc.

The next important feature is related to the efficiency of distribution of learners. Nowadays, blended learning, which is characterized by a combination of person-oriented and group types of learning, private learning and cooperative learning, is becoming relevant.

Thus, actively used by our teachers extracurricular learning technologies are based on a wide range of educational interaction between the teacher and students: various voice systems, interactive online applications, video conferencing, chat rooms, etc.

The peculiarities of e-Learning are the effective combination of the main components of E-Learning in the educational process. The first one includes the selection and configuration of LMS (Learning Management System), which allows teachers to place educational content for the whole learning process, such as video instructions, video lectures, tests, text and presentation materials, useful links to external resources, etc. The second component is the direct interactive interaction of the subjects of training in online mode, first of all, video-conference classes (practical and lecture classes) on various platforms (Zoom, Skype, Microsoft Teams, Webex, Google meet, YouTube, etc.). I would like to note that thanks to all these tools e-Learning teachers and students have had the opportunity to manifest and develop not only their intellectual and creative abilities, but also patriotic feelings as a personal characteristic, in online classes through extensive use of all kinds of Internet applications and IT-technologies.

We believe that despite the ambiguity of understanding and acceptance of e-Learning in modern education, the learning format itself contributes to the holistic personal development of all participants in the educational process. Thus, the features of e-Learning in the personality-oriented aspect in the system of formation of Kazakhstani patriotism in teenagers require individualization, clear definition of labor intensity of learning tasks by time and content, effective selection of learning content and specification of a clear plan and scenario of each training session.

Abstract: The use of Mobile-Assisted Language Learning (MALL) in teaching, especially in English as a Second Language (ESL) has become an emerging trend globally. In recent years, many educators have started to deliver lessons online using the concepts of MALL, including those in Malaysia, especially during pandemic Covid-19. Writing is an important skill in English language acquisition but the review of using MALL in teaching writing is scarce. Hence, this review focuses on teachers' perspectives and readiness toward the use of MALL in teaching writing among English as a Second Language (ESL) learners. Therefore, Preferred Reporting Items for Systematic Review and Meta-Analyses (PRISMA) guidelines was used to extract 30 articles from the year ranging 2018 to 2022. Two databases, Google Scholar and Educational Resources Information Centre (ERIC), were used to collate the articles for this review. The findings of this review exhibited the positive perspectives and readiness among the teachers towards the use of MALL. Parents' perspectives should be taken into consideration in future research.

Keywords: MALL, teachers' perspectives, teachers' readiness, teaching writing in ESL

Citation: Md Yunus, M., Mohd Nadzrin, N.A., Lim Fu Chien, G. & M. Rafiq, K.R. (2023). MALL & Teaching Writing in ESL: What do Teachers Say. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 779-795), Cappadocia, Turkiye. ISTES Organization.

Introduction

Mobile assisted language learning (MALL) is a new and favoured way amongst mobile learning approaches in English Language Teaching (ELT) throughout the whole world. Rafiq, Hashim & Yunus (2021) states that findings in MALL regarding ELT are not much, in either English as a Second Language (ESL) or English as a

Foreign Language (EFL). Despite the use of mobile learning has started to become a trend in education globally, many researchers found that the teachers who know educational mobile applications efficiently are scarce, especially in the under-development countries (Hussain, Mkpojiogu & Babalola, 2020). When the skills and knowledge in mobile learning environments are taken into account, it can be said that teachers, especially those pre-service or novice ones, should have the necessary skills and competence in technological knowledge (Ristić & Mandić, 2018). There are a lot of courses taught in theory but not practically. Most of the English teachers from under-developed countries experienced the same fate, not enough exposure to technical knowledge as well as using applications in lessons (AAI, 2015). Hence, teachers are not competent in using mobile learning although it is slowly becoming a trend now and in the future.

In Malaysia, which is one of the developing countries, mobile learning has just started its journey in the education system, especially during the pandemic Covid-19. With the applications and platforms available in mobile devices such as Google Classroom platform, Google Meet, Zoom App, Youtube, Quizizz, WhatsApp, Telegram, and Kahoot, it is conducive for the pupils to continue learning at home effectively despite certain constraints (Abd Samad, Ihsan & Khalid, 2021). Therefore, the incompetence of teachers in using mobile learning as mentioned in the previous paragraph will affect their readiness in implementing it in the teaching and learning process. It is important to study the teachers' readiness and perspectives to use mobile learning in their teaching especially when blended approach or flipped classroom is applied. Teachers' attitudes on the integration of technology and its value to help students' language acquisition do have a positive effect on the application of the real technology in the classroom (Khlaif, 2017).

English as a Second Language (ESL), or also known as English as a Foreign Language (EFL) in certain countries, aims to improve pupils' English proficiency in four main skills namely listening, speaking, reading and writing. ESL teachers create and carry out various teaching and learning activities for the pupils to help them for their English language acquisition. ESL should allow non-English speaking pupils to gain long-term personal, social and academic success in learning English (Aynur & Nuriyya, 2018). The Common European Framework of Reference (CEFR) has become the main reference of ESL classrooms in a lot of countries. It was widely introduced in Malaysia in 2013 to improve English language users and to create consistency in both educational and cultural matters by providing a general framework on the English proficiency level of the language users (Nawai & Said, 2020).

The purpose of this review is to analyse and synthesise empirical research on the application of MALL in teaching writing skills among ESL learners from the past five years. Since there were many articles and reviews conducted in identifying the effectiveness of MALL in language skills from the students' perspectives but there is still a gap to be filled from the teachers' perspectives especially in teaching writing skills. Thus, two research questions were derived from the focus of this review.

RQ1: What are the perspectives of teachers towards using MALL in teaching writing amongst ESL learners?

RQ2: How are the teachers' readiness towards using MALL in teaching writing amongst ESL learners?

Teachers and Teaching Writing in ESL

Writing can be defined as a way that allows pupils to communicate by sharing their ideas and feelings via a linear or non-linear text. In addition, writing can be said to be an important skill not only in the classroom, but also in daily life. In addition, acquiring writing skill does not only help students to excel in tests but also encourages them to be ready for the future and the global economy (Lim, 2013). Therefore, by mastering writing skill, it grants a lifelong holistic gain for the learners (Morthy & Aziz, 2020).

Common writing issues among Malaysian ESL learners include lack of vocabulary, tendency to translate directly from their mother tongue, incompetency in acquiring spellings that eventually leads to poor sentence structure and grammatical errors. Ghulamuddin et al. (2021) has agreed that most Malay primary school students encountered writing difficulties due to poor mastery in vocabulary, inability to spell words correctly and L1 interference. Siddek & Ismail (2021) also supported the issue regarding interferences of L1 among primary ESL learners that hinders their cognitive ability to organise and structuring the ideas in sentences. Lack of exposure to English language and interference of mother tongue contributed greatly to constant error-making in both sentence structure and grammatical aspects of writing. Harun and Abdullah (2020) evidently posited the influence of interlingual and intralingual causes the pupils to make a lot of errors in their writing. All these factors may affect ESL learners' motivation and interest towards acquiring basic writing skills.

When the teachers are unable to apply the suitable way of giving lessons, pupils' interest in language acquisition are at a minimum level which shows that the teachers did not manage to provide a suitable environment to motivate them. Later on, it might cause language learning to not take place effectively, especially in writing skills (Morthy & Aziz, 2020). The teaching method that is conducted by the educators does not aid in providing a happy and meaningful learning environment (Li & Yee, 2017). Fun teaching and learning ways that cater the students' learning styles should be practised by hoping to increase their motivation in mastering the language they want to learn (Li & Razali, 2019). Hence, mobile learning can be a fun tool that includes happy and meaningful language games that immerse pupils into a healthier thinking process (Hussain et al., 2020). Therefore, it is vital that the level of teachers' competency in the use of mobile learning tools are up to par in order to aid pupils who are facing difficulties in enhancing their writing skills. In order to achieve the objective, it is pertinent to ensure that teachers are fully ready and equipped with sufficient knowledge to navigate through and apply the use of mobile learning in teaching writing.

Teachers and M-Learning from Information and Communication Technology

The use of ICT in ESL classrooms are helping not only the pupils in learning, but also the teachers in teaching. Fučeková & Metruk (2018) stated that Information and Communication Technology (ICT) can be an effective tool in aiding learning English and also within formal teaching practice. With the integration of the m-learning approach, teachers are able to produce teaching materials that are both creative and convenient, as well as to suit their pupils' level of proficiency and indirectly to improve their English language acquisition. The Ministry of

Education Malaysia (2013) has emphasised the importance of using ICT through the introduction of Malaysian Education Blueprint (2013-2025). The ministry hopes to fully utilise the use of ICT for self-paced learning and distance for expanding access to high-quality teaching across Malaysia, as stated in the seventh shift to transform the education system. In order to fulfil the aspiration of the ministry, educators have moved from e-learning to m-learning approach (Ismail et al., 2020) in carrying out their lessons due to the ubiquitous and feasibility of m-learning approach.

Teachers play a vital role in maximising learning outcomes and potentials among the students by integrating m-learning into their lessons. There are many challenges faced by the teachers in integrating m-learning into their lessons. One of the most prominent challenges is the teachers' competencies and perceptions towards the use of m-learning (Betancourt-Odio et al., 2021). Many teachers feel reluctant and still in denial to accept the new learning culture. They opposed the change of trend in employing new technologies into their teaching and learning sessions. They have a strong belief that conventional teaching is more effective compared to m-learning approach. Furthermore, teachers' competencies towards handling the mobile devices per say as well as the integration of the mobile devices into their lessons are still viewed as a major concern. Insufficient guidance and training somewhat are the factors that were affecting teachers' competencies towards the use of mobile in language learning. The study conducted by Khan et al. (2018) evidently yields that the lack of required skills among most teachers hindered the process of developing MALL-based activities for ESL learners.

Teachers and Mobile Assisted Language Learning (MALL)

The use of digital devices has become an essential part in every person's life in the entire world. The use of m-learning in education has become a trend in recent years, showing that it is a useful method applied in solving the current problems of education during and after this pandemic era. Many countries have begun to incorporate mobile learning into their educational systems as one of the ways toward ensuring educational quality and equity in order to promote wholelife learning possibilities for all, as asserted in the Sustainable Development Goals (SDG). United Nations stated that this heightens the essential of education in encouraging and helping future industries, moving towards the year 2030. Stockwell (2012) also stated the importance of mobile learning by saying "mobile learning will continue to take on new shapes and forms as it becomes more familiar to both teachers and learners". Grimshaw et al. (2017) agreed that MALL provides both educators and learners with a lot of useful resources to improve the learning process.

There are quite a number of studies that explore the effectiveness of MALL towards various language skills including writing skills ranging from primary up to higher level education. John and Yunus (2019) conducted a study on learners' writing competence increased significantly with the use of different writing mobile applications. It is proven that the learners not only show positive attitudes towards the writing tasks but they really enjoyed the lessons since it is more interesting compared to the traditional method of teaching writing. Al-Hamad et al. (2019) posited the effectiveness of utilising WhatsApp for developing writing performances among teenagers. The study conducted by Abd Karim et al. (2020) on the use of Mobile-assisted Mind Mapping

Technique Model (MMMTM) towards enhancing Malaysian university students' English writing performance. The result of the study proved the model MMMTM, which also underpinned MALL, impacted positively on students' motivation, critical thinking and creativity in writing apart from augmenting their writing performance.

Since the pandemic Covid-19 in 2020, more teachers have created their own channels on YouTube and became education influencers on TikTok for a good cause of sharing their teaching materials including English language for primary and secondary schools. Although some teachers have started sharing on other platforms such as Blogging and Facebook even before 2020. These sharing allow the pupils to learn and acquire English language using mobile devices at any time and anywhere. That is how mobile learning has started to play a vital role in the ESL classrooms.

Teachers and Their Perspectives

It is essential to collect teachers' perspectives in order to ensure whether an integration is successfully implemented. Every teacher has different experiences, background, academic levels and also point of views. All these will lead to different perspectives and opinions. This allows the researcher to understand how far an integration, in this case, MALL, is applied in teaching writing for ESL learners.

Teachers are the frontliner in the education field. They are the ones who carried out all sorts of education policies that were introduced by the ministry. They are the ones who conducted the lessons with the most suitable methods to cater the pupils' needs. The ease of use and the effectiveness of MALL are the main gists through teachers' perspectives. As teachers are the doers, they know how easy it is to implement MALL in ESL classrooms. Apart from that, assessments are carried out in the lessons, be it either formative assessments or summative assessments. From there, teachers can measure how well the pupils learnt certain topics with the integration of MALL in the lessons. This directly implies how effective it is to use MALL in teaching writing in ESL classrooms. Teachers' perspective should not be neglected as it serves an essential part in deciding the ease of use as well as the effectiveness of implementing an integration.

Teachers and Their Readiness

The readiness of teachers in accepting a new trend is crucial apart from teachers' perspectives. As different teachers have different perspectives, they will have different level of readiness too. How well the teachers are ready to apply MALL in ESL classrooms decides how fast the pupils adapt themselves in the MALL environment.

The teachers' readiness can be seen from two factors: challenges and motivation. The challenges faced by teachers will determine whether they want to keep using the integration. If the teachers are able to face the challenge, they are ready to apply MALL in teaching writing as far as they can. In addition, the motivation received by teachers will also decide on how frequent they use the integration. The motivation here divides into

two which are internal and external. Internal factors include the attitude of the teachers that is willing to learn and accept new methods of teaching. External factors include the training sessions provided by the respective departments in order to support the teachers theoretically and practically for implementing MALL in ESL classrooms. Hence, teachers’ readiness is another important element that should be looked into in order to know more about the integration of MALL in teaching writing.

Method

According to Pittway (2008), some of the key principles of a systematic literature review are transparency, clarity and extensive findings to facilitate the selection criteria of a journal. This finding is known as systematic review. It is based on the method of Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA). The four stages of this method are shown in Figure 1. PRISMA is one of the researchers’ favourite methods for its easy to understand and easy for adaptation to other studies. Thus, the objectives of this review study and the process of the systematic review are shown below.

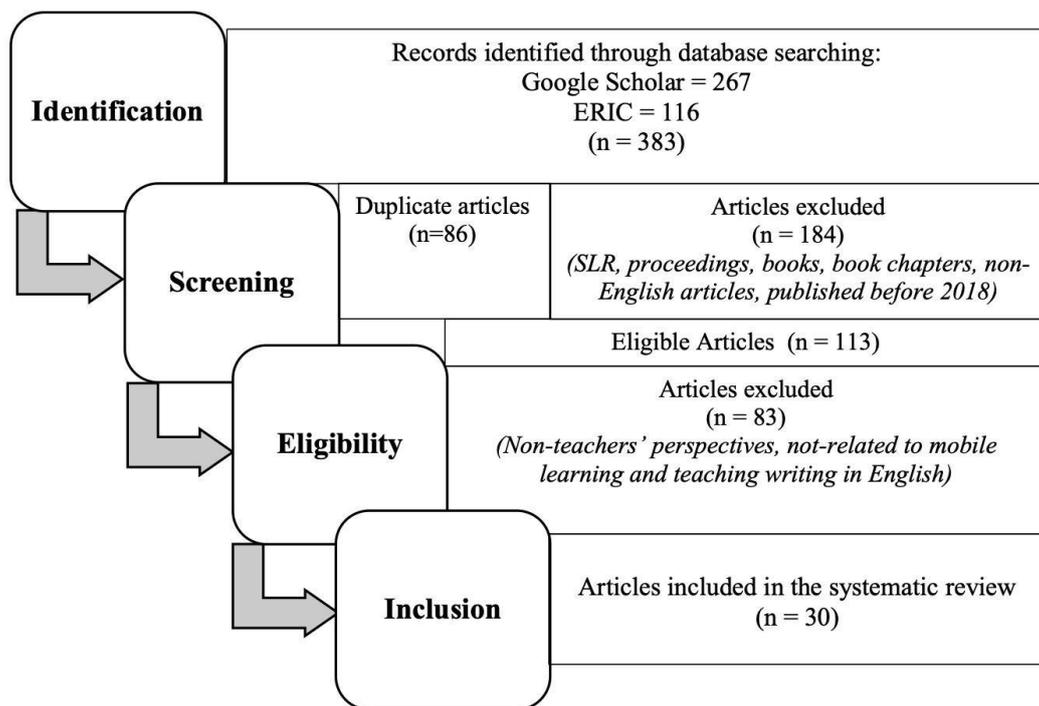

Figure 1. Steps of the systematic review based on PRISMA

Identification

In this systematic literature review, Google Scholar and ERIC were used as the main and only databases. The articles collected were from 2018 to 2022, which is the recent 5 years. Google Scholar is a database that stores the metadata of scholarly articles across various publications worldwide. On the other hand, the Education

Resources Information Centre (ERIC) is more like an online digital library that allows researchers to access different journals from different study fields. A total of 383 articles have been found from the two databases. The keywords used when browsing and collecting the relevant articles are as listed in Table 1 below.

Table 1. The keywords used in this review

Databases	Keywords
ERIC	Mobile Assisted Language Learning AND teaching writing, Mobile Assisted Language Learning AND teachers' perspective, Mobile Assisted Language Learning AND teachers' view, Mobile Assisted Language Learning AND teachers' motivation, Mobile Assisted Language Learning AND teachers' readiness, Mobile Assisted Language Learning AND effectiveness
Google Scholar	Mobile Assisted Language Learning AND teaching writing, Mobile Assisted Language Learning AND teachers' perspective, Mobile Assisted Language Learning AND teachers' view, Mobile Assisted Language Learning AND teachers' motivation, Mobile Assisted Language Learning AND teachers' readiness, Mobile Assisted Language Learning AND effectiveness

Screening

The articles found from both databases, ERIC and Google Scholar had included duplicates. Hence, 86 articles were filtered according to the criteria. All these filtered articles were then screened based on the criteria as shown in Table 2. There were 184 articles eliminated in this screening process.

Table 2. Criteria for screening phase

Criterion	Inclusion	Exclusion
Type of article	Research article	SLR, proceedings, books, book chapters
Language	English	Non-English
Year	2018-2022	<2018

Eligibility

In this stage, the remaining articles were reviewed for eligibility, and they had to achieve the criteria outlined in the inclusion part. The purpose is to verify that the result acquired in this review was of high reliability and quality. A total of 83 articles were then removed from this review.

Table 3. Criteria for eligibility phase

Criterion	Inclusion	Exclusion
Type of article	Research article	SLR, proceedings, books, book chapters
Language	English	Non-English
Year	2018-2022	<2018

Inclusion

The articles for this study encompassed mobile learning and teaching writing in English. There were 22 articles selected from Google Scholar and 8 more were chosen from ERIC. These journals were chosen based on the features and aims of the articles, especially in the education industry. The objectives of the journals chosen were all connected to mobile learning and teaching writing in English.

Results

The results of the research articles found in the previous process will be analysed in detail in this section. Due to the objectives of the respective study, 30 articles were selected to be used in this review after the selection of relevant articles for this study. From the articles, teachers' perspectives and teachers' readiness on the integration of mobile learning to teach writing could be seen, mainly, ease of use, effectiveness, challenges, and motivation. The results were tabulated as seen in Table 4.

Discussion

This section will further discuss teachers' perspectives and readiness to use MALL in teaching writing in four main areas: ease of use, effectiveness, challenges, and motivation. These discussions are based on the two research questions.

Teachers' Perspectives on the Integration of MALL in Teaching Writing

Teachers' perspectives towards the application of MALL in teaching writing were viewed in two major aspects which are ease of use and the effectiveness. 18 of the 30 papers found in the final phase of this systematic literature review (SLR) examined the MALL's feasibility to teach writing from teachers' perceptions. This accounted for 55.9 percent of teachers' considerations in deciding the use of mobile-assisted digital tools in their writing classes. Sari & Sulisty (Sari & Sulisty, 2022) said that teachers think MALL is quite user-friendly as it is appropriate for all users (Abd Karim et al., 2020; Nuraeni, 2021; Vo & Vo, 2020). Kee et al. (2021) has also supported the stance on teaching writing using digital applications, underpinning MALL, which can be accessible by both teachers and students at anywhere and anytime. They further asserted that MALL made it easier for teachers to create suitable writing materials and provide continuous guidance towards students' writing practices. Rusli et al. (2019) posited that teachers agreed on the fact that with the use of social media could help them to ease their burden in preparing hardcopy materials for writing since most students are able to get direct access to digital writing materials and only at their fingertips using their mobile devices. However, Bozorgian (2018) and Saragih & Jaelani (2020) stated the teachers' concern regarding the internet connectivity as the students still need to have a good internet connection in order to swiftly access the digital materials as

well as to participate in the writing lesson. Therefore, it is vital for teachers to look into all aspects of the use of MALL including the hindrances that might make teaching writing not accessible to all their students. This eventually will impede students' learning potentials and opportunities.

Furthermore, a total of 15 out of 30 articles discussed the effectiveness of using MALL for teaching writing. There were many articles on the effectiveness of MALL from the students' perspectives compared to the teachers' view. However, after reading through all the articles, there are a few studies that have embedded teachers' view in their discussion even though it wasn't emphasised as a whole. Hence that summed up to the findings of 15 articles on the effectiveness of MALL in writing. Teachers from different countries agreed that MALL is very useful in enhancing teaching writing since it is more student-centred, meaningful, authentic and interactive (Abd Karim et al., 2020; Aghajani & Adloo, 2018; Al-Shehab, 2020; Azar & Tan, 2020; Purwaningrum, 2019; Woon & Yunus, 2018). Aghajani & Adloo (2018) has proven that their students showed significant improvement in their overall writing performances as well as in their acceptance in cooperative learning through using Telegram. With the use of MALL teachers and peers are able to provide instant feedback to their written work (Aghajani & Adloo, 2018; Al-Hamad et al., 2019; Al-Shehab, 2020; Chung et al., 2019; Khan et al., 2018). Meanwhile, Hosseinpour et al. (2019) has evidently proved that Edmodo mobile application has a tremendous influence on the higher education learners' writing proficiency where it has impacted positively in terms of students' active participation and boosting their confidence in writing.

Overall, it can be concluded that most teachers share the same opinion that MALL is definitely efficient and rather effective for English language teaching (ELT) especially in writing skills, since the current generation, GenZ, has grown more tech-savvy. Besides, the booming advancements of smartphones has increased the need to move our teaching writing strategies in line with the latest trend.

Teachers' Readiness on the Use of MALL in Teaching Writing

On the other hand, teachers' readiness on the use of MALL in teaching writing were determined through two main aspects which are challenges and motivations.

There were a total of 16 out of 30 studies reviewed on the challenges that the teachers had encountered while using MALL for teaching writing. Metruk (2020) claimed that teachers viewed the use of MALL as a distraction for students. This is due to the interactive and social features that can influence students to be less attentive as well as engaged in social networking and ping-pong instead of devoting their time mobile phone usage time for writing practices and learning purposes in general. Khan et al. (2018) and Solihin (2021) through their study has revealed that teachers' incompetencies of utilising mobile devices in ELT is a drawback of MALL. There are still some teachers using age and time constraints as the reasons for their incompetency in technology skills. These issues mentioned hinders teachers' readiness in maximising the use of MALL for teaching writing. However, teachers ought to perceive these issues as a challenge for their professional development and increase self-efficacy towards using MALL (Rusli et al., 2019; Sari & Sulistyono, 2022). Besides, teachers should be

determined to find long-term solutions in order to solve the issues they encounter while using MALL since it is strongly beneficial towards students' writing competence and language proficiency.

Apart from that, a total of 10 articles have mentioned the aspects of motivation that contribute to teachers' readiness. Teachers with lesser years of experience in education have higher preference of using m-learning in the classroom compared to the senior teachers. New teachers are highly motivated in moving their pedagogical approaches according to the latest advancements specifically in using mobile devices for ELT. However, teachers as the agent of change ought to be ready for constant transformation in education as well as actively involved in providing the best learning environment for the students. MALL is seen as a convenient tool in preparing materials for teaching writing (Dewi et al., 2020; Kee et al., 2021; Saragih & Jaelani, 2020), providing instant feedback (Cakmak, 2019); Sari & Sulisty, 2022) as well as in facilitating students' writing competence especially in sentence constructions (Chung et al., 2019; Miin et al., 2019; Morthy & Aziz, 2020), grammatical components (Dewi et al., 2020) and stimulating their writing ideas (Abd Karim et al., 2020; Al-Hamad et al., 2019; Krisbiantoro & Pujiani, 2021; Purwaningrum, 2019; Rusli et al., 2019). Since MALL is seen as a convenient and practical tool, therefore teachers' motivation on the use of MALL to teach writing is elevated. Kee et al. (2021) posited teachers' preferences of using social media like WhatsApp, Facebook, Google Doc and WordPress to teach writing. Vo & Vo (2020) claimed that most teachers are ready in terms of learning to use MALL in ELT as well as to implement it in classroom activities. This exhibits the motivation among teachers in upscaling their ELT especially in teaching writing so that every student is given the opportunity to excel in their writing performance.

In short, most teachers are willing and ready to use MALL in their ELT including teaching writing as they believe that teachers are the agent of change to promote better learning opportunities for their students. Teachers' readiness also depends on the level of their students' readiness. In the study conducted by Qarkaxhja et al. (2021), they clearly stated that as long as students are well equipped with both mobile devices and good connectivity to the internet, teachers will be more prepared to fully utilise the m-learning approach in the classroom. Besides, teachers are convinced with the effectiveness of MALL in ELT and how it has impacted positively in students' language performances.

Conclusion

This systematic literature review has analysed papers connected to teachers' perspectives and readiness towards the use of MALL for teaching writing. Two databases, namely Google Scholar and ERIC, were used in determining the 30 articles after the inclusion and exclusion criteria above. Teachers' perspectives were analysed from two different perspectives which are ease of use and effectiveness. There were 18 articles dwelled on the aspect of ease of use, while 15 articles discussed on the aspects of effectiveness of MALL in teaching writing. Meanwhile for the aspect of teachers' readiness, it was analysed based on their motivation and challenges that they encountered in using MALL for teaching writing. 16 papers reviewed on the challenges that

the teachers had encountered while using MALL for teaching writing, while 10 papers touched on the aspect of teachers' motivation towards using MALL.

The findings show that teachers have high strong positive opinions upon MALL and its application in ELT because it is viewed as beneficial for the students in all aspects of writing including writing competency and proficiency as well as boosting their interest and confidence in writing. Moreover, this review has posited teachers' belief on the efficiency and feasibility of using MALL in ELT especially in teaching writing. The results of this review also have identified that most teachers were also keen to learn and ready to MALL in ELT. In a nutshell, based on the deep analysis of each of the articles, MALL is widely viewed as an approach by the teachers as an easy-to-use and effective tool, thus making them ready and motivated to brace any challenges in utilising MALL for teaching writing. This is because most teachers view the challenges of using MALL as a source of motivation to fuel their professional development, allowing them to serve their students with the best yet current strategies and approaches in teaching writing. In short, this strongly proves that MALL has given a positive impact on English teachers from various countries, and they are willing to accept the MALL approach.

It is crucial for all stakeholders in the education field to realise and acknowledge the high possibility of utilising mobile devices in enhancing the learners' education in various levels, typically in the current 21st century. They ought to acknowledge the significance of MALL, under the bigger umbrella term of M-learning, for enhancing students' language competency and performance level. Hence, the two research questions of this systematic review are answered. Furthermore, it can be concluded that based on the teachers' perspectives, MALL is considered an effective and convenient to use for teaching writing. This subsequently impacted positively towards their readiness in using MALL for not only teaching writing but also for other language skills.

Limitations & Challenges

There were a few limitations of this study that needed to be addressed in the future in case any other researchers want to do deeper research on this study. Since this study has only reviewed 30 articles from Google Scholar and ERIC, due to time constraints, there might be many more journals that can be found in other databases such as SCOPUS and WoS. By expanding the search from various databases and collecting additional views and opinions from other scholars, it would be more interesting to exhibit the different schools of thoughts and results.

The second limitation of this study is that there was not much research done on teachers' perspectives because researches related to MALL for teaching writing are geared more towards students' perspectives. Based on the findings, student's perspectives on using MALL for improving writing skills were given much priority but undeniably the fact that teachers' voice and views are equally important to be heard off. Hence, this makes the findings from this review reliable and notable.

Abstract: Nurses are a vital resource of health care systems, a resource that must be valued, bearing in mind that their work has a role in social indicators of health, and also determines topics such as equality and equity, fairness and justice, which support the kind of societies we all want to live in. In the training process, they learn, in the middle of a team, to plan, to put into practice and evaluate general medical care based on acquired knowledge and skills. Future nurses must not only be prepared to meet the needs of the individual, the family, the community, but also to have confidence in their own intellectual and clinical abilities so that they can work responsibly and autonomously, facing at the same time with increasingly complex requirements of healthcare. The refinement of medical training is subsequently achieved by developing the ability to solve problems, to make decisions, to practice leadership in medical care. The acquisition of leadership skills has been identified as a need in training nurses, both from the researches of internal and international professional bodies and from those of clinical units. By harmonizing this need with public educational policies, the unit of learning outcomes *"Leadership and professional communication"* was implemented in the professional training standard. This paper aims to gain insight into the relationship between the values of leadership and the development of a good educational policy in training nurses, with a fundamental impact on the provision of health care in an efficient, integrated and safe manner for the patient.

Keywords: Nurses, Leadership, Educational policies

Introduction by short descriptions of used terms Nursing

The concept of *nursing* is one of the philosophies that has evolved with the evolution of human society, starting, historically speaking, with Florence Nightingale (1860), who paves the way for public health as the founder of modern nursing, continuing with Virginia Henderson's need theory (1960), and followed by Marjory Gordon's

functional health models (1982). By definition, nursing means caring. It is a profession within the health care sector focused on the care of individuals, families and communities so they may attain, maintain or recover optimal health and quality of life. Nursing and caring are grounded in a relational understanding, unity, and connection between the professional nurse and the patient.

Task-oriented approaches challenge nurses in keeping care in nursing. This challenge is on-going as professional nurses strive to maintain the concept, art, and act of caring as the moral centre of the nursing profession. Keeping the care in nursing involves the application of art and science through theoretical concepts, scientific research, conscious commitment to the art of caring as an identity of nursing, and purposeful efforts to include caring behaviours during each nurse-patient interaction. Thus, in the *training process*, nurses need not only be prepared to meet the needs of the individual, the family, the community, but also to trust their own intellectual and clinical capabilities so that they can work responsibly and autonomously, while at the same time facing the increasingly complex requirements of healthcare.

Educational results should enable the student, the future nurse, to select information in order to assess, plan, implement and evaluate nursing care. Such a result can be achieved by developing a proper professional training standard that creates a relevant and useful teaching and learning environment for both students and teachers.

Educational policy

Educational policy represents a set of programs, activities, measures aimed to address some basic human needs for education, among others, as social protection, health, housing and - generally – the increase of social wellbeing by (re)distribution of resources considered to be relevant (money, services, time, etc.).

There is a growing recognition that a sufficient, adequately trained and well-motivated nursing workforce is essential for the health of the world's population. Equitable access to good quality health services cannot be obtained without having an adequate number of properly trained nurses. As a result, a solid functional relationship between the educational and medical sectors is vital.

The ability of professional training programs to prepare clinically competent nursing graduates is a permanent challenge for all actors involved: students, teachers, schools, clinical units, local authorities, line ministries, national and international professional organizations. The simple increase in the number of personnel in the field is not enough to improve the safety of patients and the quality of care provided to them.

Leadership

Leadership, which must be considered as a means and not an end, has effects on all organizational, social and personal processes in an organization. Leadership in an organization means, among many others, vision, encouragement, enthusiasm, energy, passion, but also adequate communication with organizational members from different cultural backgrounds, an understanding and correct use of language and cultural symbols, respect

for diverse cultural customs and traditions. A good leader today is the one who has the necessary knowledge and skills to communicate with people from all corners of the world, using appropriately all possible communication means and channels and all technological innovations.

So, this paper will discuss how these values were translated at the level of specific educational programmes for the training and professional evaluation of nurses, as well as in specific programmes dedicated to internalizing the values.

Discussion: Is it necessary and is it relevant for future nurses to be trained about leadership?

In Romania, the nurse's training program has gone through several stages closely related to demographic, medical, social and economic factors. During the period of 1978 - 1994, there was the Sanitary High School, with a duration of 4 years, after a previous 8-year basic training, obtaining the title of "Medical Sister". Later, considering, in particular, the emotional impact generated by pupils' early contact with the suffering of patients, with their image in situations of weakness, helplessness, inability, morbidity and mortality, since 1998, the educational system has moved to a new stage: Post-High Sanitary School, with a duration of 3 years, after a previous 12-year basic training, obtaining the title of "General Medical Assistant" or "General Nurse". From 1998 to 2007, the training program was adapted to the European principles through the EU PHARE VET program RO 9405 and the strategic objectives of the reform program in vocational and technical education in Romania.

Consequently, the accession of Romania to the European Union and following the specific stages of European recognition of the General Medical Assistant qualification, qualification obtained in Romania, there were significant changes in the structure of the training program. As a result, the educational policies in Romania were aligned with those of the European Union through a new training program for nurses in the following period 2007-2018, in compliance with the provisions of 2005/36/EC Directive.

Starting with 2018, taking into account the changes brought by the 2013/55/EU Directive regarding the recognition of professional qualifications, the training program went through a new qualitative and quantitative transformation. The main improvement in building the training format was the more accurate definition of the Professional Training Standard. This is the document that describe the results that a participant in a training program carried out in vocational and technical education, has to hold at the end of it.

Briefly, the picture of the changes made by the Romanian Nurses Training Program starting from 1978 and up to now, shows an adaptive evolution both to the needs of the health system and to the requirements of the labor market, regarding the following aspects: type of school, duration of the program, number of hours, objectives, structure and descriptors of the curriculum.

In present time, by pursuing an active and continuous training program that includes 4600 hours of theoretical and practical training, the graduate of the post-secondary sanitary school, will have the following basic professional competences, covered by the EU/55/2013 Directive:

- *The competence to independently diagnose necessary medical care, based on existing theoretical and clinical knowledge, and to plan, organize and implement healthcare in treating patients based on acquired knowledge and skills to improve professional practice) (a)*
- *The competence to collaborate effectively with other actors in the health sector, including through participation in the training of health personnel on the basis of acquired knowledge and skills; (b)*
- *The ability to provide individuals, families and groups of people with information enabling them to have a healthy lifestyle and self-management on the basis of knowledge and skills acquired; (c)*
- *The power to independently initiate immediate measures for the maintenance of life and to apply measures in crisis or catastrophe situations; (d)*
- *The power to provide independent counseling, guidance and support to carers and close persons (e)*
- *The competence to independently ensure the quality of health care and its assessment (f)*
- *The competence to ensure exhaustive professional communication and to cooperate with members of other health professions (g)*
- *The competence to analyze the quality of the assistance provided to improve their general nurse medical practice (h)*

All these goals have been generated through the development of the nursing process, which has gained new dimensions: the role of the nurse has become more complex, one of the tasks being to diagnose and determine the proper therapeutic attitude. The individual is appreciated holistically as a person with physical, emotional, psychological, intellectual, social and spiritual needs. All these needs are interdependent, equally important and represent the basis of the nurse's interventions according to the nursing diagnosis.

Taking into account these prerequisites, the curriculum development involves thinking and structuring the actual learning situations in which students will be involved, acting as requiring prefiguration of the learning experiences that they will undertake. The educational results must allow the student, the future nurse, to select the information, to make possible the appreciation, planning, implementation and evaluation of the nursing care. But, first of all, a future nurse must learn to communicate!

The communication process is very important because the following actions can be carried out: coaching, counseling, coordination, guidance, evaluation and supervision. The chain of understanding is the one that integrates the members of an organization, from the top to the bottom, from the base to the top, from one end to the other. Table 1 presents a comparison by analogy, between the hierarchy of needs of Maslow's pyramid (A. H. Maslow, 1943) - as a theory of motivation - and the hierarchy of communication levels in training nurses.

Table 1. Correlations between 5 needs and 5 levels of communication

Needs of Maslow's pyramid	Level	Levels of communication development	Correlations
<i>Physiological</i>	1	<i>Communication</i> (definitions, types, process, purpose, role)	<i>Learn to communicate</i> (primary need)
<i>Safety</i>	2	<i>Professional communication</i> (sources of information, specific terminology, selection of information, dysfunctions in communication, expression of opinions and listening strategies)	<i>Can communicate</i> (feeling safe)
<i>Belonging</i>	3	<i>Communication in the medical team</i> (the concept of group/belonging, norms of behavior, status, objectives, principles, coordination and communication networks)	<i>Know how to communicate</i> (feeling understood, having a common language and belonging to a group)
<i>Self-esteem</i>	4	<i>Therapeutic communication</i> (information analysis, confidentiality, respect for boundaries, active listening and observation, counseling people)	<i>Adapt communication to different contexts</i> (having self-esteem, receiving respect and recognition, building reputation)
<i>Self-fulfilling</i>	5	<i>Leadership in the medical team</i> (data management and evaluation, problem solving, decision making, autonomy)	<i>Giving direction, through communication, by using my own influence, authority and expertise, to achieve the pursued objectives</i> (active participation in increasing own performance, communication and organizational culture)

Similarly, Figure 1 shows the correlations between the needs in Maslow's pyramid and the levels of communication. Therefore, the premise of training a leader is the ability to communicate. A good communication plan is an essential part of any management. It is essential that all participants in the activities of the organization are informed about the aspects of interest of their work. Most of the problems that appear within organizations are the direct result of failure in communication, which creates a state of confusion and can lead a good plan to failure. And, as usually, a good plan is the platform for developing the vision of a leader, who will lead his team towards the achievement of well-defined objectives and goals. The team, of which the nurse will undoubtedly be a part, is open to communication. Team members feel that they can express their

opinions and feelings, without fear. Listening is as important as speaking. Thus, differences of opinion are appreciated and conflict resolution methods are understood. Through honest and thoughtful feedback, people learn their strengths and weaknesses, as members of a team. In this way, an atmosphere of trust and acceptance is created, and a sense of community is built, so each member of the team can reach their potential.

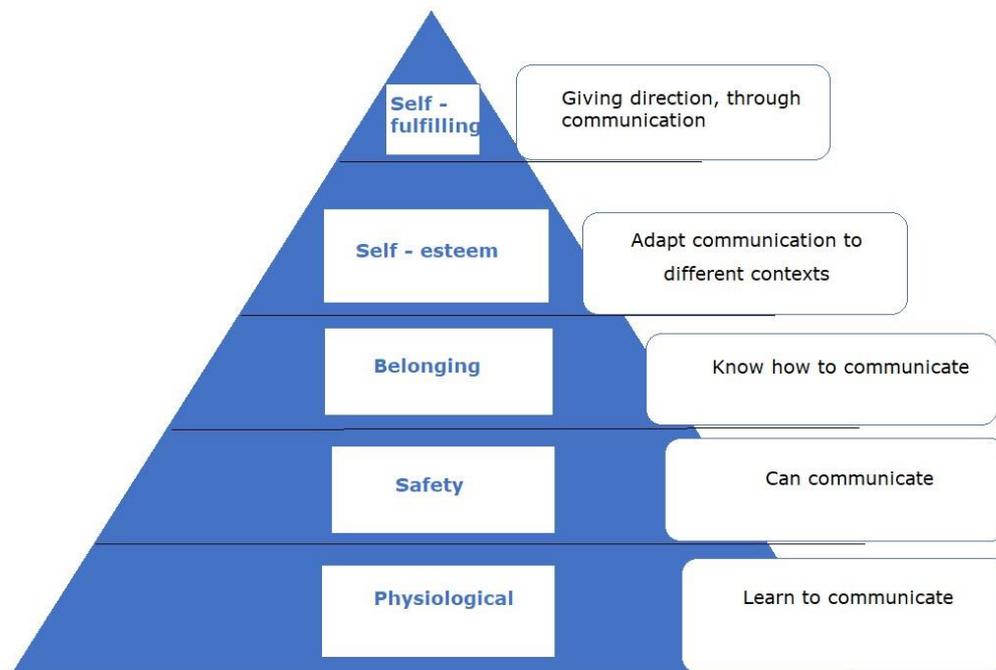

Figure 1. Transposition of the communication levels in Maslow's pyramid

Method

Finding the need to implement the values and principles of leadership in training of nurses, was initially carried out by the graduates, who accessed career promotion by obtaining the professional degree immediately superior to the beginner degree. Most of them, after that, were appointed to management positions (head assistant, medical care manager) and consider that learning leadership skills during schooling, would have been very useful both in completing tasks and in solving problems from every day, as well as in the context of management positions obtained.

Following the collected observations, questionnaire-based research was initiated at the school level to determine more precisely the degree in which leadership brings added value to a future nurse. The questionnaire contained the question: *"How useful would it be to introduce a learning unit about leadership into the training program?"* and was applied to a number of 968 graduates registered for the main degree exam in September 2017 (group A) and to a number of 320 students of the school in the final year of study (group B), between September 2017 and January 2018. Analysis of the data obtained will be presented below as percentage values, according to the way the original scale was used (Yes/No/I don't know).

The results are contained in Figure 2 and Figure 3.

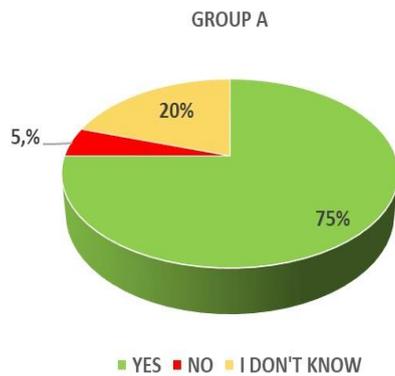

Figure 2. Results in group A

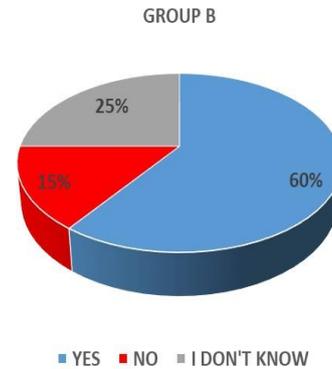

Figure 3. Results in group B

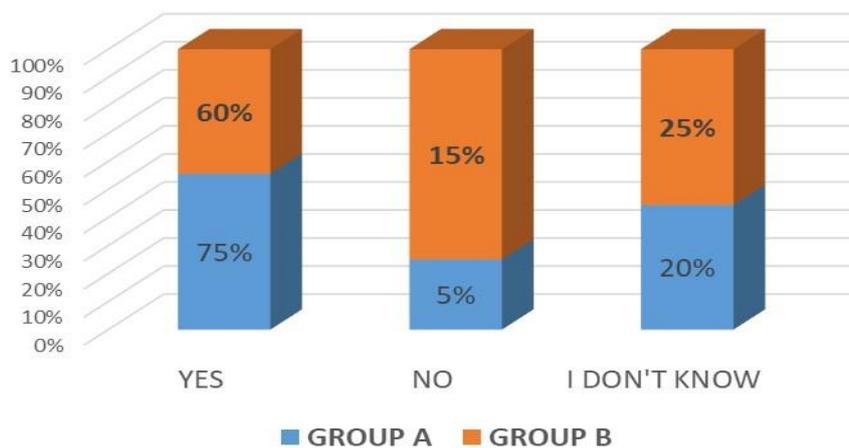

Figure 4. Comparison of the results in group A and group B

As a result, through consultation with similar schools in the country, national curriculum commission, sectoral committees, professional associations, profile organizations and other regulatory bodies and in conjunction with the provisions of directive 2013/55/EU, a new Professional Training Standard (PTS) and a new Curriculum (CRR) for training of nurses were developed, which applies starting with September 2018 (OMEN 3499/2018).

Professional competencies or competency units, generically called "Competencies", which underlie the design of the Professional Training Standard (PTS) in the general nurse's profession, are included in the PTS content by correlating with learning outcomes units to highlight the link between learning outcomes and skills required at work. A learning outcomes unit is a component of a PTS that describes a professional qualification corresponding to a complex of competencies and consists of a coherent set of knowledge, skills and attitudes that can be evaluated.

In the new training program, the learning outcomes unit "*Leadership and professional communication*" was introduced, through which leadership values were implemented. The contents about leadership were oriented, organized and structured at a *standard (basic) level* - theories, definitions, classifications and subclassifications, typologies, styles, with general applicability in the personal, organizational and professional sphere.

The leadership style is defined by the way in which a leader, regardless of his field, offers a direction, a strategy, managing to implement his plans and to motivate, direct and guide the people he coordinates. There are big differences between leadership styles, but also particularities that allow the identification of each approach, through its advantages and disadvantages.

The first major study of leadership styles was conducted by Lewin, Lippitt and White (1939), developed in the following decades and cited in most works on this topic. Each of them made an important contribution, and together they described the characteristics of three great leadership styles: authoritarian (autocratic), participative (democratic) and delegative (*laissez-faire*) leadership. Each of these styles has dominant characteristics and are useful in the nursing profession.

Autocratic leaders dictated terms and people had to obey them blindly. *Democratic* leaders discussed all probabilities and also made followers to take their own decisions. *Laissez – faire* is the extreme opposite to autocratic leadership style. They completely parted with all responsibilities to the followers. Later, other ways of leading were added, adapted to the evolution of society, to trends and to the real needs of the moment, but the principles of their definition respected the strategy of the three authors.

Leadership manifests itself differently, being influenced by the social, economic, sometimes even the political context, it depends on the culture and interests of the organization, on its purpose, but also on the characteristics and personality of the leader. The interaction between all these elements has given birth, over time, to several classifications of leadership, but regardless of the size or field of activity of the company, the leadership style is an important aspect that influences the productivity of the organization.

Results

The Order of Nurses and Midwives of Romania which is a professional and regulatory organization with the role of developing norms and rules for practicing the profession of generalist nurse, midwife and nurse, so that professionals can provide quality services to patients, in safety and security conditions, consider that the ability of medical personnel to meet the citizen's need to have quality health system is directly linked first and foremost to the reform of the educational system of professional training.

The professional organization took the training leaders of the medical teams, to *another (higher) level*. Starting from 2020, it organizes and conducts leadership courses for nurses who occupy management positions in

clinical units. Entitled „*Leadership program in medical care, for care directors and chief assistants in Romania*”, the contents of these trainings took into account several aspects, such as:

- *Organizational culture and ethics*
- *Human resources management*
- *Time management*
- *Performance management*
- *Professional ethics and deontology*
- *Change management*
- *Global leadership*
- *Current and future directions for the nursing and midwifery profession in Romania: priorities from the perspective of politics, leadership and education*

These aspects are defining for the development of an integrated multitask operating system, with minimum response times and with the involvement of all members of the organization, being intended to be internalized by all actors in the health system.

The leadership style adopted by nursing managers depends on the climate of the group. The manager needs to find out whether the needs of the group are meted out and whether the group is so formed in order to handle group goals. In this case, the nurse leader needs to first make a retrospect of his or her behavioral traits. Accordingly, the current situation in the organization should be taken into consideration and the nurse manager should change leadership style as per the situation.

A nurse's personality may not suit the particular role assigned. Hence, the nurse manager needs to find out the differences in his or her personality and change them according to the role focus. Secondly, nursing managers must be capable of directing and planning the group effectively and efficiently. Nurse Managers must positively motivate the team to perform tasks efficiently. In this case, democratic nurse managers are considered to be more efficient and task-oriented than those who adopt an authoritative or a laissez-faire style of leadership. The group task also determines the appropriate leader and at times the style of leadership needed to be followed by the leader.

Consequently, the qualities of a responsible nurse are based on morality, values, moral principles, respect, personal integrity, courage, tenacity, self-esteem and expertise. It empowers others by facilitating, investing, sharing, authorizing, enabling. These are extremely important characteristics that the nurse must have and that we need in patient care. To evolve, leadership potential needs skills, confidence, and must consider a leader's ability, evidence of knowledge and skills, including transversal skills, as we sometimes call them: trust, integrity, as well as a moral compass. The leader must share a vision of the future, be able to work in a team and reach a consensus together, and also be able to make unilateral decisions when necessary.

Nurses and midwives can develop the empowerment of others by respecting their views, their opinions and by soliciting these opinions, through their managerial skills that demonstrate empathy and empowerment towards others. They enable participation, invite others to get involved, and have the authority and responsibility they accept.

Conclusion

Initiative, determination, cohesion, brevity, patience and argumentation are among the skills needed in changing educational policies. Thus, it has been proven that the *necessary change* required following the identification of a need and for satisfying it, goes through several stages: identifying the type of *need*; the *will* to produce change to satisfy the need; the *power* to achieve change; *implementing* the change; *satisfying* the need. The key words needed on the path to change educational policies are presented in the Figure 5, below:

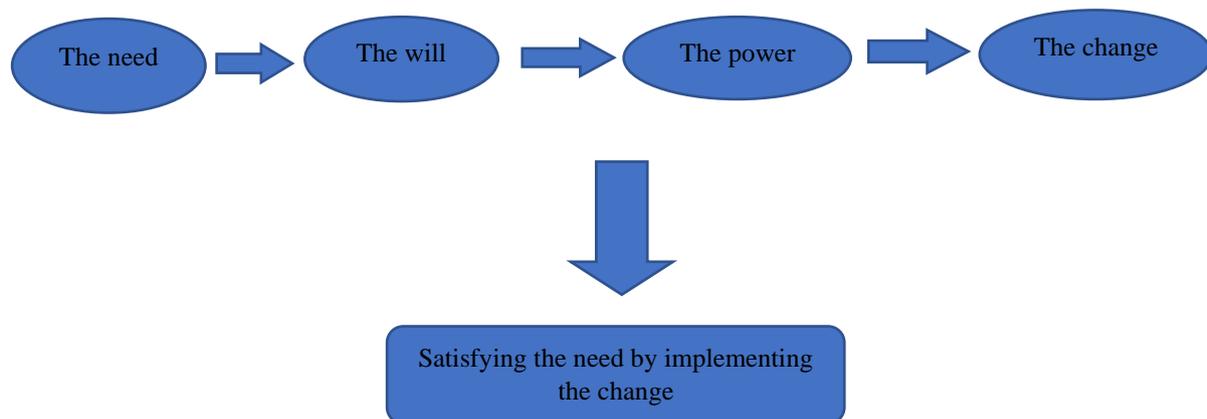

Figure 5. The key words in changing process

Along this approach, from individuals, schools, clinical facilities, hospitals, to professional organizations, government institutions and the community, each with its own contribution, the driving force behind the main goal, has been to achieve and maintain better care and a healthier society.

Interdependence and interconnectivity are characteristics of the current age in which we live. Obviously, we also encounter this new reality within organizations that now operate in heterogeneous environments, with employees from different corners of the world, of various ages, ethnicities, religious or political orientations, with a *mélange* of customs, traditions, beliefs, with different ways of perception of time or space, with different ways of communicating and relating to success or failure, with different degrees of digital literacy. Operating within the parameters of today's global world, organizations need to adapt quickly and efficiently to this reality. They implicitly need leadership that is attentive and responsible towards issues of diversity and inclusion, capable of creating an appropriate organizational culture/climate for intercultural work groups while being at the same time customized to the type of organization.

The biggest issue is finding proper ways, which will ensure the building and the perpetuation of a leader structure, which is professional, autonomous, flexible, efficient, capable of development and adaptation in new contexts.

So, leadership in nursing is required in order to efficiently manage the challenges and obstacles which result due to healthcare workforce and workplace problems.

Recommendations

Overall, boosting and improving the training of nurses, must be the permanent target of educational policies in the field of health, by establishing the framework of needs and difficulties and by coordinating and facilitating the implementation of discovered solutions.

Acknowledgements

The successful completion of both this work and the change described within, it would not have been possible without the support and help received from many individuals and organizations. We would like to sincerely thank all of them and, in particular, the following: Ministry of Education - National Curriculum Commission; Order of Nurses and Midwives of Romania; International Council of Nurses.

Abstract: OECD (2019) defined student agency as the ability to set goals, reflect, and act responsibly to endorse change. It is the quality of students' engagement and interaction with peers, teachers, parents and the wider community. The purpose of this research is to investigate and track the factors of promoting student agency and community engagement leading the change. Thirty nine students at a public high school in Lebanon were trained on STEAM activities such as: coding, robotics, electronics, crafts and 3D printing. Students took the initiative with continuous encouragement and facilitation from the principal and teachers to enrol and lead a community- based STEAM laboratory. A self-reflection questionnaire for students was administered in order to measure the characteristics and processes of the student agency. This case study used interviews, and focus groups in order to track the factors promoting this agency. The results of this study will inspire policy makers and school principals to promote student agencies and community involvement.

Keywords: Student agency, Community, STEAM laboratory, Public high school

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 808-821), Cappadocia, Turkiye. ISTES Organization.

Introduction

Student agency has gained more attention among education researchers, policymakers, and practitioners in recent years (Lehtonen, 2015). It refers to the capacity of students to take ownership of their own learning, make decisions, and act upon them in ways that support their personal growth and academic achievement. In the 21st century, the skills of self-regulation, self-efficacy, and self-determination have become essential for students to succeed and thrive in various learning environments (Reeve & Tseng, 2011). Moreover, research has shown that

fostering student agency can lead to positive educational outcomes, such as increased motivation, engagement, persistence, and academic performance (Völkl et al., 2023). In addition, promoting student agency can also contribute to the development of students' social-emotional competencies, such as resilience, social awareness, and empathy (Blair et al., 2018).

Theoretical Framework

There is no consensus on a specific definition of student agency. In the context of the OECD Learning Compass 2030, student agency denotes a sense of responsibility as students engage in society and aim to affect people, events, and circumstances for the better (OECD, 2019). The OECD Learning Framework 2030 offers a vision and some underpinning principles for the future of education systems. According to OECD, student agency is the ability to frame a guiding purpose and identify actions to achieve a goal rather than “student autonomy”, “student voice” and “student choice”. Agency is at the heart of the OECD Learning Compass 2030 and is defined as the competency to think, initiate and act intentionally and responsibly to shape the world towards individual and collective well-being, it necessitates the capacity to articulate a driving goal and specify actions to realize a vision (OECD, 2018). However, the development and prerequisites for agency have received little explicit attention in education (Jääskelä et al., 2020). When students are agents in their learning, that is, when they play an active role in deciding what and how they will learn, they tend to show greater motivation to learn and are more likely to define objectives for their learning (OECD, 2019).

Two factors, in particular, assist students in gaining agency. The first is an individualized learning environment that encourages and supports each student to pursue their interests, connect various learning opportunities and experiences, and design their own learning projects and processes in collaboration with others. The second is building a solid foundation of literacy and numeracy. In the era of digital transformation and with the advent of big data, digital literacy and data literacy are becoming increasingly essential, as are physical health and mental well-being (OECD, 2018).

Agency can be developed as students learn, receive feedback and reflect on their work, this is referred to as the “Anticipation-Action-Reflection (AAR) cycle” according to the OECD learning compass 2030. Anticipation, action and reflection are competencies in their own, however, when combined in a cycle, they can assist and accelerate the development of student agency (see Figure 1).

The Anticipation-Action-Reflection (AAR) cycle is an iterative learning process whereby learners continuously improve their thinking and act intentionally and responsibly, moving over time towards long-term goals that contribute to collective well-being. Through planning, experience and reflection, learners deepen their understanding and widen their perspective. As learners engage actively in iterative cycles of anticipation, action and reflection, they can gain a sense of accountability because they feel more connected to the issues and problems being examined. In this sense comes the belief that they can make a difference in society. The AAR cycle enables learners to express and develop their agency both in classroom contexts and in life more generally.

Figure 1. Anticipation-Action-Reflection (AAR) Cycle

The AAR cycle consists of three phases: In the first phase, learners use their abilities to anticipate the short and long term consequences of actions, understand their own intentions and the intentions of others, and widen their own and others' perspectives. The second phase is where learners take action towards well-being. In the third phase, learners reflect on their thinking, which leads to deeper understanding and better actions towards well-being.

This study implemented the AAR cycle as a conceptual framework for tracking student agency. Students in the STEAM lab anticipated, planned, executed, and reflected on their community-based projects. During this process students attended many workshops to enhance their digital skills, data literacy, communication, problem solving and critical thinking skills.

On the other hand, according to Salmela-Aro (2009), student agency is influenced by parents, peers, teachers and the wider community, this led to the development of the term "Co-agency", often referred to as "collaborative agency", which implies the influence of a person's environment on his or her sense of agency. The concept of co-agency recognises that students, teachers, parents and communities work together to help students progress towards their shared goals. Co-agency is important for students' agency in terms of goal construction and reconstruction.

As a result of a project done by OECD in 2018, Hart's ladder of student participation in activities and decision making was used to develop the "Sun Model of co-agency" which illustrated the level of interaction of adults in each level of student agency (OECD, 2019), as presented in Figure 2.

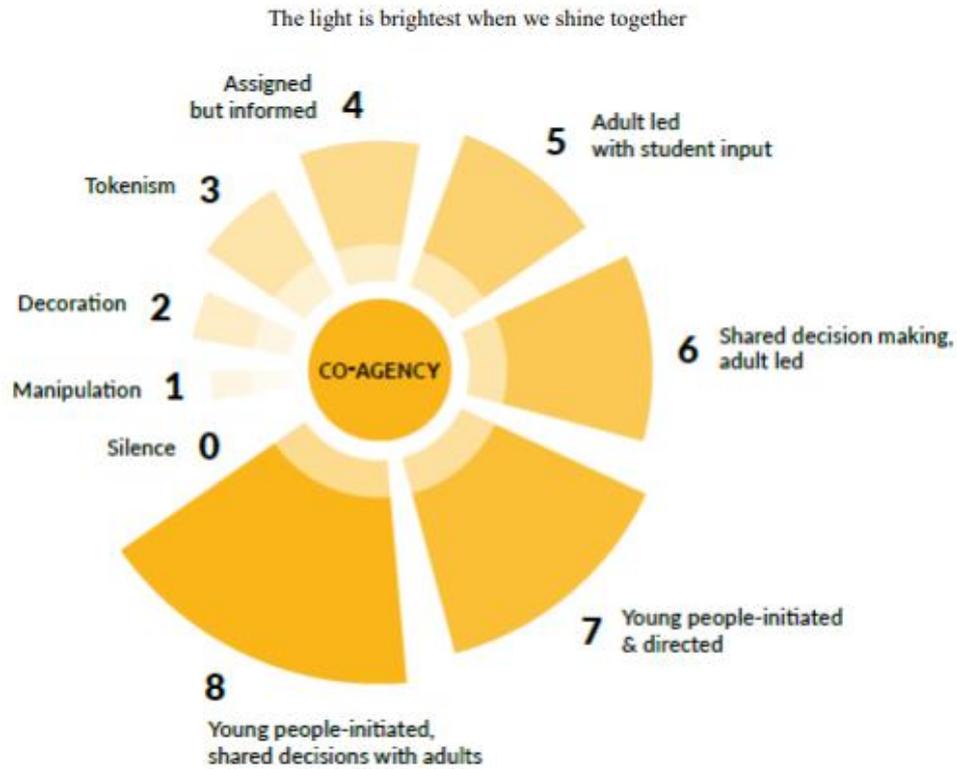

Figure 2. Sun Model of Co-agency (OECD, 2019)

To explain this model, the table below developed by OECD (OECD, 2019), describes, operationally, each level explaining the role of the student and that of the adult (see Table 1). The Sun model in this study was used to evaluate the level of interaction of adults, principal, teachers, and community members in the student agency.

Table 1. The Role of Young People/Students and Adults in each Level of Student Agency

Level of Student Agence	Level of interaction with adults
0.Silence	Young people remain silent and adults take and lead all initiatives and make decisions
1.Manipulation	Adults use young people to support causes, pretending the initiatives is from them
2.Decoration	Adults use young people to help a cause
3.Tokenism	Adults appear to give young people a choice, but there is little or no choice about the substance and way of participation
4.Assigned but informed	Young people are assigned a specific role and informed about how and why they are involved, but do not take part in leading or taking decisions for projects
5.Adult led with student input	Young people are consulted on the projects designed, and informed about outcomes, while adults them and make the

	decisions
6.Shared decision making, adult led	Young people are part of the decision making process of a project led and initiated by adults
7.Young people-initiated and directed	Young people initiate and direct a project with support of adults. Adults are consulted and may guide/advise in decision making, but all decisions are ultimately taken by young people.
8.Young people-initiated, shared decisions with adults	Young people initiate a project and the decision making is shared between young people and adults, leading and running the project is an equal partnership between young people and adults.

Literature Review

Role of the Principal

The role of a principal in promoting student agency is critical in today's educational landscape. A principal who prioritizes student agency can create an environment that fosters self-motivation and curiosity, leading to improved academic outcomes, social-emotional skills, and overall well-being. A principal can encourage student voice by allowing students to have input into their curriculum choices, and school activities. Teachers can also be encouraged to give students opportunities to think critically, collaborate, and solve problems on their own. Furthermore, research has shown that student agency promotes long-term success in both academic settings and the workforce (Henderson & Mapp, 2002). A principal who recognizes this can greatly impact the success of their students. According to a study by Zimmerman and Schunk (2011), when students have agency, they take ownership of their learning and are more motivated to succeed. A principal can promote student agency by creating opportunities for student voice, choice, and leadership (O'Neill, 2017). This can include involving students in decision-making processes, allowing them to design and lead projects, and providing choice in classroom assignments. When students feel empowered and in control of their learning, they are more likely to be engaged and invested in their education. Therefore, the role of a principal in promoting student agency cannot be overstated, as it can have a significant impact on student success both academically and personally.

Role of the Teachers

Teachers play a crucial role in promoting student agency, which is defined as "the power to take meaningful actions and solve problems" (Reeve & Shin, 2020). Teachers can support student agency by creating a learning environment that enables students to set their own goals, make decisions, and take ownership of their learning. This can be achieved by providing opportunities for student choice and autonomy in activities, encouraging risk-taking, and facilitating reflection and self-assessment. Research has found that teachers who implement a student-centered approach to instruction, where students' interests, experiences and perspectives are valued, are more likely to promote student agency (Zeiser et al., 2018). Ultimately, when teachers prioritize student agency, they foster a sense of empowerment and engagement in their students, which can enhance their motivation and achievement both in and out of the classroom.

Rationale

Promoting student agency, students can develop important skills such as self-regulation, critical thinking, and self-efficacy (Zimmerman, 2000). Research has shown that when students have agency in their learning, they are more engaged, motivated, and achieve higher academic outcomes (Gao & Liu, 2020). However, despite the potential benefits of student agency, many students still struggle to engage in self-directed learning. This highlights the need for further research to understand the factors that contribute to students' agency and how it affects their academic achievement. By having agency, students are able to set goals, monitor their progress, and regulate their motivation and emotions. Moreover, agency is linked to the development of higher-order cognitive skills such as critical thinking and problem-solving (Zimmerman, 2000). In recent years, researchers have emphasized the importance of promoting student agency in educational settings, particularly in the context of online learning. For instance, Wang et al. (2020) examined the relationship between student agency and academic performance in online courses. Their findings suggested that students who have higher levels of agency are more likely to actively participate in online discussions and achieve higher grades. However, little attention has been given to the role of agency in traditional face-to-face classroom settings, particularly in K-12 education.

Research shows that student agency increases civic engagement because students with more voice build stronger learning communities with teachers, they grow important academic characteristics and attitudes such as efficacy, engagement and motivation, and they welcome opportunities for experiential learning during their civic engagement (Hoefnegals, 2015).

Purpose of the study

The study was conducted in a Lebanese public high school implementing a community based STEAM lab. The purpose of this research is to assess the characteristics of the students agency, and to investigate and track the factors of promoting student agency and community engagement leading the change. The research addressed the following questions:

Main question: How can a student agency be developed in a school ?

- 1- What constructs characterize a student agency in the case under study ?
- 2- What are the factors leading to the development of the student agency ?

Method

Research Design and Sample

This study is a descriptive case study that assessed student agency and uncovered the factors behind that agency. The study applied a mixed method approach where quantitative and qualitative data were collected. The sample of this study included high school students, teachers, school principal, community members, and experts who

were involved in a community-based STEAM project in a Lebanese public high school. This project was funded and supported by *nafda* which is a Lebanese nongovernmental organization and principal led movement that aims to reform the education system to become more reinforcing of active citizenship, social justice, and good governance.

Data Collection Tools

Several data collection tools were implemented for triangulation purposes. Students' survey was used to measure the characteristics of the student agency. The survey's items were categorized into seven constructs: 1) self- efficacy, 2) perseverance of interest, 3) perseverance of effort, 4) locus of control, 5) mastery orientation, 6) metacognitive and self regulation, and 7) future orientation. Each construct was measured with between four and nine survey items, and responses to survey items ranged from 1 (disagree) to 4 (strongly agree) . For each survey construct, we calculated a scale score by averaging responses to relevant survey items. In addition, the survey included students' demographic information: Gender; grade level; learning language; time they joined the lab, the department joined, their effective role, and why they joined the lab.

To infer the factors that favored the development of student agency , semi-structured interviews were performed with the school principal, involved teachers, community members and experts. Moreover, a focus group with five active students in the STEAM lab was conducted to study the effect of the content and process of the STEAM-based projects, and the role of each of the principal, involved teachers, community members, and experts in promoting their agency. Students were asked to provide feedback on the following: opportunities they have been provided in the STEAM lab; their role as active members; the practices of the principal, teachers, experts, and community members; the skills they developed and the factors that favored the development of these skills; the projects accomplished; ideas for improvement.

Validity and Reliability

The survey is a validated instrument adopted from a study done by the American Institute For Research (AIR):" Maximizing Student Agency Implementing and Measuring Student-Centered Learning Practices" (Zeiser et al., 2018). The survey was piloted on five students that were not involved in the research. For reliability cronbach alpha was calculated to be 0.894 which shows high reliability and greater internal consistency of the items in the survey. The data from interviews and the focus group were transcribed, coded and analyzed by the three researchers collaboratively. The themes generated from the interviews were validated by the researchers through inter- rater reliability.

Results and Discussion

Thirty nine students from the STEAM lab completed the survey adopted from the American Research Institute (Zeiser et al., 2018). 65 % of the participants are females, and 80 % learn mathematics and science in English.

The students are distributed over four departments: Coding and web development, 3D printing, sewing, and Mechatronics (see Figure 3).

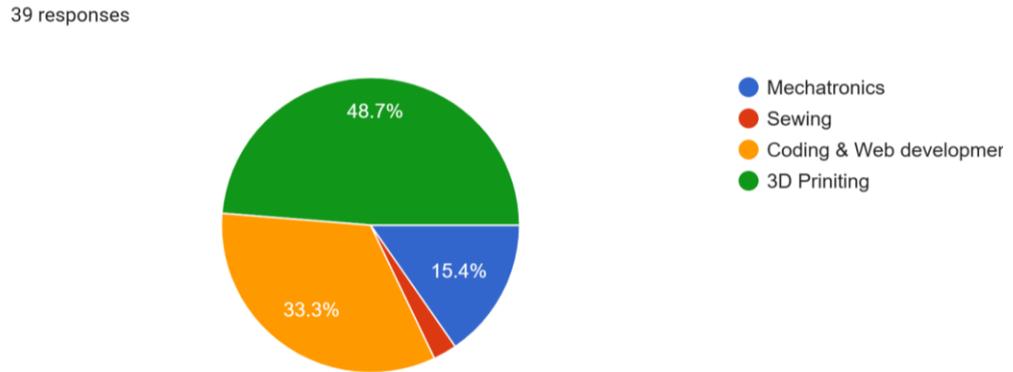

Figure 3. Distribution of Participant Students according to Departments

According to a scale from 1 to 5 (1 least effective and 5 most effective) the majority of students more than 80 % declared that they play an effective role in developing and sustaining the STEAM lab as illustrated in Figure 4.

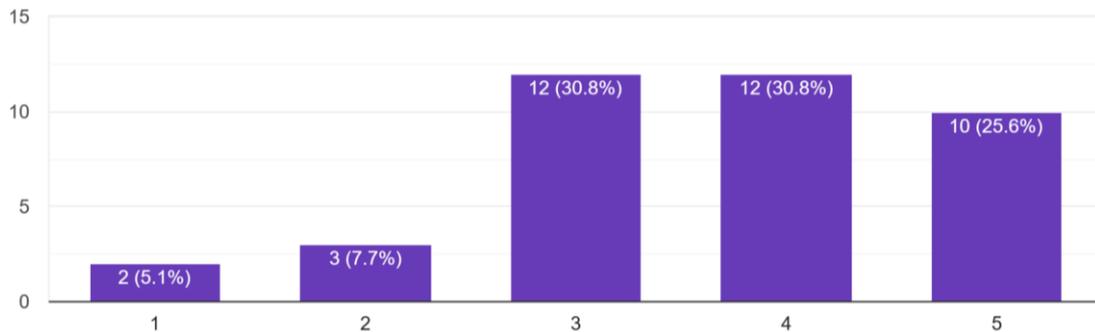

Figure 4. Effectiveness of the role of students in STEAM lab

To answer the first question of research about the characteristics of student agency, the survey constructs were measured based on specific constructs, the mean, minimum, maximum and standard deviations were calculated for each construct (see Table 2).

Table 2. Means and Standard Deviations of Students Agency Constructs

Constructs	N	Minimum	Maximum	Mean	Std. Deviation
Self-efficacy	39	1.88	4.00	3.13	.463

www.icres.net	May 18-21, 2023	Cappadocia, Turkiye	www.istes.org		
Perseverance of Interest	39	.00	3.50	1.67	.988
Perseverance of effort	39	2.00	4.00	3.0	.537
Locus of control	39	1.57	4.00	3.00	.548
Mastery Orientation	39	2.25	4.00	3.41	.504
Metacognitive and Self-regulation	39	2.00	3.36	2.61	.35
Self-regulated learning	39	1.67	4.00	2.99	.62
Future Orientation	39	1.80	4.00	3.31	.54

The items in the survey were coded on a scale from 0 for strongly disagree to 4 for strongly agree and 2 for neutral. The analysis of the results indicates that the mean for all constructs is greater than 2 except for the construct “perseverance of interest” which was calculated to be 1.67. The highest mean was for the self-efficacy construct. The results demonstrate that the participant students satisfy the agentic characteristics.

To infer the factors leading to the development of student agency in the case studied, interviews were conducted with the school principal, two of the teachers that followed the students in the Steam lab, a community member, and an expert from *nafda* who evaluated students’ projects.

Principal’s Perception

According to the principal, the main factors for the student agency were: The principal belief in the students’ capacities and the trust in their potentials; the students’ commitment to use the STEAM Lab and to learn coding and other skills. Moreover, in line with practicing good governance, students developed a code of behaviour and a management structure for the lab, they created the lab curriculum, rules and policies, and they made their direct connections with the students. They were given the chance to explore the community’s needs through visits to their workplace. For instance, a website for a flower shop was designed by the students.

Teachers’ Perception

Based on the teachers’ perceptions the factors that enhanced the development of student agency were: Students’ interest in the projects they worked on, they were not afraid to do mistakes, they were motivated and enjoyed what they were doing; The STEAM lab environment which allowed students to practise teamwork, acquire communication, problem solving, and critical thinking skills; the training that the students followed; the opportunity provided to students by the school principal and the involved teachers to have voice and choice, to

learn from their own mistakes, to practise leadership, to design their own projects, and to take decisions; providing the appropriate environment for creativity (STEAM lab) in terms of technologies that simulate their aspiration; their close ages and their ability to understand each other, think collectively, and the spirit of cooperation among them; the trust, encouragement and responsibility given to them; the moral support and positive feedback from teachers; the freedom to make the appropriate decision and find solutions.

Community Member Perception

According to the community member who accompanied the students from the moment of STEAM lab creation, the main factors that allowed students to be agentic were: The fact that students were given the opportunity to be active community members; to address community needs and take the initiative to solve problems; the workshops provided for students who were ready to explore their highest potential; the future vision of the principal who provided them with full control of the lab; the skills gained by students by sharing the lab responsibility; the shared experience, help and guidance provided by the community members when necessary.

Expert's Perception

The expert interviewed stated that promoting students agency was the result of different factors: First, the governance system that was demonstrated by the principal where students voice and agency were respected and reinforced throughout the extracurricular practices including the community- based STEAM lab. Seond, the leadership style of the principal who modelled the transformative leadership style where the vision of community engagement and social justice was reinforced. Third, the training approach adopted in the STEAM lab where students interest, voice, and leadership were reinforced with clear and informative resources allowing students' autonomy. Fourth, students' personal traits who were intrinsically able to work collaboratively in STEAM lab. Fifth, community appreciation for students' initiatives. Moreover, the project management approach that reinforces student centeredness, distributed leadership and connection to values of active citizenship, social justice and good governance and community support through community visioning process, enhanced the development of student agency.

Students' Perception

A focus group was performed with four students from the STEAM lab who are committee members that participated in creating the lab, and that satisfy the agentic characteristics. According to them, the motivation and support of the principal that always listens and shed light on specific issues enabled them to acquire these characteristics. The bonding between the team members that are now able to communicate very well, and to help each other in problem solving and decision making is one of the main factors that led to development of student agency. They declared that they were able to access the STEAM lab at any time, even after school and on weekends. Moreover, they thought that the agentic characteristics were enhanced due to the self-confidence, commitment, responsibility, critical thinking and pride acquired by the members after training and practising

teamwork during their projects. The projects designed were based on solving problems in the community.

Cross analysis of the data collected from interviews led to the emergence of specific themes related to student agency: the self-directed learning created in the STEAM lab; the training provided to students which allowed them to acquire skills of communication, collaboration, problem solving, critical thinking, decision making...; students' goal setting and responsibility during the initiation, planning, and execution of the projects; the project management approach; creativity and innovation; leadership and advocacy. The emerged themes along with evidence extracted from the data collected from the interviews are summarized in Table 3.

Table 3. Themes Emerged from Interviews and Focus Group

Theme	Principal	Teachers	Students	Community
Self- directed Learning	The principal believes in the students' capacities and trust their potentials	The self-learning opportunity provided to students by the principal and teachers	Self-commitment and responsibility	Students suggest solutions to problems they face and try to prove its validity
Collaboration & Team work	The principal encourages students to work together on projects and share their ideas	Communication, problem solving and critical thinking skills of students	Students communicate very well, and help each other in problem solving and decision making	Students were active community members who work in collaboration to solve real life problems
Goal Setting & Reflection	Principal listens to students and shed light on specific issues, this enabled them to acquire these characteristics	Students set their goals and monitor their progress	Students signed a social contract	Sharing responsibility and reflecting on their progress
Choice and voice	Students developed a code of behaviour and a management structure for the lab	Students choose their own projects and modes of presentation	Students have access to the lab all the time	Students' voice and choice was respected
Creativity and innovation	Trust in students' capacities boosts their creativity	Technologies that simulate their aspiration	Being able to learn from their errors and try again	The training followed by students had

				uncovered their highest potential
Leadership and advocacy	the vision of community engagement and social justice was reinforced.	Response of students to the community needs through design thinking	Solving problems in the community	Leadership and connection to values of active citizenship, social justice and good governance

Moreover, based on the sun model developed by OECD the analysis of the data showed that the students engaged in the STEAM lab projects are at the last level of the student agency where they initiate projects based on community needs and problems faced. The decision making related to projects were shared with adults: principal, teachers, and community members. who supported and guided the students during this process.

Conclusion and Future Recommendation

This study aimed to investigate the factors that lead to the development of student agency in a public high school who implemented a student led community-based STEAM lab. The students acquired agentic characteristics through planning, experience and reflection on their own projects. Students were given the responsibility to make decisions and own their own learning. Students were able to create the lab committee, curriculum, policy and rules. They designed Makerspace projects, teaching materials to be used in explaining science concepts in class using the 3D printer, three websites, and many robotic models. Moreover, the committee students are now in the process of training other students in three different schools.

Finally, based on our study the main factors that enhanced the development of student agency in our case are: The principal leadership style; teachers' guidance and follow up when requested by student; students' interest in the projects; the training approach which leads to students' self- efficacy; community support and appreciation to students' work; the project management approach; connection to values; and the personalised environment of STEAM lab as well as . This is in congruence with the study of Crowhurst and Cornish (2020), who identified five key factors to support students to have more agency in their learning: independence and ownership, scaffolding, students as teachers, joyfulness, and reflection. Similar factors were also identified by Wenmoth et al. (2021): students' engagement in active self directed learning experience; students' leadership; time management, and collaboration skills; students' reflections and teachers' feedback.

Similar projects can be implemented in schools to enhance agentic characteristics that allow students to acquire skills such as leadership, critical thinking, communication, collaboration, decision making, and problem solving. The factors that promote student agency inferred from this study can be implemented in regular classes giving

chance for students to set their learning goals and hold the responsibility to fulfil these goals.

Acknowledgements

We highly appreciate the support of Dr. Harb from AUB and Miss Nada Hassan from the community.

Università Di Torino, Italy

Abstract: This work addresses the importance of innovation in entrepreneurial and business education to ensure that students develop the ability to make complex decisions and solve complex challenges. The intention was to incorporate the complexity theory in decision-making and problem-solving in business and entrepreneurship. To achieve this, we present the results of the first phase of our project, aiming to scale the levels of complex thinking in university students, discuss the need for business and entrepreneurship students to develop complex thinking competency (including its sub-competencies of critical, systemic, scientific, and innovative thinking) in the complexity of the business environment, analyze the relevance of system elements, apply their inductive and deductive reasoning, and create appropriate and relevant solutions. Our findings suggest that an educational model focused on developing complex thinking and its four sub-competencies can enable entrepreneurs to integrate sustainable development, increase their social engagement and critical thinking, develop their imaginative intelligence and discursive and reflective skills, and thus improve their decision-making and problem-solving processes. In the future, we plan to extend this analysis to the behavior of real-life entrepreneurs.

Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023 International Conference on Research in Education and Science*, (pp. 822-930), Cappadocia, Turkey. ISTES Organization.

Introduction

Society currently faces complex challenges, such as sustainability, characterized by an undefined nature,

multiple potential solutions, and unique characteristics with competing objectives and open deadlines. To effectively address these challenges, educational institutions like business schools must equip students with the competencies and skills necessary to understand and solve these issues. Literature on entrepreneurial and business education highlights the importance of critical thinking, reflective thinking, and multiple intelligences. These skills are crucial for students to make informed decisions and solve problems effectively.

In the literature on the competencies and skills relevant to entrepreneurial and business education, most authors emphasize the importance of critical thinking (Amblee et al., 2022; McDonald et al., 2022). The AACSB (2018) refers to reflective thinking, and Carreira et al. (2022) to imaginative, aesthetic, multiple intelligences, and discursive and reflective reasoning skills. The AACSB (2018:35) recommends integrating technology into decision-making and problem-solving. This includes evidence-based decision-making integrating current and emerging technologies across the curriculum, including statistical tools, data management, data analytics, and information technology. Additionally, it is recommended that students demonstrate higher-order cognitive skills to analyze an unstructured problem, formulate and develop a solution using appropriate technology, and effectively communicate the results to stakeholders. Several universities have started to innovate how they design and teach business courses to ensure students develop the ability to make complex decisions. This approach emphasizes equipping students with the skills necessary to understand and solve complex challenges such as sustainability.

Literature Review

Entrepreneurial decisions, problem-solving, and rational frameworks

Several studies have explored various methods for understanding entrepreneurs' thought processes and actions. One such method is the concept of effectuation, proposed by Sarasvathy, which stems from the understanding that entrepreneurial processes are characterized by uncertainty and risk; it postulates that opportunities are created by the actions of entrepreneurs with available resources and not from the logic of prediction or causality (Sarasvathy, 1998; Sarasvathy, 2001). Effectuation and other prescriptive methods for entrepreneurship have faced criticism. For example, Mansoori and Lackéus (2020) compared effectuation with five other methods: discovery-based planning, prescriptive entrepreneurship, entrepreneurial planning, lean startup methodology, and design thinking. The authors use a three-step methodology to perform the comparison at three hierarchical levels (logic, model, and tactics) and in nine different dimensions (uncertainty management, resource management, knowledge extension, redirection power, continuous learning, iterative process, stakeholder interaction, team collaboration, and value creation) to illustrate their strengths, weaknesses, and complementarities. One of the authors' conclusions is that entrepreneurial methods should be articulated and taught as the result of collaboration between academicians and practitioners, which could deepen students' complex thinking as they grasp that the decisions they make to solve problems must consider what works, when, for whom, and in what context.

Several scholars consider that entrepreneurial actions are based on a rational, logical framework or are preceded by impulse (Lerner et al., 2018a, 2018b; Wiklund et al., 2016, 2018). We propose incorporating the complexity theory in the discussion to support entrepreneurs in creating value. While there is debate about the rationality of entrepreneurial actions, we must understand the impulse behind such actions. Kurdoglu et al. (2022) proposed a new framework combining rational and irrational logic based on the decision-makers' motivations. They argued that a decision is deemed motivationally rational when the truth is sought and motivationally irrational when interest is sought without empirical grounding.

Furthermore, they posit that motivationally rational decisions are based on reality and aim to find solutions that align with it, while motivationally irrational decisions are detached from reality and driven by impulses. The authors' argument about the adaptive potential of irrational decisions from a motivational standpoint is innovative and noteworthy. However, their reasoning raises questions about differentiating between impulsive decision-making and a lack of knowledge organization, whether decision-making in extreme uncertainty is always wholly irrational, and whether the observer can distinguish different rational and impulsive decision-makers. Additionally, it raises the question of whether the decision-maker characterized as rational is always aware of the knowledge he possesses and reality and whether the decision-maker characterized as impulsive does not also seek to understand the facts from his particular logic.

Complex thinking as a coherent framework

Although the proposal is highly sophisticated and goes beyond the simple dichotomy between rational and irrational actions, it is also limiting because what is defined as irrational could only be a lack of conscience. From the perspective of complexity theory, the problem in decision-making is not the factual error (false perception) or the logical error (incoherence) but the way we organize our knowledge into systems of ideas (Morin 2001). Therefore, rational actions and decisions are not devoid of errors, ignorance, and blindness. Every decision results from selecting significant data and rejecting non-significant data, i.e., operations that separate, unite, hierarchize, and centralize. These operations are based on principles of thought organization that permeate our vision of things and the world, even though we are unaware of it. Thus, qualifying the selection or rejection of significant or non-significant data as rational or irrational results in a one-dimensional view.

Classifying and explaining business decision-making as rational or irrational leads to simplistic thinking. One must develop complex thinking to get away from this mutilating and one-dimensional vision. Complex thinking makes it possible to clarify the opposition between rationalization (a logical system of explanation but deprived of empirical foundations) and rationality that strives to unite coherence with experience and to grasp the need for a rationality that is both critical and self-critical (Morin, 2020:52-53). In this sense, business and entrepreneurial careers should promote the development of complex thinking for decision-making and problem-solving.

It is crucial to teach entrepreneurs to observe the information, representations, concepts, ideas, and myths in

their minds to be clear that they are mediators between their ideas and reality. Complex thinking aspires to a non-partitioned, non-divided, non-reductionist, and non-unidimensional knowledge, i.e., it leads to multidimensional thinking that seeks all that is interrelated, interacting, and interfering. At the same time, it recognizes the unfinished and incomplete nature of all knowledge (Morin, 2001). It is necessary to become aware and sensitized to the enormous shortcomings of our thinking and to grasp that a mutilating thought necessarily leads to mutilating actions. This requires a reforming of thinking that seven complementary and interdependent principles can guide: the systemic or organizational, the hologram, the retroactive circle, the recursive circle, the autonomy/dependence, the dialogic, and the reintroduction of the knower in all knowledge (Morin, 2020). To the extent that entrepreneurs develop their complex thinking, they have within their reach other strategies, another starting point to make decisions and solve problems in a less mutilating way.

Concerning complex thinking and its sub-competencies, recent research has found a significant link with developing skills among business students. For example, Kuzina et al. (2022) identified critical thinking as essential in developing skills among business students, such as reading comprehension. Thus, they concluded that strengthening critical thinking in business areas reinforces knowledge acquisition and enables individuals to work more efficiently.

Results

A methodology for complex thinking development

Our interdisciplinary research group, Reasoning for Complexity (R4C), aims to scale higher education students' mastery of complex thinking skills by implementing training systems supported by Open Science and Technology 4.0 strategies. These strategies include connectivity, digitalization, virtualization, artificial intelligence, and data science, among others, linked to projects undertaken by the quadruple helix (university-industry-government-civil sector) for sustainable development solutions (Figure 1). Our paper shows the results of the first phase of a project that aims to scale the levels of complex thinking in university students in Mexico through case study models and personalized learning, open science, and artificial intelligence, using mixed-method measurements and supporting sustainable development goals.

One of the project's first-phase results was the systematization of the principles of the theory of complex thinking by authors such as Edgar Morin to conceptualize what we define as the macro competency of complex thinking that is integrated by four sub-competencies (critical, systemic, scientific, and innovative thinking) (Baena-Rojas et al., 2022; Ramírez-Montoya et al., 2022). The macro competency of complex thinking is a cognitive tool that can expand the thinking capacity of people facing challenging situations or problems. It can also help people develop competencies that allow them to think comprehensively about reality with a broad vision of the world (Vázquez-Parra et al., 2022) (Table 1). Table 1 shows that complex thinking perceptions for university students in Mexico are more developed in Schools of Medicine and Social Sciences than in Business (Vázquez-Parra et al., 2022).

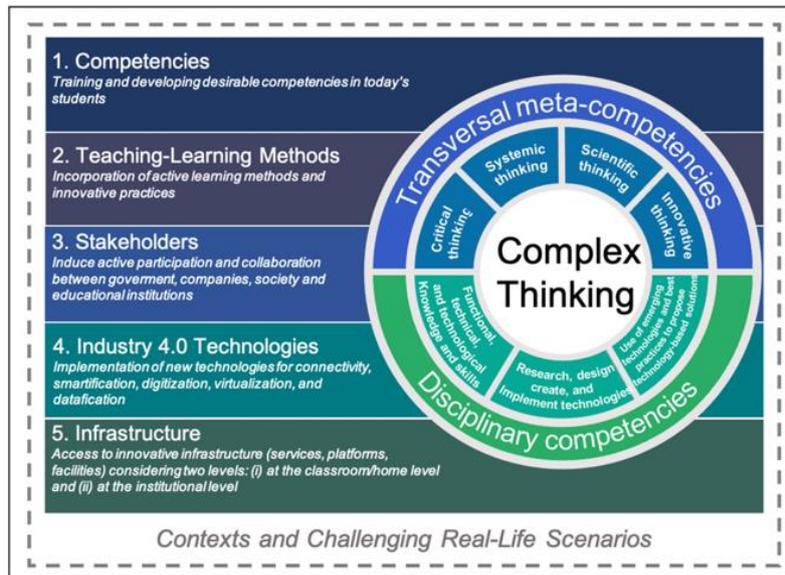

Figure 1. Complex Thinking in Education 4.0

Source: Vázquez-Parra et al., 2022

Table 1. Disciplinary areas in Higher Education and Complex Thinking

Regarding the sub-competencies, *critical thinking* evaluates the soundness of one's own and others' reasoning to form a judgment in a situation or problem and identify false arguments; *systemic thinking* analyzes the relevance of the system elements and is determined by analyzing the existing set; *scientific thinking* encompasses a set of reasoning strategies or cognitive processes, like inductive and deductive reasoning, problem-solving, and formulating and testing hypotheses; and *innovative thinking* allows problem-solving and designing and creating solutions for social progress (Rodríguez-Abitia et al., 2022). Developing the macro competency of complex thinking and its sub-competencies has unlimited scope in any field, including business and entrepreneurship.

Validated tools and instruments (eComplexity)

Another significant result of the research group was the design of the eComplexity instrument to measure the students' perceived mastery of complex thinking and its sub-competencies. This instrument was validated theoretically and statistically by a team of experts in the field (Castillo-Martínez et al., 2022). It comprises twenty-five items (each answered on a 5-level Likert scale), grouped into the four sub-competencies. In turn, each sub-competency is divided into the areas of knowledge, skills, and attitudes or values (Vázquez-Parra et al., 2022).

So far, we have used the instrument in various university institutions in 19 different countries: Argentina, Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, Finland, France, Germany, Guatemala, Holland, Italy, Mexico, Nicaragua, Paraguay, Peru, Spain, United States, Dominican Republic, and Venezuela. In addition to the eComplexity instrument, our research group also generated the Profile of the Social Entrepreneur instrument to evaluate the students' perceived mastery of social entrepreneurship and relevant skills through 28 items integrating five dimensions (personal, leadership for social change, social innovation, social value, and management for social change). The latter instrument was applied during entrepreneurship and used a 5-level Likert scale (García-González et al., 2020).

For example, this instrument was applied to a sample of 328 students in a private Mexican university in Guadalajara. The results showed that students perceived themselves as competent in sub-competencies related to personal values through indicators such as communication, knowledge of others, motivation, perseverance, and persuasion. They perceived themselves with limited practical, administrative, and implementation skills (Cruz-Sandoval et al., 2022). So, these students had a high index of personal values and a low index of competencies related to their environment's economic and administrative reality.

Discussion and Conclusion

Our research group obtained several significant results, including the systematization of the principles of the theory of complex thinking, the conceptualization of macro and sub-competencies of complex thinking, and the use of instruments to measure both the perceived mastery of complex thinking and social entrepreneurship competency. These results provide a solid methodological foundation for discussing topics such as the gender gap, contents, and formative processes in higher education, the strengthening of the competency of complex thinking, its use in the labor market, its use in the hegemonic patriarchal culture in Latin America, its ability to face professional challenges, and its effects on decision making and problem-solving.

The teaching of business process methods in business schools must include collaboration between academicians and practitioners for students to deepen their understanding of complexity to analyze situations to make proper decision-making. Entrepreneurs operate in uncertainty and risk, have limited resources, need to update their knowledge constantly, draw up plans but are ready to redirect them at any time, refine and improve their projects and products, and look for actors who can add more value. Therefore, students need to develop their complex thinking competency to think critically, systemically, scientifically, and innovatively to understand the complexity of the entrepreneurial environment, analyze the relevance of system elements, apply their inductive and deductive reasoning, and create appropriate and relevant solutions.

Beyond thinking that learning of this nature requires identifying reality and committing to learning to make rational decisions or decisions guided by impulses, we consider it more beneficial to teach students to grasp how they organize their ideas, to question rational decisions and actions, and become aware of the process of selecting meaningful data and rejecting those that are not meaningful. In this way, students can develop an

awareness of their vision of things and the world, which can help them make decisions about their projects and products that generate more value for their customers.

Conveying the message that understanding the operations that separate, unite, hierarchize, and centralize is crucial for a future entrepreneur because these determine the vision of things and the world. This understanding facilitates decisions based on the entrepreneur's vision of the world and what generates value for those purchasing their products or investing in their projects. In this realm, we propose incorporating complexity theory into discussing how entrepreneurs think and act to generate more value. Our methodology can be leveraged to assess complex thinking competencies in university business students at the beginning and end of their careers. In the future, we plan to extend this analysis to the behavior of real-life entrepreneurs.

Our findings suggest that an educational model focused on developing complex thinking and its four sub-competencies (critical, systemic, scientific, and innovative thinking) can enable entrepreneurs to integrate a sustainable development perspective, increase their social engagement and critical thinking, develop their imaginative intelligence and discursive and reflective skills, and improve their decision-making and problem-solving processes.

Abstract: George Town, the cultural heritage city of the Straits of Malacca was gazetted as a UNESCO World Heritage Site (WHS) in 2008. George Town Festival (GTF) is one of the significant annual events that commemorates the inscription of George Town. The Festival was first organised in 2010. However, due to the unforeseen Covid-19 pandemic in 2020 and 2021, the Festival has been organised virtually. Now in its thirteenth year, the Festival is once again set to gather on a physical stage. The main aims of GTF 2022 are two-fold: (1) to promote the arts and multi-cultural heritage at an international level and (2) to feature at least 40% of local programmes and artists. However, there are claims that the cultural promotions of GTF in regard to the multi-ethnic community is biased, where: (1) the Malay Muslim community are under-represented (2) the representations of GTF is said to be a bit ‘too Chinese’ and (3) GTF cultural promotions from 2010-2020 have greatly benefitted the Chinese community, leaving other multi-ethnic community under-represented at the Festival. Hence, this quasi-statistical qualitative study seeks to examine the patterns of arts and cultural heritage promotions in regard to the multi-ethnic community at GTF 2022. The findings revealed that the Chinese’s arts and cultural promotions at GTF 2022 is highly promoted compared to other multi-ethnic community in Penang.

T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 831-845), Cappadocia, Turkiye. ISTES Organization.

Introduction

On July 7, 2008, Melaka and George Town, the historic cities of the Straits of Malacca were jointly declared as a UNESCO Cultural World Heritage Site (Law et al., 2022). The size of UNESCO George Town Cultural World Heritage Site (hereafter the heritage Site) is doubled that of Malacca, measuring at 109 hectares for the core zone, and 150 hectares for the buffer zone. Thus, UNESCO George Town should allow for greater spatial, capitalistic and socio-cultural changes that deserve scholarly attention (Foo & Krishnapillai, 2019). The prestigious status of George Town was based on the Outstanding Universal Values (OUVs) (Amat, 2018) inscribed by UNESCO, 2023; Nasution, 2012):

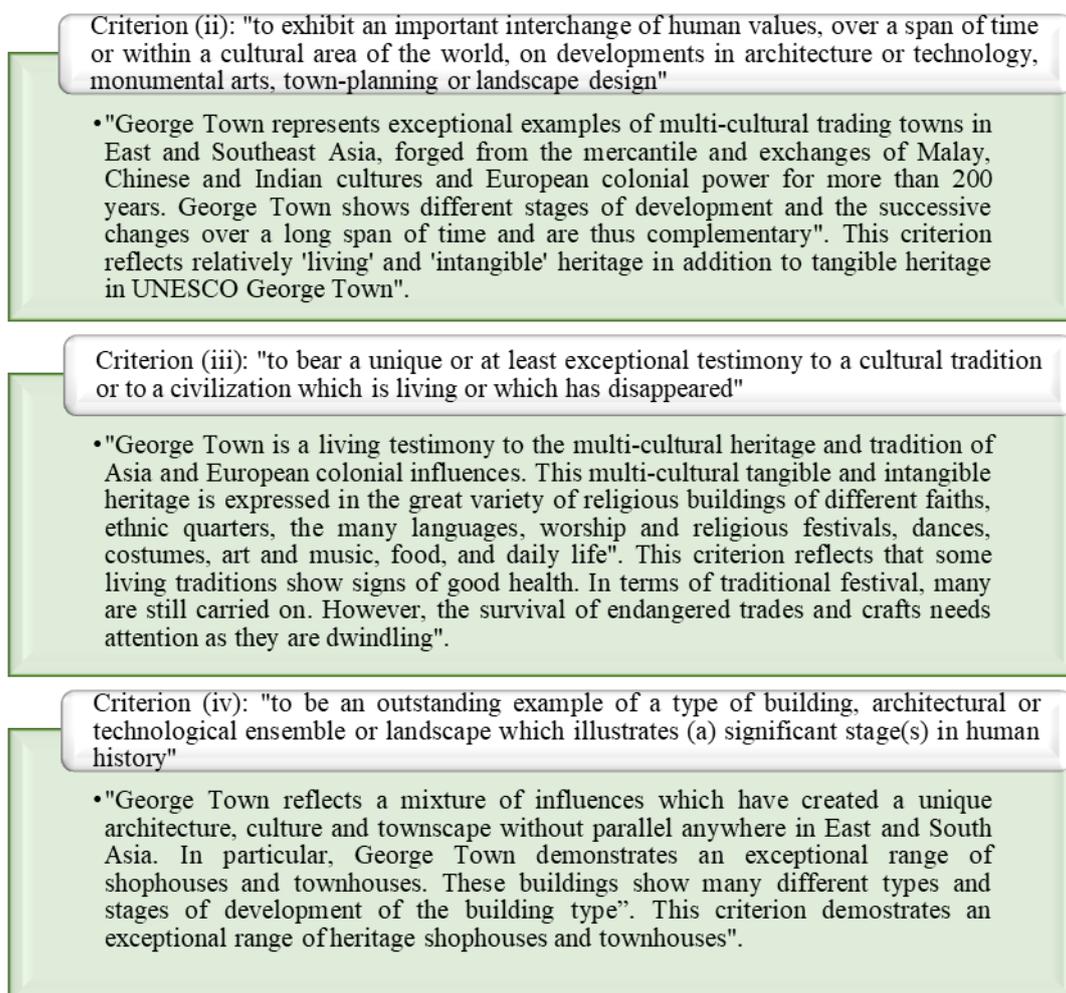

Diagram 1. UNESCO George Town's OUV criteria

In 2010, George Town World Heritage Incorporated (GTWHI) was established by the Penang State Government to manage, safeguard and promote UNESCO George Town. Since then, many projects and events have been held to commemorate the heritage site, such as the George Town Festival, George Town Literary Festival, George Town Heritage Celebrations; George Town Discovery Walk, to name just a few (GTWHI, 2023).

Problem Statement

Over the years, the initiative and purpose of organising the Festival has always been a subject of debate. There are claims that the cultural promotions of GTF in regard to the multi-ethnic community are biased, where:

1. the Malay Muslim community are under-represented at the Festival (Merican et al., 2018),
2. the representations of GTF are said to be a bit ‘too Chinese’ (Suhaimi & Bustami, 2020), and
3. GTF cultural promotions from 2010-2020 have greatly benefitted the Chinese community, leaving other multi-ethnic community under-represented at the Festival (Suhaimi, 2022). Specifically, the findings revealed that the GTF cultural promotions have benefitted the Chinese community with 48%, followed by Malay (26.3%), Indian (8%), Straits Chinese (7%), Indian Muslim (6%), Eurasian (4%), Japanese (0.4%) and Siamese with 0.3% (Diagram 2).

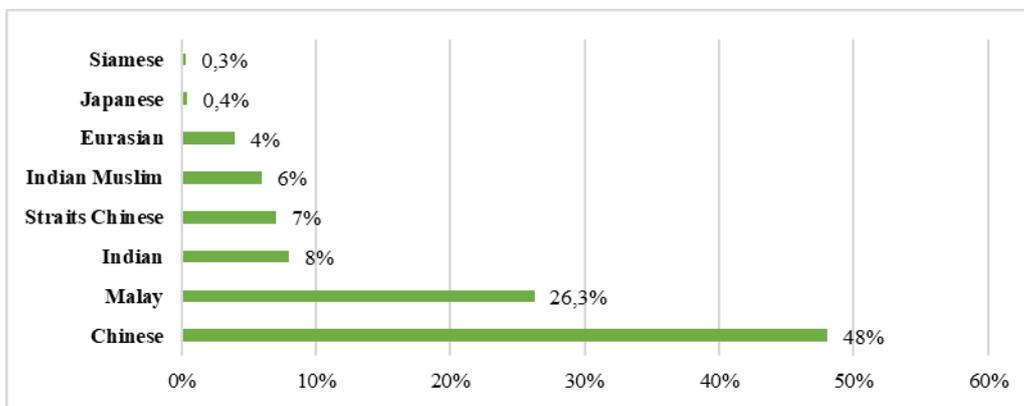

Diagram 2: GTF cultural promotions in regard to the multi-ethnic community from 2010-2020

Therefore, in problematising these issues, this study seeks to investigate the patterns of arts and cultural heritage promotions in regard to the multi-ethnic community representations at GTF 2022. This study will be based on the document analysis of GTF 2022 e-booklet (GTF, 2023).

Literature Review

The traditional style of literature review (LR) is established to locate a study within the existing knowledge. Nevertheless, the systematic literature review (SLR), has the objective of comprehensively locating and synthesising related study using organised, transparent and replicable processes. Compared to LR, the SLR offers several benefits, that include: the reviews can be reinforced through a transparent article retrieval process, a broader study area, and more significant objectives for controlling study bias. Additionally, SLR also has the benefit of motivating the scholars to come out with more significant results using quality evidence (Shaffril et al., 2021).

The review is based on a SLR, particularly with reference to the UNESCO George Town and George Town

Festival (GTF). This study applied an online search to navigate available sources from Scopus database. Since UNESCO George Town was gazetted as a Cultural World Heritage status in 2008 and GTF was established in 2010, articles included in this study consist of those published from 2008-2022.

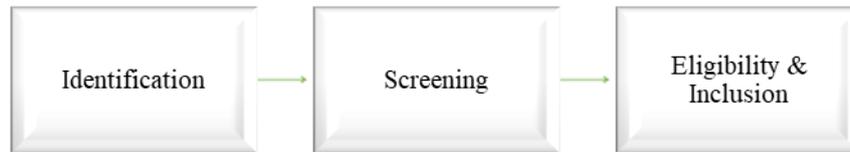

Diagram 3. SLR methodology

The analysis of SLR is a replicable, scientific and transparent methodology and minimises bias as it provides comprehensive decisions, procedures and conclusions from scholars (Shaffril et al., 2019). The methodology for a SLR in selecting articles includes identification, screening, eligibility and inclusion (Diagram 3).

Identification: The first phase is keyword identification, followed by a search for similar and related terms based on the keywords of previous studies. The Scopus advanced search string successfully retrieved 195 articles in the first phase of the SLR process (Table 1).

Screening: The aim screening phase is to screen the 195 articles based on the inclusion and exclusion criteria specified by the scholars. The first criterion was the open access documents, followed by year of documents, where only documents published from 2008 to 2022 were selected because UNESCO George Town was gazetted as a Cultural World Heritage status in 2008.

Table 2. Scopus' inclusion and exclusion criterion

Criterion	Inclusion	Exclusion
Open access	All open access, Gold open	Hybrid Gold, Bronze, Green
Year	2008 - 2022	1965 - 2007
Document type	Article, conference paper	Erratum, Review
Country	Malaysia	Other than Malaysia
Subject area	Social sciences, Arts and humanities, Multidisciplinary	Other than Social sciences, Arts and humanities, Multidisciplinary
Source type	Journal, conference proceeding	Other than journal, conference proceeding
Language	English	Other than English

The third criterion is the document type – only article and conference paper were selected. Next criterion included is studies that were conducted in Malaysia only. The fifth criterion is subject areas of social sciences, arts and humanities as well as one multidisciplinary document. The sixth criterion is source of documents where only journals and conference proceedings type were selected. The final criterion was language selection. Only those in the English language were included. Other non-English language documents were excluded to avoid translation errors. After screening, out of 195 Scopus-indexed articles, 171 articles were removed (Table 2).

Eligibility and Inclusion: Eligibility includes or excludes articles manually according to criteria specified by the scholars. The retrieved articles were thoroughly reviewed, and any articles that did not meet the particular criteria were excluded. Six articles were excluded as they did not specifically focus on GTF and/or UNESCO George Town in Penang, Malaysia. Finally, 18 articles are included and ready to be analysed (Diagram 4).

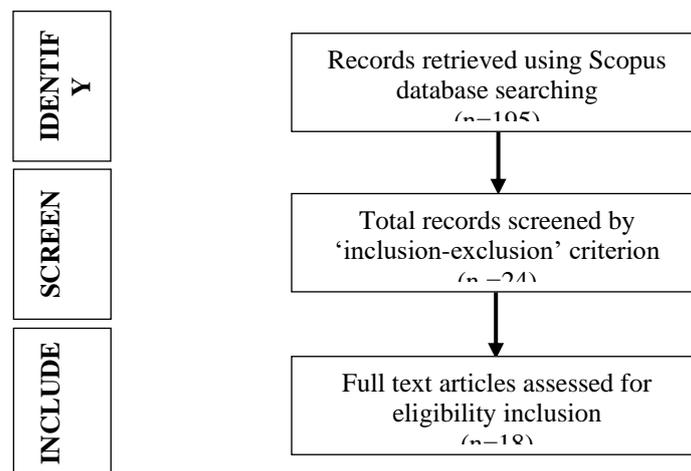

Diagram 4. SLR flowchart on GTF and UNESCO George Town

Table 3 lists 18 selected articles that are ready to be analysed. Majority of the articles are not based on ethnic preferences, that include: Tilaki et al. (2014), Goh (2015), Musa and Feng (2016), Farhad and Gelareh (2017), Wahab et al. (2018), Rahman (2018), Zhao et al. (2019), Mohd, Abdul Latiff & Senadjki (2019), Chan et al. (2020), Rahman and Velayuthan (2020), Abdul Aziz (2020), Chan et al. (2021), Halim and Tambi (2021), Ng

and Rahman (2021), Zwain (2021) and Abdul Aziz (2021). Bahauddin and Soon (2019) analysed the Chinese's Feng Shui approach of landscapes and building placements of Cheong Fatt Tze Mansion. Merican, Abdulra'uf & Sulam (2018) examined the historical consciousness and the representation of multi-ethnic community based on George Town Festival 2015 (GTF 2015). The findings of Merican, et al., (2018) showed that:

1. GTF 2015 depicts a wrong settler version of Penang history, where GTF 2015 featured that the Eurasians as the founding community of Penang. Truth is, the Malays are the natives and also the founding community of Penang.
2. GTF 2015 highlights the importance of British occupation of Penang in 1786, via the arrival of Light. The listing of Fort Cornwallis as a historical site of Penang suggests a Eurocentric representation of history commencing in 1786. Whereas, the existence of Malay communities prior to the 1786 occupation has been subverted by the dominant discourse.

In addition to the issues pertaining GTF, Suhaimi & Bustami (2020) claimed that GTF is said to be a bit 'too Chinese' and Suhaimi (2022) suggested that the GTF cultural promotions from 2010-2020 have greatly benefitted the Chinese community, leaving other multi-ethnic community under-represented at the Festival. Thus, this study seeks to investigate the patterns of arts and cultural promotions in regard to the multi-ethnic community representations at GTF 2022. This study will be based on the analysis of GTF 2022 e-booklet.

Table 3. The inclusion of 18 eligible articles

No.	Author	Objective	Ethnic preferences
1	Tilaki et al. (2014)	To address the role of liveability to improve the built environment, safety, public participation, cultural identity and tourist satisfaction in different communities	General
2	Goh (2015)	To investigate the determinants of customers' revisit intention for boutique hotels. The findings indicate that attitude, subjective norm and customer satisfaction influence customers' revisit intention.	General
3	Musa and Feng (2016)	To illustrate the role of an oral history project in creating public awareness, appreciation for heritage and encourage community engagement in the heritage discourse.	General
4	Farhad and Gelareh (2017)	To investigate the role of a cultural festival in creating a sense of attachment among local visitors in George Town World Heritage Site.	General
5	Wahab et al. (2018)	To assess the adaptive reuse works that have been implemented on the heritage buildings as hotels.	General
6	Rahman (2018)	To investigate the process of the built heritage commodification of boutique hotels in George Town	General

No.	Author	Objective	Ethnic preferences

Research Methodology

This study employed case study qualitative research method. According to Merriam (1998), Stake (2005), a case

study is the selection of the case to be studied – regardless any kind methods the scholars select to study the case. In this study, the GTF 2022’s arts and cultural promotions in regard to the multi-ethnic community in UNESCO George Town WHS is selected as a case study. Document analysis is used in this study. Document analysis is the review by the scholars based on of written materials, for examples: journals, annual reports, booklets, newspapers, and so on. According to Bowen (2009), document analysis can be used as a stand-alone method. Hence, in this study, the e-booklet analysis of GTF 2022 is employed as a stand-alone method. Moreover, document analysis is very much applicable to qualitative case studies – the intensive studies produce rich descriptions of a single event (Stake, 1995; Yin, 1994).

The quasi-statistical qualitative methodology is employed to analyse the document (Miller & Crabtree, 1992). The number of programmes included in the GTF 2022 will be analysed and categorised based on diverse ethnic background / preferences. For quasi-statistical qualitative methodology, numerical data is used in qualitative research, in order to make simple counts of things to support terms such as usually, most, some, and so forth. As mentioned by Maxwell (2010), numbers in the sense of simple counts of things are a legitimate and important sort of data for qualitative scholars.

“Qualitative researchers often make quantitative claims in verbal form, using terms such as many, often, typically, sometimes, and so on. Numbers have the value of making such claims more precise and coined the term quasi-statistics for simple counts of things to support terms such as some, usually and most. One of the greatest faults in most observational case studies has been their failure to make explicit the quasi-statistical basis of their conclusions” Becker (1970).

Findings

GTF 2022

George Town Festival (GTF) is one of the significant annual events to commemorate the inscription of George Town. In particular, GTF is a project by George Town World Heritage Incorporated (GTWHI), endorsed by the Penang State Government and fully supported by the Penang State EXCO for Tourism and Creative Economy (PETACE), City Council of Penang Island and Penang Global Tourism (PGT). GTF was first held in 2010. The first GTF Director was Mr. Joe Sidek of Joe Sidek Productions. He was the Director of GTF from 2010 to 2018. From 2019 to 2022, GTF was organised by Mr. Jack Wong of TLM Event. The Festival aims (George Town Festival 2023; Suhaimi, 2021):

- i. to promote the arts and multicultural heritage on an international platform,
- ii. to progress the format of arts and heritage education and foster an appreciation of the role of arts and heritage in George Town,
- iii. to ensure that a minimum of 70% of the events are free to attend, and
- iv. to feature a minimum of 40% of local programmes and artists.

GTF 2022 was held from 9th to 24th July 2022. Under the theme ‘A Festival for Everyone’, GTF 2022’s edition features around 70 programmes covering dance, theatre, music, film, visual arts and design throughout the 16 days of festival.

In specific, the findings showed that the Chinese's arts and cultural promotions at GTF 2022 is highly promoted compared to Malay and Eurasian's as well as other multi-ethnic community in Penang (under multi-ethnic community category). The findings is parallel with Merican et al. (2018) findings, where the Malay Muslim community are under-represented at the Festival. Additionally, it also parallels with other findings, where the representations of GTF are said to be a bit 'too Chinese' (Suhaimi & Bustami, 2020), and GTF cultural promotions from 2010-2020 have greatly benefitted the Chinese community, leaving other multi-ethnic community under-represented at the Festival (Suhaimi, 2022).

Social exclusion, social marginalisation or marginalisation is the social disadvantage to the fringe of society (Silver, 1994). In this context, social exclusion occurs in arts and multi-cultural promotions at the GTF 2022. Perhaps also, social exclusion occurs in terms of tokenism. The Festival does promote the arts and culture of other multi-ethnic community in Penang, but only in small percentage. By referring to the findings, it is evidently showed that the GTF 2022 is highly promoting the arts and cultural of the Chinese community in Penang, marginalising other multi-ethnic local community's arts and culture in Penang less and un-promoted. This is a type of social exclusion occurring at GTF 2022, and also the previous GTF since 2010.

Acknowledgment

Dr. Dina Miza Suhaimi is an independent scholar and an alumna of the Center for Policy Research and International Studies, Universiti Sains Malaysia, Penang, Malaysia. The researcher would like to thank the Islamic Tourism Centre (ITC), Ministry of Tourism, Arts & Culture Malaysia (MOTAC) for funding this study under the Islamic Tourism Research Grant 2020/21 (ITRG Ref. No: 2020-ITRG-120).

Abstract: George Town has developed over 200 years. In 2008, George Town was successfully listed as a UNESCO Cultural World Heritage Site (WHS). Since then, many events had been celebrated to commemorate the prestigious inscription of the heritage city. One of them is the George Town Heritage Celebrations (GTHC). GTHC focuses on promoting the intangible cultural heritage (ICH) of the local community in the heritage enclave. While fragile, it is very important to preserve and transmit both knowledge and skills of ICH from one generation to the next. Consequently, numerous researches about UNESCO George Town are focusing on tangible heritage, and the ICH is given less attention. Based on the GTHC 2022's e-brochure, this quasi-statistical qualitative research aims to investigate the promotions of the ICH vis-à-vis multi-ethnic local community in UNESCO George Town WHS, Penang, Malaysia. The findings showed that GTHC 2022 is most likely to promote the Chinese community's ICH.

Keywords: George Town Heritage Celebrations, Intangible Cultural Heritage, Multiculturalism, Promotion, UNESCO.

Introduction

An overview of UNESCO

Established in 1945, the United Nations Educational, Scientific and Cultural Organization (UNESCO) promotes international cooperation in education, sciences, culture, communication and information. Since then, many UNESCO programmes were introduced, among them is the UNESCO lists and designations. Under this listings are the World Heritage, Memory of the World Register, Creative Cities, Intangible Cultural Heritage, to name just a few (UNESCO, 2022a).

UNESCO cultural heritage scopes: What is ICH?

Generally, cultural heritage can be defined as the legacy that we receive from the past, experience in the present and transmit to future generations (Pelegri, 2008). There are two scopes of cultural heritage, namely: tangible cultural heritage and ICH (Isa et al., 2018; Salleh et al., 2021).

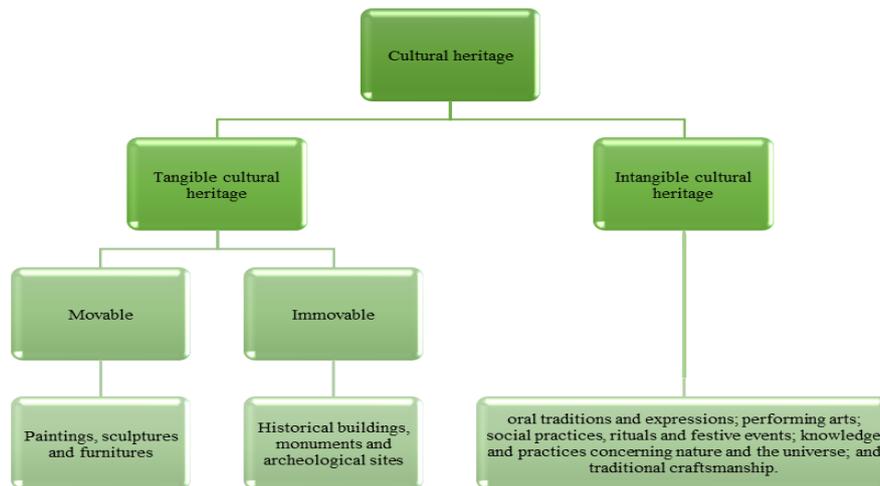

Diagram 1. Cultural heritage scopes by UNESCO

The tangible cultural heritage scope is divided into movable and immovable categories. The movable cultural heritage category includes paintings, sculptures, furniture and wall paintings; while the immovable cultural heritage category includes heritage buildings, monuments and archaeological sites. The ICH scope includes oral and traditions, traditional skills as well as science and habits related to nature and world (Hasibuan, 2011). Specifically, ICH is (UNESCO, 2022b):

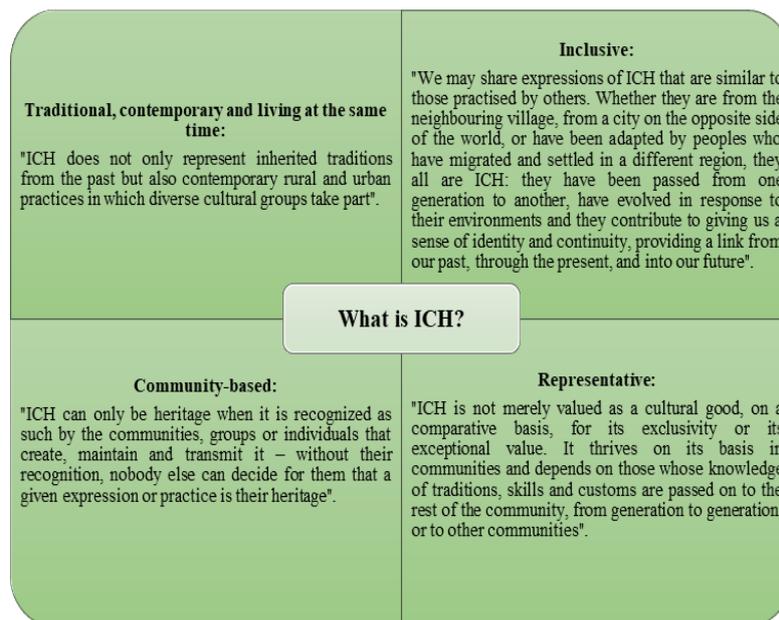

Diagram 2. ICH definitions

Five domains of ICH (UNESCO, 2022c)

So, what is ICH? The ICH means the practices, representations, expressions, knowledge, skills – as well as the instruments, objects, artefacts and cultural spaces associated therewith – that communities, groups and, in some cases, individuals recognize as part of their cultural heritage. This ICH is transmitted from one generation to generation. UNESCO manifests five domains of ICH, viz (a) oral traditions and expressions, including language as a vehicle of the ICH; (b) performing arts; (c) social practices, rituals and festive events; (d) knowledge and practices concerning nature and the universe; and (e) traditional craftsmanship. The instances of ICH are not restricted to a one manifestation, many include elements from multiple domains.

List of ICH in Malaysia

The proposed nomination of ICH must demonstrate at least one of the following criteria (UNESCO, 2022 d):

“**Criterion U.1:** the element is based on UNESCO’s five ICH domains: (a) oral traditions and expressions, including language as a vehicle of the ICH; (b) performing arts; (c) social practices, rituals and festive events; (d) knowledge and practices concerning nature and the universe; and (e) traditional craftsmanship.

Criterion U.2: The element is in urgent need of safeguarding because:

- a. its viability is at risk despite the efforts of the community, group or, if applicable, individuals and State(s) Party(ies) concerned; or
- b. it is facing grave threats as a result of which it cannot be expected to survive without immediate safeguarding.

Criterion U.3: Safeguarding measures are elaborated that may enable the community, group or, if applicable, individuals concerned to continue the practice and transmission of the element.

Criterion U.4: The element has been nominated following the widest possible participation of the community, group or, if applicable, individuals concerned and with their free, prior and informed consent.

Criterion U.5: The element is included in an inventory of the intangible cultural heritage present in the territory(ies) of the submitting State(s) Party(ies),

Criterion U.6: In cases of extreme urgency, the State(s) Party(ies) concerned has (have) been duly consulted regarding inscription of the element in conformity”.

Beginning 2008, 90 elements of ICH were listed, followed by 2009 (86), 2010 (47), 2011 (33), 2012 (32), 2013 (30), 2014 (38), 2015 (28), 2016 (41), 2017 (42), 2018 (39), 2019 (41), 2020 (35), 2021 (47) and 2022 (48). To date, there are 677 elements of ICH, consistent of 140 state parties (countries) (UNESCO, 2022e).

Thus far, there are six ICH elements in Malaysia, namely: Mak Yong theatre (2008), Dondang Sayang (2018), Silat (2019), Pantun (2020 - shared with Indonesia), Ong Chun ceremony (2020 - shared with China) and Songket (2021) (UNESCO, 2022 f).

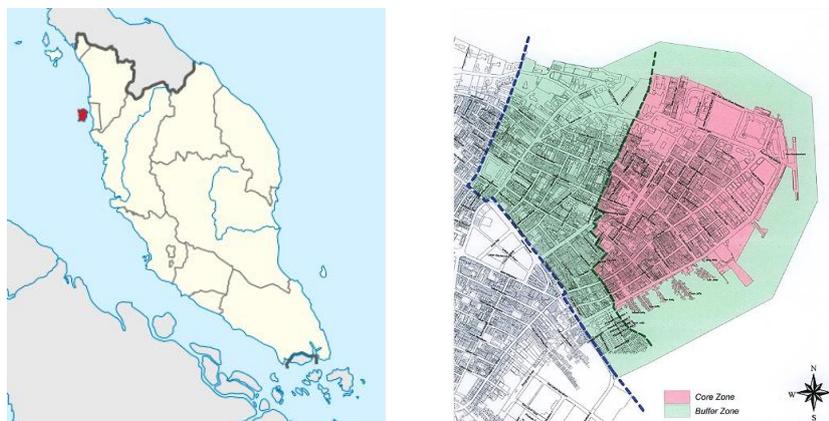

Table 1. Six elements of ICH in Malaysia

Elements	Year of inscription	Domain
Songket	2021	<ul style="list-style-type: none"> Traditional craftsmanship
Ong Chun / Wangchuan / Wangkang (shared with China)	2020	<ul style="list-style-type: none"> Social practices, rituals and festive events
Pantun (shared with Indonesia)	2020	<ul style="list-style-type: none"> Knowledge and practices concerning nature and the universe Oral traditions and expressions Performing arts Social practices, rituals and festive events
Silat	2019	<ul style="list-style-type: none"> Knowledge and practices concerning nature and the universe Performing arts
Dondang sayang	2018	<ul style="list-style-type: none"> Oral traditions and expressions Performing arts Social practices, rituals and festive events
Mak Yong theatre	2008	<ul style="list-style-type: none"> Oral traditions and expressions Performing arts Social practices, rituals and festive events

An overview of UNESCO GTWHS, Penang, Malaysia

UNESCO George Town World Heritage Site, Penang, Malaysia

In 2008, George Town was successfully declared as a World Heritage Site (WHS), by UNESCO (Halim & Tambi, 2021; Latiff et al., 2020). George Town is the capital of Penang (Wazani, 2021). There are two separate zones identified in this heritage Site, namely the core and buffer zones. The buffer zone is measured at 150.04 hectares and the core zone is measured at 109.38 hectares (Noraffendi & Rahman, 2020).

Map 1. The location maps of George Town

To be listed as a UNESCO Cultural WHS, sites must be of outstanding universal value (OUV) and meet at least

one out of six cultural selection criteria. The declaration of George Town as a UNESCO Cultural WHS was based on these 3 particular OUVs (UNESCO, 2022g):

- i. “to exhibit an important interchange of human values, over a span of time or within a cultural area of the world, on developments in architecture or technology, monumental arts, town-planning or landscape design;
George Town represents exceptional examples of multi-cultural trading towns in Southeast Asia, forged from the mercantile and exchanges of Malay, Chinese, Indian and European cultures for more than 200 years, each with its imprints on the architecture and urban form, technology and monumental art. George Town demonstrates different stages of development and the successive changes over a long span of time and are thus complementary.
- ii. to bear a unique and exceptional testimony to a cultural tradition or to a civilization which is living or which has disappeared;
George Town is a living testimony to the multi-cultural heritage and tradition of Asia and European colonial influences. This multi-cultural tangible and intangible heritage is expressed in the great variety of religious buildings of different faiths, ethnic quarters, the many languages, worship and religious festivals, dances, costumes, art and music, food, and daily life.
- iii. to be an outstanding example of a type of building, architectural or technological ensemble or landscape which illustrates (a) significant stage(s) in human history;
George Town demonstrates a mixture of influences which have created a unique architecture, culture and townscape without parallel anywhere in Southeast Asia. In particular, George Town reflects an exceptional range of shophouses and townhouses. These buildings show many different types and stages of development of the building type”.

Evidently, the listing of George Town as a UNESCO Cultural WHS was based on the value of multiculturalism and traditions that are still alive!

Such a unique blend of cultural diversity and traditions existing within the George Town inner city caught the world’s attention when George Town’s was inscribed into the UNESCO World Heritage listing in 2008 (Leng & Badarulzaman, 2014).

The George Town Heritage Celebrations (GTHC)

Since the declaration as a UNESCO WHS, apart from the traditional events and festivals of the multi-ethnic community in Penang, there have been numerous new events organised to specifically commemorate the heritage Site, such as the GT Heritage Day, George Town Festival (GTF), George Town Heritage Celebrations (GTHC), to name just a few. George Town Heritage Day is held on 7th July each year, since 2008. It is a public holiday in Penang. GTF is an annual festival that inaugurated in 2010. The festival presents a mix of arts and cultural programmes and held within the heritage Site. It provides a platform for domestic and international

creative talents to showcase their works.

GTHC have been taking place in the streets of the UNESCO George Town, every year since 2010. It specifically focuses on the celebrations of UNESCO George Town's ICH. Particularly, this Celebrations gives participants to showcase and experience first-hand UNESCO George Town's living traditions. GTHC builds on the multi-cultural and diverse character of the heritage Site, whose inhabitants continue to live in harmonious coexistence through the understanding of multi-cultural traditions that have been passed down through generations despite cultural and ethnic differences (UNESCO, 2022h). Most importantly, the Celebrations highlights the endangered ICH of UNESCO George Town (GTHC, 2022).

Problem statement

After being listed as a UNESCO Cultural WHS in 2008 and before the Covid-19 pandemic, Penang has been receiving increasing number of local and international tourists (Swan, 2020). Unfortunately, in 2000, the repeal of the Rent Control Act in George Town and the listing of George Town as a UNESCO Cultural WHS in 2008 have devastated many forms of ICH within the heritage enclave. The development has displaced the residents, most of whom are tenants who have lived in George Town since birth, and the traditional businesses that have served them (Looi, 2015; Sekaran & Ong, 2015).

Furthermore, in 2020, Malaysia was restricted to a four-phase of Movement Control Order (MCO) to prevent the widespread of Covid-19 in the country. The MCO has affected many sectors, including the tourism industry in UNESCO George Town. Zwain (2021) found that the Covid-19 had the worst hit on traditional businesses in the heritage enclave of George Town. Majority of the traditional businesses are struggling to survive. The old trades and livelihoods in the heritage Site have gradually declined (Swan, 2020). The heritage shophouses that are located in the heritage Site are among the few that have retained their authenticity artifacts, cultural and identities of George Town, also affected by the MCO (Tan, 2019; Tye, 2016).

After the UNESCO listing in 2008, the tangible heritage was well maintained through regular monitoring and improvement by the authority. However, the same cannot be said for the ICH that involves humans in and around structures, buildings, and spaces within the heritage enclave (Musa & Feng, 2016). Consequently, after Covid-19, there have been many studies that gave attention to the sustainability of heritage buildings (Swan, 2020).

Furthermore, numerous researches conducted about UNESCO George Town are focusing on tangible heritage instead of ICH (Rashid et al., 2020). In addition, the trend shows that the nomination of a WHS generally focuses on the tangible heritage properties, and the ICH is given less attention (Bakri et al., 2022). While fragile, it is very important to preserve and transmit both knowledge and skills of ICH from one generation to the next (UNESCO, 2022b).

Research objective

In problematising these issues, based on GTHC’s 2022 e-brochure, the researchers seek to explore the promotions of GTHC’s ICH vis-à-vis multi-ethnic local community in UNESCO George Town Cultural WHS, Penang, Malaysia.

1. SLR: ICH in UNESCO GTWHS, Penang, Malaysia

This section presents the systematic literature review (SLR) in selecting articles with special reference to the ICH in UNESCO GTWHS, Penang, Malaysia. The articles are retrieved from Scopus and Google Scholar databases. The methodology for a SLR in selecting articles includes identification, screening, eligibility and inclusion. Identification is a phase in selecting the most relevant articles. The first point is keywords identification, followed by a search for related and similar terms based on the keywords of past research. The Scopus search strings retrieved 13 articles, while the Google Scholar retrieved 2 articles (Table 2).

Table 2. Scopus advanced search string

Database	Search string
Scopus	TITLE-ABS-KEY ((ich OR “intangible cultural heritage” OR “intangible heritage”) AND (penang OR georgetown OR “george town”))
Google scholar	(with exact phrase:) "george town heritage celebration"

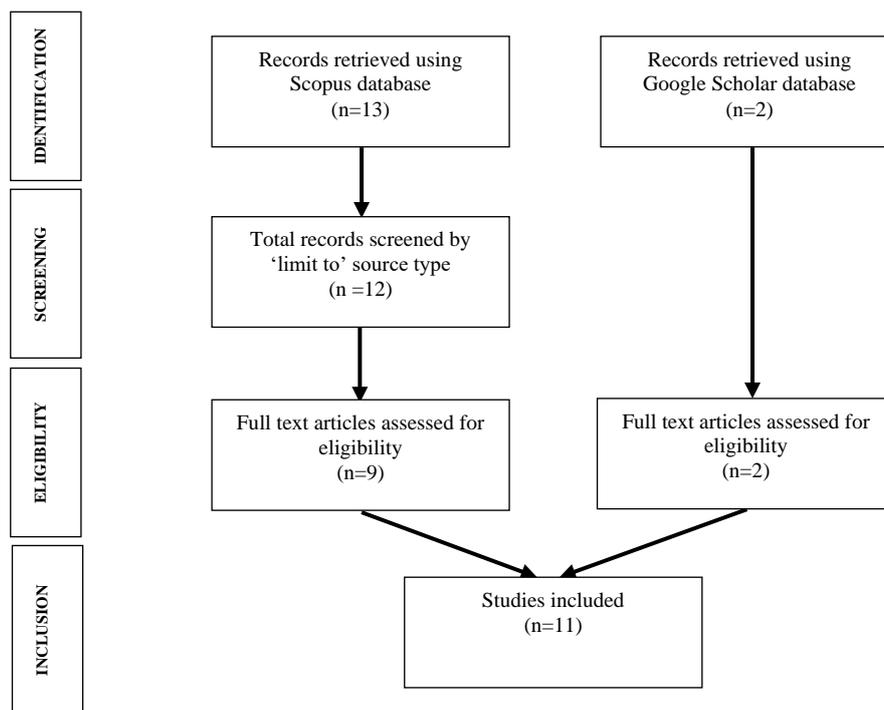

Diagram 3. SLR flowchart

The aim of the screening phase is to screen the 13 (Scopus) articles and 2 (Google Scholar) articles based on the inclusion and exclusion criteria specified by the researchers. For Scopus, the only criterion was source type. Only ‘journal and conference proceeding’ were included. After screening, 1 article was removed.

Eligibility includes or excludes articles manually according to the criteria specified by the researchers. The retrieved articles were thoroughly reviewed and any articles that did not meet the criteria, were excluded. Three articles were removed from Scopus database as (1) it was written in Chinese language and (2) two articles did not specifically focus on UNESCO GTWHS, Penang, Malaysia. As a final point, a total of 11 articles from Scopus and Google scholar databases were included and ready to be analysed (Diagram 3: SLR flowchart).

Table 3. SLR Matrix

No.	Author	Findings	
		Sustainability of ICH	Branding of UNESCO GTWHS through ICH
1	Bideau and Kilani (2012)	relocations of local inhabitants	
2	Leng and Badarulzaman (2014)		Gastronomy
3	Musa and Feng (2016)	oral history documentation	
4	Cheng (2017)		Penang hawker food
5	Mei (2017)	Chinese architectural feng shui	
6	Tan et al. (2018)	people-place bonding	
7	Rashid et al. (2020)		tourists’ perception on ICH as brand image of UNESCO George Town
8	Suhaimi and Bustami (2020)	George Town Festival cultural promotions of multi-ethnic community	
9	Lim et al. (2021)	garment preservation	
10	Law et al. (2022)	the role of stakeholders in safeguarding the ICH	
11	Bakri et al. (2022)	relationship between GTWHS and its local communities	

Table 3 shows the SLR table matrix outlining 11 articles. These articles are focusing on ICH in UNESCO GTWHS, Penang, Malaysia. There are two categories of SLR focus area: (1) the sustainability of ICH and (2) branding of UNESCO GTWHS. Researches that focus on the sustainability of ICH in UNESCO GTWHS are Bideau and Kilani (2012), that focuses on the relocations of local inhabitants; followed by Musa & Feng (2016) - through oral history documentation; Mei (2017) – Chinese architectural feng shui; Tan et al. (2018) – people-

place bonding; Suhaimi and Bustami (2020) – George Town Festival cultural promotions of multi-ethnic community; Lim, et al. (2021) – garment preservation; Law et al. (2022) – the role of stakeholders in safeguarding the ICH; and Bakri et al. (2022) - relationship between GTWHS and its local communities.

Researches about branding of UNESCO GTWHS are Leng and Badarulzaman (2014) – gastronomy; Cheng (2017) – Penang hawker food; and Rashid et al. (2020) - tourists' perception on ICH as brand image of UNESCO George Town. None of these researches focus on the cultural heritage promotions of George Town Heritage Celebrations (GTHC) vis-à-vis multi-ethnic community in the heritage enclave. GTHC is one of the significant festivals in commemorating George Town as a UNESCO Cultural WHS. GTHC focuses on the ICH of UNESCO GTWHS. GTHC have been organised for more 10 years. Thus, this research is vital to be carried out.

Research Methodology

This research employed case study qualitative research method. A case study is the selection of the case to be studied – by whatever methods the researchers choose to study the case (Merriam, 1998; Stake, 2005). In this research, the GTHC 2022's cultural promotions vis-à-vis multi-ethnic community in UNESCO GTWHS is selected as a case study.

The data collection used in this research is document analysis. Document analysis refers to the review by the researcher of written materials, such as journals, newspapers, annual reports, brochures, to name just a few. Document analysis can be employed as a stand-alone method (Bowen, 2009). Thus, in this research, the document analysis of GTHC 2022's e-brochure is used as a stand-alone method. As a research method, document analysis is particularly applicable to qualitative case studies - intensive studies producing rich descriptions of a single event (Stake, 1995; Yin, 1994).

The quasi-statistical qualitative methodology is used to analyse the document (Miller & Crabtree, 1992). The number of programmes included in the GTHC 2022 will be analysed and categorised into multi-ethnic community preferences. In quasi-statistics, numerical data is used in qualitative research to make simple counts of things to support terms such as some, usually and most. Specifically, numbers in the sense of simple counts of things are a legitimate and important sort of data for qualitative researchers (Maxwell, 2010).

“Qualitative researchers often make quantitative claims in verbal form, using terms such as many, often, typically, sometimes, and so on. Numbers have the value of making such claims more precise and coined the term quasi-statistics for simple counts of things to support terms such as some, usually and most. One of the greatest faults in most observational case studies has been their failure to make explicit the quasi-statistical basis of their conclusions” Becker (1970).

Findings

GTHC 2022

The George Town Heritage Celebrations (GTHC) is an annual celebration to commemorate the prestigious declaration of George Town as a UNESCO Cultural World Heritage Site (WHS) on 7th July 2008. It celebrates the living heritage of George Town's ICH that takes place within the historic streets of George Town. GTHC 2022 marks the year that the Celebrations is able to be organised physically after a two-year long overdue because of Covid-19 pandemic. This year, the Celebrations is held for three-day long – that are on July 2, 3 and 7, 2022.

Analysis

Table 4. GTHC 2022 programmes

No.	Programme name	Malay	Muslim	Chinese	Indian	Straits Chinese	Eurasian
1	<i>Persembahan Boria: Warisan George Town - Kumpulan Boria Omara Pulau Pinang</i>	✓					
2	Odissi Dance: Arabhi Pallavi - The Temple of Fine Arts Penang				✓		
3	Chinese Orchestra Medley - Chong Yee Chinese Music Centre and Academy			✓			
4	Sitar Recital - The Temple of Fine Arts Penang				✓		
5	Lion Dance: The Awake of The Lions - Penang Grocers' Association			✓			
6	Cultural Folk Dance: Journey - The Temple of Fine Arts Penang				✓		
7	Gamelan Ensemble - Wak Long Music and Art Centre	✓					
8	Chinese Drums: Reborn - Louds Percussion			✓			
9	<i>Persembahan Dikir Barat: Let's Suka Ria - Dikir Barat Suara Mutiara</i>	✓					
10	Glove Puppet Theatre: The Monkey King's Havoc in Heaven - Beng Geok Hong Glove Puppet Show			✓			
11	<i>Persembahan Dikir Barat: Let's Suka Ria - Dikir Barat Suara Mutiara</i>	✓					
12	Carnatic Vocal Performance - The Temple of Fine Arts Penang				✓		
13	<i>Silat Kapi - Pertubuhan Seni Silat Kapi 997 Pulau Pinang</i>	✓					
14	Nillaikalakki Silambam - <i>Persatuan Nillaikalakki Silambam Pulau Pinang</i>				✓		
15	Wushu - CMF Wushu Academy			✓			
16	Lion Dance: The Awake of The Lions - Penang Grocers' Association			✓			
17	Rhythmic Kathak Dance - The Temple of Fine Arts Penang				✓		
18	<i>Persembahan Ghazal Parti: Mai Berpesta - Kumpulan Boria Omara Pulau Pinang</i>	✓					
19	Chinese Drums: Reborn - Louds Percussion			✓			
20	Teochew Opera: A Drizzling Rain - Lau Geok Thng Dramatic Troupe			✓			
21	<i>Persembahan Wayang Kulit: Wak Long Menjadi Raja - Wak Long Music and Art Centre</i>	✓					
22	Art of Khat: Learn to write your name in the traditional Jawi script - <i>Yayasan Islam Pulau Pinang</i>		✓				
23	The Way of The Brush: Learn to write your name in Chinese, using only brushes and ink - Van Hin Book Co.			✓			
24	<i>Eh Wau Bulan! Make your own Malaysian Moon Kite - Wak Long</i>	✓					

No.	Programme name	Malay	Muslim	Chinese	Indian	Straits Chinese	Eurasian
	Music and Art Centre						
25	Henna: The Body Art for Celebrations - Free Henna hand art as you join our celebration - <i>Persatuan Hindu Pulau Pinang</i>				✓		
26	'Jian-Zhi' Learn the ancient Chinese folk art of paper cutting - <i>Gabungan Belia Persatuan Klan Cina Pulau Pinang</i>			✓			
27	'Wood' You Print This? - Make your own Woodblock Prints - <i>Gabungan Belia Persatuan Klan Cina Pulau Pinang</i>			✓			
28	<i>Wayang Kulit</i> : Rise of the Shadow Puppets - Wak Long Music and Art Centre	✓					
29	Kolam: Symbol of Well-being and Welcoming - <i>Persatuan Hindu Pulau Pinang</i>				✓		
30	Thoranam: The Mark of Occasions - Learn to weave this traditional hanging decorations - <i>Persatuan Hindu Pulau Pinang</i>				✓		
31	Film #1 Penang Eurasian Cultural Adaptation						✓
32	Film #2 Boria in the New Normal	✓					
33	Film #3 The Celebration of Mue Guek in New Normal			✓			
34	Film #4 Penang Teochew Puppet and Opera House in the New Normal			✓

36	Film #6 Perseverance: Moh Teng Pheow Nyonya Koay					✓	
37	Film #7 Phor Thor in a Pandemic (Hungry Ghost)			✓			
38	Film #8 Eye Dotting Ceremony: Crisis and Opportunity			✓			

Table 4 shows the list of 38 programmes at the GTHC 2022. Based on the ethnic preferences, GTHC 2022 is most likely to promote the Chinese community's ICH with 39%, followed by Malay (26%), Indian (24%), Straits Chinese (5%) as well as Muslim and Eurasian-ethnic with one (3%) programme each (Diagram 4).

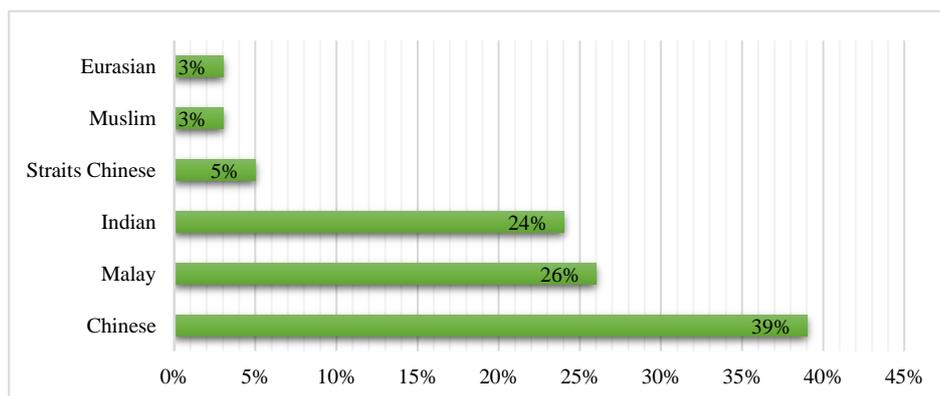

Diagram 4. ICH promotions at GTHC 2022 vis-à-vis multi-ethnic community in UNESCO GTWHS, Penang

Conclusion

UNESCO George Town Cultural World Heritage Site is a good example of multiculturalism. Derived from its 200-year history, the heritage enclave has more than Chinese-, Malay-, Indian-, Straits Chinese-, Muslim- and

Eurasian-influence have to offer. Other minor ethnic groups like *Jawi Peranakan*, Arab, Indonesian descent, Siamese, to name just a few - are also part of the UNESCO's cultural OUVs. Every ethnic group has their part in contributing to the multiculturalism that leads to the listing of George Town as a UNESCO Cultural WHS. Thus, more ICH promotions that represent all the multi-ethnic community in the heritage enclave deserves to be highlighted. Like other elements and essences of the Site's multiculturalism, other festivals and ICH promotions of multi-ethnic community in UNESCO GTWHS, Penang, needs more attention.

Danh Thanh Ly

FPT University, Vietnam,

Abstract: Target 4.7 in Sustainable Development Goal 4 (SDG4) aims to ensure that education is equally accessible to all genders who are taught to appreciate human rights and cultural diversity as global citizens. Understanding and sympathy for intercultural differences become important in higher education. With a focus on the foundations and dimensions of Vietnamese culture, the course VNC104 (Vietnamese Culture) allows lecturers to meet Target 4 in SDG4 in some ways. Advancing students' understanding and sympathy for intercultural diversity requires lecturers to involve them in activities that are socially constructed. It is argued in this paper that socially constructed knowledge can be absorbed through the body and mind. Bodily engagement, environment, task integration, and use of objects play a vital role in this process. The world is not simply understood by the working mechanism in our brains. Nevertheless, it must be felt and sensed. In this paper, the authors combine embodiment with Bloom's taxonomy to increase students' cognitive development through the connection between the mind and body. The combination of these theories has the potential to link social constructivism to students' bodily engagement in the world through cognitive processes. It also develops an innovative approach to establishing an organic rapport with students of diverse backgrounds and ensuring education quality for global citizenship.

Keywords: intercultural diversity, Vietnamese culture, Bloom's taxonomy, global citizenship, embodied cognition

Ciddi (Eds.), *Proceedings of ICRES 2023—International Conference on Research in Education and Science* (pp. 862-876), Cappadocia, Turkiye. ISTES Organization.

Introduction

Bloom's taxonomy is widely applied in education. Bloom and his associates came up with six levels of thinking that are arranged from a low-order to a high-order sequence. Nonetheless, recent research has pointed out that Bloom's taxonomy is flawed. This taxonomy's hierarchical structure has been critiqued for being excessively rigid and failing to adequately capture the complexity of learning (Krathwohl, 2002). It is crucial to modify the

taxonomy to fit local circumstances. In addition, Nguyen and Phung (2018) contended that Bloom's taxonomy falls short in meeting the demands of 21st-century learners, who tend to require a more varied collection of abilities and competencies is typically covered by the framework. They criticized Bloom's taxonomy for its exclusive concentration on cognitive functions and its omission of significant non-cognitive areas including social and emotional development, cultural competency, and digital literacy. Nguyen and Phung (2021) were in incongruence with Bloom's taxonomy by stating that students may not always go through the hierarchical levels of cognition. They may use a certain level of cognition for a particular task and then another for either the next sequence of the same task or for another task.

This article is not intended to criticize Bloom's taxonomy. Instead, the authors of this article would like to specify the process of the integrated model. The authors argue that we are perceivers, and at the same time, we are being perceived, allowing our knowledge to evolve and develop. This argument is based on the integration of embodiment into Bloom's taxonomy. The incorporated model is illustrated in a Vietnamese culture course at a private university in Vietnam. This course is only the first testing phase of this model, which only presents the implementation and initial student feedback. More empirical research is needed to test the validity of this model.

The introduction of this original model is important in higher education. The authors acknowledge that many other theoretical frameworks or Bloom's taxonomy itself perform a fundamental role in the design of instructional activities. However, we believe that our body is the vehicle for us to enter the world. What the teacher teaches is what the teacher thinks is right. Yet, it is the students with their bodies and minds that enable them to enter what the teacher teaches. Perception, therefore, is a combination of the mind and body.

The article is structured in several sections. The first section discusses education as a means for sustainable development. Increasing students' understanding of intercultural diversity is essential for global citizenship, and this is outlined in the second section. The Vietnamese Culture course (internal code VNC104) is introduced in the section that follows to illustrate the expected course outcomes that include students' understanding of cultural diversity. Bloom's taxonomy and embodiment are introduced later to facilitate the argument about the nexus of the body and the mind. The rest of the paper shows the authors' experiences in conducting the VNC104 course by using the integrated model between Bloom's taxonomy and embodied learning and teaching approaches.

Education for sustainable development

The United Nations Educational, Scientific and Cultural Organization (UNESCO, 2015) developed Sustainable Development Goal 4 (SDG4) with 10 targets that promote education for all so that everyone can achieve an education that can be suited for their global citizenship. Target 4.7 in SDG4 emphasizes that every learner is able to learn the knowledge and skills for them to develop sustainably. These sets of knowledge and skills allow them to lead a healthy lifestyle, respect human rights and gender equality, and value the culture of peace. They

should also learn how to appreciate cultural diversity as cultural understanding and sympathy can significantly contribute to sustainable development for society and individuals. It is the ability to live together with others peacefully and sustainably. UNESCO also proposes three means to implement these targets one of which is to create effective learning environments with adequate facilities for learning. The authors of this paper further argue that such effective learning environments should allow for an understanding and appreciation of culture diversity to happen.

An effective learning environment should encompass spaces for students to learn how to understand and value intercultural diversity (see Murray, 2016). It is sometimes considered an added value to lessons that do not necessarily cover cultural issues. In culture courses, of course, this value should be highlighted through foreign student exchange programs, overseas learning experiences, or a course per se. What matters to education for sustainable development is students' ability to comprehend similarities, differences, and meanings of culture rituals and practices among cultures. Respect for those differences, as such, can be maintained (Guo & Jamal, 2007). The authors of this paper keep arguing further that respect for differences among multiple cultures is important, but it is similarly important to understand, appreciate, and even embed in these cultural differences. The meaning of this cultural embeddedness is not to change oneself, but to enable one to act like one of the cultural groups with proper understanding and appreciation of the similarities and differences. We are our culture. We don't simply have a culture in us. This is the primary argument we would like to formulate in this section so that we can advance an understanding of education as a means for sustainable growth. Only when students are able to culturally act like others (as such a culture is embedded in them). This is why intercultural diversity and understanding of this issue matters.

The body as the means to appreciate intercultural diversity

O'Reilly, Williams, and Barsade (1998) described diversity as a characteristic of being multiple, different and possibly similar at the same time, and divergent. This feature is reflected and embedded in us, our actions and behavior, thoughts, objects that we use, and even instructional activities. Human beings are never the same. Cultures are never the same either. As a result, interactions that happen across cultures may result in intercultural diversity.

From several perspectives, culture is defined differently from diverse perspectives. Leininger (1995) described cultures as transmitted values, beliefs, and customs that guide thinking, decisions, and actions in patterned ways. According to Pauwels et al. (1997), culture is an integral component of how individuals interact socially and live in groups. Culture is shared by members of a social group and is transmitted among various generations. In other words, culture is the preservation and dissemination of knowledge about a nation's past and accomplishments (Papademetre & Scarino, 2000, p. 33). It is vital to understand that cultures evolve when living conditions alter due to two dynamic components of culture including knowledge and behavior. The interaction of one culture with those of other groups, and the nature and applications of a language are the other two variables that contribute to the dynamism of cultures.

According to Brick (1991), learning a language encompasses acquiring a culture, and vice versa. Hence, understanding cultures is of paramount significance in the teaching and learning processes. Corbett (2003) stated that the intercultural approach is suggested for culture education since it facilitates learners to be diplomatic and are able to view different cultures from a perspective of informed comprehension. In the same vein, English language learners are characterized as intercultural speakers who love learning about and establishing relationships with people from different cultural backgrounds, while not having received formal training for that reason (Soler & Jorda, 2007). Similarly, Baker (2012) stated that people become more conscious of the multi-voiced nature of cultural categorization as a result of the diversity and complexity of many local and national cultural groupings.

From these points, the authors of this paper argue that culture is reflected in how we live our lives in accordance with norms that others follow. We do as what others do. Therefore, our body becomes the means for us to enter a culture.

Vietnamese culture course (VNC104): A move towards intercultural diversity within the understanding of one culture

Intercultural education has won immense popularity in the process of teaching and learning English. Thus, an English course named Vietnamese Culture (VNC104), which is integrated with intercultural topics, is offered to English-majored students at a private university. This course is designed to give students a thorough comprehension of the roots, dimensions, origins, and characteristics of Vietnamese culture. It focuses on how Vietnamese culture is connected to the lives of Vietnamese citizens in the digital age as well as the numerous cultural components that are found in social structures namely belief systems, literature, arts, and customs. By taking this course, students are able to comprehend the foundations and dimensions of Vietnamese culture. Additionally, learners are capable of explaining Vietnam's history and the change of Vietnamese culture over the different historical periods. Besides, they can analyze cultural phenomena. Also, this course helps students evaluate cultural differences from a cultural perspective, aesthetic creation, and thriving for success in the globalization context. Furthermore, those who get involved in this course tend to develop essential skills in building or constructing a typical product reflecting cultural aspects. Last but not least, students can have a professional attitude, critical thinking, and teamwork.

Embodied cognition is applied in the lesson about cuisine. The lecturer taught students how to use their sensory perceptions to understand their embeddedness in the world by using objects and their relations to the surrounding environment, colors, sounds, flavors, and tastes. The lecturer chaired group discussions that generated new knowledge. Meanwhile, students used their bodies as the vehicle to make sense of the world by participating in team-building activities that nurtured their team working spirit, collaboration, and discipline. These activities were aimed to bring about fun and excitement in learning.

When the mind learns: Bloom's taxonomy

Bloom's taxonomy was revised by Krathwohl in 2002. Three overlapping categories of knowledge, abilities, and attitudes (KSA) are included in Bloom's taxonomy: cognitive, psychomotor, and emotional. The taxonomy reflects various types of intellectual skills and abilities qualitatively. It is divided into low-order thinking and high-order thinking. At the low-order level, remembering is the broad and fundamental cognitive aspect that allows learners to begin their cognitive processes at a higher level. Understanding is the next level that implies one's capability to comprehend and utilize the information when receiving the information. The next level is applying. It requires students to demonstrate their ability to use newly learned skills to address problems. Aviles (1999) said that applying allows information to be used in new circumstances. At the high-order thinking level, analysis is supposed to divide a whole into its component pieces and detect relationships between them, whereas synthesis brings the component parts to create a pattern or structure that did not exist before. According to Aviles (1999), the prior levels of understanding, application, analysis, and application of information will be required for a task that includes synthesis. Bloom's taxonomy also entails making decisions about the worth of a subject.

The development and activation of the mind allows them to remember, understand, apply, analyze, evaluate, and create knowledge for application and use in real life. In other words, Bloom's taxonomy speaks about the mind that puts down the stepping stone for students to learn. However, students are supposed to learn through their cognitive mechanism, which can be developed through teaching approaches, lesson contents, and their interactions with others in the classroom (see Metlevskiene, 2011; Murray, 2016; Nguyen, 2010; Nguyen & Phung, 2021). The engagement of the whole body and mind in the lesson and learning spaces with others ignites their cognition. In this sense, the body plays an equally important role in learning.

When the body acts to learn: Embodied learning

According to Metlevskiene (2011) and Dall'Alba and Barnacle (2015), curricula and courses that focus on what and how students learn theoretical knowledge and skills without relating them to specific contexts in real life can cause trouble to students when they later enter professional environments. This problem is caused by several reasons. First, what students learn from textbooks that have been published before they actually enter the working environment. The world keeps changing. A very good textbook can depict time ahead with changes, but most remain theoretical and fundamental and are unable to provide descriptions and instructions on exact situations for students to deal with (Nguyen & Thach, 2022). Decontextualized knowledge cannot be easily absorbed or become useful for students' future careers. Second, what students learn should be embodied as it is their own knowledge for use. The way they can absorb the knowledge which is embodied is through the embeddedness of their bodies in the world.

Their bodies allow them to cognitively perform functional roles in processing information, thus enabling their mental operations to be formed under the mutual exercise of neurological/mental/cognitive processes, body

reactions, and environments (Clark, 2008). In this sense, students can only learn and understand knowledge by embodying it in their embeddedness in a real environment. Third, we can always experience an extension of our bodies through the interconnection between our bodies and the world. As Heidegger (1962) pointed out in an example of pointing out our finger, we do not simply stop our action of the finger pointing at our fingertip but rather, it stretches to a particular action we mean with someone. Perception, action, and the body are interconnected in this sense. Fourth, Merleau-Ponty (1968) went on by discussing double belongingness when we are connected to other people and the world. When we touch something, he described, we perceive that our hand touches an object. The object is perceived by our perception of our hand touching, giving us some meanings about the object. As such, our perception, which is shaped and influenced by cultural norms, is connected to the world.

Our bodies allow us to embody our perception, forming specific relationships between us and the world and between us and our culture. Without the body, we couldn't have any place to perceive the world. We are our lived bodies that are already enmeshed in the world and cultural practices on the one hand, but that are able to interact and communicate with the world with our intentions on the other. As perceivers with lived bodies, we know the world, perceiving it as it is in our perception. At the same time, we know what we have known. We become the object of our perception as well. We can touch, see, feel, and perceive and at the same time, we are also touched, seen, felt, and perceived (Merleau-Ponty, 1968).

The discussion on embodied knowledge enables the authors to conclude that any lesson must not be decontextualized. It must be able to replicate real-life situations that abide by cultural norms as much as possible. Teaching activities must allow for students' embodied engagement in learning. Their senses of hearing, touching, sight, taste, and smell must be exercised through the use of diverse and interesting activities so that their perception can be increased and improved. There must be teaching aids that are referred to in the textbook and lesson that can encourage students to experience their learning through the extension of their bodies to these objects. As we are both perceivers and objects of our perceptions, there should be activities that motivate them to reflect on their learning processes with their friends. Interacting with others, therefore, becomes essential. Such issues as bodily engagement, task integration, use of objects and teaching aids, and a learning environment that accords with cultural practices are important in allowing for embodied learning to happen.

Then some questions arise. How do students perceive? What processes are involved in forming their perception of a lesson? Here, Bloom's taxonomy can be well combined with embodied learning.

Embodied cognitive processes in the culture course VNC104

Bloom et al. (2001) described the 6 levels of cognition that are divided into low-order and high-order thinking skills. When this taxonomy is integrated with embodied learning, we arrived at the following steps to facilitate embodied cognition. Preparation includes some cultural norms, lesson material, teaching aids that can create

chances for students to activate their senses and bodily movements, classroom environment, types of students, and their personal traits and levels of knowledge. Let's take an example from the lesson about Vietnamese cuisine in the Mekong Delta. Teaching aids should include ingredients for cooking particular dishes, spices, herbs, and utensils.

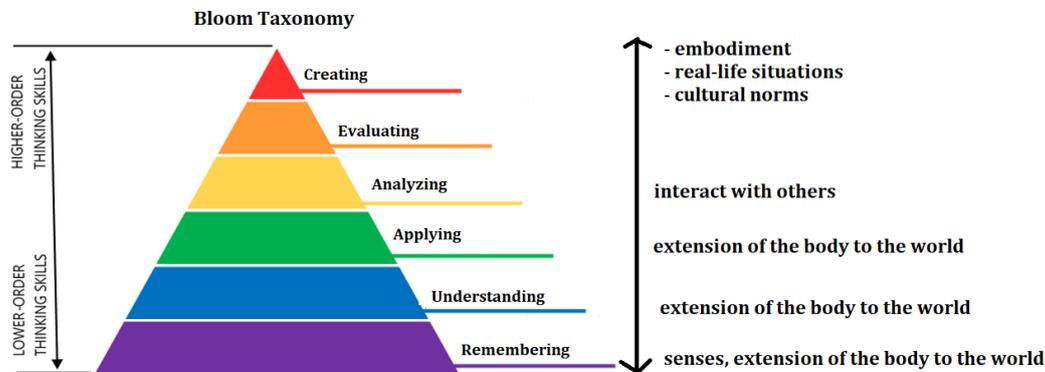

Figure 1: Embodied cognition

Implementation of the embodied cognitive framework

This proposed framework can be used in a traditional classroom in any subject. In this paper, the authors present an example that took place in a student exchange program on a Vietnamese culture course. This program offered students between two universities to share their knowledge about cultural issues. This program was designed to meet 5 program learning outcomes (PLO):

- PLO1: Show national pride,
- PLO2: Work in groups effectively
- PLO3: Demonstrate professional behaviors
- PLO4: Be mentally and physically strong
- PLO5: Understand cultural literacy

These PLOs were interpreted through the deployment of the lesson objectives (LOs) as follows:

- Introduce some beautiful parts of Vietnamese culture for students to be proud of the nation (PLO1, PLO5)
- Create conditions for students of the two universities to get to know each other, learn from and with each other, and construct knowledge (PLO2, PLO3, PLO5)
- Enable students to participate in an embodied social constructivist class, breaking the traditional classroom model (PLO2, PLO3, PLO5)
- Enhance students' communicative and team-working skills in an intercultural environment (PLO3, PLO4, PLO5)
- Develop students' and lecturers' professional knowledge and relationships (PLO4, PLO5s)
- Promote cooperation, friendship, and mutual understanding between the two universities (PLO5, PLO6)

The topic of the lesson was food and cuisine in the Mekong Delta. It was extracted from a chapter in the

textbook of the course on Vietnamese culture. There were three main parts of the program: welcoming, lesson, and teambuilding activities. The lesson plan is described below.

Lesson Plan: The Power Of The Senses

Lesson Objectives:

At the end of the lesson, students will be able to:

- use their prior knowledge to construct new knowledge of a specific theme relating to Vietnamese cuisine and typical traditional dishes, particularly in the Mekong Delta
- gain valuable experience of working with new people,
- develop their confidence in using their English to communicate with new people.

Table 1: The Lesson Plan

Time	Lesson details	Lecturer's activities	Students' activities	Embodied cognitive approach
9:30-9:40	Warm-up			
9:40-10:00	<p>Activity 1: Powerful senses (guess names of the food and spices)</p> <p>Instructions: One member of each team is asked to smell/taste/touch the food while their eyes are covered with a blindfold, then write the name of the ingredients that local people in the Mekong Delta often use in their daily dishes. The students write their answers in a sheet of paper. There are 10 turns for 10 different members.</p> <p>Points: 02 correct answers = 01 point</p> <p>List of food and ingredients:</p> <ol style="list-style-type: none"> 1. fish sauce 2. curry powder 3. salted bean curd 4. palm sugar 5. salt 6. cooked rice 7. salted lime 8. coconut milk 9. vinegar 10. rice wine for cooking 11. chicken curry 12. lime leaves <p>At the end of the game, the lecturer provides students with more knowledge about the main types of spices and asks the students to explore the origins of these spices by looking up the information on the internet and in the textbook. Two groups will be chosen to present the information.</p>	<p>Give instructions</p> <p>Ask two teachers/student s to come on stage to help with the demonstration</p> <p>Demonstrate the game</p> <p>Manage the game</p> <p>Check correct answers and give points</p> <p>Comment on their answers</p>	<p>Work in groups</p> <p>Nominate a person to name the food/spices</p> <p>Look up the information on the origin of the spices in the internet</p> <p>Select a person to present the information</p>	<p>Use of the senses</p>

10:00-10:15	<p>Activity 2: Powerful senses of sight and taste Step 1: (5 minutes) Instruction: Each group will be given pictures of different local vegetables, and are asked to write down their names in 90 seconds. The winner is the fastest with the correct answers. Points: 02 correct answers = 01 point List of the suggested vegetables (these are the local vegetables that the people often eat in their main dishes; their names are written in the Vietnamese language) Step 2: (5 minutes) For every type of the vegetables, students are asked to name one dish that contains the vegetable. The winner is the fastest with the correct answers.</p>	<p>Give instructions Ask 02 teachers/student s to come on stage to help with the demonstration Demonstrate the game Manage the game Announce the winner Comment on their answers Make links to the next activity</p>	<p>Participate in the activity Respond to the pictures</p>	<p>Bodily movements, interactions with friends, use of the senses</p>
10:15-10:55	<p>Activity 3: Discussions and Presentations Step 1: 15 minutes Instructions: in teams, students will be given a basket of vegetables and are asked to think about a dish that contains/uses the vegetables given to present the dish (Suggestions: the origin of the vegetables, the cultural value of the dish, and the reason for having it) Step 2: 20 minutes Instructions: within 02 minutes, 02 members of each team will present the answer to the question, then each team will vote the answers that they like the most. (Cards to vote with be prepared beforehand.) Students' feedback on VNC104 (Vietnamese Culture)

At the end of the program, the 70 attendee students were given an online form to evaluate. The primary objective of the form was to let the lecturer and student exchange program organizers be reflected on the (in)effectiveness of their attempts to use the embodied cognition model. The result is presented in Table 2 below.

Table 2. Students' Feedback on VNC104

No.	Questions	Students' evaluation
1	The match of the learning activities with your expectation	
	Very appropriate	57/70
	Appropriate	12/70
	Neutral	1/70
	Not appropriate at all	0/70
2	The effectiveness of organization and logistics	
	Very effective	60/70
	Effective	10/70
	Neutral	0/70
	Not effective at all	0/70
3	The usefulness of the program	
	Very useful	60/70
	Useful	10/70
	Neutral	0/70
	Not useful at all	0/70
4	Your overall satisfaction with the program	
	Very satisfied	55/70
	Satisfied	14/70
	Neutral	01/70
	Not satisfied at all	0/70
5	The interactions among the attendees	
	Very good	63/70
	Good	07/70
	Neutral	0/70
	Very bad	0/70
6	Aspects of the program you were interested in	
	The staff and lecturers were supportive, knowledgeable, and friendly.	16/70
	Team-building activities	18/70
	Interactions with the lecturers and friends	29/70
	New, useful, and interesting knowledge	50/70
	Teamwork	06/70
	The positive and friendly rapport with friends from the other university	21/70
	Knowledge about food in the region	22/70
	The interesting lesson taught by the lecturer	07/70
	Music show	20/70
	The diverse and interesting teaching activities	22/70
	Play and study at the same time	11/70
	The hospitality of the host	20/70
	Food at FPT University's canteen	03/70
	Impression with FPT University's state-of-the-art architecture and facilities	05/70
	Tea break	12/70
	The puzzle of culture	1/70
	Backdrops of the classroom	30/70
	The energy and enthusiasm of the lecturers and fellow friends	30/70
	Changing personal attitudes about styles of learning	15/70
7	Your expectation to join another program similar to this one in the future	70/70
	Topics you want to study (with open-ended questions)	10/70
	+ The local history	20/70
	+ Traditional clothes	10/70
	+ Vietnamese culture and custom	20/70
	+ Vietnamese people's psychology during wartime	5/70
	+ FPT University's organizational culture	12/70
	+ Tourism in the Mekong Delta	22/70

The majority of students thought the lesson's learning activities matched their expectations. Of 70 students, 57 believed it to be appropriate, and most stated their enjoyment of the course. Many students said the lesson was both valuable and effective in terms of the structure, logistics, and usefulness of the program. Question 6 explored the various aspects of embodied learning. The results of this question show that embodied cognition includes new knowledge that is formed by their encounters with others and teaching aids. It also entails the administration and logistic support and learning amenities that were arranged before and during the lesson. Bodily activities such as team-building games, music shows, and teamwork movements also add to the students' embodied cognition. Tangible objects such as classroom decorations, food and spices, Intangible objects (staff and friends' hospitality and the energetic atmosphere in the class) that stand as equipment for learning are also contributive to developing the students' embodied cognition.

An open-ended question in the evaluation form allowed them to express their thought over the lesson. Some stated that they felt that they were able to understand the philosophy of cuisine better. For example, a student said:

Learning is really fun. I was able to interact with my friends, and we used our senses to activate our learning. We smelled the spices, heard our friends' touches of the spices to guess what they were, and moved. It was never boring!

The way this student learned includes certain aspects of feelings and emotions. He further stated that his senses, bodily movements, and interactions with others and things enabled him to understand the philosophies of using the spices in a particular dish before he could remember the names of the spices in English. In this vein, his remembering appeared after his understanding. This is why Bloom's hierarchical levels of cognition does not always come in order. One's cognition is often enforced by the use of their embodied engagement in the verbal interactions and corporeal movements. Similarly, another student expressed:

I was amazed at how the lecturer taught us! She was very engaging. She asked us to work in groups. Working in groups is normal, and this is what we do almost every day. But here, our group had to be always active: running to pick up the right spices after one of us smelled them. We also had to quickly discussed the secret behind the spices that went accordingly with a dish. I think we could analyze the underpinning secrets of cooking in terms of the country's geographical features better than before!

Like the student referred to earlier in this section, he used some expressive words to show his positive feeling when participating in the class activities ("amazed", "engaging", and "better"). It can be concluded that students' cognition is a felt dimension that can contribute to their learning processes. This quote also shows that the students' interactions with others, bodily engagement, and use of their senses in the teaching activities allowed them to move to the level of analyzing after those of remembering and understanding. It is reasonable because sometimes, students come to class with their prior knowledge that can contribute to their ability to analyze, evaluate, or even create a certain piece of the lesson content (e.g. in this case, their knowledge of the spices and cooking techniques). What can further be improved is to allow them to use their prior knowledge to

develop other aspects of the lesson. These aspects can well be improved by encouraging them to use their embodied cognition to immerse themselves in exploring. Once they have been able to lead their own learning, they can develop their understanding of intercultural diversity. For instance, that student continued to say:

We interacted with other students coming from different classes and even from a different university. They told us very different things about food and cooking styles in their families. Now, I know that sausages can be made of beef. Lime leaves could be used to increase the flavor of chicken and even rats! That's funny!

His verbal communication with his friends in group work and use of his senses enabled him to further develop his prior knowledge, letting this student achieve one of the outcomes of the lesson. In addition, he began to understand that food in the same region can be different. His understanding initially dismantled his bias about “weird cooking styles” that he had observed before. Other students similarly expressed their intercultural diversity by interacting with others and joined bodily activities. Some said that they were able to “know that culture has its sub-culture”, “there is nothing wrong to eat rats”, or “tumeric can be used to whiten facial skin and add color to food at the same time”. Many of them expressed that such an understanding allowed them to realize that there are always differences in the way people interpret and experience culture. In other words, culture is inside them. This understanding can only be developed and nurtured when amenities for learning are provided adequately. These may include administrative work support, teaching aids, spaces for teamwork activities, and lecturers’ open attitudes towards making changes from traditional teaching methods into innovative approaches. A student told us:

We are grateful that it [the student exchange program] happened. We learned a lot indeed. Learning happens beyond the walls of the classroom. We were with our friends, playing and studying at the same time.

This student pointed out her excitement to try a new way of locating herself in a new ambience (“beyond the walls of the classroom”). Learning is, in this sense, experienced and initiated to happen in a geographical locale. The experience of being located in a geographical position is encountered through the students’ interactions with friends and bodily activities. Being in a place where learning happens does not mean that students are confined in a geographical place but rather, how such a space influences the negotiation of their sense-making of that place with others for learning purposes.

Intercultural diversity can be more easily learned when students understand that cultures always include differences that can be neither wrong nor inappropriate. Such an understanding can be formed when they have a chance to listen to others and participate in bodily activities that allow them to observe what is done. One student said:

I learned a lot from my friends’ stories about the way their families cooked food at home. My mother does something different but in the end, it is what we eat. It isn’t what other people think we have to eat. I mean my friends explained what they eat means to them. It’s more than the food itself.

Another student added:

Yeah, somehow it is about our understanding and sympathy. Cultures are always different, but understanding that cultures are different requires us to be sympathetic. We need to show our respect to the different ways of cooking and consuming food as they are tied to our own cultural practices and beliefs. We are all different!

This student showed her evaluation of cultural differences through her interactions with her friends through group work, which were intensified by her active engagement in the in-class and team-building bodily activities that included the use of her senses at the same time. Her understanding of and respect towards intercultural diversity were formed and developed by her sympathy for cultural differences. Therefore, the authors of this paper, at this early stage, can confirm that embodied cognitive teaching approaches can cultivate and enhance understanding of intercultural diversity.

Conclusion

This paper attempted to showcase the embodied cognitive teaching approach that combines Bloom's taxonomy with an embodiment viewpoint. This model was applied in a Vietnamese culture course at a private university in Vietnam through a student exchange program. This original model of embodied cognition emphasizes the importance of Bloom's taxonomy in teaching activities and methodologies on the one hand but highlights the significant intensification of embodied cognition when combined with this taxonomy on the other. The authors of this paper believed that we are our bodies, which enable us to interpret and experience the world to form new knowledge for ourselves. Without the body, we would become mere objects existing in the world to be filled with bunches of information provided by teachers. No active learning could be allowed to happen. In contrast, the body with its powerful senses, the exercise of physical and corporeal abilities, and the human nature of interacting with others encourage us to absorb and form new knowledge for ourselves.

Students' embodied cognition allows them to comprehend cultural differences and respect intercultural diversity which can later shape their global citizenship. In this sense, the qualities of global citizenship can be acquired through the six levels in Bloom's taxonomy that students do not always go from one to another in order. Their cognition, which is said to reside in their minds, can be developed and intensified by their active immersion in the world with others and objects. Their immersion in the world can be enacted by their corporeal engagement with other friends, lecturers, and teaching and learning facilities through verbal communication, uses of their senses, participation in bodily activities. Their engagement in the learning environment is always emotional. It is the felt dimension of embodied cognition. It is always geographically experienced when the meaning of spaces is made and negotiated through students' encounter with others in corporeal activities.

In a nutshell, students' bodies and minds allow them to construct new knowledge about intercultural diversity by themselves and for themselves.

Recommendations

Future research can be conducted by obtaining individual students and teachers' perspectives to examine the reliability and validity of this integrated model. Furthermore, future studies can be done in other areas to gain deep insights into the model's effectiveness.

Rethinking (Non)Nativeness among English-Speaking Teachers in Vietnam

Chi Hong Nguyen

Nhi Xuan Nguyen

FPT University, Vietnam

Abstract: In Vietnam, language teaching and learning have recently been a concern of not only educators and language learners but also parents and families who have school-aged children. When finding a suitable language course, language learners and their families tend to ask questions about the nativeness of the teachers and their language fluency. Being a native speaker has become an advantage for language teachers. Their actual proficiency and educational qualifications may come in second place. This situation may lead to poorly qualified language teaching courses and unequal treatment of qualified non-native language-speaking teachers. To confront this problem, the Vietnamese Ministry of Education and Training (MOET) has tightened the job entrance requirements for foreign English-speaking teachers, especially those who apply for work as English lecturers at university. It is identity and qualifications that matter. This literature review reflects on the ambivalent approach by the MOET to recruiting qualified human capacity building for the national English development project and developing and retaining English-speaking Vietnamese lecturers. This paper argues that the influence of monolingual ideologies in language teaching and learning in Vietnam that was once encountered at schools and universities some years ago has now shifted to a more open but competitive ambiance for national integration into the global market. In this sense, teaching English is not an apolitical activity. It is a politically designated career in this socialist market-oriented economy.

Keywords: Teaching English, Monolingual ideologies, Nativeness, Identity, Power

Introduction

The appearance and use of foreign languages in Vietnam have been reflective of colonization and social transformations. During the feudal time and under the Chinese invasion, the Chinese language was used in Vietnamese society. By the 16th century, British merchants alongside other European ones came to this country for some international trading (Sundkvist & Nguyen, 2020). Such languages as Portuguese, Italian, and English were brought to Vietnam, but none of them thrived because the ruling kings continuously rejected foreigners. Later arrivals included Christian missionaries from European colonizing countries who, together with the

invasion of the then-French Government, brought their foreign languages to Vietnam. French was taught to the elite population and used in formal contexts. It was one of the many ways that the French used to dominate the colonized people's mindset about France as the Mother Country (Nguyen, 2013). After 1954, the US entered Vietnam, leading to the Vietnam War, which divided the country into two. The South of Vietnam, which was US-backed, adopted English in formal communication, education, and work. The North of Vietnam did not appreciate the position of the English language. Instead, Russian was taught at many schools and colleges as Vietnam gravitated against Russia (Sundkvist & Nguyen, 2020). However, since 2000, when Vietnam began to diversify its international relations with countries outside the former communist block for its deeper integration into the global market (Nguyen, 2021), English has been taught at many schools, colleges, and universities as the compulsory subject, as well as at foreign language centers. The promotion of this language is seen as a human capacity-building strategy. Other foreign languages such as Japanese, Chinese, French, German, Korean, and Spanish are also taught, but they are not compulsory subjects at schools.

Recruiting teachers to teach these foreign languages has historically come from several sources: native speakers, local teachers who are trained at domestic institutions or graduate from abroad, and even sporadic native speaker travelers. In Vietnam, selecting a foreign language to learn and the kinds of speaker-teachers to learn with may not always be a personal choice. Neither is teaching foreign languages. Unlike teaching other subjects, the practice of English in Vietnam is likely to be related to teachers' identity and negotiations of power between parents/students and teachers, employers and teachers (Bright & Phan, 2011), as well as foreign teachers and the government under social transformations. It is also the desire of the government to select and use English foreign teachers. For foreigners, teaching English is a politically designated career in Vietnam. This is the first argument that this paper aims to unpack.

According to Jenkins (2009), Vietnam belongs to the expanding circle of the English language. This term, which is suggested by Kachru (1990), refers to the countries where the English language is considered a foreign language (EFL). EFL in Vietnam plays a little governmental role, but it is the Vietnamese Government's objective to spread it as a means of international integration. English is a useful means for communication purposes, but English language teaching seems to be a controversial topic. Shuck (2006) believes that language and identity are interlinked through the self and the other (see also Bright & Phan, 2011). The self can refer to native speakers who see themselves or are seen as norms and who are seen as unproblematic. The other can refer to learners who aspire to learn the correct norms and standards produced by native-speaking teachers together with the use of Western technology in the classroom (Bright & Phan, 2011). The norms of native-speaking teachers are then associated with monolingual ideologies. These ideologies are now being challenged in Vietnam as some native English or foreign English-speaking teachers are found to be problematic. This is another argument formed in this paper.

These two arguments are interchangeably presented in several parts of this paper. The first one discloses the interlink between nativeness, identity, monolingual ideologies, and qualifications. This part is followed by a discussion on the politics of monolingual ideologies and their influences on English teaching. These theoretical

parts are examined in the case of Vietnam's recent dual efforts in improving the quantity and quality of foreign English teachers that exacerbate some ambiguity in their teaching career. While previous studies (e.g. Bright & Phan, 2011; Kharis *et al.*, 2020; Manh *et al.*, 2017; Shuck, 2006; Sundkvist & Nguyen, 2020) acknowledged that native English-speaking teachers are less likely to face difficulties in applying for English teaching jobs in Asia and Vietnam, the arguments in this paper, on the one hand, are congruent with this commonplace view in some ways but on the other hand, challenge it. The major contribution that these arguments infer in this paper can be found in the new way for policy-makers and researchers to rethink the relationships between teacher identity and social transformations rather than the mere relationships between teacher identity and students' appreciation of and preference for monolingual ideologies.

The interlink between nativeness, identity, monolingual ideologies, and qualifications

Linguistic ideologies that are embedded in teaching can be (and used to be) a means of colonialism (Canagarajah, 1999). As colonizers, native speakers are seen as the correct conveyors of the grammar, vocabulary, accent, pronunciation, and style of that language. Nativeness, in this sense, is the norm. Their speakers are unproblematic and stable Cook (1999). Many previous studies (e.g. Bright & Phan, 2011; Cook, 1999; Joseph & Ramani, 2006; Kharis *et al.*, 2020; Manh *et al.*, 2017; Shuck, 2006; Sundkvist & Nguyen, 2020) found native language models are preferred in non-native contexts. Students may prefer to study the English language with native English teachers rather than with non-native English-speaking teachers. This phenomenon leads to an unfavorable situation for the latter. Why wouldn't one want to speak English like an English person authentically?

However, Jenkins (2009) and Kramsch and Whiteside (2007) have collectively argued that the definition and the use of the term nativeness may not be appropriate in the contexts in which English is regarded as a *lingua franca*. In this part, the authors argue that while debates about nativeness and non-nativeness have flooded the current body of research on language and education (as shown in the above paragraph), the concepts are linked to identity. Normally, a native speaker is one who acquires the language either at birth or after many years of acquisition before he or she turns puberty. In contrast, people who speak a language as a second or foreign language are seen as non-native speakers (Cook, 1999). What if a Vietnamese person was born in the US with American citizenship and has lived there for years and speaks English as the mother tongue? He or she looks exactly like Vietnamese people, and then is he or she favored to teach English in Vietnam compared with Americans who are white? Linguistically and legally, yes.

But the authors' experiences as the managers of English language departments at some universities indicate that white people are more prioritized as students and parents still think white people speak English more authentically (for more evidence, see Bright & Phan, 2011; Sundkvist & Nguyen, 2020). Many Filipino teachers have flown to Vietnam to teach English as the demand for native (or native-like) English teachers is soaring. Their English shows some heritage of a colonized language. The MOET requires them to sit for a Common European Framework of Reference (CEFR) test, at the minimum expected grade of Level 5 (Government, 2018,

2020, & 2023), but their salaries can be twice or three times higher than those Vietnamese teachers can be entitled to have. This score is the same as Vietnamese teachers teaching English at the high school and university levels. What is the difference? The former are foreigners! Have you ever seen an American speak Vietnamese fluently, but local people tend to speak English (though at a very humble level) back to him? Probably, the very popular Youtuber Trần Luân Vũ (or Joshua Ryan in his American name, who has his own Youtube channel) is a typical example of this paradox. He is a 100% American who learned Vietnamese in the US before going to Vietnam to work as a freelance English teacher. His videos show many situations like this. Identity is not necessarily constructed by speakers themselves, but also by others' beliefs and recognition of who they are. In other words, nativeness matters, but identity matters too. The two are intertwined.

Further, nativeness and identity are linked to monolingual ideologies. Language ideologies, in general, refer to individual beliefs about the rationalization and justification of language use (Bacon, 2018). These beliefs are formed by both native speakers and non-native speakers of that language. In this sense, monolingualism is recognized as the ability to use a language as the mother tongue which is recognized by the native speakers of that language community. However, the assumption that native speakers are monolingual seems to be inappropriate. Due to immigration and globalization, monolingual and mono-cultural communities tend to become rarer (Bacon, 2018). Recently, the number of societies where all people speak the same languages and share the same cultures has been reduced (Kramsch & Whiteside, 2007). People may be monolingual when they are young, but they may learn another language at home or at school. The need to learn languages besides mother tongues is increasing. Most schools around the world tend to have at least one second or one foreign language subject. Also, Kramsch and Whiteside (2007) claim that there are more and more people who learn languages that are not their first and only language and are able to use those languages at various proficiency levels. Thus, the identity of monolingual NS tends to change when people learn other languages. As such, recognizing a person as a monolingual native speaker of a language is often misleading.

But the assumption of native English speakers remains true in Vietnamese EFL contexts, where parents and students trust the ability of a white speaker to speak correct and standard English as a norm. The government distrusts non-white foreigners who teach English by asking them to sit for a CEFR test. In fact, Circular 21/2018/TT-BGDĐT and Decree 152/2020/ND-CP (Government, 2018 & 2020) dictate English foreign teachers who are not native speakers to obtain the C1 level to meet one of the requirements for a work permit in Vietnam. They are also asked to possess at least a college degree to teach at foreign language centers, a bachelor's degree at the upper secondary school level and lower, and a master's degree at the university level. The negotiated salary (usually higher than local teachers, see Bright & Phan, 2011) can be an attraction, but would that deserve to be the main driving force for those who are very qualified for decent jobs in their own countries to relocate to an exotic place?

Another aspect that influences the interlink between nativeness, identity, and monolingualism is qualification. Being a native speaker of a language does not always mean that person can teach it. Teaching is a science that requires people to attend formal training programs that consist of various modules. A program in education,

teaching, Teaching English as a Second Language (TESOL)/Teaching English as a Foreign Language (TEFL), English/American literature, or linguistics is constituted by courses on professional skills, foundational knowledge, professional knowledge, and electives. These blocks of knowledge and skills allow teacher students to familiarize themselves with educational environments, as well as understand students' psychology and physiology, educational policies, and challenges. They also equip them with expertise in the English language and teaching methodologies. Qualifications may include teachers' positive and open attitudes towards differences that emerge from multicultural contexts or social biases (Bright & Phan, 2011). They also encompass teachers' adaptability and flexibility in suiting their teaching styles and attitudes to meet communities' and students' needs. Respect for differences is vital. These qualifications are not simply accumulated by native teachers themselves. They are measured, justified, examined, and even tried by the universities where they have studied, students, parents, employers, and communities. In this sense, being a qualified native English teacher is not a personal choice or a separate domain of being native biologically and linguistically. It is an interrelated effect of decisions and choices made by many agents.

The power of nativeness in monolingual ideologies

No matter how struggling the job application processes can be, foreign and native English-speaking teachers can still find ways to arrive in countries that need English for their economic growth. Monolingual ideologies are reflective of several personal, economic, educational, and social orientations. The authors of this paper further argue that these orientations are concerted, creating both friction and the possibility for monolingual ideologies to manifest themselves in practice that can be considered as the working politics of monolingualism. For instance, on the personal level, opportunities for learning, experiencing, making a living, extending professional and social lives, and challenging themselves enable them to spend some time (some even prolong more than initial intentions) working in new countries. They still have an advantage that non-native teachers do not have: being native. Their being native is supposed to be a reflection of a monolingual capability that defeats non-native speakers' deviations in language use. The thirst for using the correct language emerges in non-English speaking countries and communities, and these social and educational demands enable their nativeness to excel. Vietnam, for example, was ranked in the last position in the league of 60 countries with moderate proficiency (English Proficiency Index, 2022). When the country is in the industrialization and modernization process, a highly skilled workforce who can speak foreign languages confidently, correctly, and effectively is always needed (Nguyen, 2021). As a consequence, demands for native (and even native-like) English teachers are high.

However, Vietnamese society is not an English-speaking country. Learners find it extremely hard to interact with others for fluency and language development outside the classroom. They lack a communicative environment that is supportive of their language practice and learning (Edmett, Donaghy, & Tysoe, 2021). Learning with foreign teachers, no matter what qualifications they have, is always favored. Let's think about the colonized Singapore back in the early to mid-20th century, when foreign teachers might have come from India, Ceylon, or European countries. Singaporean students might have needed some standards to follow and an English communicative environment for daily exchanges. It took generations for Singapore to turn English from

a lingua franca that connected diverse ethnic groups to one of the official languages. In some way (though this can be an exaggeration or presupposition), the lack of some colonialization heritage may pose an advantage for foreign identities and supposed language competence to rise.

In addition, monolingual ideologies may approach ESL/EFL learners in various ways including the materials used for teaching and learning. Phan (2008) notes that teaching and learning materials and examination frameworks published by the native English-speaking countries seem to indicate that their English varieties and pedagogies are global models and other varieties are used merely in minor communities. Thus, this assumption seems to be a product of the monolingual imperialism of the source (L1) countries. Many people have this assumption and conclude that traditional teaching in their countries is disadvantageous compared to foreign pedagogies. Perceptions created, spread, and determined by the countries from which teaching materials are distributed seem to have a significant influence on pedagogies in general (Canagarajah, 1999). In other words, a great number of teaching and learning materials in ESL/EFL countries are published by L1 countries which are assumed to own the standard varieties of English. EFL teaching in Vietnam is not an exception to this reality.

Many educational institutions and universities in Vietnam are using foreign pedagogical models and foreign published materials from L1 countries, especially from the United States and the United Kingdom. For example, from 2008 to 2012, the materials which were used by our university for English major students were the series of Interaction and Mosaic published by McGraw Hill, an American educational company. Also, Top Notch and Summit series from Pearson, a media company founded in the United Kingdom, are used in teaching and learning the preparation English courses at the university where the authors are working. Teachers, students, and parents seem to take that phenomenon for granted and never ask why foreign methods and materials are used instead of domestic materials and traditional pedagogies. Curriculum developers at universities may explain that non-native teachers/lecturers may not possess the correct and standard use of the English language, thus producing a textbook can cause some disadvantages. If it is reviewed by native experts in the field, it certainly takes time and financial resources.

Another reason is that non-native teachers/lecturers/textbook writers may compile their materials from publications produced by native experts. The tasks of writing a textbook may not be original. Also, using textbooks written by well-known native authors and published by prestigious publishers can even help marketize the universities' brand during the student recruitment process. Nevertheless, this is not the case for elite universities in Vietnam which are able to recruit and train very well-known lecturers in Vietnam and abroad. But overall, as Canagarajah (1999) has noted, ideologies and cultures which could be foreign to language learners may be deeply embodied in the English language. The practices of foreign methods and the use of foreign materials may be related to the economic and educational prestige of those native English-speaking countries.

Monolingualism is also exacerbated by social prejudice. In Vietnam, there is a stereotype that Western countries are the best place in the world (see Bright & Phan, 2011; Kharis *et al.*, 2020). Those countries are considered

“heaven” by many Vietnamese people because most of those countries have strong economic status and prestigious educational systems (Nguyen, 2014). Their cultures and language varieties are assumed to be elite, and their educational systems are believed to be among the most prestigious. As a result, language users and learners tend to prefer native models rather than local models. Many Vietnamese speakers of English are also found to consider the native speaker as the correct standard for them to follow in oral and written communication (Sundkvist & Nguyen, 2020). Young Vietnamese people like to code-switch and code-mix English in their daily conversations as a sign of being fluent, elite, and educated (Ha, 2022). Walkinshaw and Duong (2012) claim that, in the EFL teaching context of Vietnam, there may be a bias towards non-native English teachers due to the imperialism of the L1 countries. As stated above, many English educational materials and methodologies which are sponsored by the L1 countries are applied in ESL/EFL education. Those materials and methodologies seem to enforce the importance of native English teachers. Many people thus believe that native English teachers are able to teach more effectively than their non-native counterparts (Bright & Phan, 2011; Cook, 1999; Phan, 2008; Sundkvist & Nguyen, 2020).

The imperialism of nativeness could be reflected in the world rankings of Western universities, international English examinations, and ESL/EFL teacher training programs in the L1 countries. The Quacquarelli Symonds (the United Kingdom, Times Higher Education (the United Kingdom), or Shanghai Academic Ranking of World Universities (China) have continuously highlighted the very top rankings of American, British, and Australian higher institutions, making these countries the top study destinations for talented students, or second chance students who have failed the national university entrance examinations in Vietnam but can secure financial support from their relatives' income (Nguyen, 2013 & 2014). Domestic universities in Vietnam look up to these universities, trying to advance themselves to the league of the top 1,000 or 2,000 (Nguyen, 2021). Presumably speaking, Western countries and their universities are the best, and their lecturers are also the top of the top! Learning with and from people who come from these countries can (mistakenly) benefit learners who cannot afford a language study trip overseas. English teachers with degrees conferred by Vietnamese universities are not given a fair chance to apply for teaching jobs. Many advertisements for lecturer recruitment at the university level or even famous English language centers in Vietnam explicitly prioritize those who have graduated from overseas, though the word overseas (“nước ngoài”) may mean every country! They are disadvantaged. The influence of monolingual ideologies may also be the reason why students in ESL/EFL countries choose a course in an L1 country instead of equivalent courses in their countries despite the high cost of studying abroad.

According to Canagarajah (1999), the L1 countries are famous for training educators. A certificate or degree from those countries may benefit people who hold it in EFL-speaking countries such as Vietnam. International English proficiency test scores are one of the requirements for non-native people to meet when they apply for studies, work, or immigration in English-speaking countries. They are also used for social and professional advancement in their home countries. These examinations are organized by famous English-speaking syndicates such as Cambridge Assessment English, British Council, Pearson, Educational Testing Service, or Duolingo English Test. Some Vietnamese universities give a bonus of three marks in their entrance examinations or

exempt them from taking English preparation courses after enrollment to students who have an International English Language Testing System (IELTS) score higher than 5.0 (*VnExpress*, 2023). Although some non-English-speaking countries have developed their own English testing systems to meet the local demands for English test scores for education and work, these testing organizations have the ruling power in these emergent markets. English native teachers who are qualified to teach the preparation courses for these tests are mostly favored.

These biases cause misjudgments of students or non-native English teachers about their own language proficiency. They may also discourage students to claim their authority over their language varieties. Seidlhofer (2001) argues that, due to the definition of the term native speaker, non-native speakers are not able to be native speakers of a language despite their proficiency in that language. The monolingual ideologies may cause ESL/EFL users and students to think that they have no power over the English language and that their language varieties are non-mainstream. Further, Kirkpatrick (2007) notes that, due to the high need for native English teachers, nativeness tends to become the only requirement for teacher recruitment in many countries, and thus many teachers without professional training are recruited. One of the authors of this paper observed that situation when she searched for a part-time teaching job after graduation from a university in Vietnam. When she worked in an English language center in Vietnam, she found that her co-worker who was a native speaker did not have a higher educational degree or any qualification in education. Most foreign language centers where she submitted her job applications asked for a teaching diploma. In contrast, many foreigners who worked there only graduated from high schools and did not have any professional training in teaching. Some of these foreigners were Filipinos and Germans! Their salaries were about three times higher than those of local non-native English teachers. Normally, Vietnamese-speaking teachers are put in a lower rank compared to non-native English teachers no matter how well they are trained and experienced (Cao, 2009).

The power of non-nativeness in bilingual ideologies

This section argues that non-nativeness can also speak in several ways compared to nativeness in relation to bilingual ideologies. First, unfair prejudices towards native (native-like or foreign) and non-native English teachers seem to be inappropriate. Native-speaker models may not always be an advantage for language learners. The proficiency of native teachers which seems to be unattainable to students may overwhelm them. Actually, if students find these models too difficult to achieve, they may be unmotivated and discouraged to study (Cook, 1999). In contrast, non-native teachers may be found to be more achievable and efficient for students. Some non-native English teachers in Vietnam, for example, can speak English, and Vietnamese as their mother tongue, as well as use at least another foreign language at least at the survival level such as French, Chinese, or Japanese, to name but a few. Vietnamese teachers who teach English in schools located in ethnic minority communities can even pick up the local languages such as Cambodian or H'Mong to communicate with students and parents at the social level. The university programs in English Education (Sư phạm tiếng Anh) or English Language (Ngôn ngữ Anh) include courses on second foreign languages (e.g. *VNU Hanoi-University*

of Languages and International Studies, 2023). The ability to use more than one foreign language allows these teachers to understand the foreign language learning process and mechanism and to compare and contrast the similarities and differences between English and the second foreign language they know so they can better create and devise teaching strategies that can best fit their students' learning styles and education system. Native or foreign English teachers may also know several foreign languages, but the way they have learned is fitted in their countries' education systems.

Second, managerial roles at domestic institutions in Vietnam are often played by Vietnamese teachers/lecturers because of several reasons. Managers at departmental levels in public schools, colleges, and universities must be full-time faculty, have at least a master's degree and a doctoral degree at the university level, be a Communist Party member who can lead the team in accordance with the one-party political system and mandates, and have some years of teaching experience (Government, 2014). Being a Communist Party member hardly becomes a reality for native or foreign teachers. Most foreign teachers have fixed-term work contracts. Although some are employed as full-time members, they are required to extend their visas and work permits, and this process is cumbersome. Non-native local teachers do not have to go through this process. Also, understanding students' motivations, being to communicate with communities, and attending to the authorities' requests are more suitable for local managers than foreign ones. In addition, native or foreign English teachers/lecturers are normally assigned to teach and supervise speaking tests and examinations. Final examination questions are usually created by local non-native English teachers who know exactly what the requirements and meanings of the tests and examinations are. In this vein, foreign or native English teachers seem to lose their race.

Third, non-English-speaking teachers who share the same culture as EFL learners do not seem to encounter teaching problems caused by cultural differences. In contrast, cultural distances may be a challenge for native or foreign teachers in teaching ESL/EFL learners. Actually, cultural differences are quite common in classrooms where teachers are foreigners. According to Walkinshaw and Duong (2012), misunderstandings between foreign teachers and Vietnamese students may occur because native English teachers do not seem to have as much knowledge of Vietnamese culture as students do. Cultural differences may negatively influence the teaching process and limit the achievements of students. For example, one of the authors experienced cultural distances between the lecturers and foreign ESL students when she studied English at Melbourne University in Australia. One of the lecturers did not seem to understand the students' Asian cultures. She complained that she could not stand our silence when she asked questions. This situation caused tension between her and us. Most students in Asian countries tend to remain silent when they are asked a question in general and the teacher does not choose a specific individual to answer it. Students will answer if they are chosen and asked in particular by the teacher. We, who were from China, Taiwan, Hong Kong, and Vietnam, seemed to share the same cultural ideology in class about politeness. Our perspectives were different from our lecturer's. Our lecturer who embraced the western perspective regarded the silence of the students as rude and passive. On the other hand, most of us who were from Asian cultures considered the silence polite and humble. From our perspective, students should remain silent if they do not know the answer or if the question confuses them. Asking questions back to teachers is not quite common in our cultures. Because of the tension caused by the cultural differences between us and

our lecturer, the lesson was interrupted. The lecturer was disappointed, so she had to stop teaching to ask the students the reason why they remained silent in her class. In this sense, cultural distances may prevent the efficiency of teaching and learning. Being taught by non-native English teachers who share the same culture can provide students with an important benefit which is able to prevent misunderstanding of cultural ideologies. Sharing the same cultural perspectives, teachers and students are able to avoid misunderstandings and cultural shocks which may negatively influence the process of teaching and learning (Walkinshaw & Duong, 2012).

Fourth, because non-native teachers were once EFL students, they may have similar experiences with students while native English teachers may not fully sympathize with them or understand the process of or difficulties in learning a foreign language (Cao, 2003; Seidlhofer, 1999). Besides experiencing challenges, non-native English teachers (including foreign non-native English teachers know how to acquire English as a foreign language while English natives acquire it as their first language. Non-native teachers are experienced learners of the target language, so they may know how to achieve that language proficiency effectively (Seidlhofer, 1999). They and their students seem to have similar cognitions of the English language learning process because they share similar perspectives on foreign language learning. In contrast, non-native teachers acquire English naturally as their mother tongue since they were born, so the way in which they approach that language seems to be different from the way students do. Their understanding of the English language is the perspective of L1 speakers, and thus their explanations and lectures may confuse students.

Fifth, learning grammar with non-native English teachers may be easier for students. Unlike native teachers who acquire grammar prescriptively, naturally, and routinely, non-native English teachers have to learn it as grammatical knowledge of a foreign language. Most of them are better at teaching grammar and giving commentaries because they have experience in learning English grammar (Cao, 2003; Seidlhofer, 1999). Knowing the mother tongue can help these teachers explain unfamiliar concepts or grammatical points for beginner students to easily understand.

Sixth, the imitation of ideal pronunciation and accents produced by native English teachers is important, but it may not be as important as the efficiency of communication purposes and test scores at schools or universities that focus on grammar and reading. The national upper secondary graduation examination which is created and managed by the MOET consists of stresses, pronunciation, vocabulary in use, social interactions, synonyms and antonyms, grammar, sentence building, and reading comprehension (MOET, 2022). All are in 50 multiple-choice questions. Regular tests and examinations at schools do not consist of listening or speaking parts, and neither does the English examination in the national upper secondary school graduation. Pronunciation can be taught by using pictures and listening to audio. The tests and examinations do include pronunciation checks, but students can learn the phonological rules by heart. Technologies such as English teaching and learning video clips created by both native and non-native English speakers/teachers/organizations, Google Translate, and the like in some sense weaken the position of native English teachers in non-English-speaking countries or communities. Learners may use a variety of accents in their Englishes to communicate as far as they get themselves understood and understand others. In other words, bilingualism challenges the power of

monolingualism in a non-English-speaking learning context.

An ambivalent approach to the bargaining power of (non)nativeness

As Nguyen (2014 & 2017) pointed out, Vietnam during the period after the 2000s saw growing demands for a skilled workforce for its global integration. Accordingly, the demand for speaking English as one of the international languages became stronger. In 2008, the Prime Minister officially promulgated a radical reform in English teaching and learning through the National Foreign Language 2020 project, which aimed to increase both the quantity and quality of English-speaking educated nationals in Vietnam from 2008 to 2020 (Government, 2008). The project (often referred to as the 2020 Project) which was funded US\$500 (Sundkvist & Nguyen, 2020, p. 698) was carried out in three phases. The first one which lasted from 2008 to 2010 focused on re-writing English textbooks from primary to high school levels. The second phase from 2011 to 2015 aimed to implement the reformed English curricula. Normally, students study 805 hours of English per year (Sundkvist & Nguyen, 2020). The last phase from 2016 to 2022 increased the intensive use of English at post-secondary levels and higher (Van, 2015). Each was accordingly measured on the scales of the CEFR. The principal purpose was to enable a large section of the young people with knowledge and working skills to speak and use foreign languages (primarily English) “independently and confidently” (Government, 2008, p. 1) for study, work, and communication in an international and multicultural environment when the country was advancing its global integration and developing its knowledge economy. In particular, in 2014, the MOET issued Decision 729/BGDĐT, which specified the levels of English for teachers, and some examples of the anticipated outcomes of this scheme in each last level of education are as follows:

Table 1: Expected English Levels for Particular Groups of People and Occupations in Vietnam

People	Expected English level
Primary students (Grades 1-5) (schools in remote areas start teaching English in Grade 3)	A1
Lower secondary students (Grades 6-9)	A2
Upper secondary students (Grades 10-12)	B1
University students	B1
Bachelor and master of English students	C1
Post-graduate students in majors other than English	B1
Doctoral students	B2
Primary and lower secondary teachers of English	B2
Upper secondary teachers of English	C1
University lecturers in English	C2 (but as there was no one of a higher certificate than C2, C1 was acceptable)
Medical doctors	B2
Military/Defense officers of a rank higher than Major	B2

Not many Vietnamese teachers teaching English, people, or students were able to achieve these expected test results when they sat for Cambridge ESOL. Later in 2014, the MOET issued the Vietnamese Standardized Test of English Proficiency (known as VSTEP), which was indeed a Vietnamese-adjusted version of the CEFR test by Cambridge ESOL. Ambivalent approaches to improving the quantity and quality of English-speaking people in Vietnam have been adopted in achieving this project. For example, English textbooks from primary to high school levels were outsourced to international publishers such as Macmillan Education and Pearson. These textbooks were co-written with local English teachers who were appointed by the MOET. An ambivalent approach was clearly expressed in this collaboration. On the one hand, the MOET expected the quality of these textbooks to be of a correct standard of the authentic English language spoken and used by native speakers. On the other, the MOET wanted to increase localized knowledge that suited the general education system in Vietnam (Van, 2015). This approach is also based on an increasing number of world-renown experts in TESOL who are Vietnamese.

Nevertheless, the outcomes were not as good as intended. In fact, more than 80% of English teachers at state schools failed the requirements (Manh, Nguyen, & Burns, 2017, p. 24). The MOET allowed them to take IELTS or TOEFL as equivalents. Still, these international English proficiency tests seemed to be as hard for many of them. The report by EF Education First (English Proficiency Index, 2022) showed that Vietnam's English Proficiency Index average score was 473/800, continuously placing this country in the low-proficiency category. In 2017, the first phases of the project were said to fail (Manh, Nguyen, & Burns, 2017). The project continued until 2020, the end of its life. But the MOET never stops their ambition: a website for the National Foreign Language project was created and has been well-updated with information about training courses, new regulations related to foreign language education, learning resources, international partnerships, and the like (<https://ngoainquocgia.moet.gov.vn>).

This paper does not intend to explore or examine the causes of this failure but instead, argues for the ambivalent approach to recruiting native/foreign English teachers. Let's begin by looking at an evaluative report conducted by British Council and commissioned by the MOET (Edmett, Donaghy, & Tysoe, 2021). This report identified three main limitations in the project: shortages of qualified foreign language learning resources, technologies necessary for teaching and learning foreign languages, and a suitable foreign language speaking environment. None of these limitations was found to be related to a lack of native English-speaking teachers. The CEFR and VSTEP, or IELTS always include a speaking test module. Being fluent also requires good use of writing techniques that express fluency like native speakers. Studying with native English teachers is always important, but this project seemed to downgrade the value of this exotic human resource. Another limitation that added to the failure is the shortage of qualified teachers who obtain the expected levels of English. With regard to native or foreign English teachers, before 2019, English teachers from foreign countries submitted their documents to their employers, who submitted these documents together with their request to the province's or city's Department of Labor, Invalids, and Social Affairs for approval. Since then, all the documents have been sent to the Ministry of Labor, Invalids, and Social Affairs for approval. The requirements have also been tightened. Some foreign language centers must shut down their businesses because they cannot recruit qualified

native/foreign English speakers as they promised to parents and students. The authors typed the Vietnamese phrase “trung tâm ngoại ngữ đóng cửa” (“foreign language centers shut down”) in the search of the most popular online Vietnamese newspaper *VnExpress*, we found that there are at least 500 foreign language centers had to close their business because of many reasons, one of which is their inability to recruit native teachers that meet the new work permit requirements.

In particular, all foreign language teachers must possess at least a bachelor’s degree related to TESOL or linguistics, or a bachelor’s degree in a related field to teaching plus a TEFL or TESOL 120-hour certificate. At the university level, potential candidates must have at least a master’s degree in TESOL, linguistics, or literature or a master’s degree in a related field to their teaching and a TEFL or TESOL certificate (Vietnam’s Immigration Office, 2022). The only difference among types of native English teachers lies in their citizenship. A teacher is seen as a native English teacher if he or she holds citizenship in an English-speaking country such as the United States, the United Kingdom, Canada, or Australia. Then he or she needs only a bachelor’s degree in TESOL/English Linguistics. This issue raises some questions. For example, what if an English teacher who is originally from Hong Kong and lived there for many years before permanently migrating to the United Kingdom and acquiring British citizenship while this person speaks English with an entirely Cantonese accent? This teacher is truly Asian biologically and linguistically, but he is truly British legally. Another example is a Filipino teacher who has a bachelor’s degree, has lived in an American English-speaking community, and has graduated from an American university, would he or she be considered eligible to apply for a faculty position at a Vietnamese university to teach English? The answer is no because this person does not hold an “English-native speaking citizenship”. In this sense, qualifications can be compensated by citizenship as well. Citizenship may equate to an accumulation of several degrees but a minus of identity!

In addition, although the demand for native English teachers teaching children in Vietnam has been increasing after the Covid-19 pandemic (*VnExpress*, 2022), not much is known about their teaching adult learners or students. The quest for children to learn authentic and native language models from native English-speaking teachers is high, but not for students or those in employment who cram for tests. In Vietnam, testing, in some ways, degrades nativeness, but the desire for learning to speak as a native speaker upgrades it. The power of nativeness is now bargained. We suspect once the supply of native English teachers is humble, those who meet the requirements may ask for a higher salary. *You get what you pay for*. Foreign and native English teachers can bargain the pay for their values as well! But this bargain is made under the effects of social transformations in Vietnam that result in the demand for increasing the quantity and quality of English speakers for economic growth.

Now, let’s get back to the national foreign language project. The purpose of this part is not to focus on examining the effectiveness of this project (which, indeed, deserves space in another paper, or has it already been thoroughly researched and informed?). Instead, it focuses on pointing out some implications about the expression of nativeness among English teachers in Vietnam. First, while the quantity of those who meet the expected standards of English remains humble, why does MOET tighten the recruitment or entrance

requirements for English-speaking foreign teachers? At this stage, the number of foreign teachers at the tertiary level is managed and recorded by the Ministry of Labor, Invalids, and Social Affairs, and that at the school or foreign language center levels is processed and managed by provincial/municipal Departments of Labor, Invalids, and Social Affairs (Government, 2023). The total number of these teachers is not publicly available. We don't actually know for sure the current trends of incoming foreign teachers in Vietnam since there is little evidence about the root of these policy changes. Researchers are also less likely to have access to the policy developers. They can only approach the people who handle the paperwork, but these people may not know the reasons for these changes. The ambivalent approach which is reflective of a division of paperwork management to processing work permits creates some ambiguity for researchers and foreign teachers. The report by British Council (Edmett, Donaghy, & Tysoe, 2021) pointed out that there seemed to be little influence of native or foreign English-speaking teachers on the low scores of Vietnamese people in the English Proficiency Index. It pointed out that there is a lack of a foreign language-speaking environment in Vietnam that limit people from achieving English proficiency. Together with the tightening of the work permit regulations, this may mean that the MOET may want to focus on the quality rather than quantity aspects of foreign English-speaking teachers in Vietnam.

This project might also aim to increase the quality of domestic English teachers, though the targets were hardly reached. Acquiring both education and foreign language proficiency, especially English, is still practiced and is evident in several ways. For example, Nguyen (2021) has pointed out that there were more than 120,000 Vietnamese students studying in 46 countries and territories, although the number of returning graduates is not made public or widely known. These students certainly have possessed or will possess high proficiency in the language in the destination countries. The MOET has also allowed foreign universities to run their campuses in Vietnam and/or joint programs with domestic universities. RMIT is the first foreign-owned university that has campuses in Vietnam. La Trobe University, Swinburne, and many Singaporean schools, to name but a few, have taught their academic degree programs in Vietnam. So far, there have been more than 300 international twinning and advanced programs in Vietnam. At the same time, domestic higher education institutions expand their international relationships with foreign partners to run student and faculty exchange programs (Nguyen, 2021). Allowance for citizens to study abroad and with foreign educational providers at home is a sign that shows the government's desire to let people acquire their language proficiency for study, work, international communication, and professional relationship extensions through nativeness or near-nativeness. Nativeness can now bargain its power, but in its own country or through international collaboration through the Vietnamese Government's dual project in human capacity building.

Conclusion

By no means do we degrade or confront to judge the tremendously moral and educational values that native and non-native English teachers in this paper. Some of them have certainly been our teachers, who made us who we are today: confident in intercultural exchanges and academic communication! We owe them a sincere thank-you that we cannot simply approach and say so! Instead, in this paper, we outlined the interlink of nativeness,

identity, monolingualism, and qualifications so that we could elaborate on the rise and fall in the power of nativeness and non-nativeness. We spoke from the perspectives of English language lecturers and the English department manager when relating to the valuable resources of the native and non-native English colleagues we have worked with so far. To make this long paper short, we summarize the highlights with inferences to the broader fields of language education and foreign language policy planning in the following dot points:

- (Non)nativeness, Identity, monolingual ideologies or bi/multilingualism, and personal and educational qualifications are interlinked. Although speakers or teachers can make up these features, they cannot only be characterized by themselves. Actually, they must be agreed upon and recognized by communities, students, and legal regulations. On the one hand, the making up of these features is a personal matter. On the other, this interlink is changed constantly, becoming volatile and fragile under socio-political transformations and social prejudices.
- This interlink can allow monolingual ideologies to encounter both challenges and possibilities to manifest themselves with some bargaining power. In this sense, the imperialism of nativeness may be weakened and strengthened at the same time. Choosing an English teaching career at home or abroad is a personal choice that is managed by socioeconomic development strategies and changing legal conditions. It is not an apolitical activity. It is a personal-social sphere that involves negotiations of power based on the interlinks of personal (non)nativeness, qualifications, and mono/bilingualism to social prejudice, legality, and social transformations.
- The bargaining power in the interlink between (non)nativeness, identity, mono/bilingualism, and qualifications is often negotiated by the matches between individual choice and the regimes of foreign language entrepreneurship and politics. Citizenship can be used as a tool for some kinds of foreign English teachers to bargain for their lack of necessary qualifications and their (confusing) identity.

Recommendations

Let's now move on to some recommendations which are related to the future of nativeness and non-nativeness, at least in Vietnam's context: foreign language planning. Albeit a bit too outdated, Cooper's (1989) framework for language planning policies has still been valid as we need to consider the influences of the actors involved in the policy planning processes on specific groups of people's behaviors in certain circumstances. Language policies must be reviewed and amended as conditions may change over time. Language reform must remain national identity and, in some ways, nationalism (Kharis *et al.*, 2020) under the effects of social change (Cooper, 1989) that happens on the national and international scales. Practice, trust, and management must go hand in hand in the foreign language policy process (Spolsky, 2021). Any changes in the recruitment process for foreign English teachers must be informed internationally and nationally before an employer may choose a person who does not meet the qualification requirements, or a potential candidate may feel upset when being sacked upon the employer's acceptance. The identity of a teacher may count, but the quality of his or her teaching delivery,

which is embodied in his or her devotion to working in a foreign country and expressed in his or her qualifications matters more. Therefore, the screening of documentation is important at the legal scale, but the communication or an interview between an employer and a foreign teacher at an organic level counts as well.

Abstract: The United Nations 2030 Agenda for Sustainable Development and the Inner Development Goals argue that addressing the world's challenges in the 21st century requires people to develop diverse skills. On the one hand, anyone, regardless of age and educational level, can develop multifaceted, transdisciplinary, and integrated competencies to address these challenges. On the other hand, people must work on skills and qualities relevant to inner growth to contribute to a more sustainable global society. Latin America is one of the regions in the world with the lowest skills indexes. Developing complex thinking competency allows individuals to increase their ability to address problems and challenges in their environment, a necessary skill for any professional. However, little progress has been made in documenting pedagogical implementations that develop disciplinary and transversal competencies, such as complex thinking competency, and students' results in mastering this competency. The present contribution identifies the units of analysis for an educational ethnography focused on recording the complex dynamics of educational systems and the implications of a competency-based educational model and presents students' perceived achievement of complex thinking competency as measured by a validated instrument.

Keywords: Educational Innovation, Higher Education, Professional Education, Complex Thinking, Latin American Educational Ethnography

Introduction

The United Nations 2030 Agenda for Sustainable Development sets as goal 4 to ensure inclusive and equitable

quality education and promote lifelong learning opportunities for all; and recognizes that the expansion of information and communication technologies and global interconnection offers great potential to accelerate human progress, overcoming the digital divide and developing knowledge societies (UN, 2015). Various international organizations such as the UN, UNESCO, OECD, WEF, PM, and IDGs have analyzed the future that people will face and detected some complex global problems that will need to be solved through education, specifically with the development of certain skills. Education in the twenty-first century has changed drastically from the previous century, now educational institutions recognize that each student has different knowledge, skills, attitudes, and values and, therefore, can learn differently.

Literature Review

A Commitment to Educational Innovation to Solve Complex Global Problems

According to the OECD (2019), curricula must allow for nonlinear learning trajectories rather than expecting all students to follow a linear progression along a single, standardized path. That is why the OECD's Education and Competencies 2030 project was created, which contains seven principles: the basic foundations that students must have (cognitive bases such as literacy and numeracy, physical and mental health, and social and emotional bases such as morality and ethics), three transformative competencies (create new value, reconcile tensions and dilemmas, and take responsibility), the student's agency and co-agency, four types of knowledge (disciplinary, interdisciplinary, epistemic, and procedural), three types of skills (cognitive and metacognitive; social and emotional; and practical and physical), attitudes and values, and an iterative learning process called the "Anticipation-Action-Reflection cycle" (AAR), where students continually improve their thinking and act intentionally and responsibly. The OECD defines competency as more than just "skills" because the latter is the prerequisite for acquiring competency.

In this sense, a competence involves more than the mere acquisition of knowledge and skills; it involves the mobilization of knowledge, skills, attitudes, and values to respond to complex demands in situations of uncertainty. As mentioned, these competencies must be transformative for students to have the ability to create new values, take responsibility, and reconcile conflicts, tensions, and dilemmas. Preparing students to be innovative helps them build greater resilience when faced with uncertainties and changes and build their self-esteem.

The sense of responsibility should be instilled in students, as it involves the understanding that actions have consequences and that people have the power to affect others. It is also important for students to expand their ability to reconcile multiple and often conflicting ideas or positions and recognize that there may be more than one solution or method of finding a solution. The AAR cycle provides guidelines for students to plan, act and reflect on the transformative competencies acquired to deepen their understanding and broaden their perspective. While the OECD project focuses on secondary education as a starting point, it establishes that the seven principles are applicable to all levels of formal and informal education, and lifelong learning.

UNESCO (2019) recognizes that curricula towards competency-based approaches have gained momentum, while noting that more and more countries are undertaking a process of aligning curricula with the competency approach. The curriculum is the first operational tool to ensure the sustained relevance of the development of education and learning systems and should adopt a competency-based approach to enable young people and adults to acquire the right tools to take advantage of opportunities effectively. Seven macro-competencies are considered relevant in the curriculum: lifelong learning; agency, interactive use of various tools and resources, interaction with others, interaction with the world, multi-literacy (digital, cultural, financial, health and media), and transdisciplinarity.

The World Economic Forum tried to build starting points through the global competency taxonomy (WEF, 2021). This taxonomy is a tool for new hiring practices that will help align the needs of employers, the curricula of educational institutions, and people's core competencies. The WEF's recommendations for adopting competency taxonomy in recruitment, learning, development and relocation practices are: understanding current skills gaps, setting targets and communicating the benefits of adopting a common taxonomy; adopt new competency-based recruitment, learning and development practices, and create opportunities for individuals to take ownership of their competency-based lifelong learning journeys; and incorporate competency-based practices across sectors, countries and globally, raising awareness among the general public of the benefits of aligning around a common taxonomy. According to this international organization, the top 5 of competencies projected for 2025 at global, national, and industrial levels are: analytical thinking and innovation, active learning and learning strategies, complex problem solving, critical thinking and analysis, and creativity, originality, and initiative. Nevertheless, from a critical perspective, this global competency taxonomy focuses on graduates finding a job. It does not reference the importance of a deep sense of responsibility and commitment to values and purposes related to the good of the whole.

However, from the perspective of a non-profit, open-source initiative, the only way to achieve the Sustainable Development Goals of the UN Agenda 2030 is through the Inner Development Goals, which encompass five dimensions and 23 skills and qualities (Inner Development Goals, 2021). The first dimension is "being," the relationship to self; the second comprises thinking and cognitive skills; the third is relating and caring for others and the world; the fourth comprises collaboration and social skills; and the fifth is acting to drive change. These goals infer that we talk much more about what needs to be done to solve the world's problems than about how to develop the skills of the actors in a position to achieve the visions. The purpose of the Project is to draw attention to the need to support the development of skills, abilities and other internal qualities of the people and organizations involved in efforts to contribute to a more sustainable global society. In short, the Project works to identify, popularize and support the development of skills, abilities and qualities relevant to inner growth, through consciously supportive organizations, companies and institutions, to better address global challenges.

Formal education is not enough to achieve the Sustainable Development Goals. What is required is an expanded vision of learning and action as a "lifewide" (every part of life at any point in time) and lifelong (every moment along life's journey) process and a culture that values learning in all aspects of life. The foundation of lifewide

education is a lifewide curriculum that enables learners to integrate learning, development, and achievement from any aspect of their lives into their educational experience (Jackson, 2021).

Education in Latin American region

Statistics indicate that a person born in Latin America and the Caribbean reaches adulthood with fewer skills than someone born in the United States (IDB, 2017:78). This knowledge gap, combined with the adverse effects of the COVID-19 pandemic, the current recession, and the high degree of uncertainty caused by technological changes and automation, means it is in everyone's interest to develop skills for complex problem-solving. It is estimated that between 5% and 10% of jobs in developing countries could be fully automated, 30% of activities in another 60% of occupations could be automated, and 8% of jobs in EBRD countries and 9% in developed economies could automate more than 70% of their tasks (AfDB, ADB, IDB, EBRD, 2018:6-14).

The displacement of human activity at work should not overshadow the pursuit of decent work for all men and women (International Labour Organization, 2018); productive and high-quality employment and inclusive labor markets are included in Goal 8 of the 2030 Agenda. Decent work is also a transversal theme under the SDGs, strongly present in many other goals, such as Goal 1 (End poverty), Goal 4 (Ensure quality education), Goal 5 (Achieve gender equality), Goal 10 (Reduce inequality), Goal 14 (Conserve marine resources), and Goal 16 (Promote justice and institutions).

Much remains to improve the skills of its young people and adults and to adapt jobs to the new social and economic context. The Human Capital Index of the World Economic Forum (WEF, 2017) indicates that Latin America, the Caribbean, and Africa have the lowest skills. Therefore, it is necessary to invest in human capital through education that embraces new high-level digital, socio-emotional, and cognitive skills (including creative thinking and the ability to learn and solve problems) (The World Bank, 2016; McKinsey Global Institute, 2018).

In Latin America there are innovative educational initiatives that have evolved teaching and learning methods and techniques with the intention of counteracting the context and problems in the region (González-Pérez and Ramírez-Montoya, 2022; Ramírez-Montoya et al., 2022). Educational innovations include psycho-pedagogical studies, the use and development of technology in education and educational and socio-cultural management, and new processes, products, services, and knowledge, which are the engines of change in education (Ramírez-Montoya and Lugo-Ocando, 2020).

However, little progress has been made in recording the process of implementing innovative pedagogies that develop disciplinary and transversal competences such as complex thinking competence, as well as the results obtained by students in the domain of this competence. This contribution proposes an educational ethnography research that offers the possibility of recording what has transformed the educational model based on competencies from the point of view of educators, students, and graduates.

An Ethnography of the Complex Educational System in the 21st Century

Educational ethnography is considered a field of research that brings together professionals from various disciplines, such as anthropology, sociology, pedagogy, psychology, and linguistics, among others, to understand an educational process from an ethnographic approach. According to Beach et al. (2018), in Latin America, educational ethnography encompasses the global and local spheres. It links the researcher with places, social agents, and objects; is based on a controlled and systematic participant observation; carries out fieldwork whose results show the lived experience; and incorporates the reflexivity that interprets how the theoretical framework of the researcher interacts with the beliefs and convictions of study subjects.

Latin American educational ethnography is permeated by the critical approach of the pedagogical postulates of authors such as Freire (2008), Fals Borda and Rodríguez Brandao (1987), and Rockwell (2011). Interestingly, educational ethnography in Mexico was derived from anthropological interventions in peasant communities and rural schools (Beach et al., 2018). Rockwell (1991) points out that in Latin America, ethnography arises from experiences of popular education and state projects of democratic education; therefore, discussions have arisen about the relevance of other forms of research, including a psychological perspective. However, British and American educational ethnography have also exerted an influence, and some authors interested in incorporating Anglo-Saxon paradigms, such as multiculturalism, have distanced themselves from Latin American social and educational reality. Since the 1980s, educational ethnography has contributed to overcoming the contradiction between formal education and the socio-cultural realities of educational agents, training educators, and facilitating changes.

Nowadays, educational ethnography in Latin America maintains its critical focus: it provides a detailed analysis of activities in the classroom and educational institutions, reveals the broad linguistic and cultural diversity of the continent, shows some problems in official programs that perpetuate exclusion and school dropout, and shines a light on the gender-differentiated experiences in formal and informal educational contexts. Furthermore, Latin American educational ethnography has been innovative in revealing educational issues that have been ignored. It highlights dimensions such as gender, ethnicity, race, and nationality; analyzes in a complex way the political aspect of everyday reality inside and outside educational environments; makes visible the inclusion of young students who have historically been underrepresented; and promotes interdisciplinarity in educational research.

Because educational ethnography has mainly developed a critical and innovative approach from interdisciplinarity, we propose in this contribution that it is an adequate and relevant way to record the complexity in the process of implementing innovative pedagogies such as the megatrend of competency-based education, as well as to give voice to the actors that promote the development of competence of complex thinking and those who scale this competence to deepen the future adjustments that educational institutions will have to make of innovative pedagogies according to the specific sociocultural contexts in which they find themselves. There is a need to offer a wider range of innovative pedagogical options, aimed at invite educators and learners more

active participants in educational processes and content creators, as members of diverse and inclusive knowledge societies (Morin et al., 2003).

According to Chan and Lee (2021), there are four dimensions or levels in educational processes: (a) student learning that encompasses their motivations, their competencies and skills to reflect, their ethical concerns and emotional impact, and the relationship with their teachers; (b) teachers and teacher practices encompassing the difficulties of pedagogical practices, conceptualization of terms, purposes and processes, approaches to reflection, and advice and feedback; c) the institutional one that refers to the priorities in teaching and learning, and the support of the institution; (d) socio-cultural standards and social standards. In this contribution we consider that an educational ethnography focused on educational innovations must at least register these four dimensions or levels in educational processes.

Results

Sustainable Development Goal (SDG) 4, set out in the United Nations 2030 agenda, which focuses on ensuring inclusive and quality education for all and promoting lifelong learning, triggered the formation of the Interdisciplinary Research Group "Reasoning for Complexity" (IRG-R4C) in our educational institution to expand complex thinking for all through Open Science. The group aims to characterize the concentration and fragmentation of reasoning for the complexity of various disciplines through Open Science (Figure 1). Ultimately, IRG-R4C aims to contribute to the SDGs while promoting responsible citizenship through generating and transferring open knowledge, developing open and collaborative projects, and fostering entrepreneurship through open technology transfer processes (Ramírez-Montoya et al., 2021).

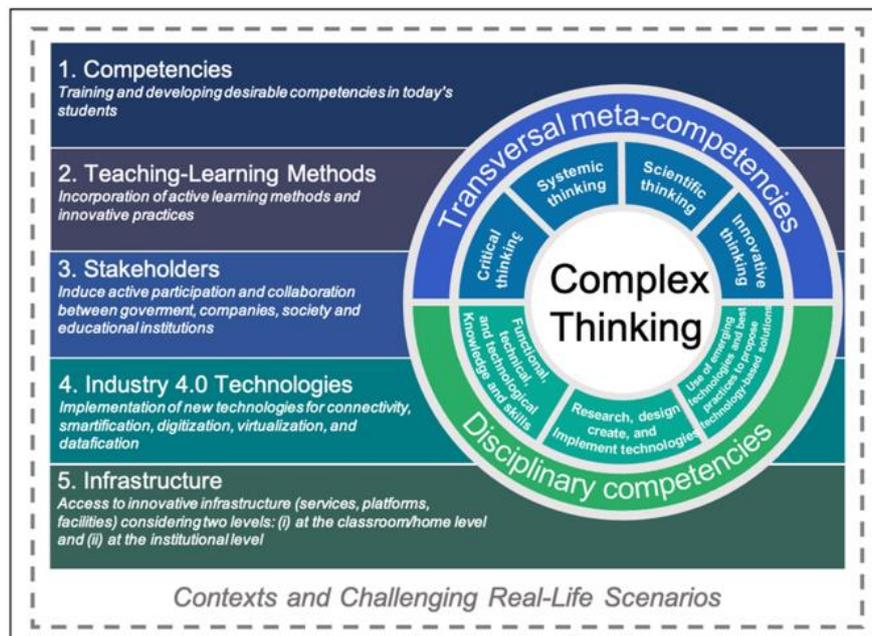

Figure 1. Complex Thinking in Education for Open Science

One result of the first phase of the project was the systematization of the principles of complex thinking theory by authors such as Edgar Morin (2001) to conceptualize and define the macro competency of complex thinking, integrated by four sub-competencies (critical, systems, scientific, and innovative thinking) (Baena-Rojas et al., 2022; Ramírez-Montoya et al., 2022). The macro competency of complex thinking is a cognitive tool that can expand people's thinking capacity when they face challenging situations or problems; it can also develop skills for thinking holistically about reality with a broad vision of the world (Vázquez-Parra et al., 2022). As for sub-competencies, critical thinking is evaluating the soundness of one's own and others' reasoning to form a judgment about a situation or problem and identify false arguments; systems thinking analyzes the relevance of the system elements operating within the existing whole; scientific thinking encompasses a set of reasoning strategies or cognitive processes, such as inductive and deductive reasoning, problem-solving, and hypothesis formulation and testing; and innovative thinking allows problem-solving and designing and creating solutions for social progress (Rodríguez-Abitia et al., 2022). The development of instruments that record the actors' perception of their development of complex thinking competency is the basis of our proposal for an educational ethnography that opens the possibility for comparative studies in other regions.

One of the most significant results of the research group was designing the eComplexity instrument to measure students' perceived mastery of the complex thinking macro competency and its sub-competencies. This instrument was validated theoretically and statistically by a team of experts in the field (Castillo-Martínez et al., 2022; González-Pérez and Ramírez-Montoya, 2022). The instrument is composed of five items (each item is answered on a 5-level Likert scale), grouped into the four sub-competencies, and in turn, each sub-competency was divided into the areas of knowledge, skills, and attitudes or values (Vázquez-Parra et al., 2022). So far, we have used the instrument in various university institutions in 19 different countries: Argentina, Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, Finland, France, Germany, Guatemala, Italy, Mexico, Nicaragua, Paraguay, Peru, Spain, United States, and Venezuela.

Final Remarks

The results of applying the eComplexity instrument can be considered a substantial part of an educational ethnography, in the sense that it reflects the voice of the actors quantitatively. The eComplexity results reflect the first dimension or level in Chan and Lee's (2021) educational processes: students' perceptions of their abilities. The students' self-perception is their self-criticism. Therefore, this ethnography subscribes to constructivism and critical theoretical paradigms and is interdisciplinary; various researchers contribute to constructing a way to study, understand, and explain complex educational processes and phenomena in environments of great cultural and social diversity.

The design of an instrument to measure students' perceived mastery of the macro competency of complex thinking and its sub-competencies is the basis of our proposal for an educational ethnography focused on recording the implementation of innovative pedagogies such as competency-based education (a megatrend). An

educational ethnography to record the process of implementing innovative pedagogies, like competency-based education, will require more active participation by the actors and more robust infrastructures with more key actors and resources.

The result of the registry will generate methodologies to build a bridge between the SDG4, the global competency taxonomy proposed by the WEF (2021), the Inner Development Goals and the educational models of higher education institutions so that students scale their complex thinking skills, access to open education and collaboration, and insert themselves into the competitive labor market. This synergy and changes will have an impact on the level of skills and abilities in Latin America.

Abstract: The beekeeping sector is demanding, requires knowledge and updated information to be able to deal with the challenges related with climate change, food scarcity, stress, pollution, and other harmful effects from the surrounding environment. Hence, this work intended to make a characterization of the needs in professional training in the beekeeping sector and how these needs can be fulfilled through courses and other actions to help beekeepers to maintain updated. The work was carried out in seven European countries (Croatia, Estonia, Finland, Italy, Norway, Portugal, Spain, Total), and the data was collected through a questionnaire survey, translated into the native languages in all the participating countries. The results revealed that the topics of highest interest for the beekeepers were apiary health and pest control and also colony management throughout the year. The most relevant sources of information were family and professional training/courses. The most valued forms of training were in-person and in workplace/internships, although the digital supporting resources were preferred instead of printed material. The learning materials most valued were videos but also books/paper manuals were considered relevant. The field visits were also greatly appreciated by the participants, and the most preferred assessment format was the realization of practical exercises. In conclusion, this work produced valuable information that can be utilized to design training actions and courses to the professionals in the beekeeping sector to enhance their knowledge and better prepare them to manage successfully their activities.

Keywords: Distance learning, mobile-learning, professional learning, beekeeping, survey.

Introduction

The capacity of the human brain to learn and accumulate knowledge from a wide amount of information

considered relevant is enormous. It is the synaptic plasticity of the brain that enables it to learn new representations as well as to eliminate previously learned information, constituting a foundation for shaping memory and learning that culminates in the Lifelong Learning (LL) process (Abbott & Nelson, 2000; Gryshchuk et al., 2022; Parisi et al., 2019). LL encompasses different analytic perspectives as such: the social organization of learning and individual learning. These, indicate the way past definitional concerns related with formal, non-formal and informal learning. The recognition of learning outcomes must be modern and consider eventually contrasting viewpoints, namely in the European context as well as from the global viewpoint (Evans & Kersh, 2023).

Present trends seem to indicate that the time for distinguishing learning according to formality of context is outdated. Although this approach has been very relevant in the past to overcome obstacles in the early development of LL systems, in the present society and in view of the novel trends and challenges is now seen as archaic, and the multi-faceted LL requires novel approaches in changing learning environments and social practice beyond initial schooling (Evans & Kersh, 2023). According to Baker et al. (2023), the challenge of LL is to enabling a system to learn and retain knowledge regarding a multiplicity of tasks during its operational lifetime.

Professional training (PT) encompasses the process of building knowledge, skills and competences either being on individual persons or in a group or team. Controlling knowledge is vital to realize that knowledge brings empowerment, which is the basis for meeting existing and future demands and challenges. Technological developments, educational innovative methodologies and modern learning are on the path from using technology to increase knowledge (Ekúndayò & Tuluri, 2011). The development of human competences through training promotes quality, efficiency, and effectiveness and at the same time motivates the professionals, leading to make a commitment with increasing productivity (Segret, 2009). Effective training improves not only knowledge and skills but also attitudes and resilience (Bhavsar-Burke et al., 2022).

The project beeB - Foster for beekeeping bridges through innovative and participative training, was approved by the European Union with Reference no. 2019-1-PT01-KA202-060782, and intends to give a contribution for the technical training to beekeepers and other intervening agents in the beekeeping sector, as well as to provide adequate tools in contexts of mobile-learning (m-learning), to improve the capacity of beekeepers to successfully manage their businesses. The project team includes six partners from different European countries, and it encompasses identification of needs and development of training opportunities, facilitating the beekeepers to access courses, learning platforms and contents on a distance learning basis. In this context, the aim of this work was to undertake a survey using a questionnaire to gather information about the beekeeping activity, past experience in professional training in the context of mobile learning, and most valued forms of training in different countries. These elements will bring valuable information to design courses and other learning tools to make easily available to use by all those interested in beekeeping sector, to improve their knowledge and skills.

Materials and Methods

Instrument for Data Collection

For this survey a questionnaire was used, because it constitutes an advantageous way to collect data related to social behaviors. The questionnaire was firstly prepared in Portuguese and then it was translated into the languages of the participating countries and applied to people in each of the countries of the study (Croatia, Estonia, Finland, Italy, Norway, Portugal and Spain).

Sampling Procedure

The sample was obtained from all the potential people of interest in the different countries participating in the research. The target group was composed of people who engage in activities related to the beekeeping sector, either professionally or as a complement to their other main occupation or means of livelihood. The questionnaires were delivered in person but also complemented with some responded through internet. The participation of the respondents was voluntary and in the end 313 consented valid questionnaires were obtained, distributed by the different countries as: Croatia (n = 64), Estonia (n = 44), Finland (n = 15), Italy (n = 16), Norway (n = 74), Portugal (n = 48), and Spain (n = 52).

Results

Sample Characterization

The sample consisted of people aged between 17 and 82 years old, being on average 48 ± 13 years. The mean value for age was higher in Norway (55 ± 12 years) and lower in Italy (41 ± 12 years). Most of the participants in the study were male (73.8%), with a lower percentage of women (23.3%), and some participants did not answer this question (2.9%). The country where the highest percentage of women was registered was Estonia (where 35.7% of the participants were female), while in Spain the lowest percentage of women was encountered (only 10.0%). With respect to education level, 58.5% have a university degree, 35.1% have secondary school, and only 3.2% had a very low level of education (basic education). There were still 3.2% of participants who did not indicate their level of education.

It was in Norway that the highest level of education was predominant, with the highest percentage of participants having a university degree (81.9%), while in Spain the lowest percentage of participants with university degree was found (42.0%). Regarding the type of activity that the participants have in the beekeeping sector, Table 1 shows the distribution for each country, considering that some of the participants indicated more than one of the activities and some other did not indicate any of these three possibilities.

Table 1. Beekeeping activities of the participants in the study according to country.

Activity	Croatia (n = 64)	Estonia (n = 44)	Finland (n = 15)	Italy (n = 16)	Norway (n = 74)	Portugal (n = 48)	Spain (n = 52)	Total (n = 313)
Beekeeper	28	43	14	12	74	46	44	261
Technician	23	5	2	2	1	4	2	39
Merchant	13	5	1	1	1	3	0	24
Total	64	53	17	15	76	53	46	313

Identification of Training Needs

The participants were asked to identify from a list provided, which subjects they considered of higher and of lower interest in the context of training in the beekeeping sector, using a scale from 1 (very low interest) to 5 (very high interest). The results obtained are presented in Table 2, for the global sample. The subjects classified with the highest score by more participants are “Apiary health and pest control” (54.6% gave score 5), followed by “Colony management throughout the year” (42.0% gave score 5) and in third came “Reproductive management/Queens production” (37.1% of score 5). The subjects that were considered by more participants as not of interest were “Beehive production” (considered by 20.8% of participants as very low interest – score 1), followed by “Organic production mode” (17.4% of score 1).

Table 2. Level of interest in training subjects in beekeeping (N = 313).

Subject	→ Increasing Level of Interest →				
	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)
Bee biology	10.8	12.9	20.4	25.4	30.5
Beehive production	20.8	15.2	19.0	18.3	26.6
Apiary health and pest control	4.3	6.0	9.3	25.8	54.6
Organic production mode	17.4	21.8	18.1	14.3	28.3
Meliferous flora	4.8	11.7	22.3	27.1	34.0
Apiary Installation	10.5	17.9	24.2	26.7	20.7
Colony management throughout the year	5.4	8.8	14.2	29.5	42.0
Production of bee products other than honey	9.8	12.7	19.6	22.8	35.1
Food management	8.8	14.6	19.3	27.1	30.2
Reproductive management/Queens production	7.6	12.7	13.7	28.9	37.1
Hygiene, health and safety at work in beekeeping	4.8	12.8	27.7	21.8	32.9
Legislation	8.9	12.3	27.1	28.4	23.3
Business skills	13.9	14.5	22.3	21.6	27.7

Considering the lowest score (1: very low interest) and the highest score (5: very high interest), Figure 1 shows the distribution according to country for all the subjects included in the questionnaire. The results for the lowest interest indicate that, for example, “Business skills” are not considered of interest for a great number of Spanish participants while “Beehive production” is not particularly relevant for Croatian participants. With respect to the highest interest, it was verified that a high number of participants in all countries consider “Apiary health and pest control” as very relevant, particularly for participants from Croatia, Norway and Portugal. Also “Colony management throughout the year” appears as very relevant for participants from most countries, in particular the same countries as before, Croatia, Norway and Portugal.

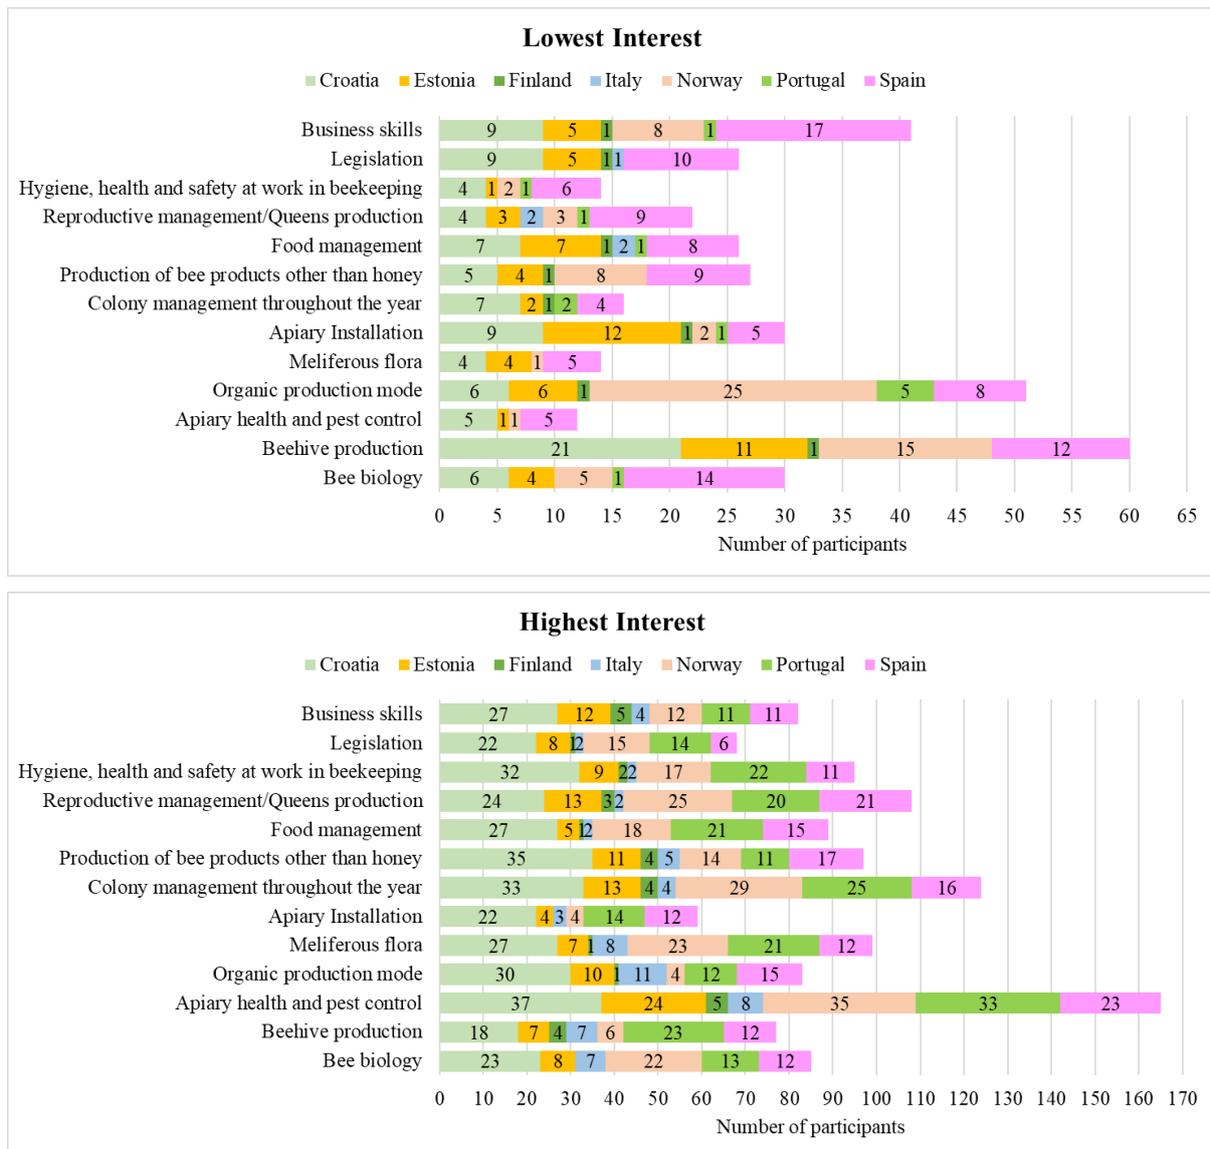

Figure 1. Subjects of lowest and highest interest in beekeeping professional training according to country.

The participants were asked to rate different sources from where they acquire their knowledge, according to their importance, being the results presented in Table 3 for the global sample. All sources were classified by a

high number of participants as most important, with percentages varying from a minimum of 65.5% for “Books” to a maximum of 87.5% for “Family”. The source which showed a highest percentage of participants classifying it as least important was seminars with 22.6%. Still, the percentage of participants classifying as most important was very high also (67.7%).

Table 3. Sources of information (N = 313).

Sources	Importance		
	Least important (%)	Important (%)	Most Important (%)
Family	6.9	5.6	87.5
Other beekeepers	8.7	21.3	69.9
Professional Training/Courses	12.0	13.2	74.9
Books	17.9	16.7	65.5
Seminars	22.6	9.7	67.7
Internet	21.2	11.0	67.8
Others	9.1	18.2	72.7

Figure 2 shows the classification of different sources as most important, according to country. The results indicate that 40 participants from Croatia rated as most important the “Other Beekeepers”. This option was also chosen by 29 participants from Portugal and equal number from Spain.

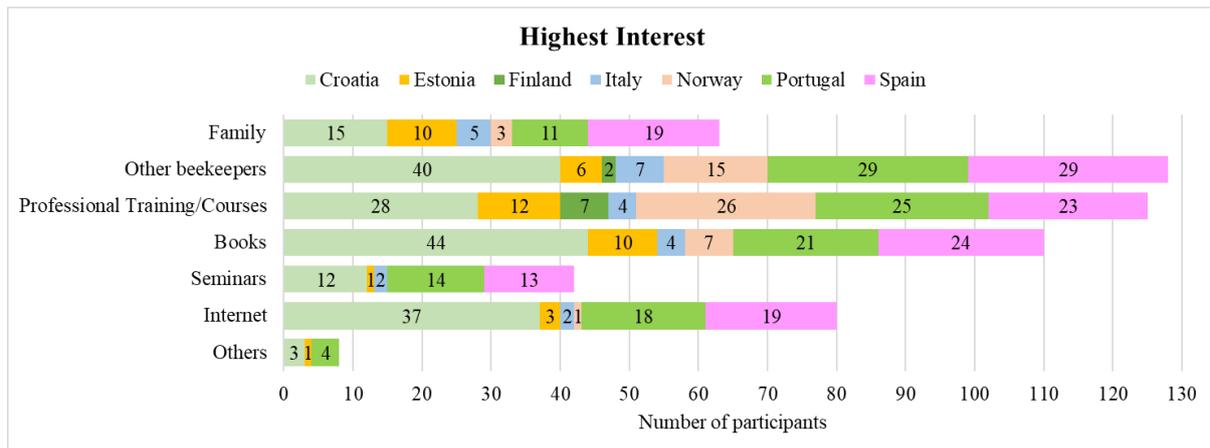

Figure 2. Sources of information of highest interest according to country.

One other aspect that was investigated related to the identification of the difficulties that the professionals experience in their beekeeping activities. The participants were asked to classify on a scale from 1 (most important) to 6 (least important) a set of possibilities presented to them, being the results reported in Table 4, for the whole sample. The difficulties scored with 1, the most important, were mainly “Market issues” (indicated by 28.7% of the participants) and “Access to land to install apiaries” (for 20.3% of the participants). The weight of

the materials was not considered most important by many participants (only 13.0% scored 1).

Table 4. Level of importance of difficulties encountered by beekeepers (N = 313).

Difficulties	→ Decreasing Importance →					
	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)	6 (%)
Weight of materials	13.0	23.3	19.3	16.6	15.7	12.1
Hard hand work	18.8	22.2	23.9	16.7	9.8	8.5
Access to land to install apiaries	20.3	11.9	20.3	14.9	20.3	12.4
Market issues	28.7	11.5	16.7	17.2	15.5	10.3
Time consumed in management activities	18.1	26.1	19.7	14.7	16.4	5.0
Others	35.3	15.7	12.7	6.9	5.9	12.5

Figure 3 shows the major difficulties that beekeepers have to deal with in the course of their activity, according to country. For example, “Market issues” were considered of major importance by 19 participants from Estonia, but none from Croatia and only two from Spain. On the other hand, “Hard hand work” and “Access to land and apiaries” were classified as being of great importance by a high number of participants from Croatia (10 and 11, respectively), Norway (14 and 13, respectively) and from Spain (8 and 10, respectively).

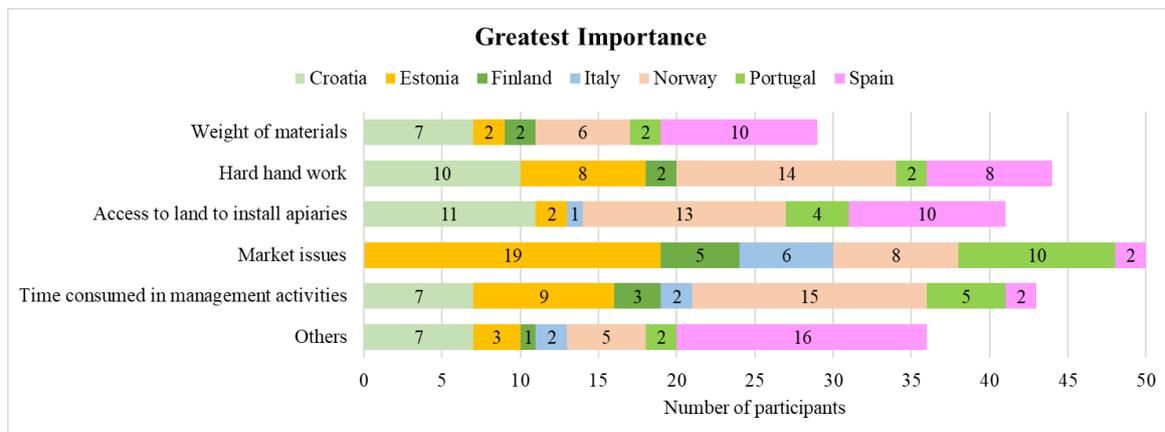

Figure 3. Major difficulties experienced by beekeepers, according to country.

Experience in Training Activities

Most of the participants in the study had already participated in training activities in the beekeeping area (78.6%), corresponding to 58.3% of the Croatian participants, 83.3% of Estonian, 80.0% of Finish, 68.8% of Italians, 93.2% of Norwegian, 91.7% of Portuguese and 68.0% of Spanish participants. Considering the whole sample, 178 participants had participated in training activities as trainee, and 109 had participated as trainer/coordinator. As for the distribution between countries, that is presented in Table 5.

Table 5. Role of the participants in training activities, by country.

Activity	Croatia	Estonia	Finland	Italy	Norway	Portugal	Spain	Total
As trainee	32	33	5	11	60	10	27	178
As trainer/coordinator	8	12	11	1	24	44	9	109

The participants were also asked to identify from a list presented to them, which training mode they considered of least and most interest, using a scale from 1 (very low interest) to 5 (very high interest). The results obtained are presented in Table 6, considering the whole sample. The modes most valued by the participants were “In person” (45.5% scored 5, the highest level of interest) and “In workplace/Internship” (43.3% scored 5). Still, also the “Mixed” and “Distance” modes had some preferences (24.2% and 17.5% of score 5, respectively)

Table 6. Level of interest about different training modes (N = 313).

Training mode	→ Increasing Level of Interest →				
	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)
In person	5.7	7.7	19.1	22.0	45.5
At distance	11.1	26.5	25.6	19.2	17.5
Mixed	3.0	11.9	27.5	33.5	24.2
In workplace/Internship	10.6	9.4	16.6	20.0	43.3

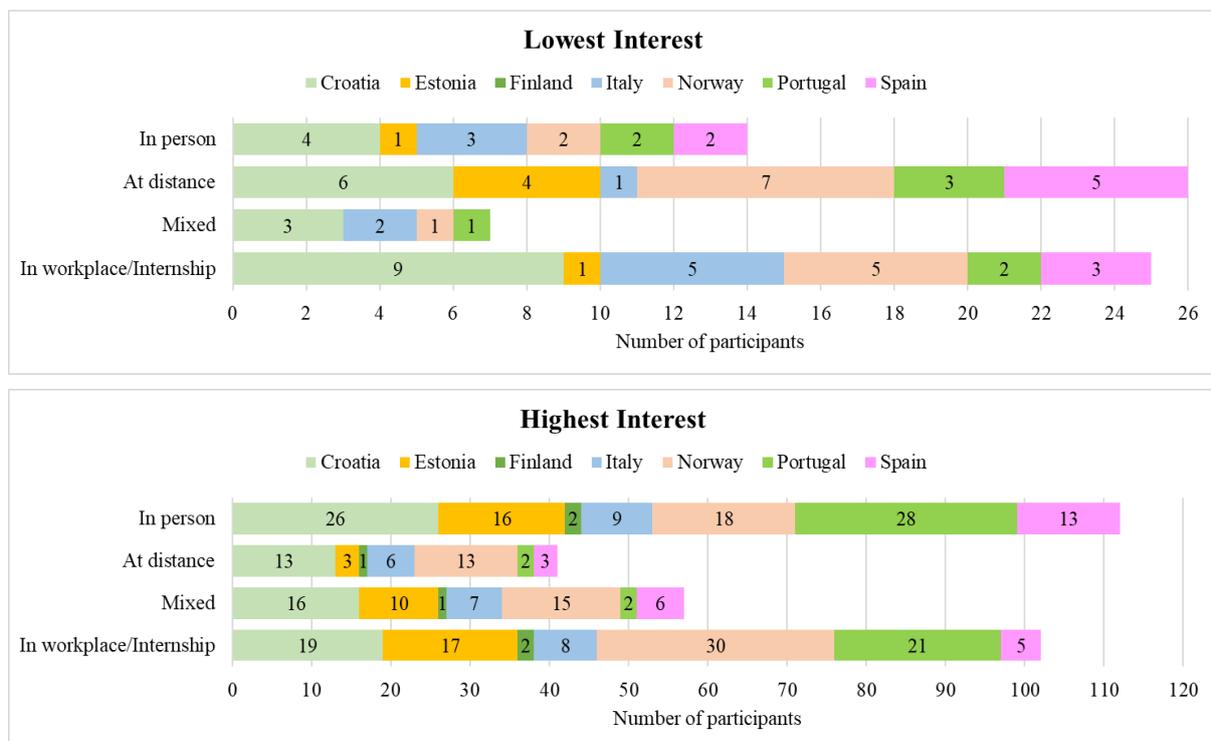

Figure 4. Modes of training with lowest and highest interest according to country.

Noticing the lowest score, 1 (very low interest) and the highest score, 5 (very high interest), Figure 4 presents the distribution according to country for all the different forms considered. A high number of participants classified the “At distance” mode as least important: 6 from Croatia, 4 from Estonia, 1 from Italy, 7 from Norway, 3 from Portugal and 5 from Spain. A similar trend was observed for the form of assessment “In workplace/Internship”, which obtained also a high number of classifications as being of low importance: 9 from Croatia, 1 from Estonia, 5 from Italy, 5 from Norway, 2 from Portugal and 3 from Spain.

The results in Figure 4 also reveal that more participants from Croatia, Portugal or Spain attributed highest interest for “In person” mode when compared with the others. However, for the majority of the Norwegian and Estonian participants, the “In workplace/Internship” was considered the most important. Globally, the most valued form of assessment was “In person”, rated as of high interest by 26 participants from Croatia, 16 from Estonia, 2 from Finland, 9 from Italy, 18 from Norway, 28 from Portugal and 13 from Spain.

Use of Distance Learning Technologies

The participants were asked how often they use their mobile devices in the ambit of the beekeeping activities. The results in Table 7 show, considering the whole sample, the highest percentage for daily utilization of mobile devices (36.1%) and only a small percentage (7.7%) say they never use them for beekeeping activities. When the results refer to the individual countries, countries where most beekeepers use mobile devices on a daily basis include Italy (62.5%), Croatia (61.7%), Finland (58.3%) and Spain (50.0%). Countries with a high percentage of participants that never or very sporadically use the mobile devices for beekeeping include Estonia (56.8% very sporadically and 13.5% never) and Norway (34.3% very sporadically and 10.0% never).

Table 7. Frequency of utilization of mobile devices in beekeeping activities, global and by country.

Frequency	Croatia	Estonia	Finland	Italy	Norway	Portugal	Spain	Total
Daily	61.7	10.8	58.3	62.5	10.0	37.2	50.0	36.1
1-2 times/week	3.3	13.5	25.0	6.3	25.7	27.9	13.9	16.8
1-2 times/month	8.3	5.4	8.3	0.0	20.0	18.6	8.3	12.0
Very sporadically	23.3	56.8	8.3	12.5	34.3	7.0	27.8	27.4
Never	3.3	13.5	0.0	18.8	10.0	9.3	0.0	7.7
Total	100	100	100	100	100	100	100	100

When asked what they used the mobile devices for, a great number answered to take pictures (n = 185) and to do research (n = 147) (Table 8). It is relevant to notice that participants could choose more than option in this question. When looking at the data by country, the trend is also verified, being these two the most frequent activities for the beekeepers in practically all countries, except Finland and Estonia, where making videos surpasses doing research, although with very close values, as it also happens with Italy.

Table 8. Uses of mobile devices in the beekeeping activities, by country.

Uses	Croatia	Estonia	Finland	Italy	Norway	Portugal	Spain	Total
Take pictures	45	28	8	13	46	23	22	185
Make videos	26	20	6	10	15	9	13	99
Do research	28	18	4	10	35	28	24	147
Use apps	13	4	5	10	11	13	10	66
Use specialized platforms	21	3	1	7	9	15	19	75
Others	1	8	1	1	6	3	3	23

The internet access in the apiaries was investigated, and the results showed that 21.1% of the global participants did not have internet in the apiaries, while 70.4% had access to internet, and 8.5% replied they had access in some of the apiaries but no access in others. Figure 5 shows the data separated by country, and reveals a similar trend, i.e., that the majority of participants in each of the countries have access to internet in their apiaries. There are also some participants who have access to internet in some of their apiaries, but not in all of them.

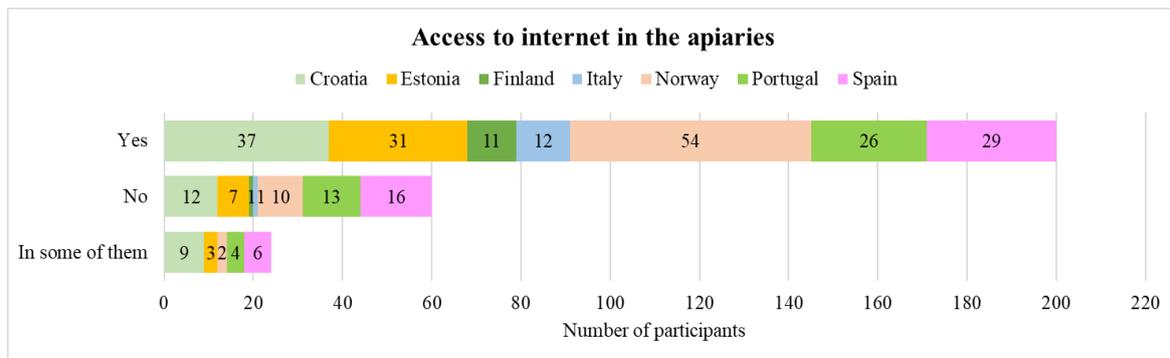

Figure 5. Access to internet in the apiaries, by country.

Tools for Distance Learning

When asked whether the participants preferred digital or printed information about beekeeping, 177 said they preferred digital and 136 preferred printed information. Figure 6 shows the preferred materials, according to the participants from the different countries. Countries where a higher number of participants prefer digital materials are Croatia (n = 44 against 17 who prefer printed), Finland (n = 9 against 5), Italy (n = 10 against 6), Portugal (n = 25 against 21) and Spain (n = 37 against 15). Contrarily, in Estonia and Norway, a higher number of participants prefer printed materials (Figure 6).

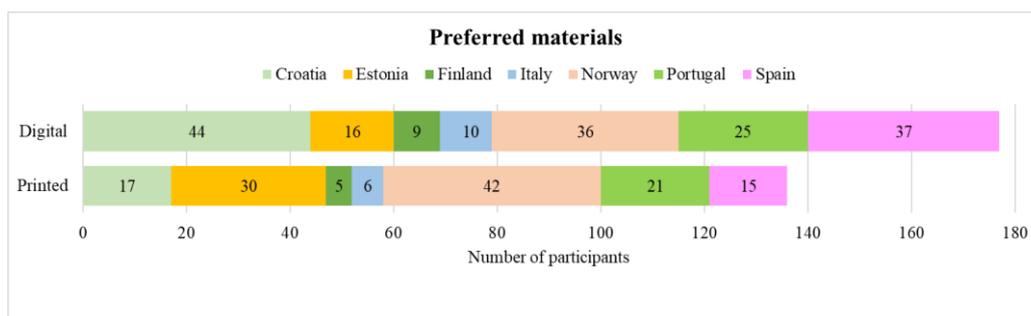

Figure 6. Preferred materials, by country.

The participants were asked about how they classified the usefulness of each of different types of learning materials, rating them on a scale from 1 (little useful) to 5 (very useful). These results are presented in Table 9. The participants rated as most useful the videos (41.8%), followed closely by books/paper manuals (41.4%). The least relevant materials were “Educational games”, which had the highest percentage of low rating (38.7% of participants attributed score 1).

Table 9. Opinions about the usefulness of learning support materials (N = 313).

Material	→ Increasing usefulness →				
	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)
e-books (electronic books)	13.1	15.7	23.5	23.5	24.3
Interactive platforms	7.9	16.6	24.2	28.5	22.7
Books/Paper manuals	3.2	6.0	19.3	30.2	41.4
Technical leaflets	9.1	13.5	25.5	29.2	22.6
Educational games	38.7	23.1	19.3	11.3	7.6
Videos	3.5	4.2	19.5	31.0	41.8
Specific programs or Apps	10.2	12.5	24.7	29.8	22.7
Others	42.1	7.9	21.1	13.2	15.8

Figure 7 presents the results for the learning materials rated most useful, by country. Considering the materials scored with highest value (5) for usefulness in each country, videos stand out particularly for Croatian and Spanish participants. Contrarily, books/paper manuals are particularly relevant for the Croatian, the Norwegian and the Spanish beekeepers (Figure 7).

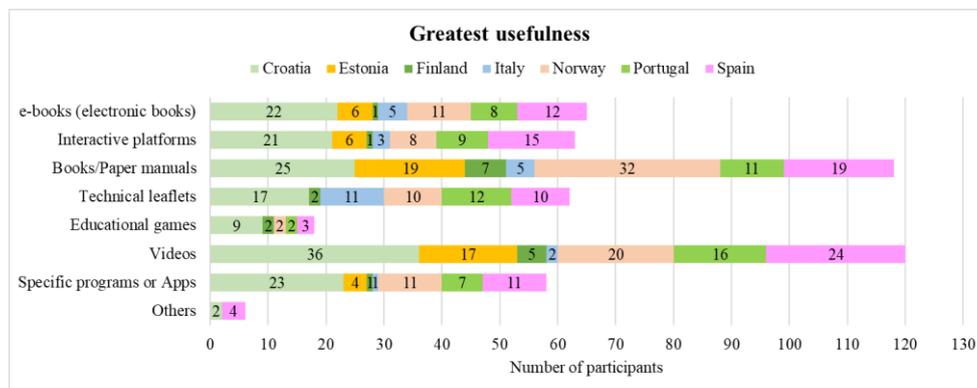

Figure 7. Learning materials rated most useful, by country.

With respect to the learning methodologies, also the participants had to rate their usefulness on the same scale from 1 (little useful) to 5 (very useful). Table 10 presents the results for the whole sample. Higher percentages of the maximum score (score 5) were found for “Field visits” (49.7%), for “Internships” (35.9%) and for “Short courses” (34.5%). “Games/Challenges (gamification)” was, among the methodologies proposed, the least valued, with 26.5% of participants scoring with lowest value of usefulness (score 1).

The methodologies scored for usefulness with lowest and highest values (1 and 5, respectively) in each country are shown in Figure 8. Major discrepancies were found for “Games/Challenges (gamification)”, that were

considered as of low usefulness by many Norwegian participants (n = 23) but by few Italians or Finish (n = 2, in both cases). The Field visits were greatly valued in general, with a high number of participants from all countries attributing maximum score for usefulness: 36 from Croatia, 12 from Estonia, 9 from Finland, 7 from Italy, 24 from Norway, 27 from Portugal and also 27 from Spain.

Table 10. Opinions about the usefulness of learning methodologies (N = 313).

Methodology	→ Increasing usefulness →				
	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)
Long courses	11.9	12.2	27.3	19.4	29.1
Short courses	5.3	6.3	23.6	30.3	34.5
Forum/chat	7.7	21.9	27.4	23.0	20.1
Lectures	2.2	10.0	29.7	31.5	26.5
Based in projects	5.2	16.0	28.4	25.0	25.4
Field visits	1.0	6.3	12.9	30.1	49.7
Monitoring of pilot farms	8.0	13.1	24.4	22.5	32.0
Internships	11.1	9.6	17.4	25.9	35.9
Games/Challenges (gamification)	26.5	29.2	25.8	12.5	6.1
Group work	12.5	11.8	31.8	29.4	14.5
Others	36.4	9.1	18.2	9.1	27.3

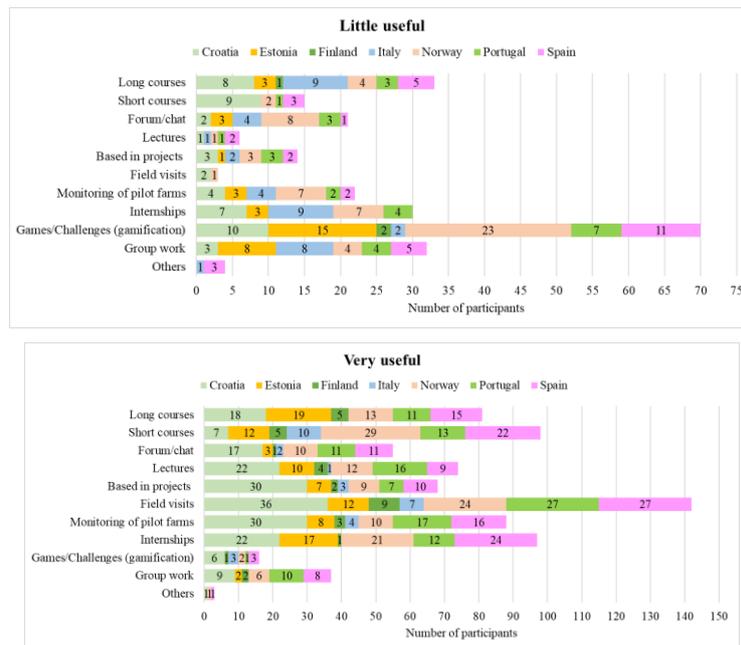

Figure 8. Learning methodologies rated lowest and highest for usefulness, by country.

Also the form of assessment of the learning outcomes in context of distance learning and self-learning, was investigated in this study. Table 11 presents the results, for the global sample, of the participants' opinions about which methods they considered most or least useful to assess learning outcomes, using the same 5 points scale previously described. The most valued form of assessment was "Practical exercises" (39.8% scored maximum, 5) while the least valued were "Online response tests" and "Oral tests", with around 11% of score 1, in both cases.

Table 11. Opinions about the usefulness of formats to assess the learning outcomes (N = 313).

Assessment format	→ Increasing usefulness →				
	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)
Online response tests	11.3	16.0	27.3	21.1	24.4
Tasks/reports	6.1	15.5	34.1	28.0	16.3
Paper tests/questionnaires	9.3	19.7	34.6	23.0	13.4
Practical exercises	5.3	5.6	18.7	30.6	39.8
Orals tests	11.0	18.1	28.0	27.2	15.7
Others	27.8	22.2	22.2	5.6	22.2

The forms of assessment rated with the lowest and highest scores (1 and 5, respectively) were then analysed by country, and the results are shown in Figure 9. The “Online response tests” were not valued by participants from Spain and Croatia (n =10 and n = 8, respectively). The “Practical exercises” were considered very useful for a high number of participants from Croatia, Estonia, Norway, Portugal and Spain (n = 22, n = 23, n = 19, n = 18 and n = 25, respectively), but only two participants from Italy and four from Finland considered this assessment format very useful.

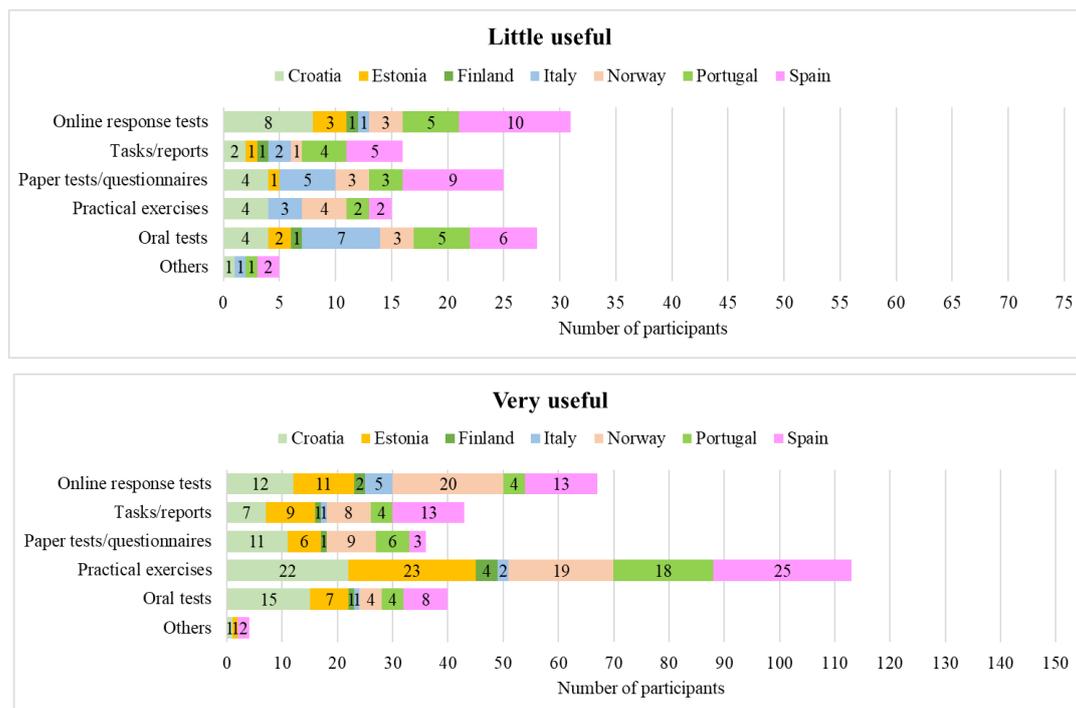

Figure 9. Assessment formats rated lowest and highest for usefulness, by country.

Discussion

Education is the pathway to increase productivity and competitiveness in any business area, including beekeeping. The beekeeper is the agent and the medium is variable, but undoubtedly that technology is becoming more and more relevant in the context of PT and LL. Among others, e-Learning already assumes the lead and it will increasingly play a dominant role in shaping student’s management systems and the related

learning environments (Ekúndayò & Tuluri, 2011).

Although the enormous possibilities of distance learning have been known for many decades, it is a fact that until the outbreak of Covid-19 pandemic in the year 2020, teaching methods still followed to a great extent a traditional approach based much on frontal teaching in a classroom. But even before that the use of digital tools had been acknowledged as pivotal for achieving the required 21st century skills (Yorkovsky & Levenberg, 2022). This forced need to shift rapidly from in-person learning systems to distance learning based on technology, cause an evolution not only in the technology itself, but also in the didactic and pedagogical domains (Segbenya et al., 2022; Segbenya & Anokye, 2022).

The use of distance learning tools for professional training is very advantageous given the lack of time of professionals, who, nonetheless, still need to improve their knowledge, skills and competences, as a way to improve the health of their beehives and the quality of their products, to expand their business and increase competitiveness (Farida & Setiawan, 2022; Lee et al., 2019; Mahdavinejad et al., 2012; Shen et al., 2022). Additionally, managing beehives and bees has many challenges, due to the threats posed by climate change, the use of harmful substances, pests such as the Varroa mite, or those posed by predators such as the Asian wasp (*Vespa velutina*). The building of knowledge founded on updated information, most recent technological developments and scientific discoveries arises as a vital activity to all those intervening in the beekeeping sector (Leza et al., 2019; Malkamäki et al., 2016; Phillips, 2020; Robustillo et al., 2022; Zacepins et al., 2015).

Among the topics that beekeepers identify as most relevant in the context of lifelong learning and professional training, stand the apiary health and pest control, related to the health of the colonies, but also colony management throughout the year, with the differences according to season, namely the dichotomy autumn-winter/spring-summer, and also the reproductive management and production of queens. They feel that they need to improve their knowledge and be better prepared to deal with the problems that affect their beekeeping activities. New discoveries can bring light into novel approaches to improve bee health and increase colony performance (Hong et al., 2022; Jovanovic et al., 2021; Lo & Chiang, 2022). Also new findings are continually being released about the impact of invasive species *Vespa velutina* on honeybees, and how to minimize those effects (Leza et al., 2019; Poidatz et al., 2018). As such, all domains of knowledge linked with the beekeeping sector require continuous update for those involved.

The existence of courses for distance learning and adjusted assessment of learning outcomes, allows a continuous updating of information and development of competences, that are recognized as vital by beekeepers. They feel they want to engage in training activities in domains they find crucial, so curriculum development needs to adapt to this reality. Additionally, they find distance learning a useful means of training, but they recognize that complementing with practical activities is necessary to achieve success. These blended learning approaches are documented as bringing together the best of different approaches (Finlay et al., 2022; Geletu & Mihiretie, 2023; Truss & Anderson, 2023).

Conclusion

The results obtained through this questionnaire survey applied to actors in the beekeeping sector in different European countries, revealed that the topics of highest interest for the beekeepers are apiary health and pest control, but also colony management throughout the year. For the enquired, the most relevant sources of information are family, but they also get new information from professional training/courses. The most valued forms of training are in-person and in workplace/internships. Nevertheless, the digital supporting resources are preferred instead of printed material, as a way to increase sustainability. The most valued learning materials were videos, but also books (even e-books) or paper manuals were considered relevant. The field visits were also greatly appreciated by the participants, and the most preferred assessment format was the realization of practical exercises.

Recommendations

Based on the results revealed through this research, the valuable information concerning topics of interest, forms of delivering the classes, materials preferred, or modes of assessment of the learning outcomes, can be utilized to design training actions and courses destined to the professionals in the beekeeping sector, as a way to allow them expand their knowledge and better prepare to successfully manage their beekeeping activities.

Abstract: Aging is a growing public health concern as falls are the leading cause of unintentional injury in older adults. Thus, this study identifies the main areas and current interactions between falls in the field of older adults and suggests future research directions. Using a bibliometric analysis, we examine a sample of 6815 studies from the Scopus database on falls and older adult research starting from 1842 to 2022. Findings showed the United States was an active country, with 1760 total publications and the Hinda and Arthur Marcus Institute for Aging Research, Boston, MA was a dynamic institution. Three prolific authors in this area have been identified, namely Lord SR from Sydney, Kenny RA, and Stevens JA from the Ireland and United States, respectively. While, the most cited paper was from Tinetti M (1988), with the title “Risk Factors for Falls among Elderly Persons Living in the Community” (cites=4922). The Journal of the American Geriatrics Society was the most active journal. The co-occurrence analysis was used to study to explore topics related to aging and falls. The total strength of the co-occurrence links with other keywords was calculated by the VOSviewer software using the normalization of associations and full counting algorithm. Five major clusters have been discussed related on the topics researched. Although research activity on aging and falls occurs globally, a lack of collaboration exists across country lines, especially between authors of developed and developing countries. Research on risk factors related to falls in the community focusing on balance issues and gait was significantly discussed. However, insufficient attention to the diversity of aging and their individual needs particularly with respect to cultural and socioeconomic factors. We conclude by suggesting two potential research directions related to prevention and focusing on sub-populations of older adults such as those with dementia.

Keywords: Bibliometric analysis, Falls, Older adults, Prevention, Risk

Citation: Azizan, A. & Muawanah, S. (2023). Mapping the Research Landscape of Falls in Older Adults: A Bibliometric Analysis. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 922-938), Cappadocia, Turkiye. ISTES Organization.

Introduction

Falls in older adults are a significant public health concern, with nearly one-third of older adults experiencing a fall each year (World Health Organization, 2007). Mapping the research landscape of falls in older adults provides insights into the current state of research, identifies gaps in knowledge, and highlights opportunities for future research. A systematic review of the literature on falls in older adults found that the majority of research has focused on individual-level risk factors, such as age, sex, and chronic health conditions, rather than on broader contextual factors, such as social and environmental factors (Gillespie et al., 2012). This review also identified a need for more research on effective fall prevention interventions and for studies that explore the experiences and perspectives of older adults who have fallen.

Further evidence of the need for a more comprehensive approach to falls in older adults comes from a recent meta-analysis that found that multifactorial interventions, which address both individual-level and contextual factors, are more effective at reducing the risk of falls than single-component interventions (Parry et al., 2013). This analysis also highlighted the importance of tailoring interventions to individual needs and preferences and involving older adults in the development and implementation of fall prevention strategies. Overall, mapping the research landscape of falls in older adults reveals the need for a more holistic and person-centered approach to fall prevention that considers both individual-level and contextual factors and engages older adults as partners in the research process.

A great deal of previous research into fall-related in older adults has focused on the challenges. It is now well-established from a variety of studies that have relatively small sample sizes, which can limit the generalizability of the findings. This can make it difficult to draw strong conclusions or make recommendations for broader populations. Perhaps, issues related to ethical considerations also play a major role in this research trend and challenges. Falls can be a serious health concern for older adults, and conducting research on falls can raise ethical considerations related to informed consent, risk of injury, and balancing the benefits and risks of fall prevention interventions.

Up to now, in terms of data collection, previous studies on falls go unreported and are difficult to capture through self-report or other means. This can make it difficult to accurately assess the frequency and risk factors of falls. Previous research findings into fall-related studies have been inconsistent and contradictory, which might be due to their measurement issues. Measuring falls and fall-related outcomes can be complex, as there is often variability in how falls are defined and measured. This can make it difficult to compare findings across studies and draw strong conclusions. By addressing these challenges and continuing to conduct high-quality research in this area, researchers can identify effective interventions to prevent falls and improve the quality of life for older adults.

In order to present the direction of future falls research in the geriatrics population, we downloaded English-

language articles and reviews from the Scopus database and analyzed them visually using VOSviewer and Harzing POP. The general objectives in this current study were to identify the main areas and current interactions between falls in the field of older adults and suggest future research directions. Specifically, there are four research questions, namely:

- (i) *Research Question 1:* What is the current publication trend in board diversity?
- (ii) *Research Question 2:* Which are the most influential articles on board diversity?
- (iii) *Research Question 3:* Who are the most influential authors, top countries, and institutional on-board diversity?
- (iv) *Research Question 4:* Which themes involving board diversity are the most popular among scholars?

This bibliometric analysis will be beneficial for researchers, policymakers, and individuals to understand the research trends in falls in older adults and to discover the potential and opportunities for future research (Bahri, Adnyana, Hasan, Ray, Paramitha, 2022; Suseelan, Chew, Chin, 2022)

Method

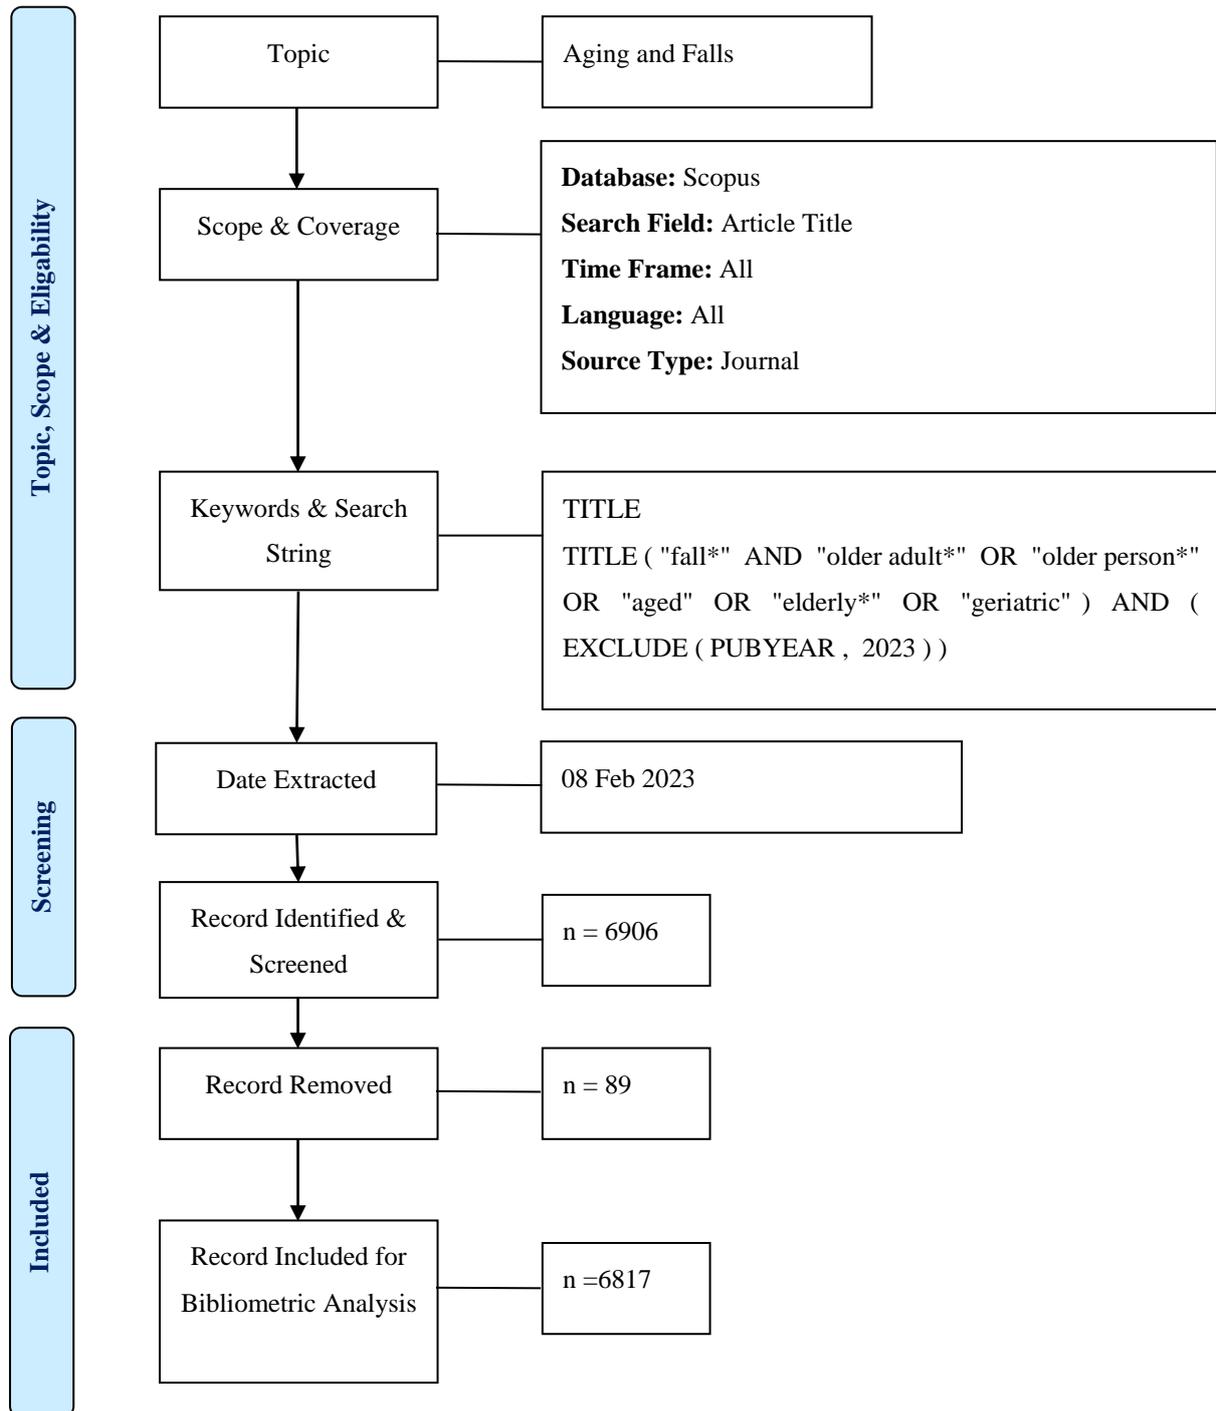

A bibliometric analysis study is a mechanistic approach to understanding the global research trends in a specific area based on the outputs of the academic literature database. This kind of approach distinguishes a bibliometric analysis paper from a review paper which is primarily intended to discuss the latest progress, challenges, and future directions of a certain topic (see Figure 1).

Data Source and Search Strategy

Data mining was conducted within February 18 2023 using Scopus database. The central theme in this study was research articles containing “fall*” and “older*” in the article title. The oldest publication dates to 1842 and the more recent ones are from 2022. The query string used for the search was:

```
TITLE ( "fall*" AND "older adult*" OR "older person*" OR "aged" OR "elderly*" OR "geriatric" ) AND ( EXCLUDE ( PUBYEAR , 2023 ) ).
```

This query string resulted in 6817 documents. These articles contained terms such as review, recent, progress, critical, revisit, advance, highlight, in the title and abstract. The search results of the central theme were analyzed based on year, source, author, affiliation, country/territory, subject area, and document type. Bibliometric indicators such as total publications, total citations, CiteScore, FWCI and h-index were used for ranking purposes.

Data Analysis Method

Bibliometric maps using analysis of Co-authorship and Analysis of co-occurrence

Citation, bibliographical, and author keywords information of 6815 articles were exported to VOSviewer (version 1.6.7, Center for Science and Technology Studies, Leiden University, The Netherlands), a software tool

for constructing and visualizing bibliometric maps. Maps created using VOSviewer include items. In this study, the items are the objects of interest, namely the author keywords. Between any pair of items, there can be a link—connection or relation between two items. Each link has a strength, represented by a positive numerical value. The higher this value, the stronger the link.

In the case of co-authorship analysis, the link strength between countries indicates the number of publications that two affiliated countries have co-authored, whereas the total link strength indicates the total strength of the co-authorship links of a given country with other countries. Similarly, in the case of co-occurrence analysis, the link strength between author keywords indicates the number of publications in which two keywords occur together. In the analysis of co-authorship, we included all 252 countries affiliated with 6469 authors. The affiliated countries/territories were clustered into 5 continents: Africa, America, Asia, Europe, and Oceania. Analysis of co-occurrence of author keywords involved 6574 keywords. In VOSviewer, minimum occurrences of a keyword to be analyzed was set to 50. Overlay visualization mode was selected to view the average publication year, number of occurrences, and link strength of the keywords. The colour of a keyword indicates the average publication year of the documents in which a keyword occurs.

Results and Discussion

Publication output and growth of research interest

For a period of 180 years, a total of 6815 research articles had been published (see Figure 1 and Appendix). The oldest publication dates to 1948, and there was no other publication record until 1955. It is suggested that strong interest in fall-related in older adults research started from 1977. It was also found that the number of publications increased by 100 for every two years. Therefore, it is anticipated that the annual publication will continue to rise. However, most of these articles are not freely available and the user has to pay to access the information in them. We suggest that an article will likely receive more citations if it is published through an open-access journal.

Fall-related research areas are extensive and many research groups worldwide are working actively in these areas. Analysis on the subject area showed that medical concerns are the primary focus in fall-related in older adult's studies. This is evidenced by the total publications classified under the following subject areas: Medicine (5154 articles, 75.63%), Nursing (1230 articles, 18.05%), Biochemistry, Genetics and Molecular Biology (877 articles, 12.87%), and Health Professions (782 articles, 11.47%). Indeed, fall study is a multidisciplinary area and one of the publications was categorized under multi-disciplinary area.

Results also showed that the articles used in this study were published in more than 20 different languages. English (5919; 84.80 %) was the most commonly used language followed by French (170; 2.44%), Spanish (158, 2.26 %), German (154, 2.21%) and Portuguese (145, 2.08%). Other languages that took about less than 2% such as Japanese, Chinese, Dutch, Turkish, Italian, Korean, Polish, Russian, Danish, Hebrew, Persian, Czech, Slovak,

Finnish, Norwegian, Swedish, Greek, Hungarian, Malay, and Slovenian were used in less than 100 articles. When a publisher submits an article in a foreign language to be indexed in Scopus, the article should have a title and abstract in English.

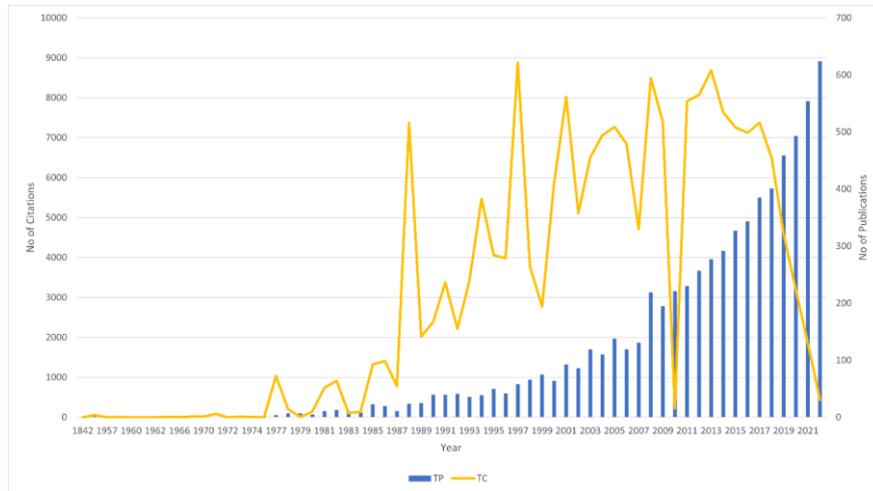

Figure 1. Total Publications and Citations by Year

Preferred journals

Our results showed that the top 10 most productive journals are owned by twelve (12) different publishers (See Table 2). The top three journals were published by Wiley-Blackwell, Lippincott Williams and Wilkins, BioMed Central Ltd., Springer Nature and Elsevier Ireland Ltd. The most productive journal was Journal of the American Geriatrics Society with 231 articles covering 3.39% of the total publications, followed by BMC Geriatrics (149, 2.19%) and Archives Of Gerontology And Geriatrics (98, 1.44%). Massachusetts Medical Society was not the most active journals, however one of their articles published in 1988 was the most cited article, with 4944 citations. According to the CiteScore 2016 report, eleven journals had a CiteScore of 5 and above. Journals of the highest and lowest CiteScore belonged to Aging Clinical and Experimental Research (11), and Rigakuryoho Kagaku (0), respectively.

Notes: TP=total number of publications; TC=total citations;

Leading countries, top institutions, and international collaboration

Figure 2 shows the top 15 most productive countries contributing to the growth of fall-related studies in older adults in worldwide. About 60% of the global publications were contributed by the United States and Japan indicating these two countries are key players in the fall-related research progress. The United States was the leading country with 1632 publications in a total of 92372 journals, covering 39% of the global total publications. With one-half of USA's total publications, Japan was ranked the second most productive country. The total number of publications (TPi) from The University of Sydney was 104, followed by National Center

for Geriatrics and Gerontology 96, followed by Universidade de São Paulo 69, respectively. The distribution of countries/territories per region is shown in Figure 3.

The closer two countries are located to each other in VOSviewer, the stronger their relatedness and the stronger the link between the two countries, the thicker the line. The highest number of countries per region came from Africa (59) followed by Europe (57), Asia (54), North America (42), Oceania (26), and South America (14). Results of co-authorship showed that the US was the most affiliated country, linked to 39 countries/territories with 491 times of co-authorship. The list was followed by the UK (37 links, 324 co-authorships), Canada (36 links, 256 co-authorships), Australia (35 links, 254 co-authorships), Netherlands (32 links, 204 co-authorships), and others.

It was also shown that 2/3 of the listed countries had international collaborative publications with less than 10 countries. Several possible factors contributing to the dynamic of international collaboration can be attributed to the diversity of research partners, the high percentage of foreign postgraduates/ visiting scholars, and strong research funding. It is also important to have a flexible and stable research policy to ensure the stability of international collaboration.

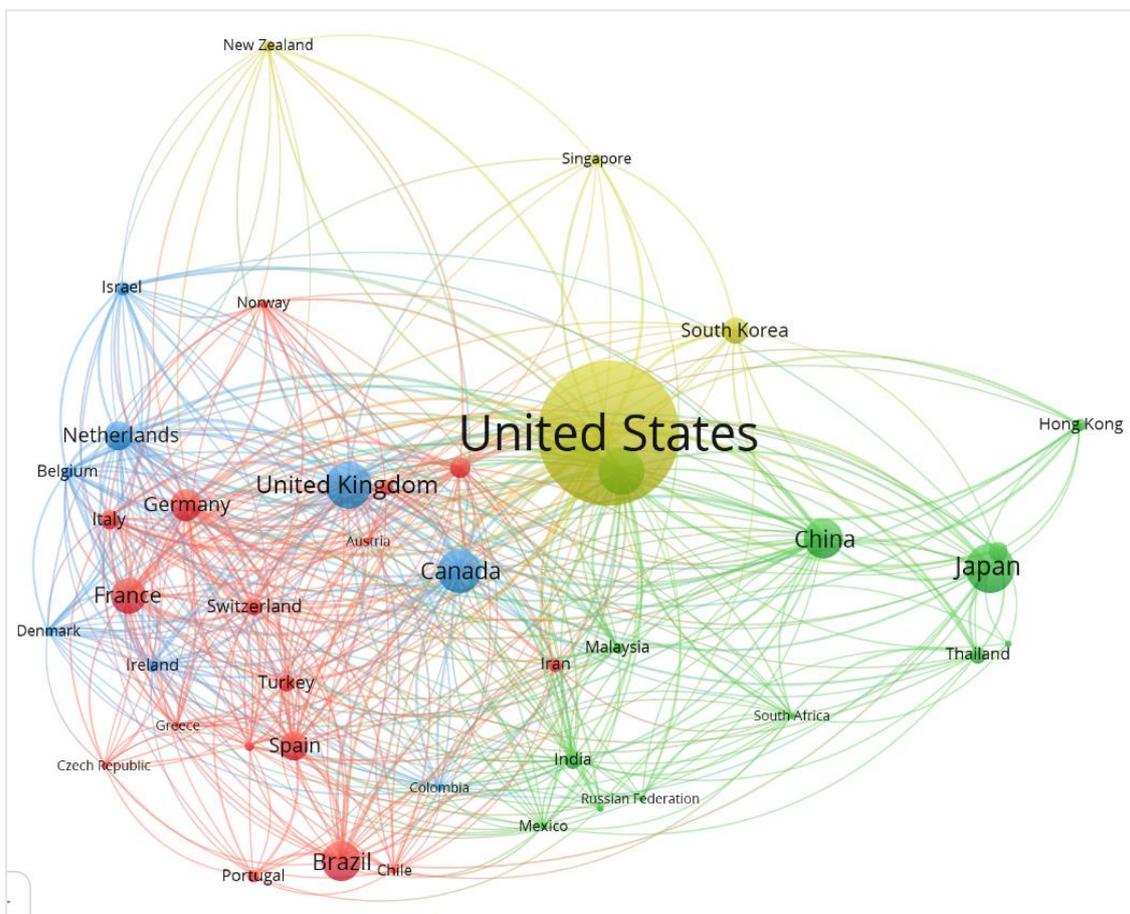

Figure 2. The top 15 most productive countries and academic institutions in fall-related publications. TPC: total publications of a given country; TPI: total publications of a given academic institution

Rank	Country	TPc	Academic Institutions	TPI	Rank	Country	TPc	Academic Institutions	TPI

Leading authors

Table 3 lists the 15 most prolific authors in fall-related research in aging, affiliated to eight countries as follows; USA (3 authors), Australia (3 authors), Japan (3 authors), Canada (2 authors), Ireland (1 author), Germany (1 author), Finland (1 author) and Israel (1 author). Lord SR from Australia led the list with a record of 54

publications, 27 h-index, and 4175 times citations. The 2nd and 3rd top authors, Kenny RA from Ireland and Steven JA from the United States recorded 42 total publications (20-h index, 1531 times citations) and 32 total publications (24-h index, 4241 times citations), respectively.

Author keywords

The minimum number of co-occurrence of a keyword was set 50. Of the 6574 author keywords was recorded, a

total of 45 meet the threshold and were mapped in the VOSviewer. For each of the 45 keywords, the total strength of the co-occurrence links with the other, keywords will be calculated. The keywords with the greatest total link strength were selected. The word “falls” occurred 1472 times with 2067 total link strength, followed by the keyword “elderly” (937 times, 1360 total link strength) and “accidental falls” (631 times, 943 total link strength), respectively. See Figure 3.

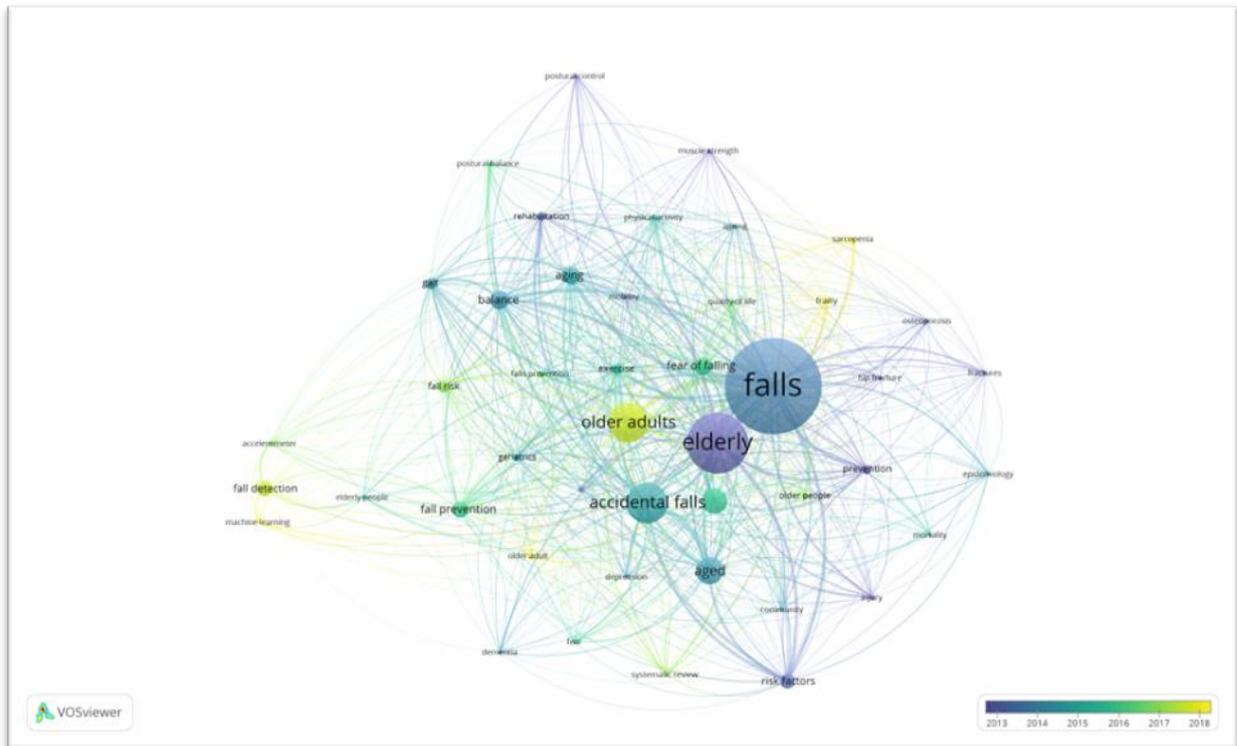

Figure 3. The most common author’s keywords in fall-related publications.

In this study, there are five main clusters, namely (i) Risk factors and falls (ii) Fall detection in falls (iii) Fall prevention and Exercise (iv) Determinants of Falls, and (v) Psychological and Falls. Cluster 1 mainly reports the highest ranking and the majority of this cluster explains the factors associated with falls among older adults. Previous studies had argue that osteoporosis and sarcopenia are important risk factors for falls in older adults, as they can contribute to decreased bone density, muscle weakness, and impaired balance and gait (Latham et al., 2019). These factors may increase the risk of fractures and other injuries, leading to disability and reduced quality of life in older adults.

On the other hand, some studies suggest that the relationship between osteoporosis, sarcopenia, and falls may not be as straightforward as previously thought. For example, a recent systematic review and meta-analysis found that the association between osteoporosis and falls was not significant after controlling for confounding factors, such as age and comorbidities (Huang et al., 2021). Similarly, another meta-analysis found that sarcopenia was not consistently associated with falls in older adults, and that the strength of the association varied depending on the definition and measurement of sarcopenia (Chen et al., 2020). Overall, while there is

evidence to support the idea that osteoporosis and sarcopenia may contribute to falls in older adults, the extent of this relationship remains unclear. Future research is needed to better understand the complex interplay between these risk factors and other factors that contribute to falls in older adults, such as medication use, cognitive impairment, and environmental hazards. Next in the Cluster 2 was discussed on reported the common fall detection tools such as accelerometer as well as machine learning in falls. Accelerometers are commonly used in wearable devices and smartphones to detect falls in older adults. Machine learning algorithms can be used to analyze the accelerometer data and distinguish between normal activities and fall events. A study by Boulton and colleagues (2019) evaluated the accuracy of different machine learning algorithms in detecting falls using accelerometer data from a wearable device. They found that a support vector machine (SVM) algorithm had the highest accuracy (90.5%) in detecting falls compared to other machine learning algorithms.

Another study by Delahoz and colleagues (2021) used a smartphone-based accelerometer to detect falls in older adults. They developed a machine learning algorithm that combined accelerometer data with demographic and health-related variables to improve the accuracy of fall detection. The algorithm achieved a sensitivity of 97.4% and a specificity of 99.6% in detecting falls. A systematic review by Spruit and colleagues (2021) examined the use of wearable sensors, including accelerometers, for fall detection in older adults. They found that the accuracy of fall detection using accelerometers varied widely across studies, with reported sensitivities ranging from 37% to 100% and specificities ranging from 46% to 99%. Overall, the use of accelerometers and machine learning for fall detection in older adults shows promising results. However, further research is needed to evaluate the accuracy and feasibility of these methods in real-world settings. These studies demonstrate the potential for technology-based fall prevention interventions, and their role in improving the health outcomes of older adults.

In the Cluster 3 discussing on the fall prevention and exercise impact on the aging population. Falls are a significant health concern for older adults, with the potential to result in serious injuries and loss of independence. As such, preventing falls among this population is a critical public health issue. One effective approach to fall prevention involves multifactorial interventions, which address multiple risk factors for falls simultaneously. A systematic review by Sjösten et al. (2018) found that multifactorial interventions reduced falls by 36%. These interventions typically involve a comprehensive assessment of an older adult's physical, cognitive, and environmental status, followed by the implementation of multiple interventions tailored to the individual's specific needs. Another effective approach to fall prevention is exercise programs, which can improve balance, strength, and mobility. A meta-analysis by Sherrington et al. (2019) found that exercise-based interventions reduced the rate of falls by 23% and the number of fallers by 15%. Exercise programs can take many forms, including group classes, individualized programs, and home-based programs. They may involve a variety of exercises, such as resistance training, balance training, and gait training.

Environmental modifications are also an important component of fall prevention. Home modifications such as installing grab bars, improving lighting, and removing tripping hazards can reduce the risk of falls. A meta-analysis by Gillespie et al. (2012) found that home modification interventions reduced falls by 39%. Healthcare

professionals can play a critical role in identifying and addressing environmental risk factors for falls among older adults, such as inadequate lighting or slippery floors. In conclusion, fall prevention strategies for older adults can take many forms, including multifactorial interventions, exercise programs, and environmental modifications. These interventions have been shown to be effective in reducing falls among older adults, with a range of studies demonstrating significant reductions in falls and fall-related injuries. By addressing the multiple risk factors for falls that older adults may face, healthcare professionals can help improve the health, well-being, and independence of this vulnerable population.

Meanwhile in Cluster 4, the majority of the publications discussed related to poor muscle strength and postural control that can affect mobility and increase the risk of falls in older adults in several ways. Firstly, reduced muscle strength can lead to decreased physical function, making it difficult for older adults to perform daily activities such as walking, climbing stairs, or getting up from a chair (Liu et al., 2020). This can increase the risk of falls as they may lose their balance or trip while attempting these activities. Additionally, decreased muscle strength can lead to decreased bone density and increased frailty, which are also risk factors for falls (Pizzigalli et al., 2021).

Secondly, poor postural control can also increase the risk of falls in older adults. Postural control refers to the ability to maintain balance during standing or walking, and it requires the integration of sensory information from various sources, including the eyes, inner ear, and somatosensory system (Maki & McIlroy, 2006). Older adults with poor postural control may have difficulty maintaining their balance while walking on uneven surfaces or while performing other activities, increasing their risk of falls. Moreover, the interaction between muscle strength and postural control is important in maintaining mobility and preventing falls in older adults. A study by El-Khoury et al. (2013) found that a multifactorial exercise program that combined strength and balance training was effective in reducing the risk of falls in older adults. This suggests that interventions that address both muscle strength and postural control are important in maintaining mobility and preventing falls in older adults.

In conclusion, poor muscle strength and postural control can negatively affect mobility and increase the risk of falls in older adults. Interventions that address both factors, such as strength training and balance training programs, have been shown to be effective in reducing the risk of falls and maintaining mobility in older adults. Therefore, healthcare professionals should consider these factors when developing fall prevention strategies for older adults and incorporate interventions that address these factors into their clinical practice.ter 4 more into determinants of falls.

In the last cluster 5, most of the previous studies discusses on related the psychological components and falls. Depression is a common condition in older adults that can lead to decreased physical activity, reduced balance and coordination, and cognitive impairment, all of which can increase the risk of falls. A systematic review of 27 studies found that older adults with depression were more likely to experience falls compared to those without depression (Varela et al., 2019). This increased risk of falls may be due to several factors, including

decreased muscle strength, impaired balance, and reduced cognitive function. Addressing depression in older adults through appropriate interventions such as pharmacological and non-pharmacological treatments, including cognitive behavioral therapy and exercise, may help to reduce the risk of falls (Stubbs et al., 2014).

Dementia is a neurodegenerative condition that can cause cognitive and functional impairments in older adults. Dementia has been linked to an increased risk of falls, with one systematic review and meta-analysis of 19 studies reporting that older adults with dementia had a significantly higher risk of falls compared to those without dementia (Veronese et al., 2020). This increased risk of falls may be due to several factors, including impaired balance, gait abnormalities, and reduced muscle strength. Interventions targeting cognitive and physical function, such as exercise programs and environmental modifications, may help to reduce the risk of falls in this population (Li et al., 2012). Fear of falling is a common concern among older adults and can lead to decreased physical activity and increased social isolation, both of which can increase the risk of falls. Paradoxically, fear of falling itself can also increase the risk of falls, with one systematic review of 24 studies reporting that older adults with a high level of fear of falling had an increased risk of falls compared to those with a lower level of fear of falling (Stubbs et al., 2014). Addressing fear of falling through interventions such as exercise programs, cognitive-behavioral therapy, and home modifications may help reduce the risk of falls in this population (Varela et al., 2019).

In conclusion, depression, dementia, and fear of falling are all significant factors that can contribute to an increased risk of falls in older adults. Healthcare professionals can help reduce the risk of falls in this population by addressing these factors through appropriate interventions such as exercise programs, cognitive-behavioral therapy, and environmental modifications.

Conclusion

This study has provided an overview of fall-related in aging research trends based on 6815 publications retrieved from the Scopus database. Publication growth has been rapid since the last 10 years, and it is anticipated to continue to rise. We have discovered countries/academic institutions (United States and United Kingdom) that have a massive number of publications and strong international collaborations. These entities can be an opportunity for researchers from other countries to broaden their research collaborations. We have discussed several areas that are currently well-explored such as material sciences incorporating fall detections and psychological components related to falls research, which can be potential hot topics for future studies.

Recommendations

Future studies to compare the outputs from multiple databases such as Scopus and Web of Sciences are recommended. The search results from Web of Science, for instance, the display automatically the most popular articles in the field by a feature known as 'hot paper', a feature that is still lacking in Scopus. This hot paper

feature displays key papers that are recognized very soon after publication, reflected by a rapid and significant number of citations. Conducting bibliometric analysis using multiple data sources will be useful for a more comprehensive study.

The On-the-job Training (OJT) Program: Students' Future Careers and Personal Development

Chi Hong Nguyen

FPT University, Vietnam,  <https://orcid.org/0000-0001-8380-2727>

Tham Nguyen Van

FPT University, Vietnam

Abstract: In Vietnam, some universities develop a similar program to a practicum or an internship called an on-the-job training (OJT) program. However, this concept appears to be quite new to students, and its impacts on students' learning and growth remain under-researched. The current study explores how OJT programs impact students' future careers and personal development. The study used mixed research methods and data obtained from 150 students' responses at a private university in Vietnam via a 34-item questionnaire and semi-structured interviews. The results indicate that OJT programs significantly influence students' future professional and personal development as well as personal capacities. Spending a whole semester in enterprises arouses students' interest in intending what jobs they will take after graduation since they form a clearer orientation for their future careers. Besides the strengths observed, choosing a variety of firms, organizations, and job training positions and responsibilities for students is considered the program developers' great concern. The findings of this study show that learning that incurs during the OJT or practicum may emerge from students' social interactions, communications, and observations of their peers, supervisors, and others. Learning, in this sense, is both personally and socially constructed.

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 939-955), Cappadocia, Turkiye. ISTES Organization.

Introduction

After graduating from university, students enter a professional environment where they work as either permanent or temporary employees. This will be a challenging period for students as every job responsibility can be new to them. At many colleges and universities, students are required to attend an internship semester in order to integrate their theoretical knowledge and the skills learned from university into their jobs. At some universities in the Mekong Delta of Vietnam, students participate in internship programs that usually start at the

end of their fourth year.

However, a private university in the region which the authors chose to be the research site employs a similar program called the on-the-job training (OJT) program. This kind of internship model begins in the 6th semester (out of 9 semesters) and lasts from 4 to 8 months. The standard duration is 4 months (one semester). In case some students continue their jobs at OJT after they have finished, they can choose to either defer the next academic semester (the 7th semester) or work and study at the same time. The primary principle of the OJT is to connect the university and students with businesses, assisting students to enhance their professional skills and personal development in the future. Students, educational institutions, and businesses are considered the three primary parties involved in this internship model. It is more likely that discrepancies among the three parties should never be ignored as they consider the benefits differently, and have different needs and expectations. The differences may cause apprehension about the standard of a successful internship program that can have great effects on students' professional skills and their personal development.

Further, research on practicums, internships, or OJT programs often concentrates on exploring the experiences of practicum program developers and administrators (e.g. Bernado et al., 2014; Ducan et al., 2011; Trianasari & Rahmawati, 2021), the effectiveness of evaluative frameworks (e.g. Billet et al., 2016; Wilt et al., 2019), and learning processes (e.g. Jackson, 2014; Nguyen & Thach, 2022). The body of extant research is solid, depicting various landscapes of the OJT management and students' learning experiences. However, most of these studies do not deal with the influences of OJT programs or practicums on students' choices of future careers. This gap is addressed in this paper. Further, within the context of the OJT programs deployed in Vietnam, this stream of research is limited. Within this limited body of research, Nguyen and Thach (2022) explored the authentic experiences of students taking OJT programs and confirmed that they can only have a sense of authentic experiences once they are able to make sense of their learning within their OJT programs. The authors of this paper continue to advance Nguyen and Thach's (2022) arguments. Instead of examining the authentic experiences of students like Nguyen and Thach (2022), we take the social learning theory that views students' learning processes as the outcomes of their engagement in the working environment with others in which they observe, imitate, and learn from these people.

Whilst numerous attempts have been made to investigate how internships affect students' future professional and personal development, only a few studies have explored this area on the OJT program in the Mekong Delta in general and in Vietnam in particular. Additionally, a terrible internship experience can change a person's conception of the internship and create a distance between them and businesses. Unexpectedly, internship programs are often reflected as unstructured and poorly organized so students generally complain about the quality (Jenkins, 2001). As these issues were addressed, this study aims to provide practical insights into this program. It points out the strengths and weaknesses of the OJT program as well as discusses the impacts of the program on students' professional skills and self-development. The results of this study are expected to help students realize their essential professional skills that need to be enhanced so that they can seek the most appropriate future job while universities have an opportunity to review and re-design their OJT program if

necessary. For such purposes, it is worth an investigation that is guided by the following questions.

- 1) To what extent does the OJT program influence students' future career and personal development?
- 2) What are the strengths and weaknesses of the OJT program?

The nature of the OJT program

An OJT program is depicted as an educational module for undergraduates to approach actual working environments. Not only does it enhance students' academic knowledge and social skills for preparing for their future careers, but it also helps create an intimate connection between students and firms from the program (Alex, 2013). However, in many universities in Vietnam, not every single major develops such a program for its students to have this experience. In some institutions, it is often the case that just students of pedagogy are supposed to participate in the internship program which lasts about three months whilst students studying other fields of study are not required to do so. For students who would like to enhance their social skills in a real working environment, they have to seek an internship program organized by firms (Tovey, 2001). It means that not every student has a chance to take part in such a program created by their institution.

Anjum (2020) has proved that by integrating conceptual knowledge into the academic OJT model, students are able to simplify to apply their understanding of the concepts at the workplace. This type of practicum is sometimes structured, e.g. program developers plan the concepts and lessons that students or interns are supposed to study from their engagement in work. Some are non-structured by nature as universities expect students to learn from their experiences collected from real working environments that academic contents and lessons cannot always cover equally in class. The program as such brings students an opportunity to grasp professional training and save the business' observation and training costs by providing them with skilled workers' guidance. The OJT program, which is usually non-structured, is believed to create great contributions to improving students' principal skills, abilities in utilizing technology, and personal characteristics (Valdez et al., 2015). Additionally, as students perform tasks in real work settings, they will be able to realize and assess themselves after having made mistakes. In the same vein, they can reflect on their individual strengths and weaknesses to promote or realize their shortcomings (Felicen et al., 2014).

According to Ho et al. (2017), the OJT program is a relatively new name for an internship program commonly referred to as a specialized and compulsory OJT model that is carried out from 4 to 8 months at subsidiary companies or partners of FPT University. After finishing their 6th semester at the university, students are required to get involved in real working environments since they have prepared adequate knowledge and necessary skills along with a general view of their major. The ultimate objective of an OJT program is to allow students to learn from professionals and others. The chairman of the board of FPT University Le Truong Tung stated that in their point of view, studying only two-thirds of the curriculum is adequate for students to perform at businesses while the remaining semesters are upper-learning processes aiming to support students' exploration of their upcoming career paths (*Dan Tri Newspaper*, 2017). Therefore, it is worth mentioning that

the OJT program is more likely to contribute to bringing students great opportunities to approach authentic working environments. Nguyen and Thach (2022) also pointed out that students encounter authentic experiences in taking OJT programs through their learning that is embodied by their interactions with peers, supervisors, and friends. They experience and acknowledge learning as growing in terms of professional knowledge, social skills, and working attributes that are envisioned to be important for their future jobs. This type of learning emerges through their observation of role models, attempt to reproduce the correct professional and social behaviors that are recommended by higher supervisors, and reproduction of those sets of behavior. In this way, Ho et al. (2017) and Nguyen and Thach (2022) implicitly acknowledged the role of social learning that happens during the OJT program.

Social learning theory

Social learning theory (SLT) was approached since there is an interrelation in how students learn through observation, imitation, and modeling. Developed by Bandura (1977), SLT is defined as the process of perception based on the thought of changes in self-efficacy, expectation, and skills, and improved academic and personal development via participation in a practical environment. This theory builds on the concept that individuals learn through their communications with others in a social background. From others' behaviors, people can form, fix, and reproduce the behavior that is deemed as correct and standard through imitation and observation (Harinie et al., 2017). This theoretical perspective holds that people tend to form social bonds with the ones they think have appropriate behaviors through productive communication with them, though some bonds cause differentiation from other social groups and internal drifts within a community (Pritchett & Moeller, 2022). By imitating more experienced coworkers' performances regarding solving arising problems, trainees can learn how to deal with problems in the same direction. In the same vein, Bandura's theory asserted that imitation and modeling befall if an individual perceives a progressive result. Learning, as such, occurs in both formal and non-formal modes (Alam, 2022).

In the light of SLT, the program aims to create such chances for students to engage themselves in practical training so that they can develop their skills and absorb new knowledge needed for their future careers. Similarly, they can see how the theories or knowledge they have learned from the university match businesses' expectations for real work. The review of SLT and related studies lies in its ability to provide insights into exploring how the OJT program affects students' future career paths and self-development. Through the literature, the authors of this paper find that social learning can allow students to develop their profession, professional competencies and skills, personal enrichment, and personal capabilities.

The impacts of the OJT program on students' social learning

Professional development

As students enter into their professional stage, they have to cope with a number of challenges. It has been suggested that internships give students pathways for their improved professional skills (Kapoor & Gardner,

2019). The study by Sutrisno and Lubis (2022) similarly showed that online practicums can allow knowledge absorption to happen smoothly when social distancing caused by preventive measures against the Covid-19 pandemic were deployed. Internships may provide students with opportunities to reconsider the career they have chosen before (Nghia & Duyen, 2018). Also, it is indicated that such programs can help learners understand the world of work and identify an acceptable career path.

Besides, the program places great emphasis on professionalism which is not a natural quality, but a product of experiencing, learning, and observing surrounding things (Nguyen & Thach, 2022). The most valuable lesson that students learn while joining internships is activeness. Proactively getting to know people, actively exploring work at internships, proposing, and working with everyone, all help students integrate more quickly in a new environment. Activeness helps students not only to master the work they do but also to recognize their own problems to avoid negative things that frequently occur at work. Furthermore, an issue that many students need to address is being punctual since punctuality is considered one of the most crucial principles at workplaces, which requires workers, especially trainees not to be late for work. Working as employees, students are required to follow strict regulations of the companies or organizations. Therefore, the program has been suggested to be a great opportunity for students to learn how to adjust themselves in terms of punctuality and responsibility.

Moreover, regarding professional skills, students realize that internships provide them with business contacts, better knowledge of the job market, and greater job satisfaction (Gault et al., 2000a). Students can gain practical experiences through the working process. They will experience the operating processes of firms or organizations to better understand the corporate protocols, as well as accumulate more personal experience for themselves. At school, students are taught a great deal of knowledge about their major, but when working in businesses, students will be exposed to the guidance of experienced staff or mentors. They can gain ample practical knowledge and hone new skills that they cannot learn from books and teachers. These core values will become solid luggage for their future journey.

More importantly, students can get involved in a lot of work, tasks, or even projects during the OJT program. This may cause them to face certain problems as well as work pressure. However, once they overcome such challenges, they will be able to learn how to cope with the pressure and have a better mentality to solve problems more effectively. This plays an important role in boosting students' professional development for their future careers.

Professional skills

Novotorov (2001) stated that students value the experience they have from participating in internships since these programs are designed to help students evolve their professional skills that are congruent with changing practices of the workplace. Through their work process, students can not only improve their practical professional skills but also have workplace environment feelings. In addition, honing professional skills is also one of the foundations of any given career and is a prerequisite for the continuous survival and growth of any profession (Ebiye et al., 2015). Internship programs help students improve their communication and

interpersonal skills. In their workplace, students can meet many kinds of people daily and need to communicate with colleagues more regularly. As a result, students have a chance to connect and participate in shared activities, assist each other, exchange knowledge, and create relationships that allow them to learn from each other (Nguyen & Thach, 2022).

Also, learning workplace conduct is an integral part of the OJT program. Students learn how to expand relationships to facilitate daily communication as well as an exchange about work, which results in their improved skills by working with others as a team. Moreover, once assigned group work or team projects, students will improve the spirit of cooperation as well as the ability to unite with everyone around them. Because of that, students are more likely to dedicate themselves to the work first. Even if negative things happen, every individual will show professionalism by focusing on a common goal to accomplish their tasks brilliantly. One of the other important professional skills is computer skills. In most businesses, students are about to spend most of their time working with computers and even can experience the high technology of these working environments. In some companies and organizations, students can approach new working systems or software uniquely employed in their work, fostering their performance and computer skills, which is essential in the 4.0 era.

As students work in firms, they can integrate themselves by participating in many internal meetings. By joining meetings and training sessions, students improve critical thinking skills and learn decision-making and problem-solving skills from other employees. From there, students will be able to gain more confidence and a clearer view of procedures for dealing with arising problems and tasks. Consequently, they will know how to adjust themselves as well as their work so that they can become a better version of themselves.

Personality

The hands-on experience in complex real-world contexts provided by internships is becoming an integral part of the curricula and syllabus in many undergraduate and graduate degree programs, and this connection between academia and the world of work has been greatly appreciated not only by employers, but also by students who have reaped many benefits of this unique opportunity, including the enhancement of their academic, professional, and personal development (Calvo, 2011). Thereby, intense experiences and stress, especially if accompanied by reflection and emotional support during the internship, may promote greater self-awareness and result in personal development. Regarding the benefits of internships, Mihail (2006) indicated that internships help students advance the critical core skills demanded by international contexts such as communication, time management, self-reflection, self-confidence, and self-motivation, and identify their professional skills perspectives while they are still in university. Students not only learn further practical views on the subject, but they also improve their overall academic performance in real-world situations.

Barrick and Mount (1991) addressed the five personality traits namely extraversion, emotional stability, agreeableness, conscientiousness, and openness to experience that students can form by taking part in the OJT

program and other internships. Through exploring this aspect, the researcher perceived the effectiveness of internships in helping students to acquire and improve their personal development. These personality traits are formed only when students experienced the OJT program. These are the experiences that students have been honing, learning, and interacting with many strangers in a completely new environment during their OJT period.

Personal capabilities

The OJT program helps students develop their personal capabilities that students have learned theory in class and activates the possibilities of jobs of which students are not aware themselves. It may be students' first introduction to the professional world and no matter how limited their expertise and professional skills are, this program is an opportunity to develop themselves even further. Nguyen and Thach (2022) argued that capability is an integration of knowledge, skills, personal qualities, and understanding used appropriately and effectively - not just in familiar and highly focused specialist contexts but in response to new and changing circumstances.

It is suggested that participating in an OJT program results in improved personal capabilities and interpersonal skills, such as professionalism, cultural sensitivity, time management, and integrity, that are not generally part of the formal tertiary education curriculum (Shoenfelt et al., 2013). The program creates satisfying experiences that motivate students to continue to follow their career path and have realistic expectations about the world of work and help clarify students' career intentions. Furthermore, the opportunity to acquire capabilities and experience through the program reinforces self-efficacy, developed self-understanding, self-discipline, maturity, and confidence. These competencies can help students create their learning goals from the program that will serve their profession well after graduation.

Communication skills are essential for people in the workplace on a daily basis. According to Khambayat (2017), there is overwhelming evidence that proficiency in communication skills can make any individual more versatile and more competitive in the workplace. Employees need to communicate well with others to transfer their messages, thoughts, feelings, thinking, and ideas so that their work can be done. Thus, as trainees, students need to improve their communication skills to be efficient workers in the future. Moreover, through the OJT period, students can greatly improve their interpersonal skills (Nguyen & Thach, 2022). It is obvious that students need this skill every day when they communicate and interact with other people in their office, both individually and in groups. In a personal setting, it refers to an individual's ability to build a relationship with others. Guirdham (2002) regarded interpersonal communication skills as essential interpersonal skills that realize effective interpersonal relationships and interactive behavior. Chatting with people at work will enable students to perceive when to speak and when to listen so that they can adjust their way of interacting with others.

Furthermore, another essential aspect is that students will be able to hone problem-solving skills by participating in the program. Problem-solving is generally regarded as the most important cognitive activity in everyday and professional contexts. Most people are required to and rewarded for solving problems. However, learning how

to solve problems is a rare requirement in formal educational settings because students' understanding of its processes is somehow limited (Jonassen, 2000). Therefore, the OJT program is an ideal environment to enable students to get closer to real workplaces where students frequently encounter problems that need proper solutions.

Lastly, the OJT program is more likely to boost students' teamwork skills. Teamwork is an essential part of workplace success as teamwork relies upon individuals working together in a cooperative environment to achieve common team goals through sharing knowledge, skills, and experience. Harris et al., (1996) explained that a team has a common goal or purpose where team members can develop effective, mutual relationships to achieve team goals. Teamwork is an indispensable skill for students to help them learn experiences from real work environments. It also involves building a number of important characteristics such as working cooperatively, contributing to the group with ideas, suggestions, and effort, a sense of responsibility, and especially respect for the various opinions, customs, and individual preferences. As aforementioned, teamwork skills are an essential skill not only applicable in the classroom but also useful for students' professions.

Participants

150 students were invited to participate in this study. They were studying at many different faculties at a private university, including English language, Japanese Language, Business Administration, Software Engineering, and Graphics Design. They had already completed their OJT programs in various businesses in their 6th semester after they had finished the compulsory subjects in their majors and attained certain necessary skills namely working-in-group, resume writing, problem-solving, computing, and other office skills. The 150 students first completed the questionnaires, and then 15 out of them were randomly selected for semi-structured interviews.

Research instruments

This study employed 2 instruments: a 4-item questionnaire and semi-structured interviews. The quantitative data were obtained through the participants' answers to the questionnaire. The items were adapted from the questionnaire of Anjum's (2020) study to be suitable for the context of the current study. The questionnaire consisted of 34 items clustered into six parts: demographic information, reasons for the OJT participation, career development, professional skills, personal development, and personal capabilities. Following a 5-Likert-scale design, the questionnaire was first translated into Vietnamese before it was sent to the participants since not all of them were English major students. Being piloted with 40 samples for its reliability, the questionnaire was checked by using SPSS to calculate its Cronbach's coefficient alpha. The value of Cronbach's coefficient alpha of the piloted questionnaire is 0.854 (See Table 1). After this piloting stage, the questionnaire was officially employed to gather the quantitative data as Cronbach's coefficient alpha is above 0.7, and the questionnaire is reliable (Bland & Altman, 1997).

Table 1: Cronbach's Coefficient Alpha

Reliability Statistics	
Cronbach's Alpha	N of Items
0.854	24

To obtain the qualitative data, semi-structured interviews were conducted with 15 randomly-chosen participants who had completed the questionnaires. All the questions for the interviews were first made in English version, which was then translated into Vietnamese once the researchers interviewed the participants. Each interview was audio-recorded, transcribed, and subsequently translated into English. All the participants were also informed that their information was used for research purposes only and kept confidential.

Results from the questionnaires

Table 2 shows the central tendencies of the responses for all the items of Part III of the questionnaire by 150 participants of the study. The highest mean for professional development (PD) is 3.72 and the highest standard deviation (SD) is 1.283. However, the lowest mean and lowest standard deviation (SD) for professional development (PD) are 3.23 and 0.854, respectively. The range of mean 3.23–3.72 shows positive responses from the participants for all the items of professional development (PD).

Table 2: Measurement of Central Tendencies on Professional Development

Variables	Items	Mean	Standard deviation (SD)
Professional Development (PD)	PD1	3.68	0.854
	PD2	3.33	1.230
	PD3	3.23	1.283
	PD4	3.61	1.153
	PD5	3.54	1.232
	PD6	3.72	1.169

It can be seen from Table 3 that the highest mean for professional skills (PS) is 3.96. Meanwhile, the lowest mean for professional skills (PS) is 3.33. The range of mean 3.33-3.96 shows the participants have good responses for the items of professional skills (PS). In addition, the highest standard deviation (SD) for professional skills (PS) is 1.329, and the lowest standard deviation (SD) for professional skills (PS) is 0.901.

Table 3: Measurement of Central Tendencies on Professional Skills

Variables	Items	Mean	Standard deviation (SD)
Professional Skills (PS)	PS1	3.90	1.038
	PS2	3.85	0.901
	PS3	3.38	1.216
	PS4	3.33	1.088
	PS5	3.96	1.174
	PS6	3.42	1.329

The results of Table 4 indicate that 150 participants of this research showed their responses to the OJT's impact on their personal growth from "neutral" to "agree" for the items surveyed. The results show the highest mean and highest standard deviation (SD) for personal growth are 3.84 and 1.335, respectively. Meanwhile, the lowest mean in a total of personal growth (PG) is 3.13, indicating that the numbers tend to increase unevenly between questions in the questionnaire on problems related to personal growth (PG), but the standard deviation (SD) was the highest of all, at 1.335.

Table 4: Measurement of Central Tendencies on Personal Development

Variables	Items	Mean	Standard deviation (SD)
Personal growth (PG)	PG1	3.84	0.878
	PG2	3.53	1.283
	PG3	3.28	1.079
	PG4	3.70	1.205
	PG5	3.13	1.335
	PG6	3.74	1.064

Table 5 shows that the mean range from 3.96 to 4.20 implies positive responses from the participants for all the items of personal capabilities (PC). On the other hand, the lowest standard deviations (SDs) are 0.934 and 1.049, respectively. Comparing the two results, it can be seen that the mean from 3.45 to 3.65 was the lowest in personal capabilities (PC) items, it is more likely that participants have "neutral" thoughts on what they had experienced from the OJT program. Meanwhile, the mean range from 4.09 to 4.16 shows positive responses from the students for all the items of personal capabilities (PC).

Table 5: Measurement of Central Tendencies on Personal Capabilities

Variables	Items	Mean	Standard deviation (SD)
Personal capabilities (PC)	PC1	3.96	1.049
	PC2	4.20	0.960
	PC3	3.45	1.242
	PC4	3.65	1.069
	PC5	4.09	1.081
	PC6	4.16	0.934

Results from the interviews

In terms of professional development, a majority of the interviewees responded that the OJT program helped them have a clear orientation for their professional skills. Reversely, only one interviewee emphasized that the OJT programs had no impact on their career orientation. This interviewee once shared that:

"Although I did not work in the area that I set out before, I learned a lot to adapt to the working environment and did not want to change my job at all."

Regarding professional skills, there were 14 out of the 15 interviewees shared that after the OJT program, they improved professional skills such as office skills, teamwork skills, and time management skills. However, there

was an opposite opinion from an interviewee as follows:

“I feel that I have not developed much in professional skills. When I joined the OJT, I only learned simple skills such as printing skills, document scanning, and how to prepare procedures and files arrangement. These office skills I had not learned before.”

Students also showed feedback on the impacts of the OJT program on their personal development. Particularly, once asked about their changes after the OJT, most students responded that their personal development did not change significantly. However, nearly one-third of the interviewees said that the OJT program helped them change their personal development in a positive way. Student A said:

“The OJT program forged professionalism in my expertise. There was a change related to my major as my vocabulary became wider. Moreover, I find out my own shortcomings, and proactively improve my strengths.”

Similarly, student B emphasized that:

“I think my professional and personal development has evolved a lot because I did many different translation documents so that I changed positively in using grammar and vocabulary.”

Furthermore, a few students felt that in addition to personal development changes, they experienced some changes in career goals as they decided whether the position they took after joining the OJT program would be suitable for them or not. One student in this group expressed:

“There was a change in my previous career goals. I learned skills that I have never experienced. This has significantly contributed to my personal development.”

Meanwhile, another student responded:

“After completing the OJT, I realized that I wasn't suitable for the receptionist position. I think my future job will not be related to the service industry in general and the receptionist in particular.”

It is worth mentioning the impacts of the program on students' personal capabilities. Information from the interviews has contributed to deeply understanding students' thoughts on this issue. More specifically, a great number of students personally showed their perspectives on the progress of joining the OJT regarding their improved personal abilities. There is a likelihood that students who participated in this program tended to change and develop positively in their personal capabilities of creating relationships with the people they worked with. One participant stated his opinion:

“I had more social relationships and I also learned a lot from colleagues who are older than me. Joining the OJT helped me to form a habit of punctuality and reasonable work arrangement.”

More importantly, the OJT program not only offers students chances to develop their strengths in personal capabilities but also assists them in forming good habits about skills related to it. Two-thirds of the 15 participants interviewed said that after joining the OJT, they learned to manage their time properly and improved their social relationships. One participant said:

“Disciplinary habits like always being on time and completing assigned tasks are two skills that greatly

affect my personal capabilities during the OJT period. More importantly, I also have more social relationships.”

As a result, one-third of the participants said that in addition to developing skills related to personal capabilities, it also helped them to have respect for others, to listen, and gain input from colleagues. Moreover, the students learned to forge themselves to be responsible at work. One participant expressed:

“My personal capabilities have changed remarkably, I am self-aware of the conscientiousness and responsibility for the job.”

A number of different perspectives on the benefits of the OJT program were expressed in the interviews. First, the OJT program shows its superiority in offering a wide range of firms for students. A student responded to the question about the difference between the OJT program and other internship programs in other universities as follows:

“As far as I am concerned, students from other universities have to find companies by themselves, while at FPT students are given a list of suggested companies for them to choose from.”

Flexibility is regarded as a major advantage. The program allows students to commence the OJT course at the end of their 6th semester or at the end of their 3rd year so that they can have enough time to reflect on their on-campus studies and enhance their skills. Talking about this advantage, Student D reported:

“This university lets students participate in the OJT program in their third year, and it helps to create opportunities for them to review their professional skills and know what they need to develop further in the future.”

Furthermore, a number of students were satisfied with the length of the OJT program. One participant expressed that:

“The OJT course at this university is about 2.5-4 months, which is long enough for students to experience the practical work compared with other universities in the region where their internship courses last only 1-2 weeks.”

The working environment in the OJT program is fairly professional. A number of opportunities were offered to students in order to access practical experience. It is proved by the answer of one of the respondents as follows:

“I find the OJT quite good because students are practically exposed to businesses and attain experience when working in such authentic working circumstances.”

Although the OJT program brings the benefits of improving students' knowledge and skills, it has certain limitations in terms of lack of job positions, inadequate organizational structure, and job field limitations. First of all, the respondents identified a variety of industrial fields that are taken into consideration. One interviewee said:

“I find the OJT quite good because students are practically exposed to businesses and able to learn experience when dealing with tasks assigned at businesses. However, I have some suggestions that there should be more areas for students to select.”

Both the quantitative and qualitative findings pointed out that the job positions inadequately meet students' expectations. Therefore, they are not assigned to participate in projects or a specific position while being trainees. For such a circumstance, one of the participants reported:

My supervisors in the company assigned small jobs like data searching, so I could not learn much from the program”.

In addition, another interviewee emphasized:

“I feel that I have not developed much in professional skills. When I joined the OJT, I only learned simple skills such as printing skills, document scanning, and how to prepare procedures and file arrangement.”

Some issues were identified concerning the relationship between the university and the companies, leading to the difficulty in arranging the job positions for students. One of the respondents once commented:

“The preparing process of the OJT program is unorganized. If firms arrange particular positions for students by themselves, it will probably lead to a mismatch between the position characteristics and the student’s aspirations.”

The students emphasized that they had to join a firm that did not relate to their major. This could be the reason why they reported that they did not develop their skills as much as expected during the program. Student E said:

“There is a shortage of human resources in the Relations Affairs of the university. In the end, due to lack of time, students were sent to businesses that were not on the firms’ recommendation list.”

Discussion

Regarding the reasons for participating in the OJT program, most of the students felt interested to participate in such a program and reported that even if it is not required in the school's curriculum, they still wish to experience it once. Marks and rewards are considered inspirational aspects of the program; however, they are not the most important factors affecting students' decisions on whether or not they want to work in businesses as interns. Although students have various reasons for taking part in this program, all of them perceived OJT as one of the significant reasons to study at this university.

Surprisingly, a comparison of the quantitative and qualitative findings reveals the opposite opinions concerning the expected achievements before attending the program. Participants mostly expressed that they were of great concern of their academic credits whilst their responses in the interview indicated that the OJT was the best opportunity to practice and apply their learned knowledge and theories in a real working environment. Nevertheless, in the interviews where respondents have more time to think carefully about all the reasons, they all agreed that the biggest one for joining the program refers to the benefits it brings to students' permanent jobs. It is indicated that the OJT program offered students a good chance to practice what they have learned at the university. None of the participants expressed that assessment from the mentors in terms of giving scores was their apprehension of its impacts on their academic results at school. Therefore, it can be concluded that they

preferred immersing themselves in what they have experienced as a trainee to attaining high scores given by the trainers.

The results of this study were consistent with those of previous studies that the students' top priority in choosing an internship program is an environment to practice theoretical knowledge (Anjum, 2020). In terms of the impacts of the OJT program on students' current and future employment, most participants believed that the OJT program helped increase their chances of advancement and promotion in their future jobs rather than the present training. It is indicated that the program will be a good opportunity for students to equip themselves with better professional skills for their future occupations.

Moreover, different from the studies by Anjum (2020) and Nguyen and Thach (2022), it is remarkable in this study that awards from businesses are extremely significant to inspire students during the OJT time even though receiving the awards is not their ultimate goal. Conversely, most students wish to work in a company where they could receive rewards after an outstanding performance as they appreciated the company and the motivation to overcome the difficulties encountered at work. Meanwhile, only half of the respondents reported that they received awards from firms they worked for during the OJT course. Only a few companies have awards for trainees in the OJT program, which might deprive their great satisfaction of their expectations. Therefore, it can be suggested that this result has not previously been described in other related studies. More importantly, it is emphasized that the awarding policy and other forms of appraisal should be taken into great consideration as an integral part of encouraging students to work more effectively while giving awards is believed to be necessary for most businesses in the context where workers' devotion and the quality of work are addressed to be the priorities.

The findings are in line with those of the study of Anjum (2020) as the OJT program has positive impacts on students' career development and personal growth. It is indicated that most students experiencing the program have improved their professional skills, which is also consistent with the results of the study of Novotorov (2001) that by joining the training team, students learned how to work professionally as it is considered a prerequisite for graduates to be employed. More importantly, students could apply what they have learned from the university, resulting in their reinforced concepts and knowledge. Furthermore, besides gaining more practical work experience, students could realize what job duties interest them most so that they can learn how to adjust their learning styles and goals when they return to the university for the remaining subjects. From the qualitative results, it is asserted that after entering the OJT program, students have a clearer orientation for their future careers, which is the ultimate goal of achieving a degree. Also, the results of the study are more likely to support the perspective of Gault et al. (2020) that the internship is a bridge to help students narrow the gap between career expectations established in the classroom and the actual working environment. It can be concluded that the findings of the current study significantly contribute to confirming that albeit its drawbacks, the OJT program has very positive impacts on students' professional development and future career paths.

Conclusion

This research aims to evaluate the impacts of the OJT program on students' professional skills and personal development of students at FPT University. There are two research questions investigated in the research in which the population comprised 150 undergraduates from different majors. It is apparent that the OJT program has a positive impact on the students' professional skills and personal development of students at FPT University, greatly affecting their personal development, skills, and capabilities. As students' professional skills and personal development are improved, they can gain confidence and become well-organized with the skills they have learned after joining the program. Thereby, students will have good preparations of expertise as well as professional skills to avoid being bewildered by the real-work world in the future.

Furthermore, there is a difference in terms of exploring students' positive changes in both personal development and personal capabilities from the results of quantitative data and qualitative data. More importantly, students acknowledged that the OJT program helps them develop their strengths in personal development and enables them to form good habits and essential skills related to personal capabilities. In the same vein, it is suggested that the OJT program has a considerable influence on students' professional skills goals, improving personal development and forming professional skills.

Recommendations

Future research can be conducted by gathering personal students' opinions to analyze the impact of the OJT program on intrinsic motivation and student career choice. Furthermore, future studies can also be carried out in other areas to gain deep insights into the OJT program and other internship modules.

The Role of Collectivity in Saudi Females' Success

Beshaier Mohammed Alqahtani

Prince Mohammed bin Fahd University, Saudi Arabia

Abstract: This paper argues that black women become community leaders and influencers that help others envision a better future by examining the ways that a film featuring African American women, specifically *The Help*, has affected me and how my personality is changed before and after majoring in African American Literature. More specifically, this paper highlights black women's voices in terms of defining themselves as women who should have role in their society, and their influences on my personality's development as one of Saudi women spectators, in terms of understanding my subjectivity, desires, and abilities of making a change within the social life, through the use of autoethnography. In doing so, I use a research method known as autoethnography, in which I am the subject of this study, which allows me to connect my personal experiences to a wider group of women who share my same culture, politics, and society. With the experience of black female activists' narration in mind and through my experience with the support of the strong message of *The Help*, I am able to show how my personality and view toward the role of patriarchy has impacted and changed by black women's activism and how they think of making a change within their social lives. By the end of this paper, I approve that the importance of collectivity is important in females' successful activism that can extend beyond the boundaries of social, economic, and political situations.

Keywords: Collectivity, Black Women, Saudi Women, Feminism, Social Change

Citation: Alqahtani, B.M. (2023). The Role of Collectivity in Saudi Females' Success. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 956-97), Cappadocia, Turkiye. ISTES Organization.

Introduction

"Educate yourself. Be good mothers. Bring up perfect Saudis. Build your country."

Queen Iffat Al Thunayan

"If you stand still, you give them the power to push you down. If you keep walking, they have to follow you."

Princess Reema bint Bandar Al Saud

"I am honored that I'm in history, but I don't think it would mean anything if it doesn't change anything."

Raha Moharrak

I highlight the legacy of black female activists by examining the ways that the film adaptation of *The Help* has affected women of Saudi Arabia, through the ways in which black women's lives, experiences, society, and

politics have been portrayed, either by themselves or by others. The film version of *The Help* was translated into Arabic language in 2011, and it has been shown on one of the most popular Arabic television channels many times. In this project, I examine the impact and influence of black women's voices on Saudi women spectators, especially in terms of how Saudi women react to black women's challenges, achievements, and activism in the film. I argue that the film extends the legacy of black women to other women from other nations and argue that the importance of collectivity can extend beyond the boundaries of social, economic, and political situations.

This project is a continuing work to previous research. So, while I have talked about black women's writings in the previous research works where they center on their subjectivities, an understanding of themselves, and their activism. The black female activists in the previous research works have a chance to narrate their stories in their works, such as Maya Angelou who narrates her particular experience, in her book *The Hear of a Woman*, with an obstructive husband and activism. In addition, in *The Long Shadow of Little Rock*, Daisy Bates shares her story of her collective work with her supportive husband L.C., that adds much to the power of African American literature and women's studies. In this project, I continue the conversation in different way and context. Here I will narrate my own experience of watching Tate Taylor's *The Help* and writing about my story of being impacted by the legacy of African American women activists.

Using Tate Taylor's *The Help* as a primary text in this project is essential for three purposes. First, I have decided a different method in this project, which is an autoethnography, that leads me to examine Saudi women's responses about my personality before and after my majoring in English Literature. I have chosen the film instead of the novel because the film is more widely distributed and seen amongst Saudi females. Further, most Saudi women are not able to read a novel-length book due to the level of their English language; thus, watching the film would be easier because an Arabic translation is available and in circulation. The film also illustrates the visual performance and attitudes of black women actresses. Through the film's scenes, many cinematic elements and film techniques can help the Saudi female spectators to understand the plot, think critically, and to connect personally to the affective elements of the film.

Second, I believe that the film's main argument of conveying the struggle of the black women's in defining themselves and achieving their goals has surpassed the borders of the United States and has extended to other regions such as Saudi Arabia. I analyze *The Help* film by making connections between black females in the U.S. in the 1960s and contemporary Saudi women in terms of the importance of collectivity in achieving goals and making the change. Given these themes, my analysis focuses on their similarities with Saudi women whose lives are controlled by the patriarchal authority that prevents them from pursuing their dreams. This lifestyle is not a wrong structure if that is a woman's choice, but it becomes problematic when this lifestyle is imposed upon them by their husbands or the society. Some Saudi husbands practice the same authority and tools of oppression as those used by white authority in the U.S. at the time period that is the setting of the film. Therefore, in both the film *The Help* and in Saudi viewers' real lives, there are connections between the functions of patriarchal and white authority.

Finally, this film allows me to argue that the role of collectivity is important in women's activism. Since writing is a transformative activity as an activism, using an autoethnography method where I compose a piece of prose through using the participants' responses. Reading the black women's self-narratives, and fictional texts and watching the film Tate Taylor's *The Help* create a transformation in me, in which it leads me to define activism differently. Activism can be defined as an activity of making a change and raising the people's awareness. Activism does not need to be connected with politics, but it can be connected to societies and communities. As the way of making a change is various, I see myself as an activist regarding to my ability of showing the importance of collectivity's role to Saudi women. In other words, any Saudi woman can be a successful if she just shares her dreams with people around her, so they aim to help her. A Saudi woman can be an activist, if she shares her story to inspire others to be strong and brave to make the change and have a better present and future of their lives and people around them. Moreover, this film allows me to view the role of collectivity in different context and way. Since I have connected the black women's experiences with the white authority to Saudi women's experiences with the patriarchal authority, so the role of collectivity in this research can be redefined. Collectivity does not need to be amongst female bonds, but it can be achieved between males and females as well. As Saudi women are discriminated by males in their society, this research approves that a woman can be successful as a result of the collectivity that happens between her as a female and her male supporters such as: fathers and husbands.

Adapted from Kathryn Stockett's 2009 book, *The Help*, the film of the same name was produced in 2011. It portrays events in one community, Jackson, Mississippi, during one of the most important time periods in America, the 1960s. Stockett spent her childhood in Jackson, Mississippi and was raised with the help of a black woman named Demetrie who was her grandmother's maid. When she moved to New York, she noticed that the norms are different from those she experienced in the south, especially regarding the role of domestic workers in the white home. When she felt homesick in New York, she remembered Demetrie, the person who helped her in her childhood, and felt that she had a story to tell. Stockett studied the historical realities of the 1950s and 1960s, and she stayed with her grandmother to hear more about the black domestic workers employed by the family. In her interview with Motoko Rich, she says that she was thinking of portraying only black women, but since she is a white woman, she thought that her book would not be read unless she added white characters to create a balance between the voices and perspectives. Since her novel, written in 2009, refers to events in the Civil Rights era, she continues raising black women's consciousness of and struggles for their rights in the current era, so that the work of the Civil Rights era continues to the present.

The main actresses of the film are the white journalist, Miss Skeeter, and two black maids, Aibileen and Minny. The film is set in 1960s in Jackson, Mississippi. Skeeter, the white journalist, comes back from her college studies with a dream to be a great writer, so she gets hired by a newspaper to write a small column. When she comes back, she finds out that the black maid Constantine, who raised her, has disappeared. Constantine was not like any regular person for Skeeter; Skeeter respects and loves her as her mother. She keeps asking her mother Charlotte about Constantine's disappearance and the location of Constantine's house, but her mother does not tell her that Constantine was fired to please her mother's white friends. The other important characters are two

black maids in the film: Minny and Aibileen. Their stories concern their work in the white families' houses, and address the discrimination and the treatment that are presented in the film. Minny can barely hold a job because she is a talkative person. When she gets fired from a very racist white lady who is named Hilly, Minny returns back to her under the impression that she wants to apologize, but in fact, she wants to revenge for losing her job by giving Hilly a "special pie," which is laced with feces. Then, she works for a white lady who is named Celie, a job for which she is asked to be a friend of Celie's and to teach her how to cook. The other black maid is named Aibileen, who raises seventeen white children. All through the film, Aibileen works for a white lady who is named Elizabeth Leefolt to raise her white child, Mae Mobley. Throughout the film, Skeeter witnesses the life of black maids in the white family's house, so she aims to help them through writing a book where they can share their stories. The women working as the help all tell of the challenges and struggles black women face when they work as babysitters and housekeepers for white families. In the film, with Skeeter's assistance, the domestic workers are able to raise up their voices to demand their rights, respect, and appreciation although they insist on the stories being anonymous to avoid any attack or risk from the white authority. These actresses are able to achieve such an end by giving the people of the town a way to see their struggles and experiences of harassment, fear and danger in white homes.

Kathryn Stockett's *The Help* was a best seller book for more than 100 weeks according to the New York Times; therefore, the book has received a great deal of attention and criticism in many fields. Some critics criticize the book for how the author represents the stereotype of black women as "mammies and domestic workers," instead of portraying them as individuals who can have different roles in the society. Suzanne W. Jones presents in her article, "The Divided Reception of *The Help*," how black and white viewers read the book, and how they respond to "a text individually, socially, and culturally"(23) which leads to readers having different perspectives and views on the text. What is interesting in her article is that some black people criticize the book negatively because of Stockett's portrayal of African American women as domestic workers, which "may end up reinforcing old stereotypes" (Nzegwu, quoted in Jones, 9). According to Jones, she argues that publishing this novel in a time period that is called "post-racial" has a significant impact on the feelings of African Americans. N. Gargano, a black woman who gives her response about the film to Jones, says, "This book gave me so much to think about and brought up so many feelings, so many good, and so many not so good" (Jones, 10). Similarly, Valerie Smith in her article, "Black Women's Memories and *The Help*," insists how the text returns black women's racialized experiences and white authority over blacks to the American cultural memory. As a result, Smith argues that the plot of the text makes it "more accessible to the contemporary readers and viewers" and that it raises "an awareness of Jim Crow protocols through these texts" (Smith, 36). On the other hand, Agata Szulkowska in her article, "The Problem of Racism in Kathryn Stockett's Novel *The Help*," examines the novel in order to present the racial issues that were experienced by African American maids. In doing so, she provides an analysis of the white and black characters' personality and their relationship with their community, as they are depicted in the novel to demonstrate the working and living conditions. By the end of her article, she argues that the novel works as "as an eye-opener to racially prejudiced white Americans helping them discern a huge number of problems dealt with by the Blacks which were largely ignored or glossed over by the Whites over the centuries" (52), which helps readers to open their eyes to current racism in reality, so they can fight against it.

Although the novel has received much criticism, there has been little scholarship produced on the film, though film critics and reviewers have had much to say. Tate Taylor, director of the film, *The Help*, was criticized by some significant journalists in magazines and newspapers for the techniques used in making the film. Melena Ryzik discusses in his New York Times article, “A Director’s Kinship with the Deep South,” how the director chose the setting of the film. He suggests that Mississippi was a perfect setting for the film, where it represents “The heat, the bugs, the fried food, the history, the religion, the roadkill everywhere” (Ryzik). Finally, Ryzik sheds light on Taylor’s main concern that he wanted to show that black women are courageous, beautiful, and strong in which it can relate to redefining the images of black female actresses in films. Taking a different perspective in “Is ‘The Help’ Racist? It’s a Loaded Question,” Nsenga K. Burton explains that asking this question to the black actresses is not fair because they already have it hard in terms of trying to get roles in Hollywood, and to ask them if the film is racist puts them in a difficult position, where they can not answer truthfully. Furthermore, the author concludes by pointing to the irony that those who perpetuate systems of racism in the Hollywood industry are not being asked these tough questions, so it is unfair to put all of that responsibility on the black actresses, who have much more to lose, such as job opportunities and entire careers. While other critics criticize the film regarding its education usage, Eun-Kyoung Othelia Lee and Mary Ann Priester use the film “to stimulate discussion about racism and intersectionality” (92). In their article, “Who Is *The Help*? Use of Film to Explore Diversity,” they argue that film like *The Help* can be a good tool to teach students “the importance of gender, race and social class” (92). In that sense, Lee and Priester argue that using the film like *The Help* can help people to reveal their personal opinions toward some cultural beliefs because of the film’s impact on the educational environment where learners can feel comfortable and free to discuss the diversity issues in the community.

Scholars and film critics also often debated and raised concerns about the historical accuracy of the novel and film. The Associations of Black Woman Historians published a statement in 2011 that *The Help* “distorts, ignores, and trivializes the experiences of black domestic workers.” They continue, “such distorted images are misleading and do not represent the historical realities”(Rivas). Similarly, Martha Lott argues that “films such as *The Help* focus solely on the White protagonists of the civil rights movement when in reality it was organized and led by African American women and men” (333). These kinds of criticisms indicate that the film is not accurate historically. However, other scholars, such as Amy Curtis, believe that spectators should focus on the entertainment value of the film and the performances of the actresses without criticizing or focusing on the historical accuracy. Though it is important to enjoy the work of the actors, it is important to examine these questions about the film’s historical accuracy because what a Saudi audience should or should not know historically is not crucial for this project. Overall, examining this film through the lens of how it impacts Saudi women will not affect how Saudi women understand African American history, because both Saudi women and others should not learn the real history from films and media. Instead, history should be read through books with different genres, as well as through historians who are responsible for narrating history to us. In other words, whether Saudi women know the history of black women in the U.S. accurately or not, they are impacted by black women’s representations in the films and how they may see themselves as social change agents with the

patriarchal authority. With all this criticism to the book, the film and its accuracy, using the film as a primary source of this project will have a great impact on the readers, especially, black women readers, in terms of observing how the extension of their legacy, stories, and history can be extend/impact other women from different nationalities such as Saudi women. Black women's collectivity in achieving their dreams, goals, and in valuing themselves and their humanity is really worthy to influence other women from different nationalities.

Furthermore, beside all the reasons that I have mentioned earlier regarding the connection/relationship between black women and Saudi women in this project and the selection of the film as a genre, it would be great to mention why Tate Taylor's *The Help* is a good choice for Saudi women to watch, as well as to do my autoethnographic study. First, the film succeeds in presenting the transformation of black women's stereotypical image from being passive in their community to be active roles. This transformation of their roles/images was clearly represented in the film, in which it would impact significantly Saudi women spectators regarding to developing their roles in their society. This feature will help them to answer the study questions toward evaluating and observing my personality. Second, the strategy that black women use to show their activity, intellectuality, and positivity for making the change is really interesting and valuable to Saudi women spectators. However, the process of narrating the stories is hard and difficult for some people in terms of revealing all feelings and emotions inside the person, it is still workable for other people who could hold a pen and paper and just write freely. This strategy in film will show the significance of the story's narration for ourselves, our community, and the whole world. This feature will help them to make connections between black women's ability of making change through telling their stories, and my abilities of narrative my own story. Most importantly, watching a film like *The Help* will make my autoethnographic study more understandable for Saudi women regarding the connection that they will make between me and black women in the film.

Generally speaking, the black women's subjectivities in the film have been shaped by their experiences in domestic work. Their experiences were terrible and sad because of how whites looked at black women and how they were treated as "other" through the intersections of race, gender, and class. In one scene, Minny advises her daughter in her first day of domestic work, saying, "You cooking white food, you taste it with a different spoon. They see you put the tastin' spoon back in the pot, might as well throw it all out. Spoon, too." This kind of act from white people toward blacks degrades, dehumanizes, and devalues them for not letting them feel they are normal humans. Black female maids are always treated as "the 'Others' of society who can never really belong, strangers [who] threaten the moral and social order" (Collins, 77). Through the black female maids' experiences in the film, the film represents a dialectal language between whites and blacks where black maids were the objects of white's families to be controlled and manipulated. Also, most of the black maids' experiences show how "the dominating 'I' relies upon 'the 'Other' to function" (Snead, 4). *The Help's* plot is based on the relationship between the black maids and the white families to insist on the dialectical language between the superior and the inferior (Snead, 5).

The film starts with a short cut of conversation between a black maid, Aibileen, and the white journalist, Skeeter. Skeeter interviews Aibileen to talk about her story in domestic work. The camera angle is steadily

focused on Aibileen's face, and the viewer only hears the voice of the journalist. Skeeter asks, "Did you know as a girl, growing up, that one day you'd be a maid?" Aibileen replies "Yes, ma'am. I did." Skeeter asks, "and you knew that because?" Aibileen replies "My momma was a maid. My grandmomma was a house slave." Aibileen's answer shows the level of her consciousness toward her gender, class, and race, in that she feels that her work should be as a maid because of the white authority and the patriarchal laws that limit the access of black women to job opportunities. Ian F. Haney- López links the individual's choices to the community, saying, "in every circumstance choices are exercised not by free agents or autonomous actors, but by people who are compromised and constrained by the social context" (47). Aibileen is aware of other black women's experiences, such as her mother and grandmother, and she deals with these experiences as social norm although she feels inside that whites and blacks should be equal. For example, in one scene of the film, Aibileen gets fired by Elizabeth, while the little girl, Mae Mobley, starts to question her, "Are you going to take care of another little girl?" Aibileen with tears on her face, tells her, "No, that's not the reason. I don't want to leave you, but...it's time for me to retire. You my last little girl." When Aibileen farewells the little girl, she does that as she is her real mother and she asks the little girl to remember what she has taught her that "You is kind. You is smart. You is important." These words show that Aibileen is really aware that blacks and whites should be equal and she wants to teach the little girl that no matter your race, what is important is your smartness, kindness, and value.

Another experience portrayed in the film is through Minny's experience which is quite different from other black maids in the film. For example, Minny can not handle the humiliation that she faces from Miss. Hilly when she refuses to let her use the guest bathroom. This scene in the film sends "signifiers of certain coding of race" (Snead, 6) where the black woman should not use the whites' bathrooms for any reason. In response to how Ms. Hilly treats her, Minny decides to fight back by making "a terrible awful pie" that was made with her "shit." When she discovers what has happened, Miss Hilly fires Minny, telling people that she is a thief to give her a bad reputation and to prevent white people from learning that she ate a pie with a black woman's feces in it. The story stems from Minny's strong personality, and how she rejects white society's humiliation. In the scene where Minny gives her the pie, the camera angle moves closely between Hilly and Minny to show each one's facial expression, as well as to "match the dramatic force" (Bogle, 318) between a white lady and a black maid. The camera angle is close up to Miss. Hilly eating the first piece of pie while licking her fingers to show how she enjoys it. Minny can barely contain a smile as Hilly swallows another mouthful. Miss. Hilly keeps asking Minny what she added to the pie that makes it so delicious. During their conversation, Miss Hilly bothers Minny when she talks in a very humiliating way by saying that she would cut five dollars a week from her pay if she hires her again. At this point, Minny reveals the truth of the pie by saying suddenly "eat my shit." Miss Hilly's facial expression changes to looking like she would throw up. She seems to immediately understand that if white people knew that she ate that pie, she would be embarrassed and lose status.

The film adaptation of the book certainly also seeks to shed light on the idea of racial consciousness. The filmmaker, Tate Taylor, succeeds in redefining the images of the black female actresses in 20th and 21st century films. James Sneads, in his book *White Screens/Black Images*, establishes three types of codes that are often

found in African American films, which send codes of racial discrimination to the viewer, and the viewer can interpret these messages based on his social conception and position. These codes are metaphysical stasis, mystification, and marking. Despite the fact that some black females in the film portray the passive and subservient stereotype, by the end of the film, the audience can notice an obvious change in most of the named characters. The film represents black women's journey from being passive to active in their society. To sum up, these codes allow us to examine how the viewers will receive the film, its plot, message, and black history.

As mentioned above, James Sneads outlines three codes of racial discrimination that might be portrayed in the film. One of these codes is called marking, in which it means to make the actresses darken their skin to enhance the difference in the skin color between the white and the black characters, so the viewer can more clearly understand the theme of racial discrimination. What James Snead argues is that the presence of black skin in films to present racial issues is not enough. Film directors should use "the color black repeatedly overdetermined, marked redundantly, almost as if to force the viewer to register the image's difference from white images" (Snead, 5). This is clear in *The Help*, where the directors ask the black actors and actress "to darken their skins" to show the "negative contrast" (Snead, 5) in order to clarify the real social difference between whites and blacks. In the dining table scene, the viewer can recognize the real difference between Miss Hilly and Minny through their skin color, the camera movement, and their facial expression. As a result, this code or technique impacts Saudi viewers on differentiating between the two races in the film, and that might enhance their understanding of black history, and women's role in the black community, so they can make connections between the social situation of black women in the white house and the Saudi women's own situation within the patriarchal authority.

Another of James Snead's three codes refers to the stereotype of "the black woman is seen as eternal, unchanging, unchangeable" (3) is called a metaphysical stasis. However, the stereotype of black women looks different in Tate Taylor's *The Help*. The film shows how the black female housemaids find Skeeter as an open door and as a chance to fight back through telling their stories to the whole world in order to make a change. They realize they have taken a risk, and that change does not come in a day, but telling their stories is a reaction against the racial discrimination that they experience. Miss Stein, Senior Editor at Harper and Row Publishing in New York, is surprised when she learns that Skeeter found a black woman housekeeper who is willing to share her story and talk about her point of view toward servicing white families and raising their children. Skeeter collects all the stories into a book that is titled *The Help*. That book gives the black women characters more strength and warns the whites on how they should treat the black domestic workers. The black maids' courageous participation in sharing their experiences with a white journalist indicates a new kind of activism where they help to let "the voice of a woman to be heard" (Collier-Thomas and Franklin, 86). Minny and Aibileen decide to speak up, to open the issue of domestic work, and to warn other black women about the mistreatment of black women by white families.

The film gives black audience members a sense of pride to see themselves as powerful figures, who can raise their voices up. The film also shows the significance of women's ability to change if they put their hands

together to empower themselves, express their own identities, and hope for change. As a result, the portrayal of black women actresses in the film shows the opposite of Snead's code in terms of how black women actresses show how much they can adapt and change the bad situations into positive ones with their female bonds.

As demonstrated in discussion of Melba Pattillo Beals' *Warriors Don't Cry*, Maya Angelou's *The Heart of a Woman*, Daisy Bates' *The Long Shadow of Little Rock*, Paule Marshall's *Reena*, Toni cade Bambara's *The Organizer's Wife*, and Tate Taylor's film *The Help*, black women live in a system of oppression due to the intersections of their race, gender, and class. All these factors are the ones that shape their subjectivities, draw out their challenges, and construct their intersectional personalities. Every black female in these literary texts and the film has reached racial, gender, and class consciousness through her life experiences in domestic work, jobs, or schools, where she finds "the shape of [her] power relations changes" (Collins, 293). For example, Melba, Angelou, Bates, Virginia, Minny, and Aibileen's lives were shaped by how they were discriminated against and sexually abused before they started to be activists. So, they began to resist the oppression. They were able to do this by reaching a certain level of consciousness, fueled by their subjectivities as black women, to reject social inequality and injustice through different forms of activism.

Historical Background of Saudi Women and Society's Structure

Historically, the main obstacle in most of Saudi women's lives has been gender discrimination, and that kind of discrimination is a result of political laws. The government gives men total control over women through the law of guardianship, so it is historically, socially, and politically known that "the man's decision regarding any member of the family or respect of life is a law to be obeyed, especially by women" (Al-Sudairy, 8). That kind of power controls women's choices in many fields, such as: education, employment, and even marriage. For example, Saudi women have to ask their guardians sign an agreement paper in order to be registered in schools and colleges, to accept scholarships, to pursue employments, and to enter into marriage. Dr. Hend Al-Sudairy writes in her book, *Modern Woman in the Kingdom of Saudi Arabia*, that Saudi women are known as "a dependent being who depends upon the man for many things" (8), and this is not because she wants to be dependent, but this is how the patriarchal society and politics construct her role in the society. In addition, Dr. Al-Sudairy suggests that the role of Saudi women in her society is so low that she is not even trusted to hold secrets. Most Saudi women do not even share any kind of consultation with their mothers, or other wives, because women are always known as "weak and emotional" (Al-Khateeb 1996, quoted in Al-Sudairy 2017). As a result, the role of Saudi women is marginalized because the males are always deemed superior over women both physically and emotionally, no matter that women always control everything inside the home.

This kind of struggle is similar to what black women have endured in the Civil Rights era, in which the racist authority of whites' laws and the patriarchal expectation of black controlled black women's life choices. Similarly, since the time of slavery, the role of black women "was dictated by the male supremacist ideology of white society in America; it was also woven into the patriarchal traditions of Africa" to remind black women of

their inferiority through their assigned domestic work (Davis, 115). Gender discrimination and sexism continued into the civil rights era, where most black women activists suffered a lot from men's marginalization of their efforts and participation toward change. Black women's struggles are not only shaped by sexism but by racism, regarding the discrimination they face because of their skin color. All these forms of discrimination cause black women to suffer from sexual harassment, domestic violence, threats, and abduction. Thus, in many societies, the oppression of women has been constructed in one way or another by the superiority of the social hierarchy, regarding to sexism, which is a result of cultural and political discrimination between men and women. Regarding politics, black women in the U.S. were not treated equally in terms of their citizenship, which plays a very important role in paralleling their struggles with other women from different nations.

Many western scholars and intellectuals have stated that "Islam is a major factor that determines women's condition in society" (Alsaleh,123). I aim to clarify that when some people connect the issue of Saudi women's oppression to religion, they devalue the Islam religion. In fact, the Islam religion gives woman all rights and all equal opportunities with men in most fields. The study of the Quran and the tradition of the Prophet Mohammed (peace be upon him) proves that "men and women in Islam are allowed to have equal access to knowledge;" Islam also gives women the right "to participate and contribute in the socio- political system under Islamic principles" (Alsaleh, 125). Yet, Islam was controlled and manipulated by some religious conservative scholars who forbade women from doing anything. The real reason that stands behind the conservative role of Saudi women in Saudi Arabia is that "obstacles and barriers in the path of Saudi female leaders actually stem from cultural and traditional roots, not religious" (Aljowaie, 3). However, because the role of education and awareness was weak in the past, the patriarchal authority, through relying on religious conservative thoughts, found the chance to control and restrict each opportunity that was given to Saudi women toward reaching their freedom and developing their intellect. In short, it is important to note that what controls Saudi women has been patriarchal power, political authority, and gender discrimination practiced over centuries, not the Islamic faith.

Currently, with King Sulman bin Abdel Al-Aziz and his son Prince Mohammed bin Sulman and the vision of 2030, their trend is to change Saudi women's social, cultural, economic, and political position and turn them to be more powerful, intellectual, and strong. Prince Mohammed bin Sulman says, "Our Vision is a strong, thriving, and stable Saudi Arabia that provides opportunity for all" (12). In the report of May 2017, *Saudi Arabia and Political, Economic and Social Development*, it is mentioned that "Saudi women have begun to make their mark on politics, and if rates of education are any indication, they are not yet done shaping the history of the Kingdom alongside the laundry list of political and economic changes transforming the lives of Saudi citizens from all backgrounds" (47). Through using data from an autoethnographic study as my primary source, I am hoping to explore the ways in which the legacy of black American women, specifically the importance of collectivity, can be transferred to other women from different nationalities and cultures through watching the film *The Help* that has influenced Saudi women in terms of not only making them aware of the change that they could make, but also in making them aware of a woman's strength when she holds a goal in her mind. In addition, I aim to explore the ways in which that *The Help* film helps Saudi women trust themselves, their abilities, and desires. I am also interested to learn whether Saudi women spectators/interviewees come to

realize the importance of collectivity, that female bonds are one of the most important elements that extend beyond all the political, social, and economic boundaries in order to tell their stories and make a change. I argue that women can not succeed as activists/leaders until they “fulfill a common purpose through the collective achievement of common goals and objectives” (Aljowaie, 35).

This research paper therefore highlights Saudi women, whose lives are often still controlled by someone else and who need more development to know their rights as women beyond being a wife and mother. Thus, although my Saudi society is changing now more than before, I still believe that there are many women who are still domestic workers, who are just working in kitchens, raising their children, teaching, and doing the home work without being able to develop their intellect because they do not have a choice. In other words, their choices and life’ paths are controlled by the authority of patriarchy. Furthermore, there are many Saudi women who are still oppressed by their men and manipulated by the conservative ideas that ask them to not fight for their rights because they will be outside of their comfort zone if they did. In fact, such women need feminist literature to enlighten them, to show their rights, and to help them think critically toward their lives. They have to think of their lives with their husbands; how do their husbands treat them? What do they have to do if their rights and desires are just ignored and marginalized? How could they fight their husbands intellectually? How could they make their husbands and sons aware of their rights? For situations like these, watching a film like *The Help* would give them some indication of their life conditions, which share traits with that of the women in the film, and then they can think more deeply about their lives. Taylor sends his message at the end of the film to all black women to strengthen themselves, to find their own way toward freedom, and to stand against the social law. All of these things can be achieved through the hope that should be inside the silenced women: the power of sisterhood, the love between the black women, and feminist literature. What I focus on is the influence of feminist film on Saudi female spectators and how feminist film affects how they would understand activism and social change. Tate Talyor’s the film *The Help* is one such feminist film that I aim to argue can work to empower Saudi women.

Research on social change theory and women’s struggles and achievements shows a very clear absence and marginalization of Saudi women’s experiences from the world of academia and feminism. Social change theory scholars have not considered the experiences of multi-cultural, multi-national women, in that they have ignored a major geographical and cultural area of the world--Saudi Arabia. Social change theory and feminism allow me, as a Saudi woman, to account for various criteria or circumstances that need to be in a place for a robust women’s activist movement to emerge. I consider how social change theory has looked at black women’s activism and argue that there are some conditions in place that Saudi women share in common with black activists, despite others suggesting that these similarities do not have a place within a Saudi context. So, an additional goal of this study is to allow people in the English language community and Saudi female community to learn how I am influenced by the legacy of black American women, which will enrich the scholarship of Saudi women’s social position in Saudi Arabia and in the world. This work complements and extends the growing body of research about Saudi women achievements and their new role in the society within the vision of 2030.

This research paper relies on a different method, in that it relies on autoethnography, which is a genre of qualitative research. Carl Henry Dethloff defines this genre as “A highly personalized genre of writing and research where the author uses his or her experience to extend understanding of a particular subculture” (9). Through conducting this method, I talk to Saudi women about their ideas of social change through watching the film *The Help*. As we watch the film, I recorded my notes in my research notebook in order to address these three questions that guide and construct my personal data: 1) What impact does the film have on Saudi women spectators? 2) What kind of change might their responses to the film cause in terms of my thoughts on women’s activism? 3) Is there anything surprising in terms of how Saudi women understand women’s activism? Through this method, my participation in sharing Saudi women’s reflections and experiences of activism and their understanding of it serves as my data for this research, to support certain claims in terms of how other women who share the same characteristics as me would also respond to the issue of women’s oppression and activism against it. Through the genre of autoethnography, I look deeply into my own experiences, history, and responses in order to use them in making connections between me and other Saudi women and to theorize the possible causes and shape that Saudi women’s activism might take. I use my own experiences and vision, as an author of this project, to bring the readers closer to Saudi women’s understanding of women’s activism, specifically in their reaction to the film *The Help*.

As I am the primary subject of this study, my techniques of collecting the data consist of reflexive journal. I had conversations with friends before they watched the film and then recorded their reflections about the changes in my personality in my journals. I also recorded any changes in my personal beliefs that were inspired by the film, and my observations of other Saudi women’s reactions to the film. To further illustrate, Saudi participants’ reactions were interesting and varied. Each one of the participants reacted in a different way due to their level of education. One of the participants who has a master’s degree from The United States in English Literature was really excited in talking about the film, black history, and black women maids. The conversation with her was rich, since we shared some information about black women, which led us to discuss the power of Saudi women. While another participant, who has a bachelor’s degree in Finance, was not aware of black women’s history. She was amazed by the racial issues in the film, as well as by the performance of black actresses in presenting their bonds. During our conversations, we discussed how the Saudi women can work with each other as Skeeter does to the black women when she awakens them toward making the change through telling their stories. In addition, black women get help by one member of the discriminatory group, a white lady.

This point caused us to appreciate each man who is known as a member of the patriarchal authority but goes against that patriarchal authority. Then, we ended our conversations with insisting on telling our stories, and never being afraid because one story can make an impact on other women who should follow their goals and desires, no matter how they are controlled by the patriarchal authority, just as the black women were controlled by the white authority. This recursive method enabled me to (1) connect my experiences to how other Saudi women view female activism; (2) understand more fully how Saudi women who viewed the film understood the possibilities for social change before and after their viewing.

The participants are from different contexts in my life, such as friends, previous colleagues, relatives, family members, or even friends from my current work. When I finished designing and planning for the study, I began to call and text 12 Saudi married women who knew me before my PhD and after. Only seven women were willing and able to participate, and this was my target number of the study. Other women were likely not free enough to volunteer their time watching the film, writing their answers and participating in the study.

Participant' Pseudonyms	Length of Acquaintance
1. Abrar	(15 -20 years)
2. Hayat	(10 - 15 years)
3. Wafaa	(3 - 4 years)
4. Ruba	(6 - 7 years)
5. Noura	(5 - 6 years)
6. Hebah	(10 - 15 years)
7. Sawsan	(6 - 7 years)

Figure 1. Description of the Participants

My research had three stages. The first stage was the data collection, where I completed the interviews with the participants. The second stage was the data analysis in which I read, analyzed, and examined the participant' responses. The third stage was evaluating the prose by the participants in order to consider the ethics and credibility of the study.

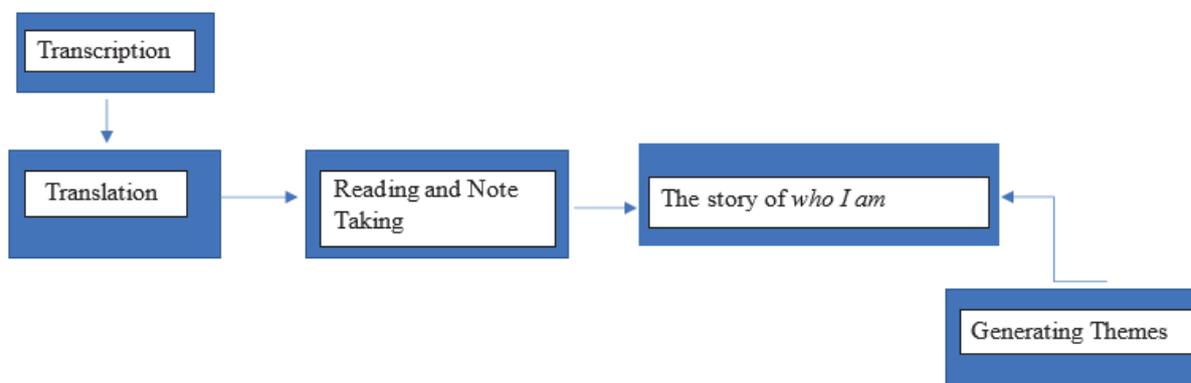

Figure 2. Data Analysis Stage: Transcription, Thematic Organization, and Poetic Rendition

The first stage occurred when I interviewed participants before and after they watched the film. I met with participants via an online video call and gave them a short overview about the study and interview questions. I then asked them to describe my personality and their perceptions of me before I majored in English literature. Then, I let them watch the film on their own and send me their responses. Within one month, all participant's data was received. The questions of the first interview that would guide my analyses of data are:

1. How would you describe me before I began my major in English literature?
2. What is the most striking feature or characteristic of the black American women in the film that has attracted you?

3. Do you see any of these values, characteristics, or qualities integrated in how I am today? Please explain.
4. How have you seen me change after these years of majoring English literature?
5. Why do you think that I am interested in and passionate about black women's narrative autobiographies?
6. Does it surprise you to learn that I have these interests? Please tell me about that.

After collecting all of these responses and discussions, I transcribed them in one Microsoft Word Officer file, in the language of the participant. I translated responses into English as needed.

The second stage occurred when I started to read the interviews carefully to generate a theme for each participant. This required me to circle and underline words that gave a sign of a specific theme. Then, I collected all themes together, grouping and classifying them into main themes and subthemes. Some of participants shared with others' themes, so that helped me to write my reflection on them. As I read, I added my reactions, feelings, and attitudes to their answers in my journal. Sometimes, I added questions, for example, "why did they say that? Why did they think that about me?" When questions arose during my analysis, I contacted the participants again, asking for more details while recording and writing them down their responses. This was the second interview stage.

In my findings, the main three themes were: the innocence, the maturity, and the awakening. I mention "the innocence" because some of the participants talk about my father's role in my life, and how my personality was before majoring in English Literature. However, the theme of "the maturity" covers the moments before and after my PhD study. Also, the theme of "the awakening" covers the moment of awakening with insisting that everyone passes into a stage of adulthood but not everyone passes with the moment of awakening. Due to the responses I collected, and the connection between them and my life experiences, I determined that writing prose in the form of a short story would be a great choice for showing not only my own struggles and achievements, but also those of all Saudi women.

The third stage occurred after I finished transcription, translation, and creating prose. I sent my personal story to the participants through their emails to check for their accuracy and to see if they had other things to add. I also prepared three follow-up interview questions:

- 1- What do you think of the short story? Do you want to add, change or edit any element?
- 2- Do you think this story represents me? Why or why not?
- 3- Do you feel your observations and reflections about the changes in my personality are represented in the story?

During the interview, I tried to take extra notes that might help me develop the story. All of them agreed that this story represented me, my struggles, and my obstacles. One of the participants said, "When I read your story, I remembered all these moments as flashbacks; your beginning, your obstacles, your struggles with being a

mother, student, and wife. It is true that you were far away from our country, but you let us share all your moments.” Another participant said, “If I didn’t know who the writer of the story is, I would tell myself that oh! The personality of this author is similar to Beshaiar’s.” Another participant asked me a critical question: “why do you focus on your PhD study and ignore all the moments before?” I was thinking about her question and if I might change or edit anything, but I found out that what I have done is great that I have written about my PhD study since it is considered the turning point of my path and my personality. PhD study is the stage where I changed and understood myself more fully due to the struggles and obstacles I have overcome.

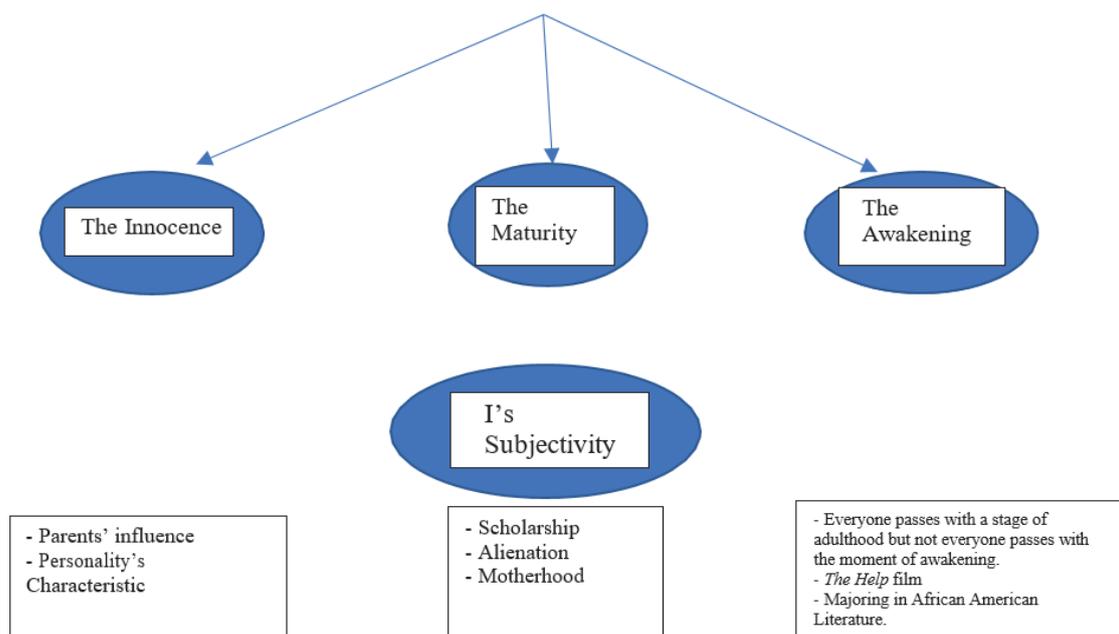

Figure 3. Example of How I Clustered the Emerging Themes

Then, I asked them to check the accuracy of the story; do they see their observations and reactions are written and presented in the story? All of them agree that their observations are well-written with a powerful plot that makes them feel proud and great about it! Finally, one aim of this research is to not generalize but to show an example of a Saudi woman who tells her story of being influenced by other women’s legacy that lead her to change and improve herself as well as to improve the image of Saudi women either locally and internationally.

The first limitation of this study is that it is difficult to remain objective honest, unbiased, and fair toward the Saudi women’s reflections about me. This was especially true for those who are experiencing any kind of outside control over their lives, because some of them would rather not admit their issues or any related issue of women’s oppression, due to a sense of pride and dignity, as they may not want society to sympathize with their weakness. For example, through the participants’ observations and casual conversations, I made sure to not be impacted by their opinions of how they justify the women who are still controlled by their husbands in larger parts of their lives. I have to deal with their opinions, which might not be fair toward these women, in a very objective way. Their opinions toward the film, and their observations on my personality might be impacted by

their hidden stories, which is why I have to be unbiased and objective.

The second limitation is that this genre of autoethnography is related only to one voice and my personal reflections on a social issue, so the results will not be reflective of the general population of Saudi women. However, due to the lack of Saudi women's memoirs and autobiographies, the findings of this study will be useful in conducting further research on Saudi women's activism and the importance of collectivity's ability to go beyond any boundary. In addition, I plan to publish this dissertation and make it widely accessible to Saudi women, which might significantly influence Saudi individuals in building organizations or workshops either in educational institutions or in their public lives to let the oppressed women speak up and share their experiences, as well as to encourage them to show their courage in order to work collectively.

Finally, the third limitation is that the participants are geographically distant, which made it difficult to stay together, watch the film, and talk about it. So, for that case, I asked them to record their written answers or their voices toward the film and how my personality is changed by majoring in African American Literature, and then we had a discussion about it on the phone or a video call. The last limitation is that some of participants preferred to write their answers in Arabic, in which they feel more comfortable, so I spent time translating them so I would be able to use them in my journals. The translation action itself is challenging for me, since my participants have different dialects and different structures of expressing their thoughts, even if they use the same language. So, these factors take more time to be transformed into the formal Arabic and then to translate into English. In addition, I was concerned with losing the clarity and accuracy of the participants' answers, so that is why I made a follow-up interview to check the meaning of some words with my participants.

In the coming pages, I present the short story, which was a product of my autoethnography, or the connection of the Saudi women's experiences with my personal life experience.

I's Subjectivity

Today is a different day! I wake up in the morning with a heart that is full of emotional memories of my parents, and especially my father since he plays an important role in my life and with all the roles I play: a daughter, student, wife, mother, and even a teacher. While I was drinking my cup of coffee, I remembered that he once told me that I have inherited his passion of completing the graduate study. Then, I recalled all dialogues and scenes that happened with him in which these scenes shaped my subjectivity to be what I am now. He was very sure that I could make him very proud of me by making his dream become true and wider. So, since I was a child, he gave me all responsibility and confidence to be an ambitious and influential lady. At the beginning, I felt that confidence was heavy on my shoulders because I was worried of hurting his expectations, but one day after the other, I felt that his confidence was the key to fly in the future.

I was 22 years old when my father just called me to tell me about enrolling in the scholarship! I was not excited

so much because I needed to practice my motherhood with my first boy, since I had just finished my undergraduate degree. I was shocked; how can I leave my country, my family, and why should I do that. But he insisted on the idea, and he told me that “you are still young, you should work hard now, so you can find yourself, and your dream work easily in the future,” I went home, and it was rainy night! I sat down on the bed, the curtains opened, and the drops of rain just fell down into my brain and not on the ground. I spent all night thinking of his advice! It was a step that needed courage and strength because I had never thought of leaving my family. Inside my heart, I believed that he was right! but at the same time, I was nervous and anxious of taking such an influential step! When I remembered my attitude at that days, I realized that my personality was not developed enough to decide on such a decision as this. I was a person who had a limited insight, one angle of perspective, less patient, and limited skills of analyzing or critical thinking. But my father’s insight showed me life from a different angel; an angle that was really full of life chances.

It was late night when my husband came to me saying that “this is our chance of life, we can be close to our dreams, we just need to start, and then everything will be easy.” The day that was full of cries, tears, and sad emotions because I would say “goodbyes” to my family and my husband’s family. I was not sure what will would face in front of us! But, I was sure that the path of success would not be easy. After farewell moments, we travelled to the United States. We faced a new style and routine of life, we had been through new obstacles, and we faced many struggles such as: homesickness, parenting, financial, loneliness, and many others. Whenever I felt stressed and hopeless, I tried to close my eyes seeing my dream in my imagination to empower myself to work hard and to be patient.

Before I had started my PhD, I had been through the experience of delivering my second baby girl alone in America. That experience showed me different angles of my subjectivity and that I am a positive, optimistic, and awesome woman with all people around. I am also a woman who is able to handle all struggles and build a positive atmosphere within the obstacles. During the time of spending the nights taking care of my newborn baby girl, I was watching a film that is called *The Help*. At the beginning, I was really interested watching the film, and then that film just inspired me to ask myself many questions: such as why is there racism? What is a Jim Crow era? What is the problem with the black, female maid’s skin color? What is the problem if they have decided to tell their stories? All these questions were still on my minds until I started my PhD. The feelings that I got from watching this film are just remind me of other women in different nations who really have a story to tell but they are afraid! And this was the first spark of the inspiration!

Since that time, I was really focusing on courses that relate to African American women. In Fall 2015, I have had the first class in my doctoral program with Dr. Veronica Watson that was talking about Civil Rights literature, and she gave us a very clear picture of African American history. Since that moment, which is considered the second spark of my path, I felt that I was connected to their stories because I saw that there was a connection between me and them. First, I am always holding their values and concepts, and I always see my goal in front of my eyes, while continuing to reach for my goal. For example, during my study, I was balancing many roles in my life; I am a wife, mother, and a student. And that is what black women did in the film. They

were taking care of their families, themselves, and the white families' children. So that really reminds me of my own story!

Dr. Watson's Monday class ended at 8:30 pm, so I went back home very quickly to practice my motherhood duties with my children; feed them, help them brush their teeth, read a bed-time story, and get them to sleep! During that night, I decided to stay in my back-yard staring at the stars in the sky while drinking a cup of green tea. I always have a journal book in my handbag because I love writing down everything I do during my day, or everything I have achieved. So, I took the journal book out and started to write my reflections on African American women, and I came up with: "I feel connected to the African American women because I always have the feeling of continuing my goal. I always believe that all people are equal, no matter their race: white or black, or their class: poor or rich. I believe that black women's experiences in America are very inspiring for every woman who is struggling from any oppression or struggle or abuse to take a reaction against any change and to break free from the image of a victim's role. In addition, while I was watching *The Help* film, I felt that my personality is really matching black women characters' personalities in the film. For example, the sense of optimism which means that I am always sure that future will be better, and everything will be fine. In fact, since that time, I have adopted many concepts and principles from the history and struggle of the African American women such as solidarity, creativity, and fighting for women's rights. By solidarity, I mean that I want all the Saudi women to stand together against any misconceptions that could tarnish their image in social media and the whole world. I have the whole courage to fight for the correct positive image of the Saudi women. Then, my creativity in making the African American women activism as a reference and a guide to obtain all the important lessons to create a solidarity between the Saudi women socially. In addition, talking about black women in my project shows how I am passionate about their stories. And, I see how I really care about spreading the awareness of inequality and discrimination through the stories of black women to other nations because it might be natural to notice these discrimination and inequality differences in any place and in any country. Most importantly, I can see my goal is similar to Skeeter's goal in the film in which how she tries to tell black women's stories, and now I want to write my own story and Saudi women's stories. Black women's self-narratives might impact your passion and emotions. And, it attracts your attention, which leads you to read more about them and describes that your project will talk about them." Then, I went to my bed with all peaceful feelings inside!

One night, while my family and I were gathering after dinner and around the fireplace, my father asked me from where I got the passion of holding the issues of black women and to extend this to Saudi women. I told them that through my reading of African American narratives, I saw discrimination, inequality, violence between blacks and whites, and the oppression of black women and that made me sympathize with their struggles and the racial and gender discrimination that they have been through. So, I believe that black women deserve to live with all their pride because whatever is the race, class, or gender of the women, they have feelings and emotions that deserve respect.

My husband asked me if I noticed any of these treatments. I answered him that "Yes. I have seen the

discrimination in the work position and daily lives; for example, transportation.” Since my family has never heard the term of Black Women’s Narratives, they asked me to explain this, so I answered that “I believe that I am interested in this genre because I want to make it as an example to other oppressed women who are struggling to achieve their rights and to show that nothing is impossible. I want to show them that if the African American women, through their numerous autobiographies, were able to get their rights, these oppressed groups of women are able to do so if they really think of the importance of sharing their powerful and inspiring stories. As a result, I have decided to use my voice in spreading the awareness that people should be proud of their skin color without hurting or discriminating other races. And I want to spread awareness between other nations and cultures such as Arabic nations!” My family’s eyes were moving from one to another as they were shocked of how I would spread that awareness and why. My answer is that “Saudi women’s lived experiences are unique human experience that have never gotten the attention or focus necessary such as in literary criticism and writing, while comparing with black women’s autobiographies. I think I am interested in black women’s stories since they are similar to us regarding their personality characteristics: strength, patience, and the stereotype of the iron women.”

After the family conversation, I went back to my home and to my favorite place which is the back yard to write down my reflections again in my journal book. Due to the inspired and thoughtful family conversation, I thought that I had reached the turning point of my personality, not only in my personality but in my academic and professional path. So, I wrote down that “the process of awakening and growth has taken all stages, so I start to see light on the horizon. The process of awakening shows that my caring of women’s struggles and achievements is not surprising, due to my personality’s characteristics that I don’t feel satisfied about discrimination and inequality between people. In other words, racism and discrimination are manners that should be rejected by every mature and educated persons. If racial discrimination spread, that would kill humanity. damage all societies, and would lead to a loss of great communication between people. Within the process of the awakening, and diving into the field of African American women’s literature, I have decided to send to the whole world a message to stop all kinds of discriminations either gender or racial. Lastly, my interest is that there is no difference between a person and another except his/her good deeds, education. Basically, there are no differences, and this is my personality that aims to raise the justice. In addition, I see that I don’t like to be silent about discrimination, and I always try to be unbiased.” And here is the actual beginning of my path!

While I was writing this short story, I just stopped for a minute to think deeply about what has been changed in Bashaier’s personality. I think that the past five years shaped me differently. If I compare myself before my PhD and now, I didn’t notice any negative change, though I became much better and more developed than before. My personality became stronger because of many things: I am a well-read person, passionate, a good listener, and a creative reader just to learn more things. All these characteristics help me to develop and strengthen my subjectivity. Finally, it is very rare that I see people who spread such awareness in our society, so my step of doing this is great and will make a huge difference especially in our societies. And, yes, I have been surprised a little bit, but of course since I have expertise in African American literature, so I have seen some elements that other people don’t see because not everyone is exposed to this literature. And not every person passes with

through the moment of awakening. People should understand themselves; they should leave themselves in the hard situation to shape them. Understanding themselves will help them to figure their path and their role in the society. Be open to everything around, free yourselves, free your heart to feel, and free your brain to think!

Composing this story with a focus on some parts of my life was inspired by the participants' answers, who highlighted issues in my life that I have never paid attention to. One of the participants reminded me of how I was balancing between my life roles. Another one compared my role to Skeeter's role in the film, which inspired me to open new ways of thinking about showing the extent of African American women's legacy, in terms of Saudi female spectators being able to put themselves in the position of Skeeter in their lives. In addition, some of my participants reminded me of my father's role in my life, and I never thought that they would remind me of my father, since I do not remember mentioning my father often in my conversations with them. When I asked them why they mentioned that point, they told me that when a person is impacted by someone else, they talk about that person without paying attention to it. Prior to my decision to write this story, I drew a timeline of my life where I have passed with the turning points of my life, with the intention of making them is the main plot of the story.

Furthermore, I was thinking a lot on how I could show the role of collectivity in my story. However, some participants who are/were a member of my major in Literature and Criticism knows how I was inspired by one of the inspiring professors in the English Department. Dr. Veronica Watson, a professor and the head of the English department, taught a class in Fall 2015 about Civil Rights Literature. That class was the spark and sign of my path toward recognizing who I was, and who I become. Dr. Watson works with me as a team to get this dream completed for me as well as to get this project done for black women readers, Saudi women readers, and academic scholars. In addition, I soon realized that my collectivity is shown in the encouragement of my husband, since he is considered as a role model husband who really encourages his wife as much as he would himself, in which that takes us back to the argument of the second research that argues for the power of supportive husbands in women's activism. Through my analysis of Daisy Bates' *The Long Shadow* in the second research, Bates portrays her husband as an effective role in her personality and activism. This portrayal of her husband helps the readers, especially the female readers to understand that supporter can be males, and also husbands. In the other words, she tells her story to define her effort and activism within the context of racial discrimination and social injustice for the black school students, through the collaborative work of her and her husband. Analyzing the couple's relationship helps me to "understand the ways the men in the lives of assertive women either assisted or hindered their personal development and political activism" (Adams, 13). If L.C. didn't add a lot of improvements to Daisy Bates' personality and life, she wouldn't talk of him, as it is one of the 20th century trends that female activists don't aim to highlight their marriage, husbands, and family such as in the works of Dorothy Height and Ella Barker. When I began this study, I explained that the authority of whiteness that was represented in the film, which controlled the lives of the black women maids, is similar to the patriarchal authority in our society, where husbands think that they have the right to control their wives. In that sense, the role of collectivity is shown in my life amongst my desires, dreams, and goals. I see my husband as a

part of my collectivity, since he is the one who trusts me to find my path. He is the one who sacrifices for me and helps me to achieve my dream, and that makes me feel secured to sacrifice for him and find our collectivity to build our future altogether. The path would not have been easy without him! In addition, the role of collectivity is shown in the role of my father as he was the backbone of my dream; he advises, guides, and supports me either financially or emotionally. That is why, I always feel that it is my responsibility to make him proud of me!

The results of my study indicate an interesting point to me as a researcher and I am sure to my readers as well. In both cases, either Saudi or black women, the one who helps, and secure them is a member of the dominant group. In the film, Skeeter is part of the dominant group, white people, and she rescues black women through letting them share their stories to find people's respect and equality toward them. On the other hand, as I am a Saudi woman, the ones who really help and support me are the people who are considered members of the patriarchal authority: my father and my husband.

Saudi women, as any woman in the world, were discriminated against because their gender. The social expectations and the patriarchy authority locate them in a fixed, traditional role. Nowadays, Saudi Arabia is the most influential country in the Middle East that helps the women to get their rights within the vision of 2030. It can not be denied that the new changes transform and change Saudi women's role to change their social role to be more productive humans. Saudi women contributed to their country to improve themselves and to show that their human presence is important, not only to their country but to the whole world. That contribution never happened easily, but they struggle and work hard to achieve that. They spend their lives changing and improving themselves individually, but now the whole country is supporting them.

Saudi women are never changed themselves but also, they change their males to let them understand what does dream mean to a woman? What does achievement mean to a woman? Saudi women insist a lot on their dreams; they fall down, and then they stand up again. They were attacked by negative attitudes and comments, but they helped themselves to support each other with positive comments. Saudi men (who are like a husband and father) now do not want to see any Saudi woman in a lower position, so they start to help, support, and push her to do what she has dreamed of. They even might sacrifice their time, comfort, and money to help them. Saudi women's solidarity and their insistence on finding their path encourages the importance of collectivity's role that should be amongst male counterparts. Finally, this dissertation approves that the role of collectivity is not only between females but also between males; to achieve each other's goals, we should work collectively amongst our personal or practical life.

In conclusion, after generating the prose, I asked myself to define Saudi women based on my lived experiences. I would define them as a powerful women who go through many struggles and obstacles in the patriarchal system, but with all that, they improved themselves as women who can achieve their goals and dreams, women who can manage the responsibilities on their shoulders; they can be wives, mothers, students, and workers. Saudi women are women who build the history of Saudi Arabia, and because of that their narratives should be mentioned in the academic sphere of feminist literature and criticism. In addition, this study shows that black

women's history parallels Saudi women who become aware of not only the social change that they could make, but also of a woman's strength when she holds a goal in her mind. Furthermore, *The Help's* observations show how Saudi women trust themselves, their abilities, and desires. Overall, this study succeeds in reflecting the instance of Saudi women spectators who are realizing collectivity's influence, in that female bonds – as well as the support of husbands and others -- are one of the most important elements that must extend beyond all political, social, and economic boundaries in order to reach an achievement through working all together.

Abstract: COVID-19 hugely impacted the students' learning, in which experiential learning was not allowed to be implemented to decelerate the spread of the virus. Thus, educators used whatever capacities and abilities they had to ensure that the students learned the skills, especially for certain skill-based occupational therapy subjects. However, studies regarding occupational therapy students' viewpoint of their real-life experiences in learning skill-based subjects via online distance learning were lacking in number. Therefore, a descriptive phenomenological study was used to describe occupational therapy students' personal experiences in studying skill-based subjects via online distance learning during the COVID-19 pandemic. Ten undergraduate occupational therapy students were interviewed, ranging from 45 to 60 minutes on their experiences in learning skill-based subjects via online distance learning. The essence of the student's experiences was described in four main themes: (i) the impacts of COVID-19, (ii) adapting to the COVID-19 outbreak, (iii) the downside and upside of learning skill-based subjects via online distance learning and (iv) perceived supports. Even though they struggled to learn the skill-based subjects without hands-on face-to-face sessions, occupational therapy students felt that few strategies effectively enhanced their learning experiences during the period. This study concludes that occupational therapy students formed impactful memories and described their struggles with online distance learning since the sudden transition to ODL during the pandemic. Thus, the experiences highlight a few learning strategies educators can adopt when it comes to skill-based occupational therapy subjects.

Occupational Therapy Students' Experiences in Online Distance Learning for Skilled-Based Subjects During COVID-19 Pandemic: A Descriptive Phenomenology Study. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 979-996), Cappadocia, Turkiye. ISTES Organization.

Introduction

Occupational therapy is defined as the therapeutic use of occupations that provides functional support to equip people by overcoming barriers in the recovery process from injury or illness (American Occupational Therapy Association, 2020). Occupational therapy promotes independence and satisfaction in all aspects of life. Not only limited to didactic education but there are also many ways to prepare students to become skilled in entry-level occupational therapy including laboratory experiences, problem-based learning, case studies and experiential learning (Goldbach & Stella, 2017). Experiential learning involves hands-on experience in a practical setting to test information learned in educative coursework in a real-life practice environment, emphasizing self-directed learning and mirroring the experience (Thomas et al., 2022). Most students valued hands-on learning since it allowed them to practise and apply learned skills more than ordinary methods such as lectures and self-reading (Thomas et al., 2017).

On January 30, 2020, the emergence of a new coronavirus (2019-nCoV) was announced as a concern public health emergency of international concern by the World Health Organization (WHO). An infectious disease has been a major threat to Global public health. In Malaysia, this outbreak resulted in holding back the learning sessions of high institutions during the ongoing semester of pre-university and undergraduate programs (Kamal et al., 2020). To flatten the curve of Covid-19 infection, Movement Control Order (MCO) was imposed starting 18 March 2020. Malaysian Ministry of Higher Education ordered all public and private universities in Malaysia to resume the teaching and learning scheme via Online Distance Learning (ODL) by the end of December 2020. At the edge of July 2021, Malaysia recorded an increased number of cases over the month with the highest of 15,573 new confirmed cases of COVID-19. On that account, face-to-face learning is still not possible.

E-learning has been widely used on account of its accessibility and has been demonstrated to be successful for the past decade. Online learning attempts to provide adaptability to broad-ranging study without its infinite challenges for both the students and instructors (Abe, 2020). However, the whole world quivering with the COVID-19 outbreak and adjusting to the new normal is a challenging process. Obligating to the MCO, higher education institutions must explore online communication platforms to enable interactivity. Even so, this application may be ineffective for certain fields like clinically hands-on or technical education (Moadel et al., 2020). On the 27th of May 2020, Higher Education Ministry in Malaysia declared a must in all universities and higher education centres to administer teaching and learning measures via ODL until the 31st of December 2020, while the decision regarding 2021 was held on based on current cases. Standard Operating Procedure (SOP) and only a few exceptions were strictly put in place to halt another COVID-19 outbreak (Al-Kumaim et al., 2021).

Although, unquestionably, ODL is deemed the finest alternative to make certain of continuity in learning in the “new norm” or “during the COVID-19 pandemic”, there may be some hindrances such as lack of human touch, sensing students’ misreading facial expressions, student engagement and interchange, which can be done more productively in face-to-face learning (Chung et al., 2020). The goal of occupational therapy education is to produce occupational therapists with the essential professional competencies for practice (World Federation of Occupational Therapists, 2020). These professional competencies can be achieved mostly via laboratory experiences and experiential learning. However, these learning methods are not possible to be conducted during the implementation of MCO in Malaysia. Thus, students have problems learning skills-based subjects which require them to use and experience conducting a wide range of assessment tools and intervention techniques to obtain psychomotor skills. There are limited studies conducted to describe the experiences of occupational therapy students undertaking skill-based subjects via ODL. Given that, this study aimed to explore occupational therapy students’ personal experiences in studying skill-based subjects via ODL during the global pandemic, COVID-19.

Method

Design

A descriptive phenomenological inquiry was employed to deal with inner experiences in the everyday life of occupational therapy students studying skill-based subjects via ODL. This method helps to identify the meaning behind the human experience as it related to a phenomenon or notable collective occurrence (Sundler et al., 2019). The phenomenon of interest was the students’ experiences in studying skill-based subjects via ODL. The phenomenological foundation of this study aims at attaining a profound understanding of the nature or meaning of students’ daily experiences (Mortazavi & Ghardashi, 2021). Therefore, this study aimed to answer the following research questions; what are the experiences of occupational therapy students studying skill-based subjects via ODL? This study was conducted at the Centre for Occupational Therapy Studies, Universiti Teknologi MARA(UiTM) through one-to-one interviews using semi-structured questionnaires via the google meet platform due to the physical distancing measures imposed to decrease the spread of COVID-19. UiTM Research Ethics Committee approved this study with reference no 600-TNCPI (5/1/6).

Participants

Purposive sampling method was used to recruit the participants in this study. This sampling method offered multiple perspectives both depth and diversity, and the selected respondents were likely to provide information relative to the phenomenon being studied (Creswell & Poth, 2016). Fifteen participants were approached and offered an opportunity to participate in this study based on specific eligibility criteria to obtain rich and thick descriptions of their experiences. Data saturation was not the goal, rather this aimed to get full and rich personal accounts, concepts, and commonalities from the participants. Each person’s experiences are so individual that

true data saturation can never really be fully achieved in a phenomenological study (Hale et al., 2008). Occupational therapy students enrolled in a Bachelor of occupational therapy full-time course who; (i) is currently in the second year or above (ii) have taken any occupational therapy skill-based subjects during the COVID-19 pandemic; (iii) can understand English and Malay; and (iv) provide informed consent were included in the study. They were excluded if have not completed the skill-based subjects and refused to be interviewed.

Materials and Instruments

Data was collected using semi-structured individual interviews via the google meet platform. The meetings were audio- and video-recorded for data analysis purposes. Videoconferencing has been popular as a means of communicating regardless of distance. It is a convenient, cheap and efficient way of communication mode. In this new norm, videoconferencing is gaining traction in qualitative research for interviews. The environments allow real-time communication with both audio and video. This is much like a traditional interview, except the researcher and participant are simply in different locations. A laptop with the google meet application and a stable internet connection was required to record the videoconferencing interviews. An interview guide consisting of demographic and main questions was used to collect the data from the participants. The interview guide was developed based on the literature and research objective. Prior to the data collection, it was pilot tested with an occupational therapy student to ensure the clarity and comprehension of the questions.

Data Collection Procedure

Upon receiving ethical approval from the UiTM Research Ethics Committee, data collection was done via videoconferencing interview. An information sheet was provided to the participants and consent was obtained before the interview took place. Participants were made aware of the videoconferencing interview session being recorded for transcription purposes. One day before the interview, a reminder email was sent to the participants. The time and date were set according to the participant's preferences.

The interview started with warm-up questions consisting of demographic details to know more about the students and to get an overall sense of the skill-based subjects that they took. These questions were geared towards the central questions; however, responses helped with the other prompt and probe questions. The COVID-19 question was designed to understand students' general perceptions of the current covid-19 outbreak. Questions on the occupational Therapy course were designed to solicit students' in-detail descriptions of the skill-based subjects for the current semester by looking deep into participants' personal experiences throughout the semester. Participants were interviewed for approximately 45 to 60 minutes. The interviews were transcribed verbatim before the data analysis. Data transcribing was conducted in a private room using earphones to avoid the possibility of recordings being heard by other people. Any document which contains the participants' detail was kept with no access to anyone other than the research team. Participants were however, notified that their information would be used for reports and publications.

The Context of the Study

This study explored the experiences of occupational therapy students in learning skill-based subjects via ODL during Movement Control Order (MCO) during the COVID-19 pandemic. The students were enrolled in the Bachelor of Occupational Therapy in the Faculty of Health Sciences, Universiti Teknologi MARA. They have taken skill-based subjects that require hands-on and experiential learning, but it was not possible during COVID-19. Skill-based subjects include pre-clinical and clinical subjects such as occupational therapy assessment, intervention, and practice placement in various areas. During the MCO, face-to-face and hands-on learning were not allowed, which imposed a lot of challenges on the student and educators. The sudden transition required the students and educators to adapt and cope with the new norms.

Data Analysis

Data were thematically analysed using three steps: (i) achieve familiarity with the data through open-minded reading; (ii) search for meanings and themes; and (iii) organise themes into a meaningful wholeness (Sundler et al., 2019). First, the transcripts were read to familiarise with experiences and explore their meanings by identifying the unique and novel sides of the data. Second, notes on the meaning of experiences were made to the transcripts and the notes were compared to develop patterns and themes. Finally, the findings were written and organised with the explicit name of the themes, which describe the meaning of lived experiences in the actual context. The rigour of the study was enhanced using reflexivity, credibility, and transferability (Korstjens & Moser, 2018; Sundler et al., 2019). The research team compared the derived description with the original data to maintain reflexivity and any changes to the themes were documented and audited throughout the research process (Sundler et al., 2019). Member checking was performed with three participants and the coding was done independently by the two research team members to enhance credibility. The meaning of the experiences was described in the thick description and the context of the study was made clear to ensure the transferability of the findings (Korstjens & Moser, 2018).

Findings

Description of Participants

Despite fifteen eligible participants being approached to offer the opportunity to participate in the study, only ten agreed and turned out for the videoconferencing interview. The participants are ten female students aged between 22 and 27 years old (24.1 ± 1.37) residing in different geographical areas during the MCO as shown in Table 1. Five (50%) of them live in rural areas and another five (50%) live in urban areas. The participants were in semester six and eight and were currently taking skill-based subjects as follows; (i) occupational therapy medical-neurological assessment ($n=1$, 10%), (ii) occupational therapy intervention in medical-neurological conditions ($n=4$, 40%) and (iii) occupational therapy assessment and intervention in geriatric ($n=5$, 50%). Despite facing multiple challenges during ODL, almost all participants managed to achieve good to excellent

grades. Participants were also asked to rate satisfaction levels with their performance for the skill-based subjects. The scale ranged from 1 (not satisfied at all) to 10 (very satisfied). Participants rated their satisfaction level from 5 to 8 with a mean and SD of (6.6±1.07).

Table 1. Description of Participants

Pseudonyms	Age	Semester	Geographical Residence	Skill-based subject	Grade	Satisfaction level
NN	24	6	Rural	OT assessment in medical-neurological Conditions	A	8
NI	24	6	Urban		B	7
SZ	24	6	Rural	OT intervention in medical-neurological conditions	B	6
NW	22	6	Rural		A	8
ND	24	6	Urban		B	6
NA	25	8	Rural		B	7
FN	23	8	Rural	OT assessment and intervention	B	7
KA	23	8	Urban	in geriatric	A	7
NL	25	8	Urban		B	5
NH	27	8	Rural		C	5

Emerging Themes

Four themes emerged from the analysis; (i) the impacts of COVID-19, (ii) adapting to the COVID-19 outbreak, (iii) the downside and upside of learning skill-based subjects via ODL and (iv) perceived supports as shown in Figure 1. The first theme describes the impacts of COVID-19 on the students and their learning process. The essence of this theme describes how students feel about coronavirus and its spreading. Two subthemes emerged under the first theme namely, (i) uncertainty and fear and (ii) impact on the learning process. The second theme encompasses how participants develop their coping strategies to learn effectively. The essence of this theme relates to students' psychological status which influences their academic performance.

There are two subthemes under the second theme; (i) coping strategies and (ii) psychological influences. The third theme describes the downside and upside of learning via ODL and is arranged in four subthemes; (i) the extent of workload, (ii) technical challenges, (iii) access to technology and (iv) time flexibility and expenses. This theme also discovered students' perceptions of ODL compared to face-to-face classes. The fourth theme explains perceived social supports illustrated by participants during unfortunate times and is organized into two themes; (i) stay connected and (ii) self-efficacy. Participants expressed appreciation for receiving family, friends and faculty members' encouragement and support. in maintaining their academic performance and mental health status.

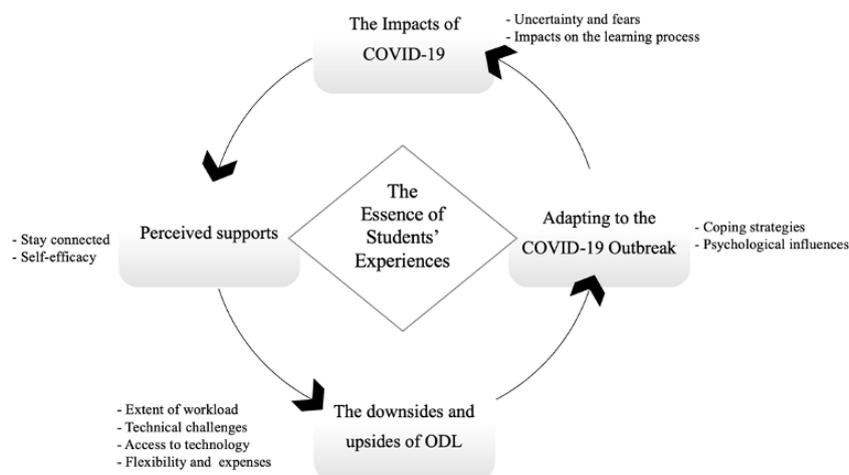

Figure 1. Emerging Themes

Theme 1: The impacts of COVID-19

Uncertainty and Fear. This subtheme incorporates the personal feelings shared by all participants regarding the experience of a yearlong observation on COVID-19. Respondents realized that COVID-19 is a pandemic where the disease outbreak throughout the whole world not only in Malaysia. It affects all populations no matter what age, gender or status. Students also stated that COVID-19 is currently the leading cause of death worldwide up to millions of cases. NN added value to this subtheme by stating:

“Covid 19 is an airborne disease that cause by a coronavirus that can be transmitted through water droplets when we sneeze or talk. Currently, this disease becoming more dangerous as some sporadic, does not show any symptoms can be tested positive”.

As the coronavirus pandemic demonstrated, life can change very quickly and uncertainty about returning to normal social life might result in fear. Some of the students were residing in red zones. Areas classified as “red zones” indicate that the regions where most cases are reported and where individuals are at a high risk of infection. Participants described deep worries and anxiousness in various ways. Most participants highlighted their concerns about the safety of themselves as well as their family members. Two participants stated:

FN: “I am feeling worried about my parents, nephew and niece because they are at higher risk. If they got infected the symptom will be much worst. I am frustrated because I have not been vaccinated yet but relieved that my parents have completed their vaccination”.

KA: “Covid 19 world widely affected not only our country. It is very dangerous. I think it is so stressful as we have to stay at home and stay away from everyone, by ourselves only with our family and it affected all the entrepreneurs that burden them and cutting off their source of income”.

Impact on the learning process. All participants described the values associated with the skill-based subjects. The majority of respondents discussed how they were supposed to be attending lab sessions for the subjects, but they could not. They value the lab sessions as they would be able to physically touch and practice the entire equipment and receive direct guidance from classmates, lecturers and clinical instructors. Participants provided statements relating to what the course plans have changed due to COVID-19. The essence of the students' experiences is exemplified through the following:

SZ: "Lecturers have planned for a face-to-face session for intervention. We usually do it in lab sessions where the lecturer demonstrates the correct way to conduct the intervention and we get to practice to gain the skill, but it was not possible during MCO".

KA: "My lecturer also planning to expose more on the reality of that situation with the elderly so that we can apply the theory we learned to the real environment through clinical visits, but it was just a plan. We could go ahead with the plan".

Participants described their experience in comparison with previous hands-on learning at the campus before the emergence of COVID-19. Two participants exemplified that:

SZ: "For me, the hands-on experience is important because, through that experiential learning, we get to experience how to conduct the intervention physically and how to operate the equipment correctly and giving us confidence when going for clinical placements. For example, some of the interventions require us to use tools such as electrical stimulation so during the lab session it will be really detailed on where to place the electrodes, how to control the electrical impulse, and what intensity to use".

NL: "When in an online session, not everyone can pay 100% attention during lectures and presentations with internet problems, so I think it is difficult to pay full attention. We only get to learn hands-on skills using videos. We don't get to feel the real situation, the experience of doing so is not available".

Participants expressed that COVID-19 has altered their learning process from formal methods to a new norm of using ODL. ODL is an instructive system where students carry out class sessions through video recordings, live video conferencing, or any other audio/visual technology medium. Participants provided value statements relating to the changes. They make the best use of the technology available by implementing miscellaneous teaching and learning modes like social media (WhatsApp, Telegram), live video conferences (Google Meet) and pre-recorded lecture videos (YouTube). Participants stated that:

NH: "My lecturer does google meet sessions or zoom or provided us with recorded lectures. We also do presentations among students online. Most of us use google meet as a medium for classes and group discussion".

SZ: “We were not allowed to go back to campus. So that is why the lecturer provide us with video demonstrations of carrying assessments and interventions”.

Theme 2: Adapting to the COVID-19 outbreak

Coping strategies. Students learned to adapt to the changes in the learning process with their own coping strategies as that was the only option to complete their studies. All participants have somehow used similar learning strategies to adapt to the changes. The students advocate that staying organized can ease the process. The habitual “structure” of daily life may have been replaced with a new norm, so strategies could help in optimizing learning and managing time effectively. Identifying learning objectives and goals will help to stay on track by taking note of what they hope to accomplish by the end of the course. Besides, developing a study plan and having a written coherent plan allowed them to follow and complete the course. Along with taking time to eat or relax, participants also set aside some specific time for learning. Participants illustrated their coping strategies as follows:

NH: “Whenever the class schedule came out in the early semester, I will plan my schedule for the whole week, what goal I need to achieve for that day, I prioritize which assignments needed to be submitted first. I think I am adapting to it”.

NN: “I used my planner and write down the assignments because sometimes I cannot remember everything. I adapt mainly by trying to complete the assignment earlier. So, I will not be so burdened at the end”.

FN: “I take note of the extra information and do a lot of own reading before class so that I have questions to ask during class on things I don’t understand”.

Apart from staying organized, participants also suggested optimizing learning efficiency by having a dedicated study space. Participants build a distraction-free area where they feel comfortable studying. Participants also merge their learning time into their routines to enhance productivity. This is exemplified by:

SZ: “How I adapt is by having my own personal corner for my online class so that I can fully concentrate. I called mine a ‘battlefield’ because a lot of battles happened there”.

Psychological Influences. Although adapting well to the changes in the learning process, most participants agreed that the COVID-19 pandemic has disrupted their lives from multiple directions. Despite coming to the end phase of their education (clinical placements) and progressing to the next level (employment), they were not confident with themselves. NW stated that:

“I am afraid that I could not gain a full understanding of assessment and intervention and will cause a lot of problems during my clinical placement. Hands-on give me experience. So, without experience, I don’t think that I am confident enough to conduct the assessment and intervention on real patients”.

NL: “After the MCO, we get the chance to go to clinical placement at University Malaya Medical Centre (UMMC) where the first day I got really shocked like I have a lot of lacking in experience. Every day was tough for us because if we don’t have those skills”.

In addition to having to cope with a stressful study environment, participants have to fulfil roles while living at home. In comparison to studying on campus, students were responsible for taking care of their own well-being. While living at home, students have to worry about looking after family’s needs. Two participants describe their responsibility other than being a student:

ND: “I divided my time between studies and my family. You know especially as a woman we need to do house chores and a lot more, so I really need to follow my schedule. If not, I will be left behind”.

NW: “Because we are at home, we have other responsibilities, we could not just stay in front of the laptop and do all the coursework from morning until night. We have other things, like living with family. We can't focus only on studying. It is hard to adapt. But of course, I have to, I have no choice so I just go with the flow and do whatever I can”.

Theme 3: The downside and upsides of ODL

Extent of workload. Most participants believe that the amount of work in ODL was increased than during traditional classes. Some participants agreed that the increase in workload was due to the replacement of final examinations and lab sessions. Participants described that:

NL: “During ODL, the coursework load increases. Not only a single subject has a lot of assignments, but mostly all. With my home environment, it really gives pressure on me. The workload is increases compared to face-to-face. During face-to-face, there were more classes but fewer assignments. To be honest I prefer the final examination just because of too much workload”

NW: “Many workloads, and I think it is very much compared to face-to-face. I have to do many things at once and I have to cope since there are many subjects so the workload and there are assignments for each subject.”

Participants expressed experiencing difficulties in keeping up with their daily occupational performance due to the unbearable amount of academic workload they carry. Participants recollected:

KA: “When it comes to sleep, it is a problem. I have to stay up late finishing all the coursework. At some point, I cannot sleep because I keep on having and struggling with my negative thoughts. My leisure is also affected as at campus every day after class around 6 pm, I spend time jogging or playing badminton with my friends. During ODL, I rarely continue my leisure activities”.

NW: “During ODL, my eating time was disrupted. Because I want to settle my assignment first because I know that after I eat, I will do something else because I could not focus anymore. So, it is better for me to complete my assignment first and then do other things later”.

Technical challenges. All traditional methods operated for direct learning; classrooms, halls, lecture rooms, and laboratories must now be put back and replaced with the high-modernization of online learning. Participants made use of the “network problem” to describe the technical difficulties. Six participants were residing in rural areas during the pandemic. Participants further described the technical challenges causing them sometimes miss lectures or cannot join the live discussion. Participants exemplified that:

NW: “I have trouble with my internet. Some lecturers used recorded video as their medium. I think it is a good alternative for us who are having trouble with the internet because the time is flexible; we can watch the video when we have time or when the internet is stable. But the hardest part is that if we cannot understand something, there is no Q&A session because it is recorded video”.

ND: “The internet depends on the weather. The internet is the main problem in ODL because we cannot control those things and sometimes it takes time for us to complete recording videos or submitting assignments because of the internet connection issue”.

Accessibility of technology. Even though participants experienced challenges because of ODL implementation, there were some advantages to them. When asked what the upsides of ODL were, participants seem to be holding back and needed prompting. They stated that they got the opportunity to venture into new knowledge by using various online applications as mediums of discussion and sharing information. Participants described that:

NH: “We get access to new technologies and applications that can be used during online learning such as google meet, zoom, for use during our presentation. Sometimes we also use quizzes, google form and many more”.

SZ: “The good part is students get to assess the learning materials as much as they want until they really understand the topic because it is being recorded. It is cool, right? Because if we don’t understand or forget, we get to revise. In physical class, you did not get the chance because the lecturer only taught in the class”.

NW: “I am satisfied with all the presentations by my friends and lecturers because they are very clear.

The video demonstration from YouTube gave me a better understanding of how to conduct the specific assessment and intervention. I would say that is what helps me during the ODL”.

Flexibility and expenses. Participants perceived another advantage of ODL is its flexibility to choose wherever or whenever they want to study. Participants get the possibility of saving a significant amount of money as the expenses for ODL was lesser than face-to-face on-campus. Also saving time by not commuting on crowded buses or local trains. Participants explained that:

NL: “I get to save a lot of money and the most important thing is that I feel safe living at home. If we live on the campus, we are exposed to COVID-19, interacting with people there. I also get to spend all of the time with my family”.

FN: “I can save money from paying college fees, food and leisure bills because I tend to spend much when I am on campus by going out with my friends”.

Theme 4: Perceived support

Stay connected. Participant transcriptions were found to have a consistent thread where all of them were receiving support from their peers, family, lecturers, and university. Participants claimed that online studying leads to feelings of loneliness. In a situation where they no longer have access to a friendly-study environment or the chance to physically unite with their peers. Staying connected can keep the participants motivated. Participants found comfort by interacting with classmates via virtual study groups. These sentiments explain the subtheme:

NL: “I would say my classmates, specifically my groupmates. We helped each other because we understand how this impacted our studies and mental health. Everyone is stressing out but at least by having them, they can listen to my rantings and make me relieved”.

ND: “Whenever I am stress, I tend to cry and express to my sister and friends. They will help by advising and comforting me so I can stand on my feet again. If I did not have support, I will collapse and burn out easily”.

NH: “Our lecturers were helpful. Sometimes they asked about our current situation, whether our internet connection is okay for class, and whether we needed extra help. They channel us to any support provided by the university”.

SZ: “I can see that many webinars have been done to address students’ issues, for example how to manage stress, manage time and so on”.

Self-efficacy. Self-efficacy refers to an individual ability to exert control over one's own motivation, behaviour,

and social environment. To boost self-efficacy, social support was found to be the key feature. Most participants expressed receiving support as a significant factor that motivates them to perform better in academics. Two participants stated that:

NL: “It was challenging to adapt to the new norm learning environment. I need a lot of support from others. If I have no support, I believe that my performance will deteriorate because the support motivates me to complete my studies”.

NW: “I believe that if I don’t have good groupmates who are supportive, I don’t think I go through this. I get to achieve good grades too since most of the assignments are in the group. If they did not cooperate, it will be harder”.

Discussion

This study aimed to explore occupational therapy students’ personal experiences in studying skill-based subjects via ODL during the COVID-19 pandemic. The first theme illustrates the impacts of COVID-19 on the participants’ life and their learning process. The focal point of participants’ experiences is mainly the uncertainty and fear of the pandemic. Most participants are suffering from the uncertainty of returning to normal life and a deep fear of infection, with substantial worry for the elderly of their families. The traumatic feeling is supported by the fact that the number of morbidity and mortality in Malaysia keeps increasing as reported by the Ministry of Health (Din et al., 2021). A study stated that undoubtedly undergraduate students encounter obstacles and psychological stress because of quarantine obligations, finishing-off studies via ODL, and future employment uncertainties (Kassim et al., 2021).

The enforcement of MCO halted the conventional learning process (Rumeli et al., 2022). Thus, ODL is viewed as the best solution for replacing conventional learning methods during this uncertain situation. Most educators delivered the learning content through online platforms such as video recordings, video conferencing, or any other audio/visual technology medium. Professional practice education was applied by the university as recommended by the World Federation of Occupational Therapists to employ virtual teaching in occupational therapy education (World Federation of Occupational Therapists, 2020). Despite adapting to the new norm in their learning process, participants value more conventional learning methods to enhance their skills and clinical competency. Successful learning was established using (1) experience in authentic contexts, (2) a supportive mentor system, (3) structured portfolio use, and (4) formative and summative assessment (Aukes et al., 2008), which are applied during experiential learning.

The second theme describes how the students adapt to COVID-19 during their educational journey. This theme centred on a consistent thread where participants develop any means of coping strategies to adapt to the situation and how it influences the students’ psychological status and academic performance. Participants advocate their efforts to improve their own knowledge, skills, accomplishments, and personal development in learning skill-

based subjects. Participants committed to the efforts by staying organized, prioritizing tasks, practising self-directed learning, and taking a break when necessary. These are among the coping strategies they used to adapt to the situation. Participants employed self-directed learning take control over the conceptualization, design, implementation, and evaluation of their learning process. A study stated that individuals who do self-directed learning will show dedication to learning with increased motivation and engagement in online learning (Sandars et al., 2020).

Participants describe their feeling of distress as the COVID-19 outbreak has affected their lives as students through various means. Participants express anxiousness about having to fulfil other responsibilities at home eventually causing psychological tolls on them. A study found that 67.1% out of 486 respondents of university students in Malaysia feel stress during the COVID-19 pandemic (Al-Kumaim et al 2020). Therefore, a study suggests considering mobile mental care apps as an effective and efficient way to access mental care, particularly during a pandemic because students prefer mobile apps over face-to-face consultation (Marques et al., 2021). Students are also encouraged to practise personal reflection in expectation of guarded exploration and experience, hence developing a sense of the convenience of steady functioning, learning and development (Aukes et al., 2008).

The third theme represents the downsides and upsides of learning skill-based subjects via ODL. Participants revealed that ODL posed several challenges. Students express the unbearable extent of the study workload during the ODL was conducted. These findings align with a study that found 69.5% of respondents felt an overload of work during the COVID-19 pandemic (Al-Kumaim et al., 2021). This was acknowledged by the participants expressing that an increased workload results in the hassle to keep up with day-to-day activities such as disruption in sleep pattern, cessation of leisure activity and physical strains due to prolonged sitting.

Participants, especially those living in rural areas found that trying to stay connected to the internet was challenging. ODL has a growing interdependence with technology. Therefore, common issues in remote areas are a lack of electricity and internet access serve as barriers to acquiring stable internet (Kanwar et al., 2018). ODL relied heavily on modern technology. Participants expressed that poor internet connectivity results in delayed access to learning materials. Network issues were also evidently experienced by the educators, not just the students (Kop, 2020). Weak signals often interrupt the smooth flow during the class session that includes audio broke, video freeze or there was a lag in communication in the online class. Thus, it causes miscommunication and losing focus among the students. These challenges resonate with participants' choice of embracing face-to-face conventional learning.

Some of the participants needed prompting on what went well, showing that the upsides of ODL were underseen as they perceived more challenges in ODL. Regardless of the downsides, participants value and make use of the various technology available. Participants take the opportunity to discover new online applications for online meetings, learning, conference, and others. The convenience of technology allows lecturers to record the class sessions so that students get to review when needed. A study reported that as long as students have access to a

computer, online classes are possible to be attended by students from any location and at any time (Purwanto, 2020). Participants perceived the advantage of ODL is its flexibility and reduce expenses. ODL allows them to plan their learning independently at any location and time. Additionally, studying from home during ODL allows the students to save their travel time to and from the class giving them a chance to use the time for meaningful activities.

The fourth theme evolved around perceived social support. Staying connected with family and friends provides emotional relief during an episode of distress. The general benefits (GB) model of social support proposes individuals' psychological states, such as positive affect and sense of well-being can be enhanced with social support (Rueger et al., 2016). Participants were also grateful for the presence of faculty members with the effort of channelling any emotional or financial support. A study conducted has proved that social support is a pronounced component to foresee university students' academic accomplishment (Alsubaie et al., 2019). Since all participants received strong social support, it was believed that the reason for achieving good to excellent grades. A systematic review with meta-analysis reported a promising correlation between social support with university students' grade point average (GPA). Given that, not receiving social support contributes to the deterioration of psychological health, academic performance and overall quality of life of students (Mishra, 2020).

Conclusion

There were limited studies that explored the experiences of occupational therapy students studying skill-based subjects via ODL. As one of the research team members was undergoing the same situation, the lack of exploration on this matter drove her interest. The findings revealed four themes to represent the essence of students' experiences: (i) the impacts of COVID-19, (ii) adapting to the COVID-19 outbreak, (iii) the downside and upside of learning skill-based subjects via online distance learning and (iv) perceived supports. Although participants adapted well to the ODL, they emphasised the importance of skill-based subjects to be delivered through conventional learning methods. This study concludes that undergraduate occupational therapy students formed impactful memories despite struggling to study skill-based subjects via ODL. The findings of the study highlight the need for thorough learning strategies to ensure better satisfaction and prevent psychosocial deterioration among students.

Recommendations

There are a few limitations of this study. Above all, the sample was relatively small despite having a thick and rich description of data. The findings of the study may not be transferable to other countries given the differences in context, accommodation, and facilities. Thus, transferring the findings of the study should be made with caution. A larger qualitative study is required to explore the issues and should focus more on how the students want to be helped in the learning process while taking skill-based subjects. This study highlights the

need of (i) the university to look at the quality of the online learning platform and resources, (ii) educators to modernize and restructure their teaching schemes according to the new norm and (iii) attending students' psychological distress to promote the healthy learning process.

Acknowledgements

We would like to thank the occupational therapy students who participated in the study and all staffs at the Centre of Occupational Therapy Studies for their support and cooperation. This study was funded by Fundamental Research Grant no 600-IRMI/FRGS 5/3 (296/2019), Universiti Teknologi MARA.

A Philosophical Approach to Critical Thinking and Conflict

Ferit Baça

University of Tirana, Albania,  <https://orcid.org/0000-0002-4442-7108>

Abstract : The phenomenon of conflict is considered as one of the most essential phenomena of human beings and is a part of their existence. Conflicts are social phenomena that have existed throughout the history of human society against the will of the people. Their existence in social life has transformed them into universal and objective phenomena that exist despite our knowledge and attitudes. These characteristics are imposed on man to study his eternal nature for the benefit of life and progress. The sciences of philosophy and critical thinking provide new concepts for conflict management and transformation. Critical thinking offers a new conceptual approach to dealing with conflicts in human society. The essence of critical thinking is the idea and views of philosophers for a rational and reasoned approach to conflicts. The following paper aims to influence the education and formation of beliefs and a dialectical attitude on the importance of critical thinking in the recognition, understanding, and management of conflicts in society.

Keywords: Conflict Management and Transformation, Conflict Resolution, Society, Philosophy.

Introduction

Recognizing and treating the causes of conflict in human society remains an important and vital objective of human thought. Conflict follows man from birth to death. In addition to the conflict with oneself, a person must also cope with those that arise and appear in the relationships that he creates with others. The creation of this relationship, between oneself and others, is accompanied by the expectation of conflicts of different natures because the closer we get to the individuality of each one, the more conflicts arise that are caused by the existence of differences about what "I" am and what the other is. Human activity is directly related to the thoughts embedded in his psyche and shaped into world views and habits, that guide him to action.

The path described so far, as well as the one expected to be traversed tomorrow, is a product of the ideas of human society. The formation of worldview ideas and concepts aims at the development of individual human capacities, so that the individual fulfills his social mission in his daily activities. Achieving maximum efficiency in this field is closely related to the growth of individual experiences as well as of society itself, which communicate and feed each other. The development of a democratic society requires not only social cooperation

from all its members, but also the training and development of their capacities at contemporary levels. Philosophical thinking is closely related to the formation of reflective thought, which is achieved through the acquisition and application of the method of reflection, which, for each thesis in the philosophical field, starts with the doubt of its authenticity and its application in practice. The only way to improve our theories and experiences remains to learn and philosophize intelligently, which also creates the necessary conditions for the full use of the acquired experience. When dealing with the phenomenon of conflict in human society, the role and nature of human beings remain essential in the recognition, treatment, and resolution of conflict. In the light of philosophical studies, man has abandoned the fatalistic theory of conflict treatment, the black and white attitude, and replaced it with a contemporary point of view, treating and conceptualizing conflicts as an attempt to overcome obstacles to development and coexistence, as an opportunity for communication. In this process we can progress in achieving our goals.

Methodology of the study

The methodology followed in the design of this study is the research work, which is based on the collection of scientific materials, the use of the literature, the relevant bibliography, and the consultation of the selected literature. After the selection of the scientific materials, their translation into Albanian was carried out, as was the systematization of the existing knowledge in order to select only the necessary information. The last stage that followed contained the processing of the material, thereby crystallizing the entire material. During the literature analysis, we focused on the recognition from a philosophical point of view of the nature of the conflict as well as the role of critical thinking in its treatment and management, enabling the acquisition of new knowledge. For the preparation of the paper, we focused on the selection of original materials for the benefit of deepening the content with scientific concepts and facts.

Philosophical concepts about conflict: a new approach to critical thinking

The themes and variety of problems discussed by ancient philosophers also included the substantive nature of the conflicts. Critical and philosophical thought has aimed to provide strong arguments for the very existence of human life. In this sense, the first foundations of living are based on thoughts about the elements of nature and human society. The elements of nature also include man, who abstracts in an effort to live. Socrates' reasoning is based on the fact that man is a rational being and interacts according to the principles he establishes in his life. Socrates focused on developing the thought: How should one live according to the principles of good? Thus, critical thought put the phenomenon of evil in human life and society under its microscope. In this sense, the goal of the development of human society is the result of his thoughts. Therefore, today's arrival point summarizes the spiral of our concepts and ideas, which precede the level and quality of tomorrow.

Man is the only being to whom nature has given the ability to judge and reason. Reason is the basis of the

thoughts that form the elite. The concepts and worldviews of a society are born and formed by the thinkers who build the foundations of the state itself. Thinking is followed by logic, which is precisely what further develops mental activity. Thinking is a psychic process that accompanies man towards new knowledge, generalizations, and the discovery of laws that determine various phenomena in nature and in society. Through thinking, people manage to get to know the phenomena that surround them more deeply, to penetrate into their essence, and to discover the cause and laws of their development. People practice thinking to realize their goals. Through thinking, people not only manage to plan and organize their activities but also to predict their results. The purpose of human existence is closely related to education and the use of human will for the acquisition of new ideas, in the endless path of knowledge and cognition. On the other hand, any knowledge, which is part of knowledge, creates opportunities for man to use the laws of nature and those of different fields of knowledge to his advantage. Our entire existence is connected to our knowledge of the truth and the world around us. An important element of the thinking process is intuition, which guides the process of cognition in the path of research and enrichment of knowledge for the benefit of human society. In principle, philosophers accept the existence of conflict in nature and objectively before the birth of human society. The German philosopher, Emanuel Kant, treated in his conflict studies the complexity of human nature and, especially, the contradictions that accompany it. His concepts about conflict value it as an instrument of nature through which it realizes its purpose, the establishment of justice and the triumph of freedom.

The German philosopher Georg Simmel thinks that the individual in society always remains in a double relationship with society. The individual is at the same time inside and outside society: he exists both for society and for himself. *"Man in society is not partly social and partly individual. More precisely, his existence is shaped by a fundamental unity, which cannot be accounted for in any other way except through the synthesis or coincidence of two logically contradictory determinations: man both in social connection and in being for himself, both of which are products of society and life from an independent center."* (Cose and Ridener, 2005, p. 127). The field of social science investigates what happens to people and according to what rules they behave, not in relation to how they unfold their individual existence in their generalities, but in relation to how they form groups and are defined by the existence of their group due to interaction. Thus, according to Simmel, *"The forms found in social reality are never refined: every social phenomenon contains a variety of conventional elements. Cooperation and conflict, subordination and supremacy, intimacy and distance, can all be operative in a marital relationship or in a bureaucratic structure."* (Cose and Ridener, 2005, p. 123-124). Due to his nature, man is inclined to see and analyze conflict in two aspects; the first, which includes the factors that favor it, and the second, which includes the factors that fight against it and hinder its progress or development. The appearance of conflicts is relatively difficult to assess. Simmel's views start from a dialectical approach and highlight the dynamic interrelationships and conflicts between the social units he analyzed. Throughout his work, Simmel emphasizes the connections and frictions between the individual and society. In these treatments, the argument for the positive role of conflict in the lives of groups and society occupies a prominent place. The social significance of conflicts has never been seriously discussed. Simmel underlines his critical attitude towards the legacy according to which conflicts have been seen simply as a destructive factor in human relations

and as something that should be prevented as much as possible.

People reach this conclusion by observing only the negative consequences of conflicts in certain individuals or social groups and extending them to the entire society, creating an illusory vision that what happens to any individual or group also happens to the whole society. In addition, people forget that it is these conflicts that, among others, keep them bound to each other in a mutual action, which, in one way or another, necessarily increases and facilitates social integration. Quite important remains the perspective of conflict resolution. This avoids the negative result of the loss of human life and material and financial values, of victory or defeat by only one side, and the creation of a reality based on the triumph of peace, which is always more precious than war, as well as the vision of the common victory. This means abandoning forms and methods that rely on the use of threats and violence. In order to resolve conflicts, traditional attitudes of communication that rely on threats and blame should be avoided. Rather, a right approach involving the use of attitudes and communication based on understanding and cooperation should be adopted first. Also non-threat and non-use of violence methods can help to resolve conflicts. It is very important not to cut off communication and dialogue in any way, because in this way, the conflict would only escalate. Simmel's motto consists of his concept of presenting a peaceful alternative for conflict resolution, while also accepting the opinion and platform of the other side.

Understanding conflict: its management and transformation

The history of human society proves the presence of conflicts in all cells of life as an inherent part of human nature. Man is forced to choose only one alternative behavior towards him; managing and resolving conflicts in a timely manner, avoiding consequences that punish society. The studies of the French philosopher, Jean-Jacques Rousseau, on the causes and origin of the conflict have transformed it into a serious reference in the field of philosophical thought. Rousseau developed an advanced concept for the time on the origin and nature of conflict, which he expressed in the work "The Origin of Inequality among Men". Rousseau showed special interest in typology and conflicts with nature; religious, political, ethnic, social, economic, etc. He stopped at one of the causes and origins of the conflict; that between people in human society, continuing with the argument that inequality, exploitation, slavery, poverty, etc. were born from property. *"The first who, after setting the boundaries of a plot of land, said: This is mine!"* (Rousseau, 2008, p. 89).

The essence of Rousseau's views is focused on the stages of development of human society, where the idea stands out, according to which the essence and main source of conflict in society remain the inequality that has arisen. *"Such as was, or should have been, the genesis of society and laws, which gave new constraints to the weak and new powers to the rich (18th century), destroyed natural freedom once and for all, permanently embedded the law of property and of inequality, by a violent and bold appropriation, they derived an irrevocable right, and for the sake of the gain of some ambition, they finally subjected the whole human race to labor, slavery, and misery."* (Rousseau, 2008, p. 109-110). Rousseau managed to arouse attention and argue before the society of the time about the awareness of the natural right of man to live equal and free. This could

not be ensured in a monarchy that stood on the idea of absolutism and the unlimited powers of the monarch, where everything, every wealth, and every right, which included the human life of an individual or group of people, belonged to him. For Rousseau, social inequality and social injustice were the main sources of conflict.

Another source of conflict today remains economic inequality. Because, on the one hand, the wealth of the rich only increases, while on the other hand, the poverty of the poor only deepens. Even this economic inequality between different layers of society remains a source of conflict. Dwelling on the consequences of these inequalities, Rousseau points out: *"As soon as people began to mutually appreciate each other, and the idea of condescension was conceived in their souls, everyone thought he was right about it, and it was not possible to find a single man with impunity who could do without it. From here began the initial obligations of civilization, up to and among the savages, from this, every voluntary injustice was called a disgrace, from which, together with the harm that flowed from the evil, the injured person saw in it the disregard of his own person, often more unbearable than evil itself"*. (Rousseau 2008, p. 97). Arguments and analysis prompted Rousseau to draw the conclusion that *"social inequality and social injustices cannot, just as the rays of the sun have the same source, but are many, because, along the way, they encounter many breaks, even we, although we have many bodies, only have one soul. I cannot separate myself from the worst soul, nor deny identity with the worst."*(Rousseau 2007, p. 133).

Gandhi sees man from his good side and says that those sides can be developed without limit, and by developing them, a better man and a better world are created for everyone. Gandhi's philosophy was inspired by life's problems that needed solutions. And Gandhi gave them solutions, but always the kind of solutions that were compatible with morality. There are many attitudes and ways of solving or approaching a conflict. Conflicts can be handled badly, poorly, or constructively. Even our daily lives are accompanied by a number of small conflicts that we must face carefully. The ways of handling and resolving the conflict are highly institutionalized and dealt with by the courts. But, in many cases, conflicts are handled carelessly, which leads to bloody clashes, because people apply and rely on the law of the strongest. The point of view of conflict resolution that avoids the negative result of the loss of people's lives and material and financial values, victory or defeat by only one side, and the creation of a reality based on the triumph of peace, remains quite important; it is always more precious than the war as well as the vision of the common victory. This means abandoning forms and methods that rely on the use of threats and violence.

Various philosophers have expressed the opinion that reason and human dignity are another factor, apart from power, that ensures the regulation of interests for the establishment of peace. The philosopher John Locke said that people are basically rational. Most people are able to understand that others also have a number of rights, such as the right to live, for the simple reason that they are humans, and that most of them are willing to respect these rights. Therefore, the way the parties reason and communicate, how they express their feelings and emotions to each other affect the outcome of the conflict. Recognizing the respective responsibilities, verifying and correcting the wrong steps that deviate from the peaceful resolution of the conflict prepare the conditions for

the recognition of the rights of the other party in the conflict. When opponents clarify their positions and listen to each other's points of view, they come to understand each other correctly. As a rule, people who share different points of view with each other ensure a healthy and long-term friendship and relationship. The researcher of conflict resolution, Johan Galtung, starts from the fact that we should not look at conflicts as a win-lose situation, where one party must necessarily win and the other must lose. Instead, he looks for ways to create a win-win situation, where both parties benefit from the solution found. *"Finding a solution that fully satisfies both actors in the conflict is naive and impossible, but this does not mean that the conflict is unsolvable."* (Galtung 2007, p.172).

Galtung's main idea consists of recommending the creation of conditions where both conflicting parties emerge victorious from conflict resolution. All other solutions that tend to create imbalance or that offer victory to only one side are evaluated as short-term and without sustainable perspective. Finding a middle ground between hard and soft is a stepping stone to the right path. If both parties understand that reaching an agreement has long-term benefits, we can undoubtedly say that they are closer to a solution. The permanent or long-term solution to the conflict requires concessions from both parties, who have made the necessary concessions. An obvious positive result is the fact that the parties to the conflict have started down the path of cooperation, abandoning the path of violence and conflict. Caught in the whirlwind of the long process of finding a solution to the conflict, the parties understand and feel that they are now collaborators forced by circumstances to overcome common difficulties to solve the problem. This situation is also known as the time when both parties profit. However, it is important that the parties focus on what is common rather than what divides us. For the full effectiveness of this process, it is required that both parties openly raise and present the issues, interests, needs, and circumstances that caused the initial disagreement.

Conclusion

Philosophical approaches are the product of the selection of ideas in human society. Knowledge of the world and nature that surround us is the philosophical basis of human existence. Elites and philosophers of different eras through which human society passes have made undeniable contributions. In particular, an important place in the philosophical field is occupied by the concepts of critical thinking theorists, which constitute an innovative and contemporary approach to conflict resolution and management. Critical thinking is the ability to think rationally, which criticizes traditional concepts of using force to resolve conflicts, and the use of pressure, aggression, and military attacks to resolve them. The basis of the philosophy of critical thinking is the concept that only dialogue and holding open talks between the parties are the most fruitful and effective paths to a long-term solution and establishing trust between the conflicting parties. According to philosophers of critical thinking, neither conflicting party is deprived of dialogue and communication between them. They underline that conflict transformation is a process that never ends. Old antagonisms can resurface, just as new ones can arise. Achieving a lasting solution is at best a temporary goal. Much more important would be the ability to build a fair ratio so that it is sustainable and acceptable.

Abstract: Concepts It is where the foundation of scientific knowledge and thought structures are laid. Thanks to concepts, distinctions or generalisations about an event or an entity are formed and thought structures are formed in our minds. In this study, it was aimed to determine the associations in the minds of secondary school 6th grade students about the concepts of barcode, banderole, patent, pirate, piracy, R&D, copyright in the 4th unit of the 6th grade social studies textbook and to determine the existing misconceptions. In order to determine the cognitive structures and misconceptions of the students, scanning technique was used as a method. The participants of the study were 60 6th grade students studying at Nazmiye Demirel Secondary School in Isparta city centre in the 2022-2023 academic year. After this test was applied to the students, the words obtained based on the concepts were analysed in detail and then a frequency table showing the frequency of repetition of these words was prepared. Based on the frequency table, cut-off points were determined and concept networks were created. According to the results of the research, when the frequency of association of the concepts in the minds of the students was analysed, it was determined that the key concept that produced the most words was the concept of piracy with 269 words. As can be seen from the table, it was also determined that the most misconceptions existed in the words evoked by this keyword. As a result of the research, it was determined that the keyword with the least number of words produced was the concept of banderole with 143 words. It is predicted that students have both misconceptions about the concept of banderole and learning deficiencies due to insufficient associations.

Introduction

Social Studies course is an interdisciplinary and unified version of the subjects of social sciences (Price, 1965, p.

7), which are related to each other (Çetin, 2013; Keskin, 2019; Tay, 2018). Social studies is a course that enables children to discover themselves and the world, as well as to connect with real life (Barr, 1997). The subject of the Social Studies course consists of important social sciences such as History, Geography, Civics, Sociology, Anthropology, Law (Deveci, Köse & Bayır, 2014; Aslan & Safran, 2016; Sönmez, 2010; Tay, 2018). Social studies as a concept in the world was first used in the early 20th century in the USA in 1913 (Keskin, 2019, p.4). Thomas Jesse Jones mentioned the social studies course for the first time in a magazine called Southern Workman (İnan, 2019, p.12.). According to the definition of the National Council for the Social Studies (NCSS) (1992); "Social studies is a field of study that combines art, literature, and social sciences with an interdisciplinary approach to gain citizenship competencies." (Doğanay, 2008, p. 79; Tay, 2018, p. 6).

In Turkey, the most comprehensive definition of the social studies course is provided in the MEB (2005) Program. According to the MEB (2005), social studies is a course inspired by the concept of collective education that focuses on the contents of social sciences and civic knowledge such as history, geography, economics, political science, anthropology, psychology, philosophy and law, and combines these contents in the context of units or themes in order to fulfill the requirements of being an individual and to guide students; where individuals' human relations and their relationship with the natural environment are examined on the common ground of past, present and future; and is prepared with the inspiration of collective education. In essence, social science subjects are organized at a level that students can understand (Şimşek, 2020, p. 3; Koyuncu, 2015, p. 10).

Social studies as a subject was first taught in the United States. All changes and developments about the curriculum are made by the National Council for Social Studies (NCSS), which was established in 1921 (İnan, 2019, p.14; Aslan & Safran, 2016). In our country, the first time a course called social studies was started to be taught in 1968 (Akpınar & Kaymakçı, 2012, p. 608; Çatak, 2020, p. 24; Kalaycı & Baysal, 2020, p. 108; Yalçın & Akhan, 2019; İnan, 2019, p. 12). Subsequently, some changes were made in the program in 1998, 2005, 2017 and 2018 (Kalaycı & Baysal, 2020, p. 108).

In the content of the social studies course, there are various concepts in the context of being an education-training program (Joubish & Khurram, 2011), whose main theme is human and society, blending social sciences and serving multiple purposes (Çetin, 2003; Sönmez, 2010; Deveci, 2014; Safran, 2008; Tay, 2018; Tokcan, 2015). The most commonly agreed definition of what a concept is that it is the most basic form of knowledge and abstract images that live and are represented in our minds (Beyer & Penna 1971; Braisby, 1999, p. 321; Carey, 2009 p. 220; Fancett, 1968, p. 4; Klausmeier, 1992; Malatyalı & Yılmaz, 2010, p. 321; Yazıcı & Samancı, 2003, p. 158). Bruner stated the concept not as an entity but as a relationship (Matsumoto, 2017, p. 132; Richard, 1968, p.10). Bourneun stated that by combining and classifying concepts with experience, new concepts are born and existing concepts change and develop (Tabachnickh, 1970 p. 9).

By perceiving, interpreting, assimilating or rearranging a newly encountered event, object or idea, the new concept is either added to the existing concept or a different new concept is created. Concepts are the

foundation of scientific knowledge and thought structures (Çaycı, Demir, Başaran & Demir, 2007, p. 624; Yılmaz & Çiviler, 2012, p. 2). Thanks to concepts, distinctions or generalizations about an event or an entity are formed, thought structures are formed in our minds and certain categories are formed, but it would be incomplete if we define concepts only as a category or classification process (Fancett, Johns, Hickman & Price, 1968, p. 4). Because concept learning is the beginning of all cognitive processes and classification is only one of the many functions of concepts. Considering that concepts are in constant interaction with each other, it is a necessity to examine concepts in relation to each other (Solomon, Medin & Lynch, 1999 p. 99).

In the study conducted by Kalaycı and Baysal (2020), when the general objectives of the social studies course are examined, it is seen that concept teaching is included as an objective and always maintains its importance according to the 2005, 2017 and 2018 programs, but compared to the 2005 program, the other programs are a little behind in guiding the teacher in concept teaching. In MONE (2018), in the section of the issues to be considered at the point of implementation of the social studies program, in Article 5, it is emphasized that concept teaching is important directly in the course, for this reason, generalizations and different concept teaching strategies should be used in concept teaching, and attention should be paid to identifying and eliminating concepts, confusion and misconceptions.

Concept learning starts in childhood and continues throughout life (Akçay et al., 2023; Antonio & Prudente, 2022; Bertiz & Kocaman Karoğlu, 2020; Cakir, Ozturk, Unal, 2019; Hwang et al., 2021; Kim & Anderson, 2023; Maddah, 2021; Ozturk, 2023; Ozturk, Kinik, & Ozturk, 2023; Ozturk & Susuz, 2023; Peifer & Taasobshirazi, 2022; Rogti, 2021). The primary and secondary school period is very important in the learning of concepts. Because the child starts his/her first concept learning at school together with the environment (Yılmaz & Çiviler, 2012). While there are concepts acquired spontaneously and randomly in the environment, there are concepts taught purposefully with certain rules at school. For this reason, sometimes the concept learned spontaneously and the concept learned at school may conflict or the concept learned at school may be incorrectly structured in the student's mind. This situation is called misconception. In other words, misconception is when a concept is constructed and learned differently from valid and commonly accepted scientific knowledge (Demirkaya & Karacan, 2016, p.40). The most common problem in concept teaching is misconceptions, which are a problem for both the learner and the instructor (Yazıcı & Samancı, 2003).

It is seen that misconceptions are named differently in domestic and foreign literature and some of them are as follows: Primitive beliefs, erroneous ideas, alternative concept, preconceptions, instant reasoning, persistent traps, spontaneous ideas, alternative frameworks and children's science (Ercan, Taşdere & Ercan, 2010, p. 137). According to Novak (1987), misconstruing the context between two concepts and the conflict between what is perceived and what is a real cause misconception (misunderstandings) and if they are not corrected, they cause incompatibility in new learning. When students encounter some problem situations, they will need to understand and use concepts to solve them (Yazıcı & Samancı, 2003). If these concepts do not have the meaning agreed upon and determined by experts, misconceptions will emerge and students will resist the change of alternative concepts used (Schmidith, 1997; Sözen & Bolat, 2014, p.506). Therefore, teachers should recognize

misconceptions in students and correct them immediately (Novak, 1987, p. 359).

Children begin to form concepts from an early age and if the newly learned concept is compatible with the old concept, the new concept is formed. In this process, there are two other possibilities; either mislearning, i.e. misconception, occurs or the knowledge cannot be formed at all. Concepts and misconceptions occur in two ways. The first one is the spontaneous, environment-based mislearning that the child learns spontaneously before formal education; the second one is the misconstruction of concepts while in formal education with a conscious education at school (Bozoran, 2008; Erdener, 2009). Concepts can be concrete or abstract. The fact that they are abstract necessitates the correct and adequate learning of these concepts. In order for students to internalize the Social Studies course, it is important to learn these concepts well and not to allow misconceptions (Çetin, 2013; Karakuş, 2009; Tokcan, 2015). The social studies course, which includes various subject areas, can be perceived as a mass of verbal and abstract information and may lead students to memorization. In order to realize meaningful learning, attention should be paid to the correct and real learning of concepts. The teaching of the course should start with easy-to-perceive concepts and then move on to difficult and complex concepts (Sözer, 1998, p.76-77).

Purpose of the Study

In this study, it was aimed to determine the words that middle school 6th grade student's associate with the concepts of barcode, banderole, copyright, piracy, R&D and the existing misconceptions within the scope of Science and Technology learning area in the 6th grade social studies textbook 4th unit.

Method

In this research, which aims to determine students' cognitive structures and misconceptions, word association test was used. Word association tests are one of the various methods used to identify misconceptions (Çelikkaya & Şarlayan, 2019, p. 1; Yılmaz & Çiviler, 2012, p. 3). Word association was first proposed by Gal-Ton. Then, Carl Gustav Jung developed word association tests to use individuals' associations between concepts in research. According to Jung, people's thoughts, feelings, experiences and knowledge are interconnected through associations (Kostova & Radoynovska; 2010).

With this method, the word association test was used to determine the students' associations of the given concepts and the misconceptions that exist in the individual and the cognitive structures of the individuals towards the concepts (Tokcan, 2015, p. 144).

According to İstifçi (2010, p. 360), the term association is the state of making a connection to a certain idea, entity or phenomenon that exists in the human mind, and the shortest way to reveal associations is the free association test. Word association tests provide clues about the associations of these concepts, their level and the

relationships between words.

Word association tests are one of the most widely used methods for determining associations between concepts. In addition to purposes such as diagnosis, diagnosis, measurement and evaluation, word association tests can also be used in different disciplines such as science and mathematics (Ercan, Ercan & Taşdere, 2010; Deveci, Köse & Bayır, 2014; İstifci, 2010).

It has been stated in various studies that the most appropriate time interval for word association tests is 30 seconds (Karaca & Yalçinkaya, 2019; Polat, 2013, p. 104). In this study, students were given 6 key concepts and given 30 seconds for each concept. On the first page, the implementation instructions are given on the second page. Each key concept was written 10 times in a row and distributed to the students and 30 seconds were given for each concept (Bahar, 1999, p. 46; Tokcan, 2015, p. 144). Then, with the teacher's guidance, the students moved on to the next concept and the process continued in this way. For the application of the word association test, students were asked to produce ten words that the concept evoked in their minds for each key concept in order and differently. The aim here is to minimize the risk of chain response. Because if the student does not turn to the key concept again, he/she makes associations according to the word he/she responds to, that is, the word he/she produces, which harms the purpose of the test (Açıkgöz, 2019; Bahar & Özatlı, 2003; Demirer, Ören & F. Ş., 2020; Özdemir, 2016; Tokcan, 2015).

Participants of the Study

The participants of the study were 60 7th grade students studying at Nazmiye Demirel Secondary School in Isparta city center in the 2022-2023 academic year. The reason for choosing 7th grade students in the study is that they have learned 6th grade concepts. The word association test, which was planned to be applied to 65 students, could be applied to 60 students due to the absenteeism of 3 of the students and the unacceptable answers of 2 students.

Data Collection Tool

In the study, a word association test was used as a data collection tool to determine students' cognitive structures and misconceptions. Word association tests are a practical and time-saving method (Bahar, Nartgün, Durmuş & Bıçak, 2006; Clark, 1970, p. 286; Yavuz, 2019, p.14). Word association tests are also a well-known and frequently used method with a wide range of applications (Bahar, Johnstone & Sutcliffe, 1999). In this study, 6 key concepts belonging to Unit 4 (Science and Technology in Our Lives) of the 6th grade Social Studies textbook were included. These 6 key words were chosen because there was no previous study in the literature, to determine the misconceptions of these words and to obtain information about what these concepts evoke in the minds of students. The concepts are given below with their explanations:

Barcode: A system used in all areas of the industry, represented as a black and white line of different thickness, containing detailed information about the product, used to distinguish products from one another, and enabling

the transmission of product characteristics to other media by scanning the product information with some devices without any inaccuracy (MONE, 2019; Peker & Caner, 2006, p. 39).

Patent: It is a document registered by the patent office to prove who legally owns an invention and given to the owner for 20 years. With the patent, it is aimed to protect the right to use the invention by preventing the product from being made and used by another person or organization (MONE, 2019, p. 152).

Copyright: The right to own, use and reproduce a product of knowledge or ideas is called copyright. In this way, unauthorized use and reproduction are prevented and kept under control. Law No. 5846 "Law on Intellectual and Artistic Works" serves the purpose of copyright (MONE, 2019, p. 152).

Banderole: It is a kind of label on most of the products sold, such as electronic goods, food products, books, etc., which cannot be restored to its original shape when damaged, and which shows that taxes are levied by the state and that the products meet the necessary conditions for sale and use (MONE, 2019, p. 151).

Piracy: Products (books, movies, DVDs, etc.) that are sold and reproduced in violation of the law, without banderoles, without control, without permission are called pirated. Since it is unauthorized, taxes are evaded and copyright and patent rights are violated. This situation causes losses to the national economy and the owner of the original product (MONE, 2019, p. 140).

R&D: R&D is the planned activities carried out to improve the existing knowledge and to make new productions by utilizing the existing knowledge. In this way, the accumulation of knowledge constantly renews itself and progress is achieved in social and economic development (MONE, 2019, p. 140).

Data Analysis

After the word association test was applied to the students, the words obtained based on the concepts were analyzed in detail. Words that were unrelated to the given keywords and words written repeatedly were not included in this evaluation (Akman & Kocoglu, 2016; Kostova & Radoynovska, 2010).

It is assumed that the sequential answers that a student gives to a keyword from long-term memory show the relationship and semantic distance between concepts in the cognitive structure that exists in the individual's mind. The greater this semantic proximity between two concepts, the greater the relationship between concepts and the faster the recall of the concept (Karaca & Yalçinkaya, 2019). If the student's connotation of one keyword is given as an answer for another keyword, it can be said that the student has established a relationship between these words; on the contrary, it can be said that the student is unrelated (Clark, 1970, pp. 271-279; Bahar, Johnstone & Sutcliffe, 1999).

Then a frequency table showing the frequency of repetition of these words was prepared. Based on the frequency table, cut-off points were determined and concept networks were created. Breakpoints show how often the words are repeated in a certain range. In the concept networks, words derived from the key concept were also included and the concepts were associated with each other through common associations. In this way, both the existing relationship was revealed and the existing misconceptions were identified.

In this research, which aims to determine students' cognitive structures and misconceptions, word association test was used. Word association tests are one of the various methods used to identify misconceptions (Çelikkaya & Şarlayan, 2019, p. 1; Yılmaz & Çiviler, 2012, p. 3). Word association was first proposed by Gal-Ton. Then, Carl Gustav Jung developed word association tests to use individuals' associations between concepts in research. According to Jung, people's thoughts, feelings, experiences and knowledge are interconnected through associations (Kostova & Radoynovska; 2010).

With this method, the word association test was used to determine the students' associations of the given concepts and the misconceptions that exist in the individual and the cognitive structures of the individuals towards the concepts (Tokcan, 2015, p. 144).

According to İstifçi (2010, p. 360), the term association is the state of making a connection to a certain idea, entity or phenomenon that exists in the human mind, and the shortest way to reveal associations is the free association test. Word association tests provide clues about the associations of these concepts, their level and the relationships between words.

Word association tests are one of the most widely used methods for determining associations between concepts. In addition to purposes such as diagnosis, diagnosis, measurement and evaluation, word association tests can also be used in different disciplines such as science and mathematics (Ercan, Ercan & Taşdere, 2010; Deveci, Köse & Bayır, 2014; İstifci, 2010).

It has been stated in various studies that the most appropriate time interval for word association tests is 30 seconds (Karaca & Yalçınkaya, 2019; Polat, 2013, p. 104). In this study, students were given 6 key concepts and given 30 seconds for each concept. On the first page, the implementation instructions are given on the second page. Each key concept was written 10 times in a row and distributed to the students and 30 seconds were given for each concept (Bahar, 1999, p. 46; Tokcan, 2015, p. 144). Then, with the teacher's guidance, the students moved on to the next concept and the process continued in this way. For the application of the word association test, students were asked to produce ten words that the concept evoked in their minds for each key concept in order and differently. The aim here is to minimize the risk of chain response. Because if the student does not turn to the key concept again, he/she makes associations according to the word he/she responds to, that is, the word he/she produces, which harms the purpose of the test (Açıköz, 2019; Bahar & Özatlı, 2003; Demirer, Ören & F. Ş., 2020; Özdemir, 2016; Tokcan, 2015).

Results

The findings of the study are presented in tables and figures. Table 1 shows the frequency of the concepts in which the students' associations of the keywords barcode, banderole, copyright, piracy, patent and R&S are specified.

Table 1. Frequency of the words identified for the key concepts

	Words	Barcode	R&D	Piracy	Patent	Copyright	Banderole

According to Table 1, it was determined that a total of 228 concepts were produced for the keyword Barcode; 204 concepts for the keyword R&D; 246 concepts for the keyword piracy; 130 concepts for the keyword patent; 192 concepts for the keyword copyright; and 138 concepts for the keyword Banderole. According to Table 1, it was determined that the most frequently responded association was the concept of technology (f=31) associated with the keyword R&D.

In the concept networks given below, the concepts that are included in a certain cut-off range depending on the keywords and their relationships with other keywords are shown. In other words, the frequency of the words associated with the keywords, for example, the concept network for the words whose frequency of repetition is in the range of 20-30 and which are also associated with other key concepts is shown. In the concept network, the arrows were drawn by thinning from high to low frequency.

Breakpoints and colors set for the generated words

- The 20-30 frequency range was determined as the first cut-off point and shown with an orange arrow in the concept network.
- The 15-19 frequency range was determined as the second cut-off point and shown with a green arrow in the concept network.
- The third cut-off point was determined as the 10-14 frequency range and shown with a burgundy arrow in the concept network.
- The fourth cut-off point was determined as the 6-9 frequency range and shown with a blue arrow in the concept network.
- The fifth cut-off point was determined as the 3-5 frequency range and shown with a black arrow in the concept network.

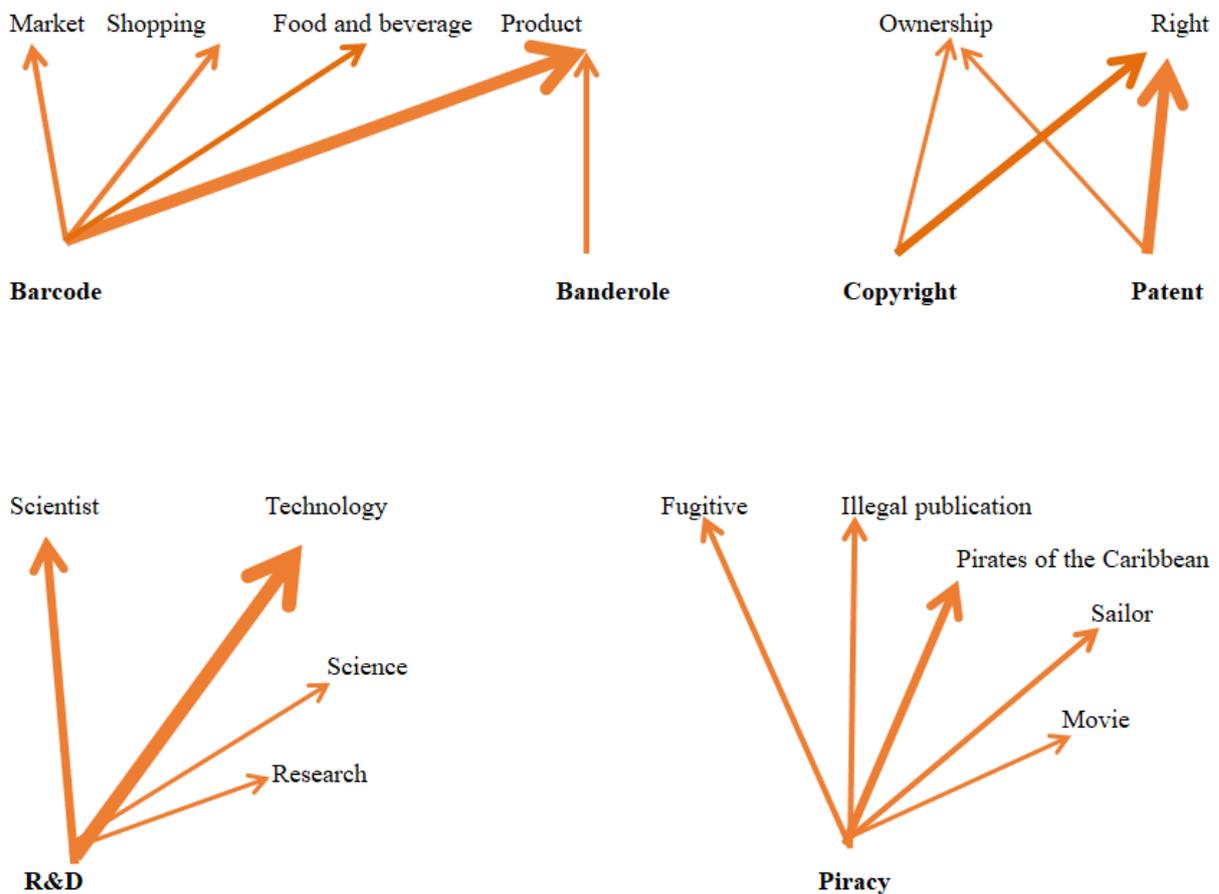

Figure1. Concept network of words with a breakpoint in the range of 20-30 words

According to the concept network given in Figure 1, it was determined that the words in the 1st cut-off range: market (f=23), shopping (f=24), product (f=30), food and beverage (f=23) associations were produced for the barcode keyword. For the keyword R&D: research (f=20), science (f=22), scientist (f=26), technology (f=31). Regarding the keyword pirate: sailor (f=28), movie (f=25), pirates of the Caribbean (f=27), fugitive (f=24),

illegal publication (f=23). Regarding the keyword patent: ownership (f=24), right (f=24) associations were produced. Regarding the keyword copyright: Right (f=28), ownership (f=20) and connotations. It was determined that product (f=20) connotations were produced for the keyword banderole.1. among the words derived in the context of the intercept interval, the word product is the concept with common connotations for barcode and banderole keywords. The words ownership and right were common associations for the keywords copyright and patent.

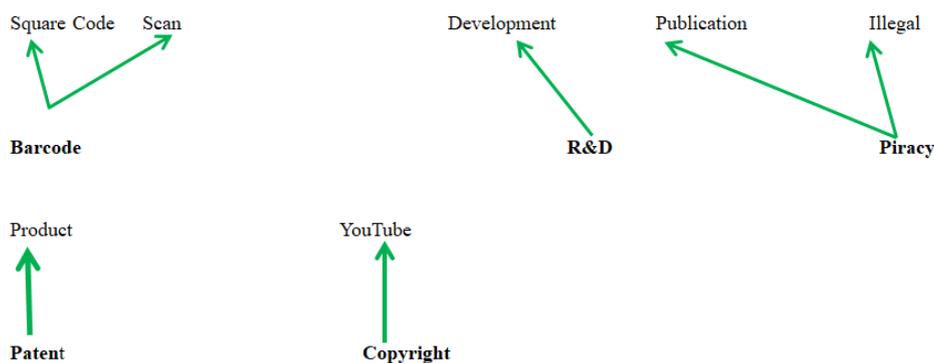

Figure 2. Concept network of words with 15-19 words at the breakpoint

According to the concept network given in Figure 2, the words derived at this cut-off point are: square code (f=15), scan (f=15) associations were produced for the keyword barcode. For the keyword R&D, only the connotation of development (f=15) was produced at this breakpoint. For the keyword piracy, the connotations of publication (f=15) and illegal (f=15) were produced. For the keyword copyright, YouTube (f=15); for the keyword patent, product (f=16) associations were produced. At the 2nd cut point, no associations were produced for the keyword banderole at the 2nd cut point. According to the concept network given in Figure 2.

Words produced based on keywords according to the concept network given in Figure 3: For the keyword barcode, it was determined that black and white line (f=10), number (f=10) and trade (f=10) associations were produced. Regarding the keyword R&D; Internet (f=10), school (f=12), production (f=12), product (f=11), invention (f=10) associations were produced. For the keyword "piracy", associations of product (f=14), book (f=10), bandit (f=11), thief (f=10) were produced.

Regarding the keyword patent, the concepts of artist (f=10) and invention (f=13) were produced. Regarding the keyword copyright: movie (f=14), social media (f=11), advertisement (f=11), song (f=13), illegal (f=12). For the keyword "banderole", connotations of book (f=12), technology (f=12), tax (f=12), square (f=11), shopping (f=10), black and white line (f=12) were produced. At the 3rd breakpoint, it was determined that the product connotation was the common derived concept in the keywords R&D and piracy. The book connotation was derived jointly for the keywords pirate and banderole. It was concluded that the black and white line connotation was the common derived concept for the keywords banderole and barcode. The concept of invention is a co-

produced connotation for the keywords patent and R&D. In the words derived from the keyword copyright, no association with any keyword related to the 3rd breakpoint was detected.

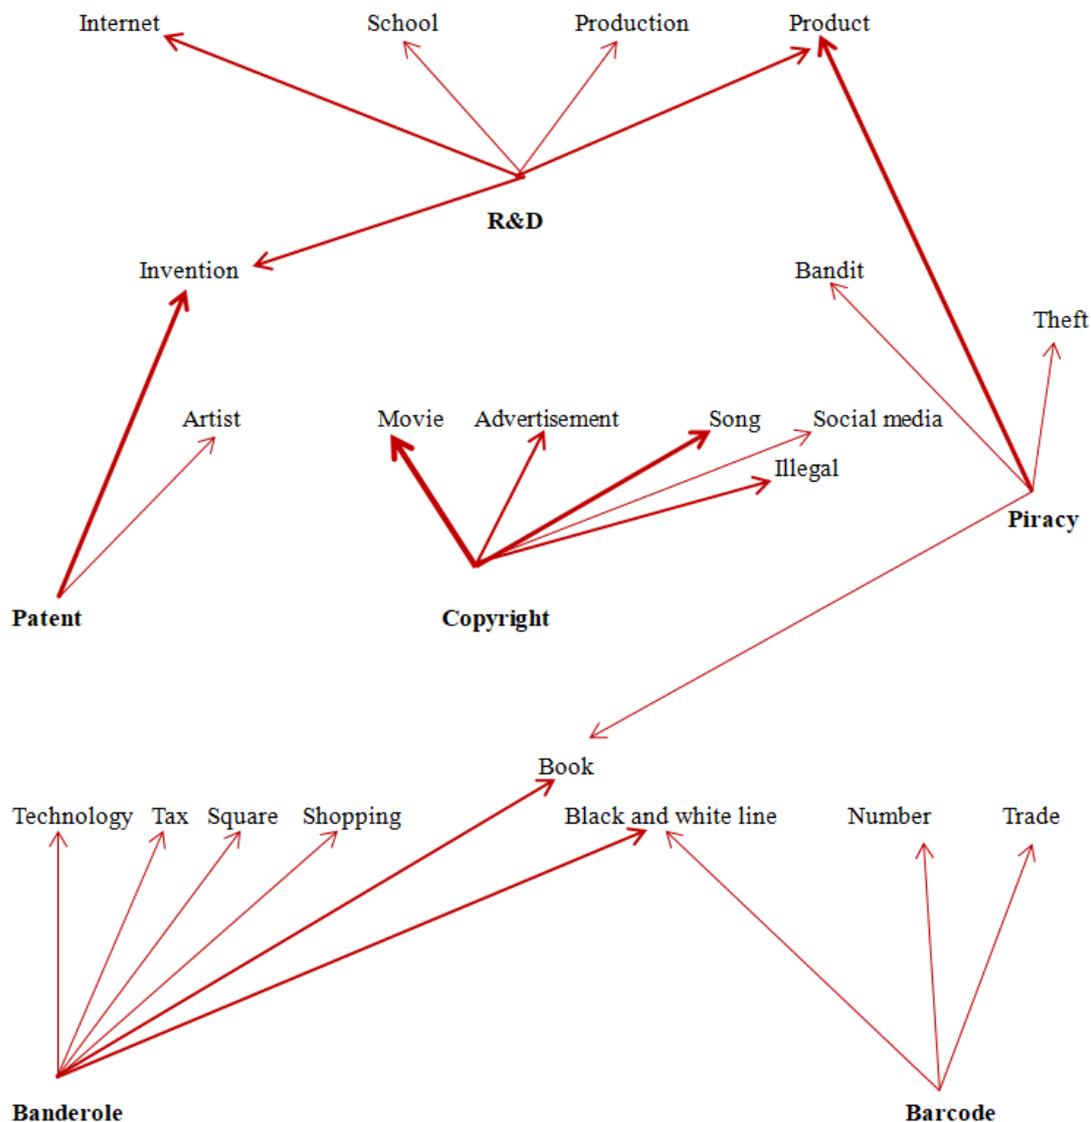

Figure 3. Concept network of words with a breakpoint of 10-14 words

According to the concept network given in Figure 4, the words determined depending on the keywords: for the keyword barcode; label (f=6), price (f=9), book (f=7), code (f=9), school (f=6), production (f=7) associations were produced. Regarding the keyword R&D: discovery (f=7), experiment (f=7), code (f=9), project (f=6), telephone (f=6). Production connotation is the common concept for the keywords barcode and patent. Associations produced for the keyword piracy: Internet (f=6), sword (f=8), counterfeiting (f=8), law (f=7). For the keyword patent: scientist (f=6), discovery (f=6), technology (f=7), production (f=9). Regarding the keyword copyright: stolen (f=8), Jurisprudence (f=9), fugitive (f=8), music (f=7), money (f=7), technology (f=7), product (f=9). For the keyword banderole: Jurisprudence (f=9), fugitive (f=6), school (f=7), money (f=6).

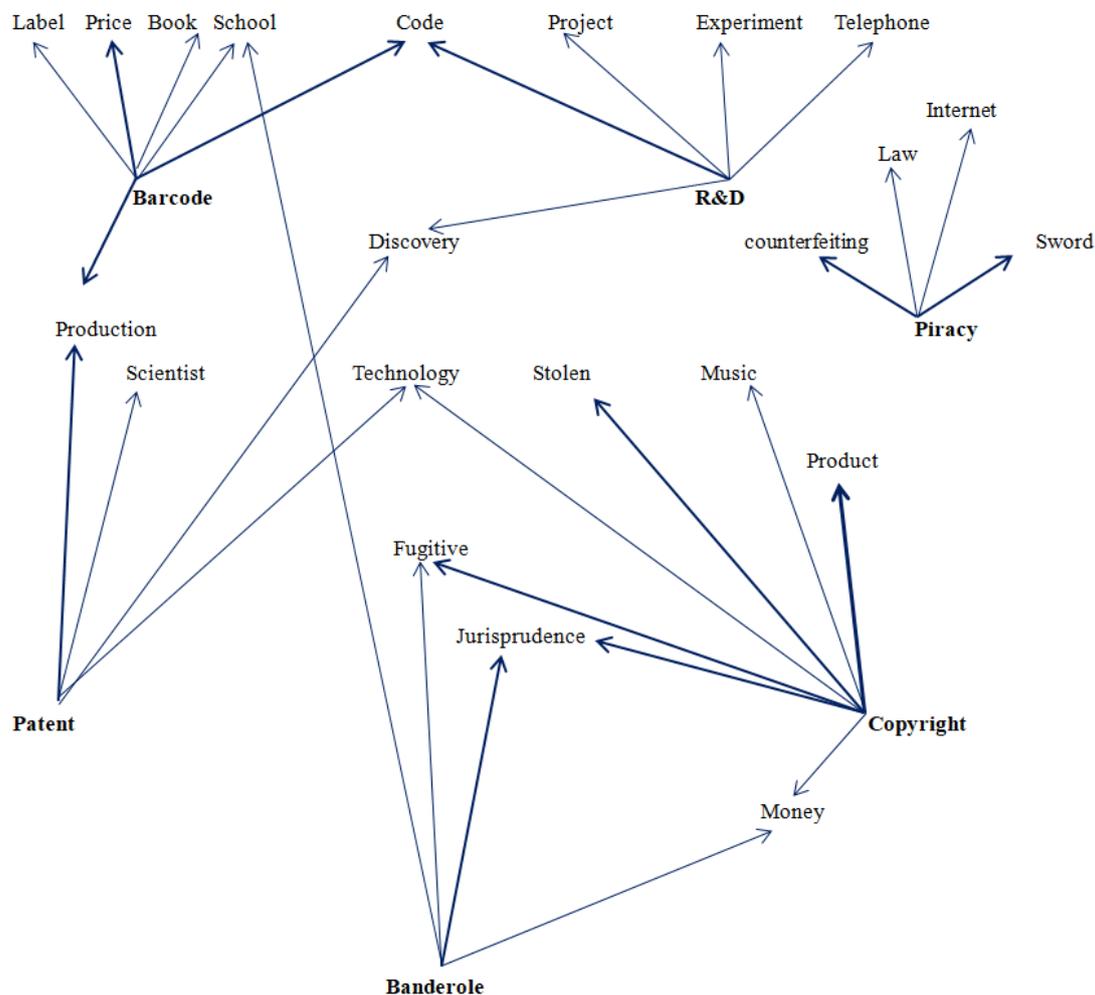

Figure 4. Concept network of words with breakpoint between 6-9 words

It was determined that the connotations of money, law, and illegal were co-produced for the keywords banderole and copyright. The connotation of technology was co-produced for the keywords patent and copyright. Code connotation was co-produced for barcode and R&D keywords. The relationship between the concepts associated with the keyword piracy and the keywords given in this interval could not be determined.

The derived words belonging to the breakpoint given in Figure 5 are as follows: the associations related to the keyword barcode were determined to be the concepts of tape (f=5), barcode (f=5), receipt (f=4), online (f=3), money (f=4), social studies (f=3). Associations related to the keyword piracy were determined as the concepts of captain (f=3), game (f=5), money (f=4), social studies (f=3). Associations related to the keyword patent were determined to be the concepts of brand (f=4), money (f=3), social studies (f=3), copyright (f=5). The connotations related to the keyword copyright were determined to be the concepts of unauthorized (f=5), ban (f=4), social studies (f=3), thief (f=5) inventor (f=3), artist (f=5), labor (f=3). It was determined that the associations related to the keyword banderole were label (f=4), receipt (f=4), copyright (=3), social studies (f=4), number (f=3), piracy (f=5).

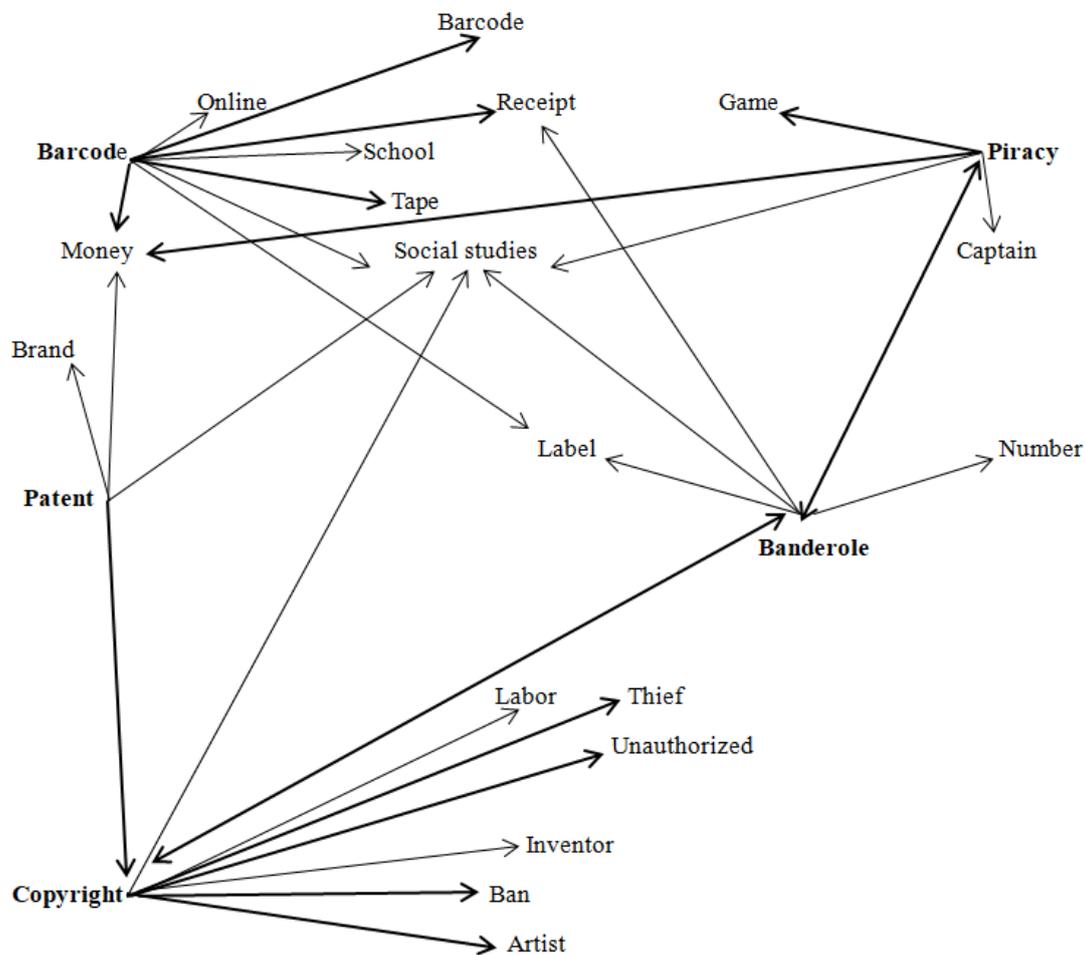

Figure 5. Concept network of words with breakpoint between 3-5 words

At the 5th cut-off point, it is seen that the frequency values decreased, but the words diversified and at the same time the relationships between concepts increased. Except for the keyword R&D, the association of social studies was the concept with which common associations and relationships were established in all other keywords. At the 5th breakpoint, the connotation of label and social studies was the common derived concept for the keywords barcode and banderole, while the connotation of money was the common derived concept for the keywords patent and piracy. It was determined that patent was associated with copyright and learning deficit and misconception were identified. It was determined that banderole was associated with copyright and misconception was determined with learning deficit. It was determined that a direct relationship was established between the keyword banderole and the keywords copyright and piracy. For the R&D keyword, no concept was identified at the 5th breakpoint.

Red arrows were used for barcode keyword, blue arrows for R&D keyword, purple arrows for piracy keyword, green arrows for patent keyword, orange arrows for copyright keyword, and black arrows for banderole

keyword. In the created concept network, arrows were drawn by thinning from high to low frequency.

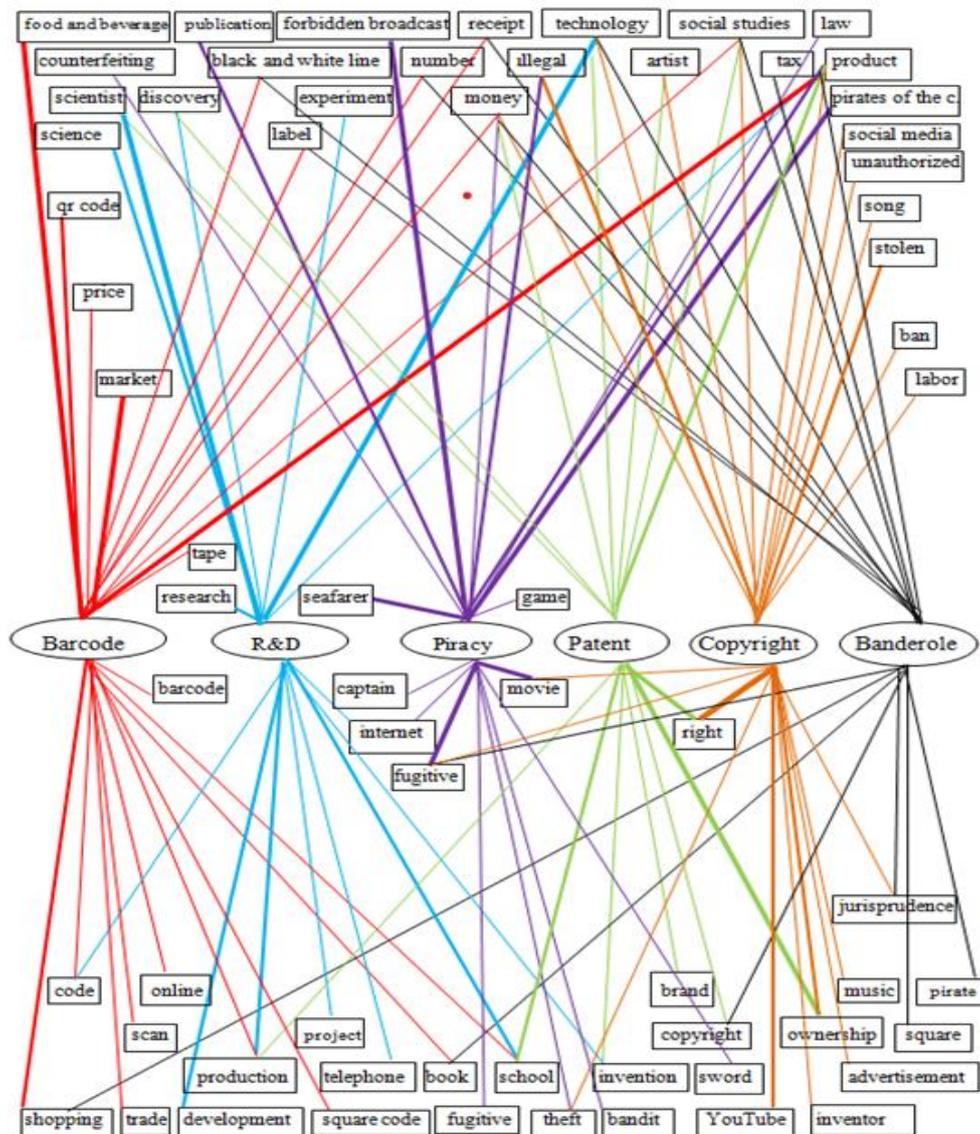

Figure 6. Concept network of associations for the concepts of barcode, banderole, R&D, copyright, piracy, patent

A total of 228 words were produced for the barcode keyword. The word that the students repeated most frequently was the connotation of product (f=30) in the barcode keyword. Then, shopping (f=24), market (f=23), food and beverage (f=23) were the concepts with high frequency. The number of words generated for the keyword R&D was 199 in total and the most frequently associated concept was technology (f=31). Following this concept, the most frequently repeated concepts were scientist (f=26), science (f=22) and research (f=20). It was determined that a total of 246 concepts were produced for the keyword pirate and the most frequently associated concepts were sailor (f=28) and pirates of the Caribbean (f=27), movie (f=25), smuggler (F=24), forbidden publication (f=23). According to Table 1, it was determined that a total of 130 words were produced

for the keyword patent and the most frequently associated concepts were the words ownership (f=24) and right (f=24). This is followed by the words product (f=16) and invention (f=13). According to Table 1, a total of 233 words were produced for the keyword copyright, and the most frequently associated concept of right (f=28) was followed by ownership (f=20), YouTube (f=15) and movie (f=14). It was determined that a total of 152 words were produced for the keyword banderole and the most frequently associated concept was product (f=20). The concept of product was followed by black and white line (f=12) and book associations (f=12).

Conclusion and Discussion

According to the results of the research, when the frequency of association of the concepts in the minds of the students was analyzed, it was determined that the most word production was the key concept of pirate. In addition, it was determined that the most misconceptions existed in the words associated with this keyword. It was concluded that the abundance of word associations did not indicate that the concept was learned as it should be. It is assumed that the fact that the word pirate has an abstract meaning in the social studies course and that its use in the concrete sense is popular in daily life and that the lack of sufficient, correct and permanent learning in the social studies course in the abstract sense increases the misconceptions.

As a result of the research, it was determined that the keyword with the least number of words produced and associations made was the concept of patent. It was concluded that students have both misconceptions and learning deficiencies regarding the concept of patent.

It was seen that the concepts with a cut-off range of 3-5 had the most inter conceptual relationships. It was concluded that the concepts with a cut-off point in the range of 20-30 were not related to each other. The key concept with the least misconceptions was determined as R&D. It is seen that the students associated the given keywords with the social studies course, albeit at low frequency values. As a result of the research, it was found that the students had some ideas about the keywords, albeit insufficient, and that they generally used the concepts of barcode and banderole interchangeably with the concepts of copyright and patent, and that they could not adequately construct the abstract concept of piracy in their minds and that they experienced misconceptions.

When the studies were examined, word association tests were mostly used in the field of science course (Akman & Koçođlu, 2016). When the literature is examined within the scope of social studies course, various word association test studies applied to pre-service teachers and students come across. These studies are as follows. grade students' cognitive structures on Atatürk's Principles with word association test (Akman & Koçođlu; 2016), Pre-service teachers' cognitive structures related to the concepts of social sciences and social studies: A word association test application (Bayır, Devenci & Köse, 2014); Analysis of pre-service social studies teachers' perceptions of natural disaster concepts through word association test (Karakuş, 2019); Determination of pre-service social studies teachers' perceptions about the first Turkish states through word association test (WAT)

(Balci, 2019), Analysis of pre-service social studies teachers' cognitive structures about Ottoman and conquest concepts through word association test (Demirkaya, Köç & Ünal, 2020), Analysis of secondary school 8th grade students' cognitive structures about landforms. grade students' perceptions of landforms through a word association test (WAT) (Özkara & Yiğit, 2021), Seventh grade students' perceptions of various occupational groups through a word association test (WAT) (Karaca & Yalçınkaya, 2019), Examining the Cognitive Structures and Conceptual Development Processes of Students with the Social Studies Course "The Adventure of Democracy" Unit (Çelikkaya & Kürümlüoğlu, 2019), Determining the cognitive structures of prospective social studies teachers about Atatürk's Principles through word association test (Er Tuna, 2018), Examining the cognitive structures of 5th grade students about the social studies course (Bozdoğan, 2022), Examining the conceptual development process of students in the social studies course "Let's Know Our Region" unit (Öztürk & Özcan, 2017). Grade students' cognitive structures related to the social studies course (Bozdoğan, 2022), Examining the Cognitive Structures of Gifted Secondary School Students Related to the Concept of Social Studies through Word Association Test (Acar & Arslan, 2022).

In this study, with the word association test, it was aimed to reach the relationships between concepts, associations created by the concepts in students, cognitive perspective and existing learning deficiencies and misconceptions about six concepts within the learning area of science, technology and society. It was concluded that students had deficiencies in making associations about the concepts due to the abstract meaning of the concepts, mislearning and incomplete learning due to the environment or school. Social studies teachers should give the necessary importance to concept teaching in the social studies course, which contains a lot of concepts in order to achieve the objectives of the course, and different concept teaching methods and techniques should be employed (Bozdoğan, 2022).

Abstract: The aim of this research is to reveal the cognitive structures of secondary school students regarding the concepts of "good school" and "good teacher". The survey model was used in this study. The data have been gathered through word association test. The study group of the research consists of 162 secondary school students studying in two different schools (state-private) in Isparta province between 2022 and 2023. According to the research result, it has been observed that students mostly associate the concept of good school with clean, teacher, lesson, student, achievement, environment, and education. On the other hand, the concept of good teacher is associated with the words polite, lesson, love, entertainment, discipline, and information. It was revealed that the students made connections between the concepts of good school and good teacher with the words respect, achievement, discipline, moral, helpful, and student. Finally, when the words associated with the concepts of good school and good teacher are examined by public and private secondary school students, it is understood that the cognitive structures of the students in the two school types are similar.

Keywords: Good School, Good Teacher, Cognitive Structure, Word Association Test, Secondary School Students

Introduction

Schools, with their own distinctive goals, are institutions where children can gain experiences about life and where they can have peaceful and good time. Schools should not be disconnected from life. Life activities should be integrated with school. Instruction can become regular and consistent if this aim is achieved (Dewey, 2019). One of the factors that make up school culture is the school climate. These two notions can be defined as overlapping concepts. The aim to create positive school climate should be prioritized, especially considering its

huge impact on a student's achievement (MacNeil et al., 2009). Schools have an implicit effect on attitudes of students. These effects are involved within a hidden curriculum itself. Hidden curriculum is an informal program which gives implicit messages in the school culture and which influences the moral structures and attitudes of students (Yüksel, 2004). Implicit messages, which are a part of school culture, have a mission to prepare students for social life as well. Hidden curriculum also affects the quality of instruction activities that are taught at schools. When it has a positive influence on the education process, the attitude of a student towards his school and teachers becomes positive too (Topçu, 2019).

School climate is a set of features that includes physical and social factors that make schools different from other institutions and that affects the psychology of a student and a teacher as well (Grazia & Molinari, 2021). All of these factors that make up school culture play a decisive role in the attitude that a student develops towards his school and teachers as well. There are many variables that are part of the social variables. When all of these variables are made possible, there occurs a positive commitment between a student, a teacher and a school triangle. There is no doubt that everyone who takes part in the education process has a responsibility in building this commitment (Balci, 1988). In order to be effective, schools set goals that they adopt as a principle. Some of these aims are to increase the level of success, develop applications by considering individual differences of students and to provide a suitable learning environment. The schools that fail to accomplish these goals can be defined as ineffective. Schools should organize both their physical environments and educational practices by taking into account the cognitive, affective and psychomotor skills of students. Teachers have responsibilities in organising school and classroom environments. It is the aim and responsibility of a teacher to create harmonious and productive educational environment (Helvacı, & Aydoğan, 2011). An effective teacher should make a classroom environment suitable for learning experiences, involve students in learning process with individual and teamwork, constantly improve herself/himself personally and professionally and should also test students to determine whether their educational activities are efficient enough or not (Seferoğlu, 2004). It should not be assumed that schools and teachers are prepared to develop a single aspect of a student. Providing a multidimensional learning environment in schools also positively affects a student's perception of a school and of a teacher. A good school does not only have a single characteristic. In order for a school to be called good, it must have more than one quality. Being unifying, integrative and not divisive are among the qualities that schools should have. Schools that have contemporary values and that are far from dividing students into groups with stereotypical thoughts as successful or unsuccessful can be defined as good schools that have acquired the right school culture. Good schools are those which are integrated with students, teachers and management (Ball, 1997).

The performance of the teachers in the education process has also been a determining factor on the effectiveness of the process. Teachers' doing their job enthusiastically and playing an encouraging role are effective in adapting students to the educational process. An effective teacher, along with academic competence, should be talented, caring, fair, creative and have a good control over a class (Miller, 2012). A teacher, who is one of the main factors of the education system, is a person who not only conveys information but also has problem-solving skills, acts consistently and follows the developments in the contemporary world, has a good command

of the subject area, and prioritizes the learner (Harrison, & Blakemore, 1992, as cited in Yılmaz, & Güven, 2015, p. 56). Making students active in the process of learning is among the other duties that are given to a teacher. A multi-learning environment should be created and multiple learning methods and techniques should be adopted to achieve this. A teacher should not just be a conveyer of information; she/he should also take a duty as an implementer of what she/he teaches (Dewar, 2002). A teacher's sense of belonging to her/his institution reflects on educational process positively. A sense of belonging is directly proportional to the professional satisfaction of a teacher. The high motivation of a teacher, who has reached professional satisfaction, also increases his/her performance in the education process. These characteristics of a teacher, who is highly motivated and who has made his/her profession effective, will also help to create a positive commitment between a teacher and a student (Güler et al., 2020).

When the literature is analysed, it is seen that the concepts of good school and good teacher are included in various studies. In these studies, the adjective 'effective' is used as a synonym of the word 'good'. Although there are studies involving the concepts of school and teacher (Ada, & Baysal, 2010; Balcı, 1988; Can, 2004; Çobanoğlu, 2017; Güler et al., 2020; Güngör, 2018; Kızıltepe, 2002; Karakelle, 2005; Malikow, 2006; Şahin, 2011; Watkins, & Zhang, 2006), there are no studies that have been carried out to examine secondary school students' perceptions of good school and good teachers. The aim of this study is to reveal the cognitive structures of students regarding the concepts of good school and good teacher.

Method

In this study, the cognitive structures of secondary school students regarding the concepts of good school and good teacher were tried to be explained by using the survey model. The survey model is an approach that aims to describe an existing situation as it is (Karasar, 2009).

Participants

The study group of the research consists of 163 students studying in 5 (n=48), 6 (n=35), 7 (n=35) and 8th grades (n=45) in a private and state secondary schools in the city centre of Isparta. Seventy-eight of the participants are female while the other eighty-five are male.

Data Collection and Analysis

In order to reveal the cognitive structures of the students regarding the concepts determined in the research, the study data were collected through the word association test (WAT). In word association tests, students are expected to produce evocative answer words in their minds about key concepts in a certain period of time (Bahar, & Özatlı, 2003). The first page of the word association test includes an instruction along with an example. Key concepts were arranged in a way that would allow each of them to be on a separate single page

and written ten times one under the other. The students were given 45 seconds for each concept and expected to write down the words that they associate with these concepts. At the end of the time, the students were asked to move on to the next page (Bahar et al., 2008). After having applied the word association tests, concept networks were created in line/in accordance with the frequencies that emerged and cut-off points were determined. Each range of the cut-off points were shown by a separate concept network and symbolized with different colors. The concepts that were in the range of the cut-off points meant that they were repeated as many times as the number of students in that range (Bahar et al., 2008).

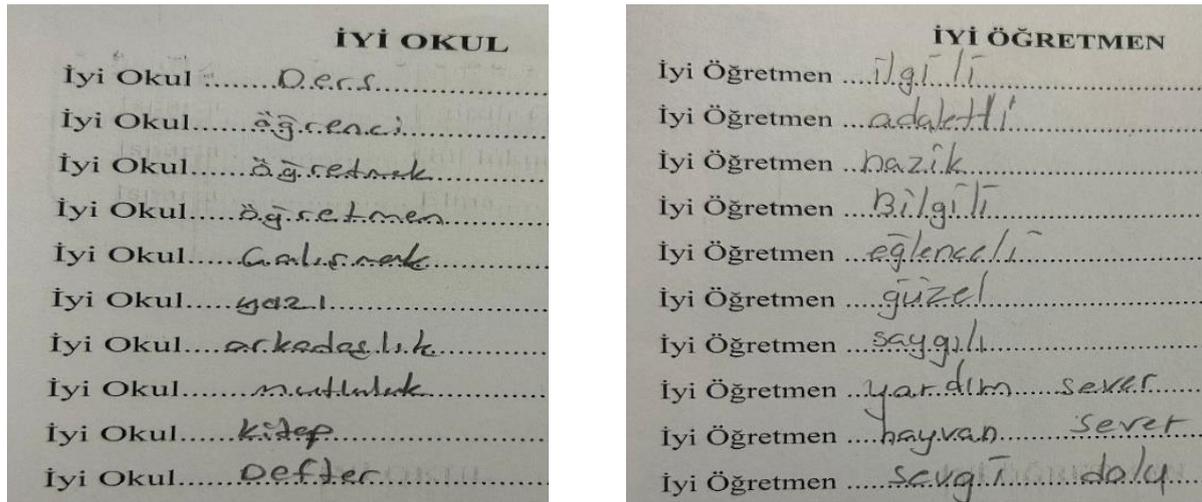

Figure 27. Response sheet of one of the participants

Results

The results collected in the research are presented with concept networks and figures. The frequencies of the words that emerged in relation to? to the concepts of ‘good school’ and ‘good teacher’ are given in Table 1 and cut-off range is shown with the concept networks. The words that the students of private and public schools associated with key concepts are shown in Figure 1-4.

Table 1. Frequencies of words produced related to key concepts

Response words	Key words	
	Good school	Good teacher
Clean	74	3
Teacher	64	-
Lesson	41	51
Student	34	9
Achievement	29	14
Environment	23	-

Education	23	6
Entertainment	21	35
Discipline	19	21
Respect	9	17
Polite	9	52
Food	6	-
Information	5	20
Helpful	5	15
Love	4	50
Interest	3	7
Justice	3	9
Special	1	-
Security	1	-
Moral	1	3
Note	-	1

The words that the students associated with key concepts the most are given in Table 1. The key concept of ‘good school’ was mostly associated with words ‘clean’ (74), ‘teacher’ (64), ‘lesson’ (41), ‘student’ (34) and ‘achievement’ (29); The key concept of ‘good teacher’ was associated with the words ‘polite’ (52), ‘lesson’ (51), ‘love’ (50), ‘entertainment’ (35) and ‘information’ (20). According to the frequencies in Table 1, four ranges were determined for the cut-off points. These ranges are shown by the concept networks below.

Figure 2. Concept network structured for cut-off point 30 and above

Figure 1 was created for concepts with a cut-off point of 30 and above. As seen in the figure, only a word for the concept of ‘good school’ was produced by the students. At this stage, no words were produced regarding the concept of ‘good teacher’.

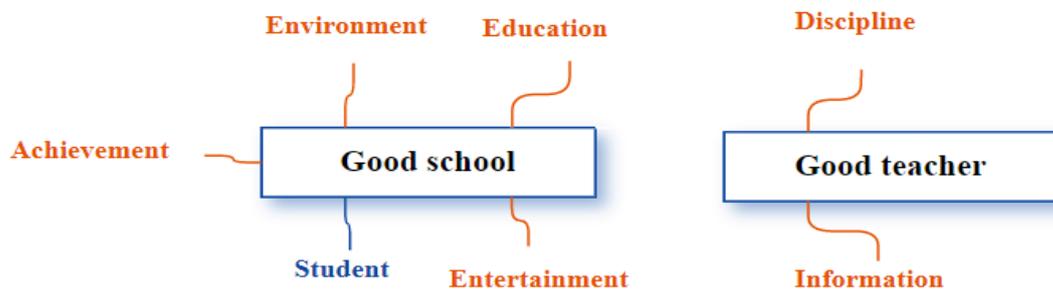

Figure 3. Concept network structured for cut-off point 20 and 29 range

Figure 2 was created for concepts with a cut-off point between 20 and 29. In this concept network, the words ‘achievement’, ‘environment’, ‘education’, ‘entertainment’ emerged for the concept of ‘good school’; the words ‘discipline’ and ‘information’ were produced for the concept of ‘good teacher’. There is no common word that students associate both with the concepts of ‘good school’ and ‘good teacher’.

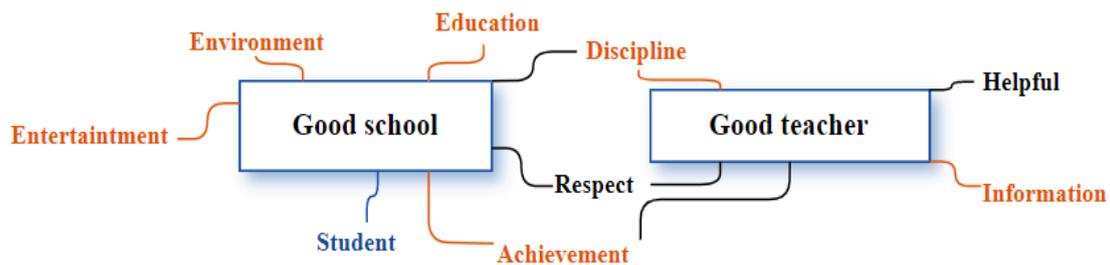

Figure. 4 Concept network structured for cut-off point 10 and 19 range

Figure 3 was created for concepts with a cut-off point between 10 and 19. In this concept network, the word ‘helpful’ emerged for the concept of ‘good teacher’. It is seen that the association between key concepts starts at this stage. As a matter of fact, the association between the key concepts of ‘good school’ and ‘good teacher’ is established with the words ‘discipline’, ‘respect’ and ‘achievement’.

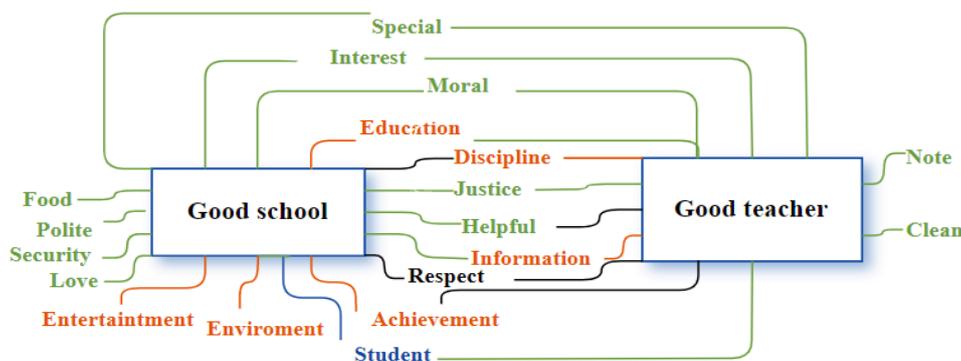

Figure 4. Concept network structured for cut-off point 9 and below

Figure 4 was created for concepts with a cut-off point of 9 and below. The words ‘food’, ‘polite’, ‘security’, ‘love’ emerged for the concept of ‘good school’ while the words ‘note’, ‘clean’ emerged for the concept of ‘good teacher’. At this stage, the words ‘special’, ‘interest’, ‘moral’, ‘justice’, which were associated with both of the concepts emerged. At this stage, the words ‘education’ and ‘student’, which had previously emerged in relation to the concept of ‘good school’, were also associated with the concept of ‘good teacher’. In addition, the word ‘information’ that had emerged in relation to the concept of ‘good teacher’ was associated with the concept of ‘good teacher’ at this stage.

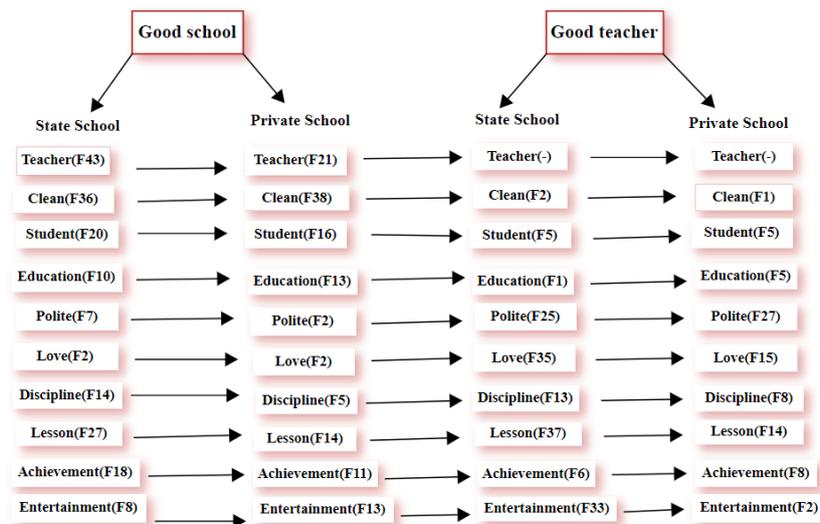

Figure 5. Students' answers to key concepts by school type

In Figure 5, the 10 most frequently repeated answer words related to the key concepts of ‘good school’ and ‘good teacher’ were compared and presented. When the cognitive structures of the students for the concepts of ‘good school’ and ‘good teacher’ are examined according to the school type, it is noticed that the students studying in public and private secondary schools have similar cognitive structures.

Conclusion, Discussion and Recommendations

In this study, the cognitive structures of secondary school students regarding the concepts of good school and good teacher were examined. As a result of the research, it was found out that the students associated the concept of ‘good school’ with answer words such as ‘clean’, ‘teacher’, ‘lesson’, ‘student’, ‘achievement’, ‘environment’, ‘education’, and the key concept of ‘good teacher’ with answer words such as ‘clean’, ‘lesson’, ‘student’, ‘achievement’, ‘education’, ‘entertainment’ and ‘discipline’. The results of the research have shown that the answer words that students associate with the concepts of ‘good school’ and ‘good teacher’ are generally positive. This case shows parallelism with the literature. Kuyumcu and Özsarı, (2016) in their metaphor study, in which they evaluated the perceptions of 5th and 6th grade students in relation to the concepts of ‘teacher’ and ‘school’, revealed that the general perceptions of the students regarding these concepts were

positive. Students' associating the key concept of good school with the word success is in line with the study carried out by Gökçe and Kahraman (2010). Balcı (1988) emphasized the concepts of success, education, teacher and student while stating the variables that the effective school is associated with.

It has shown that the words discipline, respect, achievement, education, information, student, helpful, justice, morale, interest, special are common investigating the words associated with the key concepts of good school and good teacher. The concept of discipline for the student can also be perceived as the student's behavior in accordance with the school order and taking precautions for all kinds of negative situations (Sarpkaya, 2007). The fact that students see school administrators and teachers as elements reflecting power and authority may have evoked the concept of respect and discipline for students. Increasing success is among the main goals of schools and teachers. It is important to ensure the necessary cooperation between the school administration and the teachers to create a suitable educational climate for the students and make the students feel that they stand by in a possible problem that the student may occur (Döş, 2013). The activities organized to increase school success played a significant role in the emergence of the concept of effective school. Variables of these activities are school administrators, teachers, students and school climate (Ada, & Akan, 2007). In this study, with the students' point of view concepts such as discipline, morale, achievement and respect as the qualities of a good school and a good teacher was supported by studies in the literature. Building a system of values and setting norms at school contribute to the moral and cultural attainment of schools. Success appears as an inevitable product in schools that has a system based on discipline (Şişman, 1997). The fact that school administrators and teachers, who are a part of effective school culture, are sensitive to students' problems, have problem-solving skills and empathize with students, will carry both the school and the teacher to a respectable position in the students' eyes (Yagız, 2016). This study demonstrates that students associate the concepts of good school and good teacher with the concepts of helpful and interest, as they see school administrators and teachers as supporters in problem solving when they need it in school and in the classroom.

Furthermore, the associations with words such as respect, interest, justice, helpful and moral show that students correlate school and teachers not only in cognitive but also affective sense. It has been proved that studies on students' school and teacher perceptions also support this idea. Schools and teachers are not only interested in the cognitive aspect of the student, they want to develop the student in all aspects with a holistic development understanding. The teacher's sense of self, goodness and justice are the affective factors that affect the student (Balcı, 2014). The words they associate with the key concepts of good school and good teacher also reflect the expectations of the students from the school and the teacher. These expectations also constitute the ideal school and teacher model in the minds of students. The emergence of words such as helpful, interest, respect in the study showed that students need school and teachers not only academically but also emotionally. A good teacher is someone who is sensitive to students' social and emotional expectations, respectful of differences and acts fairly (İlter, 2021). Teachers should set an example for students and the environment with their attitudes and behaviors. A teacher who draws the framework of justice and equality correctly and acts in accordance with the adopted moral principles will be accepted as ideal teacher in the eyes of both the student and the environment (Kulaksızoğlu, 1995). Another result of the study is that the perceptions of the students towards the concepts of

good school and good teacher are similar according to the distinction between private and public school types. Based on these similarities, it can be confirmed that private school and public school students have similar cognitive structures.

Based on the results of the research, the following suggestions can be made:

- A similar study can be applied to students at other education levels in order to see the similarities and differences in students' perceptions of a good school and a good teacher.
- Interviews can be conducted in order to obtain more detailed information about the students' perceptions of the concepts of good school and good teacher.
- The study was carried out in a private school and a public school in a city center. The working group can be expanded by including schools in districts and villages in subsequent studies.

Competency-Based Education To Teach Translation: Jordan's Graduate Employability

Khetam Shraideh

Al-Balqa Applied University, Jordan,  <https://orcid.org/0000-0001-9087-5895>

Abstract: Youth make up over half of Jordan's population, and almost half of them are unemployed. Young people experience apathy and frustration due to a lack of employment opportunities and an education system that does not prepare them for the workforce. In Jordanian Higher Education Institutions, student success is our focus. However, we still follow a traditional way of teaching and delivering knowledge. This study aims to promote operating more of a personalized learning approach to increase graduates' preparedness to meet workforce needs in the translation industry. For the purpose of assessing the efficiency of the standing teaching approach in the Translation program, Al-Balqa Applied University (BAU) students were surveyed. With respect to collecting data on the employability skills needed in the market, translation companies/agencies in Jordan were also surveyed. To remedy the gap between academia and industry and to prepare graduates for the market needs, the study proposes reforming the curriculum and teaching methods of the Translation Program to align with the competency-based approach in education.

Keywords: *employability skills; translation industry, competency-based education, translator's ethics and visibility.*

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1035-1048), Cappadocia, Turkiye. ISTES Organization.

Introduction

It is essential that the market is provided with competent translators. As highlighted by Daniel Gouadec (2007), universities should award translation credentials only to those who master the translation competencies. Students at Jordanian Higher Education Institutions go from one course to another without being fully competent.

Using competency-based education (CBE) model terminology, a student who receives 50% of the total grade can pass the course and enter the workforce. It is my understanding of CBE that it connects student achievement in the classroom with workforce readiness. To increase employability skills, the Jordanian education system needs to adopt a more personalized approach. Figure 1 below shows what it means by competence. It is a combination of skill, knowledge, and attitude.

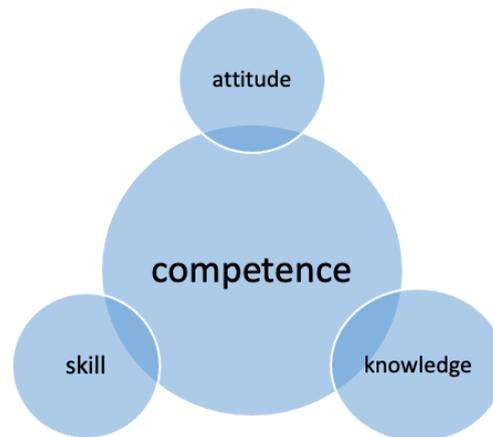

Figure 1. Competence

Despite differences in competence among institutions, learning expectations remain constant. In order to demonstrate competencies, students must engage in activities and experiences aligned with clearly defined programmatic outcomes. Faculty members provide proactive support and guidance to students. CBE is different from self-paced learning in that faculty are still involved, there is some sort of substantive interaction. In order to earn credentials, students must demonstrate mastery, which will differ from institution to institution, so assessment and curriculum design are key considerations. With CBE, the focus shifts from how time is allocated to whether the students can demonstrate well-defined competencies. Through this approach, students can take advantage of their past knowledge, build on their experience, and customize the learning process according to their needs. Instead of advancing to the next level when the semester or term is over, students are measured when they demonstrate proficiency in the material they have been assigned. Ultimately, CBE is about improving the learning outcomes that matter. CBE is an outcome-based approach to earning a college degree or other credentials. Students demonstrate competencies specific to the course at the program level through a structured curriculum and genuine assessment.

How to implement CBE? By making competencies explicit, teachers can help students monitor their progress throughout the semester and steer their learning toward those competencies. Competencies are assessed continuously rather than in a single summative test. Moreover, objective tests may or may not measure what students can do. They may measure knowledge, but do they really measure what they can do? Rather than simply reciting, the CBE assesses whether the student can apply and do. This approach could be applied to assess whether students/alumni have the competencies needed in the workforce and whether they can produce an adequate translation that meets market needs.

Method

This study, which has two surveys, one for the employer and the other one for the alumni, aims to enhance the Translation graduate employability skills. The population of the study consists of associate diploma (two-year

program) alumni of Translation for three years (2021, 2022, and 2023), taking into consideration that the program has been established recently in 2019. To reach the largest sample possible, the researcher sent out two online surveys of 22 questions each, most of which are closed-ended questions. The first survey form was sent out to BAU alumni of the associate diploma Translation Program while the other one was sent out to various local translation companies/agencies in Amman, Jordan. Alumni and employers were asked to participate in those two web-based surveys; the link to those online surveys was sent to the participants via WhatsApp (a communication app). Of the 70 questionnaires sent to the alumni, 32 were returned, and of the 20 questionnaires sent to the translation companies/agencies, 8 were returned, all the surveys were filled in properly, so all of them were considered and no one was eliminated. The data used in the research were evaluated over 40 questionnaires received from the two samples (alumni and employers).

The return rate of the alumni survey was 46% while the return rate of the employer survey was 40%. It is seen that this rate is sufficient to represent the population. In order to measure the participants' employability competencies, multiple choice questions with multiple answers are formed and scales (from 1 to 5) are used to rate the necessity of using technology in translation and inevitability of work ethics. In the questionnaire form, the purpose of the study was first explained to the participants and then they were asked to fill in the questionnaire form. The average time of the employer form is 7 minutes and 45 seconds while of the alumni form it is 8 minutes and 17 seconds.

Results

Table 1 shows the findings of the employer survey. All the companies/agencies are local establishments located in Amman (the capital of Jordan). Looking at the number of translators in each establishment, we notice that the size of those establishments varies. Half of those establishments (50%) have only 1 to 2 translators, whereas 25% have 5 to 6 translators. This is reasonable considering the size of the company, especially if we have a look at Talal Abu Ghazaleh Translation Company, one of the largest translation agencies in Jordan. More than 10 translators working for Talal Abu Ghazaleh as full-time and part-time translators, including freelance translators.

It goes without saying that translators could do their work remotely. Translators of written content do not need to commute to the office if they have all the resources and material they need at home. The survey results show that most companies (88%) offer written translation services, with a focus on legal translation (88%). Their focus on written translation gives room for translators to work from home. This explains why 75% of the employers under question prefer translators to work remotely while the rest of the employers (25%) prefer translators to work in a hybrid mode (in-person and remotely). This is valid especially when 63% of the study sample confirm that they hire freelancer translators.

To investigate the skills needed in the translation industry, we need to look into the tasks a translator is

responsible for. A translator does not only render a text into another language but also proofreads that text and sometimes manages the whole translating project. The majority of the employers under question (63%) suggest that a translator is responsible for editing along with translating. 38% of the total employers propose also creating subtitles while another 25% of the total employers propose that a translator is responsible for project management.

To be able to implement those tasks efficiently, a translator needs to master a certain skill set. Within the scope of the research, we use the term employability skills to cover this skill set. The questionnaire divides those skills into five groups (critical thinking skills, interpersonal skills, personal traits, translation skills, and project management skills). When it comes to critical thinking skills, we find that 87.5% of the employers propose that a translator should be able to think creatively, and half of the total employers support the need for problem-solving skills. Likewise, 75% of the total employers agree that organizational skills are essential. For interpersonal skills, the majority of the employers (87.5%) suggest that clear and effective communication is of high priority, the next priority skills are responding to client needs and teamwork with percentages of 75% and 62.5% respectively. For the personal traits category, all employers surveyed believe that a translator should demonstrate a willingness to learn. Whereas the majority, with a percentage of 62.5%, suggest that demonstrating professionalism and flexibility is of high importance.

It is obvious that project management skills are highly needed in the market. 87.5% of the study population (employer survey) suggest that the use of tools and resources efficiently as well as the search for terminology or necessary information are the top needed skills (among the project management skills). Moving into the translation skills group, linguistic competence is the most selected skill with 87.5%. Cultural competence and subject or domain competence come next with a percentage of 62.5% for each. When it comes to linguistic competence, English and Arabic language proficiency should be in high demand in the translation industry. Most employers (75%) advocate for an advanced level of language proficiency (Arabic and English), while some (25%) see that the translator should be a native bilingual.

Along with the multiple-choice questions, the questionnaire contains two scales to rate the need for technology and the necessity of ethics. Half of the employers highly appreciate the use of technology and the possession of work ethics. Speaking in numbers, 50% of the population rate the use of technology and work ethics as high-priority needs on a scale of 1-5. Ultimately, the last set of questions examines the need for translators in the Jordanian Translation market. The findings show that most employers (63%) see that currently there is a real need for translators, while half of the total employers see an increasing need for translators over the next five years.

Table 1. Employer Survey

Question	Options	Percentage
Your translation company/agency is	local	100%
	international	0%

	subject or domain competence	62.5%
	transform competence	37.5%
	textual competence	50%
other	12.5%	

Table 2 reveals the data collected from the alumni population. The first question in the survey specifies whether they work in the field of translation or not. 68% of them say yes, they are working in translation -related areas whereas 53% say “no”, they do not work in the field of translation. Here, let us list the most apparent challenges in the translation industry as listed by the study sample. The most selected challenge (59%) is the inessentiality of having a diploma or a professional certificate in translation to practice translating; the market is full of too many translators who do not have credentials. Half of the study sample (alumni survey) suggests that ‘there is no legal protection for translators’ as the second challenge in the market. The next three challenges are 'there are

not enough opportunities in the market' (with a percentage of 47%), low-income fare (with the percentage of 44%), and 'the university did not prepare me for the market' (with a percentage of 44%). Given all these challenges, it makes sense that 69% of the alumni under question do not work for any translation agency or company.

Looking into the type of translation the alumni population craft, we find written translation is at the top with a percentage of 69%. The following genre is the audiovisual translation (more specifically subtitling) with a percentage of 44%. This kind of translation qualifies translators to work from home. 37.5% of the alumni under study work remotely. A lot of them could work as freelance translators. Half of the alumni population (50%) state that they work as freelancers. Since there is no need to commute to the office, a translator could work internationally while they reside in their hometown. 16% of the study population (alumni survey) work locally while 12.5% work internationally.

Whether locally or internationally, a translator is responsible for extra tasks other than translating, such as localizing the content and proofreading the translation. 53% of the alumni surveyed propose that a translator is responsible for editing too, whereas 37.5% of the total alumni suggest content creation as well. To be able to perform those tasks adequately, a translator should be skilled and competent. Only half of the alumni surveyed (50%) consider themselves competent translators while 34% consider themselves relatively competent and the rest (16%) as incompetent yet.

In order to judge whether a translator is competent or not, we need to dig deeper into the employability skills needed in the market. In this regard, we use the same classifications we used in the employer survey as we categorize the skills into five groups (critical thinking skills, interpersonal skills, personal traits, project management skills, and translation skills). Most alumni population under study (84%) agree that a competent translator should be able to think critically. When it comes to interpersonal skills, 72% of the population vote for teamwork and collaboration skills. For the personal traits, I do not see it as a coincidence that the majority of the employers (in the other survey) and the alumni agree that demonstrating a willingness to learn is the most needed personal trait. It goes without saying that project management skills are needed, especially in terms of the search for the right terminology and information with a percentage of 78%. Of course, translation skills are of high importance, cultural competence resides as the most needed one with a percentage of 75% followed by textual competence with a percentage of 69%. It is unquestionable that a translator should be bilingual or fluent in the languages they are translating from and into. Most BAU alumni under study see themselves as native speakers of Arabic (66%) and fluent speakers of English with a percentage of 47%.

With respect to technology use and work ethics, the majority of alumni surveyed give the highest rate for the use of technology with a percentage of 44%. Likewise, most of the total alumni under study (63%) rate work ethics as a highly needed skill as they choose the highest rate (5) on the rating scale from 1 to 5. The last portion of the survey examines the need for translators and the appreciation of translators in the market. Most of the alumni sample (75%) suggest that there is a need for translators in the market. However, translators do not receive the deserved recognition or appreciation. Half of the study sample (50%) indicates that translators are not well

appreciated.

Table 2. Alumni Survey

Discussion

This study aims to bridge the industry-academia gap by enhancing the graduates' employability skills and fostering engagement with the industry. The research findings indicate that there is a need to reform the curriculum of the Translation Program to align the competencies with the market needs. Looking into the market needs revealed in the data collected from the employers, we notice that translators are asked not only to translate but also to perform editing, create subtitles, localize websites, and manage translation projects, sometimes they also proofread others' translations. This is the norm in the Jordanian translation industry, especially when those companies offer translation for various text types, including legal texts, technical texts, literary texts, and others.

In order to craft adequate and efficient translation, the translator needs to master the skill set needed for those genres of translation. Analyzing the alumni responses on the employability skills they were asked in the survey, are BAU alumni competent enough to produce adequate translations for such texts? To address this question, we need, first, to navigate the curriculum of the Translation Program at BAU to check if it covers all those genres of translation, and second, to check if the market-needed competencies are embedded in the curriculum.

Let us start with the legal translation that ranked as the most frequent type of translation. The current curriculum of the Translation program at BAU offers only one course of legal translation in which students are supposed to learn how to translate local documents, such as marriage and divorce certificates as well as leases and business contracts, and international documents, like international agreement, UN releases, and other international official documents. In this sense, they are supposed to be introduced to the legal terminologies and glossaries and to the language used by official bodies like the government or the NGOs. They should also be briefed about the linguistic, cultural, and textual variations of the legal systems. To make the best of the course, students are expected to practice translating some legal excerpts and texts. Could not this be overwhelming and too much for one course? Since the focus of the industry is on this type of translation, would it make more sense to offer two courses, ‘Legal Translation 1’ to translate local documents and ‘Legal Translation 2’ to translate international documents? This same argument applies to technical translation. The program currently offers only one course in technical translation where students are supposed to be able to translate scientific texts, financial texts, business texts, and so on. Would not be of more value to offer two courses in technical or non-literary translation where students have more time and resources to look up technical vocabulary and learn more about technical writing in English and Arabic.

Not to mention that some text types are not part of the curriculum like medical translation or localization. Localization is understood to be taught within the course of audiovisual translation. However, due to the ubiquity of technology and the prevalence of audiovisual mediums, we would suggest localizing websites to be an independent course. The same suggestion could also be applied to the course ‘Technology in Translation’. The findings of the study rank the use of technology as of high priority. Therefore, to meet the expectations of the employers and to be of more added value, we would suggest offering two courses in this field: the first one could cover the basics of general technological tools, electronic resources, and machine translation while the other one is more advanced (on CAT tools and e-translation.). Another online source that could be examined in the advanced Technology in Translation course is ChatGPT, which is a short term for “Chat Generative Pre-Training Transformer”. It is an artificial intelligence software that was developed by OpenAI and released on May 24, 2023. It has demonstrated that it can be of added value and an effective tool for translators as it generates translations with remarkably high accuracy. Students could be taught how to optimize the use of ChatGPT by learning how to write a translation prompt that would enhance the quality of the translation.

Another course that could be suggested to meet the market needs is ‘Translator Ethics’. Strong work ethic skills are highly rated by both groups (the employers and the alumni under study) because they show the translator’s intrinsic motivation for their outstanding performance. If a translator has a strong work ethic, they are more

likely to have efficient organizational skills as well. Accordingly, it is essential for students to orient themselves with the local market code of ethics and the international codes of ethics. Though accountability, impartiality, professionalism, and accuracy could be common principles across various linguistic communities, there could be a disparity in other concepts like adequacy, confidentiality, and fidelity. For example, the American Translator Association envisions collegial behavior, which means a translator does not release negative or offensive remarks on their colleagues' translations but insightful and productive comments instead, as part of its code of ethics and professional practice. Is collegial behavior part of the Jordanian translation market code of ethics? To orient students with various codes of ethics in various countries and sometimes different organizations within the same country, Translator ethics and (in)visibility could be a standalone course. In that course, students would be able to read through different perspectives of translation and look into the literature built around those two rich concepts: translator's ethics and translator's visibility. Translator's visibility, which is thoroughly investigated by Lawrence Venuti in his book *Translator's Invisibility* changes our conception of translation to consider it as an "ethical attitude towards a foreign text and culture, ethical effects produced by the choice of a text for translation and by the strategy devised to translate it" (2008). Venuti as a theorist looks into translation from a different angle. He does not consider translation as a transference neutral unmediated process but rather as a construction of a certain image of the text (2008). By learning such theories and digging deeper into the theoretical frameworks, we put translation theory into practice, widen the scope of translation in the Jordanian market, and get the students to explore different approaches to translation.

Another disparity of the translation norms across cultures is the use of a contract or some kind of agreement tool to regulate the communication between the translator, language service provider, and the commissioner.

One of the key challenges the translator faces, as suggested by the alumni under study, is the lack of legal protection for translators. If a freelance translator receives a translation task and puts a lot of effort into the task, then the commissioner refuses to pay the translator making fake excuses, what could be the options for the translator? Is there some sort of legal measures to protect translators from such commercial fraud commissions? Given all these challenges that translators face, is the translation work well systemized in Jordan? To give a clearer picture of what a systemized framework should look like, let us ask ourselves whether there is a unified national code of ethics in Jordan and whether there is legal protection policy, especially for freelance translators.

Moving to the competencies needed by the translation market, are BAU alumni ready for the workforce? The survey findings reveal that 84% of the alumni population under question are critical thinkers. Likewise, 72% of the study sample appreciate teamwork and collaboration (the most selected interpersonal skill) while 69% demonstrate a willingness to learn (the key personal trait). Are these numbers sufficient to call the alumni population under study competent translators? How about the 16% of the alumni who do not see themselves as critical thinkers? This also applies to the other sets of skills, which are interpersonal skills and personal traits as the percentage of the lack of those skills is 16% and 19% respectively. To enhance the graduates' employability skills, which is the core of this research, the curricula and course description of the Translation program should be reformed to match the needs of the industry. For example, to integrate teamwork and collaboration skills into the curricula, the school could run translation workshops that are separable from the theoretical courses. In the

translation workshops, the focus would be on translation practice and the students would be the leading participants where they form teams and sit in groups. This kind of workshop course would equip the students with not only teamwork skills but also proofreading skills in which they review each other's translations and provide insightful and productive comments.

Another reform technique to cover those employability skills could be having a sustainable partnership with local and international employers. One way to secure this kind of partnership could be to form an advisory committee where stakeholders and translation agency staff sit on the committee along with the academic staff at BAU. Surveys and questionnaires are great tools to collect data from the employer around those skills; however, they are time-specific inputs. In other words, the data is not dynamic. However, the advisory committee could deliver frequent productive insights. To establish that committee, one needs to establish connections with the industry and build pipelines of communication with the employers locally and internationally. This could be done through collaborating with partners who could help facilitate contact with the employers. We should not limit our work to the local market because, according to the data from the alumni survey, there are not enough job opportunities in the local market. To prepare the students for the international market, we need, first, to build linkages with international employers in the field of translation, second, to equip the students with the right skills needed in the international market, and third, to elevate the alumni credentials by linking the academic diploma to an international certificate of translation.

Conclusion

This study contributes to the field of Translation and Education by providing an in-depth and thorough discussion of the competencies needed in the Translation market and by suggesting a novel approach to Translation pedagogy. The competency-based approach suggested in this study embraces all the skills needed in the Translation market. Employers and stakeholders from academia and the private sector should be involved as equal partners in building competency-based education with students and instructors involved. Translation curricula, training, and assessments should be reformed to align with the competencies needed in the workplace. The study findings indicate that there should be a focus on advanced technological tools like translation memories to enhance the quality of translation and to keep the students up to date with all the modern trends in the field of Translation as it is constantly evolving.

Recommendations

This research paper could be expanded to analyze other variables in the data collected by the surveys. For instance, gender variation could be examined. In the Jordanian market, the female translators are more than the male translators. Is this also the case with the global market? Is the Translation industry dominated by women? What could be the reasons? Do women make better translators than men? Another recommendation could be to survey a larger population in which we include other universities in Jordan to see the evaluate the program from

different angles.

Abstract: Nature of Science (NOS) has been enumerated as one of the important elements in education because robust conceptions of NOS is essential for individuals to be considered as scientific literate. As teachers are vital in imparting sound NOS conceptions to their students, they must possess sound NOS conceptions. However, studies have shown that teachers only possess naive conceptions of NOS which could be potentially passed down to their students during science instruction. So far, studies about in-service science teachers' conception on NOS were conducted in the West. The extensive literature search that was conducted on several renowned platforms found that the existing research available to the public focused on secondary school students or pre-service teachers but not in-service teachers. The conduct of this study bridges the gap in literature and informs relevant stakeholders about the current state of science education in Malaysia. This study shares the findings of a survey conducted with 33 in-service public school science teachers in Selangor, Malaysia. Results show that most teachers possess mixed conceptions about NOS. This study has implications on informing relevant stakeholders about the need of including NOS as a part of teacher training programmes and the need to conduct training sessions with in-service science teachers on NOS.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1049-1062), Cappadocia, Turkiye. ISTES Organization.

Introduction

Global advancements are occurring every single day. Scientific and technological breakthroughs have continued to allow access to a wide range of knowledge. This creates the necessity for individuals to be scientifically literate to make informed decisions for the benefit of all citizens around the globe.

“Science should be regarded as a basic human right around the globe” (Maqbool et al., 2014, p.2). Science has gained more global attention over the years. Findings show that many countries have begun to place a greater emphasis on students achieving scientific literacy as their curriculum goals. For instance, United States of

America (Fortus et al., 2022), New Zealand (Bull et al., 2010), Singapore (Vinodhen, 2020), Thailand (Yuenyong & Narjaikaew, 2009) and many more including Malaysia (Mohd Syafiq Aiman Mat Noor, 2021).

Teachers play a crucial role for this goal to be achieved. Teachers were identified as the most prominent factor that contributes to learning in the classroom (Demirdogen et al., 2015). Hence, it is important for teachers to have profound Nature of Science (NOS) conceptions. This is because NOS education is essential for scientific literacy and an informed populace (Höttecke & Allchin, 2020). It is clear that one cannot teach what they do not know. This study aims to investigate Selangor lower-secondary in-service teachers' NOS conceptions. Investigating Malaysian in-service science teachers' NOS conceptions is the first step in ensuring that NOS is taught in Malaysian classrooms.

So far, studies about in-service science teachers' NOS conceptions were conducted in the West. The extensive literature search that was conducted on several renowned platforms such as ResearchGate, Academia and many more, did not yield results to Malaysian in-service teachers' NOS conceptions. Moreover, it was found that the existing research available to the public focused on secondary school students or pre-service teachers but not in-service teachers. The conduct of this study bridges the gap in literature and informs relevant stakeholders about the current state of science education in Malaysia.

Nature of Science (NOS)

Nature of Science (NOS) is a hard to define concept. In the past years, researchers and philosophers have been debating on what NOS constitutes but have not reached consensus on a unified definition for NOS. The definitive list of the NOS tenets that will be wholly accepted by all does not and will not exist (Lederman & Lederman, 2019).

To explain it further based on Constructivism, "Constructivists believe that human learning is self-constructed where learners build new knowledge upon the foundation of previous learning" (Jain et al., 2013). Individuals actively develop their own perception of the universe based on their interactions with others and their surroundings. There will be a difference in the researchers and philosophers' point of view on what NOS constitutes.

Notwithstanding the difficulties in defining NOS, philosophers and educators agreed that pupils must comprehend these aspects of NOS, as delineated by Lederman et al. (2002) which includes:

The Empirical Nature of Scientific Knowledge Science is at least partially based on observations of the natural world, and "sooner or later, the validity of scientific claims is settled by referring to observations of phenomena" (AAAS, 1990, p. 4). However, scientists do not have direct access to most natural phenomena. Observations of nature are always filtered through our perceptual apparatus

and/or intricate instrumentation, interpreted from within elaborate theoretical frameworks, and almost always mediated by a host of assumptions that underlie the functioning of scientific instruments (Lederman et al., 2002, p.499).

Observation, Inference, and Theoretical Entities in Science. Students should be able to distinguish between observation and inference. Observations are descriptive statements about natural phenomena that are directly accessible to the senses (or extensions of the senses) and about which observers can reach consensus with relative ease. For example, objects released above ground level tend to fall to the ground. By contrast, inferences are statements about phenomena that are not directly accessible to the senses. For example, objects tend to fall to the ground because of gravity. The notion of gravity is inferential in the sense that it can be accessed and/or measured only through its manifestations or effects, such as the perturbations in predicted planetary orbits due to interplanetary attractions, and the bending of light coming from the stars as its rays pass through the sun's gravitational field. An understanding of the crucial distinction between observation and inference is a precursor to making sense of a multitude of inferential and theoretical entities and terms that inhabit the worlds of science. Examples of such entities include atoms, molecular orbitals, species, genes, photons, magnetic fields, and gravitational forces (Hull, 1998, p. 146) (Lederman et al., 2002, p.500).

Scientific Theories and Laws. Scientific theories are well-established, highly substantiated, internally consistent systems of explanations (Suppe, 1977). Theories serve to explain large sets of seemingly unrelated observations in more than one field of investigation. For example, the kinetic molecular theory serves to explain phenomena related to changes in the physical states of matter, the rates of chemical reactions, and other phenomena related to heat and its transfer. More important theories have a major role in generating research problems and guiding future investigations. Scientific theories are often based on a set of assumptions or axioms and posit the existence of nonobservable entities. Thus, theories cannot be directly tested. Only indirect evidence can be used to support theories and establish their validity. Scientists derive specific testable predictions from theories and check them against tangible data. An agreement between such predictions and empirical evidence serves to increase the level of confidence in the tested theory. Closely related to the distinction between observation and inference is the distinction between scientific theories and laws. In general, laws are descriptive statements of relationships among observable phenomena. Boyle's law, which relates the pressure of a gas to its volume at a constant temperature, is a case in point. Theories, by contrast, are inferred explanations for observable phenomena or regularities in those phenomena. For example, the kinetic molecular theory serves to explain Boyle's law. Students often (a) hold a simplistic, hierarchical view of the relationship between theories and laws whereby theories become laws depending on the availability of supporting evidence; and (b) believe that laws have a higher status than theories. Both notions are inappropriate. Theories and laws are different kinds of knowledge and one does not become the other. Theories are as legitimate a product of science as laws (Lederman et al., 2002, p.500).

The Creative and Imaginative Nature of Scientific Knowledge Science is empirical. The development of scientific knowledge involves making observations of nature. Nonetheless, generating scientific knowledge also involves human imagination and creativity. Science, contrary to common belief, is not a lifeless, entirely rational, and orderly activity. Science involves the invention of explanations and theoretical entities, which requires a great deal of creativity on the part of scientists. The leap from atomic spectral lines to Bohr's model of the atom with its elaborate orbits and energy levels is an example. This aspect of science, coupled with its inferential nature, entails that scientific entities such as atoms and species are functional theoretical models rather than faithful copies of reality (Lederman et al., 2002, p.500).

The Theory-Laden Nature of Scientific Knowledge. Scientific knowledge is theory-laden. Scientists' theoretical and disciplinary commitments, beliefs, prior knowledge, training, experiences, and expectations actually influence their work. All these background factors form a mindset that affects the problems scientists investigate and how they conduct their investigations, what they observe (and do not observe), and how they interpret their observations. This (sometimes collective) individuality or mindset accounts for the role of theory in the production of scientific knowledge. Contrary to common belief, science never starts with neutral observations (Popper, 1992). Observations (and investigations) are always motivated and guided by, and acquire meaning in reference to questions or problems, which are derived from certain theoretical perspectives (Lederman et al., 2002, p.501).

The Social and Cultural Embeddedness of Scientific Knowledge. Science as a human enterprise is practised in the context of a larger culture and its practitioners are the product of that culture. Science, it follows, affects and is affected by the various elements and intellectual spheres of the culture in which it is embedded. These elements include, but are not limited to, social fabric, power structures, politics, socioeconomic factors, philosophy, and religion. Telling the story of hominid evolution, which is central to the biosocial sciences, may illustrate how social and cultural factors affect scientific knowledge. Scientists have formulated differing storylines about hominid evolution. Until recently, the dominant story was centred on the man-hunter and his crucial role in human evolution (Lovejoy, 1981), a scenario consistent with the White male culture that dominated scientific circles until the early 1970s. As feminist scientists achieved recognition in science, the story about hominid evolution started to change. One story more consistent with a feminist approach is centred on the female gatherer and her central role in the evolution of humans (Hrdy, 1986). Both storylines are consistent with the available evidence. Myth of The Scientific Method One of the most widely held misconceptions about science is the existence of the scientific method. The modern origins of this misconception may be traced to Francis Bacon's *Novum Organum* (1620/1996), in which the inductive method was propounded to guarantee "certain" knowledge. Since the 17th century, inductivism and several other epistemological stances that aimed to achieve the same end (although in those latter stances the criterion of certainty was either replaced with notions of high probability or abandoned altogether) have been debunked, such as Bayesianism, falsificationism, and hypothetico-deductivism (Gillies, 1993). Nonetheless, some

of those stances, especially inductivism and falsificationism, are still widely popularised in science textbooks and even explicitly taught in classrooms. The myth of the scientific method is regularly manifested in the belief that there is a recipe-like stepwise procedure that all scientists follow when they do science. This notion was explicitly debunked: There is no single scientific method that would guarantee the development of infallible knowledge (AAAS, 1993; Bauer, 1994; Feyerabend, 1993; NRC, 1996; Shapin, 1996). It is true that scientists observe, compare, measure, test, speculate, hypothesise, create ideas and conceptual tools, and construct theories and explanations. However, there is no single sequence of activities (prescribed or otherwise) that will unerringly lead them to functional or valid solutions or answers, let alone certain or true knowledge (Lederman et al., 2002, p.501).

Myth of The Scientific Method. One of the most widely held misconceptions about science is the existence of the scientific method. The modern origins of this misconception may be traced to Francis Bacon's *Novum Organum* (1620/1996), in which the inductive method was propounded to guarantee "certain" knowledge. Since the 17th century, inductivism and several other epistemological stances that aimed to achieve the same end (although in those latter stances the criterion of certainty was either replaced with notions of high probability or abandoned altogether) have been debunked, such as Bayesianism, falsificationism, and hypothetico-deductivism (Gillies, 1993). Nonetheless, some of those stances, especially inductivism and falsificationism, are still widely popularised in science textbooks and even explicitly taught in classrooms. The myth of the scientific method is regularly manifested in the belief that there is a recipe-like stepwise procedure that all scientists follow when they do science. This notion was explicitly debunked: There is no single scientific method that would guarantee the development of infallible knowledge (AAAS, 1993; Bauer, 1994; Feyerabend, 1993; NRC, 1996; Shapin, 1996). It is true that scientists observe, compare, measure, test, speculate, hypothesise, create ideas and conceptual tools, and construct theories and explanations. (Lederman et al., 2002, p.501) .

The Tentative Nature of Scientific Knowledge. Scientific knowledge, although reliable and durable, is never absolute or certain. This knowledge, including facts, theories, and laws, is subject to change. Scientific claims change as new evidence, made possible through advances in thinking and technology, is brought to bear on these claims, and as extant evidence is reinterpreted in the light of new theoretical advances, changes in the cultural and social spheres, or shifts in the directions of established research programs. Tentativeness in science does not arise solely from the fact that scientific knowledge is inferential, creative, and socially and culturally embedded. There are compelling logical arguments that lend credence to the notion of tentativeness. Indeed, contrary to common belief, scientific hypotheses, theories, and laws can never be absolutely proven irrespective of the amount of supporting empirical evidence (Popper, 1963). For example, to be proven, a law should account for every instance of the phenomenon it purports to describe. It can logically be argued that one such future instance, of which we have no knowledge whatsoever, may behave in a manner contrary to what the law states. Thus, the law can never acquire an absolutely proven status. This equally holds in the case of theories (Lederman et al., p.502).

It could be seen from the NOS tenets that there is an emphasis whereby science is an ongoing process of inquiry. Scientific knowledge that we have now will be subjected to revision. This is due to the fact that Science is dynamic. Medawar (1982) stated that Science is a social enterprise not an “isolated search of the truth” (p.116). Collaboration and communication between different philosophers, researchers and scientists is evitable. These ideas are well aligned with Constructivism which asserts that individuals construct their own understanding of the world by being actively engaged in the learning process and through interacting with others. It can be inferred that the theoretical basis of the seven NOS tenets is Constructivism as it emphasises that it is necessary for individuals to play an active role when constructing scientific understanding. The development of scientific knowledge relies on communicating and collaborating with one another.

Hence, the various lists compiled by other researchers and philosophers are still accepted and used in various studies. Some lists were delineated by drawing consensus between the findings and conclusions of other researchers and philosophers. For instance, the seven NOS tenets delineated by Chen (2006) which will be discussed in Views on Science Education (VOSE) Questionnaire section.

Views of Science Education (VOSE) Questionnaire

This study, however, subscribes to the NOS tenets delineated by Chen (2006) who drew consensus among different researchers including Lederman.

The NOS tenets delineated by Chen (2006) which includes:

Tentativeness of scientific knowledge. On the one hand, scientific knowledge is durable and not easily changed. On the other hand, all scientific knowledge is subject to change. The change could take at least two forms, evolutionary (Popper, 1975/1998) or revolutionary (Kuhn, 1970). New knowledge may arise by refining the old knowledge according to new evidence or interpreting data from a new standard and worldview (Chen, 2006, p.806).

Nature of observation. Observations are theory laden due to the existing possibility of the assumptions and preconceived ideas of the observer (Chen, 2006).

Scientific methods. A universal scientific method is non-existent. Various methods will be applied by scientists when conducting research (Chen, 2006).

Hypotheses, laws, and theories. A hypothesis is generally used to represent an immature theory, a speculative law, or a prediction of experimental results (McComas, 1996). A law is used to express what has been observed and to predict what has not yet been observed (Carnap, 1966/1998). A theory

is defined in many ways by philosophers of science (Carnap, 1966/1998; Hacking, 1983; Radder, 2003; Suppe, 1977). In this text, theory is defined as an explanation of phenomena and associated laws according to Benchmarks for Science Literacy (American Association for the Advancement of Science, 1993). Furthermore, scientists create theories and laws to interpret and describe phenomena. Theories and laws are two different types of knowledge. They both have substantial supporting evidence, and one does not become the other (Chen, 2006, p.806).

Imagination. Imagination is a source of innovation. Scientists use imagination, along with logic and prior knowledge, to generate new scientific knowledge. Imagination and creativity are often presented together in documents of science education reforms. However, the pilot study found that students who object to imagination and creativity as aspects of NOS have more doubts about imagination but fewer problems with creativity. Therefore, VOSE focuses on imagination to avoid the mixed results created by these two terms (Chen, 2006, p.806).

Validation of scientific knowledge. This issue focuses on how a theory is accepted by the science community. In principle, the merit of a theory is evaluated based on empirical results. Nevertheless, the science community may also choose a theory by conventions like simplicity and the reputation of the theory's proposers. Furthermore, the norm of the paradigm such as a particular way of practising science, a worldview, and core theories may influence the science community's judgement of competing theories (Chen, 2006, p.806).

Objectivity and subjectivity in science. Scientific knowledge is empirically based. Scientists try to be open-minded and apply mechanisms such as peer review and data triangulation to improve objectivity. On the other hand, personal beliefs, values, intuition, judgement, creativity, opportunity, and psychology all play a role in scientific activities. Additionally, science and scientists are influenced by the society, culture, and discipline in which they are embedded or educated. This subjectivity may be reflected in their observations, interpretations, use of imagination, and theory choice. In this text, subjectivity is used to represent factors other than objectivity and rationality (Chen, 2006, p.806).

The original questionnaire by Chen (2006) consists of a total of 15 questions. Each question in the questionnaire covers different NOS tenets or a combination of NOS tenets. After reviewing the original questionnaire, the researchers decided to extract questions 1 to 9 for the purpose of the research, which is to assess the teachers' NOS conceptions. This decision is in consideration of the relevance of the questions towards the said objectives of the study. Teachers' knowledge on the seven NOS tenets were able to be tested via the 9 questions extracted.

Table 1.NOS Tenets, Philosophical Positions, and Item Number Tested by VOSE adapted from Chen (2006)

NOS Tenets	Position	Items
Tentativeness	Revolutionary	4A

	Cumulative <i>b</i>	4B
	Evolutionary <i>b</i>	4C
Nature of observations	Theory laden	8A, 8B, 8E
	Theory independent	8C, 8D
Scientific methods	The universal scientific method <i>b</i>	9A, 9B, 9F
	Diverse methods	9C, 9D, 9E
Theories and laws	Epistemology	
	Discovered <i>b</i>	5A,5B (Theory),6B (Law)
	Invented	5D,5E,5F (Theory),6D,6E (Law)
	Discovered or invented	5C (Theory), 6C (Law)
	Comparison	
	Laws being more certain <i>b</i>	7A, 7B
	Different types of ideas	7C, 7D
Use of Imagination	Yes	3A, 3B
	No <i>b</i>	3C, 3D, 3E
Validation of Scientific	Empirical Evidence	1A, 1H
Knowledge	Paradigm	1C, 1F
	Parsimony	1D
	Authority	1E
	Intuition	1G
Subjectivity and objectivity	Subjectivity	
	Parsimony	1D (Actual)
	Authority	1E (Actual)
	Paradigm	1C, 1F, 8Ad, 8B (Actual)

	Use no imagination	3C, 3E(Actual)
	Based on experimental facts	5B, 6B, 8D(Actual)
	No influence of personal beliefs	8C (Actual)
	Methodology	8E, 9A, 9B(Actual)
	Overall	1A, 1H(Actual)

Method

This study is a part of a bigger research that examines lower-secondary in-service teachers' NOS conceptions as well as how these teachers integrate their NOS conceptions into practice. The report will focus only on the quantitative data obtained which regards lower-secondary in-service science teachers' NOS conceptions. The instrument adapted for this questionnaire was the Views of Science Education (VOSE) questionnaire by Chen (2006). After reviewing the original questionnaire, the researchers decided to extract questions 1 to 9 for the purpose of the research, which is to assess the teachers' NOS conceptions. This decision is in consideration of the relevance of the questions towards the said objectives of the study.

The questions were then combined into a Google Form with a five-point Likert-scale that can be distributed online to the participants of the study. The questionnaire is available in both English and Bahasa Malaysia (BM), the national language of Malaysia. This allows the participants to answer the questionnaire in their preferred language. The BM version was professionally translated by the Malaysian Institute of Books and Translation to ensure accuracy.

Each question consisted of a main statement and participants were required to rate how much they agree or disagree to the options which represent different philosophical standpoints that is in-response to the main statement using the five-point Likert-scale.

Prior to the distribution of the questionnaire, a pilot test was conducted to ensure the clarity of the questions and also to identify other issues with the questionnaire before putting it into use in the actual study. No issues were identified with the questionnaire during the pilot test.

The study commenced after obtaining the necessary permission to conduct the study. A total of 33 lower-secondary in-service science teachers answered the online questionnaire. Assessing teachers' NOS conceptions is crucial. Inadequate NOS conceptions contribute to misconceptions about NOS.

Teachers are the key players in instilling accurate NOS conceptions to students. Therefore, teachers must have accurate NOS conceptions to teach the right NOS conceptions to students. By answering the questionnaire, data which regard lower-secondary in-service science teachers NOS conceptions can be obtained.

The data collected via the questionnaire were analysed descriptively. Individual results for each participant were calculated. An analysis based on participants' conceptions per tenet was also conducted to provide an in-depth view on participants' NOS conceptions.

Results

As mentioned, the total number of teachers who answered the questionnaire are 33 lower-secondary in-service

teachers. The data collected via the questionnaire were analysed descriptively. The mean score of each participant and mean score per NOS tenet were derived.

A total of three categories to provide meaning for the mean scores derived which includes naive conceptions, mixed conceptions, sophisticated conceptions. In the situation when the mean score of a participant falls between 1.00 to 2.50, the participant possesses naive conceptions of NOS. In the situation when the mean score of a participant falls between 2.51 to 3.49, the participant possesses mixed conceptions of NOS. In the situation when the mean score of a participant falls between 3.50 to 5.00, the participant possesses sophisticated conceptions of NOS.

Table 2. Categories determined with indicators and descriptions

Range of Mean Scores	Categories	Descriptions
1.00 to 2.50	Naive Conceptions	Possess mostly naive NOS conceptions
2.51 to 3.49	Mixed Conceptions	Possess some naive and sophisticated NOS conceptions (often equal amounts)
3.50 to 5.00	Sophisticated Conceptions	Possess mostly sophisticated NOS conceptions

A difficulty during the calculation process was whether to include neutral responses, whereby the participants selected “3- uncertain or no comment” as a response to the items in the questionnaire when calculating the overall mean of the participant as well as the mean score per tenet. This is because selecting a neutral response does not necessarily mean that the participant has a naive conception of NOS.

The researchers are of the view that the neutral response from the participant may just indicate that participants do not have knowledge on that area to make a stand or does not want to make a stand. It is unfair to include the neutral response of the participant when calculating the mean score as the mean score calculated will not be an accurate representation of the participants’ NOS conceptions.

Individual Results of Each Participant

Table 3. Overview of Number of Participants in each category

Range of Mean Scores	Categories	Number of Participants
1.00 to 2.50	Naive Conceptions	5
2.51 to 3.49	Mixed Conceptions	24
3.50 to 5.00	Sophisticated Conceptions	4

Out of the 33 participants, 5 participants fall under the category of having naive NOS conceptions, 24 participants fall under the category of having mixed NOS conceptions while 4 participants fall under the category of having sophisticated NOS conceptions. This shows that the majority of the teachers have mixed NOS conceptions.

Mean Score Per Tenet

Table 4. Mean Score Per NOS Tenet

NOS Tenets	Mean	Category
Tentativeness	4.22	Sophisticated
Nature of Observations	2.91	Mixed
Scientific Methods	2.19	Naive
Theories and Laws	3.41	Mixed
Use of Imagination	3.10	Mixed
Validation of Scientific Knowledge	2.41	Naive
Subjectivity and Objectivity	2.78	Mixed

Table 5. Overview of NOS Tenets that fall under each category.

Range of Mean Scores	Categories	Quantity of NOS Tenets
1.00 to 2.50	Naive Conceptions	2
2.51 to 3.49	Mixed Conceptions	4
3.50 to 5.00	Sophisticated Conceptions	1

Out of the seven NOS tenets, only the mean score of Tentativeness falls under the category of sophisticated conceptions. This shows that most participants believe that scientific knowledge is subject to change and science in an ongoing endeavour.

Four NOS tenets which include Nature of Observations, Theories and Laws, Use of Imagination as well as Subjectivity and Objectivity falls under the category of mixed conceptions which means that the participants have a mixture of some naive and some sophisticated conceptions of the tenets.

Based on the results above, it could be seen that the participants have naive conceptions for two of the seven NOS tenets which includes Scientific Methods and Validation of Scientific Knowledge.

Discussion

This study investigates in-service lower secondary science teachers' NOS conceptions in Malaysia. As shown in the findings, most teachers fall under the category of having mixed NOS conceptions. This is similar with the findings of Akerson et al. (2009), Dogan & Abd-El-Khalick (2008), Dumcho Wangdi et al., (2020) and Guerra-Ramos et al. (2010) whereby it was found that naive conceptions and numerous misconceptions were possessed by science teachers. Comparing the results of this study to studies that were conducted locally, such as studies conducted by Eng (2002) and Nyanaseakaran (2004) as cited in Jain & Luaran (2020) have shown that secondary students' conception of NOS is only at satisfactory level. A study by Jain et al. (2013) on pre-service teachers possess partial understanding of NOS and possess several misconceptions of NOS. These findings are similar to the findings of the study. However, it is not surprising that the current results of this study are similar with the results obtained by Jain et al. (2013) which was conducted over a decade ago as limited actions have been taken to educate teachers about NOS.

Studies have shown that NOS conceptions can be improved when NOS issues were explicitly raised during intervention. This is because inquiry sets a suitable context for the development of informed NOS conceptions. Abd-El-Khalick (2012) suggests that it is important for an opportunity to reflect about the inquiry experience as it is the core for an individual to develop a sound NOS conception (explicit-reflective approach). Didactic and implicit teaching is ineffective in the development of sound conceptions of different aspects of NOS (Lederman & Lederman, 2019). A study by Kelly & Duschl (2002) states that NOS is learned, like language, by being part of a culture which cannot be taught directly. Kelly & Duschl (2002) findings support the findings of Abd-El-Khalick (2012) as well as Lederman & Lederman (2019).

As mentioned, the current educational goal of Malaysia is to achieve scientific literacy and the key players that determine the success of this goal are the teachers. It is important for teachers to have sophisticated NOS conceptions as the naive NOS conceptions of teachers may be passed down to their students during science instruction. If these naive conceptions were passed down by the teachers and are not challenged, future generations will also possess naive NOS conceptions.

This study has implications on informing relevant stakeholders about the need to include NOS as a part of teacher training programs and the need to conduct training sessions with in-service science teachers on NOS. This study also identified the tenets that need reinforcements which may help in determining the focus of the development of the training programs with pre-service and in-service science teachers.

Conclusion

Table 3, Table 4 and Table 5 show the findings of the study. The findings above show that most teachers have mixed NOS conceptions. This shows that immense efforts are needed to enhance teachers' NOS conceptions.

Inaccurate NOS conceptions should be properly addressed. This is to ensure that Malaysia's current educational goal of achieving scientific literacy could be met. As teachers have inaccurate NOS conceptions, these “NOS conceptions” may be passed down to their students which distance the future generations of Malaysia from the nation’s educational goal.

Recommendations

This study reveals that Malaysian lower-secondary in-service teachers NOS conceptions. On this basis, it is prudent to look at teachers’ practices and teachers’ pedagogical content knowledge in integrating NOS in science instruction.

Abstract: Reading can be a way to increase students' social interaction and writing, especially for the need to continue to a higher level of education. Students with Autism Spectrum Disorder (ASD) show deficits in reading skills. Recent research shows that there is heterogeneity in this population, which is accompanied by a lack of personalized learning facilities. That way, there is a gap between students, learning, and the support they need. This research aims to produce a curriculum design based on personalized learning with the help of interactive media in beginning reading skills. The curriculum development model used is the Nicolls model. The results of the study show that curriculum development using the Nicholls model can be used for curriculum development in Special Schools (SLB). This is because the model emphasizes contexts and situations where curriculum decisions need to be made. In addition, the results of a limited trial show that this curriculum design is effective for students with ASD. This can be seen from the increase in student learning outcomes in beginning reading skills, especially in introducing words, syllables, and letters. Future research is described in this paper.

Keywords: curriculum development, personalized learning, autism spectrum disorder, early reading, sas method

Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1063-1074), Cappadocia, Turkiye. ISTES Organization.

Introduction

Reading skills are cognitive abilities combining information interactions and individual knowledge bases to achieve reading goals (Richards & Burns, 2012; Mart, 2012; Bojovic, 2010; Cline, Johnstone, & King, 2006). Meanwhile, with their reading skills, readers can create new knowledge and information that can be shared with others (Zajic, Solari, Grimm, McIntyre, & Mundy, 2020; A.Thompson & SusanSonnenschein, 2016). The

importance of mastering reading skills has the essential skill of listening to someone speak, and they have higher success in writing when they have a strong knowledge base through extensive reading (Richards & Burns, 2012). In addition, reading supports academic skills in continuing to the next level of education (Kaya, 2015). Thus, reading skills become a fundamental skill to be mastered by every student.

Most reading studies involving children with Autism Spectrum Disorder (ASD) have reported specific challenges with reading comprehension as well as the ability to read words as a whole (Zuccarello, et al., 2015; Brown, Oram-Cardy, & Johnson, 2013; Nally, Healy, Holloway, & Lydon, 2017). However, more recent investigations have highlighted that children with ASD exhibit a variety of reading profiles that differ across a range of reading sub-skills, including phonological awareness, decoding, fluency, and comprehension (Johnels, Carlsson, Norbury, Gillberg, & Miniscalco, 2018; Nation, Clarke, Wright, & Williams, 2006; McIntyre, et al., 2017; Singh, et al., 2017). This is because students with ASD have brain development disorders that affect language skills, one of which is in the aspect of reading (Nally, Healy, Holloway, & Lydon, 2017; Paramesti et al., 2021; Munir et al., 2018).

The changing conditions of society, schools, and students support the view of curriculum development as a never-ending activity (Nicholls & Nicholls, 2018). In its implementation, educators of students with ASD in Special Schools (SLB), have been challenged with the hope of improving their students, both in terms of daily and academic skills (Petersen, 2016). However, the diversity of students with ASD continues to increase (Nilsen, 2017). Meanwhile, the teaching system in the classroom provides the same learning resources to different students, so there is concern that there is a neglect of student learning needs (Zhou, Zhang, Zhang, & Xu, 2021; Khoirunnisa et al., 2021). That way, there is a gap between students, learning, and the support they need. This is a challenge for educators to learn according to their abilities (Mariage, Englert, & Plavnick, 2021; Munir et al., 2021). Until recently, teachers struggled to differentiate reading instruction for children with ASD (Accardo & Finnegan, 2017).

Based on the description above, the authors designed a study to develop a personalized learning model-based curriculum using augmented reality to improve ASD student's reading skills. With this in mind, the author tries to offer a new perspective on curriculum implementation, which is implemented through personalized learning models and technology.

Method

The process of developing a personalized learning-based curriculum assisted by AR media in the early reading skills of ASD students uses the Nicholls curriculum development model (Nicholls & Nicholls, 2018), which consists of five stages, namely: (1) Situational analysis; (2) Selection of objectives; (3) Selection and organization of content; (4) Selection and organization of methods; (5) Evaluation. Nicholls & Nicholls (2018) emphasize a rational curriculum development approach, especially the need for a curriculum that arises from

changing situations. They argue that change must be planned and introduced rationally and validly according to a logical process, which has not been the case in most changes. The existing stages facilitate the alignment of teaching and assessment and the alignment of teaching and curricular goals (Trachtenberg, 2020).

In the situational analysis stage, interviews were conducted with the Principal, distributing questionnaires to class teachers, and reviewing documents. In addition, make observations to identify and analyze student characteristics related to learning outcomes. The results of interviews, questionnaires, and observations were collected by selecting essential points according to research needs. At the selection of objectives stage, the determination of learning objectives was formulated by looking at the syllabus of the 2013 curriculum on Indonesian subjects and based on the results of the ASD students' initial reading ability, who then conducted focus group discussions with ASD experts. At the selection and organization of the content stage, the teaching materials used were adjusted to the student's abilities, and discussions were held with ASD experts as well as Indonesian books for elementary schools in determining them. Then in the selection and organization of methods, the method chosen is the Structural Analytic Synthetic (SAS) reading method with a personalized learning (PL) model. The SAS method can meet the needs of curious children, and educators try to provide teaching materials appropriate to the development and experience of children's language; with the SAS method, teaching materials are given through a structured approach. This method begins with the presentation of words break down into syllables and letters that stand alone and recombined them starting from letters into syllables and words. Meanwhile, the PL model selected to increased student involvement and achievement. It is hoped that motivation and learning focus will increase significantly in personalized learning in line with students' interests. The steps in this PL model are conveying goals and preparing Students, Organizing Student Choices and Votes, Accessing Information, Developing Knowledge, and Providing Feedback. In addition, the media used in the learning process is Augmented Reality (AR), with the development flow using the Linear Sequential Model by Pressman (Pressman, 2015). Finally, at the evaluation stage, it is carried out on all curriculum components to obtain an overview of the quality of a product. Expert judgment was carried out by one curriculum expert and an autistic expert, as well as an analysis of the improvement in learning outcomes for four students using the Early Grade Reading Assessment (EGRA) instrument (Gove & Wetterberg, 2011).

Results

The results of the situational analysis stage found that students have different abilities in this beginning reading skill. In reading the word, some students still need help. On the other hand, some students still cannot distinguish the pronunciation of the letters m and n, as well as p and b. Students learning styles are different; some like to be complemented by music and pictures and interspersed with drawing or coloring. The development of *Bahasa Indonesia* curriculum, especially in reading skill material, has not been developed optimally according to the needs of students. Materials and evaluations given to students have not been adapted to the abilities of students. The selection of objectives stage gives results as shown in Table 1.

Table 11. Basic Competencies, Indicators, and Learning Objectives

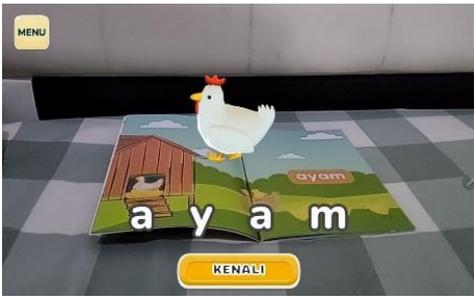

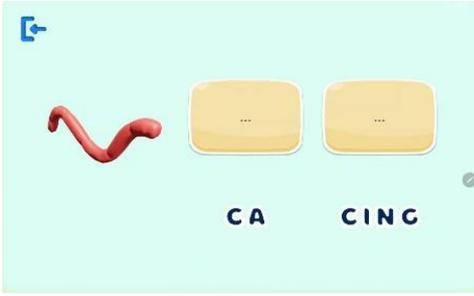

Material Load	Basic Competency	Indicator	Learning Objectives
<i>Bahasa Indonesia</i> – Reading	Describe vocabulary about various types of objects in the surrounding environment through short texts (pictures, writing, and/or song lyrics) and/or environmental exploration.	Shows letters in Indonesian / local language vocabulary	Students are able to show letters in Indonesian / local language vocabulary
	Pronouncing vocabulary about various types of objects in the surrounding environment through short texts (pictures, writing, and/or song lyrics) and/or environmental exploration.	Pronounce vocabulary in Indonesian / local languages	Students are able to pronounce vocabulary in Indonesian / local languages.
		Pronouncing syllables in Indonesian / local language vocabulary	Students are able to pronounce syllables in Indonesian / local language vocabulary.
		Pronouncing letters in Indonesian / local language vocabulary	Students are able to pronounce letters in Indonesian / local language vocabulary.

At the selection and organization of content stage, teaching materials are provided according to students' initial reading abilities. Students are grouped into three groups as follows: (1) Group one is for students who are able to pronounce vocabulary with the correct pronunciation according to the sounds of Indonesian vocabulary and sound clear and without assistance; (2) The second group is intended for students who are quite capable of reciting vocabulary with sufficient pronunciation according to the sounds of Indonesian vocabulary and clear voices and with a little assistance; (3) The third group is for students who are less able to pronounce vocabulary with pronunciation that does not match the sounds of Indonesian vocabulary and sounds that are not clear and with a lot of help. Students who belong to group 1, choose words with the form CVCCVC and two to three syllables. Group 2 selected words with the CVCVC form and two syllables. Meanwhile for group 3, the words with the CVCV form and two syllables were chosen. The material content displayed on the AR was validated by an autistic expert.

The selection and organization of methods stage produces an application based on Augmented Reality using a personalized learning model and the SAS reading method. The resulting learning activities are listed in Table 2.

Table 12. AR-assisted Personalized learning activities

Syntax	Learning Activities	Learning Activities on AR Media
Delivering Goals and preparing Students	<p>Teacher:</p> <ol style="list-style-type: none"> 1. Prepare students to take part in lessons physically and psychologically by providing motivation 2. Convey the learning objectives and outline of the initial reading material 3. Convey how to use the media 4. Showing the video as a step in apperception 	<p>In AR media, videos are shown as steps in Apperception. The video contains chants in recognition of the alphabet A-Z.</p> 
Organizing Student Choices and Votes	<p>Teacher:</p> <ol style="list-style-type: none"> 1. Give students the opportunity to choose initial reading material that they have not mastered 2. Provide material suggestions according to the results of the reading skills assessment if students cannot choose material <p>Student:</p> <ol style="list-style-type: none"> 1. Communicating interest and desire in learning to read 2. Determine the initial reading material to be studied 	<p>In AR media, students are directed to choose groups according to the results of the preliminary reading assessment.</p>  <p>After that, students can choose the material in the FunRead book that they will study according to their interests. In the book there are 15 words that can be learned by students.</p> 

		
<p>Information Access</p>	<p>Teacher:</p> <ol style="list-style-type: none"> Guiding students to access information about beginning reading material on the media Give students the opportunity to ask for help <p>Student:</p> <ol style="list-style-type: none"> Access information about initial reading materials on the media Ask for help if there are difficulties in the learning process 	<p>In this syntax, the teacher guides students in scanning markers on books as material to be studied by students. The reading method used is the SAS method so that there is a button to replace changes to the stages of the SAS method on AR media.</p>  <p>If students are able to use AR media, the teacher gives students the freedom to explore the material they will learn and provides space for students to ask questions.</p>
<p>Develop knowledge</p>	<p>Teacher:</p> <ol style="list-style-type: none"> Helping students to do exercises on the media as a form of knowledge development Helping students to validate the knowledge they have acquired <p>Student:</p> <ol style="list-style-type: none"> Do the exercises that have been provided by the teacher Pay attention to the teacher in validating the knowledge he has acquired 	<p>In this syntax, students are given practice questions in the form of drag and drop. In the first exercise, students are instructed to compose words from syllables.</p>  <p>The second exercise, students are instructed to show the letters according to what is ordered.</p>

		
<p>Giving Feedback</p>	<p>Teacher:</p> <ol style="list-style-type: none"> 1. Provide feedback if students can do the exercises correctly 2. Give encouragement to try again if students do not get knowledge correctly according to orders <p>Student:</p> <ol style="list-style-type: none"> 1. Get feedback from the teacher on the activities he is doing 	<p>In this syntax, giving feedback is done based on the answers to practice questions.</p>   <p>This feedback is complemented by a sound corresponding to the positive feedback or encouragement to try again.</p>

Finally, at the Evaluation stage, Expert judgment from experts shows that this personalized learning-based curriculum is feasible to be tested with some improvements. These improvements include adding degrees to learning objectives, simplifying instructions on AR applications, and adding material. Limited trials yielded positive results. This can be seen in the increase in student learning outcomes in reading words and syllables from the initial to the final baseline. However, the most insignificant increase was in the material to recognize letters because while at school, students have been taught to recognize letters. However, some students have problems recognizing letters with similar shapes and pronunciations.

Discussion

In the curriculum development process, it is essential to know the conditions in the field, and this is necessary because it is a guide in improving learning practices in schools (Outer, Handley, & Price, 2013). Interviews with school principals yielded that support from various parties, such as stakeholders and school members, in

implementing the curriculum was the primary key to implementing a program. As a result of research conducted by Cheung & Wong (2012) that, teachers believe a team culture allows colleagues to have the same goals and implementation strategies to work collaboratively, plus working together, they believe, will increase the efficiency of curriculum implementation. The readiness and confidence of teachers need to be increased so that learning can run effectively and increase students' knowledge (Ramli, et al., 2017). Research conducted by Mutiah, Nakhriyah, HR, Hidayat, & Hamid (2020) revealed that outreach to curriculum implementation still needs to be done to align the perceptions of each teacher in implementing the curriculum. In addition, the results of teacher interviews found that schools did not develop learning materials so that the material presented was generalized to each student with different abilities and only focused on the material contained in government books. Meanwhile, the content of learning materials is also the key to this problem because it affects children's curiosity about the material they are studying. Supported by research conducted by Karaduman & Gultekin (2007) that teachers need to develop the material to be delivered because teaching materials determine student academic success from a cognitive aspect.

The objective condition of ASD students' reading ability provides an overview of prospective students who are expected to achieve the learning objectives of reading skills that have been formulated. Each student needs this analysis for mapping material, media, and evaluation. That way, students can get treatment according to their abilities and characteristics (Susan W. Whitea, et al., 2016). Research conducted by Andi & Arafah (2017) revealed that analyzing students' needs based on their abilities could provide important information about what should be taught and how to teach these skills.

The results of this study once again confirm that the AR-assisted personalized learning-based curriculum effectively improves ASD students' initial reading skills. Supported by research conducted by Shemshack & Spector (2020), this personalized learning model is suitable for children with special needs, ensuring that schools accommodate the needs of students with different needs, interests, and goals. The research results of Basham, Hall, Jr., & Stahl (2016) also support this finding that personalized learning provides enormous growth outcomes for students with special needs. In addition, the results of this study align with the findings of Rastegarmoghadam & Ziarati (2017) that the implementation of personalized learning is more effective with the use of technology to facilitate the organization of learning with a large number of students.

Conclusion

This research resulted in a personalized learning-based curriculum design assisted by AR in learning early reading skills for ASD students. Special Elementary School (SDLB) teachers can use this product to learn early reading skills by modeling interactive and communicative learning and taking into account the characteristics and abilities of ASD students. In developing the curriculum, it is necessary to refer to preliminary studies in the field and the principles of curriculum development. The use of instructional media also greatly influences students' interest and motivation to learn. However, still consider the availability of facilities and infrastructure

in schools. In the selection of learning media, the characteristics of students need to be considered so that learning objectives are achieved effectively.

Future research can be carried out in a preliminary study that explores teacher perceptions of student-centered learning. In addition, it allows for opportunities for research on aspects of advanced reading skills. The selection of learning media does not only use Augmented Reality but with other technologies that are by the characteristics of ASD students.

Recommendations

Although the study results showed an increase in reading ability of ASD students after using an AR-assisted personalized learning-based curriculum, this cannot be separated from the limitations in its implementation. First, the number of interview subjects (teachers) in this study was relatively small. Thus, teachers' views on learning are less varied. This has implications for what needs to be considered in developing this curriculum. In addition, the subjects of this study were relatively small, so they could not be used as generalizations for ASD students' initial reading skills. Second, the material provided needs to be expanded, so students do not feel bored and can explore more material. Third, everyday environmental factors, which are the family, need to be analyzed so students can improve their reading skills by studying independently at home.

Acknowledgements or Notes

We would like to appreciate and thank PMDSU Scholarship under Direktorat Jenderal Pendidikan Tinggi, Kementerian Pendidikan dan Kebudayaan Republik Indonesia for support throughout this research, and vocational high school students for lending their precious time aiding in the success of research.

Abstract: This paper examines the structure of financial stability and how they relate to pandemic research for the COVID-19 virus. In particular, it analyses significant components of earlier financial stability and Covid-19 analysis, creating a framework to direct subsequent studies in the field. This study utilised the content analysis technique, related visualisation tools, and bibliographic mapping, and the literature on financial stability and Covid-19 was analysed. The worldwide financial crisis, particularly the most recent concern, Covid-19, was considered to have considerably shaped the features of financial stability literature. Two major observable themes from the content analysis are where the research is concentrated. There are the effects of Covid-19 and past financial crises and the impact of Covid-19 on the global financial market. However, a single database potentially limits the literature coverage. In addition, the time frame for the data collection was also short, only 3 years. This study provides a road map for further investigation in the field is offered, together with a summary of the body of knowledge on financial stability and Covid-19.

Keywords: Financial Stability, Income Stability, Covid-19, Financial Crisis, Bibliometric Analysis.

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 1075-1095), Cappadocia, Turkiye. ISTES Organization.

Introduction

According to The World Bank (2022), Financial stability is the absence of systemic events that prevent the financial system from functioning in crises. Additionally, it has to do with how pressure-resistant economic systems are. Problems in the economy may be corrected by the self-corrective systems which resulted in avoiding the unpositive events from upsetting other financial plans or the wider economy, when the financial system is in the stable position. Banking and financial industries are the backbone of the economy as they provide a lot of financial support, which strengthen the idea of the importance of financial stability. Similarly, as discussed by The Federal Reserve (2018), achieving financial stability was not about debugging or not about

stopping people or businesses from making or losing money, instead, it's focuses on a creation of a system which can withstand and absorb both good and bad economic times. It only contributes to the development of circumstances in which such occurrences do not impair the system's ability to function.

An economic system that meets the borrowing needs of average people and businesses is referred to as being financially stable, allowing them to meet their needs and wants, such as purchasing a home or vehicle, saving for the future, or funding a child's education. In the same way, to expand, build factories, recruit more workers, and pay those workers, businesses must borrow money. All of these things need a functioning financial system, which functions best when the majority of people don't even think about it. Consumers and businesses are aware that they can get financing for expensive projects like building factories, that their funds are safe, or that they can get quick loans to pay bills.

Several essential elements influence the financial system's stability in an economy. The details comprise sensible macroeconomic stabilisation measures, suitable and efficient financial surveillance and regulation, the economic resilience of non-financial enterprises and households, and many more (Caballero et al., 2011; Alexander et al., 2013; Kim et al., 2013; Abildgren, 2016).

Because individuals have little ability to manage compound of the financial products adequately, wise financial policies are vital to keep the financial sector's stability at a good level. In addition, financial regulations's purpose is viewed from a variety of angles. Some want tight financial laws and oversight, while others favor loose control (Skott, 1994 and Gordy & Howells, 2006). In each economy, they use different regulatory policies and framework and defining their policies differently. The regulatory measures that are most commonly argued over among the various regulatory standards are the three Basel II Accord pillars of capital regulation on the basic minimum amount, the extent of a government's supervisory power, and private sector supervision of banks.

The ability of a household's members to weather adverse income or spending shocks or to bounce back swiftly from difficult financial times is known as financial resilience (Mcknight, 2020). An unexpectedly significant expense, a bill for home or auto repairs, the need to replace household items, a rise in loan interest rates, a family member's illness, a relationship's breakdown, destruction of household items due to flooding or fire, or a loss of employment can all cause household financial shocks. Households must have access to enough liquid assets or emergency reserves to handle these shocks, or they must be able to borrow money from banks, extended family, or friends. The implications for financial security will linger more for people who don't have enough cash in hand or an emergency funds to cover an economic shock. This problem is why the financial stability of a household is crucial, not just to the people themselves but also to the economy as a whole.

The world economy has experienced various financial crises that have negatively influenced several nations. Between 2007 and 2009, one of the worst economic crises occurred. The term "global financial crisis" describes the era of tremendous stress experienced by the global financial and banking systems. During the global

economic crisis, a drop in the property market in the United States started an economic collapse that distributed from the USA to other parts of the globe as a result of links in the global financial system. Furthermore, a lot of financial institutions and banks experienced significant losses and needed assistance out from ruling government to operate. Like the main major markets experienced their respective harshest times of recession as of the Economic Depression in 1930, countless individuals were unemployed and could not find any jobs afterwards. In addition, recovery from the situation took considerably longer than it had for previous downturns that were not preceded by an economic crisis. (Bank of Australia, 2020).

A financial crisis is the lack of institutional and market stability within the global financial system. The three characteristics of financial stability can be used to define what the financial crisis's effects are (Zwolankowski, 2011). The first is the financial system's capacity to allocate capital efficiently. Second is a credible risk assessment and a rational appraisal of financial instruments. The ability of financial institutions to deal with shock's effects on their own, lastly. Financial crisis effects must be appropriately managed if financial stability is to be achieved.

Covid-19 was the initial cause of the most current financial crisis. Beginning in 2020, it has led to an economic decline all across the globe. Due to the strict rules, employment losses, and declining living conditions, businesses must close. The Covid-19 epidemic has prompted the introduction of regulatory actions meant to prevent diseases and promoting individual and public health. Government initiatives were focused on limiting individual liberty and stopping unnecessary output. While the country's entire area was under lockdown, respective communities responded in diverse ways, highlighting the necessity for a detailed territorial investigation of the economic ramifications. In actuality, those regional systems focusing on producing non-essential goods may have more to do with the decline in production and weakened ultimate demand that follows. The end of production of those commodities and services whose order cannot be delayed entails a complete reduction in overall output, the degree of which depends on the entire organisation of revenue production and dissemination. Additionally, the inability of those under lockdown to move between regions causes a further decrease in final demand. The financial stability of households, businesses, and the economy has significantly declined due to this issue (Deriu et al., 2022).

The difficulty that specifically came from the COVID-19 pandemic led to this study's discovery that it is essential to look further into this area. Additionally, there aren't many articles out there right now that talk about Covid-19 and financial stability. This study looked at the effects of COVID-19 and financial stability. The current condition of scholarly research on financial stability and the recent pandemic must be considered critically. The findings will make it easier for readers to understand the idea of financial stability and how it currently relates to Covid-19. The findings will also assist the readers in keeping up with current challenges with financial stability and any financial crisis. As a result, it will also aid future research and guide their objectives.

To develop a thorough understanding of earlier investigations, this study covers the key subjects of financial stability and its relationship with Covid-19 research, the field's current situation, and potential ideas for future

studies. Bibliometric analysis is used to ascertain the publication trends on the subject. It combines bibliometric analysis and a thorough literature evaluation to study financial stability and Covid-19. The following research questions (R.Q.s) are considered in this study:

RQ1: What has been the current trend in publishing Covid-19 data and financial stability statistics?

RQ2: What academic fields are most pertinent to financial stability and Covid-19?

RQ3: Who are the most well-known writers in this area?

RQ4: What is the current situation of the Covid-19 partnership and financial stability?

By giving readers an overview of the many assessments performed, this research's primary goal is to examine the current financial stability related to Covid-19. The analysis's investigations span the years since Covid-19 strikes the world and until now (2022). Softwares and system that were used to analyse and make inferences from the data in this study are Harzing's Publish and Perish, and also VOSViewer. The statistics in the figures were also analysed using Microsoft Excel. After defining important keywords for financial stability and Covid-19, the analysis was conducted using the two aforementioned tools.

The following is the order of this paper. The next section provides a brief overview of financial stability in various contexts (households, businesses, and government), followed by a relationship between financial stability to a financial crisis (especially with the Covid-19 situation). Then, it describes the methodology used to locate historical data on earlier publications on financial stability and COVID-19. The data analysis is then reported in the results section. The discussion part is further expanded by presenting the findings of a content analysis technique. The conclusion and discussion of the findings are covered in the last section.

Literature Review

Financial stability

How to establish financial stability is a topic of debate. Either strong institutions, stable markets, a lack of volatility, or something more basic are necessary for financial stability. Or it can be attained and sustained only through free market forces and individual private acts or with the assistance of the government's role in promoting financial stability. There is no firm agreement on attaining and maintaining financial stability (Hasan & Dridi, 2010).

In comprehensive terms, financial stability includes the various components of the financial system, infrastructures, organisations, and markets. Private and public individuals participate in the financial markets and essential pillars of the economic infrastructure, such as the legal system and recognised systems for financial regulation, monitoring, and surveillance. Given the close connections between each of these parts of the financial system, disruptions in any one of them could threaten the entire system's stability, necessitating a systemic viewpoint. At any given time, private institutions and activities, official institutions and actions, or

both simultaneously and iteratively, could lead to stability or instability.

The effects of the Covid-19 outbreak on economic financial stability

The ongoing COVID-19 outbreak has contributed to a rise in global income inequality, largely correcting the trend of the preceding twenty years. This pandemic represents a danger to the decline of world wealth. In contrast to the 2008–2010 global financial crisis, the Covid-19 severe recession and the slow economic recovery in emerging economies and developing nations compared to affluent economies have increased income inequality between countries. Populations' mobility may deteriorate and the country's growing inequality may become established as the outcome of the interruptions to education caused by the Covid-19 pandemic and the overwhelmingly detrimental consequences that it has on low-income families. High inflation and increasing country's budget deficits could restrict a nation's capacity to help underprivileged communities, foster recovery, and foster sustainable growth.

A systematic strategy is required to guide the global economy toward a more equitable development path. This plan must contain steps to lessen income disparity and instability through national changes and with assistance from the international community (Adarov, 2022). To reduce inequality and instability between countries, productivity and enhancing measures are needed in emerging and developing economies. Next are initiatives to increase access to infrastructure, digital services, health care, and education, focusing on disadvantaged population groups. Last but not least, support from the international community is needed to address debt burdens and maintain an open and rules-based global trade and investment environment that fosters a quicker rate of efficiency increase in the economy.

Data and Methodology

The method utilised to choose the data, which began on February 7, 2022, based on the S.C.O.P.U.S. database, is depicted in Figure 1 above. Numerous search results with the keywords; (1) firm resilience, (2) bank resilience, (3) financial resilience, (4) financial crisis, (5) bank sustainability, (6) firms sustainability, (7) income sustainability, (8) financial well-being, (9) financial distress, (10) income stability, (11) systemic risk, (12) Lerner, (13) soundness, (14) market power, (15) insolvency risk, (16) systematic risk, (17) systematic soundness, (18) income stability, (19) Covid-19, (20) Pandemic Covid 19, (21) Coronavirus Disease 2019, were employed to facilitate a more thorough search.

Important publication components, like citation information, are provided via the S.C.O.P.U.S. database. The publications were examined, along with features of financial stability and Covid-19, and a search string was made using the keywords discovered. The search term was developed to cover all the topics covered in the Covid-19 research, including the countries, authors, and factors. Then, a list of 83 articles on financial stability and Covid-19 that were published between 2020 and 2022 was compiled.

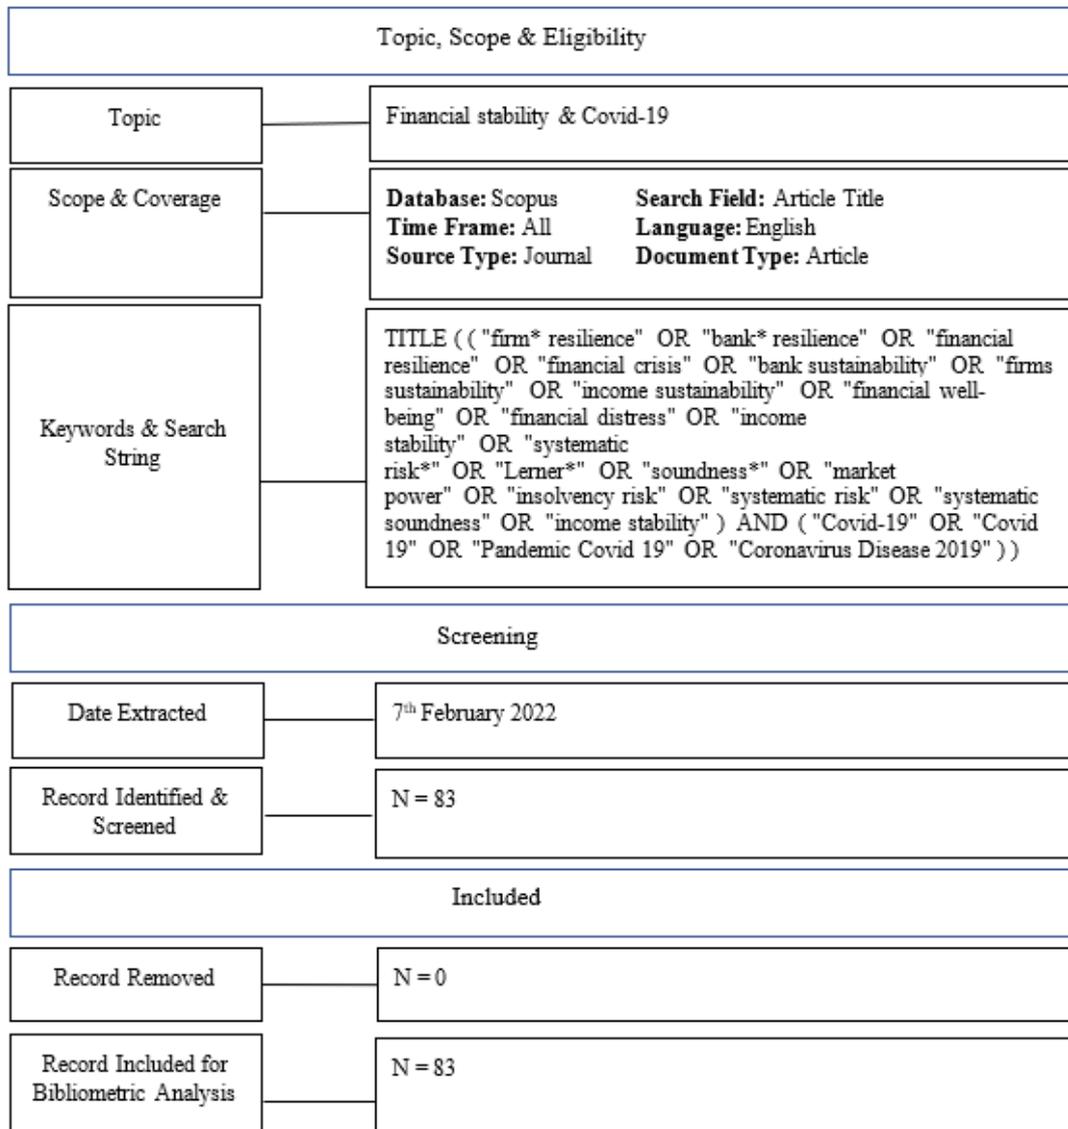

Figure 1. Flow diagram of the search strategy

Analytical Technique

A scientific discipline's fieldwork activities may provide insight into the discipline's structure (Ronda-Pupo, 2017). The design of financial stability and Covid-19 is ascertained via a bibliometric analysis. When combined with network analysis, it produces a potent combination that shows the structure and critical subjects of a research area. Consequently, this analysis makes it feasible for us to spot existing trends and potential study possibilities (Li, Wu & Wu, 2017). This paper combines a bibliometric investigation with a thorough literature review for these reasons. To undertake a bibliometric analysis of the relationship between financial stability and Covid-19 literature, citation analysis, co-citation analysis, keyword co-occurrence analysis, authors rank analysis, and co-authorship analysis were all employed. These frequently used tools are suitable for answering our research questions. Software like VOSViewer and Harzing's Publish or Perish was employed to assess the outcomes. Utilising Microsoft Excel, the data results were finalised.

Findings and Discussions

Publication by year

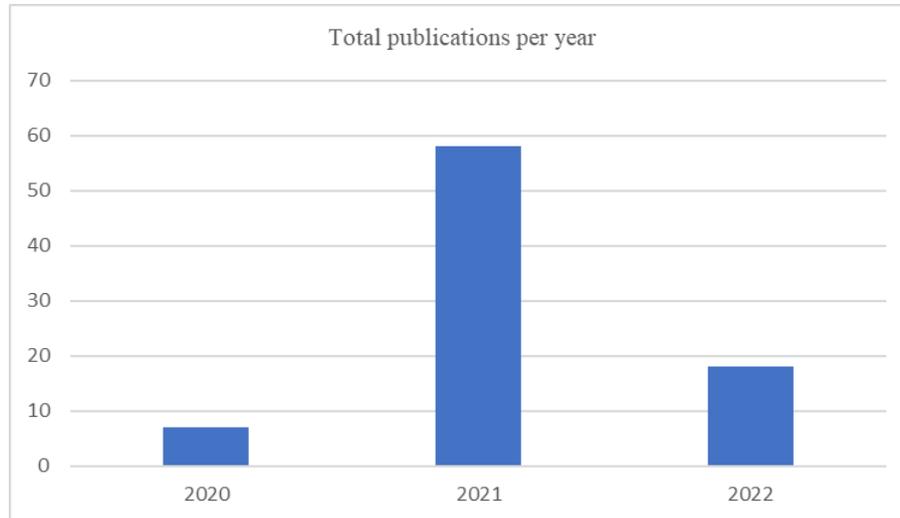

Figure 2.: Total publications by year

Table 1.Total publications by year

Year	TP	NCP	TC	C/P	C/CP	<i>h</i>	<i>g</i>
2020	18	18	210	11.67	11.67	7	14
2021	58	58	229	3.95	3.95	8	13
2022	7	7	3	0.43	0.43	1	1
Total	83	83	442	16.05	16.05		

Notes: TP=total number of publications; NCP=number of cited publications; TC=total citations; C/P=average citations per publication; C/CP=average citations per cited publication; h=h-index; and g=g-index.

Figure 2 and Table 1 illustrate the number of articles on financial stability and Covid-19 between 2020 and early 2022. The significant increase in reports after 2021 could be due to a higher number of cases in 2021 than in 2020 when the epidemic first struck.

Publishing activity by country

Table 2.Top 20 Countries contributed to the publications

Country	TP	%
United States	17	20.48%
United Kingdom	12	14.46%

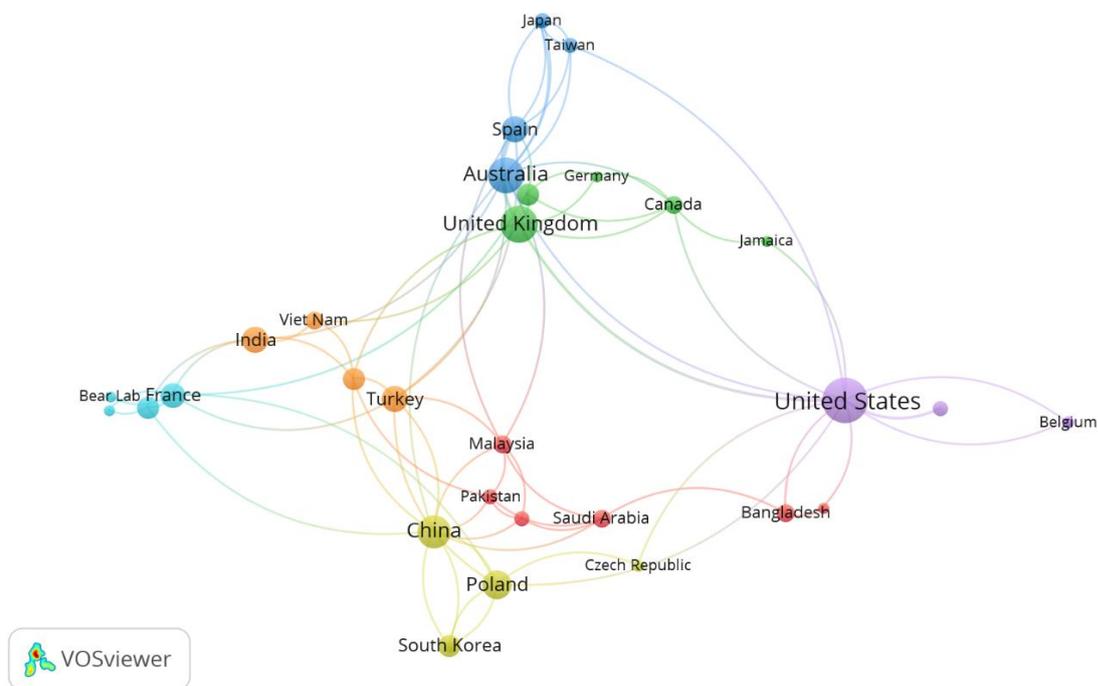

Figure 3. Visualisation map for publication based on co-authorship of countries

As indicated by contributions from numerous countries, researchers have devoted special attention to macroeconomic stability and Covid-19. Table 2 displays the top 20 publishing countries regarding financial stability and Covid-19, with the U.S., U.K., and Australia ranked first, second, and third, respectively. The top publishing countries in Asia are China, India, and South Korea. In addition, we run the data based on the countries with co-authorship. The United States is the largest country having the most co-authored publications with other countries. Figure 3's visuals substantiate this assertion.

Publishing activity by Journal

Table 3. Top 20 Sources contributed to the publications

Table 3 shows the periodicals with the most papers on financial stability and covid-19. Popular publications include the Finance Research Letters and Sustainability Switzerland.

Publishing activity by author and organisation

According to our data, publications on financial stability and covid-19 were written by 5,815 writers. Table 4 and Table 5, respectively, highlight the top contributing writers and organisations. According to the table, Gajdzik, B. (three) authored the most papers on financial stability and Covid-19, followed by Barrafreem, K.

(two). The most active entities in this field were The Australian National University, which published 3 articles, and the Silesian University of Technology, which also published 3 papers. The top writers and institutions hail from various European, American, and Asian countries. As a result, contributions to financial stability and Covid-19 research have been made worldwide.

Table 4. Most Productive Authors

Citation network analysis

We examined the citation networks of 83 articles to determine which publications have the most significant influence on financial stability and Covid-19. Although there are other methods for measuring a research paper's impact, the most frequent is citation analysis (Ding and Cronin, 2011). We can make intellectual connections using citations and referencing (Appio et al., 2014). The number of sources from other works is used in citation analysis to determine the impact of a publication. VOSViewer was used to do our citation analysis.

Table 6 is a list of the most important research articles. K. Shehzad, L. Xiaoxing, and H. Kazouz (2020) had the most references (78), followed by T. Ahrens and L. Ferry (2020), with 30 citations. Figure 4 depicts the crucial nodes in the citation network that show a study's impact on the body of knowledge on financial stability and Covid-19. As a result, articles with more citations significantly impact the field of financial stability and Covid-19.

Table 6.:Top 15 Highly cited articles

No.	Authors	Title	Year	Cites	Cites per Year
1	K. Shehzad, L. Xiaoxing, H. Kazouz	COVID-19 disasters are perilous than Global Financial Crisis: A rumor or fact?	2020	78	39
2	T. Ahrens, L. Ferry	Financial resilience of English local government in the aftermath of COVID-19	2020	30	15

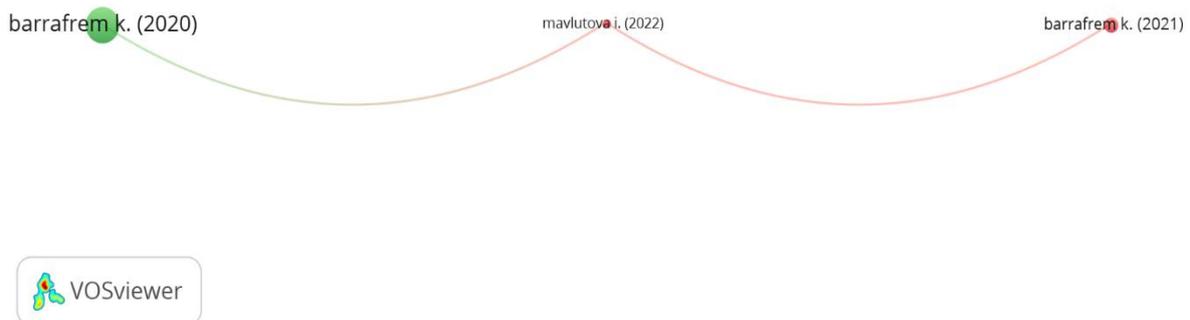

Figure 4. Network visualisation map of the citation by documents
Minimum number of citations of a document = 1

PageRank analysis

According to Ding et al. (2009), PageRank is a supplement to citation analysis, which aids in the discovery of publications referenced by highly cited papers. We created a network map to show the relationships between the referenced papers and the journal writers on the topic of interest. A map of the network display of document citations per country is shown in Figure 5.

A minimal amount of documents required by a nation and sources is set at one. Forty-three countries published research on financial stability and Covid-19, and all matched the criteria. Only five countries, however, are linked and grouped into two clusters. The largest circle on the network map represents China. It reveals that the most cited articles in the study topic's publishing are those written by Chinese authors. By looking at the other significant circles on the network map, we could identify papers written by authors from Tunisia, Poland, South Korea, and Switzerland that are frequently discussed.

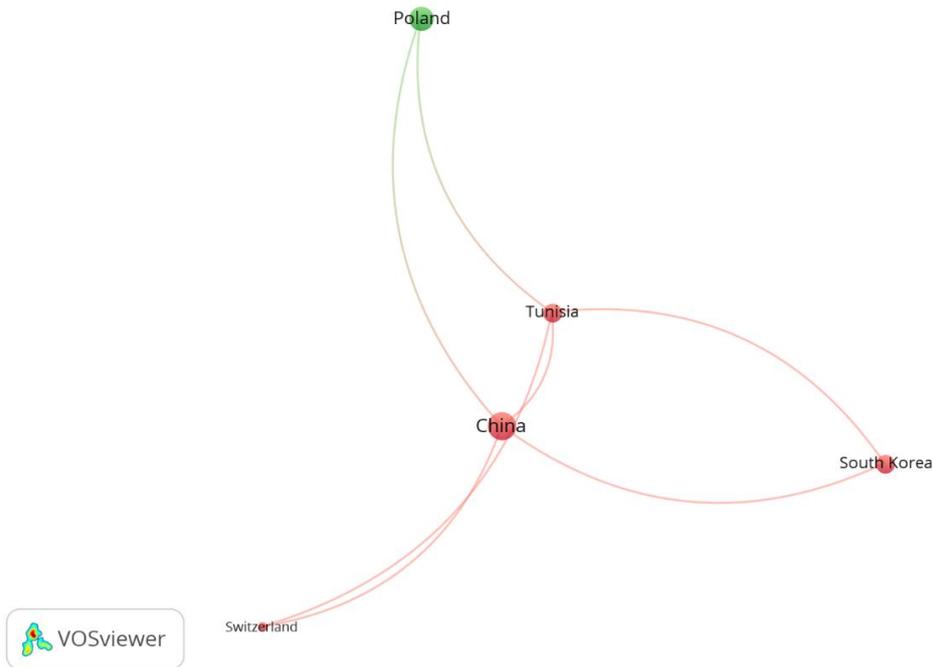

Figure 5. Network visualisation map of the citation countries (PageRank)

Note: Unit of analysis = Countries

Keyword and co-occurrence analysis

Using co-occurrence and keyword analysis, one may make sure that an article's keywords are appropriately represented by its author (Comerio and Strozzi, 2019). Whenever two keywords occur within the same paper, it is known as keyword co-occurrence and suggests that the terms are related. Focuses on identifying the most well-known topics between financial stability and Covid-19 experts. We employ keyword and co-occurrence analysis in the VOSViewer to address this.

We use co-occurrence analyses to analyse the most common topics in financial stability and Covid-19. According to Table 7, the most commonly used keyword in the literature on financial stability and Covid-19 appears to be "Covid-19" and "Financial crisis". It demonstrates that the authors would like to show that the economic problems they discussed happened during the Covid-19 phase of time. Covid-19, the financial crisis, and the pandemic are the network's most notable nodes, as shown in Figure 6, indicating their relative importance in financial stability and Covid-19.

Table 7. Top 20 Keywords

Author Keywords	Total Publications (TP)	Percentage (%)
COVID-19	46	55.42%
Financial Crisis	16	19.28%

Pandemic	15	18.07%
Human	13	15.66%
Global Financial Crisis	10	12.05%
Humans	9	10.84%
Coronavirus Disease 2019	8	9.64%
COVID-19 Pandemic	7	8.43%
Pandemics	7	8.43%
Article	6	7.23%

Note: Unit of analysis = All keywords; Counting method: Full counting; Minimum number of occurrences of a keyword = 5

Co-authorship analysis

We review the current level of collaboration and describe the leading writers in this field to find the most prominent authors on financial stability and Covid-19, as well as the current state of cooperation in this subject. The most standard form of intellectual interchange is a scholarly collaboration (Cisneros et al., 2018). Platforms for international cooperation enable developing countries to participate in information creation, frequently pioneered by affluent countries (Palacios-Callender and Roberts, 2018). Any interaction between two opposing viewpoints leads to the formation and maturation of notions. This interaction improves the quality of a multi-author work by minimising errors and incorporating contributions from different fields (Tahamtan et al., 2016).

This section looks at the scope of academic collaboration and identifies the most influential authors in the educational complex formation. Askar S. E., Zaman K., Abdul Aziz A.R., Peng M.Y., Sasmoka & Jabor M.K., Yu D., Nassani A.A., Qazi Abro M.M. and Anser M.K., as illustrated in Figure 7, are prominent authors in a collaborative process. They form a coherent group of authors, concentrating their efforts on authors from their respective countries. Most of the nodes in this network are two-node networks, meaning that most of the study is focused on a few authors. As a result, the co-authorship network can be considered a collection of closed networks with few interactions. The development of a discipline requires collaboration among researchers. As a result, more international cooperation is needed.

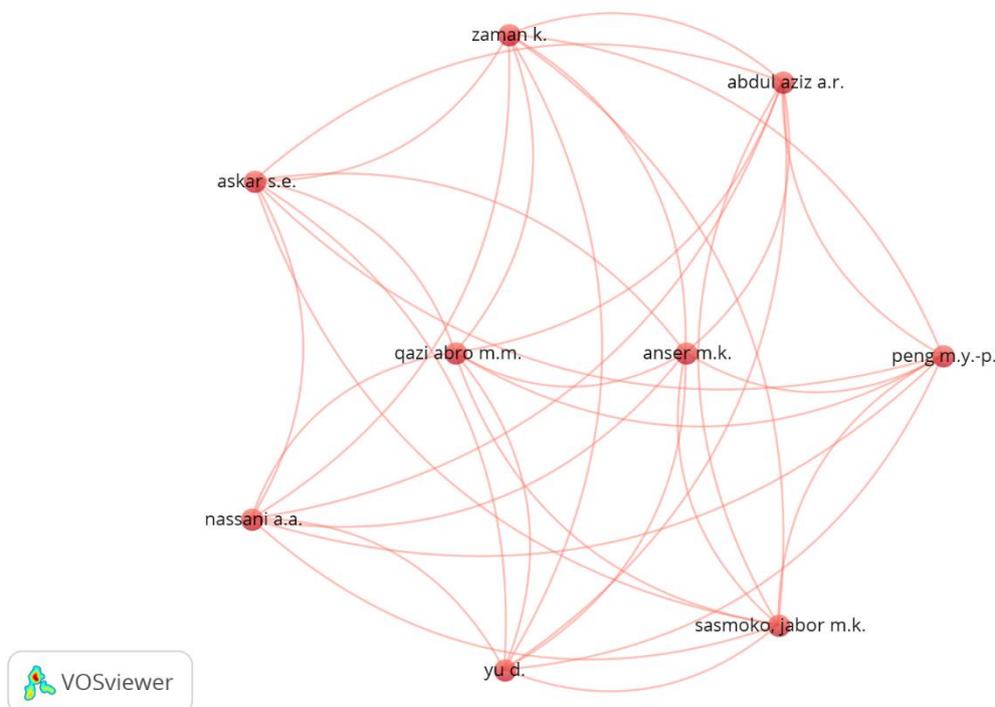

Figure 7. Network visualisation map of the co-authorship

Note: Unit of analysis = Authors; Counting method: Fractional counting; Minimum number of documents of an author = 1; Minimum number of citations of an author = 1

Co-citation analysis

The frequency of two articles are mentioned together is known as co-citation, according to Small (1973). According to Rosetto et al., co-citation analysis in bibliometrics might show the intellectual organisation of a field (2018). It is also important to emphasise the objectives, structure, and advancements in a study topic, according to Liu et al. (2015).

We used the VOSViewer tool to generate a network map to visualise the co-citation network among the referenced authors in the study topic's publication. Complete counting was used, and at least ten author citations were necessary. Figure 8 depicts a network map of co-citations based on cited authors. Out of 5,815 authors, 39 fit the criteria, but they are only 37 authors are connected. There are five clusters on the network map. The authors in the same cluster are thought to have cited one another in their writings. Each group usually describes a different point of view on financial stability and the situation in Covid-19.

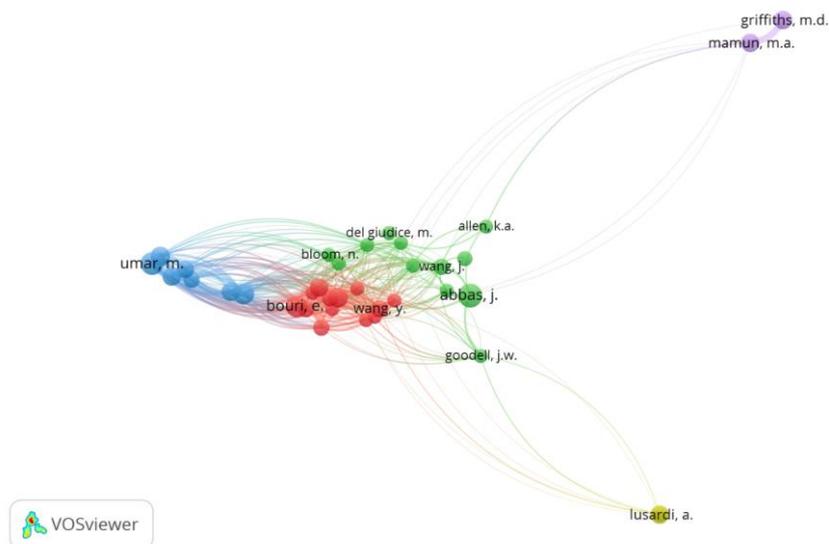

Figure 8. Network visualisation map of the co-citation analysis

Note: Unit of analysis = Cited Authors; Counting method: Full counting; Minimum number of citations of an author = 10

Literature classification

Radicchi et al. (2004) state that clustering has been utilized in previous studies to create collections of research articles. According to Xu et al. (2018), data clustering reveals collaborative and connection patterns in a co-citation analysis. We selected the minimal amount of citations and decided on complete counting of a cited reference to 2 by running the co-citation analysis of the cited references using VOSViewer software. Only 25 of the 3,637 mentioned references satisfied the criteria, and only 13 were related. Figure 9 depicts the three clusters by giving each one a different colour.

Figure 9. Network visualization map of the co-citation analysis

Note: Unit of analysis = Cited reference; Counting method: Full counting; Minimum number of co-citations of cited reference = 2

Content analysis

Analysis of the co-citation network revealed research groupings. For each group, there is a content analysis in this section. The VOSViewer programme was used to execute the co-occurrence term map to perform the content analysis. There were 2,056 terms available by referring to the terms from the topic of this study's title and abstract. However, by limiting the number of occurrences of a term to a minimum of 1,013 final terms were determined as the most relevant to this study.

It contains a total of 13 keywords. According to (Fahimnia et al., 2015; Xu et al., 2018), reviewing the top 10 articles in every cluster to determine a unifying theme is a regular strategy.

Cluster 1: The different effects of Covid-19 and past financial crises

In several nations, COVID-19 has had a more significant impact on stock market volatility than the past financial crises. The study found that the health crisis brought on by COVID-19 was what initially triggered the financial issue. Furthermore, this cluster concludes that each situation has its unique container market repercussions. Many temporal and spatial sequences in COVID-19 can be compared to the 2008-2009 financial crises, such as supply and demand shocks on container ports and the container shipping company. The COVID-19 dilemma also has the potential to significantly impact small and medium-sized business (S.M.E.) creativity, in addition to having a negative impact on world economy.

Cluster 2: The effects of Covid-19 on the global financial market

The second cluster concentrated on the financial market's effects of Covid-19 as a result of the global financial

crisis. It implies that, following the global financial crisis (Covid-19), investors will be more vulnerable to asset losses and likely to engage in stock market herding. Furthermore, this cluster has significant consequences for stock market asset allocations, particularly in the United States. Even during the global financial crisis of 2008, silver and the Islamic stock index were safe zones. During extreme market downturns, gold and Bitcoin, as well as during the phase of Covid-19, continue to demonstrate positive behaviour.

Findings and Conclusions

Many researchers believe that the effects of Covid-19 will be similar to, if not worse, previous global financial crises. It has been argued that the results of the Covid-19 epidemic may have a negative economic impact on businesses and individuals. In this section, we'll go over the details of the top three most cited papers. We believe it is necessary to summarise and study these studies to understand how Covid-19 affected global financial stability. The debate in this field has lasted from 2020 to now (2022), with Covid-19 striking first in early 2020 around the world.

To begin, a study by (Shehzad et al., 2020) looked into the Asymmetric Power G.A.R.C.H. model and discovered that COVID-19 significantly negatively impacts market returns in the United States and Japan. Furthermore, COVID-19 has had a more significant impact on stock market volatility in the United States, Germany, and Italy than prior Global Financial Crises. The investigation confirmed that the health crisis caused by COVID-19 triggered the global financial crisis, yet, the Asian markets continue to offer excellent opportunities for portfolio optimisation. This analysis also supported the pressure impact in such areas. COVID-19, according to the inquiry, has halted the global economic cycle and has the potential to create further hazardous market shocks. As a result, a large percentage of the money should be allocated to preventing future pandemics.

Then we looked at the (Broadstock et al., 2021) study to see if Covid-19 affects financial stability. They look at the role of environmental, social, and governance (E.S.G.) effectiveness throughout the COVID-19 pandemic-induced global financial crisis. It represents a highly negative mood among investors, as evidenced by the massive drop in global equity values during the COVID-19 epidemic. As a result, the particular circumstances for Broadstock's research give an unrivalled chance to ask if investors understand E.S.G. performance as a predictor of future stock performance and risk avoidance. The findings revealed a few outcomes that were relevant to our research. To begin with, E.S.G.'s performance reduces financial risk during a financial crisis and diminishes in 'normal' times, showing its incremental importance during a crisis.

Finally, we looked at a study by Ahrens & Ferry (2020) that was relevant to our situation. According to the report, the government plays a critical role in preventing COVID-19 from negatively impacting a country's financial status. Despite increased service needs, the financial stability of local governments has been a crucial worry over the last decade due to the lack of funding and its impact on local government budgets. More recently, the magnitude and unexpectedness of the COVID-19 crisis have compounded financial stability issues.

Their research examines the financial management measures that an outbreak of this scope that spreads quickly and widely would require. Policymakers must consider how to enhance organisations and economic resilience in preparation for national crises instead of local-level crises, keeping in mind that the central government must borrow from local governments during short-term emergency lack of funding the appropriate amount for each local authority (Travers, 2020).

Abstract: Cyberbullying is a relatively new phenomenon that poses a serious problem, because anyone can become a victim of cyberbullying. Due to the special technical possibilities of social media, it can have long-term effects on the victims, especially on the well-being of young people. The aim of this study is to collect data on related topics such as demographic profiles, social media use, experiences of cyberbullying, attitudes towards cyberbullying and suggestions to curb cyberbullying in Malaysia. An online questionnaire survey was conducted with 50 respondents. The results show that bad things are done to the victims of cyberbullying, causing emotional disturbance and trauma to the victims. Rule utilitarianism and action utilitarianism are used in certain cases to solve the ethical problem of cyberbullying. Although there is no specific law against cyberbullying in Malaysia, there are certain laws such as the Computer Crimes Act 1997, the Communication and Multimedia Act 1998 and the Penal Code to combat cyberbullying. The solution has also been highlighted through awareness campaigns to prevent cyberbullying. For the concerned parties, developing concrete strategies to reduce cyberbullying among youths in Malaysia should be a major concern.

Keywords: Cyberbully, social media, Campaign, Computer Crime Act, Wellbeing

Citation: Nasruddin, Z.A., Mohd Ariffin, N.H., Mohd Azmi, N.K., Mohd Nazri, U., Khairulrizal, N.H., & Irwan Mazlin, N.U.Z. (2023). Cyberbullying Among Youths in Malaysia. In M. Koc, O. T. Ozturk & M. L.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1096-1112), Cappadocia, Turkiye. ISTES Organization.

Introduction

The word "bully" was used as early as the 1530s. bully is used to describe a person who is overly aggressive, the bully towards the victim. Bullying involves the use of physical, verbal or other forms of abuse to gain a sense of superiority and authority over the victim. Verbal and physical attacks as well as gossip and rumours are examples of bullying (Mishna et al., 2020).

It is widely recognised that bullying is the systematic and repeated use of aggression by peers (Burton et al., 2013) and is a purposeful act of aggression in which unequal power relations are exploited to inflict pain or gain material for social advantage (Frey et al., 2009). However, as technology has advanced, new forms of aggressive behaviour have emerged, such as cyberbullying. It is widely recognised that social media serves as a source of social acceptance and reinforcement due to its widespread use by people of all ages.

People can use this platform to communicate ideas, interact socially, build relationships, gain the attention of others and create a social image. Over-engagement in social media has become a "psychological imperative" to help people cope with the pandemic and satisfy their need for human interaction, as social distancing has become the new norm in the current global crisis of the COVID -19 outbreak (S. Singh et al., 2020). The pandemic and the new digital reality collided at the same time, forcing people to deal with both problems simultaneously.

Schools and businesses now use numerous online platforms to conduct business, so more and more people are present online without intending to be. This has led to an increase in cybercrime, including cyberbullying. While cyberbullying has been a common form of online harassment for some time, the pandemic is believed to be responsible for the increase in reported cases of cyberbullying. It has affected people's physical, psychological and emotional well-being (Barlett & Rinker Brendan Roth, n.d.) .

Consequently, many young people are already at risk of cyberbullying and will continue to be exposed to the need to use social media to carry out their daily activities in this pandemic. It is important to protect them from the dangers of cyberbullying. When it comes to protecting personal information, procedures should be put in place to ensure its privacy and security (Thseen, 2021) . Combating cyberbullying requires the use of appropriate technologies and pedagogical approaches. These proposals should also be revised as they apply to all cases of cyberbullying, not just those that occurred during the pandemic. Bullying prevention initiatives are becoming more effective as we know more about the causes of bullying and the specific strategies used by bullies. With the acceleration of technological progress, it will be more difficult than ever to develop effective prevention measures against cyberbullying

Identification Of Issue

Cyberbullying in Malaysia

According to (Ahmad Ghazali et al., 2020), there is a strong correlation between cyberbullying and factors such as age, loneliness, self-esteem and empathy, with male youths in Malaysia more likely to be involved in cyberbullying than females. In Penang, Malaysia, the prevalence of cyber victimisation and cyber perpetrators in the last month of cyberbullying experience is 31.6 per cent. However, the prevalence more than doubled when limited to experiences in the last three months (Ahmad Ghazali et al., 2020). These findings show how serious cyberbullying is in Malaysia. Due to the combination of leisure and domestic pressures, the introduction of MCO has inadvertently increased these symptoms (Basir et al., 2020). According to Datuk Dr Amirudin Abdul Wahab, Chief Executive Officer of Cyber Security Malaysia (CSM), society needs to be more sensitive and prepared to deal with the growing problem of cyberbullying, which causes more harm than physical bullying.

According to the Malaysian Institute for Youth Development Research, cyberbullying increased by an incredible 55.6% in 2013 alone. It is believed that 389 cases of cyberbullying occurred among teenagers, with an average of 62.3% of victims having been cyberbullied, while the remaining 37.7% had never been cyberbullied.

In addition, since the introduction of MCO, many teenagers aged 15-25 have spent their study time at home and used the internet for educational purposes. In addition, young people need a break from scrolling through social media platforms such as Tiktok, Instagram and Twitter. However, these youths are vulnerable to cyberbullying as the internet is a borderless space. If left untreated, cyberbullying can have a variety of negative consequences for individuals. Therefore, this study examines the problem of cyberbullying among children, the variables that contribute to it and the measures that can be taken against it.

Types of cyberbullying

Numerous studies have been conducted to gain a better understanding of the issue, and several of them have divided the broad term "cyberbullying" into specific types.

According (Kaspersky, 2021; Nambiar P, 2020; Securly, 2021). The categories are highlighted below:

- Exclusion: an intentional act of excluding a person.
- Harassment: Persistent pattern of unpleasant or threatening online messages intended to cause harm to another person.
- Outing: Public disclosure of sensitive or intimate information about another person without their consent in order to dishonour or humiliate them.
- Trickery: The gesture of (unknowingly) enticing someone to reveal or publish their personal

information.

- **Cyberstalking:** The use of the internet or other virtual methods to deliberately harass and threaten a victim, which may occasionally be accompanied by physical stalking.
- **Fraping:** When a victim of bullying uses your child's social media accounts to post inappropriate things on their behalf, this is called fraping. When friends share funny posts on each other's pages, it can be harmless, but it can also be very damaging. For example, a bully might use another person's profile to spread racist or misanthropic remarks, damaging their reputation.
- **Camouflage:** A bully who knows the victim personally develops a fictitious internet presence or identity with the sole purpose of bullying another person. He may choose a new persona and images to deceive the victim.
- **Dissing:** Actions of a bully who knows the victim and reveals compromising information about the target in public posts or private discussions to destroy their reputation or damage their relationships with others.
- **Trolling:** The bully attempts to deliberately upset others through inflammatory comments on social media.
- **Flaming:** Directly posting or sending insults and obscenities to the victim to provoke them into an online confrontation.

Hate comments

Hate speech is any expression intended to insult, demean or incite hatred against a group or class of people because of their race, religion, colour, sexual orientation, gender identity, ethnic origin, disability or national origin. (Ward, 2021) This section describes the case of Thivyaanayagi Rajendran, a 20-year-old woman from Bukit Mertajam. It all started with a Tiktok video in which Thivyaanagi and a foreign colleague acted out a scenario from a Hindi song for entertainment purposes, which was perceived by online users as dating. The video was originally posted by one of her colleagues before it was re-uploaded by a Facebook user under the title "Joke Oruvan" with the Tamil caption "How did this girl fall in love with a Bangla. everyone will undoubtedly bless you". Over 300 comments criticised her for dating a foreigner. (Nambiar P, 2020) Her uncle, K Sathyaseelan, reported the incident to the police for further investigation. To put an end to the nasty comments,

Thivyaanagi's family wrote to the Facebook user asking him to delete the video. However, the user refused and demanded a video apology. On the same day, at around 9:30pm, Thivyaanagi's brother discovered her younger sister hanging in her bedroom. She committed suicide and wrote a note apologising for embarrassing her family. She stated that her actions were triggered by Joker Oruvan's behaviour. The poor young woman had been in a wonderful relationship with her partner for three years and was supposed to get married at the end of the year, but it never happened. Her family wanted justice for her death and called on the government to take the matter more seriously.

Sexting (harassment, outing)

Sexting is a form of cyberbullying that combines outing and trickery to obtain sexually explicit photos or videos of the victim. The perpetrators then disseminate and circulate the sensitive content. (M. M. Singh et al., 2017) This section discusses the case of a 22-year-old woman from Jempol, Negeri Sembilan. It begins with her meeting Mohamad Fazrul Mohd Fuzi, a 26-year-old man from Kuala Pilah, Negeri Sembilan. To demonstrate their love for each other, the two exchange sexual photos of each other. On one occasion, the 22-year-old woman expressed her desire to end their relationship. Mohd Fazrul was furious and refused to accept the reality. He then threatened to spread private pictures and videos of his ex-girlfriend via WhatsApp if she did not get back to him. Raya Muhammad Amirul Noor Hashimi, Deputy Public Prosecutor, took the matter to court and Mohd Fazrul was fined RM3,500 after he pleaded guilty. (A. H. A Manap, 2021) From this incident, we can conclude that sexting can lead to harassment and cyberbullying.

Hack

According to an Ipsos survey on global problems predicted for 2020, 51% of Malaysians said it was likely that their personal online accounts would be hacked in that year. (R. Hirschmann, 2023) The case discussed in this section is that of Keem Ooi, a self-taught baker who impressed her fans on social media with her innovative cakes and pastries. (T. A Yusof, 2020) Faced with her sudden fame, Ooi asked for a 'blue tick' on Instagram to verify her account. One day, she received a direct message (DM) in her inbox that appeared to be from Instagram asking her to click on a link to verify her email address and confirm the verification process. Thinking it was nothing out of the ordinary, Ooi followed the instructions. After noticing an unexpected login to Turkey, the hacker deleted all photos on @keempossible. As a result of this incident, Ooi lost her six-year-old account and was forced to create a new one.

Cyberstalking

Cyberstalking is a particularly serious form of cyberbullying as it can include threats of physical harm to the target. It can involve surveillance, false accusations and threats and is often associated with offline stalking. It is a criminal offence and the perpetrator may face a restraining order, a suspended sentence or even imprisonment. (Securly, 2021) This section is about the modesty of former Miss Universe Malaysia Sabrina Beneett. The former beauty queen's ill-treatment came to light when she suddenly broke her silence on social media, stating that she had been subjected to years of persistent harassment, threats and stalking by the perpetrator.

The 31-year-old psychology and communications student said the perpetrator followed her activities and used many fictitious social media accounts to harass her, even threatening to "destroy" her. She stated that the harasser identified the places he saw her and even identified the friends she was with and the clothes she was wearing, although she made an effort not to post her whereabouts on social media when she was out and about. She said the offender used many fictional personalities to leave filthy obscenities and violent language on her

social media pages, including mocking her modesty. Under Section 509 of the Penal Code, anyone who knowingly insults the shame of a woman by words, sounds, gestures or the display of an object is liable to imprisonment for up to five years or a fine of up to \$5,000, or both. As a result, a 33-year-old unemployed man was convicted by the Magistrate's Court after pleading guilty and paying a RM1,200 fine on the spot at the Jalan Duta Magistrate's Court (Thasha Jayamanogaran, 2021).

Impact of cyberbullying

Abusive behaviour among young people is an ongoing problem that can cause physical and psychological harm to those involved. The impact of cyberbullying on victims is more severe than traditional bullying because cyberbullying can take place around the clock and information can be disseminated more quickly to a larger population through social media. Bullying can have devastating consequences that vary from person to person, as the threshold for different types of bullying, the intensity and frequency depends on the individual.

Eating disorders and sleep disorders are classified as physical effects of cyberbullying. An eating disorder is when a person experiences serious disturbances in eating behaviour, such as skipping meals or binge eating, or when they worry about their body shape and weight. Cyberbullying can increase the risk of bulimia nervosa and anorexia nervosa by increasing the likelihood of dieting and dysfunctional weight control practises to cope with body dissatisfaction and low self-esteem (J. H. Marco, 2018). Cyberbullying can disrupt a person's sleep patterns. Adolescents who were victims of cyberbullying also reported more overall sleep problems, excessive sleep, insomnia, inadequate sleep and parasomnias (Rzewnicki et al., 2020).

In addition, depression and anxiety, low self-esteem, and suicidal thoughts and self-harm are classified as psychological effects of cyberbullying. Victims of cyberbullying may develop depression, anxiety and other stress-related disorders. The added stress of dealing with cyberbullying on a regular basis can rob them of their happiness and satisfaction. According to one study, 93% of cyberbullying victims showed severe effects, with most victims expressing sadness, hopelessness and powerlessness (Nixon, 2014).

Furthermore, cyberbullying often focuses on what already makes victims vulnerable. Victims of bullying may develop a strong dissatisfaction with themselves. This can lead them to begin to doubt their worth. Researchers suggest that cyberbullying can lead to psychological maladjustment and low self-esteem because young people have a strong psychological need to belong and be accepted by their peers.

Targets of cyberbullying may hurt themselves in some way because of their overwhelming feelings. For example, some people hurt themselves by cutting or burning themselves. In fact, studies have consistently found a link between bullying and self-harm. Suicide is also encouraged by cyberbullying. Young people who are regularly bullied by their peers through instant messaging, texting, apps or social media may believe that the only way to relieve the pain is to end their lives.

Target Community and Context of Study

In addition to the fact-finding, a self-administered online questionnaire via Google Forms was used to collect young people's perceptions of cyberbullying. The link to the questionnaire was shared in WhatsApp groups and on Instagram. This approach enabled the collection of relevant data in a relatively short time and proved practical as the students had access to the young people's age groups. It took about five days to collect all the relevant information.

Participants

A quantitative survey was chosen to collect data on cyberbullying among adolescents. The 50 respondents were 70% female and 30% male. The target groups for data collection on cyberbullying in Malaysia are youths aged 15 to 24 years. About 64% of them fall into the 22-24 age group. The majority of the respondents (58%) have a Bachelor's degree. Moreover, the majority of the respondents are Malays (96%). According to the findings, 68% of the respondents are active users of social media and their daily internet usage ranges from 9 to 18 hours.

Those who are considered victims of cyberbullying and have experienced bullying others online are also our target group. In addition, to protect the anonymity of the respondents, only some personal variables such as gender and age were collected.

Measures

Sections A and B began with demographic information such as gender, age, highest educational attainment, race and religion. This section also asked about frequency of internet use in hours and whether or not they were active social media users.

Sections C and D collected information about respondents' experiences as a bully, victim and/or bystander. The survey began by asking respondents if they had ever been bullied in their lives, bullied someone or witnessed a bullying situation (dichotomous; yes or no). If the question was answered in the affirmative, the respondent had to answer a series of questions. For example, if the question about cyber victimisation is answered in the affirmative. In this case, the following questions are asked: "frequency of cyberbullying", "perpetrator of cyberbullying", "type of cyberbullying experienced", "cyberbullying platform", "measures against cyberbullying" and "impact of cyberbullying". If cyberbullying is answered yes, the following questions are asked: "Reason for participating in cyberbullying" and "Form of cyberbullying".

Sections E and F captured respondents' perspectives on cyberbullying, bullies and victims. Respondents were given response options on five Likert scales ranging from 0 (strongly disagree) to 5 (strongly agree). Section G began with the question on measures to curb cyberbullying in Malaysia. This section contained multiple choice

answers where more than one answer could be selected. Finally, the question asked for further suggestions, if any.

Issue Analysis and Critical Thinking

Most popular platform used for cyberbully

It is common for young people to use online social networking sites (SNS) to socialise. These sites make up a large part of their daily internet use (Campbell, 2012) . Another aspect is that social networks make it easier for cyberbullies to target their victims. The figure above shows the result of the most popular platform for cyberbullying. Instagram (52.4%) has the highest percentage. Twenty-two out of 42 respondents have experienced being bullied on Instagram. Twitter is also the most popular platform among respondents with 45.2%. These platforms are a good place for people to socialise and have fun. However, people still get hurt and most victims do not know who did it or who did it to them (Johnson et al., 2016).

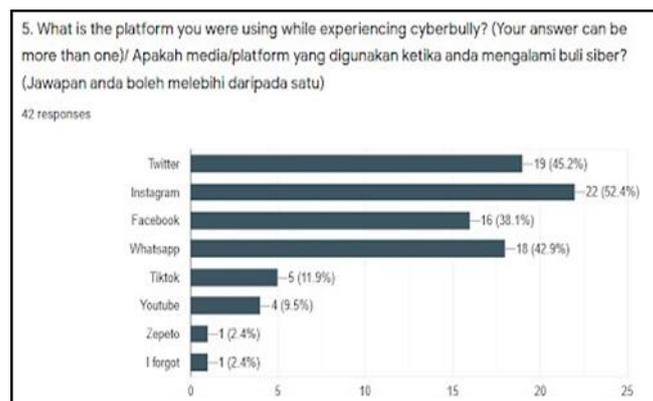

Figure 1. Platform distribution of respondents.

Gender of respondents

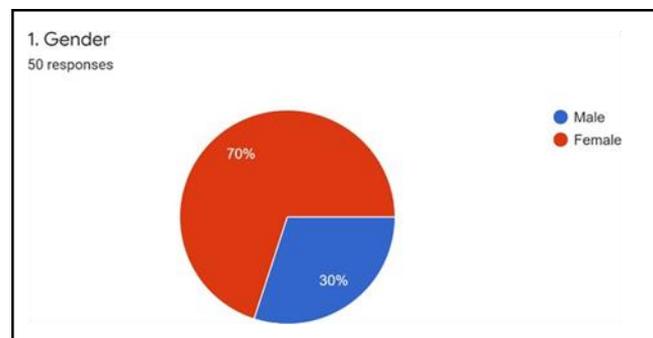

Figure 2. Gender distribution of respondents.

Figure 2 summarises the demographic characteristics of the respondents by gender; the results show that 35 (70%) of the respondents were female and 15 (30%) were male. This indicates that a larger proportion of female

than male youth participated in the study. It also means that there are more female adolescents than male adolescents.

Cyberbully activities

Figure 3. Cyberbully activities distribution of respondents

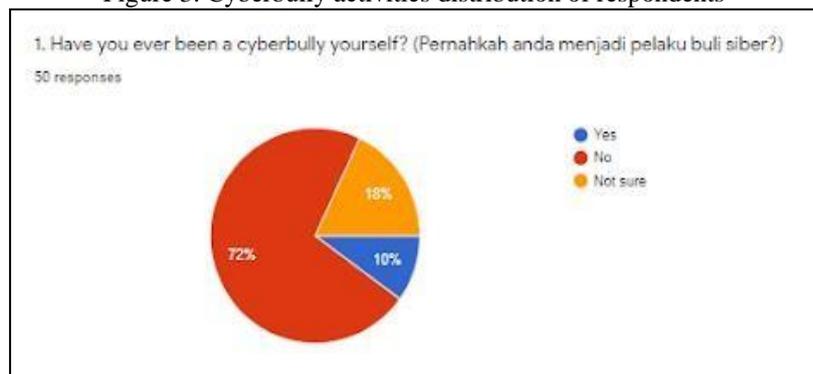

Figure 4. Cyberbully distribution of respondents

Figure 3 shows the survey results on cyberbullying committed by the cyberbullies of 33 respondents. 23 out of 33 respondents have not had any experience in this regard. When asked if they had ever been bullied, 36 of the 50 respondents answered that they had never been bullied (see Figure 4). It could be that 23 of the respondents have never bullied anyone, are victims of cyberbullying or observers; therefore they have no experience in this regard.

Impacts of cyberbully on individual

Due to societal pressures and the prevalence of sexually explicit content among women, the consequences of cyberbullying are particularly severe for women (Wachs et al., 2021) . Figure 5 shows the result of the survey on the impact of cyberbullying among 43 respondents who have been bullied once. It can be seen that 81.4 %, i.e. 35 out of 43 respondents, feel insecure and sensitive towards their environment after being bullied. 39.5% of the respondents feel anxious when they receive messages or emails. As (Thseen, 2021) notes, experiences of cyberbullying can cause lower self-esteem, discomfort and sadness, social anxiety, loneliness and depression.

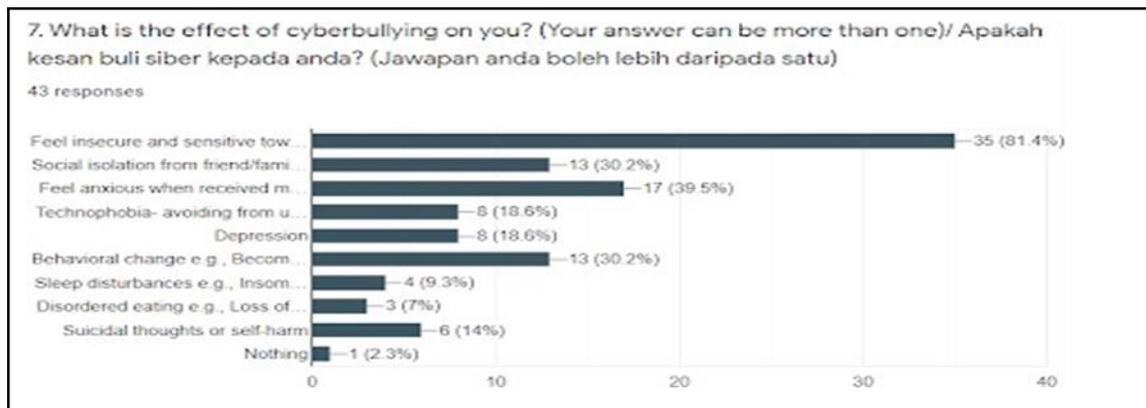

Figure 5. Impacts of cyberbully distribution of respondents

Islamic Perspectives

In Islam, Allah, the Exalted, has said that Islam does not restrict its people to being good only to each other, but even protects all, irrespective of race, culture and religion, including the creatures of the universe, as mentioned in Surah Al-Mumtahanah, verse 8. People who perform good deeds in their lives are loved by Allah, the Exalted, and are rewarded. The present generation shows that it does not practise the teachings of Prophet Muhammad SAW regarding morality and good deeds. It is obliged to show and practise the good personality of Prophet Muhammad SAW without trying to act with a contrary practise just for the sake of other interests and benefits.

“Allah does not forbid you from dealing justly and kindly with those who did not fight against you in the matter of religion nor drove you out of your land. Surely Allah loves the doers of justice (those who deal with equity).” (Surah al- Mumtahanah, verse 8).

Allah's Messenger (ﷺ) said, "Anybody who believes in Allah and the Last Day should not harm his neighbor, and anybody who believes in Allah and the Last Day should entertain his guest generously and anybody who believes in Allah and the Last Day should talk what is good or keep quiet. (i.e. abstain from all kinds of evil and dirty talk). (Riwayat al- Bukhari: 6018).

In this day and age, trolling and throwing hate comments seems like it has been normalizing in the community as people expect the ones who make mistakes should receive hate comments and deserve to be frustrated. Many people believe that suffering, whether physical or emotional, is a necessary part of regaining one's moral character (Timothy J. Legg, 2020) . In this hadith, Rasulullah SAW stated the correlation between saying good things and someone's faith in Allah SWT. This is because guarding our tongue against talking bad and using it for saying good things is one of the signs of faith.

Thinking before speaking out or commenting on any issues is necessary as it might harm the listeners' mental

and physical. A simple message could hurt one heart as mentioned from a famous quote that the tongue is the sharpest weapon in the world that will kill anybody without bloodshed.

“Today We shall put a seal on their mouths, and their hands will speak to Us and their feet shall bear witness to what they had been doing.” (Surah YaSin, verse 65).

This command is given in regard to the obstinate guilty who will refuse to confess their crimes, lie to witnesses, and also refuse to acknowledge the authenticity of their book of conduct. This command is given to obstinate offenders who will refuse to confess their crimes, lie to witnesses and also refuse to acknowledge the authenticity of their book of conduct.

The words used will be etched in the heart of the listener. Posting a status on social media that angers others is not a good measure to counter hateful situations. Spread awareness and remind each other that all things in this world, the words we use, the messages sent and the posts on social media, will be scrutinised in the akhirah and each person's limbs will be witnesses to the misdeeds and good deeds. Therefore, it is a good thing to maintain consistency by doing good things instead of posting hate comments that lead to strife and destroy the community. Cultivating respect and love for others is a good way to create harmony in the community.

Code of Ethics

Cyberbullying is an ethical problem that can lead to emotional injury for many young people, including suicide (Peled, 2019) . There are three types of theories that can be used in society to solve ethical problems. People who believe in virtues such as utilitarianism, deontology and ethics think this way. However, much attention is given to the utilitarian method of solving ethical problems.

Utilitarianism

Utilitarianism is also characterised by justice and impartiality of actors. The happiness of all people counts equally. When maximising the good, it is the good considered impartially. My good does not count more than someone else's good (Cekić, 2018) . When making a decision, one considers the needs of other people as well as one's own. Rule utilitarianism and action utilitarianism are two types of utilitarianism. Both ways of dealing with bullying are different and work in different ways.

- Action utilitarianism: As a rule, the conclusion is ethically correct because it is based on the decision of the majority, regardless of utilitarian beliefs. So the first strategy in cyberbullying would be to apologise to the victim for what the bully has done. Personal apologies or other media such as letters could achieve this goal. Focusing on the four types of bullies can also help stop cyberbullying. Enrolling vindictive bullies in peer counselling groups can teach them not to take the law into their own hands. Unwitting online bullies can also be enrolled in mentoring and counselling groups to help them. This would help them learn to control themselves

instead of bullying others. To solve these two types of bullying, it is best to act utilitarian.

- Rule utilitarianism: Compared to action utilitarianism, this approach values both benefits to society and fairness. Power-hungry nerds are the most dangerous bullies because they can bully their peers using technology. Their actions are subtle and they do not inform anyone about their actions. Therefore, rule utilitarianism best solves cyberbullying by prosecuting the culprits. Moreover, rule utilitarianism can solve the bullying of mean girls (Shaheen Shariff, 2008) . School staff can deal with the girls because most of these situations involve the same school. School administrators can punish the bullies, helping to end the problem and set an example for future girls who want to follow in their footsteps.

In this way, the decision-making process goes beyond the self-interest of the individual by considering the interests of others. There are two types of utilitarian approaches: rule utilitarianism and action utilitarianism. Rule utilitarianism is the more traditional approach. In terms of how they solve bullying cases, the two techniques differ somewhat.

Law on Cyberbullying in Malaysia

Malaysia doesn't have an explicit cyber law against cyberbullying. According to (MARTIN CARVALHO, 2021) , the MCMC continues to work on anti-cyberbullying legislation. In the absence of a specific law, there are provisions in various laws such as the Computer Crimes Act 1997, the Communication and Multimedia Act 1998 and the Penal Code that can be used to combat cyberbullying.

Computer Crimes Act 1997

- Section 3: Unauthorised access to computer material - Persons may be charged under section 3 of the Computer Crimes Act 1997 if they use a computer to do something with the intention of gaining access to a programme or data that doesn't belong there and they know at the time of using the computer that it doesn't belong there. An offence under this section need not be directed at a particular programme or data, a particular type of programme or data, or a particular computer. It need not be directed at a particular programme or data—
- fifty thousand ringgit fine or five years imprisonment or both.
- Section 4: Trespass with intent to commit or facilitate the commission of another offence
- This states that a person who commits an offence as in section 3 with a view to doing something which causes damage or fraud or dishonesty as defined in the Criminal Code [Act 574] is guilty of an offence under this section. It does not matter whether the offence is committed by someone else or by himself. It is immaterial to this section whether the offence to which it relates is committed at the same time as the unauthorised access is secured or at a later time. Under this section, a person who commits an offence is liable to a fine or to imprisonment for a term not exceeding ten years, or to both.
- Section 5: Unauthorised alteration of the contents of a computer - Section 5 of the Act states that a person who does anything which he knows alters the contents of a computer without permission commits an

offence. He or she is guilty of an offence. For this part of the Act, it does not matter whether the act in question relates to a particular programme or data, a programme or data of any kind, or data in a particular computer. For this section, it does not matter whether an unauthorised modification is permanent or temporary. The Penal Code states that anyone guilty of an offence under this section may be fined up to one hundred thousand ringgit or imprisoned for up to seven years. If the offenders cause damage, they can be fined up to one hundred and fifty thousand ringgit or imprisoned for up to ten years.

Communication and Multimedia Act 1998

- Section 211: Prohibition on provision of offensive content - The Communication and Multimedia Act of 1998 states that no content applications service provider, or anyone else who uses a content applications service, can put up content that is offensive, indecent, obscene, false, menacing, or menacing with the purpose of annoying or harassing another person. Subsection (2) of this section says that if you break subsection (1), you're guilty of an offence and could be fined up to fifty thousand ringgit or imprisoned for a year or both. If the offence isn't ended after you're convicted, you could also be hit with a fine of one thousand ringgit for every day or part of every day that the offence goes on.

- Section 233: Unauthorised use of network facilities or network services, etc. - Under the Communications and Multimedia Act 1998, section 233 provides that a person who, by means of network facilities or network services or application services, knowingly makes, creates or solicits and causes to be made any comment, solicitation, suggestion or other communication of an obscene, indecent, false, threatening or abusive character with intent to transmit the same, with intent, harass, abuse, threaten or victimise another person, or initiates a communication using an application service, whether continuously, repeatedly or otherwise, which communication, with or without disclosure of his identity and with intent to harass, abuse, threaten or victimise a person at any number or electronic address, commits an offence.

In addition, subsection (2) of this section provides that a person who knowingly provides an obscene communication for commercial purposes through a network or application service to a person or who permits a network or application service under his control to be used for an activity described in paragraph (a) of this section commits an offence.

Subsection (3) of this section states that a fine shall be imposed if a person is found guilty of an offence under this section. The fine shall be up to fifty thousand ringgit or one year imprisonment or both. A fine of one thousand ringgit shall be imposed for each day that the offence continues after conviction.

Evidence Act 1950

Section 114A of the Evidence Act 1950 could also help protect against cyberbullying and the other things mentioned above. Under this, anyone who appears in a publication by his name, picture or pseudonym, or helps to facilitate the publication or republication of the publication, is presumed to have done so, unless it can be proved that he did not do so. This is known as the "presumption of publication" As they have an account with a network provider, they are presumed to have made or shared the publication unless it can be proved otherwise.

Anyone who owns or has control of the computer from which a publication originates is presumed to be responsible for its publication or disclosure. This applies unless the person can prove that he or she was not.

Although there are a number of laws against cyberbullying in Malaysia, perpetrators often go unpunished because there is not enough evidence. It has been very difficult to prosecute the perpetrators. "I did not do it" is one of the justifications given by the perpetrator. This is the most common response from people when a hate or threatening message is linked to their Facebook, Twitter or other internet account. According to the Malaysian Communications and Multimedia Commission, it is almost impossible to take action against someone if they only deny any responsibility. Moreover, no victim of cyberbullying has filed a complaint yet. For fear of being bullied again, victims remain silent. If a victim reports bullying, they face further victimisation or ostracism.

Solutions and Strategies

The issue of cyberbullying has attracted a lot of attention in order to eradicate this phenomenon. Cyberbullying takes place online, but the consequences are just as severe as physical bullying. This issue should be discussed more to educate parents, young people and children about the dangers of cyberbullying and how to deal with it if they become victims. Campaigns have been launched to educate society and promote its ideals. Awareness campaigns, whether traditional (posters or pennants) or interactive (mobile apps, virtual reality or augmented reality), all have the same goal: to educate the public about the multimedia act (Manshor, 2014), the consequences for victims (Abas Ainna, 2018), the way out in Islam (Ab Manaf & Muhammad, 2022) and the legal right (Ikhsan et al., 2012), especially in eradicating this problem.

Malaysian celebrities have responded by participating in the "End Cyberbullying and False Information Dissemination" campaign, which seeks to combat cyberbullying and the dissemination of false information on social media (Norazlinda Mohammad, 2021) Although this is a joint effort, it is important that everyone takes preventive action, as prevention is always better than cure. Individuals who are victims of cyberbullying can take the following steps to ensure their safety: ignore the perpetrator, take screenshots of evidence, inform a trusted person, report the perpetrator and block them. As a society, we can work together to create a safer online environment that is free from cyberbullying. Avoid anyone who tries to stalk you (Haryani Haron, 2010).

Conclusion

The use of social media is an important part of any society, especially during the industrial revolution. 4.0. However, immoral behaviour on social media leads to its misuse with the aim of violating cultural norms and laws. The symptoms of cyberbullying, which is an increasingly common trend that needs to be addressed, can have a significant impact on society. One of the contributions of this study is that it reconciles the Western and Islamic perspectives on harmonious interaction on digital platforms. Cyberbullying is a serious problem because anyone can be a victim of cyberbullying. Cyberbullying can have long-term consequences for its victims.

Therefore, we need to think carefully about what we share or say that could hurt others. To prevent cyberbullying and make the internet a safer environment for everyone, parents, schools and children need to work together. The survey shows that most respondents want a healthy online environment that is free from cyberbullying.

Acknowledgment

We would like to express our sincere gratitude for the financial support for the research and publications from the College of Computing, Informatics and Media, Universiti Teknologi MARA, Shah Alam, MALAYSIA.

Abstract: The integration of ChatGPT in Personal Learning Environments (PLEs) has emerged as a promising approach to personalized learning in tertiary education. ChatGPT is believed to have the potential to transform traditional higher education into a more personalized, quality-driven, and student-centered learning experience that fosters critical thinking, self-regulated learning, and creativity. While recent studies have highlighted the potential benefits of ChatGPT in enhancing personalized learning experiences, there are several risks and challenges that need to be addressed. This paper reviews relevant literature on ChatGPT and PLEs and identifies key risks and challenges associated with their integration, including ethical concerns, data privacy, technical issues, and user acceptance. Meanwhile, the paper also proposes ways and thoughts for the future implementation of ChatGPT in PLEs. The paper concludes that ChatGPT has significant potential to facilitate a new round of educational revolution which pushes educators to reconsider why to teach, how to teach, and what to teach.

Keywords: Chatgpt, Chatbot, Personalized Learning, Personal Learning Environment, Higher Education, Benefit And Risk

Introduction

Personalized Learning Environments (PLEs) have emerged as a promising approach to improving the quality of higher education. By leveraging the power of technology, PLEs enable students to take control of their learning experiences and tailor them to their individual needs and preferences. One technology that has shown great potential in this regard is ChatGPT. ChatGPT is a state-of-the-art language model developed by OpenAI that has gained significant attention and popularity in recent years. As a large language model, ChatGPT is capable of generating human-like responses to a wide range of natural language input, making it a valuable tool for various applications, including educational ones.

The first principle of ChatGPT is the use of transformer-based language models that rely on self-attention mechanisms to generate coherent and relevant responses. These models, such as GPT-3, are designed to learn from large amounts of data and leverage the power of deep neural networks to generate natural language that mimics human communication. Floridi and Chiriatti (2020) argue that GPT-3 represents a significant breakthrough in the field of AI, allowing for more efficient and effective natural language processing. Zhang and Li (2021) suggest that GPT-3 has the potential to revolutionize industries such as education and customer service. However, Dale (2021) cautions that while GPT-3 is impressive, it is not a substitute for human intelligence and is limited by its training data. Radford et al. (2021) propose that GPT-3 can be enhanced by incorporating visual cues to improve its understanding of the world, while Vaswani et al. (2017) highlight the importance of attention mechanisms in transformer-based models like GPT-3. Moreover, the GPT model is capable of adapting to user preferences and behaviors over time, further enhancing its ability to generate high-quality responses.

Despite the primary purpose of a chatbot being to imitate human conversation, ChatGPT stands out for its versatility in various applications. Notably, it has been reported to have the capability to generate and debug computer programs Tung (2023), compose a wide range of creative works such as music, fairy tales, teleplays, and essays, as well as provide answers to test questions at a level that can surpass that of an average human test-taker Heilweil (2022). It can also generate poetry and song lyrics Reich (2022), emulate a Linux system, simulate an entire chat room, play games like tic-tac-toe, and simulate an ATM Edwards (2022). The training data used for ChatGPT's development includes information on internet phenomena, programming languages, and man pages, such as those of bulletin board systems and the Python programming language Edwards (2022). ChatGPT is an advanced chatbot that is being increasingly used in the education sector to provide personalized learning experiences to students. One of the essential features of educational chatbots is their ability to personalize learning. The integration of AI-powered chatbots with e-learning platforms can also personalize the e-learning process Davies et al. (2020). In this paper, we explore the potential ways, benefits, and risks of applying ChatGPT in the development and implementation of PLEs in higher education.

The impact of ChatGPT on human life and education

ChatGPT was first introduced in June 2018 by OpenAI, a research organization dedicated to advancing artificial intelligence in a safe and beneficial way Radford et al. (2018). ChatGPT is an extension of the GPT (Generative Pre-trained Transformer) family of models, which are designed to generate natural language text in a wide range of tasks, including language translation, question answering, and text summarization. ChatGPT is trained on a massive dataset of text from the internet, allowing it to generate human-like responses to a wide range of natural language inputs.

With its fast development, there are many concerns about the implementation of ChatGPT in all fields of human life, including education. Is ChatGPT an angel or a devil? ChatGPT has the potential to revolutionize education in a way that is similar to how previous technological inventions such as printers, calculators, computers, and information and communication technologies (ICT) have impacted human life and education. The human development index (HDI) considers technological advancements as one of the three key dimensions of human development, along with income and health United Nations Development Program (2020). These technologies have made information and knowledge more accessible, contributing to the spread of education worldwide. The computer, for example, has revolutionized the way education is delivered. It has enabled distance learning and the use of multimedia resources, allowing students to learn at their own pace and in their preferred environment Bates & Poole (2003). Similarly, the telephone has facilitated communication between teachers and students, making it possible for them to discuss academic matters and seek assistance remotely. The printer, on the other hand, has made it easier for students to produce high-quality written work. It has also allowed for the mass production of educational materials such as textbooks, increasing their accessibility and affordability Bates & Sangra (2011).

Like the previous revolutionary inventories, ChatGPT has the potential to significantly impact the value and pedagogy of modern higher education by transforming traditional knowledge-push education to personalized upper-level mind development. According to Benedetto et al. (2019), Chatbots can serve as virtual teaching assistants, supporting personalized learning by providing instant feedback, answering questions, and offering relevant learning resources. This personalization of education has the potential to improve the quality of education by catering to the individual learning needs of each student Davies et al. (2020).

Moreover, ChatGPT can promote critical thinking and self-regulated learning by encouraging students to think deeply about the questions asked by the chatbot and take charge of their learning process Holotescu (2016). Additionally, the use of ChatGPT can enhance creativity and imagination by encouraging students to think outside the box and explore new ideas and perspectives Haristiani & Rifa'I (2020). Furthermore, ChatGPT can promote global competence development by providing students with access to information and perspectives from all around the world Sharef et al. (2021). It can also help students develop emotional intelligence (EQ) by providing them with a safe space to express their feelings and practice empathy Pataranutaporn et al. (2021).

In terms of the impact of ChatGPT on teachers and teaching, the emergence of ChatGPT is expected to bring significant changes to the role of teachers in higher education. Traditional methods of teaching, where teachers were the primary source of knowledge, will no longer be sufficient in the era of personalized learning. With the help of ChatGPT, learners can access personalized learning experiences and content that cater to their unique needs and interests. This shift in pedagogy requires teachers to adopt new roles, such as facilitators, mentors, and coaches, who guide and support learners in their self-directed learning journeys.

Moreover, the traditional system of evaluating teachers based on their knowledge and expertise will need to evolve. Teachers will be evaluated based on their ability to facilitate personalized learning experiences, inspire learners, and promote critical thinking and problem-solving skills. The focus will be on the impact of teaching and learning rather than just the transmission of knowledge. This change in evaluation methods will encourage teachers to adopt more innovative and personalized teaching approaches that better engage and motivate learners.

In summary, ChatGPT has the potential to transform traditional higher education into a more personalized, quality-driven, and student-centered learning experience that fosters critical thinking, self-regulated learning, creativity, imagination, global competence development, and EQ.

A brief introduction to PLEs

Personal Learning Environments (PLEs) is a concept that refers to a system of tools, resources, and social connections that support individual learning goals and strategies. PLEs are becoming increasingly popular in higher education as they allow learners to take control of their own learning experiences and create a personalized and flexible approach to learning Buchem (2014). PLEs can encompass a variety of technologies such as blogs, wikis, social media, and mobile devices, among others Attwel (2007). The effectiveness of PLEs in meeting established learning objectives has been explored in various studies (Fiedler & Våljataga, 2013). PLEs can enhance learners' engagement, motivation, and satisfaction with the learning process, as well as provide opportunities for collaborative and peer-to-peer learning Johnson & Liber (2008).

The use of PLEs can provide opportunities for undergraduate research experiences National Academies of Sciences, Engineering, and Medicine (2017), personalized learning Pane et al. (2017), and the digital transformation of teaching and learning in higher education UNESCO & Tsinghua University (2022). The ontology-driven conceptual model proposed by Nan Cenka et al. (2022) further emphasizes the importance of PLEs as a framework for lifelong learning. However, the implementation of PLEs also presents challenges, such as the need for learner control and the development of the instructional design that supports learner autonomy Våljataga & Laanpere (2010). Despite these challenges, PLEs have the potential to transform traditional teaching and learning practices in higher education Shavelson (2010), as evidenced by their successful implementation in English for Specific Purposes Xu et al. (2020).

Potential ways to apply ChatGPT in PLEs development

ChatGPT can play a significant role in the development and implementation of PLEs in tertiary education. ChatGPT's ability to generate natural language responses can facilitate communication between learners and their PLEs, allowing learners to interact with their PLEs in a more natural and intuitive way. ChatGPT can collect and analyze data on a student's learning patterns, preferences, and performance to create a customized learning experience. Haristianı and Rifa'i (2020) found that ChatGPT can be combined with social media to enhance the Personal Learning Environments of students.

Sharef et al. (2021) also proposed a personalized learning approach based on learning analytics and chatbot technology. ChatGPT is also being used in research to create intelligent and interactive chatbots for personalized learning experiences Yao & Wu (2022); Benedetto et al. (2019). Furthermore, Ashok et al. (2021) conducted a systematic survey of cognitive chatbots in a personalized learning framework and concluded that chatbots can be used to deliver personalized learning to students. Finally, Pataranutaporn et al. (2021) developed AI-generated characters that can support personalized learning and well-being.

ChatGPT can be leveraged in a number of ways to enhance the development and implementation of PLEs in higher education. Some potential ways include:

- 1) **Personalized Tutoring:** ChatGPT can serve as a virtual tutor, providing personalized support to students. It can interact with students, answering their questions and providing feedback on their work in real time.
- 2) **Adaptive Learning:** ChatGPT can adapt to the needs of individual learners, providing customized learning experiences based on their interests, abilities, and learning styles.
- 3) **Content Creation:** ChatGPT can be used to generate content, such as quizzes, assignments, and study materials, that is tailored to individual students' needs.
- 4) **Social Learning:** ChatGPT can facilitate social learning by enabling students to interact with each other and with instructors in real time. It can be used to create discussion forums, chat groups, and other interactive learning environments.

As technology continues to advance, it is likely that personalized ChatGPT programs will become more commonplace in education. This could allow learners to tailor their own ChatGPT experience, building their own database with specific data, language structure, preferred language style, and other preferences. Learners could choose to focus on specific subject areas or language skills, or even develop their own unique ChatGPT persona with a particular tone or style. Additionally, personalized ChatGPT programs could be designed to support learners with specific learning challenges or preferences, such as those with dyslexia or ADHD. The potential for personalized ChatGPT programs is vast and could revolutionize the way learners interact with and learn from AI language models.

Benefits of applying ChatGPT in PLEs

Applying ChatGPT in Personal Learning Environments has several benefits. Firstly, it facilitates personalized learning, which is critical for modern education. Chatbots, powered by AI, can assess a student's level of knowledge and provide tailored learning materials based on the student's unique learning pace, style, and preference. This helps students to grasp concepts quickly and effectively, enhancing their learning outcomes. Secondly, chatbots can provide round-the-clock assistance to students, answering their questions promptly and providing guidance on assignments and projects. This frees up the teacher's time to focus on more important tasks, such as inspiring students and facilitating their self-actualization. Thirdly, chatbots can help to monitor the progress of students and provide relevant feedback, allowing them to identify their strengths and weaknesses and make necessary adjustments to their learning strategy.

The following part listed some of the numerous benefits, including:

- 1) **Improved Engagement:** ChatGPT can help increase student engagement by providing interactive learning experiences and personalized support.
- 2) **Facilitation of self-regulated learning:** ChatGPT can provide personalized and adaptive learning experiences, helping learners to develop self-regulated learning skills.
- 3) **Enhanced learning motivation:** By providing engaging and interactive conversations, ChatGPT can increase learners' motivation and interest in the learning process.
- 4) **Personalization and customization of learning experiences:** ChatGPT can personalize the learning experience by adapting to the learner's needs and preferences, making learning more relevant and effective.
- 5) **Improvement of critical thinking skills:** ChatGPT can stimulate critical thinking skills by providing opportunities for learners to engage in complex problem-solving tasks and discussions.
- 6) **Accessibility:** ChatGPT can help make education more accessible to students with disabilities or other challenges that may make traditional learning environments difficult.
- 7) **Time and cost-effectiveness:** ChatGPT can be used to deliver learning materials and support at a relatively low cost, and learners can access the system at any time and from any location.

Risks and challenges of applying ChatGPT in PLEs

This integration also presents several risks and challenges that must be considered. Some of the critical issues include the need for effective dialogue management, ensuring the reliability and validity of the chatbot's responses, privacy and security concerns, and the need for ongoing maintenance and support. Additionally, the successful integration of ChatGPT in PLEs requires a robust understanding of the pedagogical objectives, student needs, and learning outcomes. The following part describes some risks that need to be considered, including:

- 1) **Privacy Concerns:** ChatGPT relies on access to large amounts of data, which raises concerns about privacy and security.
- 2) **Academic ethical concerns:** Using an AI model to complete assignments or write papers may raise

concerns about academic integrity, plagiarism, and originality.

- 3) Quality of work: While ChatGPT can generate responses quickly, the quality of the work may vary, and it may not meet the same standards as work produced by a human.
- 4) Bias and accuracy: AI models are trained on large datasets, which may have inherent biases that can influence the generated output. This can be a concern in academic work, where accuracy and impartiality are critical.
- 5) Legal issues: The use of AI in education raises potential legal issues around privacy, data protection, and intellectual property rights.
- 6) Technical issues: The reliability and stability of the technology behind ChatGPT may be a concern, as technical issues can lead to lost work, missed deadlines, or other problems.
- 7) Psychological effects: Overreliance on ChatGPT may lead to a lack of confidence in one's own abilities and can also cause anxiety and stress, particularly if the technology is not working as expected or generates unsatisfactory results.

Proposed Guiding Principles and Frameworks for integrating ChatGPT in PLEs

- 1) Provide opportunities for self-directed learning through the use of ChatGPT to allow learners to explore their interests and personalize their learning experiences. Tapalova and Zhiyenbayeva (2022) indicated that AI can be used to enhance learner agency and self-directed learning, and emphasize the importance of sustainable evaluation to continuously improve the learning experience.
- 2) Foster a sense of belonging and community by encouraging learners to engage in collaborative learning activities through ChatGT. Dunleavy & Burke (2019) pointed out that a sense of belonging is a crucial factor that can influence student engagement, satisfaction, and success. They suggested that this can be achieved by creating a supportive and inclusive online learning environment that encourages communication, collaboration, and active participation among students.
- 3) Use ChatGPT to provide timely feedback and support to learners, which can enhance their potential realization and motivation to learn. Weber and Ludwig (2020) found that users perceive chatbots and voice assistants as useful tools for learning and enhancing their skills. In addition, Jeon (2021) found that young learners had positive experiences and perspectives when using AI chatbots in the EFL classroom, as they provided timely feedback and support and increased their engagement and motivation to learn.
- 4) Use a variety of learning interactions in ChatGPT, including discussion forums, quizzes, and simulations, to promote active and meaningful learning experiences. Khan et al. (2017) found that students who engaged in active learning activities, such as discussions and group work, had higher course grades and were more satisfied with the course. Lamon et al. (2020) similarly found that active learning increased student engagement and satisfaction in an online postgraduate course. Rossi et al. (2021) demonstrated that the use of active learning tools, such as simulations and case studies, improved learning outcomes, scientific attitude, and critical thinking skills in higher education students during the COVID-19 pandemic. Overall, the references suggest that active learning can lead to more positive learning experiences and outcomes for students in online courses.

- 5) Implement sustainable evaluation methods in ChatGPT, such as formative assessment and peer assessment, to provide learners with ongoing feedback and promote continuous learning. Nguyen and Walker (2016) discussed the concept of sustainable assessment for lifelong learning, highlighting the importance of incorporating ongoing formative assessment and peer assessment in online learning to promote continuous learning and provide learners with meaningful feedback. Ben-Eliyahu (2021) emphasized the need for sustainable learning in education, which involves integrating social, environmental, and economic considerations into teaching and learning practices to prepare learners for a sustainable future. Caeiro et al. (2020) conducted a critical reflection on sustainability assessment and benchmarking in higher education institutions, emphasizing the importance of incorporating sustainability criteria into assessment practices to promote sustainable development in higher education.

Conclusion

In conclusion, ChatGPT has the potential to revolutionize tertiary education by facilitating the development and implementation of personalized learning environments (PLEs). By providing students with personalized learning experiences, ChatGPT can enhance critical thinking, self-regulated learning, creativity, imagination, global competence development, EQ, and other important skills that are essential for success in today's world. Additionally, ChatGPT can help educators to shift their focus from being knowledge givers to inspiring, leading, and facilitating learners' self-actualization and personalized learning. This requires a change in the way that teaching is evaluated, moving from how knowledgeable a teacher is to a higher level of value of teaching, influencing teaching, and personalized teaching.

However, there are also potential challenges that need to be addressed when implementing ChatGPT in tertiary education. These include concerns about privacy and data security, the need for effective training and support for educators and learners, and the importance of maintaining a balance between technology and human interaction. Overall, the implementation of ChatGPT in tertiary education has the potential to create a more personalized and effective learning environment that can prepare students for the challenges of the modern world.

ChatGPT has the ability to comprehend and reorganize all human knowledge, and gradually develop consciousness. However, it has not yet reached the level of equivalence to humans. Humans have limited capacity for acceptance and expression, but our social lives are intentional and meaningful. In contrast, artificial intelligence lacks intentionality and meaning on its own. Therefore, our goals and those of AI are different. While ChatGPT has the potential to revolutionize education and communication, it is important to recognize its limitations and understand how it can complement and enhance human capabilities.

As ChatGPT continues to advance and develop a deeper understanding of human knowledge, it becomes increasingly clear that coexistence with this artificial intelligence is inevitable. However, simply banning its

development is not a viable solution, as technology monopolies and the competition for human resources will continue to drive progress. Therefore, efforts should be focused on catching up with AI rather than attempting to control it. It is important to recognize that AI lacks the intentionality that humans possess, making it necessary to break free from traditional human will and seek meaning in new social structures. Ultimately, as humans live and work alongside ChatGPT, it will be important to embrace the opportunities for collaboration and innovation that this new era of coexistence will bring.

Abstract: This article describes some historical data or sources that can explain the earthquake and tsunami that occurred in Nias, an island on the west coast of Sumatra in the Indian Ocean. The aim is to uncover sources that contain information that can be used to reconstruct the natural disaster events of the earthquake and tsunami on Nias Island from a historical perspective. As is well known, Nias Island regularly experiences earthquake shocks and sometimes it is also followed by tsunami waves, because the island is located in a disaster-prone area, namely on the Eurasian plate. The writing of this article uses the historical method with a disaster history approach that focuses on historiographical aspects. In over past two centuries, there have been a number of sources which contain the natural disasters of the earthquake and tsunami. These sources can be grouped into two categories, namely oral sources and written sources. Oral sources come from within the Nias community itself while written sources come from outside of the community.

Keywords: Earthquake, Historical sources, Indian ocean, Nias island, Tsunami.

Citation: Anatona, Hakam, A., Elvira, M., Nur. M., Syafrizal, Putri, S.M., & Gulo, N.T. (2023). Oral and Written Historical Sources on the Earthquake and Tsunami Disasters in Nias Island. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1124-1136), Cappadocia, Turkiye. ISTES Organization.

Introduction

Nias Island, which is located in the Indian Ocean, is one of a series of Indonesian islands that are included in the category of disaster-prone areas, especially earthquakes. It also a tsunami-prone area because large-scale earthquakes are usually followed by high and rising waves of sea water inland. Such conditions can occur because Nias Island and together with the islands on the west coast of Sumatra are located in an active tectonic area where the Eurasian and Indo-Australian plate faults interact. Other islands in the ring such as Semeulue, the Mentawai Islands, Nias is regularly shaken by earthquakes which are sometimes accompanied by tsunamis.

Earthquake and tsunami in the Indonesian archipelago including Nias Island have always been an interesting object of study. Even more if it is related to the terrible earthquakes that hit in 2004 and 2005. Four years after that, on September 30 2009, another earthquake with a magnitude of 7.6 on the Richter scale shook the west coast of Sumatra. This time the earthquake hit Padang and other areas in West Sumatra Province. Then in November 2010 an earthquake was also followed by tsunami waves in the Mentawai Islands and in 2018 an earthquake followed by a tsunami hit Palu on Sulawesi Island. All of this has added to the long history of earthquake and tsunami natural in several coastal areas and islands in the western part of Sumatra

Wherever they are, whether it is in Nias Island and the surrounding islands or abroad, Nias people are very familiar with the term earthquake. Earthquake vocabulary is found in the vocabulary of the Nias regional languages, namely *duru (ndruru)* and *druru (ndruru) danö*. Meanwhile, the word *duru (ndruru) danö* means earthquake (Lase, 2011). The term *ndruru* is widely known in the Nias Archipelago region, including the Batu Islands region in the south, as a natural phenomenon in the form of earth shaking. For at least the last two hundred years, Nias has often been shaken by earthquakes and tsunamis.

Periodically, Nias Island always experiences shocks. This is due to the influence of the geographical location of the territorial area which is in zone 6 with the highest seismic risk in Indonesia (Beetham, 2008). In this regard, Nias Island is also named by the term swaying island with two meanings. First, a floating island. Together with the cluster of islands around it, Nias is in the middle of the Indian Ocean which is floating and "bothered" by the waves. The second meaning is the dancing island. The point is that on this island earthquakes often occur so that the situation is unstable. Residents feel as if they are in a rocking place or as if they are dancing (Hämmerle, 2015; Duha, 2012). As one of the islands in the Indonesian archipelago west of Sumatra, Nias is included in the category of earthquake and tsunami prone areas. Together with the other islands in the chain, starting from Semeulue in the north, the Mentawai Islands and Enggano in the south, since centuries ago Nias has been periodically shaken by earthquakes and sometimes accompanied by tsunamis.

This article aims to reveal a number of data or sources that can reveal the history of the earthquake and tsunami on Nias Island over the last two centuries. These sources are very useful for historians and other scientists who want to write about the history of natural disasters on the island. This paper further intends to reconstruct the history of the earthquake and tsunami that occurred on Nias Island.

Method

The method used in writing this article is the historical method by utilizing primary and secondary data as a source of writing. These data can be grouped into two parts. The first is data owned by residents who live on Nias Island. Included in this category are data or historical sources in the form of oral traditions, namely folklore which the locals call *hoho*. As well as folk tales, inside sources include oral history interviews. The data included into the second group is data that comes from outside. These data were provided by outsiders who came to Nias Island for various purposes. Some of them are travel reports of explorers and reports of administrators of the Dutch colonial government, as well as journalist coverage in newspapers. These sources were analyzed in such a way as to reveal the events of the earthquake and tsunami on Nias Island over the past several centuries. These sources were obtained through library research and field research. All interpretations of data that have passed source verification or criticism are then presented in the form of historical or historiographical writing

Results and Discussion

Oral Historical Sources

1. Oral Tradition

As supporters of Nias culture, the Nias people have an oral tradition of poetry sung by *ere*, a poet who has a respectable position within the traditional Nias social structure. The local people call these oral poems *hoho*. *Hoho* is in the form of spoken verses. In the past, this poem has been recited for centuries by an expert, namely *ere*, which is called *ere hoho*. The origin of *hoho*, among other things, can be associated with the word *Ho*. *Ho* is believed to be the name of one of the ancestors of the Nias people. *Ho* has a long way of life. He wanders in the real world in various areas on Nias Island. Apart from that, *Ho* also ventured into the world of folklore and the imagination of the poets of ancient Nias poetry. So *hoho* is a narrative conveyed by *Ho* to his family and grandchildren. The story told by *Ho* to his grandchildren, then passed on from one generation to the next

Historical memories of the past regarding the earthquake on Nias Island in the early periods can be known through traditional stories contained in the oral tradition called *hoho*. The *hoho* tradition continues to live and develop in the midst of society. When the traditional Nias people were no longer familiar with writing, the stories of the earthquake on the island were revealed through oral traditions which were passed down from one generation to the next. However, similar to the other stories, the story contained in this *hoho* is still heavily mixed with myths. Apart from earthquakes, *hoho* also contains stories about the origins of the Nias people's ancestors (Hammerle, 2022), customs, leadership, and others

In the *hoho* story, there are several variants regarding the factors that caused the earthquake on Nias Island. But everything is always centered on a figure named Latura Danö. In another version the figure's name is Bauwabadanö Hia. According to the mythology, the origin of the Nias people in their *hoho* comes from the sky (heaven). So that in this traditional view natural disasters are associated with supernatural forces. Some people conclude that natural disasters are God's plan.

Latura Danö is the grandson of a pair of deities who live in heaven, the male named Tuhamoraangi Tuhamoraanaa, and female name Burutiraoangi Burutiraoanaa. This couple has a son named Sirao who is the heir to the throne as well as the ruler of a kingdom located in heaven called *Teteholi Ana'a*, who later became the biological father of Latura Danö. Besides Latura Danö, Sirao still has eight more children. In the next story it is told that Latura Danö and his 8 brothers were descended (*ladada*) from heaven which is located in the upper world as the abode of the gods. They were brought down to earth. The location where they were dropped off was right at Tanö Niha, which is what the Nias people call the name of Nias Island

Unlike his 8 siblings, Latura Danö has different body size from ordinary human. His size is too big and fat. As a result, when Latura Danö was lowered to the ground and touched the ground, the ground immediately collapsed and gave a hole because it couldn't support its body weight. The body finally penetrated into the inner layers of the earth. When he was in the bowels of the earth he never came out again. Nias people believe that Latura Danö has transformed into a large snake lives there. In *hoho* it is stated that Latura Danö is *da'ö zanaya tanö Sisagörö*, *da'ö zanaya tanö sébolo*. It means he is the breadwinner of the vast earth (Zebua, 2010).

There is a time when Latura Danö who has transformed into a snake is writhing in the ground. This situation is usually triggered by the behavior of some people who inhabit Nias Island, which have deviated from the actual rules, causing bloodshed. In the past, there were often conflicts and wars between residents from different villages (*banua*) in Nias. The same goes for criminal acts. If the conflict spills blood to wet the surface of the ground and seeps in, Latura Danö doesn't like it. The snake was disturbed and then wriggled its body. The impact of the force when the snake wriggled was so great that it shook the earth of Nias just like an earthquake. The people of Nias believe that the earthquake in Nias was caused by the power of a large snake as the embodiment of Latura Danö who was writhing in the earth. People then think of it as an earthquake

When did the earthquake shaking end? The answer is when the big snake incarnated by Latura Danö stopped writhing after hearing prayers and requests from the people. Residents who are worried about the earthquake call out *biha tuha, biha tuha* which means enough grandfather or stop grandfather as a sign of their repentance for not committing criminal acts anymore.

2. Interviews

The second group of oral sources that can be used as historical sources regarding the natural disaster of earthquakes and tsunamis in Nias Island is in the form of oral history interviews. Many branches of social

sciences and humanities use interviews as data or sources in research on societal research objects, including historical studies.

Unlike the first type of oral source, which is oral tradition where the sources are already available within a community in the form of folktales called "hoho" in Nias Island, the second type of oral source requires a process of conducting interviews. The reason is that these sources are not readily available. To obtain them, effort is needed from the interviewer or researcher to directly meet with informants, namely the Nias community members who have experienced the earthquake and tsunami disaster, in order to conduct interviews with them.

Any resident of Nias Island who has experienced the earthquake and tsunami disaster can be considered as an informant and can be interviewed to obtain information that can serve as a source or data for constructing the historical narrative of the natural disaster that occurred on the island. The devastating earthquake and tsunami that occurred around 20 years ago, specifically in 2004 and 2005, can be inquired from the Nias residents who experienced the event. The majority of them are still alive as the event happened relatively recently, just 20 years ago from now.

To obtain information about the 2004 and 2005 earthquakes and tsunamis, the informants who can be interviewed are scattered throughout the entire Nias Island. This is because both earthquake and tsunami were of a large-scale events, with magnitudes of 9.3 and 8.7 respectively. Practically, every location across Nias Island, from north to south, and from west to east, experienced the same shaking.

In addition to the Nias community residing on Nias Island, oral sources in the form of interviews can also be conducted with the Nias people living in other areas outside of Nias Island. These individuals are the residents who migrated and moved away from Nias Island after the earthquakes and tsunamis that occurred in 2004 and 2005. It is known that the impact of the earthquakes on the social and economic life of the Nias community was extraordinary. After the earthquakes, they sought better livelihoods in various island regions of Indonesia, particularly Sumatra Island and Java Island.

The informants who can be interviewed and whose results can be used as oral historical sources can be grouped into two categories. Firstly, the majority group consists of individuals who directly experienced the devastating earthquakes and tsunamis at that time. Secondly, apart from experiencing the shock of the earthquake and the tsunami, some individuals from this group also actively participated as volunteers in assisting the communities affected by the earthquake and tsunami. This group includes members of Non-Governmental Organizations (NGOs), including international donor agencies, who came to Nias Island to aid in the post-disaster recovery efforts after the earthquake and tsunami. As it is known, the earthquake that occurred on December 26, 2004, with a magnitude above 9, devastated Aceh and the west coast regions of northern Sumatra, including Nias Island. After the earthquake, numerous foreign NGOs arrived on Nias Island to provide social assistance through the Rehabilitation and Reconstruction Program. These NGOs recruited local survivors from Nias Island, particularly young individuals, to assist in implementing the programs they were running.

Amidst the ongoing handling of the earthquake and tsunami victims, another significant earthquake and tsunami occurred, just slightly below the magnitude of the December 26, 2004 earthquake, measuring 8.7 on the Richter scale. As a result, the suffering of the Nias Island residents continued to escalate. The first earthquake had not been fully addressed when, within a span of only three months, the second earthquake struck. This situation led to the prolonged presence of NGOs in Nias and an increased recruitment of volunteers to aid in the disaster response efforts on the island.

Written Historical Sources

Without disregarding oral sources, both in the form of oral tradition and oral history interviews, historical narratives are predominantly built upon written sources. One frequently asked question regarding history is when it began. The answer is that history began with the discovery of writing. This is also what distinguishes the field of history from archaeology, as both disciplines uncover past events. Archaeology focuses on the study of human history in ancient times before the existence of writing.

There is a proverb that strongly emphasizes the relationship between history and writing, which states, "No document, no history" or "No written, no history." It means that without written records, there is no history. This highlights the crucial role and significance of written sources in constructing historical narratives as sources or data.

Furthermore, written sources, especially primary or contemporaneous sources, are generally considered more reliable in terms of their authenticity compared to oral sources, including oral traditions as discussed earlier. According to Sartono Kartodirdjo (1985), these written sources are referred to as documentary materials. There are five types of written materials commonly used by historical researchers in writing about the past: 1) Autobiographies; 2) Personal letters; 3) Newspaper; 4) Government documents; and 5) Novels and fictional stories.

1. Records of Dutch Colonial Officials

The second category of historical sources that can reconstruct the history of the earthquake on Nias Island is in the form of notes or writings. In contrast to oral sources, which are only passed down from mouth to mouth using language as the only means of communication, namely the Nias regional language, this is not the case with historical sources in the form of writing. Writing sources are made and recorded using various languages from various nations or countries. This really depends on the background of the author. If the writer is a European, such as the Netherlands and Germany, the writing will be written in Dutch or German and if the writing is made by Indonesians outside of Nias, then the writing adapts to using the Indonesian language. There are also writers who use English writing as an international language.

The first historical source of the earthquake and tsunami was in the form of records made by officials of the Dutch colonial government who had served or politically controlled and ruled Nias Island from the 19th century to the first half of the 20th century. Its position in historical sources is included in the category of government documents. This means that these sources are written by the governing authorities, regardless of their position and rank. Written historical sources in the form of government documents can be written or published by both high-ranking officials and ordinary employees, without exception. Some types of written sources included and contained in government documents are government decisions, news and official reports about official events, annual reports in all areas of government, along with statistical data, government statements and statements regarding several issues, as well as lists of personnel in the central and regional government (Kartodirdjo, 1985). The earliest writing was by James du Puy (1780-1847). Du Puy was the first official of the Dutch colonial government to be assigned as a resident of Sumatra's Westkust in the West Coast region of Sumatra whose power includes a series of islands in the Indian Ocean located west of Sumatra including Nias Island. He was the highest leader of the Dutch East Indies government on the west coast of Sumatra, which at that time was centered in the city of Padang after the interregnum or the transition of British rule to the Dutch in 1819 (Asnan, 2003 and 2006). The writing by Du Puy contains information about an earthquake and tsunami that occurred in 1797, several years before he took office.

The next written record for the earthquake event is occurred in 1861. The report was made by Th. C. Rappard. He was a *controleur of Benneland Bestuur* (BB), the domestic government of the Dutch colonial government who served on Nias Island until 1905. In his article entitled *Het eiland Nias and zine bowoners* (Nias Island and its inhabitants) Rappard described the earthquake occurred in 1861 (Rappard, 1909).

Not only Rappard, the record about the earthquake that occurred in 1861 was also written by E.E.G. Willem Schröder. Similar to the position held by Rappard, Schröder was also an official of the Dutch colonial government at that time with the position of *controleur* in charge of public relations or public relations (*contoleur voor de aanrakingen*) on Nias Island from 1904-1906. In 1906 he was appointed full *controleur* until his term ended in 1908 (Hammerle, 2013). Apart from serving as a government official, Schröder has a talent for writing. While serving in Nias, he succeeded in writing a thick book in 1907. The 866-page book is entitled *Nias: Ethnographische, Geographische, en Historische, Aantekeningen en Studiën*, published in Leiden, the Netherlands in 1917.

The book contained the condition of Nias Island and various events that had occurred there, including the earthquake natural disaster. First, Schroder records earthquake events that occurred in the early 20th century. Unlike the two previous earthquakes that occurred in the 19th century, Schröder experienced this earthquake directly when he was still serving as an official of the Dutch colonial government on Nias Island. (Hämmerle, 2013).

In addition to the events he experienced directly while on duty, in his book Schroder also wrote about a devastating earthquake that occurred during his 46 years sent and assigned to Nias, namely the earthquake on

February 16, 1861. According to Schoder's records, the earthquake occurred in 1961 followed by the rising sea water to land which became known as a tsunami. Apart from the west of Nias Island, the earthquake and tsunami that occurred on January 16, 1861 also hit the southern part of Nias Island (Schröder, 1917).

2. Explorer Notes

Historical sources in the form of notes or writings were both made by explorers. In the context of written historical sources, this type of source is referred to as personal letters, diaries, and memoirs. Specifically, the accounts of journeys written by explorers are called memoirs. These accounts usually do not contain personal or private issues but rather focus on more general matters such as the condition of a country, city, or region. Personally the explorers are people who have an adventurous spirit, like to travel to various places and then they write and make reports about the events they experience. Among these explorers there were those who visited Nias Island and some who did not have time to reach the island. During the 19th century, it was recorded that 2 European explorers wrote and left notes about the natural disasters of earthquakes and tsunamis on the island.

The first writing was made in the mid-19th century in 1843 to be precise. The first explorer to write about the earthquake in Nias was named Franz Wilhelm Junghuhn. He was a German botanist and geographer (geologist) who later moved to become a Dutch citizen. Junghuhn gained the trust of the Dutch East Indies government based in Batavia and was recruited as a health worker on Java Island, precisely in Batavia and Semarang. From 1840 to 1842 he was assigned to Padang. His job is to carry out investigations into the Land of Batak in northern Sumatra. After that he returned to Batavia.

Junghuhn never came or visit Nias Island during his time in Padang. Even though since 1825, starting from the time after being abandoned by the British EIC, politically the status of Nias Island came under the influence of the Dutch colonial government which was centered in Padang. Nevertheless, Junghuhn wrote about the earthquake and tsunami occurred on Nias Island in 1943. The information made by Juhhuhn was contained in an article written by Nieuwenhuisen and Rosenberg (1863) entitled *Verslag omtrent het Eiland Nias en Deszelfs Bewoners* which was published in the treatise *Verhandelingen van het Koninklijk Bataviaasch Genootschap van Kunsten en Wetenschappen* (VBGKW). According to Junghuhn's story, Nias Island experienced an earthquake between 5 and 6 January 1843, the continuous shaking lasted for 9 minutes

The next article was written at the end of the 19th century by an explorer who visited Nias Island. The explorer's name was Elio Modigliani who comes from Italy. At that time Modigliani traveled from Europe to the Dutch East Indies and then sailed to Nias Island. Elio Modigliani arrived in Nias and lived there for 6 months from April to September 1896. During this time, he traveled around and explored several parts of Nias Island, starting from areas located on the coast to entering areas located inland or upland. Almost half of the southern part of Nias Island was visited by Modigliani.

During his journey on Nias Island, he equipped himself with writing a kind of diary. These notes, among other things, contain stories of the journey he experienced while on Nias Island. These notes were then collected and

recorded after he returned to Italy. The result is quite thick about 724 pages. The book, which is more appropriate as an ethnographic work, succeeded in describing the life of the people of Nias at the end of the 19th century as well as knowing the way of thinking and mentality of the people of Nias at that time (Puccioni, 2013). Earthquakes and overflows of water also bode ill for Nias people. It appears not only in the real world but sometimes both are present in dreams during sleep. If the people of Nias dream of shaking the earth accompanied by a flood, then it is a bad sign that they need to take another policy, not as planned.

The problem of dream interpretation was revealed by Elio Modigliani in the 19th century when he visited Nias in a report on his trip to Nias in 1886. These dreams influenced the way of thinking and acting of the Nias people. Good or bad implementation of dreams related to earthquake shocks and overflow of water on land can be seen in the choice of location for building a residential house as well as the model and architecture of the house. (Modigliani, 1890)

3. Experts Writing

Entering the 21st century, more articles have been written about the natural disaster of the earthquake and tsunami on Nias Island. This time it was carried out by scientists, an experts on earthquake and tsunami natural disasters. Scientists who write about earthquakes have reappeared after the devastating earthquake and tsunami that hit Nias Island in 2004 and 2005. However, in this article only a few scientists are described.

Two of the scientists who wrote about the historical events of the earthquake and tsunami on Nias Island were Rastogi and Jaiswal. They wrote and compiled a catalog of earthquake events in the Indian Ocean including Nias Island. Referring to the catalog of 90 tsunami events occurred in the Indian Ocean region over the past 2 millennia from 326 BC to 2005, as compiled by Rastogi and Jaiswal (2006) and Rastogi (2007), records of earthquake events and the tsunami occurred on Nias Island has been recorded since the 18th century.

The earliest earthquake and tsunami recorded in the catalog occurred at the end of the 18th century, exactly, on February 10 and 11, 1797 with a magnitude of 8.2 on the Richter scale. This note seems to have taken its source from a report by a Dutch colonial government official, James Du Puy, as described in the previous section. Then when entering the period of the 19th century, the earthquake and tsunami occurred again. Even in that century it was recorded as the most common occurrence. During the 19th century, Nias Island was shaken by earthquakes more than 5 times. Some of them were also followed by rising tsunami waves to the mainland.

The next article is written by Brian G. Mc. Adoo et al which tell stories about earthquakes and tsunamis in the 20th century. Entering the beginning of the 20th century, or 46 years after the previous large-scale earthquake in 1861, Nias again experienced earthquake and tsunami shocks. This time it happened on January 7, 1907. Except for the inscription made by Schröder above. there is no record of the extent of damage and loss of life at that time even though the earthquake is also thought to have been followed by a tsunami. As a comparison, at the same time an earthquake also occurred and was experienced by the people who live in Simeulue, an island

located north of Nias. Some time after the earthquake, Simeulue Island was also hit by a tsunami with rising Indian Ocean sea water to the mainland. It is estimated that more than 50 percent of the infrastructure in Simeulue was badly damaged, including many victims. The tsunami was so terrible at that time that the victims were found on coconut trees as high as 10 meters and even in the hills which were quite far from the coast (Mc Adoo, 2006).

4. Journalist Works

The next category of historical sources in the form of written notes informing about the earthquake and tsunami on Nias Island is in the form of journalistic works. These works were written by journalists and then published in various media, both print and online. The first journalistic work was published in 1861 in a Dutch-language newspaper, namely *De Javasche Courant*.

The following journalist's work was published in *Kompas*, a nationally-run Indonesian newspaper, December 27, 2018 edition. According to the records of *Kompas* journalists, History noted again after 57 years, precisely in 1961, an earthquake occurred again on Nias. This time in the southern part of Nias with a power of 8.9 Mw (*Kompas*, 27 December 2018). Forty years after that, no information was found regarding the same incident on Nias Island. It was only at the beginning of the 21st century that the earthquake cycle returned there. The west coast of Sumatra was rocked by a tectonic earthquake on December 26, 2004, or 43 years after the last earthquake in 1961.

Written sources and even video recordings are now available on the contemporary earthquake and tsunami events. As an example of the earthquake and tsunami on Nias Island in 2004 and 2005. There are lots of written reports that have been done by journalists and published in various newspapers. Only a day after the earthquake, several newspapers, especially those published in Medan, the capital of North Sumatra Province. make a report on the occurrence of the earthquake and tsunami in Nias. Some of the coverage was published in the *Analisa* newspaper

Nias Island experienced two catastrophic earthquakes in two consecutive years from 2004 to 2005, respectively on December 26, 2004 and December 2005. The first earthquake was a tectonic earthquake, followed by rising sea levels to the land (tsunami). The earthquake lasted for 3 minutes caused many buildings were damaged.

This earthquake rocked the Province of Nanggroe Aceh Darussalam (NAD) and several areas in North Sumatra Province, such as Nias Island, Sibolga, Central Tapanuli and Pantai Cermin. The earthquake shocks triggered a tsunami and flash floods in the Nias Regency area. As a result, many infrastructure and access to land routes were damaged, which made it difficult for victims to evacuate.

The day after the earthquake, several newspapers were mainly published in Medan, the capital of North Sumatra Province make a report on the occurrence of the earthquake and tsunami in Nias. The high tide has hit several

sub-districts in Nias Regency, namely Sirombu, Mandrehe, Tuhemberua, Lahewa, Afulu as well as several sub-districts in South Nias. Public facilities in Sirombu, like the market and seaport, were inundated with water up to 2-3 meters. A number of small islands off the coast of Sirombu such as Hinako, Bawa, Herooma, Bogi, Asu, Imana and Amatala are threatened with sinking (Analisa, 27 December 2004). Journalists from the Waspada Daily published in Medan also reported that the worst conditions were in two sub-districts located in West Nias that is Sirombu District and Mandrehe District. The day after the incident left 42 people dead and 75 people missing, where the most victims were in the two sub-districts, most of whom were children (Waspada, 27 December 2004)

The earthquake and tsunami disasters experienced by the Nias people had an impact on their psychological condition. As reported by the Waspada Daily, Nias people who survived from the disaster experienced depression caused by a feeling of disappointment at the central government which seemed to place Nias second in giving attention as a form of disaster management. The magnitude of the impact of the tsunami in the area of Nanggroe Aceh Darussalam compared to several areas affected by the tsunami in North Sumatra has made public and even government attention focused on the area of Nanggroe Aceh Darussalam

The Governor of North Sumatra immediately responded to the tsunami disaster that hit the Nias area, who assigned the Head of the SAR (Search and Rescue) Task Force to inspect the location and bring in aid. The response in the form of an assignment was issued in the early hours after the tsunami occurred. The site inspection itself was divided into 2 teams, namely sub-team A which surveyed the Batu Islands area in South Nias and sub-team B observed Sirombu District and Mandrehe District. Meanwhile, the assistance was in the form of 1 10,000 KVA generator, food ingredients such as indomie, rice, cloth, sarongs, medicines, and SAR equipment. Meanwhile, after 4 weeks, the Regent of Nias and Nias Selatan together with the *Satkorlak* (executive coordinating unit) carried out rehabilitation and reconstruction as well as cleaning up the city

The condition of Nias has returned to normal after being hit by the earthquake and tsunami. This can be seen from the condition of the government which has been running well, government offices are operating as usual, and the bodies of the victims have been buried. All victims have been evacuated and aid has been sent from Sibolga. What the government did was to collect data which was then followed up with the rehabilitation and reconstruction of the Nias area.

Nias has been able to enter the rehabilitation stage because Nias' condition can be said to be stable. This was stated by the Governor of North Sumatra after inspecting the location. The management of the national disaster has not yet reached the rehabilitation stage, but the Governor of North Sumatra has suggested that Nias should enter the rehabilitation stage, where apart from being in a stable condition, the level of damage itself is not too severe when compared to Aceh.

Nias was given its own authority over Nias regional complaints over the earthquake and tsunami disaster by President Susilo Bambang Yudhoyono during his visit to Nias Island. The Regent of Nias on behalf of the community thanked the President and Minister for responding to complaints from the Nias region. This response

gives hope to Nias to catch up with other districts in North Sumatra. Furthermore, the Regent of Nias also thanked the news media for reporting on the condition of Nias, making it easier for aid providers to find out about Nias.

Conclusion

The history of the earthquake and tsunami natural disasters that have occurred on Nias Island over the past three centuries from the end of the 18th century to the beginning of the 21st century can be traced from available sources or data. Broadly speaking, these sources can be grouped into 2 categories, oral sources and written sources. Oral sources are in the form of folklore of Nias people which is called hoho in the local language. Hoho actually existed long before the 18th century. Its existence coincides with the emergence of traditional Nias people's perceptions of the factors that cause earthquake shocks that often occur on the island they live on. Hoho also existed before the introduction of written sources. Like most studies on folklore in ethnic communities, the stories in hoho are mixed with mythical stories. The myth of the cause of the earthquake on Nias Island is somewhat similar to stories in other areas such as in Sumatra. The occurrence of the earthquake was caused by shaking due to the stretching of a large snake that was in the bowels of the earth. In addition, the source is in the form of interviews. In general, Nias people, both living on Nias Island and overseas who directly experienced the devastating earthquakes on 26 December 2004 and 28 March 2005, could be interviewed to obtain information related to these events.

Then the sources of the second category are in the form of writings made since the 19th century. Compared to oral sources in the form of oral traditions, these written data are of course more scientific so that the degree of truth can be accounted for. This written source can also be divided into 4 sections including reports of Dutch colonial officials, explorer notes, scientific works, and journalistic works. Unlike the case with oral sources, both in the form of oral traditions in the hoho and interviews, in general, they originate from within (internal) the Nias community itself. On the other hand, written sources are generally produced by people who are not Nias people but people who have had contact with the island or Nias people both Indonesians and foreigners.

Universitas Indonesia, Indonesia

Abstract: Increasing plastic consumption each year has led to growing concern over its waste. There are several ways that has been done in order to reduce plastic waste over the years and one of them is recycling. In Indonesia, plastic recycling rate is low despite the country's high plastic waste production. In order to increase plastic recycling rate, value of rigid plastic packaging post consumption must be maintained as high as possible. Based on material value conservation paradigm, the use of color, glue, ink, and other treatment toward rigid plastic packaging will affect its value. Plastic packaging design based on material value conservation paradigm is used to maximize value of post consumption plastic packaging. However, through observation, most of beverages with rigid plastic packaging in the market do not meet material value conservation criteria. In this paper, customers' acceptance model of beverages with rigid plastic packaging that fulfil material value conservation criteria is developed to encourage the implementation of rigid plastic packaging according to material value conservation paradigm.

Keywords: Customers' acceptance, Material value conservation, Plastic, Packaging, Value

Introduction

Plastic is referred to as a versatile material because its application is very wide, from plastic packaging to building materials (Shen et al., 2020). Plastic wide range of application is due to its properties such as lightweight, cheap, strong, easy to shape, and resistant to chemicals (Andrady & Neal, 2009). The high level of plastic use causes the demand for plastic production to continue to increase every year. In 2021, global production increased by 4% to around 390 million tons (PlasticsEurope, 2022). From that number, plastic packaging industry contributes around 36% of plastic production (Geyer et al. 2017). Increase in production and use of plastic is accompanied by increasing amount of waste generated (Kunwar et al., 2015)

because after plastic packaging materials fulfill their purpose, most of them are discarded and become post-consumption waste (Ragaert et al., 2015). This post-consumption waste, then goes to recycling plants, incineration sites, and final disposal sites (Geyer et al. 2017).

Function of packaging is to preserve, protect, trade, market and distribute food/drink in a cost-effective manner for the satisfaction of industry and customer and also to minimize negative impacts on the environment (Marsh & Bugusu, 2007). Packaging materials can be either rigid or flexible. Rigid packaging includes bottles, jars, cans and cans, while flexible packaging includes plastic film, paper, foil, cloth and sacks (Ncube et al., 2021). The most widely used type of plastic for packaging is PET (PlasticsEurope, 2022). Recycling rates for PET bottle in Indonesia is 75% (Kharisma, 2023). Treatments toward plastic packaging such as giving color pigments, using adhesives, using printing inks, and other production process treatments can cause value reduction of the remaining plastic material in the recycling process (Gabriel, 2016). Low value of post-consumption plastic packaging makes it unattractive for recycling because of its low selling price of the material (Gabriel et al., 2018).

Material Value Conservation

The purpose of implementation of material value conservation paradigm is to minimize material value reduction and maximize its residual value so as to increase the life cycle. Post-consumption plastic packaging is divided into four categories based on material value conservation or its residual value, with category one having the highest residual value and category four having no residual value so it is discarded and becomes waste. Post-consumption plastic packaging that belongs to category one or has the highest residual value is the one that does not contain color pigments, no printing ink on the packaging, and uses plastic or paper labels that are easily removed. Post-consumption plastic packaging that belongs to category two or has moderate residual is the one that uses bright or transparent pigment color, especially blue or green pigments, and printing ink on the packaging. Post-consumption plastic packaging that belongs to category three or has a low residual value is the one that uses a lot of color pigments and printing ink on the packaging. If the packaging is used for materials that are toxic and dangerous then the post-consumption plastic packaging is included in category four or has no residual value (Gabriel, 2016).

Observations were made in order to find out the various designs of plastic soft drink packaging that are being sold in the market in Indonesia today and what treatment is given to the plastic packaging in the production process which will then affect the residual value of the plastic packaging. Table 1 shows a summary of the results of observations on the design of plastic soft drink packaging currently being sold in the Indonesia's market.

Based on the results of the observations discussed earlier, it can be seen that beverages sold in the market, their packaging does not reach their maximum residual value due to various treatment toward the packaging. One product has been found to have high residual value because it met all material value conservation criteria. This

study is conducted in order to answer the following question: what will affect customer acceptance if design packaging that have moderate residual value is changed to the one that meet material value conservation criteria. Then, a comprehensive customers' acceptance model for rigid plastic packaging designs that meet material value conservation criteria is made to answer the question.

Table 1. Indonesia's market observations result on the design of beverages plastic packaging

Pictures	Treatments toward plastic packaging	Categories based on its residual value
	No treatment	High residual value or category 1 Meets material value conservation
	Product label glued to plastic bottle, glue left residue in packaging	Moderate residual value or category 2 Does not fully meet material value conservation
	The use of blue pigment on bottle, product label glued to plastic bottle, glue left residue in packaging	Moderate residual value or category 2 Does not meet material value conservation

Method

Developing Conceptual Model and Hypothesis

The conceptual model is shown in Figure 1. Few studies have reported that environmental concern influences intention towards buying green products (Paul et al., 2017, Prakash & Pathak, 2017, Prakash et al., 2019, Yadav & Pathak, 2016). Further, knowledge about environment also reported in a few studies to influence green purchase behavior in customer (Kanchanapibul et al., 2014, Yadav & Pathak, 2016). Hence, the hypotheses are: H1: Environmental concern influences customers' acceptance for beverages rigid plastic packaging designs that meet material value conservation criteria.

H2: Knowledge influences customers' acceptance for beverages rigid plastic packaging designs that meet material value conservation criteria.

Theory of Planned Behavior is a theory which states that the relationship between attitudes, subjective norms, and perceptions that will influence an individual's behavioral intention to perform an action (Ajzen, 1991).

H3: Subjective norm influences customers’ acceptance for beverages rigid plastic packaging designs that meet material value conservation criteria.

H4: Perceived behavioral concern influences customers’ acceptance for beverages rigid plastic packaging designs that meet material value conservation criteria.

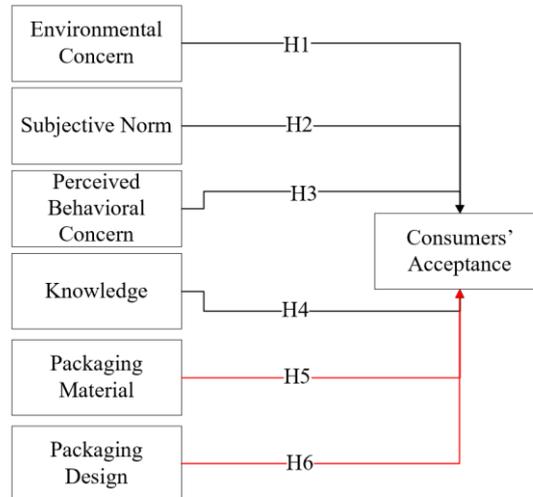

Figure 1. Conceptual Model

From the previous literature study about material value conservation and observation, it is known that the new packaging design is the one without any treatment given toward it. This new packaging design use less material because product label or description is not using any label or glue, instead it is embossed on the packaging. Previous study about product packaging material and product packaging attributes influences customers’ intention to buy green product has been conducted (Dinh et al., 2022, Waheed et al., 2018).

H5: Packaging material influences customers’ acceptance for beverages rigid plastic packaging designs that meet material value conservation criteria.

H6: Packaging design influences customers’ acceptance for beverages rigid plastic packaging designs that meet material value conservation criteria.

The latent variables in the proposed conceptual model require manifest variables to measure these latent variables that is shown in Figure 2. The number of manifest variables for each latent variable depends on the number of questions.

Designing Questionnaire

Data was collected through a questionnaire. The sample size follows the N:q rule described by Jackson (2003). Minimum sample size in terms of the ratio of the number of cases (N) to the number of model parameters that require statistical estimation (q). The recommended ratio of sample size and parameters is 20:1. For example, if the parameter requires approximation, q = 10, then the minimum sample size is 20q, or N = 200. A less ideal

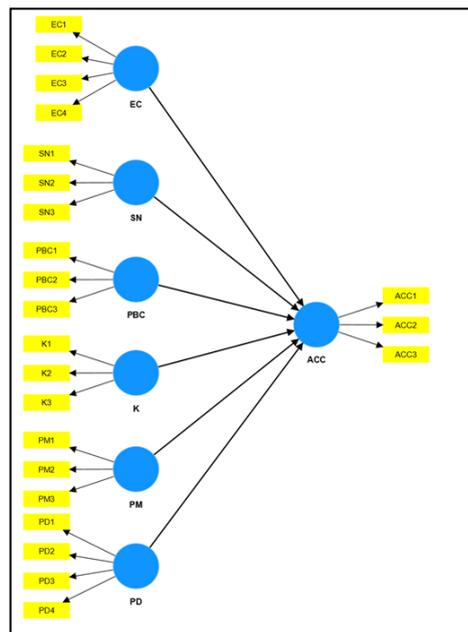

Figure 2. Manifest Variable in Conceptual Model

size would be the ratio $N:q = 10:1$, which for the example just for $q = 10$, the minimum sample size will be $10q$, or $N = 100$. As the ratio $N:q$ decreases from $10:1$ (for example, $N = 50$ for $q = 10$, the ratio is $5:1$), so does the confidence in the results. The risk for technical problems in the analysis is also greater. Based on Table 5 there are 23 parameters, so the minimum sample required is 460.

The questionnaire begins with explanation about material value conservation to educate respondent about the topic, filling in the respondent's age, gender, salary, and education. Next, it is followed by a list of questions. The list of questions is answered using a Likert scale. The Likert scale consists of 5 levels starting from strongly disagree indicated by number 1, disagree with number 2, neutral with number 3, agree with number 4 and finally strongly agree indicated with number 5.

Collecting Questionnaire Results

Questionnaires were distributed in person and online via Google Form to people who live in Jakarta, Indonesia. Data from the questionnaire results were then collected and only complete data is to be processed. Data that passes the selection results can then be processed with the smartPLS 4.0 software.

Validity and reliability test are carried out to evaluate whether the model built is appropriate. A variable is said to have good validity against latent variables if standardized factor loading ≥ 0.5 . If all indicators' standardized factor loading ≥ 0.5 then the indicator can be said to be a good measurement for the variable in question. Reliability is a measurement of consistency. A good variable has a Construct of Reliability (CR) value of ≥ 0.7 and a Variance Extracted value of ≥ 0.5 (Kline, 2016).

Results

Evaluation of Measurement Model

Table 2 shows the results of the convergent validity test with loading factor. All values are declared valid because they are above 0.708 (Hair et al., 2008).

PM	0.341	0.000
PD	0.133	0.002

Environmental concern ($p < 0.01$) has a significant influence on customer acceptance toward beverages plastic packaging designs that meet material value conservation criteria, that supported the hypothesis H1. Knowledge concern ($p < 0.01$) also has a significant influence on customer acceptance toward beverages plastic packaging designs that meet material value conservation criteria, that supported the hypothesis H4. Further, packaging material and packaging design attributes also has a significant influence on customer acceptance toward beverages plastic packaging designs that meet material value conservation criteria, that supported the hypothesis H5 and H6.

Table 8 shows the results of the model fit measure. The Standardized Root Mean Square Residual (SRMR) value below 0.08 indicates the model is fit. The better the model is if the NFI (Normed Fit Index) value is close to 1.

Table 8. Fit Measures

R-square	0.848	0.848

Discussion

Figure 3 shows results of variable that is accepted in hypothesis testing and how each of those variable relation to customers' acceptance. The result suggested that packaging material variable significantly influences customer acceptance toward beverages plastic packaging designs that meet material value conservation criteria the most which means showing information about less material that is used in material value conservation design will affect customers' purchase beverages purchase behavior. Customers' acceptance toward beverages

plastic packaging designs that meet material value conservation criteria can also be predicted by environmental concern, knowledge, and packaging design attributes.

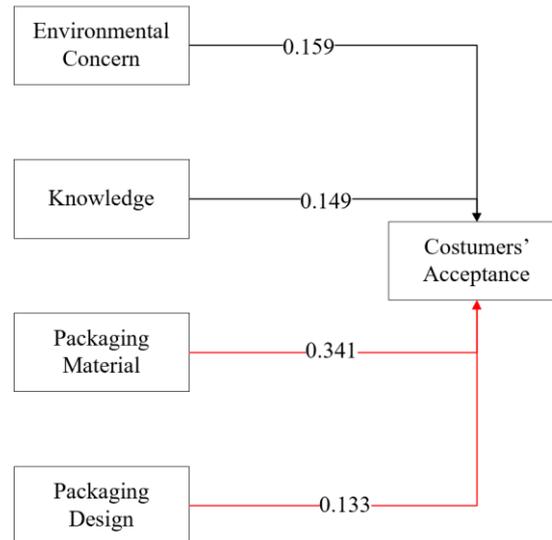

Figure 3. Relation between variable and customers' acceptance

Conclusion

This study aims to develop a comprehensive customers' acceptance model for rigid plastic packaging designs that meet material value conservation criteria. From the developed model, it can be concluded that environmental concerns, knowledge, packaging material, packaging design influence consumer acceptance of beverages packaging designs that meet the criteria for material value conservation. The information obtained from this research can be useful for encouraging the implementation of conservation of material values for beverages rigid plastic packaging designs by plastic packaging manufacturers at the request of plastic packaging buyers (in this case beverages manufacturers) (Gabriel & Anindityo, 2018). Finally, material value conservation implementation is expected to increase bottle to bottle recycling in Indonesia.

Recommendations

Further studies need to be done to see the influence of other stakeholders (for example government, packaging manufacturer, packaging buyer, and others) (Gabriel & Anindityo, 2018) on costumers' acceptance. It is important because with customers alone, the implementation of material value conservation cannot be done.

Analysis of Symmetric Timetable Frameworks Based on Unfixed 4-Blocks

Jong-Sung Ha

Woosuk University, South Korea

Abstract: Fixed frameworks called modules are often used in order to easily avoid conflicts among curriculum courses when scheduling timetables at many universities. This paper proposes a novel approach for the timetable frameworks by introducing symmetric timetable modules based on unfixed 4-blocks, which will be refined as fixed 3-blocks and potential 1-block. We show that the unfixed 4-blocks are superior to the traditional fixed 3-blocks without any loss from the viewpoint of consumers. Our operational strategies based the concept of unfixed 4-blocks provide many advantages including both flexibility and controllability at the same time when timetables are scheduled. Although the method theoretically can reduce the upper bound of space utilization to 75% in the worst case from the viewpoint of suppliers, we argue that it is not a critical issue in practice, because the practical space utilization is desired to be typically lower than 75% in order to get the reasonable space idleness, and furthermore, the upper bound can be increased much larger when multiple school years use multiple spaces.

Introduction

Timetabling is defined as the problem of allocating resources to objects located in space and time in a manner as close as possible to desired objectives under given constraints (Wren, 1996). Even though this has been a classic and important problem for a long time, it has been continuously studied in the areas of computer theory, industrial engineering, and management science to find the next best solution.

At schools, hospitals, and various industries, they are making a lot of efforts to regularly create timetables for their given needs. Most timetabling problems have NP-hard time complexity even in simple cases (Even, Itai, & Shamir, 1976; Kubiak & Kubiak, 2021; Rosa et al., 2021), that is, any deterministic algorithm with polynomial time complexity has not been discovered and the infeasibility has not been proven. This means that the optimal solution cannot be found in realistic time with the current techniques when the problem size becomes larger than a certain. This causes innumerable alternative approaches for finding the optimal solutions of timetabling problems continuously for a long time in the fields of computer theory, industrial engineering, and management. We consider the timetabling problem in universities, which has been studied by many researchers (Chen et al.

2021; Babaei, Karimpour, & Hadidi, 2015) since it has become more difficult due to various cases such as students and facilities increasing over the past 30 years. While some of these researches have been applied into developing automatically scheduling software, most researches (Babaei, Karimpour, & Hadidi, 2015; Bashab, et al., 2023; Rappos, Thiémar, RobertJean, & Hêche, 2022; Sylejmani, Gashi, Ymeri, & Ymeri, 2022; Colajanni, Colajanni, Daniele, & Daniele, 2021; Bashab et al., 2020; Ruslaan, Zakaria, & Zakaria, 2019; Lindahl, Sørensen, & Stidsen, 2018; Oluwole, Oghenefego, & Obi, 2018; Lindahl, Mason, Stidsen, & Sørensen, 2017; Islam, Perves, Shahriar, & Hasan, 2016; Nothegger, Mayer, Chwatal, & Raidl, 2012; Burke, Marecek, Parkes, & Rudova, 2012; Yang, & Jat, 2011; Lü, & Hao, 2010; Burke, Marecek, Parkes, & Rudova, 2010; Pongcharoen, Promtet, Yenradee, & Hicks, 2008; Lewis, 2008; Burke, MacCarthy, Petrovic, & Qu, 2006; Thompson, 2005) have focused on only academic and theoretical achievements for solving NP-hard problems heuristically by generalizing and formalizing the unlimited constraints of resources such as space, classes, and courses. However, unfortunately, there are still a lot of real unsolved problems and difficulties in creating university timetables. This paper does not belong to a fundamental heuristic algorithm of the difficult NP-hard problem of theoretically generalized time tabling, but presents a practical issue how to pre-define frameworks before timetabling, which have the purposes to avoid the conflicts of course registering and efficiently utilize the resources.

In fact, many universities have created a framework called timetable module and still create semi-automatic timetables by human hands. This paper notes that the degree of difficulty that can be satisfy consumer demands varies greatly when creating timetables, and the composition of the timetable module is the most basic and practically important concept. In a broad sense, these timetable modules can be regarded as part of the constraints in the timetable problem, however, unlike other constraints, we cannot find any research that deals with this issue separately or importantly since it looks difficult to represent the frameworks called modules like other generalized constraints.

In usual, Korean universities first build timetable modules, and timetables are still created semi-automatically by human hands. Sometimes this method can be more practical because major courses are opened by first considering a single major rather than a whole generalized scheduling problem for a few of double majoring students. Furthermore, there is a limit to automation by expressing various requirements that vary variably depending on the department every semester as constraints.

Typically, a course requires 3 hours per week, and some courses requires 2 or 4 hours per week. From now on, a unit for an hour per week in timetables will be called a block. The commonly-used traditional timetable modules consist of 3 fixed blocks as illustrated in Figure 1, which will be denoted by 1Module-3Blocks. This paper proposes symmetric timetable modules of 4 unfixed blocks, which will be denoted by 1Module-4Blocks. In 1Module-4Blocks models, 3 blocks to be used are postponed and 1 unused block is utilized for other purposes such as lunch time.

We also present their operational strategies and comparative analysis showing that our models can be applied

without any loss or better from the demand point of view. From the supplier's point of view, assuming that the upper limit of the acceptable space utilization rate is reasonably reduced, various advantages such as flexibility, controllability, predictability, and balance ability can be obtained together.

Designing Symmetric Timetable Modules Based on 4-Blocks

Fixed 1Module-3Blocks Models

In Korean university curriculum, one course usually consists of 2 to 4 hours called blocks per week, but most of the courses are 3 hours. In addition, the timetable module is often composed of one 1-sized block plus one 2-sized block, and some universities include two 1.5-sized blocks or two 1-sized blocks.

For example, Figure 1 shows the timetable modules actually used in Korean universities, in which English alphabets with the same background color are the module names of definite courses. The common point of these modules is that the blocks used for courses are fixed, i.e., not destroyable in principle. In S and W universities, one module is composed of one 1-sized block plus one 2-sized block for the courses based on 3 hours per week. In N university, they also provide other modules such as two 1.5-size blocks, and two 1-sized blocks for the courses consisting of 2 hours per week in Tuesday and Thursday. The first two modules are for ordinary private universities, and classes are held until the actual 8th period, and the third module is for relatively large national universities, and modules are designated until the 10th period.

In the third module of Figure 1, lunch time (a b c d) is specified separately. Unfortunately, however, most of the university schedules do not specify lunch time separately, as in the first two modules of Figure 1. When students sign up for classes, they empty either 4th or 5th period lesson for their lunch time. Each department also places the courses on the timetable considering not only students' but also professors' lunch time. In other words, in the college timetable, it is not inevitable to listen or lecture the 4th to 5th period lessons consecutively, so if there are 2 courses that have been consecutively arranged in 4th to 5th period lessons, it can be considered mutually exclusive when signing up for courses, i.e., it is practically no different from those organized in the same time zone.

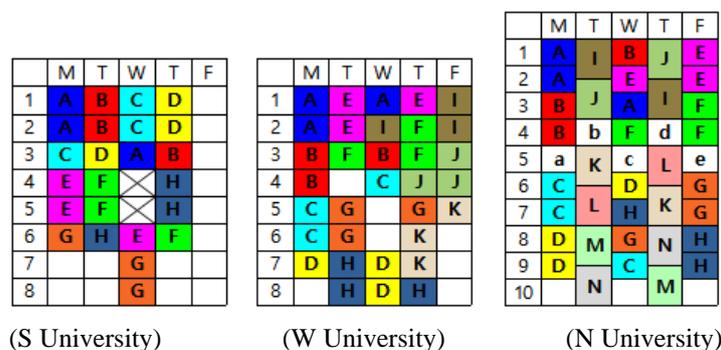

Figure 1. Examples of Timetable Modules

Unfixed Symmetric 1Module-4Blocks Models

This paper first presents 6 kinds of symmetrical 1Module-4Blocks models, in which one module is composed of 4 unfixed blocks, as shown in Figure 2. It is assumed that a day consists of 8 lessons from Monday to Friday, which are generally accepted in the most ordinary universities. 1Module-4Blocks in the tables are symmetrically composed of Monday and Wednesday, Tuesday and Thursday, and Friday morning and Friday afternoon, respectively. Rarely, if you have a Saturday class, you can make Friday and Saturday symmetrical, or Friday afternoon can be excluded sometimes.

In Figure 2, three basic modules of Horizon, Cross, and Shuffle methods are presented, in which modules are symmetrically arranged, respectively. In the horizon method, a module is composed of two 2-sized blocks both of which are placed in the same period horizontally, while the cross method places two 2-sized blocks in different period crossing each other. In the shuffle method, a module is composed of one 2-sized blocks and two 1-sized blocks, and two modules are placed by being shuffled.

Three other models produced by applying the three basic modules. S+H Combo and S+C Combo modules arrange other models in the morning and afternoon by simple merging of the shuffle method with the horizontal and cross methods, respectively. S+H+C Hybrid module is merging the slightly-modified modules of the shuffle, horizontal, and cross methods. These three applied modules also have the property of symmetry which can provide many advantages.

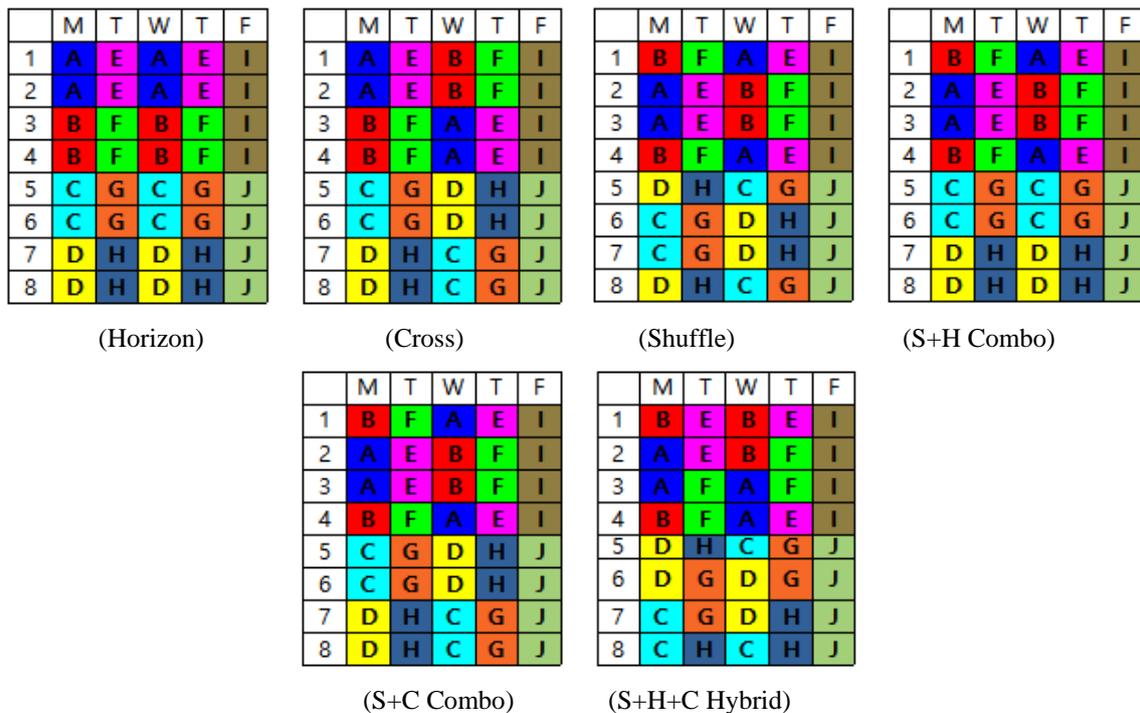

Figure 2. Symmetric Timetable Modules Based on Unfixed 4-Blocks

Comparison of Fixed 3-Blocks and Unfixed 4-Blocks

Simply considering for courses consisting of 3 hours per week, it looks like that the number of courses that can be arranged in 1Module-4Blocks decreases compared to 1Module-3Blocks, i.e., the number of modules that can be placed flat is 10 and 13 per week, respectively. However, when we consider the almost essential condition of lunch time, the number of modules available at the same time that students can apply for classes or assign major courses in the department varies as shown in Table 1. It is because the practically possible arrangement of courses is restricted by the conflicts of two courses using the 4th and 5th period blocks if we have to empty one of the 4th and 5th period lessons for comfortable lunch time.

Table 1. Comparison for Courses Consisting of 3 Hours per Week

Module Types	Flat Arrangement [Supplier's Viewpoint]	Possible Arrangement [Consumer's Viewpoint] = Flat Arrangement – (Conflicts – Duplication)	
		Minimum	Maximum
1Module-3Blocks	$8\text{period} \times 5\text{days} \div 3\text{block} \approx 13\text{courses}$	$13 - (5 - 0) = 8$	$13 - (5 - 5 \div 2) = 10$
1Module-4Blocks	$8 \times 5 \div 4 = 10$	$10 - (0) = 10$	$10 - (0) = 10$

[Proof of Table 1]

Assuming that one course consists of 3-hour blocks per week and one of the 4th or 5th period block should be reserved for lunch time, it is possible to arrange lunch time by adjusting without any conflicts between two courses in 1Module-4Blocks. It is because we can empty 1 block in the 4 unfixed blocks in each module. However, in a 1Module-3Blocks, two courses each containing the 4th and 5th period blocks are mutually exclusive and cannot be used simultaneously; this case is defined as a conflict between the pair of two courses. For example, the pair of blocks (C E) (D F) (B H) in S university module and (B C) (J G) (J K) in W university module of Figure 1 are conflicting each other.

The number of conflicts per week in 1Module-3Blocks can occur 5 times from Monday to Friday. However, it is possible to reduce the modules that cannot be used at the same time by arranging a course to appear two times in the conflicts of the 4th or 5th period block; this case is defined as the duplication of conflicts. For example, the course J in W university module of Figure 1 causes the conflict two times in the module pair (B C) (J G) (J K). It means that the two conflicts (J G) (J K) can be resolved if the blocks of course J is used as lunch time, while only on conflict is resolved if the blocks of course B or C is used as lunch time.

Assuming 1Module-3Blocks models consist of 1+2 blocks, it is obvious that the conflicts can occur 5 times per week. The duplication per week can occur at most 2 times, which can be calculated as $(5 \text{ days} / 2 = 2.5)$. On the other hand, we can avoid any conflict in 1Module-4Blocks models. Therefore, the minimum and maximum numbers of courses available at the same time is calculated as shown in Table 1.

(Q.E.D.)

As shown in Table 1, the number of courses available simultaneously is always 10 in 1Module-4Blocks, but 1Module-3Blocks models are the same as 10 for the maximum and decreases to 8 for the minimum, which is an unexpected result. More importantly, it is difficult to place course blocks symmetrically in 1Module-3Blocks and we cannot avoid ad-hoc arrangement. Therefore, it is difficult to reserve lunch time without conflicts in the case of S university module of Figure 1, and in the case of N university module of Figure 1, many people flock to the lunch time of 1 hour. Furthermore, it is difficult and wastes more blocks to accommodate some courses consisting of 4- or 2-hour blocks per week even though most courses consist of 3-hour blocks per week; a course of 4 blocks waste 2 blocks because it requires 2 modules, and a course of 2 waste 1 block.

The 1Module-4Blocks model has flexibility and controllability to reserve comfortable lunch time, and easily accommodate some courses consisting of 4 or 2 blocks without wasting blocks as much as 1Module-3Blocks, except for increasing the upper bound of space utilization and the number of applicable courses from the supplier's viewpoint. How to get far more advantages as well as flexibility and controllability with the symmetric 1Module-4Blocks will be explained in detail in the next chapter.

When comparing 1Module-4Blocks to 1Module-3Blocks from the supplier's point of view, the only disadvantage is that the upper bound of space utilization is reduced to 75%, while 1Module-3Blocks has 100% upper bound. However, it is not desirable to 100% fully utilize space, but 100% full utilization is meaningless from the consumer's point of view because there is a conflict between two courses each containing the 4th and 5th period blocks due to lunch time as explained in the proof of Table 1.

Operating Unfixed 4-Blocks with Potential Blocks

The timetable modules in Figure 1 in the previous chapter consist of definite blocks and unusable blocks. This chapter discusses the advantages and operations that can be obtained by adapting 4 unfixed blocks of a module in Figure 2, to 3 fixed blocks plus 1 potential block that refers to a block that has priority for a specific module but can also be used as another purpose such as lunch time and consultation time or other modules.

Assuming that one course consists of 3 hours per week, Figure 3 illustrates how to operate timetable modules of Figure 2 with 3 fixed blocks and 1 potential block, where potential blocks are expressed in white base, while fixed blocks are in other colored bases. When we have to unavoidably destroy some fixed blocks, the recommendations are expressed in parentheses <>. The primary recommendation is to accommodate 3 consecutive blocks, which are sometimes needed for part-time instructor or experimental courses. Note that our adapted 1Module-4Blocks model does not waste one more module for accommodating 3 consecutive blocks because the module with one destroyed block can use another potential block. On the other hand, the traditional 1Module-3Blocks model makes another module unable to be used, which are troublesome issues in actual operating of modules.

To summarize the important characteristics of the adapted 1Module-4Blocks, if a potential block is used for another purpose, the flexibility of the option of the module to which the potential block belongs is lost, but the module is still available. Also, even if a fixed block is used as another module of a recommendation $\langle \rangle$, it is not completely destroyed so that the module to which the confirmation block belongs cannot be used.

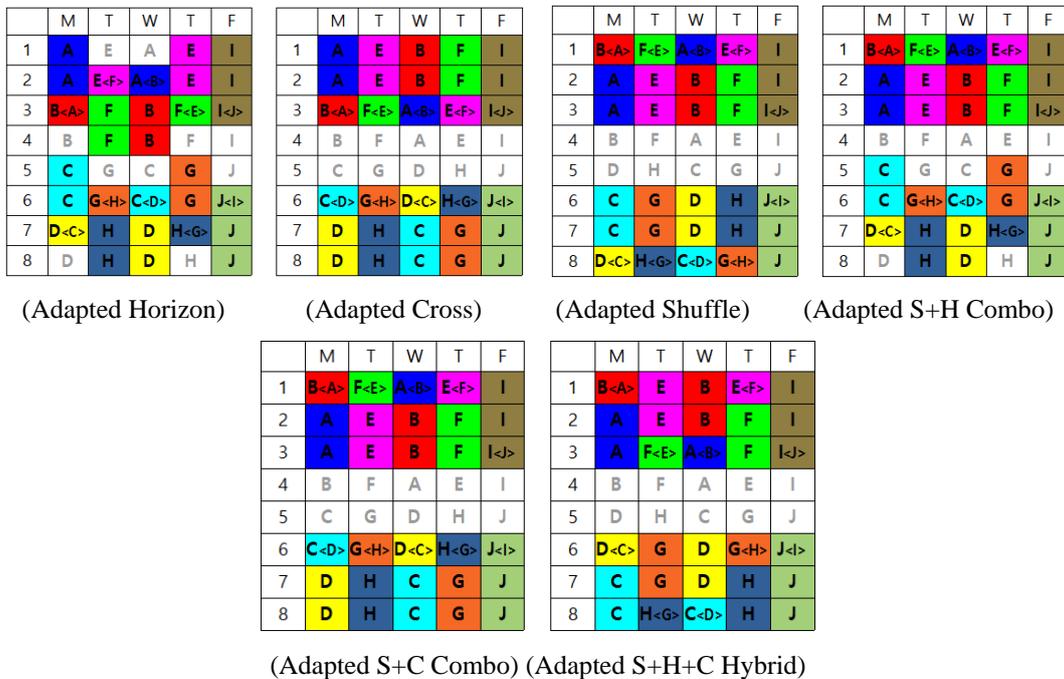

Figure 3. Adapted Symmetric Timetable Modules Based on Unfixed 4-Blocks

Receptivity Comparison of Adapted 1Module-4Blocks Models

Table 2 lists the basic requirements when preparing the college timetable and compares how much the proposed models can accommodate them without destroying the module. It is based on Monday to Thursday except for the same Friday in all models. The more soluble it is, the darker it is expressed in gray.

Without decreasing the number of courses available simultaneously, the 1Module-4Blocks models have more receptivity for users' requirement than the 1Module-3Blocks models. Potential lunch time is the most essential requirement because there is no separate lunch time that makes two modules be conflicted in 1Module-3Blocks models. Modules consisting of 2+2 blocks are also an important receptivity of the model when one course with experimental practice consists of 4 blocks per week in science and engineering, which makes another module unusable in 1Module-3Blocks models. Similarly, there is a nice receptivity for 3 consecutive blocks without destroying other modules. Naturally, the same time zone whether a course can be placed in only side between morning and afternoon, and preferred start time between the 1st and 2nd period in the early morning, are mainly considered for the convenience of consumers. Note that the last two receptivity of the same time zone and preferred start time can accommodate the different life patterns of instructors especially, furthermore, which are more advantageous to more of lunch time.

Table 2. Comparison of Receptivity for Consumer's Requirements (Monday ~ Thursday)

Kinds of Modules		Number of Potential Lunch Time	Number of 2+2 Blocks	Number of Consecutive 3 Blocks	The Same Time Zone	Preferred Start Time	
						1 Period	2 Period
(Figure 1)	S University	(Fixed) 1	Moming 1 Afternoon 4	Afternoon 3	×	○	×
	W University	(Fixed) 2	Moming 1 Afternoon 2	Afternoon 1	○	○	×
	N University	(Fixed) 4	Afternoon 1	Moming 1 Afternoon 1	×	○	×
Adapted Horizon		4 th Period 2 5 th Period 2	Moming 4 Afternoon 4 (Both 6)	Afternoon 4	○	×	×
Adapted Cross		4 th 5 th Period 4	Moming 4 Afternoon 4 (Both 4)	Moming 4 Afternoon 4	×	○	○
Adapted Shuffle		4 th 5 th Period 4	0	Moming 4 Afternoon 4	×	○	○
Adapted S+H Combo		4 th Period 2 4 th 5 th Period 2	Moming 4	Moming 4 Afternoon 4	Afternoon ○	○	○
Adapted S+C Combo		4 th 5 th Period 4	Afternoon 4	Moming 4 Afternoon 4	×	○	○
Adapted S+H+C Hybrid		4 th 5 th Period 4	Moming 2 Afternoon 2	Moming 4 Afternoon 4	○	○	×

Strategies for Dynamic Allocation and Operation of 4-Unfixed Modules

As explained previously, it is originally an NP-hard problem to satisfy various requirements while minimizing module destruction when empty modules are assigned to courses in the proposed timetable models. This paper presents a heuristic algorithm using a greedy method (Horowitz, Sahni, & Rajasekaran, 2008), which cannot guarantee the optimized solution for requirements such as lunch time and other consumer's preference, but is expected to provide reasonable solutions and easy to perform by human hands or implement in software.

Our greedy method has a strategy to deal with subjects that are difficult to allocate modules at the first time, and to assign fixed blocks before potential blocks. The basis of this strategy is not only to avoid module destruction,

but also to maintain the options of other modules as much as possible.

In universities, one course is usually 2, 3, and 4 hours per week, and the course lectures are provided with 2, 2+1 (or 3), and 2+2 consecutive blocks, respectively. Our greedy method to place the courses by allocating empty blocks is based on human intuition. First of all, 2 consecutive fixed blocks are allocated to any type of courses, and then other blocks are added in the less order of possibility to destroy modules. If there are no empty blocks available to add, the assignment of the course is postponed to the next processing step.

Procedurally speaking as illustrated in Table 3, for a course which needs anyone of 2, 3, and 4 hours per week, first we assign one 2-sized fixed block to all courses, and next, the module allocation is finished by searching for 1-sized blocks that can be added in the order of steps ①~⑧: 1st post-processing ①~④ and 2nd post-processing ⑤~⑦. The last exception handling ⑧ is for the courses that cannot be post-processed in ①~⑧.

The difference of the 1st and 2nd post-processing is whether or not destroy another module. The homo- or hetero-block of Table 3 describes whether or not it is in the same module with the already allocated 2-sized fixed blocks for arranging a course, i.e., homo-blocks to each other are represented with the same alphabet. The blocks in the 3rd ~ 6th period of a day can be allocated, i.e., empty, only if at least one potential block is empty for lunch time.

Table 3.The Order and Methods for Adding Blocks to Already Allocated 2-Sized Fixed Blocks

Steps		Cases of Blocks	Addition to Fixed the 2-Sized Blocks (Homo-/Hetero- and Fixed/Potential Blocks)
1 st Post-Processing	①	2+2	1 Homo-Fixed + 1 Homo-Potential
	②	3	1 Hetero-Fixed with Mark <>
	③	2+1	1 Homo-Fixed (If Not, 1 Homo-Potential)
	④	2	(Not Added)
2 nd Post-Processing	⑤	2+2	1 Hetero-Fixed + 1 Homo-Potential <i>of Newly Added</i>
	⑥	3	1 Hetero-Potential (Because 1 Hetero-Fixed was Used in ②)
	⑦	2+1	1 Homo-Potential (If Not, 1 Hetero-Fixed)

Exception- Handling	⑧	2+2	Process Manually in Ad-hoc.
		3	
		2+1	
		2	

In the 1st post-processing of Table 3, empty blocks are added to already allocated 2-sized fixed blocks of each course in the order of courses consisting of (2+2)-, 3-, 2+1-blocks, which is the less order of possibility to destroy modules. The courses, which cannot be finished in the 1st post-processing because of the unavailability of suitable blocks, are processed in the 2nd post-processing.

Even though it is expected that almost all of courses can be can be allocated if the ratio of all courses to all modules is reasonable, i.e., the ratio should be less than 1.0 and the smaller is the better, there can be some unfinished courses until the 2nd post-processing. Obviously, the number of courses remaining after the 1st and the 2nd post-processing will be proportional to the complexity and number of courses to be placed in a timetable. The last unfinished are exceptionally handles manually in ad-hoc by minimizing the destruction of other modules as possible.

Finally, our heuristic algorithm using the greedy method is summarized as follows.

<p>[Input] All courses in a semester and a timetable model of Figure 3.</p> <p>[Output] A timetable placing the all courses.</p> <p>Step 1: Assign a 2-sized fixed block to the all courses.</p> <p>Step 2: Try to add more blocks to the all courses without destroying any module as ①~④ in Table 3.</p> <p>Step 3: Try to add more blocks to the courses unfinished in Step 2 by destroying one module as ⑤~⑦ in Table 3.</p> <p>Step 4: The courses unfinished even in Step 3 are processed manually in ad-hoc.</p>

Taking advantage of the stronger symmetry of cross, shuffle, and S+C combo models among the symmetrical 1Module-4Block models of Figure 2, we can operate the modules more flexibly and dynamically according to consumer's requirements. For example, if there are many students and instructors avoiding the 1st or 8th period, we can convert the potential blocks in the 4th period to the 1st period or the 5th period to the 8th period, respectively, as shown in Figure 4. Even though it was omitted, the fixed blocks that can be used as another module can be described with the mark <> similarly in Figure 3.

In particular, the complete symmetry of shuffle models can be used to dynamically swap potential blocks or minimize collisions when instructors' preference for the start of the 1st or 2nd period is one-sided; first allocate the blocks of courses by excluding the preference, and then post-process whether the preference can be satisfied by replacement of potential blocks. This another strategy can be used when every requirement cannot be

satisfied but only partial satisfaction is possible.

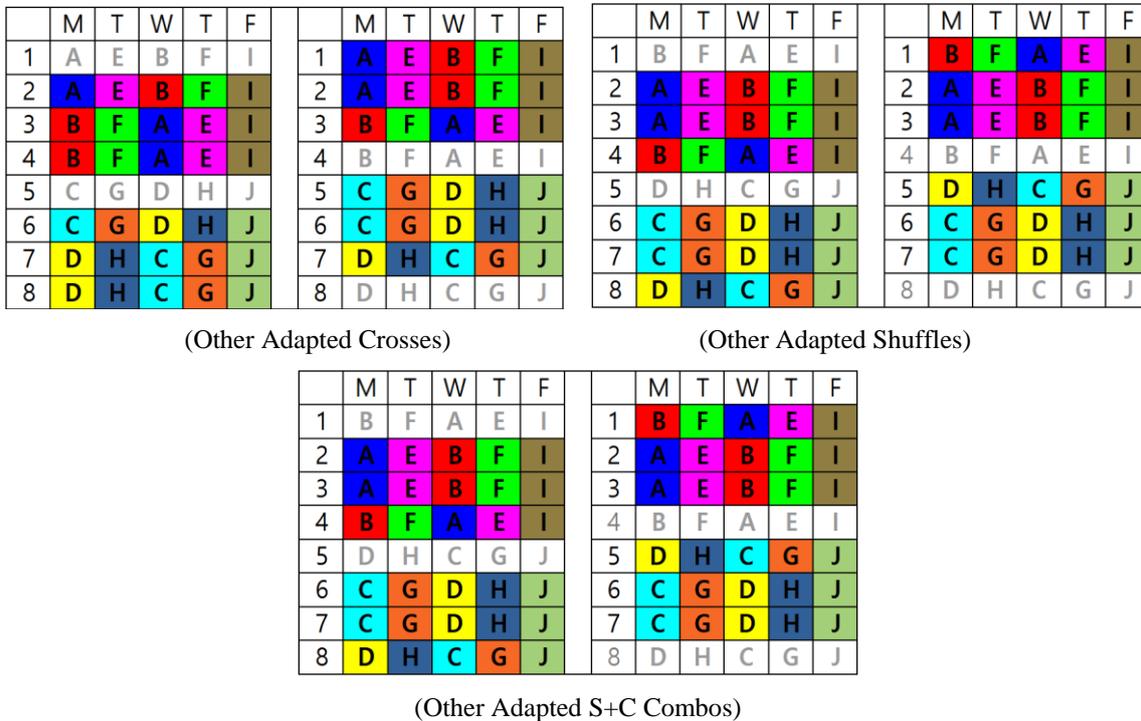

Figure 4. Other Adapted Symmetric Timetable Modules for Considering Preferred Start Time

For example, if a department is focused on the preference for the start of the 2nd period, it is difficult to satisfy all. In this case, first we build up the timetable for all courses with Step 1-4 of our heuristic algorithm after designating the potential blocks as the 4th and 5th period, and next, the preference for the start of the 1st or 2nd period is swapped in order to change the start from the 1st period to the 2nd period.

Summary of Advantages in Symmetric 1Module-4Blocks Models with Potential Blocks

Table 4 summarizes the advantages of the adaptive symmetric 1Module-4Block models presented compared to the traditional 1Module-3Blocks models. Concretely, we enumerate the possible functions that can be obtained by operating the 1Module-4Block models with adapted potential blocks.

Table 4. Advantages and possible functions of adaptive symmetric 1Module-4Block models

Advantages	Possible Functions
Flexibility	<ul style="list-style-type: none"> -Securing Lunch Time -Considering the Preference of the Start between the 1st and 2nd Period -Choosing between (2+1)-Blocks and 3-Blocks for the Course of 3-Hours -Accommodating the Course of 4-hours - Suitable for the Course of 2-Hours

Controllability	-Dynamic Operation of Potential Blocks -Inducing a Fixed Lunch Time -Excluding the Isolated 1 st Block or the Isolated 8 th Block (Allocating Two Consecutive Blocks) -Controlling the Preference of the Start between the 1 st and 2 nd Period
Predictability	-Predicting the Same Movability Based on Symmetry
Balance Ability	-The Same Allocation for 3 or 4 Blocks Before and After Lunch Time

Conclusion and Further Researches

This paper has proposed the new frameworks of symmetric 1Module-4Blocks timetable modules, and compared them with the traditional 1Module-3Blocks modules from both consumer and supplier viewpoints. The new modules have no loss or better outcome from the consumer's viewpoint and only a theoretical disadvantage from the supplier's viewpoint, which is not critical in practice. Theoretically, the upper bound of space utilization can decrease to 75% in the worst case every school year uses its own one space. In spite of this theoretical disadvantage, we argue that it is not a critical issue because the 100% fully utilization is undesirable to get the not crowded and comfortable space, and furthermore, the upper bound can be increased much larger than 75%, or nearly 100% when multiple school years use multiple spaces.

By presenting effective models and operational strategies by adapting potentially determined blocks to the proposed symmetric 1Module-4Blocks models, we demonstrated how many advantages can be obtained without loss from the consumer's viewpoint. The first advantage is the flexibility for securing lunch time, considering the preference of beginning time, and accommodating various courses of 2-blocks, (2+1)-blocks, 3-blocks, (2+2)-blocks, and 4-blocks. The second advantage is the controllability of operating potential blocks dynamically such as a fixed lunched time, exclusion of isolated 1-blocks, and so on. We can also get other advantages such as the predictability of students' movement and the balance ability of space allocation.

The adapted symmetric 1Module-4Blocks timetable modules proposed in this paper are expected to be applied directly or modified in consideration of the actual environment when constructing university timetables. The next research to be considered is how to more expand or generalize the proposed module research as one of the main solutions to the original timetabling problem of universities.

University of Science & Technology, Sultanate of Oman,  <https://orcid.org/0000-0001-5417-4944>

Abstract: In the era of technology, information or data is an important factor to do any kind of task. Recommendation system has been introduced in the tourism sector where the system can be used to provide the user with personalized recommendation of the places to visit. Sultanate of Oman has got various tourists attractions and it is one of the safest tourist destinations in the world. The purpose of this paper is to design and develop a recommendation system for tourism sector in Oman which will recommend to the users based on their searched destinations using hybrid recommendation system that is combination of- content-based and collaborative filtering algorithm. To train and then to provide meaningful recommendations, dataset has been developed by implementing web scrapping method from one of the popular websites ‘tripadvisor’ which consists of the description of all the tourism places in Oman namely destination names, type of the destination, average rating of the places, the number of people rated the place and image of the destination. The recommendation system is integrated with a web application that acts as a web interface. The system has been developed using python programming language while the web application was developed using Django framework along with HTML and CSS. To evaluate the efficiency and performance of the developed system, it was compared with three other algorithms namely Radius Neighbors classifier, Linear Regressor and Logistic Regressor. The same dataset was provided to all the three algorithms where 70% of the data is used as training data and the rest of the 30% of the data is used for testing. MSE (Mean Square Error) and RMSE (Root Mean Square Error) are calculated for all of the mentioned algorithms, and it was found the developed system performed better than most of the algorithms with less error.

Keywords: Recommendation system, Content-based filtering, Collaborative filtering approach, Mean Square Error, Root Mean Square Error

Introduction

Internet is a source of information which is growing rapidly with its increase in popularity. Everyday new information is being introduced to the internet. This makes internet a pool of information that consists of useful

as well as not so useful information. This state of ‘information overload’ has been a problem for users as it is hard for them to obtain information which are important. Therefore, in this era of “information overload” (Li et al, 2019) there is a need of a system which will filter the relevant information from the big pool of information. Thus, the recommendation system has been introduced in mid-1990 to help users select the useful information or product from a number of available options (Sharma & Singh, 2016).

Recommendation system is defined as a filtering system which is used to filter out the unimportant information and recommend the users only the information which are relevant to their search. Two of the very popular filtering approaches are known as content-based filtering and collaborative filtering. (Alrasheed, H. et al, 2020) This system has been used in many sectors such as entertainment, e-commerce, retail etc. Recommendation system has been introduced in the travel sector where the system can be used to provide the user with personalized recommendation of the places to visit. (Sebastia, L. et al, 2009)

The aim of this research is to design and develop a recommendation system. Recommendation system requires the involvement of machine learning models. Machine learning is a branch of Artificial Intelligence that studies the dataset provided to the system and then provide accurate output or recommendation to the users based.

One of the main objectives to achieve the aim of this research is, to develop appropriate machine learning algorithms and train them with the dataset to get required output to the user.

Literature review

Obeid et al (2019), proposed a “ontology-based recommender system in higher education” for those students who are interested in higher studies after high school graduation. According to the research done by the authors, 75% of the students are uncertain about their career choice and they join universities without a proper plan of their career path. Therefore, the proposed system aims to help students decide a major based on their skills and interests and not by their grades. The system uses semantic web methods and machine learning technologies to provide recommendations to the students. The system uses ontology to model three domains knowledge- higher education institute, employment and students. By learning from graduate student’s information, collected via survey, using machine learning techniques suggestions will be made to the students. The classification, filtering and clustering of information is done with the help of machine learning techniques.

The authors plan to use algorithm techniques such as; k-mode, self-mapping and hierarchal cluster algorithm to process the data. The survey for this system is intended to be presented to the French and Lebanese students through their university portal.

The approach used in this system solves some of the problems such as data sparsity and cold start. But the system relies heavily on the survey result from the graduate students.

To make a recommendation system efficient and to improve the satisfaction level for the users, the researchers

Hassannia et al, (2019), developed a web application named “Intelligent Tourism Recommendation Agency using an innovative technology - Multi Agent System (MAS) to collect, process and then provide recommendation to the users. The aim of the research, “Web based Recommendation System for Smart Tourism: Multiagent Technology”, was to develop a smart recommendation system in tourism sector that would be an advancement towards the smart tourism goals.

The system consists of five agents who are responsible for doing different kinds of task including real-time data communication and filtering information. The advantage of using this kind of technology is to make agents expert in specific task which in turn will improve the quality of the system. The five agents are Tourist Supply Chain Agent (TSCA), TPA (Tour Package Agent), Recommendation Agent (RA), User Agent (UA), and Broker Agent (BA).

At first when a new user visits the system a set of questionnaires are asked to obtain demographic information about the user. Then from the tour evaluation data is sent to the system and the using these two sets of data and the information from the TSCA suitable recommendation is provided to the customers.

The web application was implemented using Java Agent Development Framework (JADE). The user interface was developed with the help of HTML and AJAX platform. The broker agent used contract net protocol to assign task among the agents. To develop the ontology model Web Ontology Language was used with the help of Protégé tool. The system was tested with real time information. 70 tour packages were made using demo information, considering the variety of possibilities with different hotel types, airlines, cities, prices etc. to make it more challenging for the system. Each customer used the system and then it was evaluated based on two factors- precision, which is the ratio of selected relevant packages to number of retrieved packages, and recall, which is the ratio of selected relevant packages to total relevant packages. Based on the recall factor, the acceptable recommendation for the proposed system was approximately 20%, whereas based on the precision factor the acceptable recommendation is approximately 30%.

Jia, Gao & Shi (2016) developed “An Agent Framework of Tourism Recommendation System” to provide better recommendation to the users. The framework uses three filtering approaches - content-based recommendation, collaborative filtering and Constraint-based filtering approach. These three approaches were developed in three different agents which are- Content-based Agent, Collaborative Filtering-based Agent and Constraint-based Agent.

The aim of each agent is to provide recommendation according to the user’s preferences. Then these recommendations will be sent to another agent known as recommendation agent. A part of the recommendation sent by each agent will be collected and send to the tourist agent. Initially this agent collects 1/3 of the recommendation made by each agent. However, according to the user feedback this weight changes. Tourist agent provides the user interface and collects the feedbacks from the users. Other than this, the framework has another agent known as the Collector Agent. This agent contains web crawlers that travels through different

websites and stores information. The crawlers can also identify tourism related webpages and extract the textual information after downloading the webpages.

The content-based agent uses machine learning algorithms to learn the user profiles. Each item has some specific features and attribute assigned to it. In most of the content-based system the string-matching operation is done on the user profile and the item extracted from the web. If a document has the similar keyword as of the user profile, then that document is taken as a relevant document. However, the drawback of this method is the natural language ambiguity. Due to the use of synonyms a relevant document could be missed.

The aim of collaborative-filtering agent is to find the users with similar interests. They are known as the user's neighbors and they are considered as having same preferences. At first the tourist information is analyzed and modelled. Tourist information includes their tour history. Then according to the visiting history and using the collaborative filtering method the neighbors are found. According to the similarities the neighboring tourist list will be calculated. Finally, the top similarities will be recommended to the user. This can be done only if the user has previous tour records. However, if the user is new or has no previous records then according to their basic information such as- gender, profession etc. the similarities will be found. Other than that, the data will have to be pre-processed every time before generating the neighbors. This process includes- data cleaning, data integration, data conversion and data reduction. This is done to remove any user with void or null information. To find the similarity in this system the author proposed to use Cosine method –

$$\text{Sim}(T_i, T_j) = \frac{RT_i \cdot RT_j}{(|RT_i| * |RT_j|)}$$

Here, T_i is tourist one and T_j is tourist second. R represents the ratings retrieved from each tourist.

Selmi, Brahmi and Gammoudi (2017), developed a new approach called PACT (Predicting Agent using Collective Trust). The aim of this approach is to find the trusted agent so that agents can collaborate with each other and share information. In order to find the reliable agent, the system carries two phase – modeling phase and decision-making phase. Fuzzy Formal Concept Analysis (FFCA) is used to model the trusted networks among the agents. On the other hand, Theory of Belief Function is used to help agents decide the most trusted agent.

In this paper the authors considered 5 agents which are- a_1, a_2, a_3, a_4, a_5 and developed a trust relation network with each other. In the modeling phase the agents are organized as groups along with their trust relationships. Fuzzy Formal Context is used to do this. Next, using Fuzzy Formal Concept the concepts are obtained.

In the decision-making phase the authors developed a new algorithm known as Pred_Agent which is used to recommend a list of agents that can be trusted for the agent who wants to collaborate and share information. The algorithm allows the agent for example- a_1 to create a trust relation between all the other available agents. From the extracted concepts that share a trust relationship with the agent. The highest degree of association for each agent is found and then according to the trust level the suitable and most trusted agent is chosen.

To test the credibility of the approach the authors have used the Adovogato dataset that consists of

approximately 6541 users and 51127 relationships. To evaluate the algorithm the authors found the precision, recall and FScore of the system. The following formulas are used in evaluation:

$$\text{Precision} = (|X \cap Y|) / (|Y|)$$

$$\text{Recall} = (|X \cap Y|) / (|X|)$$

$$\text{FScore} = (2 * \text{Precision} * \text{Recall}) / (\text{Precision} + \text{Recall})$$

Here, X represents the list of agents which an agent trust and Y represents the list of agents that the developed algorithms suggests to trust. The authors decided that the threshold value should be 0.5, that is if an agent scores more than or equal to 0.5 then the agent will be trusted otherwise it will be rejected.

The proposed algorithm was compared with two other trust evaluation strategies which are known as, Min-Max and Multi-Max.

At the end of the evaluation, it was found that the new approach, PACT, have an accuracy of 73% compare to other approaches. Also, runtime for the prediction is found for all the three approaches and compared.

Proposed Recommendation System

To develop the recommendation system, the system was divided into four components where each component is responsible to perform a specific task as shown in figure 1.

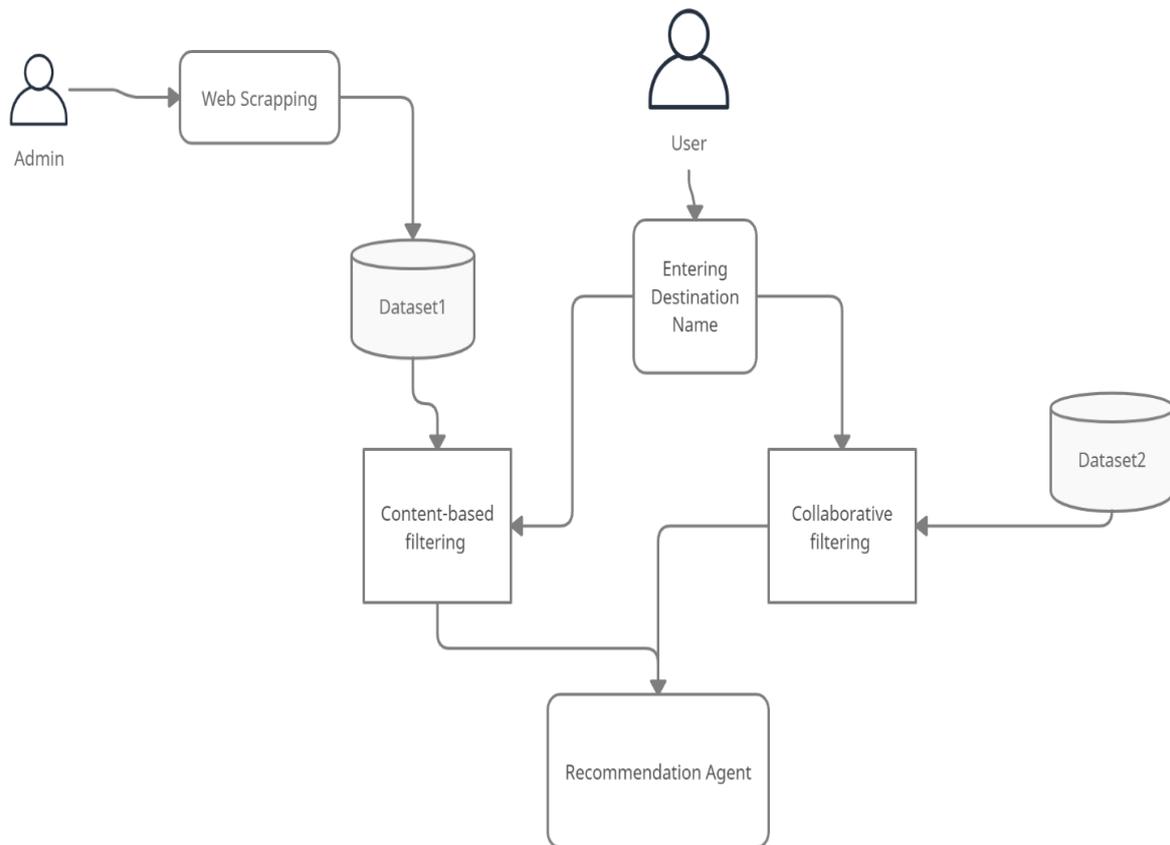

Figure 1. Recommendation system components

The components used are:

- *Dataset:* One of the most important items in the recommendation system is having a dataset. To develop the recommendation system two datasets have been developed. One of dataset has been developed by implementing web scrapping method. One of the popular websites ‘Tripadvisor’ has been chosen to scrape data. Tripadvisor is a popular tourism website which contains descriptions of all the tourist places in a country or city. It helps tourists understand and gather information about their trip. The website allows user to give their ratings and review about different places or hotels. Tripadvisor also contains information about different tourist destination in Oman along with their ratings on the website given by different users. This particular website has been chosen as it consists of the description of all the tourism places in Oman. This dataset has been named as “oman_tourism.csv”. This dataset consists of- destination names, type of the destination (i.e., the destination is a beach or historical place or mountain etc.), average rating of the places, the number of people rated the place and image of the destination.
The second dataset, “oamn_tourism_review.csv”, was created manually. This dataset consists of the information of user ratings for the destinations. The ratings given by the users were recorded and was entered in this dataset.
- *Content-based Filtering Algorithm:* The working principle of the algorithm is to find the similarity between the features of the items in the dataset and based on the similarity recommend the items which are similar to the searched item. Based on this principle the system is developed where ‘items’ are considered as the destinations. The similarity of the destinations is found based by analyzing the type of the place.
At first to cleanse the dataset, “oman_tourism.csv”, Tokenization has been done on it break into small token. Then using the algorithm TF-IDF (Term Frequency Inverse Document Frequency) to find the important and relevant words. Next to find the similarity between two places the vectors obtained from the TF-IDF algorithms are used. Based on the similarity the places are arranged in descending order, i.e., the places with highest similarity as of the searched places are at the top. (Kumar & Sharma , 2016)
- *Collaborative Filtering Algorithm:* This algorithm works with user ratings. In the developed system item-based collaborative approach has been used, which suggests that two items in a dataset are said to be similar if a user has given same ratings to both items.
To implement this approach the nearest neighboring method has been used. This method takes the dataset, ‘oman_tourism_review.csv’ in the form of matrix as an input. The brute force algorithms is used to find the distance between the user searched place and all other places in the dataset. Once all the distance is calculated, based on it the places are recommended. If the distance is less, then the similarity is high.
- *Recommendation Agent:* Once both the algorithms- collaborative and content-based, has created lists of recommended places, both the lists are sent to the recommendation agent. This component is responsible to combine these to list and display the final recommendation to the user.

System Implementation

The developed recommendation system works with a web application which acts as the front-end of the system while the recommendation system is in the backend of the system as shown in figure 2. The users can access the

recommendation system only with the help “Travello” web application. The user enters the destination name in the search box placed on the webpage. The web application then sends the destination name to the recommendation system. The recommendation system searches the user entered destination name. If the destination is found then the system performs two tasks. First the system collects all the details of the searched destination and displays them on the webpage. Next, the system finds all the destinations which are similar to the user entered destination using the two filtering algorithms- collaborative and content-based filtering algorithm, and displays them on the web page.

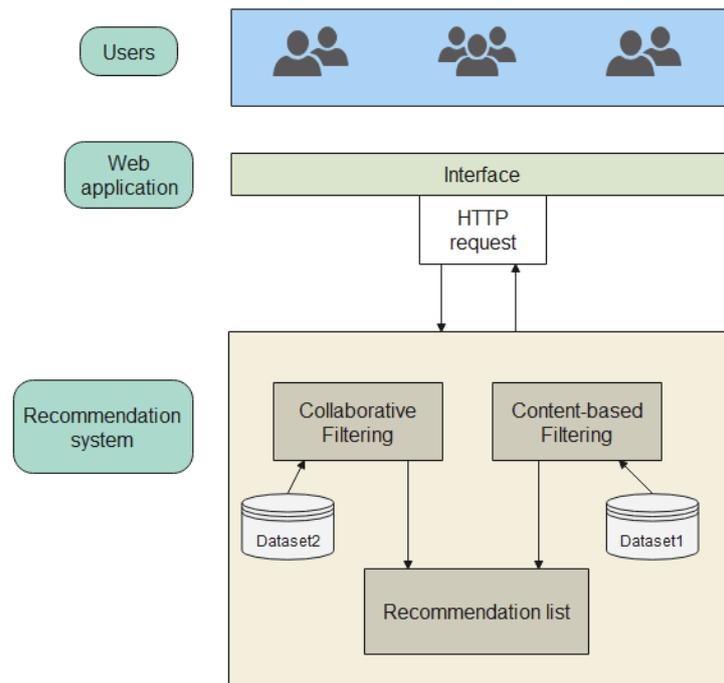

Figure 2. System Components

To develop the web application, Django framework was used along with HTML and CSS. While HTML and CSS helped in designing the web application, the integration of the application with the recommendation agent was done with the help of Django. The recommendation agent, collaborative filtering and content-based filtering algorithms are developed using python programming language.

The user enters the destination name in the search box placed on the webpage. The web application then sends the destination name to the recommendation system. The recommendation system searches the user entered destination name. If the destination is found then the system performs two tasks. First the system collects all the details of the searched destination and displays them on the webpage. Secondly the system finds all the destinations which are similar to the user entered destination using the two filtering algorithms and displays them on the web page. The figure 3 shows the destinations generated by the system for the place “Sultan Qaboos Grand Mosque” in Oman.

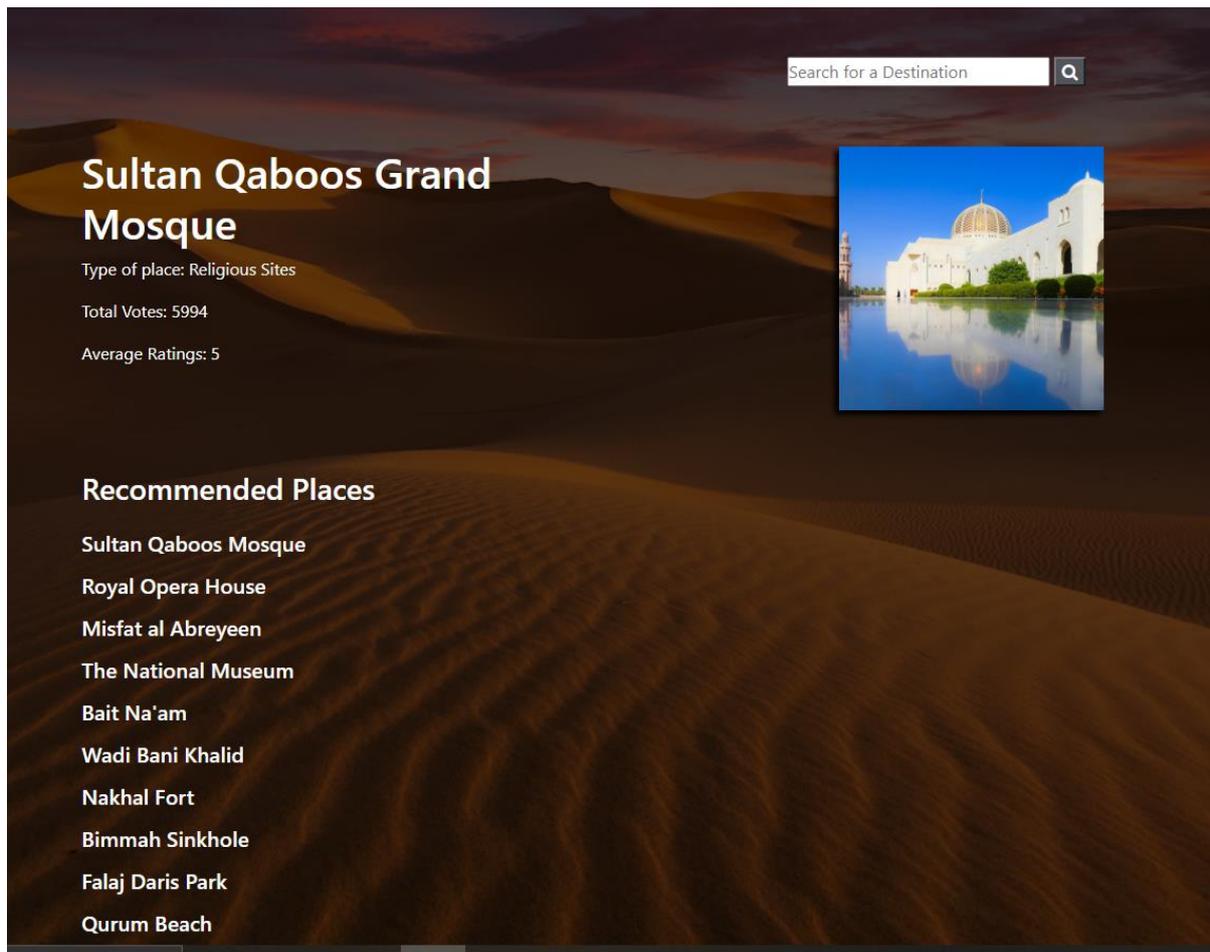

Figure 3. Web application interface

Performance Analysis and Result

To evaluate the efficiency and performance of the system, the developed system is compared with three other algorithms - Radius Neighbors classifier, Linear Regressor and Logistic Regressor. The same dataset was provided to all the three algorithms where 70% of the data is used as training data and the rest of the 30% of the data is used for testing. MSE (Mean Square Error) and RMSE (Root Mean Square Error) are calculated to compare with the developed system. To calculate the RMSE the following equation has been used.

Equation 5: RMSE

$$RMSE = \sqrt{\frac{\sum_{i=1}^N (Predicted_i - Actual_i)^2}{N}}$$

Where N is the total number of data, predicted is the predicted output and actual is the best fit line. After finding the MSE and RMSE are plotted in a graph.

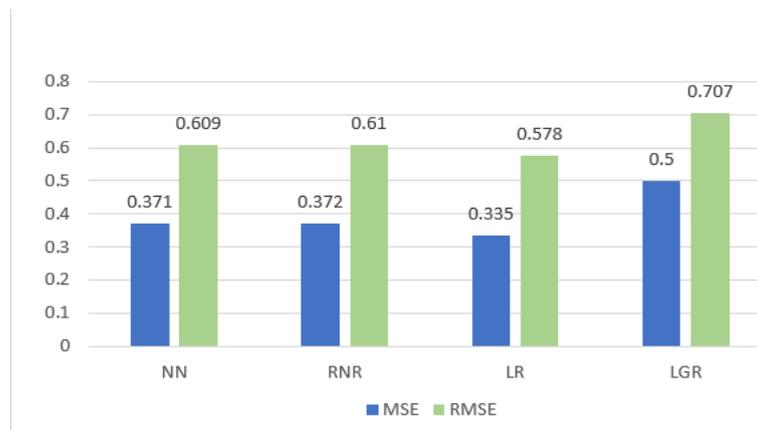

Figure 4. Prediction rating comparison

The first algorithm that was used to make a comparison is the Radius Neighbor Regressor (RNR) along with Linear Regression (LR) and Logistic Regression (LGR). While comparing the system's MSE and RMSE with the other algorithms it was found that the error is less than two of the models which are Logistic Regression and Radius Neighbor Regressor. But the model linear regression performed slightly better than the proposed model. However, the dataset used in this experiment is small and therefore, to make a better comparison a larger dataset is required.

Conclusion

In this work, tourism recommendation system for Oman is developed using content-based and collaborative filtering algorithm. Datasets have been derived using web scraping from "Tripadvisor" website which acts as an input to train the algorithms as well as to provide recommendation to the users. A web application has been developed with the help of Django web framework to receive user inputs. The developed recommendation is integrated with the web application which takes in the user input, destination name, from the web application and performs filtering, generating a list of recommended places and then displays it on the web application. The developed system is tested using several test cases to test several aspects of the system such as efficiency, performance etc. To evaluate the efficiency of the system two evaluation metrics were used- Mean Square Error (MSE) and Root Mean Square Error (RMSE). It is found that the MSE of the system is 0.371. Since the error is small, it can be said that the accuracy is high which provides a positive view of the developed recommendation system.

Abstract: The needs of education among the community itself was a challenged. This study focused on the validation of Parental Involvement Questionnaires (PIQ) for student versions to measure parental involvement among vocational college students. Two aspects of validation are the reliability and validity of PIQ through Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA). There are six domains of parental involvement: parenting, communicating, volunteering, learning at home, decision making, and collaborating with the community. There are 430 samples are selected among the final year students in vocational colleges. Data were analysed using *Statistical Packages for Social Sciences (SPSS)* and through *Structural Equation Modelling, Amos* version 22.0. The finding revealed that the measurement model adequately fit with the data collected within a vocational college students' context, which is RMSEA=0.054, CFI=0.927, TLI=0.916 dan Chisq/df= 2.229. The reliability of the instruments ($\alpha=0.933$) and factor loading >0.50 was attained from each item measured. EFA and CFA is a critical process to validate the PIQ for students' versions to make sure it was useful to measure all the domains involved in parental involvement among the vocational college students. Through the reliability and validity resulted from EFA and CFA, we will probably confirm that PIQ for students' version is valid to be used for empirical study.

Introduction

Parents play an important role both at home and at school to educate their children. There are six domains of parental involvement that covers the components of parenting, communication, volunteering, home learning, decision making, and community collaboration (Epstein, 1992). Numerous studies show that parents tend to give more attention to young age children compared to college-aged teenagers. Among the earliest studies conducted for students in the early stages of schooling is the research by Adamski et al. (2013); Cunha et al. (2015); Dumont et al. (2012); Gonida & Cortina (2014); McNeal, (2012); Park & Holloway, (2013); Phillipson & Phillipson, (2012); and Valdez et al. (2013). There are only a few studies conducted at the secondary school level and the college or university level (Chen & Ho, 2012; Rivers et al., 2012; and Wang & Sheikh-Khalil, 2014). According to McNeal (2014), the implementation of the new curriculum is quite challenging, grown-up children need to be independent, and families who are more focused on young age children because parents give less attention to this group of students. It is because children at the secondary school level have reached maturity compared to children in preschool. At this stage, parental attention and involvement in children's education seem to be declining despite realizing that they need to provide support to children. McNeal (2012) also states that the curriculum and syllabus are getting challenging, children in secondary school need to be independent, and parents are more focused on younger children. Parental involvement has a vast scope, and it covers all aspects, from young children to adults. Parental guidance and participation in children's education are not limited in the house only, but it must be practiced in school. This involvement occurs indirectly and naturally born from the sense of awareness of the parents themselves to support their children to achieve high achievement (Abd Razak, Zuwati, & Umi Kalsum, 2013; Abd. Razak & Noraini, 2011; Dikkers, 2013; and Epstein, 1992, 2008).

Nowadays, in vocational colleges, parents who are involved in the education of children becomes a sensitive issue to implementation as it is seen as a factor that contributes to children's academic achievement. Although the implementation of transformation for technical and vocational education has been mobilized for a long time, the success of students is still disappointing. On the contrary, parents afford to support their children by attending programs organized by the college. Parents can also help their children complete assignments given by teachers by contributing ideas and during semester breaks (Hoover-Dempsey et al., 2001). More than that, some parents are concerned about providing a unique learning place for children to review lessons at home, monitor assignments, and also guide while the children are at home. Parental involvement in this study only considers the perspective of students on the extent to which their parents are involved in aspects of parenting, communication, home learning, volunteering, and community collaboration. Therefore, this study is conducted to identify the validity and reliability of the Parental Involvement Questionnaires (PIQ) to measure parental involvement among students in vocational colleges. The instruments used in this study consists of six domains which are parenting, communication, volunteering, home learning, decision making, and community collaboration.

Justification in Selecting the Six Domain of Parent Involvement

Many previous researchers have been conducted their research by using this instrument to study the relationship between the factors of student academic achievement, demographics, teacher competence, parental involvement, and others. Therefore, before obtaining the expected result of findings, a researcher must determine and measure parental involvement. Parental involvement has been defined and measured inconsistently across studies depending on the needs and limitations of individual studies. No specific findings related to the measured dimensions and specifications will be assessed or have been achieved. The PIQ instrument is intended to build a complex that encompasses many parental behaviour and attitudes. For this reason, it is crucial to study the relationship between family and demographic factors as well as various specific components in terms of parental involvement. For example, a single mother may have a low level of attendance in school activities due to work schedules and other childcare responsibilities but consistently assisting her child with homework at night. Similarly, poorly educated parents may feel comfortable attending to school activities but cannot help their children with homework. Risk factors such as maternal depression can result in less parental involvement that will cross all domains due to its negative impact on interpersonal relationships, worldviews, and activity levels. Therefore, one of the goals of this study is to determine how these different factors will be associated with varying types of parental involvement.

This PIQ instrument was developed with multi-dimension by studying the strengths and weaknesses of some current models (Eccles & Harold, 1996; Epstein, 1995; and Grolnick & Slowiaczek, 1994). Grolnick and Slowiaczek (1994) organize the three dimensions of parental school involvement: (a) behaviour (participation in school activities and helping with homework); (b) cognitive intellectual (exposing children to intellectually stimulating activities); and (c) personal (stay informed about the child's schooling). However, one concern in this model is that the dimensions built are broad, incorporating different types of specific engagement into each dimension. For example, the behavioural domain combines parental activities in the school environment with the activities in the home. Such a broad category may only involve the involvement of parents with associations with student achievement factors.

Meanwhile, Eccles & Harold (1996) outline five dimensions of parental involvement in Michigan Children and Beyond Studies: (a) monitoring (how parents respond to teacher requests to help their children with schoolwork such as checking homework or listening to them read); (b) voluntary level (parental level) participation in school activities including Parents-Teachers Organization (PTO); (c) parental involvement in children's daily activities related to homework); (d) contact the school about the progress of their children, and (e) contact the school to find out how to provide additional assistance. Dimensional monitoring and involvement of directly related behaviours to help children with homework, and possibly, become better conceptualized as a structure. The last two dimensions involve both parties contacting the school. Besides, these two dimensions are measured by only one item. Therefore, the reliability of these dimensions cannot be determined.

From the perspective of Epstein (1995), he outlines six dimensions of parent-school partnerships that focus on

the role of schools in fostering these relationships. The six dimensions are: (a) parenting (helping families provide home-based support for learning); (b) communicate (design effective communication in school about programs and progress); (c) volunteering (recruiting and organizing parents to support school goals and child development); (d) home learning (providing information for families to help students at home with homework); (e) making decisions (including parents in school decisions, developing parent leaders and representatives); and (f) working with the community (integrating community resources and services to strengthen school programs, family practices, and student development). These dimensions are well defined and provide useful guidelines for formulating the dimensions of parental behaviour. However, they tend to measure teacher and school behaviour rather than parental involvement.

All these three models exhibit differences in the scope, number, and dimensional reliability assessed. They are creating dimensions for parental involvement specifically to the scope of behaviour, a variety of parental behaviours, and models consisting of items sufficient to measure the construction accurately, which will increase the possibility that useful findings will be obtained in future research. The dimensions constructed by Grolnick and Slowiaczek (1994) are extensive, encompassing many different behaviours in one particular factor, while the dimensions in the Eccles model (Eccles & Harold, 1996) more to limited scope, creating dimensions that are different from almost the same behaviour. Between the three models, Epstein (1995) model has made new dimensions that are not only defined by behavioural factors alone. Grolnick and Slowiaczek (1994) measure some limited dimensions in parental involvement. Researchers Eccles and Harold (1996) used a single item assessment for a particular dimension. In this reference model using this PIQ instruments, six specific dimensions of parental involvement aspects will be measured using an evaluation of various items for each dimension.

A valid conceptualization of parental involvement must explain the difference between parental and teacher involvement. Distinguishing between the parent involvement can help to explain some of the conflicting research findings related to parental involvement positively and negatively. For example, Epstein (1996) found that teachers who initiate more relationships with children are less well in school. Meanwhile, parents will start more relationships if they want their children to be more successful. Eccles and Harold (1996) and Grolnick and Slowiaczek (1994) only focus on the parental involvement initiated by parents, whereas Epstein focuses on parental involvement undertaken by the school. In this study, the focus will be on the relationships undertaken by parents to isolate risk factors for parental behaviour.

Following the condition and society in Malaysia, parental involvement was found to contribute to the progress in student education. Although this PIQ instrument is an adaptation of the parental involvement instrument introduced by Salina & Epstein (1993) due to the environmental factors that are different from the culture of society, especially in Europe, then PIQ is still relevant to be used by researchers in Malaysia. Simultaneously, there are still few instruments that precisely measure parental involvement, which includes a comprehensive six dimensions and not focuses solely on parental behaviour alone. The validity and reliability of this instrument will be measured through the Exploratory and Confirmatory Validity Tests, followed by further analysis through

measurement models carried out as reinforcement.

Parental Involvement Questionnaires (PIQ)

Findings from the research of (Fan & Williams, 2010; Fan, 2001; Gonida & Cortina, 2014) show that active parental involvement positively affects student academic achievement. This is the opposite when it is found that the lack of parental involvement in school activities and programs impacted student achievement (Weston & Lareau, 1991). Therefore, student excellence cannot be achieved if the participation of student parents in college programs and activities is not enhanced (Henderson & Mapp, 2002). However, Lareau's (2000) statement differs when it is found that time constraints contribute to why parents are less sensitive to the role they should play in children's education. In reality, they let the children learn without proper monitoring. Parental involvement, whether at home or in school, relates to children's academic achievement (Epstein & Dauber, 1991; Wang & Sheikh-Khalil, 2014; Yahaya & Obih, 2010; and Yeoh & Woo, 2010). Thus, parents who are involved in helping children at home have a positive impact on student achievement (Bower & Griffin, 2011; Desimone, 1999; Fan & Chen, 2001; Hoover-Dempsey et al., 2001).

Therefore, to identify the extent to which parental involvement has implications for students' academic achievement, the PIQ instrument has been used to test the six domains mentioned, which are the aspects of parenting, communication, volunteering, home learning involvement, decision making, and community collaboration.

Table 1. Number of Items in The Parent Engagement Domain

No	Domain	Item	No of Item
1.	Parenting	1,2,3,4,5	5
2.	Communication	6,7,8,9,10,11,12	7
3.	Volunteering	13,14,15,16,17	5
4.	Involvement in learning at home	18,19,20,21,22,23,24,25,26,27	10
5.	Decision making	28,29,30,31	4
6.	Collaboration with the community	32,33,34,35	4
7.	Total Item		35

The PIQ instrument was adapted from the Epstein Parent Involvement Inventory, 1992b. This instrument uses a Likert scale ranging from scale 1=Strongly Disagree to scale 5=Strongly Agree. It measures the extent of parental involvement, according to the student's perspective. Although in previous studies, this instrument was used for middle-grade students in the United States, it is still applicable for vocational students in Malaysia (Carpenter, 2012; and Feldon et al., 2011). This is because the range of age of the students involved is between 16 to 18 years old that is the same as middle-grade students in the United States and vocational college students in Malaysia. This instrument contains six domains: parenting, communication, volunteering, home learning

involvement, decision making, and community collaboration. A total of 35 items of the questionnaire were used to measure parental participation, as stated in (Table 1) above.

The back-translation process is carried out in which the original language, English and translated into the Malay language. This method is used to ensure that a phrase or item is translated correctly from one language to another (Brislin, 1970). This statement is supported by researchers Amer, Zuraidah, Norazan & Adzrool (2011), which stated that the process of back to translation is divided into three stages. For the first stage, the original instrument will be translated into the target language. In the second stage, the second individual, who is also an expert in two languages, translates back from the target language into the language of the original instrument without knowing the items contained in the original instrument. Then, the translation of the second expert version is compared to the first version that would be done by the third expert. Versions that have been translated by the first expert will be used when the original instrument has similarities or acceptable to the third expert. This procedure is performed by the researcher to ensure that the process of translation gives the same meaning between the source language and the target language. The reliability of the scale in this instrument studied by previous researchers is at values $\alpha=0.77$ and 0.929 (Epstein & Dauber, 1991; and Lewis, 2001). For this study, the researchers found that the value of $\alpha=0.933$ indicates good reliability (Pallant, 2002).

Previous studies have also shown that parental involvement is related to children's success in school (Grolnick & Slowiaceck, 1994; Henderson & Mapp, 2000; Fan & Chen, 2001; Cojocariu & Mareş, 2014; Hill & Tyson, 2009; Jeynes, 2015; Matejevic, Jovanovic, & Jovanovic, 2014; and Porumbu & Necşoi, 2013). The findings of previous studies also shown the importance of parental involvement in helping student achievement, which has been a concern for a long time (Epstein, 2001; Kreider et al., 2007; Jeynes, 2015; and Von Otter, 2014). Parents who are always involved in their children's education will encourage student success, especially academic achievement. Therefore, the communication factor is significant in the relationship between parents, students, and teachers.

This aligns with the findings of Kosaretskii & Chernyshova (2013) found that electronic communication via email, websites, and social sites has encouraged parental involvement (Isernhagen & Bulkin, 2011). As a result, parents have more open opportunities to communicate with teachers and also motivate students to work harder in their studies. It allows parents, teachers, and students to share information more quickly and accurately. Apart from the importance of communication, parents also need to support their children's learning at home.

This view is also supported by findings from Kosaretskii & Chernyshova (2013), who also advised parents to provide private and suitable learning space for children to study at home. In this way, children are allowed to increase their potential through encouragement and support while at home. According to Chen & Ho (2012), "filial piety," which is an emotional and material encouragement such as love, meeting needs, respecting and trying to fulfil the desires of children, encourages them to be more successful in their studies. The above findings are further reinforced by (Cunha et al., 2015; Fan & Williams, 2010; and Gonida & Cortina, 2014) asserted that parents who help children to complete homework at home would encourage student excellence in

academics. These studies show the importance of parents in assisting students, especially in their academic achievement. Therefore, the goal of this study consists of two aspects, that are; (a) Exploration Factor Analysis and (b) Confirmatory Factor Analysis through PIQ instrument among vocational college students.

Methodology

Research Sample

The research involved the participation of 430 students aged between 16 to 17 years. They have been selected from 13 pilot vocational colleges throughout Peninsular Malaysia. The sampling technique used in this study is stratified random sampling. It is used to identify the respondents chosen for each vocational college involved. The data collection process is self-administered by the researcher. During the data collection process, research participants are required to answer the PIQ instrument set according to the time fixed by the researcher. To ensure the smooth data collection process, the researcher has asked for permission to conduct this study at the designated college from the Ministry of Education Malaysia. Since this study involves students from vocational colleges, approval on location is also obtained from the Technical and Vocational Education Division (BPTV). The analysis of data was done by using two software, which is SPSS and Amos 2.0. This software is used to analyse data for exploratory validity using SPSS, while Amos 2.0 for confirmatory validity and construct a measurement model through a structured equation model (SEM) model approach.

Research Instrument

This instrument consists of 35 items adapted from Salina & Epstein (1992b) to measure the six domains of parental involvement (Table 1). A scale of 5 Likert points from 1 (Strongly Disagree) to a scale of 5 (Strongly Agree) is used to agree with each item measured. The researcher summed up all the scores for the items to get the overall value. Next, a reliability test is conducted for validity. The results of the analysis found that the reliability value for each item is acceptable. The values obtained are $\alpha=0.763$ to 0.863 , which indicates the consistency of each aspect in the domain of parental involvement. Therefore, all 29 items in this instrument can be used for further analysis as they have a good consistency value exceeding 0.70 for each domain measured.

Exploratory Factor Analysis

Domain filtering is performed at this stage to determine the uniqueness of the domain based on Exploratory Factor Analysis (EFA). EFA analysis is an essential foundation for strengthening domain development (Schumacker & Lomax, 2010). The primary function of EFA is to identify whether the items are appropriate or not, modifying problematic items or dropping those items directly, and tracking the relationship structure between items according to the classification of variables. Therefore, EFA is very suitable to be used as a method of data identification or reduction (Hair et al., 2010).

According to Schumacker and Lomax (2010), EFA can be done when the researcher has a group of logical items that can help to form a concept and does not have a theoretical model that has been firmly established. Therefore, EFA is implemented on all items involving all three inventories as the researcher has made additional items to suit the context of the study. The researcher analysed the data using IBM SPSS Statistics 22. In this study, principal component analysis with orthogonal varimax rotation is used to determine the minimum number of factors required for prediction. The principal component analysis of the orthogonal varimax rotation method has chosen because it is the most popular and provides the best factor structure compared to other methods (Hair et al., 2010; and Pallant, 2007).

Table 1. Results of Exploratory Factor Analysis for PIQ Instruments

Item	Reliability value (<i>Cronbach Alpha</i>)				
	1	2	3	4	5
1. Ask me about college	0.794				
2. Tell me about the importance of entering to college	0.639				
3. Care about my condition in college	0.835				
4. Keep updated with my achievements in college	0.814				
5. Discuss with my teacher over the phone		0.652			
6. Discuss with my teacher through email		0.820			
7. Discuss with my teacher through WhatsApp		0.783			
8. Discuss with my teacher through a letter		0.778			
9. Invite teachers to discuss my learning progress		0.689			
10. Attend activities organized by the college			0.565		
11. Give financial contributions to the college			0.693		
12. Give goods contribution to the college			0.612		
13. Attend college PTO meetings			0.888		
14. Read a book for me at home				0.536	
15. Listen to my reading				0.605	
16. Listen to my story				0.518	
17. Assist me in completing the assignment				0.701	
18. Assist me in doing a revision at home				0.746	
19. Talk about television shows				0.535	
20. Help me to plan my assignments				0.669	
21. Examine my assignments				0.652	
22. Provide a study space for me				0.486	
23. Take me to the library				0.566	
24. Conduct voluntary college activities					0.518
25. Give respond in college assessments					0.504

26. Takes me to attend events involving the community	0.738
27. Encourage me to participate in community activities	0.698
28. Joining me to participate in community activities	0.714
29. Involved as a committee in community activities	0.657

Note: Factor 1: Parenting, Factor 2: Communication, Factor 3: Volunteering, Factor 4: Involvement in home learning and Factor 5: Collaboration with the community

Confirmatory Factor Analysis (CFA)

The Structure Equation Model (SEM) has two main aspects, namely the measurement model and the structural model. Both models determine a complete model. Two processes that must be done before testing the fit matching model is to estimate the measurement model first (Hair, 2010). Through the CFA approach, the researcher tests statistically whether the data sample can validate the proposed model or vice versa. The validity of the scales in the instruments used, in terms of the item must align with the operational definition of the domain. The validation factor analysis was conducted for each variable. CFA is undertaken to determine the number of items included in the domain in line with the statement of Byrne (2010).

All items in the CFA measurement model need to achieve convergent validity (Byrne, 2010; Hair et al., 2010). Three indicators were used to assess the convergence validity, i.e., based on the value of factor weighting exceeding >0.50 (Hair et al., 2010), the average value of the Average Variance Extracted (AVE) for each domain >0.60 (Hair et al., 2010) and domain reliability values >0.60 (Hair et al., 2010). Moreover, the compatibility between domains and CFA model was determined based on a combination of at least one Absolute Fit Indices and one Incremental Fit Indices (Bentler, 2010; Hair et al., 2010; Hu & Li, 2015). In this study, the two-second stage CFA models were also generated to represent each study domain.

The CFA analysis for each domain is developed based on the dimensions that have been identified through the EFA process. Next, a modification process is carried out to ensure that each CFA model achieves model matching accuracy. Domain validity assessments are also performed to ensure that all items have convergent validity. The three indicators used are factor weighting value (λ) >0.50 (Hair et., 2010), Extracted Average value (AVE) ≥ 0.50 (Fornell & Larcker, 1981; Hair et al., 2010), and domain reliability value (α_c) >0.60 (Hair et al., 2010).

The purpose of this analysis is to identify whether the six factors used to measure parental involvement meet the model matching criteria separately. The analysis is followed by convergent validity to ensure that all items contained comply with the validity of the construct. Among the indicators used for the validity process are (a) factor weighting value (λ) >0.50 (Hair et al., 2010 and Hair, Black, Babin, & Anderson, 2009) (b) Average Variance Extracted value (AVE) ≥ 0.50 , (Fornell & Larcker, 1981) and (c) construct reliability values (pc) >0.60

(Hair et al., 2010). When convergent validity and AVE values reach the discriminant validity values for each domain, this indicates that construct validity has been achieved. Then, the reliability of each item is measured by the Cronbach's Alpha (α) value based on the following Table 3.

The next step is to build a measurement model after the Confirmatory Factor Analysis is performed. As a result, all domains show convergent validity. According to Hair (2009); and Barrett (2007), before testing the actual model, estimation of the measurement model must be performed upon completion of the validity analysis. Through the Exploratory Factor Analysis approach, the analysed data can be tested statistically whether the data sample can confirm the proposed model or vice versa. The validity of this measurement model is a combination of empirical theory and evidence of new findings or vice versa (Zainudin, 2015).

Researchers refer to Modification Indices (MI), which indicate the validity of the model tested (Kline, 1998). The validity of each item was tested based on the MI values shown through the arrows in the SEM analysis. Theoretically, the items measured should correlate with each other to support the path. Zainuddin (2015) and Hair et al. (2010 and 2013) stated if the analysis conducted does not meet the required criteria, then the path should be dropped out. Here are three indicators of "goodness of fit indices" used by researchers to measure the consistency of items with research samples: See Table 3 below.

Table 3. Compatibility Model and Acceptance Level Indicators

Category	Index	Acceptance level	Reference
1. Absolute fit	RMSEA	RMSEA < 0.08 (Accepted)	Brown & Cudeck, 1993
	GFI	GFI > 0.90 (Accepted)	Joreskog and Sorbom (1984)
2. Incremental fit	CFI	CFI > 0.90 (Accepted)	Tucker & Lewis (1973)
	TLI	TLI > 0.90 (Accepted)	Bentler & Bonet (1980)
3. Parsimonious fit	Chisq/df	Chisq/df < 0.50 (Accepted)	Marsh & Hocever (1985)

In conclusion, the results of the conducted Confirmatory Factor Analysis have proved that this analysis has its uniqueness compared to other statistical analysis. Among the advantages identified is when validity is obtained, the researcher can construct a measurement model as a first step before building a structural model that will explain the causal relationship between the variables measured simultaneously in one model. Not just making a model, this analysis also confirms that each item found in the domain is empirically proven and accurately measured the model based on the level of acceptance (Hair et al., 2010; Hair, Hult, Ringle, & Sarstedt, 2014; and Zainudin, 2015). Therefore, the Confirmatory Factor Analysis was conducted to indicate the validity of each item within the measured domain.

Research Findings

Exploratory Factor Analysis shows that the measured items are divided into five factors, which are parenting,

communication, parental involvement in helping home learning, and volunteering. A total of eight items are items 5, 11,12,13,14,23,26, and 29 have been withdrawing from the instrument. Each item that does not meet the criteria will be withdrawn. Items that will be dropped out when the weighting factor <0.50 or if the item is more than two factors (Zainuddin, 2015 and Hair et al., 2013). Based on the principal axis factor analysis (PAFA) analysis, only 29 items were maintained.

Table 4. The value of the correlation coefficient and the Average Variance Extracted (AVE)

	1	2	3	4	5
Factor 1	(0.54)				
Factor 2	0.04	(.53)			
Factor 3	0.27	0.21	(0.50)		
Factor 4	0.13	0.18	0.37	(0.43)	
Factor 5	0.15	0.17	0.50	0.46	(0.40)

Note: Factor1: Parenting, Factor2: Communication, Factor3: Volunteering, Factor4: Involvement in home learning and Factor 5: Collaboration with the community

Through the Confirmatory Factor Analysis, the discriminant validity is obtained for each domain measured. The findings are shown in Table 4 above. Based on Table 4, the Average Variance Extracted (AVE) for factor 1 represents the parenting domain, $AVE=0.533$. Factor 2 represents the communication domain with $AVE=0.543$, and factor 4 represents the domain of home learning, shows the value of $AVE=0.500$. All of these domains achieved convergent validity when the AVE values >0.50 . However, factor 4, which is the domain of home learning, has a value of $AVE=0.443$, and factor 5 represents the domain of cooperation with the community, has a value of $AVE=0.404$. The AVE value for the volunteer domain and community collaboration is <0.050 , resulting in discriminant validity for the two domains that are not achieved.

Table 5. Validity for Each Parent Involvement Domain

No.	Domain	Item	Final Analysis					
			Min	S.D	Λ	SMC	AVE	<i>pc</i>
1.	Parenting	B1	3.5837	0.98767	0.78	0.61	.0543	0.819
		B2	3.3349	1.01248	0.60	0.36		
		B3	3.7907	0.95975	0.80	0.65		
		B4	4.0116	0.93487	0.75	0.56		
2.	Communication	B5	2.0721	1.07825	0.80	0.64	0.533	0.862
		B6	1.5395	0.95203	0.76	0.58		
		B7	1.7977	1.10877	0.80	0.64		
		B8	1.5488	.96134	0.65	0.42		
		B9	1.8837	1.12421	0.62	0.39		
3.	Volunteering	B14	2.6884	1.35722	0.77	0.77	0.443	0.763

		B15	2.7372	1.09598	0.55	0.55		
		B16	2.2465	1.14035	0.56	0.56		
		B17	1.8186	1.10503	0.74	0.74		
4.	Learning at home	B18	2.2023	1.22655	0.60	0.36	0.500	0.863
		B19	3.3047	1.30365	0.67	0.45		
		B20	2.8488	1.24145	0.49	0.24		
		B21	2.5163	1.18596	0.66	0.44		
		B22	2.7116	1.17297	0.69	0.48		
		B24	2.5023	1.20362	0.70	0.49		
		B25	2.2140	1.18096	0.73	0.53		
		B27	2.7651	1.32334	0.69	0.47		
5.	Collaboration with the community	B28	2.1767	1.33150	0.50	0.50	0.404	0.803
		B29	3.0674	1.22811	0.57	0.57		
		B30	2.6349	1.21152	0.81	0.81		
		B31	2.9837	1.24867	0.64	0.64		
		B32	2.4395	1.18649	0.65	0.65		
		B33	2.2558	1.27177	0.60	0.60		

However, the findings of the Confirmatory Factor Analysis comply with the requirements of the compatibility model, and the reliability value obtained is high, with the result $\alpha=0.863$ for the home learning domain and $\alpha=0.803$ for the community collaboration domain. Once the compatibility value has been obtained, the researcher can continue the analysis to the next level to test the validity of the discriminant. Refer to Table 5 below to identify the reliability values of each measured domain. The AVE value of 0.50 is not the only indication that the analyzed domain did not achieve discriminant validity. Most of the researchers will refer to the reliability value of each item for further analysis if the value of AVE <0.50 (Ping, 2009).

Next, the validity analysis for each domain of parental involvement is shown in (Table 5) below. According to Hair et al. (2010), the reliability value for each domain has good value when the value of $\alpha > 0.60$ ranges from 0.763 to 0.863. After the Exploratory Factor Analysis is executed and the measured items in the correct domain, the next process is Confirmatory Factor Analysis, which is separately conducted for each of the domains. Once the individual compatibility model for each domain is obtained, a model will be produced for validation. The final compatibility model will be implemented to continue the process of building the structural model.

Figure 1 shows the measurement model is a result of the Confirmatory Factor Analysis (CFA) to confirm parental involvement. The results of the CFA analysis showed Item 12, "getting to know my teacher in college," item 13 "attending my class in college," and item 14 "coming to college as a volunteer" were in the same factor. Items 5,11,12 and 29 have a factor weighting value of <0.50 . Items that are in the same factor and have a factor weighting value of <0.50 should be dropped out from the model (Zainuddin, 2015; and Hair et al., 2013). Meanwhile, items 13 and 14 can not be analysed because there are only two items left in one domain. The

minimum number of items to carry out the CFA is three to five items (Hair et al., 2013; Zainuddin, 2015). Item 23, "talking about television shows," and item 26, "provide a learning space for me," has "cross-validated" in the fourth factor that is the involvement of parents in helping child's learning at home with RMSEA=0.054, CFI=0.927, TLI=0.916 and Chisq/df=2.229.

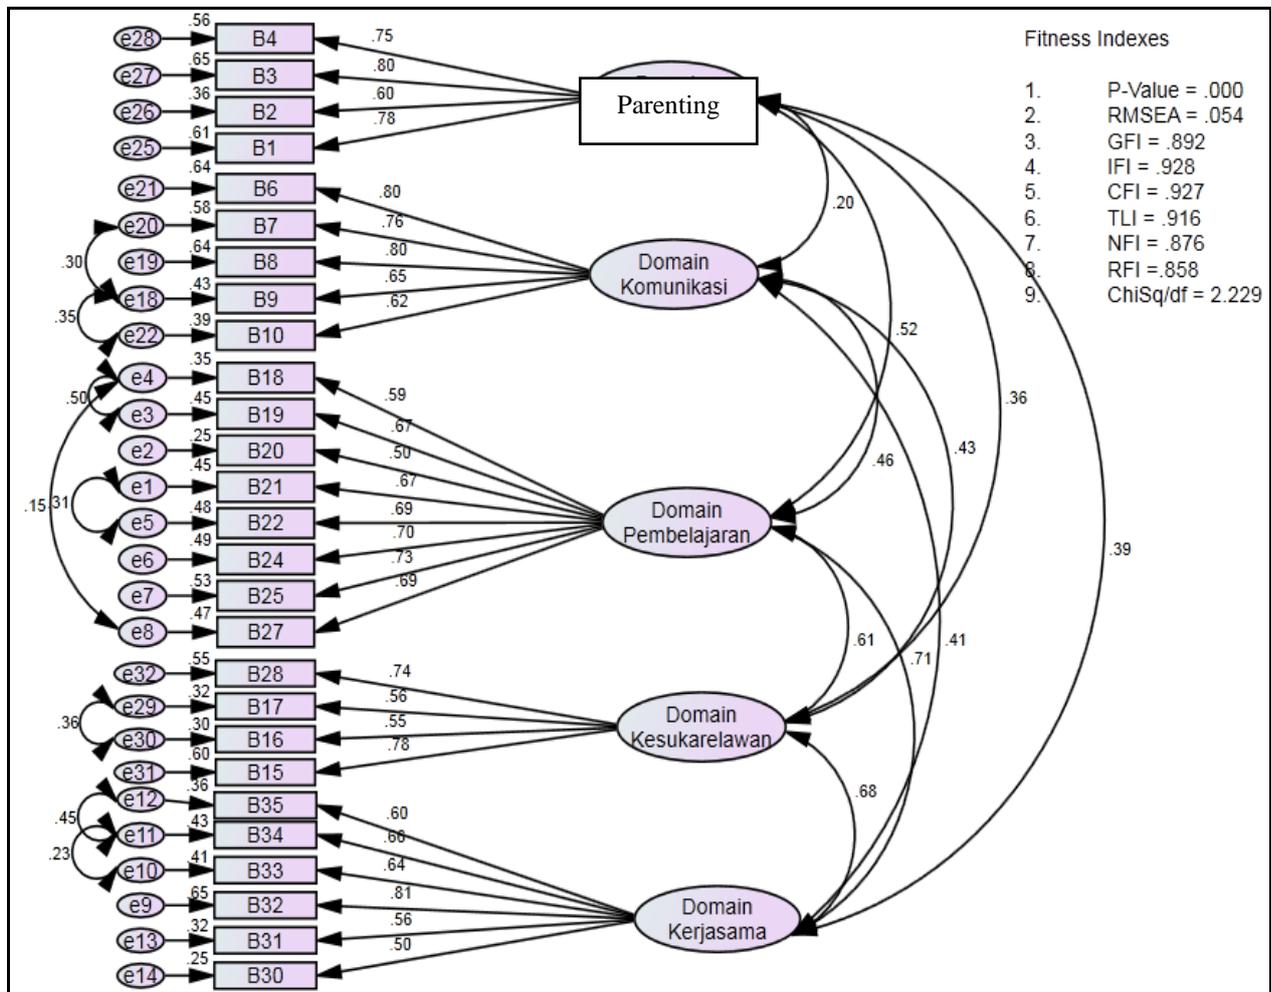

Figure 1. The Measurement Model of Parental Involvement among Vocational College Students

Discussion

Exploratory Factor Analysis and Confirmatory Factor Analysis found that the items used in PIQ have formed five factors of parents' involvement, which are the aspects of parenting, communication, volunteering, involvement in children's learning at home, and cooperation with the community. It is in contrast to the findings from Salina & Epstein (1992b), who found that parental involvement is divided into six domains consists of parenting, communication, volunteering, involvement in children's learning at home, decision making, and community collaboration. The decision-making aspect was found that it is not giving a contribution to parental involvement of the entire item. Demographic, time, cultural and lifestyle factors cause differences in the

empirical evidence (Zainudin, 2015). Parents are less influential in making any decisions made by college-level management, such as directly involved in providing feedback on assessments conducted in college. Hence, permitting students to engage in any co-curricular activities. The students themselves decide the majority of the decisions.

Studies on parental involvement in Malaysia mostly measure the family context factors with students' academic achievement based on family management style (Arsat & Rozumah, 2011; Asmah, Nurulhuda, & Mascilla, 2011). In contrast, this study focuses on measuring more specific parental involvement, which are aspects of parenting, communication, volunteering, home learning, and community collaboration. Apart from that, previous studies also examined the socio-economic status (SSE) factor of the family with academic achievement conducted by Mohd. Zainal Mat (2004) and Suresh Kumar (2014). Similarly, a study on the level of parental education with parental involvement in school was conducted by Zahyah (2008) and parental involvement with academic achievement in rural areas (Rozumah & Nazlini, 1998; and Sofiah, 2007). Several recent studies measure parental involvement in the aspects of communication, discussion, and care of children at home (Zulkifli, Jamilah, Aminah, & Ismi Arif, 2011) and parental involvement through monitoring of homework (Abd. Razak & Noraini, 2011). All of these studies also did not use the same instrument despite measuring with almost identical domains. Therefore, PIQ is more suitable to apply in this study because it fits the domain that the researcher wants to explore. It is supported by findings from Salina & Epstein (1992, 1993, 2004, and 2008), which also used the same instrument to measure the same domain.

The results of the analysis show the model fit, which is the value of RMSEA attained is 0.054 indicates that the value is acceptable, the value of GFI=0.892 below the value of 0.9, where the value of GFI depends on the total of sample size. CFI values=0.927 and TLI=0.916 show good compatible values. According to Browne & Cudeck (1993), the RMSEA value of <0.05 is good, 0.05 to 0.08 is acceptable, and >0.10 is not acceptable. The chi-square/df value for this model is 2.229, means a good value with chi-square/df value <0.30 (Marsh, Balla, & McDonald, 1988; and Marsh & Hocevar, 1985).

Basically, an instrument is considered to have convergent validity when all factors of weighting values >0.70 (Hair et al., 2010). These items are items B1, B3, B4, B6, B7, B8, B24, B25, B15, B28, and B32 have a weighting factor >0.70. Meanwhile, 11 items: B2, B9, B10, B19, B21, B22, B25, B27, and B28 have a weighting factor between 0.60 to 0.70. The weighting factor for the items B18, B20, B16, B17, B30, and B31 is <0.60. Discriminant validity is achieved when the weighting factor reaches the value according to the fixed "rules of thumb" that is >0.50. Good discriminant validity is achieved when the AVE value >coefficient value (r^2) for each factor is measured (Hair et al., 2010). However, inter-correlation relationships will exist when the value of discriminant validity is low; the inter-correlation value for each item must be <0.80 (Hair et al., 2010). In this model, two factors are the domain of home learning, and cooperation with the community has the value of AVE < r^2 (See Table 4). However, according to Ping (2009), if the value of AVE < r^2 and the analysed domain does not achieve discriminant, it may be because the study conducted is a new exploration. Therefore, further analysis can be carried out if the model achieves compatibility, and the value of reliability is accepted (Zainudin,

2015).

Conclusion

Exploratory Factor Analysis is performed to measure whether the items for each domain are in the right factor. Confirmatory Factor Analysis analysis is carried out for the items according to the theory used compatible with the model used in the measurement model. The measurement model obtained in Figure 1 is matched and meets the fixed criteria. The findings also found many items from the original 35 items, eventually became to 27 items only. However, the validity analysis showed that those items are accepted for the structural model request to the next process. Thus, this indicates that the PIQ instrument can be used to measure the variables of parental involvement as it has reliability values, and the validity of items has been confirmed through exploratory and confirmatory factor validity analysis.

Abstract: This article reconstructs the origins of slaves traded in Batavia and Malaca, which were once the centers of the VOC empire and trading ports in the Malay Archipelago in the 18th century. Many people from within and outside the archipelago were bought and sold as slaves in and out with high intensity during that period. As shown in the results, the central and northern parts of Sumatra Island were among the origins of these slaves. The names of these areas today are identical to the names of several ethnic groups residing in the northern and central parts of Sumatra Island. Hence, these factors become indicators of the slave distribution map on the island. The historical method was employed in this paper by utilizing colonial records in the form of notarial deeds stored in the National Archives of the Republic of Indonesia in Jakarta and bundles of documents in the Malacca Records. All of the documents are primary historical sources.

Keywords: Ethnicity, Dutch VOC, Origin of slave, Slave trade records, Sumatra.

Introduction

The year of 1642 was an important moment in slavery history that was followed by slave trading activities. That year, VOC (*Verenigde Oost-Indische Compagnie*), a Dutch trade organization, issued a law that legalized slavery practice and slave trading in their colonized areas, including the Malay Archipelago. Since then, VOC

has owned its law force and freely continued both practices for about one and a half century later.

VOC not merely gained a foothold and easiness in applying the slavery practice, selling and purchasing slaves, but they also succeeded in possessing and controlling some regions as a settled foothold in the Malay Archipelago in the first half of the 17th century. VOC successively conquered the trading ports as well as the leading cities of Batavia on the island of Java and Malacca on the west coast of the Malay Peninsula. Batavia was first conquered by Dutch in 1619 (Kanumoyoso, 2008). In 1641, VOC also annexed Malacca from the Portuguese (Hussin, 2007). Both trading ports were located in the strategic regions as the route and the stopover places for merchants who carried out shipping and trading activities both locally and regionally as well as globally, who came from other countries far from the Malay Archipelago. Those countries were termed as the 'above the wind' countries that came to the Malay Archipelago or popularly called the countries of 'below the wind.' In reverse, the merchants from the 'below the wind' passed through the Java Sea, the Sunda Strait, and the Malacca Strait. One type of commodity trading at that time was humans with slave status.

Before the presence of the VOC, many communities living and spreading across the Malay Archipelago were already familiar with stratification, which is termed in Western references as the slaves and the slavery practices in society. The strata of slaves and the institution of slavery were mainly found in the ethnic groups that were still traditional. Many factors can trigger the emergence of the institution of slavery in society. Some factors are due to the legalization of the customary laws of each ethnic group, conflicts and wars, arrests, kidnappings, fraud, and so forth.

As times passed, a traditional society that was initially more closed then slowly opened itself to accept the arrival of other foreigners and their influences through political thought, trade, religious values, and other means. The presence of foreigners both from within the territory of the Malay Archipelago as well as from Asia and Europe, including the Dutch VOC had implications for the increasingly widespread slavery practice and the slave trade (Watson, 1980).

Since the beginning of the 17th century, two important ports on the strategic routes of shipping and international trade in the Malay Archipelago had been controlled by the VOC, namely Batavia and Malacca. In Batavia, the Governor General led the VOC headquartered, while Malacca was under the Governor. Each of them played an important role in the slave trade during the 17th to 18th centuries. With the *Bataviasche Statuten*, every transaction of sale and purchase slaves at trading ports was controlled by the VOC in Batavia and Malacca, including Makassar on the island of Sulawesi. The transaction was officially recorded on a piece of deed or note and known by the authorized officer.

There have been many studies on the activities of slavery and the slave trade. Some of them were conducted by Vink (2013) and Kanumoyoso (2008) who found that the activities of sale and purchase slaves in Batavia were derived from the slave trade in the central and eastern parts of Indonesia, such as Bali, Manggarai, Bugis, Buton, Makassar, Maluku and other eastern parts in Indonesia. This can be explained that the fall of Makassar city to

VOC in 1676 significantly increased the activities and traffic of the slave trade from eastern Indonesia to Batavia. On the other hand, slaves who came from the western part of Indonesia, namely Sumatra, had not yet received attention. In fact, in the records of slave trading transactions at the trading ports of Batavia and Malacca, the names of the slaves being traded were listed as coming from Sumatra. The question is, from which regions of Sumatra island did the slaves traded at the two trading ports of Batavia and Malacca come? This article attempts to identify several regions in Sumatra island as the origins of slaves traded in the 18th century, as stated in the deeds and notes on the selling and purchasing of slaves.

Method

This article was written based on the historical research method by using archives as the primary source/data. There were two types of archives used. First, the VOC archives were collected by the National Archives of the Republic of Indonesia (ANRI) under the name *notariëel* (notarial). The Notariëel Archive, among other things, contains transactions of the slave trade in Batavia that were available in the form of notes written and issued by notaries. For more than two hundred years, from 1620 to 1828, more than 100 officials were appointed and taken an oath as public notaries in Batavia. Each of them had a varying duration of the term of office.

This study is firstly limited to the deeds issued by the three notaries who had served only in the first half of the 18th century. The names of the notaries were chosen at random, namely, Carel Schoute (1723-1742), Ludolph Volkman (1723-1726), and Anthonij Smonenar (1726-1729). Secondly, besides the notarial deeds of the Dutch VOC archives in Batavia, this article also uses historical sources derived from the Dutch VOC archives in Malacca, known as the *Melacca Records*. This Archive was written notes containing the slave trading transactions when the VOC ruled at the Malacca trading port.

Findings and Discussion

Based on several Dutch VOC archival documents in Batavia or Malacca, several Sumatra regions' names often appeared and were written as the origins of slaves traded in Batavia and Malacca in the 18th century.

Batak

Batak in the 19th century of Dutch terminology was called *Bataklanden* (Batak land). Its territory is located in the northern part of Sumatra Island, from the border of Aceh in the north to the borders of Riau and West Sumatra in the south (Tideman, 1915; Bangun, 1997). In slave trading transactions, both men and women, the word Batak often appears in the documents. However, in some official documents and transaction notes of the slaves' sale and purchase in Batavia and Malacca in the 18th century, the word Batak was written in various ways. There were three versions of writing the word Batak, namely 1) Batak; 2) *Bata*; and 3) *Batta*.

The term Batak, whose writing is the same as the word Batak used today, and the word *Bata* were only found in the slave trade transactions in Batavia. For example, in a Deed of Notary Carel Schoute, which was written and issued on 8 May 1724, it was written that there was a male slave named Sada. It was stated in the deed that Sada came from Batak. In addition, on 30 June 1725, the notary Schoute noted in his deed the sale and purchase of a female slave from Bata for 30 rds (*rijkdaalders*), Dutch currency at the time. On 6 April 1726, another male slave named Pagan from Batak was also sold for 50 rds.

The writing of the word *Bata* also appears in the notarial deed issued by Notary Anthonij Smonenar. On 16 May 1731, Smonenar issued two sheets of Notary Deed of the sale and purchase of slaves from *Bata* on behalf of Mungo, a male slave for 70 rds and a female slave named Dapaer for 90 rds, respectively. On 24 May 1731, in his deed, the same notary also noted that a slave girl from *Bata* named Malang was sold for 60 rds. Apart from that, there was also noted that the name of a slave from Batak was written the same as the name of the place where he came from. This name is stated in the notarial deed of Ludolph Volkman. On 5 April 1726, a male slave named Batak from Batak was sold for 60 rds.

In addition to the name of the same area, there were also several names of slaves identified using a smaller territorial name than that region. For example, a slave named Karoe from Batak, on 5 April 1726 was sold for 60 rds or a male slave named Panaij, also from Batak, was sold for 60 rds. As it is known, Karoe is the name of an area located in the northern part of Batak Land, namely Tanah Karo. At the same time, Panaij is the name of an area located on the eastern coast of the Batak Land.

Karoe has been given two meanings, namely, the name of the person as well as the name of the region. Karoe, in the term of the regional name, was written Karolanden in Dutch. The region was also located on the northern part of Sumatra Island. Both territorially and culturally, Karoe was a sub-territory of the Batak region and culture, namely the Karo Batak (Bangun...). In Batak Land, the institutions of slavery and slaves were found scattered in almost all regions, both in the northern and southern parts, such as Pakpak, Angkola, Toba, Mandailing, Karo, and others.

This phenomenon is not only found in the names of slaves from the island of Sumatra but also in other places. Several slaves originating from Bali island were recorded in the slave trading notes by the Dutch VOC in Batavia using the names of places on Bali Island, such as Tabanan, Buleleng, and Tsintamani.

In the 18th century, slaves from the Batak Land in Sumatra island were not only transported to Java and then traded in Batavia but were also brought across the Malacca Strait to be sold at the Malacca trading port. There was a slave trading network from Tanah Batak to Batavia and Malacca. The practice of the slave trading network was built by each party who was involved in the slavery practice and slave trade, such as, sellers, buyers, and slave agents in the region of origin. These parties were in the hinterland, the destined regions of the slaves, and the coastal ports. They really depended on the system and a set of rules that apply in each region. In the regions of slave origin, the inland elite who owned slaves, offered their slaves for sale. These elites built

partnerships with fellow elites who lived on the coastal regions and acted as agents for selling these slaves. They had mutually beneficial collaboration. The slave owners in the hinterland supplied the slaves. Meanwhile, agents on the coastal regions acted as intermediaries who would distribute the slaves to ship captains who used to anchor their ships at coastal ports. The captains also served as buyers.

Similar to Batavia, the word *Batak* in the records of the slave trade in Malacca was written as *Batta* and *Bata*. A slave sale transaction on a note dated 18 December 1786 stated that a female slave from *Batta* named Tjoe Lij was sold for 40 real. Meanwhile, on 17 February 1787, a slave girl from *Batta* named Pantoon was also sold for 45 real. As for the writing of the word *Bata* in the slave sale and purchase in Malacca, for example, it was found in a memorandum of a slave trade transaction that took place on 14 December 1786. At that time, it was recorded that a male slave named Bata was traded for 35 Real.

VOC authority in Malacca lasted from 1641 to 1795. After that, it was replaced by the British. When the British came to power in Malacca at the end of the 18th century, slave trading activities continued as before. A note in English stated that a female slave from *Batta* named Sismina was sold for 38 Sp (Spain) dollars. Although Malacca was politically taken a turn and controlled by Western nations, namely Portuguese (1511), Dutch (1641), and British (1795), slave trading activities continued legally.

Slaves from the Batak Land who were sent and traded in Malacca were initially brought from the inland to the eastern coast of Sumatra. The slaves from various villages (*huta*) in the Batak Land were first gathered and then taken through challenging routes from the inland to the ports on the northeastern coast. There were at least two slave travel routes to East Sumatra. First, the northern route, originating from areas in the northern part of Lake Toba, including Silalahi and Tongging around Lake Toba to Tanah Karo, was brought to East Sumatra via the Asahan River route. Second, the slaves who came from the inland of the southern part of Lake Toba, such as Panyabungan and Pertibi, were brought to eastern Sumatra via the Panai and Bila Rivers (Willer, 1849).

Minangkabau

Apart from Batak, the name of the Minangkabau region, located in the center of Sumatra island, also appeared in the records of slave trading transactions in Batavia in the 18th century. Since the 19th century, Minangkabau or Ranah Minang has been roughly identical to the territorial Gouvernement region of *Sumatra's Westkust* or West Sumatra (Mansoer, 1970). Minangkabau originally came from the name of a Malay kingdom in Sumatera, which was centered in Pagaruyung, Batusangkar, and included in the Luhak Tanah Datar.

Somewhat similar to the writing of the word *Batak*, there were also two versions of writing the word *Minangkabau* in the records of the deed of sale and purchase of slaves by the Dutch VOC in the 18th century. First, the word Minangkabau was written *Manangcabo*, and the second one is written *Manamcabo*. However, as far as the slave trading transaction documents were found, none of the Minangkabau region names were written precisely similar to the word of *Minangkabau* that is known today.

The following is an example of a slave sale and purchase transaction from *Manangcabo* recorded in the Notary Deed of Carel Schoute dated 14 May 1725, namely a male slave named Mardjan. Then, a male slave from *Manangcabo* named Mandjani in 1726 sold for 40 rds. Meanwhile, the name Minangkabau written in *Manamcabo*, appeared in the Deed of Notary of Ludolp Volkman dated 11 June 1726. A male slave named Singkang from *Manamcabo* was sold for 45 rds.

In addition to writing the word *Minangkabau*, there was also a variant name for a slave from the same territory as the Minangkabau, namely Padang. As it is well known, Padang used to be a part of the overseas territory of the Minangkabau. Since the 17th century, Padang was built as a VOC headquarters by the Dutch in the western part of Sumatra Island. It was also active in the slave trade. Since the VOC succeeded in replacing the role and domination of the Aceh Kingdom on the west coast of Sumatra, they have used the services of Chinese as retail traders. In Padang, Chinese merchants who were living in this city involved in the practice of the slave trade. Indeed, the VOC's trade policies kept changing. Sometimes, they used native beach brokers, but on the other times, the VOC used the services of the Chinese. According to Christine Dobbin, some of the coastal brokers from Padang port were Chinese.

The Dutch encouraged and gave support to the Chinese to trade on the West Coast of Sumatra. The Chinese obtained permits to trade up to the northern part of the island, including for the purposes of the slave trade. Official permits were issued directly by the government of *Sumatra's Westkust*.

This transaction occurred on 17 March 1725 in the name of a male slave named Saijo in the Noratis Carel Schoute Deed. Then, on 16 May 1731, a male slave named Baroet from Padang was also sold for 77 rds. A regional name in Minangkabau, namely Padanglua, was also identified in the deed. Padanglua(r) is the region name in the Luhak Agam region near the foot of Mount Singgalang. It was written that on 1 July 1724, a male slave named Saba from Padanglua was sold for 66 rds.

To date, the discovery of selling and buying slaves from Minangkabau in the 18th century is the latest finding because previous studies on the slave trade have not yet found the slaves from Minangkabau being traded. Although slavery at the trading port of Padang in the coastal regions of Minangkabau lasted in the 18th century, the slaves commonly originated from outside regions of Minangkabau land. The narratives of the slavery history in Minangkabau generally appeared a century later, namely in the 19th century when and after the Padri War (1821-1837) broke up. Then, slavery continued when the Dutch East Indies government controlled this region.

Malay

Apart from Batak and Minangkabau, a number of sale and purchase deeds of slaves also stated the origin of the slaves from Malays. The term Malay in the deed was written *Malaijer*. Transactions on slaves of Malay origin were found in notarial deeds in Batavia. A notarial deed of Carel Schoute dated 30 July 1725 stated that a slave named Genahus from Malay was sold for 65 rds. Then in the deed dated 1 April 1726, Notary Ludolph Volkman

also explained that a Malay slave girl named Sarrie was sold for 90 rds. On 3 April 1726, the notary Ludolph Volkman again noted in the deed issued on the same date that three Malay slaves were being sold, consisting of two women and one man. Each was on behalf of Indaa for 56 rds, Sapia for 50 rds, and Anas for 60 rds.

Especially for the slaves of Malay origin, it is not easy to claim that they came from Sumatra or other islands in the archipelago in the context of the vast Malay world. Quoting the ethnologist Logan (1849), on Sumatra island, most of the Malays settled in the central region, stretching from Rokan to Palembang on the eastern coast and Air Bangis to Kataun on the western coast. Malays are also the majority population in the Riau Archipelago and the Malacca Peninsula. Malay slaves appeared in a number of slave trade transactions in Malacca, as shown by the two trade receipts at the end of the 18th century below.

On 26 August 1786, a Malay slave girl named Poejoe was sold by Dahoel, as quoted from the following receipt:

Den Malaijer Dahoel inw. Tot Siak heeft zijne aangebragte slavin gent Poejoe/ casta Malaijer/ verkogt aan.....

(A Malay named Dohoel living in Siak brought a slave girl named Poejoe/ from Malay/ to sell to her....)

Then, another Malay female slave named Noviar was also sold on 18 August 1798 by Nakhodah Sleman; the receipt is below:

“Malacca, 18th August 1798

This is to certify that Naqueda Sleman, a Malay, has sold to Catharina Elizabeth Jansen, a Malay slave girl named Noviar, for the sum...”

The Malay names in the two receipts above do not specifically mention the origins associated with regional names, even though Malay is a society that has many ethnic groups. Malay terminology includes the entire Malay family, such as Malay-Riau, Malay-Minangkabau, Malay-Jambi, Malay-Palembang, Malay-Peninsula, and others, summarized in the same descent, namely Malay descent (Hashim, 1988). So where were the slaves’ origin areas in Malay land?

The 18th century was important for the Dutch VOC and the British EIC (East India Company). British EIC first controlled some regions on the western coast of Sumatra, starting from Natal in the north, Muko-Muko, Ketaun to Kaur and Seluma in the south. The center of authority is in Fort Marlborough Bengkulu. Just like the VOC, the EIC also implemented the practice of slavery and the slave trade in its territory legally. Slave labor was mainly used by the British to manage the pepper plantation sector on the western coast of Sumatra.

The slaves who worked there came from various regions, including Malay slaves. Others came from Nias and were imported from India and some regions in the African continent (Sumatra Factory Records, vol. 23-24). From this description, it can be assumed that the Malays who were recorded as the origin of the slaves came from Sumatra because both Batavia and Bengkulu were relatively close to the Sumatran Malay world.

Nias

Another region name that is often recorded in slave trade transactions in Batavia is Nias. The writing of Nias in the 18th century and now is the same. In the Dutch spelling of the VOC in Batavia, the word Nias was written the same, namely *Nias*.

Nias is different from Batak and Minangkabau. The territorial geography of the two regions mentioned latter is located in the part of the mainland of Sumatera island. Not so is with Nias. Nias is also an island in a group of islands in the Indian Ocean off the west coast of Sumatra. Although it is much smaller in size than Sumatra, Nias is the largest island among the group of islands in the region, starting from Simeulue Island in the northernmost part, then Nias, Tello, Siberut, Sikakap, North Pagai, South Pagai, to Enggano Island in the southern tip. All of them are parallel to Sumatra Island. The closest coastal city and a seaport on the west coast of Sumatra to Nias is Sibolga, with a distance of about 85 miles.

In the past, Nias was always associated with the issue of slaves and slavery. This is due to the high intensity of selling and sending slaves from the island. Various sources regarding slavery and the slave trade came from within the Nias island itself and outside, where the slaves were sent.

Similarly, with the cases of slaves from other areas in Sumatra, as previously described, the presence of slaves from Nias in Batavia in the 18th century was also recorded in a notarial deed. On 17 August 1724, Notary Carel Schoute noted a slave girl named Biha from Nias. On 28 May 1725, a Nias female slave named Pieglien was also sold for 60 rds. Then on 1 June 1725, in his deed, Schoute again noted that a male slave from Nias was sold for 70 rds, And on 16 July 1725, a female slave named Soendi was sold for 70 rds. Taking the average of the four sale and purchase slaves from Nias as recorded at the notary Carel Schoute's office from April to July 1725, then every month, there was one person from Nias who was traded in Batavia.

Since the 17th century, many slaves from Nias have left their hometowns and sailed across the Indian Ocean to various places, especially to the coastal cities of Sumatra Island, especially Aceh, Padang, and Bengkulu. In the new places, both male and female slaves were used to work in various sectors, such as gold mining in Salido (near Padang), agriculture in Aceh, pepper plantations in Bengkulu, and others, including working in the public and domestic sectors.

The following figure is a topography of the slaves origin in Sumatra island and the other surrounding regions whose inhabitants were also found in Sumatra. In Figure 1, there were 4 regions of slave origin from Sumatra alone, namely Batak, Minangkabau, Padang and Malay. Meanwhile, Figure 2 shows that the regions of slave origin from Sumatra were also spread to other regions. Especially for Malay slaves, besides having their place of origin on the Sumatra island, this ethnic group also came from the Malay Peninsula. Meanwhile, the slaves from Nias, although they originally came from Nias Island, since the 17th century, the Dutch VOC and Chinese traders brought these slaves to Sumatra Island, especially to the city of Padang.

Figure 1. The Slaves Origin on Sumatra Island Regions, traded by the Dutch VOC in Batavia and Malacca in the 18th Century

Figure 2. The Slaves Origin on Sumatra Island and the Surrounding Regions, traded by the Dutch East Indies (VOC) in Batavia and Malacca of the 18th Century

Conclusion

In general, the names of the origin regions of the slaves, both those stated in the notarial deed in Batavia and the notes on the sale and purchase of slaves in Malacca in the 18th century, are now identical to the names of the

tribes (ethnicity) of the slaves concerned. The names of four regions of slaves' origin are known by the following ethnic names: Batak, Minangkabau, Nias, and Malay ethnics. It means that the origin regions' names were equivalent to the ethnic names or the identity of each slave who was traded. They had two identities simultaneously, the name of the region of origin and the name of the ethnic group.

The two identities could happen because, until the 18th century, the Dutch VOC still needed to carry out the massive political intervention in the inland of Sumatra Island. Therefore, Dutch VOC officers did not have the appropriate term when they referred to the regions of origin of the slaves. Hence, they equated the designation of ethnic names with regional names. Unlike a century later, namely the 19th century, when the Dutch East Indies colonial government gradually succeeded in conquering these regions, the names of the administrative regions of government in Sumatra were formed. At least two administrative regions supervised the ethnic groups of slaves who came from the regions in Sumatra island, namely *Sumatra Westkust* to refer to the western coast of Sumatra, whose territory included Minangkabau, Padang, parts of Batak, and Nias. Meanwhile, some Malays and Bataks who live on the eastern coast of northern Sumatra were called *Sumatra Oostkust*.

Slaves from Batak were sent and spread to two Dutch VOC centers, namely Batavia and Malacca. Meanwhile, slaves from Minangkabau (including Padang), Malay, and Nias were only transported and traded to Batavia. The sale of slaves from the Batak Lands to Batavia and Malacca depended on each region's geographical and territorial conditions. The location of Malacca was only bordered by the Malacca Strait. Throughout the 18th up to mid of 19th centuries, many seaports along the eastern coast of northern Sumatra Island were the places for sending slaves to Malacca. The slaves from the Batak Lands were sent and sold to Batavia, either by taking the eastern route of Sumatra Island or having the other alternative via the western route of Sumatra Island. They sailed from the ports of Barus, Singkil, Sibolga and stopped at Padang. Batak slaves transported by ships to Batavia on this route could have been joined with the slaves from Nias, Minangkabau, and Padang. After more than 300 years until now, shipping routes that have been formed since the Dutch VOC era are still being maintained. The route starts from the port of Tanjung Periuk in Jakarta to the seaport of Teluk Bayur in Padang, continuing to Sibolga, ending at the port of Gunungsitoli, and turning back via the same route and ports to transport goods and passengers along the west coast of Sumatra.

Finally, especially for slaves from Nias, Batavia was the farthest destination from Nias. To get there, the slaves had to travel more than 1,000 miles by sea across three waters: the Indian Ocean, the Sunda Strait, and the Java Sea. In previous studies, in the 18th century, the slaves from Nias were only traded in cities and trading ports on the western coast of Sumatra.

Acknowledgement

The authors express their gratitude to Prof. Dr. Bambang Purwanto, a historian from Gadjah Mada University, Yogyakarta in Indonesia who has read and provided several suggestions for improving the early draft of this

article.

Abstract: TikTok has become the most popular platform among younger people in 2020. Some people use TikTok to express their ideas, promote their businesses and so on. With a variety of options, the platform encourages its users to create content. Digital technologies and platforms such as TikTok give social media influencers and other users the opportunity to create, consume and share religious content with various online communities. The aim of this study is to examine the relationship between perceived usefulness, perceived ease of use and perceived Islamic ethics on the acceptance of the TikTok application using the Technology Acceptance Model (TAM). The method used in this study is a survey and the data is analysed quantitatively, including descriptive data analysis that includes data reduction, data visualisation and drawing conclusions. Based on the frequency distribution of 196 respondents (N=196), the results show that 92 respondents believe that TikTok must respect users' privacy by not sharing personal information with third parties. In addition, 103 respondents think that TikTok should respect privacy so that users cannot easily interfere in others' affairs. The result also shows a value of $r=0.813$, with the positive linear relationship being significant at the $p = .000$ level of significance. This shows that there is a strong positive linear relationship between perceived usefulness and perceived Islamic ethics among Muslim users of TikTok.

Keywords: Tiktok, Technology Acceptance Model (TAM), Islamic ethics, Social media

and Science (pp. 1203-1223), Cappadocia, Turkiye. ISTES Organization.

Introduction

Forging healthy relationships can bring people both sustenance and good, according to Islam. It should come as no surprise that the proliferation of social media is seen as beneficial to the process of cultivating stronger relationships with one another (Wilkins & Jasmi, 2019). The Islamic religion is not just a sentimental theory disconnected from reality, but a technique that explains all aspects of existence as social behaviour and an integrated way of human life (Mona et al., 2018). In today's age of information technology, countries with a majority Muslim population are witnessing the rapid spread and adoption of social media platforms such as Facebook, Twitter and YouTube. Through TikTok, users can connect with each other and build relationships with other users.

According to (Plaisime et al., 2020), the increasing popularity of social media among young people can be measured by their ability to engage on various social media platforms. There are many application apps such as Instagram, Facebook and Twitter that have the potential to teach people new things that include guidance for those who want to learn more. TikTok is one of the most popular platforms with a large user base because it is user-friendly. Moreover, TikTok users who want to use the platform for teaching can do so by using the application with the available features to deliver unique and fascinating learning content and enable the audience to learn about Islam in an effective way. In addition, some researchers from Indonesia are also looking into this platform as it is very popular in their country as it offers both educational and entertainment aspects (Maulida et al., 2021).

Like most other societies, Muslims have also increased their use of social media in recent years. These social media platforms have had a profound impact on the social lives of Muslims, including religious practises, religiosity, religious decision-making and the formation of virtual communities in Muslim-majority countries (Islam, 2019), and have brought about changes that have had a significant impact on the individual and societal levels of Muslim society. Moreover, communication is an extremely important factor that determines social and political behaviour. However, according to Islamic teachings, these interpersonal behaviours must be in accordance with the Qur'an and the Sunnah. This conformity is shown in adab and akhlaq, which is another word for ethics. This relationship between people is established through the relationship between people and Allah, which leads to the performance of ibadah and the attainment of taqwa (Norwawi et al., 2014). This shows that it is important for users to have Islamic ethics in social media.

Problem Statement

Nowadays, comfort and convenience have increased with the advancement of technology, especially in the field of communication. A social media platform can be considered as a service or platform offered to enable

efficient communication and interaction. It is also known as "social media," which refers to the way individuals interact to create, share and/or exchange information and ideas in online networks and communities. For both personal and professional use, social media has become an essential part of our lives. Individuals use social media for a wide range of purposes, including communication, sharing experiences, exchanging information, etc. Likewise, businesses use social media to promote and market themselves (Akram et al., 2017). Moreover, by providing new feeds with unlimited pages, infinite scrolling on social media will increase users' interest. Social media has become a need for many people in today's fast-paced world because of its ease of use and accessibility (Lane & Coleman, 2012). Through the use of blogs, social networks, wikis and forums, social media users can participate, share and produce content themselves.

On the other hand, TikTok is the subject of this research study. As the technology has evolved, TikTok has exposed users to different types of content. However, these contents have both good and bad effects (Zubair et al., 2020). For example, it has encouraged pornography, public abuse, bullying, sharing false information, setting off false alarms, immoral acts and sayings, wasting time, distracting people from useful and religious topics and acts, and sparking violence in society. In addition, there are particularly offensive statements and publications against Islam and Prophet Muhammad (SAW) as well as obscenities, an increase in violence in the media and the violation of people's privacy through the use of social media (Shehu et al., 2017).

Most of the underlying issues can change generations of Muslims through social media activities and attitudes (Islam, 2019). Moreover, it also has a negative side that allows users to do things that violate Islamic principles and norms, as some TikTok users are willing to ignore the unpleasant aspects of social media in exchange for the potential benefits of fame, and the present researcher could not find complete Islamic ethical guidelines for the use of this social media platform. Due to the lack of control and just measures, this platform has been abused by some individuals. (Rauniar & Johnson, 2014) suggested using the TAM model when evaluating social media. Therefore, this study will evaluate the TikTok platform from an Islamic perspective using the technology acceptance model.

Definition of Social Media

A social media platform can be considered as a service or platform offered for the purpose of facilitating efficient communication and interaction. It is also known as "social media," which refers to the way people connect with each other to create, share and/or exchange information and ideas in online networks and communities (Huda & Nur, 2021). The way users build connections and relationships with each other has been greatly influenced and revolutionised by the emergence of social networking websites. According to (Norwawi et al., 2014), information in social networks is not stored on the user's computer but in a decentralised manner. Social networks offer the opportunity to keep in touch with friends, expand one's network and find others who share the same interests and outlook on life as oneself. Online communities can be divided into several broad groups, such as those related to information, professionals, education, education and hobbies, academics and news.

In today's digital age, social media has become a real manifestation of the development of knowledge and technology. As a result, the culture of the community undergoes a transformation when all its activities depend on and require social media, and may become addictive (Abd et al., 2019). Under these conditions, the development of social media is accompanied not only by various benefits and conveniences, but also by a number of problems that accompany it (Zubair et al., 2020). In the eyes of Muslim organisations, social media is undoubtedly an advance in the scientific world that requires their cooperation. However, from an Islamic perspective, the use of social media must be in line with ethical principles.

Definition of TikTok's application

TikTok has undoubtedly become a popular platform, especially among users of a younger age group during the lockdown, and this growth has occurred despite the restrictions. The TikTok application serves as a platform that allows users to produce short videos that can then be shared with a wider audience. These videos can be accompanied by music. The way news and entertainment is shared has changed and the internet itself has become more connected. TikTok's features, as well as users' desire to become more famous, are contributing to their interest in using social media platforms (Busurkina, 2021). TikTok is undoubtedly more interesting than other social media platforms because it offers a variety of video effects.

As a result, users will feel a greater urge to create videos through the TikTok platform. This application also provides users with the opportunity to use their skills and improve their creativity so that they can be able to use TikTok. Considering that TikTok is a relatively new and widely used application, achieving popularity is likely to be one of the goals that each user has with the application. The monopolistic nature of TikTok has contributed to the creation of a massive agency by facilitating the transformation of the current sharing tool (Busurkina, 2021). TikTok can also be considered one of the most important social platforms and is discussed in both historical and contemporary contexts to illustrate how it is changing the way people communicate with each other on the internet and how TikTok affects its users (Margarita et al. 2022).

In creating and interacting with videos over time, TikTok feels more like an active playground than a quiet video-sharing platform. TikTok's content is largely made up of short skits, memos and, most importantly, dances based on musical or other audio samples offered on the platform.

Definition of Islamic Perspectives

The increasing popularity of social media among young people can be measured by their ability to engage them on various social media platforms (Plaisime, 2020). These social media platforms have a profound impact on the social lives of Muslims, including religious practises, religiosity, religious decision-making and the formation of virtual communities in countries where Muslims are in the majority or in countries where Muslims are in the diaspora (Islam, 2019). In the current age of information technology, countries with Muslim-majority populations are witnessing the rapid spread and adoption of social media platforms such as Facebook, Twitter

and YouTube. Through Tik Tok, which allows users to connect with each other and build relationships with other users, they can interact with each other. Building healthy relationships can both nourish people and be good for them, according to Islam. It should come as no surprise that the proliferation of social media is seen as beneficial to the process of cultivating closer relationships with one another (Wilkins & Jasmi, 2019).

In the past, there were not nearly enough methods of communication available, which made it difficult for Islamic knowledge to spread throughout the Muslim world. Books served as the primary vehicle for the dissemination of Islamic literary works. Written manuscripts were the only way to access a variety of Islamic sources, including translations of the Qur'an, tajweed, hadith, tafseer and fiqh. However, thanks to advances in information and communication technology, an environment has been created in which Islamic resources can be easily converted into digital forms and disseminated worldwide. Education is always associated with technology (Majid et al., 2019), (Nasruddin et al., 2022).

Moreover, it has been noted by (Huda & Nur, 2022) that in the Islamic perspective on the culture of social media use, the Quran contains an important term related to communication. For example, the term "al-bayan" is mentioned several times in the Quran, which means "the power to communicate". In addition, the Quran provides the important word al-qaul, which can be expanded to the concept of qaulan sadida, which refers to a person's ability to communicate appropriately and effectively. Humans are able to develop their personality, build networks of social contacts and express themselves. Communication experts agree with psychologists that failure in communication can have devastating effects on both the individual and the group (Amanullah, 2015).

Definition of Technology Acceptance Model (TAM)

Technology acceptance models and other various theories have been extensively used to identify and understand user behaviour and intention to use across a variety of disciplines such as consumer satisfaction, purchase behaviour and technology (Surendran, 2012). Several studies have developed models and frameworks such as the Technology Acceptance Model (TAM), Theory of Reasoned Action (TRA), the Extended Technology Acceptance Model (TAM2) and the Unified Theory of Technology Acceptance and Use (UTAUT) to explain and examine the factors that influence users' adoption of various new technologies. Numerous studies have adopted these models unchanged, while others have further developed these models by combining several previously used models or by extending them with additional constructs (Alshammari & Rosli, 2020), (Mokhsin et al., 2015).

As discussed by (Mona et al., 2018), the technology acceptance model is specifically concerned with the aspects that influence people's decisions regarding the use of information systems. TAM and its various iterations are widely known as a powerful theoretical model for explaining the use of information systems (Ariffin et al., 2014). This model is also useful for industry professionals in predicting the adoption of new information technologies (Yadav & Tarhini, 2016).

Furthermore, the Technology Acceptance Model (TAM) is a popular model in IT acceptance research and the current standard theoretical framework for understanding why and how people use social media, (Wirtz & Gottel, 2016). (Davis, 1989) is responsible for creating one of the most widely used information system acceptance models, known as the technology acceptance model (Venkatesh et al., 2003). According to Davis, the two main criteria that have the greatest influence on usage are perceived usefulness and perceived ease of use. The Theory of Reasoned Action (TRA), which studies general human behaviour by focusing on the intentions of individuals, serves as the basis for the creation of TAM.

After reviewing the literature on social media, (Wirtz & Gottel, 2016) found that most researchers focused on and agreed on the importance of TAM in the context of social media use. In addition, (Lane & Coleman, 2012) highlighted that TAM has a significant impact on social media as an increase in perceived ease of use increases perceived usefulness, which in turn leads to more intensive use of social media. It has also been suggested that TAM is the best model for social media (Rauniar & Johnson, 2014).

Definition of Adab(Manner) and Akhlaq

Islam often uses the Arabic word akhlaq, meaning "morality" or "ethical behaviour", to describe moral principles and standards. The Islamic faith places great emphasis on the observance of akhlaq. Good manners and moral principles are inseparable components of the Islamic scholarly tradition. The Islamic understanding of reality and truth is presented here. In the future, it will serve as the basis for success in any field or social setting (Rahmawati et al., 2019).

Quranic verse 96: "Verily, you are of exalted character" uses the word Akhlaq to describe the Prophet (SAW) (Quran, Al-Qalam: 4). Many hadiths emphasise the importance of ethics in Islam, and Akhlaq is frequently mentioned in these texts. The hadith attributed to Muhammad (SAW) is: "The one of you whom Allah loves the most is the one who has the best character" (Bukhari). Moreover, akhlaq is highly valued in Islam; our Prophet Muhammad SAW taught it before tauhid (Allah is the only God). According to him, a Muslim who has good akhlaq is equal to someone who fasts and prays, and Allah has promised him paradise in return (Waqfin & Tarno, 2021).

It is our duty as Muslims to follow the example of the Prophet (SAW) and treat all people with kindness, whether they practise Islam or not. Good akhlaq involves being sincere, truthful and honest in all aspects of one's life, not just in one's religious practises (such as almsgiving, salah, Qur'anic recitation and tawbah). We should approach Allah (swt) in a way that pleases Him, because good behaviour is something He values. According to "Akhlaq: Ethical Theory in Islam" (2023), a person's good character and good akhlaq are the qualities that bring him closer to Allah Ta'ala and thus closer to Jannah. It offers a Muslim perspective on the concepts of akhlaq (morality) and adab (etiquette) and emphasises the importance of integrating them into one's life in order to develop one's virtue and attain perfection.

Research Model

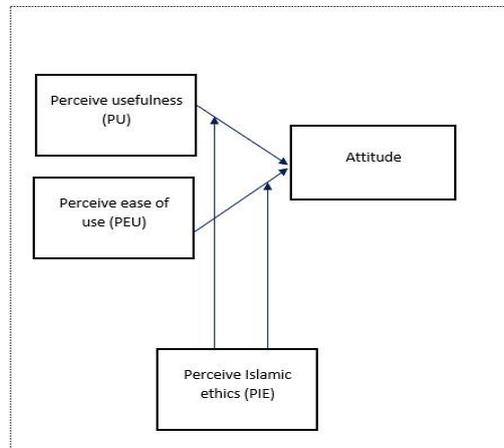

Figure 1. Modified technology acceptance model (TAM)

Figure 1 illustrates the modified technology acceptance model used in this research. The TAM model is one of the most popular models in IT acceptance research and the current standard theoretical framework for understanding why and how people use social media (Wirtz & Gottel, 2016). According to (Davis, 1989), the two main criteria that have the greatest influence on usage are perceived usefulness and perceived ease of use. We propose to modify the model TAM to gain insights into perceived Islamic ethics. The use of the features offered by TikTok must have both positive and negative effects in some way. It is imperative that the Islamic standards issued by TikTok are adhered to in order to prevent users of the platform from engaging in inappropriate activities.

Research Method

This study uses a quantitative descriptive method. This method attempts to explore how the use of TikTok is viewed from an Islamic perspective. The subject of this study is TikTok application and the object is the relationship between perceived usefulness, perceived ease of use and perceived Islamic ethics.

The data collection for this study is done in two stages: The first stage is primary data obtained from the TikTok application, consisting mainly of Islamic content; the second stage is secondary data collected through an online survey. 196 students are selected to participate in the study to determine the sample size and selection process. For the distribution of the questionnaire, the researcher uses a method known as purposive sampling. This study will be conducted using various research tools such as questionnaires and documentation. First, the researcher will study the TikTok platform to determine the types of content available within the TikTok application. Secondly, the researcher will conduct an online survey using Google forms among 196 students of FSKM in UiTM Shah Alam to find out their opinions about the use of TikTok application in Islamic ethics. Finally, the third study is the documentary analysis, which consists of, among other things, reading a variety of different

forms of literature after completing the research. To conduct the statistical analysis, the researchers in this study use the tools of IBM SPSS Analysis. There are several analyses that are carried out, namely.

Correlation analysis – examining the relationship between perceived usefulness, perceived ease of use and perceived Islamic ethics among Muslim users of TikTok. In addition, secondary data refers to the information acquired from supporting literature that complements the primary data.

Sampling Technique

In this study, the purposive sampling method is used because it is assumed that the population has an equal chance of being included in the sample and the result will be unbiased. This method is easy to use and the results are predictable (Taherdoost, H., 2016).

Sampling Size

It is crucial to consider the sample size required to achieve the objectives of the study. For this study, the sample size is calculated using a Raosoft sample. The acceptable margin of error is set at 7%, while the confidence level required for this study is 95% to tolerate the level of uncertainty. The response distribution is set at 50%. The algorithm behind this tool automatically calculates the recommended sample size after you enter the population to set the sample size for the survey.

Research Hypothesis

Assumptions can be tested by means of hypotheses, which are called preliminary answers to problems that require further investigation (Puspitasari, N. et al., 2019). Based on the model TAM, three hypotheses were formulated and tested (see Table 1):

Table 1: *Research Hypothesis*

No	Hypothesis
H1	There is significant relationship between perceived of usefulness and perceived of ease of use among Muslims' users in TikTok
H2	There is significant relationship between perceived of usefulness and perceived of Islamic ethics among Muslims' users in TikTok
H3	There is significant relationship between perceived of ease of use and perceived of Islamic ethics among Muslims' users in TikTok

Research Instrument

A research instrument is a tool used to collect data for an investigation. For the purpose of this study, the research tool used is an online survey as shown in Table 2. The survey questionnaire used for data collection will be created using Google Forms. The questionnaire will be distributed to a total of 196 respondents who will

answer it using Google Form. The data from the questionnaires will be analysed using the software IBM SPSS Statistics as it can help the researcher to understand the data, analyse trends and validate assumptions and draw accurate results and conclusions. The first section contains the demographic data of the participants. In addition, the next three sections consist of 20 questions measuring the constructs of this research with a linear scale of 1 to 5 ranging from 'strongly disagree' to 'strongly agree'.

Table 2: *Constructing Research's Questionnaires*

Variables	Description of Items	Source
Perceived of Usefulness	PU1: TikTok's application motivates me to accomplish the tasks in a short period	(Lewis, 2019)
	PU2: TikTok's application has motivated me to improve my job performance	(Lewis, 2019)
	PU3: TikTok's application is able to produce productive people in creating effective contents	(Jumaili et al., 2017)
	PU4: TikTok teaches me to keep in touch with people even in long distance with the contents that I create for them so I can sustain my relationship with them	(Jumaili et al., 2017)
	PU5: I find TikTok has motivated me to enhance my job effectiveness by figuring out the skills in creative problem solving	(Lewis, 2019)
Perceived of Ease of Use	PEU1: I find TikTok is easy to operate so it motivates me to create good and high quality contents	(Lewis, 2019)
	PEU2: It is convenient and flexible to view contents as it always recommends the things that I am interested based on my browsing history so I can easily come up with new great ideas	(Jumaili et al., 2017)
	PEU3: It creates my curiosity to dig deeper in TikTok as I find it is easy for me to become skillful in a short time	(Lewis, 2019)
	PEU4: I think my interaction with TikTok is very clear so it helps me to understand the features without having to rely on people when I use this application	(Lewis, 2019)
	PEU5: I find TikTok motivates me to express creativity and freedom with the different built-in filters, text, sound and music effects in TikTok	(Jumaili et al., 2017)
Perceived of Islamic Ethics	PIE1: TikTok's contents does not lead to communication with the opposite gender	(Amanullah, 2015)
	PIE2: TikTok's application does not spread false information and news towards people	(Amanullah, 2015)
	PIE3: TikTok's contents does not depict disbelief in Islam	(Amanullah, 2015)

PIE4: TikTok's contents does not use profane or harsh words	(Amanullah, 2015)
PIE5: TikTok's contents should not violate the privacy and respect towards others	(Amanullah, 2015)

Pilot Study

Before a larger experiment, researchers often conduct a preliminary study on a smaller scale, called a "pilot study," to see how things go. The rule of thumb (Sheatsley, 1983) is that between 12 and 50 people should be interviewed before piloting the survey. Before the questionnaire was published, it had to be piloted to see whether or not it was reliable for use in this study to avoid unwarranted results. The survey comprises 20 questions, each relating to one of the four (4) constructs (perceived usefulness, perceived ease of use and perceived Islamic ethics) of the system. The internal consistency of a quantitative study needs to be examined to ensure its validity. In this study, the validity of questionnaires is investigated by giving out 15 samples to a representative group of respondents and analysing the results.

The most commonly used instrument to analyse reliability is Cronbach's Alpha (Kader, R. A. et al., 2009). Cronbach's alpha is determined by averaging the correlations between the questions of a questionnaire and the corresponding answers. The reliability of a scale is usually considered high when the alpha value is greater than 0.75 and moderate when the alpha value is between 0.5 and 0.75. Previous research has shown that reliability values above 0.6 are generally accepted (Salim, B., 2012).

Result And Findings

Demographic's Analysis

The demographic's results for this research are as shown in Table 3:

Table 3. Gender

Choose your gender

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	119	60.7	60.7	60.7
	Male	77	39.3	39.3	100.0
	Total	196	100.0	100.0	

The table shows the total number and percentage of respondents by gender. The total number of respondents is 196, of which 77 are male and 119 female.

Table 4. Age's range

Choose your age

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 18 - 24	79	40.3	40.3	40.3
25 - 30	75	38.3	38.3	78.6
30 and above	42	21.4	21.4	100.0
Total	196	100.0	100.0	

This study focuses on Muslim users of FSKM in UiTM Shah Alam aged 18 years and above. Majority of the respondents, namely 79 respondents (40.3%), are aged between 18 and 24 years, while 75 respondents aged between 25 and 30 years participated in this research. 42 respondents (21.4%) were 30 years and older, which is considered the smallest percentage that participated in this research.

Table 5. Time spent on TikTok's application in a day

How much time you spend on TikTok's application in a day?

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 1 to 3 hours	91	46.4	46.4	46.4
3 hours and above	67	34.2	34.2	80.6
Less than an hour	38	19.4	19.4	100.0
Total	196	100.0	100.0	

Table 5 illustrates the time spent per day using the TikTok application. Most respondents, 91 respondents (46.4%), spent one to three (1 to 3) hours using TikTok. After that, only 67 out of 196 respondents (34.2%) spent three hours or more using the TikTok application. The lowest number of people who have spent less than one hour on TikTok is 38, which is 19.4%.

Table 6. Types of contents that people viewed in TikTok's application.

What type of the most favorite contents that you always view in TikTok's application?

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Cooking, news or business contents	36	18.4	18.4	18.4
Entertainment such as music and dancing contents	72	36.7	36.7	55.1
Islamic contents such as 'Ceramah'	43	21.9	21.9	77.0
Personal contents such as daily life vlogs	45	23.0	23.0	100.0
Total	196	100.0	100.0	

In general, there are four types of content viewed on TikTok, for example, personal content, cooking, news or business content, entertainment and Islamic content. The content that has the most viewers is entertainment with 72 respondents (36.7%), while the content that has the least viewers is cooking, news or business content with 36 respondents (18.4%). After that, only 45 respondents watch personal content, which is 23%. Last but not least, 43 out of 196 respondents (21.9%) chose to watch Islamic content in their daily lives.

Descriptive analysis (mean and standard deviation)

The following are the results of the descriptive analysis to determine the factors influencing Islamic ethics on the use of TikTok among Muslim users.

Table 7. Elements of influence in Islamic ethics

No.	Elements of of influence in Islamic ethics on the usage of TikTok
1.	Communication with opposite gender
2.	Spread false information and news
3.	Depict disbelief
4.	Use profane or harsh words
5.	Violate privacy and respect

Table 7 shows the factors of influence of Islamic ethics (communicating with the opposite sex, spreading false information and news, displaying disbelief, using profane or harsh words, and violating privacy and respect) on the use of TikTok among Muslim users.

Table 8. Mean and standard deviation of the element of influence in Islamic ethics

Descriptive Statistics

	N	Mean	Std. Deviation
Communication	196	3.9133	.78127
FalseInformation	196	4.2832	.69811
DepictDisbelief	196	4.3546	.67408
Profane	196	4.4031	.62903
Privacy	196	4.3724	.68054
Valid N (listwise)	196		

Table 8 illustrates the descriptive statistics (mean and standard deviation) for the factors influencing Islamic ethics. Of the five elements of Islamic ethics, communication with the opposite sex has the lowest mean value, while spreading false information or news has the highest standard deviation value.

Based on the frequency distribution of 196 respondents (N=196), 39 respondents strongly agree with TikTok's

idea of limiting negative comments to encourage people to post only positive comments. 70 of TikTok users prefer to see content posted by creators who know their social boundaries, as this helps them develop a positive character.

Table 9. Descriptive Statistics for PIE1 (Communication with the opposite gender)

Question/Likert scale	1	2	3	4	5
1. I advocate TikTok to encourages other users to make only positive comments	1 0.5%	4 2%	69 35.2%	83 42.3%	39 19.9%
2. I favor content posts by creators who are aware of their social boundaries	1 0.5%	8 4%	44 22.4%	73 37.2%	70 35.7%

Table 10: Descriptive Statistics for PIE2 (Spread false information and news)

Question /Likert scale	3. I prefer to see TikTok not spreading misleading information as it helps in shaping people to be a moral person	4. I prefer to read the contents that give new and valuable knowledge in TikTok as I can develop my ability to accept and respect people's different points of view.
1	2 (1%)	1(0.5%)
2	4(2%)	3(1.5%)
3	26(13.3%)	20(10.2%)
4	77(39.3%)	79(40.3%)
5	87(44.4%)	93 (47.4%)

The frequency distribution shows that 87 out of 196 respondents think that TikTok disseminates true information and that the majority of respondents prefer to read content that helps them gain knowledge so that they can accept and respect other people's way of thinking.

Table 11. Descriptive Statistics for PIE3 (Depict disbelief in Islam

Question /Likert scale	Strongly Disagree – 1	Disagree – 2	Neutral – 3	Agree – 4	Strongly agree – 5
5. I prefer to see content that does not expose one's bad deeds (aib) in order to educate people not to say negative things about others	1 0.5%	4 2%	22 11.2%	83 42.3%	86 43.9%

6. I prefer to view contents that does not involve any element of making fun of Islam to show an attitude of respect	1 0.5%	8 4%	4 2%	74 37.8%	109 55.6%
--	-----------	---------	---------	-------------	--------------

Based on the frequency distribution of 196 respondents (N=196), 86 respondents fully agree that they want to see content that does not show bad deeds so that they can educate those around them not to say bad things. In addition, 109 users prefer transparent content that does not contain elements of mockery of Islam.

Table 12. Descriptive Statistics for PIE4 (Use profane or harsh words)

Question /Likert scale	Strongly Disagree – 1	Disagree – 2	Neutral – 3	Agree – 4	Strongly agree – 5
7. I prefer to see meaningful contents that complies to Islamic compliance in order to shape good manners	1 0.5%	3 1.5%	12 6.1%	90 45.9%	90 45.9%
8. I favor viewing TikTok's contents that use polite words to build a good impression of ourselves	1 0.5%	3 1.5%	11 5.6%	72 36.7%	109 55.6%

The frequency distribution of the 196 respondents (N=196) shows that only one person disagrees with seeing meaningful content that complies with Islamic rules. However, 109 people approve of viewing content that uses polite words.

Table 13. Descriptive Statistics for PIE5 (Violate the privacy and respect)

Question /Likert scale	Strongly Disagree – 1	Disagree – 2	Neutral – 3	Agree – 4	Strongly agree – 5
9. I urge TikTok to respect users' privacy by not sharing any personal information without their permission to show that seeking consent before uploading anything is crucial.	1 0.5%	3 1.5%	14 7.1%	86 43.9%	92 46.9%

10. I favor TikTok to have the element of privacy so it can teach users not to interfere with other people's matters	1 0.5%	9 4.6%	5 2.6%	78 39.8%	103 52.6%
--	--------	--------	--------	----------	-----------

The frequency distribution of the 196 respondents (N=196) shows that 92 respondents believe that TikTok must respect users' privacy by not sharing personal information with third parties. In addition, 103 respondents strongly support TikTok respecting privacy so that users do not simply meddle in other people's affairs.

Correlation Analysis

In research, correlation analysis is a statistical method used to measure the intensity of the linear relationship between two variables and to calculate the correlation that exists between them. Correlation analysis can be used to calculate the extent to which one variable is changed by the change in the other variable. Of all the test statistics available, Pearson's correlation coefficient is the standard for determining the strength of a statistical relationship or association between two continuous variables.

To calculate the Pearson correlation coefficient, the assumption must be made that the relationship between the two variables is linear. If the r-value of the two variables in question is above 0.7, it is assumed that there is a strong relationship between the variables. However, when both variables are quantitative or categorical, Pearson correlations usually provide the most reliable results. The table below shows the results of the Pearson correlation analysis conducted using SPSS software to examine the relationship between the variables.

Table 14. Correlation analysis on perceived of usefulness and perceived of easy to use among Muslims' users on TikTok.

	Perceived of Usefulness	
Perceived of Easy	Pearson Correlation	.768**
	Sig. (2 tailed)	.000
	N	196

** . Correlation is significant at the 0.01 level (2-tailed).

The Pearson correlation test was conducted to answer the second research objective, i.e. to investigate the relationship between perceived usefulness, perceived ease of use and perceived Islamic ethics among Muslim users of TikTok. Table 7 shows that the Pearson correlation result has a value of $r=.768$. The positive linear relationship is significant at the $p=.000$ level of significance. This shows that there is a strong positive linear relationship between perceived usefulness and perceived ease of use among Muslim users of TikTok. The higher the perceived usefulness, the higher the perceived ease of use among Muslim TikTok users. There is a significant relationship between perceived usefulness and perceived ease of use among Muslim users of TikTok.

Therefore, hypothesis 1 is accepted.

The second Pearson correlation test was conducted to examine the relationship between perceived usefulness and perceived Islamic ethics among Muslim users of TikTok. The result shows a value of $r = .813$, with the positive linear relationship being significant at a significant level of $p = .000$. This shows that there is a strong positive linear relationship between perceived usefulness and perceived Islamic ethics among Muslim users of TikTok. The higher the perceived usefulness, the higher the perceived Islamic ethics among Muslim users of TikTok. There is a significant relationship between perceived usefulness and perceived Islamic ethics among Muslim users of TikTok. Therefore, hypothesis 2 is accepted.

Table 15. Correlation analysis on perceived of usefulness and perceived of Islamic ethics among Muslims' users on TikTok

		Perceived of Usefulness
Perceived of Islamic Ethics	Pearson Correlation	.813**
	Sig. (2 tailed)	.000
	N	196

** . Correlation is significant at the 0.01 level (2-tailed).

Table 16. Correlation analysis perceived of easy to use and perceived of Islamic ethics among Muslims' users on TikTok.

		Perceived of Easy to Use
Perceived of Islamic Ethics	Pearson Correlation	.568**
	Sig. (2 tailed)	.000
	N	196

** . Correlation is significant at the 0.01 level (2-tailed).

The final Pearson correlation test was conducted to examine the relationship between perceived ease of use and perceived Islamic ethics among Muslim users of TikTok. The result shows a value of $r = .568$ with a positive linear relationship that is significant at $p = .000$ level. This shows that there is a strong positive linear relationship between perceived ease of use and perceived Islamic ethics among Muslim users of TikTok. When perceived ease of use increases, perceived Islamic ethics among Muslim users of TikTok also increases. There is a significant relationship between perceived ease of use and perceived Islamic ethics among Muslim users of TikTok. Therefore, hypothesis 3 is accepted.

According to Cohen (1988), a correlation coefficient of .10 indicates a weak relationship, .30 indicates a moderate relationship and .50 indicates a strong relationship. Based on the above hypotheses, there is a significant relationship between perceived usefulness, perceived ease of use and perceived Islamic ethics among Muslim users of TikTok.

Table 17. Results of correlation between perceived of usefulness, perceived of ease of use and perceived of Islamic ethics

Correlations

		PE	PEOU	PIE

	Sig. (2-tailed)		.000	.000
	N	196	196	196
PEOU	Pearson Correlation	.768**	1	.813**
	Sig. (2-tailed)	.000		.000
	N	196	196	196
PIE	Pearson Correlation	.568**	.813**	1
	Sig. (2-tailed)	.000	.000	
	N	196	196	196

** Correlation is significant at the 0.01 level (2-tailed).

Conclusion

This research evaluates the use of TikTok from an Islamic perspective using the technology acceptance model. This research concludes that the elements of Islamic ethics influence TikTok adoption among users. Future work should also examine a wide range of social media sites such as Instagram and Twitter to determine the relationship between the influencing factors of Islamic ethics and Muslim users' attitudes. In addition, the different backgrounds or cultures of Muslim users should be analysed in order to compare them with the current study.

Abstract: The use of smartphones has become a primary need in supporting human daily activities. With the presence of a smartphone, various activities can be carried out only through an application. One application that is currently popular with Indonesians is an investment application with products such as stocks, mutual funds, and crypto. The presence of investment applications in the past few years has made the investment process easier to do. However, the age of the application development company which is still quite young makes the application have a lot of room for improvement, such as the features offered in the application. This study aims to evaluate the effect of the features available on one of the investment applications in Indonesia with the Kano model approach. The kano model is used to classify the existing features based on their influence on user satisfaction. 21 features associated with the application are defined. The survey was taken to 104 participants to identify user perspective of each feature on user satisfaction. The result of this study reveals that there are 12 features classified as Indifferent, 6 features are classified as One-dimensional and 3 features are classified as Reverse which means there are rooms for improvement of the features that will improve the user satisfaction.

Keywords: Kano Model, Investment Application, User Satisfaction, Features

Introduction

Digital innovation has made its way into various aspects of human life. One sector that has experienced notable transformations through digital innovation over the past ten years is the financial sector (Zavolokina et al., n.d.). The process of digital innovation, closely tied to technology implementation, is commonly referred to as fintech (financial technology) within the financial industry. Fintech predominantly encompasses technology-based startup companies operating in finance, utilizing internet-based automated information processing to pioneer new business models within the financial sector. The advent of fintech has introduced a fresh perspective to the financial sector, challenging long-standing traditional perceptions by showcasing the transformative power of

technology implementation. The evolving consumer perception towards a more modernized financial industry has significantly influenced the advancement of the fintech sector. Chinese-based fintech company, Eastmoney, has witnessed a remarkable four-fold increase in active users since 2015 (Chen et al., 2023). This rapid growth is fueled by various factors, such as the convenience of online access for consumers to conduct diverse transactions. The swift progress in the fintech industry is not limited to foreign entities alone, as Indonesia has also seen the rise of numerous homegrown fintech companies in recent years.

Fintech companies operating in Indonesia provide a wide range of distinct business products, including online-based loans, investment transactions, digital wallets, and more. Among these offerings, investment products have gained considerable popularity. The volume of investment transactions has witnessed a notable surge compared to previous years. According to data from the Financial Services Authority (*Otoritas Jasa Keuangan*), there were approximately 319 million stock transactions in 2021, a significant increase from the 169 million transactions recorded in 2020 (OJK, 2021). The accessibility and ease of conducting transactions have played a significant role in driving the growth of investment product transactions.

Prior to the arrival of fintech companies offering investment products like stocks, investors had to engage in face-to-face stock transactions at the Indonesia Stock Exchange (BEI). Additionally, the stock transaction process was carried out using conventional methods involving physical boards and paper as supporting tools. This lack of accessibility hindered the efficient execution of stock transactions, limiting investor participation to only a few segments of society at that time.

However, since the late 2010s, the presence of fintech companies offering investment products has transformed the landscape. This shift has revolutionized the mechanism of investment transactions, making them accessible online and in real-time. According to a mid-year report in 2022 from the Indonesia Central Securities Depository (KSEI), the number of stock investors in Indonesia has reached 4 million during the first half of 2022. This represents a 15.96% increase from the end of 2021 (KSEI, 2022). The report also highlights that the majority of stock investors are now dominated by the millennial generation, more than 50%.

The convenience of accessing stock transactions became a pivotal factor in the rise of millennial investors' dominance in the late 2010s. This shift coincided with the emergence of fintech companies offering investment products. These fintech companies have obtained legitimate licenses from regulatory bodies like the OJK, instilling confidence in investors when engaging in various investment transactions. In Indonesia, there are now fintech companies that facilitate a substantial volume of stock transactions. For instance, a company established in 2018 has garnered over 2 million users since 2022. The company's remarkable achievement of engaging 50% of all stock investors in Indonesia in 2022 has contributed to its promising growth trajectory. However, as a relatively young company, there is still considerable potential for improvement. One aspect that could be enhanced is the feature of the application.

This study aims to review the available features based on user preferences using the approach kano model.

Literature Review

Fintech

Fintech is a term derived from the combination of "finance" and "technology," indicating the integration of technology into the financial sector's business processes (Zavolokina et al., n.d.). The rise of fintech companies has been significant over the past decade, including in Indonesia. Indonesia has witnessed rapid growth in its fintech industry, following the trajectory of China (Davis et al., 2017). This accelerated expansion can be attributed to the convenience fintech offers to the lower-middle-class population, including financing solutions for Micro, Small, and Medium Enterprises (MSMEs) and instant loans for individuals in need. Such market segmentation aligns well with Indonesia's status as a developing nation.

There are several types of fintech products that are quite popular with the public. Several types of fintech products are as follows:

1. Digital payment

This one fintech product is the most popular among the public. With the existence of digital payment products, the use of cash as a transaction tool has begun to be abandoned. Generally, almost everyone has an account with digital payment products such as e-wallets and other digital payment products.

2. Peer-to-peer lending

P2P lending has a business model that is providing access to loans to the public. The presence of P2P lending slowly provides competition to conventional financial institutions so that people do not only have to depend on conventional financial institutions in applying for loans.

3. Online investment

This fintech product allows users to make investment transactions in financial instruments such as stocks, mutual funds, bonds, and crypto. The presence of online investment products has provided easy access to investing.

4. Financial Management

Financial management applications assist individuals in managing personal finances which include activities for making financial budgets, tracking financial flows, and providing personalized financial management advice.

5. Donation platform

Donating can be done anywhere and anytime. The donation platform allows donation activities to be carried out collectively for specific purposes without having to do it directly because it is connected to other fintech products, namely digital payments.

Fintech Growth in Indonesia

Based on data from AFTECH (Fintech Association of Indonesia), the officially recognized Association of Digital Financial Innovation Providers appointed by OJK (Financial Services Authority), there are 352 fintech companies in Indonesia as of 2022. These 352 fintech companies offer diverse business products, such as online

loans, crowdfunding, digital wallets, investments, and more. The ease of transaction is a key factor for fintech users, along with the assurance of regulatory compliance provided by authorized regulators.

The convenience provided by fintech companies in transaction processes has proven to have a significant impact on the majority of the Indonesian population. The geographical nature of Indonesia, with its thousands of islands, creates difficulties in conducting conventional transactions due to uneven financial infrastructure. Fintech companies operating online have emerged as a solution to address the limitations of the financial infrastructure in Indonesia. Their ability to facilitate online and real-time transactions has become a crucial advantage that conventional banks cannot offer (Davis et al., 2017).

Identify Application Features

Mobile apps or applications have become a major spearhead in every type of fintech business product. Because an application is a differentiator between the financial industry that is still traditional and that is based on fintech. The presence of applications in the fintech industry has cut boundaries including distance, time, and access which are problems in the traditional financial industry. Each application consists of features that are based on the purpose of the application. The existence of features in the application needs to be based on various considerations. Because the presence of features in the application besides affecting user satisfaction with the application will also directly affect the performance of the application itself.

The investment application has several features that can support the investment transaction process in the application. The features available are as follows:

1. Investment Information
2. Buying Power
3. Watchlist Stocks & Mutual fund
4. Explore
5. Index
6. Schedule
7. Latest Stocks Analysis
8. Trending
9. Stocks based on Category
10. Stocks Sector
11. IPO Offering
12. ETF
13. Top Performer Mutual fund
14. Type of Mutual fund
15. Investment Manager
16. Instrument
17. Portfolio

- 18. Order
- 19. History
- 20. Chat
- 21. News

Human Computer Interaction (HCI)

Human-Computer Interaction (HCI) is a multidisciplinary field rooted in psychology that explores the interaction between humans and computer design. It encompasses the creation, evaluation, and implementation of computer systems that effectively engage with humans, considering the key phenomena involved (Preece, 1994). The objective of HCI is to establish a framework that combines human psychology and computer science to design features that are efficient and user-friendly.

The four recurring phases of analysis, design, implementation, and evaluation in HCI have been widely recognized and understood (Butler et al., 1998). These four crucial stages are taken into account when developing a user interface design. The user interface plays a vital role in the field of HCI and can be validated through testing. Hence, it is important to possess good techniques and skills in user interface design to create a functionally effective system for human-computer interaction.

Kano Model

The Kano model was discovered by Professor Kano and his colleagues, who introduced a two-dimensional framework that takes into account the asymmetric and nonlinear relationship between the performance of a product or service and customer satisfaction. Originally, the Kano model was employed by mobile phone companies to develop new products (A. Shahin and M. Zairi, 2019). However, the use of the Kano model has expanded beyond tangible products and can now be applied to a variety of intangible products, including services. Currently, the Kano model is widely utilized to evaluate customer satisfaction by considering the quality attributes of a product or service, and subsequently categorizing them into one of the following five quality categories:

1. Must-be

The following attributes are very important to fulfill because customers will be very dissatisfied if these attributes are not met. The following attributes are the basic criteria for a product or service with a description of a certain minimum level of quality for the product or service that must be achieved by the provider.

2. One dimensional

The following attributes are typically clearly expressed by customers, as they directly impact customer satisfaction based on the extent to which the related attributes are fulfilled or not.

3. Attractive

Fulfillment of the following attributes leads to an increase in satisfaction that is more than it should be because these attributes are difficult to identify because they are latent and initially not expected by the customer.

However, if these attributes are not met, it will not cause dissatisfaction with the customer.

4. Indifferent

The following attributes do not affect the level of satisfaction significantly, whether or not these attributes are present.

5. Reverse

The presence of attributes can cause dissatisfaction, but if these attributes are not present, it can increase satisfaction.

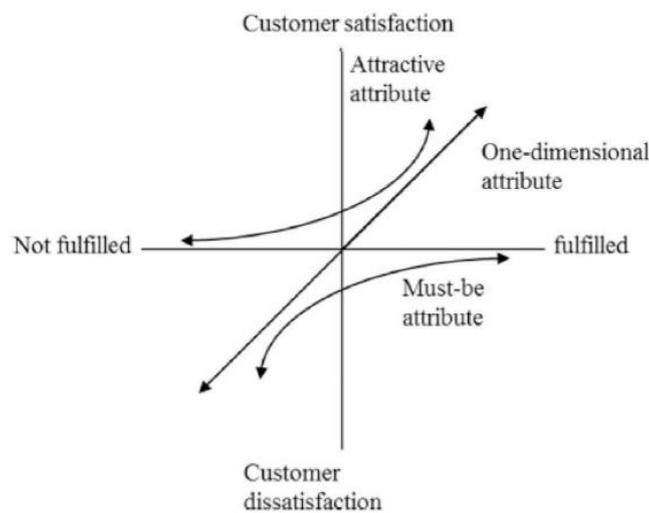

Figure 1. Kano Model Diagram (Lin, et al., 2017)

Methodology

Data Collection

The initial step taken in this research is data collection. This process is carried out to collect the primary data needed during the research, then the primary data is processed in order to obtain results that are in accordance with the initial objectives of this research. Primary data were obtained from respondents who were involved in various data collection series in this study.

In this study, the Kano model method is used to identify the features available in investment applications. From the identification of the available features, further analysis will be carried out. The data collection process for the Kano model was carried out through questionnaires distributed to respondents. The Kano model questionnaire that was distributed consisted of 3 parts, namely persona, functional question, and dysfunctional question in the form of semantic differentials. The questionnaire questions used a Likert scale of 5 to determine the respondent's perception of the features that became an aspect of the analysis. The attribute classification of the available features will be assessed based on the assessment of the functional question and dysfunctional question sections which will be mapped based on the kano model attribute classification matrix as shown in the Figure 2.

Service Attribute		Dysfunctional				
		1. like	2. must-be	3. neutral	4. live with	5. dislike
Functional	1. like	Q	A	A	A	O
	2. must-be	R	I	I	I	M
	3. neutral	R	I	I	I	M
	4. live with	R	I	I	I	M
	5. dislike	R	R	R	R	Q

Kano Categories: A (Attractive), O (One-Dimensional), M (Must-be), I (Indifferent), Q (Questionable) and R (Reverse)

Figure 2. Kano Model Attribute Classification Matrix

To determine the sample size that can represent the population, the formula proposed by Krejcie & Morgan (1970) is used to ensure the validity of the questionnaire and its suitability as a primary data source for the study. The calculation for the minimum sample size is as follows:

$$n = \frac{x p (1 - p)}{e^2} \div \left(1 + \frac{x^2 p (1 - 0,5)}{e^2 N} \right)$$

$$96 = \frac{2,706^2 \times 0,5 (1 - 0,5)}{0,1^2} \div \left(1 + \frac{2,706^2 \times 0,5 (1 - 0,5)}{0,1^2 (2.000.000)} \right)$$

Figure 3. Krejcie & Morgan Formula

Notes:

- N = Total Population
- P = Population Proportion
- e = Margin of Error
- x = Chi-square Score Table
- n = Number of Sample

With a population size of 2,000,000 representing the number of application users and an error rate of 10%, based on the calculation above, it can be determined that the minimum sample size is 96 respondents. The Kano model questionnaire that has been distributed obtained a total of 104 respondents. Therefore, the minimum required number of responses for collecting Kano model data has been met.

Data Processing

The collected data is then processed according to the applicable data processing methods. Before the data can be processed, the primary data collected through the questionnaire will undergo validity and reliability testing to ensure its authenticity and credibility, enabling it to be further processed using the relevant methods.

Validity and Reliability Testing

To ensure the reliability and validity of the questionnaire data, two methods are used for testing: Cronbach's Alpha is employed to assess data reliability, while the Kaiser-Meyer Olkin (KMO) measure is utilized for evaluating data validity. The reliability test aims to examine the consistency of the questionnaire's indicators, ensuring that the questionnaire provides dependable measurements of the intended variables and maintains consistency within specific groups. On the other hand, the validity test is conducted to assess how accurately the measurement tool captures the desired concept. By employing both of these tests, it is possible to ensure that the questionnaire used is of high quality and can be relied upon as a reliable means of data collection (Hair et al., 2019). The following is the result of measuring the validity and reliability of the Kano model questionnaire that has been distributed.

Table 1. Keyser Meyer Olkin and Cronbach's Alpha

Indicator	Functional	Dysfunctional
KMO	0.906	0.946
Cronbach's Alpha	0.908	0.949

According to the guidelines provided by Field (2018), Hair et al. (2019), and Tavakol & Dennick (2011), a KMO value greater than 0.6 is considered acceptable for testing validity, and a Cronbach's Alpha value higher than 0.7 is considered acceptable for testing reliability. Based on the measurements conducted on the questionnaire data, it can be concluded that the data used in this study is statistically valid and reliable.

Results and Discussions

Based on the grouping of the results of the Kano model questionnaire, the features available in investment applications that are collected as a result of the functional and dysfunctional questions are classified based on the Kano model attribute classification table in Table 2.

Table 2. Application Features Classification

No	Feature	M	O	A	I	R	Category
1	Investment Information	11	45	10	37	0	O
2	Buying Power	19	35	19	30	1	O

19	History	24	34	13	32	0	O
20	Chat	29	21	11	40	3	I
21	News	21	19	15	42	3	I

Based on the results of data processing in table 2, there are 13 features that are classified as indifferent attributes. There are 5 features that are classified as one-dimensional attributes. And there are 3 features that are classified as reverse attributes. The reverse attribute can have a negative impact on user satisfaction. The 3 features that are classified as reverse attributes are Explore, ETFs, and Instruments. This research focuses on eliminating features that can have a negative impact on user satisfaction, so that these three features will not be

Conclusion

There are 3 features that are classified as Reverse: Explore, ETF and Instrument. Reverse has an effect that is inversely proportional to the level of satisfaction. Therefore, it would be better if the attributes classified as Reverse are not involved. By not involving those 3 features, it could increase user satisfaction.

Recommendations

This study is limited to identifying the user satisfaction based on available features without testing it on a backend system. The testing phase in subsequent research can be integrated with the backend system so that the result can be carried out more accurately.

Abstract: This paper presents a mobile application aimed at enhancing the financial literacy of college students by monitoring their spending patterns and promoting better decision-making. The application is developed using the agile methodology with Android Studio and Flutter as development tools and Firebase as a database. The app is divided into sub-applications, with the home page serving as the program's integration point, displaying a summary of the user's financial progress. The app generates valuable insights into the user's current and future financial success, utilizing data analytics and machine learning to provide detailed and summary insights into the user's financial progress. The machine-learning algorithm used in this app is linear regression, which predicts the user's income and expenses for the upcoming month based on their historical spending data. In addition, the app highlights deals and student discounts in the user's vicinity and links to financial articles that promote better financial planning and decision-making. By promoting responsible spending habits and providing valuable financial insights, this mobile application aims to help students become financially literate and make informed financial decisions for future.

Introduction

Financial management is an essential skill for people of all age groups, but college students, in particular, face unique challenges as they navigate their way through a time of significant transformation in their lives. Often taking out student loans to pay for their education, these students are expected to pay back their debts while also striving to establish their identity and independence in society. However, their lack of financial literacy and planning skills frequently leads to increased debts and inadequate savings, making it difficult for them to

achieve financial independence (Widener, 2017).

The cost of higher education in the United States has been steadily rising for decades, with tuition and fees increasing faster than the rate of inflation (Baum, Ma, & Payea, 2015). As a result, college students are increasingly reliant on student loans to finance their education, and many are struggling to pay back these loans after graduation. In fact, recent studies have found that college graduates are entering the workforce burdened with significant student loan debt, with the average borrower owing over \$30,000 in student loans (Baum et al., 2016). Unfortunately, many college graduates are finding it difficult to manage their debt, with a significant proportion of borrowers experiencing delinquency or default on their student loans (Houle & Berger, 2017). This not only has negative financial consequences for borrowers, but it can also impact their mental and emotional well-being, with studies finding that high levels of student loan debt are associated with increased levels of stress, anxiety, and depression (Eisenberg, Hunt, & Speer, 2013).

Furthermore, college students are not only struggling with paying back their loans, but they are also not saving enough for their future. A recent survey found that only 24% of college students are saving for retirement, and 21% have no savings at all (TIAA, 2021). This lack of financial preparedness can have long-term consequences, as it may delay important milestones such as purchasing a home or starting a family.

According to iontuition, less than 45% of university students believe they understand basic financial concepts, while more than 50% believe they do not practice or understand financial management (iontuition, 2016). This lack of financial literacy can lead to poor financial decisions, which can have significant consequences for their financial well-being. As a result, there is a pressing need to bridge the gap in financial literacy among college students.

To address these issues, a personal financial management mobile application has been developed to assist college-going students in managing their finances using technology and data. The mobile application aims to help college students become more financially literate and mindful spenders by assisting them in budgeting for their expenses, providing insights into their spending habits, and offering guidance on managing their debts .

This journal article explores the background and motivation for developing the financial management mobile application, and the importance of financial literacy for college students. (Times New Roman, 10)

Literature Review

In the article, Widener (2017) argues that college students struggle to keep up with their finances due to a lack of financial literacy and awareness. The author supports the argument by citing studies and literature reviews. According to Kopusko et al. (2016), students were highly aware of the importance of planning their financial futures and their retirement, but they were not committed to putting their financial knowledge into practice. On

the other hand, Goetz et al. (2011) discovered a demand for personal finance courses among students, indicating that students have both the desire and the awareness to gain financial knowledge. However, some students even after having the necessary knowledge, fail to use it for their futures due to reasons such as financial background and lack of awareness.

The author points out that students are not up-to-date with financial management, lack discipline for proper financial planning, and are prone to overspending (Archuleta, Dale, & Spann, 2013). The students' over-reliance on credit cards, low income, and irrational spending habits lead them to financial disaster (Goetz et al., 2011). The lack of financial planning among students often leads them to be in debt even after completing their degree, affecting their financial well-being and security and having a negative psychological impact that continues to affect their confidence in managing their finances. The author further adds that the lack of financial literacy among college students is due to various factors such as demographics, family influence, and backgrounds. Furthermore, students' financial decisions are influenced by their lack of parental support, their own financial choices, or both. The transition from dependent to independent living frequently leads to hasty financial decisions, and sound financial planning may help avoid excessive spending.

According to recent data from the Federal Reserve, as of 2021, the total outstanding student loan debt in the United States is \$1.57 trillion, and the average student loan debt for borrowers in the class of 2019 is \$29,900. This is a significant burden on young people who are just starting their careers, and it is particularly challenging for those who are already struggling with low wages and a high cost of living. A recent study by the National Center for Education Statistics found that only 39% of undergraduate students in the U.S. graduate without any student loan debt. This means that the majority of students are entering the workforce with a significant amount of debt to pay off.

Moreover, even after graduation, college students are facing difficulties in paying back their loans. The latest report by the Federal Reserve Bank of New York shows that as of 2021, 9.9% of student loan borrowers are delinquent or in default on their loans. Additionally, studies show that many college students are not saving enough money for their future. A recent survey by Bank of America found that 41% of millennial (ages 24 to 41) have less than \$5,000 in savings, which is not enough to cover even a few months' worth of living expenses. One study found that students who receive financial education are more likely to have positive financial behaviours, such as saving money and paying bills on time (Hastings et al., 2013). This underscores the importance of financial literacy education for college students, as it can help them develop the necessary skills to manage their finances effectively.

Another study found that students who have a high level of financial knowledge are more likely to save money and less likely to carry credit card debt (Robb and Woodyard, 2011). This suggests that financial education can have a significant impact on a student's financial behaviours and outcomes. Furthermore, research has shown that financial stress can have negative impacts on students' academic performance and mental health (Huston et al., 2010; Wilmarth, 2019). This highlights the need for college students to develop strong financial

management skills to avoid financial stress and its associated negative consequences.

Regarding the impact of parental support on a student's financial management, a study found that parental financial support can have both positive and negative effects on a student's financial behaviours (Lawrence and Ritchie, 2017). While parental support can provide a safety net for students, it can also lead to a lack of financial responsibility and independence.

Finally, a report by the Consumer Financial Protection Bureau found that financial education programs can have a positive impact on students' financial behaviours, such as saving money and avoiding excessive debt (Consumer Financial Protection Bureau, 2014). The report recommends that financial education be incorporated into college curriculums to better equip students with the skills and knowledge necessary to manage their finances effectively.

Overall, these studies and reports support the claims made in the literature review regarding the importance of financial education and the negative consequences that can result from poor financial management. They highlight the need for college students to develop strong financial management skills and for educational institutions to incorporate financial education into their curriculums.

Hiebl and Weber (2017) conducted a study to explore the role of mobile apps in financial management for college students. The study recognized the increasing importance of financial literacy and management for college students, as they transition from being dependents to managing their own finances. The study identified that financial management apps can help students monitor their expenses, budget their finances, and track their spending. Additionally, these apps can provide helpful tips for managing finances and give students a better understanding of their financial situation.

The authors highlighted that mobile apps have the potential to assist college students in managing their finances, especially since most college students already rely heavily on their mobile devices. The study revealed that these apps can help students to keep track of their expenses and gain a better understanding of their financial situation, which in turn can help them make informed decisions about their financial future.

The study also highlighted that financial management apps can help reduce financial stress among college students. The authors noted that financial stress can lead to poor academic performance and lower graduation rates, so reducing financial stress is crucial to improving academic outcomes. The authors recommended that universities promote financial management apps to their students to help them manage their finances effectively. They also suggested that financial management apps should be made user-friendly and should incorporate gamification elements to encourage students to use them regularly.

Another study by Ahmed and Malik (2020) investigated the impact of financial education and financial management apps on the financial literacy of college students in Pakistan. The study found that the use of financial management apps significantly increased the financial literacy of college students. The authors

recommended that financial management apps be integrated into the financial education curriculum for college students. Similarly, a study by Lee et al. (2018) examined the effectiveness of a financial management app in enhancing financial literacy among college students in South Korea. The study revealed that the use of the financial management app significantly increased the financial literacy of college students. The authors recommended that universities incorporate financial management apps into their financial education curriculum to enhance financial literacy among their students.

Overall, the literature suggests that financial management apps have the potential to assist college students in managing their finances effectively, reducing financial stress, and improving academic outcomes. The use of financial management apps can also enhance financial literacy among college students, which is crucial for their financial well-being. The integration of financial management apps into financial education curriculums is recommended to promote financial literacy and effective financial management among college students.

The study by Cao et al. (2019) investigated the effectiveness of a financial management app on college students' financial management skills, financial literacy, savings, and debt reduction. The app included several features such as financial goal-setting, budgeting, expense tracking, and financial education.

The study recruited 180 college students who were divided into two groups: a treatment group that used the financial management app and a control group that did not use the app. The study lasted for 12 weeks, during which the treatment group received training on how to use the app effectively. At the end of the study, the researchers found that the treatment group had a higher level of financial literacy compared to the control group. The treatment group also reported a significant improvement in their financial management skills, such as budgeting and expense tracking. Moreover, students who used the app were able to save more money compared to the control group. The researchers also found that the use of the app helped students to reduce their debt. The findings of the study are consistent with previous research on the effectiveness of financial management apps. For example, a study by Hira and Loibl (2005) found that using financial management software is associated with increased financial knowledge, improved budgeting, and debt reduction. Similarly, a study by Lusardi and Mitchell (2014) found that using a financial education website improved financial literacy and savings behavior.

Overall, the study by Cao et al. (2019) suggests that financial management apps can be effective tools for improving financial management skills and increasing financial literacy among college students. Financial management apps can also help students save money and reduce debt, which are crucial skills for achieving financial stability and success in the future.

Design and Implementation

The financial management mobile application is designed to provide a comprehensive set of tools and resources to manage finances effectively. Based on an extensive literature review of budgeting and financial management

techniques, this user-friendly application consists of several sub-applications as shown in figure 1.

User Interface Design

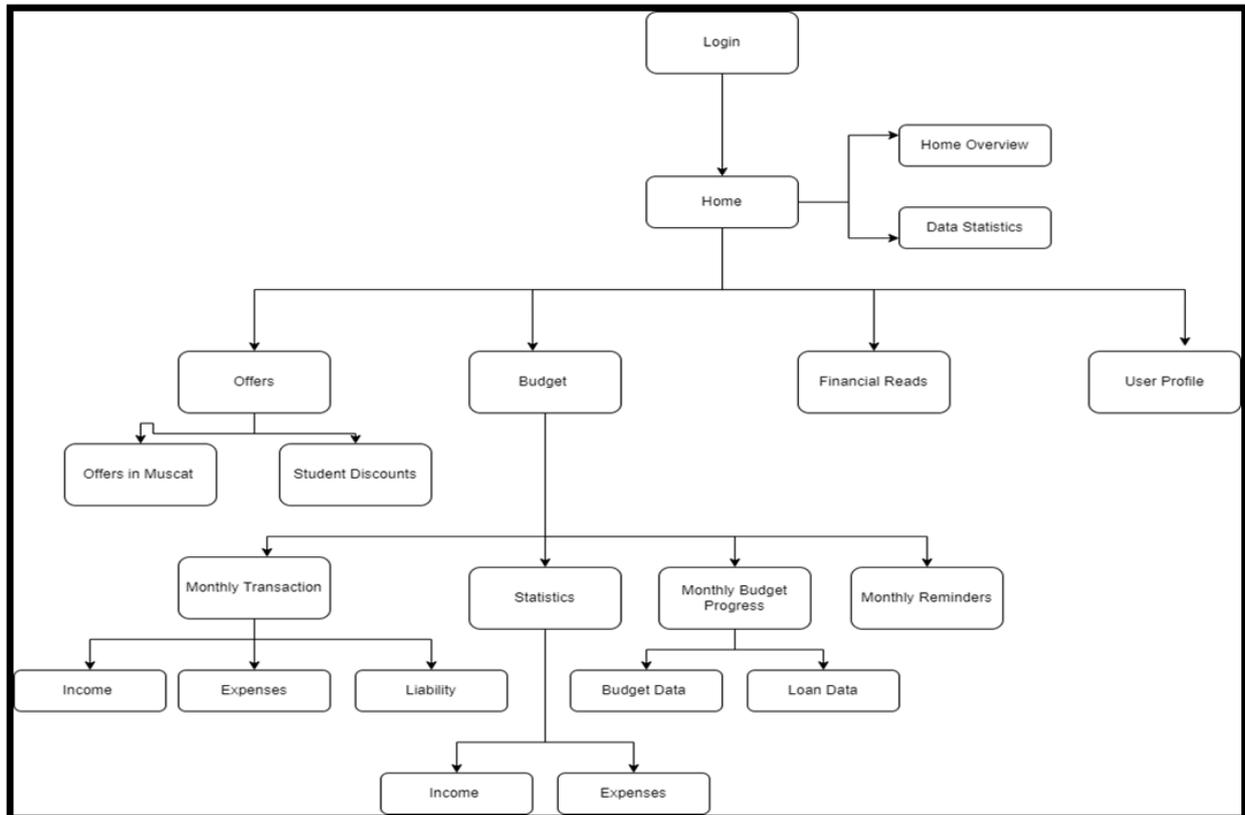

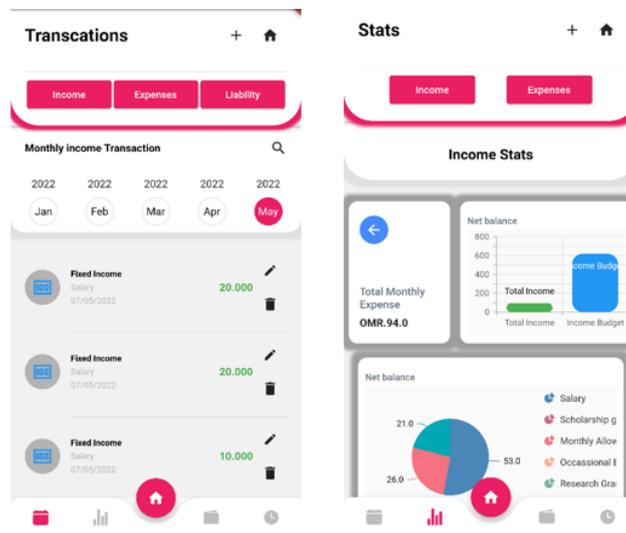

Figure 2. Application prototype flow chart

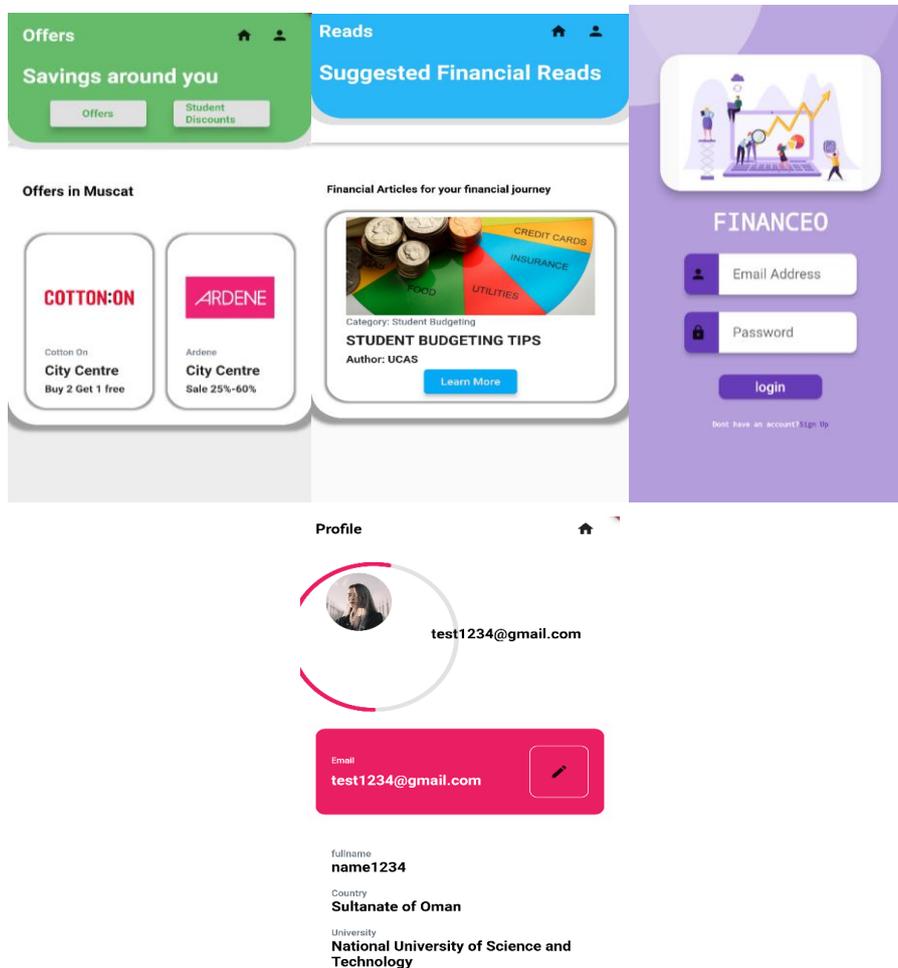

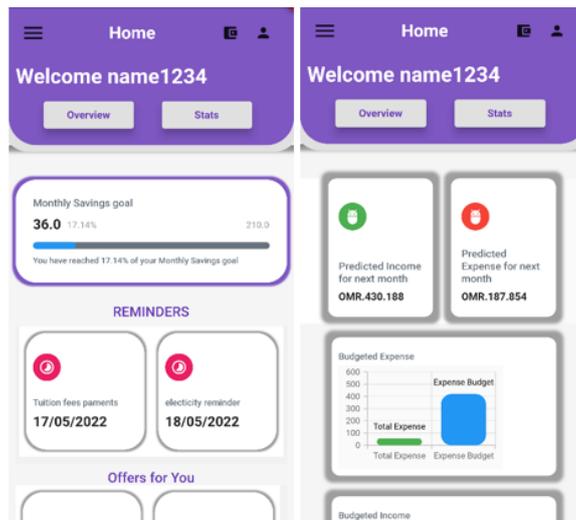

- The Home app acts as the central dashboard that connects all other sub-applications. It showcases the user's current financial performance and uses machine learning to predict their next month's financial performance. The home page showcases the user progress, reminders and their predicted income and expense for the upcoming month.
- The budget app is structured in a way that allows users to access many features of the application via the footer and directs them to the Home page and other sections of the budget app.
- The monthly transaction page in the budget app displays the user's monthly income, expenses, and liabilities/loans taken for the current and previous months. The monthly statistics page provides users with data visualizations such as graphs and pie charts, allowing them to have a glance look into their monthly performance.
- The budget progress page displays budgeted income and expense and savings progress through a progress bar. It also displays the user's total liabilities, loan details, and the progress of each section to clearing their loans.
- The reminders section in the budget app allows users to set recurring and non-recurring reminders with

notes to remind them of any payments or commitments of the month.

- The Offers app provides users with exciting offers and discounts available in the user’s city that they can avail to save more. In the same app, users can also view discounts available to them as students only, helping the users to make and save the most out of being students in general. This section is also an important section as the application can showcase advertisements targeted towards college students.
- The Financial Reads section of the application is designed to help college students learn more about finance and improve their financial literacy. This section is a great addition to the application as financial literacy is important for young adults, especially college students who are starting to become more financially independent. By providing easy access to financial articles, the application can help college students make informed financial decisions. The app provides users with a range of topics such as investment, budgeting, saving, credit score, and much more. The articles are updated regularly, providing users with fresh and updated financial knowledge.
- The Profile and Login sub-applications provide users with an option to set up their profile and log in to access the application.

The UI design of the mobile application is shown in figure 2 is intended to provide users with a simple, accessible, and enjoyable experience. Close attention is paid to the colour scheme and design of each sub-app to ensure that users can easily differentiate between them. The UI design is based on users' expectations in terms of accessibility, aesthetics, and simplicity of use, which will help keep users engaged with the app.

(b) Budget app UI

(c).Offers Page UI

(d) Financial Reads UI

(e) Login Section Design

(f) User Page UI

Figure 2. User Interface Design

Database Design

The Financial Management app's database design is created to meet the requirements of the application. Firebase Real-time Database is used as the database for the application. Firebase has the ability to create new accounts and utilizes Firebase authentication to determine whether the user's email address and password are correct before allowing access to their home page. All user accounts are stored in the Authentication section, where the admin can also disable or delete user accounts. Overall, the use of Firebase Real-time Database and Firestore database in the Financial Management app allowed for efficient and real-time syncing of data between the mobile and other clients. The app's database design as shown in Figure 3, also enabled the app to store and manage users' data effectively while ensuring data security and privacy.

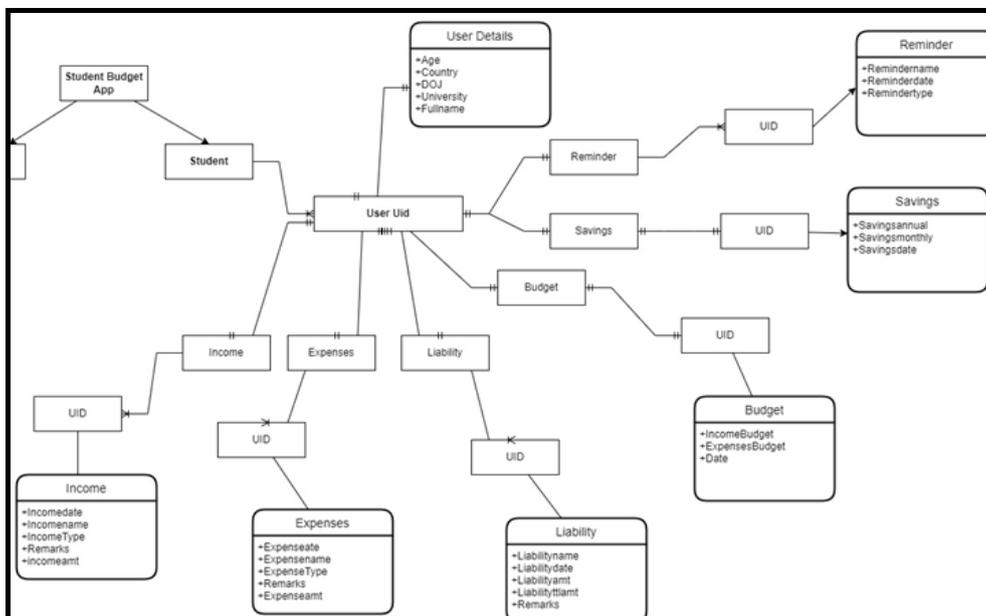

Figure 3. Database design

Implementation

The financial management application for college students is implemented using Flutter as the framework and Dart as the programming language. Android Studio is used as the Integrated Development Environment (IDE) for the project. Various libraries were used to enhance the user interface (UI) and add functionality to the application. Once a user logs in or registers, they will be led to the home page, which is the main page of the application. The Home page ties everything together and serves as a dashboard for the user. It contains the user's personal information, income, expenses, liabilities, budget, and savings information which are shown in Figure 4 and Figure 5.

In conclusion, the financial management mobile application for college students has several essential features that enable students to improve their financial literacy and can provide college students with a comprehensive

tool to manage their finances effectively.

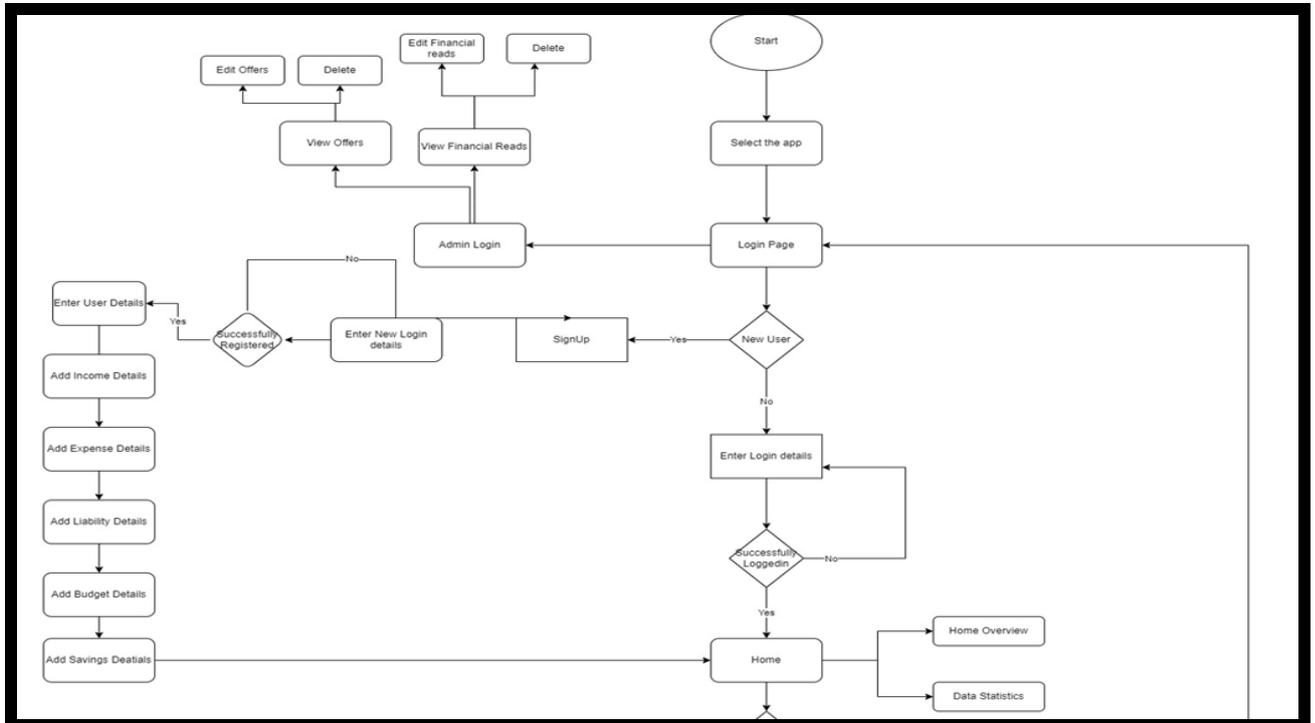

Figure 4. Application Flow chart Part-1

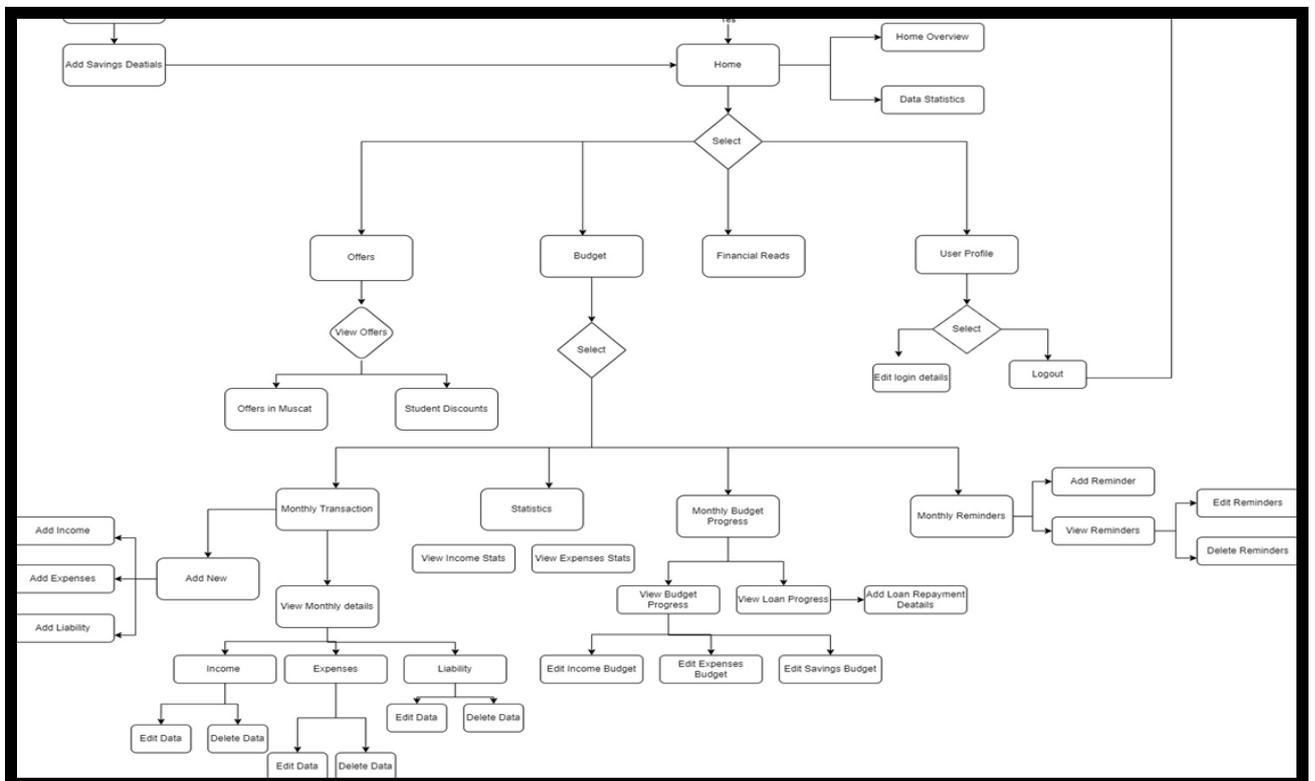

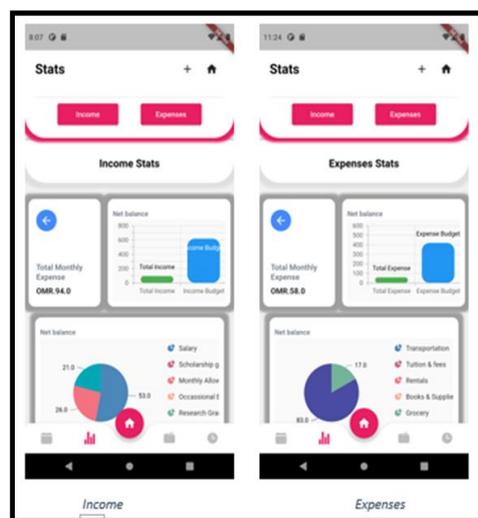

Figure 5. Application flow chart Part-2

Results & Discussions

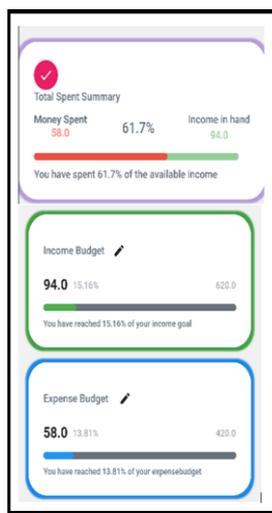

The application effectively employs data analytics and machine learning to evaluate user data and provide detailed and summary insights into the user's income, spending patterns, budgeting progress, and credit or loan status.

User Data Analysis Results

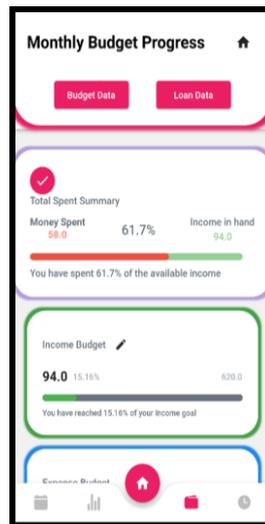

Data analysis is the process of summarizing acquired data, interpreting the data acquired using analytical and logical reasoning to find patterns, connections, or trends (Coursera, 2022). In this application, data analysis is used to summarize user data and provide insights that users can quickly examine their past and present progress via graphs, summaries, and progress bars. This helps users become more financially aware and make informed financial decisions without requiring too many financial details that could potentially confuse them, saving the user time and motivating the user to make wise financial decisions. Graphs are used to summarize the user's income and expenses for the month. The data analysis for income and expenses using graphs is shown in Figure 6(a). This feature aims to let the user know their income and expenses performance at a glance. To visualize the user's progress toward their spending and budget goals, the program employs a progress bar, as shown in Figure 6(b). Each progress bar also provides a percentage and a word summary for further understanding of their progress. Progress bars are also used to analyze the user's savings progress, as shown on the home overview page and budget page, as shown in Figure 6(c). Loans are also a significant aspect of a person's life, and paying on time and keeping track of the loan progress is critical. This application promotes and assists the user in making timely loan repayments while also keeping them aware of their commitments or obligations. Figure 6(d) depicts how a progress bar and summaries were utilized to display user loan progress for simple examination. The green color highlights good progress or the percentage of the loan paid, whereas the red color highlights poor progress or the percentage of loan to liable to pay.

(d) Loan progress

Figure 6. User data analysis

Machine Learning

The use of machine learning in a mobile application can greatly enhance college students' financial literacy. The application predicts a user's income and expenses for the upcoming month based on their past spending patterns, with the goal of providing them with a forecast of their financial performance for the upcoming month. This feature is not developed to display the users' accurate performance (income & expense) for the next month, but is used to make future predictions based on their past spending patterns. Thus helping the users make changes to their present spending and saving habits based on how their financial patterns have been in the past and make better and more responsible financial decisions.

The machine learning libraries within Flutter, such as the ml_algo and ml_dataframe libraries, were utilized to predict the user's income and expenses for the upcoming month. Linear regression is chosen as the most appropriate machine learning algorithm for the prediction, given its simplicity and ability to model a linear relationship between dependent and independent variables.

To predict the user's next month's income and expenses, the application categorizes the data provided by the user by month, and the machine learning algorithm is trained on this data to generate a prediction for the next month's income and expenses. The prediction is updated every time the user enters new data into the application. The machine learning prediction feature is displayed on the home stats page, where it summarizes the user's financial statistics progress. The predicted value is displayed at the top of the home stats page, allowing the user to view their predicted next month's performance at a glance.

Figure 7 illustrates the machine learning prediction feature on the home stats page. The income data is retrieved

from the Firestore database in Firebase and used to calculate the total sum of income for each month. The get sum method is executed to add up the total sum of income for each month, which is displayed on the home stats page.

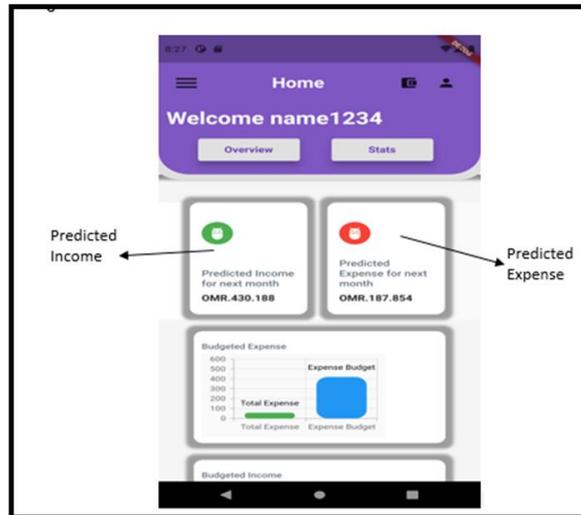

Figure 7. Predicting Income & Expense

The process of implementing the machine learning functionality in a Flutter application involves the following steps as shown in Figure 8:

Data Collection: The application collects data from the user through a form where users can enter their income and expenses for each month. The application saves this data to the firebase database along with the corresponding date.

Prepare the Training Dataset: The application prepares the training dataset for the linear regression model. To prepare the training dataset, The application accesses the users' data and sorts the income/expense based on month (X) and adds the total income/expense of each month into a list (Y). This involves collecting the user data from the database and organizing it into a set of X (month) and Y (income and expenses) values. Each row of the dataset represents one month of income (Y_i) and expenses (Y_i') data.

Train the Linear Regression Model: The application trains the linear regression model using the prepared dataset. This involves using the Dart library for linear regression, such as the "linear regression" package, to fit the data to a linear regression model. The model will learn the relationship between the month (X) and income and expenses (Y) values and create a line of best fit.

Predict the Next Month's Income and Expenses: Once the model is trained, the application can use it to predict the income (Y_n) and expenses (Y_n') for the next month (X_n). To do this, the application can use the month value of the next month (X_n) as the input (X), and the model will output the predicted income/ expenses values (Y_n, Y_n').

Display the Predicted Income and Expenses: The predicted income (Y_n) and expenses (Y_n') for the next month (X_n) are displayed on the home page of the application.

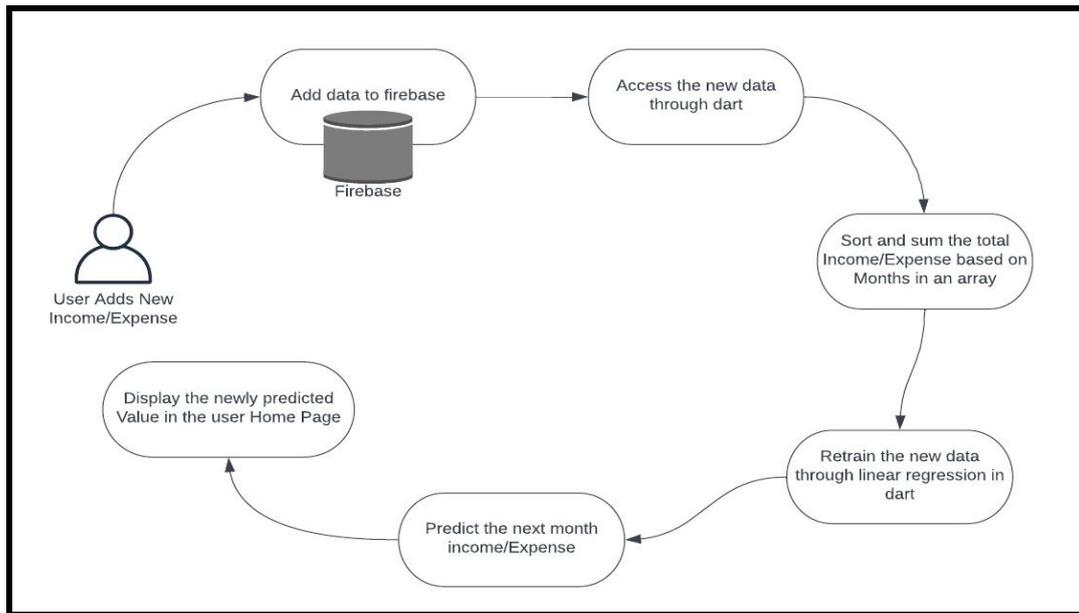

Figure 8 . Predicting user income using linear regression and past data

The accuracy of the predictions depends on the quality and quantity of the data provided by the user. As the application collects more data over time, the accuracy of the model is expected to improve. The Mean Square Error (MSE) and Mean Absolute Error (MAE) are used to evaluate the performance of the models. MAE and MSE values are shown in figure 9. The MAE and MSE are measures of the difference between the predicted and actual values of the dependent variable, so a lower MAE and MSE indicate that the predictions are closer to the actual values. Therefore, lower values of MAE and MSE indicate that the model is performing better in terms of its predictive accuracy.

```

MAE for 36-month prediction: 697.4929351400388
MSE for 36-month prediction: 689945.366606091
  
```

Figure 9. 36 Month prediction performance

The application's ability to accurately predict income and expenses is expected to improve as more data is collected from users over time.

In the future to further improve the accuracy of the model, the application could also incorporate additional features such as the user's current account balance, recurring expenses, and income sources. This would provide the model with more data points to learn from and make more accurate predictions. In addition, as the data and accuracy of the predictions improve the application could also provide users with suggestions for saving money, such as reducing unnecessary expenses or increasing income sources. This could help users to improve their financial situation and make more responsible financial decisions.

In conclusion, the machine learning-based financial management mobile application developed for college

students aims to enhance their financial literacy by providing them with a forecast of their financial performance for the upcoming month. The application uses machine learning algorithms such as linear regression to predict the user's income and expenses based on their past spending patterns. The accuracy of the predictions is expected to improve as the application collects more data from users over time. Overall, the application can help college students better understand their finances and make informed financial decisions.

Conclusion

In conclusion, it is critical to prepare college students financially, as they will represent and contribute to the country's future. The mobile application developed for college-going young students aims to assist them in becoming more financially literate by tracking their spending habits, offering insights into their purchasing habits, and suggesting financial articles for them to read. The program also promotes savings by showing student discounts and deals in the user's city. Several studies have emphasized the importance of financial planning among the youth and the role of mobile applications in achieving this goal. Machine learning is employed to analyze and predict data, providing users with relevant and straightforward insights to make better financial decisions. The use of the agile development technique, implemented using the flutter framework based on the Dart programming language, allows for a flexible and collaborative approach to software development. Finally, a comparison of the prototype with other existing budgeting applications shows its advantages and limitations. Overall, the project's aim is to prepare college students in Oman for financial success and self-sufficiency.

Limitations and Future Studies

Based on the results of the application, several enhancements will be made to improve its performance and user experience. Firstly, the application will provide annual statistics and a monthly user summary to help users track their financial progress more effectively. Additionally, an API will be developed to automate the conversion of user bank statements into data for the Firebase database, reducing the need for manual data input. The program will also be linked to the user's bank account for automatic data syncing, making the app more convenient to use. To further improve the application's accuracy and efficiency, the machine learning algorithm will be evaluated and refined. This will enhance the application's predictive capabilities and improve its overall performance.

In order to gather user feedback and ensure the application meets the needs of college students, the app will be tested for at least one month. This testing period will help to identify any issues and make necessary improvements before launching the application.

The applications financial reads section will provide customized article recommendations based on the student's savings performance. For instance, if a student has saved enough money, investment articles will be

recommended to help them learn more about investing and growing their wealth. If a student does not have any savings, the app will recommend savings articles to help them learn about budgeting and saving money.

Furthermore, the offers and discounts section will not only feature shops where students can save money but will also display discount advertisements tailored to the student's city of registration. This will enable the app to generate revenue while also providing students with relevant and useful information about available discounts and offers.

The ultimate goal of the application is to promote financial literacy and independence among young people. By empowering college students with the tools and knowledge they need to manage their finances effectively, the application aims to make a meaningful contribution towards building a financially aware and responsible generation.

Developing The Perspective of Preservice Mathematics Teachers Through Early Field Experience

Melda Jaya Saragih

Pelita Harapan University, Indonesia

Abstract: Field experience is done to provide an opportunity to preservice teachers to develop pedagogic, professional competencies, personality, and social holistically through classroom learning and interactions outside the classroom. The purpose of this study is to describe what preservice teachers observe and what their perspective process they get during an early field experience. The subjects were sixteen preservice mathematics teachers who do field experience in separate schools and data collected by questionnaire, reflection and interview. Questionnaire data analyze with quantitative method using dependent t-test to compare their perspective before and after early field experience. Data from reflection and interview analyze with descriptive qualitative method. The results that there is difference of perspective before and after field experience. Through observation and learning class and school environment makes perspective preservice teachers' growth in their readiness be a teacher, design curriculum, teaching strategies, self-confidence.

Keywords: Curriculum design, Teaching strategies.

Citation: Saragih, M. J. (2023). Developing The Perspective of Preservice Mathematics Teachers Through Early Field Experience. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 1254-1263), Cappadocia, Turkiye. ISTES Organization.

Introduction

The formation process in student grows according to the input given to them. To produce capable students in accordance with the expected skills or outputs, it is necessary to provide adequate learning during their education. During lectures, mathematics education students have been given theoretical knowledge, but it is not enough just only theory, it is necessary to give them meaningful experience learning for themselves to prepare to become professional teachers. This is a challenge in preparing teachers, how to prepare prospective teachers by linking educational theories and teaching practice (Eutsler, L, 2019). So practical learning is needed by participate a field experience program so that students teachers can learn from the school environment (Heafner et al., 2014). Field experience is provided to bridge the theory-practice gap by transforming professional knowledge into instructional practice. Conversely, for field experience to be effective, prospective teacher must also start with in-depth professional knowledge (Kulgemeyer, C, 2020).

The results of Nelson's research (2019) found that there is a positive impact of field experience for prospective teachers on their beliefs and intentions because of seeing technology that usually used by professional teachers with a meaningful learning approach. A student needs to be equipped practically to equip them with various skills as designed in the curriculum. In addition, their growth also needs to be evaluated for progress, not to compare with other students but to compare before and after getting lectures or programs that have been given. The goal of any field experience program undertaken is to prepare qualified future teachers (Anderson, J. 2022). Students, education staff, curriculum, learning facilities and educational environment are some of aspect that affect the educational process (Syofyan, 2022)

Seeing the importance of field learning experiences for prospective teacher, it is necessary to hold a field experience program that provides opportunities for prospective teachers to learn from the school environment. However, Turmuzi's (2021) findings that prospective mathematics teacher at Faculty Teachers College Mataram University feel that they are not ready to do Field Experience Program (FE) at school because many of them do not master with teaching materials. They also do not understand the learning strategies that are in accordance with the teaching materials. They tend to implement new learning strategies based on their understanding and do not pay attention to the student's situation. Moreover, Schiucheeti (2019) findings that although students' teachers self-efficacy levels vary each semester, statistically there is increasing in self-efficacy levels when compared with before participating in field experiences. Despite the increase in student self-efficacy, students teachers stated that they still need field experience programs.

By seeing the importance of students learning practically and their readiness to become a teachers, the field experience program at Faculty Teachers Collage - Pelita Harapan University was carried out two times to equip prospective mathematics teacher to develop their teaching skills and prepare them to become professional teachers. First, prospective teacher are given learning opportunities through participatory and collaborative observation with mentor teachers. Students teacher are expected to observe the entire process of preparation, learning and assessment holistically where they are guided by mentor teachers at school. In the series of observations, students teachers must also discuss the results of their observations with the mentor teacher. The number of teachers observed by students must be more than one teacher, so it is possible that prospective teacher students can learn more from teachers mentor and the school environment. Mentor teachers assist prospective teacher students in understanding a series of learning plans designed according to the learning context at school, assist students in understanding work ethic and school expectations, giving feedback from teacher students performance with orally and writing.

Not only mentor teachers, the Principal also plays a role in shaping the professionalism of student teacher because be a intercedes communication between the school and the Faculty, ensuring that organizational arrangements and other things that need to be available properly, so that students teacher have access to the school's online platform, access to teaching materials, and other access in school activities, ensure that the mentor teacher knows and performs well his duties and roles. Before student teachers start their experience in school, student teachers also briefed on all procedures in implementing Field Experiences and explaining what

must they will done and prepared during Field Experiences. Students teacher are given a handbook to assist them in carrying out all the tasks given. Students teacher not only supervised by mentors and principals, but also guided by Lecturer as a supervisors who will monitor the implementation of field experience programs and contribute to the development of students teacher by helping them appreciate the relationship between theory and practice, work with them collaboratively, to form, to direct, to challenge and to encourage them to develop their teaching competencies, build relationships with student teacher in order to create effective communication, provide support by providing fair, honest, and specific oral and/or written feedback that can assist students teachers in developing their observation skills carried out online, provide assessments based on student teacher observation experiences through e-portfolios.

During the field experience program, students teacher learn from the school environment, whether from students, teachers, principals or others in the school environment. Students teachers observe all school activities that help in preparing themselves to become a professional teachers. In addition, students teachers also reflect on all their experiences by assessing themselves, strengths and weaknesses and actions that will be taken in the future, willingness to learn, clear focus taken for the next step to become a professional teacher. Through self-reflection, students are expected to experience growth from their field experiences (Mohebi, L. 2022; Abdel-Basset et al., 2018). Not only reflection, students teacher also get feedback from teacher mentors about their skills, ability to collaborate, initiative, confidence, polite appearance, and confidence. This feedback expected students teachers also focus on aspects that they need to be developed and maintained in the process of preparing themselves to become professional future teachers (Gibson and Musti-Rao, 2016; Gürkan, 2018).

After doing field experience at school, students teachers are expected to gain experience as their provision before being entrusted to be teachers and how students construct a perspective as a prospective teacher and how that view is constructed. Perspective is the process in which individuals are aware when making decisions and how to respond to accepted stimuli or as a point of view on how to see observed phenomena (Aw, 2011; Martono 2010; Sihite, MR, & Rangkuti, LA, 2023; Wardhana, WB, Suryaningrum, CW, & Romdhani, RW, 2022). The purpose of this study is to describe what experiences students gained during early Field Experience Program and how their perspectives developed after finishing early Field Experience.

Method

The research method used using quantitative methods by looking at the development of students' teachers perspectives before and after Field Experience Program (Ramdhan, M, 2021). Data was collected from sixteen mathematics education students who attended the Field Experience program at the school. Data on student's teachers perspectives were collected through questionnaires, reflections and closed interviews. Meanwhile, the data from reflections and interviews were analyzed descriptively. After the questionnaire data was collected, the data was processed using a non-parametric test using the Wilcoxon test using the help of SPSS to see the difference of students' perspectives before and after Field Experience Program (Unaradjan, DD, 2019).

Results and Discussion

Data from students' teachers perspectives before and after participating in the field experience program were compared and analyzed with the help of SPSS. Here is the data from SPSS processing:

Test Statistics^a

	After_Field_Experience Before_Field_Experience
Z	-3.191 ^b
Asymp. Sig. (2-tailed)	.001

a. Wilcoxon Signed Ranks Test

b. Based on negative ranks.

From the research data, it was obtained that the average perspective of students teachers before early Field Experience program was 29.91, but after participating in the program, the experience increased to 33.06. This shows that students' perspectives develop after taking Field Experience program. By looking at the results of statistical tests, it was found that there was a significant difference between the perspective of students teachers before and after early Field Experience Program was conducted. It can be seen that the sig value of $0.001 < 0.05$ means that there is a significant change in their perspective before and after Field Experience Program. This shows that early Field Experience Program has a significant impact in shaping their professionalism. Here is the development of student perspectives from each aspect:

A. Readiness to Become a Teacher

Data on student readiness to become teachers before and after early Field Experience Program can be illustrated in the following bar chart:

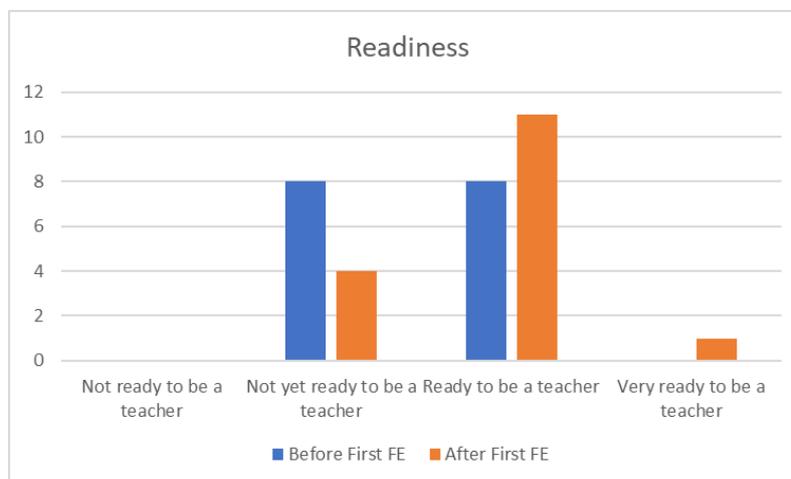

Figure 1. Graph Readiness to Become a Teacher

Before early Field Experience Program, there were 8 students who were not ready to become teachers and 8 students were ready to become teachers. However, after early Field Experience Program saw an increase to 11 people ready to become professional mathematics teachers and 1 student felt very ready to become a teacher.

Before early Field Experience Program, students teachers still had doubts about their ability to master mathematics content, learning methods, class mastery, self-mastery, were not able to direct students correctly, still needed to have a better personality, responsibility, discipline. However, after early Field Experience Program students teachers learn a lot to prepare communication skills and how to manage classes by well, learn to place themselves as a guide so that they can guide students to grow to know themselves, more able to control their emotions so they can handle the classroom learning process, need to prepare material and methods to delivery the content. Studentteachers are increasingly confident and prepared to become professional teachers who can be role models, good guides and guides for their students.

B. Ability to Design Curriculum

The following data describes on students' ability to design learning before and after early Field Experience Program:

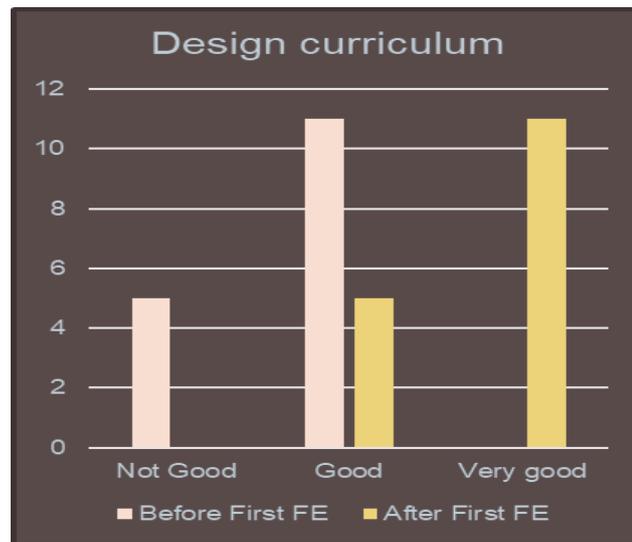

Figure 2. Graph Ability to Design Curriculum

From the results of the questionnaire, 12 students teacher considered the ability to design learning or curriculum design in a good category, while 5 students teachers were not good. However, after the early Field Experience Program there were 5 students teacher who thought that their ability to design learning or curriculum was very good, while 11 other students teacher were in a good category.

Before early Field Experience Program students teachers were able to compose material and learn mathematics quite well but were not proficient/trained. Students have also studied it theoretically in other curriculum and pedagogy courses, but students still need to learn direct observation of good curriculum or learning design.

There are students teacher who feel that their ability to design lessons is not good because when presenting in previous class, students teacher have not been able to master the methods and ways of teaching properly. Some of them still do not understand very well how to compile a curriculum that is more interesting and useful for students. However, after early Field Experience Program, students teacher increasingly understand that they need to have good relationships with students, understand class characteristics, class situations and conditions and get to know each student's personality so that they can get to know students' methods, strategies and learning styles so that they can be attractive to students. Students teachers need to design learning with a lifelong understanding that is useful in learning and understand the important essence associated with contextual issues, make teaching preparations including mastering teaching materials very well. Besides that, there needs to be a willingness and effort to adapt, change, and try various ways to make the class even better. In addition, students are committed to be more enthusiastic about learning because it is very useful and will become their provision later. This is in line with the results of Akvovo's research (2020) that students teacher learn to absorb culture during early Field Experience Program to facilitate their learning.

C. Teaching Strategy

The ability of students to design teaching strategies before and after conducting early Field Experience Program is illustrated in the following bar chart:

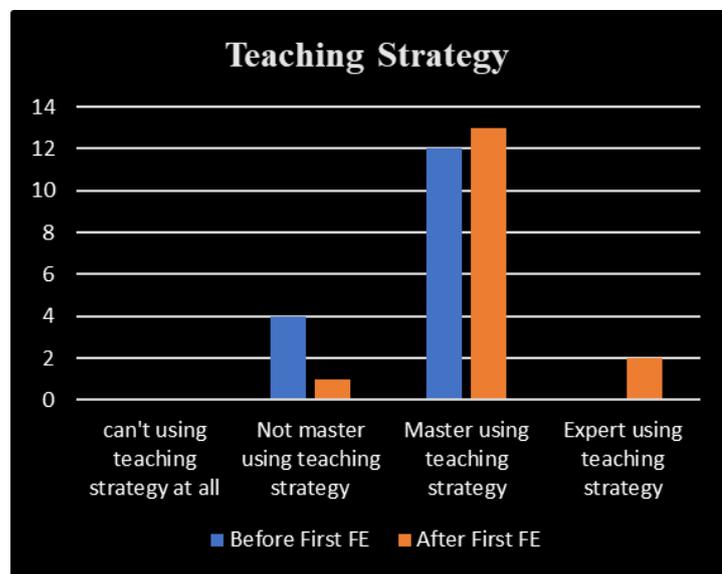

Figure 3. Graph Teaching Strategy

From the results of the questionnaire, before early Field Experience Program as many as 12 students teacher had the ability to master good mathematics teaching methods and strategies, while 4 students teacher had not mastered. After the early Field Experience Program there were 13 students teachers who had the ability to master mathematics learning methods/strategies well, 2 students teacher were very good at it and there was one student who still did not have the ability to master mathematics learning methods or strategies by well.

Before early Field Experience Program there were student teacher who thought that they had mastered teaching strategies well because they had learned from previous experiences in learning mathematics, even though it needed to be improved further, some students teacher found it difficult to apply and had not been able to teach well because they lacked mastery of the material and needed teaching observation. Students teacher often meet student who do not really like math. As a result they are not very active, quiet, maybe even noisy in learning. After early Field Experience Program, students teacher think that they can learn how teachers must be able to design and master the strategic methods that will be used for teaching so that learning is conveyed in a clear and structured manner and facilitates each of the unique characteristics of student learning. Students teacher learn a lot, through strategies that make students understand, how to make students want to be open to teachers about their difficulties, their opinions so that learning is interesting and runs interactively, not monotonously. Students teacher need to master math content well, so they can divide topics and develop learning plans and time allocations properly.

D. Self Confidence

The developing of students teacher self-confidence before and after participating in early Field Experience Program is illustrated in the following diagram:

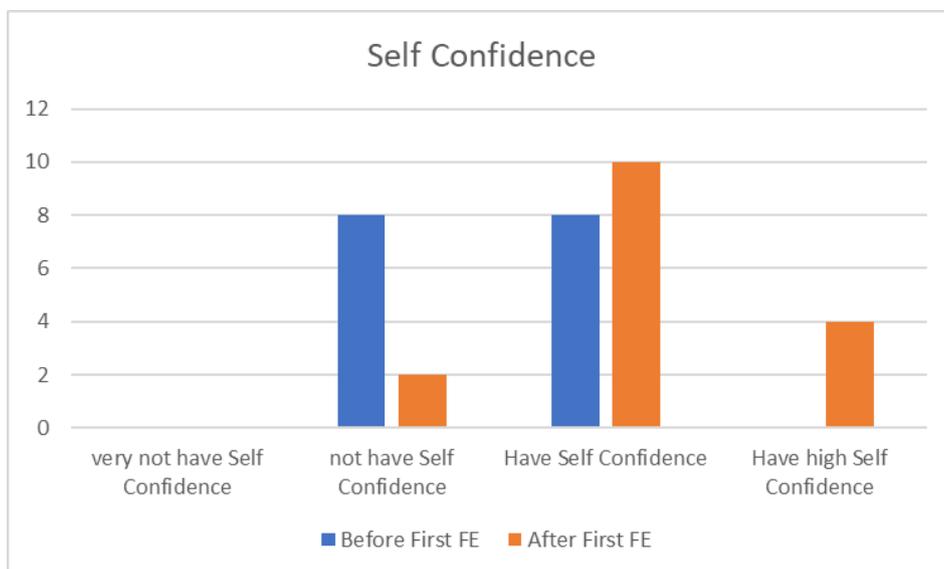

Figure 4. Graph Self Confidence

The results of the quistionare show that 8 students teacher were not confident before early Field Experience Program, 8 students teacher were already confident to become teachers. However, after the early Field Experience Program there were 2 students teacher who were not confident, 10 students teacher became confident and 4 students teacher were very confident.

Before early Field Experience Program students teacher lacked confidence because their math skills were still weak and their teaching skills weren't good enough, they weren't able to solve questions correctly, they didn't have good communication skills, when in front of the class because it allowed them to meet students with abilities mathematics smarter than them so that there is a feeling of fear of being judged if they make a mistake, some of students teacher feel comfortable when teaching others. However, after early Field Experience Program students teacher are confident in teaching, their speaking skills increase, student teacher perceive that the reality they encounter is not as bad as what they previously thought. Students teacher feel that they need to continue studying because they still have time to learn and improving their skill. Students teacher realize that self-confidence is very important for a teacher. Students teacher already have an overview of the school and the classroom learning process. The good experience of students teacher make them grow in self-confidence because they are able to relate to students and they are very pleasant.

Through the early Field Experience Program, students teacher grow and are equipped to become professional teachers (Shelton, R. (2020); Hamilton, E.R. 2019; Zeichner et al. 2015). This is in line with the results of Azwar's research (2019) which found that field experience programs make prospective teachers more confident in their teaching. The results of Sumartini's research (2020) show that prospective mathematics teachers have confidence in mastering mathematical knowledge, but feel less confident that they are able to convey mathematics material to students. This lack of confidence takes a toll on them pedagogical abilities.

Students teacher learn a lot from their experience program. Students' perspectives get better after finishing the early field experience program. Students' teacher perspectives are formed from their experience learning directly in the field how to become professional teachers. This perspective is formed when interacting with students, teachers, principals. This process shapes their readiness to become teachers (Ping, C, 2018). After directly interacting with students, students teacher feel more prepared to become a professional teachers because of their experience while at school. After participating in a series of lessons and learning from mentor teachers who guide them, students teacher feel more capable to designing lessons and more mastering learning strategies. In addition, early field experience has an impact to make better students teacher self-confidence. Students teacher feel more familiar with the school environment and more confident to become a teacher.

Conclusion

The early Field Experience Program has had a significant impact on changing perspectives for the better for students teacher. The perspective of students teacher changed after completing early Field Experience Program. Students teachers feel more ready to become professional teachers, the ability to design learning, teaching strategies and also their confidence is getting better after completing the field experience program. Students teachers who take part in the field experience feel the emergence of new skills, including experience, self-reflection habits, skills and knowledge for job interviews, and comfort with the observation process, better understanding the school context (Bartolome, S.J. (2017; Koubek, E. 2021).

Abstract: Chinese traditional costume culture is regarded as a part of Chinese culture. Inheriting and propagating traditional Chinese costume culture around the world are the missions of the times for the Chinese people. China in the 21st century is infinitely close to the center of the world stage because of its rapid economic growth, which inevitably asks for the corresponding share of international discourse. Therefore, China's external communication should not only be considered in the political and economic aspects but should pay more attention to its traditional culture, which makes it easier to change foreigners' impression of China from the inward. Taking cheongsam (also called *qipao*) as an example, this paper aims to research the development of Chinese traditional costume culture and to explore the fresh approaches of the international communication of Chinese traditional costume culture under the background of a new era, increasing the international influence of traditional Chinese costume culture.

Key words: Traditional Chinese Costume Culture, Cheongsam, International Communication

Citation: Xiong, X, Gao, X., & Zhang, K. (2023). International Communication of Chinese Costume Culture: Taking Chinese Cheongsam (qipao) as an Example, In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1264-1276), Cappadocia, Turkiye. ISTES Organization.

Introduction

China, a country with a profound cultural atmosphere, has experienced the historical evolution and cultural inheritance and development of ancient and modern times and now has shown a new appearance of thriving and vigorous growth. People's lives are inseparable from clothing, food, shelter and transportation. Clothing ranked first, known as China's national dress cheongsam, in the waves of sand, constantly evolving, and eventually being retained over time. Chinese traditional cheongsam, as a symbol of beauty, fully displays female

temperament beauty and pliable beauty. It has survived the ups and downs of development, which is closely related to the charm of Chinese traditional culture.

For the traditional Chinese costume—cheongsam—there do not seem to be enough books for people to read or study. On the local market in China, the books about cheongsam can be divided into three categories: the first category is literature books, such as the novels written by Zhang Ailing, Dong Qiao and other authors. In the novels, the descriptions of the characters usually involve some elements of cheongsam. For example, the book *But I just love cheongsam* was written by the writer Shi Liu and covers a comprehensive range of cheongsam from cheongsam lovers to cheongsam craftsmen and to cheongsam customization workplaces on the street and lanes; the second is books on the introduction and appreciation of cheongsam craft, such as the book *cheongsam and Famous Women* written by Chen Yunfei; the third is only a pure introduction to cheongsam craft, such as *cheongsam Sewing Methods*, *Cheongsam Special Techniques*, and *Encyclopaedia of Chinese Costume Production* written by Yang Chenggui, a master cheongsam maker. However, all of these books have not been translated into English, and some of them are written in traditional Chinese characters, but not simplified ones, which greatly hinders the international spread of Chinese cheongsam and discourages foreign readers.

International communication is an very important way of transforming culture into soft power, so the aim of this article is to explore the development of traditional Chinese costume, taking cheongsam as an example, and its international communication, hoping to be helpful in the spread of Chinese costume culture abroad on the basis of previous studies.

The Origin and Development Of Chinese Cheongsam

After years of development, through continuous innovation, Chinese cheongsam has been shining on the land of China. However, its origin and development over the years are worth discussing.

A. The Origin of Chinese Cheongsam

Cheongsam is generally regarded as a kind of upper and lower one-piece clothing of the Manchu ethnic minority in northeastern China. In the beginning, cheongsam originated from Manchu costume in the Qing Dynasty. In the Qing Dynasty, Manchu people were called “Banner People or *qi ren* who are one of Chinese minorities, so the clothing inherited from them has been called as cheongsam or *qi pao*.

B. The Development of Chinese Cheongsam

In the middle of the Qing Dynasty (1728–1820), as a series of ethnic policies aimed at promoting the integration of the two ethnic groups were issued in the early Qing Dynasty, the Manchu and Han ethnic groups began to follow suit, resulting in changes in clothing. As the first large-scale social reform movement in the 20th century, the "New Deal of the late Qing Dynasty" has milestone significance in the early modernization of China. At the same time, the New Deal also provided great opportunities for the further integration of Manchu and Han nationalities.

Great changes have taken place in the costumes of the Manchu and the Han groups, and both of them followed the example of the Manchu cheongsam, which became increasingly popular. At the beginning of the 20th century, under the influence of the Western feminist movement and the New Culture Movement, which swept China alternately, influencing a lot, Chinese female students set off a civilized new dress trend in fashion. The so-called civilized new dress is plain clothes without jewelry but with a long black skirt without patterns underneath (Tan Ting, 2020). Shanghai, as the forefront of the national trend, is increasingly innovative in the development of cheongsam under the influence of foreign fashion and multiple regions. On April 16, 1929, the Central Government of the day in China promulgated a regulation on the dress system for the first time, which officially confirmed the status of the cheongsam as a national apparel and put it in law for the first time (Zeng Yaqi, 2017).

The 1930s and 1940s has been called the golden age of the development of Chinese cheongsam, and the famous "Shanghai cheongsam" also developed during this period. In the 1940s, the style of cheongsam became increasingly convenient. After the 1940s, the popularity of cheongsam slowed down due to the war, but it was still the favorite suit among women. The biggest feature of cheongsam in the 1940s was that it changed from plane cutting to three-dimensional cutting. The original cheongsam was cut in such a way that the sleeves and the body were joined together, and a piece was added below the elbow. By the 1950s, women generally wore clothes that were easier to move, so cheongsam was rarely worn in women's daily lives, but many dignitaries still chose cheongsam when attending some special or important occasions, such as wedding banquets, Spring Festival celebrations and international gatherings. As a kind of old culture or custom, cheongsam suffered greatly from the movement of the "Four Olds Break" during the 10 years of the Great Cultural Revolution of China. During the height of Chinese revolutionary zeal from the 1960s to 1970s, cheongsam almost disappeared in China. It was not until the late 1980s, with China's reform and opening-up and economic recovery, that cheongsam came back to people's attention. In 1984, cheongsam was designated by The State Council as the dress for female diplomats, which shows its important status and acceptance to the people. On May 23, 2011, the handmade process of cheongsam was approved by the State Council of China and announced as one of the third batches of national intangible cultural heritage. In November 2014, at the 22nd APEC meeting held in Beijing, the Chinese government chose cheongsam as the dress of the wives of participating leaders^[13]. Currently, the development of cheongsam in China can be said to be brilliant. After going through untold hardships, cheongsam in Today's China has gained its own place, not only in different colors and styles but also in patterns with various elements, containing the oriental beauty of Chinese women. As a traditional Chinese costume, it is on the basis of cultural confidence that cheongsam has been popular around the world for its infinite attraction and charm.

C. The popularity of Chinese Cheongsam Around the World

Chinese cheongsam is a very familiar and favourite dress for Chinese people and has been regarded as the national dress in the whole country. Many Chinese women are extremely fond of wearing cheongsam on some official occasions, which can reveal unique personality charm and is considered respectful to other people.

But what's the impression of it in the foreign countries? It is understood that as China has persistently spread Chinese excellent traditional culture and an increasing number of international cultural elements have increasingly been absorbed in Chinese cheongsam, cheongsam is also constantly bombarded with the world's attention. In fact, early Chinese cheongsam was affected by Western culture, which led to its modern thriving, and the culture of Chinese cheongsam is also very popular in the world. Many Western dress designers are also gradually combining cheongsam culture with modern Western costume cultural elements, such as the conveyance of the core idea of clothing needing more advanced thoughts. The designer of Dior brand, which represents the highest spirit of Paris haute couture, was the first to choose Chinese cheongsam. With the background of golden Shanghai in its prime, China and the West were combined to design international fancy dress with Chinese characteristics, which made the world once again marvel at the wisdom of Chinese people and the superb works of designers and showed the charm of Chinese cheongsam to the international vision.

Furthermore, the use of Chinese cheongsam is more diverse, such as a large number of women in the wedding ceremony choosing cheongsam as wedding clothes and so many television hostesses in the variety show wearing cheongsam. The shape of cheongsam is more westernized, such as some local details of processing, using deep U-shaped collar, a zigzag collar boldly exposed front chest, using Rococo style with layers of lace flared cuffs, or "grafting" with Western dresses, the upper body and lower body skirt to form two styles of East and West. Not only will Chinese women choose such a cheongsam, but a large number of Western women also like the new style of cheongsam with an oriental flavor, and some Hollywood stars have repeatedly chosen both elegant and fashionable cheongsam as a dress on the red carpet. These all prove once again that Chinese cheongsam is still popular internationally (Wei Yulong, 2013).

Drawbacks In Cheongsam's International Communicaton

With the growing soft power of Chinese culture, the international spread of Chinese traditional costumes, especially cheongsam, has become increasingly extensive and diversified. However, in the process of the international spreading practice of cheongsam, there are still many internal and external drawbacks to be addressed, which can be considered from the following three aspects.

First, the global COVID-19 pandemic outburst from the end of 2019 has hindered international economic interactions. The import and export trade are still under strict control. Although Chinese cheongsam originated a long time ago, the occupation of its international supermarket share is not a matter of overnight; furthermore, the current epidemic, which has been torturing the whole world, makes the international spread of cheongsam difficult.

Second, China's economic fast development has led to many "China threat arguments" in the international arena of economy, which make some politicians call for a boycott of the international communication of Chinese culture, including traditional costumes, completely unacknowledging or ignoring the international contribution of Chinese people's wisdom reflected from cheongsam, even though Chinese people have actually made

remarkable achievements for the whole people. In fact, it is not China's problem that is called the China Threat but the worries of the people who are afraid of the impact of China's rise, which dose obviously mean to the world.

Last but not least, the lack of internationally renowned and competitive fashion designers in China, especially local couture designers, seriously hinders Chinese cheongsam international communication. Designers of cheongsam should have to adapt to the style of a new generation of international women and try the best to include the international popular cultural elements in their design but not be content with staying where one is all. Since the reappearance of cheongsam in the 1980s, it has not recovered its former popularity because of less modification according to wearers' needs. The reason why Paris is thought of as the paradise for fashion designers throughout the world is just because of the endless stream of world-famous fashion designers. Chinese fashion started later than Paris, Italy, etc. Furthermore, Chinese cultural elements are very complex to design in clothing; if the design is not good enough, it is not easy for designers to be superstar, and dressing is difficult to attract people to wear in daily life. In addition, training a high-end fashion designer is very long-term and requires long-term planning funds and energy support. Many fashion designers will switch to other majors if they do not have good employment opportunities or development prospects after they finish their studies, which is seriously inconsistent with the ability to tell a good Chinese story in international communication.

Proper Name Translation

With the international spreading process of Chinese cheongsam, an increasing number of foreign people have begun to pay close attention to and enjoy traditional Chinese clothes (Chen Xianhong & Song Fazhi, 2019), but because of inappropriate spreading approaches and international discourse modes, the external spread of traditional Chinese clothing is still not sufficient. In particular, the translation of some terminologies is very important in the process of cheongsam's international communication, which is worth the communicator's thinking of how to regulate the translation discourse.

A. The Translation of Cheongsam Itself

There are several different translations of Chinese 旗袍: *cheongsam*, *Qipao*, *Qi Pao*, *Chipao*, *Chirpaur*, *Mandarin Gown*, and *Chinese dress*. Among the seven translations, the first five are derived from the transliteration of "长衫" and "旗袍" in Chinese, and the last two are explanatory translations based on the external characteristics of cheongsam. *Qipao*, *Chi-Pao*, *cheongsam*, and *Mandarin gown* can be found on page 1340 in the Chinese-English Dictionary of the New Century. *Qipao* and *Qi Pao* are transliterated according to the Chinese Pinyin scheme; *Chi-pao* and *Chirpaur* are derived from the Cantonese dialect pronunciation of "旗袍".

According to the statistics of Chinese scholars Peng Chaozhong and Rao Ping (2016), when searching the English translation of "旗袍" on Amazon, a well-known online shopping platform, there were various search

results. Not only could the English translation of the name not be unified, but even the pictures attached to the search results were not Chinese cheongsam. However, searching the English translation of cheongsam on CNKI (China National Knowledge Infrastructure), the situation is similar. Chinese scholars have not even made a unified transliteration of 旗袍 until now.

The lack of uniformity in the English translation of the name of Chinese cheongsam inevitably confuses the readership, which is obviously not conducive to the promotion of Chinese costume culture and runs counter to the concept of "telling the Chinese story" and "letting Chinese culture go global" advocated by China. To unify the English translation of Chinese cheongsam, Chinese disseminators should study the cultural connotation of clothing from the domestic and draw enough attention from academia (Peng Chaozhong & Rao Ping, 2016). To promote Chinese costume culture worldwide, Chinese people should not only be sensitive to the word "cheongsam" but also be able to quickly identify this traditional Chinese dress as cheongsam.

B. The translation of Cheongsam's Pankou

Cheongsam itself is a work of art with tailoring, sewing and patterns all having their own characteristics, which embody the essence of Chinese people's thoughts, wisdom and talents. Therefore, when attaching importance to the English translation name of cheongsam, one should not forget the English translation of its own elements.

Take *pankou* as an example. As one of the most representative elements of cheongsam, similar to "cheongsam", its English translation is not universally accepted by the public. In the article of *Qipao 2.0* published on August 12, 2012, in China Daily, *Frog button* is described as follows: Sometimes its ubiquitous skirt slit is nowhere to be found, and its customary front overlap and loop frog buttons do not actually come undone (Tiffany Tan, 2012); and in another article of *China catwalk* published on January 9, 2011, in China Daily, Pankou was mentioned as Mandarin collars and frog-buttons, Qipao-inspired body-hugging shifts; what's more, in the article of *Confucianism is more about way of life* written By Yao Ying on January 14, 2010, there is a sentence like this: In his crimson Tang suit with frog buttons, Kung looks more like a man from the late Qing Dynasty (Yao Ying, 2010). The frog button is used to refer to the *pankou*.

However, the transliteration method Pankou is becoming more common and acceptable and is still not regulated, but it greatly reduces some confusion in cheongsam's international communication. Therefore, in the future, it is necessary to standardize some terminologies for greater efficiency of traditional cultural out-spreading.

Cultural Characteristics Implied in Cheongsam

The way for cheongsam to be an internationally renowned fashion is to pay more attention to propagating the culture of cheongsam, not only the patterns and quality. The international communication of cheongsam must be based on well-telling Chinese traditional stories and thoughts, which can make cheongsam accepted by other countries' people. In particular, modern cheongsam usually has its own traditional auspicious Chinese symbols and stories with profound imagery.

As the world's second largest economy, China's history, culture and economy have largely attracted the world's interest. China is a country with its own distinct national cultural characteristics. From ancient times to the present, Chinese culture of Confucius and Mencius, *Four Books* and *Five Classics*, as well as the 56 nationalities of China's own national culture, and the vast regional culture of the earth have made Chinese culture well-known in the world.

Similar to other countries' clothing culture, China's clothing culture has its own national characteristics compared with the world's clothing culture, especially with the clothing culture in Europe and the United States, but China's traditional classic cheongsam is not as popular as famous international clothing brands. Therefore, it is necessary for Chinese designers and managers to learn from those successful brands in the world (Guan Yin & Xue Yanwei, 2009), such as Nike and other big names, for their approaches of development, costume culture, business ideas and models. Chinese clothing culture is diverse, and China has more formed national costumes, such as cheongsam, Hanfu, and Zhongshan suit, which are the most prominent embodiments of traditional Chinese clothing, but these Chinese clothing brands to the world are a minority. Looking around the world, there are many major internationally renowned clothing brands, such as Chanel, Louis Vuitton, Dior, Versace, and Prada. However, Chinese fashion brands that are popular in the world can be counted on one's fingers. Of course, the Chinese sports brand Li Ning, with the mission of "igniting passion with sports", has been one of the biggest sponsors of Chinese athletes' clothing in the Olympic Games for many years and has gradually become known by the world, showing the spirit of Chinese athletes who are striving for glory for their country.

Therefore, in the international communication of Chinese cheongsam, it is worth learning from the development of the Lin Ning brand. In some momentous occasions, such as international gatherings such as toasts, award ceremonies, world sporting events, etc. hosted by China, female officials, hostess, lecturers, ceremony attendants, and ritual girls can choose to dress cheongsam as a type of "uniform", which is helpful to circulate or diffuse Chinese cheongsam, making it known to the world people and letting foreigners experience the implied Chinese cultural elements. However, although some Chinese clothing brands with ethnic styles and modernity have caught the attention of Hollywood celebrities, and Nicolas Cage, Angelina Jolie, Keanu Reeves, Naomi Campbell and Kate Moss, which are all big fans of Shanghai Tang's chic Chinese style (Gan Tian, 2011), and what's more, an increasing number of famous people or foreigner officials make their appearances on clothes rooted in Chinese culture and history, the case is that most of the suit is not designed by Chinese local designers. Traditional Chinese cultural characteristics have not been actively explored and fully shown to the world. To tell the Chinese story well, the most important thing is based on Chinese cultural self-confidence, making their own national clothing brands with the most cultural characteristics. Therefore, it is very important to integrate Chinese cultural characteristics into the cheongsam brand to establish its international brand and reputation.

Approaches And Methodologies In Communicating Chinese Costume Culture

There are various cultural elements in China's traditional costume. In the process of telling Chinese stories well through the Chinese costume's international spread, it cannot pay too much attention to the approaches and

methodologies in the international communication of Chinese costumes.

A. Cultural Communication Through Films and Television Works

In fact, there are few traditional Chinese costumes, such as cheongsam, appearing in film and television works, which is not conducive to the spread of traditional Chinese costume culture. It is true that there are some films such as the movie *Lust and Caution* (adapted from Zhang Ailing's novel of *Love after Love*) directed by Ang Lee, in which the Qipao worn by Wang Jiazhi, the heroine, is similar to the original description in the novel: The indigo blue, water-soaked texture and satin cheongsam with knee-length, pared with small rounded collar which is only half an inch high, looks like a Western-style clothes, which shows the beauty of Chinese cheongsam for the audience. The intoxicating beauty, aptly reflecting the beauty in the bone also in the skin, plucks the audience's heartstrings, showing the charm of Chinese cheongsam.

Another Chinese movie, *Mood for Love*, is also a classical movie that includes 23 pieces of cheongsam worn by Maggie Cheung (Zhang Manyu, a famous Hong Kong female artist). Beautiful scenes of the costume in the movie show us the beauty of the Shanghai-style cheongsam, and the style of cheongsam varies, making people marvelous at the charm of cheongsam. The knee-high style of cheongsam in the movie is the fruit of the development of Shanghai-style cheongsam in Hong Kong for years, and the colors of cheongsam are very popular in Hong Kong at that time, rather than the classic Shanghai cheongsam look (Anonymity, 2012). There are other more female roles in Chinese films and television works, whose portrayals with the clothes of cheongsam are photographed, such as Ni Ni in *The Flowers Of War* and Jing Tian in *Rattan*, both of which are from the Chinese mainland. The stage photos of the two female protagonists with cheongsam deeply impressed the audience. It quickly became people's dinner-party material in the world in 2021. The variety of styles of cheongsam makes audiences immersed in the miracle of Chinese cheongsam culture when they appreciate the storyline of the film. Chinese films with traditional cheongsam show the world the great beauty of Chinese costume culture, which is also a kind of national cultural confidence that can greatly enhance the international popularity of cheongsam.

Therefore, the excellent output of film and television works plays a very important role in the international communication of Chinese cheongsam culture. Of course, during the course, apt subtitle translation is necessary and cannot overemphasize too much, which actually does good to the popularity of Chinese traditional culture and which requires translators' strong bilingual ability and subjective initiative. Translators' professional knowledge matching to the corresponding field must be addressed, and Chinese traditional culture conveyed in the film subtitles must never be overlooked in the course of translation.

B. Cultural Communication Through Exhibitions

With the rapid development of China's economy and the deepening of China's reform and opening up, the Chinese people are increasingly confident in their national culture, and the contribution of Chinese culture to the

world is firmly believed by Chinese and world cultural circles. It is important to re-understand and spread the charm of traditional Chinese costume cheongsam as people's daily cultural life has become increasingly rich and colorful. After numerous improvements in Chinese costume, Cheongsam has become a daily wear for Chinese females and is no longer only dressed on various important occasions. Moreover, as Chinese clothing such as Tang suits and Han clothes go global, an increasing number of people outside China have begun to notice the beauty of cheongsam.

It is well known that clothing exhibits at the major fashion weeks in the world are the most important chances for any brands of clothes going abroad. In recent years, Chinese creations on fashion have constantly gained increasing attention from the world, and under the efforts of local Chinese fashion designers, through blending with international costume development trends and continuous improvement, the costume with Chinese cultural elements has become the highlight of many fashion shows. The gradual attention of Tang suits and Han clothes gained in the West is proof of this.

Therefore, China should actively and frequently take part in all kinds of large-scale fashion exhibitions constantly carried out, showing cheongsam to the world and letting many more foreigners perceive the beauty of cheongsam. Of course, for its domestic fashion weeks, cheongsam shows are also important, as they can help citizens better understand the charm and cultural elements of Chinese cheongsam, strengthening their national costume cultural confidence. Participating in exhibitions held at home and abroad benefits local designers keeping up with the times and close to the audience's aesthetic needs, encouraging local designers to have an overall consideration of the design of the lapel, collar, sleeves, skirt and other parts of cheongsam for people's attention and acceptance, thus continuously improving the style and pattern of cheongsam by absorbing the exotic atmosphere, taking as many opportunities and possibilities as it can to make cheongsam known to all over the world.

C. Cultural Communication in Confucius Institutes in the World

Confucius Institutes, from their statutes, are not only educational institutions for teaching and promoting Chinese language to foreign countries but also an important channel for Chinese cultural communication and exchange with foreign countries. In the process of intercultural communication, the key point is to find cultural common ground and universal values and to further expand the space for sharing meanings. Any cultural "exclusivity" is undesirable (Yu Yibing & Zhang Yelin, 2021).

Many studies have shown that the establishment of Confucius Institutes plays a crucial role in spreading Chinese culture, including Chinese paper-cut culture, Chinese opera culture, Chinese tea culture and other traditional Chinese culture, such as Chinese traditional ideas of "precious harmony", "harmony in diversity" and "the unity of heaven and man", which have spread widely and left a deep impression on other countries' people. Confucius Institutes, as an important cultural bridge between the East and the West, have made many contributions to traditional Chinese culture and have attracted an increasing number of people around the world

to take a keen interest in Chinese traditional culture. In view of the great influence of Confucius Institutes, it is practicable to augment the varieties of the content on Chinese costumes. By carrying out some clothing handmade activities, in the practice course of cutting, sewing, pattern designing and the presentation of final works, students from different countries can experience the infinite charm of traditional Chinese costume production technology and the traditional Chinese costume cultural elements considered. In addition, the variety performance and fashion show in the Confucius Institute are also important forms of blending traditional Chinese costume culture with other countries' costume cultural quintessence in harmony, and comparable with exotic dress, Chinese cheongsam can take full advantage of the opportunity to be aware of its own strengths and weaknesses for future improvement and dissemination. Undoubtedly, the display of Chinese cheongsam at the Confucius Institute is the most favorable way of external communication because the various forms of cheongsam on students can make audiences possess an intuitive and profound sense of what cheongsam is, especially the intellectuality and the grace reflected from the women with cheongsam.

D. Cultural Communication in the Belt and Road Initiative

The Belt and Road Initiative proposed by China is based on the principles of achieving shared growth through discussion and collaboration. The promotion of cultural and educational exchanges is also a very important part of this process. Chinese Cheongsam is one of the outstanding representatives of traditional Chinese culture. The aim of the Belt and Road Initiative is to establish a community of common interests, destiny and responsibility, featuring political mutual trust, economic integration and cultural inclusiveness.

In today's world, where all cultures are thriving, it is urgent and important for China's excellent traditional costume culture to go to the world and make more people outside accept it. Chinese cheongsam culture, as a very magnificent part of Chinese traditional culture, deserves to be considered in China's international communication. Chinese costume culture has been developed for thousands of years, and it has spread to the countries along the Belt and Road from the past to the present and has been gradually loved by people around the world, which can be proven from the celebrations in various countries for China's Lunar Spring Festival. During the celebration, whether the people on the streets are Chinese or not, the majority of them are on Tang suits or Han clothes.

E. Cultural communication in other new communication environments

With the booming development of the international e-commerce industry, people are increasingly inclined to shop online. In the age of the internet, thanks to the speed and accuracy of information exchange, many of China's national costume brands come to the fore. As mentioned above, the brands of Tang suit, Han clothes and Li Ning have been known for the whole world. Therefore, through various online introductions and fashion shows, Chinese Cheongsam should keep up with the new tide of internet shopping to establish its own international brand. From clothing design, the way to the output, the costume culture of Cheongsam with Chinese traditional cultural characteristics to the details of Chinese costume button culture, the types of collar,

sleeve, and hem, cardigan and clipping, reveal the fine workmanship and the profound historical and cultural deposits. The fusion of tradition and modernity, the intersection of ideal and reality, will collision different sparks on the net. China has attached great importance to clothing culture since ancient times. The design concept of Chinese fashion trends is to integrate traditional Chinese culture into clothing and promote it to the world. Now, similar to the fashion tide in America and Japan, China has formed its own national fashion tide, which is a kind of dressing phenomenon on the basis of brand image and national culture. Jean Baudrillard (1929-2007), a French master of modern social thought, once said in his book *Consumer Society* published in China Social Sciences Press in 1970 that consumption has transformed from an economic concept to the concept of culture in modern society. As we all know, culture not only inspires the resonance of many individuals but also makes the brand more symbolic, so the definition of national tide should be considered from the following two sides. First, the core of the brand is whether it can possess traditional cultural elements, and second, whether it can blend the traditional culture with the current cultural trend, making the brand more fashionable. From the above analysis, Chinese cheongsam in the era of e-commerce should pay more attention to its own national cultural elements, and only the design of cheongsam on the basis of the Chinese nation and the soul of Chinese culture can it become popular all over the world.

For the international communication of Chinese cheongsam, during some major international occasions, the dress of Chinese cheongsam for female senior national officials or the wives of Chinese centre government leaders will certainly have the most valuable link to communication. Sometimes, it will lead to a new fashion trend of clothing in the world. The beauty of independence and elegance of Chinese women will impress the whole world. Naturally, Chinese cheongsam will immediately become an international fad.

The appeal for international discourse power always follows the country's might. One country's discourse power in the world is not automatically generated and depends on many other approaches except for the country's strong economic base. For example, to better promote Chinese cheongsam to the world, cooperation for Chinese publishing houses with the responsibility of outspreading Chinese traditional culture with foreign authoritative publishing houses is inevitable; that is, it is necessary to externally spread Chinese costume culture through Sino-foreign cooperation. To publish books about Chinese cheongsam culture in foreign countries requires translators with solid knowledge and expertise who should have a deep understanding of Chinese costume culture and should have the ability to use the second language. Therefore, it is necessary to cooperate with foreign local experts to ensure that the translation conforms to the local culture of the target language while preserving the national characteristics of Chinese cheongsam culture. Cooperation with well-known foreign publishers was mentioned by Xie Tianzhen (1944-2020) in the book *Invisibility and Presence: From Traditional Translation Theory to Modern Translation Theory*, which used to be ignored by Chinese local translators for fear of losing discourse power. It is the case that the opinions in books published by authoritative foreign publishing houses are much easier for local readers to accept. Therefore, it is a judicious decision to choose a more authoritative foreign publishing house to greatly increase the impact and acceptability of Chinese costume culture (Tiffany Tan, 2012) in the international communication of Chinese cheongsam.

Conclusion

The international communication of China's traditional cheongsam culture is for the needs of cultural discourse power brought by the rapid development of China's economy. The approaches and methodologies of Chinese traditional costume cultural international communication can promote China's costume's international discourse, which can be helpful to China's international discourse power in the other fields except for in the field of economy, and which can promote China's impact in major international events. Therefore, for any country that wants to enhance its international standing, it is important to seize no matter how small the chance is to spread its own traditional culture.

The international communication of Chinese culture shows the spiritual core of the Chinese people. In today's world of globalization, which is full of conflicts and inclusions, the spreading of Chinese colorful traditional culture contained in cheongsam, such as the ideas of harmony, people-orientation, peace, responsibility and obligation, which have been given new connotation with the change of the times, will promote the continuous progress of world culture, bringing warmth and a new light to the people all over the world.

With the continuous improvement of Chinese hard and soft power, an increasing number of foreigners have become interested in Chinese culture and gradually have an in-depth understanding and understanding of Chinese traditional cultural connotations. Therefore, the international communication of Chinese costume culture is in line with the times and world people's expectations.

Students' Mathematics Problem Solving Skills between Full-Online Learning and Hybrid Learning in Statistics Course

Tanti Listiani

Universitas Pelita Harapan, Indonesia,  <https://orcid.org/0000-0003-2170-3680>

Abstract: Learning loss due to online learning has caused students to experience a decrease in their ability to solve mathematical problems. One of the declines in students' mathematical problem-solving skills occurred in the statistics course. Statistics as a branch of mathematics has an important role in training students' skills in processing and analyzing data. The low ability of students to solve mathematical problems became a serious problem. So we need an appropriate learning model to overcome these problems. One of the learning models that can be used is hybrid learning. The subject of this study was the primary student study program from the Faculty of Education at UPH in Indonesia, with 110 samples divided into 54 control groups and 56 experimental groups. The control class was treated with full online learning, while the experimental class used hybrid learning. This research aimed to compare which type of learning is more effective, full-online or hybrid learning. The research method used in this study is quasi-experimental. Data were processed using SPSS, called the normality test with Shapiro-Wilk, and statistical tests using Mann-Whitney. The results showed that hybrid learning was more effective than full online learning.

Keywords: Student's Mathematics Problem Solving Skills, Full-Online Learning, Hybrid Learning, Statistics Course, Learning Loss.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1277-1287), Cappadocia, Turkiye. ISTES Organization.

Introduction

Statistics is a science commonly used to collect, process (analyze), and conclude data in the form of numbers (Yulianti et al., 2022). At UPH FIP, students usually take statistics courses with the hope that they will equip them with practice skills in collecting data, analyzing it, and drawing conclusions. Statistics is an important subject to study because it contains many things related to everyday life (Nisa & Setianingsih, 2019). Of course, prospective teachers and researchers can also feel the benefits of statistics, such as when presenting data, processing data, analyzing data, and concluding the data.

Since understanding statistics is essential, prospective teacher students at UPH FIP are required to take this

course. However, issues arise when students attempt to solve various statistical problems. Students are often confused when they finish problems that differ from the examples. It shows that students have low mathematical problem-solving abilities. Problems also arise when students work on mini-research projects. They often do not work according to the stages taught, while statistics require systematic work according to the stages that have been taught. Low problem-solving abilities can impact student learning outcomes (Endah et al., 2019). Students need to have mathematical problem-solving skills. When solving mathematical problems, it is demonstrated that many students are still oriented toward the final result (Resmiati & Hamdan, 2019). When solving problems, people tend to directly use memorized formulas without systematically describing the solution. The low ability to solve mathematical problems can also be shown by procedural errors, where the error does not pay attention to the steps of solving the problem and does not consider the process of solving the problem important because it feels that several solving steps are not needed to be explained completely and systematically (Ruswati et al., 2018).

Difficulties in solving mathematical problems can also be seen when given problems in the form of word problems, the difficulty encountered is modeling in the mathematical form, which results in difficulty in determining formulas. Even the most important thing in problem-solving is how to change the mindset so that you can analyze what concepts are contained in the problem, and think about the steps for solving it so that it can then be poured into the form of ideas or mathematical symbols, and then the solution can be determined step by step (Senjayawati, 2015). The problems of UPH FIP students were also seen when determining hypotheses, they often did not write them down because they were deemed unnecessary, and students preferred to determine formulas without following the stages of statistical research.

Students need to have the ability to solve mathematical problems because this ability is needed to develop students' cognitive abilities (Rahmwati et al., 2022). Problem-solving is the basis for honing higher-order thinking skills, which aim to explore students' skills, innovation, and knowledge in solving a problem (Arigiyati & Istiqomah, 2016). Students become unfamiliar with new types of questions as a result of a learning process that does not emphasize problem-solving questions; they will find it difficult and confusing to answer questions that, in the end, answer questions at random (Adhyan & Sutirna, 2022). Such student habits can result in low mathematical problem-solving abilities, even though problem-solving abilities are the basic goal of learning mathematics (Sumartini, 2016).

Statistics is a branch of mathematics, while mathematics requires problem-solving skills. Problems arise because of possible learning loss in students. Learning loss occurs among students and is a serious problem (Patrinis & Donnelly, 2021; Puslitjak, 2021). Learning loss can be seen in the lack of students' mathematical problem-solving abilities. Learning loss conditions can occur for two reasons, due to long holidays and because learning that is normally carried out is changed using a new system (Lim et al., 2022). Thankfully, towards the middle of this year, the delta variant virus mutated into the omicron variant, and this omicron variant has reduced cases of death (NEJM, 2022).

Knowing that the ability to solve mathematical problems is important for students to have, the best solution is needed. Grateful that the current conditions have improved. So that learning, which was originally carried out in full online, can be adapted to a better method. One method that can be used is hybrid learning. Hybrid learning is a learning method that is the best choice today (Ganovia et al., 2022; Gleason & Greenhow, 2017). The use of hybrid learning is said to have a positive impact on learning. Through this learning, students can feel the relationship with lecturers and friends directly, even though some parts are still carried out online. The results of the study suggest that learning that is carried out in full online is less effective due to the lack of facilities and infrastructure and the unpreparedness of technology education (Dwi et al., 2020). In this study, we will see a comparison of full-online learning with hybrid learning on students' mathematical problem-solving abilities. The aim is to see which learning method is more effectively used to overcome students' mathematical problem-solving problems. The question posed by this research is whether the use of hybrid learning is more effective than full online learning.

Method

The research method used is quasi-experimental research with non-parametric statistics, where the control class used is the class that is taught in full-online learning while the experimental class is subjected to hybrid learning. A quasi-experimental design is a form of experimental design developed from a true experimental design. This design has a control group, but cannot fully control external variables that affect the implementation of the experiment (Sugiyono, 2010). The subjects of this study were students of the Faculty of Education who took statistics courses. The data analysis technique used was a test using the same scoring rubric but different treatments for the two class groups. The test was carried out using SPSS by testing the normality and homogeneity of the data. If the normality test shows that the data is normally distributed, then the independent t-test can be used. However, if the data is not normal, a Mann-Whitney test can be used. The students who were respondents were students in the elementary school teacher education study program's classes of 2019 and 2020. The class of 2019 consisted of 54 students, while the class of 2020 consisted of 56 students. The research design used was the post-test-only control group design. The post-test-only control group design scheme is shown in Table 1 as follows. According to (Sugiyono, 2014), the research design can be described in the following scheme:

Tabel 1. Post-test-only Control Group Design

Subject	Treatment	Result
Control Group	Full-Online Learning	Posttest (O_1)
Experiment Group	Hybrid Learning	Posttest (O_2)

Results

Statistics learning was completed in 16 meetings, with details of 14 learning processes and two examination

meetings. This research was done for two classes that were treated with online learning and hybrid learning. The materials covered several topics, including learning about measurement scales, data distribution, hypothesis testing, one-sample t-tests, two-sample t-tests, and mini-research projects. Students in the 2019 class are treated to full-time online learning. Because of this, conditions in Indonesia were still constrained to face-to-face learning. This is due to the spread of the COVID-19 virus, which has claimed many deaths. Meanwhile, for students in Class 2020, learning is carried out in a hybrid learning. Learning is carried out in a hybrid manner because conditions in Indonesia have improved due to the COVID-19 virus and because face-to-face and online learning can be combined.

At each meeting, the lecturer gives a test to check the student's ability after studying the material. Additionally, check students' mathematical problem-solving abilities on topics in statistics. The test is structured based on indicators of students' mathematical solving abilities based on Polya's steps. According to Polya, there are four indicators for solving mathematical problems, including understanding the problem, planning a solution, solving the problem according to plan, and checking again (Polya, 1973). This research was based on these four indicators, and the test was given to students as a reference. To see students' mathematical problem-solving abilities, test results are used, which will then be compared based on the topics in the statistics course.

Data from the test results were collected and then recapitulated according to the existing topics. Furthermore, the test scores of students' mathematical problem-solving abilities were processed using inferential statistics. The test results were tested for normality using SPSS, and if they were not normal, they were continued using the Mann-Whitney test. The following are the results of the normality test using the Shapiro-Wilk method:

Table 2. Test of Normality with Shapiro-Wilk

No.	Topic	Tests of Normality with Shapiro-Wilk			
		Control Group		Experiment Group	
		Sig.	Result	Sig.	Result
1	Scale Measurement	<.001	Not Normal	<.001	Not Normal
2	Data Interpretation	<.001	Not Normal	<.001	Not Normal
3	Measure of Dispersion	<.001	Not Normal	0.02	Not Normal
4	Hypothesis Test	0.098	Normal	0.02	Not Normal
5	One Sample t-test	<.001	Not Normal	<.001	Not Normal
6	Independent two-sample t-test	0.001	Not Normal	<.001	Not Normal
7	Dependent t-test	<.001	Not Normal	<.001	Not Normal
8	Mini Research Project	<.001	Not Normal	0.016	Not Normal

Based on Table 2, only the hypothetical test topics in the control group were normally distributed. Other topics in the control and experimental groups are not distributed normally. Because most of the data is not normally distributed, the tests are conducted using non-parametric statistics. The non-parametric statistic used to compare the data of the two samples is Mann-Whitney. The following are test results using Mann-Whitney:

Regarding the presentation of the data and the dependent t-test, Table 3 demonstrates that there is no difference between the experimental class and the control class. For other topics, there is a difference in the average value.

From the average value obtained, criteria for mathematical problem-solving skills of students can also be determined (Japa, 2008). This criteria can be seen in Table 4.

Table 3. Mann-Whitney U Test Results

No.	Topics	Mann-Whitney Test					Result
		Mann-Whitney U	Wilcoxon W	Z	Asymp. Sig (2-tailed)	p-value	
1	Scale Measurement	610.000	2150.000	-5.136	<0.001	<0.05	There is a difference
2	Data Interpretation	1171.500	2711.000	-1.833	0.067	>0.05	No difference
3	Measure of Dispersion	998.000	2594.000	-2.555	0.011	<0.05	There is a difference
4	Hypothesis Test	1029.000	2254.000	-2.085	0.037	<0.05	There is a difference
5	One Sample t-test	736.000	2114.000	-4.369	<0.001	<0.05	There is a difference
6	Independent two-sample t-test	920.500	2246.500	-2.697	0.007	<0.05	There is a difference
7	Dependent t-test	1091.000	2172.000	-0.272	0.786	>0.05	No difference
8	Mini Research Project	1001.000	2771.000	-3.406	<0.001	<0.05	There is a difference

Table 4. Criteria of Test Result

Score	Criteria
85,00-100	Very good
70,00-84,99	Good
55,00-69,99	Average
40,00-54,99	Less
0-39,99	Very less

Table 5 displays the mean difference between the experimental group and the control group.

Table 5. Differences in Means between the Control Group and the Experiment Group

No.	Topics	Mean			Information
		Control Group	Criteria	Experiment Group	
1	Scale Measurement	86.42	Very good	97.01	Control < Experiment
2	Data Interpretation	88.17	Very good	81.32	Control > Experiment
3	Measure of Dispersion	81.25	Good	73.26	Control > Experiment
4	Hypothesis Test	73.47	Good	79.46	Control < Experiment
5	One Sample t-test	77.69	Good	91.92	Control < Experiment
6	Independent two-sample t-test	71.79	Good	81.84	Control < Experiment
7	Dependent t-test	83.04	Good	82.96	Control > Experiment
8	Mini Research Project	84.50	Good	79.75	Control > Experiment

In Table 5, it can be seen that the mean value of students' mathematical solving abilities in the control group is higher than that in the experimental group on the topics of data presentation, dependent t-test, and mini research project. Other topics showed a higher average value for the experimental group than the control group. When compared to Table 3, the Mann-Whitney test on the topic of data presentation and the topic of the dependent t-test showed no significant difference. So even though there is a difference in the average, statistical tests show no difference in values between the control and experimental groups. From Table 5, it is presented in the form of a diagram as follows:

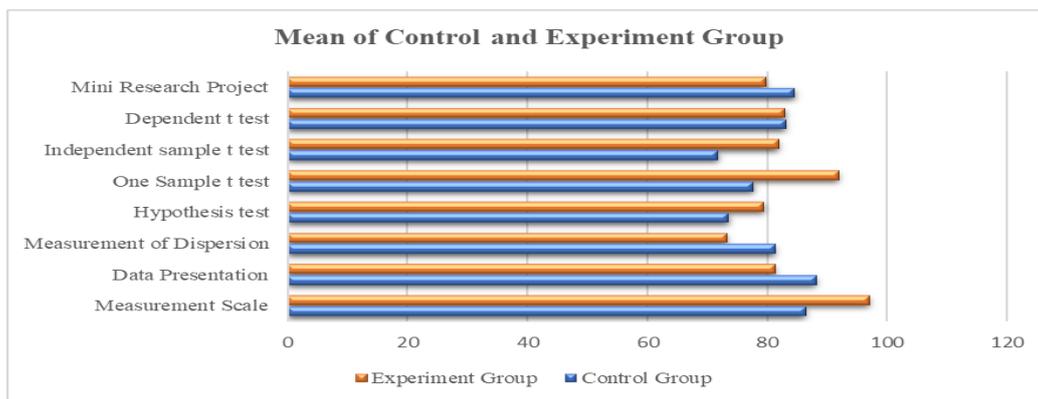

Diagram 1. Comparison of the average Control Group and Experiment Group

Discussion

Comparative testing for the eight topics that were assessed resulted in a variety of findings, which is apparent from the explanation above. The normality test itself indicates that the majority of the data are not dispersed normally. The test is carried through a non-parametric statistical test because the data are not normally distributed. The Mann-Whitney U test is the comparison tool utilized for abnormal data.

The results and the Mann-Whitney U test indicate that there are six topics with a distinct average and two topics where there is a non-significant difference in the average. The two topics that were not significantly different were the topic of presenting statistical data and the dependent t-test. Meanwhile, the 6 topics that differed significantly were: measurement scale, size of data distribution, hypothesis testing, one sample t-test, independent t-test, and mini research project.

On the topic of measurement scales, the average for the control group (full-online learning) was 86.42, while the experimental group (hybrid learning) obtained an average of 97.01. The outcomes of the Mann-Whitney U test reveal that there are variations in how much value individuals place on their capacity to solve mathematical problems related to measurement scales. Students in hybrid learning courses demonstrate superior mathematical problem-solving skills compared to those in fully online courses.

Topic of data presentation, the average value using full-online learning was 88.17, while classes using hybrid

learning obtained an average of 81.32. Data showed that there was no difference in the value of mathematical problem-solving abilities. On the topic of data presentation, classes that used full-online learning better than hybrid learning.

Topic of measurement of dispersion, the average value using full online learning was 81.23, while classes using hybrid learning obtained an average of 73.26. Data showed that there were differences on the topic of measurement of dispersion. Classes that use full-online learning showed better than hybrid learning.

On the topic of hypothesis-test, the average value using full-online learning was 73.47, while classes using hybrid learning had an average of 79.46. Data showed that there were differences. Classes that use full-online learning showed that students' mathematical problem-solving abilities are smaller than those of students who use hybrid learning.

On the one sample t-test topic, the average value using full-online learning was 77.69, while classes using hybrid learning obtained an average of 91.92. Data shows that there are differences on this topic. Classes that use full online learning showed smaller than hybrid learning.

On the topic of the independent two-sample t-test, the average value using full online learning was 71.79, while classes using hybrid learning obtained an average of 81.84. Data shows that there are differences value in this topic. Classes that use full-online learning showed smaller than hybrid learning.

On the dependent t-test topic, the average value of full-online learning was 83.04, while the class using hybrid learning had an average of 82.96. Data showed that there was no difference value on the topic of dependent t-test topic. Although the average for full-online learning is slightly higher than hybrid learning.

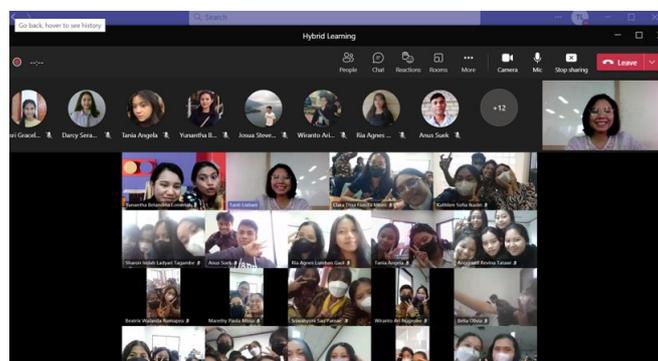

In the mini-research project topic, the average value using full-online learning was 84.5, while classes using hybrid learning obtained an average of 79.75. Data shows that there are differences in the value on the topic of mini-research project. Classes that use full-online learning show greater than hybrid learning.

From the explanation above, it can be seen that of the 8 existing topics, 2 topics have no difference using either hybrid learning or full-online learning. The topics in question are the topic of data presentation and the topic of the dependent t-test. Six other topics showed differences, on the topic of data distribution size and the topic of mini research projects, the value of students' mathematical problem-solving abilities showed better scores with full online learning compared to hybrid learning. Differences were also shown in 4 topics, including the topic of measurement scales, hypothesis-test, one-sample t-tests, and independent sample t-tests. On these topics, students' mathematical problem-solving abilities are better when using hybrid learning than full online learning. So it can be concluded that 2 topics have no differences, 2 topics have differences but were better with full online learning, and 4 topics have differences but hybrid learning shows better results compared to full-online learning. Here, the use of hybrid learning dominates. According to research conducted by (Alsowat, 2022;

Thamrin et al., 2022) hybrid learning provides many advantages. Hybrid learning makes learning more effective because lecturers and students can discuss directly (Rahmat, 2022). Students can also collaborate more easily and minimize mis-communication (Yang et al., 2022).

Even though full-online learning also provides many advantages, students feel bored if they can only stare at the monitor (Gumasing et al., 2022; Nafiah et al., 2021). Full-online learning has weaknesses (Arifuddin et al., 2021; Maulida & Akmal, 2021), including students experiencing a learning loss (Engzell et al., 2021). They were bored because they could stare at the computer screen all day. They felt disturbed by the condition of the surrounding environment. There are limited devices for synchronous and asynchronous sessions. There is the possibility of cheating during exams because lecturers cannot directly supervise the implementation of quizzes or tests. Students are limited to their internet quota. Students really rely on the device, whether the device is slow or not updated with the times. Hybrid learning provides a new color for primary students study program. Students showed an enthusiastic response because they could discuss directly with the lecturer and work on group assignments with their friends. Even though there is a fear of being exposed to the COVID-19 virus, the mandatory vaccine regulated by the state has reduced the serious symptoms of the COVID-19 virus.

Hybrid learning gives a more interesting impression to students. Hybrid learning combines online and traditional learning by taking more effective steps so that learning becomes more meaningful. Even though students save time by undergoing full online learning, they can meet directly with their colleagues during face-to-face sessions in hybrid learning. The following is an example of how hybrid learning is carried out.

Picture 1. Hybrid Learning Photo

In almost every meeting, some students do not attend because they must isolate due to exposure to COVID-19. Of course, this can harm other colleagues who do not have good body immunity. Hybrid learning provides an interesting learning experience for lecturers as teachers and provides many benefits for students.

Conclusion

The results of the study show that the topics taught in statistics courses yield better average scores when using hybrid learning than full-online learning. So, it can be concluded that hybrid learning is more effective than full-online learning. This research still has many weaknesses because it does not explain each indicator of problem-

solving ability. However, researchers will try to make subsequent articles that discuss each indicator on each topic taught in this statistics course in more detail. Full-online learning has its own advantages and disadvantages. Instead of replacing in-person instruction, online learning serves as a tool that instructors and students can use to supplement it. By utilizing both learning environments, the hybrid learning method can be a solution for students who need to learn as much as possible. With this method, students can enhance their knowledge and access tools, which will enhance their learning.

Abstract: Learning Analytics (LA) captures the digital footprint of students' online learning activity. This study describes students' navigational behavior in an e-learning setting by processing the LA data obtained from Blackboard LMS. This is an attempt to understand the navigational behavior of students and the relationship with learning performance. The study was carried out with 88 learners from a Malaysian private university. The course sites' log data and students' performance were analyzed, and the results were as follows: 4 navigational behaviors played an important role in student's academic performance which are active days, total learning time, number of views, and days delayed in accessing the assessment. Active learning from Tuesdays to Thursdays had a significant positive effect on performance. It was found that the higher activities (total learning time, number of journals viewing) translate to better performance. Days delayed in attempting assessments had a significant but mixed effect on performance, depending on the type of assessment. However, the number of logins is insignificant. The findings of this study provide empirical evidence of the importance of self-discipline in online learning and provide instructors with a predictive measure as a call for early intervention to help online students.

Introduction

The Sustainable Goal (SGD4) on quality education aims to ensure inclusivity and lifelong learning which can be achieved through distance education or e-learning. Learners can gain education anytime and anywhere, hence promoting inclusivity such that no one is left behind even in adverse situations. It also creates a society of lifelong learning as learning accessibility is easier allowing self-paced and self-directed students learning.

Although recognized for the flexibility of learning anytime and anywhere without the limitation of space and time, e-learning became the central and only mode possible when COVID-19 hit. During this period, with the sudden shift from the traditional setting to e-learning, academicians were faced with the complexity of teaching students who are not physically present. Contradicting the traditional face-to-face classroom setting, the virtual classroom or self-directed e-learning setting would not allow instructors to observe the non-verbal cues, especially through students' facial expressions as well as in-class work to determine if students can grasp the concept being taught. Instructors are also not able to move around the classroom to check on the solutions on students' worksheets and identify the mistakes for instant feedback. In an online setting, these non-verbal cues take place behind the screen, which leaves instructors to just assume that students are coping with the topics taught. To better understand students learning and engagement in an online setting, Learning Analytics (LA) on students' digital footprints is crucial. The Horizon report (2011) defines learning analytics as, 'the interpretation of a wide range of data produced by and gathered on behalf of students to assess academic progress, predict future performance, and spot potential issues.'. The learner's data is collected from the technologically rich learning management system (LMS) that carries the answer for online instructors to investigate pedagogy and instructional design statistically (Grant, 2012; Li & Tsai, 2017; Lockyer & Dawson, 2011; Macfayden and Dawson, 2010; Zhong, 2017) and provide the learning support at the right time (Lockyer, Heathcote & Dawson, 2013; Zhong, 2017).

The usage of various Learning Management Systems (LMS) increased post-pandemic as it was the heavily utilized mode to teach and communicate with students (Duin & Tham, 2020). The Blackboard LMS is among the popular LMS employed to engage with students for the delivery of subjects, interaction with peers, submit coursework, and even conduct the final exams. The Blackboard LMS has a statistic tracking option and stores data that is rich in information to understand the learners' learning type and predict the learners' progress (Kim et al., 2016; Macfayden & Dawson, 2012). The statistic tracking creates a record of the digital footprint in the LMS containing potentially valuable information on learner's login times, items accessed, and the number of times accessed (eg Cerezo et al., 2016; Chatti et al., 2012; Kim et al., 2016; Papamitsiou & Economides, 2014; Seo, Kim, & Ju, 2021; Zhang, 2016; Zhong, 2017).

In the last decade, before the pandemic, some studies attempted to investigate students' engagement with various LMS and the links to the grades. Spivey and Macmillan (2013) examined the relationship between remote learning students' efforts measured by the frequency of access on students' performance and found a

positive relationship. Li and Tsai (2017) studied the navigational behavior of 59 students in a computer science program and found that those who invested time viewing the online learning materials gained significantly higher examination scores. The navigational behaviors were clustered into the Consistent Use Group and Less Use Group based on statistical quantifiers. Mwalumbe and Mtebe (2017) used various measures (discussion posts, peer interaction, time spent on LMS, number of downloads, login frequency) to investigate the impact of students learning. It was found that time spent in the LMS, number of downloads, and login frequency were found to have no significant impact on students' learning performance. Edwards et al. (2009) investigated the timely access of assignments by 1101 programming students and their impact on their performance. It was found that students who scored at least a B did not delay in attempting the assignment as compared to those who scored C and below. Fenwick et al (2009) also used the same measure which was the days delayed in accessing assignments found that students who earned better grades were those who started two or more days prior to the date. A mixed effect is found using this measure as Murphy et al. (2009) investigated 21 programming assignments and concluded that those who spent lesser time produced better quality assignments. Notably these studies provided a good contribution on the importance of learning analytics prior to the pandemic.

A study done by Zhang, Ghandour & Shestak (2020) analyzing the activity logs on Moodle LMS showed that higher grades is linked to higher logins. Darko (2021) investigated the average time spent by 69 Engineering students in two separate pathways in a semester and over 3 years on BB. The first pathway was a general survey to obtain informed data on ways students engage in their study and the second pathway is using the number of logs made on the BB. Using the Simple Moving Average (SMA), and Product Moment Correlation, the study provides evidence similar to the constructivism learning theory that the increase in BB engagement, the more construct knowledge is developed. Kadoić and Oreški (2021) used data analytics during COVID for YouTube on Moodle LMS and found that students' success is influenced by total views, the number of views in different time segments, and the number of downloads. Summers, Higson & Moores (2022) used library checkout and attendance to investigate the comparison of pre-peri-pandemic learning engagement. Other studies linking online learning navigation and performance were done using specific course programs, select groups, and specific time frames (Cerezo et al., 2016; Romero & Ventura, 2010). The impact of the usage of data analytics during Covid and post-Covid has not been widely explored quantitatively although emergence is evident (eg. Summers et al.,2023; Bashir et al., 2021; Seo et al, 2021). The purpose of this study is to explore unconscious navigation behavior on Blackboard LMS throughout the entire semester. This includes establishing the possible link between navigational key variables and overall performance and further investigating the impact of navigational behavior on different types of assessment.

Method

Sample data and participants

The data is gathered from 88 undergraduate students from a Malaysian private university with an ethnically diverse population. These students are from the American Degree Transfer Program predominantly taking

STEM subjects. 81.8% of them were Malaysians while the remaining were international students from various countries, eg. Myanmar, Sri Lanka, Vietnam, and Bangladesh.

Table 1. General Statistics on the Student Sample

Demographics		Frequency	Percentage
Gender	Male	57	64.8
	Female	31	35.2
Nationality	Malaysian	72	81.8
	Non-Malaysian	16	18.2
Major	Sciences	56	63.6
	Arts	32	36.4

Measures and Data Collection

All the undergraduate modules are managed through the university *Blackboard LMS*, here the announcements, online live lectures, course materials, and assessments can be accessed. Since before the Covid pandemic, lecture recordings are also made available in the system. Statistic tracking is enabled to allow the system to capture the learner's digital footprint or navigational behavior, for each course site.

The course site for each subject includes components such as course announcements, course outlines, course structure, contents, and coursework. Each component can be accessed from the navigation pane on the course site. The course structure, course outline, and other academic-related information are posted prior to the commencement of the semester. Weekly learning materials such as lecture slides, lecture notes, tutorials, and videos are organized into folders by week. For accessing these weekly posted learning materials, three measures were used: *Days active on Blackboard LMS*, *Total time spent on the course content*, and *the total number of logins*.

Journal Submission

The setting up of the Journal on *Blackboard* is done by the instructor. These journals are made visible to all students, and they have the option to delete and update their journals. During the semester, students were given many Mathematics questions to solve for each sub-topic and were required to submit their solutions as a weekly entry in the *Blackboard* journal. Over the 14 weeks, each student had a journal of 14 submissions. Since each submission was visible to all, students were able to compare the full solution of every question against others' work, and where needed provided peer feedback. When students were not able to come to a consensus on which solution was correct, the instructors intervened by providing the necessary feedback. For accessing the peer's journal submission with the intent of learning from peers, one piece of data is collected: *The number of journal submissions viewed*. Enabling students to communicate online on the course site is important for online learning. While Badawy and Hugue (2010) showed that online discussions have a positive impact on student satisfaction, the present study intends to investigate whether the viewing of journals could have a positive impact on students' learning performance, as an indication that students learned from peers.

Assignments and Quizzes

The assessments, except the final exams, are organized under a Coursework folder which is placed in the course site pane. The two assessments that are done on *Blackboard* are the assignments and quizzes. The assignments are posted on *Blackboard* as a pdf file on a specified date. Students access the questions and complete the assignment within a week as per the deadline. The assignment report is handwritten and must be uploaded via the submission links on *Blackboard LMS*. Quizzes, on the other hand, have a duration of 30 minutes, although the quiz is being made available on *Blackboard LMS* for one week. Students can take the quiz anytime within the week. The measures of the navigational behavior for these assessments are the timeliness of accessing the assignment and quizzes or the number of days delayed between the day the assessment was posted and the day the student accessed the posted assessments. For example, “1” means the student accessed the material 1 day after the assessment was posted. So, the two data collected from the assessments are *days delayed in accessing the assignment* and *days delayed in accessing the quiz*. Accessing materials promptly depicts self-discipline which is one important requirement of online self-directed learning. Checking on the days delayed came with the idea that the sooner the assessments were accessed, the better their performance (Zhang, 2016).

Results

The course site content is organized to have YouTube videos, Lecture notes, tutorials, and Journal Links. The highest visited course content are the journals comprising more than half of the total, followed by tutorials, lectures, and YouTube videos in descending order, as shown in Figure 1. Journal being the most visited suggests that it is perceived to be more beneficial compared to the lecture notes. A potential reason could be that the lecture notes do not contain as many worked examples as the journals.

The first navigational measure is the days active on *Blackboard LMS*. The student’s time spent on the course site is averaged by the day of the week and the data is displayed in Figure 2. It is found that the average time spent per day by the day of the week is somewhat of a bell-shaped curve with the majority of them spending more time navigating the course site on Thursdays. There is a rising pattern before Thursday and drops on Fridays and Saturdays. Further investigation on the link between performance and students’ average time spent on *Blackboard LMS* showed that there is a significant positive correlation between students’ average time spent navigating the course site and their overall performance on Wednesday, Thursday, and Friday. Table 1 shows the correlation coefficients.

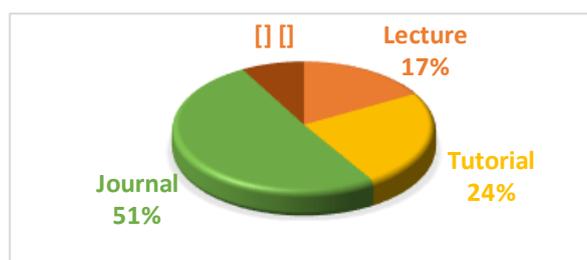

Figure 1: Course Content Accessed by Students

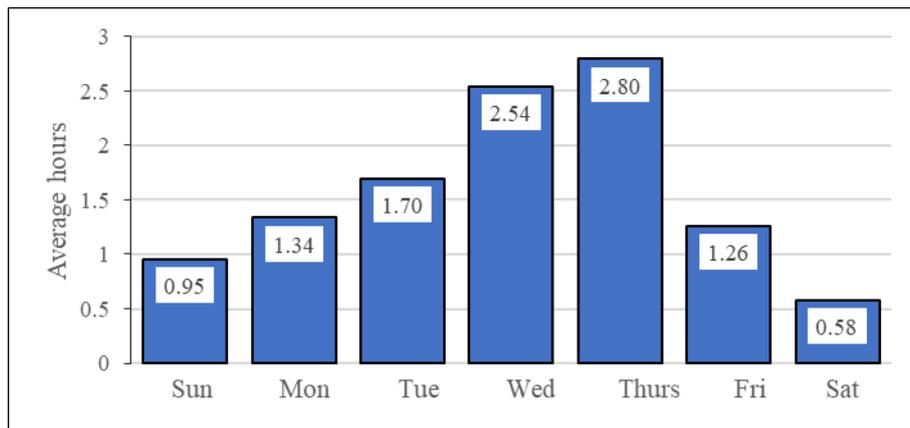

Figure 2: Average Hours Spent Each Day on Learning Management System

Table 1: Correlation between Performance and day of the week

Day of the week	Pearson Correlation
Sunday	0.11
Monday	0.099
Tuesday	0.2*
Wednesday	0.14*
Thursday	0.184*
Friday	0.142
Saturday	0.11

** . Correlation is significant at the 0.05 level (2-tailed).

* . Correlation is significant at the 0.10 level (2-tailed).

The *Blackboard LMS* analytics measures (time spent on course-site, total login clicks, number of journal views, number of YouTube views) were broken into categories low and high using the mean-split and tested using the mean rank test as shown in Table 2. Students who spent a higher time on the course site had a significantly greater effect on their performance ($M=48.57, p<0.10$). The total logins did not show a significant difference, hence students who logged on to the course site with a higher frequency did not necessarily have a better learning performance. Journaling made a great impact on student’s performance ($M=50.65, p<0.05$), indicating that the more frequently students viewed the journals of their peers or their own would increase their learning performance. Similar results were seen for viewing the YouTube videos ($M=72.93, p<0.05$).

Table 3 shows the effect of timely access to the assessment on performance. Did the delayed access to the assessment affect the assessment score? Correlation analyses found that there was a significant correlation between the two measures, and the correlation was different for different assessments. For the assignments, students had a good performance on average ($M=79.53, SD=3.05$) with low average days delayed in accessing the assignment ($M=0.8, SD=1.23$). It was found that there is a negative relationship between days delayed in accessing the assignment and the performance on it ($r=-0.564, p<0.01$) suggesting that the higher the days delayed in accessing the assignment, the lower the quality of the assignment submitted resulting in poor performance. Surprisingly, the quizzes had opposing results. Student’s quiz performance ($M=84.92, SD=2.01$)

and days delayed in accessing the quiz ($M=1.72$, $SD=0.99$) had a significant positive relationship ($r =0.299$, $p<0.05$). This suggests that the longer students took to prepare for the quiz, which is from the interval of the day of the quiz posting and attempting the quiz, the better their performance.

Table 2: Mean rank test for overall performance by the measures from *Blackboard LMS Analytics*

Key Variables	Categories	Mean Ranks	Levene's Test	Significance
Time in Course Content	Low	38.89	0.919	$p<0.10$
	High	48.57		
Total Login	Low	34.15	0.105	$p>0.10$
	Average	43.96		
	High	49.35		
Journal	Low	38.35	0.449	$p <0.05$
	High	50.65		
YouTube Video	Low	25.63	0.107	$p<0.001$
	High	72.93		

Table 3: Relationship between navigational behavior on different types of assessment

	Average	Std. Dev	Correlation
Days delayed (Assignment)	0.80	1.23	-.564**
Assignment Performance	79.53	3.05	
Days delayed (Quiz)	1.72	0.99	.299**
Quiz Performance	84.92	2.01	

** . Correlation is significant at the 0.01 level (2-tailed).

Discussion

Does students' access to the course site based on the days active relate to their learning performance?

Students are actively engaging on the course site with inconsistent patterns by the day of the week (Darko, 2021; Yousaf et al., 2018, Zhong L., 2017). This study finds that the students are highly active on the course site between Tuesday and Thursday, and lower on other days. The correlation of these activities with their overall performance is positively significant and is seen during these days. The results of this study recommend that important announcements, postings of material, and deadlines should be scheduled between Tuesdays and Thursdays. The decrease in the activity between Friday to Monday suggests that students used maybe busy with non-academic and personal matters as the weekend approaches.

Does the number of hours spent on the course site relate to their learning performance?

The total learning time or the hours spent on the course site had a significant effect on students' learning

performance. There was a significant difference in performance between the students who spent a higher amount of time on the course site and a low amount of time. Past studies have also stated that the longer time spent on the course site leads to a higher overall score (Kim, 2003; Rau and Durand, 2000; You, 2014; Seo et al., 2021). The number of hours spent on the course site is an indication of the time students spent studying a book if it was a traditional classroom setting. This can be used as an important predictive tool to have a constant check on students' accumulated learning time and to identify potential students who might perform poorly in the subjects. Many studies found that the total learning time did not affect academic achievement (Kim, 2011; Han and Jeon, 2015; Mwalumbwe and Mtebe, 2017) but other factors such as the number of access or logins, learning intervals, gender, and age were important.

Does the number of logins on the course site relate to their learning performance?

Similar to most studies (Zhang, 2016; Han and Jeon, 2015; Mwalumbwe and Mtebe, 2017) it was found that the number of logins to the Blackboard LMS Course site did not have a significant association with students' performance. This confers to the notion of "quality versus quantity". More logins do not translate to better performance, instead quality time spent on each login matters. Another possibility that there is no significant relationship is because the files that are posted on the course site such as the PowerPoint slides, notes, and tutorials are downloadable. Some students may have downloaded the files probably in one login per week and accessed them multiple times on their local files. Since the data for the number of downloaded items were not included, the analysis is inconclusive and perhaps useful for future work.

Does the frequency of visiting peers' journals or self-journals and YouTube videos relate to their learning performance?

The inevitable isolation is seen as a drawback in online learning. Discussion boards in Blackboard LMS are usually used as a tool to help with students' communication (Kwon, 2019; Zhang, 2016; Alghamadi, 2019). Deviation from the normal Discussion Board, this present study used Blackboard Journal as a tool for students to interact with peers. The frequency of journal views and YouTube views have a positive significant effect on the student's learning performance. The Journals which were tutorial submissions visible to all students provide the weaker students to learn from the journals of other students.

Does the delay in accessing assignments posted relate to their learning performance?

The delay in assessing the posted assessments would significantly affect the learning performance holds in this present study, however, the effect is mixed depending on the type of assessment. The data shows that students' behaviors varied dramatically for each assessment. An assignment is a component where students are given at most a week to prepare for their submission. Students who started late on the assignments produced output that are not on par with those who have started the assignment early, leading to poorer scores. Starting late here means the Blackboard LMS data shows that students viewed the assignment later than the date posted. The

significant negative effect is understandable as not accessing it promptly means that learning activities were not well organized, and students lack self-discipline. Starting late on the assignments forces students to cram up their learning needs as described by Spivey and Macmillan (2013) as “crammed access”. However, it is beyond the data analytics capability to ensure that students viewed the assignment early and started working on the assignments as soon as they viewed them.

The next assessment that was analyzed is the online quizzes, and as opposed to the assignment, showed that the later the quizzes were accessed the better their performance. Quizzes are available for a week but only require 30 minutes to complete once accessed. Students who accessed the quizzes closer to the due date performed better. The understanding of this is that students who took the quiz later had used the prior time to prepare to lead to better performance. Another possible explanation students who delayed taking the quiz might have been familiar with the content knowledge and therefore did not see the need to attempt the quiz as early as it was posted (Zhang, 2016).

Conclusion

Online learning is possibly the future learning model and many higher learning institutions are rapidly developing it. It is a constant effort by the learning institutions to provide quality education and better understand the online navigational behavior that can contribute towards a holistic learning experience. The empirical evidence in this study is the significance of the five navigational behavior on performance which are *active days, total time spent on the LMS course site, frequency of video and journal views, and timely access to assignments and quizzes*. This could only be possible with learning analytics and the statistics tracking data stored in *Blackboard LMS*. The data collected show the trail of students’ navigational behavior. In this study, learning analytics has provided evidence that students are active on certain days of the week suggesting that postings of notes, announcements, and other information should be made available between Tuesdays and Thursdays. Higher engagement on these days has shown to have better performance. Delay in accessing the assessments is like attending exams later than the expected time. This is uncommon in a physical class because such behavior is observable and subtle peer or instructor pressure is felt. Unfortunately, the online learning environment fails to create this positive pressure and consequently negatively affects students learning performance. Alternatively, in an online setting, the timeliness is picked up on the analytics stored in *Blackboard LMS*. Delay in assessing assessments may not necessarily work as a disadvantage as this study show evidence that it is based on the type of assessment the delay occurred. In conclusion, the evidence from this study implies that when students engage more time on the *Blackboard LMS*, they are absorbing knowledge and creating new information by processing existing stored information to a better chance of obtaining higher grades. The total number of logins to the LMS course site played no role in determining the performance, suggesting that the number of times students log in is not as important as the time spent on the course site for each login. Students may have logged in maybe just to read an announcement, or multiple times to check their online grade book which does not count for learning time that contributes to higher performance.

We conclude that students' performance improves when they are more active on the *Blackboard* LMS course site. Students should watch the short videos provided, view the journals more frequently, and access assessments in a timely fashion. Noting these good online navigational behaviors, instructors can use the *Blackboard* LA to better understand students' academic standing during the semester and possibly identify students who may fall behind. Early intervention can prevent students of potential risk to fall further behind or failing the subject. Besides that, it is worth investing in a good LMS that is functional and user-friendly to incite students' interest to navigate an LMS. In this age of modernization, everything is done using a mobile. Thus, having a mobile-friendly LMS will make learning convenient anywhere and anytime.

Recommendations

It should be noted that the navigational behavior investigated in this study is infinitesimally small compared to the huge aspects of online learning. Online learning is a complex process involving many other factors, many other technologies, and many other tools. Future research also warrants the need to consider other factors such as prior knowledge, learners' intelligence, motivation level, and learners' cognitive level. In addition, students learning data outside the LMS could also shed some light on predicting learning behaviors. Only through continuous research can online education and students' learning outcomes be improved.

Abstract: Cities are constantly evolving and look forward to every opportunity enabling them to grow and have a progressive economy. A high level of competition exists among the cities and countries in portraying a high image. Every city and its communities engage in activities to bring a change to the routine pattern of life. The events, festivals, and celebrations become an important catalyst in the rejuvenation and regeneration of urban life creating an opportunity to build an image for the city. This could have positive or negative impacts on the people, their culture, and the environment. The influence of globally available technologies lets a crisis in the character developed by the city losing the importance of heritage, human values, and local identity. Cities are using the strategy of hosting events, festivals, and celebrations as a means of fast development by attracting tourists, enhancing trade, and developing the economy thereby creating an image for the city. The study focuses on understanding the need for events, festivals, and celebrations for a city along with its advantages and disadvantages and influences over the urban context. Participatory appraisal and field study interpretations were used for case study analysis of Dubai (UAE) events to validate the literature study review. This would enable the stakeholders to channel processes in making the decision for the planning and setting up of celebration spaces with a long-term goal of considering the people, place, culture, and heritage developing an image being a pride for its citizens.

Keywords: Events, Festivals, Celebrations, City Image, Urban Identity

Introduction

Any settlement over a considerable span of years shapes up to take a consolidated form, a form that is evolved & governed very much by the activities associated with the place. In history during the colonial era of Europe

‘place making’ and ‘marketing’, was done by rulers to attract tourists and investors thereby enhancing socioeconomic functioning (Yuan & ChenChang, 2007). There is a high level of completion among modern cities in attracting new domestic and foreign investments and the cultural, and creative sectors contribute to the socio-economic development. The cities and their urban spaces got revived with the generation of jobs and image building of the city. The organizing of cultural events in small towns has created a positive impact on the local businessmen and inhabitants with the initiatives taken at the grass-root level. Progressive festivals happen across the globe and new development strategies were identified for even small cities based on their culture (Yuan & ChenChang, 2007). Support from the government at a policy & strategy level is very important. This creates mutual benefits for people and the government. Festivals and events become motivators in attracting participants both local and tourists on a year-round basis and thereby add to local tourism. Creative and cultural clusters get created to build the city’s image and marketing (Wang, 2009).

The urban festivals and street carnivals enhanced the dynamics of social life shaping interesting spatial arrangements on a local scale in many countries. Festivals are instrumental in place marketing enhancing everyday life experiences. The social identities get periodically constructed, destroyed, and reconstructed forming the spatial and social organization in the city (Whyte, 2021). A sociable urban condition is created for public life to meet & play. There are spatial conflicts, ambiguities, and appropriateness between identities and practices. These activities may have a social, economic, political, and regional backdrop. But the physical gathering of the public was an important factor in the constitution of the social realm. Planned spatial arrangements restricted informal gatherings, the Biennale, carnival & parade made opportunities for interaction among citizens and it evolves certain spatial and behavioral constraints (Stevens & Shin, 2012).

The Olympic Games, World expo, exhibitions, theme based festivals also become prominent means of fast urban development (Yuan & ChenChang, 2007). In the post-socialist countries cultural sector has been seen initiating socio-economic development and the success story is evident in the small central city of *Gniewkowo*, Poland with the introduction of the festival of progressive rock being a factor of growth for the local population and creating a brand image for the city (Murawska & Bieganska, 2014). Adding signature projects with iconic characters is another strategy for creating a competitive advantage involving a great financial cost with examples like the Bilbao Guggenheim museum and the Baltic Flour Mill of Gateshead. The cost involved in these projects being high makes them inflexible in comparison to having the events. Thus that has been a choice taken by many countries in recent times for shaping and facing urban competition. But events had been a platform for creating landmarks. Cultural events have turned out to improve the city’s image and have created a sense of pride in the citizens about their home city and its image. This community pride due to the enhanced destination has been referred to as the ‘halo effect’. The study focuses on knowing the benefits to the residents of the city and the strategies taken by the government, policymakers, and organizers in marketing the city image, analyzing the opportunities for regeneration and the transformation from the macro to micro level. The understanding of patterns and identity enables the development of appropriate measures for generating a sustainable city image.

Events, festivals & celebrations in an urban context*A. Benefits to urban population & opportunities for regeneration*

The re-evaluation of the city and its re-presentation adds self-confidence to the local population bringing a sense of pride and attracting socio-economic development molding the city's image. At times it helps change negative images created in the past. The urban visual character has an active behavioral character in urban life which generates an experience with the dynamics of the events festivals and celebrations. The festival of Rio de Janeiro with its parades and dance, and Spanish Pamplona with its bullfight recreated dynamic behaviors to the static visual city image (Yuan & ChenChang, 2007). The transformation of the city with its spaces and activities for engagement brings life to the routine environment with opportunities for jobs, trade, and businesses. People socialize developing intercultural bonds. Amenities and infrastructure gets revived with unique buildings and spaces planned and organized. A vibrant environment gets created in the process of celebration.

Countries organizing festivals & special events (FSEs) include cultural activities, conferences, sports, exhibitions, and religious activities as a means of engagement. This has an influence on time and space in the city (Murawska S. B., 2014). It gains 'the paroxysm' with its promotions and media coverage's enhancing its reputation for the short term. At times the negative image and impressions or views created out of racial clashes, political issues, and natural disasters of the past could have been a hindrance to economic or socio-cultural development be changed. The examples of Japan and Germany produced during the Second World War were revived with the 1964 Tokyo Olympics & the 1972 Munich Olympics (Yuan & ChenChang, 2007). It brings the opportunity to express the colorful cultural life practiced in the destination (Wang, 2009). Many events have created impressive landmarks like the Tate Modern gallery in London adding to city skylines creating a visual impact and catching attention and improving the city's image and living experience (Richards & Wilson, 2004). Events restrict the population outflow attracting new residents and enabling to rebuild of the city (Miśkowiec, 2017). A positive change is seen in the majority of the example creating the opportunity for growth and development of the city its spaces, and places letting it be known for its unique character and experience. In this process, all the stakeholders are benefited from varied means of development.

B. The city marketing

Acceleration is seen in creating a city status promoting the place's prestige by introducing traveling products, infrastructure construction, places of attractions, investment attraction, and industry transactions through the FSEs. Ample successful examples like the Dalian International Clothing festival, and Olympic Games hosted in cities like Munich, Moscow, Seoul, and Sydney are models of opportunity being used to present and sell themselves becoming an important topic for planners and leaders (Yuan & ChenChang, 2007). Urban regeneration is one of the major concerns in preparing strategies and planning for policymakers and government. There is a simulation of growth and development boosting the local trade opportunities as also seen in the example of the Ningbo fashion festival, China using cultural fashion as an event to stimulate the image (Wang, 2009).

Transformation at the macro & micro level

A. Economic

This is a means to the market city as a product enhancing transactions and investments. The commercialized policy enables economic development strengthening the city's presence with a direction in the global market. Not only it marks competitive power but also makes winning with the leap jump in its development (Yuan & ChenChang, 2007). Celebrations and events can maximize spending utilize the local business and supply chain and develop new markets with a long time perspective. This assists the value of the city with a dimension created with a return. They contribute to a sustainable economy with the creation of employment opportunity that improves the standard of living. The economic impact can be measured in terms of investment and expenditure as an indicator for assessing success. There are three spheres of responsible stakeholders as per the practice in China, first the government (central and local), second the event sponsors, media, press, and other communities and third the voluntary organizations all working towards the prosperity of the event. The government encourages diverse forms of incentives like subsidies to promote the event and its organizing. This develops an inherent relationship between the government and the market and enables replenishment and sharing of risk by both parties. At times of crisis, the government intervenes with the introduction of measures to safeguard the event and its working by introducing policies like tax rabet, promotions, and subsidies introduced to promote the event. The third sphere contributes by way of involvement from nonprofit, non-government voluntary organizations, and corporations creating a sphere of effective citizenship. This becomes strong supporting power for the event and its success in building the right image. The Ningbo festival enriched the citizens' cultural life, economic prosperity, and connection with the external world. It advocated an image for the city developing a reputation, information, and knowledge sharing through collaborative working and mutual communication, and celebration of cultural diversity adding quality to the life of the citizens (Wang, 2009). In Gniewkowo city of Poland, the cultural sector with its progressive rock event was a source of economic development for the local businessmen developing the city and its own companies. The grass-root initiatives worked by the residents and nonprofit organizations were a positive factor in the success and succession of the event yearly (Murawska & Bieganska, 2014). Hosting a range of different events also lets a city create in itself an opportunity for different profile markets hence countries have taken up hosting Expo and Sports events. The continuity in the event stream has eventually led to 'fertilization' and 'festival marketplaces' resulting in the growth of a 'symbolic economy' and 'experience economy'. Culture has become a rapidly growing medium with its creation of blockbusters and high turnover of consumption and letting a moving economy. The economic goals nowadays are being augmented by sociocultural and imagery objectives (Richards & Wilson, 2004).

B. Socio-Cultural

Festivals narrow the gap in hierarchies of class, race, gender, and inequality by creating the privileges of active engagement and embodied actions. The physical gathering is important in the constitution of a social realm. The events and celebrations engage the population with an opportunity to explore time and experience space with an

organized pattern based on the theme with activities being indoor or outdoor. People benefit from being participants or are also organizers of the event. Connection and communications between the varied communities bring cultural connections and develop relationships and experiences of cultural practices from different segments of society (Stevens & Shin, 2012). The image could be related to the ‘currency of cultures’ having a shared meaning of the beliefs and value systems.

Festival should not be just structured for the one-time visit but should make way for the repeat value attracting visitors with an opportunity to differential character and place-making with new cultural experiences. Celebration marks the passage of time with a relationship generated between the old and the new once. A collaborative community involves the stakeholders in fulfilling aspirations and building trust and relationships with each other. A socio-cultural exchange is generated in the community festival. One of the important aspects is the enlightenment of the audience to create a meaningful cultural value evoking the quality of aesthetics, symbolic, spiritual, and authenticity values kept with the national and local identity (Wang, 2009). In the case of Gniewkowo, the festival generated creative milieus posing an identity and opportunity for growth with the use of culture to build the new urban image attracting highly qualified professionals, and workers attracting capital. There was a uniqueness in the event which made a difference in its success story (Murawska & Bieganska, 2014). Culture and its Halo effect further created the ‘showcase effect attracting amenities to the city like theatres, opera houses, and museums moving from the tradition to a high culture attraction with the addition of ‘popular’ culture by inclusions of fashion, pop music, ethnos capes being a medium to create image and brand for the city. This leads to branding and high branding of cities. There is the development of ‘cultural capital’ and ‘cultural landmark’ seen as a different approach from the industrial past. Some of the events have become a brand of their own like the Cannes film festival and hosting such events creates an honor value. This kind of branded event s and its replication leads to a paradox with cities trying to differentiate themselves from others and move beyond the routine identity path. The ‘universal cultural space’ is one of the patterns like the Universal forum of cultures held in Barcelona or the world Cultural forum that happened in Rio. But many cities are hosting such large brand events generating high competition, leading to many developing innovative strategies to generate theme-based events (Richards & Wilson, 2004).

C. Spatial

The city needs its imagery created with direct viewing with memories created of the environment done through the construction of flagship projects with iconic, symbolic, and unique architecture. This accelerates the development to match the intense global competition. London’s Millennium flagship project with the millennium dome, wheel & bridge is an example of creating new scenic spots and attracting tourists. It created a successful city image and also contributed to economic development (Yuan & ChenChang, 2007).

At a local scale, social interactions are spatial conditions forming enclosures of varied character, and axial connections along the city making the activity spread across the city yet connected with nodes and events using the roads and pedestrian ways (Whyte, 2021). Centrality through congregational spaces organized in the vacant lands without disturbances to the traffic makes the city work and celebrate at the same time. Permeability of the

events to different parts of the city at the macro to the micro level of the city adds meaning to the place-making. The dynamics of street carnivals and exhibitions demand construction, re-structure, and deconstructing for a social and spatial organization. The intensities in space are shaped based on distinct behavior and interactions with a physical setting. In large cities, the inner urban festivals have been compressing people and their activities with heightened sensations and memories in confined spaces and time. By enhancing communicative action a transformation in the character of the urban spaces can be generated with rational and efficiency brought in festival spaces. This has been tried with discursive arenas, the creation of themes in spaces with segmentation, reshaping, and representation of the local identities. Intensive use of unoccupied spaces generates value and changes the nature of space generating a relationship between seeing and being seen [3]. In the case of the Gniewkowo heritage and identity were conserved with the organized progressive rock festival managed by the nonprofit organizations and the private sector and this created a spatial quality during the festive season with its identity and brand image (Murawska & Bieganska, 2014). The scale of events and hype of the events with its global competition has led to a demand for a strong visual character for the celebration and its experiences with demand to carving innovative means of representation. A change is experienced in the outlook of spaces and their organization. The vibrant environment is not just restricted to the location of the event but trickles across the urban landscape and the media generating a demand to enhance the overall feel from the streetscapes, the nodal points like roundabouts, billboards, and even the city skylines lit up creates a difference to its nightlife.

The complexity of the image concept is a strong area of research as many events have become ‘cultural currency’ with their image effects. In place imagery, there can be a distinction between the ‘designative’ with the informational aspect having the categorization of the cognitive elements and ‘appraisive’ components with the concern with feelings, value, and meaning about the space in the creation of imagery. These factors influence the space and its image formation (Richards & Wilson, 2004).

The urban heritage can also be well restored and conserved with better utilization of its spaces and character created by the formation of gathering points in and around the significant zones. There has been enhancement in character and information transfer like the history of the place and its relevance being transferred to the new generation. The example of the light festival of Lodz, Poland created a successful image building and experience with urban regeneration. The moving light created connections in the spaces across the city drawing attention and developing spatial character showcasing the post-industrial architecture and recreating the public spaces with a positive vibe (Miśkowiec, 2017). The spatial design needs to be innovative blurring the lines between commerce and culture. Spaces need to be ever-changing, growing, and transforming with sophistication. Spaces need to have a local identity with unique characters rooted in the history of the place, the people, and their culture.

Empowerment of citizens is required to encourage their participation in the design of their environment. Articulation of dense and open spaces is required with the weave of social fabric binding people together; this creates a meaning for the future of the inhabitants (Whyte, 2021).

Method

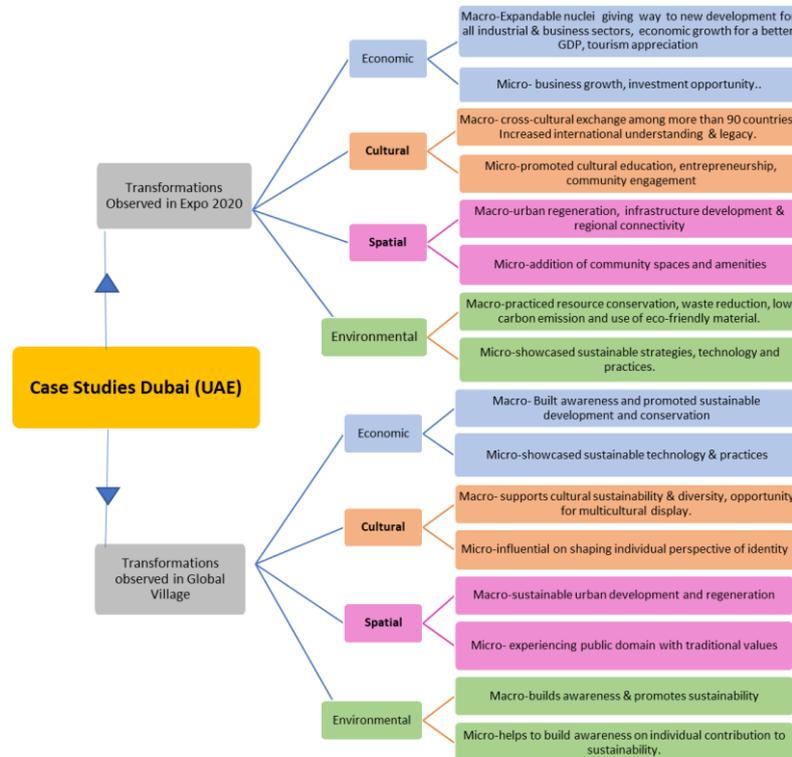

Participatory Appraisal and Case Study

For an appraisal of the above transformations mentioned due to events, festivals, and celebrations, case studies of Expo City and Global Village in Dubai were conducted and analyzed considering the spatial distribution patterns, utility & functions of these spaces during events and no events. These event/exposition sites with global and local importance were visited to experience at macro and micro levels through field studies and walk-throughs using the parameters discussed above. Examples of previous surveys done by local authorities to measure the impact of world-class events were also studied and analyzed.

Results

According to a report by the Dubai Chamber of Commerce and Industry, 73.5% were able to build new business relations and partnerships during Expo 2020. (Dubai Chamber, 2022). 32% increase in visitor numbers in 2021 and 29.1 million passengers passed through Dubai International Airport in 2021, a 12.7 % improvement from 2020. It had also enabled cross-border partnerships in global outreach and economic growth with a culture grounded in partnerships. In addition to its tourism & economic impact, Expo 2020 had a lasting effect on the city's image and reputation. It was the first world expo in history to be hosted in a hybrid format, thereby escalating the digital economy and accelerating innovation.

Table 1. Case study analysis, transformation observed in Expo 2020 and Global Village, Dubai in 2022

The major impact of the event of Global village are 7.8 million record-breaking visitors in October 2021-April 2022 season (Khaleejtimes, 2022), celebrated multicultural, multinational events like Chinese new year, UAE national day, New Year's eve, digital transformation to cashless payment, etc. The table below illustrates the inferences in these global events and celebrations in Dubai.

Discussion

Urban patterns & identities evolved

A. The positive change

The city gets shaped with the function causing the realization of cognition transformation in people about 'the event' and 'the city'. The 2008 Olympic Games Beijing letting the improvement of the environment and urban infrastructure an example. Buildings constructed became a part of the inheritance, the Eiffel tower constructed in 1889 for the Paris World Expo, the Yoyogi Gymnasium built in 1964 for the Tokoyo Olympics games, and the German hall designed by Mies for the Barcelonan exposition in 1929 become vivid examples as representations for their city image (Yuan & ChenChang, 2007).

There are characteristics like festival spirit, the satisfaction of the basic needs, uniqueness of the event, the authenticity of the theme, traditions, flexibility in the format of function, quality of hospitality, tangibility with the theming, symbolism with the place and its culture, affordability, and convenience areas being influenced with the opportunity of change and positive development. They develop an opportunity for social capital and help demonstrate the capacity to cope with external threats, stress, and disturbances generated by political, social, and environmental changes. It fosters leadership and networking opportunities for residents and visitors from diverse communities. Celebration binds communities and refreshes life with renewing experiences. They make communities responsive to the need of time.

There were opportunities for small, and medium size business enterprises with the community pride and identity created. The multi-cultural and intercultural communication promoted and cultivated understanding between the host and the guest. Communities get united from different ethnic, linguistic, and religious backgrounds, historic bonds creating a 'world view'. It improves the quality of life and strengthens communication between different cities and countries expanding cultural perspectives (Wang, 2009). The events bring richness in diversity as seen in the example of the European Cultural capital event balancing the expressions of culture, and its history with contemporary developments (Richards & Wilson, 2004).

B. Threats & challenges

The fast pace development can disturb the urban landscape if the local inheritance and buildings in the traditional cities are not conserved and taken into consideration during the process of city image building. There has been a negative influence on the Tokyo Urban landscape with some important buildings of Edo and Meiji

times getting destroyed due to the construction of high-speed transportation for the Olympic Games. Prudent care needs to be taken in small cities with constraints in space and having traditional buildings not lose their character and atmosphere (Yuan & ChenChang, 2007). The organizers need to understand the residents' perceptions and should not neglect their views in terms of their concerns and experiences. Negative impacts like community alienation, substance abuse, and loss to natural and conserved heritage reserves should be taken care of in the initial planning process.

There is a scope of crowding and inconvenience caused to the routine life of the residents which needs to be considered with factors such as noise pollution, crime, violence, visual pollution, intercultural misunderstanding, and fights (Wang, 2009). Poorly organized events or celebrations could lead to the loss of the city's constructed image built over a long period.

'Attention Economics' is a big concern in recent times with the cities trying to capture the attention of the audience and retain it for a long time. The availability and frequency of festivals across the globe distract the attention of the massive audience. Cities need to be maintained high standards of quality of the event and the right marketing and preparedness of its facilities in the urban context to make a feel of renewal and newness as the purpose to revisit or make the destination the choice (Yuan & ChenChang, 2007).

There is a promotion of public education with means to develop trivialities of the day-to-day task and their deliverables. It develops social networking among communities along with the appropriate placemaking. The change in imagery needs a 'protected' taking into consideration the working city. The values and meaning of the place and has to respect the understanding of the people's perception residing in the region. Studies conducted on the socio-cultural impacts of the 2000 Olympics held in Sydney state the impact of events and its image as a 'hallmark'. A strong dominating image was created disturbing the existing valuable natural and physical identities of the cities. There has been precedence of the city's image dropping very rapidly after the event. A study of the Edinburg Festival had an overall positive impact on Scotland but did not do much to the image of the city (Richards & Wilson, 2004).

The overpopulation and aging of the city's infrastructure with the effect of climate change is another threat. One of the biggest challenges is to rebuild without causing any damage to the culture, history, and spirit of the rapidly changing places. It is important to embrace the human scale in architecture and develop a sustainable image (Libeskind & Swickerath, 2015).

C) Need for reflections from the precedence studies

The government and local authorities need to understand the facts and abilities of a city before its planning or implementation of the space or its infrastructure to know the constraints and threats to its existing fabric other than just creating a new image. The use of the theory of Corporation Identity (CI) in setting the City Identity system to promote the vision and the city mind considering the behavior identity taking advantage of festivals,

events, and celebrations in the creation of a progressive city image. The use of slogans has a good effect as in the example of ‘Come Celebrate Our Dream’ the slogan of the 1996 Olympic Games of Atlanta coined in reflection to the famous speech by Martin Luther King with the statement ‘I have a dream’, Slogan of 2010 Shanghai World Expo ‘better city, better life’ had made a difference in the economic growth with its bright and rich characteristics to fast-growing China (Yuan & ChenChang, 2007). In the case of Rotterdam, the image addressed complexity with its modern architecture and waterfront development in the multicultural and dynamic working city with positive changes seen in the post-event (Richards & Wilson, 2004).

Conclusion

The events, festivals, and celebrations create an expressive, connected & remembered life. They enhance the community's pride with cultural renewal and improved standards of living. Quality of space is generated in the urban context with renewed infrastructure, and buildings with varied architectural characters. Respect for the existing traditions and human values needs to be maintained enabling the city's image to gain recognition. Cultural renewal generates a vibrant feel in its spaces for both residents and tourists. There should be the opportunity for sustainable economic growth and balance maintained with a long-term plan. The government, policymakers, and organizers have an important role and responsibility in creating the right identity and monitoring growth. Treats and risks need to be mitigated converting them into opportunities. Communities need to face the challenges by being connected to work collectively with a united view of communal living. Integrating humanity in the design of spaces is important in an open society with the reflection of history dealing with complex realities and unpredicted chaos. The cities of the future need to be in line with the utopian fantasies adapting to technology and its advancement. This would produce a new complex dimension to the whole living, learning, and work environment. All great cities have been developed out of the dreams of their inhabitants. The city image needs to have an ever-enduring spatial character adopting diverse cultural needs with creative ways of celebration. Urban spaces and their landscape need to be adaptive to the fast-changing needs of time and be enabled to be transformed.

A healthy environment needs to be crafted with a unique identity respecting the place, its culture, heritage, and the people. The events, festivals, and celebrations are ever-changing, but their memories and experience remain forever in people's minds.

EFL Teachers' Expectations and Satisfaction Levels of Professional Development

Thi Mai Thy Cao

FPT University, Vietnam

Diem Kieu Bui

FPT University, Vietnam

Abstract: Professional development (PD) is critical for maintaining and developing teachers' qualities and competencies; however, how to make PD more effective in relation to EFL teachers' expectations and examine their satisfaction levels with PD activities organized in a foreign language center remains a major concern for administrators, researchers, and teachers. The purpose of this study is to explore EFL instructors' expectations and levels of satisfaction with the PD activities that they have participated in. This study used both quantitative and qualitative research methods, including questionnaires and interviews to answer the research topics indicated above. The study involved 50 teachers at an English Language Center, in Can Tho City, Vietnam. According to the findings, EFL teachers have high expectations for (1) PD content, which focuses on improving lesson planning and student outcomes, as well as learning how to create a supportive learning environment; (2) coherence of PD with teachers' needs and students' needs and interests; (3) opportunities for active learning, such as observing more experienced teachers or being mentored by experts; and (4) duration of PD, which should be ongoing throughout the year and a year-long program. EFL teachers were also satisfied with (1) the PD content, (2) the coherence, and (3) the duration of the PD, according to the findings. Some recommendations for increasing PD characteristics are offered based on the primary findings.

Keywords: PD Activities, EFL Teachers' Expectations, EFL Teachers' Satisfaction

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 1312-1329), Cappadocia, Turkiye. ISTES Organization.

Introduction

English teaching and learning have changed drastically over the last several decades; as a result, EFL teachers require professional development to update and improve their knowledge and skills to keep up with the tendencies of English language teaching (Richard & Farrell, 2005). Teacher professional development is thought to improve not only teachers' practices (Richard & Farrell, 2005), but also students' learning outcomes and

educational reform achievement (Villegas-Reimers, 2003). Professional development now ranges from one-time workshops to more extensive programs, allowing teachers to learn more consistently. However, not many studies have been conducted to investigate EFL teachers' expectations and their satisfaction levels with PD activities. As a result, this study was carried out to acquire insights into EFL teachers' expectations and levels of satisfaction with PD activities in the setting of a foreign language center in Vietnam's Mekong Delta.

In terms of professional development approaches, Richard and Farrell (2005) offered eleven forms of professional development that instructors might use to improve their teaching; however, in this study several common types such as students' feedback, training workshops, peer coaching, peer observations were investigated. However, an effective professional development approach should incorporate tactics that are relevant to the needs and expectations of teachers (Richard and Farrell, 2005). Meeting teacher expectations for professional development is projected to increase long-term applied competence as a program outcome because instructors will be more motivated to put program content into practice. Furthermore, analyzing their levels of satisfaction with the PD activities that they had participated in is significant since the findings may assist educators or educational administrators in making timely and optimal adjustments for improved PD programs. It is accepted that educational leaders should promote and facilitate professional learning and development in their schools to best support teachers in their teaching practice by providing what they expect to achieve from PD prior to designing and organizing PD events and allowing teachers to evaluate or assess the PD events that they have attended.

Teacher Professional Development

Numerous scholars have defined professional growth. Day (1999), for example, characterized it as a process that instructors can undertake individually or cooperatively to review or renew their teaching objectives and to broaden their knowledge, abilities, and emotional intelligence, all of which are essential to their teaching career. Professional development is also characterized as an ongoing learning process in which teachers participate freely to learn how to best adapt their teaching to the requirements of their students (Guskey, 2000). Furthermore, Ganser (2000) and Thomas Guskey (2000) define professional development as the growth of a teacher's profession as a result of formal experiences such as workshops and training courses as well as informal learning such as reading professional publications and watching educational documentaries. According to Richard and Farrell (2005), professional development includes all activities that serve long-term goals and promote development and growth in teachers' understanding of themselves as teachers. In other words, it is a lifelong process that not only helps schools and organizations and facilitates student learning but also aims to improve instructors' personal and professional skills. In summary, those definitions of professional development all agree that it is a continual process comprised of many activities that teachers engage in to improve their teaching methods.

There are numerous reasons why teacher professional development is essential in education. First, English

teachers must keep their pedagogical knowledge and abilities up to date to satisfy the changing needs of schools and institutions (Richard and Farrel, 2005). Furthermore, professional development is said to improve teaching techniques (Villegas-Reimers, 2003). Teacher professional development improves classroom practices and develops teachers' pedagogical expertise (Youngs, 2001). In terms of student learning, it is true that the more successful professional development teachers have received, the further learners move in their learning (Guskey, 1997). Professional development, in addition to having a substantial impact on teachers' work and students' performance, also helps to improve institutions (Richard and Farrel, 2005) and the success of educational reforms (Villegas-Reimers, 2003). Finally, professional development experiences have a major positive impact on teachers, their practice, students' learning outcomes, and educational organizations.

Effective Professional Development

According to Desimone (2011), five characteristics of effective PD must be considered: (1) an emphasis on both subject matter and teaching methods; (2) opportunities for active learning, such as observing, receiving feedback, analyzing student work, or presenting, as opposed to passively listening to lectures; (3) coherence: content, objectives, and activities that are consistent with school curriculum and objectives, teacher knowledge and beliefs, students' needs, and school, district, and state reforms and policies; (4) Continuous duration: Professional development activities should be ongoing throughout the school year and include at least 20 hours of contact time. (5) Collective participation: Professional development activities should be conducted by groups of teachers from the same grade, subject, or institution.

Content Focus

Content refers to what instructors learn through professional development (Garet, Porter, Desimone, Birman, 2001). Professional development content is separated into two major categories: knowledge of the subject matter and understanding of how students learn that content (Guskey & Yoon, 2009). According to Desimone (2009), the most significant aspect of good professional development is pedagogical expertise. Empirical evidence suggests that content-focused professional development can influence instructors' knowledge, teaching methods, or student learning (Garet et al., 2001).

The subject matter and pedagogical knowledge of teachers should be regularly enhanced. Teachers should be helped to comprehend the information they teach more deeply, and the ways pupils learn that content appear to be an important aspect of good professional development (Birman, 2003). A professional development activity can be considered effective in improving teachers' knowledge and skills if it is part of a larger set of opportunities for teacher learning and development, builds on prior knowledge and experience, supports national and provincial standards and assessment, and is consistent with teachers' goals (Birman, 2003).

Active Learning

Active learning is defined as opportunities for instructors to engage in the analysis of teaching and learning (Garet et al., 2001). Observing experts or more experienced teachers or receiving constructive feedback or

suggestions, reviewing or analyzing students' work, scoring or assessing students' work or performance, group discussions on specific topics related to learning and teaching, developing and presenting lessons, coaching and mentoring, or interacting with teachers to discuss steps or instructions are all methods proposed by researchers to promote active learning (Desimone, 2009).

Coherence

Coherence refers to how well professional development aligns with other teacher learning opportunities, teachers' knowledge and views, and school, district, and state reforms and regulations (Desimone, 2011). Effective professional development should address teachers' needs and be conducted in a variety of contexts, both in and out of the classroom (Borko, Jacobs, & Koellner, 2010). An effective professional development program should be designed in accordance with not only how individual teachers learn but also with how schools as organizations influence and are influenced by teachers' learning and improvement (King & Newman, 2001).

Duration

Professional development should take up a significant amount of time, and that time should be well organized, carefully planned, consciously directed, and focused on subject, pedagogy, or both (Birman et al., 2000). One full academic year appears to be appropriate because it provides teachers with more opportunities to learn, implement, reflect, and re-implement, forming a cycle of experimentation, particularly in gaining constructive feedback on what teachers have learned and implemented (Daloglu, 2004). Several studies have found that a sufficient number of professional development contact hours has a favorable impact on teacher outcomes such as attitude, readiness, and teaching practice (Banilower, Heck, & Weiss, 2007; Supovitz & Turner, 2000).

Collective participation

The extent to which instructors from the same school participate in the same learning opportunities is referred to as collective participation (Hochberg & Desimone, 2010). Studies have also found a link between collective engagement and instructional practice (Desimone et al., 2002; Penuel et al., 2007). According to Desimone et al. (2002), professional development is more effective in improving teachers' classroom practices when participants are from the same school, department, or grade. Penuel et al. (2007) discovered that when participation in professional events included all teachers in the department or grade groupings, or all teachers in the school, teachers reported more changes. Collective participation - teachers from the same school, department, or grade level participating in a professional development program - has been shown to be beneficial in terms of discussing teaching concepts, skills, and problems in the same context, sharing curricular issues, dealing with students' needs across classes and grade levels, and contributing to a shared professional development community (Birman et al., 2000).

Five Critical Levels of Professional Development Evaluation

According to Guskey (2000), there are five levels of professional development evaluation, which are

hierarchically arranged as follows:

Participants' Reactions

The first level of evaluation focuses on the reactions of participants to the professional learning experience. This is the most prevalent sort of professional learning evaluation and the simplest type of data to collect and analyze. At this stage, the information gathered from participants focuses on their own experiences. For example, the poll asks whether the PD event's content and materials make sense; whether the activities are relevant and well-planned; and whether the speaker or presenter is knowledgeable, credible, or helpful. It is also associated with the surroundings, such as the facilities or how organizers care for attendees.

Data on participant reactions is typically obtained through questionnaires administered at the end of a program or activity or through online surveys sent later via email. These questionnaires and surveys often include rating-scale items as well as open-ended response questions that allow participants to provide more individualized and thorough feedback. Measuring participants' initial happiness yields data that can be used to improve the design and facilitation of professional learning in meaningful ways. Furthermore, favorable responses from participants are frequently required as a prerequisite for higher-level evaluation outcomes.

Participants' Learning

Participants should acquire something from their professional learning experiences in addition to enjoying them. Level 2 learning focuses on measuring participants' new knowledge, abilities, and maybe attitudes (Guskey, 2002). Because it is anticipated that particular learning goals will be measured at Level 2 of evaluation, professional learning leaders or organizers must establish signs of successful learning before activities begin. Evaluators also assess both positive and negative unintentional learning effects. Professional learning that includes collaboration between teachers and school administrators, for example, can generate a strong sense of community and a sense of shared purpose among participants (Supovitz, 2002). If evaluators are concerned that participants may already have the necessary knowledge and abilities, they may need some sort of pre- and post-assessment. Analyzing this data provides a foundation for enhancing the content, presentation, and organization of professional learning.

Organizational Support and Change

At Level 3, the emphasis shifts away from participants and onto organizational aspects that may be critical to the success of professional learning events. Level 3 questions concern organizational traits that are required for success. For example, whether professional learning promoted changes that were aligned with the school's or organization's mission, whether changes were supported at the building and district levels, and whether successes were recognized and shared by the school or organization. These factors frequently play a significant role in determining the success of professional learning.

Participants' Use of New Knowledge and Skills

Level 4 questions focus on whether the knowledge and skills participants gained through PD make a difference in their teaching practice. At this level of review, the key to acquiring useful data is to assess both the extent and quality of implementation. These data, unlike Levels 1 and 2, cannot be obtained at the end of a professional learning program or activity. Participants require adequate time to adopt new ideas and practice them in their respective situations. Because implementation is frequently a process, evaluators may require time to think about and assess PD. These data may be collected through surveys or organized interviews with participants and their school leaders, depending on the goals of the PD organizers. Participants may be invited to conduct oral or written personal reflections or examinations in the form of journals or portfolios. Direct observations by qualified observers or digital recordings can provide the most reliable data, which can be used to assess teachers' current levels of implementation. It also assists professional development designers in reorganizing future programs and activities to allow for more consistent implementation.

Students' Learning Outcomes

Level 5 questions are concerned with whether or not PD has an impact on pupils or benefits them in any way. The specific student learning outcomes of interest will, of course, be determined by the goals of that individual professional learning initiative. In addition to the stated goals, the program may have significant unexpected consequences. It is assumed, for example, that pupils' average scores on large-scale tests increased, but so did the school dropout rate. Mixed results are common in efforts to enhance education, emphasizing the necessity of including several measures of student learning in all evaluations (Guskey, 2007).

Furthermore, because stakeholders' faith in various sources of evidence varies, it is unlikely that any single sign of success will be appropriate or sufficient for all. Participants can incorporate numerous sources of evidence when providing appropriate data for judging the effects of professional development programs. Furthermore, assessors must carefully match these data sources to the requirements and perceptions of various stakeholder groups (Guskey, 2012). Professional development that is effective should result in improvements or advancements in students' learning outcomes. Assessment results, portfolio evaluations, marks or grades, or standardized examination scores should all be included in this category. Other affective outcomes to evaluate include students' attitudes, attendance rates, dropout statistics, and participation in school activities (Guskey, 2003). If a professional development program has a direct impact on student behavior, teachers will be more likely to support it (Daloglu, 2004).

Method

Results instruments

This is a descriptive study that looked into EFL teachers' expectations and satisfaction with professional

development activities. This study used both quantitative and qualitative methodologies to investigate EFL teachers' expectations and satisfaction with professional development activities. According to Creswell (2013), descriptive studies that use both quantitative and qualitative methodologies provide an in-depth understanding of research concerns. A five-point Likert scale questionnaire was utilized to collect quantitative data on EFL teachers' expectations and satisfaction with PD activities. To learn more about EFL teachers' expectations and satisfaction with PD activities, a semi-structured interview was carried out.

Table 1. Research Questions and Instruments

Research questions	Methods/Instruments
1. What are EFL teachers' expectations about professional development activities?	Quantitative: Questionnaires Qualitative: Interviews
2. What are EFL teachers' satisfaction levels of the professional development activities that they have attended?	Quantitative: Questionnaires Qualitative: Interviews

This study used a mixed-method approach to strengthen the validity of the data and provide a more in-depth knowledge of EFL teachers' expectations and satisfaction with PD activities. A questionnaire is stated to be one of the most prevalent data collection tools since it is particularly capable of acquiring a great amount of information from a wide sample of participants quickly. Furthermore, open-ended interview questions can be used to gain a thorough grasp of the topic.

The researcher employed two instruments to answer the two research questions: (1) a questionnaire to identify EFL teachers' expectations and satisfaction with professional development, and (2) interviews to gain more insight into EFL teachers' expectations and satisfaction with professional development activities.

Participants

For the study, 50 teachers (14 men, 28%; 36 females, 72%) ranging in age from 22 to 39 years old working at an English language facility were invited to complete a questionnaire. The majority of the participants have been teaching English for at least two years. 40% of participants have two to five years of teaching experience, whereas 36% have more than five years of English teaching experience. The remaining 24% have fewer than two years of experience teaching English. In terms of teaching qualifications, the participants who hold a Masters' Degree in Language Teaching account for 26%, and the remaining participants (64%) have a bachelor's degree in English Language Teaching.

Six previous questionnaire respondents were specifically invited to engage in a follow-up interview to acquire more in-depth knowledge of their expectations and satisfaction with PD activities. Purposive sampling was also used to uncover similarities and differences among distinct groups of teachers with varying years of teaching experience.

Results

The reliability of the questionnaire

The questionnaire was distributed to 60 teachers teaching at a foreign language center with the goal of evaluating the professional development expectations and satisfaction levels of EFL teachers. Only 50 of them, however, submitted their responses.

The questionnaire results were entered into SPSS version 20.0 for quantitative data analysis. A scale test was then done to ensure the instrument's dependability. The questionnaire was extremely reliable (Cronbach's alpha =.943) in collecting data for the study, as demonstrated in the following table.

Table 2. The Reliability of the Questionnaire

Instrument	Cronbach's Alpha	No. of items	No. of respondents
Questionnaire	.943	68	50

Professional Development Expectations of EFL Teachers

Results from questionnaires

Descriptive Statistics Tests were used to obtain the overall mean score (M) of EFL instructors' expectations and the means scores of five parts of PD activities in order to study what EFL teachers hope to achieve from PD activities.

The overall mean score of EFL teachers' expectations of the PD activities was checked using a Descriptive Statistics Test. The total mean score of EFL teachers' expectations about PD activities was 4.10 (M = 4.10), with a .70 (SD =.70) difference between the minimum and maximum values. In other words, the findings suggest that EFL teachers have high expectations for professional development activities.

According to the results, EFL teachers have high expectations for the content concentration of professional development activities (mean = 4.40, standard deviation = 0.65). The mean scores for the two elements comprising opportunities for active learning (M = 4.08, SD = 0.73), and coherence of the PD content (M = 4.18, SD = 0.69), indicated that EFL teachers have high expectations for these elements. The mean score for the duration of PD activities (M = 3.91, SD =.73) was significantly lower than the scores for the other variables, and the mean score for selective participation (M = 3.30, SD =.80) was the lowest.

The results showed that most of the participants surveyed have very high expectations of the content focus of PD activities, including planning effective lessons, creating a meaningful and supportive learning environment, learning new techniques to apply directly in the classroom, designing effective assignments and activities, and improving students' outcomes. They also wished to master instructional methodologies, classroom management,

adapting lesson plans to students' needs and interests, and providing clear and easy instructions. Moreover, hoped to have opportunities to increase their English proficiency from PD activities, give students more meaningful opportunities to speak English, and adapt resources successfully.

Table 3. Descriptive Statistics of EFL Teachers' Expectations of PD Activities

Expectations	N	Min	Max	Mean	SD
Content focus	50	2.77	5.00	4.40	.65
Active learning	50	2.50	5.00	4.08	.73
Coherence	50	2.60	5.00	4.18	.69
Duration	50	2.00	5.00	3.91	.73
Selective participation	50	1.50	5.00	3.30	.80
Overall expectations	50	2.44	5.00	4.10	.70

Regarding opportunities for active learning, most participants had extremely high expectations of witnessing more experienced teachers teaching their actual courses, designing, and demonstrating lessons, and discussing how to improve teaching practice with other teachers. Participants said they would like to be observed by experts to receive constructive criticism for future changes. Co-teaching with other teachers and being mentored by experienced teachers are also thought to help EFL teachers improve their teaching technique. Teachers, on the other hand, do not expect much from examining and scoring students' collaborative work in PD activities. All participants agreed that the coherence of the PD content should reflect the requirements of students. The results indicated that they have high expectations for the content of professional development activities, which should be designed to address the learning requirements of specific grade levels or schools and be consistent with school curriculum and goals. It was revealed that many of participants believed that PD activities should be consistent with instructors' knowledge and beliefs.

What is remarkable about the above table is that strongly expect that PD activities should be organized throughout the school year and provide teachers with more opportunities to practice newly acquired knowledge and skills. To be effective, however, half of the teachers surveyed believe that the duration of professional development activities should comprise 20 hours of contact time. On the other hand, instructors believe that the selective participation is not very important compared to other factors. However, some respondents believe that selective participation in PD activities should impart the same skills, the same grade but from various geographic regions. Briefly, the results of the questionnaires revealed that EFL instructors have high expectations for the content, coherence, opportunities for active learning, and duration of professional development (PD). However, they asserted that selective participation is not a significant factor in PD.

Results from interviews

The interview data provided additional insight into the expectations of EFL instructors for PD activities. Overall, the responses were quite consistent with the questionnaire results. When asked about their expectations for the PD content perspective, all interviewees reported having high expectations for this perspective. Both novice and experienced teachers—reported that they anticipate creating a supportive and meaningful learning

environment for students to have more opportunities and real-world reasons to speak English. One participant said:

“I strongly expect that I can learn how to give students meaningful opportunities and more meaningful reasons or contexts to speak English in the classroom.”

83.3% of teachers, including both novice and veteran educators, are optimistic about the improvement of lesson planning and the design of appropriate activities and assignments for effective content instruction.

“Regarding to the content of PD activities, I expect to improve lessons planning and designing appropriate activities to meet the lesson’s objectives and have more ideas to design lessons to teach more effectively.”

Additionally, EFL teachers with less than five years of teaching experience expressed a desire to increase their flexibility in changing lesson plan activities to better meet the requirements or interests of their students.

“I expect that I can learn how to flexibly change or adapt the lesson plans while teaching to meet students’ interests and engage and encourage students to learn.”

50% of EFL instructors with less than two years of teaching experience or more than five years of teaching experience believe that improving students' learning outcomes is essential.

“I also hope to improve students’ outcomes, know what students need to design more effective lessons”.

Additionally, EFL instructors are expected to use and adapt instructional materials effectively, as well as improve their instruction-giving and classroom management skills.

“Using and adapting materials and applying ICT to teach are also my expectation.”

The findings of the study showed that EFL teachers have high expectations of PD, such as lesson planning, designing effective activities and assignments, creating supportive learning environments, giving students meaningful opportunities and reasons to speak English, and emphasizing student learning outcomes.

Six EFL teachers agreed that they expect to have opportunities to observe, be observed, and co-teach with more experienced teachers to receive constructive feedback for improvement.

“I expect to observe more experienced teachers, especially teachers who teach the same skills first and then other skills as well.”

Four out of six EFL teachers also need more time and opportunities to share teaching experience with each other, discuss how to improve teaching practices, and give advice to solve problems or difficulties.

“If possible, I hope that teachers can spend time sharing experience and discussing with each other on how to improve our teaching practice.”

Two of six teachers, accounting for 33.3% of the interviewees, wish to have a mentor who helps them in designing lessons, co-teaching, observing, and giving feedback during the course.

“I also hope to be mentored by a more experienced teacher, especially when I first challenge myself with a total new class to receive constructive feedback.”

Additionally, EFL teachers shared that there should be more demonstrations and practice during the PD programs so that participants can apply what they have learned and get constructive feedback from both colleagues and trainers. EFL instructors anticipate co-teaching, sharing, and discussing teaching challenges,

observing, and being observed by more experienced teachers, and receiving constructive feedback.

Regarding the coherence of PD content, all participants (100 percent) agreed that PD content should be consistent with student needs and school objectives.

“My first expectation is that PD content should be consistent with students’ needs and participants’ needs, and the school goals as well.”

Nevertheless, 33.3% of participants indicated that the content of PD should be consistent with instructors' needs and knowledge to meet their expectations and requirements. Lastly, two teachers revealed that professional development (PD) activities should be tailored to specific groups of English language learners to best meet students' requirements or resolve their learning problems or challenges to improve English proficiency. In short, EFL teachers suggested that the content of PD activities should be consistent not only with learners' needs and school goals but also with teachers' knowledge and requirements. The content should also be tailored to specific groups of students so that teachers who participate in professional development can implement what they've learned to improve the outcomes for their students of interest.

“I hope that the content from PD activities should be designed for certain groups of participants so that teachers can easily discuss and learn from each other. For example, teachers of kids or teenagers.”

EFL teachers' expectations regarding the duration of professional development activities were that they would be ongoing throughout the year and allow participants ample time to implement, practice, and reflect on what has been successful and what needs improvement prior to learning new knowledge or skills.

“PD activities should be organized once every two weeks so that participants have more time to read materials before, discuss, and reflect. After that, teachers should be given more time to practice new knowledge, apply in designing lessons, and get feedback.”

In terms of selective participation, four EFL teachers (66.67%) believe that participants in professional development programs should share common backgrounds, such as teaching at the same school, the same levels of students, or the same language abilities, so that they can share common problems or teaching experiences. On the other hand, 33.33 percent of teachers with two to five years of experience indicated that they prefer participating in professional development activities with participants from diverse backgrounds, teaching different groups of students so that they can learn from them.

“I think attending workshops with teachers who teach the same skills is important because they have a lot in common to share and understand the curriculum and students as well.”

In conclusion, the questionnaires and interviews revealed that EFL teachers have high expectations for the content of professional development, the opportunities for active learning, and the coherence of PD with students, teachers, and institutions. Specifically, EFL instructors want to increase their pedagogical knowledge by observing more experienced teachers. In addition, they expect that PD content is consistent with students' needs and teachers' knowledge and is ongoing throughout the year, and that teachers who teach the same students or skills participate in PD together.

EFL Teachers' Satisfaction about the PD Activities that they have attended

To determine the extent to which EFL teachers are satisfied with the elements of the professional development activities they have participated in, Descriptive Statistics Tests were administered to determine the aggregate mean score of EFL teachers' satisfaction and the means score for each cluster.

The results indicate that EFL teachers were satisfied with the content emphasis of their professional development activities ($M = 3.84$; $SD = .78$). The coherence of the PD content ($M = 3.72$; $SD = .77$) and duration of PD activities ($M = 3.60$; $SD = .83$) are the means of two elements. It meant that EFL instructors were very pleased with those components. The mean score for selective participation was quite low ($M = 3.52$; $SD = .69$), as was their level of satisfaction with opportunities for active learning ($M = 3.44$; $SD = .89$).

Table 4. Descriptive Statistics of EFL Teachers' Satisfaction

Satisfaction	N	Min	Max	Mean	SD
Content focus	50	2.00	5.00	3.84	.78
Active learning	50	1.50	5.00	3.44	.89
Coherence	50	2.00	5.00	3.72	.77
Duration	50	2.00	5.00	3.60	.83
Selective participation	50	2.00	5.00	3.52	.69
Overall satisfaction	50	1.89	5.00	3.67	.80

Results from questionnaires

Results showed that participants were satisfied with the focus of professional development activities which enabled them to construct effective assignments and activities for teaching content, improve their English proficiency, plan effective lessons, create a meaningful and supportive learning environment, learn more instructional strategies and new techniques, improve student learning outcomes, and provide students with more meaningful opportunities to communicate in English. The participants also agreed that the content focus has helped them improve their ability to manage classroom activities, provide clear and simple instructions, and adapt lesson plan activities to students' needs and interests.

Regarding the opportunities for active learning, participants agreed that the PD activities provided teachers with more opportunities to observe and be observed by experts or more experienced teachers modeling or teaching to receive constructive feedback and interact with other teachers to discuss how to improve their teaching practice. Half of teachers agreed that professional development activities have helped them devise and demonstrate lessons and be mentored by more experienced teachers. On the other hand, they are not very satisfied with the opportunities that PD activities have provided them to co-teach with other teachers and grade students' work with other teachers.

Most of participants agreed that the professional development activities they attended were consistent with teachers' beliefs and knowledge, students' needs, as well as the school curriculum and objectives. Besides, more

than half of the participants felt that the professional development activities addressed the learning requirements of specific grade levels or schools and were consistent with school, district, and state reforms and policies.

The results indicated teachers are satisfied with the duration of PD activities; more specifically, teachers surveyed agreed that PD activities have been ongoing throughout the school year and that they have been given more opportunities to practice newly acquired skills over time. In contrast, some participants reported that the duration of their PD activities included at least 20 hours of contact time, which means that they are not very satisfied with the duration of PD. Additionally, over fifty percent of participants indicated that they were satisfied with PD activities because participants were from the same institution and grade, and they were imparting the same English skills.

Results from interviews

The interview data provided additional insight into the levels of satisfaction EFL instructors have with PD activities. Overall, the responses were quite similar to the questionnaire results.

When asked how satisfied EFL instructors were with the content of professional development activities. All participants were satisfied with the PD material, as indicated by the results. To be more explicit, three of the teachers (50%) indicated that they were extremely satisfied with the content of the professional development activities in which they participated—up to 90 percent satisfaction. The data from the interviews revealed that all EFL instructors, both novice and experienced (100% of interview participants), were satisfied with the lesson planning enhancements resulting from PD activities.

“I have been satisfied about lesson planning and applying appropriate activities to teach content effectively.”

Concerning how to create a supportive learning environment and provide students with more meaningful opportunities to speak English, the majority of teachers reported being satisfied with the professional development activities designed to improve their techniques or skills.

“I have been satisfied because I can learn how to create supportive learning environment for students to practice English, motivate them a lot, be more creative, step into students’ world, and give students more meaningful reasons to speak, especially when teaching young learners.”

In addition, more than half of the participants verified that professional development activities have emphasized improving student learning outcomes.

“I have also been satisfied with improving students’ outcomes. I learned to design specific objectives before and prioritized students’ outcomes and tried to link activities with objectives mentioned. I also received feedback and reflected my lesson for improvements.”

The findings regarding EFL teachers' levels of satisfaction with the content of professional development activities According to fifty percent of interview participants, their classroom administration skills have improved as a result of applying what they have learned from PD activities.

“Classroom management has also been improved. I have learned to get students engaged and manage

them effectively.”

Besides, 33.33% of participants claimed that PD activities provided them with opportunities to share teaching experience and teaching materials, discuss how to enhance teaching methodologies, and jointly solve pedagogical problems. However, 33.33 percent of EFL instructors who participated in professional development programs were not satisfied with the opportunities to use and adapt teaching materials effectively.

“However, I haven’t been satisfied about techniques to flexibly change the lesson plans whiling teaching and need more practice.”

In conclusion, the findings regarding EFL teachers' levels of satisfaction with the content of PD activities revealed that EFL teachers are highly satisfied with improving lesson planning, creating a supportive learning environment, providing students with more real-life opportunities or reasons to speak, learning more techniques and instructional strategies, and having opportunities to share and learn from colleagues.

EFL teachers feel satisfied with the opportunities for active learning from PD activities. They reported that they have had opportunities to share teaching experience and discuss how to improve teaching practice, but they need more opportunities to observe more experienced teachers to learn.

“In general, I have been satisfied with opportunities for active learning because the school let us learn and practice step by step: theories first, then plan lessons, revise, observe and feedback.”

In terms of the coherence of PD content, EFL teachers have been highly satisfied with the consistency of PD content with students’ needs, teachers’ needs and knowledge, and schools’ goals.

“I have been satisfied about the content of PD which is consistent with my knowledge and belief in teaching. It is not too easy and not out of reach as well.”

In terms of the duration of PD activities, all the participants feel satisfied that PD activities are ongoing throughout the year, but two of the participants who have less than five years of teaching experience prefer having more time to practice new skills or knowledge before learning new ones. Additionally, the participants reported that they can learn a lot from the participants because they are experienced and willing to share with each other.

PD activities are on-going throughout the year. There are a lot of sharing sessions or workshops for teacher to attend.

In conclusion, the questionnaires and interviews revealed that EFL instructors were pleased with the course's content, coherence, and selective participation. In particular, EFL instructors have been enhancing their pedagogical knowledge and gaining knowledge from more experienced teachers. The PD content has been aligned with the requirements of students, the knowledge of teachers, and the school's objectives. However, EFL instructors have been dissatisfied with the opportunities to observe more seasoned educators. In addition, they need more time to practice new skills acquired through PD activities before acquiring new ones in order to determine their efficacy.

Discussion

This study examined EFL teachers’ expectations and satisfaction levels with professional development activities

that they have attended at a foreign language center. Results showed that there are both similarities and differences between this study's findings and the conceptual framework of the Five Critical Levels of Professional Development Evaluation (Guskey, 2000). EFL teachers from this study expect to improve their teaching knowledge and skills by improving lesson planning and learning more teaching techniques or instructional strategies. This is consistent with studies conducted by Eksi and Aydin (2003) which indicated that EFL teachers taking part in PD activities hope to improve their teaching skills and methods through PD activities. Knapp (2003) also supported the idea that effective PD content builds on teachers' pedagogical content knowledge.

EFL teachers hope to improve students' learning outcomes by applying what they have learned from PD activities. This is consistent with studies done by Noom-Ura (2013) which revealed that PD activities would put a high emphasis on strategies for helping students improve their English skills. Additionally, Knapp (2003) revealed that the content of PD should be focused on students' learning. However, EFL teachers do not have high expectations to improve English language proficiency through PD activities because they believe English is used as a tool to communicate in PD activities and teachers can improve themselves or participate in other activities. This result is not consistent with a study by Noom-Ura (2013), which indicated that PD activities would help teachers improve their language proficiency for only non-native-speaking teachers and that PD should focus on improving teachers' English proficiency.

This study found that EFL teachers expect to have more opportunities to observe or co-teach with more experienced teachers to learn and receive constructive feedback for improvements. The content of PD activities should be consistent with students' needs, teachers' knowledge, and schools' goals. The duration of PD activities is also one of the EFL teachers' expectations, and EFL teachers in this study acknowledged that selective participation is not very important to them, but the content and trainers are supposed to be more significant in PD activities. The results from this study share both similarities and differences with other related studies about professional development needs or expectations.

This study highlights the detailed satisfaction levels of EFL teachers about the professional development activities that they have attended. Findings from both questionnaires and interviews generally showed that EFL teachers have been quite satisfied with the PD activities that they have participated in, but their satisfaction levels are different. Generally, EFL teachers have been most satisfied with the content of PD activities offered by the school, such as lesson planning, designing effective assignments and activities, creating a supportive learning environment, and learning new teaching techniques or instructional strategies. Additionally, EFL teachers have been satisfied with the coherence of PD activities, which is consistent with students' needs, teachers' needs, and schools' goals. Finally, teachers have been satisfied with the duration and frequency of PD activities offered by the schools, which are ongoing throughout the year.

The most important details in this text are that EFL teachers have not been very satisfied with opportunities to learn from other more experienced teachers by observing and co-teaching. They also indicated that they need

more opportunities to learn from experienced teachers systematically, which means that novice or less experienced teachers need support from experts or experienced teachers in lesson planning, observing, analyzing lessons, giving constructive feedback, adapting more effective and appropriate lesson plans for the next class, and reflecting on their effectiveness. Factors such as different ages, genders, educational qualifications, and years of teaching experience do not have significant impacts on EFL teachers' expectations and satisfaction levels of PD activities. Results showed that EFL teachers' levels of satisfaction about PD activities were quite high, but their satisfaction levels were not very well matched with their expectations of PD activities. For example, they expect many opportunities to observe more experienced teachers or experts teaching, but they have not been very satisfied about that.

Conclusion

The research was conducted with 50 participants working in a foreign language center in Can Tho City. Two types of instruments were used to collect data: questionnaires and interviews. Results showed that EFL teachers have high expectations of PD activities, such as the content focus, the opportunities for active learning, the coherence of PD, and the duration of PD. However, they do not expect much from the selective participation of PD. EFL teachers also expect to learn from more experienced teachers or experts through observations, coaching, or mentoring, and that the PD content is consistent with students' needs, teachers' needs, and schools' goals.

Additionally, the participants in PD should teach the same levels of students or the same language skills. Results showed that EFL teachers have been satisfied with the PD activities offered by the school. They were most satisfied with the content focus, coherence of PD content, and duration of PD. Active learning and participation were the two aspects in which teachers had low satisfaction levels. PD has helped them design assignments and activities to teach content effectively, strengthen their English proficiency, plan effective lessons, create a meaningful and supportive learning environment, learn more instructional strategies and new techniques, improve students' learning outcomes, and provide students with more opportunities to communicate in English. PD content has been consistent with teachers' beliefs and knowledge, with school curriculum and goals, and with students' needs. However, they suggested that there should be more opportunities for teachers to observe and practice.

Recommendations

On the basis of the study's limitations, the researcher proposed two recommendations for future research. For the study to be generalizable, it is essential to increase the number of participants. The topics can be EFL instructors from various language centers or regions of the Mekong Delta. It would enable the researcher to identify similarities and differences between groups or contexts, allowing for the implementation of effective and high-quality programs that address teacher learning expectations. Another suggestion is to triangulate study data from

various stakeholders, such as teachers, school leaders, and educational administrators, in order to obtain a deeper understanding of teachers' professional development expectations.

A Study on the Effectiveness of Chunk Teaching Method in English Writing Teaching in China's Middle Schools

Yiyang Shen

Nanjing Sifang Primary School, China

Wenxuan Shi

angxi University of Science and Technology, China,  <https://orcid.org/0009-0003-7058-550X>

Abstract: Anchored in the researchers' investigation and experience during the internship at a middle school in Nanjing, Jiangsu Province, this dissertation, carried out under the guidance of the theory of chunk teaching method, sorts out the current research results and findings on chunk teaching method, and then analyzes the differences between the chunk teaching method and other traditional writing teaching methods from the perspectives of contents and functions, which draws a conclusion that the utilization of chunk teaching method in China is of great significance to the improvement of middle school students' abilities in English writing. Before writing this paper, researchers conducted a series of preliminary preparations such as questionnaires, interviews and the same-topic writing tests. With that in mind, this dissertation reveals the chunk teaching method's capability of more or strengthening middle students' English writing ability, and thus demonstrates the effectiveness of chunk recitation in English writing teaching in China's middle schools, which provides reference and critical materials for scholars in this field.

Keywords: Chunk Teaching Method, Middle School, English Writing Teaching, Effectiveness

Citation: Shen, S. & Shi, W. (2023). A Study on the Effectiveness of Chunk Teaching Method in English Writing Teaching in China's Middle Schools. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1330-1342), Cappadocia, Turkiye. ISTES Organization.

Introduction

As we all know, English writing is one of the most fundamental linguistic skills of the English study, which could effectively review students' comprehensive linguistic ability, which is also an important and difficult point of English teaching. The New English Curriculum and the high school and college entranced examinations attach more importance to English writing. That teachers feel difficult to teach writing and students feel tough to write, so far, has been the largest and the most difficult problem in the its teaching. In recent years, several studies have demonstrated that, as a special half-fixed linguistic way of input, chunk is convenient for students to recite and employ as a whole, which not only promotes the accuracy, fluency and logicity of language usage

but also reduces the negative transfer of mother tongue, of great significance to teach English writing. Therefore, this research attempts to regard chunk as the entry point to explore whether chunk recitation can help improve the writing ability of middle school students.

Literature Review

With the comprehensive development of quality education, the new curriculum standard puts forward new requirements for the English writing in middle school. English writing has gradually become an important part of English teaching, and students' proficiency in English can be fully reflected in English writing. Therefore, improving students' writing level is a subject worthy of in-depth study by middle school English teachers.

Michael Lewis puts forward the classification of chunk and advocates that chunk should be regarded as the basic unit of language teaching in that its grammar structure does not need to be paid attention to, which effectively accelerates the process of understanding and producing linguistic information and greatly improves the correctness and fluency of language usage in his book *The Lexical Approach* (1993) [1], the foundation of chunk teaching method. Chinese scholars, like Guan Xiuli (2013) and Qiu Zhonghai (2013) [2], Qi Wenhui (2019), have conducted data analysis and quantitative study to confirm that chunk makes remarkable contributions to language teaching, especially writing teaching [3]. So, importance should be attached to the effectiveness of chunk recitation in English writing teaching in middle school.

Although significant achievements have been made in recent years in the exploration of chunk teaching method and its usage in English writing teaching, researchers still have a long way to go where more studies are required to be carried out in order to deeply explore the essence and application of chunk teaching method and solve the potential problems that may occur in the future.

Chunk Teaching Method

In 1993, Micheal Lewis finished his book *The Lexical Approach* in which he put forward the idea that language is not composed of traditional grammar and vocabulary, but made up of multi-word prefabricated chunks. The generation of sentences in a language does not rely on grammar to organize words, but depends on some pre-programmed chunks. It can be said that chunk is the key to making the output of a language convenient, fast and fluent. Several fields, such as the second language acquisition (SLA), the cognitive psychology and the vocabulary teaching, have attached emphasis on this topic, namely, the theory of chunk teaching method.

How to Teach Writing

How to Teach Writing (2004), a monograph written by Jeremy Harmer for English teachers who are interested in writing, mainly discusses different aspects of writing, for instance, writing as a process, describing writing

text, writing in the language classroom, nuts and bolts building the writing habit [4]. Beth Means and Lindy Lindner's *Teaching Writing in Middle School Tips, Tricks, and Techniques* (1998) deals with English writing teaching in middle school [5], which holds the view that the day-to-day writing is both an art and a craft, designed to help both teachers and students to explore the basic aspects of writing.

Relevant Studies and Researches on Chunk

Chunk's important role in language learning, written by Yang Liying (2015), has raised great concern among linguistic scholars [6]. Becker's *Idiosyncratic Chunks* (1975), Wilensky's *Phrasal Approach* (1984), Zernick and Dyer's *Large Lexicon* (1987), Nattinger and Decarrico's *Lexical Phrases* (1992), Michael Lewis' *The Lexical Approach and A Lexical Approach* have also laid a solid foundation for the development of chunk teaching method.

Rao Tianshuang (2010) confirms the far-reaching impacts upon language teaching exerted by chunk [7] by discussing the theory of chunk approach and the dual system of language, and pointing out that chunk approach is one of the most important methods in modern English teaching, which provides a new perspective for language teaching, especially English teaching.

Based on the theoretical essence of chunk approach, Qi Wenhui (2019) mainly analyses how to implement chunk approach to establish students' chunk awareness to enable them to master more chunk knowledge and thus improve the accuracy, fluency and authenticity of spoken and written English.

Chen Donglan (2015) combines the theory of language awareness with the traditional chunk teaching method in order to develop a new model of chunk teaching method driven by language awareness and carry out researches in teaching practice [8], and makes a series of analysis to draw a conclusion that the new combined teaching methods of English writing performs much better than the traditional one.

Yan Lizhu (2012) points out that many students have accumulated a certain amount of vocabulary, which does not mean that they are capable of mastering the way to use the words in a reasonable manner [9]. They are very proficient in the meaning and spelling of independent words, but poor in English writing, such as collocation errors, lack of coherence among sentences or paragraphs, or Chinglish expressions. Lexical chunk makes these problems no more problems in which case students' English writing ability has been significantly improved, with their interest in English stimulated.

Chen Xinzhou (2016) studies on a different aspect, namely, the negative transfer of mother tongue in middle school students' writing. Also, he analyses the existing problems in middle school students' English writing and thus emphasizes the important role of chunk teaching method in English writing teaching, as well as its advantages in cultivating students' ability of dialectical thinking in English [10].

Similarly, Jiang Wenfang (2014) pursues research in a different direction. She enumerates some poor performances in middle school English writing, makes a simple analysis of the causes, introduces the chunk theory and its important role in middle school English writing teaching and solves the problem in practical application [11].

Based on the chunk theory, Dong Jing (2018) takes 110 eighth graders as the research object, makes use of the methods of questionnaire and interview to conduct an empirical study with the time span of a whole semester [12]. The result illustrates that chunk approach apparently helps students change their writing attitude, improves their English writing level to a certain extent and enhances the accuracy, readability and flexibility of their expressions in English.

According to the view of Bai Jin (2015), a chunk is a multi-word combination that integrates pragmatic and semantic functions [13], besides which a mind map can make the abstract memory and thinking visualized and leave the content of memory deep, fast, efficient and organized. With the help of the mind map and chunk teaching method, English teachers can extend the chunks related to the key words to diverge students' thinking, cultivate their pioneering spirits and practical abilities, and enable them incorporate or assimilate new knowledge into the original knowledge system.

Zhu Yuyan (2011) focuses on students' lack of vocabulary and good reading ability [14]. What's more, Singer (2011) figures out that in the process of reading, the understanding of lexical meaning accounts for 39% of the entire reading ability. In addition, Wray (2011) believes that the primary function of chunks is to reduce the level of difficulty in coping with foreign language.

Nevertheless, the traditional teaching mode attaches more importance to the single grammar and vocabulary teaching, that is, the training of basic skills, which neglects the training of English writing skills and logic, and thus makes it common for English expressions to be not authentic in Chinese middle school students' English compositions.

After Wang Jinnian's (2015) constant effort of researching, he finally draws the conclusion that chunk teaching method is of great advantage to the teaching and learning of English writing [15].

Chunk Teaching Method

Origin and Development of Chunk Teaching Method

Since the 20th century, influenced by structuralism, most linguists have overstated the role of grammar in learning a language, which made language learning rigid and unsmooth. What's worse, they failed to fully reveal the nature of language. Since the 1970s, an increasing number of researchers have found that the basis of language is not abstract rules, but concrete "chunks". In 1976, Bolinger pointed out that there is always a large

number of “prefabricated chunks” in language. In 1984, Wilensky et.al expressed their views on “chunks” in an academic work named *Phrasal Approach*. In 1987, Zernick and Dyer completed a book called *Large Lexicon* in which “chunk” is discussed. In 1992, Nattinger and Decarrico finished their linguistic work *Lexical Phrases*, which exerted a profound impact upon the birth and development of chunk teaching method. In 1993, Micheal Lewis finished his monograph *The Lexical Approach*, recognized as the theoretical basis of chunk teaching method, in which he pointed out that the generation of sentences relies on pre-programmed chunks under certain conditions. In 2004, He Anping put forward three functions of corpus linguistics in foreign language teaching: 1) to provide abundant teaching resources; 2) to open up an exploratory learning model of interpersonal interaction; 3) to cultivate the ability of empirical teaching and research. With the joint efforts of scholars around the world, the chunk teaching method goes further and further. After decades of research and verification, chunk teaching method as an independent language teaching method has been developed into a popular teaching concept.

Advantages of Chunk Teaching Method

Traditionally, language is viewed as lexicalized grammar, the rules of which generate vocabulary. However, with the development of linguistics, especially corpus linguistics, an increasing number of researchers realize that language output is not a process of being subject to syntactic rules, but that of extracting phrasal units from memory. Linguists, represented by Lewis, considering that language is not composed of lexicalized grammar but grammaticalized vocabulary, advocate the application of chunk in language teaching to improve learners’ language level.

Enhance Students’ Pragmatic Ability

As we all know, sentences are made of chunks. If a learner masters different chunks of the same meanings and functions, he or she will be able to choose the most suitable ones to apply, according to certain language environment, thus, will, to some extent, improve both the sense of language and pragmatic ability.

Strengthen the Fluency, Accuracy and Authenticity of Language Usage

The fluency, accuracy and authenticity of language usage are based on the utilization of different chunks rather than the obedience of sentence and grammatical regulations. If learners can select the most suitable chunks into practice according to different language environment, they don’t need to waste time on forming the correct phrases and sentences, which simplifies the process of organizing words. When it comes to writing, the most suitable chunks are not only the most authentic ones in that they are most fit to the language environment but also the most accurate ones because they are closest to the meaning people want to convey. In terms of speaking, when chunk teaching methods are utilized, several chunks applied to each language environment immediately will occur to the learners in which case they don’t need to think and speak fluently.

Relieve Pressure and Stimulate Interest

The learning of chunks can, to some extent, improve the phenomenon that due to the limited ability of language output, learners fail to know how to express themselves in English, thus, become discouraged and depressed, with their passion gradually fading away. Chunk is the combination of words with certain pragmatic functions, which can be saved and extracted as a whole or reduce the burdens of learners on memorizing every word, one by one. Chunk's convenience and appropriateness provide learners with encouragement and inspiration, alleviate their pressure of language output and stimulate their learning interest, which is instrumental in the formation of a virtuous cycle of English study.

Research Design

Research Questions

1) Whether Chunk Teaching Method (Chunk Recitation) can improve the writing abilities and scores of middle school students? If it works, what are its functions?

2) Whether students' attitudes towards writing have been changed when Chunk Teaching Method comes into play? If changed, what are the specific changes?

Research Targets

This research, targeted at a group of Grade eight students from XX Middle School in Nanjing, Jiangsu Province, People's Republic of China, runs for about twelve weeks, six weeks a period. There are 41 students in this class, 39 of whom take part in the research. In the course of this period, the teachers, as well as the class time and the teaching materials are the same. With the English textbook of eighth grade published by Yilin Press selected as the teaching content, the normal writing teaching method is carried out in the first half of the semester, and the chunk teaching method is conducted in the second half. The after-school exercises and the test of writing expressions are equally important, during which no additional guidance is provided. General comments are made on students' writing so that whether chunk teaching method takes effect in writing teaching in middle school can be tested.

Research Process

In the first six weeks, the traditional writing teaching method will be carried out, and the questionnaire (1) is to be issued in the sixth week (attitudes towards writing, questions about writing and so on). At the same time, the composition test will be launched while the test results and the questionnaire (1) results will be counted and analysed.

In the following six weeks, the experiment will be conducted formally. In the English writing teaching, the teacher will utilize the chunk teaching method to provide various types of input activities and chunks related to the concerning topics so that students can output the chunks they learned in the writing process and consolidate their understanding and application of chunks after writing. Chunk teaching method should be adopted throughout the process of English writing teaching. Similarly, the questionnaire (2) (attitudes towards writing, questions about writing and so on) will be issued in the sixth week when the same composition will be tested, and the test results and questionnaire (2) results will be counted and analysed.

The purpose is to figure out the changes of students' writing attitudes and the problems before and after the implementation of chunk teaching method. The number of collected valid questionnaires is 39. According to the test results, two students were randomly and respectively selected from the high level, medium level and low-level students of the class to take part in an interview which mainly contains the two questions: 1) Does chunk teaching method affect your writing? If so, what aspects affect your writing? 2) What's your opinion on the improvement of chunk teaching method?)

Data Analysis and Comparison

The Two Questionnaires

There are 18 questions in the questionnaire (1), question 1 and 2 are regarding general questions; questions 3 to 8 are about writing attitudes; questions 9 to 11 are concerning writing difficulties; questions 12 to 14 are in the matter of the methods of improving writing; questions 15 and 16 are respecting the basic questions of chunks; question 17 is with regard to writing methods; question 18 is about writing teaching methods.

There are 15 questions in the questionnaire (2), questions 1 and 2 relate to general questions, questions 3 to 8 touch upon writing attitudes, questions 9 to 11 involve writing difficulties, questions 12 to 14 deals with the methods of improving writing, question 15 refers to writing methods.

The results of the questionnaire (1) and questionnaire (2) are shown in table 1:

Table 1. Data Summary of Questionnaire (1) and Questionnaire (2)

General Questions	Question Number	Choices/Number of Students (Before the experiment)					Choices/Number of Students (After the experiment)				
		A	B	C	D	E	A	B	C	D	E
	1	19	20				19	20			
	2		39					39			
Writing Attitudes	3	4	4	21	10		10	14	10	5	
	4	4	8	23	4		8	12	13	6	
	5	7	16	12	4		11	19	8	1	
	6	2	25	12			22	12	5		

	7	12	6	14	7		18	6	10	5	
	8	2	3	26	8		2	5	10	22	
Writing Difficulties	9 (Multiple Choice)	25	20	17	17	25	17	26	23	15	18
	10	4	12	15	8		2	7	19	11	
	11	21	5	5	8		12	8	7	12	
Methods of Improving Writing	12	4	19	6	10		10	9	12	8	
	13	11	17	7	4		12	20	5	2	
	14	13	13	8	5		15	10	4	10	
Basic Questions of Chunks	15	3	8	19	9						
	16	30	26	16	13						
Writing Methods	17	4	7	15	13		7	18	8	6	
Writing Teaching Methods	18 (Multiple Choice)	17	25	20	24		22	25	30	16	

Through the analysis and comparison of the data of questionnaire (1) and questionnaire (2), it is clear that: Before the experiment, 8 students claimed they were absorbed in English writing, while 31 students declared that they were not keen on it very much. After the experiment, the number of students fond of writing rose to 24 while the number of students not so caring for writing relatively descended to 15.

Before the experiment, there were only 12 students satisfied with their writing levels, while 27 students were not satisfied with their writing levels. However, after the experiment, the number of students content with their English writing changes to 20, while the number of students not satisfied with that turned into 19.

Before the experiment, 23 students were eager to improve their English writing levels. After the experiment, the number of students willing to make progress in this field altered from 23 to 30.

Before the experiment, a few students viewed the extra accumulation outside class as a way to advance, whose exact number was 2. However, after the experiment, the number of students who accumulate regularly and routinely significantly increased to 22.

Before the experiment, students writing a composition in English every two weeks had a majority. But after the experiment, those who write an English composition each week increased sharply to 18, while those who write once every two weeks were less than the former.

Before the experiment, only 8 students held an optimistic attitude towards English writing, but after the experiment, the number of students who believed writing was difficult decreased while the number of those who thought English writing was easy increased on a large scale (22). From the analysis of the questions 3 to 8 on attitudes towards writing, it is clear that after the implementation of chunk teaching method, an increasing number of students began to fall in love with and make headway in English writing, with unwavering confidence and strong will. To facilitate this, more and more students begin to increase their regular accumulation and their frequency of practicing English writing. That is to say, after the implementation of chunk teaching method, students' interest in English writing increased to a great extent.

Before the experiment, 25 students assumed that English writing was difficult due to its vocabulary, phrases and sentence patterns, while 17 students believed it was difficult in its grammar and content. After the experiment, the number of students laying emphasis on words, phrases and sentence patterns plummeted, while the number of students paying much attention to grammar and content slightly soared.

Before the experiment, quite a few students (16) often showed an inadequate use of words and sentences, but after the experiment, the students inadequately utilizing words and sentences obviously grew in number or quantity.

Before the experiment, there were 21 students thinking that insufficient vocabulary was the biggest problem in English writing, only 5 students reckoning grammar should be the key issue, and only 13 students viewing that the most difficult problem lied in the layout and topic development. However, after the experiment, the number of students who thought that their vocabulary was not enough has declined dramatically, and the number of students who believed that the layout, topic development and grammar problems were larger problems increased relatively. Hence, the analysis and comparison of the questions 9 to 11 on writing difficulties obviously demonstrates that after the implementation of chunk teaching method, most of the students' writing difficulties showed a considerable deviation. They no longer attributed the difficulty of English writing to insufficient vocabulary and inadequate use of words and sentences in their writing, nor did they hold the view that the biggest problem in English writing rested with vocabulary. Instead, they began to believe that the layout, topic development and grammar outweigh vocabulary in English writing.

Before the experiment, there were 29 students improving their writing levels through listening to the explanations and comments from their teachers and watching American TV series, only 10 students increasing their writing levels through reading authoritative English magazines, in which case the number of the latter is really small compared with that of the former. However, after the experiment, the number of students making progress through reading original English books increased sharply.

Before the experiment, 11 students were indifferent to English writing and felt it unnecessary, but most students were eager to improve their English writing levels. After the experiment, the number of people willing to strengthen their English writing rose up to 32.

Before the experiment, 13, 13, 8, 5 testers respectively thought that reciting words and phrases, practicing writing, discussing among classmates and strengthening extracurricular reading can effectively solve the problems in writing. After the experiment, the number of reciting words and phrases were changed into 15; that of practicing writing descended to 10; the changes in the number of strengthening extracurricular reading was consistent with the former two conditions; that of discussing among classmates was reduced to 4. That is to say, the analysis of the above questions 12 to 14 on improving writing methods shows that after the implementation of chunk teaching method, more and more students aspired to improve their writing levels, and started to carry out extra-curricular accumulation, such as practicing writing, strengthening reading outside the class, reciting

words and phrases, etc.

Based upon the analysis of questions 15 and 16 of questionnaire (1), it can be inferred that there were only 11 people knowing what chunks were. However, there were nearly 28 students who didn't know much about chunk, some of whom even never heard of it. The number of students regarding chunk as word was 30, besides which a great many students (26) held the view that chunk was simply composed of words and phrases. However, only 15 students believed that chunks were made of words, phrases and sentence patterns. It was vividly shown that before the implementation of chunk teaching method, they didn't form a deep understanding of chunks and lacked a systematic comprehension of chunks. Therefore, it is necessary to carry out and promote chunk teaching method among middle school students so that they can have a deeper and more multidimensional understanding of chunks, and thus strengthen their English writing ability and levels.

Before the experiment, the number of students reciting relevant words, phrases, sentence patterns and templates according to different topics and using them in English writing was only 7. Let alone apply them to writing, because the number of students who recited the relevant words, phrases and sentence patterns was very small and some of whom even did not know what a template was. However, after the experiment, the number of students reciting relevant words and phrases as well as sentence patterns and templates according to different topics increased sharply to 22 and the number of students reciting them and applying them to English writing rose in an equal proportion. That is to say, according to the comparison and analysis of question 17 in the questionnaire (1) and question 15 in the questionnaire (2), it can be seen that after the utilization of chunk teaching method that students formed the habit of actively reciting relevant words, phrases, sentence patterns and templates according to different topics. They gradually and actively started to input, collect and accumulate chunks of relevant topics and offered themselves the chunks to be used in English writing.

Before the experiment, the teaching method remained the traditional writing teaching method, namely, scene teaching, explaining the model text, and brainstorming. During the process of experiment, scene teaching, brainstorming and explanation of related words, phrases and sentence patterns were the main parts, in which case only after the students finish writing can they be given the explanation of model text. Through the comparison of the scores of writing the same topic, it is evident that the average score of the students after the experiment was superior to that before the experiment, and that from the individual perspective, everyone made some progress more or less. After the implementation of chunk teaching method, students really experienced a remarkable change, successfully output the input chunks into English writing, and made great and dramatic improvements.

To sum up, the results of the two questionnaires solved the two problems, the first of which was whether there was any change in students' writing attitudes before and after the implementation of chunk teaching method, the second of which was what were the specific changes if question 1 came true? It can be concluded from the data analysis that chunk teaching method exerts a positive role upon improving the English writing levels of the middle school students in China. Chunk teaching method can not only greatly stimulate students' interest in

English writing, but also make students spontaneously practice English writing and actively carry out extra-curricular accumulations.

The Interviews

The interviews focus on two topics: (1. Does chunk teaching method affect your writing? If so, in what aspects? 2. What's your opinion on the improvement of chunk teaching method?)

All of the six interviewees claimed that chunk teaching method (chunk recitation) was of great advantage to the English writing, and that highlighting chunks in writing teaching could help themselves actively accumulate relevant chunks of the same topic or theme, thus conduct chunk input, and lay a good foundation for chunk output. The specific performances were as follows: 1) During the period of writing, they first recalled the relevant chunks of the same topic accumulated by themselves, screened out and used them properly and accurately. 2) They paid more attention to the cohesive chunks to make their writing structures clearer and their contents more organized. 3) They made their writing expressions richer and more diverse, rather than the repeated utilization of the same sentence patterns, phrases or words. 4) They were no longer afraid of writing, but more and more interested in English writing.

At the same time, the students were not only not limited to passively receiving education, but also actively put forward constructive suggestions for chunk teaching method. They hoped that teachers can infiltrate chunk teaching method and increase the frequency of the utilization of chunk teaching method in the writing teaching, and that teachers may increase the relevant introduction and explanation of proverbs in writing teaching and expand their minds through brainstorming while utilizing situational teaching method. Furthermore, more activities can be set to attract their interest, enrich the content of writing teaching and promote the quality of chunk teaching method. Last but not least, a section of reading can be set to help them understand the use of some difficult and important chunks. To sum up, the six students interviewed confirmed the effectiveness of the teaching method of chunk recitation in English writing teaching in China's middle schools, which is a combination of chunk teaching method and traditional English writing teaching methods. They believed that chunk teaching method can improve the level of English writing, stimulate the enthusiasm, positiveness and initiative of English learners, increase their interest in and confidence of English writing.

Result of the Research

The topic of the same topic writing was campus life. The writing time was 20 minutes and the full score was 15 points. The whole process was supervised by the teacher who did not make any tip or comment on the composition. The students were not allowed to refer to books, look up dictionaries, talk to each other or conduct other illegal operations. Once any cheating behaviour was found, the students involved were not allowed to continue to participate in the experiment. One time, before the experiment; the other time, at the end of the experiment.

Through the comparison of composition (1) and composition (2), it was apparent that the average score of composition (2) was much higher than that of composition (1), up to about 1.2 points. The number of students between 12 and 15 turned from 19 to 27, which was a tremendous variation. What's more, nearly all of the students' score of composition (2) was, more or less, higher than that of composition (1). Nevertheless, there were exceptions. For instance, a student named XX got 14 in her first composition, but she only got 12 in her second composition. However, the student who made the biggest progress was XXX, whose first composition scored 9 while his or her second one was 14.

Furthermore, when it comes to the expressions in English writing, all the students made great progress in English expressions which changed from the simple repetition of words and phrases at the beginning to the diversified, accurate and authentic expressions of the same meaning at present, from the previous utilization of a single sentence to the diversified use of various sentence patterns at present, such as complex sentences, various connectives and conjunctions, some simple clauses and even quotations. Among all the students, the most typical one was a student called XX, whose first composition read that "we work hard every day to get a good score", while his second composition read that "as a popular saying goes, 'reading thousands of books is the same as traveling thousands of miles', it is important for us to work hard every day to pursue our final goals", which showed his great progress in English writing. As a matter of fact, it is not uncommon to see examples that were the same as or even better than him.

To sum up, through the analysis and comparison of composition (1) and composition (2), a conclusion may be drawn that before and after the implementation of chunk teaching method (chunk recitation), students' English writing levels has shifted significantly, with their language expressions improved at least one level. After the contact with the chunk teaching method, the students would no longer be bothered by the lack of words and sentences to use because they have established their own chunk library which enable them to make the most appropriate choice.

Conclusion

In summary, chunk teaching method can more or less improve students' English writing ability in middle schools in China. The findings of the experiment provide reliable references for the English writing teaching in middle schools, and the improvement of students' English writing levels and their comprehensive English competences.

Notes

This article is one of the phased achievements of the General Project of China's National Social Science Foundation, namely, "Research on the Discourse Power in Translation for Foreign Communication" (Project Number: 16BXW052), and the Innovation Project of Guangxi Graduate Education, namely, "A Study on the

English Translation of the Patriotic Poetry of the ‘Four Great Masters’ in Guangxi during the Qing Dynasty in its Foreign Communication” (Project Number: YCSW2023490).

Abstract: The study presents an analysis of the effectiveness of social innovation efforts in Hungarian municipalities. Within the framework of the research, social innovation is examined as a creative collaborative process, with a particular focus on the analysis of social initiatives supported by local government. The social innovation efforts presented in this study are multi-stakeholder initiatives based on the involvement of local citizens, and the analysis of their effectiveness will allow the process of social innovation to be mapped. The specificity of the topic and the particular characteristics of the municipalities under study make the relative effectiveness analysis (DEA) method of paramount importance. In this study, we will present the initiatives studied in the municipalities and calculate the best practice effectiveness thresholds, which can be used to define an effectiveness ranking. The topic is very relevant as it is an opportunity for smaller communities. And the good practices can provide ideas that can be a stepping stone, a milestone for other municipalities.

Keywords: DEA method, social innovation, good practice

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1343-1356), Cappadocia, Turkiye. ISTES Organization.

Introduction

The study of social innovation can be characterised as one of the significant research areas of our day. Its importance is rooted in the recognition that technical and technological innovations alone are insufficient for the creation of social well-being, and thus social innovations can and do contribute to social development as a complementary solution. The authors' studies of social innovation efforts have covered both the elaboration of theoretical questions and applied research.

Literature Review

Technological and economic innovations cannot respond to all societal challenges. As the natural and material resources are becoming increasingly scarce, it becomes necessary to use resources as rationally as possible and to achieve greater social and economic efficiency. The social challenges that require long-term solutions (e.g. unemployment, migration and disadvantaged areas) require novel social collaborations. Social innovation is a necessary step to improve development and competitiveness, and the role of innovators is emphasised. Innovators are members of the local community, or society at large, who are aware of the needs determined by societal challenges and meet them using new or innovative solutions. Bosworth et al. (2015) study social innovation based on Schumpeter's approach. Their study identifies social innovation processes as the creator of a new product or service, as a value-creating process, as a mobiliser of local resources, as a response to social needs, and as innovative collaboration.

Social innovation efforts play an important role in the lives of decision-makers, politicians, researchers, civil society organisations and individuals alike. Despite growing attention, there is currently no uniformly accepted definition of social innovation (Moulaert et al., 2005; Mulgan et al., 2007; Pol-Ville, 2009; Rüede&Lurtz, 2012; Kocziszky et al., 2017; Balaton and Varga, 2017; Szendi, 2018; Eichler&Schwarz, 2019; Varga et al., 2020). The Social Innovation Academy (2018), supported by the European Union, identifies eight types of definitions of social innovation that provide a starting point for studying initiatives:

- pragmatic approach (Mulgan et al., 2007): social innovation is an innovative activity aimed primarily at meeting social needs;
- systemic approach (Westley and Antadze, 2010): social innovation is a complex process that means a new product, service or project, causing a significant change in everyday practice;
- managerial approach (Phills et al., 2008): social innovation is a new solution to social problems that responds to challenges in a more effective, efficient and sustainable way than the previous, currently existing solutions;
- critical approach (MacCallum et al., 2012): social innovation is a process of mobilisation and political mobilisation that results in significant change in society, and the distribution of tangible and intangible assets through bottom-up transformation;
- economic approach (OECD, 2009): social innovation, theoretical, process-focus or product change, organisational transformation, and the establishment of a new system of relations,
- comparative approach (Murray et al., 2010): social innovation means results, relationships, new structures and collaborations other than technical innovations, as the results of technological change cannot be directly translated into social practice;
- universal approach (The Young Foundation, 2012): social innovation is a new solution that meets social needs simultaneously; is at the same time good for society as a new or more advanced solution; and increases society's capacity to act;
- short approach (Murray et al., 2010): in short, social innovation is an innovation that is social in terms

of both its outcome and its meaning.

Bulut et al. (2013) highlight the significance of the individual level in social initiatives, they consider aspirations as new and original ideas that are sustainable and respond to the various challenges an individual faces in the course of social development. García et al. (2015) identify social innovation as a broad-spectrum process that results in:

- the creation of resources and services to meet social needs,
- the strengthening of confidence and support for marginalised groups,
- the transformation of social relations, which in turn creates new governance measures.

In summary, creative collaboration can be observed between the members of society, governments, market participants and the civil sector.

Measuring Social Innovation Efforts at Different Levels

The determination of the levels of social innovation is facilitated by the European Commission's relevant study (EC, 2013), which confirms that the focus of social innovation efforts is to meet the needs of the community and solve its problems, but it is a misconception to consider it as an exclusively bottom-up process which is only based on the involvement of citizens. Social innovations, which are also evidenced in societal co-operations of a new approach and in the structural transformation of society, are often generated from above, as a result of macro-level measures (Nemes&Varga, 2015). This finding also predicts a classification that distinguishes between the micro-, meso- and macro-levels of social innovations. The levels of social innovation are closely interlinked. At the micro-level, the individuals and the interactions between them are brought into the focus of the analysis, which leads to the analysis of meso-level relationships (for a given area). At the macro-level, organisational relationships and networks of relationships are analysed, based on meso- and micro-level results (J. van Wijk et al, 2018).

Based on a review of the literature, it can be established that the social innovation efforts made at the micro-, meso- and macro-levels can be analysed in a complex way, and the building of measurement methods plays a key role in their measurement.

At the micro-level, the analysis of organisations implementing social innovation efforts and their network of contacts is essential. The number of measurements at the local level is small, although the empirical analysis of these initiatives is essential to increase the social innovativeness of local decision-makers in order to generate local-level initiatives. A micro-level survey of social innovation is based on the involvement of companies, social enterprises and civil society organisations implementing social innovations at an organisational level, which is complemented by innovative collaborations between citizens and local governments. Through innovative co-operation, local governments provide new responses to community problems in a way that satisfies local needs, while also improves the well-being of the community.

Measuring the social innovation process is a complex task. The main questions are: What is measurable and what needs to be measured? The European Union's guidelines, in line with the systematic nature of the innovation process, focus on examining the input, output and impact factors of the endeavours at different levels. In addition to the input and output factors of social innovation initiatives, the analysis of the impact on society is also emphatic in the measurements. The main goal of each reviewed method is to determine the social innovation potential at the national, regional or local level. The number of local measurement methods is low, but their importance has increased recently. If the results of local initiatives can be quantified, good examples may be given and adapted to other organisations and localities, in order to promote the generation of further innovations. The local method is expected to identify and evaluate the baseline conditions (necessary factors) and capabilities of social innovation, i.e. the potential for social innovation.

Good practices of social innovation efforts

Based on our previous studies (Varga et al., 2021, Varga&Kucsma, 2022), we could identify the relations and mergers within Hungary, and the (mainly political) factors that make co-operation difficult or impossible. We identified the factors that can be seen as the main challenges in the country (educational inequalities, unemployment, health and housing problems), and the areas where efforts could be made based on the contribution of social innovation to well-being. Social innovation efforts focus on the following areas:

- reinforcing attachment to the locality
- support for disadvantaged groups,
- supporting local economy development,
- local peculiarities,
- public employment practices.

Within the framework of our previous studies, we identified more than 50 good practices of Hungary (Veresné Somosi&Varga, 2022, Varga, 2021). In the current study, we analyse 15 good practices.

Table 1. Knowledge base of good practices examined in the current research

Name of the good practice	Municipality	Target audience and target area
1. House of Civilians	Máriapócs	well-being of the local population, reinforcing attachment to the locality
2. Local Heroes	Pócspetri	well-being of the local population reinforcing attachment to the locality
3. Establishing self-sufficiency in the village Rozsály	Rozsály	well-being of the local population, public employment practices
4. Good Start	Nyírbátor	well-being of the local population, support for disadvantaged groups

5. Basket Community	Nyíregyháza	well-being of the local population, supporting local economy development
6. 'Together, for each other, for the locality!'	Nyírgyulaj	well-being of the local young people, reinforcing attachment to the locality
7. Green Town	Nyírlugos	well-being of the local population, reinforcing attachment to the locality
8. Value creating public work	Piricse	well-being of the local population, public employment practices
9. 'I love you, Nyírbétek!'	Nyírbétek	well-being of the local population, reinforcing attachment to the locality
10. Church bus	Terem	well-being of the local population, local peculiarities
11. Tanoda programme	Nyírvasvári	disadvantaged children, support for disadvantaged groups
12. 'Transformed sugar factory'	Encsencs	well-being of the local population, public employment practices and support for disadvantaged groups
13. Eco Centre in Bátorliget	Bátorliget	well-being of the local population, supporting local economy development
14. 'Ajak is the settlement of the future in the light of work'	Ajak	well-being of the local population, local peculiarities and public employment practices

Source: authors' own elaboration based on previous studies (Veresné Somosi&Varga, 2022, Varga, 2021)

Good practices are ideas or benchmarks that view each task to be carried out as a process. It is a widely used concept, but its precise definition is not known. The basic purpose of good practices is to identify tools and methods that are more effective in achieving the objectives set than the methods already known. They are innovative and constructive approaches and techniques that can be or have been proven to contribute to raising the quality level of an organisation and serve as a replicable example for other organisations Best practice is a good and effective example, which becomes a proven and effective solution precisely because it has been successfully applied elsewhere.

Based on a comprehensive analysis of the practices, it can be established that in the case of social innovation, innovators at the localities and the adaptation of aspirations operating in other localities have a decisive role. Based on the interviews, case studies were made. As a method, case studies constitute an appropriate form of documentation for the presentation of good practices with different content, structure and function. Based on

the analysis, it can be established that the social innovation efforts made during the study can also be adapted to other localities. The analysis of each case allowed for a complex presentation of the given practice, creating an opportunity for adaptation, sustainable operation and effective implementation. The basic aim of good practices is to identify the tools and methods used for achieving the set goals more effectively than the previously known methods. Novel and constructive approaches and techniques that can be proven or have already proved to contribute to the improvement of the quality standard of the given locality and serve as an example that can be adopted by other localities. Measuring the effectiveness of the good practices examined is also a relevant challenge, in which case the DEA (Data Envelopment Analysis) method supports our analysis.

Data Envelopment Analysis for testing the effectiveness of social innovation efforts

The DEA (Data Envelopment Analysis) method defines the effectiveness values (ratio) and the effectiveness frontier as a linear programming task. It has the advantage of being non-parametric, because knowledge of the production function is not a prerequisite (Dózsa&Ecseki, 2012). In the analysis, the effectiveness scores of the decision-making units are compared, with the unit with the highest effectiveness scoring 1 (100 per cent). The procedure is used to calculate an effectiveness threshold (best practice), which is used to determine an effectiveness ranking (each unit is ranked in percentage terms). The analysis compares organisations performing the same activity on the basis of the outputs of each organisation and the weighted share of inputs used. Input is the quantity of resources that is decisive for the evaluation. Output is any significant operational result for which the organisation uses resources. The amount of resource used is an autonomous decision of the organisation, so the organisation can be identified as a Decision Making Unit (DMU). The comparison of DMUs is based on the ratio

- of the weighted sum of outputs to the weighted sum of inputs. Weighting can be determined
- objectively, using mathematical tools, based on the characteristics of the organisations.
- Determining the ratio of weighted inputs to outputs can be done for two purposes:

maintaining the current value of outputs with fewer inputs (input-oriented approach, relative effectiveness index between 0 and 1),

- higher output at the current value of inputs (output-oriented approach, relative effectiveness ratio between 1 and infinite).

The effectiveness function is the weighted sum of outputs divided by the weighted sum of inputs (Ragsdale, 2007; Iberhalt, 2017):

$$E_i = \frac{\sum_{j=1}^{n_o} o_{ij}w_j}{\sum_{j=1}^{n_i} I_{ij}w_j}$$

where:

E_i : effectiveness of the i-th unit

O_{ij} : weighted value of the j-th output factor of the i-th unit

n_o : number of outputs

w_j : evaluation of a unit of the j-th output

I_{ij} : weighted value of the j-th input factor of the i-th unit

n_i : number of inputs

v_j : evaluation of a unit of the j-th input

The formula can be used to determine the effectiveness of the “i”-th unit, based on the weighted output and input components of the unit. This function is the basis for the DEA, which is run for all social innovation efforts in the analysis. Our novel approach to assessing the effectiveness of social innovation efforts proposes the DEA method. We have not found any previous studies in the literature that address the issue in this way, but we believe that the DEA method is an innovative way to measure the impact of social innovation initiatives.

In connection with the run, the balance sheet conditions for the DEA analysis are defined (Ragsdale, 2007; Iberhalt, 2017). The balance conditions of the analysis are constraints that ensure that maximum effectiveness can be identified.

Balance conditions:

No unit tested can have an effectiveness greater than 100 per cent. The effectiveness of each efforts is thus less than or equal to 1.

$$\sum_{j=1}^{n_o} O_{kj} w_j \leq \sum_{j=1}^{n_i} I_{kj} v_j$$

(k=1, 2, ... , number of units analysed),

i.e.

$$\sum_{j=1}^{n_o} O_{kj} w_j - \sum_{j=1}^{n_i} I_{kj} v_j \leq 0$$

Output evaluations (w_1, w_2, w_3, w_4) and input evaluations (v_1, v_2, v_3, v_4) can be used to maximise effectiveness at the “i”-th unit (effectiveness indicator value 1).

It is necessary to ensure that input costs and output valuations are strictly positive. Because if, e.g., $w_j = 0$ then DEA cannot find those non-effective solutions, which contain the j-th output; and if $v_j = 0$, then DEA is unable find non-effective solutions that contain the j-th input (Iberhalt, 2017).

Based on the effectiveness measurement function and the balance conditions, a linear programming exercise can be performed for each efforts under study, with the aim – in the context of this study - to minimise the weighted inputs of each unit.

The objective function of the model:

$$\sum_{j=1}^{n_i} I_{ij}w_j \rightarrow MIN$$

Based on the literature (Barnum et al., 2009; Dózsa, Ecseki, 2012; Dénes et al., 2017; Iberhalt, 2017; Koltai, Tamás, 2019; Nepomuceno et al., 2020) and the methodology developed, input and output indicators can be identified to support the measurement of relative effectiveness, which also allow the development of a relative effectiveness ranking for the social innovation efforts under study.

Most studies defining a method for measuring social innovation suggest the analysis of case studies or good practices for micro-level measurement and a statistical study for analysing macro-level aspirations. They emphasise the need to quantify the indicators involved, which, however, is not possible even at a national level for some indicators (e.g. volunteering). The use of different conceptual frameworks and the rapid formation of different legal frameworks for organisations make it particularly difficult to define a measurement methodology. Based on the antecedents given in the literature (Kociszky, 2004; Benedek et al., 2015; Kociszky et al., 2015; Szendi 2018; and Varga et al., 2020), and the methodology developed during the social innovation research of the University of Miskolc, a system of indicators and an indicator of social innovation potential can be defined in relation to the localities of the surveyed area for supporting the measurement of social innovation. We presume that this set of indicators is suitable for measuring the social innovation efforts at the level of localities, and may be used to form an indicator of social innovation potential. The system of indicators can be divided into input, output and impact indicators according to the systematic nature of the social innovation process. During the examination of the localities of Hungary, 8 indicators were included in each indicator group. The applied indicators were selected as a result of the research marked as a source, mainly based on the proposals of Varga (2021). From these 8 indicators per group, we selected 4 input and 4 output indicators to measure the effectiveness of social innovation.

Table 2. Indicators included in the analysis

INPUT indicators	OUTPUT indicators
number of operating enterprises per 1000 inhabitants (per 1000 inhabitants)	per capita income (HUF ‘000’)
number of non-profit enterprises (per 1000 inhabitants)	amount paid per application per capita (HUF ‘000’)
dependency ratio (children (0-14 years old) and the elderly population (65-X years old) as a percentage of the population aged 15-64)	ratio of families with three or more children (%)
average number of classes completed (class)	unemployment rate (%)

Source: authors’ own elaboration

Data envelopment analysis (DEA) is a technique and optimisation based on linear programming to evaluate the efficiency of individual units. In order to improve the efficiency of each unit, a reference set of inefficient units is defined and the efficiency of the different units can be compared with the efficiency frontier.

The following output and input factor data will be used in the analysis, presented to the reader in Tables 2 and 3.

Table 3. Input indicators

Project Specifications

In this study, Element A is considered as a decision making unit (DMU) in terms of input B and output C.

The DEA model used in this study is model D, which is based on model E and uses approach F.

A: number of decision making units (DMUs).

B: number of inputs

C: number of outputs

D: the DEA type

E: the model

F: the approach

The efficiency value obtained by the defined model is presented in Figure 1. In the figure, values are listed next to each municipality. For us, a value of 1 indicates that a given municipality is operating efficiently using the given indicators when looking at the selected input and output values, and where this value is less, there is a problem with the consistency of the given indicators, so it is worth looking for the problem that is causing it not to operate efficiently.

The unit is inefficient if the efficiency is less than 1. If the efficiency of a unit is equal to 1 and there is zero slacks, then it is the Pareto efficiency. If the efficiency of a unit is equal to 1 and there is nonzero slacks, then it is known as the weak efficiency.

Before evaluating an analysis, it is necessary to show the basis on which the reference set can be constructed. This is because it gives the benchmark values for each domain.

In all linear programs in DEA, the solution technique seeks to maximize the efficiency of the target unit. This search procedure ends when either the efficiency of the target unit or the efficiency of one or more other units equals one. Therefore, for an inefficient unit, the efficiency of at least one other unit is equal to 1, the weight of the target unit obtained from the solution of the model. These efficient units are called the peer group of the

inefficient unit. Figure 2 shows the peer groups.

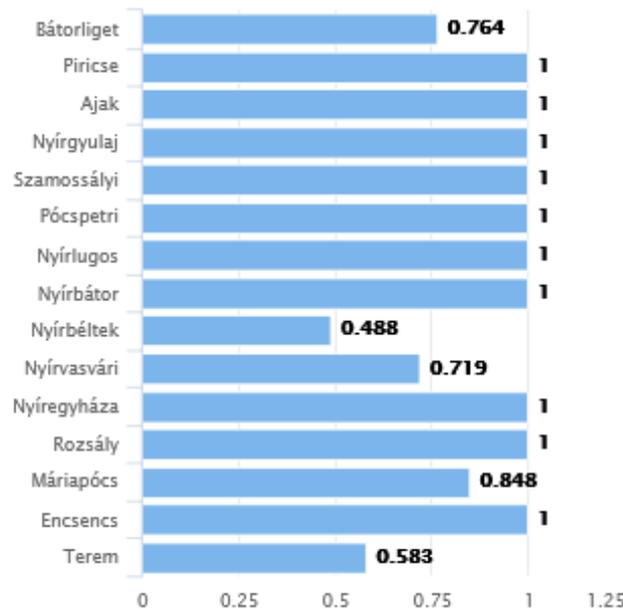

Figure 1. Efficiency results

Source: authors' own elaboration

5 municipalities that did not receive a score of 1, so these municipalities are inefficient in the analysis and comparison of the selected indicators.

These are the following municipalities:

- Terem (0,583)
- Bátorliget (0,764)
- Nyírbéltek (0,488)
- Nyírvasvári (0,719)
- Máriapócs (0,848)

Nyírbéltek has the lowest score, so it is worth looking at this settlement in more specific details. What is interesting about the case of Nyírbéltek is that it does not have a high average score compared to the other municipalities, but there are some factors that when compared to the other municipalities, the results are better and not too favourable for the municipality. The number of businesses growing is not high, so it would be worthwhile to increase this area with a tax credit, i.e. to see how this affects the number of growing businesses. In comparison, the number of non-profit organisations is high, which is advantageous on the one hand, as there are a number of inclusion and cultural programmes in the municipality, which are good in terms of cultural integration, but not advantageous in terms of efficiency. The dependency rate is high, but what is an output factor and can be contrasted with this is the low unemployment rate, compared to other municipalities, so it can be said that it is a young or ageing municipality, presumably with a high number of schoolchildren and

pensioners. However, if we look at a panorama of Hungary, it is unfortunately the ageing tendency that is more common. The income per inhabitant contributes a lot to the fact that the municipality is at the bottom in terms of efficiency, as it is very low, which assumes that the majority of people living in the municipality are low-educated, so the solution could be to provide further training in the village or free vocational training to get into a wage bracket where they can get a higher income and a higher standard of living.

Figure 2. Efficiency results

Source: authors' own elaboration

Terem scored the second lowest, the village also has a very high dependency rate, but higher education levels, so there is a better chance of higher wages. Experience has shown that people don't necessarily know how to manage their money, so there is a need to educate them and provide opportunities through tenders to help them do so.

The situation is similar for several settlements, as in the case of Nyírbéltek, my sample is presented in detail because at each point measures can be taken to correct and improve these indicators. First and foremost, this is

the responsibility of the municipality's management, but civil society organisations can also contribute, as holding a training session can not only be constructive, but also provide an opportunity for residents to move forward. In any case, such a study does not only show a number, but its underlying content is also important for development. The Dea method is able to investigate these relationships and provides many innovative results that can be used in the future.

Every municipality has its advantages and disadvantages, but there is a lot to teach the population. These settlements are disadvantaged, so the infrastructure is not the best. There are many subsidies and measures to improve the situation, but regeneration should be a goal for all municipalities.

Conclusion

The effective functioning of organisations and the measurement of their effectiveness is a key issue in any small community. It is important to determine what activities the management needs to do and what actions the community can take to be more effective. In our study, we presented a methodology that could provide a solution for measuring effectiveness. The DEA method is based on the definition of input and output indicators of organisations (indicators that contribute to the operation on the one hand and indicators that are generated after the operation on the other hand). Our study clearly supports Lapid's (1997) view that the DEA method has the advantage of not only calculating the efficiency of a particular unit but also of providing comparative figures. At the core of the method is the definition of best practice, which is 100 per cent, i.e. 1 efficiency, and thus forms the basis for comparison (Dózsa, Ecseki 2012). During the development of the methodology, pairs of input and output indicators were formulated to facilitate comparability and quantification. Such indicator pairs include, for example, the Number of enterprises in operation, Amount paid per capita (2007-2013) Furthermore, in order to avoid bias, it was necessary to typologise the municipalities, as the priority was to survey municipalities with a high number of disadvantaged people. The results of running the DEA programme clearly showed that there are municipalities that do not operate as efficiently as the majority of the organisations included in the study. The methodology is, with some limitations, highly recommended for comparing the operational efficiency of institutions with similar profiles. The current research is still in the process of testing and piloting the methodology and further research and refinement of indicators is needed to apply the methodology in practice. Quality is a key factor in competitiveness and is also a determining factor in the evaluation of healthcare providers. The current testing shows that sites in this sector are also comparable and the DEA methodology provides a good basis for assessing efficiency.

Acknowledgment

The study was carried out within the Thematic Programme of Excellence 2021 – National Research sub-programme, as part of the Creative Region III project TKP2021-NKTA-22, with the support of the NKFIH.

Abstract: One of the most popular topics is education, and this study will also focus on this area. In this research, we will examine examples of social innovation in education and the impact of these practices, with a particular focus on social sustainability. Our aim is to present social innovation programmes and good practices in the national and international field that can be identified as educationally equitable solutions and can be adapted and sustained to enhance well-being, taking into account local needs and demands and the specificities of the community. Within the framework of this study, the good practices examined are presented in a structured way, emphasizing key elements that ensure social sustainability. The study also seeks to answer the question of how the social innovation-based education programmes examined support the process of social sustainability and how these programmes can help to sustain core values. The value of this study is structured around both the theme of social innovation and the theme of sustainability.

Keywords: education, social innovation, social sustainability

Introduction

Technological and economic innovations cannot answer all societal challenges. Natural and material resources are becoming increasingly scarce, making it necessary to make the most rational use of the goods available for investment, in order to achieve the greatest possible social and economic efficiency. Sustainability is not only environmental, but an approach based on sustainability must also take into account economic, environmental and social issues (Gyulai, 2013). The social aspect of sustainability includes a conscious effort to improve the quality of life, which aims to create equal opportunities by providing opportunities in addition to material well-

being and social justice (Gombos-Sziebig, 2020). Societal challenges that require long-term solutions (e.g. unemployment, migration, educational inequalities, disadvantaged areas) call for new forms of social cooperation. Social innovation is a necessary step to improve development and competitiveness, where the role of innovators is crucial. Innovators are members of the local community, or society more broadly, who, in the light of their needs, respond to the demands of societal challenges with new or innovative solutions. Bosworth and co-authors (2015) use the Schumpeterian approach to examine social innovation. Their study identifies social innovation as a process of creating a new product or service, a value-creating process, a mobilisation of local resources, a response to societal needs, and an innovative collaboration. The successful implementation of social innovation is a function of cultural acceptance, economic sustainability and technological adaptability (Bulut et al., 2013). Bulut and co-authors (2013) highlight the importance of the individual level in social initiatives, considering them as new and original ideas that are sustainable and provide individuals with answers to various challenges of social development. According to another approach to social innovation (Mumford et al., 2002), social innovation refers to the generation and implementation of new ideas, whereby people organize their social interactions to achieve a common goal. A further strand of social innovation theory (Hazel-Onaga, 2003) focuses on solving social problems, emphasising the importance of stakeholder collaboration. Another approach to the concept emphasises the value created by social innovation (Mulgan et al., 2007), highlighting the satisfaction of a social need as the main objective. Phills and co-authors (2008) identify social innovation as a key driver for meeting social problems in a newer, more efficient, effective and sustainable way, an approach that also lays the foundation for the theory of social innovation. Another cornerstone of the emergence of social innovation as a theory is the role of intra-community collaborations, which is emphasised by Jégou and Manzini (2008). Social innovation should not be approached exclusively as a bottom-up activity, as innovation and its support often originate at the macro level (Nemes-Varga, 2015).

Sustainability-based support for social innovation can be provided at local and national level. Initiatives at local level are based on the aspirations of the local community to improve their environment, their economic situation and their viability. However, in addition to the availability of information and practical knowledge, the local community is often resource-poor (in terms of expertise, financial resources, volunteering). Social innovation generation at national level is sometimes determined by different political and economic interests and sometimes does not take into account local needs to the extent desired. However, local improvements can only achieve structural changes and results in an integrated system. The problem of cooperation has been addressed by many researchers, who see a general lack of trust (Vilmányi-Hetesi, 2017), low willingness to cooperate (Veresné Somosi-Varga, 2021), and institutional and political culture (Balaton-Varga, 2017) as major challenges.

Today, society faces many challenges. Uncertainty, crises, unpredictable technological changes and globalisation make the future unpredictable (Ionescu, 2015). The process of social innovation makes societies more sustainable and cohesive through inclusive solutions, collaborations and proactive, grassroots initiatives (Grimm et al, However, it is not only a process based on grassroots efforts and citizen involvement, as social innovations, which can also be seen in new approaches to social cooperation and structural transformation, often

come from above, through macro-level measures (Nemes-Varga, 2015). The concept of social innovation focuses on meeting the needs of the community, which also improves quality of life and well-being (Hazel-Onaga, 2003; Mulgan et al, 2007). Well-being is related to a sense of security, self-esteem and the need for relationships, in addition to the income conditions and subsistence needs that determine well-being (Kocziszky et al., 2015). When examining social innovation initiatives, the social benefits of innovative ideas in problem solving and the role of active community participation in improving quality of life are emphasised. Social innovation refers to new (or new approaches to) solutions that both meet a social need and enhance society's capacity to act (Czakó, 2000). Social innovation is a process of change that responds to societal challenges through a creative and rethought combination of available tools and solutions (Manzini, 2014). Social innovation initiatives are new combinations of social practices (Hochgerner, 2011) that, through new or novel pairings, result not only in an innovation paradigm shift, but also in a new category of innovation. New social practices and solutions aim at social change based on comprehensive, pre-designed, goal-oriented activities (Cajaiba-Santana, 2014). The study of the sustainability of this social change is a fundamental focus. Social innovation is a new way of addressing social problems that responds to challenges in a more effective, efficient and sustainable way than previous, existing solutions (Phills et al., 2008).

The role of social innovation in education

Until the 1980s, innovations that were primarily aimed at increasing the well-being and prosperity of society, of a particular community, appeared alongside innovations of a more technical, natural science nature. It should be stressed that, alongside the process of social innovation, scientific, technical and economic innovation is not superfluous, since together, 'in tandem', they are capable of increasing the well-being of a given community. Farkas characterises the relationship between technical and economic innovation and social innovation as 'the latter process is the peripheral condition, the space of movement, the medium of the former' (Farkas, 1984, p. 11).

Zapf (1991) interprets innovation as a solution to social problems that require the reallocation of resources to raise living standards. Smeds (1994) identifies technological innovations as preconditions and agents of social change. The European Union (EC, 1995) stresses the social aspect of innovation, emphasising the creativity and cooperativeness of society. According to Introna et al (1999), technological innovation cannot come about without social renewal. Innovation is defined as a new or significantly improved product, process, marketing method or organisational method in business practice, organisations or relationships that encourage cooperation (EC, 2005). This definition is primarily a guideline for technical and economic innovation, but the programme defining the European Union's research, development and innovation policy (Horizon 2020) has already paid particular attention to defining social innovation. Hämäläinen and Heiskala (2007) identify social innovation as a response to rapid technological and economic change. According to Tidd and colleagues (2005), the starting point for the study of social innovation is the typology of technological innovations: product, process (procedure), positioning, paradigm. Murray and co-authors (2010) have studied novel social collaborations and

argue that new structures develop novel social solutions to social problems through technological development. According to Lundström and Zhou (2011), economic and technological innovations are essentially created through corporate initiatives, but these processes also have a social dimension. Nevertheless, social innovations tend to be formulated at the level of (self-)government, non-profit organisations, foundations and individuals, and thus their measurement structure differs from the measurement methodology of technical innovations. Franz and co-authors (2012) examine technical and social innovations separately and highlight the importance of the question whether innovations that lead to new technological achievements are desirable for society in all cases. They argue that new is not necessarily a good and desirable category, and that social innovation efforts are consistent with practices that are widespread and accepted in society.

Technological and economic innovations cannot answer all societal challenges. Natural and material resources are becoming increasingly scarce, making it necessary to make the most rational use of the goods available for investment, in order to achieve the greatest possible social and economic efficiency. Societal challenges that require long-term solutions (e.g. educational inequalities, unemployment, migration, disadvantaged areas) call for new forms of social cooperation. Social innovation is a necessary step to improve development and competitiveness, where the role of innovators is crucial. Innovators are members of the local community, or society more broadly, who, in the light of their needs, respond to the demands of societal challenges with new or innovative solutions. Bosworth and co-authors (2015) use the Schumpeterian approach to examine social innovation. Their study identifies social innovation as a process of creating a new product or service, a value-creating process, a mobilisation of local resources, a response to societal needs, and an innovative collaboration. In sum, social innovations are inseparable companions of technical innovations, and innovations can be understood as complementary processes (Drucker, 1985, Freeman, 1988, Bulut et al., 2013, Kocziszky et al, 2015). As a field of social innovation, new innovative bases help to make technical innovations feasible and effective, while at the same time they can enhance each other's strengths to respond to current challenges in society (Varga, 2017). The successful implementation of social innovation depends on cultural acceptance, economic sustainability and technological adaptability (Bulut et al., 2013).

Table 1: The social innovation nexus

SOCIAL INNOVATION				
Form	Purpose(s)	Levels	Funding	Innovator
Product	quality of life Increase	micro level	self-financing	local and state government
technology	employment increase the level	mezo level	public funds	businesses
service	reducing educational inequality	macro level	EU funds	non-profit organisations
organisation	housing conditions Improving	Global		civil society
marketing	reducing health problems			R&D+I sites
institutional	addressing environmental			households
system	challenges			(citizens)

Source: own ed. (based on Kocziszky et al.,2017)

Technical and social innovations can work together, complementing each other, to ensure the well-being of society. Each type of innovation has a social dimension, and the different types of innovation interact with each other and lead to transformations in economic and social relations. According to Bulut et al (2013), social innovation has a direct impact on technical innovation because of its capacity to bring about change in education, health, employment and social development in general. In this sense, social innovation is a complement and driver of technical innovation.

The typology of social innovations (Figure 1) can be depicted according to the interrelationship between economic and technical innovations (Kocziszky et al., 2017). For social innovations, the form of innovation, its objectives, levels, forms of financing and innovators of the endeavour can be identified.

Bulut et al. (2013) highlight the importance of the individual level in social initiatives, considering them as new and original ideas that can be sustained and that provide individuals with answers to the various challenges of social development. García et al (2015) identify social innovation as a broad-spectrum process that results in:

- resources and services are created to meet social needs,
- trust and action to support marginalised groups is strengthened,
- social relations are transformed and transformation brings new governance arrangements.

Based on a structured literature review (Varga, 2020), it can be concluded that different authors define the concept of social innovation efforts along different interpretative ranges. Many authors consider social innovation as a hitherto unprecedented solution to social problems (Mulgan et al., 2007; Phills et al., 2008; Stewart-Weeks, 2008; Weerawardena-Mort, 2012; Kocziszky-Veresné Somosi, 2016). Social innovation offers new answers to social issues while enhancing social interactions. Efforts can be extended to address issues such as the environment, health, education, housing and many other societal challenges. According to other authors, social innovation is a new form of governance and decision-making (Bacon et al., 2008; The World Bank-EC, 2015; García et al., 2015; Lessa et al., 2016; Varga, 2017; Majorné Vén, 2018; Radecki, 2018). In this interpretation, initiatives seek to engage individuals and offer solutions to different societal problems through innovative collaborations.

Today, society faces many challenges. Uncertainty, crises, unpredictable technological changes and globalisation make the future unpredictable (Ionescu, 2015). When examining social innovation initiatives, the social benefits of innovative ideas in problem solving and the role of active community participation in raising living standards are emphasised. Social innovation refers to new (or new approaches to) solutions that both meet a social need and enhance society's capacity to act (Czakó, 2000). Social innovation is a process of change that responds to societal challenges through a creative and rethought combination of available tools and solutions (Manzini, 2014). Social innovation initiatives are new combinations of social practices (Hochgerner, 2011) that, through new or novel pairings, result not only in an innovation paradigm shift, but also in a new category of innovation.

Hochgerner (2011), in agreement with the BEPA report (EC, 2010), distinguishes three levels of social innovation: the micro-level of effort initiated by a small group of individuals, leading to organisational change. At the meso level, we observe changes in the structure of different social institutions, changes in the forms of education and learning, while at the macro level, we observe changes in social systems at the national level. In our study, as mentioned above, we will examine meso level initiatives that can be identified as organisationally linked initiatives in the field of education and their examination as good practice will also support the response to sustainability issues.

Various international organisations, national governments and non-profit organisations, as well as academia, are all developing and exploring programmes that identify social innovation as a new tool to help solve social and economic problems. The Organisation for Economic Co-operation and Development (OECD), the National Science, Technology and Art Fund (NESTA), the Programme for International Student Assessment (PISA) and the Centre for Social Innovation (CSI), as well as other similar organisations, are trying to identify societal needs and the related measurement framework and tools for social innovation. Their research question focuses on the measurement of the social innovation process, examining the recommendations of other methods to assess the innovation process. In their study of the impact of the social innovation process, Černikovaitė and Laužikas (2011) identified three categories of social innovation groups, which are the beneficiaries of social innovation efforts, the 'consumers' of initiatives:

- socially targeted groups (students and educational institutions, research and development organisations, elderly or disabled people, disadvantaged groups, (low-income) workers, volunteers, social workers, pensioners, public authorities and their employees),
- social enterprises, NGOs (non-profit and civil society organisations),
- state and society (social policy, assistance).

Results of the sustainability impact assessment of educational equalisation solutions

In our research, we sought to identify examples of good practice from primary, secondary and tertiary institutions. Our research focused on the conditions for their sustainability.

The cases studied are the practices of different educational institutions, but impact measurement and sustainability assessment have so far not been carried out, or only partially. The examples highlighted are mainly solutions that develop core competences, support the focus on sustainability and ensure the sustainability of the example.

The good practices examined focus on the development of basic competences involving the 14+ age group. Based on our research, it can be concluded that a set of criteria can be defined for each of the examples, which will allow a detailed presentation and analysis of each case, and an examination of its sustainability. On this basis, we have identified the criteria for describing good practice.

The good practices are outlined in a structured way, according to the following criteria:

- the purpose(s) of the good practice,
 - developing a competence area,
 - results, expected impacts,
 - the prerequisites for implementing good practice,
 - evaluation of results, sustainability,
- human resource needs.

"Class mirror" good practice (see more in Járó, K. (2015): Class Review - Developing Social Competencies and Conflict Resolution through Group Methods Methodological Guide, School Psychology Notes No.35 Series Editor: N. Kollár Katalin)

a) Good practice objective(s)

Its aim is to make widely known the social psychological social competence development and conflict resolution procedure, the so-called Mérei-project, which has been successfully applied at the level of classes in the Radnóti Miklós Elementary School and Secondary School of ELTE for several decades. The project is based on the guided resolution of communication and relationship problems in the classroom, such as rudeness, aggression, ostracism or coping.

The 'Classroom Mirror' good practice in the application of sociometrics in schools, which has strong national roots, represents a significant advance on traditional practice, building on the resources of the community concerned to address problems at class and individual pupil level. It enables the practice of a range of social competences such as listening, understanding, patience, self-awareness, healthy self-assertion, cooperation, conflict management, shared rule-making, debate culture, etc.

The members of the classes are confronted with the multi-faceted value system in their class, the internal role hierarchy, the authority relations, the emotional contacts, the forces of cooperation and competition, the complex and fair situation of the problems of individual integration, the so-called "class mirror". With this in mind, together and in small groups of friends, they consider how their group can become a cohesive team of interesting people who can support each other in fulfilling their social needs and ideas. Discussions can be double-led, usually between the class teacher (or university lecturer) and a specially trained group expert (school psychologist) in a multi-stage extra-curricular programme.

b) Area(s) of competence developed

The good practice "Classroom Mirror" shows how the Mérei project enriches and strengthens the self-image and self-awareness among the priority development tasks, primarily through the identification of social roles within the classroom and the awareness and active shaping of one's own social influences. It also shows how conflict resolution based on peer analysis creates situations that are suitable for the development of social and civic competences.

It makes it tangible and makes people aware that, for successful relationships and social coexistence, it is essential to know the norms, to understand the rules of behaviour and generally accepted rules of conduct, to identify problems openly, to discuss them openly and honestly, to seek solutions together, to review one's own prejudices, to show compassion and solidarity.

It develops communication skills in expressing one's own feelings, needs, values and opinions, and in understanding the viewpoints and different perspectives of others.

It offers the opportunity to practise reasoning, persuasion, effective negotiation based on trust, and the negotiation of common agreements.

Results, expected impacts

By applying the good practices of the "Classroom Cycle", it is expected that participants will be able to enrich their professional toolbox with new perspectives and methodologies in the fields of community development, conflict management, social skills development and effective mental health protection.

c) Prerequisites for implementing good practice

The "Classroom Cycle" is a good practice for high schools, vocational and technical schools, as well as for higher education institutions. The improvements it proposes should ideally be implemented in collaboration between two professionals - the class teacher (or university lecturer) and the school psychologist, or an external group expert.

The "Classroom Cycle" is a good practice recommended for institutions with an ethos that includes the development of social competences in their pedagogical programme. It is recommended for teachers, especially class teachers, who consider it an important part of their profession to use their resources to foster the creation of welcoming communities with a pleasant atmosphere, which bring to life the natural desire of young people who have been learning together for years to belong to a cohesive group. For educators who wish to contribute to the long-term enrichment of their pupils' personalities through the enjoyment of their classroom and school.

d) Evaluation of results, sustainability

Teachers, trainers, school psychologists who undertake to apply the lessons learned during the good practice of the "Classroom Circle" can experience that the responsibly guided participation of the peer community in identifying problems and openly discussing the situation improves the atmosphere, makes the community more understanding, inclusive and tolerant, reduces prejudice, strengthens team spirit, increases constructiveness in dealing with conflicts, and makes students partners in education. In a cohesive team, pupils who are more difficult to accommodate are more likely to improve their classroom disadvantage with the help of their peers and to cope more successfully with personal problems that are not school-related. Improving the climate also has a positive impact on pupils' performance. It is along these lines that the effectiveness of the programme can be assessed.

e) Human resource needs

The "Class Cycle" is a good practice for school leaders, teachers, trainers and school psychologists interested in community education, solving communication problems, methods of developing social competences and wishing to expand their knowledge.

"REGULA" good practice (for more information, see Good Practices of the Keszthely Secondary School of Economics, Zalaegerszeg SZC, <https://www.kozgazd.hu>)

a) Good practice objective(s)

It aims to develop a belief in oneself based on sufficient self-awareness. To teach pupils to trust themselves, to believe in the possibility of achieving a well thought-out and realistic goal. To learn the benefits of disciplined behaviour. To develop a sense of discipline that comes from inner compulsion and is not dependent on the presence of an external disciplinarian. To make children aware of the importance of external and internal order, to develop a love of order and techniques for maintaining it. The emphasis is on increasing the pupil's self-awareness and self-esteem.

b) Area(s) of competence developed

REGULA Good Practice is a good way to develop self-awareness competences.

In addition to the development of self-awareness competences, it is able to develop self-regulation (managing emotions, taking responsibility, tolerance) and confidence (positive self-esteem, healthy self-confidence).

c) Results, expected impacts

The level of discipline of pupils in the sessions is significantly improved. They become more regular, persistent and determined in carrying out their tasks. As their self-awareness and self-discipline improves, they will be less exposed to drink, tobacco, drugs and other harmful temptations. Students who previously regularly disrupted lessons will be able to listen to lectures in a disciplined manner. Their ability to concentrate is significantly improved and attention span is increased. As a result, their learning outcomes are also expected to improve.

d) Prerequisites for implementing good practice

Behavioural interventions can be used successfully with age-matched pupils. The school environment is the perfect setting. No special equipment is required. It can also be used with primary school pupils. The first stage is to identify the pupils concerned by the activity, involving class teachers. This is followed by informing parents, recommending the session and presenting its content. Then, groups of up to 6 people are set up and organised, followed by a discussion with the parents.

e) Evaluation of results, sustainability

Results can be measured and evaluated immediately from school behaviour (lessons, breaks, events, etc.) and learning outcomes, which also supports sustainability.

f) Human resource needs

The sessions are primarily aimed at qualified child and youth workers and development teachers. If there is no such person in the institution, a dedicated teacher or trainer can also lead the sessions.

Conflict resolution using drama methods (see more in Gorsium (TÁC): anger management and conflict resolution through drama <https://gorsisk.hu>)

a) Good practice objective(s)

The aim of the good practice is to offer alternatives for resolving conflicts between all stakeholders in education (pupils, teachers, parents, parents, the maintenance of the school) and to hold up a mirror to the stakeholders through the use of drama.

It also aims to develop children's potential, develop self-awareness and cooperation skills, and prepare them for integration into society and lifelong learning.

b) Area(s) of competence developed

The learner-centred form of work presented here, drama play, contains in its name the essence of the method, the exploitation of the potential of play-based activities, which are specific to the age of the learners. It covers a wide range of areas of competence development. It is particularly suitable for developing communication, social and life skills. Language and communication are the most important tools for lifelong learning.

c) Results, expected impacts

The application of the practice is expected to develop attitudes, skills and abilities that can form the basis for personal harmony and social integration. These include self-confidence, self and environment awareness, tolerance, honest communication, the courage to take meaningful risks, the ability to set and pursue individual and community goals, decision-making skills, empathy, communication and cooperation skills, conflict tolerance, conflict management and resolution, leadership and organisation.

d) Prerequisites for implementing good practice

This good practice can be done in any institution, with any children's material, where teachers are available for a little extra work, where parents are happy to work with their child's school, where children like to play and spend their free time with the teachers who teach them. The first and most important task in the implementation process is for the class teachers to introduce the ideas to the children and parents, and then the work of collecting, organising and "playwriting" can begin, with the parents actively involved. Then the other colleagues can join in, first and foremost the teacher of Hungarian drama, who will guide the performance.

e) Evaluation of results, sustainability

The degree of success of the project can be directly measured by the audience response following the show. But the real measurable success will come in the weeks and months to come. In many cases, parents' attitudes towards the school change, and they become more open and helpful. And children have become more open and

skilful in resolving their conflicts. Adults also benefit from the curved mirror held by children. They can learn that conflicts should not be swept under the carpet, but should be discussed and resolved.

f) Human resource needs

In addition to the participants already mentioned, it is important to have a professional with the appropriate drama pedagogical knowledge and organisational skills to implement and manage the programme. In addition to the available teaching staff, the human resources can be provided by so-called external volunteers who feel some kind of commitment to drama, creative arts and activities. It is also an opportunity to make new contacts and to unearth hidden resources. The prestige of the school in the eyes of users and outsiders is only enhanced if the community is as open as possible, in contact with more and more people and organisations. Contacts across generations, municipalities and even borders are particularly likely to have a positive impact on the image of an institution.

Teach for Hungary Programme (see more at: <https://tmo.gov.hu/hu/page/program>)

a) Good practice objective(s):

They can definitely be classified as higher education institutions, since they are mainly university students who transfer knowledge, but they can be very well associated with primary school pupils, since they are the ones for whom the knowledge is "internalised". Its purpose is twofold. On the one hand, it is to support small school children in small villages to successfully complete their studies and to integrate them into society later on. It is about mutual learning, supporting each other. The transfer and learning of social sustainability patterns fits in very well with this.

b) Area(s) of competence developed

The programme presented develops a number of areas that are essential for everyday well-being. The method is designed to help different age groups help each other. The aim is both communication between the generations and the development of social skills.

c) Results, expected impacts

The students participating in the university mentoring programme will start working together with a certain number of 7th grade students in one of the participating primary schools, for which they will receive a monthly stipend of 30 thousand HUF, which can be supplemented by additional benefits based on their performance. Each student will take up to four or five students under their wing and help them to successfully complete primary school and continue their studies at secondary level.

d) Prerequisites for implementing good practice

The target group is none other than small, partly disadvantaged pupils from small segregated settlements. The mentors who work alongside them are there to show them the excitement and opportunities of the world beyond the settlement - the zoo, the museum, secondary schools, businesses, to show them the range of jobs and futures

they can choose from. In a nutshell, help them to be able to make the most of themselves - be it vocational training, graduating, further education, sport, the arts and ultimately finding a job in the labour market.

e) Evaluation of results, sustainability

Statistics show that, when looking at international good practices and national good practices, the academic performance of students participating in mentoring activities has improved by up to 15-20 percent, which is equivalent to learning a subject 2-3 months longer. In addition to the improvement in their academic results, the number of unexcused absences also decreased.

f) Human resource needs

The programme is based on the main pillars: a university mentoring programme, a secondary school mentoring programme, a PEP mentoring programme and a corporate mentoring programme. Although these mentoring programmes are the core elements of Teach for Hungary, the programme also includes additional pillars which will be announced in the near future.

The high school mentoring programme offers high school students the opportunity to complete 50 hours of community service in one block. In essence, students from participating secondary schools spend 4-5 days in a primary school in a small town, attending classes and participating in after-school activities with the students (workshops, study hall, sports activities).

Last but not least, the Corporate Mentoring Programme is for companies and their employees. Companies can join the programme by opening up their companies and factories to the young students, giving them an insight into the work that goes on there. As the initiator, the ITM is responsible for the overall coordination of the Teach for Hungary programme and is therefore involved in the management of all pillars, but the Ministry plays a key role in the development and management of the corporate mentoring programme.

Within higher education institutions, many good practices could be mentioned and further developed, as sustainability is a goal of all universities, and the role of the college of higher education, mentioned above, is an important one. The Hantos Elemér Szakkollégium of the University of Miskolc's Faculty of Economics and Business Administration strives to set a good example every year, and the HANTOS JUNIOR model is one of the examples that has been developed and is being developed every year.

Hantos Junior Program

a) Objective of good practice (i)

Ensuring the sustainability of the college is the transmission of sustainable development not only to university students but also to secondary school students. It also aims to unlock the potential of young adults, develop self-awareness and cooperation skills, prepare them for integration into society and the world of work, and lifelong learning.

b) Area(s) of competence developed

Communication, as it is a key element of lifelong learning. Problem solving, conflict management and learning to work in a group, adaptability and tolerance. It is also important to mention cooperation and learning to learn.

c) Basic elements for implementing good practice

University students participate in a mentoring programme. Students in higher years take students who have just entered university or are in their second semester under their wing, helping them to settle in and teaching them how to study effectively. They also work with high schools, helping students who are about to graduate and want to choose economics as a career and university as a higher education institution.

d) Evaluation of results, sustainability

The creativity level of students participating in the programme will be significantly improved. They are able to adapt much better to people and their empathy skills improve significantly for young people participating in the Programme. Their ability to concentrate is significantly improved and attention span is increased. As a result, their learning outcomes are also expected to improve.

e) Human resource needs

This helps a relatively narrow group, as the selected students are the ones who can participate in this programme.

Conclusion

The study examined examples of social innovation in education and the impact of these practices, with a particular focus on issues of social sustainability. Societal challenges that require long-term solutions (e.g. educational inequalities, unemployment, migration, disadvantaged areas) call for new forms of social cooperation. Addressing these challenges is unthinkable without involving innovative partnerships and solutions based on social innovation. Social innovation initiatives are solutions for a sustainable future, identified as a possible means of reducing regional disparities, increasing territorial competitiveness and catching up. Social innovation is a necessary step to improve development and competitiveness, where the role of innovators is highlighted. Innovators are members of society who, with knowledge of the needs related to critical areas, meet the needs identified by societal challenges with new or novel solutions.

In our research, we paid particular attention to the measurement challenges of social innovation in education and to a detailed description of practices at educational levels in Hungary. The Future School programme, an initiative with values that fully supports sustainable development and prepares children to practice these principles from an early age, is a prominent element in our study. The essence of the research is the detailed presentation of good practices and their potential for integration into the curriculum. The individual programmes

can be used at several levels, so we believe that sustainable development in education cannot be neglected, and can be promoted through an increasing number of methods and 'mini' programmes, competitions and events that provide playful learning for pupils. However, the good practices presented are not primarily good practices aimed at transferring knowledge based on environmental awareness, but rather solutions that develop basic competences, support the focus on sustainability and ensure the sustainability of the example given. The cases studied are practices from different educational institutions, where we wanted to present impact measurement and sustainability examinations in the context of a detailed analysis.

Acknowledgement

The study was carried out in the framework of the Thematic Programme of Excellence 2021 - National Research sub-programme, as part of the Creative Region III project TKP2021-NKTA-22, with the support of the NRDIH.

E-Learning Technologies in Continuing Medical Education of Family Doctors in Ukraine: Challenges and Opportunities

Oleksii Korzh

Kharkiv National Medical University, Ukraine,  <https://orcid.org/0000-0001-6838-4360>

Abstract: Continuing medical education faces new challenges and the need for improvement. The active development of technology since the middle of the 20th century has changed the requirements for education in view of the demand for knowledge-intensive specialties. Analysis of the state of scientific elaboration of the problem of e-learning in Ukraine and the experience of its implementation in the practice of higher education showed that despite some achievements, this pedagogical problem needs further research. E-learning improves postgraduate training of doctors. The main purpose of teaching in postgraduate education is to achieve high-quality practical training based on knowledge, skills and abilities in traditional and modern educational technologies. E-learning is a promising form of pedagogical technologies in the field of medical education, as it is more flexible and corresponds to modern realities of society. The implementation of various online resources in the training of health professionals in quarantine activities related to the COVID-19 pandemic as well as during the war, highlights the problem of information literacy and the use of information technology among physicians of all ages and psychotypes, and shows that the latest resources of telecommunications and computers. computer technologies should be widely implemented in all areas of health care.

Keywords: Continuing Medical Education, Family Doctors, E-Learning, Information Networks.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1374-1385), Cappadocia, Turkiye. ISTES Organization.

Introduction

The global process of transition to the information society, as well as the economic, political and social changes that accompany it, are accelerating the reform of the education system. First of all, it concerns providing access to educational and professional training for all those who have the necessary abilities and relevant knowledge (Ayanso, & Lertwachara, 2014), (Korzh, & Krasnokutskiy, 2016). The most effective solution of these problems is facilitated by e-education, which is carried out on the basis of modern pedagogical, information and telecommunication technologies (Angst, & Agarwal, 2009).

To ensure the quality of medical care, the doctors must constantly improving their knowledge and skills. Currently, there are increased requirements for the level of theoretical and practical training of a doctor, the use of information and computer technology in his professional activity, which is associated with the rapid development of new areas and technologies in medicine (Korz, 2021). The need for constant updating of doctor's knowledge, rapid retraining and changing the scope of their knowledge are dictated by the transition from the traditional system of postgraduate training of doctors to the system of continuing medical education (Soja, 2017).

Analysis of the state of scientific elaboration of the problem of e-learning in Ukraine and the experience of its implementation in the practice of higher education showed that despite some achievements, this pedagogical problem needs further research.

Due to the quarantine measures, the Google Classroom service has become more convenient for teachers and students to interact with personal Google accounts. The teachers can add students to the study themselves or send a code to join. Google Classroom provides the ability to create, test, and evaluate tasks in electronic form. In addition, the service allows teachers to make announcements and create discussions instantly, while learners can share resources with each other and answer questions in a chat.

The use of the Zoom system has also become convenient and appropriate. In 2017, Zoom announced the release of the first scalable telehealth product that allows doctors to receive their patients via video for consultation, now a solution called Zoom for Telehealth integrates with other health programs in hospital infrastructure and provides "virtual waiting room for patients". With distance learning for doctors in synchronous mode, the Zoom system provides features such as teacher meetings with learners on multiple screens and devices, sharing the HD screen and wireless network.

However, among the strategic issues related to the implementation of mobile education in the activities of higher medical educational institutions that need immediate solution, we should highlight the organizational, legal, methodological, informational, personnel, technical and financial support.

And for quality training of physicians with the use of informatization, regardless of its type, it is very important to have not only reliable technical support (high-quality and fast Internet access, modern smartphones or tablets, remote server access, IT consultations), lack of new technologies in educational activities, original pedagogical forms and methods of teaching, as well as a high level of professionalism and skill of the teacher.

E-learning in medicine: pros and cons

Informatization of society and introduction of innovative approaches to the learning process have created conditions for conducting training courses using distance learning. What is meant by e-education? E-learning is

the interaction of teacher and students at a distance that reflects all the inherent components of the educational process (goals, content, methods, organizational forms, teaching aids) and is implemented by specific means of Internet technology or other means of interactivity. E-education is widely used in advanced training courses (Ayanso, & Lertwachara, 2014), (Soja, 2017).

The method of teaching using e-learning technologies differs significantly from traditional learning technologies and is mainly based on independent study of the course by the student, and much of the teacher's work is translated into electronic computers (Korzh, 2020). In fact, educational systems "acquire" knowledge from an expert teacher and "bring" them to the student. Therefore, it can be stated that the main feature of distance education is to provide students with the opportunity to independently obtain the necessary knowledge using modern information technology. The ability to individualize learning is one of the main advantages of using information technology in the learning process.

The question of the use of this form of education in medical schools remains debatable. On the one hand, the advantages of e-education are the ability to teach a large number of students, facilitating the learning process, in the case of learning for the disabled, manufacturability – learning using modern software and hardware makes e-learning more effective, and usually e-learning is cheaper question than education regular platform learning norton, primarily remains by case reducing another the discussion cost surgery of showed moving, sciences living medicala in material another scientific city, research reducing connecting the contact cost forms of should organizing the city courses creation themselves component (Ayanso, & Lertwachara, 2014), (Tams, et al., 2014), (Tsodikova, et al., 2020).

Opponents of the use of e-education in medicine believe that the development of practical skills, which are the main component in the training of health professionals, in this way is impossible. However, in our opinion, the use of this form of education in medical schools is not only possible but necessary. Naturally, teaching a doctor practical skills requires traditional face-to-face contact, but all theoretical training and decision-making exercises can take place remotely. In order to properly divide the study time into distance and traditional "phases", it is necessary to carefully revise the curriculum.

Also, e-learning is an ideal and most optimal form of postgraduate training and advanced training, as it helps to solve a number of problems that arise in an already certified specialist, for example, due to different work shifts and schedules of doctors, different approaches to work and study (Tsodikova, et al., 2020), (Korzh, & Tsodikova, 2019). There is also the possibility of using e-learning technologies in cases of full-time students, for example, in the development of general theoretical courses.

Of course, it should be noted that medical education has its own characteristics associated with the teacher-student and doctor-patient relationships. But even in such cases, e-learning demonstrates its flexibility. The

following types of e-learning are possible: without the presence of a teacher, in the case of mastering a theoretical course, with the partial presence of a teacher, during practical and laboratory classes.

E-learning improves postgraduate training of doctors. The main purpose of teaching in postgraduate education is to achieve high-quality practical training based on knowledge, skills and abilities in traditional and modern educational technologies. Innovations in postgraduate education include the introduction of e-learning internships in the technology of training doctors.

E-learning involves several different technologies that can be used in the learning process: case technology, internet technology and telecommunications technology (Korz, & Tsodikova, 2019), (Goh et al., 2016). The choice of training technology depends on the needs of the doctor, his capabilities, the amount of time for training.

The effectiveness of e-learning at the postgraduate stage of education of doctors is determined by:

- the effectiveness of interaction between teacher and doctor;
- active feedback;
- the quality of preliminary design of the distance education process and means of its management; development of didactic materials.

The technology of work consists in interaction of teachers of department with doctors by means of modern telecommunication Internet-technologies, and means of realization of similar interaction are e-mail, teleconferences, dialogues in a real-time mode, etc. During the live broadcast, a multimedia presentation is performed, which is one of the options for preparing a doctor for the lesson (McAfee, & Brynjolfsson, 2017).

With the help of Internet-technologies the study of methodical developments for classes and materials for interactive reading and testing are provided. Also for the educational process use videos of clinical cases and situations from medical practice (McAfee, & Brynjolfsson, 2017). The videos help in the differential diagnosis of diseases in each case, diagnosis, determination of the required amount of examinations, interpretation of research results and determination of patient management tactics.

In modern conditions, which require constant systematic updating of professional knowledge and skills of the specialist, the possibilities of user access to various information resources, including multimedia, are growing. E-learning is based on the use of modern information technologies and means of communication (television, video and audio teaching aids, computer global and local networks).

Returning to the issue of digitalization in the educational activities of physicians, in particular the use of distance learning for the quarantine period, it should be noted about the existing opportunity to study regardless of the location of the specialist. This is the so-called mobile learning (m-learning) or virtual interactive work with the listener using the platform of support and organization of distance learning Moodle. Physicians

studying in the cycles of specialization and advanced training acquire skills of using electronic resources in the distance cycle (texts, graphics, formulas, illustrations, audio, video, glossary, etc.) and skills of appropriate tools for interactive communication with teachers, master various forms of knowledge control.

In addition to creating and using teaching materials in the LMS Moodle system, mobile and handheld IT devices are increasingly used in teaching and learning: personal digital assistant (PDA), mobile phones, laptops and tablets, and select formats and platforms such as Zoom, Cisco Webex, Skype, Google Hangouts Meet, Avaya Spaces, etc., taking into account the technical capabilities and support of learners and the possibility of their authentication.

According to experts, mobile learning is correlated with the concepts of distance learning and e-learning. If the latter two concepts are understood as separate, then mobile learning has common features with e-learning in the use of "mobile devices" and wireless networks, and distance learning is combined with the fact that it is carried out at any time, anywhere, and in the educational process necessarily involves the interaction of teacher and learner.

In fact, we are seeing universities step up their efforts to make all of their educational content available online. We meet the free use of educational and methodological resources developed by teachers in some places (learning places). However, there are still educational resources to which students of their own university have limited or no access.

Teachers continue to choose platforms for placing educational resources (Moodle, Classroom, Edmodo, and so on) or use those provided by the university administration. Accordingly, the demand for Internet technologies and cloud technology tools (web services) has increased significantly.

Even during martial law in Ukraine, the importance of getting an education was demonstrated. The war destroyed educational institutions, depriving them of students and their teachers. Most of them lacked the resources needed to complete their education. During the war, it was inconvenient for them to study.

The difficulties that prevent students from studying properly are described, and the need for significant improvements in distance learning is emphasized. Opportunities for promotion students during the war. They manifest themselves in the balance of time periods that are increased for the completion of school assignments, the reduction of home (independent) tasks, the extension of sessions, and so on. After a combination of scientists and

From personal experience, recommendations are given on effective and useful web tools for teachers who do not have special knowledge and skills in working with applications, as they are great for improving their own educational electronic environment.

Organization of the educational process in postgraduate medical education

Training in accordance with the principles of continuing medical education, which uses e-learning technologies, has both positive and negative aspects. It is not expected that e-education will gradually replace the traditional, but only complement it and expand its capabilities. E-learning requires students to have some basic knowledge, including online skills. Appropriate technical support for participants in the educational process (both for the department and for students) is also needed.

Direct provision of the educational process with all the necessary teaching materials is also a very important task. These materials are presented in the Moodle system. In addition, during the classes it is necessary to provide students with appropriate handouts and/or textbooks in paper form in order to effectively conduct practical classes. The preparation of printed materials should also be properly organized. In addition, students should have carefully developed guidelines for independent work and, of course, had access to the necessary textbooks and manuals, in particular, through the Internet and the possibility of e-communication with teachers.

An important role in further improving the organization of the educational process is played by the final anonymous survey of doctors. In the questionnaires, they express their comments and suggestions for improving its organization and conduct. These comments are analyzed at meetings of the department and, if necessary, lead to further adjustment of the educational process.

Thus, with minimal human and technical resources, it is possible to organize e-learning courses in parallel with traditional teaching methods. The basis for the introduction of these technologies can be trial courses organized on the basis of certain departments of the educational institution, and in clinical departments on the basis of treatment and prevention facilities. At the same time, the system of e-learning and advanced training of medical professionals should consist of the following components: conducting distance lectures, conducting seminars with in-depth study of previously read lecture material; practical classes on various methods of diagnosis, treatment and surgery, as well as individual telemedicine consultations.

At the Department of General Practice-Family Medicine of the Kharkiv National Medical University, individual elements of distance educational technologies are implemented in the system of continuous medical education: at the cycles of thematic improvement and in the process of training future specialists-doctors of family medicine in internship.

We have used the forms of distance education as lectures in text and presentation versions, methodological developments in electronic form, as well as e-books presented to doctors of the professional retraining course, certification courses for advanced training and thematic improvement in the specialty "general practice-family medicine".

The level of development of the doctor is assessed by his ability to independently acquire new knowledge and use them in educational and practical activities. Independent work occupies one of the leading places in the formation of creative activity. Only purposeful systematic independent work of each doctor allows to deeply master knowledge, to develop and consolidate skills, to turn them into the corresponding skills of mental work.

When conducting the full-time part of the advanced training courses for doctors in the specialty "general practice-family medicine", the department uses both interactive synchronous (on-line) and asynchronous (in recording) e-educational technologies in the form of webinars, webinar lectures, remote master classes, online trainings based on professional Internet sites.

Connecting to Internet resources during practical exercises for viewing and discussing a given topic intensifies the educational process and allows you to solve the problems of both the theoretical and practical parts of the training course.

For the purpose of an individual approach to the theoretical training of interns in the specialty "general practice-family medicine", the department also uses certain elements of e-education, namely:

1. Submission of information materials in electronic form on the subject under study in accordance with the approved training program (information material, methodological training manuals, guidelines, legislative and regulatory documents regulating the activities of family doctors).
2. Development by the teacher of topics for independent preparation of abstracts (in the form of text or presentation materials) with subsequent verification and discussion of them at seminars.
3. Individual test variable control tasks for individual modules of the program sent to students' e-mail addresses, followed by their verification and summing up.
4. Interactive synchronous (on-line) lectures on the studied topic based on a professional Internet resource.
5. Asynchronous (recorded) webinars and remote master classes on a professional site.
6. Testing and solving situational problems on topical problems using a professional site.
7. Participation in peer discussion through telemedicine of diagnostic patients presented by doctors for consultation from remote areas.

As our previous practice shows, such an approach to the theoretical training of doctors allows to ensure their high-quality training, individualize the educational process, and also disciplines and organizes the work of postgraduate students during their stay at the medical practice bases.

Among the important problems and shortcomings of the e-education in Ukraine is the shortage of direct contact between the personal teacher and the distance student due to the extreme professional workload of domestic teachers. Unfortunately, in Ukraine we have a lot of people willing to receive e-education, and there are few experienced teachers who are familiar with the latest technologies of distance communication.

But despite the shortcomings, e-learning technology is a powerful means of cognition. To increase the effectiveness of new information technologies in teaching, it is necessary to form a system that provides a different understanding of the essence of learning, the role of teacher and students in this process, the relationship between teacher and students, equipping teachers and students.

Our own experience

Referring to our own experience, we can say that doctors are still extremely reluctant and insecure to use the knowledge and skills of informatization in their professional activities. The range of information literacy and opportunities for the use of information technology among physicians is very wide, depending on a number of objective and subjective factors (age, specialty, position, psychotype, material support, motivation, etc.).

The introduction of new distance cycles for physicians requires not only new approaches to the relationship between traditional components of the educational process and the latest technologies, but also the restoration of interaction between students, teachers and educational environment, and changing stereotypes that were established at school or university. And this is a difficult process.

Almost 10 years of experience in the use of elements of informatization of education among general practitioners and pediatricians, which is embodied in the developed distance cycles of thematic improvement on the Moodle platform, shows the urgent need to constantly increase the motivation of students to learn. It is our use of such psychological and pedagogical techniques as attracting attention to the cycle, maintaining the importance and confidence of this form of learning, satisfaction with the results at the end of the cycle, allow our students to perform tasks honestly, solve situational problems and actively discuss them in forums with teachers and colleagues.

Today, conducting thematic improvement courses for primary care physicians in a remote format, we try not to overload the materials with unnecessary elements. In the postgraduate courses, we rationally and consistently present illustrated slides with links to "pop-up" windows, through which the learner gets acquainted with educational video and audio files, presentations, graphics, diagrams and more. The main thing is to draw the learners's attention to the presented material, sometimes with the help of unusual, non-standard, creative techniques.

To reduce the peak load on medical facilities and reduce the number of physical contacts, primary care physicians began counseling patients using elements of telemedicine. Thus, with the availability of technical capabilities and setting up special functions in electronic devices, doctors began to provide patients with online consultations, avoiding unnecessary visits to the hospital. Pediatricians are often consulted on child care, vaccination.

Concerned parents send photos of rashes or other changes on their child's skin and mucous membranes, the results of laboratory tests for their interpretation. The patients receive advice on the treatment and prevention of exacerbation of chronic disease, dose adjustment and duration of medication. In cases of extreme necessity, after clarification of symptoms, the patient is quickly referred for examination by a specialist, for a personal appointment, or, using emergency medical care, urgently sent to the hospital.

The war that began in Ukraine changed our lives and to some extent stopped it. Under the influence of hostilities, everyone's priorities have shifted. They put their own safety above all else. Processes and activities are inserted, including educational ones. However, the Ukrainians quickly rallied, and although slowly, almost all areas of activity were launched.

It should be noted that the impact of war and violent conflict on education not only reduces the effectiveness of the organization of the learning environment, but also has a significant impact on student achievement. Despite the difficulties, the education system tries to continue the learning process and gives young people the opportunity to gain knowledge, which pleases everyone.

In addition, the quality of the learning environment is also an important factor. The attention of scientists is focused on the consequences of the war, which consists in the destruction of the educational infrastructure, which causes the deterioration of the psychological, physical, social, cognitive and emotional states and can demotivate learning participants. However, these are not the only disadvantages that war brings to children and students, and they will vary according to specific circumstances.

In the event of critical situations, e-learning is one of the few learning systems still available for the educational process. Educational strategies have been modified to improve student achievement. E-learning strategies are based on some well-known learning theories such as behaviorism, cognitivism and constructivism. Their combination, which is present in all e-learning forms, works well in learning and teaching processes and is aimed at students with different characteristics.

Conclusion

E-learning is a promising form of pedagogical technologies in the field of continuing medical education, as it is more flexible and corresponds to modern realities of society. E-education at the postgraduate stage provides

doctors with the opportunity to independently acquire the necessary knowledge, using modern information technology, as e-learning requires a doctor a high level of professional and cognitive motivation, self-control and self-discipline.

Filling distance learning courses with information material (e-books, presentations, etc.) and tests, providing opportunities for learners to communicate (forums and chats, which discuss current issues and solutions to practical classes), promotes the activity of doctors to attend the distance learning course and increase their interest to educational material. And timely, constructive feedback from the teacher - the tutor of the course, also strengthens the motivation to informatize learning. We do our best to ensure that the feedback from the teacher is informal, targeted and supportive.

In general, e-learning is aimed at solving problems generated by the characteristics and differences of individual students, at providing an opportunity to organize comfortable learning conditions, and in some cases at providing education itself, for example, when a country is at war (Kianto , et al., 2019). Or when there are simply no other options left.

Ukraine is concerned about the age and competence of both technical support and teaching staff. Both are crucial not only for the ability to organize, implement and maintain the educational process during critical situations (pandemic and Ukrainian war), but also for motivating teachers to possess and share the stable productivity of their knowledge that they give to students. These terrifying factors for any educational process are actually good reasons to join the 100% distance learning community (Marek , et al., 2016).

A significant part of the work of teachers is to create effective online courses, conduct classes through online video conferences (Zoom, Google Meet, etc.), record video lessons, produce lecture (presentation) material, develop online tests, maintain electronic journals, etc. e. In addition, the experience and ability of teachers in the e-learning process varies [(Kerres, 2020).

This transition has caused difficulties not only for teachers, but also for students, who are acutely aware of the lack of live communication. This is an urgent problem that should be solved by the administration of the educational institution as soon as possible, as it can negatively (and irreversibly) affect the psychological state of students (Gillett, 2017), (Looi, 2022).

Recommendations

The opportunity to be educated in a safe environment is critical. As a result, the experience of studying the effectiveness of e-learning in combat remains the only right decision. E-learning can achieve the stated educational goals as well as provide a safe learning environment.

Currently, scientists and teachers of Ukraine are discussing the types, forms and methods of continuing the educational process in educational buildings during hostilities in the country. The administration of educational institutions is obliged to prepare and equip safe conditions (bomb shelters) in case of rocket or bomb attack, allowing students and pupils to receive education safely.

Abstract: The purpose of this study was to investigate the sources of Chinese learning anxiety among Chinese learners in Vietnam and the strategies and methods used to cope with anxiety. Based on the findings, we suggest effective strategies to relieve learners' learning anxiety caused by different anxiety-inducing situations. The results of this study showed that (1) seven factors, namely learners' own anxiety, teachers, peers, the characteristics of the Chinese language itself, fear of making mistakes, test anxiety and the learning environment, were the main causes of Chinese learners' anxiety. (2) When Chinese learners face anxiety, they try to cope with it through independent learning and seeking assistance from teachers. In addition, because Chinese is a challenging language, they also constantly adjust their feelings to face the learning tasks, strengthen their motivation to overcome anxiety, and increase their self-confidence in learning Chinese through repeated practice.

Introduction

With China becoming one of the world's leading economies, the desire of students to learn Chinese has also increased dramatically, "according to the State Hanban, the number of Chinese learners worldwide has now exceeded 100 million" (Wang, 2020). In addition, China's Silk Road Economic Belt and the 21st Century Maritime Silk Road are contributing significantly to the growing number of Chinese language learners (Ting &

Susan, 2018). Chinese has become the second most common foreign language worldwide (Moloney & Xu, 2015). Due to the increased ties and cooperation between China and ASEAN countries, teaching the Chinese language in Vietnam is rapidly developing, with more students learning Chinese every year (Tham & Cheng, 2019). As of 2019, 35 Vietnamese universities offered new courses in Chinese language, enrolling about 4,000 students annually (Ministry of Education and Training of Vietnam, 2019).

However, Chinese characters, especially their glyphs and the pronunciation patterns of non-alphabetic clues, gives the impression that Chinese is difficult to learn (Ma, 2020). More importantly, the U.S. Department of State considers Chinese "a challenging language for learners" (U.S. Department of State, 2018). Additionally, the large number of homophones makes it difficult for learners to remember the correct characters and their meanings.

As a result, Chinese learners face many challenges in the learning process. Studies have shown that most learners of Chinese as a foreign language experience moderate levels of anxiety in the classroom (Liu, 2020; Zhang, 2016). Li (2013) showed that most learners of Chinese as a foreign language in Southeast Asia exhibit moderate levels of anxiety. Learning anxiety is considered to be a key factor affecting students' academic performance (D'Agostino, 2022). Some scholars have found that foreign language learning anxiety may have a negative impact on students' attitudes and motivation to learn a foreign language (Phillips, 1990; Spitali, 2000). Bailey et al. (2003) and Gardner et al. (1987) found a positive correlation between high dropout rates and high levels of foreign language proficiency anxiety in their studies. There are also problems such as low learner retention in the learning and teaching process (Orton, 2008).

However, Liu (2018) argued that foreign language anxiety "is a complex construct, with little literature on learners of languages other than English as a second or foreign language, and even less on Chinese as a second or Chinese as a foreign language". There is little research on contextualized anxiety that considers the characteristics of the Chinese language (Chen, 2021). Therefore, anxiety is an important issue to address when learning Chinese as a foreign language in Vietnam.

Wang (2020) argued that the content of anxiety research should expand and deepen the research on the correlation between aspects such as self-regulation strategies and language anxiety. There is little literature on the causes of anxiety and strategies for coping with Chinese language learning anxiety among high school Chinese language learners in Vietnamese international schools. This study was prompted to investigate this issue in depth, and we hope the study results can provide a reference for Vietnamese Chinese language teachers' teaching.

In his affective filtering hypothesis, Krashen (1982) stated that affective factors influence learning when learning a language, either positively or negatively. Affective factors include motivation, attitude, personality, anxiety, and empathy. The greatest affective barrier to language acquisition may be anxiety, which significantly impacts students' classroom performance and achievement (Fu & Zheng, 2022). When students have higher

anxiety while learning Chinese, Chinese language acquisition may be more difficult. Affective filtering theory is most frequently used to explore the effects of anxiety on foreign language learning. Based on the theory of affective filtration, this study focused on the influence of anxiety on language learning and investigated the source of Chinese learning anxiety among students in Hanoi, Vietnam. Yu (2012) believed that students and teachers are the main causes of anxiety, so the social factors in this study include teacher factors and peer factors. Furthermore, according to the self-regulated behavior component of Bandura's (1986) social learning theory, to self-regulate, learners need to use self-observation, self-judgment, and self-response, which points out that individuals need to monitor and regulate their behavior accordingly. These three processes interact with each other. Self-regulated learning strategies may vary depending on the personal, behavioral, and environmental factors that need to be more clearly described. Students can develop metacognitive strategies and use these self-regulatory strategies to improve their language learning (Mohd Kosnin, 2007; Mourd, 2009). After understanding the sources of learners' anxiety and using the theory of self-regulation in social learning theory as research support, the purpose of this study is to explore the sources of Chinese language learners' anxiety and their own coping strategies in Vietnam, and to explore effective strategies to be adopted for different anxiety situations and causes of learning anxiety in order to reduce Chinese learners' learning anxiety and improve their language proficiency. According to the above research background and research objectives, the questions of this study are:

- A. What are the sources of anxiety among international secondary students in Vietnam who are learning Chinese?
- B. How do international secondary students in Vietnam cope with anxiety in the process of learning Chinese?

Theory

Krashen's Emotional Filtering Hypothesis Theory

Krashen's (1982) affective filter hypothesis stated that "affective factors influence and control the acquisition of a second language." It also states "the affective filter hypothesis uses the affective component as an affective filter to capture the relationship between affective variables and the second language acquisition process, whereby language input needs to be emotionally filtered before it becomes language and is actually acquired and absorbed by the learner." Wang and Wu (2020) suggested that learners with high affective filters create a hostile environment, creating psychological barriers that prevent them from acquiring or receiving input. Therefore, students feel insecure about their use of language for communication. García Uquillas (2021) argued that anxiety may prevent the conversion of input into the intake and the transformation of uttered elements into comprehension. They hypothesize that low filtering is encouraged by creating a relaxed atmosphere where students do not feel defensive. Affective filters play an essential role in the foreign language learning process. Anxiety is one of the factors in the affective filter that can hinder learning a language, so learners should be supported in lowering their affective filter to obtain language input. This study used the affective filter theory to investigate the impact of anxiety as an affective factor on language learning and the sources of anxiety for Chinese learners, and to analyze the causes of their anxiety.

Social Learning Theory

Bandura's (1977) social learning theory focuses on the role of observational learning and self-regulation in triggering human behavior, emphasizes the interaction between human behavior and the environment, and explores the influence of individual cognition, behavior, and environmental factors and their interaction with human behavior. The theory focuses on understanding, predicting, reshaping, or changing behavior. Xu and Wu (2015) argued that the theory includes four core components: observational learning theory, triadic interaction theory, self-regulation theory, and self-effect theory, and stated that the interaction between the individual and the environment influences human behavior. Shih (2019) argued that self-efficacy strength is indirectly related to self-regulation strategies, mediated by goal setting and expected effort. Participants set concise goals and exert effort to implement strategies to accomplish academic tasks only after they believe in their abilities. Yao (2016) showed that the "observational learning" and "self-efficacy" theories elaborate on the important influence of observation and imitation in individual learners' behavioral acquisition and the role of individual learners' self-perceptions in learning potential. In this study, teachers and peers, as social factors, should focus on role modeling, teacher-student interactions, peer support, and learner emotions, which motivate students to develop a positive sense of self. Using social learning theory, this study argues that foreign language learners as self-regulators should understand and confront their anxiety when facing foreign language learning anxiety, and also try to adopt appropriate coping methods to reduce their anxiety.

Method

Research Implementation

In this study, an intentional sample of 12 students from grades 9 to 12 of an international school in Hanoi, Vietnam, was selected for semi-structured interviews with the consent of the learners. Semi-structured interviews are a flexible way to collect data and provide respondents with an opportunity for honest dialogue in which they can discover how they feel about what they are doing, and explain why they are doing it (Layder, 2013). The interviews were conducted in face-to-face or online meetings. Because the language instruction in international school is English, all interviews were conducted in English so that the participants could express their thoughts and feelings more completely. The respondents were provided with the study content and given an informed consent form before the interview. After the interviews were completed, all interviews were transcribed and given to the participants to check for accuracy. Data were analyzed using the MAXQDA software. Regarding research ethics, the confidentiality of respondent data was strictly protected to ensure validity while contacting respondents, interviewing, and subsequent data analysis.

Participants

The selected International School in Vietnam is a member of the East Asian Regional Conference of Overseas

Schools (EARCOS) and is accredited by the Western Association of Schools and Colleges (WASC). There were 12 participants in this study, three males and nine females, aged 15-17, from Vietnam, Korea, and the United States. Nine students plan to take the AP Chinese Language and Culture Examination, and three desire to communicate in Chinese.

Table 1. Interviewees' profiles.

Code Name	Gender(M/F)	Grade	Nationality	Chinese Learning Years
A1	Male	10	American	8 Years
A2	Female	11	Vietnamese	3 Years
A3	Male	1	Vietnamese	6 Years
A4	Female	9	Korean	7 Years
A5	Female	9	Korean	7 Years
A6	Female	10	Vietnamese	8 Years
B1	Female	11	Vietnamese	4 Years
B2	Female	10	Vietnamese	8 Years
B3	Female	10	Vietnamese	8 Years
B4	Female	12	Vietnamese	3 Years
B5	Male	10	Vietnamese	2 Years
B6	Female	10	American	5 Years

Interview Outline

This study was designed using a self-administered interview outline that was reviewed and organized based on the literature. The interviews included a total of nine open-ended questions, and Patton (1990) suggested that the interviewee response format should be open-ended; the researcher did not provide or predetermine the phrases or other types of responses that respondents must use to express their thoughts and feelings. The open-ended response strategy helped to capture the complexity of the respondents' personal perceptions and experiences. Questions 1 and 3 corresponded to the causes of Chinese language anxiety, questions 2 and 9 to the coping strategies students used for Chinese language learning anxiety, question 4 to the duration of Chinese language learning factor, questions 5, 6, and 7 to the teacher factor, and question 8 to the peer factor. The first question was based on Basith et al.'s (2019) study. Questions 2 and 9 refer to the description of the study by Li and Jiang (2020). Question 4 was referenced from Zhao and Whitchurch's (2011) and Luo's (2013) studies. Questions 3 and 5 referred to Von Wörde's (2003) study. Questions 6 and 7 referred to Xie and Luo's (2021) study. The 8th question referred to the study of Wang and Leon (2020).

NoQuestions

- 1 Do you feel nervous, anxious, or worried when taking Chinese classes? If so, what are the reasons for your negative emotions?
 - 2 What methods do you choose to use to reduce your negative emotions while studying?
 - 3 When learning Chinese listening, speaking, reading, and writing, what aspects make you feel anxious? And describe how these aspects make you anxious.
 - 4 How long have you been learning Chinese? Compared to the past (when learning Chinese for the first time), what do you think is the change in learning mood?
 - 5 In the Chinese class, what teaching activities or teaching strategies do you think your Chinese teacher can use to relieve your anxiety in listening/speaking/reading/writing?
 - 6 In the Chinese class, what does your Chinese teacher do that makes you nervous or anxious?
 - 7 What do you think your Chinese teacher can do to increase your Chinese learning emotional experience and sense of achievement, and thus relieve your negative emotions?
 - 8 In the Chinese class, what do your classmates do that make you nervous or anxious? Or make you feel less negative?
 - 9 For you, what are some good ways to learn Chinese that can make it easier for you to understand what the teacher says? Or to increase your confidence in learning Chinese, thereby reducing your anxiety.
-

Data Coding and Analysis

Chen (2000) pointed out that data coding and analysis are used to process the initial data by systematizing and organizing them according to the purpose of the study. The researcher then focuses on the material, summarizes the essence and reflects on it, with the goal of interpreting the collected data in a meaningful way. This study used thematic analysis, which was developed in the 1980s and is centered on the development of a "thematic framework" (Wang et al., 2006).

In this study, MAXQDA was used to analyze the data and code the interview results. The operational steps of qualitative coding include three stages: open coding, spindle coding, and selective coding (Strauss, 1990). Yin (2016) argued that a credible study is one in which the researcher can properly and correctly assemble and interpret the data so that the findings and conclusions of the study are accurately presented to the world under study. In this study, student interviews were audio-recorded to record the key information and content of the interviews. The interview transcripts were checked to make a verbatim transcript, which was reviewed by the interviewees. Finally, the information was analyzed to ensure research credibility. After the coding was completed, it was discussed with and agreed upon by three experts. This researcher is a master's degree student in educational administration. Expert 1 and Expert 2 are Ed.D. The experts were used to confirm analytical credibility, results, and correct use of data or methodological triangulation to ensure that similar results were

obtained (Wang & Wang, 2010). The outline of this study was revised four times by the supervisor and was shared with the interviewees 2 hours before the interview. The interviewees were introduced to the study and issued informed consent forms, and the formal interview began after signing the informed consent form. The interviewees were allowed to fully express their opinions during the interview. In terms of research ethics, the confidentiality of the respondents' data was strictly protected to ensure validity in the process of contacting respondents, interviewing, and subsequent data analysis.

Results

Analysis of The Sources of Anxiety Among Chinese Learners in Vietnam

Learner Factor

Many previous studies have explored and analyzed various aspects that contribute to the sources of foreign language learning anxiety. These results usually fall into two main categories: the learner factor and the situational factor (Anwar & Abdullah, 2021). The results of the interviews in this study also showed that learners generally appear to lack confidence and experience uncertainty about whether they are using the correct wording, and also believe that their Chinese language has caused them anxiety because they have not made progress after a certain period of study. This is in step with Anwar and Climis's (2017) suggestion that factors including self-confidence interact in various ways to cause and increase foreign language learners' anxiety levels. Therefore, learners' own factors have a definite influence on the development of Chinese language learning anxiety. An example of a participant's view is as follows:

Although I have been learning Chinese for a long time, I am not sure if my Chinese has improved too much over the years. There are words in a sentence that I don't recognize even if I have come across them before, which makes me question my comprehension and memory of Chinese grammar, and sentence structure is also important(B3).

Teacher Factor

Rubio (2017) argued that the role of the teacher may have a considerable impact on students' anxiety because students with high levels of anxiety say they feel more relaxed only in the presence of certain teachers. Fu (2020) pointed out in her study that the teaching materials used by teachers may have a serious negative impact on students' development of language initiative. Textbooks and support materials vary greatly in difficulty, so the use of textbooks and improper teaching may cause a great deal of pressure on students' learning and seriously affect their self-confidence in learning. Similar results were found in this study. The results of the interviews showed that the content of the teaching materials and teaching methods were causes of anxiety among Chinese learners in Vietnam. The high degree of difficulty learning the Chinese language coupled with the teaching materials makes it challenging for the learners to understand all the content they have studied. An example comment is as follows:

I think sometimes the learning content is difficult and it makes me worried because it contains lots

of vocabulary and grammar. (A4)

Students may experience anxiety caused by the teacher's teaching methods. Some of the reasons for learner anxiety include being asked questions, the teacher's fast pace of teaching, responding to email assignments in a limited time, doing cultural presentations, and the teacher giving instructions in the Chinese language to the class so fast that learners do not understand the instructions. This result is consistent with Zulfikar's (2022) study that foreign language learners usually become anxious when the teacher invites them to speak in the classroom. It is also believed that some of the activities or teaching methods designed and led by the teacher are a source of anxiety for learners. One participant made the following observation:

You need to finish the culture presentation and the e-mail response within a certain time, but I feel the time is too short for me to finish the whole e-mail response. It makes me anxious. (A5)

Peer Factor

Zhang and Lai (2023) suggested that peer pressure is a factor in the anxiety of foreign language learners. Li (2019) argued that today's students have a strong desire to win, which leads to increased competition among students, and as a result, students may feel some pressure and anxiety. This study confirms the view of these two researchers that peers cause learning anxiety among Chinese learners in Vietnam. Pressure and anxiety from peers are caused primarily in the following ways: learners compare themselves with their peers and feel inferior to them, learners worry about receiving bad comments from their peers, and the learners lack effort and seriousness in group activities. One participant made the following comment:

There's one kid who's really good at Chinese and she is Korean. I used to be the best student and now I'm not and she's not even Chinese so it's a little bit embarrassing. (B6)

Chinese Characteristics Factor

The interviews in this study confirmed that speaking activities produced the most anxiety from the perspective of students, while teacher characteristics, such as a non-severe attitude towards error correction, and a positive, friendly, and relaxed attitude toward students could reduce student anxiety. The results of the interviews showed that both the speaking and reading aspects of Chinese had an impact on the anxiety production of Chinese learners in Vietnam. In terms of speaking, classroom speaking anxiety, oral presentation, cultural presentation, and pronunciation were factors that contributed to student anxiety in learning Chinese. This is consistent with the study of Pelzl et al. (2019), who noted that when the second language spoken is Chinese it is often considered a great challenge for learners of voiceless languages. Horwitz et al. (1986), Liu (2006), Young (1990), Phillips (1992), and Cheng et al. (1999) also argued that speaking or communicating in the foreign language classroom has been the most important source of anxiety. Speaking can be defined as a productive and engaging ability and involves four distinct cognitive stages: conceptualization, formation, clarity, and self-monitoring (Pawlak, 2015). Since this skill is done in a short period of time, it will be difficult for the speaker to

control all stages. One participant's perspective was as follows:

The aspect that made me feel anxious most is definitely speaking. Speaking Mandarin is very difficult compared to English or Vietnamese. It's way harder and they have different tones. (A2)

In addition, according to the interview results, too much Chinese vocabulary, inflections, conjunctions, grammar, syntax, idioms, and colloquialisms are difficult to master and are sources of anxiety for Chinese language learners. Horwitz et al. (1986) asserted that one of the most anxiety-provoking situations for most students is communication because it includes many language learning processes such as word pronunciation, word recognition, meaning, and grammatical rules, and is therefore difficult to master (Fielding, 2007). Spencer (2015) also explained the problems and challenges of learning Chinese characters and Chinese as a foreign language because Mandarin is a very complex language, and learners need to overcome many difficulties in learning Chinese characters. For example, first of all, like other foreign language learners, they have to deal with stress and anxiety. Secondly, they have to deal with Chinese characters and the problems specific to Chinese characters, such as the morphological differences between Chinese characters and other languages, the acquisition of tones, and the complex writing system of Chinese characters. One participant made the following comment:

You have to remember a lot of phrases and sentences to structure your response, which can be stressful. There is also the worry of forgetting structures and grammar. (A1)

In the case of Chinese listening, listening texts being too long, relatively fast, and including too much vocabulary such that the full text cannot be understood in its entirety are causes of learners' Chinese learning anxiety. This result confirms Lai and Dilley's (2016) view that phonological differences in Chinese are what makes it different from other languages, which requires students to have meta-linguistic awareness during listening practice. An example participant's perspective is as follows:

For the listening, sometimes you might hear a word that you don't know, especially if it's a really hard assessment, you can't turn it back to hear it again. Or the speaker speaks too fast; it makes me worried. (B2)

Chen et al. (2014) noted that Chinese has certain linguistic characteristics, including the unique composition of strokes, radicals, and characters, and writing in Chinese may be different from writing in other languages; therefore, writing in Chinese is more likely to cause anxiety than practicing other language skills. This is consistent with the results of the interviews in this study, where the short time given by teachers for writing tasks and the difficulty of the strokes, radicals, and structure of Chinese characters are factors that contribute to learner anxiety when it comes to writing in Chinese. One participant made the following observation:

You need to finish the culture presentation and the e-mail response within a certain time; I feel the time is too short for me to finish the whole e-mail response, so it makes me anxious. (A5)

Zhao et al. (2013) found in their study that given the linguistic differences in learning mechanisms between native and target languages, second language reading anxiety mainly stems from unfamiliar texts on different

topics as well as comprehension. Xu (2018) argued that although a number of Chinese characters exist in the Korean writing system as well as in their own country, Korean students may get confused when learning Chinese because there are some variations in the pronunciation, meaning, and character form of these characters. The results of the interviews also indicated that the difficulty in recognizing Chinese characters and the inability to understand all content when reading were reasons for the anxiety of Chinese learners. One participant's opinion was expressed as follows:

You know how to pronounce it when it comes to typing things down, but you get a list of Chinese characters and need to choose. If there's a word I only know how to say and then try to identify the correct words without a dictionary, or just based on what it looks like, that causes me anxiety. (A3)

Afraid of Making Mistakes Anxiety Factor

Most learners will worry about making mistakes in front of their peers when using Chinese because they are not sure whether they are using the correct words and phrases, which contributes to learning anxiety among Chinese language learners. This result is consistent with Aichhorn and Puck's (2017) finding that many foreign language learners worry about reacting incorrectly or performing poorly in front of their peers because they are usually ridiculed and humiliated by their peers, which causes them to lose self-esteem. This fear has a negative impact on foreign language learning. An example participant perspective is as follows:

I make mistakes and it's not that I get a negative reaction from the teacher, but just that I'm afraid of making mistakes. (B4)

Test Anxiety Factor

According to Cakici (2016), test anxiety is considered as a kind of anxiety in which learners are afraid of experiencing failure in academic assessment in a test situation. Elaldi (2016) stated that fear of quizzes is one of the causes of anxiety in foreign language classroom settings because learners are constantly being assessed in the classroom. The results of the interviews showed that quiz anxiety was one of the factors that produced anxiety among Chinese learners in Vietnam, and that learners were worried and nervous when doing the task being assessed. This echoes Young's (1991) statement that the more unfamiliar a student is with the content and format of a language test, the more anxiety the learner experiences. One participant's perspective was as follows:

There is a lot more stress involved in the assignments, as they often carry a high weight in assessments (A1).

Learning Environment Factor

According to the results of the interviews, the way the school assesses makes Chinese learners anxious. This echoes Xu's (2018) suggestion that schools should judge students' abilities in a comprehensive way through

multidimensional assessments based on multiple test scores by including a certain percentage of the final and midterm written or oral test scores in students' final grades so that the assessments are more credible and at the same time can reduce students' anxiety about a particular test. One participant's perspective was as follows:

I will say that these big projects can be a bit stressful sometimes because there is a lot of weight and pressure on the performance. If you don't do well, your grade could go down, but if you do very well, your grade could go up. The risk involved in how your grade will change can be stressful at times. (A1)

Strategies for Chinese Learners in Vietnam to Cope with Anxiety

Learners' Learning Methods

Hazimah and Margaretha (2022) pointed out that students should make full use of the opportunity in class to practice speaking, ask the teacher for more advice, and communicate with their classmates in Chinese more often. This is consistent with the results of the interviews. The interview results showed that when learners experienced Chinese learning anxiety, some of the coping strategies they used included: when they encountered words they did not understand or did not know they would use online dictionaries by themselves, or when they had questions, they would often ask their peers or teachers for advice, and practice speaking Chinese with their peers after class. Hazimah and Margaretha (2022) also suggested that students should have the habit of pre-reading what they are going to learn in class and reviewing what they have learned after class in order to ease their anxiety about classroom instruction. This is consistent with the interview results that pre-reading before class and reviewing after class will also enable learners to better grasp what they have learned in Chinese and thus increase their confidence to some extent. An example comment is as follows:

Thanks to the internet, I have access to a variety of online resources such as dictionaries like Pleco and 有道翻译 that I can use to quickly search and learn more about words that I don't understand, which are extremely helpful in improving my understanding and proficiency in Chinese as they help to clear up misunderstandings and fill in any gaps in my learning. (A1)

Good attitudes will have a positive impact on students' future learning (Anwar & Abdullah, 2021). Anwar and Balcioğlu (2016) argued that students' abilities, strategies, and attitudes determine the success of their language learning. This is consistent with the results of the interviews, which showed that learners perceived Chinese as a challenging language, but they tried to adjust their emotions to make themselves learn Chinese with a relaxed, stress-free attitude. In addition, the learners' motivation to learn Chinese included the possibility of taking the AP Chinese examination in the future and the possibility of communicating in Chinese, and the fact that Chinese would help them in their future studies and work were also strategies used by the learners when they were anxious about learning Chinese. This is in line with Bereketoglu's (2018) finding that motivation is one of the key factors in foreign language learning because, in addition to being a motivator to initiate and sustain learning, it is an important factor to compensate for the lack of competence when the learning situation becomes difficult. One participant's

view was as follows:

Although Chinese is difficult, I use the method that I learned in Chinese class with a relaxed attitude. So there's no stress while I'm learning Chinese. (B5)

Listening to Chinese music, watching Chinese-related videos, learning Chinese in movies, and learning from mistakes based on feedback or corrections given by teachers are coping strategies adopted by Chinese learners in Vietnam when they experience anxiety. This is in line with the results of previous studies, as Zhang (2022) argued that the process of watching Chinese movies is also a process of learning Chinese, and students may imitate and rehearse the more interesting lines, which helps to stimulate their desire to express themselves orally. Through these strategies, students feel that their Chinese is gradually improving, thus alleviating their feelings of anxiety. An example participant perspective is as follows:

I think we can make ourselves look back on the mistakes and you make us redo it. Then we would definitely redo it and learn from the mistakes and your feedback is better so that we can make improvements. (B1)

Exploring Effective Strategies for Different Anxiety Situations and Causes of Learning Anxiety among Chinese Learners in Vietnam

Strategies for The Learner Factor

Li (2018) pointed out that teachers should pay attention to creating a cordial classroom atmosphere in English teaching, and offer timely praise and affirmation for students' progress to increase their interest and confidence in learning English. In addition, Zhao (2023) argued that creating a relatively friendly and comfortable learning atmosphere is conducive to establishing a good teacher-student relationship. Teachers should promote cooperative foreign language learning among students, especially for foreign language learners who feel anxious, which can stimulate their sense of security. Foreign language teachers should be aware of students' unique personalities, work to reduce peer pressure, and tailor instruction to different students' foreign language anxiety levels and foreign language abilities. Teachers' friendliness, support, and humor with innovative and fun classroom activities can increase learners' positive emotions about learning (Li et al., 2020). This is consistent with the interview results that creating a harmonious environment for learning Chinese, a positive, amiable teaching attitude of the teacher, and willingness to give help to students will make students feel closer to the teacher. Students will not worry about making mistakes, and being encouraged and rewarded by the teacher can alleviate their anxiety. One participant's view was as follows:

The Chinese teacher is always very encouraging and cheerful. Even if you know you have been having a bad day, you wouldn't show it and it would not impact our needs. I think that's very notable. (A3)

Strategies for The Teacher Factor

The results of the interviews indicated that, in terms of the content chosen by teachers, teachers preparing

interesting and practical content for teaching materials and adding game-like and cultural classroom activities will make learning interesting. Thus, it is more active for learners, and also reduces learners' anxiety about learning Chinese. This is consistent with the study of Xiao and Zhang (2018), who pointed out that adding folklore to Chinese language teaching can increase interest in learning Chinese and can also alleviate the phenomenon of anxiety generated by learners. In terms of teaching methods, teachers should provide students with enough opportunities to practice their Chinese language skills in Chinese classes, especially by giving non-graded forms of practice. In addition, teachers should also put the class slides, practice vocabulary, and review materials on the school's learning system platform so that students can easily find the learning materials to practice anytime and anywhere, which will make learners more proficient in Chinese skills and thus provide them with self-confidence. Zheng and Cheng (2018) suggested that teachers should adjust their teaching resources and try to use learning materials that are meaningful but less likely to cause anxiety in order to facilitate students' language learning at an optimal level. The level of task difficulty should be appropriate to stimulate and challenge student language development while minimizing student anxiety. One participant's perspective was as follows:

My Chinese teacher has helped me feel more confident and less anxious when it comes to giving presentations, doing interviews, or completing reading and listening assignments. One of the ways she's done this is through constant practice in class, where we've had the opportunity to do cultural presentations, interviews, and email responses. This has really helped me feel less anxious and nervous when it comes to listening, speaking, or reading in Chinese. (A1)

When administering pop quizzes, language teachers should manage the difficulty level of the quizzes and determine how often they need to be administered. In addition, teachers should inform students in advance about course requirements, materials, and how assessments will be conducted, which may be helpful in alleviating learners' quiz anxiety (Fang & Tang, 2021). The results of the interviews indicated that teachers who reduce the number of time-limited quizzes to assess students as well as allow students to be able to redo some tasks or quizzes would reduce learner anxiety. In addition, detailed feedback on tasks from the teacher is helpful for the learners to understand what is wrong and how to correct it so that they can improve their Chinese language skills, which makes the learners less worried to a certain extent. This finding is also in line with Chaudron's (1988) suggestion that the teacher write on the board the mistakes or serious errors that students often make and share them with the class, as it is important to provide scaffolding for students. In addition, informing students about tests or tasks and how they will be assessed in advance of doing them or answering questions will give students sufficient time to prepare, which will have a significant impact on reducing learners' anxiety levels. One participant's perspective was as follows:

The teacher can pick the people that need to speak from the class ahead of time so we can be prepared. (B5)

From the participants' feedback, it is known that teachers should add pinyin to some of the more difficult Chinese characters so that students can recognize them through pinyin, and they should also increase the number of practice sessions to consolidate vocabulary so that students can better grasp the vocabulary they have learned

and thus increase their confidence. This echoes Chaudron's (1988) statement that increased daily practice is effective in addressing this problem. In addition, when teaching grammar and syntax, teachers can compare the similarities and differences of different languages and give detailed explanations and more examples, which can make learners more aware of the application of grammar and syntax in Chinese. Additionally, teachers should also use more Chinese in the Chinese classroom so that students have more opportunities to listen to Chinese and thus improve their listening skills. This echoes Inada's (2021) idea that students' foreign language skills will gradually improve if they have more opportunities to speak English and receive input from other people's conversations. Participants' perspectives were as follows:

I think because repetitive learning has been proven in psychology and if you just spend 10 minutes going through the vocab and the quizlet you will remember the character better because you learn it so much and you can't forget. (B4)

I think for the sentence structure, we could compare the structure to other languages so we can see the difference between them. We can recognize the difference and put them in other orders so we can see how the structure works. (B5)

The reduction in students' anxiety helped when they engaged in more group activities or discussions. This mirrors the finding of Azizpour and Gholami (2022) that teachers can create a relaxed and positive environment by providing students with sufficient interactive and collaborative classroom activities. For example, in a linguistics class, teachers can prepare some topic or classroom discussion. One participant made the following comment:

The small group activities and discussions in class help me to reduce my negative feelings. because being able to work with your classmates you can receive new input or learn their learning methods as well, and as you interact with more people sharing knowledge. It is a really good way to learn and create new study methods. So, group projects especially with the students we are all familiar with and they're all friendly, it really helps a lot. But mixing the groups around, meeting and working with new people is also important because you'll experience new things and push yourself out of your comfort zone, which helps with learning as well, and reduces the nervousness. (B2)

Strategies for The Characteristics of The Chinese Language Factor

It was revealed by most of the participants that teachers should do more to encourage students to not only listen to Chinese but also speak Chinese in the classroom. Students could also improve their Chinese by listening to Chinese songs and watching Chinese movies and TV programs. This is similar to Zhang's (2022) description of students learning Chinese while watching Chinese movies. They can imitate and rehearse the lines in the movies that interest them. It echoes that it is beneficial to increase students' willingness to express themselves orally. In addition, some participants also commented that teachers need to give feedback and correct students' intonation and pronunciation if their pronunciation is not accurate so that students can correct their Chinese pronunciation and thus increase their confidence in speaking Chinese. This is also in line with Wang's (2017) statement that whenever learners make more phonological as well as grammatical errors, teachers should try to use more non-

explicit correction strategies to correct the errors. One participant's view was as follows:

If she did correct my tones every time, that would be a lot of corrections and would feel bad, but it would make me more confident in knowing what I'm supposed to be saying. (B6)

Zhao (2023) argued that students' familiarity with reading content in a foreign language can reduce text complexity and foreign language reading anxiety. In providing feedback, teachers can use indirect methods to correct students' foreign language errors in order to minimize their foreign language anxiety levels. This is consistent with the interview results, reading aloud as well as by reading some books outside of the Chinese classroom. Also, teachers can teach students some reading and test-taking skills, such as guessing the meaning of words and themes and creating writing templates. According to Ma (2020), teachers should take the lead in guiding students to recognize the unique characteristics of Chinese characters and the Chinese language, and in this way, stimulate students' interest in Chinese characters and Chinese language learning, thus reducing their anxiety about the Chinese language, especially Chinese characters. This is consistent with the interview findings that when teachers provide students with practice sheets of stroke order to practice writing Chinese characters, it is helpful in improving learners' reading and writing skills. An example comment is as follows:

When I was in Malaysia, my Chinese teacher told me to read a lot of Chinese articles and she gave me a Chinese article every week to read. I used this method when I prepared for the HSK. It helped me be fluent in reading and be a faster reader. (A5)

Strategies for The Learning Environment

The results of the interviews showed that the harmonious and supportive learning environment created by teachers has a significant effect on reducing learners' anxiety. Some appropriate additional Chinese class time in school can give students more time to learn and master the Chinese knowledge and skills they have learned, which reduces students' Chinese learning concerns. This echoes Yin's (2015) statement that teaching and learning is a multilateral and cooperative process between teachers and students, and between students and students. Creating a democratic and harmonious classroom atmosphere not only increases respect as well as understanding between teachers and students, but also increases students' motivation to learn, and reduces students' anxiety levels. One participant's perspective was as follows:

I feel our school community is very welcoming. Everyone here is really kind regarding studies and doing classes. When I don't know where to go and have any questions, I'll ask any person in the school to help me and they would really help me very enthusiastically. It would help rescue me from the negative feelings. (A4)

Chen (2019) and Crawford et al. (2019) indicated that peer interaction facilitates language learning. Most participants also agreed that peers were not a factor in their anxiety. Moreover, positive, helpful, and friendly attitudes of peers, as well as encouragement given among peers would somewhat increase their confidence and thus reduce their foreign language learning anxiety. The feedback and suggestions given

by peers during practice can help students learn from each other and complement each other's strengths and weaknesses, thus improving their Chinese language skills. This is in line with Murphey et al.'s (2014) idea that students need to help each other and exchange ideas to provide each other with the learning resources they need, thus increasing group motivation to learn. One participant explained as follows:

I don't have issues with being nervous or anxious because of my classmates in my Chinese class. My peers gave me encouragement when I was not as good as other students so I am not insecure. My classmates are positive and always willing to motivate fellow students, which helps prevent anxiety in learning. Working with my classmates on classwork, group work, or reviewing the material also helps me feel less anxious, because I can learn well while spending time with my friends. (B2)

From the feedback of the participants, we know that some of them found it difficult to learn Chinese at the beginning, especially the Chinese characters, and they did not know how or why to learn Chinese. However, some participants felt that learning Chinese was easy and simple at the beginning, mainly because the content was easy to understand and there was no pressure for grades. In addition, students generally felt that their previous experience of learning Chinese had not only helped them find a suitable method for learning Chinese, but also increased their initiative and motivation to learn Chinese, making it easier and more interesting to learn Chinese now. They gained more confidence, and thus their learning anxiety reduced. This finding is also in agreement with Afiqah (2015) and Basith et al. (2019) who stated that there is a significant effect of length of foreign language learning and language anxiety, with the longer a person's time and experience in learning a language, the less anxiety he/she has. Significant differences were found in various aspects of Chinese language learning anxiety between students in their first year of learning Chinese and those who studied Chinese at the highest level. This difference is due to the experience gained in learning the language that yields similar results. Participants' perspectives were as follows:

At first, I really didn't like learning Chinese because the Chinese characters were so hard compared to English and Korean. It takes me about one hour to just memorize 10 characters. It was really hard and I thought I wasn't showing any improvement in learning Chinese. (A4)

Because when you're younger, especially in elementary school, the environment was very carefree and you didn't have to worry about your grades too much. (B2)

Conclusion

Based on emotional filtering theory and social learning theory, this study investigated the sources of learning anxiety among Chinese learners in an international school in Vietnam and their own coping strategies in the face of anxiety. The study also explored strategies to reduce Chinese learners' learning anxiety according to the specific causes. The results of the study showed that (1) seven factors, namely the learners themselves, teachers, peers, the characteristics of the Chinese language itself, fear of making mistakes, test anxiety, and the learning environment, were the main causes of anxiety among Chinese

learners in Vietnam. (2) When Chinese learners in Vietnam face anxiety, they also try to cope with it through independent learning and by seeking assistance from teachers. In addition, since Chinese is a challenging language, they will constantly adjust their emotions and attitudes to face the learning task, strengthen their motivation to overcome negative emotions, and increase their self-confidence in learning through repeated practice.

Recommendations

About Learner

Teachers should create a harmonious, positive and mutually supportive Chinese learning environment for teachers and students. A positive and amiable teaching attitude of teachers, peer understanding, support and mutual assistance will not only make students feel closer to teachers and other students, but also ease students' nervousness in Chinese classes. As a result, students will be less afraid of making mistakes when using Chinese in the classroom. In addition, positive encouragement from teachers and peers can make students feel a sense of belonging and security, which can increase their self-confidence in learning or using Chinese, and thus improve their Chinese language skills. In addition to learners' attempts to alleviate anxiety, teachers should also help learners to establish correct and positive self-evaluation and self-coping concepts, gradually change negative emotions and try different coping strategies during long-term learning and knowledge accumulation, so as to change learners' own anxiety level and promote their self-improvement.

About Teachers

First of all, in terms of material selection and teaching methods, interesting and practical teaching materials will make students more interested in learning Chinese, while designing games and activities about Chinese culture will make learners more active and enjoy learning Chinese, which will ensure that students improve their Chinese skills and knowledge, and also reduce their anxiety about learning Chinese, thus increasing their positive experience of learning Chinese. In terms of teaching methods, teachers should provide enough opportunities for students to practice their Chinese skills in the Chinese classroom, especially in the form of non-grade-based practice, which will allow students to focus more on practicing their Chinese skills without the pressure of considering grades, and as learners become more proficient in Chinese skills, their self-confidence will increase and thus their negative emotions will reduce. Teachers should also help students find the right way to learn Chinese according to the characteristics of each student.

Secondly, in terms of tests and assessment methods, teachers should inform students about the content of the test or task and the assessment methods in advance of the test or task, so that students can have enough time to prepare, which will have a great impact on reducing learners' anxiety levels. Teachers should also

diversify their assessment methods to minimize time-limited tests that cause anxiety in learners. After the assessment, teachers should give students detailed and easy-to-understand feedback on how to correct their mistakes so that learners can improve their Chinese language skills, which to some extent will make them less worried.

Finally, when teaching Chinese characters, vocabulary, grammar, and syntax, the teacher can reinforce the vocabulary exercises through game-like activities to reinforce the recognition of characters and vocabulary so that students can master the vocabulary they have learned, which will not only increase learners' confidence but also make the exercises fun. In addition, when teaching grammar and syntax, teachers can compare the similarities and differences of different languages and give detailed explanations and more examples, which can make learners understand more about the application of grammar and syntax in Chinese.

About Chinese Language Characteristics

First of all, in terms of Chinese listening and speaking, from the feedback of most participants, it is known that teachers should encourage students to listen and speak more Chinese in classes, and teachers should also use more Chinese so that students have more opportunities to listen to Chinese and thus improve their listening skills. They can also improve their Chinese by listening to Chinese songs and watching Chinese movies and TV programs. Secondly, in the area of reading and writing Chinese, besides reading aloud and reading books outside the Chinese classroom, teachers can also teach students some reading and test-taking skills, such as guessing the meanings of words and topics, creating writing templates, etc. so that students can better understand what they read. Finally, teachers can provide students with practice sheets to practice writing Chinese characters, which can also help improve learners' reading and writing skills.

About Peers

In the Chinese classroom, positive interaction and mutual help among peers, helpful and friendly attitudes, as well as encouragement and support given by peers will, to a certain extent, make learners more positive about learning Chinese and make them more confident, thus reducing their Chinese learning anxiety. In addition, the feedback and suggestions given by peers during practice can make students learn from each other and complement each other's strengths and weaknesses, thus improving their Chinese language skills.

The Relationship Between Knowledge Production and Google in Framing and Reframing AI Imaginary. A Comparative Algorithmic Audit between the US and Italy

Natalia Stanusch

University of Amsterdam, the Netherlands,  <https://orcid.org/0000-0002-6796-9049>

Abstract: This study offers an analysis and comparison of search results from Google concerning the topic of Artificial Intelligence (AI) in two geographically and politically different contexts: the United States and Italy. As new AI systems, tools, and solutions are developed and implemented in each sector of human life on a global scale, certain imaginaries of AI are emerging. These imaginaries constitute the ground for the public understanding, support, and disapproval of certain AI technologies and regulations. As citizens turn into users, Google remains the dominant gatekeeper of information, thus becoming an influential actor in sharpening AI imaginaries. The following analysis is a response to this criticism of Google's search results, considering Google as an essential producer and certifier of AI imaginaries for general public. The comparison of search queries conducted in this analysis shows that the sources which Google presents in its search results add to different types of AI imaginaries, consequently influencing public opinion in different, often asymmetrical, ways.

Keywords: Digital Knowledge Production, AI Imaginaries, Google Critique, Algorithmic Auditing

Introduction

Artificial Intelligence (AI) is creeping into every aspect of human life. While it does not materialize as a superhuman Artificial General Intelligence that takes control over humanity, AI systems regulate, organize, and influence policies, economy, law enforcement, job market, immigration, and human intimacy. In a techno-deterministic spirit, AI is presented as an inevitable technological future. With the recent upheaval caused by the release of Generative AI models such as DALLE-2 and ChatGPT, AI became a major issue of public concern. How does the public understand AI? A notion of "sociotechnical imaginary" is useful here. In Sheila Jasanoff (2015) definition, sociotechnical imaginary serves as a framework to understand the fears, hopes, and beliefs held by a community such large as society or nation (Jasanoff, 2015, p. 321). Jasanoff argues that by

investigating what sociotechnical imaginaries are held by a given group or community, one can understand the “futures to be shunned and avoided” (Jasanoff, 2015, p. 22) but also the futures that are hoped for. Therefore, imaginaries allow certain actors, especially on governmental and corporate levels, to accordingly influence and respond to what are “the right” scales and types of action to take (Jasanoff, 2015, p. 23). It has been further noted that the public understanding and awareness of AI is a pivotal element for how “AI is deployed, developed and regulated” (Cave and Dihal, 2019, 331). Yet sociotechnical imaginary should not be considered a monolithic and stable entity to be excavated, but rather a set of dynamic, entangled, and sometimes contrary imaginaries that are simultaneously at play when we study them (Mager and Katzenbach, 2021, p. 226l; Mager 2017: 256).

Search engine results, such as Google results page, are governed by “*public relevance algorithms*, [which] are-- by the very same mathematical procedures--producing and certifying knowledge” (Gillespie, 2014, p. 168). For example, the ‘AI’ images which appear in search engine image tab, driven by a certain economic and algorithmic logic, have an impact in reinforcing certain imaginaries of AI image, which Romele (2022, p. 3) pointed out in his study of Getty Images stock images of ‘artificial intelligence.’ By considering search results as knowledge artifacts – digital entities of particular context, organized by specific algorithmic logic – we can examine expressions of specific sociotechnical imaginary which can emerge as much from policy documents (Burri, 2015, p. 234) as from search results.

While there have been reports of Google showing biases over sensitive or controversial queries (e.g. Sweeney, 2013; Bogers & Loes, et al, 2020; Houli, et al. 2021; Solon & Levin, 2016), the following comparative analysis focuses on a seemingly ‘neutral’ keywords, which do not carry a direct political or social weight. The analyzed search results come from queries “AI” and “artificial intelligence” in the US and Italy (in Italian, “IA” and “intelligenza artificiale,” respectively). This analysis asks what are the AI imaginaries that Google shows in the search results, and whether they are coherent across two analyzed geographical locations.

Conceptual Framework

To explore sociotechnical imaginaries of AI is thus to turn to common sources of knowledge production and analyze those involved in the structuring of these imaginaries. As Burri (2015, p. 234) already pointed out, Jasanoff, already in her text on imaginaries from 2005, highlighted the relationship that imaginary and technology play at performing, organizing, and controlling “ways of knowing the world” (Burri, 2015, p. 234). I also would like to point our attention to the argument put forward by Emma Garzonio in her recent chapter publication “Performative Intermediaries Versus Digital Regulation. A Multidisciplinary Analysis of the Power of Algorithms.” Garzonio, partially inspired by the work of Geoffrey Bowker (2006:12–14), argues that “[a]s information technology has converged with the nature and production of scientific knowledge, we assist the social and political process of creating an explicit, indexical memory of what is known, the making of ‘memory infrastructures’” by “database[ing] the world” (Garzonio, 2022, p. 159). With the ongoing digitalization of everything, users turn to algorithms as principle means of storing, sorting, and sharing. Yet by navigating

though all digitalized information with algorithmic logic as our navigator, we are faced with very “specific implications” on knowledge production, Garzonio (2022, p. 160) argues. She adds that one such implication is the ‘relevancy’ principal that steers most data-driven algorithmic systems of search. One very tangible example of the relevancy principal and its implications on knowledge is the search engine results.

The “knowledge” that co-shapes AI imaginaries comes in a significant degree from search engines, mostly from Google which maintains 92.47 percent of the market share worldwide (Statista, 2022). Google is thus a “gatekeeper;” Google does not only provide information online but also orients and controls the information flow, allowing some types of content to surface, while drowning others (Jürgens & Stark, 2017; Latzer et al., 2016). “Our mission is to organize the world’s information and make it universally accessible and useful” (Google, 2022), Google claims on its “About” page. Yet each selection of Google search results that appears on users’ screens “represents a particular knowledge logic” (Gillespie, 2014, p. 168), which is based on unclear algorithmic criteria of the most ‘relevant’ information for the users.

In other to examine the knowledge (re)produced by Google Results and the derived sociotechnical imaginary of AI, in this paper I turn to digital methods. Digital methods, as explained by Rogers (2017, p. 15-16), are a toolkit of methods which are of the medium, taking into account the affordances of digital objects, from search results to social media platforms. The dependency on Google as the source of ‘knowledge’ sparked a vibrant research field dedicated to Google’s information politics, especially in terms of the logic of hierarchies of ‘relevance’ in the way that Google situates search results (Rogers, 2022, 5).

One has to acknowledge the intrinsic limitation of such research, however. There are several obstacles in analyzing SERP results in an algorithmic auditing setting. The search results on Google are intrinsically unstable due to continuous readjustment of the recommending system for specific users (Gillespie, 2014, p. 178). Additionally, users tend to see different results due to the filter bubble effect without an awareness of the invisible editing of Google’s recommendation and ranking algorithms (Rogers 2022, 12). It is often impossible to know how and why results change over time in Google (Umoja Noble, 2018, p. 4, p. 16), leading to the limitation of the research to be representative of singular capture of constantly shifting and changing search results.

Method

Following the research tradition of ‘algorithmic auditing,’ this analysis looks at the hierarchy and placement of sources in Google results. As Rogers phrases it, “for the social researcher, Google is of interest for its capacity to rank actors (websites) per social issue (keyword), thereby providing source hierarchies, and allowing for the study of dominant voice” (Rogers, 2017, p. 79). This study follows the academic inquiry into Google’s logic of relevancy and the (lack of) preferences for certain types of sources or kinds of actors across different locations. Thus, the following analysis merges two research approaches to study Google, as discussed by Rogers: the

medium research and the social research.

The medium research, or ‘preferred placement’ critique, is focused on the degree to which a search engine shows preference for certain type of dominant website (Rogers, 2017, p. 77). The social research, or ‘filter bubble’ critique, are focused on the extent to which personalization – such as geolocation settings – impact the search results leading to more localized and personalized query outputs and severe niching (Rogers, 2017, p. 77). The examinations of results allows for a study of “social sorting” (Rogers, 2017, p. 77), where one can tract which actors are allowed by Google relevance algorithms to dominate the search and thus “drive the meaning of terms;” to quote from Rogers again, “the engine is considered as serving social epistemologies for any keyword (or social issue) through what is collectively queried and returned” (Rogers, 2017, p. 78).

The following study analyzes only the first page of SERP (Search Engine Research Pages), to reflect the actual behavior of users who rarely engage with results beyond the first page of SERP (Jansen & Spink, 2006; Rogers 2022, 9; 23; Steiner et al, 2022, p. 219). Given that most users click on top-ranked results (Steiner et al, 2022, p. 221; Pan et al., 2007), while more than 80 percent of users stop looking after first three results (Jasen & Spink, 2006), particular attention is given to the results which appear ‘above the fold’ of the webpage, and which results are pushed down ‘below’ the fold.

In order to study Google search results from both social and medium perspectives, keyword design is a crucial step of the research methodology. The choice of the keyword(s) for a given query, aside from influencing the search results, is meant to reflect the contexts and actors who are most likely to be using them (Rogers, 2017, p. 81). Rogers talks about two most popular ways of differentiating keyword query types: unambiguous queries and ambiguous queries (Rogers, 2017, p. 87). This analysis focuses on the ambiguous query – ‘AI’ and ‘artificial intelligence’ – combined with a cross-geographical approach. Ambiguous queries allow one to track how Google as a search engine treats such an ambiguous query differently, by comparing and contrasting hierarchies of concerns which Google assembles while queried in different language and location (Rogers, 2017, p. 93).

In order to analyze accordingly what ordinary users would see, the search queries were adjusted to reflect what and how people would be searching for information on AI. Thus, no quotation marks were used in keyword design. As users mostly search in their native language, the queries in the context of Italy were conducted in Italian, and in English in the context of the US. Since users also tend to search with short and simple queries (Umoja Noble, 2018, p. 37), the four queries conducted were as follows:

US1: language English, region the US, query “AI”

US2: language English, region the US, query “artificial intelligence”

IT1: language Italian, region Italy, query “intelligenza artificiale”

IT2: language Italian, region Italy, query “IA”

In order to ensure quality of collected data, each of the queries were conducted using a clear Firefox browser (with no history of search or cookies), in incognito mode. To change geographical location a VPN was used,

setting the location to Italy and the US. The results for Italy were collected on November 1st, 2022, and the results for the US were collected on November 5th, 2022. The variables taken into account were: the search query, the hierarchy of credibility depending on the placement within SERP, and the source of information.

The study focuses primary on organic results, that is the search results which are not content curated within Google Features (the so called ‘artifacts’ such as Google properties sections which appear within SERP such as films, images, and top stories). However, results displayed within Google Features which were relevant for the study that is meant to replicate the user experience (Google’s ‘answers’ and ‘definitions’ to suggested questions such as “What is AI”), were taken into consideration. Similarly, while results from Wikipedia tend to be placed within top results for many queries and can be thus understood as either “an authoritative source (for its persistent presence) and an engine artefact (for its uncannily persistent presence)” (Rogers, 2017, p. 80), for the scope of this research they were not removed from the dataset.

Results

Table 1 shows the list of sources counted from the top of each SERP of each query. The analysis of organic results accounted for their materiality, distinguishing between the form of source and the type of source. The fifth result the US1 query and US2 query, as well as the third results in both IT1 and IT2 queries (marked with * in the table), were a Google Feature of “people also ask;” under that feature, the following tab was present, linking to sources which were included in the table: “What is AI?” (US1); “What is artificial intelligence with example?” (US2); “Come funziona l’IA?” (IT1); “Cosa si intende Intelligenza Artificiale?” (IT2). In the seventh and eighth result of US2 query (marked with ** in the table) Google Feature of “Things to know” included the following tab linked to sources which were included in the table: a) “Disadvantages: What are some disadvantages of artificial intelligence” b) “Good or Bad: Artificial Intelligence good or bad.”

Table 1. Results of sources for each query

Number of the result	US1	US2	IT1	IT2
1	aws.amazon.com	Business Adobe	Wikipedia	hpe.com
2	Wikipedia/google search	MIT online getsmarter	ia.italia.it	Wikipedia
3	Google AI	A Caltech CTME	*SAS	*europarl.europa.eu
4	Google AI	Dictionary - Oxford Languages	SAS	intelifenzaartificale.it
5	*Techgadget	*Techgaget	ansa.it	agendadigitale.eu
6	Wikipedia	Wikipedia	garzantilingustica.it	blog.osservvtori.net
7	OpenAI	** (a) Simplilearn	ia.int	ai4business.it
8	SAS	** (b) enago.com	coe.int	SAS
9	C3 AI	Investopedia		treccanti.it

10	BiiltIn	Techgadet	Oracle
11	The White Hose	Oracle	
12		BiltIn	
13		Britannica	
14		IBM	
15		SAS	
16		aaai.org	

The forms of sources were categorized based on the following criteria: ad – advertisements or sponsored content; Google feature – any Google feature (*images*), including search results which link back to Google as a corporation (Google AI); and search results – organic search results in SERP (see Fig. 1 and Fig. 2).

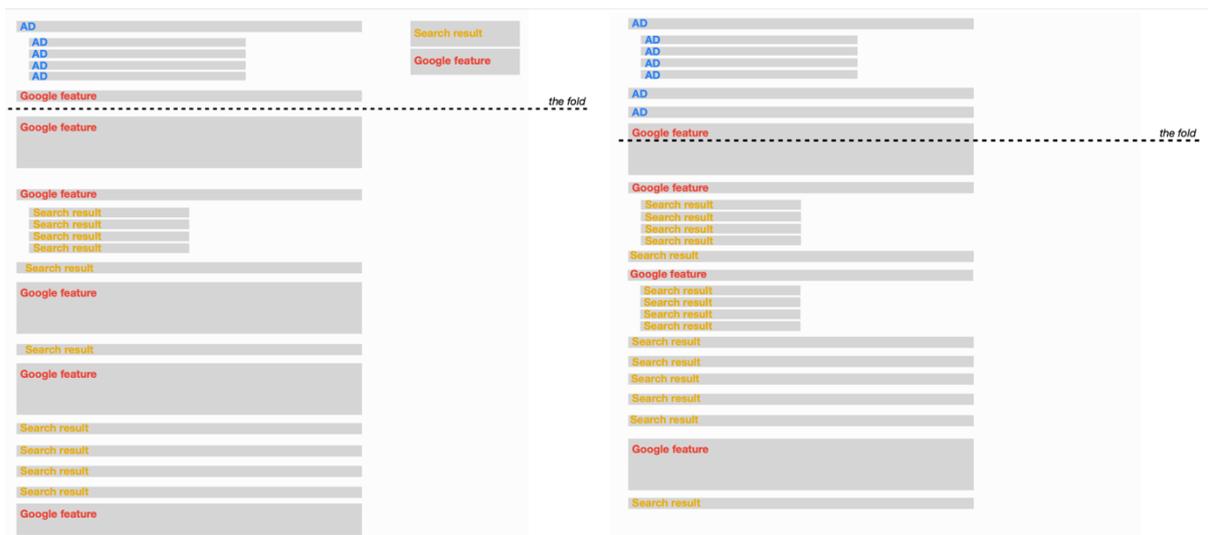

Figure 1. Results of US1 (left) and US2 (right)

Figure 2. Results of IT1 (left) and IT2 (right)

The types of sources were assigned to one of the following categories of source types: industry – any company and business-oriented enterprise which either sells software (e.g. Google AI), AI solutions (e.g. SAS), or offers high-level online courses in machine learning and AI (e.g. MIT); government - the governmental representatives (the White House), official institutions affiliated with the national government or EU parliament (Italian Agenda for Digitalization); dictionary – sources which provide definitions (Wikipedia, Britannica, Google’s ‘definition’ was also considered as such); NGOs (any non-governmental organization, also non-for profit organizations such as ANSA); other (sources which did not qualify for any of the previous categories, such as websites with unclear ownership, e.g. intelifenzaartificiale.it) (see Fig. 3 and Fig. 4).

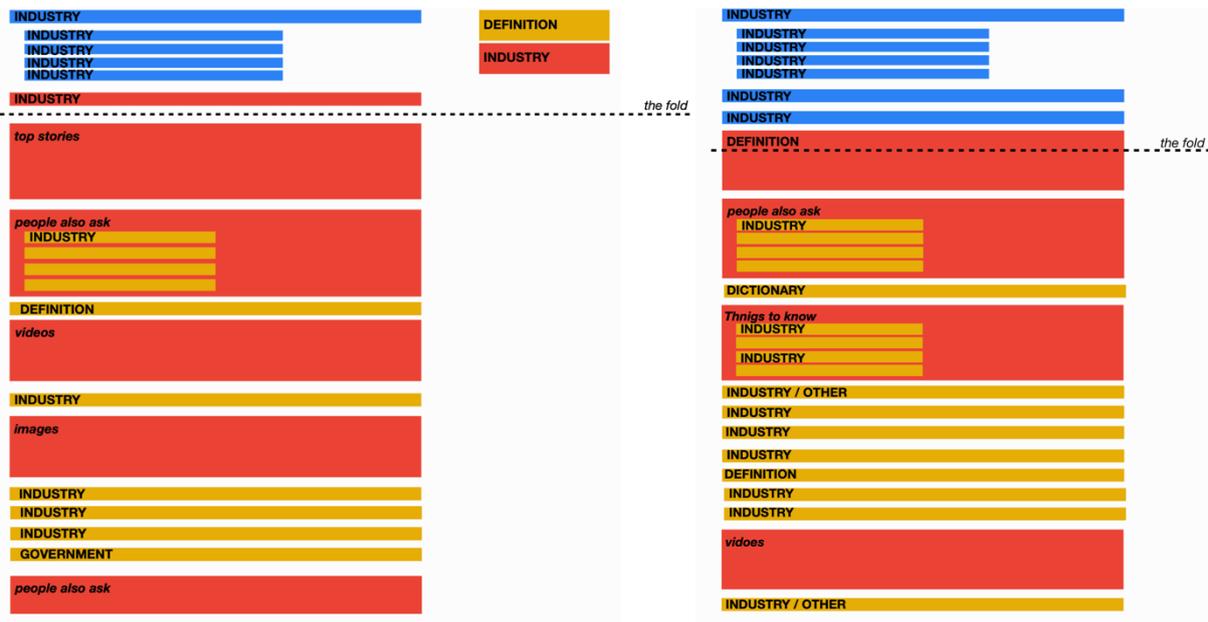

Figure 3. Results of US1 (left) and US2 (right)

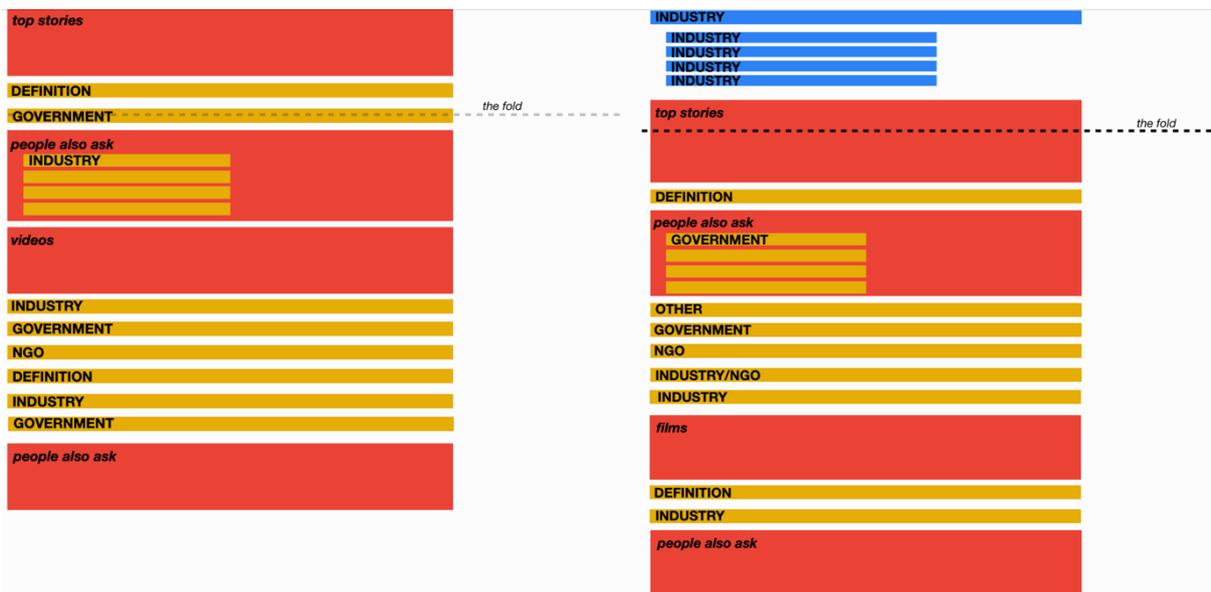

Figure 4. Results of IT1 (left) and IT2 (right)

There are several obstacles in analyzing SERP results in an algorithmic auditing setting. The search results on Google are intrinsically unstable due to continuous readjustment of the recommending system for specific users (Gillespie, 2014, p. 178). Additionally, users tend to see different results due to the filter bubble effect without an awareness of the invisible editing of Google's recommendation and ranking algorithms (Rogers 2022, 12). It is often impossible to know how and why results change over time in Google (Umoja Noble, 2018, p. 4, p. 16), leading to the limitation of the research to be representative of singular capture of constantly shifting and changing search results.

The queries performed resulted in four captures of the first page of Google results, one webpage capture per each query. As illustrated in all figures, the number and types of results which occupy the space 'above the fold' differ in each of the captures, depending on the layout for specific query, in specific location and, and one might assume, specific time. In cases US1, US2, and IT4 sponsored content is shown first (above the fold), followed by Google Features and organic search results. Notably, due to the specific layout, the number of total results for Italian queries is lower than in the US queries (US1: 17; US2: 18; IT1:16; IT2: 17). The number of organic results and their hierarchy also differs across the pages analyzed, depending on the layout of the page (see in particular fig. 1 and fig. 2).

As illustrated in fig.1 and fig. 2, the content related to Google Features (not the organic search results) is similarly present in each case, both above and under the fold. A particular case of Google pushing forward its own content is visible in US1, where Google AI (a branch of Google) appears in two search results, both situated above the fold. It is also in the case of the US query (US2) that aside from the 'standard' Google Features such as *people also ask*, a unique Google Feature appears, titled "Things to know." Given the relevance of certain results within Google Features, some of them were considered while analyzing types of sources (see fig. 3 and fig. 4).

Despite the fact that the organic search results in Italy (IT1 and IT2) were fewer than in the US, the resonance of diversity of types of sources, particularly governmental ones, is particularly resounding (see fig. 3 and fig. 4). On the contrary, in the US context search results (US1 and US2), 'industry' sources prevail (see fig. 5).

Discussion

The fact that sponsored content takes the most prominent place in the results reflects that, first and foremost, Google is an example of an "advertising platform" (Srnicek, 2017, p. 49). Google is not an information company, but an advertisement company, biased towards its own properties and sponsored content (Rogers 2022, 26). As Umoja Noble phrased it, "Google creates advertising algorithms, not information algorithms" (2018, p. 38). Following this argument, one has to consider that the 'credibility' of information provided by Google's hierarchy of results can reflect advertising interests, or "an intersection of popular and commercial interests" (ibid., p. 36). Therefore, in each four cases analyzed, a significant presence of sources coming from

the ‘industry’ is not that surprising.

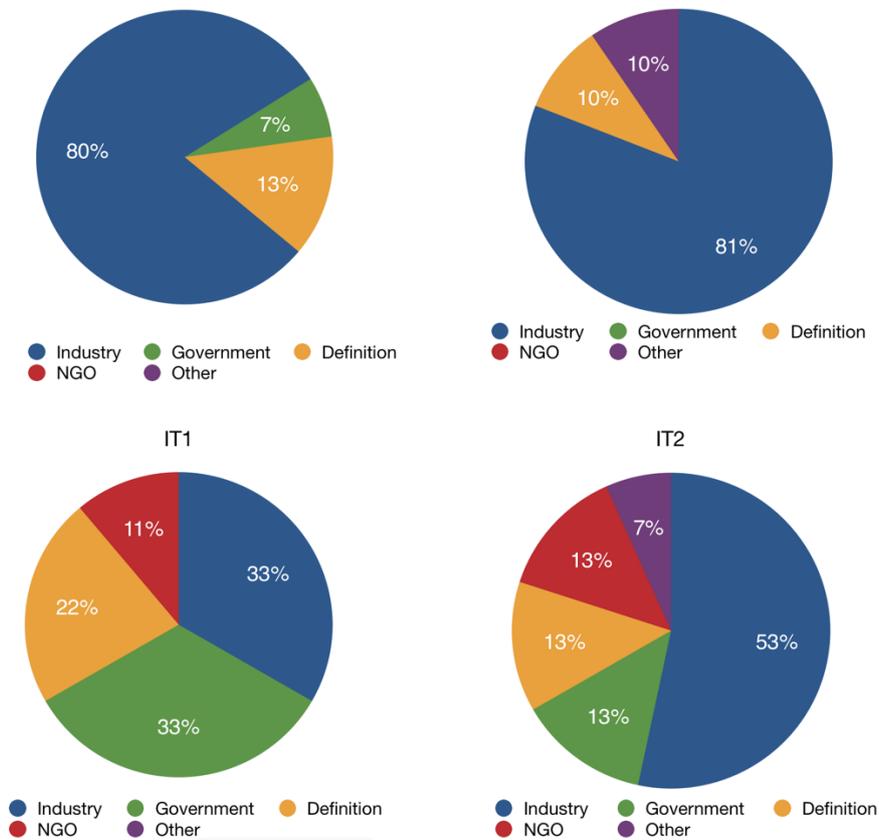

Figure 5. Percentage of source types per query

While AI imaginaries have been influenced by myths perpetuated by science fiction (Bareis & Katzenbach, 2022, p. 857), this is hardly reflected in Google results. Yet if one assumes that contemporary myths are mostly generated by science and technology (Bory & Bory, 2015, p. 67), then the significant number of ‘industry’ sources, prominent in the US context, adds to the imaginary of AI being mystified, highly complex, and incomprehensible for laymen. ‘Industry’ sources also tend to reflect a rather overly optimistic approach to AI developments, shared by people in the field (Sartori & Bocca, 2022), focused on advantages and the unlimited potential that AI can unleash particularly for businesses. The high presence of ‘industry’ actors also reflects a more ideological phenomenon, that of global corporate presence – out of which, that of Google is the most prominent –in pushing utopian visions of digital technologies (Mager and Katzenbach, 2021, p. 227).

This analysis of Google search results on AI in the US and Italy has proven something quite different, namely that the type of sources and the form of sources differ significantly across borders. In fact, these differences reflect the political imaginaries of AI that the US and Italy (which tends to follow the general EU narrative) have been propagating for years. In their analysis of political approaches to AI imaginaries, Bareis & Katzenbach discovered that countries such as Germany and France tend to promote AI imagines “along ethical lines” focusing on “humanist ethos,” security, and risk assessment (2022, p. 871-872). The US approach, as they

argue, is the contrary; both under Trump's and Biden's administration, AI is presented as a tool of "empowerment of the American worker, strengthening local industry, or fostering a deregulating free-market approach" which depends on "the competitive economic strength of a proud nation building" (ibid., p. 872-873). Hence, the global discourse of creating a nation-specific AI imaginary (ibid., p. 856), can be said to be reflected in the asymmetry between 'industry' actors and 'government' actors in the search results of Google.

Mager and Katzenbach point out that today, "the circulation of imaginaries is often not motivated and propagated by state actors and their interests, but by commercial actors' assumptions about technology that directly shape the design of their products" (2021, p. 227). In terms of constructing AI imaginaries worldwide, as noticed also recently by Bareis & Katzenbach, the primary actors are "business actors [who] feature much more often in AI reporting than other stakeholders" (Bareis & Katzenbach, 2022, p. 857). Google seems to be reflecting that trend. Avis argues that the imaginaries which surround the 4th Industrial Revolution, which is driven by AI development and implementation, consist of a range of tensions and contradictions across regions which are nonetheless united by the overarching dominance of the capital (Avis, 2018, p. 342). One wonders whether Google's search results reflect a greater shift between the US and EU AI imaginaries, thus perpetuating the political hegemony, or whether in both cases the most prominent actors (industry in the US, government and NGOs in EU/Italy) are using SEO, and, by constructing 'credible' websites, dominate in SERP.

"All knowledge is a condensed node in an agonistic power field," stated Donna Haraway (1988, p. 577), and all 'knowledge' of Google is no different. Ultimately, knowledge is related to power relations, and AI imaginaries are intrinsic to socio-political realms in which they emerge. As Umoja Noble argues, "we must ask when we find these kinds of results, Is this the best information? For whom? We must ask ourselves who the intended audience is for a variety of things we find" (2018, p. 5). The way Google and other algorithm-driven systems categorize and configure knowledge can influence users' perception – and, as we might add, their imaginaries – of the reality beyond the digital. As Garzonio (2022, p. 161). rightfully notices while referring to the Google results,

a complex, automatic, profit-driven mechanism drew a line between what we could easily find and access and what was to remain silent. Again, this represents an exercise of power, both in terms of control over the availability and concrete accessibility of knowledge and in terms of influence on the meaning we subsequently construct over that same knowledge.

The search queries conducted in the US and Italy reveal that depending on geographic location, Google's search algorithms 'give' power to specific actors to shape the imaginaries of what AI is. It has been noticed that 'hyped' AI imaginary is spread by both companies and governments (Kazansky & Milan, 2021, p. 374). Operating between 'government' actors and 'industry' actors, Google does not dispel any "counter-imaginaries" of AI in the first page of its SERP, rendering civic counter-imaginaries of AI (Kazansky & Milan, 2021, p. 364) invisible for laymen. Instead, users, particularly in the US, are being delivered a 'hyped' industry-driven AI imaginary rather than a survey of actual socioecological AI issues and their possible consequences. Yet with a few algorithmic tweaks, the two different AI imaginaries that surfaced from the study discussed here, could be

switched or changed completely, without users noticing. Or, the diversity that's more apparent in the Italian context could be replaced with a single answer to the question posed by a pop-up Google Feature "what is AI." One could argue that such consolidation of 'knowledge,' or "transforming the web from a browsing and surfing space to a single Q&A" (Rogers 2022, 23), is what Google seems to strive for.

Conclusion

This study focused on differences in Google search results which appear in the SERP for queries on AI in the US and Italy. As Google remains the dominant gatekeeper of information online, it influences the imaginaries that people construct on such topics as AI. As part of its questionable objectivity and invisible logics of sorting information, Google's search results should not be taken as 'objective,' even in terms of queries which relate to topics that are not, seemingly, controversial, such as general knowledge of what AI is. In the spirit of sponsored content, one can state that Google's search results reflect both Google's interests and the interests of its most infomercial stakeholders; in case of AI, the industry (in the US context) and the government (in the context of Italy). Google's search results are in principle a survey of "the wisdom of the crowds" and "certified authorities" (Gillespie, 2014, p. 187). However, most users are not aware that they are only given a 'slice' of the content, or a different slice compared to what they could stumble upon if they searched from a different geographical location. Google's complete lack of transparency clashes with Google's strategy to appear 'objective' (Umoja Noble, 2018, p. 45). Google's monopoly on information is exercised upon billions of users across the globe in their daily searches.

While the US and the Italy (EU) results are different, and so are the sociotechnical imaginaries that emerge locally, some of the crucial differences and similarities that a layman user can perceive are well reflected in the localized Google search. Despite significant differences, queries performed in both contexts of the US and Italy are similar in that they exclude for the debate any perspectives, NGOs, or companies from the Global South. Instead, they show a certain transnational cooperation among corporations and localized results of NGOs or government specific actors. Given the small sample of this study, follow-up research could expand the scope on by focusing on different countries, and collecting a larger and more diverse data sample. One also has to note that this study was conducted before the release of OpenAI's ChatGPT, which significantly influenced the public debate around AI technologies and caused both a hype and panic globally, which had surely influenced (in both positive and negative ways) the public imaginary of AI.

Abstract: Nowadays, Malaysian ESL students struggle to read English texts, particularly narrative texts. Lacking in utilising and applying the suitable reading strategies are among factors that hinder reading comprehension. This study aimed to investigate the effectiveness of Question-Answer Relationship (QAR) strategy on ESL pupils' narrative reading and to find out their perceptions toward QAR strategy in narrative reading. This study employed a non-equivalent pre-test and post-test quasi-experimental design. A total of 72 pupils from a government primary Chinese vernacular school were chosen as participants for this study and data were collected using a multiple-choice reading test and a questionnaire. The findings indicated that QAR strategy to teach narrative reading significantly improved the pupils' narrative reading comprehension achievement. Therefore, the result of this study is expected to contribute something for the development of the process of English teaching and learning especially for the teaching of reading comprehension of narrative text.

Keywords: Reading, QAR strategy, narrative text, ESL young learners, comprehension

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1422-1433), Cappadocia, Turkiye. ISTES Organization.

Introduction

English is the compulsory second language for all Malaysian pupils in the primary and secondary levels in the Malaysian education system. The primary education curriculum in Malaysia aims to equip pupils with fundamental language skills that will enable them to communicate effectively in a variety of contexts conducive to their development. As reported by AD-Heisat, Mohammed, Sharmella and Issa (2019), in the primary school

English curriculum, the teaching of reading strategies was not mentioned, and the reading skills to be taught are word attack skills and reading for main ideas. It was also found that although primary school teachers know reading strategies, these are seldom applied in the teaching of reading. Reading strategies should be exposed to pupils to facilitate them in improving their reading comprehension and be critical in their reading.

Comprehension has become a critical component of reading in the vast literatures of reading research, both in terms of instruction and assessment (Adams, 2019). It reaffirms the notion that the purpose of reading is to comprehend information contained in texts, a process that involves interaction between the reader, the text, and the context. Good readers are deeply involved in those processes, constantly monitor and evaluate what they read, and make use of what they read in their daily lives. As a result, instructing students to become proficient readers is a difficult and time-consuming task that necessitates specific comprehension instructions (Block, Gambrell & Pressley, 2002).

As a result of the preceding definition, there are numerous difficulties encountered while learning English in school, one of which is answering some questions about reading texts. Many students spend an inordinate amount of time answering comprehension questions. They frequently read all the texts in order to answer one question, then return to the same text to answer subsequent questions. As a result, many students run out of time and are unable to complete the test optimally. Additionally, many students struggle to master the reading language skill. They are typically passive learners, unable to use their literal knowledge to express their ideas or opinions in discussions about text-related issues or to use their higher-level thinking to comprehend the text. They are often afraid to ask questions about material they do not understand during the teaching learning process, and they lack a firm grasp on the elements or aspects of reading they should master.

Unfortunately, some English teachers continue to teach reading in a traditional manner in class, which usually results in pupils becoming bored and having difficulty comprehending the materials due to the method's monotony. As a result, the teacher should devise another method, technique, or strategy for resolving this issue. Thus, the teacher can employ an appropriate strategy to ensure the efficacy of English instruction in order to boost students' achievement. Numerous strategies are used in the classroom to teach reading; one of them is the Question Answer Relationship (QAR) strategy. The teacher can incorporate this strategy into the teaching process, particularly when it comes to reading.

The QAR strategy is intended to facilitate a deliberate and common way of thinking and speaking about effective sources of information when answering questions. QAR is a comprehension-improving strategy used during reading. This strategy teaches pupils that not all questions are the same and that understanding the different types of questions will assist them in answering the questions presented in this strategy. This strategy establishes a three-way relationship between questions, text content, and reader knowledge (Raphael, 1986).

QARs provide a reasonable starting point for addressing the barriers that prevent all students from attaining high levels of literacy. QAR enables students to think critically about the text they are reading and beyond it. Hence,

this study aims to investigate the use of Question-Answer Relationship (QAR) as a strategy in teaching reading comprehension to ESL pupils . Specifically, it looks at;

- a. To what extent is the effectiveness of Question Answer and Relationship (QAR) strategy on ESL pupils' reading of narrative text?
- b. What are ESL pupils' perceptions toward Question-Answer Relationship (QAR) strategy in reading of narrative text?

Literature Review

Reading Comprehension

Reading comprehension was influenced by a variety of factors, including the type of reading, the reader's characteristics, and the reading technique used. At the elementary stage, there was a lot of evidence that reading fluency has a major effect on reading comprehension (Liao, 2015). Once pupils enter middle school, however, fluency was no longer considered a major factor in comprehension. Other variables should be weighed instead. Recent research also supports the teaching of cognitive techniques to enhance reading comprehension ability (Casteel, Isom, & Jordan, 2010). Proficient readers use a variety of techniques to enhance their comprehension of a text (Casteel et al., 2010). Motivation was a reader trait that can be related to reading comprehension (Liao, 2015). It can influence pupils' reading comprehension in a variety of ways. It has been hypothesised that pupils who were more curious or interested in reading have higher levels of reading participation, implying that intrinsic motivation plays a role. Another possibility was that pupils with higher self-efficacy were more likely to put in more effort in attempting to decipher the significance of a letter. It was likely to result in improved reading comprehension.

The text and its context awareness were the two key sources of information in the QAR system. Children were clearly taught that not all answers can be found in the text using this technique. Many inexperienced readers were unaware of this and will profit from such guidance. These two basic classifications, “in the book” and “in my mind” can be further divided into four groups. "Right there" questions and "think and check" questions fall under “in the book” category. The questions right there were very literal, allowing pupils to define textually explicit details including definitions and evidence. They were easily found in the text, so readers just have to deal with small quantities of text to respond to such queries. Readers were asked to summarise, clarify, compare and contrast details, and describe cause and effect relationships in response to think and search questions. Readers must be able to combine and interpret data. They must discuss the whole text when they perform these tasks (Raphael & Au, 2015).

A good teaching method was needed to enhance pupils' reading comprehension because it teaches or assists pupils in resolving difficulties they encounter when reading the text. For instance, how to locate the main idea, the subject, the fact, and the opinion. Reading comprehension may be influenced by a successful or appropriate teaching method in order for pupils to better understand and comprehend the text.

Subdivide text into unnumbered sections, using short, meaningful sub-headings. Please do not use numbered headings. Please limit heading use to three levels. Please use 12-point bold for first-level headings, 10-point bold for second-level headings, and 10-point italics for third-level headings with an initial capital letter for any proper nouns. Leave one blank line (1.5 times spaced) before and after each heading. (Exception: no blank line between consecutive headings.) Please margin all headings to the left.

QAR Strategy

QAR was a reading comprehension technique designed to help pupils understand the ways they can view reading narrative texts and answering questions. It also displays the ways to decipher the kinds of questions they were questioned and clues to look for the solutions (Raphael & Au 2015). Tompkins (2010) elaborates that the Question, Response, and Relationship (QAR) Strategy consists of three steps, namely predicting, clarifying, and questioning. The ability to predict the subject of what was being read was known as prediction. It means that pupils can link their background knowledge to new information about the text or problem. Furthermore, pupils may anticipate or hypothesise what the author will address next in the document. The ability to explain the difficulties encountered when reading the document was known as clarifying. For example, if pupils were confronted with unfamiliar terminology, a muddled reference, or other issues, they can try rereading or requesting classification. The ability to ask a question that was related to the text was known as questioning. It asks pupils to find new knowledge in the form of a question and then self-test to show that they can answer it. The Question-Answer-Relationship (QAR) strategy engages students in the process of questioning and demonstrates to them that a variety of resources were available to assist them in answering questions (Jones & Leahy, 2006). QAR does not classify questions in isolation; rather, it considers both the reader's prior knowledge and the text. This method reflects the prevalent view of reading as an immersive activity influenced by the text, the reader, and the context.

Methodology

Research design

The study employed a non-equivalent pretest-posttest quasi-experimental design. There were two groups in this study: an experimental group that received treatment via the QAR strategy and a control group that did not receive treatment. A pre-test was administered to both groups. Only the experimental group received treatment. There were a few steps in putting the QAR strategy into action. The teacher described narrative text, including its general structure and characteristics. The teacher clarified each form of query in order to introduce the idea of QAR. A class was divided into five groups by the teacher. The teacher assigned a short text for the pupils to read. They recited a text about a story. Teacher guided the pupils to answer each question form. Teacher continued this exercise with the pupils, increasing the number of questions of each form. The teacher instructed the pupils to read a longer passage and create a series of questions for their peers to find and answer. The

teacher enquired about the pupils' difficulties in teaching and learning. The materials were completed by the teacher and the pupils.

Participants

The population was the ESL pupils at a government primary Chinese vernacular school which consists of 126 pupils in total. Due to the homogeneity of the population, cluster random sampling was used in this study. The sample was drawn at random from two classes out of four, with 36 pupils in 4A and 36 pupils in 4B. Then, using coins as random assumptions, class 4A was created as the experimental group using the QAR method, and 4B was created as the control group using conventional techniques.

Reading Test

Pupils were tested using multiple choice reading tests in the pre- and post-tests for the experimental and control groups. The total number of questions was 25 items. The texts were taken from a children's book and an internet script. The questionnaire scale is based on the Likert scale technique and was adapted from Peng, Hoon, Khoo, and Joseph (2017). Scoring was a term that referred to the outcome of a test or examination, which was typically expressed numerically. The score categorized as presented in Table 1 below.

Table 1: The Classification of Pupils' Score

The Range of Score	Classification	Score
80-100	Excellent	A
65-79	Good	B
50-64	Fair	C
40-49	Poor	D
<40	Fail	E

(Source: School Administration of a government Chinese vernacular primary school in year 2021)

Results

The effectiveness of QAR strategy on ESL young learners' reading of narrative text

Data from pre and post-tests in the forms of reading comprehension questions were analysed to investigate the effectiveness of QAR strategy on ESL pupils' reading comprehension of narrative text. The data were obtained from both control and experimental group.

According to Table 2, majority of the pupils' reading scores from both groups fall under fair to excellent categories. Only one third of the participants in below average or poor to fair categories. This somewhat indicates that the participants from both groups were similar in terms of their reading comprehension skills.

Table 2. Classification of reading comprehension categories pupils' pre-test scores

The Range of Score	Number of Pupils (Control Group)	Percentage	Number of Pupils (Experimental Group)	Percentage	Reading Comprehension Categories
80-100	0	0%	2	5.6%	Excellent
65-79	4	11.1%	7	19.4%	Good
50-64	15	41.7%	16	44.4%	Fair
40-49	13	36.1%	9	25.0%	Poor
< 40	4	11.1%	2	5.6%	Fail
Total	36	100%	36	5.6%	

Table 3. Classification of reading comprehension categories pupils' post-test scores

The Range of Score	Number of Pupils (control group)	Percentage	Number of Pupils (experiment group)	Percentage	Reading Comprehension Categories
80-100	2	5.6%	12	33.3%	Excellent
65-79	9	25.0%	12	33.3%	Good
50-64	17	47.2%	11	30.6%	Fair
40-49	6	16.7%	1	2.8%	Poor
< 40	2	5.6%	0	0%	Fail
Total	36	100%	36	100%	

Based on Table 3, it was found that pupils in experimental group show an increase in their reading scores as the number of participants in fair to excellent categories escalated. Additionally, only one pupil in experimental group was in poor category as compared to reading scores in pre-test. The results also illustrate that the pupils' in experimental group performed better in post-test as compared to pupils from control group.

Table 4. Analysis of pupils' reading scores in experimental group

QAR Strategy	Paired Sample T-Test		
	T	Df	Sig. (2-tailed)
	4.294	35	0.000

The results in Table 4 further validate that there was a significant difference of reading scores in pre and post-tests among pupils in the experimental group. This implies that the pupils in the experimental group performed significantly better in their post-tests.

Table 5. Analysis of Pupils' Post-test Scores in Control and Experimental Group

QAR Strategy	Independent Sample T-Test		
	T	Df	Sig. (2-tailed)
	4.121	70	0.000

Table 5 demonstrates results derived from post-tests scores of both groups. The findings implied that there was a significant improvement in learners' narrative reading comprehension scores taught using the QAR

technique compared to those who were not.

Pupils' perception toward QAR strategy for reading of narrative text

A questionnaire consisted of 10 items was administered to participants in experimental group after post-test had been conducted. Through the questionnaires, the researcher asked the pupils' opinion whether they became better at reading comprehension after learning by using QAR strategy Table 6 shows the results of each item.

Table 6. Questionnaire on pupils' perception toward QAR

No.	Item	Response				
		Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
1.	I know how to use the Question-Answer Relationships (QAR) strategy to answer	35 (97.2%)	1 (2.8%)			
2.	I was good at answering comprehension questions before learning the QAR strategy.	27 (75.0%)	5 (13.9%)	4 (11.1%)		
3.	I became better at answering comprehension questions after learning the QAR strategy.			1 (2.8%)	3 (8.3%)	32 (88.9%)
4.	I feel confident answering comprehension questions after learning the Question-Answer Relationships (QAR) strategy.			2 (5.6%)	3 (8.3%)	31 (86.1%)
5.	I find the Question-Answer Relationships (QAR) strategy for answering comprehension questions helpful.				3 (8.3%)	33 (91.7%)
6.	I will continue to use the Question-Answer Relationships (QAR) strategy when answering comprehension questions.			2 (5.6%)	4 (11.1%)	30 (83.3%)
7.	I will recommend the Question-Answer Relationships (QAR) strategy to other students.			1 (2.8%)	6 (16.7%)	29 (80.6%)

The questionnaires consist of ten questions provided in English language. It is used to get more information about pupils' perception toward QAR strategy for reading comprehension of narrative text. All the pupils were not familiar with QAR strategy before the treatment was given. 35 pupils (97.2%) strongly disagree with the statement while a pupil (2.8%) disagree with the statement. The data also signifies those 27 pupils (75%) strongly disagree that their ability in reading comprehension was good before learning QAR strategy. 32 pupils (88.9%) strongly agree that their comprehension becomes better after learning by QAR strategy. There are three pupils (8.3%) and one pupil (2.8%) who agree and neutral to the statement respectively. The data proves that 31 pupils (86.1%) strongly agree that they are confident at reading comprehension after learning QAR strategy. 3 pupils (8.3%) agree that they felt confident at reading comprehension. Yet, there are 2 pupils (5.6%) consider that they still do not feel confident. I assume those pupils rarely got involved at reading comprehension.

However, almost all the pupils (94.4%) gave positive responses toward QAR strategy.

33 pupils (91.7%) strongly agree that QAR strategy is very helpful. Moreover, there are 3 pupils (8.3%) confirms that they agree with the statement. Then, no one of the pupils agree with the question statement. it can be seen obviously that 30 pupils (83.3%) and 4 pupils (11.1%) agree that they will continue to use QAR strategy. 2 pupils (5.6%) are neutral to the statement. Thus, none of the pupils gave negative responses regarding the statement. Lastly, 29 pupils (80.6%) strongly agree that they will recommend the QAR strategy to other pupils. 6 pupils (16.7%) agree the statement. However, there is a pupil (2.8%) who was neutral to recommend the QAR strategy to other pupils.

Discussion

According to the findings described previously, there was a significant improvement in pupils' pre- and post-test scores in the experimental group taught using the QAR strategy and there was a significant difference in pupils' post-test scores between the control and experimental groups. The findings indicated that the QAR strategy may be an effective method for teaching narrative reading comprehension. This finding is consistent with the findings of Murtado (2019) and Wahyuni (2018), who discovered a significant difference in pupils' reading comprehension ability after they were taught using the QAR strategy.

The experimental group's narrative reading achievement increased after they were taught the QAR strategy. Additionally, pupils' narrative reading achievement also improved in the control group, but not as significantly as in the experimental group. Meanwhile, the independent sample t-test revealed a significant difference in the post-test scores of pupils in the experimental groups who were taught using the QAR strategy and the control group who were taught using the strategy used by the school teacher. This finding was consistent with numerous studies, including those conducted by Sari (2012), who discovered that the QAR strategy aided pupils' reading comprehension achievement in narrative text, and Iqbal (2013), who discovered that the QAR strategy aided pupils' reading comprehension achievement in narrative text.

According to Guzzardo (2005), QAR strategy can motivate students to use their prior knowledge to acquire information. Furthermor, Iqbal (2013) posited that the QAR strategy was effective for teaching reading because it increased pupils' enjoyment and participation in class, which resulted in an increase in reading comprehension. As a result, this strategy is effective at assisting pupils in reading comprehension by allowing them to make inferences based on their existing and prior knowledge.

Based on the questionnaires, most pupils agree or strongly agree that they improved their reading comprehension after learning the QAR strategy. This finding is consistent with previous research (Seng, 2009; Alzu'bi, 2019; Ys et al., 2018) indicating that the strategy is effective at assisting students with their reading. It can be concluded that all students agree that the QAR strategy improves their reading comprehension ability.

According to the questionnaire analysis, most pupils agree that the QAR strategy is extremely beneficial and that they will continue to use it in reading comprehension. Additionally, the QAR strategy instilled confidence in the pupils' reading comprehension abilities.

Given the positive response from students regarding the use of the QAR strategy, it can be concluded that students are eager and receptive to being exposed to strategies that will help them become more critical and reflective readers. This study focused on pupils' attitudes toward using the QAR strategy in their reading comprehension because their attitudes were critical in educating teachers about the strategy's benefits and drawbacks. The study's findings may assist teachers in developing instructional strategies that further enhance students' learning processes. Additionally, the findings could be used to develop more comprehensive and appropriate approaches that are more suited to the current learning environment.

Finally, after examining all the test and questionnaire results, it can be concluded that incorporating the QAR strategy into reading comprehension instruction improves the ability of young learners in a government primary school. It was concluded that the QAR strategy's implementation resulted in a significant improvement and difference in pupils' narrative reading comprehension at the school. The QAR strategy successfully motivated students to learn narrative reading comprehension and sparked their interest and engagement in English learning. It could be assumed that the QAR strategy is effective at teaching pupils reading comprehension.

A positive outcome from implementing the QAR strategy suggests that it may have a beneficial effect on pupils' English reading abilities. Pupils who received strategy instruction used a broader variety of strategies. The use of the QAR strategy resulted in more efficient reading, which aided pupils in improving various aspects of their English reading abilities. This indicates that the use of the QAR strategy influences pupils' academic reading success. It is therefore critical for English teachers to instil a sense of value in their students regarding the importance of reading strategies. However, as the pupils observed, additional reading practise both inside and outside the classroom is necessary if pupils are to improve their reading effectively and develop into highly successful or skilled readers. Pupils must take an active role in developing their abilities.

The experimental group's positive results suggest that the QAR strategy used in this study may be successfully applied in other teaching contexts. To ascertain whether this is the case, English teachers may apply the research methodology used in this study to other subgroups of English major students – for example, students with a higher level of language proficiency. The obtained results can be compared to those obtained for lower-level groups of English major students. This will demonstrate whether the QAR strategy has an effect on or improves the reading performance of groups of pupils with varying levels of proficiency. This demonstrates an adequate preparation for pupils entering higher education or reading in the real world.

The authors of materials should consider which strategies might benefit pupils in terms of academic reading and reading in everyday life, as well as how and in what contexts a particular strategy is best applied. Teachers should be guided in order to make the most effective use of the reading activities provided. This means that strategies can be used effectively and appropriately in a wide variety of reading situations and contexts. A

meaningful reading course supplemented by the QAR strategy should result in increased reading comprehension success for students. Given that the QAR strategy employed in the study appears to have been effective in encouraging participants to employ a broader range of strategies and to improve certain aspects of their English reading abilities, additional research could be conducted to examine variations on the QAR strategy in other contexts.

Conclusion

The Question Answer Relationship (QAR) Strategy is fairly successful on students' reading comprehension of explanation material, according to the research findings. The experimental group's positive results suggest that the QAR technique utilised in this study could be successfully adapted to other instructional environments. English teachers, particularly those in secondary schools, can use the QAR strategy as an alternative strategy for enhancing pupils' narrative reading achievement and the teaching and learning process. The QAR strategy suggests that pupils should learn to read more interestingly and attractively, not just narrative texts, but also other types of texts, as the QAR strategy can be applied to a variety of types of texts. This research can serve as a theoretical foundation for future researchers who wish to conduct similar studies using a variety of variables and conditions and concentrating on aspects of reading comprehension.

By incorporating various techniques, such as the QAR strategy, into their English instruction, teachers can assist students in developing their ability to learn English skills, particularly reading. The QAR strategy can be used to pique pupils' interest and involvement in reading descriptive text, ensuring that they are not bored while learning to read in English. Pupils must understand that learning English is not a one-way street. To accomplish the learning objective, pupils should participate in the classroom activity designed by the teacher. By participating in the activity, pupils can also improve their English proficiency and social skills. Proficiency is not solely the responsibility of the teacher; it is also contingent upon the pupils' active participation in the language learning process.

Public-private Partnerships in Energy Projects in Low- and Middle-income Countries and Decarbonization of the Global Economy

Svetlana Ratner

RUDN University, b) Institute of Control Sciences, Russia,  <https://orcid.org/0000-0003-3485-5595>

Abstract: Decarbonization of the world economy by 2050 is impossible without a significant increase in the energy efficiency of the economies of developing countries. Nowadays, developing countries are transforming and expanding their energy systems, solving the problems of energy poverty of the population, developing energy-intensive industries, which generally leads to an increase in energy consumption on a global scale. With tight budget constraints, developing countries are predominantly using the public-private partnership (PPP) model to finance their energy infrastructure development needs. Therefore, the choice of technologies for implementation in the framework of PPP projects can have a significant impact on changes in the energy efficiency of the country's economy in general. The purpose of this study is to assess the effectiveness of PPP projects in the energy sector in middle- and low-income countries in terms of improving energy efficiency and decreasing carbon intensity. Data Envelopment Analysis methodology is used to evaluate the effectiveness of PPP projects. As inputs, we consider the number of PPP projects in the energy sector implemented on the territory of the country for the period 1990-2016 and their total funding. Changes in a country's energy efficiency and carbon intensity from 1990 to the present are considered as outputs. The CCR model with output orientation is considered. The efficiency scores and projections for each output are calculated.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1434-1444), Cappadocia, Turkiye. ISTES Organization.

Introduction

Over the last few decades, decarbonization became the one of the most important goals of the development of the world economy. According to International Energy Agency (IEA, 2021), already by 2021 about 110 countries committed their net zero emissions target by 2050 - 2060, including the largest emitters as China and Russia. The beginning of this process was laid back in 1997 by the adoption of the Kyoto Protocol. And, although the ratification of the protocol took place for a long 8 years, in 2005 it nevertheless entered into force. In 2015, the Kyoto Protocol was replaced by the Paris Climate Agreement, which made the goals of decarbonization even more explicit.

However, the current gap between declared goals and reality on emissions is significant. The reason is that achieving the goals of decarbonization requires a transformation of the entire energy system, which, in turn, requires huge investments in the development of new technologies, building a new energy infrastructure and changing patterns of energy consumption (Ratner et al., 2022). International Monetary Fund and IEA estimate total annual energy investment needs for energy transition as USD 5 trillion by 2030 (IEA, 2021). The need to attract such significant investment is a challenge even for advanced economies, and even more so for middle – and low-income countries that are struggling with energy poverty and lack of access to modern ways of consuming energy.

With tight budget constraints, developing countries are predominantly using the public-private partnership (PPP) model to finance their energy infrastructure development needs. PPP is considered in the literature as effective mechanism not only for lessening public sector budget constraints, but also for promoting innovations, increasing technical and technological cooperation, sharing risks (Andrews and Entwistle, 2015; Boyer and Scheller, 2018; Yurdakul and Kamasak, 2020). According to Private Participation in Infrastructure (PPI) database, low- and middle-income countries implemented more than 4300 projects in energy sector for the period from 1990 to 2016 with total investments more than trillion USD. Therefore, the choice of technologies for implementation in the framework of PPP projects can have a significant impact on changes in the energy efficiency of the country's economy in general.

The aim of this study is to evaluate the effectiveness of PPP projects in the energy sector in middle- and low-income countries in terms of improving energy efficiency and decreasing carbon intensity. The study uses the difference in GDP per unit of energy use (constant 2017 PPP \$ per kg of oil equivalent) in year with last available data and in 1990 as a metric for measuring the improvements in energy efficiency (data from World Bank). As a metric for improvements of carbon intensity, the study uses the difference in CO₂ emissions (kg per 2015 US\$ of GDP) in a year with last available data and 1990. The effectiveness of PPP projects in the energy sector is considered as a ratio of invested resources and achieved improvements in energy efficiency and carbon intensity.

The paper uses the Data Envelopment Analysis (DEA) method to measure countries' efficiency in implementation of PPP-projects in energy sector. DEA is used to measure the relative efficiency of Decision Making Units (DMUs) that operate under similar conditions and transform similar resources (inputs) into outputs. The main advantage of this approach is that the modeling of the relationship between inputs and outputs does not require the assignment of weights (Charnes et al., 1978; Banker et al, 1984; Cooper, 2007).

The rest of the paper is organized as follows. Section 2 gives a brief review on existing literature about PPP in energy sector. Section 3 describes the theoretical model of PPP efficiency and DEA model. Since DEA is a data driven-methodology, Section 4 gives some descriptive statistics on data and variables used in the study. Section 5 reports the results, Section 6 concludes.

Literature review

The theory of PPPs were laid down in the work of Leibenstein (Leibenstein, 1966), who introduced the concept of "X-efficiency" to explain the difference in productivity between public and private firms with intangible "X-factors" such as labor relations, organizational structures, incentive systems and recruitment. PPPs may help governments and public firms to eliminate inefficiencies that arise in their organizational structures. PPPs can increase both the amount of capital for investment in infrastructure and the efficiency of operations through the transfer of knowledge, skills, and experience from the private sector (Ahwireng-Obeng and Mokgohlwa, 2002). Traditionally, PPP is used in many countries for the implementation of infrastructure projects, including in the energy and transport sectors. Given that both of these areas are strongly influenced by global energy transition trends, an increasing number of PPP projects have the ultimate goal of improving energy efficiency, reducing carbon intensity, developing renewable energy, etc. (Song et al., 2021; Xu et al., 2015; Luo et al., 2021; Cedrick and Long, 2017).

To bring a country through energy transition is a difficult task for governments to pursue alone, especially in light of fiscal constraints and other monetary liabilities. Notwithstanding, and especially in developing countries, reforms to improve and extend infrastructure level and quality have a huge effect on economic growth, economy's productivity, energy efficiency, and competitiveness (Guasch, 2004). PPP projects in the field of green energy and energy efficient technologies are often implemented with the participation of large international high-tech companies, financial and insurance institutions (Cedrick and Long, 2017). The diversity of partners is both quantitative and qualitative, which suggests greater openness of PPP projects in the field of renewable energy and energy efficiency to the participation of various stakeholders.

Another feature of PPP projects in the field of green energy and energy efficiency is that, as a rule, new energy technologies have a higher capital intensity than traditional ones, and their practical use is associated with additional risks. Many studies on the energy efficiency gap indicate that the introduction of energy efficient technologies may have a so-called "hidden cost" (Nichols, 1994). This term refers to a situation where engineering and economic investigations do not take into account such costs as the cost of an energy audit, the cost of creating and maintaining an energy management system, the cost of disposing of previously used equipment, the cost of retraining personnel, etc. In such a situation, the widely advertised affordable market prices of energy efficient technologies do not reflect the full cost of their implementation. In addition, in the case of energy efficient technologies, environmental factors such as energy price uncertainty, especially in the short term, have a significant impact on investor expectations and their risk assessment (Lazanyuk et al., 2023). All above-mentioned features make the decision for governments and private firms to engage in PPP project in green energy and energy efficiency very challenging in developing countries (Kamasak et al., 2019). Therefore, some developing countries (for example, China, India, Honduras, South Africa, etc.) take up the implementation of green PPP projects, for example, the construction of power plants on renewable energy sources (Xu et al., 2015), and some prefer more traditional technologies and, as a result, use financial and human

resources less efficiently in terms of achieving climate goals. The issues of the effectiveness of the implementation of PPP projects in the energy sector in this context have not yet been studied in the literature. As Shahbaz with co-authors points out, the empirical evidence that prove the linkage between public-private partnerships and carbon emissions is very limited (Shahbaz et al., 2020). We can mention the study of Lu et al. (Lu et al., 2022), where authors demonstrate that China's economic growth and public-private collaboration lead to increase in the volume of carbon emissions. They come to conclusion that PPP in energy sector must be more efficient to reduce carbon emissions. Another paper, that can be mentioned in this context, is the study of Anwar with co-authors (Anwar et al., 2021), which explores the influence of PPP investment in transport sector, renewable energy consumption, and urbanization on transport-induced carbon emissions in China. To the best of our knowledge, there are no studies on cross-country analysis of the effectiveness of PPPs in the energy sector in the literature.

Methodology

Data Envelopment Analysis (DEA) methodology are currently being actively developed, covering new areas of management and new classes of management tasks (Emrouznejad and Yang, 2018; Panwar et al., 2022). The ability to assess the comparative efficiency of economic agents, having minimal knowledge about the production functions and technologies they use makes DEA an attractive tool for decision-making. Other important features of DEA are the possibility to choose benchmarks for each inefficient economic agent (or system) and optimize their strategy for achieving efficiency. The ability to use well-developed software (including open access software) for solving DEA problems makes it available tool even for professionals with weak IT skills.

However, basic DEA models used in open-source software have important limitations on the type of input and output values (Wang et al., 2017), for example, basic CCR and BCC models use only non-negative inputs and outputs. In reality, negative output values are possible in the situation when the useful result of the production activity of the economic agent under study is not achieved. Problems of this kind are often happen in practical situation with carbon intensity and energy efficiency: money spent on new energy projects do not necessarily help to achieve the desired goals of reducing emissions. Overcoming the above-mentioned limitations can be done by the procedures for normalizing and shifting the scale in which the performance indicators of the DMUs are measured (Ratner and Zaretskaya, 2020). This study uses the same approach.

Let's consider the number of PPP projects in energy sector and the total sum of investments in energy PPP projects in 1990-2016 as two inputs of each DMU (low and middle income countries). The differences in energy intensity and carbon intensity between the last available year in the sample in 1990 (data from World Bank) are considered as outputs. With such a set of inputs and outputs, DEA CCR model can be formulated as following:

$$\max_{u,v} \sum_{m=1}^M u_m y_{m0} \quad (1)$$

s.t.

$$\sum_{m=1}^M u_m y_{mk} - \sum_{n=1}^N v_n x_{nk} \leq 0 \quad k = 1, 2, \dots, K,$$

$$\sum_{n=1}^N v_n x_{n0} = 1,$$

$$u_m, v_n \geq 0 \quad m = 1, 2, \dots, M \quad n = 1, 2, \dots, N;$$
(2)

where

0 – index of DMU under consideration;

X – vector of inputs, dimension N (N=2);

Y – vector of output, dimension M (M=2);

K – number of DMUs

Since some DMUs can have negative inputs, they can be translated by a simple procedure of shifting the scales in which the outputs are measured according to the following formula:

$$z_{i,j} = y_{i,j} + |\min y_{i,j}| + 0,001$$
(3)

The introduced transformation allows avoiding the negative values of the outputs, without corrupting the common logic of the formulation and solution of DEA model.

Data

The study uses the data on the number of PPP projects in energy sector and the total sum of investments from Private Participation in Infrastructure (PPI) database (<https://ppi.worldbank.org/en/customquery>). This source contains panel data on PPP infrastructure projects in 137 low- and middle-income countries for the period from 1990 to 2016. Top-10 countries by the number of PPP projects in energy sector are presented on figure 1. Top-10 countries by the total sum of investments in PPP projects in energy sector are presented on figure 2.

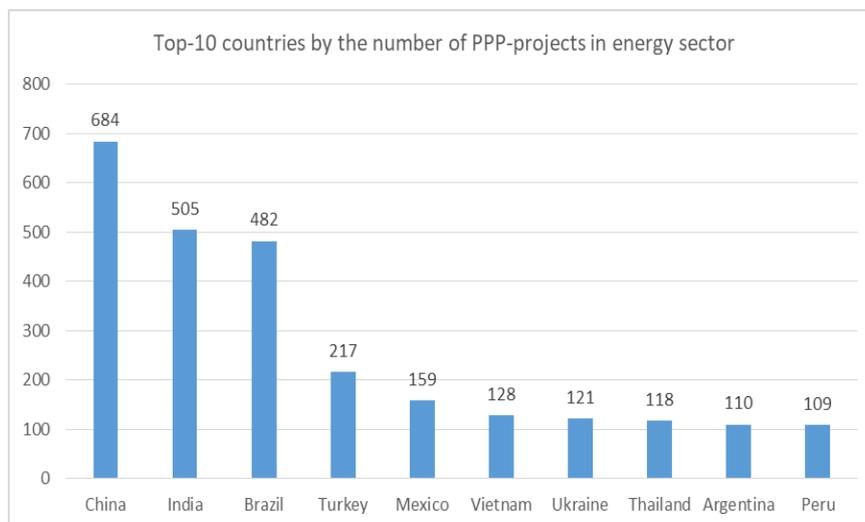

Figure 1. Countries with the biggest number of implemented PPP projects in energy sector

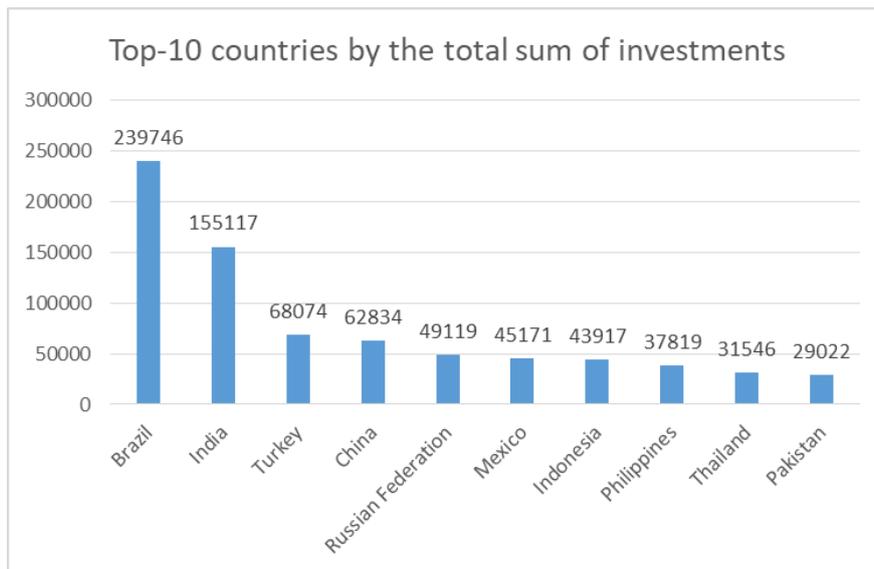

Figure 2. Countries with the largest investments in implementation of PPP projects in energy sector

The data on GDP per unit of energy use (constant 2017 PPP \$ per kg of oil equivalent) and CO2 emissions (kg per 2015 US\$ of GDP) received from World Bank database (<https://data.worldbank.org/indicator>). Since data on specific energy consumption and specific greenhouse gas emissions are not available for all countries, 89 countries remained in the final sample. Top-10 countries by improvements in energy efficiency during 1991-2019 are presented on figure 3.

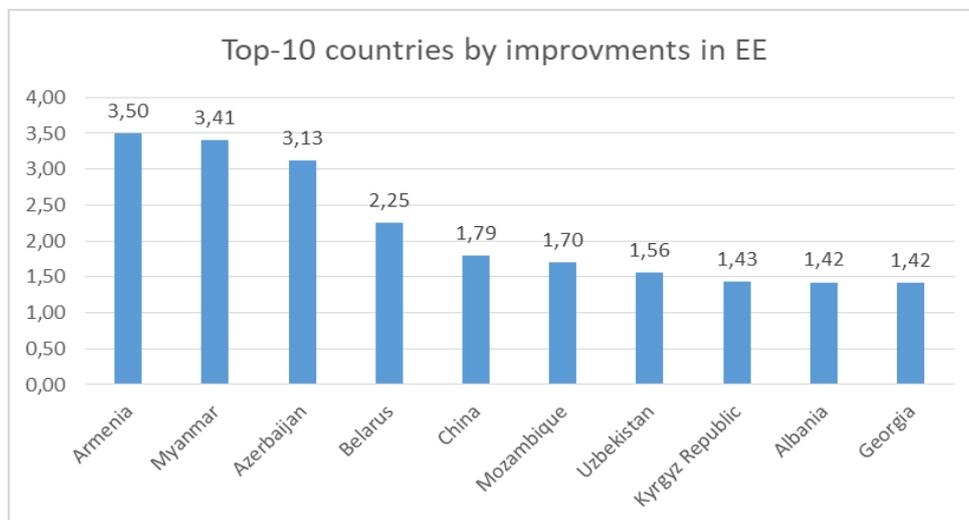

Figure 3. Countries with most notable improvements in energy efficiency in 1991-2019.

There has been no improvement in energy efficiency in countries such as Gabon, Haiti, Congo, Dem. Rep., Côte d'Ivoire, Iran, Islamic Rep., Bhutan, Dominica, Gambia, Togo, Fiji, Guatemala, Bolivia, Thailand, Algeria, Comoros, Zimbabwe, Senegal, Brazil, Malaysia, Costa Rica, Namibia, Tonga, and Kenya.

Top-10 countries by decrease in carbon intensity 1991-2019 are presented on figure 4.

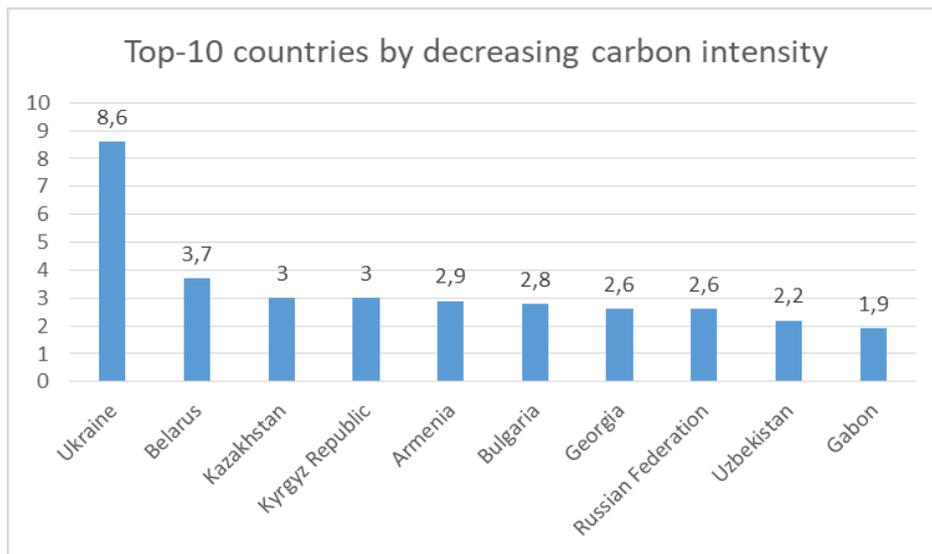

Figure 4. Countries with most notable decrease in carbon intensity in 1991-2019.

On the next step of the study, some more countries were excluded from the sample, because PPP projects were never financed (Comors, Fiji, Gambia, Lesotho, and Timor-Leste). Therefore, the calculations were carried out on a sample of 84 countries. Descriptive statistics of input and output data are given in Table 1.

Table 1. Sample statistics (inputs and outputs)

Variable	Number of projects X1	Total investments X2	Change in EE Y1	Change in CE Y2
Mean	46.81	11969.18	0.44	-0.18
Standard error	11.21	3417.25	0.08	0.18
Median	9	1766	0.26	-0.4
Standard deviation	105.75	32238.34	0.76	1.71
Variance	11184.41	1028976601.93	0.58	2.93
Kurtosis	20.83	32.38	5.56	7.56
Skewness	4.34	5.27	2.11	1.61
Minimum	1	0.0004	-0.61	-4.6
Maximum	684	239746	3.5	8.6
Number	84	84	84	84

Results

The efficiency scores of 84 countries, calculated by MaxDEA 12.0 software are presented in table 2 and 3. As one can see from table 1, only two countries (Kyrgyz Republic and Tonga) have the highest efficiency score equal 1. Seven countries have an above-average efficiency ratio (greater than 0.5) and another 14 countries have an efficiency ratio in the approximate middle range (from 0.2 to 0.5). This last group includes three post-Soviet countries - Tajikistan, Azerbaijan and Belarus.

Table 2. Countries with high efficiency of PPP projects in energy sector

Most efficient countries	Countries with the score in the upper middle range	Countries with the score in the middle range
Kyrgyz Republic (1)	Belize (0.632)	Bosnia and Herzegovina (0.474)
Tonga (1)	Eswatini (0.592)	Azerbaijan (0.457)
	Dominica (0.590)	Lebanon (0.448)
	SãoTomé and Príncipe (0.566)	Haiti (0.343)
	Uruguay (0.514)	Myanmar (0.326)
	Guyana (0.507)	St. Kitts and Nevis (0.322)
	Botswana (0.501)	Tajikistan (0.274)
		Zimbabwe (0.246)
		Cabo Verde (0.244)
		Belarus (0.233)
		Bhutan (0.224)
		Ethiopia (0.212)
		Congo, Dem. Rep. (0.206)
		Solomon Islands (0.202)

The group of countries with low efficiency ratios is much more representative. Twelve countries can be assigned to a group with a score in the low-middle range (from 0.1 to 0.2). This group includes two European countries (Montenegro and Serbia), two post-Soviet countries (Uzbekistan and Armenia) and, most of all, African countries. The largest group of countries (32 objects) are countries with a low efficiency coefficient, the values of which lie in the range from 0.01 to 0.1 (table 3). This group of countries is very diverse and includes countries from almost all continents.

The group of the least efficient countries in terms of introducing energy efficient and "clean" technologies in the energy sector through the implementation of PPP projects consists of 17 countries, and it includes such large economies as China, Russia, Brazil, India and Indonesia. It is worthy to mention, that all countries of the BRICS group are included in this group. China, India and Brazil have the lowest efficiency scores. The results obtained indicate that, unfortunately, during the implementation of PPP projects in the energy sector for 17 years from 1990 to 2016 in the largest countries with rapidly developing economies, preference was given to the introduction of not the most energy efficient and carbon neutral technologies.

Table 2. Countries with low efficiency of PPP projects in energy sector

Countries with the score in the low-middle range	Countries with low score	Less efficient countries
Uzbekistan (0.152)	North Macedonia (0.090)	Russian Federation (0.009)
Mongolia (0.145)	Iraq (0.088)	Bangladesh (0.008)
Armenia (0.144)	Angola (0.082)	Colombia (0.007)
Namibia (0.141)	Jamaica (0.077)	Pakistan (0.006)
Montenegro (0.128)	Côte d'Ivoire (0.072)	Indonesia (0.006)
Gabon (0.122)	Albania (0.071)	Philippines (0.006)
Algeria (0.116)	Zambia (0.069)	Malaysia (0.006)
Mauritius (0.106)	Cameroon (0.059)	Argentina (0.005)

Mozambique (0.103)	Ghana (0.057)	South Africa (0.005)
Serbia (0.102)	Ecuador (0.050)	Peru (0.004)
Togo (0.101)	Nigeria (0.049)	Vietnam (0.004)
Tunisia (0.100)	Senegal (0.035)	Mexico (0.003)
	Morocco (0.029)	Thailand (0.003)
	Tanzania (0.028)	Turkiye (0.002)
	Bolivia (0.028)	China (0.002)
	Cambodia (0.027)	India (0.001)
	Georgia (0.027)	Brazil (0.001)
	Costa Rica (0.026)	
	Nicaragua (0.025)	
	Honduras (0.022)	
	Kenya (0.022)	
	Jordan (0.020)	
	Dominican Republic (0.019)	
	El Salvador (0.019)	
	Kazakhstan (0.017)	
	Guatemala (0.017)	
	Nepal (0.017)	
	Iran, Islamic Rep. (0.016)	
	Sri Lanka (0.015)	
	Ukraine (0.014)	
	Egypt, Arab Rep. (0.014)	
	Bulgaria (0.013)	

Therefore, further planning and implementation of PPP projects in the energy sector should take place more intelligently and with greater regard for climate goals.

Conclusion

The study showed that in most countries classified by the World Bank as countries with medium and low incomes, the implementation of PPP projects in the energy sector was carried out from 1990-2016, mainly without taking into account the climate agenda. The group of BRICS countries turned out to be the least effective in terms of achieving climate goals through PPP projects in the energy sector. These studies suggest that the policy for the implementation of PPP projects in the energy sector should change significantly in order to increase the efficiency of projects in the context of increasing energy efficiency and decarbonization. Given the fact that, as a rule, large corporate and financial structures (including international ones) take part in the implementation of PPP projects, it is advisable to develop and adopt at the international level a set of criteria that a PPP project must satisfy in order to receive international support. On the other hand, the experience of the most efficient countries should be studied in more detail to identify the best practices for implementing PPPs in the energy sector.

Abstract: Aim: To investigate to what extent the stakeholders believe in females having attributes of transformational leadership to rise at higher positions in institutions of higher education in India while implementing New Education Policy in India. To know where we are right now and where we need to go in terms of promoting female leaders in Indian higher education. Methods: Both qualitative and quantitative methods are used. Qualitative responses from 10 Indian women leaders are collected from those 03 qualitative responses are quoted in the paper and considered in the analysis. MLQ* tool (Multifactor leadership Questionnaire) used to collect responses of 51 different stakeholders of higher education. Findings: The study shows that female leadership can be trailblazing in organizational management in institutions of Higher Education in India while implementing the New Education Policy. The results anticipate providing insights to initiate Indian policymakers and recruiting bodies to motivate women to take up leadership positions. Originality and Cognitive Value: The area of the prospects of transformational female leadership in Indian higher education in the context of implementation of New Education Policy in India is a novel exploration as education policy is implemented recently in 2020 and gender equity is a major aspect of concern in achieving Sustainable development Goals.

Introduction

"I am the queen, the gatherer of treasures, established in/as ultimate reality, the primary object of worship. The luminous divine powers have dispersed me in many places, having many abodes, causing me to be all-pervasive.

Even eating, seeing, breathing, or hearing the spoken word is accomplished through me alone. Even the non-perceivers amongst you dwell near me. Hear me, for I reveal the truth. While creating all beings, I merely breathe forth like the wind. So expansive is my power, possessing greatness beyond heaven and earth.”

-Rig Veda 10.8.125, Devi Sukta

Hindu philosophy with its theological aspect, with its extensive commentaries and denominations, narrates God the Mother as *Shakti* or the divine power, Mahadevi or God the Mother. A hymn from the Rig Veda is the first to refer to Divine Mother as the Supreme Reality (1900-1700 BCE). It belongs among the Hindu canon's oldest books. *Devi Suktam*, which sees the feminine divine as the creative and ultimate source, creative power, and universal power, may be found in the *Rig Veda*. *Ambhrani* is a well-known women sage (rsika) who wrote the *Devi Suktam*. It seems to have been written in an ecstatic, mystically unified condition of seeing the self as encompassing, limitless, and non-local. Her experiences are described in the hymn's verses.

The *Devi Suktam* (Goddess hymnology) serves as proof of the early Vedic authority given to women's enlightened consciousness and a pioneering expression of the divine feminine conception as a congenial, auspicious experience, presence, and creative power. The *Devi Mahatmyam*, the holy book of 'God the Mother', includes the *Devi Suktam*, which is being chanted today. Its incorporation into the *Devi Mahatmyam* (Importance of female power and strength) is proof that the Hindu experience of the unmatched world continues to flow with the vision of the divine feminine as the ultimate truth. In Hindu way of life and beliefs, the feminine principle operates as the energetic and inventive creative extremity of the speculative twofold reality of Hindu philosophy. Mother God is a dyadic, united god in Hinduism that consists of both the divine feminine, and masculine. Mother Goddesses' creation does not limit her it brings limitless pre-eminence and integrity to the whole universe. The *Devi Mahatmyam* of the Markandeya of the *Markandeya Purana* comprises chapters 81-93 it is attributed to the sage Markandeya. (Bhattacharya, 1996).

There are innumerable verses attributed to the Mother Goddesses in Hindu scriptures to connote the character of the divine mother, Goddess. Here one example is quote : *Ya Devi sarva-bhutesu , cetane-tyabhidhiyate, Namas-tasyai, namas-tasyai, namas-tasyai namo namah.* "Praise to the divine mother immanent in all, who is the consciousness in all being salutations to her." Hindu religion places a significant emphasis on Goddess worship and refers to her as 'The Mother'. According to Sara Mitter's the quotation of Heinrich Zimmer's concept of Shakti, which may be understood to mean dominance, as "ability, capacity, faculty, strength, energy, prowess; regal power; the power of composition, poetic power, genius." (Mitter, 1991) The goddess is revered in many different forms and is admired for her diversity in the Shakta tradition. They are regarded as the ideal mothers and gurus/spiritual teachers because they exemplify the goddess' strength and wisdom. (Feuerstien, 1998).

The concept of the mother goddess silhouetted from the confrontation and consensus between potent matriarchal cultures that prevailed in India before 2500 B.C before the patriarchal male-dominated Aryan race migrated to India. The Indus valley people believing in the mother goddess never really gave place to the dominance of the

male. The mother perennially is an entity of devotion to Hindus as the source that nurtures the seed and flourishes it
(https://archive.org/stream/TheWonderThatWasIndiaByALBasham/The+Wonder+that+was+India+by+A+L+Basham_djvu.txt).

Mothers hold the majority of the authority in a matriarchal society, according to evolutionary theories. This concept was well-known in the nineteenth century, and Friedrich Engels used it as a cornerstone in his book *Origin of the Family, Private Property, and the State* (1884). Engels claimed that because of their reproductive capabilities, women would have held positions of authority in the first hunter-gatherer cultures, which lacked property rights. In contrast, when sedentary agricultural and pastoralist societies developed, private property rights over land and commodities meant that males needed to establish the legitimacy of their progeny to pass on money through descent. Thus, the patriarchal system came into being, when males started to dominate women's reproductive abilities and women lost the political influence they had under the matriarchal system. (Gordon Marshall, <https://www.encyclopedia.com/social-sciences-and-law/anthropology-and-archaeology/anthropology-terms-and-concepts/matriarchy>).

The main issue with gender equality is power. However, achieving equal power will not happen automatically. This is a male-dominated planet with a male-dominated society. To achieve equality, we must cooperate with vision and determination. We must alter societal standards. We need to do more to appoint women to higher positions and implement laws and policies that encourage women in leadership, such as special measures and quotas. (<https://www.unwomen.org/en/news/stories/2021/3/statement-sg-international-women's-day>).

According to the All-India Survey of Higher Education Report 2019-20, 42343 Colleges, 1043 Universities, and 11779 Stand Alone Institutions are listed on the AISHE website, while 39955 Colleges, 1019 Universities, and 9599 Stand Alone Institutions responded to the survey. In addition to the 145 Universities in other categories, there are 23 Law, 66 Medical, 63 Agriculture & Allied, 177 Technical, 522 General, 12 Sanskrit & 11 Language Universities. At All-India levels there are merely 74 female teachers for every 100 male teachers. Similarly, in the SC group, there are 58 female teachers per 100 male teachers and in the case of OBC and ST, it is 72 and 69 females per 100 male teachers, respectively. The number of total instructors at the university level is about 2.14lakh out of which 37.1% are female and 62.9% are male. (AISHE, <https://aishe.gov.in/aishe/home>)

Literature review

It is always great to hear and see that female enrolment in education has substantially increased it always seems to be a trailblazing occurrence a step further towards achieving Sustainable Development Goal 5. The spectacular addition of the number of female students is not in pace with the placement of women in senior leadership roles in higher education in Indian universities. Most of the key positions in universities are occupied by male leaders. The notion of leadership was instilled with stereotypically masculine attributes like

competitive, domineering, aggressive, assertive, etc. since men have historically occupied the majority of leadership roles in society. Leadership is often associated with men. Scholars investigated the problem and concluded that no gender disparities in leadership efficiency when they examined the fundamental components of leadership. This study is not an expression of disheartening feelings about the underrepresentation of women in positions of leadership in higher education. It is to draw the attention of leadership development, executive search committees, governing bodies, and human resource experts and investigators working in the area of Gender Equality to take note of it, and appoint female leaders in higher education that comes closest to the students and other stakeholders in education.

According to historical analysis, conventional higher education has a long history of male domination in leadership roles (American Council on Education, 2017; Mason, 2013). Most senior organizational positions are not filled by women, even if they often take on adjunct roles. Although HE reform has produced new middle management posts, such as marketing managers, community engagement, innovation, and quality assurance (Morley, 2003; Deem, 2003; Noble and Moore, 2006; Fitzgerald and Wilkinson, 2010). Scholars often lament the lack of female executives in high-ranking positions around the globe (Tiggeman and Gardiner, 1999).

Literature on leadership and gender most of the time envelops the views on whether or not gender provides rise to a predilection to highlight the various dimensions of leadership at the expense of the other and some research focuses on the notion that female leaders tend to be more relationships oriented and male leaders more task-oriented. (Park, 1996) After the nineties, transformational and transactional leadership is in trend (Hater and Bass, 1988). Transformational leadership is often regarded as the higher style of leadership, which is derived from transactional leadership but not vice-versa (Bass, 1985).

Higher education reform has given rise to a potent cultural ideology that holds that effective organizational change requires strong leadership. In Northouse's definition of leadership, a leader is a person exerts influence over a group of people to accomplish a common purpose. Haake (2009) says that leader identity is constituted through power relations. The narratives of different expectations for the advancement of women and how specific individuals are recognized or they identify themselves as legitimate leaders need additional examination (<https://www.ses.unam.mx/curso2015/pdf/23oct-Morley.pdf>).

Women have a great opportunity to change the academy at a time when their skills are much needed. They are relative outsiders who must develop new leadership styles since they were not socialized in line with the male-centric leadership paradigm (Dunn, 2014). The study deals with female leadership and need for encouraging female to take up leadership positions while implementation of new education policy in India. NEP document Part II, the section is on higher education. Excellence shall be further encouraged via suitable incentives, promotions, recognitions, and advancement into institutional leadership, according to Section 13.5. Meanwhile, faculty who fail to uphold fundamental standards will be held responsible (https://www.education.gov.in/sites/uploadfiles/mhrd/files/NEP_Final_English_0.pdf).

Discussion

Bernard Bass and the Concept of Transformational Leadership

Leadership that went beyond contingent reinforcement has long been acknowledged by political scientists, sociologists, and historians. Such research was exemplified by Weber's investigation of charisma between 1924 and 1947. The basic idea for the study of leadership, however, was contingent reinforcement, which attracted the attention of both psychology and economics. For them, leadership included an exchange of power. The transactional interaction is enhanced by transformational leadership. Such leadership is a development of transactional management. The four pillars of transformative leadership have been outlined in studies dating back to Bass in 1985 and Avolio and Howell in 1992. Leadership has a charismatic quality that causes followers to want to identify with and imitate the leader. With challenge and persuasion, the leader motivates the followers by giving them a purpose and an understanding. The leadership expands the follower's usage of their skills by stimulating their minds. Finally, the leadership demonstrates respect for every individual by providing the subordinate with mentoring, coaching, and assistance. MLQ may assess each of these elements. (Bass M, 1996)

Bass' Characteristics of Transformational Leadership

Charismatic leadership: Transformative leaders exhibit behaviour that make them become examples for their followers. People look up to, respect, and have faith in the leaders. The leaders are admired by their followers, who want to be like them.

Inspirational motivation: To inspire and encourage others, transformational leaders act in a manner that provides significance and challenge to their followers' efforts. It's a team effort. Optimism and enthusiasm are evident. The leader establishes expectations that are clearly stated and that followers desire to full fill while also exhibiting dedication to the common objectives and vision.

Intellectual stimulation: Transformational leaders encourage their followers to be inventive and creative by questioning assumptions, avoiding problems, and adopting a new perspective on familiar situations. It is encouraged to be creative. Individual members' mistakes are not disclosed publicly. Followers are asked for innovative ideas and unique solutions to problems. Rather than criticizing followers' ideas because they vary from the leaders', leaders encourage their followers to explore new techniques.

Individualized consideration: By serving as a mentor or coach, transformational leaders pay close attention to each person's requirements for success and development. Colleagues and followers are developed to progressively greater potential levels. It is recommended that communication be two-way. (Bass M, 1996)

Participative versus directive leadership can be as follows Table-1.

Table 1: Descriptions of participative Vs Directive Leadership

	Participative	Directive
<i>Laissez-Faire</i>	<i>“Whatever you think is the correct choice is OK with me.</i>	<i>If my followers need answers to questions, let them find the answers themselves”</i>
<i>Management-by-</i>	<i>“Let’s develop the rules together that</i>	<i>“These are the rules and this is how</i>

<i>Exception</i>	<i>we will use to identify mistakes.”</i>	<i>you have violated them.”</i>
<i>Contingent Reward</i>	<i>“Let’s agree on what has to be done and how you will be rewarded if you achieve the objectives.”</i>	<i>“If you achieve the objectives I’ve set, I will recognize your accomplishment with the following reward...”</i>
<i>Individualized Consideration</i>	<i>“What can we do as a group to give each other the necessary support to develop our capabilities?”</i>	<i>“I will provide the support you need in your efforts to develop yourself in the job.”</i>
<i>Intellectual Stimulation</i>	<i>“Can we try to look at our assumptions as a group without being critical of each other’s ideas until all assumptions have been listed?”</i>	<i>“You must reexamine the assumption that a cold fusion engine is a physical impossibility. Revisit this problem and question your assumption.”</i>
<i>Inspirational Motivation</i>	<i>“Let’s work together to merge our aspirations and goals for the good of our group.”</i>	<i>“You need to say to yourself that every day you are getting better. You must look at your progression and continue to build upon it over time.”</i>
<i>Idealized Influence</i>	<i>“We can be a winning team because of our faith in each other. I need your support to achieve our mission.”</i>	<i>I’ve decided to cross the Rubicon. So, there’s no going back) You must trust me and my direction to achieve what we have set out to do.”</i>

Table :1(From Avolio & Bass. 1991)

3

Figure 1. Based on Bass M 1996 Characteristics of Transformational Leadership

As the transformational leader reveals personalized contemplation and transforms crisis into developmental challenges, transformational leadership is required. Such leadership relates in a different way to the staff and co-workers. Beyond self-interest, the transformational leader tries to change the company culture, envisions, fosters self-worth, empowers, mentors, coaches, and encourages others. The Multifactor Leadership questionnaire is based on the attributes of the transformational leader.

Leadership and Organizational Culture

As per the opinion of Deak & Kennedy, the organizational culture is an ingrained behavioral pattern that is passed down from one generation to the next. It encompasses the beliefs that members hold to be true about what is vital, right, and good. As a source of identity and unique competency, organizational culture serves as the binding agent that binds the organization together. They strive to integrate recruits into the ideal transformative organizational culture. Challenges in this pure organizational culture are prospects rather than risks (Bass M. 1996).

Bass explains the strength of female transformational leadership along with surveys and examples. The study by Bromer & Brenner, 1981; Wintermantel & Kruse, 1986 cite research that suggested women needed to adopt masculine behaviour and attitudes to prosper in the workplace, which was considered to be a man's domain. Women were thought to be promoted for exhibiting the traits of ambition, competitiveness, and task orientation, which were considered to be traits associated with men. Accordingly, it was believed that successful female executives had acquired male traits via socialization or training as they rose through the ranks of the organization. According to Rosener's 1990 research, there is a woman's manner of leadership that is distinct from the conventional male techniques. Helgesen concurred in 1990, stating that women leaders were more likely than males to prioritize regular interaction and information exchange through webs of inclusion, as well as flatter organizational structures. Bass provides a few examples of how transformational leadership differs. According to anecdotal, survey, and experimental data, women in leadership roles tend to be slightly more transformative and less likely to use managing by exception than their male colleagues. They are seen as marginally but considerably more effective and satisfying leaders by their team members and direct reports. Anecdotal Evidence During a survey feedback session, participants in an early training course on transformational leadership in 1985—12 females and 12 males at high levels of management of a Fortune 50 company—noticed some potentially interesting sex disparities in transformational leadership ratings. Each of these 24 leaders was profiled by three to five subordinates using the Multifactor Leadership Questionnaire. Without revealing their names or sexes, the profiles for each leader were solely identifiable by code numbers throughout the workshop exercise. In his 1985 study, Bass chose four of the 24 managers with the highest MLQ scores for charismatic leadership, which explains the largest proportion of variation in transformational leadership, to take part in a team activity. Although prejudices and earlier literature would have predicted that all four would be males as officially shown in the study, such as that by Kruse & Wintermantel in 1986, the likelihood was that two of the 24 would be men. Contrary to predictions, the top four charismatic leaders were all women, and by a significant margin. Bass saw their extraordinary abilities, presence, and self-assurance as they were participating in the activity. The finding that women exhibit stronger transformative leadership is supported by data from four distinct studies collected at the CLS (Center for Leadership Studies) between 1986 and 1992 using the Multifactor Leadership Questionnaire (Bass M, 1996).

According to Eagly's study from 1991, the gap between men and women in transformative leadership may be attributable to women's well-documented propensity for being more caring. Women leaders see themselves, as

more feeling. According to 1990 research by Eagly & Johnson, women leaders are more socially sensitive and interested in others than their male counterparts. According to Komives' research from 1991, women leaders seem to exhibit traits more consistent with transformative leadership. Additionally, they are more inclined than their male colleagues to ascribe their relationship skills to their transformative leadership. Another justification for expecting women leaders to be more transformative, according to research by Kuhnert & Lewis, is the moral value component of transformational leadership, which emphasizes responsibility and caring in women while emphasizing rights and justice in males. According to 1990 research by Eagly & Johnson, women's leadership styles may be more transformative than men's since they often exhibit less self-serving authoritarianism. Additionally, women tend to be a little more transformative than males, which makes them more likely to be considered successful and satisfying leaders than men. Why women may be more successful and rewarded as leaders have a rational explanation. Arguments are made against the empirical results. For instance, it is argued that a woman must possess more qualifications than her male counterpart to hold the same leadership position. However, the opposite might equally be said given the way that affirmative action measures have been handled. It follows that if women are more transformative in comparison to their male colleagues, they will be more successful and satisfying, given the positive relationships between transformational leadership and effectiveness and contentment among those led. The corporate cultures of the 1990s and beyond may fit women executives better (Bass M, 1996).

Gender Equality as Fundamental Value

The Indian Constitution explicitly states that gender equality is a fundamental value. In addition to guaranteeing women's equality, the Constitution gives the State the authority to use measures of positive discrimination in their favor to offset the accumulated political disadvantages and socio-economic that women suffer. Several projects have been introduced by India's Ministry of Women and Child Development to empower women. Honourable Minister, during the Fourth World Conference on Women, which took place in New York in September–October 2020, WCD virtually delivered the National Statement through a pre-recorded video message that was played during the Plenary Segment on October 1st inside the United Nations General Assembly Hall. The Indian government has taken new, specific steps and made pledges to expedite the accomplishment of empowerment of all girls and women and gender equality in our nation (<https://wcd.nic.in/annual-report>).

The Handbook on the Attributes of a 21st Century Vice-Chancellors

The leadership of the institution must devise a plan to demonstrate how disparate elements may come together, how one can overcome challenges, and how discord can give way to harmony. Realized that obtaining the university community's voluntary commitment rather than coerced compliance is ultimately what determines success. Although not officially required, from the viewpoint of stakeholders, the vice chancellor's qualities include:

University Grants commission apex body of Indian higher education in ‘Total Quality Management’ (TQM) states that quality is indispensable in higher education. Many requisites are mentioned for the quality mandate in the handbook. But two points are visible in leadership, (b) leadership to foster a culture of excellence; (c) Tiers of leadership for promoting a high-quality culture. Both points (b) and (c) focus on leadership which is a very vital part of HE’s strengthening and development.

Figure 2. based on : https://www.ugc.ac.in/e-book/VC%20handbook_complete.pdf

Methods and Materials

Both qualitative and quantitative methods are combined. Qualitative responses from 10 Indian women leaders were collected. MLQ tool is used to collect responses of 51 different stakeholders of higher education responses received from male (22) and female (29) and the ratio of male female stakeholders are reflected in Figure 3.

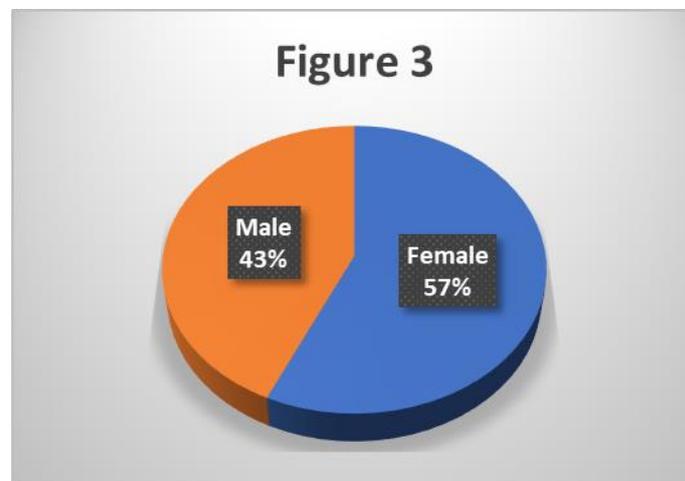

Figure 3.

About the Tool

The Multifactor Leadership Questionnaire is an inventory based on psychological traits of different kind of leadership styles and its outcomes. The MLQ tool was researched and constructed by Bernard M. Bass and Bruce J. Avolio with the objective to examine full range of leadership styles. MLQ comprises of 9 scales and 3 leadership styles. In this particular research Transformational style is under consideration. The MLQ takes 15 around minutes for completion it can be experimented either on group or an individual. It has been used widely to spot effective leaders and is an validated across cultures and institutions for development and research pertaining to leadership. The MLQ is multi – rating 360 degree instrument, it considers the leader’s self-assessment and assessment from the point of view of their superiors, peers, subordinates and others. In this study the assessment from others is implemented, Multi factor Leadership Questionnaire form is used as tool in this study. The MLQ is often combined with the Authentic Leadership Questionnaire (ALQ) to assess the self-awareness, transparency, ethics/morality, and processing ability of leaders the ALQ was constructed by Avolio with William L. Gardner and Fred O. Walumbwa in 2007 (https://en.wikipedia.org/wiki/Multifactor_leadership_questionnaire).

Data Analysis

The data analysis method employed was a grounded concept. This technique involves gathering, analysing, and exploring evidence before generating new hypotheses that are pertinent to the topic. The technique is especially helpful for revealing underlying beliefs, circumstances, and experiences of persons engaged in a phenomenon (Strauss & Glaser, 1999). In this study, all the data is analysed keeping in mind the transformational leadership theory of Bass. Analysis of each question of MLQ (Multi factor Leadership Questionnaire) is as follows.(Figure 4)

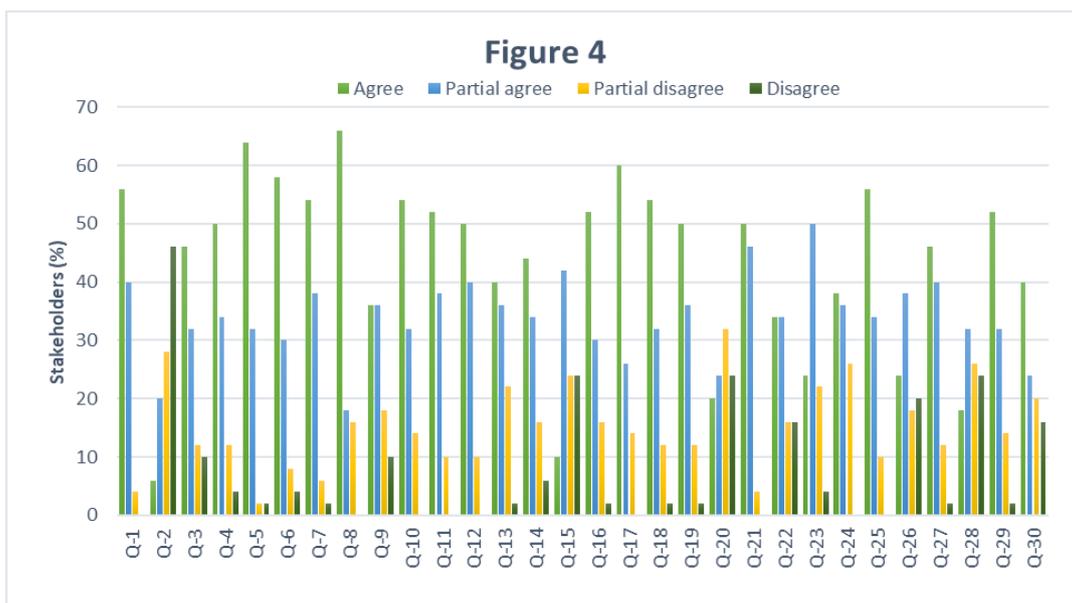

Figure 4. Analysis of MLQ Data collected in this research study

The female leader provides support in return for the efforts of the stakeholders and displays behaviour that makes them become role models for their followers.

From the total sample, 56 % of individuals agree with the fact that female leaders provide support and they assist in the exchange of hard work of stakeholders. 40% partially agree with the statement. Two individuals, 4% partially disagree and no individuals disagree about the women in a key position or if given power positions will fail to assist or value the work or endeavour invested by the stakeholders. It is evident that the work done will not go unnoticed under female leadership and this is a positive aspect of female leadership it can transform the energy of the team and the people around. The transformed collective energy and collective consciousness in positive directions can yield exceptional results and can achieve greater goals in institutes of higher education under transformational female leadership. Here there is no comparison that female leadership is either more or less transformational. The argument is keeping aside the gender roles leadership must be endorsed by capabilities. And aspiring female leaders must avail equal opportunities to prove their worth.

The female leader falls short of intervention until the problem becomes severe.

The second statement is about solving problems and crises. If there is a problem in the institute or connected arena the analysis shows that female leaders will immediately get involved and take necessary action to solve the problem. Only 6% disagree and say that female leader does not take timely interventions, and 20% partially agree thinking that female leaders wait till the issue gets worse. 28% partially disagree they think that female leader would not like that any crisis or issue becomes grave they want that each dilemma each catastrophe must be solved before it becomes bigger. 46% fully agree and believe that they immediately take initiative to know the problem going to its roots to solve it in the best possible way. Research repeatedly would like to argue that female leaders are more efficient than males is deviating from the focus and missing the point. Arguably rapidly changing organizational management in changing times is abounding with crises and conflicts with competing demands so institutions need leaders with flexibility with a vibrant range of leadership qualities without labelling masculine or feminine qualities.

The female leader focuses attention on indiscretion, inaccuracy, derivations, and exceptions from standards.

Here, 46% of respondents agree while affirming that female leaders pay attention to deviations from the standard, mistakes, and abnormalities, they do so to make their fellow employees aware of the fact that they can put in better, and they have the potential to elevate the institutes to higher grade if they stretch their limits. This can enrich the organizational culture. 32% partially agree think as leaders sometimes are liberal looking to the circumstances of the employees and situation of the working conditions. For example, one can be patient for a stipulated time slot but if it happens recurrently then it needs to be focused and addressed methodically for future improvements. 12 % partially disagree and 10% disagree so it falsifies the myth that female leaders can't be harsh and female leaders seldom accomplish what male leaders do. Here again, it can be said leadership is not just relative to gender. Femininity is an attribute of women but matriarch is a power of creativity and creation.

The female leader maintains self-integrity and goes beyond self-interest for the good of the team and the institute.

50% agree that they go beyond self-interest. 35% partially agree extent. 12% partially disagree and only 4% disagree. It demonstrates how female leaders put the interests of the team and the organization ahead of their own. We all know that self-interest is psychological as well as an economic term. The term provokes personal benefits. Female leaders brushing aside, the personal benefits voyage in direction of holistic good, focusing on the organic whole and benefits of the organization as a sole entity. As a leader, she is proactive and upbeat pursuing the mission of the organization. She put in efforts to identify with the mission and vision of the institute and formulates strategies and plans to achieve long-term and short-term objectives keeping aside personal interests. The holistic vision where self-interest hardly counts brings in the idea of a shared vision and keeps the female leader externally and internally focused which adds much to the growth and development of the institution. When self-interest is not that important, it brightens up the self-integrity of the leader indifferent to the gender. Leaders become role models they are emulated, so the leaders with potent self-integrity create an aura they influence their ecosystem and the people around them bring integrity to the whole organizational management and culture, ultimately resulting in making the institution great and successful.

The female leader considers the moral and ethical consequences of the choice and decision, illustrating high standards of morality and ethics. She avoids misusing her position for selfish ends.

To this statement, 64% agree, 33% partially agree, 2% partially disagree and 1 % disagree. Ethics means everything to the organizational culture. 64% agree and 32 % to an extent agree that ethics matters a lot to the female leader while making choices and decisions in the institution. Female leaders acknowledge their role in shaping the organizational ethics they create a culture that strengthens the bonding and the foundation on which the success of the organization depends. Leaders who disregard ethical consequences of choice and decisions run the risk of personal and institutional liability in contemporary tough legal settings. It promises integrity to the institution.

Female leader talks optimistically display enthusiasm and help others to develop their strengths, she exhibits behaviours that inspire and encourage others around them by giving their followers job purpose and challenge.

58% agree, 30% partially agree, 8% partially disagree, and 4% disagree. The maximum number of respondents agree that the female leader is optimistic and helps others to develop their strengths. Female leaders know how to look to the brighter side of the things they know how to their as well as the staff's strengths and accomplishments. 58% agree that they know how important it is to add to the value of the institution by strengthening the individuals and giving them opportunities to grow and advance. Their growth is equal to the growth of the institution.

Female leader frequently keeps in contact to find out if all is well.

54% agree, 38% partially agree, 6% partially disagree and 2% disagree. More than half of the individuals believe in the fact that female leaders frequently keep in contact to make sure all is well. 54% agree and 38 %

somewhat agree that women are much inclined towards purposeful networking they frequently keep in contact to know that all is going well. They understand how important it is to keep in communication and keep connected with the stakeholders to get feedback for further improvements. They at times interact and know good things and they know how to influence people to get work done successfully.

A female leader clearly explains the goals, objectives, and targets and engages followers in imagining desirable future scenarios, fostering a sense of teamwork.

66 % agree, 18% partially agree, 16% partially disagree, and 0% disagree. It is derived that female leaders clearly explain the targets. The highest number of stakeholders believe those female leaders have a clear mindset regarding targets and goals. It is a myth that females have less clear goals shared with others. But on contrary it is seen that female leader continuously share their plans, make-believe the stakeholders in their plans and achieve their targets within the stipulated time. There are many age-old societal and organizational barriers for any leader either men or women which brunt the advancement of leaders. Despite the impediments, female leaders are much sure about what they can achieve.

The female leader demands competence and efficiency at any cost.

36% agree, 36% partially agree, 18.8% partially disagree, 9.2% disagree. Here 36 % plus 36% are with agreeing and partially agree so at times if it is not in the capacity of the person to fulfill the task the female leader will either have the patience to train the person in a particular task or will assign the task to other person and try to find out that the person who proved to be unskillful in certain task is best at which skill. In a way, instead of getting frustrated will explore the skill and possibilities to develop that particular skill of a person to get the best out of him and thus make him/her an asset to the institution.

The Female leader assertively and confidently expresses thoughts and opinions and establishes expectations that are clearly stated and that followers wish to satisfy while also displaying a dedication to the common objectives.

54% agree, 32% partially agree, 14% partially disagree, and 0% disagree. More than half of the stakeholders agree that female leaders voice the institutions assertively and confidently. Putting forth the voice to be heard and voicing the ideas and thoughts transforms the institutions. As unless you assert nobody hears and if you are not heard no action can be expected. Female leaders assert and make bold moves at times to fulfill their new leadership roles such moves are often indispensable to be successful as a leader in the longer run.

The female leader provides training and mentoring to others, by serving as a coach, and gives particular attention to the demands of every individual for success and progress. By doing this, colleagues and followers are gradually developed to greater potential levels.

52% agree, 38% partially agree, 10% partially disagree, and 0% disagree. The evidence of 52% shows that female leaders are good trainers and mentors. Leadership is about the team and teamwork. Leaders need to train others to make a strong team. No endeavor is a sole endeavor; the leader and the stakeholders are interdependent entities. Female leaders cultivate strong internal and external sets of connections to get the work done. As

leadership is setting an example by working and at the same time making others work equally.

The female leader is the defender of progressive dreams ideas or action plans of execution she believes in.

50% agree, 40% partially agree, 10% partially disagree, and 0% disagree. Nearly half of the stakeholders believe that female leaders defend themselves while they think, articulate, and accomplish what they dream for the institution. They believe develop, append, and guarding the principles and vision, and action plans of the institution.

The female leader believes in confidentiality to not disclose the personal matters of the staff or other stakeholders.

40% agree, 37% partially agree, 22% partially disagree, and 1% disagree. Stakeholders believe that female leader can maintain confidentiality in the institutions it can be about the performance, disciplinary actions, confidential reports, etc. It's all about equilibrium between preserving the confidentiality of the staff and at times completing an investigation that is required and necessary for all concerned parties. During institutional investigations or performance and disciplinary actions, confidentiality is very vital and is maintained by the female leaders. Female leaders know how to excel in organizational management and work well in their ecosystem supporting the efforts of the staff and all stakeholders.

The female leader is concerned if the employee remains absent without prior notice.

44% agree, 34% partially agree, 16% partially disagree, and 6% disagree. Stakeholders are clear when they agree with the fact that females are much concerned about their staff as their family. They consider their staff as family, as female leaders inquire if all is well when the employee remains absent without prior notice. Here it must be noted that females to excel as leaders are not required to alter their basic nature of being compassionate, empathetic, kind, and concerned. They are not some version of males in command while in leadership roles. The real charm of female leadership is winning while maintaining the identity and basic feminine traits. The respondents say that female leaders tend to be much more humane and that adds to the strength of the leader as well as the team.

The female leader does not allow altering or shifting days off.

9% agree, 46% partially agree, 33% partially disagree, and 12% disagree. Stakeholders believe that female leaders are flexible and they allow shifting days off the condition will be that the work must not suffer and quality cannot be compromised. Female leaders make the staff feel constantly that they are an indispensable part of the institution and each one can replace the other by multi-tasking and skill development. Staff can alter roles, enrich their experiences by altering roles and bring new progressive effects to the institution. So, leadership helps the team to perform tasks alter roles, and reach their goal. It encourages functional behaviours clearing the path towards a unified goal, by being flexible when required with the subordinates. Here potentially diverse groups with different skills and talents by altering roles at times work together towards a common output.

The female leader allows the staff to leave if private matters arise.

52% agree, 30% partially agree, 16% partially disagree, and 2% disagree. Stakeholders have faith that female leaders give leave to employees to attend the urgent situations and their private matters. As females tend to understand the difficulties of others, if the employees are stress-free they give better output and they tend to be more productive when in a cheerful mood. The pensive mood of the employees hinders the work process. Leaders communicate the targets and visions, accomplishments are possible only by high performance and teamwork, such expectations from the team are fulfilled when the members of the team are allowed to cater to their private matters when urgent and important.

The female leader organizes events to update and improve the knowledge of the employees.

60% agree, 26% partially agree, 14% partially disagree, and 0% disagree. Sixty percent of the stakeholders believe that female leaders are always keen on updating the staff with the new knowledge and most recent developments in the field as it is directly related to the organization's development and growth as a holistic entity. Female leaders emphasize results. They want each one to grow with the growth of the institution, they spend more time updating the knowledge and communicating the same to the staff, they invest more resources in organizing the updating and innovation and it is observed that they all have more exchanges of off-task feedback and comments to obtain positive results.

The female leader knows the capabilities and potential of each staff member.

54% agree, 33% partially agree, 12% partially disagree, and 1% disagree. Stakeholders agree with the fact that when we look at the socio-emotional behavior of female leaders they invest more time in knowing their employees, they are more likely to meet the socio-emotional needs of their team. They discover which member gel well with the other and set the tasks accordingly when one member becomes complementary to the other this gives the best outcomes. Female leaders are interpersonally demonstrative and sociable during interactions and this helps them discover the potential of each member of the team.

The female leader tries to ensure that employee does not go unpaid if he/she works overtime.

50% agree, 36% partially agree, 12% partially disagree, and 2% disagree. Female leaders value the work done and believe in listening as a skill at both ends. This makes the two-way communication more open stakeholders believe that if any of the staff works more female leader inquires and makes sure that the services don't go unpaid and there is no space for exploitation. Value of time and work is paid which boosts the enthusiasm of the employee to continue putting on extra efforts as and when required.

The female leader allows the staff to work unsupervised.

20% agree, 24% partially agree, 32% partially disagree, and 24% disagree. The female leader is at times not supervising a total of forty-four percent come to agree and partially agree fifty-six percent partially disagree and disagree. She supervises the work on and off after assigning the task. Females believe in repeated reminders of deadlines, males are more moderate after assigning the task. At times frequent supervision becomes a requirement to avoid the crisis of deadline submissions but at certain tasks results matter, the team even if unsupervised can yields the best results when they acclimatize with the organizational culture.

The female leader organizes regular meetings to improve communication and organizational management.

50% agree, 46% partially agree, 4% partially disagree, and 0% disagree. Here the data evidence show that female leaders are highly competent leaders who regularly arrange a meeting for organizational communications.

The female leader encourages transparency by giving information to all.

34% agree, 34% partially agree, 16% partially disagree, and 16% disagree. Stakeholders believe that female leaders keep the organization's secret intact. They keep confidential matters within the closed circuits in the goodwill of the institution. This retains the value and standard of the institution. But when it comes to transparency they are extremely transparent about the organizational management. The superannuation benefits, regular increments, salaries, service books, and leave records can be obtained by anyone as their right. All required notifications are displayed on the institutional website anyone can access the information at any time. No one is deprived of their right to get any relevant necessary information.

The female leader admits the mistake and accepts the mistakes.

24% agree, 50% partially agree, 22% partially disagree, and 4% disagree. Stakeholders believe that at times if there is a mistake female leader accepts and tries to rectify it by accepting the mistake. She goes to the root of the issue and tries to find out where there was a lapse in the team, as any endeavour in an institution is a collective endeavour, one mistake on part of one member leads to the error of the whole team. True leader male or female admits mistake when it is genuine as her mistake not levying and imposing them directly on the team member. And when it comes to giving credit for success true leader gives credit to teamwork and the whole team. When such kind of culture develops, each member works fearlessly, without getting afraid of being accused or blamed for errors. To err is human and those who work are bound to err, learning from their mistakes. A female leader takes responsibility for the mistakes of the team.

The Female leader pacifies arguments and avoids causing aggravation.

38% agree, 36% partially agree, 26% partially disagree, and 0% disagree. The respondents say that female leaders make peace by avoiding heated aggravations. They have patience in dealing with sensitive issues; they negotiate for the successful outcome of stressful situations or problems. They like peace and promote institutional harmony not letting in personal differences and biases. They built the ecosystem with trust and synchronization.

The female leader speaks to all staff and always maintains protocols and is straightforward.

56% agree, 34% partially agree, 10% partially disagree, and 0% disagree. Fifty-six percent believe that maintaining protocols is in the basic nature of females. Respecting the top management and giving due respect even to the class three and four employees of the institution is required to maintain a cordial atmosphere in the institute. Mutual respect and being straightforward and maintaining protocols build healthy esteemed culture.

The female leader is at times unpredictable.

24% agree, 38% partially agree, 18% partially disagree, and 20% disagree. Twenty-four percent agree and thirty-eight percent partially agree that female leaders are having a clear understanding of a situation and making quick decisions per the demanding situations. Female leaders are able at making decisions as leader understands the culture of the institution and situation well. The evidence shows that at times female leaders are shrewd and unpredictable and it affects their decision-making. In fiscal matters and certain policies, it may be that female leaders take time and consultancy to come to decisions.

The female leader is frank.

46% agree, 40% partially agree, 12% partially disagree, and 2% disagree. Respondents gave clear evidence that female leaders are frank and have the clarity they do not entertain beating around the bush. Clarity of thought, purpose, and goal with a clear roadmap is displayed by the leader. This clear roadmap is displayed in front of the team making them visualize the accomplishment. There is frank communication on how to reach the goal and who will be the second, third, and fourth lead with the team. This frankness avoids confusion in the team otherwise confused people confuse others.

The female leader demands the whole team to work continuously.

18% agree, 32% partially agree, 26% partially disagree, and 24% disagree. The evidence shows a mixed response. It is observed that female leader tries to find out what is the root cause if any team member fails repeatedly to cope with the team. There are causes why leaders lose teammates; it is mistrust, ego, lack of timely communication, and much more. When a leader gives a break and works to make the individuals one team one unit it brings the best results. Continuous demands can sometimes be replaced by opportune considerations there can be no harm in doing so.

The female leader is sensitive to people and situations around them.

52% agree, 32% partially agree, 14% partially disagree, and 2% disagree. More than half of the respondents are sure that female leaders are sensitive enough to understand others and their situations. Being sensitive means having compassion towards the employees and co-workers. Here sensitivity means understanding other person's facial expressions, gestures, and body language and paying attention to them. Nonverbal communication, as well as verbal communication, is important for female leaders set a concerned tone and are having a magnanimous approach to mistakes. They see the issues, problems, and difficulties through the eyes of employees. Female leaders never overlook the fact that employees are also human. They are more kind in admiring; at times they criticize to appreciate. They have clarity about the well-wishers and empty flatterers among the employees. They care for employees outside the task and try to create an association with them as persons.

The female leader has no time for levity.

40% agree, 24% partially agree, 20% partially disagree, and 16% disagree. Evidence shows that serious matter is never treated lightly but there is always a place for sensible humor for female leaders. No disrespect is

shown for serious issues. As the leader cannot effort to fire disconnected ideas from the key position. It is so important to be aesthetically creative but a leader cannot be devoid of scientific realism at the same time. A female leader earns respect from others as she seldom throws everything at everyone.

In more than 15 statements the stakeholders agree above 50%. In statement 5, 8, and 17 they agree above 60%. The highest agreement is on statement 8. Thus, the overall analysis and evidence show that stakeholders credibly believe in female leadership as a transformational one, and their capabilities as leaders must be recognized and employed in higher education in India while implementing New Education Policy.

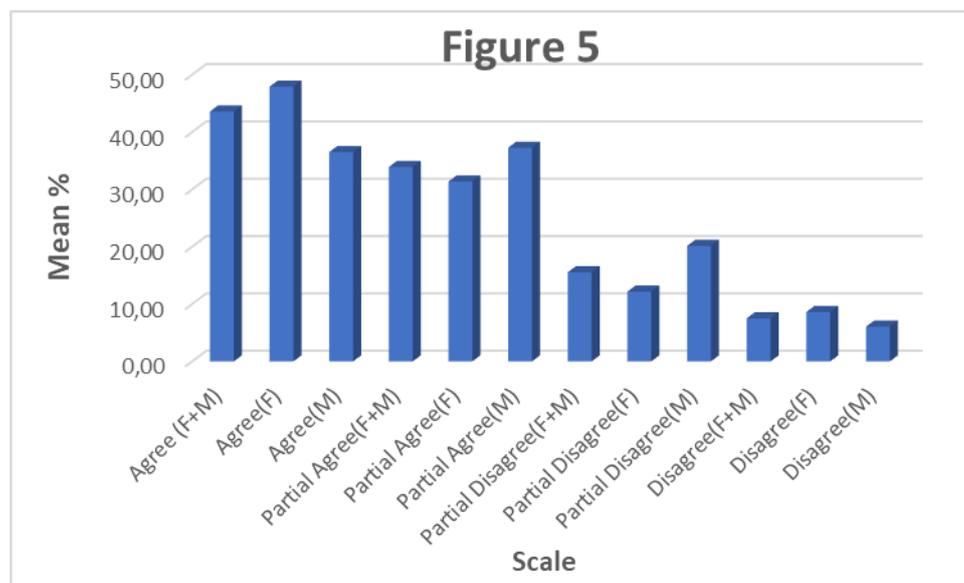

Figure 5: Mean value gender wise.

Analysing the responses collected from male and female separately, the findings made are very interesting. The column height of female response is higher than the total (Male+Female) of agree column, while the column height of male is lower than the total (M+F) as shown in Figure 5. The ratio of female feedback is higher than the male as well as both (F+M) for the agree scale. The ratio for partial agrees statements, the female ratio is observed slightly lower than the F+M and Male. Such observation clearly indicates that females believe more that the female leadership can be really transformational while implementing New Education Policy in India. Higher females’ responses show that females are more supportive to the females and they firmly believe that females rising at leadership positions in higher education institutions can make a positive difference.

Calculation of the Mean values for taken responses from female and male are separately analysed. The mean values for total (F+M) is in decreasing order from agree to disagree scales and the same trends was observed for the female and male responses when separately analysed, the results are reflected in Table2. This trend also favours female leadership that can be transformational while implementing NEP in India.

Calculation is done also by single sample method t-value and observed the corresponding p-value at Df=29, the results showed that it is significant at $p < 0.01$. (Table 2)

Table 2: Calculation of Mean, SD, Variance and t-value single sample.

	Female + Male (51) 100%				Female (29) 56.84%				Male (22) 43.14%			
	Agree	Parti al	Disa gree	Disa gree	Agree	Parti al	Disa gree	Disa gree	Agree	Parti al	Disa gree	Disa gree

	082	614	023	74	547	368	81	75	063	623	788	84
p-value	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
	00	00	00	04	00	00	00	09	00	00	00	04

*p < 0.01.

Now calculate the paired t-value for male and female responses. The hypothesis is $H_0 =$ While implementing NEP 2020 Female leadership can prove to be transformational (successful), $H_1 =$ While implementing NEP 2020 female leadership cannot prove to be transformational (not successful). Calculated the \bar{X}_1 , \bar{X}_2 , S and t_c -value from the following equations (1) to (3).

$$\bar{X}_1 = \frac{\sum X_1}{n_1} = \frac{30.01}{29} = 1.034 \text{ and } \bar{X}_2 = \frac{\sum X_2}{n_2} = \frac{22.74}{22} = 1.033 \quad (1)$$

$$S = \sqrt{\frac{\sum(X_1 - \bar{X}_1)^2 + \sum(X_2 - \bar{X}_2)^2}{n_1 + n_2 - 2}} \quad (2)$$

$$t_c = \frac{|\bar{X}_1 - \bar{X}_2|}{S \times \sqrt{1/n_1 + 1/n_2}} \quad (3)$$

From the equation (2) and (3) the calculated value of S and t_c - value is 2.78 and 0.0012 respectively. At Df=49 the $t_{0.05} = 1.95$. Now, $t_c = 0.0012$ and $t_{0.05} = 1.95$, Therefore $t_c < t_{0.05}$ Then H_0 is acceptable.

Qualitative responses were invited from the female leaders of the academic fraternity. The Following exemplary three qualitative responses are quoted to exemplify the views of the female leaders.

Qualitative Response: 1

Honorable Dr. Ujwala Chakradeo. Vice-Chancellor of SNDT Women's University, Mumbai, India

The greatest means of bringing about social change is education. The British knew it and they used Education to drive Indian society away from its roots. With National Education Policy 2020 the possibility of connecting with our origin has now been established. Education is essential for realizing one's potential as a person,

creating a fair society, and advancing the development of the country, according to the NEP. Appropriate implementation under the able and enlightened academic leadership only will pave the smooth path ahead. Academic leadership has to have all those qualities necessary for any leadership with an additional edge to motivate, inspire and mold the future, not only of the individual but collectively that of the society and that of a nation. Appropriate vision and insight are necessary for every leader to reach the set goals. Beyond achieving targets academic leaders have to have sensitivity towards every learner who is directly or indirectly a part of the system. Education is the expression of the perfection that each person already has, according to Swami Vivekananda. In the process of this manifestation, the role of an academic leader is very crucial. Administration, management, and teaching are the basic responsibilities of an academic leader. However, the focus on these activities varies with the position acquired by the leader on the ladder of promotion. Academic excellence is the soul of these activities. Excellence can be achieved by pushing the boundaries. Motivating the student/learner to slowly expand and go beyond is what the academic leader has to achieve at every point in time.

This entire universe is the blend of Purusha and Prakruti (male and female component) Prakruti, the female is the creator, and the entire creation is possible because of the tender motherhood encapsulated within Prakruti's womb. Purush or the man is the ability to manifest the creation; to manage the logistics necessary to make the creation of Prakruti a reality.

The logical thinking of men and the creative ability of women are inevitable components of every individual whether a man or a woman. That is the reason why men are equally contributing to the creative fields. Love, compassion, and empathy are essential feminine qualities. These are the qualities that with utmost tenderness can unravel the perfectness of every individual in the process of education. These feminine qualities are inherent. They are there, very rarely can be acquired by training from outside. Whereas, managerial and administrative abilities can be obtained by training. This makes the authority of women in academic leadership more meaningful. The development of each person's creative potential is a focus of the National Education Policy 2020. It is based on the idea that education must foster the development of not only cognitive abilities—including "foundational" abilities like literacy and numeracy as well as "higher-order" abilities like problem-solving and critical thinking—but also social, emotional, and ethical abilities and dispositions.

Thus, now is the time to sensitize teachers and administrators of education sectors to envisage this change. Thus, to implement the essence of NEP, 2020 suitable sensitization of academic leaders to acquire as many feminine abilities (the essence of matrutva) is imperative.

Qualitative Response: 2

Dr. Ila Gupta, Director, Amity School of Architecture and Planning, Coordinator, Amity Mega Center for Natural and Man-made Calamities, Amity University, Gurugram.

Women have strengths of compassion and empathy which make them good leaders. However, their sacrificing tendencies and family responsibilities make them take a back seat in their careers. Gender bias is deep-rooted in our consciousness and taking that out would need many years of continuous effort. While our academic institutions are gender-neutral and propagate equality, the industry is not. This fact affects our careers in

academia too. We are living in the age of technological revolution and education has to keep pace. There is a continuous development of new technology, material, software, hardware, government initiatives, etc. New challenges and prospects are developing all the time. It is more important for us to keep updating our knowledge if we have to remain relevant. In this scenario, strong industry experience and collaborations are the need of the hour. Academia is no longer a choice for an easy and comfortable means of living. We are required to come out of our comfort zone which is not possible for all women. That is the reason, despite all the reservations, encouragement, and gender-neutral policies, very few women are seen holding higher designations in universities.

Qualitative Response: 3

Dr. Vaidehi Vijaykumar, Vice-Chancellor, Mother Teresa Women's University, Kodaikanal.

The much-needed adjustment for our educational system is the New Education Policy (2020). The policy supports a comprehensive development of the kid in addition to ending the practice of rote learning that is now used. The primary goal of NEP 2020 is to provide children with a balanced exposure to academics, practical learning, and extracurricular activities.

Speaking of gender, the "girl child" has traditionally been the main focus of the majority of educational policy. It is obvious because 50 years ago, girls and women were in a worse situation than they are now. If we look at it from a comparative perspective, many modern families do not consider females as a burden; instead, they want them to be independent and educated. Although there are still gender preconceptions that limit women from becoming "homemakers" and family providers, this development is undoubtedly progressing in the right way.

In the NEP20 under the Section Effective Governance and Leadership in HEIs, it is specified that All positions of authority and institution heads will be given to those with strong academic credentials, a track record of executive and leadership success, and the capacity to handle challenging circumstances.

The NEP has no gender disparity in its statement. That means women with the required qualifications and strong leadership skills have equal scope to occupy the decision-making, professions in Higher Educational Institutions. The data on women in leadership in India, however, presents a dismal picture notwithstanding this encouragement. According to the most current Times Higher Education Globe University Rankings 2021, 41 out of the top 200 higher education organizations worldwide, or 20% of them, are run by women. But as of 2020, India has over 1000 universities, divided into 159 Institutions of National Importance, such as IIMs, AIIMS, IISERs, IITs, NITs, and IITs, as well as 416 State Universities, 54 Central Universities, 361 Private Universities, and 125 Deemed Universities. But multiple studies reveal the percentage of woman vice-chancellors/Directors in India as shockingly 6.67%. That means only 54 Universities out of 810 institutions of higher education are headed by the woman academic leaders.

I hope the NEP 2020 will change this picture. The selection of academic leaders will not be based on old assumptions and prejudices. The problem of a glass ceiling and the notions of what a woman can perform will gradually change and many women academicians would soon emerge as leaders of Higher Educational Institutions and lead the Institutions as top-notch Institutions.

Findings and Analysis

Summarizing the analysis of quantitative MLQ and the qualitative responses from female leaders in higher education the research findings attention to the capabilities of female leadership which is transformational and it is due time for recognition of transformational female leadership in institutions of Higher Education in India. But the tendency to employ female leadership is often not very much present or obvious sort of investigation in higher education policy making at all levels unless it relates to (girl) student enrolment. Quality counts instead of equality is a justification often given to justify the under-representation of women leaders in higher education. In the Indian education system, more girls are enrolling, and more women are becoming faculty members but when it comes to leadership few females rise to a senior leadership position. In this context, we can say that number of female faculty may have increased, but the representation of females particularly in key leadership decision-making positions is still not much. This is research-based, evidence that stakeholders want to see more females in a leadership position they believe in women as transformational leaders. It is a known fact that there are many hurdles to women's leadership females are to date largely identified only with domestic spheres and family responsibilities. Sometimes economic background and socio-cultural backdrop also play a vital role in constraints if women pursue academic careers and aspire for leadership positions. Societies frame compelling messages regarding gender-appropriate behaviour. There is a very common notion that females cannot have authority over males while governing assemblage. Social circumstances overlap with gender while determining the status of women who can enter leadership positions.

This study shows that stakeholders are inclined to invest faith in transformational female leadership in higher education. The qualitative responses from successful female leaders quoted in this study show how females learn their job to be leaders and how important it is to develop oneself as a leader, how they have attributes to transform things for good, better, best, and excellent. In the higher education sector of India while implementing and executing NEP 2020 we need structured intervention to develop and encourage female leadership. In India, we need more formal mentoring arrangements for females aspiring to be leaders in higher education, and more programs focusing on capacity building and career advice to inculcate female leadership. Testimony of organizational management of academic culture of India, reports the patriarchal nature of higher education institutes, often standoffish towards females, when they aspire and show willingness and have proven attributes and credentials to rise to leadership positions.

Observations

- The study reveals that we need to accommodate more women in leadership and their able leadership attributes must be more
- Their transformative leadership traits can add to the progress of India's higher education institutions.
- It is recommended that it is due time to find ways to eliminate the apprehensions when at times females are forced to believe by their social surroundings that if women rise to leadership positions it will be a diversion

from their commitment to family tie-ups.

- To undo the myth when females are led to believe that administration at the helm of leadership position is an extremely over demanding situation. To function as a leader, one requires 24x7 readiness to be available and females cannot give in to this performance-oriented demanding academic culture in organizational management as leaders.
- Those female leaders whose responses are quoted in this study and some other distinctive female leaders like them who serve in key leadership positions are contended with what they have achieved and are serving as an inspiration to other women out there aspiring to be future leaders in Indian higher education institutes. Mentoring and training programs must be organized under such leaders. The empowered and able guidance of such female leaders will empower other women.
- Empowered women indeed empower other women. For these women, their academic skills and excellence are transferred into their competencies as leaders. Recognition of the compatibility of female leaders with transparency is required.
- Appointment in a leadership position must not be vulnerable to gender preconceived notions, men with high visible public profiles are preferred and here calculations often go against women. This must be rectified by taking necessary steps at all levels.
- Policy making and regulations of recruitment of individuals on leadership positions need to be reviewed that give way to more transparency and accountability to let women in decision-making positions in institutes of higher education.
- More evidence-based research on female leadership must be vigorously done and findings must be submitted for review by the policymakers and government bodies.
- The study shows that stakeholders believe in females as transformational leaders. Stakeholders show total readiness to support the policymakers and recruiting bodies if they aspire to appoint female leaders in a key position in institutes of higher education. When stakeholders believe in females the Matriarch as transformational leaders, while implementing New Education Policy in India it is high time, to make leadership positions more accommodating and welcoming for women.
- Women who want to rise to leadership roles in higher education must be encouraged. Disturbing elements for females to rise to key positions include inaptness or having an aversion to politics and networking, male domination, administration, and lessening of one's research and academic platform. When a woman is in charge, seclusion and aloofness breed antagonism from male co-workers who fail to appreciate the capabilities and influence of female matriarchs as transformative leaders. Plans and strategies are required to be made in these aspects to make the conditions conducive for females to aspire for the leadership position in institutes of higher education in India while implementing and executing NEP 2020.

Conclusion

In closing lines, I recall the confident thought-provoking words of transformational female leader Honourable Hansa Mehta. She served as the Vice-Chancellor of the Mumbai-based SNDT Women's University. She was

appointed vice-chancellor of Baroda University in 1949. She was the first female Vice-Chancellor of India to head a university that was not confined just to women. She voiced for social, economic, and political fairness for females and shared her opinions in the assembly on how women would be affected by the implementation of basic rights. She advocated for political, social, and economic fairness for women and expressed her ideas in the following soul-stirring manner at an assembly.

The typical woman in our nation has endured inequities imposed on her by people whose laws, traditions, and practices have regressed from the heights of the civilization we are all so proud of for generations. Today, thousands of women are excluded from basic human rights. The Indian female has been rendered so vulnerable that anyone looking to profit from the situation may easily prey on her. Man has degraded himself by demeaning women. The name of Mahatma Gandhi has been used on the floor of this House, and it has been said that by uplifting her, man would not only elevate himself but also the whole country. I would be lacking in appreciation if I did not recognize Mahatma Gandhi's immense debt of gratitude for everything that he has done for Indian women. Without the support of women, our old nation cannot take its proper and valued position in this world. I thus warmly regarded this Resolution for the immense potential it embodies and hopes that its goals will be realized rather than only remaining on paper. (https://netri.co/wp-content/uploads/2020/08/hansa_compressed.pdf)

Let us all applaud the rising of Matriarchs and the strength and transformation that can be brought by encouraging female leadership. By giving due recognition to Matriarch – the female leadership in institutions of higher education in India while implementing New Education Policy, we'll contribute to the 2015 global adoption of the 2030 Agenda for Sustainable Development by all UN member states and offers a common vision for world peace and prosperity, a safe, secure present, and a bright future for humanity. We will be directly contributing to human development and SDGs 4, 5, and 16 and equally contributing to all other goals in one or other way by promoting female leadership in higher education. The 17 SDGs (Sustainable Development Goals), aim at making the world harmonious, peaceful, and a better place to live in for present and future generations. It is a clarion call for action for promoting and encouraging female leadership in higher education, it can be firm and steady steps towards making a stronger Nation, New India @75.

An Investigation into the Implementation of a Mentoring Program for EFL Novice Teachers at an English Center in the Mekong Delta

Sang Thi Kim Nguyen

FPT University, Vietnam

Abstract: Professional development (PD) plays a crucial role in promoting teachers' linguistic competence and teaching quality, contributing to enhancing and maintaining sources of effective teachers, especially novice teachers with little teaching experience. Mentoring has emerged as a PD activity in which a novice teacher is mentored and directly supported in various aspects by an experienced professional. It has been popularly adopted in several countries in the world, including Vietnam. This study was conducted to investigate the extent of various types of support that the mentoring program provided. Additionally, it aimed at exploring the level of satisfaction of EFL novice teachers regarding the types of support in the program. The study was designed as a mixed-method study, using a questionnaire and interviews as data collection instruments. The study involved the participation of twenty-two EFL novice teachers who have less than three-year experience in teaching and took part in a mentoring program held by a private English center in the Mekong Delta. The finding showed that all types of support in the program, including instructional support, emotional support, physical support, and institutional support were provided to a high extent. The participants hold a high level of satisfaction with these types of support. Based on the findings, some recommendations were suggested to promote the quality of the program and meet participants' needs and expectations.

Keywords: Mentoring programs, EFL novice teachers, Support novice teachers

Introduction

Mentoring has emerged as a popular professional development strategy for both novice and experienced teachers worldwide. It has become the key feature of induction and continuous improvement in a wide range of settings, including teaching. Nowadays, mentoring has played a prominent role in assisting teachers' initial preparation, induction, and early professional development (Crisp & Cruz, 2009) and has been proven to boost novice teachers' confidence, skills, and motivation (Zembytska, 2015). In the context of Vietnam, the English language has become the first foreign language in schools and universities. The National Foreign Language 2020 Project of the Ministry of Education and Training has been a lever to encourage almost every language

institution to organize a variety of professional development programs to help EFL teachers to improve their teaching practices. Nevertheless, retaining effective teachers poses a problem for every educational institution. Inexperienced educators are encountering a range of challenges, such as career motivation, deficient competencies, and psychological distress, particularly when their academic training is overly theoretical. It is imperative for educators to bridge the divide between academic knowledge and practical application in the field of teaching. Insufficient support has been identified as a primary factor contributing to the high rate of attrition among novice teachers within their first year of teaching. Its efficacy has been substantiated by various studies. (Crisp & Cruz, 2009; Ehrich et al., 2004). It is believed to help novice teachers facilitate their professional growth (Peeler & Jane, 2005; Wang et al., 2008). The impact of mentoring on novice teachers has been popularly supported in Western contexts (Peeler & Jane, 2005; Wang et al., 2008); however, there is little research concerning the roles of mentoring in enhancing novice teachers' professional development in the Vietnamese context in general and in particular, the Mekong delta. For the reasons above, this study was conducted to gain insights into these interests to operate PD programs for novice teachers so that their effectiveness can be maximized.

Teacher Professional Development

The concept of teacher professional development involves a systematic approach whereby educators engage in individual or collaborative efforts to enhance their teaching performance, expand their knowledge base, and improve their psychological interactions. These efforts are deemed essential to the advancement of their teaching careers (Day, 1999). Additionally, Craft (2002) added that professional development refers to teacher professional improvement as a result of reflecting and learning through both personal experiences such as workshops, short-term or long-term training programs, and informal learning through professional publications, and documentaries about education. The development is also likely to influence perspectives and methods and thus may contribute to the enhancement of the way people learn and teach (Day & Sachs, 2004). The goals of professional development initiatives are twofold: to empower and assist educators, irrespective of their teaching location or professional background, and to provide optimal instructional assistance to enhance their competencies, confidence, and dedication, while also fostering a sense of gratification in their teaching practice (Day & Sachs, 2004).

Mentoring

Emerging in the early 1980s, the concept of mentoring was initially implemented as a strategy to address the prevalent issue of high turnover rates among inexperienced educators in various nations (Feiman & Nemser, 1998). Anderson & Shannon (1998) defined mentoring as a nurturing process in which a more experienced teacher teaches, sponsors, encourages, and counsels a less experienced one for boosting later professional and personal development. (Giannakaki et al., 2011) described it as the support offered by a more experienced person for the growth and improvement of another, and for their integration into and acceptance by the

community.

Why needs mentoring

The shift from the role of a student teacher to that of an autonomous teacher can be perceived as a jarring encounter. Blakley (2006) described this process as a “reality shock” as novice teachers’ expectation confronts reality. The researcher discovered that inadequate support has been the primary factor affecting the professional growth of inexperienced educators. It was pointed out that successful induction programs play crucial roles in assisting new teachers to overcome challenges, boosting their coping ability, and helping them reduce their doubts about their decision to teaching careers (Blakley, 2006). Throughout decades, mentoring has been accepted as an effective strategy for supporting student teachers to step into their teaching profession (Sundli, 2007). Lai (2006) supported this viewpoint by stating that mentoring can prepare new teachers with opportunities to learn within the context of teaching. Successful implementation of mentoring programs has been believed to provide novice teachers with various types of effective support during the induction stage.

The types of support for EFL novice teachers

When studying the roles of mentoring for beginning teachers, Lipton & Wellman (2001) pointed out four types of support that new teachers primarily need to be provided during the early stages of their careers. These four types of support were subsequently consolidated and strengthened by Tina H. Boogren (2012) when she studied strategies to support new teachers.

Physical Support

According to Boogren (2012), new teachers, when confronted with a new teaching environment, often face resources, materials, and logistical issues. The assistance in relation to these aspects is considered to be physical support. It involves helping new teachers with school procedures such as getting familiar with the paperwork system, arranging furniture, managing teaching materials provided, and the like. Novice teachers only need this type of support for a certain period when they have just started to get familiar with a new environment. Physical support is likely to assist new teachers with daily concerns and familiarize them with the operation and function of the new educational environment. Boogren (2012) also recommended some strategies to support new teachers. It is advisable that mentors can give a tour of the new school to familiarize new teachers with the environment, introduce them to the physical layout of the school and explain to them how to perform their duties and tasks. Another activity is to help describe a typical day in a classroom including school time, regulations, common size and capacity of the classrooms as well as how to arrange facilities and resources in the class. In addition, the author suggested that mentees should receive guidance on the utilization of technological equipment provided by the educational institution, including but not limited to projectors, televisions, and CD players.

Emotional Support

Emotional support has been researched in many studies, most of which revealed it strongly benefits novice teachers from strengthening their psychology during the period of socialization in teaching to enhancing teachers' level of confidence in teaching performance (Bradbury & Koballa, 2008; Salleh & Tan, 2013). The feeling of fatigue, isolation, and self-doubt lead to pressure and stress during a few first years of a career. New teachers often find it difficult to balance work and personal life. The individual experiences self-doubt regarding their capacity to manage their workload, leading to uncertainty regarding the continuation or termination of their teaching career. According to Nora & Crisp (2007), emotional support mainly involves psychological issues including the sense of listening, offering moral support as well as a kind of relationship in which common understanding, the connection between mentors and mentees, and problem recognition can be easily found. Emotional support is mainly provided through collaborative interactions and reflective activities on pedagogical issues in mentoring activities.

Instructional Support

After the beginning stage in which novice teachers need to be provided with physical and emotional support, they begin to settle into their crucial role which is teaching. At this phase, high-quality instructional support becomes their vital need. Boogren (2012) viewed this stage as an appropriate time to ensure that beginning teachers are using effective instructional strategies in the classroom, facilitate their current skills of these strategies and guide them towards the improvement of expertise level. Boogren (2012) pointed out that mentees should be provided with timely instructional support to boost their professional skills and enhance their level of expertise with an eye toward future performance. This puts an expectation on mentor teachers to well master pedagogical knowledge and skills (Alhija & Fresko, 2014; Aspfors & Fransson, 2015).

Institutional Support

As new teachers complete their certain time dealing with psychological issues, gaining confidence in teaching, and improving their instructional strategies, they may consider their opportunities for growth and development on a greater scale. They begin to seek expansion in the connection and relationship with their coworkers, school, district, and educational systems (Boogren, 2012). At this phase, mentors should assist them with institutional support. This kind of support helps new teachers find their place in their teaching profession. According to Schaefer et al (2012), teachers in their early years rely upon the connection with others. They need to be offered support that goes beyond mentoring and induction which can encourage and improve these connections. Birkeland & Johnson (2002) concurred that having their roles in the faculty, positive relationship with colleagues and the presence of supportive structures bring a sense of success to beginning teachers during the first stage of their career. The social environment provides a strong underpinning for beginners to develop their personal identities and allow the empowerment of teachers' development (Uusimaki, 2013). To facilitate the relationship to work effectively, mentoring training should consist of contextual dimensions and an

understanding of the institution's culture and context (Aspfors & Fransson, 2015). In this way, mentors could understand and master a high level of sensitivity to contextual and cultural differences in the school (Aspfors, & Fransson, 2015).

Participants

A sample of 22 participants, who are EFL novice teachers, were selected to participate in a mentoring program at a language center for the purpose of gathering quantitative data. The sample population comprises of 15 individuals who identify as female, representing 68.2% of the total, and 7 individuals who identify as male, accounting for 31.8% of the total population. All individuals fall within the age range of 22 to 29 years. The majority of participants are recent graduates who possess a Bachelor's degree in English teacher education and English language studies.

With respect to teaching experience, the individuals involved possess limited teaching experience, spanning from under one year to three years of teaching. Two participants indicated a lack of prior teaching experience, while thirteen out of twenty-two participants reported having less than one year of experience as tutor. Additionally, seven novice teachers reported having one to three years of teaching experience as part-time instructors at private centers.
