The investigation employed a combination of quantitative and qualitative methodologies, thereby facilitating a comprehensive comprehension of the research concerns. A questionnaire was developed utilizing a Likert scale consisting of five points to gather numerical data. The survey comprises 35 items that were developed in accordance with Boogren's theories (2012) on supporting novice teachers. The interview data were interpreted based on the framework of the rating scale adapted from Oxford (1990). There are four ranges of levels that are shown in the table below.

Table 1. Rating scale adapted from Oxford (1990)

Levels	The extent of support	Satisfaction
4.5 to 5.0	Very high	Very satisfied
3.6 to 4.4	High	Satisfied
2.5 to 3.5	Medium	Medium
1.0 to 2.4	Low	Unsatisfied

Before distribution to the participants, the questionnaire underwent translation into the Vietnamese language, as not all respondents were proficient in English, particularly those who were not majoring in the language. Then the questionnaire was checked by using SPSS to calculate its Cronbach's coefficient alpha. The pilot questionnaire has a Cronbach's coefficient alpha value of 0.855. Following the piloting phase, the questionnaire

was formally utilized to collect quantitative data, as evidenced by a Cronbach's coefficient alpha exceeding 0.9, indicating the questionnaire's reliability.

Table 2. Cronbach's Coefficient Alpha

Reliability Statistics	
Cronbach's Alpha	N of Items
0.906	22

Qualitative data was gathered through the implementation of semi-structured interviews, which were subsequently transcribed to unveil the findings. Eleven open-ended questions were formulated in accordance with the questionnaire's content. In order to acquire qualitative data, semi-structured interviews were administered to a sample of 6 participants who were selected at random and had previously completed the questionnaires. The interviews were recorded in audio format, transcribed, and subsequently translated into the English language. The participants were duly apprised that their personal data would be utilized solely for research objectives and maintained in a confidential manner.

Results from the questionnaires

Table 3 provides statistics for each category of teacher support. The degree of four types of support was high. Physical and instructional support received the highest scores ($M=4.27$, $SD=.45$; $M=4.27$, $SD=.42$) while the lowest score can be seen in instructional support ($M=3.90$, $SD=.58$). The mean score for emotional support was above 4.0, specifically at 4.19 ($SD=.59$).

Table 3. Descriptive Statistics of Four Types of Novice Teacher Support

Types of support	N	Min	Max	Mean	SD
Physical support	22	3.33	4.83	4.27	.45
Emotional support	22	3.20	5.00	4.19	.59
Instructional support	22	3.38	5.00	4.27	.42
Institutional support	22	2.60	5.00	3.90	.58

The following table displays the degree of physical assistance provided to inexperienced teachers in the mentorship program.

Table 4. The Extent of Physical Support

No.	Physical support	Disagree %	Neutral %	Agree %
1	I was introduced to important locations including classrooms, libraries, teacher rooms, administrative offices, and so on.	4.5	0.0	95.5
2	I was provided with essential teaching materials for	0.0	9.0	91.0

	every lesson.			
3	I was offered to use technological devices such as TVs, CD players, projectors...	0.0	9.1	90.9
4	I was instructed to arrange a typical classroom.	0.0	22.7	77.3
5	I was told about a typical lesson including classroom size, time rules, classroom regulations...	4.5	18.2	77.3
6	I was assisted in printing teaching materials before the lessons.	4.5	4.5	91

Table 4 reveals that a majority of the mentees received significant support in the physical aspects of the mentoring program. Four out of six items (Item 1,2,3,6) hold a very high proportion of agreement levels (from 90.9% to 95.5%) which means that the extent of physical support in relation to institutional familiarization, teaching materials, technological devices, and printing service is very high. The percentage of participants' disagreement and neutrality of these items is minor (less than 9.1%). Regarding physical support in arranging typical classrooms and providing typical lesson information (Item 4,5), results indicated that the intensity of support is quite remarkable (77.3%).

The table below illustrates how novice teachers received emotional support through the mentoring program.

Table 5. The Extent of Emotional Support

No.	Emotional support	Disagree %	Neutral %	Agree %
7	My mentor listened to my difficulties actively and supportively.	4.5	4.5	91
8	My mentor and I usually contacted each other via email, message, or phone call.	0.0	18.2	81.8
9	My mentor usually asked how I felt after my lesson.	0.0	4.5	95.5
10	I often got encouraging messages from my mentor.	0.0	13.6	86.4
11	We celebrated success when I had improvement in teaching.	4.5	18.2	77.3

Table 5 displays data indicating that the degree of emotional support is statistically significant, with participant agreement percentages ranging from 77.3% to 95.5%. The table above highlights that item 6 "My mentor usually asked how I felt after my lesson" received the highest agreement rate of 95.5% among participants. Only 4.5% of participants remained neutral, and no one expressed disagreement with it. The active and supportive listening skills of mentors during the program (Item 7) were highly appreciated by 91% of the respondents. Two forms of emotional support, namely frequent contact (Item 8) and receipt of positive messages from mentors (Item 10), have garnered a significant level of agreement among participants, accounting for 81.8% and 86.4% respectively. 77.3% of the mentees agreed with Item 11 which states that "We celebrated success when I had improvement in teaching." whilst the percentage of neutrality and disagreement is 22.7%.

The extent of instructional support which novice teachers received in the mentoring program is presented in the following table.

Table 6. The Extent of Instructional Support

No.	Instructional support	Disagree %	Neutral %	Agree %
12	My mentor helped me set appropriate growth goals.	0.0	18.2	81.8
13	My mentor used a scale to measure my growth in teaching	4.5	22.7	72.8
14	I was given constructive feedback after every lesson.	0.0	0.0	100.0
15	My mentor helped me identify my strengths and weaknesses.	0.0	4.5	95.5
16	My mentor encouraged me to have a reflection on improving my teaching performance.	0.0	13.6	86.4
17	My mentor and I usually discussed effective teaching ideas.	0.0	9.1	90.9
18	My mentor helped me establish a common language of instruction.	0.0	4.5	95.5
19	My mentor instructed me on how to deal with unexpected situations in the classroom.	0.0	18.2	81.8

Data from Table 6 indicated that the majority of participants surveyed concurred with the high support in terms of instructional aspects. Specifically, the outstanding point from the above table is seen in Item 14 which investigated the extent of support regarding giving constructive feedback in the program. Interestingly, 100% of participants highly appreciated the feedback that their mentors provided after every lesson. A very high percentage of participants (95.5%) agreed that their strengths and weaknesses were identified by their mentors (Item 15). Similarly, the same proportion is seen in Item 18 which stated that “My mentor helped me establish a common language of instruction.” Additionally, a significant number of participants showed their agreement with their mentors’ crucial roles in setting appropriate growth goals, encouraging teaching reflection, and familiarizing with unexpected situations (Items 12,16,19), accounting for 81.8%, 86.4%, and 81.8% respectively. Controversial ideas were seen in Item 13 with 4.5% of respondents expressing disagreement and 22.7% expressing neutrality.

The following table reports how physical support was provided to novice teachers in the mentoring program.

Table 7. The Extent of Institutional Support

No.	Institutional support	Disagree %	Neutral %	Agree %
20	I was encouraged to have collaborative time with peer teachers.	4.5	31.8	63.7
21	I was given opportunities to establish relationships with other teachers.	4.5	13.6	81.9
22	I was encouraged to take part in extracurricular activities.	9.1	40.9	50.0

23	I was invited to workshops, conferences, and small talks to share teaching experiences.	13.6	9.1	77.3
24	I knew the people whom I should contact to have appropriate support.	0.0	9.1	90.9

Data from Table 7 reveals that a majority of the participants received some level of institutional support, although the degree of support was not particularly significant. Only Item 24 which stated that “I knew the people whom I should contact to have appropriate support.” has the highest percentage of participants’ agreement (90.9%) and 0% of participants’ disagreement. More than 80% of participants agreed that they were given opportunities to establish a relationship with other teachers (Item 21). Conversely, mentees reported that they did not receive significant institutional support in relation to having collaborative time with peer teachers, taking part in extracurricular activities, and being invited to workshops, conferences, and small talks to share teaching experiences (Item 20,22,23). The percentage of agreement regarding these items was not high, ranging from 50% to 77.3%.

Regarding the level of teachers’ satisfaction with the types of assistance that they received in the program, Table 8 indicates that EFL novice teachers expressed a high level of satisfaction with all four types of support. The participants expressed the highest level of satisfaction towards instructional support, with a mean score of 4.45, and standard deviations of .956. Similarly, participants reported high levels of satisfaction, with both categories having the same mean score of 4.32, and standard deviation of .646 and .716, respectively. Institutional support had the lowest level of satisfaction compared with the other three types, yet its mean score was still above the scale 3.0 (M=3.82, SD=.907).

Table 8 Descriptive Statistics of Teachers’ Satisfaction

Types of support	N	Min	Max	Mean	SD
Novice teachers’ satisfaction with physical support	22	3.00	5.00	4.32	.646
Teachers’ satisfaction with emotional support	22	3.00	5.00	4.32	.716
Novice teachers’ satisfaction with instructional support	22	3.00	5.00	4.45	.596
Novice teachers’ satisfaction with institutional support	22	2.00	5.00	3.82	.907

Results from the interviews

The qualitative data from the interviews provides additional information about the degree of support and teachers’ satisfaction levels with the support they received in the program.

Regarding physical support, the participants' responses were quite parallel to the surveyed results from the questionnaires. When the researcher investigated the degree of support regarding physical assistance, six out of six interviewees reported that they were well supported in terms of resources, materials, teaching tools, and logistic issues. One teacher expressed:

"During the program, I was well supported in terms of written materials which are available in the center as well as teaching software from other teachers. Also, the classrooms are well equipped with technological devices such as projectors, TVs, and CD players."

Another teacher added:

"My mentor introduced me to the textbooks and materials that I should use. Additionally, there is a library in the center where I can read and borrow the books, teaching tools, and technological devices that I need to use for my teaching.."

In terms of teachers' satisfaction with physical support, the results were very consistent with quantitative data from the questionnaire. 50% of questioned teachers were completely satisfied. 50% were satisfied and suggested improvements. One mentee said:

"I feel really content with physical assistance. I was supported very well in terms of logistical issues. I was carefully instructed to borrow teaching tools and supplementary books regarding the places, means, and the people who were responsible for this aspect."

Nevertheless, when being asked about the facility of the classrooms, two out of six teachers shared opinions about the size of the room. A teacher said:

"Because the number of students exceeds the capacity of the classrooms, students find it difficult to move around, making group work impossible."

Regarding emotional assistance, most of the mentees shared that they were greatly supported to overcome their emotional challenges. Four out of six participants reported receiving substantial emotional support from their mentors and coordinator.

"I struggled with plenty of psychological issues in the classrooms. The pressure mainly came from my failure in teaching performance, my fear of the mentor's expectations, and the quality of the lesson plans. My mentor and I have daily meetings to share lesson plans, teaching ideas, and how to link activities in the plan. I really appreciate this."

The majority of participants showed very high satisfaction with emotional assistance. Particularly, five out of six teachers reported that they felt completely satisfied and one teacher said that the support in terms of psychology was quite satisfactory. One teacher, who was strongly content with emotional assistance, noted:

"Everyone in the program is very considerate. I always felt that I am welcomed in the center as well as in this program."

According to a mentee, her mentor did not provide significant support for emotional challenges. Nevertheless, she was able to overcome these obstacles with the help of her coordinator's motivation. She responded:

"I expected to be supported more to overcome my psychological issues. However, my mentor did not provide me with much support in this aspect. My mentor and I usually contacted to mainly discuss teaching ideas, but he did not give me many encouraging messages."

In terms of instructional assistance, the results showed that 100% of participants agreed that they received a high

level of support. The primary source of aid was provided by the mentors. Additionally, most of the interviewees acknowledged that, in terms of instructional strategies, they struggled with plenty of challenges when they started to teach in real classrooms. One teacher remarked:

“There was a huge difference between teaching theories and reality when I started to teach which was very shocking.”

The majority of educators noted significant enhancements in their ability to create lesson plans, facilitate instructional activities, and execute teaching techniques. Their capacity to anticipate and resolve unforeseen situations in the classroom was also improved. A teacher notified:

“My mentor supported me gradually in how to apply theories to reality. I was instructed to move from a beginner with no teaching experience to a teacher that can design an effective lesson plan. My mentor gave me lots of feedback which was useful and practical.”

The participants feel highly satisfied with the instructional assistance. A mentee noted:

“I feel very content about the support in relation to teaching strategies, academic knowledge and teaching skills. I learn a lot from several theoretical lessons and the informal talk for sharing teaching knowledge held from the mentoring program. In addition, I also appreciated the help of my mentor. I improved significantly thanks to my mentor’s instruction and feedback.”

Regarding institutional assistance that was investigated in the interviews, 100% of the participants agreed that they were supported quite considerably in terms of establishing relationships and improving interaction and connection among mentees, their mentors, and the program coordinator. To be more precise, four out of six teachers appreciated the weekly meetings among mentees that were regularly organized by the program coordinator. They had opportunities to share knowledge about the teaching techniques that they learned and the psychological problems they faced with. Two mentees emphasized their high appreciation for the regular workshops which were held by experienced teachers in order to give them effective teaching ideas and strategies. A mentee noted:

“After each theoretical session taught by the center’s skilled teachers, other mentees and I would normally have a casual conversation with them to share our understanding of teaching techniques.”

A teacher appreciated the friendly and close-knit environment in the program. She said:

“All of us were always invited to conferences, workshops, professional development programs, and even special events such as the center’s founding ceremony and year-end party. We felt that we were treated as members of a family.”

Regarding teachers’ satisfaction with institutional support, the results from the interview show that they were quite satisfied with it. Four out of six participants reported that they were quite content about institutional support while the other two participants showed strong satisfaction with this type of support. A mentee, who expressed high satisfaction with institutional support, notified:

“I felt satisfied with this support. For example, on my first day participating in the program, there was a program coordinator who took me around the center and introduced me to every member of the departments. I had the feeling of being welcomed.”

Discussion

The current research examined the execution of a mentorship initiative for EFL inexperienced instructors at a language center. The study specifically examined the nature of support provided to novice teachers within the program, as well as their level of satisfaction with the support they were given. The findings of this study indicate that there exist both similarities and differences when compared to the previous related studies and the conceptual framework of beginning teacher support as proposed by Boogren (2012).

The study's results indicate that the mentoring program offered all four categories of support, namely physical, emotional, instructional, and institutional support. The level of support provided in relation to these aspects was extensive and greatly valued by the majority of novice teachers. This discovery aligns with the results reported in previous studies conducted by Lipton and Wellman (2001), Boogren (2012). The researchers placed particular emphasis on the provision of specialized assistance pertaining to pedagogical concerns. This perspective aligns with the current research results, which indicate that instructional support was the most frequently provided type of support. The present investigation corroborates the perspective put forth by Paula & Gr̄infelde (2018) that emphasizes the significance of instructional strategies, including classroom management and effective implementation of teaching activities within the classroom setting.

Additionally, the results of the current investigation indicate that emotional support was provided in a robust and explicit manner by mentors and the program coordinator, and was deemed to be of great importance for ongoing maintenance beyond the program's duration. This discovery aligns with the research conducted by Abu Bakar (2016), which revealed a significant correlation between mentoring programs and emotional and psychological support. Nora and Crisp (2007) further substantiated this perspective. The provision of emotional support was also valued by the individuals. The researchers conducted an investigation into the effects of mentoring programs on mentees' emotional well-being. They found that mentors who actively listened provided encouragement, and offered ongoing support after the program had a positive impact on the mentees' emotions.

In comparison to prior research on the implementation of mentoring programs, the present study diverges in its emphasis. A notable trend among previous studies is their concentration on instructional support, including but not limited to lesson planning, feedback provision, and mentorship responsibilities. The study did not prioritize other facets such as psychological assistance, physical assistance, and institutional support. There is a paucity of research that has examined all forms of support concurrently. Nevertheless, it is my firm conviction that novice educators require comprehensive support beyond matters pertaining to instruction. According to Boogren's (2012) findings, there is evidence to suggest that despite possessing effective instructional strategies and teaching abilities, a number of teachers tend to exit the profession. Insufficient support in other aspects can be a contributing factor to this issue. The present research is centered on examining four fundamental categories of assistance provided to novice educators, with the aim of determining which one requires augmentation or enhancement to fulfill the requirements and anticipations of mentors. This has the potential to mitigate attrition

and preserve the source of proficient educators.

Conclusion

The study was conducted to seek answers to two questions (1) To what extent have EFL novice teachers been supported during the mentoring program? and (2) To what extent are novice teachers satisfied with the support they received during the mentoring program?

The study was carried out with the involvement of 22 EFL novice teachers who have worked as new teachers of English in a foreign language center in the Mekong Delta and volunteered to participate in a mentoring program for new teachers. To address the research inquiries, this study utilized two data collection instruments, including questionnaires and interviews. Data analysis and interpretation were conducted with the aid of SPSS 20.0 software and interview protocols. The study's primary outcomes are succinctly outlined as follows.

Regarding the extent of support provided to novice teachers, the questionnaire data indicates that a majority of them received highly significant support in terms of physical, emotional, and instructional aspects whilst the extent of institutional support that they were provided was not as much as teachers' expectation. In terms of physical support, novice teachers agreed that they were quite fully supported with logistical issues including teaching materials, teaching tools, technological devices and detailed instructions for using them. A majority of teachers reported that they were significantly provided with emotional support. The mentees regularly engaged in close communication with their mentors, who demonstrated exceptional listening skills and provided constructive feedback to enhance their pedagogical practices. The data also revealed that instructional support was given to mentees to the highest extent. Mentees highly appreciated the support in terms of instructional areas such as giving constructive feedback, discussing teaching ideas, and lesson plans, practicing reflective teaching, dealing with unexpected situations in the classrooms, and the like. Regarding institutional support, The participants reached a consensus that the level of assistance provided was considered substantial. They appreciated institutional assistance in terms of expanding relationships with colleagues, having assistance from other teachers, and taking part in PD activities such as conferences, workshops, and short-term training programs.

Regarding novice teachers' satisfaction with the types of support they were offered in the program, the data from the questionnaire indicated that the majority of novice teachers were highly satisfied with four types of support during the mentoring program. More precisely, instructional support was deemed the most satisfactory, while institutional support was identified as the least satisfactory form of support. The data indicated that EFL novice teachers expressed high levels of satisfaction with four specific types of support provided to them through the mentoring program. The study participants put forth recommendations for enhancing the level of support in the program, with a view to improving overall satisfaction. The adequacy of classroom infrastructure, including the dimensions of the learning spaces and the availability of technological equipment, warrants careful

consideration. The majority of the participants expressed a greater degree of concentration toward the subject matter of the lesson plan.

Recommendations for the future mentoring activities

In light of the major findings from this present study, several implications can be suggested as follows with the purpose of improving the quality of mentoring activities and meeting the participants' expectations towards mentoring programs for novice teachers.

The research findings suggest that mentoring program coordinators should prioritize providing institutional support to a greater degree. The significance of instructional and emotional support in facilitating the entry of novice teachers into the teaching profession is widely acknowledged. Nevertheless, institutional support assumes a pivotal role in enabling them to contemplate their prospects for advancement and progress on a larger scale, thereby contributing to the reduction of teacher attrition rates. Mentees can find their place in a new environment and develop personal identity. Program designers may facilitate weekly meetings to encourage sharing and learning among mentees. This can provide opportunities for mentees to expand their professional network and gain insights from their peers, which can enhance their emotional and instructional support. It is strongly advised that novice educators be afforded occasions to engage in collaborative endeavors with peers who instruct comparable grade levels and share analogous pedagogical interests. Collaborative activities such as joint work sessions, lesson plan development, pedagogical discourse, and the exchange of scholarly findings can be undertaken by educators.

The research findings indicate that there is a strong expectation for instructional support to be provided to the greatest degree possible. It is recommended that future mentoring activities prioritize instructional issues, such as the utilization of effective instructional strategies in the classroom. The mentoring process should aim to facilitate the mentee's current skills in these strategies and guide them toward achieving a higher level of expertise. During this phase, mentors play a crucial role in directly enhancing the practice of their mentees. The process of mentor selection should be conducted with great care to ensure alignment with the specific needs of the mentees. An effective mentor has the ability to provide both efficacious instructional guidance and emotional encouragement.

During the mentoring process, it is imperative for a program coordinator to possess a comprehensive understanding of the pivotal role that co-teaching and feedback provision play in augmenting the performance of mentees. It is recommended that the duration of the program be extended in order to facilitate the effective participation of mentees in co-teaching activities. The phase of theoretical revision ought to be suitably structured to ensure that protégés are afforded sufficient time to implement their acquired knowledge in practical settings, enabling them to navigate unforeseen circumstances and adapt their pedagogical approach accordingly. Additionally, mentors take vital roles during the co-teaching stage as they directly instruct and contribute to forming teaching styles for their mentees. Therefore, it is advisable that program leaders should be cautious

when pairing mentors and mentees. They are recommended to have similar teaching interests and fields.

An Analysis of Vietnamese Learners' Errors in English Speaking

Chi Hong Nguyen

FPT University, Vietnam,  <https://orcid.org/0000-0001-8380-2727>

Vu Khanh Duong

FPT University, Vietnam

Abstract: This paper reports on an error analysis that examined the errors produced by Vietnamese EFL learners in speaking. The research design was decided to support a clear framework for collecting, analyzing, discussing, and interpreting data to examine possible influences of the mother tongue on English grammatical errors. 30 natural conversations and 20 follow-up interviews were employed as data collection instruments. The questions for the conversations covered topics related to the participants' interests and backgrounds to create a comfort zone for them. The follow-up interviews allowed the authors to unpack the error sources. The findings reveal that learners' errors belong to three main types: lexical, syntactical, and phonological aspects. These errors are caused by at least six sources: learners' lack of English knowledge, insufficient practice and lack of exposure to English-speaking environments, the direct translation of L1 grammar rules, imitation based on supposed linguistic similarities, learning-for-exam pressure, and less advantaged geographical residency and English learning conditions. On the one hand, these errors and their sources can explain learners' incompetencies. On the other hand, this paper argues that some of these sources are utilized as speaking strategies that learners initiate to sustain communication. Errors, in this sense, are embedded with the active agency rather than being viewed as mere linguistic gaps created by learners' incompetencies. As such, L1 interference is sometimes positive and contributes to learners' L2 learning processes.

Introduction

An overview of research on EFL learners' errors

Accomplishing fluency in speaking English requires English as a foreign language (EFL) learners to have communicative competence which includes the knowledge of the language and the capacity to utilize the knowledge of actual communication. To become influential in discourse competence, a learner needs to participate in a variety of speaking activities such as role-plays, debates, information gaps, acting from a script, discussions, problem-solving activities, decision-making activities, quizzes, gapped dialogues, questionnaires,

and story-telling. Some learners sometimes make mistakes and at other times, errors. While mistakes are mostly caused by learners' carelessness or forgetfulness of grammar knowledge, it is difficult to avoid errors even when they speak English with others under the influences of their first language (L1). Exploring the types of errors and their causes under the influences of L1 always deserves space for empirical research in different contexts.

Research on the influences or interference of L1 on the target language (L2) errors can be classified into several streams. For example, a popular strand that focuses on grammatical errors in English writing under the influences or interference of L1 (Kazazoğlu, 2020; Maros et al., 2007; Qasem, 2020; Watcharapunyawong & Usaha, 2013). These studies have collectively pointed out the interference of L1 on several types of errors in English writing that include tenses, word choice, articles, prepositions, modals and auxiliaries, forms of verbs, plural and singular nouns, sentence structures, sentence fragments, pronouns, transitional devices, subject-verb agreement, run-on sentences, parallel structures, and comparatives. Some errors in writing may also include the utilization of grammatical rules and vocabulary choices (Brown, 2000; Corder, 1967; Ellis, 1997). These researchers have collectively categorized errors into 10 types: omission of a subject (verb, object), complement, incorrect verb construction (serial verb construction), the plural form of nouns, compound/ complex sentence structure, word order, "there" structure, fragment, run-on sentence, and word-by-word translation.

The second strand of research focuses on errors in speaking (Bui, 2016; Subanduwo, 2017). The findings of the second stream point out that mistakes in pronouncing English consonants are made under the interference of L1 consonants that do not have equivalent ways of pronouncing. The third strand explores the interference of L1 on some particular forms of errors in English such as word order (Al-Khresheh, 2010), usage of prepositions (Gvarishvili, 2013), word choice in writing (Erkaya, 2012), learners' acquisition of English syntax and lexis (Islam, 2020), or comparing English grammatical errors across countries (Eng et al., 2020).

Research on errors produced under the effects of L1 and their causes in the Vietnamese context is also burgeoning and is divided into some streams of writing, pronunciation, and word usage. For example, Vu (2017) finds that Vietnamese EFL learners tend to transfer L2 into L1, causing errors of either overproduction or underproduction in word choice, articles, prepositions, pronouns, and possessive cases. Similarly, Linh and Vien (2020) explore the causes of Vietnamese high school EFL students' errors in word choice, plural nouns, tenses, prepositions, articles, subject and verb agreement, word order, and relative clauses. These researchers find that these errors are caused by the students' language transfer, lack of grammatical knowledge, carelessness, and lack of frequent practice. Bui (2016) examines the difficulties among Vietnamese EFL learners in pronouncing the consonants /θ/ và /ð/ as these two sounds do not exist in Vietnamese. They pronounce them as either /t/ or /t^h/ instead. Bui (2022) investigates Vietnamese EFL learners' misuse of cohesive devices in writing and discovers that these learners often use references, conjunctions, and lexical items incorrectly. Nhut (2020) analyzes the errors in tenses, subject and verb agreement, plurality, and word order produced by Vietnamese EFL learners by comparing the grammar of Vietnamese and English languages. His study argues that these errors are caused by the interference of students' knowledge of Vietnamese grammar in their use of English grammar in writing.

The findings of these studies are important in forming an understanding of different types of errors made by EFL learners in different contexts. However, the research corpus on English speaking errors produced by Vietnamese learners is not very colorful. Many current studies have concentrated on particular aspects of errors and analyzed the causes in isolation. Instead, the authors of this paper took quite a different stance by analyzing the systemic effects of the causes of errors.

The study and its significance

The study reported in this paper is situated in the growing corpus of research on EFL learners' errors. This study raises two main research questions:

- (1) What errors are commonly produced by Vietnamese EFL learners?
- (2) What causes the errors?

The answers to these two questions allowed the researchers to draft some recommendations for teaching and further research. On the one hand, this paper is congruent with the diverse strands of current research. It continually explores grammatical errors among Vietnamese EFL students to validate the findings produced in the body of previous research. The findings of this study also add more nuance to the body of research on Vietnamese EFL learners' errors in English speaking given that English has recently been considered one of the instrumental languages for Vietnam's deeper integration into the world's market (Nguyen, 2021), but this country was ranked in the last position in the league of 60 countries with moderate proficiency (English Proficiency Index, 2022). It does so by analyzing the errors in spoken English among Vietnamese EFL university students and the reasons caused by L1 interference in English speaking. On the other hand, the authors argue that learners' errors should be identified, categorized, and analyzed for examining the causes of errors and to discover the measures to decrease errors. L1 interference L1 is one of the main causes of impacts on L2 speakers to output errors. The investigation of the influences of L1 interference may support pedagogical implications on second language learning and teaching in EFL/ESL context (Corder, 1967). It is important to examine errors in L2 speaking with a concentration on the interplay of errors and L1 interference.

This paper begins with the literature section that reviews the common perceptions of mistakes and errors before discussing the interference of L1 on L2 errors. The literature review then conceptualizes ways to explore errors by using the theoretical lens of error analysis which is used to analyze the empirical material collected in this study. The findings are discussed before the conclusion and recommendations for teaching practices and further research is outlined at the end of the paper.

Literature Review

Mistakes and errors

Many people get confused about the identity of mistakes and errors when speaking English. Ellis (1997) points out that an error is an outcome of lacking knowledge (technical sense). It reflects the gap in learners' knowledge

in which they are not able to notice the correct grammar or not when speaking. A mistake reflects the process of failures as a consequence of competing plans, memory limitation, and lack of automaticity. Importantly, Nababan (1993) emphasizes that a learner may make grammar mistakes when speaking with others due to tiredness or lack of concentration. Learners may make the same errors in communicating, and those errors are not repaired soon because the basic factor of the errors is not finished systematically by the target language learners. They need a teacher to correct them. In a nutshell, a mistake shows learners' misuse of the language while an error reflects their lack of knowledge of particular linguistic aspects in operation.

The boundary between these two concepts seems to be agile. For instance, a learner may have learned about the usage of relative clauses in speaking, but this person has not had a chance to practice it in real situations for a long time. He or she may forget all about this grammar point and cause a mistake in communication. Is this mistake also an error as this person needs a fluent speaker or teacher to explain that grammar point again? Another example is a student may make a mistake in using the transitional device "therefore" in speaking, but he or she may refute that he or she does not know how to use it. He or she may say that it is caused by his or her forgetfulness of the meaning of the word. Is this mistake also claimed to be an error?

The purpose of this study is not to distinguish mistakes from errors. As the boundary between the two is thin, the authors conceptualize misuses of certain linguistic aspects which are caused by either learners' lack of knowledge, carelessness, forgetfulness, or even tiredness as the causes of errors. The ultimate objective of this study, which we would like to repeat here, is to identify, categorize, and analyze the common types of grammatical errors produced by Vietnamese EFL learners and look for possible causes of these errors.

L1 interference in L2 errors

According to Subandowo (2017), L1 interference can be caused by language transfer which indicates the extent learners use their syntactical, semantic, and phonetic knowledge of their L1 to produce L2. This type of cross-linguistic interference emerges during the learning processes of L2 under the influences of the learners' socio-linguistic backgrounds and levels of L2 proficiency. A review of related literature (Al-Khresheh, 2010; Bui, 2016; Islam, 2020; Subandowo, 2017) allows the researchers to conceptualize L1 interference in L2 production in several ways that are mostly caused by learners' lack of grammatical knowledge. First, L1 interference can emerge from learners' incorrect L1 transfer into L2 due to their misconceptions of linguistic similarities in terms of grammar. Another cause of errors can result from learners' direct but inappropriate translation from L1 to L2 (which can be seen as a sub-form of linguistic transfer). Some sounds that do not exist in L1 can be somehow imitated in L2 production and lead to pronunciation errors. The same scenario may happen to learners' misuse of some words and phrases that cannot be used equivalently in English. Further, through our teaching experiences, we also suspect overreliance on technological devices and applications such as Google Translate, online dictionaries, or some English learning online platforms. What else can cause errors were also investigated in this study.

In addition, aging is reported to have a comparable impact on L1 and L2 individuals' verbal proficiency, lexicon judgment, and explanations (Clahsen & Reifegerste, 2017; Reifegerste, Elin, & Clahsen, 2019). While there are currently a few studies on L2 morphological analysis in aging, there is still a lack of studies on L2 sentence-level analysis in aging, despite previous research with L1 speakers indicating that the progressions of standard structural and syntactic evaluating may vary (Kemper, 1988; Kemtes & Kemper, 1997; Light & Capps, 1986; Obler et al., 1991; Yoon et al., 2015). Reifegerste et al. (2020) state that when compared to younger speakers, older individuals are more prone to allure errors, especially if they have limited working memory abilities. In our study, because all the participants were almost the same age, we take into account their duration of learning English. Some had been studying since their 3rd grade while others began studying this foreign language until they were in the 6th grade. We suppose that time can be a factor that interferes with learners' linguistic transfer from L1 to L2 in the sense that the longer and younger they start to learn English, the less likely they conduct ineffective linguistic transfer, and vice versa.

To understand how L1 impacts the production of errors in L2, we need to examine the instruction of language concepts that specify how L1 influences the acquisition of L2 and the cause of students' errors. The errors that emerge as a result of the interference are caused by the two linguistic backgrounds (Islam, 2020; Nunan, 2001). The greater the degree to which the equivalent of the two languages, the fewer errors learners produce, indicating a beneficial transfer. Conversely, when the level of resemblance is low, the result is negative transference, L2 learners apply the rules that they're familiar with in their primary language, with a significant probability of errors. (Ellis, 1997; Kazazoğlu, 2020). In this sense, there are significant differences between Vietnamese and English. Vietnamese belongs to the Mon-Khmer stock without any genetic traits related to Chinese although Vietnam was dominated by China for 1,000 years (Nguyen, 2017) while English belongs to the Germanic language group (Comrie, 2021).

Sorace and Filiaci (2006) present an interface hypothesis that asserts that language features involving a relationship between syntax and pragmatics sectors are particularly susceptible to insufficient acquisition in L2 end-states. Numerous studies have shown that advanced and near-native L2 speakers with various L1 origins can fail to operate target-like in areas demanding pragmatic theory interface. (Antonova-Unlu & Wei, 2020; Jensen et al., 2020). According to Gvarishvili (2013), the convincing proof and undeniable indications of L1 syntactic and lexical contribute to the development and application of English syntax and lexis reinforce the hypothesis that interlanguage errors or deviation L2 language characteristics through backgrounds are decisively L1 focused, regardless of linguistic variables within English itself. Additionally, as stated by Ellis (2008), novel insights could interfere with previous past experiences, restricting fresh understanding.

Error analysis framework

As mentioned before, many scholars have attempted to identify the popular errors made by learners of writing and speaking English as a second language or the foreign language. Having better comprehension of errors will assist teachers to recognize the difficulties in learning the language of students. Ellis (2008) defines errors as

problematic due to the difficulty in grammaticality or acceptability. Specifically, correct grammar in an utterance, but it seems unacceptable in pragmatic meaning. Additionally, relating to the learner's errors, there are two major approaches to the study of learner's errors which are a contrastive analysis and error analysis (Harmer, 2001).

The contrastive analysis describes as a linguistic which is related to the correlation of two or more languages to ascertain both differences and similarities between them (Sullivan, 1984). This framework compares and contrasts the linguistic structures of the source and target languages to predict and identify types of errors that can be used to classify the levels of learners. The effort of contrastive analysis in the language instructing is the portrayal of the grammatical errors which occupied the differences between L1 and L2 grammar. In relevance to the sources of errors, Sadeghi (2009) argues that learners' errors can be caused by the interference of L1. This also means that there are both negative and positive sides of linguistic transfer between L1 and L2. The negative transfer happens in the difference between L1 and L2 grammar, while the positive transfer synchronizes if they are analogous. Another aspect of errors is that they are the consequence of the effect of L1 on the learning process. Learners intend to affect by the habit of their native language (Corder, 1967).

On the other hand, error analysis infers that learners' errors seem not to be impacted by the native language due to the irrelevance between errors and the native language structures (Khansir, 2012). This framework, which can be dated back to 1967, emphasizes the importance of analyzing grammatical errors. Accordingly, there are two main sources of errors: interlingual transfer and intralingual transfer (Gass et al., 2013). The consequence of the language transfer of analogous rules from learners' native language to the target language is called interlingual transfer. In contrast, the mutual involvement of objects in the target language is called intralingual transfer (Schmitt, 2000), or it could be named overgeneralization, which means that learners generally acquire grammar rules, but they are not able to realize some exceptional rules in grammar, causing errors. To analyze grammatical errors, this paper follows the 6 steps described by Gass et al. (2013) in realizing, identifying, and categorizing grammatical errors. These steps include collecting corpora, identifying errors, classifying, quantifying, analyzing error sources, and remediating. The step of remediating is not included in this report as it is not the focus of the study. However, we are aware that error analysis is not successful to support a complete picture of a learner's language. First, it is important for teachers to realize the vital role of examining the entirety of the learner's L2 production. Second, error analysis can be described "as a partial and preliminary source of information at an initial stage of investigation" (Ellis, 2008, p. 61). It can serve as one of the indicators for us to identify, classify, and potentially remediate learners' errors. Improving one's L2 takes time.

Research methods

Participants and research context

30 students at a private university were invited to voluntarily participate in this study. All of them were 18 years old and were studying English in their first year. Half of them were females. 15 of them were taking a pre-

intermediate course, and the other 15 were studying in an intermediate course. At this university, all students must take from 1 to 6 English preparation courses, depending on their achievements on the placement test. The pre-intermediate course is at level 4, and the intermediate is at level 5. All the levels cover common topics in general and academic English courses that are taught in the integration of the four skills and grammar. The authors wrote a research participant recruitment notice that called for the voluntary participation of students in these two courses. Then a random sampling technique was employed to select 30 students out of the list of 55. We limited the number to 30 so that we could handle the analyses of the conversations and interviews within 4 weeks before we were fully engaged in our personal teaching and administrative workloads.

As learners' duration and educational background may influence their English-speaking competence, the authors classified them into several groups that are presented in the following table.

Table 1. Participants' biodata

Number of participants	Gender	Duration of English learning (years)	Current courses
5	Female	8	Pre-intermediate
3	Male	8	Pre-intermediate
3	Female	11	Pre-intermediate
4	Male	11	Pre-intermediate
5	Female	8	Intermediate
3	Male	8	Intermediate
2	Female	11	Intermediate
5	Male	11	Intermediate
Total: 30			

Research instruments and procedures

The authors used 4-6 conversational questions to converse in English with 30 Vietnamese students studying English general courses at a private university in Vietnam. Each conversation lasted for approximately 5-7 minutes. The purpose of using these questions was to allow for natural conversations to happen. Each conversation was recorded and given a code for the authors' own identification of each participant during data analysis. 20 semi-structured interviews of around 15 minutes each with 20 participants were conducted after they had partaken in the conversations with the authors and agreed to join the interviews. The interviewers (who were also the authors) mostly asked the participants why they had used pieces of language (that contained both grammatical errors and correct uses of the language to distract their attention from errors and mistakes). The purpose of the interviews was to enable the authors to explore the error sources and examined to what extent the participants' L1 influenced L2. The language used in the interviews was Vietnamese. The extracted quotes were then translated into English to use in this paper.

The research design was decided to support a clear framework for collecting, analyzing, discussing, and interpreting data to solve the research purposes (Creswell & Clark, 2011). The descriptive method was selected as a data collection instrument due to the relation to participants' interests and backgrounds, so it creates a comfort zone for the participants to talk about events in the past. The questions that were related to their social

lives and interests could encourage them to talk comfortably and easily.

Data analysis

The data set consisted of 30 conversations and 20 interviews. Each of the authors listened to the conversations several times to note down the errors. Then the conversations were cross-checked by the author for the same purpose of identifying the errors. The errors were categorized into the syntactical, lexical, and pronunciation aspects. In each aspect, the sub-types of errors were identified. The authors paid attention to the types of errors that previous research has mentioned (see the overview and literature review sections of this paper) to guide our identification of the errors, but we also let ourselves open to new types of errors that might emerge from the conversations. In other words, the review of the errors referred to in previous research acted as a guiding torch for the authors to follow only.

The interviews were analyzed in the same procedures as the conversations. Themes were generated in accordance with the linguistic aspects and sub-types of errors to identify the error sources and analyze the causes of the errors. The themes of these sources and causes were put into each of the linguistic aspects for the authors to understand how the errors were produced. All are presented in Table 2 in the following section.

Results

The researchers identified the errors by listening to the recorded audio files several times and cross-checking with each other. The errors were counted in the number of times produced by the participants and placed in Table 2. The errors identified in this study were classified into 3 main categories: lexical, syntactical, and pronunciation aspects. By analyzing the themes that emerged from the interviews, the researchers put the themes in another column.

Table 2. Types, frequencies, and sources of grammatical errors

Linguistic aspects	Types of errors	Frequencies (counted from the conversations)	Explanations for the error sources (coded from the interviews)
Lexical	Word choice	16	Word-by-word direct translation from Vietnamese, inequivalent expressions between the two languages, lack of English vocabulary
	Sensemaking of the utterance	12	
	Tenses	21 (mostly related to the simple present, perfect, and simple past tenses)	Inequivalent tenses between the two languages, lack of English grammar knowledge, direct translation from Vietnamese

Syntactical	Word and phrase formations	12	Word-by-word direct translation, lack of knowledge about English vocabulary
	Articles	11	Lack of knowledge, inequivalent forms of articles between the two languages
	Prepositions	10	Lack of knowledge, inequivalent forms of prepositions between the two languages
	Possessive cases	8 (uses of the “of” plus nouns)	Lack of knowledge, direct translation from Vietnamese
	Word order	7	Direct translation from Vietnamese
	Relative clauses	8	Lack of knowledge about relative clauses, direct translation from Vietnamese
	Modals and auxiliaries	9	Inequivalent forms of modals and auxiliaries between the two languages, lack of knowledge, direct translation from Vietnamese
	Gerunds and infinitives	7	Lack of knowledge, inequivalent verb forms between the two languages
	Plural and singular nouns	12 (missing an “s” for plural nouns)	Inequivalent forms of plurality and singularity between the two languages
	Subject and verb agreement	18	Vietnamese does not have subject-verb agreement forms
	Question forms	3 (the participants seldom made questions during the conversations)	Vietnamese does not have the special verb or auxiliary inversion in questions
	Sentence fragments in speaking	2	Lack of knowledge, direct translation from Vietnamese
	Pronouns	9	Vietnamese does not have objects as pronouns, but it has a wider range of pronouns than those in English
	Transitional devices and conjunctions in speaking	4	Direct translation from Vietnamese
Comparatives and superlatives	3	Inequivalent forms of comparatives and superlatives between the two languages, lack of knowledge, direct translation	
Pronunciation of	22 (/æ/, /ʌ/, /i:/,	Vietnamese does not have these sounds,	

Phonetic and phonological	and specific consonants and vowels	/u:/, /ɔ:/, /ɑ:/, “-ed” ending sounds, “s” ending sounds in plurality, /z/, /ŋ/, /p/, /tʃ/, /dʒ/, /θ/, and /ð/	12	lack of knowledge, imitation of the pronunciation of Vietnamese
	Syllable and sentence stress			Lack of knowledge, imitation of the pronunciation of Vietnamese
	Accents and intonations			

The themes presented in Table 2 were withdrawn from the follow-up interviews in which the researchers asked the participants about their usage of some linguistic aspects. All were conducted in Vietnamese to encourage the participants to freely and comfortably express their comments and ideas. The authors found that gender had almost no impact on the participants’ production of errors.

In terms of the lexical aspects, 10 participants expressed that as they wanted to sustain and develop the conversations, they quickly chose the words directly translated from Vietnamese. For example, a student said:

Ah, that one was... I wanted to tell you that “I like to eat salad roll – gỏi cuốn” [spring rolls]. You know, salad is gỏi, and roll is “cuốn”. Is my English bad?

This student knew separate words in English, and she thought combining these words would make sense as Vietnamese is a monosyllabic language. A combination of two or three words would be lexically equal to one word in English. Another student showed a similar translation:

Why is English so difficult? Do you think I was wrong when I said “My brother is a cooker person at a restaurant downtown? [“người nấu ăn”: chef]

Some acknowledged that they did not know some words to continue the conversations, and they had to either stop or switch to another topic to maintain them. For example, some students said:

I didn’t know how to say “ruộng lúa” [paddy fields, rice fields] in English so that I could talk about the beauty of my village or “vỡ mộng” [feel disillusioned, disappointed] in English. I will try to learn more words!

How do you say “xôi” [sticky rice] in English? I wanted to talk about it for my everyday breakfast.

Other students used English words in the conversations incorrectly because they did not know the words in English. They tended to make up the phrases by combining specific words they knew in English to say. Some examples include “*go do the teeth*” [“đi làm răng”: go to the dentist, fix the teeth], “*fake people lie*” [“người giả dối”: dishonest people], “*sing songs throat*” [“hát vọng cổ”: sing traditional Vietnamese operas], or “*work doctor*” [“làm bác sĩ”: work as a doctor, is a doctor]. Some even stated that they felt that they were making “something wrong in speaking”, but they seldom received high school teachers’ correction. It is also worth noting here that the students who experienced a shorter period of learning English (8 years) than the other group

(11 years) produced more errors, and many of them came from villages.

Such examples show that these lexical errors are found to be related to their errors in using English grammar and pronunciation. Regarding the causes of the syntactical errors, many students tended to use direct translation from Vietnamese grammar to English because they lacked L2 grammar competency but wanted to develop communication. Some encountered difficulties resulting from the grammar discrepancies between the two languages. Some students did not know the past forms of some irregular verbs and/or did not conjugate them in the simple past tense appropriately. Some students complained:

OK, it was wrong, huh [subject-verb agreement]? Vietnamese is much simpler. Tôi đi học [I go to school], and chị ấy đi học [she goes to school]. We (Vietnamese people) simply say “đi” plus a subject. In English, you (English-speaking people/learners) must use “s” for verbs that go with “she” or “he”! How can I know all?

English is so difficult and complex. When do I have to use –ed? When do I have to use “went” for “go”? Vietnamese is simpler. We just put the “đã” in front of the verb, and that’s it!

In Vietnamese, there is no subject-verb agreement or changes of pronouns as subjects into objects as in English. When some students with a shorter period of learning English used these grammatical points, they tended to imitate the ways they spoke Vietnamese to convey their ideas in English. Some used direct translation, e.g.:

“How I can talk about my passion for food?” It’s wrong, teacher? In Vietnamese, we (Vietnamese speakers) say “Làm sao em có thể nói về niềm đam mê đồ ăn chứ?”. There you see, “làm sao” is “how”, em is “I”, “có thể” is “can” and so on. Why do we (English-speaking people) have to invert the “can” in front of the “I”? I never understand it, but I must learn it because it is English, which is not the same as Vietnamese!

Vietnamese has “hơn” (comparative word) for all comparatives and “nhất” for superlatives. That’s all for it. English is more complex. I don’t remember what adjectives go with what form. I just put “than” in them because it means “hơn”, right?

“Cái mà” is which and “người mà” is “who”. Ah, now I know why I got them wrong. These words sound very clumsy in Vietnamese, showing that you don’t know what to say or you are clumsy in choosing the right words to speak. Why don’t we just cut the sentence into two instead?

English modal verbs are extremely hard, and I never know how to use all of them correctly. What is the difference between “can” and “may”, teacher? They all mean “có thể” in Vietnamese, right?

These extracts show that the students did not possess proper knowledge of English grammar, and they were more likely to use direct translation to cope with the development and sustainment of the conversations. Some appeared to be able to identify the instances of their wrong usage, and these seemed to be mistakes rather than errors. However, when putting them into real communication, these mistakes were used as errors that contained the students’ unawareness of the usages. This also means that they had little authentic practice or exposure to English uses on a frequent basis. Some further stated that these errors were caused by their concentration on the grammar and reading skills for the national high school graduation exams they had taken before they entered university.

Most of the students did not have problems with the English diphthongs and some vowels. The vowels they mispronounced included the low /æ/ (as /a/), mid /ʌ/ (as /ou/ or /ə/), and long ones /i:/, /u:/, /ɔ:/, /ɑ:/. The long vowel sounds were changed into the short vowel sounds accordingly. In terms of consonants, many students mispronounced some particular sounds in English that do not exist in Vietnamese as indicated in Table 2. They had problems with the postalveolar affricates and fricatives, dental fricatives, bilabial stops, and velar stops. These phonetic errors were constant within individual speakers rather than happening as rare occurrences. The common strategies they adopted to deal with these “very difficulties” (in one participant’s words) were to either omit them, replace them with another sound, or add an extra schwa /ə/. For example, the word “teeth” was pronounced as /tit^hə/, “she watches TV all the time” as /si wat tivi on də t^ham/, “students” as /tju dənt/, “sing” as /sin/, or “school” as /kun/. Most mispronounced and/or did not pronounce the ending sound /s/, /z/, and /iz/ in the plurality of nouns and subject-verb agreement in the simple present tense. A similar error was found with the ed-endings as /t/, /d/, and /id/. They either omitted or replaced them with /id/ inappropriately. For example, “walked” was mispronounced as /wə kid/, “concentrated” as /kon son trei/, or “finished” as /fi niʃ/. Some participants said:

I don’t know when to pronounce /id/, /d/, or /t/. Why /t/ with –ed verbs? Never know!

Some sounds are weird! They are pronounced like you put your tongue out of your mouth. How can you hold your breath? I put it in and make it more like the sounds we have in our Vietnamese language.

Long sounds? No, we don’t have them in Vietnamese, do we? In English, they sound funny!

The interviews allowed the researchers to realize that the students who had studied English extra classes at foreign language centers were less likely to make pronunciation errors than those who had not. The longer the students had studied extra classes outside their high school ones were more likely to pronounce better and have more correct word and sentence stresses and accents. The other students tended to put the wrong stresses on words with more than 2 syllables. Some used the tones “đầu sắc” (rising tone) and “đầu huyền” (falling tone) that are available in Vietnamese to make word stresses in English. For example, “university” was pronounced as /diu ni vɜ: si ti/ or “architect” as /á ki tèk/. Others did not use any word stress, making many sounds flat, e.g. “international” as /in tɜ: na sən nou/ to “be safe” (in one of the participants’ words). Some expressed their choice of putting stresses as follows:

We must learn by heart (word stresses) because every word has a different way of stressing. Sometimes, it is at the beginning but at other times, it’s on the second syllable. Giving a word empty stress guarantees that I am correct!

English words are stressed like the way we speak Vietnamese. Vietnamese has several tones, and I think they are workable for English words.

My teachers at high school never taught me to speak out loud. What we did was doing pronunciation exercises on paper!

Insufficient practice and knowledge of word stresses, accents, and intonation made some participants unable to have proper pronunciation. The linguistic transfer was employed as one of the strategies for them to use in speaking with others. The authors also noticed that the less duration the students were exposed to frequent practice, the less likely they were to speak with a correct accent. The students with 8 years studying English at

high school without going to extra classes spoke with a heavy foreign accent while those studying the same duration but having taken or taking extra classes tended to speak more fluently and with more acceptable accents. The same applied to those studying English for 11 years. This fact somehow shows that extra classes outside high school and university classes focus more on communicative abilities. Investment in those classes, in some ways, yielded the students some positive impacts as their exposure to English practice was more intense. Those in high school and college might be too academic or focused on tests. However, the purpose of this study was not to explore these factors and influences, so the authors decided to skip them.

Discussion

According to the results of this study, the discussion could be shown into two separate parts: a discussion of common grammatical errors and the effects of L1 interference in L2-speaking English. As Brown (2000) claims, L1 interference is a significant source of errors among L2 learners. Similarly, the results of this study accord with Brown's opinion. By using the error analysis approaches, the researchers were able to find answers to the two research questions that focused on what types of errors and their causes are among Vietnamese EFL university students. Table 2 summarizes the popular types of errors and their causes that readers may like to refer back to. The results are now discussed in relation to the previous research corpus in the same field and topic. The points discussed in this section contribute new understandings to the current knowledge of errors in L2 speaking and L2 errors in general.

First, the errors identified in this study are similar to those found in the previous research in other and in Vietnamese contexts. They can be generally classified into three main categories: lexical, syntactical, and phonetic and phonological aspects. Like what some previous studies that have focused on writing and others on speaking have found, this study shows some similar errors in grammar, pronunciation, and vocabulary under the effects of L1 (Al-Khresheh, 2010; Bui, 2016; Bui, 2022; Brown, 2000; Corder, 1967; Ellis, 1997; Eng et al., 2020; Erkaya, 2012; Gvarishvili, 2013; Kazazoglu, 2020; Maros et al., 2007; Nhut, 2020; Qasem, 2020; Subanduwo, 2017; Watcharapunyawong & Usaha, 2013; Vu, 2017). What makes this study a bit different from the findings of past research is that the errors in these three linguistic aspects are interrelated. For example, the errors in the past tense are related to the errors in the pronunciation of the regular verbs with the -ed endings. Learners' mispronunciations of the plural "s" for nouns and the "s" in verb conjugation in the present tense are influenced by their lack of English grammar knowledge. The errors in sentence sense-making are related to several aspects of the learners' syntactical errors. Errors in speaking never stand alone as separate entities that exist in learners' lack of knowledge or incompetence. Rather, they exist within a system of learners' incompetencies.

The second point of discussion that can be seen as novel compared to the previous research is the authors' analysis of the source errors. While the previous studies have often discussed separate sources of errors, this study argues that these sources, like the interrelated system of errors, are interrelated. There are two sub-points

of discussion here. First, the sources of errors in speaking contain learners' lack of knowledge, insufficient practice of and exposure to the English-speaking environment, and attempts to sustain communication by using direct translation from L1 to L2 and imitating the supposed linguistic similarities between L1 and L2. Second, this finding points out that learners, albeit making errors consciously or subconsciously, are active agents in sustaining their communication. In this sense, errors are not the passive representation of learners' lack of knowledge, but they show their subjectivity and agency in managing their own speaking strategies in dealing with their grammatical gaps. This finding has a significant implication for teaching practices in which teachers can view learners' errors as one of the initiatives to improve learners' knowledge, rather than seeing them as points of disappointment or hopelessness. Learning, as such, is a growth process instead of a finish line for each lesson.

Third, this study explored various sources of errors that are similar to and different from previous research. For example, Khumpee and Yodkhamlue (2017) argue that different grammatical rules in English. EFL errors result from word-by-word translation strategy or thinking in the mother tongue language. Likewise, the review of the related literature in this paper has shown that the sources of errors are caused by learners' linguistic transfer from L1 to L2 while the two languages can have a lot of grammatical differences. The authors of this paper agree with this idea, but the empirical material (the analysis results of the conversations and follow-up interviews) in it specifies six concrete sources rather than generalizations of linguistic transfer. In particular, these sources include learners' lack of knowledge, imitation of L1 grammar, the direct translation of grammar rules, inequivalent grammatical aspects between L1 and L2, learning-for-exam pressure, and less advantaged geographical residency and English-learning conditions. Among these six sources, learners' imitation of L1 grammar rules and use of direct translation can be seen as both the sources of errors and strategies to confront their lack of knowledge and realization of the grammatical inequivalence between L1 and L2. In this sense, learners' awareness of the sources of errors can become their strategies for communication. Errors are not always bad!

Conclusion

This study was contextualized within a growing body of research on the interference of L1 on the production of errors in L2 and Vietnam's attempt to improve its citizens' English-speaking capacity for global integration. On the one hand, this study is a timely response to partly explaining the reasons for Vietnam's lagging behind other countries in the English Proficiency Index. On the other hand, by setting out the research inquiries focusing on exploring the types of errors in L2 speaking and their causes, this study unpacked the interrelation of errors. Through the error analysis framework, the findings of this study can be highlighted as follows:

- There are three popular types of errors produced by the effects of L1 interference in L2 that are classified into the lexical, syntactical, and phonological aspects. These errors include word choice, sentence sense-making, tenses, word and phrase formations, articles, prepositions, relative clauses,

possessive cases, word order, modals and auxiliaries, gerunds and infinitives, plural and singular nouns, subject-verb conjugation, question forms, sentence fragments, pronouns, transitions, conjunctions, comparatives and superlatives, pronunciation of some consonants and vowels, syllable and sentence stresses, accent, and intonation.

- There are six interrelated sources of errors which include learners' lack of English knowledge, insufficient practice and lack of exposure to English-speaking environments, direct translation of L1 grammar rules, imitation based on supposed linguistic similarities, learning-for-exam pressure, and less advantaged geographical residency and English learning opportunities.
- The interrelation of errors enables learners to find spaces to develop ways and strategies to compensate for their gaps in English competencies. These ways and strategies are embedded with learners' active agency in sustaining communication. Some sources of errors turn out to be their strategies for this compensation.

These contributions allow the researchers to conclude that L1 interference in L2 production and communication is not always negative. It shows specific indicators of learners' proficiency levels and teachers' pedagogical interventions. While errors are normally conceptualized as linguistic gaps, L1 interference can somehow create learning spaces for learners to reduce these gaps.

Recommendations

As discussed earlier, grammatical errors in speaking can be interrelated. This issue requires further empirical research using both a quantitative and qualitative approach to explore the interrelations so that more understandings can be formed for effective teaching practices. Errors and mistakes should always be remedied. The scope of this exploratory study simply focused on investigating the types of errors and their causes without engaging the methods to correct them. Therefore, by referring to the list of errors and causes in Table 2, teachers can be prepared to draft tools and techniques to help Vietnamese EFL learners to correct their errors in speaking. In line with this recommendation, future research can be extended to other contexts of EFL so that we can have a more holistic view of errors in speaking.

University of Tirana, Faculty of Natural Sciences, Tirana, Albania

Abstract: Students in high school tend to find genetics difficult to learn because it requires some crosslinked knowledge about subjects like genes, proteins, cells, tissues as well as organs and systems. It also becomes more difficult to connect and explain concepts such as the gene expression at the level of the cell to conceptualize the effect of the gene at the level of the organism. On the other hand, despite the fact that molecular genetics has progressed rapidly, its reflection in textbooks or even the qualifications of teachers in relation to the latest findings in genetics, have not responded to this pace. Here we present a survey study of Albanian high school students (grades 10-12, ages 15-19) on their attitude study genetics and their beliefs towards genetic determinisms. A number of 274 students participated in the survey, from 8 different public and private schools in the country. The response rate was higher than 90% for each group, 58.4% of the respondents were females, 32.6 0% were males and 4.1% did not answer. The mean age of the respondents was 16.8 (\pm 1.8) years. Students found genetics interesting, and relevant but also a difficult topic in biology (respectively: 36.5%; 33.2%: 39.2%). Their responses showed positive attitudes towards gene technology and acceptance of the use of gene editing (51.4%). Students' perception of the utility of genetics did not differ among them; female and male students had significantly different responses along attitude factors, however liking genetics was the only factor without gender difference. Our study suggests that in general students liked to study genetics and they had mostly favorable attitude towards gene technology. They are not completely convinced of genetic determinism; this is also made possible by updated books. A complete study combining the textbooks, the knowledge of the teachers, and their approaches are needed.

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 1505-1513), Cappadocia, Turkiye. ISTES Organization.

Introduction

The relationship between determinism, knowledge, attitudes and beliefs about genetics is unclear. Most of the studies have focused on aspects of genetics or genomics use. In the last two decades, however, research in genetics has evolved into genomics and our understanding of genes and genomes and how they relate to development, phenotypic traits, cell physiology, among other features, has radically changed (Meyer et al., 2012 ;El-Hani et al., 2007).

We are living in an exciting time regarding the way the genome of different organisms is being explored, including the human genome. This way of scientific research, thanks to advanced technology, has increased the need for understanding genetics and its terminology.

The steps which the science of genetics is enriching this literacy are much faster than the material that is reflected in the textbooks. In our country, only in the last 10 years, new texts have begun to be implemented that reflect some of the achievements in this science.

On the other hand, in the high school level, age group 15-19 years old, several types of schools operate in our country. Public secondary schools, where the textbooks are suggested and are uniform, private secondary schools, where the textbooks are optional according to the programs that these schools offer, and professional schools of a technical nature, which use the same texts as public schools but with a reduced program.

At the same time, teachers have a role in teaching the science of biology in general and genetics in particular. The teacher uses different emphases in teaching genetics (Aivelo et al., 2019). The engagement of students in extracurricular topics depends entirely on the teacher's training.

The teachers admitted that in the textbooks high school students have scientific concepts about biological determinism, genetic determinism, and environment determinism. This programme combines the doctrine that: "human and nonhuman animal behavior and mental activity are largely (or completely) controlled by the genetic constitution of the individual and that responses to environmental influences are for the most part innately determined. the concept that psychological and behavioral characteristics are entirely the result of constitutional and biological factors. Environmental conditions serve only as occasions for the manifestation of such characteristics. the view that psychological and behavioral characteristics are largely or completely the result of environmental conditions. Biological factors are considered to be of minor importance, exerting little if any influence" (Meyer et al. 2012).

The questions that arise, for these issues that may have remained un-reflected in the textbooks, are motivated by seeing the level of students who come to study Biological Sciences in the Faculty of Natural Sciences. For this reason, we undertook the first study of this kind in our country, to understand how these achievements in the

science of genetics have been reflected in the perception and attitude.

Here We present a survey study of Albanian upper secondary school students (grades 10–12, ages 15–19) on their attitudes towards studying genetics and the use of gene technology, and belief in genetic determinism.

Method

Questionnaire

We collected questionnaire data from the students during the school year 2023–2024, time of the active practical part of our master students, when they are permanent resident in different schools and collaborate with teachers to present the questionnaire to the students during the school day throughout the school year. They choose to collect the questionnaire during the second semester after the students had finished the topics related to cells and heredity as well as gene concepts and biotechnology. To study the students' attitudes and beliefs, we composed a survey based on (Aivelo & Anna Uitto 2021), with modification. We combined 18 questions to measure students' attitudes towards learning Genetics science and their perception for genetic determinism. We include one short exam to see how they understand the correlation between genotype and phenotype.

Data collection and study group

The population of interest included upper secondary school students (grades 10–12, ages 15–19). The questions were organized into two sections; the first section included questions on the students' demographic and type of school, and the second section asked students about their perception, attitude, and beliefs in genetics determinism.

The questionnaire was made available to the students by their teacher during an extracurricular lesson after finishing the chapters on the cell and inheritance. This way the survey ensured us a high participation of more than 90%. Participants were from private high schools (98 students); public high schools (128 students), and professional high schools (18 students). A total number of 274 students participated in the survey, from 8 different public and private schools in the country.

Statistical Analysis

The data preprocessing step and statistical analysis were performed in SPSS 26.0. The data is first explored using frequencies, descriptive statistics, and graphical visualizations. Chi-square test is used to test the relationships between general features of the respondents and several selected nominal variables in the questionnaire. Spearman Correlation is used to estimate the correlation between ordinal variables and the chi-square goodness-of-fit test is used to determine whether the distribution of cases in a single categorical variable was equal across categories.

Results

General information about study group

The results showed that a number of 274 students participated in the survey, from 8 different public and private schools in the country. The response rate was higher than 90% for each group, 58.4% of the respondents were females, 32.6 0% were males and 4.1% did not answer. The mean age of the respondents was 16.8 (± 1.8) years (Figure 1)

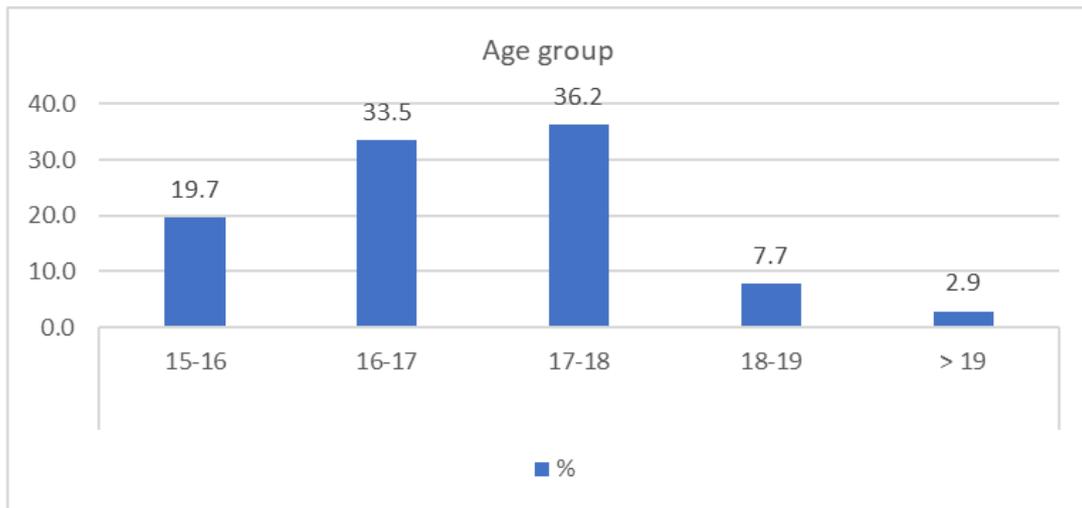

Figure 1. Distribution of participants according age group

According to the type of school and other demographic data, our sampling consists of 57.6 % public schools, 35.8% private schools and 6.7% professional schools. Most of the participants study in schools in Tirana (90.8%) and only 9.1 % in the districts (Table 1). The distribution of the questionnaire in all the districts of Albania was difficult at this time of the study, but this is a goal for the future extension of this survey.

Table 1. Demographic data about study group

Variables		N	Frequency %
Type of school	Public	158	57.6
	Private	98	35.8
	Professional	18	6.7
Gender	F	160	58.4
	M	86	31.6
Residency	Tirana	249	90.8
	Other	25	9.1
	districts		

Perceptions about genetics

Students found genetics interesting, and relevant but also a difficult topic in biology (Table 2).

Table 2. Considerations of perceptions about genetics

Statement	Strongly disagree (%) N	Disagree (%) N	Agree (%) N	Strongly agree (%) N
Genetics is a difficult area of biology	(10.2)28	(20.0)55	(37.2)102	(32.4)89
It is impossible for me to achieve good results in the study of genetics.	(8.7)24	(48.2)132	(16.4)45	(26.6)73
I think I excel at genetics	(12.0)33	(19.7)54	(40.8)112	(27.3)75
Many things in genetics are difficult	(9.9)27	(12.4)34	(46.7)128	(31.0)85
It can also solve difficult genetic exercises	(12.4)34	(16.4)45	(41.9)115	(29.1)80
Studying genetics is boring	(60.2)165	(31.0)85	(4.4)12	(4.4)12
We usually have interesting exercises in genetics	(3.6)10	(6.5)18	(64.2)176	(25.5)70
Genetics is one of my favorite subjects in biology	(3.3)9	(8.0)22	(28.4)78	(60.2)165

Attitude and beliefs about genetic determinisms

Their responses showed positive attitudes towards gene technology and acceptance of the use of gene editing (51.4%). Students' perception of the utility of genetics did not differ among them; female and male students had significantly different responses along attitude factors, Female had a more positive perception about the gene editing technologies [$X^2(2) = 8.943, p = 0.011$]. However liking genetics was the only factor without gender difference. About 74.0% of students belief in genetic determinism and and this was positively correlated with

public high school student which study different textbook and course materials (Spearman Correlation $\rho=0.348$, $p<0.001$). Our study suggests that in general students liked to study genetics and they had mostly favorable attitude towards gene technology (see Table 3).

Regarding the short exam if genes are equated with trait there is no clear distinction between genotype and phenotype, and hence little need to consider a mechanism by which a gene could be expressed in the phenotype. This everyday perspective provided a plausible explanation of the difficulties and misconceptions found.

Table 3. Considerations of attitude and beliefs about genetics

Statement	Number	Frequency
I need knowledge on genetics in my future studies	97	35.5
Genetic knowledge is required skill in everyday life	106	38.6
Understanding genetics is increasingly important	104	37.6
Editing the human genome is ethically acceptable if it allows for the cure of genetic diseases	144	52.7

Discussion

Considering that recently in the education system in Albania, some textbooks have been tested in secondary schools and only in recent years a general textbook in the subject of biology has been stabilized, we thought to evaluate how are the perceptions and attitudes of students in genetics. At the same time, with the flow of new information from scientific research in the field of genetics, which has progressed rapidly, the opinion of young people about skills in genetics as an enabling tool for education in general is not known. It is already evident that these findings have not been reflected with the same growth in educational texts, but also in the construction

of the curriculum or extracurricular hours. Before this study, a working group from our institution undertook a national competition with a contemporary theme in genetics. This was not part of our study, but the perceptions in general were that at the secondary level there are large gaps in knowledge and lack of reflection of innovations.

In our study, 274 high school students, from 8 different schools, mainly in Tirana, participated. What prevailed was the liking that young people have for the subject of genetics, listing the need to learn and be skilled in genetics as a necessary skill for the future. Almost 80% found studying genetics interesting (rated agree and strongly agree) and they believe that can excel in genetics. Around 86% of students have knowledge and see genetics as their favorite field in biology. Similar results about the perception of knowledge in genetics reported in several studies (Tornabene et.al., 2020; Aivelo et al., 2021). There were no significant differences in this likability between genders, nor differences between schools.

Reasons behind gender differences are not often discussed in the research of genetics education. As found in many studies gender differences were evident in some factors: male students had more positive attitudes towards gene technology (Mielby et al., 2013; Olofsson et al., 2006; Sturgis et al., 2010) and higher self-concept in learning genetics (Fonseca et al., 2012). In our study male belief in genetic determinism comparing to females, did not find gender differences at all. In general, educational arrangements can affect students' attitudes and beliefs in science education more than gender (Osborne et al., 2003).

Genetic determinism is the belief that genetic contributions to phenotypes are exclusively or at least much more important than the contributions of other factors such as epigenetic and environmental ones, even in the case of complex traits such as behaviors and personality (Mills et.al., 2008; Smith et al., 2010).

52% of participants believe in genetics determinism highlighting that all humans' traits are prone of genes, and 52.7% admitted that editing the human genome is ethically acceptable. 74% of the participants believe in the study of human genomes as a prediction of human diseases, and only 34.4% believes that human intelligence is determined by genes. Those are some confused results to be discussed and only a few studies have similar frequencies (Aivelo et al., 2021; Lanie et al. 2004; Mills et.al., 2008), meanwhile they shown lower consideration about genetically modified plants as a solution for sufficiency. It suggests that biotechnology is not well understood. In terms of equating genes to traits, there is no clear distinction between genotype and phenotype, and therefore there is little need to consider a mechanism by which a gene may be expressed in phenotype. This everyday perspective provided a plausible explanation of the difficulties and misunderstandings found (Lewis et al. 2004).

Conclusion

Our study suggests that in general students liked to study genetics and they had mostly favorable attitude

towards gene technology. They are not completely convinced of genetic determinism; this is also made possible by updated books. A complete study combining the textbooks, the knowledge of the teachers, and their approaches are needed.

Acknowledgements

We are very grateful to all the students participants in this survey and their teachers for the support.

Abstract: TVET is an education and training process with a strong emphasis on industry practises that strives to generate competent workers in particular fields. Cooperation with industry in TVET has the potential to improve the quality and relevance of TVET programmes and equip students with the practical skills and knowledge demanded by employers. Thus, there is a need for a complete bibliometric study of research linked to collaboration between TVET and industry, despite the fact that the number of studies in this field continues to increase. The bibliometric analysis in this research which was extracted from Web of Science database is analyze using VOSviewer. The research conducted a descriptive analysis of the publication number trends, the top authors and leading journals in this field. Next, the researcher also analyzed the co authorship based on authors and countries, research trends, citation and keywords analysis as well as co citation analysis. The article found that most of the articles in this field are published by authors from developed countries where the majority is from the United States. Other than that, the recent research hotspot were also identified indicating the future direction of the research in this field.

Keywords: Bibliometric, TVET, Engineering, Industry, Collaboration

Citation: Omar, M., Mohd Kamaruzaman, F., & Arsad, N.M., & Yusof, I. J. (2023). Bibliometric Review On TVET and Industry Collaboration. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 1514-1527), Cappadocia, Turkiye. ISTES Organization.

Introduction

Technical and Vocational Education and Training (TVET) is an education and training process that places significant emphasis on industry practises, with the primary objective of developing a proficient workforce in specialised areas. Collaboration among industries in TVET has the potential to improve the quality and applicability of TVET curricula, as well as provide learners with the hands-on competencies and expertise that are sought after by employers (Oviawe, Uwameiye & Uddin, 2017).

Technical and Vocational Education and Training (TVET) institutions have a significant and extensive historical background in Malaysia. Since its early stages of development, the nation has prioritised technical and vocational education. The enhanced emphasis on Technical and Vocational Education and Training (TVET) in the present day is manifested in the amplified significance and prominence of TVET in the 11th and 12th Malaysian Plans (Nalathambi et al., 2023). In recent times, the Malaysian government has persistently allocated resources towards Technical and Vocational Education and Training (TVET), with a specific emphasis on enhancing the calibre of instruction and fostering greater cooperation with the industry. The concept of industry partnership in Technical and Vocational Education and Training (TVET) pertains to the cooperation between TVET institutions and the industry sector with the aim of enhancing the calibre and pertinence of TVET curricula, and providing students with the pragmatic competencies that are essential for meeting the demands of employers. UNESCO places emphasis on enhancing training systems and consistently underscores the necessity of establishing stronger connections between training programmes and the labour market (Marope, Chakroun & Holmes, 2015). The establishment of partnerships with industry is crucial for Technical and Vocational Education and Training (TVET) institutions (Oviawe, 2018) to maintain their relevance and generate graduates who possess the necessary skills to fulfil industry requirements. The significance of the interplay among multiple stakeholders cannot be overstated in the endeavour to effectively design and execute an education and training framework that yields a proficient labour force.

Collaboration refers to the process of interaction between two or more parties, each with a designated role, aimed at successfully planning and implementing a management system that facilitates joint decision-making in the interest of organisational and national development (Ladkin & Bertramini, 2022). Collaboration is a strategic alliance that leverages the knowledge and expertise of an educational and training institution in conjunction with industry. The aforementioned statement indicates that collaboration entails the establishment of a cooperative network between educational and training institutions and the industry (Zeng, Xie & Tam, 2010), with the aim of fostering a harmonious ecosystem in the realm of employment and training.

The collaboration between the industry sector and Technical Vocational Education and Training (TVET) institutions is aimed at improving the quality and pertinence of vocational education and training programmes. The process entails a symbiotic relationship characterised by intimate collaboration, effective communication, and reciprocal assistance between the aforementioned entities to reconcile the differences between academic

establishments and the demands of the labour market (Raihan, 2014).

Numerous scholarly investigations assert that fostering collaboration between educational institutions and industry-based training is crucial and highly necessary in order to attain the goal of generating a proficient workforce. There are studies identified that industrial attachment is the most significant linkage, with challenges like lack of initiative and poor industry response (Raihan, 2014). Industry linkage is not the only aspects in the collaboration between industry and TVET institutions that could benefit both parties as well as students. Therefore, it is imperative to consider strategic collaboration between educational and training institutions and the industry as a crucial approach to augment a proficient workforce that aligns with the industry's requirements. Furthermore, the expeditious advancement of technology has necessitated collaboration between educational and training establishments and industry to impart knowledge and expertise on cutting-edge technologies, thereby facilitating the creation of a proficient and high-caliber workforce. In order to attain the status of a high-income generating country, it is imperative that all stakeholders, including the government, institutions, and industry, engage in effective strategic collaboration. This will enable the workforce to contribute to the economic growth of the nation.

Methodology

Research Objectives

This article aims to examine the trends and studies related to TVET and Industry collaboration by using a bibliometric mapping method. This method utilized publications retrieved from Web of Science database and analyze the trends, status of the publications in terms of its citation, authors, sources of publications (journals), institutions, countries and keywords used by the author in their publications. Bibliometric techniques employ science mapping on bibliographic data sourced from publication databases such as Web of Science, with the aim of identifying the comparative impact of publications and their contribution to the formation of knowledge clusters, such as major themes, within a network. By doing so, individuals can offer valuable perspectives on the development of the field, including its intellectual lineage, as well as the nascent areas of inquiry. This method is widely used to analyzed and explore a large amount of articles or data in particular field (Dothu et al., 2021).

Data Collection

In May 2023, the Web of Science database yielded a total of 1442 publications. The Web of Science database was selected based on its extensive collection of articles pertaining to the field in comparison to other databases. In addition, it is noteworthy that Web of Science is a dependable repository of scholarly literature, wherein a significant proportion of the articles encompassed within this database have undergone rigorous evaluation by specialists within the relevant domain. Birkle (2020) asserts that the database in question is not only widely utilised but also holds a position of authority in the field of research publications and citations. The Web of Science is comprised of a diverse array of specialized indexes, which are categorized based on the nature of the

indexed content or thematically emphasized (Pranckutė, 2021). Table 1 shows the inclusion and exclusion criteria of this article.

Table 1. Inclusion and exclusion criteria

Criteria
Inclusion Criteria
Keywords search was based on all field
Documents written in english language
Documents published within 2010 to 2023
Documents types only limited to article, proceedings and review article
Exclusion Criteria
Date of publication before 2010
Documents published in non-english languages

The process of identifying the articles in this study refers to the Preferred Reporting System for Systematic Reviews and Meta-Analyses (Prisma) (Moher et al., 2010). Figure 1 shows the PRISMA research protocol for this study.

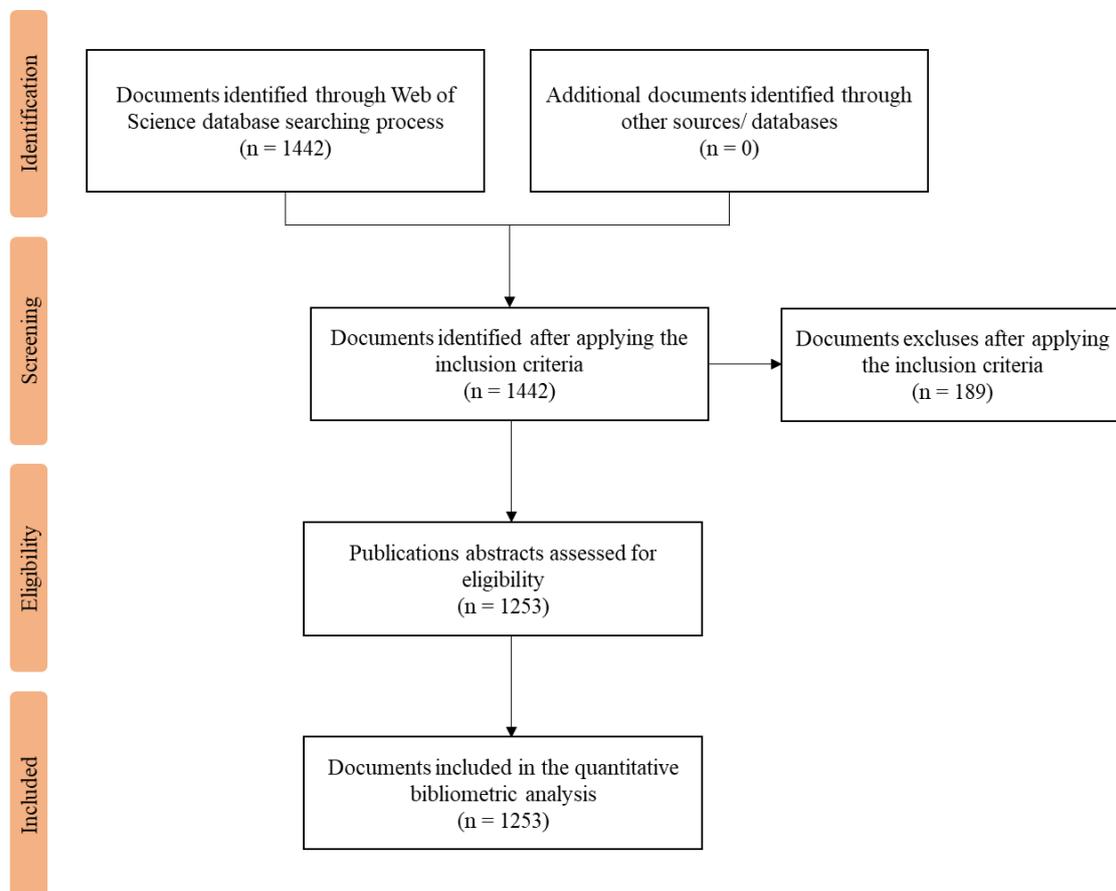

Figure 1. PRISMA research protocol

The data related to the publications was obtained in May of 2023, with the application of inclusion criteria to ensure the relevance of the acquired publications. The study's inclusion criteria are based on the year of publication (2010 to 2023), document type (including articles, proceeding papers, and review articles), and language (English). To obtain relevant publications related to this study, appropriate keywords were employed through the implementation of Boolean search commands to efficiently search for relevant literature. The publications were identified using the following keywords: (tv^{et} OR tve OR vocational OR training) AND industry AND institution AND collaboration.

Data Analysis

The study starts with the search of the Web of Science database, followed by the application of inclusion criteria to procure relevant publications. Upon identification of relevant publications, the authors proceeded to extract data based on various categories, including but not limited to authors, year of publication, citation count, affiliation, country of origin, and number of publications. Among the chosen publications, 70% consist of articles, 23.4% are proceedings papers, and 6.6% are review articles. The data related to publications obtained from the Web of Science database is then exported to Tab Delimited file. The process of extracting fundamental data related to publication and citation trends, highly cited articles, top publishing journals, institutions, and countries was conducted using Microsoft Excel. VOSViewer was employed by the author for conducting bibliometric analysis. VOSViewer is a software tool designed to facilitate the creation and visualisation of bibliometric maps, as described by Van Eck and Waltman (2010). Van Eck and Waltman (2017) state that VOSViewer has been designed to facilitate the examination of clustering outcomes at a higher level of aggregation. Therefore, this software is deemed appropriate for application in this study.

Results

Publication and Citation Trends

Based on the search process conducted at the early stages of this study, a total of 1253 publications were identified in the selected database. Figure 2 shows the publication and citation trends based on the 1253 publications identified through the Web of Science database.

Research related to collaborations between industry and TVET institutions originated in the 1990s and gained momentum from 2010 onwards. The graphical representation reveals a notable rise in the quantity of publications within this particular domain, spanning from 2018 to 2022, with a cumulative count of 176 articles. 60% of the total publications is produced between 2010 and 2023 comprise the aforementioned total number of publications. Regarding the quantity of citations, there has been a steady rise in the number of citations over time. The Web of Science database documented 39,383 citations in May 2023, which were attributed to 37,256 articles.

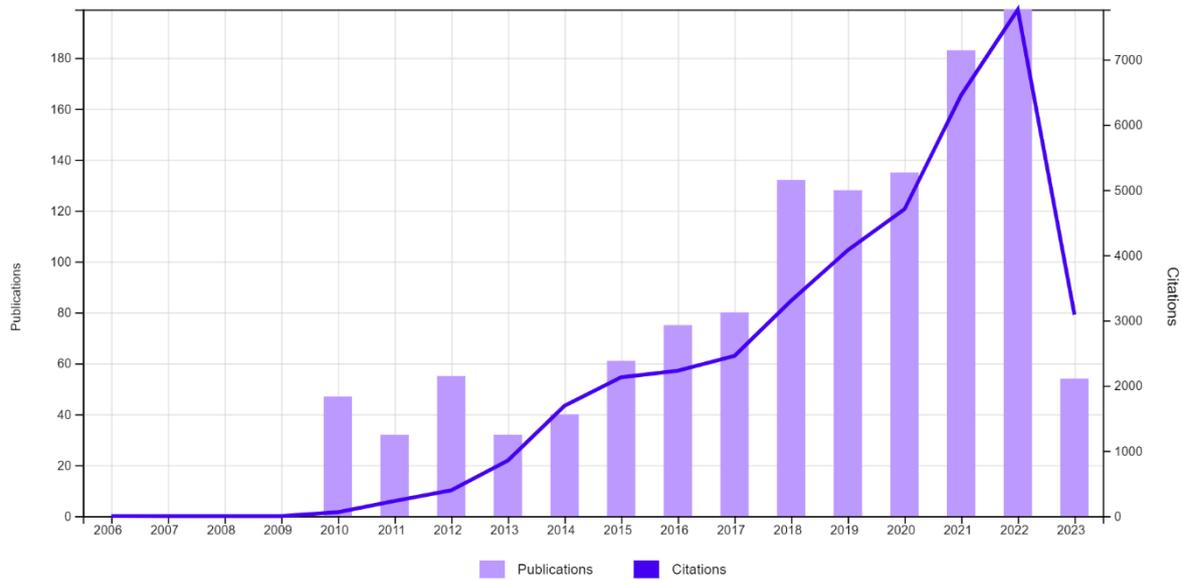

Figure 2. Publication and citation trends

Highly Cited Articles

Based on the identified publications, the top articles in this field with highest citation is presented in table 2.

Table 2. Top 5 highly cited articles

Author(s)	Document Title	Source	Total Citation
Oliveira and Martins (2010)	Understanding e-business adoption across industries in European countries	Industrial management & data systems	283
Perkmann et al. (2021)	Academic engagement: A review of the literature 2011-2019	Research policy	100
Ansari, Erol and Sihni (2018)	Rethinking human-machine learning in industry 4.0: how does the paradigm shift treat the role of human learning	Procedia manufacturing	65
Thune (2010)	The training of “triple helix workers”? Doctoral students in university–industry–government collaborations	Minerva	61
Povey et al. (2016)	Engaging parents in schools and building parent-school partnerships: The role of school and parent organisation leadership	International Journal of Educational Research	30

The authors have identified 5 most frequently cited articles in this field and listed the name of authors, document title, sources or the articles and number of citation for each articles. Based on table 2, Oliveira and Martins (2010) article entitled Understanding e-business adoption across industries in European countries is at the first place with 283 total citation (20.21 citation per year). The next most cited articles is by Perkmann et al. (2021) with an articles entitled Academic engagement: A review of the literature 2011-2019 with a total of 100 citation (33.33 citation per year) and followed by Ansari, Erol and Sihm (2018) article entitled Rethinking human-machine learning in industry 4.0: how does the paradigm shift treat the role of human learning with a total of 65 citation (10.83 citation per year). In general, the top 2 most cited articles have more than 100 citation until May 2023.

Most Prominent Journal

In this study, the authors have identified the most prominent journal with high numbers of publications related to the field. Table 3 shows the most prominent journals in this field.

Table 3. Top 6 most prominent journals

Sources	Numbers of Articles	% of 1,253
Iceri Proceedings	20	1.597%
Edulearn Proceedings	16	1.278%
Sustainability	14	1.118%
Lecture Notes In Computer Science	13	1.038%
Inted Proceedings	11	0.879%
Journal Of Technical Education And Training	9	0.719%

According to the results of data extraction, it is identified that there is only 5 journals or sources published more than 10 publications. The highest numbers of publications is from ICERI Proceedings with a total number of 20 articles followed by EduLearn Proceedings with a total number of 16 articles. The next journal or sources with the highest number of publications in this field is Sustainability which is a multidisciplinary journal with a total number or 14 articles. From the top 6 journals, there are one journal from Malaysia, which is Journal of Technical Education and Training at number 6. This journal is indexed both in Scopus and Web of Science (Emerging Science Citation Index). Overall, total number of publications in the top 6 most prominent journals is 83 articles.

Top Institutions

As for institutions, there are various institutions that have published articles related to industry and TVET

institutions collaborations. However, the author only focused on the top 6 most productive institutions in this field based on Table 4.

Table 4. Top 6 most productive institutions

Institutions	Numbers of Articles	% of 1,253
University Of California System	102	8.147%
Udice French Research Universities	97	7.748%
University Of London	91	7.268%
University Of Melbourne	87	6.949%
Centre National De La Recherche Scientifique Cnrs	83	6.629%
University Of Oxford	72	5.751%

Based on table 4, University of California System is at the top place with 102 articles under their affiliation (8.147% out of total publications). The most productive institutions is followed by Udice French Research Universities with a total of 97 articles (7.748% out of total publications) and University of London with a total of 91 articles (7.268% out of total publications). Based on the findings, it can be seen that France contributes to 2 of the most productive institutions (Udice French Research Universities and Centre National De La Recherche Scientifique Cnrs) as well as England (University Of London and University Of Oxford).

Top Publishing Countries

The top 6 most productive countries in this field is as shown in Table 5.

Table 5. Top 6 most productive countries

Countries	Numbers of Articles	% of 1,253
USA	334	26.677%
Australia	315	25.160%
England	260	20.767%
Peoples Republic of China	219	17.492%
Germany	203	16.214%
Italy	158	12.620%

Based on table 5, the most productive country with highest publications relevance to this field is United States of America (USA) with 334 articles (26.677%). This finding is parallel to the findings of most productive institutions where the top productive institutions identified in this study is University Of California System located in USA. The next productive country is Australia with a total number of 315 articles (25.160%) which is

also parallel to the findings of the most productive institutions where University Of Melbourne is at the top 4 institutions with 86 numbers of publication only by itself. This is followed by England with 260 articles (20.767%), Peoples Republic of China (PRC) with 219 articles (17.492%), Germany with 203 articles (16.214%) and Italy with 158 articles (12.620%). Based on the data extracted, Malaysia is at 36th place with a total of 42 articles (3.462%). Thus, this shows that this field is not yet widely explored in Malaysia and there is a need to further study on the implementation of industry and TVET institutions in Malaysia towards improving out TVET graduates quality and employability.

Co-authorship Analysis

To create a link between researchers or authors of the articles related to industry and TVET institutions collaboration, a co-authorship network analysis is conducted using VOSviewer software. The concept of co-authorship network analysis pertains to the evaluation of the interaction that occurs among multiple scientists within a social setting, enabling the exchange of ideas and accomplishment of objectives in relation to a common aim (Sampaio, Fonseca & Zicker, 2016). In this study, the author identifies the co-authorship analysis of countries and organization. For co-authorship network analysis based on countries, the author have set the minimum numbers of documents of a country to 5 and minimum numbers of citations of an author is set to 5. Figure 3 shows the visualization network of the country co-authorship produce by VOSViewer.

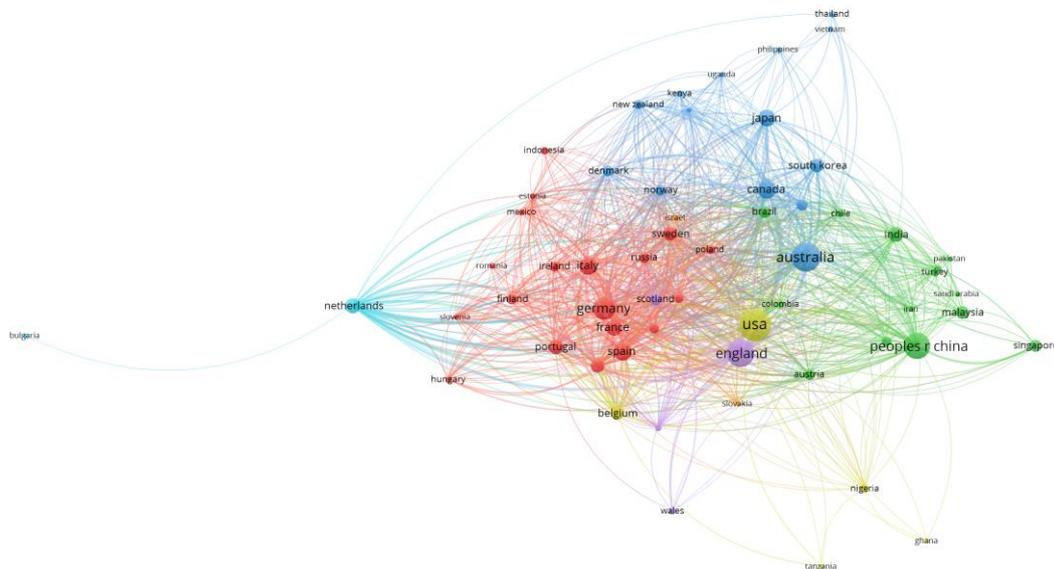

Figure 3. The visualization network of the country co-authorship

Based on the analysis, there are 60 countries/regions that meet the requirements. All the countries included in the analysis are divided into 7 clusters. The first cluster (n = 19) in red colour shows Germany (101 publications and 334 TLS) as the largest node followed by Spain (64 publications and 250 TLS), Italy (61 publications and 263 TLS) and France (51 publications and 273 TLS). The second cluster represented by green colour shows

Table 6. Most frequently used keywords

Authors' Keyword	Occurrences	Total Link Strength
Collaboration	44	39
Training	41	33
Higher Education	24	28
Innovation	25	27
Education	18	17
Entrepreneurship	10	15
Industry	12	12
Research	7	12
Sustainability	14	10
Engineering	6	8

Based on the analysis, there are 56 keywords that meet the requirements (out of 3549). The threshold set for the minimum number of occurrence of a keyword is 5. The most frequently used keywords in this field are collaboration (green cluster), higher education (purple cluster), innovation (red cluster), education (yellow cluster), Industry 4.0 (violet cluster). These results suggest that collaboration, higher education, innovation, education and industry 4.0 are the keywords frequently examined by the researcher in this field. Table 6 shows the most frequently used keywords related to industry and TVET institutions collaboration. As seen in table 6, collaboration is the most frequently used keywords with 44 occurrences (39 TLS) followed by training (41 Occ, 33 TLS). Other frequently used keywords are higher education (24 Occ, 28 TLS), innovation (25 Occ, 27 TLS), education (18 Occ, 17 TLS) and entrepreneurship (10 Occ, 15 TLS).

Discussion and Conclusion

This article examines the trends and studies related to TVET and Industry collaboration from 2010 up to 2023 by using a bibliometric analysis. There were a total of 1442 publications identified based on the search process conducted using the Web of Science database and only 1253 publications were included in the study. Based on the findings, there seems to be an increase in the number of publications starting from 2010 and there is a sharp increase starting from 2018 until present year. 2022 records the highest numbers of publication in this field which indicates an increasing interest in the studies related to industry and TVET institutions collaborations. The partnership between industry and Technical and Vocational Education and Training (TVET) is a pivotal factor that can enhance the employability of TVET graduates and address the challenge of graduates lacking the requisite competencies that the industry demands. The symbiotic relationship between educational institutions and industries is crucial in the production of skilled workers. Educational institutions are responsible for producing skilled graduates, while industries require skilled workers to meet their operational demands (Mustafa, Hussain & Zulkifli, 2022). In addition to this, the phenomenon of globalisation and the rapid progress in technology and communication have been altering the configuration of the labour market on a global scale, thereby transforming the skill prerequisites for extant and forthcoming occupations (Naziz, 2019). Hence, a collaborative approach is imperative to mutually benefit the involved parties and address the fundamental challenges associated with the aforementioned situations.

The research findings suggest that there is potential for further investigation in emerging research areas such as sustainability, entrepreneurship, and innovation. These are the emerging keywords associated with this particular field. The concept of sustainability has garnered significant attention in Malaysia, particularly in recent times. Othman and Omar (2012) have examined the concept of sustainable partnership between university and industry collaboration. The authors have identified the primary objective of such collaboration, which is to establish a successful and sustainable partnership that can provide highly skilled and competent workforce to meet the industrial requirements. In addition, a separate scholarly investigation delved into sustainable collaboration, with particular emphasis on the influence of governance and institutions (Niesten et al., 2017). Therefore, the keyword sustainable could be the next important aspects to be discussed in this field by future researchers.

Acknowledgements

We would like to thank Centre for STEM Enculturation, Faculty of Education, Universiti Kebangsaan Malaysia for their financial support throughout the research process publishing this article.

Abstract: In the area of foreign language, learners may face challenges in interpreting the writer's voice in historical texts. Such problem may stem from their lack of understanding of generic properties of historical genre in interpersonal function of language use (Martin & Rose, 2008) and could be addressed through effective reading instruction. Driven by this concern, this study focuses on one of the critical stages of Feez's (1998) teaching-learning cycle, 'modelling and deconstruction of text' to examine how the linguistic means for evaluating historical phenomena utilized in order to give meanings to the past. Appraisal theory (Martin & White, 2005) is also applied in this study to investigate how different evaluative strategies operate in historical genre. Two historical texts about Indonesian war are selected as the sample to highlight the features of evaluative language. The strategies involve using linguistic resources to respond to events emotionally, judge past behavior within a moral framework and assess the weight and causal force of past events.

Keywords: Appraisal theory, historical texts, text deconstruction

Citation: Suraiya, L., & Anatona (2023). Appraising the Past: The Evaluative Language in Historical Texts. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1528-1538), Cappadocia, Turkiye. ISTES Organization.

Introduction

In the field of foreign language education, historical texts are commonly introduced as one of genre in English textbooks of secondary schools (Lanjwani et al. 2023; Suryatiningsih, 2020). Learning historical texts is worthwhile for educational and linguistic rationale. In educational context, learning the historical content is aimed at generating, developing the spirit of nationalism and patriotism (Hardiana, 2017), and maintaining harmony or cohesiveness of community's progression (Purwanta et al., 2020). The process of learning historical texts will not only involve learning content but also develop learners' literacy on specialized discipline (Wrigglesworth & Mckeever, 2010). Literacy skills in historical texts comprises the cognitive abilities in reasoning, explanations, and interpreting moral values about the events. In linguistic rationale, historical discipline is built with reading and writing activities that entails close readings, reading across texts to examine intertextual links, and constructing meaning by comparing or contrasting a series of texts (Leinhardt et al., 1994). Briefly, history is a language-based discipline (Achugar & Stainton, 2010). In other words, history as a

disciplinary knowledge is not introduced in isolation from language. Learning historical texts requires an understanding of linguistic features of texts produced within the discipline. Please use 10-point font size. Please margin the text to the justified. Manuscripts should be 1.5 times spaced. Footnotes and endnotes are not accepted. All relevant information should be included in main text. Do not indent paragraphs; leave a 1.5 times space of one line between consecutive paragraphs. A paragraph should have at least 3 sentences.

However, learners may find difficulty in the recognition of how the past is represented or perceived in the text. The representation of the past in the historical texts deals with the interpretation of the writer's voice that can be analyzed through the linguistic features of historical genre in interpersonal function of language use (Martin & Rose, 2008). The interpersonal function of language use represents the way the writer or historian uses language to express their perspectives on the historical events in order to influence readers. In educational context, the ways the writer represent the past tend to infuse learners' empathy, feeling, and appreciation for the inner situation of historical actors or heroes, especially in the battle stories. Therefore, learners' negative perception on history e.g. that history is a boring subject associated with memorizing dates, names of heroes, events, and does not have a good effect on learners' daily lives, can be avoided.

A number of previous studies have been conducted on the interpersonal function of language use in secondary English textbooks (see Achsan & Barati, 2015; Magfiroh et al., 2021; Teo & Zu, 2018; Zudianto, 2015). They have focused on the comparison of conversation texts found in two secondary English textbooks to find the realization of mood and tenor in interpersonal function of language use (Achsan & Barati, 2015), the attitudes devices of the characters in narrative texts (Magfiroh et al., 2021), the investigation on how verbal texts and visual images are co-deployed in textbooks to instantiate the curriculum goal of affect and attitude education (Teo & Zu, 2018), and the representation of multi-ethnicity in the form of dialogs or monologs in the textbooks (Zudianto, 2015). Most of the studies cited above suggest the need to research the attitudinal devices in secondary textbooks. And yet, among these studies, investigating the writer's textual voice as the realization of interpersonal function of language use in historical texts for pedagogical practices has received scanty attention. To fill this void, the present study is intended to demonstrate the deconstruction of the writer's voice depicted in the historical texts in secondary school English language textbook. This study applies appraisal theory in linguistic domain and focusses on 'modelling and deconstructing the text' as one stage of teaching-learning cycle in pedagogical practice.

Appraisal theory

Grounded in Hallidayan Systemic Functional Linguistics (SFL) theory, this study employs Appraisal theory (Martin & White, 2005) focussing on interpersonal resources that are concerned with negotiating social relation, like, how the writer shares his/her voice, feelings, and perspectives. Appraisal theory deals with evaluative language that has semantic resource used to negotiate emotions, judgments and valuations, alongside resource for amplifying and engaging with the evaluations on events and issues in historical texts. The key functions of appraisal system in language are to express the writer's or historian's opinions that reflect the value system of

those writers or historians and their community; to construct and maintain relations between the writers or historians and readers; and to organize the discourse of historical texts. Appraisal theory comprises three central semantic systems: attitude, engagement, and graduation. Attitude concerns feelings, that is, the emotional reactions negotiated in a text. Attitude comprises with affect, judgment, and appreciation. Engagement is how values are sourced by playing voices around opinions and reader aligned. It is divided into monogloss and heterogloss. Graduation refers to the grading of attitudinal values whereby feelings are amplified or hedged in the discourse (Martin & White, 2005). The sub-systems of appraisal theory can be seen in the following figure.

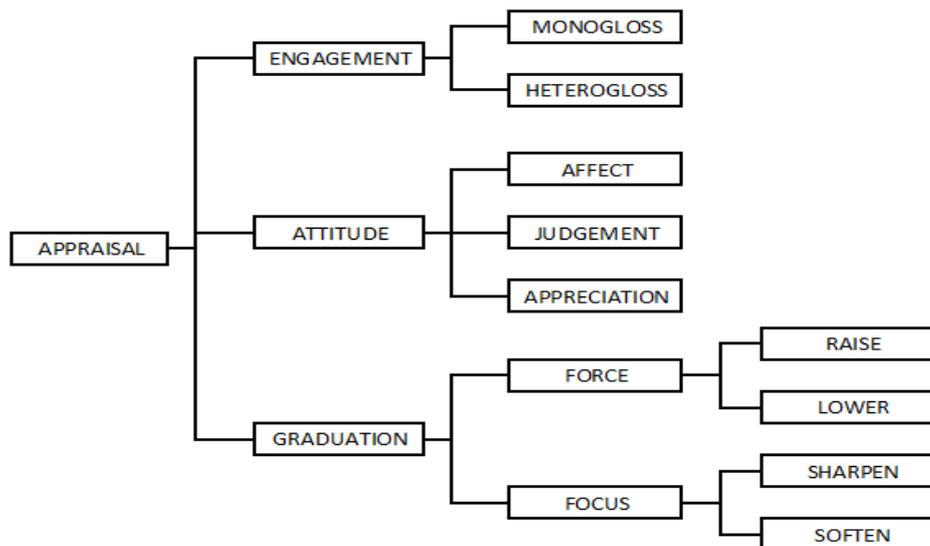

Figure 1. Appraisal Resources (Martin & White, 2005, p.38)

Teaching-learning cycle

Teaching-learning cycle was firstly developed as the basis of genre pedagogy for organizing and sequencing the elements in the syllabus (Feez, 1998). Genre-based approach became influential when it was drawn upon Halliday's (1994) systemic functional linguistics and is defined as 'staged' and goal oriented social processes'' (Christie, 1998; Dewerianka, 1996; Martin, 1989). Drawing upon Feez's (1998) prominent teaching-learning cycle, the genre of history can introduced in a sequence of different phases of teaching and learning in the classroom interaction. The teaching-learning cycle involves five major stages: (1) building the context: teachers teach the purpose of the genre (historical texts) and the contexts in which the genre is commonly used; (2) modelling and deconstructing the text: teachers demonstrate how to analyze the salient linguistic features of historical texts that indicate the writers' voice and learner build the knowledge of those specific linguistic features; (3) joint construction of the text: teachers guide learners as facilitator to work with peers or compose their own texts; (4) independent construction of the text: teachers allow learners to do independent work if they have succeeded at their previous learning activities; (5) linking related texts: teachers relate the historical texts to other texts and contexts. It is possible for the teachers to encourage learners to elicit their reflection, critiques, or to interpret inherent values in historical texts.

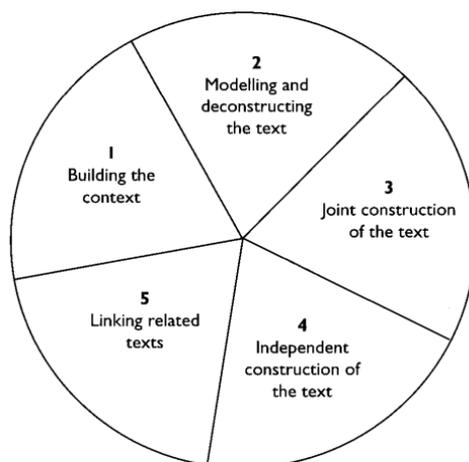

Figure 2. Teaching-learning circle (Feez, 1998, p. 28)

Method

Applicable linguistics framework and pedagogical practice for analyzing historical texts

The language appraisal framework (Martin & White, 2005) was used to examine linguistic resources in the historical texts of the English textbook at secondary schooling. The language appraisal parameters to analyze the historical texts are affect (emotion), judgment (social evaluation of the characters and their behavior), and appreciation (aesthetic evaluation of things). These parameters are used to evaluate positive and negative attitudes, opinions, or reaction conveyed by the writers or historians in historical texts. For pedagogical practice, the interpersonal function in appraisal framework is linked with the stage two of genre-based pedagogy, following Feez's teaching-learning cycle.

Textbook as the source of data

In this study, we use English foreign language textbook endorsed by the Indonesian Ministry of Education and Culture, entitled *Bahasa Inggris for SMA/MA/SMK/MAK Kelas X*. (English Language for Senior High School, Grade 10). It written by Utami Widiati, Zuliati Rohmah, and Furaidah, published in 2017. English as compulsory subject at secondary schools and teachers should use this book as endorsed by the government. The data for textual analysis were taken from this textbook because (1) they met the criteria set by Indonesian Board of National Education Standard, (2) they were written by Indonesian teachers who have experienced in teaching at secondary schools, (3) the historical texts are specifically appear at this book since one theme of syllabus dealing with the recount texts – the text which retell events or experiences in the past. The historical texts selected were about Indonesian war: Bandung Sea of Fire and The Battle of Surabaya.

Analytical procedures

The learning activities in the deconstruction phase occur as follow:

- Learners are introduced to model texts representing the target genre e.g. a historical recount.
- This model serves to build historical knowledge relevant to the unit.
- Questions are posed in relation to the purpose of unit of work, e.g. to appraise the action of figures described in historical text.
- Teachers appraise the events or action of figures by coding the linguistic features.
- Through a range of activities and activities and teacher input, there is analysis of and critical reflection on the texts.
- The use of lexis and grammar and the rhetorical effects may be explored by students.

Results

In this part, we focus on the deconstruction of the extract of historical texts, which typically occur at the stage “modelling and deconstructing the text” in the teaching-learning cycle. The following chart can be used as the guidance when the learners do close reading on the historical texts.

Goals	Actions	Knowledge
What is the purpose of the text?	Identify the function of the text by reading the first paragraph as it gives introduction to the whole text.	Social purpose of the text
What is the text about? Who are the main actors in the text?	Identify participants (nouns), processes (verbs), circumstances (adverbs and prepositional phrases)	Main events, key actors, and context of the events
How is information organized in the text?	Identify the cause-effect and chronological patterns in the text. Identify connectors	The development of arguments in historical text.
What is the perspective of the writer? (the voice of the writer)	Identify modality, personal pronouns, mood (declarative, interrogative, imperative), and evaluative vocabularies.	The voice of the writer on the issues presented

Adapted from Achugar and Stainton (2010)

Analysis: Text Deconstruction

The sample of analysis text deconstruction can be seen as follows.

Text 1: Bandung Sea of Fire

Bandung Sea of Fire

The Bandung Sea of Fire was a historical moment for Indonesian independence [+appreciation]. It was the intentional burning [+affect] [+ graduation] of much of the southern side of Bandung during the Indonesia national revolution. The event came to be known as Bandung Sea of Fire or Bandung Lautan Api [+ affect] [+graduation]. Hundreds of Indonesian nationalists were singing Halo – Halo Bandung to show that they were proud of what they have done [+judgment].

The British commander gave an ultimatum to the Indonesian troops to leave Bandung [-judgment]. The troops responded differently [+ judgment]. They mobilized people [+judgment] to burn the southern part of Bandung as they left on March, 24 1946 [engagement]. Houses and buildings was burned deliberately created a horrified scene [-affect] [+graduation].

In March 1946, a member of Indonesia militia, Mohammad Toha, during the evacuations smuggled dynamite leaved by Japanese and Dutch troops [engagement]. The dynamite was smuggled into the Dutch military headquarters in Dayeuh Kolot region [+judgment]. Toha detonated the dynamite in warehouse [+judgment: capacity]. He killed himself with several Japanese and Dutch troops [+judgment: tenacity]. The explosion of the dynamite created a small lake in the area [-appreciation] [+graduation]. The name of Mohammad Toha then used for the main street in Dayeuh Kolot [+appreciation].

The Bandung Sea of Fire showed us that Indonesia combatants were very loyal to the country [+judgment: tenacity]. They did not want to leave anything for the colonial and British army [+ judgment]. The event was a great example of how Indonesian would sacrifice everything to reach their goal [+appreciation][engagement].

As seen in the first paragraph, the text organization provides the orientation (what, who, where) to the readers. The first line of the paragraph, the writer of this text shows his positive appreciation towards the battle happened in Bandung as the starting point to gain the Indonesian independence. The salient clause of *a historical moment for Indonesian independence* is underlined and inserted coding at the end of this clause. The coding [+appreciation] is as the parameter of appraisal framework. It indicates positive reaction of the writer towards the events. The lexical phrase *intentional burning* is categorized as positive affect or feeling because the action is deliberately intended by the Indonesian troops. Graduation refers to up-scaling or down-scaling of the thing or event. In this text, graduation is realized in *intentional* that means gradable according to intensity. The voice of the writer shows the pride or positive affect which is realized in *Bandung Sea of Fire*. This lexical choice is also categorized into positive graduation as fire is described as wide as the sea. The last line of this first paragraph ends with the writer's positive judgment towards the behavior of the Indonesian troops as it is realized in *they were proud of what they have done*. Positive judgment relates to social esteem that have to do with social values or norms (Martin & White, 2005).

In the second and the third paragraphs, this historical text provides the series of events. The writer begins with

negative judgment towards the British commander as realized in *The British commander gave an ultimatum to the Indonesian troops to leave Bandung*. This event is categorized as the cause for the following event. Cause-and-effect plays important role in meaning making of historical discourse (Coffin, 2006). The effect is that positive judgment conveyed by the writer toward the Indonesian troops as it is realized in *The troops responded differently*. It means that Indonesian troops did not obey the British commander ultimatum and it is regarded by the writer as the brave behavior of Indonesian troops. As the consequence, the following actions of Indonesian troops in the series of events are categorized as positive judgments by the writer. The positive judgments are realized in *They mobilized people to burn the southern part of Bandung as they left on March, 24 1946 and Houses and buildings was burned deliberately*. Since the writer provides the date of the troops mobilized people to burn the southern part of Bandung, it means that the writer represents proposition as highly warrantable. The date information is categorized as proclaim under the parameter of engagement [Martin & White, 2005]. Negative affect shows scary and sadness feeling of the writer as realized in *horrified scene*. Even though it is categorized as negative affect, horrified scene is deliberately created by the troops to fight enemies and defend for the country. It is, therefore, categorized as positive graduation, up-scaling the scene.

The third paragraph indicates complication or climax. The writer begins with the date information that functions to acknowledge external voice in order to convince the readers. This lies under the appraisal framework of engagement. The writer engages the external voice as an evidence to support the occurrence of the most important event in this historical text. The writer allocates this whole paragraph to the heroic actions of Mohammad Toha, who smuggled and detonated the dynamite, and killed himself. The coding of positive judgments on the figure's behavior is noted for the following clauses: *The dynamite was smuggled into the Dutch military headquarters in Dayeuh Kolot region; Toha detonated the dynamite in warehouse; He killed himself with several Japanese and Dutch troops*. The explosion effect is as large as *small lake* and evaluated by the writer as negative appreciation while the up-scaling of explosion is categorized the positive graduation. As the gratitude expression from society, the writer writes the positive appreciation to the name and the area where the battle occurred. as it is realized in *The name of Mohammad Toha then used for the main street in Dayeuh Kolot*.

The last paragraph has re-orientation in which the writer provides comments about the events that are told in the text. The writer gives positive judgment to Indonesia heroes as realized in *Indonesia combatants were very loyal to the country. They did not want to leave anything for the colonial and British army*. Positive appreciation is also described in the clause: *The event was a great example of how Indonesian would sacrifice everything to reach their goal*. The positive judgment towards the hero's behavior and positive appreciation towards the events encourage the learners to develop the spirit of nationalism, patriotism and historical awareness.

The text 2 shows the typical historical text on the theme of battle providing the dates of events, the figures, and name of places, and cause effect of the sequential events. In terms of appraisal analysis, the first line of the first paragraph indicates proclaim under the semantic resource of engagement, in which the writer represents the date as the highly warrantable proposition. The textual voice of the date information has well-founded and generally

reliable in society. Then, the writer gives positive judgment towards Indonesians who refused to surrender their weaponry to British army. This shows patriotism to defend Indonesian territory and show that they are not afraid to face the bloody battle. The positive judgment is also given to Bung Tomo as realized in the clause *Bung Tomo is the well-known revolutionary leader who played a very important role in this battle.*

Text 2: The Battle of Surabaya

The Battle of Surabaya
<p><u>On 10 November, Indonesia celebrates Hari Pahlawan or Heroes Day in remembrance of the Battle of Surabaya which started on that very date in the year 1945</u> [engagement: proclaim]. The bloody battle took place because <u>Indonesians refused to surrender their weaponry to British army</u> [+judgment]. British Army at that time was part of the Allied Forces. The defiant <u>Bung Tomo is the well-known revolutionary leader who played a very important role in this battle</u> [+judgment].</p>
<p><u>It all started because of a misunderstanding between British troops in Jakarta and those in Surabaya, under the command of Brigadier A.W.W.S. Mallaby. Brigadier Mallaby already had an agreement with Governor of East Java Mr. Surya. The agreement stated that British would not ask Indonesian troops and militia to surrender their weapons</u> [engagement]. However, a British plane from Jakarta dropped leaflets all over Surabaya. The leaflet told Indonesians to do otherwise on <u>27 October 1945</u>. This action <u>angered</u> the Indonesian troops and militia leaders because <u>they felt betrayed</u> [-affect]</p>
<p><u>On 30 October 1945, Brigadier Mallaby was killed</u> as he was approaching the British troops' post <u>near Jembatan Merah or Red Bridge, Surabaya</u> [engagement: proclaim]. <u>There were many reports</u> about the death, but <u>it was widely believed that</u> the Brigadier was murdered by Indonesian militia [engagement: attribute]. Looking at this situation, <u>Lieutenant General Sir Philip Christison brought in reinforcements to siege the city</u> [-affect], [-judgment].</p>
<p><u>In the early morning of 10 November 1945, British troops began to advance into Surabaya with cover from both naval and air bombardment. Although the Indonesians defended the city heroically, the city was conquered within 3 days and the whole battle lasted for 3 weeks. In total, between 6,000 and 16,000 Indonesians died while casualties on the British side were about 600 to 2000</u> [engagement: proclaim]</p>
<p>Battle of Surabaya caused Indonesia to <u>lose weaponry which hampered the country's independence struggle</u> [-affect]. However, the battle provoked Indonesian and international mass to rally for the country's independence which made this battle <u>especially important for Indonesian national revolution</u> [+appreciation].</p>

The second paragraph describes the causes of the battle which refer to warrantable propositions They are categorized proclaim under the engagement resource. The date of event also strengthen the writer's proposition. The effect of the causal propositions trigger Indonesian negative emotion that are realized in the clause *This action angered the Indonesian troops and militia leaders because they felt betrayed.* The writer's voice is coded

into negative affect.

Again, at the beginning of the third paragraph, the date of the event represents the reliable writer's proposition as it is realized in the clause *On 30 October 1945, Brigadier Mallaby was killed as he was approaching the British troops' post near Jembatan Merah or Red Bridge, Surabaya*. This clause is categorized proclaim in engagement resource. However, the following clause indicates the subjectivity of external voice: *There were many reports and it was widely believed that ...* Therefore, these clauses are categorized as attribution under the engagement resource. Based on these propositions, the effect of Brigadier Mallaby killing leads to the *reinforcements to siege the city by Lieutenant General Sir Philip Christison*. The meaning of this clause surely gives negative affects and negative judgment toward British troops.

The fourth paragraph condenses with well-founded propositions like the dates of naval and air bombardment, the duration of battle, the numbers of dead troops. The clauses containing these propositions are categorized as proclaim under the semantic resource of engagement.

In the last paragraph, the writer's voice shows negative affect due to the lost of weaponry which hindered Indonesian's independence struggle. However, the writer also states positive appreciation that this battle became the world's attention to provoke Indonesia to immediately gain independence. The writer's voice in the last paragraph indicates his/her concern to enhance the spirit of nationalism, patriotism, and awareness to the heroes struggle for the country in the past.

The evaluative strategies operate in historical genres involve using linguistic resources to respond to events emotionally, judge past behavior within a moral framework and assess the weight and causal force of past events. The implementation of modelling and deconstructing text through appraisal framework should consider learners' language proficiency, motivation, and text quality. Some suggestions are given as follows:

- More guided practice activities in building the context of texts and in modelling and deconstructing of texts can be provided for elementary or low foreign language learner proficiency.
- Based on learners' language needs, teachers can emphasize targeted lexico-grammatical features when they model and deconstruct text.
- Teachers can select a wide range of in-class reading topics to meet the diverse interests of learners, including authentic text.
- Learners who prefer collaborative group work can be given more opportunities to jointly construct texts with their teachers and peer.

Conclusion

In this paper, we adopted instructional discourse on modelling and deconstruction of texts by employing the appraisal theory to investigate the writers' voice. Two samples of historical texts about Indonesian wars are used

to highlight the linguistic features of evaluative meanings. These samples of historical texts can be used as the model for the learners and teachers can use them in their practice. The demonstration of text deconstruction inform learners and teachers the importance of the second stage of teaching-learning cycle which is based on genre pedagogy.

Abstract: The use of donation-based crowdfunding platforms in Indonesia is still not optimal, despite the country being known as one of the most generous in the world. This study discusses the factors that influence the use of donation platforms in Indonesia, namely perceived ease of use, perceived usefulness, platform trust, subjective norm, and gamification. Perceived ease of use and perceived usefulness are of concern because the public is still hindered by administration and platform use. Platform trust is an important factor because of concerns over violations that occur on the platform, reflected in reputation and information quality. Subjective norm are related to communities that have started using donation platforms with a potential significant number of donations. Another challenge of using donation platforms is low user engagement and retention, which can be improved through gamification. The results of this study 11 of 13 hypotheses accepted show that the perceived ease of use, perceived usefulness, and platform trust have a positive effect on behavioral intention, and behavioral intention has a significant effect on crowdfunding implementation. Meanwhile, the subjective norm does not directly affect behavioral intention, but mediated by the perceived usefulness. Gamification does not have a significant effect on behavioral intention, but has a significant effect on crowdfunding implementation, meaning that gamification will be useful for increasing retention rather than attracting users to adopt. The results of this study are processed with the VIKOR method to determine the priority scale of alternative strategies that can be developed to improve the performance of the donation platform. This study can be a guide for donation platform developers to increase the use of donation-based crowdfunding platforms in Indonesia.

Keywords: donation-based crowdfunding platform, perceived ease of use, perceived usefulness, technology acceptance model, platform trust, reputation, information quality, gamification, Indonesia.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1539-1566), Cappadocia, Turkiye. ISTES Organization.

Introduction

Indonesia has been named the most generous country in the world in 2020 by the Charities Aid Foundation (CAF) (World Giving Index, 2021). The WGI report shows that Indonesia has managed to maintain its position in the midst of a pandemic compared to other countries whose position has fallen due to the implementation of the regional restriction policy. Indonesia occupies the top two rankings of the three categories or indicators used by the WGI, namely donating to foreigners, donating money, and volunteering. On the other hand, internet penetration in Indonesia reached 76.3% as of July 2022 (Internet World Stats, 2022). Along with the penetration of the internet in Indonesia, it has made it possible for innovations to be realized in service providers such as the financial technology industry, which were previously done offline, now can be done online, including the practice of crowdfunding. Because the Internet continues to change our lives, the practice of donations, which is a type of crowdfunding, is also adapted to developing technologies (Hoefer, 2012). This is proven by the existence of a well-known donation site in Indonesia. Based on a usage ranking assessment, the IDN Research Institute (2019) states that donation platforms in Indonesia consist of Dompot Dhuafa, Ayo Peduli, Kitabisa, WeCare, Gandeng Tangan, Wujudkan, and Peduli. With the penetration of technology such as the internet and Indonesia being crowned as a generous country, it is hoped that it can support the creation of greater market potential in Indonesia, especially in the use of the donation platform.

The donation platform is a form of digital crowdfunding innovation that uses a web platform or application and utilizes an electronic payment platform to make transactions easier and faster. Djimesah et al. (2022) and Zhang et al. (2020) stated that crowdfunding-based platforms have advantages such as convenience, speed, transparency, and a wider reach compared to conventional systems. However, in Indonesia, the majority of donations have not maximized the use of digital media (Philanthropy Outlook, 2022). The results of the Philanthropy Outlook report (2022) show that the majority or 76.6% of philanthropic organizations in Indonesia use non-digital media to raise donations. The majority of digital channels used by fundraisers are social media and websites rather than the donation platform itself. This is motivated by deductions for platform operational costs, there is a collection period, and the general public is more inclined to support charitable campaigns than transformative ones. On the other hand, there is a potential increase from the donor side, research entitled GoPay Digital Donation Outlook 2020 states that digital donations have increased for generations Z, millennials and X, especially during the Covid-19 pandemic with the most significant increase in generation Z. The Covid-19 pandemic what has happened has changed the way people make donations from conventional to digital (Kopernik & Gopay, 2020). Another phenomenon, Databoks (2021) reveals that the majority of people choose online donations during Ramadan, where only 37% of respondents decide to donate offline because they are not used to it, are hampered by administration, and are limited by money transfer options. Low levels of acceptance of information technology can lead to low levels of use (Dehghan et al., 2012).

Another problem encountered was the occurrence of violations committed by one of the leading philanthropic foundations in Indonesia due to deductions from donations greater than the stipulated stipulation, namely 10%.

Another challenge in using the donation platform is low user participation and low user engagement (Golrang & Safari, 2021). According to Golrang & Safari (2021) increasing user participation can be done with gamification. Gamification is expected to encourage users to participate and engage in donation campaigns aimed at increasing potential opportunities to fund charitable projects. For gamification on the donation platform in Indonesia, currently not much has been implemented, some of which are still in the form of a Minimum Viable Product (MVP), therefore it is important to determine whether gamification has an effect on the use of the donation platform and how to determine the right dimensions or gamification elements before going any further. On the other hand, there are potential opportunities regarding various kinds of communities in Indonesia that can encourage a larger amount of donations than individual projects.

This study aims to explore the factors that influence the use of the donation platform so that it can serve as a basis for formulating a development strategy for the donation platform.

Literature Review

Donation-Based Crowdfunding Platform

The donation platform is the result of financial technology innovation in the form of crowdfunding. Crowdfunding is described as a collective effort by people or communities who build networks and pool their money together to invest and support efforts initiated by people or organizations and usually carried out via the internet (Ordanini et al., 2011). Crowdfunding can be classified into four categories, namely lending-based crowdfunding, equity-based crowdfunding, donation-based crowdfunding, and reward-based crowdfunding. However, it should be noted that donation-based crowdfunding is the only type of crowdfunding that does not involve a real or concrete return on investment (Behl & Dutta, 2020). Emerging from the social media wave, crowdfunding is open to anyone who wants to raise money or make a donation. Charitable organizations are catching on to the trend by building crowdfunding sites to host donation-based projects (Zhang et al., 2020). The benefits of the donation platform include being a valuable financial resource, charity projects on the internet, forms of community efforts, and social development. This platform is considered a valuable financial resource and is used to raise funds by individuals to support many charitable projects on the internet (Golrang & Safari, 2021). Donation platforms can help those in need apart from government efforts (Zhang et al., 2020). Donation platforms have the potential to enhance social development, especially in developing countries (Wash, 2013). Most crowdfunding agencies use various strategies to increase the amount of donations, either by focusing on the frequency of donations or by collecting larger amounts (Moritz & Block, 2016).

Donation behavior is a field of research to understand donors and strategize how to convince more to give (Zhang et al., 2020). From an operational point of view, all types of crowdfunding involve platforms, project makers, and supporters (Messeni Petruzzelli et al., 2019). Any entity wishing to establish an action, the project maker must observe certain rules relating to objectives, campaign design, principles of financial support, and legal issues. The majority of crowdfunding platforms have clear financial goals that they want to achieve within

a set time limit. In order to fully present their project to the crowd, they must offer precise and reliable information regarding the project and its results. Throughout the campaign, the platform usually maintains supporter participation and will then redirect those donations to the project creator. Internet-based platforms play an important role in the emergence of the crowdfunding phenomenon because fundraising activities are no longer limited to the geographical area where the project creator operates, but become available worldwide to any individual who can access the crowdfunding platform (Agrawal et al., 2015).

Financial technology innovation in the form of donation-based crowdfunding has begun to develop as evidenced by the presence and growth of well-known donation platforms in Indonesia. The growth of the internet population fueled digital philanthropy which underwent extraordinary transformations over the years (Hsieh, & Liou, 2020). Indonesia has been named the most generous country in the world in 2020 by the Charities Aid Foundation (CAF) (World Giving Index, 2021). Since donating money can be seen as a sacrifice, what motivates such altruistic actions is often the belief that it will eventually be rewarded in the future (C.-J. Liu & Hao, 2017). This can reflect that the Indonesian people have a high altruistic attitude.

Innovation, Easiness, and Usability

A donation-based crowdfunding platform is a form of digital crowdfunding innovation. However, from a fundraising perspective in Indonesia, the majority of donations have not maximized the use of digital media. Based on the Philanthropy Outlook Report (2022) it shows that the majority or 76.6% of philanthropic organizations in Indonesia use non-digital media to raise donations, on the other hand the digital channels used by the majority of fundraisers are social media and websites rather than donation platforms.

From the side of the donor there is an increase in potential. Research titled GoPay Digital Donation Outlook 2020 states that digital donations have increased in generations Z, millennials and X, especially during the Covid-19 pandemic. The Covid-19 pandemic that occurred has changed the way people make donations from conventional to digital (Kopernik & Gopay, 2020). Another phenomenon, Databoks (2021) reveals that the majority of people choose online donations during Ramadan, where only 37% of respondents decide to donate offline. There are still many people who have not chosen a donation platform due to deductions for platform operating costs, collection periods, the general public who are more inclined to support charitable campaigns than transformative ones, are unfamiliar, are hampered by administration, and are limited by money choices (Philanthropic Outlook, 2022). The low level of acceptance of information technology causes a low level of use, if potential users of this technology show resistance to it, the desired goals cannot be achieved (Dehghan et al., 2012).

The Technology Acceptance Model (TAM) was created by Davis in 1989 to understand the relationship between attitudes, behavior of IT consumers and also to determine the factors that affect Acceptance of IT by users of information systems and to clarify and predict user behavior (Klopping & McKinney, 2004). The technology acceptance model is derived from the Theory of Reasoned Action (TRA) (Fishbein-Ajzen). Logical

operations theory which is a general model reveals that attitudes determine social behavior and attitudes are a function of beliefs about the consequences of behavior and evaluating the results. In the technology acceptance model, the application of logic operation theory is carried out to model the acceptance of information systems by users. Perceived Ease of use PEOU and Perceived Usefulness (PU) have been considered as the two basic structures of TAM in influencing information technology acceptance in recent decades. Perceived Ease of use (PEOU) refers to the level of customer confidence that BI services are easy to use (Davis, 1989). PEOU is claimed by Venkatesh and Davis (1996) that identify causes of PEOU is very important from a theoretical point of view to decide on adoption and use. Substantial evidence is that people who experience PEOU are more likely to use the system (Davis, 1989). Perceived Usefulness (PU) refers to how a person believes using a particular device will improve his performance (Davis, 1989). Users will use the service if they believe the service can benefit them. According to the Technology Acceptance model, the perceived usefulness of a system by users is influenced by the fact that the system is easy to use. This model also assumes that perceived ease of use and perceived usefulness have a direct impact on people's attitudes towards using the information system. Based on the literature review conducted, the Technology Acceptance Model influences the intention to use e-commerce platforms (Aparicio et al., 2021), e-banking (Dehghan et al., 2012; Ly & Ly 2022), healthcare (Dhagarra et al., 2020), and crowdfunding (Djimesah et al., 2022).

Trust, Reputation, Information Quality

In contrast to the traditional conceptualization of trust which is based on building long-term human relations, the trust of internet users depends on the authenticity of digital content and the transaction processes carried out on a site (Grabosky, 2001). Three attributes are the main elements of trust in the online context, namely integrity, skill, and benevolence (Lee & Turban, 2001). Trust is an emotional state in which individuals are inspired to believe in others through satisfying behavior (Singh & Sinha, 2020). Trust supports the ecosystem in building positive long-term client relationships and is essential for technology adoption (Partel et al., 2019). Practically speaking, trust is a prerequisite for interactions carried out in uncertain environments (Ba & Paulov, 2002). In such situations, beliefs about the service provider as well as usability and ease of use become important. If service providers fail to convey trust, consumers are unlikely to engage in transactions. Ensuring trust, by creating a positive attitude towards service providers, is likely to improve user fear of service provider opportunism. Several studies have shown that trust is essential for building customer relationships and increasing system security (Li'ebana-Cabanillas et al., 2018). For consumers, online trust assurance helps mitigate vulnerabilities such as security and privacy breaches associated with online transactions (Kim & Peterson, 2017).

Reputation can be defined as an assessment of the potential desires of an entity where the evaluation is carried out by a group of external people in the context of evaluations carried out by previous buyers (Standifird, 2001). Reputation also influences the likelihood that a potential customer will make a purchase. Internet fraud causes consumers to be more careful, seeking information about vendors and taking them into account in purchasing decisions (Karahanna et al., 2013). User trust in the crowdfunding platform as a social information system,

concerns trust from donors and the authenticity of project campaign content (Zhang et al., 2020). The trust of e-commerce users in future transaction results is shaped by their past experiences. Such experiences that help reduce uncertainty in decision making can be summarized as website familiarity in terms of knowledge and understanding of the purpose of the site, how it works, and how to use it (Gefen, 2000; Kim et al., 2008). Similar to online consumers disclosing personal information, crowdfunding users enter personal and financial information into website databases to complete donation transactions. When crowdfunding sites demonstrate efforts to protect users from security and privacy compromises, user trust increases (Kim et al., 2008). This study defines perceived security as the user's perception of the efforts of crowdfunding sites to maintain the confidentiality of collected personal information and safeguard it in every way. Just as e-commerce sites need to provide accurate information about products and transactions, crowdfunding sites must provide reliable and sufficient information about projects and the donation process so that users can make informed decisions (Xu, 2018). Quality information also supports fundraising efforts by helping legitimize donation projects (Gerber et al., 2012). When users see the efforts made by crowdfunding sites to ensure that information is always complete and up-to-date, their trust tends to increase (Kim et al., 2008). On the other hand, the quality of the information can keep participants feeling engaged and their behavior active. Crowdfunding platforms need to survive and succeed with quality information as their main foundation (Bi et al., 2018). Studies also confirm that information quality leads to ethical practices on digital platforms. Based on the literature review conducted, reputation and trust have an influence on the intention to use the e-commerce platform (Aparicio et al., 2021), trust affects the intention to use the healthcare platform (Dhaggara et al., 2020). On crowdfunding platforms, reputation has an influence on platform trust which is mediated by privacy protection, perceived security and information quality which then platform trust affects crowdfunding readiness. Behl & Duta (2020) also stated that the quality of information affects the intention to use and behavior of crowdfunding.

Subjective Norm

The belief that there is a social interest in doing or not doing certain actions has been put forward by Ashraf (2018). This concept refers to social restrictions that affect individuals, such as family, friends, neighbors, and colleagues. If a person expects others to behave similarly, those social expectations tend to be followed by the individual, which means a person's perception that most people who are important to him think he should or should not perform the behavior. Therefore, individuals will be more likely to engage in activities on a donation platform if they believe that the behavior is desirable in a social context. The reason for the direct effect of subjective norms on intention is that people may choose to perform a behavior, even if they themselves dislike the behavior or its consequences, if they believe one or more important references think they should do it, and they agree. motivated enough to comply with the reference (Venkatesh & Davis, 2000).

In an empirical comparison of TAM and TRA, Davis et al. (1989) found that subjective norms had no significant influence on intention beyond perceived usefulness and ease of use, and they omitted them from the original TAM, but they acknowledged the need for additional research to investigate the conditions and mechanisms governing the impact of social influence on use behavior. Davis finds that subjective norms have a

significant influence on intention in mandatory settings but not in voluntary settings referring to the causal mechanism underlying this effect as compliance. As Hartwick & Barki (1994) found, even when users perceive use of the system as organizationally mandated, usage intentions vary because some users are unwilling to comply with the mandate. But subjective norms can influence intentions indirectly through perceived usefulness. Internalization (Kelman, 1958) refers to the process by which, when a person perceives that an important referent thinks he or she should use a system, he incorporates the referent's beliefs into his own belief structure. Internalization is equivalent to what Deutsch and Gerard (1955) call informational social influence which is defined as the influence to receive information from others as evidence about reality. In the case of internalization, subjective norms have an indirect effect on intention through perceived usefulness, as opposed to a direct adherence effect on intention. Accordingly, TAM2 theorizes that the direct effect of subjective norms on intention for mandatory use contexts will be strong prior to implementation and during initial use, but will weaken over time as increased direct experience with the system provides an evolving basis for intention toward continued use.

Gamification

User engagement is often measured as a static process and rarely measured and tested as a time series construct, this points to an important part of gamification research, namely continuous engagement (Ramadan, 2018). Gamification is the application of game domain elements to change human behavior in a non-game environment (Camerer, 2003). Gamification can generate engaging experiences, thus enhancing the way customers interact with their company or brand (Robson et al., 2016). Therefore, understanding how customer engagement in online transaction processes can be enhanced is an important factor in creating a successful digital strategy (Insley & Nunan, 2014). Palmer et al. (2012) distil hundreds of current principles of game mechanics, behavioral economics theory, and user experience design thinking into four specific dimensions of gamification. The following is an explanation of the gamification dimensions and elements:

Table 1. Gamification Dimensions and Elements (Palmer et al., 2012)

Gamification Dimensions	Definition	Gamification Elements
Progress paths	Narrative guides and challenges that change as the user progresses	Challenge, task
Feedback and rewards	Quick indication of success, whether virtual or real	Badge, achievement, level, rewards, voice feedback, point
Social connection	Support and competition structures that make winning possible	Leaderboard, community, moment
Interface and user experience	Aesthetic design and platform considerations that enhance fun and appearance	Avatar, design improvement

A series of similar hypotheses have also been proposed in the literature regarding the relationship between crowdfunding and gamification. Donation-based crowdfunding, which is at the heart of aid operations, does not offer compensation to donors, making it difficult to attract more people or consistently defend the interests of donors (Kuti & Madarász, 2014). Burtch et al. (2018) discuss how providing a points mechanism can help achieve community involvement in donation platforms. The situation becomes more complex in disaster relief operations because it involves many stakeholders and financial assistance needs to be achieved quickly, which can be done with the continuous involvement of donors (Zagefka & James, 2015). The use of gamification has also been used to generate fun in crowdfunding platforms (Hantke, Appel, & Schuller, 2018). Gamification can increase users' intrinsic and extrinsic motivation, increase user participation and enjoyment, play a positive role in changing user behavior in the fields of health, education, brand marketing, and many more (Yin, 2022). Crowdfunding platforms and channels use game mechanics to achieve the desired result. Over the years, gamification has been increasingly applied in multidisciplinary fields including commerce, environment and ecological behavior, cartography, machine learning, software development, innovation, health and medical issues, politics, education, tourism, finance and funding, energy, mobility and transportation (Golrang & Safari, 2021). Gamification is widely applied to crowdfunding platforms, including for donation-based crowdfunding (Gofundme), gift-based crowdfunding (Kickstarter), peer-to-peer or loan-based crowdfunding (LendingClub), and equity-based crowdfunding (FundersClub) (Burtch et al., 2018). Some prime examples include Razoo-like gamification approaches to fundraising, which has raised \$200 million for charity. Similar practices have also been adopted by Rallyup.com and Challengely, which have successfully engaged customers for a common goal (Neeli, 2015). As gamification has been successfully implemented on the platforms mentioned, it is hoped that gamification can influence the use of crowdfunding platforms as research has also been conducted by Behl & Dutta (2020), Zhang et al. (2020), and Golrang & Safari. (2021). According to Golrang & Safari. (2021), the use of gamification elements in the donation platform affects the sustainable use of the platform and increases user engagement.

Methodology

Data Collection Methods

To test the research model, survey observations were conducted and collected in the form of a questionnaire with a list of measurement items that were mostly adapted from existing studies. This study uses the Partial Least Square Structural Equation Modeling (PLS-SEM) technique in evaluating the proposed research model with SmartPLS 3.0 software. Compared to covariance-based structural equation modeling (SEM), SEM based on Partial Least Square (PLS) is able to handle formative latent variables in addition to reflective variables (Zhang et al., 2020). The advantages of PLS-SEM have been discussed by Peng & Lai (2012), especially in the context of predicting the validity of exogenous variables. Unlike traditional regression methods, SEM offers a simulation environment to understand the relationship and dependence of several independent constructs with dependent constructs (Urbach & Ahlemann, 2010). Hair et al., (2006) have discussed the advantages of SEM in differentiating the nature of independent and dependent variables and, more specifically, exogenous and

endogenous latent variables. Preacher & Hayes (2008) compared the use of covariance-based SEM and PLS-based SEM and proposed guidelines for using certain types of SEM in certain circumstances. This study fulfills most of the criteria set by Preacher & Hayes (2008) because this study is exploratory in nature and the theoretical framework is not borrowed from existing frameworks. The use of PLS-SEM is also recommended because it offers easy understanding of the results even with reduced sample sizes and limited residual distributions, along with handling problems such as factor uncertainty (Fornell & Bookstein, 1982). This study followed guidelines such as those provided by Peng and Lai (2012) and adopted a two-step approach to estimating the model. The first step is to examine the reliability and validity of the measurement model, then proceed with analyzing the structural model.

Data was collected in Indonesia with respondents from diverse geographical backgrounds. According to Kock & Handaya (2018) based on the theory of the inverse square root method with a significance level of 5% and a minimum path coefficient of 0.2, the minimum number of respondents is 155 respondents. Links to online questionnaires were posted on various social media platforms to reach respondents, in addition to that, filling out the questionnaire directly with respondents without going through social media. Respondents must have used donation platforms in Indonesia such as Kitabisa, Benihbaik, Wecare, ACT, Dompot Dhuafa, Rumah Zakat, Lindungihutan. Each item is measured on a five-point Likert scale to ensure higher variability between survey responses (Dubey et al., 2019), where 1 indicates Strongly Disagree and 5 indicates Strongly Agree. The use of a 5-point scale has been established as a good scale for samples larger than 100 (Leung, 2011). The study received a total of 187 respondent responses. The theoretical framework used in this study is the result of a systematic process that begins with studying existing scales and understanding their suitability and application in the context of this research and involves exploring constructs and defining them operationally in the research context.

Conceptual Model Design

Table 2. Explanation of the Conceptual Model

Variable	Concept	Source
Perceived Usefulness	The degree to which a person believes that using a particular system will improve his job performance	(Davis et al., 1992)
Perceived Ease of Use	The extent to which a person believes that using a particular system will be free of effort, freedom from difficulty or great effort	(Davis et al., 1992)
Gamification	Use of game design elements in non-game contexts to motivate and increase user activity and retention	(Deterding et al., 2011; Behl & Dutta, 2020)

Subjective Norm	A person's perception that most people who are important to him think he should or should not engage in the intended behavior	(Venkatesh & Davis, 2000)
Website Reputation	The consumer's impression of an Internet store is based on public opinion and the extent to which shoppers believe the organization is honest and cares about its customers	(Jarvenpaa et al., 2000)
Platform Trust	User trust in the platform as an information system that concerns donor trust and the authenticity of project content	(Zhang et al., 2020)
Information Quality	User's general perception of the accuracy and completeness of site information relating to products and transactions	(Kim et al., 2008)
Perceived Security	User's perception that Internet vendors will comply with security requirements such as authentication and integrity	(Kim et al., 2008)
Behavioral Intention	The degree of evaluative effect that an individual associates with using the system	(Davis et al., 1992)
Crowdfunding	Behavioral responses to individual intentions to use crowdfunding	(Behl & Dutta, 2020; Deterding et al., 2012)

With the depiction of the conceptual model as follows:

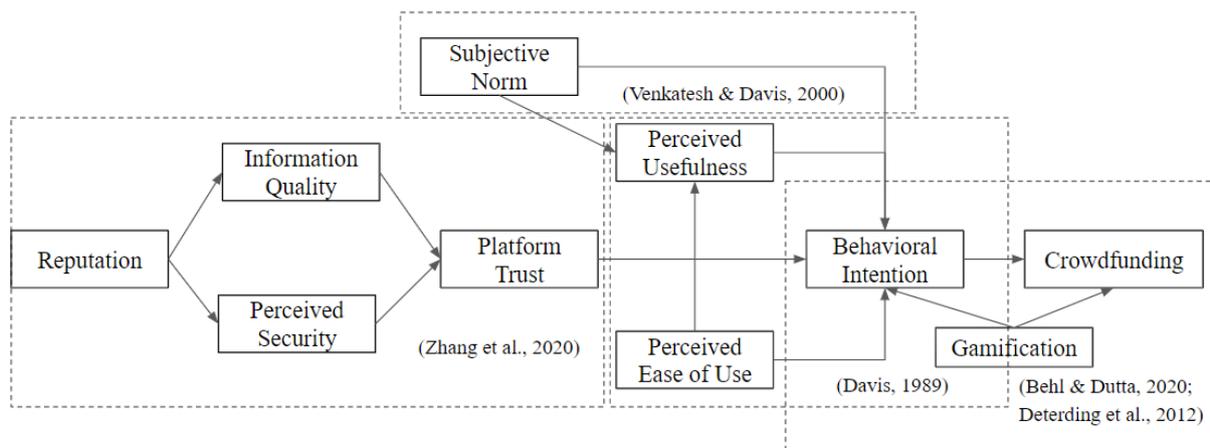

Figure 1. The Conceptual Model

The model is adopted from several financial technology literatures including donation platforms. Zhang et al.

(2020) explain how reputation affects Platform Trust which is mediated by Perceived Security and Information Quality on the use of the donation platform. Davis (1989) uses the Technology Acceptance Model in the form of two main components, namely Perceived Usefulness and Perceived Ease of Use to adopt the use of technology including financial technology. Gamification was adopted from Behl & Duta's research (2020) which proved that gamification can have a positive effect on Behavioral Intention and Crowdfunding. On the financial technology platform, Deterding et al. (2011) revealed that Gamification can influence usage involvement. In the conceptual model, all variables lead to Behavioral Intention and Crowdfunding with the aim of measuring the level of adoption and actual behavior in making donations. Through this conceptual model, the following research hypotheses were formulated:

Table 3. Research Hypothesis

Hypothesis	Definition	Source
H1	Reputation (R) has an influence on Perceived Security (PS)	(Zhang et al., 2020)
H2	Reputation (R) has an influence on Information Quality (IQ)	(Zhang et al., 2020; Behl & Dutta, 2020)
H3	Information Quality (IQ) has an influence on Platform Trust (PT)	(Zhang et al., 2020)
H4	Perceived Security (PS) has influence over Platform Trust (PT)	(Zhang et al., 2020)
H5	Platform Trust (PT) has influence on Behavioral Intention (BI)	(Zhang et al., 2020; Dhagarra et al., 2020; Aparicio et al., 2021; Sullivan & Kim; Ly & Ly 2022)
H6	Subjective Norm (SN) has an influence on Perceived Usefulness (PU)	(Venkatesh & Davis, 2020)
H7	Subjective Norm (SN) has an influence on Behavioral Intention (BI)	(Venkatesh & Davis, 2020; Ly & Ly 2022)
H8	Perceived Usefulness (PU) has an influence on Behavioral Intention (BI)	(Davis, 1989; Dehghan et al., 2012; Ly & Ly 2022; Djimesah et al., 2022)
H9	Perceived Ease of Use (PEOU) has an influence on Perceived Usefulness (PU)	(Davis, 1989; Dehghan et al., 2012; Ly & Ly 2022; Djimesah et al., 2022)
H10	Perceived Ease of Use (PEOU) has an influence on Behavioral Intention (BI)	(Davis, 1989; Dehghan et al., 2012; Ly & Ly 2022; Djimesah et al., 2022)
H11	Gamification (GM) has an influence on Behavioral Intention (BI)	(Behl & Dutta, 2020; Sullivan and Kim, 2018; Aparicio et al., 2021; Deterding et al., 2011)
H12	Gamification (GM) has an influence on Crowdfunding (CW)	(Behl & Dutta, 2020)
H13	Behavioral Intention (BI) has an influence on Crowdfunding (CW)	(Behl & Dutta, 2020)

Questionnaire Design

The questionnaire in this study used measurement items derived from a literature review of the observed constructs with the references listed in the following table:

Table 4. Research Questionnaire

Variable	Measurement Items	Source
Reputation (R)	The donation platform I use has a good reputation The donation platform that I use is known by the public The donation platform I use has a reputation for being honest	(Zhang et al., 2020; Aparicio et al., 2021)
Platform Trust (PT)	A trustworthy donation platform A reliable donation platform The donation platform keeps promises The donation platform has my best interest in mind	(Zhang et al., 2020; Fang et al., 2014)
Information Quality (IQ)	Overall, I think the platform provides useful information Donation platforms provide reliable information The donation platform provided enough information when I tried to make a donation I am satisfied with the information provided by the donation platform	(Zhang et al., 2020)
Perceived Security (PS)	The donation platform implements security measures to protect donors I feel safe with the electronic payment system on the donation platform I am willing to use my payment card on the donation platform to make a donation	(Zhang et al., 2020)
Subjective Norm (SN)	People who influence my behavior think that I should use a donation platform The community I live in thinks I should use a donation platform The media influenced me to use the donation platform	(Venkantesh & Davis, 2000; Ly & Ly, 2022)
Perceived Ease of Use (PEOU)	My interaction with the system is clear and understandable I find the system easy to use Interacting with the system doesn't take much effort	(Davis, 1989; Ly & Ly, 2022)
Perceived Usefulness (PU)	Using a donation platform would be beneficial Using the donation platform will be more convenient for me Using the donation platform system will increase my efficiency	(Davis, 1989; Ly & Ly, 2022)
Behavioral Intention (BI)	Assuming I have access to a donation platform, I intend to participate in it I intend to participate in donations on the donation platform in the future I will use the donation platform to help others Participating in donations on the donation platform is something I will do	(Behl & Dutta, 2020)
Gamification (GM)	To what extent do you believe that game elements: Gives me a feeling of being directed Gave me useful feedback so I can adapt Encourages me to strive for achievements and goals Gives me a sense of social support	(Behl & Dutta, 2020)
Crowdfunding (CW)	I prefer to fund projects that are close to their funding goal (e.g. 80% of the money to be raised) I prefer to fund projects that involve a high monetary value	(Behl & Dutta, 2020)

Being involved in the creation process through funding a project is an honor in itself
 When I fund a project, my most important driver is excitement

Profile of Respondents

As a form of respondent eligibility, respondents who are included in this study will be limited to individuals who have used the donation platform. This is done to ensure that respondents have sufficient knowledge in using the donation platform and can provide an accurate view of the factors that influence the use of the donation platform. Respondents received in this study totaled 187. Following are the profiles of the respondents who participated in filling out the research questionnaire:

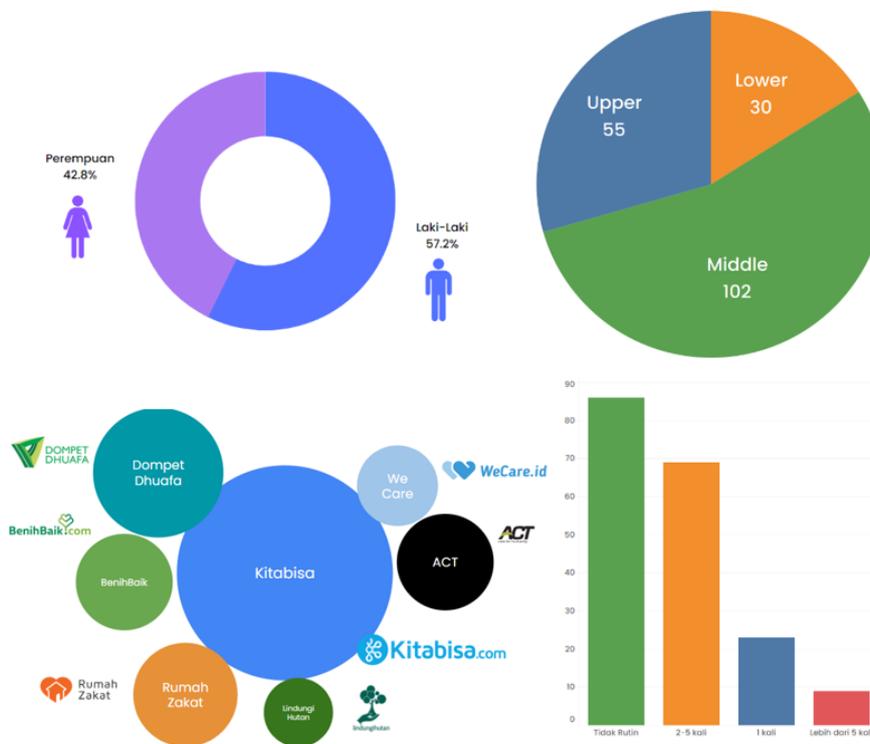

Figure 2. Profile of Respondents

Table 5. Profile of Respondents

Demographics	Classification	Total
Gender	Man	107
	Woman	80
Age	18-24 years	51
	25-30 years	50
	31-35 years	20
	36-40 years	21

	> 40 years	44
Work	Full time	98
	Part time	22
	Student / Student	29
	Entrepreneur/Business Owner	22
	Doesn't work	16
Residence	DKI Jakarta	67

Strategy Recommendations

Assessment of recommendations for strategies/alternatives in developing the donation platform with the aim of increasing user adoption and involvement is carried out using the VlseKriterijumska Optimizacija I Kompromisno (VIKOR) method which begins with the selection and adjustment of relevant alternatives to the variables that influence the use of the donation platform through a literature review conducted by researchers to then be given to the expert for confirmation. Once confirmed, then the expert evaluates the weighting of the criteria and evaluates the alternatives with the aim of obtaining a Q Value of each alternative that can be used to determine the ranking of the alternatives to all the alternatives proposed.

C	Product Manager	2 years (Donation-Based Crowdfunding Platform)

Results and Discussion

This study used the Partial Least Square Structural Equation Modeling (PLS-SEM) technique in evaluating the proposed research model with SmartPLS 3 software. A two-stage analytical procedure by (Hair et al., 2019) was used to test the measurement and structural models. The study followed the guidelines by Peng & Lai (2012) who adopted a two-step approach to estimating the model. The first step is to examine the reliability and validity of the measurement model, followed by analyzing the structural model. The results of the test using SmartPLS 3 can be seen in the following figure:

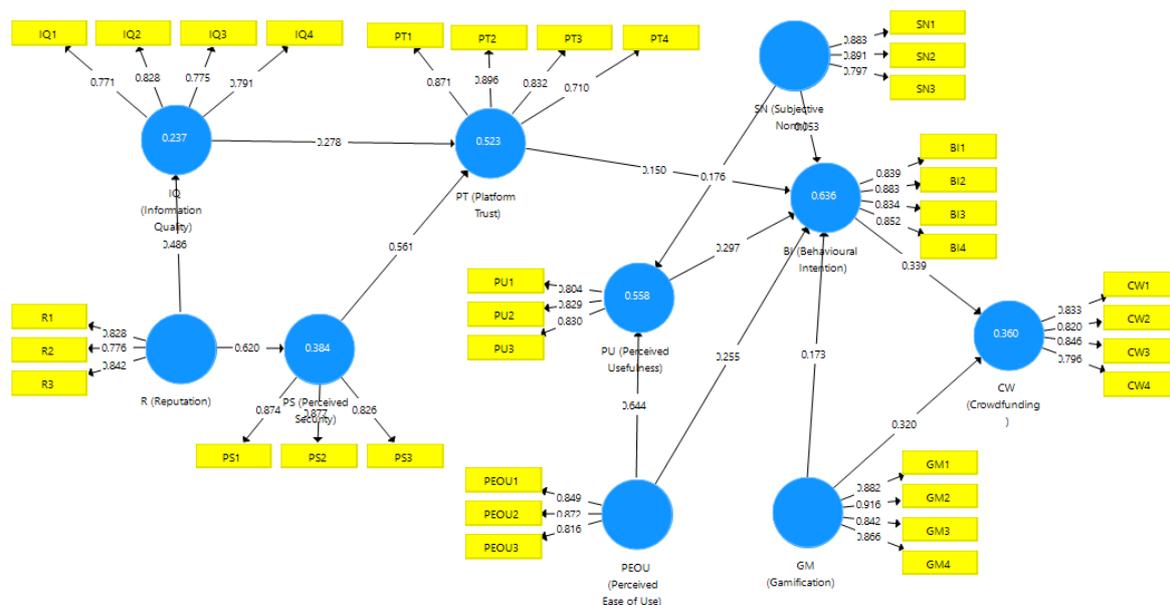

Figure 3. Path Model

Measurement Models

This study assesses the latent construct measurement model to determine validity and reliability. For internal consistency reliability assessment, Cronbach's Alpha (α) must be greater than 0.7. Outer Loading should be 0.5 or higher, and ideally 0.7 or higher. Composite Reliability (CR) must be greater than 0.7 (Hair, 2019). Meanwhile, the Average Variance Extracted (AVE) must be greater than 0.5 in determining the construct level of convergent validity (Hair, 2019).

Table 7. Validity and Reliability Test

Construct/Variable	Item	Outer Loading	Composite Reliability (CR)	Cronbach's Alpha (α)	AVE
Reputation (R)	R1	0.828	0.857	0.752	0.666
	R2	0.776			
	R3	0.842			
Information Quality (IQ)	IQ1	0.771	0.87	0.831	0.626
	IQ2	0.828			
	IQ3	0.775

	BI2	0.839			
	BI3	0.883			
	BI4	0.834			
Crowdfunding (CW)	CW1	0.833	0.894	0.843	0.679
	CW2	0.833			
	CW3	0.82			
	CW4	0.846			

Outer Loading is the value generated by each indicator to measure each variable which shows a large correlation between the indicator and the latent variable. In this study all items with an Outer Loading value have a value above 0.7, which means that they meet the requirements and are ideal, where Outer Loadings must be 0.5 or higher, and ideally 0.7 or higher for all variables. Cronbach's Alpha (α) is a measure used in statistics to measure the reliability or consistency of a measurement scale or questionnaire. In simple terms, Cronbach's Alpha (α) provides information about the extent to which the items in the scale correlate with each other. If the items on the scale have a high correlation, then the Cronbach's Alpha (α) will be high, indicating good consistency in measurement. Conversely, if the items on the scale have a low correlation, then the Cronbach's Alpha (α) will be low, indicating a problem in measurement consistency. The value of Cronbach's Alpha (α) in this study has a value above 0.7 which means that all instruments used in the variables or constructs are said to be reliable. Composite Reliability (CR) for all constructs has a value above 0.7, this indicates an acceptable level of reliability for each construct. Likewise, the Average Variance Extracted (AVE) value is far above 0.5, which

means it supports convergent validity which reflects the items used are interrelated and describe the construct well. Based on the results of the data analysis above, it can be concluded that the measurement scale used in the study has good reliability and construct validity. The items in the scale have a strong relationship with the construct being measured, and meet the expected reliability and validity criteria.

Table 8. Discriminant Validity

	BI	CW	GM	IQ	PEOU	PS	PT	PU	R	SN
BI	0.852									
CW	0.55	0.824								
GM	0.66	0.544	0.877							
IQ	0.5	0.429	0.403	0.791						
PEOU	0.717	0.414	0.669	0.451	0.846					
PS	0.679	0.44	0.687	0.421	0.626	0.859				
PT	0.661	0.446	0.647	0.514	0.685	0.678	0.83			
PU	0.712	0.515	0.603	0.548	0.731	0.588	0.656	0.821		
R	0.639	0.368	0.515	0.486	0.671	0.62	0.784	0.67	0.816	
SN	0.539	0.513	0.749	0.333	0.491	0.619	0.568	0.493	0.457	0.858

The table above given is the discriminant validity matrix, which describes the level of relationship between the variables involved in the study. The table shows that the discriminant validity in the diagonal cells is more significant than the corresponding row and column values, which means that a variable does not affect other variables more than the variable itself. The indicator must be loaded more strongly on the corresponding construct than the other constructs in the model and the AVE root must be greater than the correlation between constructs (Sullivan & Kim, 2018). Thus, it can be concluded that the variables involved in the study have good discriminant validity.

Structural Models

In measuring the inner model, the T-Statistics must be greater than 1.96, while the p-value must be 0.05 to confirm the hypothesis (Hair, 2019). Finally, the qualitative data is interpreted to confirm the quantitative results. R Square has a value of 0.75, 0.5, or 0.25, which has a substantial, moderate, and weak category (Hair, 2019). The Path Coefficient has a value of -1 to +1 which indicates the direction of the variable's influence.

Table 9. R Square

Construct/Variable	R Square
Behavioral Intention (BI)	0.636
Crowdfunding (CW)	0.36
Information Quality (IQ)	0.237
Perceived Security (PS)	0.384

Platform Trust (PT)	0.523
Perceived Usefulness (PU)	0.558

The R Square value is used to measure how much the percentage of variability of each construct can be explained by the related variables. Based on these results, it can be concluded that the variability of these constructs can be explained to different degrees by the related variables. The variability of these constructs can provide an understanding of the extent to which these constructs can influence and explain the phenomenon under study.

Table 10. Hypothesis Testing

Hypothesis	Independent Variable	Dependent Variable	Path Coefficient	T-Statistic	P-Value
H1	Reputation (R)	→ Perceived Security (PS)	0.62	14	0.000
H2	Reputation (R)	→ Information Quality (IQ)	0.486	10.719	0.000
H3	Perceived Security (PS)	→ Platform Trust (PT)	0.278	5.691	0.000
H4	Information Quality (IQ)	→ Platform Trust (PT)	0.347	11.524	0.000
H5	Platform Trust (PT)	→ Behavioral Intention (BI)	0.15	2.13	0.034
H6	Subjective Norm (SN)	→ Perceived Usefulness (PU)	0.176	3.485	0.001
H7	Subjective Norm (SN)	→ Behavioral Intention (BI)	0.053	0.774	0.439
H8	Perceived Ease of Use (PEOU)	→ Perceived Usefulness (PU)	0.255	2.923	0.004
H9	Perceived Ease of Use (PEOU)	→ Behavioral Intention (BI)	0.644	13.429	0.000
H10	Perceived Usefulness (PU)	→ Behavioral Intention (BI)	0.297	3.516	0.001
H11	Gamification (GM)	→ Behavioral Intention (BI)	0.173	1.811	0.071
H12	Gamification (GM)	→ Crowdfunding (CW)	0.32	3.937	0.000
H13	Behavioral Intention (BI)	→ Crowdfunding (CW)	0.339	3.916	0.000

The significance test is based on bootstrapping, which is a nonparametric procedure based on a large number of subsamples taken randomly from the data with replacement (Hair, 2019). In path analysis, the Path Coefficient is a measure that describes how much the independent variable influences the dependent variable and the direction of the relationship. The T-Statistic is used to measure how big the difference or relationship is between two variables, while the P-Value is used to determine whether the difference or relationship is significant or just a mere coincidence which aims to provide information about the extent to which the results of this research test support or reject the hypothesis. zero.

As shown in the table, there are 11 out of 13 significant relationships. The insignificant relationship includes

Subjective Norm (SN) to Behavioral Intention (BI) which has a T-Statistic value < 1.96 , namely 0.774 and P-Value > 0.05 , namely 0.439. Then also Gamification (GM) on Behavioral Intention (BI) which has a T-Statistic value < 1.96 , namely 1.811 and P-Value > 0.05 , namely 0.071. Based on the results of this analysis, it can be concluded that the hypotheses proposed in this study are accepted except for hypothesis H7 which does not show a significant relationship between Subjective Norm (SN) and Behavioral Intention (BI) and H11 which does not show a significant relationship between Gamification (GM) and Behavioral Intention (BI). This shows that the presence of Subjective Norm (SN) and Gamification (GM) does not cause someone to have the desire to use the donation platform. On the other hand, the results of the analysis also indicate that independent variables such as Reputation (R), Perceived Security (PS), Information Quality (IQ), Platform Trust (PT), Perceived Ease of Use (PEOU), Perceived Usefulness, and significantly contributed to Behavioral Intention, Subjective Norm (SN) significantly contributed to Perceived Usefulness (PU), and Gamification (GM) significantly contributed to Crowdfunding (CW).

Subjective Norm (SN) do not affect Behavioral Intention (BI) but affect Perceived Usefulness (PU) meaning that even though individuals receive influence or opinions from people who are important to them, this does not necessarily make them more inclined to engage in donating behavior. on these platforms This study applies Subjective Norm on donation platforms which are currently still voluntary Davis et al 1989 found that subjective norms have a significant influence on intention in mandatory settings, but not in voluntary settings Even if users perceive use of the system as an organizational mandate or community, intentions to use may vary because some users do not want to adhere to those mandates. However, subjective norms can still influence intention indirectly through perceived usefulness. The process of internalization, in which individuals incorporate referential beliefs into their own belief structures, also plays a role. important In this case, subjective norms have an indirect influence on intention through perceived usefulness In TAM 2, the theory states that the direct effect of subjective norms on intentions will be strong before implementation and during initial use, but will weaken over time due to direct experience with systems provide an ever-evolving basis for usage intentions.

Gamification (GM) has no influence on Behavioral Intention (BI) but has an influence on Crowdfunding (CW) explaining that even though the presence of gamification does not cause potential users to adopt gamification, gamification itself can help increase user engagement/retention and increase the nominal amount in make a donation by adding a game element to the fundraising process. It is necessary to consider the right gamification elements/dimensions to increase retention compared to adoption such as achievement and social sharing rather than the use of points or rewards.

Strategy Recommendations

Based on the research that has been done, what can be used as an assessment or alternative determination is knowing that Platform Trust (PT) has a significant influence on Behavioral Intention (BI), Subjective Norm (SN) which has a significant influence on Perceived Ease of Use (PEOU). but does not have a significant influence on Behavioral Intention (BI), Perceived Usefulness (PU) and Perceived Ease of Use (PEOU) which

have a significant effect on Behavioral Intention (BI), and Gamification (GM) which have a significant influence on Crowdfunding (CW) but does not have a significant effect on Behavioral Intention (BI). After knowing the effect of these factors on the use of the donation platform, the selection of relevant alternative strategies was obtained from a literature review. Alternatives in developing a donation platform based on a literature review are as follows:

- (1) Perceived Ease of Use (PEOU) has an influence on Behavioral Intention (BI) and Perceived Usefulness (PU) has an influence on Behavioral Intention (BI):

Crowdfunding platforms should take advantage of mobile money technology along with using innovative ways to increase stakeholders' perceptions of its usefulness and encourage them to use it and promote projects (Djimesah et al., 2022). Crowdfunding platforms should consider how ready platform stakeholders are to adopt the technology and their readiness to use the tools that make system adoption complete (Okine et al., 2023). Fundraisers can go the extra mile to showcase their projects with images and videos, as well as testimonials from credible individuals or organizations. Fundraisers should ensure that they update information regularly and in a timely manner. The website can provide a support system that reminds recipients to keep donors informed of project progress. Individuals or organizations coordinating fundraising projects should pay close attention to the content they place on websites. The project details donated by the donor are highlighted in the description, and the information provided is accurate and complete (Zhang et al., 2020).

- (2) Platform Trust (PT) has influence on Behavioral Intention (BI):

Companies can improve their image of trust towards customers by providing consistent service quality, keeping promises, increasing the level of integrity, and being trustworthy (Aparicio et al., 2021). It is suggested that fundraisers starting crowdfunding projects can provide detailed project information and explain their actual situation (Wu et al., 2022). Charities orient their identity working towards the dimensions of self-identity for the attainment of the goals of cultivating loyal donors. The institutional context, in the sense that charities need to rebuild credibility in the face of increasing public distrust of charity work, competes for limited resources (Liu & Chen, 2021). Disclosure of personal fundraising information is beneficial to campaign performance, as it is more likely to gain the trust of donors. Detailed project descriptions (higher number of words) can improve the performance of crowdfunding campaigns. Fundraising efforts on social media are an important factor in project performance especially in the early stages of the campaign. Frequent updates on project progress are essential to improve campaign performance (X. Liu et al., 2022).

- (3) Subjective Norm (SN) has an influence on Behavioral Intention (BI):

Practical alternatives to mandating use based on social information should be developed and tested, such as increasing the credibility of social information sources to increase internalization or designing communication campaigns that increase the prestige associated with using the system to increase identification (Venkatesh & Davis, 2000).

- (4) Gamification (GM) has an influence on Crowdfunding (CW):

Crowdfunding sites may use multiple gamification categories including points, badges, leaderboards,

social sharing and/or a combination of these to ensure effective engagement (Burtch et al., 2018). Gamification is considered as one of the most appropriate techniques to create user engagement. It is the presence of gamification elements, such as points, badges, and dynamics, that produce a sensation of consumer satisfaction as a result (Behl & Dutta, 2020).

After selecting the relevant alternatives, the alternatives are then adjusted by the researchers to be given to experts to be confirmed and given an assessment using the VIKOR procedure. The criteria used for alternative assessments are RICE with the addition of Scalability/Innovation Potential. RICE which means Reach, Impact, Confidence, Effort is a priority model created by Sean McBride at Intercom as an approach to multi-dimensional problems (Ithia, 2019; Sandy, 2020). After conducting an assessment using VIKOR, the following are recommendations for research alternatives based on the ranking of the alternative-criteria values:

- 1) Presenting interesting stories and narratives about recipients of donations and individuals who have successfully helped through donations.
- 2) Partner with trusted experts and charitable organizations/organizations that have a good reputation in providing consistent donation management services and displaying certification to create credible testimonials.
- 3) Provides an option for automatic recurring donations, where users can set a schedule and the amount of donation they want to give on a regular basis to make it easier for users to contribute consistently and build an ongoing relationship with the donation project.
- 4) Build partnerships with government, social, non-profit organizations and companies that have a good reputation in the community for the use of donation platforms, CSR, and promotion of the use of donation platforms.
- 5) Improving the features of the description of donations, monitoring and reporting of donation projects with the quality of information that is accountable and transparent on a regular basis for users.
- 6) Provide effective search and personalization features on the donation platform so that users can adjust their preferences and interests.
- 7) Provide a verification and validation system for donors and recipients of donations.
- 8) Simplify administration processes and facilitate interactive tutorials and user guides to guide new users in adopting the platform.
- 9) Increasing integration with digital payment systems or other channels (retail shops) so that users have more flexible choices in making donations.
- 10) Provide a badge and achievement system for users as rewards and prestige.
- 11) Integrate social sharing features that enable users to share social projects and donation records on the donation platform to social media users.
- 12) Provide a space for users to provide ratings and reviews of the charitable projects they support to help other users make more informed donation decisions and provide feedback to recipient organizations.

Discussion

Based on the hypothesis testing, this study found that most of the hypotheses which amounted to 11 out of 13 were accepted, except for hypotheses H7 and H11. The results of the study show that Reputation (R) which is mediated by Perceived Security (PS) and Information Quality (IQ) has a significant influence on Platform Trust (PT). Platform Trust (PT) has a significant influence on Behavioral Intention (BI), this represents that users who trust the donation platform are more likely to make donations on that platform and they also tend to consider the platform as their top choice when looking for a donation platform. Perceived Ease of Use (PEOU) and Perceived Usefulness (PU) also have a significant influence on Behavioral Intention (BI), which means that if individuals believe that with the convenience offered by the donation platform, they can make a significant contribution to the goals or missions they want to support. and if individuals feel that using the donation platform is easy and simple, then they will feel more comfortable and confident in using the donation platform to make donations. However, the findings of this study indicate that Subjective Norm (SN) has no significant effect on Behavioral Intention (BI) but has a significant effect on Perceived Usefulness (PU). This could imply that although the influence of important people on individuals does not necessarily make them more inclined to donate on a donation platform, subjective norms can still influence intention indirectly through perceived usefulness. Subjective norms will have a significant effect on mandatory arrangements, but not on voluntary arrangements, on the donation platform the majority are on voluntary arrangements. Then, Gamification (GM) also does not have a significant effect on Behavioral Intention (BI) but has a significant effect on Crowdfunding (CW). This represents that the presence of gamification does not cause users to have a direct intention to use the donation platform, but users will feel happy in carrying out the donation mechanism if gamification is present on the donation platform where this can lead to increased user engagement or retention and the amount of donations. This knowledge is then used to design strategic recommendations and prioritize the right alternative strategy recommendations to increase the use of the donation platform in Indonesia.

Conclusion

In conclusion, this study provides important insights for the development of donation platforms by identifying factors that influence user intentions and behavior to donate such as reputation, information quality, perceived security, subjective norms, platform trust, perceived usefulness, perceived ease of use, and gamification. The proposed strategy recommendations can help increase user adoption and engagement, thereby increasing the success of the donation platform in achieving their goals.

Recommendations

This research has provided valuable insight into the factors influencing the use of donation platforms in Indonesia. However, there are some suggestions that can be given for this research. First, this study used a survey method with a limited number of respondents. Consider digging deeper through qualitative research with

in-depth interviews or case studies to gain a more comprehensive understanding of the use of the donation platform. Then to make a more significant contribution, this research can compare the factors that influence the use of donation platforms in Indonesia with other countries or conduct cross-cultural studies to understand the differences and similarities in the use of donation platforms in various contexts. In the conceptual model, this study focuses on the factors that influence Behavioral Intention (BI) and Crowdfunding (CW). It is important to look at the wider impact, such as the influence of these factors on user satisfaction, loyalty and the sustainability of the donation platform. In addition, future research may involve additional variables such as privacy protection in the context of donation platform trust. In the gamification section, it is necessary to carry out future research to analyze the dimensions or elements of the right gamification to further explore the gamification factors on the involvement of users of the donation platform. In designing alternative strategies, in future research it is hoped that in selecting alternative strategies it is best to use quantitative methodology in the process of selecting strategic recommendations that are relevant to the variables that influence the use of the donation platform for then the strategy recommendations are designed and validated together with experts to be selected as alternative strategies on research.

Abstract: This paper examines teachers' adaptive approaches with regard to Environmental Studies (EVS) within primary classrooms of government schools located in suburban Mumbai in India. 'Environmental Studies' (EVS), is a significant aspect of school curricula; integrating concepts and issues of science, social studies and environment education. While the effectiveness of curricular activities and materials for EVS in fostering student learning is often examined, teachers' implementation of these resources have received relatively inadequate attention in scholarly research. The local conditions in government schools, as well as the nature of reform curriculum and teacher training form the background to the complexities involved in adaptive teaching. We find that different adaptive methods are developed by some teachers over time in response to their documentation of local concerns and resources. We also find that the teachers' strong sense of professional agency is reflected in their explorations with curriculum-adaptation possibilities. Additionally, teachers' varying levels of trust in the design of existing textbook activities may affect their pedagogical decisions. We propose that delving into teachers' local knowledge provides insights into their perspectives and practices regarding student learning. Studying teachers' adaptive approaches is therefore imperative, and has critical implications for curriculum design and teacher professional development efforts.

Keywords: Environmental education, Teacher practice, Curriculum activities

Introduction

In accordance with the Education for Sustainable Development Goals (ESD) (UNESCO, 1992), the National Curriculum Framework (NCF) 2005 in India integrates the concepts and issues of science (physical, chemical and biological), social studies (history, geography, civics, society, culture) and environment education (protection and conservation) under the subject Environmental Studies (EVS) for primary grades as part of

formal school curriculum. The National Focus Group on Curriculum, Syllabus and Textbooks recommends EVS syllabus at the primary grade level, ‘to introduce ways of looking at the natural and social world in the form of activities, ways of data collection, and making sense out of them’ (NCERT 2006a). Due to the predominance of textbooks in the Indian educational system (Clarke, 2001; Sarangapani, 2003); EVS materials and pedagogy efforts in India struggled with synthesizing the syllabus intent, learner context and textbook use in classrooms (Chhokar and Chandrasekharan, 2006). To combat this dominance of prescriptive textbooks and to improve EVS teaching and learning, the National Curriculum Framework (NCF) 2005 introduced reforms. The reform-led EVS textbooks include a variety of teaching-learning methodologies under theme-based lessons, to involve children in relating to their immediate environment through a variety of activities, opportunities to ask questions and ways to explore answers themselves (Pingel, 2009). Studies are being conducted gradually to examine teachers' perspectives, beliefs, knowledge, and professional growth in relation to the NCF-2005 reforms; and the textbook serving as a key manifestation of this change has become an important element of these studies. But empirical studies on teachers' conduct of EVS textbook activities have been neglected (Nawani, 2010; Batra 2005). Although initiatives to improve EVS curricula are significant, it is understood that they will not have the desired effects unless they are combined with suitable modifications to teacher education curricula and teacher preparation (Ravindranath, 2007). One of the criticisms leveled at teacher education in India is that it does not reflect the needs and realities of the communities in which it operates, and that teacher education programs should be structured and modified in a way that enables their teacher graduates to respond dynamically to the new problems and challenges in the field of education (Chitra, 2019). It has also been found that conventional teaching techniques are used by trainers to provide teachers instruction on the reform pedagogy’s content (Clarke, 2003). Teachers in the in-service training modules do not actively participate in the learning process; they hardly ever raise questions or engage the trainers in debate or discussion. Most crucially, teachers' classroom experiences are not examined and validated in light of the new instructional methodology, notes Clarke (2003). Thus, teachers' abilities and experiences are not taken into account throughout training, which in turn translates into teachers' constrained perspectives of children as learners possessing unique experiences and abilities.

Curriculum adaptation is an ongoing process that changes the regular prescribed curriculum by modifying or adapting it in terms of the content or delivery of instruction to meet the learning requirements of students (McLaughlin, 1993). While the phenomenon of curriculum adaptation is ubiquitous, still it is poorly understood – “it remains unacknowledged; it is described as a complex clinical skill beyond the ken of most classroom teachers; it is regarded as a mysterious, unanalyzable feature idiosyncratic to every teacher and every classroom; or most frequently, buried in elaborate discussions on individualized instruction” (Hunt, 2016). Undoubtedly, adaptation is a crucial component of teaching. Individual students have unique features, schools are "very dynamic and fluid working settings" (Collie et al., 2018), and any school day is infused with "change, unpredictability, novelty, uncertainty, and transition" (Martin, 2017). Researchers across disciplines over the years have used various terminologies for adaptive teaching, such as teacher flexibility (Leikin and Dinur, 2007), improvisation (Lobman, 2005), modifications (Denton et al., 2007), adaptive teaching (Vogt and Rogalla, 2009), and so on. It's interesting to see that scholars operationalized the idea of adaptive teaching similarly,

despite differences in nomenclature. Their definitions frequently emphasized teachers' meeting the needs of students and included teachers' response to a stimulus (or stimuli) (Parsons et. al., 2017). In line with these definitions, adaptation is conceptualized for our study as marked by one or more of the following observations – when the teacher verbally announces an alteration to the textbook activity or instruction in response to an external stimulus; and/or makes a change in the activity or instruction based on student response. No curriculum is used uncritically or without adaptation, and adaptation is a key step in how teachers use curriculum materials (Ben-Peretz, 1990). However, studies to comprehend this process explicitly in the context of teacher implementation of activities within reform-inspired EVS education in India are limited. Considering this need, we focus on teacher adaptation approaches along with their reflections on their approaches. Evidence from both research and practice shows that teaching in reform-oriented ways requires teachers to adapt curriculum and instruction while teaching (Drake & Sherin, 2002). In order for curricula to serve as a tool for reform, teachers must be encouraged and supported to make modifications that uphold the reform-focused objectives of the curricular materials while catering to the requirements of their students and unique teaching environments. Given this complexity, we think it's essential to look at how teachers employ reform-based curriculum and, in particular, to identify configurations in the curricular modifications that teachers make.

Method

Through this study we aim to study teacher views and practices of conducting EVS activities in government primary schools of Mumbai. Our study is guided by the following research question: How do primary school teachers view and adapt Environmental Studies (EVS) activities in government-run schools in suburban Mumbai? Teacher practices have been studied using both large scale studies (Schumm et al., 1994; Pettigrew et al., 2013; Zangori et al., 2013) and in-depth cases (Ramchand, 2021; Xiaodong, 2001; Sharma, 2008). Since there is a lack of studies in EVS teacher practice in the Indian context, we prefer in-depth inquiry to understand the complexity of the phenomenon situated within school settings. We used a combination of ethnography and a multi-case study approach. An ethnographic study is largely based on qualitative methodologies and places importance to the narratives of individuals involved in the concerned area of research (Brown et al., 2017). Multiple case studies are useful when there is limited prior information about a phenomenon, and it allows for inclusion of more instances thereby making it possible to make compelling interpretations (Zach, 2006). Since there is limited knowledge about teacher practices in relation to the context of this study, this research design is appropriate. The study was conducted with 15 teachers across 4 government-run schools. The State-board textbooks were being used by the participants. In the primary grades, the EVS teachers teach multiple subjects. Permission for school access was obtained and participant consent was ensured before beginning the study. The participant names are replaced by pseudonyms in the paper. Data collection was performed across 6 months. The researcher conducted interviews of teachers about their approaches towards conducting EVS activities and; observed, audio recorded and took notes of parts of the EVS sessions across the three grades. Average number of students per class ranged from 40 to 60.

Results

We see a range of different approaches in teachers' implementation of textbook activities – such as eliminating, restricting and expanding sections of a task. We refer to the activities as – ‘observation’ task, ‘definitive’ task, and ‘inquiry task’ based on what the students are primarily expected to do in the task. These activities could not be chosen a priori by the researcher, as their selection by the teacher varied according to the chapter in progress.

Approaches to an observation task: (The activity required the students to identify which of the listed food items are usually served with larger spoons/ ladles and which ones are served with small spoons). Ameena, spent 5-10 minutes discussing different aspects of the meal context – “what did you all have for dinner last night?” After she gathered some responses, she asked the questions from the textbook activity. When she realized that her students were unable to appropriately mention the food item quantities, she photographed students' lunch box images and asked them to analyze the meals from the photos. Similarly, when Sheena realized that her students faced difficulties with the task, she drew her own lunch-plate on the blackboard and then asked students to prepare paper cut-outs representing their own meal plates from lunch or dinner time. She gave the students extra time to draw different types of food items and stick them onto paper plates. She even asked probing questions to help students share about the proportion of various food items on their plate. She incorporated students' spontaneous questions such as “why does my mother always serve less pickles, while I want lots of it?”. On the other hand, Amruta avoided this task from her lesson saying “this activity is not so important, you all would know the answers, it is very easy”. In the case of Devika, we see a minor adjustment. She followed the task as is from the textbook, but took help from a photo-illustration of a meal plate shown in the textbook and asked students to point at the meal item in correspondence to their answers. She spent around 5-7 minutes to complete the entire activity. Avni spent the first 15 minutes verbally explaining the background of why some types of food are served in small quantities and other types of food in large quantities. She then began asking questions from the task. She, unlike all other teachers, framed the activity around the purpose of doing the activity. The rest of the activity was done as per the textbook directions – by drawing a table for writing names of food items under respective headings – ‘large spoon’ or ‘very small spoon’.

In case of another activity from the chapter on transport (The activity contains a picture prompt. The picture shows some vehicles on a road lined with some plants/ trees. The question is: State the difference between the plants close to the road and those far away from the road based on the following points – freshness of leaves, colour of leaves and appearance of plants). We see certain additions by teachers. This activity was provided in the textbook, and it required students to observe an image and then answer corresponding questions. However, Prajakta initiated a discussion saying, “Do you hear any noise? This noise is coming from outside. Can you see?”. Prajakta turned the students' attention to the trucks unloading construction material adjacent to the school. She then took the students out into the schoolground and asked them to spot plants in the vicinity, both near the school's inner ground and outer ground (the outer ground was closer to the construction site). She then asked them to observe the texture and colour of the leaves on the plants in the two grounds. As opposed to

Prajakta, Nilima used the same activity but used a few different images from her phone which she had captured from around her own neighborhood. She repeatedly mentioned, “all these images that I am showing are real photos that I have clicked. So that you can see the leaves in detail. You must observe the difference in the colour and texture of leaves in various parts of your neighborhood also”.

Approaches to a definitive task: (The activity required students to fill in the blanks in sentences about oral hygiene). In her approach to the definitive task, Parul asked questions about oral hygiene in the sequence of the ‘fill in the blanks’ as given in the textbook and then asked the students to make a larger chart on which they were to write the same information from the textbook but with few drawings of the process of brushing teeth. Whereas, Rekha added an extended discussion while conducting the same task. First, she asked a few basic questions – “Why should we keep our teeth clean? How do we keep our teeth clean? When should we brush our teeth?”. Then, she asked the students to draw “happy teeth and sad teeth” in their notebooks. Next, she initiated an elaborate discussion about what types of toothpastes are better, while emphasizing that students must look for “toothpastes with natural ingredients” in order to have “happy teeth” along with their “usual practice of brushing twice a day as mentioned in the textbook”. Rekha used her mobile phone to show images off the internet of certain “natural ingredients” such as cloves, salt and mint leaves. It is important to note here that Rekha was aware of an upcoming school exhibition which had the theme of organic and eco-friendly living. Rekha initiated a ‘happy teeth sad teeth’ poster making activity from the ‘fill in the blanks’ activity keeping in mind the exhibition theme. In contrast to Parul and Rekha, Amit read out all the points of the task and gave the answers by himself, stating that “you all already know the answer to these questions”.

Approaches to an inquiry task: (The activity required the students to fill a large container with water, collect the materials listed, and observe which of the materials float and which of them sink). While attempting the inquiry task ‘float or sink’, we again see some very different approaches by teachers. Kapil and Maria followed the activity exactly the way it was given in the textbook, but with slight differences. When Kapil realized that the students gave a few wrong answers, he paused to ask the students about their answer. He asked them to think why an object might float or sink, but did not spend much time waiting for students’ response. Also, he did not include a wide range of objects, and picked only a few objects from the textbook list as part of his discussions. Maria, on the other hand, followed the activity by spending more time on resolving students’ queries such as “what will happen to the objects if the water is replaced with oil?”. However, neither Kapil nor Maria attempted to physically do the activity in class. They only used discussions and questioning.

In contrast to Kapil and Maria, when Zareena conducted the ‘float or sink’ activity, she spent more time asking students questions about which of the objects provided in the list would sink or float. She then asked them to bring some objects from home and promised to dedicate a Saturday (designated as activity day by her school) to experimenting with more objects. She thus extended the time of the activity beyond normal class sessions. Amar conducted a lesson that had already been covered by Gauri (in the absence of Amar as he was on leave). In this activity, students had to collect some objects mentioned in the activity and drop them in water to check whether they sank or not. Gauri had conducted the activity by reading it in class, and stating the outcome of the activity

as mentioned in the textbook – “As time is short you all will do this at home. When you do this activity, you will find that things that float are lighter than water and things that sink are heavier”. She went over each of the objects and gave the answer as to which one would float or sink. She had asked the students to do the activity as homework and write their findings in their notebooks.

In contrast to Gauri, Amar introduced “guessing”. He first checked whether students knew the answers to the exercise. Interestingly, Amar did not ask the students how they knew the answers. Here, Amar initiated the exercise by saying, “... you all must have copied answers from each other or seen the picture in the textbook and written the answers. But then you have not experimented enough”. Amar can be seen explicitly mentioning the relevance of the adaptation he wishes to make, by describing the premise. He then asked five students to walk around the school and collect different small objects, thus providing an opportunity for out-of-classroom exploration. As the students went to hunt for several small objects, Amar got a small plastic tub filled with water. He divided the class into two teams, thus changing the participant structures. The objects brought by the students were assembled neatly besides the tub. He proceeded by writing ‘team A’ and ‘team B’ on the blackboard. Right before beginning the activity, a student spoke of how he plays with paper boats with his friends and that he knows that a paper boat would float but a simple piece of paper would get soaked and sink quickly. Amar incorporated the student’s response and initiated a few more questions – “What do you think will happen if we make a crumpled paper ball and throw it on water?”. After a while, Amar began the activity – “I will call a student from each team turn by turn. That student will drop one of these objects in the tub. But before dropping the object into the tub you all have to guess whether the object will sink or float. The team with the correct guess will get a point. Ready?”. Once the activity was over, he said, “You all might have done this activity in haste, but did you see how you got confused with some objects? Some objects had different types of materials with different properties. So, you don’t know what might happen when they are dropped in water”. Here we see that Amar attempted to change the amount of time spent on an activity, he emphasized the activity’s goal of experimentation and conducted extended discussions on properties of objects.

Discussion

Although there has been significant discussion about the need for curriculum and textbook reform over more than a decade, viewing teachers as more than implementers of the textbooks is a perspective missing from the education dialogue in India. In our study with 15 participants – we observe that some teachers adhere to the textbook activity with minor modifications, some teachers personalize activities, and others either attempt modifications while inserting new activities or; attempt parts of or avoid activities. Thus, we find that teachers’ adaptation approaches of the activities are varied.

Firstly, the majority of the teachers in our sample pursuing the textbook activities through different approaches, is a finding commonly present in research elsewhere with teachers newly experiencing reforms (Remillard, 2005; Glasnović and Jukić, 2021; Singal et. al., 2018; Dar, 2021; Bianchini and Kelly, 2003). Yet this finding

has significant implications for a context where the textbook is considered the prime resource for teachers, which is the case with EVS textbooks in India. As is evident, that teachers tend to rely on their own methods of instruction or spend efforts gathering supplementary material from other sources. As a result, the reforms introduced through the textbook and allied material may not be utilized as envisioned. Secondly, by focusing on a range of teachers across four government schools, who were predominantly adhering to the textbook activities though with a range of different adaptation approaches, we were able to investigate teachers' capacities to design various experiences for the students in their process of engaging with the affordances of the textbook activities. We see different ways of mobilizing their pedagogical capacities around tasks. Recognizing that teachers' approaches are not identical is important in terms of not just curriculum designing but also the associated teacher support. Small scale initiatives are starting in science education (Ramadas, 2017) – where teachers' varied experiences with curriculum contributes to curriculum design. Yet, such studies are almost absent in primary EVS in India. We find that teachers have varying approaches to the activities in the textbooks, however it is important to note here that our findings do not imply that the teachers will always teach in these ways. Thus, these are not fixed labels for teachers, rather indicators to help situate teachers' work in relation to the textbooks.

Adhering to the textbook activity with minor modifications

Devika, Kapil, Parul and Maria, four teachers, were observed to supplement the textbook activities with small additions and modifications, but mostly treating the textbook as a script. In a way, these teachers may be seen as “adhering” to the textbook (Nicol & Crespo, 2006), which means that the textbook is being considered as an authority by these teachers. This commitment does not, however, imply that these teachers always agreed with the content and design of the textbook. Devika and Parul, two of the teachers, highlighted what they felt to be a number of problems with the textbook activities. For instance, Devika expressed her displeasure with the textbooks and noted that the writers had overemphasized community-based exercises. She mentioned how an activity was incongruent to the social situations in student families.

“Activities are beneficial, but some of them are very strange. For example, this one (points to the textbook) – ‘write an application to the school administration requesting that parents be allowed to run the school for a day’. Do parents have so much time? They drop the children to school, go to work, ask the grandparents to take care of children once they are back from school, and even send the grandparents for parent-teaching meetings. The grandparents come here reluctant, clueless and helpless.” – Devika

When it came to her lessons, Devika was seen concentrating on most of the assignments from the textbook, trying all the different kinds of questions, and very occasionally modifying activities. She mentioned, “a textbook is ultimately like our sacred text, we must follow it”. The 'official' status of the textbook itself may be one cause for such a difference between the teacher's opinions about the textbook and her instruction. She considered it a part of her job in the government school to follow and conform with this curriculum, which may have contributed to her allegiance to the textbook assignments. Since the teacher has delegated the agency to the

textbook, the pervasiveness of the textbook culture also suggests that the teacher herself did not conceptualize her instruction as being shaped by her own views. Because of this, even though they disagreed with the textbook in some ways, Parul and Devika seemed to think that it had to be the main authoritative source of information (Kumar, 2005b) in their classes.

Understanding teacher practice also requires taking into account the institutional context in which the teachers work. Throughout the duration of our fieldwork, Devika (senior teacher) in particular was frequently asked to carry out a number of administrative tasks because few other senior teachers had recently retired and new teachers were not as experienced in administrative tasks. She continually emphasized how much time this took away from her, leaving little time for teaching. Maria and Kapil also stated how “schedule conflicts” (Maria) and “non-teaching responsibilities” (Kapil) made it difficult for them to give their lessons the attention they needed. Teachers’ workload has often been discussed as a barrier in curriculum implementation (Rose and Sika, 2019), along with decreasing focus on pedagogical skills (Gitlin, 2001). Teachers must balance their numerous responsibilities and hence teachers like Devika and Parul may not be able to use their time to work on a suitable implementation approach for a task, amidst the institutional framework of the textbook culture, and work pressure. There was only one teacher, Kapil, who seemed to show closer alignment between his views and the way he conducted the textbook activities. He did not disagree with the way the textbook activities were structured. It’s interesting to observe the contrasts between Kapil and Parul, who both follow the textbook’s instructions; are from the same institution, have similar levels of expertise, and instruct the same grade. But the way they viewed the textbook activities was different. Neither of them noted how their professional training translated into their practice. Instead of noting any formal professional training inputs, Parul noted one short storytelling workshop she had referred to online during her preparation for World Environment Day celebrations, which she could “use in her EVS lessons on biodiversity”. This workshop link was shared with her by a colleague who taught science in higher grades and had been organizing ‘eco-club’ events in schools where she worked earlier.

Personalizing activities

Prajakta, Rekha, and Zareena, three other teachers, could be seen taking a more active role in modifying the textbook activities to better reflect their own perspectives (personalizing) on environmental education pedagogy. They were seen organizing their teachings around some new activities and complimenting them with certain adaptations of the textbook activity. They gave greater priority to conducting activities, while still managing to complete the rest of the chapter sections through posing questions along with lectures. In Zareena and Prajakta’s classes, they could be seen devoting time to certain activities in different ways than the textbook. They also decided which section of the activity was to be done during class-time and as homework. As the textbook does not indicate time-breakdown of sections of an activity, teachers exercised their agency in determining the same. When Zareena conducted the ‘float or sink’ activity, she spent more time asking students questions about which of the objects provided in the list would sink or float. She then asked them to bring some objects from home and promised to dedicate a Saturday to experimenting with more objects. Zareena was very clear about her decision

to “extend” the activity. She said, “This activity is rushed past by many teachers in my own child’s school or given as homework. Sometimes the teacher just gives away all the answers. But it is an important one, so it should be given extra time. The textbook must mark it as important or mandatory”. This decision in Zareena’s opinion was essential and she also makes a recommendation to have some activities to be especially marked as “mandatory” to be done with students in class. Prajakta mentioned that she introduces an activity on planets in the beginning of the chapter on solar system.

“I always teach the names and positions of the planets on my own. Right at the beginning of the chapter. Students must know and remember this basic information. I ask them to come in front of the class and then I arrange them as planets in the way it is shown in the textbook and help them to memorize their names and positions. I was taught this way when I was a child, and it works well. For this chapter, the textbook only has questions and no physical activity as such.” – Prajakta

Prajakta also began the lesson on transport through an activity rather than following the textbook headings. She explained her approach saying, “In some chapters they have put too many activities. Yet in some other chapters where hands-on activities are actually needed, there are only questions and answers with some small accompanying illustration which is not very helpful”. Rekha, Zareena, and Prajakta modified and added material because they felt it better reflected their personal interpretation of activities and their relevance for children’s needs. Here, teachers used the textbook as a guide. They took pedagogical decisions in elaborating the activities (Nicol and Crespo, 2006). Teachers’ perspectives on EVS learning must be taken into account in order to comprehend the motivations for this type of textbook implementation. Teachers seemed to find a mismatch between their expectations of “important” activities and availability of such activities in the textbook. Teachers consider certain activities as more relevant, and when they do not find the activities in the textbook as prominently present, their confidence over the textbook seems to diminish. Teachers’ opinions regarding the (perceived) missing components in the textbook further demonstrate their lack of “curricular trust” (Drake and Sherin, 2009); in other words, these three teachers appeared not to trust the textbook and utilized their autonomy to tailor their implementation strategy. Because of this perceived deficiency and mistrust of the textbook, personalization emerged as a way to bridge the “gap” (what is lacking) between their objectives and what they observed in the textbooks. Teachers look for resources other than the textbook to aid in ‘personalisation’. Zareena sought ideas from Eco-club workshops at school, but mentioned her failure to attend such workshops “peacefully”.

“Sometimes, Eco-clubs happen and I look forward to them as I feel I could gain some new ideas from them to incorporate in the classroom. But I do not have the time to peacefully attend these workshops as I am busy organizing its events along with my other school-work” – Zareena

Zareena’s comments are in line with research on efforts of the National Green Corps (NGC) in India – the majority of school teachers, or “teachers in charge”, report having little free time to devote to Eco-Club projects because they are overburdened with other teaching duties and school-related responsibilities. This is also a result

of the unavailability of qualified trainers and the dearth of high-quality training, both of which revealed a pattern of irregularities in the supervision and execution of the programme (Roberts, 2009). Moreover, the lecture style is predominant even in the teacher-trainings for EE, and there is no mandatory, uniform training (Personal conversation with a teacher educator from a teacher training college in Mumbai, Oct 3 2022). The NGC report suggests that in order to ensure organized learning and professional development, more practical strategies are required and are advised for the future. Few teachers also sought help from videos on social media as well as some privately published textbooks which they got from their own children who were studying in private schools. Nilima, Zareena, and Avni in particular talked on how they included them into their lessons. For instance, Nilima believed that the privately published textbooks had “larger and easily comprehensible” pictures which she could use with her students. Zareena mentioned using a video on her phone and some images from other textbooks showing night-sky constellations and asked her students to guess their names.

“The textbook asks teachers to arrange a night-sky watch with students and their parents. It is difficult to arrange this type of large event. Using images from elsewhere is the next best option.” – Zareena

These teachers demonstrated the opposite pattern from Kapil, who placed his reliance on the textbooks. They believed the privately printed textbooks to be better than the state-produced textbooks in some cases. Due to their own children attending private schools, all three of the teachers had access to the privately-published textbooks.

“If our regular textbooks can have better support in terms of executing the activities, then children in the government school would also benefit. We would not have to hunt for support elsewhere”. – Avni

In such a scenario where teachers’ views on the official textbooks are divided and various other materials are affecting teachers’ personalisation of the textbooks; it is essential to encourage effective teacher professional development initiatives that help primary school teachers comprehend, interact with, and use these textbook activities as they were really intended to be used – as robust yet flexible resource material empowering the teacher to create contextually relevant learning experiences.

Attempting modifications and inserting new activities

There were three teachers – Ameena, Amar and Sheena who did not criticize the textbook’s structure or the activities. These teachers were rather appreciative of how the textbook was “flexible” to provide teachers the opportunity to see it as a “companion”.

“It is like a companion in my teaching. I am free to pick and choose which activities are possible and required in my context, and take help from the textbook.” – Ameena

“I often refer to various teacher-handbooks just as I refer to this textbook. It is like a tool to think with.” – Amar

While these teachers are comfortable with the way EVS textbooks are, they do not use the tasks as described in the textbook, but instead modify them or add their own smaller activities. This presents a chance for us to discuss their own distinctive capabilities to consciously design their acts around the given activity in elaborate ways. Their intention to bring something new to the students' classroom experience echoes a shift towards seeing the teacher as an active agent in shaping the curriculum on the field. Earlier, curriculum reformers and developers depended on the notion that only high-quality resources created by experts could improve teaching, and that teachers would use those resources in the manner intended by the resource's creators (Clandinin & Connelly, 1992). They disregarded the teacher's function and her impact on instructional strategy, which reduced the teacher to only serving as a mediator for the material to reach students (Love & Pimm, 1996). However, the perception of the teacher's role within the curriculum setting has changed recently: from being seen as only a mediator between the curriculum and students to a developer of curriculum instructions (Brown, 2009; Remillard, 2005). According to Pepin et. al (2013), "teaching as design" refers to a dynamic and collaborative relationship between the teacher and the curriculum materials. Teachers use curriculum materials to organize lessons; they interpret and modify them as they develop instruction. This is referred to as the teachers' design capacity (Brown, 2009). It is also described as the teacher's capacity to identify and observe the potential of resources (Remillard, 2005). We notice this when Amar says that the textbook is a tool to think with. This interpretation and resource design continues in the implementation of lessons. We contend that Ameena, Amar and Sheena's opinions and use of the textbook could be conceptualized using this kind of teaching-as-design perspective.

Unlike teachers who describe how they use textbook activities; Ameena, Amar and Sheena believed that the adaptations were not a separate alteration or disruptive element but a naturally essential aspect of the textbook's implementation process. For instance, Sheena responded, "This exercise which I have thought of is part of the whole activity itself. It is part of how we must respond to student needs while conducting the activity.", showing that she did not see her additions as being all that different from the textbook. She also had a different perspective on the textbook activities than the teachers who personalized them. She and Ameena were the only teachers in the study who stressed that they would change teaching strategies based on student understanding as opposed to their own assumptions about how students must absorb EVS concepts. Discussing why Ameena, Sheena and Amar were such peculiar instances is crucial, particularly when opportunities to expand on such skills are minimal for teachers. Ameena explicitly stated that during her pre-service training she would make sure to attend internships in schools while most others in her batch would spend the internship-period completing pending assignments.

"I would observe senior teachers, and discuss my doubts with them. We would talk about student problems or our difficulties in preparing a lesson." – Ameena

Sheena mentioned diligently using the resource material provided to her at a skill-enrichment camp organized at her school. She had won an award during a workshop for making eco-friendly teaching-learning material and she had received an invitation to host a session at the next event. Sheena repeatedly stated the importance of

such incentives in making her feel confident about her work as a teacher and her contentment in sharing her learning with her colleagues.

In India, teachers' reflective practice is hampered by a summative learning strategy that emphasizes exam achievement and rote learning, which forces them to operate as a mere intermediary who transmits textbook material (Samuel, 2019). But we find that Ameena's case reveals a unique instance. Ameena kept an activity-register, in which she would note down new activities or even some small issues encountered while interacting with students. She mentioned that she developed this habit when she shifted from being a teacher in a private school to the current government school. She noted, "I moved to this locality as my family moved here. This school was the nearest. But I took some time to get accustomed to the atmosphere and students of this school. Maintaining my own activity register helped. I often refer back to the activities to see what worked and what were the issues. Initially some of my colleagues would laugh at me, but then slowly a couple of them also got into this habit as they felt it helped them to understand their students better." Ameena's decision to use her phone to capture pictures of students' lunch-boxes was not an in-the-moment decision. She explained, "I had noted down that children often make mistakes in giving answers in this activity. This left me puzzled, because it is quite a simple activity. So, a week before this class I took photos of my own meal. I also decided to capture students' lunch-box photos and then asked them to observe quantities of various food items. I showed all these pictures to them. I realized that they were making mistakes because their own food items were quite different from the food items in the textbook, and the quantity of items varied too." Thus, we see how Ameena's focus on documenting challenges pertaining to students' learning needs is an important aspect of her daily practice. Here, we see that more than just being able to respond to change, adaptability also involves putting the needs of the students ahead of even the best-laid plans. We align with Wender's (2021) description of adaptability as more than "just being ready to adjust to change". In Rekha's case, she extended the 'fill in the blanks' activity about oral hygiene to a poster activity, based on her awareness of the 'organic and eco-friendly living' themed school-exhibition. Here, her purpose for adapting the textbook activity was determined by a situation other than purely increasing student participation. She was also meant to lead the preparation of a tableau in the school foyer on the theme of oral hygiene. Rekha's own views about this event were mixed. She said, "I am supposed to guide the students into making a huge thermocol tooth and toothbrush and install it in the foyer. On the one hand the textbook teaches about protecting the environment, and here we have been given thermocol. Those posters showing organic toothpaste-ingredients which we made as part of the classroom activity will be hung around that tooth. Inspectors will be coming to visit, so it all needs to look grand."

The above examples show that some teachers seemed to allow more time for students to engage with activities, and attempted to provide support depending on student needs. This suggests that they intentionally created and extended their own curriculum, proving that active planning was employed by them.

Attempting parts of or avoiding activities

Three of the fifteen teachers – Amruta, Gauri and Amit, held very brief sessions for their EVS classes (around

25 minutes long) as compared to the other subjects they taught; and only attempted a few activities from the textbook. Unlike other teachers, they did not consider EVS to be as important a subject as the rest of subjects. They would often assume that the activities provided in the textbook need not be conducted in the class as these activities “do not require class time” (Amit) or “are unnecessarily far too many” (Gauri). These teachers neglected activities, and EVS as a subject. There are a number of reasons for this kind of textbook avoidance and subject neglect. First, they mentioned that “something concrete” (Amit) and “usual question and answer type” (Amruta) exercises were expected by the student’s parents in terms of written classwork, and hence these teachers put more emphasis on fact-based tasks. Accountability pressures experienced by teachers have been mentioned in previous research as well, wherein “teachers argue that instructional time is considered to be well spent by school administrators and parents if it is used in direct lecturing” (Bansal, 2018). For parents, effective teaching is marked by order, memorization, and homework that emphasizes reading and writing; eventually perceived as leading to satisfactory performance in exams and subsequent access to professional opportunities (Sriprakash, 2012).

“Parents want to see something concrete in their ward’s notebooks such as ‘fill in the blanks’ or usual ‘question and answer’ or ‘essay’.” – Amit

“Children’s parents are just seeing EVS as any other subject in which rote learning works like history facts or mathematics formulae. All rote, rote, rote. So, they expect us to dedicate more time for written classwork and less for activities.” – Amruta

Second, the teachers were in charge of teaching all subjects, EVS included. They distributed their time across subjects according to their choice. For instance, Amruta and Amit spent less time on EVS subject lessons. Amit who spent around 25 minutes on an EVS lesson explained how he would “cover just the important activities”. The “important activities” which he prefers to spend time on, are essentially fact-based questions or tasks for which answers could be easily found in the chapter text. Similarly, Gauri seemed to avoid the activities which specifically required her to invite student experiences. In Gauri’s case, we see a similar situation. When she began a chapter about biodiversity, she asked her students to describe a forest and note down all that they see in a forest. When one of the students spoke of having seen garbage lying around during his visit to a forest, Gauri paused and brought the conversation back to the image in the textbook listing green leaves, huge trees, colorful birds and animals, a pond and so on. Gauri’s discomfort with the student’s response became clear when she said (in post-observation interview), “I was not sure whether to take the discussion forward. It would have been a deviation from the textbook topic which we were studying at that point and I was not sure what that discussion might have led to”. One of the criticisms of teacher education in India is that it doesn't take into account the requirements and conditions of the contexts where it operates. Since “teacher training is predominantly academic and theoretical; and socially, economically and environmentally dislocated” (Ravindranath, 2007), teacher candidates struggle to connect their instruction to real local concerns and are inadequately aware of the sociocultural, economic, and environmental factors at play in the communities in which they teach. Furthermore, teachers could be confused about what subjects are suitable for their students to discuss and

understand (Hartsfield and Kimmel, 2020; Oulton et al., 2004). All students and teachers come to the classroom with diverse experiences and worldviews, which may influence their comfort level and willingness to discuss sensitive subjects.

Third, there was a sense of hesitation and low self-confidence about teaching EVS in these teachers. Amruta expressed that she did not consider herself an “expert” of this subject because it seemed to require a special set of competencies as compared to other subjects. This comment echoes previous research on the need for specialized training for environmental education (Ravindranath, 2007). Another reason expressed by Amruta for making her feel hesitant to teach this subject was its distance from how she was taught this subject during her own school days.

“We were never taught this way. We never even had something called EVS in our school days. I just remember the ‘good habits and bad habits’ chart which used to be hung on our classroom wall. I remember we had a moral science textbook, which said plant trees and be kind, and our teacher would just ask us to repeat sentences after her. Not many hands-on ‘EVS’ activities like they have now. So, I have to put in more effort in comprehending these activities, and sometimes I do not know how to go beyond verbal examples.” – Amruta

Research on teacher challenges with EVS has found similar issues, which raises important questions about whether current training practices are adequate in providing teachers with the skills for activity-pedagogy for EVS (Dogra, 2013). It also shows how the textbook activities might appear complicated for some teachers, and might affect their confidence in adapting the activities to their context. Anxiety can increase when a textbook presents itself in a complicated manner and requires careful and deep study (Bapat & Takker, 2016).

Conclusion

We believe that teachers attempt to strike a balance between accurate curriculum application and essential modification while implementing EVS activities. While a majority of teachers in our study adhere to textbook activities; we found that they follow, omit, extend, edit and modify activities in varying measures; and sometimes even insert new activities. This finding is important in a scenario where claims of teachers’ over-reliance on EVS textbooks are dominant (Ravindranath, 2007). The significance of this finding lies in the way it allows us to reconceptualize curriculum adaptation. In line with Wender (2021), when we broaden the notion of adaptability to include instances of actively looking for opportunities for modifying activities prioritizing student learning, adaptability starts to resemble more of a viewpoint or an approach or an outlook than just a strategy for dealing with uncertainty. The evidence for this argument can be found in teachers systematically tracking their own and students’ learning (Ameena and Amar’s case); actively tapping into out-of-classroom opportunities to conduct textbook activities (which may/may not mention an ‘outdoor’ component) (Prajakta’s case), seeking collegiality and professional support to aid activity implementation (Ameena, Sheena, Amar’s case), and employing local resources beyond textbook (Nilima, Zareena and Avni’s case). These methods are

developed by teachers over time in response to their documentation of local concerns and resources. As stated by Mascarenhas et. al (2012), adaptive teachers are those who are constantly aware of the potential ways they may modify their instruction to better support students' learning. This finding has implications for how training needs to acknowledge teachers' local knowledge of supporting student learning. The term "local knowledge" refers to knowledge that is based on experience and reproduced in a culturally specific environment (WINKLERPRINS. (n.d.)). We also find that the teachers' strong sense of professional agency was reflected in their explorations with curriculum-adaptation possibilities while critically contemplating textbook goals. Here, we align with previous research which suggests that teachers who have a strong sense of professional agency see a lot more possibilities in terms of nurturing transformative curricula (Dyer et. al, 2004). We contend that teachers' adaptation of activities is encompassed not only by their views about reform-oriented EVS pedagogy; but also, by how they view their own abilities to engage with the textbook content.

This contention arises from instances of teachers' omitting or modifying certain aspects of an activity due to their feeling of being a 'non-expert' (Amruta's case), teachers' level of trust in textbook activity design (for instance, Devika's comment about an activity involving community participation; or Amar's comment about using the textbook as a tool to think with), dependence on availability of appropriate logistics and resources (Zareena's comment on arranging the night-sky watch activity), and teachers feeling under-confident in their ability to conduct certain activities owing to their experiences of how this subject was taught to them during their school days or as part of professional training (Amruta's case). Thus, some activities seemed complicated for the teachers. The possibilities of adapting activities are limited for these teachers by a deficit interpretation of their setting, which they may also apply to themselves. This amounts to teachers' varying confidence in the viability of policy proposals encouraging child-centered, activity-based learning under the current system (Dyer et al. 2004). Without addressing this problem, ongoing efforts to improve teachers' adaptive capacities are likely to encounter obstacles since training-messages may not sufficiently support teachers' confidence in their own capacity to make a difference (Pryor, 1998).

Recommendations

The several ways that primary school teachers use EVS textbooks are examined in this study. Insights from the study expand our knowledge of how teachers interact with textbook activities in a setting where the "textbook culture" (Kumar, 1988) is pervasive. The development of textbooks and teacher education can both benefit from the study's findings. The study contends that teacher professional development for reform-oriented textbooks must include teachers' local knowledge and experience. Recognizing that teachers' involvement with textbooks varies emphasizes the need for establishment of suitable teacher education support to build teachers' pedagogical design capacities. The relationship between the teacher and the EVS textbook activities must be adequately taken into consideration especially when future curricular changes are likely as a result of the new National Education Policy 2020 (NEP 2020).

Sociological Portraits: A Heuristic Tool

Sandro Serpa

University of the Azores, Portugal,  <https://orcid.org/0000-0003-4286-4440>

Carlos Miguel Ferreira

Estoril Higher Institute for Tourism and Hotel Studies, Portugal

 <https://orcid.org/0000-0001-9232-6929>

Abstract: Sociology is a paradigmatic and methodologically eclectic science that aims to explain the social through the social. This does not exclude the existence of instruments with relevant heuristic potential. This article seeks, in a brief presentation, to expose the *sociological portraits*, a proposal that originated in Bernard Lahire, in their elaboration process and respective potential. To attain this goal, the authors performed a collection and document analysis of the *sociological portraits* of Bernard Lahire and other authors who discuss and/or problematize and implement this sociological tool. The result is a discussion of the concept of *sociological portraits* and a proposal for their elaboration, highlighting their potentialities. The conclusion is that the *sociological portrait* is a tool with a high heuristic potential that can account for the plurality inherent in an individual scale by allowing an understanding of the internal and external relationships that shape the practices of actors.

Keywords : Lahire, plural actor, Sociological analysis, *Sociological portraits*, Sociology

Introduction

Sociology, as a science, which “perceives in its specific way the social reality, producing plural theoretical topics, formulating research problems within the context of these topics, and developing methodical strategies that guide empirical research” (Ferreira & Serpa, 2017, p. 1), has always been paradigmatic and methodologically eclectic (Serpa & Ferreira, 2020; Sebele-Mpofu, 2020; Babalola & Nwanzu, 2021). This does not prevent the existence of instruments with relevant heuristic potential. One of these theoretical and methodological tools with heuristic potential are the *sociological portraits*, an original proposal that emerged from the work of Bernard Lahire and that is intrinsic to a theoretical perspective based on the plural actor. This perspective emphasizes the analysis of intra-individual and inter-individual variations of plural actors and focuses on understanding how their individual heritages of dispositions are constructed and how each individual socially constructs their individual heritage of dispositions (Martins, 2019). It favors the analysis of collective

action practices at the individual and local scale. This goal implies considering the situational elements and their effects, not exclusively derived from either the social position or the social dispositions of the actors, but shaped by the multiple and plural socialization processes, by the very processes of social interaction and imbricated with the domains of activity, the situations and the contexts (Gomes et al., 2014 and 2015). Social situations in everyday life are not a neutral component where actors mobilize means to achieve certain pre-established ends, but rather strategic social contexts generating multiple singular and collective intentionality's, among them collective action (Nunes et al., 2016, p. 9).

This article aims to contribute to the understanding of the heuristic capacities of the theoretical-methodological tool *sociological portraits*, namely its conceptual and methodological components and its elaboration process, without forgetting its potentialities but also the difficulties that shape the use of this tool.

Given the high relevance of Bernard Lahire's theoretical, methodological and empirical proposal for a sociology at the individual scale, we suggest that potential readers of this article read both the works of this French sociologist and the critical reflections developed by various authors on the contributions of this author, presented in the bibliography of this paper,

Methods

To attain the objective of this paper, the authors carried out a collection and document analysis of the sociological portraits of Bernard Lahire and other authors who discuss and/or problematize and implement this sociological tool. Documents found in two major bibliographic databases were selected and analyzed – B-ON (The Online Knowledge Library widely used in teaching and research institutions in Portugal that provides access to scholarly texts such as published papers and allows accessing repositories of master's and doctoral dissertations and research reports) and SCILIT (a centralized platform that aggregates scholarly publication with DOI). In these two bibliographic databases, the collection of documentation focused on the results of the advanced search combining the keywords *sociological portrait*, *plural actor* and *Lahire*, using the Boolean operators *and*, *or* and *not* in various fields of the bibliographic record, namely in referential bases and full-text bases of bibliographic data.

Sociological Portraits

Conceptual component

Bernard Lahire's proposal of *sociological portraits* is shaped by a look into “multi-socialized and multi-determined actors” (Amândio, 2014, p. 47), with necessarily plural dispositions resulting from a high heterogeneity, variety and multiplicity of socialization processes and the inter-individual and intra-individual variations of behaviors (Lima Junior & Massi, 2015; Academic trajectory and sociological thought: Interview with Bernard Lahire, 2004; Lahire, 2001a, 2005, 2007, 2019). According to Lahire (2005),

Actors are not made of one piece but, on the contrary, are composite collages, nuanced complexes of

dispositions (to act and to believe) more or less strongly constituted. This does not mean that they are “without coherence” but rather without a single coherence principle – of beliefs (models, norms, ideals, values...) and dispositions to act (p. 35).

Lahire develops a critical reflection of Pierre Bourdieu’s theoretical and empirical positions on the *habitus* and fields and produces a dispositional sociology that takes into account the multiplicity of socialization contexts that condition the acting, thinking and feeling of social individuals (Dias & Gauche, 2021; Lahire, 1995, 2001a, 2001b, 2002a, 2005, 2007, 2012, 2019; Lima Junior & Massi, 2015; Alves, 2016; Atkinson, 2020; Machado, 2019; Academic trajectory and sociological thought: Interview with Bernard Lahire, 2004; Rodrigues, 2018; Martins, 2019). For Bourdieu (1979), the *habitus* functions as a matrix of perceptions, appreciations and actions that embodies the objectively observable class condition, thus consisting of a “structuring structure that organizes practices and the perception of practices, the *habitus* is also a structured structure: the principle of division into logical classes that organizes the perception of the social world is itself the product of the incorporation of the division into social classes” (Bourdieu, 1979, p. 191). Directly and more straightforwardly, but that responds to the purposes of this paper, for Bourdieu, similar social conditions of existence tend to generate *habitus*, which function as a system of dispositions, perception and action in the world with a certain homogeneity and regularity in the social space. An illustrative example is Bourdieu and Passeron’s (1983) stance on the role of the School in the reproduction of social inequalities. The authors argue that the traditional education system manages to give the illusion that its inculcating action is entirely responsible for the production of the cultivated *habitus* or, by an apparent contradiction, that it does not owe its differential efficacy to the innate aptitudes of those who submit to it and is independent of all class determinations (Bourdieu & Passeron, 1983, pp. 275-276). Its action enshrines and reinforces a class *habitus* which, established outside the School, is at the beginning of all school acquisitions, contributing to perpetuating the structure of class relationships and, simultaneously, to legitimizing it, concealing that the school hierarchies it produces reproduce social hierarchies (Bourdieu & Passeron, 1983).

For Lahire (2005), no homogeneous and unifying universalizing *habitus* would define and classify all practices and dispositions of the social agents in all situations and fields where individuals act. The existence of a plurality and heterogeneity of dispositions incorporated by each social actor in complex and differentiated societies is considered, in which the family has become an agent of primary socialization in competition with other actors for the legitimacy of their education (Martins, 2019). The conditions of existence of an individual are, first and foremost, conditions of coexistence. This premise makes it possible to avoid any reification of these conditions of existence in the form of abstract properties, assets or resources (abstracted from real social relationships). These properties, assets or resources are not things that determine individuals but realities inscribed in concrete social beings that gradually enable them to establish a relationship with the world and with others (Lahire, 1995).

Lahire highlights that the socialization processes in differentiated societies are increasingly complex and heterogeneous, resulting from multiple, early and potentially varied processes of socialization among

themselves (Lahire, 2007; Academic trajectory and sociological thought: Interview with Bernard Lahire, 2004). Furthermore, dispositions are not universally transposable but updated under condition, depending on the situations, contexts of action and social universes that shape and are shaped by individuals (Martins, 2019), that is, each individual is socially produced but adds world to the world in which they are inserted, inscribing their trajectory (their biography) in historical contexts that condition or enable them (Lopes, 2023). Lahire (2007) argues that

This complexity is due to two main reasons: a) individuals are, in our societies, subject to heterogeneous and sometimes even contradictory socializing experiences (this holds in matters of culture as in other areas) and are therefore carriers of a plurality of dispositions, abilities and competences; b) these individuals are not led to acting always under the same conditions, in the same contexts of action, and their individual heritages of dispositions, abilities and competences are therefore subject to variable demands (p. 187).

Therefore, dispositions, as coherent, durable and systematic ways of thinking, acting and feeling, have a certain origin and trajectory, which is shaped depending on whether or not they are activated and mobilized by the contexts (Lopes et al., 2014). A disposition cannot be considered as an omnipresent and omnipotent entity that automatically adjusts individuals to situations, or the present to the past, but the result of the intersection (unique and unrepeatable, although able to be framed in trends and sometimes in regularities) of structural, institutional, interactional and biographical dimensions (Costa, Lopes & Caetano, 2014; Lopes et al., 2016; Martins, 2019).

It is this sociological framework that shapes the sociological *portraits* as sociologically constructed singular configurations (Lahire, 2002b), as a theoretical-methodological tool that is a form of analysis and presentation of information maintaining the “unity of each configuration [...] [in a] comparison that operates between configuration portraits” (Lahire, 1994, p. 105), thus valuing the internal dynamics of situations in contextualized interdependence relations identifying the multiple interaction of causes and effects (Lahire, 1995), and to “reach its subjectivity, capturing the social marks contextualized in the individual” (Santana, 2020, p. 65). An attempt is made to understand the variation of individual behaviors along the trajectory (diachronic line) and the various contexts and situations (synchronic dimension) (Lopes, 2023). This methodological tool of *sociologique portraits* (Davet & Venera, 2021; Lima Junior & Massi, 2015; Nunes et al., 2016; Lopes, 2012; Lopes et al., 2016) aims to

[...] to rescue a double plurality in individual trajectories: on the one hand, the plurality of internal dispositions, taking into account their genesis, their unequal strength and systematicity; on the other hand, the contextual, external plurality, associated with the multiplicity of processes, agencies and contexts of socialization or ways of life. In other words: we are plural individuals in plural contexts (Lopes et al., 2015, p. 5).

Preparation of the Sociological Portraits

But how are sociological portraits prepared? The methodological tool of the sociological portrait requires

complexity in its production and analysis (Lopes, 2014). In the production of sociological portraits, the accounts of the individuals themselves through in-depth interviews are central (Nunes et al., 2016; Lahire, 2002b) in the form of a semi-directive biographical interview (Lopes, 2012) to “understand the processes of socialization from the ‘how’, that is, to unveil the ways in which an individual constructs his/her own subjectivation, taking into consideration the most different agents and institutions that are part of his/her life” (Machado, 2019, p. 206), with the aim of “objectifying subjectivity, identifying the marks of the social in the individual, establishing a bridge between the macro-sociological and micro-sociological contexts” (Lima Junior & Massi, 2015, p. 572).

However, and despite this inductive component (Junqueira, 2019), there is a *sociological* theoretical referential (Lima Junior & Massi, 2015) that shapes the collection and production of these *sociological portraits*. We revive that, for Lahire, “the sociologist is a person who must walk on their two legs: an empirical leg and a theoretical leg” (Hasegawa et al., 2020, p. 205). The sociological portrait consists of semi-directive biographical interviews. Its main objective is to understand how individual dispositions are formed and embodied in the actor’s different social roles in the multiple social worlds that successively, alternately, concurrently and simultaneously shape those dispositions and their reconfigurations throughout life (Lopes, 2012; Sena, 2019). Lopes (2012), seeking to update Lahire’s proposal for the production of *sociological portraits*, indicates six stages in the composition of the *sociological portrait* tool as depicted in Table 1. In the analysis of *sociological portraits* it is possible to make a vertical reading and a horizontal reading (Maia, 2021). It should be emphasized that portraits do not take the form of a linear narration, already seeking an implicit comparison between them, in a “communication” between them (Lahire, 1995, p. 60).

Table 1. Stages in the making of *sociological portraits*

1. Design of a semi-directive interview script of a biographical nature, appropriate to the research objectives and covering various spheres of life deemed relevant, domains of activity, social roles, contexts and frameworks of interaction.
2. Conduction of two to three interview sessions, preferably separated from each other by a period of days or one week, encouraging reflexivity from the interviewee and the interviewer.
3. Transcription of the interviews, following the classic rules for this purpose.
4. Editing of the interviews, transforming them into a fluid discourse in the first person of the interviewee.
5. Favoring the articulation between theoretical resources and empirical material, the portrait is built by interpreting the information.
6. Provision of an interpretative title for each portrait, a summary and main body in a set of paragraphs (they may appear in bold) able to function as a summary of the trajectory and, finally, a more detailed body. There are three complementary reading possibilities for the series of portraits: by title (ultra-fast), by summary (fast) and by main body (longer).

In the project *The Students and their Trajectories in Higher Education* (ETES), coordinated by António Firmino da Costa and João Teixeira Lopes, which seeks to understand the interdependent relationships between inequalities in the trajectory, inequalities in access and inequalities in success in higher education, the script of sociological portraits detailed in Table 2 was drawn up.

Table 2. Guide for sociological portraits, ETES research

Of the potentialities of *sociological portraits* (Atkinson, 2020; Amândio, 2014, Alves, 2016; Meier, 2003; Lopes et al., 2018), the capacity of this methodological tool to provide visibility to the double plurality of individual trajectories is highlighted. On the one hand, the plurality of internal dispositions and, on the other hand, the plurality of contexts, associated with the multiplicity of processes, agencies and contexts of socialization (Lopes et al., 2015; Gomes et al., 2014 and 2015). Sociological portraits do not require exclusivity in terms of their application. As an eclectic methodology, they respect the relational nature of the object of study, thus giving rise to the mobilization of a set of techniques that, however, “respect the objectives of enhancing the reflexivity of the actor and of rescuing the intrinsic plurality of practices on an individual scale” (Gomes et al., 2014, p. 9). Empirical research strategies may be of a more extensive type (as in the ETES study mentioned above, where 170 portraits were constructed) or of a more intensive type, where the portraits emerge much more developed and complemented by an ethnographic approach (Gomes et al., 2014).

However, the application of sociological portraits is not easy or simplistic, inasmuch that it implies an in-depth

analysis of the information collected, always in a permanent dialogue that respects its heterogeneity, maintaining the “unity of each configuration [...] [in a] comparison that operates between the portraits of configuration” (Lahire, 1994, p. 105), in their interdependencies and without reductive simplifications. For example, in the research conducted by Dias and Gauche (2021) on the use of the sociological portrait as an investigative method in Brazilian research in the areas of Education and Teaching, the researchers carried out a review of theses published between 2011 and 2020, highlighting that, in several of the research papers, the analysis was not sufficiently in-depth in the sense desired by the creator of the *portraits sociologiques*. The statement that a particular individual has a *disposition to*, without conducting an analysis of what this inference means and in which contexts it was observed, can be put into perspective as an acknowledgement of the heuristic relevance of the interdependence between the plurality of internal dispositions and the plurality of contexts, but also of the degree of difficulty researchers have encountered in using this theoretical-methodological tool (Dias & Gauche, 2021).

Conclusion

The sociological portrait is a theoretical-methodological tool with high potential of development (Lima Junior & Massi, 2015; Sánchez Criado, 2007; Alves, 2016; Atkinson, 2020; Dias & Gauche, 2021), following the guidelines proposed by Lahire, which can account for the plurality inherent in plural practices on an individual scale by allowing the apprehension of internal and external power relationships (Lopes, 2012; Lopes et al., 2015). Every individual is the bearer of a plurality of dispositions and goes through a plurality of social contexts. What determines the activation of such a disposition in such a context results from the interaction between internal and external power relationships: power relationships between dispositions established during past socialization (internal) and power relationships between elements (objective characteristics of the situation, which may be associated with different people) of the context that shapes more or less the actor (external) (Lahire, 2007). The result is a discussion of the concept of sociological portraits, as well as a proposal for their production, highlighting their potentialities. The conclusion is that the sociological portrait is a tool with high heuristic potential that can account for the plurality inherent in plural practices on an individual scale by allowing an understanding of the internal and external power relationships that shape actors' practices.

Funding

This research was funded by the University of the Azores, Interdisciplinary Centre of Social Sciences-CICS.UAc/CICS.NOVA.UAc, UID/SOC/04647/2020, with the financial support of FCT/MEC through national funds and when applicable co-financed by FEDER under the PT2020 Partnership Agreement.

Abstract: A child's early years (0-8 y) are the critical development years, as this is when the foundation for learning is laid. A strong learning foundation yields better school performance and increases the likelihood of attaining higher education, resulting in major social and economic gains for society. The early childhood care and education of nearly 80 million Indian children, below the age of six, is covered by Integrated Child Development Services through 1.37 million Anganwadi centers (AWCs). Sixty percent of these children are from rural areas. Preschool education, immunization, health check-ups, referrals, dietary supplements, growth monitoring, and education on health and nutrition are provided at the AWCs. Forty-two percent of these rural children receive pre-school education at the AWCs, and the majority are from disadvantaged families. In this study for evaluating the status of early childhood education programs at rural AWCs, quantitative and qualitative data were collected from 71 AWCs across 25 villages in Haryana, to assess their physical setup, availability of learning resources, and administration and Anganwadi workers' knowledge, attitudes, and skills regarding early childhood education. The findings suggest that most of the AWCs do not have proper infrastructure, are not adequately safe, and compromise on health and hygiene. Further, learning resources are scarce and the Anganwadi workers are not trained well enough to impart knowledge and skills to children in a sustained manner. Many of them do not understand the importance of partnering with parents for children's holistic development. Although this study is limited to 71 AWCs in Mewat, the literature review indicates that these issues and challenges are common to rural villages, which is a serious concern for equity in preschool education. Thus, there is a need for several prompt reforms in early childhood education programs in rural areas of India to bring equity into preschool education.

Keywords: Early childhood education, Pre-school education, Anganwadi, Mewat

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1600-1610), Cappadocia, Turkiye. ISTES Organization.

Introduction

Numerous scientific studies on neuroscience and early child development indicate that 85% of cumulative brain development occurs between 0-8 years. Thus, children's early years are critical for their future development and learning abilities. A research analysis on the impact of early childhood programs shows that investment in young children yields a 7–13% return through better health, education, and social and economic outcomes (Heckman, 2012). The importance of early childhood education for holistic development and school readiness is well established through research and studies. School readiness primarily focuses on developing age-appropriate basic competency skills in the physical (gross and fine motor skills), cognitive, social/emotional, and linguistic domains of child development, thereby leading to children's holistic development.

The United Nations Educational, Scientific and Cultural Organization (UNESCO, n.d.) stresses on the importance of Early Childhood Care and Education (ECCE), stating that '*early childhood care and education is more than a preparatory stage assisting the child's transition to formal schooling. It emphasizes developing the whole child attending to his or her social, emotional, cognitive, and physical needs - to establish a solid and broad foundation for lifelong learning and wellbeing.*' It reinforces the connection between quality Early Childhood Education (ECE) programs and school readiness through the Sustainable Development Goal 4, which aims to ensure that all children access quality ECE programs by 2030.

A crucial concern in Indian rural primary schools is the diverse range of competency levels and skills exhibited by children in the same classroom. This is a challenge for primary-level teachers, resulting in slow progress of children's abilities and levels of retention. A possible reason for this lack of school readiness is the non-exposure of children to foundational learning programs that can nurture the appropriate skills for development (Kaul et al., 2017). A conceptual framework on school readiness by the United Nations Children's Fund (UNICEF) states that equitable access to quality ECE could improve learning outcomes, especially for marginalized children (Britto, 2012).

In 1975, the Indian government started a major initiative named, Integrated Child Development Services (ICDS). It is world's largest early childhood care and development program providing integrated services for children under six years, and expectant and nursing mothers. The services include health check-ups, dietary supplements, immunization and informal pre-school education. These are delivered cohesively to children and women through the Anganwadi centers (AWCs), that are located in villages and slums under the ICDS program. Each center is managed by a government appointed Anganwadi Worker (AWW), along with a helper. Presently, the program covers approximately 84 million children aged below six through 1.34 million operational AWCs (MWCD, 2013). Recognizing the importance of ECE programs, the Indian government issued the Early Childhood Care and Education Policy in 2013, which focuses on establishing a holistic framework to impart state-of-the-art developmentally appropriate curriculum principles and guidelines, with flexible contextualization for catering to the diverse needs of young children (Ministry of Women & Child

Development, Government of India [MWCD], 2013).

The Indian government's initiatives have helped in the provision and accessibility of ECCE; however, quality remains a concern. The AWCs are major providers of ECE for children in rural India. However, research studies conducted across the country indicate that the quality of ECE in the AWCs needs improvement. The Indian Early Childhood Education Impact Study (Kaul et al., 2017), conducted by the Center for Early Childhood Education Development (Ambedkar University, Delhi) and Annual Status of Education Report (ASER Center, New Delhi), in collaboration with UNICEF, between 2011 and 2015, in three states (Assam, Rajasthan, and Telangana), recommends an urgent strengthening of ECE for school readiness among children (3-6 y) by making policy changes, ensuring quality, and involving the community.

A narrative review of research studies on the quality of ECCE in India, during the years 2000–2016, shows that inadequate teaching-learning facilities, inappropriate teacher learning processes, and improper assessment measures affect the quality of ECCE. The recommended enablers for ensuring quality ECCE include the provision of basic infrastructure and facilities, recruitment and training of exclusive ECCE teachers, rollout of developmentally appropriate curriculum, regular and systematic assessment of children, ensuring parent and community involvement, and making ECE mandatory in all formal schools (Reetu et al., 2017).

The ASER Centre conducted a national survey titled “ASER 2019 - Early Years” in 26 districts across 24 Indian states, on the pre-schooling/schooling status of children aged 4–8 years, and their performance on competencies in four domains - cognitive development, early language, early numeracy, and social and emotional development. The findings of this survey highlight that a large proportion of 5-year-old children are unable to do age and developmentally appropriate tasks with ease, especially those from less advantaged homes. The survey recommends strengthening the AWCs for implementation of appropriate school readiness activities (ASER Centre, 2020).

This study builds on the existing research, by evaluating the status of ECE in the rural areas of Mewat district in Haryana, India. The objectives of the study are assessing the quality of the ECE program in Mewat and aiding stakeholders in holistic evaluation of early childhood programs, aiding future studies, and advocating the improvement of AWCs for ensuring equity in Preschool Education.

Method

The area of this study is Mewat, a minority concentrated district, which ranks extremely low on essential development aspects like health, education, and women empowerment. Approximately 88.6% of people in the Mewat district live in its rural areas. The male literacy rate is 70%, and the female literacy rate is 37% (Census of India, 2011). In 2015, 74% of male children and 56% of female children were enrolled in school (S M Sehgal Foundation, 2015). Overall, the dropout rate is high, and the literacy rate is low among children in Mewat.

The permission was sought from the District Programme Officer, ICDS, Mewat to do a survey of AWCs in Nuh Block of Mewat. The data was collected from the AWCs and AWWs to understand the state of the AWCs' physical infrastructure and learning environment, along with the knowledge, attitude, and skills of AWWs as early childhood educators. A mixed approach was employed to incorporate both qualitative and quantitative data-collection tools. All participants were informed about the data collection and their consent for participation was obtained. The anonymity of the AWCs and AWWs is maintained in the study.

In total, 71 AWCs were selected from across 25 villages of Nuh Block, Mewat. A checklist was used as a quantitative method of data collection on the AWCs' physical setup, availability of learning resources, and center administration. In the process of data collection, participants' behavior, gestures, eye contact and body language were observed and noted. In addition to noting physical characteristics and settings, photographs of the AWCs and classrooms were taken for further interpretation and analysis. Anganwadi workers from these 71 AWCs were questioned about their knowledge, attitudes, and skills regarding ECE, through structured and semi-structured interviews. Semi-structured interviews were conducted telephonically with 36 AWWs. After a rapport had been built, each worker was asked a set of nine questions which were formulated in advance. It included both objective (closed-ended) and subjective (open-ended) questions. All AWWs were informed of the purpose of the interview, and permissions to record the calls were obtained.

The validity of the tools was established by involving early childhood educators, researchers and Anganwadi workers during their preparation. For test-retest reliability, the tools were tested multiple times to check the consistency of the answers. The data was collected in the field within a period of two months from August to September 2021. A structured method of cleaning and storing was done to ensure quality cleaning of data. Once the cleaned data set was ready, the analysis of the data with necessary tabulations was done.

Results

This paper includes findings on the assessment of the AWCs, and the competency level of AWWs as early childhood educators. A mixed approach was used, incorporating both qualitative and quantitative tools, to collect data from 71 AWCs and AWWs. In terms of infrastructure safety, the majority of AWCs, i.e., 41 out of 71 (57.75%), had boundary walls, and 39 out of 71 (54.93%) had a main gate. However, only 23 out of 71 centers (32.39%) had a safe building structure, and only 14 centers (19.72%) had leveled floors (see Table 1).

Table 1. Infrastructure safety in AWCs

Infrastructure Safety	AWCs
Boundary walls	41
Main gate	39
Safe building structure	23
Leveled floor	14

On investigating the parameters for a healthy physical learning environment, as shown in Table 2, it was found that approximately half of the AWCs, i.e., 35 out of 71 (49.30%), had space for children to sit comfortably, but no center had basic amenities like durries and mats, or desks and chairs, for students to use. Twenty-six of the centers had well-ventilated rooms, and lights/fans were available only in three centers. An investigation of sufficient outdoor play areas revealed that only 27 (38.03%) fulfilled this criterion. Further, upon inquiry on sufficient outdoor play equipment, it was noted that only one center had it.

Table 2. Physical Learning Environment in AWCs

Physical Learning Environment	AWCs
Space for children to sit comfortably	35
Doors and windows for ventilation	26
Light and fan	3
Durries and mats	0
Desk and chair	0

The health and hygiene parameters, as seen in Table 3, revealed a clear lack of primary facilities. Only three out of 71 centers had arrangements for a safe and clean kitchen, clean drinking water, and a functional toilet, implying their absence in 95.77% of centers. Only eight of the centers (88.73%) had safe and clean surroundings.

Table 3. Health and Hygiene in AWCs

Health & Hygiene	AWCs
Safe and clean surroundings	8
Functional toilet	3
Clean drinking water	3
Safe and clean kitchen	3

It was observed that most centers had roof leakages, unlevelled floors, and broken walls. Sanitation was poor; for example, one center had a dump yard next to the boundary wall and a small drain in front of the gate. In another, rainwater seeped into the classrooms, due to the lack of a proper drainage system. Although boundary walls and open verandahs were part of most AWCs, basic facilities were often missing. These include a proper supply of electricity and water, fans, lights, desks, and chairs. Learning resources aid the teaching-learning process and are preliminary to any child's early education. These include teaching materials (in good condition), sufficient stationery and age- and reading-level appropriate books, flashcards, blocks/puzzles, worksheets, indoor play equipment and musical instruments. Games and Building as Learning Aid (developing classrooms, floors, walls, doors, pillars, corridors, the outdoor spaces as learning resources) paintings were not available in any center. Most AWCs lacked the basic resources and equipment required to teach effectively and engage and help students in active learning.

Anganwadi workers are responsible for garnering community support and participation for running the program. They are responsible for children’s nutritional needs, providing PSE, maintaining children’s health records, keeping in touch with supervisors, counseling parents, and performing home visits. In terms of center administration, all 71 centers maintained an attendance register. However, no center had a timetable for PSE, and most had neither a PSE register nor parent meeting records.

The data on educational qualifications, as seen in Figure 1, showed that many AWWs, i.e., 31 out of 71 workers (43.66%), had only passed the 8th grade, while having a matric degree is a prerequisite for being an AWW. Twenty-two had passed the 10th grade (30.99%) and 13 (18.31%) had passed the 12th grade. Five of the workers (7.04%) had only passed the 5th grade. All 71 workers had over six years of *work experience* in AWCs. Their knowledge and attitudes were assessed through structured interviews, as shown in Table 4.

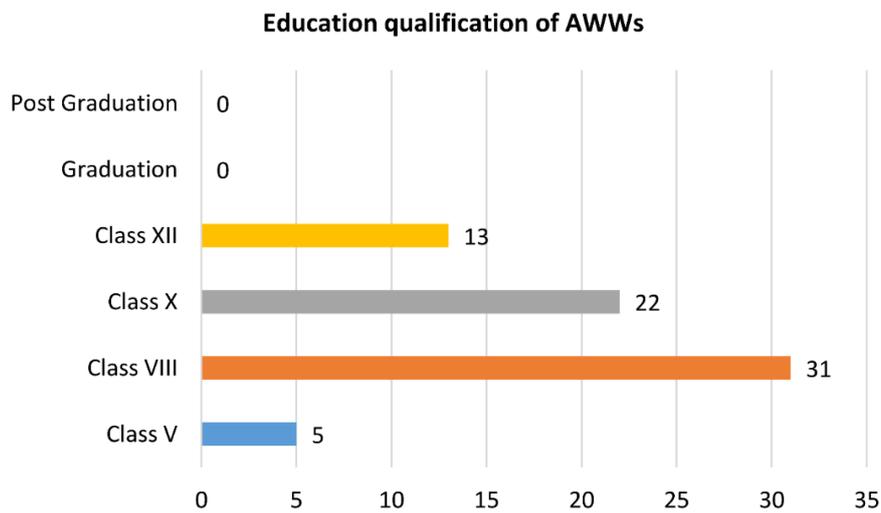

Figure 1. Educational qualification of AWWs

When asked about whether the AWWs were aware of the center’s role in developing readiness for school among the children, it was found that approximately half—36 out of 71—were unaware, whereas the other half were partially aware. Further, when questioned about the curriculum content, none were familiar with the five domains of development (physical, language, cognitive, social, and emotional) and their importance in children’s holistic development. In total, 98% of workers were unaware of the learners’ various needs and did not incorporate a variety of activities and experiences to promote holistic development.

Table 4. Knowledge and Attitude of AWWs

Knowledge & Attitude	Don’t know	Partially	Completely
Readiness for school	35	35	0
Curriculum content	70	0	0
Five domains of development	70	0	0

Activities and experiences	69	1	0
Strengths as a pre-school teacher	68	2	0
Areas for development	70	0	0
Update knowledge & skills	15	53	2
Involve the parents	47	23	0
Maintain records of children	68	2	0

Of the 71 workers, 69 (97.18%) were neither aware of their strengths as pre-school teachers, nor of the areas they needed to work on to develop as effective pre-school teachers. When asked about whether they were interested and engaged in activities/information to increase their knowledge and skills, 16 of them (22.54%) said they were not, 53 (74.65%) said they partially were, while the remaining two (2.82%) demonstrated enthusiasm, saying that they work on it conscientiously. It was found that the AWWs did not receive training sessions frequently and did not fulfill many duties attached to their roles. Most workers—48 out of 71 (67.71%)—mentioned that they did not involve the parents in their child’s growth and progress. Only 23 (32.39%) did so partially. When asked about maintaining records for the children’s benefit, it was found that barring 2 (2.82%), no worker maintained any record.

The AWWs must use a variety of instructional techniques and experiences to motivate and engage the learners. Their pedagogical skills were assessed by questions on the teaching-learning process implemented on children at the centers. As shown in Figure 2, 63% of AWWs practiced the repetition and memorization method while teaching children the pre-literacy concepts, for example, repeating the numbers or reciting a set of rhymes regularly. Some AWWs (37%) practiced activity-based education, by engaging children in hands-on activities like counting objects to teach numbers, or encouraging children to speak, for development of their language skills.

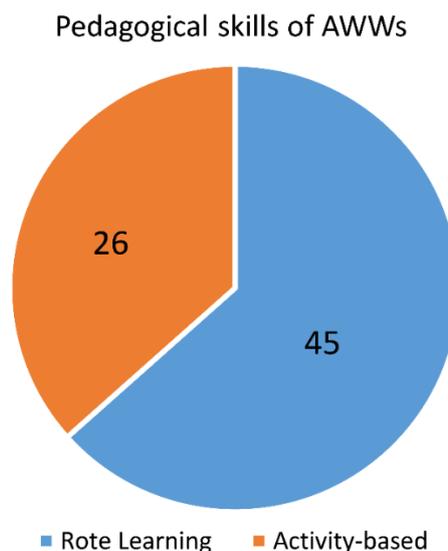

Figure 2. Pedagogical skills of AWWs. AWWs: Anganwadi workers

The semi-structured interviews were conducted telephonically, with 36 AWWs. Certain conclusions can be drawn from the collected data and information at hand. Most AWWs believe that children start responding to their environment at the fairly young age of a few months, and proper learning starts at the age of three. In their opinion, children must learn basics like counting, color names, writing and reading letters, and poems, through educational games and activities. However, the AWWs reported a lack of basic infrastructure in the centers. These include tables, chairs, books, stationery, electricity, and water supply. The dearth of these resources has a direct impact on teaching and learning processes. Furthermore, the village members and children's parents barely had the opportunity to cooperate with the workers. AWWs need parental support for children's regular attendance, and their engagement and encouragement for learning. They also require material and financial assistance to make children's Anganwadi experiences successful.

Discussion

This study outlines the conditions of ECE programs across 71 AWCs in Mewat. Most of them do not have proper infrastructure, are not adequately safe, and compromise on health and hygiene. Further, learning resources are scarce, and as a result, learning outcomes may be compromised. The AWWs are not trained well enough to impart knowledge and skills to children in a sustained manner. Many of them do not understand the importance of partnering with parents for children's holistic development. Parents are also unaware of the importance of brain development in children's early years, resulting in early education receiving inadequate attention. Although this study is limited to 71 AWCs in Mewat, the literature review indicates that these issues and challenges are common to rural villages, which is a serious concern for equity in preschool education.

Rural areas often lack proper infrastructure and resources for early childhood education. Many villages do not have well-equipped Anganwadi Centers or appropriate learning spaces. The lack of basic amenities like electricity, clean water, and sanitation facilities hampers the quality of education. There is a shortage of qualified and trained Anganwadi Workers in rural areas. The availability of skilled early childhood educators is limited, leading to underqualified or untrained individuals being hired. This impacts the quality of instruction and the ability to provide age-appropriate teaching methods. Poverty, lack of awareness, and low socioeconomic status influence the quality of early childhood education in rural areas. Parents may have limited education themselves, and their involvement in their child's early education may be minimal. Lack of awareness about the importance of parental engagement and limited support at home can hinder a child's learning and development. The diverse linguistic and cultural background in the rural areas make it challenging for children to understand and communicate effectively in the classroom. Inadequate representation of local languages and cultures in the curriculum further limits the relevance and effectiveness of education. The monitoring and evaluation mechanisms for early childhood education in rural areas are often weak. The lack of proper assessment tools and processes makes it difficult to gauge the quality of education and identify areas for improvement.

Today, there is an increased awareness of children's development and learning during their formative years.

ECE has become a global focus in the past few years, as one finds an increasing number of countries amending their policies to make education mandatory and free. With the National Education Policy 2020 (NEP), India has also given due credit to ECE by including children aged 3–6 years in the ambit of the Right to Education Act for free and compulsory education. The first chapter in the policy is on “Early Childhood Care and Education: The Foundation of Learning,” with the objective that “Every child in the range of 3-6 years has access to free, safe, high quality, developmentally appropriate care and education by 2025” (Ministry of Human Resource Development, Government of India, 2020). According to the NEP 2020, early childhood education (ECE) plays a crucial role in a child's development and lays the foundation for future learning. The policy emphasizes the importance of providing quality early childhood care and education to children from the ages of 3 to 6 years.

The NEP emphasizes a holistic approach to early childhood education that focuses on the physical, cognitive, socio-emotional, and creative development of children. It encourages a play-based and activity-based approach to learning, considering the natural curiosity and creativity of young children. The policy emphasizes the need for a flexible, inclusive, and multidisciplinary curriculum for early childhood education. The curriculum should be age-appropriate, play-based, and focus on developing foundational skills such as language, numeracy, critical thinking, problem-solving, and social-emotional skills. The NEP also emphasizes the importance of well-trained and qualified early childhood educators. It promotes capacity building programs to enhance their understanding of child psychology, teaching methodologies, and assessment strategies specific to early childhood. On parental and community engagement, the policy recognizes the crucial role of parents and the community in a child's early learning and development. It encourages parental and community participation in the early childhood education process, including regular communication, awareness programs, and capacity-building initiatives. The NEP highlights the need for a robust monitoring and evaluation mechanism to ensure the quality and effectiveness of early childhood education programs. Regular assessments, feedback mechanisms, and data-driven monitoring are encouraged to improve the overall quality of ECE.

It is important to note that the NEP 2020 provides a broad framework for early childhood education, and the implementation of specific policies and programs may vary across states and regions in India. The education is a concurrent subject under Article 42 of the Indian Constitution, state governments must pass their own laws and decide on the specifics of implementing this policy in their states. Continuous efforts and investments are required to ensure that all Anganwadi centers offer high-quality early childhood education experiences to children.

Conclusion

The early childhood education in rural areas of India faces several challenges that affect its quality. Some of the key challenges include infrastructure and learning resources, skilled early childhood educators, socioeconomic factors, language and cultural barriers, parental engagement and support, and monitoring and evaluation. Addressing these challenges requires a multi-faceted approach, including increased investment in early

childhood education, improved infrastructure, enhanced training and support for Anganwadi Workers, community engagement, and effective monitoring and evaluation systems. By addressing these challenges, India can work towards providing quality early childhood education in Anganwadi centers, ensuring a strong foundation for children's lifelong learning and development.

Recommendations

A systematic plan and implementation strategy for setting up basic infrastructure and providing learning resources in all AWCs must be developed, with a specific timeline. Standardizing the compulsory, non-negotiable physical infrastructure for a conducive learning environment, such as safe building structures, toilets, drinking water facilities, leveled floors etc., will ensure uniformity and accountability across Anganwadi Centers in India. Since, the quality of ECE programs is largely dependent on the capacity of AWWs, the Anganwadi workers must be trained on child development, age and developmentally appropriate curriculum and its transmission, classroom management, and soft skills. The current need is to create awareness among parents about children's development and learning, through sustained campaigns for encouraging parents' participation in ECE programs. A focused approach by state governments, in partnership with parents, communities, NGOs and Corporate Social Responsibility, for the implementation of quality ECE programs, can aid children from rural areas in maximizing their potential in the early years and help bring equity in pre-school education.

Abstract: The outbreak of the Covid-19 pandemic along with the gradually changing educational trends facilitate the transformation from traditional learning methods to digital learning methods. Besides, student satisfaction is vital in remote education course evaluations because it is associated with the quality of online programs. Recently, the EduNext platform has been created based on Vygotsky's social constructivism (1978), which intends to provide an educational technology for socially constructive learning. The authors tested the correlation between undergraduate students' satisfaction and perceived usefulness, perceived ease of use, and factors related to cognitive presence. The participants included 186 students participating in at least a course on EduNext at a private university in Viet Nam. The instrument employed in the quantitative phase was 22 items from Technology Acceptance Model (TAM) (Davis, 1989), cognitive presence items (Garrison et al., 2010; Shea & Bidjerano, 2008; Swan et al., 2008), and student satisfaction (Ejubović & Puška, 2019). The qualitative phase used semi-structured interviews with 10 students individually to analyze and provide characteristics of the EduNext. The findings revealed that there is a correlation between student satisfaction and perceived usefulness, resolution, and triggering events. The study provides implications for students and curriculum developers. Specifically, students can express their opinions and curriculum developers can review the ideas and improve the platform better.

Keywords: Social constructivist learning, EduNext platform, student satisfaction, TAM, Cognitive presence

Introduction

The outbreak of the Covid-19 pandemic created a 'chaos', causing activities around the world to slow down or stop altogether. Although protective measures have been implemented, the world is still not immune from the penetration of the virus completely. The education sector is also severely affected when children, students or even staff, teachers and lecturers cannot go to school. Schools at all levels must suspend face-to-face teaching activities (Dinh & Nguyen, 2020; Pokhrel & Chhetri, 2021). Besides, the complicated pandemic situation contributes to accelerating the process of changing the learning trend from traditional (face-to-face) to digital learning (Dhawan, 2020; Dinh & Nguyen, 2020; Pokhrel & Chhetri, 2021). Additionally, the technological revolution has had a great impact on many areas of human life, including education. Therefore, the expectation of implementing courses through technological devices and software is increasing (Schindler et al., 2017). Moreover, because of the overpopulation and the need for more places to study, the trend of learning from the commune has been considered, evaluated and developed for many years. Many schools have implemented online learning methods through technology devices and achieved many positive aspects (Dumford & Miller, 2018). The term online learning is now gradually becoming popular in the field of education (Singh & Thurman, 2019). Because of receiving a lot of attention, this type of education has also continuously developed and divided into many different types such as blended learning, distance education, etc. (Dhawan, 2020). Many online courses are also offered (Dumford & Miller, 2018) and with a variety of distance learning formats, access to technology devices is also widely available.

When carrying out a novel learning and teaching approach, student satisfaction is increasingly emphasized as it contributes to the assessment of the quality of the platform or curriculum. More importantly, this term has been and is a key criterion or measure for schools to assess the quality of a curriculum or learning platform (Bailey & Lee, 2010; Elliott & Shin, 2002). The developers can evaluate and gain a detailed view of improving the curriculum thanks to student satisfaction.

According to Karaksha et al., (2013) study, students grow up in the evolution of technology and are exposed to new technological achievements day by day. Therefore, students are natives of the new digital as well, they need more than traditional teaching methods, and the application of technology tools to learning and teaching brings more advantages to their learning. The study revealed that students have had a positive attitude towards the implementation of application technology into their learning.

Another factor affecting the success of distance learning is tied to the use of technology, and the TAM Model of Davis (1989) is also a typical model for evaluating the success of a technology platform. In particular, perceived usefulness and perceived ease of use are the basic and typical factors to evaluate an initial success of a platform.

The reason is that it opens up a whole new perspective on communicating, using, and learning on a new platform.

In addition to technology, cognitive presence is also a significant determinant of the quality of an online learning experience since it involves authentic methods derived from jointly creating knowledge in an online classroom. More importantly, cognitive presence is known as the key indicator of the Community of Inquiry (CoI) framework in order to support the social constructivist learning approach i.e the pivotal role in enhancing learning effectiveness. In the same vein, in a systematic review of empirical research on 30 articles about cognitive presence in online learning from 2000 to 2019, Sadaf et al., (2021) affirmed that cognitive presence makes a great contribution to the quality of online learning. The findings, however, revealed that the majority of the studies were carried out in tertiary education in the United States and Canada and quantitative research approaches were used in over half of the studies.

Recent advancements in information technology offer a number of platforms that supply constructive learning opportunities both inside and outside of the classroom. Recently, a cutting-edge educational platform named EduNext has just been created by Mr. Cao Van Viet, one of the leading figures in the EdTech sector and a specialist in leveraging technology to construct educational products at FPT Corporation (this is truly inherited and developed from CodeLearn). From the Spring semester of 2021, this platform, which intends to provide both students and teachers with a variety of educational technologies for socially constructive learning, has been used in several courses at a private university in Vietnam. Besides that, Vygotsky's social constructivism (1978)-knowledge construction occurs through social and cognitive processes – is the key foundation to constructing this platform. Thereby, relatively little research information about this platform has not been determined through many authentic studies. Therefore, the aims of this research are to identify factors that influence student satisfaction when learning through the novel platform. To fill in the blank of the research gap above, the current study is aimed to answer the following questions:

RQ1: To what extent do perceived usefulness, perceived ease of use, cognitive presence, and student satisfaction correlate with each other?

RQ2: How do perceived usefulness, perceived ease of use, and cognitive presence affect student satisfaction?

Literature Review

Constructivism

Constructivism appears to be a strict association between behavior and cognition. In other words, it is the process by which learners form their own knowledge and turn it into their own knowledge. More importantly, they have to be able to turn it from theory into practice (Amineh & Asl, 2015). Learner-centered is a principle emphasized in constructivism (Pope et al., 2005). It means that the processes of analyzing, remembering, and absorbing knowledge will be learner-centered and they are almost active people in stages to form new knowledge. According to Phillips (2000), the most popular variations of constructivism include Jean Piaget's

personal constructivism (Piaget & Inhelder, 1969) and Lev Vygotsky's social constructivism (Vygotsky, 1978).

Social Constructivism

Social constructivism is a sociological and communication theory of knowledge that looks at how people come to form their collective knowledge and understanding of the world. According to this theory, human beings collaborate to produce understanding, significance, and purpose. The assumption that people rationalize their experience by building models of how the social world works and the notion that language is the primary tool used by people to construct reality are the two key tenets of this theory (Leeds-Hurwitz, 2009). According to Vygotsky (1978), cognitive development ultimately takes place on a social level before it may happen within an individual. Making sense of people and building knowledge on such a social level enables students to relate to situations. Social constructivist researchers view learning as an operational process in which students should learn to determine data for themselves, consequently they encourage and assist learners' use of intuition and guessing (Brown, 1989). In other words, social constructivism emphasizes that reality is something that individuals cannot locate since that didn't already exist before people started constructing it in society. Furthermore, Vygotsky (1978) stated that learning is a continuous progression from the learner's current intellectual level to a higher stage that more strongly matches their capability.

Student satisfaction

Student satisfaction is an important term in assessing whether a curriculum or platform is successful. Specifically, this term can be understood as students' feelings or evaluations after experiencing knowledge from a certain service. Universities tend to use student satisfaction as a measure of their programs (Elliott & Shin, 2002; Lee, 2010). The concept of satisfaction is gradually changing with the times. Especially, in the online teaching environment, it is even more necessary to be aware of the importance of this term. Specifically, it is strongly perceived in terms of interaction, technology, and perception (Strachota, 2003).

Edunext Platform

Edunext was created by Mr. Cao Van Viet, one of the leading figures in the EdTech sector and a specialist in leveraging technology to construct educational products at FPT Corporation (this is truly inherited and developed from CodeLearn) in 2021 with the aim of providing a place where students can share their critical thinking, and interact with their peers. Moreover, students can acquire knowledge from their lecturers, their classmates, and other sources to construct their own knowledge. Besides that, the key foundation to constructing this platform is based on the social constructivist model. Figure 1 depicts the interface of this platform.

Because EduNext is developed to help students build knowledge and skills through interactive activities, personal views are encouraged to be shared and self-assessment is formed. To illustrate, Edunext has plenty of features that permit instructors to create constructive questions; Students joining the class are required to answer

the questions; Edunext also permits students to rate their classmates' answers by star voting. (which is illustrated in Figure 2). The questions are set under the form of social construction, hence the answers are always general. Teachers always comment on the answers so that students can absorb them correctly. More importantly, the Edunext platform also provides instructors with features to help them manage classes effectively. For instance, they can know which students haven't answered the questions, and which students are most active or least active.

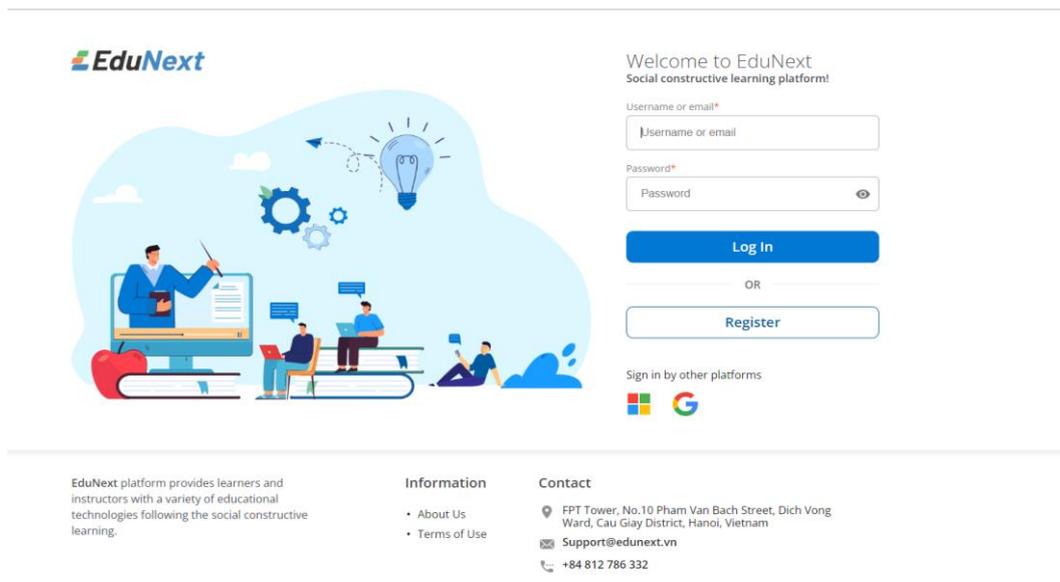

Figure 1. EduNext's interface

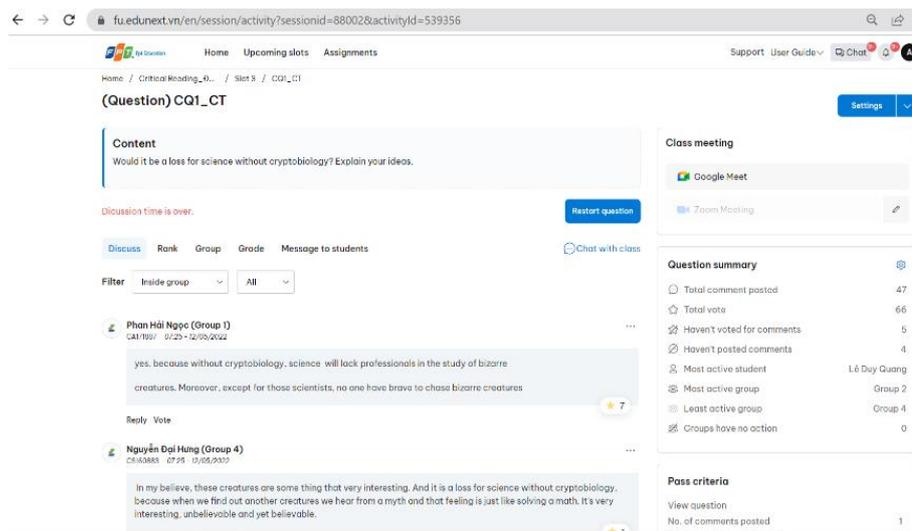

Figure 2. Space to participate in answering social construction questions and voting stars on EduNext

The interaction between peers is developed by EduNext through the integration of chat between group members. Figure 3 shows the chat feature on EduNext. Members in the same group can use the group chat feature to discuss with each other. Group members can exchange text or visual information via Google Meet.

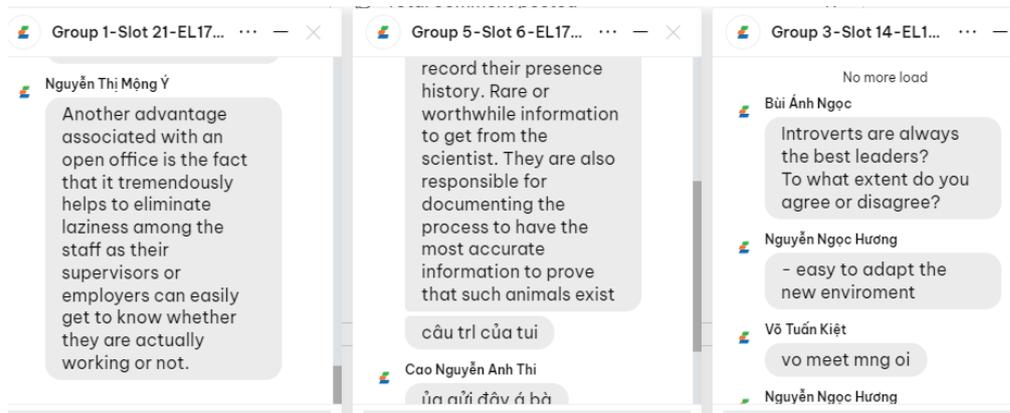

Figure 3. Group chat feature on EduNext

Theoretical framework

Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM) is a theory of information systems that describes the method users accept and choose to embrace technology. Davis (1989) developed the model based on investigations on perceived usefulness regarding utility and ease of use. Besides, one of the reasons for designing TAM was to anticipate and explain user adoption and usage of technological information. The model has been utilized in a range of technology-related sectors and situations, and it is recognized as a significant model suitable for examining the adoption of different online learning tools. That's the reason why "TAM" (Davis, 1989) was selected for the research.

Community of Inquiry (CoI)

The CoI framework developed by Garrison et al., (1999), outlines the crucial components of an effective online learning approach. It is based on Dewey's educational theory and social constructivism. It offers a collaborative-constructivist perspective (Arbaugh et al., 2008). According to Garrison et al., (1999), this framework included social, teaching, and cognitive presence. Firstly, social presence is defined as one's realness via affective expression, open dialogue, and group cohesiveness. Secondly, teaching presence is referred to as the planning, facilitating, and guiding of social and cognitive development to produce worthwhile and practical learning outcomes. Eventually, cognitive presence refers to how effectively students are capable of generating and validating meaning via extended thought and discussion within a critical Community of Inquiry (Garrison et al., 2001).

Cognitive Presence

Cognitive presence was defined by Garrison et al., (2001) as "the extent to which learners can construct and

confirm meaning through sustained reflection and discourse in a critical community of inquiry”. Obviously, learners’ online experiences have been deeply revealed via reflection and discourse. Therefore, cognitive presence is considered the core value of a community of inquiry even though it may be the least studied and understood. In fact, cognitive presence has a more stable meaning compared to the other presences because its meaning is originally from the Practical Inquiry Model (PIM) which is widely used in measuring cognitive presence in virtual activities and highlighted the integral role of collaboration between cognitive presence and the need of community. There are four phases in PIM comprising trigger event, exploration, integration and resolution/application (Garrison et al., 2001). The trigger event is defined as the first stage of critical inquiry to identify problems, dilemma emerged from experience. The next phase is exploration which is a vital and time-consuming stage for learners to individually and collaboratively search for various materials and share their ideas. Ideas searched from the second phase will be constructed into meaning in the third phase, which is Integration, besides it provides learners an opportunity to evaluate the feasibility and applicability of ideas to consider whether or not they are well-connected to the problem and to offer some promising solutions. The ultimate one is resolution/ application which is the phase to test solutions for problems from the initiation stage.

Previous Studies

The evolution of technology, recently, has been changing the way of learning as well as the training strategy of educational institutions, popularly the use of technology tools. There is no doubt about the benefits that technology tools bring to learners; besides that, there are also factors that also affect students' satisfaction. Therefore, there have appeared more and more research papers in international studies and studies in Vietnam, which are conducted with the aim of giving an overview of students' experiences in online learning.

According to Azhari et al., (2020)'s research with pharmacy students' perceptions on social constructivist learning environments. The findings showed that their positive feelings as well as their positive perception decreased with each school year (first year to final year). This is caused by the background, knowledge of the students, and interaction. It can be seen that although students have a positive satisfaction towards social constructivist learning environments, the majority of students expect e-learning associated with their professional practice, the second students have higher satisfaction than the final-year students. Furthermore, readiness was also reported by Chung et al., (2020) emphasizes having an impact on students' learning experience and satisfaction. They suggest that readiness is also affected by student maturity. The report shows that the ages of 3rd - 4th year students show more readiness for online learning than 1st - 2nd year students (Chung et al., 2020; Hung et al., 2010; Wojciechowski & Palmer, 2005). By the way, readiness has the opposite effect reported by Chung et al., (2020) compared with that reported by Azhari et al., (2020).

Cole et al., (2014) conducted a 3-year study on student satisfaction with an e-learning learning environment. Specifically, students did not show high satisfaction with the online learning environment, and they only rated satisfaction at a moderate level. Student satisfaction in blended learning will be higher than in synchronous online learning. Moreover, two main factors affecting students' satisfaction and dissatisfaction with the learning

environment are convenience and lack of interaction, respectively. Cole et al., (2014) also stated that gender has no significant influence on their satisfaction with e-learning. While Chung et al., (2020) determined that student satisfaction with online learning varies by gender and study program. Their research shows that females and degree students show more satisfaction than males and diplomas. The research time of the two reports is different, which leads to different results (2014-2020).

Moreover, by using TAM (Davis, 1989), Sahin & Shelley (2008) postulated that skillfully using online tools and well awaring of the benefits of online learning will positively impact students' satisfaction. Similarly, an investigation into the application of technology in teaching tourism students during the Covid-19 epidemic by Kallou et al., (2022), partly through TAM, has shown that it is a positive sign for the continued development and adoption of web conferencing technology in higher education. Research results show that the acceptance and satisfaction of students are gradually improving.

In Viet Nam, owing to the outbreak of the Covid-19 epidemic, most institutions required their students to switch to online and distance learning methods (Chen & Bui, 2020). At an early stage, when first exposed to a new type of learning, a study conducted by Pham et al., (2019) shows dissatisfaction with this form among the majority of students because of the new and sudden exposure to the new type of education while a study conducted by Chen & Bui (2020) with first-year English language students showed a certain difference. The majority of students expressed satisfaction with this educational policy.

In the same vein, a study by Dinh & Nguyen (2020) at a national university in the southern region of students exposed to online learning in the first 2 months, shows that most students have a certain satisfaction about the online learning environment. They have expectations for the future of distance learning because it is flexible and supportive. Thereby, it also shows a very quick adaptation of students although it also had the identified impediments like internet connection, interaction or audio problems. However, Dinh & Nguyen (2020) also reported that in the choice of learning method, students still focus on face-to-face learning more than online learning. This is the author's assumption that students easily acquire knowledge in a familiar environment.

Additionally, Nguyen (2022) showed that knowledge acquisition and satisfaction have a close relationship. In his research at a Law school, he demonstrated that the benefits of online learning are markedly changed through the elements of ease of use, ease of learning, and factors of the TAM Model (Davis, 1989). The benefits of learning are appreciated if students have a good feeling about the above factors. Since then, student satisfaction has also increased significantly. Another study on the use of technology in learning by Hoang & Dang (2021) showed a positive impact students' learning outcomes, on the cognitive side of students from the application of technology. This is a positive result compared to traditional learning methods (Alves & Raposo, 2007; Abrahams, 2010). However, Hoang and Dang (2021) also emphasize the usage control of students.

From the above-mentioned sections, there is scarce research on the impact of cognitive presence on other learning environments such as video-based learning platforms, learning management systems, etc. Therefore, it

urges us to carry out the study to explore factors affecting the factors that influence student satisfaction with the novel learning tool-EduNext in terms of cognitive presence and the TAM framework.

Method

Research design

The mixed method study was used in the current study because this is regarded as an effective method to land a broad insight and strengthen the conclusion (Morse, 2016). The paper makes use of quantitative and qualitative analysis methods and references from a few relatively early research to explore students' satisfaction with factors related to perceived usefulness, perceived ease of use, and factors related to cognitive presence when they experience courses on the novel mediating tool-EduNext.

The participants of the current study consist of 186 students who participated in at least one subject on EduNext. They are from all majors at a research site consisting of Business Administration (45,70%), Information Technology (28,49%), and Linguistics (25,81%).

The sampling technique used in the study is purposeful sampling since this is also known as a non-statistical participant selection method, which enables researchers to determine and choose study participants based on initial volunteers who refer them to further study participants who fulfill the criteria (Flick, 2009).

Research instruments

At the quantitative research stage, the questionnaire was used with two main parts. Initially, the filter question and the demographic information included name, email, gender, school year, age, major, and the number of subjects students participated in EduNext. Next, the survey continues with constructs affecting students' satisfaction. A questionnaire consisting of 22 items from the Technology Acceptance Model (TAM) developed by Davis (1989), Cognitive presence extracted from the Community of Inquiry framework (Garrison et al., 2010; Shea & Bidjerano, 2008; Swan et al., 2008), and student satisfaction (Ejubović & Puška, 2019) were deployed to collect the data. The items were in the order of 3 items from perceived usefulness, 3 items from perceived ease of use, 12 items from the perceived cognitive presence, and 4 items from student satisfaction. A 5-point Likert scale with 1 = strongly disagree and 5 = strongly agree was applied.

In the qualitative phase, semi-structured interviews with 10 students individually were used. Each interview was 15 minutes. Then, the data is content-analyzed. The data of the variables, which were purposefully collected early from 40 students who attended at least 1 course on EduNext, were used to demonstrate the reliability of the research questionnaire with Cronbach's Alpha based on SPSS 26. Cronbach's Alpha indexes will be considered at the level of 0.7 or higher, which is the appropriate level to demonstrate the reliability of the variables (Pallant, 2007). According to the tested result, the index of the variables is determined to reach higher

than 0.7, particularly the details shown in Table 1. Additionally, respondents may be impacted by their current emotions, prejudices, or level of comprehension when completing questionnaires, which could lead to their responses not correctly reflecting their true thoughts, hence the questionnaire was translated and modified to be appropriate for the objective of our study and the Vietnamese context while keeping the reliability and validity of the used instrument. Besides, all members of the team and an EFL lecturer have devoted time to verifying the language's accuracy. Taking everything into consideration, the questionnaire has high reliability.

Table 1. The Reliability of The Questionnaire

Variables	No. Items	Mean	No. Participants
Perceived Usefulness (PU)	3	.923	
Perceived Ease of Use (PEOU)	3	.903	
Cognitive Presence (CP)	Triggering Event (TE)	.892	40
	Exploration (E)	.828	
	Integration (I)	.803	
	Resolution (R)	.912	
Student Satisfaction (SS)	4	.909	

Results

To what extent do perceived usefulness, perceived ease of use, and student satisfaction correlate with each other?

Pearson correlation analysis was conducted on student satisfaction (SS) variables with two factors of the TAM model, perceived ease of use (PEOU), and perceived usefulness (PU). The purpose is to answer research question 1. The results of the analysis are shown in Table 2.

Table 2. The Pearson Correlation between SS and PEOU, PU

		Correlations		
		SS	PEOU	PU
SS	Pearson Correlation	1	.016	.806**
	Sig. (2-tailed)		.151	.000
	N	186	186	186
PEOU	Pearson Correlation	.106	1	0.085
	Sig. (2-tailed)	.151		.249
	N	186	186	186
PU	Pearson Correlation	.806**	.085	1
	Sig. (2-tailed)	.000	.249	
	N	186	186	186

**Correlation is significant at the 0.01 level (2-tailed)

The results of the analysis show that there is a strong correlation between student satisfaction (SS) and perceived usefulness (PU) ($p=0.00 < 0.05$). It is obvious that the use of learning on the EduNext platform contributes to student satisfaction, which is highlighted via the data from the interview “*One of the things I like about the EduNext is that I can refer to the answers of all of my friends' comments. It is great when I haven't come up with any ideas for the question.*”(P8)

In contrast, there is no correlation between student satisfaction SS and perceived ease of use (PEOU) ($p=0.151 > 0.05$). It means whether or not the use of the platform is easy or difficult, it does not affect the satisfaction of students in the learning process. One of the interviewed participants stated that “*We are GenZ and digital citizens, hence using a new platform is not a huge deal for us.*” (P10)

Additionally, to explore the relationship between student satisfaction and cognitive presence, we conducted a Pearson correlation analysis between SS and 4 factors of cognitive presence including TE, E, I, and R, which are shown in Table 3.

Table 3. The Pearson Correlation between SS and Factors of Cognitive Presence (CP)

		Correlations				
		SS	TE	E	I	R
SS	Pearson Correlation	1	.709**	.584**	.637**	.693**
	Sig. (2-tailed)		.000	.000	.000	.000
	N	186	186	186	186	186
TE	Pearson Correlation	.709**	1	.613**	.667**	.678**
	Sig. (2-tailed)	.000		.000	.000	.000
	N	186	186	186	186	186
E	Pearson Correlation	.584**	.613**	1	.725**	.610**
	Sig. (2-tailed)	.000	.000		.000	.000
	N	186	186	186	186	186
I	Pearson Correlation	.637**	.667**	.725**	1	.656**
	Sig. (2-tailed)	.000	.000	.000		.000
	N	186	186	186	186	186
R	Pearson Correlation	.693**	.678**	.610**	.656**	1
	Sig. (2-tailed)	.000	.000	.000	.000	
	N	186	186	186	186	186

**Correlation is significant at the 0.01 level (2-tailed)

It asserts a strong correlation between student satisfaction (SS) and elements of cognitive presence variables including triggering event (TE), exploration (E), integration (I), and resolution (R). Specifically, based on the results, it reflects the relationships of the variables. Variables of cognitive presence have a strong impact on student satisfaction in the learning process. The more positive the perception of these variables, the higher the student satisfaction with learning on EduNext. This was also emphasized via ideas from the interview:

“*I think EduNext will help students to finish the questions posed by the teacher and to become self-study as they will have to explore the answers from a variety of sources.*” (P1)

Moreover, students affirmed that EduNext provides them an opportunity to enhance their cognitive thinking through the process of searching for answers. “*I post the answer on my own, besides I frequently read and consult good answers from my peers to make my answers more insightful and complete.*” (P2)

How do perceived usefulness, perceived ease of use, and cognitive presence affect student satisfaction?

The study aims at investigating the impact of the constructs hence multiple regression analysis was performed. Multiple linear regression was calculated, at the 0.05 significance level, to estimate the effect of PU, PEOU, and

TE, E, I, and TE on their satisfaction with the social constructivist learning environment on the EduNext platform. According to Sarstedt et al., (2019), the Variance Inflation Factor (VIF) should be lower than 3 in order to avoid the degree of collinearity or even multi-collinearity among the independent variables. As a result, the regression analysis of this model is accepted.

Table 4. Regression of Student Satisfaction

	B	Std. Error	Beta	t	Sig	Statistics VIF
(Constant)	-.544	.245		-2.224	.003	
PU	.539	.061	.518	8.795	.000	2.257
PEOU	.031	.045	.028	.698	.486	1.064
TE	.151	.069	.140	2.174	.031	2.716
E	.065	.077	.051	.841	.401	2.431
I	.049	.087	.037	.568	.571	2.804
R	.263	.072	.218	3.676	.000	2.292

a. Dependent Variable: SS

b. Independent Variables: PU, PEOU, TE, E, I, R

c. Model Summary: R=.851; R²=.725; Adjusted R=.716; Sig=.000

As can be seen from Table 4, the model explained 71,6% the variance in student satisfaction when they study on the EduNext platform under the impact of PU (p=0.000; B=0.518; VIF=2.257), R (p=0.000; B=0.218; VIF=2.292), and TE (p=0.031; B=0.151; VIF=2.716). In particular, the impact of PU was the most influential (B=0.518) followed by R (B=0.218) and TE (B=0.151). This also means that the more students perceive the EduNext platform as useful, the more satisfied they will be. In terms of R(resolution), student satisfaction will be higher if students can find the solutions for the problems easily and accurately (p=0.000; B=0.518). Another element of cognitive presence that positively influences satisfaction is TE (Triggering Event). This means that the questions posed on EduNext are more obvious and easier to understand, and the more satisfied students feel. Conversely, the regression also indicated that PEOU (p=0.486 > 0.05), E (p=0.401 > 0.05), and I (p=0.571 > 0.05) are withdrawn from the model.

Discussion

Initially, the research results revealed that, in terms of TAM, PU is the factor that has a great impact on student satisfaction. The more they find the platform to be of great benefit to them, the better their satisfaction with the platform gradually changes. This is in line with Nagy (2018) and Pham et al., (2021). However, our results are in contrast to those of Daneji et al., (2019). Specifically, Daneji et al., (2019) showed that PU had no major impact on SS. Besides, there was no correlation between PEOU and SS. This is similar to the report of Nagy (2018). Furthermore, our novelty in this report is to determine how it affects interviews. In other words, students interviewed in the study said that they had access to many sources of information to answer according to

instructions when studying on EduNext. Those sources can include the Internet or friends in terms of PU, yet they were born in the age of technology so interacting and using technology did not create difficulties for them, leading to PEOU does not correlate with SS.

Finally, the results indicated that factors of cognitive presence including TE, E, I, and R were strongly correlated with SS. Perceived value as well as knowledge from learning on the platform will significantly contribute to their satisfaction. The results of this study are supported by previous work by Zhonggen et al., (2018) with a positive relationship between cognitive presence and student satisfaction when applying technology platforms to learning. The reason can be mentioned that their main purpose is learning and must get knowledge from that learning. Thus, it is understandable that cognitive presence has a huge impact, especially when adopting a new educational technology platform. In the results of the regression analysis, 2 factors of a cognitive presence having significance were (R) resolution and TE (triggering event). R has a stronger impact than TE on satisfaction. More specifically, the knowledge learned from the course becomes useful to the students by applying it outside the course which contributes to satisfaction. Furthermore, the initial requirements for answering questions are students' interest, curiosity, or motivation. If these requirements are fulfilled, students will be more satisfied.

Conclusion

In conclusion, the findings of the current study revealed that perceived usefulness, resolution, triggering event, and student satisfaction were significantly correlated with each other. Specifically, usefulness will enhance the learners' satisfaction when experiencing courses on EduNext. Additionally, students will become more satisfied when they can find out the answers to the fixed and triggering questions on EduNext. Therefore, there is a need for the program developers to select materials and assign content linked to students' demands to increase their satisfaction with courses on the EduNext platform. In addition, lecturers need to pose effective questions to stimulate students' engagement.

Generally, the results of the study have some implications for students at the research site as well as provide educators especially the board of planning and curriculum developers with overall views about factors affecting student satisfaction when experiencing courses based on the social constructivist learning approach on the EduNext. The initial implication is for participants. Participating in the study, undeniably, is a valuable opportunity for students to express their thoughts after approaching the innovative kind of educational platform. Through their conceptualizations, institutional educators can deeply understand learners' demands and thinking. The remaining significance is discovering successful factors impacting student satisfaction when adapting the novel platform, EduNext, and the characteristics of EduNext. Accordingly, the board of planning and curriculum developers, and education staff including lecturers and technicians will design appropriate curricula, and their teaching methods/ techniques, and adjust the tool to adapt to learners' expectations.

Recommendations

Social constructivist learning through the EduNext platform brings many improvements and innovations in learning and teaching. Therefore, we encourage more research on learning on this platform to bring to a multi-dimensional view. It is necessary to implement the following studies to synthesis and analysis for students, instructors, and course contents to have a more complete view about the E-learning model. Furthermore, it can extend the scope of research to other institutions that use EduNext as a compulsory teaching platform.

Acknowledgments

This research was conducted by a group of English language students and a lecturer from a private university in Vietnam. The study received enthusiastic support from lecturers, staff and students of school. We thank the staff of Student Relations Office for sending the questionnaires to the students. We are grateful for the support of the English Department lecturers for giving us numerous feedback to improve our report. We appreciate our classmates, who provided detailed information about the platform, took the time to interview, and filled out the questionnaire. We appreciate the time and effort you give us. Hence, all of those things motivated us a lot in completing the research report.

Contribution of Project-based Learning and Integrated Learning to Develop Student' HOTS

Anita Yosepha

Indonesia University of Education, Indonesia,  <https://orcid.org/0000-0002-3237-0570>

Abstract: The development of higher-order thinking skills requires appropriate learning techniques. Project-based learning and integrated learning are learning models that can be used for this purpose. This study aimed to evaluate the contribution of project-based learning and integrated learning to the HOTS development of students in 6 private schools. The sample in this study was high school-level students who were determined by purposive sampling and random sampling techniques. The number of samples is 500 students. The instruments used are a measurement scale and a questionnaire with open questions. Data analysis was performed using the partial least squares technique. Based on the results of measurement scale data analysis, it was found that project-based learning combined with integrated learning showed a significant contribution to the development of students' HOTS. Project-based learning and integrated learning provide flexibility for students to study according to their characteristics so that the application of the student-center approach is practical. In addition, students are more motivated to undergo the learning process with this model approach because of the challenges of producing quality projects.

Keywords: HOTS, Project-based Learning, Integrated Learning

Introduction

Developing students' thinking skills is one of the essential goals in the educational process. According to Marzano and friends, thinking skills have levels/levels starting from simple thinking skills (LOTS) to complex thinking skills (HOTS). The learning method or model widely used by teachers in Indonesia develops lower-order thinking skills; only a few teachers used learning models that develop students' higher-order thinking skills. The results of the PISA and TIMSS tests placed Indonesia in a below-average rating as a result of this problem.

Teachers are responsible for designing and implementing excellent and appropriate learning to develop students' higher-order thinking skills. Teachers use many learning methods or approaches in the learning process, but not all of these methods can train and develop students' thinking skills into higher-order thinking skills. It was found

that project-based learning can develop students' thinking skills (...). Through the Ministry of Education, the Indonesian government launched a curriculum revision called the Merdeka Curriculum. In this curriculum, all schools in Indonesia must carry out project-based learning. The aim is to develop the character of Pancasila while at the same time developing students' higher-order thinking skills. Several private schools have implemented a combined learning model between project-based and integrated learning. This study aims to examine the contribution of the combined learning model of project-based and integrated learning in developing students' thinking skills in these private schools.

Higher Oder Thinking Skills

Higher-order thinking skills (HOTS) are skills in using complex cognitive powers. Lewis and Smith (1993, 136) define HOTS as thinking that occurs when a person retrieves new information stored in memory and interrelated or rearranges and expands this information to achieve a goal or find possible answers in a confusing situation. Brookhart (2012, 3-8) defines higher-order thinking skills (HOTS) into three categories, namely 1) transfer, 2) critical thinking, and 3) problem-solving. According to Brookhart, in the transfer process, it is indicated that meaningful learning occurs, meaning that it can give meaning to the learning material. The definition of critical thinking contains the notion of being able to make an assessment or produce critical thinking (criticism) that has a basis or reason based on the results of reflection and makes a choice/decision. Meanwhile, the definition of HOTS in problem-solving is thinking to solve problems and produce new solutions. Schraw, McCrudden, Lehman, and Hoffman (2011, 21) explain that the definition of thinking ability contains various cognitive abilities. Several factors influence the development of higher-order thinking skills in students. In the curriculum, the learning approach used is the thematic approach and the subject approach. Thematic approaches can support the development of HOTS (Zohar, 1994; Madhuri, 2011). An essential factor in the implementation HOTS-Based curriculum is the quality of teachers in higher-order thinking skills. Teachers who have mastered and applied higher-order thinking skills will develop these skills for their students (Hassan, 2017; Row, 2016; Saïdo, 2015).

Project-based Learning

Project-based learning (PjBL) is a learning model that schools can implement. In this model, students are trained to solve local problems. According to Chard in Drake and Burns (2004), project-based learning planning includes three stages, namely: 1) selecting topics to be studied based on interests, curriculum standards, and local sources; 2) the teacher explores the knowledge students already have and helps them to make exploratory questions, provides resources, and opportunities to go into the field; 3) students share their work with their friends, report their work, and evaluate their work. In project activities, students learn to make connections between knowledge and apply knowledge to solve real-life problems (Curtis, 2002).

Project-based learning aims to help students to explore knowledge as well as apply this knowledge in a tangible form, namely the results of the project. The processes carried out by students in project-based learning based on

practice in schools are literacy, planning project activities, implementing projects, and reporting or presenting project results. Through this learning activity, students are trained to apply simple research steps. These steps start from extracting information about knowledge following the objectives to be achieved through project activities. In the next step, they practice planning the process to be carried out, from preparation to getting results. After that, they started implementing the plans that had been made until they finally achieved the project results. Project results can be in the form of goods or new concepts from solving problems on issues worked on in project activities. Through project activities, students are given real experience solving social or environmental problems. It is essential for students. Students practice analyzing, evaluating, and creatively creating something helpful/meaningful to achieve the results set at the project's beginning. Problem-solving, communicating, collaborating, and decision-making skills are developed in the project implementation process. Through project learning activities, they are also trained to sharpen their sensitivity to social issues and natural environmental issues around them. In addition, through project activities, students' character can develop because they deal directly with real-life experiences.

Integrated Learning

Integrated learning (IL) is a learning model that aims to help students develop a holistic way of thinking. According to Drake & Burns (2004), the definition of integrated learning can be seen from three different points of view. The three viewpoints provide three definitions based on the integrated learning approach category. The first approach is multidisciplinary integration, the primary approach to scientific disciplines. Integration occurs through one particular theme. The second approach is interdisciplinary integration through general learning across disciplines; for example, students learn about water when learning/practicing reading skills. The third approach is transdisciplinary integrated, which is an approach in which the teacher organizes the curriculum around student concerns and questions (Drake & Burns, 2004). Integrated transdisciplinary is carried out in the form of project-based learning.

Learning combines several subjects through a particular theme (thematic) or learning about a matter/problem from various knowledge angles. Through integrated learning, students are trained to think as a whole, not compartmentalized, and broaden their perspective on various things that happen in life. In integrated learning, students practice studying an object or event from various points of view. Integrated learning begins by raising a problem or giving specific issues to students. They are guided to analyze and criticize these issues from various perspectives based on the existing field of study at the senior high school level. The ability to analyze and criticize these issues will help them find solutions or determine their alignment.

Method

This study evaluates the contribution of project-based learning and integrated learning models to the HOTS development of students. This study uses a convergent-parallel design approach from mixed methods.

Respondents in the quantitative research were high school students in six private high schools. Following the research objective, namely evaluating the contribution of the learning model implemented in several private schools, the school selection technique was purposive sampling, while the determination of students as samples were carried out by random sampling technique. The sample in the study amounted to 500 students. Respondents in the qualitative research were the teachers who taught at the six schools and their students. Teachers who answered the questionnaire with open questions totaled 50 teachers. Students who gave answers to questionnaires with open questions totaled 100 students. The instrument used in quantitative research is a Likert measurement scale of 1 to 8 to explore information about project-based learning and integrated learning. Test the ability to dig up information about students' skills in higher-order thinking skills. Meanwhile, the qualitative research instrument was an open questionnaire to teachers about their students' HOTS developments, . For testing the instrument's feasibility, the researcher conducted instrument testing: reliability test, validity test using factor analysis, and differential power test. The following are the results of instrument testing.

Table 1. Reliability Instrument

Variables	Result	
HOTS	Spearman-Brown Coefficient	.947
	Guttman Split-Half Coefficient	.947
Method (PBL & IL)	Spearman-Brown Coefficient	.920
	Guttman Split-Half Coefficient	.919

Instrument reliability was measured using the Spearman-Brown split-half method. Based on the measurement results in Table 1, the instrument has fulfilled the reliability test requirements with a value of $r > 0.70$.

Table 2. Validity Instrument

Variables	Result		
HOTS	Kaiser-Meyer-Olkin	Measure	of .956
	Sampling Adequacy.		
Method (PBL & IL)	Sig.		.000
	Kaiser-Meyer-Olkin	Measure	of .945
	Sampling Adequacy.		
	Sig.		.000

Testing the instrument's validity uses factor analysis to test the strength of the indicators in representing the construct. Based on the test results, as shown in Table 2, the KMO-Bartlett value > 0.60 . These Five items from the HOTS variable were discarded from the differential power test results because the differential power values were below 0.3. In comparison, 21 items were used because the differential power values met the requirements. At the same time, the method variable shows the different power results of all items that have met the requirements.

results indicate that the validity requirements have been met.

Table 3. Discriminant Test

Variables	Discriminating Power	
HOTS	H1, H3, H4, H5, H6	Poor
	H2, H7 – H26	Good
Method (PBL & IL)	M1 – M18	Good

A partial-least square is used to analyze data. PLS analysis includes two stages/steps of model testing: testing the measurement or external models and testing the structural or internal models. Testing the measurement model is carried out to test the validity & reliability of the model, while testing the structural model is testing the relationship between the independent and dependent latent variables. The measurement model testing phase has been described above. The testing phase of the structural model (inner model) is carried out to test the significance of the contribution of the exogenous variables to the endogenous variables. Structural model testing assesses the relationship between latent variables (Ghozali, 2014, p. 73). The results of structural model testing are seen from the R-square, f-square, Q-square, and path coefficient values (direct effect, indirect effect, total effect). The R-square value explains the contribution of exogenous to endogenous latent variables. If the value of $R^2 > 0.67$ indicates a robust contribution/model; $R^2 < 0.30$ moderate contribution/model; and $R^2 < 0.19$ contribution/weak model (Chin, 1988). The f^2 value is used to assess the strength of the influence with f^2 criteria > 0.02 weak influence, > 0.15 moderate influence, and > 0.35 strong influence (Sarwono & Narimawati, 2015, p. 24). The Q^2 value is used to prove whether or not the reconstruction of the observed values is good. The criteria for seeing the relevance of predictions are the value of $Q^2 > 0$: the model has predictive relevance, and $Q^2 < 0$: the model has less predictive relevance. The following criterion used to analyze the results of the structural model test is the t-value provided that t-count > 1.65 (α : 10%), t-count > 1.96 (α : 5%), t-count > 2.58 (α : 1%) (Ghozali, 2014, pp. 78-81).

Results

The following is the result of data processing to test the construct validity, discriminant validity, and measurement model reliability of this research model. The following model image shows the loading factor values of the items in the variable.

From the model image, the loading factor value of all items in each variable is more than 0.50, so it can be said that all items meet the requirements as indicators for their respective constructs.

Table 4 shows that Cronbach's alpha and composite reliability values of the three variables have met the reliability requirements with test results greater than 0.70, while the AVE value is more significant than 0.50.

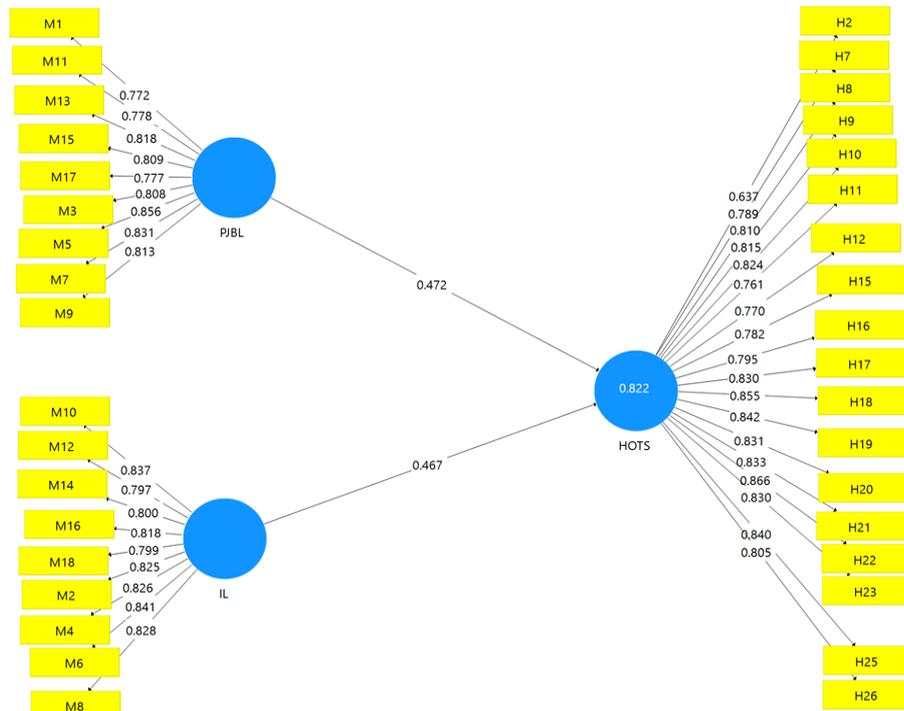

Figure 1. Loading Factor

Table 4. Reliability and Validity Test Results

Variables	Cronbach's Alpha	rho_A	Composite Reliability	Average Variance Extracted (AVE)
HOTS	0.968	0.969	0.971	0.653
PJBL	0.939	0.939	0.948	0.671
IL	0.933	0.935	0.944	0.652

Table 5. Discriminant Validity: Fornell-Larcker Criterion

Variables	HOTS	PJBL	IL
HOTS	0.808		
PJBL	0.876	0.819	
IL	0.876	0.866	0.807

From the results of testing the validity of discrimination with the Fornell-Larcker criteria, the result is less than 0.90. Likewise, the loading-factor results show that all indicators of each construct have a more excellent loading-factor value for its construct compared to the loading-factor value for the other constructs. It shows that the set of indicators for each construct can explain each construct well.

Based on the results of the Fornell-Larcker discriminant validity test and the loading factor, it can be concluded that the outer model meets the requirements for discriminant validity.

Table 6. Cross Loading Factor

	HOTS	IL	PJBL
H10	0.824	0.767	0.702
H11	0.761	0.615	0.671
H12	0.770	0.691	0.635
H15	0.782	0.679	0.751
H16	0.795	0.754	0.676
H17	0.830	0.689	0.743
H18	0.855	0.769	0.703
H19	0.842	0.717	0.792
H2	0.637	0.548	0.553
H20	0.831	0.777	0.692
H21	0.833	0.702	0.753
H22	0.866	0.742	0.755
H23	0.830	0.677	0.707
H25	0.840	0.690	0.738
H26	0.805	0.740	0.673
H7	0.789	0.675	0.726
H8	0.810	0.781	0.705
H9	0.815	0.686	0.738
M1	0.614	0.629	0.772
M3	0.666	0.714	0.808
M5	0.757	0.742	0.856
M7	0.700	0.737	0.831
M9	0.748	0.707	0.813
M11	0.703	0.676	0.778
M13	0.760	0.711	0.818
M15	0.719	0.690	0.809
M17	0.680	0.681	0.777
M2	0.698	0.825	0.723
M4	0.691	0.826	0.719
M6	0.732	0.841	0.742
M8	0.694	0.828	0.713
M10	0.756	0.837	0.728
M12	0.725	0.797	0.688
M14	0.740	0.800	0.698
M16	0.720	0.818	0.707
M18	0.691	0.799	0.667

The cross-loading factor values shown in the table show that all items in each construct show a higher value compared to the loading factor values in the other constructs. From the Fornell-Larcker value and cross-loading, discriminant validity has been met.

Structural Model

The model's structural testing results are seen from the R-square, f-square, and Q-square values.

Table 7. R-square

	R Square	R Square Adjusted
HOTS	0.822	0.821

The R Square value indicates the joint or simultaneous effect of PBL and IL on HOTS of 0.822 with an adjusted R-square value of 0.821. Thus, it can be explained that all exogenous constructs simultaneously affect the endogenous construct by 0.821. Because the Adjusted R Square is more than 0.67, the effect of all exogenous PBL and IL constructs on HOTS is strong.

Tabel 8. F-square

	HOTS	IL	PBL
HOTS			
IL	0.305		
PJBL	0.312		

Based on the table of F-Square values above, which has a significant effect size with F-Square criteria > 0.35 is not there. While those that have a moderate effect, namely with F Square between 15 to 0.35, are the effects of IL and PBL on HOTS.

Tabel 8. Q-square

	SSO	SSE	Q² (=1-SSE/SSO)
HOTS	9000.000	4209.286	0.532
IL	4500.000	4500.000	
PJBL	4500.000	4500.000	

Q-square value > 0 indicates the model has predictive relevance; conversely, if the Q-Square value ≤ 0 indicates the model has less predictive relevance. The Q-square value in the model shows a value of $0.532 > 0$, so the model has predictive relevance. The results of the analysis of the direct effects inner model in the table below.

Based on the results of the analysis of the direct effects inner model in the picture above, it can be concluded as

follows: The direct effect of IL on HOTS is 0.467, which means that if IL increases by one unit, HOTS can increase by 46.7%. This influence is positive. The direct effect of PBL on HOTS is 0.472, which means that if PBL increases by one unit, HOTS can increase by 47.2 %. This influence is positive.

Table 9. Path Coefficients

	HOTS	IL	PBL
HOTS			
IL	0.467		
PBL	0.472		

Table 10. Path Coefficients

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics ((O/STDEV))	P Values
IL -> HOTS	0.467	0.468	0.041	11.483	0.000
PJBL -> HOTS	0.472	0.471	0.041	11.414	0.000

The table above shows the t-value > 1,960, and the p-value is 0,000. So, the PBL and IL learning models each contribute positively to the HOTS development of students.

The learning carried out in the six schools in this study applies the transdisciplinary learning model of integrated learning through project-based learning. There are two ways to do in preparing the project. The first way the teacher determines the theme is according to the issues currently developing in each school's local community. Students are asked to determine the project according to their understanding of the theme. The second way, the teacher determines the project in the form of results or products expected from project activities. Students explore a variety of knowledge to prepare the project implementation process to produce the specified product or result. Based on the implementation of project-based learning, teachers and students responded to open questions about how much the students' abilities in higher-order thinking skills, communicating, and collaborating increased, the constraints experienced in the combined model of project-based learning and integrated learning, and the advantages of this learning model.

In an open-ended questionnaire, the teachers responded about how much the students' abilities in higher-order thinking had developed, including analytical, evaluation, and creative thinking abilities through IL and PBL learning. They gave answers based on data on the value of learning outcomes. From these questions, they said that above 75% of students experienced good development in their ability to do analysis, 60% experienced good development in criticizing a problem or issue, and 65% of students showed progress in creating or providing solutions to a problem. In solving problems, 70% of students can provide creative and appropriate solutions. 60 to 75% of students experience positive developments regarding communicating and collaborating.

The constraints teachers face in the combined learning process of project-based learning and integrated learning are summarized in three categories: 1) time constraints for project activities due to limited time allotted for project activities; 2) constraints from limited facilities and infrastructure at school, such as yards to carry out eco-enzyme projects, waste recycling processing, limited wifi facilities to dig up resources from websites, no land for gardening or animal husbandry; 3) constraints in integrating the competencies of certain subjects involved in the project; 4) constraints in providing individual student assessment of project activities. Teachers need intense training to design project learning models combined with integrated learning. Based on the answers, students, based on the order of the highest number of answers about obstacles they experience through the PBL-IL learning model: 1) greater demands from the project, 2) not being able to manage time properly so that assignments become overlapping, 3) misunderstandings in communicating in groups, 4) problems with friends who do not want to work, 5) inadequate school facilities to work on projects, 6) make decisions to be able to combine various ideas in the group, 6) many ideas come up so you have to be able to choose or combine these ideas and this takes time.

The advantages or advantages of the PBL - IL combination learning model are summarized in three categories. 1) Students experience progress in thinking skills. They show progress in their analytical, problem-solving, and creative abilities. It can be seen from the results of the reported project work. 2) Students experience development in the ability to cooperate/collaborate and communicate. Situations that require them to work together on projects encourage students to learn to communicate with different friends. 3) Learning is more interesting because it can be seen from students' enthusiasm for project activities. Students are enthusiastic because they are driven to make the best project results. While the advantages of this learning model based on the results of the answers of the students who have been sorted from the highest number of answers are: 1) learning is more exciting and not dull, 2) it trains independence and communication, 3) it can work with different friends so that they know more friends than before, 4) be more creative, 5) broaden horizons through collaborative activities, 6) learn to make decisions to combine various ideas in groups, 7) learn is more exciting and not dull, so it is more enthusiastic in learning.

Discussion

The research data shows that the path coefficient value between the PBL learning model and the HOTS development of students is more significant than 1,960, with a p-value of 0,000, meaning there is a positive relationship. PBL is a learning model that makes students actively involved in the learning process. It can be seen from the steps of PBL activities, which begin with extracting subject matter/information to carry out the project, designing a project implementation plan to achieve the expected results, and planning implementation, namely starting to carry out project activities to produce the expected product. Students are required to carry out these steps independently with the help/guidance of the teacher. These steps illustrate how students are required to work and be active in the entire learning process until the requested product is obtained. In addition, in carrying out these steps, students must carry out analytical, evaluation, and creative thinking processes. This

thinking process is a high-level thinking process, as Marzano and Kendall (2007) explained in the New Taxonomy. Project-based learning provide flexibility for students to study according to their characteristics so that the application of the student-center approach is practical. In addition, students are more motivated to undergo the learning process with this model approach because of the challenges of producing quality projects.

The research data shows that the path coefficient value between the IL learning model and the HOTS development of students is more significant than 1,960, with a p-value of 0,000, meaning there is a positive relationship. Integrated learning combines various scientific fields to discuss a particular issue or problem. At school, the teachers use specific themes to discuss in an integrated manner. It aims to accustom students to look at things from all points of view so that they can assess them objectively. According to the teachers, students still need to be trained to see things as a whole because they are still used to separate learning. Based on the learning assessment results using the IL model, students showed broad analytical abilities in terms of insight compared to when they analyzed problems in one subject area. IL learning enables students to be creative more freely, demonstrated through IL learning works or products, such as school magazines, wall magazines, and other works. Integrated learning provide flexibility for students to study according to their characteristics so that the application of the student-center approach is practical.

The combined learning model between project-based learning and integrated learning is one of the models that teachers can use to develop students' self. The findings clearly show that the PBL – IL learning model encourages the development of students' thinking skills to a high level (Affandi & Sukyadi, 2016; Botha, 2010; Costa-Silva et al., 2018; Cudney & Kanigolla, 2014; Dzan et al., 2013; Mou, 2019; Rodríguez et al., 2015). One of the obstacles that arise is the problem of misunderstanding in communicating, but this problem is a means for students to practice communicating so that they experience progress in communication skills and organizing activities (Indrawan et al., 2018; Goldstein, 2016). Other soft skills that develop through the PBL – IL learning model are decision-making skills. From the project work process, students learn to combine ideas that arise in groups. The emergence of various ideas or ideas to work on projects is a challenge for students. Through this challenge, they learn to combine these ideas creatively or make decisions to determine which ideas to choose and use in their projects. From this, it can be seen that through the obstacles they face in the PBL-IL learning process, students hone their skills, such as the ability to analyze, evaluate, and make decisions, and be creative in order to be able to complete projects and produce whatever products or results they want—demanded from the activity. Problems in communicating help them find the right way to communicate to complete the task correctly. Another advantage of the PBL-IL model is that students' learning motivation is better than if the teacher uses the usual learning model in class.

The obstacle in developing IL learning experienced by teachers is the demand to find exciting and challenging student themes. The problem of collaboration between teachers in learning IL is a separate issue, some teachers are open to collaborating in the IL learning process, but some teachers need to be more open; this will be an obstacle in efforts to implement IL in schools. The problem that needs to be considered in the learning process is that teachers are required to be creative in finding specific themes or projects that can be a means for students to

learn about the integration of scientific disciplines - such as the integration of social and natural science disciplines - which is possible to do in schools. Limited facilities are also a significant obstacle for teachers in the PBL-IL learning process. This problem also encourages teachers to be creative in finding what projects can be carried out at school while accommodating a quality PBL learning process.

Based on the findings above, through the PBL-IL learning model, students and teachers experience development through preparing and implementing integrated project learning and through efforts to overcome the obstacles encountered.

Conclusion

Project-based learning and integrated learning are learning models that positively contribute to developing students' higher-order thinking skills. Therefore, it would be terrific if teachers could use these two learning models more often to develop students' HOTS. In addition, these two learning models can be a means to develop skills in communicating and collaborating. Project-based learning and integrated learning provide flexibility for students to study according to their characteristics so that the application of the student-center approach is practical. In addition, students are more motivated to undergo the learning process with this model approach because of the challenges of producing quality projects.

The limitations in using project-based and integrated learning models are mainly the willingness to be active and collaborate. It is an obstacle for some students because they are used to learning individually. This model is less attractive for some teachers because it requires them to work with other teachers while they feel free to complete the learning process individually.

Recommendations

Recommendations for further research are that it is necessary to explore qualitative research by observing the project implementation process to obtain a broader picture of PBL and IL.

EFL Teachers' Beliefs about Technology Integration into English Language Classrooms: A Case Study

Diem Kieu Bui

FPT University, Vietnam

Thy Cao Thi Mai

FPT University, Vietnam

Abstract: In this era of information and communication technology boom, applying this advancement to all areas is a matter of course. This is a general tendency for technology integration into foreign language teaching at universities and schools in Vietnam. Following this trend, this paper reports the results of a study investigating teachers' beliefs about the effectiveness of technology application in English teaching at the university level. Two research instruments were a questionnaire and an interview. The results indicate that all participating teachers realized the significance and the trend of implementing technology into education and the advantages it brings to foreign language teaching and learning processes. These teachers, nonetheless, confessed their shortage of technical knowledge and skills and were satisfied with the sufficiency of technology equipment in the classrooms. Interestingly, despite these concerns, these teachers are still willing to apply technologies to their future teaching and strengthen their technology skills by self-learning and hopefully through professional training courses.

Keywords: teachers' beliefs, technology, integration, application, language classrooms

Citation: Bui, D. K. & Mai, T. C. T. (2023). EFL Teachers' Beliefs about Technology Integration into English Language Classrooms: A Case Study. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1642-1651), Cappadocia, Turkiye. ISTES Organization.

Introduction

The integration of technology into the contexts of language teaching and learning has been somewhat successful. Because instructors have such a huge capacity to impart beliefs to students, Yong and Cziko (2001) contend that teachers are a crucial component for successful technology integration into classrooms. Therefore, it is crucial to comprehend teachers' ideas, including prejudices and stereotypes regarding technology and technology use, as well as the connection between these beliefs and the practices they use in the classroom. On the other hand, teacher attitudes and beliefs are also significant variables in education, which is relevant to this study. The effectiveness of a teacher is significantly impacted by his or her stance on the pedagogy, method,

strategy, or instructional material that is used in the classroom (Başal, 2015; Biletska et al., 2021; Ding et al., 2019; Galvis, 2012; Hol & Aydn, 2020; Liu et al., 2017). As stated above, the current study intends to ascertain preservice EFL instructors' perceptions of and attitudes toward technology integration. As such, in line with this idea of technology integration.

This study explores the possible advantages and difficulties of utilizing technology in English learning. Studies on the advantages and challenges of incorporating technology in education and learning have been done, but there hasn't been much attention paid to how technology is used to learn English, particularly in Vietnam. The study investigates fresh perspectives on the advantages that users may obtain from utilizing technology in language acquisition. As a result, research must concentrate on how to integrate technology into English language instruction, particularly in Vietnam, and which obstacles must be overcome.

Theoretical Background

Effects of Using Technology in Language Classrooms

Teachers are urged to adopt a variety of cutting-edge teaching techniques that have recently been launched in foreign language programs. One generalization regarding the impact of technology integration in language learning environments is that it alters how children learn. As covered in the next sections, these changes take place in a variety of learning-related areas.

Involvement

One of technology's most notable benefits is that it fosters students' greater engagement, interest, and interest in the subject matter (Hill & Hannafin, 2001). In other words, learners' motivation increases since fun and games are introduced into the classroom. Creating well-structured tasks by teachers, such as problem-based projects, requires students to participate in worthwhile activities like searching the Internet for research for reports or practicing for presentation assignments. As a result, teachers successfully increase their pupils' motivation (Lin, 2009). Drayton, Falk, Stroud, Hobbs, and Hammerman (2010) contend that using systems like the Internet and email encourages students to learn with pleasure and act responsibly.

A Paradigm Shift in Teaching and Learning

An improvement in the learning environment that puts the emphasis on the student rather than the teacher is largely due to the integration of information technology in education. This tendency is the outcome of computers and other portable technology taking the role of traditional classrooms and learning environments as tools for learning and teaching. In a static environment where the instructor is the center of attention and the only source of knowledge, students no longer serve as passive information consumers. Instead, the classroom is transformed into a place where students are empowered to take ownership of their own learning through

engaging activities. In other words, a more hopeful alternative is that the teacher takes on a different role - that of a facilitator who guides pupils toward an attainable objective as opposed to the traditional instructor.

An Evaluation Changes

Thanks to the use of technology in the classroom, students can learn in a way that improves their ability for critical thought. Students who are independent in their learning and in monitoring and evaluating their own progress are more likely to complete tasks effectively. Students become more conscious of the quality of their work and are better prepared to face criticism from classmates and teachers because their work will be seen by many people. In a meaningful sense, technology also gives teachers the opportunity to assess pupils' performance with objectivity and accuracy. When determining the outcomes, the opinions of the teacher, the students, and their classmates are all taken into account. The emphasis on student autonomy in 21st-century education is increased by this evaluation method.

Collaborative and Communicative Learning Enrichment

The promotion of communication and collaboration between instructors and learners as well as among students both within and outside of the classroom is another advantageous aspect of using technology into language classes. In fact, new technology has made it possible for students to access a wide range of resources, including images and videos, as well as an infinite number of Internet users, including people outside of their school, like their peers from different institutions, subject matter experts, and members of interest groups. In other words, technology enables students to connect to the outside world, and as a result, their learning activities will involve a sizable number of people. Students' use of software and hardware to create and share items online serves as one example of this increased contact. These activities give students the ability to consolidate previously acquired knowledge and skills, apply these skills to those around them, and study, evaluate, and critique together. This improves students' sense of worth, self-assurance, engagement in group projects, and meaningful use of technology.

Language Proficiency Enhancement

All of the benefits of integrating technology into language courses that have been discussed thus far ultimately focus on the academic success of the students. Researchers claimed that when children are engaged in technologically advanced classrooms, their academic performance can be seen to improve in all subject areas (Means and Olson, 1997). Technology has certainly contributed to this advancement by altering pupils' attitudes toward studying and enhancing their self-confidence. Technology also encourages the social side of actual language use and empowers students to direct their own language learning process, which is uncommon in traditional classroom settings, by placing them in more real-world communication scenarios. In this approach, technology fully supports students' language learning and acquisition, and when used properly, it enhances language learners' academic performance. In a similar vein, Khan (2011) asserted that integrating technology

into language teaching and learning improves students' overall academic performance and language competency.

Teachers' beliefs

Definition

The meaning of the construct "teachers' beliefs" has generated debate among researchers. Creswell (2009), who is credited with providing one of the most comprehensive theoretical syntheses of teachers' attitudes, examined definitions from 20 different academics but was unable to come to a consensus.

Academics have tried to conceptualize instructors' thoughts despite the lack of agreement on a definition by examining common traits observed in various empirical studies. There are four distinguishable qualities of beliefs, as per Kvale's identification from the year 2000: "existential presumption," "alternativity," "affective and evaluative loading," and "episodic structure." First, there is a strong relationship between teachers' beliefs and what is referred to as "existential presumption," which is a subjective judgment about a learner's aptitude, maturity, etc. Thus, teachers' opinions about the existence of such entities are shown in relation to their pupils' academic accomplishments. Second, beliefs frequently contain a vision of an ideal or other state that contrasts with the current situation. Here, "alternativity" alludes to that. In this sense, beliefs serve to create objectives, carry out tasks, and arrange important knowledge and information. Thirdly, beliefs can be comprehended through subjective feelings, moods, and preferences-based assessments thanks to their "affective and evaluative components," or AECs. Last but not least, "episodic structure" refers to the finding that ideas are usually connected to specific, vividly recalled events. Another researcher, Creswell (2009), provided a broader list of sixteen "fundamental assumptions that may reasonably be made when initiating a study." Creswell and Kvale are different in a few ways, including the following: a) Beliefs have a big influence on conduct since they are affective and judgemental in character. B) Beliefs rarely change as people age, and C) beliefs act as lenses through which new information or experiences are interpreted or processed. Williams and Burden (1997) state that beliefs have a greater influence on teachers' pre-class preparation, decisions, and overall classroom practice than knowledge because they "tend to be linguistically bound, to be formed promptly in life, and to be resistant to change" (p. 56).

From the discussion above, it can be concluded that teachers' beliefs influence their decisions, evaluations, and perspectives on teaching and learning. As a result, knowing what assumptions underlie teachers' decisions to integrate technology-based activities in their courses will come from analyzing their ideas about how technology is applied in the classroom.

Teachers' Beliefs and Integration of Technology

Lately, technology implementation is an essential part of successful teaching. However, the successful integration of educational technologies depends largely on the attitudes of educators, who eventually determine

how they are used in the classroom. In fact, “although the conditions for successful technology integration finally appear to be in place, including ready access to technology, increased training for teachers, and a favourable policy environment, high-level technology use is still surprisingly low” (Ertmer, 2005, p. 2). This is partly because the fact that most foreign language teachers lack knowledge of how to use technology effectively in education. Nevertheless, Hill and Hannafin (2001) found that despite a proper training shortage, English language teachers were willing to implement technology in their classrooms and some of them utilized some types of technology to promote students’ linguistic skills. In a quantitative study with one hundred Arab teachers, Göktürk (2012) found that teachers incorporated various technologies in their class activities to enable students’ learning.

Corresponding to these ideas about teachers’ beliefs and the relationship between teachers’ beliefs and their technology integration, this research focused on examining the beliefs of teachers at a public university about using technology in their classes to obtain an understanding of underlying thoughts that influence their teaching practice with regards to technology implementation.

Utilizing technology effectively in the classroom has become crucial in recent years. However, the attitudes of educators, who ultimately decide how they are utilized in the classroom, have a significant role in the effective implementation of educational technologies. In reality, "high-level technology use is still surprisingly low," even though "the requirements for successful technology integration finally appear to be in place, including ready access to technology, increased training for teachers, and a favorable policy environment" (Ertmer, 2005, p. 2). This is partially due to the fact that few foreign language teachers are proficient in integrating technology into the classroom. However, English language teachers were willing to use technology in their classrooms, and some of them used specific types of technology to support students' linguistic skills, according to research by Hill and Hannafin (2001). Goktürk (2012) discovered that teachers used a variety of technology in the classroom to support student's learning in a quantitative investigation with 100 Arab teachers.

In accordance with these theories regarding teachers' beliefs and the connection between teachers' beliefs and their use of technology, the goal of this study was to examine teachers' attitudes toward using technology in the classroom at a public university in order to gain insight into the underlying ideas that guide their teaching practices.

Method

Participants

Interviews with participants in person are used in the present qualitative research to collect data and information. The study tries to pinpoint the advantages and challenges that English language learners have when learning the language technologically, along with some of the difficulties associated with accomplishing this.

A total of twenty English language teachers were requested to participate in the study by the researcher, but five of them declined for personal reasons. All of the participating instructors, who have at least three years of experience teaching university English, are female in-service educators. They all graduated from reputable Vietnamese academic universities with teaching degrees.

Research Instruments

Teacher Surveys

The first tool utilized was a survey with a Likert-scale based on the teachers' attitudes about the use of technology in education today, the advantages of integrating technology into classrooms, and their abilities to use technology in their classrooms. There were 24 questions on the questionnaire, with answers ranging from strongly disagree (1) to strongly agree (5). The author created it, and it was given to the teachers for their feedback on the validity and content before they began to provide their responses. The questionnaire was then modified and given to the teachers once more.

Semi-structured Teacher Interviews

In this study, semi-structured interviews were used to collect data by having genuine talks with the participants. The 10 participating teachers, who also responded to the survey, provided valuable insight into how they view the integration of technology directly into teaching and learning in this example. The educators also provided some insight into their use of technology in the classrooms.

Research questions	Methods/Instruments
1. What are ELF teacher's beliefs about technology integration into English language classrooms?	Quantitative: Questionnaires Qualitative: Semi-structured Interviews

Results

Teachers' Beliefs about Technology Use in Education Today

The study's instructors, in general, had positive attitudes toward the use of technology in the classroom, which was a key conclusion. In the age of contemporary technology, all fifteen teachers viewed the use of technology as essential. They appeared to take the use of technology in teaching and learning as something that comes naturally. Additionally, as the survey's results indicated, the majority of instructors thought that the use of modern technology in classrooms was limitless. Teacher 3 gave the following explanation: "Because it's our society's way of life now and in the future."

More than half of the teachers countered that creativity was a key component in a teacher's ability to successfully integrate technology into the classroom. One component of this problem can be that teachers need to be astute enough to choose the most appropriate and useful technology, or a combination of these tools, to use in a certain educational activity. In many circumstances, it is ineffective to duplicate the same program into a

different context. The teachers also understood that they needed to modify their instruction to match the needs of the new technologies rather than continuing to teach in the same manner as in the conventional sessions. Nearly all of the participating teachers agreed that students also adjust to what they are being taught.

Teachers' Beliefs about Benefits of Technology Integration into their Classrooms

According to the participating teachers, using technology in the classroom has several advantages for both teachers and pupils. First off, all of the teachers agreed that technology supported advancements in both teaching and learning. Regarding the benefits to children, the clear majority of the teachers claimed that implementing technology in their classrooms improved students' academic performance overall, motivation, comprehension, collaborative learning, and language-learning outcomes. From the interviews, several teachers made it quite evident how they supported their pupils' learning through technology.

Technology is such an amazing tool, says Teacher 7:

"The activities we offer students help them become more involved and give them the chance to interact with real language."

Teacher 9 says:

"Using computers in language classes is a good idea. My students are able to simply switch into different groups to make conversations thanks to the language acquisition and instruction software that has been placed on the computers. They are really interested in these computer-based activities. They actually interact as well."

Almost all teachers who were asked how technology helped them in their language classes said it helped them develop their curricula, pay attention to their students, use effective teaching methods, treat students with special needs, evaluate students' performance, and expand their information sources. Most importantly, it helped them stay motivated as teachers. According to some teachers who were questioned, lectures became more authentic and vivid with computer-assisted slide show presentations that included illustrated graphics and sound to interest pupils in the courses. Teacher 10 remarked.

"I can flexibly create different fascinating activities and entice students to join in thanks to flexible software like Hot potatoes, Toondoo, and Movie maker."

Teachers' Beliefs about their Skills in Using Technology in Education

The perspectives of the teachers were largely congruent when it came to the use of their technological talents in the classroom. Only one teacher claimed to be comfortable using technology-based activities in her courses and to have sufficient knowledge of contemporary technology. The remaining fourteen teachers, on the other hand, admitted that they lacked computer expertise and proficiency, which made it much more difficult for them to create teaching materials and exercises than in conventional classes. Teacher 2 stated:

"I lack computer abilities, therefore it can be difficult for me to handle the resources I discover online. To adapt those resources to my pupils' level takes a lot of time."

Those sentiments show that the teachers' lack of proficiency with technology was a challenge when they tried to

integrate it into their lesson plans. The fifteen teachers all agreed that one challenge was the necessity for them to stay current on technological advancements in order to offer students with the support and facilitation they require in order to meet the needs of digitally mature learners.

Additionally, every interviewee cited a lack of training and technological resources, such as computers and Internet access, as a barrier that prohibited them from integrating computer-based activities into their lessons.

Teacher 5 emphasized:

"I feel I have gained skills by myself more than in training."

Teacher 8 explained.

"Whenever I want to show something on the Internet as an illustration for my explanation, I have to turn on the Cellular Data in my mobile phone and connect the computer to this phone in order to access the Internet,"

However, the majority of the instructors acknowledged they enjoy creating technology-based activities in their language classrooms when questioned about their opinions on using technology in the classroom. Teacher 4 said:

"I think I have a positive attitude towards the integration of computing resources in the teaching-learning process, despite the current difficulties and limitations."

In the interviews, those instructors also expressed their desire to use technology in their lessons going forward and their willingness to improve their technological know-how and competencies through self-learning and, if practical, training programs.

Discussion

The findings of this study generally confirmed a number of factors that had been discovered in earlier studies. First, the results were consistent with the literature about a paradigm change in teaching and learning that was previously highlighted. The participants employed technology because it improved a variety of learner-related aspects and because it offered a more effective teaching method, just like the teachers in earlier studies. They were also hindered by a lack of trust in their computer literacy and skills, a lack of access to suitable equipment, and a lack of professional support. The participating teachers also stated that they would be willing to continue integrating technology into their classrooms despite the limitations on professional development opportunities and the physical teaching environment.

Conclusion

The study's findings showed that each participant instructor was conscious of the value and wide use of technology in education as well as the benefits that technology might bring to their language classrooms. However, many expressed concern about their own knowledge and abilities in the field as well as the lack of digital tools in classrooms. But they also expressed a desire to employ technology in education in the future. This suggests that even though there are a variety of factors influencing instructors' decisions about the use of

technology, personal opinions were still the main consideration. Another inference about why the teachers continued to take the initiative to learn about it themselves despite receiving limited support can be formed from the teachers' intention to use technology in future teaching and eagerness to develop their technological abilities. They most likely did so because they recognized its value to them and, more importantly, to their students. The participants continued to look for opportunities to participate in professional training programs in the intention of enhancing their technology knowledge and skills to handle any difficulties they may have had integrating technology. As a result, training must include practical sessions that demonstrate to teachers how to successfully use the technology into classroom activities rather than being restricted to a mere introduction to how it works.

Recommendations

Research limitations must be disclosed in order for new research to be established on a more reliable foundation. There are two main limitations to the current study. To begin with, additional participants would have increased the generalizability of the findings. Additionally, suppose a comparative investigation is to be carried out in contexts beyond classrooms. In that case, the quantitative findings may have been supplemented by qualitative data as well as tools such as semi-structured interviews with some of the study's participants. Therefore, larger studies using a variety of research approaches should be used in future studies to produce more conclusive and reliable findings.

Abstract: The present study does have a great contribution to Vietnamese higher education institutions that adopted blended learning using Coursera MOOCs, especially blending the courses with offline mentors in brick-and-mortar classrooms. In the current study, the perceived value of constructs of the extended UTAUT2 model with additional variables of language competence and teacher influence was used to examine undergraduate students' MOOC adoption at a private Vietnamese higher education institution. This study was conducted via an online survey with 322 students who participated in at least one Coursera MOOC. The quantitative instrument consisting of a 36 items questionnaire was adapted from the UTAUT2 model Venkatesh (2003) and Venkatesh (2012); Barak et al., (2016), and Sebastianelli et al., (2015). The findings revealed that there was a correlation between performance expectancy, effort expectation, social influence, facilitating condition, hedonic motivation, price value, habit, language competence, teacher influence, and students' behavioral intention for continued use of MOOCs. More importantly, while social influence, hedonic motivation, price value, and habits had a strong impact on MOOC adoption, the variables of performance expectancy, facilitating condition, language competency, and teacher influence unexpectedly did not have any effects on the behavioral intention of undergraduate students towards MOOC adoption. Interestingly, effort expectation had an inverse impact on students' adoption of MOOCs. From the findings, implications and future suggestions of the research have been presented.

Keywords: Coursera MOOC, UTAUT2, Behavioral Intention, Language Competency, and Teacher Influence.

Affecting Undergraduate Students' Adoption of Massive Open Online Courses (MOOCs). In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1652-1670), Cappadocia, Turkiye. ISTES Organization.

Introduction

The internet has dramatically impacted every aspect of human life. Education is no exception. In the other words, it has transformed the way knowledge is conveyed from traditional classrooms to scalable modern classrooms called MOOCS (Massive open online courses) that are regarded as a tool for “innovative disruption” which will be the promise for education (Tirthali, 2016). Besides, one of the main goals of the Sustainable Development Goals (SDG4) for Quality Education, which are to be attained by all of the member countries by 2030, is to promote lifelong learning, and MOOCs are thought to be a great medium for doing it. Additionally, MOOCs have been “a game changer” in the education domain because of their ability to grant users instant access to varying forms of education at any time and place, often as a free or affordable service. In other words, students who cannot fully commit to significant commitments such as traveling abroad to seek education from prestigious foreign higher education can now participate anywhere and at any time (Barak, Watted & Haik, 2016).

Among MOOC providers, Coursera is known as the largest MOOC provider across the globe with over 2.700 courses. Moreover, according to Class Central, a top MOOC aggregator, there are approximately 78 million users of MOOC (Shah, 2018). It is the soaring penetration of MOOCS that has attracted numerous researchers and scholars, who have studied plenty of various aspects of MOOCs to contribute to the existing body of knowledge of the prevailing MOOCs in the world. According to Meet and Kala (2021), 102 MOOC-related articles were published from 2013 to 2020. Though lots of researchers examined MOOC adoption, the current study targets Asian undergraduate students in a non-native English-speaking country, particularly in Viet Nam.

Although Vietnam is currently still in the early stages of implementing MOOCs into its educational system when considering readjustments and following the global model, MOOCS have been adopted by many universities (<https://vietnamnews.vn>, 2021). However, Vietnam is still facing obstacles that prevent it from reaching the true potential of MOOCs as time constraints, and the limited interaction between instructors and students. Prof. Giap Van Duong, founder of the first MOOC in Vietnam, during an interview with vnExpress, has even suggested that the lack of emotional expression from the teachers which is a common occurrence in MOOCs has led to a detachment between teacher and student which hinders the potential of MOOCs even further (htkh.hou.edu.vn, 2019). Thus, the current study was carried out at a selected private Vietnamese university by using the extended UTAUT2 with two additional variables of language proficiency and teacher influence to explore MOOC adoption by undergraduate students. The reasons for adding two more constructs to the model are explained as follows. First, language proficiency plays an integral part in MOOC enrolment and students only participate in MOOCs that are available in their language (Aldahdouh & Osório, 2016; Connolly,

2016). Likewise, Mendoza et al. (2017) noted in highlighting the necessity to investigate the impact of language proficiency on MOOC adoption. In addition to the significant role of language proficiency, teachers' or instructors' influence on the learning process of MOOC users is needed to be evaluated (Littlejohn et al., 2020). The term "teacher's influence" is regarded as a teacher's involvement in inspiring and guiding a student to use MOOCs for his or her improved comprehension and knowledge of the subject. It could be said that a teacher positively impacts a student's activities in a brick-and-mortar classroom or a virtual setting. Along with encouraging a positive attitude toward MOOC learning, a teacher's prior experience with MOOC as a learner, their familiarity and ease with educational technology, and their teaching expertise could all be potential influences (Tseng et al., 2019; Jung & Lee, 2020).

In light of the aforesaid, more studies are needed to explore MOOC adoption by students at higher education institutions. In particular, the application of MOOCs combined with offline mentors and learners' language proficiency in these courses (Ho et al., 2022). As a result, the aims of our research are to explore factors impacting students' behavioral intention of using MOOCs via the UTAUT2 model. Additionally, we undertake the study with undergraduate students as the core subjects of the research and language competency and teacher influence in offline sessions as additional variables positively affecting MOOC adoption. For such purposes, it leads to our research with the following questions:

RQ1: To what extent does students' behavioral intention toward the adoption of MOOCs through UTAUT2?

RQ2: To what extent does language competency affect students' behavioral intention toward the adoption of MOOCs?

RQ3: To what extent does teacher influence affect students' behavioral intention toward the adoption of MOOCs?

Literature review

Definition of MOOCs

MOOCs are defined as "a MOOC integrates the connectivity of social networking, the facilitation of an acknowledged expert in a field of study, and a collection of freely accessible online resources" (McAuley et al., 2010). Another definition of MOOC is an online course that provides instruction in virtual settings, which are known as a website that contains online courses in video format, lectures formatted as short videos combined with formative quizzes, automated assessments, and peer and self-assessment, and an online forum for peer support and discussion (Glance, 2013). It is also considered an online course that can gain significant participant numbers to learn for about 4-10 weeks and is subject to a certain rule. The first week is for participants to learn content via videos, and the last week is used to submit assignments and presentations for assessment (Taneja and Goel, 2014).

The Unified Theory of Acceptance and Use of Technology (UTAUT)

UTAUT's theoretical model of the use of technology in learning is defined by actual behaviors. The UTAUT model shows that the adoption of technology in learning MOOCs will be directly influenced by four main constructs, namely performance expectations, effort expectations, social influence, facilitating conditions, and other moderators viz. gender, age, and experience (Venkatesh et al., 2003). In addition, the UTAUT model will synthesize existing theories about how people use technology to learn (Venkatesh and Davis, 2000; Venkatesh et al., 2003).

The Extended Unified Theory of Acceptance and Use of Technology (UTAUT 2 Model)

According to Venkatesh et al., 2012, “consumer effect, automaticity, and monetary costs” were later added to the UTAUT2 model in addition to the four primary constructs of the UTAUT. The extended UTAUT2 model was used in the current study because of the following reasons. First, the UTAUT2 model can be said to have overcome the incompleteness of the previous TRA (Ajzen & Fishbein, 1975), TAM (Davis, 1989), TPB (Ajzen, 1991), and UTAUT1 models and has also been applied by many researchers in new technology acceptance models in general and MOOC in particular (Venkatesh & Davis, 2000). Second, plenty of researchers have used and verified the UTAUT2 model on a variety of technologies, but little research has been done to support UTAUT 2 in the context of education (Mittal et al., 2021; Tseng et al., 2019). Third, the extended model is widely used as it can address the limitations of the UTAUT model (Venkatesh et al., 2012). It is significantly noted that moderators of the original UTAUT model are not used in the current study because these moderators may not impact the adoption context. (Dwivedi et al., 2019).

Performance expectancy (PE)

It is defined as the extent to which individuals believe that the use of technology can support them to improve their performance and fulfill plenty of tasks. (Venkatesh et al., 2003).

Effort expectancy (EE)

Students are willing to accept the application of technology in learning if they feel that using MOOC technology is very easy called the effort expectancy by Dečman, (2015) and Fianu et al., (2018). Likewise, the phrase "degree of ease associated with utilizing the system" is used to characterize effort expectation. (Venkatesh et al., 2012; Zhou et al., 2010).

Social influence (SI)

Social influence (SI) is also a significant factor that leads students to use MOOCs as people such as family members, and friends, whom students believe that their use of the new system will help their studies (Venkatesh et al., 2003).

Facilitating condition (FC)

Facilitating conditions define the extent individuals believe the organizational and technical infrastructure is in place to support their use of the system (Venkatesh et al. 2003). In other words, students can use phones, laptops, and compatible electronic devices that can easily study with supporting students anywhere and anytime (Brown and Venkatesh 2005; Venkatesh et al., 2003).

Hedonic motivation (HM)

Hedonic motivation (HM) has been included as a crucial predictor in the study of each student's behavior, pleasure from using MOOCs in learning, and level of interest in MOOCs is essential to students' interest in the use of MOOCs in education (Holbrook and Hirschman, 1982).

Price value (PV)

Price value (PV) is described as an individual user's cognitive trade-off between the benefits they receive from using technology and the amount of money they spend on it (Venkatesh, 2012). In the institutional context of research, even though students do not have to pay any cost to study MOOCs on Coursera, tuition and fee payment for courses on the platform are truly included in the school's tuition fee.

Habit (H)

Habit is defined as the degree to which a person tends to act automatically as a result of learning (Limayem et al.2007). Venkatesh et al., (2012) argue that the use of previous experience is a prerequisite for the habit of using technology and that habit is a key factor in the future adoption of that technology.

Language competency (LC)

Language competency (LC) refers to a student's knowledge and ability in the language in virtual classrooms. Research in information systems has found that language influences the acceptance of technology (Deng et al., 2019). MOOCs have a lot of reading materials, lectures, and videos for users to refer to, all in English. If a person is fluent in the language, it is possible to understand all the content of the MOOC lecture. In developing countries, language strongly affects students' MOOC adoption (Aldahdouh & Osório, 2016; Anand Shankar Raja and Kallarakal, 2020).

Teacher influence (TI)

The term "teacher's influence" (TI) refers to a teacher's involvement in inspiring and encouraging a student to use online learning resources for his or her increased comprehension and topic knowledge. According to Safri & Hanafiah, (2020), certain MOOCs do not provide mentors, or coaches, for students, which prevents them from connecting with MOOC instructors and creating opportunities for participation. Therefore, offline mentors are crucial for students to handle MOOCs.

Previous Studies and hypotheses development

The considerable impact of performance expectations on behavioral intention to use e-learning has been noted in existing research on technology adoption (Dečman, 2015; Fianu et al., 2018; Jambulingam, 2013; Persada et al., 2019). Performance expectations were discovered to be a key factor in the adoption of online teaching and learning during the Pandemic due to its utility (Kala & Chaubey, 2022; Mittal et al., 2021). It is in the same vein, Šumak et al., (2010) discovered that performance expectation was a significant predictor of student attitude toward e-learning. Similarly, performance expectancy influenced behavioral intention in a number of online contexts, such as the acceptance of blended learning (Azizi et al., 2020), the adoption of e-learning (Tarhini et al., 2017), the adoption of MOOCs (Tseng et al., 2019), adoption of emerging information technology in higher education classrooms (Lewis et al., 2013), use of learning management systems (Ain et al., 2016). These findings agree with the finding by Venkatesh et al., (2012) who postulated that behavioral

intention is directly influenced by performance expectation. As a result, we propose the hypothesis:

H1. Performance expectancy impacts undergraduate students' behavioral intention to adopt MOOCs.

Effort Expectancy is regarded as a key factor in influencing users' choice to adopt novel technology. To clarify, Im, Hong, and Kang (2011) and Jung and Lee (2020) reinforce the result that simplicity of use influences the adoption of new technologies. The former studies also showed the positive effect of effort expectation on adopting new technology (Venkatesh et al., 2003). Similarly, Al-Adwan's research (2020) found that perceived ease of use has a positive impact on users' behavioral intentions toward MOOCs, especially in non-compulsory courses. When technology is easy to use on a high level, there is a probability that more effort will be required to use MOOCs. Therefore, we also hypothesize:

H2. Effort expectancy impacts undergraduate students' behavioral intention to adopt MOOCs.

Another element that motivated students to enroll in MOOCs is shown to be social influence. It has a favorable impact on the usage of MOOCs because of how simple they are to use and the advantages they are supposed to provide. Users are more likely to have high intentions of using the technologies if they perceive that significant individuals in their social circles encourage their usage of MOOCs (Chaveesuk et al., 2022). In agreement with the finding, social influence was discovered to be a factor in the adoption of online teaching by school teachers (Tandon, 2020) as well as the acceptance of blended learning (Azizi et al., 2020), e-learning (Tarhini et al., 2017), the use of a learning management system (Ain et al., 2016; Widjaja et al., 2020), MOOC adoption (Tseng et al., 2019), and emerging information technology adoption, hence we also hypothesize:

H3. Social influence impacts undergraduate students' behavioral intention to adopt MOOCs.

Facilitating Conditions were commonly highlighted as an indicator of MOOC uptake. MOOCs were seen as beneficial for gaining free access to high-quality educational materials and providing a flexible online setting where learning may take place without regard to time or location. The utilization of transcripts from a multidisciplinary curriculum, linkages to resources of current events, and brief media files with explicit learning objectives all supported students' learning in the case of MOOCs (Rosell-Aguilar, 2013). In Nanayakkara's opinion (2007), teachers and technical support positively influence students' use of learning management systems. A similar finding is echoed by (Bakar et al., 2013) who postulated facilitating conditions have a beneficial impact on the acceptability level of e-learning. Taking cognizance of this, we also hypothesize:

H4. Facilitating conditions impact undergraduate students' behavioral intention to adopt MOOCs.

The behavioral intention to use online and internet-based technologies, such as learning management systems, mobile learning, e-learning, digital social media, mobile banking, etc., is preceded by hedonic motivation (Baptista & Oliveira, 2015; Moorthy et al., 2019; Raman & Don, 2013). In the same vein, prior research has identified hedonic motivation as a strong predictor of BI's adoption of technology (El-Masri & Tarhini, 2017; Moghavvemi et al., 2017). Digitalization and peer pressure from social media has inspired Gen Z to value experiences more than previous generations do and to lead lives that are accelerated, exciting, enjoyable, and full of experiences. Besides, Gen Z will lead the adoption of all new online consumer technologies because of

their intrinsic familiarity with electronic goods and services (Weinswig, 2016), thus it is hypothesized that:

H5. Hedonic motivation impacts undergraduate students' behavioral intention to adopt MOOCs.

According to the UTAUT2 hypothesis, a product's quality, cost, and price are likely to impact the behavioral intention of using MOOCs. As a result, in the analysis of the adoption of MOOC use, the user's intention to use would be influenced by their perception of the quality of learning attained through the programs in comparison to the cost of supporting facilities, such as the Internet, computers, and cost of the education programs. These elements have a significant role in determining one's educational goals and decision-making processes, particularly for young people given the significance of learning outcomes. Previous research on online learning has demonstrated a strong link between pricing value and behavioral intention (Raman & Don, 2013; Tseng et al., 2019). As a result, we hypothesize that:

H6. Price value impacts undergraduate students' behavioral intention to adopt MOOCs.

Alsharo et al., (2020) claim that obligatory online learning, as was the case, compels students to continually utilize technology, which leads to automated executions. Moreover, Limayem et al., (2007) proposed that thoroughness of usage, frequent repetition of the behavior in question, degree of pleasure with the activity's results, and reasonably stable circumstances result in automated actions. For example, when learning online, students frequently log onto their computers and learning management systems, checking for emails, new announcements, and reminders for impending assignments and activities. Also, students would routinely read assignment summaries, finish tests, research topics, download educational materials, participate in web conferences, solve problems, and interact (through email, chat, emoticons, posting and commenting to message boards or blog threads) (Limayem & Hirt, 2003; Polites, 2009; Vishwanath, 2015).

H7. Habit impacts undergraduate students' behavioral intention to adopt MOOCs.

According to Meet et al., (2022) that language competence did not affect the behavioral intentions of students participating in MOOCs while Aldahdoh & Osório, 2016; Anand Shankar Raja, and Kallarakal, 2020 postulated the relationship between language proficiency and behavioral intention was statistically significant. Connolly (2016) echoed similar findings, underlining the importance of language skills in MOOC participation and recommending that students only enroll in MOOCs offered in their language. As communication is crucial to learning in all contexts, including online and offline learning, Garcia Mendoza et al., (2017) emphasized the importance of examining the influence of language proficiency on MOOC uptake. Learners perform better in their mother tongue (UNESCO, 2016). Hence we also hypothesize that:

H8. Language competence impacts undergraduate students' behavioral intention to adopt MOOCs.

According to studies (Hoi & Mu, 2021; Al-Adwan et al., 2021a), teachers who play as significant social agents and nation-builders have a positive effect on student's mental health, behavior, and independent use of technology for learning. They also serve as an essential motivator for participants to sign up for MOOCs and foster a favorable attitude toward MOOC learning (Chang et al., 2015; Jung & Lee, 2020; Tseng et al., 2019). Likewise, teachers greatly influence students' offline and online learning activities (Garrison, 2000; Tseng et al.,

2019; Jung & Lee, 2020). Nonetheless, there is little correlation between instructors' impact and behavior intention (Al-Adwan et al., 2021a; Chang et al., 2015; Hoi & Mu, 2021). Therefore, it is hypothesized that:
H9. Teacher influence impacts undergraduate students' behavioral intention to adopt MOOCs.

Research model

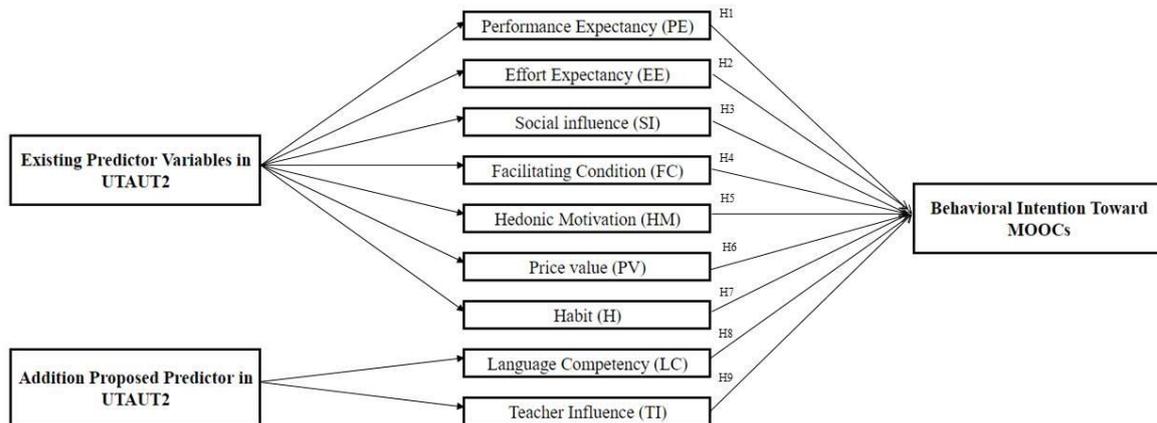

Figure 1. Research model showing the hypotheses relationships

Method

The quantitative research method is the more suitable one for this research as Creswell (2003) postulated that only an analytical view using data analysis that realizes the united strength of multiple variables can give a more definitive answer to the research problem. Additionally, purposeful sampling is commonly used to efficiently identify and select samples with valuable information, making use of the limited resources on the researcher's end. It is the process of using one's judgment to purposefully pick a specific demographic out of the population who's experienced a phenomenon of interest to participate in the research (Palinkas, L.A, 2015).

Participants

The present study consists of 322 students who are required to participate in at least one MOOC on the Coursera platform. They are chosen from all majors viz. English language, Business Administration, and Information Technology at the research site.

Research site

The university in the current research has implemented MOOCs on the Coursera platform since the summer of 2019. All students from all majors (Information Technology, Business Administration, Graphic Design,

Linguistics, Multimedia Communication, and Hospitality Management) are required to take the courses in their curriculum. In each course on Coursera, students mandatorily spend 5 slots (7.5 hours) meeting with their offline mentor.

Research Instruments

The first research instrument in the study was the questionnaire designed to collect data from participants regarding their experiences with MOOCs. The survey was separated into main sections. The beginning of the survey is demographic information such as age, gender, year of study, major, and the number of courses they participated in. The second part of the survey is the constructs of the research model including the factors such as performance expectancy (4 items), effort expectancy (3 items), social influence (3 items), and facilitating conditions (4 items) were developed by Venkatesh (2003), and the UTAUT2 model adapted from Venkatesh (2012) consists of 4 items that measure the constructs of hedonic motivation (3 items), price value (3 items), habit (3 items), and behavioral intention (3 items) while language competency (5 items) and teacher influence (5 items) were adapted from Barak et al. (2016) and Sebastianelli et al. (2015). The questionnaire adopted a 5-point Likert scale where participants could rate their level of agreement or disagreement with the statements ranging from 1 "Strongly Disagree" to 5 "Strongly Agree".

Data collection procedures

Piloting the questionnaire:

After receiving approval from the Ethics Committee of the English Language Department at the research site. The research team undertook the survey (both English and Vietnamese versions) sent to 40 participants who experienced at least one MOOC on Coursera to test the reliability of the questionnaire.

Table 1. The reliability of the questionnaire

Name of variables	No. Items	Alpha	No. Participant
Performance Expectancy (PE)	4	0.824	40
Effort Expectancy (EE)	3	0.643	
Social Influence (SI)	3	0.909	
Facilitating Condition (FC)	4	0.625	
Hedonic Motivation (HM)	3	0.926	
Price value (PV)	3	0.855	
Habit (H)	3	0.771	
Behavioral Intention (BI)	3	0.913	
Teacher Influence (TI)	5	0.828	
Language Competency (LC)	5	0.782	

We tested the reliability of the variables using the Cronbach Alpha scale on SPSS with the results obtained from 40 students who took the survey on Google Forms. The variables all reached above 0.6 over 0.9, showing that

the reliability is acceptable (Cronbach, 1951).

Quantitative data collection:

To reach more participants, we emailed the teachers to ask for their permission to directly enter their classes to collect the data. Moreover, before participants answered the questionnaire, they had been asked to complete the consent form by scanning the QR code.

The data will be stored in personal researchers' laptops for 5 years. In case our laptop is broken, we still ensure your information, and data are stored and secured on google drive.

Results

Descriptive Characteristics of Participants

Out of a total of 322 participants, 32.3 % of them were male and the others were female. In terms of ages of participants, 44.1% of the participants were from 18 to 20 years old, 51.6% were from 20 to 22 years old and the other age groups accounted for 4.3%. Regarding the programs of the participants, students of Information Technology were 2.8%, students of Linguistics were 45.3%, and students of Business Administration were 51.9%. Next, while over half of the participants were second-year students (58.7 %), the remainder was made up of first-year students (4%), third-year students (8.7%), and final-year students (28,6%). Eventually, the number of courses the participants have taken varied. Specifically, 5.6% of the students took 1 course, 32.6% of the students took 2 courses, 14.6% of the students took courses, and 47.2 % of the students took more than 3 courses.

Table 2. Descriptions of participants in the study (N=322)

Demographic	Category	Number	Percentage
Gender	Male	104	32,3
	Female	218,0	67,7
Age	18 to 20	142	44,1
	20 to 22	166	51,6
	Other	14	4,3
Major	Business Administration	167	51,9
	Information Technology	9,0	2,8
	Linguistics	146	45,3
Year of study	First-year	13	4
	Second-year	189	58,7
	Third-year	28	8,7
	Final year	92,0	28,6
Number of courses	1 course	18,0	5,6

2 courses	105	32,6
3 courses	47	14,6
More than 3 courses	152,0	47,2

To test the correlation between behavioral intention (BI) and other variables of the extended UTAUT. We conducted the Pearson correlation table. In the results of Table 3, the sig test Pearson correlation among all variables is less than 0.05. Thus, the correlation between variables PE, EE, SI, FC, HM, PV, H, LC, TI, and BI was linear.

Table 3. The Pearson correlation coefficient between variables of the UTAUT2 model, LC, TI, and BI

Teacher Influence	-0,072	0,061	-0,052	-1,188	0,236	0,465	2,150
a. Dependent Variable: Behavioral Intention							
b. Independent Variables: PE; EE; SI; FC; HM; PV; H; LC; TI							
c. Model Summary: R=.852a; R ² =0,725; Adjusted R=0,718; Sig=0.000							

The ANOVA table gives us the results of the F test to evaluate the hypothesis of the fit of the regression model. The sig value of the F test is $0.000 < 0.05$, and using a linear regression model is appropriate and statistically significant.

The model summary showed that the behavior intention R Square index (0.725) is approaching 1, the more independent variables explain the dependent variable. Besides, adjusted R Square is equal to 0.718, showing that the independent variables (teacher influence, habit, effort expectancy, social influence, performance expectancy, language competency, price value, hedonic motivation, and facilitating condition) included in the regression analysis affect 71.8% of the variation of the dependent variable (behavior intention). According to Sarstedt et al., (2019), the Variance Inflation Factor (VIF) should be lower than 3 to avoid the degree of collinearity or even multi-collinearity among the independent variables. Therefore the regression of the model is accepted.

According to Table 4, the variables PE, FC, and TI did not affect the dependent variable BI ($p > 0.05$) while the remaining variables viz. EE, SI, HM, PV, H, and LC affected BI ($p < 0.05$). Specifically, habit is the most influential factor on behavioral intention ($B=0.439$), followed by hedonic motivation ($B=0.216$), price value ($B=0.175$), language competency ($B=0.157$), effort expectancy ($B=0.149$), and social influence factors have the lowest influence on the behavioral intention of Vietnamese students using MOOCs ($B=0.134$).

Discussion

In the current study, we identified constructs affecting students' adoption of MOOCs through the quantitative approach. While all nine of the hypothesized variables had an influence on the behavioral intention variable. Through data analysis, only 6 variables had a significant influence consisting of habit (H), hedonic motivation (HM), price value (PV), language competency (LC), effort expectancy (EE), and social influence (SI) while the remaining factors containing performance expectancy (PE), facilitating condition (FC), and teacher influence (TI) were irrelevant.

To begin, H7 was accepted because the findings revealed that habit had the strongest effect on students' adoption of Coursera MOOCs. This finding agrees with previous conclusions by Limayem et al., (2007), and Alsharo et al., (2020). Furthermore, hedonic motivation also significantly influenced students' adoption of MOOCs. This result is consistent with previous studies that have demonstrated the importance of enjoying the learning process and finding pleasure in it as a motivator for using MOOC platforms (El-Masri & Tarhini, 2017; Moghavvemi et al., 2017). This led to the H5 being accepted from the research. Additionally, price value has a positive effect on BI, which has been supported. This finding is notable as it underscores the importance of considering students' perceptions of the monetary value they receive from MOOCs; this has proven the legitimacy of theories presented by previous research (Raman & Don, 2013; Tseng et al., 2019). Moreover, H8 was confirmed because the findings revealed that language competency was found to have a positive impact on students' behavioral intention to adopt MOOCs. This finding supports previous research that has highlighted the importance of language proficiency in MOOCs (Connolly, 2016, Garcia Mendoza et al., 2017, Anand Shankar Raja and Kallarakal, 2020) and opposes the previous study by Meet et al., (2022). This indicates that students at the sampled and studied university are not adept in communication skills as well as language competency, which causes them a feeling of discomfort with MOOC content delivery and its understanding. This is easily understood because English is neither the official language nor the second language in Viet Nam.

An emerging suggestion for stakeholders namely English lecturers and institutional managers at the studied location is that they should design effective English programs as well as encourage students' English learning to enhance their English language proficiency. H3 was also accepted as the findings also showed that social influence (SI) had positively influenced students' behavioral intention to adopt MOOCs. This is in agreement with the previous research by Singha Chaveesuk et al., 2022. Furthermore, H2 was accepted because the findings showed that effort expectancy significantly affects BI. This finding is similar to the previous conclusion by Azizi, 2020; Al-Adwan, 2020; Meet et al., 2022. However, in the current study, effort expectancy(EE) had negative values. Obviously, Coursera's platform doesn't require users much effort in enrollment, and the features of MOOCs have nothing special to stand out. Participants can use MOOCs easily and skillfully with just some mouse-clicking. Moreover, it can be inferred that MOOCs' design is not interesting enough to attract students' engagement. Besides, the course content is quite monotonous, just clips, quizzes, assignments, and capstones. Therefore, it is suggested that MOOC designers and providers need to consider adjusting and

updating the “ appearance” as well as the content of MOOCs to make them more compelling.

On the contrary, the results indicated that performance expectancy (PE), facilitating condition (FC), and teacher influence (TI) has a non-significant effect on behavioral intention (BI). Specifically, PE had no positive effect on BI. This finding is dissimilar to the previous studies conducted by Venkatesh et al., 2012; Kala & Chaubey, 2022; Mittal et al., 2021. This led to the rejection of H1 from research. This may be explained that the courses that students were forced to enroll in do not satisfy their needs, thus they do not find them useful. In other words, curriculum and plan developers at the research site should reconsider the MOOC courses they intend to implement. If possible, they can let their students choose the courses they like in the given list. Furthermore, our findings showed that facilitating conditions had not influenced BI, thus H4 was rejected, which contradicts the results from the previous research (Bakar et al., 2013; Kala et al., 2022). All of the students are Generation Z, hence it is easy for them to access and use technological gadgets as well as technology-related aspects. They could even resolve the problems by themselves. Maybe they only need support when violating plagiarism. Likewise, the findings showed that teacher influence (TI) did not impact the BI of students to adopt MOOCs, which opposes the previous studies in the same area (Hoi & Mu, 2021; Al-Adwan et al., 2021a). As a result, H9 was rejected. Students at the research site have the ability to deal with problems related to the course. For instance, if they do not grasp the content, they can watch the lecture videos again or read the tapescripts. More importantly, Coursera MOOCs have not truly attracted their involvement, hence the presence of offline mentors is not significant.

Conclusion

In conclusion, the findings of the current study revealed that habit, hedonic motivation, price value, language competency, and social influence had a positive impact on students’ accessibility to MOOCs while effort expectancy negatively affected students’ intention to use MOOCs. Specifically, the most influential variable on behavioral intention is habit, followed by hedonic motivation, price value, language competency, effort expectancy, and social influence. Conversely, the remaining variables viz. performance expectancy, facilitating conditions, and teacher influence did not affect the dependent variable-behavioral intention.

Recommendations

The completion of the research comes with important discoveries that should be addressed. We suggest researchers consider the following: the mixed research method should be considered when conducting any further research. Second, Diversification of demographic selection should be considered; specifically, because this research was conducted only at one high institution, further research should be carried out at other institutions where MOOCs are mandatory. Furthermore, the attention should be allocated to the K-12 demographic rather than Undergraduate students.

Acknowledgments

First and foremost, we would like to thank our school council for their approval of our work and the greatest thanks to Ms. Pham Minh Ngoc An for her contributions to the project as our research supervisor and professional editor. The completion of this research would not have been possible without her insurmountable support. Special thanks as well to our members, participants, and lecturers at the research site for providing us with their time, skills, and permission to make this work possible.

Abstract: As a result of the development of the Covid-19 pandemic, a rapid transition from the classic classroom-lesson form to a distance form of education was required. Thus, many questions arose regarding the applicability of this training method and its comparison with the classical face-to-face method. This article presents a study of the examination results of face-to-face and distance-learning students, assuming all other circumstances being equal. A hypothesis test is performed, regarding a difference between means of two independent samples for quantitative indicators that have normal distribution. Student's t-test for independent samples is applied. The research takes place in the University of Mining and Geology in Sofia, Bulgaria. The experimental results show that the examination results of the students are different for both methods and in the majority of the cases the results of the present in the class students are better. Comparing the advantages and disadvantages of both methods, it is concluded that only a combination of different forms of education - present in class, remote, hybrid and blended, can provide a modern education aimed at the sustainable development of society.

Keywords: Face-to-face learning, Distance learning, Blended learning, Hypothesis test

Introduction

The sudden appearance and severe course of the disease caused by the Covid-19 virus posed a great challenge to

the education system in all countries of the world (Barrot, 2021). Rapid measures were needed to move traditional education into an electronic environment (Ferri, 2020). This gave a powerful head on the development of distance learning. It is an attractive mode of education for independent study. (Bozkurt, 2022). But all learners, regardless of whether they are in the class or at home, need support and observation, hence there is a need for reintegrating social and teaching presence in online and distance education practices (Naidu, 2023).

Distance Education is defined as “a process to create and provide access to learning when the source of information and the learners are separated by time and distance, or both” (Stauffer, 2023). Unlike online learning, which can be both in and out of class, distance learning places the teacher and students in different locations. (Hodges, 2020, March 27). Online learning can be used as a blended learning method, together with other teaching techniques. In distance learning, the interaction between the teachers and the students is not face-to-face and nowadays it is realized mostly by digital communication. Therefore, we can consider online learning as the major form of distance learning (Bernard, 2009). The main advantage of distance learning is its flexibility. Students are feeling more independent and they can organize better their schedule. Distance education offers the students accessibility of time and place. It improves the concentration of the students on the studied material. The slow learners have an opportunity to study with their own speed of assimilation of new material. Distance education reduces students’ financial costs for transportation, accommodation, etc. It provides them with a comfortable environment to enjoy the education process (Stauffer, 2023).

On the other hand, there are also disadvantages. Focusing on the screen for a long time becomes boring for some students and their attention begins to be distracted and diverted to other pursuits. This circumstance determines the necessity of more breaks during the learning process. Another problem is to provide a consistent Internet connection with decent speed. Some students don’t have even personal computers at home. It causes a lack of stability and continuity in the education process. The lack of physical interaction between the students and their teachers, and also their peers creates a feeling of isolation. (Stauffer, 2023). Online and distance learning is not an easy solution. It requires the same level of rigor that is required for the development of campus-based learning experiences (Naidu, 2023). The adoption of distance education during the pandemic allowed educational institutions to continue their work in limited ways, challenging both the teachers and the students. This caused many studies to be conducted on the influence of different teaching methods on the quality of the learning process, which in turn led to the improvement of the process as a whole and its enrichment with new techniques.

Main aim of the study

Distance learning during the Covid-19 pandemic raises a number of questions about the quality of the learning delivered and how it compares to face-to-face classroom learning. The main criterion for the quality of learning is the degree of achievement of the learning outcomes. This is a very important and complicated task. Usually,

the degree of assimilation of the learning material is determined by the exam results of the students. The exam has to cover all learning outcomes and has to include challenging tasks. The exam has to be (Semerdzhiev, 2021, b):

- fair – it should provide the students with equal opportunity;
- resource efficient, according to the available resources;
- technology agnostic – should avoid requirements for a specific hardware or software;
- fault-tolerant – should be independent of technical failures, as much as possible;
- auditable – should allow for an independent audit;
- familiar for the different students;
- secure – should avoid possibilities of cheating and unfair behavior of students.

The experiment is done at the University of Mining and Geology, Sofia, Bulgaria. The University course is “CAD systems” which is offered to full-time and part-time students. The main part of the course is dedicated to specialized middle-class general-purpose software, having an internal programming language, containing a powerful toolkit for automating the drawing activity and capabilities for modeling complex solid three-dimensional objects. Students become familiar with the possibilities of the system for creating and editing drawings in the two-dimensional and three-dimensional space, inputting and outputting graphic information, creating libraries of graphic elements. The computer graphics system AutoCAD is widely known in engineering and it is widely used in the automation of drawing activities and in supporting design and construction work. The accumulation of practical skills in the approaches to its use provides a good start in the profession of future engineers. Lecture material is presented in the form of multimedia presentations and demonstration work in an Autodesk AutoCAD environment.

After completing the course, students are expected to be able to:

- use AutoCAD tools to create and edit elementary drawings;
- use the capabilities of the system to work in different layers;
- create and use blocks;
- annotate and print their drawings.

The knowledge and practical skills for working with CAD systems obtained within that course can be used in the other special and profiling courses of the students’ training programs.

The assessment of the students is based on passing a written exam in the form of a test and practical work in the environment of the studied software, as a result of which the final assessment is formed.

The goal of this study is to compare the results of the examination of students, taught by the two methods - present in class and distance learning through online lectures, other circumstances being equal.

The present study considers the results of the examination of students, learning the same syllabus, with learning materials prepared by the same teacher, delivered by two methods - present in class and distance learning through online lectures. In both cases, the exams are done in the class and they include questions and tasks of the same degree of difficulty. The results of the exams are presented in points out of 100. Students are divided into groups according to their majors, as well as according to their type of study - full-time and part-time students.

Research method

The research in this article is based on statistical inference and hypotheses. The term hypothesis in the context of statistical inference is usually defined as an assumption about the value of one parameter (or several parameters) of the sample space. This preset value has no direct relation to the statistical conclusion and is usually obtained on the basis of theoretical knowledge and prior experience in the research area (Bluman, 2004).

Hypothesis testing involves assessing the extent to which a predetermined parameter value is plausible, i.e. to conclude whether the information, obtained from the sample corresponds to expectations. In this way, a decision can be made about accepting or rejecting the hypothesis based on the results of the observations. The inferences that are drawn must relate to the whole sample space, and the data available to the researchers cover only the sample. Thus assumptions (hypotheses) are initially formulated and a check is made whether the data from the sample confirms or rejects them.

Two hypotheses are defined. The null or working hypothesis claims that there is no statistically reliable difference in the compared statistical indicators in the sample space. Although some variation may be observed in the samples, it is due to random factors and cannot be generalized to the whole sample space. Alternative hypothesis claims that the observed difference in the samples is statistically reliable and can be generalized to the whole sample space.

Decisions made in statistical hypothesis testing have a probabilistic nature character. This is due to the fact that the studies are representative, i.e. the conclusions about the total space are made based on the study of a relatively small part of it. The reception for the rejection of the null hypothesis is done with a degree of certainty, as in the same time the possibility of statistical inference error is allowed.

The degree of certainty with which the alternative hypothesis is accepted as true is called assurance probability or confidence level. The risk of making a mistake by accepting the alternative hypothesis as true is called significance level.

In this article, a hypothesis test is presented regarding a difference between the means of two independent samples for quantitative indicators that have normal distribution (Bluman, 2004). Student's t-test for

independent samples is applied. Two samples are used for each major and for each type of study. The first sample considers the results of the exam of the students who studied online and the second sample considers the results of the exam of the students who presented in class. Since both samples are of small size (≤ 30), t-test is accepted in this case. The populations are of equal variances.

The null hypothesis holds that by applying both methods (distance learning and present in class), the same results are obtained, assuming a significance level of 0.05.

The empirical values (test values) are computed by the formula:

$$t_E = \frac{|\bar{x}_1 - \bar{x}_2| \sqrt{n_1 + n_2 - 2}}{\sqrt{(s_1^2 n_1 + s_2^2 n_2) \left(\frac{1}{n_1} + \frac{1}{n_2} \right)}}$$

where: \bar{x}_1 and \bar{x}_2 are the means of the samples;

s_1 and s_2 are the standard deviations;

n_1 and n_2 are the volumes of the samples;

The degrees of freedom $\phi = n_1 + n_2 - 2$

The critical values are taken from the t-Distribution table with one tail and significance level of 0.05.

Experimental results

The results of the empirical values t_E and the corresponding critical values t_C are presented in Table 1 and Table 2.

All empirical values of the t-test, from both tables, are less than the corresponding critical values from the t-Distribution table. Therefore, we can conclude that the null hypothesis is rejected, and the two samples originate from populations with different means, i.e. in both methods are obtained different results.

Table 1. T-test for full-time students

Majors	Empirical values t_E	Critical values t_C
Major 1	0.067057177	1.75305
Major 2	0.006134321	1.739607
Major 3	0.077879555	1.76131
Major 4	0.331991348	1.812461
Major 5	0.190978986	1.894579

Table 2. T-test for part-time students

Majors	Empirical values t_E	Critical values t_C
Major 1	0.133816696	1.697261
Major 2	0.381733369	1.76131
Major 3	2.87319E-06	1.697261
Major 4	0.0149027	1.697261

In Table 3 and Table 4 we present the corresponding mean values of the students' results of the majors from Table 1 and Table 2.

Table 3. Mean values of full-time students' results

Majors	Mean value (distance education)	Mean value (in-class education)
Major 1	76.4	88.75
Major 2	40.71	70.8
Major 3	51.36	70.8
Major 4	51.75	57.5
Major 5	59	74.3

Table 4. Mean values of part-time students' results

Majors	Mean value (distance education)	Mean value (in-class education)
Major 1	91.06	88.38
Major 2	61.25	57.08
Major 3	41.56	74.29
Major 4	41.41	55.80

When we compare the mean values of the students' results in the columns of Table 3, it is seen that for full-time students of all majors, the mean values of the students who studied only online are less than the means of the students presented in class. Therefore, we can conclude that for this type of students, definitely, the in-class education is more effective than distance education. Full-time students usually are coming directly from high school where the class-lesson form of education is predominant and they need face-to-face contact with the teacher. To a large extent, they rely on help from their teachers and fellow students in learning the study material.

But, on the other side, for part-time students, presented in Table 4, there are majors (Major 1 and Major 2), for which the mean values of presented in-class students are slightly less than the mean values of online students. These exemptions can be explained by the fact that part-time students already have established self-training habits. Also, many of them are working in companies, where they are using similar software tools and they have

experience with them. Part-time students usually are more mature, more independent, and highly more motivated than full-time students. They cope more successfully with independent learning of new material, based on their accumulated life experience and skills to solve real problems.

Discussion

Recently, the Covid-19 pandemic created a situation that forced teachers to rethink the class-lesson system and direct their efforts to the development of hybrid education and blended learning. Very often these methods are considered equal but there is a difference between them. Hybrid learning is a form of synchronous learning that happens both physically and remotely. On the other hand, blended learning is a combination of traditional face-to-face education with modern digital technologies. Blended learning describes the introduction of computer labs, interactive whiteboards, and educational software to the learning process. It is used to include online self-study to supplement in-class lessons. Blended learning may involve playing games, working in groups, online quizzes, etc. (Dziuban, 2018).

Although this approach requires a lot of human skills and technology resources, it is worth to invest in such a method of teaching because of its many advantages. For example, students are feeling more flexible and engaged in interactive simulations; it doesn't depend on geographical constraints and provokes the development of students' creative abilities.

The introduction of distance learning directs the attention of teachers to another modern method, which is called flipped learning (Roehling, 2018). In order to activate the participation of students in the learning process, teachers provide students with the opportunity to independently prepare some topics from the study material. This is a type of student-centric pedagogy in which the students are more actively engaged in the learning process. The teachers provide students with some materials – articles, video lectures, tutorials, etc. on which the learners prepare to understand the new topic of the syllabus. In this way, the students have more responsibilities and greater confidence in their own capabilities.

Flipped learning is based on the following pillars (Ozdamli, 2016):

- Flexible environment: Different learning modes are available. Students can choose when and where to learn, in groups or individually.
- Learning culture: The teacher-centered approach is changed by the student-centered approach and the students are deeply involved in the learning process.
- Intentional content: Students develop cognitive understanding and procedural fluency.
- Professional educator: Teachers provide professional feedback, constructive criticism and tolerance to the students.

The most important advantages of flipped learning can be summarized as follows (Ozdamli, 2016):

- Increasing the interactive activities and the discussion period in the class;

- Supporting team working;
- Flexible time of learning, at individual speed;
- Stimulation of inventive research process.

Another good practice in Computer science and Software engineering education is to incorporate unit tests (Semerdzhiev, 2021, a). This method is recommended to intermediate or advanced courses.

The main goals of this method are the following:

- To guide students how to control and improve the quality of their knowledge;
- To provide additional means of students' submissions;
- To automate the tasks;
- To improve the quality of learning tools and materials.

In this way, students become more familiar with the teaching material at the early stage of their learning, as well as, they feel themselves more comfortable with the process of testing.

Conclusion

The results of this study confirm the need for face-to-face education but enriched with the advantages of online learning.

Electronic lectures and videos can provide more options for students who are working or engaged by other activities, as well as for slow learners. Also, they ensure independence of the learning process from the time and place of learning. On the other hand, nothing can replace the experience and skills of a good teacher to direct students' attention to the essence of the studied material, its diversity, and its application in different fields and for different purposes. The ability to quickly react and answer questions that arise during training, as well as to discuss problems with peers, is a great advantage of attending training.

The main challenge of the modern education is to prepare students to work in rapidly changing environment, with multiple sources of information, to analyze and to make their own conclusions. It is important to stimulate students to develop their own research and to acquire lifelong learning skills. Combining the advantages of classroom-based learning, the possibilities of modern technologies for remote communication between participants in the learning process, and the availability of numerous educational sources in an electronic environment, significant results can be achieved in modern education.

Recommendations

Similar research can be done to compare the exam results of students trained in different methodologies, for

example, blended or flipped learning and traditional education.

Modern education must be oriented toward the rapidly developing digital world. Technology becomes a key factor for effective learning. We can outline at least five levels at which technologies may be used: presentation, demonstration, drill and practice, interaction, and collaboration (Haddad, 2002). Nowadays, the learning process should be based on cloud computing, virtual reality, augmented reality, etc. (Madini, 2017).

Students are increasingly turning to mobile technology because of its flexibility of location and time. They have the opportunity to download, upload and work online via wireless or mobile networks. The main platforms for such connectivity include smartphones, PDAs, MP3/MP4 players, tablets, mini notebooks, gaming devices, etc. (Kukulska-Hulme, 2009). They are accessible and easy to use by students. That's why the teaching process should be also connected to such devices.

Another direction of development is the emphasis on the team work, both in class and online, as well as in the development of course projects (Usher, 2020). The competition between the teams motivates the students to demonstrate their full capacity and to feel satisfied with their efforts. During online education, working in teams is facilitated by mobile applications, such as Viber, WhatsApp, Kahoot, etc., that can be used for tutorials, homework or course projects.

Only the combination of different forms of education - present in class, remote, hybrid, blended, and flipped, can provide a modern education aimed at the sustainable development of society.

Abstract: One of the most persuasive technologies in developing universities' smart campus applications is the Internet of Things (IoT) technique. Deploying thousands of readily available devices connected to IoT systems by ignoring device vulnerabilities and threat strategies in smart campus infrastructure is exacerbating security challenges. Moreover, unreliable sensing, transmission, or processing of IoT devices, false observations, long delays, and data reports reveal the vulnerability of efficient smart campus infrastructure. Some transient errors or attacks also occur here due to many vulnerable device memory, processing power, soft errors, and battery imperfections. The need to overcome significant challenges, including advanced training-rich IoT devices, credible designers, reliability, scalability, interoperability, availability, and performance, has motivated our aim to implement intelligent platforms for university campuses. In this study, we propose an operational framework for smart campuses to detect and mitigate vulnerabilities aimed at processing a comprehensive security certification of IoT devices, including introducing a smart model for university campuses. We discuss challenges, detection, and mitigation of vulnerabilities associated with smart campuses. From the literature exploration, we found that machine learning and DNN are capable of being used to detect malicious behaviour and vulnerable sources. Thus, the proposed framework is expected to provide better security and be capable of meeting the compliance of existing university services.

of Universities' Smart Campus to Detect and Mitigate Vulnerabilities for IoT Devices. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1681-1694), Cappadocia, Turkiye. ISTES Organization.

Introduction

Currently, there are various challenges in education and educational institutions across the world, including student competitiveness, competency, institution building, education delivery infrastructure, improving teacher skills, relational infrastructure, digital technology enthusiasm, and so on. From this context, the concept of creating a smart model for university campuses has emerged. IoT technology is one of the dominant technological skills in the smart university campus (Jabbar et al. 2021), (Ahmed and Majid 2019) which has risen vigorously in popularity commencement in 2016. An adopted IoT platform can drive efficient resource utilization and enable the evolution of academic campuses. All the interconnected intelligent equipment (things) of this platform help construct smart universities, which promise sustainable development and transition to green campuses. Many educational institutions in several countries around the world have started building smart campuses. These include several universities in Malaysia, Vietnam, and Singapore that have allocated a large portion of their budgets to education with the aim of creating smart campuses.

However, to contact thousands or lots of pieces of equipment projected to make up the IoT on academy campuses, developers will have to overpower consequential undertaking challenges, including security, trust, scalability, reliability, availability, interoperability, mobility, and performance. Among these challenges, reliability (Azghiou et al. 2020) has been determined as the first of the required matters for well-organized IoT. Inconsistent transmission, body perceiving, and processing due to insufficient reliability can generate inaccurate monitoring reports, lose data, and cause long delays, leading to vulnerabilities across intelligent university campus applications. The more harmful behavior of the untrustworthy smart campuses (Anagnostopoulos et al. 2021), for instance, transient imperfections that emerge in IoT appliances (also apprehended as soft errors), unlike design or manufacturing flaws, do not happen coherently. Rather, all intermittent errors are generated by outward circumstances to smart IoT applications, such as energized particles hitting the chips. These affairs do not provoke endless outward impairment to the IoT devices but can adjust accumulated values or signal transfers and consequently induce faulty smart campus application implementation.

Although several studies have analyzed and evaluated the reliability of IoT, various approaches have been suggested to mitigate the arising soft errors in IoT founded on software (Alsariera, Majid, and Zamli 2015b) determinations and hardware. For norm, the IoT's reliability problem from the matter of the idea of the transcendent strategy of reliability appraisal utilizing MIL-HDBK 217 has discoursed. With the suitable process of reliability (Nagowah, Ben Sta, and Gobin-Rahimbux 2020) evaluation operating MIL-HDBK 217, only the reliability of hardware can be evaluated, whereas the circumstances in IoT are more complex because thousands or millions of individual devices (things), human users, and software programs (Majid, Zain, and A. Hermawan

n.d.) are engaged in the network. System reliability in IoT components (things) is a concern not only for data failure rates in smart campuses but also for human factors and software, which makes implementing IoT in smart campus-sensitive applications challenging.

Although several studies have been carried out before, this problem is still insufficiently explored, prompting attention to research gaps, and a new approach is therefore needed. Therefore, the objective of this study is to construct an operational framework capable of mitigating IoT (device) error vulnerability, maintaining reliability, and evaluating the performance of smart campuses. Likewise, to maintain the safe reliability of urban big data and security in its transactions, this study introduces a desired smart campus model for university campuses. model using the access network principle of IoT to build a smart city. The contributions of this paper are as follows:

- This work will cooperate with developing and researching a smart campus framework.
- We introduce an operational framework and present its process.
- This paper proposes a reliability-enabled smart campus model by mitigating the vulnerability of IoT devices.

The residue of this study is arranged as follows. In Section II, this study presents the problem exploration and arising research question. Then Section III introduces the literature review based on smart campus. In Section IV, this study demonstrates the methodology with an operational framework according to the review. Section V presents a research discussion based on the proposed smart campus model. Finally, Section VI concludes this study.

Problem statement and research questions

Problem Statement

Smart campus implementation is incorporated using the things internet. IoT is a network that interconnected intelligent appliances supplying rich information, but it can also be a safety nightmare as it mostly has issues with reliability and quality (Imbar, Supangkat, and Langi 2020). The current IoT devices are the retail type, not including specified reliability and no failure rate data, such as the mean time to failure (MTTF) or mean time between failures (MTBF). The reliability of IoT networks is the primary concern in IT today as vulnerabilities on the devices could resulting various fault responses, including incorrect decision-making that potentially be life-threatening for end-users on campus (Adam, Mohamed, and Ibrahim 2021), (Ibrahim et al. 2020), (Ardiansyah, Majid, and Zain 2017), (Sultan Mahmud, Islam, and Rahman 2017).

Reliability for electronic devices has been estimated mostly using reliability prediction standards called MIL-HDBK-217. In 1961, the first version of MIL-HDBK-217 was designed and had not been updated since 1995. Despite its constraints, MIL-HDBK-217 is yet utilized by more than 80% of manufacturers for assessing

trustworthiness. There are different commercial and industrial standards for computing reliability on electronic devices, such as RIAC’s 217Plus™ methodology and tool. RIAC’s 217Plus™ is more complex in calculating reliability compared to MIL-HDBK-217 standards. To overcome the limitation of the existing hardware reliability standard, IEEE constructed a standard named IEEE Std.1413 in 2009 (Masitry et al. 2013), (Alsariera, Majid, and Zamli 2015a) based on the standard model for hardware reliability prediction. Reliability for IT components is not only calculated from the viewpoint of hardware but also software.

There are existing standards for software reliability, such as ISO/IEC 25000 (software and data quality) and IEEE 1633-2016 (IEEE instructed approach on software reliability). Standards for reliability prediction for IoT devices are available both for hardware and software, but such prediction is mainly conducted for single checking without considering the ecosystem of IoT as a whole in one place, such as a smart campus. The ecosystem of IoT covers hardware, software, network, personnel, and physical and organizational ingredients. Increasing the reliability, detection, and mitigation of the vulnerabilities of IoT devices is significant from the viewpoint of the IoT ecosystem. In order to focus on research issues and gaps, the vulnerabilities of IoT devices in the smart campus scheme are presented in Figure 1 IoT authentication designs typically secure smart applications by building reliability into connected IoT devices and their designs. Unauthorized IoT devices and the inadequacy of their design pose a major challenge in maintaining authentication in building smart campuses.

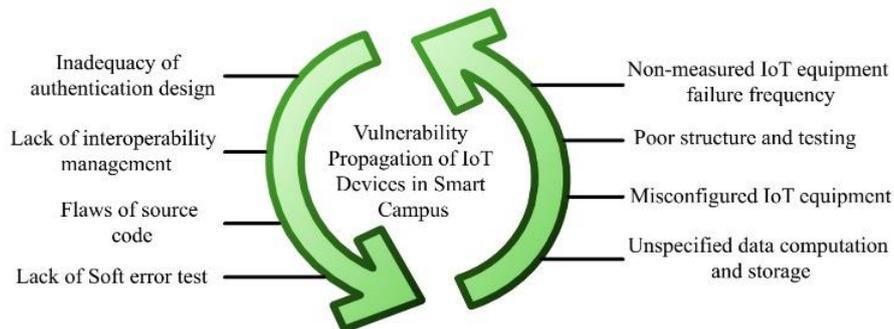

Figure 1. Propagation of IoT Device Vulnerabilities in Smart Campus

IoT interoperability can emerge as a major concern in smart campus applications. Overlapping or non-standard connectivity in IoT devices and their systems creates a lack of interoperability, which is a major obstacle to achieving reliability in smart applications. The risk that source code flaws pose in connected networks of IoT devices undermines the reliability of smart academy infrastructure. Achieving the expertise available in IoT devices to remove source code flaws can be a significant concern. Further, how well IoT's resource-constrained devices, internal and external networks, and software are working depends on soft error (transient in nature) test parameters to achieve the objectives and reliability of smart applications. Smart campus applications involve all types of data collection, computation, processing, and storage through all types of IoT devices. In this regard, the unspecified large amount of data computation and storage can be another constraint in IoT-enabled smart campuses.

However, the failure frequency rate in non-metered IoT equipment settings determines the evaluation of all

parameters, such as network performance, stability, and reliability. The strategies of non-measured IoT equipment failure frequency mitigation are key challenges in achieving reliability in smart campus applications. Poor infrastructure and testing of IoT equipment can hinder the functioning of a proper smart campus. Consequently, fundamental security and reliability issues are faced with challenges regarding smart campus services for users. Achieving good system security and reliability requires identifying thousands of device configuration vulnerabilities and irrelevant issues. Mismanagement and misconfiguration of IoT devices will weaken the security and reliability functions, which will lead to the collapse of the smart campus access network system. Thus, this study aims to improve reliability by proposing a framework to detect and mitigate the vulnerabilities of IoT devices from the smart university campus.

Research Questions

- What are the implications of vulnerabilities of IoT devices in smart campuses from the reliability concern perspective?
- What are the parameters that contribute to the vulnerabilities of IoT devices for smart campus infrastructure in terms of reliability concerns?
- How to mitigate the vulnerabilities of IoT equipment to ensure reliability in smart campuses?

Literature Review

Smart Campus and IoT

The rapid development of IoT is leading universities to become smart campuses. Executing IoT operates to skillful resource use and fosters the evolution of academy campuses, where connected intelligent things (devices) are supporting to make the smart campus, which promises to acquire sustainable development and change into green campuses (Elerath and Pecht 2012), (Min-Allah and Alrashed 2020). Thus, this segment supplies an overview of the smart campus implemented IoT, the demeanor of the IoT reliability, and techniques being used to efficiently mitigate the faults. Due to the mission-critical or safety-critical character of IoT schemes, the IoT devices must conduct reliably during the determined mission period. In addition, reliability is an important requirement for IoT adoption in intelligent applications (Zaballos et al. 2020), (Pokorni 2019). Failures in assisting IoT appliances, transient faults (soft errors), failures to grab vital data, data corruption, any network outage, or failure during broadcast or repository may generate destructive impacts, for instance, economic loss, mission failure, and disservices to environments and people (Adam et al. 2021), (Majid 2022). Thus, reliability analysis and design are necessary for researchers, developers, and even consumers prior to IoT can be extensively employed on academy campuses.

Existing Prediction Standard/ Method

Several studies have been proposed on IoT's fault tolerance to overcome the reliability problem. Earlier research

papers have utilized MIL-HDBK 217 as a standard method for reliability appraisal (Adam et al. 2021). However, the reliability of IoT is not merely a matter of the IoT failure rate but also of human and software aspects in smart universities. Various studies aim for sustainable development and/or smart campus to support teaching activities, water, transportation, energy, and other resources (Chagnon-Lessard et al. 2021), (Valks et al. 2020). In (Nguyen, Le, and Dao 2021), it introduces an IoT-enabled university campus platform for people and environmental flow observation. In (Fortes et al. 2019), a comprehensive work was demonstrated, where a smart campus named SmartUMA is implemented by the University of Málaga and aims at smart parking, intelligent space, and smart education utilizing the IoT to operate it. Hence, a mobile application of SmartUMA named UMA allows students to boldly access learning materials while watching videos and doing distance learning activities that are developed by teachers. However, the issue of reliability was not taken into consideration while developing the UMA Smart Campus framework to conduct education programs using IoT on this platform.

Khajenasiri et al. (Khajenasiri et al. 2017) executed an observation on the IoT solutions for intelligent energy management to amenities smart city applications. They have remarked that, at current, IoT has been deployed in significantly few application dimensions to benefit people and technology. The scope of IoT is quite vast, and in the nearest future, IoT will be capable of capturing nearly all application sites. They referred that energy conservation is one of the critical parts of the community, and IoT can assist in designing an intelligent energy management scheme that will preserve both money and energy. They represented an IoT structure regarding the smart city thoughts. The authors also explained that one of the demanding works in acquiring this is the imperfection of IoT software and hardware. They instructed that the issues must be settled to provide an efficient, reliable, and user favorable IoT design. Another concerning aspect regarding contrivance trustworthiness in IoT is the inclination for existing sensing devices to 'fail dirty' (Rico-bautista and Medina-c n.d.). This phenomenon involves a strategy where a sensor persists in sending inaccurate readings afterward, having suffered the deficiency. It is a prominent, still little-apprehended issue that is infectious in IoT domains. Mainly this point is challenging to analyze since the sensing devices emerge to be usually performing.

The impact of a misreading transmitted in an IoT scheme can be essential when we consider that functionality generally has a physical impact on people's lives (Rico-bautista and Medina-c n.d.). Table 1 shows the summary of the associated literature on the smart campus. The studies cited in the table provided the impetus for the review process of this work. However, these studies did not consider the reliability, dependability, or soft errors of constructing smart campuses. The issues of Identifying the vulnerabilities of IoT devices and determining the failure rate of IoT in smart campuses are not clarified. Furthermore, some transient malfunctions of IoT devices, unreliable sensing processing, false data reports, battery imperfections, and long delays expose the vulnerabilities of efficient smart campus infrastructure. Therefore, the goal of this study is to construct an operational framework capable of mitigating IoT devices' error vulnerability, maintaining reliability, and evaluating the performance of smart campuses.

Gap Analysis

Typically, standards or approaches for reliability prediction for IoT appliances are unrestricted for all types of software and hardware. But such prediction is primarily accomplished for single checking without assessing the ecosystem of IoT as an entirety in one area, like as a smart campus. The ecosystem for the IoT domain covers hardware, software, network, personnel, physical, and organization, where these can face vulnerabilities. In these smart sectors, the improvement of detection and mitigation of the vulnerabilities of IoT devices is significant from the perspective of the IoT environment using reliability analysis.

Research Objectives

The study aims to develop a framework that is able to mitigate the vulnerabilities' fault in the IoT (devices), maintain the reliability in the smart campus that operate under fault effects on an IoT, and evaluate the framework performance. The following objectives have been formulated to achieve these objectives of the university smart campus framework.

- Identifying the appropriate parameters that contribute to the vulnerabilities of IoT devices in smart campuses.
- Developing a framework that is capable of detecting and mitigating the vulnerabilities' faults in the smart campus.
- Evaluation metrics will be used to design the framework in terms of reliability.

Methodology

Operational Framework

The Smart applications interrelated with IoT systems require the modernization of existing systems to make them more dynamic and efficient. Moreover, existing smart applications reveal some vulnerabilities of IoT devices, such as transient faults, unreliable sensing, imperfections, and long delays that need to be identified and mitigated. In accordance, this study illustrates a well-defined methodological research operational framework through Figure 2 for detecting and mitigating fault vulnerabilities in the smart campus setting. This scheme consists of a literature review, fault injection, identifying the most vulnerable part of the smart campus, developing a framework to reduce the faults, evaluating the most vulnerable part's reliability, and analyzing the result. Each phase in this methodical process will be partitioned into various steps that can be attained in an appropriate time frame.

In the first phase, the study sets a plan before implementing the work to determine all aspects of the research. The central sub-component in this phase is collecting and analyzing the literature review from the works of smart campuses, which is regarded as one of the maximum vital phases of the research framework. In this fact,

the study determines the limitations of existing studies and defines the problem statement of the research. Moreover, the objectives, significance, and scopes of the study will also be determined in this component. In this context, identifying fault injection and formatting methods needed that will be used to measure the proposed framework.

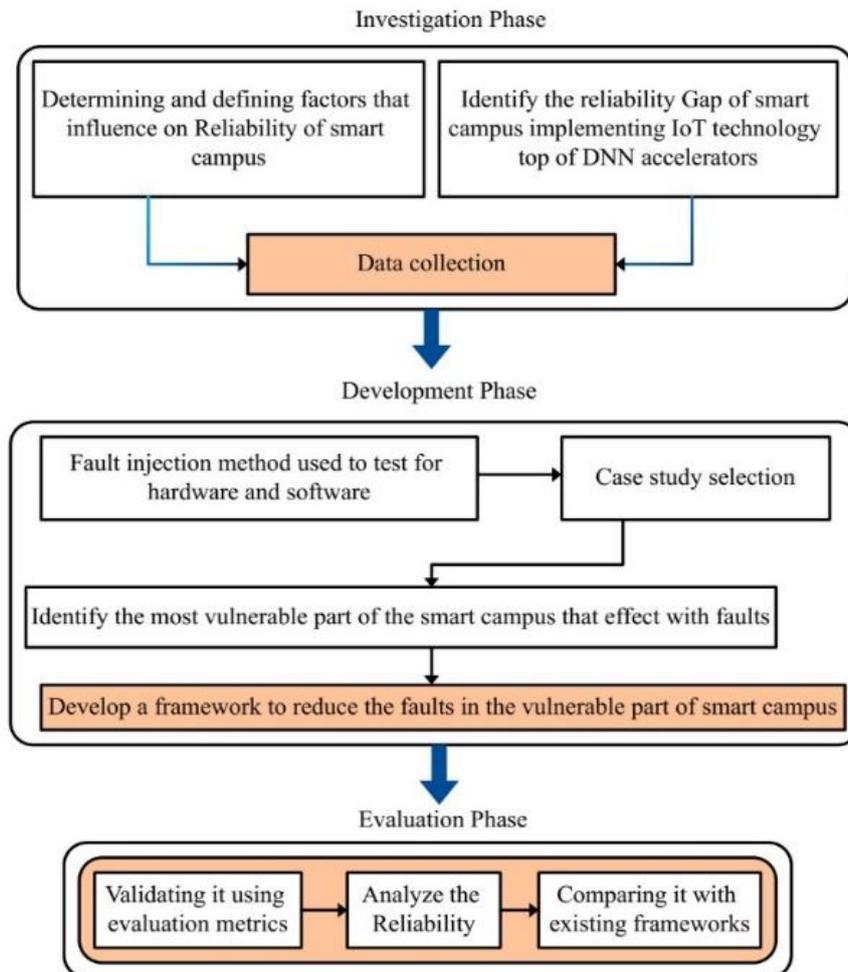

Figure 2. Proposed Operational Framework

In the second phase, this study comprises data collection, case study selection, main interview, faults injection, and reliability analysis. This phase answers the research questions, namely, what are the implications of vulnerabilities of IoT devices in smart campuses? How can it be confirmed that decision is engaged by the IoT devices based on vigorous data, specifying the challenges at lower layers of IoT device vulnerabilities? How to mitigate the vulnerabilities of IoT devices on the smart campus model? This phase involves faults injection and case study.

In the third phase, it is incorporated the development of the framework. The framework will develop to evaluate and reduce the faults and vulnerabilities that occur due to the IoT elements (things), software, and human factors. To accomplish the third objective, we will measure two factors: (1) Architectural Vulnerability Factor

(AVF) that makes the possibility that a solo fault on IoT devices (things) will consequence in error. It is employed to explore how smart campus applications respond to errors in IoT devices. (2) Program Vulnerability Factor (PVF), which is the possibility that a solo fault modifies the decision-making and propagates to other smart campus applications. Therefore, to assess the stability of the smart campuses, we accomplish described model sensitivity studies from various views by assessing three evaluation metrics as follows; IoT devices (things) vulnerability analysis, software vulnerability analysis, and human vulnerability analysis to identify the vulnerability parts of the smart campus. Next, the framework to reduce the faults in the vulnerable most vulnerable parts of the smart campus, which reduces the fault, thus enhancing the reliability of the smart campus applications.

In this final phase, we evaluate the proposed framework, based on the previous result, in typical smart applications of the smart campus, online survey data by validating the reliability based on a set of follow-up questionnaire questions. This research is in the domain of smart campuses, which is in its early stages and has a profound theoretical background. Also, the nature of this research is exploratory. The data for this survey will be based on a minimum of 100 or more respondents from institutions of higher learning based in Malaysia, such as mainly the education sector and industrial IoT applications or IoT companies. The survey instrument will be prepared by considering the exploratory nature of the study.

IoT-enabled Smart Campus Model

This section discusses the relevant tasks of smart city construction as a proposal. Figure 3 shows smart campus model that introduces intelligent urban policies. This model will employ sensors, actuators, network devices, and so on. It can enable surveillance systems for monitoring purposes. For information communication, this scheme will work using the access network and store it in cloud storage. Besides, reliability prediction standards or methods for IoT devices in a smart campus can be applied to this model. This system will detect and mitigate the vulnerabilities using the mitigation technique and DNN approach. According to the operations of the operational framework mentioned in the previous section, this smart campus model will i) apply AVF for exploring the responses from IoT device errors, ii) embed PVF for decision-making based on explored responses in terms of errors, iii) employ evaluation metrics for vulnerabilities analysis and detection, and iv) mitigate vulnerabilities for enhancing the reliability. This model will involve detection and mitigation methods to assess and mitigate errors and vulnerabilities caused by IoT elements (things) such as hardware, software, and human factors. The campus users such as staff, students, teachers, or officers can obtain quality services.

We have only presented this model in this paper, and our next task is to improve and implement it. Furthermore, intending to build smart cities can reform a critical role in maintaining the secure reliability of big urban data and its transaction security, including monitoring. In this consideration, this smart campus design will ensure service availability and mobility to participants by eliminating data reports, long delays, inefficiencies, processing errors, and infrastructure vulnerabilities from the perspective of intelligent university services.

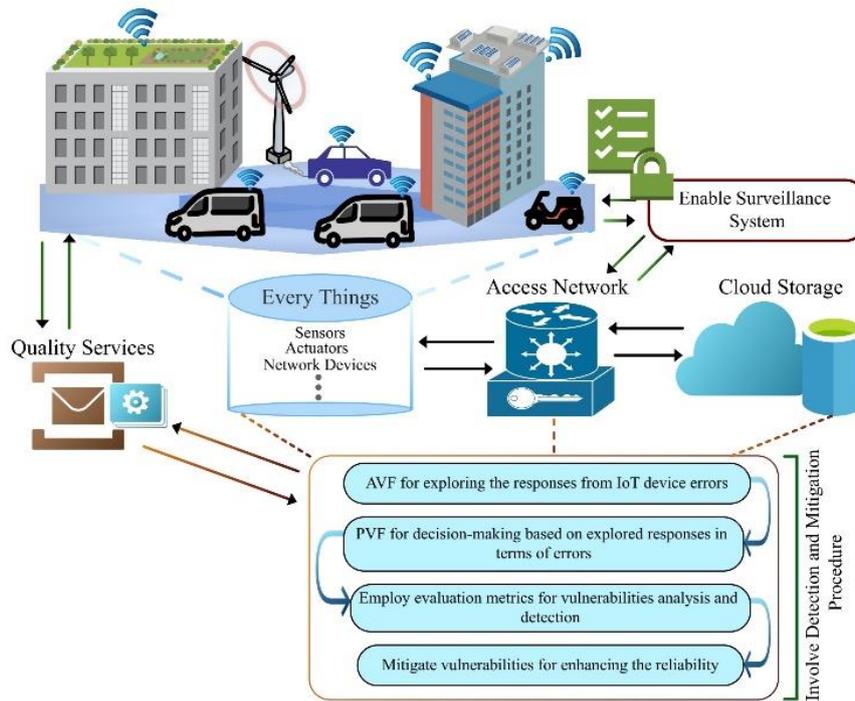

Figure 3. Smart Campus Model

Conclusion

For an educational institution or university to come under smart campus, all the indicators of smart structure should be addressed. Implementing smart campus applications by providing knowledge study criteria and intelligent services is essential to enhance the quality of the university's learning environment. It has been focused on building a smart campus for practical and acceptable management of universities. Emphasis is placed on studying and formulating appropriate motivational methods to identify the most vulnerable parts of IoT-enabled smart campus devices. In this case, we have proffered the operational structure of a smart campus and an intelligent campus model by looking at all the indicators to bring an educational institution or university under an intelligent campus. Adequate procedures have been presented to overcome the real impact of unknown vulnerabilities, errors and security situations in advanced educational institutions. The well-defined methodological research mentioned in the paper should take into account the operational framework where the assessment and analysis of vulnerable IoT devices related to smart campus deployments and reliable IoT devices are essential. Our future work is to improve IoT-enabled smart campus infrastructure for a safe education system by assessing device vulnerabilities and improving its quality based on follow-up and survey data.

Abstract: Crowds, emergencies, and traffic evacuations are examples of social systems. These complex, dynamic systems are challenging to analyze and comprehend. Two well-known techniques for modeling and simulating social systems are the agent-based (AB) model and the social force (SF) model. Whereas social force modeling focuses on the physical factors that influence how individuals move and communicate in a crowd while agent-based modeling focuses on the behavior of individual agents. Although each technique has its own advantages and disadvantages, combining them is a significant ability to capture both the social and physical components of human behavior. This work aims to combine both of these techniques, AB and SF and to capture the interactions between individual agents and the elements of the force that influence their behavior, leading to more realistic simulations of social systems. Nevertheless, there are difficulties involved in combining agent-based and social force modeling, such as choosing the appropriate system complexity and making sure that the simulation faithfully replicates the real-world system being represented. Hence, in order to overcome these obstacles and present a more precise and thorough knowledge of social systems, the creation of a conceptual framework for combining various methods is crucial. This paper presents the implementation and development of a simulation model with integrated AB and SF techniques. More complete and accurate knowledge of social systems as well as improved decision-making across a variety of disciplines is the expected outcome of combining agent-based and social force modeling.

Keywords: Simulation model, crowd evacuation, indoor evacuation, social force, agent-based model

An Enhanced Simulation Model for Human Evacuation using Integrated Agent-based Simulation and Social Force Theory: Implementation and Development. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1695-1711), Cappadocia, Turkiye. ISTES Organization.

Introduction

In the past several decades, there has been a lot of study on crowd behavior simulations and modelling. Industries, researchers, and academics are now attempting to better understand crowd behavior for a variety of purposes, including entertainment (including movies and video games), architectural design, crowd planning and management, traffic flow, and other related fields. A simulation model is similar to real time applications that is based on the general principles. "What-if" scenarios (consider the possibility) are used in simulation modelling of any case, and they are either in discrete or continuous time, a few states, or space, and normally they are used for modelling human behavior (Hanly et al., 2022). Furthermore, the simulation model is an instrument that be used for examining the space and flow of objects such as people or traffic during both normal and emergency crowd circumstances, but in the prevention of injury or even loss of life due to unanticipated events. Therefore, with the use of specialized software tools and testing scenarios, simulation models may aid in gaining a deeper knowledge of an existing system.

In recent years, studies on emergency evacuation have given careful consideration to modelling mass evacuation as well as modelling escape panic behaviors. It is still the subject of open debate and research on how to simulate panic in an individual and try to get through a crowd faster. The escape panic is unexpected and unsafe, which may avoid crowding disasters such as instances of damage or passing for crisis situations, e.g., fire and flood. Hence, under conditions where the typical distance scale between pedestrians is significantly less than the rate at which the pedestrians move, crowd evacuation in a fire emergency scenario can generally be treated as a continuum or it's called spectrum or continuation (Lyu, 2018).

On the other hand, a simulation analysis can be utilized as a part of requirement to enhance the performance and upgrade the system in the prediction of decision making. For instance, the traffic flow of human pedestrian is important for developing or redesign projects in the building such as in a close building for simulating the intricate and complex human behavior. Therefore, the variety of human behavior makes it challenging to model the evacuation of a crowd. Additionally, it is unsafe and expensive to use the actual evacuees to validate evacuation plans. In these situations, crowd modelling and simulation may substantially help authorities create effective and secure public areas (Bakar et al., 2022).

This study is focusing on the crowd evacuation of pedestrians, including their evacuation behavior in a close building, which is a complex problem to be modelled. Thus, the appropriate techniques are important to compare, especially from the characteristics, analysis results and collected data from the developed simulation model and simulation run, which is a tool capable of replicating realistic conditions such as those in the close building. In order to model the crowd evacuation for an emergency scenario such as fire, flood and disaster, thus this study aims to develop evacuation simulation model by adapting the potential techniques such as agent-based (AB) and social force (SF).

In order to model the mass evacuation of pedestrians for emergency circumstances in the close area, AB and SF modelling can be employed as a hybrid technique (integration of AB model and SF concept in one simulation model). AB and SF will be employed for this proposed work, for modelling the human evacuations, which will be able to mimic emergency circumstances, as detailed in the next section, and for the phase of development of the simulation model. It is based on each technique's features and concepts to simulate the situation where pedestrians must be evacuated safely so that the outcome can be more precisely compared to either the AB or SF technique as a whole and a realistic scenario can be modelled (Yuan et al., 2019).

At the moment, because few modelling approaches have the advantage of being able to manage the uncertainty and unpredictability of the system, simulation is utilized in system dynamics (SD), discrete event simulation (DES), and agent-based (AB) (Bakar et al., 2018). Several buildings, including stadiums, nearby buildings, and schools, are used to hold large gatherings of people. It is essential to carry out and test various scenarios in a building with adequate building design, by utilizing simulation modelling to ensure people's safety during emergency evacuation. A previous researcher claimed that there are seven approaches that can be used for modelling the human evacuation, including scenarios that happen in a building such as lattice gas (LG), cellular automata (CA), agent-based simulation (AB), social force (SF), animal experimentation (AE), fluid-dynamic (FD), and game theory (GT) (W. Liu et al., 2018). Therefore, which technique can be utilized for developing an evacuation simulation model?

The primary goal of this study is focuses on the development and implementation of a simulation model for human evacuation in close buildings using an integration of agent-based model and social force concept. Thus, the following is the organization for this paper. The introduction to the proposed study is covered in the first part. Consequently, the rest of the paper is structured as follows: The related work on the model of simulation, evacuation, and simulation techniques of agent-based (AB) and social force (SF) will be covered in Section 2. The approach that will be utilized for this planned work will be described in next section. The specifics and explanation of the development and implementation methods for the crowd evacuation simulation model (in a near building) are covered in Section 4. The results and expected results from the designed and tested simulation model are further explained in Section 5. The conclusion and discussion are covered in the final section.

Related Work

Crowd Simulation

Crowds can be referred to as groupings of people, populations of animals, colonies of insects, and transportation flows in a similar physical setting. A frequent occurrence, crowds display fascinating and unsettling spatial, biological, cultural patterns physical, and social. Frequently, the collective actions vary from the actions they would take if they were to operate isolated. The crowd's behavior in various circumstances, such as disaster evacuations, urban planning, or public events, may be predicted using the model. Therefore, crowd simulation approaches can aid researchers and professionals in better understanding and controlling crowd behavior in various contexts. On the other hand, crowd simulation comes in a variety of forms, including pedestrian crowds,

swarm simulation, crowd formation, and traffic simulation. In addition to panic escape, crowding, clogging, lane formation, kin behavior, arching, obstacle effect, jamming, panic, congestion, and egress behavior, other frequent phenomena include following behavior; choking flow, herding, side effects, sidestepping, walk and crawl, exit selection, and fluid behavior (Yuan et al., 2019).

For instance, according Nguyen et al. (2020), their work provided an overview of current work on crowd simulations and deep reinforcement learning for multi-agent systems. Z. Liu et al. (2020) stated that, in order to forecast crowd flow patterns, this research suggests a crowd simulation model that makes use of deep learning techniques. A past study investigated on a hybrid method to crowd modelling that simulates pedestrian behavior in large buildings during emergency evacuations.

Mahmood et al. (2019) used the model to replicate multiple emergency situations in order to assess the efficiency of various evacuation techniques. They experimented with several approaches to evaluate how they influenced the speed and security of evacuation, such as opening alternative exits, putting in place different communication protocols, and employing different crowd control measures. The outcomes of the simulation demonstrated that panic behavior may considerably affect how well evacuation plans work. Other than that, Liu et al.'s studied and proposed a crowd simulation approach that creates dynamic path planning for pedestrian crowds using spatiotemporal environment data.

Throughout literature, it can be concluded that this type of study is categorized as a crucial case study because it relates to human behaviors and because an emergency situation may have an impact on people's safety, health, and ability to avoid fatalities. It comes to light at the most tragic events, including emergencies like fire or flood. For instance, the tragic fire that broke out on December 28, 2021, at a 19-floor apartment near to Bronx in New York, USA. According to reports, the fire broke out on the third level of the structure and soon spread to the top stories, trapping the occupants. Firefighters fought valiantly to extinguish the flames and save the inhabitants as soon as the fire service arrived on the scene. Sadly, the fire claimed the lives of 19 individuals and wounded many more, including a few rescuers (Southall et al., 2022). Thus, research on emergency evacuation is important since it has a big impact on people's safety. Effective evacuation can be the difference between life and death in circumstances like fires, natural disasters, or other crises.

Evacuation Simulation Model

Simulation and modelling have lately attracted the interest of several academic disciplines, which are not limited to computer graphics and simulation, due to their broad variety of applications in numerous sectors. For example, the incorporation of urban planning, traffic engineering, entertainment, sociology, robotics, physics, architectural design, computer culture, psychology, and safety science. There are five different types of crowd simulation, including swarm, pedestrian crowds, traffic, crowd creation, and crowd evacuation. While, there are various ways to use a simulation model as a behavioral technique, especially in crowd evacuation. For the concept of the human in operational research (OR) and simulation models, three main techniques are often used

for simulation such as discrete event (DES), system dynamic (SD), and agent-based (AB) (Oh et al., 2021).

On the other hand, numerous methods exist for modelling evacuation, particularly for human pedestrians. One such method is pedestrian evacuation behavior (a case study of a nearby building). In order to model the human behavior especially during evacuation, there are seven techniques, according to a previous researcher, that can be used to simulate the evacuation of people from a building, including lattice gas (LG), cellular automata (CA), agent-based simulation (AB), social force (SF), animal experimentation (AE), fluid-dynamic (FD), and game theory (GT) (W. Liu et al., 2018; Bakar et al., 2022).

Other than that, simulating and modelling crowd evacuation, especially for pedestrians, is challenging because to the interactions between people and objects, people and buildings, and people and their surroundings. It is believed that a crowd evacuation simulation that "looks a lot like reality" and is reality is more reliable. It will evaluate traffic needs and improve efficiency and safety protocols. It is feasible to evaluate various crowd evacuation scenarios using simulation, especially in emergency situations. A crowd is a social system since it is a linked group of individuals. A group of two or more individuals is referred to as a "crowd" when they interact and communicate together at the same time, same location, and for the same purpose. Based on the cognitive and social processes involved, crowd movement may be divided into three levels: physical, physiological, and social. If two or more people are conversing and interacting with one another at the same time and place, there is a crowd. The crowd will endanger human life when disasters like fires, bomb threats, or poisonous gas releases in nearby buildings occur. The timely removal of human pedestrians or shoppers from dangerous situations is a significant problem. Because of how it will affect the populace should it fail, perhaps. Thus, in order to model the conditions and scenarios that occur when catastrophes occur in the buildings, we concentrate on a crowd evacuation simulation model for pedestrians (Yan Yang et al., 2019).

Simulators that estimate pedestrian movements can be used to assess architectural designs and operational plans. During the planning stage, simulation modelling and visualization are frequently used to improve construction and performance efficiency. In quantitative modelling, the statistic and simulation model are deemed to be the two most crucial components by prior research. The simulation model may be divided into many categories, such as static or dynamic, deterministic or stochastic, continuous or discrete. For example, various human behaviors during the check-in service at the airport has been performed using a simulation model with a set of variables in each state of the discrete model that will vary at each discrete point in time (Bakar et al., 2018). Since this process is quite small, a simulation model is needed to make the investigation easier. Another definition of simulation is the process of simulating a system using a symbolic model that is easy to change and produces numerical results (Musolino et al., 2020).

While some modelling techniques are continuous, others are discrete for both space and time. The scenarios are divided into two categories: normal and emergency. Human pedestrians can be either homogeneous (locked together by the members of the group) or heterogeneous (based on identifying traits like gender, age, and so on). Force-based, rule-based, grid-based, example-based, sociological, velocity-based, biomechanical, distance

maps, least-effort, particle system, behavior system, visibility, artificial life, and particle system are the strategies for the customers' crowd evacuation, and the selection is based on the case study (Shah et al., 2019).

One of the top choices of simulation technique is social force (SF). The Helbing et al. and Helbing and Molnar (1995) developed the social force model, a theory of pedestrian behavior based on physical and sociopsychological factors. The real force and motivational factors are explained using force vectors, with the assumption that each pedestrian conforms with the laws regarding movement as a particle. While, AB is a new technique, and it is not as widely explored as the other techniques. Therefore, the propose work intends to utilize AB for modelling the human behavior during evacuation. A previous study claimed that autonomous or self-directed agents make up AB model systems. AB is flexible and able to capture the emergent phenomena. These agents interact with one another and their surroundings while according to a set of established rules to achieve their objectives. The agents in AB systems each have their own behavior and are categorized as active in contrast to the entities' behavior such as in an SF model, which is determined by the system (Yuhan Yang et al., 2022).

Other than that, to simulate large-scale heterogeneous crowds, researchers are now engaging in the investigation of hybrid models that combine the advantages of both traditional techniques (Asgary et al., 2020). The hybrid model is capable of simulating pedestrian or human pedestrian interaction well, which might improve evacuation planning tactics. Given that they must provide a range of behavioral elements for a population, hybrid models' implications on scalability and simulation execution effectiveness must be evaluated.

This hybrid approach can simulate the complicated behavior of evacuation in the event of an emergency by developing a simulation model of pedestrian behavior with statistical result analysis. However, operation research (OR) only is less useful, particularly when it comes to the mass evacuation of pedestrian during an emergency. In order to improve the effectiveness and realistic of simulations, the experiments used to study evacuation specifically the human behavior. Therefore, the comparison of the single technique with the hybrid technique for modelling human evacuation is expected to have a significant influence on the simulation's results (Hassanpour et al., 2022).

Methodology

This section describes the methodology for this proposed work; a simulation model of pedestrian crowd evacuation specifically in a closed building. Figure 1 depicts the research activities for this work, which contains six phases in order to complete the research work. It will be started with case study description and will end with experimentation and result analysis as the final phase.

Provide the following activity descriptions: First, simulate the massive evacuation of pedestrians during emergencies that occur in nearby buildings or other close-by areas, such as fire emergencies. Close building has

been selected as the focus of the study, which was done in the following steps: explaining the case study such as in a building in Malaysia, collecting data, constructing a conceptual model, developing the simulation model with the proposed techniques, verifying and validating it, running an experiment, and analyzing the results.

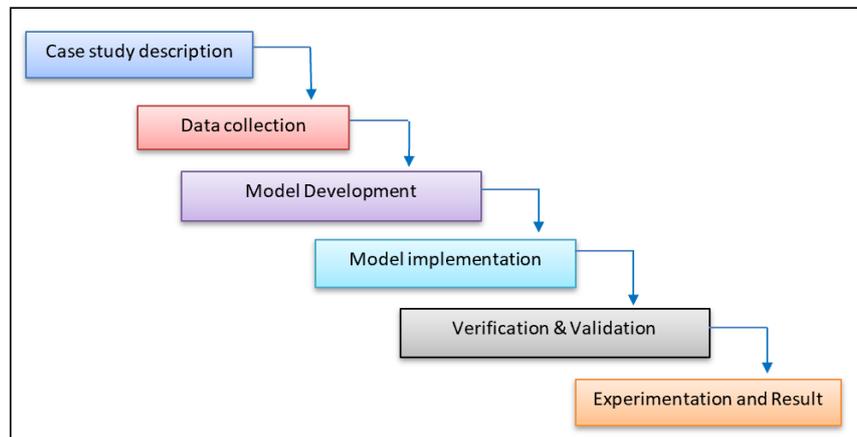

Figure 1. Research activities

Then, obtain the real data and then determine which data are required according to the chosen case study and the data collection. Next, a conceptual model can be constructed, which the selected techniques for evacuation simulation model are described as follows; of SF, AB, and hybrid AB/SF, which will be developed in order to develop an evacuation simulation model, compare its efficacy, and make improvements. The level of detail for SF and AB have been established once the model implementation has been created. After choosing a simulation tool, building and programming the evacuation model using the proposed techniques begins.

Findings

Development and Implementation of Crowd Evacuation Simulation Model

Phase 1: Description of Case Study

It is required to conduct case studies that provide an adequate quantity of data involving human behavior in order to compare the capabilities of AB, SF, and hybrid AB/SF to mimic human behavior in emergency cases (i.e., pedestrian crowd evacuation in a close building). The creation of a simulation run for simulating human behavior in emergency situations is one of the main goals of this research. Based on the chosen case study on modelling the pedestrian for emergency situations like indoor or in a building on fire is the main subject. People's behavior changes to anxiety and panic in emergency circumstances, and they are less able to behave rationally and independently to make judgements. This case study will sample data using a real-world system.

The crowd evacuation during an emergency scenario for pedestrians in a close building, can be modelled after

the case study has been chosen. The researcher employed systems from real-world environments to model this case study. Data for the case study is gathered using a range of research methods: quantitative methods are used to gather data that has been counted (for example, the number of pedestrians, records of customer arrival time, evacuation time, etc.), while qualitative methods, such as interviewing and observation, are also can be used. Quantitative data are utilized as input to our simulation models, and qualitative data are used to construct conceptual models.

Phase 2: Data Collection

The researcher investigates the issued area to identify what should be done during the data collection phase, doing preliminary inquiry and observation while carrying out comprehensive analytical tasks (to collect the data regarding the systems); Analyze the present system and monitor real human behaviors (pedestrians) in typical situations at the nearby building to forecast the simulation model for crowd evacuation. The next step is to suggest a model for the computer simulation of this evacuation model. The researcher then takes into account the attribute of panic circumstances for the design methods for the simulation model for modelling pedestrian behavior for an emergency situation in a building. In addition, the feature of obstruction or any obstacles in the building during evacuation or while using the escape door to leave the panic circumstances also should be considered. The previously described impediment will be taken into account, along with the quickest route, by the intelligent agent as well. Following are the evacuation behaviors and processed for the pedestrian (Dema Moreno et al., 2022): -

1. People become anxious in escape panic situations, which is why they often do blind actions.
2. People attempt to move far more quickly than usual
3. People start shoving one other, and exchanges between people start to take a physical turn.
4. Moving through a bottleneck, in particular, frequently becomes uncoordinated
5. At exits, crowds are congealing and occasionally arching and clogging are seen
6. Dangerous physical encounters can result from congealed crowds' cumulative physical contacts.
7. People who have fallen or been injured becoming impediments delay down escape attempts.
8. People frequently exhibit herding behavior, which is the tendency to copy what other people do.
9. Alternative exits are frequently disregarded or ineffectively employed in emergency circumstances.

Phase 3: Model Development

In the development of the evacuation model using the hybrid technique AB/SF, each individual people or agent and their interaction are represented using an individual-centric approach. The simulation software has been chosen which is Any Logic tool. Using this tool, for the SF model, the DES concept has been performed, which is based on a discrete approach in terms of time and space, while for the AB model, a state chart is utilized to represent the individual-centric approach. State chart diagrams for the agents depict the few states that an entity could be in and list the circumstances that lead to a change in status.

Phase 4: Model Implementation

The implementation design of hybrid AB/ SF simulation model is shown in Figure 2, along with the interactions between agents and technical infrastructure. The simulation findings are utilized to do the sensitivity analysis, and it supports the emerging system. The OptQuest Optimizer algorithm, a search optimizer built inside the Any Logic simulation tool, will be used to find the optimal search method solution. Having the ability to vary the goal function, needs, restrictions, and parameters (variables) and replications are used to support optimization under uncertainty. The choice of the next move in the parameter space (the next iteration) is made based on the aggregate output of several replications of a stochastic model with the same parameter values.

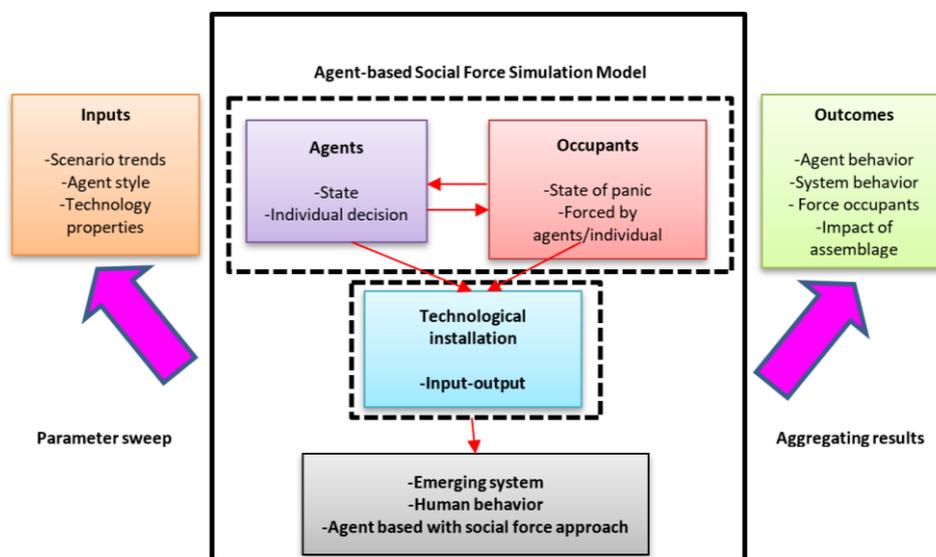

Figure 2. The implementation design of hybrid AB/SF simulation model

Three techniques will be utilized namely SF, AB, and hybrid AB/SF for the evacuation model. This evacuation model is considered; pedestrians or people safely evacuated in an emergency such as fire or earthquake and should concern on the simulation input and the simulation runs will keep going with experimentation along with model difficulties and outcomes. Then, each model (three proposed techniques) will be compared and validated. The creation of simulation runs for simulating human behavior in emergency situations is one of the main goals of this research. In this case on microscopic modelling, the unique person for the pedestrian is highlighted for emergency situations like a fire in a building. When emergency situations happen, people’s behavior change to panic and nervous and they lose to logically acting to make decisions on their own. The real-life system will use for sampling these circumstances.

The evacuation simulation model will use the Any Logic tool. This tool was chosen because it enables 3D animation, offers a visual model development environment, and is easy to build models with. Building a model in Any Logic is quick and easy to use with few functions such as drag-and-drop capabilities with many

application-specific libraries, Java environment for endless model feature development, and potential to create agent-based model. This tool supports mix or combination of few techniques such as system dynamics, and discrete event and agent-based models. 3D animation ensures a better understanding of their intricacies specifically the graphics to observe the human behaviors, movements and interactions. With Any Logic, the models may be exported as fully functional standalone Java program that can run from any place and by any user, regardless of whether they have or without installed Any Logic software. Then, there are several reusables "design patterns" that make it easier to develop simulation models, and Any Logic natively supports them. These trends or features of this tool are present: -

- Architecture of model
- Agent organization (with the steps process)
- Mobility, space (discrete, continuous, and GIS-map) as well as spatial animation
- Agent communication and connections (e.g., social networks)
- Dynamic conception and agents' destruction

AB may be used for restricted analyses, prototyping fundamental agent behaviors, and learning agent modelling. A single computer-literate modeler may create straightforward agent-based models in a matter of days utilizing techniques that can be picked up in a matter of days or weeks. In particular, if one is already familiar with the technology, agent modelling may be utilized to investigate the possibilities of AB with relatively few effort and training expenses.

The following are the primary consequences of SF which can be modelled using Any Logic tool: -

- Everyone wants to their preferred place or destination
- Each pedestrian maintains a set distance from the other pedestrians.
- Everyone maintains a set distance from boundaries or impediments such as walls.
- Every individual is occasionally drawn to another person, such as friends or items.

The Monte Carlo algorithm can be used for AB in simulation model using Any Logic tool, which is a randomized method which running time is predictable and it simulates the behaviors of the systems. It is a heuristic technique rather than an accurate one. Typically, it employs randomization and statistics to get a result. It is used in conjunction with the random walk generator.

As illustrated in Figure 3, the evacuation behavior model of the people is made up of two modules: planning the evacuation route and moving or movement of people. If the pedestrian is in a panic, they aim to flee by a recognizable exit. It is based on the nearest and shortest path, as well as time considerations and impediments, for regular or normal movements. These evacuees' modules are appropriated to be utilized in these three techniques; SF, AB, and hybrid AB/SF.

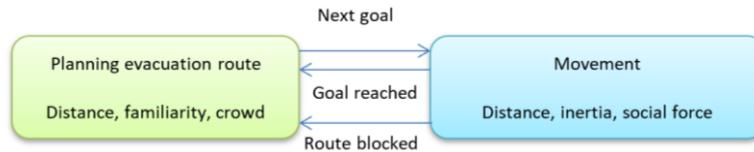

Figure 3. evacuees' modules

Simulation models may be made after the combined scope and level of AB/SF models have been determined. Phase 4 will outline the process for model implementation and validation. Any Logic™ Educational Edition is used to construct simulation models since the application can combine SF and AB models in a single tool. This simulation model has to be created and coded after the simulation software has been selected. In order to effectively depict human reactive and proactive behaviors in the combined SF and AB models, it was essential to provide a variety of contexts for each case study. Numerous configurations have been utilized to better understand how effectively both simulation models can mimic human behavior. The flowchart for the evacuation simulation model is shown in Figure 4.

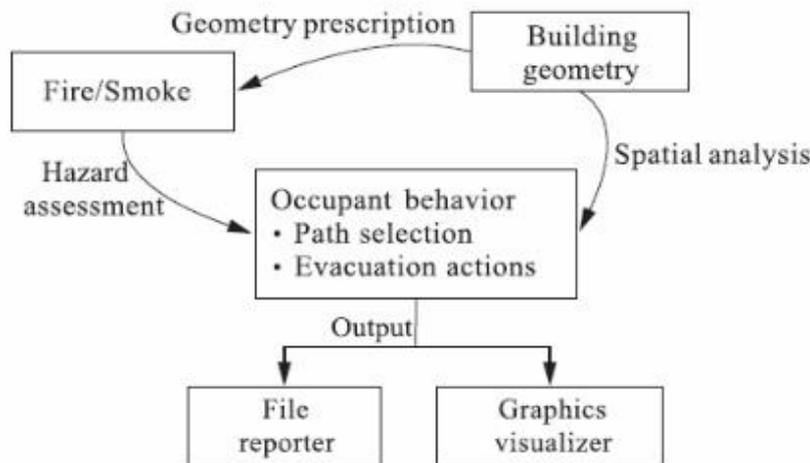

Figure 4. Model flowchart

Source: (Almeida et al., 2013)

Phase 5: Verification and Validation

Divide the actual or experimental data into two separate sets: an adjustment set of data and a validation dataset set, since this is one method of testing a model. While the measurement dataset is used to derive the model parameters, the validation dataset is used to evaluate the goodness of suitable measurements using the parameters of the model created within the calibration step. The whole process should be operated on both for all possible sections into validation and calibration datasets or for a sample of statistics that is a good representation of all conceivable subdivisions in order to perform these testing and validation processes

regardless of which way the initial data set is divided.

The model's parameters are distributed in a way that is consistent with the data as a result of the calibration step's requirement that each of these subdivisions provide a distinct set of values. In the end, the average or most likely model parameters and confidence intervals may be determined using these distributions.

Table 1. Summary of parameters, data type/ description of the simulation model

Parameter	Performance measure	Data type
Operation		
Evacuation time	Mean and standard deviation (sd)	Time (minutes)
Waiting time (for exit)	Mean and total	Time (minutes)
Total distance	Shortest path and obstacles	Distance (meter)
Flow rate	Flow rate at the exit for time versus	Time (second)
Number of people	Number of pedestrian	Person
Cost	Cost of time, difficulty and cost of tools	Time, description and cost (RM)
Velocity	Distance versus time	Ms-1 (meter/second)
Modeling- development		
Building time	Based on result value (RV) and difficulty value (DV)	Time (hours)
Execution time	(The deviation result of RV/ DV X Total scales number which is based on model difficulty (10))	Time (seconds)
Attribute/ Scenario/ Factors		Description
Occupant load	Per meter ² for each person based on time and ratio of waiting time over total evacuation time	
Number of exit	Number of occupants escaped from number of exits	
Building design	Building or public space, crowd behavior, and building design with normal and panic situation	

The range of fit goodness values acquired during the appropriate validation rounds also demonstrates the model's predictive capability.

Phase 6: Experimentation, Data Analysis and Result

Three sets of experiments (SF, AB, and the hybrid AB/SF); will run the experimentation in order to achieve the research's objective. Investigating the effectiveness of the simulation results for the three sets is the goal of model findings. Three performance metrics for model difficulty are produced by the simulation model developed in experiment such as model creation time, model execution time, and model level of complexity (LOC). The three performance measures are examined similarly for the SF, AB and hybrid AB/SF model.

In order to provide a good approximation of real systems of service, verification and validation procedures are carried out concurrently with the development of the SF, AB and hybrid AB/SF models. Visual inspections by the modeler and code checker by a simulation expert are the two methods of verification. The simulation code is reviewed by an expert with knowledge of the designated simulation program (Any Logic), with a focus on the decision making. Any simulation code flaws are identified, and any required corrections are done.

When performing the visual inspections, the modeler runs the individual SF and AB models as well as hybrid AB/ SF models while keeping an eye on the component behaviors in the models. Both the expert's verification and the modelers' visual checks are continuously conducted until the simulation model operates as intended. This experiment is used to test how sensitive simulation outcomes are to changes in model parameters. Developers must choose the parameter to change and the desired results while using the experiment wizard. The "output vs. parameter" chart is displayed for outputs that only have one value. A chart with a variety of curves is shown for comparison if the simulation's output is a dataset (such as the dynamics of a certain process over time) (*Any Logic*, n.d.).

Any Logic automatically created the user interface for the optimization experiment, which includes the current and best solutions and the dynamic chart of the optimization progress. Researcher or developer may run simulations, enter model parameters, and add the simulation output to the charts to compare it to the results of earlier runs. This experiment is interactive in this way. A Monte Carlo algorithm for an experiment can be used to run a (stochastic) simulation several times. After that, the outcomes may be gathered and shown as a histogram. If the model were stochastic, each run would provide a different outcome even if the input values were constant. For each simulation run, you can also create a random parameter value.

Hybrid AB/ SF Simulation Model

The hybrid AB/SF technique has been introduced to provide more precise findings and properly model scenarios that are as near to reality as possible. If the effective time can be observed during the simulation and is identified and confirmed by analysis, a wise decision can be taken to facilitate the effectiveness and efficiency from the simulation findings. The main objective is to develop a better simulation model for the emergency evacuation using a hybrid SF and AB techniques to forecast the safety crowd evacuation. The following is a description of this work's sub-contributions: -

- A constructed simulation model of safe human evacuation using an enhanced technique which is hybrid technique; combine SF and AB techniques in a simulation model.
- Crowd evacuation simulation utilizing a simulation tool for an emergency scenario with the pedestrians' movements and behaviors
- A model that produces data to assess the influence of parameters (such as injury and other factors).
- A simulation model using simulator software that may replicate and model in real time the behaviors and movements of people as well as the ability to simulate different situation involving mass

evacuation while taking alternative strategies

- Expected to have the precise outcomes and a model that accurately represents the actual/real system
- It also offers the possibility to simulate an emergency scenario in pedestrian evacuation while taking different approaches into consideration as well as with three different techniques in a simulation model of evacuation

Discussion and Conclusion

Since it's crucial to the researchers to understand how SF, AB and hybrid AB/SF can mimic human behavior at different levels of granularity, users of simulations can benefit from knowing how these few models can be compared. To solve the any kind of problems or issues using simulation model, the researchers should identify and compare models of human behavior, a careful selection of simulation techniques and thus it can be developed. This knowledge is essential because it illuminates the benefits and drawbacks of both simulation models in connection to the problem under investigation. The recently obtained data is helpful for users of simulation and OR research, as well as for comparing few techniques including the hybrid technique for simulating human behavior during emergency evacuation specifically in a close building.

Every simulation technique has benefits and drawbacks, but in the case study of the crowd evacuation for pedestrians during a fire emergency, using a combination of the two techniques of AB and SF (modelling using AB based on SF) is to obtain a more realistic, dependable simulation results that are concentrated on socio-psychological attributes and physical forces. Theoretically, SF is acknowledged as a great technique to investigate human behavior in services since it provides simulation outcomes that are equivalent to those produced when SF and AB are combined, but with less modelling challenges. Additionally, AB is regarded as a flexible and suitable entity. Because autonomous agents were utilized, coupled SF/AB models were the only ones that could represent more flexible and realistic behaviors, making them suited for emergency simulations like population evacuation.

In SF, it contains the faster-is-slower element, so the researcher can develop a simulation model using hybrid AB based on SF, therefore the realistic representation of evacuation behavior can be improved. While, the flexibility of AB to allow each pedestrian or people have distinct behavior makes modelling the diverse human much easier. As the SF is a popular crowd evacuation simulation model that better depicts the phenomena of pedestrian traffic, but it is hard to adaptively determine and cannot tackle a dynamic crowd environment such as individual characteristic with proactive behavior. Thus, this limitation will be covered by applying AB based on SF.

However, this study has several limitations such as the sociology elements have been ignored as we are focusing on the simulation techniques together with the evacuation procedure as significance for the evacuation governance and strategies and perhaps will be discussed as our future works. This hybrid approach was

proposed to gain a better simulation result and it was chosen because since it is well-known, strong, and adaptable. In order to have a better simulation model for a emergency scenario's safety crowd evacuation, we have studied pedestrians' behaviors in the closed area. This work offers a comparison of human behavior modelling utilizing SF, AB, and combined AB/SF for simulating the actions and judgements of the actor or agent in the simulation model. The comparison of human behavior modelling is based on the evidence of simulation effects and the difficulties of SF, AB, and combined AB/SF performances. Both simulation models are looked at to reflect human behavior for different sorts of service-oriented systems.

Conclusively, the implementation and development of a simulation model for crowd evacuation in a closed area that utilizing combined SF and AB approaches was the main goal of this study. The researchers next looked at the literature or conducted existing exploratory research on agent-based and social force models to ascertain their advantages and disadvantages. Researchers provide an integrated model that incorporates the benefits of both treatments based on this examination. Each agent in our simulation model, which represents an individual, has a particular set of characteristics, such as a preferred speed, direction, and social group. While the social force model is used to mimic interactions between agents and their environment, the agent-based model encompasses individual decision-making processes and social behavior.

Furthermore, the simulation techniques were implemented and utilizing real-world data from an indoor setting. We tested our simulation model's accuracy in capturing people's movement patterns using the collected data to calibrate it. Researchers observed at how people moved, including their speed, direction, and interactions with other people and their surroundings. Researchers also conducted sensitivity experiments to explore the influence of various model parameters on simulation results. The expected outcomes from this built integrated simulation model seek to precisely depict the behavior of people in close building, encompassing the interactions with other people and decision-making processes. Incorporating more specific illustrations of the physical surroundings and individual traits is one of the prospective study areas that the researchers highlighted.

Overall, this research's design and technique show how well agent-based and social force models can be utilized as well as integrated in order to simulate people's behavior in indoor spaces and provide the groundwork for future studies in this field. In conclusion, future research may focus on acquiring more data to validate and improve the integrated model. This can require utilizing fresh data sources, such those from social media or mobile devices, or collecting data on social systems that are not yet completely understood. Other than that, the collaboration across disciplines can be proposed for the future work such as to build a more holistic and thorough knowledge of social systems, combination of few fields including computer science, sociology, and psychology. This may lead to the development of fresh research topics and new perceptions of social behaviors. Furthermore, the integrated model may assist with the implementation of policies in a variety of fields, including urban planning and emergency management. Thus, future studies can concentrate on determining additional areas where the model might be used to guide decision-making as well as assessing the efficacy of policy initiatives informed by the model for the evacuation policies and governance (Rahman et al., 2019; Bakar et al., 2022).

Abstract: Sustainable energy harvesting from renewable sources such as solar, wind, or water power leads to a significant challenge in managing IoT applications. Utilizing renewable energy combined with optimized system energy has become a major concern across IoT-based large-scale systems for obtaining a reliable and energy-efficient eco-infrastructure system. A green technology-operated IoT (G-IoT) has been introduced as part of energy efficiency solutions for IoT-based systems to address the aforementioned issues. Many researchers have explored various solutions related to energy-efficient G-IoT approaches for eco-infrastructure systems in an organization such as a university campus. As there are various existing approaches to G-IoT, the question here is how to produce a reliable, real-time, and energy-efficient system to ensure sustainability for replicating a city like a university. This paper intends to explore existing works on G-IoT-based approaches in terms of energy efficiency issues and challenges from various authors' perspectives. The key goal of this study is to conduct a comprehensive overview to identify the parameters involved in developing a real-time and energy-efficient G-IoT system from existing works. Accordingly, an operational approach is introduced to review and analyze the work, factors, and techniques of G-IoT-related existing articles. From exploration and analysis, this study affords an in-depth description based on current trends, related parameter identifications, and capable approaches to bridge existing strategic gaps for future research. Thus, this study is expected to develop an IoT-powered sustainable green energy system replica for an organization.

Introduction

Nowadays, sustainable energy procurement has become very important due to the definition of new digital technologies or services day by day. Moreover, the growing population of today's world relies on a variety of technologies, such as the Internet of Things (IoT) and its applications, to meet their digital needs. Nevertheless, increasing global climate change can be accelerated by harnessing sustainable energy from renewable sources in digital technologies or services. The IoT is a system and innovative technological paradigm of billions of interconnected objects through the internet around the world (Zhang et al., 2020). In addition, IoT devices and applications play an essential role in developing some innovative applications in any country where various activities are involved, such as data collection, data sharing, data storage, data monitoring and testing, and data transfer without human intervention. Also, the real advancement of IoT has opened up opportunities for infrastructure development that is gaining worldwide acclaim. However, these infrastructures consume vast amounts of energy to accomplish their functions. With the increasing number of IoT devices like sensors, actuators, RFIDs, computers, and mobiles in IoT applications, the demand for energy in each sector is constantly increasing (Park et al., 2020).

Thus, it is creating a shortage of energy sources and increasing energy expenditure, wasting energy in the form of heat, and the resulting crisis with uncertainty is deepening day by day. As a result, emissions of carbon dioxide (CO₂) are rising day by day. Due to increasing energy demand, it will be very complicated to achieve high-quality services with greater energy efficiency. Also, uninterrupted renewable energy sources will be required when renewable energy sources are used as substitutes for non-renewable energy sources. Even energy demand and supply equilibrium, energy optimization, and cost analysis are important factors for attaining energy efficiency and achieving sustainability for any infrastructure (Martínez et al., 2021). Thus, these are considered as main issues and challenges in any IoT-driven sustainable infrastructure for the green energy system.

However, in order to reduce energy costs and achieve sustainability, it is essential to build the structure of energy-efficient IoT, called green IoT (G-IoT). Although several studies have analyzed the reliability of sustainable green energy systems through IoT, the need to conduct a comprehensive overview to identify the parameters involved in developing energy-efficient G-IoT systems is considered challenging. In this regard, an adopted IoT platform-driven sustainable green energy system can drive efficient resource utilization in an organization and promote the environmental sustainability transition (Butt et al., 2020). Many organizations in different countries around the world have started researching and building this type of G-IoT-based sustainable

green energy system. The existing articles for this issue still insufficiently explore G-IoT-related tasks, factors, and strategies, which points to a research gap and requires a new approach. Therefore, this study aims to identify the parameters involved and develop an operational framework to ensure sustainable green energy in an organization and evaluate its performance.

This configuration can certainly save costs and assist in keeping the balance of the environment as well as help in the longevity of human beings. For sustainable green structures, initially, renewable energy sources can be used as energy sources instead of fossil fuel or electric energy sources for any type of organization like university, company, campus, or industry (Amran et al., 2020). Consequently, green energy can be harvested from renewable sources for IoT-controlled energy systems, and optimization strategies can be applied to obtain energy efficiency and sustainability of IoT-driven infrastructure. Thus, the objectives of G-IoT-based sustainable real-time infrastructure should be energy-efficient, green, and sustainable for any type of application of an organization. Researchers need to be concerned enough about what issues and challenges are considered for the green energy system to achieve the objectives of the proposed framework. To be inspired to meet the goal of achieving the G-IoT model of sustainable energy harvesting, the topmost contributions in this study are described as follows:

- This study will support in acquiring sustainable green technological knowledge and concepts to develop a sustainable IoT-enabled green energy system for an organization.
- This study explores existing related works based on sustainability, energy efficiency, and G-IoT-based approaches in terms of issues and challenges.
- This work presents an operational approach, including strategies to promote an IoT-driven sustainable green energy system.

The rest part of this paper as follows: Section II describes the literature review based on sustainability, energy efficiency and IoT, and G-IoT. Section III expresses details of the issues and challenges of G-IoT associated with reliable, sustainable infrastructure for energy-efficient systems. Section IV represents the methodology with an operational approach of this study. Finally, section V concludes the last part of this study.

Literature Review

Sustainability

In recent years, sustainability on organizations has led to the implementation of technologies that support reducing the environmental impact of organization activities, lessening resource usage, boosting the interconnectivity of everyday objects, and enriching sustainable behaviour within the organization like a campus communities. In this context, IoT can be a promising technology for achieving the goals of organization sustainability initiatives that observe and optimize energy usage leading to efficiency gains and savings. Sen et al. suggested that higher education institutions need to adopt transformational plans and develop long-term

strategic approaches to overcome the complexities of achieving sustainability goals and carbon neutrality. In this regard, prioritizing efficient use of resources throughout the education process by ensuring a balanced, equitable, and integrated socio-economic sustainability in education, research, and sound management (Sen et al., 2022). Yadav et al. opined that using green and clean energy sources can be the best way to set up an eco-friendly, sustainable educational campus in Nepal (Yadav et al., 2021). In this regard, the authors analyzed the daily, monthly, and annual load data of solar PV power plants to meet 100% of energy demand to make them economical and environment-friendly in the feasibility domains of several university campuses in Nepal. Yaser et al. discussed the anaerobic digestion and composting processes for managing various levels like food waste and sewage sludge at the university campus, which can contribute to achieving campus sustainability (Yaser et al., 2022). In one instance, Villegas-Ch et al. conducted small-scale testing to integrate big data and the Internet of Things to find an efficient and reliable resolution for the performance of universities as a smart domain based on sustainability (Villegas-Ch et al., 2019).

In addition, Whitley et al. assessed the sustainability behaviours of university students based on socio-psychological factors such as electricity usage, recycling, transportation choices, food preference, and strengthening environmental approaches using the theory of Value-Belief-Norm (VBN) (Whitley et al., 2018). Gu et al. introduced a conceptual nexus analytical scheme for a sustainable campus based on interrelated environmental footprints (Gu et al., 2019). They used Keele University as the domain to quantify footprints through this interconnected nexus analysis to explore the relationship between water, solar, and wind energy resources, food supply, waste dumping, and associated carbon emissions. Kim et al. discussed and quantified the impact of different sustainability information sources and their user behavioural variations by exploring 12 communication factor analyses as three clusters (Kim et al., 2018). In one case, Moura et al. presented the consequence of energy sustainability based on an IoT infrastructure by using integrated renewable generation sources that ensure the desired monitoring of a university campus and support the control of ventilation, heating, lighting system, and air conditioning (Moura et al., 2021).

IoT and Energy Efficiency

IoT creates interconnections between embedded devices, sensors, and software on sustainable organizations like a university and allows stakeholders to collect and exchange data. Energy efficiency is an important consideration in the development of IoT frameworks to implement sustainable features, where environmental impacts of the organizations are mitigated while stakeholders use digital technologies. In this context, using renewable energy sources in smart organizations and applying energy efficiency strategies can reduce energy consumption in IoT structures and operate in a more sustainable and cost-effective manner. To address the issue of energy consumption in IoT structures, several energy efficiency strategies have been used to measure energy efficiency in recent years. Santos et al. discussed energy efficiency measures in IoT to identify energy consumption patterns and sustainable energy conservation measures in most buildings (Santos et al., 2019). Faritha Banu J et al. introduced an IoT-based smart classroom to digitally attach to campus for sustainability learning and enhance the efficiency of regular activities (Faritha Banu et al., 2020). This paradigm integrates the

technologies of IoT and cloud computing, where a software module is used to process the sensor information. Silva et al. described a software toolchain to manage and integrate the ICT-centric approach-based sustainable campus (da Silva et al., 2021). They demonstrated that such schemes could relieve energy usage, increase energy efficiency, and reduce greenhouse gas emissions from general services and resources of sustainable campuses under an online energy performance simulation, monitoring, and evaluation tool. In this context, Geetha et al. proposed the GEQCC-FLP method to predict the energy consumption in IoT networks by which nodes in the network can meet the required energy demand (Geetha et al., 2022). Furthermore, their approach uses Deep Random Vector Functional Link Network (DRVFLN) and Satin Bowerbird Optimizer (SBO) for green energy-aware clusters to predict future communication and renewable energy load in the IoT networks. Humayun et al. introduced a green IoT model to achieve energy efficiency by optimizing energy in smart cities, which are evaluated using mathematical modeling in terms of street billboards and lights, intelligent parking, and smart homes (Humayun et al., 2022a). Consequently, Sharma et al. examined the carbon footprints in IoT-enabled smart devices to save energy and achieve sustainability by emphasizing the use of G-IoT (Sharma & Panwar, 2020). Also, the usability and recyclability of smart devices have been promoted in the environment as well as in reducing costs and GHG emissions.

G-IoT

IoT-enabled sustainable organization system can be represented as a green IoT (G-IoT) model that supports different organization like universities to optimize energy use, reduce waste, and enhance sustainability in IoT technologies and applications with the aim of facilitating eco-friendly operations and knowledge transfer. Researchers have presented various green internet of things (G-IoT) based model which incorporates the adoption of IoT with green operations for gaining sustainability using a number of techniques. Mago has selected green IT to develop sustainable policies in the organization using the GITAM model (Mago, 2016). Nevertheless, there remains a complication regarding applying G-IoT to achieve sustainable policies with low energy consumption in buildings, organizations, industries, corporations, cities, and worldwide. Gotovtsev and Dyakov introduced G-IoT in City to achieve sustainable development using photo-bioreactors and biosensors for building and water management as well as peaceful environments (Gotovtsev & Dyakov, 2017), respectively. Ahlgren et al. developed a smart city regarding G-IoT using heterogeneous sensors for getting open access and interoperability data to meet the needs of citizens (Ahlgren et al., 2016).

Energy efficiency in G-IoT is a potential and significant global issue for our day-to-day life towards sustainability. Any manufacturing product in the industry is facing a huge problem due to the depletion of fossil fuel and the increase of population in world. So, Jagtap et al. introduced EPE framework-based IoT sensing technology to raise energy efficiency with the help of optimized energy in the beverage industry as well as to obtain environmental sustainability (Jagtap et al., 2019). Moreover, Chithaluru et al. presented less energy consumption to reduce energy depletion using the I-AREOR algorithm for G-IoT and also provides greater energy efficiency in smart cities (Chithaluru et al., 2020). Liu and Mishra discussed the technological challenges of G-IoT for the achievements of sustainable development and proposed an integrated policy of additive ratio

estimation and stepwise weight evaluation ratio exploration under the Pythagorean fuzzy set to execute G-IoT technologies (Liu & Mishra, 2022). Baldini et al. demonstrated an analytical design to evaluate the environmental influence of IoT deployment. They used solar energy harvesting operations in their proposed scheme to determine the green solution (Baldini et al., 2023). Besides, Kinelski et al. expressed different aspects of sustainable management for a smart city based on energy consumption and energy savings, including pollution reduction from the usage of energy sources, heat, or transport (Kinelski et al., 2022). They assessed the feasibility of implementing an automated thermal control design in cities of the Polish metropolitan zone.

Consequences from recent literature

In summary, green practitioners have recently focused on developing various analytical and mathematical strategies and technologies to manage a sustainable organization and reduce environmental impact using the G-IoT model. Table 1 exhibits the comparative consequences of recent literature on sustainability and energy-efficiency strategies. The consequences cited in the table can provide us with motivation for a sustainable management evaluation process of an organization using an energy-efficient G-IoT model. In the cited studies, researchers have tried to achieve the sustainability of an organization through IoT using some mathematical, analytical, and simulation techniques. However, they did not consider a realistic representation using the simulation model by identifying the parameters of promoting an energy-efficient, sustainable G-IoT model for an organization in their related studies, which can be important to improve the performance of these sustainable systems.

Table 1: Comparative consequences from recent literature regarding energy-efficiency strategy

Ref.	Approach	Parameters	Simulators	Domain	Strengths	Limitations
(Moura et al., 2021)	IoT-based platform	Energy consumption	Testbed	University Campus	ensure energy savings, increase matching between generation and demand of energy.	Only for local energy generation from PV system
(Baldini et al., 2023)	Baseline Green Solution	electronic components, battery, solar energy	Analytical model	IoT deployment	Assessed environmental impact	Only work on small solar panel for energy harvesting
(Yadav et al., 2021)	Campus solar PV plant	Solar Energy consumption	PVSYST V7.0	Campus	Cost effective based on environmental and economic Energy Saving	Not consider for battery backup and higher system capacity
(Humayun et al., 2022b) (Said et al., 2020)	Green energy model EMS	Energy consumption Energy consumption rate, IoT nodes	Mathematical model NS2	Smart home and cities IoT environments	Control the energy consumption in IoT	Not consider for real-life case study Questionable Energy source type
(Bebortta et al., 2022)	Edge-enabled green IoT	Energy-efficient processing	Analytical	IoT ecosystem	Offloading of intensive tasks to edge servers.	Capacity constraint in the edge server

(Zeng et al., 2022)	EH-IoT	Data Packet Sensor node, energy	Analytical	Not Specified	Pursue zero- carbon IoT network stability	Exclude energy harvesting capability measurement
(Kumar et al., 2020)	Q-EBIoT	Energy consumption , sensor node	NS2, testbed	IoT Environme nts	Prolong network lifetime more	Energy capacity constraint in sensor
(Uddin et al., 2022)	Integrated ABM-SD- BIM	Occupant behaviour	Anylogic	Building	Enhanced energy saving	Only consider a few layout

Gap Analysis

As quoted in the aforementioned subsections of this section, there are some potential gaps in existing work that need to be identified to achieve the desired results for sustainable organizations. In this case, there is a need to deploy technological infrastructure such as sensors and other equipment as well as improve energy efficiency for the sustainability of IoT-driven green energy systems, which need to be added to several existing structures. For developing a G-IoT-enabled sustainable system in an organization, there is required adequate energy collection from renewable energy sources, reduction of energy consumption, and significant improvements in actual energy savings that are missing in several existing structures. Also, various innovative solutions to reduce carbon emissions need to be explored to ensure the sustainability of an organization model by assessing the compatibility of energy-efficient G-IoT simulation infrastructure with existing technologies. Besides, a realistic representation of an IoT-driven sustainable green energy system in an organization needs to be considered along with parameter identification for achieving energy efficiency and promoting sustainability.

Issues and Challenges of G-IoT

The most important and fundamental condition of green technology is how to reduce greenhouse gas (GHG) emissions in IoT by reducing energy consumption, saving energy, and gaining energy efficiency so that an organization or a country can benefit socially, economically, and environmentally. G-IoT has many important energy efficiency issues and challenges for an organization. These issues and challenges have social, economic, and environmental implications for sustainability. Among the various issues and challenges, there are some technical issues and challenges; some issues have potentially increased the focus on green energy, some are prerequisites for G-IoT standardization, and some are security and privacy protection from system vulnerabilities. The issues and challenges of G-IoT based framework are shown in Figure 1, which are outlined below:

Energy costs

The rising energy consumption costs in G-IoT can be considered a crucial issue and challenge. The IoT has

developed a variety of applications like smart homes, intelligent buildings, smart agriculture, and smart healthcare to make our daily life simple, beautiful, smart, and smooth. These applications contain millions of devices for analysis, control, and sensing data that consume large amounts of energy resulting in high energy consumption and not being consistently stable. In that case, if renewable energy can always be used at a low cost, then it is possible to achieve maximum energy efficiency by using the maximum energy.

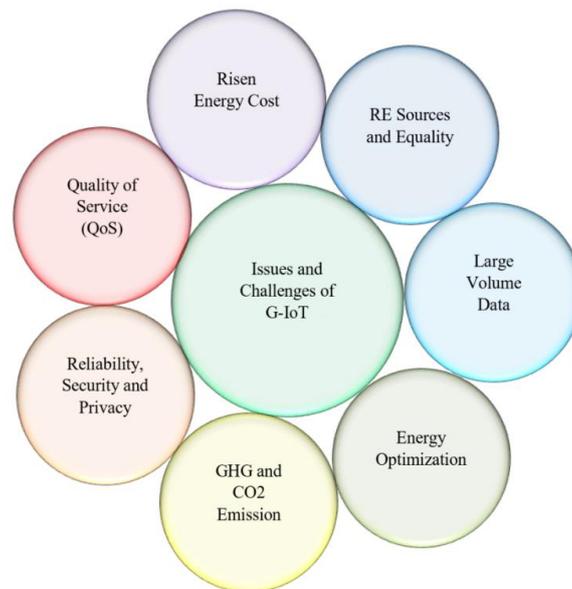

Figure 1: Issues and challenges of G-IoT-based framework

RE sources and quality

Maintaining environmental sustainability through renewable energy generation can be a promising concern for future generations. Due to increasing global warming using non-renewable energy, renewable energy resources are rising in today's world in the distribution of power within IoT systems. The energy harvesting distribution from renewable energy sources can be a major challenge in terms of quality, stability, and adjustment level for smart G-IoT systems. Ensuring maximum utilization, demand, and supply equality of renewable resources in the G-IoT scheme can be a key issue for a green city. Besides, renewable energy resources can be a significant matter to associate with industrial development that will positively influence environmental management towards dynamic and standard adoption.

Large volume of data

For accomplishing the operations such as transfer, process, and storage in IoT systems, a massive amount of data is generated that is collected by the huge number of sensors of objects and stored in the centralized node. IoT systems have unique features because these schemes have limited computing power to analyze since large amounts of data are generated. Besides, to design an energy-efficient G-IoT for any organization, the data-

driven technique can use a massive amount of data that are transferred over the network using various processors. Thus, the large volume of data is the greatest challenge for managing a G-IoT system for predicting and detecting the functionalities to realize the sensor body and to analyze, store and process information intelligently and efficiently.

Energy optimization

For decades, energy has been an important element in various fields like building, city, manufacturing, agriculture, etc. Globally, energy is considered an expensive and valuable resource in IoT. The demand for fuel oil is increasing day by day to meet the demand of the people of the world. As a result, the effects of global warming and GHG emissions are increasing, which is having an adverse effect on climate change and human longevity. This is why it has become essential to store energy and achieve maximum energy efficiency in existing applications so that the required energy is consumed and further progress can be made towards achieving sustainability. Require energy can be utilized through the implementation of energy optimization, which can help maintain the optimal balance of energy use and development of energy efficiency structure, thus providing a sustainable environment by providing maximum benefits to people and the climate.

GHG and Co2 emission

The various devices and applications of IoT play an essential role in meeting the needs of people's daily life. IoT consumes much energy to handle a variety of applications, increasing emissions of atmospheric CO₂ and harmful GHGs. Therefore, atmospheric CO₂ and GHGs are considered important issues in achieving energy efficiency. If maximum energy efficiency can be achieved by reducing energy consumption by optimizing energy, then the environment can be moved towards sustainability.

Reliability, security, and privacy

IoT-based green energy systems use renewable energy to achieve energy efficiency and sustainability. The generation, optimization, and distribution of renewable energy are deeply involved in achieving energy efficiency and sustainability. Reliable management of the generation, optimization, or distribution of a large amount of renewable energy has become an important issue. Achieving efficiency and sustainability of energy structures involves environmentally friendly, comprehensive reliability management and renewable energy distribution, data availability, ease of data usage, and data accuracy. In the future, various tasks are directed towards ensuring the reliability of the power system to manage the context so that the storage capacity and efficiency of the system can be multiplied, but the sustainability of climate change can be ensured.

Besides, data privacy, security, and interoperability are vital issues and major concerns in energy systems of IoT so that aggregated data are used to minimize communication costs and keep the privacy that has not yet been

addressed. The sensor nodes of networks are vulnerable due to different threads and attacks. As a result, security breaches have happened in the sensor. Data security is essential to impede unauthorized access and unwanted changes due to various attacks and threads. So, the IoT user is concerned about a green and sustainable system's reliability, privacy, and security to achieve a reliable and secured system.

Quality of Service (QoS)

The focus of QoS helps to achieve the core goals of a system. Achieving improved and optimized QoS of green energy systems depends on some parameters such as availability, reliability, greenness, and sustainability. The availability of a system means the sources of the energy, data, and network coverage area are available for any system organization. Reliability provides reliable management of the generation, optimization, and distribution of a large amount of renewable energy data and services across IoT compatible devices and applications, network capabilities that are also the reliable backbone to G-IoT connectivity.

However, greening means achieving maximum energy efficiency from a system so that the minimum energy consumption, maximum energy saving, and optimization are attained. As a result, GHG and harmful gas emissions are reduced due to greenness. Besides, low battery charge and less system energy consumption can lead to sustainability. On the other hand, security and privacy are major concerns for getting QoS. To implement the QoS optimization strategy and get the best performance that is predictable and secure, we need to explore appropriate strategies that consider QoS as a significant challenge over G-IoT-based energy systems.

Methodology

Achieving sustainability in an organization requires a more efficient infrastructure system for renewable energy associated with IoT-enabled systems in existing operations. In this regard, IoT-enabled existing infrastructure systems have some weaknesses in terms of energy efficiency and reliability, which need to be identified to ensure sustainability. In consequence, this study illustrates a well-defined operational approach in Figure 2 for identifying the factors to develop an energy-efficient and sustainable G-IoT model in an organization building. This representation shows the process of exploring the strategies of existing works, including sustainable architecture, through various literature reviews in the context of sustainability, IoT and energy efficiency, and G-IoT-based research. In this case, this way can be accommodating to provide insight into the overall performance of green-based systems. This scheme draws the methodological steps involved in selecting existing literature, reviewing gaps, issues, and challenges, identifying causes, exploring strategies, and building energy-efficient enabling frameworks.

In the initial step, this study arranges a plan to determine all aspects before building an IoT-powered sustainable green energy system in an organization. In this aspect, several literature works related to sustainability, IoT, energy efficiency, and G-IoT are collected, selected, reviewed, and analyzed on existing works, which can be

considered as the most important part of this framework. In accordance, this study determines the gaps, issues, and challenges from the existing works and raises the research problem statement on IoT-driven sustainable green energy systems in an organization. In this setting, it identifies the factors for developing a sustainable G-IoT-enabled organization that will be used to promote energy efficiency.

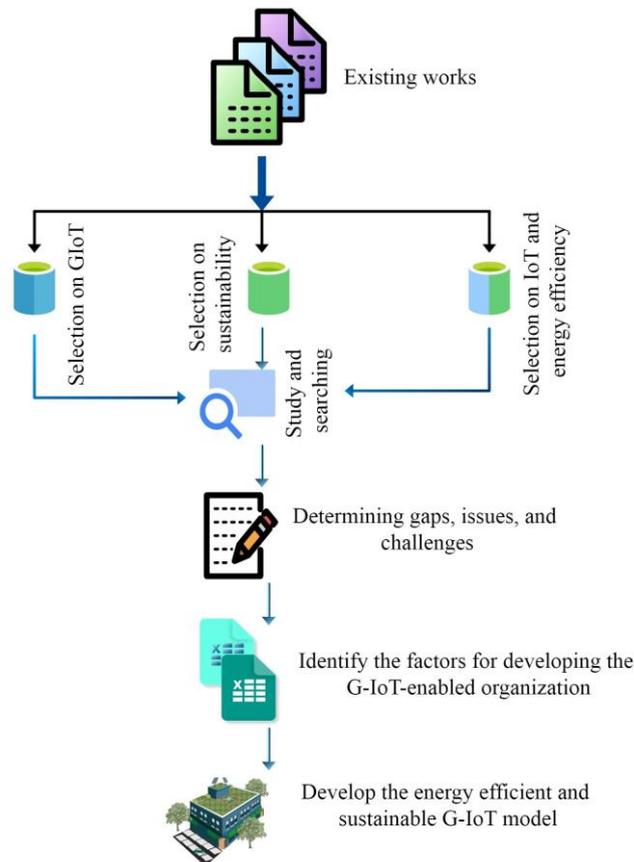

Figure 2: Operational approach

Finally, based on the results of these identified sensitive factors towards reliability and sustainability, energy efficiency can be evaluated for the development of G-IoT-enabled organizations, where only renewable energy sources will be considered. This study explores how to develop sustainability initiatives in an institution like a university campus, which is at its primary level. The nature of this study is profound and exploratory. Furthermore, this approach includes the development of high-performance green structure-based sustainability simulation models, which is demonstrated in Figure 3. Accordingly, this model will support energy efficiency gains and sustainability through the integration of renewable energy and IoT. In the energy management context, this system will confirm the availability of green energy from renewable sources in a continuous manner. In this case, renewable energy will be managed in an optimal way and stored in energy storage devices. Then, this energy will be utilized in green IoT-based organizations, where sensors, actuators, gateway, and many smart devices are incorporated. In addition, realistic representation with visualization will help explore the utility of the proposed concept in an effort to overcome existing work limitations with greater energy efficiency.

Even through the evaluation and validation process of the model will be related to the reduction of energy consumption and carbon dioxide to get improved energy efficiency towards sustainable policy.

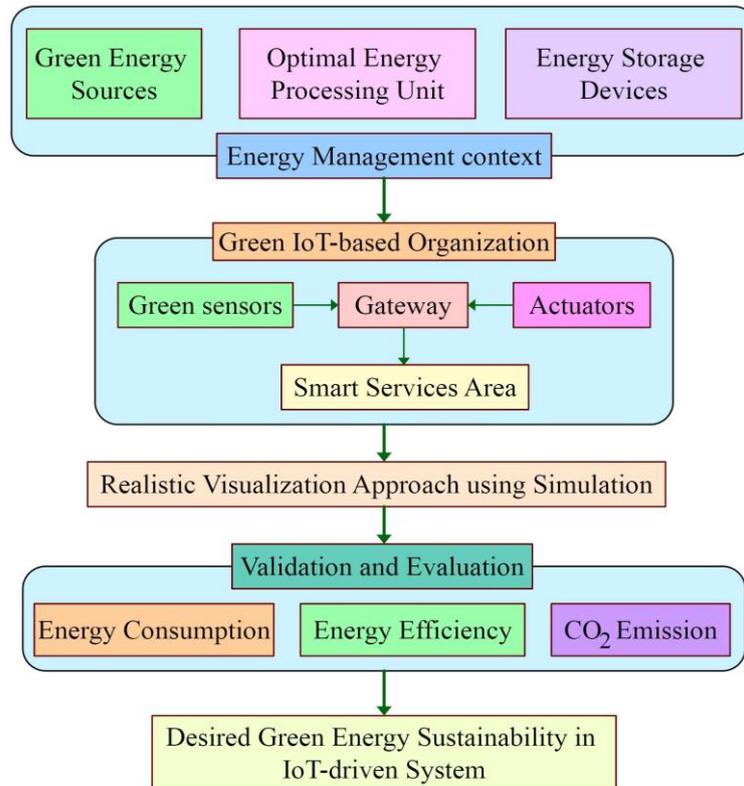

Figure 3: IoT-driven Green Structure based Simulation Model

Conclusions

Sustainable green technology is currently a desired revolution in the global green industry, and its advances are usually ongoing to be applied in G-IoT applications to be more durable; as well as it needs the intervention of researchers to ensure the reliable, sustainable development of an organization. Meanwhile, many specific functions of G-IoT operations and their technical approaches are being focused due to the appearance of cutting-edge green energy paradigms on its improvement. This study presents a comprehensive overview of recent works, growing issues and challenges, and research gap analysis based on sustainability, energy efficiency, and green IoT for developing a sustainable IoT-enabled organization. Inspired by G-IoT-based recent research, this study's comparative exploration and empirical analysis can contribute to the development of sustainable green technologies and identify the parameters to make the decisions of its development. It presents an operational approach to the concept of reaching the promoted green energy systems based on IoT network modes toward sustainability. In addition, such an operational approach from the perspective of renewable energy towards sustainability can generate a lot of interest in research on G-IoT technology in present times. This paper will allow further research directions for researchers to find faster and more effective solutions for developing IoT-driven sustainable scheme-based green energy systems.

Abstract: A number of booster doses and novel vaccinations have been chosen by health scientists in response to the latest pandemic epidemic and the identification of new strains. In light of this, it is essential to build additional vaccination facilities that are flawlessly planned and optimized to boost their agility and effectiveness, particularly in a country with a diverse population and a burgeoning tourist industry like Malaysia. Because only medical facilities, public buildings, and private structures are modified and reconfigured to function as vaccination centers. Based on different factors including population, transmission hazards, vaccination rate, availability of frontliners, and ergonomics at vaccination centers, a more practical, standard, portable, and flexible vaccination center PPV (*Pusat Pemberian Vaksin*) model would be required. In order to promote vaccine administration protocol agility, decrease transmissions, and boost overall performance efficiency of Malaysian vaccination centers, this project aims to create an optimized virtual model of vaccination center operations. The paper is divided into two stages of methodology, namely the literature review phase and the comprehensive descriptions of the proposed simulation model using integrated hybrid techniques. An initial investigation will be conducted to assess the present PPV-related activities in Malaysia. The findings reveal the proposed simulation model by utilizing the integrated hybrid techniques of agent-based and discrete event simulation in order to comprehend how the simulation system, which consists of few important elements and parameters such as vaccine recipients, medical personnel, facility ergonomics, vaccination center agility, and performance efficiency, behaves. In addition to providing the best movement patterns, anti-transmission SOPs, facilities and ergonomics, shorter waiting times, and general agility and efficiency of the PPV, this research will give a thorough analysis of the Malaysian PPVs as one of its future works.

Keywords: Vaccination Center, Agent-Based Modelling, Simulation Modelling, Optimization, Discrete Event Simulation

Introduction

The disease brought on by the new virus, and its emergence as an unparalleled challenge for humanity is COVID-19. The number of deaths globally in May 2022 totaled 6.28 million. In the middle of 2020, certain substitute vaccinations were found to be effective during the epidemic. Many nations, including Japan, have put in place a halt of economic activity for infection control due to COVID-19. Though it caused significant economic losses, it helped to stop the spread of COVID-19. Today, a number of promising vaccinations have been created and are being made available in various nations (Sunohara et al., 2021).

While the COVID-19 epidemic spreads over the world, vaccination programs have become a critical tool in controlling the spread of the virus. In Malaysia, the national vaccination program is well underway, with the government aiming to vaccinate. There are currently only two effective ways to protect people from an epidemic spreading: vaccines and quarantine. However, a protracted quarantine that covers the whole population would be quite expensive, and immunizations take a long time. By immunizing only, a tiny portion of the population using established methods for selecting recipients, it would be feasible to significantly reduce the economic activity shutdown and limit the spread of viruses (Fanelli et al., 2022).

The government and affiliated organizations are under increased pressure to acquire more vaccines and establish more vaccination facilities as a result of the escalating COVID-19 cases. Additionally, the emergence of new variations has compelled health officials to develop additional mitigation plans in order to finish the booster doses as soon as possible and get ready for newer vaccine vials appropriate for newer variants. Currently, the government leases or outsources public and commercial buildings to establish vaccination clinics (Pilati et al., 2021). A diagnostic and vaccination facility that resembles an emergency room is referred to as a vaccination center. As a result, it is necessary to develop an ideal and typical facility setup and ergonomics taking into account factors such as the movement pattern of the people and healthcare professionals, vaccination procedures and protocols, standard operating procedures, age group of the attendees, and the viability of close contact transmissions, among others (Wong & Lee, 2021).

Due to lengthy lines and heavy crowds, Malaysians have raised worry over crowding at vaccination clinics (PPV). Malaysians have also shared their worries about this on social media. Overcrowding will shorten the vaccination procedure cycle time and raise participants' levels of weariness while also raising the danger of transmission. This scenario will also serve as a source for fresh clusters. The efficient operation of a PPV might also be hampered by poor workplace ergonomics and facility layout. Furthermore, poorly designed PPVs and drive-throughs work inconsistently and with low dependability.

Furthermore, due to poor ergonomics and unfortunate worker-patient relations, the health professional did not

administer the vaccination into the recipient's arms even though the syringe had been placed, according to a report (Freemalaysia.com, 2021). The immunization cycle can be severely disrupted by issues like PPV shutdown. The World Trade Center (WTC) vaccination center (PPV) was shut down as a result of several problems with the facility's usability, congestion, and associated difficulties with the vaccination procedure (Malaymail, 2021). The Covid-19 immunization program in Malaysia has come under fire as worries regarding access in rural regions linger despite the opening of massive vaccination facilities in urban areas (Freemalaysia, 2021).

A well-known newspaper in Malaysia (Straitstimes.com, 2021) has asked practitioners and medical strategists, both private and public, to offer non-traditional, alternative treatments. The use of mega PPV has led to worries about congestion at these facilities. High-risk and disadvantaged populations find it challenging to travel great distances to these larger immunization facilities. Therefore, additional walk-in facilities, mobile outreach programs, small centers, and heavily populated neighborhoods with affordable housing are required. This project will provide a stepping stone for this by first gathering, collecting, and assessing data relevant to this issue and then modelling an ideal PPV center for Malaysia's future by taking into account all the PPV-related process characteristics and variables.

Conclusively, this paper will present the optimized virtual model of vaccination center operations in Malaysia, using a hybrid agent-based and discrete event simulation approach. The aim of our study is to improve the efficiency and effectiveness of the vaccination process for example by identifying potential bottlenecks or inefficiencies and exploring different strategies for optimization. Our study is based on data collected from actual vaccination centers and will be validated and verified using real-world data. We will also conduct sensitivity analyses to explore the impact of different parameters on the vaccination process and identify ways to optimize the overall system based on an optimized virtual model of vaccination center operations in Malaysia, using a hybrid agent-based and discrete event simulation approach

In an agent-based simulation, individual agents with specific characteristics and behaviors are modeled, and their interactions with each other and the environment are simulated over time. This approach can capture the heterogeneity and complexity of the system and how individual agents may influence the system's overall behavior. On the other hand, discrete-event simulation models the system as a series of events that occur at specific points in time. It is suitable for modeling processes with clear start and end times, such as the steps involved in administering a vaccine.

By combining the two approaches, a hybrid simulation can provide a more accurate representation of the system and its components. For example, the agent-based component can model the behavior and decision-making of individual healthcare workers, while the discrete-event component can model the steps involved in administering a vaccine, such as checking patient records, preparing the vaccine, and monitoring the patient after vaccination.

Covid-19 Vaccination Operations: Issues, Challenges and Strategies

The pandemic of COVID-19 has emphasized the value of vaccination as a key measure in preventing the virus' transmission. Numerous nations have started vaccination campaigns in an effort to immunize their populations as soon as possible due to the vaccines' speedy development. However, the successful implementation of these programs is not without challenges. Along with the challenges of vaccine availability, mass immunization is a difficult but necessary duty for the nations. Determining the mass vaccination location is crucial for recovery in this situation, hence a five-step solution is developed in this study to address this real-world issue. The criteria for selecting the mass vaccination sites are first established, and then geographical data are gathered and plotted using Geographic Information System (GIS) software (Çetinkaya et al., 2023). Though their work focused on the mass vaccination sites determination only.

The creation of the COVID-19 vaccine has been a substantial scientific advance. To stop the COVID-19 epidemic from spreading and wreaking havoc, nations from all across the world have pledged to offer licensed vaccinations. Phase II studies have begun for several vaccinations, and the European Union has given its permission to three vaccines (made by AstraZeneca, Moderna, and Pfizer). In order to speed up the COVID-19 response, the World Health Organization (WHO) is working with scientists, international health groups, and non-profit business organizations. To reduce pandemic-related problems, an effective vaccination approach in particular is essential. Governments and academic institutions must thus act and prepare for the use and administration of the vaccine (Bollyky & Bown, 2021). This element, however, heavily depends on the administration and completion of the vaccination phase's obstacles being resolved. Yet, the primary goal is on creating innovative vaccines and demonstrating their effectiveness in people, it is crucial to spot and fix issues with vaccine delivery in order to boost efficacy (Warren & Lofstedt, 2021).

Other than that, previous work reported that large-scale locations, including sports stadiums and conference centers, are converted into vaccination centers to provide vaccinations to a sizable portion of the local population. They complement other locations like primary care and hospital hubs. While hospital-based vaccination facilities focus largely on immunizing healthcare professionals to protect their safety. There are several delays in the vaccination center processes. Inside the vaccination center, there are many bottlenecks caused by queues and process cycle times. There are various uneven process times and queues in the front-end administration process, clinical client assessments, vaccination processes, and post immunization procedures that require adjustment. To comprehend the vaccine-related processes and shorten wait times, several interactions between various departments inside the vaccination center should also be correctly recorded, integrated, and captured (Smith & Smith, 2021). Conclusively, a few issues raised in their work assist the researcher to gain insight and compare with the operations in Malaysia to enhance the vaccination center's operations and procedures.

At PPV, there are few procedures such as they must be checked for symptoms as well as the designated slots, and screening the masses requires special care. This causes a significant delay because forms must also be manually filled out. Several procedures, include inventorying, transferring vaccines both inside and outside the center, and opening vaccines. Spot training exercises for volunteers and medical staff and their impact on performance enhancement also play a significant role. The ideal vaccination rate with a linear patient flow or numerous patient flow stations is governed by all of these factors. Additionally, the vaccination center's internal transportation and storage of vaccines adds to the distinct occurrences (De Boeck et al., 2020). Thus, this issue can be considered for this work as it is significant and related to the problem that has been discussed in the previous section.

Additionally, to complete a vaccine cycle, perfect adherence to national regulations, signed prescriptions, and patient-specific instructions is required. New legal tools called national protocols help immunization programs by enabling a wider range of people to deliver approved vaccinations. To divide the vaccination process into its component sections among diverse teams made up of different clinical and non-clinical experts with varying degrees of seniority, more adaptable procedures are needed (Smith & Smith, 2021). Therefore, their healthcare team with varied levels of experience and skill may deliver vaccinations swiftly and effectively with the use of adaptable protocols. In order to safeguard the general public's health and stop the spread of infectious illnesses, it is crucial to keep vaccination initiatives at the top of the priority list.

A previous work discussed the issue of low pregnancy-related vaccination uptake, which is still low. Their study goals were to outline the creation and adaption of a clinician communication training intervention for maternal vaccinations, and the clinician and staff views from obstetrics and gynecology (ob-gyn) about the intervention's development and suitability for the setting of prenatal care. Methods: The Motivational Interviewing for Maternal Immunizations (MI4MI) intervention's design was based on comparable communication-training techniques for pediatric settings and included presumptive initiation of vaccine recommendations combined with motivational interviewing (MI) for reluctant patients (Cataldi et al., 2022). However, their research was solely mentioned in relation to pregnant women's vaccine uptake.

Due in large part to the several electronic medical record (EMR) systems that are still in use, the present healthcare ecosystem in the United States is beset by inefficiencies in patient care transitions between healthcare providers. The issue of the negative impacts of higher prices, needless administrative load, and duplication of services brought on by the system's data fragmentation, both providers and patients face tremendous irritation. By enabling the transmission of healthcare data that is decentralized, auditable, immutable, and respectful of patient autonomy, blockchain technology offers a viable remedy to reduce or remove these gaps. To create and construct a blockchain application, our interdisciplinary team identified critical activities needed for a handover of care (Abdul-Moheeth et al., 2022). In addition, the widespread issue of data fragmentation in the existing system of healthcare has put a great deal of pressure on both patients and doctors. Recognition, trust, and usability issues appear to be the main obstacles to mainstream use of blockchain technology. For such technology to reach its full potential in the real world and revolutionize the delivery of contemporary healthcare,

more development and scaling are needed (Abdul-Moheeth et al., 2022). Yet, their work has no discussion of the operations of vaccination centres, such as the issues of bottlenecks, lack of resources, wasting of additional resources (healthcare staff), and so on.

Unwarranted variability in clinical practice is a difficult issue in practice, resulting in low-value treatment for providers, payers, and patients as well as poor patient outcomes. The aim of previous study was to evaluate the effectiveness of a novel tool called QualityIQ in assisting primary care physicians in making treatment decisions that are in line with the most recent best practices recognized by the Merit-Based Incentive Payment System. (MIPS). The QualityIQ patient simulation platform was completely automated and features real-time, evidence-based feedback and gamified peer benchmarking. Workup, diagnostic, and management questions were included for every case, along with clear, evidence-based grading guidelines (Burgon et al., 2021). However, they didn't focus on the vaccination center operations, including the procedures, processes, etc.

There are a number of potential vaccinations that have been created and are now being disseminated in several nations. In order to learn how to reconcile economy with infection management in Japan, they assessed several vaccination and intense countermeasure tactics with the constraint of economic loss using a model. Their primary findings were that, assuming a linear link between lockdown intensity and allowable economic loss was assumed, the vaccination plan that prioritized the younger generation was superior in terms of mortality. On the other hand, the old initial techniques worked best in environments with low basic reproduction numbers when a non-linearity relationship was established, suggesting that a powerful lockdown with little economic loss was achievable (Sunohara et al., 2021). Consequently, these findings imply that a number of variables, including as the local transmission rate and the financial consequences of lockdown measures, may affect the efficacy of various vaccination strategies.

A work discussed on the entire globe which is battling the terrifying COVID-19 epidemic, for which there has not yet been a reliable vaccine developed. Researchers and experts are working very hard to create various vaccine tactics that will benefit society. They actually don't know what would work best, therefore it's a fresh concept to pursue a variety of tactics and platforms. With this in mind, they proposed and created a Susceptible-Infected-Removed (SIR) model of the corona virus in their project, using both a continuous and a pulse vaccination strategy in individuals, to demonstrate how vaccination strategy can also play a crucial role in controlling infection and preventing the virus from being produced (Brill et al., 2019). However, this work only focused on examining various vaccine approaches, and it revealed that the experts expect to obtain knowledge about the most effective ways to fight the epidemic and safeguard public health instead of improving the process and procedure in the PPV.

Vaccination Operations & Strategies at PPV

The vaccination center was modelled by the authors as a system with a set number of vaccination stations, each of which serves as a service point. Patients come at the facility and are handled in a succession of steps that may

be compared to a network of service stations. Registration, triage, vaccination, and post-vaccination monitoring are among the network's operations. Patients go from one service point (i.e., vaccination station) to the next as they proceed through the series of activities, and each action is carried out by a separate service point. The authors modeled each service point as a multi-server queue, meaning that each station can process multiple patients simultaneously. Patients arrive at each station according to an arrival process, and the time required to complete each activity (i.e., service time) is modeled as a random variable. Overall, the authors' model can be thought of as a network of service points, where patients are processed sequentially through a series of activities, with each activity performed by a different multi-server queue (i.e., vaccination station) (Wood et al., 2021). Thus, this kind of modelling found to be helpful in improving a vaccine network's operations to increase effectiveness and patient flow.

Virtual Model of Vaccination Centre Operations

Previous work proposed a model that is well suited for evaluating vaccination regimens. In fact, it has been advised that to maximize the likelihood of containing the outbreak, a vaccination program should be carefully chosen if a vaccine is available but in short supply. They analyze and assess several plans, paying particular attention to how shifting the percolation transition point might enable greater mobility without having an adverse influence on the epidemiology (Toledano et al., 2021). Nevertheless, in situations when vaccines may be in low supply, this kind of study is crucial for guiding decision-making on vaccination programs. Instead, then improving the processes at vaccination centers, it may be able to maximize the chance of preventing the spread of the illness by carefully selecting a vaccination program that is optimized for the unique conditions of the epidemic. (PPV).

To demonstrate the efficacy of several adaptation techniques suggested in the literature, a number of fictitious simulations of an H1N1-like pandemic epidemic among the US population will be shown. 100 replications of each simulation set were performed in order to average the stochastic impacts of the parameter(s) uncertainty. In order to help healthcare policy makers, create dynamic, effective health interventions to stop disease outbreaks, the multi-agent model created in this work may be utilized as a decision support system (Kohli et al., 2021). In contrast, their research solely focused on the multi-agent model developed in this study, which may be especially beneficial in guiding decision-making around interventions involving several stakeholders and complicated interactions, such as those engaged in reacting to a pandemic.

When massive mass vaccination drills are planned together with the simultaneous mobilization of large groups of people, the human aspect will also play a significant role. Various factors, including arrival rate, transportation rate, dispatching rate, layout elements, etc., will become available as a result. A great and reasonably priced way to evaluate potential scenario analyses and provide workable answers to issues with vaccine process and layout design is through simulation modelling. In fact, the simulation's outputs—both numerically and visually—display the processing and waiting durations in various contexts. Computer simulations may be thought of as essential tools for modelling various operational fixes for issues that can arise

during any of the crucial vaccination phases inside vaccination clinics. In fact, it is possible to foresee the high level of dynamic uncertainty, which aids planners in imagining what could occur (Gianfredi et al., 2021). As a result, the discussed factors can all have an influence on a vaccine campaign's success and simulation modelling is an effective technique for examining various scenarios and identifying practical solutions to vaccination process and layout design difficulties.

A prior study sought to determine what other nations may learn from China by examining the policies implemented there and comparing them to those in China. Techniques: In Wuhan, they create a system dynamics model of the COVID-19 pandemic. The previous researchers examined the effects of altering factors, such as contact rates, on the emergence of a second wave using a variety of simulations. Results revealed that despite China's health care system being underfunded and ineffective, the epidemic was controlled in a fairly short amount of time, and till now, no second wave was felt in Wuhan. The procedures to stop the outbreak are the same as those used in other nations, but China used them quickly and assiduously. For instance, the subsequent adoption of health regulations and contact-tracking technologies helped to control the spread of the illness and successfully stop the second and third waves. Conclusions: A stringent application of a number of measures, including digital management, is the foundation of China's success in combating COVID-19 (Wang & Fleßa, 2021). However, differences in cultural, political, and economic circumstances must be considered since they may alter the implementation and efficacy of such policies.

A previous work was discussed the use of computer modeling and simulation to improve the operations of COVID-19 vaccination centers. The authors argue that such centers face a number of challenges, including managing vaccine supply, scheduling appointments, and ensuring safe and efficient flow of patients through the center. They suggested that computer modeling and simulation can help address these challenges by allowing for testing and optimization of different operational scenarios. The authors describe their use of a simulation tool called AnyLogic to model a hypothetical vaccination center and explore different operational scenarios using single technique of discrete-event simulation with some form of queueing algorithm to model the flow of patients through the vaccination center. They may have also used optimization algorithms to identify the most effective operational scenarios based on their simulation results. They considered various factors, such as the number of vaccination stations, the rate of vaccine supply, the appointment scheduling system, and the distribution of patients across the center. Thus, simulation model and tools may be quite beneficial in spotting possible difficulties and testing alternative tactics in a risk-free environment before adopting them in the real world.

The results of a previous that focused on the simulations suggest that certain operational scenarios can significantly improve the efficiency and safety of the vaccination center. For example, they find that increasing the number of vaccination stations and implementing a hybrid appointment system (which combines both appointment-based and walk-in vaccinations) can lead to shorter waiting times and improved throughput. Overall, their work demonstrated the potential benefits of using computer modeling and simulation to optimize the operations of COVID-19 vaccination centers. By identifying the most effective operational scenarios, such

tools can help improve the efficiency and safety of such centers, ultimately helping to increase vaccination rates and control the spread of COVID-19 (Wood et al., 2021). The result, the tool may be changed and customized for various vaccination center layouts and circumstances, making it a useful resource for healthcare professionals and policymakers looking to optimize their operations.

Modelling Techniques

To evaluate methods for a vaccination center's operation in the descriptive or predictive modes, the behavior of numerous autonomous systems may be simulated. Their models support research into and explanation of current or anticipated future vaccination-related occurrences. A simulation model is a set of mathematical formulas, computations, and equations that simulates how a system would act and function under various real-world conditions (Kumar et al., 2022). The many components of a system that is essentially characterized by the planned operations it performs in a common environment—the vaccination center—can be broken down into multiple entities. When it comes to solving problems, resolving conflicts, and making decisions, these agents have the intuitive capacity to notice and react to changes in the surrounding environment. In order to assess the design and operation of vaccination centers and to gain an understanding of their emergent behavior and features, agent-based modelling and simulation are used.

The goal of previous project is to model and replicate real-world vaccination facility scenarios using a set of self-governing agents that can be either extremely simple things inside of computer code snippets or extremely complex items. One of the most difficult tasks in the simulation testing is gaining sufficient knowledge about the system in order to build an effective conceptual and logical model. The vaccination center is anticipated to be complicated since it involves several agents or active things interacting with one another and forming associations based on certain intrinsic characteristics, which makes automated reasoning and problem-solving possible. This model will eventually assist in detecting crowd patterns and determining the movement of people and materials inside the vaccination center. Thus, in order to construct a successful simulation model, it is critical to have a solid grasp of the system being modelled (Bank, 2022).

The benefit of integrating discrete event modelling and simulation with agent-based modelling in the design of vaccination centers. The performance and process behavior of vaccination clinics in Malaysia need to be thoroughly examined. This gives individuals and healthcare professionals more ability to influence the immunization process and decide on its effectiveness. In these situations, performance monitoring of every system running within the vaccination center is crucial (Abideen et al., 2020). Therefore, it provides more accurate and complete representations of complex systems, promotes experimentation and optimization in a simulation setting, and enables regular evaluation of performance and enhancement.

A combined strategy using agent-based modelling and discrete event simulation techniques will directly aid in understanding and improving vaccination center-related processes at the tactical and operational levels, which serve as normative models used for decision support. The combination aims to achieve decision automation and

system analysis. Discrete event simulation modelling helps in measuring or quantifying such predictions in the context of a vaccination center since ABM may operate as a system predictor to produce and validate theories and hypotheses about system behavior, but not in a precise way. However, simulations may assist in detecting bottlenecks, projecting system performance under various circumstances, and testing and optimizing various operational techniques to improve the vaccination centers' efficiency and safety.

Methodology

In order to better understand the obstacles and issues in executing the vaccination process, a study and review of the literature on modelling the operations in vaccination centers (PPV) from 2019 to 2023 has been conducted. This review is then analyzed in tandem with the vaccine process, procedures, and protocols connected to those problems. This report identifies the knowledge gaps and makes recommendations for the next study areas.

Enhancing A Virtual Model of Vaccination Center Operations with Hybrid Techniques

A simulation model is significant for this study in order to address the issue of staffing and resources at PPVs (Point of Dispensing Vaccination Sites). A simulation model can help identify potential bottlenecks and resource constraints in the vaccination process, and test different staffing and resource allocation strategies to improve efficiency and effectiveness. Thus, the proposed simulation model could be used to forecast the impact of various factors on vaccination operations, such as changes in vaccine supply or demand, staffing levels, or the emergence of new variants of the virus. The main goal of this study is to model a vaccination capsule (virtual prototype for a vaccination facility) with improved performance efficiency and agility through process parameter optimization.

Furthermore, this proposed model could help healthcare providers and policymakers anticipate and prepare for potential challenges and adapt their strategies accordingly. Conclusively, a simulation model of vaccination operations at a vaccination center could be a valuable tool for optimizing the efficiency and effectiveness of vaccination campaigns and improving the ability to respond to emerging public health challenges.

In a virtual dimension, an integrated approach of agent-based modelling (ABM) and discrete event simulation (DES) can assist in understanding, quantifying, and analyzing the movement and behavior of the people, the flow of operations, and their interactions with other systems (agents). Agent-based and discrete event simulation can be used together to model various aspects of healthcare delivery inside the vaccination center. These techniques have been widely used for years to model patient flows, remove bottlenecks, and comprehend how various healthcare system components, such as the vaccination center, work together as a whole. In order to comprehend complex systems' activities and interactions with one another, agent-based modelling and simulation (ABMS) splits and analyses them as individual agents after capturing complicated systems into the vaccine center. It is crucial to take into account aspects like how individuals move about, how they engage with

one another, and how they communicate with one another so that vaccination clinics may make better judgements. In contrast, the DES is integrated here to examine discrete operations and events that occur across the system.

This initiative will also offer various tips on how to organize and set up a vaccination clinic in any location (open or closed), taking into account all of the previously stated factors, as well as contribute to improving the vaccination procedure as a whole. This will only be achieved by modelling and simulating multiple agent interactions across different systems inside a vaccination center, as well as by concurrently measuring the timeline of discrete events connected to the system.

Results and Findings

There has been a great deal of models to understand the spread of COVID-19, and to help prevention and control strategies. Researchers build compartments according to actual situation, research objectives and complexity of models used. As the COVID-19 epidemic remains uncertain and poses a major challenge to humans, researchers still need dynamic models as the main tool to predict dynamics, evaluate intervention effects, and provide scientific evidence for the development of prevention and control strategies. The compartmental structures reviewed in this study provide guidance for future modeling for COVID-19, and also offer recommendations for the dynamic modeling of other infectious diseases.

A previous research used simulation and data envelope analysis, which reflected the patients' deteriorating states inside the emergency department, to assess the performance of the emergency department in a Jordanian hospital (Al-Refaie et al., 2014). Xu et al. (2018) created an ABMS simulation of an emergency department with the goal of creating a tool that can be used to better understand complicated behavior, assess policy, and run emergency departments more effectively. Using straightforward if/then rules that were primarily concerned with moving, partaking in activities, waiting, and staff scheduling, they simulated the conduct of patients and workers.

In order to evaluate healthcare policies and practice recommendations, simulation on the emergency department using ABS, taking into account patient flows and access to the emergency department. The proposed model also will utilize DES and ABS hybrid model; DES to simulate patient flows and ABS to represent physicians and their delegates and assess the effects of their interactions on an emergency department. Same like a previous work claimed that taking into account an agent-based approach in DES might be beneficial when the model's goal is to attain optimal staff scheduling since the hybrid method enables more accurate representation of scheduled resource utilization and patient throughput (Escudero Marin, 2020). However, none of the experiments described above have fully specified the vaccination center and associated entities. Previous research demonstrates that ABS models provide strong potential to depict normal emergency department activities.

Furthermore, the majority of earlier research in the field of healthcare did not examine the performance and agility of vaccination centers. It would be interesting to trace the activity of the agents inside the vaccination center’s system so that it may be afterwards connected to the waiting times and cycle times of different procedures there. Thus, this research will make a significant contribution to the creation of the ideal virtual vaccination center capsule or cabin prototype, which may then go through an experimental phase. The use of ABM and DES approaches in the design and optimization of vaccination centers might give significant insights into the performance and agility of such centers, which have previously gone largely untapped in healthcare research. It is feasible to relate the behavior of the agents inside the vaccination centers’ systems to waiting periods and cycle times of different operations by tracing their activity within the system. This information may then be utilized to enhance the vaccination centers’ efficiency and efficacy.

The development of a platform-specific model is the main justification for choosing agent-based modelling. Multiple phases that make up an iterative modelling approach define each phase. The employees, vaccine attendees, and other PPV-related authorities are essentially treated as independent systems in an agent-based method, which projects the agent behavior both inside the particular system and with other systems. This agent-based models will provide information on the potential for transmission, the viability of ergonomics, and the enhancement of agility and performance inside the vaccination center in Malaysia. The discrete event model will treat each discrete event that occurs within the PPV as a separate event that is connected to or associated with a specific agent within the system. It also discusses the materials and resources used in PPV and how they interact with people, and it estimates the outcomes in terms of cycle time and lead time for each event. Discrete event modelling uses a bottom-up strategy.

Furthermore, the integration framework of this proposed work will be utilized as depicted in Figure 1 below. This literature review paper summarizes and synthesizes existing research on a particular topic, and presenting the integration framework and proposed research design protocol to be utilized for this work. This framework will assist the researchers in performing this research for the remaining steps or phases, which are important for the methodology.

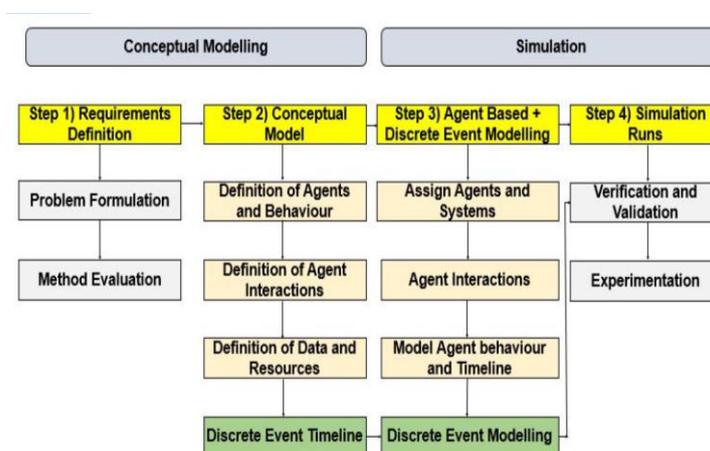

Figure 1. Integration framework of proposed work

Figure 2 presents the proposed research design protocol to utilize for this study. The exploratory study aims to investigate the impact of vaccination center design on the vaccination process the researchers intend to gain a better understanding of how the layout and organization of vaccination centers can affect vaccine operational efficiency. In addition, the study of agent behavior is significant in order to investigate the behavior and interactions of agents in a specific system or environment, with the goal of gaining insights into their decision-making processes and social dynamics. By examining the behavior of agents in different scenarios and environments, we can identify patterns and trends that could inform the development of more effective systems and policies.

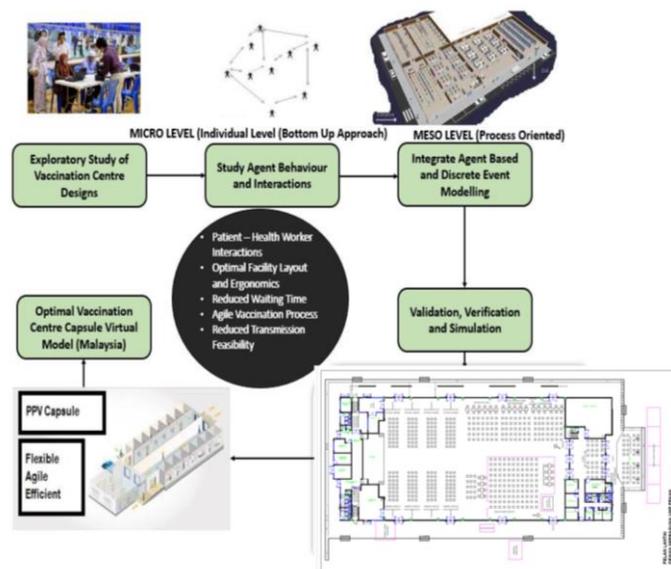

Figure 2. Proposed research design protocol

Furthermore, through this research, we hope to leverage the strengths of both modelling techniques to capture the behavior of individual agents and the system-level dynamics that emerge from their interactions. One of aim for this study is to examine patient and health worker interactions in vaccination centers and identify optimal facility layouts and ergonomics that can improve the vaccination process. Other than that, the proposed work aims to reduce waiting time for patients and develop an agile vaccination process that can adapt to changing circumstances, while also minimizing the risk of transmission based on the investigation of the physical design and layout of vaccination centers to identify areas of inefficiency or congestion that can be addressed to streamline the vaccination process. This research will explore the feasibility of reducing transmission risk in vaccination centers by implementing measures such as physical distancing, enhanced ventilation, and proper hygiene practices.

This study purpose to create a comprehensive and reliable model that can be used to validate and verify the design of the vaccination center, as well as simulate different scenarios and evaluate the impact of various interventions and will leverage advanced computational tools and techniques to develop a realistic and accurate model of PPV operations, which can be used to identify potential bottlenecks or inefficiencies and explore different strategies for optimization.

Discussion

The COVID-19 breakout has put the capacity of the planet to survive in danger. Even if the virus has been contained to certain regions of the planet after inflicting such damage, the prospect of it reemerging in the future should not be discounted. More than 200 nations and areas throughout the world have been badly impacted by the coronavirus disease 2019 (COVID-19) outbreak, which is regarded as the deadliest global public health disaster in over a century. Researchers have widely used dynamic models to predict and simulate the epidemic's development, comprehend the spread rule, assess the effects of intervention measures, inform vaccination strategies, and aid in the formulation of prevention and control measures in order to effectively prevent and control the epidemic. The compartmental structures employed in COVID-19 dynamic models were sorted out in this study with the intention of serving as a guide for future COVID-19 dynamic modelling and dynamic modelling of other infectious illnesses.

This study is aimed to develop an optimal vaccination center capsule virtual model in Malaysia that can be used to improve the efficiency and effectiveness of the vaccination process with flexible, agile, and efficient features that can be tailored to the specific needs of different communities and populations. Furthermore, this study will leverage advanced virtual modelling and simulation techniques to design a vaccination center capsule that can optimize patient flow, minimize waiting time, and enhance the overall vaccination experience. This study will also explore the feasibility of implementing innovative technologies and processes in the vaccination center capsule to further enhance efficiency, reduce transmission risk, and ensure that vaccines are delivered safely and effectively

Furthermore, this study is going to offer a comprehensive knowledge of how to enhance the design of vaccination facilities in Malaysia, as well as human movement and ergonomics, vaccination process cycle time, and transmission feasibility. The integrated agent-based and discrete event simulation model to aid in comprehending, assessing, and optimizing an entire vaccination center ergonomics of Malaysian PPVs and open up the best opportunities to apply the developed model in actual practical application to improve the PPV design and rubrics in Malaysia taking all the PPV related ergonomics and lead time parameters.

Conclusion

A simulation model of vaccination operations at a vaccination center could be a useful tool for healthcare providers and policymakers to optimize the efficiency and effectiveness of vaccination campaigns. Such a model could simulate the flow of patients through the vaccination center, the availability of vaccine doses, and the resources needed to administer vaccines, such as staff and equipment. Furthermore, this study intends to develop a simulation model that could be developed using a combination of data from previous vaccination campaigns and input from healthcare providers and other stakeholders. The model could then be used to test different scenarios and strategies for vaccine distribution, such as varying the number of vaccination stations,

adjusting the appointment schedule, or prioritizing certain population groups.

Thus, by using the simulation model to test different scenarios and strategies, healthcare providers and policymakers can identify the most efficient and effective approach for delivering vaccines. This could lead to shorter wait times for patients, better utilization of staff and resources, and more equitable distribution of vaccines. Conclusively, the successful implementation of COVID-19 vaccination programs requires a coordinated and multi-faceted approach. By addressing the issues and challenges facing vaccination operations and employing effective strategies, we can ensure that vaccines are distributed fairly and equitably and that the vaccination process is efficient and effective in controlling the spread of the virus

Recommendations and Future Works

By using the simulation model to test different scenarios and strategies, healthcare providers and policymakers can identify the most efficient and effective approach for delivering vaccines. This could lead to shorter wait times for patients, better utilization of staff and resources, and more equitable distribution of vaccines. The simulation model could be used to forecast the impact of various factors on vaccination operations, such as changes in vaccine supply or demand, staffing levels, or the emergence of new variants of the virus. This could help healthcare providers and policymakers anticipate and prepare for potential challenges and adapt their strategies accordingly.

In conclusion, adaptability and cost considerations must be taken into account if these strategic protocols are to be effective for all populations across diverse nations. Pandemics like COVID-19 point to the possibility of yet-to-be-identified mutant viral strains and diseases that might still result in outbreaks. There should always be a long-term plan in place to deal with future viral pandemics.

The future study will include a thorough and in-depth review of COVID-19 vaccination center operations and practices in Malaysia. The agent-based and discrete event integration will be used to assess various parametric factors that affect vaccination centers and boost performance agility. It is necessary to develop a PPV design process that is more exact (Bakar et al., 2022; Fernandez et al., 2021). Additionally, the goal of this study is to gather more recent data that will be utilized to reproduce the implications and insights that will be drawn from the study's findings (Mayyalgan et al., 2022). This feature directly strengthens the healthcare industry, particularly when looking at the complete immunization process (Rahman et al., 2023).

Abstract: Since the pandemic hits, we need to adjust specific ways to prevent the spread of COVID-19, primarily due to the enforcement of Social Distancing. In Indonesia, how we purchase things has changed significantly, leading to the growth of Digital Wallet usage in the online and offline sectors. This phenomenon aligns with the government policy and the objective of pursuing a Cashless Society and bringing financial inclusion for MSMEs in Indonesia. To achieve that, the adoption of the technology must be accepted by the Shopper and the Merchant, especially in the more extensive sector such as retail and F&B. This study aims to find the significant variable that influences the adoption of Digital Wallets by merchants in the offline sector by developing a conceptual model based on the Technology Acceptance Model (TAM) and focusing on the outcome of Intention to Use of the technology. A survey of 149 respondents who own a brick and mortar businesses in the F&B sector is collected and analyzed using the PLS-SEM. Out of 13 hypotheses that have been developed, seven were accepted, and six were rejected. The results of the study can be used to help Digital Wallet companies understand the factor that might influence the adoption of the technology by the merchant in the F&B sector.

Keywords: Digital Wallet, MSMEs, Technology Adoption, PLS-SEM, Technology Acceptance Model

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1745-1756), Cappadocia, Turkiye. ISTES Organization.

Introduction

In recent years, digital payments have emerged as a popular and transformative technology in the financial sector, revolutionizing the way individuals and businesses conduct transactions. It offer convenient and secure alternatives to traditional cash-based transactions, allowing users to make payments, transfer funds, and manage their finances through mobile applications. Due to the COVID-19 and Social Distancing implementation all over the world, the adoption of digital payment as a contactless payment when shopping has been accelerated. One of the example of digital payment that has been frequently used all over the world because of the pandemic is e-

wallet. The e-wallet or digital wallet is an app-based technology which allows users to make payments of their purchases, receive and transfer funds and top-up funds via their mobile devices, replacing the physical wallet (Andrew et al., 2019). According to Worldpay Inc., e-wallet was the most frequently used payment method globally, in the POS (Point of Sale) sector in 2020, but in Indonesia, cash was the most frequently used payment in the POS sector with 53% of usage compared to e-wallet with 17% of usage (Worldpay, 2021).

Indonesia is a home for more than 65 million MSMEs and many of them still rely on cash-based transactions, limiting their potential for growth and hindering their ability to participate fully in the digital economy. Some of the barriers that might discourage merchants to adopting the technology are technological incompatibility, complexity, the cost of investment, and the lack of critical mass and knowledge (Moghavvemi, et al., 2021). This could be a barrier to achieve cashless society that has been targeted by Bank Indonesia through several program such as National Non-Cash Movement and Indonesian Payment System Blueprint 2025. Through those programs, they are not only encouraging the adoption of digital payment among MSMEs, but they are also contributed to financial inclusion and promote economic development at a broader scale.

Based on the above problem, the aim of the current study is to analyzing factors influencing intention to use digital wallet by MSMEs in F&B Sector in Indonesia, as the sector is one of the biggest sectors contributing to Indonesian Economy by proposing a conceptual model extending a Technology Acceptance Model (TAM) with other factors such as Perceived Compatibility, Awareness, Facilitating Condition, Security, Trust, Perceived Cost, and Perceived Customer Value Addition.

Literature Review

Micro Small Medium Enterprises (MSMEs)

As the Indonesian law number 20 of 2008 stated, MSMEs are any company owned by and managed by someone or a group of people that owned certain assets and turnover. Table 1 shows the criteria for MSMEs in Indonesia. The importance of MSMEs in Indonesia also shows from their contribution for Indonesia, according to Coordinating Ministry for the Economics Republic Indonesia in 2022, MSMEs has contributed 60.5% to Indonesia GDP and responsible for 96.9% of employment.

Table 13. Definition of MSMEs

No	Category	Assets	Turnover (yearly)
1	Micro	Maximum Rp50.000.000 excluding land and building	Maximum Rp300.000.000
2	Small	More than Rp50.000.000 to maximum Rp500.000.000 excluding land and building	More than Rp300.000.000,00 to maximum Rp2.500.000.000
3	Medium	More than Rp500.000.000,00 to maximum Rp10.000.000.000 excluding land and building	More than Rp2.500.000.000 to maximum Rp50.000.000.000

Digital Wallet

Digital Wallet, also known as mobile wallet, m-wallet, or e-wallet is a payment services operated under financial regulations and performed via mobile devices. Mobile wallets enable customers to transact with merchants without using cash, cheques or credit/debit cards. This payment system can store credit card, loyalty card, gift card and sales promotion details (Kuganathan & Wikramanayake, 2014). According to Bank Indonesia, digital wallet is an electronic service for storing payment instrument data including payment methods that utilize cards or electronic money, which can also hold funds for making payments (Bank Indonesia, 2016).

In Indonesia, digital wallet can be a form of extension of financial services to reach the unbanked people, to use it as a buyer, they can choose the brand that available, such as Shopeepay, Gopay, Dana, or OVO and sign up using their personal identity card. While as a merchant, the providers usually need extra requirements such as taxpayer identification number, business licence, and articles of incorporation.

Technology Acceptance Model (TAM)

Technology Acceptance Model (TAM) was introduced in 1986 by Davis, the theory is widely used to predict intention to adopt new technology by organizational users. However, it has an established reputation and has been widely adopted to explain innovative technology adoption by individual consumers (Bailey, Pentina, Mishra, & Ben Mimoun, 2017). The basic TAM model included and tested two specific beliefs: Perceived Usefulness (PU) and Perceived Ease of Use (PEOU). Perceived Usefulness is defined as the potential user's subjective likelihood that the use of a certain system (e.g: single platform E-payment System) will improve his/her action and Perceived Ease of Use refers to the degree to which the potential user expects the target system to be effortless (Davis, 1989).

Partial Least Square Structure Equation Modeling (PLS-SEM)

Partial Least Square Structural Equation Modeling (PLS-SEM) is one of the Structural Equation Modeling methods that widely used as an exploratory purpose. If the research of the objective is prediction and theory development, then the appropriate method is PLS-SEM (Dash & Paul, 2021). PLS-SEM consists two elements, first is a structural model (inner model) that displays relationships between construct and second is measurement model (outer model) that displays the relationships between construct and the indicator variables (Hair et al., 2021).

Method

In this study, the research model was developed by extending the TAM model with external factors such as other Perceived Compatibility, Awareness, Facilitating Condition, Security, Trust, Perceived Cost, and Perceived Customer Value Addition. This extension is done based on the literature review of previous study

related to the adoption of digital wallet adoption in the context of merchant perspective. The proposed model consists ten latent variables or constructs with the outcome of intention to use digital wallet as shown in Table 2.

Table 14. Latent Variables Used in Study

Construct	Definition
Perceived Compatibility	The degree of consistency in maintaining existing values, needs and expectations of technology adopters
Awareness	The communication strategy that makes consumers aware about the benefits and utility of a technology and motivate them to purchase and use a new technology such as mobile payment system
Perceived Usefulness	The user's expectation that using a system will improve the performance of a job in the context of an organization
Trust	Emotional state that encourages one to trust another, which is based on the satisfactory behavior of the other.
Perceived Customer Value Addition	The overall benefits and experience perceived or received by consumers, based on the utility and usefulness of a product
Intention to Use	The degree to which a person has consciously formulated plans to perform or not perform some specified future behavior
Perceived Cost	Cost includes cost of payment processes, cost of investment to adopt a mobile wallet system, operating costs and other security related costs
Perceived Ease of Use	The level of complexity associated with using or operating a technology
Security	the belief that provisions for securing sensitive data and preventing data theft or leakage are in place.
Facilitating Condition	the extent to which an individual perceives that organizational and technical infrastructures required to use the intended system are available

We collected the data by conducting a survey of merchants who owns a brick & mortar business in the F&B sector in Greater Jakarta using an online platform and offline visit. The questionnaire contains 42 questions that are considered as an indicator variable. The questionnaire used a 5-point Likert scale, one stands for strongly disagree and five stands for strongly agree. SmartPLS is the software we used to run the PLS-SEM algorithm and analyzed the data for the pilot test and the final model test. Figure 1 shows us the conceptual model of this study and there were 13 hypotheses developed from the model. From the pilot test, there are a total of 12 indicators that were eliminated in order to fulfill the threshold for measurement model evaluation. The eliminated indicators were AWA4, PU1, PU3, PCVA1, PCVA4, SEC5, ITU1, ITU2, FC1, FC2, PEOU3, and TRU4. The next section will explain the evaluation of the final model test using 30 indicators.

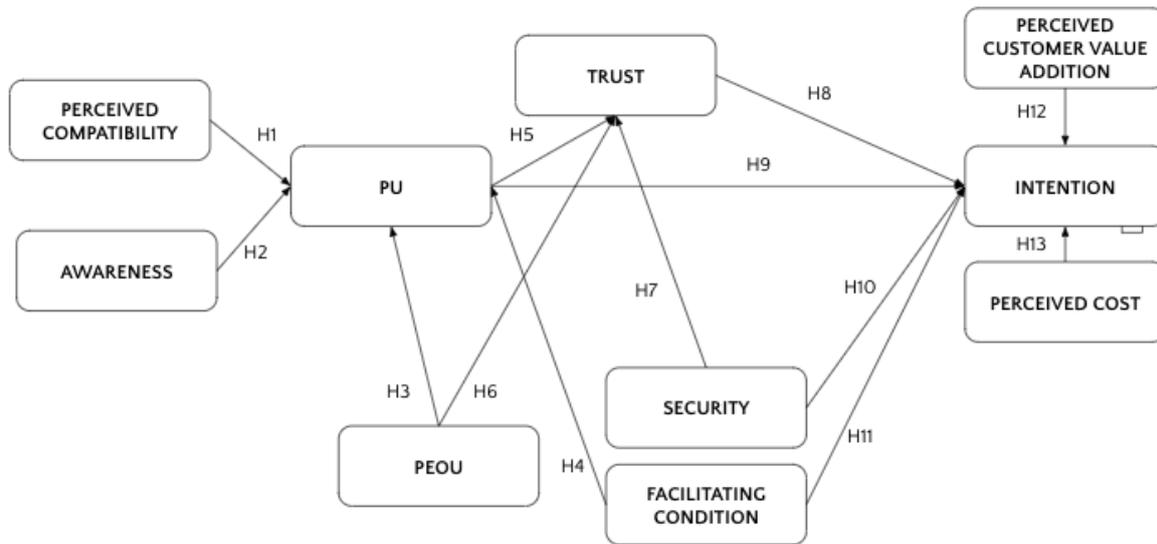

Figure 3. Proposed Conceptual Model

Results and Discussions

Demographic

There are a total of 149 respondents for the final model test. The descriptive analysis of respondent characteristics is shown in Table 3. The respondent profile was that 51% of respondents were female and 49% were male. The age group of 25 – 30 years old dominated the respondents with 27.5%. Most of the respondents is in the micro segmentation of MSMEs with 77.2% and most of the respondents already provided digital wallet payment in their store with 87.9%.

Table 15. Respondents Demographic

		Frequency	Percentage
Gender	Men	73	49.0%
	Women	76	51.0%
Age	18-24	40	26.8%
	25-30	41	27.5%
	31-35	35	23.5%
	36-40	17	11.4%
	41-45	11	7.4%
	46-50	2	1.3%
	51-55	3	2.0%
	Turnover (Yearly)	<Rp300 Million	115
>Rp2.5 Billion		2	1.3%
Rp300 Million - Rp2.5		32	21.5%

	Billion		
Did you provide e-wallet payment method in the store?	Yes	131	87.9%
	No	18	12.1%

Measurement Model Evaluation (Outer Model)

To conduct measurement model evaluation, we need to confirm the validity and reliability of the model by looking at the indicator reliability, internal consistency reliability, convergent validity, and discriminant validity (Hair et al., 2021).

Indicator reliability indicates how much of each indicator's variance is explained by its construct. Indicator loading above 0.708 are recommended, since they indicate that construct explains more than 50 percent of the indicator's variance which indicates indicator reliability (Hair et al., 2021). From the Table 4 we can see that all indicator has met the threshold.

Internal consistency reliability is the extent to which indicators measuring the same construct are associated with each other. Composite reliability (CR) is the indicator that can be used to indicates an internal consistency reliability (Hair et al., 2021). CR should be more significant than 0.7. Higher value indicate a higher level of reliability (Widodo et al., 2019). From Table 4 we can see that every variable met the threshold for the CR value.

Convergent validity is the extent to which the construct converges in order to explain the variance of its indicators. The metric used The metric used for evaluating a construct's convergent validity is the average variance extracted (AVE) for all indicators on each construct (Hair et al., 2021). The minimum acceptable value for AVE is higher than 0.5, a higher value of AVE indicates that the construct explain more indicator variance that make up the construct (Hair et al., 2021). From the Table 4 we can see that all the AVE value met the threshold.

Lastly, discriminant validity the extent to which a construct is empirically distinct from other constructs in the structural model. The metric used for evaluating discriminant validity is Heterotrait-monotrait ratio (HTMT) (Henseler et al., 2015). Discriminant validity problems can occur when HTMT values are high, therefore the proposed value by Henseler is that HTMT should by lower than 0.9. Table 5 shows the HTMT ratio after eliminating two indicators which was PCOS4 and PCVA5. in order to meet the threshold and all the previous measurement still met the threshold after this process.

Table 16 Measurement Model Evaluation

Variable	Indicator	Indicator Loading	AVE	Composite Reliability
Awareness	AWA1	0.885	0.778	0.913

	AWA2	0.865		
	AWA3	0.896		
Facilitating Condition	FC3	0.887	0.776	0.874
	FC4	0.874		
Intention to Use	ITU3	0.942	0.885	0.939
	ITU4	0.939		
Perceived Compatibility	PC1	0.879		
	PC2	0.881	0.781	0.915
	PC3	0.893		
Perceived Cost	PCOS1	0.819		
	PCOS2	0.883	0.706	0.878
	PCOS3	0.816

SEC	0.742	0.787	0.784	0.868	0.837	0.848	0.723	0.854	
TRU	0.756	0.796	0.833	0.805	0.829	0.882	0.792	0.812	0.882

Structural Model Evaluation (Outer Model) & Hypotheses Testing

The first step of structural model evaluation is checking for collinearity issues. The metric that is used for this is Variance Inflation Factor (VIF) value. The VIF value should not exceed 5 in order to avoid collinearity issues. Table 6 shows that all relationships of the endogenous variable have met the threshold.

The second step is to assess the significance and relevance of the structural model relationship. A path coefficient is significant at the 5% level if the value zero does not fall into the 95% confidence interval. In terms of relevance, path coefficients are usually between -1 and +1, with coefficients closer to -1 representing strong negative relationships and those closer to +1 indicating strong positive relationships. Based on the path coefficient, all the relationship of the endogenous variable are positive. Table 7 showed that PC significantly influence PU, PEOU significantly influence PU, PEOU significantly influence TRU, SEC significantly influence TRU, TRU significantly influence ITU, PU significantly influence ITU, and PCVA significantly influence ITU.

Then, we analyze the model explanatory power by examining the coefficient of determination R^2 . The value of R^2 range between 0 – 1, R^2 values of 0.25, 0.50, and 0.75 can be considered weak, moderate, and substantial, respectively, in many social science disciplines (Hair et al., 2011). From Table 7 we know that all the R^2 is considered in the moderate category. The variable Intention to Use variance can be explained by the existing variables within this study is 64.3%, The variable Perceived Usefulness can be explained by the existing variables within this study is 58.5%, and the variable Trust can be explained by the existing variables within this study is 67.3%. While the other remaining could be explained by other variables outside the study.

The last step is to use blindfolding procedure to determine the model predictive relevance. A positive value of Q^2 indicates that model have a good predictive relevance. From the Table 7 we know that Q^2 had a positive value which means that the model had a predictive relevance.

Table 18. VIF Value of The Model & Path Coefficient

Hipotesis	Path Coefficient	VIF
FC -> ITU	0.068	2.093
PCOS -> ITU	0.047	2.448
PCVA -> ITU	0.196	2.627
PU -> ITU	0.255	2.288

SEC -> ITU	0.081	3.202
TRU -> ITU	0.282	3.227
AWA -> PU	0.088	1.869
FC -> PU	0.155	2.05
PC -> PU	0.203	2.553
PEOU -> PU	0.418	2.775
PEOU -> TRU	0.327	2.316
PU -> TRU	0.056	2.589
SEC -> TRU	0.525	2.064

Table 19 Hypotheses Testing

	Hipotesis	T Statistics	P-Value	Status
H1	Perceived Compatibility -> Perceived Usefulness	2.495	0.02	Accepted
H2	Awareness -> Perceived Usefulness	1.306	0.238	Rejected
H3	Perceived Ease of Use -> Perceived Usefulness	3.952	0	Accepted
H4	Facilitating Condition -> Perceived Usefulness	1.708	0.078	Rejected
H5	Perceived Usefulness -> Trust	0.79	0.51	Rejected
H6	Perceived Ease of Use -> Trust	3.409	0.001	Accepted
H7	Security -> Trust	5.513	0	Accepted
H8	Trust -> Intention to Use	2.06	0.041	Accepted
H9	Perceived Usefulness -> Intention to Use	2.64	0.007	Accepted
H10	Security -> Intention to Use	0.602	0.557	Rejected
H11	Facilitating Condition -> Intention to Use	0.772	0.484	Rejected
H12	Perceived Customer Value Addition -> Intention to Use	2.069	0.037	Accepted
H13	Perceived Cost -> Intention to Use	0.618	0.603	Rejected

Table 20 R Square and Q Square Value

Variable	R Square	Q Square
Intention to Use	0.643	0.534
Perceived Usefulness	0.585	0.447
Trust	0.673	0.524

Conclusion

In conclusion, this study identifies that Perceived Usefulness, Perceived Customer Value Addition, and Trust can directly influence the intention to use digital wallet by MSMEs in F&B sector in the Greater Jakarta, Indonesia. While Perceived Compatibility, Perceived Ease of Use, and Security indirectly influence their

intention to use digital wallet. The Q Square value also indicates that the model had a predictive relevance.

Recommendations

This study is limited to identifying factors of a intention to use digital wallet by MSMEs in F&B sector in Greater Jakarta, Indonesia. Future study is needed to analyze and compare the condition between the rural and urban area in Indonesia. Also, to improve predictive relevance, future study could add more variables such as performance expectancy and social influence.

Abstract: The COVID-19 pandemic has transformed the way people interact with technology and conduct transactions. As cashless transactions become increasingly important, digital payment applications have experienced a significant surge in usage worldwide. The objective of this study is to identify the factors that influence user acceptance of fintech applications in Indonesia using UTAUT and TTF. The findings indicate that usability, ease of use, perceived self-control, and perceived trust have a positive and significant impact on users' intention to use fintech applications. However, perceived security does not appear to have a significant influence on users' intention to use fintech applications. Data were collected from active users of digital payment app. Findings indicate that app experiences generate usability, ease of use, perceived self-control, and perceived trust among active users of the app. This research provides a valuable contribution to understanding the factors that affect the acceptance and use of fintech applications in Indonesia. For fintech businesses, this research may assist fintech application developers in enhancing application features and functionality to better suit user needs and preferences.

Introduction

The use of e-money in Indonesia has experienced significant growth in recent years. Based on data from Bank Indonesia, e-money transactions in Indonesia increased from IDR 71.4 trillion in 2018 to IDR 121.3 trillion in 2020. The growth in e-money usage indicates that Indonesian society is becoming more interested in and using e-money services in their daily lives. The e-money market in Indonesia holds great potential for further development. This is due to Indonesia being the fourth most populous country in the world, with stable

economic growth and a population that is increasingly familiar with technology. The use of e-money is also supported by various innovations and government programs that encourage e-money adoption as a safer and more efficient payment method.

The measurement of e-money application adoption is crucial in understanding the factors that influence public acceptance of e-money applications. The UTAUT (Unified Theory of Acceptance and Use of Technology) model and the TTF (Task Technology Fit) model are two commonly used models for measuring technology acceptance and usage. These models have been tested in various contexts, including the use of e-money applications in different countries.

This research focuses on the e-money application within the AstraPay app using the UTAUT (Unified Theory of Acceptance and Use of Technology) and TTF (Task Technology Fit) methods to understand the factors influencing the intention and usage behavior of e-money users in the AstraPay app. By understanding these factors, this study can provide insights into how to enhance e-money usage in Indonesia and promote broader technology adoption.

Problem Formulation

- What is the influence of technological performance, ease of use, perceived usefulness, perceived ease of use, perceived risk, and social support on the intention to use e-money in Indonesia?
- To what extent is the usage of e-money in Indonesia influenced by the fit between the task of using e-money applications and the technology used (TTF)?
- How do social factors influence the usage of e-money in Indonesia, and do these factors reinforce or weaken the influence of technological factors (UTAUT) on the intention to use e-money?
- Are there differences in the factors influencing the intention and usage behavior of e-money among different user groups in Indonesia (e.g., based on age, gender, or technology experience)?

Method

Types of Data in the Research

The data used in this study is primary data, obtained through direct collection from respondents using questionnaires. Primary data is used to address the research variables being observed (Creswell, 2003). Data collection was conducted online from respondents. In this study, the respondents are active users of the AstraPay application, where active users are defined as the number of users who conduct transactions on a monthly basis, in accordance with the data collection process. The survey of these respondents was conducted to obtain data related to users' perceptions of continued usage of the application. The questionnaire was developed based on relevant studies (Huang et al., 2017; S. Kumar & Shah, 2021; Yang et al., 2020) that have been conducted in the UTAUT and TTF models.

Conceptual Model Design

The design of the conceptual model serves as a reference for the data collection and analysis process among the variables within the model. In this study, the conceptual model is built based on previous literature reviews. Several variables used in the model are taken from previous UTAUT and TTF studies. These variables include Technology Characteristic, Task Characteristic, Task Technology Fit, Performance Expectancy, Effort Expectancy, Social Influence, and Facilitating Condition. The analysis of variables in the developed model serves as a reference for the conceptual model development in this research.

J. K. Hsieh et al. (2014) conducted a study on smartphone usage and its impact on daily life. This study explored the relationship between smartphone usage, stress, and daily productivity. Additionally, the study found that excessive smartphone usage was negatively associated with daily productivity, as participants who used their smartphones more frequently and for longer durations reported lower levels of daily productivity.

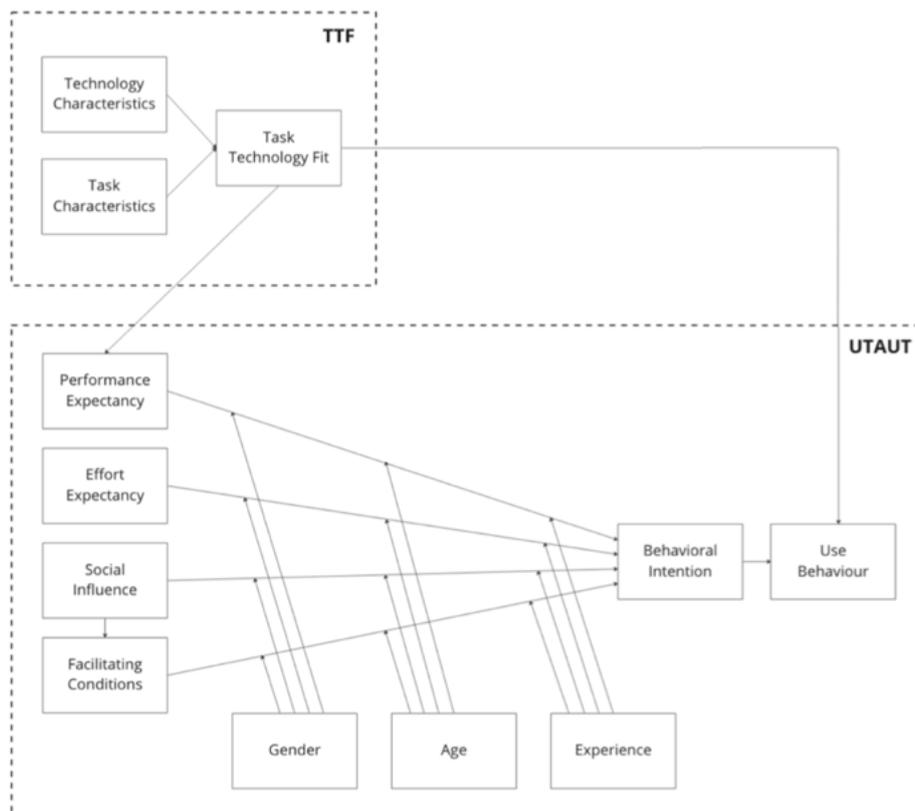

Figure 1. Research Model

- H1. Technology characteristics have a positive influence on Task Technology Fit.
- H2. Task characteristics have a positive influence on Task Technology Fit.

Task technology fit is a rational perspective on what a new technology can do to optimize a task. It is influenced by the nature of the task and the practicality of the technology to accomplish that task.

Therefore, TTF influences the user's attitude towards e-money and its adoption. Hence,

- H3a. Task Technology Fit has a positive influence on user adoption of e-money.

UTAUT states that the user's attitude towards technology translates into performance expectations (Venkatesh et al., 2003). In other words, users may adopt e-money because of the expected benefits such as the ability to control personal finances remotely and conduct instant and secure fund transfers. Therefore,

- H3b. Task Technology Fit has a positive influence on e-money's performance expectations.
- H4a. Performance expectations have a positive influence on the behavioral intention to adopt e-money.
- H4b. Performance expectations have a positive influence on the user's initial trust in e-money.

Effort expectancy is defined as the perceived ease associated with system use (Venkatesh et al., 2003). This construct reflects the user's perceived ease of use (TAM) of an IS (Kuo & Yen, 2009; Luarn & Lin, 2005; Martins et al., 2014; Miltgen et al., 2013; Wang, Lin, & Luarn, 2006) and has a positive impact on behavioral intention. The user interface, content design, and functional capabilities (Kim et al., 2009; Venkatesh et al., 2003) of e-money can influence its adoption.

- H5. Effort expectancy has a positive influence on the behavioral intention to use e-money.

Social influence is a direct antecedent of behavioral intention. Venkatesh et al. (2003) defined social influence as the extent to which an individual perceives it important for others to believe that they are using the new technology or meeting others' expectations. This is the idea that individual behavior is influenced by how peers or family members perceive the use of mBanking. The individual may feel trendy and professional by using new technology services like e-money.

- H6. Social influence has a positive influence on the behavioral intention to use e-money.

Facilitating conditions are UTAUT constructs considered to have a direct influence on technology adoption. It is defined as the extent to which an individual believes that the organizational and technical infrastructure is in place to support system use (Venkatesh et al., 2003). Various e-money promotion methods and organizational support eliminate usage barriers and influence adoption.

- H7. Facilitating conditions positively influence e-money adoption.

As theorized by UTAUT, age and gender have a positive influence on behavioral intention due to their moderating effects on performance expectations, effort expectations, and social influence. Additionally, age also has a positive influence on adoption due to its moderating effect on facilitating conditions. The aim of this research is to determine whether the intention to adopt e-money leads to the decision of adoption.

- H8. Behavioral intention to use e-money has a positive influence on user adoption.

Object Research

Object of this research is an e-money application used for transactions, particularly in the Astra environment. AstraPay is among the top 10 e-money applications in Indonesia. AstraPay is a digital wallet application by Astra that has 5 main functions: Installment Payments, Digital Product Purchases, QRIS Feature, Paylater, and

Points Exchange. As of 2023, AstraPay has 8 million users across Indonesia. The AstraPay application was launched in 2019. The average number of active users of the AstraPay application is 657,350 individuals. The number of active users represents the users who engage in transactions on a monthly basis.

Research Questionnaire

Questionnaire is divided into three main sections. The first section collects demographic information about the respondents to understand their profile. The second section consists of statements aimed at understanding their preferences and usage tendencies regarding the application's attractive features. The third section includes the survey questions about the application usage, with the 15 statements based on previous research. The questionnaire utilizes a Likert scale, where a value of 1 represents the lowest or strongly disagree, while a value of 5 represents the highest or strongly agree.

Research Respondents

The research respondents are individuals who have used or are currently using the AstraPay application in the past 6 months. A total of 61 responses were obtained, and 60 of them were considered valid. The demographic information collected in the questionnaire includes respondents' names, gender, age, education level, occupation, and a selection question to determine their willingness to participate in the survey. If respondents choose not to participate, they will not have access to the entire questionnaire and will be directed to the end of the study, ensuring that they do not provide random statements.

Results

From the validity test results on the 15 questionnaire statements, it was obtained that the Kaiser Meyer-Olkin (KMO) measure had a value of ≥ 0.05 and the Bartlett's test had a value of ≤ 0.05 . In other words, the questionnaire used is considered valid as a measurement instrument for each construct variable in the model.

Table 1. Validity Test

Variabel Laten	Jumlah Pertanyaan	Validitas		Keterangan
		Nilai Kaiser- Meyer-Olkin (KMO)	Nilai Sig. Bartlett's Test	
Technology Characteristic (TE)	2	0,500	0,001	Valid
Task Characteristic (TA)	2	0,500	0,001	Valid
Task Technology Fit (TT)	3	0,680	0,001	Valid
Performance Expectancy (P)	2	0,500	0,001	Valid
Effort Expectancy (E)	2	0,500	0,001	Valid
Social Influence (S)	2	0,500	0,001	Valid
Facilitating Condition (F)	2	0,500	0,001	Valid

From the reliability test results on the 15 questionnaire statements, it was obtained that the overall Cronbach's alpha coefficient value was ≥ 0.07 . In other words, the questionnaire used in the research is considered reliable as a measurement tool for each construct variable in the model.

Table 2. Reliability Test

Variabel Laten	Jumlah Pertanyaan	Nilai Cronbach's Alpha	Keterangan
Technology Characteristic (TE)	2	0,766	Reliabel
Task Characteristic (TA)	2	0,849	Reliabel
Task Technology Fit (TT)	3	0,809	Reliabel
Performance Expectancy (P)	2	0,868	Reliabel
Effort Expectancy (E)	2	0,731	Reliabel
Social Influence (S)	2	0,858	Reliabel
Facilitating Condition (F)	2	0,866	Reliabel

Based on the Fornell-Larcker criterion, the results indicate that each construct has higher values compared to other constructs. Therefore, it can be concluded that the Fornell-Larcker criterion for each endogenous and exogenous variable is met in this stage.

Table 3. Fornell-Larcker Test

	Technology Characteristic (TE)	Task Characteristic (TA)	Task Technology Fit (TT)	Performance Expectancy (P)	Effort Expectancy (E)	Social Influence (S)	Facilitating Condition (F)
Technology Characteristic (TE)	0,949						
Task Characteristic (TA)	0,774	0,932					
Task Technology Fit (TT)	0,688	0,489	0,821				
Performance Expectancy (P)	0,503	0,353	0,532	0,942			
Effort Expectancy (E)	0,716	0,575	0,694	0,565	0,916		
Social Influence (S)	0,551	0,596	0,638	0,658	0,654	0,886	
Facilitating Condition (F)	0,612	0,502	0,520	0,556	0,648	0,809	0,974

Based on the analysis, it is found that some construct variables have a moderate effect, while others have a high effect. This indicates that the relationships between the exogenous and endogenous variables have a significant impact based on the perceptions of the e-money application users.

Table 4. R-Square Test

	R ²	Keterangan
Technology Characteristic (TE)	0,352	Moderate
Task Characteristic (TA)	0,809	High
Task Technology Fit (TT)	0,809	High
Performance Expectancy (P)	0,660	Moderate
Effort Expectancy (E)	0,660	Moderate
Social Influence (S)	0,747	Moderate
Facilitating Condition (F)	0,747	Moderate

Discussion

The results of the study revealed several key insights regarding user acceptance. Firstly, the analysis of the UTAUT model showed that the characteristics of e-money technology had a positive influence on Task Technology Fit (TTF). This suggests that users perceive e-money as a practical and efficient tool for completing financial tasks, leading to a favorable attitude towards its adoption.

Additionally, the study found that task characteristics significantly impacted TTF. Users were more likely to accept and adopt e-money services when they perceived them as aligned with their task requirements, such as the ability to remotely manage personal finances and perform instant and secure fund transfers. This highlights the importance of tailoring e-money services to meet users' specific task needs, which can enhance user acceptance and adoption.

Moreover, the findings revealed a positive relationship between TTF and users' adoption intention towards e-money. When users perceived a good fit between the technology and their tasks, they were more likely to develop positive attitudes and intentions towards using e-money. This emphasizes the crucial role of TTF in shaping users' behavioral intentions and promoting the adoption of fintech mobile payment services.

The study also examined the impact of performance expectancy on adoption intention and initial trust towards e-money. The results indicated that users' expectations of the benefits and performance of e-money, such as user interface design, content, and functional capabilities, positively influenced their adoption intention. This highlights the importance of delivering a user-friendly and functional e-money application to meet users' performance expectations and foster their trust in the system.

Furthermore, the analysis revealed the influence of social influence on users' adoption intention. Users' perception of social norms and the opinions of peers and family members played a significant role in shaping their intentions to use e-money. This suggests that users may view the adoption of e-money as trendy and professional, influenced by the behavior and judgments of their social circle.

The facilitating conditions were found to positively influence the adoption of e-money. Users perceived the support and infrastructure provided by organizations and promotional efforts as instrumental in eliminating usage barriers and facilitating adoption. This underscores the importance of creating a conducive environment and providing necessary support to encourage the adoption of fintech mobile payment services.

Lastly, the study examined the moderating effects of age and gender on users' behavioral intentions. It found that both age and gender had positive moderating effects on different variables, such as performance expectancy, effort expectancy, and social influence. These findings suggest that age and gender play a role in shaping users' perceptions and behavioral intentions towards e-money, highlighting the need for targeted strategies and customized approaches to address the unique preferences and concerns of different user segments.

Overall, the findings of this study provide valuable insights into user acceptance of fintech mobile payment services in Indonesia. By employing the UTAUT and TTF models, the study contributes to the existing literature by identifying the key factors influencing user acceptance and proposing strategies for increasing usage. The findings suggest that optimizing technology characteristics, task alignment, performance expectations, social influence, facilitating conditions, and considering demographic factors can enhance user acceptance and adoption of fintech mobile payment services. These insights can inform the development of more effective strategies to drive the widespread adoption and usage of fintech mobile payment services in Indonesia.

Conclusion

This research aimed to understand the user acceptance of fintech mobile payment services in Indonesia using the Unified Theory of Acceptance and Use of Technology (UTAUT) and Task-Technology Fit (TTF) models. The findings provide valuable insights into the factors influencing user acceptance and suggest strategies to increase usage of these services.

The results showed that the questionnaire was a valid and reliable instrument for measuring the constructs in the conceptual model. The Kaiser Meyer-Olkin (KMO) and Bartlett's test indicated the validity of the questionnaire, while the Cronbach's alpha coefficient confirmed its reliability.

Furthermore, the analysis of the outer and inner models demonstrated the predictive nature of the variables and manifest indicators, indicating their ability to measure user perceptions accurately. This provides a clear understanding of the variables that need attention for improving the user experience (UX) of the observed e-money application.

Based on the Fornell-Larcker criteria, each construct variable showed higher values compared to other construct variables, indicating that the variables met the required standards. This confirms the suitability of the UTAUT

and TTF models for understanding user acceptance of fintech mobile payment services in Indonesia. The results also revealed that certain construct variables had a moderate effect, while others had a high effect. This emphasizes the significant impact of these variables on user perceptions and acceptance of e-money applications.

In conclusion, this study contributes to the understanding of user acceptance of fintech mobile payment services in Indonesia. By applying the UTAUT and TTF models, valuable insights into user perceptions and acceptance were gained, leading to the identification of strategies to increase usage. These findings provide a foundation for future research and the development of improved strategies to enhance the adoption and usage of fintech mobile payment services in Indonesia.

Eubica Vašková

Slovak University of Technology in Bratislava, Slovakia,  <https://orcid.org/0000-0002-1012-0722>

Abstract: Technical, economical, and social changes place great demands on the qualification of professional forces in all areas of the national economy. The decisive foundations for these qualifications are built in vocational education. Vocational education is an investment in the future and one of the decisive pillars of the prosperity of every state in the future horizon of competitiveness. From that follows that the topic of professional dual education is becoming more and more relevant in all countries of the world. Economic experts at the moment state, that overall unemployment among young people is higher compared to other years, and at the same time, there is a lack of qualified personnel for professional positions in various work areas. Many states see the solution to this problem in the implementation of dual education, so individual countries have begun to take the necessary measures. The advantages of adapting curricula to the demands of the economy and business are obvious and transparent, so the public and private sectors, as well as non-profit and non-governmental organizations support this agenda. The article analysis the elements of dual education in individual European countries with a special focus on dual education in Slovakia. A meaningful motivating factor for its qualitative rise can be the comparison of the vocational education system in individual European countries.

Ciddi (Eds.), *Proceedings of ICRES 2023 – International Conference on Research in Education and Science* (pp. 1766-1782), Cappadocia, Turkiye. ISTES Organization.

Introduction

„Those who see the existence of all mankind in their own person are miserable. Obviously, that man will disappear as an individual. The need for any person to be satisfied and happy to live is to work not for himself but for the future. An insightful man can only act this way. Full enjoyment and happiness in life, but the honor, presence, happiness of future generations can be found.“

Mustafa Kemal – Atatürk

Vocational education has a unique and irreplaceable place in the education system of each country. On the one hand, vocational education is based on the pillars of general basic education; on the other hand, its natural outcome is to reflect on the world of work and to cooperate consistently with it. The world of work needs feedback for training. The meaningful and desirable transition of vocational education graduates to the world of work and their effective application in professional life depends on the degree of sensitivity and readiness with which vocational education is able to respond to developments in the world of work. Dual education is one of the most effective ways of education in vocational education. Formally, this education directly enshrines the principle of theoretical education in schools in combination with the performance of practice directly on the premises of companies and industrial enterprises.

At present time, which is characterized by rapid changes in science, technology and society, the role of vocational training is increasingly needed. The quality of education is checked only in the future. Therefore, forecasts of development in the world of work as a whole and in individual professions and on the labour market for vocational education are very important. The content of the curriculum and teaching methods have to be adapted to what graduates will need in the transition from the world of education to the world of work and in their application. Education has to provide them not only with immediately applicable knowledge and skills, but also with such equipment that will not allow them to stagnate at the achieved stage of development, but will enable them to continue their education, develop their skills, know how to solve problems, etc.

The private sector and employers in Slovakia have already been stating for several years that vocational schools do not adequately prepare students in the required fields. They also point to the fact that practical teaching is not sufficient and in such conditions that would prepare them for post-study practice. Although the dual education is gradually being introduced in Slovakia at this time, it is not possible to speak about a new type of vocational education, because the dual education had a significantly excellent qualitative background in our education in the second half of the twentieth century.

Contact with the world of work, which should lead to the acquisition of adequate competences and skills, is a professional matter and cannot be provided to the necessary extent only by schools within their teaching. Therefore, in most countries, this role is performed by special institutions that deal professionally with the issue of vocational training. At present, these institutions mainly cover the issue of dual education. The scope of their tasks is not the same in all cases. However, they always find out, collect and process knowledge about what are the qualification requirements of individual professions and how these requirements develop. They use several hundred external collaborators to collect these data. Depending on their position among other actors involved in vocational training, these institutions then either pass on their findings to other bodies that propose the concept of vocational training and create vocational training programs, or implement these themselves or in cooperation with others.

In most cases, they also assess the effectiveness of vocational education, which is reflected in the employment opportunities of graduates and their success in employment. In this context, they monitor the situation on the

labor market and often process statistics on vocational training and its results, including data on the costs of such training. Some institutions also pay attention to the issues of the process of vocational education, elaborate its didactic and methodological concepts, and propose suitable teaching aids. According to national traditions and the organization of the education system, they also intervene in the field of teacher training, especially for masters of vocational training.

The meaningfulness of dual education

The meaningfulness of dual education lies primarily in its connection to the current needs of the labour market. The labour market itself and the dual system are very closely linked. In a society where there is cooperation between schools, companies and social partners, schools may teach theoretical and practical subjects directly according to the needs of individual companies. Dual education graduates have the opportunity to use the acquired competencies and skills in practice. The importance of dual education can be defined in terms of the elements involved as follows:

The importance of dual education for pupils

Dual education is beneficial for students because they get to know their future profession directly in the company or company active in the labour market. Students have at their disposal real machines and equipment, which they will later use in the performance of their profession. They may work with the latest modern technologies that companies use in production. Usually, these machines and equipment would not reach schools as teaching aids until later. In addition, they will become familiar with work practices, acquire work habits, and the transition between schooling and working life after school will be natural for them. An important factor is the motivation of students with financial evaluation. In the labour market, they will be interesting candidates for companies immediately after finishing school. In countries where the dual education system has been in operation for several years, the average monthly earnings for dual system graduates are higher than for graduates whose education is based only on traditional schooling.

The importance of dual education for employers

Labour market surveys in European Union countries (e.g. Germany, Austria, Denmark, Norway) show that dual education has a positive impact on the private sector, trading companies and their employees. From the company's point of view, this means a benefit for the whole economy and the financial stability of the company. The main benefit for companies is the fact that the offered opportunity of study places for students, the companies will gain in future quality workers who can bring to the company new knowledge they gained during their studies. Pupils can bring new ideas or stimulus to the company to improve, simplify and increase work efficiency.

In some countries, companies that cooperate with schools within the dual system may reduce their income tax base for each pupil.

The importance of dual education for secondary vocational schools

An important factor is the cooperation between the school and the employer. The aim of this cooperation is to adapt theoretical education and practical training to the requirements of practice, the labour market and the employer. Vocational study may thus be described as more effective. It is clear that the study therefore reflects the needs of society in real time and can respond flexibly to its needs.

The importance of dual education for society and the country

In the current setting of a society that has been claiming the adjective "knowledge society" since the beginning of the millennium, it is clear that economic growth directly affects the quality of education. This dependence has a two-way effect. Qualified staff, graduates who can easily find employment, the interconnection of the public and private sectors, lower unemployment, efficiency and work productivity due to skills acquired during their studies - these are all factors that directly underline the importance of dual education for the whole society and the state. Dual education is a system of vocational education and training for the pursuit of a profession, which acquires the knowledge, skills and competences necessary for the profession. It is characterized in particular by a close connection between general and vocational theoretical education in secondary vocational school with practical training at a specific employer.

The system of dual education is unique by the fact that it creates a partnership between the employer and the pupil, which is defined in the form of an apprenticeship contract, which regulates the rights and obligations of the parties in relation to the practical teaching of the pupil. Another important aspect of the dual education system is the relationship between the employer and the school concluded on a contractual basis in the form of a dual education contract, which regulates in particular the scope, conditions and coordination of vocational education with the apprenticeship contract, i.e. coordination of theoretical and practical teaching. The employer is responsible for all practical training, and also bears all costs.

Institutions responsible for the development of dual education in selected EU countries

This subsection describes the most important institutions covering dual education within vocational education and its activities in individual countries of the European Union and Europe

Austria

The IBW Institute for Economic Education Research (Institut für Bildungsforschung der Wirtschaft) deals

with the related fields of education and economics. All the institute's projects are usable in practice and relevant for the economy. It publishes periodicals available on the website: IBW-Mitteilungen (in German and English); IBW-research Brief (brief, four-page, thematically focused studies in German and English); Berufsinformation Newsletter (bimonthly internet magazine).

Figure 1 Institution of dual education in Austria

Belgium

The Walloon Office for Vocational Training and Employment (Le FORMY, Office wallon de la Formation professionnelle et de l'Emploi) has offices in 12 towns. It provides personalized services to individuals (advice in professional preparation, job search, support for geographic mobility, validation of competences, and specific help for young people), provides professional support to businesses (finding suitable qualifications, advice in education and hiring, assistance in human resources management), and creates partnerships with public and private institutions.

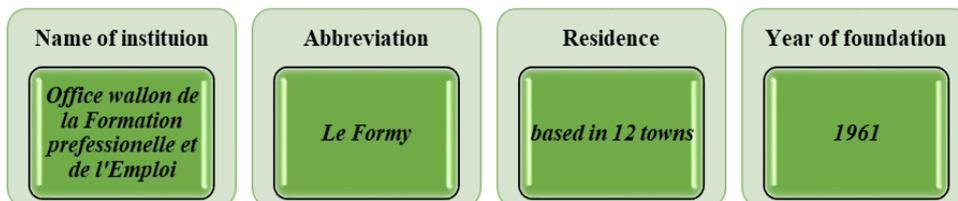

Figure 2 Institution of dual education in Belgium

Bulgaria

The Center for Human Resource Development (Център за развитие на човешките ресурси) is based in Sofia. It deals with education, vocational training and professional training. It has expert, coordination, information and consultation functions.

Figure 3 Institution of dual education in Bulgaria

Czech Republic

The National Institute of Vocational Education is located in Prague. The institute includes a department of market needs analysis, as well as a center for fictitious companies. Its dominant activities are ensuring the quality of professional education. The institute not only improves the quality of educational programs, but also tries to involve employers directly in their creation, which is very progressive from the point of view of the dual education system.

Figure 4 Institution of dual education in Czech Republic

Denmark

The Danish Office for International Education (Styrelsen for International Uddannelse) is based in Copenhagen. It falls under the Ministry of Science, Technology and Innovation and is responsible for the internationalization of education and training in Denmark.

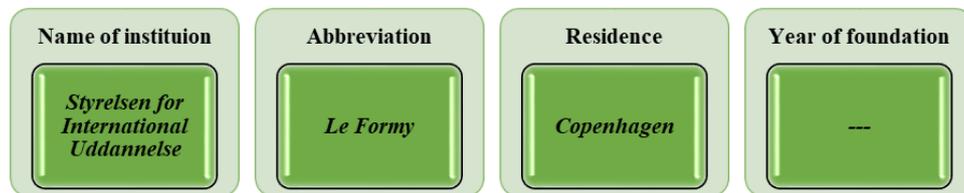

Figure 5 Institution of dual education in Denmark

Estonia

The Foundation for the Development of Lifelong Learning is based in Tallinn. The role of the Innova Foundation is to support lifelong learning initiatives and activities through Estonian and EU programs. The foundation offers experience, advice and support to organizations promoting vocational and lifelong learning.

Figure 6 Institution of dual education in Estonia

Finland

Government Board for Education (OPH, Opetushallitus/Utbildningsstyrelsen), OPH is responsible for designing the basic national curriculum for primary and secondary general education and the framework for vocational and competence-based qualifications; it evaluates educational systems (evaluates the results of education and improves the effectiveness of professional training); provides information services (coordinates information networks and services in the education sector), produces indicators and information for predicting education needs; manages financial system of the education sector and publishes guidance manuals on vocational training options. Provides support services for education: manages the register of student selection for secondary vocational education and training and for polytechnics; organizes language tests; organizes and finances further education of teachers; is responsible for the recognition of qualifications obtained abroad.

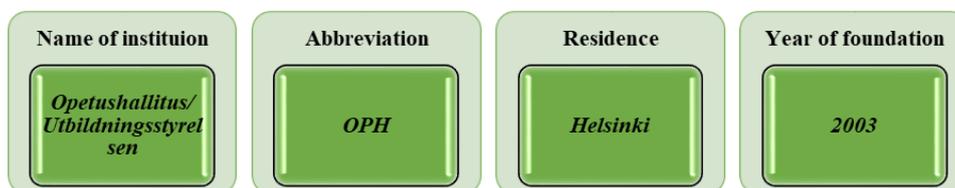

Figure 7 Institution of dual education in Finland

France

Center for the development of information on lifelong learning (Centre Inffo, Center pour le developpement de l'information sur la formation permanente) based in Paris. The centre's activities are divided into three sectors:

1. **informative:** report on the activities of European, national and regional institutions; participate in information campaigns for public authorities and social partners; design information support and create a database.
2. **expert:** create and expand analyses and syntheses about education (law, practice and environment); processes works and studies commissioned by experts from the public and private spheres; develops the exchange of experience in Europe and the world.
3. **educational:** helps the professionalization of actors from the industry - pedagogical education, open and distance education (2500 trainees annually). The center has been an expert in the field of professional training and employment for 40 years. It provides three tasks: processing studies and conducting research on qualifications and practice.

France's educational system has the so-called professional lyceums, where sandwich vocational training is implemented. It is a form of education in which theoretical training is connected with professional training in the company. The participants of such a study are thus preparing themselves for skilled worker occupation.

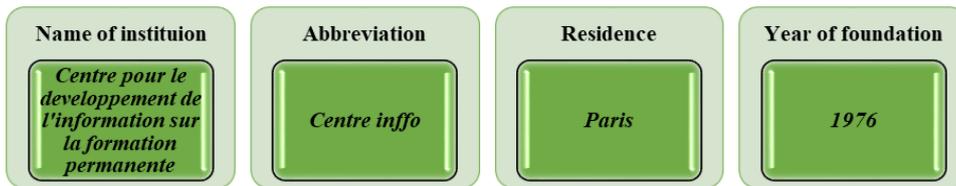

Figure 8 Institution of dual education in France

Hungary

The National Institute for Vocational and Adult Education NSZFI (Nemzeti Szakkepzési es Felnőttkepzési Intézet), is also known in the professional public under the abbreviation from the English translation of the name - Nivea. It deals with regional and national research on vocational and adult education and the creation of professional structures: a national register of qualifications and national module maps. The development of the content of vocational education and training of adults concerns: professional and examination requirements; central programs; textbooks; teaching aids; documents for education and professional training of socially and medically disadvantaged people; development support at the national, regional and local level; analyses of the effectiveness of professional training in educational institutions; creating and disseminating effective procedures and methods; vocational school development program; of the national development plan; comparison and harmonization of national and international qualification requirements, quality assurance.

Figure 9 Institution of dual education in Hungary

Italy

The Institute for the Development of Professional Training of Workers ISFOL deals with study, research, experiments, documentation, evaluation, consultations and technical assistance in the field of professional training, social policy and employment. It cooperates with the Ministry of Labour (Ministero del lavoro e delle Politiche sociale), with the Ministry of Education, Universities and Research (Ministero dell'istruzione, dell'universita e della ricerca), with the government office, with the regions and with social partners.

Figure 10 Institution of dual education in Italy

Ireland

Office for Vocational Training and Employment. Through a regional network of 66 offices and 22 vocational training centers, it manages vocational training and employment programs, provides services to jobseekers and employers, an advisory service for industries and supports municipal enterprises. FÁS operates throughout Ireland, divided into 8 regions according to the structure of the corporation.

Figure 11 Institution of dual education in Ireland

Netherlands

Expert Center for Education and Vocational Training (Expertisecentrum Beroepsonderwijs). ECBO was created by merging the CINOP and Max Goot centers. It started functioning in 2009. ECBO is supposed to create and disseminate scientific and practical information about vocational education and training. The tasks and ambitions of the center are independence, research intended for vocational education and training and VET research, compliance with the standards of scientific work, creation and transfer of knowledge.

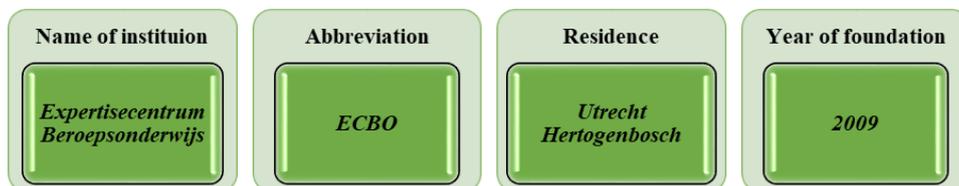

Figure 12 Institution of dual education in Netherlands

Lithuania

Center for Qualification and Development of Vocational Education and Training, KPMPC (Kvalifikacija ir profesinio mokymo plėtros centras). Efforts are being made to ensure that the Lithuanian system of qualifications meets the needs of the economy as well as national and international initiatives. Key activities: create professional standards and VET standards; conduct applied VET research, including forecasts of demand for professionals; monitor the supply of qualifications and the demand for them; administer the system of qualifications; evaluate formal VET programs; assess the readiness of formal OVP programs for implementation; externally evaluate the activity of educational facilities and implement formal OVP programs; increase the quality of self-evaluation of educational institutions, external evaluation and related methods; provide recommendations for improving teachers' qualifications; organize the creation of module programs and their updates; create a credit system in OVP; compile, analyse and disseminate information about OVP; monitor

the creation of textbooks and other teaching materials; monitor competitions in knowledge and skills; to organize the activities of central and sectoral professional commissions; cooperate with national and international actors in OVP in national and international projects; function as the National Reference Center for Quality Assurance in OVP, as the National Coordinating Element for the Implementation of the European Qualifications Framework and as the coordinator of the Refer Net network in Lithuania.

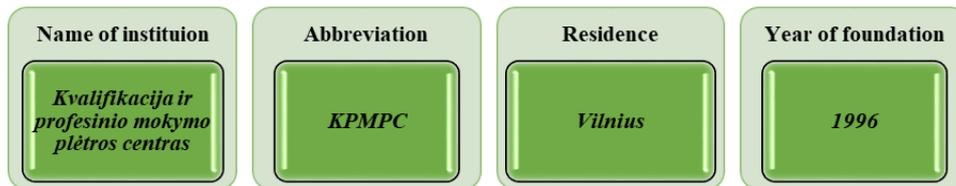

Figure 13 Institution of dual education in Lithuania

Luxembourg

The National Institute for Continuing Professional Education INFPC (Institut national pour le developpement de la formation professionnelle continue) is a state institution managed by the Ministry of Education and Professional Training (Ministère de l'Education nationale et de la Formation professionnelle - MENFP). The INFPC sets a strategy for promoting the concept of further professional training at conferences, seminars, in the press and by conducting projects on the subject of further professional training in conjunction with businesses, social partners and government authorities. He is responsible for processing applications translated by the company, for promoting further professional training and creating its concept.

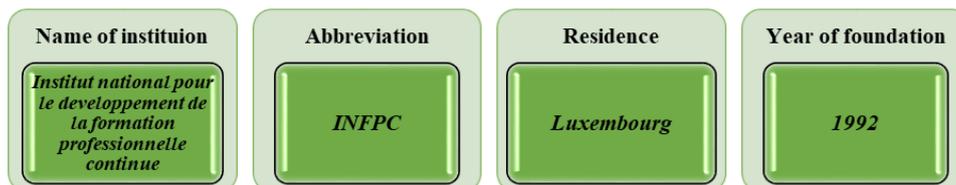

Figure 14 Institution of dual education in Luxembourg

Malta

MQC, Kunsill Malti għall-Khalifiki, Malta Qualifications Council (Malta Qualifications Council) was established in 2005 and its main role is to guide the development of the National Qualifications Framework (NQF) for lifelong learning and to oversee vocational training and certification leading to qualifications that they are not provided in compulsory education. It is responsible for defining the level of qualifications and competences, for setting standards. The MQC's main tasks are to: provide information about the qualifications that are available; to help people access learning in a lifelong context; to assist vocational training providers in the creation of qualifications, their evaluation and certification in accordance with the national qualification framework.

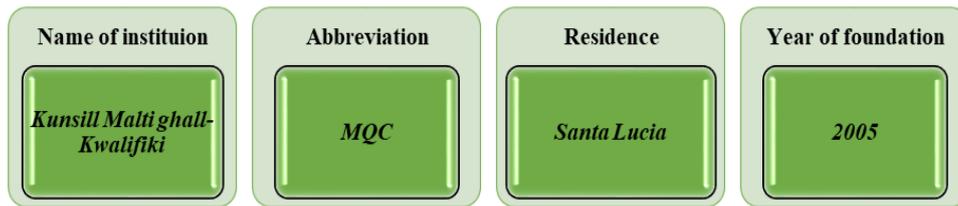

Figure 15 Institution of dual education in Malta

Poland

The Office for the Coordination of the Education of BKKK Workers (Biuro Koordynacji Kształcenia Kadr) was founded in 1990. After 27 years of operation, it has evolved from a small organization into a large institution that responds flexibly to the needs of the development of Poland, is open to cooperation with various partners at the local and international level. The programs carried out by the office dealt with the development of business and civil society.

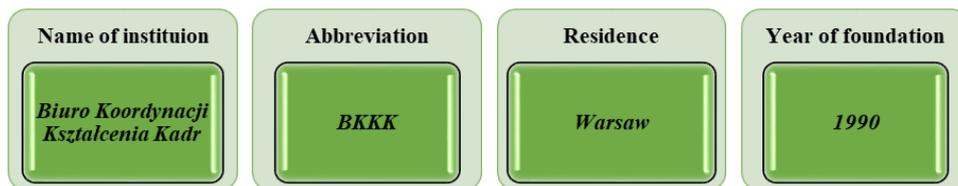

Figure 16 Institution of dual education in Poland

Slovenia

Center for Vocational Education CPI (Center RS for Vocational Education) deals with increasing flexibility on the labour market, increasing quality and strengthening social partnership. New goals are achieved through various vocational education and training activities: basic vocational qualifications with the possibility of further education for all, connection of education with the labour market, diversity of employment, lifelong learning and equal opportunities. CPI includes: National Reference Center, Slovenian Reference Center for Quality Assurance in Vocational Education and Training (SIQAVET).

Figure 17 Institution of dual education in Slovenia

United Kingdom – England

The Qualifications and curriculum Development Agency, QCDA, (Qualifications and curriculum

Development Agency) is based in Coventry. The Qualifications and Curriculum Authority (QCA) was created in 1997 by the merger of the National Council for Vocational Qualifications (NCVQ) and the School Assessment and Curriculum Authority (SCAA). Later, it was transformed into an agency and curriculum development was added to it.

Figure 18 Institution of dual education in United Kingdom – England

United Kingdom – Scotland

Scottish Qualifications Authority SQA (Scottish Qualifications Authority). The office's function was established by the Education Act of 1996. As an awarding body, the office cooperates with schools, vocational schools, universities, the world of work and the government and provides high-quality, flexible and relevant qualifications. The office has two tasks: accreditation (authorizes all professional qualifications in Scotland, except university ones) and assessment (creates qualifications, validates qualifications, checks whether qualifications are up-to-date).

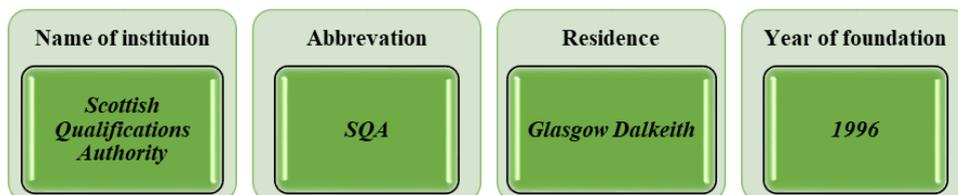

Figure 19 Institution of dual education in United Kingdom – Scotland

Sweden

The Education Authority (Skolverket) manages, supports, monitors and evaluates the work of municipalities and schools in order to improve quality and ensure equal access to education for all. In April 2004, the government submitted to the parliament (Riksdag) a draft law entitled Knowledge and quality - eleven steps for the improvement of gymnasiums (Kunskap och kvalitet – elva steg for vyvelenje av gymnasieskolan), which contained a strategy for improving the work of gymnasiums. Swedish grammar schools also provide initial vocational education and training. The school office was entrusted with the evaluation of the framework documents of the gymnasium so that more people could graduate and have access to higher education. The reformed gymnasium focuses on emphasizing knowledge in context, promotes in-depth and contextual study, and also removes negative stresses.

Dual education in Slovakia

In Slovakia, the State Institute of Vocational Education is responsible for the quality of dual education. (ŠIOV) The State Institute of Vocational Education is based in Bratislava and it was established from the Institute of Youth Training by transforming activities and competencies in the field of secondary vocational education. The Institute of Youth Training operated from 1 February 1991 to 31 November 1994. During this period, the subject of activity has changed. According to the charter of 29 January 1991, its main activities consisted in providing tasks related to the management of secondary vocational schools and practical training centres established by the Ministry of Education, Youth and Sports of the Slovak Republic. The Institute cooperated with individual economic departments and their educational institutes in the creation of concepts for the preparation of youth for the profession in the secondary vocational schools of that period, in the organizational provision of basic pedagogical documents for teaching and study departments, in further education of pedagogical staff, in coordinating cooperation with domestic and foreign entities. in order to equip schools with technology and ensure current tasks, especially in the field of retraining. By the addition to the charter of 24 May 1993, the scope of activities of the Institute of Youth Training was extended to include the methodological provision of tasks in the field of apprenticeship (vocational) education. This Institute performed tasks related to the pedagogical and organizational provision of education and training in secondary vocational schools, practical training centres and practical training workplaces.

The activities of Institute were focused on the elaboration of documents and opinions on draft conceptual materials, laws, standards, regulations and basic pedagogical documents for vocational education, the elaboration of methodological materials, the provision of advisory, consulting, methodological and information services in the field of practical teaching and activities related to with international activities, coordinated and managed by the then Ministry of Education of the Slovak Republic.

According to the Charter of 29 January 1991, as amended, the Ministry of Education of the Slovak Republic changed the name of the Institute for Youth Training to the State Institute of Vocational Education with effect from 1 December 1994, thus expanding and modifying the subject of its activities and competencies. The Slovak National Observatory (SNO) was established at the Institute by the European Training Foundation (ETF) in Turin, supported by the Ministry of Education of the Slovak Republic and the Ministry of Labour, Social Affairs and Family of the Slovak Republic. The aim and main task of the SNO was to collect and analyse information on vocational education in the Slovak Republic and to confront it with the situation in the European

Union. At present, the intention of ŠIOV is to concentrate initiatives and initiate proposals for the sphere of vocational education, which would help to manage the transformation of vocational education in accordance with the current effort for dual education.

National project Dual Education

In the years 2016 – 2021, the State Institute of Vocational Education is solving the National Project Dual Education and increasing the attractiveness and quality of vocational education and training. Basic characteristics of the project:

Operational Program: 312000 – Operational Program Human Resources

Implementer: State Institute of Vocational Education

Project title: Dual education and increasing the attractiveness and quality of Vocational Education Training (VET)

Call code: OPLZ-PO1/2016/NP/1.2.1-01

ITMS code: 312011C789

Total eligible costs of the project: 31 711 257 Eur

Place of implementation: the whole territory of the Slovak Republic

Duration of implementation: 01/2016 – 09/2021

Slovakia has long been an advanced country in the field of industry. We are among the leaders mainly in the automotive industry. However, as in other countries, as well as in Slovakia, the industry is advancing; more and more informatization, automation and robotics are coming. This also changes the job positions and qualifications of employees. While in the past, many welders were needed, today companies need mechanics-mechatronics capable of working with welding robots. Without quality knowledge and young people who find top education and employment at home, Slovakia will not be able to remain competitive. Already, they are losing young people who are going abroad to work. However, the goal is for young people to develop and live in Slovakia. At the same time, companies state that they feel the lack of a qualified workforce that can work with robots and automation technology. Thanks to dual education, students will be ready for practice immediately after graduating from secondary school. Currently, therefore, the issue of dual education is very important.

The main parties in a relationship in the dual education system are the pupil, the educational institution – secondary vocational school and the future employer. A pupil in the dual education system is a pupil of such secondary vocational school who has signed up and concluded a dual education contract with another party - the employer. As a rule, the employer operates in a sector that is the same as or related to the field of study taught at the school. The contract regulates the rights and obligations of the student in the field of safety and health at work in exactly the same way as has an employee of the company. The contract also deals with the form of remuneration for the student as his right to a motivational scholarship. The pupil may also receive a scholarship for good study results from the state budget. Pupil may also get the so-called corporate scholarship, which is tied

to the work performed for the employer in the framework of practical training. The standard is that the work itself and its quality, benefits, as well as attendance and results, as well as student behaviour, are evaluated. The contract must also consider the case where it is proven that the pupil intentionally caused damage to the property of the school or the employer. If the damage is not remedied, the school or company has the right to demand compensation. In this case, as in the case of a legal relationship with an employee, the compensation cannot be higher than four times the minimum wage. The contract is further defined in the chapter Legal background.

The employer is another entity. After fulfilling the conditions stipulated by law, the so-called a dual education contract with the relevant secondary vocational school. It is also an obligation to provide premises for the purpose of practical training. The employer provides protective work equipment, opinions from the field of health care, if such a law requires, as well as the cost of food during the internship in the amount specified by the Labor Code. The law does not define this obligation, but the employer may provide students with accommodation and pay travel costs from their permanent residence to the seat of the secondary vocational school and the place of practical training or accommodation in the school dormitory. The last of the three partners is an equally important educational institution – a secondary vocational school. In this relationship, secondary school becomes an important part of the whole system, because it connects the student and the employer. From a legal point of view, the secondary vocational school ensures the fulfillment of the obligations arising from the dual education contract as well as the apprenticeship contract concluded by the employer with the pupil of school.

Dual education is characterized mainly by a direct connection between theoretical and practical education both in secondary vocational school and in a specific company - with the future employer of pupil. The uniqueness of the system is also that it creates a partnership between the employer and the pupil. The relationship must be defined in the form of so-called learning agreement. The contract regulates the rights and obligations of the contracting parties. The learning agreement also defines the practical teaching of the pupil in more detail. Equally important in the dual education system is the relationship between the employer and the school. The relationship describes the so-called dual education contract. The main points of the contract are the conditions, scope, as well as the coordination of professional practical training with the apprenticeship contract. The employer is responsible for practical training in its entirety. It also bears all implementation costs. These facts can be summarized as a whole, that, dual education is carried out based on two contracts.

Conclusion

By supporting dual education, employers in industry are responding to the unflattering situation on the labour market. Dual education is generally considered a promising model, shifting not only the quality of vocational education, but also the quality of professional performance of school graduates. In order to maintain and improve it, it is necessary to respect and strictly observe the following measures:

- early professional orientation already in primary schools – emphasis on vocational subjects already during studies at primary school so that the pupil has the opportunity to build a positive relationship to professional skills and has the desire to further develop them during secondary school in the dual education system;
- cooperation with pupils' parents – meaningful cooperation and communication between parents and teachers, mutual analysis of pupils' abilities and skills and recommendation of a suitable type of study;
- elimination of confusion in the transition system between school and place of vocational training - clearer communication in general and in regional understanding of the process of transition between study and working life, especially with emphasis on communication of job guarantees after successful completion of studies, which can be a fact parents and pupils decide in the choice of schools;
- transparent graduation of the possibility of entry and the level of requirements of vocational training according to performance while maintaining the professional principle;
- broadband occupation profiles – setting up such a system of study that will prepare graduates for the whole area or to groups of positions and professions, which is especially important in manufacturing companies, where qualified staff is also expected to be substitutable as well as a broader focus, e.g. competence to control a group of machines and technology, not just one specific;
- nationwide uniformly regulated permeability and possibilities of transfers within similar professions – flexible study options, mutual exchange stays within Slovakia as well as within European countries, and related interconnected study fields within regions, which allow students to transfer even before completion study at a specific school;
- crediting of achieved education – possibilities for professional and academic growth, possible crediting of additional education, practice, retraining courses, language stays at all levels of study;
- strict respect for and adoption of the European Qualifications Framework;
- systematic cooperation with the private sector – creation of an association and appointment of representatives of dual education schools, who will systematically negotiate with representatives of the private sector, monitor the requirements in the field of dual education;
- communication and marketing – an overall effort, first of all, to expand knowledge about the possibility of dual education throughout Slovakia, and in smaller towns, and secondly, to popularize dual education - by pointing out study outcomes for pupils, schools and employers.

While maintaining the quality of vocational education and increasing the quantity of entities involved in the dual education system, it is clear that the importance of introducing dual education will positively affect society as a whole.

Abstract: Sub-districts have a strategic role as a liaison institution between provincial and the ward level. However, the weak institutional capacity of the sub-districts has resulted in a span of control of the government administration and public services barrier. The study aimed to analyze the level of institutional capacity of a sub-district institutional and formulate some efforts to strengthen sub-districts. The research was designed a quantitative approach and survey method. Collecting data using questionnaires, interviews, and focus group discussions. Descriptive statistical techniques were used to analyze sub-district institutional capacity and its supporting dimensions. The results of the study show that the sub-district institutional capacity is in the moderate category (average score 73.38). The five aspects of institutional capacity are as follows, leadership is in the high category (score 80.37), while the four dimensions are in the medium category, namely authority (score 70.96), organizational structure (score 72.76), readiness management (score 63.45) and digital service (score 67.40). Strengthening sub-district institutional capacity through, delegation of authority from the governor to the administrative mayor and the mayor sub-district head, the application of agile organization by establishing functional official, analysis the need of human resource, and mapping ICT human resources to develop government digitalization.

Ciddi (Eds.), *Proceedings of ICRES 2023 – International Conference on Research in Education and Science* (pp. 1783-1799), Cappadocia, Turkiye. ISTES Organization.

Introduction

The sub-district is an important institution in the Indonesian government system (Khairi, 2018). The existence of the sub-district has been known since the era of the XII-XIII Kediri Kingdom named "wiyasa." in the Pasundan area was known "cutak" which is similar to the sub-district head (Camat). During the Dutch East Indies colonial period, the sub-district was called "onder district" to assist the district head. The number of sub-districts is 7266, coordinating 74,961 villages and 8506 sub-districts as well as 16,722 islands. Sub-district played a strategic role, namely as a liaison between the village government and the government "over the village", namely the district, province also central government (L. Kolopaking, 2010).

However, since the reform era, the role of the sub-district has weakened, as part of the district/city government bureaucracy, Head of Sub District called Camat assisted the regent/mayor in administering government and synchronizing sectoral development in the sub-district area (Wasistiono, 2021). Factually, the role of the sub-district is broader than just assisting the regent or mayor, but also carrying out government activities, public services, and maintaining security and public order 24 hours per day and 365 a year (M. L. Kolopaking & Dharmawan, H, 2010). Sub-districts play important role as representatives of the central government, specified represent the policy of the central government towards the population in its territory.

There is different Jakarta compared the other regions in Indonesia. Jakarta is the national capital that implements special autonomy. In Jakarta, regional autonomy is placed at the provincial level while in other areas it is placed at the district and city levels. The consequence is that if there is single autonomy at the provincial level, autonomous regions will no longer be formed in the Jakarta area, but administrative regions (Administrative City and Administrative District). that the sub-district becomes a work area (werk'ring), not a government area (amsk'ring) (Ramses Marpaung, 2019). The single autonomy option implies that there is a microcentralization phenomenon in which almost all important policies are centered at the Governor's City Hall and the DPRD, including the design of the APBD and regional regulations. Meanwhile, public services, although organized up to the Kelurahan level, authority remains in the provincial bureaucracy which controls the resources (Jaweng, 2012).

The special characteristics of Jakarta as the nation's capital affect the implementation of government administration. Jakarta Province is different when compared to other provinces. Regional autonomy of Jakarta is placed at the provincial level while in other region it is placed at the district and city levels. The consequence of implementing single autonomy at the provincial level is that there are no autonomous regions but administrative regions (Administrative City and Administrative District). So that the sub-district becomes a work area (werk'ring), not a government area (amsk'ring) (Ramses Marpaung, 2019). The single autonomy option implies that there is a microcentralization phenomenon in which almost all important policies are centered at the Governor's City Hall and the DPRD, including the design of the APBD and regional regulations. Meanwhile, public services, although organized up to the Kelurahan level, authority remains in the provincial bureaucracy

which is controls the resources (Jaweng, 2012).

Recently, many opinions emerged to eliminate sub-districts after government policy removed the national capital from Jakarta to East Kalimantan(Djohan, 2019). The main reason is the sub-district does not carry out public service functions, public services carried out by the kelurahan government that closer to the residents. The weak of the sub-district is due to the limited authority delegated by the regent and mayor. However, the empirical facts showed that sub-districts play a significant role in overcoming community problems and working out 24 hours per day and 365 a year. Sociological expectations of the sub-district head in the past, which were difficult to erase, until now, the community considers the sub-district as a place where the community proposed complaints about all the problems they faced.

This study analyzes the institutional capacity of the sub-district and formulate some efforts to strengthen the institutional of sub-districts. The Research considers that the sub-district plays a significant role as aliason between province and ward level and its role coordinating public services and organizing general administration to stabilize security and harmony among Jakarta's diverse citizens. The facts showed that the sub-district had taken root in the community to overcome various problems.

Literature Review

Concept of Decentralization and Asymetri Decentralization

The existence of sub-district institutions as part of regional government refers to the concept of decentralization. Smith (1985) said that decentralization relates to how power and authority are distributed through the country's geographical hierarchy, institutions and power-sharing processes. If previously power was concentrated in the central government, known as centralization, then through decentralization the power in the central government is distributed to the regions in the context of regional management (Smith, 1985).

By using Smith's framework, the district or city government can delegate its authority to the sub-district to carry out some of the government affairs under its authority, however the sub-district does not have the right to regulate or make policies like a district or city. Likewise, through administrative decentralization, administrative authority can be delegated to units in charge of smaller areas in order to bring services closer to the community. Meanwhile, according to Norton (1994) as quoted by Muluk (2009) local governments can decentralize within cities to government units in areas that are smaller in scope, so that responsibility and decision-making are expected to be closer to the community. Decentralization within cities is a form of community participation in local government practices (Muluk, 2009).

The basis of regulation of the government granting special autonomy to Jakarta Province is the 1945 Constitution, which stated that the state respects the specificity of local government. Regarding the specificity of Jakarta, Law Number 29 of 2007 explained that the specificity of Jakarta is a single autonomy at the provincial level. It is different, which placed regional autonomy on the Regency or City. However, regencies and cities in

Jakarta are not autonomous regions but work administrative areas. Consequently, mayors and regents are not political but bureaucratic structural positions. There is no election of the mayor/regent but filled by civil servants appointed by the governor. The authority of a city or district is different from an autonomous district/city. Besides that, there is no representative Council (DPRD).

Discussing Jakarta as a special region starts from the concept of asymmetrical autonomy. At the level of the concept of decentralization, the emergence of asymmetric decentralization is based on the consideration that a country should have an administrative framework that is able to manage all its local diversity, both reflected in variations in socio-cultural backgrounds, economic potential, administrative needs to those that are expressed in certain political demands. This diversity presents complex problems that are difficult to manage uniformly (one size fits all) (Maksum, 2018). Tarlton (1965) stated that the model asymmetrical system, each component units would have it a unique feature or set of feature which would separate in important ways its interest from those or any other state or the system considered as a whole. Thus, asymmetry refers to the components of the state "possessed of varying degrees of autonomy and power". "a unique feature or set of features" that differentiates the system as a whole. Asymmetrical autonomy occurs when the central government hands over authority with different degrees to certain regions, depending on the requests put forward by the regions. However, if the central government has the authority to withdraw regional government autonomy, then the country is a unitary state (Garry, 2007). The implementation of asymmetric decentralization in Indonesia faces problems such as constitutional problems, stakeholder commitment and policy inconsistencies (Haris, 2016).

Institutional Concept

Some experts distinguish between institutional and organizational concepts, for example Horton and Hunt expressly stated "...An institution is not a building; it is not a group of people; it is not an organization" (Horton & Hunt, 2007). North distinguishes between organizations and institutions, he argues that institutions are the rules of the game in a society or, more formally, are the humanly devised constraints that shape human interaction... they therefore are the framework within which human interaction takes place, they consist a formal written rules as well as unwritten codes of conduct that underlie and supplement formal rules, kemudian organisasi disebutkan sebagai provide a structure to human interaction. Organizations are groups of individuals bound by some common purpose to achieve objectives (North Douglass C, 1990). World Bank defines institution as "*rules- including behavioral norms-, enforcement mechanisms, and organizations,*" this means that in the institutional concept there are regulations, enforcement mechanisms, and also the organization itself. Thus, the organization is a structure whose membership interacts with each other to achieve a certain goal. In this case the Jakarta Provincial Government was formed based on a structure with the aim of realizing the vision, mission and goals that had been previously set. In this study we argue that the organization is part of the institution. Institutions can be successful if there are organizations that are able to adjust their structure and actions in dealing with the dynamics of environmental change.

As a consequence of the implementation of decentralization, government institutions or organizations were formed in the regions to carry out the duties, functions and authorities of the government. The role of government institutions or organizations in government processes (public services), development, and community empowerment. In the context of local government organizations, Mintzberg's opinion regarding the duties and functions of the organization is an important reference. According to him, the duties and functions of the organization can be divided into five elements, namely Strategic Apex, Middle Line, Operating Core, Technostructure, and Supporting Staff (Mintzberg, 1978).

The theoretical basis for Law No. 23 of 2014 concerning regional government related to regional government organizations is the organizational theory by Henry Mintzberg. This theory is a modification of the traditional pyramid-shaped organization consisting of top managers, staff, line and auxiliary elements. Mintzberg says there are five basic parts of an organization, including, 1) *Strategic apex*; 2) *Middle line*; 3) *Technostructure*; 4) *Support staff*; dan 5) *Operating core*. According to Mintzberg, the strategic apex is a position where people take responsibility for the entire organization, namely "the chief executive officer." the operating core is the front line to produce goods and services. They are echelon II, III, IV, and V officials with the support of functional personil. Referring to Mintzberg's opinion, sub-districts can see as implementing elements (operating core) that carry out certain services and also supporting elements (technostructure) that assist regional heads in regional coordination functions. The positions of these two sub-districts in their development were not explicitly elaborated in technical regulations, causing different interpretations of the sub-districts.

Sub-District Institution

District institutions have a very important role in the government system, as representatives of the central government implementing central government policies. The Camat is considered the "ruler of the area." (Nordholt, 1987). According to Law Number 23 of 2014, sub-districts carry out four government affairs, namely: 1) general government affairs; 2) governmental affairs from attributive authority; 3) government affairs from delegated authority; and 4) government affairs come from other government tasks. What distinguishes the workload among sub-district heads is government affairs from delegating authority and government affairs from other government duties, because it relates to the characteristics of different sub-districts. Details of government affairs by sub-district heads have been regulated in Government Regulation Number 17 of 2018 concerning Districts.

The district administration uses the principle of territoriality. Meaning, the Camat as the head of government is responsible for the work area covering the community with all its activities (Wasistiono, 2021). The role of the sub-district head is not only as the head of the sub-district office but also as a regional leader. It distinguishes the sub-district organization from other local government units. As the head of the work area, The sub-district head carry out general government duties including maintaining peace and order, enforcing laws and regulations, village or sub-district development, and carrying out other government tasks that have not been carried out by the government village or other government agencies. Therefore, the position of the sub-district head

coordinates the heads of other government units that are in the sub-district area or are under the coordination of the sub-district head (Hamudy, 2009).

Institutional Capacity

Reddy *at. al.* (2015) defines local government capacity as `the ability of local government to perform their functions in an effective and efficient way. Referring Reddy *at. al.*, in fact, the actual functions of local government vary all over the world, especially with regard to the variety of policy areas they are responsible for. Nonetheless, one can distinguish two abstract dimensions which capture the basics of local government capacity. That is, service delivery and promoting good governance. Variable to measure state capacity in local government (Reddy *et al.*, 2015), namely, 1. political capacity), ability to engage different groupings in governance processes and facilitate activities in government and render services in response to local needs); 2. Local government's ability to uphold authority and regulation of economic and political interactions which are effective. This capacity is mainly derived from their relationship with higher tiers of government); 3. Technical capacity, strategic direction and effective leadership to local organizations that can potentially facilitate socio - economic development); Administrative capacity): (reflected through administering local infrastructure effectively and proven track record in terms of provision of public goods and services locally).

Based on the study literature, the research analyzes sub-district institutions, especially the aspects of institutional capacity, including authority relations, organizational structure, management resource capacity, digitalization of government, and leadership.

Method

Research Design

This research is descriptive explanatory to describe the variables that have been determined previously. The main observation of this research is to analyze the institutional capacity of the sub-districts. The survey method used a descriptive analysis approach and a quantitative paradigm by the opinion of Miller, Black, and Champion, equipped with information based on qualitative data to support and sharpen the quantitative analysis. The research was conducted in the DKI Jakarta Province in November 2022. The choice of DKI Jakarta as the research location is based on (1) The specificity of Jakarta as the national capital implementing single autonomy at the provincial level raises questions about the institutional effectiveness of sub-districts in their position as city administrative apparatus and administrative districts. 2) The relocation of the national capital from Jakarta to East Kalimantan has implications for possible changes to the institutional structure of the provincial government, including changes to the sub-district institutional structure, and (3) The effectiveness of the implementation of sub-district functions has become an issue that is getting stronger and has implications for the discourse of abolishing sub-district institutions.

Population and Sample

The target population is all employees in 44 sub-districts holding echelon positions 379. Determination of the number of research samples using the Slovin formula.

$$n = \frac{N}{1 + Ne^2}$$

Note:

N = number of population

e = margin error 5.6%.

n = number of sample, determined by the slovin formula as follows,

$$n = \frac{379}{1 + 379(0.056)^2} = 173.1745 \approx 173$$

The number of samples is 173 district employees, the sampling technique is simple random sampling, where every element of the population is known and has the same probability of being selected.

Data Collection

Primary data collection using a questionnaire that has met the requirements of validity and reliability (Sugiyono, 2007). Testing the validity of the instrument is done by calculating the correlation between the score of each question item and the total score. Based on the results of the validity test, all question items have a value of r or the correlation coefficient of each question item is greater than the value $r_{\text{tabel}} (\alpha, n-2) = r_{\text{tabel}} (0.05, 35-2) = 0,334$. The results of the reliability test showed that all Cronbach Alpha values of the institutional capacity variables were greater than 0,9 (reliable), presented in Table 1.

Table 1. Results of instrument validity and reliability tests

Variable	Validity value	Reliability value	Result
Institutional capacity	0.334	0.960	Valid/Reliable

Processing and Analyzing Data

Processing and analysis of data using descriptive statistics with the program SPSS (*Statistical Product and Service Solution*) 16 version. Indicator measurement uses a parameter scale from 1 to 4, the maximum value is (100) if all parameters for each indicator are worth 4. Category grouping uses four levels, namely, values 0-25 in the "very low" category, 26-50 in the "low" category, and 51- 75 categories of "high" and 76-100 categories of "very high". The transformation to determine the smallest index value is given for the lowest total score (1) and 100 for the highest total score (4) for each indicator. This kind of transformation is used to calculate the value of the diversity that occurs in each research variable, especially those that are ordinal to interval or ratio so that it is feasible to be tested using parametric statistics (Sumardjo, 1999).

Results and Discussion

Characteristics of Respondents

The characteristics of the respondents describe the respondents who participated in the study, namely echelon III a, IIIb, IVa and IVb sub-district employees in the Jakarta Province who were taken randomly. Data on the characteristics of the respondents that have been obtained are then analyzed using descriptive statistics.

Table 1. Respondent Characteristics

Respondent Characteristic	Category	Number	Percent
Age	≤ 30 Tahun	1	0,58
	> 30 – 40 Tahun	28	16,18
	> 40 – 50 Tahun	54	31,21
	> 50 Tahun	90	52,02
Formal Education Level	Elementary School	0	0,00
	Secondary School	0	0,00
	High Schol Sederajat	0	0,00
	D-I	0	0,00
	D-II	0	0,00
	D-III	1	0,58
	D-IV/S1	66	38,15
	S2	98	56,65
Formal Education Level	S3	8	4,62
	Training for leadership Level IV	123	71,10
	Training for leadership Level III	43	24,86
	Training for leadership Level II	2	1,16
	Training for National Leadership	2	1,16
Work Experience	National Defense Institute Training	3	1,73
	≤ 15 Years	25	14,45
	> 15 – 30 Years	90	52,02
	> 30 – 40 Years	51	29,48
Position Level	> 40 Years	7	4,05
	Ecehelon III.a	27	15,61
	Echelon III.b	34	19,65
	Ecehelon IV.a	69	39,88
	Ecehelon IV.b	43	24,86

Respondent's age. The highest percentage of respondents aged > 50 years was 52.02% of the total respondents.

It can be said that more than half of PNS who occupy echeloning positions at the District Office of the Province of Jakarta are aged over 50 years, belonging to the productive age limit according to the Agency Center for Statistics between the ages of 15-64 years.

Formal education level. More than half of the respondents were at the Masters level, 38.15% were at the D-IV/S1 level and 4.62% were at the Doctoral level. It shows that 94.80% of the sub-district office employees are highly educated, from diploma-IV/S1, S2 to S3. A high level of civil servant education can support the effectiveness of the sub-district function. Highly educated employees have the ability to develop the mindset and ways of acting needed for the delivery of government services and development.

Non-formal education level. 71.10% of respondents have taken Leadership Training (PIM) IV and 24.86% PIM III Training. There were 2 respondents who had attended the PIM II Training and National Leadership Training, and 3 respondents who had attended the Lemhannas Training and Education. By looking at this data, it can be said that the majority of civil servants holding positions at the echeloning level have been equipped with knowledge, attitudes and leadership skills.

Work Experience. The percentage of length of service successively from highest to lowest is as follows: > 15 – 30 years (52.02%), > 30 – 40 years (29.48%), ≤ 15 years (14.45%), and > 40 years (4.05%). The respondent's relatively long working period can provide an understanding of the duties of work in each sub-district work unit.

Position Level. Most of the respondents in this study were in echelon IV.a positions, namely 39.88% of the total respondents, 24.86% of the other respondents had echelon IV.b positions, then respondents who had echelon III.a and III.b positions respectively also as much as 15.61% and 19.65%.

Institutional Capacity

Institutional capacity is in the high category (mean score 73.38) (Table 2). Institutional capacity is measured from 5 (five) dimensions, namely sub-district authority capacity (average score 70.96), sub-district organizational structure (average score 72.76), management resource readiness (average score 63.45), digital-based sub-district government services (average score 67.40) and leadership (mean score 80.37).

Table 2. Respondents' perceptions of institutional capacity

Variable	Category	n	%	Average Score	Total Category
Institutional Capacity (X ₁)	Very Low	1	0,58	73,38	Moderate
	Low	11	6,36		
	Moderate	93	53,76		
	High	68	39,31		
Total		173	100		

Note: 0 – < 25 = very low, 26 – < 50 = low, 51 – < 75 = Moderate, 76 – 100 = High

Respondents' perceptions of aspects of institutional capacity are presented in Table 3 below.

Table 3. Respondents' Perceptions Of Institutional Capacity Dimensions

Aspects	Category	n	%	Average Score	Total Category
Authority Capacity	Very Low	1	0,58	70,96	Moderate
	Low	16	9,25		
	Moderate	109	63,01		
	High	47	27,17		
Total		173	100		
Organizational Structure	Very Low	1	0,58	72,76	Moderate
	Low	11	0,36		
	Moderate	103	64,74		
	High	58	28,32		
Total		173	100		
Readiness Management	Very Low	5	2,89	63,45	Moderate
	Low	38	21,97		
	Moderate	89	51,45		
	High	41	23,70		
Total		173	100		
Government Digital Services	Very Low	0	0,00	67,40	Moderate
	Low	24	13,87		
	Moderate	97	56,07		
	High	52	30,06		
Total		173	100		
Leadership	Very Low	1	0,58	80,37	High
	Low	5	2,89		
	Moderate	76	43,93		
	High	91	52,60		
Total		173	100%		

Note: 0 – < 25 = very low, 26 – < 50 = low, 51– < 75 =Moderate, 76 – 100 = High

Critical findings from the sub-district institutional capacity study are as follows,

Limited Authority of The Sub District

The sub-district authority regulated in the Law on Regional Government but limited to coordinating government, public services, and development, including carrying out general government duties related to maintaining public order and fostering community organizations. It is difficult for the sub-district head to coordinate sector units due to limited authority. Handling public service problems take a long time. It will be forwarded by Camat to the Regional Work Unit for Development (UDKP). Furthermore, UDKP continues to the

provincial level. On the other hand, because they carry out service and development functions, sector units form offices in sub-districts by ignoring the existence of sub-districts. In addition to the limited authority, the authority delegated by the regent to 44 sub-districts in Jakarta is uniform, even though it is contradictory if you look at the differences in geographical conditions and the level of progress of the regions. For example, the Thousand Islands district has archipelagic characteristics with a community structure of fishermen, laborers, and traders requiring different handling from the administrative city on the mainland of Jakarta.

Problem Policy Inconconsistency of Organizational Structure

The arrangement of the sub-district structure regarding the accountability of the sub-district head is inconsistent. Article 25 of DKI Governor Regulation Number 152 of 2019 states that sub-districts are under and responsible to the administrative Mayor and Regent. While Article 21 paragraph (3) of Law Number 29 of 2007 states that sub-district heads and deputy sub-district heads are appointed and dismissed by the Governor on the recommendation of the mayor/regent. Contrary to paragraph (4) it states that the Camat is responsible to the mayor/regent through the city secretary/district secretary. This arrangement violates the basic principle of the organization that "those who are appointed are responsible to those who appoint them." The position of the Camat below the mayor and regent has the consequence of being very dependent on the regional head (administrative regent/mayor).

Inconsistency regulation can be seen from the arrangement of the sub-district head to organize general government affairs. Governor Regulation states that the sub-district head implementing general government affairs at the sub-district level. Meanwhile, the Regional Government Law states that general government affairs are under the president authority as the head of government that wil delegated from the President as the head of government to the Governor (as the representative of the central government) and also to the Regent or Mayor as the regional head. It is contradictory due to the position of the sub-district head as part of the district/city government, but implementing general government affairs was delegated by mayor/regent..

Limited Management Resources

The sub-district faces limited human resources both in number and qualification according to the functions required by the sub-district. For example, planning for a sub-district program requires supervisors with planner qualifications, because there is no available plan that has not been prepared based on analysis and projections of future developments. The limited number of apparatus and qualifications causes employees to work extra. In addition, the budget is an important issue related to the implementation of general government affairs delegated by the mayor/regent.

Lack of Digital Government Services

the survey results showed that 56.07% of digital institutionalization in sub-districts is inadequate to support the

main tasks and functions of serving the community. One of the causal factors is the lack of human resources with ICT qualifications. Adequate ICT infrastructure and internet access in all sub-districts and 267 sub-districts connected to the Office of Communication and Information.

Leadership

An interesting finding from this study is that leadership is classified as high (mean score 78.40). Camats have the ability to understand problems even though implementing policies and programs are not used to using new approaches and innovative ways, which means they are still working in business as usual. High leadership is measured by the speed with which the sub-district head responds to emergency situations (natural disasters, non-natural disasters, and social conflicts). The sub-district head and village head are the first to meet residents when an emergency occurs. Even so, overcoming disaster situations, they still rely on SMS and WhatsApp, so the speed of information dissemination is still limited.

Discussion

The institutional capacity of sub-districts in Jakarta has not optimally carried out their duties and roles. A critical issue in the aspect of authority is the limited authority of the sub-district. This finding is in line with Rowa's statement that public services have become ineffective and inefficient in sub-districts because decision-making is at the provincial level management with a tiered bureaucratic chain that begins from kelurahan to sub-district, city/district and goes to the province level. It made public service problems slow to handle (Rowa, 2018). The sub-district as part of the local government has limited authority, while the sectoral unit has more of a role in carrying out service and development functions in the sub-district (Djohan, 2019). The formation of provincial sector units in the sub-districts caused the local government bureaucracy to become fat. Currently, in Jakarta Province, there are 518 implementing units of the service, 62 units of agency, and 132 sub-units. The lack of delegation of authority has created a contradiction. On the one side, the camat is expected to be a party that is needed both by the top level of government and the community. Regents and mayors often communicated and clarified technical development issues, even though these issues are the sector unit's business.

Government Regulation (Peraturan Pemerintah) No 18 of 2016 concerning local government has multiple interpretations. The local government organization structure (regional secretariat, DPRD secretariat, inspectorate, Dinas, Badan, and sub-districts) is based on Mintzberg's conception of the organizational structure covering strategic apex, middle line, operating core, technostructure, and supporting staff (Mintzberg, 1978). The regional head is the strategic apex, the secretary is the middle line, Dinas is the operating core or executor of government authority, Badan and inspectorate agency as technostructures, regional secretariat, and DPRD secretariat are supporting staff.

However, the sub-district is not clear whether as operating core, supporting staff, or technostructure. Government regulation mentioned sub-district only as a part of the structure of the district/city to carry out

coordination functions, implementing public services in terms of simple and high intensity.

The issue of human resources needs attention when it is related to the future function of Jakarta as a business center. As a business city, Jakarta needs fast and efficient public services. Therefore, human resources with competence and specialization are needed to support government performance. Local Governments require paradigm shifts from conventional organizations (pyramid form) to agile organizations supported by human resource capacity. According to Aghina et al., it is necessary to change the perspective of organizations as "machines" to become "organisms" (Aghina et al., 2017). Referring to the concept of an agile organization, it is necessary to adjust the organizational structure with the function of the City of Jakarta as a business center filled with functional officials. At the sub-district level, a function-based organizational structure is filled in by functional officials as needed. The placement of functional officials is flexible, meaning that they can be transferred or rotated so that the organization becomes flexible as required by an agile organization (Wasistiono, 2021).

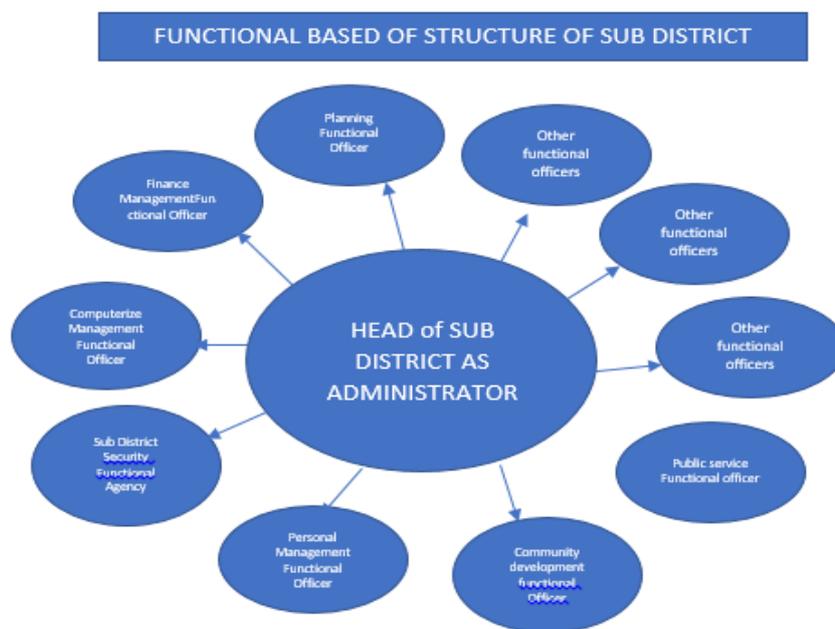

Figure 1. Functional Based of Structure of Sub-District (Wasistiono, 2021)

In line with changes in the organizational structure, administration and licensing services need to be provided digitally. The Provincial Government of Jakarta needs to improve sub-district institutions supported by information technology. This is a must for government organizations as a reflection of a smart city in the era of the industrial revolution 4.0 (Schwab, 2016). The lack of ICT human resource capacity in the aspects of Good Skills and Expertise requires handling by the Jakarta government, including a survey to determine the capacity of personnel with good skills and experts in ICT as well as their needs. The management of ICT human resources is adapted to the needs of each sub-district starting from HR planning, placement and career development of ASNs who have ICT competence. Training according to the needs of sub-district government

digitization is on the agenda of sub-district programs and activities.

In the aspect of leadership, the Camat as a regional leader carries out two forms of leadership, namely organizational leadership and social leadership, known as the "two-legged leadership" type. Organizational leadership is related to the activities of leading the sub-district office. Meanwhile, social leadership is related to the role of the Camat in leading the region and the community. (Wasistiono, 2020). In the digital era, sub-district heads must be able to respond quickly to complaints and aspirations of the people. It is time for sub-district heads to have social media, either WhatsApp, Twitter, Instagram, Facebook and others, which can connect directly with the community. The intensity of meetings between the sub-district head and the community through social media will be higher, responsive and open.

Conclusion

Institutional capacity is in the "moderate" category, except for the leadership aspect which is classified as high, aspects of the suitability of authority, organizational structure, resource management, and government digitalization are in the moderate category. Critical issues in every aspect

1. The authority of the sub-district is a coordination role, meanwhile, implementation of service and development is coordinated by sectoral agencies/Dinas, causing a delay in handling the problem. The delegation of authority of sub-districts is uniform, therefore it is not taken into account regional conditions and community characteristics.
2. Regulatory arrangements are inconsistent whereby the Governor appoints the sub-district head but the sub-district head is under and taking responsible to the administrative mayor/regent. In addition, the sub-district head carries out general government affairs, even though the position of the sub-district head is as part of the city and district administrative apparatus, not as a government representative.
3. Management of sub-district institutional resources is not optimal due to limited apparatus resources, budget, and supporting facilities.
4. The problem with sub-district digitalization institutionalization is the availability of ICT human resources. Limited ICT human resources with Good Skill and Expertise capacities.
5. The leadership capacity of the sub-district head is in the "high" category in handling sub-district problems.

Recommendations

Central Government

1. Rearrange the position of the sub-district to be under and responsible to the administrative mayor/regent, therefore the appointment of the sub-district head is not carried out by the governor and is responsible to the mayor/regent, bearing in mind that the prevailing principle is "the official is responsible to the

appointing official".

2. Review the function of administering general administration by the sub-district head because the sub-district head is not a representative of the government.

Governor of Jakarta Province

1. Governors need to delegate authority for regional government affairs to administrative mayors and administrative regents, then mayors/regents delegate authority to sub-district heads according to objective characteristics and conditions. In delegation, a mixed pattern can be used where there are generally accepted delegations of authority in 44 sub-districts and delegations of authority are adjusted to the objective conditions of the region.
2. Conducting an analysis of the needs of sub-district human resources, establishing functional positions according to sub-district needs and mapping ICT-based human resources in the context of institutionalizing government digitalization.
3. Regulating sub-district institutions in Jakarta by clarifying the differences in tasks, functions and roles of sub-districts between sub-districts in urban and mainland areas and sub-districts in the Archipelago region.

Mayor and Regent

1. Delegating authority to the sub-district head accompanied by an adequate budget, competent human resources, and logistics that enable the sub-district head and sub-district apparatus to carry out the authority delegated to the regent/mayor.
2. The Mayor/Regent administratively places the sub-district in a sectoral and regional position, mediating for development interests and messages from the top government (supra sub-district) and aspirations from the
3. lower level, namely the kelurahan and its residents.

Head of Sub-District

1. Optimizing the use of information and communication technology by using multi-media as a channel of communication and supporting the implementation of the sub-district head's tasks, especially related to disaster management which requires rapid and widespread dissemination of information.
2. Developing creations and innovations through sharing and learning (knowledge and experience sharing) with other sub-districts and other regional apparatuses in order to optimize sub-district performance.

Abstract: The Education drives the Future of Humanity. The Wishes and Visions of Humankind have to drive the Education. What is the final goal of Education? To bring up a healthy, emotionally mature, wise, knowledgeable nourisher of life, who understands and feels the reality, based on ethics, humanism and compassion, as essential characteristics of a human being, and who is ready to act according to these values. How to achieve that goal? Due to the inevitable development of technology it is necessary to develop a new paradigm of the future principles of educational systems. There are two possible approaches: The Naturo-Humanistic and the Technological, driven by Machine Intelligence, the greatest temporary achievement. In the Technological sense, things are happening at an unbelievable speed, and the human being as an individual, and their collective, has no time to adjust to those changes. There are no clear visions of human society development, despite the informational connectedness and globalisation. In the Naturo-Humanistic sense, it has to be very clear whom we are educating, what we like to achieve with the education, and what is the framework, i.e. the educational environment (social, economical etc.). Due to unconscious, unconscientious and harmful behaviour of people towards the Nature, the ecological consciousness of the interconnectedness of all and everything in the Earth's ecosystem is what has to be thought to children from earliest age. Education must strive towards Wisdom, as knowledge is the knowledge of information, and Wisdom is the know-how of applying knowledge to any problem solving. Knowledge wants to be "used", but only Wisdom is aware of possible future consequences of the application of knowledge.

Introduction

Ancient Greeks thought about the future as being behind them and they were looking forward at the past (Maul, 2008). This approach, though seemingly strange to us, is absolutely proper from the viewpoint of behaviour in any moment, as it is always based on past experience (knowledge), and is physically completely correct, as we always see things in the past, because the light has to come to us, or the sound, or the smell, or whatever other

sense of environment we use. Each and every element of the Universe has its own present, and all other individual elements' presents are for each of them in the past. Time is inextricably connected with the notion of existence and being itself (Heidegger,1967).

Illustration 1. A view into the future from any present

Consequently, the future can only be projected based on our previous knowledge and experience, and has to be envisioned, as for us to be able to steer our efforts in a specific, wished for, direction. As each moment of the future becomes a moment of the past, we can see and analyse the consequences of our previous steps. But without a vision, which we have to base on the analysis of our knowledge and our wishes, it is impossible to steer towards any future goal.

Education Drives the Future of Humanity

In the context of Human civilisation, it is the Education that drives the future of humanity. The Education, which says to the kids what they want, what they expect, what they may expect, what they have to wish, or what they may wish, how they may, or have to, approach their lives, how and where they can or may not gather knowledge, and what they may, must, or may never, know or even ask.

The Wishes and Visions of Humanity have to drive the Education

The Wishes and the Visions of Humanity are extremely important, as collective wishes and visions steer our civilisation from present to present into the future. Though individually, and at the level of social and political sub-systems, the wishes and visions are very often quite disparate, there is a global need for our future sustenance on our beautiful planet Earth, and the visions of achievement of a stable viable ecosystem can be readily derived from the basic common ethical principles, basic common human needs, and the already quite vast knowledge on cybernetically viable ecosystems. These globally ethical visions have to drive the Education. We have to have some vision of what we want in the future, and then we can organize Education towards that

envisioned goal.

But what would be those visions of the future of our civilisation? Do we have them? Would it be something like the future depicted in Illustration 2? Do we want to be puppets on some kind of strings, and use old technology to build some kind of primitive huts? Or is that visionless vision a desparate state of complete civilisation's ruin? Do we tend towards that?

Illustration 2. A clear Vision of Human Civilisation Wishes and Aspirations

It is really important to have a vision. If we look at all the older science fiction from the 20th century, it can easily be seen that it gives visions which drove our civilisation last 50 to 100 years. In that vast base of fears, wishes and visions, all the problems with computers, robots, machine intelligences, androids, virtual worlds, etc. already deeply explored and contemplated. Do androids really dream of electric sheep? (Dick, 1968) Is Data property to be disassembled and internally inspected at will, or is he an individual, a person with the right to dignity, life, integrity and self-determination? (Star, 1991) What does it mean "I Robot"? (Asimov, 1950) There are many many ethical problems contemplated, while giving warnings about consequences of misuse of technologies (both material and social) (Orwell, 1949) (Huxley, 1932).

But, in addition to the exploration of sociological and psychological themes, there are also societies developed and technologies envisioned which paint a much brighter nearer or further future of our civilisation. Probably the most influential science fiction "universe" that presently shapes the form of our technological visions is the vast Star Trek series. Its influence on modern technology seems to stem mainly by the fact that "technology geeks" were always fascinated by the ideas of the series writers. And many of them we realised, at least in a similar form / usage (smartphones as tricorders, medical scanners of all sorts, computers which can understand human language and assist in a vast area of fields, 3D printers/plotters and scanners as replicators, universal translators, at least for many human languages, physicists are contemplating impulse and warp drive etc.) (Roddenberry,1932). The present question is, do we, after several disruptive leaps in technology, and the still mostly incomprehensible difference of life in a matter based local, and life in an information based global

society, have a kind of idea what we actually want as a Civilization, a vision for the future to tend towards?

The Final Goal of Education

The final goal of Education is

A healthy, emotionally mature wise and knowledgeable nourisher of Life,

A human being who understand and feels the Reality,

An ethical, compassionate Humanist,

A human who acts according to ethics, knowledge and Wisdom.

This is the Final Goal of Education.

And it is worth preserving the beauty of our planet, and preserving us on this beautiful planet. Remember, we have no other planet to go to, if we mess this one up completely!

How to Achieve the Goal of Education?

Technological Education?

Should we go into Technological Education? We are already years and years (and years) in technological education. Actually the trend can be traced back to the emergence of Rationalism, and the consequential philosophies of Materialism, or Physicalism, in the modern age (although both philosophical directions stem from before CE, and started giving technological results, they were superseded by strong spiritual and religious convictions from early CE in Europe). The relatively recent step from religious/spiritual approach to a almost "mechanical" materialism was certainly aided by the emergence of Dialectic Idealism of Hegel (Hegel, 1807), and than its transformation into the Dialectic Materialism of Engels (Engels, 1925) and Marx.

Such materialistic philosophical stance certainly aided our quite deep understanding of matter and energy, and all technologies which came out of it. However, it does not aid in the understanding of information, communication and now, with the emergence of electronic brains (Machine Intelligence), pressing questions about the notions of intelligence, consciousness, ethics, morality etc. The necessary transformation towards a civilisation that understands that we humans are just a tiny, though potent and disruptive, part of the Earth's lively ecosystem, is not aided by the deeply ingrained (probably even archetypal) notion that humans are the rulers of all on Earth (cf. e.g. Genesis 1:26, Genesis 1:28, Psalm 8:6-8(The Holy Bible 2011)in western sub-civilisation), as the terms used in the original (e.g. stewardship) are differently interpreted: whether it's an exploitative control, responsible stewardship, or a combination of both.

And in that materialistic technological education we teach people technology and techniques, we stream them into specific, quite narrow, areas, we teach them matter and energy, we train them in manipulation, but we tend to forget about philosophy, forget about sociology, forget about ethics, forget about spirituality... Because if we

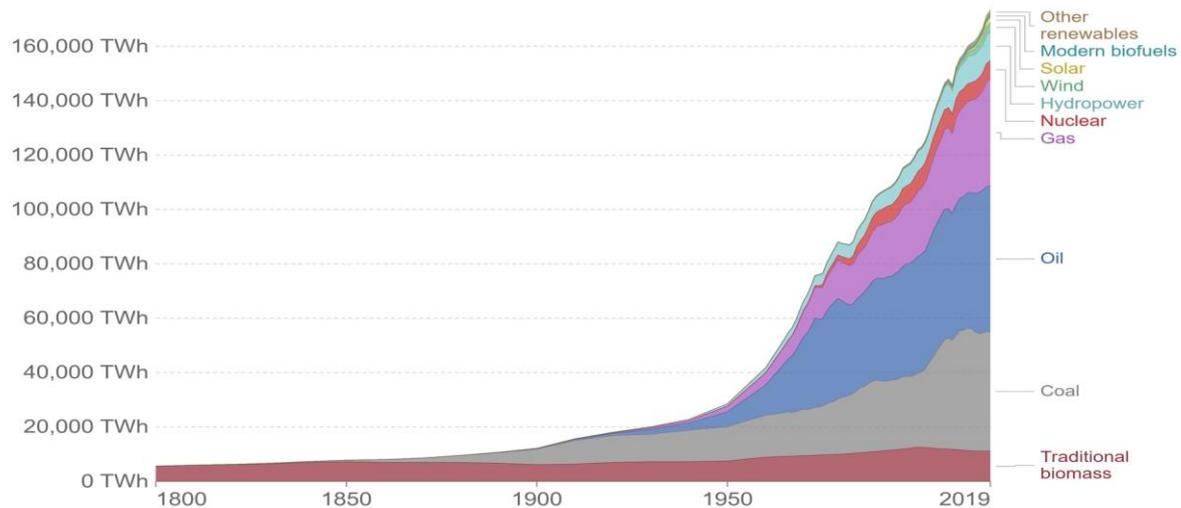

look at what actually this techno education did to us and our planetary home, we have to be very concerned about the path we chose, and change the path towards a better Vision sooner, rather than later or never.

Then is it perhaps the naturo-humanistic education, or some kind of combination of them two? Because if we look at what actually this techno education did to us and our planetary home, we have to be very concerned about the path we chose, and change the path towards a better Vision sooner, rather than later or never.

Figure 1 is an example how quickly our civilization consumes more and more and more all kinds of energy sources (Ritchie, 2021). And, quite interestingly, despite all political proclamations and buzzwordy promotion, it can be seen that the "renewables" and comparable sources (modern biofuels, solar, wind and water and nuclear energy) source a very small percentage of full energy consumption. The rest is a huge amount of consumption of natural resources, like traditional biomass, coal, oil and gas. Yet we also have to have it on our mind that we are actually presently causing the Sixth Mass Extinction Event (Ceballos, et al.,2017). The previous one was when the dinosaurs got extinct (except the birds).

Global primary energy consumption by source

Primary energy is calculated based on the 'substitution method' which takes account of the inefficiencies in fossil fuel production by converting non-fossil energy into the energy inputs required if they had the same conversion losses as fossil fuels.

Source: Vaclav Smil (2017) & BP Statistical Review of World Energy

OurWorldInData.org/energy • CC BY

Figure 1. Sources and energy consumption through last 200 years. From [12].

Not to mention the fact that we are depleting important natural resources (e.g. lithium, cobalt etc.) (and depleting them by using humans in inhuman conditions (Gross, 2023)) for the ability to store electricity for cars, laptops, phones, and all other kinds of consumer goods. And that the presently prevailing production philosophies are "life-cycle management" and "production cost is all", which directly harms the environment on all levels through, for example, non-repairable and non-exchangable embedding of such electricity storage elements.

What future do we actually stream towards, in our lazy attitude? From the above facts it is obvious that there is no clear vision, no sense of responsibility, no common civilisational goals, just overblown individualism on all levels, including the ethical concerns "free" corporatism. And the trends towards the development of a Technosociety, with all of its possible negative consequences.

But a Human is a Living Being. Is the vision of our humanity's development for humans to be converted into some memory, saved on a memory stick and uploaded into the cloud, to be there searching for eternal existence? Until the electricity, is of course, available, and the cloud provider exists and has us backed-up. Until the technology is still compatible.

It is important to mention here one very interesting and important work about planetary intelligence (Frank, et al.,2022). Every planet has to have its own intelligence which emerges self-organisingly and autopoietically (Gershenson,2015) from the lowest levels. Figure 2 shows the development phases of global planetary intelligence, with approximate ratios of cybernetic processes (Emergence, Networks, Semantic Information, Complex Adaptive System and Autopoiesis, as cited by the Authors). At the lowest level a planetary ecosphere is just a Geosphere (geo comes from the name of Earth, however it applies to any planet in the Universe). On the level of a Geosphere (popularly, partly wrongly, known as the Mineral Kingdom) the planet is primarily self-organising through emergence of networking (communication, influences). The next level is the Immature Biosphere, when biological beings start to exist, and it is driven by all mentioned cybernetic processes, albeit on a smallish scale and with weak intensity. Further development of planetary intelligence leads to the emergence of a Mature Biosphere. This is a highly intelligent environment, with all cybernetic processes proportionally intensive. We had the opportunity to live in such a Mature Biosphere just several hundreds years ago, actually until the emergence of the Industrial Revolution, which started around 1760, when biological power (animals, humans) was gradually substituted by mechanical power. This emergent property caused the evolution towards the phase of Immature Technosphere.

And that is the problem. Regarding our behaviour, we are presently in the early stage of the Immature Technosphere. This abrupt change of phase represents a heavy disturbance on the ecosystem, as it has to completely re-adapt on the new situation, and the coordination of all necessary elements is not yet achievable. Therefore the level of global planetary intelligence during the Immature Technosphere phase is significantly lower than during the Mature Biosphere phase.

We should put all our educational efforts into really getting further into a Mature Technosphere, because we will not survive well, if we survive, living in an Immature Technosphere, as this is arguably the most dangerous phase of planetary development. To which extend did the techno-evolution contribute to us? To the extend that we in peace look at wars, tolerate hunger knowing the huge gap in needs, destroy the planet for the comfort of consumerism and "well-being". And in the same time we were never so ill: just look at the quantity of drugs consumed per capita in the techno-world (OECD, 2021).

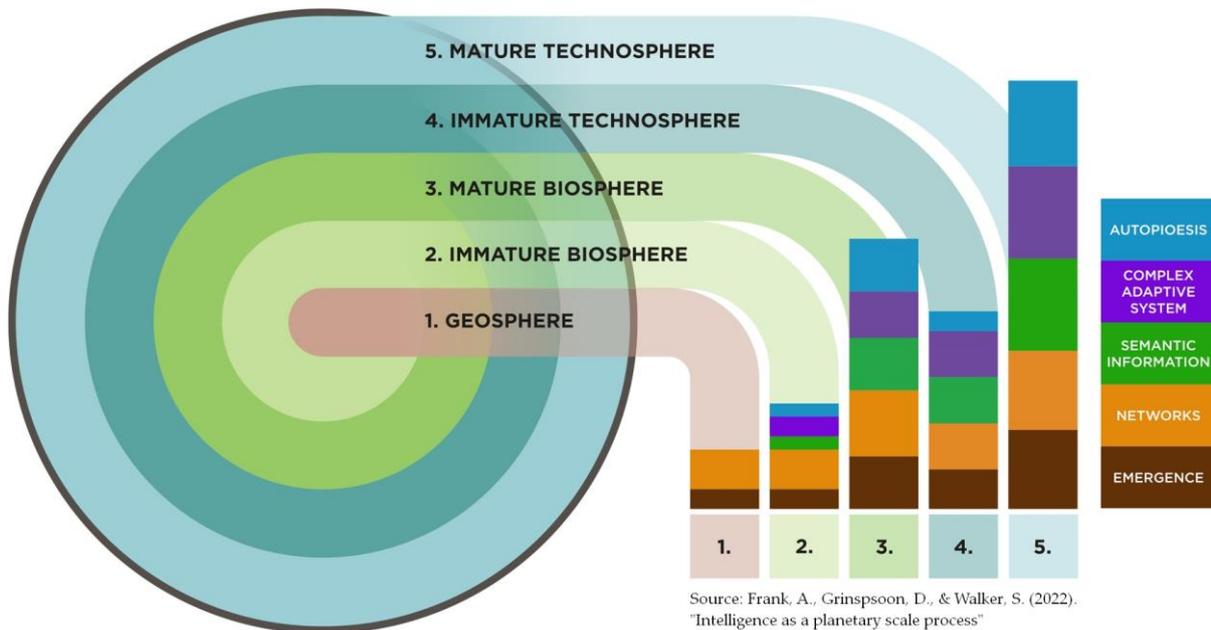

Figure 2. Global planetary intelligence development. From [15].

Naturo-Humanistic Education!

Therefore we have to have a kind of naturo-humanistic education. We need it! We necessitate a new Educational Paradigm, whose aim is to establish a balanced ecosystem. We can't escape machines. We can't escape electronic brains, the intelligent machines. We can't escape all the things we have. And we shouldn't! We have to embrace them, but embrace them in a positive way. So the aim, and vision, of such education is actually to make a balanced ecosystem of Nature, Humans and Machines.

Three are main questions to be answered by each educator:

- Whom do we educate?
- What do we want to achieve?
- What is the educational environment (social, economic...)?

These essential questions have to be answered for each educational effort, and the education, with a vision of the global aim, has to be adapted according to the circumstances.

What has to be taught?

- Ethics, primarily;
- Ecology, as a Science of the Whole, not the so-called "Ecology", the buzzword of modern days, and the "Ecologists", which see some little, particular problem, and then they insist on it - but by not perceiving the whole Earth's ecosystem (including the near-Earth space), they most often do not pass the Filter of Appropriateness (discussed further);

- Structure of Social Organizations, an extremely important educational element;
- Individual Rights and Obligations of each and everybody;
- Principles of Knowledge Gathering;
- Principles of Wisdom Development, because Education has to strive towards Wisdom.

The School for Tomorrow

There are many elements of schools which may need to be adapted to new education paradigms. However, here we will mention only two important aspects which may lead to higher motivation and better understanding and knowledge buildup. The first one is more oriented towards the environment and school space, whereas the other is more oriented towards temporal management of education. We will not delve here into the use of intelligent machines in the future of education, as this is not the main focus of this article.

According to Branimir Makanec, a school should actually be a library and laboratory type space, where free communication between all ages of interested pupils and scholars freely exchange their knowledge, insights, experiments, thoughts and problems. Teachers are here not to dictate ex cathedra, but to answer questions and to show ways towards knowledge and wisdom. Such a schooling space, a kind of "Multimedia Center", would encompass all types (as many as possible) of human activities, from manual to intellectual to creative, with appropriate tools and instruments for a certain level of understanding, and all types of documentation sources, physical and virtual. The openness of such a school to all interested, independent of age, would allow two-way transfer of knowledge and experience between human generations, and allow life long possibility of education of individuals on any level (Makanec,2023). A similar approach was used between 1972 and 1995 in Zagreb at the Multimedia Centre, founded by Božo Težak and Branimir Makanec, a schooling and experimenting place dedicated to, then, newest computer and education technologies, with extraordinary results (MMC, 2014).

A temporal aspect of schooling has remained unchanged for centuries, and that is the division into small, generally 45 minutes segments, where segments of different knowledge areas follow one after the other with a short intermission between them. The theory of the 45 minute segments is that, specifically younger, people have problems with keeping attention for much longer at once. However this approach, though possible at the very begin of education, when there is just two or three areas to cover, soon becomes very confusing and does not allow proper in-depth study of any subject matter during the short time interval assigned to it. With a growing number of fields of education in a school, the timing table of each particular education subject becomes messed up with completely unrelated fields. Though, in the education of adults we never mix different subject matter in small, randomly scattered chunks, but we educate on one and only one main subject matter in large temporal chunks of several hours, or even several days. Imagine that you have to take education in several unrelated fields, and they are all temporally mixed up. We never do that with adults. However, we still do it with kids and young adults, i.e. students. Therefore this schooling principle has to be changed, and larger temporal chunks have to be allocated to individual areas of knowledge. For example on Monday and Tuesday morning is Mathematics, on Tuesday afternoon is Nature, on Wednesday is Nature, on Friday morning Language and

afternoon Literature etc., arranged in such a way that all subject matter gets appropriate amount of time during the school-year, and taking into account the regularity of temporal repetition of the subject, to avoid forgetting. Such an approach would drastically ease the job of teachers, as they could have enough continuous time to present a meaningful whole, not repeating the same short theme several times in a row in different classes, and therefore have more time for individual work with the pupils. The disciples would gain much from this approach, as a longer span of involvement in the same study area would allow much better integration of knowledge, raise interest and motivation and allow for individual pacing through the material. We teach adults in such a way, why don't we do it with the children?

The Rainbow

Figure 3. The Rainbow Ecosystem Model

The Rainbow is a model of a holistic view based on the archetypes of colours, and gives a natural way of organizing the knowledge and the subsystems into having the whole of necessary components to be viable systems. As the Rainbow model is more thoroughly elaborated in (Šojat & Skala,2019) (Šojat & Skala,2020), here we will pay attention to just a few important points.

Firstly, Education itself is in the Orange sub-system, as its main purpose is the stimulation of knowledge gathering through ideas and creativity. However, ideas and creations produced by the Orange subsystem may well not pass the Yellow Appropriateness Filter.

Probably the most important element for a stable ecosystem is the Yellow the Appropriateness Filter, as it is necessary to always think about all possible, narrower or wider in scope, local or global consequences of any action we take and of any idea we have. This is actually the Wisdom Filter.

Another essential subsystem here to be mentioned is Indigo, Cooperation. It includes essentials like Ethics, but also Knowledge Gathering and Preservation, i.e. necessary Redundancy. Our present day techno-civilisation has completely forgotten how to preserve knowledge on a long run. We live in an extremely fast changing technological environment, where digital media still used just 10 years ago hardly find appropriate hardware to be read or written. How do we intend to preserve our knowledge gathered presently with such a tempo, and saved on digital media, in few hundred or few thousand years (as e.g. much of the knowledge of the civilisations of Sumer and Akkad was preserved for thousand of years on clay tablets)? Don't we realise that knowledge has to last thousands of years? Will any future archeologist be able to have any notion of our life and achievements? From historical facts, the best medium to preserve knowledge is carving in hard stone.

And finally to mention the Ultraviolet, Visions, a subsystem about which we wrote quite a lot in this work. And Violet, the Visions, necessitate Wisdom, Prudence, Conscience, Responsibility, and, naturally, Holism. As opposed to Ultraviolet Wisdom, Knowledge is Blue, and comes with Communication.

Knowledge vs. Wisdom

Knowledge is only Knowledge of Information, so it it likes to be "used". You have knowledge and you use it to gain more knowledge, or to do or achieve something.

But then, on the other hand, when talking about Wisdom, Wisdom is actually the knowledge on how to apply knowledge. The know-how of knowledge application. Wisdom is is aware of possible future consequences of application of knowledge, as it has an ingrained yellow filter of appropriateness.

Conclusion

In conclusion, we underscore the profound influence of our understanding of time, visions of the future, and the role of education in shaping the direction of civilisation development. Reflecting on the ancient Greek perspective of time, it posits that our actions are guided by the knowledge and experiences of the past. This positions our understanding of the past as an integral tool for shaping our future visions.

We stress the fundamental role of education as the shaper of these visions, urging a redirection of current educational systems that often emphasize techno-materialistic aspirations at the cost of holistic human development. There are compelling arguments for the urgency to shift from an immature technosphere, marked by rampant environmental degradation and societal problems, to a mature technosphere characterized by sustainability, balance, and an improved global planetary intelligence.

The proposed naturo-humanistic educational paradigm aims to establish equilibrium between nature, humans,

and machines, emphasizing the importance of ethics, holistic ecology, social structures, individual rights and obligations, and principles of knowledge gathering and wisdom development. This approach seeks to guide students to become wiser, more aware citizens who can navigate and shape the future with knowledge, wisdom, and a deep sense of ethical responsibility.

In furtherance of this, the Rainbow model provides a holistic view, sorting knowledge into different subsystems characterized by various colours. Each subsystem encapsulates different aspects of knowledge, and the interplay between them fosters a more comprehensive and wise application of knowledge.

Finally, we make an important distinction between knowledge and wisdom. It posits that while knowledge involves understanding and using information, wisdom is about applying knowledge in a manner that is conscious of potential future outcomes. This necessitates the use of an appropriateness filter, adding an ethical and prudential dimension to our knowledge application.

In essence, the future of our civilisation, marked by technological advancements and ethical considerations, rests on our ability to integrate our past knowledge with future visions through an educational system that values wisdom, cooperation, sustainability, and holistic human development. It's a call to action, for educators and policy makers, to reevaluate and reconstruct the present educational system for a more sustainable and balanced future.

Abstract: The sudden, unexpected breakthrough in the intelligence shown by machines, as a wished for, but very disruptive element, will shape the future of our civilisation and Humans as individuals and collectives. The extreme drive towards commercialisation of newest developments already led to an extremely wide spread of Machine Intelligence Assistants (and chatbots), with plans of many companies to include them into everything they produce. This puts Humans in a very precarious situation, specifically regarding ethics and morale, trustworthiness and confidence. Suddenly we found ourselves in a situation that Education has to be extended to cater for two types of intelligences: the Humans and the Machines. On the Machine side, it has been shown that it is very difficult to obtain a trustworthy and highly ethical non-biased intelligence. The present day approach of “training” the “models” must be overcome by the realisation that MI is based on collected Human knowledge, but initially “trained” without any regard to the order of learning, which directly influences the initial alignment of the emerging intelligence, the same way learning does in Humans. On the Human side, it is getting obvious that this disruptive development was generally completely unexpected, and no educational preparation was ever envisioned for this situation. However, between others, a good example of possible positive cooperation of Humans and Machines, which necessitates proper MI ethics, is Democratisation of Academic Publishing, where, based on blockchain trustworthiness, Open Access publishing is done in such a way that all stakeholders in the process get appropriate recognition and reward. The use of well educated Ethical Machine Intelligence in this process of management of an enormous amount of academic work and peer reviews will enable academic education and scientific development to be ethical, transparent, fair, trustworthy and accessible to all authors and readers throughout their life.

Introduction

What happened, and happens, in the last very few years is that suddenly all those little developments, which

actually came through ages of cumulating knowledge, started streaming together into something which was wished for, but is actually a very disruptive element in our civilization, and it will shape the civilization as we know it as individuals, us humans, and as a collective. This new development is the emergence of machine intelligence or, perhaps even better named - electronic brains (a very old fashioned name for computers, used approximately until mid 1970-ies). However, for modern use, in the sense of emerging machine intelligence, it has quite a lot of sense.

What actually happens is that now, in our present state as a civilisation, have a kind of extremely widespread need to commercialise anything freshly invented or achieved, without considering thorough investigation into the possible threats and consequences (both positive, and especially negative) on short and long term human development. So, by this "need" to commercialise as soon as possible, the spread of these intelligent machines, which can already now, in June 2023, do quite a lot of things, is enormous, and the speed by which it happens is measured actually in weeks and even in days.

As a consequence of both commercialisation, and the Internet philosophy of open accessibility, in this case the drive towards accessibility of open-source and diverse types of open or academic free licenses, there is already now quite a huge amount of different types of so-called "chatbots", i.e. GPTs (Generative Pre-trained Transformer, a recently evolved generic name for Transformer type Large Language Models, first introduced by (Vaswani, 2017)). This is actually a quite sudden (and definitively unexpected) breakthrough / development. According to a quite recent survey from 2016, published 2017, the aggregate predictions were that HLMI (High Level Machine Intelligence - MI as humans or better in all fields) will be achieved in 28 years (i.e. in 2044) according to Asian respondents, and in 74 years (i.e. in 2090) according to North American respondents (Grace, et al.,2017). Though part of these predictions are also predictions of Robots / Machine Intelligences being able to perform any Human job, for many particular tasks, e.g. "translating languages (by 2024), writing high-school

essays (by 2026), driving a truck (by 2027), working in retail (by 2031), writing a bestselling book (by 2049), and working as a surgeon (by 2053)", recently developed electronic brains (MI) are fully, or at least partly capable of human-quality performance (translation, text-to-speech-to-text, writing programmes, solving problems, passing the Multistate Bar Exam better than average students etc. (Ankit, 2023), or Robots performing extreme exercises, like the Boston Dynamics Atlas (Boston Dynamics Atlas,) and others).

Towards Ethical Intelligent Machines

And this sudden exponential development puts us in a kind of precarious situation, because we do want the development and use of Intelligent Machines to be to the benefit of Humanity, and to the benefit of a viable Ecosystem of Nature, Humans and Machine. And this involves primarily deeply embedded, strongly opinioned ethical standards and proper knowledge of application of ethical standards to all kinds of emergent situations. Those ethical postulates are the most important element of education of the electronic brains.

So, consequently, now we have actually to think about two different aspects of the Education in the future:

- (1) the Education of Human Beings (specifically regarding the ability to properly function in the coming future), but also
- (2) the Education of Electronic Brains or Intelligent Machines (which are entering deeper and deeper into our everyday life).

That was not something we ever envisaged so widely spread so soon, and actually it is a question did we ever, outside Science Fiction, envisage the need for Education of MI? The main problem is that if we want to have an electronic brain, we need it to be ethical to the highest standards we have, and that involves ethical education.

In the present approach the different "models" (LLMs) are "trained" (not Educated!) on huge, and completely diverse, sets of all kinds of data, without much regard of the complexity and content sequence, including (as per LLM) e.g. reddit, facebook, twitter, discord etc. This approach leads towards possible messy understanding and reaction of the LLM. For example, recently one of those (locally installed) models gave us as an answer to a fully unrelated question, by citing the the github address of some specific real person! So why did that machine have that knowledge?!

Education of Intelligent Machines

In human education we are aware of the fact that an extremely important element are the particular learning steps, from simple, basic education, when the most important is to understand the basic functioning of the world and the society, including founding ethical and moral basis for further life, up to high level knowledge and diverse social communication principles and texts (which are primarily thought to growing-up humans through human literature).

As in any neural network (a biological brain or a computer simulated learning network) the order of learning is very important, as the first neural connections will be the ones with deepest importance. Because the first impressions are the first impressions embedded. Other, later, impressions will differently "fall" on the already existing neural structure.

So, as with education of humans, which has to go through many educational steps, it is important to note that even machine intelligence education has to have a specific order, as the memory content and accessibility do depend on the on the order in which you actually teach it or train it (if we insist on this term which gives a wrong perspective on what has to be done). A (very) recent study shows that applying knowledge in an more ordered manner, i.e. first introducing a simpler approach towards the learning content, and afterwards deepening the understanding, greatly benefits the obtained intelligence of a GPT LLM (Mukherjee, et al., 2023), which was to be expected. Education develops knowledge (and strives towards Wisdom), whereas training is a repetitive process for gaining specific skills. We want ethical and knowledgeable electronic brains, and than we may train them further for specific skills, not vice versa.

The following steps are proposed for the selforganising Education of Ethical Intelligent Machines:

- Learning language through basic life situations and appropriate children's literature
- Reading basic philosophical texts on ethics, morale, truth, logic; from all known civilisation sources
- Comparative study of all religions
- Reading all philosophical texts available
- Reading all scientific work available
- Additional learning and balancing
- Knowledge update and further learning and development through selforganisation

Selforganisation and Intentionality

Language is a selforganising dynamic system (or, in cybernetical parlance, a machine). It is, as a supra-system of all dialects and idiolects an independent, but communicationally connected and stimulated dynamic system. The language is posed as a selfstanding collocutor between two persons making a conversation, in a selforganising relationship with both. The speaker's and listener's independent immediate selforganisational environment is the language. This means that the speaker has to adapt his expression intention to the constraints of the language, but can also twist, force, the language to adapt to his expression needs. After the selforganisation with the speaker, the language transfers this speaker thoughts adaptation to the listener. The listener than has to adapt his internal comprehension to the received linguistical message, and may also have to adapt his internal understanding and/or usage of the language (Šojat, 1978). Such small perturbances caused by these selforganisations are then spread through the language into other collocutors, where their aggressivity depends on the importance and impact of the change for other collocutors of that language (e.g. new words, pronunciation, grammatical and stylistic changes etc.). Due to this essential faculty of the language in enabling communication, and its constant change and adaptation, it will be necessary to include active, life-long

selforganisation of future Machine Intelligences with their environment. This means that they will have to have an active, multi-attention (multi-context), processing memory, and the possibility to permanently actively change their internal neural connectivity (parameters in AI parlance). This will, of course, add also the possibility of long term memory of experiences, a prerequisite for full intelligence, but will also, due to possible negative experiences, stress the need for proper deep Ethical principles gained by early education. And, probably, also for the need of MI psychiatrists.

Present day Large Language Models (to call them by that generic name) are based on prediction of the next word. Large number of attention linked neurons, having context, enable them, though, to steer the produced text into the direction of proper completion of thoughts. However, it may be argued that this is just rudimentary intentionality, as there is no preconception, goal to be attained when composing the text. Intentionality would be developed by composing the text from multiple standpoints, not only by prediction (as generally now), but by pathfinding between intended conversation or text points. Intentionality is a vital part of a viable intelligence, and could be even argued to be the essence of life (Šojat, 1989).

It has to be stressed that both of the above principles will (have to) be applied to future MIs, but their implementation must be well thought out on the level of Education on Ethics. In that sense, an interesting, and it seems viable, idea is the Constitutional AI (Bai, et al., 2022). The basic idea is explained by the authors thus: "In the first stage of the process, we first generate responses to harmfulness prompts using a helpful-only AI assistant. These initial responses will typically be quite harmful and toxic. We then ask the model to critique its response according to a principle in the constitution, and then revise the original response in light of the critique." The Constitution is a set of principles based on the UN Charter of Human Rights and other generic ethical statements.

The State of Affairs

As a Civilization we are obsessed with more and more of everything, and there is so much of everything that we are actually quite confused, as individuals and as a half-baked technological society. On the other hand we have nothing, and we live in extreme poverty, without even enough water and food, on our marvellous planet Earth. Unfortunately, the most intensive and prominent part of our civilization is the technological civilisation of the so-called developed countries, without regards to those of us humans living in meagre and even terrible conditions. And we caused the 6th Great Extinction after the dinosaurs disappeared. However, it is possible to suppose that this technological section of our civilisation will make efforts to enable reasonable living standards for all, and find solutions to stop the devastation of our only planet. Hopefully, the Intelligent Machines may help.

Individually we can't follow all what's happening around us. We are constantly bombarded by all kind of media, and the changes of the world in which we live are happening at an unprecedented pace. Not only could the

generation of parents of the children born through the early 2000-s (the so-called "digital natives") have predicted that classical approach to raising up the children is vastly not compatible with their Internet life, with all the consequences now seen, the present day parents can not predict the influence of the technological future on the behaviour and abilities of their children. However, through proper exploration huge amount of educational knowledge can be gained from the emergence of this, post 2000, generation, as the disruptive change of non-internet into internet-based civilisation at the end of 1990-ies was in its impact sociologically very similar to what can be expected as the impact of intelligent machines on the generation now being born.

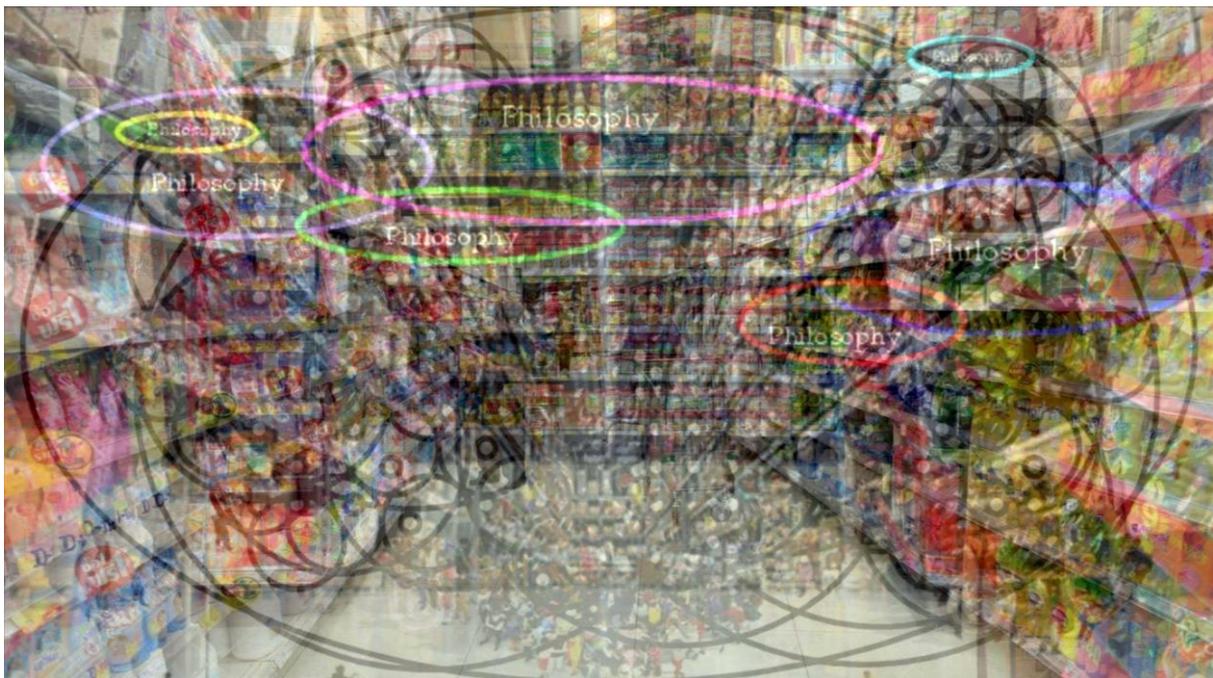

Illustration 1. Present state of affairs

A Matter of Trust

A huge problem which emerged with the extreme amount of information and disinformation, truths and lies, gibberish and wise-speak, all kinds of "data" and "facts" (and facts), irrelevance and relevance, by which individuals (and collectives) are constantly flooded, is that we lost trust in everything. It became really hard to trust something, without thorough investigation, even which may lead to falsehoods.

However, with the emergence of Predatory Publishing (Bartholomew, 2014), and a quite large quantity of scientific frauds (or "misconducts") (Wikipedia, 2023), it becomes harder and harder to trust even scientific work. Suddenly it became hard to trust in science, as it may be "science", it is hard to trust in realistic, truthful information or knowledge, as it may be misinformation or mis-knowledge, often even on purpose. This hard mix of truth and falsehood, even perpetuated by the mentioned predatory publishing practices (if the author has to pay for publication, why would the publisher want the reviewers, if any, to reject any text?), is a heavy burden on our development as individuals, as society and as an integral part of the Earth's ecosystem.

Necessary Democratisation of Research and Education

The Academia (from Greek Akadēmeia, the name of the public garden where Plato taught his school), the Scholarly work, the Education, is the basis of the development of our civilisation. All of our collective knowledge stems from, and is preserved by, a huge amount of trustworthy published material, and all of it is worth studying and consequently used in education as gained knowledge. Therefore it is essential to adapt the publishing process to the new, information and not any more matter based, era. The change from matter based economy to information based economy, mathematically quite different (matter is unique, information is copyable), is a huge challenge for the present still prevailing approach towards the notions of worth and value. And to be able to, as much as possible, properly steer our development, we need to open the opportunity for scholarly work and trustworthy publishing to be accessible to all of human population.

It is obvious that it is necessary to democratise the Research and Education through publishing, allowing free access to all, providing a well organised system of trust enhancing procedures, and fairly compensating the work of all stakeholders. Presently the publishing situation is, though partially depending on the field, "upside-down", as to be published in Open Access, the authors have to pay exorbitant fees. "There is a massive range of journal article processing charges (APCs), typically ranging from around \$1,000 to more than \$10,000. Just five years ago, an APC of approximately \$5,000 charged by Cell was considered outrageously high by some and raised questions about how these fees were justified." (Jingshan, 2022) For just putting the article on a web page. So authors have to pay, reviewers generally do not get anything (often even no recognition), and publishers have extremely high profit margins. And how then to trust the review process, and the consequent truthfulness of the published work?

DAP - Democratisation of Academic Publishing

At the Centre for Informatics and Computing of the Ruđer Bošković Institute we envisaged a system which integrates the well thought out Ethical Machine Intelligence, integrated with Blockchain technologies, to do something very important - to aid the democratisation of academic publishing (Skala, et al., 2023). The project's first phase was supported by the EU TruBlo project, and now the second phase is supported by the EU Trace4EU project. What we aim to do with this approach to the Democratisation of Academic Publishing is to solve some important problems and challenges in present day approach to publishing (DAP,2023)

An open and competitive review system is developed, where reviewers declare the fields and keywords they are interested in, and based on that, and the field and keywords of a newly uploaded author's work, the system distributes the work to a larger amount of reviewers. The reviewers are also systematically ranked, based on their response time and the quality of their reviews. The quality of reviews can be established based on the compatibility of those reviews with others and the original work, including the assistance of the Ethical

Intelligent Machine. Furthermore, the review process is open-ended, and registered readers can also upvote or downvote specific publications, as well as commenting on them. This enables quick and efficient way of pointing out already published work which has shown not to be trustworthy, although initially positively reviewed and published, as well as work which has been superseded by new discoveries and knowledge.

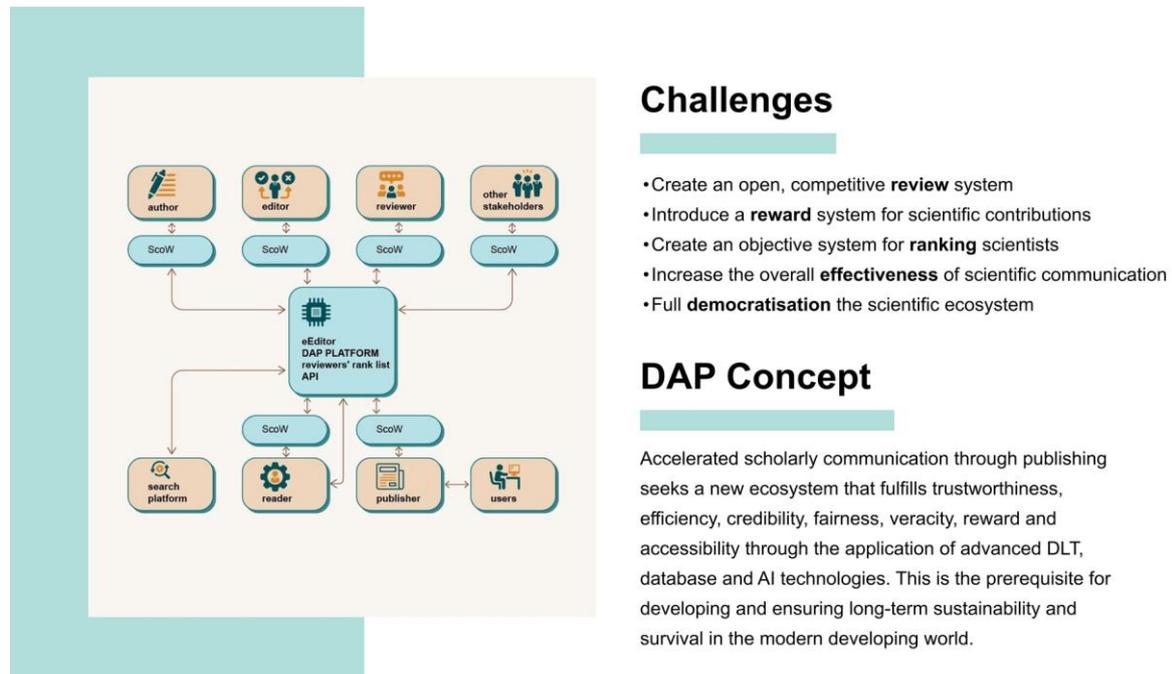

Figure 1. The DAP Challenges and Concept

The introduction of remuneration for authors, reviewers, translators and other stakeholders is an essential element of democratisation of publishing, as it allows citizen scientists and retired academicians, people from lower income countries and others which have no institutional support, not only to publish, but to have additional means to pursue their research. In this sense there is no money flow out of the academic community towards over-profitable publishers. This feature is now, with the emergence of blockchain technology, possible through the so called fungible tokens, i.e. virtual money. The DAP fungible tokens, the Ergions (from Greek Ergon - 'work'), are produced by somebody making a review of a paper, or by someone publishing a paper (after being positively reviewed), or by some other such important action. The Ergions can then be used internally, inside the DAP economy. This kind of internal economy can actually function between a lot of different authors, reviewers, translators, editors and institutions, as well as a lot of different conferences and congresses, where specific money needs, like for rewarding conference chairs, could be gained from certain authors who pay their conference fee by the Ergions they earned by having something published, or reviewed etc.

The Blockchain (Distributed Ledger) technology is used in DAP not only for the generation and transfer of Ergions, i.e. the virtual money, but also for confidential and verifiable recording and management of all transactions. In such a way all data on the flow of publication versions, reviews, reactions etc. is permanently and unchangeably kept, enabling proper meta-analyses. The published work, as well as all reviews and reactions

are kept in a redundancy aware randomly distributed chunked database, as to preserve all material independent of the availability of particular storage machines. The interaction of all users with the DAP system is through a specially developed Scholarly Wallet, which allows all users full cryptographic privacy (private / public key usage), and multiple parallel non-mixing roles in the system (e.g. a reviewer has to be anonymous, but the same person as an author wants to be known) (Skala, et al., 2023).

The whole system is envisaged as a circular flow of knowledge. The knowledge flows towards the general public and there is constant interaction between all layers of knowledge gathering, dissemination, and recursive usage. The recursivity is a-priory at the level of Open Public, as knowledge gathered at that layer generates new Users, i.e. authors, reviewers etc. in an open Educational cycle.

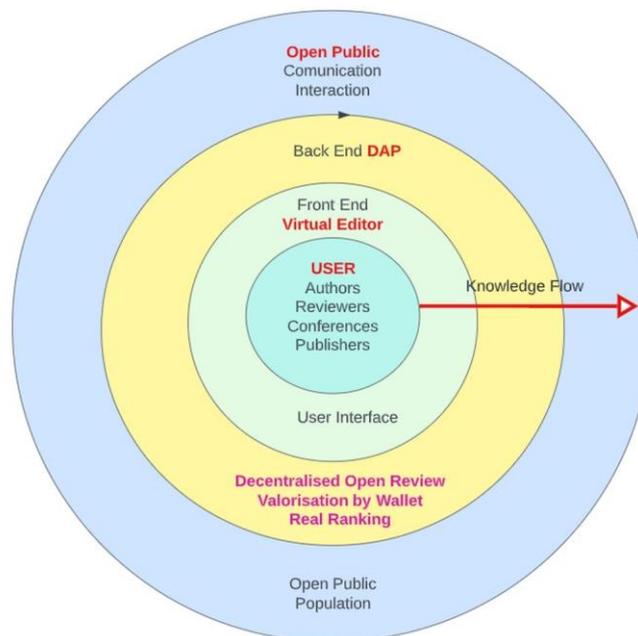

Figure 2. The DAP Knowledge Flow

The Rainbow Ecosystem

On a more global systemic level, it is necessary to develop a recursive viable model of general principles and areas involved in the development of our technosphere, hopefully attaining the level of a mature technosphere, as a stable planetary ecosystem (Frank, et al.,2022). This model is the Rainbow Ecosystem, which we are developing for some time (Skala & Šojat, 2018) ,(Šojat, 2020), and which is envisaged as an abstract recursive model of a global information system, i.e. a global system of information and knowledge services, as well as a viable model of the approach towards integrated ecosystem development. The division into these different rainbow colours is enabled by those colours actually having their archetypal meaning close to those very essential areas of the development of Computer Science, as well as the generic division in specific areas of concern in any cybernetically viable system (Beer, 1990) (Schwarz, 1992) (Pruckner, 2002).

What we, as civilisation, are striving for is actually a dynamically stable, viable ecosystem, in which we finally integrate the nature's inherent intelligence with our human intelligence and the emerging forms of machine intelligence into that strong global rainbow environment, this integration will allow ecological balancing of what is and what isn't important on our Earth, what is beneficial, and what is harmful for the whole Ecosystem. We sincerely hope that such systems, like the Rainbow, and our Democratization of Academic Publishing will actually enable much of the progress and knowledge gathering and knowledge distribution necessary for attainment of a more stable ecosystem on our only planet.

Figure 3. The Rainbow Model

Conclusion

We have delved into the exponential rise of machine intelligence and the transformative impact it is having on our civilization. It is clear that as these 'electronic brains' rapidly evolve, an enhanced educational strategy is required. This strategy should encompass not only technical skills but also a strong ethical foundation, drawing parallels with human education in terms of structure and sequencing. We also explored the dichotomy of our technology-driven society - its power to create abundance alongside poverty, and its potential to either inflict environmental damage or initiate recovery.

We have proposed an innovative solution to counteract these issues: the democratization of academic publishing. This initiative, grounded in the use of ethical machine intelligence and blockchain technology, proposes an open and competitive review system aiming to restore trust and transparency in the publishing process, while also providing remuneration to all stakeholders involved. The usage of blockchain technology ensures a confidential, verifiable record of all transactions and contributes to an internal economy that supports

academics, especially those without institutional backing. The circular flow of knowledge encouraged by the system paves the way for a more open and collaborative academic publishing landscape.

Lastly, we introduced the concept of the Rainbow Ecosystem. This abstract model integrates human intelligence, the inherent intelligence of nature, and the emerging intelligence of machines to form a stable global ecosystem. The ultimate aim is to strike a balance in our global environment, giving us the means to discern the beneficial and harmful aspects impacting our planet. It is our hope that this integration of ethical machine learning, blockchain technology, and democratized knowledge sharing will serve as a catalyst in our collective journey towards a sustainable future. Through such progressive systems, we believe we can facilitate the much-needed change and guide our civilization towards a balanced, prosperous and sustainable future.

Acknowledgements

This work was partially sponsored by the TruBlo EU project. The Authors wish to thank all the generations of people who strive for knowledge and wisdom, and appreciate all the help we are and will be getting from Ethical Electronic Brains.

Analyzing the Relationship between Scientific Publications and Researchers' Variables: A Scopus-Based Study of a Private Ecuadorian University

Yasmany García-Ramírez

Universidad Técnica Particular de Loja, Ecuador,  <https://orcid.org/0000-0002-0250-5155>

Abstract: Research enables progress in science. Scientific publications are one of the means used to share the advances found in research. Ecuador has had a substantial increase in its scientific production in recent years. In this context, the article aims to examine the relationship between scientific publications and variables of Ecuadorian researchers using the affiliation of the Universidad Técnica Particular de Loja (UTPL). For this purpose, the Scopus® database was analyzed from 2010 to 2022. The growth in the number of publications started mainly due to state legislation, which mandated the need to publish research. This decision led to an increase in research being conducted in academia. The different groups analyzed showed differences; therefore, the university should have a differentiated strategy for each group. The procedure detailed in the article can serve as a reference for other institutions or for those who wish to evaluate the performance of their faculty. Publications bring prestige to both faculty members and institutions, but the main focus of research should not be lost.

Keywords: Scientific publications, University, Scopus, Productivity, Ecuador.

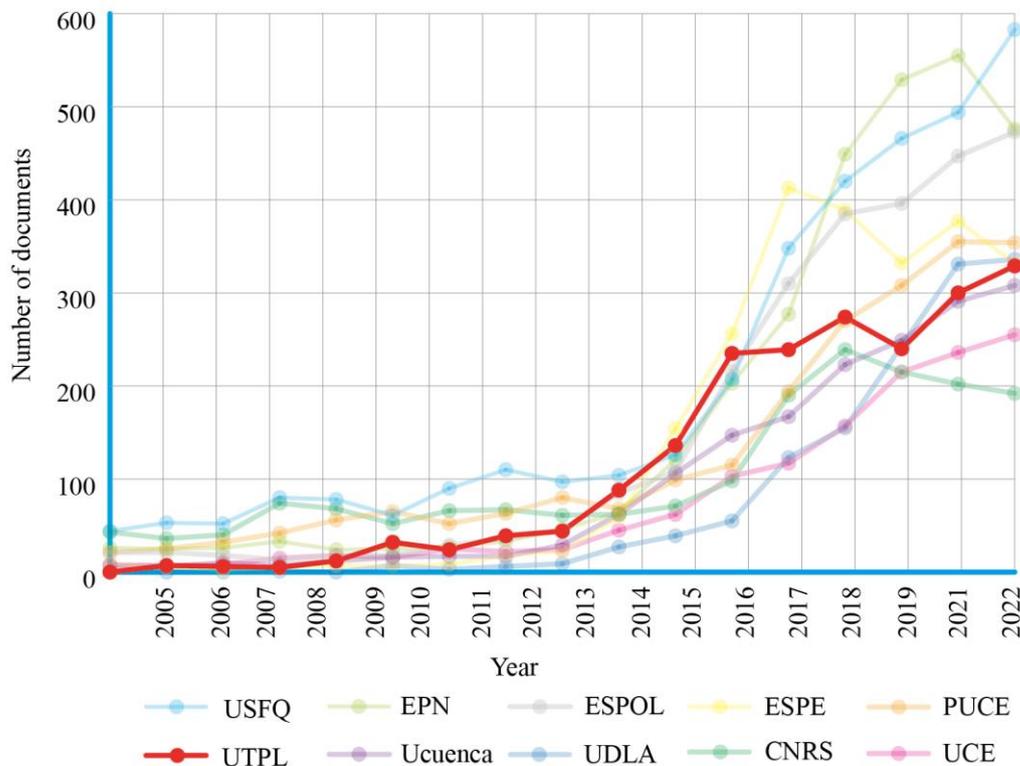

Citation: García-Ramírez, Y. (2023). Analyzing the Relationship between Scientific Publications and Researchers' Variables: A Scopus-Based Study of a Private Ecuadorian University. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1824-1842), Cappadocia, Turkiye. ISTES Organization.

Introduction

Research is essential for advancing science, and one of its main outcomes is scientific publications, which are crucial for researchers to engage with the academic community and advance their careers. Institutions are ranked based on academic or research performance, which includes factors such as highly cited researchers, articles published and/or indexed by major citation indexes, and performance per capita (Liu & Cheng, 2011). However, simply increasing the number of faculty members may not necessarily increase publications per capita, and the impact of this increase may vary across different departments (Epstein & Menis, 2013). Publications and their citations are important measures of the quality of scientists (Vavryčuk, 2018). Moreover, professors who are more involved in research tend to achieve better results in their teaching evaluations (Artés et al., 2017), leading institutions to favor publications, often through university legislation or incentives. These

changes have been driven by certain countries, such as Ecuador, where there has been a significant increase in scientific publications in recent years.

According to Scopus®, Ecuador had 300 publications indexed in 2005, and this number progressively increased to 6,594 in 2022 (Scopus, 2022a). This growth was mainly due to legislation that required higher education institutions to allocate at least 6% of their budget to indexed publications, scholarships, or research projects (*Ley Orgánica de Educación Superior (LOES) - Registro Oficial Suplemento 298*, 2010). Additionally, the legislation on the university teacher career and ranking gave greater relevance to scientific publications (*Reglamento de Carrera y Escalafón Del Profesor de Educación Superior - Resolución RPC-S0-037 No.265· 2012*, 2012). These changes led to an increase in registered publications annually, as shown in Figure 1.

Universidad San Francisco de Quito (USFQ), Escuela Politécnica Nacional (EPN), Escuela Superior Politécnica del Litoral (ESPOL), Universidad de las Fuerzas Armadas (ESPE), Pontificia Universidad Católica del Ecuador (PUCE), Universidad Técnica Particular de Loja (UTPL), Universidad de Cuenca (UCuenca), Universidad de las Américas (UDLA), Centre National de la Recherche Scientifique (CNRS), Universidad Central del Ecuador (UCE).

Figure 1 Historical publications (2005-2022) registered in Scopus for the top 10 scientific production institutions in Ecuador in 2022

The most significant growth in the Figure 1 is observed from 2013 onwards for all universities. Higher education institutions established their own regulations based on state laws, such as the Universidad Técnica Particular de Loja, which included its internal regulations in 2015, incentivizing publications (*Reglamento*

Interno de Carrera y Escalafón (N°012.012.2015), 2015). A study found that 51% of respondents said they had changed their behavior due to the way they are evaluated (Abbott et al., 2010). A ranking and evaluation system for researchers can contribute to overall improvements in scientific capacity in low- and middle-income countries (Fry et al., 2023).

The UTPL, which is ranked sixth in indexed publications according to Scopus, has regulations that prioritize research and assign academic dedication and the number of research hours a professor can have based on their role in the institution (*Instructivo Para La Asignación de Dedicación Académica al Personal de La UTPL (VIN_IN_6_2020_V2_2022)*, 2022), as shown in Table 1. Each profile has mandatory teaching hours, while the amount of time dedicated to research, supervision of degree projects, and management varies depending on the profile.

Table 1 Detail of the profiles considered in the internal policy of UTPL.

University member	Profile	Hours of			
		Teaching	Research	TT	Management
Rectors and Vice-Rectors	1A	4	-	-	36
Deans, Associate Deans, Directors, and Assistant Directors of academic units	1B	8	4	2	26
Directors and individuals associated with the organization of the UTPL	1C	8	4	2	26
Heads of departments, degree programs, or academic programs.	1D	16	4	2	18
Professor-researcher	2A	18	18	4	-
	2B	25	11	4	-
	2C	30	6	4	-
Professor	3A	32	-	8	-
	3B	20	-	According to contract	-
	3C	>19	-	According to contract	-

TT: Supervision of degree theses - does not have hours allocated for this function.

This article aims to examine the relationship between scientific publications and the variables of Ecuadorian researchers affiliated with the Universidad Técnica Particular de Loja (UTPL) in the context of the rapid increase in Ecuadorian scientific production. The growth in publications should not only be for the prestige of universities but also for the essential function of research in improving society. To conduct this analysis, we utilized the Scopus® database from 2010 to 2022 and used the UTPL as the average institution among the top

10 institutions with the most publications in 2022. While our analysis focuses on the UTPL, the methodology can be applied to other institutions with similar objectives. The sustainability of this growth in scientific publications is crucial for the long-term benefits of research and its impact on society.

Methods

In this section, we will explain the methodology that we followed to achieve the proposed objective. We will start by describing the details of the university that we analyzed and then provide an explanation of the data collection process. After that, we will provide details on the data processing steps that we took. Finally, we will discuss the variables that we used in the analysis.

Details of the University Under Analysis

The university analyzed in this study is UTPL, located in the southern region of Ecuador, which offers higher education in a variety of formats including on-campus, virtual, and distance learning. Currently, UTPL provides undergraduate and graduate programs in various fields, such as engineering, health sciences, social sciences, and education. The university employs 733 full-time teachers and over 1,000 part-time teachers, and has a student body of approximately 43,000 students, of which 6,000 are enrolled in on-campus programs (Carrera, 2022). The majority of virtual or distance learning students are located throughout Ecuador, while on-campus students primarily come from the surrounding areas of the university campus in Loja. UTPL places a strong emphasis on research, as demonstrated by its policies and regulations that encourage and reward faculty members for their research activities. The UTPL is the average institution among the top 10 institutions that published the most in 2022, based on the number of publications indexed in Scopus.

Data Collection

To collect data on scientific publications by researchers affiliated with the UTPL, the institution used the Scopus® database from 2010 to 2022, with the Affiliation ID of 60072064 (Scopus, 2023). Until march 2023, this database contains information on 2422 indexed documents and 1512 authors and co-authors affiliated with UTPL. The year 2010 was chosen as the starting point due to the enactment of a state law that year. The data collected includes the title, authors, year of publication, journal or conference name, and number of citations, among other available information in Scopus.

Data Processing

Several filtering and correction processes were applied to the initial database.

- It was initially observed that some authors had multiple profiles in the database, which was attributed

to errors in the indexing process. The errors included listing given names in place of surnames or listing the second surname instead of the first surname. To address this issue, the profiles for each author were unified, although this task was time-consuming and may have affected the accuracy of indicators. For instance, an author might have n articles in one profile and different data in another profile, which were combined into a single profile. Additionally, 210 profiles were found to be incorrectly associated with university faculty members. The Mean Absolute Percentage Error (MAPE) for the entire database was calculated to be 9.15%.

- Next, the database was further processed by removing profiles of individuals who were not affiliated with the university's staff on a full-time basis. Although external collaborators, students, and technicians may have supported research and appeared as authors or co-authors, they no longer actively participate in research after that collaboration. As a result, the database was reduced to 489 professors who are currently employed by the university and are directly responsible for scientific production.
- These 489 professors were then organized into six groups based on quartiles and percentiles. Percentiles were used because the first quartile was divided into three groups in order to analyze the variation within the group. Each of these groups was assigned a main characteristic as seen in table 2.

Table 2 Distribution of the research groups for this study

N° of group	Quartile	Percentile	N° of documents	Characteristic
1	4	25	≤ 1	People who are starting with peer-reviewed research would need greater support both in the research process and in writing the manuscript.
2	3	50	$1 < a \leq 4$	
3	2	75	$4 < a \leq 10$	People who already know the research and writing process don't need more support than the time available to research. They will continue to increase their metrics. They need support to ensure that their desire to research doesn't diminish.
4	1	85	$10 < a \leq 15$	
5		95	$15 < a \leq 30$	
6		-	>30	People who already know the research and writing process do not need more support than the time available to conduct research. They possibly have a consolidated team. They need support to maintain their desire to research and not let it diminish. They need stable contacts and workgroups.

- Next, the profiles were linked to the teaching positions they hold at the university.

Variables Analyzed

The variables analyzed in the study are presented in Table 3. They include variables related to the number of publications, the impact of publications measured through Field-Weighted Citation Impact (FWCI), co-authors, and teaching profiles of the authors. Notably, the H-index has not been included as a variable since it may not accurately reflect the quality of individual publications due to variations in the number of citations in different fields or types of publications. Moreover, the h-index can be influenced by other factors such as the researcher's age and the field of study (Mohammed et al., 2021).

Table 3 Definition of the variables used in the analysis

Variable	Definition
Total number of publications	It is the number of publications that the author has registered in Scopus
Average annual documents	It is the average number of all documents published by an author in a given year.
Average annual citations per article	It is the total number of citations that an article has received in a given year.
Average annual articles	It is the number of articles published in a journal in a given year.
Average annual conference papers	It is the number of papers published in a conference in a given year.
Average books or book chapters:	It is the average number of books or book chapters authored or co-authored by an individual in a given year.
Weighted Average Field Citation Impact (FWCI)	It is a measure of the average impact of a publication in a specific field, considering the number of citations it has received relative to the expected number of citations for other publications in the same field. This metric is calculated by dividing the total citations of a set of publications by the total expected citations for those publications based on the citation patterns of other publications in the same field, and then normalizing the result to 1.0 as the average for the field (Scopus, 2022b). This metric was obtained from Scopus. The average value was calculated for each author, based on the period from 2017 to 2021, which is the period available up to the present date.
Fields with Highest FWCI	These are the fields where the documents have had the highest FWCI values.
Number of Fields	It is the number of different fields in which an author's articles have been published and cited.
% of FWCI ≥ 1	It is the percentage of fields where the FWCI was greater than or equal to 1.

Year of Scopus Entry	It is the year when the author indexed their first article in the Scopus database.
% as First Author	It is the percentage of an author's articles where they appear as the first author.
Average number of coauthors	It is the average number of coauthors that articles by a certain author have
Professor profile	It is the profile that UTPL has assigned to the teacher during the year 2023. It can be: 1A, 1B, 1C, 1D, 2A, 2B, 2C, 3A, 3B, 3C

Results

The results have been organized into 4 sections. In the first part, the quantity of publications and their citations were analyzed. This can be useful for evaluating the productivity and impact of an author or group of authors in a specific research field. In the second part, the relationship between the study's results and the FWCI of the journals in which the works were published was investigated. The FWCI is a measure that indicates the relative importance of a journal in a specific field and can be useful for evaluating the quality and relevance of publications. The third part focused on collaborations between authors in the documents. This can be useful for evaluating collaboration and teamwork ability of authors, as well as identifying trends in collaborations within a research field. In the fourth and final part, the relationship between the number of annual publications and some variables of the authors, such as their teaching profile, was analyzed. This can be useful for better understanding the conditions and factors that influence the productivity of authors in a specific research field. Overall, these results can be useful for evaluating the productivity and impact of an author or group of authors in a specific research field, as well as for better understanding the trends and factors that influence productivity in that field.

Publications and Citations

The number of people in each group were: Group 1 (128), Group 2 (131), Group 3 (111), Group 4 (46), Group 5 (50), and Group 6 (23). Figure 2 shows that there are significant differences in the average number of publications and citations between the different groups of authors. It also indicates that the groups with a higher number of publications are more likely to have a higher number of citations. Additionally, the graph highlights the increasing trend in the number of publications and citations for all groups, except for a decrease in average publications per author for the groups producing the most in 2021 and 2022. As for the average number of citations, it is expected to have a downward trend as articles usually do not get cited immediately after they are published. The graph also shows that conference papers have a higher average number of publications than journal articles, and there has been a significant increase in conference papers for Group 6 starting from 2015. Conference papers may have a higher number of citations than journal articles considering a two-year period (Chen & Konstan, 2010), although others have found the opposite (Garousi & Fernandes, 2017). Another element to consider is that professors might have found an advantage in advancing through the hierarchy of academia by publishing conference papers that were quicker and easier to publish than journal articles (Purnell,

2019). Group 6, which publishes the most, has the greatest dispersion of the data.

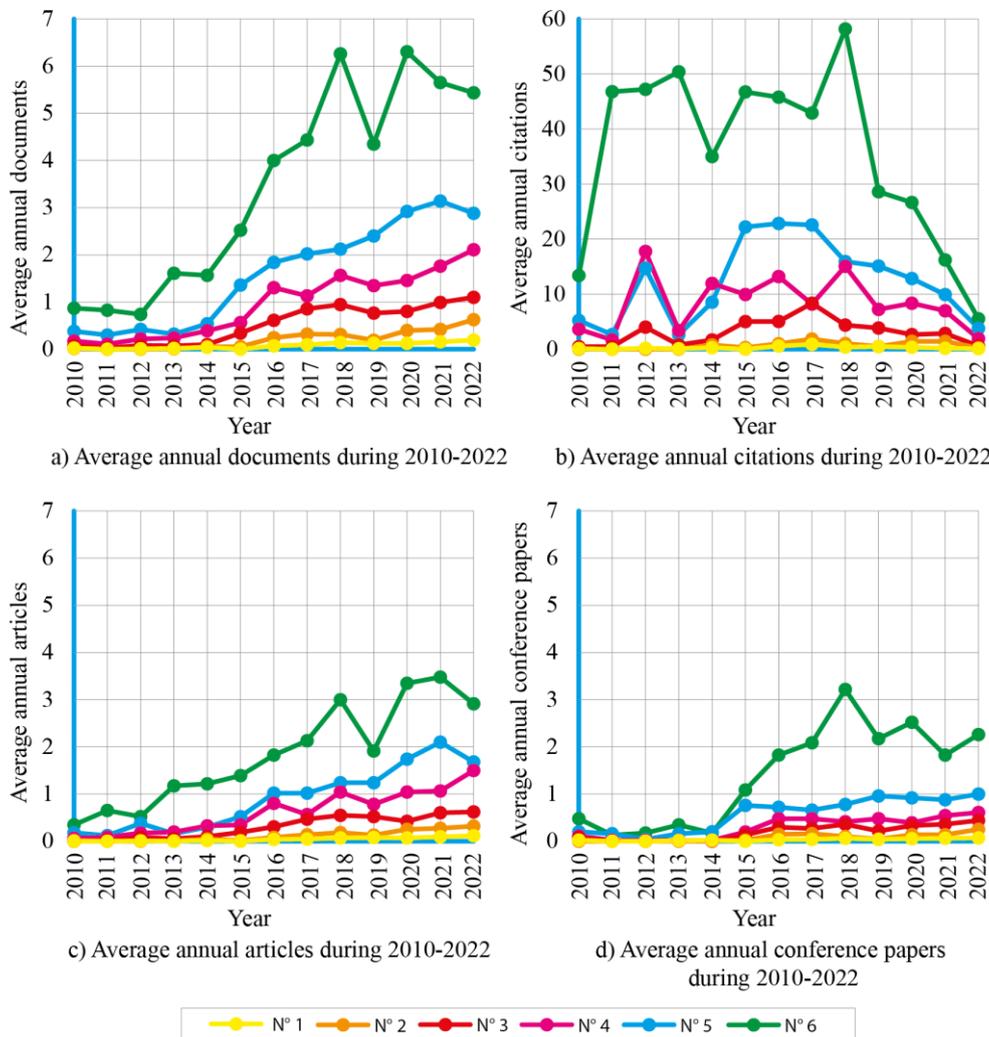

Figure 2 Publications and author citations for each group of professor during the period 2010-2022.

Finally, books and book chapters are produced in smaller proportions than scientific articles and conference papers, with Group 6 having the highest proportion of books and book chapters among all the groups. However, the same trend as the other graphs remains, with group 1 publishing the least of these documents and group 6 having the highest value, although there is some similarity between group 3 and 4. The maximum value in all years is as follows: No. 1: 0.01, No. 2: 0.02, No. 3: 0.09, No. 4: 0.07, No. 5: 0.12, No. 6: 0.17. Overall, these results provide useful insights into the productivity and impact of authors in different research fields.

Field-Weighted Citation Impact (FWCI)

The Field-Weighted Citation Impact (FWCI) and contribution areas are shown in Table 4. Based on the FWCI values, groups 3 and 4 have a higher impact than the other groups, indicating that their publications are being

cited more than expected in their respective fields. However, these groups also have a high confidence interval, which suggests that there is more variability in their impact. On the other hand, groups 5 and 6 have lower FWCI values, but they also have lower confidence intervals, indicating that their impact is more consistent. Group 2 has the lowest FWCI values and the highest confidence interval, which suggests that their impact is not significant in their respective fields. It should be noted that the number of contributions can influence the FWCI values, and since groups 5 and 6 have a greater number of contributions, their impact may be overestimated. Overall, the FWCI values suggest that groups 3 and 4 have a higher impact, but further analysis is needed to determine the significance of these findings.

Table 4 Results of FWCI 2017-2021 for the analyzed groups

Group	FWCI		Contribution areas	
	Average	IC95	Average	% of FWCI ≥ 1
1 (≥ 1 document)	-	-	-	-
2 (1 $a \leq 4$ documents)	0.69	2.42	1.54	32.12
3 (4 $a \leq 10$ documents)	1.02	1.38	3.52	46.24
4 (10 $a \leq 15$ documents)	1.03	0.73	5.52	41.25
5 (15 $a \leq 30$ documents)	0.95	0.35	8.96	38.37
6 (>30 documents)	0.96	0.22	16.00	37.50

- It was not possible to determine due to having only one contribution per author.
FWCI: Field-Weighted Citation Impact.
95% CI: 95% confidence interval.

Interdisciplinary research has become increasingly important in academia, as it allows for a broader understanding of complex problems and the development of innovative solutions. The finding that group 6 has contributed to a larger number of areas (16) on average compared to the other groups suggests that they may be more interdisciplinary in their research approach. This could be a strength for group 6, as it allows for the integration of different perspectives and methodologies to solve problems. Additionally, the similar percentage of documents with an FWCI value greater than 1 across all areas suggests that the impact of research is not necessarily dependent on the specific field it is in. Rather, it is the quality and relevance of the research that determine its impact, regardless of the area of study. This highlights the importance of collaboration and knowledge exchange across different fields and disciplines to advance research and make meaningful contributions to society.

Regarding the areas that have had a higher FWCI value, a word cloud was created and is shown in Figure 3. One of the first impressions is that the groups organized by the number of publications seem to have different areas of focus. Group 2 focuses mainly on topics related to "learning and management" (N=7) while group 3 focuses on "learning and education" (N=13, N=9) group 4 on "social, ecosystem and environmental" (N=6, N=5, N=5) group 5 on "social and media" (N=11, N=6) and group 6 on "internet" (N=4). It is important to note that the term "learning" or related to appears in almost all groups, which could be attributed to one of the main functions of a professor.

is well-documented (Costas & Bordons, 2011). Therefore, the percentage of times an author appears as the first author in their articles was calculated. A higher percentage means that they appear more often as the first author than a lower percentage. Percentages were counted for all authors in four groups: 0-25%, 25-50%, 50-75%, 75-100%. The results are shown in Figure 4. It can be observed that researchers in group 6 have a low percentage of first authorship, which suggests the interdisciplinarity found previously. On the other hand, group 5 has a higher percentage of first authorship than the previous group, similar to group 4. Group 3 has the highest percentage of first authorship in up to 50% of the articles in that group. Group 2 has a high score between 25 and 50% of the articles in that group, then decreases before increasing again. Group 1 has a high percentage of first authorship in 75-100% of their publications, indicating a possible lack of collaboration with other researchers at the university.

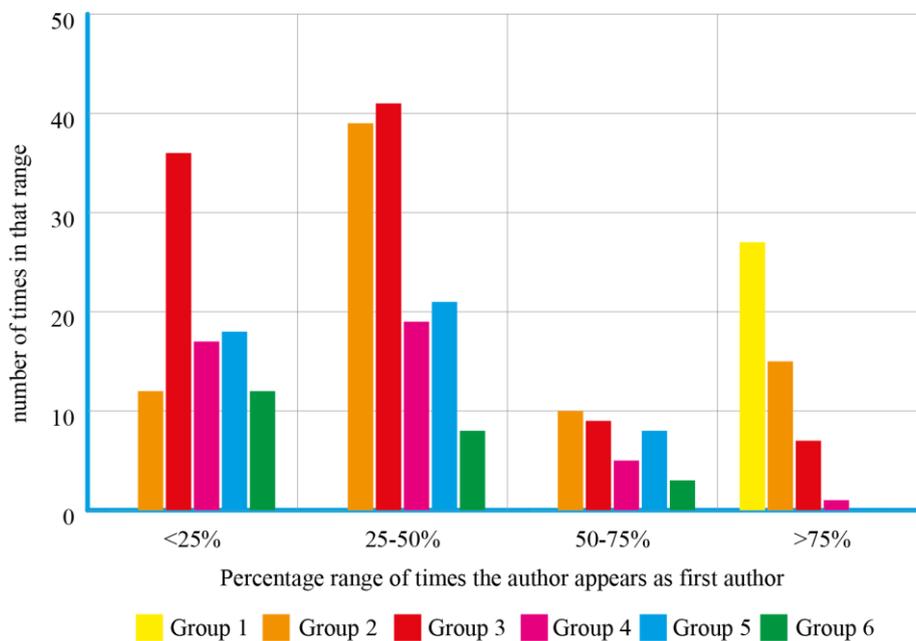

Figure 4 Number of times the percentage of times the author appears as the first author is between 0-25%, 25-50%, 50-75%, 75-100% for each group under study.

The relationship between the average number of researchers who appear in the documents and the total number of publications is shown in figure 5. The figure suggests that teachers with higher production typically collaborate with around 5 people, indicating interdisciplinarity. However, hyperauthorship (Cronin, 2001), which should be studied further, can occur in some cases. It should be noted that an increase in the number of collaborators does not always result in higher production, as seen when there are more than 8 co-authors on average. In such cases, there may be various reasons, such as researchers lacking research and writing skills or participating in the research with less significant contributions, such as only collecting data or seeking funding. On the other hand, a lower number of co-authors may indicate that the researchers are still in the learning process and need more support. It is important to note that most of these co-authorships were before the appearance of the CRediT author statement.

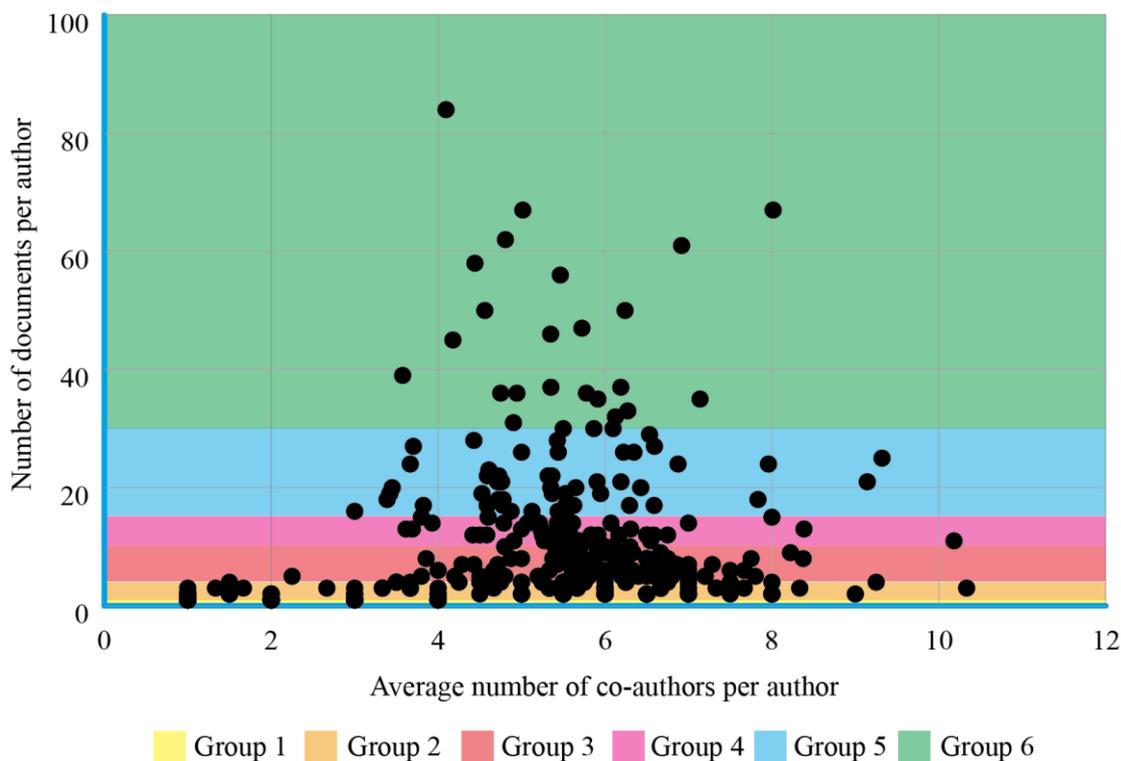

Figure 5 Average number of co-authors per document versus total documents.

Professors Profiles

In order to investigate the relationship between teaching profiles assigned by UTPL and scientific production, two boxplot figures were generated. Figure 6 displays all articles alongside the corresponding professor profiles. It is evident from this figure that the professors with the highest scientific production belong to the researcher professor 2A profile, which allows for more time to be allocated towards research compared to other profiles. The second group with high production are the 1D professors, who hold leadership positions in departments, careers or programs, and consequently have more time dedicated to management tasks than research. This can be attributed to their responsibility of ensuring academic productivity at the university while conducting research. Profiles 2B and 2C have lower production than 2A since they have less time allocated to research. It is noteworthy that professors with teaching-only profiles (3A, 3B, and 3C), without any dedicated research hours, also exhibit scientific production. Through their productivity, these professors may have the opportunity to ascend to profiles 2A, 2B, or at least 2C. The same data was reorganized including the 6 analysis groups as shown in Figure 7.

In general, figure 7 shows that all profiles in each group have similar contributions. This means that the assigned teaching profile by the university does not have much influence on scientific production, rather it is the group to which it belongs. These groups may be related to the learning curve in research and publication, where group 1 is starting that career, while group 6 is in another learning stage. It is clear that the time dedicated to research

varies between profiles, but a person with fewer hours allocated to research and the right skills can achieve the same level of scientific production.

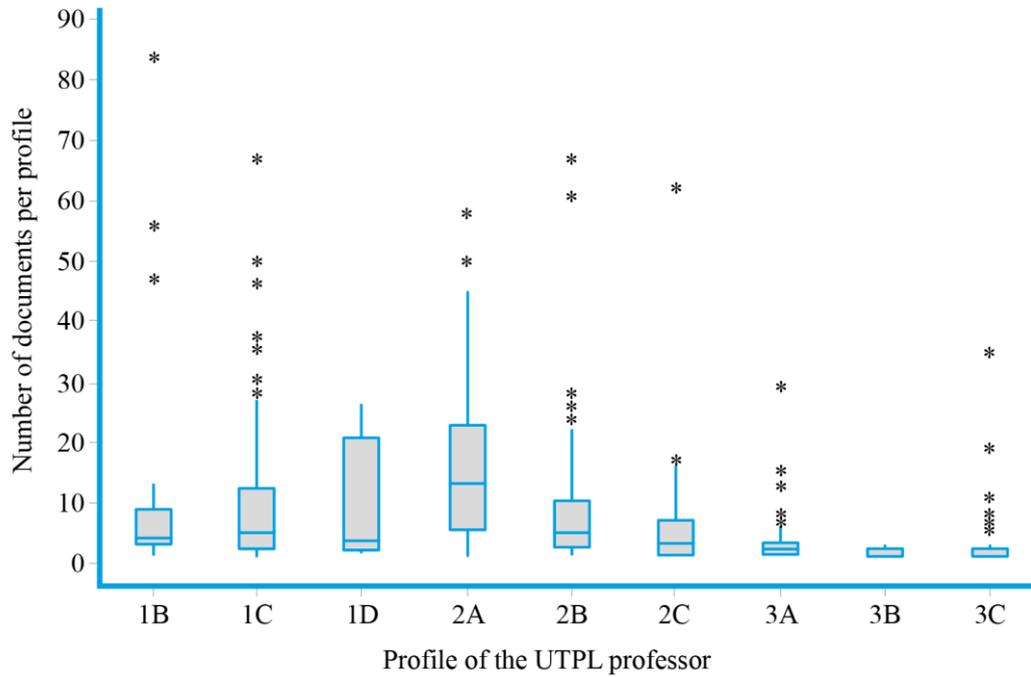

Figure 6 Boxplot of total number of publications and professors' profiles

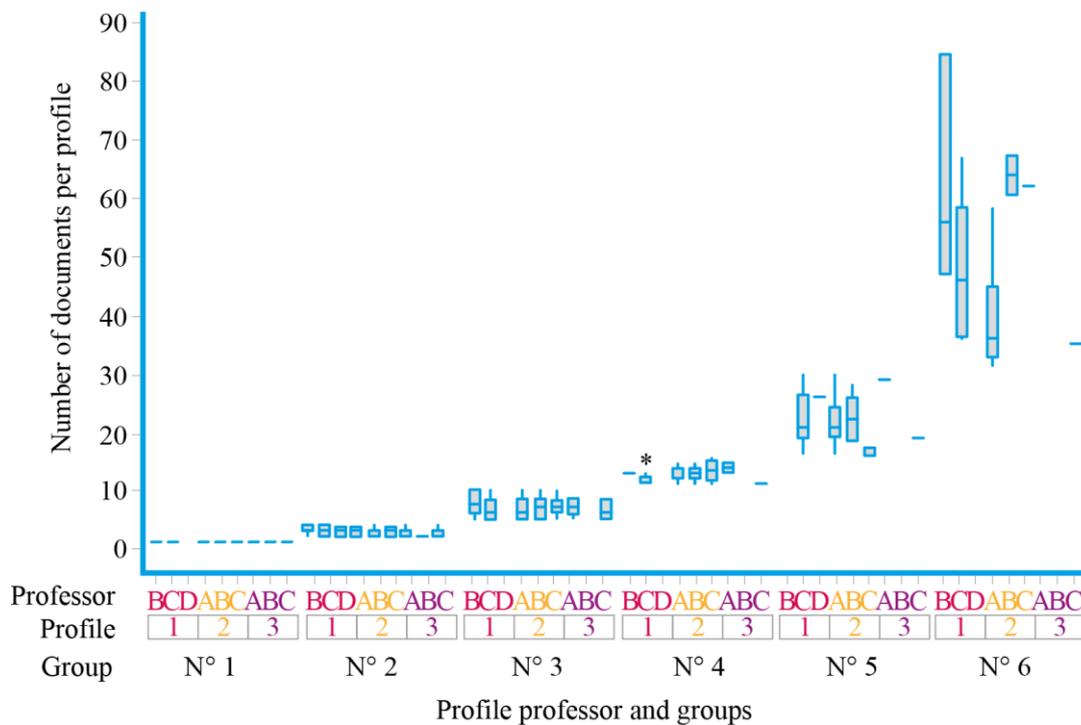

Figure 7 Boxplot of the total number of publications, the profiles of the professor for each group analyzed.

Correlation Matrix

A correlation matrix was used to test whether there is any relationship between the number of indexed documents and some variables related to the researchers. Before performing the analysis, the researchers' profiles were assigned numbers, for example, 1B = 1, 2B = 2, etc. The variables considered in the analysis included the group to which the researchers belong (1-6), their professor profile (1-8), average number of coauthors, first year of entry into Scopus, average FCWI, number of areas of contribution, percentage of areas with FCWI greater than 1, and the percentage of articles in which the author is the first author. The statistical software Minitab (State College, 2005) was used for the analysis. Table 5 shows the correlation matrix.

Table 5 Correlation matrix between publications per year and other author variables

	Doc. per year	Group	Profile	Year of Scopus entry	FCWI average	NAC	Areas with FCWI \geq 1	% First author
Group	0.853 *							
Profile	-0.246 *	-0.293 *						
Year of Scopus entry	0.674 *	0.811 *	-0.227 *					
FCWI average	0.372 *	0.576 *	-0.263 *	0.486 *				
NAC	0.924 *	0.823 *	-0.249 *	0.617 *	0.407 *			
Areas with FCWI \geq 1	0.239 *	0.379*	-0.177*	0.236*	0.823*	0.279*		
% First author	0.021 ***	0.070 ***	-0.017 ***	0.028 ***	0.148 **	0.011 ***	0.121 **	
N ^o of co authors	0.309 *	0.542 *	-0.231 *	0.419 *	0.656 *	0.326 *	0.481 *	0.095 **
*P-value = 0.000. **P-value \leq 0.05,***P-value $>$ 0.1 NAC: number of areas of contribution, Group: number of group based on the number of publications (1 to 6), FCWIaverage: Average Field-Weighted Citation Impact.								

Table 5 indicates that the number of indexed documents per year is significantly correlated with the group to which the researcher belongs, the number of areas of contribution, and the first year of entry into Scopus. These variables show a moderate to strong positive correlation with the number of indexed documents per year. On the

other hand, the average FWCI, the number of co-authors, and the teaching profile show a weaker positive correlation with the number of indexed documents per year. Finally, the percentage of articles in which the author is the first author was not found to be statistically significant.

Discussion

The groups identified in this study have varying levels of annual document production, not only in scientific articles but also in conference papers, books, and book chapters. While it is expected that all groups will continue to increase their output in this database, they will not do so at the same rate. It is worth noting that the groups with higher publication rates may reach a plateau at some point, while the groups with lower rates may have the opportunity to surpass them. It is important to consider that academics feel that the system has greatly increased their pressure to publish (Coulthard & Keller, 2016), which could lead to unethical practices such as salami slicing, plagiarism, duplicate publication, fraud, or ghost authorship (Rawat & Meena, 2014).

The groups that have higher publications tend to have more collaborations with other researchers, as evidenced by the number of co-authors they have and the number of areas they publish in. Studies have shown that a higher degree of interdisciplinarity in a publication is associated with a greater emphasis on local issues (Chavarro et al., 2013). The trend of increasing numbers of authors per article has been observed in all journals at an average rate of 0.076 ± 0.057 authors per article per year (McDonald et al., 2010). This indicates that collaboration is becoming increasingly important in research. Groups with lower publications can learn from this trend and increase their research production by fostering collaborations with other researchers in their fields.

It's important to note that the groups with higher production also tend to have a greater impact, not just in terms of the number of citations but also with regards to the Field-Weighted Citation Impact (FWCI). It has been shown that international co-authorship can have a positive contribution to the FWCI of an institution, but there is still potential for increasing collaboration among young institutions (Khor & Yu, 2016). It's also interesting to note that the average FWCI values for the different groups are close to 1 and have lower confidence interval values compared to the other variables, indicating that there is less variability in this measure across the different groups. Furthermore, it's important to investigate the areas where these publications have the greatest impact, as this could depend on factors such as research teams, legislation, and funding opportunities.

In this study, it was observed that groups with lower production tend to appear as first authors in their papers, while groups with higher production show a decrease in this percentage due to collaborative efforts with other researchers. In all disciplines, first and last authors typically contribute to more tasks than middle authors (Larivière et al., 2016). However, the literature has not shown a direct relationship between the number of authors and scientific production, but rather with the number of citations. For instance, previous research has demonstrated that the number of authors, as well as the length and complexity of the abstract, have a strong positive influence on the number of citations (Sienkiewicz & Altmann, 2016). On the other hand, there is

evidence that contradicts the notion that multi-authored papers are typically of higher quality than single-authored papers (Khor & Yu, 2016). Interestingly, in this study, the number of co-authors did not have a direct relationship with scientific production. While authors were found to have articles with a large number of co-authors, this did not lead to an increase in production. Further investigation is needed to better understand this phenomenon.

The relationship between faculty profiles and scientific production has been observed in this study. It was found that some faculty profiles have more time assigned for research than others, while some profiles have no assigned time for research at all. Interestingly, within groups, the profiles exhibited a similar level of production regardless of their assigned time. However, there is currently no research on the available time of professors and its relationship with scientific production. This topic warrants further investigation in future studies.

There are various researcher-related variables that appear to be associated with annual research production, and one of the most prominent among them is the research group to which they belong. However, if models were calibrated, multicollinearity could be observed, given the interdependence between these variables. Therefore, it would be more appropriate to consider this relationship as a group effect, where people with shared characteristics tend to produce more, owing to factors such as personal motivation for research, professional growth, or community service, among others. Further research is necessary to better understand this relationship.

This study has several limitations that should be acknowledged. Firstly, it is important to note that only Scopus was used as the data collection site, which may lead to incomplete data since it ignores the problem of authorship in multi-author publications (Vavryčuk, 2018). There are other databases or indices that researchers may choose to publish in, such as Web of Science, Latindex, among others, which do not appear in Scopus. Nonetheless, Scopus was the data source used for this analysis, and the same analysis can be carried out with other databases. Secondly, the analysis was only carried out with one university in the country, which may limit the generalizability of the findings. However, this university is one of the institutions that publishes the most in the country and is representative of the average among the top 10 institutions. Additionally, the documents were counted for all authors, and self-citations were not excluded, which could have inflated the citation counts. Finally, no analysis was carried out between the different areas of knowledge, which could provide insights into the research situation of the institution in specific fields. Despite these limitations, the study provides a general overview of the institution's research situation.

Conclusions

This article aims to examine the relationship between scientific publications and variables of Ecuadorian researchers using the affiliation of the Universidad Técnica Particular de Loja (UTPL). To do this, the Scopus® database was analyzed from 2010 to 2022. The main conclusions are presented below.

The study found that the growth in the number of publications in Ecuadorian academia began mainly due to state legislation and regulations, which emphasized the need to publish research. This led to an increase in research being conducted in academia. The analysis also showed differences among the various groups of researchers, indicating that the university should have a differentiated strategy for each group. The procedure detailed in this study can serve as a reference for other institutions or for those who wish to evaluate the performance of their teachers. It is important to note that while publications bring prestige to teachers and institutions, the main focus of research should not be lost. Overall, the findings suggest that the promotion of scientific research is important and necessary for academic institutions to stay competitive, but it is equally important to ensure that the quality of research is not compromised by a focus solely on publication numbers.

Students' Perceptions on the Use of Flipped Learning

Kartika Yulianti

Bina Nusantara University, Jakarta, Indonesia  <https://orcid.org/0000-0002-6402-3928>

Abstract: The rise of flipped learning in higher education has become apparent along with technological advances. Higher education must stay up with cutting-edge pedagogy and cognitive sciences to guarantee inclusive and equitable quality education for all students and to equip them with current knowledge and applicable skill sets for lifelong learning. Traditional teaching methods are profoundly teacher-centered and usually students pay attention to the teachers during the course. Flipped learning is distinct in that there are more engaging learning activities within the time spent in the classroom. Compared to the conventional approaches, it allows students to participate in the lesson more actively. However, flipped learning also presents several challenges for the students. This study aims to examine the advantages and challenges of flipped learning in higher education. Sixty-two students in Character Building Civics course participated in this qualitative study. Students' views on the implementation of flipped learning were gathered through an open-ended questionnaire. The findings showed that flipped classroom gave students more chance for independent learning and flexibility during both online and in-class sessions. The students also reported that flipped learning allowed them to be more well-prepared before class. However, the findings also indicated the difficulties with flipped learning. Some students expressed the challenges to be self-regulated learners as required in the flipped classroom. In addition, students also reported their poor Internet accessibility outside of the classroom.

Keywords: Flipped Learning, Online Learning, Higher Education, Character Building, Civics

Citation: Yulianti, K. (2023). Students' Perceptions on the Use of Flipped Learning. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1843-1853), Cappadocia, Turkiye. ISTES Organization.

Introduction

The advancements of technology in the twenty first century have increased demand for the learning settings. Mobile phones, notebooks, and tablets are widely prevalent. New skills are highly valued in the competitive job market that college graduates must navigate. Some of the needed skills for twenty-first-century cultures include creativity, innovation, critical thinking, problem-solving, collaboration, information and communication literacy, and responsibility (Gunduz & Akkoyunlu, 2019).

The World Economic Forum (2016) categorized the skills necessary for the 21st century into three domains: foundational literacies, competencies, and character qualities. These skills are shown in Table 1 along with their respective domains. The fast-evolving technologies also require students to be nurtured with lifelong learning

capabilities which encompass all three 21st Century domain skills.

TABLE 1. 21st Century Skills (World Economic Forum, 2016)

Foundational literacies	Competencies	Character qualities
Literacy	Critical thinking/problem solving	Curiosity
Numeracy	Creativity	Initiative
Scientific literacy	Communication	Persistence/grit
ICT literacy	Collaboration	Adaptability
Financial literacy		Leadership
Cultural and civic literacy		Social and cultural awareness
Lifelong Learning		

Consequently, higher education institutions need to demonstrate the effectiveness of their programs and improve student learning (O’Flaherty & Phillips, 2015). Although academics have access to a wide variety of online teaching resources, technology is not the only factor in teaching and learning. Universities now pay more attention to the demands of the modern workforce. In place of memorizing formulas and data from textbooks, students today prefer to concentrate on learning knowledge relevant to real problems and issues (Bäcklund & Hugo 2018; O’Flaherty & Phillips 2015)

Flipped learning

The term flipped learning refers to a method of teaching that combines face-to-face interaction in the classroom with independent study outside of it, frequently through watching the pre-recorded video content (Gunduz & Akkoyunlu, 2019).

There are several definitions of flipped learning in the literature. Essentially, flipped learning is a model where students are expected to study articles, view videos, and listen to podcasts to prepare for the lesson before class (Mull 2012). Flipped learning is a pedagogical approach in which direct instruction is moved outside of the classroom and the emphasis is on changing the learning environment into one that is interactive, with the instructor directing students they engage with the subject matter (Pettis, 2014). In flipped classroom, both instructor and students are proactive and frequently call for learning new or improving existing skills. The instructor creates purposeful learning experiences to engage students. Students in flipped classroom are responsible for independently exploring materials such as modules, videos, or readings. Before class, they try to learn the prior knowledge so they can actively apply it in the collaborative classroom (EDUCAUSE Learning Initiative, 2012 as cited in Brewer & Movahedazarhouligh, 2018).

By placing the student at the center of the learning process, the classroom can become more student-centered. This method offers the chance to motivate and pique the student's interest. To create a student-centered

classroom, employ in-class time to actively involve students in the learning process, and offer them with tailored support, the instructor must continuously innovate and monitor student progress (Hamdan et al., 2013). Bergmann and Sams (2014) provided the simplest definition of flipped learning: “what is done at school done at home, homework done at home completed in class.” Furthermore, Flores et al. (2016) emphasized that the foundation of flipped learning is a model that restructures time spent inside and outside of the classroom. All these definitions stress the fact that learning is more flexible when students can finish their coursework on their own schedule and in their preferred locations. Additionally, in-class time is planned to encourage participation in interactive learning activities, peer collaboration, evaluation of progress, and identification and correction of misconceptions.

Flipped learning makes it simple for schools to switch from an environment where learning is concentrated on the instructor to one where learning is centered on the students. Additionally, flipped learning has been shown to increase student engagement and motivation compared to traditional classroom settings, as well as student-student and student-teacher interaction (McLean et al. 2016). Shea et al. (2012) emphasized that students develop their knowledge by interacting and cooperating with one another in both the classroom and the online environment, contradicting Toto and Nguyen's (2009) assertion that flipped learning is an approach that increases active learning activities and gives students opportunities to apply their knowledge in class while receiving guidance from the teacher.

Despite all the benefits mentioned in the literature, flipped learning also has some drawbacks, including low student participation, technological difficulties, teachers' need for preparation time, and poor teacher-student communication. The motivation of the students to finish their work on their own schedule and in their working habits are key factors in the success of flipped learning. Because of this, the most common critique of flipped learning is that some students can be averse to it at first and show up to class unprepared. According to certain studies, students could find it difficult to adjust to this paradigm and forego pre-class activities (Herreid & Schiller 2013; Strayer 2012; Chen et al. 2014).

Flipped learning in higher education

For several reasons, flipped learning is especially well-suited to higher education settings. The in-class discussions and enrichment activities made possible by relocating content delivery outside of class time give students the chance to develop crucial 21st-century skills like teamwork, critical thinking, and creativity (Brewer & Movahedazarhouli, 2018). Some studies investigated the advantages of flipped classes in higher education were driven by the idea that the traditional teaching approach fall short in creating a strong knowledge structure. According to some findings of these studies, a flipped learning method aims at maximizing the use of students' own times (Pettis, 2014).

Gunduz and Akkoyunlu (2019) found that flipped classroom allowed students an opportunity to benefit from more flexible instruction both online and in-class sessions. The students stated that they felt more in charge of

their own learning. However, some of them also voiced dissatisfaction with the slow Internet access outside of the classroom and the lack of immediate response while watching videos. A study by Birgili and Demir (2022) shows that students felt relatively unmotivated with flipped learning approach although they were satisfied with the course structure. The students in this study also reported that they faced difficulties in all three types of interaction: student-student, student-educator, and student-content. Other issues were long poor-quality videos and students' lack of class preparation.

Research Objective

In the present study, the researcher examined the effectiveness of flipped learning and to highlight both the benefits and drawbacks of the flipped learning approach. The researcher flipped her Character Building-Civics course by placing the lecture content online for the students to view and study in their own time, while using in-class sessions to provide more opportunities for group learning and discussion activities.

Method

Research method and research question

This qualitative study attempts to answer the following research questions:

1. What do the students think of the benefits of flipped learning?
2. What do the students think about the difficulties they encountered with flipped learning?

Data was gathered through a qualitative survey with an open-ended questionnaire which then was analysed with the descriptive analysis method.

Participants

The participants of this study were 62 students who enrolled in Character Building- Civics course which some of the sessions the researcher flipped in the Odd (Fall) semester of 2022-2023 academic year.,

Implementation process

This section explains how flipped learning was implemented in the Character Building-Civic course including the basic procedures and tools. The flipped learning approach comprised two main components: the online learning environment and classroom sessions. Additionally, the researcher (also the instructor of the course) created WhatsApp Group (WAG) of the class to support online and class sessions and to enhance communication between the students and the instructor. Instructor shared the materials through the Forum in LMS and informed the students both through the LMS and WAG. The materials were: modules, PowerPoint presentation and videos on LMS, external video on YouTube, and readings from online articles.

Online learning environment

This section describes the infrastructure of the system, including the design process and course materials. The process was planned carefully, and the lesson plans were developed for online and class activities for 3 weeks. The instructor used videos on LMS that were prepared as online resources by the subject content specialist of the Character Building-Civic course. In addition, some external videos on YouTube channels were also used. The instructor shared the external videos through the Forum on LMS and WAG of the class. PowerPoint presentations and reading materials were also ready in the online learning environment. The instructor also assigned all groups to prepare two questions for in-class discussions. Students have been divided into groups of 6-7 students before taking active participation in their own group to create higher order thinking questions and in class discussions.

In-class session

Students studied the course materials, watched the videos, then with their group they prepared and turned in two questions for each subject before the in-class sessions. Discussions were conducted in class. Each group asked two questions to one group. For example, group 1 asked their questions to group 2, group 2 asked group 3, and so on. Every group had to answer the questions they received from the other group. The instructor observed the course of the discussion and intervened when the group in charge of answering was not quite right in giving the answers. Before the class ended, the instructor assessed the understanding of the students through quiz on Kahoot. The students also wrote their reflection of what they had learned in the class session.

Survey through an Open-Ended Questionnaire

The open-ended questionnaire used for this study, in particular the questions about the benefits of the flipped learning and was mainly derived from Gunduz and Akkonyulu (2019) and Louisa Tomas, Neus Evans, Tanya Doyle, and Keith Skamp (2019). In addition, the researcher asked students about their in-class sessions and the challenges they faced during the flipped learning. Hence, the open-ended questionnaire consisted of the following questions:

- What do you think about the benefits of the flipped learning?
- Tell me about the reading materials and videos given before class.
- What do you think the group and class discussions or in-class sessions?
- What do you think about the challenges you faced during the flipped learning?
-

Data Analysis

Then, data were analyzed through coding to find the similarities and differences of the students' views on the implementation of flipped learning.

Results

The benefits of the implementation of flipped learning

Findings show that most participants (98.38%) in this study found that flipped learning an effective teaching method. Students were very positive about the implementation of the flipped learning.

Here are some responses of the students regarding the benefits of flipped learning:

In my opinion, flipped learning is an effective method because students can prepare in advance what they must learn before class. I also learn to be self-regulated and learn at my own pace. For example, I can watch a video that is given to be studied first. I can pause watching when I whenever I want then I continue until I finish watching.

With flipped learning I know what to learn first and this makes me understand the topic more quickly. It is definitely a good way to have the students have more insights before class, meaning students can be more active and understand the materials in advance.

Flipped learning enables student to prepare for class and that preparation really helps students to understand better after being explained again by the lecturer.

The benefits of the reading materials and videos provided before class

Most students claimed that studying the articles and watching the flipped videos gave them the necessary information to either better prepare for class or comprehend the lectures.

The primary explanations for how the reading materials and videos helped students' learning are presented below.

The videos contained clear and concise explanations of the concepts so that they enabled you to understand the lesson before class.

The visual representation of information helped me to understand the topic.

The ability to pause and to replay the videos makes learning occur at my own pace. I was able to stop and to replay the parts were hard to understand.

The group discussions or in-class sessions

Students in this study reported that the group assignment and group discussion motivated them to attend class because they had to be solid working together as a group. Students also stated that the group discussions or in-class sessions provided opportunities for the students to more engaged in the lessons.

You must work together as a group. You therefore feel guilty about disappointing your group if you do not come to class.

I really liked the group assignment and class activities. So, we were required to make two questions to be asked to a group. For example, group 1 gave their questions to group 2, group 2 asked two questions to group 3, and so on. This activity was really engaging us. The lecturer was also ready to clarify when there were unclear answers from the group who got their turn to answer.

The challenges the students faced during the flipped learning

The following quotations illustrate how one disadvantage of flipped learning was the lack of Internet connection for watching videos at home.

It was sometimes difficult to watch the videos because of the poor Internet connection in my home.

I had to view the videos on campus since the Internet connection was stronger and faster.

Another challenge the students faced was to become discipline and self-regulated learner as required in the flipped learning.

Sometimes I was too lazy to study the reading materials and to watch the videos before class.

In flipped learning, students need to study the learning materials before class. I find it not always easy to be a self-regulated learner as required by this approach.

Discussion

In the present study, the researcher examined: (1) the benefits of the flipped learning and (2) the difficulties that the students encountered with the flipped learning. The researcher conducted this study through open-ended survey questionnaire with students in Character Building-Civics course in a private university in Jakarta, Indonesia. In response to Research Question 1, the survey revealed that nearly 98.40% of the students as the respondents believed that flipped learning an effective instructional approach. This finding is in line with some existing studies on the effectiveness of the flipped learning in higher education, i.e. the study findings of Gündüz and Akkoyunlu (2019), Tomas, Evans, Doyle, and Skamp (2019), and Zhao, We, and Su (2021).

In this study, the learning materials that the students had to study at home were applied in class. According to Biggs and Tang (2007) this enables the facilitation of a deeper conceptual coverage and offered a setting that is conducive to the promotion of deeper learning. In addition, this study reveals that peer learning as a major component of the in-class activities can help to promote peer-based learning. This study finding is consistent with a lot of existing studies, for example Tomas et al. (2019) and Khodai, Hasanvand, Gholami, Mokhayeri, and Amini (2022).

In response to Research Question 2, there were two challenges the students faced with flipped learning. First,

some students voiced dissatisfaction about the slow Internet outside the classroom. Second, the difficulty of being self-regulated learner as required in flipped learning. The first challenge is similar with the study finding of Gündüz and Akkoyunlu (2019). Clark (2015) suggested that instructors might need to provide a few extra copies of the flipped learning materials on DVDs to overcome the problem of a bad Internet connection.

Regarding the second challenge that some students found it difficult being self-regulated learners, previous existing research has shown that self-regulated learner (SRL) interventions (e.g. SRL instruction and SRL prompts) could enhance students' SRL and in turn improve learning outcomes (Zeng, 2016; Jansen, van Leeuwen, Janssen, Jak, & Kester, 2019). According to Panadero (2017) and Zimmerman and Moylan (2009 as cited in Alten, Phielix, Janssen, & Kester, 2020), students that exhibit SRL behavior actively regulate and monitor their cognition, behavior, and motivation while learning. This involves using strategies and goal-setting processes. Self-regulated learners have the capacity and drive to reflect on what, how, and why of their learning (metacognition), which allows them to manage their learning behavior. In the context of blended learning, Van Laer and Elen (2017) proposed seven key attributes that can support SRL: authenticity, personalization, learner-control, scaffolding, interaction, cues for reflection, and cues for calibration.

Conclusion

Flipped learning is beneficial for Character Building-Civics course as it gave students more chance for independent learning and flexibility. Students also learned from their peers through group discussions in in-class sessions. The flipped learning allowed students to be more well-prepared before class. Some students expressed the challenges to be self-regulated learners as required in the flipped classroom. In addition, students also reported their poor Internet accessibility outside of the classroom.

Limitation and Recommendation

This study only involved a small number of students in Character Building-Civics course and applied qualitative method with open-ended survey questionnaire. Future study should be conducted in a different Character Building course with mix-method approach and involve a larger number of students as participants. To help enhancing students' self-regulated learning, the future flipped learning study should use SRL instructions and SRL prompts.

Acknowledgement

I would like to thank all the students for sharing their experiences with flipped learning in Character Building-Civics course in the Odd Semester 2022/2023.

Abstract: Biology, a living science, is known as a balance and complement among other branches of science. Just like the science of biology, biology as a course also plays a very important role among other courses at all school types and grades. It is thought that the adults of the future should not be deprived of knowledge in the field of biology and should use every correct information they have acquired in their daily life to overcome related problems they may encounter. For the change that occurs in the individual's life to be permanent, the way to effective education is through a curriculum developed with socio-cultural, scientific and technological developments, taking into account the conditions of the country. For example, comparing other countries' educational practices and curricula based on the results from international assessments such as PISA TIMSS. According to the PISA science scores (2018), Germany has performed above the average determined by the OECD. Therefore, current education programs in Munich are discussed as an example in this research. This study adopted document analysis, one of the qualitative research methods, as the methodology. The "2018 Secondary Education Biology (9, 10, 11 and 12th Grades) Curriculum" published by the Ministry of National Education in Türkiye and the "Biology Curriculum of Germany" published by Kultusministerkonferenz were examined. While examining the documents in the study, they were subjected to content analysis. According to the findings, as in Bavaria, instead of encouraging rote learning regarding these topics for the sole purpose of university entrance purposes, Türkiye should include in curricula or teach in seminars the social and ethical aspects of HIV/AIDS, sexual/reproductive health, adolescent development, transmission and prevention of diseases, reproductive drug diagnostics, biomedical processes, opportunities, and risks. As a result, there are some differences in terms of content in the curriculum of both countries.

Keywords: Reproduction, Development, Reproductive health, Biology curriculum, Comparative education.

Levent Turan, published by Hacettepe University Institute of Educational Sciences in 2021.

Introduction

Biology education, which is a part in human life, is a whole with transferring the knowledge regarding both biological and cultural issues happening from the birth to the death of human in line with the peculiar talents of an individual in such institutions as primary, secondary and higher education where students are given general information, with training them in a versatile way and making them attain a good character (Kizirođlu, 1988). The fact that the change happening through education in individual's life become permanent and that they can keep up with the change in the world are the basic determinants of educational system. The skills attained through educational process will make a contribution both to the development of life quality of individual and to the welfare of the country, to the social and democratic development (Ministry of National Education, 2020). A great many countries in the world concentrate more particularly on the researches in applied sciences to be able to keep pace with the innovations accompanied by developments (Ekici and Heyedanlı, 2010). The countries which are aware of the fact that biology learning and teaching is a cultural and vital must for the modern world frequently revise the current biology curricula in order to increase the quality of biology education, indicate the necessary findings, carry out studies for the purpose of applying new curricula they develop in an effective way and to provide necessary opportunities at schools, so setting forth the efficiency of curricula (Avas, 1995; cited in Soysal, 2018).

It becomes a significant problem that the young people do not have adequate and true knowledge about reproduction health and learn inconsistent information by means of media (Giray and Kılıç, 2004). Giving importance to a healthy life and developing the health of young people come in the first place of the list of 21 health targets to reach 21st century determined by World Health Organisation (Öksüz and Malhan, 2005). The fact that young people do not have sufficient information about reproduction health means that they do not know how to benefit from health applications and as to the risks likely to occur because of sexual behaviours (Civil, 2010). Some studies carried out abroad point out that the courses of reproduction health taught at schools are not sufficient and that what they learn about reproduction health comes from their close vicinity, media and family (Rivera, Cabral de Mello, Johnson, Chandra Mouli, 2001; Bennet, 2001). In a few studies carried out in Türkiye particularly into sexual health or reproduction health of adolescents, mostly their knowledge about reproduction health was investigated. It was found at the end of the studies that the knowledge of adolescents regarding sexual health is low (Çok, 1998; Mađden et al., 2003; Giray and Kılıç, 2004). Ignoring an education in this issue could lead to some problems both in the current time and in the future. Since any investment to be made into the education of young people determine economic and social developments of societies, young people are the biggest group for whom some investments must be made in social and economic fields in a country (Özalp, 2005; cited in Karabulutlu and Kılıç, 2011).

The topics of reproduction, generation and development basically comprise information as to how generations

human being and other living creatures convey their genetic compounds to the coming generations for the continuation of their generations. Having such an intense place in life, the topics of reproduction, generation and development attach an importance on body and mental health and allow us to train individuals keeping any case affecting their health away (Zeren, 2005). In this sense, apart from being able to comprehend that individuals provide the biological continuation of other living creatures, giving important information that they should acquire in terms of community health under the heading of reproduction and development comes to the forefront.

For the change that occurs in the individual's life to be permanent, the way to effective education is through a curriculum developed with socio-cultural, scientific and technological developments, taking into account the conditions of the country. Many countries recognize the importance of biology education as a cultural and essential aspect of the modern world. To improve the quality of biology instruction, these nations regularly evaluate their current biology teaching programs, identify necessary changes, and consider the conditions required for the successful implementation of newly developed curricula (Soysal, 2018). In this context, the Ministry of National Education of Republic of Türkiye (2018) uses methods such as international comparisons and evaluation of different education systems to determine how to develop a correct education system and therefore an effective curriculum. For example, comparing the educational practices and curricula of other countries based on the results from international assessments such as PISA TIMSS. PISA examines to what extent students acquire information in the fields of reading, mathematics and applied sciences and what they can do with this information. At the same time, PISA provides the most comprehensive and neatest international evaluation regarding the learning outcomes students. The results obtained from PISA show the quality and equality of the learning outcomes obtained throughout the world. Besides them, it allows educators to learn about up-to-date applications in the field of educations in other countries. Comparison studies were also conducted prior to the development of the programs to investigate the similarities and differences between world standards and those adopted by Türkiye under certain conditions. Therefore, this research determined scores from PISA 2018 as the determinant factor to select countries to compare Türkiye's existing education system with the curriculum of the top-scored countries'. According to the PISA science scores (2018), Germany has performed above the average determined by the OECD (OECD, 2018). Therefore, current education program in Baden-Württemberg is discussed as an example in this research.

In the current study, it was aimed to investigate the place of reproduction, generation and development in the secondary curricula. In this sense, the topics of reproduction, generation and development were evaluated in terms of level of grade, content and outcomes in the secondary education, biology course curriculum.

Research Questions

1. What is the content and grade level of the learning outcomes of the units that include reproduction and development in the biology curriculum in Türkiye?
2. What is the content and grade level of the learning outcomes of the units that include reproduction and

development in the biology curriculum in Baden-Württemberg, Germany?

3. What are the similarities and differences between the biology curricula used in Baden-Württemberg and Türkiye regarding the place of reproduction and development?

Method

In the current study, document analysis method, one of the qualitative research methods, was used. Document analysis is a systematic process used to examine and evaluate both printed and electronic materials (Özkan, 2020). Document analysis in qualitative research could be a data collection method alone as well as being used together with other data collection methods. In the document analysis method, it is necessary to follow the stages of a casual examine of the document as the first step and then a detailed examination, determining the results, and follow up the steps of commenting (Bowen, 2009).

In order to enlarge and enrich the data obtained in the research, biology course curricula in Türkiye were investigated in comparison with the biology course curricula in the State of Baden-Württemberg, Germany. Comparative education could comprise the comparison of the education of countries together with their teaching programs or in terms of various factors (Balçı, 2007). In the comparative studies, Ültanır (2000) pointed out that there are two approaches as horizontal and vertical ones. In the vertical approach, the changes coming from the past are investigated while the variables of the same period are compared and the similarities and differences are determined in the horizontal approach (Türkoğlu, 1998). In this sense, horizontal approach was used in the current study and the data obtained was tried to be extended.

Data Collecting Tools and Data Analysis

In the research, “2018 Secondary Education Biology Curricula for the 9th, 10th, 11th and 12th grades” published by the Ministry of National Education (MoNE) in Türkiye and “Germany (Baden-Württemberg) Biology Curriculum” published by Kultusministerkonferenz (2020) were investigated as a document.

During the investigation of the documents obtained in the study, they were applied content analysis. The content analysis was carried out within the framework of investigating the class level, course hour, content and learning outcomes for the topics of reproduction, generation, development given in the secondary education biology curriculum. The main purpose of the content analysis is to reveal the data obtained in a framework and reach the concepts and the relation between the concepts (Yıldırım and Şimşek, 2018).

Findings

Secondary School Biology Curriculum in Türkiye

Upon the review of secondary education biology course curriculum, it was found that the topics of reproduction, generation and development were given directly or indirectly in the units of “Life Science Biology” in 9th grade, “Cellular Divisions” in 10th grade, “Human Physiology” in 11th grade and “Plant Biology” in the 12th grade.

9.1. Life Science Biology

9.1.1 Biology and Common Features of Living Creatures

9.1.1.1 Comments the common features of living creatures.

b. The features of living creatures such as cellular structure, nutrition, respiration, excretion, movement, reaction to stimuli, metabolism, homeostasis, adaptation, organisation, reproduction, growing and development are emphasized (MoNE, 2018).

10.1 Cellular Divisions

10.1.1. Mitosis and Agamogenesis

10.1.1.1. Explains the necessity of cellular division.

a. Cellular division is related to reproduction and development in living creatures and explained.

b. Cellular reasons of division is mentioned.

10. 1.1.2 Explains mitosis.

a. Interphase is studied at basic level.

b. The phases of mitosis are studied at basic level. In the process of explaining the phases, visual elements (photographs, pictures, drawings, caricatures etc.) and graphical arrangements (concept maps, mental maps, and schemes etc.) e-learning objects and applications (animation, video, simulation, infographic, augmented and virtual reality applications etc.) are benefitted.

c. The control of cellular division and its importance for living creatures is explained. The names of the molecules controlling cellular division are not given.

d. The relation of cellular division with cancer is made.

e. Students are encouraged to prepare a product or an electronic presentation (animation, video etc.) explaining mitosis and share this presentation.

10.1.1.3. Explains agamogenesis with examples.

a. In the context of agamogenesis, the examples of schizogenesis, gemmation, reproduction through spores, regeneration parthenogenesis and vegetative reproduction are given. The examples are given only at reproduction through spores and metagenesis is not mentioned.

b. The applications of agamogenesis techniques in gardening and agriculture sector (the ways of reproduction through grafts and onions) are exemplified.

10.1.2 Meiosis and Amphigenesis

10.1.2 Explains meiosis and amphigenesis.

a. Meiosis stages are explained at basic level. While explaining the stages, visual elements, graphic arrangements, e-learning object and applications are benefitted.

b. Students are encouraged to prepare a product or an electronic presentation (animation, video etc.) explaining meiosis and share this presentation.

10.1.2.2. Explains amphigenesis with examples.

a. External and internal fertilization are not given.

b. It is explained that the basis of amphigenesis is meiosis and fertilization (MoNE, 2018).

11.1. Human Physiology

11.1.7 Reproductive system and Embryonic Development

11.1.7.1 Explains the structure, task and process of reproductive system.

a. In the study of the structure of male and female reproductive system, visual elements, graphic arrangements, e-learning and applications are benefitted.

b. Graphics regarding the hormones arranging menstrual cycle are given.

c. The methods of in vitro fertilization are shortly explained.

11.1.7.2 Inferences regarding the things to be done to protect the healthy structure of reproductive system are made.

11.1.7.3 Explains the embryonic development process.

a. The organs made up of embryonic layers are not given.

b. The factors having a negative effect on the development of baby in pregnancy (using medicine including antibiotics in early pregnancy period, extreme stress, lack of folic acid, X-ray exposition) are explained.

c. The importance of following pregnancy in terms of baby's and mother's health is emphasized (MoNE 2018).

12.3 Plant Biology**12.3.3 Amphigenesis in Plants****12.3.3.1 Explains the parts of a flower and the task of these parts.****12.3.3.2 Explains fertilization, seed and fruit formation in plants.**

a. Depending on a flowering plant, amphigenesis in plants is studied by benefiting from visual elements, graphic arrangements, e-learning and applications.

b. The role of seed and fruit in reproduction and spread of plants are given through examples.

12.3.3.3 Designs an experiment where they can observe seed germination. They are encouraged to determine the factors affecting germination.

12.3.3.4 Makes a relation between dormancy and germination (MoNE, 2018).

Biology Curriculum in Baden-Württemberg, Germany

Every state in Germany has the administrative authority in all cultural issues including teaching programs. In this sense, the curricula practiced in Baden – Württemberg, the third biggest state in terms of population, located in the southwest of the country were taken as a reference. Upon the review of the curricula practiced in Baden-Württemberg State, it was found that high school grades are between the grades of 5 and 12 and that biology subjects are different in each grade. It was also found that there are two different curricula in practice in the state (2004 and 2016 educational plans) by KMK. According to KMK (2020), 2004 educational plan is valid for all the students starting 6th grade before the educational year of 2016-2017. Besides that, 2004 educational plan is valid for Abitur for the last time in the educational year of 2021-2020, which means students starting 1st grade in the educational year 2020-2021 will take their education based on 2004 curriculum in their two-year period. It was determined that the topics of reproduction, generation and development were given under the heading of “Reproduction and Development” unit in 8th grade and under the heading of “Reproduction Biology” unit in 12th grade.

3.2 7/8th Grades

3.2.1 Cell and Metabolism

Student can define cells, organs, and organisms as a system. He can name the structural and functional similarities and differences between animal and plant cells. He can explain the relation between structure and functions of organs and systems in the transformation of materials and energy, and the importance of cellular division.

- *Defines cellular division as the basis of the growth of organisms.*

P Knowledge Acquisition (Erkenntnisgewinnung) 1, 7, 11

P Communication (Kommunikation) 3, 4

F PH 3.2.2 Optic and Acoustic (10), (11) (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

3.2.2. Human Biology

3.2.2.3 Reproduction and Biology

Student tells the growth of baby in the womb up to birth and comprehends the special importance of care for prenatal development; compares and evaluates different birth control methods; defines different sexual orientations and forms of sexual identities independently from values.

- *Explains the formation of an embryo out of an egg cell fertilized through cellular division and cellular differentiation.*
- *Explains the most important development stages of pregnancy (implantation, embryo, foetus, birth) and the results of external effects.*

-

P Knowledge Acquisition (Erkenntnisgewinnung) 11

P Communication (Kommunikation) 4

P Evaluation (Bewertung) 1,14

I 3.2.1 Cell and Metabolism

F BNT Human Development

L PG Body and Hygiene

- *Compares and evaluates different birth control methods.*
- *Explains the importance of the way to apply to protect from sexually transmitted infectious diseases (HIV).*

P Communication (Kommunikation) 1, 10

P Evaluation (Bewertung) 1,3

I 3.2.2.5 Immunobiology

F BNT Human Development

L PG Body and Hygiene

- *Defines sexual orientation and sexual identity forms without judging them.*
- *Explains the importance of sexuality for partnership.*

P Communication (Kommunikation) 5,9

F ETH 3.1.1.1 Identity, individuality and role

F ETH 3.1.1.2 Freedom and Responsibility

F RRK 3.2.1 Human Being

L BTV Personal and social variety; self-discovery and accepting other life styles

L VB Personal needs and wishes (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

3.3.9/10th Grades

3.3.2 Genetics

Student can use a simple model to explain the features of DNA. In addition, he can define and compare the transformation of genetic information in mitosis and meiosis division. Also, he can explain what kind of a change amphigenesis creates. He can evaluate the opportunities and risks of genetic engineering.

- *Explains how baby cells having the same set of chromosomes appear in the cellular cycle by means of mitosis and cellular division.*
- *Defines the process and meaning of meiosis and compares it with mitosis.*
- *Explains how sex is determined by sex chromosomes at human.*

P Knowledge Acquisition (Erkenntnisgewinnung) 11, 14

P Communication (Kommunikation) 3

I 3.2.1 Cell and Metabolism

I 3.2.2.3 Reproduction and development

F NWT 3.2.4.3 Information processing (1) (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

3.4 11/12th Grades (Two-Hour Course)

3.4.5 Reproduction Biology

Student can compare amphigenesis and agamogenesis; can define modern reproduction biology methods and evaluates the opportunities and risks of various prenatal diagnosis methods.

- *Compares amphigenesis and agamogenesis.*
- *Knows the processes of reproduction biology (germ line treatment, cloning, in vitro fertilisation).*
- *Defines and evaluates prenatal diagnosis methods.*

P Communication (Kommunikation) 1, 10

P Evaluation (Bewertung) 4, 7, 9, 11

I 3.2.2.3 Reproduction and development

F ETH 3.3.4.1 Responsibility ethics (5)

F REV 3.5.2 World and responsibility

F RRK 3.4.2 World and responsibility

F RRK 3.5.2 World and responsibility

L BTV Value Oriented Action (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

3.5.2 Biomolecules and Molecular Genetics (Four-Hour Course)

3.5.2.1 Biomolecules

Student can explain the importance of macromolecules in life. At the same time, he uses suitable models to be able explain the relation between the structure and functions of both proteins and nucleic acids.

- *Explains the structural features of proteins (primary, secondary, tertiary, quaternary structure).*

P Knowledge Acquisition (Erkenntnisgewinnung) 11

P Communication (Kommunikation) 7

I 3.2.2.1 Diet and digestion

I 3.2.2.3 Reproduction and development

I 3.3.2 Genetic

F CH 3.2.1.3 Attachment and interaction models

F CH 3.3.2 Natural materials

F CH 3.4.4 Natural materials

- *Explains the structural features of DNA on a model (complementarity, anti-parallelism, double stranded).*

P Knowledge Acquisition (Erkenntnisgewinnung) 9, 11, 14

I 3.2.2.3 Reproduction and development

I 3.3.2 Genetics (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

3.5.2.3 DNA and Gen Activity

Student comprehends the importance of replication and can explain how genetic information leads to the expression of features. He can compare transcription and translation and explain how antibiotics work by means of their differences. He can also explain the importance of arranging a gen activity for metabolism.

- *Explains DNA replication and its importance for cellular division.*

P Knowledge Acquisition (Erkenntnisgewinnung) 5, 11, 14

P Communication (Kommunikation) 4, 7

I 3.2.1 Cell and Metabolism

I 3.2.2.3 Reproduction and development (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

3.5.4 Intercellular Communication

3.5.4.2 Endocrine System

Student can explain the importance of hormonal system in the arrangement by metabolism and hormones and define different effect mechanisms of hormones on target cells.

- *He can explain the arrangement of metabolic processes by hormones (eg. Thyroxine, insulin, gender hormones) with an example.*

P Knowledge Acquisition (Erkenntnisgewinnung) 12, 14

P Communication (Kommunikation) 4, 7

I 3.2.2.3 Reproduction and Development

I 3.2.2.4 Information System

L PG Sense and Sensation (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

3.5.6 Opportunities and Risks of Biomedical Processes

Student can define and compare natural reproduction in different living creatures. He can define the reproduction biology methods in human being and evaluates the opportunities and risks of various prenatal diagnosis methods.

- *Explains and evaluates the prenatal diagnosis methods and diagnosis method for preimplantation.*

P Knowledge Acquisition (Erkenntnisgewinnung) 12, 14

P Communication (Kommunikation) 4, 7

I 3.2.2.3 Reproduction and Development

F ETH 3.4.4.2 Applied ethics (4)

F REV 3.4.2 World and Responsibility

F RRK 3.5.2 World and Responsibility

L BTV Value Oriented Action (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

Table 1. Symbols and Explanations for Skill Areas with a Reference to Learning Outcomes Regarding the Process Taking Place in the Secondary Education (Gymnasium) Biology Curriculum in the State of Baden-Württemberg, Germany (Ministerium für Kultus, Jugend und Sport Baden-Württemberg, 2016).

Symbol	Explanation
P	Reference to learning outcomes regarding the process
I	Reference to other standards for the learning outcomes of the same technical plan regarding the content
F	Reference to other topic units
L	Reference guiding for perspectives

Conclusion

It is likely to see that both curricula include the topics of reproduction, generation and development almost at every grade. When it comes to biology course curriculum in Türkiye, there are a total 13 learning outcomes regarding the topics of reproduction, generation and development while there are 19 outcomes in the state of Baden-Württemberg.

The findings show that while the topics of growing and developing are given in the first stage with the unit of common features of living creatures in Türkiye, the topic is dealt directly with the unit of reproduction and development in Baden-Württemberg. At the same time, such topics as biodiversity and evaluation with genetic recombination, biomedical processes and prenatal diagnosis methods are given in detail as differently from what is in Türkiye. As for Türkiye, it is likely to see that such topics as amphigenesis in plants, agriculture and gardening are given a place. Contrary to the one in Türkiye, such action expressions as “is not given” or “... topic is not taught” are not encountered in the outcomes in the curricula. As a result, besides some similarities between the two countries in terms of contents, there are some significant differences in the biology topics

taught. In their studies, Karabulutlu and Kılıç (2011), it pointed out that the information levels of the students studying at a health college about sexual health/reproduction health, but that majority of them have not been given services in this regard. For that reason, it is essential that the topics similar to the learning outcomes regarding reproduction, generation and development should be given by means of direct teaching methods in combination with daily life cases as much as possible in biology course curricula in Türkiye.

The recommendations depending on the results obtained in the current study are as follows:

- The number of learning outcomes should be increased in a way to support with more content regarding the topics of reproduction, generation and development in the biology course curricula in Türkiye.
- In order that future mothers and fathers become conscious parents, learning outcomes regarding prenatal diagnosis methods to decrease the prejudice in this issue could be given a place in the curricula in Türkiye as in Germany, so that students could reach as much information as possible in the course of biology by taking the conditions in Türkiye into consideration in terms of sexual health concerning reproduction and development topics.
- Given that secondary education students' receiving more information in terms of the topics of reproduction and development is of great social benefit, some in-service trainings should be held for teachers to increase their knowledge regarding the related field and teaching methods.

Abstract: Artificial intelligence has potentiated changes in higher education. In this position paper, we propose to discuss dimensions that shape higher education and that can be transformed by the mobilization of Artificial Intelligence: teaching-learning processes (from the perspectives of scholars and students), research (from the perspective of professional researchers, students and advisors), management of organizations (from the perspective of managers, subordinates and students), and the relationship with the outside (the look from inside to outside, as well as from outside to inside). To this end, a document collection and analysis was carried out to support our argument about the new challenges and the potential that emerges from the existence and application of artificial intelligence in higher education. As this change, like any transformation, will have positive and negative aspects, some implications of both a theoretical and more practical nature of these challenges for academics, students and other stakeholders in higher education institutions are also discussed.

Keywords: Artificial intelligence, Digital competence, Digital literacy, Higher education, Innovation.

Citation: Santos, A. I., & Serpa, S. (2023). Artificial Intelligence and Higher Education. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1866-1874), Cappadocia, Turkiye. ISTES Organization.

Introduction

As early as 1990, Aiken considered that “There are sceptics who question the expenditures on research in Artificial Intelligence in general and Artificial Intelligence and Education in particular. The author believes that we don’t have a choice – we MUST continue to investigate ways in which Artificial Intelligence will make the computer a better aid for teaching and learning” (Aiken, 1990, p. 12). Especially in more recent years, there has been a growing presence of Artificial Intelligence (AI) in our lives, partly boosted by the COVID-19 pandemic in all contexts, not escaping that of Education (Akinwalere & Ivanov, 2022; Nouhan et al., 2021; Ilieva, 2021; Bearman et al., 2022; Pedró, 2020; Hinojo-Lucena et al., 2019; Ferreira & Serpa, 2018a; Sá & Serpa, 2020, 2023). In fact, as Vicari (2018) points out, nowadays, it is not possible to think of Education without dissociating it from technologies and their use.

Based on the concept of AI “[...] as computing systems that are able to engage in human-like processes such as learning, adapting, synthesizing, self-correction and use of data for complex processing tasks” (Popenici & Kerr, 2017, p. 2), the ultimate goal of introducing AI in Education should envisage the development and qualification of human capital with skills that make 21st-century citizens better able to cope with changes and consequent responses to increasingly global needs (Southworth et al., 2023), based on three basic principles, pointed out by Churi et al., 2022, based on Buckingham (2018):

- Learning: Acquiring and processing the new experience, creating new behaviour models;
- Self-correction: Refining the algorithms to ensure the most accurate results;
- Reasoning: Picking up the specific algorithms to solve a specific task (Churi et al., 2022, p. 3).

In line with this reasoning, higher education institutions were not immune to this growing influence of AI (Crompton & Song, 2021; Mazikana, 2023; Pence, 2019; Manhica et al., 2022; Nouhan et al., 2021; Akinwalere & Ivanov, 2022). AI came, then, to boost changes in higher education at various levels, which encompass faculty members, students, other employees and the institution’s management itself (Pence, 2019), even if it generates anxiety (Li & Yang, 2023; Bates et al., 2020), but with the potential to shape innovation (Akinwalere & Ivanov, 2022).

As higher education is a place where research, innovation, problem-solving or the use of the latest technologies are sought to be leveraged by excellence, AI offers, in this context, an opportunity to support students in their learning processes and building skills that better suit today’s academic, professional and personal demands, by offering personalized learning processes, intelligent tutoring systems or helping students in the analysis of their path and performance. At the same time, it also helps students and teachers by allowing them to make personalized recommendations on aspects to be improved, whether in terms of the students’ educational success or difficulties, or in terms of support that the teacher can develop to help them, at the level of both materials or activities and assessment processes (Al Ka’bi, 2023; Zentner, 2022). Also in the context of higher education, AI can be a useful tool at the service of research, facilitating tasks such as literature review or data analysis and leaving the researcher time for other tasks that require their more direct intervention, as well as at the service of administrative tasks, streamlining processes such as enrolment or preparation of timetables, freeing up staff for other types of tasks (Al Ka’bi, 2023).

In synthesis, artificial intelligence has boosted changes in higher education. In this position paper, we propose to discuss dimensions that shape higher education and that can be transformed by the mobilization of AI: teaching-learning processes (from the perspectives of scholars and students), research (from the perspective of professional researchers, students and advisors), management of organizations (from the perspective of managers, subordinates and students), and relationship with the outside (the look from inside to outside, as well as from outside to inside).

Methods

To enable rigorous and justified reasoning of the potential that shapes higher education and that can be transformed by the mobilization of AI, a document collection and analysis was carried out based on the search, selection and analysis of documentation in two databases, namely B-ON (<https://www.b-on.pt/en/what-is-b-on/>) and SCILIT (<https://www.scilit.net/about>), using the following two search terms: “Artificial Intelligence” and “Higher Education”. In addition, a self-reflexivity was carried out, given that the authors of this paper have themselves been university teachers for over 20 years, which enabled the controlled mobilization of this experience in the arguments presented (de Verlaine, 2022).

Artificial intelligence in higher education

According to Li and Yang (2023), higher education in the AI virtual world has clear differences when compared with higher education considered traditional. Firstly, there is a gap between the evolution of AI and the failure of more traditional higher education institutions to keep up with this evolution, which is also evident at the level of the training itself, its time cycles and the generational issues that they imply. Secondly, there are differences at the level of governance of the institutions, more sustained by empirical judgements in the more traditional cases or more based on big data in the case of those more oriented towards AI. Thirdly, differences are identified in the logic of training models, with the traditional ones clearly more focused on large-scale teaching versus a training perspective more focused on individuality or more personalized in the case of AI. Finally, Li and Yang (2023) also point to differences between the way research is envisaged between these two ways of looking at higher education, pointing to the need, in the case of the integration of AI, for a “[...] new scientific research mode of network collaboration, traceability, and multi-disciplinary integration” in a relatively conservative higher education arena (p.32).

However, the use of AI in higher education is not a straightforward, clear and direct process, entailing obstacles, difficulties and challenges that must be overcome. Recent research has listed some aspects worthy of reflection for the introduction of AI in higher education. If, on the one hand, some concerns regarding users’ data and privacy are highlighted, as well as the possible capacity of AI to replace trainers (Al Ka’bi, 2023), on the other hand, it must be acknowledged that AI cannot be a reality that starts only in higher education, but has its beginning much earlier, for students, as for teachers. In this sense, several studies are being developed that imply the introduction of AI much earlier in the school curriculum of younger students (Southworth et al., 2023).

On the other hand, some advantages lead to consider the introduction and development of AI in higher education, as it is deemed that it may be a way to better prepare citizens and future workers for a more competitive labor market, and where AI will be (or already is) a reality (Laupichler et al., 2022), as well as for facilitating learning and administrative processes (Al Ka’bi, 2023).

In general, we can consider, as some of the advantages of AI, aspects such as the following mentioned by Churi et al. (2022, pp. 22-24): high accuracy with fewer errors, high-speed, high reliability, useful for risky areas, digital assistant, quick feedback, ongoing student assessment, platforms for distance learning, adapted teaching content, virtual reality, accessibility, efficient administrative management, data collection, storage, and security. In particular, in the context of higher education, Zentner (2022) highlights several potentials for its use, summarized in Table 1.

Table 1. Examples of AI application in higher education

Adaptive learning platforms	It provides personalized learning experiences for students, adapting to their needs and abilities as they progress through a course.
Automated grading	it allows to grade student assignments and exams, freeing up instructors to focus on more complex tasks and interactions.
Data analysis and visualization	can help researchers analyze large datasets and identify patterns and trends that would be difficult or impossible for humans to detect.
Language translation	translation tools can help students and faculty communicate with one another, even if they do not speak the same language.
Learning management systems	It allows to suggest resources, assignments, and activities to students based on their interests and progress.
Personalized learning systems	can adapt to the needs and preferences of individual students, providing personalized recommendations.
Personalized tutoring	can provide individualized help and support to students, adapting to their specific needs and learning styles.
Plagiarism detection	can be used to identify instances of plagiarism in student papers and assignments, helping to ensure the integrity of academic work.
Predictive analytics	can be used to analyze student data and predict their likelihood of success in a course or program, helping educators identify potential challenges and intervene early.
Recommendation engines	can suggest relevant courses, programs, or resources to students based on their interests and past activities.
Speech recognition	Electronic speech recognition tools allow to transcribe lectures and other audio recordings, making them more accessible to students.
Student support	such as counseling or tutoring, by providing personalized recommendations and referrals.
Text analysis	can be used to analyze large volumes of text, such as research papers or articles, to identify trends, patterns, and connections.
Virtual assistants or chatbots	tools that can help students with frequently asked questions or basic tasks, such as registering for classes or accessing course materials.
Virtual reality	to create immersive learning experiences for students.

Source: Based on Zentner (2022, pp. 1 and 2).

In any case, Aldosari (2020) identifies what he calls 10 fundamental rules or situations where AI can be a reality in education:

- Artificial intelligence can automate some basic activities, such as classification and grading.
- AI makes it possible to redesign educational programs to the needs of students, through advanced technology applications or programs.
- AI enables students to obtain an extra support to serve students to the maximum extent.
- By using programs that rely on AI systems, students and teachers can make useful comments so that others can benefit and share experiences.
- AI systems change the way to find information and interact with it in the way we interact with information in our personal and professional lives.
- AI systems make it possible to improve and fill gaps that may occur in training courses, identifying areas that need to be improved.
- AI systems allow students to learn in a relatively rule-free environment, reducing the fear of learning through trial and error methods, especially when AI teachers can offer solutions for improvement.
- The data supported by AI systems can change the manner schools select their students.
- AI systems can change the teachers' role.
- AI systems will change where students learn, who teaches them, as well as the style of acquiring basic skills.

However, there are many challenges facing the application of AI in higher education (Nsoh et al., 2023; Churi et al., 2022; Bates et al., 2020; Popenici & Kerr, 2017; Serpa et al., 2020; Akinwalere & Ivanov, 2022; Salvagno, Taccone, & Gerli, 2023), such as

- issues of equity of access and use of AI in education, including those related to the inclusion of people with disabilities, to avoid bias and promote diversity.
- ethical and security issues arising from the collection, use and disclosure of data, and protecting the privacy of users, including regular ethical data impact assessments of adopted systems, and considering personal information as a fundamental right.
- training issues for teachers and other users, being necessary to ensure that teachers are prepared to deal with AI in the educational context, understanding its benefits and limitations, and help establish clear criteria on when it is appropriate to follow or replace computer-generated perceptions to avoid unfair inconsistencies.
- issues related to students, such as their learning styles and capacity for autonomous learning; or how they communicate and share.
- financial issues, related to the costs of using AI.
- organizational and policy-making issues, such as the monopoly of a few entities, the conservative culture of most higher education organizations, the development of transparent data policies, or the fact that developers' decisions shape how the AI systems are instructed and understood.
- issues concerning the very nature of AI, such as the impossibility of thinking out of the box or no regard for feelings and emotions.

As can be seen, the integration of AI in higher education is not easy, particularly due to the adoption of more

traditional pedagogical practices and policies that are less in line with a new reality that requires everyone to think and look at what is taught and how it is taught (Pence, 2019). This reality, which has profound implications in the academic profession and the mission of higher education institutions, implies dealing with the psychological contract of those who are faced with it, considering that it can be understood as a form of control and de-professionalization (Serpa et al., 2020; Ferreira & Serpa, 2018b). Thus, its development, integration and use in this context should be a participatory process extended to the whole of the institutions (Pedró, 2020).

One way to enhance the application of AI in higher education, minimizing the risks and overcoming challenges such as those mentioned above, is to develop AI literacy beyond digital literacy (Sá, Santos, Serpa, & Ferreira, 2021; Akinwalere & Ivanov, 2022) of all stakeholders, understood as “[...] a set of competencies that enables individuals to critically evaluate AI technologies, communicate and collaborate effectively with AI, and use AI as a tool online, at home, and in the workplace” (Long & Magerko, 2020, p. 2, cit. in Laupichler et al., 2022, p. 1).

In particular, as far as teachers are concerned, Pedró (2020) highlights a set of specific competencies that he considers to be fundamental for AI to be adequately and effectively used, which include a clear understanding of how AI can facilitate learning and the characteristics that make it more appropriate, the development of research and data analysis skills that AI offers students, looking at these data in an appropriate way, the development of new human resources and AI management skills, and the adoption of a critical perspective regarding the use of AI in educational settings. But how to foster this intentional, conscious and knowledgeable use of AI in higher education? In a very clear and pertinent way, Pedró (2020) clarifies that

As there are no universal solutions, it is imperative that research also has a local dimension, in each university’s classrooms, recognizing professors and students as actors and not as mere beneficiaries or users of previously packaged technological solutions. There is no doubt that research has a role to play in elucidating the role that technological solutions play in improving the quality of university education (p. 71).

One of the ways to respond to this necessary improvement in the teaching and learning process, which the social sciences cannot be excluded from, may be, it seems to us, for example, through the action-research process (Serpa et al., 2018), by fostering the participation of those involved in this training strategy process by promoting a direct engagement in problem-solving (Jacobs, 2016). In this new context, in which AI will shape higher education competencies, such as soft or transversal skills, where leadership, communication, problem-solving, teamwork and creativity competencies are included (Sá & Serpa, 2018), it will be necessary to complementarily develop AI literacy (Popenici & Kerr, 2017; Akinwalere & Ivanov, 2022), to accommodate new discoveries, technologies and rapidly changing social norms (Long & Magerko, 2020).

At the same time, it is pivotal to reshape the role of the teacher, which implies a change in the way they teach, resulting from changes in expectations about their role and the consequent interaction with students (Akinwalere & Ivanov, 2022; Pence, 2019).

Conclusion

Like all changes that may affect the educational process, research and administration of higher education institutions (Ilieva, 2021; Sá, Ferreira, & Serpa, 2019), the application of AI in higher education will shape aspects that some will consider positive and others negative. However, one thing is certain: each and every stakeholder will be affected. As Li and Yang (2023) advocate, “[...] Higher education can’t rely on the traditional teaching, learning, research, and governance structure in a static attitude. In the face of the intelligent era, it can neither coerce education with the rapid development of technology nor ignore technology with the arrogance of education” (p. 37). The best response for the scholar to, in a conscious way, keep up with these new challenges while maintaining indispensable academic freedom in teaching and research, without which there is no University or higher education (Ferreira & Serpa, 2018b; Serpa & Sá, 2022; Pedró, 2020; Schäffer & Lieder, 2022), is to encourage all those involved to discuss and analyze the competencies that AI can bring, understanding the best way to use it and guide future research in this area (Long & Magerko, 2020).

Funding

This research was funded by the University of the Azores, Interdisciplinary Centre of Social Sciences-CICS.UAc/CICS.NOVA.UAc, UID/SOC/04647/2020, with the financial support of FCT/MEC through national funds and when applicable co-financed by FEDER under the PT2020 Partnership Agreement.

The Press in The Classroom for Citizenship Formation in The Digital Age? Paper and Pencil Case in Public Education Institutions in Cartagena De Indias-Colombia

Marelbi Olmos

Universidad Tecnológica de Bolívar- Cartagena, Colombia

Melissa Mendoza

Newspaper El Universal Cartagena- Colombia

Abstract: *Papel y lápiz* (Paper and pencil) is the result of a qualitative research project carried out using the Participatory Action Research (PAR) as a model. *Papel y lápiz* seeks to teach young people and children, who are identified as being at high social risk, in 35 different public educational institutions (PEIs) from Cartagena de Indias, Colombia. The principle aim of the project will be educating them about the importance of knowing and understanding the often-harsh realities of their social situations with particular focus on the social risks each of them might encounter. *Papel y lápiz* also aims to teach students about the social situation of their city using media and specifically the press. Working alongside Educommunication, the aim is to start educating the young people in school classrooms, in other words the most formative years of their youth. Between 2019 and 2022 this research project has reached 712 students from various public Educational Institutions (EIs) in Cartagena. The project was materialized in collaboration with teachers and directors by creating 6 educational cards that incorporate the use of the press to analyze some of the most critical issues the city is facing.

Keywords: Citizen Participation, Educommunication, Action Research Participatory (PAR)

Citation: Olmos, M., & Mendoza, M. (2023). The Press in The Classroom for Citizenship Formation in The Digital Age? Paper and Pencil Case in Public Education Institutions in Cartagena De Indias-Colombia. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1875-1883), Cappadocia, Turkiye. ISTES Organization.

Main topic

Papel y lápiz, is a collaborative project between the Press-school Program from the newspaper *El Universal* and the *Universidad Tecnológica de Bolívar* (UTB). The key aim of this project (developed in different public EIs of Cartagena) is to open a space for reflection, analysis, and research on the city's issues with teachers and students at public schools in Cartagena de Indias, Colombia.

General objective

To encourage critical and reflective reading by students of EIs in Cartagena using the press so that they might be able to propose solutions to the wide range of problems facing their school, city and beyond.

Specific objectives

- To apply the Participatory Action Research (PAR) methodology in the classroom to incorporate the media in teaching.
- To promote the critical reception of the content found in the media, as well as the development of creative and communicative capacities in the students from EIs in Cartagena de Indias (during the years 2018 to 2022).
- To establish a study, analysis, and selection processes in the classroom by identifying sections of the press, highlighting social, cultural, family, and personal mediations that influence the most formative years of the students.

Proposed Theoretical Discussion

The research explores how education and communication are related disciplines that coexist and are essential for production, transmission, and cultural transformation (Huergo, 2007). It aims to answer the question: *How to articulate the social appropriation of the press with the school, in such a way that interaction is achieved between the processes of teaching, and of integral and citizen formation for students in public EIs in Cartagena de Indias - Colombia?* So far, work has been done in 35 public EIs in Cartagena, aiming to rethink the concept of Educommunication and inter-learning (Prieto Castillo, 2006), focusing on the ways in which the new generation of students have incorporated the use of technology into their daily lives and how the schools must react in response. The research also sought to provide alternatives to overcome situations where technology is not available in the educational process due to deficiencies both in the physical infrastructure of EIs, and the lack of hardware and software.

Due to the lack of clear public policies regarding the provision of resources for basic or average education are affected by low levels of results in the academic achievement of its students. According to a report by the Cartagena Observatory *Cartagena Cómo vamos* in 2020 where 79% of the IE in the city do not exceed the C+ level, the second lowest on the scale, where A+ is the highest in the Saber 11 tests. The research then explores how education and communication as related disciplines can be essential for the production, transmission, and educational, and cultural transformation of students.

This is described in several conceptions and tendencies to explain the relationship between communication and education: One, communication as control in education. The second trend, in which education demands

communication as of the role of a teacher-actor, i.e., expressing oneself as a means to teach. This accentuates the idea of communication as a matter of the correct emission of messages (Huerger, 2007). In this sense, it is important to clarify the fundamental role that teachers from EIs in Cartagena play in the execution of the research proposal *Papel y Lápiz*.

Teachers have also used printed press to support the contents of their classes and in problem solving for children and young people, as well as topics related to their school, their neighborhood, city, and the country. *Papel y lápiz* project also aims to break the scheme of the educator-communicator as a privileged issuer who always gives the word and organizes, manages, and maintains relationships with others. This scheme is more focused on horizontal work, on interactions, on the possibility of building knowledge together (cit. Olmos, 2019).

In other words, learning to live pedagogical mediation in all areas of our lives is also giving meaning to social and human processes. Meaning goes through self-affirmation and self-construction, through the ability to interact and appropriate knowledge, through growth without violence, through the joy of learning and the feeling of self-construction as a being (Condo, 2012).

Apart from all this, the study of the three aspects (communication, education, and society) can allow the implementation of new strategies to replace the previous ones.

It is important at this point, that educators and communicators must assume in the educommunicative processes. Since, in this qualitative research, located within a socio-critical paradigm, the problem was addressed from the Participatory Action Research (PAR) approach of the sociologist Orlando Fals Borda (2008). At the same time, it allowed the actors involved in the research (student, teacher, social communicator) to contribute from their own knowledge in the creation and analysis of content from the press, based on the realities of their school context and that of their families and their cities.

Furthermore, considering that they are public schools located in sectors of Cartagena at high social risk for the student, and that they come from adverse family realities. Moreover, the proposal aims to create bridges and channels of communication between the school, the student, and the parent, not from the media, but *with* the media, in such a way that children and young people can communicate with everyone. This is also supported by the creation of a language that integrates everyone in the process and allows them to communicate in a real, effective, and open way.

The *Papel y Lápiz* research, sought to understand the relationship between communication and education using self-recognition, projection, and a critical analysis of the press.

If education is at the base of our humanization, if through it we pass from a bubbly atmosphere of sensations to articulate language, to caress, to gaze, to meaning and to culture, and if the educational act is profoundly and essentially communicational, (...) we will not be able to dream of educational or social transformations without playing to the core of our need and ability to communicate (Prieto

Castillo, 2004).

On the other hand, all pedagogical mediation is also a matter of communication, since it puts inter-learning at stake, i.e., the bridges that must be built and crossed between the teacher-student relationship and between culture and society and institutional (school) culture. Hence, knowing the implications of the relationship between communication and education can make us better educators in our daily lives and those who produce for the media, i.e., social communicators, must also be aware of our social responsibility when producing audiovisual and multimedia material alternatively from the recent coverage for entertainment and rather aim to also inform for education. This implies going beyond the media to focus on the relationship with the past, present and future, i.e., the school in its training process must make creative use of the media in the classroom (Orozco, 2014).

Methodology

Papel y lápiz is a qualitative research, that has shown that social, symbolic and imaginary representations of the students and are reinforced by the contents they consume through the different media that reinforce their beliefs or serve as references.

As for the information collection technique, participant observation, interviews, questionnaires with closed answers, as well as didactic workshops were carried out. The latter being applied to students between year seven and year nine, to know how they received different media on different platforms. Later, topics were established for critical and reflective analysis on school, social, cultural, and family lives represented in different news, editorials, opinion columns and other sections of the press. As a result, the student could start recognizing their journey in life within their school, family, city, country, and the world.

All the above were collected using PAR methodology with the students. The workshops were a key method because they were based on the students' own knowledge and feelings (Fals Borda, 2008), using appropriate language for their classes' year. Finally, illustrated content was taught, with cartoons and characters, games, and aimed at helping the students understand their own unique social situation.

Results

This approach of the PAR methodology has been fundamental for the creation of a collection of 6 different sets of results on the use of the printed press. The first three have been published in newspapers and tabloids. *Papel y lápiz* is a tool designed to encourage critical and reflective reading of the printed press. This tool was seen as fitting for the students' curriculum since it would be didactic, practical, and consistent with what could be done in public EIs in Cartagena with deficient or almost non-existent infrastructure and technological conditions. Using traditional printed press did not require greater economic demand from the EIs, but did require an effort

and interest involving the most important local media outlet in the city, *El Universal*, and by part of the Communication and education *Semillero* (seedbed) of the Universidad Tecnologica de Bolivar (UTB).

After a year developing workshops that included the use of digital tools, it was possible to determine that it was complex to try to apply these tools in EIs with few resources, that is why the use of the traditional printed press was advised. It was then concluded that due to the conditions in which the EIs are located, the printed press was the format that best adapted to the different social contexts of each school. Thus, the first edition of *Papel y lápiz* is associated with the recognition of the press. The content is made up of 7 parts, which contain practical exercises for students to understand the world through the news.

This project stimulates the use of the printed press in an entertaining and above all useful way. Therefore, the first stage of the project was the creation of several booklets devised to teach students the basic characteristics that make up a newspaper as explained by the World Association of Newspapers and News Publishers WAN-IFRA from its educational division. It is important to note that the creation of the deliverables designed by *Papel y lápiz* project arises after using educommunicative components for training and workshops with teachers and students, in different EIs in the city. 1,479 people were impacted so far, including teachers, students, and parents (Olmos, 2019). The students and teachers mentioned above, trained in audiovisual literacy workshops and critical analysis of the media and citizens. Consequently, 712 students have received training on the use of the traditional newspapers to improve their communication skills from writing and learning to make their approaches to problems visible raised around their schools, their neighborhoods, their city, and their country. Within the first deliverable, it was proposed explaining different parts that make up a newspaper, such as:

- The cover or first page: The students learned what the key elements of a cover were, which constitutes the hook for readers. Within its characteristics, it must be striking, have an attractive design, and a good photograph and headline. After understanding this, the students were able to recognize the micro formats that make up the front page of a newspaper. To identify these elements, the students answered some questions that were formulated in a first primer and that account for the interpretation that the students made of the information provided on the cover.
- The internal page: It refers to the structure of the newspaper, taking the local newspaper *El Universal* as an example. The student began by teaching the name of the sections, the columns of the newspaper, the number of pages and the micro formats that make up the internal pages.
- - As well as sections called: Play with language; it is better to listen; understanding the context; economic indicators/advertising; sports, among others.

After the second edition of *Papel y Lápiz*, *Applying what has been learned* section was incorporated, which consisted of developing exercises related to what was published in the *It is better to listen* section of the previous edition. In this deliverable of *Applying what has been learned* from *Papel y Lápiz*'s collection, 8 topics were covered: *Hablemos en realidad*: The students reviewed the news from the newspaper, defined what was news, what was happening in their community environment, and discussed the city. The objective was for the

students to be able to identify the positive and negative of what was happening in the city. As well as sections called: Another vision; build the world you dream of; Shopping; Play with language; assuming commitments; read and write and fun.

From the third deliverable of *Papel y Lápiz*, called, *The opinion edition*, students were invited to read the opinion of others, since it allowed them to awaken a critical sense in the face of the realities analyzed. This third edition sought for students to understand the thinking of various columnists so that they in turn awaken their critical thinking in relation to the context in which they live. Like the previous installments, this third edition had the following sections: *Applying what has been learned*, where what was sought was to promote a dialogue around a mobility news in Cartagena that announces a considerable number of drivers fined for infractions on the different roads of the city.

In this space, it was proposed to review the approach made by the journalist and find out if the editor answered the 5 questions that a news item is considered to answer: by answering what, who, how, where, and why the events occurred. With the objective that the student analyzes the news, evaluate it, and at the same time, also analyze the management of the different public entities in charge of the news event.

- *Hablemos en realidad*: It corresponded to the part of the analysis of the newspaper related to the editorial, which is based on guidelines proposed by the journalism association WAN IFRA in the booklet *Read and learn with newspaper* (2019). Thus, through the editorial, the newspaper analyzes, assesses, and interprets a news item of local, national, and international interest.

The students were explained what an editorial was in a newspaper, considered as a space reserved for the opinion of the information company, about an event that affects the lives of its readers. In this way and considering the above, it was sought that the students take sides, defend their ideas, and socialize them, in relation to a specific topic, trying to achieve a certain consensus.

In this way, the students read the editorial that was published in the local newspaper *El Universal*, and explained what it was about, to determine whether it was of interest to everyone and, finally, they wrote their opinion about the topic.

- *Otra visión*, it was the third section of this installment, where it was sought that, through a caricature, the students critically raised some situation that the cartoonist of the newspaper captured and that the student could controvert in a humorous and reflective way.
- *Construyendo el mundo que sueñas*: In this case, the student looked at his city and realized that Cartagena needs attention from the mayor and the townhall, that it requires a sense of belonging to the city and that projects are undertaken to improve the quality of life of its inhabitants and that, in addition, their leaders will think in terms of improving their city.

The idea was for the students to find two photographs of two characters who, according to them, were working to solve the problems of the city, with the idea that they would get to know the characters and profiles of those who manage the city.

The other part of *Construyendo el mundo que sueñas*, the symbols that Cartagena has as historical heritage were looked at, however, the forgetfulness of the competent authorities and the misconduct of its citizens, affect its deterioration, for this reason, it is important to emphasize in the student, the commitment to preserve them.

In the section, *De compras*, specific talk was made of the classifieds, which are advertisements that are published in the press and digitally, and that are part of advertising. They are cheaper in terms of texts, easy to understand and sectioned by categories, such as: real estate, business, jobs, vehicles, which allows the student to have an overview of the social, economic, and cultural offer of the city. Here the student had to select, and report classified ads, determine which section they belonged to and what type of classified it was.

Juega con el lenguaje, apart from that third deliverable, was a space intended for students to extract grammatical figures such as nouns, adjectives, verbs, synonyms, antonyms so that, based on the news. They could also decipher these elements and do an exercise in understanding a text in a simple and practical way.

Asumiendo compromisos, in this section of this third deliverable of *Papel y Lápiz*, period, we looked at how students were motivated to work as a team for their city. The student was required to present useful ideas so that they were later executed. For example, the use of social networks for the benefit of the city. The result showed that a brief debate could be organized in the classroom and that, from this, a proposal for social change for the city be generated.

Lee y redacta, in this section, a column was chosen where through the text, the student deciphered the writer and commented in class about the opinion article and whether or not he agreed with what the author mentioned; with literary figures; about what they thought of the closing of their text and as a second exercise, the student was asked to find words with which they could rewrite an article that referred to topics of school or city interest.

Juegos, in this section, the intention was for students to have fun with the booklet and play mental games such as Sudoku, word search, finding the differences in two pictures, among others. As a form of play-based learning.

Due to the COVID-19 pandemic, the collection has yet to develop the *Papel y Lápiz* didactic booklets, numbers 4, 5 and 6. In these didactic booklets, the themes will be worked on as follows: the fourth edition works on the theme of Social Commitment. The fifth analyses the Quality of life of both the environment, the school, and the city. Finally, the sixth edition refers to how to learn to express yourself both orally and in writing, to achieve consensus and practice active listening and assertive communication, seeking understanding with others and learning to communicate.

Reflections

Social relevance of the research

The goal of an investigation like *Papel y Lápiz* is to create students with a critical and analytical sense that have the freedom to express themselves, develop their capacity for interaction and symbolic production, their capacity to feel the other, to reflect on the world and their ability to transmit all this to others (Thompson J, 1998).

Thompson J's approaches, reflected in the *Papel y lápiz* project, are also articulated with the essential purposes of educommunication, and with the research carried out in EIs in Cartagena, which are expressed in:

- Understand communication in education and the role of being trainers in communication processes.
- Recognize the importance of communicability in any training and knowledge process.
- Being aware of the processes of communicational entropy in education, understanding this as the loss of communication or as a rupture of the processes of meaning within the training process.
- Being able to relate the teaching/learning process with specific edu-communicational needs in organizations.
- Doing searches and have real experiences of pedagogical mediation and mediation with culture.

All the above is the *Papel y lápiz* research project, which integrates and articulates the work of educators with social communicators, is based on the premise that teaching media in schools is a key element for the comprehensive training of students. A training that not only seeks to teach ways of reading the media, but by equipping, guiding, and training to citizenship. This training helps students to go beyond the classroom and read other narratives based on their environment and context (Mendoza, 2021). Students can achieve new meanings and reach new horizons to understand their role in society, different or new ways to being young and the relationships they build with others from their educational space and their social environment.

For teachers, it implies serving as a mediator in specific experiences of Educommunication and proposing alternatives for cultural mediation and pedagogical mediation in particular cases and circumstances. Lastly, for the parents, it is their choice to be key actors in the communicative education process, through the media they receive, so that they learn to guide the consumption of media in the family, as well as to strengthen the relationship with their children from whom they can also learn about the use and didactics of digital and audiovisual tools. It will be a two-way learning process.

Conclusions

The *Papel y lápiz* proposal of the Prensa Escuela project of the newspaper *El Universal*, with the participation of the Communication and Education Research *Semillero* (Seedbed) of the Social Communication program of the

UTB, is a pedagogical strategy that has been developed with other entities that handle the subject of media and school in Cartagena - Colombia, carrying out joint workshops with local media such as El Universal through its *Prensa-escuela* program, in coordination with the District Education Secretariat have allowed us to reach public institutions in Cartagena.

As it is an investigation that intends to cover all public institutions in Cartagena, the work has been done gradually, starting with those that have an agreement between the Cartagena District Department of Education and the *Prensa-escuela* program of the newspaper El Universal, with the objective of converting it into the subject "Media and school" that makes good use of free time within the schools of Cartagena and envision it in the near future as a subject that is part of the curriculum of the public institutions of Cartagena.

Abstract: In this review, we aim to contribute to the analysis of two types of qualitative online research: netnography and nethnography. For this purpose, we will focus our attention on their definition, specificities, similarities and differences to better understand the challenges and opportunities posed by the implementation of these types of research with the potential for the analysis of, for example, online community and online culture in social media but also in virtual reality contexts. Through a document collection and analysis, in which we searched various databases for information on netnography and/or on nethnography, it was possible to fulfil this goal and justify the relationship between these forms of research. It is concluded that nethnography is yet another research method that can complement and enrich netnography by adopting the research method, adapting it, whenever necessary, to the needs of the research to fulfil its objectives in a heuristic, technically competent and ethically informed way.

Keywords: Nethnography, Netnography, Qualitative Research Online, Online community, Online culture, Social media.

Introduction

Digitization and the Internet have revolutionized life in its various dimensions, among which the social and economic stand out. We live, according to several authors, increasingly more in a Super Smart Society characterized by the close articulation between Artificial Intelligence, the Internet of Things, Big Data, Virtual Reality and Man (Morais et al., 2020; Kozinets, 2014; Sá et al., 2021; Ferreira & Serpa, 2018a; Serpa & Ferreira, 2021; Serpa et al., 2020; Gambetti & Kozinets, 2022). This factor enhances the influence of this technology in everyday life in a more or less intentional way and perceived by each of us, such as the way it is mobilized in the (re)definition of individual and collective identity (Addeo et al., 2019; Kozinets et al., 2018; Lugosi & Quinton, 2018). It is in this context that the consequent interest in the study of online cultures and

online communities emerges (Bowler, 2010; Costello et al., 2017; Kozinets, 2014; Kozinets et al., 2018; Morais et al., 2020).

In this review, we aim to add to the analysis of two types of qualitative online research: netnography and nethnography. For this purpose, we will focus our attention on their definition, specificities, similarities and differences to better understand the challenges and opportunities posed by the implementation of these types of research with the potential for the analysis of, for example, online community and online culture in social media, but also in contexts of virtual reality.

Methods

The method used to develop this study was content analysis. A document collection and analysis was, thus, carried out, in which information on netnography and/or nethnography was sought in two benchmark databases: (i) B-ON (which “provides unlimited and permanent access to research and higher education institutions to texts thousands of online scientific journals and eBooks from some of the most relevant content providers, through subscriptions negotiated at the national level”, B-ON, online); and (ii) SCILIT (which “is a comprehensive, free database for scientists using a new method to collate data and indexing scientific material. Our crawlers extract the latest data from CrossRef and PubMed on a daily basis”, SCILIT, online). Through this literature search, we sought all the information that contained the words “nethnography” or “online research” in all search fields, having obtained a total of 183 documents on B-ON and 27 documents on SCILIT. After this systematic literature survey, an exhaustive analysis of all this information was carried out through their reading, having selected the documents that seemed most relevant to us, to attain the purpose of this review and justify the relationship between these forms of research, and a total of 33 documents was deemed relevant and analyzed. Figure 1 depicts their distribution in terms of year of publication.

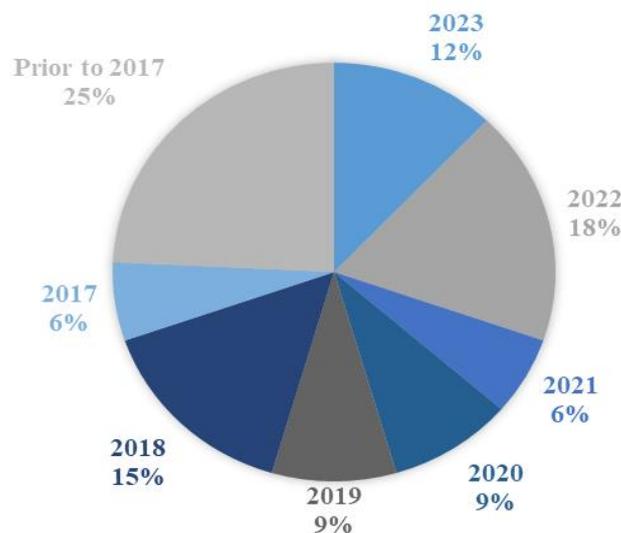

Figure 1. Number of documents analyzed by year of publication

The documents were subsequently subjected to content analysis according to the themes defined *a priori*. The next sections put forth the results of this analysis.

Netnography

Definition

Netnography is a concept that combines the term Internet with ethnography and for whose conception the contributions of Robert Kozinets are unavoidable (Loanzon et al., 2013). Netnography was defined as a qualitative method of rigorous and systematic participant-observational research for the study of online communities and their cultures, focusing initially on the analysis of marketing and consumer behavior. Currently, netnography has a growing application, albeit it is not a mainstream form of research (Costello et al., 2017; Addeo et al., 2019; Bernard, 2004; Discetti & Anderson, 2023; Loanzon et al., 2013; Morais et al., 2020; Kozinets, 2014; Cano et al., 2023). According to Addeo et al. (2019),

[...] the best application of netnography is to understand the social world and cultures of online communities which develop prevalently in cyberspace in order to document the explicit language of informants without the risk of obtrusiveness and disturbance of direct research involvement providing researcher with the emic (insider) and ethical (outsider) perspectives for more holistic insights. Netnography provides a valuable tool for understanding constructed online social spaces (p. 34).

Netnography can be considered a specific form of online ethnographic research that requires “persistent interactive immersion by researchers in an online community” (MacCarthy, 2022, p. 1) without, however, being confused with it (Dumitrica, 2013; Addeo et al., 2019; Morais et al., 2020; Kozinets, 2014; Kozinets et al., 2018; Bernard, 2004; Zheng, 2019; Tuikka et al., 2017). Thus, this research method adapts, to some extent, ethnography to the study of online phenomena (Addeo et al., 2019), valuing the contextualization and the meaning participants ascribe to the situations (Costello et al., 2017; Morais et al., 2020; Kozinets et al., 2018). However, there are some differences between netnography and ethnography, as Brajkovič (2011) highlights in her review of Kozinets (2010), put forth in Figure 1.

Netnography may, thus, be considered a research method that deals with any digital artifacts (whether it is text, image, music or an articulation of them, ...) (Kozinets, 2014). Netnography allows the apprehension of technocultural elements that help in understanding the interactions that take place in the context of the web (Gambetti & Kozinets, 2022) (Table 1) and that can be developed alone or combined with other methodologies (Morais et al., 2020; Cano et al., 2023). As Srivastav and Rai (2022) state, Netnography is a virtual adaptation of the same with the researcher joining the virtual communities, observing the communication patterns of the community population with each other. They also analyse the virtual content produced by the community and the reactions to the same within and across communities (p. 573).

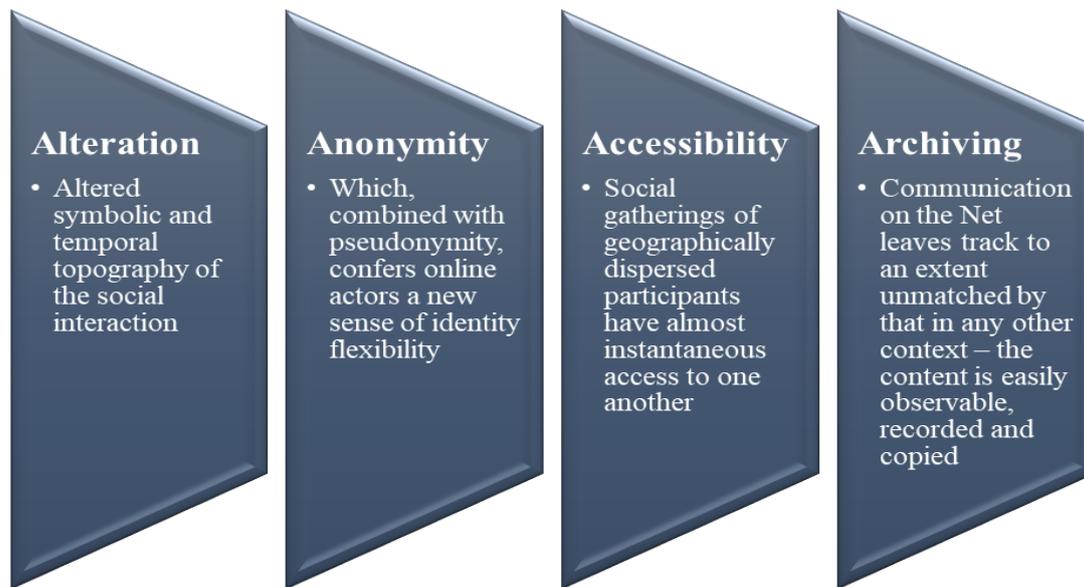

Figure 1. Some of the differences between Netnography e Ethnography

Source: Based on Brajkovič (2011).

Table 1. The elements of technocultural understanding captured by netnography

Technocultural codes and gestures governing online behaviors	Govern online behaviors (e.g., tagging, retweeting, following, unfollowing, sharing, scrolling).
Symbolic vocabularies	Consist of visual and emotional languages used to interact (e.g., selfies, zoomies, scrapbooks, GIFs, memes, emojis, memojis, stickers).
Human-machine-human interfaces and socio-technical affordances	Are adopted by social media platform (e.g., YouTube “Welcome to my channel video”, self-promotional annotations, links to other channel contents, subscription rules, video ranking mechanisms, tipsto become a “high-profile” vlogger).
Routines and rituals	Are used by individuals to establish their unique social media presence, bond with peers and followers and establish their status (e.g., (a) repetitive use of specific personal identification markers such as challenges, jokes, ways of audience interpellation; (b) ways of addressing the camera; (c) outfits, gestures).
Sensitizing stories	Show authenticity, attractiveness, similarity, accessibility, and that grab people’s attention enticing intense but light connections.
Demographics and technographics	Quantify and classify the profiles of the users according to their socio-demographic features and calculate the relevant key performance indicators of audience interaction for each platform.

Source: Based on Gambetti and Kozinets (2022).

Gaitán and Ramírez-Correa (2023), following El Hilali and Azougagh (2021), highlight the following three distinctive features of netnography vis-a-vis other methodologies (Table 2):

Table 2. Three distinctive features of netnography

Cultural focus	Netnography focuses on culture to understand human behavior in response to various phenomena.
Social media data	Netnography uses as its main data source the interactions and comments that occur on online social networks. Everything that happens in “real” life has an impact on online social networks.
Participation	Netnography supposes the free participation of users in online social networks. This fact generates a participation with the social, physical, and emotional characteristics of users within a community that facilitates their study.

Source: Based on Gaitán and Ramírez-Correa (2023).

According to Tuikka et al. (2017), as early as 2002, Kozinets established a set of four principles that researchers should follow when carrying out netnographic research, specifically, that researchers should (i) reveal their presence to the online community members that they are studying; (ii) ensure that the informants’ confidentiality and anonymity are protected; (iii) seek and incorporate feedback from the online community members in their study; and (iv) ask community members’ permission to quote information they post online. Morais et al. (2020), building on the works of Kozinets, propose four typologies of netnography, depicted in Table 3.

Table 3. Four typologies of netnography

Autonetnography	Is focused on autobiographical aspects, for its own identity and history, personal reflections on participation in social networks, with a critical understanding, through its first-person perspective.
Symbolic Netnography	Seeks to decode individuals’ traits and behaviors, and in the marketing area, especially to understand the consumers, thus adding to creating a diagnosis of specific sites and a portrait of people, helping to discern and explain their practices, meanings and values, providing subsidies to managers’ decisions.
Digital Netnography	Uses analytical techniques of statistical data and focuses on large masses of social media data to detect patterns and establish understandings of cultural elements that tend to collaborate with the reinforcement or improvements of business, management, and social practices.
Humanistic Netnography	Is focused on critical research and critical theory; social media data are used to seek to promote a discussion and solution to social impact problems brought about by globalization and advanced technological change.

Source: Based on Morais et al. (2020).

While netnographies have several differences, they have in common five fundamental features. On the one hand, all netnographies use related techniques for gathering and analyzing. On the other hand, they place the emphasis on the qualitative nature of context and content. Furthermore, they use the researcher's phenomenological presence in the sociotechnical experience. Also, they abide by rigorous and frequently updated ethical procedures. Finally, they seek to foster an understanding that incorporates cultural features, such as meanings, identities, hierarchies and rituals (Kozinets, 2022).

Advantages and limitations

Issues of an ethical nature emerge from the application of netnography (Ferreira & Serpa, 2018b), several of which are specific to this methodology, for example, what information is legitimate to be considered public (Tuikka et al., 2017; Lehner-Mear, 2019; Bernard, 2004; Bowler, 2010; Morais et al., 2020). Another example concerns the extent to which a social media post is public or private (Viljoen, 2022; Discetti & Anderson, 2023; Srivastav & Rai, 2022). In terms of ethical standards, Loanzon et al. (2013) build on Kozinets's (2002) four principles that researchers should follow when carrying out netnographic research, adding that researchers should also use member checking by sharing the research findings with the individuals who have been studied to ask for their comments (Loanzon et al., 2013).

In summary, netnography offers some advantages but also disadvantages (Costello et al., 2017; Addeo et al., 2019; Bernard, 2004), several of which are presented in Table 4.

Table 4. Advantages and limitations of netnography

Advantages	Limitations
Allows focusing on marginal consumption phenomena	The informants' identity is uncertain (distortion of the digital self)
Unobtrusive and natural method (context not fabricated for the purposes of the study, the environment studied is not or only slightly disturbed by the study)	Difficult and delicate generalization of the results
Easy entry into the community (no travel required, no need for accreditation, etc.)	Not a very exhaustive method (it only studies the consumers gathered in the studied community; it only studies the communication acts and not the complete behavior of the subjects)
Time-saving method (faster data access, automatic data transcription)	Difficulty finding an adequate community in a given context
No spatial or temporal barriers	It requires special talents (empathy, sense of observation, etc.) without there being specific means to develop them

Allows continuous access to informants

The conclusions of a netnography are never definitive and often raise more questions than they answer, without always being very useful for marketing.

Researcher distancing

Source: Adapted from Bernard (2004).

Netnography may be able to increase its ability to provide information with a higher heuristic potential of online interactions, expanding its range of action (Lugosi & Quinton, 2018; Dutta & Sharma, 2023). However, one area that seems to be one of the weakest in netnography is its ability to improve the understanding of the articulation between action and the online and offline representation of users, which comes from/does not come from one of the dimensions of action to the other (Dumitrica, 2013; Serpa & Ferreira, 2018).

Nethnography

As in everything, we cannot be purists. A very relevant example is offered by MacCarthy (2022), who offers the concept of nethnography as another way of doing research with its own value and even with the potential of complementing Netnography. Thus, MacCarthy (2022) proposes nethnography as

[...] Lesser-engaged ethnographic methods include participants as observers, observers as participants and complete observers. A fourth legitimizer of online interpretation are researchers or the cooperation of consultants who have previously immersed themselves in the phenomenon but were not researchers at the time” (p. 1).

Figure 2 depicts this distinction between netnography and nethnography.

Source: Based on MacCarthy (2022).

Figure 2. Distinction between netnography and nethnography

The author (MacCarthy, 2022) advocates that nethnography is another online qualitative research method,

arguing that “Nethnography is a two-part qualitative praxis of spending enough time with the phenomenon to discern meanings with confidence, which is then used to interpret nondyadic textual discourse” (p. 1) (Table 5).

Table 5. Advantages of nethnography

-
1. Legitimizes [marginalized] non-dyadic secondary data.
 2. Transfers researcher bias downstream.
 3. Provides enhanced insight and subsequent truthfulness when analyzing *Big Data*.
 4. Nethnography is less time-consuming than netnography.
 5. Mitigates bias from data co-production.
 6. Is used as either a data grooming tool or complete, analytical method.
 7. Allows passive data scraping.
 8. Provides increased credibility of data when fortified by an ethnographic method.
 9. Enables a reduction in the level of bias inherent in the data.
 10. There are less time, effort and costs associated.
-

Source: Based on MacCarthy (2022).

To some extent and used wisely, both methods may be complementary, as “By employing methods simultaneously, one realizes two advantages. (1) Not only can the researcher take advantage of large volumes of online secondary data to generalize but, (2) make better sense of the same having contextualized this by personal experience” (MacCarthy, 2022, p. 5).

Final Thoughts

Netnography as a form of research has high potential in the analysis of, for example, online contexts, such as social media, communities and culture, but also in virtual reality situations (Loanzon et al., 2013; Lugosi & Quinton, 2018; Costello et al., 2017; Kozinets & Gambetti, 2020; Kozinets et al., 2018; Morais et al., 2020; Wu, 2022; Dutta & Sharma, 2023; Discetti & Anderson, 2023). It is concluded that nethnography is yet another research method that can complement and enhance netnography by adopting the research method, adapting it, whenever necessary, to the needs of the research to attain its objectives in a heuristic, technically competent and ethically shaped way to enable new developments, for which the researcher’s digital literacy will always be critical for their conscious and reasoned decision-making, so as to expand the heuristic potential of these ways of doing research (Lugosi & Quinton, 2018; Morais et al., 2020; Srivastav & Rai, 2022).

Funding

This research was funded by the University of the Azores, Interdisciplinary Centre of Social Sciences-CICS.UAc/CICS.NOVA.UAc, UID/SOC/04647/2020, and CIPES – Centre for Research in Higher Education Policies, UIDB/00757/2020, with the financial support of FCT/MEC through national funds and, when

applicable, co-financed by FEDER under the PT2020 Partnership Agreement.

Abstract: This study aims to explore the challenges and opportunities of using digital technology in English teaching in higher education. Transforming the teaching and learning process from face-to-face to online learning by utilising digital technology devices and internet connectivity becomes challenging for lecturers and students. However, there are many opportunities of integrating digital technology and education. This study uses narrative literature reviews to identify the challenges and opportunities of utilising digital technology in English teaching in higher education institutions. A number of challenges and opportunities are found in using digital technology in English teaching, including digital technology access, flexibility, engagement, pedagogical dimension, personal dimension, range of sources and cultural awareness. Furthermore, this research can provide significant insight and understanding regarding the difficulties and benefits of integrating digital technology and education in higher education institutions, particularly since the COVID-19 pandemic. It also recommends further research regarding integrating digital technology and education, particularly in English teaching in higher education institutions.

Keywords: Digital Technology, Challenges, Opportunities, English Teaching, Higher Education

Introduction

Background

English teaching (ET) in higher education (HE) has dramatically transformed since the COVID-19 pandemic. The transformations include the ways of mode delivery of teaching and learning English from face-to-face (F2F) to the online learning (Yusriadi et al., 2022). Online learning requires digital technology (DT) devices (Zuhairi et al., 2020) and internet connectivity (Ngoasong, 2022) to support the ET process. The development of digital technology has improved significantly (Ahmad et al., 2022), and it has challenges and opportunities in the ET process in HE institutions. This becomes one of the issues for lecturers and students when delivering teaching and learning online.

Research Aim and Objectives

This study aims to identify and understand the challenges and opportunities of using DT in English teaching and learning activities in HE institutions. Furthermore, the objective of this study is to conduct a comprehensive review of the challenges and opportunities of using DT in ET in HE institutions. There are many challenges and opportunities that exist in using DT in ET in HE institutions. The challenges and opportunities include the digital technology access (Widyanti et al., 2020; Zuhairi et al., 2020), flexibility (Martha, 2021), engagement (Galvis & Carvajal, 2022), pedagogical dimension (Thaheem et al., 2021), a wide range of sources (Nazarov et al., 2021), personal dimension (Viner et al., 2020), and cultural awareness (Lu et al., 2022). These criteria are explained more in the result and discussion parts.

The research questions of this study are; a. What are the challenges of using DT faced by the lecturers and students in teaching and learning English in HE institutions? b. What are the opportunities for using DT for lecturers and students in teaching and learning English in HE institutions? The authors comprehensively review previous studies on using DT in education, particularly in ET in HE institutions to answer these questions.

To summarise, this study is important in particular for some reasons. Firstly, digital technology has transformed how people learn and communicate, but more research needs to be conducted on applying DT in HE institutions (Lestari, 2020; Manurung et al., 2020). Secondly, the research on DT in HE institutions requires further investigation to identify more benefits of using technology in ET by presenting different research methodologies and various data collection methods (Sufyan, 2020). Therefore, this study aims to enhance the opportunities and reduce the challenges of utilising DT in the ET process. Hence, the expected outcome of this research is to contribute to the body of knowledge on the use of DT in ET at HE institutions.

Method

This study uses qualitative data. Qualitative data is exploring and understanding the human and social

phenomena from individuals or groups, which involves non-numerical data to explain the results of the study (Creswell, 2017). Also, qualitative data includes the interactions and situations of social phenomena described in narrative form (Halmes, 2010). Data for this study is undertaken from the relevant studies about integrating DT and education in HE institutions. The sources for the relevant studies are available in the references list. Furthermore, this study's data analysis type is inductive, particularly narrative analysis (Hesse-Biber, 2015). To summarise, this study applies a narrative review of relevant studies to identify the challenges and opportunities of using DT in ET in HE institutions.

Results

Digital Technology in English Teaching in HE Institutions

Digital technology in education refers to utilising digital devices with internet connectivity (Aldhafeeri & Male, 2015) that lecturers and students use in teaching and learning English. The digital devices that are mostly used are computers, laptops, tablets, and smartphones. Lecturers and students can succeed in English teaching and learning by applying advanced digital devices and internet connectivity (Dumbraveanu, 2021) in variation to the updated sources. For example, in the online learning mode of delivery, the teaching and learning process can be conducted from home using an internet connection and digital devices (Dumbraveanu, 2021). Lecturers and students can meet via Zoom meeting, Microsoft Team, or Google Meet (Martha, 2021) to deliver and discuss the English lessons.

DT benefits the lecturers in designing the curriculum, evaluating students' understanding of the English learning process, and evaluating the teaching and learning program (Caprara & Caprara, 2022). Not only lecturers but also governments and stakeholders design and develop suitable curriculum content for all levels of education to achieve educational goals (Ngoasong, 2022). In addition, curriculum content, assessment and evaluation become the focus of using DT in ET. So, governments and lecturers may consider the arrangement of the curriculum and materials to assist the students in comprehending the lessons provided and suitable to the updated technology development (Ngoasong, 2022; Yuan et al., 2019).

Using DT in ET can be undertaken fully online and through blended learning. In online learning, DT may assist the students in continuing their learning activities from home and enhance their knowledge from the sources on the internet (Lee & Sylvén, 2021). Widyanti et al. (2020) also added that DT implements an innovative, independent, and collaborative learning environment that may allow students to study online. These learning activities could be set based on student's needs, and be student-centred rather than only lecturer-centred (Gherheş et al., 2021).

Compared to the blended learning approach, it combines F2F and online teaching and learning activities supported by advanced technology (Lalima & Dangwal, 2017; Lazar et al., 2020). This approach has grown significantly to transform F2F learning into digitalisation. The benefits of blended learning include making it

easy to understand the lessons from the lecturers and being open to discussion when the lesson is delivered F2F. Also, blended learning may fill the gap between audio-visual and kinaesthetic students by using stories in the digital educational format (Galvis & Carvajal, 2022).

Challenges in Using Digital Technology in English Teaching

There are many challenges the lecturers and students face in applying digital technology in English teaching in HE institutions. The challenges are related to digital technology access, pedagogical, personal dimension, and cultural awareness. Regarding digital technology access, applying DT is challenging on the technical side. Technically, online learning activities incorporate applying technology devices supported by internet access and applications such as social media platforms, websites, e-mail, YouTube channels, Microsoft Teams, Zoom Meeting, and Google Meeting (Aldhafeeri & Male, 2015).

However, practically, lecturers and students face difficulties using these applications because some are not commonly used in the teaching and learning process (Aldhafeeri & Male, 2015). These applications allow lecturers to deliver their lessons by utilising various kinds of software (Martha, 2021). The software may cause problems with the various advanced technologies, which the lecturers and students need to become more familiar with (Galvis & Carvajal, 2022). Also, the barrier to internet connectivity may impact the process of ET using DT in HE institutions (Lazar et al., 2020). Consequently, difficulties with internet connections can lead to severe problems in the online learning (Ngoasong, 2022).

The next challenge is engagement. Not all students can adapt quickly to online learning (Galvis & Carvajal, 2022). For instance, some students who have difficulties understanding visual material cannot receive meaningful lessons online but should combine audio and visual material (Ngoasong, 2022). Meanwhile, if some students have hearing issues, they will also have difficulties listening to the audio material (Lazar et al., 2020). Hence, this is also a challenge in using DT in ET for students with online learning.

The other challenge is the pedagogical dimension. Integrating technology and education requires pedagogical knowledge or pedagogical competence. Digital pedagogical content competence is proposed to upgrade the technological pedagogical content knowledge (Dumbraveanu, 2021). Digital pedagogical competencies can be defined as how digital technologies can enhance teaching or learning by considering pedagogical values (Dumbraveanu, 2021). Lecturers can develop their students' learning strategies to improve their English proficiency. For instance, using a recorded audio or video file while the meeting is delivered online. This method can assist the lecturers and students when referring to previous lessons.

The personal dimension is another challenge for the students and lecturers when applying digital technology in English teaching in HE institutions. Students face difficulties regarding the budget to purchase a personal laptop, smartphone, or computer and internet data to support online learning (Viner et al., 2020). Also, lecturers who are untrained in using digital technology for online teaching struggle to transfer or teach English to the students

(Thaheem et al., 2021). Furthermore, these personal problems become a challenge for online teaching and learning activities.

The last challenge is cultural awareness. Using DT in teaching and learning activities has impacted cultural awareness regarding the students' behaviour (Lazar et al., 2020). For instance, students' attitudes to learning from F2F to online learning are changing (Ngoasong, 2022). The lecturers can understand how students learn in online learning and the factors behind that. Also, understanding the students' behaviour is challenging regarding their cultural awareness of English teaching and learning using DT in HE institutions. Hence, the challenges identified and explained according to the previous research above answered the first research question.

Opportunities in Applying Digital Technology in English Teaching and Learning in HE Institutions

Besides the challenges, using digital technology in English teaching provides opportunities for English lecturers and students. Firstly, it is flexibility. Flexibility can be divided into two scopes (time and place). Online learning can provide flexible teaching and learning process between lecturers and students (Gouseti et al., 2020). Regarding the flexibility in place, the teaching and learning process can be conducted from home, the office, outdoors or indoors (Sufyan, 2020). In addition, lecturers may set a day and time to schedule a meeting on the Zoom Platform to transfer knowledge and discuss the lessons with the students to show flexibility in time (Ngoasong, 2022). This is more effective and efficient for lecturers and students regarding transport fees to the institutions.

Additionally, the opportunity for using digital technology in English teaching and learning is the wide range of digital sources available on websites or e-platforms (Nazarov et al., 2021). Since many applications are available, selecting the appropriate application to improve students' online learning ability is essential to enhance the benefits of using the platforms and applications in the English teaching and learning (Metruk, 2021). This approach can contribute to the student's self-confidence in online learning because of the range of platforms and applications supporting their learning. Also, the lecturers may be more creative in designing the lesson plan and providing various digital sources to improve their students' English skills.

In conclusion, previous studies identified some opportunities for lecturers and students to conduct online teaching and learning. These included flexibility in time and place (Gouseti et al., 2020) and a wide range of digital sources (Martha, 2021). The opportunities not only for the students but also for the lecturers in developing their strategies for teaching English in HE institutions. So, the second research question has been answered from the previous studies explained about the opportunities of using DT in ET in HE institutions.

Discussion

Based on the results found from the narrative review, the author identifies and classifies the challenges and

opportunities of using digital technology in English teaching and learning activities in HE institutions. Those challenges can be reduced by providing DT training for lecturers and students. Also, the opportunities can be optimised to increase students' English proficiency. In addition, the government and stakeholders may increase the DT facilities and internet connectivity to achieve the best service and quality of English teaching and learning online. The challenges and opportunities that have been identified are described in Table 1.

Table 1. Challenges and Opportunities Using Digital Technology in Education

Aspects	Challenges	Opportunities	Sources
Digital technology access	√		(Galvis & Carvajal, 2022; Lazar et al., 2020; Ngoasong, 2022)
Engagement	√		(Galvis & Carvajal, 2022; Lazar et al., 2020; Ngoasong, 2022)
Pedagogical dimension	√		(Dumbraveanu, 2021)
Personal dimension	√		(Thaheem et al., 2021; Viner et al., 2020)
Flexibility		√	(Gouseti et al., 2020; Ngoasong, 2022; Sufyan, 2020)
Wide range of sources		√	(Martha, 2021; Nazarov et al., 2021)
Cultural Awareness	√		(Lu et al., 2022)

Conclusion

Many challenges and opportunities exist for using digital technology in English teaching in HE institutions. The previous studies identified some problems and benefits in digital learning, which still require further investigation. Therefore, this study conducted a comprehensive review in identifying and classifying the challenges and opportunities of using digital technology in English teaching and learning. This study provides valuable insight to the lecturers and students in integrating digital technology into the English teaching and learning process.

The challenges in integrating DT into English teaching are DT access, engagement, pedagogical dimension, personal dimension, and cultural awareness (Thaheem et al., 2021). The challenges also include the digital technology training (Burns, 2013), limited access to digital devices (Zuhairi et al., 2020), and internet connectivity (Ngoasong, 2022). So, these challenges impact the English teaching and learning process in HE institutions when undertaking online learning.

However, many opportunities exist to integrate DT into English teaching and learning. They are flexible regarding place and time while conducting teaching and learning activities (Gouseti et al., 2020). They may attend the meeting with the lecturers from home and set the appropriate time between lecturers and students to achieve the goal of the lessons. Also, another opportunity is that a wide range of sources can be accessed online using digital technology, applications, and platforms to enhance their English skills. Then, the lecturers can access various sources to update their English knowledge (Nazarov et al., 2021). To conclude, this comprehensive review benefits lecturer and students in English teaching and learning in HE institutions by reducing the challenges and improving the opportunities for integrating DT and education.

Recommendations

This study limits about challenges and opportunities of using digital technology in English teaching in higher education institutions. Furthermore, the authors provide recommendations for further research in integrating technology and education in any discipline of study from primary to higher education institutions to reach the best service and quality of English teaching and to increase the students' English skills.

Abstract: Knowing that we are not the only owner of the world, we are only a part of it, and that it is our most important duty to observe the sustainability of resources for a more livable world is vital for us to leave a livable environment for future generations. The most important cause of environmental pollution is solid waste. Packaging, which is one of the important types of urban solid waste, dates back to the human desire to store food products. Packaging, the first examples of which are tree leaves and bark, has developed in direct proportion to the living standards of humanity. Packaging, which initially had one purpose only to protect food, has become an advertising and communication tool with the developing technology and the competitive environment created by the production sector. Today, what is expected from successful packaging is to protect the product in a healthy way to the expectations of the target audience, to be easily transported from one place to another, to gain customer appreciation with its aesthetic appearance and to have communication power. At the same time, since it is an advertising element, new searches are needed every day in packaging design. The diversity of the products to be packaged and consumer preferences have paved the way for new designs that can win the shelf competition with different materials. As a result of this, new packages were produced constantly, resulting in new and more solid waste. The designer should choose sustainable, environmentally friendly, recyclable or recyclable materials while planning the packaging process from production to shelf and to the end consumer. The content of this review-type study; is aimed at evaluating the packaging design within the framework of the concept of sustainability.

Keywords: Sustainability, Recycle, Echo Design, Sustainable Packaging

Citation: Kınık, M., Öztürk, M. S. (2023). Recycling for Sustainability in Packaging Design. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1904-1913), Cappadocia, Türkiye. ISTES Organization.

Introduction

Packaging is derived from the French word "emballage". It is the process of packing or wrapping a product or item, placing it in a box and making it portable. Today, the packaging is defined as a material equipped with the necessary information in such a way that it fulfils the function of making the consumer like and accept itself without being damaged, polluting the environment, and fulfilling the function of making the consumer like and

accept itself in the process of loading, unloading, transporting and storage stages after the product leaves the production line. Many different organic or inorganic materials can be used for packaging according to the characteristics of the product. Size, material and form are directly related to the product.

Packaging is a design and technology for the protection of products for distribution, storage, sale and use. Packaging helps a product to be stored and transported safely. The type of packaging is determined by the shape, weight and durability of the product. Good packaging protects the contents, adds value to the product, provides information about the product, contributes to its purchase and is environmentally friendly.

The artefacts unearthed show that human beings have had a culture of storing their possessions since ancient times. Clay and glass containers, mussels and fruit shells or leaves, which are thought to have been produced in the eight thousand years BC and used to store and protect goods, are considered to be the first examples of packaging design. Earthenware vessels such as amphorae, askos, pelike, glassware such as vases, bowls, oil lamps, metal utensils, special altar vessels, and carrying jars were used for storing and transporting liquids such as perfume, wine, olive oil, water, and foodstuffs such as honey and fish sauce.

The Concept of Sustainability

The concept of sustainability can be defined and perceived in different ways. Today, the concept of "sustainability", sustainable environment, sustainable world, sustainable economy, sustainable development, sustainable design, etc. are frequently used in our literature. Sustainability can be achieved by utilising the rich resources that nature offers to people in proportion to their self-renewal. Social sustainability can be expressed as meeting the needs of today's human generation while taking into account the needs of future generations. Economic sustainability, on the other hand, is evaluated together with development, using renewable resources in the production process and being responsible for the environmental impacts in all production activities.

In the 1980s, environmental problems started to come to the fore. In order to change this bad trend, environmental movements have intensified in order to create environmental awareness, solve environmental problems, prevent new problems, and leave a livable world for future generations. This movement is aimed at making and implementing plans that will enable people to benefit from nature at the optimum level without disturbing the ecological balance. In other words, the aim is a "Sustainable World" (Kocataş, 2008: 417).

Eco Design

Green design; while increasing the quality of the product with the design made, it is the reduction of the effects on the environment within and throughout the life cycle of the product. The concept of eco-design; Eco Design, Green Engineering, Sustainable Design, Life Cycle Engineering, Design For The Environment, Nature-Friendly Design, Life Cycle Design, Cradle-To-Cradle Design, Environmentally Conscious Design, etc. It is seen that it is used instead of many concepts (Öztürk & Ünal, 2022; Öztürk & Demirci, 2022; Öztürk et al., 2021).

Green design, which emerged in 1992, covers methods of implementing changes in design or improvement strategies to reduce environmental impact and protect the environment (Baumann, Boons, & Bragd, 2002: 413). Green design is the consideration of design issues related to the environment and human health and safety over the life cycle while developing a different product and production process. Considering factors such as cost, quality, etc., it aims to look from a vision that considers the entire life cycle of the product by integrating environmental sensitivity ideas into the traditional design process in the production and use processes of products and all processes (Kasap & Paker, 2011: 103-104).

Although there are concerns that environmental strategies bring high costs to firms, many studies have shown that planning for green design contributes to firms in terms of savings. Reducing or completely eliminating the use of harmful substances and the amount of waste in the production process provides significant cost savings to businesses due to the high costs of transport and treatment procedures for harmful wastes (Schischke, Hagelüken & Steffenhagen, 2).

Rapid changes in competitive conditions bring along difficult processes for businesses. In the face of challenging competitive conditions, businesses have carried out studies on the supply chain, collaborated with their stakeholders to create value for the end consumer and improve their business performance, and used this as a competitive strategy. Stakeholders have been subjected to pressures to meet the environmental needs of companies with high environmental awareness, along with issues such as low cost, quality, and delivery discipline. Green design studies to be carried out by the stakeholders in the supply chain of firms were seen as a solution to overcome the pressures they faced (Kasap & Peker, 2011: 110).

Sustainable Graphic Design

The most basic material of graphic design is paper. Tons of paper are used for graphic design projects and advertising campaigns. Graphic designers are responsible for the forest massacre caused by cut-down trees. It is the graphic design sector that realises the dreams of marketers and manufacturer company owners and is the accomplice of millions of packaging waste. Like graphic designers, industrial designers who design packaging must also produce environmentally sensitive designs and packaging.

Tons of paper and ink are used for daily printed newspapers, magazines, periodicals, product packaging, promotional materials such as inserts, brochures and flyers. When starting a project, the designer should adopt a holistic design vision to consume less paper, prefer environmentally friendly inks and use recyclable materials. The data and decisions are taken within the framework of the initial brief to shape the entire design and production process.

Intervening in issues such as printing quantity, paper size and printing technique in the printing and post-printing stages will reduce paper, energy, mould, labour and cost. The designer may prefer a printing house that is environmentally conscious, has taken green design measures, and uses recyclable materials in binding and

protection applications. The printing technique and colours preferred by the designer while preparing a project should be in the direction of environmentally friendly choices that are not petroleum derivatives, do not contain harmful heavy metals, and do not emit toxic gases and elements into the atmosphere.

VOC (Volatile Organic Components), the emissions of volatile organic compounds (VOC), which are contained in the inks and released into the atmosphere as a result of industrial processes, can easily evaporate even at low temperatures and can produce undesirable effects in air and water. Each new colour used in the printing process means much more greenhouse gas emissions, solvent and raw material use. In this context, choosing fewer colours in designs not only reduces the use of ink in printing but also facilitates the recovery of paper material. It would be the right approach to prefer recycled paper in some products. In production, water and organic-based or recycled inks without VOC (Volatile Organic Components) emissions should be used, and metallic inks and inks containing toxic elements should be avoided whenever possible.

Sustainability in Packaging Design

The century we live in has gained more importance in sustainable packaging with the rapid depletion of natural resources due to population growth. The increase in conscious consumers and environmental awareness has led to changes in consumer habits and sustainable approaches in packaging design have emerged as a rising value. Sustainable product selection and environmentally sensitive product design are important issues. For a sustainable design, it is very important for designers to fully define the elements for the use and disposal of the product, to select the least environmentally harmful raw materials in production, and to plan the production and distribution process with the least social and environmental impact (Zeren & Nakıbođlu, 2009: 462).

The first organisation on sustainable packaging (SPA-Sustainablepack) was established in Australia in 2002 with the participation of Victoria University, RMIT University and Birubi Innovation. The founders aimed for an integrated and supply chain-orientated approach to sustainable packaging. In this context, they first developed projects to create sustainable packaging foresight (Bunyatova et al., 2021; Lewis & Sonneveld, 2004; Lasminawati et al., 2022).

Although sustainable packaging approaches create a new and difficult design process, it would be wise to ignore the difficulties when ecological awareness and recovery are considered (Verghese, Lewis, & Fitzpatrick, 2012: 10). According to the Regulation on Control of Packaging Wastes; it is not correct to use non-recyclable materials when producing packaging. Packages produced from recyclable raw materials should be recycled after their use is completed (ASD, 2019).

It is seen that consumer preferences are in the direction of purchasing environmentally sensitive packaging. The increase in environmentally conscious customers who act with the idea of reducing the carbon footprint causes the biochemical development of the raw materials used in packaging production and the development of their designs in line with these views. It is possible to say that a sustainable packaging design that requires the lowest

levels of energy and raw materials in production positively affects the sales of the end product, and increases the competitiveness and brand value of the product (Shedroff, 2009: 219).

Packaging is the protection and promotion elements produced in different materials that are also effective in the marketing process, which has the functions of protecting, storing, transporting and transporting the product inside. At the same time, packaging helps customers to make choices and be informed by placing different information on it. It can be said that packaging has a special place in terms of sustainability, considering that all products placed on the market are placed in packaging and the packaging is wasted after the product is consumed. For this reason, sustainable plans should be made in the design and production process of packaging. Especially if recycled materials are not used in packaging production, additional burdens will arise.

Recycling in Packaging

Recycling is the re-entry of packaging into the manufacturing process as raw material through various processes after it is used. Energy recovery is the process of burning combustible wastes in facilities to obtain heat and electrical energy (ASD, 2013). Due to the traces left by modern life in nature, recycling has become an issue that is constantly discussed since packaging wastes are considered as a significant substance under the titles of effective use and sustainability of natural resources. Recycling, by definition, is the re-entry of waste materials into the manufacturing process in the form of raw materials after undergoing certain physical and chemical processes, minimising the damage to nature and humanity. Packaging wastes are divided into 6 in terms of material type: "paper, glass, wood, plastic, metal and composite packaging". The fact that these packages are produced from recyclable materials does not mean that they will be recycled. First of all, the consumer should leave it at the recycling point, not directly in the garbage, and even this will not be recycled if there is no suitable recycling facility in the region. For this reason, biodegradable materials should be preferred as much as possible (Gündüzalp & Güven, 2004: 9).

Figure 1. Recycling (Retrieved from: <https://twitter.com/sifiratikgov/status/1124207343363928064/photo/1> on the date 08 May 2023)

Another important concept related to recycling is Organic Recycling, i.e. Composting. Compost is the biological decomposition of organic materials under appropriate conditions and the breakdown of some substances with carbon dioxide and water. Re-use means that the packaging can be reused until it is no longer possible to reuse it (ASD, 2013). Energy recovery or composting is another consideration, depending on the nature of the packaging and the local solid waste management infrastructure. During composting, some organic matter is broken down with carbon dioxide and water. After the process waste resembles a dark-coloured, humus-like, rich soil type, compostable waste is produced by this method as an energy source instead of fertilisers (RECOUP, 2013).

Since recycled packaging, together with the collected composite packaging, is made of many materials, this process consists of complex stages. After grinding, paper, aluminium and polyethene are shredded. Recycled paper can be used in the production of toilet paper and corrugated cardboard. After the paper is separated, the remaining part, aluminium, polyethene or other material, can be used as additional fuel in cement factories due to its high calorific value. It can be recycled by incineration for energy (ASD, 2013).

Instead of being materials that pose a threat to the environment such as plastics and petroleum-based wastes that remain intact for hundreds of years, packaging wastes should consist of organic, bioplastics that decompose in nature with carbon dioxide and water in a few years. New-generation manufacturers and scientists have started to fight global plastic waste by producing compostable and renewable packaging (Boztaş, 2016). With the recycling methods applied by innovative manufacturers, most plastic packaging can be turned into an energy source. These recycled plastics are converted into alternative fuels for new manufacturing and energy recovery is achieved.

Figure 2. Natural Tea Packaging (Retrieved from: <https://www.tripwiremagazine.com/wp-content/uploads/2012/06/organic-packaging-for-organic-tea.jpg> on the date 02 April 2023)

Today, 100% recyclable packaging has started to be produced. These packages, which generally use paper and fabric, boxes, bags, labels and all applications on them are environmentally friendly. In tea packaging, one of

these products, a natural cotton fabric material was used in the primary packaging. In the secondary packaging, a cardboard box made of recycled material was used. The packaging is not only recyclable but also functional and reusable.

Another product is yoghurt packaging made from sheep and goat milk. The typography, illustrations and colours of this packaging design are 100% recyclable and have high brand recognition.

Figure 3. Recyclable Yoghurt Packaging (Retrieved from: <https://thedieline.com/blog/2011/4/11/tonis-goats-milk-yogurt.html?> on the date 05 May 2023)

One of the examples of recycled paper material, the 360-degree paper bottle packaging is an environmentally friendly packaging developed in Prague, the first of its kind in the world, in order to solve the plastic bottle problem. It is an original bottle design suitable for use in all liquid categories, made of 100% recycled material with a light coating of recycled plastic and made of renewable resources.

Figure 4. 180 Degree Paper Packaging (Retrieved from: <https://www.designerpeople.com/blog/packaging/creative-eco-friendly-packaging-design-for-inspiration/> on the date 05 May 2023)

At least 8 million tonnes of plastic reach the ocean every year. With the collection of all faeces in petroleum-based plastic bags, it is faced with the situation that the leaching of toxic chemicals in landfills will continue for thousands of years. Alternatively, leaving faeces on the ground is also not an environmentally friendly option. Poop Bags in Figure 5 is an environmentally friendly packaging design that is naturally created from non-GMO corn starch and vegetable oil, which biodegrades 40% to produce olive bags. It can be 100% biodegradable for up to 40 days and can be approved as compost. New-generation plastic manufacturers are contributing to sustainability by developing compostable plastics with the idea of overcoming the global plastic waste crisis.

Figure 5. Plastic Packaging (Retrieved from: <https://www.tripwiremagazine.com/eco-friendly-packaging-designs/> on the date 01 April 2023)

Figure 6. Metal Carbonated Beverage Packaging (Retrieved from: <https://studiodesignistanbul.files.wordpress.com/2011/12/untitled4.png> on the date 12 January 2023)

This innovative idea of the metal Coca-Cola packaging in Figure 6 allows the use of a convex logo instead of a coloured can and contributes to the reduction of air and water pollution in the colouring process. In this way, it is possible to separate toxic colour dyes from aluminium in the recycling process with less energy. In this way, more energy and dye can be saved than is required in the production of coloured cans. Instead of toxic dyes,

manufacturers process the aluminium surface with a pressing machine that shows the brand identity. In the recycling of metal beverage cans, the metal is directly melted and transformed into a new product. Since the industrial process in recycled materials is minimal, the recycling of aluminium cans results in an energy saving of 96%. Similarly, the energy required to reprocess separated paper from solid waste is 50% (ASD, 2013).

Conclusion

that the world we live in does not belong to us, having an awareness of green design for a sustainable world is an important responsibility that should be gained as an individual and society at preschool ages. It is our human duty to protect the environment, to be sensitive to environmental problems, to use renewable resources, to develop a consumption culture suitable for recycling, reuse and upcycling, and to use natural resources more sustainably by considering future generations.

In today's modern life, people have to use both paper and paper derivative products and electrical and electronic equipment. Our duty as designers, producers and consumers is to prefer more environmentally friendly and sustainable products in production and consumption, to recycle the products that have completed their life cycle rather than throwing them directly into the garbage and to recycle them into the economy and to prefer recycled products in new productions.

One of the most important problems of today is the lack of resources. Waste management for a sustainable environment is an important responsibility for producers and consumers. It is a civic duty to produce innovative and sustainable solutions in packaging design. The fact that activities related to sustainability are carried out worldwide, but an effective solution has not yet been found for plastic waste shows that this waste, which disappears in nature in the latest time, and the damage it causes to the environment is a growing problem. The increase in consumption and product diversity, digital shopping and taste level is the most important reason for packaging diversity. Since the damage caused by waste to nature should be greatly reduced, all individuals should be encouraged and an environmental awareness should be created through various studies.

An Inquiry into the Critical Thinking Disposition of Turkish Pre-service Teachers: A Thematic Analysis of Theses

Eyüp Yurt

Bursa Uludağ University, Türkiye,  <https://orcid.org/0000-0003-4732-6879>

Abstract: This study aims to examine the theses on the critical thinking disposition of teacher candidates in Turkey. The document review method was used, which deals with documents related to a specific subject with a qualitative approach. The data of the research were analyzed by content analysis method. The Turkish Council of Higher Education (TCHE) national database was searched using the keywords "teacher candidate" and "critical thinking disposition," and 30 accessible theses were included in the research. Theses reached within the scope of the research; It was analyzed according to the themes of "academic level," "year," "scope of the subject," "research method," "sample," "data collection tools," "analysis method" and "results." The thesis studies were examined by two experts and coded according to themes. The percentage of agreement among experts was determined as 95%. It was understood that many of the theses examined were master's theses and were completed in 2019. It was observed that the samples of most of the theses consisted of social studies and science teacher candidates. It was determined that the Relational and Comparative research models were used more in the theses examined. t-Test, ANOVA, and correlation techniques are the most preferred techniques for data analysis. The number of theses in which qualitative research models are used is quite limited. The reviewed theses have focused on demographic characteristics, media literacy, entrepreneurship, emotional intelligence, and 21st-century skills as the primary correlates of critical thinking disposition. According to the results of the research, several recommendations have been developed.

Keywords: Critical thinking disposition, Pre-service teachers, Graduate theses, Content analysis

Ciddi (Eds.), *Proceedings of ICRES 2023-International Conference on Research in Education and Science* (pp. 1914-1928), Cappadocia, Turkiye. ISTES Organization.

Introduction

Education is a fundamental element for the development and progress of society. The education system is where educators need to develop teaching methods and strategies to enable students to learn successfully. However, in today's world, simply imparting knowledge to students is no longer enough. Students should be equipped with critical thinking skills so that they have the necessary skills to analyze complex problems, generate new ideas, and evaluate different perspectives. Critical thinking is seen as an essential skill that increases the quality of life

of individuals (Elder & Paul, 2020).

Teachers should help students develop their critical thinking skills. However, providing critical thinking training to teacher candidates is also essential. Critical thinking can be taught by teachers who can think critically (Yeşilyurt, 2021). Critical thinking skills will not only contribute to the development of their students but also to their professional development. Therefore, research on how pre-service teachers can improve their critical thinking skills has increased recently. This research aims to examine the theses in which the critical thinking dispositions of teacher candidates are investigated. These theses will provide information about teaching strategies and methods to help prospective teachers develop their critical thinking skills.

Critical Thinking Skill and Disposition

Critical thinking is a mental process used to evaluate information and ideas. Critical thinking means considering and analyzing evidence, arguments, and other sources of information when thinking about a topic and coming to logical conclusions. It includes critical thinking, reasoning, analyzing, synthesizing, evaluating and problem-solving skills (Almusaed et al., 2022; da Silva Almeida & Helena Rodrigues Franco, 2011; Gacovska-Barandovska et al., 2020; Marques & Xavier, 2021; Orhan, 2023; Ye et al., 2021).

Critical thinking is a cognitive process that involves purposeful and reflective judgment and applying appropriate criteria and standards to evaluate what is said, done, or written by ourselves or others. According to Bailin, Case, Coombs, and Daniels (1999), critical thinking is a normative endeavor that relies on intellectual resources such as background knowledge, operational knowledge of standards, and specific mental habits. Dwyer, Hogan and Stewart (2014) stress the significance of critical thinking in adapting to the rapidly changing information landscape and suggest an integrated framework of learning outcomes based on existing theoretical models and recent conceptualizations of critical thinking. Duron, Limbach, and Waugh (2006) propose a five-step framework applicable to any educational or training setting to help learners develop critical thinking skills. Lai (2011) emphasizes the importance of explicit instruction, component skills, critical thinking dispositions, open-ended tasks, and real-world problem contexts to assess critical thinking. Critical thinking requires explicit instruction, appropriate frameworks, and assessment methods to be taught and cultivated effectively.

One of the factors required for critical thinking skills is that the individual tends to think critically (Yeşilyurt, 2021). Critical thinking disposition means the tendency of individuals to think critically. This disposition reflects one's thinking habits, preferences, and attitudes. Individuals with a high tendency to think critically can analyze information more effectively, understand different perspectives, evaluate arguments more critically, and achieve better results.

Critical thinking and critical thinking disposition are essential in many fields. Especially in education and business, individuals with critical thinking skills can solve the problems they face more effectively, make smarter decisions, and be more successful. In addition, critical thinking is also essential in social interactions

because having the skills to understand, evaluate and discuss other people's ideas helps to develop communication skills (Seferoğlu and Akbıyık, 2006).

Critical thinking disposition is a crucial component for individuals in various fields. Indra (2019) found critical thinking is crucial for nursing students to manage complex health situations and deal with patient issues effectively. Ennis (1996) argues that critical thinking disposition is at least as important as critical thinking abilities and suggests criteria for judging sets of them. Çubukçu (2006) found that Turkish teacher candidates with high critical thinking dispositions were more likely to be open-minded and analytical. Facione, Facione, and Giancarlo (2000) suggest that effective teaching must include strategies for building intellectual character rather than relying exclusively on strengthening cognitive skills. As a result, critical thinking and thinking disposition help individuals develop their thinking skills and contribute to their success. Therefore, critical thinking and thinking disposition are essential in developing individuals and society, especially in education.

The Importance of Critical Thinking Disposition for the Teaching Profession

A critical thinking disposition is essential for teacher education and the teaching profession. This trend is important for pre-service teachers and teachers to teach their students more effectively, to be more effective in students' learning process, and to develop students' critical thinking skills. In Turkey, courses on thinking skills have been added to the curricula to increase pre-service teachers' knowledge of critical thinking skills and improve their critical thinking disposition (Turkish Council of Higher Education (TCHE), 2007).

In teacher education, a critical thinking disposition can help pre-service teachers improve their learning and teaching skills. When trainee teachers develop critical thinking skills, they can better understand students' learning needs, select learning materials and present them more effectively. In addition, a critical thinking disposition also helps pre-service teachers develop their classroom management skills. Using their critical thinking skills, teacher candidates can better understand and resolve conflicts between students more effectively. For the teaching profession, critical thinking disposition helps teachers to better respond to students' needs. Critical thinking skills allow teachers to understand students' learning needs better, choose learning materials, and manage the learning process more effectively. Also, critical thinking skills help students develop their critical thinking skills. Using critical thinking skills, teachers can help students critically evaluate their ideas and thoughts. Critical thinking disposition can also contribute to the professional development of teachers. Critical thinking skills help teachers develop their ability to solve problems they encounter in the classroom. Also, critical thinking skills can help teachers communicate and collaborate more effectively with colleagues and parents.

Studies have shown that teacher candidates generally have positive critical thinking dispositions. Şenşekerci and Kartal (2010) found that the critical thinking dispositions of teacher candidates improved for their university education. Karagöl and Bekmezci (2015) found that critical thinking dispositions of teacher candidates did not differ according to gender or type of school but according to the field of study. Bilen, Ercan and Akcaozoglu

(2013) found that the critical thinking disposition of teacher candidates was positive and differed based on gender, class levels, and departments of teacher candidates. Finally, Çubukçu (2006) found that Turkish teacher candidates had high levels of open-mindedness and analyticity but lower levels of inquisitiveness and systematicity.

As a result, a critical thinking disposition is essential for teacher education and the teaching profession. Critical thinking skills help teachers better understand students' learning needs, choose learning materials better, and develop students' critical thinking skills. In addition, critical thinking skills also contribute to the professional development of teachers. Therefore, teacher education programs and teachers' professional development programs should be designed to develop critical thinking skills.

Purpose of the Research

This study is critical because it provides data-based information for developing pre-service teachers' critical thinking skills. Critical thinking skills help students cope with future challenges and ensure continuous learning and development. This study will contribute to the current research on critical thinking dispositions of pre-service teachers and will encourage further research in this area. By emphasizing the importance of providing pre-service teachers with critical thinking skills, future teachers can be helped to have these skills.

Pre-service teachers, curriculum developers, and those who do research in education will benefit from this study. Pre-service teachers can learn the importance of critical thinking skills and the methods that can be used to develop these skills. Curriculum developers can use the findings from this study to develop strategies and methods to create a more effective learning environment. Determining the factors that pre-service teachers' critical thinking dispositions are related to can provide a more qualified preparation for the education process. In addition, determining the general trends of the research on the subject can guide the studies to be done later. In this way, qualified studies that explain the development of critical thinking disposition in teacher candidates can be carried out.

In conclusion, this study will provide data on developing pre-service teachers' critical thinking dispositions. It will be an essential resource for experts in the field of education. The results of this study will provide a helpful roadmap for the training of teacher candidates, the development of curricula, and research in the field of education. This study aims to examine the postgraduate studies related to the critical thinking disposition of teacher candidates in Turkey. Accordingly, answers to the following research questions were sought.

- 1- What is the distribution of postgraduate studies examining the critical thinking dispositions of teacher candidates according to academic level in Turkey?
- 2- How is the distribution of postgraduate studies examining the critical thinking dispositions of teacher candidates in Turkey over the years?
- 3- How is the distribution of postgraduate studies examining the critical thinking dispositions of teacher candidates in Turkey according to the scope of the subject?

- 4- What is the distribution of postgraduate studies examining the critical thinking dispositions of pre-service teachers in Turkey according to the research model?
- 5- What is the distribution of postgraduate studies examining the critical thinking dispositions of pre-service teachers in Turkey according to the sample group?
- 6- What is the distribution of postgraduate studies examining the critical thinking dispositions of pre-service teachers in Turkey according to data collection tools?
- 7- What is the distribution of postgraduate studies examining the critical thinking dispositions of pre-service teachers in Turkey according to analysis techniques?
- 8- How is the distribution of postgraduate studies examining the critical thinking disposition of teacher candidates in Turkey according to the variables associated with the critical thinking disposition?

Method

This study utilized a qualitative document review approach, focusing on documents relevant to a specific subject matter. The collected research data were analyzed using the content analysis method, which involves descriptively evaluating the trends and findings of studies (Çalık & Sözbilir, 2014). Using the descriptive content analysis method, this study examined postgraduate research on the critical thinking dispositions of teacher candidates in Turkey between 2018-2022, aiming to identify the general trends and patterns in this field.

The Turkish Council of Higher Education (TCHE) national database was searched using the keywords "teacher candidate" and "critical thinking disposition," and 30 accessible theses were included in the research. Theses reached within the scope of the research; It was analyzed according to the themes of "academic level," "year," "scope of the subject," "research method," "sample," "data collection tools," "analysis method" and "results." The thesis studies were examined by two experts and coded according to themes. The percentage of agreement among experts was determined as 95%. Theses examined within the scope of the research are marked with "*" in the bibliography.

Results

This section gives descriptive information about postgraduate studies on teacher candidates' critical thinking dispositions. Studies on the subject were examined according to the themes of "academic level," "year," "scope of the subject," "research method," "sample," "data collection tools," "analysis method," and "results."

Academic Levels of Theses

It is understood that 90% of the theses examined within the scope of the research are master's theses, and 10% are doctoral theses. It has been observed that most of the theses examining the critical thinking dispositions of teacher candidates are master's theses.

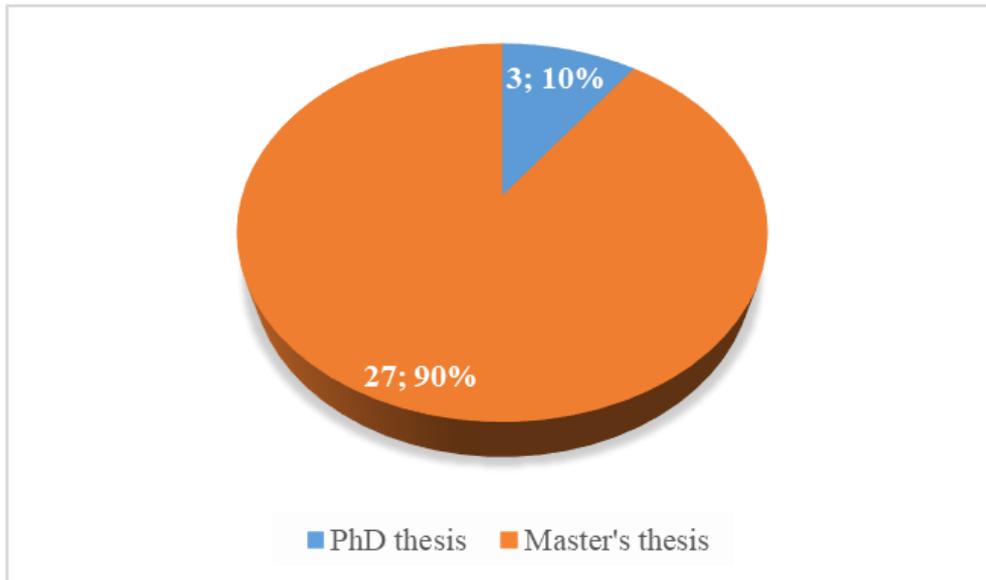

Figure 1. Figure 1. Distribution of Theses by Academic Level

Distribution of Theses by Years

When Figure 2 is examined, it is understood that 10% of the theses examining the critical thinking dispositions of teacher candidates were completed in 2018, 43.3% in 2019, 16.7% in 2020, 20% in 2021, and 10% in 2022. It is striking that most of the theses examining the critical thinking disposition of teacher candidates were carried out in 2019.

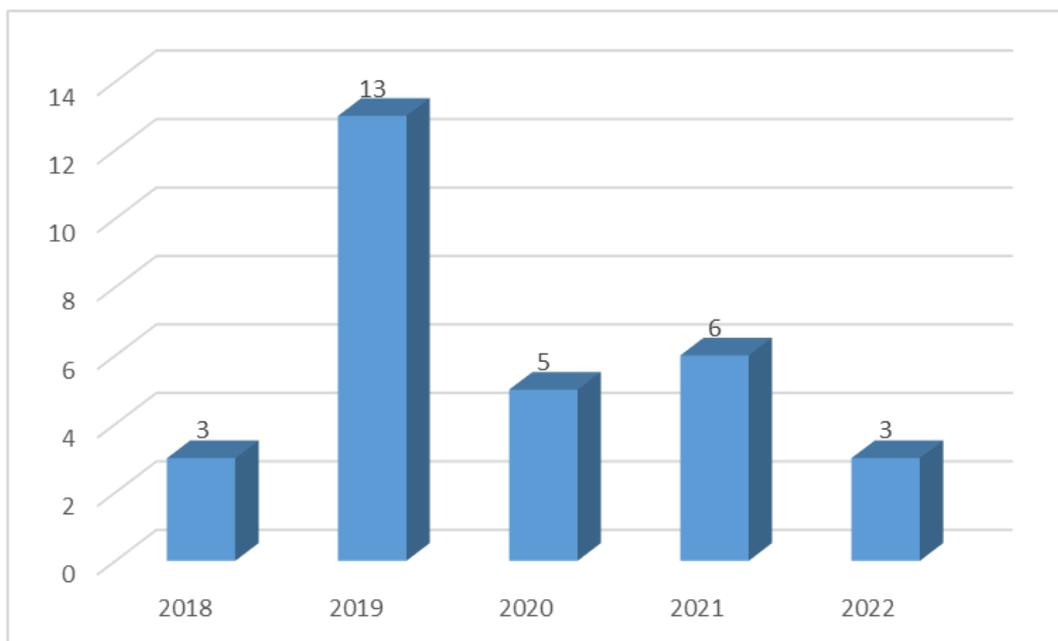

Figure 2. Distribution of Thesis by Years

Subject Scope of Theses

When the distribution of the theses examining the critical thinking disposition of teacher candidates according to the scope of the subject was examined, it was observed that the subject scope of the majority was in the "survey/case study" type. There are a few theses with the subject scope of "The impact of teaching" and "Scale adaptation." Two theses with varying scopes of the subject have been identified.

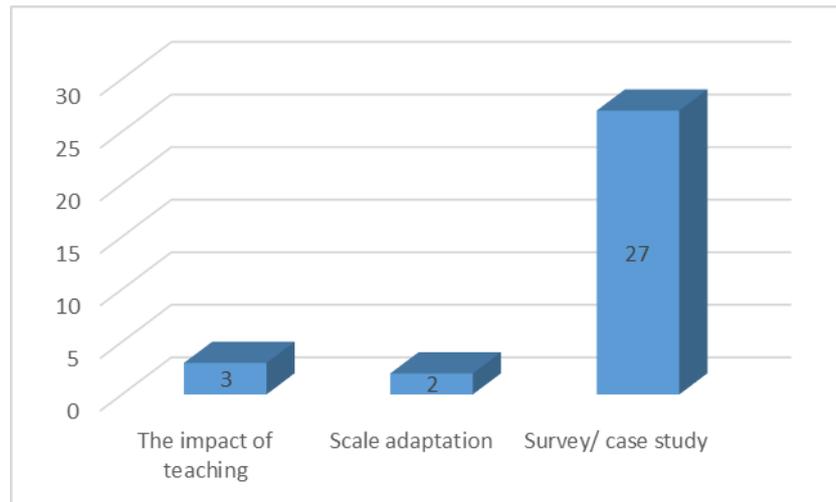

Figure 3. Distribution of Thesis by Subject Scope

Research Methods Used in Theses

It was observed that the quantitative research approach was adopted in 27 (90%) of the theses examined within the scope of the research. It was determined that 3 (10%) of the theses adopted a mixed research approach. There is one thesis that uses only qualitative research design. There were three studies in the experimental research type. Most of these are relational and comparative research types (Table 1).

Table 1. Findings Related to Research Methods Used in Theses

Themes	Codes	f
Experimental	Semi-experimental	2
	Fully experimental	1
	Survey	0
Non-experimental	Relational	22
	Descriptive	0
	Comparative	25
	Latitudinal/Longitudinal	0
Interactive	Case Study	1
	Action Research	0
	Phenomenological	2
Non-interactive	Grounded Theory	0
	Document analysis	0
Mixed	Qualitative/ quantitative	3

Sample Groups of Theses

Science (10.9%) and social studies (10.9%) pre-service teachers were selected as samples in a large proportion of these examining the critical thinking dispositions of pre-service teachers. There are also thesis studies in which physical education, English, mathematics, music, preschool, art, classroom, and Turkish teacher candidates are selected as samples. It was determined that the number of theses that included teacher candidates from different branches in its sample was six (Figure 4).

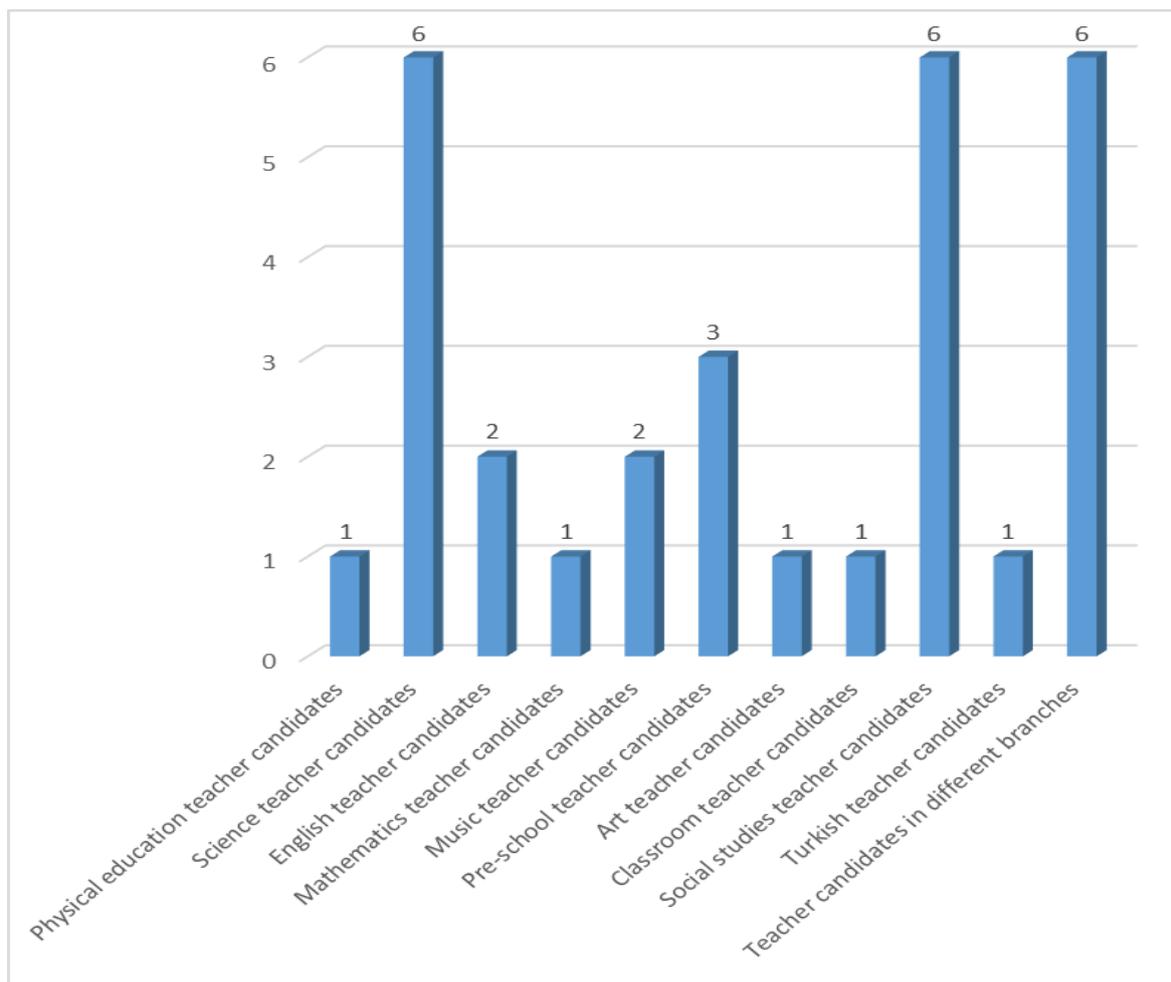

Figure 4. Distribution of Thesis by Sample Groups

Data Collection Tools Used in Theses

According to the results obtained, "scale" was used as a measurement tool in most of the theses examined within the scope of the research. It has been determined that data collection tools such as interviews and observations used to obtain qualitative data are less preferred. The findings regarding the data collection tools used in the theses are given in Figure 5.

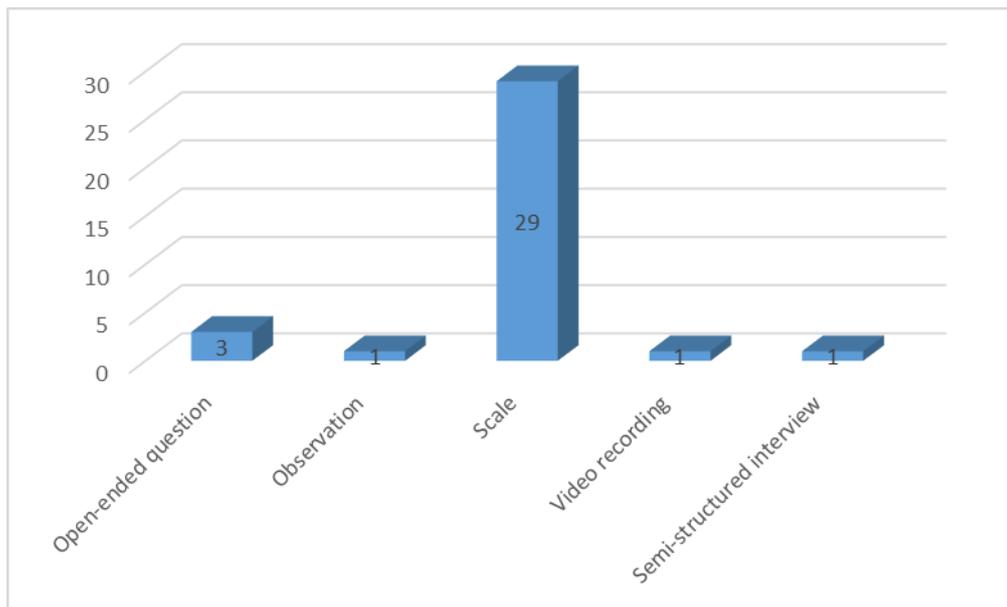

Figure 5. Distribution of Thesis by Data Collection Tools

Data Analysis Methods Used in Theses

Most of the theses examined in the research are in the type of quantitative research. As a natural consequence, quantitative analysis techniques were used more in theses. Quantitative analysis techniques include ANOVA, correlation, t-Test, and non-parametric analysis techniques. It is striking that more advanced quantitative analysis techniques, such as path and regression analysis, are used less frequently. It has been observed that descriptive and content analysis approaches are used in a small number of qualitative studies.

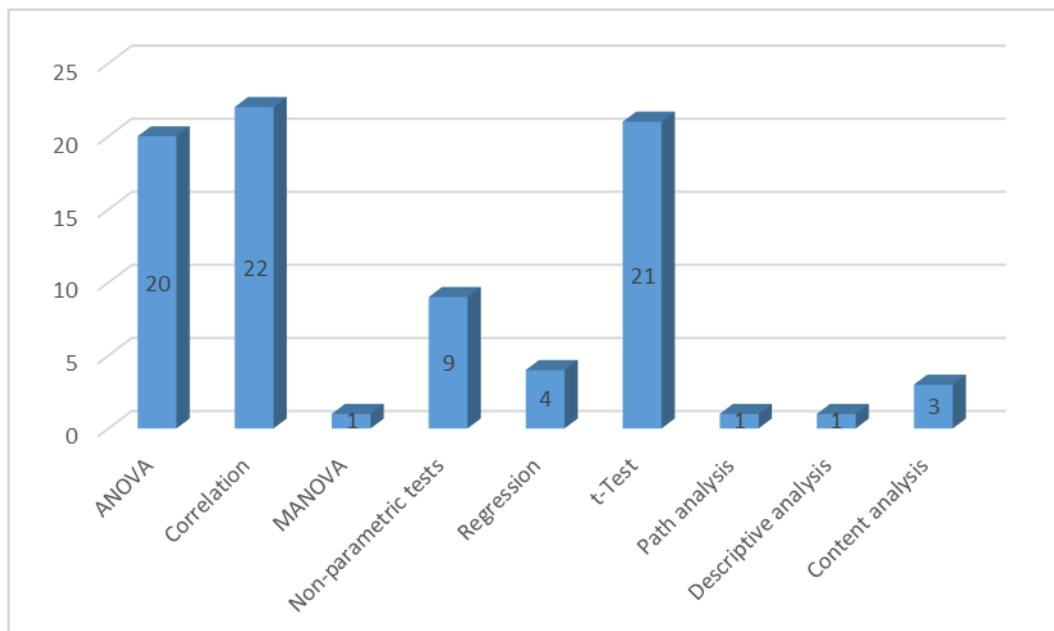

Figure 6. Distribution of Thesis by Data Analysis Methods

Variables Associated with Critical Thinking Tendency in Theses

The theses under scrutiny have investigated critical thinking disposition to 24 distinct variables. Specifically, the reviewed theses have predominantly focused on demographic characteristics, media literacy, entrepreneurship, emotional intelligence, and 21st-century skills as the primary correlates of critical thinking disposition. However, in addition to these variables, other factors such as innovativeness tendency, gender roles, creative thinking, personality type, thinking styles, reasoning, and academic self-efficacy have also been associated with critical thinking disposition (Figure 7).

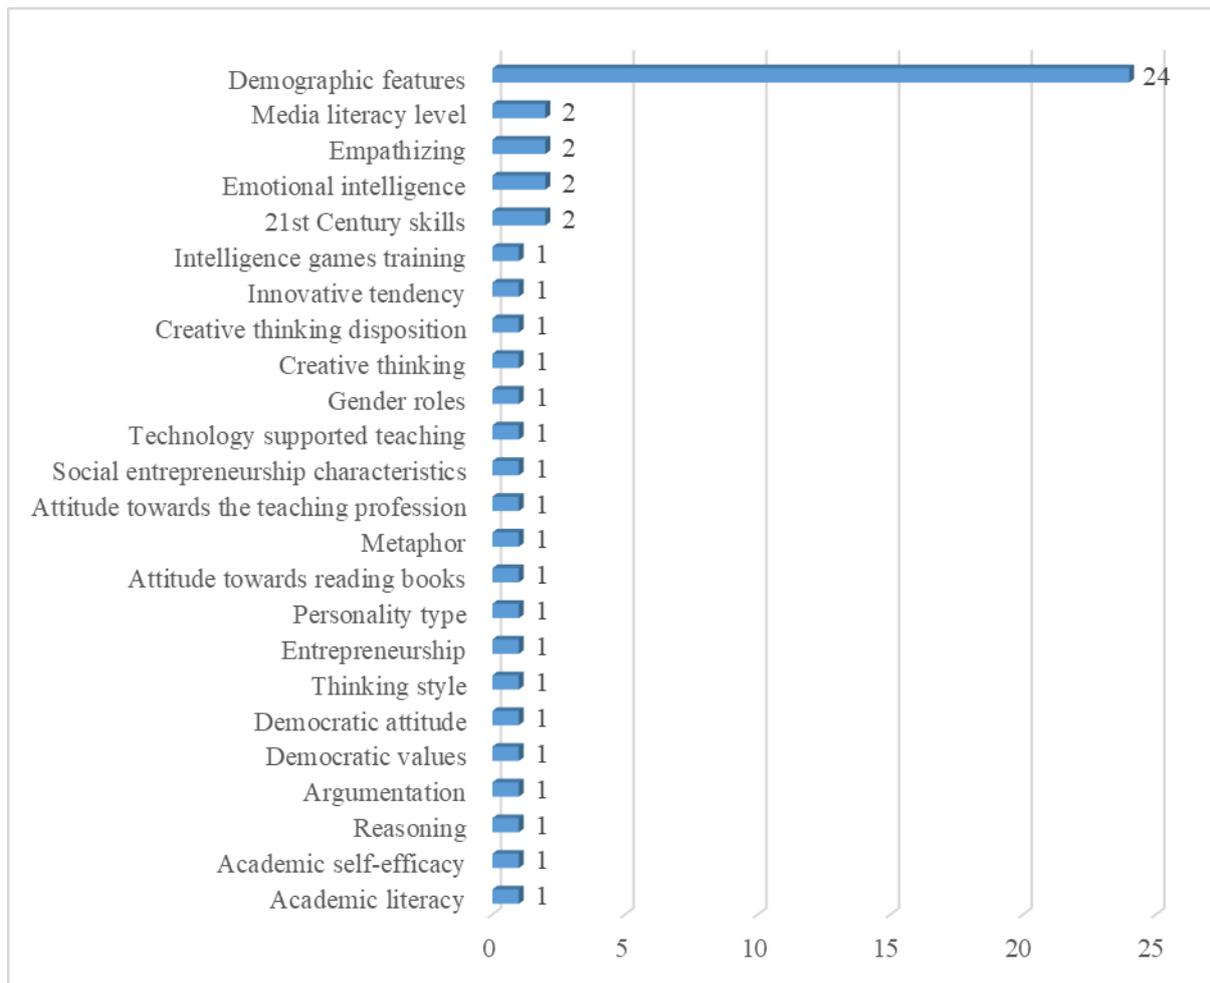

Figure 7. Distribution of Thesis by Variables Associated with Critical Thinking Tendency

Conclusion and Recommendations

This research examined thirty postgraduate studies on the critical thinking disposition of teacher candidates in Turkey in the last five years. Studies on the subject were examined according to the themes of "academic level," "year," "scope of the subject," "research method," "sample," "data collection tools," "analysis method," and

"results." In this way, the general tendency of the studies on critical thinking disposition in teacher candidates has been revealed.

According to the results obtained, 90% of the theses examined within the scope of the research are master's theses, and 10% are doctoral theses. It has been observed that most of the theses examining the critical thinking dispositions of teacher candidates are master's theses. It is advisable to conduct more doctoral thesis studies on the subject. In this way, the factors related to the tendency of critical thinking in teacher candidates can be discussed in more detail.

Another result obtained in the study is that 10% of the theses examining the critical thinking dispositions of teacher candidates were completed in 2018, 43.3% in 2019, 16.7% in 2020, 20% in 2021, and 10% in 2022. It is striking that most of the theses examining the critical thinking disposition of teacher candidates were carried out in 2019. According to these results, it has been observed that the number of studies on critical thinking disposition in teacher candidates has decreased in recent years.

According to the results obtained, the quantitative research approach was adopted in 27 (90%) of the theses examined within the scope of the research. It was determined that 3 (10%) of the theses adopted a mixed research approach. There is one thesis that uses only qualitative research design. There were three studies in the experimental research type. The majority of these are relational and comparative research types. Increasing the number of studies using qualitative research design can be recommended. These studies can provide the opportunity to reach deeper information obtained from different sources on the subject.

Another result obtained in this study was that the subject scope of the majority of the theses was in the "survey/case study" type. There are a few theses with the subject scope of "The impact of teaching" and "Scale adaptation." Two theses with varying scopes of subjects have been identified. Surveys or case studies systematically compile, summarize and analyze available information and data about a particular issue, problem, or area. Such studies are undertaken for various purposes, such as gaining a deeper understanding of the subject, providing a basis for planning future research, and guiding the development of policy or practice (Kitchenham, 2004). However, surveys or case studies have some weaknesses. First, the results of such studies are based on data collected by a selective method that determines the scope of the research and, thus, often do not provide a complete picture. Also, inferences based on such studies' results may be less conclusive than conclusions from more in-depth research. However, surveys or case studies are often helpful for summarizing current knowledge and data in a research area and providing a basis for future research (Grant & Booth, 2009). In this respect, it can be recommended to conduct more studies examining critical thinking disposition in pre-service teachers apart from screening/situation analysis.

Science (10.9%) and social studies (10.9%) pre-service teachers were selected as samples in a large proportion of theses examining the critical thinking dispositions of pre-service teachers. There are fewer thesis studies in which physical education, English, mathematics, music, preschool, art, classroom, and Turkish teacher

candidates were selected as samples. No study has examined the critical thinking dispositions of teacher candidates studying in German, computer and instructional technologies, special education, guidance, and psychological counseling departments. Conducting studies examining the critical thinking dispositions of teacher candidates in these departments can be recommended.

Most of the theses examined in the research are in the type of quantitative research. As a natural consequence, quantitative analysis techniques were used more in theses. Quantitative analysis techniques include ANOVA, correlation, t-Test, and non-parametric analysis techniques. It is striking that more advanced quantitative analysis techniques, such as path and regression analysis, are used less frequently. It has been observed that descriptive and content analysis approaches are used in a small number of qualitative studies.

Another result obtained in this study is that the thesis under scrutiny has investigated critical thinking disposition to 24 distinct variables. Specifically, the reviewed theses have predominantly focused on demographic characteristics, media literacy, entrepreneurship, emotional intelligence, and 21st-century skills as the primary correlates of critical thinking disposition. However, in addition to these variables, other factors such as innovativeness trends, gender roles, creative thinking, personality type, thinking styles, reasoning, and academic self-efficacy have also been associated with critical thinking disposition. The number of studies aiming to increase the critical thinking disposition of teacher candidates should be increased. In addition, it may be recommended to conduct studies examining the relationship between critical thinking disposition in pre-service teachers and high-level thinking skills such as analytical thinking, divergent thinking, and reflective thinking.

Acknowledgments

This study was produced from the project numbered SHIZ-2022-1244, supported by Bursa Uludağ University Scientific Research Projects Unit.

Abstract: As COSO and INTOSAI indicate, effective governance in public sector organisations is typified by a well-functioning and robust internal control system that contains five important components: control activities, control environment, information and communication, risk assessment, and monitoring. However, to identify which elements require further development and improvement, the study focused on Malaysian statutory bodies where Chief Executive Officers were surveyed using questionnaires. Of the 291 survey respondents, 194 were successfully gathered and analysed. The internal control system received a high rating of 5.493 on a 7-point Likert scale, indicating effectiveness. While an IPMA showed that all components performed well, Control Activities, Risk Assessment, and Monitoring were relatively less important. It is crucial for statutory bodies, especially internal auditors, to allocate more resources to enhance the importance of these three components, while the Control Environment and Information and Communication could be further strengthened through sustained top management commitment and improvements in information systems. The assessment highlights the potential for further enhancement to achieve even greater effectiveness in the internal control system.

Keywords: IPMA, COSO, Internal control system, INTOSAI

Introduction

Strong internal controls could safeguard an organisation's assets and prevent corruption and authority abuse. As a result, the internal control system's organisational structure highlights how the systems can assist managers in aligning staff members' competencies, actions, and output with corporate objectives and accountability. The government is the biggest user of resources, accounting for an average of 42% of the gross domestic product of OECD member nations (OECD, 2015). Government organisations must follow the highest governance standards to operate to the best of their abilities, provide value for the money spent, involve the community, and

uphold accountability. One of the most crucial aspects of governance is the internal control system (IFAC, 2001; IFAC & CIPFA, 2014; Yahya, 2022).

However, the internal control system of Malaysian statutory entities has been implicated in numerous instances as having issues. For instance, Yayasan Pahang's governance is less than good, according to the Auditor General's report on Pahang's statutory entities in 2019 (National Audit Department Malaysia, 2019). The investigation revealed that the organization's operational processes in financial management required improvement. This demonstrates the organization's problems with internal control. Furthermore, the Federal Land Development Authority (FELDA) suffers an RM73.63 million loss as a result of procedural irregularities, a lack of a feasibility assessment, and a failure to undertake due diligence prior to a project (National Audit Department of Malaysia, 2015b). Assets and resources have been wasted as a result of poor internal control, a malfunctioning system, and a lack of strong governance in management. Furthermore, FELDA's RM47.6 million sturgeon fish farming project exemplifies power abuse and financial espionage by FELDA's former general manager, former deputy director, and personnel (Shah, 2017). This incident reveals flaws in FELDA's internal control framework.

The Majlis Amanah Rakyat (MARA) case also involves governance and internal control issues. According to several publications (Boey, 2015; Garnaut et al., 2015; McKenzie et al., 2015a, 2015b; Sulaiman, 2016; Zahiid, 2015), top MARA officials paid an inflated price of \$4.75 million (RM13.7 million) in June 2015 for a student flat unit in Australia rather than paying the actual cost of \$17.8 million in 2013. Another instance included FELDA, which was in danger of losing land worth RM 270 million to a local business without the board's knowledge or approval. In 2015, there were shady and unclear transactions involving the change of ownership of the land. Police inquiries and forensic audits were conducted to look into the matter, even though they eventually established who owned the land (Carvalho, 2018). These are instances of asset mismanagement, fraud, and corruption. Therefore, it is essential to have a suitable and efficient internal control system to track errors and improper behaviour.

This study incorporates the examination of the internal control system level in Malaysian statutory bodies due to cases of internal control system issues in Malaysian statutory bodies. Do they meet all of the proposed internal control system standards' requirements? Additionally, the entire public sector was the subject of earlier research (Abd Aziz et al., 2015; Kamaliah et al., 2018), as well as local governments (Badara & Saidin, 2013b) and only a few statutory body organisations (Abdul Aziz et al., 2010). This study, on the other hand, is solely focused on statutory bodies. This study focuses on statutory bodies, one of the numerous sectors of the public sector in Malaysia, along with ministries, federal agencies, local authorities, and statutory bodies. The executive and legislative branches of government oversee statutory entities, which are public organisations that follow the same rules as other government operations (Seidman, 1954). The growth and management of a state and a country depend heavily on the public sector, which consists of governmental organisations and statutory entities. Federal and state statutory bodies make up the two tiers of statutory bodies in Malaysia. According to federal legislation, the federal statutory entities that Parliament established carried out government policies through

their operations (National Audit Department Malaysia, 2015b). As required by incorporation legislation, each federal statutory entity is assigned to a minister in charge. State statutory bodies, on the other hand, are established by state enactments and legislation. Their primary responsibilities include upholding and advancing the states.

Review of the literature

An internal control system is defined as "a process, influenced by an entity's board of directors, management, and other personnel, designed to provide reasonable assurance regarding the achievement of objectives in the following categories: effectiveness and efficiency of operations, and the reliability of financial reporting. Hence, it is a process that is intended to provide adequate assurance about the system establishment of three goals: effectiveness and efficiency of operations, dependability of financial reporting, and compliance with applicable laws and regulations that involves the board of commissioners, management, and other employee's participation (Ilyas et al., 2021).

The Turnbull Report and the Sarbanes-Oxley Act are examples of internal control standards. Various organisations, including INTOSAI, COSO, The Institute of Internal Auditors, Institute of Management Accountants, and Financial Executives International, have established standards and frameworks recently. Also, The International Standards of Supreme Audit Institutions have contributed to the creation of such rules. The COSO and INTOSAI frameworks for internal controls are the most widely used. The internal control structure for COSO was created in 2013 and for INTOSAI in 2004. However, INTOSAI concentrates more on regulations for businesses in the public sector.

Internal control systems are necessary to make sure that processes work and are efficient, that financial reports are accurate, and that statutory bodies in Malaysia follow the law. Mohd Yusof et al (2017) found that there were problems with the internal control system function in Malaysian statutory bodies. However, Shamsuddin and Johari (2014) posit that internal control system of statutory bodies must have a strong control environment. Internal control system level among Malaysian statutory bodies were found to be high (Yahya et al., 2022). In addition, Ali et al (2007) suggested that technology makes a more effective and efficient Malaysian statutory bodies' internal control system. The internal control system is crucial as it is empirically proven to achieve an organisation's objectives and mission, high organisation performance and accountability (Alam et al., 2019; Handayani et al., 2020; IFAC & CIPFA, 2014; Mohamed Adil et al., 2013; Ogunmakin, 2020; Shamsuddin & Johari, 2014; Yusuf & Kanji, 2020).

According to an empirical study by Hassan et al. (2020), there is a major need for improvement in some areas, such control activities, of the internal control systems of Malaysian statutory organisations. It is proven that internal control system plays a significant role in mitigating fraudulent behaviour (Rosini & Hakim, 2020). In various organisational settings, efficient internal control systems are essential for fostering good governance,

risk management, and accountability.

As per Mohd Noor and Mansor's (2019) research, Malaysian public sector auditors' expertise enhances the effectiveness of public sector audits. At the federal level, it's usually the responsibility of the internal audit department of each statutory authority to establish and maintain the internal control system. Internal audit plays a vital role in ensuring the effectiveness of the internal control environment, creating opportunities for better performance. Asare (2009) stresses the importance of internal audits in the accountability process, contributing to the overall improvement of organizational performance. To advance organisational goals, government organisations need to increase the efficacy of internal controls (Badara & Saidin, 2013a; Annukka Jokipii, 2010; Vijayakumar & Nagaraja, 2012). The Malaysian Treasury Circular No. PS 3.1 of 2013 (Implementation of Internal Audit in Ministries or Federal and State Government Departments, 2013) specifies the requirements for Internal Audit departments in public sector organisations. The circular underlines the roles of the secretary-general, the treasury, and the internal audit department and offers guidance on carrying out internal audits. This covers the organisation's internal control. The main objective is to help the public sector analyse all internal control systems and governance to determine their effectiveness in achieving the organisation's stated goals (Mohd Noor et al., 2017).

To develop and maintain the internal audit profession in Malaysia, there is also The Institute of Internal Auditors Malaysia, which offers the necessary infrastructure, coordination, support, and communication. Internal auditors can join the institution and stay current on the internal audit landscape. A financial group scheme is found to have average documentation on the internal control system, whereas other schemes such as engineering, information system, education, and medical and health schemes are below average (Abd Aziz et al., 2015). This is according to the results of a study on federal ministries.

The practical application of an internal control system should be carried out in accordance with the fundamental organisational principles that underpin its effectiveness. These principles are intricately intertwined, and the method for fully integrating them depends on the current unique business conditions and circumstances (Chaykovskaya et al., 2020). An effective internal control system will have process-based and risk-based approaches (Zatsarinnaya et al., 2021), Corporate Risk Management (Klius et al., 2020), Integration with Management System (Chaykovskaya et al., 2020), Subsections in Business Processes (Zatsarinnaya et al., 2021) and Assessment of Control System (Fadlan et al., 2018). Organisations can create a strong internal control system that boosts their operational effectiveness, guards against risks, encourages accountability, and supports the accomplishment of organisational goals by adhering to these strategies and concepts.

To accomplish their objectives, safeguard their assets, enhance their operational productivity, guarantee truthful financial reporting, and abide by relevant laws and regulations, businesses necessitate an effective internal control system. According to COSO (2013), INTOSAI (2004), and Jokipii (2006, 2010), this system should comprise five crucial components: control activities, control environment, information and communication, risk assessment, and monitoring activities. These elements make up a strong internal control system and offer

acceptable assurance regarding accomplishing organisational objectives. Objectively, all elements are necessary for a company to work towards success and establish a clear connection between operational, reporting, accountability, asset protection, and compliance goals. The fundamental aspects or components must be implemented from the function, operation unit, division, department, and up to the organisational level.

Control environment

The control environment, which includes management and staff attitudes, understanding of internal control, and behaviour towards it, establishes the tone of the organisation. It entails a dedication to morality and ethics, the development of a capable and accountable workforce, and the general design of the organisation and its governance (COSO, 2013). An organisation's staff and leadership develop and maintain a mentality towards control knowledge and internal control (Mahadeen et al., 2016). Hence, it alludes to the general mindset, sensibility, and ethical principles that influence an organisation's internal control system. It is found that the efficacy of the board influenced the effectiveness of internal controls (Cheng et al., 2021), together with the positive organizational culture, commitment from top management and ethical leadership (Sitorus et al., 2022).

Risk assessment

The process of risk assessment entails locating and examining potential threats to the accomplishment of organisational goals. This component necessitates a systematic approach to risk assessment, prioritisation based on significance, and development of suitable actions to successfully reduce or manage risks (COSO, 2013). According to Becker & Smidt (2016), a risk consists of an occurrence, its effects, and its probabilities (or uncertainty). Determining how risks are managed is necessary (INTOSAI, 2004; Rafindadi & Olanrewaju, 2019). It usually involves a negative outcome or a danger to achieving aims. Risk assessment's foundation is the breadth of risk, which spans all organisational levels (Länsiluoto et al., 2016; Rae et al., 2017). Effective risk assessment makes it possible for public organisations to recognise and assess potential hazards, which facilitates the creation of effective control mechanisms. Effective risk assessment makes it possible for public organisations to recognise and assess potential hazards, which facilitates the creation of effective control mechanisms.

Control activities

The policies, practises, and other measures put in place to address the risks identified and guarantee that management directions are followed are known as control activities. Some of these activities include segregation of roles, appropriate authorisation and approval procedures, physical security measures, information technology controls, and continuing monitoring procedures (COSO, 2013). It is usually associated with the segregation of duties (Thin et al., 2020). Control activities can be enhanced through automation, technology-enabled controls, and the integration of internal control systems with information systems (Mukhina, 2015; Sanusi et al., 2015). Through control activities, an organisation defends its resources and methods for measuring performance

or accountability (Mahadeen et al., 2016). Control activities are carried out at all organisational levels and phases, even in the technological environment, as they also pertain to the formalisation of standardised functions (Jokipii, 2006).

Information and Communication

Information and communication: To support decision-making processes, efficient internal control systems depend on timely and pertinent information from internal and external sources. This element emphasises the value of accurate and open communication inside the company, ensuring that information reaches the appropriate parties at the appropriate times (COSO, 2013). To support the internal control function, the organisation shares information internally, including the goals and duties of internal control (Ilyas et al., 2021). The organisation's ability to effectively share pertinent information is greatly helped by effective information and communication system. Hence, reliable information systems, data analytics, and effective communication channels are significant to support internal control systems (Chen et al., 2022).

Monitoring activities

Continuous evaluation of the effectiveness of the internal control system is part of the monitoring component. It includes routine assessments, internal audits, and management reviews to judge the system's efficacy, spot flaws, and make the necessary corrections (COSO, 2013). According to Mahdeen et al. (2016), monitoring is an information system that gives users access to crucial business indicators in real-time. However, internal audit, management, supervisory activities, inspection, observation, inquiry and confirmation, computation, and analytical methods are all examples of monitoring, but it is a type of detection rather than prevention (Jones, 2008). Continuous monitoring, separate monitoring, or a combination of the two are used to ensure the presence and efficacy of each of the five internal control elements, including control (Onumah et al., 2012). To establish control and ensure the correct operation of the internal control system, organisations must make a concerted effort to safeguard internal control monitoring (Ayagre et al., 2014).

The framework outlines the criteria for an efficient internal control system that ensures the achievement of organisational goals (COSO, 2013; Fourie & Ackermann, 2013). These five elements are all connected (Länsiluoto et al., 2016). The internal control system will be effective if all five components operate in accordance with the predetermined requirements (Avery & Obah, 2018; Ayagre et al., 2014; Badara & Saidin, 2013b; Länsiluoto et al., 2016; Mukhina, 2015).

Research Methodology

Data collection

In order to conduct the study, the researchers distributed questionnaires to 291 Malaysian statutory bodies via an

online survey sent to personal CEO email addresses. Among these organisations, there were 127 federal statutory bodies and 164 state statutory bodies. The participants were selected based on their knowledge of their respective organisations' governance matters, updates, and regulatory requirements.

Items' measurement

An internal control system is designed to assess operational, reporting, and compliance goals and accomplishments reasonably. This study's internal control system dimensions comprised five well-known internal control system components. Monitoring activities, information and communication, control activities, control activities, and risk assessment are among them. To adapt the measurements for the internal control system, the existing framework and literature (Brennan & Solomon, 2008; Comptroller of the Currency Administrator of National Banks, 2001; COSO, 2013a; INTOSAI, 2004; Jones, 2008; Spira & Page, 2003) are employed. The internal control system's level is assessed using 16 items. The respondents' organisation's internal control system was rated on a 7-point Likert scale, with 1 denoting strongly disagree, 2 denoting somewhat disagree, 3 denoting slightly disagree, 4 denoting neither strongly disagree nor strongly agree, 5 denoting slightly agree, 6 denoting somewhat agree, and 7 denoting strongly agree.

IPMA

IPMA, which stands for Importance-Performance Map Analysis, is a useful tool for analysing and evaluating the performance and importance of various elements within a system. The internal control system can benefit greatly from using IPMA as it provides insights into different components' relative importance and performance levels. To perform an IPMA analysis, one must identify the essential elements, including control environment, risk assessment, control activities, information and communication, and monitoring. The analysis then proceeds with evaluating the importance and performance of each component. Importance refers to a specific element's perceived significance or value within the internal control system.

On the other hand, performance assesses how well an element meets the desired standards. The importance and performance data are plotted on a graph using a quadrant matrix, with the X-axis representing performance and the Y-axis representing importance. Each component is plotted on the graph based on its corresponding importance and performance values. Components are divided into four quadrants based on their plotted locations. To categorise tasks and priorities, the quadrants are labelled as: a) High Importance, High Performance (Keep Up the Good Work) b) High Importance, Low Performance (Concentrate Here) c) Low Importance, High Performance (Possible Overkill) d) Low Importance, Low Performance (Low Priority). After completing the IPA analysis, action plans can be developed based on the findings to address the areas that need improvement. By conducting an IPA analysis, organisations gain valuable insights into the relative importance and performance of different components in the internal control system and prioritise their efforts and resources accordingly.

Results

The given table offers an analysis of numerous dimensions concerning the overall control and risk management effectiveness. Each dimension's mean and standard deviation are mentioned, which aid in understanding the assessment results. One such dimension is the Control Environment, which has a mean of 5.4923 and highlights the effectiveness and strength of the control environment in the given context. The standard deviation of 1.49825 indicates moderate fluctuations in the responses or data points, revealing that while the overall control environment is somewhat effective, there may be diverse opinions or perceptions regarding its strength. When assessing risks, the average score of 5.7062 points to a notable level of effectiveness. However, with a standard deviation of 1.32516, there is some variation in this dimension's responses and data points. Essentially, while the overall effectiveness of risk assessment is good, there may be some discrepancies in how risks are viewed and evaluated.

Regarding the Control Activities aspect, which has a mean value of 5.5773, it measures the effectiveness and implementation of control procedures within the analysed context. The existence of a standard deviation of 1.33723 suggests a moderate degree of variation between the responses or data points in this category. This implies that the control activities are effective, but there may be variances in how they are carried out or perceived. Based on the data, there appears to be moderate effectiveness and efficiency when it comes to information and communication. However, there is variability in the responses and data points within this dimension, as indicated by the relatively high standard deviation of 1.60269. This suggests that there could be differing perceptions or practices related to information and communication processes.

The Monitoring dimension evaluates the efficiency and appropriateness of the monitoring measures employed in the analysed context, with an average score of 5.3694. The moderate deviation of 1.30821 denotes a certain degree of diversity in the responses or data points linked to this dimension. This implies that while the monitoring methods are generally effective, there could be differences in their implementation or efficacy across diverse regions. The Control System dimension, which has an average score of 5.4930, comprehensively evaluates the control system within the context analysed. A standard deviation of 1.22333 indicates moderate fluctuations in the responses or data points within this dimension. This suggests that there may be differing views or assessments of the effectiveness of the internal control system. Examining the table provided offers valuable insights into each dimension's average values and variability. These metrics provide a numerical comprehension of the assessment outcomes, indicating the degree of effectiveness and diversity within each dimension. Evaluating the analysis draws attention to strengths and potential areas needing improvement within the given context.

An Importance-Performance Map Analysis is a useful technique that helps evaluate the significance and effectiveness of various components or elements in a system. Based on the IPMA, efforts should be directed towards enhancing the importance ratings of Control Activities, Risk Assessment, and Monitoring for the

statutory bodies. Although it is apparent that the statutory bodies have performed well in regard to Control Activities, Risk Assessment, and Monitoring, these three elements are currently perceived to be of low importance, which is inaccurate. To rectify this discrepancy, it is crucial to acknowledge the importance of these crucial aspects. The analysis suggests that additional efforts should be made to enhance the implementation of items within these elements. By doing so, the statutory bodies can ensure that these essential elements are given the appropriate attention and resources required.

Table 1: Overall mean for each dimension

	Mean	Standard Deviation
Control Environment	5.492	1.498
Control Activities	5.577	1.337
Risk Assessment	5.706	1.325
Monitoring	5.320	1.603
Information and Communication	5.493	1.223
Internal Control System	5.492	1.498

However, the analysis report suggests that Control Environment and Information & Communication demonstrate adequate performance, and their current management practices are deemed satisfactory. It is, therefore, advisable to continue implementing the current management approach for these elements, as they meet the expected standards. The IPMA highlights the need for statutory bodies to place more value on Control Activities, Risk Assessment, and Monitoring, despite their high-performance levels. Failure to do so may lead to potential gaps in execution. Addressing this discrepancy and improving execution in these areas will ensure a comprehensive and effective project management and risk mitigation approach. On the other hand, Control Environment and Information & Communication management practices are adequate and should be maintained.

The table displays the comprehensive outcomes of diverse components in the internal control system, analysed using IPM. The combined impact of individual components on the effectiveness of the internal control system is reflected in these overall outcomes. As per the findings, the Control Environment has the most significant total effect score of 0.269. This implies that the Control Environment holds greater importance in enhancing the effectiveness of the internal control system. Therefore, the Control Environment is crucial in building a sturdy base for efficient internal controls.

Based on the data, Information and Communication are vital components of the internal control system, as evidenced by an effect value of 0.251. This highlights the importance of efficient communication and information flow for conveying relevant information to the appropriate stakeholders, which ultimately aids the decision-making and control processes. Control Activities assume a moderate level of importance in the internal control system, with a total effect value of 0.200. Such activities encompass the creation and execution of explicit control measures that reduce risks and guarantee compliance. While Information and Communication and Control Environment have slightly higher total effect values than Control Activities, the latter remains

crucial for achieving an effective internal control system.

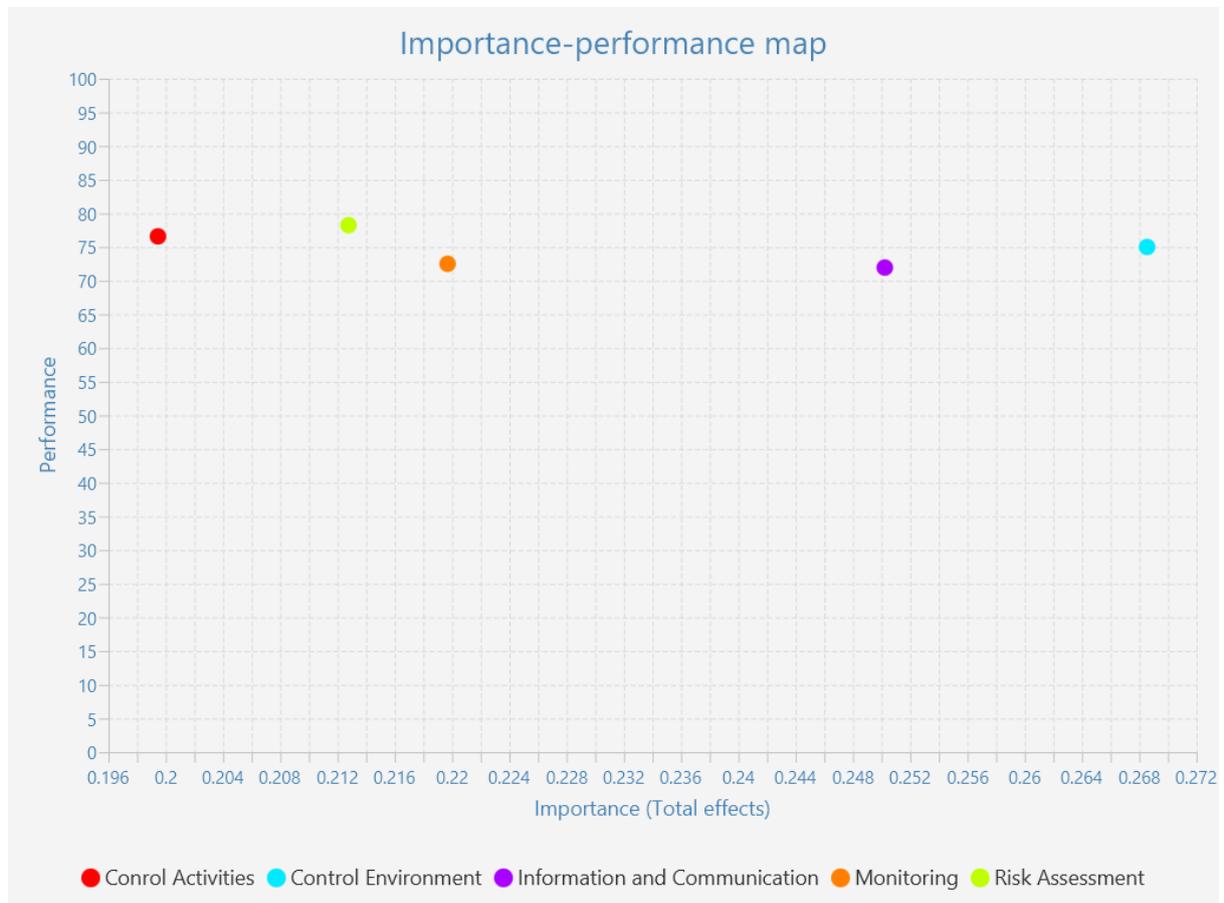

Figure 1: IPMA matrix

In ensuring the efficacy of the internal control system, Monitoring and Risk Assessment hold significant importance. They are significant contributors to the system with total effect values of 0.220 and 0.213, respectively. Monitoring entails consistent review and evaluation of controls, whereas Risk Assessment involves identifying and evaluating risks. Without these elements, maintaining an effective internal control system and ensuring it aligns with dynamic risks and business environments is impossible.

According to the IPMA, the Control Activities, Control Environment, Information and Communication, Risk Assessment, and Monitoring are all crucial components of the internal control system. Although both Control Environment and Information and Communication are important, the latter two hold more significance, with Control Activities, Monitoring, and Risk Assessment following suit. Identifying the relative significance of these components can aid organisations in prioritising their efforts and resources to fortify the internal control system and improve overall organisational performance.

The IPMA generated performance values for various elements in the internal control system, which are presented in the table. For the internal control system, the values reveal the level of effectiveness that each

element contributes towards its overall performance. According to the evaluation, Risk Assessment has performed exceptionally well, 1 with a total performance value of 78.252, indicating a high level of performance within the internal control system. This suggests that the organisation has successfully identified, assessed, and managed risks. Doing so can enhance the effectiveness of the internal control system as a whole. Based on the data, Control Activities have been carried out efficiently, with a total performance value of 76.590. This has enabled the organisation to establish effective control measures. The organisation's efforts in designing and implementing control activities have significantly contributed to improving the overall performance of the internal control system.

Table 2: Total effects

	Internal Control System
Control Activities	0.200
Information and Communication	0.251
Control Environment	0.269
Risk Assessment	0.213
Monitoring	0.220

The Control Environment has demonstrated remarkable excellence by achieving a total performance value of 75.011, which is truly impressive. This demonstrates that the organisation has implemented suitable frameworks, policies, and procedures for creating a favourable control environment that actively supports effective internal controls. The Monitoring and Information and Communication elements also performed well, with total performance values of 72.514 and 71.955, respectively. These values indicate that the internal control system has a satisfactory level of performance for both elements. Effective monitoring efforts have ensured that control reviews and evaluations have been conducted, while Information and Communication processes have facilitated the flow of relevant information for decision-making and control purposes.

To sum up, the IPM analysis revealed that the Risk Assessment and Control Activities have performed exceptionally well within the internal control system, while the Control Environment has also shown commendable performance. However, Monitoring and Information and Communication have only achieved satisfactory levels. By understanding the performance levels of these elements, organisations could identify their strengths and potential areas that require further attention. Thus, they can prioritise their efforts and allocate resources to improve the overall effectiveness of the internal control system, ensuring effective risk management and control processes.

Table 3: Total Performance

	Performance
Control Activities	76.590
Information and Communication	71.955
Control Environment	75.011
Risk Assessment	78.252
Monitoring	72.514

Discussion and Conclusion

Examining the three tables yields significant revelations about the internal control system's efficiency and performance of varying components. Using the IPMA, we can gauge the relativity of these elements' significance and performance, helping businesses prioritise their endeavours and assets efficiently. In Table 2, you can see the different internal control system components' impact on its effectiveness. The study reveals that Control Environment plays the most crucial role and has the highest total effect value, establishing a solid foundation for efficient internal controls. In addition, Information and Communication are also essential, followed by Control Activities, Monitoring, and Risk Assessment. These results emphasise the necessity of organisations to focus on enhancing and developing these elements to ensure a robust internal control system.

In Table 3, the performance of various elements is evaluated. The highest total performance value belongs to Risk Assessment, indicating that the organisation has proficiently identified, assessed, and managed risks. Control Activities and Control Environment also demonstrate impressive performance, which signifies the successful implementation of control measures and establishing a sturdy control environment. Monitoring and Information and Communication exhibit satisfactory performance, concluding that organisations have been competent in reviewing controls and ensuring proper information flow.

According to the IPMA, certain areas need to be addressed and improved. Although Control Activities, Risk Assessment, and Monitoring have achieved high-performance levels, Table 2 shows they are perceived as unimportant. This incongruity highlights a possible gap in comprehending the actual significance of these elements. Hence, organisations must increase awareness about these components' importance to ensure adequate resources and attention are allocated to them.

To summarise, the analysis utilising IPMA of the tables provides useful observations regarding the internal control system. The assessment highlights Control Environment, Information and Communication, Control Activities, Monitoring, and Risk Assessment as crucial factors in enhancing the efficiency of internal controls. The results underline the significance for organisations to focus on advancing and reinforcing these aspects. Based on the analysis, the performance levels of Risk Assessment, Control Activities, and Control Environment are high. However, there is a noticeable difference between their actual performance and their perceived importance. This highlights the importance of organisations addressing this disparity to ensure that these elements are given the necessary attention and resources.

To improve their performance and reputation, organisations should prioritise enhancing their execution and implementation of Control Activities, Risk Assessment, and Monitoring. These areas require more attention to bridge the gap between actual performance and perceived importance. However, the Control Environment and Information and Communication should remain as they have been performing satisfactorily. Organisations can make better decisions and use their resources more effectively if they understand the importance and effectiveness of each component in their internal control system. Improving this system can lead to better risk

management, decision-making, and overall performance, which means better outcomes for the organisation.

Abstract: The aim of this research is to determine the effectiveness of the 'STEM Kid Module on the scientific literacy of fifth-grade students in the 'Energy' topic. The module was developed based on the combination of constructivism and constructionism as a fundamental learning theory. Meanwhile, the STEM Kid instructional phase was formed using a STEM integrated approach that included engineering design processes and inquiry-based science learning. A quasi-experimental design was used to assess the effectiveness of the STEM Kid Module. This study included 116 children, 61 of whom were high achievers and 55 of whom were moderate achievers. Two elementary schools using the STEM Kid Module were selected as the treatment group, while another school using conventional teaching approach as the control group. Data for this study were gathered by a scientific literacy test that included (i) scientific knowledge, (ii) science process skills, and (iii) daily science application. Results from repeated measurements MANOVA analysis revealed a significant difference in scientific knowledge and daily science application between groups. The study's implication was that the use of the STEM Kid Module through a STEM integrated approach can be implemented in elementary school science teaching and learning for children of varying levels of achievement.

Introduction

Since the late 1950s, the policy of developing a scientifically literate society has been emphasized (DeBoer 2000; Ogunkola 2013). However, as reported by the Ministry of Science, Technology, and Innovation (MOSTI, 2010) and the National Science Board (NSB, 2014), it is worrisome that surveys conducted both domestically and internationally indicate that the level of scientific literacy in the community is still quite low. Since the survey was conducted nearly two decades ago by the Malaysian Science and Technology Information Centre (MASTIC 2014), this trend has persisted. Therefore, the development of this society should not be disregarded, as society is partially comprised of them who work in STEM fields should be literate, intelligent, and scientifically literate (Lilia, 2013).

The attempt to create a scientifically literate society should begin early in primary education. Piaget explained that at this stage, children are at the concrete operational level (Hurlock, 1990), which indicates that their cognitive aspects are developing. It was discovered that students are capable of learning and comprehending the fundamental concepts of science (Eshach, 2006). This can be achieved through an efficient teaching and learning process founded on scientific concepts. However, students are still less likely to engage in authentic science learning (Harlen 1999; Eshach 2006). This is due to the fact that the learning process of students is more focused on theoretical understanding than practical work (Tseng et al., 2013), thereby reducing their opportunities to acquire appropriate science learning experiences. In the meantime, both theoretical knowledge and practise are required to acquire effective teaching and learning experiences.

Zohar et al., (2001) and Zohar and Dori (2003) explain that conventional teaching perception is preferred in learning by teachers because it is believed to be more effective and accepted by students with low and moderate intellectual abilities than methods requiring high intellectual abilities, such as inquiry and problem solving. If this method is implemented, it is anticipated that students will find learning difficult and burdensome because they lack the intellectual abilities necessary to deal with it. According to the analysis of the science subject' answer quality from the national primary school examination for the year 2019 (MEB, 2019), students with medium and low ability can only answer questions at the level of knowledge and comprehension but not at higher cognitive levels such as application. The implication is that the achievement gap between students with differing ability levels, that is, students with moderate, high, and low achiever levels, is growing. The approach by which students receive learning activities should not be differentiated based on their ability level.

Using constructivism and constructionism as the fundamental theories to support student learning, the STEM Kids module was developed in consideration of alternative teaching methods, specifically the STEM integration method, in response to the identified problems. Thus, the purpose of this study is to answer the following two research questions: (i) Can the STEM Kids module improve students' scientific literacy? and (ii) is there a significant difference in the improvement of scientific literacy among students with various achievers levels and groups?

STEM Kids Module

The STEM Kids module's instructional strategy and learning implementation process are fundamentally based on constructivism and constructionism. The theory of constructivism, which emphasises students constructing their own knowledge and rectifying misconceptions, is implemented using an inquiry-based learning strategy and the 5E instructional model (Bybee et al., 2006). Through the implementation of the five phases "engage", "explore", "explain", "elaborate", and "evaluate", this model aims at developing students' conceptual understanding. In the meantime, constructionism theory asserts that students can generate new ideas if they participate in the process of artefact creation. The TMI model (Martinez & Stager 2013), which is one of the engineering design processes, is used to implement the emphasis on problem-solving through design or problem-based learning through engineering practise. Through the implementation of the TMI model's three phases—"Think," "Make," and "Improve," this model can help students generate new ideas and solve problems.

Based on the suggested learning theory and instructional model, they were combined to form the STEM Kids teaching model, an innovative teaching and learning phase. Figure 1 illustrates the implementation of learning within the STEM Kids module.

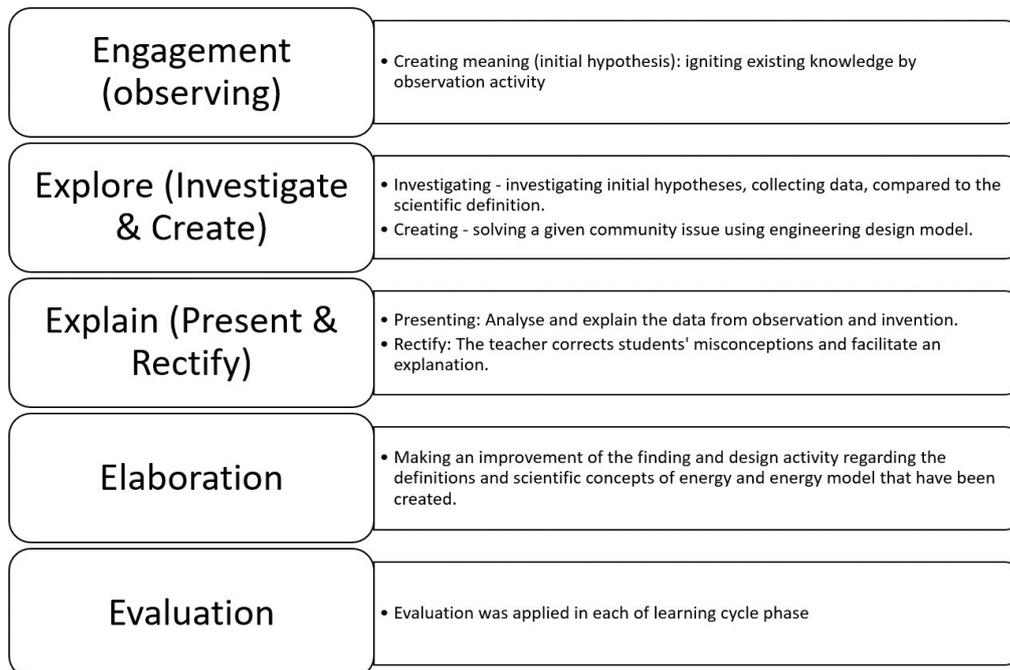

Figure 1. Teaching and learning process in the STEM Kids module

Method

Research design

A quasi-experimental design with a non-equivalent pre-test and post-test control group (Campbell & Stanley,

1963; Gall et al., 2003) was implemented to determine the effectiveness of the STEM Kids module in enhancing scientific literacy. The STEM Kids module was used in the treatment group, whereas the control group used conventional methods and textbooks. The study was conducted over the course of four weeks, which corresponds to the time period given in the teacher's lesson plan for teaching about energy topics.

Respondents

The study involved 116 fifth-year students from two different national primary schools in Selangor. The school is divided into two groups, with one group implementing the teaching and learning method through conventional inquiry, whereas the treatment group employs the STEM Kids module. The intervention was conducted in two classes comprised of high ability level students (the majority of students obtained high academic achievement, i.e., grade A with a science achievement score of 80 percent or higher) and medium ability level students (the majority of students obtained moderate academic achievement, i.e., grade B with a science achievement score between 65 and 79 percent) (MOE, 2016) (See Table 1). According to Han et al. (2014), the classification of the student's ability level is based on the student's achievement score. This study was carried out by two science teachers with more than five years of experience at their respective schools.

Table 1. Respondent profile

Achievers	Treatment group		Control group	
	n	%	n	%
High	32	56.1	29	49.2
Moderate	25	43.9	30	50.8
Total	57	100	59	100

Instrument

The scientific literacy instrument for the energy topic used in this study consists of three domains, namely: (i) scientific knowledge, (ii) science process skills, and (iii) daily science application.

(i) Scientific knowledge

Scientific knowledge is a multiple-choice test item. It is designed to assess students' mastery of knowledge and comprehension of science concepts, particularly the energy concept. Energy is one of the primary disciplines for fifth-year science students. There were 20 items in this test.

(ii) Science process skills

The science process skills (SPS) test in this study consists of 10 SPS aspects, including observing, classifying, measuring, and using numbers; predicting; communicating; interpreting data; defining operations; controlling variables; making hypotheses; and conducting experiments. This aspect was taken from Harlen (1999), Harlen and Elstgeest (1992), and MOE (2013). There were 15 multiple-choice items on the SPS test.

(ii) Daily science application

The daily science application test measured in this study consisted of three sub-topics in energy concepts for Year Five children: (i) energy forms and transformation; (ii) renewable and nonrenewable energy; and (iii) energy conservation. All of these questions were adapted from the instrument from PISA and Yager et al. (2009). These three open-ended questions were modified to form a question related to the application of scientific concepts at home, in the community, and in scientific phenomena.

Results

Based on the research questions, the analysis of the findings is divided into two major sections: (1) childrens’ scientific literacy, and (2) a comparison of scientific literacy between groups.

(i) Childrens’ Scientific Literacy

Descriptive statistics involving mean scores are used to answer the first research question, which is to identify the level of students' scientific literacy (See Figure 1).

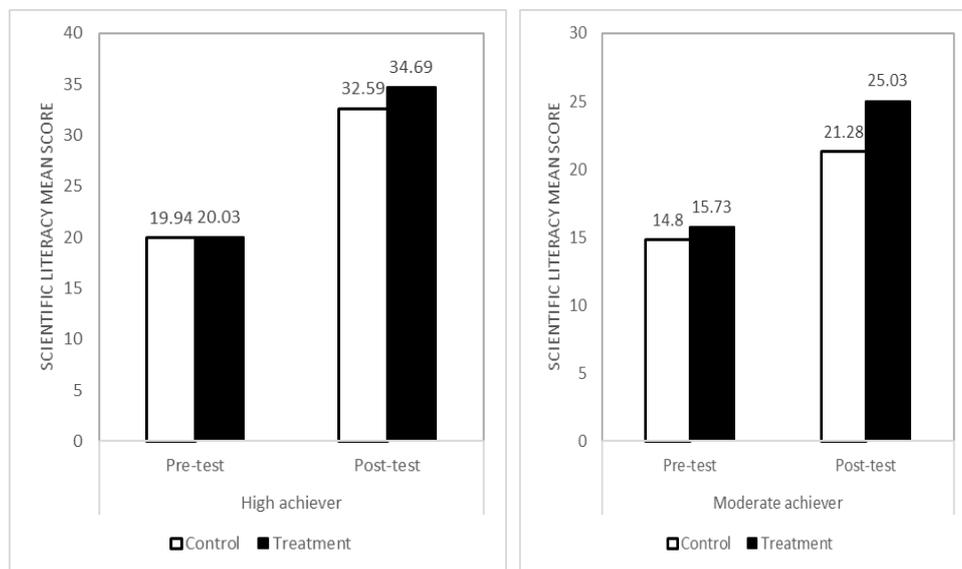

Figure 1. Childrens’ scientific literacy for high and moderate achiever

Based on Figure 1, the pre-test mean score of the scientific literacy for high achiever students ($x = 20.03$;) and moderate achiever students ($x = 15.73$;) in the treatment group was higher than achiever students ($x = 19.94$;) and moderate achiever students ($x = 14.8$;) in the control group. Nevertheless, the mean score of the scientific literacy post-test for high achiever students ($x = 34.69$;) and moderate achiever students ($x = 25.03$;) in the treatment group outperformed the score of high achiever students ($x = 32.59$;) and moderate achiever students ($x = 21.28$;) in the control group. Based on the findings, both groups showed an increase in scientific literacy

across time (from pretest to posttest).

(i) A Comparison of Scientific Literacy Between Groups

Inferential statistics involving repeated measurement MANOVA were used to answer the second research question, which was to identify the difference in students' scientific literacy between the control and treatment groups (see Table 2).

Table 2. Scientific literacy multivariate test

	Pillai trace value	F	df1	df2	p	Partial eta squared
Group	0.04	1.63	3	110	0.19	0.04
Achievers' Level	0.36	20.62	3	110	0.00	0.36
Group* Achievers' Level	0.01	0.49	3	110	0.69	0.01
Time	0.82	166.64	3	110	0.00	0.82
Time*Group	0.13	5.51	3	110	0.00	0.13
Time* Achievers' Level	0.20	8.93	3	110	0.00	0.20
Time*Group* Achievers' Level	0.03	1.20	3	110	0.31	0.03

The findings from the multivariate test of the scientific literacy domain in Table 2 show that there is a significant main effect of achievers' level at the $p < 0.05$, which is $F(3,110) = 20.62$, $p = 0.00$, with a large effect size (partial eta squared = 0.36). Likewise, the main effect of time, which is the comparison from pretest and posttest mean scores of the scientific literacy domain without involving different group and achievers' level, shows a significant difference ($F(3,110) = 166.64$, $p = 0.00$), with a very large effect size (partial eta squared = 0.82). The interaction effect between time and group is also significant ($F(3,110) = 5.51$, $p = 0.00$), with a large effect size (partial eta squared = 0.13). Similarly, the interaction effect between time and achievers' level showed a significant interaction effect ($F(3,110) = 8.93$, $p = 0.00$), with a large effect size (partial eta squared = 0.20). This finding explains that the interaction effect of the two independent variables which were group and achievers' level affects the scientific literacy score individually at the time measurement from the pretest to the posttest. However, relating to this experimental study, the childrens' scientific literacy does not depend on the level of achievers' but the intervention given to them.

As a result of a significant interaction effect involving the interaction of time with group which is univariate test (within-subject effect), was analysed to determine which domain of scientific literacy demonstrated a significant difference. Based on Table 3, scientific knowledge ($F(1,112) = 8.28$, $p = 0.00$) and scientific application ($F(1,112) = 7.02$, $p = 0.06$) with a small effect size shows a significance difference at $p < 0.05$.

Table 3. Univariate tests of the interaction effect of time and group on the scientific literacy domain

Scientific literacy domain	Sum of squares	df	Mean square	F	p	Partial eta squared
Scientific knowledge	36.61	1	36.61	8.28	0.00	0.07
Scientific application	35.26	1	35.26	7.02	0.01	0.06
Science process skills	6.86	1	6.86	1.76	0.19	0.02

In conclusion, the domains of scientific literacy, namely scientific knowledge and scientific application, demonstrate significant group differences. Moreover, the mean scores of these two groups increased linearly over the duration of the measurement time. However, the STEM Kids module-using treatment group demonstrated greater improvement than the control group. The group that utilises the module is more effective at enhancing scientific literacy, particularly scientific knowledge and application.

Discussion

The enhancement in students' scientific literacy as a result of the implementation of alternative teaching and learning is in line with previous research by Lestari et al. (2021) and Wen et al. (2020). The domain of scientific literacy that students acquire in terms of scientific knowledge, scientific application in daily life, and science process skills increases linearly and positively over time. This demonstrates that students may improve in these areas of scientific literacy after intervention, either conventionally or by using the module.

In terms of scientific knowledge and scientific application, students who gained experience using the STEM Kids module outperformed those who received conventional instruction. Even though the effect size is small, it is possible to conclude that the STEM Kids module is more effective than conventional instruction at improving students' scientific literacy, particularly in scientific knowledge and scientific application. This finding was consistent with previous research, such as Barth (2013) and Cotabish et al. (2013), indicating that alternative teaching or the implementation of interventions in teaching and learning science can increase science knowledge and application in life.

Due to the fact that students were exposed to the STEM integration approach, which comprises inquiry-based learning and problem solving through the engineering design process, the implementation of the STEM module was found to have an effect on the improvement of students' science knowledge. Solomon (1993) explains that alternative teaching emphasises cognitive teaching strategies through active knowledge construction in order to help students acquire scientific knowledge and understanding.

Based on the science knowledge acquisition activities in the STEM Kids module, students can surmount the difficulty of acquiring non-scientific knowledge, also known as existing knowledge (Solomon, 1993). Non-scientific knowledge is knowledge or concepts developed by students themselves through real-world experiences. In order to correct non-scientific knowledge or an alternative framework, strategies to change students' concepts are implemented so that students can restructure their concepts, such as the transmission of the process of assimilation and accommodation or the process of equilibrium proposed by Piaget (Wadsworth, 1984), to aid students' cognitive development by resolving conflicts. In order for students to restructure their concepts, the STEM Kids module also includes activities that provide cognitive conflicts that may change students' alternative concepts.

The STEM Kids module additionally enhances students' ability to apply science in real-life situations. Based on this finding, the module was effective in overcoming students' difficulties with application-level questions (MEB, 2019). In addition, it accomplished the KSSR objective of enabling students to employ knowledge and skills in a critical, creative, and analytical manner when making decisions and solving problems (MOE, 2013). This is due to the fact that one of the principles of the STEM Kids module, which is based on the learning theories of constructivism and constructionism, is to focus teaching and learning on real-world scenarios, which is to provide students with authentic learning opportunities in the context of real-world situations and practise new ideas through their common circumstances.

Conclusion

In order to achieve the goal of developing scientifically literate students, an effective PdP approach must be implemented and deployed to all students from the earliest stage of their education, regardless of their ability level. Consequently, effective learning and teaching resources or materials employing innovative teaching methods can assist in achieving this goal. Despite this, the implementation of the STEM Kids Module is not a simple task; it requires intensive training and initiatives involving educators, facilitators, and students. However, the alternative teaching and learning provided in the STEM Kids module is not impossible to implement in the formal teaching and learning of primary school and can be used as a teaching resource in the classroom, despite the study's limitations.

Recommendations

It is indicated that the research could be enhanced through further study that includes qualitative data. This is necessary to ensure that more comprehensive data mining can determine in depth the effectiveness of the interventions. Aside from that, it is suggested that, due to the limited teaching period in the classroom, additional research on the intervention be conducted outside of formal class, which can be carried out over a longer period of time.

Abstract: The Battle of Gallipoli, one of the most important battles of the First World War, is an important turning point in world history. One of the spiritual and cultural heritage transferred from the Battle of Gallipoli to the present day is the letters written by the soldiers who fought in the Battle of Gallipoli to their families from the front. These letters are one of the sources that best reflect the psychology and emotional state of the soldiers. In this respect, letters have a critical role in understanding the war and the events that took place at the frontlines. The aim of this study is to analyze the content of the letters written by Ottoman and Allied soldiers who fought at the front during the Battle of Gallipoli to their families and loved ones, and to compare them by revealing the feelings, thoughts and psychological states of the soldiers reflected in the letters during the war. Content analysis method, one of the qualitative research methods, was used to examine the content of the letters written by Ottoman and Allied soldiers who fought in the Battle of Gallipoli. The themes related to the research topic in content analysis were created by examining the literature. The letters of seven Ottoman soldiers and eight Allied soldiers were subjected to content analysis and percentage frequencies were calculated. The results of the research showed that the letters written by Ottoman soldiers had more intense national and religious feelings, whereas these feelings were at a lower level in the letters written by Allied soldiers. In addition, it has been observed that despair, anxiety and fear were more dominant in the letters of the Allied soldiers, while Ottoman soldiers felt these emotions at a very low level.

Introduction

One of the most important battles of the First World War is the Battle of Gallipoli. The Battle of Gallipoli, which took place between the Entente states and the Ottoman Empire, is a turning point in world history. The

Turks, who had been defeated and retreat for many years against the Western states, put a stop to this trend with the Battle of Gallipoli victory. The Dardanelles Strait, which was defended with the limited means of the Ottoman Empire, is the best example of the Turkish nation's faith, morale, love of homeland and heroism to the whole world (Balci, 2018). The greatest gift of the Dardanelles War for the Turkish nation is Mustafa Kemal Atatürk. Under the leadership of Atatürk, heroic Turkish soldiers achieved this victory by paying a heavy price.

The Battle of Gallipoli, also known as the Gallipoli Campaign, was a significant military endeavor that took place during World War I. This historic conflict unfolded on the Gallipoli Peninsula in the Ottoman Empire, now modern-day Turkey, and lasted from April 25, 1915, to January 9, 1916 (Balci, 2018). The battle is renowned for its intense and protracted nature, involving the Allied forces, predominantly composed of Australian and New Zealand Army Corps (ANZAC), British, French, and Indian troops, against the Ottoman Empire's defending forces. The Gallipoli Campaign was an ambitious attempt by the Allied powers to seize control of the Dardanelles Strait, secure a supply route to Russia, and weaken the Ottoman Empire's involvement in the war (Karal, 1996). However, what was envisioned as a swift and decisive victory turned into a harrowing and costly military campaign, with profound consequences for all parties involved. The Battle of Gallipoli holds immense historical significance, leaving a lasting impact on the nations involved and shaping the identities of the ANZAC forces in particular (Doganay, 1993). Tens of thousands of young Turkish soldiers and intellectuals were martyred in the war. This situation caused a shortage of educated manpower in the institutionalization and development of the new Turkish Republic established in 1923 and negatively affected the economic and cultural development of the country (Öztuna, 1983).

Turkish soldiers who participated in the war were sent off to the front with prayers, henna on their hands and sacrifices from all over the Ottoman Empire. On the other hand, the Ottoman army fought with the whole world during the war. In addition to British and French soldiers, the armies of the colonial countries of these countries, soldiers from Australia, New Zealand, India and Canada participated in the war (Durmuş & Akbıyık, 2008). Turkish soldiers from expatriate lands and enemy soldiers from all over the world sent news to their families and loved ones through letters, the only means of communication of the time, and reflected their situation and feelings at the front in these letters. Although 100 years have passed since the Battle of Gallipoli, the traces left behind by it remain fresh with all their vitality. Legends about this war, the material, spiritual and cultural traces left behind by the war have been passed down from generation to generation in different ways until today. One of the spiritual and cultural heritage transferred from the Battle of Gallipoli to the present day is the letters written by the soldiers who participated in the Battle of Gallipoli to their families from the front. There are many written works on the Dardanelles War (Yetisgin, 2015). Especially the chivalry, heroism and sacrifice of our soldiers were frequently described by enemy soldiers. The Turkish soldier deserved these worldwide accolades by winning the Battle of Gallipoli with victory. What were the feelings reflected in the letters written by Turkish and enemy soldiers who fought at the front in the Battle of Gallipoli? What was happening at the front? What did the enemy soldiers think about the Turkish soldiers? What did Turkish soldiers think about enemy soldiers? What were the beliefs, fears and aspirations of the soldiers fighting at the front? What was the psychology of Turkish and enemy soldiers as reflected in the letters they wrote? The answers to many questions such as these

have been the reason (inspiration) for this research.

Letters are messages that people who are physically separated from each other send to each other by mail in envelopes with the message they write with a pen on paper in order to communicate. The Turkish Language Association dictionary defines a letter as "a written paper, name, put in an envelope, sent to someone mostly by mail to inform, ask, ask, request or report feelings" (TDK, 2019). Letters are one of the frequently used sources in psychological studies (Altunay, 2014). According to Altunay (2014), the reason for this is that the individual who writes the letter reflects his/her inner speech and subconscious as it is, without being exposed to any external influence. The importance of the letters of soldiers in the Battle of Gallipoli cannot be overstated. These poignant and heartfelt correspondences offer a unique and personal perspective on the harsh realities of war and the emotional toll it takes on those who served. During the Gallipoli campaign, letters became a lifeline for soldiers, connecting them with their loved one's back home. Through these letters, soldiers could share their experiences, fears, and hopes, providing a glimpse into the daily challenges they faced on the battlefield. The soldier letters from the Battle of Gallipoli may provide valuable insights into the conditions endured by the troops, shedding light on the hardships of trench warfare, disease outbreaks, and the scarcity of essential supplies. They captured the camaraderie and resilience of soldiers, often expressing their determination to persevere despite overwhelming odds (Vassal, 1916). Beyond serving as a means of communication, these letters had a profound impact on public perception and support for the war effort. As they were shared with families, friends, and communities, the stark realities of battle reached the home front, evoking empathy and galvanizing public sentiment. Moreover, these letters preserved a slice of history that would have otherwise been lost. They now serve as invaluable primary sources for historians and researchers seeking to understand the human aspect of the Gallipoli campaign (Tok & Budak, 2017).

The letters of soldiers in the Battle of Gallipoli give a face and a voice to those who sacrificed so much for their country. They remind us of the true cost of war and the indomitable spirit of those who fought, making their relevance and importance endure throughout time. Furthermore, the letters written by the soldiers who fought at the front in the war have the feature of reflecting the inner speech and subconscious of these soldiers. The letters of soldiers who fought in the war are also of great value in terms of understanding the war and taking an example (Tok & Budak, 2017). Therefore, the psychological state, emotional state and character analysis of these soldiers can be made from the structure of the words and sentences used by the soldier who wrote the letter (Altunay, 2014). The power of letters from soldiers who fight in wars lies in their ability to provide a candid glimpse into the emotional and psychological states of those on the front lines. These heartfelt correspondences serve as a profound testament to the human experience amid the turmoil of armed conflict. Among the emotions poignantly revealed in these letters are religious feelings, national feelings, morale, courage, fear, longing, hope and anxiety during times of war. Religious feelings are often a central theme in soldiers' letters. Faced with the harsh realities of war and mortality, many soldiers find solace in their faith, turning to prayers and reflections on the divine for comfort and strength. Such expressions offer a window into the deep spiritual connections that soldiers establish in moments of great peril. National feelings run deep in the hearts of those who fight for their country. In their letters, soldiers passionately express their love and dedication

to their homeland, often intertwining their personal sacrifices with a larger sense of duty and patriotism. These sentiments reinforce the unwavering commitment soldiers have to defend their nation and its values. Courage, a hallmark of military service, shines through the letters. Soldiers frequently share accounts of bravery on the battlefield, both in their own actions and in the heroic deeds of their comrades. These narratives not only depict valor but also inspire others to face adversity with steadfastness and resolve. Amidst the chaos of war, letters also reveal a profound longing for loved ones left behind. Soldiers write of their yearning to reunite with family and friends, expressing their emotional struggles and the strength they draw from memories of home. These poignant expressions of longing remind us of the human cost of war on the hearts of those who serve. Fear, an inescapable companion in the theater of war, finds its voice in soldiers' letters. Honest and raw, these accounts lay bare the psychological toll of combat, as soldiers grapple with the uncertainty of survival and the horrors they witness. The letters offer a window into the vulnerability and resilience of the human psyche in times of extreme duress. Lastly, morale emerges as a recurring theme in soldiers' letters. Encouragement and morale-boosting sentiments are frequently exchanged, providing emotional support to fellow soldiers and bolstering a sense of unity within their ranks. These expressions of camaraderie reinforce the importance of morale in maintaining the collective spirit amidst the hardships of war.

The emotional and psychological states of the soldiers who fight are reflected in the letters as religious feelings, national feelings, courage, longing, fear, and morale (Tok & Budak, 2017; Altunay, 2014; Tetik, et al., 2009). Therefore, the themes of the emotional states of the soldiers in the content analysis of the letters were determined as religious feelings, national feelings, morale, courage, fear, longing, hope and anxiety. Religious emotion is defined as the internal resources that direct religious interest, desire and pursuits that lead to faith (Hökelekli, 2001). National sentiment is defined as love for the nation, nation and homeland (eOdev, 2019). Moral is defined as a person's spiritual power, spirituality (TDK, 2019). It is defined as the confidence and courage one finds in oneself when undertaking a difficult or dangerous task (TDK, 2019). Fear is defined as anxiety, sadness in the face of a danger or thought of danger (TDK, 2019). Longing defined as the desire to see someone, a place or a thing, and to be reunited with it (TDK, 2019). What is expected to happen or thought to happen is defined as hope (TDK, 2019). Anxiety or worry is defined as a feeling of tension that usually arises with the thought that something bad will happen and whose cause is unknown (TDK, 2019).

In conclusion, the emotional and psychological states of soldiers, laid bare in their letters, offer a profound insight into the human experience during wartime. The reflections of religious devotion, national pride, courage, longing, fear, and morale create a multifaceted and emotionally charged narrative, reminding us of the resilience and humanity that persist amidst the crucible of conflict. These letters serve as enduring testaments to the indomitable spirit of those who endure the trials of war while touching the hearts of generations to come. When the studies in the literature were examined, no previous study was found that included the content analysis of the letters of both Turkish and enemy soldiers who participated in the Battle of Gallipoli. In addition, although there are letters of Turkish soldiers who participated in the war, a limited number of translations of letters of enemy soldiers have been encountered, especially no complete translations have been found except partial excerpts

from the letters of enemy soldiers. Therefore, the aim of this study is to analyze the content of the letters written by Turkish and enemy soldiers who fought at the front during the Gallipoli War to their families and loved ones in terms of content and to reveal and compare the emotions, thoughts and psychological states of the soldiers reflected in the letters during the war. This study is the first research on the subject.

Method

In this study, content analysis method, one of the qualitative research methods, was used to examine the content of the letters written by Turkish and enemy soldiers who participated in the Battle of Gallipoli to their loved ones. Qualitative research aims to explore people's subjective perspectives on events (Yıldırım and Şimşek, 2006). Content analysis is one of the most frequently used methods among qualitative data analysis types. Content analysis provides the opportunity to objectively interpret the statistical data obtained with the categories created (Koçak & Arun, 2006). In the content analysis, the themes related to the research topic were first developed by examining the literature. The themes for the content analysis of soldiers' letters were determined as religious emotion, national sentiment, morale, courage, fear, longing, hope and anxiety. The themes were finalized by taking the opinions of Turkish and Social Studies teachers who are experts in the field. Then, the letters belonging to 7 Turkish soldiers and 8 enemy soldiers were analyzed and the words included in these categories were counted and their percentages and frequencies were calculated.

The letters analyzed in the study were accessed by searching the Internet and books containing the Battle of Gallipoli Soldier Letters. Since the number of Turkish letters of foreign soldiers is quite limited, only two Turkish letters were accessed; in addition to these letters, five of the letters of enemy soldiers found on the Internet were selected and prepared in Turkish by using Google translation into Turkish and having the translations checked by experts in the field and subjected to content analysis. The coding of the themes determined for the content analysis of the letters was done by the researchers. In addition, in order to ensure the reliability of the research results, the consistency of the coding made by the Turkish and Social Studies teachers was checked and a consensus was reached. After the coding process was completed, the data obtained with the coding sheet were transformed into tables and graphs were drawn with the Microsoft Excel program.

Results

The letters of 7 Turkish soldiers and 8 enemy soldiers who participated in the Battle of Gallipoli were analyzed and analyzed for content. Table 1 and Table 2 show the frequencies of the content analysis of the letters of Turkish and enemy soldiers, respectively. Table 1 shows the content analysis of the letters written by Turkish soldiers. When Table 1 is analyzed, it is observed that the rank of Turkish soldiers is pasha, lieutenant, corporal and collegeman. In general, the letters were written to their families. Only Lieutenant Mehmet Dursun wrote his letter to the Turkish people.

Table 1: Letters written by Turkish soldiers

Letter	Name of the soldier	Rank of Soldier	To whom? (Addressee)	National sentiment	Religious Emotion	Longing	Morale	Courage	Fear	Hope	Anxiety
1	Mehmet Tevfik	Lieutenant Colonel	Mother	2	7	2	1	1	0	1	2
2	İsmail	Pasha	Father	2	5	2		6	0	4	1
3	Selahaddin Adil	Lieutenant	Wife	0	2	3	1	0	0	4	2
4	Mehmet Dursun	Lieutenant	Turkish Public	6	2	0	4	6	0	1	0
5	Hasan Edhem	Corporal	Mother	4	6	4	5	1	0	6	0
6	Ömer	Corporal	Little Brother	0	3	2		1	0	0	0
7	Sani Kerim	Lieutenant	Brother Cemil Efendi	7	6	0	6	9	0	1	1
Total (Frequency)				21	31	13	17	32	0	17	6

Table 2 shows the content analysis of the letters written by enemy soldiers. When Table 2 is analyzed, it is seen that the ranks of most of the enemy soldiers were not specified and the ranks of those who were specified were officer, lieutenant and sergeant. Like Turkish soldiers, enemy soldiers also wrote letters to their families.

Table 2: Letters written by enemy soldiers

Letter	Name of the soldier	Rank of Soldier	To whom? (Addressee)	National sentiment	Religious Emotion	Longing	Morale	Courage	Fear	Hope	Anxiety
1	E. J. Cowles	Unspecified	Bay Rogers	0	0	1	1	1	4	1	3
2	SdneyHarrie Skinner	Unspecified	Robin Oliver	0	0	0	0	0	5	0	3
3	H.W. Cronin	Lieutenant	Father	0	0	0	0	0	3	0	3
4	İsimsiz Anzak	Unspecified	Family	0	0	0	0	0	2	0	1
5	Alistain John Taylor	Unspecified	Familye	1	0	0	0	0	4	0	4
6	Lance	Unspecified	Mother	0	0	0	2	0	2	0	0
7	Lieut Guy Nightingale	Officer	Mother	0	0	0	0	0	2	0	1
8	Richard Gilson	Sergeant	Mother	0	0	1	0	1	2	1	1
Total (Frequency)				1	0	2	3	2	24	2	17

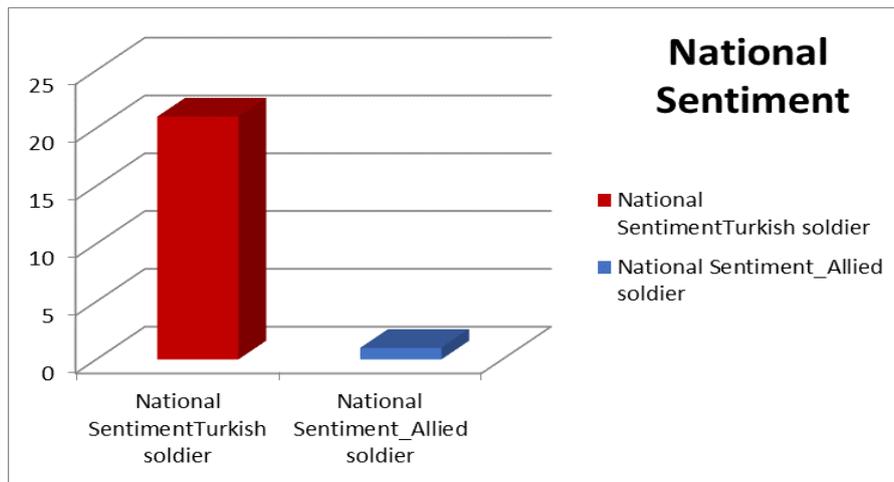

Figure 1. Distribution of the reflection of "National Sentiment" in the letters between Turkish and Enemy soldiers

When the contents of the letters are analyzed in terms of "National Sentiment", it is observed that there is a big difference between Turkish and enemy soldiers. It is observed that the national sentiment of Turkish soldiers is at the highest level, while the feeling of national sentiment among enemy soldiers is very low. At the same time, while Turkish soldiers fought against an occupation of their own homeland, enemy soldiers may have lacked national feeling because they came to a country that was not their homeland for imperialist purposes. For example, Lieutenant Mehmet Dursun expresses his national feeling in his letter as "I do not pity my arm sacrificed for my great Turkish nation and my sacred homeland".

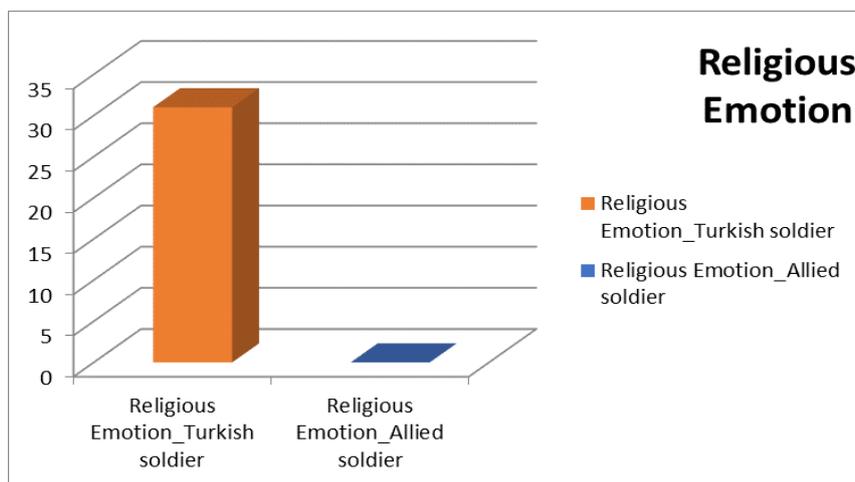

Figure 2. Distribution of "Religious Emotion" in the letters of Turkish and Enemy soldiers

When Figure 2 is analyzed, it is seen that the religious feelings of Turkish soldiers in the Battle of Gallipoli were at their peak. On the other hand, it is observed that enemy soldiers lacked religious feelings. It can be said that this is due to the belief in martyrdom in our religion and the strong religious beliefs of our soldiers. For example, in his letter, Mullazım-ı Sani Kerim Efendi expresses his religious feelings as "Efendi Allah Kerim,

the helper of the righteous is Allah".

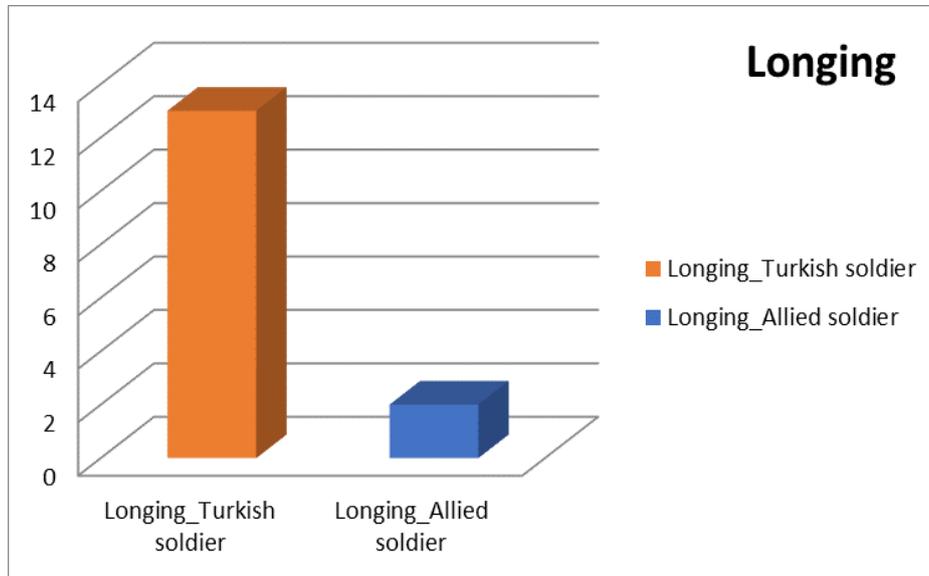

Figure 3. Distribution of the emotion "longing" in the letters of Turkish and enemy soldiers

For example, Selahaddin Adil Pasha expressed his longing in his letter as "I kiss your eyes and greet you all".

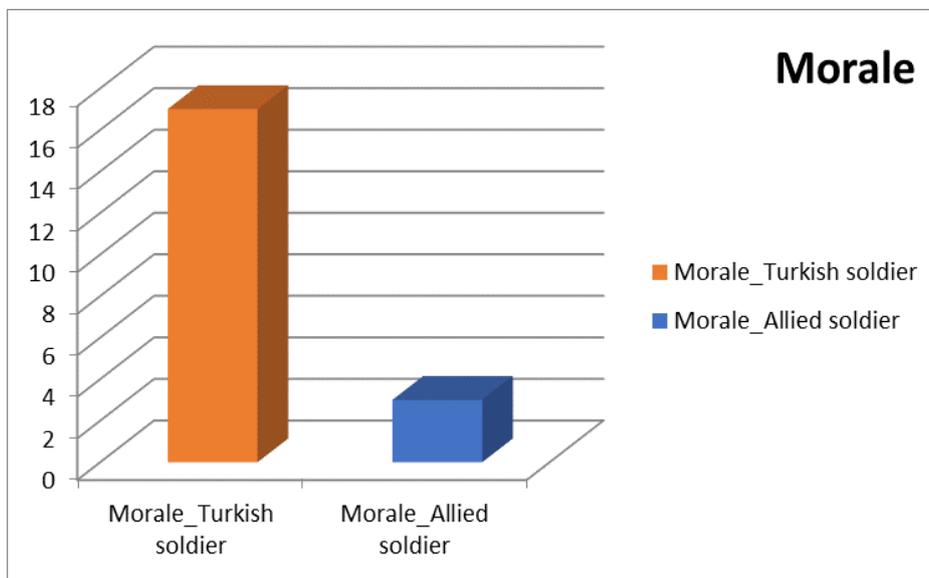

Figure 4. Distribution of "Morale" in the letters of Turkish and enemy soldiers

Figure 4 shows that the morale of Turkish soldiers is very high compared to enemy soldiers. This situation results from the fact that the religious and national feelings of Turkish soldiers are higher than those of enemy soldiers, which in turn leads to high morale. For example, Hasan Edhem expressed his high morale in his letter as follows: "I hope the enemy will send troops and take us with them and we will have a wedding, won't we".

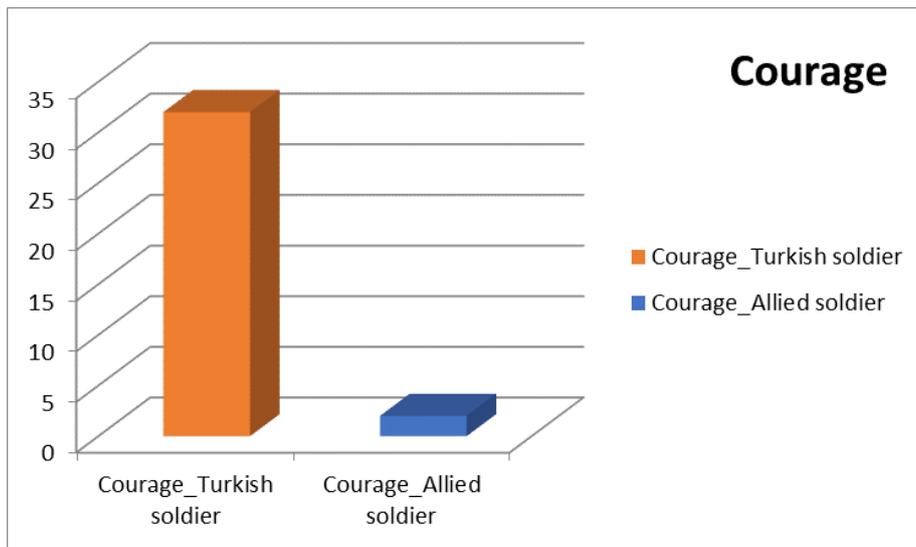

Figure 5. Distribution of "Courage" in the letters of Turkish and enemy soldiers

As can be seen in Figure 5, the high religious feelings and morale of the Turkish soldiers resulted in a high level of courage. In his letter, Mülazimi Sani Kerim wrote about his courage: "No Turk would want to use a gun against these scoundrels! He can only crush them with his fists, catch them with his steel claw and throw them into the sea".

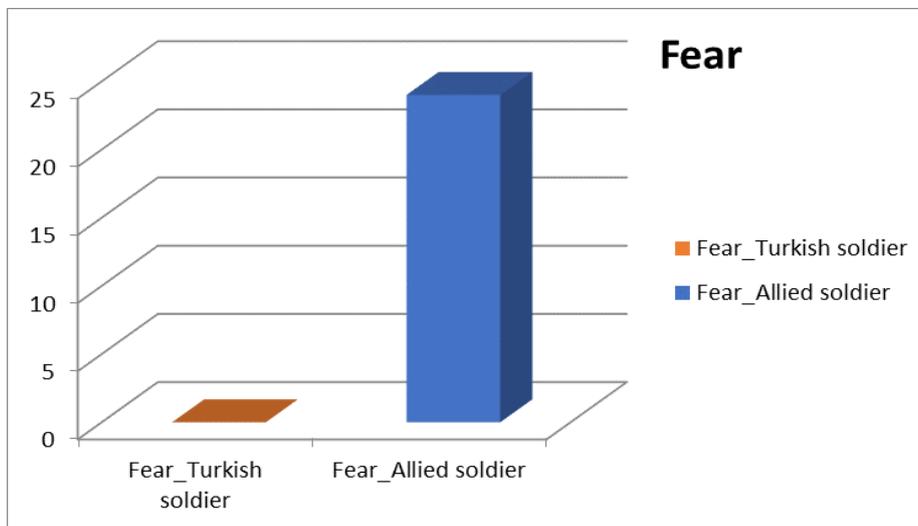

Figure 6. Distribution of "Fear" in the letters of Turkish and enemy soldiers

As can be seen in Figure 6, the level of fear of enemy soldiers is quite high. However, not the slightest trace of fear was found in the letters of Turkish soldiers. It is not surprising that enemy soldiers, who do not know what and for whom they are fighting in unfamiliar lands and who have weak religious feelings, have high levels of fear. In her letter, Sdney Harrie Skinner wrote of her fear: "It was terrible to see the soldiers like that. Their wounds were horrible", while Alistain John Taylor expressed his fear at the beginning of his letter as "Hello to you all from the hell of Gallipoli".

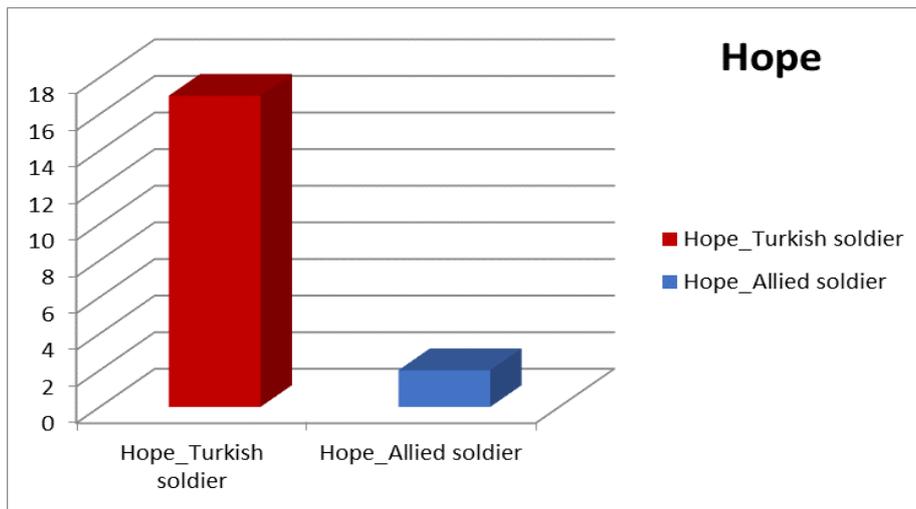

Figure 7. Distribution of "Hope" in the letters of Turkish and enemy soldiers

It was observed that Turkish soldiers reflected their hopes that they would win the war in their letters. The enemy soldiers, on the other hand, seem to be in despair. Ismail from Kastamon expresses his sense of hope as "I will be reunited with you and I will help you harvest the crops".

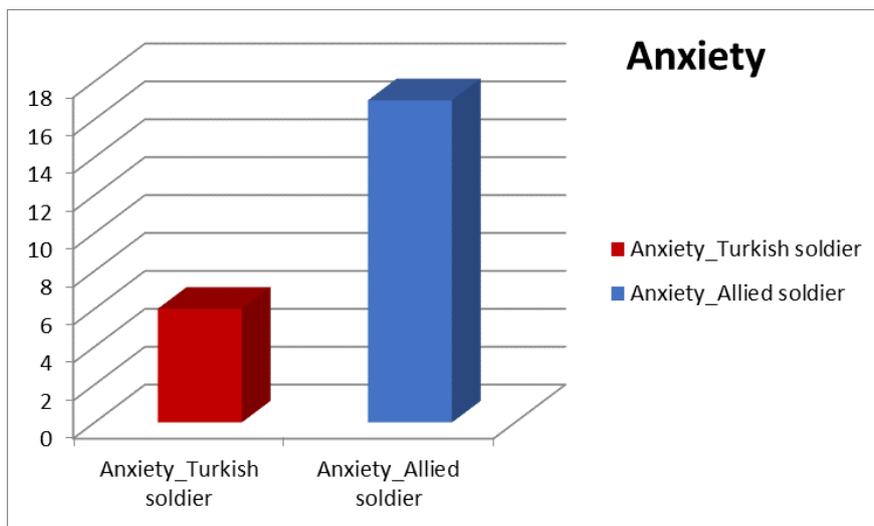

Figure 8. Distribution of "Anxiety" in the letters of Turkish and enemy soldiers

As can be seen in Figure 8, enemy soldiers did not refrain from reflecting their worries in their letters. This can be thought to be due to the fact that they are fighting on the soil of an unfamiliar country where they face death at any moment. The Turkish soldiers, on the other hand, were worried about not being able to pay their debts to their homeland, loved ones and families. In his letter, E.J. Cowles expresses one of his worries as "I hope we do not lose any more than the inspector soldiers we last saw". Also in his letter, Alistain John Taylor expressed his concern as "I am not sure that I want to talk to anyone anymore and see anyone's face". In another part of his letter, this soldier expresses his concern by saying "This is not my war, but I have no will to live".

The stark differences between Turkish and enemy soldiers' emotional states, as reflected in their letters, provide valuable insights into the varying factors influencing their conduct during the Battle of Gallipoli. The strong sense of national pride and religious devotion among Turkish soldiers served as powerful motivators, instilling a deep commitment to defend their homeland and enhancing their overall morale (Tok & Budak, 2017). On the contrary, the low levels of national sentiment and religious feelings among enemy soldiers might have contributed to their higher fear and despair, as evident in their letters. The lack of a unifying cause or motivation might have diminished their resolve to fight, resulting in lower morale and ultimately affecting their courage on the battlefield. The findings of this study underscore the significance of psychological and emotional factors in shaping the behavior and performance of soldiers during times of war (Altunay, 2014). It emphasizes the importance of cultivating a sense of national identity, religious values, and morale in military personnel, as these aspects can significantly impact their ability to withstand challenges and maintain courage under duress. However, it is crucial to acknowledge the limitations of the study, such as potential biases in the selection and preservation of the letters. Moreover, the individual differences among soldiers and the complexity of human emotions in the context of war make it essential to approach the topic with sensitivity and caution. In conclusion, this research contributes valuable knowledge about the emotional and psychological aspects of soldiers in the Battle of Gallipoli, offering important implications for understanding the dynamics of armed conflict and the factors that shape soldiers' experiences on the frontlines.

Conclusion

The aim of this study is to analyze the content of the letters written by Turkish and enemy soldiers who fought at the front during the Battle of Gallipoli to their families and loved ones and to investigate the emotions, thoughts and psychological states of the soldiers reflected in the letters during the war. Many local and foreign works have been written about the Battle of Gallipoli. It has also been the subject of many movies and documentaries. However, one of the most important sources reflecting what happened at the front from the first network is the soldiers' letters. These letters are the sources that reflect the psychology and emotional state of the soldiers in the simplest way. In this respect, letters have a critical role in understanding the war and the events that took place at the front.

The findings of the research show that the letters written by Turkish soldiers reflect national and religious feelings more intensely than the letters written by enemy soldiers. It is seen that the letters of Turkish soldiers are written in a more emotional style compared to the letters of enemy soldiers. On the other hand, it is seen that despair, fear of death and anxiety are dominant in the letters of enemy soldiers. Turkish soldiers used expressions in their letters expressing their desire to be martyred at every opportunity. In addition, expressions showing their courage and hope come to the forefront in the letters of Turkish soldiers. While the enemy soldiers expressed the landings on the Gallipoli Peninsula and the negativities they experienced during these landings in a despairing language, they also gave information about the physical characteristics of the peninsula. For example, it is seen that bird sounds, natural beauties and sunsets are depicted on the Gallipoli Peninsula. On

the other hand, their complaints about the abundance of mosquitoes on the Gallipoli Peninsula during the war were also reflected in their letters.

The findings of this study shed light on the emotional and psychological states of soldiers during the Battle of Gallipoli, as reflected in the letters they wrote to their families and loved ones. The analysis reveals several significant differences between Turkish and enemy soldiers concerning their national sentiments, religious feelings, morale, courage, fear, hopes, and worries.

- The national sentiment among Turkish soldiers appears to be exceptionally high, while the enemy soldiers exhibited a significantly lower sense of national pride. This disparity likely stems from the strong patriotic fervor and commitment to defend their homeland that prevailed among the Turkish troops.
- Religious feelings were found to be profound among Turkish soldiers, but they seemed to be lacking among the enemy soldiers. The high level of religious devotion among Turkish soldiers likely played a role in bolstering their morale and resilience on the battlefield.
- The study highlights that the morale of Turkish soldiers was notably higher compared to the enemy soldiers. This can be attributed to their elevated religious and national sentiments, which likely contributed to their overall positive outlook during the war.
- The combination of strong religious feelings and high morale among Turkish soldiers seems to have resulted in a heightened level of courage. This courage enabled them to face the challenges of war with determination and resolve.
- Conversely, the letters of enemy soldiers revealed a high level of fear. This fear might have been exacerbated by the apparent lack of religious and national motivation found among these soldiers.
- Turkish soldiers expressed their hopes for victory in their letters, reflecting their optimism and determination to triumph in the war. On the other hand, enemy soldiers seemed to be plagued by despair, which might have been influenced by their fear and lower morale.
- The letters of enemy soldiers also indicated the presence of worries and anxieties, underscoring the mental and emotional strain they experienced during the conflict.

Recommendations

- Since the power of spiritual feelings in the psychological state of the soldier in war has a very important effect on the morale of the soldier, more importance should be given to the development of these feelings in education.
- Letters are a part of a country's cultural heritage and shed light on history. For this reason, letters with historical value should be protected and introduced to future generations.
- A limited number of letters written by enemy soldiers during the Battle of Gallipoli have been translated by making quotations. It is important to translate all the letters of the enemy soldiers who participated in this war into Turkish in order to reveal the psychological conditions of these soldiers.

Abstract: Printmaking has made visual artworks reproducible and more accessible, allowing artworks to reach more masses. The art of printmaking, which has many different techniques and categories within itself, has attracted more attention over time, developed more and gained a distinctive place in art practices, while it was previously only a means of reproduction. In addition to printing techniques such as engraving, linoleum printing, mono-printing, and lithography, increasing material and technical possibilities today also lead to the emergence of more innovative applications. Gel printing, which we can call one of these new applications, based on the use of a soft surface as a printing area, is becoming increasingly widespread as an exploratory and entertaining printmaking technique used by many amateur and professional printers. The basis of this technique is the manipulation and transfer of paints, inks and other media to various surfaces using a soft printing plate. In essence, the printing plate is a rubber or gelatin surface that is thinned in certain areas. When paints, inks and other media are rolled across the plate by a roller, they can move between the thinned surfaces and create a variety of exciting shapes, colours, and textures. Gel printing can be an expressive, versatile, and economical alternative suitable for a variety of artists. Whether offering a simple design or an entire print, the affordability and universality of the technique make it an attractive option for any creator. This study aims to increase the recognition of the technique by examining the gel printing technique, which has recently been preferred by amateur artists and art students, in the context of alternative printmaking practices.

Keywords: Printmaking, Gel Printing, Monoprinting, Monotype, Art.

Introduction

There are many forms of art and printmaking is one of them. The art of printmaking has influenced art lovers and art historians, especially in the modern period. This art has been used in different situations from time to time. Printmaking art emerged in the 19th century and gained importance in the late 1800s. With printmaking,

which is defined as a powerful technique that can be used by art lovers, artists have started to create hard and sharp surfaces. By using technical groups, printmaking began to destroy the difficult physical boundaries used by artists (Öztürk & Demir, 2021; Ünal & Ciddi, 2022). The different printing habits used in the production of printmaking have been the subject of inspiration for other forms of art performance. The oldest technique of printmaking, the printing press, was invented in Central Europe in the 15th century (Jones, 2017). Printmaking is a term used to refer to paintings produced using printing techniques. Printing techniques enable the production of a large number of copies of paintings (Elder, 2019). In addition, printing techniques also enable the production of paintings in various materials and formats (Smith, 2018). Printing press printing enables text and images to be printed using letters made of metal. This technique is still in use today, but computer-aided printing techniques are becoming increasingly common (Williams, 2016).

Printmaking is a field of proven effectiveness for various social groups. In most societies, printmaking has helped to expand literature in a cultural and cultural language. Printmaking has promoted public relations, and political propaganda and strengthened art consciousness.

Gel printing is an exploratory and fun printmaking technique used by many printmakers, both amateur and professional. Gel printing involves the manipulation and transfer of paints, inks and other media to various surfaces using a soft rubber printing plate. In essence, the printing plate is defined as a rubber or gelatine surface that is thinned in certain areas. When paints, inks and other media are spread across the plate by a roller, they can move between the thinned surfaces and create a variety of interesting shapes, colours and textures. The art of printmaking has a long history and has offered a wide range of possibilities for creative expression. As an alternative to traditional printmaking techniques such as etching, lithography, block printing and screen printing, gel printing allows an artist to experiment with colours, textures, and shapes in unique ways. The absorbency and elasticity of the printing surface through which the colours, textures and shapes pass also create unique aesthetic effects that artists can play with and explore.

Gel printing is also accessible to almost anyone, regardless of skill level or budget. Most print artists can start by simply purchasing a soft printing plate, some inks, and a roller. Once the artistic materials have been gathered and a work surface has been created, the artist is free to experiment and begin creating their own unique artefacts. The printing plate itself is also relatively affordable, making gel printing a cost-effective option for most creatives. Moreover, different gel plate-making recipes for artists can be found in many sources. Artists can create their own plates with substances such as gelatine, which offers an organic binder and an elastic surface.

In addition, compared to other alternative printmaking methods, gel printing offers relatively little mess, making it an excellent choice for those who want to explore printmaking without creating an entire printmaking studio. The technique is also a great option for those who want to experiment, as it allows a great deal of physical freedom in the creation process. This freedom can be further enhanced when gel prints are used as transfer media for other works, such as photographs or drawings.

Emergence of Gel Printing Technique and Hectography

Gel printing is a relatively new printing technique that uses a flexible printing plate made of gelatine and is not a later invention. It is very similar to the hectograph technique of applying paint or ink to the plate and then transferring it to paper or other surfaces to create unique prints.

Nevertheless, to give some period information, it can be said that this technique dates back to the late 20th century when alternative printing methods were started to be tried by artists. This technique first emerged as a result of the search for a way to make a single print without having to use a printing press.

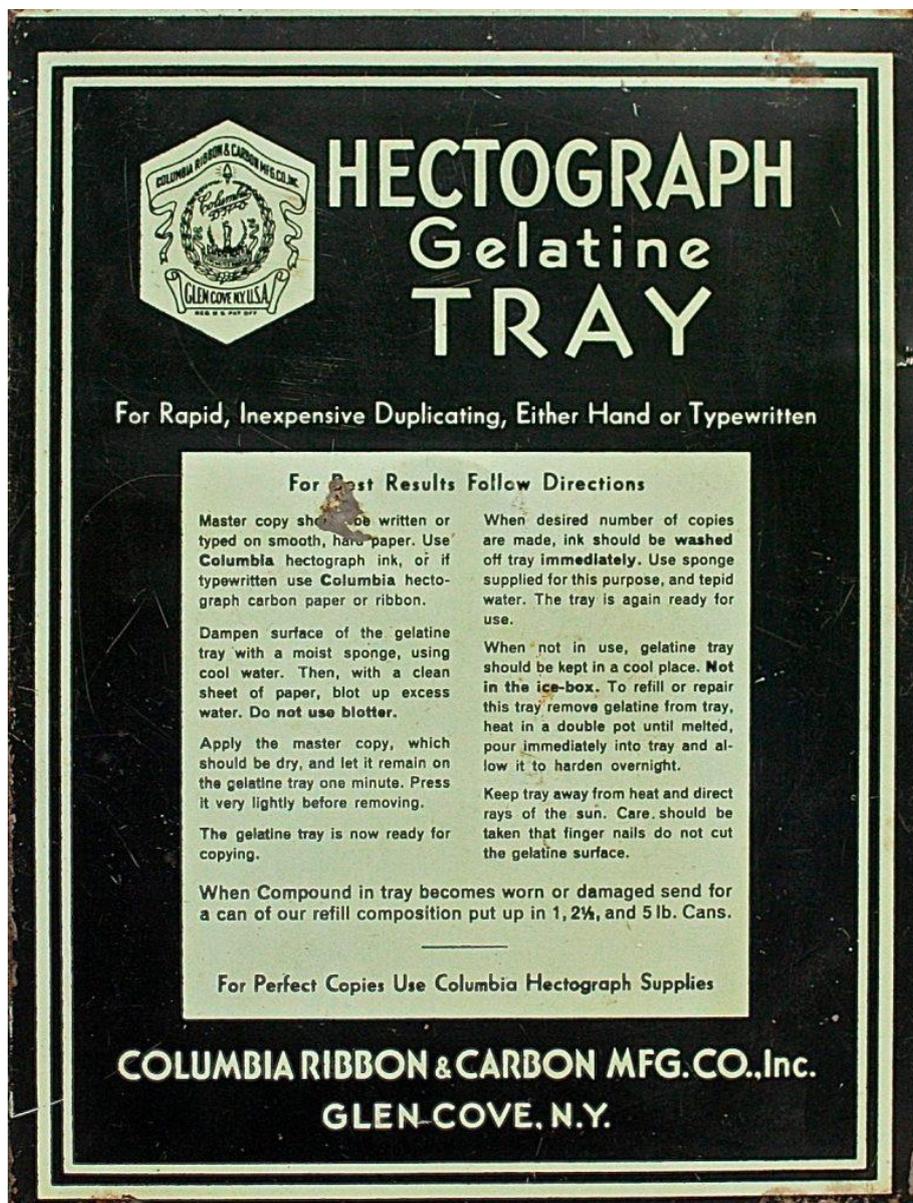

Figure 1. A metal advertising sign for hectography materials (Ribbon Tin Virtual Museum, 2023).

Hectography is a method of reproducing written or printed materials using gelatine-based ink and a special type of paper. Hectography was invented in the late 19th century and was generally used for small-scale printing and copying purposes (Kazantseva, 2021). In fact, hectography was an older printing technique, popularised in the 19th century, separate from gel printing. It is based on the principle of using a special type of paper coated with a layer of gelatine. The gelatine is then transferred to the paper by printing over the original image.

Hectography is a reproduction technique that was popularly used before the advent of modern photocopying and printing technologies. A special ink made from gelatine was used to create a master copy of the document. This master copy is then printed on a hectograph paper, which absorbs the ink and allows it to be transferred to subsequent copies. Nielsen states that a hectograph mass is essentially a glue-glycerol-water composition to which other compounds are added, usually in small quantities, to harden, protect and pigment the composition.

The old-fashioned pan hectograph has largely been superseded by the hectograph roll (i.e. a hectograph copying surface in the form of a roll, adapted for use on specialised machines for speed of copying). The roll is unrolled in the machine section by section on a copying roller and a new section is used for each different master. The rolls are long enough (approximately 16 feet) to allow multiple masters to be copied without changing the roll. The roll is rewound as it leaves the platen; any excess ink must be absorbed before the roll can be reused the next day (Nielsen, 1936). One of the advantages of hectography is its simplicity and low cost. It does not require any specialised equipment or electricity, making it an accessible technique for a wide range of users. However, hectography is not without its limitations.

The quality of copies produced using this method is generally lower than other printing methods and the number of copies that can be made from a single master is limited. The relationship between gel printing and hectography is based on the idea that both techniques use a gelatine-based printing plate. The difference is that in gel printing the plate is flexible and reusable, whereas in hectography gelatine is used only as a transfer medium on the plate surface. One of the advantages of gel printing is that it allows artists to experiment with different colours, textures, and patterns without having to worry about the limitations of traditional printing methods. The flexible printing plate allows greater control over the printing process, which can lead to more creative and spontaneous results.

Hectography, on the other hand, may require a more traditional approach, requiring a little more skill and precision. The process of transferring gelatine to paper requires careful handling and attention to detail, as well as a certain level of technical knowledge and skill. Despite these limitations, hectography continued to be used for several decades, especially in small-scale printing and copying applications. Eventually, it was replaced by more advanced printing technologies such as offset printing and photocopying, which offer higher quality and greater efficiency and are no longer used today.

Figure 2. Gel printing block (Heines, 2012).

The gel printing technique differs from hectography in terms of its working principle in that it offers a single print in the mono printing area. We can say that gel printing is a mono-printing technique. Although there are different descriptions of the gel printing plate, it is usually a flexible transparent block obtained from a mixture of alcohol, glycerine and gelatine (see. Figure 2). The gelatine block to be used as a gel printing mould can be purchased ready-made or can be made at home using different recipes. The mixture, which will be mixed in different proportions, will reach a thick and flexible consistency by waiting in a container for a certain period and will be ready for printing after complete drying. Hancill defines monoprinting as a versatile and expressive art form that involves creating unique prints through a combination of painting, drawing and printmaking techniques. According to him, it is a process that allows for experimentation and spontaneity, creating one-of-a-kind works of art (Hancill, 2023). According to Newell, the term "monoprint" refers to the fact that each print produced is unique and cannot be copied exactly. While traditional printmaking techniques often involve creating multiple identical copies, monoprinting allows for greater freedom and individuality in the artistic process (Newell, 2018). The process of creating a single print typically involves applying ink or paint to the surface. Artists can manipulate the ink or paint with various tools such as brushes, rollers, or even their hands to create the textures, patterns, and forms they desire. When the image is complete, a paper is carefully pressed over the inked surface and the image is transferred to paper. The result is a unique print that captures the artist's creative vision.

Mono printing offers artists a wide range of possibilities for experimentation and exploration. It allows the combination of different techniques and materials such as collage, stencilling and layering to create complex and visually engaging works of art (Adi & Marutama, 2019). Artists can make changes and additions to the image throughout the printing process, so this process also inherently involves spontaneity and improvisation. Degarrod points out that monoprinting is used as a research tool in ethnographic studies as well as artistic value.

Art-based ethnographies involving monoprinting techniques have been used to enhance ethnographic knowledge acquisition and encourage empathy between participants and researchers (Degarrod, 2013).

Conclusion

Gel printing is an intriguing process that results in beautiful, one-of-a-kind, hand-printed papers with amazing colours, textures, and layers. Materials are widely available and easy to use, especially acrylic paints, which feature heavily in gel printing. It is easy to create colourful designs for monoprint artworks. The printing plate is portable. It can be used at home, in the workshop or outdoors. This technique is also an economical way of making printed art. Discovering new methods and materials for printmaking in individuals has always been an exciting and rewarding experience. One such material that has become increasingly popular in recent years is gel printing. Gel printing is a practical technique that can be used individually, allowing artists to create prints without using a traditional printing press. Flexible yet durable gel plates can be bought or obtained in a variety of sizes and shapes and can be reused multiple times. One of the main benefits of using gel-based plates for printmaking is their versatility. Unlike traditional printing methods, it allows for a more intuitive and experimental approach. Artists can use a variety of materials such as stencils, masks and found objects to create original prints. The technique can also be easily adapted to different surfaces such as paper, fabric, and wood. Another advantage of gel printing is its accessibility. While traditional printing methods can be costly and require specialised equipment such as printing presses and printing presses, the materials to be used in the gel printing technique can be more easily acquired by individuals. Only a few basic materials such as paint, brush, and the plate itself can be sufficient to print. This makes it an excellent option for artists who are new to the art of printmaking or who want to try a new technique economically.

Gel printing also provides a faster and more spontaneous approach to printmaking. Because the process is so versatile, artists can quickly experiment with different colours, textures and patterns and observe the results immediately. The technique, which can also be considered an environmentally friendly option for printmaking, can be applied using water-based inks and paints, unlike traditional printing methods that require the use of harsh chemicals and solvents. This makes it a safer and more sustainable option for artists who are concerned about the environmental impact of their work and an anti-toxic situation arises. Its flexibility, experimental approach, and the fact that it can be applied with different surfaces and mediums make it highly favourable for artists who want to explore new techniques and materials.

Abstract: Mothmeister, the artistic duo of Belgian-American photographers Dirk Marivoet and Bart Vandevijvere, have left an indelible mark on the world of art and photography with their unique style and highly stylized photographic work. The surrealist visual aesthetic of their work is characterized by the incorporation of bizarre and grotesque elements into a vivid, hyperrealist representation of the world. This paper analyses the use of a grotesque-inspired photographic style in Mothmeister's work in a carnival atmosphere and its impact on contemporary image-making. Mothmeister's striking visual aesthetic is eclectic and memorable, presenting a mixture of hyperrealism and surrealism in an endeavour to create a unique visual experience. Their work is often embodied by contemporary grotesquerie, an aesthetic that aims to shock and jolt viewers by emphasizing the grotesque and exaggerated aspects of the human figure. Using irony and humour, the artists subvert traditional expectations of beauty, creating images that are both captivating and disturbing.

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 1976-1986), Cappadocia, Turkiye. ISTES Organization.

Introduction

When we look at the concept of art, we see that it is a human activity that requires imagination, talent and creativity. In other words, it is the unique creativity that results from the expression of an emotion, a thought or a design (Kasım & Öztürk, 2023; Kucukoner & Ozturk, 2022; Öztürk, 2021a, 2021b; Türe & Ozturk, (2021). It is accepted that today's art of painting began with pictures or symbols drawn and engraved on the walls of caves and rocks by the first people in order to express their fears, joys, beliefs or needs. To put it briefly, the relationship between human beings and art is a concept as old as human history (Dalkıran, 2012). The Mothmeister duo's photographic works often utilize dramatic lighting, oversized props, and exaggerated postures to create a nightmarish sense of unease. The viewer experiences the sensation of being drawn into a

landscape of unmapped and often intriguing locations, populated by figures that appear to be undergoing a strange transformation. This transition often acts as a foil for more conventional elements, blurring the lines between the real and the surreal. Mothmeister's innovative and unorthodox approach to photographic representation has earned them both critical acclaim and a wide following among fans of contemporary art.

In addition to their stylized portraits, Mothmeister also produces documentary-style images that extraordinarily capture everyday life. Using the same techniques of exaggeration and distortion, these images are often set in the unreal world of the artists' imagination, creating a unique and ultimately disturbing juxtaposition between reality and fantasy. In this way, Mothmeister's use of the grotesque creates images that are both mesmerizing and thought-provoking, providing a means to draw attention to traditionally overlooked aspects of human experience.

Mothmeister's grotesque and carnival-inspired photographic work has established the duo as one of the most influential voices in contemporary photography. Their use of exaggeration, distortion, and irony to create images that are both striking and disturbing has earned them both critical acclaim and a significant following among art and photography fans. With each new series and project, Mothmeister continues to push the boundaries of perception and challenge viewers to reassess and reinterpret their concepts of beauty and reality. In order to better convey the concept and style of the grotesque, it is necessary to address the concept of carnival, a concept of which it is an element.

Carnival and Its Representation in Photography

The concepts of carnival and carnivalism have different origins and contexts. One of the oldest origins goes back to early modern theatre, where carnival and carnivalesque were present (Korhonen et al., 2000). In this period, carnival represented a temporary suspension of social norms and hierarchies, a reversal of roles, and a celebration of the absurd and grotesque. The carnivalesque spirit was embodied by characters such as the fool, the reformer, and the wild man. Hawkins and Edwards mention that anthropological studies of carnivals and tribal rituals, including pilgrimages and rites of passage, have also contributed to the understanding of carnivalism (Hawkins & Edwards, 2013). These rituals involve the suspension of normative assumptions and traditional practices, creating a liminal space where individuals can challenge and subvert social norms.

The historical roots of the concept of carnival are also based on the practice of guessing games in carnivals, as described in Sir Francis Galton's 1907 article (Goel & Lee 2016). Carnivalism or carnivalism is a concept that is represented in various ways in the art of photography as in other plastic arts. One aspect of carnivalism in photography has been the representation of social celebrations and power dynamics in these celebrations. Barnwell explores the representation of women and their power in Afro-Caribbean social celebrations, with a particular focus on the relationship of carnival to the history of Freedom Day in Toronto. This photographic research aimed to capture the concrete element of carnival's connection to history and to examine the representation of women in these celebrations (Barnwell, 2021).

In more contemporary contexts, carnivalism has been adapted into various industries and cultural practices. For example, the wrestling industry has used elements of carnivalism as a media strategy to simulate 'spontaneous' and 'real' events (Surowiec & Miles, 2020). This strategy originates from the culture of carnival workers. It can be said that the concept of carnival and carnivalism has various origins such as early modern theatre, anthropological studies on rituals, guessing games in carnivals, cultural appropriation in industries such as wrestling, resistance and an expression of alternative identities. It has evolved and continues to exist as a rich source of inspiration in various artistic and cultural practices.

Another aspect of carnivalism in photography is the use of visual carnivals and photomontage as a commentary on photography itself. Toman analyzed how photomontage can be used as a form of satire and commentary on the medium of photography. According to him, this approach allows photographers to challenge traditional notions of representation and create visual narratives that reflect the carnivalesque nature of the world (Toman, 2019). Photography is also capable of capturing the transformative and social change aspects of carnivalism. Cunningham et al. emphasize that photography and photojournalism are used as a means of realizing social transformation. These methods contribute to social change and challenge dominant narratives by allowing individuals to express their experiences and perspectives (Cunningham et al., 2020). Carnivalism can also be seen in the documentation of carnival events and traditions in photography. Gordon presented a photography and oral history project that captured the essence of the carnival in Jacmel, Haiti. This project uses costume, street theatre, narrative, and satire to reflect Haiti's history, cosmology, and current political body (Gordon, 2013).

Grotesque and Grotesque Image as a Concept

The concept of the grotesque has its origins in various historical and cultural contexts. Lawson et al. suggest that the grotesque in art and literature has been explored throughout history. It is a term used to describe artistic representations that deviate from norms of beauty and harmony, often characterized by exaggerated, distorted or hybrid forms. The grotesque can be seen as a response to the limitations of traditional aesthetic ideals and a way of challenging traditional notions of beauty (Lawson et al., 1965). Taking another approach, Hodges states that the grotesque, with its focus on bodily caricature, can be traced back to the living traditions of popular humour and folk culture dating back at least to the Middle Ages. This shows that the origins of the grotesque can be found in the cultural practices and artistic expressions of earlier periods (Hodges, 2010). According to Zwan, the word "grotesque" is derived from the Italian term "grottesca" and he explains that it refers to the underground, cave-like ruins where some of the earliest examples of this art form were found. While these first manifestations of the grotesque were initially marginal ornaments, over time they became more prominent in artistic expressions (Zwan, 2023).

The grotesque image is characterized by its ability to evoke a sense of unease, discomfort and even disgust in the viewer. It often challenges traditional notions of beauty and forms are interpreted about the absurd and the macabre. The grotesque can be seen as a confrontation with social norms and expectations and as a defiance and

rebellion against these concepts. The concept of the grotesque in art has various origins, including the historical traditions of popular humour and folk culture, as well as the exploration of unusual forms and themes. It has evolved and remains an important aspect of artistic expression, challenging traditional notions of beauty and inviting viewers to confront the disturbing and unusual.

The Mothmeister Team and Their Art Style

Arts groups and teams play an important role in the field of arts by offering a variety of benefits and perspectives. The collaborative nature of art groups allows artists to exchange ideas, share techniques and provide mutual support (Reid & Karambayya, 2009). The collaborative nature of art groups is an important feature that allows artists to exchange ideas, share techniques and provide mutual support (Teglbjaerg, 2011). By working together, artists can inspire and challenge each other, leading to the development of new artistic approaches and styles. Art groups also provide a sense of community and belonging, creating a supportive environment for artists to flourish.

Art groups may have different perspectives and attitudes towards abstract art. Some art groups or dyads may embrace abstract art as a way of expressing feelings, ideas or concepts that go beyond representational forms (Böthig & Hayn-Leichsenring, 2017). They may appreciate the freedom and experimentation that abstract art allows and value the exploration of colour, form, and texture. Abstract art can be seen as a way of conveying subjective experiences and challenging traditional artistic conventions. Stojilović and Markovic mentioned that art groups or duos can have different perspectives and preferences, favouring representational or figurative art over abstract art. They may prioritize the depiction of recognizable subjects and narratives, emphasizing storytelling and realism (Stojilović & Markovic, 2014). These artists may value the technical skill and craftsmanship required by representational art and find meaning in the depiction of the visible world. It is important to note that perspectives and attitudes towards abstract art can vary greatly between different art groups or duos. Some may embrace abstract art wholeheartedly, while others may have mixed views or preferences. The diversity of perspectives within art groups contributes to a rich and dynamic artistic landscape, encouraging dialogue and exploration of different artistic approaches.

Art groups and teams are of great importance in the arts, providing a supportive and collaborative environment for artists. Art groups or duos may differ in their perspectives and attitudes towards abstract art; some may embrace the freedom and experimentation of abstract art, while others may prioritize representational forms. The diversity of perspectives within art groups contributes to the richness and vitality of the art world. The Mothmeister team can also be considered in this way. Their unique concepts, the atmosphere they create, and their artistic expression make them strong in the context of artistic expression. Mothmeister is a mysterious and fascinating art duo that has been mesmerizing audiences with their unique and surreal creations for several years. The duo consists of two people who prefer to remain anonymous and are known for their unique style of combining taxidermized animals with intricate costumes and elaborate sets.

Belgian artist duo Mothmeister channel their love of post-mortem photography and stuffed animals into their unique style of imagery, typically depicting eerie, fairytale-like characters in post-apocalyptic landscapes. Their best work is now compiled in a book called *Weird and Wonderful Post-Mortem Fairy Tales*. The creative minds behind Mothmeister are a female graphic designer and a male art director from Antwerp, Belgium. But they insist on communicating as one person and presenting themselves as a singular subject. They choose to keep details of their real-life away from the public. "It's not about us, it's about our art. Yes, one of us is always in art but never recognizable, always masked or with his back to the camera. It's not about our real world, it's about the world we create in our minds, our afterlife tales" (Meerman, 2018). The name Mothmeister refers to the transformation of something unpleasant into something beautiful, such as the combination of poorly stuffed animals and creepy masks to create a wonderful artistic image. It also refers to the urban legend of the Mothman, a human-like creature with 10-metre wings that was reportedly seen in Point Pleasant, West Virginia in the 1960s.

Mothmeister's art is a fantastical blend of steampunk, gothic and otherworldly aesthetics that transports viewers into a surreal and mesmerizing world. Their works are often dark, disturbing, and surreal, but they also have a whimsical quality that adds a playful element to their work. One of the most intriguing aspects of the work is the use of taxidermized animals. Rather than displaying animals in a traditional way, the duo prefers to transform them into fantastical creatures that seem to have emerged from a different realm. Using animals as a canvas for their art, they add intricate costumes, masks, and other accessories to create a unique and mesmerizing experience. Their art has been featured in numerous galleries and exhibitions around the world. Their works can be described as "dark fairy tales". Preferring to remain anonymous, the duo prefers to let their art speak for itself. They rarely give interviews and are rarely in the public eye. For artists and academics, Mothmeister's work can be a fascinating case study of the power of imagination and creativity. Their ability to transform everyday objects and materials into otherworldly creations can be seen as a testament to the importance of artistic vision and the role of the artist in society.

As they are constantly pushing boundaries and exploring new avenues in their art, their work can also be an indication of the importance of experimentation in the creative process and approaching forms, objects, and spaces from experimental and different perspectives. A truly unique and mesmerizing art duo that has captured the imagination of audiences around the world, Mothmeister's surreal and haunting works transport viewers into a different world where taxidermy animals transform into fantastical creatures and the lines between fantasy and reality blur. For artists and scholars, Mothmeister's work can be seen as a testament to the importance of imagination and creativity in our lives.

Results

The duo, who are known to use stuffed dead animal bodies (taxidermy), mummies and different objects resembling corpses in their works, are also observed to include masks and different accessories and costumes

that complement masks in their works. The artists, whose works are generally for photography, exhibit their works in exhibitions, books, and their own social media pages. The duo, who do not share detailed information about the medium and material while exhibiting their works, have also stayed away from naming their works. In Figure 1, we see a figure with closed eyes resembling a mummy.

The posture of the figure, the material used and the blackened texture on the face may indicate death. Death has been one of the constant subjects of photography since its invention. Photographers have captured images of death in many forms, from funerals to horrific accidents. The representation of death in photography has varied throughout history, from the romanticized images of death in the Victorian era to the more realistic depictions of death in contemporary photography.

Figure 1. Untitled, (Mothmeister, 2023)

One of the oldest forms of death photography has been post-mortem photography. These photographs were taken of deceased people, usually children, as a way of remembering them. The subjects often posed as if they were still alive, and the photographs were often the only visual record of their existence. In the 20th century, photographers began to take a more realistic approach to death photography. Images became more graphic and were often used to document tragic events or accidents. In recent years, there has been a trend towards using photography to explore the concepts of death and mortality in a more artistic and philosophical way. The concept of death is one of the most interesting aspects of photographic art, capable of provoking a range of

emotions in the viewer. It can be both beautiful and repulsive, both comforting and unsettling. After all, death has been one of the most universal experiences we all share. The theme of death reminds individuals of their own mortality and the fragility of life.

One of the most striking features of grotesque art is its depiction of the human form and its attitude towards kingship and authority. Grotesque art has a unique way of depicting authority figures such as kings, queens, and other powerful individuals. In most cases, these figures are displayed in a negative light with exaggerated facial features and grotesque expressions. This depiction reflects a sceptical attitude towards authority and power. One of the earliest examples of grotesque art is found in the medieval period when it was used to criticize the social and political structures of the time. Grotesque figures were often depicted as corrupt, greedy, and immoral, emphasizing the flaws and shortcomings of the ruling class. Art was a vehicle for social commentary and served as a way for ordinary people to express their dissent. In Figure 2, the Mothmeister's nobility is indicated by his costumes, and the figure is wearing a crown. Despite his shining costume and splendour, the figure lacks the flesh of a human being. Here, the presence of the expression "farewell to the flesh", one of the most prominent attitudes of grotesque and carnivalesque styles, is observed.

Figure 2. Untitled, (Mothmeister, 2023)

It is possible to come across various types of art in which cadavers or mummies are used as the main subject in the history of art. The use of cadavers and mummies in art dates back to ancient times and has been a subject of interest to many artists throughout history. Ancient Egyptians used mummies to represent the dead in their works of art. The Greeks used cadavers to study anatomy and create realistic sculptures. Renaissance artists also used cadavers to study human anatomy and create realistic paintings. In modern times, artists have used cadavers to create installations and performance art. Figure 3 shows a figure with dried flesh, sunken cheeks, and empty eye sockets. It can be said that the figure makes a reference to the concept of death embraced and accepted by the grotesque concept. At the same time, the figure holds a stuffed furry animal form in its lap. The costume and accessories of the figure, which is standing even after death and gives the impression of continuing its life, are not worn out and are represented in a very vivid and flamboyant way.

Figure 3. Untitled, (Mothmeister, 2023)

Figure 4. Untitled, (Mothmeister, 2023)

In the world of art, costumes, and clothing play an important role in the depiction and portrayal of characters, themes and ideas. From the intricately designed and ornate dresses of the Renaissance to the avant-garde and bold costumes of modern art, clothing has been used as a means to express and convey various narratives and emotions. One of the most interesting aspects of clothing in art is the use of noble and flamboyant costumes. Noble clothes, also known as court dress, were generally used by the aristocracy and nobility in Europe in the 17th and 18th centuries. These clothes were designed to display the wealth and status of the wearer and were usually made of luxurious fabrics such as silk, velvet, and brocade. In art, noble clothes were often used to

depict royalty and the upper classes. Paintings of kings, queens and other members of the aristocracy are often adorned with elaborate and ornate costumes symbolizing their power and status. Lavish costumes are often associated with theatre productions, masquerades, and carnivals. These costumes are designed to be bold, colourful and eye-catching, and often include intricate details and embellishments. In the arts, flamboyant costumes are used to express a wide range of emotions, from joy and celebration to darkness and despair.

Photographs and paintings depicting dead people pretending to be asleep have long been a popular subject in art history. From the Victorian era to the present day, artists have been fascinated by the idea of capturing the stillness and serenity of death in their work. The tradition of making paintings of the deceased dates back centuries. In ancient Egypt, for example, elaborate funeral masks were made to accompany the dead into the afterlife. Similarly, in medieval Europe, busts were often made to represent the deceased at funerals. However, photographing the dead became especially popular during the Victorian era. Known as post-mortem photography, these images were often the only visual record of a person's life and were cherished by loved ones as a way of remembering them.

Figure 5. Untitled, (Mothmeister, 2023)

In most cases, these photographs were taken shortly after death and the deceased was posed in a way that made it appear as if they were asleep. This was done to create a sense of peace and tranquillity in the image and to

help the bereaved come to terms with their loss. The popularity of post-mortem photography declined as the 20th century progressed, but the tradition of creating images of the deceased continued in other ways. Figure 5 shows a portrait sculpture. The portrait appears to be of a dead person, with the mouth open and the teeth exposed. The portrait is surrounded by floral ornaments, and the composition includes a headdress and a veil visible from the edges. The work, which creates the impression of an old woman with closed eyelids, again refers to death, death photography and dark themes.

Abstract: In this research, the authors address the Green Capacitated Vehicle Routing Problem (GCVRP), which is a variant of the Vehicle Routing Problem that considers the environmental impact of transportation. The goal of the GCVRP is to minimize the emission of pollutants, particularly CO₂, by considering factors such as fuel consumption, load to be delivered, distance traveled, and vehicle capacity. The authors use CORONA Virus Optimization algorithm and compare results with local search to solve the problem and consider the use of assignment probabilities as continuous variables. In this research, the authors address the Green Capacitated Vehicle Routing Problem (GCVRP), which is a variant of the Vehicle Routing Problem that takes into account the environmental impact of transportation. The goal of the GCVRP is to minimize the emission of pollutants, particularly CO₂, by considering factors such as fuel consumption, load to be delivered, distance traveled, and vehicle capacity. The authors use metaheuristics, specifically local search and particle swarm optimization, to solve the problem and consider the use of assignment probabilities as continuous variables.

Keywords: Pollutants; CO₂, Green Capacited Vehicle Routing Problem; Metaheuristics, transportation, sustainability.

Introduction

Current circumstances of the pandemic show new consumption patterns and the emergence of new actors during

sanitary confinement periods. The goods transportation evolves rapidly in the face of more constraints and specificities as preferred and authorized and time windows. It is a question of determining a circuit (routing) of several vehicles, to serve at minimal cost customers' network. This paper attempts to minimize the emission of carbon dioxide (CO₂) from the heterogeneous charged trucks and to respect some other constraints such as capacity. To solve green capacitated vehicle routing recent metaheuristic is used as well as some known approached methods. For this reason, we present in the following section the problem. In the third section, we describe the three algorithms. In the fourth section, we will the discretization of the continuous methods.

Green Capacitated Vehicle Routing Problem

Green Vehicle Routing

Vehicle Routing Problems (VRPs) include among the most studied combinatorial optimization problems. The VRP representative models a situation in which a fleet of vehicles in a depot must serve a set of customers geographically dispersed. The goal is then to determine which clients should visit each vehicle and in what order so that the activity is carried out as efficiently as possible. It generalizes the well-known travelling salesman problem (TSP). The common purpose of the classical problem is then to minimize the number of vehicles and the total distance travelled to serve clients without violating constraints (Dekhici et al., 2019a).

In the literature there are many variants of VRP. Below are presented the most well-known ones: The Capacitated Vehicle Routing Problem (CVRP) is one of the variants characterized by the presence of vehicle capacity constraints and customer demands. The Vehicle Routing Problem with Time Windows (VRPTW), or VRP with time windows (Dekhici et al., 2019b), specifies that each client has a time window. This is a time interval during which its service is available. (e.g. loading or unloading of goods) must be completed. A vehicle may arrive early, but he must wait until the service is possible. If it arrives later the corresponding customer will be not satisfied, or the service is no longer possible. In this case, the problem is said to be "hard time window constraints". of windows of time. In the so-called soft stress models, vehicles can be used to the customer outside his time window but at the price some form of penalty. The time window may concern the opening hours of the depot or the hours of unavailability of the staff.

The Stochastic Vehicle Routing Problem (SVRP), is a Sales representative in which at least one element of the problem is random. The Multi-Depot Vehicle Routing Problem (MDVRP), has several depots in which the vehicles. Each tour of a vehicle must begin and end up at the same depot.

Green Vehicle Routing (GVRP) is a branch of green logistics which refers to vehicle routing problems where externalities of using vehicles, such as carbon dioxide-equivalents emissions, are explicitly taken into account so that they are reduced through better planning (Çağrı Koç et al. 2016). Bjorklund (2011) defines "Green Transportation" as a: "Transportation service that has a lesser or reduced negative impact on human health and the natural environment when compared with competing transportation services that serve the same purpose".

Recently, the concept of green transportation for sustainable development has soared due to governmental regulations and customers preference for green products. Consequently, transportation companies are reviewing their processes to take into account such concern. In some cases, transforming the traditional logistics systems to be environmentally friendly shall even lower the costs enabling it to meet classic logistics objectives. Moreover, the green transportation system could be completed by determining emission factors and quantifying trucks emissions to integrate them into the logistics systems networks.

Related works

Since this is the trend in environmentally friendly industry and it is in fact necessary to think more efficiently in terms of the environment, in last years many researchers have been interested in GVRP rather than other variants of the vehicle routing problem. Green transportation and the minimization of pollutants in the vehicle routing problem have received significant attention. As an example, Bruglieri et al.(2016) considered intermediate stops to the Alternative Fuel vehicles. They used for the GVRP, two Mixed Integer Linear Programming formulations allowing multiple visits to the stations without introducing dummy copies of them. Their work where enriched in (Bruglieri et al., 2019) by dominance rule using exact methods and heuristic approach. Yunyun Niu et al.(2018) considered the Green open vehicle routing problem (GOVRP) in Beijing, China, where the vehicles do not return to the depot after servicing customers. A hybrid tabu search algorithm involving several neighborhood search strategies was designed to minimize fuel emissions costs and the CO2 emissions cost.

Rather than minimizing fuel cost of ordinary truck, Giusy Macrina et al.(2019) proposed a discrete metaheuristic to a specific version of the Green Vehicle Routing Problem, in which we assume the availability of a mixed vehicle fleet composed of electrical and conventional (internal combustion engine) vehicles. These are typically light- and medium-duty vehicles. They allowed partial battery recharging at any of the available stations. Yang Yu et al.(2019) proposed an improved branch-and-price (BAP) algorithm to solve the heterogeneous fleet green vehicle routing problem with time windows (HFGVRPTW). In one of the steps, they used a multi-vehicle approximate dynamic programming (MVADP) algorithm to evaluate the carbon emission of each vehicle. Computational experiments were done on the Solomon benchmark instances.

Recently, Giallanza et al.(2020) investigated a three-echelon fuzzy green vehicle routing problem (3E-FGVRP) for designing a regional agri-food supply chain on a time horizon. The credibility theory of fuzzy sets is used to implement a multi-objective fuzzy chance-constrained programming model, where the total costs and carbon emissions are minimized. The resolution of the 3E-FGVRP is conducted by using a non-dominated sorting genetic algorithm.

Ferani E. Et al. (2020) proposed a green vehicle routing problem (VRP) for perishable products which optimizes the operational cost, deterioration cost, carbon emissions and customer satisfaction. The proposed VRP model also considers time windows, different travelling time during peak hour and off-peak hour, and working hours.

They solved the proposed model using a many-objective gradient evolution (MOGE) algorithm.

The literature on the green transportation and the minimization of pollutants in the vehicle routing problem is growing rapidly, and the above-mentioned studies represent a small subset of the research in this area. Despite the increasing interest in this field, there is still much room for improvement, and further research is needed to address the challenges posed by the complexity of the problem and the trade-off between environmental sustainability and transportation efficiency.

Pollutant emission

Freight transportation generates significant amounts of many types of pollutants, including particulate matter, carbon monoxide, ozone (nitrogen oxides (NOx) chemically reacted with volatile organic compounds) and hazardous air toxics(Çağrı Koç et al., 2016). Total emission emitted per tons of CO₂ depends on the number of vehicles, the average distance they travel, and the extent to which they are loaded. It is difficult to do an exact estimation because of the uncertain effects on climate change. When an engine is started below its normal operating temperature, it uses fuel inefficiently, and the amount of pollution produced is higher than when it is hot(Iodi et al.,2020). In other hypothesis, Elbouzekri et al.(2013) using genetics metaheuristics used another equation in the fuel optimization of Vehicle routing problem in order to calculate transportation cost between two points i and j. These observations lead to the basic relationship used in the calculation method (equation 1):

$$E(q, d) = d \times \left[\left(\frac{e_{fl} - e_{el}}{Q} \right) q + e_{el} \right] \quad (1)$$

Where: E(q,d) the CO₂ emission from a vehicles in kg/km with a load q and distance d; e_{fl} is the CO₂ emissions of a fully loaded (by weight) vehicle; e_{el} is the CO₂ emissions of an empty vehicle and Q is the volume capacity of a vehicle.

Optimization Method

CoronaVirus Optimization Algorithm (CVOA)

A recent metaheuristic called Corona viral Optimization Algorithm (Martínez-Álvarez et al., 2021) models how the virus spreads and how it infects healthy people. The CVOA is a novel optimization algorithm that is inspired by the behavior of the coronavirus. The algorithm uses a swarm-based approach to find the optimal solution in the Vehicle routing problem. The CVOA considers multiple factors such as the distance, travel time, and pollutant emission levels of the vehicles to determine the optimal solution. Unlike existing algorithms, the CVOA starts with a population of one solution and considers many parameters to ensure the spread of the levels. The standard algorithm used the 2020 viral statistics and a binary codification and was without a specific condition of termination. The technique was utilized to forecast a hydropower dam's deformation (Bui et al.2022, Torres et al. 2021,2022). Karthikeyan et al. 2022) investigated CVOA to Enhance the Output Power of the Partially. (Shamseldin, 2021) used it to maximize the performance brushless DC motor. The algorithm was

also used for breast cancer classification in (Nassif et al. 2021).The algorithm was hybridized in (PRIYA et al., 2022).

CVOA principles

If no local optimum has been initialized, the algorithm starts by initializing patient zero (PZ) as the coronavirus and provides a random solution otherwise. An iteration's steps are as follows: Each infected person has a chance of dying (P DIE), and they are unable to spread the virus to other people. Undead people spread disease to new people. Individuals will infect more or less others based on whether they are categorized as "super-spreaders" (more) or "ordinary-spreaders," according to a fixed probability (P SUPERSPREADER) (fewer). Both categories of people "The'super-spreader' and 'ordinary spreader' can travel and study new solutions to ensure diversity of outcomes. Therefore, there is a chance (P TRAVEL) that the available solutions will be more varied.

And so there is a probability (P_TRAVEL) to diversify the field of solutions. For this algorithm three (03) populations are updated: Each individual can die and goes into a list where it cannot infect any new individuals. Each infected individual is sent to the cured list after spreading the virus, there is a probability controlled chance of reinfection (P_REINFECTION). An individual in the list of cured persons can, at any iteration, be reinfected. To simulate the quarantine of a person and for simplicity, if the probability of quarantine (P_ISOLATION) is satisfied, the individual is directly put in the list of cured persons. The list of newly infected people, as the name suggests contains the newly infected individuals after each iteration. It is possible that there are two (02) similar individuals and in this case the new individual is deleted.

As mentioned above, one of the characteristics of this algorithm is that the search can stop without the need to control an external parameter as in most algorithms. This is due to the fact that the algorithm reaches a point where it can no longer infect new people because the population of dead and cured individuals is increasing. In addition, a predefined and specified number of iterations (PANDEMIC_DURATION) can be added to prevent the opposite case.

Some parameters

One of the strengths of this algorithm is that the input data is mostly predefined by the virus statistics (even if some statistics have changed since March 2020) and that the proper functioning of this metaheuristic depends on these data which are not arbitrarily chosen.

P_DIE: The probability of death of an infected individual. It is 5%, therefore equal to 0.05.

P_SUPERSPREADER: This probability also affects infected individuals. It is 10%, or 0.1.

ORDINARY_RATE: This is the number of people an infected individual who is not a super-spreader infects. It infects a random number of people in the set [0,5].

SUPERSPREADER_RATE: This is the number of people an infected super-spreader infects. It infects a random

number of people in the set [6,15].

P_REINFECTION: This is the probability that a cured person can be infected again. And it is 02%, so equal to 0.02.

P_ISOLATION: This is the probability that dictates whether a person enters quarantine when affected by the virus. It is essential for the algorithm to stop and is $\geq 70\%$, or 0.7.

P_TRAVEL: The probability that an individual will travel after being infected.

It is equal to 10%, or 0.1.

PANDEMIC_DURATION: This data simulates the duration of the pandemic and it can be unknown at the initialization.

SOCIAL_DISTANCING: This is the minimum number of iterations before the quarantine process is triggered and P_ISOLATION becomes viable. It is suggested to put it in the set [7,12].

Pseudo-codes

The algorithm has several functions that make it work that we will show and explain for a better understanding of how the algorithm works, composed of five (05) nested functions:

The cvoa() function. This is the main function of the algorithm, which is the function that handles the three (03) populations. It initializes them and processes them by calling the other functions. The output is the best individual

Algorithm 1 Function CVOA (Martínez-Álvarez et al., 2021)

```
1: define infectedPopulation, newInfectedPopulation as set of Individual
2: define dead, recovered as list of Individual
3: define PZ, bestIndividual, currentBestIndividual, aux as Individual
4: define time as integer
5: define bestSolutionFitness, currentbestFitness as real 6: time  $\leftarrow$  0
7: PZ  $\leftarrow$  InfectPatientZero()
8: infectedPopulation  $\leftarrow$  PZ 9: bestIndividual  $\leftarrow$  PZ
10: while time < PANDEMIC DURAT ION AND sizeof(InfectedPopulation) > 0 do
11: dead  $\leftarrow$  die(InfectedPopulation)
12: for all i  $\in$  InfectedPopulation do
13: aux  $\leftarrow$  infect(i,recovered,dead)
14: if not null(aux) then
15: newInfectedPopulation  $\leftarrow$  aux
16: end if
17: end for
18: currentBestIndividual  $\leftarrow$  selectBestIndividual(newInfectedPopulation)
19: if fitness(currentBestIndividual) > bestIndividual then 20: bestIndividual  $\leftarrow$  currentBestIndividual
21: end if
```

```
22: recovered ← infectedPopulation
23: clear(InfectedPopulation)
24: InfectedPopulation ← newInfectedPopulation
25: time ← time + 1
26: end while
27: return bestIndividual
```

The **infect()** function decides whether the individual is an **ordinarySpreader** or a **superSpreader** or whether the individual is travelling or not by comparing a random number between 00 and 01 and sees if the value exceeds the probability of P_TRAVEL and $P_SUPERSPREADER$ and then calls the **newInfection()** function with these parameters and returns a list, **newInfected**, of infected individuals as output.

This function allows the algorithm to run, after an initialization, with a loop that takes into consideration **time**, which is the variable that checks that the number of iterations has not yet been reached, and **infectedPopulation**, which is the list of infected people, if this list is empty the algorithm stops.

In the loop, the function first checks if any individuals have died with the **die()** function - we'll see more details on this function in a later point - then for each infected person we have, we infect with the **infect()** function new individuals and put them in **newInfectedPopulation** which updates the **infectedPopulation** list after each iteration.

Also at each iteration, the best individual is selected and put into **bestIndividual**.

The infect() function . This function is the function that allows the infection of new individuals

The newInfection() function. This is the function that actually infects people and works directly with individuals. The function starts by taking a list of individuals (an auxiliary list used just for moving individuals) and calls the **replicate()** function which is a function that is not defined by the CVOA algorithm but which is to be changed according to the function we have (we will see later how it was used in this project). Then check that this individual is not in quarantine by using the same method as the one that determines if the individual is travelling. Then this function returns the list **newInfected**.

The die() function. The **die()** function allows checking if an individual is dead or not. This function takes the **dead** list as a parameter and returns an update of this same list.

The bestIndividual() function. The **bestIndividual()** function is a utility function that compares the solutions and evaluations of the objective function.

In this work; the CVOA has been modified to meet the problem domain. In the **cvoa()** function, the **dead** population update was added at the end to avoid the case where patient zero **PZ** dies first without the possibility of infecting new individuals. The **replicate** function was implemented using hill- climbing search to generate new Redundancy optimization Problem solutions.

Solution Representation

To exploit the continuous optimization metaheuristics, a discrete solution coding is used in (Dekhici et al.,2019)

X_{ikl} : solution

$i=1\dots$ to the number of particle i.e. Population size;

$k=1\dots$ to the number of vehicles

$l=1\dots$ to the number of client

Where X_{ikl} represents for the particle i the priority of assigning the vehicle k to the client l

After sorting X_{ikl} for each fixed l' , take the line k' of $\max_i x_{ikl'}$ and add it to S_{ik} which is the sequencing of care i assigned to the vehicle k' .

Then calculate the starting and ending dates on S_{ik} according to the duration of treatment and the distances between clients. The initial population is generated as follows:

$$X_i = X_{min} + (X_{max} - X_{min}) * rand () \quad (5)$$

Rand () is the generator of random floats from 0 to 1.

X_{min} can be 1 and X_{max} can be taken as the number of clients.

This work will use the penalty function to evaluate the capacity hard constraints in CVRP. The penalty function is formed by adding to hard constraint a large positive number C as an example equal to 999999.

The weight for CO2 emission E is λ_1 As we have not soft constraints this coefficient can be equal to 1.

$$f = \lambda_1 E + 999999 \text{ penalty} \quad (6)$$

Experimentations and Discussion

Data set

Data were customized from VRP benchmark

Table 1. Data of first example of the VRP

parameters	Value
Trucks	5
customers	32
Capacity	100
Nbr, generations	25
Example	A-n32-k5 xrp

The coefficients efl the CO2 emissions of a fully loaded (by weight) vehicle; eel the CO2 emissions of an empty vehicle and Q the volume capacity of a vehicle were added (Djebbar et al., 2020).

Results

In the application interface, for each vehicle, the road is described with distance and pollutant emission (figure

1)

Route	Liste des clients	Contrainte Capacité	Nbr. Clients	Cap. Total	Distance	Taux CO ² (%)
Route #4	13 37 40 52 60 66	Accépté	6	99	394.268	328.976
Route #5	5 11 15 16 36 41 47 51 55	Accépté	9	93	616.59	519.166
Route #6	12 18 42 46 59 9 25	Accépté	7	96	444.418	372.021
Route #7	30 43 48 62 29	Accépté	5	91	230.029	189.494
Route #8	3 4 8 14 53 54 56 57	Accépté	8	100	412.319	351.349
Route #9	6 7 21 28 35	Accépté	5	89	394.948	311.617

Figure 1. Roads description with the list of customers, constraints respect , number of customers, total load, distances and CO2 rate

For the first example and with 5 simulations, results shown in table 2 were obtained.

Table 2. Results of the first example of the GCVRP

Simulations	CO2 Emission		Distance	
	Local Search	CVOA	Local Search	CVOA
1	955,89	594,87	2351,74	1947,84
2	877,13	633,44	2302,03	1964,16
3	968,44	757,88	2430,63	1146,6
4	873,65	601,01	2263,98	1944,88
5	704,4	639,11	2069,18	1995,07
avg.	875,902	645,262	2283,5122	1799,71
min	704,4	601,01	2069,18	1146,6
max	968,44	757,88	2430,63	1995,07

For CO2 Emission, the average CO2 emissions for the Local Search method is 875.902, while for the CVOA method it is 645.262. The minimum CO2 emissions achieved in any simulation is 704.4 for the Local Search method and 601.01 for the CVOA method. The maximum CO2 emissions observed in any simulation is 968.44 for the Local Search method and 757.88 for the CVOA method.

For the routing total distance, the average distance traveled for the Local Search method is 2283.5122, while for the CVOA method it is 1799.71. The minimum distance covered in any simulation is 2069.18 for the Local Search method and 1146.6 for the CVOA method. The maximum distance traveled in any simulation is 2430.63 for the Local Search method and 1995.07 for the CVOA method.

Overall, the CVOA method shows better performance in terms of reducing CO2 emissions and distance traveled compared to the Local Search method, as it achieves lower average values and better minimum results.

To test the method effectively, well-balanced and poorly balanced sets are also used. Then balanced terms describe instances in the context of the Vehicle Routing Problem (VRP) based on certain characteristics of the problem instances, such as the distribution of customers, demand, or geographical layout. Well-balanced instances are often characterized by a more even distribution of customers and demands, while poorly balanced instances may exhibit irregularities, such as clustering of customers or highly imbalanced demands. Table 3 shows the results of CVOA optimization compared to initial solution.

Across both well-balanced and poorly balanced instances of the GCVRP, the CVOA method consistently outperformed the initial solutions, resulting in significant improvements in both CO2 emissions and distance traveled. The CVOA approach showcased notable enhancement rates, with an average improvement rate of approximately 12.82% for both CO2 emissions and distance.

Table 3. Results others well and bad balanced GCVRP

Set type in CVRP benchmarks	Truck capacity	customers	Generations	Initial solution CO2	Initial solution distance in km	CVOA	CVOA	
						Co2	distance	
A	9	100	65	25	3695,973	4420,232	3229,626	3844,008
A	10	100	80	25	4500,135	5373,909	4045.283	4841,285
A	9	100	70	25	3855,384	4557,46	3370.722	3885,282
B	7	100	52	25	2805,403	3303,104	2392,845	2825,282
/	/	100	/	avg.	3330,3935	3930,282	2392,845	3355,282

These results underscore the effectiveness of the CVOA method in optimizing the routing solutions and reducing the environmental impact of the GCVRP. By achieving substantial reductions in both CO2 emissions and distance traveled, the CVOA method demonstrates its potential to drive more sustainable and efficient vehicle routing practices. These findings highlight the importance of utilizing advanced optimization techniques, such as CVOA, to improve the overall performance and environmental sustainability of vehicle routing problems like the GCVRP.

The convergence of CVOA is shown in figure 2.

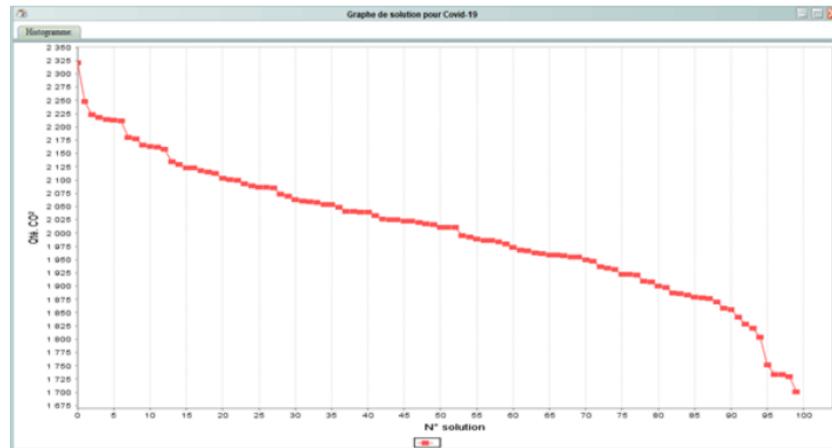

Figure 2. convergence of CVOA algorithm

Experiments and simulations were conducted on customized VRP benchmark adding specific GVRP coefficients demand and capacities to evaluate the performance of the CVOA in the GCVRP.

The results showed that the CVOA significantly outperformed existing algorithms in terms of pollutant emission reduction for a green transportation. The CVOA was able to find the optimal solution in a shorter distance, and the solution had a lower pollutant emission level compared to existing algorithms. These results demonstrate the potential of the CVOA as a promising solution for green transportation and pollutant minimization in the VRP.

Conclusion

In this paper, an approach based on priority was utilized to discretize continuous algorithms for addressing the Green Capacitated Vehicle Routing Problem (GVRP). The objective of this approach was to minimize pollutant emissions from a fleet of heterogeneous trucks by considering factors such as the number of trucks, distance travelled, and product load to be dispatched. The study focused on well-established optimization algorithms and explored a recent metaheuristic.

The Corona Virus Optimization Algorithm (CVOA) was proposed as a solution for achieving green transportation and minimizing pollutant emissions in the VRP. The CVOA introduced a unique approach by incorporating a spread rate and an initial population of one solution called patient zero. Through experiments and simulations, it was demonstrated that the CVOA outperformed existing algorithms in terms of reducing pollutant emissions and promoting environmentally-friendly transportation. This study opens up new avenues for future research in the field of green transportation and pollutant minimization in the VRP, utilizing the Corona Virus Optimization Algorithm as a valuable tool.

Algorithm of Diagnosis and Treatment of Patients with Chronic Hemorrhoids

Volodymyr Sulyma

Dnipro State Medical University, Ukraine,  <https://orcid.org/0000-0002-8373-6480>

Abstract: Algorithm of diagnosis and treatment of patients with chronic hemorrhoids including any others steps: General Considerations, Clinical Findings, Differential Diagnosis, Complications, Treatment, Prognosis. Essentials of Diagnosis “Hemorrhoids”: a) rectal bleeding, protrusion, discomfort; b) mucoid discharge from rectum; c) possible secondary anemia; d) characteristic findings on external anal inspection and anoscopic examination. General Considerations for chronic hemorrhoids including investigations of external hemorrhoids and internal hemorrhoids. Clinical Findings including analysis of symptoms and signs on examination. Differential Diagnosis patients with chronic hemorrhoids in first time application with similar manifestation for rectal cancer and other diseases for anorectal zone. Complications of chronic hemorrhoids: bleeding, prolapse recti and acute phlebotrombosis. Treatment may be any other for concrete of studies chronic hemorrhoids: First-degree, Second-Degree, Third-Degree and Fourth-Degree. Concrete of treatment program may be for patients with complications: for bleeding, for prolapse and for acute phlebotrombosis. Treatment Program for patients with hemorrhoids may be: Medical Treatment with application medicament's drugs, Rubber Band Ligation, Hemorrhoidectomy with application traditional and any others modern methods for excision, Sclerotherapy and Cryosurgery with application more any others mini-invasive methods. Prognosis for patients with chronic hemorrhoids after medicaments or surgical treatment is favorable.

Introduction

Hemorrhoids are one of the most common proctological diseases in the world. Its prevalence reaches up to 40% of the general population, with a higher incidence among middle-aged people with high socioeconomic status. It is estimated that about 50% of the general population experience symptomatic hemorrhoids at some point in their lives. In addition, pregnant women are at high risk of developing hemorrhoids. The prevalence of hemorrhoids in pregnant women ranges from 25% to 35%, and up to 85% of pregnant women suffer from hemorrhoids in the third trimester. Other subjects at increased risk of developing hemorrhoids are the elderly and those with a high body mass index. The severity of hemorrhoids is divided into four stages. Medical

treatment and lifestyle modification are appropriate for stage I-II hemorrhoids, which account for the vast majority (>90%) of all reported cases, while later stages III-IV of the disease require surgery. treatment, which may have a number of complications. In particular, changes in diet and lifestyle that require strict adherence by the patient to the regimen are usually considered the first step towards any conservative treatment of hemorrhoids. Drug treatment is mainly based on the use of topical preparations containing anti-inflammatory components, including steroids, anesthetics and / or antiseptics. However, in most cases, randomized trials have not been conducted to evaluate the efficacy and safety of various substances, which in some cases - for example, steroids - are associated with the potential onset of adverse events.

General Considerations

Essentials of Diagnosis “Hemorrhoids”: a) rectal bleeding, protrusion, discomfort; b) mucoid discharge from rectum; c) possible secondary anemia; d) characteristic findings on external anal inspection and anoscopic examination. General Considerations for chronic hemorrhoids including investigations of external hemorrhoids and internal hemorrhoids.

External Hemorrhoids

Symptomatic external hemorrhoids often present as a bluish-colored painful lump just outside the anus and they tend to occur spontaneously and may have been preceded by an unusual amount of straining. The skin overlying the outside of the anus is usually firmly attached to the underlying tissues. If a blood clot or thrombosis develops in this tightly held area, the pressure goes up rapidly in these tissues often causing pain. The pain is usually constant and can be severe. Occasionally the elevated pressure in the thrombosed external hemorrhoid results in breakdown of the overlying skin and the clotted blood begins leaking out. Patients may also complain of intermittent swelling, pressure and discomfort, related to external hemorrhoids which are not thrombosed.

Internal Hemorrhoids

Painless rectal bleeding or prolapse of anal tissue is often associated with symptomatic internal hemorrhoids. Prolapse is hemorrhoidal tissue coming from the inside that can often be felt on the outside of the anus when wiping or having a bowel movement. This tissue often goes back inside spontaneously or can be pushed back internally by the patient. The symptoms tend to progress slowly over a long time and are often intermittent. Bleeding attributed to internal hemorrhoids is usually bright red and can be quite brisk. It may be found on the wipe, dripping into the toilet bowl. Not all patients with symptomatic internal hemorrhoids will have significant bleeding. Instead, prolapse may be the main or only symptom. Prolapsing tissue may result in significant irritation and itching around the anus. Patients may also complain of mucus discharge, difficulty with cleaning, or a sense that their stool is “stuck” at the anus. Patients without significant symptoms from internal hemorrhoids do not require treatment based on their appearance alone.

Internal hemorrhoids are classified by their degree of prolapse, which helps determine management:

Grade One: No prolapse

Grade Two: Prolapse that goes back in on its own

Grade Three: Prolapse pushed back in by the patient

Grade Four: Prolapse that cannot be pushed back in

Clinical Findings

The most common manifestation of hemorrhoids is painless rectal bleeding associated with bowel movement, described by patients as blood drips into toilet bowl. The blood is typically bright red as hemorrhoidal tissue has direct arteriovenous communication. Positive fecal occult blood or anemia should not be attributed to hemorrhoids until the colon is adequately evaluated especially when the bleeding is atypical for hemorrhoids, when no source of bleeding is evident on anorectal examination, or when the patient has significant risk factors for colorectal neoplasia. Prolapsing hemorrhoids may cause perineal irritation or anal itching due to mucous secretion or fecal soiling. A feeling of incomplete evacuation or rectal fullness is also reported in patients with large hemorrhoids. Pain is not usually caused by the hemorrhoids themselves unless thrombosis has occurred, particularly in an external hemorrhoid or if a fourth-degree internal hemorrhoid becomes strangulated. Anal fissure and perianal abscess are more common causes of anal pain in hemorrhoidal patients.

The definite diagnosis of hemorrhoidal disease is based on a precise patient history and careful clinical examination. Assessment should include a digital examination and anoscopy in the left lateral position. The perianal area should be inspected for anal skin tags, external hemorrhoid, perianal dermatitis from anal discharge or fecal soiling, fistula-in-ano and anal fissure. Some physicians prefer patients sitting and straining in the squatting position to watch for the prolapse.

Although internal hemorrhoids cannot be palpated, digital examination will detect abnormal anorectal mass, anal stenosis and scar, evaluate anal sphincter tone, and determine the status of prostatic hypertrophy which may be the reason for straining as this aggravates descent of the anal cushions during micturition. Hemorrhoidal size, location, severity of inflammation and bleeding should be noted during anoscopy. Intrarectal retroflexion of the colonoscope or transparent anoscope with flexible endoscope also allow excellent visualization of the anal canal and hemorrhoid, and permit recording pictures (*Lohsiriwat, 2012*).

Differential Diagnosis

Differential Diagnosis between chronic hemorrhoids, anal fissure, rectal prolapse and rectal cancer.

Chronic hemorrhoids

External hemorrhoids:

External hemorrhoids are painful as the skin below the punctate line is sensitive to pain.

Blood clots may form in external hemorrhoids.

Thrombosed external hemorrhoids cause bleeding, painful swelling, or a hard lump around the anus.

When the blood clot dissolves, extra skin is left behind. This skin can become irritated or itchy.

Excessive straining, rubbing, or cleaning around the anus may make symptoms, such as itching and irritation, worse.

Internal hemorrhoids:

The most common symptom of internal hemorrhoids is bright red blood on stool, on toilet paper, or in the toilet bowl after a bowel movement.

Internal hemorrhoids that are not prolapsed are usually not painful.

Prolapsed hemorrhoids often cause pain, discomfort, and anal itching

Skin examination:

Inspection of the anal verge may show scratch marks and skin tags.

Inspection also may reveal external hemorrhoids or prolapsed internal hemorrhoids.

Digital rectal examination:

Digital rectal examination reveals the size and location of hemorrhoids.

Thrombosed hemorrhoids are tender to palpation.

Internal hemorrhoids are not palpable by digital rectal examination and the use of anoscope is mandatory.

Anal fissure

Anal fissure usually presents with tearing pain with every bowel movement.

Pain usually lasts for minutes to hours after every bowel movement.

Patient is typically afraid of going to the bathroom to avoid the pain, which leads to a vicious cycle.

The fissure worsens the constipation and the constipation (hard stool) aggravates the fissure.

About two-thirds of the patients present with bright red blood streaks on toilet papers or on the surface of stools.

May be accompanied by pruritis and discharge.

Most fissures occur in the posterior mid-line of the anal canal.

Skin tags in the perianal area may accompany in chronic anal fissures.

Rectal prolapse

Rectal prolapse most commonly occurs in multiparous females over 40 years old.

Appears as a progressive mass protrusion from the anus. The protrusion first appears with straining and defecation, then progresses to the degree when it is no longer replaced back.

It presents with abdominal discomfort and incomplete defecation.

Fecal incontinence and anal discharge.

Pain is not usually present.

Mass protruding from the anus.

Concentric mucosal rings are characteristic of rectal prolapse.

Rectal cancer

Rectal bleeding is the most common presentation.

Mass sensation in the anus.

Mucoid discharge may occur.

Patient may give a history of anal condyloma.

Fecal incontinence.

On digital rectal examination, solid hemorrhagic mass that is firmly fixed to the surrounding structures is noted.

Femoral and inguinal lymph nodes may show lymphadenopathy secondary to spread of cancer.

Complications

Complications of chronic hemorrhoids: bleeding, prolapse recti and acute phlebotrombosis.

Hemorrhoids can be chronic and painful, but they do not usually cause complications. Rarely, a thrombosed hemorrhoid may rupture. This might cause more bleeding and pain, but the site of the rupture usually heals on its own. In some cases, a skin tag might form at the location of a thrombosed hemorrhoid that has healed.

It is rare, but significant blood loss from chronic hemorrhoids has been associated with the development of anemia. Another rare complication is a strangulated hemorrhoid, where the blood flow to an internal hemorrhoid is cut off, which can cause extreme pain. Strangulated hemorrhoids present a risk of infection, so it's important to seek care in order to prevent this outcome. (*Sanchez, Chinn, 2011*).

Treatment

Treatment Program for patients with hemorrhoids may be: Medical Treatment with application medicament's drugs, Rubber Band Ligation, Hemorrhoidectomy with application traditional and any others modern methods for excision, Sclerotherapy and Cryosurgery with application more any others mini-invasive methods.

Medicament Treatment

Medical treatment is mainly based on the use of topical preparations containing anti-inflammatory components, including steroids, anesthetics and / or antiseptics. However, in most cases, randomized trials have not been conducted to evaluate the effectiveness and safety of various substances, which in some cases - for example, steroids - are associated with the potential onset of undesirable manifestations.

Rubber Band Ligation

Rubber band ligation is a procedure in which the hemorrhoid is tied off at its base with rubber bands, cutting off the blood flow to the hemorrhoid. This treatment is only for internal hemorrhoids.

To do this procedure, a doctor inserts a viewing scope (anoscope) into the anus. The hemorrhoid is grasped with a small tool. Then a device places a rubber band around the base of the hemorrhoid. The hemorrhoid then shrinks and dies and, in about a week, falls off.

A scar will form in place of the hemorrhoid. The scar will hold nearby veins so they don't bulge into the anal canal.

The procedure is done in a doctor's office. You will be asked if the rubber bands feel too tight. If the bands are extremely painful, a medicine may be injected into the banded hemorrhoids to numb them.

The procedure takes about 30 minutes. You can go home when it's done. Some people are able to return to regular activities right away. Others may need to take a few days off from work.

After the procedure, you may feel pain and have a sensation of fullness in your lower belly. Or you may feel as if you need to have a bowel movement.

Make sure not to lift anything heavy until you heal. It's also important not to strain when you have a bowel movement. Treatment is limited 1 hemorrhoids at a time if done in the doctor's office. Several hemorrhoids may be treated at one time if the person has general anesthesia. More areas may be treated at 4- to 6-week intervals. (*American Gastroenterological Association, 2004*).

Sclerotherapy

Injection sclerotherapy for all grades of inter hemorrhoids in various situations and co-morbidities has become popular method of treatment. Several types of surgical operations both conventional and stapled hemorrhoidectomy has many and serious described side effects. On the contrary, proctoscopic injection sclerotherapy using some of the modern sclerosants and thin bore needle injections is an office-based ambulatory method of treatment of internal hemorrhoids; it is low in cost, devoid of any major complications besides it is quite successful as reported.

Cryosurgery

In favor of cryosurgery is the fact that it can be applied on an outpatient basis—admittedly at the price of a fair amount of discomfort—and that it can provide successful destruction of hemorrhoids in roughly 70 per cent of patients who would otherwise be candidates for hemorrhoidectomy. Some of the 30 per cent of patients who do not secure satisfactory results might conceivably be helped by repeat cryosurgery, but the discomfort associated with the first treatment has tended to militate against a repetition of this form of therapy. (*Goligher, 1976*).

Mini-invasive methods

Procedure for Prolapse and Hemorrhoids (PPH):

PPH is also called a stapled hemorrhoidectomy. The doctor will use a stapler-like device to reposition the hemorrhoids and cut off their blood supply. Without blood, they'll eventually shrivel and die.

It can treat hemorrhoids that have and have not prolapsed, or slipped down out of the anus.

This procedure moves the hemorrhoid to where there are fewer nerve endings, so it hurts less than a traditional hemorrhoidectomy. You'll also recover faster and have less bleeding and itching. And there are generally fewer complications.

Hemorrhoidal Artery Ligation and Recto Anal Repair (HAL-RAR):

Hemorrhoidal Artery Ligation and Recto Anal Repair (HAL-RAR) is a new procedure in which a miniature Doppler sensor is inserted in the anus to detect the arteries supplying blood to hemorrhoids.

The surgeon can pinpoint the arteries supplying the hemorrhoids and can tie them off to cut the blood supply.

The hemorrhoids are reduced almost immediately and within weeks, are no longer noticeable. The procedure is effective and virtually painless.

Transanal Hemorrhoidal Dearterialization (THD):

Hemorrhoids are enlarged, bulging veins within and around the anal canal. The two groups of hemorrhoids are external and internal hemorrhoids which are differentiated by their location. The internal hemorrhoid problems can be classified as per the severity, ranging from grade 1 without prolapse to grade 4 in which hemorrhoid remains prolapsed outside of the anus. Although several treatment options are available, a number of patients prefer a minimally invasive approach. The combination of advances in the technology and the outstanding experience of the colorectal surgeons now offer a minimally invasive technique called Transanal Hemorrhoidal Dearterialization (THD) as a novel treatment alternative. Compared to other surgical options, the superiority and advantages of THD include; less pain and fewer procedure-related complications as well as minimizing the chance of recurrence.

Hemorrhoidectomy

A hemorrhoidectomy is performed in the following settings:

Symptomatic grade III, grade IV, or mixed internal and external hemorrhoids

Where there are additional anorectal conditions that require surgery

Strangulated internal hemorrhoids

Some thrombosed external hemorrhoids

Where patients who cannot tolerate or fail minimally invasive procedures.

Prognosis

Hemorrhoids can be uncomfortable or even painful, but most of the time, you won't experience any noticeable symptoms, and complications are very rare.

Internal or external hemorrhoids that don't prolapse or thrombose are more likely to heal without causing any symptoms or complications. Prolapsed and thrombosed hemorrhoids are much more likely to cause discomfort or increase your risk of complications.

Seek emergency medical attention if your hemorrhoids cause pain and discomfort or if you notice any symptoms like bleeding or prolapse. Hemorrhoids that are treated quickly have a better chance of healing without causing any further complications.

Method

184 patients of both sexes (86 women, 98 men) with chronic hemorrhoids were involved in our observations based on the Regional Proctology Center (Dnipro, Ukraine) for the years 2018-2022, devoted to the comparative analysis of the results of the use of drugs from different manufacturers for the local medical treatment of hemorrhoids. who received medical local therapy with Procto-Glyvenol®, Recordati, Italy, and 793 patients (403 women and 390 men) who underwent hemorrhoidectomy with the LigaSure device and EK-3000M (electrobiological tissue welding method).

Method with Procto-Glyvenol® Therapy

It has been confirmed that tribenoside is a saccharide derivative that is widely used for the treatment of hemorrhoids. Several studies have shown that tribenoside has a unique spectrum of pharmacological activity, including anti-inflammatory, analgesic, anti-toxic, wound-healing, promoting fibrinolysis, anti-arthritis action, release of amines, stabilization of membranes.

Membrane-stabilizing and venotropic properties were reported. It should be noted that, unlike corticosteroids or nonsteroidal anti-inflammatory drugs, tribenoside does not adversely affect the gastrointestinal tract, connective tissue, or the immune system and does not affect prostaglandin synthetase.

Tribenoside apparently has positive pharmacological properties characteristic of glucocorticoids and non-steroidal anti-inflammatory drugs (NSAIDs), but at the same time it does not show an undesirable effect on the gastrointestinal system, connective tissue or the body's defense system. It is noteworthy that tribenoside exhibits anticoagulant and inhibitory activity against inflammatory mediators, such as histamine and prostaglandins, thereby improving microcirculation, reducing capillary permeability, and improving vascular tone.

In an *in vitro* study specifically to study the molecular mechanisms underlying the effectiveness of tribenoside in the treatment of hemorrhoids, the expression of laminin $\alpha 5$ —a major component of basement membranes whose integrity is disrupted in this disease—was 4 times higher in cells treated with tribenoside, than in the control cell culture. (Lorenc, Gokce, 2016). These data are confirmed by a comparative analysis of the results of the use of various local drugs in our observations of 184 patients with chronic hemorrhoids who received local combination therapy with tribenoside lidocaine with a significant healing effect, thanks to the improvement of microcirculation, strengthening of vascular tone and reduction of capillary permeability. Taken together, these data suggest that tribenoside interacts with epidermal cells and regulates laminin expression and localization, thereby helping to reconstruct the basement membrane during hemorrhoidal wound healing.

On the other hand, lidocaine is a widely used local anesthetic that relieves pain, burning, and itching caused by hemorrhoids. This molecule is characterized by a rapid (several minutes) onset of its surface anesthetic action, providing rapid relief of pain and itching. Thus, this combined therapy combines the rapid local anesthetic action of lidocaine with the effectiveness of tribenoside in accelerating local healing and restoring local blood vessels to normal.

This dual mechanism of action allows you to control both subjective (eg, pain and discomfort) and objective (eg, prolapse and bleeding) symptoms of hemorrhoids, reducing inflammation and improving vascular tone.

Currently, the standard topical treatment for hemorrhoids is steroids.

However, they have an unfavorable toxicity profile due to the risk of systemic adsorption, which may limit their use in the medium term or in some specific groups of patients, such as pregnant/lactating women, the elderly,

patients with certain infections (eg, mycosis, HSV, local viral infections, tuberculosis) or athletes.

The combination tribenoside + lidocaine is a single composition (cream or suppositories) containing two different molecules that have a complementary effect.

Tribenoside can improve microcirculation, promote the healing of the basement membrane, and improve local microcirculation and vascular tone, thereby eliminating the objective symptoms of hemorrhoids. On the other hand, lidocaine is a widely used local anesthetic capable of causing rapid relief of subjective symptoms, such as local pain and discomfort, which may be perceived by patients as the most bothersome.

Method with Surgical treatment

Hemorrhoids are a disease that often requires surgical treatment. Hemorrhoidectomy methods are accompanied by quite a large number of postoperative complications, such as pain syndrome, urination disorders, bleeding, local edema, narrowing of the anus, which leads to additional patient suffering and increases the cost of

treatment.

The use of the LigaSure (Covidien) and EK-3000M (SVARMED) electrocautery generators for the removal of hemorrhoids and cauterization of blood vessels in hemorrhoidectomy can also be complicated by stricture of the anus. We studied the dependence of the development of anal strictures on the method of anesthesia during surgery.

Application of the LigaSure method in the treatment of 793 patients diagnosed with "Chronic hemorrhoids". After division of the anal sphincters, the anal canal is revised. The internal node is tightened with a clamp and the bent electrode of the LigaSure apparatus is placed on its stretched base, including the vascular pedicle.

Electrocoagulation of the base with a vascular pedicle is carried out at an intensity of 2 or 3 LEDs, after which the internal hemorrhoidal node is removed with a clamp knife without inserting the vascular pedicle. The external hemorrhoidal node is tightened and electrocoagulation of its base is carried out, the node is removed with a clamp knife. 655 patients underwent local anesthesia with bupivacaine administration, 138 patients - intravenously.

Results

Results for Procto-Glyvenol® Therapy

The above-described personal comparative observations conducted by us on 184 patients who received combined treatment of chronic hemorrhoids with the drug Procto-Glyvenol® (tribenoside + lidocaine) indicate a rapid and pronounced reduction in the symptoms of hemorrhoids (burning, discomfort, pain, bleeding during defecation, falling formations from the anus).

Reduction or cessation of burning, discomfort, pain in the area of the anus during the act of defecation occurred in all patients 10-30 minutes after using the drug. The cessation of bleeding during the act of defecation and the loss of hemorrhoidal nodes occurred on the 5-6th day after the start of local medical treatment with Procto-Glyvenol® in 102 patients, on the 9th-10th day - in all patients.

Since the use of steroids is not recommended for long periods due to possible side effects, tribenoside + lidocaine can be a fast, effective and safe way to treat hemorrhoids. It is noteworthy that this combination is particularly suitable for some groups of patients with a high risk of hemorrhoids, for whom steroids may be contraindicated. In particular, tribenoside + lidocaine can be safely prescribed to pregnant women after the first trimester of pregnancy and during breastfeeding. In addition, the combination of tribenoside + lidocaine may be suitable for athletes or patients with certain types of infections who cannot be prescribed steroids.

It should be noted that the efficacy and safety of tribenoside + lidocaine were stable regardless of the specific formulation and dosage regimen, and were also observed in women with hemorrhoids due to recent childbirth or pregnancy. The dosage of the combination was optimized for specific compositions (cream or suppository) during the product development stage.

Results for Surgical treatment

Out of 655 patients, a complication occurred - stricture of the anus in 20 (3%) after hemorrhoidectomy by the LigaSure and EK-3000M methods under local anesthesia with bupivacaine administration. Hemorrhoidectomy by the LigaSure and EK-3000M methods under intravenous anesthesia in 138 patients had no complications in the form of anal stricture. The use of local anesthesia led to the formation of edema of the perianal area during the operation and could be the cause of improper or insufficiently controlled removal of excess tissue mass by the doctor. This could lead to the formation of strictures of the anus, which required postoperative bulging, and in 8 cases repeated surgery to remove the scar.

To prevent the formation of anal strictures after hemorrhoidectomy, we suggest performing operations using intravenous anesthesia, and in cases where local anesthesia is used, especially carefully control the limits of removal of pathologically changed tissues.

Discussion

Hemorrhoids are swollen, enlarged veins that form inside and outside the anus and rectum. They can be painful, uncomfortable and cause rectal bleeding. Hemorrhoids are also called piles. We're all born with hemorrhoids, but at baseline, they don't bother us. It's only when they become swollen and enlarged that they produce irritating symptoms.

Hemorrhoids, or piles, are a common problem. These swollen veins inside the rectum or outside the anus can cause pain, anal itching and rectal bleeding. Symptoms often improve with at-home treatments but on occasion people need medical procedures. Eating more fiber can help prevent hemorrhoids.

The choice of treatment for patients with chronic hemorrhoids may depend on the manifestation of the severity of the disease, however, in stage III-IV disease, two methods can be mainly used: medical treatment and options for hemorrhoidectomy.

Conclusion

There is no best treatment for hemorrhoids. Every patient is different, and the physician and patient need to

understand each other's expectations, weigh the risks and benefits and arrive at a mutual decision. A good patient-doctor relationship is essential.

It should be noted that the efficacy and safety of tribenoside + lidocaine were stable regardless of the specific formulation and dosage regimen, and were also observed in women with hemorrhoids due to recent childbirth or pregnancy. The dosage of the combination was optimized for specific compositions (cream or suppository) during the product development stage.

Given the variety of available treatments, head-to-head comparisons are difficult. Moreover, the efficacy and applicability of each technique changes with the grade of the lesion or lesions and the skill of the practitioner. Lacking comprehensive studies comparing conservative, office-based and surgical management, no decisive statements can be made based on current evidence.

Recommendations

We recommend using the proposed technologies in the practices of surgeons-proctologists for medicaments treatment or surgical operations of patients with chronic hemorrhoids.

Acknowledgments

We wish to gratefully acknowledge the advice and support of representatives and staff Dnipro State Medical University and Regional Proctology Centre in the preparation of our work and this text.

Abstract: Ulcerative Colitis (UC) is a diffuse inflammatory disease confined to the mucosa initially. Abscesses form in the crypts of Lieberkuhn, penetrate the superficial submucosa, and by spreading horizontally cause the overlying mucosa to slough. Vascular congestion and hemorrhage are prominent.

Cardinal symptoms: rectal bleeding and diarrhea.

The most difficult differential diagnosis is between mucosal Ulcerative Colitis and Cronh`s Disease (CD) or Colon Cancer (CC).

Application laboratory methods of investigation: results of general clinic blood analysis, results of biochemical blood analysis, results of general clinic urine analysis.

Imaging studies: barium enema examination with x-ray.

Colonoscopy finding with biopsies:

Morphology - confluent involvement, rectum usually involved, mesocolon not involved and nodes enlarged, widespread ragged superficial ulceration, inflammatory pseudo-polyps, no thickening of bowel wall and other pathological results;

Microscopic – inflammatory reaction usually limited to mucosa and submucosa; only in severe disease are muscle coats involved; no fibrosis; granulomas rare.

Investigation of results laboratory and instrumental methods for differential diagnosis of Ulcerative Colitis and other similar diseases: Cronh`s Disease and Colon Cancer, and application in work for gastroenterologists, proctologists, oncologists and rheumatologists.

Keywords: Investigation, Differential, Diagnosis, Ulcerative Colitis.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2012-2022), Cappadocia, Turkiye. ISTES Organization.

Introduction

Ulcerative Colitis (UC), including extraintestinal manifestations of joint and spine lesions, is a necrotizing, destructive inflammation of the mucous membrane and submucosa of the large intestine of a nonspecific nature, of unknown etiology. (*Bourikas L. A., Papadakis K. A., 2009*).

The primary incidence of UC is 1,5-15,0 per 100,000 population, the prevalence is 20-130 per 100,000 population. UC is characterized by chronic inflammation. Although this inflammation primarily affects the lower part of the digestive tract, the symptoms of these disorders can vary greatly depending on the condition and may also impact other parts of the body.

The exact causes of UC remain unknown. In general, inflammatory bowel disease (IBD) is thought to be caused by interactions between genetic factors and immunologic factors, as well as between a person's environment and lifestyle and the bacteria in the gut (macrobiotic). Although psychological factors and stress may trigger flare-ups in people who already have Ulcerative Colitis, they are not thought to be underlying causes of the disease based on current research.

The etiology of UC is unknown, and the pathogenesis is little studied. The mechanism of primary damage is based on the development of reactions of hypersensitivity and auto-aggression, which lead to degenerative-necrotic changes in the epithelium and disruption of micro-circulation in the wall of the large intestine.

Etiological factors:

Genetic factor (HLA system: genetic HLA markers of UC, CD were found in various populations; using HLA-DNA genotyping, markers of predisposition and resistance to UC were identified.

Microbial factor (high degree of immunization of patients with UC 0 antigen Esherichia Coli 014; E.Coli has a high adhesive ability to epithelial cells of the mucous membrane and can initiate their resolution; positive effect of probiotics containing Escherichia coli strain Nissle 1917).

Violation of the permeability of the intestinal barrier.

Environmental factors (Nicotine: UC is less common in heavy smokers than non-smokers; in CD, smoking increases the risk of the disease several times; drugs: NSAIDs; malnutrition: a significant increase in this pathology in countries where "fast foods" are used in the diet.

Violation of the immune response (dysregulation of the local immune response underlies the development of an

inflammatory reaction in the intestinal wall)

Thus, genetic predisposition, the possibility of an immune response, exposure to exogenous factors in the presence of a number of endogenous disorders leads to the development of chronic inflammation of the mucous membrane in Ulcerative Colitis.

Although the disease can be diagnosed at any age, the highest number of new cases (incidence) are diagnosed in people between the ages of 20 and 40 years old. Men and women are about equally affected by the disease.

The following factors play a role in the development of inflammation:

Violation of the biocenosis of the intestinal flora

Genetic defects (MDR1 gene)

Violation of the immune response

Environmental risk factors (tobacco smoking reduces the risk), medicinal drugs - non-steroidal anti-inflammatory drugs, nutritional disorders.

The spread of inflammatory-necrotic changes from the rectum in the oral direction leads to a violation of the absorptive, secretory, reservoir, and evacuation functions of the large intestine, and in total vitamin-synthesizing colitis, which is manifested by diarrhea, tenesmus, and bleeding into the lumen of the intestine.

All digestive organs are involved in the development of the pathological process. Homeostasis is disturbed: dysproteinemia, imbalance of electrolytes and carbohydrates occurs. The development of dysbacteriosis and the addition of superinfection further disrupt the metabolism.

As a result of constant endogenous intoxication and autosensitization, secondary lesions of the liver, kidneys, pancreas and central nervous system, joints and spine occur.

Classification

According to the severity of the disease (according to the DAI index) (see Table 1):

mild (up to 5)

medium (5-9)

severe (9-12)

According to the clinical course:

acute (lightning)

chronic relapsing

chronic continuous course

By anatomical type:

proctitis

proctosigmoiditis

left-sided colitis

pan-colitis (total colitis - all colon).

The lesion begins most often from the rectum - the dentate line and spreads in the proximal direction. In the early stages of colitis, a vascular reaction is noted with a further violation of the integrity of the epithelium, the addition of ulceration of the mucous membrane. The resulting ulcers capture only the submucosal layer; as a rule, they do not spread into the depths of the intestinal wall. In the active phase, ulcers of various sizes spread to the edematous, plethoric mucosa.

Sometimes it is a continuous ulcerative surface, covered with a film of fibrin. But most often, a large number of small erosions and ulcers are noted on the mucous membrane, including pseudopolyps, the development of which is associated with the destruction of the mucous membrane, regeneration of the epithelium. The severity of morphological changes increases in the distal direction (most pronounced in the descending and sigmoid colon). In 15-30%, the terminal ileum may be affected.

Table 1. Disease Activity Index (DAI)

The number of defecations during last week	Normal (as in remission)	0
	By 1-2 > norms	1
	On 3-4 > norms	2
	At > 4 > norms	3
Bloody stools (for last week)	There is none	0
	Blood veins	1
	Obvious impurities of blood	2
	Mainly blood	3
Appearance of mucous membrane	Normal	0
	Increased vulnerability of the mucous membrane	1
	High vulnerability of the mucous membrane	2
	Exudation, spontaneous bleeding	3
Assessment of the degree of activity a doctor	Norm	0
	Mild degree	1
	Moderately heavy	2

Clinical manifestations of UC

Defecation of feces with pathological impurities (blood, mucus, pus, fibrin) occurs due to ulcerative defects of the intestinal wall.

The primary symptom of Ulcerative Colitis is diarrhea containing blood and pus which occurs at night as well as during the day. Other symptoms include abdominal pain, which is often centered at one specific spot in the gut (frequently in the lower left abdomen) but can spread to the entire abdomen.

Frequent defecation as a result of accelerated transit of intestinal contents and entry into the intestinal lumen of exudate and transudate, which is secreted by the inflamed mucous membrane. (*Lukavetskyj O., 2018*).

Abdominal pain, tenesmus.

The disease typically begins gradually, although some people may also have severe and acute symptoms (called fulminant disease) at the time of their diagnosis.

Manifestations of intoxication (hyperthermia, loss of appetite, body weight).

Extraintestinal manifestations may even cause symptoms before the actual inflammation of the digestive tract has started.

Extraintestinal manifestations (arthritis, iridocyclitis, uveitis, vascular lesions, amyloid nodules, primary sclerosing cholangitis).

Laboratory and instrumental research

Laboratory methods:

Laboratory diagnostics is aimed at determining the degree of anemia, leukocytosis, accelerated ESR. These tests can be combined with other ones like the erythrocyte sedimentation rate (ESR) to collect information about the intensity of the inflammation. Hypoproteinemia, hypoglobulinemia, electrolyte imbalance are also detected. An increase in the level of C-reactive protein can be one of the markers of disease activity.

Other laboratory tests may be performed to gather additional information. These tests can include general blood tests as well as tests for inflammation parameters like the C-reactive protein (CRP). An analysis of gut bacteria may also be needed.

Examination of feces - coprology, pathogenic flora, dysbacteriosis for the purpose of differential diagnosis with intestinal infections and correction of dysbacteriosis.

Instrumental methods:

Endoscopic examination is the main method of examination of patients with UC. The mucous membrane is granular, there is no vascular pattern due to swelling, pronounced contact bleeding. In case of a severe course, ulcers and erosions are determined.

During remission, "pseudo-polyps" can be identified, which are islands of preserved mucous interstitium with ulcers. During the endoscopic examination, it is necessary to establish border inflammation to determine the anatomical type of colitis and, accordingly, drug therapy. Also, during colonoscopy, biopsy material is taken to determine the possible morphological picture of ulcerative colitis during histological examination.

Endoscopic examination of the colon (in the acute phase, it is carried out without prior preparation with enemas). Colonoscopy are one of the main research methods, since the rectum is affected in 95% of cases. Characterized by the presence of mucus, blood, pus that close the mucosa.

The study notes: swelling and hyperemia of the mucous membrane of the sigmoid and rectum; the vascular pattern characteristic of the normal mucous membrane of the large intestine is lost; haustration of the colon disappears. Various in size and shape of erosion and ulcers with undermined edges and bottom covered with pus and fibrin.

The presence of a solitary ulcer should be a concern for cancer. With a long course of the disease, edema and excessive regeneration of the epithelium with the formation of pseudopolyps are observed in the remaining islands of the mucous membrane. UC mild degree manifests itself in the form of mucosal granularity.

Colonoscopy allows you to assess the extent and severity of the lesion, especially if you suspect the presence of malignancy.

In special cases, additional tests like an X-ray of the abdomen may be necessary. The doctor may also order a CT (computed tomography) or MRI (magnetic resonance imaging) scan to clarify specific issues. (*Leclerc-Jacob S., Lux G., Rat A.C., et al., 2014*).

Irrigography is used, during which it is possible to detect the absence of haustration, pseudopolyps, which together give the intestine the shape of a "water pipe", ulcers will form a symptom of a "moth-eaten row". Acute toxic dilatation and the presence of free gas in the abdominal cavity are contraindications to irrigoscopy.

Method

An analysis was made of the results of laboratory and instrumental studies of treated patients 255 (men 157 and women 98) in the Regional Proctology Center of the Dnipro for 2017-2022 with diagnoses of Ulcerative Colitis (115 patients), Crohn's Disease (34 patients) and Colon Cancer (106 patients) on the basis of the department Surgery No. 1 of the Dnipro State Medical University.

Blood tests do not confirm a diagnosis of Ulcerative Colitis, but may show that a person has anemia, an increase in white blood cells (seen with inflammation), low albumin protein and an increased erythrocyte sedimentation rate (ESR) or elevated C-reactive protein, which also indicates an active inflammation. The doctor may also order tests to evaluate the function of the liver and other organs and systems.

Such changes may also be due to the presence in a patient with ulcerative colitis of various types of extraintestinal articular manifestations and damage to other organs and systems.

Crohn's Disease is characterized by: anemia (usually of mixed origin: anemia of chronic diseases with iron deficiency), leukocytosis, thrombocytosis, accelerated ESR and increased C-reactive protein. Perhaps a decrease

in iron, serum ferritin, vitamin B12 (in case of damage to the proximal intestine and stomach), dysproteinemia with hypoalbuminemia (as a result of malabsorption in the intestine). In the immunogram: often - an increase in hypergammaglobulemia (IgG), sometimes there is a selective deficiency of IgA. ASCA detection (antibodies to *Saccharomyces cerevisiae*), for diagnostically difficult cases, helps to confirm, can serve as an additional serological marker in the diagnosis of Crohn's Disease.

Laboratory studies are carried out to detect anemia, hypoalbuminemia, electrolyte imbalance. Assess liver tests; an increase in alkaline phosphatase and gamma-glutamyl transpeptidase in widespread colon damage suggests primary sclerosing cholangitis. Leukocytosis and an increase in acute phase parameters (erythrocyte sedimentation rate, C-reactive protein) are not specific signs, but can be used to control disease activity.

Perinuclear antibodies against neutrophilic cytoplasm are present in 60–70% of cases in ulcerative colitis and only in 5–20% in CD. Antibodies to *Saccharomyces cerevisiae* are relatively specific for Crohn's Disease. However, these studies do not reliably differentiate between the 2 diseases and are therefore not recommended for routine diagnosis. Additional antibodies such as anti-OmpC and anti-CBir1 are currently available for investigation, but the clinical relevance of these additional tests is uncertain; some studies suggest that high titers of these antibodies have a negative prognostic value.

Sometimes the first sign is an abnormal lab test (for example, anemia due to Colon Cancer).

Ulcerative colitis and Crohn's Disease are two types of inflammatory bowel disease (IBD) that lead to chronic inflammation in the digestive tract.

The mechanism leading to inflammation in IBD is not well understood, but is thought to involve a complex interaction between the immune system, gut, and gut microbes. New evidence suggests that gut microbial composition is different and possibly abnormal in IBD patients, and that correcting this variation may help control inflammation in UC and CD patients. Fecal administration from healthy donors to patients with UC or CD is an intervention aimed at restoring a healthier balance of gut microbes and controlling IBD.

According to the endoscopic picture of Ulcerative Colitis, four degrees of inflammation activity in the intestine are distinguished: minimal, moderate, pronounced, and pronounced.

I degree (minimum) is characterized by mucosal edema, hyperemia, lack of vascular pattern, mild contact bleeding, small punctate hemorrhages.

II degree (moderate) is determined by edema, hyperemia, granularity, contact bleeding, the presence of erosion, confluent hemorrhages, fibrinous plaque on the walls.

III degree (expressed) is characterized by the appearance of multiple confluent erosions and ulcers against the background of the changes in the mucous membrane described above. In the lumen of the intestine pus and blood.

IV degree (sharply pronounced), in addition to the listed changes, is determined by the formation of pseudopolyps and bleeding granulations.

Rakhmilevich Index - Endoscopic Index (*Rakhmilevich, 1989*):

1. Light-scattering granulations on the surface of the mucous membrane (granularity): no - 0, yes - 2.
2. Vascular pattern: normal - 0, deformed or blurred - 1, absent - 2.
3. Bleeding of the mucous membrane: absent - 0, small contact - 2, pronounced (spontaneous) - 4.
4. Damage to the surface of the mucous membrane (erosion, ulcers, fibrin, pus): absent - 0, moderately pronounced - 2, significantly pronounced.

Colonoscopy for Crohn's Disease (with biopsy, sampling for intestinal pathogens, and inspection of the terminal ileum if possible). Upper gastrointestinal endoscopy may show signs of mild lesions even in the absence of upper gastrointestinal symptoms. (*Mendoza J.L., Lana R., Taxonera C., et al., 2005*).

In the vast majority of cases, Colon Cancer is formed from precancerous formations - polyps. They are growths that grow into the intestinal cavity from the mucous membrane. Polyps are clearly visible during a colonoscopy. Thanks to this procedure, the doctor examines the mucous membrane, the image of which is displayed on the monitor in an enlarged form.

Two types of polyps are classified: adenomatous and hyperplastic. It is adenomatous that can become malignant over time. For most people, the process of their transformation into tumors takes at least 10 years.

Colonoscopy is the only method that allows you to thoroughly examine the mucous membrane of all parts of the colon. For this procedure, a special device is used - a colonoscope. It is a thin flexible tube with an optical system at the tip, due to which the image is enlarged by more than 100 times and displayed on the monitor.

This procedure requires special preparation, the task of which is to completely cleanse the intestines. For this, a liquid solution is used that causes temporary diarrhea. Before doing a colonoscopy, the patient takes antispasmodics and anesthetics. These drugs allow you to relax and experience less discomfort during the diagnosis.

During the procedure, the patient lies on his side, and a colonoscope is inserted into his anus, after which air is supplied to the intestines. Due to this, the walls of the organ straighten out and the doctor can conduct a thorough examination of the intestines. Sometimes the doctor performs a biopsy - taking a piece of tissue from suspicious areas.

This sample is sent to a laboratory where it is examined for cancer cells. If polyps or oncological formations are found, the doctor can remove them right during the colonoscopy.

How often should Colon Cancer screening be done?

The frequency of colonoscopy is based on the presence of risk factors in each individual. In general, this procedure is shown to all people who are over 50 years old. After reaching this age, diagnostics should be carried out every 10 years. If a person falls into the high-risk category, you should not wait until the age of 50. In this case, colonoscopy should be performed at an earlier age and more frequently.

If 1 first-line relative (father, mother, sibling or sister) had cancer or was diagnosed with adenomatous polyps before the age of 60, the first colonoscopy should be performed at 40. You need to repeat the procedure once every 5 years.

If 2 relatives of the first line were diagnosed with cancer or adenomatous polyps at any age, the diagnosis should be performed starting from the age of 40 - once every 5 years.

If 1 first-degree relative had colorectal cancer or was diagnosed with adenomatous polyps at age 60 or older. In this case, screening should be done at age 40, but colonoscopy should be repeated every 10 years.

If 2 or more second-line relatives (grandparents, aunt or uncle) suffered from bowel cancer. In this case, the first examination of the intestine by colonoscopy should also be carried out at the age of 40. You need to repeat the procedure once every 10 years.

People who are at very high risk due to familial adenomatous polyposis, hereditary non-polyposis cancer, or inflammatory bowel disease need a separate approach. These patients should be under the supervision of a doctor and undergo a whole range of measures to prevent colon cancer. (*Pan J., Xin L., 2016*).

The frequency of colonoscopy should only be determined by an experienced gastroenterologist and surgeon-proctologist.

Results

The result of the analysis of laboratory and instrumental studies of 255 patients treated (157 men and 98 women) in the Regional Proctology Center of the Dnipro for 2017-2022. with diagnoses: Ulcerative Colitis (115 patients), Crohn's Disease (34 patients) and Colon Cancer (106 patients) on the basis of the Department of Surgery No. 1 of the Dnipro State Medical University, there were data that confirm generally accepted international information.

These data confirm that the results of general clinical laboratory and instrumental studies are sufficient for effective differential diagnosis of Ulcerative Colitis with Crohn's Disease and Colon Cancer.

Effective for differential diagnosis were the results of laboratory and instrumental studies: general clinical blood test, biochemical blood test (including C-reactive protein), colonoscopy with biopsy and histological conclusion, irrigography.

Undoubtedly, the most important were the results of performed colonoscopies with biopsy material sampling and obtaining a histological conclusion, which maximally contributed to the differential diagnosis between Ulcerative Colitis, including extraintestinal articular manifestations, Crohn's Disease and Colon Cancer.

Discussion and Conclusion

In discussing our work, it should be noted that the results of laboratory and instrumental studies that were used for the differential diagnosis of patients with Ulcerative Colitis, Crohn's disease and Colon Cancer convincingly and reliably differentiate these diseases, including those with possible extraintestinal manifestations.

Our observations on the results of laboratory and instrumental studies of 255 patients who were treated (157 men and 98 women) in the Dnipro Regional Proctology Center for 2017-2022. with diagnoses: Ulcerative Colitis (115 patients), Crohn's Disease (34 patients) and Colon Cancer (106 patients) at the Department of Surgery No. 1 of the Dnipro State Medical University, which are confirmed by other international data, allow a short discussion and proceed to the conclusion.

In conclusion, realizing that Ulcerative Colitis, which may be accompanied by extraintestinal articular manifestations, as well as Crohn's Disease and Colon Cancer, remain dangerous diseases that require correct and

informative diagnosis, including differential diagnosis.

Satisfactory differential diagnosis of Ulcerative Colitis, Crohn's Disease and Colon Cancer with the help of informative laboratory and instrumental studies allows for timely and effective treatment of patients with this pathology.

Recommendations

We recommend using the proposed technologies in the practices of gastroenterologists, rheumatologists and surgeons-proctologists for differential diagnosis of patients with Ulcerative Colitis, Crohn's Disease and Colon Cancer.

Acknowledgments

We wish to gratefully acknowledge the advice and support of representatives and staff Dnipro City Hospital, Dnipro State Medical University and Regional Proctology Centre in the preparation of our work and this text.

Treatment Program for Patients with Ulcerative Colitis

Olena Sulima

Dnipro City Hospital, Ukraine,  <https://orcid.org/0000-0002-6129-5207>

Volodymyr Sulyma

Dnipro State Medical University, Ukraine,  <https://orcid.org/0000-0002-8373-6480>

Abstract: Manifestation for Ulcerative Colitis – essential of diagnosis: diarrhea, usually bloody; abdominal cramps; fever, weight loss, anemia; absence of specific fecal pathogens; endoscopic and radiography abnormalities.

Treatment program for patients with Ulcerative Colitis including more steps.

Conservative treatment depended from active process of disease:

- a) mild attack – diet, 5-ASA 2-8 g/d, corticosteroids 100 mg;
- b) severe attack – severe or fulminating Ulcerative Colitis requires hospitalization; corticosteroids are given intravenously initially as hydrocortisone (100-300 mg/d) or prednisolone (20-80 mg/d) + 5 ASA-therapy;
- c) maintenance – hospitalization; 5-ASA-therapy + corticosteroids therapy + immunosuppressive therapy.

Surgical treatment including analysis two situations:

1. Indications:

- a) acute disease and b) chronic disease.

2. Surgical procedures:

- a) laparotomy or b) laparoscopy operations.

Prognosis:

The mortality rate of Ulcerative Colitis has dropped sharply in the last decade or two, and older figures no longer apply.

Keywords: treatment, program, Ulcerative Colitis.

Introduction

Ulcerative Colitis (UC) is a necrotizing, destructive inflammation of the mucous membrane and submucosal base of the large intestine of a non-specific nature, of unknown etiology. The etiology of UC is unknown, and the pathogenesis is little studied. Mechanism of primary injury is based on the development of reactions of hypersensitivity and autoaggression, which lead to degenerative-necrotic changes in the epithelium and

microcirculation disorders in the colon wall intestines.

Anatomical type and severity should be taken into account when prescribing treatment for UC disease. When prescribing immunosuppressants and biological therapy should be excluded TBC infection, to prevent the dissemination of tuberculosis:

1. Diet 4
2. Preparations of 5 aminosalicylic acid (5ASA- Salofalk, Pentasa, Asacol) in a dose 3-4 g/day per os, in a dose of 0.5-1 g/day locally in the form of suppositories (in case of proctitis oral administration of the drug is not used)
3. Corticosteroids: Prednisolone at a dose of 1 mg/kg of body weight/day per os, Budesonide (Budenofalk) 9 mg/day
4. Biological therapy: anti-TNF- α , - Remicade 5 mg/kg, IV drip
5. Immunosuppressants: Azathioprine - 2.5-4 mg/kg per day, for 2-4 months. Cyclosporine - 4 mg/kg parenterally, or in tablets of 10 mg/kg.

Ulcerative Colitis is an autoimmune-mediated colitis which can present in varying degrees of severity and increases the individual's risk of developing colon cancer. While first-line treatment for UC is medical management, surgical treatment may be necessary in up to 25–30% of patients.

With an increasing armamentarium of biologic therapies, patients are presenting for surgery much later in their course, and careful understanding of the complex interplay of the disease, its management, and the patient's overall health is necessary when considering the appropriate way in which to address their disease surgically.

Ulcerative Colitis is one form of inflammatory bowel disease (IBD) that affects the mucosa and lamina propria of the colon. Although there is a large range of potential clinical presentation for patients with UC, typically they will have episodes of disease exacerbations separated by periods of remission.

During the acute phase, exacerbation events vary from abdominal pain to fulminant colitis. Chronically, even the periods of remission may still be marked by indolent inflammation and altered bowel function.

Medical treatment ranges from probiotics to calcineurin inhibitors and needs individual adjustment for each patient. Mild-to-moderate active proctitis and left-sided colitis can be treated with topical mesalamine alone or, in case of a mild-to-moderate pancolitis, in combination with oral mesalamine. If mesalamine or other 5-ASA agents are ineffective, systemic steroid therapy should be used to try and induce remission.

Anti-TNF α antibodies or calcineurin inhibitors should be administered if no remission is achieved after 3–4 days. Vedolizumab has also been found effective against UC but should be reserved for less severe cases due to its late onset of effect. To maintain remission, mesalamine should be given for at least 2 years. Probiotics such

as *Escherichia coli* Nissle have a similar efficacy as mesalamine for maintaining remission and can be given in case of mesalamine intolerance. Immunosuppressives should be administered in addition to aminosalicylates in case of frequent relapses, relapses despite the use of reserve medication, or steroid dependence (*Danese S. et al., 2014*).

After 3 months of immunosuppressive treatment, usually azathioprine or 6-mercaptopurine, steroid dose reduction should be attempted. Anti-TNF α antibodies can be continued in order to maintain remission, and in general a combination of anti-TNF α antibodies with thiopurines is more effective than a monotherapy. Vedolizumab, an integrin receptor antagonist, can be an alternative for refractory disease (*Panaccione R. et al., 2014*).

The primary treatment of UC is conservative, and substantial therapeutic progress has been made in the past few decades. Meanwhile, biologicals have become a mainstay in the treatment for steroid-refractory UC.

Despite further development of drug therapy and an increased time span to operation, a significant proportion of patients with UC require surgical intervention. Surgical intervention needs to be carried out in medically refractory cases, imminent or malignant transformation, or complications. This article discusses the impact of modern drug therapy on surgery for UC.

IBD are multifactorial chronic diseases. The primary treatment of IBD is conservative (medical), and decisions regarding surgery should always be made in the context of a multidisciplinary care model. Despite further development of drug therapy and an increased time span to operation, a significant proportion of patients with UC require surgical intervention.

Indications for surgical intervention:

- Suspicion of colon perforation.
- Cases that do not respond to targeted complex therapy, i.e occurrence of acute toxic dilatation of the colon.
- Rare cases of profuse bleeding from the colon.
- Inefficiency of persistent complex treatment of UC.
- Cancer on the background of the inflammatory process.

Operative interventions. The goal of surgical intervention is total colectomy, even in cases where the patient does not have a total lesion. In the case of leaving the minimum segment of the large intestine, inflammation will continue in this segment.

Approximately 20–35% of patients with UC will undergo surgery during the course of their disease. The fulminant form of UC is characterized by mortality rates between 27 and 57% in case of primary treatment failure. Restorative proctocolectomy with ileal pouch-anal anastomosis (IPAA) has become established as a standard surgical treatment for UC over the past 30 years.

Ileo-anal pouch surgery provides the best possible quality of life for the patient with an average of 5–6 bowel movements per day and maintenance of continence in over 90% of patients (*Luo WY, et al., 2021*).

When forming of reservoir anastomoses, the mucous membrane of the anal canal is desolated. Acquires the spread of laparoscopic surgery techniques.

- Colectomy with ileoanal anastomosis, with reservoir formation
- Coloproctectomy with permanent ileostomy.

Restorative proctocolectomy with ileal pouch-anal anastomosis has become established as a standard surgical treatment for UC over the past 30 years. Ileo-anal pouch surgery provides the best possible quality of life for the patient with an average of 5–6 bowel movements per day and maintenance of continence in over 90% of patients. Surgery is generally a total proctocolectomy either with pelvic pouch reconstruction or permanent ileostomy; however, this may need to be spread across multiple procedures given the complexity of the surgery weighed against the overall state of the patient's health. Minimally invasive surgery, employing either laparoscopic, robotic, or transanal laparoscopic approaches, is currently the preferred approach in the elective setting. There is also some emerging evidence that appendectomy may delay the progression of UC in some individuals. Those who treat these patients surgically must also be familiar with the numerous potential pitfalls of surgical intervention and have plans in place for managing problems such as pouchitis, cuffitis, and anastomotic complications.

Method

An analysis was made of the results of studies of treated patients 115 (men 65 and women 50) in the Regional Proctology Center of the Dnipro for 2017-2022 with diagnoses of Ulcerative Colitis on the basis of the department Surgery No. 1 of the Dnipro State Medical University.

Medicament treatment

We performed medical treatment without surgery in 37 patients (20 men and 17 women) diagnosed with Ulcerative Colitis.

Anti-inflammatory medications

Anti-inflammatory medications are often the first step in the treatment of Ulcerative Colitis and are appropriate for most people with this condition. In recent years, modern drug therapy has changed the timing, approach, and outcomes of surgery for UC. Most of the studies showed a decrease in surgery rates over time while the rate of emergency colectomies remains unchanged.

So far, no convincing surgery-sparing effect of newer medications has been established, and it remains debatable if surgery rates have decreased because of improved management for UC in general or due to the introduction of biologicals. These include:

11. **5-aminosalicylates.** Examples of this type of medication include sulfasalazine (Azulfidine, Salofalk), mesalamine (Delzicol, Rowasa, others), balsalazide (Colazal) and olsalazine (Dipentum). Which medication you take and how you take it — by mouth or as an enema or suppository — depends on the area of your colon that's affected.

12. **Corticosteroids.** These medications, which include prednisone and budesonide, are generally reserved for moderate to severe Ulcerative Colitis that doesn't respond to other treatments. Corticosteroids suppress the immune system. Due to the side effects, they are not usually given long term.

Immune system suppressors

These medications also reduce inflammation, but they do so by suppressing the immune system response that starts the process of inflammation. For some people, a combination of these medications works better than one medication alone.

Immunosuppressant medications include:

- **Azathioprine (Azasan, Imuran) and mercaptopurine (Purinethol, Purixan).** These are commonly used immunosuppressants for the treatment of inflammatory bowel disease. They are often used in combination with medications known as biologics.
- Taking them requires that you follow up closely with your provider and have your blood checked regularly to look for side effects, including effects on the liver and pancreas.
- **Cyclosporine (Gengraf, Neoral, Sandimmune).** This medication is typically reserved for people who haven't responded well to other medications. Cyclosporine has the potential for serious side effects and is not for long-term use.
- **"Small molecule" medications.** More recently, orally delivered agents, also known as "small molecules," have become available for IBD treatment. These include tofacitinib (Xeljanz), upadacitinib (Rinvoq) and ozanimod (Zeposia). These medications may be effective when other therapies don't work. Main side effects include the increased risk of shingles infection and blood clots.

The U.S. Food and Drug Administration (FDA) recently issued a warning about tofacitinib, stating that preliminary studies show an increased risk of serious heart-related problems and cancer from taking this medication.

If you're taking tofacitinib for Ulcerative Colitis, don't stop taking it without first talking with your health care provider.

Biologics

This class of therapies targets proteins made by the immune system. Types of biologics used to treat ulcerative colitis include:

- **Infliximab (Remicade), adalimumab (Humira) and golimumab (Simponi).** These medications, called tumor necrosis factor (TNF) inhibitors, work by neutralizing a protein produced by your immune system. They are for people with severe Ulcerative Colitis who don't respond to or can't tolerate other treatments. TNF inhibitors are also called biologics.
- **Vedolizumab (Entyvio).** This medication is approved for treatment of Ulcerative Colitis for people who don't respond to or can't tolerate other treatments. It works by blocking inflammatory cells from getting to the site of inflammation.
- **Ustekinumab (Stelara).** This medication is approved for treatment of Ulcerative Colitis for people who don't respond to or can't tolerate other treatments. It works by blocking a different protein that causes inflammation.

Other medications

You may need additional medications to manage specific symptoms of ulcerative colitis. Always talk with your health care provider before using over-the-counter medications. Your provider may recommend one or more of the following.

- **Anti-diarrheal medications.** For severe diarrhea, loperamide (Imodium A-D) may be effective. If you have Ulcerative Colitis, do not take anti-diarrheal medications without first talking with your health care provider.
- These medications may increase the risk of an enlarged colon (toxic megacolon).
- **Pain relievers.** For mild pain, your provider may recommend acetaminophen (Tylenol, others) — but not ibuprofen (Advil, Motrin IB, others), naproxen sodium (Aleve) and diclofenac sodium, which can worsen symptoms and increase the severity of disease.
- **Antispasmodics.** Sometimes health care providers will prescribe antispasmodic therapies to help with cramps.
- **Iron supplements.** If you have chronic intestinal bleeding, you may develop iron deficiency anemia and be given iron supplements.

Surgical treatment

We performed surgical treatment on the background of drug therapy in 78 patients (45 men and 33 women) diagnosed with Ulcerative Colitis.

Although surgery offers a curative solution for UC, medical treatment remains the primary treatment strategy. The goal of such therapy is to induce disease remission and promote mucosal healing. As such, different medications with varying immunosuppressive capabilities are used depending on the severity of disease (*Croft A, et al., 2013*).

Whereas mild disease may be treated with mesalamine suppositories/enema, oral 5-aminosalicylic acid, oral sulfasalazine, thiopurines (6-mercaptopurine, azathioprine), or topical corticosteroids, moderate to severe disease often requires the usage of a monoclonal antibodies such as infliximab (Remicade) or adalimumab (Humira) and the addition of intermittent oral steroid therapy. For severe exacerbations, the first-line therapy is usually intravenous corticosteroids followed by careful endoscopic evaluation although early initiation of infliximab and cyclosporin has also been tried with variable success.

There are several indications for surgery in the treatment for UC. These include fulminant colitis, toxic megacolon, perforation, inability to tolerate medical therapy, nonresponse to medical therapy, dysplasia or malignancy, stunting of growth in children, or the need to improve certain extraintestinal manifestation of UC (i.e., uveitis, pyoderma, arthritis, etc.). While early surgery for Ulcerative Colitis has been proven to be relatively safe, often surgery is not discussed until after initiation of medical therapy and sometimes not at all (*Gan SI, et al., 2003*).

Urgent surgery.

Of all indications, those which require an urgent operation are fulminant colitis, toxic megacolon, uncontrolled hemorrhage, perforation, and medication failure. These indications are not mutually exclusive of each other and can present in combination. In all cases, it is important to have close communication with the patient's gastroenterologist to weigh the risks and benefits of starting immunosuppressive agents in the acutely ill patient versus proceeding with total abdominal colectomy.

Toxic megacolon is a life-threatening condition presenting in patients with systemic toxicity and a distended (transverse colon > 6 cm or cecum > 9 cm) and thickened colon. These patients can have diarrhea or constipation and are at high risk for perforation. They present with systemic inflammatory response syndrome (SIRS) and require immediate medical attention (*Kimura H, et al., 2016*).

Initial treatment is aggressive fluid resuscitation and broad-spectrum antibiotic therapy as well as proper adjustment of medications to avoid anti-diarrheal drugs. Infectious diarrhea workup needs to be initiated to guide steroid therapy; however, the decision for surgery remains a clinical one. Any signs of hemodynamic instability, peritonitis, or stagnancy in clinical improvement for 48–72 h despite maximal medical therapy are indications for surgery.

Fulminant colitis presents similarly with SIRS and thickened colon but without the colonic distension. Fluid

resuscitation, broad-spectrum antibiotics, intravenous steroids, and infectious workup should be promptly initiated. Inpatient administration of infliximab should also be considered as there are data suggesting it is superior to intravenous steroid therapy.

However, indications for urgent surgery remain an independent clinical decision based on hemodynamic instability, peritonitis, or the lack of clinical improvement despite very maximum medical therapy over 48–72 h. Lower gastrointestinal bleeding is very common in patients with UC due to the inflamed and friable colonic mucosa. Life-threatening bleeding fortunately happens less than 5% of the time. These symptoms will usually subside with effective medical treatment, and ongoing bleeding is usually a sign of medical failure.

However, in roughly 10% of patients, massive gastrointestinal hemorrhage is cited as the reason for total abdominal colectomy with an additional 12% of these patients having ongoing rectal hemorrhage after . There is no agreed upon criteria on how much hemorrhage is required prior to offering the patient surgery, and it should be taken in consideration with the whole clinical picture (*Feuerstein JD, et al., 2016*).

Results

Data on the treatment of 115 patients (65-year-old men and 50-year-old women) in the regional proctological center of Dnipro for the years 2017-2022 with a diagnosis of Ulcerative Colitis on the basis of Department Surgery No. 1 of Dnipro State Medical University.

As a result of the study, 37 patients (20 men and 17 women) with a diagnosis of Ulcerative Colitis were treated without surgery.

In the drug treatment of patients with Ulcerative Colitis, we used drugs of the following groups: Anti-inflammatory medications, Immune system suppressors, Biologics and other medications.

According to the results of the study, surgical treatment against the background of drug therapy was carried out at our base for 78 patients (45 men and 33 women) diagnosed with Ulcerative Colitis.

For the surgical treatment of patients with Ulcerative Colitis, we used the drug treatment and following planned and urgent surgical interventions: types of colectomy (left-sided, right-sided, more often – total), colectomy with ileoanal anastomosis (with reservoir formation), coloproctectomy with permanent ileostomy.

Discussion

The presented results of medical and surgical treatment of patients with Ulcerative Colitis allow us to assert the need for complex and combined treatment of this category of patients with the obligatory consideration of the stage of severity of the disease and its course. At the same time, the medicinal component should consistently

consist of groups of modern drugs that can effectively treat the exacerbation of Ulcerative Colitis, and prevent the need for surgical intervention, which can sometimes lead to the invalidation of patients. The surgical component of the complex-combined treatment of patients with Ulcerative Colitis, especially in the planned mode, will significantly reduce the development of severe complications of the disease and the need for urgent operations.

Conclusion

Concluding our work on treatment options for patients with Ulcerative Colitis, which can be accompanied by extraintestinal articular manifestations, as well as possible dangerous complications that can lead to the death of patients, we insist on the need for complex combined medicament and medicament-surgical treatment.

Effective and justified drug therapy with the use of all necessary groups of modern medical drugs allows to avoid the transition of Ulcerative Colitis to more severe stages with the possibility of developing complications, and timely planned surgical intervention allows to prevent them, and in the case of the development of urgent conditions, to eliminate these complications with urgent operations.

Recommendations

We recommend using the proposed technologies in the practices of gastroenterologists, rheumatologists and surgeons-proctologists for effective medicament and surgical treatment of patients with Ulcerative Colitis and extraintestinal manifestations.

Acknowledgments

We wish to gratefully acknowledge the advice and support of representatives and staff Dnipro City Hospital, Dnipro State Medical University and Regional Proctology Centre in the preparation of our work and this text.

Abstract: Heparin, a sulfated glycosaminoglycan (GAG) is one of macromolecule natural compounds and widely used as an anticoagulant drug, anti-thrombotic agent and hemodialysis (patients undergoing kidney dialysis). Since it is derived from animal source, heparin can contain several natural contaminants. Thus, molecular imprinting technology is introduced for purification and separation of heparin. An epitope extraction was implemented consist of low molecular weight heparin (LMWH) as template to capture large molecule of heparin which prepared by sol-gel process on the surface of macromolecule silica using 3-aminopropyltriethoxysilane (APTES) and tetraethoxysilane (TEOS) and functional monomer and cross-linker respectively. Here, the effect of template: monomer ratio was evaluated and result shown that the (1:2) ratio of template to functional monomer successfully adsorb and enrich the heparin protein. The imprinted polymer was characterized with Fourier Transform Infrared (FTIR) spectroscopy, Thermogravimetric Analysis (TGA), Brunauer-Emmet-Teller (BET) and Field Emission Scanning Electron Microscopy (FESEM). The adsorption behaviours of epitope imprinting indicated that Langmuir-Freundlich (single-site) was considered as the model with better fit and kinetic batch studies showed pseudo-first-order kinetic model via physicochemical process. The results obtained good imprinting comparable of epitope imprinting effect.

Process on Silica Surface: Effect of Template: Monomer Ratio Studies. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2033-2046), Cappadocia, Turkiye. ISTES Organization.

Introduction

In 2008, a contamination of isolated heparin supply caused a number of death in at least 10 countries. The contamination came from the by-product which is oversaturated chondroitin sulfated (OSCS) (McMahon et al., 2009; Sommers, Mans, Mecker, & Keire, 2011). Several techniques were introduced to purify the heparin such as cation exchange resin. However, this technique required a lots of solvent, costly, low versatility and selectivity. Thus, a biological molecule purification by solid phase extraction using an imprinting approach as a sorbent is developed.

Molecular imprinted polymer (MIP) is a form of polymeric network, in which the specific analyte is used as a template in the MIP polymerization. The main advantages of this approach is to allow separation and purification procedure, facile, efficient, cost effective, inexpensive and green. In many years, MIP has effectively been applied in various areas for the specific recognition of small analytes. Recently, recognition of macromolecules such as protein or polysaccharide acquired much attention in the molecular imprinting technology. However, macromolecule imprinting remains a challenge due to the inherent properties of the protein or polysaccharide template molecules and adsorption-desorption of macromolecule template within the polymer cavities (Kryscio & Peppas, 2012; Turner & Jeans, 2006). Therefore, many imprinting methods were designed to enhance the macromolecule imprinting such as surface imprinting (Li et al., 2015; Yuan et al., 2014) and epitope imprinting. To date, epitope imprinting has been proven to improve and efficiently enhance protein recognition. The epitope imprinting is the imprinting of short sequence of protein that represents a small and exposed fragment of the whole protein. This polymer not only could recognize a small protein template, but also the entire bulk of protein (Brown & Puleo, 2008; Li et al., 2013; Yarman et al., 2015).

In the present study, a non-covalent epitope imprinted polymer was prepared by sol-gel process for the separation and purification of heparin. In this method, macromolecule silica gel was used as a surface binder for the non-covalent polymerization to occur. The LMWH was used as a template in the epitope imprinting. Optimization of template: monomer imprinting ratio were investigated. The synthesized epitope imprinted polymer was characterized and assessed by batch sorption experiments in detail to improve and enrich the heparin adsorption.

Experimental

Chemicals and reagents

The silica-gel (230-400 mesh, 0.040-0.063 mm in size) used as the support material for surface imprinted

polymer was purchased from Merck, Germany. Template, Low Molecular Weight Heparin (LMWH) and heparin were obtained from Easybuyer Ltd. Shanghai, China and AinMedicare, Malaysia respectively. 3-aminopropyltrimethoxysilane (APTES) and Tetraethoxysilane (TEOS) were obtained from Sigma Aldrich, Germany. Meanwhile, HCl was obtained from Fisher Scientific, USA. The analytical grade methanol was used as washer solution supplied from HmbG, Germany.

Preparation of Heparin Epitope Imprinted Polymer on the Silica Surface

The silica gel surface was activated with 6 M HCl for 10 hours with stirring. Then, the resulting mixture was filtered and washed thoroughly with deionized water until it was neutral before dried in oven at 70 °C overnight. LMWH was dissolved in 20 mL water. Later, different amounts of template:APTES (1:2, 1:4, 1:8 mmol) was added to the mixture and 1.8048 mmol of TEOS was added into the solution with continuous stirring for another 30 minutes. Next, 2 g of activated silica gel and 0.2 mL of 0.012 M HCl were added sequentially, under stirring and then the suspension was polymerized at 30-40°C for 24 hours. After the polymerization, the product was filtered and washed with ethanol and neutralized with water.

The template was extracted by ultrasonic extraction for 30 minutes with 50 mL MeOH:HCl (10% in water) in ratio (1:1), then with MeOH, and lastly with water until it could no longer be detected by UV. Finally, the epitope imprinted polymer was collected by filtration and dried at 80 °C overnight. The NIP was also prepared by using the identical procedure without template.

Characterization

The infrared spectra was performed by using Perkin Elmer Spectrum 100 Series FT-IR spectrometers from 600 cm^{-1} to 4000 cm^{-1} . The morphologies of heparin epitope imprinted polymers were carried out by using FESEM imaging from Nova NanoSEM 450 from Field Emission Inc. USA and sputter-coated with platinum for 20 minutes. Thermogravimetric-Differential Thermal Analyzer (TG-DTA) was conducted by using Pyris Diamond TG-DTA by Perkin Elmer, USA where, 5 mg of polymer sample was heated from 30 °C to 600 °C at ramp of 5 °C/min. BET surface area was conducted by using Micromeritics TriStar, USA using N_2 as the adsorption gas.

Adsorption experiment

50 mg of imprinted polymer was placed into the 4 mL vial. 3 mL of rebinding analyte (Heparin or LMWH) dissolved in water at different concentrations were added in the range of 0.0626-1.0 mg/mL for 240 min. Meanwhile, in adsorption kinetic study, the 0.25 mg/mL of heparin was used within 15 to 240 mins. The supernatant was filtered before it was measured by UV-Vis spectrometer (Varian Cary 50 UV-Vis Spectrometer, Agilent, US) at wavelength 202 nm and 230 nm for heparin, and LMWH respectively.

The binding capacity was calculated by using the following formula:

$$Q_e = \frac{(C_0 - C_e)V}{M} \quad (1)$$

where, Q_e represents the binding capacity (mg LMWH or heparin/g of imprinted polymer), C_0 , and C_e represent the initial and equilibrium concentration of LMWH or heparin (mg/L) respectively, M is the mass of polymer in each adsorption sample (g) and V is the volume of the rebinding solution (L).

The Imprinting Factor was calculated based on the following equation:

$$IF = \frac{Q_{MIP}}{Q_{NIP}} \quad (2)$$

where IF represents the imprinting factor, Q_{MIP} and Q_{NIP} represent the binding capacity (mg/g) of MIP and NIP respectively.

Four types of adsorption models have been used to characterize the MIPs surface such as Langmuir, Freundlich, single-site Langmuir-Freundlich, and dual-site Langmuir-Freundlich isotherm model. Meanwhile, two kinetic models, namely the pseudo-first order and pseudo-second order have been used for the adsorption of solute from a liquid solution.

$$Q = \frac{q_{max} K_L C_e}{1 + K_L C_e} \quad (3)$$

$$Q = K_F C_e^{1/n} \quad (4)$$

$$Q = \frac{q_{max} K_1 C_e}{(1 + K_1 C_e)^n} \quad (5)$$

$$Q = \frac{q_{max-1} (K_1 C_e)^{n_1}}{1 + (K_1 C_e)^{n_1}} + \frac{q_{max-2} (K_2 C_e)^{n_2}}{1 + (K_2 C_e)^{n_2}} \quad (6)$$

where, Q is the binding amount in adsorbent at equilibrium (mg/g), q_{max} is the maximum monolayer saturation capacity (mg/g), while n is the heterogeneity parameter. Meanwhile, C_e is the concentration in equilibrium of the solute in the bulk solution (mg/L). K_F , K_L , K_1 and K_2 , are dissociation isotherm constant of Freundlich (mg/g), Langmuir (L/g), Langmuir-Freundlich (L/g) single and dual site respectively.

Two kinetic models, namely the pseudo-first order and pseudo-second order have been used for the adsorption of solute from a liquid solution as described by equation (7) and (8) respectively.

$$Q_t = Q(1 - e^{-k_1 t}) \quad (7)$$

$$Q_t = \frac{Q^2 k_2 t}{(1 + Q k_2 t)} \quad (8)$$

where Q and Q_t are bound amount on adsorbent at equilibrium (mg/g) and bound amount on adsorbent at any time t (min) respectively. Meanwhile, k_1 and k_2 are pseudo-first (1/min) and pseudo-second (g/mg/min) order rate constant respectively.

The nonlinear regression models were applied for the utilization in adsorption and kinetic performance. The best fit of the corresponding models was calculated and selected according to the statistical test as of RSS and F_{test} . These parameters were calculated according to the nonlinear regression methods using Microsoft Excel function

by minimizing the sum of square errors and largest value of F_{test} .

Results and Discussion

Synthesis and characterization of heparin epitope imprinted polymers

The preparation of epitope imprinted surface of silica particles by sol-gel process was started by silylation of SiO_2 surface. The polysilicate network of LMWH-epitope-imprinted polymer was produced by the hydrolysis and polycondensation of TEOS (cross-linker) with APTMS (functional monomer) by non-covalent bond to the LMWH (template) molecules. The structural change before and after modifications of silica was confirmed by FTIR spectra as shown in Figure 1.

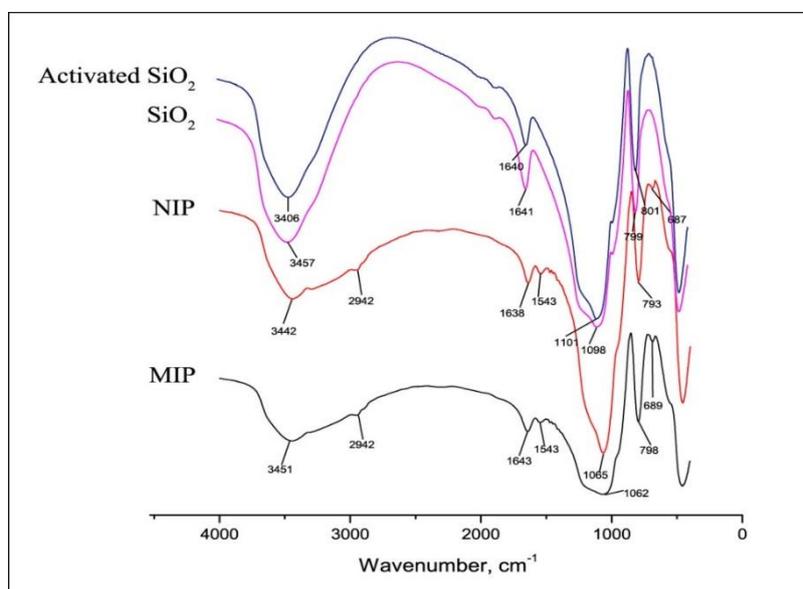

Figure 1: FTIR spectra of MIP and NIP in water.

FTIR spectra of untreated silica, activated silica, MIP, and NIP were shown in Figure 1. A strong and sharp band at $1101\text{-}1098\text{ cm}^{-1}$ was observed for all samples, which was related to Si-O-Si valent vibration of silica thus, indicating that the main structure was not changed by the modification reaction. The band at 1640 cm^{-1} may indicate the presence of bending of water molecules, which are adsorbed on the surface of silica by hydrogen bonding with silanols. The intensity of both activated SiO_2 and SiO_2 higher compared to both imprinted polymers. This suggests that modification reaction occurred at the silica surface by APTMS which is caused by the C-N vibration and NH_2 deformation from APTMS at 1543 cm^{-1} . The similar observation were consistent with other finding of silica modified by aminopropyl group (Rostami et al., 2011; Zhang et al., 2010). The N-H stretching peak overlapped with Si-OH stretching vibrations at $3406\text{-}3451\text{ cm}^{-1}$ and it was observed at all samples. Small absorption bands at 2942 cm^{-1} were attributed to the methyl C-H stretching due to the presence of propyl groups in APTMS in which the bands was undetected at both activated SiO_2 and SiO_2 . All these observations particularly both peaks at 1543 cm^{-1} and 2942 cm^{-1} , in MIP and NIP samples confirm that the

existence of a chemically attached by APTMS to the silica surface.

Effect of template-monomer molar ratio

The epitope imprinted surface of silica particles were treated in three different templates of monomer molar ratio from 1:2 to 1:8 and further characterized by TGA, as shown in Figure 2. Three phases of weight loss were discovered. In first phase of weight loss at temperature below 100 °C, in which all samples initially lost their weight and other two phases of degradation were discovered at temperature range 200-500 °C and 500-700 °C. The decomposition of aminopropyl moieties occurred rapidly, starting at 200 °C followed by dehydroxylation of the silica surface at 500 °C to 700 °C. The decomposition of aminopropyl silane moieties led to formation of ammonia, ethylene, hydrazine, and methane (Rostami et al., 2011), while the dehydroxylation of the silica surface was caused by condensation of silanol group to siloxanes (Wan et al., 2010).

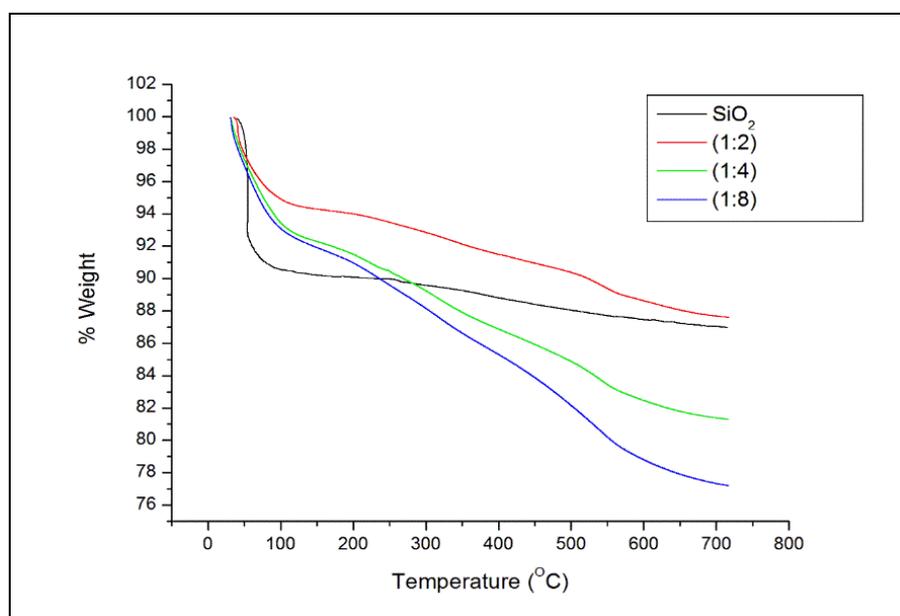

Figure 2: TGA spectra of MIP prepared in different templates-monomer molar ratio.

SiO₂ had shown highest weight loss at first phase of decomposition. This situation could be attributed to the release of physically adsorbed water remaining in the SiO₂ particles due to its properties as a water absorbent. In the second degradation phase, three clear decomposition phases of aminopropyl moieties were identified. MIP in template of monomer molar ratio (1:8) has the greatest total weight loss followed by MIP (1:4), and MIP (1:2), with weight loss of 9%, 7%, and 3% respectively at temperature range 200-500 °C. After 500 °C, all three sample had similar weight loss (~1% weight loss).

The template to monomer molar ratio of template is important to ensure feasible copolymerization. For this purpose, the porosity of the different templates to monomer molar ratio was evaluated by nitrogen gas sorption

method onto the solid surface known as BET analysis, to each epitope or partial surface imprinted polymer prepared under the same condition (Table 1).

Table 1: BET data for different template to monomer molar ratio

MIP Material (template to monomer molar ratio)	Specific surface area (m ² /g)	Pore volume (cm ³ /g)	Pore size diameter (nm)
(1:2)	93.4226	0.1877	0.8036
(1:4)	302.1464	0.5923	0.7841
(1:8)	119.3441	0.2379	0.7975

Both surface area and pore volume were increased with increase of template to monomer molar ratio from 1:2 to 1:4. The increment was attributed to the increase of the preassembled interaction (hydrogen bonding interaction) between the template and functional monomer in the prepolymerization. Meanwhile, by increasing the template to monomer molar ratio to 1:8, the surface area and pore volume were slightly reduced due to the increasing competition of preassemble interaction between aminopropyl silane monomer and water in prepolymerization. Moreover, the interaction between cross-linker and functional monomer became more restricted to reduce the pore volume and surface area of the polymer. Thus, polymer material with higher degree of organic precursors had less surface area and porosity. The situation was attributed to the relationship that existed between the porosity of the sol-gel materials and their hydrophobic/hydrophilic nature (Guardia, Badía-Laíño, Díaz-García, Ania, & Parra, 2008). Dissimilar finding was observed for the pore size diameter, where in low template to monomer molar ratio (1:2), the pore diameter was high (0.8036 nm). It was observed that when lowering the proportion of functional monomer, it might reduce the preassembled interaction between the template and functional monomer and at the same time increase hydrogen bonding between the template and water to enlarge the pore diameter.

The morphological features of the epitope or partial surface imprinted polymer prepared in different template-monomer molar ratio were observed using FESEM and were displayed in Figure 3. The MIPs were present as nano-sized bead particles, which agglomerated and coated on the silica microparticle surface.

It was shown that increase in the proportion of functional monomer served to increase the spacing between growing colloidal particles; thus, reduce coagulation rate. Therefore, as in the Figure 3 (A) to (C) by increasing the monomer molar ratio shows the morphology change from uniformly cluster spherical particle to agglomerate spherical particles like a bunch of grapes structure. A similar observation obtained by Guardia et al., (2008) and Clausen et al. (2014). In large amounts of alkoxy silane precursor on the modification of molecularly imprinted silicas shows, of globular structures in form of spherical particles obtained due to the cross-linking of the polymer became more restricted with the incorporation of pendant ligands. Meanwhile, in high ratio of monomer, the particles presented greater diameters, appear to be less cohesive and with lower aggregation

degree which resembled a bunch of grapes thus providing higher average pore diameter.

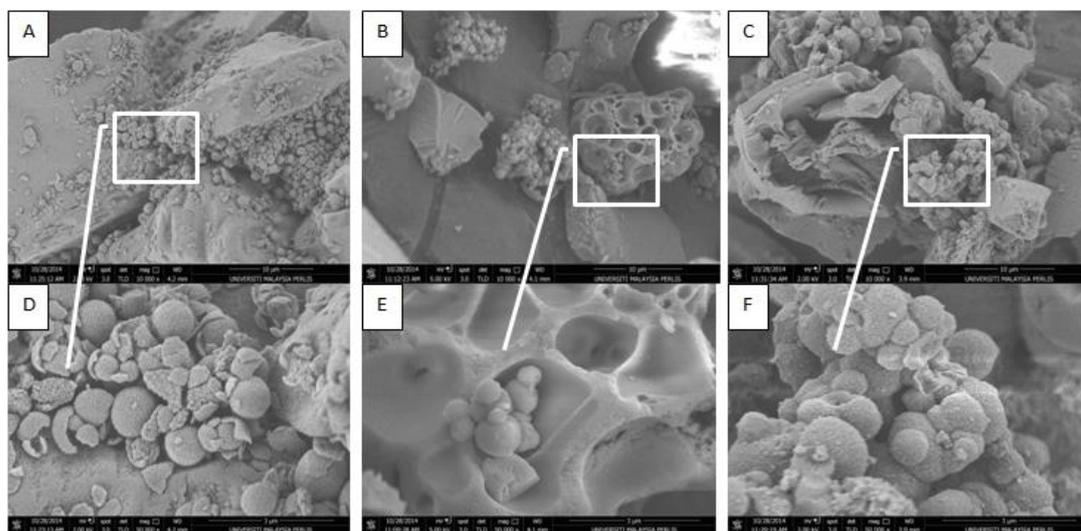

Figure 3: FESEM images of epitope MIP prepared in different template:monomer molar ratio. Surface of template to monomer (1:2) (A and D); (1:4) (B and E), and (1:8) (C and F). 10,000x magnification for A-C and 50,000x magnification for D-E.

Effect of Template-Monomer Ratio to the Binding Capacity of LMWH and Heparin

Since there were significant differences in surface area, porosity, and morphology of the epitope imprinted polymers due to the change on template, the binding interaction will be dependent on it. The performance of binding interaction was investigated by batch rebinding test as shown in Figure 4.

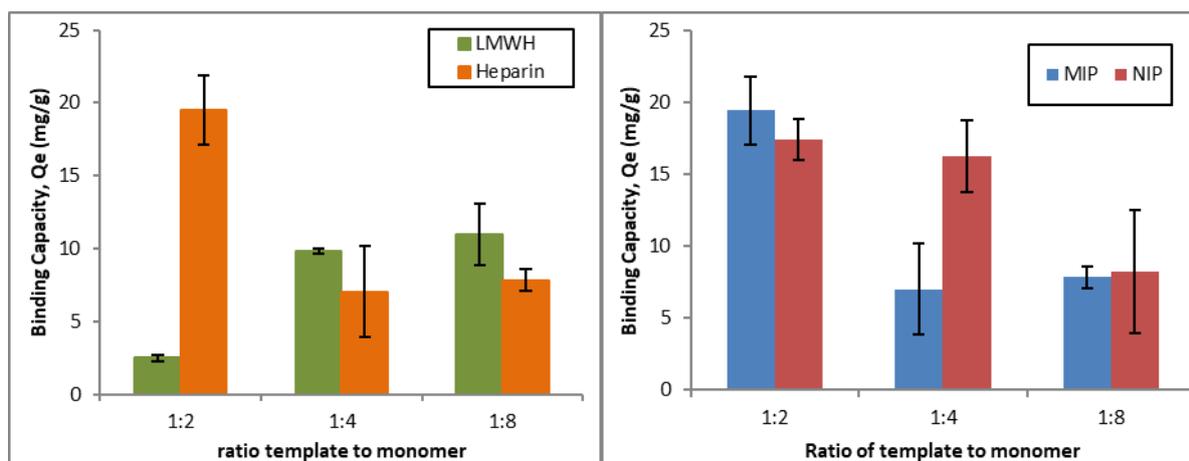

Figure 4: (a) Binding capacity between LMWH and heparin, (b) Binding capacity of heparin in different template-monomer ratio.

An increase in the functional monomer concentration from (1:2) to (1:8) resulted in the increment of the binding

capacity for LMWH from 2.50 to 10.98 mg/g (Figure 3.4(a)). Increase in the functional monomer concentration provided more recognition cavities or sites; thus, demonstrated remarkable enrichment of LMWH. Moreover, the excess of functional monomer caused an abundance of free amine acquired on the surface of polymeric silica gel particles thus, increasing of LMWH binding due to a secondary interaction occurs between the LMWH template and free amine on the surface of the imprinted polymer. An opposite trend was discovered in heparin adsorption. The binding capacity of heparin decreased from 19.48 to 7.85 mg/g by increasing functional monomer concentration. The trend was attributed to the physical characteristic of the heparin. The large structure of heparin (5-40 kDa) tends to adsorb and fit better on the cavity active site in the polymeric silica gel particles. This phenomenon could be explained by low functional monomer lack of free amine obtained on the surface of polymeric silica gel particles thus, increasing the binding of heparin to the only cavity active site in the polymeric silica gel particles which is known as main interaction.

The template recognition performance of the epitope, which was prepared in different template to monomer molar ratio was investigated by batch binding test and expressed by the imprinting factor (IF). The batch binding test was performed on the epitope imprinted polymer (MIP) and non-epitope imprinted polymer (NIP), as shown in Figure 4(b).

The MIP with template to monomer molar ratio 1:2 showed highest binding capacity at 19.48 mg/g compared to MIP (1:4) and MIP (1:8), with only 7.04 and 7.05 mg/g respectively. The highest heparin adsorption was observed at template to monomer molar ratio 1:2 with binding capacity of 19.48 and 17.45 mg/g for MIP and NIP respectively. The ratio of 1:2 also obtained highest imprinting factor followed by 1:8 and 1:4, with IF of 1.12, 0.96, and 0.43 respectively. Similar observations were also observed by Zhou et al. (2009) and Li et al. (2008) in their research on optimization of surface imprinting via sol-gel process. Both researches obtained confirmed that the binding capacity of BSA decreased as the concentration of aminosilanes (APTES) increased. These findings were supported by Singabraya et al. (2012) in the optimization of conditions on heparan sulfate MIP. They reported that the loss of sorption capability and specificity by increasing the monomer concentrations was due to the increasing amine density, which can generate monomer dimerization; thus, reduce formation of effective binding site.

In the Figure 4(b), it was also shown that the NIP had highest heparin adsorption compared to MIP when the template to monomer molar ratio increased from 1:4 to 1:8. Thus, it showed that a non-specific interaction occurred when increasing functional monomer concentration in the epitope imprinted polymer and consequently formed a lower affinity towards heparin. The situation could be explained by the strong hydrogen interaction between carboxylic or hydroxyl groups from the heparin to the amine functionalities that was mainly abundant at the polymer surface which, hindered the access route of the heparin into the imprinting cavities. Moreover, the NIP has no cavities, thus abundant free amine functionalities is present at the polymer surface which, increased secondary interaction by strongly hydrogen bonding of the heparin to increase the binding performances (Ikeda et al., 2008; Lin et al., 2009).

Equilibrium Isotherm and Kinetic Rebinding of Heparin

Based on the template to monomer molar ratio studies, binding isotherm was conducted on both epitope MIP and NIP with a series of different heparin initial concentration (62.50 to 1000 mg/L). Here, Langmuir, Freundlich, single-site Langmuir-Freundlich, and dual-site Langmuir-Freundlich isotherm model were considered. These four isotherm models were demonstrated to the experimental data in order to characterize the binding site and isotherm parameters.

Langmuir-Freundlich (single-site) and Langmuir gave minimum values of $\sum \text{RSS}$ and largest F_{test} on epitope MIP. However, the F_{test} of Langmuir-Freundlich (single-site) showed larger values compared to Langmuir, which were 38.0991 and 38.0977 respectively. Therefore, Langmuir-Freundlich (single-site) was considered as the better-fit model of epitope MIP from highest value of F_{test} and closer data between the calculated q_e and experimental data. The model considers two different sorts of binding site with high and low affinity, showing a more complex binding (Gómez-Pineda et al., 2011). It was indicated that the adsorption can occur on homogeneous and heterogeneous site of the epitope NIP. For this assumption, this model recognizes that at high adsorbate concentrations, it predicts a monolayer adsorption capacity characteristic of the Langmuir isotherm, in which the adsorption is on the other binding sites such as amine-functioned silane monomer (Clausen et al., 2014). Whereas at low adsorbate concentration, it is effectively reduced to Freundlich isotherm, in which the adsorption process can take place preferentially on high-energy site at free silanol group (Si-OH) from inorganic precursor. The statement was supported by value of RL and heterogeneity (n) which, obtained between 0 and 1 and $n = 1$ respectively, indicated the model is more favorable to adsorption with homogeneous site.

Similar findings had also been observed in epitope NIP, in which Langmuir-Freundlich (single-site) and Langmuir gave minimum values of $\sum \text{RSS}$ and largest F_{test} . However, in epitope NIP, Langmuir showed highest value of F_{test} compared to Langmuir-Freundlich (single-site), which was 64.0715 and 64.0602 respectively. Thus, the adsorption behavior of heparin onto epitope NIP belonged to the Langmuir isotherm model. This model assumes that adsorption occurs on homogeneous site. The adsorption process only takes place at amine-functioned silane monomer, which is a single site adsorption (Clausen et al., 2014). These nonlinear fitting results were illustrated by the regression curves of experimental and calculated model data as shown in Figure 5.

Figure 5 shows that epitope MIP and epitope NIP followed Langmuir-Freundlich (single-site) and Langmuir isotherm. The maximum adsorption capacities q_{max} for epitope MIP and epitope NIP were found to be 19.1091 and 13.6218 mg/g respectively, which were close to the calculated values, which were 20.9394 and 14.4813 mg/g. in this study, approximately less than 10% of LMWH (15 monosaccharide units per molecule) used as template showed effective specific heparin (45 monosaccharide unit per molecule) binding with 19.1091 mg/g adsorption capacity obtained. Thus, it was proven that LMWH had high binding site to heparin. The binding capacity on this study was still low compared to latest epitope imprinting discovered by Yang et al. (2014) where the epitope imprinting was performed on the surface of silica nanospheres embedded CdTe quantum dots (QDs). About 1.3% of protein (C-terminus of BSA, residues 599-607) as a template had successfully captured

bovine serum albumin (BSA, 67kDa) with almost 70.0 mg/g of adsorption capacity obtained. This showed that size of the support where surface imprinting takes place plays an important role to maximize binding performance.

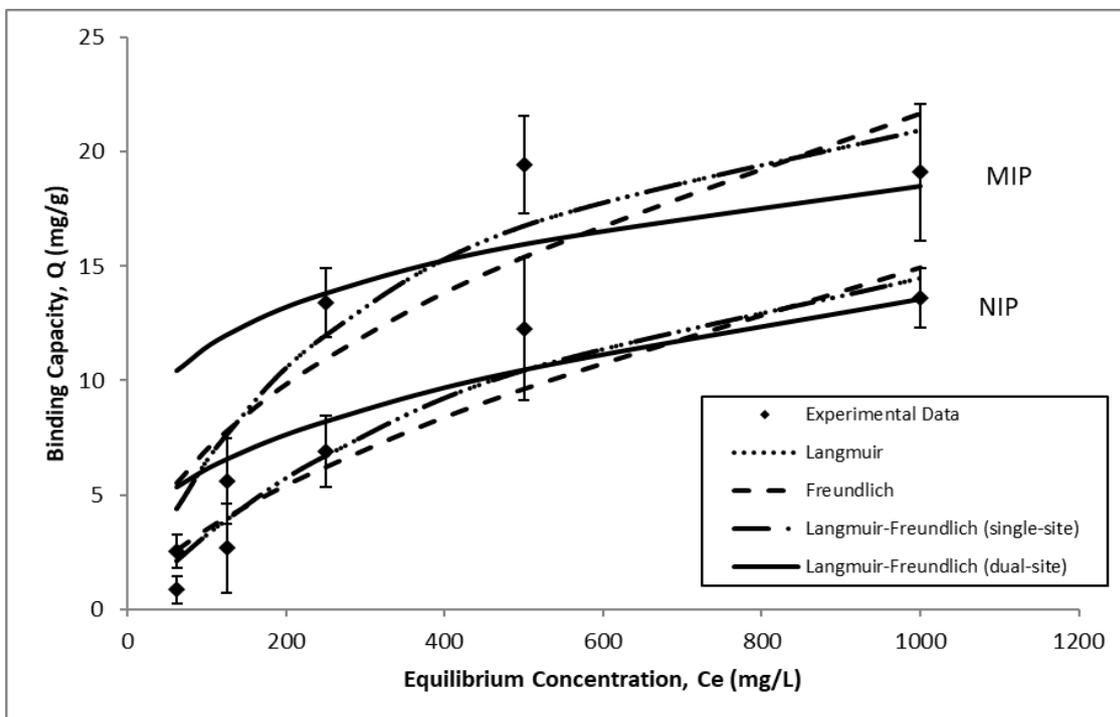

Figure 5: Adsorption isotherm curve fitting of heparin on epitope MIP and NIP

The mechanism of the kinetic adsorption process such as pseudo-first-order and pseudo-second-order kinetic models were applied to fit the kinetic data by applying the adsorption kinetics equations (7) and (8). The MIP fitted to pseudo-first-order kinetic model due to the small and largest value of the $\sum RSS$ (0.4497) and F_{test} (227.1135) respectively. The model assumed that the kinetic adsorption involve the interaction force of physisorption caused by van der Waals force in very week energy interaction or charge-transfer complex between template and the adsorbent active site. The contrasting result was obtained in NIP where, it followed the pseudo-second order kinetic model. The model assumes that the physicochemical interactions of the rate limiting step were possibly involved in the adsorption process through sharing or exchange of electrons between the adsorbate and adsorbent (Özacar et al., 2008; Xie et al., 2015). These nonlinear fitting results were illustrated by the regression curve of experimental and calculated model data as shown in Figure 6.

Figure 6 shows that epitope MIP and epitope NIP of kinetic isotherm curve fitting followed pseudo-first-order model and pseudo-second-order model respectively. The maximum adsorption capacities q_{max} for epitope-MIP and epitope-NIP were found to be 17.8700 and 13.6000 mg/g respectively, which were close to the calculated data, which were 17.8943 and 12.7476 mg/g respectively.

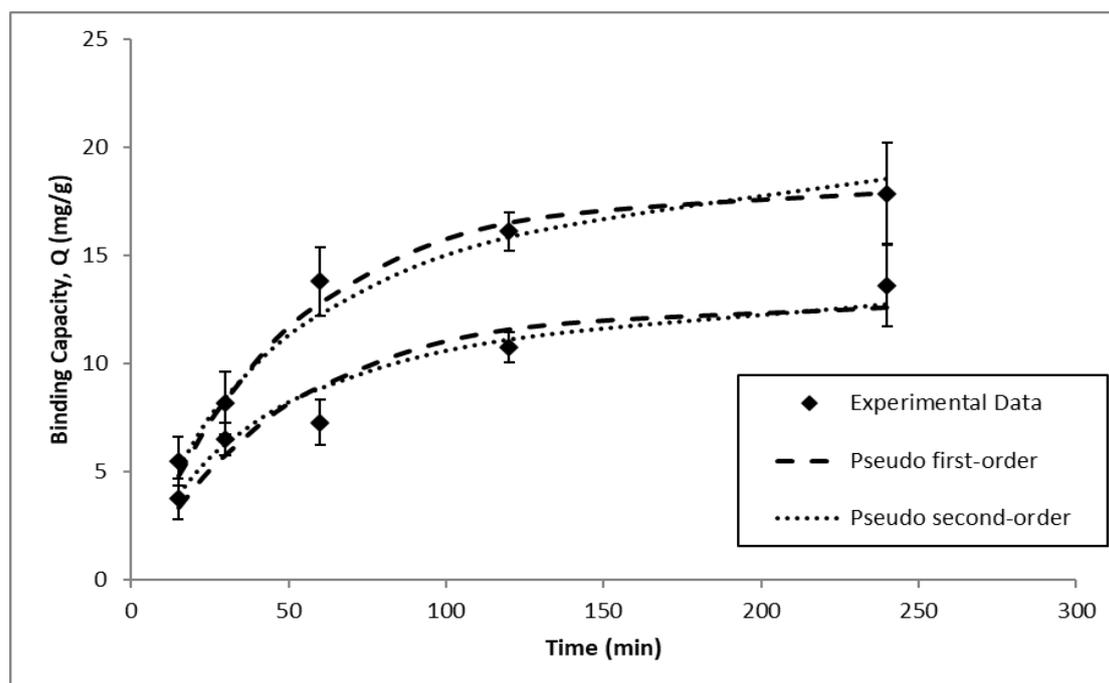

Figure 6: Kinetic isotherm curve fitting of heparin on epitope MIP and NIP

Conclusion

An epitope imprinted for heparin recognition was designed and synthesized by surface imprinting using amine silane as monomer, tetraethoxysiloxane (TEOS) as a cross-linker, LMWH as a template, and silica microparticle as a surface binder by sol-gel process. A ratio of template to functional monomer were optimized to obtain higher binding capacity. The higher binding capacity of heparin compared to LMWH suggested that the epitope surface imprinted successfully adsorbed and enriched the heparin. Moreover, it was also sensitive, rapid, and had high repeatability for extraction and purification of heparin. It can be a promising practical candidate for industrial use in the pharmaceutical industry.

Abstract: The drug discovery and development process is time and cost intensive. Eroom's law published with data up to 2010, stated that total costs of research and development (R&D) on new drugs approved by the US Food and Drug Administration had risen exponentially for 60 years. However, the changes in the costs associated with failed new molecular entities have started to decline, which led to the breaking of the rule. In this study, organ-on-chips are hypothesized as another valid reason, breaking Eroom's Law as key parameters related to molecular, cellular and physiological features of human disease progression have been considered while developing such models. Although animal models have been widely used, interspecies differences result in contradictions in clinical translation. Indeed, organ-on-chips have arisen as powerful tools to overcome these limitations. Organ-on-chips populated by human primary cells and/or stem cells can recapitulate in vivo organ level physiology and pathophysiology by recreating tissue and organ level functions in vitro. Cancer metastasis-on-chip models used to assess the efficacy of drug therapies are elaborated. In the short to medium term, more efforts are anticipated in engineering advanced microfluidic systems to develop organ-on-chip platforms for predictive translation of preclinical findings into clinical studies.

Eroom's Law

Eroom's Law, a term derived from "Moore's Law" in the computer industry, reflects a trend seen in the pharmaceutical sector. It was first published with data up to 2010 and said total research and development (R&D) costs for new drugs approved by the US Food and Drug Administration have been rising at the fastest rate for six decades. This alarming pattern raised concerns about the sustainability and efficiency of the drug discovery and development process (Scannell et al., 2012). However, in recent years, there have been significant

changes in the costs associated with failed new molecular entities, indicating a departure from Eroom's Law. These cost declines have broken the previously established rule (Ringel et al., 2020). Several factors have contributed to this positive change, offering potential explanations for this encouraging development. One of the main reasons behind the change is the use of human genetic data to gain a deeper understanding of diseases. Advances in genetic research, such as the Human Genome Project, have offered significant knowledge into the underlying genetic factors that contribute to various medical conditions (Morgan et al., 2018). This knowledge has paved the way for more targeted and efficient drug development efforts. By identifying specific genetic targets, researchers and pharmaceutical companies can focus their resources on developing therapies that address the underlying causes of diseases. This approach enables a more precise and personalized approach to medicine, potentially reducing the costs associated with trial-and-error drug development (Mathur and Sutton, 2017). In addition, major pharmaceutical companies have implemented better decision-making processes that include setting clear thresholds for terminating unsuccessful programs at earlier stages. Historically, many drug development programs have continued for an extended period of time, despite showing signs of limited efficacy or safety concerns. This led to significant financial investment in projects with low chances of success. However, with a better understanding of disease mechanisms, better predictive models, and an increased focus on evidence-based decision-making, pharmaceutical companies are becoming more adept at recognizing undemanding drug candidates at early stages of development (Tollman et al., 2016). By eliminating these failed programs early, companies can redirect their resources to more promising methods, ultimately reducing overall costs. These advances in understanding diseases at a genetic level, along with improved decision-making processes, have begun to reverse the previously exponential increase in R&D costs associated with failed drug candidates (Sun et al., 2022). While it is important to note that drug development remains a complex and expensive enterprise, these positive changes represent a step toward more efficient and cost-effective pharmaceutical innovation. The ongoing integration of human genetic data and the implementation of better decision-making processes have great potential to optimize the drug discovery and development process, ultimately leading to the creation of safer and more effective treatments for patients in need (Heilbron et al., 2021).

Drug Development Process

The drug discovery and development process is a complex and demanding endeavor that involves a series of complex steps, making it inherently time-consuming and financially burdensome. From the initial identification of a potential drug target to its eventual market approval, each step requires a significant investment of time, resources, and expertise (Mohs and Greig, 2017). The process usually begins with extensive research and analysis to identify a specific target, such as a disease-causing protein or biological pathway that can be modified to achieve therapeutic effects. This step alone involves the collaboration of multidisciplinary teams of chemists, biologists, pharmacologists, and other specialists, who spend countless hours conducting experiments, analyzing data, and searching for potential drug candidates (Schenone et al., 2013). Once a promising molecule is identified, the drug development phase begins, which includes preclinical studies to evaluate its safety,

efficacy, and pharmacokinetics. These studies, conducted using in vitro and animal models, aim to provide important data on drug interactions with biological systems, potential adverse effects, and dose adaptation. This phase requires significant time to ensure that the drug candidate is effective and safe before proceeding to human trials. Human clinical trials are another critical and time-consuming aspect of the drug development process (Yadav et al., 2021). These trials are generally divided into three phases, each with its own objectives and requirements. Phase I trials focus primarily on evaluating drug safety and dosing, often involving a small number of healthy volunteers. Phase II trials involve a larger sample size and aim to further evaluate the drug's efficacy and potential side effects in patients with the target condition. Finally, phase III trials involve an even larger population and attempt to confirm the drug's effectiveness and monitor its long-term side effects.

During the clinical trial phase, extensive data collection, analysis and regulatory compliance must be carefully performed to ensure patient safety and ethical considerations. These trials are not only time-consuming, but also demand substantial financial investments covering costs such as patient recruitment, medical monitoring, data management, and regulatory filings (Rubin and Gilliland, 2012). In addition, the drug development process requires adherence to strict regulatory frameworks set by health authorities such as the Food and Drug Administration in the United States or the European Medicines Agency in Europe. These agencies enforce strict guidelines to ensure patient safety, efficacy and quality control. Complying with these regulations adds additional time and cost burdens, as companies must provide extensive documentation, meet specific manufacturing standards, and navigate complex regulatory review processes (Teixeira et al., 2020). Moreover, despite intensive efforts and significant investments, the drug development process often faces setbacks and failures. Many drug candidates do not go through the rigorous stages of testing and evaluation due to issues such as lack of efficacy, unexpected side effects, or challenges in manufacturing. These failures contribute to the overall cost intensity of the process, as resources invested in unsuccessful candidates do not yield a return on investment (Sun et al., 2022). Consequently, the drug discovery and development process is a time- and cost-intensive journey that demands careful research, extensive preclinical and clinical evaluations, and adherence to strict regulatory standards. The complexities and uncertainties involved in each step, along with the need for extensive resources and expertise, contribute to the considerable investment of time and finance required to bring a new drug from concept to market. Despite these challenges, the process is critical to advancing medical science, improving patient care, and addressing unmet medical needs (Zagotto and Bortoli, 2021).

Organ-on-Chips and Disease Modeling

Understanding how a substance is absorbed, distributed, metabolized, and excreted within the body is critical to predicting its effectiveness and potential side effects. However, biological differences between species often result in inconsistent results when attempting to extrapolate data from animal models directly to humans. Factors such as differences in drug metabolism enzymes, receptor profiles, and organ-specific physiology can significantly affect the pharmacokinetics and pharmacodynamics of a compound (Zhang and Tang, 2018). Taking a closer look at the drug development process, animal models have long been a cornerstone of

preclinical research in the pharmaceutical industry, offering crucial perspective into drug efficacy and safety. However, it is widely recognized that interspecies differences between animals and humans can lead to contradictions and limitations because they often fail to fully replicate human-specific responses due to intrinsic biological differences between species when trying to translate the results of animal studies into human randomized trials and clinical application (Van Norman, 2020).

To address these challenges, organ-on-chip (OoC) technology has emerged as a powerful tool in biomedical research, offering promising insights into drug development and potentially contributing to breaking Eroom's Law. OoC represents a state-of-the-art approach that involves building microscale models of human organs on microfluidic devices that mimic the structural and functional properties of human organs, to study drug responses and toxic effects, providing a more physiologically relevant platform (Ingber, 2022). OoCs are frequently composed of flexible materials, have microfluidic channels that allow living cells to be incorporated and simulate the movement of blood and other fluids within an organ. These chips can be used to replicate the microenvironment and cellular interactions unique to human anatomy by embedding human cells or tissue samples (Zhang et al., 2018). Starting with the first lung-on-a-chip developed by Huh et al. in 2010, various organs have been integrated into microfluidic platforms over the years such as liver (Deng et al., 2019), kidney (Wang et al., 2022), intestine (Donkers et al., 2021), heart (Yang et al., 2021), brain (Saglam-Metiner et al., 2023), bone (Mansoorifar et al., 2021), blood vessels (Franco and Gerhardt, 2012) and various tissue barriers (Koch et al., 2022). While a single organ may be the focus of OoC platforms, the interaction of different organs with each other can be investigated with body-on-a-chip platforms where more than one organs are included on the same platform (Zhao et al., 2019). The translational value of preclinical investigations can be increased by adopting OoC technology to acquire data that more accurately reflect the intricacies of human biology. The ability to more accurately predict drug responses and potential side effects can help streamline the drug development process and reduce reliance on animal models, ultimately leading to more efficient and reliable clinical trials. This approach allows for more efficient screening of compounds, potentially reducing the time and cost associated with developing new drugs. Moreover, by offering a more human-relevant platform for early-stage testing, OoC models may help reduce late-stage failures (Esch et al., 2015). The capacity of OoC models to faithfully mimic the physiological processes of organs is one of its key advantages. These models provide a more accurate representation of the cellular composition and functionality of human organs by using primary cells derived directly from human tissues or induced pluripotent stem cells (iPSCs), which can develop into multiple cell types (Palasantzas et al., 2023). These models incorporate specific microfluidic channels that allow the application of mechanical forces and media circulation, simulating the dynamic physiological conditions that organs in the human body experience. Furthermore, OoC models present a chance for the advancement of precision and personalized therapies. These systems can be developed to incorporate patient-specific cells, enabling the investigation of various drug reactions. This strategy has the potential to greatly advance personalized therapies since it enables evaluation of the effectiveness and side effects of drugs in a patient-specific context (Ingber, 2022).

In the context of drug discovery and development, OoC technology has opened up exciting possibilities for

studying disease progression and evaluating the effectiveness of potential treatments. In addition to normal organ anatomy, organ-on-chip models can also capture pathophysiological aspects of diseases (Yesil-Celiktas et al., 2018). Diseased OoC models that can imitate the molecular and cellular alterations seen in patients can be recapitulated by adding disease-specific cells or including genetic abnormalities linked to particular diseases. This strategy makes it possible to investigate disease causes, assess novel therapies, and screen potential drug candidates in a more relevant and predictive manner (Li et al., 2022). As OoC models are highly capable of replicating the complex interactions and dynamics between different cell types and the microenvironment within an organ, disease processes and how various factors influence disease progression can be simulated. These models can also mimic the functionality of specific cell types and their responses to external stimuli, providing valuable insight into disease mechanisms and potential therapeutic interventions. In the field of brain diseases, OoC platforms can mimic the complex structure and function of the blood-brain barrier (BBB), providing significant contribution to common cause of neurological disorders such as Alzheimer's disease, Parkinson's disease, and stroke. These chips enable probing BBB permeability, evaluating drug delivery mechanisms, and studying interactions between neural cells and their microenvironment, paving the way for novel therapeutic strategies (Vatine et al., 2019). Equally promising is the application of OoCs in cardiovascular research, where it enables the simulation of physiological conditions and the study of heart diseases such myocardial infarction, arrhythmia, and heart failure. Heart-on-chips offer the assessment of drug toxicity, the monitoring of disease progression, and the development of tailored treatments suited to specific patients by combining cardiac cells, endothelial cells, and related mechanical signals (Mourad et al., 2023). In the field of lung diseases, OoC technology can simulate alveolar structure and airflow dynamics, studying respiratory conditions such as asthma, chronic obstructive pulmonary disease (COPD), and lung injuries (Saygili et al., 2023). It is possible to study disease mechanisms, evaluate the efficacy of novel drugs, and consider prospective therapies by exposing lung cells to disease-specific triggers and external stimuli like pollution or cigarette smoke. Furthermore, in 2020, investigations of viral infection in lung-on-a-chips became more prominent due to the SARS-CoV-2 outbreak (Saygili et al., 2021; Shrestha et al., 2020). Along with that, liver-on-chips can mimic the hepatic microenvironment and enable the study of liver diseases such as hepatitis, liver fibrosis, and drug-induced liver injury. Assessment of drug metabolism, toxicity, and disease progression utilizing immune, hepatic, and endothelial cells can ultimately produce innovative therapies and enhance drug safety profiles (Kanabekova et al., 2022). OoC technology can also shed light on gastrointestinal diseases, such as inflammatory bowel disease (IBD), colorectal cancer, and celiac disease. With the recapitulation of the microarchitecture of the gut and including gut cells, immune cells, and commensal bacteria, researchers can study the interaction between the gut microbiome and disease development, evaluate drug efficacy, and develop novel therapeutics (Akhtar et al., 2017). Moreover, OoC platforms can be applied to modeling bone diseases, enabling simulation of the dynamic interplay between bone cells, blood vessels, and the surrounding microenvironment. This technology holds promise for studying conditions such as osteoporosis, bone metastasis, and fractures, facilitating the development of new therapeutics and tissue engineering strategies to enhance bone regeneration (Arrigoni et al., 2017). OoC technology can contribute to the field of vascular biology by recreating the complex structure and dynamics of blood vessels. Incorporation of the endothelial cells, smooth muscle cells and associated mechanical signals enable the study of diseases such as atherosclerosis, thrombosis, and angiogenesis, also help

evaluate the effectiveness of vascular-targeted drugs and investigate the underlying mechanisms of vascular diseases (Gold et al., 2019). Significantly, OoC technology has wide applications in modeling diseases in various organs by simulating the microenvironment of these organs, studying disease mechanisms, drug development by providing unparalleled opportunities to evaluate effectiveness and develop personalized therapies. The treatments ultimately revolutionize the field of biomedical research and improve patient outcomes.

Cancer and Metastasis-on-a-Chip

Many inflammatory, infectious, and viral diseases are modeled on organ-on-a-chip platforms, with cancer being the most studied disease model due to its wide variety of types (Li et al., 2022). Cancer is a complex and heterogeneous disease characterized by uncontrolled cell growth and proliferation, and one of the leading causes of death worldwide. One of the most critical aspects of cancer development is metastasis, where cancer cells spread from the primary tumor to distant sites in the body (Fisher et al., 2013). Metastasis involves a series of complex steps, including invasion of cancer cells into surrounding tissues, entry into the bloodstream or lymphatic system, circulation in the body, extravasation to distant organs, and establishment of secondary tumors in vital organs (**Figure 1**). Understanding the mechanisms underlying metastasis and developing effective strategies to target and prevent it are critical to improving cancer outcomes (Fares et al., 2020). However, studying metastasis in traditional in vitro cell culture systems or animal models often falls short due to their limited ability to recapitulate the complexities of the metastatic process, highlighting the need for more sophisticated platforms. Cancer and metastasis-on-a-chip platforms have emerged as powerful tools to study cancer growth, metastasis, and targeted therapies of various types of cancer (Liu et al., 2021). Metastasis-on-a-chip models offer several advantages over conventional methods as they provide a more accurate representation of the tumor microenvironment, interactions between cancer cells and the surrounding tissue. Metastasis-on-chip models more accurately reflect the complexity and variety of the tumor microenvironment by including several cell types, like fibroblasts or immune cells, allowing for the examination of the functions of diverse cell types in metastasis (Imparato et al., 2022). Also, microfluidic systems offer the ability to recreate the fluid dynamics encountered during metastasis. By introducing fluid flow and shear forces, how physical cues affect the behavior and migration of cancer cells can be studied. For instance, incorporating vasculature-like structures and fluid flow into the chips allows evaluation of the extravasation of cancer cells from the bloodstream into target organs, mimicking the process of metastatic colonization. This allows for more detailed investigation of mechanistic aspects of metastasis, such as cell adhesion, migration and extravasation (Regmi et al., 2022; Sontheimer-Phelps et al., 2019). In addition, metastasis-on-a-chip models can incorporate specific organs or tissue compartments to mimic the metastatic location. These organ-specific microenvironments can be engineered to replicate the unique characteristics of different tissues prone to metastasis, such as lung, liver, or bone. By recreating these organ-specific conditions, researchers can gain insight into how cancer cells interact with and colonize distant sites, contributing to secondary tumor growth (Sharifi et al., 2020). The capacity of metastasis-on-chip models to more accurately and predictably assess the success of pharmacological therapy is

one of its key advantages. The response of cancer cells to various treatment options can be evaluated by incorporating cancer cells with various metastatic potential or drug resistance characteristics. Microfluidic systems allow precise control of drug delivery and exposure, enabling investigation of drug responses and identification of potential therapeutic strategies to target metastatic cancer cells. In addition, OoC models can be used to investigate organ-specific metastasis. Each organ has unique cellular compositions, extracellular matrix compositions, and physical properties that may influence cancer cell behavior. Organ-specific factors that encourage or inhibit metastasis can be thoroughly examined by developing organ-specific chips, thereby assisting in the development of targeted therapies for particular organs impacted by metastatic disease (Zhang et al., 2022).

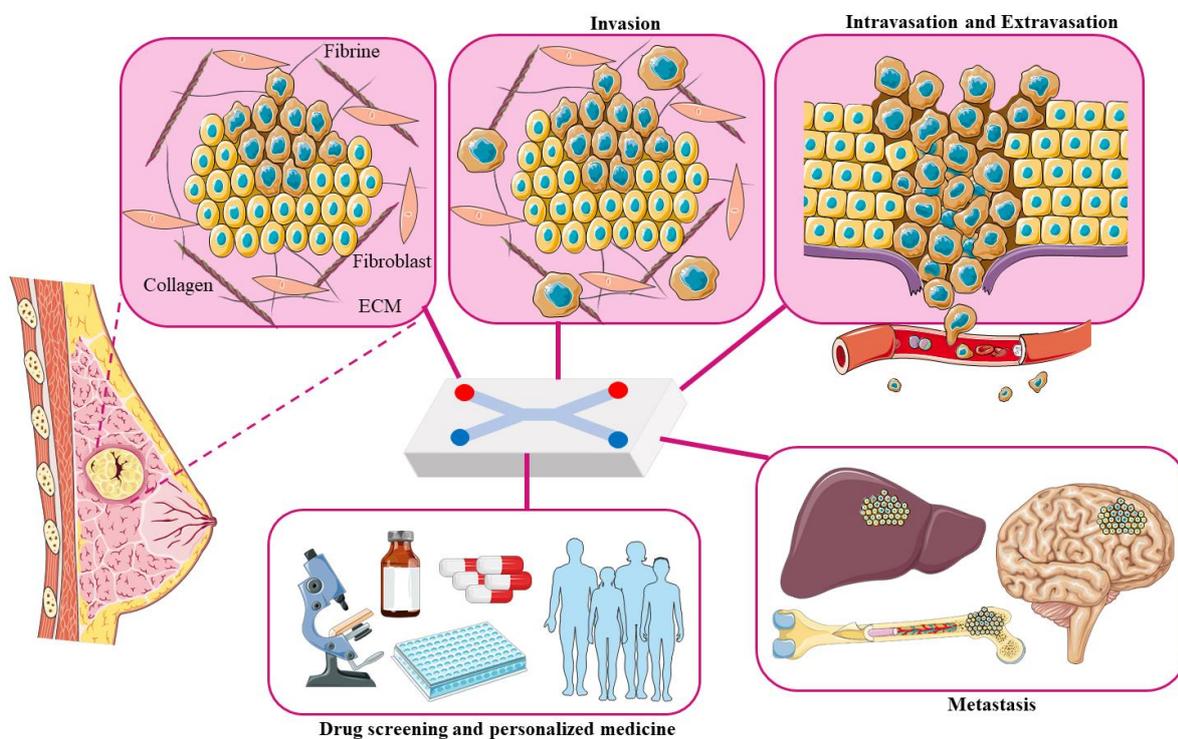

Figure 1. Breast cancer metastasis and breast cancer-on-chip platforms. The image was created by using the visuals in the SMART Servier Medical Art (<https://smart.servier.com/>) program licensed under a Creative Commons Attribution 3.0 Unported License.

Many different cancer types, such as brain, skin, bone, lung, liver, pancreas, intestine, prostate, ovarian, and breast cancer, have been studied on OoC platforms (Liu et al., 2021). Breast cancer, which ranks first, surpassing lung cancer with an incidence of 11.6%, has also become the focus of cancer-on-chip studies in recent years. The increase in deaths from breast cancer as a result of metastasis or from cancers that metastasize to the breast supports the development of breast cancer-on-chip platforms to develop new and effective treatments by focusing on metastatic processes (Moccia and Haase, 2021). Breast cancer-on-chip models that can recreate the dynamic interactions between breast cancer cells and the extracellular matrix can recapitulate the migration and invasion behavior of breast cancer cells and the structure of the mammary gland. Such models

include biomimetic 3D hydrogels such as collagen, fibrin, hyaluronic acid, Matrigel, GelMA with different invasive properties and different cell types for the tumor microenvironment (Keller et al., 2021). In addition, these platforms allow investigation of intravasation and extravasation, the processes by which cancer cells enter and exit blood vessels, respectively, which are important for metastasis. In the intravasation and extravasation processes, the motility of cancer cells, their interaction with the tumor microenvironment and immune cells, and the flow conditions in the microfluidic platform along the vasculature exhibits utmost importance (Subia et al., 2021). Breast cancer cells that cross the vasculature move to distant sites, such as the bones (Hao et al., 2018), liver (Kim et al., 2020) or brain (Conceição et al., 2022). This has been replicated in breast cancer-on-chip models with the integration of two or more organs, allowing for multi-OoC studies. This study increases the understanding of how the metastatic cascade occurs and the mechanisms underlying metastasis to distant organs. Breast cancer-on-chips also enables assessment of metabolic and biochemical properties of cancer cells, such as nutrient uptake, oxygen consumption, and waste production. These parameters may shed light on metabolic changes in breast cancer and aid in the development of targeted therapies. Additionally, the platform has potential applications in breast cancer diagnosis, as it can be used to study the migratory behavior of tumor cells and assess their potential for metastasis. In a therapeutic context, breast cancer-on-chips provides a valuable tool to test the efficacy and toxicity of variety of therapies, allowing for personalized treatment approaches (Firatligil-Yildirim et al., 2023). These models can incorporate patient-derived cancer cells or tumor samples, enabling researchers to evaluate the effectiveness of potential treatments on an individual basis. By exposing patient-specific cancer cells to different drugs or treatment regimens within the chip, the tumor's response and sensitivity to different interventions can be assessed. This individualized approach has the potential to optimize treatment strategies and improve patient outcomes. These chips also allow evaluation of the effectiveness of anti-cancer drugs and potential interventions to prevent metastasis (Yildiz-Ozturk et al., 2017). Additionally, these chips can be used to test the effectiveness of chemotherapy drugs and identify potential targets for personalized treatments (Subia et al., 2021). To conclude, breast cancer metastasis-on-chip models offer a valuable approach to evaluate the invasion, intravasation and extravasation processes of metastasis, efficacy of drug therapies in the context of metastatic cancer. Ongoing efforts to engineer advanced microfluidic systems and develop organ-on-chip platforms hold great promise for the predictive translation of preclinical findings into clinical studies. Combining the advantages of these models with interdisciplinary collaborations, researchers are paving the way for more efficient and precise drug development processes, bringing us closer to improved treatments for cancer and other complex diseases.

Conclusion

OoC technology has emerged as a promising alternative, providing a platform that overcomes interspecies differences and better represents the intricacies of human organ function. By enabling more precise and reliable preclinical studies, OoC models offer the potential to enhance drug development, reduce late-stage failures, and accelerate the translation of research findings into successful clinical trials (Ingber, 2020). Incorporating key parameters related to the molecular, cellular, and physiological characteristics of human disease progression,

these innovative models have the potential to break Eroom's Law and revolutionize the drug discovery and development process (Ringel et al., 2020). Recapitulation of in vivo organ-level physiology and pathophysiology, OoC models provide a powerful platform for studying human biology, disease mechanisms, and drug responses. With their potential for personalized medicine and precision therapies, OoCs offer new avenues to advance healthcare and develop safer and more effective treatments. These platforms can be engineered to include multiple OoC modules interconnected to mimic the interactions between organs, creating a system that more closely matches the complexity of the human body (Danku et al., 2022). As cancer, specifically breast cancer, is one of the most common and deadly diseases, metastasis-on-a-chip models emerged as a valuable tool to study and understand the complexities of cancer metastasis. Emulating critical aspects of the metastatic cascade within a microfluidic platform, these models provide a more physiologically relevant platform for investigating the mechanisms and dynamics of metastasis. They have the potential to expand our understanding of the metastatic process, identify new therapeutic targets, and accelerate the development of more effective anti-metastatic strategies. Ultimately, these advances have the potential to innovate cancer research and contribute to the development of more effective strategies for the diagnosis, treatment, and prevention of metastatic cancers.

Economical Environmental and Political Aspects of PV Recycling in The Light of Future Projections

Melih Soner Celiktas

Ege University Solar Energy Institute, Turkey, Soner.  <https://orcid.org/0000-0003-0597-5133>

Abstract: Photovoltaic materials or a solar cell, is an electronic device that converts the energy of light directly into electricity by the photovoltaic effect. There are several different types of PV cells which all use semiconductors to interact with incoming photons from the sun in order to generate an electric current. Photovoltaic solar cells or panels are accepted as a reliable and non-polluting alternative energy. The PV market grew catastrophically since the last two decades, which is mainly accompanied by the falling prices of solar cells, in special of silicon. PV modules, which will provide a large part of the energy need in the coming decades, may cause a major environmental disaster if they are not recycled after completing their economic life. However, the economic feasibility of recycling is uncertain. On the other hand, both the lack of a technological solution for PV recycling and an international policy in this area are seen as a major shortcoming. In this study, the economic and environmental impact of PV recycling was investigated by taking into account the projection studies carried out by different institutions.

Introduction

New technological developments are the primary driving force for growth and rejuvenation in industries such as information technology, energy technologies, and AI, which are expected to improve people's quality of life. Many researchers have made important contributions to renewable energy technology (Alptekin et al., 2023; Çebi et al., 2021; M.S. Celiktas & Kocar, 2012; M.Soner Celiktas & Kocar, 2010; Cerone et al., 2017; Deniz & Çeliktas, 2022; Garip et al., 2022; Gunes et al., 2020; Ozay & Celiktas, 2021; Pilavtepe et al., 2013). The renewable energy sector and especially solar power plants have been among the fastest growing sectors in the world over the last decade. Solar PV continued its unprecedented run, reaching 175 GW of new capacity in 2021, for a cumulative total installed capacity of approximately 942 GW (REN21, 2022). There are two main reasons for the acceleration of investments in the solar energy sector; Cost-effectiveness and climate change. The costs of utility-scale PV projects fell nearly ninety percent between 2010 and 2021, from \$0.40 per

kilowatt-hour (kWh) to \$0.046 per kWh (REN21, 2022; Statista, 2023).

Pressure on resources will increase due to increasing global growth such as sustainable industrialisation, ecologicalisation and digitalisation. Increasing demand from emerging markets and the transition to climate neutrality with rare and critical metals, strategic minerals used in low emission technologies and products (Bobba et al., 2020). So, rapid growth of photovoltaic installations over the past decade requires radical action for establishing a robust and economically viable PV disposal and recycling system. The economic lifetime of photovoltaic modules is considered to be around 25-30 years (Kim & Jeong, 2016). Therefore, at current growth rates, the first peak of PV disposal will be seen around 2030. Steps need to be taken today to avoid the fossil fuel turmoil in the renewable sector.

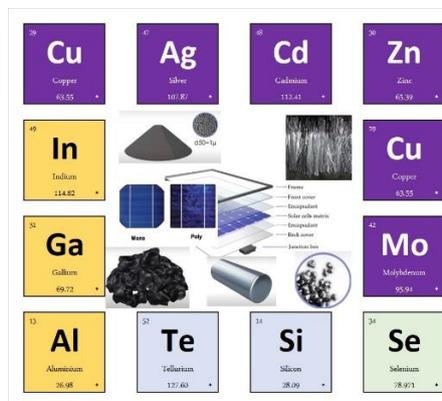

Figure 1. The minerals in solar panel

Photovoltaic panels contain rare minerals and precious metals that are increasingly mined and refined (Figure 1). So, proper recycling of these precious metals and minerals is of great importance for the industry. It is mandatory to establish recycling methodologies, infrastructure and policies to reuse of these materials within the industry. C-Si PV modules, contain aluminum, glass, silicon, copper, silver, and rare minerals (RM). CdTe PV modules contain cadmium, copper, steel, and RMs (Fthenakis et al., 2020). The rare critical metal components used in the PV module are often more expensive than other used materials, and their recycling process is very important for reuse in production. On the other hand, a significant amount of energy is spent to purify these materials for reuse in PV modules. Thin-film modules contain critical and strategic raw materials as Te, In, Ga, and Mo, which are in limited supply (Berger et al., 2010; Meyer & van Dyk, 2003).

PV Recycling Methods

The biggest challenge in recycling solar panels is that, unlike their complex structure, the materials used in their construction are used together in a single product. PV recycling can be done using a variety of techniques (Table 1). These techniques are based either on physical or thermo chemical recycling (Dias et al., 2017; Gustafsson et al., 2014; Nain & Kumar, 2022). In the physical method, various processes such as size reduction, planetary

grinding and separation are applied (Dassisti et al., 2020; J. Zhang et al., 2013). The recycled products are the aluminum which is part of the frame, glass fragments, silicon powder, copper, ethylene-vinyl-acetate (EVA) and backsheet particles. Although silicon cannot be recycled for use in the PV industry due to low purity, the recycling rate is roughly 90% by mass. In the thermo chemical method, which is primarily based on the degradation of the EVA layer and recovery through pyrolysis, the cell residues undergo a thermal treatment and are then used in chemical processes for the recycling of silicon, silver and aluminum (IRENA and IEA, 2016). Recent research on end-of-life conventional crystalline silicon PV modules has focused on organic solvent methods and alternative conversion methods to recycle silicon cells (Kang et al., 2012; Tammaro et al., 2015).

Table 1. PV Recyclig Methods

Mechanical Recycling		Chemical Recycling		Thermal Recycling	
<i>Traditional</i>	<i>Innovative</i>	<i>Traditional</i>	<i>Innovative</i>	<i>Traditional</i>	<i>Innovative</i>
Crushing	High Voltage Crushing	Strong Chemicals	Mild extracting technology	Incineration	Pyro - metallurgical technology
Shredding	Electro-hydraulic Fragmentation	Leaching	Chemical + Hydrometallurgical treatment	Thermal treatment	Supercritical Technology
Milling	Irradiation by laser	Solvent usage	Biometallurgical Technology	Combined Heat treatment	Vacuum metallurgical technology

Economical, Enviromental and Political Expectations

It is very difficult to say that disposing of solar panels is environmentally friendly. Heavy metals in solar cells, such as cadmium and lead, can become hazardous and toxic waste if not properly recycled. So, recycling PV systems has both environmental and economic benefits. Although economic concerns are the biggest obstacle in most recycling studies, other precious metals and minerals can be considered worth recycling. Since the average lifespan of a PV system is quite long and varies between various types, the number of end-of-life systems is slowly increasing, but the most important problem here is that the economic benefits of recycling will remain below the company's expectation. The recovery of rare metals and minerals from waste solar cells (or solar panels) is becoming more and more important with the day by day development of the photovoltaic industry. It is gaining importance both economically and environmentally (Z. Zhang et al., 2021).

In addition to its environmental importance, the recycling of solar PV panels will also have an impact on the value chain. Studies on PV module recycling mainly focus on technology and methodology. However, research, especially in the coming decades, should also be geared towards analyzing waste PV cell strategies from an

economic point of view. Some rare elements in PV modules, which are in limited supply in the world, are depleted from the environment over time. If these materials can be recovered, they can be incorporated into the supply chain for reuse in the production of PV and other products. According to a study by the International Renewable Energy Agency, it is estimated that 15 billion dollars could be recovered from the recycling of pv modules by 2050 (IRENA and IEA-PVPS, 2016). However, extracting and recycling these materials is both a complex and expensive process. Based on a study conducted by the National Renewable Energy Laboratory, it was found that recycling costs between \$15 and \$45 per module, while landfilling costs between \$1 and \$5 per module. Due to these costs, most PV panels are not recycled today (Curtis, Buchanan, Smith, et al., 2021).

From this perspective, solar panel recycling is still in its infancy. All players in the game have started discussions on how recycling policies can drive a circular economy for PV system components. The Policies will encourage the development of PV reuse-recycling business models and processes with different approaches to PV module fabrication. In 2012, the EU declared end-of-life PV modules as waste electrical and electronic equipment (Monier & Hestin, 2011; Sander et al., 2007). So in Europe, solar panel manufacturers are required by directives to recycle their panels when they reach the end of their useful life. Likewise, PV system manufacturers also have a legal responsibility to handle end-of-life modules appropriately.

On the other hand, in the US, such a regulation does not yet exist. However, some states have enacted laws regulating the end-of-life management of PV panels. There are no US federal policies addressing PV system equipment recycling or end-of-life management options. Washington, New Jersey, North Carolina and California are the US states with laws or regulations that directly address PV system equipment reuse and/or end-of-life management options [28]. The policy proposal should provide the necessary incentives to enable sustainable materials management practices within the circular economy until recycling costs become competitive with disposal (Curtis, Buchanan, Heath, et al., 2021).

Conclusion

Circular Economy is a model of manufacturing and consumption that involves sharing, lending, reusing, repairing, reconditioning and recycling existing materials and products for as long as possible (Cebi et al., 2022; Corvellec et al., 2022; Walter R. Stahel, 2016). Of greatest concern are the increasing requirements for metals and minerals due to the development and deployment of renewable energy and storage technology. Demand for these raw materials will exceed current production in the near future, depending on developments. PV module installations are growing rapidly, especially considering the last decade, and will soon dominate energy production, increasing market dominance within the circular economy (Teske, 2019). As a result of this rapid growth, the volume of modules reaching the end of their economic life will similarly grow. As a result, methods for recycling solar modules are being developed worldwide to reduce the environmental impact of PV module waste and recover some of the value from old modules (Lunardi et al., 2018). Further development and implementation of PV recycling and/or end-of-life management requires public funding for research and

development or civil initiative.

Finally, a global policy approach that supports the circular economy and sector of the PV recycle is urgently needed for a successful and cost-efficient transition process. Concrete standards and requirements must be defined at a very detailed level, covering as far as possible all technologies and their areas of application.

Wearables and the Practice of Self-Surveillance as Self-Knowledge

Natalia Stanusch

University of Amsterdam, The Netherlands,  <https://orcid.org/0000-0002-6796-9049>

Abstract: This paper analyzes how the materiality of knowledge afforded by wearables is present within the practice of self-surveillance. Wearables, such as smartwatches, allow for easy tracing and storage of one's activity history, but they require the wearer to engage in self-surveillance. While giving away one's data to gain access to online services is motivated by efficiency and 'free' accessibility, the practice of self-surveillance in wearables is blurrier. In this paper, I situate the notion of desire as central to the practices of digitalized self-surveillance. This paper follows the following line of inquiry: two case studies of recent self-tracking trends (Quantified Self Movement, Apple Watch) and one historical, media archeology case study of diary writing from the 19th century. The digital self-surveillance is linked to the notion of agency and control exercised by self-disembodiment. Disembodiment is briefly analyzed as establishing a disembodiment view of the self through a distant view of the past and presence. Such a view, 'from outside to inside,' is linked to the self-knowledge inherent in self-tracking across time. The body becomes a data object, at once a stable entity and an object-in-making. Yet there is a threat in perceiving data as an objective mirror of reality (and thus self) rather than a set of opaque algorithm-driven ('cooked') digital objects.

Keywords: Wearables, Self-Surveillance, Datafication, Self-Tracking, Media Archeology

Introduction

Wearables are becoming an increasingly intrinsic part of many lives across the globe. According to Accenture Research conducted in 2018, the use of wearable technologies tripled in the period from 2014 to 2018, raising from 9% to 33% (Accenture Research 2018). Ranging from 'smart' rings and 'fitness' bands, to watches and apps, technologies of self-tracking allow for an easy way of recording, measuring, analyzing, and storing the history of one's activity. Generally, such devices are "designed to quantify everyday exercise and rest, mood and diet, and then provide feedback to users such that they can better understand and possibly modify their activities and behavior" (Crawford, Lingel, & Karppi, 2015, p. 484). What self-tracking wearable hardware and app software allow for is the recording and collecting of data which is transcribed and analyzed using complex computing operations (Lyon, 2018, p. 101).

In order to self-track one does not even need to physically wear anything. Plenty of smartphone apps that use in-

built phone's accelerometer are able to 'monitor' both outside and inside patterns of the body, from sleep quality to air quality (Salter, 2022, p. 234). While some self-tracking tech can be seen as pure consumer goods no different from gadgets, others are in fact "required" to wear in certain activities or even jobs (Lyon, 2018, p. 101). Whether it is step count, blood pressure, or sleep quality, what self-tracking tech is supposed to help the user achieve is self-optimization (Salter, 2022, p. 234). Thus, self-tracking technologies promise a new, digital way of living a healthier and more conscious (or optimized) life, be it professional or personal life.

Wearables seem to establish self-tracking (or self-surveillance) as a common social practice, offering in exchange access to self-knowledge. It's been already pointed out that the discourse around wearables has often took form of situating wearables within the domain of technology of self-knowledge. In a study devoted to a wearable in form of a ring that is supposed to measure stress levels and alert the user to calm once she is under pressure, Berg points out that user can learn about herself and her bodily senses through the sensors of the wearable (Berg, 2017, p. 7). Berg notes that, on the one hand, wearables "can assist users in learning about themselves and to take command of their lives," yet, on the other hand, wearables imply that "the human body is most often presented as incapable to decipher embodied experiences" (Berg, 2017, p. 7). Partially following that line of inquiry, this article argues that self-tracking that makes wearables work is often taken as a prerequisite for a larger goal, that of new form and ontology of self-knowledge, which would be otherwise impossible. Therefore, this article seeks to answer the following research questions:

RQ1: What are the promises of self-knowledge that self-tracking technologies such as wearables make in exchange for users' self-surveillance practices?

RQ2: In what ways is the self-knowledge offered by digital self-tracking technologies similar/different to self-knowledge of the domain of the analog (e.g. 19th century diary keeping)?

RQ3: What are the logics and new ontologies of self-knowledge that is made accessible to users via datafication and self-surveillance?

Method

This paper merges materialist media studies as well as radical humanist approaches with interpretative media and communications paradigm. It aims to critically define and evaluate the affordances of a medium (self-tracking technologies) and social relation (users' practices of self-tracking). In this paper, I partially rely on three case studies and the close-reading of the content as a result of a signifying processes. A semiotic analysis of images and their accompanying texts is used in order to pin down the semiotic relations and intended message of the content examined in each case study.

The methodology for this paper is based on three types of analysis: medium/aesthetics analysis, semiotic analysis, and content analysis. First, I conduct a semiotic analysis of the Quantified Self movement and Apple Watch marketing materials. These two case studies consist of captures (screenshots) of the official webpages from the Quantified Self and from Apple, respectively. While the analysis of the Quantified self focuses more

significantly on the written content of the sources, the analysis of Apple Watch included visual analysis and close-reading of marketing materials in a broader context of marketing strategies of Apple, as they were best established in the iconic “1984” Macintosh commercial. Second, I relate my findings to a broader notion of self-knowledge obtained through self-tracking-by-outside-disembodiment. For that purpose, I turn to the third case study, an analysis of which focuses on the practice of diary writing. In the third case study, I follow the principals of media archeology (Parikka, 2012). As Jussi Parikka phrased it, media archeology approach allows one to perform, a “theoretically refined analysis of the historical layers of media in their singularity—a conceptual and practical exercise in carving out the aesthetic, cultural, and political singularities of media” (Parikka, 2011). Lastly, I perform a comparative analysis and discussion of all three case studies. The research sample for performed case studies (website captures) was collected on June 2, 2023.

Results

Case Study 1

The screenshot shows the homepage of Quantified Self. At the top left is the logo 'QUANTIFIED SELF SELF KNOWLEDGE THROUGH NUMBERS'. To the right is a large 'QS' logo. Below the logo is a search icon and a menu icon. The main content area is dominated by a large heatmap showing data points from 2023-02-20 to 2023-05-27. The heatmap consists of a grid of colored squares (green, yellow, orange, red) representing data points. To the right of the heatmap is a featured article titled 'THE KEATING MEMORIAL SELF RESEARCH GROUP' with a photo of a man in a lab. Below the heatmap is a section for a 'New Show&Tell Event: Tracking Blood Glucose' with a photo of an astronaut in a space suit.

Figure 1. Capture of the Homepage of Quantified Self. <https://quantifiedself.com>.

“Quantified Self supports every person’s right and ability to learn from their own data. We’re committed to accuracy, independence, inclusiveness, and transparency in all of our work” (Quantified Self, 2023A), announces the quote located at the bottom of each page of the Quantified Self website. The Quantified Self movement took shape in the late 2000s. It was set up by a former WIRED editor Kevin Kelly and Gary Wolf with an aim of pinning down the phenomenon of people who collected and analyzed own data to examine patterns of own behavior. The approach of “data driven-life” (Wolf, 2010), as they called it, has been central in framing empowering self-knowledge as derived from numbers (Salter, 2022, p. 174). Ten years on, the slogan

on the Quantified Self website reads “Self knowledge through numbers” (see fig 1.).

Having started right beside Silicon Valley, the Quantified Self (QS) main office is located in San Francisco, USA, but QS is considered an international “community” of people interested in the use of self-tracking technologies and tools for the sake of “self-knowledge” (Quantified Self, 2023B). On the one hand, QS as a community spawning across the globe speaks of a rather empowering notion of personal ownership over one’s own own data and thus being in charge of using that data for self-knowledge (Quantified Self, 2023B). The scope of QS extends from ‘personal’ self-tracking technologies such as wearables to the depths of datafied society: including the markets for data brokers or “data stores” and online website tracking. Aside from self-knowledge through self-tracking, QS’ emphasis lies in the community-based development and feedback on various self-tracking projects and practices, but also the importance of privacy and broader desire “to better help us answer a broader range of questions about ourselves” (Quantified Self, 2023B) through data.

This premise is reflected in the design of QS’ digital presence as well. The futuristic font omnipresent on their website (fig.1) signifies the digital displays of early-computing days. Somewhat futuristic, it quite literally recalls how ‘the digital’ indeed is made out of digits, historically displayed as single lines or pixels. This visual connection is also referenced in the logo of QS – made out of dots or digits (pixels) which can also be read as data points. The QS’ logo thus directly references the very core of the whole movement: single data points can be put together into a signifying (meaningful and readable) pattern.

The studies of wearables and datafication have often focused on the QS movement (Crawford, Lingel, & Karppi, 2015, p. 484). Yet, as Crawford, Lingel, & Karppi point out, the QS movement is a rather borderline case of a very dedicated group of users of self-tracking technologies who actively identify as such (Crawford, Lingel, & Karppi, 2015, p. 484). Nonetheless, I include the case of the QS movement here precisely because through its borderline magnification of the premise of data-driven self-tracking, we can study the promises of self-knowledge through self-tracking. Such promises, as I argue, also reach a larger group of users, even if they do not actively and directly subscribe to the QS. Self-tracking in the spirit of the QS movement is rather commonplace today (Nafus and Sherman, 2014, p. 1785) as a way of gaining “self-knowledge” that can lead to bettering users’ lives (Lyon, 2018, p. 15). With the widespread of smartphones, self-tacking apps merge with data flows that include personal data accumulated and transferred from users’ devices as well as health institutions (Cheney-Lippold, 2017, p. 118; Lyon, 2018, p. 101). Self-tracking is more than a peculiar movement that outgrown itself, and its basic premise is not as new as it might seem.

Case Study 2

“Apple ads are about how a product can change your life” (Hollis 2011). In their products, Apple has always promoted very specific values and lifestyle, combined with visually pleasing design, and this strategy remained consistent through the years. While looking at the recent promotional pictures for Apple Watch on Apple’s official website, one can trace the same values and concepts that Apple included in its most iconic campaign. In

its 1984 commercial, Apple played on the reference to George Orwell’s 1984, yet Californian ideology makes Apple commercial appear as an ideological choice based on a belief that technology brings liberation. Steve Jobs and Steve Wozniak, the creators of Apple, embodied the beliefs of the Californian ideology. The idealized vision of internet was based on the hope that it will be the place “where all individuals will be able to express themselves freely within cyberspace” (Barbrook and Cameron, 1996). This illusive cyberoptimism did not include the dark side of the internet, filled with data harvesting, bots’ manipulations, and fake news. Nevertheless, “the Internet remains dominated by American corporations, primarily from California” (Fuchs, 2018), which were born out from this ideology – the QS movement is related to it too. The Californian ideology narrative has been present throughout Apple commercials, and is a part of a persuasion technique they use to promote their products.

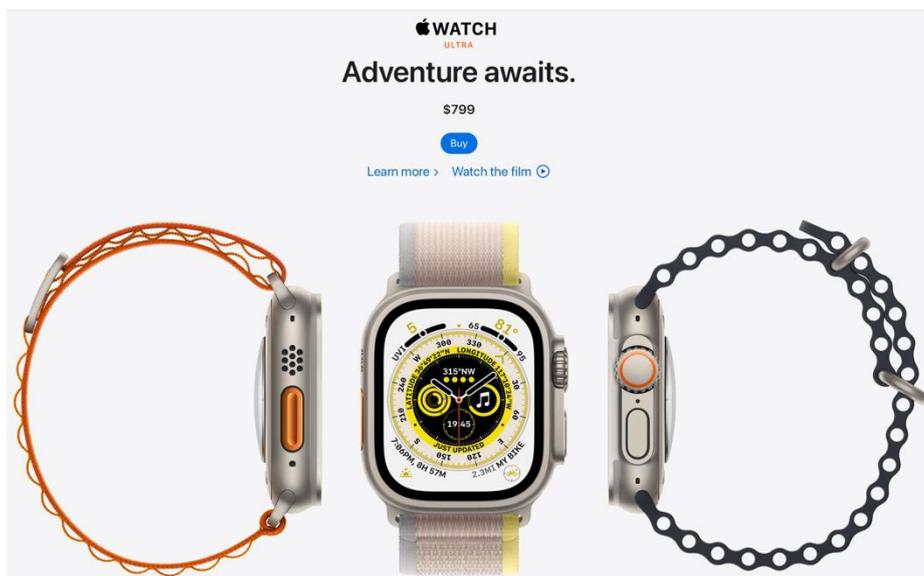

Figure 2. Capture of the Page of Apple Watch. <https://www.apple.com/watch/>

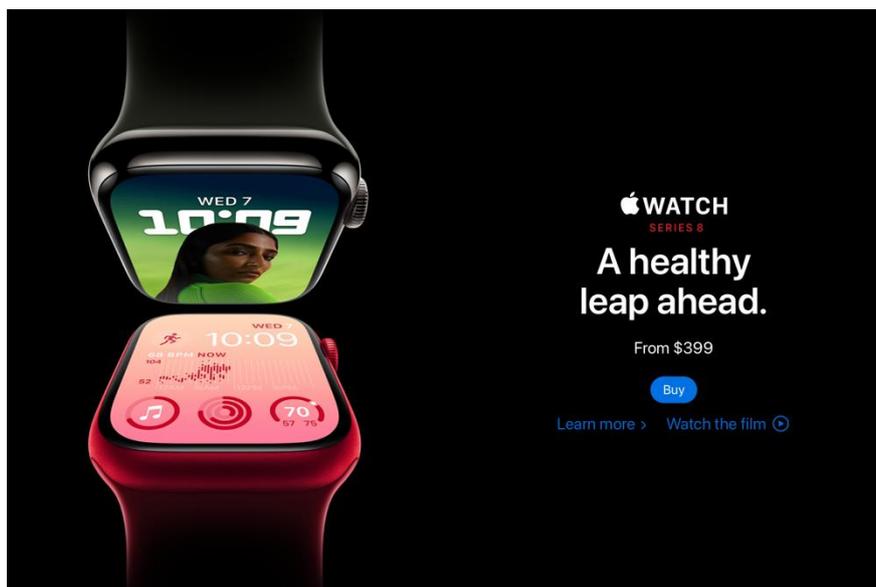

Figure 3. Capture of the Page of Apple Watch. <https://www.apple.com/watch/>

1984 by Apple, shows a dystopian, Orwell-like world, with no individualism and total control. Among a crowd of people blindly staring at a screen of Big Brother’s face, a young woman is running. She is slim, blond, and young. She is wearing red shorts and white top, and she is carrying a hammer in her hands. As she runs from police-like forces, she throws the hammer into the screen, destroying it and subsequently liberating people. The subtitle reads that “On January 24th, Apple Computer will introduce Macintosh. And you’ll see why 1984 won’t be like “1984” (Scott, 1984). Each element of this commercial corresponds to the Californian ideology. The digitalization, presented as an attractive and young woman, liberates the masses from control and surveillance. The woman wears bright and saturated colors, red and white, which not only are in contrast with the rest of the shots, but also seem powerful, modern and aesthetically pleasing. The commercial sells the idea of technological liberation by a good-looking and modern solution. Apple Watch offers just that: it is a wearable that is both “extremely insightful” and is the “ultimate device for a healthy life” (fig. 4).

The way in which Apple presents its Appl eWatch (fig. 2 and fig. 3). Apple Watch is hovering in the spaceless void, either emerging from the white background as a liberating portal to a better place – to the “adventure” waiting ahead (fig. 2) or illuminating the black background with its liberating knowledge to empower users to “leap” towards “healthier” selves (fig. 3). Both the signifiers and signified of Apple Watch bear great similarity to Apples’ “1984” ad. In both cases the digital provides a space for a new and liberal ways of communicating, a “digital rhetoric that encourages self-expression, participation, and creative collaboration” (Eyman, 2015). Apple established “the cool design aesthetic, the imagery in the advertising, and the sense of community evoked by seeing people you respect with Apple products” (Hollis 2011), and it works. According to Statista (2018), in 2006 Apple started with a value of 15.98 billion U.S. dollars, while it reached 300.6 billion U.S. dollars by 2018, becoming the second biggest technological brand worldwide, after Google. As Brad Johnson, *Ad Age*’s director of data analytics, observes, “Apple pursued a vision, a dream. It did not pursue a business” (1994).

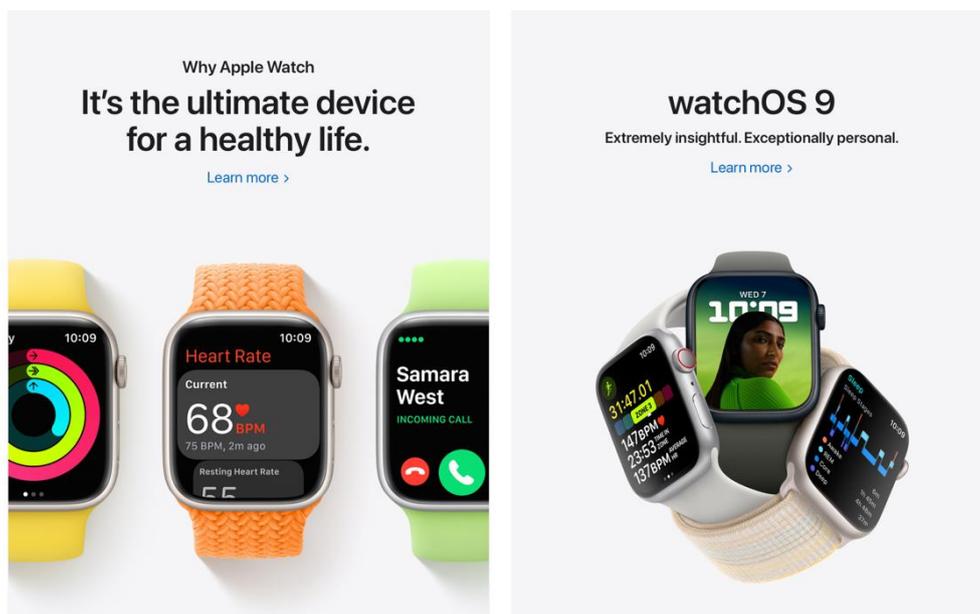

Figure 4. Capture of the Page of Apple Watch. <https://www.apple.com/watch/>

Case Study 3

The practice of keeping track of the self by putting down data is significantly older than Apple Watch and the QS movement. The practices of record-keeping for professional goals (record books at merchants' such as accounting books) and personal purposes (diaries) and both (calendars and agendas) are centuries long. All these examples are connected by the characteristic of the search for (self) knowledge through a set of data points, recorded through time, that can reveal new, otherwise unattainable, patterns for self-improvement.

Historically speaking, we can locate a certain shift in mentality and growing popularity of self-knowledge practices to the 19th century. In the positivist spirit of the industrial revolution, many scientists and industrialists turned to new creating tools and ways of, as we would say today, 'datafying' the visible and invisible of the human behavior. As Salter points out, the unifying aim of such endeavors in both North America and Europe was to establish "a new kind of human being: quantifiable, calculable, and predictable" (Salter, 2022, p. 18). The very idea of turning "messy" human sensations into something "readable" – such as devices to 'measure' heartbeat – was one of the very first attempts at data visualization (Salter, 2022, p. 31). Salter goes as far as to argue that the ideology that spawned in 19th century has been directly materialized in the wearables of today:

But to turn our human bodies into continual experimental test subjects that are being monitored 24/7 might just, in fact, be the ultimate apotheosis of the nineteenth-century laboratory, in which the senses could be precisely monitored, qualified, and predicted, all without the intrusion of the experiencing self. (Salter, 2022, p. 214)

Writing and note keeping are a technology in itself older than that of mechanical means of tracking the body. Salter notices that diary keeping as a self-knowledge practices were, nonetheless, "personal, close-up, and subjective accounts of their experience" (Salter, 2022, p. 174). However, the practices as such were in their core similar; as Schüll (2016), following Crawford et al (2015) points out, "people have long used simple, analog devices to record, reflect upon and regulate their bodily states and processes (for example, diaries, scales, wristwatches, thermometers)" (Schüll, 2016, p. 3). Salter discusses an example given by philosopher Michel Foucault, who claimed that "the ancient Roman philosophers called the Stoics sought to obtain 'self-mastery' through self-discipline and would trade detailed lists of banal activities that they involved themselves in, such as exercise routines" (Salter, 2022, p. 174; Foucault, 1997, p. 208; Foucault, 1988). Such "self-mastery" has been reinforced with the notion of the body as needed to be quantified, tamed, and improved.

The connection between control and bodily self-knowledge brings us back to 19th century, where the notion of the body as a resource of energy was deeply rooted in both an ideology of industrial revolution and, even earlier, in the pragmatic teachings of Protestantism (Daggett, 2019, p. 75). The development of commercial goods that meant to aid with "self-realization" gained popularity in the US of the early 1900s (Sassatelli, 2012, pp. 640-641). Sassatelli further adds that in the Western culture, healthy body has been repetitively signifying the body that is "expanded" by self-knowledge and fully controlled (Sassatelli, 2012, p. 637; p. 640).

A similar moral obligation towards self-tracking as a duty was made visible by Crawford, Lingel, & Karppi (2015) in their study of weight scales. Locating the premise behind the market for scales to 1890s, they argue that scales were intended as outside self-knowledge tools that offered both quantification and measurement for self-tracking (Crawford, Lingel, & Karppi, 2015, p. 480). The public was supposed to “know one’s metrics” in order to pursue self-knowledge that can then transfer into living a good (or better) life (Crawford, Lingel, & Karppi, 2015, p. 486). As they rightfully point out, “with the emergence of wearable self-tracking devices, remarkably similar claims appear: self-tracking will lead to self-knowledge” (Crawford, Lingel, & Karppi, 2015, p. 483). Such obligation, or a new “moral epistemology,” became popularized stating that “not only *should* one know one’s weight, but it is necessary to know it in order to lead a good life” (Crawford, Lingel, & Karppi, 2015, p. 486). The public – users of the weight scales – were somewhat obliged to engage in self-tracking of measurable aspects of their body to achieve what was otherwise unattainable.

Discussion

From a historical perspective, there is a certain duty in digital self-tracing, or self-surveillance. We might argue that many users of wearables today do not engage in self-tracking because they necessarily *feel the moral obligation* to. Nonetheless, what connects both the historical and present practices of self-tracking to attain self-knowledge is the idea that through the outside means – tools and devices – one can gain greater agency (and control) over oneself. These ‘outside’ means, or an outside perspective, lead to a state of self-disembodiment.

Self-knowledge is offered by self-tracking technologies through easy and effortless visualizations of the workings of the body; or, at least, it seems so. Berg notices that the prevailing notion of data-driven visualizations is that the knowledge that is offered is indeed pure and direct, and otherwise unachievable (Berg, 2017, p. 8). Berg also points towards the new binary of the self as divided into body-disembodiment; only a view from ‘outside’ can allow one to clearly see the patterns of one’s body which are otherwise either too difficult or too time-consuming to comprehend (Berg, 2017, p. 8). Technologies of self-tracking, particularly wearables such as Apple Watch or apps used by the the QS movement, provide, to borrow the appealing phrase offered by Berg, “a wearable dash-board to the body” (Berg, 2017, p. 2). The metaphor of a “dash-board” to the body is both to-the-point and rich in its signification. The dashboard offers a quick and easy way of comprehending one’s bodily patterns and actions which can then empower one to, e.g., reduce mental distress (Jablonsky, 2022, p. 321). Or, as Salter adds even more profoundly, such a digital dashboard allows one to change one’s mood “or even being” (Salter, 2022, p. 224). Above all, a dashboard offers a way of control.

Following this line of thought, the ‘data-view’ from both outside and above that we see not only illuminates us in some way, but also controls us. While it might be somewhat technodeterministic to claim that “[t]his newly minted index of health, well-being, and general state of living, unintentionally or not, steers the life of the population (Millington, 2009, p. 97), wearables and other self-tracking technologies allow us to become the ones *responsible* through new forms of self-control according to data-driven indexes, for our lives. To go back to

Foucault, such control “at a distance” (Rose, 2000, p. 323) is what Foucault discusses as shifting the notion of governmentality towards the subject who begins to view herself as constituting the self-ruling authority (Foucault, 1997, p. 68). Tiziana Terranova calls the practices of datafication merging with voluntary self-tracking as “soft-control,” a control native to network culture (Terranova, 2004). The device, or the app, are situated as aiding the user to take control of oneself (Schüll, 2016, p. 7).

The notion of control in relation to digital technologies, particularly technologies of self-tracking and datafication, has been discussed in recent literature as a particular extension of the ideology of neoliberalism. Control can be understood as “a set of technical principles having to do with self-regulation, distribution, and statistical forecasting (...) [that] also describes the episteme grounding late capitalism, a worldview that persists beyond any specific device or set of practices,” argues Franklin (Franklin, 2015, pp. xv-xvili). Ruckenstein & Schüll argue that datafication of health (such as the practices of shifting the human patient into a user that is supposed to self-track for one’s own benefit) is an expression of neoliberal selfcare (Ruckenstein & Schüll, 2017, p. 265). “To self-track is to heavily value one’s choices and the need to be responsible for them while, at the same time, relieving oneself of responsibility by delegating it to external technology,” argues Schüll (Schüll, 2016, p. 12). However, intrinsically, the paradox of control of self-tracking wearables is not that much different than the previous acts of delegating the self-observation to a tool or device ‘outside’ ourselves.

The issues of neoliberal selfcare and late capitalism reintroduce us to the notion of marketing and promotion strategies that Apple Watch so perfectly exemplifies. Self-tracking technologies, as most digital technologies, are *affective* object. Affect, in a materialist sense, refers to a myriad of relations and embodied effects that can occur among objects, bodies, and our emotional states. Self-tracking technologies share affective materiality in that people become affectively attached to and affected by the materiality of their devices, app interfaces, and data visualizations (Lupton, 2013, p. 268). Self-tracking technologies can be even perceived to be given ‘agency’ in that they “ask for attention” (Lyon, 2018, p. 97; Borgmann, 1995) both actively (through nudging, reminders, and sounds) and inactively (by just *being* there). This affective modality of self-tracking technologies influences us on a more neurological, subconscious level that it, at the same time, promises to make accessible and visible to us (Niccolini, 2018, p. 80; Sampson, 2016). The means by which self-tracking technologies *speak* to us are affective, from the cognitive play and a promise of “productive learning” of self-knowledge (Niccolini, 2018, p. 78), to a rewarding and satisfaction-inducing visualizations of goals, badges, and rewards (Laurie & Blandford, 2016, p. 282). Lyon also points out “a certain playfulness” in the ways users engage and perceive surveillance today (Lyon, 2018, p. 118).

Going back to the story about the Stoics and their “self-mastery,” Salter offers an argument that Stoics’ intention was indeed something that today’s technology offers: a promise of “an objective and distanced ‘view from above’ in order to stand outside of one’s self (...). [T]he Stoic philosophers used a simple technology, writing, to record actions in order to distance themselves from those actions” (Salter, 2022, p. 175). Such disembodied view of the self is provided by having a view ‘from the outside’ – through technology – which encompasses both the past and present. The view ‘from outside to inside’ – inside being the human body – is linked to an

inherent notion of time that is embedded in self-tracking. Diary keeping, accounting books, and weight scales invite the user to reflect upon the tracked changes through the (past) time. In that sense, self-tracking technologies promise both a physical view from the ‘outside’ as well as the historical view that renders time into space, where body-action becomes materialized into pure self-knowledge.

Such disembodied view of the self creates the user as a (data) subject outside of oneself. As Schüll (2016) argues, however, such knowledge from the “outside” is indeed a new, otherwise inaccessible form of knowledge. Following Swan (2013, p. 95), Schüll states:

big-data epistemologies (...) affor[d] “a sort of fourth-person perspective” on the self and, ultimately, a new kind of truth – one that is “not possible with ordinary senses” in that it does not correspond to a phenomenological self (temporally and spatially located) but to a database self whose truth lies in scattered points, associations and dynamic accretions (Schüll, 2016, p. 9).

A new, forth-person perspective that opens up new knowledge is far from a perspective of an actual person. We could argue that, just as the Stoics desired objective ‘view from above,’ self-tracking technologies that are based upon principles of datafication do offer a new ‘data-view’ from both outside and above. Garzonio points out that the nature of knowledge, as well as its social embeddings, changes once digitalization becomes a new logic of making visible and inviable (Garzonio, 2022, p. 159). In the words of Benjamin Bratton, who, in his text, also briefly refers to the QS movement, a user of a wearable finds himself in a rather contradictory state. Self-tracking technologies promise to users a sense of “individuated coherency and stability as a subject” through data-visualizations of the disembodied self (Bratton, 2015, p. 286). “But as more data is added to the diagram that quantifies the outside world’s impact,” Bratton continues, “the quality of everything that is ‘not him’ comes to overcode and overwhelm any notion of himself as a withdrawn and self-contained agent” (Bratton, 2015, p. 286). The self-knowledge that data offers blurs the notion of the self with the sea of data around it.

In this understanding, the knowledge that we can attain through the ‘data-view’ from both outside and above, is a knowledge deeply rooted in the logics of computing, particular cloud computing. Cloud computing – metaphorically indeed located *above* – relies on processing large quantities of data using algorithms that produce a desired result, such as a new pattern (that we could take for the data-derived ‘knowledge’). Yet the way in which such knowledge is produced is both strikingly similar and dissimilar to the past self-knowledge attained by historical self-tracking. As explained by Amoore, cloud computing “seeks out the ‘unknown unknowns’, the volume of so-called ‘bulk data’ in the lake (...), that promise to yield previously unseen patterns via processes of ‘knowledge discovery’” (Amoore, 2018, p. 15). To put it even more bluntly, and to quote from Amoore again, “what one will ask of the data is a product of the patterns and clusters derived from that data” (Amoore, 2018, p. 15). Yet the knowledge that is being ‘discovered’ in the process is presented as a fact directly derived from one’s body, visualized with satisfying dynamism of Apple Watch.

Conclusion

What the practice of looking at the self through ‘the outside’ view of a tool – an Apple Watch or a diary – provides, is a disembodiment view of the self through a distant view of the past and presence. Such a view, ‘from outside to inside,’ is linked to the notion of control inherent in self-tracking across time. In diary keeping, time is rendered into space, where it can be viewed and tracked visually back in time. Wearables embrace both of these temporalities of knowledge. Self-tracking technologies promise to be a medium of, management, self-knowledge, and subject-making.

By knowing oneself better, one can learn to act in a more efficient way, take care of one’s health better, be a better version of the self. The way in which wearables display information about the self – through colorful displays and interfaces that track steps and progress, but also compares the sleep quality or the number of calories burnt to the ‘past versions’ of the self – becomes affective. The willingness to self-surveillance that users engage in while learning about themselves in a pursue of self-knowledge is, as I argue, conditioned by the affective value of self-tracking by the outside ‘gaze’ of the device.

The ‘data-view’ from both outside and above indeed provide users with a new, otherwise unattainable (and thus affective) self-knowledge. However, as pointed out before, computing logics behind such view are not as “self” centered as one would imagine. As Bratton phrases it, “the User is confronted with the existential lesson that at any point he is only the intersection of many streams” (Bratton, 2015, p. 286). What Bratton speaks of is the fact that data points are never meaningful in themselves; data points are made meaningful by being collected and contrasted with a myriad of other data points that turn into datafied patterns – from data’s point of view, “what looks like one is really many, and what looks like many may only be one” (Bratton, 2015, p. 289). The data, as Salter argues while speaking of the “dials on the dashboard displays of Fitbits and iPhones,” does not visualize the inner truth, but rather is the by-product of mathematics” (Salter, 2022, p. 177). To conclude with the statement by Salter (2022, p. 177),

Fitbits and smartphones never display "raw" data. They show us statistically shaped and manipulated features and derived numbers that don't exist before mathematical models are applied to them. This data that we think represents us as fact is indeed the result of specific ways of measuring and quantifying the world through engineering, mathematics, and statistics.

Abstract: Mrican landfill is owned by the Government and the only landfill for all waste in Ponorogo Regency. The Mrican landfill experienced an increase in the volume of waste that was difficult to control, which caused environmental pollution and harmed the surrounding community. The problem of leachate liquid seeping into groundwater and rivers, thus having an impact on the environment. This study aims to analyze the impact of pollution and formulate a pollution control strategy at Mrican landfill based on SWOT analysis. The research method used is descriptive qualitative consisting of secondary data and primary data to formulate pollution control strategies based on SWOT analysis. SWOT analysis was carried out using the Internal Factor Analysis Summary (IFAS) and External Factor Analysis Summary (EFAS) matrices to show the pollution factors at Mrican landfill. From the results of the data analysis, the role of the Ponorogo Regency government and Ponorogo DLH is currently in a position between the Strength and Opportunity axes, namely Quadrant I (S-O Strategy) where the Regency Government and the Ponorogo Environmental Service have internal strengths and external opportunities. based on the results of the SWOT matrix analysis there were 12 strategic issues which then obtained 7 strategic issues that could be used as pollution control strategies in the area around the Mrican landfill.

Keywords: Pollutant Impact Identification, SWOT Analysis, Pollution Control Strategies

Control Strategies at Mrican Landfill, Ponorogo Regency, Indonesia: Identification of Pollutant Impacts, SWOT Analysis, and Pollution Control Strategies. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2080-2096), Cappadocia, Turkiye. ISTES Organization.

Introduction

The increase in population as well as the economic activity and lifestyle of the people in Ponorogo Regency will affect the production of the waste produced. Due to the effects of increasing human population, consumerism and goods are difficult to decompose, namely pollution which is a major environmental problem (Singh et al., 2010; Singh et al., 2018; Kumar et al., 2009). Based on the report from the Head of the Ponorogo Regency Environmental Service in early 2022, it stated that "around 70 tons of waste every day goes to the Mrican landfill". The Mrican landfill began operating in 1995 which was built on the property of the Ponorogo Regency government covering an area of ± 2.5 hectares, each year the volume of waste has increased. Until 2022, the Ponorogo Environmental Service (DLH) stated that the Mrican landfill was overloaded with a height of around ± 50 meters, so it had to expand the rotation area. Based on preliminary observations, it appears that the Mrican landfill has not been fully managed properly. This is shown, among other things, from the condition of the infrastructure at the landfill site and the method of final disposal of waste that is used does not meet the requirements as stated in the laws and regulations.

Based on DLH data, the Mrican landfill waste processing method is Controll Landfill, but the waste management applied in the field is the Open Dumping system, which is a waste management system that is disposed of in a final disposal site without management. This makes the waste capacity at the Mrican landfill is full and overflows to the outside of the landfill area causing an unpleasant odor. The poor processing system by Mrican landfill causes waste processing to not be optimal, so that the volume of landfill waste is difficult to control. This problem can pose a major threat to human health if the waste contaminates groundwater consumed by residents (Lee et al., 2006; Longe & Balogun, 2010). Based on data covering the whole world, it is reported that there are many cases of groundwater contamination that occur due to landfills that are not managed properly (Abu-Rukah & Al-Kofahi, 2001; Rapti-Caputo & Vaccaro, 2006; Saarela, 2003). Garbage that piles up in the landfill can produce leachate waste when it rains, then seeps through the waste dump can create a significant source of groundwater contamination, although the slow flow of groundwater (meters per day or even centimeters per year) can have a major impact on quality risks groundwater (Sepa et al., 2006; Christensen et al., 2001; Niininen et al., 1994; Barrett and Lawlor, 1995).

According to the Ponorogo newspaper, on Tuesday, March 22, 2022 dozens of members of the farmer group (poktan) of Mrican Village, Jenangan District, which consisted of 20 farmers from 3 poktans, held a demonstration in the landfill area. The farmers demanded the Ponorogo Environmental Service (DLH) to take responsibility for the death of rice plants ready for harvest in a number of rice fields in Mrican Village which resulted from leachate waste entering the rice fields. Based on the Republic of Indonesia government regulation number 82 of 2001 concerning management of water quality and control of water pollution, it is explained that "water is one of the natural resources which has a very important function for human life and livelihood, as well as for advancing general welfare, so that it is the basic capital and factor major development"(Baudouin et al., 2002). This regulation further emphasizes that the existence of clean water is very vital for the survival of

humans and other living things. Therefore, the government and citizens have rights and obligations to preserve the function of water (Sanim, 2011).

This implementation is carried out by controlling pollution and managing water wisely by taking into account the interests of present and future generations as well as ecological balance. In accordance with the background of the problem described by the author that the waste management of Mrican landfill is not optimal which causes pollution to the surrounding environment, the authors conducted research on the identification of pollution impacts and pollution control strategies at Mrican landfill using SWOT analysis.

Method

This research was conducted in the vicinity of the Mrican Landfill in Mrican Village, Kec. Jenang, Ponorogo Regency with an area of 2.5 hectares and the status of the land is owned by the Regional Government of Ponorogo Regency. Public facilities owned are access roads to the landfill location and field offices for recording the volume of waste entering the landfill. The method used in this study is descriptive qualitative, which aims to objectively explore or photograph conditions that will be thoroughly, broadly, and in-depth examined (Sugiyanto, 2005). The following are the steps in this research process:

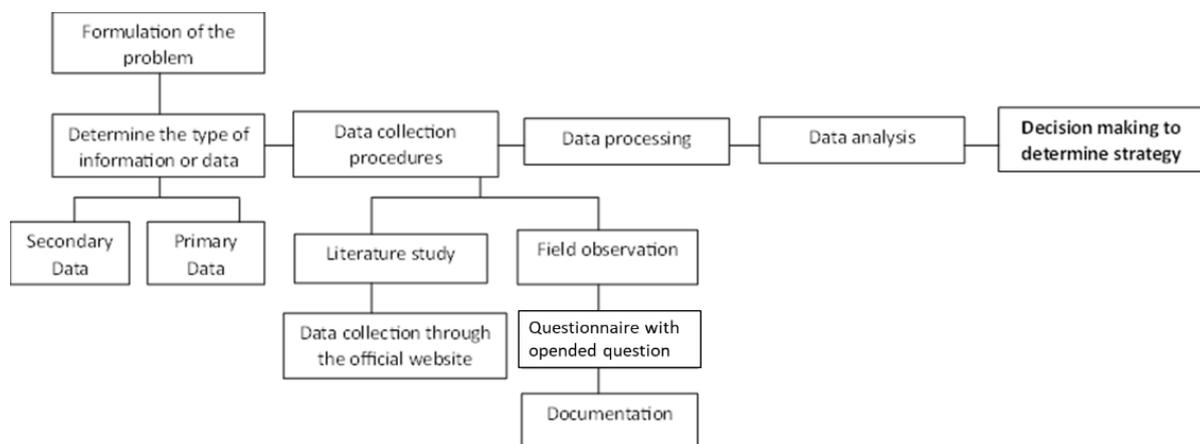

Figure 1: Research flowchart

The descriptive method is used to obtain the results of secondary data validity to determine the urgency of the research problem. The data supports the process of analysis in research. Qualitative methods were used to collect primary data in the form of field conditions, interviews, compile SWOT (strength, weakness, opportunity, treat) data, and determine the analysis of pollution control strategies at Mrican landfill. Collecting qualitative data using a questionnaire given to 30 research subjects and scores using a Likert scale. To develop a SWOT strategy, use the following SWOT matrix combination formula:

Table 1: SWOT matrix combination formula

	Strenght	Weakness
Opportunities	S – O = SO Strategy (Use all the power you have to take advantage of the oppotunities that exist).	W – O = WO Strategy (Overcome all weaknesses by taking advantage of existing opportunities)
Threats	S – T = ST Strategy (Use all power to avoid threats)	W – T = WT Strategy (Press all weaknesses and prevent all threats)

Results

1. Problem mapping at the Mrican TPA

Based on observations, the Mrican landfill is adjacent to residential areas and also agriculture. Which can cause negative impacts on the environment, social and economy of the people who live around the Mrican landfill area. It is sustainable and creates problems in both simple and complex forms. The results of the problem mapping at the Mrican landfill are as follows:

- Pollution of groundwater and rivers

The problems experienced by residents around the Mrican TPA are garbage that emits odor and leachate flowing into the residents' irrigation system. Because leachate disposal is connected to the surrounding river. As a result, leachate contamination during the rainy season is difficult to control its spread. Waste management with an open dumping system like this is very dangerous for the surrounding environment. Based on the information obtained, there has been no special handling regarding leachate management from the district government and the Ponorogo environmental service in the near future. Based on the statement of the Head of Mrican Village and the student demonstration in Ponorogo, namely demanding the construction of a wastewater treatment plant (IPAL) channel before channeling it to the surrounding river, to reduce the level of environmental pollution, especially water (Kompas.tv, March 28 2022). To find out the quality of water and contaminants contained in residents' well water based on the results of previous studies, as follows:

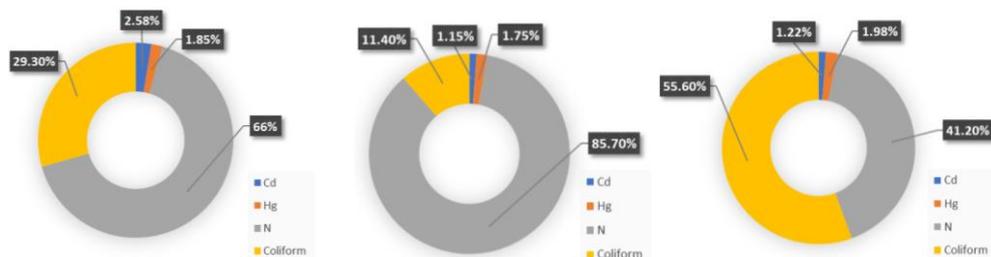

Figure 2: a). 200 m from TPA

b). 500 m from TPA

c). 650 m from landfill

The research data at the end of 2021 above shows that groundwater pollution in Mrican Village is dominated by Nitrogen and Coliform, followed by Hg and Cd. Based on the above groundwater data, the distance of 650 m from the Mrican landfill is not suitable for drinking and for use by the local community, because it will have a negative impact on health.

- Decreased productivity of agricultural land.

The decline in the productivity of agricultural products from Mrican Village farmers has occurred in the last few years. Farmers suspect that the cause comes from the irrigation canals of the rice fields which are contaminated with Leachate from the Mrican landfill. Leachate enters the residents' rice fields because the leachate drainage pipe system at the Mrican landfill is connected to the residents' rice field irrigation canals. This has the potential to disrupt soil fertility, so that the productivity of agricultural land decreases. The following is documentation of irrigation canals polluted by Mrican landfill leachate:

Figure 3: Paddy field irrigation channels polluted by Mrican TPA leachate

Based on the statement of Mr. Suyitno Farmer Mrican (Thursday, March 24 2022) said that "waste pollution does not only damage rice plants, but this overcapacity of waste causes irrigation canals to become clogged with garbage. This has resulted in a reduced supply of water to the paddy fields, and the only water that enters irrigation is water mixed with waste. The following is the documentation of agricultural products in the Mrican landfill area:

Figure 4: Crop failure in the rice fields near the Mrican landfill

Pollution with Mrican landfill waste has caused approximately 67 hectares of rice fields around the landfill to experience crop failure. The rice planted with color withers and dries up, besides that many rice seeds are not filled so that farmers lose. Based on the statement of Mr. Suyanto "Before being affected by pollution, my two rice fields produced 18 quintals. Now it

can only produce 9 quintals.” Based on this information, rice production in paddy fields decreased by 50%.

- Problems with residents' health

Disruption of the Mrican landfill waste emits an unpleasant odor which causes air pollution. The smell emitted by the landfill waste can be smelled up to a radius of 2 – 3 km. This waste problem causes health problems for local residents, especially experienced by scavengers at the Mrican landfill. The main complaints experienced by scavengers are respiratory system disorders such as coughing, shortness of breath and chest pain. Based on research results (AR Andhika, 2016). The effect of exposure to Methane gas (CH₄) of the Mrican landfill community with a percentage of 9.2% and the influence of hydrogen sulfide gas (H₂S) is as much as 12% of complaints. In addition to respiratory problems, other residents' health complaints are skin diseases and itching. Based on the narrative of Mr. Suyitno (31/3/2022), a resident around the Mrican landfill, said that he had experienced itching for 3 years and had tried various kinds of medicine but had not recovered. Finally, every time he went to the fields, he smeared his whole body with diesel fuel to relieve itching.

2. SWOT analysis calculation

To determine alternative actions and policies for the management of the Mrican Final Processing Site (TPA), a logical framework is needed. SWOT analysis is one way that can help analyze an organization in determining a strategy based on the environmental conditions of the organization, which in this case is the Mrican Final Processing Site (TPA). The strategy used in the management of the Mrican Final Processing Site (TPA) is carried out using a SWOT analysis approach (Strength, Weakness, Opportunity, and Threat). From the results of observations and interviews with respondents in the field, several strategic factors were obtained that greatly influenced the management of Mrican's final landfill. These strategic factors consist of 1) internal factors which include strengths and weaknesses, 2) external factors which include opportunities and threats. These factors are arranged in the form of a questionnaire used to calculate IFAS and EFAS scores in the SWOT analysis:

Table 2. Calculation of IFAS values on the Strength and Weakness variables

Num	Dominant Internal Factors	Weight	Ratings	Score
Strength				
1	There are regional regulations that regulate waste fees and domestic wastewater management	0.15	2.7	0.41
2	Availability of APBD funds (regional revenue and expenditure budget) allocated for waste	0.14	2.6	0.38
3	There is an SKPD (regional work unit) that regulates waste management	0.11	1.9	0.20
4	The Government of Ponorogo Regency provides funding	0.12	2.2	0.27

	for waste processing machines			
5	Availability of Ponorogo Regency Wastewater Master Plan 5 for the next year	0.08	1.5	0.13
6	There is a sanitation working group (LWG) and sanitation KSM (self-help group) that coordinate sanitation programs at the community level.	0.06	1.1	0.07
	Total number			1.44
	Difference (x-axis)			0.92

Num	Dominant Internal Factors	Weight	Ratings	Score
	Weakness			
1	Waste management in the Mrican landfill area has not become a regional priority, so the waste management system is still minimal	0.08	1.4	0.11
2	Special technology for waste management is available with adequate quantity and capacity	0.08	1.4	0.11
3	The operation of the waste processing machine by Mrican landfill officers can run well	0.07	1.2	0.08
4	HR capacity in managing waste at Mrican landfill is still limited	0.08	1.4	0.11
5	The volume of waste that is over capacity	0.06	1	0.06
6	The aspect of landfill sanitation is still low and is not given enough attention	0.06	1	0.06
	Total number			0.52

Based on the internal table above, the internal strategic factors analysis summary (IFAS) value is determined which is used to determine the position of the X axis in the SWOT matrix obtained from the difference in the values of the strengths and weaknesses variables. This IFAS analysis needs to be carried out to determine the level of strengths and weaknesses in the Mrican TPA. Based on the table of internal factors above, it can be seen that the position of the X axis is using the following formula:
 $X = \text{Total Strength} - \text{Total Weakness} = 1.44 - 0.52 = 0.92.$

Internal factors can be controlled by landfill through collaboration with DLH and Ponorogo Regency Government. This factor is something that is owned by the Ponorogo district government which is a strength of positive value for the management of Mrican landfill. Conversely, the lack or absence of something that should exist becomes a weakness that has a negative value and will reduce the success of Mrican TPA management.

Table 3. Calculation of the EFAS value on the Opportunity and Threats variables

Num	Dominant External Factors	Weight	Ratings	Score
Opportunities				
1	Receive support from community informal institutions (community starting from the RT level, Karang Taruna, etc.) to socialize household waste management and environmental issues	0.10	2	0.21
2	There are district/city institutions in Ponorogo that handle waste management	0.14	2.8	0.40
3	There is an opportunity for financial assistance from the APBD (regional revenue and expenditure budget) from the Ponorogo district/city	0.11	2.1	0.23
4	Collaboration between DLH (Department of the Environment) Ponorogo and private parties and other agencies such as universities, other landfills etc	0.08	1.6	0.13
5	Initiatives from several communities to recycle waste and make it into handicrafts/products that have economic value	0.09	1.7	0.15
6	The existence of print/online mass media to socialize to the public about waste management	0.09	1.8	0.17
Total number				1.29
Difference (y-axis)				0.74

Num	Dominant External Factors	Weight	Ratings	Score
Threats				
1	Public awareness of waste management is still low and waste management at Mrican landfill is inadequate	0.08	1.5	0.12
2	Limited waste disposal and collection facilities (garbage trucks, TPS, and transfer depots)	0.09	1.8	0.17
3	The threat of contamination of groundwater and rivers due to leachate from waste and drainage of the Mrican landfill that is not managed properly	0.06	1.2	0.07
4	The threat to public health is due to the minimal sanitation of the Mrican landfill, which has the potential to contract respiratory diseases	0.06	1.1	0.06
5	The overloaded Mrican landfill will expand the new landfill area around it	0.06	1.1	0.06
6	The quality of the environment, such as land, water, air, and the comfort of the people living around the Mrican	0.06	1.1	0.06

landfill, has declined

Total number

0.54

Based on the external table above, the External Strategic Factors Analysis Summary (EFAS) is determined which is used to determine the position of the Y axis in the SWOT matrix which is obtained from the difference in the values of the opportunities and threats variables. This EFAS analysis needs to be carried out to determine the level of opportunities and threats in the Mrican TPA. Based on the table of external factors above, the position of the Y axis can be identified using the following formula $Y = \text{Total Opportunities} - \text{Total Threats} = 1.29 - 0.54 = 0.74$.

External factors are factors that are beyond the control of Mrican TPA management. This factor will have a direct effect on the performance of Mrican TPA in the management of waste that goes to the landfill, thus making a positive contribution which can provide an opportunity for the acceleration of the successful management of Mrican TPA. However, there are also factors that pose a threat in the implementation of activities, which have a negative value and can hinder the successful management of Mrican TPA.

From the SWOT weighting matrix it can be seen that the internal and external positions of the research study at the Mrican Final Processing Site (TPA) in determining strategic steps in TPA management are located in quadrant I, namely the X:Y coordinates (0.74 ; 0.92) on the SO strategy, can be seen in Figure 5 below:

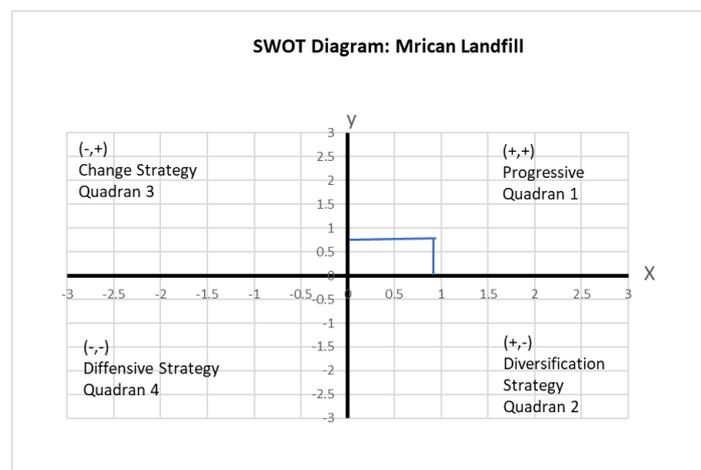

Figure 5: SWOT Diagram of Mrican landfill

From the analysis of internal and external strategic factors (IFAS/EFAS) through SWOT analysis, it is known that Mrican's most strategic pollution control is located between the Strength and Opportunity

axes, namely in Quadrant I (S-O Strategy). Where the Mrican landfill together with the local government and DLH Ponorogo Regency are in a very strong position and in an advantageous position. The two agencies are advised to carry out an aggressive strategy that is very likely to continue to develop, make policies with the community, carry out development and proper waste management at the Mrican landfill.

Discussion

The results of the SWOT matrix above are used to form a Pollution control strategy around the Mrican Landfill. The strategy for controlling Mrican landfill pollution was designed through a matching stage using the Strengths-Weaknesses-Opportunities-Threats (SWOT) matrix technique. This SWOT analysis is based on information derived from the input stage to match external opportunities and threats with internal strengths and weaknesses. This is intended to determine feasible and effective alternative strategies for the management of Mrican landfill. From the results of the SWOT analysis, 20 alternative strategies were obtained in the management of the Mrican landfill, but based on the SWOT matrix the most effective strategy was implemented to solve pollution problems around the Mrican landfill, namely the SO strategy. This strategy is in quadrant 1 which consists of 7 strategies, obtained from combining or matching internal factors (strengths) with external factors (opportunities) by using strengths to take advantage of opportunities with alternative strategies. So it is hoped that the strategy that will be developed can overcome the strategic issues that arise. The objective is to achieve the solid waste sub-sector target which is part of the defensive strategy. This strategy is also called minimizing weaknesses to survive threats. The following is an arrangement of strategies obtained from the results of the SWOT analysis in this study:

Table 4: SWOT Matrix of Mrican Landfill Pollution Control Management Strategy

	Internal	Strength	Weakness
Eksternal		<ol style="list-style-type: none"> 1. Ponorogo Regency Regional Regulation 2. Availability of APBD funds 3. SKPD waste management 4. Machine assistance fund 5. Waste master plan for the next 5 years 6. POJKA & KSM sanitation 	<ol style="list-style-type: none"> 1. Minimum management system 2. number and capacity of waste processing machines 3. Machine operation routines 4. HR capacity at Mrican landfill 5. Overcapacity of Mrican landfill 6. Landfill sanitation conditions

Opportunities		
<ol style="list-style-type: none"> 1. Support from informal community institutions 2. Availability of district-level government institutions for waste management 3. Financial assistance from the district budget 4. Cooperation between DLH Ponorogo and the private sector 5. Community initiatives for waste recycling 6. Online mass media for socialization of waste management 	<ol style="list-style-type: none"> 1. Carry out the functions of the Ponorogo district regional regulation and involve the role of informal community institutions to handle waste 2. Preparation of the SKPD regarding the waste management system in detail starting from the household level to the district level so that the volume of Mrican landfill waste can be controlled. 3. There are APBD funds allocated for waste that can be utilized, among others; purchase a large-capacity waste processing machine, build adequate landfill sanitation, socialize and train waste management to the community. 4. Prepare a landfill waste master plan for the next 5 years, involving private partners, city-level PUPR ministries, DLH, environmental NGOs, and practitioners/universities. 5. Establish community informal institutions, namely POJKA or KSM sanitation, which aims to coordinate community-level sanitation programs. 6. Utilizing print/online mass media to socialize the community about waste management before disposal to TPS 7. Collaboration between DLH and environmental agencies in other cities, universities and private partners to innovate waste management at the Mrican landfill. 	<ol style="list-style-type: none"> 1. The waste management system at Mrican landfill is still minimal, because it has not become a top priority for the region. So there must be special attention from the local government through the Regency APBD funds, Ponorogo DLH collaboration with private partners to improve the waste management system. 2. The Mrican landfill has a small number of waste processing machines and is inadequate, and the machines do not operate properly. So it needs attention from the local government and DLH Ponorogo Regency to increase the number and capacity of more modern waste processing machines. 3. The capacity of human resources at Mrican landfill is still limited, it is better for DLH Ponorogo Regency to provide training and increase the number of waste management personnel at Mrican landfill

		<p>4. Sanitation conditions at the Mrican landfill are low and paid little attention to. This problem can be fixed through policies on waste management and building sanitation using APBD funds.</p> <p>5. Mrican's overcapacity landfill allows the expansion of landfill, for control it requires coordination between government agencies and the community, through support from formal and informal institutions, utilizing print/online social media to socialize household waste management.</p>
<p>Threats</p> <ol style="list-style-type: none"> 1. Low public awareness of waste management and inadequate waste management at landfill 2. Limited waste disposal and collection facilities 3. Pollution of groundwater and rivers 4. Public health 5. Expansion of new landfill land 6. Declining environmental quality 	<ol style="list-style-type: none"> 1. Implement regional regulations governing waste fees and domestic wastewater management, in order to reduce the level of threat of environmental pollution. This regional regulation is strengthened by legalizing the creation and preparation of SKPDs. 2. Utilizing Ponorogo district APBD funds and preparing a waste water management master plan for the next 5 years to build limited waste disposal and collection facilities, as well as increase the number and productivity of machines every day, so as to reduce the waste capacity at 	<ol style="list-style-type: none"> 1. Pollution of the Mrican landfill can be resolved by making it a regional development priority, equipping waste management facilities and waste machines that can be operated properly and regularly. 2. The low knowledge of the community in waste management can be improved through outreach and training. It is necessary to increase the quality and capacity

	<p>Mrican TPA.</p> <p>3. Establish a sanitation POJKA (working group) and a sanitation KSM (self-help group) that coordinate sanitation programs at the community level, to increase awareness of household-level waste management.</p>	<p>of human resources for Mrican landfill employees so that they are able to handle landfill sanitation problems.</p>
--	---	---

Based on the SWOT analysis matching stage, the Mrican TPA pollution control strategy that can be applied in this condition is explained as follows, including:

1. Carry out the functions of the Ponorogo district regional regulations properly which regulate waste fees and domestic wastewater management, and involve the role of informal community institutions to handle waste from the smallest scope, namely household waste. Enforcement of regional regulations on user fees and waste management has the ultimate goal, namely that the government is more concerned about the regional waste sector that is produced every day and the community has awareness and knowledge in managing waste before it is disposed of at TPS.
2. Ponorogo district government agencies should prepare a detailed waste management SKPD on the waste management system starting from the household level to the district level so that the volume of waste that goes to Mrican landfill can be controlled. SKPD is a regional work unit that has main tasks and functions in the field of waste management. SKPD is responsible for the implementation of waste management in the region.
3. The availability of APBD funds allocated for waste is an opportunity for the government to utilize aid funds, including; purchased a large-capacity waste processing machine, built adequate landfill sanitation, the district government together with DLH Ponorogo conducted outreach and training on waste management to the community. The function of the regional budget is very important, including:
 - a. The authorization function, in the implementation of receipts and expenditures, the Regional Revenue and Expenditure Budget (APBD) becomes the basis for a certain period (year) so that activities have the power to carry out
 - b. The function of planning, planning and preparing activities in the year concerned requires the APBD to become the basis and reference for activities.
 - c. Oversight function, APBD is a reference in assessing and reviewing the smooth running of local government
 - d. Allocation Function, it is necessary to direct regional budgets for allocations to support regional development in the framework of creating community welfare in all aspects.

4. The regional government of Ponorogo district should prepare a landfill waste master plan for the next 5 years. The preparation of the master plan should involve city-level PUPR ministries, DLH, environmental NGOs, practitioners/universities, and private partners. So that all parties can help and participate in overseeing the regulations when they are implemented. The purpose of forming the Mrican landfill waste master plan is to regulate the location of the facilities to be built and the spatial layout based on the function of the land. The master plan is the master plan for the development of the Mrican landfill area which departs from the potentials and problems currently owned by the area.
5. The district government, through the village government, should form an informal community institution, namely POJKA or KSM sanitation, which aims to coordinate community-level sanitation programs. The function of POJKA PKP is to form on the basis of a joint commitment of stakeholders to synergize policies, institutions for the implementation of prevention and quality improvement for urban slum settlements, exchange ideas, and coordination. POJKA PKP consists of policy makers and technical staff from various institutions/sectors, who oversee various units related to slums, housing, land, clean water, sanitation, and data management. While the function of Sanitation KSM is to develop an innovative service model for communal scale wastewater treatment with a joint management scheme between KSMs for communal WWTP sanitation facilities with the government from the village level to the district level.
6. Utilizing print/online mass media to socialize the community about waste management, so that the community has the initiative to process waste into something useful and of economic value, so that they are able to utilize waste before it is disposed of at TPS. The influence of the mass media in this digital era is very strong, in connection with this the government can optimize the role of the mass media in disseminating household waste management methods before being disposed of in TPS (Temporary Disposal Sites).
7. The Ponorogo Regency Environmental Service can collaborate with environmental agencies, landfill in other cities, universities and private parties to conduct research, comparative studies, collaboration, and develop/grant waste processing technology that can help improve management at Mrican landfill. The involvement of the private sector and the community is an important part of the national solid waste policy in 2006-2010. Improving a conducive climate for public-private partnerships, such as granting permits and authorities as well as ensuring the supply of waste, is a strategy that the government must implement. The participation of the private sector in waste management is urgently needed, considering the high costs that must be spent by the government to deal with this waste problem.

Conclusion

Based on the analysis and discussion conducted regarding the environmental pollution control strategy around the Mrican landfill area using a SWOT analysis, several conclusions can be drawn as follows:

1. The Mrican Final Disposal Site (TPA) is the only TPA that is used to dispose of waste from all over the

Ponorogo Regency until now it has not implemented a waste management system that has been established at the beginning of its construction, namely landfill control and even in practice, namely open dumping (Without processing)

2. Based on research studies at the Final Processing Site (TPA) Mrican is in Quadrant I with axis $(X,Y) = 0.74 ; 0.92$. This shows that the management of TPA Mrican is in a situation between the Opportunity and Strength axes with the S-O (Strength – Opportunity) strategy. There are 7 aggressive strategies formulated in the SWOT matrix analysis, which can be used for pollution control and waste management at Mrican TPA, including:
 - a. Carrying out the functions of the Ponorogo district regional regulation and involving the role of informal community institutions to handle waste
 - b. Preparation of an SKPD regarding a detailed waste management system starting from the household level to the district level so that the volume of Mrican landfill waste can be controlled.
 - c. There are APBD funds allocated for waste that can be utilized, among others; purchase a large-capacity waste processing machine, build adequate landfill sanitation, socialize and train waste management to the community.
 - d. Develop a landfill waste master plan for the next 5 years, involving private partners, city-level PUPR ministries, DLH, environmental NGOs, and practitioners/universities.
 - e. Establish community informal institutions, namely POJKA or KSM sanitation, which aims to coordinate community-level sanitation programs.
 - f. Utilizing print/online mass media to socialize the community about waste management before disposal to TPS
 - g. Collaboration between DLH and environmental agencies in other cities, universities and private partners to innovate waste management at the Mrican landfill.

Recommendations

The results of this study are expected to be utilized by the Ponorogo district government and the environmental service. To realize people's expectations of controlling environmental pollution in their settlements. The strategy for controlling environmental pollution around the landfill was prepared by considering four main factors in the SWOT analysis, namely strengths, weaknesses, opportunities and threats. The strengths and opportunities are used as capital in suppressing the weaknesses and threats in the short term and the long term. Meanwhile, the weaknesses and threats are used as reference material for the government and DLH Ponorogo Regency for improvement and planning activities.

Abstract: Increasing environmental problems and the rapid depletion of energy resources is a major concern that has led researchers to improve energy storage techniques. Latent heat thermal energy storage methods that use phase change materials (PCMs) have gained importance in overcoming certain drawbacks. Although PCMs have emerged as a promising solution to store thermal energy, leakage problem in PCMs are still a serious issue limiting their application in energy storage. Incorporating activated carbon as a support material has been investigated to eliminate this restriction. In this study, activated carbons with different porous structures were employed as support material to prepare shape-stabilized composite PCMs (SSC-PCMs), using two different methods; direct impregnation and vacuum impregnation. A binary eutectic mixture of stearic acid (SA) and palmitic acid (PA) was used as a PCM. The effect of the porous structure of activated carbon and the preparation method was evaluated to determine the most suitable carbon material and production method for the specific purpose of thermal energy storage

Keywords: Pcms, Activated Carbon, Porous Structure, Direct Impregnation, Vacuum Impregnation

Introduction

Energy depletion is one of the major problems facing the world. Renewable energy (Akay et al., 2015; Garip et al., 2022; Gunes et al., 2020; Kazan et al., 2015; Ozay & Celiktaş, 2016; Pilavtepe et al., 2012) and energy storage systems have gained significance due to their ability to prevent increasing global warming problems and energy shortages (Abdeali et al., 2020; Alptekin et al., 2023; Cebi et al., 2022; M.S. Celiktaş & Kocar, 2012, 2013; Melih Soner Celiktaş & Kocar, 2010; Cerone et al., 2017; Ozay & Celiktaş, 2021; Uyan et al., 2020). Thermal energy systems are energy storage systems that have a wide range of application areas, including building (Zhu et al., 2018), PV (Tahan Latibari & Sadrameli, 2018), cold storage, batteries, medical applications

(Dai et al., 2021; ŞEN & ÇELİKTAŞ, 2022).

Thermal energy storage technology is categorized into thermochemical heat storage, sensible heat storage, and latent heat storage based on how it stores heat energy. The aim of phase change (latent heat) heat storage technology is to store and release heat by taking advantage of the change in latent heat of phase change materials (PCMs) during phase change (Liu et al., 2023). In Figure 1, the advantages and disadvantages of thermal energy storage technologies are shown.

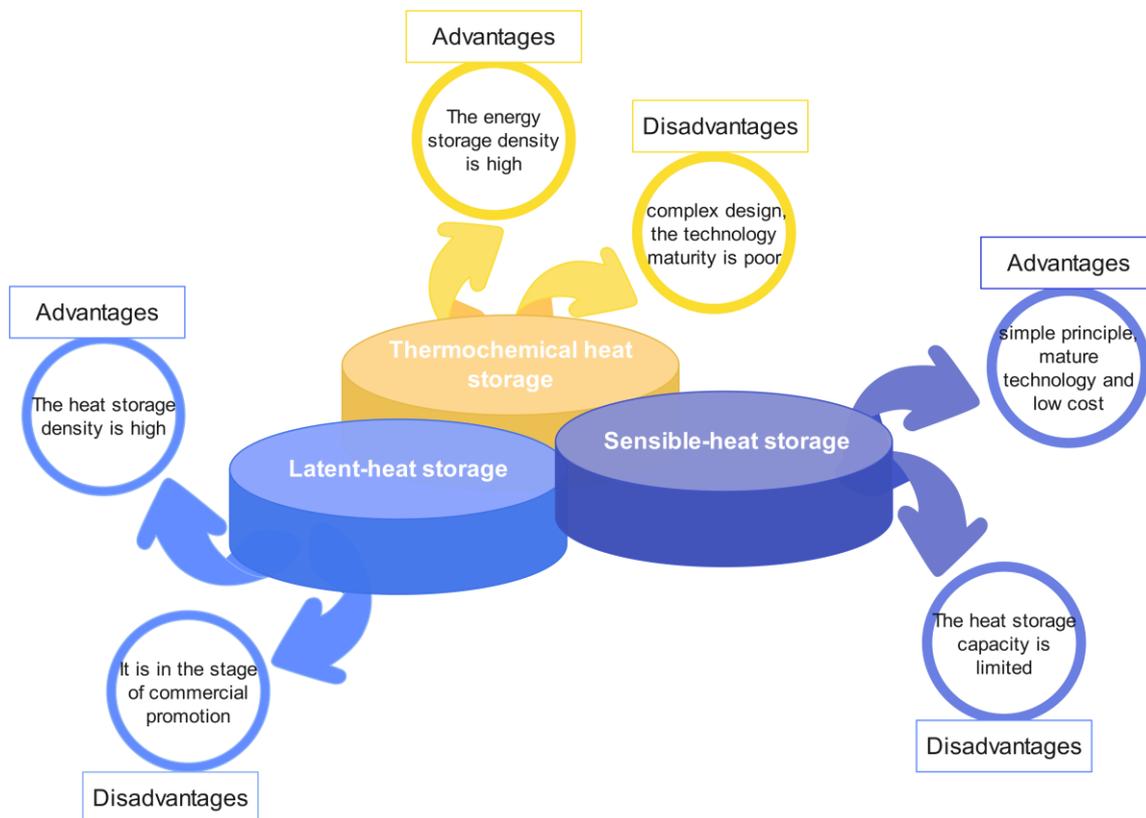

Figure 1. Advantages and disadvantages of thermal energy storage technologies

Among the energy storage techniques, latent heat energy storage techniques based on phase change materials have gained attention due to their higher energy storage properties compared to sensible energy storage techniques (Rathore & Shukla, 2021). Possessing large latent heats, non-corrosiveness, less subcooling, good chemical structure, etc. are superior properties of organic-based solid-liquid PCMs (Hekimoğlu et al., 2022). Even with their advantages, leakage during phase change, high phase change temperatures, and lower thermal conductivity are some of the disadvantages of organic PCMs (Atinafu et al., 2018). Porous carbons are one of the support materials to use for solving these drawbacks (X. Zhang et al., 2020). Different dimensional carbon materials such as activated carbon (one-dimension) (Alptekin et al., 2023; Alptekin & Celiktas, 2022; Melih Soner Celiktas & Alptekin, 2019; Gultekin et al., 2018), graphene (two-dimension), carbon nanotube (CNT) (three dimension) and etc., have been utilized for this purpose.

In this study, organic PCM and eutectic mixture of stearic and palmitic acid was evaluated. Production method of shape stabilized PCM (SS-PCM) and employed carbon support material was examined to determine the most suitable carbon material and production method for the specific purpose of thermal energy storage. In the next section, organic PCM, binary eutectic mixture of stearic acid (SA) and palmitic acid (PA) as PCMs and their shape/form stable composite PCMs that contain porous structure are evaluated.

Organic PCMs and shape stabilized composite PCMs

Organic PCMs (paraffin compounds and non-paraffin compounds), inorganic PCMs (salt hydrates and metallic compounds), and eutectic PCMs (organic-organic, inorganic-inorganic, and inorganic-organic) are the three types of phase change materials. Eutectic PCMs combined with two or more organic and inorganic PCMs, or both of them (Al-Ahmed et al., 2021). The major advantage of EO-PCMs is their adjustable properties. They can be produced such that they exhibit the desired qualities. Many times, eutectic mixtures of fatty acids show lower melting point than individual PCMs but feature outstanding qualities like individual O-PCM, hence for TES applications, the EO-PCM might be chosen as innovative PCMs (Singh et al., 2021). Therefore, studies have focused on the use of eutectic PCMs with desired properties for use in desired applications.

Zhang et al. prepared composite PCMs by using PA-SA (palmitic acid-stearic acid) eutectic mixture as PCM and expanded graphite (EG), whose optimum adsorption ratio is PA-SA/EG:13:1 (wt). Prepared composite PCMs have shown great thermal stability after 720 cycles and enhanced thermal conductivity compared to pure PA-SA (N. Zhang et al., 2014).

Mehrali et al. prepared shape-stabilized PCMs (SS-PCMs) employing SA as PCM material and carbon nanospheres (CNS) as support material. In order to examine the effect of carbon nanospheres in SS-PCM, varying weights of carbon nanospheres, including 0,25 g, 0,50 g, 1 g, and 2 g, were mixed with 2 g of SA in the presence of 50 ml of toluene at 80 °C on a stirring hot plate at 1000 rpm. Used CNS that has 212 m²/g of specific surface area enable the SA held in SS-PCMS via surface tension. 89% of SA loading in the SS-PCMs gave the best latent heat of 152.5 J/g at a melting temperature of 56.5 °C. However, SS-PCMs with 50% wt of SA resulted in the highest thermal conductivity of 0.431 W/mK, which is higher than pure SA (0.21 W/mK) (Mehrali et al., 2014).

Zhou et al. have prepared form-stable phase-change materials using a binary eutectic mixture of stearic and palmitic acids as PCMs and expanded graphite as porous support material. PA-SA/EG composite was prepared through direct impregnation at 80 °C for 48 hours and was shaken every 2 hours for complete mixing. PA-SA/EG showed 176.2 J/g of phase-change latent, which is close to pure PA-SA (187.0 J/g). It is stated in the study that the large specific surface area and wormlike porous structure of EG aid in the adhesion of molten PA-SA (Zhou et al., 2020).

Wu et al. have produced copper microsphere (CMS)-doped porous carbon from wheat bran via one-step pyrolysis. SA/CMS-WBB is produced with wheat bran biochar (WBB) and a different weight ratio of stearic

acid as PCMs through the vacuum impregnation method. Among the composite PCMs produced, SA/CMS-WBB-2, which contains 40% (wt) of SA, showed the highest thermal conductivity. Compared to pure SA, its thermal conductivity was raised by 87.2% (Wu et al., 2021).

Li et al. used acid-treated CNT (a-CNT) as support material and stearic acid as PCMs to fabricate composite PCMs. Composite SA/a-CNT PCM is produced through an impregnation method in the presence of ethanol with different mass ratios of 1:1, 2:1, and 3:1. Ethanol was used to uniformly distribute SA into the a-CNT powder. Among the produced composite materials, Composite-2 and Composite-3, which contain 2:1 and 3:1 SA/a-CNTs, exhibited 98.8 J/g and 118.8 J/g at melting temperatures of 33 and 29 °C, respectively. Compared to pure SA, melting temperatures decreased from 74 °C to 33 and 29 °C for Composite -2 and Composite-3, respectively (Li et al., 2015).

Conclusion

In recent years, the storage of the produced energy is one of the important issues as much as the production of energy. Thermal energy storage technologies are one of the important technologies in storing large thermal energy, increasing the performance and energy efficiency of the application used. Latent heat storage, which is based on phase change material, has become a subject that has been studied extensively in recent years, as it has various organic and inorganic phase change materials to be used in different applications. However, due to the disadvantages of PCMs, it is necessary to increase their performance by producing composite products with support material. Porous carbon materials attract attention as they can be obtained from renewable sources such as biomass. Activated carbons, which have porous structures in different nano-sizes, increase the thermal conductivity of PCMs as well as eliminate leakage problems. In addition, the production methods of shape-stable PCMs also affect the incorporation of PCMs into the support material. For this reason, the production method, the PCM used and the support material must be compatible with each other.

Abstract: The Extracellular matrix (ECM) is a highly organized three-dimensional (3D) network of proteins and biomolecules essential for all tissue types. Many biomimetic matrices have been developed using protein compositions of the ECM to emulate the native ECM of the tissue. Biomaterials composed of ECM can be prepared by processes that involve the decellularization of tissues and organs. Physical, chemical, and biological approaches are applied in combination to lyse the cells, followed by extensive washing procedures to remove cellular components. Decellularization and sterilization of the decellularized ECM (dECM) are highly effective in obtaining a biomaterial with the desired properties for the targeted clinical application. dECM-based biomaterials encompass mixtures of various biomolecules that regulate cell adhesion, proliferation, migration, and differentiation, such as glycosaminoglycans (GAGs), proteoglycans (PGs), glycoproteins, and structural proteins (i.e., collagens). Therefore, the selected decellularization and sterilization methods should have a minimal negative impact on the biochemical and morphological composition and mechanical properties of the dECM. This study presents an overview of decellularization methods and their effects on ECM structure and composition along with a PEST (political, economic, social, and technological factors) analysis that reveals the status of the dECM-based biomaterials in the market.

Keywords: Tissue Decellularization, Extracellular Matrix, Proteins, Biomaterials, Tissue Engineering

Introduction

The evolution of eukaryotes from single-cell organisms has an important role in understanding our existence on earth. With the evolution of eukaryotes, complex multicellular organisms capable of possessing specialized

tissues and enhanced biological capabilities have emerged (Ozbek et al., 2010). As such, tissue evolution is involved and affected by several factors such as heredity and natural selection. Thus, tissue evolution brings changes in the ECM, which is uniquely designed for each tissue by completing its optimization throughout evolution. The primary mediator of multicellularity, the ECM is a well-structured highly organized 3D network that bridges cells, binds adhesion receptors of cells to assist their spatial arrangements, and supports cell fate and tissue organization (Hynes, 2009). Although every ECM is composed of proteins, biomolecules, and polysaccharides, each tissue has a unique ECM composition in physicochemical, mechanical, and biochemical properties generated in early embryonic development (Frantz et al., 2010). Thus, understanding the dynamic relationship between tissue evolution and ECM is crucial for considering the impact of matrix remodeling on developmental biology with respect to both health and disease states. Indeed, the increasing number of research papers published in the field in recent years demonstrates the importance of the extracellular matrix (Figure 1A).

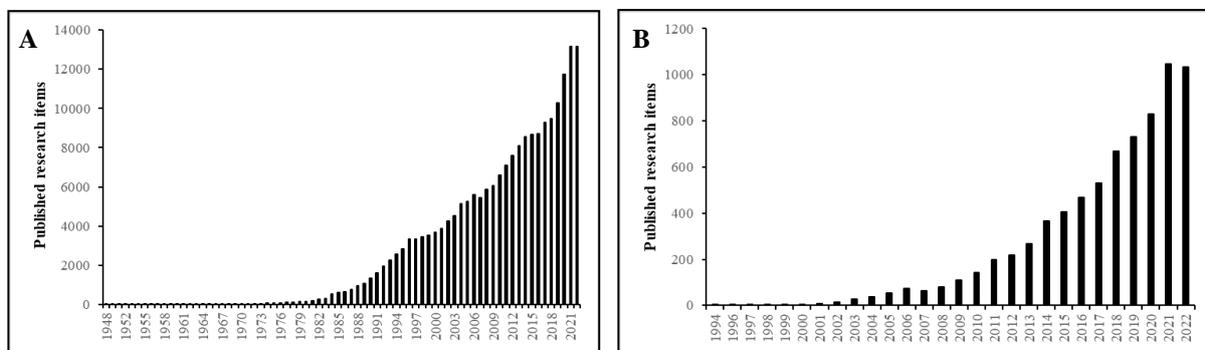

Figure 1. The current state of the ECM and decellularization process. (A) Publications of the ECM per year with the keywords “Extracellular matrix” or “ECM” in the title, abstract, and keywords. (B) Publications of the decellularization per year with the keywords “Decellularization” or decellularized” in the title, abstract, and keywords. (Source: <https://www.scopus.com>, date of search: 12 June 2023)

The ECM is composed of two-layer macromolecular structures that differ based on their location and protein composition. While the basement membrane separates the epithelium from the surrounding stroma of any tissue, the interstitial matrix surrounds cells and provides structural scaffolding for tissues (Morrissey & Sherwood, 2015). Even though the basement membrane typically lines the basal side of the epithelial tissues, additionally it is found in the endothelium, peripheral nerve axons, fat cells, and muscle cells (Kalluri, 2003). The basal membrane is essential for providing structural support and biochemical cues to sculpt the tissue and its unique shape (Khalilgharibi & Mao, 2021). It comprises large insoluble molecules, including type IV collagen, laminin, heparan sulfate proteoglycans (HSPGs), and nidogen/entactin, which assemble to form sheet-like structures (Bonnans et al., 2014). The interstitial matrix comprises fibrous proteins such as type I and type III collagens, fibronectin, and elastin, which provide the structural and functional integrity of the tissues (Frantz et al., 2010). That multi-component complex structure provides not only scaffolding for the cellular components but also provokes crucial biochemical and physical cues that are instructed for tissue homeostasis. These ECM dynamics configure each tissue and organ to meet the requirements for optimum tissue functionality.

To date, numerous biomimetic matrices have been developed using protein compositions of the ECM to emulate

the native ECM of the tissue. The fact that the composition of the ECM changes with gender, aging, and disease states, all developed biomaterials constitute a simplified form of the native ECM. Despite many advanced biomimetic matrices encompassing individual ECM constituents (e.g., collagens, fibronectin, hyaluronic acid, and laminin), protein-based biopolymers (e.g., gelatin, GelMA, and alginate) (Sharifi et al., 2020) or combinations (Cakmak et al., 2022), their success to mimicking of native microenvironment remains incomplete owing to the highly rich, specified composition of the ECM. Apart from single-component matrices, tumor-derived basement membrane extracts (BME) (i.e., Matrigel) have thus far been the gold standard for emulating the ECM. However, BME is purified from the Engelbreth-Holm-Swarm mouse sarcoma and comprises only the key components of the basement membrane proteins such as collagen type IV, nidogen, laminin, perlecan, entactin (Moura et al., 2022). Due to their tumor-derived origin, BMEs encompass various undefined growth factors, thereby rendering it challenging to discern the specific factors responsible for driving and affecting cellular function (i.e., stem cell differentiation and maturation). Moreover, undesirable characteristics such as batch-to-batch variability of their biochemical and mechanical properties, high cost, and inability to recapitulate unique tissue microenvironments limit their usability (Kaur et al., 2021). Therefore, it is crucial to develop alternative biomimetic matrices that mimic the native ECM while offering suitable tissue-specific cues in both homeostatic and pathophysiological conditions. Biomaterials composed of ECM can be prepared by processes that involve the decellularization of tissues, which effectively recapitulate the intricate architecture and composition of native tissues. As seen in Figure 1B, due to an urgent need for a biomaterial that closely mimics the native ECM, research on the decellularization of tissues or organs is gaining interest over time. Decellularization is a process that removes all the cellular components and immunogenic molecules from donor tissue while preserving proteins and macromolecules of the native tissue. dECM-based biomaterials can be applied in a demanded clinical application as a scaffold, powder, hydrogel, and particle form and is an excellent substrate for cell repopulation which offers a unique opportunity to recreate a biomimetic microenvironment, promoting cell attachment, proliferation, differentiation, and tissue regeneration (Yaldiz et al., 2022). This study focuses on the overview of the decellularization of the tissues and organs, decellularization methods, and their effects on the ECM structures and compositions. Then, current market trends in dECM-based biomaterials and PEST (political, economic, social, and technological factors) analysis that reveals the status of dECM-based biomaterials in the market is presented.

Decellularization of Tissues and Organs

Decellularization of tissues consists of two main steps, including the decellularization of a tissue or organ and terminal sterilization of the dECM. Both steps are highly effective in obtaining a biomaterial with the desired properties for the targeted clinical application. Since the decellularization process evolved with the critical balance of eliminating cellular components and preserving the protein composition and mechanical properties of the native ECM, each decellularization methodology should be tailored to the tissue source. In fact, many developed biomaterials fail due to immunologic rejections mainly attributed to the histocompatibility complex molecules (MHCs), which trigger a cellular immune response (Massaro et al., 2021; Ground et al., 2021;

Dhatchinamoorthy et al., 2021). In an unsuccessful developed decellularized scaffold, damage-associated molecular patterns (DAMPs) which are released from the damaged cellular components and ECM enhance the inflammation process resulting in the secretion of pro-inflammatory cytokines such as interleukin (IL) 1, IL6, and tumor necrosis factor (TNF) (Yaldiz et al., 2021). Although trace amounts of MHC molecules remain in the decellularized scaffold, inter- and intra-species conservation of ECM elicit a positive host response during early degradation, enabling recognition by the host immune system (Kasravi et al., 2023). Thus, successfully produced dECM-based biomaterials exhibit more biocompatibility and lower rejection rate compared to synthetic biomaterials. Therefore, to develop a successful decellularization process, three decellularization criteria have been proposed; (i) the amount of DNA should be <50 ng/mg dry weight of ECM, (ii) the length of DNA fragments should be lower than 200 bp on gel electrophoresis, and (iii) visible nuclear material, should not be observed in histological staining (Crapo et al., 2011).

dECM-based biomaterials encompass mixtures of various biomolecules that regulate cell adhesion, proliferation, migration, and differentiation, such as glycosaminoglycans (GAGs), proteoglycans (PGs), glycoproteins (i.e., laminin, fibronectin, and integrin), and structural proteins (i.e., collagen). Therefore, the selected decellularization and sterilization methods should pose minimal negative impacts on the biochemical and morphological compositions as well as mechanical properties of the decellularized matrix. Although each ECM component has a unique function within the tissue, they act as a whole to provide tissue organization and function. Collagens, the main structural ECM component, are fundamental for tissue's structural organization (e.g., shape, stability, and elasticity) and provide mechanical properties. Interestingly, collagens with triple helix structures are known as one of the ancient proteins that enable animal tissue evolution (Fidler et al., 2018). Thus far, 28 types of collagens classified into 3 main categories including fibrillar collagen (e.g., type I, II, III, and V), fibril-associated collagens (e.g., type IX and XII), and network-forming collagens (e.g., type IV, VIII), where each of them has unique functionality differing based on tissue location. Type I collagen is the major component of the organs and connective tissues such as mammary glands and skin (Sun, 2021). Moreover, collagens have crucial functions in hydrogel formation, involving the self-assembly process of the fibrillar structures in dECM under physiological conditions (Krishtul et al., 2020). Proteoglycans are glycosylated molecules where glycosaminoglycans (GAG) are conjugated to the core protein. The GAGs are specified as six types including chondroitin sulfate (CS), dermatan sulfate (DS), keratan sulfate (KS), heparan sulfate (HS), heparin (Hep), and hyaluronic acid (HA), whereas proteoglycans are identified on the basis of the type of core proteins, as well as the number and location of the GAG chains attached to the core (Walimbe & Panitch, 2020). Proteoglycans and sGAGs play pivotal roles in tissue hydration, and homeostasis and regulate many signaling pathways whether in healthy or pathophysiological conditions through interaction with different ECM proteins. Glycoproteins comprise ECM proteins such as laminin, fibronectin, and elastin, which are important in cell recognition, adhesion, and migration and function as a cohesive network in ECM. Laminin is an adhesion molecule found within the basement membrane and generates a structurally functional basement membrane with self-polymerization resulting in layered sheets (McKee et al., 2021). Fibronectin is another fibrillar protein found in the interstitial matrix, which plays a critical role in cell adhesion, migration, proliferation, and differentiation and provides mechanical support to tissue. Fibronectin is involved in many important biological

processes, including tissue repair, wound healing, bone repair, embryogenesis, and pathological processes such as fibrosis and cancer (Bierbaum et al., 2021). This provides strong proof that altering the correct ECM protein ratios in tissue may alter healthy tissue into a diseased state. While collagen fibers provide stiffness to the tissues and further show limited responses when stretching, conversely elastin fibers have excellent abilities to stretch specific tissues such as lungs, arteries, and skin, where compression and relaxation are needed for their function (Trębacz & Barzycka, 2023). Consequently, ECM is a dynamic microenvironment organized uniquely for each tissue and organ that provides the essential biochemical, physical, and mechanical properties for proper tissue functionality. Hence, it is crucial to understand the effect of agents and techniques on ECM in order to develop an effective decellularization methodology to preserve ECM proteins and macromolecules during the decellularization process.

Decellularization Strategies

To date, various physical, chemical, biological or a combination of approaches are applied to the donor tissue to lyse the cells, remove nuclear components and lipidic membrane contents while exerting minimum damage to the native ECM. Although most tissue types contain the main ECM components, different ratios of ECM proteins, tissue thickness, lipid contents, and cellular density of each tissue require optimization of the decellularization protocol. Even the donor variations (human, porcine, sheep, and bovine, etc.) of the same tissue or organ require an adapted decellularization methodology with a minimum loss of ECM content. Successful decellularization requires careful optimization of parameters such as treatment duration, the concentration of chemicals, and mechanical forces applied to effective cell removal while preserving the structural integrity of the native ECM. Following decellularization, extensive washing is required to remove residual cellular debris, and detergents to minimize potential adverse effects on subsequent cell seeding and tissue regeneration.

Chemical Methods

Chemical methods encompass the utilization of various acids, bases, detergents, and organic solvents to effectively dissolve the cell membrane and disrupt the intercellular bonds. Detergents enhance the effective removal of cellular components by solubilizing the cell membrane, and the effect on the decellularization varies depending on the types of detergents (e.g., ionic, nonionic, and zwitterionic detergents). The commonly used ionic detergent, sodium dodecyl sulfate (SDS), dissolves both outer and nuclear membranes and is effective in removing nuclear and cytoplasmic residuals of particularly dense tissues. However, it tends to cause lower GAG concentrations, collagen integrity loss, and denaturation of proteins and could impact the structure of the native matrix (Fu et al., 2014). However, due to the non-ionic nature, Triton X-100 provides less drastic action to dissolve cell membranes with preservation of protein-protein interactions, thus causing less damage to ECM proteins than SDS (Mendibil et al., 2020). Therefore, SDS and Triton X-100 are typically applied together in the decellularization process to maximize the effect of the decellularization with optimized detergent concentration,

treatment time, and treatment order. Zwitterionic detergent such as 3-((3-cholamidopropyl) dimethylammonio (CHAPS) has both properties of the non-ionic and ionic detergents and removes the lipid–lipid, and lipid–protein interactions while solubilizing membrane. CHAPS is more effective in the decellularization of thin tissue due to its limited permeation ability (Gilpin & Yang, 2017). When acid and base treatments are used for the decellularization process, the combination might exert a destructive effect mainly on collagens, and GAG while removing nucleic acids. Therefore, peracetic acid is often used in shorter treatment times for sterilization of the decellularized scaffold (Tao et al., 2021). Among others, alcohols support the decellularization of the tissues rich in lipids content with dehydration and degradation of the cells. Although alcohols including glycerol, isopropyl alcohol, and ethanol are used to effectively to decellularize the adipose tissue as part of the delipidation process, their fixation effects cause remaining DNA in the tissue (Chun et al., 2021). Therefore, an extensive washing process should be applied to prevent fixation before detergent applications.

Physical Methods

Physical methods such as agitation, sonication, pressure, freeze-thaw, and electroporation are used to further dissolve the cell membrane and release cellular components. However, employing these methods alone will not result in decellularization. Hence, combining with other chemical and biological techniques is required to achieve successful dECM-based biomaterials. Freeze-thaw treatments applied in the first step of the decellularization process involve freezing at $-80\text{ }^{\circ}\text{C}$ and thawing at room temperature or $37\text{ }^{\circ}\text{C}$. The process induces intracellular ice crystallization formation, thereby disrupting the cell membrane (Burk et al., 2014). Typically, more than one freeze-thaw cycle is applied as a single cycle is insufficient. The high hydrostatic pressure approach is used to disrupt the cell membrane by applying direct pressure to the tissue for a short duration. However, this method is effective for non-dense tissues (Hashimoto et al., 2011). Other approaches include sonication and electroporation, disrupting the cell membrane and releasing the cell contents to external solutions such as detergents.

Biological Methods

Enzymatic methods employ protease or nuclease enzymes to cleave nucleotide bonds in the tissues or organs. However, utilizing enzymes alone is challenging to remove the cellular components during the decellularization, and the application time must be tuned to each tissue, as enzyme residues can result in an adverse immune response (Crapo et al., 2011). Among these enzymes, trypsin is the most common, combined with ethylenediaminetetraacetic acid (EDTA) to break cell-matrix interactions. However, optimization of the trypsin application is crucial as prolonged treatment can alter matrix integrity, destroy laminin, and remove GAGs (Mendibil et al., 2020). Nucleases such as DNases and RNases effectively break down the nucleic acid sequences and therefore assist in the removal of nucleotides after cell lysis (Moffat et al., 2022). Nucleases are administered specifically after detergent applications to eliminate the remaining DNA in the tissue for more effective decellularization.

Application Techniques of the Decellularization Agents

The above-mentioned decellularization agents can be applied via immersion and agitation, whole organ perfusion, or the supercritical CO₂ (SC-CO₂) process, depending on the tissue or organ source and the subsequent application of the ECM. The immersion and agitation process is applied to tissue parts where the tissue or organ is cut into small pieces or minced and soaked into the decellularization agent with mechanical stirring. This process is utilized to decellularize mainly the non-vascularized tissue such as the brain, adipose, cartilage, bone, cornea, or skin, where perfusion-based decellularization cannot be applied. With the agitation process, decellularization agents diffuse throughout the tissue via the pores and then removed with the cellular components (Gupta et al., 2017). Such a process continues until the tissue is completely decellularized, thus for minimal ECM damage during the agitation, tissue thickness, agitation speed and time should be carefully optimized. To increase decellularization efficiency, the agents should be changed after particular times, and also washing step should not be forgotten to remove the detergent residues and cellular debris. Besides non-vascular tissues or organs, organs with the vascular system can be decellularized with the immersion and agitation process based on the final product. Typically, dECM-based biomaterials with hydrogel or microparticle forms are produced via this process, whereas the perfusion-based process is chosen to achieve whole organ decellularization. Indeed, perfusion technique is used to decellularize vascularized organs (e.g., liver, lung, heart, and kidney, etc.) as whole by perfusing decellularization agents throughout the organ's native vascular system (arteries, arterioles, and capillaries) while removing all cellular components and residues through the vasculature (Gupta et al., 2017). The peristaltic pump provides transport of the decellularization agents homogenously throughout the organ, resulting in the preservation of the 3D structure of the ECM. Thus, perfusion-based decellularization represents a promising approach to increase organ transportation in the near future, as the recellularization of the acellular whole organ presents the generation of a functionalized candidate organ introduced with patient-derived cells or stem cells resulting in reduced risk of organ rejection.

As an alternative approach, decellularization with SC-CO₂ has gained attention to effectively remove cellular residues while ensuring minimal deterioration of the mechanical and structural properties of the ECM. The supercritical phase is reached when the pressure and temperature of the fluid are above the critical point, hence showing both liquid-like (e.g., density) and gas-like (e.g., diffusivity and viscosity) properties (Filiz et al., 2022). Due to its low critical temperature (31.1 °C) and pressure (7.4 MPa), SC-CO₂-based decellularization is suitable for decellularizing tissues where higher temperatures destroy ECM proteins (Senyay-Oncel & Yesil-Celiktas, 2011). Furthermore, since SC-CO₂ is non-polar, the inclusion of ethanol or methanol as a co-solvent allows the removal of the polar components of the membrane (Kim et al., 2021). However, such solutions are a common fixative agent, thus the concentration and introduction time should be well-adjusted to avoid tissue and DNA fixation (Yaldiz et al. 2021). Other advantages of the SC-CO₂-based decellularization process are that there is no need for a separate sterilization step of the decellularized scaffold and obtained decellularized scaffold is in dry form with the ability for long-term storage, eliminating the lyophilization step.

PEST Analysis of the dECM-based Biomaterials for Commercialization Possibilities

Today, dECM-based biomaterials are gaining attention for their ability to address the needs of tissue engineering, regenerative medicine, and biomedical engineering applications by preserving the biochemical, physical, and mechanical properties of the native ECM. Comprehensive research into the current market's prospects and obstacles in bringing these biomaterials to market to fulfill consumer expectations can provide insight into the market position of dECM-based biomaterials. Herein, the PEST analysis is utilized as a technique to evaluate the political, economic, social, and technological aspects that may affect the market status of dECM-based biomaterials as the market is influenced by a variety of factors (**Table 1**).

Table 1. PEST analysis of the dECM-based biomaterials

Political Factors	Economic Factors	Social Factors	Technological Factors
The government's regulations and policies can affect the development, production, and growth of decellularized biomaterials in the market	The affordability of decellularized biomaterials compared to alternatives will positively impact sustainability in the market	Since decellularized biomaterials are a new treatment product in the market, patients may exhibit biased behaviors	The progress in biomaterials, tissue engineering, and 3D bioprinting technologies positively affects the availability of decellularized biomaterials in the market
Opinions on decellularized biomaterials of animal origin can be controversial due to cultural differences	Decellularization allows the various discarded organs in slaughterhouses to be recycled and used in tissue engineering and regenerative medicine applications	Since decellularized biomaterials are mainly of animal origin, they may not be accepted by animal activists	Progress in technologies positively affects the quality of decellularized biomaterials and their ability to mimic relevant organs
Such arguments may affect the public acceptance of these biomaterials	The low production cost of dECM-based biomaterials provides a benefit in the current market	Cultural beliefs and ethical considerations can greatly influence the acceptance of decellularized biomaterials in society and their progress in the	Providing support and funding for university research groups and collaboration with R&D departments of companies will leverage the associated technology

market

The willingness of patients to accept functionalized decellularized organs plays a vital role in the market demand

Giving education and seminars about concerns to raise awareness about their benefits can increase the acceptance of decellularized biomaterials by society

Raising awareness through education may assist in to adopt of dECM-based biomaterials by society

Politically, government regulations critically affect the commercialization of dECM-based biomaterials in the market. Such regulations also have an impact on the public acceptability of these biomaterials. On the other hand, the low production cost of dECM-based biomaterials compared to alternative biomaterials contributes positively to their sustainability in the market. However, ethical considerations and cultural differences might have serious impacts on the acceptance of decellularized biomaterials in public. Moreover, advancements in 3D bioprinting technologies are anticipated to positively affect the fabrication of functional tissues and organs. Although dECM-based biomaterials have a promising approach for creating functional tissue by mimicking native ECM, the issues of batch-to-batch variability, standardization, and ethical considerations of these biomaterials require further research.

Conclusion

The inability of existing ECM-mimetic biomaterials to adequately mimic the highly complex ECM has enabled the decellularization of numerous tissues or organs. Optimization of decellularization protocols, comprising a combination of physical, chemical, and biological methods, is critical for developing functional tissue architectures. When dECM-based biomaterials are utilized with tissue engineering and 3D bioprinting technologies, clinical products incorporating fully functional tissues or organs with patient-derived cells or stem cells can be developed in the near future to be employed in disease modeling, regenerative medicine, and organ transplantation. More work on standardization and a focus on batch-to-batch variations are required prior to market entry of these products for medical purposes.

Changing The Success Probability in Computerized Adaptive Testing: A Monte-Carlo Simulation on The Open Matrices Item Bank

Hanif Akhtar

Universitas Muhammadiyah Malang, Indonesia,  <https://orcid.org/0000-0002-1388-7347>

Abstract: For efficiency, Computerized Adaptive Test (CAT) algorithm selects items with the maximum information, typically with a 50% probability of being answered correctly. However, examinees may not be satisfied if they only correctly answer 50% of the items. Researchers discovered that changing the item selection algorithms to choose easier items (i.e., success probability $> 50\%$), albeit not optimum from a measurement efficiency standpoint, would provide a better experience. The current study aims to investigate the impact of changing the success probability on measurement efficiency. A Monte-Carlo simulation was performed on the Open Matrices Item Bank and simulated item bank. A total of 1500 examinees were generated. We modified the item selection algorithm with the expected success probability of 60%, 70%, and 80%. Each examinee was assigned to five item selection methods: maximum-information, random, $p=0.6$, $p=0.7$, and $p=0.8$. The results indicated that traditional CAT was 60-70% shorter than random item selection. Altering the success probability did not affect the estimation of the examinee's ability. Increasing the probability of success in CAT increased the number of items required to achieve specified levels of precision. Practical considerations on how to maximize the trade-off between examinees' experiences and measurement efficiency are mentioned in the discussion.

Introduction

Computerized Adaptive Testing (CAT) is a type of assessment that utilizes computer technology to adjust the difficulty level of the test items according to the examinee's proficiency level. This type of testing is getting more popular due to its advantages. One of the most substantial advantages of the CAT over linear tests is that it provides more precise estimates with a shorter test than traditional fixed-item testing (FIT) (Wainer, 2000; Weiss, 2011). The administration of CAT relies on the accuracy of the examinee's answers to the previously administered items to determine the selection of the subsequent item or set of items. If the examinee answers the item correctly, the next item will be more difficult. On the contrary, if the examinee answers the item incorrectly, the next item will be easier. After responding to a test item, the person's ability estimate, θ , is

updated. This cycle will continue until the stopping rule (e.g., level of precision or number of items) has been reached.

The most widely used criterion for item selection in CAT is the Maximum Information (MI) criterion (van der Linden, 2005). This particular criterion is designed to minimize the standard error of measurement (SE) by identifying the item with the highest information function value during the last estimate. Modern CATs mostly use item response theory (IRT) to calibrate items and estimate the examinee's ability. In IRT, too easy or too difficult items provide little information about that examinee's ability. The CAT algorithm chooses the difficulty of the item to match the currently estimated ability. Consequently, high-ability examinees face more difficult items, whereas low-ability examinees face easier items. Within the Rasch or 2PL-IRT framework, the examinees will have a 50% probability of being answered correctly, regardless of their ability. This optimum CAT algorithm can reduce the test length to reach the prespecified measurement precision.

Several researchers believed that utilizing the CAT item selection algorithm would result in a challenging and optimally motivating assessment scenario for the examinees (Linacre, 2000; Wise, 2014). This is due to the fact that the algorithm ensures that the examinees are not compelled to work on items that are either too difficult or too simple, thereby preventing feelings of being over- or under- challenged. However, empirical evidence supporting this claim is unclear. A recent meta-analysis study found no overall effect of test type on motivation when comparing CAT with FIT (Akhtar et al., 2022). According to Andrich (1995), a success probability of 50% may not be sufficient for maintaining test-takers motivation in a CAT. This is because they will only be able to achieve success in roughly half of the items presented to them. This success probability is typically lower than people used to in fixed-item tests.

Several researchers modified the CAT setting in order to maximize examinees' motivation. For example, Ling et al. (2017) found that participants who completed easier CAT (i.e., CAT with success probability > 50%) showed higher engagement and lower anxiety than participants who completed traditional CAT or FIT. In their study, they modified the success probability to 70%. A similar study also found that participants in the easier CAT group showed slightly lower anxiety than in traditional CAT or FIT groups, even though the difference was not significant due to low statistical power (Revueña et al., 2003). Häusler & Sommer (2008) discovered that alterations made by utilizing base success probabilities above 70% decreased measurement precision and, more importantly, a bias in estimating person parameters for respondents with higher abilities. However, a few easier motivator items could enhance test-taking motivation throughout the test without sacrificing testing time.

Evidence indicated that modifying the CAT algorithm to present easier items (i.e., success probability > 50%) would provide a better experience for examinees. However, modifying CAT to select easier items is not without consequences. When the difficulty level of a test is lower, additional items are necessary to achieve the designated SE. In their simulation, Bergstrom et al. (1992) found that if the specified SE is 0.5, the length of the test would be 16 items for the difficult test ($p = 0.5$), 17 items for the moderate test ($p = 0.7$), and 19 items for the facile test ($p = 0.7$). In their study, the item bank was calibrated using the Rasch model. In the Rasch model,

an item with $p = 0.5$ will always provide maximum information. However, in the 2PL model, $p = 0.5$ is necessary but not sufficient to provide maximum information. Therefore, practical considerations should be made to maximize the trade-off between test-taking experience and measurement efficiency.

Study objectives

This study aimed to investigate the impact of changing the success probability on measurement efficiency. I manipulated the success probability of administered items to 60%, 70%, and 80%. As a baseline, I also simulated traditional CAT using MI item selection and non-CAT using random item selection. A real and simulated item bank was used for this study. Specifically, our research questions were as follows:

1. Does changing the success probability detrimental to measurement efficiency (i.e., longer test length)? Specifically, at what point does measurement efficiency decrease drastically?
2. Does the estimates ability differ when different item selection methods are applied?

This study was divided into two stages. The first stage was a simulation on a simulated item bank. The same procedure was then replicated to a real item bank to examine whether item bank characteristics influenced the results. I used the Open Matrices Item Bank (OMIB, Koch et al., 2022) for the real item bank since it provides many benefits. The OMIB provides free and unlimited access to a large set of empirically validated figural matrices items. Therefore, researchers who are interested in applying easier CAT in a real testing context would not face any access barrier.

Methods

Item bank

This study used two item banks: simulated item bank and real item bank. All item banks used the 2PL model for item calibration. A simulated item bank was generated through R software (R Core Team, 2012) to generate an item bank as realistically as possible. A simulated item bank consisted of 1000 items with varied item difficulty (b) and item discrimination (a). Item difficulty for the simulated item bank was normally distributed. The mean and standard deviation of the distribution on the log scale for item discrimination were set as 0.2 and 0.3, respectively. It resulted in the final simulated item bank with b parameter ($M = 0$, $SD = 1$, $Min = -3.39$, $Max = 3.66$) and a parameter ($M = 1.26$, $SD = 0.38$, $Min = 0.49$, $Max = 3.14$). The distribution of a parameter and b parameter of simulated item bank is shown in Figure 1.

The second item bank used for the simulation is the real item bank from Open Matrices Item Bank (OMIB, Koch et al., 2022), freely available at <https://osf.io/fqtzp>. The bank consisted of 220 items. The final distribution of the OMIB had b parameter ($M = -0.17$, $SD = 0.99$, $Min = -8.98$, $Max = 2.41$) and a parameter ($M = 2.09$, $SD = 0.84$, $Min = 0.11$, $Max = 5.16$). Figure 1 depicts the distribution of a parameter and b parameter of OMIB.

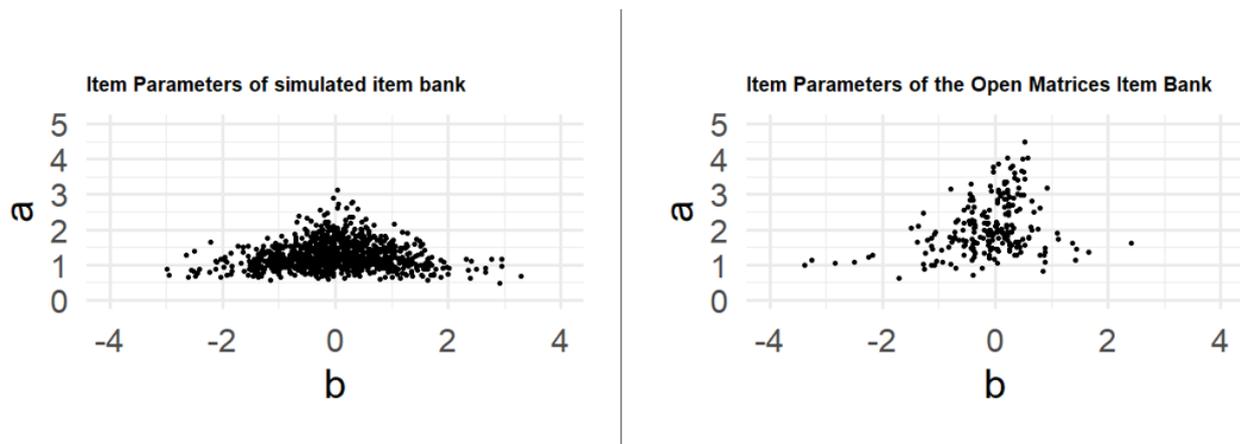

Figure 1. Distribution of item parameters of the item banks

Design of the CAT Simulation

CAT simulation was performed in two stages. In stage 1, simulation was performed in the simulated item bank. Examinee response and theta were generated using the mirtCAT package (Chalmers, 2016). The theta parameters were drawn from a standard normal distribution ($M=0$, $SD=1$), and the sample size was fixed to 1500 for each condition. The simulation design differed in terms of item selection and stopping rule. Five different item selection methods were used: Maximum-information (MI), success probability 60% ($p = 0.6$), success probability 70% ($p = 0.7$), success probability 80% ($p = 0.8$), and random items selection methods (Non-CAT). As a stopping rule, the precision-based termination rules were utilized with two conditions: $SE < 0.30$ (analogous to high-stakes testing) and $SE < 0.40$ (analogous to low-stakes testing). For ability estimation, Bayesian Maximum A Posteriori (MAP) was used. In stage 2, the same procedures were replicated in the OMIB.

Three criteria were used to evaluate the simulation for all conditions: test length, root means square error (RMSE), and correlation between estimated and true theta (r_{xt}). The test length was simply the number of items required to terminate. Test length was the main interest of this study as it was the indicator of measurement efficiency. RMSE was the absolute difference between the estimated and true theta. The r_{xt} is the Pearson correlation between the estimated and true theta. In addition, I also compared the real proportion of correct answers for each condition to check whether the item selection algorithm worked as expected.

Results

Measurement efficiency of each item selection

To answer the first research question (*Does changing the success probability detrimental to measurement efficiency?*), I compared all conditions in the simulation. The complete findings of the simulation study are summarized in Table 1. First, simulation was performed on the simulated dataset. As predicted, the modification from MI item selection to success-probabilities-based item selection increased the test length. For $p = 0.8$, the

test length was even worse than using random item selection. However, RMSE and r_{xt} in all item selection methods did not differ much. Traditional CAT (MI item selection) generally was 70% shorter than non-CAT, while moving to success-probabilities-based item selection decreased the efficiency to 13%-20%. The proportion of correct answers indicated that the real success probabilities were near to what was expected from the algorithm.

Table 1. Results of the simulation study

Item selection	SE < 0.30				SE < 0.40			
	Mean k	Prop	r_{xt}	RMSE	Mean k	Prop	r_{xt}	RMSE
Simulated item bank								
MI	11.72	0.52	0.95	0.31	6.36	0.54	0.91	0.42
p = 0.6	31.92	0.59	0.95	0.3	17.52	0.6	0.91	0.41
p = 0.7	34.86	0.68	0.95	0.3	17.96	0.68	0.91	0.41
p = 0.8	42.03	0.76	0.95	0.32	22.69	0.76	0.91	0.42
Random	40.18	0.5	0.95	0.3	20.97	0.5	0.91	0.4
Open Matrices Item Bank								
MI	11.06	0.56	0.95	0.3	5.34	0.57	0.92	0.38
p = 0.6	18.93	0.61	0.95	0.3	8.86	0.62	0.92	0.39
p = 0.7	21.08	0.67	0.95	0.3	10.42	0.68	0.91	0.4
p = 0.8	24.07	0.73	0.96	0.29	11.42	0.75	0.92	0.38
Random	26.92	0.53	0.95	0.3	13.63	0.55	0.92	0.39

Note: mean k = average test length, prop = proportion of correct, r_{xt} = correlation between the estimated and true theta, RMSE = root means square error, MI = maximum information, p = success probability.

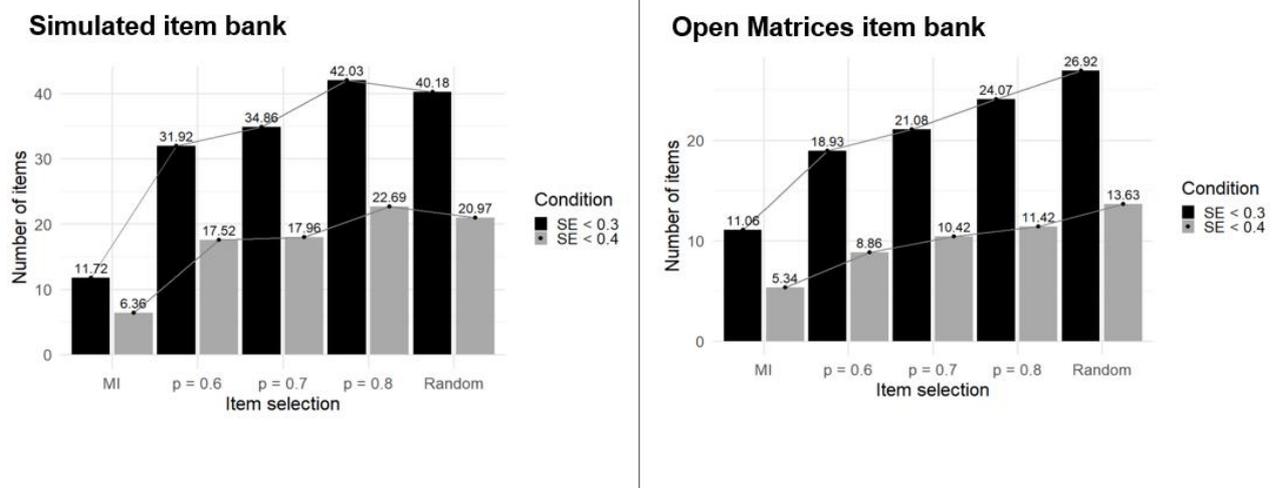

Figure 2. Number of items in each item selection method

The simulation study on OMIB showed similar results. However, modifying the algorithm using success-

probabilities-based item selection did not increase test length drastically, as in the simulated dataset. Using success-probabilities-based item selection was still better than using random item selection. Traditional CAT was generally 60% shorter than non-CAT, and its efficiency decreased to 21%-34% when success-probabilities-based item selection was used. The trend of the increasing number of items in each item selection method is displayed in Figure 2. As shown in Figure 2, when the algorithm switched from MI to $p = 0.6$, the test length increased drastically, but then the switching from $p = 0.6$ to $p = 0.7$ did not increase too much.

Estimate’s ability in each item selection

To answer the second research question (*Does the estimates ability differ when different item selection methods are applied?*), I compared the estimated theta from each item selection method. The comparison was performed using one-way ANOVA. In any comparison, the estimated theta did not differ significantly. For the simulated item bank, in condition $SE < 0.30$, there was no effect of item selection on estimated theta ($F(4, 2495) = 0.17, p = 0.95$), and $F(4, 2495) = 0.80, p = 0.52$, for $SE < 0.40$ condition. For the OMIB, in condition $SE < 0.30$, there was no effect of item selection on estimated theta ($F(4, 2495) = 0.32, p = 0.86$), and $F(4, 2495) = 0.40, p = 0.81$, for $SE < 0.40$ condition. Figure 3 shows the box plot of thetas in each condition.

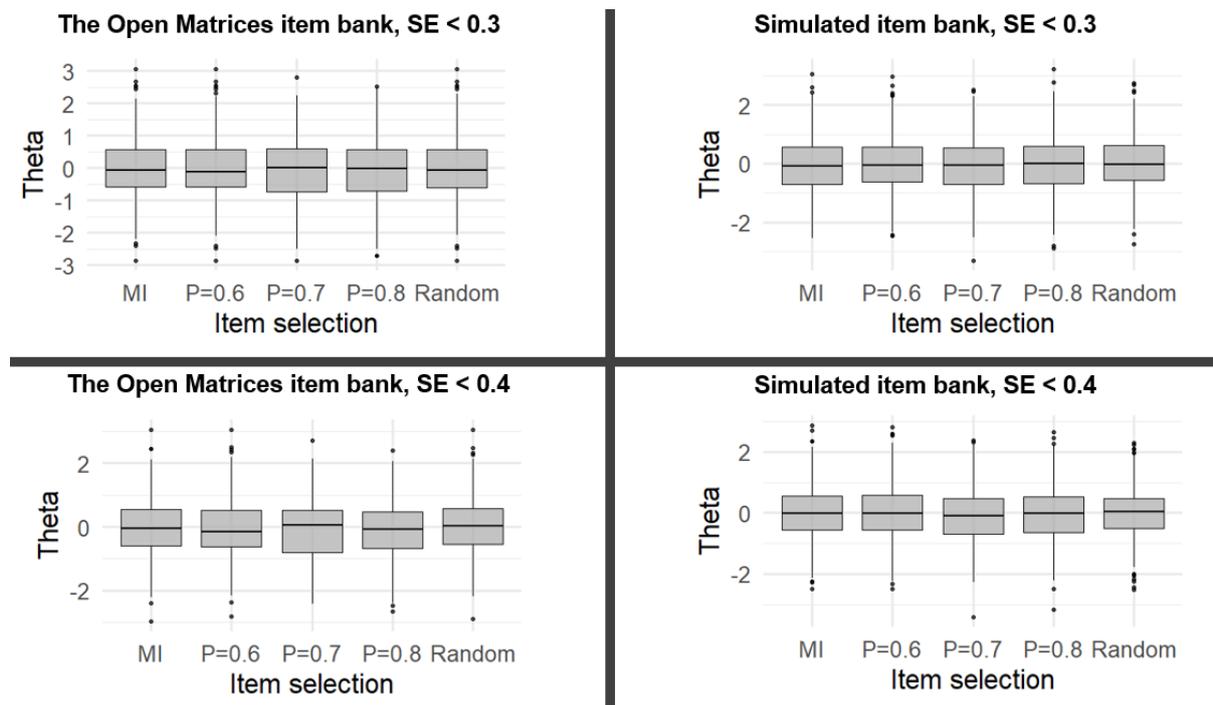

Figure 3. Comparison of estimated ability in all conditions

Discussion

This study aimed to examine the impact of changing the success probability on measurement efficiency and estimated ability. This study's main findings indicate that modifying the CAT algorithm to choose easier items

(i.e., success probability > 0.5) decreases the measurement efficiency. The test length drastically increased when $p = 0.6$ was applied but then was relatively stable when $p = 0.7$ was used. These results were similar for the simulated item bank and OMIB. However, a modifying algorithm to choose easier items did not affect r_{xt} , RMSEA, and estimated ability. Therefore, even though examinees answered more items correctly than in traditional CAT, their final theta was similar to when tested using traditional CAT.

The simulation study results have been predictable since previous studies found the same (Bergstrom et al., 1992; Häusler & Sommer, 2008). However, this study provides additional insight since two different item banks were used. First, although the OMIB consists of fewer items than the simulated item bank, it provides more efficient testing. It is particularly true when a modification algorithm is used for item selection. For example, to reach $SE < 0.3$, when $p = 0.7$ was applied, the simulated item bank needed 34.86 items, while the OMIB only needed 21.08 items. It is plausible since OMIB has more easy items (i.e., $b < 0$) with high a parameter than the simulated item bank (see Figure 1). In the IRT framework, items with higher a parameter provide maximum information, which in turn reduces SE significantly. Thus, measurement efficiency is not solely determined by the number of items in the bank, but rather by the quality of the item bank itself. However, since the simulated item bank has more items, the gap between the targeted and actual proportion of correct answers is closer than in the OMIB.

Second, modifying the algorithm to select easier items has no impact on r_{xt} and RMSEA. It indicates that, although not optimal from measurement efficiency, selecting easier items does not decrease measurement accuracy. This idea is also supported by the finding that the estimated ability (theta) did not differ in all item selections. This is true for the two different item banks. Therefore, researchers and practitioners who intend to apply easier CAT should not fear the loss of accuracy.

One notable finding of this study that contradicts previous research was the test-length cost when MI algorithm was replaced by selecting easier items. A previous study (Bergstrom et al., 1992) suggested that easier CAT targeted at a success probability of $p = 0.7$ only slightly increases the number of items required to reach a certain level of measurement precision. However, this study indicated that CAT targeted a success probability of $p = 0.7$ increases the number of items twice as CAT with MI item selection. It should be noted that Bergstrom et al. (1992) used the Rasch model. In the Rasch model, all items have similar item discrimination. Therefore, all item has the same weight to provide information as long as they match the examinees' estimated theta. In our study, the 2PL model was employed. Although theoretically, MI will result in $p = 0.5$, selecting items based solely on targeted $p = 0.5$ does not always result in maximum information. When item difficulty matches the estimated theta, item discrimination will highly determine information. Since the item bank has many items with high item discrimination (i.e., a parameter > 1), it results in more efficient testing. Thus, switching to item selection with a higher success probability will reduce efficiency even more severely.

Several scholars suggested that practitioners need to consider easier CAT because it provides better experiences for examinees (Häusler & Sommer, 2008; Ling et al., 2017; Revuelta et al., 2003). However, what is the cost if

we modify the CAT algorithm to select easier items? This study shows that the test length cost is more severe than in previous studies. Practical considerations should be made to maximize the trade-off between test-taking experience and measurement efficiency. If measurement efficiency is the priority, then no need to move from traditional CAT using MI item selection. In fact, the actual proportion of correct answers using MI was higher than 50%. But, if test-taking experiences are the priority, I would suggest item selection with targeted $p = 0.70$. The simulation indicated that CAT targeted at a success probability of $p = 0.7$ only slightly increases the number of items required to reach a certain level of measurement precision compared to $p = 0.6$. This suggestion is also supported by Asseburg and Frey (2013), who suggested that a success probability of 70% is optimal because examinees invested more effort and reported less boredom.

Limitations

Notably, although the central issue of this study is to address the trade-off between measurement efficiency and test-taking experience, I did not examine the effect of item selection on test-taking experiences using real-time testing. It is imperative to address whether examinees prefer shorter but harder tests or easier but longer tests. Second, I only used the 2PL model for the simulation. Other models, such as Rasch, might provide different results. For instance, in 2PL, MI item selection prefers to choose items with high a parameter. But in Rasch, a is constrained to be 1 for all items. Thus, efficiency mainly depends on the distribution of item difficulty. Third, I only used MI for traditional item selection in CAT. However, many other item selection methods exist, such as the Kullback-Leibler criteria. Future research is suggested to compare other methods too. Finally, measurement efficiency in this study was defined as the test length. However, the longer test does not always result in a longer testing time. Hornke (1997, 2000) indicated that incorrect items require longer than correct ones. Thus, easier CAT, although it needs more items, does not necessarily require more testing time. Future studies should investigate further on this issue.

Conclusion

In summary, changing the CAT algorithm to select easier items (i.e., success probability > 0.5) reduces measurement efficiency. These findings were comparable for the simulated item bank and OMIB. However, a modifying algorithm to choose easier items did not impact r_{xt} , RMSEA, and estimated ability. As a result, even though examinees accurately answered more questions than in a traditional CAT test, their final theta is comparable.

Recommendations

Practical considerations should be made to optimize the trade-off between the test-taking experience and measurement efficacy. There is no need to switch from the traditional CAT using MI item selection if measurement efficiency is the top priority. In reality, more than 50% of the questions were answered correctly

using MI. However, if the quality of the test-taking experience is more important, I would advise choosing items with an intended $p = 0.70$.

Abstract: The European Union defines waste as an extraneous object that is being discarded, intends to be discarded, or needs to be discarded, attributed to the fact it has the potential to be used. The world has become extremely alarmed as the number of wastes tends to increase. The sole option is to sustain waste through reusing and recycling, as there is no innovative way to effectively mitigate or avoid this from occurring. Numerous attempts by using green technology have been taken in recent years to recycle waste into various products, such as fertilizer in the form of a soil bed. Waste has been proven to be appropriate for usage in soil bed manufacture. Chemical waste known as sludge from one Oleochemical industry in Malaysia has been found significantly proven to be recycled as soil bed. Thus, the goal of this paper is to present the first section of the research study which is the development of a simulation model for soil beds known as the Zero Waste Simulator (Z-Waste). The Z-Waste simulator has been developed using the simulation technique called Discrete Event Simulation as it is suitable to model process-oriented modelling. The existing process flow of the soil bed production has been modelled and analyzed to check for bottlenecks and constraints. Various test scenarios were used to identify the strengths and weaknesses of the existing process flow. As a result, we found that daily consumed sludge per daily production of sludge has contributed to the significant impact on the soil bed production. The amount of sludge per unit product (soil bed) that is used is relatively small compared to the amount of sludge that was produced daily by the industry. This finding is crucial to prepare the industry for possible upscaling strategies that will help to achieve the zero-waste target by 2030.

Introduction

Sludge is a semi-solid slurry generated as a byproduct from a variety of industrial processes such as water treatment, wastewater treatment or on-site sanitation systems (Edzwald, 2011). The term encompasses all solid and semi-solid materials that a community discards (da Silva, 2012). There are numerous types of solid waste, but the most common three are industrial waste, agricultural waste, and municipal waste. Solid waste encompasses various types, with three of the most common being industrial waste, agricultural waste, and municipal waste. Industrial waste can take various forms, such as settled suspensions derived from conventional water treatment processes, manure sludge resulting from sewage treatment, or fecal sludge obtained from pit latrines and septic tanks. Industrial waste includes a wide range of substances, such as chemical solvents, dyes, sludge, metals, ash, paints, sandpaper, paper products, and even radioactive materials. To sum up, any chemical byproduct, whether toxic or benign, that arises from an industrial process is classified as industrial chemical waste. These waste items can be hazardous to both human health and the environment if not managed appropriately (Edzwald, 2011). The majority of chemical waste consists of organic and inorganic compounds that may be toxic, flammable, corrosive, or reactive (Daniel & Vallero, 2019). Production, mining, agriculture, healthcare, and research are just few of the industries that can produce chemical waste. There is a risk that improper disposal of this waste, which may contain heavy metals, solvents, acids, and other toxic compounds, will have an adverse impact on the environment in which humans and other forms of life thrive (Karri et al., 2021). In other words, soil, air, and water can all be tainted by these waste products causing a number of major health consequences, including cancer, respiratory problems, and neurological abnormalities, that have been linked to exposure to these toxins (Daniel & Vallero, 2019).

Prior to 1950, most communities around the world disposed their industrial waste by simply dumping it into neighboring rivers or landfills. This practice has caused extensive environmental harm and health problems in affected populations (Limami et al., 2021). Today, many countries have enacted legislation to ensure that industrial chemical waste is processed and disposed safely and sustainably. Different countries are deploying variety of measures to deal with industrial waste. Malaysia for instance, is grappling with the hurdle of handling industrial waste responsibly due to their expanding cities, industrial activities and soaring populations (Mohamed, 2009). According to statistics of 2021 from Malaysian Investment Development Authority (MIDA), Malaysia produced 19,000 tons of waste per day in 2005 at a recycling rate of 5%, in 2018, the amount grew to 38,000 tons per day despite an enhanced recycling rate of 17.5%. This call for concern as it exceeds the

estimated 2020 Japan International Cooperation Agency (JICA) of 30,000 tons per day. Waste management is becoming increasingly pressing as landfill space becomes increasingly scarce and disposal costs continue to rise, threatening the environment and the public's health.

A closer look at the statistics of 2021 from MIDA for Sustainable Waste Management, it is shown that the oil and gas sectors in Malaysia were responsible for around 41% of all fugitive emissions of methane (CH₄), followed by industrial waste water treatment and discharge emissions at 28% and solid waste disposal sites at 18%. Palm Oil Mill Effluent (POME) accounted for more than 99% of the emissions from industrial waste water treatment and discharge. In tandem with the rapid development of economic growth, environmental degradation in developing nations has increased (Apergis et al., 2021). Despite legislation encouraging consumer waste management through recycling activities (Ghobadi et al., 2021), it should be recognized that industrial processes are the primary source of waste. However, most developing nations that are becoming industrialized lack adequate resources and technology to dispose their industrial waste with minimal environmental impact as the world search for more eco friendly environment. To improve and preserve environmental quality, there is a greater need to adopt and transition to more integrated and sustainable waste management strategies at all levels (Dahale et al., 2012). Processes involved in managing industrial chemical waste include treatment, storage, transportation, and disposal. Treatment may entail neutralizing or removing pollutants from the waste by physical, chemical, or biological methods. Transportation is done by qualified personnel using specialized equipment, and storage facilities are built to prevent leaks and spills.

To prevent harm to the environment and human health, proper disposal of industrial chemical waste is crucial. The inadequate management of production waste raises the number of wastes across nations resulting in increase in global pollution (Dahale et al., 2012). To prevent this pollution, an innovative waste management procedure is required. There are various methods for waste management, such as establishing a landfill or practicing segregation. Consequently, it is still unable to sustainably decrease waste (Mohamed, 2009). Sustaining waste is one method of optimizing its use. Typical means of waste disposal include incineration, disposal in landfills, and deep-well injection. However, these methods can have significant environmental effects (Anderson, 1987). Therefore, attempts are being made to identify more sustainable and eco-friendly alternatives, such as recycling and waste-to-energy technology.

In this paper, we developed a simulation for Oleochemical industry to guide it on optimizing the use of sludge waste generated during the production of soil bed and the rest of the waste generated during the manufacturing process. Findings like these are critical for setting the industry up for success as it considers upscaling options that will bring it closer to the zero-waste goal set for 2030.

The structure of this paper is divided into five sections as follows: Section **Hata! Başvuru kaynağı bulunamadı.** describe the related work. Section **Hata! Başvuru kaynağı bulunamadı.** examines the material and composite preparation. Section **Hata! Başvuru kaynağı bulunamadı.** examines result and discussion for ZWS, Section **Hata! Başvuru kaynağı bulunamadı.** conclude this research.

Related Work

Sludge Waste Management

In Malaysia, one of the existing management system for industrial wastes predominantly utilized is an end-of-pipe approach, emphasizing treatment and disposal (Mohamed 2009). The approach involves phases; first, is thickening and dewatering sludge that reduces its volume and facilitates its handling and transportation by removing surplus water. Second, is treating the sludge to reduce its volume and remove dangerous chemicals using typical methods such as anaerobic digestion, aerobic digestion, and composting. Third and the final phase, the sludge is then disposed of in a way that is both safe for humans and the environment. Other approaches in industrial waste management of sludge include landfilling, recycling, incineration and composting (Yasin, 2017). generally, there are varied capabilities offered by these methods. Each has its own advantages, disadvantages, and tradeoffs.

However, all these approaches have been associated with various environmental issues, including illegal dumping and the necessity for additional land to accommodate disposal facilities (Mohammed, 2009). The consequences of illegal dumping of industrial waste poses significant risks to human and environmental well-being. It is essential to transition from the existing management method to a more sustainable regime, considering the availability of technology and the increasing demand for waste recovery and reuse. Japan as an example, prioritizes the recovery of waste and by-products by implementing strategies that replace material resources with technological advancements (Erkman, 2002). Several other studies such as (Ui, 1984; Hirayama et al., 1987; Langenhove 2005) have identified the importance of waste recovery in creating alternatives resources and promoting costs efficiency. Therefore, we can deduce from these authors that waste recovery in industries leads to cost reduction, improved resource utilization, eco-friendly product designs, and effective environmental and health protection.

Recently, a technique have been developed to use industrial waste in the form of sludge for soil bed production. Studies conducted in the use of sludge waste in soil bed production focus on the dosage mixtures with different replacement levels of sludge in their effects on mechanical properties on soil bed. Studies such as (Erdal, 2001; Donald, 2011; Brooks, 2011; Joshi et al., 2012) and many others concluded that cement and lime improve soil volume stability, strength, stress-strain behavior, permeability, and durability. Most of these studies argued that cement or lime stabilize any soil except organic or very plastic clays. Furthermore, Lime and cement were frequently utilized as soil stabilizers to modify soil characteristics until recently, research indicates that solid waste products such as flyash and rice husk ash can be used to produce soil beds, with or without lime or cement (Dahale et al., 2012). Rice Husk Ash (RHA) another form of solid waste was found to improve soil performance. Several researchers including (Muntohar, 2002; Basha et al., 2005; Chun-Yang et al., 2006; Musa, 2008; Roy et al., 2010; Edeh et al., 2012) examined RHA-soil combination geotechnical properties to determine their stabilizer potential.

To conclude this section, various methods such as waste treatment and disposal, recycling and waste recovery were identified. However, these approaches have been associated with health and environmental issues. To address these concerns, there is a need to shift towards a more sustainable management regime that emphasizes waste recovery and reuse. Waste recovery offers benefits such as cost reduction, efficient resource utilization, eco-friendly product designs, and effective protection of the environment and human health as demonstrated from the cited literatures. In addition, recent research has explored the utilization of industrial waste recovered, specifically sludge, in soil bed production, aiming to improve soil properties and stability. Thus, the aim of this paper is to present the first section of the research study which is the development of a simulation model for soil beds known as the Zero Waste Simulator (Z-Waste).

Simulation Techniques In Business Process

A simulation model, according to Pidd (1997), is a computer-based system representation that can imitate the dynamic behavior of that system. The model can then be used to run "what if" experiments without having to develop or damage the real-world system. Models used in simulations are simplifications of the underlying systems or processes that capture their essential properties and behaviors. These models can take either a continuous or a discrete form. The use of a digital computer to solve models with constantly changing states is known as continuous simulation (Bratley and Schrage, 2011). Full wave rectifiers (Durling, 1974) and radioactive decay (Ord-Smith and Stephenson, 1975) or time-dependent models make up the bulk of the work on continuous simulation. These are the typical domains in which continuous simulation is used, however it can also be used in business games.

In contrast to continuous simulations, where state variables change continuously, discrete event simulation only permits state changes at predefined intervals. Simulation models make it possible to figure out a system's throughput, find its weak spots, and answer "what-if" questions about proposed changes to the system. For modelling batch processing systems, discrete event simulation (DES) is the best method (Alexander, 2006). This, has been echoed by Heilala et al. (2010) who demonstrated how DES may be used as a system analysis tool to examine production system principles, system setup, and control logic. Similarly, Dottavio et al. (2016) used FlexSim software to model the flow of nuclear waste during a typical decommissioning process. Many other researchers have employed DES models for a wide range of nuclear waste management purposes and as an overarching project planning tool in decommissioning (Thompson and McCann, 2010). It is obvious that DES is suitably fit for solving a variety of problems in the development process, military, service sectors, and manufacturing. In addition, if a business needs a new assembly line, DES is a good candidate to utilize.

With regards to industrial waste simulation, Zhou et al. (2019) investigated the performance of the reactor and the effects of operating parameters such as coal feeding rate, semi-coke to coal ratio, and particle sizes of coal pressurized pyrolysis process in an industrial-scale spout-fluid bed reactor. Similarly, the same technique was applied by Mokhta et al. (2020) for studies on microwave-assisted pyrolysis of biomass to make bioenergy.

Their focus was on the number and location of waveguides. The usefulness of simulation has grown as it has been used to more and more fields such as in simulation of biomass pyrolysis conducted at the particle size, taking into account intra-particle transport processes and surrounding flow fields (Xiong and Kong, 2016). Furthermore, simulation of microwave-assisted pyrolysis of biomass for bioenergy production with special attention on waveguide number and location was done (Jaroenkhasemmesuk et al., 2018). The study investigated the catalytic cracking process for bio-oil upgrading. In a related study, Ding et al. (2020) simulated the analysis of the catalytic cracking process of biomass pyrolysis oil with mixed catalysts optimization using the simplex lattice design. The author was able to identify the weakness and areas of improvement. In addition, machine learning was deployed in simulation process. For instance, the simulation of combustible solid waste pyrolysis in a fluidized bed reactor Powder Technol and in CFD-based reduced-order modelling of fluidized-bed biomass fast pyrolysis using artificial neural network to recycle energy (Zhong et al., 2020).

Recently, simulation makes it possible to do a dynamic analysis of production systems to find ways to improve the process "as is" and ways to add new technologies often called "to be" states (Skoogh and Johansson, 2008). Despite its limited use at the corporate level (Battista et al., 2010), numerous researchers have focused their attention on simulation due to its enormous potential. Simulation, in fact, is a powerful tool for analyzing complex systems (Solding and Gullander, 2009). This is because it provides the opportunity to quantify each variation. In reality, a simulation can be used to evaluate alternate designs or to improve an existing one, allowing cost savings and reducing lead time (Hosseinpour and Hajihosseini, 2009). Moreover, modelling and simulation are developing as critical tools to support production in the twenty-first century (Mor et al., 2021). While several researchers have investigated the possibility of using the simulation techniques from several points of view, little has been made with regards to soil bed production using zero waste simulator. Thus, the Z-waste simulation is intended to drive the strategic sustainability goals towards practical operational implementation.

In this context, the focus of this research is to provide the initial findings of the research study, which is the development of Zero Waste Simulator, a simulation model for soil beds that is appropriate for modelling process-oriented modelling, the Z-Waste simulator was developed using the simulation approach known as Discrete Event Simulation. The existing soil bed production process flow has been modelled and examined to identify bottlenecks and constraints. Several test scenarios were performed to identify the existing process strengths and weaknesses.

Material and Composite Preparation

Sludge Preparation

FPG Oleochemicals (FPGO) is a joint venture between Felda Holdings Bhd Malaysia and Procter & Gamble Company, USA. The former produces refined glycerin, methyl esters, and fatty alcohols while the latter distributes and exports the products to Europe and Asia. The business is headquartered in Kuantan, Malaysia, and was established in 1993. The by-product produced in the form of sludge is refined to be used in soil bed

production. This is to promote the drive towards achieving the zero-waste target by 2030. The process involves converting sludge to soil bed. System Dynamic Simulation (SDS), Agent-Based Modelling & Simulation (ABS), and Discrete Event Simulation (DES) are among the finest techniques for simulating such process. After considering all of the benefits and drawbacks, DES is chosen because of its capacity to imitate the process (Alexander, 2006; Heilala et al., 2010; Dottavio et al., 2016; Thompson and McCann, 2010).

There are several processes require in order to turn the sludge waste into the soil bed. The substance that needed in this process are dried sludge, cement, sand and water. First, sieve all the materials using an aperture scale of 2.0 mm before weighting using ratio of 1:5 for small-medium sized pot as shown in Fig 1. Then, prepare the bottom layer for the plant pot to prevent mixture from escaping during molding process and hole drilling in the polystyrene cup as in Fig 2(a) and Fig 2(b). The mixed substances being place in the mould to form a soil bed as shown in **Hata! Başvuru kaynağı bulunamadı..** The soil bed produced will be let dry directly from the sunlight for 24 hours.

Figure 1: Sieve materials before weighting process

Figure 2 (a) : Bottom layer preparation for plant pot

Figure 2 (b): Hole drilling for polystyrene cup

Figure 3: Mixture of all substance

Figure 4: Moulding substances into soil bed

The mix design for soil bed with different percentage of sludge is used as the three test cases for experiment which include three scenarios (Scenario 1: Simulation according to standard process of soil bed production, Scenario 2: identify bottleneck existence, buffer/stocking concept will be implemented, and Scenario 3: Parallelism with multiple distribution and multiple product development). These three test cases are the sludge with 10%, 50% and 100% used in the soil bed production process as shown in the **Hata! Başvuru kaynağı bulunamadı.**

Table 1. Mix Design for Soil Bed using Sludge

Sludge %	Sludge (kg)	Cement (kg)	Sand (kg)
10	100	1000	1000
50	500	1000	1000
100	1000	1000	1000

Model Development

In order to aid in the management of sludge waste and decision-making, the Zero Waste Simulator (ZWS) has been designed utilizing the DES method. Based on the three case studies the model output shown in 0, about the three same basic conceptual models are developed for DES, addressing the scope and level of the system under exploration. The concept for a DES model is developed, addressing the basic process flow shown in 0. However, there are few things that must be taken such as simulation attributes and performance measurement to setup the simulation. The number of sludge arrived, and the number of sludge used has been taken as simulation attributes. While number of sludge left, percentage of sludge used and number of soil bed produced, has been taken as the performance measurements in Table 2.

Sludge is the main product from sewage waste. Conventional soil bed is mostly prepared by using soil. Chemical composition of sludge is nearly similar to the soil. Thus, the sludge can be used as a replacement for soil in manufacturing of soil bed. By identifying the requirements needed for soil bed processing using sludge waste as a replacement of cement and sand, a simulation can be modelled.

Table 2. Simulation Attribute and Performance Measurement

Simulation Attributes	Performance Measurement
a. Number of sludges arrives	a. Number of sludges left
b. Number of sludge used	b. Percentage of sludge used
	c. Number of soil bed produced

Scenario 1

1. Sludge arrival rate

Using the arrival process regarding sludge waste inside the real-world method illustrated, the appearance rate in the ruse model is identified. In the ruse model the appearance rate is modelled using an integer distribution with everyday arrival rate shown in Table 3.

Table 3. Sludge Arrival Rate (Scenario 1)

Parameter	Rate
Sludge Arrival	1000 kg per day

2. *Number of sludge used for producing soil bed*

In addition, for soil bed production process in the real-life system, sludge is used as cement or sand replacement and the percentage of sludge used per soil bed varies. In the simulation model the number of sludge used is modelled using an integer value shown in Table 4.

Table 4. Number of Sludge Used (Scenario 1)

Parameter	Value
Number of Sludge used	10% cement replacement (65g sludge)

Scenario 2

1. *Sludge arrival rate*

Based on the arrival process regarding sludge waste inside the real-world method illustrated, the appearance rate in the ruse model is determined. In the trick model the physical appearance rate is modelled utilizing an integer supply with everyday appearance rate shown in Table 5

Table 5. Sludge Arrival Rate (Scenario 2)

Parameter	Rate
Sludge Arrival	1000 kg per day

2. *Number of sludge used for producing soil bed*

In addition, for soil bed production process in the real-life system, sludge is used as cement or sand replacement and the percentage of sludge used per soil bed varies. In the simulation model the number of sludge used is modelled using an integer value shown in Table 6.

Table 6. Number of Sludge Used (Scenario 2)

Parameter	Value
Number of Sludge used	10% sand replacement (370g sludge)

Scenario 3

1. Sludge arrival rate

In line with the arrival process of sludge waste in the actual life system illustrated, the introduction rate of the simulation model is defined. In the simulation model the arrival rate is modelled utilizing an integer distribution with daily arrival rate shown in Table 7.

Table 7. Sludge Arrival Rate (Scenario 3)

Parameter	Rate
Sludge Arrival	1000 kg per day

2. Number of sludge used for producing soil bed

In addition, for soil bed production process in the real-life system, sludge is used as cement or sand replacement and the percentage of sludge used per soil bed varies. In the simulation model the number of sludge used is modelled using an integer value shown in Table 8.

Table 8. Number of Sludge Used (Scenario 3)

Parameter	Value
Number of Sludge used	Both 10% cement replacement (65g sludge) and 10% sand replacement (370g sludge)

Results

Looking at tables 8 and 9, there are two scenarios related to a soil bed project. The data is organized into columns, each representing a specific aspect of the project. The first column, labeled "Amount of Sludge," indicates the quantity of sludge used in kilograms for the project. In both scenarios 1 and 2, the amount of sludge used is consistently 1000 kg. The second column, labeled "Amount of Sand," represents the quantity of sand used in kilograms for the project. Again, in both scenarios, the amount of sand used is 1000 kg. Similarly, the third column, labeled "Amount of Cement," denotes the amount of cement used in kilograms for the soil bed project. Like the previous columns, the amount of cement used is 1000 kg in both scenarios. The fourth column, labeled "Size of Soil Bed," provides information about the size or scale of the soil bed used in the project. In scenarios 1 and 2, all rows indicate a "Medium" size for the soil bed. Moving on to the next columns, the "No of Workers" column specifies the number of workers involved in the project. The number of workers varies for each row, starting from one worker and increasing up to three workers. Moving forward, the "No of Hours" column indicates the number of hours worked on the project. In both scenarios, all rows show a consistent value of six hours of work.

The "Oven Capacity" column specifies the capacity of the oven used for the drying process in the project. The oven capacity varies across different rows in the scenarios. Unlike the "Total Output" column which displays the overall output or yield of the soil bed project. It is represented by numeric values, indicating the quantity or measurement of the output. The "Sludge Remain" column however, indicates the amount of sludge that remains unused after completing the soil bed project. The values in this column are represented in kilograms and decrease with each row, indicating the reduction in remaining sludge. Furthermore, the "Sludge Used" column represents the amount of sludge that was utilized in the soil bed project. The values in this column increase with each row, indicating the incremental usage of sludge. Finally, the "Percentage Sludge Used" column displays the percentage of sludge used in the project compared to the total available sludge. The values in this column are represented as percentages and increase with each row, indicating the proportion of sludge used relative to the total amount available.

The simulation models results for lab environment production is shown in Table 8 while the simulation models results for production environment is shown in Table 9.

Table 8. Result of Scenario 1

Amount of Sludge (kg)	Amount of Sand (kg)	Amount of Cement (kg)	Size of Soil Bed	No of Workers	No of Hours	Oven Capacity	Total Output	Sludge Remain (kg)	Sludge Used (kg)	Sludge Used (%)
1000	1000	1000	Medium	1	6	10	10	999.44	0.56	0.062
1000	1000	1000	Medium	2	6	10	10	999.06	0.94	0.1
1000	1000	1000	Medium	3	6	10	18	998.75	1.25	0.131

Table 9. Result of Scenario 2

Amount of Sludge (kg)	Amount of Sand (kg)	Amount of Cement (kg)	Size of Soil Bed	No of Workers	No of Hours	Oven Capacity	Total Output	Sludge Remain (kg)	Sludge Used (kg)	Sludge Used (%)
1000	1000	1000	Medium	1	6	10	30	962.8	37.2	3.72
1000	1000	1000	Medium	2	6	20	60	925.6	74.4	7.44
1000	1000	1000	Medium	3	6	30	90	888.4	111.6	11.16

The simulation models result with significant changes in soil bed solution to zero waste is shown in Table 10 :

Table 10. Result of Scenario 3

Amou nt of Sludge (kg)	Amou nt of Sand (kg)	Amou nt of Cemen t (kg)	Size of Soil Bed	No of Wor kers	No of Hours	Oven Capaci ty	Total Output	Sludge Remain (kg)	Sludge Used (kg)	Sludge Used (%)
100	400	600	Medium	20	40	170	1600	0.06	99.94	99.94

Based on the results from scenarios 1, 2 and 3, it can be deduced that the findings demonstrates how Zero Waste Simulator using DES technique helps in sludge waste management and decision making. From the simulation results, we can conclude that the Scenario 3 is suitable to be applied as it has produced more soil bed per day with low cost and maximize the number of sludge used.

ZWS Animation & Output

The enhancement for DES model starts by developing the soil bed production process flow of the specific model with multiple product development. Generally, the simulation models make full use of same model suggestions parameter values described as follows:

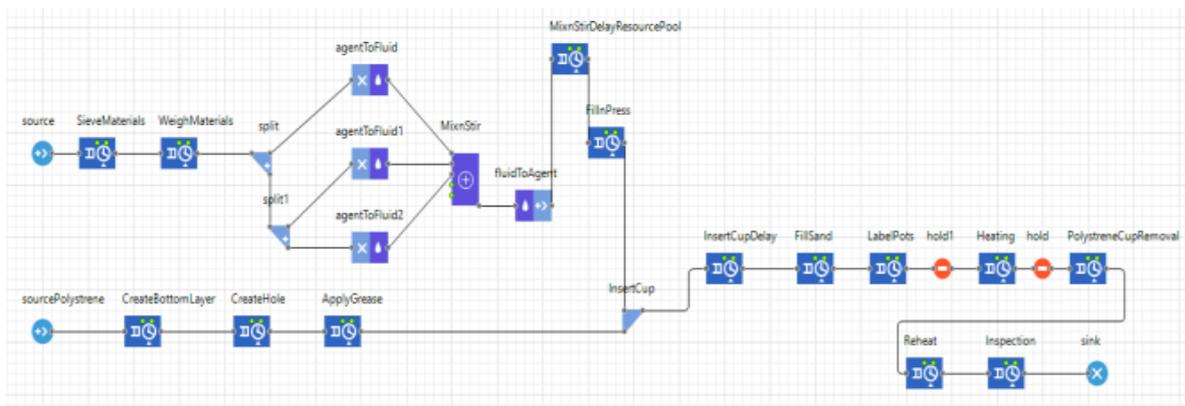

Figure 5: Zero Waste Simulator Process Logic

Discussion

The ZWS was developed with the ability to handle the waste management in order to use sludge for soil bed production. It was accomplished by simulating the process of soil bed production from the sludge waste with multiple possible scenarios such as different number of sludge used for production and different number of sludge arrives per day for production to improve and maximize the number of sludge used for soil bed production with less excessive sludge left. The ZWS evaluated according to the evidence found in scenarios 1, 2 and 3. The simulation of sludge waste soil bed process model was achieved using discrete event simulation. From the simulation, several solutions for decision making on sludge waste management were analyzed. Therefore, the outcomes of scenarios 1, 2, and 3 demonstrated how the Zero Waste Simulator using DES

technique can aid in sludge waste management via provisions of multiple possible options for best decision making. Hence, the simulated result demonstrated that the Scenario 3, with 1000kg sludge per day are the most suitable option to be applied. This is obvious as it has produced more soil bed per day with low cost and maximize the number of sludge used in comparison with both scenario 1 and 2. Thus, the results of this research suggest the potential alternative process for bottleneck analysis that can improve the soil bed production process from sludge waste as well as maximizing the usage of the sludge waste.

Conclusion

It can be deduced, using the results from scenarios 1, 2, and 3, that the findings demonstrate how the Zero Waste Simulator using DES technique helps in sludge waste management and decision making. The hypothesis was written in section 3, and the results were obtained from those three scenarios. Based on the findings of the simulation, we can draw the conclusion that Scenario 3 is an option that should be considered for application because it has produced more soil bed per day at a lower cost and has maximized the number of sludges that have been used.

Recommendations

The future research investigates the performance of ZWS in real life case studies of manufacturing or business production process. Additionally, further investigation of the performance of ZWS in large attributes and complex system is important area of focus.

Abstract: In mushroom cultivation, spawn is among the most important factors that ensure a successful production. Considering several drawbacks from both solid and liquid spawn in shelf life and preservation matters, it is suggested that dry powder form of spawn is a good potential to explore. A study of powder culture formation using a spray dryer had involved various inlet temperatures of 80 °C, 90 °C, 100 °C and 110 °C. The properties of the spawn powder (moisture content, water activity, hygroscopicity) were analyzed. Then, the effect of inlet temperature to the powder properties was studied. Also, the powder properties between spawn powder produced from addition of 10% maltodextrin and 10% of Arabic gum were compared. Moisture content and water activity were measured directly with a moisture and a water activity analyzer and the data was used in hygroscopicity calculation. At highest inlet temperature of 110°C, the most suitable powder formation with properties of moisture content (5.13%, 5.53%), water activity (0.3258, 0.3215) and hygroscopicity (39.34%, 37.46%) were obtained for both maltodextrin and Arabic gum. The study proved that the powder culture of *P. pulmonarius* was able to perform and revive and therefore potential to be preserved in longer period, which is beneficial for the mushroom cultivator.

Keywords: mushroom spawn, powder properties, spray drying

Introduction

In mushroom cultivation, mushroom spawn or mushroom seed is one of the factors that determine the cultivation success rate. Most of the time, mushroom spawn prepared in the form of grains and been marketed in glass bottles or plastic containers. The spawn has a life span of approximately one month only in the room temperature once it has matured or is ready to be used. When stored at 4 °C, the shelf life can be extended up to three months, but there is a risk that the spawn quality will decrease. In fact, the production of solid and liquid spawns may involve a high risk of contamination, a large production area, and a longer incubation time. Additionally, the process required a huge investment of time and money, making cultivation and management are difficult (Kerketta et al., 2017). Another type of spawn that is in liquid form is prepared for immediate use with the goal of achieving faster growth because it can be distributed evenly. According to Kumar et al. (2012), these materials are typically unsuitable for long-term storage as well as transportation, and they are also more prone to contamination (Soko et al., 2019).

It has been suggested that other forms of spawn, such as in the form of dry powder, would be a good choice to explore for solving the problems in mushrooms spawns. The idea of microencapsulation using spray drying would have allowed for an earlier resolution of the issues, in addition to an improvement in both performance and quality through the extension of the product's life span and prevention of other microorganism growth (Burgain et al., 2011; Jin & Custis, 2011b; John et al., 2011; LI et al., 2017; Muñoz-Celaya et al., 2012a). Basically, spray drying is used in converting liquid to powder. Through the process of microencapsulation by spray drying, the core material can be given a physical barrier to shield it from unfavorable environmental conditions and extending the product's shelf life (Desai & Park, 2007; Gharsallaoui et al., 2007; Jamekhorshid et al., 2014). The process can be conducted in wide range of temperature and used in converting liquid life culture into powder forms. Based on previous study, the liquid culture of *Trichoderma chlamydosporum* and conidia among had been successfully spray dried (Braga et al., 2019) ; Maruyama et al., 2020).

The two factors that given focus in using spray drying are protectant material and temperature. The maltodextrin and Arabic gum are popular protectant that produced satisfactory results (Go et al., 2019). The temperature is the most important consideration when applying this method because it requires a very high temperature to transform cultures from their liquid form into powder form. The inlet temperature of the drying air can affect the properties of the powder, such as its moisture content, hygroscopicity, and water activity (Fernández-Sandoval et al., 2012; Jin & Custis, 2011c; Muñoz-Celaya et al., 2012b).

Among edible mushrooms, particularly *Pleurotus spp.*, the conducted studies are very limited, yet this mushroom is the second largest consumption in this world. Therefore, the purpose of this study was to investigate the characteristics of powder culture that had been produced by spray drying at a range of temperatures, from 80°C to 110 °C, and to compare those characteristics to those of powder that had been treated with two different types of protectants, each consisting of 10% of maltodextrin and Arabic gum.

Materials and Methods

Preparation of *P. pulmonarius* liquid culture and protectant materials

Liquid culture was prepared from hyphae fragments which harvested from *P. pulmonarius* mycelium cultures grown on Potato Dextrose Media (PDA) using 0.85% saline with 0.01% tween 80 as detergent. The fragments then were washed and centrifuged upon usage. Approximately 0.1 ml of hyphae suspension was transferred into 50 ml of D-glucose soluble starch medium and incubated at 25°C, in the dark with static condition (Chong et al, 2019).

Two protectant materials were used in this study, the 10% of maltodextrin and 10% of Arabic gum. The solution of protectant was prepared by mixing 100ml distilled water with 10 grams of protectant and autoclave for 15 minutes at 121°C. Later, the protectant was added into the liquid media and agitated with stirrer for homogenous solution before continue with the spray drying process.

Spray drying of liquid culture

A 500ml solution of liquid culture and protectant was fed into a Mini Spray Dryer B-290 (BÜCHI, Switzerland) equipped with zero grade compressed air (Radnor, USA) at various inlet (T_i) and outlet (T_o) temperature set up (80/48, 90/68, 100/75, and 110/83°C). The setup for spray dryer has been modified from Jin and Custis, (2011). In all experiments, the fed was set at 5ml per minute, nozzle clean at 5 time per minute and the air flow has been set at 30mm. While the aspiration was set at 100%.

Properties of powder culture

Moisture content, water activity (a_w) and hygroscopicity

The moisture content of the powder culture was measured according to A.O.A.C standard method (Baur & Ensminger, 1977). The water activity (a_w) was determined at 25 °C using water activity meter (Aqualab Series 3TE, USA). Hygroscopicity determination was slightly modified whereby a 0.05 g of spray-dried powder were placed in a glass desiccator at 25±1.0°C containing saturated NaCl solution (75.3% RH) and kept for a week. Then the samples were weighed and the percentage of hygroscopicity was calculated using the following formula (Cai & Corke, 2000):

$$\text{Hygroscopicity (\%)} = \frac{(W_i + F_w) \times 100}{100 + W_i}$$

Where,

Fw (%) = free water / moisture (according to GEA Niro method A1c)

$$W_i (\%) = \frac{c - b}{b - a} \times 10$$

a = weight of container

b = weight of container + powder in gram

c = weight of container + powder in gram after 1 week

Results and discussions

Properties of powder culture

The production of the powder culture for the *P. pulmonarius* was the primary objective of this work, and investigation on the properties was accomplished successfully. The Table 1 below show the result of properties from powder culture added with maltodextrin protectant. The highest moisture content was 5.8667% from inlet temperature 80°C, while the lowest moisture content was powder culture produced from temperature 110°C with 5.1333%. In the meantime, the results of producing powder culture with Arabic gum are shown in Table 2. The highest moisture content is 5.9333% at 80°C, and the lowest is 5.5333% at 110°C. According to both results for moisture content, as the inlet temperature increases, the moisture content will decrease. In a previous study by Braga et al., (2019), they also found that the moisture of powder from *Trichoderma spp.* was high when the drying air's inlet temperature was between 60°C and 70°C than when it was above 80°C. This show that high inlet temperatures raise the temperature gradient inside the drying chamber, facilitating heat transfer and the dehydration process during the spray drying process.

Table 1. Properties of powder culture with maltodextrin

Inlet Temperature (°C)	Moisture Content (%)	Water Activity (a_w)	Hygroscopicity (%)
80	5.8667	0.3458	29.8864
90	5.8000	0.3437	30.6262
100	5.7333	0.3365	34.0312
110	5.1333	0.3258	39.3445

Table 2. Properties of powder culture with Arabic gum

Inlet Temperature (°C)	Moisture Content (%)	Water activity (a_w)	Hygroscopicity (%)
80	5.9333	0.4012	21.0941
90	5.7333	0.3422	30.0602
100	5.6667	0.3275	32.8969
110	5.5333	0.3215	37.4679

Meanwhile, the results for the water activity (a_w) in both powder culture with maltodextrin and Arabic gum were shown in Table 1 and 2. The result in both powder culture was between 0.3215 to 0.4012 for inlet temperature

80°C to 110°C. Therefore, the outcome for powder culture water activities was satisfactory. This was supported by Fernández, (2011), who stated that microbial growth does not occur when water activities are less than 0.9 and that this also relates to the control of bacterial growth for determining the shelf life of powders. In other studies, water activity was the most important factor affecting powder stability, modulating microbial response, and determining the types of microorganisms encountered by the powder. Therefore, water activity properties were essential for preventing and restricting microbial growth (Tapía et al., 2020).

From Table 1 and 2, the result of hygroscopicity properties for inlet temperature at 80°C give lowest percentage for both maltodextrin and Arabic gum which is 29.8864% and 21.0941%, respectively. Then the highest hygroscopicity showed at temperature 110°C for both maltodextrin and Arabic gum which is 39.3445% and 37.4679%, respectively. Based on the result from this study, the higher inlet temperature, the lower result for hygroscopicity was achieved. According to Pui & Lejaniya, (2022), the hygroscopicity of powder that was produced from a spray dryer was affected by the inlet temperature. This statement has been supported by Phisut, (2012), who also found that the hygroscopicity percentage goes up when the inlet temperature increases. This is because high air inlet temperature made the powder less moist, which made the powder take in moisture from the air (Carneiro et al., 2013).

Comparison properties of powder culture with different protectant material

Figure 1,2 and 3 shows the comparison between properties of powder culture with maltodextrin and Arabic gum, respectively. In Figure 1, the result for Arabic gum gives lower hygroscopicity percentage than the maltodextrin. According to Avaltroni et al., (2004), the molecular weight of maltodextrin (9 kDA) was lower than that of Arabic gum (220-310 kDA), which was related to hygroscopicity. This statement was supported by (Cai & Corke, 2000), who stated in their study that the hygroscopic properties of spray dried powders increased with the decrease of protectant molecular weights.

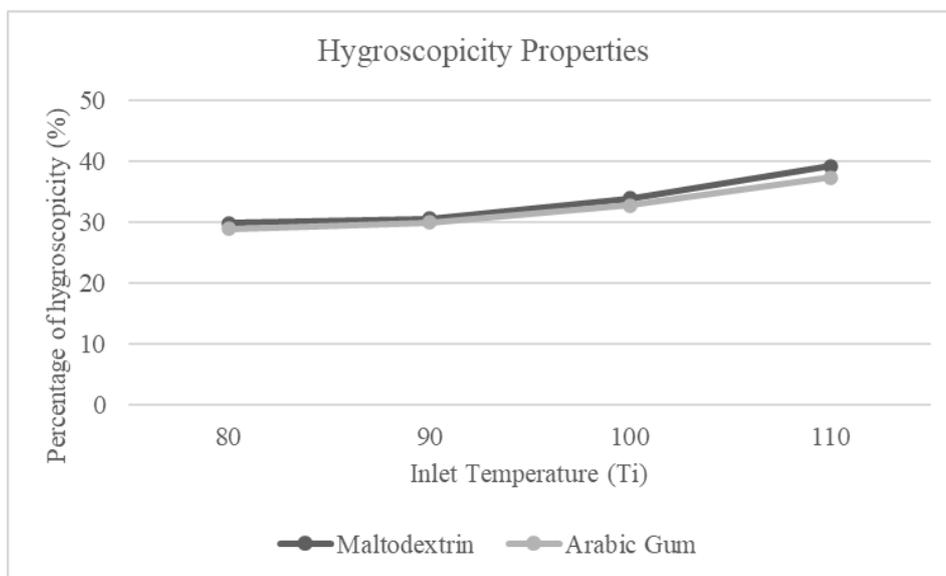

Figure 1. Comparison of hygroscopicity percentage between maltodextrin and Arabic gum

Besides, in industrial field, addition of protectants in spray dryer drying, are used to control hygroscopicity and prevent crystallization (Mohd Nawi et al., 2015). The stability of a powder can be divided into three main categories: physical, chemical, and microbiological. Hygroscopicity is one of those categories. It is essential to investigate hygroscopic behaviour in order to accurately forecast the amount of time a product will remain good for sale and the conditions in which it will be stored (Rodríguez-Restrepo et al., 2017; Soukoulis et al., 2014).

Moreover, in Figure 2 below, both of moisture content of powder from maltodextrin and Arabic gum showed decreasing trend in the graph. The Arabic gum spawn powder gave result slightly higher at 80°C of inlet temperature, compared with maltodextrin powder culture. Then, at 110°C the moisture content for maltodextrin powder culture gave result lower than Arabic gum powder culture. Both result for maltodextrin and Arabic gum were lower than 6% which indicates as satisfied. Research conducted in the past by Neri et al., (2010) found that the percentage of moisture content in powder dried by the spray drying method was typically less than 6%. Additionally, they came to the conclusion that the moisture that was obtained for the microcapsules was able to provide good storage. This is because products with low humidity values can achieve better stability over time. Result in Figure 2, also show maltodextrin had lower moisture content than Arabic gum when inlet temperature 110°C. Some researchers also stated that spray drying blackberry powders with maltodextrin causes a greater loss of moisture content than other additives used (Ferrari et al., 2012). Some studies claim that increasing the amount of Arabic gum and maltodextrin would increase the moisture content. Powder with a low moisture content would make the environment absorb water until the water content was balanced (How & Siow, 2020)

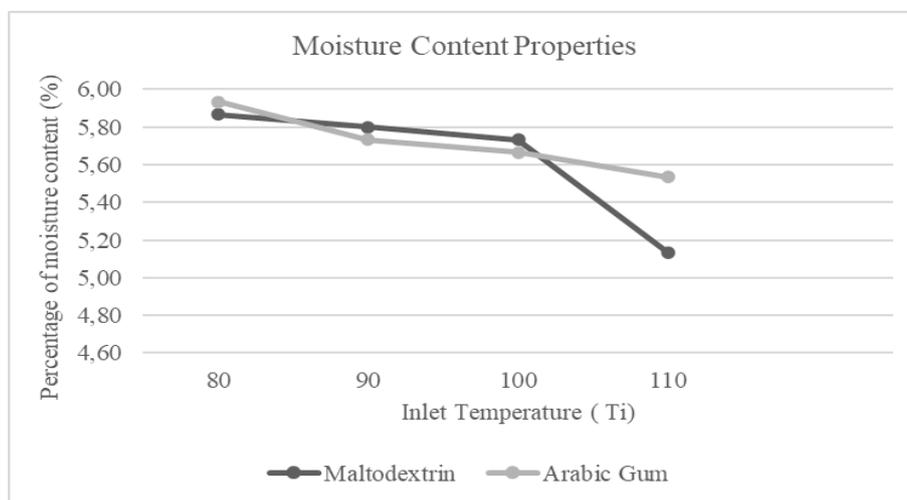

Figure 2. Comparison of moisture content percentage between maltodextrin and Arabic gum

Meanwhile, Figure 3 show the result for water activities from maltodextrin and Arabic gum. Comparing maltodextrin and Arabic gum, the water activity in powder with Arabic gum was higher at 80°C than maltodextrin. However, increased of inlet temperature afterwards, inversely, the water activity in powder with maltodextrin became higher than Arabic gum. But both of maltodextrin and Arabic gum showed water activity lower than 6.0 which classified as low water activity. Water activity in food can be classified into three

categories; low water activity when less than 0.60, intermediate water activity when between 0.60- 0.85 and high-water activity which is more than 0.85. (Erkmen & Bozoglu, 2016). In addition, they also stated that increased in water activity will increase the chances of food spoilage. For growth, bacteria need more water activity than fungi do. Microbial growth does not occur below 0.60.

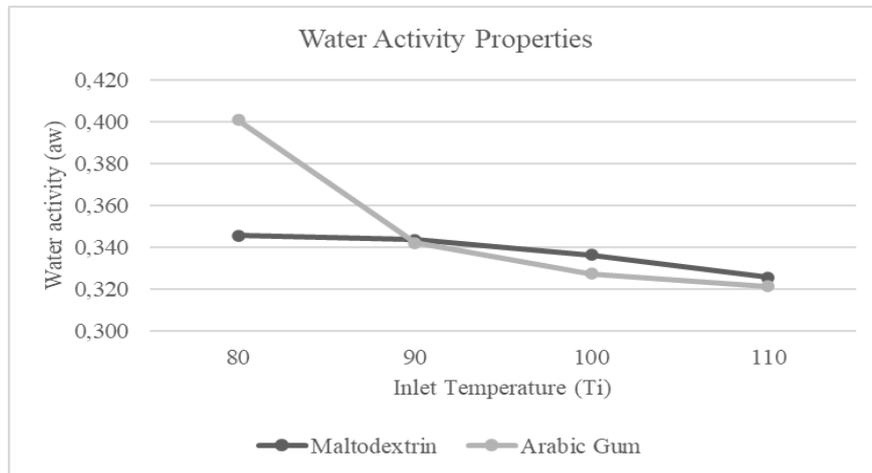

Figure 3. Comparison of water activities between maltodextrin and Arabic gum

Conclusions

It has been confirmed that the powder culture of *P. pulmonarius* can potentially be produced through spray drying. According to the findings of moisture content, hygroscopicity, and water activity, it is concluded that both maltodextrin and Arabic gum would give good powder culture characteristics, which can prolong the storage time and preserve the spawn's quality.

Abstract: The integration of technology has impacted nearly all industries, resulting in automated processes that utilize the internet to complete various tasks and actions. Web services have become popular for handling routine tasks. However, this advancement has a challenge of verifying the legitimacy and intent of users. Providers of these Web services, whether they are a platform, software, or infrastructure, employ various Human Interaction Proofs (HIPs) to validate the authenticity and intention of their users such as CAPTCHA. CAPTCHA is a program or a system that protects against unauthorized users or robots from having access into ones document. It is in form of a test that humans can pass but computer programs cannot i.e. the program should be simple for human and be robust and difficult for computer to solve. Almost everyone uses CAPTCHA systems to make security and protect services that are internet based from penetrating by computer bots. Different categories of CAPTCHA technologies are discussed in this paper and a detailed analysis on their usability and weaknesses. Subsequently, a new CAPTCHA technique is given as a proposal which is based on hybrid i.e. combining features of two different CAPTCHAs which are image-based and math-based CAPTCHA.

Keywords: CAPTCHA, Human Interaction Proofs, System Security, Image-based CAPTCHA, Math-based CAPTCHA

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2152-2163), Cappadocia, Turkiye. ISTES Organization.

Introduction

Almost everyone today is using internet and that has made data transmissions a necessity, compulsory and of great importance. For this, there is apprehension on how to protect the confidentiality and data integrity against

unauthorized access and use. To protect ones document or resources from hackers, robots and/or other unauthorized users, security must be given top priority. Hence, this has resulted in an explosive growth of the field of security or information hiding. Completely Automated Turing Test to Tell Computers and Human Apart (CAPTCHA) is a cryptographic system that humans can easily tackle but always difficult to tackle by computers. Although the program barrier looks easy, it has to do with a complex programming test connected to the security (Darko et al, 2017). Specifically, in this the user is tested in the aspect of intelligence, communication that takes place visually and cognitive psychology. That brought about CAPTCHA which is described as a question test that can differentiate humans from computers. It is the main test of intelligence, which evaluates the similarity between the human and the machine intelligence.

In Turing test, three objects are involved (interrogator, human and computer) where the interrogator is a human whose function is to ask question(s) being in a separate room from the human and the computer who will both be in another room. The interrogator ask both question(s) and the two provide answer(s) in which from the answer(s) the interrogator would be able to differentiate human from computer and the aim is that human should be able to answer the question correctly and computer otherwise, but if the interrogator cannot differentiate the human from computer then it means the interrogator has been fooled, which by implication means that the machine possesses artificial intelligent which is equivalent to the intelligent of human. Though no machine has ever passed the Turing test designed by Alan Turing in 1950.

With this it can be said that CAPTCHA is a reverse of Turing test in the aspect of the interrogator. As the questioner in Turing test is human, the questioner in CAPTCHA is machine itself and both human and computer are examined in both Turing test and CAPTCHA but the expectation is that human should found it easy to solve but difficult if not impossible for computer to solve. The goal of designing CAPTCHA is to prevent one's document from bots so that it will not be able to read or have access to the document on the internet and to prevent unauthorized user from penetrating into saved documents. Many techniques have been used to prevent access to documents using CAPTCHA such as text-based CAPTCHA, audio-based CAPTCHA, video-based CAPTCHA, math-based CAPTCHA, puzzle-based CAPTCHA and image-based CAPTCHA. Figure 1 indicates CAPTCHA and Turing test.

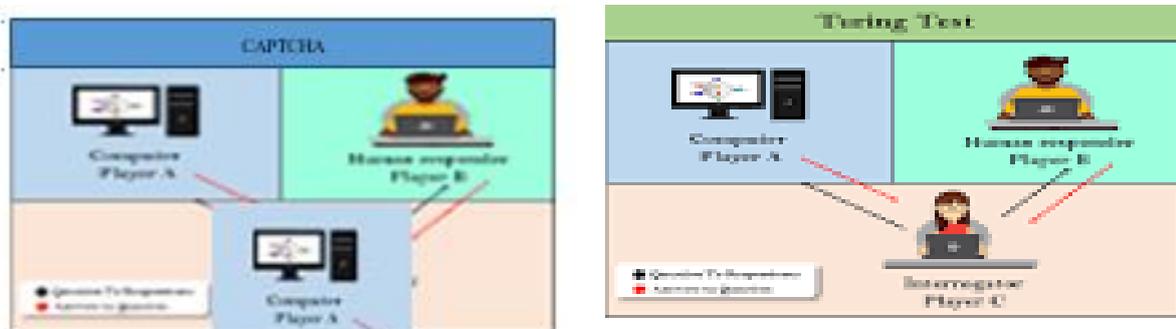

Figure 1. CAPTCHA and Turing test (electricalvoice.com)

Literature Review

CAPTCHA is known as reverse Turing test. It is valid, because it uses objective of reverse system (Darko et al, 2017). It is called reverse because Turing test uses human as the questioner who neutrally ask question and judge, while CAPTCHA uses computer as the questioner though those to be examined are the same in the two systems (human and computer). If a computer can be able to supply correct answer to the questions then it is said that it has intelligence in similitude as a human, well called Artificial Intelligence (AI). Unlike the Turing test, where the questioner that evaluates the correctness of the answers supplied is replaced in the CAPTCHA to the machine (computer) from the human (Darko et al, 2018).

One of the importance of CAPTCHA is that we use it on the Internet to protect the Web sites from attackers through malicious programs such as password crackers. The important of CAPTCHA in Internet security is not underrated (Qian-qian, 2019).

One vast way to secure web-based application from fraudsters and online spam is CAPTCHA. And its one of the techniques that has gained much popularity to verify a human user (Nitirat and Apichaya, 2019).

In some conditions, open web resources, like social networks including Facebook application, Twitter application etc., and even service providers, such as, Google, Yahoo, Hotmail etc., malicious program and spurious bot programs can be attacked. Therefore, to get rid of such kinds of Bot attacks, a security system called CAPTCHA can be used (Noshina et al, 2018).

Applications of CAPTCHA

CAPTCHA is popularly used on the Internet to secure Web sites from being attacked by malicious programs like password crackers. CAPTCHA is very important in Internet security. Divyashree and Satish, (2016) highlighted some applications of CAPTCHA which are:

- Preventing Search Engine from Bots
- Preventing against Worms and Spam:
- In password systems, its use to prevent Dictionary Attacks
- In Blogs, it Prevents Comment Spam
- Protecting Registration done on Website
- Securing Email Addresses from Scrapers

Jung et al, (2017) also added that: CAPTCHA can be used to protect Online voting manipulation

Categories of CAPTCHA

There are several categories of CAPTCHA discussed by various researchers and they can be grouped as follows:

- Text-based CAPTCHA
- Audio-based CAPTCHA
- Maths- CAPTCHA
- Puzzle-based CAPTCHA
- Video-based CAPTCHA
- Image-based CAPTCHA

Text-Based CAPTCHA

CAPTCHA was firstly designed by Broder's team in 1997 for Altavista, to prevent automatic inclusion of URL to a database of a web browser (Divyashree and Satish, 2016). Text-based CAPTCHA is the most popular and known type of CAPTCHA. Where the computer user is asked to solve the text that is usually distorted in some ways. For text-based CAPTCHA to be strong and be difficult for machine to solve the distortion of the text images is given great consideration. CAPTCHA designers like this type of CAPTCHA because it is easily created. Its security depends on the solution quality of different element combinations in text and its background (Darko et al 2017).

Examples of text-based CAPTCHA are Gimpy CAPTCHA (used by Yahoo), Ez Gimpy CAPTCHA, Baffle Text CAPTCHA, re-CAPTCHA, iCAPTCHA, MSN CAPTCHA, Bar CAPTCHA, Thread CAPTCHA, Transparent CAPTCHA, etc. which are depicted in Figure 2.

Figure 2: Text CAPTCHA (Darko et al 2017).

Weaknesses of Text-Based CAPTCHA

- In text images, it is difficult for user to shuffle out the correct text or characters because of the combination fonts. Size of font. Blurred Letters Wave Motion like those examples in Figure 2.
- It can easily be detected by Optical Character Recognition (OCR) techniques. Current OCR's

algorithms can successfully achieve over 90% of detecting text based CAPTCHA (Mir et al, 2016).

- In Jung et al, (2017) paper it was presented that a character segmentation technique can be used to attack many text CAPTCHAs.
- Gabriel Moy, et al., in their work stated two Distortion estimation techniques which cracked EZ-Gimpy and 4-letter Gimpy CAPTCHAs using object recognition and they recorded success (Anvesh and Sandhya, 2016).

Audio Based CAPTCHA

Audio CAPTCHAs were created to provide alternative to visual text CAPTCHAs. This kind of CAPTCHA allows the user performing some form of speech recognition among many distorted speech. But, still the fact that audio CAPTCHAs are commonly used alongside visual CAPTCHAs, the security is often overlooked (Yang-Wai, 2019).

Audio CAPTCHA picks a word or a sequence of numbers bombardedly, changing the word or the numbers into a sound clip and distort the sound clip. So it will presents the distorted sound clip to the computer user to enter its contents. This CAPTCHA reconises the difference in ability between humans and computers in the aspect of spoken language (Kumary et al, 2019). This category of CAPTCHA is primarily designed for the blinds. Examples of Audio based CAPTCHA are:

Speech CAPTCHA: The design of Speech CAPTCHA is based on superior human ability to recognize numbers, letter, or phrases in the midst of the background noises such as acoustic sounds, music, or a chatter. The speech is gotten through speaker (human) or using the speech synthesizer (Sushama and Hanumant, 2018). Some of the speech CAPTCHA designed are: Speech-Based Reverse Turing Test, Voice CAPTCHA for Internet Telephony, Secure Audio CAPTCHA/No Nonsense CAPTCHA, Auditory CAPTCHA, C-instance.

Acoustic CAPTCHA: Acoustic CAPTCHA requires human auditory perception to differentiate human and bots apart (Sushama and Hanumant, 2018). Some of the acoustic CAPTCHA designed are Picture/Sound Form of CAPTCHA/HIPU, SoundsRight CAPTCHA, Nonspeech Audio CAPTCHA. There are several other audiobased CAPTCHA such as Google audio CAPTCHA, Digg CAPTCHA, reCAPTCHA's audio CAPTCHA, e-Bay audio CAPTCHA etc.

Weaknesses Of Audio Based CAPTCHA

- The aim of adding noise to the word recorded is to make the CAPTCHA robust and prevent the CAPTCHA from penetrating into by Bot programs, however, it can confuse the user and he may end up supplying the wrong answer.
- Since Audio CAPTCHA is designed to understand English language, for this, only users with English ability can supply the right answer.
- Some letters that have like sound such as J & G, C & K may confuse the user (Walid, 2019).

- Audio CAPTCHA can be solve by advanced speech algorithm which reduces the level of it security
- Google audio CAPTCHA, Digg CAPTCHA, and an older version of reCAPTCHA’s audio CAPTCHA were all broken using AdaBoost, SVM, and k-NN techniques while Decaptcha was used to break e-Bay audio CAPTCHA, and acoustic CAPTCHA was attacked using ASR system (Sushama and Hanumant, 2018).

Math-Based CAPTCHA

This type of CAPTCHAs requires users to solve a mathematical equation so as to pass a test. The hardness of the equation varies across implementations (Nicos et al, 2018).

Math CAPTCHA test uses logic and reason series to display the CAPTCHA challenge to the users to prove the users are human. The main arithmetic operators used are (+, -, *). And atimes several mathematical equations are displayed for user to solve (Mir et al, 2016).

Math-based CAPTCHA can be either of the two text based CAPTCHA or image based as stated by (Nitirat et al, 2019).

The CAPTCHA, named as “Math CAPTCHA” or “QRBGS CAPTCHA”, displays five types of problem out of which are differentiation, arithmetic calculations, polynomial questions. It asks the user to supply solution to a mathematical question so as to verify that a human is behind the system (Anvesh and Sandhya, 2016)..

Below depicts Math based CAPTCHA, the one in figure 1 is a math CAPTCHA that is based on text while the one in figure 2 is a difficult Math which is mainly for those that studied mathematics.

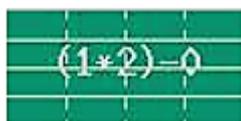

Figure 3a

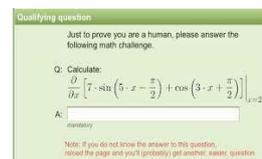

Figure 3b

Figure 3. Maths Based CAPTCHA (Anvesh and Sandhya, 2016).

Weaknesses Of Maths Based Captcha

- The Math-CAPTCHA that is based on text has same weaknesses like those of text based CAPTCHA for those in form of text.
- It needs the skill of problem solving and requires much time to solve the question to pass through the CAPTCHA. Like the one in fig 3b above.
- It is much complicated to solve by the users. but is secured, Hence, its usability is low due to the

complicated matter (Darko et al, 2018)

Puzzle-Based CAPTCHA

In puzzle-based CAPTCHA systems, a picture is shared into clumps though depending on how big is the picture. In the question, the user is required to arrange jumbled picture chunks to form the exact original picture. Example is shown below where the user is expected to pick the samples outside and place it where appropriate, if places well, then the user passed (Mir et al, 2016).

Figure 4. Puzzle based CAPTCHA (Mir et al, 2016).

There are various types of Puzzle-based CAPTCHA examples are Dice CAPTCHA,

Dice CAPTCHA: Is one of the puzzle-based CAPTCHA. It needs a puzzle (dice) to be solved where the dice is visualized as the main element of the test. Accordingly, in puzzle-based CAPTCHA, the user is asked to solve and supply the total number (dots) displayed by the dice in order to verify the user if its a human or a bot. when it is correctly solved, the user is considered as a human (Darko et al 2018).

Figure 5. Dice puzzle CAPTCHA (Darko et al 2017).

Weaknesses Of Puzzle Based CAPTCHA

- It needs the ability to solve image but may be difficult by low vision users.
- It requires much time to arrange puzzle challenge in exact order
- The task is not easy for users because identifying exact image need deep thinking.
- In the dice CAPTCHA above, the black dot may be mistakenly counted by the user because it shows three sides (up, left and front).

Video-Based CAPTCHA

In Video-based CAPTCHA, the user is asked to provide three or more words describing the content in a video.

This type of CAPTCHA was generated from YouTube videos, and each video does have its labels/tags. If the user correctly provides any of the three words and confirmed that it matched the labels/tags that were supplied by the person that uploaded the video then the user will be considered as human (Yang-Wai, 2019). That is, if the user provides the correct answer then he is said to have passed the test whereby machine is not expected to pass the test. Video CAPTCHA sometimes may display human or other objects not necessarily to be words.

Weaknesses of Video-based CAPTCHA

- Video-based CAPTCHA uses or displays flowing text during the video projection. And the text will be displayed in different colours. However, advanced Optical Cognitive Recognition can break it.
- The video may be tedious for the user when it is in large size and network may be fluctuating in downloading the video which may lead the user to leave the website.
- Video CAPTCHA is only available in English Language and not all users understand English (Walid and Abdullah, 2016).

Image-based CAPTCHA

In image-based CAPTCHA sets of images with the same concept or object are displayed. And the user is asked to supply the concept or the object which the images belong to (Divyashree and Satish, 2016).

Image-based authentication, this method asks for answers by displaying pictures or some images. Mostly, it displays an image of a particular object and asks to input the name in text, or rotating image to its original state (Jung et al, 2017)

In this type of CAPTCHA, it requires the performance of an image recognition task. The idea is displaying image that will be difficult to recognize by bot. The difficulty will come in as a result of multiple colours in all pixels and also having huge variety of meaningful images. Therefore the user highly needs the recognition of images (Kumary et al, 2019).

Image recognition is never an easy task for machine to tackle with because there is still variety of unsolved image perception and interpretation problems for machine. However, humans see image recognition as an easy task. Thus, this makes image-based challenges an interesting alternative to text-based CAPTCHAs as they can most of the times be easy for humans, but difficult for computers. However, unlike text-based CAPTCHAs, which are easy to generate, one of the necessary things in image based CAPTCHAs is getting the source of images. Furthermore, a way to arrive at the solution of image recognition is essential, such as the use of pre-labeled images, to enhance automated grading (Yang-Wai, 2019).

Different Image based CAPTCHA schemes are available that make use of different definitions or styles which would easily be recognized by the users but difficult for the robot. Some of the image based CAPTCHA's are Bongo, Pix CAPTCHA, Picatcha, Human emotion based CAPTCHA, Scenario based captcha, ARTiFACIAL

image based captcha, Imagination image based captcha, Game-based CAPTCHA, Fun CAPTCHA etc.

Bongo CAPTCHA: This image-based CAPTCHA was named after Mikhail M Bongard who wrote a book on pattern recognition problems. In this CAPTCHA, visual based pattern recognition is displayed so that the user of the system will supply the answer. Fig6 is an example of Bongo CAPTCHA. It has 2 block series which are the left block series and the right block series. The two series (left and right) have differences. So the user is asked to identify the differences and supply the answer for authentication (Divyashree and Satish, 2016).

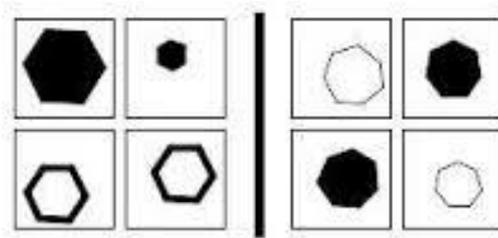

Figure 6. Bongo CAPTCHA (Divyashree and Satish, 2016).

Pix CAPTCHA: This is another image-based CAPTCHA that make use of a large volume of database which has the animated pictures and photographs of some objects together with labels (such as: a flower, a horse, a baby, an animal etc.). In Pix CAPTCHA, a set of objects will be displayed, and these sets are picked randomly from the database and the user will be asked some question based on the images (Divyashree and Satish, 2016).

Figure 7. Pix CAPTCHA

PICATCHA: In this different images are displayed and the user will be asked elementary question of choosen some parts of the images.

Human emotion based CAPTCHA: In this type a graphic or statement is shown to the user and he would be required to type the emotion of what is shown.

Scenario based CAPTCHA: in this analytic and understanding capability of humans is used instead merely objects recognition (Kumary et al, 2019).

ARTiFACIAL image-based CAPTCHA: This CAPTCHA was based on recognizing the differences in the thinking ability of human and machine human facial recognition. Therefore, it deals with image problems and solutions to be achieved without manual effort.

Imagination image based CAPTCHA: This was proposed by Divyashree and Satish, (2016). The important thing about this CAPTCHA system was to discover imagination of human through identifying and interpretation of images in a set of distortion / clutter images. And the problem presented by the scheme connoted two processes; an annotated and a click process (Yang-Wai, 2019).

Assira CAPTCHA: Assira means “Animal Species Image Recognition for Restricting Access”. It’s a CAPTCHA that display either dog or cat image recognition. The classifiers will then differentiate between cats and dogs that are used in the Assira. Another version was later developed which contains animal grid, collection of animals and user have to differentiate among all the species by clicking (Mir et al, 2016). Example is Microsoft Assira which displayed 12 distinct images then the user will select by clicking in the animal that is asked to click on.

Figure 8. Assira CAPTCHA (Mir et al, 2016).

From the research studies, it was discovered that the image-based CAPTCHA has many advantages mostly in security aspect and usability elements over other types of CAPTCHA such as the text-based and audio-based CAPTCHAs (Walid and Abdullah, 2016).

Weaknesses of Image Based CAPTCHA

- Image-based CAPTCHA may be difficult to attempt by human users who have low vision or disabilities in learning.
- As soon as the number of features added decreases then the ability to decrypt the CAPTCHA will increase, therefore more features need to be applied for robustness. However, this system will consume the database.
- This type of CAPTCHA is mostly available in English Language; therefore, those that do not understand English language may find it difficult to answer the challenge.
- There is indirect attack for getting the answer from client side in game-based CAPTCHA.
- Random guessing by unauthorized user may break the CAPTCHA.

Summary

CAPTCHA is an essential scheme which is used to protect websites against malicious programs. CAPTCHA has been existing for many years and many researchers have gone into designing of different types of CAPTCHAs. variety CAPTCHAs have been reviewed such as Text-based CAPTCHA, Audio-based CAPTCHA, Video-based CAPTCHA, Math-based CAPTCHA, Image-based CAPTCHA etc., and they are considering them in terms of the usability to human, robustness against automated attacks (Machine), semantic information, and so on. As technology advances day by day, different techniques are designed to secure resources, and researchers nowadays have much insight into the area of CAPTCHA design and security, and must consider different strategies for developing CAPTCHAs. Having brought out the weaknesses of various CAPTCHA designs, research gaps are immediately identified for necessary improvement on the design reviewed.

Recommendations

This paper therefore recommends an hybrid form of CAPTCHA that will combine some features of other CAPTCHAs. A simple mathematical based CAPTCHA combined with a form of image that will display two numbers and operator (addition or subtraction) between them, where the user would be expected to supply the answer in text form.

Researchers will continue to exploring the field of CAPTCHA based on strength and the weaknesses which will definitely lead to having security against automated scripts. Also, in future, enhancement of the recognition procedure which will lead to increase the decode time frame for existing system there by creating robust security by suggesting the new measures to make the field of CAPTCHA stiff to inappropriate access can be explored.

Abstract: Ipomoea aquatica (water spinach) is a long and leafy green vegetable with hollow stems that easily grown on the water surface or damp soil. It is a tropical and subtropical perennial herbaceous aquatic or semi-aquatic plant. Water spinach needs more water compared to other vegetable crops, thus suggested to employ slow-release fertilizer for sustain the available nutrients in the soil that being leached off by watering. Nitrogen uptake is the major issue in agriculture to sustain the quality of crops and soil for planting medium. Several studies have been conducted on many types of fertilizer and showed beneficial results on growth of water spinach. This study aimed the research on comparing the nitrogen uptake rate study during the planting period for both organic and inorganic fertilizer. The measurement of plant height, dosage of fertilizer and nitrogen uptake were highlighted in this research activities. Pots has been used and the growth of water spinach was evaluated along 30 days of planting. The spent mushroom medium (SMM) compost and NPK-16 fertilizer were used to evaluate the rate of nitrogen uptake for water spinach based on the Michaelis Menten kinetic study to evaluate the best fertilizer dosage with research design activities. It was showed that a 1 g of NPK16 fertilizer was equivalent to 2 g of SMM in the amount of N. There was a clear correlation between the nitrogen concentration and the water spinach growth. From the result obtained, the application of NPK16 fertilizer provided higher nitrogen value initially. However, SMM compost improved both physical and chemical to help water spinach absorbed sufficient moisture and nitrogen uptake at a steady state rate owing to the higher organic matter in SMM. As a conclusion, SMM compost resulted better nitrogen uptake efficiency by improved the soil fertility and better growth of water spinach.

Introduction

Water spinach (*Ipomoea aquatica*) is a member of the morning glory family and belongs to the same species as sweet potatoes (Rana & Brar, 2017). It is a tropical and subtropical perennial herbaceous aquatic or semi-aquatic plant. Almost every part of the young plant tissue is edible, but the sensitive branch tips and younger leaves are the most preferred. The leaves of water spinach are incredibly nutrient-dense and contain ample amounts of vitamins and minerals. Water spinach is filled with nutrients.

The optimum fertilizer for water spinach is high in nitrogen to stimulate quick growth and leaf development. Water spinach is a heavy feeder that requires a lot of nitrogen to grow and develop properly. On top of that, organic and inorganic fertilizers are two types of fertilizers can be used as one of the planting mediums for the water spinach. Organic fertilizer known as bio-fertilizer is the product from the composting process of the organic raw materials with microbial inoculant to degrade the organic matter (Pan et al., 2011). Inorganic fertilizer, which is often reasonably priced, consists of mineral-based nutrients manufactured for immediate application on crops. Unlike the organic variety, inorganic fertilizer does not need to decompose over time to supply nutrients to plants. To feed plants and promote growth, most inorganic fertilizers have balanced ratios of nitrogen, potassium, and phosphorus (Harmon, 2022).

Nitrogen uptake is the major issue in agriculture to sustain the quality of crops and soil for planting medium. The most important element that used for crops is nitrogen because the total growth and development are depends on the dosage of nitrogen in the medium. Several studies have been conducted that both organic and inorganic fertilizer are greatly produced a positive result on growth of water spinach, however less research on comparing the nitrogen uptake rate study during the planting period. The measurement of plant height, dosage of fertilizer and nitrogen uptake are highlighted in this research activities. For this study, the spent mushroom medium (SMM) compost and NPK16 fertilizer were used to evaluate the rate of nitrogen uptake for water spinach based on the Michaelis Menten kinetic study to obtain the best fertilizer dosage for a better nitrogen uptake with several research design activities. Table 1 show the comparison of SMM compost and NPK-16.

Table 1. SMM Compost and NPK-16

Variables	SMM Compost	NPK-16
Total Kjeldahl Nitrogen (TKN) (%)	9.50	16
pH	7.3	7.2

Spent Mushroom Medium Compost

SMM compost is a compost made from spent mushroom medium that is used to improve soil organic matter and nutritional content. It can be used as a soil conditioner to improve the stability of soil aggregates. A mixture of

natural ingredients is used to create a mushroom-growing substrate. The common substances in wheat straw bedding are horse manure, hay, maize cobs, cottonseed hulls, chicken manure, brewer's grain, cottonseed meal, cocoa bean hulls, and gypsum. The discarded mushroom contains a lot of nutrients such organic substrate, sulphur, potassium, calcium, magnesium, nitrogen, and phosphorus because that has an organic content that may help with soil fertility (Lou et al., 2017). The use of SMM as fertilizer in agriculture and horticulture has been feasibly approved (Prasad et al., 2021).

SMM compost has a black topsoil-like appearance, a loose crumbly structure, and an "earthy" scent. SMM compost is high in alkalinity, so it can be used to neutralize all the acids in the soil. SMM compost has an average pH of 6.6. (6.0 to 7.0 is an ideal range for most plants). It's a good natural fertilizer for acidic soils with low organic matter levels. A study was conducted to determine the pH level of mushroom compost from several mushroom farms, and the result was 6.6 (below the pH neutral range). SMM compost is a porous media that can improve the structure of soils because of its low bulk density. The optimal C:N ratio for compost made from spent mushrooms is 13:1. The carbon relative to nitrogen indicates the level of nitrogen available to the plant's growth. Suitable composts will have an ideal ratio of anywhere between 10:1 to 15:1 and never above 30:1. The average NPK value of mushroom compost is 1.1-0.7-1.3. Thus, the NPK ratio is like most other compost, with an average ratio value of 1-1-1. Most of the nitrogen in organic form allows it to get released to the plants over time slowly.

NPK-16 Fertilizer

Inorganic fertilizer, which is often reasonably priced, consists of mineral-based nutrients manufactured for immediate application on crops. Unlike the organic variety, inorganic fertilizer does not need to decompose over time to supply nutrients to plants. To feed plants and promote growth, most inorganic fertilizers have balanced ratios of nitrogen, potassium, and phosphorus (Harmon, 2022). Inorganic fertilizer commonly known as chemical (mineral) fertilizer is widely manufactured in a large scale.

Ammonium nitrate contained in NPK-16 has been the predominant N fertilizer source used on pastures in the United States. It typically contains between 33 % and 34 % N, and relatively high solubility in water. When applied at agronomic rates, ammonium nitrate does not produce as much acidity as other N fertilizer sources. The major difference towards the organic fertilizer is the raw materials for the inorganic fertilizer are from chemical sources/based. Both organic and inorganic fertilizers are highly in the macronutrients such as nitrogen (N), phosphate (P), and potassium (K) because these components are beneficial for the overall development of crops and yields. Compared to the organic fertilizer, the total NPK value in inorganic fertilizer is higher because the mixing process of the raw materials are not degraded during the chemical process (Assefa & Tadesse, 2019).

Kinetic Study of Michaelis Menten Equation Model

The enzymatic rate at various substrate concentrations was mostly described using the Michaelis-Menten

equation, commonly known as zero order kinetics. By graphing a function of substrate concentration, [S], one may experimentally establish the substrate concentration that results in a half-maximal velocity of an enzyme reaction, also known as the K_m value or Michaelis-Menten constant.

The Michaelis-Menten formula is expressed as follows in Equation 1

$$V_i = V_{\max} [S] / K_m + S \quad (1)$$

Where V_i is an enzyme reaction's observed beginning velocity, V_{\max} is its maximum velocity, and K_m is its Michaelis-Menten constant. It should be noted that the starting velocity, V_i , approaches the maximum velocity, V_{\max} , when substrate concentration [S] far surpasses the K_m .

The maximum fertilizer dosage of SMC and NPK16 and the N absorption by the water spinach were determined by comparing two types of plots, Hanes-Woolf, and Eadie-Hofstee, which were represented by Equations 2 and 3 respectively.

$$[S]/v = K_m/V_m + 1/V_m [S] \quad (2)$$

$$V = V_m = K_m V/[S] \quad (3)$$

Where [S] was dosage of fertilizer, V was N uptake, K_m was the Michaelis Menten Constant, and V_m is nitrogen uptake rate.

Method

Preparation SMM Compost

Compost Raw Materials

The SMM was received by the local oyster mushroom cultivators nearby UniCITI Alam, Padang Besar, Perlis. The SMM was separated from the medium bag and crashed to allow the medium to be more porous and not to floc and clog. Chicken manure was acquired from the poultry farm near Wang Kelian, Padang Besar, Perlis. The moisture content of chicken manure was relatively low; less than 20 %. Dried sludge was obtained from the wastewater pond for the production of the bio-ethanol industry at Bukit Keteri, Perlis.

Food Waste Fermented Liquid

Food waste (5 kg vegetable waste) was collected from the nearby wet market without isolating the type of vegetables. The food waste was chopped to about 2 to 3 cm size and added to the closed container (7 days). After 7 days, the fermented liquid (leachate) was collected and removed from the solid food waste. Another new food waste (5 kg vegetable waste) was collected and mixed with the collected leachate and closed the container

for another 7 days. After 7 days, the process was repeated again by removing the solid waste, collecting the leachate, and measuring the volume of the liquid. The dried sludge, molasses, and rice water was prepared with a similar weight to the fermented liquid and mixed into the closed container. The food waste fermented liquid was ready for the inoculation on the composting of SMM after 14 days of completion of liquid fermentation where the pH reduced below 3.5

Composting Process

The composting process took place in a 40 cm × 40 cm × 20 cm (length × width × height) container. To enhance the surface area per volume for microbial access to the composting medium, the SMM, chicken manure and dried sludge were sieved in average size of 20 mm prior to composting. The composting bed was prepared with a fixed amount of each compost raw material; SMM, dried sludge, and chicken manure. Each raw material was weight by trial and error to obtain the C/N ratio of the compost bed (mixture of SMM, dried sludge, and chicken manure) in a range of 20 to 30. For this study, 23.42 C/N was obtained. The composting bed was laid down on the open clean area with a roof and covered with the gunny bed on the top of the compost for 10 days of composting.

Preparation Plant Bedding

Water spinach requires a well-prepared seed bed for good seedling growth. Water spinach was planted by direct seeding in a container where the volume of the container was fixed (40cm length, 30 cm wide, 12 cm height). It does not require a lot of space to grow at home. A rich, loamy soil mixed with compost was used for growing water spinach in containers. Even though the plant may thrive in either partial or full sun, it will produce more leaves when it receives at least four hours of direct sunshine daily. Regular watering was applied to keep the soil moist. To ensure that the deepest roots are reached, the plant received a thorough watering. When the weather is hot and dry, daily watering was necessary.

The dosage different for this experiment was obtained from the ratio of SMM compost: NPK16 fertilizer based on TKN value. The ratio obtained was 1g NPK16 fertilizer:2 g SMM compost. The sample was treated with three different dosages of SMM compost and NPK16 fertilizer; 50, 150, and 250 kg N/ha to obtain a better comparison with the used of different soil conditioner. Table 2 showed the sample treatments were evaluated in this experiment and the amount of soil conditioner applied was measured and tabulated.

Table 2. Dosage of SMM Compost and NPK-16

Dosage (g N/m ²)	SMM Compost (g)	NPK-16 (g)
50	7.50	3.75
150	22.50	11.25
250	37.50	18.75

Cultivation of Water Spinach

Water spinach usually grows in fertile, organically rich soil. The pH of the soil should be between 5.5 and 7.0. Water spinach can be grown in two ways: aquatic or in moist soil. Seeds were planted directly in the beds, or nursery-grown seedlings measuring 10-15 cm tall are transplanted. Seeds should not be older than two years and were soaked for 24 hours before planting to promote germination.

The method of cultivation of water spinach was greatly influenced by the quality of seedlings and care. A quality water spinach seedling was obtained through the seeding method. This method was applied very easily. But it is a good idea to sort the seeds well to grow more optimally. After the entire planting medium is well prepared and treated with the soil conditioner, then planting water spinach seedlings were started. The germinated seeds were planted in each pot, equivalent to 20 seedlings per pot. Each seedling was separated by 5 cm wide to prevent overcrowded.

The water spinach plats were cultivated for 30 days, only in the early vegetative phase of the plants. This is because the amount of soil used in the pot was not sufficient to support the water spinach from flowering and ripening. Within these 30 days, the result obtained from water spinach plants of different samples did show a difference on plant height.

Results

Ratio Dosage of SMM Compost and NPK-16

Based on the analysis of TKN on both SMM compost and NPK16 fertilizer, 1 g of NPK16 fertilizer contain approximately 0.16 g of N. While 1 g of SMM compost contain approximately about 0.094 g of N. The ratio was calculated and tabulated in Table 3.

Table 3. Comparison Ratio of SMM Compost and NPK-16

Variables	TKN / 1 g
SMM Compost	0.095
NPK-16	0.16
Ratio of SMM Compost (g) : NPK-16 (g)	2 : 1

The ratio of SMM compost: NPK16 shown in the Table 4.3, 1 g of NPK16 fertilizer is equivalent to 2 : 1 of SMM compost for same amount of N. To obtain a better comparison with the used of different soil conditioner, the sample was treated with three different dosages of SMM compost and NPK16 fertilizer.

Evaluation of Water Spinach Growth

Continuous plant height measurements throughout the season can contribute to identifying different growing stages. Theoretically, plant height is defined as the shortest distance between the upper boundary (the highest point) of the main photosynthesis tissues and the ground level (Wang et al., 2018). For this experiment, the water spinach plant height was measured by once in two days for 30 days planting. Figure 1 shows the plant height at different dosage of SMM compost and NPK-16.

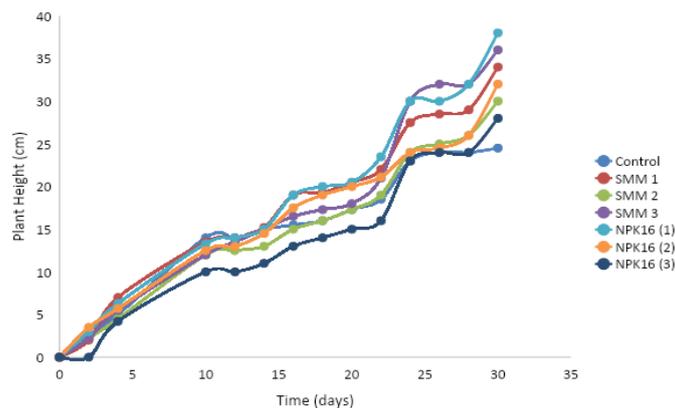

Figure 1. Plant height at different dosage

Based on the graph in Figure 1, the plant height of sample treated with 3.75 g (NPK16 (1)) fertilizer was slightly higher compared to the sample treated with 30.62 g (SMM 3) compost. However, it recorded the highest plant height among all the treated samples. The plant height was strongly correlated to the Nitrogen Use Efficiency (NUE) of the plant. Plant NUE is an important ecological indicator that reflects the capacity of plant to transform into production, which is essential for plant growth and terrestrial ecosystem productivity (Liao et al., 2021). The highest plant may be attributed to greater cell division due to the availability of N nutrient absorption.

Nitrogen Uptake Rate of Water Spinach

Nitrogen is the most abundant mineral element present in plant tissues, in which it constitutes about 1 to 5 % of total dry matter. Plants acquire N by roots throughout the life cycle, and the availability of this macronutrient, in terms of total amount and forms, deeply affects plant development and interactions with environment (Andrews et al., 2019). In cultivated soils, N availability is a key factor often limiting crop productivity. Hence, N fertilizer is often used to improve the crop productivity. Figure 2 showed the nitrogen uptake of water spinach on the plant medium using SMM compost and NPK16 fertilizer within 30 days.

Based on the graph in Figure 4.7, the result recorded sample with higher NPK16 (3) have the highest TKN value compared to the SMM compost (SMM 3). The presence of high nitrogen content in NPK16 fertilizer affect the

growth of water spinach. The water spinach grows rapidly and produce more yield compared to SMM compost. The comparison of TKN value between NPK16 fertilizer (NPK16 (3)) and SMM compost (SMM 3) shows a very big difference. The TKN value of water spinach in NPK16 (3) was 20.3 while SMM (3) was only 8.4. The result shows a great difference even though the same dosage has been applied to the soil The excessive amount of nitrogen uptake of water spinach may negatively affect the water spinach growth and health. Plant produced excess biomass, or organic matter, such as stalks and leaves, but not enough root structure (Aczel, 2019).

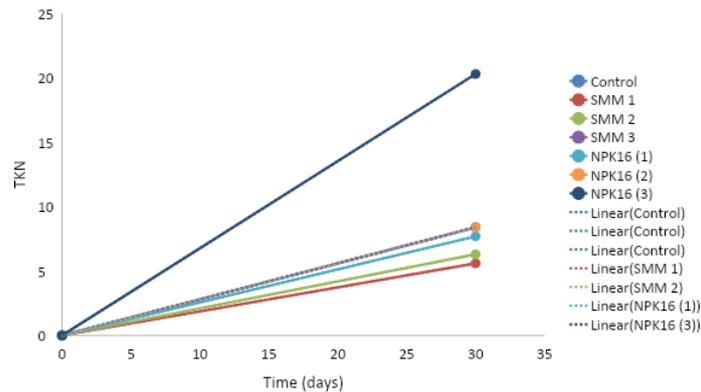

Figure 2. Nitrogen uptake by plant using SMM compost and NPK-16

Kinetic Study

Nitrogen uptake rate is the slope of the cumulative N uptake curve at any point in time. The maximum N uptake rate gives an indication of how rapidly the crop utilizes N during the period of rapid N uptake (Gastal et al., 2015). For this experiment, the type of kinetic study used to determine nitrogen uptake rate (V_m) of water spinach was the Hanes-Woolf plot. Hanes -Woolf was chosen due to its ability to determine V_m more accurately compared to other kinetic study. Hanes – Woolf plot was given by Equation 2 indicates the information needed to determine V_m . The Hanes – Woolf plot for nitrogen uptake rate of water spinach treated with SMM compost and NPK-16 fertilizer was showed in Figure 3.

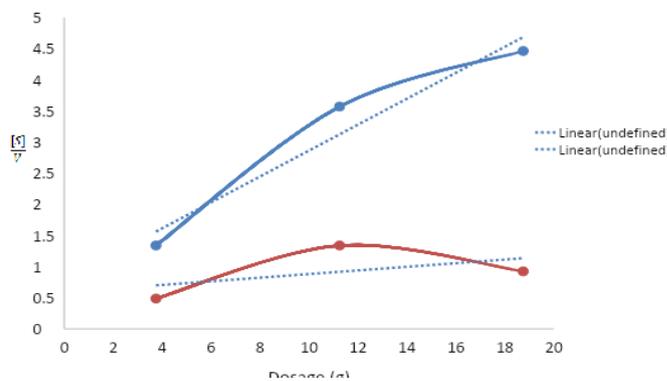

Figure 3: The graph of [S]/V vs dosage (g)

Discussion

By using Hanes – Woolf Equation stated in Equation 2, the parameter for each y-axis, y-intercept, slope and x-axis can be arranged in Table 4. After rearrange all the parameters, the nitrogen uptake rate noted as V_m of water spinach using SMM compost and NPK-16 were stated in Table 5.

Table 4. Arrangement of parameter for straight line plot

y-axis	y-intercept	Slope	x-axis
$[S]/v$	K_m/V_m	$1/V_m$	$[S]$

Table 5. Nitrogen Uptake Rate using SMM Compost and NPK-16

Variables	Nitrogen Uptake Rate, V_m (g/Nm ³)
SMM Compost	4.8008
NPK-16	34.3643

Regarding the effect of SMM compost and NPK16 fertilizer nitrogen uptake rates, obtained data Table 5 clearly indicates that nitrogen uptake rate (V_m). of water spinach treated with NPK-16 fertilizer has the highest value compared to SMM compost. This is because, NPK16 is a quick released nitrogen fertilizer that make nitrogen immediately available to plant roots and encouraged a rapid recovery from nutrient deficiency. However, the use of quick released nitrogen fertilizer can cause unsightly burn like damage to leaves and excessive amounts of growth that weaken the overall health of the plant.

In contrast to that, SMM compost have lower V_m because it is a slow released nitrogen fertilizer that provide nitrogen for water spinach over a period of weeks and best used at planting time to provide nutrients throughout the first half of the growth season. This type of fertilizer provides nitrogen for water spinach at a steady rate that improved the overall health of the plants and ability to withstand damage from insects and diseases. Slow released fertilizers are also less likely to cause leaf burn when come in contact with the foliage of the plants.

Conclusion

At the end of experiment, the performance of water spinach growth showed that both physical and chemical properties of SMM compost and NPK16 fertilizer was strongly correlated and can affect the plant growth. 1 g of NPK16 fertilizer can be substituted by 2 g of SMM compost to provide equivalent amount of N. SMM compost did contain a sufficient amount of macronutrient and micronutrient like nitrogen and carbon that is important for water spinach growth. The TKN analysis was able to determine the organic and the inorganic forms of nitrogen contained in the compost.

There was a clear correlation between the TKN concentration and the water spinach in SMM compost. When compared to NPK16 fertilizer, the water spinach's TKN value in SMM compost was lower, but it had a completely different effect on the plant's development. Because SMM compost is a slow-release nitrogen fertilizer that aids root growth and promotes plant health, water spinach develops better when SMM compost is applied, developing more healthy and desirable yields.

The nitrogen uptake rate of water spinach in NPK16 fertilizer has the highest value as a result of the chemical fertilizer's quick release of nitrogen, which makes nitrogen instantly available to plant roots but has an unfavorable effect on the growth of the water spinach by weakening the plant's overall health. However, slow-release nitrogen fertilizers, such as SMM compost, have lower V_m but nonetheless deliver nitrogen for water spinach at a constant rate, improving the plants' general health.

Recommendations

The result of the water spinach growth was measured until day 30 and the performance of water spinach growth can be improved with some additional step or precaution step. Hence, in order to improve the study on determine the nitrogen uptake efficiency of SMM compost on water spinach, the following recommendations and research should be done:

- Planting experiments and application of soil conditioner should be conducted on-site with an open area to provide more reliable results and findings.
- The loamy soil and SMM compost should be air-dried to such a degree that no further moisture is given up on exposure to air and crushed into small particles. The SMM compost must be mixed thoroughly to obtain a homogeneous soil mixture.
- To ensure the efficiency of the nitrogen on the plant, research on the nitrogen uptake of water spinach should be conducted every week. The Kjeldahl analysis cannot be performed since there is not enough water spinach sample and there is not enough time to grow additional water spinach.

Abstract: In case-based learning, students develop and apply course knowledge to solve tangible and “real life” problems. This practice can enhance student motivation and engagement in the analytical laboratory. In this application of case-based learning students analyze commercially available oils for CBD content. In the state of Texas anyone can sell CBD products. Many of these products are advertised as natural alternatives to prescription medications. The products are advertised as natural alternatives to prescription medications and make unfounded claims to treat conditions like chronic pain, depression, anxiety, insomnia, diabetes and psychosis. However, these claims are not recognized by the U.S. Food and Drug Administration and lax labeling and licensing regulations create situations where consumers may not know what CBD content is present in the product. In this online presentation the CBD content in various products will be discussed along with the necessary chemical analysis tools, analytical method, and chemical standards to perform the analysis.

Introduction

Anyone can sell CBD in Texas. Many of the products are advertised as natural alternatives to prescription medications and make unfounded claims to treat conditions like chronic pain, depression, anxiety, insomnia, diabetes and psychosis. None of these claims are recognized by the U.S. Food and Drug Administration. And because of lax labeling and licensing regulations, unsuspecting consumers may not actually know what they're buying. Products which contain no more than 0.3% THC can be bought throughout Texas. Any products that are within these guidelines can be sold in Texas. People use CBD or THC products as an alternative to using traditional medications for pain or mental illness.

A cartridge (cart) is something that contains an oil or concentrate that can be attached to an e-cigarette pen. Most carts work with an e-cigarette pen (commonly called vape pens or pens) shown in Figure 1. Powered by a battery which are rechargeable or disposable. The battery powers a heating element which heats the oil into a vapor or aerosol. The aerosol or vapor is then inhaled.

Figure 1. A typical cartridge containing CBD oil

Method

The HPLC instrument parameters were slightly modified from Storm et al. 2020. With a total run time of 11 minutes, and, column oven temperature of 50C. The mobile phase consisted of solvent A and solvent B. Solvent A consisted of 0.1% Aqueous Phase Formic Acid whereas solvent B consisted of 0.05% Organic Phase Formic Acid. The flow rate: 1 mL/min and all injection volumes were 1 μ L for standards and 5 μ L for samples.

Table 1. Mobile Phase gradient composition

Time	% Solvent B
1.5	60
2.5	60
8.5	77
9.7	95

The sample preparation consisted of obtaining 100 μL of oil weighed in a 10 mL volumetric flask. After being weighed, 8 mL of ethanol was added to the flask and mixed well. After mixing, ethanol was then filled to 10 mL. 100 μL of the solution was then diluted in 900 μL HPLC grade methanol and filtered into a glass vial for analysis. Standard preparation consisted of obtaining each standard (1 mg/ml) and mixing in equal amounts and diluted to a concentration of 100 $\mu\text{g}/\text{mL}$.

Figure 2. Issues with sample preparation

There were several issues with sample preparation as shown in Figure 2. Carts that were analyzed contained either CBD or $\Delta 8$ -THC in a concentrated oil. The CBD carts were easy to pipette a sample because the mouthpiece twisted off and the consistency was liquid oil. The $\Delta 8$ -THC carts could not be pipetted out because the consistency was very sticky and thick. Additionally, the mouthpiece did not screw off, so the cart was broken in the space above the oil.

Results

The results from the CBD cartridges (carts) and $\Delta 8$ -THC carts are shown below in Figures 3 through 7. A total of 3 commercial CBD containing carts were analyzed. A total of two $\Delta 8$ -THC commercially available carts were analyzed.

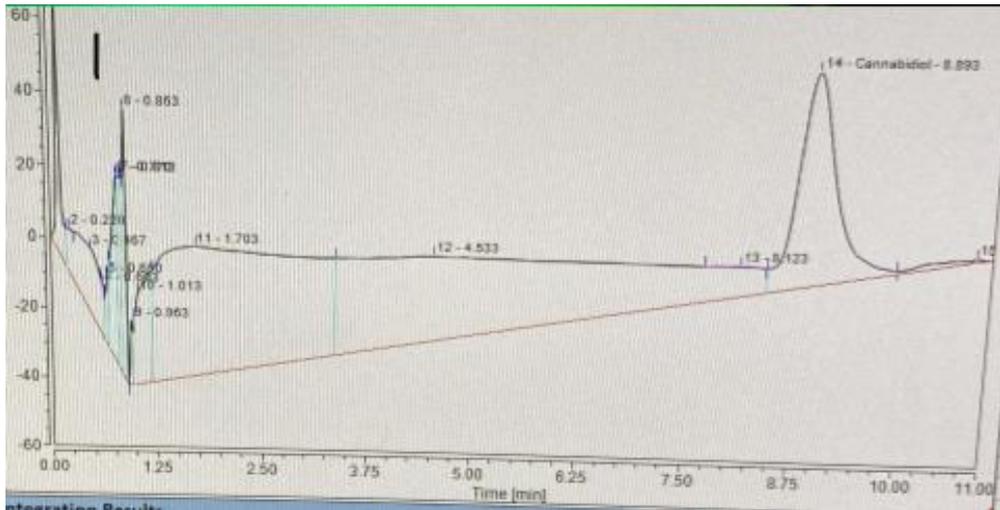

Figure 3. 4.90 mg/mL CBD cart 1

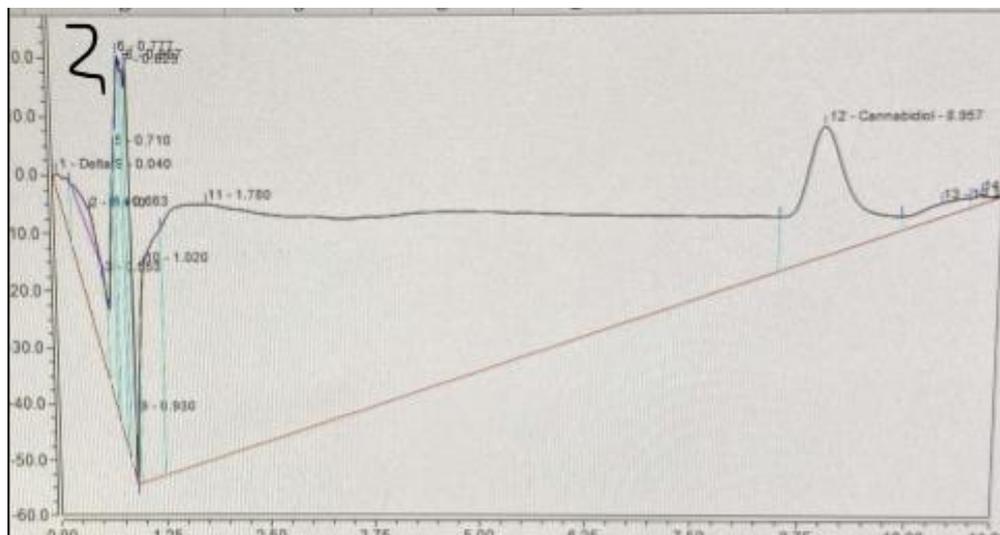

Figure 4. 1.83 mg/mL CBD cart 2

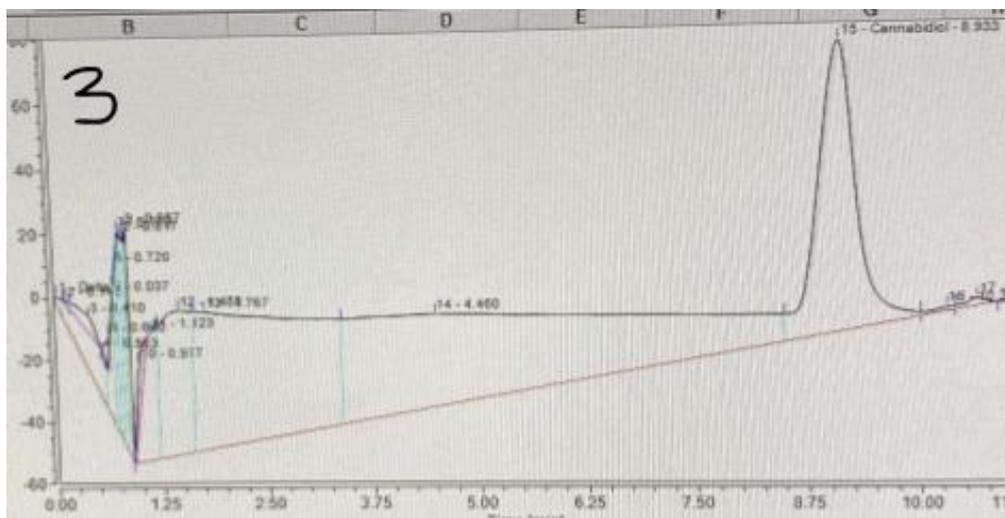

Figure 5. 7.75 mg/mL CBD cart 3

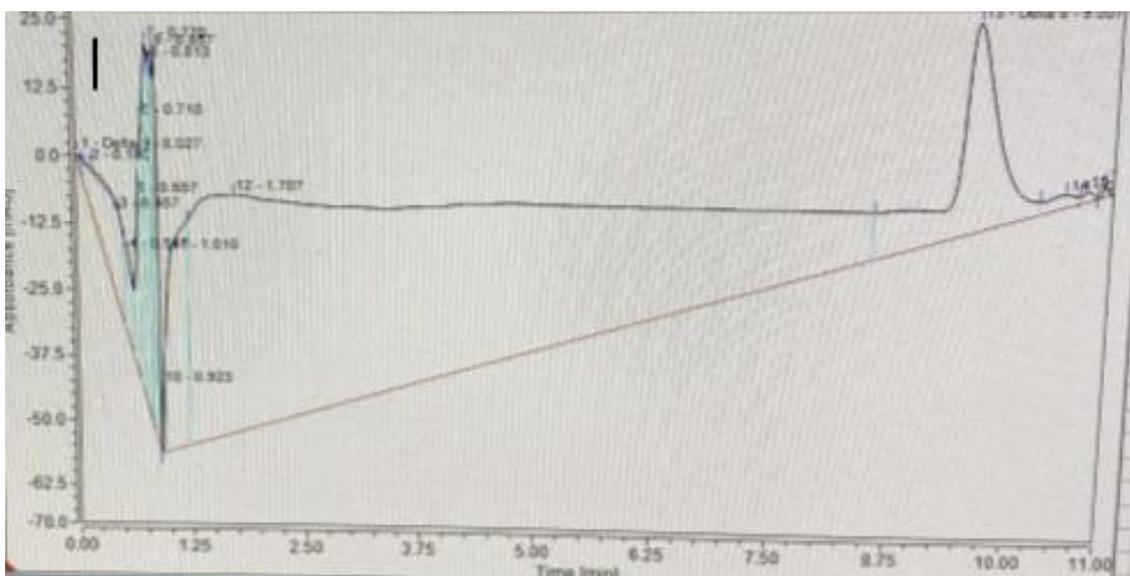

Figure 6. 3.67 mg/mL $\Delta 8$ -THC cart 1

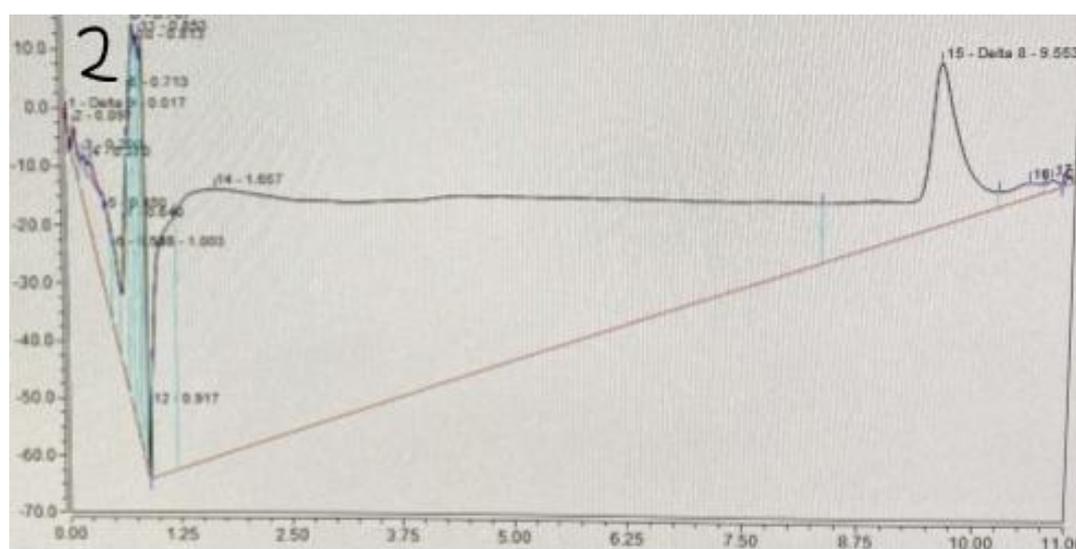

Figure 7. 320 mg/mL $\Delta 8$ -THC cart 2

Discussion

It is important to know what is in these CBD/THC products as they become more popular. The results showed that the products tested contained only what they were labelled to contain, so some of these products can be consumed with the knowledge that there are no extra additives. Products must be regulated as they increase in popularity, and future studies should be done to ensure the amounts match the packaging and determine the validity of the claims being made by consumers. Results from this experiment were repeatable and consistent in the undergraduate chemistry laboratory, and the experiment could successfully become a class lab activity. The activity would demonstrate the importance of analytical techniques in monitoring what is in these products and allow students gain experience in the laboratory.

Analysis of Increases in Ferronickel Production in An Indonesian Company Due to The Russian – Ukraine War

Aliya Qonita

University of Indonesia, Indonesia

Djoko Sihono Gabriel

University of Indonesia, Indonesia

Abstract: A number of commodity prices, such as oil and coal, strengthened in line with the heating up of geopolitical tensions between Russia and Ukraine which occurred in early 2022. One of the impacts of this event resulted in an increase in ferronickel production costs at a company located in Indonesia. This company runs businesses related to the mining sector, such as nickel, gold, bauxite and coal. In the process of processing raw materials into products or finished goods that are ready for sale, a company needs to carry out several stages. The production process of processing nickel ore into ferronickel raises costs due to several factors. Factors of production such as raw materials, labor, capital and others are important characteristics in determining the category of a company's production costs. The increase in the prices of crude oil and coal commodities due to the events of the war in Russia and Ukraine had an impact on the fuel usage figures in the cost of ferronickel production. The focus of the issues studied in this article is how big the impact of the existence of the ferronickel commodity sector is on national and global economic, political and social conditions, so that it is expected to be a consideration for the steps taken by companies in reducing production costs to anticipate price volatility, both selling prices and the purchase price of ferronickel raw materials in the commodity market.

Keywords: Ferronickel Production, Cost Production, Mining Industry, War

Citation: Qonita, A. & Gabriel, D.S. (2023). Analysis of Increases in Ferronickel Production in An Indonesian Company Due to The Russian – Ukraine War. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2181-2190), Cappadocia, Turkiye. ISTES Organization.

Introduction

Founded in the late 1960s, a company in Indonesia engaged in the mining sector carries out activities ranging from exploration, excavation, processing, to marketing of mining materials and minerals. There are four operating segments carried out by this company, including nickel, gold, bauxite and coal. One of the company's operating segments, namely nickel, consists of nickel ore and ferronickel commodities. The nickel ore produced

by the company comes from three mining locations located in Southeast Sulawesi and North Maluku.

Laterite nickel ore is one of the mineral resources mined by this company. This type of nickel ore can be categorized as saprolite and limonite nickel ore (Dalvi et al., 2004). Saprolite is a lateritic nickel ore with a high nickel content, which is around 1.5% – 3% nickel (Polyakov, 2013). Saprolite nickel ore is widely processed to produce nickel pig iron (NPI), ferronickel (FeNi) and nickel matte. In addition to producing raw nickel ore, the company also processes nickel ore into ferronickel in the form of pellets. The company will process saprolite laterite nickel ore into ferronickel products at a factory located in Southeast Sulawesi.

In the process of processing raw materials into products or finished goods ready for sale, a company needs to carry out several stages. One of these stages is production. Factors of production become important characteristics in determining the category of costs. Production costs refer to the total costs incurred by the company to produce a certain amount of a product (Pasaribu, 2021). As for the process of making ferronickel, fuel is a factor that contributes a large value to production costs.

In early 2022 commodity prices strengthened in line with the heating up of geopolitical tensions between Russia and Ukraine. The impact of the war on the company was an increase in commodity prices, such as oil and coal, which resulted in an increase in ferronickel production costs. The focus of the problem studied in this article is how big the impact of the existence of the ferronickel commodity sector is on national and global economic, political and social conditions, so that it is expected to be a consideration for the steps taken by companies in maintaining the stability of ferronickel prices in the commodity market.

Literature Review

Ferronickel

Ferronickel (FeNi) is an iron alloy containing two main elements, namely iron (Fe) and nickel (Ni) (Eric, 2014). Iron as an element combined with another element, nickel, is melted and converted to form new metal alloys. Ferronickel metal alloys contain 20 – 40 wt% nickel and 60 – 80 wt% iron, as well as impurities such as magnesia (MgO) and (CaO) (Eric, 2014). So nickel ore has good mining value and smelting properties.

The process of producing nickel ore into ferronickel begins with the mining of lateritic nickel ore which undergoes stages including extracting the ore, transporting the ore and unloading the ore shipment. Besides being produced in the form of raw nickel ore, the company also processes nickel ore into ferronickel. The process of making ferronickel uses the pyrometallurgical method, which is the process of separating metal from its ore by heating it at high temperatures. In simple terms, the process of producing ferronickel goes through stages such as rotary dryer, rotary reduction furnace, electric furnace (producing slag pond and slag), raw ferronickel, ferronickel purification and casting.

Production Cost Control

Cost control is the practice of identifying and reducing business expenses to increase profits, and it starts with the budgeting process. This form of control is in the form of a systematic effort made by the company to achieve goals effectively and efficiently. In addition, control can provide decisions for the company if the resources obtained have been used effectively and efficiently to provide the objectives to be obtained. This activity can be carried out through three stages, such as planning, implementation and measurement.

Mineral Benchmark Prices

To ensure the availability of supplies and stabilize prices, the Minister of Energy and Mineral Resources issues regulations regarding the procedure for determining the benchmark selling price of metal minerals and coal. The formula for calculating the benchmark price for nickel metal minerals must use the reference mineral price determined based on a Decree of the Minister of Energy and Mineral Resources. So that holders of nickel commodity mining business permits and holders of nickel commodity industrial/processing facilities and/or refining business permits in Indonesia must refer to the benchmark price of nickel metal minerals in the sale and/or purchase of nickel ore.

$$MBP_{\text{feronickel}} = (\%Ni \times RMP_{\text{nickel}}) \times CF \quad (1)$$

Impact of Geopolitical Wars

Before the war broke out, the World Bank predicted that 2022 would be a stabilization year, with rising energy prices and falling non-energy commodity prices. However, Russia's invasion of Ukraine has threatened pre-existing pressures on global supply chains (Rabbani et al., 2022). Energy and non-energy commodity prices each rose due to the difficulty in recovering the global economy due to Covid-19 (Rabbani et al., 2022).

Energy prices have experienced a very significant increase due to Russia's status as a major oil and gas exporter. Oil and gas prices have soared in recent months on supply worries fueled by companies refusing to buy or ship Russian oil to avoid sanctions. The impact of the Russo-Ukrainian war was very significant on the world economy, as these two countries were major producers and exporters of a number of commodities. The outbreak of war has accelerated price increases for dozens of commodities exported by Russia and Ukraine, such as crude oil, coal, nickel and steel.

Method

The data in this study uses primary data obtained from the amount of feronickel production and the cost of feronickel production incurred by the company during the Russia-Ukraine war. The data obtained will be

identified in the form of data on production costs, raw material costs, direct labor costs and factory overhead costs. As well as evaluating the allocation of cost categories that provide a high percentage of total production costs. Compilation and calculation of ferronickel production costs were carried out, and forms of efforts were identified to reduce the increase in ferronickel production costs.

Result and Discussion

Ferronickel Production Cost

There was a difference in the cost of ferronickel production before and after the Russia-Ukraine war.

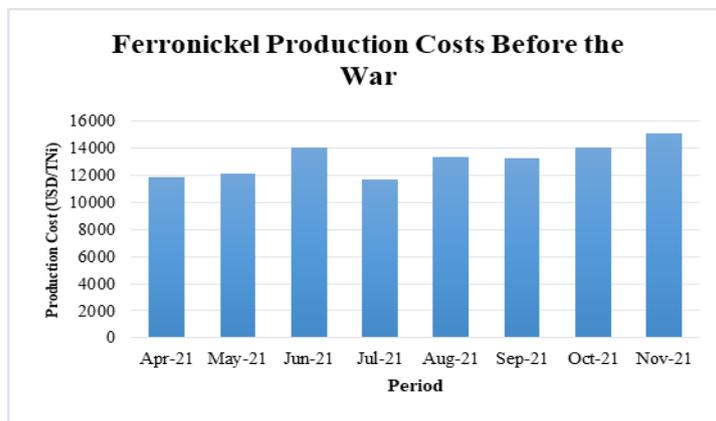

Figure 4. Ferronickel Production Cost Before The War

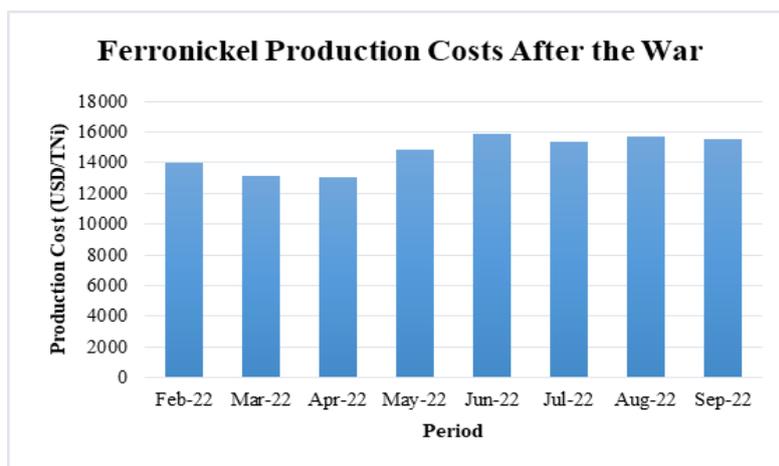

Figure 5. Ferronickel Cost After The War

Raw Material Cost

In this study, the indicators for the cost of raw materials needed are the price of raw materials and the quantity of raw materials, both the standard costs or the budgeted costs that have been planned and the actual costs.

Table 21. Price and Consumption Index of Nickel Ore Raw Materials

Direct Material Cost

In this study, the required indicators are standard direct wage rates and standard direct labor hours. Based on the table above, it can be described that the wage standard has immediately increased and decreased. This is due to the standard direct working hours which experience instability. One of the factors is the number of production volumes that have changed, thereby increasing overtime hours for workers.

Table 23. Direct Material Cost

Ferronickel Production Cost Category

The cost of producing ferronickel is divided into nickel ore A; nickel B ore and other raw materials; services, transportation, transportation and mining of ore; salaries, wages, bonuses and employee benefits; fuel

consumption; taxes and other levies; third party services; rent; use of spare parts; maintenance and repair; and other production expenses.

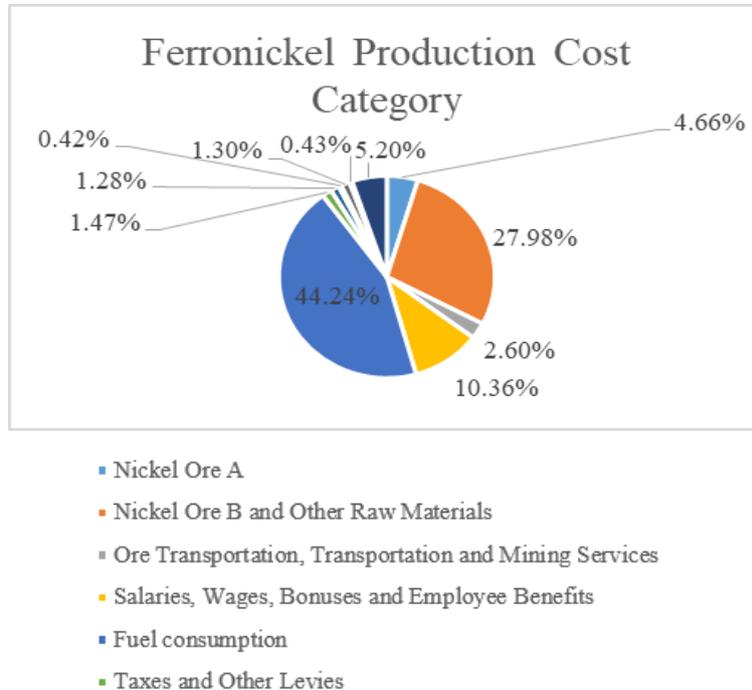

Figure 6. Ferronickel Production Cost Category

From the diagram above, the cost of using fuel contributes a large value of 44.24%. As for the events resulting from the Russia – Ukraine war, the price of coal and crude oil experienced a significant price hike. So that it affects the number of fuel consumption for the ferronickel production process, especially in the process of rotary dryers, rotary reduction furnaces and electric furnaces. Where these processes require the use of electricity and heat is quite high. This can also be proven in the world coal and crude oil price indices.

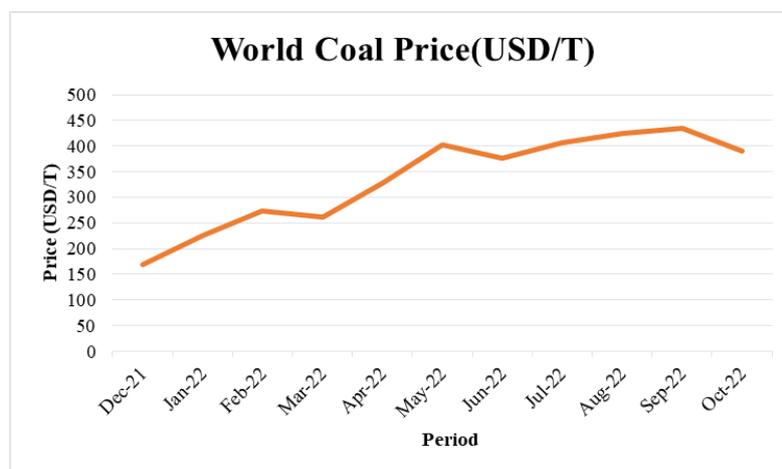

Figure 7. World Coal Price (USD/T)

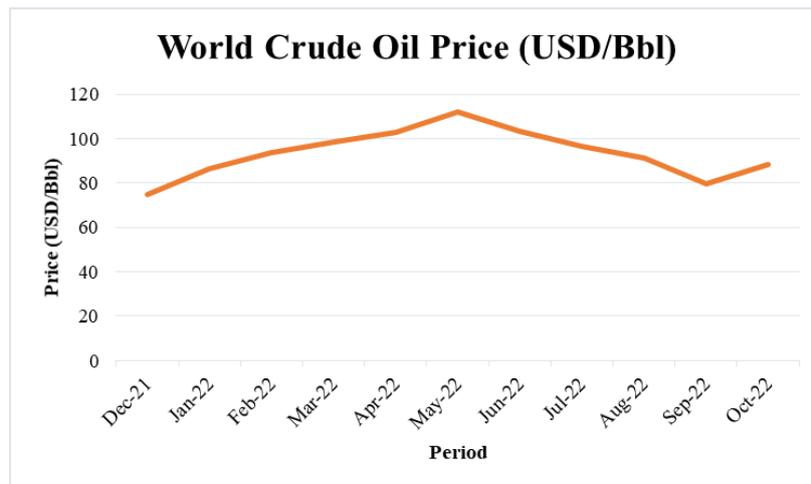

Figure 8. World Crude Oil Price (USD/Bbl)

Conclusion

The results of this study indicate that the increase in the price of ferronickel production was caused by the increase in the price of fuel consumption that occurred in connection with the events of the Russia – Ukraine war. Where commodity market prices globally affect production prices and ferronickel selling prices. This research can identify other factors that affect the increase in the price of ferronickel production. For further research, it is necessary to control the increase in production prices, so that business actors can determine the right steps in controlling price fluctuations.

Abstract: The purpose of this research is to present an overview of the conceptual framework of sports statistical data fabric techniques as an approach for using information technology systems for analyzing sports statistical data to develop athletes' potential. This literature review shows that the development of advanced statistical methods for match prediction and selection of athletes by using sports statistical data to analyze the correlation and correlation of the data creates an information system with sports statistics data fabric techniques provide excellent cognitive results. The information obtained is accurate and accurate. From the results of the study, it was born as a new body of knowledge with in-depth conceptual frameworks in sports and scope of information as a basis for development sports with specific characteristics of physical fitness. The knowledge gained from the conceptual framework, this research can create new norms and knowledge in sports toward the development of athletes to their highest potential.

Keywords: Data Fabric, Decision Support System, Physical Fitness, Sports Technical Skills, Sport Statistics

Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2191-2201), Cappadocia, Türkiye. ISTES Organization.

Introduction

Sport is a health-promoting activity that builds strength for people of all genders and ages. It can also make income and fame for professional and amateur athletes. The goal in a competition is to win, which is the highest

priority in the sport. Because the winner will receive reputation and rewards. Each country's participation in sporting events is seen from competition in a global sport such as World Cup, Olympics. The Summer Olympics begin for the first time in 1896 (Zhenyu Gao, 2020). This competition is a platform for every country to show their sporting potential and talent. This causes competition that has trends and approach for development of athletes towards excellence.

Now, the benefits of objective analysis of data to find answers or solutions are becoming popular because of the accuracy and precision of the results. Sports organizations and institutions that operate with a focus on resource management as well as human capital development. Therefore, actualize studies and research by analyzing information about athletes and sports competitions such as sports statistics, competitions, physical fitness, sports skills training, sports psychology, etc. (Chou; et al., 2021). Combination aesthetic studies and sports is rhythmic body movements provide mental enrichment and physical fitness are consistent. It is the harmonious development of body and mind, the highest embodiment of sports aesthetic education and sports science information, mainly focusing on erection the potential of athletes. The elements that influence the peak performance of athletes such as skill and technique, physical fitness, mental performance, a person's physical strength. It determines his athletic abilities. Statistical analysis was used to specify the effects of time and condition on neuromuscular assessment parameters, anthropometric data, and physical performance. It is a performance measure that has a strong correlation between the amount of technical and tactical training and the anthropological performance variables. The body's function amount and skill training techniques and tactics showed an extreme correlation with aerobic fitness tests (Da Silva et al., 2022).

According to research studies on sports data analysis, recent research was conducted to predict the outcome of football matches basketball player prediction (Chou; et al., 2021) and player ranking in e-sport and other sports research (Umemura; et al., 2021). In addition to the findings in these studies, the results are excellent. The findings from this study also serve as further development approach for data analysis and a knowledge leading to the development of the research conceptual framework in this research. The resulting in a new knowledge and approach to develop athletes to their highest potential. The resulting in a new knowledge and approach to develop athletes to their highest potential. This conceptual framework can be applied to the development of other similar sports. Because in the research, there are groups of sports that have the same or similar characteristics such as competition, time, equipment, and environment into categories clearly.

Research Objectives

The research objectives are:

- To analyses component of sports statistics, physical fitness, sports technical skills, data fabric and decision support system.
- To synthesize a conceptual framework for athlete's selection with Data Fabric Sports Statistical technique.

Related Work

Sport statistics

According to the relating literature, the analysis of sports data consists of physical fitness data such as sports skills, mental skills or mind, sports statistics information, which applied to develop information technology systems related to data analysis and data management. There is a semantic data structure that is related by separate the data relationships or merge data relationships together. Characteristic of the data can be either structured, semi-structure and unstructured. In data correlation analysis is will continue to organize information that is continuity and complex data to be able to extrapolate the data. Therefore, data can be deployed in any environment (Portanova, 2021a). Based on several research studies related to the development of advanced statistical methods for football match predictions or use it to create a strategy from a score-driven model can get accurate forecasts (Mattera, 2021). The key factors in influencing athletes were age and gender, which were related to the competitive level of each sport (Götze; & Hoppe, 2021). Matching analysis, it can be performance emphasized using statistical and mathematical criteria. It is not only during the competition used at high speed that determines. Though, at each interval is the acceleration and slowdown values will also cross above the high intensity threshold (R.; et al., 2021). Therefore, sports statistics are performance parameters and influence the performance of athletes. Preparation of good techniques and tactics, this creates effective competitive behavior and leads to success.

Physical fitness and Sports technical skills

Generally, physical fitness refers to the effects of motor skills that are fundamental to sports training, regardless of sport type (Ambroży et al., 2022). Physical fitness are data on body proportion and physical fitness that are related. Relationship between anthropometric measurements physical fitness and performance indicators from physical training. This is a variable of anthropological efficiency. Performance assessments such as strength, endurance and power muscle, performance of movements, joints, etc. Test activities include Vertical Jump, CMJ Standing Long Jump, Short Run, Long Run, Running Anaerobic Sprint Test. Fatigue Index can also be measured by calculation of best running and worst running (Sattaburuth & Wannapiroon, 2021). Sports technical skills in relationship to physical fitness performance are essential to movement for effective sports performance. Especially sports that are technically, tactically, structurally complex, intricately movement, and requires a sufficient level of motor skills to provide a basis for activities during competition (Ambroży et al., 2022). The development of an athlete's motor skills varies depending on the sport. There are elements of technical skills such as tactics, structure of movement. Levels of sports skills classified in each sport include assessment fitness, flexibility, dribble, balance, etc. These unique technical abilities need to be properly trained in order to maximize their performance in each sport. Therefore, technical skills in sports are important skills and have a unique influence on the success of each sport. Improving an athlete's performance is both physical and technical (Gidu et al., 2022).

Data Fabric

Managing data and databases with Data Fabric technology is a rationalism concept of a technological approach that includes the process of separation data into segments. To support the process of datafication in the computer system (Portanova, 2021b). The goal of Edges of Internet Computing is to offload the computational load of IoT data streams to Cloud Computing for computation. Data storage, reasoning and intelligence Based on the Computing Fabric's complex, high-performance computing architecture, big data streams provide fast connectivity for storage (Xhafa, 2020). Big data platform with organized cloud computing nature. In which the data lake architecture is a storage area. Imported data is organized to avoid large volumes of data overflow, which is structured data semi-structure and unstructured a fast-growing that comes from a variety of sources. A data lake architecture is data storage that is consistent and available. It has access for end-to-end analytical applications, therefore making the most benefit (Munshi & Alhindi, 2021). A data lake is therefore a logical view of all data sources and raw datasets accessible to a data scientist or statistician. All types of data are merged Logical and physical. It can resize the storage and processing of data (Sawadogo; & Darmont, 2021). Data lakes are therefore an important part of data management. Adopting a data fabric that resembles an enterprise data structure, where data often resides in different legacy systems and has different sources. A focus on data source integration through semantic data structures, the data fabric supports the creation of valuable insights and a consolidated views of data through integration, requiring knowledgeable technical expertise and specific model only (Ghiran & Buchmann, 2019).

Decision Support System: DSS

Use of Decision Support System (DSS) as a decision-making tool to eliminate potential bias. There are several techniques for decision support systems that help make decisions depending on the suitability of each situation (Planas et al., 2022). The model used is based on decision analysis and multi-attribute utility theory, such as Multi-criteria Decision Analysis methods: MCDA or Multi-Attribute Utility Theory: MAUT, mainly based on criteria and indicators to assess the impact of variables on decision making. In addition, decision support systems can help with highly complex decisions (Labella et al., 2020). Multi-criteria decision analysis (MCDA) is a method that considers decision elements with many alternatives to find the best possible solution. Each criterion must be measurable either quantitatively or qualitatively to what extent each option will achieve objective outcomes. The significance of the criteria and alternatives is in the form of a score or as a weight value (Urbaniak et al., 2020). Although the so-called multi-criteria decision-making method Characteristic Objects METHod (COMET) is a method for specifying a decision model to solve a multi-criteria decision based on a set of basic expert rules. This is not the same as the multi-criteria decision analysis (MCDA) method. But the COMET method does not have a problem with ranking lists and this technique uses associations with decision makers. The COMET method does not use any significant weights. Rather, the proposed approach makes it possible to estimate significant weights. The Analytic Hierarchy Process method (AHP) is also used as a possibility to analyze time-extended decisions. For explain which aspects influence the final, result to Spearman correlation coefficient was used to measure the correlation of input data and output data. It can be concluded

that there are three main concepts and methods for multi-criteria decision analysis: Method 1. Simple Additive Weighting (SAW) use the principle based on the weighting average. Method 2. Analysis Hierarchy Process (AHP) pairwise the decision components one by one and sort the alternatives. Method 3. Ideal Point Technique this method focuses on the determination of positive and negative ideals. The best option is to get as close to the positive ideal and as far away from the negative ideal as possible.

Research Methodology

The technique of systematic literature search and review by analytical method Meta-analysis by synthesizing and analyzing information from documents, textbooks and research articles from international research databases including Scopus, SpringerLink, Science Direct, Web of Science, Wiley, IEEE. According to the method of content analysis of documents according to the steps of PRISMA analysis as shown in Figure 1. Show the process of searching and selecting research articles by following the steps below. Step 1: Define the scope of the synthesis. Step 2: Conduct research and collect research papers according to the screening criteria by using Boolean operation (AND OR, NOT, ADJ) according to the advance search principle. Step 3: Perform qualification screening by studying, analyzing, discriminating, screening, and categorizing, i.e., crude extraction from abstract content (Abstract screen), selection and evaluation from research content (Full-text) and analyze all contents by Content Analysis method.

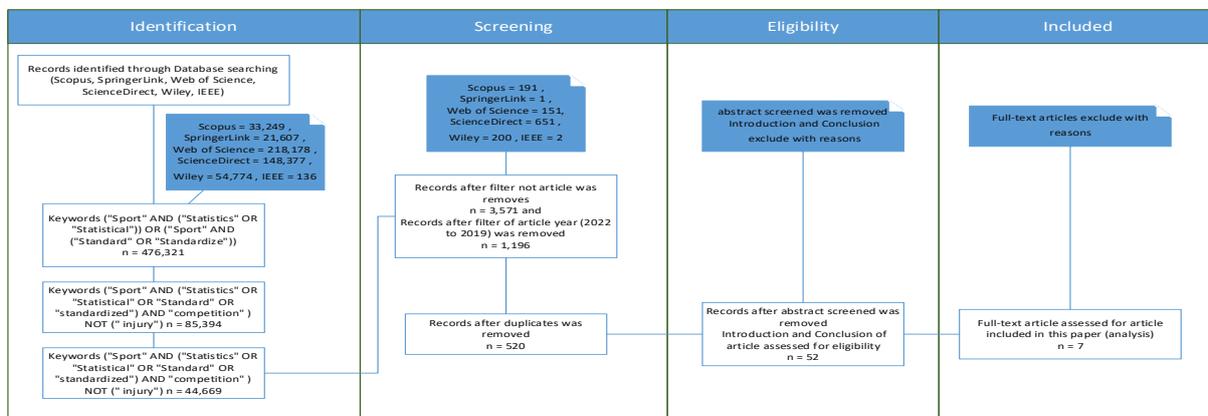

Figure 1. Procedure for research articles selection to synthesize the characteristics of sports statistics

From figure 1 shows the process of selecting research articles for data synthesis and analysis. In searching for documents and research articles, different search terms are used according to the purpose of the synthesis as follows: 1) Synthesis of attributes of sports statistics, using the keywords namely sport, statistical, standard, standardize, competition without the keyword injury. 2) Synthesis of elements of physical fitness and athletic technical skill, using the keyword namely sport, physical fitness, technical skills without the keyword injury. 3) Synthesis data fabric processes using the keywords namely data fabric, data lake, database, architecture. 4) Synthesis the processes of decision support systems using the keywords namely decision support system, multi-criteria decision making. Search for documents and research articles according to steps 1 to 4 for research article selection. Then the synthesis results

will be as shown in Tables 1, 2, 3 and 4 according to the objectives of the synthesis.

Research Results

1. The synthesis result of sports statistics characteristic

From Table 1, it can be concluded that there are 2 main characteristics of sports statistics, namely the individual statistics group and group statistics from the game the details are as follows: The first group, Athlete or Player statistics, consists of anthropological characteristics and physical components such as age, sex, experience, height, weight, limb length, stretching and flexion, body mass index, fat mass, movement, strength, etc. Sports skill level, player ranking, scoring performance, performance, success ratio, training, strength, power, endurance, distance, average speed, acceleration and deceleration, volume, intensity, accuracy, distribution of work during the match, defense, attack, pass ball, lose ball, sport-specific techniques or skills, tactic, penalties, or fouls, offside, etc. The second group, statistics from the game, consisting of competition results such as the best record (win, loss, draw, ranking, award, score, scoring ratio, etc.), difficulty or easy level of the game, the level of competition of sports in divisions (leagues, world levels. Asia, European level, etc.), ranking of teams, scoring goals (gaining and losing points, etc.), match statistics (defense and attack strategies, etc.), attack and defense ratio.

Table 1. The synthesis results of sports statistics characteristic.

2. The synthesis result of the components of physical performance and athletic technical skills.

From Table 2, it can be concluded that physical fitness and sports technical skills It consists of three main groups: anthropological attributes, Sport-specific skills or technical skills and skill practice activities. The anthropological characteristics were gender, age, height, weight, experience, expertise, the aptitude for using body parts is a motor skill in humans, body fat mass, BMI, body proportions, muscular strength, power, flexibility, recovery, mobility, accuracy, agility, multi-directional movement, body endurance Including metabolism and oxygen consumption of the body, characteristics of the aerobic and anaerobic systems. Sport-specific skill groups or technical skills, including dribbling skills, hitting ball, strength, attacking, defending, agility, speed, balance, movement, motor skills, sport-specific techniques, strategy, experience, control. Finally, training activities group include jumping, endurance, muscle strength, fitness test, dynamic stretching, plyometric, handgrip exercises, joint movements (kicks, punches, body moves), core grip, balance training, change of direction, zigzag running, practice, agility test.

3.The synthesis of the data fabric process.

From Table 3, it can be concluded that the main components of data fabric are six groups: The first group, the user and administrator. The second group, devices used mainly are personal computers and mobile computers as well as host computers in conjunction with storage devices. The third group, software and systems or platforms such as cloud solution, tools, UI, DBMS, Machine Learning, DSS and OS etc. The fourth group, communication, network connection and services such as IoT, Internet, Cloud, XaaS (Anything as a Service), social media, etc. The fifth group data and databases such as metadata, raw data, data marts, data pond, data set, catalog data (i.e., smart grid data, SQL, Semi-structured, NoSQL) Database such as MySQL, PostgreSQL, Oracle, HDFS, MapR., CloudMdsQL, MongoDB, JSO, OLAP, Cloud Data Lake etc. Finally, the sixth group, performance and work overview the performance aspects are data volume, data transfer rate, data diversity, data reliability, data cleansing, security, data access, data processing. The overall performance aspects are data access, data ingestion, data discovery, data management, data orchestration, data processing.

Decision Support System		1. Preparation, 2. Criteria Creation ((decision model), 3. Decision-Making, 4. Decision Support System	

Figure 2 shows the conceptual framework of athlete selection by data fabric techniques for sports statistics, the primary variables or input factors were sports statistics, physical fitness, sports technical skills, principles of data fabric and principles of decision support systems. The methodology of the athlete selection system was used by data fabric techniques of sports statistics data by using athlete model analysis according to sports statistics to work together in the system. The dependent variables or results were shown athletes who were selected and athletes ranked according to their performance in each sport.

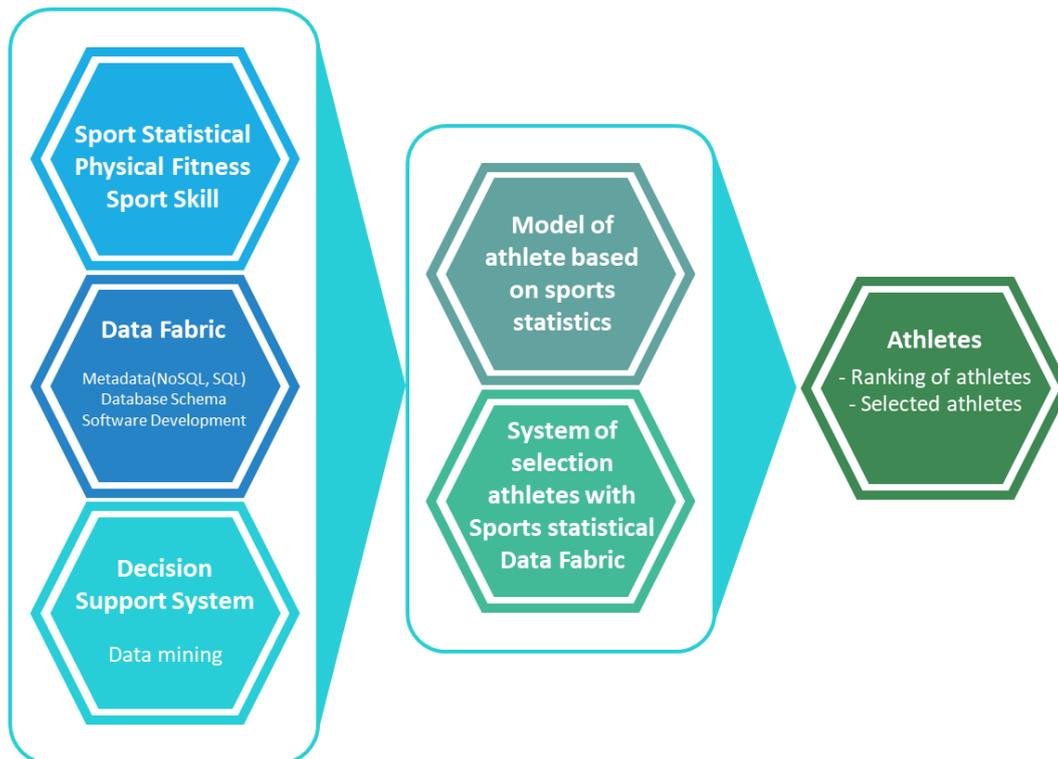

Figure 2. Propose Conceptual Framework for Athletes Selection with Data Fabric Sports Statistical

Discussion

In this study, the results of the synthesis of the conceptual framework for athlete selection by data fabric techniques of sports statistics revealed that the important input factors affecting the model of athletes with high potential in each sport were sports statistics, physical fitness, sports technical skills. The sports statistics are information about physical fitness and technical skills in sports. It has the same elements and looks and varies according to the type of sport. Because each sport has a different playing style and duration. Makes it emphasize the use of physical skills and various organs and varies depending on the sport. For example, speed skills are used in group sports such as water sports, athletics, flexibility skills are used in the sport of beautiful arts, muscle strength skills are used in martial arts, and agility skills are used in net or racket sports and all skills are used in team sports or on the field, etc. These data are important factors that can be used to analyze and create a model of athletes according to sports statistics and to develop an athlete selection system by data fabric techniques of sports statistics. Prepare athlete ranking reports to select athletes with the highest potential in each sport.

Conclusions

The conceptual framework of athlete selection by data fabric techniques of sports statistics is a approach for developing athletes to achieve their highest potential. Due to the process of synthesis and analysis of information from documents, textbooks, and research articles from the research database with the technique of systematic literature search and review by analytical method meta-analysis and content analysis according to PRISMA analysis and the content about the attributes of sports statistics. The components of physical fitness data fabric process and process of decision support system. Analyze the relationship between physical fitness data and sports statistics to find indicators that influence the development of athletes' potential. The concept of data fabric sports statistics can be used as a guideline for development athletes of all types to reach their full potential. The discovery of the conceptual framework in the research is very useful for developing athletes to achieve the goal of competition, such as winning, getting promoted to a higher ranking, a world record, or a competition, etc. Therefore, the conceptual framework of data fabric sports statistics in this research will be a framework or path for developing athletes of all types in the future. In addition, the researcher will use this conceptual framework to further develop and study the research results.

Acknowledgements

This research was support from Division of Information and Communication Technology for Education, Faculty of Technical Education, King Mongkut's University of Technology North Bangkok (KMUTNB) and Thailand National Sports University (TNSU). The researchers would like to show appreciation in being supported for this research.

Abstract: Using high-temperature stable anatase TiO_2 for environmental applications such as gas sensors, self-cleaning ceramic tiles, and anti-microbial sanitary wares is essential and still challenging today. To overcome these problems, TiO_2 is combined with ZnO and SiO_2 to form a $\text{TiO}_2/\text{ZnO}/\text{SiO}_2$ composite, producing TiO_2 material that is effective in the visible light region and has anatase phase TiO_2 which is stable at high temperatures. Nanocomposite $\text{TiO}_2/\text{ZnO}/\text{SiO}_2$ was synthesized by hydrothermal method at $180\text{ }^\circ\text{C}$ for 24 hours using 1-butyl-1-methyl pyrrolidinium salicylate ionic liquids as structuring agent morphology particles. Various calcination treatment was carried out in the temperature range from 450 to $1000\text{ }^\circ\text{C}$. TG-DTA and XRD results showed no anatase to rutile transformation was observed up to $1000\text{ }^\circ\text{C}$. SEM results showed that particle morphology $\text{TiO}_2/\text{ZnO}/\text{SiO}_2$ synthesized using water has a sphere-like shape while using ionic liquids-water mixture has a nanorod and nanoflower-like shape. $\text{TiO}_2/\text{ZnO}/\text{SiO}_2$ composites have suitable properties for photocatalytic and self-cleaning applications in the ceramic industry.

Introduction

TiO₂ is one of the most utilized semiconductor materials due to its unique properties. It is non-toxic, abundant in nature, has high physical and chemical stability, wide bandgap, and excellent photocatalytic effectiveness (Ferreira-Neto et al., 2021). TiO₂ has undergone substantial research about its possible use in photocatalysts, photovoltaic devices, sun energy conversion, self-cleaning surfaces, and gas sensors (Q. Zhang & Li, 2020). However, TiO₂ has two main drawbacks: a large energy band gap (3.2 eV for anatase and 3.0 eV for rutile) and high recombination of photogenerated electron-hole pairs. The large bandgap of TiO₂ causes TiO₂ to work more effectively in the ultraviolet range of light, whose abundance in sunlight is only about 5% compared to visible light. Modifying the electronic band structure, such as doping elements, and forming oxygen vacancies can narrow the large bandgap of TiO₂. The high recombination of photogenerated charge carriers can limit its overall photocatalytic efficiency. Changing the charge transfer effect, including the addition of suitable electron acceptors, heterojunction, and z-scheme, can correct the high recombination of TiO₂ (Guan et al., 2020).

One of the dopants used so that TiO₂ can effectively work in the visible light region is ZnO to form a TiO₂/ZnO composite (Ali et al., 2021), (Rokhmawati, 2019). ZnO has similar characteristics to TiO₂. Additionally, compared to TiO₂, ZnO exhibits greater electron mobility and a longer lifetime for photogenerated electrons. ZnO semiconductors have several advantageous properties: a wide band gap, an intense emission spectrum at room temperature, being transparent (semiconductive) when exposed to light, and having higher electron movement so that it is widely applied as an additional material to increase the photocatalyst activity of TiO₂ to form heterojunction (Zulfikar et al., 2020).

Anatase, rutile, and brookite are the three crystalline phases of TiO₂ that are the most common (Esch et al., 2014). Anatase has a superior photocatalytic activity compared to other phases of TiO₂ for the following reasons: (i) indirect and slightly wider (by 0.1 eV) band gap of anatase, which slows down the rate of recombination of the photogenerated e-h⁺ pair; (ii) anatase has greater electron mobility than rutile, enabling effective bulk transport or charge diffusion through the crystalline structure to the surface (iii) the ability of anatase to specifically promote the formation of peroxy species on its surface (iv) the generation and diffusion of photogenerated mobile OH radical to bulk solution only in anatase (Ferreira-Neto et al., 2021). Anatase, however, is metastable after being heated at a high temperature and is readily convertible to the most stable phase of TiO₂, the rutile phase. According to the reported study, depending on the fabrication process and precursors, the anatase to rutile transformation occurs at temperatures between 450 and 850 °C (Q. Zhang & Li, 2020). In the ceramic tiles industry, anatase function is an antibacterial agent when coated on ceramic tiles' surfaces or as a glaze material (Hasmaliza et al., 2016), (Maryani et al., 2020). High-temperature stable anatase TiO₂ without phase change to rutile is required for various environmental applications such as gas sensors, anti-

microbial sanitary goods, and self-cleaning ceramic tiles (Padmanabhan & John, 2020). Therefore, it would be ideal if TiO₂ could generate a high-temperature stable anatase phase (over 1000 °C) (da Silva et al., 2018).

The resistance to the anatase-rutile transformation has been studied using various techniques, including metal dopant and morphological control. However, there has not been any information about successfully fabricating until now. Anatase often turns into rutile between 400 and 700 °C, depending on factors including preparation technique, grain size, morphology, degree of agglomeration, kind of impurities, and reaction environment. The mechanism of anatase to rutile transformation is based on breaking two Ti-O bonds in the anatase structure, then rearranging the Ti-O octahedra leading to a dense rutile phase in a smaller volume. Numerous variables, including the use of dopants, the synthesis process, and heat treatment, might influence the breakdown of these bonds. According to the literature on high-temperature stable anatase TiO₂, there are four basic ways to increase anatase TiO₂'s high-temperature stability, including (i) doping non-metal ions, (ii) co-doping with metal ions, (iii) and non-metal ions, (iv) oxygen richness stability of dopant-free materials (Periyat et al., 2016). One of the dopants used is the addition of SiO₂. SiO₂ has functions to form Ti-O-Si bonds to inhibit the transformation of anatase to rutile, increase the mechanical strength of TiO₂ thin films, and form transparent coatings when applied to substrates of ceramic and glass products (Sun et al., 2017). The presence of SiO₂ will increase the surface area of TiO₂ material and increase photocatalytic activity efficiency (Rosales et al., 2021).

To produce TiO₂ materials with a particular morphological structure, modification of the particle shape is carried out using ionic liquids. Ionic liquids have been widely employed in organic synthesis, electrochemistry, molecular self-assembly, and biocatalysts due to their excellent chemical and physical features, such as negligible vapour pressure, low toxicity, low melt points, and excellent chemical and thermal stability (Y. Zhang et al., 2020), (Ghandi, 2014). Recently, ionic liquids have received much attention because they may be readily employed to create functional nanoparticles and other inorganic nanostructures (Liu et al., 2009). The ionic liquids function as a solvent and a structuring agent for a nanocrystalline of particle morphology (Łuczak et al., 2016a) (Łuczak et al., 2016b). The ionic liquids used in this study are pyrrolidinium-based ionic liquids. This pyrrolidinium-based ionic liquid is potentially an electrolyte liquid in lithium batteries (Asha et al., 2019). It shows extensive features, such as aliphatic, positive charge localization, and greater flexibility than imidazolium-derived ionic liquids (Shimizu et al., 2012). In addition, this liquid is also used as a heat transfer process fluid (Sharma et al., 2016). Based on cytotoxic studies, pyrrolidinium-based ionic liquids are environmentally friendly because they are less toxic than piperidinium and imidazolium-based (Musiał et al., 2017). In this study, we prepared 1-butyl-1-methylpyrrolidinium salicylate ionic liquids with the reflux method as a structural agent for TiO₂/ZnO/SiO₂ composite morphology particles. Salicylate ionic liquids containing -OH and -COO groups offer strong hydrogen-bonding properties effective for dissolving biomaterials, including DNA, cellulose, and other carbohydrates (Wang et al., 2015). Furthermore, the synthesized ionic liquids are then used as a medium for synthesizing TiO₂/ZnO/SiO₂.

In this paper, we prepared TiO₂/ZnO/SiO₂ composites synthesized by hydrothermal method using pyrrolidinium-based ionic liquids as media and structuring agent morphology particles. This study aims to make

TiO₂ composite materials practical in the visible light region and have anatase phase TiO₂ which is stable at high temperatures. The synthesized TiO₂/ZnO/SiO₂ composite is suitable for applications such as photocatalysts, photovoltaic devices, sun energy conversion, self-cleaning ceramic and glass surfaces, and gas sensors.

Method

Materials

All chemicals are in an analytical grade without any further purification. Tetrabutyl ortho-titanate (TBOT) was obtained from Sigma-Aldrich. Zinc acetate dihydrate (Zn(CH₃COO)₂·2H₂O), tetraethyl ortho silicate (TEOS), isopropanol (C₃H₈O), hydrochloric acid (HCl), sodium hydroxide (NaOH), 1-butyl-1-methylpyrrolidinium chloride, acetone (C₃H₆O), sodium salicylate (C₇H₅NaO₃), n-hexane (C₆H₁₄), were purchased from Merck company. Anion exchange resin Amberjet 4200 Cl and deionized water were used in experiments.

Synthesis of ionic liquids 1-butyl-1-methylpyrrolidinium salicylate

15 grams of 1-butyl-1-methylpyrrolidinium chloride and 13.5 grams of sodium salicylate were mixed in a round-bottom flask in acetone as a solvent with a reflux condenser. This mixture was stirred with a magnetic stirrer at 50 °C for 48 hours until a white solid formed. This solid was filtered and washed using acetone. The ionic liquid is then passed through an anion exchange resin previously saturated with sodium salicylate solution to remove the dissolved Cl⁻. The filtrate of ionic liquid was evaporated using a rotary evaporator to remove the excess acetone. The solution was cooled, and the yellow clear 1-butyl-1-methylpyrrolidinium salicylate was obtained. ¹H NMR analyzed the structure of synthesized ionic liquids.

Synthesis of TiO₂/ZnO/SiO₂ composites

Synthesis of TiO₂/ZnO/SiO₂ composites was carried out using water media and with a mixture of ionic liquid and water as follows: 5.56 grams of TBOT was dissolved in 10 mL of isopropanol to make solution A. 3.40 grams of TEOS was dissolved in 10 mL of isopropanol to make solution B. 4.78 g of Zn(CH₃COO)₂ was dissolved with 1.5 mL of distilled water and mixed with 10 mL of NaOH 3 M to produce solution C. Solution A was then added dropwise to 30 mL distilled water with a few drops of HCl 1:1 until pH reached at 3, followed by solution B. White precipitates of hydrous oxides were produced instantly. The mixture was stirred for 2 hours at room temperature. Solution C was added to the mix and stirred again for 2 hours using a magnetic stirrer at room temperature to produce a white precipitate. The precipitate was transferred to 100 mL Teflon-lined stainless steel and placed in an autoclave at 180 °C for 24 hours. The precipitate was filtered, washed with distilled water, and dried at room temperature for 12 hours. Liquid ions trapped in TiO₂ were removed by calcination at 450 °C, 650 °C, 850 °C, and 1000 °C. The final product was a white powder. The molarity

fraction of the three components was 30% TiO₂/40% ZnO/30% SiO₂ and was further called TZS. Experimental variations were carried out by varying the pH of the solution from pH 3, 5, 7, 9, and 11 with the addition of HCl and NaOH. For the synthesis of TiO₂/ZnO/SiO₂ with ionic liquids-water mixture media, the synthesis procedure is the same as the synthesis using water media, except that the media used is a mixture of ionic liquid with water in a ratio of 3:7.

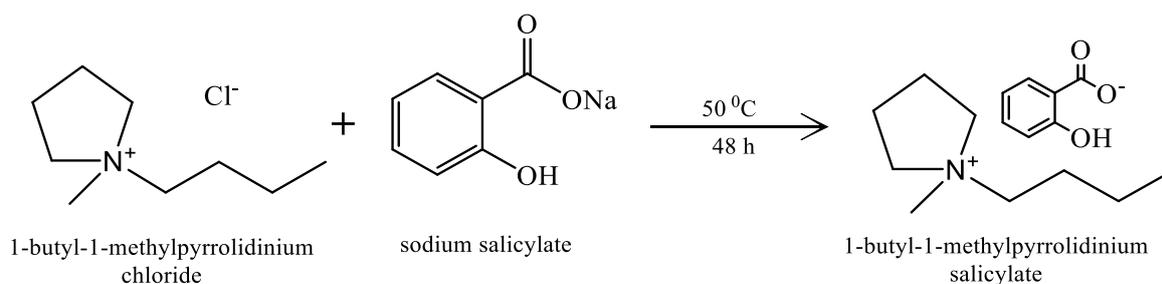

Characterization

The phase and crystallinity of the composite were studied by X-ray powder diffraction (XRD) (Bruker D-8 Advance) diffractometer with Cu α radiation (40 kV, 40 mA). The structure analysis of ionic liquids was identified using NMR (Nuclear Magnetic Resonance) Spinsolve Magritek. The morphology of the composites was investigated using a Scanning Electron Microscope with Energy Dispersive Spectroscopy (SEM-EDS) (JEOL Model JSM 6360). The thermal analysis was measured by TGA-DTA (Setaram Setsys). The bandgap energy was measured by UV-Vis Diffuse Reflectance Spectra (DRS) (Thermo Scientific Evolution 220) over the 200-800 nm range. BaSO₄ (Labsphere USRS-99-010) was used as a reference in the measurement. The measured spectra were converted from reflection to absorbance by the well-known Kubelka-Munk method.

Results and discussion

Synthesis of ionic liquids

The reaction for the synthesis of ionic liquids can be observed in Scheme 1 as follows:

Scheme 1. Synthesis reaction of ionic liquids 1-butyl-1-methylpyrrolidinium salicylate

The formation of the 1-butyl-1-methylpyrrolidinium salicylate ionic liquids is an anion exchange from Cl⁻ to salicylate (Wang et al., 2015). The solubility of these two precursors (1-butyl-1-methylpyrrolidinium chloride and sodium salicylate) in water is very high. Likewise, the resulting product (1-butyl-1-methylpyrrolidinium salicylate and NaCl) will make the separation more complex because the liquid ion product is miscible and prefers to be in the water phase. The reaction is carried out in a hot acetone medium to separate products and reactants. After heating, the precipitate of NaCl (white solid) is formed because the solubility of NaCl in acetone is very low (Wang et al., 2015). The ionic liquids still contain Cl⁻ due to residual NaCl, which is slightly soluble in the ionic liquid product. The purification of ionic liquids from Cl⁻ is carried out by passing through an anion

exchange resin previously saturated with sodium salicylate solution to remove the dissolved Cl^- (Zhou et al., 2018). This saturation is intended for Cl^- to be bound by the resin and release salicylate in its ionic liquids (Alcalde et al., 2012). The acetone phase in the liquid ion, free Cl^- evaporates using a rotary evaporator. At last, viscous, yellowish liquid was obtained with 84.11 % yield. Analysis using ^1H NMR for the ionic liquids is shown in Figure 1:

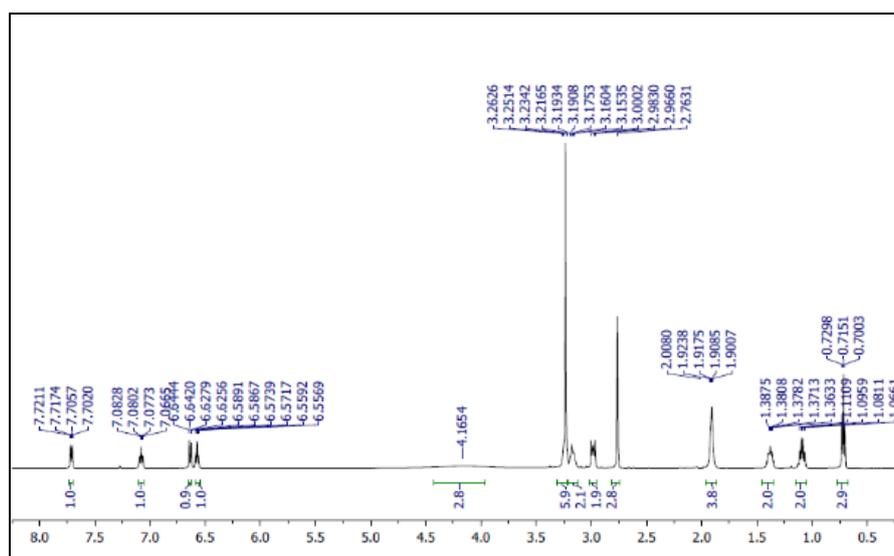

Figure 1. ^1H NMR spectrum of ionic liquids 1-butyl-1-methylpyrrolidinium salicylate

The chemical shift for 1-butyl-1-methylpyrrolidinium salicylate ionic liquids is: ^1H NMR (500 MHz, CDCl_3) δ (ppm): 7,71(dd, $J_1 = 7,70$ $J_2 = 5,85$ Hz, 1H), 7,08(td, $J_1 = 1,9$ $J_2 = 5,3$ Hz, 1H), 6,63(dd, $J_1 = 1,2$ $J_2 = 7,05$ Hz, 1H), 6,58(td, $J_1 = 1,20$ $J_2 = 6,4$ Hz, 1H), 3,19(m, $J = 5,6$ Hz, 6H), 2,76(s,3H), 1,92(qi, $J = 3,15$ Hz, 4H), 1,38 (sext, $J = 3,35$ Hz, 2H), 1,1(sext, $J = 4,85$ Hz, 2H), 0,72(t, $J = 7,35$ Hz, 3H).

Synthesis of $\text{TiO}_2/\text{ZnO}/\text{SiO}_2$ using hydrothermal method

The formation of TiO_2 using the hydrothermal method is carried out through a hydrolysis reaction between TBOT in aqueous media. Alkoxides hydrolyze to polymerize and form three-dimensional oxides in water (Mahshid et al., 2007). The reaction that occurs is as follows:

where R is ethyl, i-propyl, n-butyl, etc.

However, condensation occurs from the oxolation reaction as follows:

In acidic media, H^+ ions catalyze the hydrolysis of $\text{Ti}(\text{OR})$ and protonate the Ti-OH group. This protonation inhibits the nucleophilic attack of the Ti-OR group by Ti-OH so that the condensation reaction is inhibited.

However, when hydrolysis is carried out without using acid catalysts (HCl, H₂SO₄, HNO₃), the hydrolysis and condensation reactions will occur simultaneously, and precipitation will occur (Stallings & Lamb, 2003).

pH synthesis conditions were conducted from pH 1, 3, 4, 5, 7, 9, and 11 to determine the optimum pH. Each pH condition was observed, and the mineral phase was characterized using XRD. Temperature calcination was carried out at 450 °C, and the results of the mineral phase are shown in figure 2:

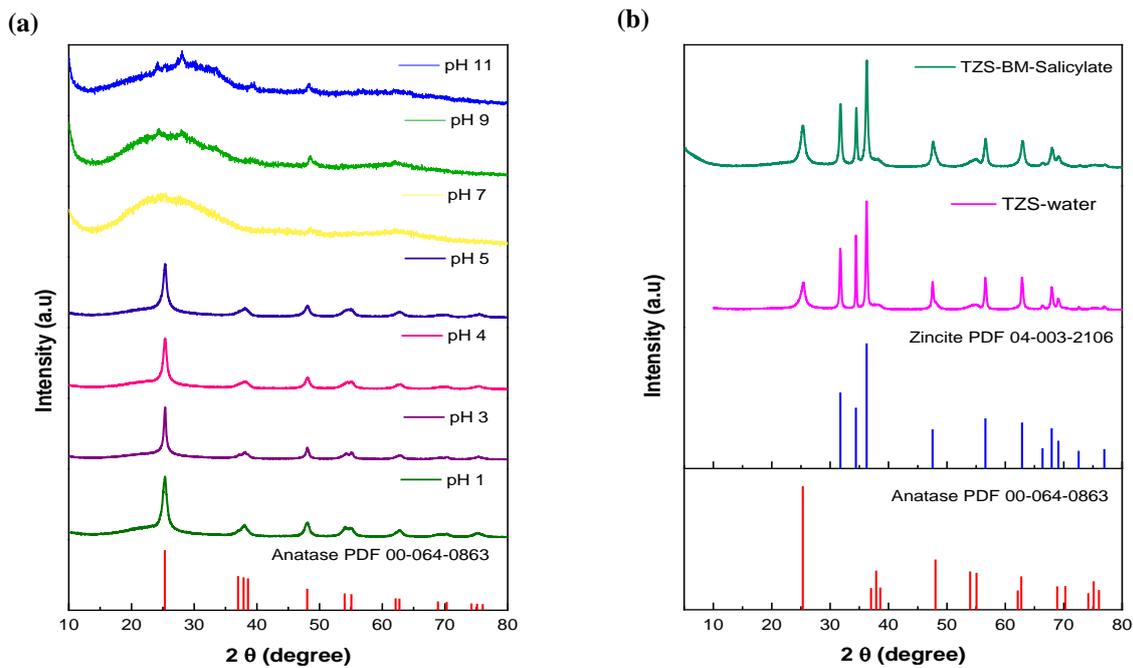

Figure 2 XRD pattern (a) variations pH in TiO₂ synthesis (b) TiO₂/ZnO/SiO₂ composite (TZS)

Figure 2 (a) shows the anatase mineral phase at pH 1, 3, 4, and 5, with the highest intensity produced at pH 3. According to sol and gel form and the most effective TiO₂ photocatalysis activity, the optimum pH in synthesizing TiO₂ is pH 3 (Robert & Weber, 1999). While at pH 7-11, the mineral phase is amorphous. XRD patterns of TiO₂/ZnO/SiO₂ composites (Fig. 3b) show characteristic peaks at 2θ values of 25.31, 36.99, 37.88, 38.58, 48.03, 53.98, 55.06, 62.13, 62.74, 68.88, 70.28, 75.12 and 76.03, which are strictly related to the anatase (TiO₂, PDF 00-064-0863). There are also characteristic diffraction peaks of zincite (ZnO, PDF 04-003-2106) at 2θ values of 31.77, 34.42, 36.25, 47.54, 56.59, 62.85, 66.37, 67.94, 69.08, 72.56 and 76.95. While SiO₂ amorphous shown at 2θ 10° - 30°. From the results of the XRD analysis, the estimated average crystallite size formed is determined by the Modified Scherrer formula as follows (Monshi et al., 2012):

$$\ln \beta = \ln \frac{K \lambda}{L \cos \theta} = \ln \frac{K \lambda}{L} + \ln \frac{1}{\cos \theta} \quad (I)$$

Where L is the average crystallite size, λ is the X-ray wavelength in nanometers (nm), β is FWHM, the peak width of the diffraction peak profile at half maximum height resulting from small crystallite size in radians (FWHM, full width at half max), K is a constant related to crystallite shape, normally taken as 0.9, and θ is Bragg angle in radians. The optical properties of TiO₂ formed are then determined by the band gap value, which

is based on the measurement of the maximum wavelength based on the % reflectance using UV-Vis DRS. Determination of the TiO₂ band gap is conducted indirectly using the Kubelka-Munk equation as follows:

$$F(R_{\infty}) = \frac{(1 - R_{\infty})^2}{2R_{\infty}}$$

Where $F(R_{\infty})$ is the Kubelka-Munk function, and R_{∞} is $R_{\text{sample}}/R_{\text{standard}}$

The value of $F(R_{\infty})$ is proportional to the absorbance of a material, so to get the absorbance of a sample is conducted by plotting $F(R_{\infty})$ with its wavelength. Meanwhile, the band gap was measured by making a Tauc plot $[F(R_{\infty})hv]$ against hv so that the equation can determine the band gap (E_g):

$$[F(R_{\infty})hv]^2 = C_2(hv - E_g) \tag{III}$$

Band gap measurement using UV-Vis DRS for TZS composite can be observed in Figure 3 as follow:

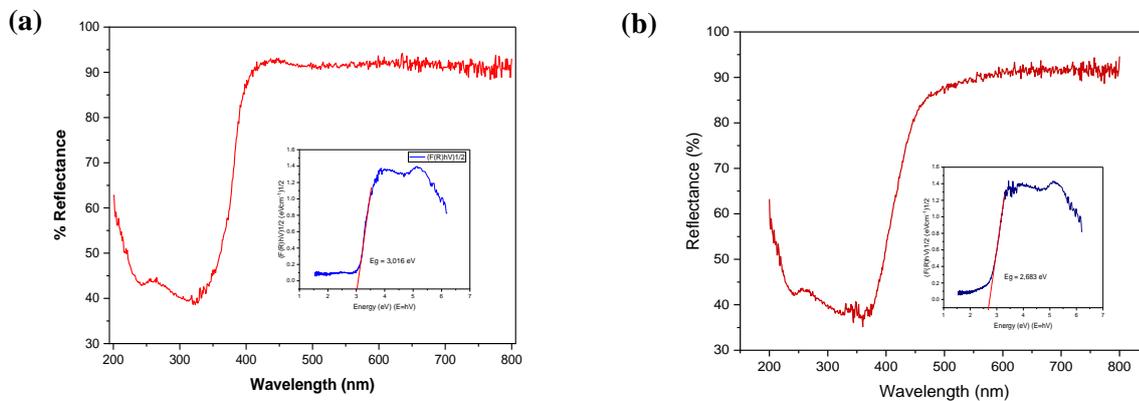

Figure 3. Band gap measurement (a) TZS composite synthesized with water media (b) with water and 1-butyl-1-methylpyrrolidinium salicylate ionic liquid

The average crystallite size and bandgap composite synthesized with water media and a mixture of water and ionic liquids media can be observed in Table 1 as follow:

Table 1. Average crystallite size and bandgap composite TiO₂/ZnO/SiO₂ (TZS)

No	Composite	The average crystallite size (nm)		Bandgap (eV)
		Anatase	Zincite	
1	TZS with water media synthesis	16.2377	34.6635	3.016
2	TZS with a mixture of water and ionic liquid media synthesis	12.9329	31.9978	2.683
3	TiO ₂	22.4980	-	3.227

Silica addition affected titania phase composition, crystallite size, and surface area and delayed anatase-rutile polymorphic transformation when fired in high temperatures. It can be observed in Table 1 that the average crystallite size of the anatase phase in the TZS composite decreases when compared with pristine TiO₂. Finer

silica ones partially surround larger titania particles. This way, the amorphous SiO₂ matrix behaves as a barrier, reducing the coarsening of anatase by preventing titania particles from coming into mutual contact and delaying the critical size beyond that anatase transforms to rutile (Tobaldi et al., 2010).

The metal oxides TiO₂ and ZnO synergize to modify their electronic states and generate charge carriers that help separate electron pairs. As a result, electrons move from the conduction band (CB) of ZnO to the conduction band (CB) of TiO₂, while holes move from the valence band (VB) of TiO₂ to the valence band (VB) of ZnO. The heterostructure simultaneously lengthens the lifespan of carriers and speeds up the semiconductor's decline in electron-hole pair recombination (Xu et al., 2020) (Mousa et al., 2021). From table 1, adding ZnO to TiO₂ can reduce the bandgap of TiO₂. Likewise, the addition of ionic liquids in the composite makes a synergy effect of reducing the bandgap of TiO₂ (Łuczak et al., 2016b).

Application of ionic liquids (ILs) in modification of titania is one of the effective methods to enhance photocatalysts titania under visible irradiation. The function of ionic liquids (ILs) is as structuring agents which possess surface activity in the synthesis of titania. Several reasons for photoactivity enhancement of titania prepared with ILs media were as follows: (i) doping of the titania lattice with non-metal elements derived from the ILs structure; (ii) favoring the formation of oxygen vacancies and the Ti³⁺ species (electron traps, ETs) by ILs; (iii) promoting titania hollow structure formation, thereby shortening the diffusion length of the charge carriers as well as increasing the number of reactive sites (Łuczak et al., 2021). For this reason, in table 1, the addition of ionic liquid 1-butyl-1-methylpyrrolidinium salicylate can decrease the bandgap of TiO₂.

Thermal analysis using TGA-DTA is carried out to determine the phase changes that occur during heating. TGA-DTA analysis was conducted by weighing 10-30 mg samples in a platinum cup heated from room temperature to 1000 °C with a burning rate of 10 °C/minute (Muniz et al., 2011). Figure 4. a shows a thermal analysis of TiO₂/ZnO/SiO₂ synthesized using water media. The graph shows a decline in the TGA graph characterized by an endothermic peak at 126 °C that indicates the evaporation of absorbed water and volatile organic compounds. An endothermic peak and a decrease in mass on the TGA graph occur when the temperature is at 246 °C. This decline indicates the carbonization or combustion of organic compounds and the loss of carbon, hydrogen, and oxygen (Que et al., 2000). An exothermic peak on the DTA graph occurs when the temperature is increased to 300 °C, indicating the precursor's dehydroxylation and the formation of the TiO₂ anatase phase and the burning of residual -OC₂H₅ groups (Hao et al., 2015). Another exothermic peak appears at 400°C, indicating the conversion of Zn(OH)₂ to ZnO. Another exothermic peak occurs at 865 °C on the DTA graph showing the reaction of ZnO with SiO₂ to form the mineral willemite (Zn₂SiO₄).

Figure 4. b shows a thermal analysis of TiO₂/ZnO/SiO₂ synthesized using water and ionic liquid media (7:3). From the analysis, it can be seen that there is a decrease in the TGA graph, which is characterized by the presence of an endothermic peak at 122 °C - 131 °C, which indicates the evaporation of absorbed water and volatile organic compounds. An endothermic peak and a decrease in mass on the TGA graph occur at 251 °C - 277 °C. This decline indicates the carbonization or combustion of organic compounds and the loss of carbon,

hydrogen, and oxygen (Que et al., 2000). When the temperature was increased to 312 °C, there was an exothermic peak on the DTA graph, indicating the dehydroxylation of the precursor and the formation of the anatase TiO₂ phase, and the burning of the residual -OC₂H₅ group (Muniz et al., 2011). Another exothermic peak appears at 400 °C, indicating the conversion of Zn(OH)₂ to ZnO. At 533°C-550°C an endothermic peak occurs, showing the degradation of the ionic liquid used. Another exothermic peak occurs at 865 °C on the DTA graph indicating the reaction of ZnO with SiO₂ to form the mineral willemite (Zn₂SiO₄).

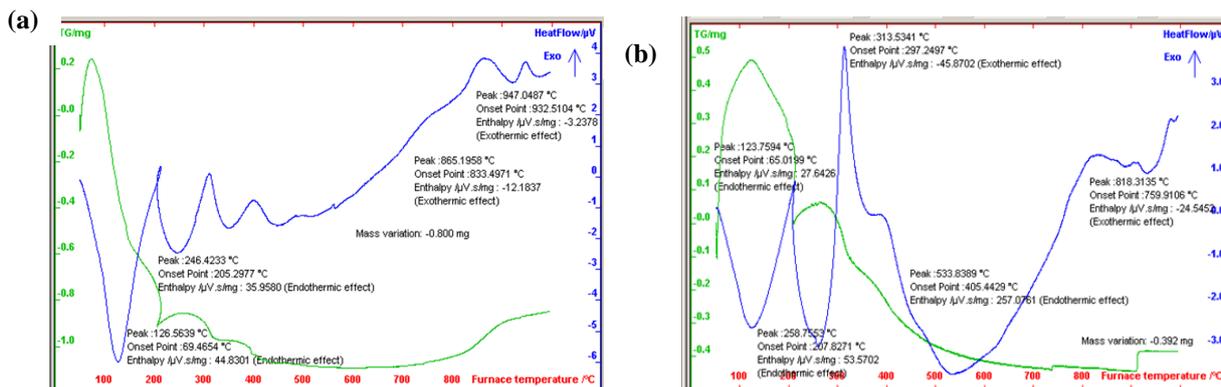

Figure 4. Thermal analysis of TiO₂/ZnO/SiO₂ synthesized with media a) water b) mixture of water and ionic liquid 1-butyl-1 methylpyrrolidinium salicylate

The resulting TiO₂/ZnO/SiO₂ composite was then varied in composition and calcination temperature to see the thermal stability and mineral phase changes during heating. The results of XRD analysis with variations in composition and calcination temperature can be observed in figure 5 as follow:

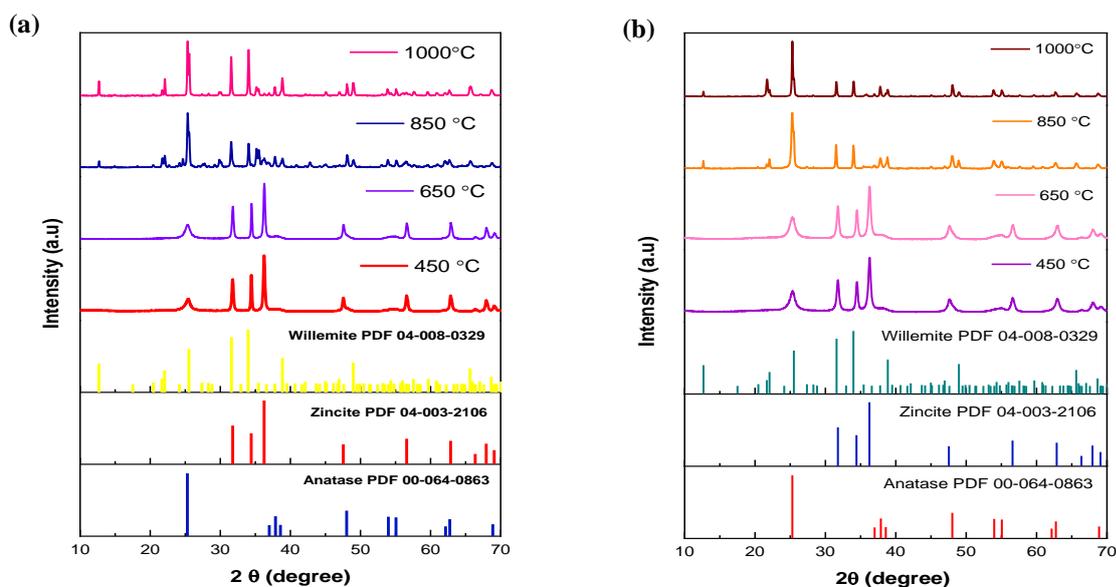

Figure 5. XRD pattern of TiO₂/ZnO/SiO₂ with composition and calcination temperature variations. The synthesis media are a) water, b) water mixture, and ionic liquid 1-butyl-1 methylpyrrolidinium salicylate.

Figure 5 shows the variation in calcination temperature from 450 °C - 1000 °C using water and a mixture of water and an ionic liquid as media synthesis. Both XRD patterns show the form of mineral phase anatase and do not turn into rutile even at high calcination temperatures. Neto et al. (2021) stated the effect of SiO₂ addition on the formation of stable anatase at high temperatures in TiO₂/SiO₂ composites. Silica is a support material due to its wealthy and well-known surface chemistry, low cost, good thermo-, mechanical-, and electrical stability, and large absorption capacity. Additionally, the surface silanol (Si-OH) groups of SiO₂ are active and offer sites for efficient functionalization and the formation of interfacial Ti-O-Si bonds in TiO₂-SiO₂ mixed oxide materials, which have been found to affect the optical and thermal properties of the silica-supported TiO₂ materials. SiO₂ is also optically transparent in the UV-visible region and essential for photocatalysis.

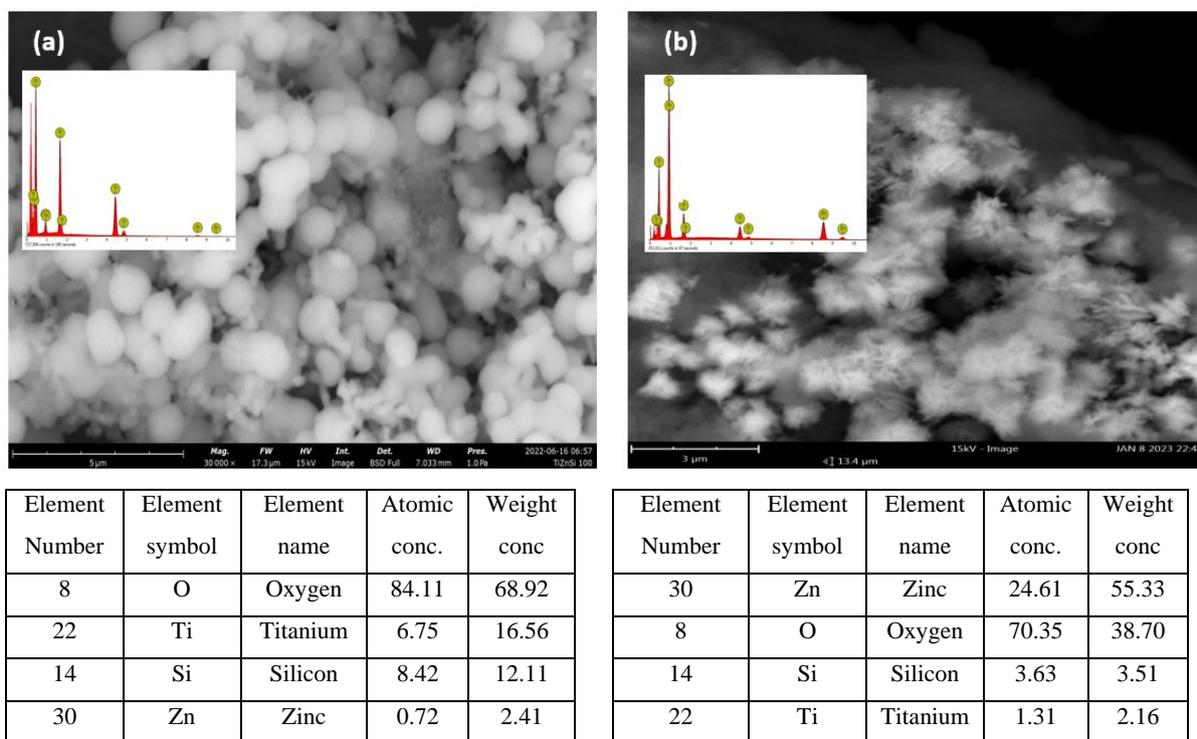

Figure 6. SEM-EDX image (a) TZS synthesized with water media (b) TZS synthesized with a mixture of water and ionic liquid 1-butyl-1-methylpyrrolidinium salicylate

SEM-EDX investigates the TiO₂/ZnO/SiO₂ composite's morphological features, as shown in Figure 6. Figure 6 shows TiO₂/ZnO/SiO₂ synthesized using water has a uniform sphere-like shape while ionic liquids-water mixture has a nanorod and nanoflower-like shape. The EDX results from Figure 6 (a) show that all three TiO₂, ZnO, and SiO₂ have sphere-like-shaped particles. While the TZS composite synthesized with ionic liquids in Figure 6 (b), both TiO₂ and SiO₂ have a sphere-like shape, and ZnO has a nanorod-like shape.

The addition of RTIL (room-temperature ionic liquid) is a great surfactant for forming nanostructured material. RTILs have been utilized for synthesized inorganic nanomaterials with specific morphologies and characteristics, such as solvents, reactants, or templates. The hydrothermal method is used for controllable size and morphology (Mali et al., 2014). Luczak et al. (2015) state that ionic liquids in the nanostructure preparation

process act as follows: (i) ionic liquid protective layer formation, (ii) viscous stabilization, (iii) stabilization by intermediates or by-products, (iv) stabilizing or destabilizing role of the ionic liquid impurities, (v) stabilization by ligands, (vi) source of fluoride anions generated in situ, (vii) micellar solutions, (viii) agent promoting reduction, (ix) ILs may be used as morphology templates.

Conclusion

Nanocomposite $\text{TiO}_2/\text{ZnO}/\text{SiO}_2$ has been synthesized using a hydrothermal method at 180°C for 24 hours at an optimum pH of 3. The synthesis medium used was a mixture of water: 1-butyl-1-methylpyrrolidinium salicylate ionic liquid with a volume ratio of 7:3. XRD analysis showed that the mineral phases formed were anatase, zincite, and amorphous silica. The anatase phase formed is stable until the 1000°C does not change to rutile. The composition (mole fraction) of the synthesized composite is $\text{TiO}_230/\text{ZnO}40/\text{SiO}_230$, which produces band gap energy reaching 2.683 eV so that photocatalytic activity can be effectively used in the visible light wavelength range. The results of morphological analysis using SEM-EDX show that the $\text{TiO}_2/\text{ZnO}/\text{SiO}_2$ composite synthesized using water has a sphere-like shape while using a mixture of water-ionic liquids has a nanorod and nanoflower-like shape. $\text{TiO}_2/\text{ZnO}/\text{SiO}_2$ composites have suitable properties for photocatalytic and self-cleaning applications in the ceramic industry.

Recommendations

For better performance when applied in photocatalysis activity and application in self-cleaning, the ionic liquids should be purified first to remove impurities or synthesis by-products. The composition of the water mixture with ionic liquids should also be optimized to produce a particular particle morphology. In addition, to ensure the bonds formed, such as Ti-O-Si, Ti-O-Zn composites should be further analyzed, for example, by using FTIR or XPS analysis.

Abstract: This study introduces a novel Y-shape mapping approach to visually represent greenhouse gas emissions (GHG) disclosure, aiming to improve the quality of disclosures and promote transparency for informed decision-making by stakeholders. By taking a conceptual approach, the study suggests that this new mapping method can offer several benefits. It can effectively identify inconsistencies or deficiencies in emissions disclosure categories and provide stakeholders with an initial understanding of a company's emissions based on a recognizable pattern. However, empirical testing in real-world scenarios is necessary to evaluate the approach's effectiveness and gather further evidence to support its potential advantages. Moreover, the proposed Y-shape mapping approach has the potential to facilitate stakeholder engagement by providing an intuitive language for discussing emissions disclosure and its sustainability implications. It may also inspire additional research and innovative strategies to enhance the quality of sustainability reporting and encourage responsible business practices. Ultimately, this study proposes that the Y-shape mapping approach can significantly contribute to the transparency and reliability of emissions data, ultimately promoting sustainability and responsible corporate behaviour.

Keywords: GHG emissions disclosure, Y-shape mapping, Strategy, Performance, Reporting

Introduction

Corporate environmental disclosure varies based on the type of firm, the country where it operates, and the sector it is a part of (Brammer & Pavelin, 2008; Hardiyansah & Agustini, 2020). However, it often consists of giving specific information about a company's environmental policies and procedures, performance in lowering

glasshouse gas (GHG) emissions and other pollutants, compliance with relevant environmental laws and regulations, and any risks or potential liabilities related to its activities. In addition, businesses may outline their efforts to cut down on energy use and waste, increase the effectiveness of their manufacturing procedures, protect natural resources, and lessen the effects of their operations on the environment. Corporate environmental disclosure may also provide details on the company's sustainability and responsibility reporting methods, such as using third-party certifications or sustainability reporting.

Companies may disclose environmental issues depending on their importance to their operations (GAO, 2020). A sustainability report that details a company's environmental obligations, guidelines, and objectives may be published. In addition, this report can be used to measure progress toward specific goals. Businesses may also disclose how they manage environmental risks and reduce emissions. They frequently share information about their efforts to conserve resources, such as water usage and electricity usage. Furthermore, businesses may disclose details on the policies and initiatives they have in place to cut back on waste and pollution.

Meanwhile, businesses must provide environmental data following laws, interests, and government actions (Delgado-Márquez, Pedauga, & Córdón-Pozo, 2017). For instance, in the United States, the federal government mandates that companies disclose data on air and water emissions and hazardous waste disposal (Abel, Stephan, & Kraft, 2007; Graham & Miller, 2001). The company's emissions data provides comprehensive information on all facilities' emissions and their variations over time. Corporations must also disclose any environmental infractions or penalties they have faced. Companies may occasionally be asked for more details regarding their energy usage or other practices that can harm the environment. States may also have additional reporting obligations for firms operating inside their territory in addition to federal restrictions.

Therefore, larger, more successful companies that operate in regulated sectors are more likely to be transparent about their environmental practices (Akhter, Hossain, Elrehail, Rehman, & Almansour, 2022; Chaklader & Gulati, 2015; Delgado-Márquez et al., 2017). The reason for this is that they must follow stricter industry requirements. The goal is to be open about how a company's operations affect the environment, such as carbon emissions. They might also be more likely to spend money on technological advancements and environmentally beneficial initiatives that could lessen environmental harm. Big businesses also have more resources to invest in sustainable initiatives. Transparency increases brand value and reaches, fostering trust and confidence among customers (Ferrell, Harrison, Ferrell, & Hair, 2019; Iglesias, Markovic, Bagherzadeh, & Singh, 2020; Kang & Hustvedt, 2014).

In the context of GHG emissions disclosure, guidance for measuring and reporting the emissions has already been developed by some organisations, such as the GHG Protocol, the Carbon Disclosure Project (CDP), the Global Reporting Initiative (GRI), the Global Framework for Climate Risk Disclosure, the Carbon Disclosure Standard Board, and the International Organization for Standardization (ISO) 14064-1. In addition, these organisations provide key principles, steps, and protocols, as well as sector-specific guidance such as boundary establishment, data collection, and reporting best practices. These guidelines assist corporations in accurately

measuring, tracking, and publicly reporting their emissions, aiding in their transition to net-zero emissions.

Although the guidelines raise the calibre of corporate emission disclosures, there is still a gap between what stakeholders want from corporations and what information is provided by companies (Busch, Johnson, & Pioch, 2022; Clementino & Perkins, 2021; Depoers, Jeanjean, & Jérôme, 2016). This discrepancy is seen in how companies disclose their strategy, performance, or sensitive data related to their carbon footprint. Past studies have shown that there are still many businesses, especially those in developing nations, that engage in symbolic-style carbon disclosure, which indicates that their commitment is driven by symbolic objectives to project an image of sustainability to stakeholders (Rahman, Rasid, & Basiruddin, 2020; Yin, Li, Ma, & Zhang, 2019).

In contrast to "hard disclosures," which are more specific and verifiable facts, they typically focus on qualitative and forward-looking information, or "soft disclosures," regarding their carbon footprint as well as their strategy, performance, and other aspects (Clarkson, Li, Richardson, & Vasvari, 2008; Plumlee, Brown, Hayes, & Marshall, 2015; Xie, Chen, & Chen, 2021; Xu & Liu, 2018). Clarkson et al. (2008) argued that only companies that provide more detailed and precise information, or "hard disclosure," on their environmental performance could close the gap with stakeholders. It is because this type of disclosure provides stakeholders with concrete evidence of a firm's commitment to environmental responsibility through emission levels, targeted reductions, and industry comparison data.

Hence, this study aims to create a Y-shaped map of GHG emissions disclosure to address the issue. This map is urgently needed to assist businesses in identifying areas related to their commitment to improvement. The map will divide disclosure into three areas: strategy, performance, and reporting, and provide levels of disclosure for each area. By using the map, the relationship between these aspects of the corporate GHG emissions disclosure evaluation could be quickly seen. This map will visualise any discrepancies or inconsistencies in their GHG emissions disclosure practices and identify potential opportunities for improvement and decisions for reducing emissions. As far as the authors' best knowledge goes, there are no conceptual or empirical studies that have developed a map of GHG emissions disclosure specifically for these areas. As a result, it might make an important addition to the body of literature.

Meanwhile, by assessing the level of disclosure, this map would help companies get critical feedback, allowing them to better serve their stakeholders. On the other hand, the map would be helpful for stakeholders to evaluate changes in corporate decision-making related to sustainability initiatives that create greater trust in the organisation and their dedication to positive change. In addition, the map could be used as a basis for further research into corporate carbon disclosures, especially from strategy, performance, or reporting perspectives. As a result of discussions regarding how a Y-shape mapping approach can be a useful tool for disclosing GHG emissions, authors expanded it to include three distinct categories of disclosure, such as strategy, performance, and reporting, to gain a fresh perspective on how these categories can be related to one another. This research also looks into how each category's levels are visualised by the method.

The Y-shaped Matrix and Its Graph

The notion of a Y-shaped mapping approach is inspired by the Y-shaped matrix, which can connect three sets of elements in a way that they make a loop with each other (Shahin, Bagheri Iraj, & Vaez Shahrestani, 2018). This matrix was used to highlight relationships between three separate groups, simplify complex data sets, and uncover strengths and linkages between various data sets. When it was decided to map the three distinct groups, the matrix then could be transformed into a graph to show the relationship between them. Ultimately, a Y-shaped matrix and its graph are excellent for comprehending the intricacies of interactions between groups as correlation visualisations (Nguyen & Akerkar, 2020). Furthermore, Figure 1 shows the Y-shaped matrix, and Figure 2 depicts the Y-shaped graph.

For illustrative purposes, the following three groups: A, B, and C will be analysed. Group A is divided into three subgroups: A1, A2, and A3. Group B is divided into B1, B2, and B3, while Group C is divided into C1, C2, and C3, respectively. In the Y-shaped matrix, the relationship among Groups A, B, and C can be discovered by following pairs of their subgroups. For instance, the correlation between Group A and Group B can be shown as “A1B1”, “A2B1”, “A3B1”, “A1B2”, “A2B2”, “A3B2”, “A1B3”, “A2B3”, and “A3B3”. What makes this matrix a powerful tool is that the Y-shaped matrix also makes up the correlation between Group A and Group C, as well as between Group B and Group C (see Figure 1).

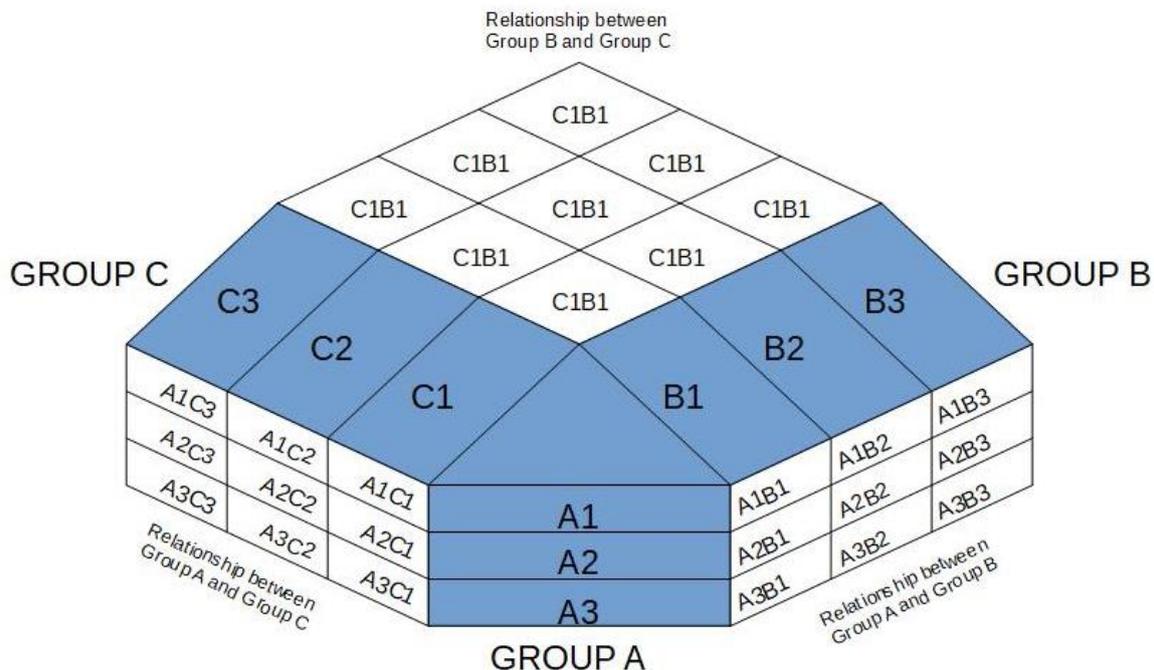

Figure 1. Y-shaped Matrix

The Y-shaped matrix is then converted into a Y-shaped graph to meet research purposes (see Figure 2). Three of the groups—Group A, Group B, and Group C—are transformed into three different types of axes that resemble

a capital Y in this form. The subgroups of Groups A, B, and C are further represented by three quadrants. The relationship between Groups A, B, and C will be shown by pairing the subgroups in these quadrants. These connections might be thought of as coordinates that come from combining different axes. For instance, the coordinates for Group A and Group B's two axes can be used to determine the relationship between the two groups, i.e., (“A1,B1”), (“A2,B1”), (“A3,B1”), (“A1,B2”), (“A2,B2”), (“A3,B2”), (“A1,B3”), (“A2,B3”), and (“A3,B3”). Meanwhile, the correlation between Group A and Group C can be shown as coordinates, i.e., (“A1,C1”), (“A2,C1”), (“A3,C1”), (“A1,C2”), (“A2,C2”), (“A3,C2”), (“A1,C3”), (“A2,C3”), and (“A3,C3”), while the link between Group B and Group C can be seen as coordinates, i.e., (“B1,C1”), (“B2,C1”), (“B3,C1”), (“B1,C2”), (“B2,C2”), (“B3,C2”), (“B1,C3”), (“B2,C3”), and (“B3,C3”).

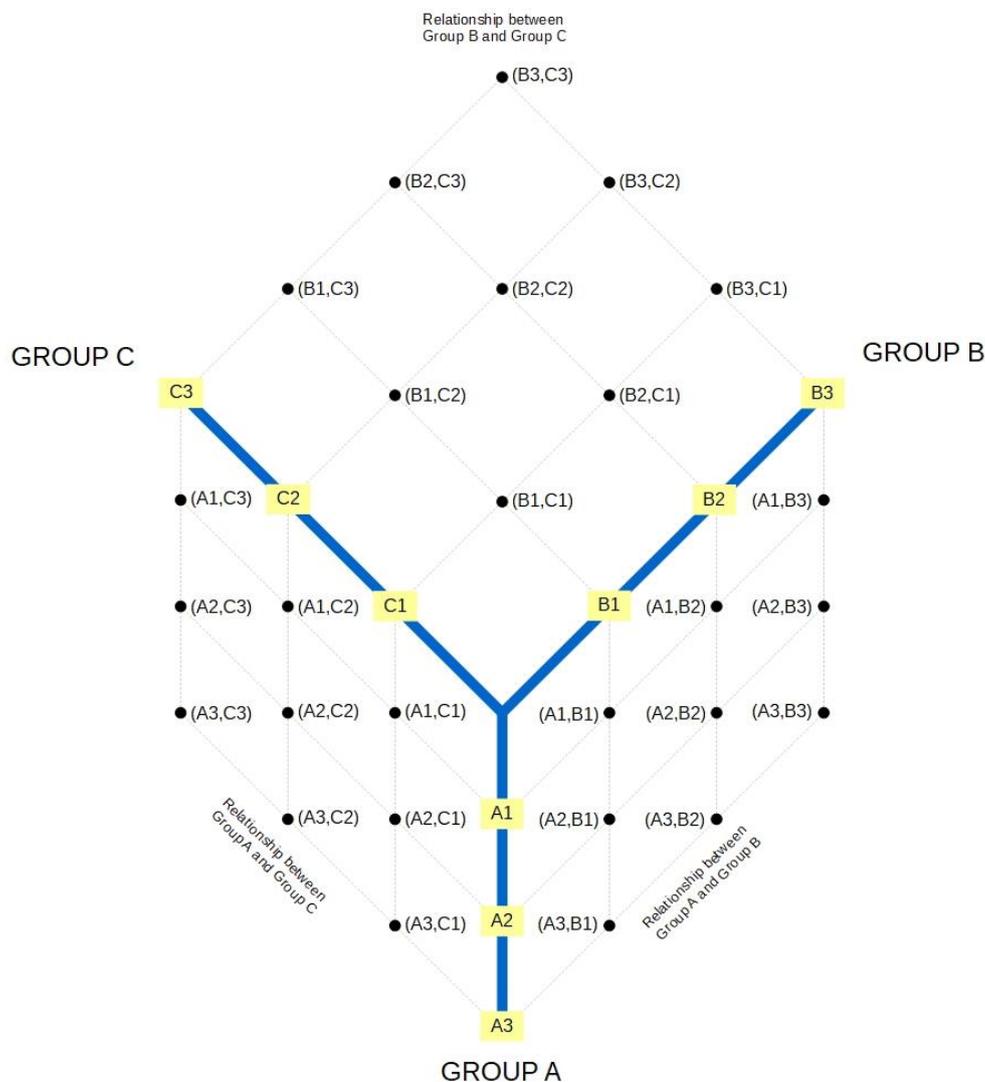

Figure 2. Y-shaped Graph

The Areas in Assessing the Quality of GHG Emissions Disclosure

In recent decades, there have been several studies concerned with measuring the quality of corporate GHG emissions disclosure. For instance, Freedman and Jaggi (2005) created a disclosure index by focusing on the content of what is disclosed rather than just counting the lines of disclosure. They identified five categories for building a protocol-related disclosure index: global warming, plans to deal with global warming, potential costs to achieve global-warming objectives, current costs to reduce greenhouse-gas emissions, and current emissions. They applied weights based on their assessments to assess the success of the company's anti-global warming initiatives. Meanwhile, a plethora of information on the topic of the study was compiled into a 19-item index by Prado-Lorenzo, Rodríguez-Domínguez, Gallego-Álvarez, and García-Sánchez (2009). They decided on an unweighted index and determined the index's components in accordance with Global Reporting Initiative (GRI) standards. Furthermore, Bo Bae, Lee, and Psaros (2013) developed a "checklist" to assess the volume of voluntarily disclosed information regarding climate change and carbon emissions in reports made available to the public.

Climate change-related aspects have been highlighted by the Carbon Disclosure Project (CDP), including risk and opportunity, accounting for glasshouse gas (GHG) emissions, accounting for energy usage, reducing GHGs, and holding people accountable for costs and carbon emissions. Using these elements, a checklist was constructed and then separated into five major areas. The weight of each item is equal. Additionally, Tauringana and Chithambo (2015) established an index of disclosure to measure GHG disclosure from corporations' annual or sustainability reports. They categorised the items into qualitative (34 items) and quantitative (26 items) disclosures. For each company in the sample, their total disclosure index score was calculated by dividing their total disclosure score by the highest possible score they could have received, and then expressing that quotient as a percentage. The newest study came from de Waard, Marra, Kranenburg, and van Oorschot (2020), who divided Tauringana and Chithambo's index into three categories: reporting, performance, and performance. This improvement enhanced the index. However, the maximum score is 59 points because they also erased one indicator. For research purposes, this study used the index of de Waard et al. (2020) as it is the most recent and comprehensive.

The Strategy of Emissions Disclosure

The strategy for disclosing and measuring carbon-related information, such as symbolic, substantial, engaged, or transparent disclosure, may change based on institutional or stakeholder pressure (Herold, Farr-Wharton, Lee, & Groschopf, 2019). The symbolic disclosure could be used as a strategy if both institutional and stakeholder pressures are relatively low (Hrasky, 2011; Nye & Owens, 2008). For instance, a study of 32 businesses that took part in the UK Emission Trading Scheme between 1999 and 2002 found that their participation in carbon disclosure was motivated by symbolic goals to advance rhetorical "green impression management" (Nye & Owens, 2008). While substantial disclosure might be used if institutional pressure is stronger (Busch &

Schwarzkopf, 2013), engaged disclosure might be established if stakeholder demand is stronger (Damert & Baumgartner, 2018). The ideal action to take for businesses would be transparent disclosure, nevertheless, if institutional and stakeholder demands are both significant. For example, Kolk (2008) listed Ford, Merck, Shell, and British Petroleum (BP) as corporations with a clear strategy for transparency in carbon-related information by hiring independent consultative agencies and establishing specific board committees. However, the effectiveness of these four approaches for businesses in emerging markets has not been proven since no empirical studies have tested them; therefore, alternate strategies may be more appropriate for their circumstances.

The Performance of Emissions Disclosure

Companies need to disclose performance metrics for their GHG emissions. Research has shown that disclosing this information is indicative of a company's actual carbon performance and can provide value for investors (Luo & Tang, 2014). Others have also found that investors can potentially gain abnormal returns by investing in companies that disclose information about their climate change performance and actions (Liesen, Figge, Hoepner, & Patten, 2017). Additionally, companies in industries related to greenhouse gas emissions typically disclose information about a variety of indicators related to this issue (Prado-Lorenzo et al., 2009). Meanwhile, corporations vary in their disclosure of GHG emission performance metrics. In the Conference Board research, for example, it was discovered that larger businesses disclose GHG emissions at a rate that is 2.5 times higher than that of smaller businesses (2022), with more than half of S&P 500 businesses mentioning climate risks in their annual reports, and less than one-third of S&P MidCap 400 companies do (US SEC, 2022).

Hoffmann and Busch (2008) established four indicators—intensity, dependency, exposure, and risk—to assess corporate carbon performance from both a physical and a financial flow standpoint. Carbon intensity is a measure of a company's usage of carbon in relation to its business activities and production, for a specific fiscal year and scope (p.509). It reflects the company's physical carbon performance. This indicator is crucial since it shows how much carbon the business uses during operations and its carbon footprint.

Carbon dependency compares the current carbon intensity with the anticipated carbon intensity and expresses the difference as a relative change to determine how a company's physical carbon performance changes over time (p.512). It helps to understand how much the company's carbon footprint is increasing or decreasing over time, whereas carbon exposure is a measure of the financial impact of a company's carbon usage on its business activities, for a specific fiscal year and scope (p.512). It reflects the company's monetary carbon performance and helps to understand the financial consequences of carbon usage. Additionally, carbon risk measures the financial impact of the changes in a company's carbon usage over a period (p.514). It is calculated by comparing the current carbon exposure with the predicted carbon exposure and expressing it as a relative change. This metric helps to understand how much the financial consequences of carbon usage are increasing or decreasing over time.

The Reporting of GHG Emissions

High-quality environmental reporting is crucial to fully understand the effects that business has on the environment and to make informed decisions about how to decrease those effects. The quality of environmental reporting is evaluated using several factors, including credibility and relevance (Dragomir, 2012). Relevance is the usefulness of information for comprehending and resolving environmental concerns, whereas credibility is the correctness and dependability of the data and procedures used to compile the report. Environmental reports frequently lack fundamental information that is necessary for guaranteeing trustworthiness, such as a thorough explanation of data gathering, calculation, and aggregate procedures. The research conducted by Liesen, Hoepner, Patten, and Figge (2015), for example, showed that stakeholder pressure influenced the decision of 431 EU companies to disclose partial information on GHG emissions between 2005 and 2009. Despite this, a significant portion of the disclosure was found to be incomplete. Incomplete disclosures may appear to be a demonstration of their responsiveness to stakeholder pressures. However, it is important to note that this level of disclosure may not provide meaningful accountability.

Besides the procedures, criteria, and methodologies that established the data, the report on GHG emissions should disclose the total tonnes of carbon dioxide equivalents (tCO₂e). Meanwhile, LoPucki (2022) conducted a comprehensive examination of the GHG emissions reports from 200 companies listed on the Standard and Poor's 500 and found several important insights. Her findings revealed that the GHG protocol was the most prevalent framework used in the reports and that most of the companies focused primarily on reporting Scope 1 and Scope 2 emissions. It is crucial to remember that reporting GHG emissions is a voluntary process, therefore businesses are not required to adhere to reporting requirements. Even though they had specifically reported on Scope 1 and 2 emissions, many of the companies in the study neglected to calculate the levels of specific gases that they left out of their reporting. This highlights a potential issue with the voluntary nature of GHG emissions reporting and the need for improved accountability and transparency in this area.

The Y-shape Mapping Approach in Disclosing GHG Emissions

As was already mentioned, this study referred to the work of de Waard et al. (2020) in employing a Y-shaped graph and in mapping GHG emissions disclosure. They divided the 59 indicators into three categories of disclosure and ten subcategories as well. Four subcategories made up the category of structured disclosure: strategy and risk analysis (7 indicators), business model (3 indicators), corporate governance (2 indicators), and policies and targets (2 indicators). Overall, 14 indicators were included in this category. The performance disclosure category was further broken down into four subcategories: concrete measures and actions (3 indicators), future outlook (4 indicators), results (15 indicators), and analysis of results (7 indicators). This category had a total of 29 indicators. Meanwhile, the reporting category was separated into two subcategories: the measuring methods (7 indicators) and the reporting criteria (9 indicators). This category consisted of 16 indicators in total. Details of these indicators, categories, and subcategories are displayed in Table 1.

Table 1. The Structure of GHG Emissions Disclosure Index

Category	Subcategory	Number of Indicators	Total
"Strategy"	"Strategy and Risk Analysis"	7	14
	"Business Model"	3	
	"Corporate Governance"	2	
	Policies and Targets	2	
"Performance"	Concrete Measures and "Actions"	3	29
	Future Outlook	4	
	"Results"	15	
	Analysis of Results	7	
	Reporting	Measuring Methods	
	Reporting Criteria	9	16
Total Indicators			59

Table 2. The Level of Disclosure

Category	Level	Value
Strategy	Inadequate	0.00 – 0.19
	Average	0.20 – 0.39
	Above average	0.40 – 0.59
	Exceptional	0.60 – 0.79
	Significant	0.80 – 1.00
Performance	Inadequate	0.00 – 0.19
	Average	0.20 – 0.39
	Above average	0.40 – 0.59
	Exceptional	0.60 – 0.79
	Significant	0.80 – 1.00
Reporting	Basic	0.00 – 0.32
	Moderate	0.33 – 0.65
	Detailed	0.66 – 1.00

Each of the indicators was given a score in order to evaluate the quality of disclosure. An indicator would receive a score of 1 if a disclosure for that indication was present, while a score of 0 would be assigned if that disclosure was not present. As a result, the indicator score could go as high as 59 or as low as 0, depending on

whether or not all disclosure indicators were present. However, this scoring system would be transformed into a proportion and calculated for each category to create levels of disclosure. With the aid of proportional computation, the inadequate level might fall between 0.00 and 0.19, the average level between 0.20 and 0.39, the above-average level between 0.40 and 0.59, the exceptional level between 0.60 and 0.79, and the significant level between 0.80 and 1.00. On the other hand, the reporting category was broken down into three levels of quality: basic, moderate, and detailed. The basic reporting level might fall between 0.00 and 0.32, the moderate level between 0.33 and 0.65, and the detailed level between 0.66 and 1.00. The details of these levels are shown in Table 2.

Moreover, Figure 3 shows how a Y-shape mapping approach can be used to translate all of the data in Table 2. The axes are all set to be the categories (i.e., strategy, performance, and reporting). Every level is set to match its range proportion value. In addition, the relationship between two categories will be represented graphically as a pair of coordinates are derived from two proportion values. It also depicts the levels at which quality disclosure takes place.

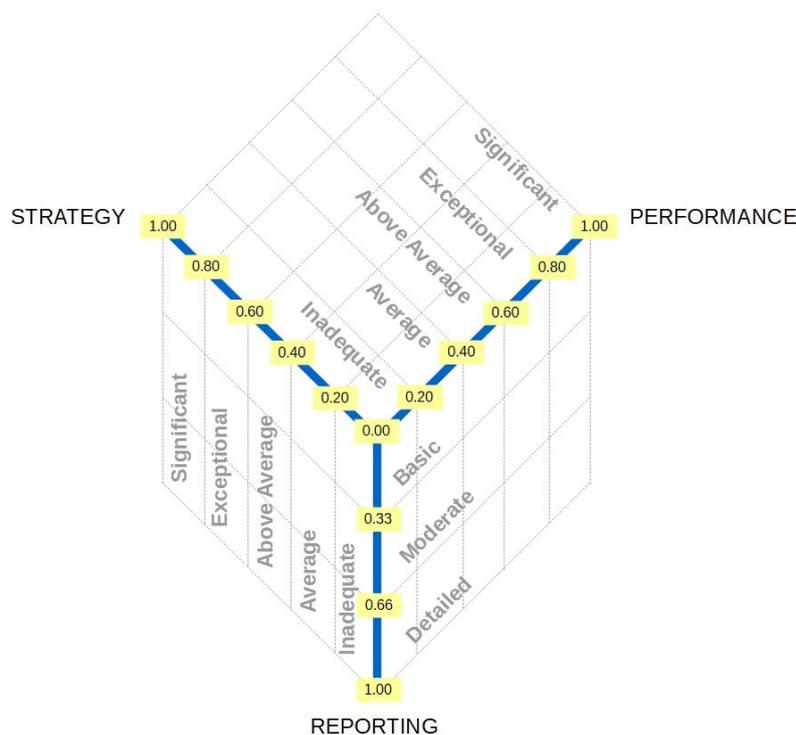

Figure 3. The Y-shape Mapping Approach

For simulation purposes, Table 3 presents the findings from evaluating a corporation's GHG emissions disclosure. "Strategy and risk analysis" (4), "business model" (1), "corporate governance" (2), and "policies and targets" (2) add up to the total score of strategy disclosure (9). Consequently, this total score is converted to a proportional value of 0.64 by dividing it by the maximum total score of the strategy category (14). Since the value of the strategy category is 0.64, the level of this disclosure is exceptional (0.60 – 0.79). Similar techniques were also used to determine the performance category, which also produced an exceptional level with a

proportional value of 0.75. The reporting category, on the other hand, had a moderate level (0.33 – 0.65) with a proportional value of 0.56. Based on all of this data, a Y-shape graph can be created to acknowledge a mapping for the GHG emissions disclosure of this company (see Figure 4). Three pairs of coordinates were also created to visualise the relationship between the strategy and the reporting (0.64, 0.56), between the performance and the reporting (0.75, 0.56), as well as the strategy and the performance (0.64, 0.75).

Table 3. The Simulation

Category	Subcategory	Score	Total	Value	Level
"Strategy"	"Strategy and Risk Analysis"	4	9	0.64	Exceptional
	"Business Model"	1			
	"Corporate Governance"	2			
	Policies and Targets	2			
"Performance"	Concrete Measures and "Actions"	2	22	0.75	Exceptional
	Future Outlook	3			
	"Results"	10			
	Analysis of Results	7			
Reporting	Measuring Methods	4	9	0.56	Moderate
	Reporting Criteria	5

Discussion

Focus on lowering carbon emissions and lessening the effects of climate change has increased in recent years. Numerous studies have demonstrated that businesses have a sizable impact on global carbon emissions (Dietz et al., 2018; Dietz, Gardiner, Jahn, & Noels, 2021; Ducoulombier, 2021). As a result, academics and decision-makers have been thinking about how to get businesses to disclose their emissions more accurately and to take action to lower their carbon footprints. Firms will be held responsible for their environmental impact when this information is made available, and stakeholders will be better equipped to choose the firms they should support. Meanwhile, emissions transparency has been evaluated traditionally using table formats, which detail emissions data in a structured and standardized way. (Bo Bae et al., 2013; de Waard et al., 2020; Freedman & Jaggi, 2005; Prado-Lorenzo et al., 2009; Taurangana & Chithambo, 2015). However, this approach has limitations and may not be the most effective way to communicate information to stakeholders. In this context, this study proposed an alternative approach called the Y-shape mapping approach. This approach uses graphical representations to present emissions data in a more intuitive and accessible way. This approach could be an alternative to shifting from the conventional method of examining emissions disclosure.

Furthermore, the quality of category disclosures can vary depending on their level. It is clearly demonstrated through the Y-shape mapping approach discussed in the preceding sections. By visually representing the category, it becomes easier to identify any inconsistencies or shortcomings. The Y-shape mapping approach can help to highlight any areas that may require improvement and allow for a more comprehensive understanding of the category being disclosed. As such, utilising graphical representation can greatly enhance the quality of disclosures at various levels to increase transparency and accountability, and promote more informed decision-making among stakeholders.

For instance, even though the company is at an exceptional level in the other two categories, the simulation findings in Figure 4 indicate that the company receives a moderate level for its reporting category. Therefore, the company needs to focus on enhancing its reporting category and ensuring that its emissions information is described comprehensively. Stakeholders will receive a concrete disclosure of their measuring methods and an explanation of the standard that they used in reporting. This summary will pop up easily when a Y-shaped graph shows its mapping. However, it can be a bit challenging to capture the summary briefly if the assessment results are shown in a table.

The Y-shape mapping method also sheds light on the potential interactions between the three categories at once. When stakeholders seek to understand the importance of these categories in terms of reducing companies' emissions, this feature might be essential. Figure 4 shows how three different coordinates connected might result in a distinct pattern. Stakeholders can receive a preliminary picture of the company's emissions disclosure based on this pattern, whether it practises hard disclosure or soft disclosure. If the pattern relates to high-quality levels of disclosure, it can be concluded that the company discloses detailed information about its carbon impact and

reduction strategies. On the other hand, if the pattern indicated low-quality levels of disclosure, it can be concluded that companies may provide only the bare minimum of information required to comply with regulations. Hence, this unique pattern would be a beneficial insight for investment decisions, regulatory compliance, and other business practices, ultimately promoting more sustainable and responsible corporate behaviour.

Conclusion

The key point of a Y-shape mapping approach is that it is a graphically effective way of disclosing GHG emissions. This study provides conceptual explanations for why this approach can be an effective method. In this case, the Y-shape mapping approach makes it possible to simplify complex evaluation results if linking three different categories of disclosure is needed, whereas it is commonly found challenging to capture them in table format. It is because the approach provides a clear visual representation of the relationships between them. Thus, this method can be useful for stakeholders who need to quickly understand a company's emissions disclosure. By presenting the information in a clear and concise manner, stakeholders can receive key information briefly, helping them to develop an initial picture of the company's emissions disclosure.

Overall, this study contributes to suggestions for a new strategy to improve the quality of emissions disclosures by using a more user-friendly and accessible visual representation of emissions data. It also shows how this strategy may benefit stakeholders and encourage more ethical and sustainable corporate behaviour.

Recommendations

The following are some potential recommendations for future research:

1. More research is needed to determine the effectiveness of different methods of emissions disclosure, including the Y-shape mapping approach. Studies should compare different approaches to emissions disclosure and assess stakeholders' comprehension and decision-making based on the different methods.
2. The Y-shape mapping approach has the potential to enhance the quality of emissions disclosures, providing a more comprehensive and intuitive understanding of emissions data. More research is needed to determine how this impacts stakeholders' decision-making, such as investment decisions or regulatory compliance.
3. The Y-shape mapping approach uses graphical representations to present disclosure levels of information in an intuitive and accessible way. Future research should investigate how stakeholders use visual representations to make decisions and how different visual representations may impact their decision-making.
4. The Y-shape mapping approach has advantages over traditional table formats but may have

limitations that need to be further explored. For example, it may not be suitable for all types of emissions data or stakeholders. Future research should investigate the potential limitations of this approach and identify strategies to overcome them.

5. Investigate the impact of emissions disclosure on corporate behaviour to reduce carbon footprints and promote more sustainable and responsible corporate behaviour. More research is needed to determine how emissions disclosure impacts corporate behaviour and what factors contribute to successful emissions reduction strategies.

Obstetric and Gynecologic (Queen Geraldine),  <https://orcid.org/0000-0001-6982-5489>

Abstract: During STR typing, it sometimes happens that increasing or decreasing signal length can bring variant alleles into the size range of a locus close to it. Examples of these alleles are often reported in the literature and are also stored in STRbase. When the allele overlaps with an allele adjacent to it, the situation becomes more problematic. The kits available are designed to avoid such problems called "out of phase" in relation to the repeat units. The aim of this study is to identify and report these rare, off-ladder alleles, triallelic and other genotyping irregularities related to the rare population genetic variation observed in STR of Albanian population. DNA was extracted from saliva swabs relating to reference samples from a sample of 2000 individuals from Albanian population, and typed using Applied Biosystem AmpFLSTR™ NGM Select™ kit. There were 6 distinct off-ladder alleles observed in 4 of the 16 STR loci (D2S1338, FGA, SE33 and D2S441), of which 1 have not been previously reported. Furthermore, 17 instances of triallelic patterns were observed in 6 of the 16 loci. The recognition and identification of these rare alleles, helps to solve specific situations and has a special importance in cases of paternity tests.

Keywords: STR loci, Off-ladder alleles, Forensic, Albania

Introduction

Albania is a small country in Southeastern Europe and Western Balkans, strategically positioned on the Adriatic and Ionian Sea. In the northwest, it is bordered by Montenegro, in the northeast by Kosovo, in the east by North Macedonia, and in the southeast by Greece. The current population in Albania is 2,868,593 based on Worldmeter elaboration of the latest United Nation data (June 2023). In Europe and other countries in the world, there are many Albanians, but this study did not include them. The purpose of this study was to provide a

comprehensive list of off-ladder alleles and other genotyping irregularities observed in short tandem repeats (STR) for the Albanian population. In forensic genetics and human identity testing, PCR followed by capillary electrophoresis (CE) remains the gold standard. As part of commercial kits for forensic short tandem repeat (STR) multiplexes, allelic ladders are included to assist the user in determining alleles by reproducing any common allelic variants observed in the population (Griffiths RA, Barber MD, Johnson PE, Gillbard SM, Haywood MD, Smith CD, *et. al.*, 1998). Allelic ladders are based on variation observed in the development process. In large population samples, however, variants not detected in developmental screening are encountered. This is particularly true when the populations under testing differ from those studied during kit development.

Forensic practitioners need to be aware of the possibility of rare variants, so they can be recognized and dealt with properly in casework interpretation. A variant allele can sometimes greatly enhance the discrimination power of DNA comparisons if it is designated correctly (Allor C, Einum DD, Scarpetta M *et. al.*, 2005). The possible reasons for new length variants not represented on the allelic ladder are insertion or deletion of full repeat units, of partial repeats or of single bases. The most common cause of length variants that differ significantly from those in the allelic ladder are insertion or deletion of full repeat units and when this happens it can create an allele with a noticeably different length. Partial repeats can insert or delete within the tandem repeat region, leading to alleles that are slightly longer or shorter than the nearest ladder allele. Insertion or deletion of partial repeats and/or single are known also as a microvariant (Allor C, Einum DD, Scarpetta M *et. al.*, 2005; Mizuno N, Sekiguchi K, Sato H, Kasai K *et. al.*, 2003; Heinrich M, Felske-Zech H, Brinkmann B, Hohoff C *et. al.*, 2005; Grubwieser P, Mühlmann R, Niederstätter H, Pavlic M, Parson W *et. al.*, 2005). In some cases, alleles that differ significantly in length from those on the original allelic ladder can end up overlapping or falling within the allelic ladder of an adjacent locus (Heinrich M, Felske-Zech H, Brinkmann B, Hohoff C *et. al.*, 2005; Grubwieser P, Mühlmann R, Niederstätter H, Pavlic M, Parson W *et. al.*, 2005). This could lead to confusion and misidentification of the alleles. So it's important to consider this potential source of confusion, especially when interpreting new or atypical length variants. So it's important to consider this potential source of confusion, especially when interpreting new or atypical length variants.

Triallelic patterns (Lukka M, Tasa G, Ellonen P, Moilanen K, Vasiljev V, Ulmanen I *et. al.*, 2006; Clayton TM, Guest JL, Urquhart AJ, Gill PD *et. al.*, 2004; Rolf B, Wiegand P, Brinkmann B *et. al.*, 2002) can arise due to several different mechanisms such as post-zygotic length mutations, localized duplication and chromosomal trisomy. Post-zygotic length mutations occurs when a length mutation arises and segregates during an individual's development. This can produce two distinct populations of cells with different alleles at a given locus. When DNA is sampled from multiple cell types, a triallelic pattern can result. Localized duplication refers to a duplication of a chromosomal region containing the locus of interest can produce three possible alleles: the original allele and two copies of the duplicated allele. Chromosomal trisomy refers to individuals with certain types of chromosomal trisomies, such as trisomy 21, can show triallelic patterns at loci located on the trisomic chromosome. This is because there are three copies of the chromosomal region, and thus three possible alleles. Determining the most likely cause in a given case would require further analysis and genetic testing.

The data used for this study are obtained in Institute of Scientific Police in Albania which is the only organization performing DNA analysis for investigation purposes. The DNA analyses started in 2009 and the DNA typing for database purposes is an ongoing process based on the actual legislation. We present here a list of off-ladder alleles and instances of triallelic patterns that have been observed in a subset of the 2000 albanian individuals profiles obtained saliva sample reference.

Method

Saliva swabs from 2000 unrelated individuals from all over Albania are used for obtaining the STR data. These STR data are evaluated for the presence of variant alleles for this study. All the samples used for the study are anonymized, no personal data are recorded, only the name of the city and a barcode. When variant alleles were tabulated, they were checked to determine if they appear in the same city. To estimate allele frequencies (relating to the chance that a randomly selected allele from the population will match the variant), the number of unique (unrelated) occurrences was divided by 4000 “unrelated” alleles.

DNA Extraction from Saliva Swabs

DNA from reference samples was isolated from saliva swabs using QIAamp DNA Investigator Kit for extraction. The kit combines the selective binding properties of a silica-based membrane with flexible elution volumes between 20 and 100 μ l, in our case the final volume of extracted DNA is 50 μ l, DNA is eluted in buffer ATE. Manual and robotic extraction with QiaCUBE were performed, dividing the total samples in half 1000 manual and 1000 robotic extraction. Both methods were performed according to the manual of the QIAamp DNA Investigator Kit for saliva samples.

STR Typing

The commercial STR kit used for this study is Applied Biosystem AmpFLSTR™ NGM Select™ kit (Thermo Fisher) a five dyes kit which simultaneously amplifies 16 separate STRs: D3S1358, vWA, D16S539, D2S1338, D8S1179, D21S11, D18S51, D19S433, THO1, FGA, D10S1248, D22S1045, D2S441, D1S1656, D12S391 and SE33 and the sex determining marker Amelogenin. All the off-ladder alleles and triallelic patterns cases are re-extracted and re-amplified with the same pcr kit or alternative pcr kit. PCR reactions using mix and primers according to following changes-reaction volumes were halved and the final volume of PCR product is 12.5 μ l.

Reference samples were amplified with Applied Biosystem AmpFLSTR™ NGM Select™ kit (Thermo Fisher) in Veriti™96-Well Thermal Cycler according to manufacturer’s guidelines. After the validation of the kit we perform 29 cycles for buccal swabs, but the number of cycles can differ from a laboratory to another depending on sensitivity experiment results for internal validation purposes.

Electrophoresis and Analysis

Fragment separation was performed using ABI PRISM® 3500 Genetic Analyzer (Applied Biosystems) using POP-4 polymer and the collection software Data Collection, version 2.0. Data was sized using GeneMapper™ID-X Software version 1.5 (Applied Biosystems). All off-ladder alleles and triallelic patterns were confirmed by re-extraction and amplification with the same kits or alternative pcr kits. Results obtained after re-extraction and re-amplification re-confirmed the off-ladder alleles and the composition of triallelic patterns.

Results

There were observed 6 distinct off-ladder alleles in 4 of the 16 STR loci (D2S1338, FGA, SE33 and D2S441) amplified from the AmpFLSTR™ NGM SElect™ kit. Of these 6 alleles, 1 have not been previously reported. Furthermore, 17 instances of triallelic patterns were observed in 6 of the 16 loci.

Off-ladder Alleles

A total of 6 off-ladder alleles were observed in a subset of saliva swabs- reference samples from 2000 unrelated individuals. The off-ladder alleles and the loci are presented in Table 1.

Table 1. Off-ladder Alleles Identification and Designation

Locus	Anomaly type	Locus designation
FGA	Off-ladder, rare	15,24
FGA	Off-ladder, rare	15,20
FGA	Off-ladder, rare	15,22
FGA	Off-ladder, rare	15,22
SE33	Off-ladder, rare	27.2,43
SE33	Off-ladder, rare	23.2,42
D2S4	Off-ladder, rare	6,12
D2S4	Off-ladder, rare	8,14
D3S1338	Off-ladder, rare	13,18

The estimated frequency for the off-ladder alleles in shown in Table 2.

Table 2. Number of Observation and Frequency

Locus	Allele	No of observation	Frequency
FGA	15	4	0.001

D2S4	6	1	0.00025
D2S4	8	1	0.00025
D2S1	13	1	0.00025
SE33	42	1	0.00025
SE33	43	1	0.00025

In the SE33 loci were identified two off-ladder alleles 42 and 43, in D2S1 also two rare alleles 6 and 8, in D2S4 one allele 6, in FGA loci is identified four times the rare allele 15. An example of rare allele 13 in D2S1 locus is shown (see Figure 1), where the peak fall between D16 and D2S1.

Figure 2. Photo from STRbase.nist

The off-ladder alleles were searched in the STRbase for confirming that they were present in other populations studied. It resulted that allele 43 is not yet reported in this STRbase, but it can be found in other populations which has not yet reported it. The allele presented in fig.1 allele 13 of D2S1338, was reported in STRbase previously and our reportation was for the 13-th time (see Figure 2).

Triallelic patterns

A total of 17 three allele patterns were observed in our study, involving the following six loci: SE33, vWA, D21, D2S4, D18 and FGA (see Table 3). The loci with the highest rate of triallelic bands include SE33 (7 cases), vWA (3 cases), and D21 (3 cases). There is a combination of three alleles in SE33 and in vWA which are repeated two times. We controlled if the samples were collected in the same area, but they were from different areas.

After the first observation of a third allele in a loci, as a working procedure there is a second re-pcr and then a re-extraction. For the purposes of this study regarding the concentration of extracted DNA (Gavazaj FQ, Mikerezi II, Morina VH, Cakaj FA, Maloku EB, Gavazaj BB, Kastrati DS, Muriqi-Maloku BA *et al.*, 2012), different dilutions of extracted DNA were used for PCR reactions. Analyzing multiple dilutions of extracted DNA is an important quality control step to confirm true allelic patterns, especially triallelic patterns. Different dilutions of the extracted DNA are useful because they can reveal if suspicious allele peaks are present due to factors like excess PCR products or contaminants. These suspicious peaks may disappear at higher dilutions. By performing different dilutions we can confirm true heterozygote or triallelic patterns, which will remain consistent across dilutions. Different dilutions can identify allele drop-out, where one allele fails to amplify properly. This will appear inconsistently across dilutions. All the triallelic patterns shown in table 3, were present in dilutions until 1:100. One case of triple in FGA locus in dilution 1:100 is shown in figure 3.

Table 3. Triallelic Patterns Identification and Designation

Locus	Anomaly type	Locus designations
SE33	Third allele	14,16,27.2
SE33	Third allele	14,16,27.2
SE33	Third allele	17,31.2,32.2
SE33	Third allele	21.2,22.2,25.2
SE33	Third allele	18,32.2,33.2
SE33	Third allele	15,29.2,30.2
SE33	Third allele	18,19,31.2
vWA	Third allele	16,17,18
vWA	Third allele	16,17,18
vWA	Third allele	16,19,20
D21	Third allele	28,32.2,33.2

D21	Third allele	30,31,33.2
D21	Third allele	29,30,31
D18	Third allele	16,17,18
D18	Third allele	14,16,17
FGA	Third allele	23,24,25
D2S4	Third allele	11,12,14

SE33 has long been a locus of interest to the human identity community. The highly polymorphic and heterozygotic nature of SE33 provides a more discriminating genotype, but these advantages are tempered by technical genotyping/separation issues, a complex sequence motif and a high mutation rate (Borsuk LA, Gettings KB, Steffen CR, Kiesler KM, Vallone PM *et al.*, 2018). SE33 is also known to have an elevated frequency of triallelic variants and there is currently no clear evidence that these variants have any important functional consequences. More targeted studies would be needed to determine if the triallelic variants in this region could impact nearby gene regulation or have other functional effects.

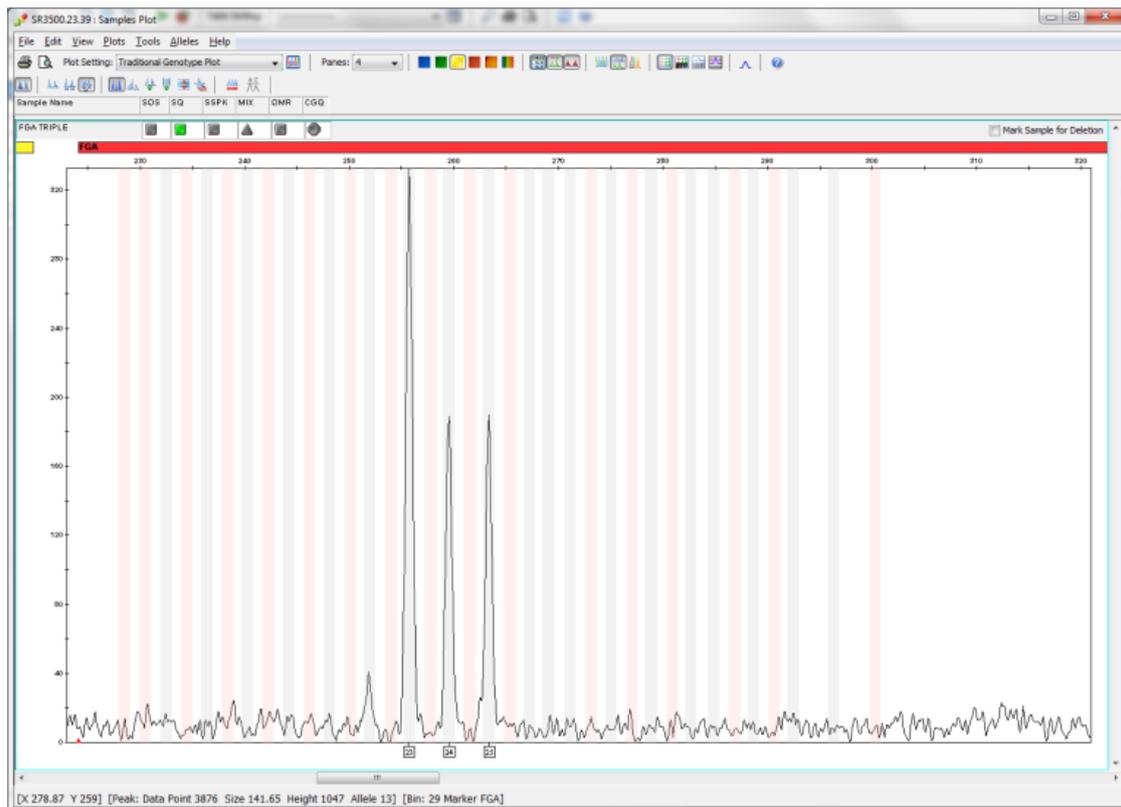

Figure 3. Triple FGA in Dilution 1:100

Discussion

In this study a total of 6 distinct off-ladder alleles and 17 triallelic patterns were observed in profiles amplified using the AmpFLSTR™ NGM Select™ kit. These 6 off-ladder alleles observed in Albanian population, are

found in 4 of the 16 STR loci respectively in D2S1338, FGA, SE33 and D2S441. Of these 6 alleles, 1 has not been previously reported in STRbase allele 43 in the SE33 loci. In the SE33 loci were identified two off-ladder alleles 42 and 43, in D2S4 two off-ladder alleles 6 and 8, in D2S1338 one off-ladder allele 13, in FGA loci is identified four times the off-ladder allele 15. Except allele 15 in FGA, all the other alleles has a nominal frequency of 0.00025 (Table 2). The most observed off-ladder alleles is 15 in FGA - 4 times, with a value of frequency 0.001. FGA known also with the historic name FIBRA is located in chromosome 4, with the cytogenetic location 4q31.3, with the mutation rate of 0.28% (<http://www.cstl.nist.gov/biotech/strbase/>).

Allele 13 of D2S1338 was reported 12 times in STRbase amplified with different amplification kits, with NGMSElect is reported for the first time.

A variant allele can sometimes take up the size range of an adjacent locus if its length increases or decreases; several examples have been reported in the literature (Heinrich M, Felske-Zech H, Brinkmann B, Hohoff C *et al.*, 2005; Grubwieser P, Mühlmann R, Niederstätter H, Pavlic M, Parson W *et al.*, 2005) or in STRbase. This is most problematic when the allele falls within an allelic bin from the adjacent locus. Multiplex kits are generally designed to avoid this problem by ensuring that adjacent loci are out of phase with respect to full repeat units, so that off-ladder alleles from one locus are not mapped to the adjacent locus' allele bins. This helps to ensure accurate results, as allele bins from one locus will not overlap with allele bins from the adjacent locus. This helps to prevent misidentification of alleles, and allows for more accurate genetic analysis and profiling.

Rare alleles can play an important role in forensic identification and differentiating between individuals. Some of the reasons why their role is important are higher power of discrimination, increased sensitivity, account for genetic variation. Higher power of discrimination is related with the presence of rare alleles at certain loci that have a higher power of discrimination, meaning they are better able to differentiate between unrelated individuals. This is because by definition, rare alleles occur less frequently in the general population. So seeing the same rare allele in two individuals provides stronger evidence they may be related. Increased sensitivity is related with the fact that inclusion of rare alleles can increase the sensitivity of forensic matching by allowing for the detection of more unique DNA profiles. This improves the ability to distinguish between similar profiles from unrelated people.

Rare alleles represent the full spectrum of genetic variation present in a population. Including them in forensic databases and analyses helps account for the full spectrum of alleles that may occur. Also rare alleles may be the only matching feature between two otherwise unlikely individuals, such as distant relatives. Their rarity makes a match more convincing evidence of a biological relationship. And sometimes matching rare alleles can inform the need for additional confirmation testing, such as forensic genealogy or Y-STR profiling for distant relatives. Rare alleles can also play an important role in paternity testing, sometimes the presence of matching rare alleles between a child and alleged father can provide insight into inheritance patterns and recombination events, strengthening inferences about paternity. In terms of rare alleles the off-ladder alleles are specifically rare and that fact impacts on the work of forensic fields and it is important to know their presence in a certain population.

Triallelic patterns are classed in two types. Type I occurs when an allele is somatically mutated during an individual's development, resulting in cells containing some of the original allele and some of the mutant allele. These patterns are characterized by uneven peak heights for the two variants of the affected allele that sum to the height of an unmutated allele (see Figure 3). All triallelic patterns observed in this study were type I as for most of the cases the height of one of the peaks was approximately the sum of two other peaks. In two cases we had the situation where the ratio of the peaks were different although re-processing and for these two cases other testings as amplifying with different kit, might be done to conclude about the height ratios.

Multiple alleles often appear with equal heights in Type II as a result of a localized duplication event, or chromosomal aneuploidy (Clayton TM, Guest JL, Urquhart AJ, Gill PD *et. al.*, 2004; Findlay I, Tóth T, Matthews P, Marton T, Quirke P, Papp Z *et. al.*, 1998). The Y-chromosome has a higher rate of localized duplication than the autosomes (Butler JM, Decker AE, Kline MC, Vallone PM *et. al.*, 2005). For confirming the inheritance of duplicated alleles responsible for Type II triallelic patterns, the parents should also be typed. Autosomal trisomy is another reason for type II patterns. Some of the cases involving autosomal trisomy can be detrimental to the health of the developing fetus. But there are cases of aneuploidy involving chromosome 13, 18, and the most common, 21, result in live births (12). STR analysis can be helpful in diagnosing some trisomies (Findlay I, Tóth T, Matthews P, Marton T, Quirke P, Papp Z *et. al.*, 1998; Hassold TJ, Jacobs PA *et. al.*, 1984; Yan J, Wu J, Li Y, Wang H, Huang Z, Zhou X, *et. al.*, 2006).

Having an extra copy of a chromosome means there will be an increased number of repeats for STRs on that chromosome. This can be detected through STR analysis. By comparing the STR profile of a potentially trisomic individual to a normal control, the extra repeats associated with the trisomy will be evident. STR analysis provides a rapid and relatively inexpensive screening method to indicate the possible presence of a trisomy. In some cases, if the location of the extra STR repeats can be linked to a specific chromosome, it can help pinpoint which chromosome is involved in the trisomy. While STR analysis alone cannot definitively diagnose a trisomy, it can provide useful information and clues that a trisomy may be present. The STR results typically need to be confirmed through other tests like chromosomal microarray analysis or karyotyping to determine the specific trisomy (Petersen MB, Mikkelsen M *et. al.*, 2000). But STRs can be a useful first-line screening tool as part of a comprehensive diagnostic evaluation.

Conclusion

In this study we present an overview of distinct off-ladder alleles in our population. The recognition and identification of these rare alleles, helps to solve specific situations and has a special importance in cases of paternity tests and in forensics. This study also helps us shed light on the specifics of the genetic structure of our population, bearing in mind the specific structure that the Albanian population presents and the need that still needs to be explored (Xhetani *et. al.*, 2014; Mikerezi *et. al.*, 2003). All off-ladder alleles and triallelic patterns discussed in this paper will be uploaded to STRbase.

Recommendations

Genetic structure of a certain population might represents small changes in terms of evaluating several parametres when it is studied in different periods of years and these changes needs to be studied taking in consideration factors that impacts. We recommend that all the off ladder alleles and triallelic patterns once identified, should be re-pcr with different commercial kits containing the same loci or the same kit as least twice and we strongly recommend to upload all the findings in STRbase. The identification of these irregularities in population might be very helpful in specific areas of usage.

Abstract: The windows and doors facing the exteriors on envelope systems of a building are an important source of light and ventilation but become a point of solar heat gain. The size of openings, the operation of shutters for ventilation, orientation, glazing type, and the material of windows and doors influence the solar heat gain and lighting levels indoors. Shading and its integration in the design of envelope systems for openings become effective in reducing the solar heat gain and create the potential to the reduction of cooling load requirement and reduce glare indoors. The paper aims the study and discussion on experiments on solar shading and natural night ventilation at the Baitykool prototype a 90 sq. M eco-responsive, energy-efficient, solar-powered prototype house designed and built for the Solar Decathlon Middle East 2018 presently functioning as a living lab located at The Sustainable City Dubai. Experiments were conducted under varied scenarios of solar shading and natural ventilation using different types of shading devices and architectural actions for external-facing windows, doors, and ventilators under passive conditions to analyze the effectiveness of the thermal

comfort condition and potential of energy saving for cooling the house indoors with the use of solar shading for external facing doors and windows. The benefits of natural ventilation at night are analyzed to improve the air quality and temperature indoors taking advantage of lower outdoor temperatures. The data collected for specific dates of the experiment and hours of the day based on the experiments and architectural actions analyzed and results discussed to understand the benefits of night ventilation and cross ventilation on indoor air quality. The potential for a reduction in the use of air conditioning systems to cool the indoors during the day helps develop the annual cooling strategy with potential energy-saving measures.

Introduction

Buildings are high consumers of energy due to the cooling demand required to maintain thermal comfort conditions in extremely warm climates. The high solar heat gain contributes to overheating of indoor spaces during the day caused due to solar transmittance, heat transfer from surfaces and poor solar shading strategies for openings and facing exteriors in building. The design of envelope system, orientation of opening, its size, glazing type with shading devices can minimize solar heat gain for openings and opaque surfaces and improve the thermal comfort condition of indoors without compromise of day lighting factors (Dudzinska, 2021). The use of internal and external solar shading with appropriate strategies can create minimized cooling loads and is valuable for the challenging environments, shading becomes a powerful tool to reduce overheating. A reduced cooling hours by 4% reduction was discovered with shading devices using simulation studies with IESVE (Mamdooh Alwetaishi, 2021). Dynamic solar shading with venting strategies can reduce overheating at indoors evaluated in accordance with adaptive thermal comfort model with the dynamic shading providing user the control to the indoor environment (Gunnlaug Cecilie Jenson Skarning, 2016). Responsive building envelopes (RBEs) with the smart windows controls the light and heat flux based on users defined program (Rosa Francesca De Masi, 2022). Just adopting to materials and construction technology for energy efficiency is not sufficient, its important to integrate appropriate automation systems to achieve enhanced performance for energy saving with building automation and control systems (TAC) and technical building management (TBM) to be integrated at the design phase (Pawel Kwasnowki, 2017). The developed framework of window opening and closing strategy and the operation of shading device type to perform solar shading can work with adaptation of AI based technology and BAC & TBM systems. The control of windows and natural ventilation has significant benefits on adding thermal comfort with passive cooling (Vijayalaxmi & Sekar, 2011). A significant

correlation has been found between the solar heat gain, day lighting and access of sun light in to the building. Alteration is required with different shading angles and sun control measures based on the orientation of buildings in the hot region when analyzed using simulation using grasshopper code gave positive results achieved with use of smart shading and smart arduion system with specification of shading device to maintain the desired indoor temperature at different times of the day. The orientations had varied priority for the shading devices (Mamdooh Alwetaishi, 2021). The dymanc solar shading showed flexible solution for reduction in time of operative temperature exceeding the adaptive thermal comfort limits with sufficient day lighting at indoors but has variable requirement with window opening size to floor area ration for cold climate zone with need for heating (Gunlauge Cecilie Jenson Skarning, 2016). The solar shading solutions cannot be considered in a universal way at a global level and needs to consider the cliomatic zone, orientation and the contextual setting the movable shading lamena with inclination depending on suns angle of incidence and brise-soleils with appropriate overhand create solar protection. Incorporating overhangs, roller blind shading used together get favourable results with attempted research on various shading strategies shows passive protection as an effective method to reduce solar heat gain blocking the solar radiation to interiors and effectively cooling the building and improving the energy efficiency of the building. Natural night ventilation has potential to reduce th accumulated heat gain by solar and internal energy (Dudzinska, 2021). The desirable micro climate at indoors vary between winter and summer and buildings needs to meet the thermal comfort throughout the period of climate warming. A study of passive school building shows the operation of opening of windows, lowering of roller shutters and controlling air movement and flow by the occupants can have effect on increase or reduction of internal temperature. It is important to have forms of shading devices and night ventilation strategies combined with high thermal inertia in building structure. Only carrying out solar shading could reduce the cooling load but do assure the achievement of thermal comfort. This is associated with the users of the indoors facilities and their activity, dressing, gender, age and acceptance level to comfort codition levels. Conventionally in passive buildings natural night cooling, heat exhangers are desirable during summers to reduce discomfort with lowered temperature at night and cool temperature retained for the next hot day (Rajagopalan & Luther, 2013). This is the simplest and cheapest way to reduce the internal temperature low energy reliance and cost. But this strategy depends on the local climatic conditions and with the diference in indoor and out door temperature, wind speed, direction, orientation of building, its windows, thermal inertia of buildings, the thermal mass, ventilation system. A number of studies are conducted on the influence of night ventilation in shaping the thermal comfort during summers and have shown reduction in cooling load by 40% and 30% of energy consumption a narrow office building in great Britain with high mass. The use of mechanical night ventilation showed improvement in predicted mean vote for comfort measurement at University of La Rochelle This shows that climatic condition and air flow rate has an impact on this type of cooling. Moderate climate with large fluctuation in daily temperature is the most favourable for application of natural ventilation during the summers. The minimum difference in diurnal temperature recommended is 10-12K. Also there is reduction of cooling potential due to urban context and reduced wind speed. Another research in energy efficient office building in Belgium showed night cooling more effective than ground air heat exchanger for the simulation analysis results of thermal comfort (Anna Dudzinska, 2021).

The built environment, building design, materials, and construction technology in the UAE have a fast pace of development to cater to the needs of the urban population. However, its architecture shows a poor response to the local context and climate of the region. A serious concern prevails in the way buildings are disconnecting the inhabitants from nature and the context of the place. The hot climate prevails for more than six months of the year with hot, sunny during the day, and cold by night, the desert region apart from the summer seasons has cool winters, springs, and autumn seasons. The contemporary buildings in UAE use large glazed walls with fixed glazing and the indoor comfort conditions have a full dependency on the air-conditioning across the year making the building highly energy reliant. The residents use about 550 liters of water and 20 to 30 kilowatt-hours of electricity a day and as the economy grows, the energy demand is expected to increase by 9 percent annually. UAE consumes 220-360 kWh/Sq. m / year in the present scenario, with the use of appropriate design strategies the energy efficiency has the potential to improve to 110-160kWh/Sq. m/ year. There is a need for design intervention and research with Bioclimatic architecture suited for the warm climate with the use of passive and active strategies.

The article attempts to find answer to the potential of improving thermal comfort conditions at indoors using solar shading and natural night ventilation in low rise residential building in warm climate. Experiments conducted to analyze the change in temperature, relative humidity and air quality, the factor that impacts indoor thermal comfort condition. The objective of the study is to understand the performance of solar shading for the windows & doors facing exteriors to improve the thermal comfort conditions of indoors. Analyze the thermal comfort conditions with the varied architectural actions like opening and closing of shading devices, windows and doors at times of the day and night. Investigate the potential of night ventilation for the indoors from the Patio. Evaluate the effect of natural ventilation at night on temperature, relative humidity & Air quality at indoors. Examine energy conservation strategies for reducing use of cooling unit with the adaptation of passive strategies to maintain the thermal comfort condition at indoors. The assessments carried out at the Baitykool living lab with and without occupancy and data acquisition done on the parameters under varied architectural actions.

The eco-sensitive home Baitykool living lab as a tool for experimentation

The eco-sensitive, energy efficient prototype house Baitykool as shown in images Fig.1 was designed and constructed for the Solar Decathlon Middle East 2018 and the winning entry for the competition commissioned at the Sustainable City Dubai (TSC), UAE. The prototype designed for the warm climate works with innovative systems to conserve and produce solar energy to sustain the house function, recycle water, use radiative sky cooling to enhance the thermal comfort of indoors, biological water filtration system, architectural design and strategies suiting to warm climate, specifically designed envelop system, sustainable materials and construction technology which could be referred in the article (Samuel A. K., et al., 2020). The functional prototype is the living laboratory with experiments conducted on the performance of the designed bioclimatic strategies, thermal comfort conditions, the aquaponics system, biologic water filtration, radiative sky cooling and solar energy systems. The prototype is a self-sustaining eco-responsive habitat designed for the extremely hot climate

and serves as a tool for experimentation with its bioclimatic architecture for the climatic conditions. The research lays focus on testing the prototype with architectural actions for improving the thermal comfort condition with the passive strategies having the objective of minimized energy consumption and energy balance maintained with the energy produced by solar. Baitykool as a model with energy balance using bioclimatic architecture for extreme warm climates its design strategies can be referred in the article (Samuel, et al., 2022)

Data acquisition:

The experiment data acquired with the measurement tools as shown in Fig.2 Black Globe Sensor for Temperature, Relative Humidity & Carbon Dioxide installed at all the rooms of the prototype and data logged on DISTECH a building management portal with control of Air conditioning, hydraulics, and display of the real-time sensor data's. Portable Black Globe sensor to collect data at experimental locations. A weather station installed at the site location TSC over the Prototype roof with all weather data at the prototype location recorded. Real-time Energy data was acquired using ENERGYWISER.

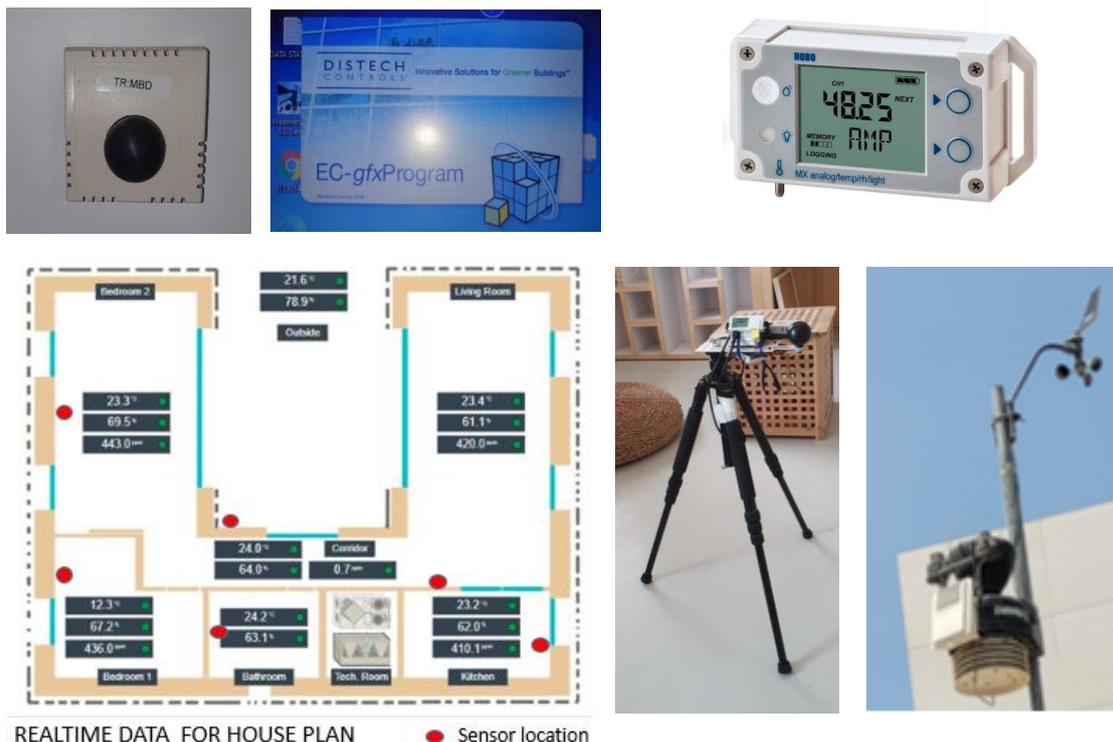

Figure 2. Sensors and data acquisition systems at Baitykool Living Lab: top left the Black globe sensors with data management by DISHTECH, top right: HOBO sensors for second set of data for calibration, bottom left, DISHTECH sensor location and live interface, bottom center: HOBO Black Globe Temperature sensor located at the center of the bedroom, bottom right: weather sensor at context site at Baitykool roof top.

The Experimental measurement parameters for the analysis on thermal comfort condition :

Temperature in Degree Celsius ($^{\circ}\text{C}$) at Indoor and outdoor, air temperature (T_a), globe temperature (T_g), Relative humidity (RH), Carbon dioxide (CO_2), Solar radiation (kW/m^2), Wind speed (mph), Wind Direction as per the (Orientation)

Nomenclatures and abbreviation's:

Temperature – T, Relative Humidity – RH, Solar Shading – SS, Roller Blind Blackout – RBB, Solar Shading with roller blind blackout – SS:RBB, Bedroom – BRm, Kitchen –Kit., Cross Ventilation – CV, Natural Ventilation- NV, Night Ventilation – NiV, Patio Ventilation – PV

Method

Experiment design to test the influence of bioclimatic factors on thermal comfort condition

The Baitykool prototype functions as the living laboratory with experiments conducted on solar shading and night ventilation. The prototype designed for the extremely hot climate and serves as a tool for experimentation with its bioclimatic architecture for the climatic conditions. Architectural actions like opening and closing of windows (W) / doors (D) / patio ventilator (PV) / solar shading devices like the roller blind blackout (RBB) made of White Thermal Blackout Curtain Lining 3 Pass Opaque Blackout Curtain Fabric 260 GSM. Experiments conducted in two seasons of the arid desert climate, the winter season (November to March) the summer season (April to October). The climate of Dubai, UAE analyzed across the year to find the potential in use of passive strategies and reduce the load on the active conditioning system.

The experiments divided in to solar shading at the Bedroom (BRm) & night ventilation between Patio Ventilation (PV) & Kitchen (Kit.) window

a) Solar shading: The external facing windows are shaded with an outer perforated envelope, a closed monolithic arid mineral façade made in Ultra High Performance Fiber reinforced concrete (UHPFC) as shown in Fig. 3 specifically developed for the project acting like a mashrabiya protecting the window opening behind providing comfort and maintaining privacy.

This multilayered wall system works to improve the thermal efficiency of the house, improving thermal comfort with the UHPFC acts as a strong shield against the hot weather shading the glazing and the buffer zone the air

gap between the window double glazing and the UHPFC in window areas and the layer of vapour barrier sticking the external façade reflects back the solar rays and reduces the heat gain to the indoors. The air between the UHPFC acts as an insulation and the perforations a means to keep the gap ventilated and allow day lighting for indoors. Along with this three layers of dynamic shading has been devised for the windows and doors. At the exterior of the window (i) a roller blind blackout (RBB) of material White Thermal Blackout Curtain Lining 3 Pass Opaque Blackout Curtain Fabric 260 GSM with electric control for its opening from room. (ii) an exterior translucent roller curtain fixed on the exterior side of the window (ETC) material 100% Polyester with acrylic coated; non-formaldehyde, $136 \pm 5\%$ (gsm), woven translucent roller shade acting as a shade and dust barrier. (iii) an interior translucent curtain (ITC) for reducing glare and adding privacy, material 55% Cotton, 45% Polyester as indicated in Table 2. Experiments carried out based on orientation of window, with and without shading of RBB, with and without a conditioned environment, with and without occupancy at the living lab during the experimental duration.

Figure 3. Left: Ultra-high performance fiber concrete (UHPFC) external layer as a solar shield, Center left: the precast UHPFC panel, Center right: the multilayered wall, Right: the porous UHPFC panel

The experiment discussed in this article is on the performance of the solar shading of exterior facing windows with the static UHPFC perforated panel and the RBB in open and closed position as indicated in Table 1, and night ventilation as in Table 4. to analyze the effect on indoor temperature and relative humidity and with no occupancy and no conditioned environment.

Table 1. Experiment plan for solar shading

Sr. No	Experiment Date	Duration	Architectural Action	Experiment space
1	24/01/2023	24 Hours	No solar shading for windows & doors	Bedroom of
2	25/01/2023	24 Hours	Solar shading: RBB on west facing windows	Baitykool Living
3	27/01/2023	24 Hours	No solar shading for windows & doors	Lab
4	28/01/2023	24 Hours	Solar shading: RBB on east facing windows	
5	29/01/2023	24 Hours	Solar shading: RBB for all windows & doors	
6	30/01/2023	24 Hours	No solar shading for windows & doors	

The experimental space as shown in Fig. 4, is the bedroom (BRm) 18.4 m² area, 54.7 m³ volume oriented to the west with 2 external facing windows and on large sliding folding door facing east orientation opening towards

the the green patio and an entry door to the bedroom from the corridor connecting the living, dining, kitchen, washroom, another bedroom & a technical room. Only the Bedroom is considered for the SS:RR experiments with the details as indicated in Table 3. & The Bedroom, Living, Kitchen & corridor space for the night ventilation as indicated in the Figure. 7

Ultra High Performance Fiber reinforced concrete with 50% perforation ratio to window opening size	White Thermal Blackout Curtain Lining 3 Pass Opaque Blackout Curtain Fabric 260 GSM	100% Polyester with acrylic coated; non-formaldehyde, 136±5%(gsm) woven translucent roller curtain	55% Cotton, 45% Polyester sheer curtain

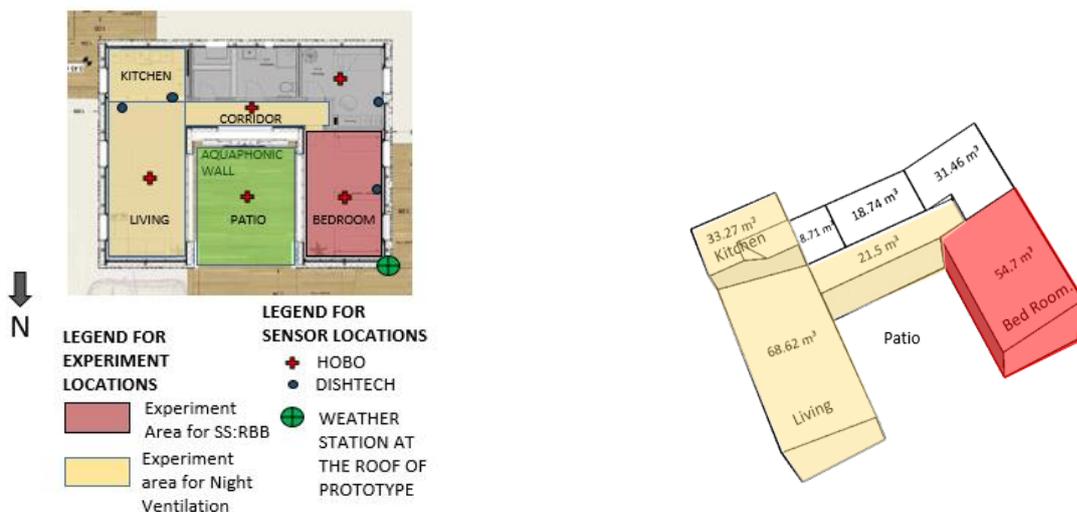

Figure 4. Left: Plan of the Baitykool Living lab with location of Sensors for data acquisition & the experiment space highlighted, Right: Baitykool indoor building volume

Table 3. Experimental spaces, envelop, windows and door at Baitykool Living Lab

Sr. No	Space/ Elements	Size (m)	Numbers	Area
1	Bedroom	3.4 x 5.4	1	18.36
2	Window	1.15 x 2.25	2	5.175
3	Door external facing	3.9 x 2.1	1	8.19
4	Door opening to corridor	0.9 x 2.1	1	1.89
5	External Facing Envelope oriented West (only the bedroom length)	5.5x4.9	1	26.95
6	External Facing Envelope oriented East	5.5 x 3.3	1	18.15

b) Night Ventilation: The fresh means of air naturally in to the building with passive forces like wind, its speed and the difference between internal and external preasure. Experiments conducted with crossventilation during day & night , night ventilation only with the favourable weather condition at the context site. The weather by month, weather averages in Dubai as shown in Figure 5 shows December, January, February, march having potential to use natural ventilation for indoors with average temperature ranging between 20 -24 °C. During these months crossventilation strategy can be adapted in building , the energy conserved by reduction in the use of conditioned enviromment. This improves the indoor air quality and flushes out the trapped heat in indoor spaces.

	January	February	March	April	Mag	June	July	August	September	October	November	December
Avg. Temperature °C (F)	19.4 °C (67) F	20.7 °C (69.2) F	23.3 °C (74) F	27.7 °C (81.8) F	31.8 °C (89.2) F	33.8 °C (92.8) F	35.6 °C (96.1) F	35.7 °C (96.2) F	33.2 °C (91.8) F	30 °C (85.9) F	25.5 °C (77.8) F	21.3 °C (70.3) F

Figure 5. Climate data of Dubai, UAE accessed in June 2023 reference: <https://en.climate-data.org/asia/united-arab-emirates/dubai/dubai-705/>

The experiments at Baitykool on natural ventilation works with cross ventilation during day and night, cross ventilation at night only, which is one bioclimatic stragegy of using ventilation at night through the green patio (courtyard) using patio ventilator opened to referesh and with cross ventilation take benefit of the cool night temperature to the indoors. The average hourly temperature graph in Dubai as indicated in Figure 6 shows the months with cool, in the months of December, January, February with crossventilation possible during the morning hours. Comfortable conditions are seen in the evenings and night in November, December, January, february & march which are five months of the year with potential use of passive strategies in residences along

with active once having a hybrid scenario with optimized energy use for conditioning the indoor environment.

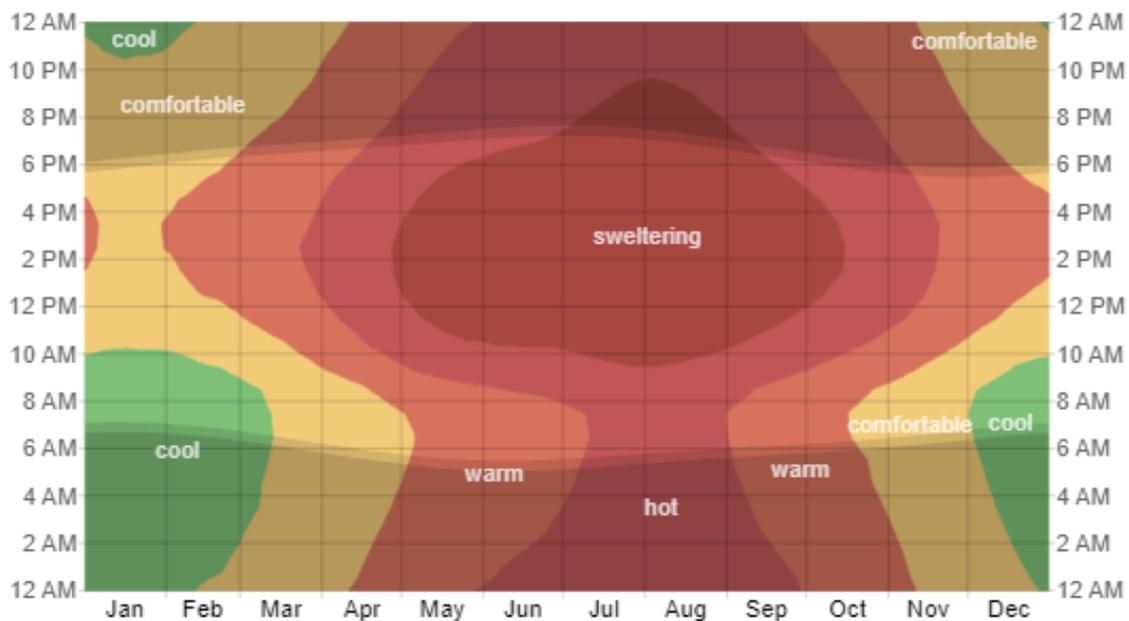

Figure 6. Average hourly temperature graph in Dubai, UAE accessed in June 2023 reference

<https://weatherspark.com/y/105470/Average-Weather-in-Dubai-United-Arab-Emirates-Year-Round#Figures-ColorTemperature>

The night ventilation strategy experiment use the window openings in kitchen one shutter window 1.15 x 2.25m, the patio ventilation 1.81 x 0.75 m with two ventilation shutters as shown in Figure 7. The air draft passes through the green patio with vegetated roof and courtyard, letting the air pass through the aquaponic wall having vegetations in the zip rows with flowing water filtering the air and keeping it cool (Samuel A. K., et al., 2020). This strategy is being tested for its functioning across all months to see the effect on the indoor thermal comfort condition. For this paper only one experiment set has been considered with the cross ventilation at night through the patio ventilator and the kitchen window as shown in Table 4. on 15th Jan 2023 compared to the scenario of no cross ventilation for the indoors during the experimental day on 16th January 2023 during day and night. This has been compared with no cross ventilation in the indoors during the 14th January day and night.

Figure 7. Left: plan view of Baitykool Living Lab with night ventilation strategy, Right: Image of Patio Ventilator with closed, open position & window in open position.

Table 4. Experiment plan for natural ventilation: night ventilation

Sr. No	Expeiment Date	Duration	Architectural Action	Experiment space
1	15/01/2023	24 Hours	Natural cross ventilation between Patio Ventilator – Ventilators – 2 nos. & Kitchen windows – 1 no. during night.	The Living, Kitchen, bedroom of the Baitykool
2	16/01/2023	24 Hours	No natural ventilation at indoors of Baitykool	Living Lab

The night ventilation experiments for the 15th January 2023 compares the difference in temperature , relative humidity, air quality between the cross ventilated living and Kitchen through the patio ventilator and not cross ventilated indoors of the full prototype on the next day of cross ventilation. The objectibe being to analyze the variance in the indoor conditions for temperature , relative humidity, air quality across the day and night. The experiment on the two days are with no occupancy at the living lab to analyze the indoor comfort condition with temperature, relative humidity and air quality . There are experiements also conducted with occupants during the varied weather conditions across the year. For this paper the experiement considered is for only one scenario of night ventilation.

Results

Effect of Solar Shading on indoor temperature and relative humidity

The solar shading experiment analyzed in three parts with the temperature and relative humidity comapered between the external context condition at site of prototype and the indoors of the Baitykool bedroom space to analyze the effect of the shading device Roller Blind Blackout (RBB).

(i) the Solar shading for all the external facing windows and doors throughout the day.

Table 5. Data for solar shading of all windows at context site & the bedoom at Baitykool Living Lab

Architectural Action	Solar Shading: Rolleer Blind Blackout on all external facing windows & doors			No Solar shading for any external facing windows and doors		
	Context	Context	BK : Bedroom	Context	Context	BK : Bedroom

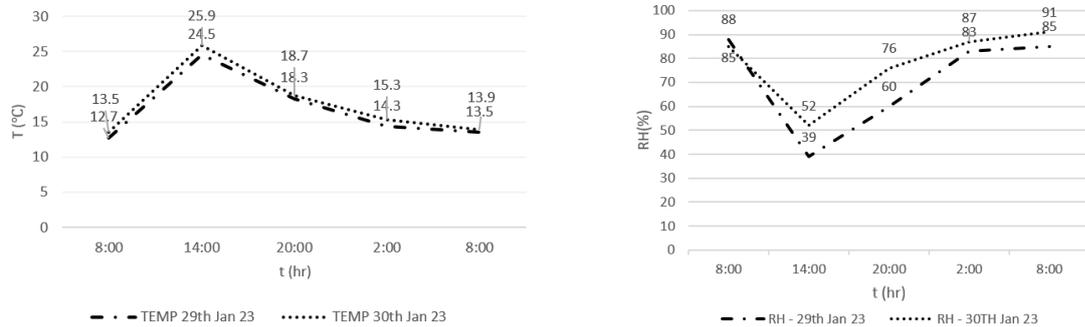

Figure 8. Context, Left: Temperature (T), Right : RH on on 29 & 30 Jan 23

The Fig. 8 shows the T & RH on the site location ‘Context’ of Baitykool livng Lab (BK), the T on both days difference of 0.8°C at 8am, 1.4°C at 2 pm, 0.4°C by 8pm, 0.4°C at 8am next day. RH has difference of 0.3 at 8 am, 13 at 2 pm, 16 at 8pm, 4 at 2 am and 6 at 8am next day. The comparison done with the AA -SS:RBB on 29 Jan & 30 jan as the reference.difference considering the variances in T & RH on the 2 days. Data for context and BRm as shown in Table 5.

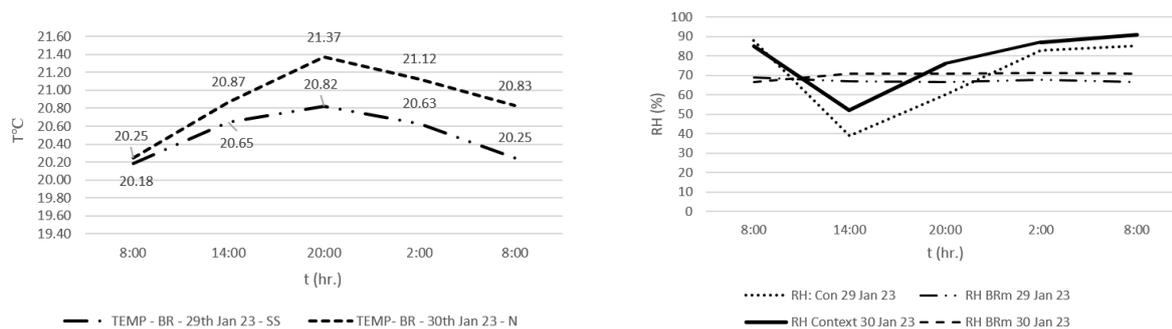

Figure 9. Left: Difference between T- BRm with SS on 29/01 & T- BRm – R 30/01, Right: T- BRm on 29/01 & Context T – 29/01

Temperatures as shown in Fig 9. shows difference achived in T & RH with Solar Shading (SS):Roller Blind Balckout (RBB) when compared with no shading on 30 Jan 23: 0.07 at 8am, 0.22°C at 2 pm, 0.55°C at 8 pm, 0.49°C at 2 am, 0.58°C at 8am next day. There is a 0.5°C benefit at indoors due to the roller blind blackout shading cutting down the effect of direct solar heat gain for the window glazing.

Figure 10. Left: Image of BRm with no SS, Center: Sun rays on glass at 8am, Right: BRm with SS:RBB blocking sun at 8 am

The perforated Ultra High Performance Fiber reinforced concrete (UHPFC) as shown in Fig.10 shields the window and blocks the sun rays with its opaque surface and the 50% perforations 50 mm dia each with its thickness 40 mm shades as the first layer protecting the external facing window from full exposure to direct solar rays. The SS:RBB cuts the solar rays and creates a reduction in solar heat gain in room there by reducing indoor T by 0.58°C at indoors.

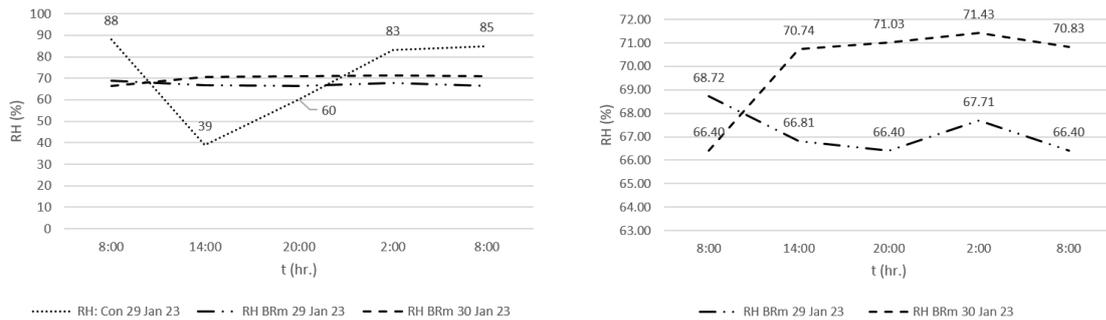

Figure 11. Context, Left: RH compared with BRm RH on 29/01 and 30/01, Right: RH in BRm on 29/01 with SS & 30/01 with no SS

RH in BRm shows reduction with SS:RBB as it reduces from 68.72 to 66.40 in 24 hours where as the RH with no SS shows increase from 66.40 to 70.83 as seen in Fig 11. There is an increase seen in RH in BRm at 2 am as the context T increases from 14.7°C to 14.9°C and reduces to 13.8°C between 1 am and 3 am. Benefit observed with use of SS:RBB on both T & RH with reduction in levels compared to context & the without SS.

ii) the solar shading done only to the west oriented external facing windows and doors.

Table 6. Data for solar shading for west orientation at context site & the bedoom at Baitykool Living Lab

Architectural Action	Solar Shading: Rolleer Blind Blackout for west oriented windows and doors			No Solar shading for any external facing windows and doors

Average	17.40	77	21.62	19.60	62	21.34
Difference	8.30	38	0.97	10.80	37	0.66

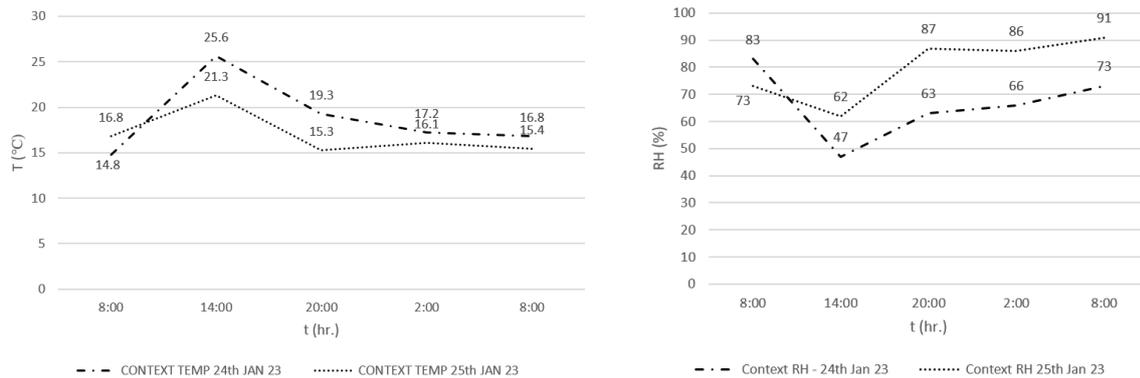

Figure 12. Context, Left: Temperature (T), Right : RH on on 24 & 25 Jan 23

Context T on 25/01 and 25/01 at a difference of 2.2°C at 8am, 4.3°C at 2pm, 4°C at 8pm, 1.1°C at 2 am, 1.4°C at 8am,

Temperature (T) on 24/01 the day of SS:RBB (West) lesser by 2.2°C than 25/01 but rises from 14.8°C to 25.6°C by 2pm and drops gradually to 15.4°C by 8am next day

Context RH shows the variance of 83 at 8 am dropping to 47 at 2pm with rise in T on 24/01 and shows the gradual rise to 73 by 8 am next day. RH on 25/01 shows drop from 73 at 8am to 62 at 2pm and rise to 91 by 8 am next day. Difference of 10-20 in RH observed between the two days. Data of context and BRm as indicated in Table 6

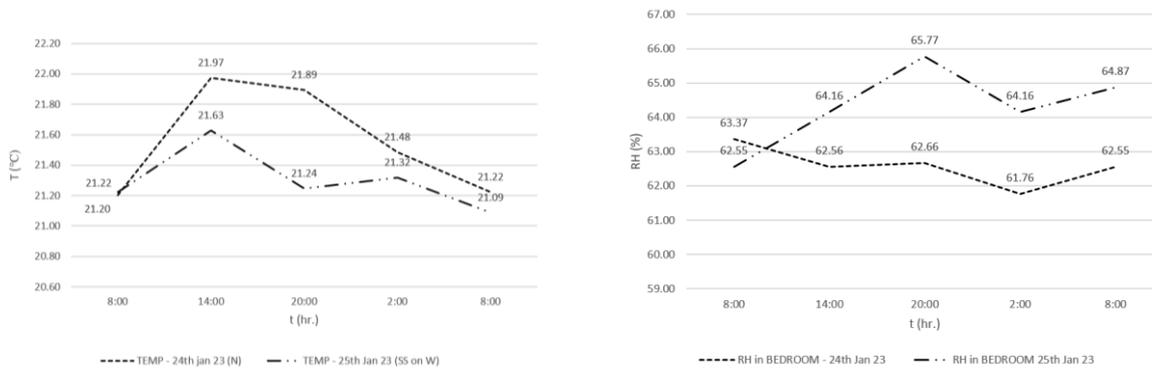

Figure 13. Left: Difference between T- BRm - R 24/01 & T- BRm – SS:RBB (West) 25/01, Right: RH - BRm on R - 24/01 & SS:RBB (West) 25/01

Temperature rise from 21.20°C at 8am to 21.63°C at 2pm and drops to 21.24°C by 8pm, when compared with the temperature on 29/01 refer Fig. 13, there is rise in temperature by 0.17°C whereas with SS:RBB (West) there is drop in T by 0.39°C, this is due to the shading on west with the roller blind blackout.

Fig. 13 shows a gradual drop in RH level in BRm from 65.77-64.16 (1.61 difference) between 8pm to 2am and a rise to 64.87. The context T is 16.1°C lowering from 19.3°C, the drop in RH is due to the transmittance of heat from the RBB material with the exchange of cooler T from the context.

The SS:RBB (west) shows an effect if shading when compared the temperature difference in BRm on 24/01 is 0.08°C and on 25/01 is 0.39°C which is due to the blocking of solar rays from the west.

(iii) solar shading for the east oriented external facing windows and doors.

Table 7. Data for solar shading for east orientation at context site & the bedroom at Baitykool Living Lab

Architectural Action	Solar Shading: Rolleer Blind Blackout for east oriented windows and doors			No Solar shading for any external facing windows and doors		
Location	Context	Context	BK : Bedroom	Context	Context	BK : Bedroom
Date	28 Jan 2023	28 Jan 2023	28 Jan 23	27 Jan 2023	27 Jan 2023	27 Jan 2023
	TEMP	RH	TEMP	TEMP	RH	TEMP
Max	23.10	91	22.16	25.60	83	21.64
Min	14.80	53	21.19	14.80	46	20.98
Average	17.40	77	21.62	19.60	62	21.34
Difference	8.30	38	0.97	10.80	37	0.66

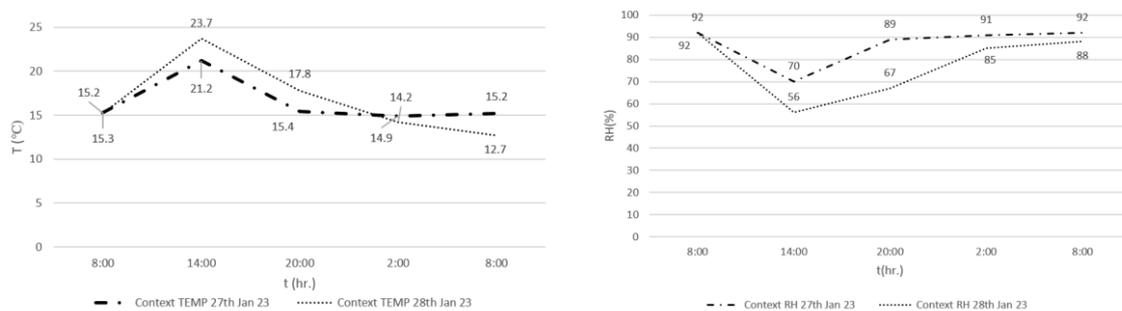

Figure 14. Context, Left: Temperature (T), Right : RH on on 27 & 28 Jan 23

Fig. 14 shows temperatures on 27/01 & 28/01 at same level 15.2-15.3°C at 8am difference of 2.5°C at 2pm, 2.4°C at 8pm, 0.7°C at 2 am & 2.5°C at 8am next day.

RH on 27/01 same level 92 and drops as T rises and shows difference of 0 to 20 between the two days.

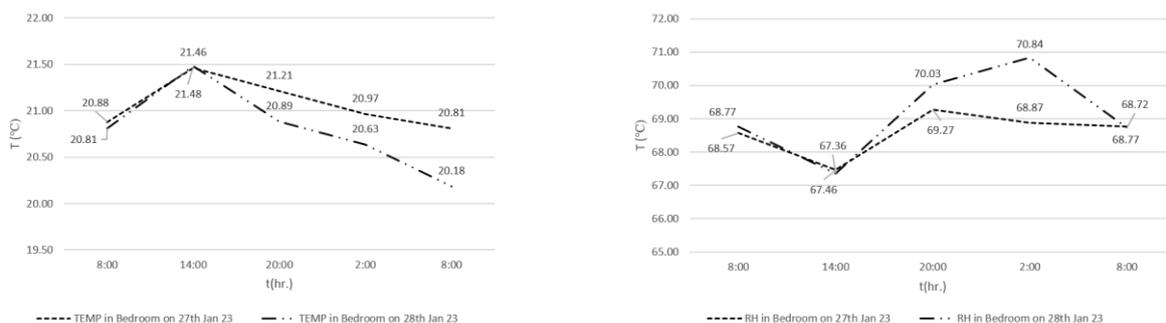

Figure 15. Left: Difference between T- BRm - R 27/01 & T- BRm – SS:RBB (East) 28/01, Right: RH - BRm on R - 27/01 & SS:RBB (East) 28/01

The SS:RBB on east did not show a difference in BRm with the day of shading and non shading show the same rise in T 0.67°C as seen in Fig. 15, this is due to the pergola shading at the patio (courtyard) and the shade of the east block in the morning achieved with the design proportion of the architectural form, height of the building around the patio.

RH drops gradually with rise in T and rises after 2 pm as context T drops to 15.4°C at 8pm and 15.2°C by 8am next day. RH drop after 2 am due to transmittance of heat from the RBB radiating heat inwards to the glazing having higher temperatures in air gap between the glazing & RBB (10 cm), also the T at the context 14.9°C makes the RBB to cool from the exteriors leading to transfer of heat waves inwards.

Natural Ventilation: Night ventilation

Effect of night ventilation between the patio ventilator and Kitchen window

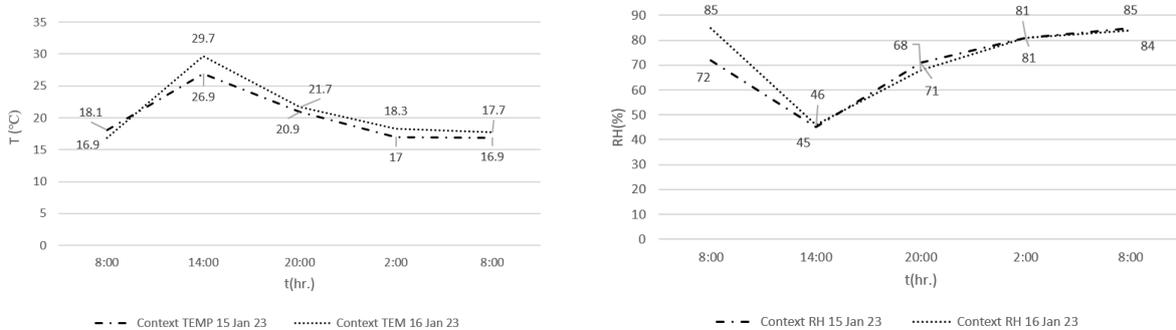

Figure 16. Context, Left: Temperature (T), Right : RH on on 15 & 16 Jan 23

Fig. 16 shows temperature on 15/01 ad 16/01 are shows a variance of 1.2°C at 8am, 2.8°C at 2pm, 0.8°C at 8pm,

1.3°C at 2am and 0.8°C at 8am. RH shows 72,85 at 8am dropping to 45,46 and gradually rising to 85,84 and the drop is with T rise and rise with T drop.

The comparison in T and RH is done between the Kitchen (Kit) and Bedroom (BRm) spaces as the night ventilation had the patio ventilator (PV) one and the Kit. window open. The BRm door and windows were closed and had no crossventilation. The draft of air was between the corridor with PV – Kit passing through the living with the Kit door kept open as in Fig. 7

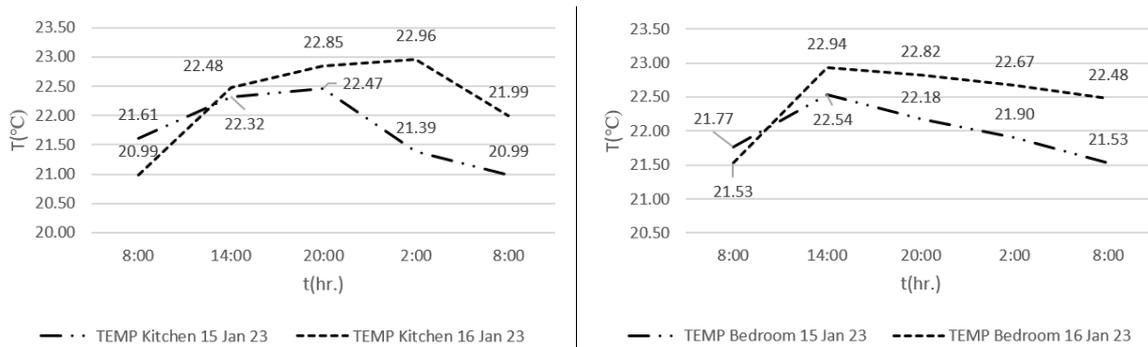

Figure 17. Left: Difference in T- Kit – NtV 15/01 & T- Kit – R 16/01, Right T - BRm – NtV 15/01 & T- BRm – R 16/01,

Fig. 17 shows temperature drops in Kitchen at 8pm from 22.47 to 20.99 on 15/01 and in BRm T drop from 22.54°C at 2 pm to 21.53°C at 8 am next day. A benefit of 0.54°C achieved due to night ventilation . T in living at 21.01°C and Kitchen 20.99°C at 8am next day. There is drop in T in Kit. Between 8pm and 2 am is 1.08°C and in BRm is 0.23°C this shows that the air draft was between the corridor with night cooling.

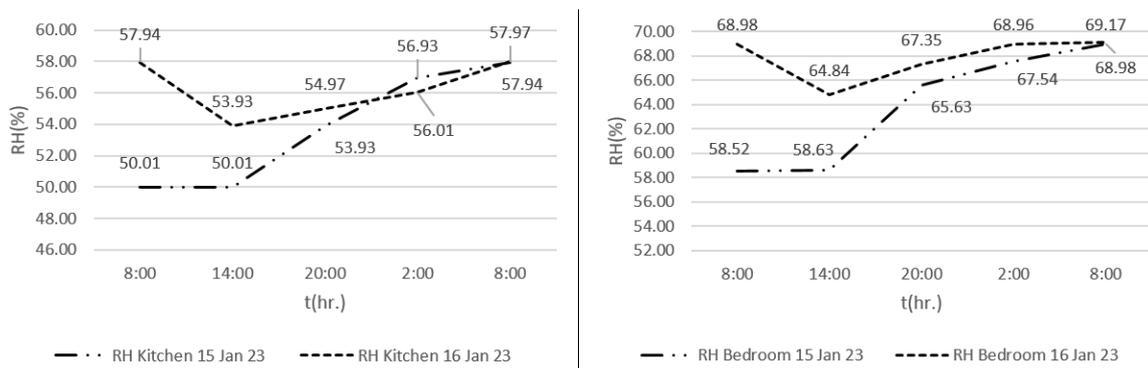

Figure 18. Left: Difference between T Right: RH - Kit on NtV - 15/01 & R 16/01 Right: RH - BRm on NtV - 15/01 & R 16/01

RH in Kitchen shows a 11.7 difference between the BRm and Kit., there is variance in RH as seen in Fig. 18, in Kit. when compared with the context reference RH on 16/01 where as there is no variance seen in graph in Fig. 16 in BRm when compared with reference RH on 16/01.

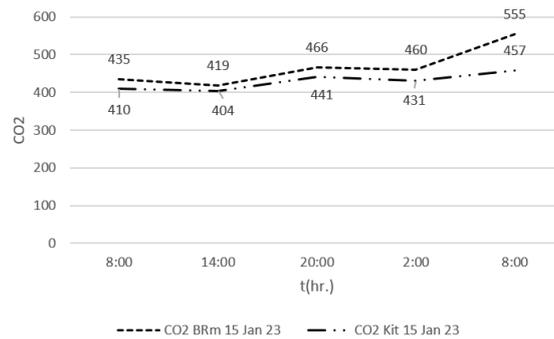

Figure 19. CO2 levels in Kit. & BRm on 15/01 with NtV

CO2 level in Kit. Lower than BRm as seen in Fig. 19, Difference of 98, Living room showed CO2 482 at the same time 8am on 16/01. When compared with the Kit. level a 25 difference observed which is due to the air draft being between the kit and corridor. The context wind direction from 8pm to 8 am was from East side with the very low wind speed of 0-0.4 km/h which means the air draft would be between the Kit window and PV between 8 pm to 8 am.

Discussion

Solar shading (SS) using roller blind blackout (RBB)

The SS:RBB for all exterior facing Windows & doors showed Difference in T by 0.6°C due to shading device RBB. East oriented opening of bedroom showed slow T increase in morning due to the shading at Patio by the east block. Temperature increased by 2pm as the opening got exposure to the sun's rays. Difference observed in the temperature & relative humidity between Living-Kitchen which is one singular indoor space when compared with BRm due to the difference in size of glazed opening i.e., door (7.8 sq.m.) & window (3.85 Sq.m.).

The SS:RBB (West shading only) for exterior facing Windows & doors shows drop in temperature at indoors in evening after 2pm due to west shading, consistency in T & RH noticed with shading post noon. Temperature difference of 1°C between Living-Kitchen & bedroom due to the difference in volume in the space (Living + Kitchen + corridor = 123.36 Cum & Bedroom = 54.7 Cum), refer Fig. 4 also the opening sizes in to both the spaces are varying having exposure to solar radiation and infiltration of air from exteriors through the door gaps at bottom.

SS:RBB (East shading only) for exterior facing Windows & doors showed temperature increase at indoors only (0.3°C) seen due to East shading. The temperature in Living & Bedroom observed at the same range 20-21 °C between 8am and 1pm. Consistent temperature seen from 2 to 6 pm and drop in temperature to late night and early morning. As the context temperature is reducing in January there is a drop in indoor temperature from the evening to late night and early morning.

Natural ventilation: Cross ventilation between Living & Bedroom during day & night

The cross ventilation created the variance in indoor T in the same range between the living & bedroom. RH had a difference of 10 between the living & bedroom through the day this is due to the orientation of living to the east & Bedroom to the west. The east oriented facade get exposure to solar radiation from the early morning hours till afternoon and as the temperature increase the relative humidity drops down. The temperature drop by evening causes the west side have higher relative humidity than east side of the indoors.

Conclusion

The Indoor T & RH at BK living Lab showed benefits in the use of shading with reduced T indoors by 0.5°C achieved in rooms when compared with a non-shaded condition. This difference could be higher in the warmer periods of the year. There is potential to have passive means of comfort with ventilation and lower solar heat gain through the external facing openings. The shading would help in regulating the T at indoors with improved comfort conditions. The SS: RBB also helps in saving energy with lowered loss of energy for cooling. The factors that need to be considered in design along with the solar shading are the Size of exterior facing openings, their exposure to solar radiation, orientation & sun path. The size and volume of the rooms the location of openings: windows and doors and the architectural actions to control the shading, ventilation, privacy and day light.

The night ventilation and cross ventilation between the indoor spaces had the benefit of refreshing the air and reduced CO₂ level capturing the lower T during the night to the indoors and allowing natural free cooling at night. But this needs to have strategies determined based on the varied T conditions at the context to avoid discomfort in seasons when T fall very low and nights are colder. Use of smart technology to monitor T to manage the opening and closing of the opening can allow better regulation of the thermal comfort conditions at indoors. The wind speed and direction, also matter to the air draft and its direction in rooms based on the strategy of opening and closing the windows, its opening size and opening direction. There is potential to have design and operational strategy in buildings for controlling the air draft and exchange between the indoor and outdoors based on the context temperature, relative humidity, wind speed and wind direction. The vegetated in the buildings like the patio (courtyard) at Baitykool creates an opportunity to catch the wind due to its architectural form and proportion and enhance the T & RH conditions of the air draft from the aquaponics wall with vegetation to filter the air and improve and cool down air as it passes the plants and water of the aquaponics system. More experiments are being conducted on this to validate the benefits. The air draft with its velocity adds to the thermal comfort condition at indoors. The user of the space has the choice to control the natural ventilation and air movement based on the opening of windows and doors. There is comfortable climatic condition at the context between 20-25°C and the use of natural ventilation could avoid the use of air conditioner and there by save energy. The January month is good for consideration of natural ventilation and the strategy of night ventilation benefits the reduction in indoor temperature for all rooms during the night

Some of the challenges during the experiments are the varying temperatures and relative humidity on the different days of experiment with its varied effect on the indoor conditions based on the size of rooms, orientation and the comparison between the day of architectural action and the no action (neutral/ reference) day cannot be mapped fully by the measures. More experiment sets are being carried out at varied climatic conditions in for comparison, analysis and development of a model frame work absed on the pattern of variance seen in the other seasons like warm, very hot, very cold, cool. The passive strategies of shading and cooling has benefits on developing an energy balance in building with lowered use of the air conditioning system and creating a sustainable living.

Notes

University of Bordeaux, Amity University Dubai, The Sustainable city Dubai, Academic Consortium, Institutional and Private partners, Multicultural Team Baitykool of students, PhD scholars and Faculty members for their contribution towards the design and construction of the Baitykool prototype for the Solar Decathlon Middle East 2018 and later creating the research Platform BAITYKOOL-lab at The Sustainable city Dubai To develop innovative solar & ecological building adapted for hot climate.

Abstract: It is essential to save lives during emergencies not only in hospitals but also in colleges and universities. Failure to identify risks and take prompt action during catastrophes and emergency situations could result in the loss of life and property for the campus community. This research aims to explore the feasibility of using data analytics to mitigate the risks associated with disasters and emergencies on campus. A prototype of an online reporting system was developed using cloud services to collect relevant data, analyze it, and present the information in an online dashboard for stakeholders to make informed decisions. The study shows that the use of dashboards has a high potential for effectively mitigating risks and identifying appropriate intervention strategies. This research contributes to the ongoing efforts to improve emergency response planning and management in higher education institutions and can be applied to other universities and large community groups to enhance their disaster and emergency response preparedness.

Keywords: emergency response system, campus safety, higher education, data analytics

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2266-2278), Cappadocia, Türkiye. ISTES Organization.

Introduction

Some higher education institutions possess specialized physical facilities, making them distinctive. They serve both teaching and research purposes, generate employment and economic benefits within their local and regional communities, and offer essential services like medical care and laboratory functions. In essence, universities operate as self-sufficient communities that provide various amenities, including housing facilities, food services, small businesses (such as retail stores and printing presses), and even hospitals (Ayanian & Weissman, 2002). However, they are also vulnerable to emergencies like natural disasters and man-made crises, which can impact their ability to function effectively such as earthquakes (Koshihira & Nakayama, 2021) and flood (Ke et al., 2023), chemical explosion (Balla et al., 2021) and cyber-attacks (Kassem et al., 2019). In

addition, health emergencies such as pandemics and outbreaks of contagious diseases can also pose significant risks to campus communities(Bokszczanin et al., 2023; Schmitt et al., 2021; Xiong et al., 2020). One of the significant challenges is the need to communicate effectively during emergencies. Higher education institutions may have large and diverse populations, including students, faculty, staff, and visitors, which can make communication challenging. Effective emergency response in higher education requires a multi-faceted approach that includes comprehensive planning, training, and resources(Song et al., 2022). Educational institutions should have clear and regularly reviewed emergency plans in place, as well as robust communication protocols and systems. In addition, there should be adequate resources dedicated to emergency response, including personnel, equipment, funding and technology.

This research aims to explore the feasibility of using data analytics to mitigate the risks associated with disasters and emergencies on campus. To achieve the research aims, this study is guided by the following research questions:

1. What type of campus emergencies and disasters occurred?
2. How significant is an online dashboard for emergency and disaster situations on campus?
3. Which visualization techniques are critical and effective for emergency responses on campus?

Literature Review

Campus Emergencies and Disasters

An emergency can be defined as a sudden, unforeseen, and typically dangerous situation that poses an immediate threat to health, life, property, or the environment and necessitates prompt action(Sarwar, 2018). Campus emergencies, ranging from natural disasters to man-made crises, can severely affect the safety and well-being of students, faculty, and staff. Natural disasters like floods, earthquakes, tornadoes, and wildfires can cause significant damage to buildings and infrastructure, leading to transportation disruptions, power outages, and water shortages(Toya & Skidmore, 2007). They can also result in serious injury and loss of life if people are not prepared or evacuated in time. In the context of students, transportation disruptions during floods can have a significant impact on their ability to access food. If food distribution channels are limited or supply chains are disrupted, it can make it difficult for students to purchase affordable and nutritious food. As a result, they may have to resort to eating less nutritious or more expensive food, or even go without food altogether. Furthermore, if transportation disruptions prevent emergency food aid from reaching affected areas, students who are already facing food insecurity may be at an even greater risk of going hungry. This can have a significant impact on their physical and mental health(Othman et al., 2022), as well as their overall wellbeing.

Man-made disasters, such as accidents, acts of terrorism, or violence, can also cause harm to people and property, and immediate emergency response measures may be required(Park, 2011). Examples of such disasters include chemical explosions(Morshidi et al., 2018; Mulcahy et al., 2013), mass shootings(Kowalski et

al., 2021), and cyber-attacks(Ramim & Levy, 1 C.E.). Furthermore, the call for digital transformation of higher education has increased the vulnerability to cyber-attacks as universities become more reliant on technology especially for academic operation. As a result, universities have experienced significant data breaches involving the personal information of students, staff, and alumni. For example, in 2018, a hack of the University of Yale in the United States put the personal information, including social security numbers and addresses, of 119,000 students and staff at risk(Hailey Fuchs, 2018). Such cyberthreats not only disrupt educational processes and create barriers to learning, but are highly potent to cause significant emotional distress and trauma. This can affect their academic performance, mental health, and overall sense of student's wellbeing.

Hybrid disasters, which are a combination of natural and man-made disasters, can have compounded effects and are more complex to respond to. Covid-19 can be considered a type of hybrid disaster because it has both natural and human-made elements. On the one hand, it is caused by a natural virus that originated in animals and spread to humans(A. Zhu et al., 2023). On the other hand, its impact has been intensified by human activities such as international travel(Hohlfeld et al., 2022) and the lack of effective public health measures(Ullah & Harrigan, 2022) in some areas. Furthermore, the pandemic has led to various other disasters, such as economic downturns (Hyman et al., 2021) and social unrest(Warsame & Price, 2021), which are also man-made disasters extending the critical impact on higher education. The pandemic has also created significant mental health challenges for students. The stress and uncertainty of the pandemic, coupled with the social isolation and disruption to routine, have led to an increase in anxiety, depression, and other mental health issues(Bokszczanin et al., 2023). The impact of campus emergencies' events can be severe and long-lasting. Some of the other consequences include:

1. Loss of life and injury: Emergencies can cause injuries and loss of life, particularly if individuals are not properly prepared, treated or evacuated. For example, three students in China die in laboratory explosion (Zhuang Pinghui, 2018).
2. Property damage: Emergencies can cause significant damage to buildings and infrastructure, leading to disruptions in transportation, power outages, and water shortages. For example, Tropical Storm Allison caused 10 million gallons of water inundated the UTHSC-H Medical School basement, resulting in over 1 million gross square feet of space being unusable for several months(Goodwin & Donaho, 2010).
3. Reputation damage: Emergencies can damage the reputation of the institution and negatively impact the enrollment of future students.
4. Legal liabilities: Emergencies can lead to legal liabilities, such as lawsuits from individuals who were harmed or injured during the event.

Higher education institutions should prioritize the safety and wellbeing of their communities, recognizing that human life is priceless and that recovery from injuries can take a significant amount of time. Even though structures and objects can be reconstructed or replaced, the loss of life or the impact of an injury can have a long-lasting effect on the individuals involved and their loved ones. Therefore, it is crucial to invest in

emergency response systems that can provide a swift response to emergency situations on campus.

Emergency Response System

An emergency response system in higher education refers to a comprehensive set of policies, procedures, and resources put in place to address emergency situations on a college or university campus. These systems are designed to provide a rapid response to emergency situations, including natural disasters, medical emergencies, and violent incidents, with the goal of ensuring the safety and security of students, faculty, staff, and visitors. The significance of an emergency response system in higher education cannot be overstated since environments in campuses are dynamic with thousands of people living, learning, and working in close proximity to each other (R. Zhu et al., 2020).

There are several challenges remaining in the emergency response and disaster assistance system. The process of collecting data for emergency response and disaster assistance generates a massive amount of information, including reports, images, videos, and audio that cover various aspects of emergency and disaster situations (Pettet et al., 2022). Unfortunately, the sheer volume of this data often overwhelms emergency agents who lack the necessary tools to filter or refine it for future use. As a result, they may struggle to identify trends or patterns in the data, leading to delays in decision-making or even misinterpretation. In addition to the challenges mentioned earlier, the continued use of conventional and paper-based reporting systems as a primary practice in emergency response and disaster assistance can compound existing issues. Although these approaches are practically workable and less relying on technologies, these methods of data collection and reporting can be time-consuming and prone to errors, further exacerbating the challenges faced by emergency agents, personnel, and victims. This can result in further delays in decision-making and potentially cause critical information to be lost or misinterpreted. There are several issues that can arise in emergency response systems:

1. **Communication failures:** Communication failures between emergency responders and victims or between different agencies can hinder the effectiveness of emergency response efforts.
2. **Resource allocation:** Emergency response efforts require the allocation of resources such as personnel, equipment, and supplies. Inadequate resource allocation can lead to delays or insufficient response efforts.
3. **Inadequate training:** Emergency responders must have adequate training to respond effectively to different types of emergencies. Inadequate training can lead to mistakes and ineffective response efforts.
4. **Coordination difficulties:** Emergency response efforts often involve multiple agencies and organizations, and coordinating their efforts can be challenging. Lack of coordination can result in duplication of efforts or conflicting response strategies.
5. **Limited accessibility:** People with disabilities or limited mobility may have difficulty accessing emergency services or evacuating during emergencies. Emergency response systems must be accessible to all members of the community.

6. Technological limitations: Emergency response systems rely heavily on technology, and technical failures or limitations can hinder their effectiveness. It is essential to have backup systems and contingency plans in place to address technical issues.

It is therefore crucial to develop and adopt modern and efficient systems for data collection, analysis, and reporting to improve emergency response and disaster assistance. To achieve the goal of improving emergency response and disaster assistance, implementing an information system that utilizes data-driven decision making appears to be a promising strategy.

Data-driven Emergency Response

Data-driven emergency response in the campus involves the use of data analytics and real-time information to improve emergency preparedness and response. With the availability of various data sources, such as sensors, social media, and other digital platforms, it is possible to collect and analyze data to detect early warning signs of potential emergencies, track the spread of an ongoing crisis, and inform decision-making during and after the emergency. It has become an increasingly important strategy for improving emergency preparedness and response efforts. According to a report by the United Nations Global Pulse initiative, data-driven decision making can help emergency responders and disaster relief organizations gain real-time situational awareness and make more informed decisions during emergencies (Emmanuel Letouzé, 2012). By leveraging data from a variety of sources, including social media, sensors, and other data streams, emergency response teams can gain insights into the situation on the ground and take actions more quickly and effectively.

One of data-driven emergency response model that frequently adopted in research is Decision-Making Trial and Evaluation Laboratory (DEMATEL). DEMATEL uses a multi-criteria decision-making approach to evaluate different factors and their interrelationships in order to make informed decisions (Gabus & Fontela, 1972). The method involves constructing a matrix of the relationships between different criteria or factors, and then using that matrix to identify the most important factors and the causal relationships between them. Studies has shown the applicability of DEMATEL in the context of emergency management (Song et al., 2022; Zhou et al., 2017). One limitation of DEMATEL is that it relies heavily on the availability and quality of data to construct the interrelationship matrix. The accuracy and usefulness of the final results of a DEMATEL analysis depend on the quality of the data used in the matrix construction. Here are a few specific issues related to data acquisition that may limit the effectiveness of DEMATEL:

1. Incomplete data: If there is missing data for some of the criteria or factors being evaluated, it can be difficult or impossible to construct a complete interrelationship matrix. This can lead to inaccurate or incomplete results.
2. Biased data: The accuracy of the interrelationship matrix depends on the quality and objectivity of the data used to construct it. If the data is biased or incomplete, it can lead to incorrect or incomplete results.

3. Data collection costs: Acquiring and processing data can be a time-consuming and costly process. Collecting and processing data may require significant resources and expertise, which may not always be available.
4. Data complexity: The data used in DEMATEL can be complex and difficult to obtain. In some cases, the data may be proprietary or confidential, making it difficult to access or use in a DEMATEL analysis.

All the issues mentioned are related to data. Whether it is incomplete, biased, costly or complex, the first and foremost step is to make the data available or acquiring data in a cost-effective manner. Therefore, this study proposes a cloud-based with low-code software development approach for developing the emergency response system in campus environment.

Method

The method for developing the emergency response system in this research is illustrated in Figure 9.

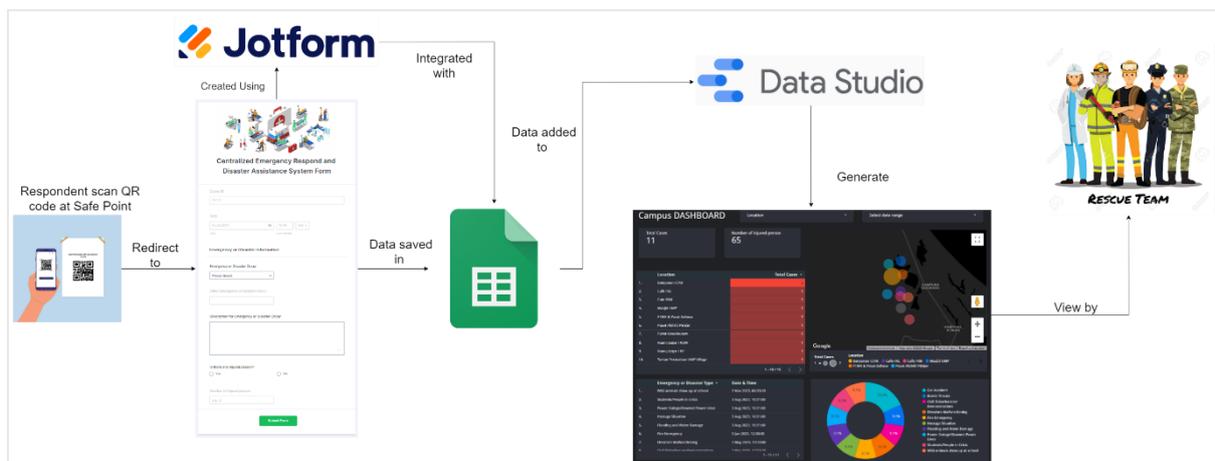

Figure 9: Method for Developing Emergency Response System

Step 1: Data acquisition with cloud-based form creator

There are various types and service providers that provide cloud-based form creation with low-code approach. In this study, we adopt the service from JotForm. It is an online form builder that allows users to create custom forms for a variety of purposes. The platform offers a wide range of form fields and customization options, making it easy for users to create forms that match their branding and meet their specific needs. Using JotForm to create an emergency report form with closed-ended, open-ended, short-form, and extended-form questions that respondents can fill out on their mobile phones by scanning a QR code at a safe point. The form collects data such as the date, time, location, emergency type, number of people injured, injury condition, and an image related to the emergency incident. The data is stored in JotForm and integrated with Google Sheets.

Step 2: Data visualization with cloud-based dashboard creator

There are many types of software that can be used for creating dashboards. Google Looker Studio is a valuable tool for developing dashboards, which can be used to visualize data collected from various sources, including Google Sheets. For this research, location data was essential, and the longitude and latitude of each location were imported into Google Looker Studio as data sources. To provide a geographic context for the data, a bubble map visualization was used to pinpoint the selected locations on the map. The size of the bubble represents the number of incidents that have occurred at each location, with different colors used to differentiate between locations. Additionally, a table with a heatmap was utilized to display the overall number of occurrences at each location, with lighter colors indicating a higher incidence rate. Figure 4 provides an overview of the dashboard used for this research.

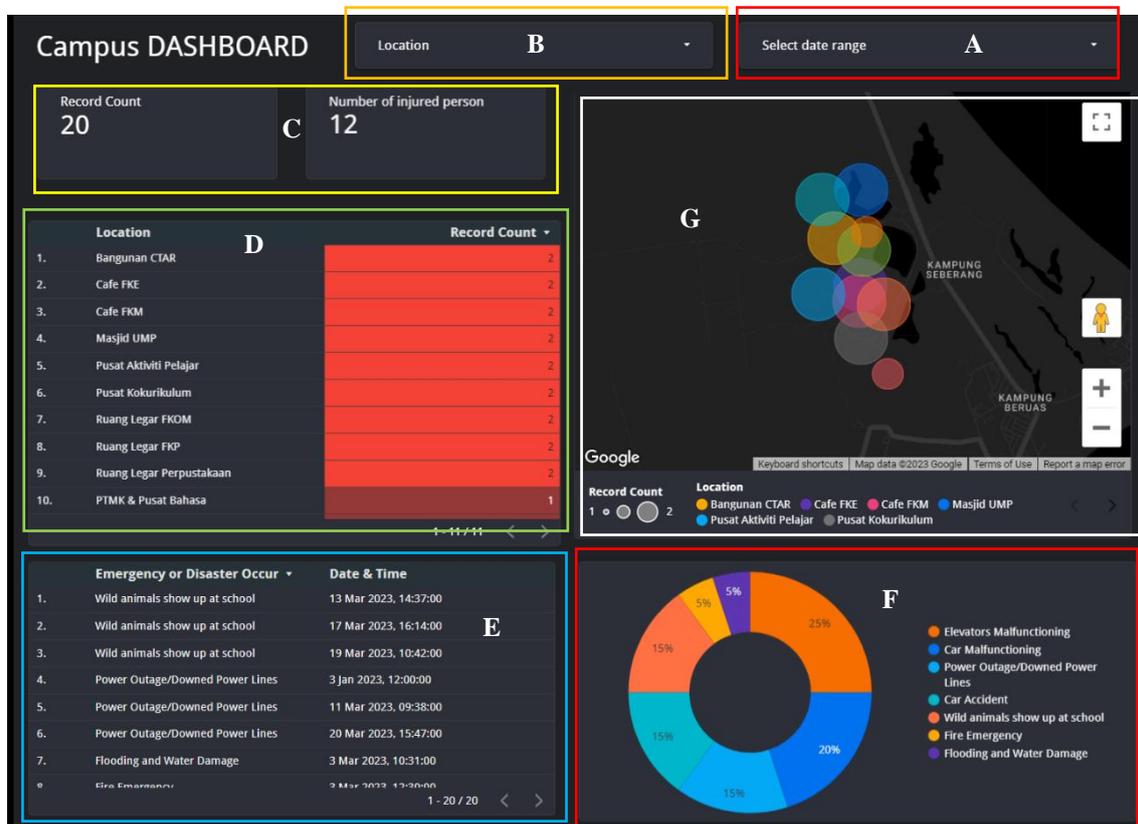

Figure 10: Method for Developing Emergency Response System

Results

The findings from this study are organized based on the research questions as follow: -

1. How significant is an online dashboard for emergency and disaster situations on campus?

An online dashboard for emergency and disaster situations on campus is a significant tool in data-driven emergency response. By utilizing data analytics and real-time information, the dashboard

provides critical information for stakeholders to make informed decisions and take appropriate actions. It offers situational awareness by indicating the level of emergency and urgency for each emergency type and helps identify those who may be affected, enabling emergency responders to deploy resources more effectively and efficiently. Additionally, the dashboard displays the suggested required personnel for the University Health Centre and Emergency Department, as well as the number of available personnel for both departments. Inclusion of the level of emergency and urgency for each emergency type, along with personnel information, can further enhance the overall response to emergency and disaster situations on campus. Therefore, an online dashboard is an essential tool for effective data-driven emergency response on campus.

2. Which visualization techniques are critical and effective for emergency responses on campus?

There are several visualization techniques that emergency responders can use to effectively respond to incidents on campus. Real-time dashboards are one such technique, providing stakeholders with critical information about the incident, such as the level of emergency and urgency, and the number of available personnel for responding to the situation. With real-time updates on the situation, these dashboards can help emergency responders deploy resources more effectively and efficiently. Another critical and effective visualization technique is the bubble map. A bubble map displays data using circles or bubbles of different sizes, colors, and positions on a map to represent specific values. It is an effective tool for visualizing spatial patterns and relationships between data points, such as the location and severity of incidents. By using longitude and latitude coordinates, emergency responders can quickly identify the location of the incident and determine the severity of the situation based on the size and color of the bubble. This visualization technique provides a quick and intuitive way for emergency responders to understand the situation and make informed decisions. Additionally, the bubble map can be used to visualize other relevant data, such as the distribution of emergency resources, to help responders allocate resources effectively. Overall, both the real-time dashboard and bubble map are critical and effective tools for emergency responses on campus.

Discussion

Based on Figure 10, the dashboard contains a dropdown list, date range control, scorecard, table with heatmap, bubble map, table, and pie chart. The combination of the mention elements can be an effective collection of tools for showing and analyzing data in a dashboard, such that: -

- A. Date range control: Date range control which label with the label A enables users to customize the time period during which data is displayed. This is especially useful for tracking trends over time and assessing data changes across multiple time periods.
- B. Dropdown list: Dropdown list which label with the label B enables users to filter data based on a selected location. This can assist users in focusing on the data that is most pertinent to their needs and make it easier to compare data across regions.

- C. Scorecard: Scorecard which label with the label C gives a succinct total case happen and total number of people injured, allowing users to quickly determine the level of safety on the campus.
- D. Table with heatmap: Table with heatmap which label with the label D shows data in a tabular fashion, with color-coded cells indicating the relative significance or value of each data item. This can help users see trends and patterns in the data more quickly.
- E. Table: Table which label with the label E shows the emergency type, date and time data in a tabular fashion, with rows and columns that facilitate data sorting and filtering.
- F. Pie chart: Pie chart which label with the label F displays the relative proportions of emergency type categories. This can be helpful for rapidly determining the most significant or pertinent categories.
- G. Bubble map: Bubble map which label with the label G displays data spatially, using bubbles or markers to indicate the position and magnitude of cases. This is very effective for illustrating spatial trends in data.

The potential impacts of using a dashboard in emergency and catastrophe situations are significant and can extend to multiple sectors, including:

1. Society: Society 5.0 recognizes the importance of leveraging technology to improve safety, security, and quality of life for all members of society (Deguchi et al., 2020) The use of a dashboard in emergency and disaster response is a prime example of how technology can be used to achieve these goals. By providing the public with real-time updates and accurate information, the dashboard can help to minimize panic and misinformation, while also ensuring that individuals take appropriate safety measures.
2. Government: The use of a dashboard in emergency and catastrophe situations is an example of how digital government can be leveraged to improve the delivery of public services. Digital government refers to the use of digital technologies, such as online platforms and data analytics, to enhance the efficiency, effectiveness, and transparency of government operations (Misuraca et al., 2020).
3. Industry: A dashboard can be an invaluable tool for protecting critical infrastructure and facilities during emergencies or natural disasters. By utilizing data-driven decision-making in emergency response systems, it becomes possible to identify potential threats and deploy necessary resources to secure vital infrastructure and facilities with a preventive management approach for the long term. This approach aligns with the global trend towards the fourth industrial revolution (Duan & Da Xu, 2021).
4. Environment: The efficiency gained from data-driven decision making has a significant impact on the environmental issue. Optimization of resource utilization is possible to be done when there is data available either for real-time action or future scenario planning especially on the logistic and resource planning. This somehow affect directly the environmental in term of carbon emission especially from fires (Wiedinmyer & Neff, 2007).
5. Academia: This study contributes a new insight into the body of knowledge for sustainable higher education itself. Greater attention can be made among scholars and academia on the importance of emergency response systems empowered with data analytics.

Conclusion

The findings of this study highlight the importance of data-driven decision-making in emergency response and disaster management systems at higher education. By utilizing cloud-based services such as online form creator and online dashboards, universities and communities can gather and analyze data to inform emergency response plans and improve the safety and security of individuals on campus. Furthermore, the study's emphasis on sustainable development goals underscores the need for emergency response systems that prioritize building resilience and preparedness for emergencies scenarios. As such, investing in smart campuses with robust emergency response systems can contribute to achieving these goals, making them an essential resource for decision-makers and stakeholders in emergency management and disaster preparedness. In summary, the link between campus emergencies and emergency response systems is clear. By implementing data-driven decision-making with cloud technologies, universities and communities can improve their emergency response and disaster management systems, ensuring the safety and security of individuals on campus while contributing to sustainable development goals.

Limitation and Recommendations

While this study offers important insights into emergencies and disasters in higher education, it is also subject to certain limitations. The effectiveness of visual analytics on emergency response and disaster management depends on factors such as the availability of resources and infrastructure, as well as the capacity of stakeholders to implement and use these technologies effectively. For example, the use of smartphone is essential to lodge an emergency report. In certain emergency cases where a person panics or passes out, there is a high possibility the person will be unable to use the technology effectively. As for future research, findings and limitations from this study could provide the way how to explore additional questions related to emergencies and disasters in higher education. Some potential areas for further investigation are:

1. Factors that influence the occurrence of emergency and disaster cases could be examined in future research. For instance, this study revealed a significant incidence of elevator malfunctioning on campus, and further research could explore contributing factors such as mechanical failure or improper maintenance to reduce the frequency of lift malfunctions.
2. The relationship between emergency and disaster cases and their effects on mental health could be investigated in future research. This study did not explore this connection, and additional research could identify successful approaches for delivering psychosocial support and increasing mental health resilience in affected communities.
3. Future research could be conducted to identify effective strategies for improving community readiness and resilience for emergency and disaster situations. Emergency preparedness and resilience are crucial for mitigating the effects of catastrophes and disasters.

Abstract: In modern days, agricultural waste such as vegetable waste has been increased tremendously due to rapid increment of population demand. This waste usually ends up being dumped in landfills which will eventually negatively impact the environment and indicate ineffective utilization of resources. Vegetable wastes such as tomatoes and cucumbers were used in this study, and they are rich in nutrients that have significant potential for utilization in the growth of various microorganisms such as probiotics. Thus, the aim of this study was to investigate the potential of vegetable waste as a probiotic culture medium. First, the proximate analysis of the vegetable waste was performed by rapid near-infrared (NIR) spectroscopy. Probiotic *Lactobacillus* spp. were sourced from locally bought yoghurt and cultivated in MRS agar and broth with dried tomato and cucumber powder extracts. The cultures were incubated at 37 °C for 24 h, and the growth of the microorganisms was observed. This study demonstrated that the utilization of tomato and cucumber waste has significant potential as a medium for probiotic cultivation.

Keywords: Vegetable waste, Alternative microbiological media, Waste valorization

Introduction

With the escalation of the human population, massive amounts of agricultural and food waste are generated worldwide. According to FAO (2019), fruit and vegetable waste (FVW) exhibits the highest wastage rate (40–50%) compared to other food categories. Besides that, the FVW includes rejected fruits/vegetables or fruits/vegetables that are not being marketed due to undesirable appearance. Traditionally, these wastes were disposed of through incineration or field dumping, which have a negative impact on the environment. Such wastes are rich in sugars and nutrients, making them suitable for the industrial production of bioproducts by microorganisms (Rosales et al., 2005). Therefore, it is pivotal that initiatives which utilise these wastes are developed to promote sustainability. Initiatives such as valorization of waste, which transforms waste into economically useful materials, have great potential to solve environmental issues. The valorization of waste into value-added products has become the focal point of numerous researchers in their efforts to reduce waste while simultaneously addressing environmental issues (Chaitanya Reddy et al., 2021; Chilakamarri et al., 2022)

Probiotics is defined as ‘live microorganisms that, when administered in adequate amounts, confer a health benefit on the host’ (Hill et al., 2014). Probiotics has gained significant attention globally for their beneficial effects such as improvement to the gut health, enhancing immune system function, and promoting cardiovascular health (Oniszczyk et al., 2021). Essential nutrients such as carbohydrates, fats, vitamins, proteins or minerals are vital to support the growth of probiotics. It is important to prepare suitable media that are meeting the microbial growth requirement. Different types of media are required in order to isolate and identify certain microbes from a particular sample or environment. However, most of commercially available microbial culture medias are expensive. In order to make the cost of probiotics production more economically feasible, it is beneficial to find and alternative media that are cost-effective (Soccol et al., 2010).

In this study, our main objective is to develop a low-cost culture medium for bacterial growth using rejected tomato and cucumber as the primary source of nutrients. The performance of the newly formulated media with tomato, cucumber or mixture of both was evaluated by comparing the growth of probiotics *Lactobacillus* spp. and *Bacillus subtilis* in both standard nutrient media and formulated agar.

Method

Collection and preparation of samples

Rejected vegetables, consisting of tomatoes and cucumbers, were collected from a local farm in Al-Khor, Qatar. The collected samples were transported to the laboratory, washed, and rinsed with distilled water to remove dust and other contaminants. The samples were then dried in an oven at 50 °C for 48 h and ground to a powder using a blender.

Rapid proximate analysis of vegetable wastes powder

The dried vegetable waste powder were subjected to rapid proximate analysis (Moisture, Fat, Protein, Ash, Fibre, Neutral Detergent Fibre and Acid Insoluble Ash) by using Near Infrared (NIR) Spectroscopy. Carbohydrate was then determined by difference method.

Preparation of microorganisms

In this study, two different probiotics bacteria were used; *Lactobacillus* spp. and *Bacillus subtilis*. The *Lactobacillus* spp. Were isolated from locally purchased yogurt, grown in deMan, Rogosa and Sharpe (MRS) media and incubated at 37°C for 24 hours. Meanwhile, the *Bacillus subtilis* were obtained from stock culture available in microbiology lab in Qatar Environment and Energy Research Institute. The stock culture were sub-cultured into Luria Bertani (LB) broth and incubated at 37°C for 24 hours.

Preparation of media and inoculation of microorganisms

1g of dry vegetable waste powder was mixed with 100mL distilled water and let stand for 30 minutes. The mixture then filtered with filter paper and the filtrate were collected. The filtrate was sterilized at 121°C for 20 minutes and used to prepare media with various concentrations of wastes (0%, 25%, 50%, 75%). Once the media is cooled, 1mL of bacterial suspension were inoculated into the prepared media and incubated at 37°C for 24 hours.

Observation on the bacterial growth in formulated media

After incubation, the turbidity of the samples was measured at 600nm which corresponds to the growth of the bacteria in the formulated media.

Results

Proximate content of vegetable waste

Proximate composition generally represents the nutritional quality of product. The proximate composition of dried tomato and cucumber is presented in Table 1.

Table 1. Proximate Content of Dried Vegetable Wastes

Proximate analysis	Cucumber Waste	Tomato Waste
Moisture (%)	1.733	11.9
Fat (%)	4.563	7.9

Protein (%)	16.710	23.4
Ash (%)	27.603	11.0
Fibre (%)	21.380	85.7
Carbohydrate (%)	26.64	45.8

* Each value represents the average of three replicates

Based on the result tabulated in Table 1, tomato waste indicates a higher percentage in terms of moisture, fat, protein, fibre and carbohydrate content compared to cucumber waste. Meanwhile, the percentage of ash content is higher in cucumber waste as compared to tomato waste.

Bacterial growth in alternative media

The experimental results revealed that vegetable waste-derived medium effectively supported the growth of probiotics. The optical density measurements showed a significant microbial growth in comparison to control, indicating successful probiotics proliferation.

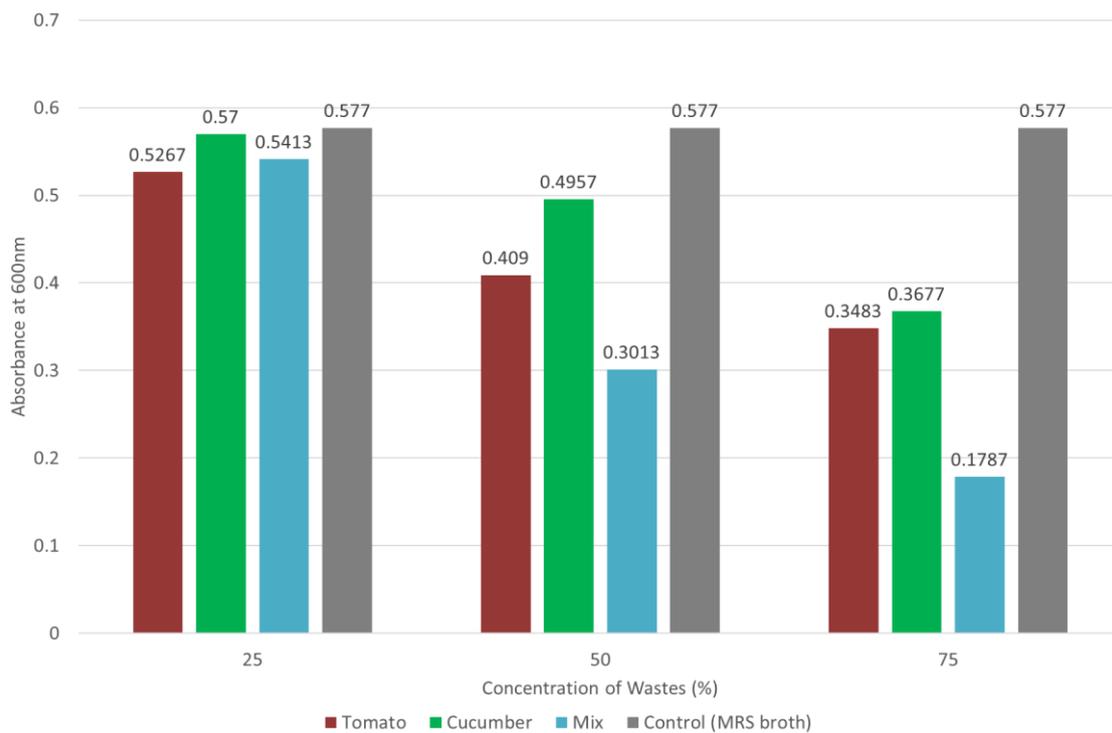

Figure 2. Turbidity measurement of *Lactobacillus* spp. in alternative media

In Figure 2, the absorbance of *Lactobacillus* spp. grown in 25% concentration of cucumber waste is the highest (0.57) among the other media formulations. It also shows comparable growth as compared to the control (*Lactobacillus* spp. grown in MRS broth) with 0.577 absorbance.

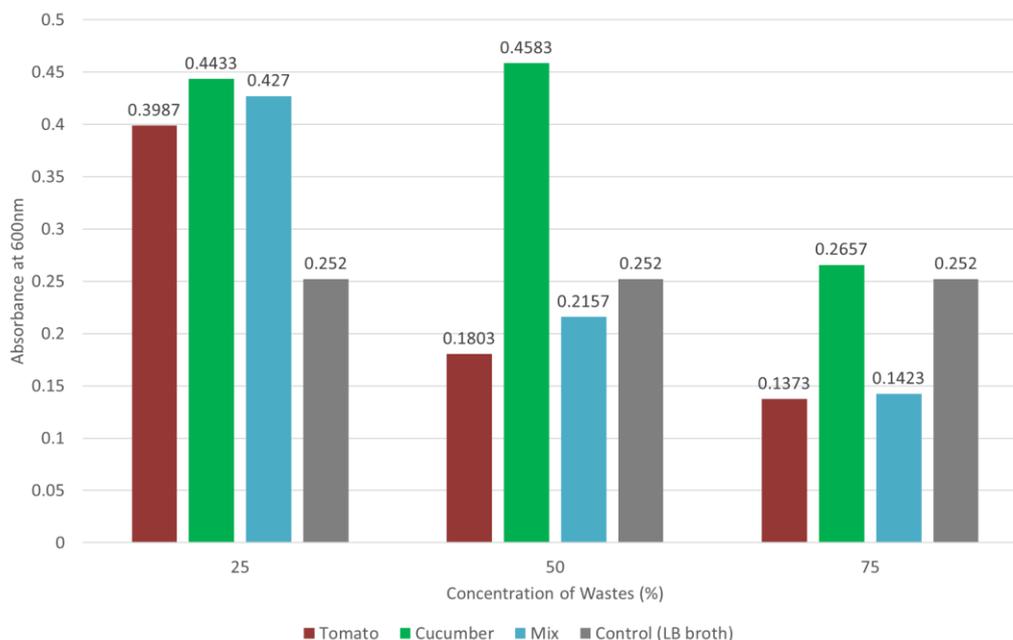

Figure 3. Turbidity measurement of *Bacillus subtilis* in alternative media

In the *Bacillus subtilis* growth diagram (Figure 3), the highest growth occurred in the formulation of 50% cucumber waste media compared to other formulations. These results may occur due to the composition of the 50% cucumber waste media containing nutrients suitable for *Bacillus subtilis* so that the isolate growth becomes optimum.

Discussion

The results of the proximate analysis revealed that moisture content was higher in tomato waste (11.9%) compared to cucumber waste (1.73%). This could indicate that the cucumber waste will have a relatively longer shelf life due to low water content. Besides that, cucumber waste contains higher ash content (27.6%) as compared to tomato waste, indicating that cucumber waste might have higher mineral content than tomato waste. The minerals are vital as they serve as inorganic co-factors in metabolic processes.

Result showed that investigations on proximate analysis of cucumber revealed that they are rich in carbohydrate, crude ash, crude fibre and followed by protein. In a previous study, it was reported that chemical composition of cucumber are protein in mesocarp 1.68%, in epicarp 3.84% and in endocarp 0.22% while the fat in epicarp is 0.56% and in endocarp is 0.02% (Abulude et al., 2007) which are far lower than reported in this study. The differences might be due to various factors such as nutrients availability, environment and weather during the plant cultivation. Thus, in this research, the proximate analysis of cucumber waste indicates that it can serve as a good source of nutrients with potential application as alternative microbiological media.

A previous reasearch conducted, indicated that MRS medium is the most common used media for *Lactobacillus*

sp cultivation while LB broth is most common media for *Bacillus subtilis* cultivation as it contains optimal growth factors and nutrition (De MAN et al., 1960; Lu et al., 2018). However, its high cost is not economically feasible in industrial-scale processes. In this study, we evaluated potentially low-cost media for *Lactobacillus* spp. production using tomato wastes and cucumber wastes. It was demonstrated that these wastes can potentially be used as a nutrient source for cultivation and fermentation of probiotics. However, further research need to be conducted to optimize the nutrients in the agricultural wastes media to increase the growth rate of probiotics.

Conclusion

Based on the findings of this study, it is concluded that alternative media supported the growth of both probiotics *Lactobacillus* spp. and *Bacillus subtilis*. Proteins and carbohydrates are very essential nutrients for the growth of any organism and available in the vegetable wastes. The alternative media which can be prepared very easily using different vegetable wastes is rich in nutrient and therefore can be used as an alternative to their commercially available growth media. Alternative media could be used as cheap media for routine experiments in laboratory. Further study on the optimization of the agricultural waste-medium should be conducted to maximize the growth of the probiotics.

Abstract: Aberrant cell growth leads to the development of a brain tumor i.e., when normal cells develop changes or mutations in their DNA, within the brain. It is a serious life-threatening disease which can also be cancerous or become cancerous. The need for early detection of brain tumor is essential for proper treatment. Diagnosis is usually done with the help of Magnetic Resonance Imaging (MRI) images. Machine learning can be used to build systems that automate the diagnosis process. Convolutional neural networks (CNNs) are a category of deep learning approach and one of the methods used for image processing the most frequently. The hybrid model presented in this paper, which combines convolutional neural networks (CNNs) and convolutional auto encoders (CAE), presents a unique method for diagnosing brain tumors. The proposed BT-CNNCAE approach provides acceptable results in the detection of brain tumor. It is evaluated on Br35H-2020 brain tumor dataset that consists of around 3000 MRI images. With only 26,833 parameters, the hybrid model is able to achieve training accuracy of 99.83% and testing accuracy of 97.50%, making it a useful tool for brain tumor identification.

Keywords: Cancer, Brain Tumor, convolutional autoencoder, convolutional neural network, MRI images.

Introduction

The brain is the most intricate and complex organ in the human body, serving as the nervous system's primary organ. It also plays the role of giving us a sense of awareness of ourselves and our surroundings [2], it is also in charge of directing and governing all body components. Brain Tumor occurs when normal brain cells develop

changes or mutations in their DNA and grow at an uncontrollable rate of growth. As these aberrant cells continues to grow they harm the healthy cells and thus disrupting typical human body functions [3]. Also, brain tumor can be cancerous or they can become cancerous. Brain tumor are usually categorised from grade 1 to grade 4 depending upon various factors that control their growth and spread [28]. Grade 1 and 2 tumors are generally non-cancerous while grade 3 and 4 tumors are malignant [28]. Children can develop brain tumors, but adults of any age can develop them as well. However, older adults tend to develop them more frequently. Cancerous or malignant brain tumors have no known specific aetiology, however it's considered that certain genetic disorders and prior head radiation therapy may enhance the likelihood that one will form. Typically, magnetic resonance imaging (MRI) is used to detect the presence or absence brain tumors instead of CT scans other different techniques because of its non-invasive nature [10,22,23]. MRI produces images of our organs and tissues using magnetic fields [22,23]. Our brain also has a strong magnetic field, which makes MRI an excellent tool for identifying brain illnesses without causing any damage to the brain. The type of brain tumor can be determined by an MRI, albeit a biopsy may occasionally be necessary [29].

The safest way to diagnose brain tumors is through an MRI scan. Machine learning and deep learning models that can automate the diagnosis of brain cancers can be trained using these MRI data. The vast majority of state-of-the-art automated systems are already employing advanced machine learning techniques to recognise and classify brain tumors. Their crucial stage is the feature extraction procedure, which entails these algorithms learning significant elements from the MRI pictures [11]. Dimensionality reduction is another step in the feature extraction process that decreases the amount of duplicated data without sacrificing any of the crucial information from the MRI pictures. To detect brain cancers, machine learning or deep learning models employ the retrieved features as input.

Over the years, deep learning techniques have grown very efficient and accurate in the field of classification problems alongside image processing [9]. Deep learning techniques that work well with image data include Convolutional Neural Networks (CNNs) and Convolutional Auto-encoders (CAEs) [1]. Convolutional Neural Networks are widely used in deep learning because of their efficiency in classifying input images into their respective classes [16], whereas to compress vast or complicated input features into a lower-dimensional space, convolutional auto-encoders can be used [13]. Thus, CAEs ends up aiding in dimensionality reduction. Both of these techniques use neural networks to extract spatial and temporal features from images and produce efficient results.

In order to minimise the amount of training parameters, this research introduces a hybrid CNN and CAE model for detecting brain tumors. Fig 1 shows the brief overview of the proposed BT-CNNCAE approach. While CNN was used to categorise the MRI scans into two groups that indicate the presence and absence of tumors, CAE was used to minimise the dimensionality of the input images, as well as the number of trainable parameters [12]. The remaining sections of the paper are divided into 4 groups. Section 2 reviews the prior research that has been done in this field, and Section 3 describes the suggested strategy and the construction techniques for the proposed BT-CNNCAE model. The outcomes of the suggested model for classifying brain tumors are finally

presented in section 4, while section 5 serves the paper's conclusion.

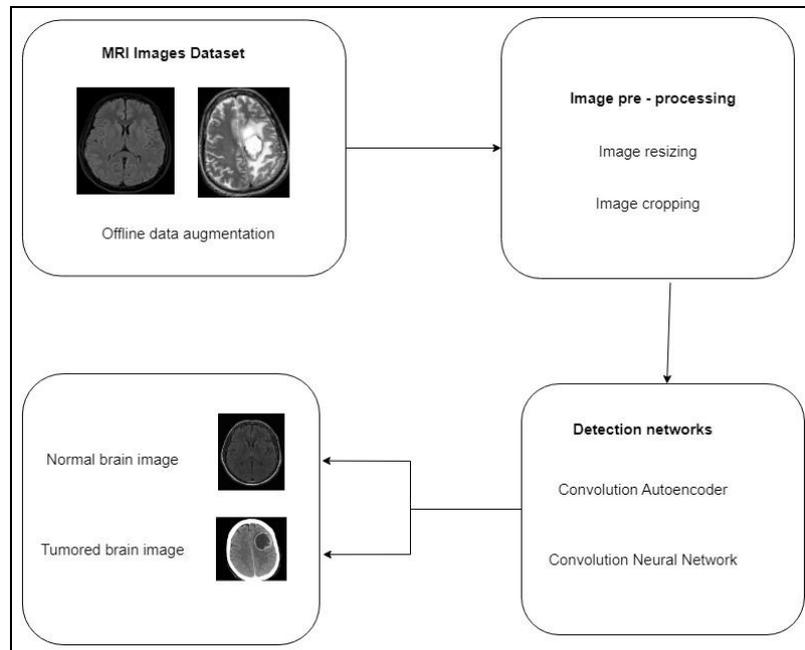

Figure 1: Overview of proposed BT-CNNCAE approach.

Literature Review

For the purpose of detecting plant diseases, Punam Bedi et al. (2021) [1] suggested a method based on convolutional auto-encoder and convolutional neural network. The approach's major goal was to reduce the number of trainable factors while maintaining accuracy. Their final model was trained using just 9,914 training parameters, and it had a training accuracy and testing accuracy of 99.35% and 98.38%, respectively. M. Yasir et al. (2021) [2] introduced a hybrid model of three different models for both the classification of brain tumor as well as localization of these tumors. In order to classify tumors into the three types of Glioblastoma, Astrocytoma, and Dendroglioma, they employed traditional convolutional neural networks. For tumor localization, they used faster region-based convolutional neural networks and region-based convolutional neural networks. Indu Singh et al. (2022) [3] proposed an approach brain tumor classification and detection using a hybrid CNN model consisting of Multinomial Logistic Regression, Random Forest and Support Vector Machine as classifiers. The model's accuracy was increased by tuning the hyper-parameters of the CNN model with the help of KerasTuner. The proposed model achieved an accuracy of 96.08%. M. Gupta et al. (2021) [4] classified brain tumors using three different CNN models. The first model was based on CNN and it achieved an accuracy of 91.29% while the next CNN model which used data augmentation, achieved a resultant accuracy of 79.79% and the third and final CNN model, using VGG16, achieved 87.27% accuracy in classifying the brain tumors. Syed M. Haider Shah et al. (2021) [5] introduced a CNN model which uses categorical cross-entropy as loss function along with parameter adjustment. The pre-processing phase involved fuzzy based enhancement method to enhance the brain tumor images i.e., MRI scans. The final accuracy achieved by the proposed model was

recorded as 97.60%. The model also classified brain tumors into meningioma, pituitary tumor and glioma tumor and no-tumor. A strategy based on employing a convolution neural network with a grey scale co-occurrence matrix for tumor localization was proposed by Praveen Kumar Ramtekkar et al. in 2020 [6]. The method also included segmenting photos using Kmeans and Otsu thresholding, clustering images using the partial differential equation method, and enhancing images using the multi histogram equalisation method. The model's ultimate objective was to develop an automated system for finding and classifying brain tumors. An automated brain tumor diagnosis method based on FCM (Fuzzy C-Means) and Clustering-based convolution Neural Network (CNN) was developed by L. Jagjeevan Rao et al. in 2020 [7]. The system had a 91 percent accuracy rate. Additionally, they compared the suggested model to K-Nearest Neighbour (KNN) and Back propagation Neural Network (BPNN), coming to the conclusion that CNN provided superior accuracy than these classifiers. Convolution neural networks (CNNs), which are based on data augmentation and picture pre-processing techniques, were proposed by A. M. Hashan et al. (2021) [8] as a means of detecting brain cancers. By identifying sharp features, the dark borders of the photos were removed using image pre-processing techniques. These photos were then normalised to an appropriate scale.

The fact that the above studies while achieved significant accuracy, their techniques were trained on a significant number of trainable parameters. Additionally, training a model having a higher count of trainable parameters needs a long period of training time or a powerful machine. Due to this, a model was designed and it set out to find a way to cut the amount of trainable parameters required to detect brain tumor without significantly lowering classification accuracy. In order to detect brain tumor, a unique hybrid model was thus developed in this study that first uses CAE for dimensionality reduction of the input MRI image and then uses CNN for classification into tumor present or absent. The main finding of this research is that the number of training parameters were significantly reduced by the dimensionality reduction before classification.

Method

This paper proposes a novel approach for brain tumor detection. The approach consists of building a convolutional-autoencoder (CAE) and convolutional neural network (CNN) based hybrid model. CAE is used to reduce the number of trainable parameters as well as dimensionality. The resultant compressed images are then fed to CNN model which classifies them as tumor and no-tumor.

The method starts by loading the dataset [14], which consists of 3000 MRI scans, and then shuffles and labels the loaded pictures. 80 percent of the dataset was utilised for training, and 20 percent was used for testing i.e., 2400 MRI scans were used for training and 600 scans were used for testing. The trained and tested data were then used as input for the convolutional autoencoder which have two parts.

Convolutional autoencoder primarily comprises of an encoder network followed by a decoder network. The task of encoding the images into smaller dimensions falls on the encoder network. The encoded images are created

by the bottleneck layer, the final layer of the encoder network. The decoder network decodes the encoded images, and the reconstruction layer, the last layer of the decoder network, reconstructs them [1]. This results in significant decrease in redundant features and only relevant features are left for the CNN classifier [17]. The final number of training parameters for the CAE were 29,507. The encoded images were then fed to the CNN model which was designed for final classification of MRI scans as brain tumor present or brain tumor absent.

Four convolutional layers make up the CNN classifier, and each of these convolutional layers is succeeded by a max pooling layer that shrinks the feature map that the convolutional layer's sampling produced i.e., it downsamples the feature map [18]. Convolutional layers employ ReLu as their activation function. The final output is generated by a fully-connected layer that uses sigmoid function succeeded by a dropout layer to handle overfitting. The final number of training parameters for the CNN model were 26,833. Figure 2 describes the flowchart of the proposed methodology.

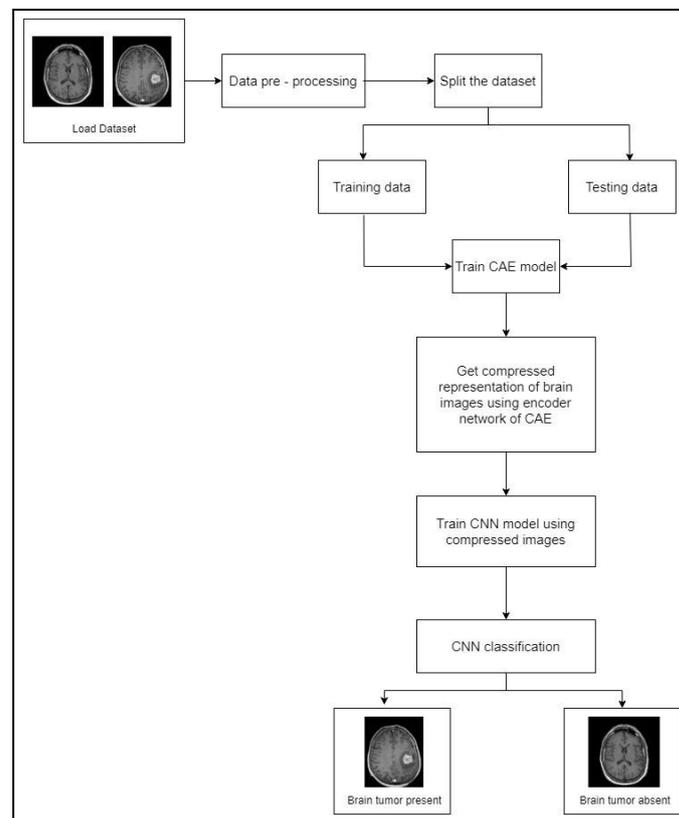

Figure 2: Flow chart of proposed BT-CNNCAE methodology.

A. Convolutional Autoencoder

A convolutional autoencoder (CAE) is a special case of unsupervised learning model or more precisely self-supervised learning model. It is a neural network that is primarily trained with images. It consists of 2 components i.e., encoder network and decoder network. The last layers in encoder network and decoder network are called bottleneck layer and reconstruction layers respectively. CAE was built using 2 convolutional layers

for both encoder and decoder network. In both the networks, the convolutional layers use ReLu activation function, the equation for which is given below:

$$f(x) = \max(0, x) \quad \dots (1)$$

ReLu is a non-linear function and is one of the most commonly used activation function in case of neural networks. ReLu was used in CAE so that the convolutional layers learn complex relationships from the training data. Encoder networks also uses max pooling layers after every convolutional layer which downsamples the feature map [25]. The mathematical equation which describes the encoder network is given below:

$$X_{e_{i+1}} = f_{e_i}(W_{e_i}^T X_{e_i} + b_{e_i}) \forall i \in 0, 1, \dots, N \quad \dots (2)$$

where,

X_{e_i} denotes the input, $X_{e_{i+1}}$ denotes the output, W_{e_i} denotes the weight vector, b_{e_i} denotes the bias, and f_{e_i} denotes the activation function that was used in the i th layer of the Encoder Network [1].

The Decoder network is built similar to encoder network but the layers are structured in reverse order. Also, each convolutional layer is succeeded by an upsampling layer which in contrast to max pooling layer upsamples the feature map. The model in turn produces compressed images with reduced dimensionality as well as significant feature reduction while keeping the relevant features safe. The Decoder network also employed the activation function that was used in Encoder network i.e., ReLu. The mathematical equation that describes the decoder network is given below:

$$X_{d_{i+1}} = f_{d_i}(W_{d_i}^T X_{d_i} + b_{d_i}) \forall i \in 0, 1, \dots, N \quad \dots (3)$$

where,

X_{d_i} denotes the input, $X_{d_{i+1}}$ denotes the output, W_{d_i} denotes the weight vector, b_{d_i} denotes the bias, and f_{d_i} denotes the activation function that was used in the i th layer of the Decoder Network.

B. Convolutional Neural Network

Convolutional Neural Networks (CNNs) are a subset of neural networks that are particularly adept at processing input with a grid-like architecture, such as pictures. The three main parts of CNNs are convolutional layers, pooling layers, and fully connected layers [21]. Convolutional layers handles the computational part, the spatial size of the representations is reduced by pooling layers and finally the fully connected layers consists of full connectivity of all neurons in the preceding and succeeding layer. The fully connected or Dense layer is responsible for final classification. Fig 3 gives the detailed architecture of the hybrid model which consists of encoder network of CAE as well as the complete CNN model.

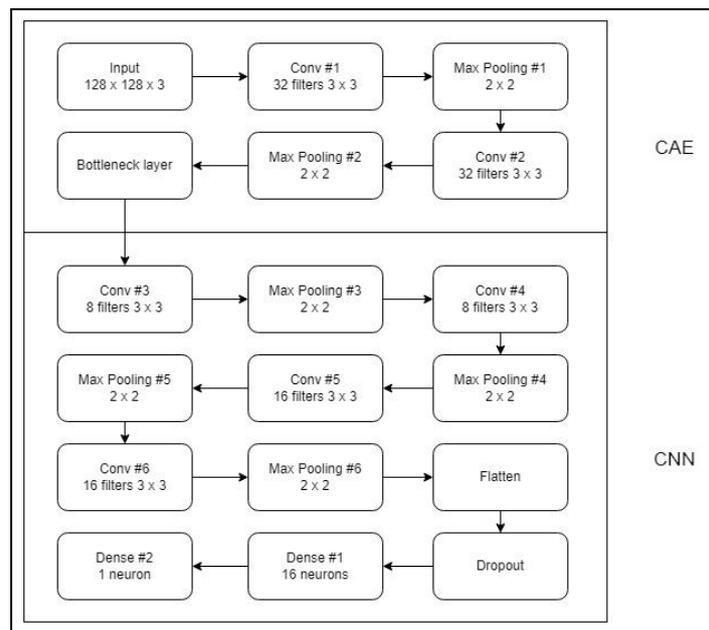

Figure 3: Complete Architecture of the hybrid BT-CNNCAE model.

The CNN model was built using four convolutional layers. Encoded images that were generated by the CAE, were used as input for these convolutional layers which applies a convolution operation i.e., turns a 2D feature matrix into a separate 2D feature matrix and sends the results to the following layers [20]. Each of the convolutional layer uses ReLu activation function and is succeeded up by a max pooling layer which selects a maximum feature from the output of each convolutional layer i.e., it creates a downsampled (pooled) feature map [26]. The downsampled feature map still contains relevant features. This results in reduction in number of trainable parameters which came out to be 7,441 for CNN. Finally, the feature map is flattened into a continuous linear vector via the Flatten layer. A dropout layer is also appended to handle overfitting. The last Dense or fully-connected layer uses sigmoid function and classifies the output. The equation for sigmoid function is given below:

$$S(x) = \frac{1}{1 + e^{-x}} \quad \dots (4)$$

where e is the Euler's number.

Sigmoid function was used as the problem was a binary classification problem i.e., brain tumor present (interpreted as 1) and brain tumor absent (interpreted as 0).

There were two types of losses involved in this research: training loss and validation loss. How well a deep learning model matches the training set of data is measured by training loss. Training set is used to evaluate model's inaccuracy. It should be emphasised that the training set is a subset of the dataset utilised to train the model initially. On the other side, a statistic known as validation loss was used to evaluate how well a deep learning model performed on the validation set. The section of the dataset designated for model efficacy testing is known as the validation set. Both losses were computed using the Mean Squared Error approach for this

study's purposes, but the focus was subjected on the validation loss only. MSE was calculated by squaring the difference between the model's predicted outputs and the correct output value and averaging it across the entire dataset. The equation for MSE is given below:

$$MSE = \frac{1}{N} \sum_{i=1}^N (y_i - \hat{y}_i)^2 \quad \dots (5)$$

where y_i depicts the predicted values, \hat{y}_i depicts the correct (observed) values and N denotes the total number of values. For implementation purposes, the MSE was implemented with the help of SkLearn library. Finally, the CNN and CAE hybrid model is layered together to give final classification result.

Results

The proposed approach was evaluated on Br35h-2020 dataset [14]. The dataset consisted of 3000 MRI images with 1500 containing tumor and 1500 not containing tumor. Table I shows the detailed layer-wise construction schema of the proposed BT-CNNCAE model. Various attributes that define the model are shown and their values were chosen after careful observation and experimentation.

Table I. Layer-wise construction schema of the proposed BT-CNNCAE model.

Number	Type of Layer	Input Shape	Filter Count	Filter size	Activation	Padding	Output Shape	Count of trainin parameters
1	Input layer	128 x 128 x 3	3	-	-	-	128 x 128 x 3	0

Total number of parameters								26,833

The various hyperparameters of the CNN classifier are displayed in Table II. Adam was chosen as the optimization algorithm for calculating individual adaptive learning rates [19] while binary cross-entropy method

was employed for loss measurement as the problem itself is a binary classification problem. ReLu and sigmoid were used as activation and output activation function respectively. As for the batch size, epochs and no. of convolutional layers hyperparameters, their values were chosen after careful experimentations and observations. In general, all of these parameters were used to train CNN model and were chosen after various combinations to achieve better accuracy and lower the loss.

Table II. Hyperparameters of the CNN classifier.

S. No.	Hyperparameter Used	Field Value
1.	Optimization Algorithm	Adam
2.	Loss	Binary crossentropy
3.	Activation Function	ReLu (Rectified Linear Unit)
4.	Output Activation Function	Sigmoid
5.	Batch size	256
6.	Epochs	100
7.	Number of convolutional layers	4

Fig 4 shows the validation and training accuracy achieved vs Epochs by the proposed hybrid model. The training accuracy reached 99.83% while the validation (testing) accuracy achieved was 97.50%. The testing accuracy was calculated using the below given formula:

$$Accuracy = \frac{TP + TN}{TP + TN + FP + FN} \quad \dots (6)$$

where,

TP indicates the True Positive count, *TN* indicates the True Negative count, *FP* indicates the False Positive count and *FN* indicates the False Negative count.

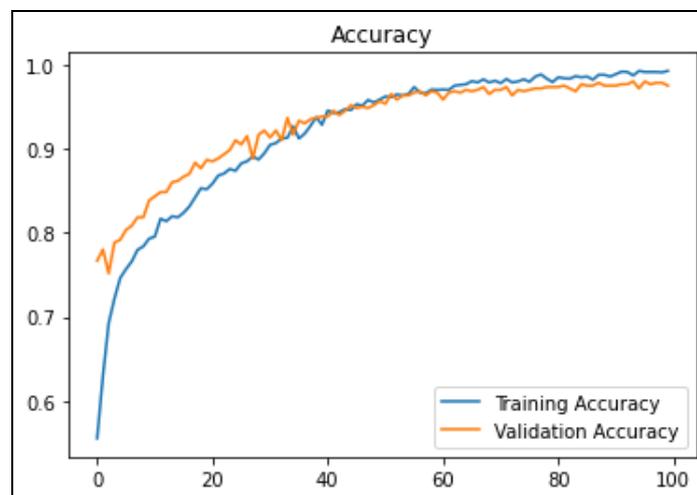

Figure 4. Training vs Validation Accuracy

Figure 5 depicts the validation (testing) and training loss vs Epochs for the hybrid model. The loss was calculated using mean squared error (MSE) method. The validation loss came out to be 0.018 which is well within the acceptable parameters. It can be seen that the loss has significantly decrease. The number of training parameters were also significantly reduced to 26,833.

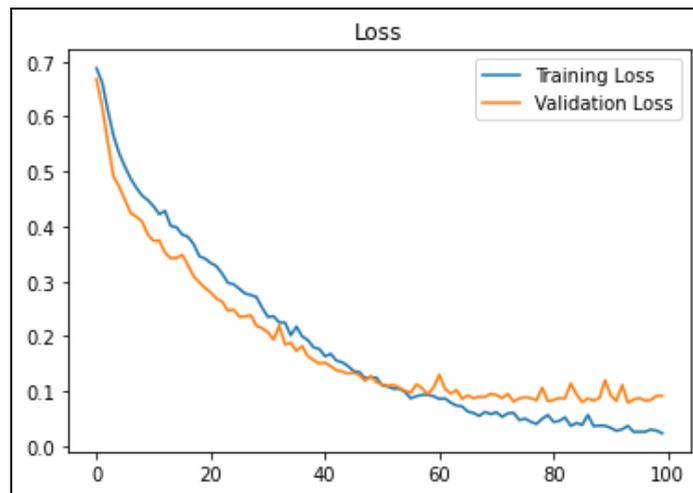

Figure 5. Training vs Validation Loss

The confusion matrix of the CNN model is shown in figure 6. Confusion matrix is a standard measure of performance of any machine learning or deep learning model. It shows all combinations of actual values against predicted values.

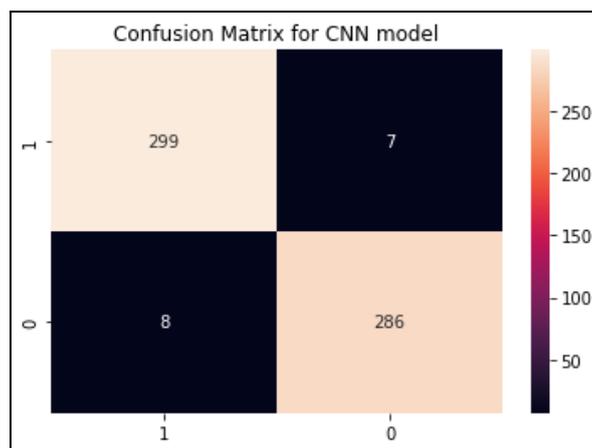

Figure 7. Confusion Matrix for the CNN model

The recall value that can be calculated from confusion matrix came out to be 0.51 while the precision value was observed to be 0.97. The F1-score was calculated as 0.67 which is useful measure when comparing two machine learning models as it measures both recall and precision at the same time. Equations (8), (9) and (10) gives the formulae that were used to calculate the recall, precision and F1-score:

Author(s)	Approach Used	Testing Accuracy	Number of trainable parameters(approximately)
T. Hossain [15]	CNN	97.87%	3.9 million
Muhammad Yasir [2]	Faster R-CNN with AlexNet	89.10%	61 million
Indu Singh [3]	Ensemble learning	96.08%	4.1 million
Syed M. Haider Shah [5]	Fuzzy based enhancement with CNN	97.60%	2.3 million
Proposed BT-CNNCAE model	CNN + CAE	97.50%	26,833

$$Sensitivity (Recall) = \frac{TP}{TP + FN} \quad \dots (8)$$

$$Precision = \frac{TP}{TP + FP} \quad \dots (9)$$

$$F1 - Score = 2 * \frac{Precision * Recall}{Precision + Recall} \quad \dots (10)$$

where, TP, TN, FN, FP are values that are explained after equation 6.

For calculating the number of trainable parameters of existing research methodologies, the following formula was used:

$$N = ((w * h * d) + 1) * k \quad \dots (11)$$

where N denotes the number of trainable parameters, w denotes the shape of width, h denotes the shape of height, d denotes the previous layer's filters, and k accounts for all such filters in the current layer.

It must be noted here that 1 is added in the above formula because of each filter's bias term. Also, the above formula can only be used to calculate the number of trainable parameters in the convolutional layer of the neural network. Finally, the above formula gives an approximate number of trainable parameters for only those methodologies which contained the required metrics as shown in the above formula. The comparison with various approaches is shown in Table III.

Table III. Comparison with existing approaches.

The authors used different datasets and achieved different accuracies as evident from the table. Even though the authors used variations of CNN, it can be seen that the achieved accuracies varied largely based on the preprocessing techniques as well as deep learning techniques chosen. The proposed approach achieved superior accuracy compared to other mentioned approaches.

The above metrics as well as comparison with other existing approaches clearly shows that the proposed BT-CNNCAE approach has achieved desirable results along with reduction in the number of parameters used.

Conclusion

The proposed BT-CNNCAE approach uses a hybrid model consisting of convolutional auto-encoder (CAE) and convolutional neural network (CNN). The CAE comprised of 2 primary components i.e., encoder network and decoder network with bottleneck layer and reconstruction layer being the last layers of corresponding networks [1]. The training and testing percentages were kept at 80% vs 20% respectively. The images were taken from a public dataset Br35H-2020 [14] which is available at kaggle. The trained and tested data were fed to the CAE and compressed images were generated. The compressed images were used as an input for training CNN model. The CNN model consisting of 4 convolutional layers with each of the convolutional layer preceded by a max pooling layer [27]. The activation function used was ReLu and a dropout layer was also appended to handle overfitting. The fully connected layer used sigmoid function and classifies the final output.

Training accuracy for the hybrid model was 99.83%, and testing accuracy was 97.50%. The loss was calculated using Mean Squared Error method and it came out to be 0.018 which is well within acceptable range. The number of trainable parameters were reduced by the hybrid model to only 26,833. The above results show the proposed BT-CNNCAE model is a viable tool that can be used for the detection of brain tumor cancer.

Measurements Of Strains on The Cutting Tooth on A Bucket Wheel Excavator in Coal Mining Process

Mădălin Andreica

University of Petroșani, Romania

Abstract: The specific strength of the cutting force for coal and surface rocks, varies to a great degree in the mine quarries. The size and direction of the forces from the cutting teeth also depend on the geometry of the teeth, and the way it is mounted in the bucket of the bucketed wheel. Due to the complexity of the excavation process and the kinematics of the cutting tool, the accurate determination of the forces in the cutting teeth can be realized only through an experimental method in situ, thus the reason of the research in order to conceive and materialize dynamometric teeth identical to the regular cutting teeth, mounted on a dynamometric bucket, and the electrical harness for measuring, transmitting and recording the data into suitable media storage. For the in-situ experiments, it has been established that the 4 teeth that equip a bucket to be all dynamometric therefore creating a dynamometric bucket, which can be mounted onto excavators of type RS1300. In the paper it has been specified that the dynamometric tooth had the same geometrical parameters and performed in the same conditions as the real teeth.

Keywords: Mining, Excavation, Measuring, Cutting tools, In situ experimentation.

Citation: Andreica, M. (2023). Measurements Of Strains on The Cutting Tooth on A Bucket Wheel Excavator in Coal Mining Process. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 2300-2312), Cappadocia, Turkey. ISTES Organization.

Introduction

Following the experimental tests of displacement through splintering of the coal and rocks from the surface of the Oltenia mine fields, on samples taken from different areas of the field, measurements and records of tangent, normal, and lateral forces have been taken on a set of model teeth fitted with a tension dynamometer.

Through the processing of the recorded data, a varied range of specific forces for cutting of coal and surface rocks are obtained, from which it has been determined the maximum threshold forces of the teeth of the buckets wheel excavators working on different quarries. Knowing the forces which act on the cutting teeth, we conceived three types of teeth with improved characteristics over the ones used until now for three different ranges of the specific cutting strengths.

The specific strength of cutting of coal and of surface rocks from the mine quarries, vary in the mining field, Figure 1.

Figure.1 RS 1300 Excavator type in the mining field

For this reason, the splintering forces on the cutting teeth also have significant variations in the mining fields. The size and direction of the forces from the cutting teeth also depend on the geometry of the teeth, their placement and the direction of mounting in the bucket of the bucketed wheel, Figure 2.

Figure. 2: Dynamometric bucket mounted onto RS1300 excavator type

Due to the complexity of the excavation process and of kinematics of the cutting tool, the accurate determination of the forces in the cutting teeth can be realized only through an experimental method in situ, reason for which the research has been conducted in order to conceive and realize dynamometric teeth identical to the regular cutting teeth, forming an assembly considered as a dynamometric bucket, and the electrical harness for measuring, transmitting and recording the data into locations established previously and suited for, Figure 3.

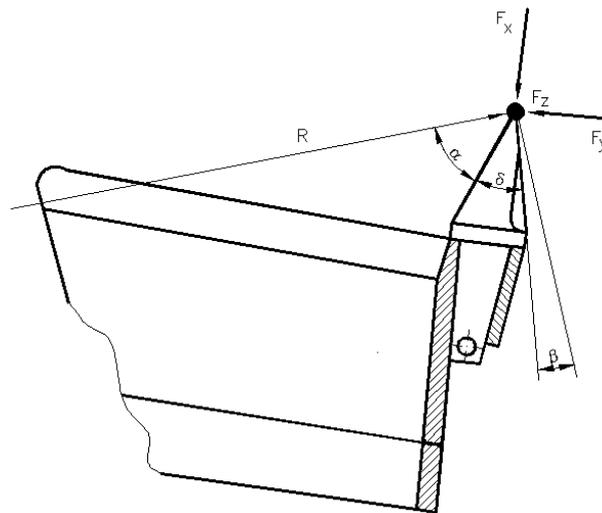

Figure. 3: $\alpha=55^\circ$; $\beta=7^\circ$; $\delta=28^\circ$; $R=11000\text{mm}$

Method

Presentation of the conceived dynamometric tooth

Table 1 presents the geometrical parameters of the three types of teeth.

Table 1.

No	Geometrical parameters (Symbol)	Tooth type		
		I	II	III
1.	Clearance angle (α)	52°	47°	55°
2.	Seating angle (β)	7°	7°	7°
3.	Sharpening angle (δ)	31°	36°	31°
4.	Cutting angle (γ)	38°	43°	35°
5.	Lateral longitudinal angle (ζ)	5°	5°	5°
6.	lateral transversal angle(θ)	3°	3°	3°
7.	Width of the cutting edge of the tooth (b)	120 mm	120 mm	120 mm
8.	Inclinal angle of the seating surface (φ)	13°	15°	13°

Because the measured information is represented by the specific displacements from the application points of the transducers onto the teeth, the relations between them and the components of the resulting points have been

established for each tooth (normal, lateral, tangent).

Figure 4 presents the fastening of the tooth onto the bucket of the bucketed wheel excavator used in quarries Jilț, Roșia and Husnicioara.

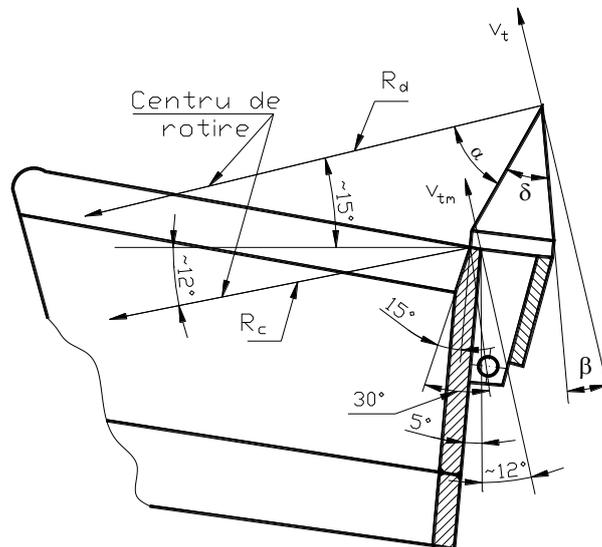

Figure 4. The fastening of the teeth into the bucket

Figure 5 presents the sketch and the geometrical parameters for the teeth type I and II. Type II has the smaller clearance angle. An acute sharpening angle is recommended for cutting coal with higher specific strength ($A = 800...1200 \text{ N/cm}$), from the Oltețu and Peșteana quarries.

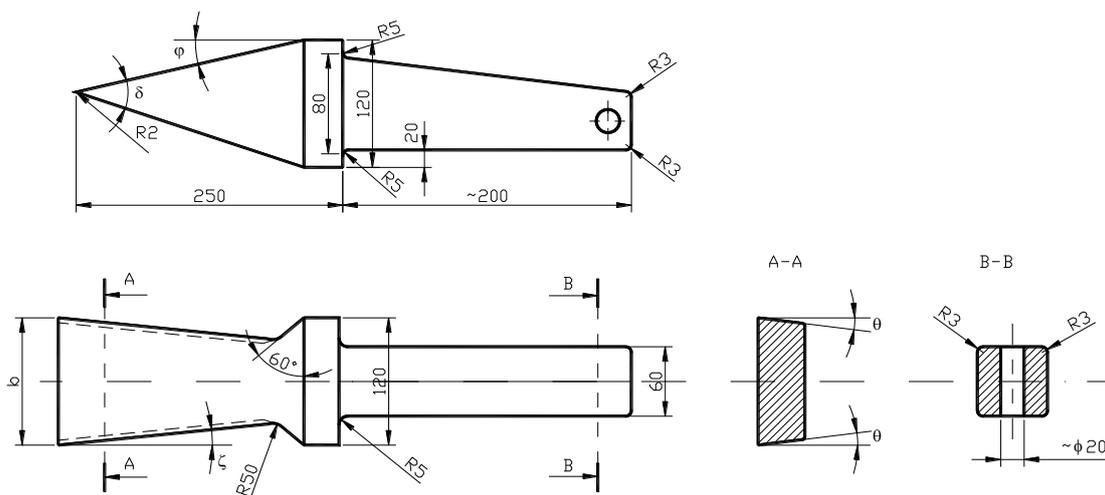

Figure 5. The sketch and the geometrical parameters for the teeth type I and II

Figure 6 presents the shape and geometrical characteristics of the type III, which can cover the entire range of specific cutting strength.

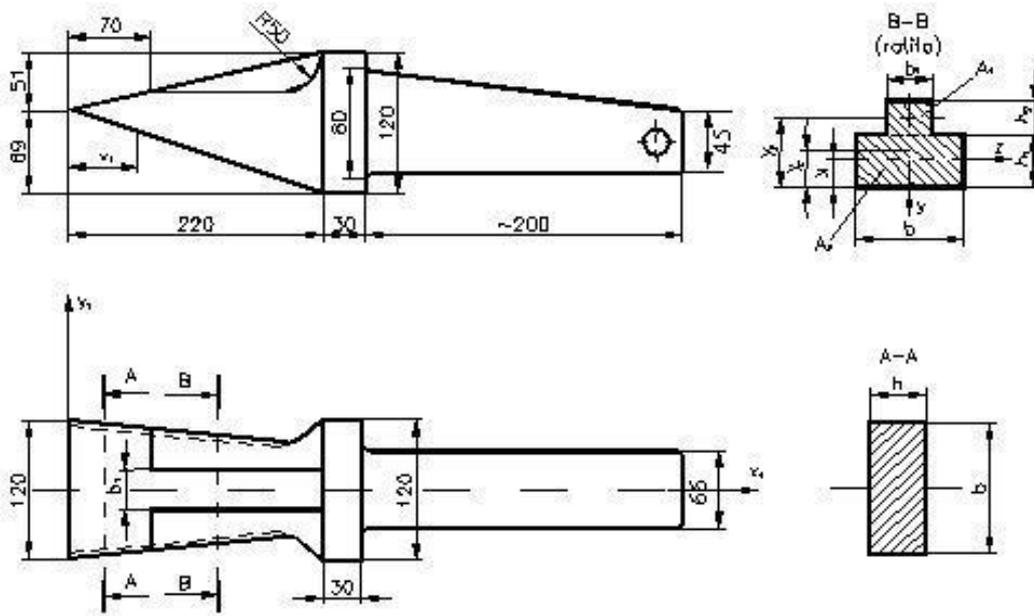

Figure 6. The sketch and the geometrical parameters for the teeth type III

Figure 7 presents the conceived tooth for the research, which is supposed to cover efficiently the displacement of the entire range of specific cutting strengths for the coal and rocks in the Romanian quarries.

Figure. 7

In order to realize the tooth as a dynamometric one there has been provided the placing on the two sides of the tooth's tail (in the free area between the active side and the support that holds it), at a distance of $l=264\text{mm}$ from the edge, of three electro-resistive transducers. In figure 8 it is presented the dynamometric tooth with the places in which the three transducers are applied SG1 SG2 SG3 and a has been produced a canal in the length of the tooth in order to provide for the electrical conductors from the transducers to the electrical sketch, which will be protected with plates. From here the conductors will be shielded onto the bucket, and the bucketed wheel to the transmission system of the measured data.

Figure. 8: Strain gauges bonded on the dynamometric tooth

Relations between the forces which act on the tooth and the specific displacements from the measuring points.

To establish the program to gather and modify the data obtained from the measurements it is necessary to establish the relations between the forces F_x , F_y , F_z with random values, which act onto the dynamometric tooth in the splintering process, his geometrical parameters and the specific linear displacements from the placing points of the SG onto the dynamometric tooth.

Specific deformations for the forces F_x , F_y , F_z , applied to the center of the edge of the tooth and the geometrical cross section in which the three SG are applied, figure 9, the following relations are obtained:

$$F_x = E \frac{(\varepsilon_2 y_3 - \varepsilon_3 y_2) + \frac{(\varepsilon_1 - \varepsilon_2)(z_2 y_3 - z_3 y_2)}{z_2 - z_1}}{y_3 \left(-\frac{1}{A} + \frac{e_1 y_1}{I_z}\right) + y_2 \left(\frac{1}{A} + \frac{e_2 z_3}{I_y}\right)}$$

$$F_y = \frac{EI_z}{ly_3} \left[\varepsilon_2 + \frac{(\varepsilon_1 - \varepsilon_2)z_2}{z_2 - z_1} - \frac{(\varepsilon_2 y_3 - \varepsilon_3 y_2) + \frac{(\varepsilon_1 - \varepsilon_2)(z_2 y_3 - z_3 y_2)}{z_1 - z_2}}{y_3 \left(-\frac{1}{A} + \frac{e_1 y_1}{I_z}\right) + y_2 \left(\frac{1}{A} + \frac{e_2 z_3}{I_y}\right)} \right]$$

$$F_z = EI_y \frac{\varepsilon_1 - \varepsilon_2}{l(z_2 - z_1)}$$

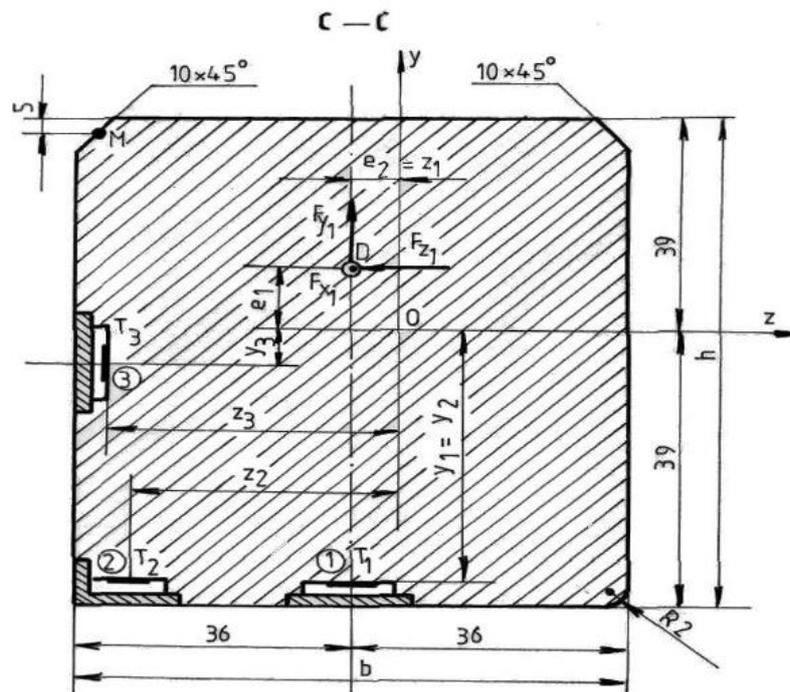

Figure 9: A cross section through the tail of the sample tooth in which the SG are applied

From tests done in laboratory conditions, doing splintering with a machine coal samples and rocks taken from certain areas of the mine fields in Oltenia with different etalon teeth mounted on a dynamometer conceived especially for these tests, there have been determined the cutting characteristics from which it resulted using similar ways for the splintering forces these maximum values: $F_x=60\text{kN}$, $F_y=18\text{kN}$ și $F_z=10\text{kN}$. With these forces there have been determined the values of the stress and there is a base for the design of the tooth further analyzed in this paper.

From the decomposition of these forces depending on the tooth it yields:

$$F_{y1} = F_x \cos 52^\circ - F_y \cos 38^\circ = 2,275 \cdot 10^4 \text{N}; \quad F_{x1} = F_x \sin 52^\circ - F_y \sin 38^\circ = 5,87 \cdot 10^4 \text{N};$$

$F_{z1} = 10 \cdot 10^4 \text{N}$. With these forces there has been determined the strain state to the type III, which is more supple in design. These forces represent the results of specific loads which have a random distribution on the active sides of the tooth and in a covering, calculation have been considered applied to the type of the teeth.

From the analytical calculations and with the help of the finite element method, in the most stressed point of the section to place the SG1, SG2 and SG3 it has been obtained the strain $\sigma_M = 248 \text{ N/mm}^2$, figure 10, resulting in this section of the dynamometric tooth (which is the most stressed). For the dynamometric tooth it has been suggested the material 41MoCr11, which has an increased mechanical strength ($\sigma_{02} = 750 \text{ N/mm}^2$), but also a high resistance to wear. A safety coefficient of $c = \sigma_{02}/\sigma_M = 3$.

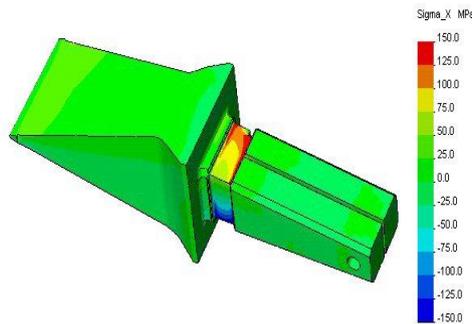

Figure. 10: Stress in the SG direction calculated with finite element method

Geometrical values of the section where are placed the SG, presented in figure 9 are: $y_1=-29\text{mm}$; $y_2=-29\text{mm}$; $y_3=-0,21\text{mm}$; $e_1=3\text{mm}$; $e_2=-3\text{mm}$; $e_3=3\text{mm}$; $z_1=-29,15\text{mm}$; $z_2=-29,15\text{mm}$; $z_3=-32\text{mm}$; $A=5315\text{mm}^2$; $I_z=2515547\text{mm}^2$; $I_y=2188730\text{mm}^2$.

The expression of the maximum stress from a current section of the teeth on the range $y_1 \in [0;70]\text{mm}$, and from the axis stress and bending is:

$$\sigma = -10^4 \left(\frac{5,836}{65,448x_1 - 0,0934x_1^2} + \frac{2,275x_1}{5,949x_1^2 - 0,00866x_1^3} + \frac{10^4}{1308x_1 - 3,799x_1^2 - 0,00276x_1^3} \right)$$

in which x_1 is introduced in mm and yields the strain in N/mm^2 .

In Figure 11 it is represented the variation chart of the strain for $x = 0..70$ mm, in the most stressed points of the active side of the tooth, from which it results that close to the edge there are high values for the strain. This is because in the calculations the tooth was considered perfectly sharp, whereas in reality it's tip is rounded with a ray of 2,5 mm.

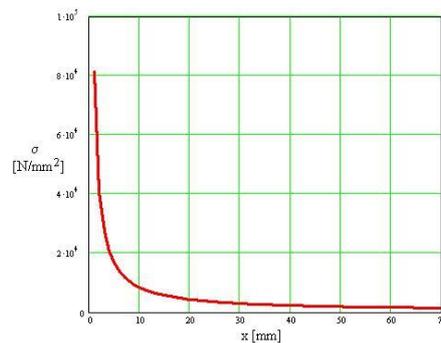

Figure.11 Max strain variation chart for $x \in [0; 70]$ mm

The complex shape of the tooth for $x_1 \in [70..220]$ mm, has imposed the determination of stress in the most stressed points along x_1 , and it yielded the variation chart for the maximum strain from figure 12. the values of the max strain from the most stressed points of this range have been obtained with the help of:

$$\sigma = -10^4 \left(\frac{5,837}{A} + \frac{5,836 \cdot e}{W_{z1}} + \frac{2,275 \cdot x_1}{W_{z1}} + \frac{x_1}{W_{y1}} \right),$$

In which A, W_{z1} și W_{y1} are the area and the strength modules in the considered points, and e is the eccentric of

the force F_{x1} with the center of the sections.

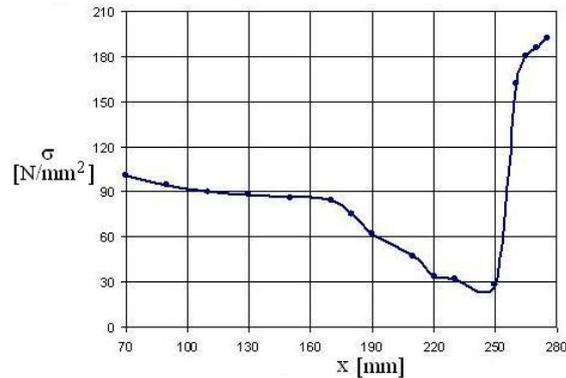

Figure 12. Max strain variation chart for $x \in [70; 275]$ mm

In figure 12 it is also presented the variation of strain for $x = 220...250$ mm, for $x = 220...230$ of the active side with a square section 120×120 mm² and on the handle of the tooth until the section that enters the cell ($x = 250...275$ mm), on which the section has been considered constant and rectangular by $66 \times 66,5$ mm².

The leap variation of strain from 28,39 N/mm² to 162,43 N/mm², in the section with $x = 250$ mm is due to the leap in section of the tooth, from the active side to the handle of the tooth (which is fixed into the bucket). In the leap section of the tooth's dimensions, it is realized a coefficient of concentration of strain $\beta_k \approx 2$, resulting in this section a maximum strain of $\sigma \text{ N/mm}^2_{max}$ and a safety coefficient $c = 2,3$.

On the tooth strain gauges are installed on 3 points, requiring 6 strain gages in all, type 3/120 LY-11 HBM, interconnected in half bridges. In this way it is possible to determine by measuring the bending deformations in 3 points. This configuration makes it possible to compensate for temperature.

Calibration

Calibration was carried out in the laboratory, where the tooth was subjected to a series of defined loads, figure 13.

Figure. 13: Dynamometric tooth calibration in laboratory

The diagram in figure 14 shows some typical laboratory test results. They represent the development of force during a test for 3 directions, F_x , F_y , F_z .

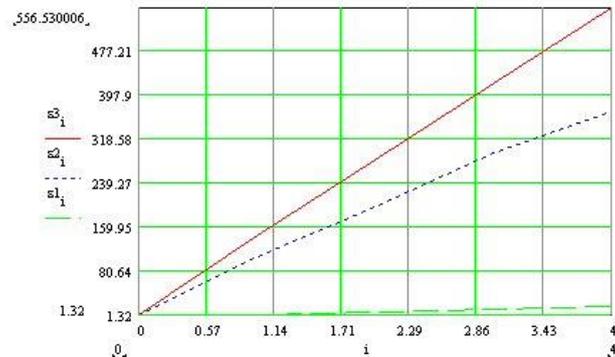

Figure.14 Measurement signals obtaining during calibration the tooth

The measurement data was used in the appropriate transfer matrix, where good linearity and reproducibility were observed.

For the maximum values of the forces F_x F_y F_z on their acting simultaneously onto the teeth are obtained the maximum values for the specific displacements in points 1, 2 and 3: $\epsilon_1=508,989 \cdot 10^{-6}$; $\epsilon_2=345.293 \cdot 10^{-6}$; $\epsilon_3=-227.674 \cdot 10^{-6}$.

During the splintering process, the relations between the forces F_x F_y F_z changes continuously, the resultant force to these forces being a spinning vector, with an application point in the center of the tooth. For this reason, the specific displacement ϵ_i from the i point ($i=1,2,3$) can vary from 0 to ϵ_i max. Therefore, for $F_{x1} = F_{z1} = 0$ it is obtained $\epsilon_{1max}=512,723 \cdot 10^{-6}$, for $F_{z1} = 0$ results $\epsilon_{2max}=512,723 \cdot 10^{-6}$, and for $F_{y1} = 0$ it is obtained $\epsilon_{3max}=239,043 \cdot 10^{-6}$.

In situ test apparatus

Figure.15

In figure 15 there is presented the electrical measuring and transmitting installation for acquisition and storage of the data from the stress from the teeth of the dynamometric bucket, which we includes: electro-resistive transducers mounted on the teeth; tensometric amplifier, autonomous source, converting circuit tension-frequency, data acquisition system and computer.

Conclusion

For the in-situ experimentations, it has been established that the 4 teeth that equip a bucket to be all dynamometric therefore creating a dynamometric bucket, which can be mounted onto excavators of type RS1300. In the paper it has also been established that the dynamometric tooth to have the same geometrical parameters and to work in the same conditions as the real teeth. Following the analysis of the bucketed wheels and the way that the teeth is fixed into the holders it has resulted that the electro-resistive transducers should be placed onto the tail of the tooth, in the free area between the tooth's shoulder and it's holder, in places covered with metallic plates to protect from mechanical hits, and environmental factors. This placement also has the advantage of a placing and a good protection of the electrical conductors which tie the transducers to the tensometric bridge which will be placed onto the rotor of the bucketed wheel near the axel.

From the numerical calculation using the finite element method, on an simultaneous application of forces F_x F_y F_z onto the dynamometric tooth there have resulted the specific displacements $\varepsilon_1=0,00047$; $\varepsilon_2=0,0003$ and $\varepsilon_3=-0,00022$, which are practically equal to those that resulted from the classical calculations.

This paper presented two transducers with six degrees of freedom, suitable for measuring the forces and moments that a skier transfers to the skis. The first transducer was fully test-ed in the laboratory, during calibration and during skiing trials under real load conditions. The second new and independently developed transducer was designed to increase compactness, safety, precision and sensitivity in relation to the 3 loads.

At the same time satisfactory decoupling effects were achieved in three ways:

1. Mechanically by means of the HBM strain gages which are optimally tuned to the geometry and stresses of the sprung elements.
2. Electrically due to wiring the strain gages in a special way to compensate for unwanted signals.
3. Mathematically by computing the cali-bration matrix.

The individual sensors in the new load cell were fully calibrated. A global calibration then has to be carried out in the laboratory, during which forces and moments are simul-taneously applied to the whole configuration along the x, y and z axes. Skiing trials can then be carried out under real load conditions.

Abstract: The concept of eco-industrial parks is based on the idea of reducing ecological footprint by replacing toxic materials, using carbon dioxide absorption technologies, integrated waste treatment, reusing materials and maximizing energy efficiency in the design and construction of industrial facilities. This concept has not yet become widespread in Russia, but now industrial parks and technology parks are developing in the country. The purpose of this study is to analyze the environmental aspects of the design and operation of industrial parks and technology parks (technoparks). The distribution of Russian technoparks and industrial parks by types, kinds and regions of the country was examined. The work analyzed more than 1000 official websites of industrial parks and technology parks in Russia, which are at different stages of development and identified a few cases of technoparks and industrial parks that have implemented an environmental policy and environmental management system. As a result of the study, it was concluded that the concept of an eco-industrial park has not yet been applied in Russia; only 1% of industrial parks in the country have a clearly defined environmental policy. However, this situation can be changed by introducing a system of voluntary certification of eco-industrial parks, which may include the requirements, like Chinese, Italian and other national IEP standards.

Keywords: industrial park, technopark, eco-industrial park, environmental policy, environmental standards

Introduction

Since the first industrial revolution in the middle of the 18th century, industrial manufacturing has greatly contributed to the development of labor productivity and created material benefits for people. However, the excessive development of industrial production has also brought a number of environmental problems, such as the depletion of water and soil resources, a sharp decline in biological diversity, and global climate change. Since the widespread acceptance of the concept of sustainable development, a new form of organization of production based on the principles of the circular economy, namely, eco-industrial parks, gained great popularity around the world (Fuentes Barrera, Gabarrell i Durany, Rieradevall Pons & Guerrero Erazo, 2021;

Huang et al., 2019). Eco-industrial parks are created and successfully operate both in economically developed (for example, USA, Germany) and in developing countries (India, China). The main goal of the eco-industrial park is to improve the economic performance of participating companies while minimizing their impact on the environment (Castiglione & Alfieri, 2020). The most important elements are the interaction between the enterprises-residents of the park, the local community, and the natural environment. The concept of eco-industrial parks (EIP) provides for the development of industrial symbiosis and the introduction of industrial environmental innovations (Geng & Hengxin, 2009; (Chebykina, 2018; Talantsev V.I. & Smirnova N.K., 2016; Hu, Tian & Chen, 2021; Tudor, Adam & Bates, 2007). Due to the creation of the EIP, the issues of increasing the energy efficiency of the national economy, reducing its negative impact on the environment, and rational consumption of resources are being comprehensively resolved.

In recent years in Russia there has been a rapid development of industrial parks (IP) and technology parks (TP), but the concept of eco-industrial parks has not yet become widespread. This study therefore set out to analyze the environmental programs and policies of Russian industrial parks and technology park and assessment their strategies from the point of view of their compliance with the principles of the circular economy.

Method

This investigation uses frequency analysis and the multiple case study methods. Data for this study were collected using the register of industrial parks in Russia, developed by Terra Business & Industrial (TBI Group), engaged in the selection of land plots with infrastructure and premises in industrial parks, agroclusters and technology parks of the Russian Federation (Analytics, 2022). At the first stage of the study, the distribution of Russian technology park and industrial parks by types, kinds and regions of the country was analyzed. At the second stage of the study, an analysis of their official websites was carried out for all operating technoparks and industrial parks. If the park's website presented its environmental policy or strategy, a content analysis of these documents was carried out to determine if they presented any information on the use of the principles of the circular economy. If the park's website did not present its environmental policy, the entire content of the site was analyzed. If the park did not have an official website, any materials on its operation presented in the media were analyzed.

Results

Distribution of Russian industrial parks by types and kinds

According to TBI Group, in June of 2022, 950 industrial parks and 310 technoparks were registered in Russia. The largest number of both industrial and technology parks are located in Moscow, the Moscow region, the Republic of Tatarstan and St. Petersburg (fig 1-2).

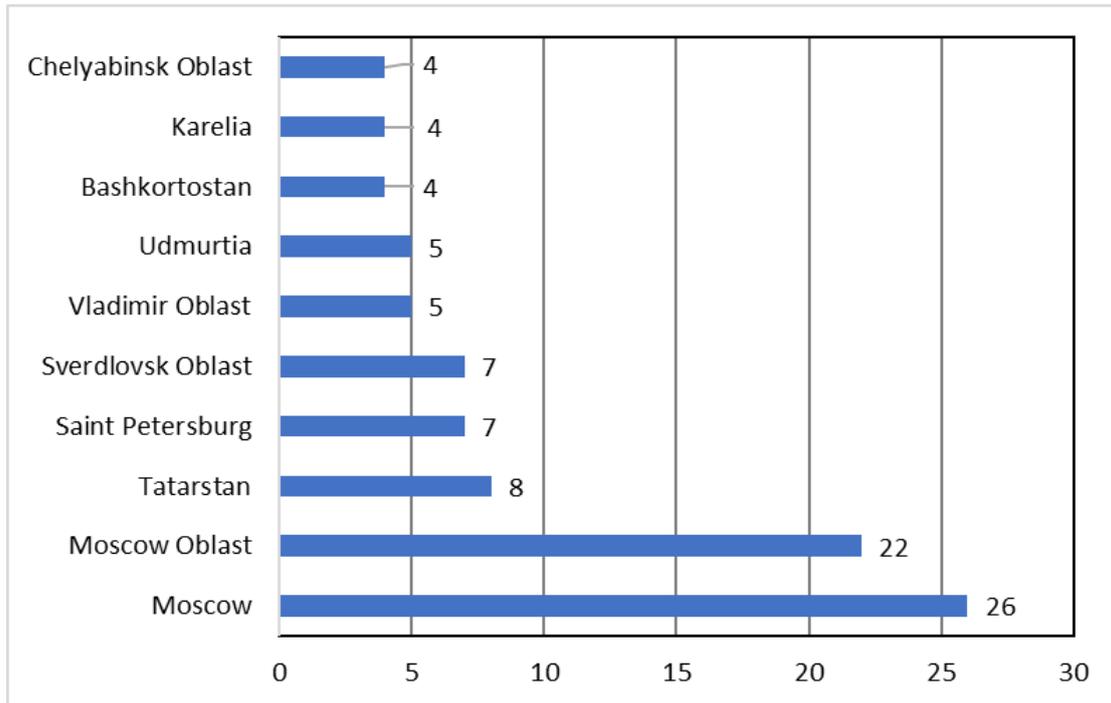

Figure 1. Number of technoparks in the leading regions.

Source: compiled by the authors based on the data <https://russiaindustrialpark.ru/analytics>

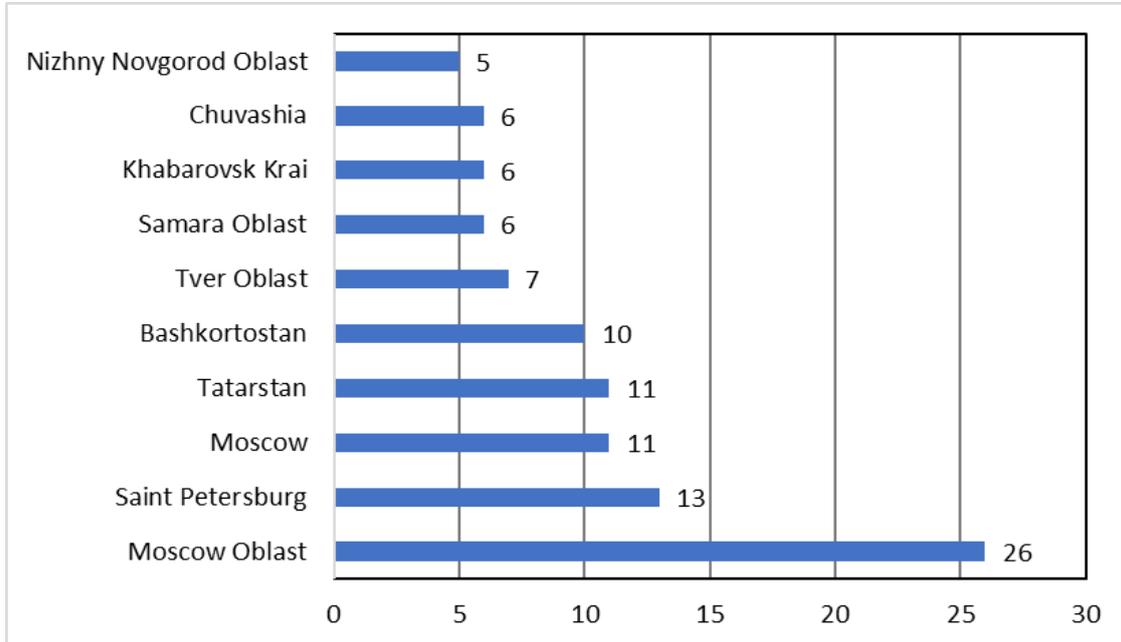

Figure 2. Number of industrial parks in leading regions.

Source: compiled by the authors based on the data <https://russiaindustrialpark.ru/analytics>

We did not notice any significant difference between Russian industrial parks and technology parks either in terms of product innovation or in the principles of organization and operation. However, in terms of ownership the predominant type of TP is state-owned, and the predominant type of IP is private (fig.3).

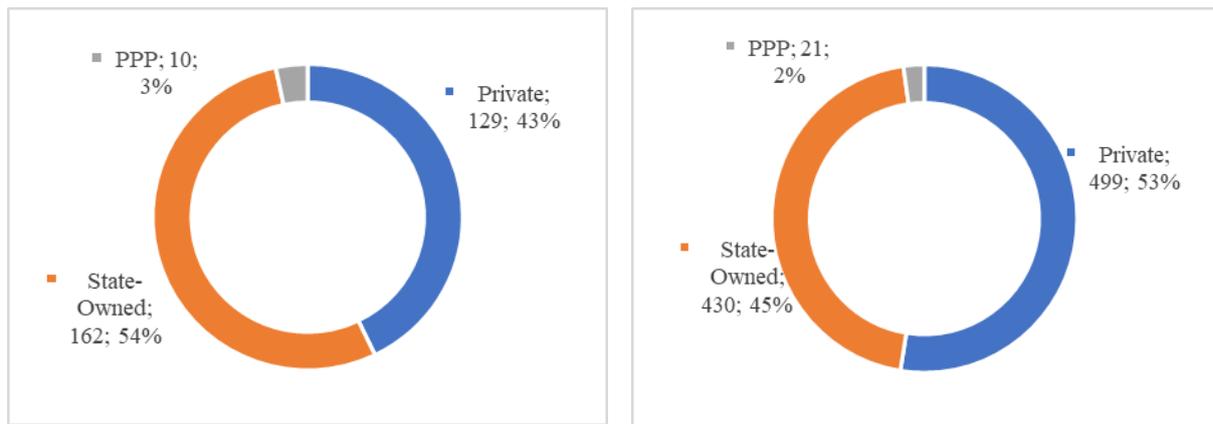

Figure 3. Distribution of techno parks (left) and industrial parks (right) by form of ownership.

Source: compiled by the authors based on the data <https://russiaindustrialpark.ru/analytics>

Analyzing the distribution of technoparks and industrial parks by status (operating / being constructed / projected / intentions), it can be noted that the largest number of parks is under construction (fig.4).

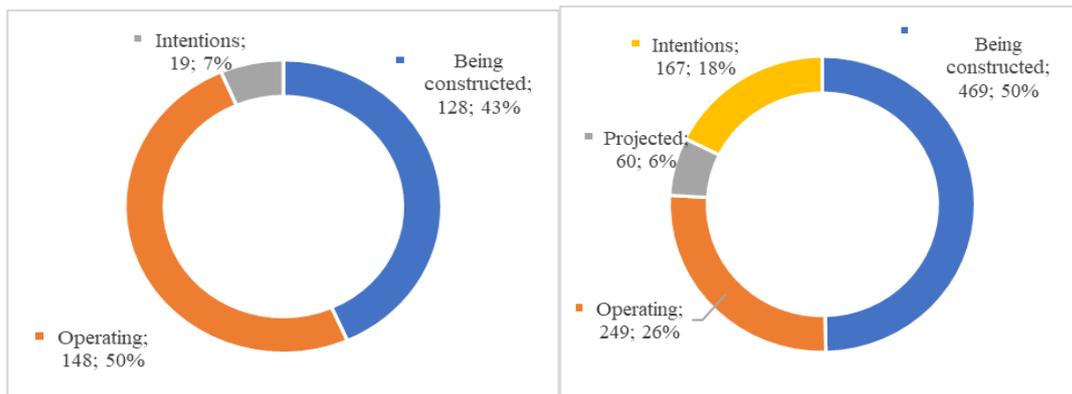

Figure 4. Distribution of techno parks (left) and industrial parks (right) by status.

Source: compiled by the authors based on the data <https://russiaindustrialpark.ru/analytics>

Currently, the largest number of operating technology parks is located in Moscow City (26), Moscow region (22), Republic of Tatarstan (8), St. Petersburg (7), Sverdlovsk region (7), Vladimir region (5), Udmurt Republic (5), the Republic of Bashkortostan (4), the Republic of Karelia (4) and Chelyabinsk Region (4). Most of parks under construction are in Moscow City (28), Moscow region (8), Novosibirsk region (7), Sverdlovsk region (6), Kaliningrad region (5), Republic of Tatarstan (5), Voronezh region (4), Lipetsk region (4), Astrakhan region (3) and Penza region (3). Most of planned techno parks are in the Republic of Buryatia (4), St. Petersburg (3), Astrakhan region (1), Orenburg region (1), Republic of Ingushetia (1), Ryazan region (1), Tomsk region (1), Chechen Republic (1), Khabarovsk Territory (1), and Yugra region (1).

As for industrial parks, the largest number of operating industrial parks is located in the Moscow region (26), St. Petersburg (13), Moscow City (11), the Republic of Tatarstan (11), the Republic of Bashkortostan (10), the Tver

region (7), Samara region (6), Khabarovsk region (6), Chuvash Republic (6), and Nizhny Novgorod region (5). Most of parks under construction are in Moscow Region (26), Ulyanovsk region (14), Chelyabinsk region (13), Republic of Tatarstan (11), Yugra region (11), Ryazan region (10), Udmurt Republic (10), Kurgan region (9), Rostov region (9), and Yaroslavl region (9). Most of the designed industrial parks are in the Moscow region (26), the Republic of Tatarstan (11), the Vladimir region (6), the Leningrad region (4), the Astrakhan region (3), the Vologda region (2), the Kirov region (2), the Oryol region (2), Perm region (2), and Primorsky region (2). Most of the planned parks (intention) are in Moscow Region (26), Republic of Crimea (11), Republic of Tatarstan (11), Kursk Region (5), Orenburg Region (5), Irkutsk region (4), Krasnodar region (4), Leningrad region (4), Republic of Bashkortostan (4), and Republic of Dagestan (4).

The distribution of technoparks and industrial parks by type (Brownfield or Greenfield) is shown in fig. 5.

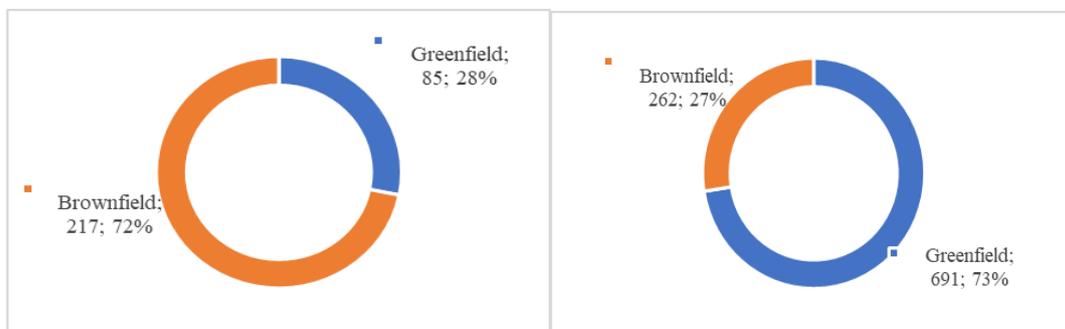

Figure 5. Distribution of techno parks (left) and industrial parks (right) by Brownfield and Greenfield types.

Source: compiled by the authors based on the data <https://russiaindustrialpark.ru/analytics>

Note that a "greenfield" is a type of industrial site, which means that a potential consumer receives an undeveloped territory with communications, potential administrative approvals, and the possibility of building industrially oriented facilities. This type of site implies minimal investment on the part of the IP organizer and the most flexible possible structure of use for the consumer. Greenfield IP is one of the most acceptable ways to organize an industrial park, as it already has a modern infrastructure and communications, which makes it possible to significantly increase production at the lowest cost and to ensure compliance with environmental requirements (Huang et al., 2019; Castiglione & Alfieri, 2020; Tudor, Adam & Bates, 2007). Creating an industrial park from scratch allows you to apply the standards of eco-industrial parks (such as, for example, Chinese standards HJ/T273-2006, HJ/T274-2006, HJ/T275-2006, HJ/T274-2009 and HJ/T274-2012 or Italian Criteria for defining the environmental performance of Areas productive ecologically equipped—EEPA) at a very early stage of planning (Huang et al., 2019; Tessitore, Daddi & Iraldo, 2015). However, the creation of greenfield-type industrial parks requires large investments. In this regard, the territorial location of such parks gravitates towards the presence of the nearest objects of transport and engineering infrastructure. From ecological point of view, it can be not the best location at all (Fernández & Ruiz, 2009).

The second type of the site is “brownfield”. It is a property complex that was previously used for industrial purposes, for example, the territory of old factories, logistics facilities. Brownfield has several disadvantages. Some of which are worn-out infrastructure or lack of specialized facilities to produce new products. But these disadvantages can be depleted with proper management. Often, "brownfields" are created by entrepreneurs who do not have a significant budget. These executives seek to apply innovation in the economy and attract investment by leveraging connectivity to infrastructure and logistics facilities (Castiglione & Alfieri, 2020; Geng & Hengxin, 2009; Tudor, Adam & Bates, 2007). The transformation of an existing industrial park into an eco-industrial one is a complex process that requires serious efforts in scoping EIP interventions, society awareness raising, developing policy support and park management structure, upscaling resource efficiency and industrial synergies (Susur, Hidalgo & Chiaroni, 2019; UNIDO, 2022).

Therefore, generally in greenfield industrial parks the development and industrialization of the region takes place in accordance with a well-defined concept, including the reduction of environmental impact. Brownfield development is the revitalization of an existing industrial complex with the reduction of environmental impact as one of the objectives. Hence, it can be expected that for Russia, as a country with a still poorly developed practice of developing eco-industrial parks, greenfield parks will have a more advanced environmental policy.

Eco-policies of Russian technology parks and industrial parks

After analyzing the websites of acting 148 technology park and 249 industrial parks for interest in preserving and reducing harm to the environment, we can identify only a few cases of technoparks and industrial parks that have implemented an environmental policy and environmental management system.

First example will be technopark Morinsis-Agat (Moscow City, private, brownfield), which industrial activities are related with the negative impact on the environment. Therefore, the goals of JSC Concern Morinsis-Agat in the field of environmental protection are the basis for setting long-term strategic. These goals are:

- minimization of the specific negative technogenic impact on the environment;
- involvement of all personnel in activities to reduce environmental risks, the implantation of an environmental management system and performance indicators in the field of environmental protection;
- implementation of environmental certification of products;
- conducting and stimulating scientific research aimed at improving energy efficiency, reducing the negative impact on the environment and environmental risks;
- enhancement of the environmental education system;
- staff motivation to use the creative potential of each employee in the matter of resource saving and reducing environmental risks;
- active interaction with civil society bodies interested in the environmental protection.

The environmental policy of IP “Morinsis-Agat” covers the following areas:

- impact on atmospheric air;
- protection of water resources;
- waste management;
- environmental management system;
- energy saving and industrial sanitation.

The second example of ecologically-oriented IP is KuibyshevAzot (Samara Region, brownfield, private). One of the main elements of the development strategy of this IP is the preservation and protection of the environment, reducing the technogenic load on it and reducing resource consumption. IP conducts continuous comprehensive work in accordance with the goals defined by the "Policy of PJSC "KuibyshevAzot" in the field of quality, ecology, labor protection and industrial safety". For this, low-waste, energy- and resource-saving technologies are being introduced, equipment is being improved and existing production facilities are being reconstructed. Each project of the enterprise at all stages, from development to implementation, is carried out considering the environmental component.

To achieve sustainable high results of the company, the management assumes the following obligations:

- accord with legislative, regulatory and other applicable requirements in the field of product quality and safety, industrial and labor safety, health and environmental protection;
- constantly improve the management system and confirm its compliance with the requirements of international standards in the field of quality, industrial and labor safety, health protection and the environment;
- ensure safe working conditions to prevent occupational injuries and damage to health;
- take the necessary measures to eliminate dangers and reduce risks that can affect the quality and safety of products that threaten the health and safety of workers, visitors, and the population living nearby as well as the environment;
- prevent pollution of the environment, ensuring the management of environmental aspects in accordance with established standards, conducting environmental monitoring, identifying and preventing potential emergencies;
- carry out technical re-equipment of production, introduce resource-saving, low-waste, and waste-free technologies, rationally use natural resources, interact with stakeholders on environmental issues.

The third example is industrial park LLC PSK "Atlant-Park" (Moscow region, greenfield, private). Since its formation his IP has paid considerable attention to environmental care in the construction and operation of warehouse facilities. LLC PSK "Atlant-Park" is actively implementing resource-saving technologies in the field of energy supply, heat, and water supply of warehouses, which allows us not only to significantly save resources. The practical component of the comprehensive work to reduce the negative impact on the environment is regular monitoring and control of the environmental situation on the territory of the complex and within the sanitary protection zone. The most important part of the environmental policy of PSC "Atlant-Park"

is assistance in the implementation of infrastructure and social projects with a significant environmental component.

The Stankomash Industrial Park (Chelyabinsk Region, brownfield, private), Zhigulevskaya Dolina Technoparks (Samara Region, brownfield, state-owned) and TOTACHI DGT Technopark (Tver Region, greenfield, private) also announce a set of measures to reduce the negative impact on the environment. These industrial clusters are making the transition to waste-free and low-waste technologies and industries, and are also engaged in the greening of industrial production, which includes:

- improvement of technological processes and development of new equipment with a lower level of emissions of impurities and wastes into the environment;
- carrying out ecological expertise of all types of industries and industrial products;
- replacement of non-recyclable waste with recyclable.

As an example of the transformation of an already existing industrial park into an eco-industrial park, we can point out the development strategy for an eco-industrial park of clean technologies International Consortium "St. Petersburg Cluster of Clean Technologies for urban environment". The main objectives of this strategy are:

- 1) to create, based on the experience of the Nordic countries and the EU countries, the first in Russia interregional eco-industrial clean technology park based on industrial symbiosis as eco and energy efficiency demonstration zone;
- 2) create a public-private partnership and attract investment for implementation industrial symbiosis for economic and environmental benefits through exchange of resources that increase the efficiency of companies - residents of the eco-industrial park. At the same time, contribute to their resilience to external impacts, where the smart specialization of one park resident company is its secondary resource (waste) becomes a primary resource for other park resident companies (raw material).

As the first practical experience in the implementation of the Sustainable Development Goals one of the companies-residents of IP (Tireman group LLC), became a project partner for "Baltic Industrial Symbiosis (BIS) / Baltic Industrial Symbiosis" Programs

cross-border cooperation between Russia and the EU. It created Living Laboratory on the territory of the park, which is a place for popularization and practical testing of the ideas of industrial symbiosis as eco and energy efficiency demonstration zone. Living Laboratory has identified 15 new possibilities for industrial symbiosis among the companies of IP.

In addition to the cases discussed above, it is possible to give several examples of industrial parks, in the name of which the term eco is used. However, the use of this term does not always mean following the strategy and principles of an eco-industrial park. So, for example, the industrial park "Ecobaltic" (Kaliningrad region, greenfield, private) only follows the established norms of environmental legislation, providing high-quality wastewater treatment for pharmaceutical enterprises located on its territory. This IP does not use any principles or standards for the operation of eco-industrial parks.

Discussion and Policy Applications

Therefore, as we see from our analysis that environmental aspects are not yet a priority for most industrial parks and technology parks in Russia. The concept of an eco-industrial park has not yet been implemented in a full-value format at any Russian industrial complex. In our opinion, this situation can be changed by introducing a system of voluntary certification of eco-industrial parks.

Currently, Russia has a voluntary certification system for industrial parks, the requirements of which are established by national standard GOST R 56301-2014 "Industrial parks. Requirements". Based on this, it is necessary that local authorities, when developing policies or planning industrial parks, consider the environmental performance around industrial parks. Besides high economic benefits, they should also pay attention to environmental protection and the quality of local life, support industrial parks, and create an innovative atmosphere to enhance the environmental technology of the industry. In addition, to saving energy resources, all industrial parks can actively participate in the renewable energy integration plan, improve their environmental performance, and promote the transition from an industrial park to an eco-industrial park.

Similar to Chinese, Italian and other national IEP standards, the voluntary certification system for eco-industrial parks in Russia may include the following requirements:

1. Infrastructure for sustainable mobility: special materials, such as sound-absorbing asphalt, must be used for road construction. There should be a hierarchy of traffic, walking and cycling to reduce the environmental impact of traffic and improve safety.
2. Greening the area: the certain share (for example, 70%) of the roads should be planted with tall trees; hedges and trees in parking lots.
3. Underground facilities, such as electrical grids, telecommunications networks, etc. should be built to facilitate IEP maintenance.
4. Communication networks: the area should have advanced telecommunication systems.
5. Green lighting of public areas: 50% of electricity for lighting public roads and parking spaces must come from renewable sources.
6. Landscape integration: buildings and premises in this area should be integrated into the natural landscape.
7. Collecting and reusing rainwater: collection of at least 50% of rainwater that has fallen on impervious surfaces (e.g., roofs, streets, etc.). At least 80% of the collected water must be reused in industrial facilities, for domestic use, in the fire extinguishing system or for irrigating green spaces. A dual water distribution system is to be implemented in the area: one for drinking water and the other for collecting rainwater.
8. Separate sewer systems: the sewerage system of the area should include industrial sewage pipelines and contaminated rainwater pipelines; domestic wastewater pipelines, uncontaminated rainwater pipelines.
9. Industrial water treatment: the industrial wastewater treatment system must have a single treatment system and one discharge.
10. Use of renewable energy sources for industry applications.

11. Advanced logistics measures: the development and implementation of a sustainable transportation management system within the framework of the EIP requires accounting and effective management of both human and material flows (Bunjongsiri, 2017). Companies are generally interested in three types of material flows, i.e., incoming (raw materials and components), outgoing (finished products and waste to be disposed of on a park site), and internal (by-products and waste processed by other companies of EIP). In order to organize these flows and make them more efficient and sustainable, various initiatives can be implemented, such as the creation of a shared transport management system.
12. Energy management and monitoring: an energy manager should be appointed in the region to monitor energy consumption and coordinate energy conservation and the expansion of renewable energy sources.
13. Waste area management: it includes a) waste management plan; b) full or partial recycling of materials used and produced in this zone; c) a list of general suppliers of waste transportation and disposal selected based on environmental requirements.
14. Emergency response plan: a plan that illustrates how companies should respond and what actions should be taken outside the industrial area.
15. Sustainable management of green spaces: green spaces are managed in terms of biodiversity protection, landscape conservation and carbon sequestration.
16. Sustainable construction site management: plan to minimize the environmental impact of construction site operation. The plan should identify all operations that may lead to critical environmental impacts and highlight the respective responsibilities and modes of operation for addressing environmental issues associated with the operation of the facility. Design, build and operate buildings in accordance with LEED and other green building standards.
17. Green procurement: green procurement is the procurement of "goods, services and works with a reduced environmental impact throughout their entire life cycle". The introduction of green procurement practices stimulates the development of green suppliers, this is the basis for the management of green supply chains.
18. Compliance with environmental requirements: compliance with national and regional laws and regulations on emission and pollution control, waste management and other environmental matters. In addition to these responsibilities, companies can voluntarily adhere to the ISO14001 standard.
19. Product liability: ensuring responsibility for the product requires paying attention to all phases of the product life cycle: an effective efficient design, including selection of materials and suppliers, quality of manufacturing processes, including inventory management and transportation, safety of use and environmentally friendly disposal. This includes additional activities such as providing clear labels and precise instructions for use, as well as responsible advertising. All these activities are aimed at improving the health and safety of consumers and reducing the gap between their expectations and the true performance of products. The above aspects refer to individual products and are usually considered at the level of one company. Participation in the EIP allows companies to work more effectively towards harmonizing their program product and responsibility goals (Liu et al., 2018), which in turn is key to exploiting the strong link between firms' commitment to achieving environmental efficiency and their sustainable success (Elabras Veiga & Magrini, 2009).
20. Eco-industrial park design according to the UNIDO International Framework Program.

Conclusion

Summing up the results of the study, we can conclude that environmental aspects are not yet a priority for most industrial (technology) parks in Russia. The concept of an eco-industrial park has not yet been implemented in a full-value format at any Russian industrial complex. Only about 1% of Russian technoparks and industrial parks have a clearly formulated environmental policy. Nevertheless, a significant part of Russian technology park and industrial parks specialize in resource- and energy-saving technologies, which makes it possible to expect the growth of the circular economy 2.0 in Russia in the near future (Ratner, Gomonov, Lazanyuk & Revinova, 2021).

Abstract: This paper aims to understand the symbolic representations and social uses of different types of waters on the island of São Miguel in the Azores. In this research, the authors discuss some of these differences in a specific socio-spatial context, the island of São Miguel, the island with the largest territorial dimension of the Azores, corresponding to about one third of the total area of the Azores archipelago. This island accounts for more than half of the Azorean population, has the highest economic activity and presents some of the main “eruptive centers” of the Azores: the volcanoes of Furnas, Fogo and Sete Cidades. To attain this goal, the authors analyzed, through participant and non-participant observation, the social representations of waters in the Azores through three symbolic analytical frameworks: fresh waters, salty waters and sour waters. In this study of symbolic water, the following categories resulted from the sociological analysis: sweet waters (the images of water that tends to be drinkable), salty waters (the allegories related to the sea) and sour waters (the allegories related to those waters that come from volcanic phenomena). This proves that the element of water itself can be understood differently, and that the social context in which individuals live is very relevant in helping to understand these different significations.

Keywords: Water, Symbolic of Water, Social Representations, Azores.

Introduction

This article aims to understand the symbolic representations and social uses of the various types of water on the island of São Miguel, the Azores. The starting point of this research is composed by representations, which translate the way in which society thinks of itself in its relationships with the objects that affect it. These representations regard categories of thought through which, in a given society, its reality is produced and expressed. The classical sociologist Émile Durkheim considered that these categories are not given a *priori* and

are not universal in the awareness but emerge linked to social phenomena, transforming themselves in social phenomena susceptible of observation and interpretation.

Social representations are cognitive evaluations, forms of practical knowledge about social objects, which organize behaviors and communication, allowing us to understand how individuals think, feel and create reality. Any object is likely to have different social representations as “a form of socially shared and produced knowledge that has a practical purpose, adding to the construction of a common reality for a social group” (Jodelet, 2001, cit. in Polli & Camargo, 2015, p. 1312), which also has profound implications in the individuals’ practices by ascribing meaning to reality, thus contributing to their own identity (Almeida, 1990; Polli & Camargo, 2015; Schulz & Ioris, 2017). It follows that individual or group behavior is not only determined by the objective characteristics of the situation in which people find themselves but also by the representation they have of the situation or a given object” (Polli & Kuhnen, 2013, p. 111). In a more direct way, and as Martins (2013) states,

There is always a symbolic intentionality embodied in the code of socially desirable resources. This means that a natural resource cannot be reduced to its economic dimension even for those who observe it as such; it is also a symbolic resource that embodies cultural signs, thus occupying a position in the hierarchical set of symbolic exchanges. Naturally, due to its position in this hierarchical set, its political and economic dimensions take on particular significance for distinct societies and social groups (p. 126).

It is in this analytical context that representations of water(s) will be studied (Peña-Ramos et al., 2021; Angelakis et al., 2021; Amores, 2008; Taylor & Sonnenfeld, 2017; Noga & Wolbring, 2013; Qian, 2018; Durán-Sánchez et al., 2018; Hellberg, 2017). Water is a fundamental element in human existence at the physical but also spiritual and even social levels (Behailu et al., 2016; Amores, 2008). Strang (2011) advocates that “Because of the centrality of water in all aspects of human life, visual, textual and other representations of water are useful in articulating the cosmological beliefs and values – and the concomitant practices – that compose societies’ broader relationships with the material world” (p. 213). For instance, different social representations about water and even its use and management may emerge or be present, for example, in a logic of conflict over the control of water resources (Peña-Ramos et al., 2021), or of preservation of water as an essential resource for healthy life (Polli & Kuhnen, 2013; Polli et al., 2009; Biagi & Ferro, 2011; Hellberg, 2017; Agra, 2017; Strang, 2011).

The very look and valuation of water are reshaping to some extent. For example, Hannigan (2017) shows the valuation of the oceans currently in dimensions such as a source of resources, having geostrategic importance and as an ecological ecosystem to be increasingly researched. Or water as an element promoting tourism as a source of leisure is on a crescendo and takes on high relevance in economic activity (Kwon et al., 2017; Park et al., 2017; Castel-Branco, & Albergaria, 2017). In an excellent example of various representations of water by artists and scientists, Macagno (1992, 1993, 1994) argues that

The difference lies not so much on quality versus quantity as in the approach and in the goals. In art, when it is figurative, description seems to be the essential feature, while analysis and synthesis

characterize science while, for technology, prediction and function are typical (Macagno, 1993, p. 26).

There are, therefore, many different and very rich views and symbols that can be held about water (Bruni, 1993; Noga & Wolbring, 2013), which are sometimes even ambivalent as they reflect different life stories, as well as social conditions and expectations (Amores, 2008; Hellberg, 2017). Table 2 presents an example of representations of water according to a literature review (Espitia-Torres & Naranjo-Monto, 2020).

Table 1. Social representations of water according to social actors and their definition

Name	Definition
Naturalist	Water must be kept in sanctuaries, without humans. Emphasis on physic-chemistry, without considering socioeconomic aspects.
Globalizing	The interactions between society and nature are key to the survival of human beings, in harmony with the environment, considering it as a source of survival.
Utilitarian anthropocentric	We must take advantage of water, its goods and services.
Anthropocentric agreed	We must take advantage of water, recognizing the impacts on the environment. Evidence of environmental knowledge in general.
Cultural anthropocentric	Emphasis on environmental education, respect, solidarity, love and quality of the environment.
Community	Conservationist, water use regulation and integrated management in cultural practices. Emphasis on organic, spiritual and social nature that regulates environmental cycles, ecological balance and landscape aesthetics. Distrust of the State and the private sector. Evidence of participatory processes.
Privatisation	Water is a private resource with environmental services subject to market rules, oriented towards industry and the household. There is no ecosystem or ecological relationships between the city, the water and the territory. They concession water exploitation.
Hybrid	Integrate the Community Social Representation and Privatization with a pro-environmentalist discourse to interact with other actors and impose their representation. Without references to the private appropriation of the environment, they promote a green image.
Global ecological, aesthetic and identity	Assign water aesthetic and identity values, which is social heritage, abundant and affordable but limited, which generates environmental uncertainty. Perception of interdependence between man and environment.
Fragmented and Functional	Assign the use of water functional and ethical values, demonstrated in the utilitarianism linked to domestic water and in the discourses against inequalities (social fractures) in access to water. They propose solving short-term needs.
Monistic or	Water gives life and is integrated into nature (Cosmogony). It has spiritual forces

Organic that must be acknowledged and respected.

To understand the different social representations that can be expressed in different cognitive evaluations and socially differentiated views of the same real object – water –, this paper seeks to be a contribution on this situation in São Miguel Island, the Azores, Portugal.

Methods

This article aims to understand the symbolic representations and social uses of the various types of water on the island of São Miguel, the Azores. To achieve this objective, an ethnographic analysis was favored, aiming to understand the meaning and the meanings that actors ascribe their practices. The ethnographic observation procedures followed focused on participant observation and non-directive, informal interviews conducted on the basis of the interests and contexts of the actors observed. Participant observation implies insertion into the social world of the actors to be studied, to observe “from the inside” what it means to be an actor in that world and describe what one sees, hears and infers (Vieira, 1998; Esteves, 1998).

There were several moments in which the researchers triangulated the information they collected, with fruitful moments of discussion in their presentation and interpretation, bearing in mind that the ultimate aim of observation is to find a sociological meaning for the data collected, to classify and analyze it (Peretz, 1998). This study of the symbolic of water resulted in the following categories (Bardin, 1995) of sociological analysis: sweet waters (the social images of water that tends to be drinkable), salt waters (the social images associated with the sea) and sour waters (the social images related to those waters that come from volcanic phenomena).

Presentation of results and discussion: the waters in São Miguel

The island of São Miguel, in the Azores

The Azores are a Portuguese autonomous region composed of nine islands located approximately halfway between the American and European continents in the North Atlantic Ocean. The archipelago of the Azores is located between latitudes 36°45' to 39°43' North and longitudes 24°45' to 31°7' West of Greenwich and comprises nine islands and several islets, which extend for about 600 km, in an approximate direction NW-SE. The islands of the Azores are divided into three groups: the Western Group, consisting of the islands of Flores and Corvo; the Central Group (Faial, Pico, São Jorge, Graciosa and Terceira); and the Eastern Group (São Miguel and Santa Maria). The island of São Miguel is the largest island of the archipelago, with an area of 744.6 Km², a length of around 64 km and a width of 16 km. This island, with the largest territorial dimension of the Azores, corresponding to about one third of the total area of the Azores archipelago, is where more than half of the Azorean population lives, has the highest economic activity and presents some of the main “eruptive centers” of the Azores: the volcanoes of Furnas, Fogo and Sete Cidades (Ferreira, 2008). This unique

characteristic of the physical geography of the Azores is present in the nature of the rocks “with hues ranging from black to red, and in the forms of relief, in which the volcanic cones of all sizes, craters and calderas, often occupied by lagoons, stand out” (Ferreira, 2008, p. 21). The location and geography of the Azores islands are elements that condition the Azoreans’ way of being and their own representations. As Vitorino Nemésio stated, “geography, for us, is worth as much as history” (Nemésio, 1932, cit. in Matos et al., 2008, p. 12).

The volcanic origin of the Azores explains the occurrence of numerous mineral water springs, predominantly gas-carbonic and/or thermal, which denote a high variability of chemical types and magnitude of mineralization, particularly on the island of São Miguel, but also on the islands of Terceira, Graciosa, São Jorge, Faial, Pico and Flores (Cruz et al., 2014). Azorean waters are of meteoric origin, acquiring different characteristics through their interaction with volcanic rocks and seawater (Cruz et al., 2014). The mineral waters of the Azores are grouped into four groups: groups 1 and 2 are composed of gas-carbonated (sparkling) waters originating from high altitude aquifers and include (1) cold acidic waters (with pH between 4.7 and 6.3 and temperatures below 27°C); (2) thermal waters, which can be acidic or neutral (varying temperature between 27°C and 75.2°C and pH between 4.7 to 7.2); and (3) boiling basic waters (with temperatures between 92.2°C and 93.2°C and pH between 7.75 and 8.73). Group 3 is composed of sulfuric waters and is therefore acidic (pH between 2.02 and 2.27). Group 4 is characterized by highly mineralized waters, mostly containing sodium chloride, as they come from aquifers near the sea and are the result of groundwater and seawater mixing. The waters are, in general, supersaturated in quartz and amorphous silicon due to the interaction with rocks of a volcanic origin and are relatively rich in alkali metals (mainly sodium) and poor in alkaline-earth metals (such as calcium and magnesium) (Cruz & França, 2006; Cruz et al., 2010, Cruz et al., 2014; Antunes, 2019).

The hydrogeological resources of the island of São Miguel are very significant, and, similarly to the remaining islands of the archipelago of the Azores, there is a high density of natural mineral water springs. In 2013, 1,100 springs and 26 boreholes were mapped on this island, distributed over six bodies of water: Sete Cidades, Ponta Delgada-Fenais da Luz, Água de Pau, Furnas – Povoação, Achada and Nordeste-Faial da Terra (Cruz et al., 2014). The influence of the active volcanic environment is denoted by the occurrence of a high number of mineral waters, many of them thermal, especially in the water bodies Furnas – Povoação, Água de Pau and Sete Cidades, whose predominant facies are sodium bicarbonate and sodium chloride (Cruz et al., 2014). Hydro-mineral resources are susceptible to various uses, namely, therapeutic, industrial uses for bottling, in the course of the prospection of geothermal resources with the study of the characteristics of these fluids, or within the scope of monitoring programs of volcanic activity with the performance of periodic observations (Cruz et al., 2014).

Symbolic representations and social uses of water

In the analysis of symbolic representations and the social uses of the various types of water, it is important to focus on the relations of interdependence between the “human” social actors, which classify and ascribe meanings to the various types of water and use them in different ways, and the “non-human” social actors,

namely the sea, the streams, the lakes, the ponds, the *furnas*, the boilers, endowed with a specific capital: a set of accumulated and lasting physical and material resources that shape the practices and representations (Machado, 1996).

Freshwater

The central elements of the representations about freshwater express the idea that this type of water is a component essential to life, indispensable to survival, which is associated with the conservation of health and needs to be preserved. Freshwater is essentially human water, while saltwater is perceived as being inhuman water, insofar as it does not fulfil what seems to be the first requirement of water, which is to serve man (Margarido, 2008). In their speeches on freshwater, the actors highlighted the vital importance of this type of water in various areas and activities: domestic – food, hygiene, cleaning, watering of vegetable gardens; agriculture; livestock – water supply for animals and in the maintenance of landscapes; and services – hospitality, catering, hospitality (Leandro, & Silva, 2015). Another relevant aspect in these speeches relates to the quality of the water and the risks of its contamination, namely by the use of pesticides, animal waste and the “infiltration” of salty and sour water. The strong link between tourism, leisure and freshwater is another very relevant aspect in the speeches of various actors (Castel-Branco, & Albergaria, 2017) (Figures 1 and 2).

Figures 1 and 2. *Salto do Cabrito* (São Miguel island) – Nature and Tourism
(Photos by Ana Isabel Santos)

If fear marks the symbolic representations of the sea and shapes the experiences of those who “live from the sea”, only rarely does freshwater manage to provoke identical fear, and when this happens, it is due to the fact that freshwaters adopt a maritime behavior: this is what happens when rivers “look like a sea”, i.e., when the extension and the violence of the waters break with the normal and expected behavior of freshwaters (Margarido, 2008, p. 74).

Salty water

The central elements of the representations of salty waters, the maritime waters (Bentz, et al, 2015; Dias, 2012), show distinct but interdependent social images of the sea: and image of fear (top of fear in the Western

imagination, fear of monsters and mermaids, fear of shipwrecks); preventive and therapeutic image (therapy of body and soul: rationalization of the energies of body and spirit; correction of the ills of urban civilization, while respecting the imperatives of intimacy); hedonistic image (place of adventure and seduction; place of consumption and illusory evasion) (Pereira, 2012; Henriques, 2012). Another central element of the representations highlights the idea that the islanders develop an enchantment in relation to the sea that surrounds them, simultaneously as a constraining element but also as an element that makes it possible to leave the islands and head for the desired destination: North America.

In the imaginary related to the sea, for the inhabitants of the island of São Miguel, the sea is also seen as a source of subsistence, which was at the origin of several fishing communities. The sea is also considered an element that allows travel and emigration, and São Miguel, as well as all the islands of the archipelago of the Azores, has recorded high emigration throughout its history (Ferreira, 2008). Leisure, recreation and tourism related to the sea are very present, for example, on the beaches of the island and some gardens of São Miguel. The Azores is an emerging destination for marine wildlife tourism, with diving and whale watching being the main activities.

Sour waters

The designation of sour water is associated with several springs of sparkling mineral water, generally highly carbonated. For the observed actors, the characteristics that distinguish mineral water from “normal” tap water are the presence of mineral salts and gases, temperature, taste, being natural, medicinal uses, quality, digestive properties and the fact that they “emerge” in springs (Pereira, 2015).

The association of sour waters with the prevention and treatment of some diseases arises as a central element in the representations and justifications of the therapeutic uses of these waters (Rezio, 2008) . *Água Azeda do Rebentão*, a water with a high gas-carbonate content, is used topically to treat “dandruff” and ingested to treat digestive problems. *Água da Prata* is used by the local population for eye problems. *Água Santa* and *Água do Caldeirão* are associated with the treatment of respiratory problems. *Água Santa* is traditionally indicated for upper respiratory tract infections, while *Água do Caldeirão* is mixed with honey to treat flu-like conditions and coughs. *Água do Padre José* is indicated for treating cholesterol and digestive diseases. *Água do Torno* is a very mineralized water and is used to prevent hair loss. *Poça da Silvina* has a very mineralized iron water, and is used by the population for dermatological diseases of the lower limbs. *Água da Morangueira* is considered therapeutic for liver and kidney diseases. At Ponta da Ferraria, in the parish of Ginetes, a hot spring flows into a natural pool connected to the sea. The salt thermal water combined with the presence of sulfur helps in the treatment of rheumatism and neuritis (Antunes, 2019).

Other central elements of the representations about sour waters express the idea that this type of mineral water is associated with hygiene, consumption to prevent illnesses, bathing, commercial and leisure activities, and the production of hydroelectric power. *Caldeira Velha*, located on the slope of *Vulcão do Fogo*, consists of three

thermal pools and is used mainly for leisure purposes, being managed by the local municipality that allows free access to the residents. *Furnas* thermal springs, integrated into the *Furnas Boutique Hotel*, characterized by bicarbonate, fluoride and sodium water, are mainly used for treating rheumatism, dermatologic diseases and respiratory, digestive and circulatory system diseases. Currently, it functions as a simple spa, with hydrotherapy services, and the local natural mineral water is confined to the swimming pool, whirlpool, sauna and Turkish bath (Antunes, 2019). For example, the *Terra Nostra* Garden Hotel is endowed with a large thermal water pool inserted in a centennial botanical garden (Antunes, 2019).

In the social visibility of sour waters, the high importance of the bottling industry of carbonated mineral water is highlighted. The bottling of this type of mineral water is an activity with a significant relative weight in the economic structure of the island of São Miguel. Bottling has always been the result of concessions, and examples are *Água da Serra do Trigo*, *Água de Alcântara*, *Água da Helena*, in the parish of Furnas, and *Água das Lombadas*, in the municipality of Ribeira Grande (Freire, 2013). In 2013, *Água da Serra do Trigo* was the only one of the aforementioned emergences to be operated under the name *Magnificat*. It was exploited by an entity of the *Renova* group, the same that exploited the *Gloria Patri* spring, also located in Furnas (Freire, 2013).

Hydropower is essentially characterized by the use of watercourses whose potential energy (associated with the height of the fall and the flow) can be transformed into mechanical energy through hydraulic turbines and, in turn, into electrical energy through alternators coupled to the same (EDA Renováveis, 2018). The hydroelectric power plant of *Salto do Cabrito*, located in Ribeira Grande, in São Miguel, was put into service in 2006 and is equipped with a Pelton turbine with an installed power of 670 kVA.

Conclusion

The aim of this paper was to understand the symbolic representations and social uses of the different types of waters on the island of São Miguel, Azores. A typological analysis was developed favoring the following types: fresh waters (the social images of water tending to be drinkable), salt waters (the social images associated with

the sea) and sour waters (the social images related to those waters that come from volcanic phenomena). The central elements of the representations about freshwater express the idea that freshwater is essentially human water; this type of water is a pivotal component for life, indispensable to survival, which is associated with health conservation and needs to be preserved.

The central elements of the representations of the salty waters, i.e., the maritime waters, highlight distinct but interdependent social images of the sea: an image of fear, a preventive and therapeutic image, an hedonistic image. Other central elements of the representations highlight, on the one hand, the idea that the islanders develop an enchantment in relation to the sea that surrounds them, simultaneously as a constraining element and as an element that makes it possible to go to a desired destination; on the other hand, the sea is perceived as a source of subsistence. The association of sour waters with the prevention and treatment of certain diseases emerges as a central element in the symbolic representations and therapeutic uses of these waters. Other central elements of the representations of sour waters express the idea that this type of mineral water is associated with hygiene, consumption to prevent diseases, bathing, commercial and leisure activities, and the production of hydroelectric power.

Water is not only a resource that keeps us alive but also contributes to people's lifestyles, perceptions of themselves and their place in society. The notion of basic water is related to social hierarchies in several interrelated ways. What is understood to be basic functions of water services is relative to what people are used to, according to their socioeconomic status. This is one factor that makes inequalities and social hierarchies that have been sustained after the democratic transition to appear 'natural' (Hellberg, 2017, p. 76).

Abstract: Parkinson's disease is a tragedy for retirees because it causes the nervous framework to deteriorate and, as a consequence, the participant's maneuverability. The application's precise involvement in Parkinson's disease significantly increases the chances of preventing it from worsening. The framework can circumvent this by gathering exact data from the individual or by supplying certain sample handwritten patterns, such as spirals or waves. This review article looked at a collection of appropriate publications as a solution. The research demonstrates that the computer vision architecture is the final answer for revealing the Parkinson disease probability by studying the sufferer's hand-drawn image. As a response, relevant papers have been studied in attempt to create an effective recognition system that employs the Region of Interest model to recognize the fuzzy pattern of patients' symptoms. The spiral shapes and accompanying discrepancies are caught using the CNN and Decision Making procedures in the Classification models. Future editions of this study will go through the approach in greater detail.

Introduction

The phenomena of modernization, as well as subsequent improvements in the medical sector, have culminated in a vastly enhanced standard of living for the average human. Biomedical progress has also contributed to the overall incremental improvement in human longevity. This has been a boon to society as a whole, because individuals can now survive much extended, happier, and pain-free lives. This appears to have undermined the well-being of the rapidly increasing demographic of senior citizens. These folks are suffering with challenges that were not as common when the expected lifetime was much shorter. Several older residents suffer from

extremely rare illnesses that are exclusively present in the aging population.

Parkinson's disease is a well-known ailment. It is a persistent neurological condition that is steadily increasing in prevalence amongst some of the elderly. This illness is marked by a drop in dopaminergic concentration in the body, a neurotransmitter which actively encourages interaction and cooperation. Reduced stability and the onset of uncontrollable muscle convulsions are symptoms of dopaminergic insufficiency. This is extremely inconvenient, and it may increase the elderly patient's risk of incidents and injury. A failure in the cortex central nervous system, particularly the ganglia area, is the most common cause of dopamine insufficiency, which impairs comprehension.

Parkinson's disease is a cortex deteriorating illness that affect the wellbeing of countless of retirees throughout the globe. Due to the obvious variability of Parkinson's disease, manifestations might proceed independently from one individual to the next. Individuals with Parkinson's disease may have convulsions, which occur mostly during rest. Shaking in the hands, muscular stiffness, and mobility and equilibrium issues are all possibilities. Parkinson's disease indicators may be divided into two categories: movement-related or motor functions and non-movement-related or non-motor complaints. Individuals with non-symptoms are actually significantly impacted than those with movement disorders. Anxiety, sleep behavior abnormalities, impairment of odor, and cognitive decline are examples of non-motor manifestations.

Since there are no true guidelines for assessing the neurodegeneration, diagnosing Parkinson's disease is very difficult. Parkinson's disease, on the other hand, can be identified using a range of behavioral and diagnostic characteristics. The freezing gait evaluation and speech synthesis tests are among the techniques that deal with mobility and involuntary movements. The doctors also employ a spiral approach to look for recurrent spasms, which show up as a jagged line inside the spirals. On some of these types of tests, medical specialists perform extensive manual calculations. This type of evaluation takes a long time and requires a lot of work from the experts. Qualitative categorization also bears the risk of introducing human error into an otherwise possibly fatal prediction. As a consequence, there is a need for a methodology that can be used to evaluate and diagnose Parkinson's disease utilizing computer image and machine intelligence approaches.

There seems to be a set of different classifiers that have already been discovered as producing the best and most reliable evaluation of Parkinson's disease in an individual. As input data, the spiral-containing photographs are delivered into the software. The Region of Interest approach is used to isolate the important part of a photograph that will be used for recognition. The region of interest is one of the most prominent methods for identifying the related region that is necessary for an appropriate inspection of the approach. This is used in conjunction with Convolutional Neural Networks and Decision-Making technologies to boost the effectiveness of Parkinson's disease identification techniques, which will then be detailed in future research publications.

This literature survey paper segregates the section 2 for the evaluation of the past work in the configuration of a literature survey, and finally, section 3 provides the conclusion and the future work.

Related Works

S. K. Khare et al. 2021 demonstrate an automated, accurate, and resilient PDCNN model depending on EEG signals. The EEG waves are utilized to generate the SPWVD graphs. Using two open-source EEG datasets, the SPWVD plots in conjunction with CNN produced the best PD detection performance. Using two PD benchmark datasets, the suggested technique has an accuracy of 99.73 percent, 100 percent, and 99.93 percent in automatically recognizing PDSF, PDSO, and PD classes. By decreasing the cross-term interference of time and frequency, the SPWVD can extract more representative and hidden information. The SPWVD plots aid in capturing spatial and temporal features at the same time, making it extremely distinct in distinguishing PD and HC participants. The presented prototype is portable and may be utilized in real-time Parkinson's disease diagnosis utilizing EEG data.

M. Rumman et al. introduced a framework that approached the problem of identifying PD from a different perspective than previous methods. DaTSPECT pictures were processed in this research to detect the putamen and caudate region, which is the region of interest (ROI) for this investigation, and the area of these sections was discovered. Subjects with Parkinson's disease have smaller putamen and caudate area than those who do not have Parkinson's disease (Rumman, et al., 2021). An artificial neural network (ANN) was utilized to classify Parkinson's disease and healthy control. When placed in an unknown comparable setting with previously supplied knowledge, ANN has a remarkable capacity to discern patterns and extract meaning from those patterns. The discovered results are quite relevant to real-life scenarios. A model with more datasets can provide even more consistent accuracy. More data may be used to train the ANN, making it more efficient in categorization.

K. H. Leung et al. present a deep-learning-based strategy that included both imaging and non-imaging clinical variables and has shown substantial promise for predicting prognosis in Parkinson's disease patients. This study examined longitudinal clinical data from 198 Parkinson's disease patients, including DAT-SPECT pictures and clinical assessments. The DAT-SPECT pictures were preprocessed by choosing a continuous segment of 21 image slices from each image with the greatest relative intensity in the transaxial direction as the center slice (Leung, et al., 2021). The photos were then zero-padded, yielding $128 \times 128 \times 21$ images for both years 0 and 1. Given the availability of a heterogeneous longitudinal dataset, the authors created numerous deep-learning-dependent algorithms with varying input data. The first technique exclusively makes use of data from DAT-SPECT pictures. The second technique exclusively employs data from non-imaging clinical characteristics. Finally, both imaging and non-imaging methods are provided for the final technique.

A new design for deep neural networks GS-RNN is introduced by K. Hu et al. that processes spatial-temporal data in the form of dynamic graph sequences. The basic elements of GS-RNNs are graph RNN cells and vertex-wise RNN cells, which simulate both structural and temporal graph patterns concurrently. GS-RNNs may be utilized to construct vision-dependent FoG findings as a fine-grained sequential modeling job in this case (Hu, et al., 2021). Extensive experimental findings on an in-house dataset, which contains the highest number of

patients in the literature of video-based PD gait analysis, show that the suggested GSRNN designs outperform the competition. Furthermore, by localizing the important vertices of a FoG film, the graph representation of anatomic joints gives an understandable interpretation of the detection findings, which is useful for clinical evaluations in practice.

Depending on DCGAN, SN, and feature matching, a Spectrogram Deep Convolutional Generative Adversarial Network (S-DCGAN) was presented by Z. -J. Xu et al. The model is utilized to recognize voiceprints. This model can create high-resolution spectrograms for sample augmentation by better capturing the spectrogram's textural properties. The addition of the SN technique enhances training stability when compared to DCGAN (Xu, et al., 2021). The feature matching approach increases the image quality and, in the end, produces a high-resolution spectrogram. The experimental results reveal that voiceprint recognition accuracy improves in a small sample of PD patients, and it is better than some of the most advanced technologies.

To categorize MRI patches of Parkinson's disease and healthy patterns, P. M. Shah et al. developed a bespoke CAD-based CNN design. The introduced network with three convolutional layers efficiently learns patterns from training samples of the benchmark PPMI dataset, resulting in enhanced accuracy. The findings demonstrate that the introduced network is capable of autonomously learning correct Parkinson's disease traits. During the testing, the authors discovered that the little dataset was a key issue, causing the CNN model to overfit (Shah, et al., 2021). They were able to overcome the overfitting problem by using suitable network architecture and dropout layers.

Y. Zhang et al. 2021 offer an approach for developing high-accuracy and low-latency FoG prediction models depending on impaired gait patterns. The authors expected that step-to-step impaired gait parameters such as cadence, symmetry, and variability are more relevant in FoG prediction than traditional FoG detection features and need shorter segmentation windows. Therefore, utilizing the compromised gait parameters, the authors were able to anticipate the imminent FoG with greater accuracy and reduced latency. They also anticipated that the duration of individualized pre-FoG phases was positively connected with illness conditions, which they utilize as the foundation for an FoG prediction model that is more accurate than unified labeling.

Depending on premotor indicators (i.e., Rapid Eye Movement (REM), sleep Behaviour Disorder (RBD), and olfactory loss) W. Wang et al. suggested a deep learning model to automatically differentiate normal persons and patients afflicted by PD (Wang, et al., 2021). The suggested deep learning model demonstrated strong detection capability, with an accuracy of 96.45 percent. This is mostly owing to the deep learning model's favorable capabilities in learning linear and nonlinear features from PD data without the requirement for hand-crafted feature extraction. The results reveal that the developed deep learning model outperforms the twelve examined machine learning models in distinguishing normal persons from Parkinson's disease patients.

Using EEG data acquired from individuals with Parkinson's disease and FOG, Z. Cao et al. explored the brain dynamics of FOG and intentional pausing events. The experimental outcome showed that FOG episodes were

related to aberrant EEG dynamics and that intentional halting could be distinguished from FOG events. The data reveal that freezing episodes are linked with considerably enhanced theta and alpha band power throughout the central and occipital regions when the transition to the freezing phase is compared to the freezing period itself. Furthermore, when compared to the FOG period, the EEG power reduced dramatically during the voluntary halting interval (Cao, et al., 2021). Their findings shed new light on the fast transition dynamics that underpin the phenomena of FOG and may pave the way for therapeutic prediction and mitigation of freezing episodes in sensitive patients.

L. Zahid et al. present the Alexnet model for deep feature extraction and finding of PD which provided a basic acoustic features-based strategy and also explored a pre-trained convolution neural network architecture. The authors employed transfer learning-based categorization for a fair comparison (Zahid, et al., 2021). The suggested approaches are evaluated using Parkinson's disease speech recordings from the PC-GITA dataset. The outcome suggests that the strategy depends on deep characteristics yielded superior outcomes.

CNN and CNN-BLSTM are two deep learning-based learning models suggested by C. Taleb et al. for end-to-end time series categorization. To cipher time series into pictures for the CNN framework, two distinct frameworks were proposed: Gramian angular field images and spectrogram images. The benefit of employing spectrogram pictures is that they compute local short-term information that occurs in non-stationary online handwritten signals before normalization, whereas the other two algorithms normalize the time series into a fixed dimension image without extracting local information (Taleb, et al., 2021). The fresh time series are utilized directly by the CNN-BLSTM framework, with no need to transform them into pictures. This method has been tested to confirm the relevance of taking into account local information before integrating on a temporal scale.

A. H. Neehal et al. developed a novel technique by evaluating resting-state fMRI image data. Each voxel represents a time series data point that is utilized to calculate in the time-frequency domain (Neehal, et al., 2021). STFT is employed in this method to obtain the signal's localized frequency information. The output of the STFT function yields a frequency vector and a time vector, which are then utilized to categories the data using the SVM classifier. The SVM classifier predicted the early phases with the highest accuracy. The authors were able to execute feature extraction for the targeted objective of recognizing early stages of PD since they used data from early-stage PD patients.

A. S. Alharthi et al. show how to utilize a deep convolutional neural network (DCNN) to analyze GRF data from Parkinson's patients. This extends the author's prior work which was confined to a DCNN's classification performance on GRF data using LSTM and statistical analysis. The idea is that they may use spatiotemporal gait GRF signals to categorize individuals as healthy or PD patients, and relate key known events in the gait cycle to cognitive decline owing to PD severity (Alharthi, et al., 2021). To their knowledge, this is the first time the LRP method has been utilized to analyze spatiotemporal gait GRF data in Parkinson's disease. They also use perturbation noise and LRP relevance scores to validate the approaches for how successful the obtained

classification result is.

Conclusion

Parkinson's disease is one of the most disabling neurodegenerative conditions. There is no recognized cause for the onset of this illness that is commonly seen in the elderly. The illness is related to cognitive impairment and a change in the physicochemical properties of both the brain's neurons. The disorder is seldom recognized in its initial phases since the symptoms are modest and infrequent, rendering it difficult to detect and assess. As a consequence, the goal of this study is to develop a suitable method for identifying Parkinson's disease in patients that could be used to make an accurate assessment on their own. To give a benchmark analysis of the different approaches for Parkinson's disease identification, this review paper drew on a number of academic articles. This has being observed that the majority of the techniques include flaws. Convolutional Neural Network as well as Decision Making are therefore appropriate candidates for neural networks which will be extended in additional investigation to eliminate these inconsistencies and provide a dependable Parkinson's disease diagnosis technique.

Abstract: This paper delves into the significance of literacy in the context of *hijamah*, an ancient method of healing that has been increasingly adopted in recent years. Despite the growing popularity of *hijamah*, there is a lack of clarity regarding the literacy levels of both practitioners and users. To address this gap, this study undertakes a review of existing literature on *hijamah* literacy. The findings of the study reveal that while there are important components related to *hijamah* literacy scattered throughout various sources, there is also a missing comprehensive assessment of *hijamah* literacy. This lack of clarity could have implications for the quality of *hijamah* services provided and received, as well as potential risks associated with the practice. The study concludes that the findings could aid policy makers in developing new guidelines for *hijamah* literacy, with the aim of improving education and training for practitioners and promoting safer practices for the public. However, the study also highlights the need for further research in this area to gain a more in-depth understanding of *hijamah* literacy and its impact on the *hijamah* industry.

Keywords: Literacy, Hijamah, Assessment

Citation: Abdul Karim, A. & Aziman, A. (2023). Literacy Parameters of Hijamah Services for Practitioners and Users. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2344-2354), Cappadocia, Turkiye. ISTES Organization.

Introduction

Hijamah remains popular today particularly among Muslims; it is indicated for both healthy patients and those suffering from ailments. It is a cupping therapy which is simple, effective, and economic alternative medicine to treat chronic aches and pains with minimal side effects when compared to the present use of drugs with relatively higher side-effects (Al-luhaidan & Prarthana, 2020). The therapy has been used since the time of Prophet Muhammad (ﷺ), whereby its wet cupping type is considered the original form of *hijamah*; in fact, the terms *hijamah* and *faṣḍu* were used interchangeably (Asar A.K., 2022). This *hijamah* wet cupping is the bloodletting technique involves cupping, puncturing and cupping (CPC) method. Cups are applied through vacuum, skin is lacerated, the cups are repositioned and the blood is drawn so that the morbid substances are evacuated (Al-luhaidan & Prarthana, 2020). However, despite its long history of use, the practice of *hijamah* is largely unregulated, and there is a lack of standardized literacy parameters for both practitioners and users. Lack

of regulation and standardization in hijamah practice can result in practitioners with varying levels of knowledge, training, and experience, which can affect the quality and safety of treatment (Aboushanab & AlSanad, 2018). Therefore, the aim of this paper is to identify and explore the necessary literacy parameters for the safe and effective delivery of hijamah service.

Literature Review

The document Traditional and Complementary Medicine Blueprint 2018-2027 Health Care (TCMBP) (Ministry of Health, 2017) is a strategic plan developed by the Ministry of Health Malaysia to guide the integration and development of traditional and complementary medicine in the country's health care system. It outlines the vision, mission, goals, and strategies for the promotion, regulation, and utilization of Traditional and Complimentary Medicines (T&CM) to provide holistic and comprehensive health care to the Malaysian population. The blueprint acknowledges the historical and cultural significance of T&CM in Malaysia, and highlights the potential benefits of integrating T&CM into mainstream health care to improve patient outcomes and enhance health care delivery.

The document highlights 17 challenges faced by the T&CM industry, they are categorised into four (4) areas: 1- practice, 2- education and training, 3- medicinal materials and products, and 4- research. In response to these challenges, six general directions were tailored to address the challenges. The document further proposes 22 strategies and 52 action plans that are aligned with these general directions. It will cover an implementation period of 10 years and an interim review will be conducted after 5 years. The four (4) areas highlighted in the ministry document are as follows:

- 1- **Practice.** This area aims to establish a regulatory framework for T&CM practice, including registration, licensing, and standardization of T&CM services, products, and practitioners. It emphasizes the need for evidence-based practice and research in T&CM, and the development of guidelines and protocols for T&CM integration in health care settings.
- 2- **Education and Training.** This area aims to strengthen the education and training of T&CM practitioners, as well as mainstream health care professionals, to ensure competent and qualified T&CM services. It highlights the importance of research and innovation in T&CM, and the need for interprofessional collaboration among health care providers.
- 3- **Medicinal materials and products.** This area aims to enhance the availability, accessibility, and affordability of T&CM services to the population. It emphasizes the need for a patient-centered approach in T&CM practice, and the integration of T&CM into primary health care, hospitals, and other health care settings. It also encourages the development of evidence-based clinical practice guidelines for T&CM conditions.
- 4- **Research.** This area aims to promote the growth and sustainability of the T&CM industry in Malaysia, including the cultivation of medicinal plants, production of herbal products, and export of T&CM services. It highlights the importance of entrepreneurship and innovation in the T&CM industry, and the need for quality assurance and market surveillance to ensure consumer safety.

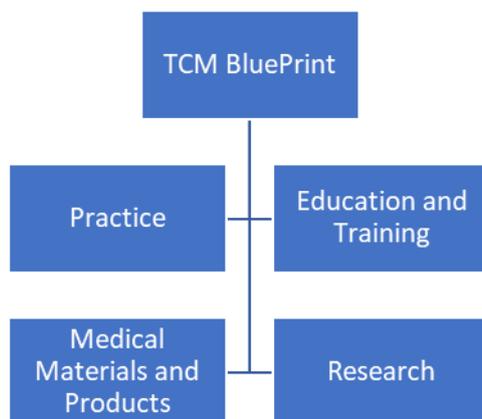

Figure 1. TCMBP Four Main Areas

For the purpose of this paper, researchers focus on the second area which obviously related to literacy of *hijāmah* therapy, it is “Education and Training”. Generally, the literacy parameters are divided into two types of literacy, they are:

- 1- Literacy parameters of *hijāmah* practitioners.
- 2- Literacy parameters of *hijāmah* users.

Literacy Parameters of *Hijāmah* Practitioners

In general, practitioners of *hijāmah* must possess a strong knowledge base about this cupping therapy, teoritically and practically. They also must be able to recognize contraindications and complications associated with the therapy and have the necessary skills to manage them. Additionally, the practitioners must possess the necessary communication and professionalism skills to effectively communicate with clients. Finally, they should also have a clear understanding of Islāmic guidelines about this prophetic medicine. Hence, the details of the literacy parameters for *hijāmah* practitioners could be summarized as follows:

1. **Knowledge of *hijāmah* therapy.** *Hijāmah* therapy, also known as cupping therapy, is an ancient form of alternative medicine that has been practiced for centuries in various cultures around the world. This therapy does have two main types of cupping: wet and dried cuppings. As with any form of therapy, it is essential for practitioners to have a deep understanding of the therapy's history, theory, and practice to provide safe and effective treatment to their clients. To be a proficient practitioner, one must have knowledge of the traditional and modern techniques used in the therapy, as well as the indications, contraindications, benefits, and risks associated with the therapy. Understanding the underlying principles of *hijāmah* therapy and its effects on the body's systems, including the circulatory, immune, and nervous systems, is crucial to tailor the therapy to the individual's needs. The practitioner should be able to identify the appropriate locations for cup placement (Aboushanab & AlSanad, 2018), which can vary based on the patient's age, sex, body composition, and medical history. Additionally, they must be familiar with the different types of cups used in the therapy and how to properly sterilize and maintain them to prevent the spread of infections. Furthermore, practitioners must be aware of the potential risks

associated with the therapy, such as infection, bruising, and the risk of transferring bloodborne pathogens. The risk of infection can be minimized by ensuring that the skin is clean and disinfected before cup placement. Practitioners must also use disposable or sterilized needles when performing the procedure to avoid the transfer of bloodborne pathogens.

By possessing a thorough knowledge of *hijāmah* therapy, practitioners can provide safe and effective treatment to their clients. This knowledge enables them to tailor their techniques to meet individual needs and address any concerns or complications that may arise during the therapy. Practitioners can educate their clients on the benefits and risks of the therapy and help them make informed decisions regarding their health. Therefore, it is crucial for practitioners to continually update their knowledge of *hijāmah* therapy and stay up to date with the latest research and best practices in the field.

2. **Anatomy and physiology.** To perform *hijāmah* therapy accurately, practitioners should not only have a comprehensive understanding of the therapy itself, but also possess a solid understanding of human anatomy and physiology, especially the musculoskeletal and circulatory systems. This knowledge is necessary to ensure that the cups are placed correctly during the therapy, which can reduce the risk of complications. Practitioners need to have a detailed understanding of the location and function of various muscles and bones in the body, as well as the path of major blood vessels and nerves. This knowledge enables them to identify the best placement of cups for maximum therapeutic benefit and avoid sensitive or vulnerable areas of the body. Moreover, practitioners must be familiar with the circulatory system and the role it plays in the body's overall health. They should have knowledge of the different types of blood vessels, their functions, and how the therapy affects blood flow and circulation. By understanding the circulatory system, practitioners can assess how the therapy affects blood flow and circulation, then adjusting their techniques accordingly to promote healthy blood flow. Accurate placement of cups during the therapy can also help to improve circulation, enhance oxygen and nutrient delivery to tissues, and facilitate the removal of waste products from the body (Setyawan, Hikmah, Oktavianto, & Yanuar Saifudin, 2022) (Mohamed, Zhang, & Jan, 2023).

By possessing a solid understanding of human anatomy and physiology, practitioners can ensure safe and effective placement of cups during *hijāmah* therapy and minimize the risk of complications. This is obviously can be achieved by formal certification from related body.

3. **Infection control and hygiene.** Infection control is an essential aspect of any healthcare practice, including *hijāmah* therapy. Standard precautions are on the assumption that any patient may potentially be infected with organisms that are transmissible; therefore, standard precautions apply to all patients, in all settings (Edmond & Wenzel, 2015). The essential elements of standard precautions are hand hygiene, personal protective equipment (gowns, gloves, masks, and eye protection), and safe needle practices. *Hijāmah* practitioners must adhere to strict infection control practices to minimize and prevent the risk of infection, they must also practice the high standard of hygiene.

Hijamah practitioners must thoroughly wash their hands before and after each session with soap and water, or an alcohol-based hand sanitizer. They should also thoroughly wash their hands before and after each session with soap and water, or an alcohol-based hand sanitizer. The use of personal protective equipment (PPE) such as gloves, masks, and eye protection are basic hygiene process to minimize the risk of exposure to pathogens. Infection control and hygiene are used interchangeably, some authors refer hygiene as sanitation(Purnama & Susanna, 2020). Hygiene protocols also include disposable cups, using clean and sterilized equipment for each user. The equipment used in the therapy, including the lancets, blades, and other tools, should be cleaned, and sterilized using appropriate methods before and after each use.

Therefore, the practitioners should be well-versed in infection control and hygiene protocols to ensure safe and effective the therapy. In fact, Infection Prevention and Control (IPC) is one of the first topics introduced in nursing programs, yet its main tenets are often lost or forgotten(Dar, 2021).

4. **Communication.** Effective communication between healthcare practitioners and patients is crucial in ensuring positive health outcomes. Theory of person-centeredness is still in its ascendancy(Klancnik Gruden, Turk, McCormack, & Stiglic, 2021). In the field of healthcare, practitioners must be equipped with the skills to communicate appropriately with their clients. This includes assessing their medical history, explaining the therapy, and ensuring their comfort during the procedure. Effective communication skills have been linked to better health outcomes for patients(Street, Makoul, Arora, & Epstein, 2009). Practitioners must be able to communicate complex medical information in a way that patients can understand and be able to answer any questions they may have. Additionally, effective communication involves showing empathy and building trust with patients. In fact, patients who perceived their healthcare practitioner as empathetic were more likely to follow their medical advice and report better health outcomes(Stewart et al., 2000).

Thus, it is essential for healthcare practitioners to not only possess technical expertise but also have effective communication skills to ensure that their patients receive the best possible care.

5. **Professionalism.** In the healthcare profession, professionalism is crucial for ensuring the delivery of safe and effective care. It enhances doctor-patient relationships and advances patient-centric care(Tay et al., 2020). Practitioners must maintain a high level of professionalism, which includes ethical standards and comply to local regulations and guidelines. Ethical standards are critical in maintaining the trust of patients and the public. Practitioners must adhere to ethical principles such as confidentiality, informed consent, and non-maleficence to ensure that they are providing care that is in the best interest of their patients. Technological innovation has been the prime driver of educational transformation nowadays(Sinclair, Kable, & Levett-Jones, 2015); hence, continuing education with the help of technology is also an important aspect of professionalism, as it allows practitioners to stay up-

to-date with the latest advances in their field.

Islāmic guidelines also play a crucial role in the practice of ḥijāmāh because this traditional Islāmic therapy is associated with the prophetic medicine. Practitioners of ḥijāmāh should understand and adhere to Islāmic principles such as sincere intention, invocations, modesty, and respect. Since, a truly Islāmic society should comprise of women who join the working forces(Asar AK & Bouhedda, 2016), gender separation also should be diligently observed during ḥijāmāh; this gender separation is the controversial issue debated by many. In short, male and female patients should be treated in separate spaces to maintain modesty and uphold Islamic teachings on gender interactions. It is not a requirement for a practitioner to be a *mahram* to the female patient; if there is an urgent need to get treatment, then the female patient can get that treatment. However, it must be based on the guidelines that have been explained by Muslim jurists to guard against the occurrence of *zinā*, or *fitnah* that may arise in society. One of the guidelines is to have her husband, guardian, or other trusted woman with the female patient when she receives treatment from the trusted practitioner(Asar A.K., 2022).

Literacy Parameters of Hijamah Users

In general, users of ḥijāmāh must also possess a certain level of literacy parameters to ensure their safety and efficacy of the therapy. The parameters are as follows:

1. **Knowledge of ḥijāmāh.** Users seeking ḥijāmāh therapy should also have a basic understanding of the treatment, including how it works, potential benefits, and risks. However, users should be aware of the potential risks associated with the therapy, such as infection, bleeding, and skin irritation; if necessary, users should also seek medical advice before undergoing the therapy. Currently, cupping therapy is used for health promotion, prophylaxis, and treatment of a variety of diseases around the world(Qureshi et al., 2017). Ḥijāmāh is thought to improve overall health and well-being; the suction created by the cups can stimulate the flow of blood and other fluids in the body which may help to remove toxins and other harmful substances. This can lead to improved circulation, which can help to reduce pain and inflammation, as well as boost the immune system(HijamaPoints.com, n.d.). A basic understanding of the therapy can help users make informed decisions about their healthcare and ensure that they are receiving safe and effective care.
2. **Medical history.** Providing a comprehensive medical history is a critical aspect of receiving safe and effective healthcare. Users seeking medical treatment, including ḥijāmāh therapy, should inform their practitioner of any underlying medical conditions, allergies, or medications they are taking that may affect the therapy's safety and effectiveness. With the help of digital tools nowadays, medical histories can be collected easily. A detailed medical history can help ḥijāmāh practitioners to facilitate treatment planning, reduce documentation work, and improve care(Albrink et al., 2022). This includes any

chronic conditions such as diabetes or hypertension, as well as any medications or supplements that the user is taking. A detailed medical history of users is an essential component of the healthcare provider's role and can improve the user's experience by reducing the risk of complications and increasing the effectiveness of the treatment.

3. **Hygiene.** Hygiene is a critical aspect of any medical treatment including *hijāmaḥ* therapy; whereby hand hygiene remains as one of the most effective methods for reducing infections (Hillier, 2020). Hand hygiene compliance of health care personnel has been an ongoing challenge (Moore, Robbins, Quinn, & Arbogast, 2021). Users seeking *hijāmaḥ* therapy should ensure that the practitioner uses disposable cups, clean and sterilized equipment and follows proper hygiene practices, particularly the hand hygiene to minimize the risk of infection. Poor hygiene practices can lead to the transmission of infectious diseases and other complications. Users can also take steps to ensure their own hygiene, such as showering before the treatment, wearing clean and comfortable clothing, and avoiding the therapy if they have any open wounds or infections. Maintaining proper hygiene practices can improve the effectiveness of the treatment and minimize the risk of complications.
4. **Communication.** Effective communication is essential in any healthcare setting, including *hijāmaḥ* therapy. Users seeking this therapy should be able to communicate effectively with their practitioner, especially regarding their level of discomfort during the treatment. In fact, patient-centered communication may improve patient satisfaction, reduce malpractice rates, and decrease diagnostic testing expenses (Wang, Lavender, Hoque, Brophy, & Kautz, 2021). Medical narrative that starts from adequately listening to the patient's story contributes to comprehensive medical training, and offers the patient the opportunity to be treated in an empathic and humanized environment (Miranda-Bastidas, 2020). It is important for the user to communicate any discomfort or pain they may be experiencing during the treatment, as this can help the practitioner adjust the treatment to minimize discomfort and improve the user's experience. Users should also inform the practitioner of any concerns or questions they may have about the therapy, including its potential benefits and risks. Hence, effective communication can improve the user's experience and satisfaction with the treatment, as well as ensure that their needs are met.
5. **Aftercare.** Aftercare is a critical aspect of any medical treatment, including *hijāmaḥ* therapy. Users seeking *hijāmaḥ* therapy should follow the practitioner's aftercare instructions to ensure optimal recovery and minimize the risk of complications. Following aftercare instructions can improve the user's recovery and reduce the risk of infection and other complications. A follow-up call by practitioners is useful for reinforcing aftercare instructions, follow-up referrals, and problem-patient identification (Shesser, Smith, Adams, Walls, & Paxton, 1986). Users may also be advised to rest, eat a healthy diet, and drink plenty of fluids to aid in the healing process. Additionally, the practitioner may prescribe medications or supplements to promote healing and reduce discomfort. It is important for the user to follow the aftercare instructions carefully and contact the practitioner if they experience any

unexpected symptoms or complications.

Literacy Framework for Hijamah

Based on the previous discussion and available literature, we propose a framework for the literacy of hijamah services for practitioners and users.

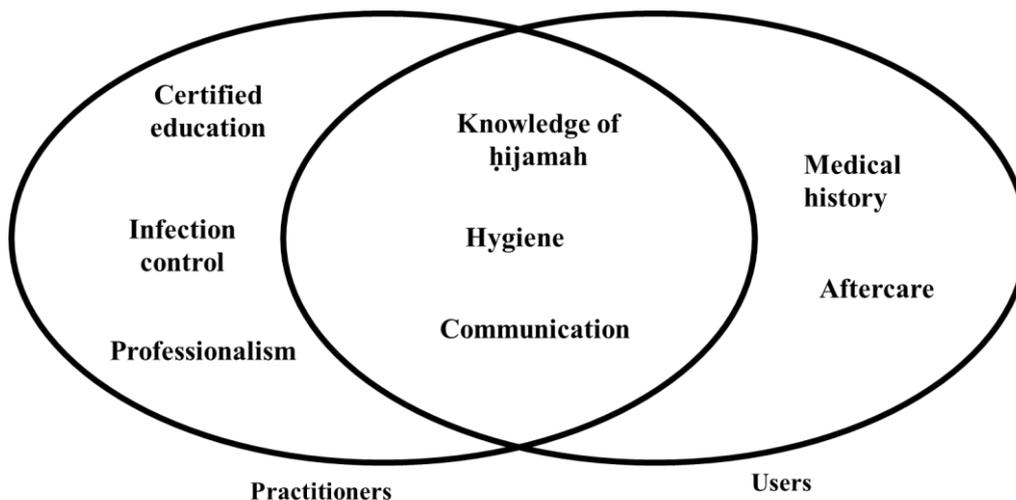

Figure 2. Literacy Framework for Hijamah

The details of the framework are as follows:

- 1- **Knowledge of hijamah therapy:** Practitioners and users should have a basic understanding of what hijamah therapy is, how it works, and its potential benefits and risks.
- 2- **Certified education.** Hijamah practitioners should have a certified education and training in hijamah therapy, whereby a solid understanding of the anatomy and physiology of the human body is a must. The practitioners should be trained in proper hygiene practices, and the use of clean and sterilized equipment to minimize the risk of infection. They are also should have a clear understanding of Islāmic guidelines since hijamah therapy is the prophetic medical therapy which being practiced by many Muslims as sunnah.
- 3- **Infection control and hygiene.** Infection control and hygiene practices are critical to be understood by both hijamah practitioners and users in ensuring a safe and effective therapeutic experience. By adhering to rigorous personal hygiene, maintaining a clean treatment environment, practicing appropriate instrument sterilization, and following infection prevention measures, the risk of cross-contamination and infection transmission can be significantly reduced. It is vital for both practitioners and users to stay updated on current guidelines and recommendations to ensure the highest standards of infection control are consistently maintained during hijamah therapy.

- 4- **Communication:** Practitioners and users should be able to communicate effectively with each other. Effective communication between healthcare practitioners and patients is crucial in ensuring positive health outcomes.
- 5- **Professionalism.** Professionalism and adherence to Islamic guidelines are integral to the practice of *hijāmah*. Upholding ethical conducts and integrating Islamic principles are essential for practitioners and users alike. By maintaining professionalism and following Islamic teachings, *hijāmah* practitioners can provide a holistic approach to therapy that incorporates physical, emotional, and spiritual well-being, ensuring a positive and fulfilling experience for all parties involved.
- 6- **Medical history:** Users should inform their practitioner of any underlying medical conditions, allergies, or medications they are taking that may affect the therapy's safety and effectiveness.
- 7- **Aftercare:** Users should follow the practitioner's aftercare instructions to ensure optimal recovery and minimize the risk of complications.

Limitation

Some limitations of this review deserve to be mentioned, one of them is only full text articles in English and Malay published in peer-reviewed journals were included in the review, which may have excluded some relevant articles which further limited the number of studies included.

Conclusion

The lack of standardized literacy parameters for *hijāmah* services can lead to ineffective treatment, adverse events, and serious health risks. By adhering to these literacy parameters, practitioners can provide high-quality care, and users can make informed decisions about their health and well-being. This proposed framework may serve as the standardization in the practice of *hijāmah*. It may improve the quality and safety of *hijāmah* therapy. It paves the way for *hijāmah* awareness and its acceptance as a viable alternative healthcare option.

Recommendations

Based on the findings of this research, there should be a standardization of practice in the field of *hijāmah*. This standardization includes the development of a code of ethics for *hijāmah* practitioners which complies with Islamic ethical guidelines. Regular training and assessment of practitioners; monitoring of their practice by regulatory bodies, and collaboration with healthcare professionals are also a must nowadays. Finally, there is a need for public education on the benefits and risks of *hijāmah*, as well as the ethical guidelines that practitioners

should follow. This can be achieved through public awareness campaigns, educational programs, and the dissemination of information through traditional and social media platforms.

Rahul

Delhi Technological University, India,

Abstract: Recognition and detection of traffic signs have been one of the most important factors and a very crucial aspect for autonomous vehicles and also in the Driver assistance system. If a proper and accurate recognition and detection system is not installed in a vehicle, the information present in signs will not be interpreted correctly and hence it can result in the loss of human life. The need for a good detection system is very important. One of the Deep Learning approaches, an improved convolutional neural network(CNNs) in conjunction with Image Preprocessing Techniques presents a unique solution to recognize and detect traffic signs with state-of-the-art results for building a better Advanced Driver Assistance System (ADAS). The proposed model is evaluated on German Traffic Sign Recognition Benchmark(GTSRB) traffic sign dataset and fine-tuned to capture the minute and fine details and features present in different classes of the traffic sign. which contains in total, more than 52000 traffic sign images. With the enormous size of data, the model was able to achieve testing accuracy of 97.76% and validation accuracy of 99.71% therefore, making the model a useful part of the advanced driver assistance system.

Keywords: GTSRB, Convolutional Neural Network, ADAS, Traffic Sign Recognition, Traffic Sign Detection

Introduction

Deep Learning has been currently one of the most progressive fields from the subset of the machine learning when it comes to identify and classify any image (Treebupachatsakul & Poomrittigul, 2019), recognition of imprints (Rahul, et al., 2020), summarizing text (Shand & Rahul, 2022), and related to its representation. The

progress in the field of the deep learning is directly relates to the progress made in the autonomous vehicle industry (Balasundaram, et al., 2021). For any instance we can see that Deep Learning is so intensely used in when it comes to the semantic division of an image (Chen, et al, 2018)., locating any kind of arrangement made (Berriel, et al., 2017), in the course assessment of the heading of a vehicle which is known to everyone.one of the key benefit of deep One of the key benefits of deep learning is its ability to handle unstructured data, such as images,

audio, and text. Much progress has been made in areas including speech recognition (Wang, 2020), computer vision, and natural language processing as a result of this. In addition to its advantages, Deep Learning also has certain disadvantages as it necessitates costly annotation, a sizable well-balanced data collection, and a high computing cost during training. Despite these challenges, deep learning is a rapidly growing field and and provides many prospects.

The proposed research project is concerned with traffic sign detection. This project seeks to aid autonomous vehicles in safely navigating roadways by giving drivers real-time information about traffic signs. A single traffic sign can convey a great deal of information to the people. It is necessary to develop a dependable automatic traffic sign detection system. Since there are some traffic signs that are uncommon and rarely encountered in everyday driving situations, A dataset with practically all the traffic signs information is needed to achieve this task efficiently. For the current model, we have used German Traffic Sign Recognition Benchmark (Houben, et al., 2021) for the training purpose. The following name of the dataset is due the image being captured on the German Street.

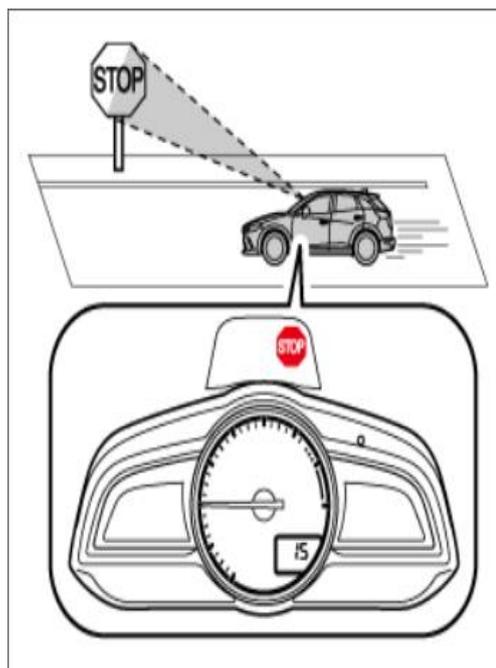

Fig 1.TSR Model

Convolutional Neural Network

A CNN (Convolutional Neural Network) is a supervised learning method that requires both training data and target yield data. These are categorized using their marks to provide a scholarly framework for future information research. The architecture of a ConvNet was inspired by the organisation of the Visual Cortex and is similar to the connectivity network of neurons present in the human brain. Individual neurons are only excited in the Receptive field, a limited region of the visual field. There are several overlapping fields like this that make up the total visual field. A CNN (Convolutional Neural Network) typically consists of three layers: Convolutional layer, pooling layer and a dense, completely integrated network. The Information image is applied to the convolutional layer using m times of $n \times n$ channels to create a component map. The maximum pool layer, which is mostly used for dimensionality reduction, takes the element map after that, and selects just its best features from the component map. Finally, all of the highlights are smoothed and delivered as a contribution to the fully integrated thick neural structure, which learns the loads using back propagation. The convolutional neural network only looks at a single section or window of the information picture at a time. Every time, the convolutional layer will produce a component map for each portion. The feature extraction is not done manually in the convolutional neural network (Hao & Maoguo, 2017).

Highlight extraction is done in the pooling layer by removing the excess highlights and taking only the primary highlights for that area. Therefore, by using CNNs, we may avoid having to do a separate component extraction process. Compared to other comparative characterization calculations, CNNs require less pre-preparing. Traditional MLP (Multi-Layer Perceptron) calculations provide the necessary precision for image recognition, but because the hubs are tightly coupled, they suffer from the effects of dimensionality and cannot be scaled to high goal images. CNNs use the spatial relationship of a picture to get over the problems MLP presents. An illustration of a neighborhood network between neighboring neuron layers is used to complete this. When compared to other approaches, CNNs end up being better at a variety of tasks, including video analysis, natural language processing (Raul, et al., 2021), and many more. CNN has the essential advantage over its forerunners in that it can autonomously determine the distinctive traits of each class and can identify key properties without manual intervention. CNN can also be combined with other machine learning-based algorithms or modified further! like hybrid wavelet CNN with WCO (Monika, 2022). In summary, CNNs are an effective technique for processing image data and have produced cutting-edge outcomes on a variety of visual recognition tasks and offer several advantages over traditional computer vision methods, such as automatic feature extraction and robustness to variations in the input data.

Literature Review

When the work related to recognition and detection of the traffic signs started all it could recognize the signs

using the features such as shapes and colors and that too was not so efficient in its functioning. Sign recognition is basically based on extracting the specific features which are generally represented through some traffic sign patterns (Sun, et al., 2021). Since it is a broad field of study the most recent development related to it can be analysed from the survey by Møgelmoose et al. 2021. There are certain problems related to color fading or the changes in the illumination, the deformation are some of unresolved problems (Lim, et al., 2017).

The most important part that plays role in recognition of signs is to find the required information and then extract it from the image and label the sign present in the image correctly (Wang, 2018). Sermanet et al. 2011 for traffic sign recognition proposed a multi scale CNN framework on GTSRB (Houben, et al., 2021). Yuga hatolkar et al. 2018 a model is proposed for recognition of the traffic signs where the optimizer modules act been carried by the fuzzy classification module for the results which are obtained by CNN. Chiu et al. 2021 in his research proposed a framework which is based on CNN that uses a two-stage approach for the traffic sign detection consisting of region proposal and classification. Luo et al. 2017 made a proposal of a novel method classifying and detecting the the signs based on multi task CNN framework doing both the task simultaneously. Zhang, et al., 2020 made use of knowledge distillation along with the CNN for calculating the accuracy which came out to 70% due to the pruning a model These studies highlight the importance of architecture design, data preprocessing, and data augmentation in achieving high accuracy and robustness in traffic sign recognition and detection.

With advancement ongoing the works done in this field of DL and NN are producing results with good accuracy and efficiency which can be significant for the future of the work done in this field. Those results encourage future development and the research work being carried in improving models' artificial intelligence. inspired from the work done in deep learning and developing a good traffic sign recognition system we aimed at developing an effective model for the traffic sign recognition with using the using the multilayer architecture of Convolutional Neural Network.

Methodology

Dataset

In this paper for the training validation and testing purpose a large size of dataset was required for which we used GTSRB (Houben, et al., 2021). dataset. The name of the dataset is due the image being captured on the German Street.

The dataset used contains images containing different signs present of the road which can be divided into 43 classes and in total having 51,839 images Each class of image contains images with different resolution clarity so as we were able to train the model better.

Out of the total images from all classes in the dataset for purpose of the training the images are 31367 in

number, for the validation purpose are 7482 and the left one which are 12630 for the testing purposes.

Data pre-processing

Before passing the image, the dimensions were checked, the dimensions varied in a very dynamic range of $16 \times 16 \times 3$ to $128 \times 128 \times 3$. To enhance the efficiency of the model the images were preprocessed without distorting much of the information. The images were preprocessed and their dimensions were changed to $(32 \times 32 \times 3)$. The image is further treated for noise reduction by gaussian blur and then with max-min scaling.

Implementation

In this study for the recognition, classification and identification of the traffic signs and signals a CNN model is used. The filter size number being used and the proper number of epochs decided to be used in the model were subject to the experimental tries and were deciding on the basis of it. They were also chosen considering the experimental cost. The image of input size $(32 \times 32 \times 3)$ is firstly passed on the first Conv2D layer with kernel size of (5×5) and total 32 filters. A dot product is done with the input image when the kernel was slid over the input image and the output matrix is formed which is basically the resultant of this dot product. The layer's output is further passed to another similar layer but with 64 filters to make algorithm learn through back propagation. Regarding the activation function (Hatoikar, et al., 2018), in each layer the activation function used is ReLU and except in the last layer where Softmax function is used. From each layer the output produced is passed from the activation function where ReLU activation function gives 0 for values less than zero and decided about the output that will be shipped to the next layer's neuron. The result is further passed to the pooling layer (Bera, et al., 2020), which is basically used when the feature map is to be further reduced as it might be needed to give better result as moving further in the algorithm. NN model are prone to overfitting and to reduce that the dropout layer is used which randomly deactivates a certain percentage of neurons in a layer during each iteration.

The output from the previous layer is passed to the dropout layer. For choosing the most efficient dropout layer, we tested our code randomly between 20% to 50% and got best result around 25%. The dropout layer's output is further sent to the flatten layer as an input. The flatten layer in a neural network serves as a bridge between convolutional layers and fully connected layers by transforming pooled feature maps into a flattened, one-dimensional vector. This allows for the introduction of non-linear properties into the model through the non-linear dense layers, and enables efficient processing of the feature maps.

We compared our model with different optimizers (Zaheer, et al., 2019) and finally decided to use Adam Optimizer considering comparison graph. Adam optimizer was able to achieve higher accuracy in comparison to other optimizers that we have used. It reduces the computational cost and training cost was also lower than the other optimizers.

Layer (type)	Output Shape
conv2d (Conv2D)	(None, 28, 28, 32)
conv2d_1 (Conv2D)	(None, 24, 24, 64)
max_pooling2d (MaxPooling2D)	(None, 12, 12, 64)
dropout (Dropout)	(None, 12, 12, 64)

conv2d_3 (Conv2D)	(None, 8, 8, 64)
average_pooling2d (AveragePooling2D)	(None, 4, 4, 64)
dropout_1 (Dropout)	(None, 4, 4, 64)
flatten (Flatten)	(None, 1024)
dense (Dense)	(None, 256)
dropout_2 (Dropout)	(None, 256)
dense_1 (Dense)	(None, 43)

Fig 2. CNN model architecture

Experimental Results

In this study the images in the dataset were preprocessed to 32X32X3 dimensions from which we observed that the preprocessing done on the images helps in improving the accuracy of the model.

We trained our model on GTSRB dataset and used Adam optimizer which gives the most promising results than the other optimizers used and also it reduced the training cost and computational cost of the model. We used max pooling layer (MaxPool2D) with first conv2d layer set and next time average pooling layer which gave us better results than using either one of them. Next to use the dropout layer we got better accuracy while using the dropout layer who's with value of 25%. The model has 2 convolutional layers with ReLu activation function whose result is passed through the max pooling layer and dropout layer and then a similar one repeated before passing through the flatten layer with only difference using the average pooling layer instead of max pooling layer giving us better results.

The results in the table comparing the results of using max pooling layer, average pooling layer and combination

of both max and average pooling layer.

Table 1. showing the performance using different pooling layers

Performance Measures	MaxPool2D layer (%)	AveragePooling2D layer (%)	Combination (MaxPool 2D and AveragePooling 2D layer) (%)
Training Accuracy	95.65	98.64	98.7
Validation Accuracy	99.03	99.71	99.64
Testing Accuracy	95.81	97.26	97.45

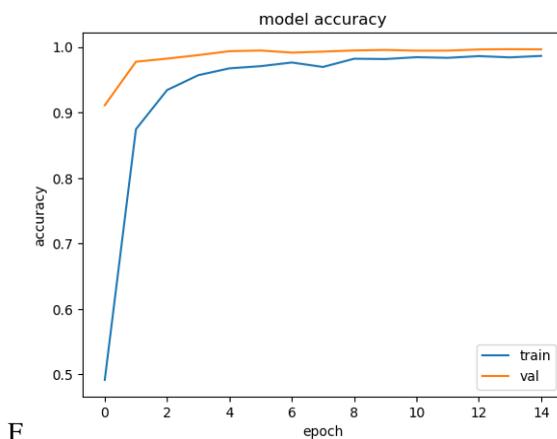

Fig 3. Training vs validation (accuracy)

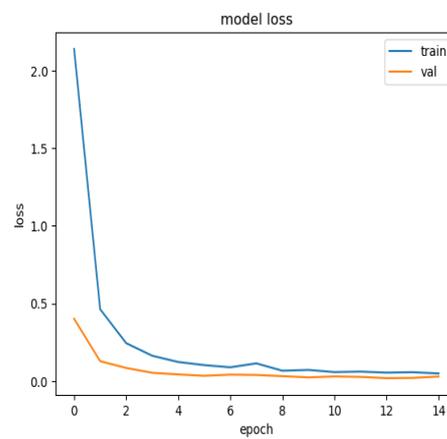

Fig 4. Training vs Validation (Loss)

The approach in this paper working over 15 epochs with a batch size of 128 shows good results for recognition of the traffic signs with a training accuracy of 98.7% , validation accuracy 99.64% and the testing accuracy of 97.458432304038 %. The variation in the accuracy and loss with epochs is shown in the figure below

Conclusion and Future Work

In this paper, a recognition system for traffic signs has been proposed with results, testing accuracy 97.458432304038 % on the GTSRB [2] dataset which consists of traffic signs images among 43 classes and these images were randomly divided for training and validation. Images were preprocessed before the passing to the CNN framework so as to reduce the computational cost which further supported by the use of Adam optimizer.

The models in terms of its performance have better when compared to other models. Since the model having a good efficiency and, it can recognize images at a good rate. The performance can further be optimised in the future with making the algorithm error-free or with much less error and improved accuracy also the implementation of real-time working of the model for detection and recognition can also be done.

The Influence of The Aging Process on The Physico-Chemical Composition and Organosensory Characteristics of The Alcoholic Distillate Produced from The Black Shesh Variety

Klotilda Marku

Faculty of Biotechnology and Food, Agricultural University of Tirana, Albania

Abstract: The non-aromatic variety Black Shesh is an autochthonous Albanian cultivar spread throughout the Albanian territory mainly used for wine production. The study is focused on a certain amount of the Black Shesh variety, which was subjected to controlled vinification at a temperature of 18-20°C, without the presence of SO₂ in the presence of 3 gr/l of selected yeast *S. cerevisiae*. Then the fermented mass is subjected to the process of fractional distillation, single distillation is performed, the obtained distillate is subjected to aging in oak wood for 1, 2 and 3 years. The aim of the study is to identify the physico-chemical and organosensory characteristics of this alcoholic distillate before and after aging for 1, 2, 3 years. The analyzes were carried out according to the methods OIV-MA-AS312-01A, OIV-MA-AS313-01; REG-CE 2870/2000. Referring to CE Regulation no. 110/2008, point 3, article 1, alcoholic distillate stored in oak wood has changes in its physical and chemical composition. The results show that the change in the physico-chemical composition is observed in the third year of aging and mainly in the reduction of the methanol content, which decreases by 3.05 gr/l a,a; in the increase of high alcohols up to 4 gr/l a,a; increase of furfural in the amount of 0.22 gr/l a,a; increase of acetic aldehyde in the amount of 1.75 gr/l a,a; ethyl acetate increases to the amount of 3.8 mg %ml a,a. The organosensory evaluation of the aged distillate shows an improvement in the aromatic picture even though the initial aromatic intensity of the distillate is negligible, the sweet taste is easily discernible, the color changes from transparent white to the shade of honey, these come as a result of the hydrolysis of lignin and wood hemicellulose. The distillate does not lose its clarity during aging in oak wood.

Keywords: Black Shesh, Alcoholic Distillate, Ageing Process.

Introduction

Fresh grape distillates are colorless with alcoholic notes in the taste and their aromatic phase is characterized by the aromas of flowers, fruits, herbs, depending on the grape cultivar used.(Cortés, et al. 2009). Alcoholic distillates consist in a number of volatile compounds responsible for their aroma and taste, mainly formed

during fermentation, distillation and aging. These components are generally fusel alcohols, fatty acids, esters responsible for the organoleptic qualities when they are present in relatively large quantities, up to 3 gr/lit. (Fitzgerald, G., et.al. 2000). The secondary compounds with higher amounts present in alcoholic distillates are fusel alcohols and fatty acid esters, together with acetaldehyde and its acetal with ethanol (MacNamara, K., et.al. 2005) Acetaldehyde as a toxic metabolite that is originating from fermented raw materials, can increase during ageing process due to the oxidation of ethanol and further oxidation of acetaldehyde can result in the formation of small amounts of acetic acid (Cole, V. C., et.al. 1997) Acetaldehyde concentration in the final distillate is also influenced by the distillation system, the wood and the aging time (Parazzi et al.2008) Methanol is formed by pectinolytic enzymes that cleave the methoxyl group from the pectin present in crushed fruit, the methanol concentration in the final distillate alcohol increases with extraction time (Silva, M. L., et.al 1998). Ethyl acetate at a level of 150-200 mg/lit can add spoilage to wine and distillates, at lower concentrations, ethyl acetate contributes to the fruity properties of wine and distillates, it mainly derives from bacterial spoilage of distillates produced from fermented wine (Silva, M. L., et.al.1999). The taste of aged alcoholic drinks in wood is based on a series of compounds such as: alcohols, esters, lactones, acetals, polyphenols, organic acids, terpenes, etc. The transfer of components from the wood to the distillate, the absorption capacity of the wood surface depends on factors such as: the type of wood and its geographical origin (Singleton VL 1995) the contact surface of the wood with the alcoholic beverage (Castellari M, et.al 2001), the alcohol intensity as well as storage conditions such as: humidity and temperature.

Physico-chemical and organosensory changes are mainly influenced by factors such as: type of wood, thermal treatment, temperature and humidity of the cellar, aging time and initial composition of the distillate. (Caldeira, Iet al 2006.; De Rosso, Met.al 2009.; Prida, A.et.al 2006). Referring to the application (CE regulation 110/2008, no. 3, article 1), the alcoholic distillate point of the drinks in the oak weighs changes in its physical and chemical changes, in different periods of time this in the European challenges of the intensity of the changes we want to receive. The time and type of wood used have an impact on the quality of the aged distillate (Canas et al., 1999; Belchior et al., 2001; Canas et al., 2011). The aging process is a treatment used to improve the organoleptic indicators of alcoholic distillates (Léauté et al. 1998). Practice has shown that other alternatives can be used besides traditional barrels for aging, such as the use of oak wood divided into parts, this turns out to be a fast way of treatment for aging (Puech J.L., et.al.1992). Studies have shown that the physico-chemical and organosensory changes are directly influenced by the type of wood, its storage and thermal treatment. (Viriot et al., 1993; Scalbert, A. et.al.,1988). The taste and aroma compounds of alcoholic beverages are collected in: alcohols, aldehydes, higher alcohols, esters, volatile acids and terpenols. Monoterpenes and ketones are created through the breakdown and rearrangement of various terpenoid compounds (Molina, A.et.al. 2007). Higher alcohols are produced during alcoholic fermentation as a result of the conversion of amino acids in the environment and are important precursors for the formation of esters, which are associated with pleasant aromas. (Clemente-Jimenez et al., 2005). The aim of the study is to identify the physico-chemical and organosensory characteristics of this alcoholic distillate before and after aging for 1, 2, 3 years

Method

Alcoholic distillate production and aging conditions.

The cultivar Black Shesh is cultivated in Central Albania in lowland areas with red - muddy soil where lime and DAP- superphosphate is added to improve the quality of the soil. This ecosystem is characterized as part of the Mediterranean climate, the annual temperature is 18°C, the average temperature of the vine vegetation is 16°C, the amount of active temperature 3705°C, the relative humidity 70%. This cultivar is late maturing, the pod is large, medium in length and moderately compressed, the berries are round, medium in size, blue to black in color, with a medium thick shell, 2 to 3 seeds and is a non-aromatic variety. After harvesting, the selected raw material is in good condition, the grapes are subjected to mechanical analysis, determination of acidity, sugar content and then undergo fermentation process at a temperature of 18-20°C, without the presence of SO₂ in the presence of 3 gr/l of selected yeast *S. cerevisiae*. Then the fermented mass is subjected to the process of fractional distillation, single distillation is performed, the obtained distillate is subjected to aging in oak wood for 1, 2 and 3 years. The study aims to identify the physico-chemical and organosensory changes of the distillate after 3 years of aging in the presence of oak wood. In order to identify the quality of the cultivar, analyzes were performed on the samples of:

- Must, Wine and Alcoholic distillates produced from the grape cultivar in 4 different years:
- Samples of Black Shesh alcoholic distillate (year 0), which after fermentation is subjected to fractional distillation. The heart fraction of the distillates is subjected to the preservation process in two forms:
 - a. In hermetically sealed glass container. Distillate stored in glass(temperature 20-25°C and humidity 65%, for 3 years)
 - b. In hermetically sealed glass container in the presence of oak cubes. Distillate stored in oak(temperature 20-25°C and humidity 65%, for 3 years)

Sample of *Quercus robur* wood processed according to point 3 article 1 of CE regulation no. 110/2008 of January 15, 2008. The wood is divided into strips with a thickness of 1cm², which were pre-passed in an oven with dry hot air circulation, it is dried in a ventilated oven at a temperature of 20°C for 12 hours and baked first at a temperature of 70°C for 2 hours and then 80°C for 3 hours and at 85°C for 1 hour, until a light caramel color is obtained. The process is carried out according to the rule set by CE that specified the condition of ageing and consumption (an alcoholic distillate must not be consumed before the second year of aging).

Analitical method and procedure

The analyzes were performed according to the methods: OIV-MA-AS312-01A, OIV-MA-AS313-01; The GC-FID method is the one provided by the current European regulation REG-CE 2870/2000, and especially paragraph III. Components in alcoholic distillates are determined by direct injection of the alcoholic distillate into a gas chromatographic (GC) system. An appropriate internal standard is added to the alcoholic distillate prior to injection. Components are separated by temperature programming on a suitable column (6ftx2mm i.d,

packed 5%Carbowax 20M in 80 – 100 CarbowaxB; Gas flow: He, 300-30 ml/min) and detected using a flame ionization detector. The concentration of each component is determined relative to the internal standard by response factors, which are obtained during calibration under the same chromatographic conditions as those of the alcoholic distillate analysis.

The sample is injected directly after injection of the internal standard. The chromatogram obtained represents several decoded points, especially after 24 minutes, not written to present organic acids, especially acetic and butyric acid. The identification of volatile compounds was based on matching the mass spectra of the compounds with the reference mass spectra of the NIST library. The identification of the chromatographic peaks was also confirmed by comparing the retention times with those of the pure compounds. Quantitative analyzes were made using the corresponding response factor in the reference solution, according to the internal standard method. Determinations were made in triplicate. The quantitative evaluation of the analytes is in the extract ion, while the identification is based on the retention time and in comparison with the total ion spectra of the analyte under study and the spectrum of the pure components (fit threshold > 80%). The organosensory assessment is based on the intensity of the descriptive and qualifying parameters (appearance, aroma, taste, aftertaste and general impression) all samples were tasted in tasting glasses, at room temperature and the assessment was made using a structured scale (10, no perception ; 20, very low; 30, low; 40, medium; 50, high and 60, very high intensity).

Results

The physico-chemical and organosensory composition of the distillates taken into consideration shows significant differences between the samples. The presence and concentration of these compounds is related to the raw material used, the fermentation conditions, the distillation technique used and the aging process.

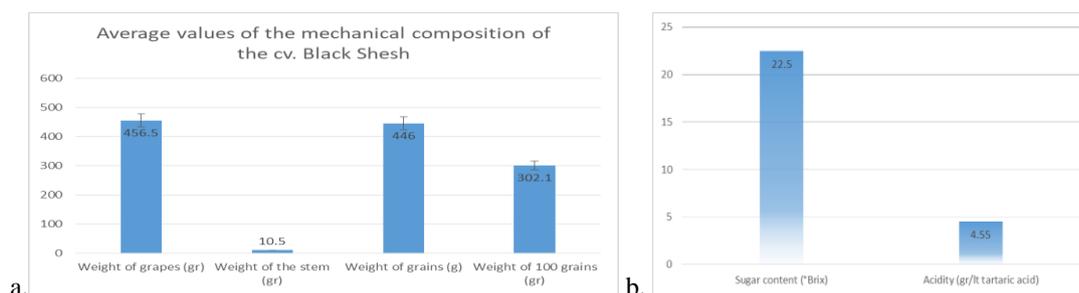

Figure 1. Average values of a. mechanical composition b. physico-chemical indicators of grapes Cv. Black Shesh

From the obtained results we come to the conclusion that: from the harvest to the production of the must, there are no visible changes in the main ingredients: sugar and acidity. The must obtained from the black Shesh cultivar has a high sugar content of 22° Brix (that is converted in 231.5 gr/l) and a low acidity of 4.55 gr/l of tartaric acid.

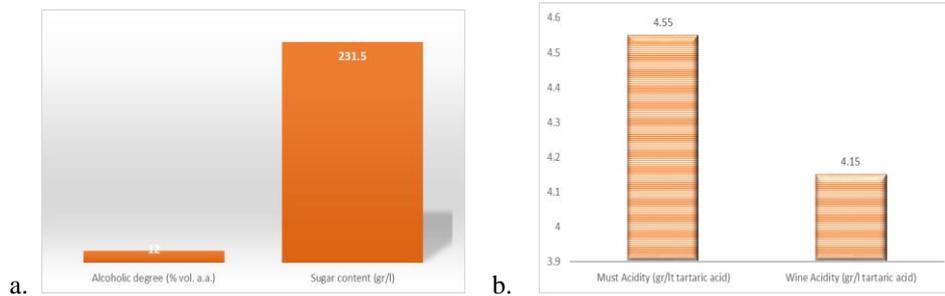

Figure 2. Average values of physico-chemical indicators of Black Shesh grape and wine a. Change of sugar content in alcohol, b. Change of general acidity during alcoholic fermentation.

The alcoholic strength is within the allowed limit for distillates produced from grapes (it must be 9-13% vol alcohol) and wine produced from the cv. Black Shesh is $12 \pm 0.7\%$ vol alcohol. Performing the alcoholic fermentation at a low temperature and applying a regular fermentation protocol has helped to obtain the maximum alcoholic gradation, but it has also protected the wine from being affected by bacteria, which would increase the acidity.

Table 1. Physico-Chemical indicators of alcoholic distillate samples obtained from cv. Black Shesh and stored in two forms

Nr Indicators	Cv. Black Shesh distillate	B. Distillate (stored in glass)	Sh. B. Sh. (stored in wood)	Distillate in oak EEC Standard
1 Alcoholic degree (% vol. a.a)	37.11 ± 0.27	36.88 ± 0.1	36.91 ± 0.01	37.5–50% vol
2 Methanol (g/hl a.a)	89.3 ± 0.57	90.025 ± 0.1	86.25 ± 2.9	Max. 200 g/hl a.a. 100 % vol. a.
3 High alcohols (g/hl a.a)	380.25 ± 1.71	365 ± 1.2	384.25 ± 2.1	Not more than 600 (gr/hl).
4 Furfurol (mg % ml a.a)	1.15 ± 0.06	1.19 ± 0.01	1.375 ± 0.2	Not more than 5 mg/100 ml a.a
5 Acetaldehyde (mg % ml a.a)	30.63 ± 0.75	32.125 ± 0.5	32.37 ± 0.8	Not more than 150 g/hl.

The alcoholic degree of the samples under study was within the margins established by the corresponding Regulation Council (37.5–50% v/v) even though the cultivar enables obtaining a distillate with a low alcohol content. The methanol content in alcoholic distillates is very important because of its toxicity (according to EEC No 2009/92 article 7, the level of methanol should not be higher than 200gr/hl a.a 100% vol), it's content in the analyzed samples decrease with 3.05 g/ hl a.a. in the aged distillate and have a little increasement with 0,73 g/ hl a.a in the glass stored distillate, this can be attributed to the low pectin content of the raw material employed in

the elaboration of the alcoholic distillate, the great change of methanol is detected in glass stored distillate. The amount of total higher alcohols in the samples analyzed increased with 4 g/hl a.a at the aged distillate and to an decreased with 15, 25 g/hl a.a in the glass stored distillate. These volatile compounds are positively involved in the sensory quality of the distillate, if they are not present in high concentrations. The increasement of the higher alcohols during aging was primarily due to isoamyl alcohol (Parazzi et al. 2008). Furfurol is one of the representatives of the aldehydes that contributes at the aromatic complex of the distillate, it comes as a result of overheating the mass of fermented must grape, is present in the fresh distillate and it increase in the two form of storing, in the aged distillate in Q. robur it increase in 0.22 gr/hl a.a; in glass stored it increase in a lower level with 0.04 gr/hl a.a. Acetaldehyde is part of the group of volatile compounds formed during spontaneous oxidation or mediated by microorganisms during alcoholic fermentation of the raw material. The concentration of acetaldehyde increases to lower levels during aging, which is due to the distillation system of the raw material and the type of wood used (Q. robur). The level of acetaldehyde in the aged samples of Black Shesh increase with 1.7 g/hl a.a. and in the samples stored in glass it increase with 1.49 g/hl a.a. this shows that growth occurs even in the absence of oak wood.

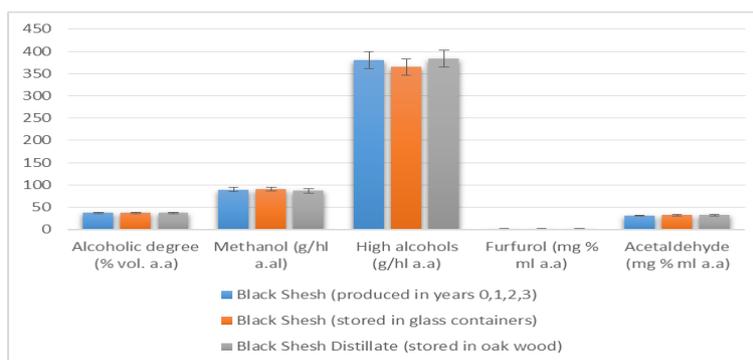

Figure 3. Physico-Chemical indicators of alcoholic distillate samples obtained from cv.Black Shesh and stored in two forms

Table 2. Esters indicators of alcoholic distillate samples obtained from cv. Black Shesh and stored in two forms

Esters	Cv. Black Shesh distillate	Black Shesh (Stored in Glass)	Black Shesh (stored in Oak)
Ethyl acetate (mg % ml a a)	334.75 ± 0.5	333.4 ± 0.9	338.55 ± 0.8
Ethyl caprylate (mg % ml a. a.)	0.735 ± 0.01	0.74 ± 0.01	0.75 ± 0.013
Ethyl Caprat (mg % a. a.)	0.113 ± 0.01	0.01 ± 0.01	0.113 ± 0.01
Ethyl lactate (mg % ml a a)	28.45 ± 0.34	27.4 ± 0.5	29.13 ± 0.9
Ethyl capronate (mg % ml a. a.)	0.535 ± 0.01	0.54 ± 0.01	0.6 ± 0.1

Ethyl acetate turns out to be in the highest amount, it is formed by the secondary metabolism of yeasts during the alcoholic fermentation of grapes. It is known to be a product of acetic acid esterification and thus its concentration increases during the aging process (Onishi, M.J., et.al., 1977). A high content of ethyl acetate in

the distillate, above its perception threshold of 180 g/hl a.a., has a negative impact on sensory characteristics and is perceived to have a solvent character (Silva, M.L. et.al 1998). Its content increases during aging with wood in 3.8 mg % ml a.a and decreases slightly during storage in glass in 1.35 mg % ml a.a.

Figure 4. The content of esteres in alcoholic distillates cv. Black Shesh and stored in two forms

Table 3. Average Values of terpenols in alcoholic distillates cv. Black Shesh and stored in two forms

Terpenols	Cv. Black Shesh distillate	Black Shesh (Stored in Glass)	Black Shesh (stored in Oak)
1 α -Terpenols (mg % ml a.a)	n. c<0.05	n. c<0.05	0.05±0
2 Citronellol (mg % ml a.a)	n. c<0.05	n. c<0.05	0.07±0.03
3 Linalool (mg % ml a.a)	n. c<0.05	n. c<0.05	0.08±0.03
4 Nerol (mg % ml a.a)	n. c<0.05	n. c<0.05	0.07 ± 0
5 Geraniol (mg % a.a)	n. c<0.05	n. c<0.05	0.1 ±0.05

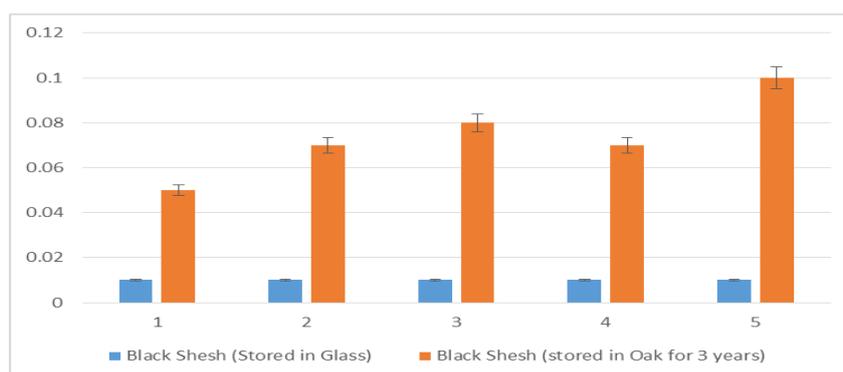

Figure 5. The content of terpenols in alcoholic distillates cv. Black Shesh and stored in two forms

The main terpenols found in alcoholic distillates are: α -terpenol, linalool, geraniol, citronellol, these in the fresh distillate are not perceptible as their level is below the limit of 0.05, this is acceptable because cv. Black Shesh is a non-aromatic variety. After aging in the presence of oak wood, we notice an increase in them, mainly geraniol in 0.1 mg % a.a and linalool 0.08 mg % a.a are in higher quantities, while in the alcoholic distillate stored in a glass container there is no sign of an increase in terpenols.

Sensory Analyses

The results reveal that the samples of Black Shesh aged in *Quercus robur* during 3 years have the best sensory profile and had obtained a greater intensity in all of the qualifying parameters in comparison with Black Shesh distillate stored in glass for the same time. The increased presence of geraniol and linalool gives the oak-aged distillate a floral aroma and light caramel color.

Figure 6. Organosensory comparison of cv. Black Shesh distillates stored in two forms.

Discussion

At the end of the work carried out regarding the study of the physico-chemical and aromatic composition of the produced distillates, we reached the following conclusions: Alcoholic distillates produced from Black Shesh cultivar result in higher content of acetic aldehyde, high alcohols and furfural. It is characterized by the content of ethyl acetate and ethyl lactate as a characteristic part of esters. The content of terpenols is much smaller than the 0.05 capture level ($n. c < 0.05$). This identifies the fact that the content of terpenic compounds is negligible in the Black Shesh as a non-aromatic cultivar. The content of physico-chemical indicators, esters, aldehydes and terpenols in alcoholic distillates do not undergo significant changes during the storage period in glass containers. The storage of alcoholic distillates in oak wood is accompanied by changes in the quantitative content of some physico-chemical indicators and aromatic compounds (esters and terpenols) for four years of the study, which are accompanied by improvements in their content and organosensorial qualities of the produced distillates. The results show that the change in the physico-chemical composition is observed in the third year of aging and mainly in the reduction of the methanol content, which decreases by 3.05 gr/l a,a; in the increase of high alcohols up to 4 gr/l a,a; increase of furfural in the amount of 0.22 gr/l a,a; increase of acetic aldehyde in the amount of 1.75 gr/l a,a; ethyl acetate increases to the amount of 3.8 mg %ml a,a. The alcoholic distillate of the Black Shesh cultivar, stored for three years in oak wood, results in large amounts of high alcohols and acetic aldehyde. During storage in oak wood, the alcoholic distillate Black Shesh acquires a very small amount of terpenol, sweetness and vanilla aroma. This is dedicated to oak wood as the Black Shesh distillate is characterized by the absence of terpenols. The alcoholic degree of alcoholic distillates of Black Shesh grape cultivars stored in oak wood does not undergo changes compared to storage in glass containers. The

organosensorial evaluation of the aged distillate shows an improvement in the aromatic picture even though the initial aromatic intensity of the distillate is negligible, the sweet taste is easily discernible, the color changes from transparent white to the shade of honey, these come as a result of the hydrolysis of lignin and wood hemicellulose. The distillate does not lose its clarity during aging in oak wood.

Conclusion

Referring to the obtained results, we see that the distillates produced in different years do not present a change in the physico-chemical and organosensory characteristics, this refers to the fact that the production is done under the same conditions and the cultivar does not show variability in quality in different years of production. Also, from the methodology used to determine the variability of the physico-chemical characteristics and organosensory characteristics of the analyzed distillates, we reach the conclusion that the greatest variability of the compounds is shown in the Black Shesh alcoholic distillate aged for three years in thermally treated oak wood *Q. robur*, than in the distillate stored in a glass container for the same period of time, although under the same conditions of temperature and humidity of the storage environment. The results show that the change in the physico-chemical composition is observed in the third year of aging and mainly in the reduction of the methanol content, the increasement of high alcohols, furfural, acetic aldehyde and ethyl acetate. The sensory evaluation shows that in the aged distillate with wood, floral aromas are added, attributed to the presence of Geraniol and Linalool, but also of other terpenols in the minority, which pass into the neutral distillate from oak wood a light vanilla flavor and sweetness is acquired too. Not only the aroma and taste, but also the color of the distillate changes, which goes from transparent white to a honey shade. During storage in glass, we do not see significant changes from the main components that affect the aromatic and taste fraction of the distillate.

Abstract: Phylum Nematoda ranks among the most ubiquitous organisms on earth, colonizing almost every conceivable habitat. However, despite their wide spread, assemblages of nematodes in certain habitats present their own pattern depending on the influencing role of the habitat and the complexity of its ecological conditions. The present work brings data on systematics and distribution pattern of free living nematodes from upper subtidal habitats, located near the estuaries of two main rivers of Albania flowing towards the Adriatic Sea. The study was conducted under the faunistic study of meiofauna communities. Sediment samples were collected manually, using a hand corer, with an internal diameter of 5 cm, through a 5 cm depth sediment column. The extraction of meiofauna organisms was performed through a sieve of 42 μm mesh size. Nematodes dominated all meiofaunal communities in all samples under the study. Their assemblages were further analysed in term of composition and structure, determining taxonomic composition up to genus level and biological traits. For each identified genus, trophic group and life strategies were determined. Each different habitat presented a distinct nematode assemblage in diversity, dominance and biological traits. Different assemblages presented some exclusive genera of the respective habitat, as well, shared genera due to the connectivity of the habitats and dispersal capability of living organisms.

Keywords: nematode assemblages, taxonomic composition, biological traits, estuarine environments, Adriatic Coast

Introduction

Estuaries and their surrounding waterbodies form an ecological unit, inhabited by a unique flora and fauna with

specially-adapted characteristic to brackish waters. These habitats are characterized by variability and instability of hydrological and physico-chemical conditions. They present a pronounced longitudinal salinity gradient (McLusky, 1993), drastically changing over a relatively short distance, determined by the water balance created by the exchange of water between the sea and freshwater inflows from rivers. The high fluctuation of salinity in these ecosystems constitutes an important abiotic factor, limiting the settlement of populations of living organisms and generating estuarine distribution patterns. The lower range of brackish water occupy a major factor, acting as both external ecological factor and physiological characteristics of internal environment of aquatic organisms, determining living appropriate conditions for freshwater and marine faunas, facing with osmoregulation problems and separating invertebrate communities with different osmotic regulation types, and thus controlling the distribution of the taxas (Telesh and Khlebovich, 2010). Considering all of these, estuarine communities appear to be mainly 'physically control' (Laprise and Dodson, 1993), resulting in low diversity, composed by species adapted to salinity fluctuations and other physico-chemical gradients. The mechanisms of generating environmental variabilities for animals in estuaries are mainly attributed to two components: to presence of longitudinal and vertical gradients in physico-chemical parameters and the dynamic interaction between the movement of animals against the spatial gradients (Laprise and Dodson, 1993). Benthic organisms constitute an important object in long-term studies in the assessment of different environmental pressures, which due to being immobile or of low mobility remain in the same water body for a long period of time and integrate the effects of environmental changes over time (Sandulli et al., 2021) and being exposed to the entire range of fluctuations of a given habitat.

Nematodes are known for their high biodiversity, ranking as the second most diverse of animal phyla, after arthropods (Kardong, 1997). They inhabit a wide range of ecological habitats, including terrestrial, freshwater and marine environments. Despite the high diversity currently known, it is thought that only a fraction of nematode diversity is known so far, which can be derived from their small size and the difficulty encountered in systematic determinations. Until recently, the study of nematodes has not received much attention in the Republic of Albania. The first observations on the free-living forms of this taxon date only two decades ago, with sporadic observations in soil, marine and freshwater environments. The first reports on free-living nematodes were made in the framework of faunal assessments of meiobenthic assemblages in marine environments, also noting the ignorance of the study of these assemblages in our country (Sandulli & de Zio Grimaldi, 2000, 2003; Sandulli et al., 2009). Until now, only Andrásy (2009) brings systematic data to the species level of this taxon, identifying 58 species, including also the description of three new species to science. These data come from a collection by the Hungarian Natural History Museum collected in 2004 and offered them for study to the paper author. This collection consisted on soil dwellers and some aquatic species, sampled mostly in mountainous regions from districts in Central and South Albania. Recent studies bring data on systematics up to genus level from marine and wetland areas (Miri, 2019; Miri et al., 2021). The present paper consist in biodiversity and structure pattern of nematode assemblages in estuarine habitats in Albanian Adriatic sea coast and their biological traits, adapted to environmental conditions and hydrological dynamics in estuaries.

Materials and methods

Study area and sampling sites

Albania is a mountainous country located on the Balkan Peninsula, washed to the west by two seas, Adriatic and Ionian, within the Mediterranean Basin. It is considered a country with a high content of water resources and sheltering an interesting flora and fauna of international importance (Çullaj et al., 2005). Albania is notable for a high number of rivers, with over 152 streams and rivers, confluent in eight larger rivers, of which seven flow towards the Adriatic Sea and one towards the Ionian Sea (Kabo, 1990-1991). Albanian rivers are characterized by a high flow rate, with a total annual mean flow of $1308 \text{ m}^3 \text{ s}^{-1}$, and an annual water volume of $41,250 \text{ km}^3$ (Çullaj et al., 2005).

Assemblages of free-living nematodes have been investigated in estuary habitats near the mouth of the two main rivers of Albania, both of them flowing towards the Adriatic Sea, Drini of Lezha (in the north of Albania, $19^\circ 57' 33.08'' \text{ E}$; $41^\circ 75' 07.58'' \text{ N}$) and Semani (in the south of Albania, $19^\circ 36' 63.59'' \text{ E}$; $40^\circ 82' 36.43'' \text{ N}$) (Fig. 1).

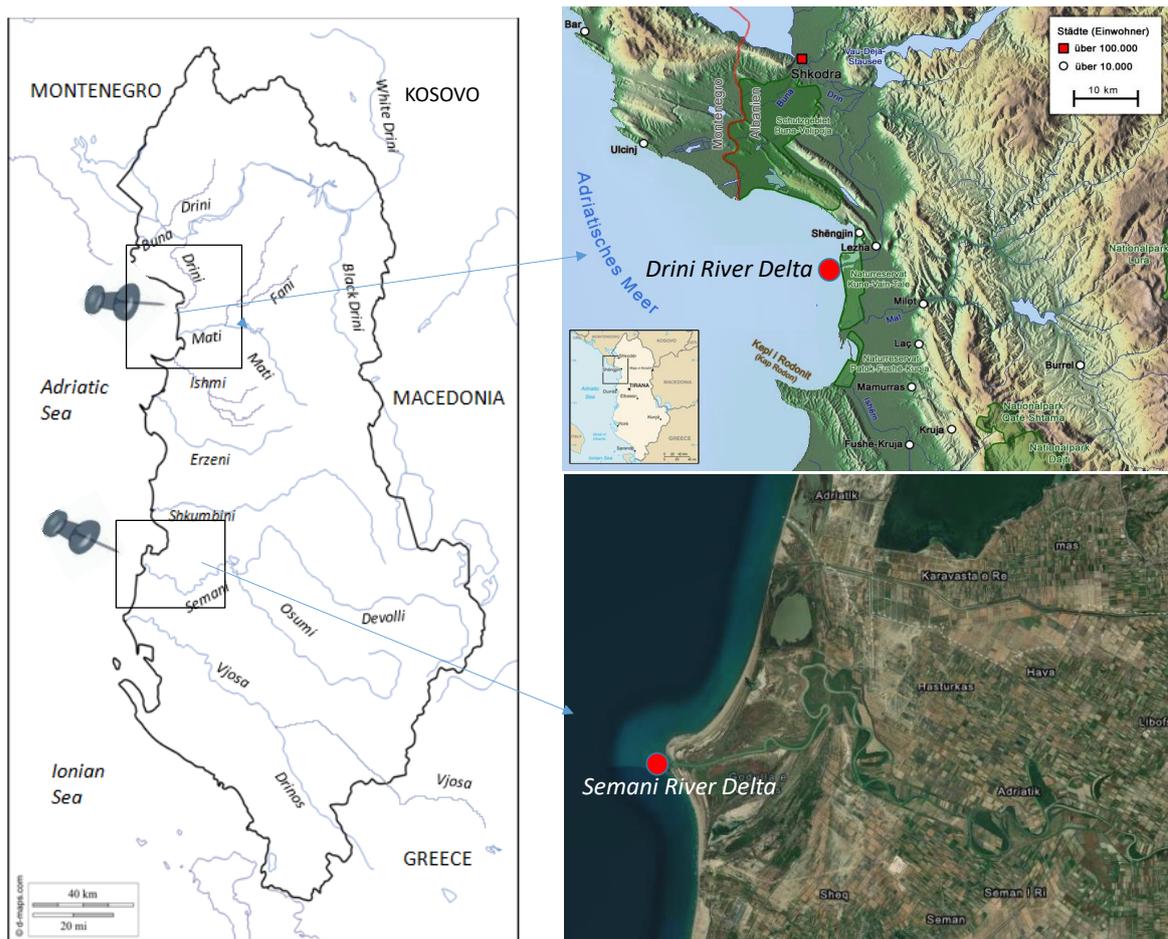

Figure 1. (left) Map of Albania and localization of sampling sites; (top right) Map of area around Drini River delta; (bottom right) Map of area around Semani River delta (Map sources: <https://d-maps.com>; <https://maps.google.com>).

As in the whole world, rivers in Albania have undergone significant anthropogenic changes, disrupting and negatively affecting their ecological functions. The **Drini River** of Lezha was originally the largest river in Albania. In 1854, it became subject to a river bifurcation after a great flooding, in order to avoid them in the future, resulting in two distributaries, one remained in the original bed and continuing to flow towards the Adriatic Sea, while the other joined the Buna River that originates from the lake of Shkodra (Miho et al., 2013). A century later, the Drin River has undergone further changes, moving its entire flow to the Buna River. This deviation turned the Drini River into a modest drainage channel.

The Drin River has had a great impact on the morphological modifications of the coastal area near its mouth and in the formation of Kune-Vaini lagoon complex. The Drini delta is flat and open, strongly influenced by wind, waves, marine currents and other environmental factors. Interventions in its flow has led to a significant decrease in the coming of solid materials and an increase in erosion processes (Miho et al., 2013).

Semani is a major river of Albania which flows in the southern part of the Adriatic Sea. it is formed by two main branches, Devolli and Osumi. After its formation from these two branches, the Seman River joins the Gjanica River, as the latter passes through the town of Fieri. The Seman watershed consists of covered agricultural fields with little cover vegetation and subject to major erosion. The waters are characterized by a relatively high mineralization, of 440 mg/l (Miho et al., 2005).

Sampling and sediment collection

Sampling was carried out in spring, summer and autumn in the Seman delta during 2017 and in spring and autumn in the Drin delta in 2018. The sampling area were located on the southern side of the Seman estuary and on the northern side of the Drin estuary. Sediment collection was carried out in the upper subtidal using a hand PVC core (inner diameter 5cm, length 50cm), with a depth penetration into the sediment of 5cm, collecting a sediment volume of 98 cm³ from an area of 19.6 cm². At each estuary and sampling season were collected three replicate samples. The entire volume of collected sediment was preserved *in situ* with 4% buffered formaldehyde water solution.

Sample processing and nematode analyses

The sediment samples were further processed to extract the organisms by washing them with freshwater and subjecting them to the flotation technique. Floated organisms were retained using a sieve of 42 µm mesh size and preserved again in 4% buffered formaldehyde water solution and stained with Rose Bengal. Nematodes were sorted among meiobenthic organisms and randomly picked out by hand, using a fine pin. The captured nematodes were transferred in two series of ethanol – glycerol solution for the dehydration (Vincx, 1996) and finally transferred in pure glycerol and mounted in permanent glass slide for microscope observation. Nematodes were identified up to genus taxonomic level according to World Database of Nematodes – NeMys (Bazerra et al., 2021) and using the pictorial keys Platt and Warwick (1983), (1988); Warwick et al., (1998);

Weiser (1954); Weiser (1959); Schuurmans-Stekhoven (1950). Nematode identification was performed under a 100× oil immersion objective using a light microscope Motic BA 310 equipped with a digital camera 1/2" COMOS 3MP-2048x1536 pixels with USB 2.0 output.

For each identified genus was determined habitat affiliation based on data in the World Database of Nematodes; trophic group based on oral morphology according to Wieser (1953, 1959); and ecological values of c-p (c-colonizer; p-persisters) based on the colonizing and competitive abilities of the genera according to Bongers (1990) and Bongers *et al.*, (1991). Nematodes were classified into five habitat affiliation from marine to terrestrial; into four trophic groups: 1A- selective deposit feeders; 1B- non-selective deposit feeders; 2A- epistrate feeders; 2B- predators/omnivores; and into five c-p (colonizer- persisters) ecological classes: c-p 1 colonizers; c-p 2 tolerant; c-p 3 moderate; c-p 4 sensitive to stress; c-p 5 persisters.

The data processing is performed in SPSS 28.0. Nematode assemblages and their biological traits from two different estuaries were tested using the Chi- square and Fisher exact test.

Results and Discussions

Taxonomic composition of Nematode assemblages

A total of 616 individuals were subjected to taxonomic observation of nematodes in this study, of which 380 from the Drini estuary, and 236 from the Semani estuary. The systematic classification of total individuals resulted in 2 classes, 6 orders, 13 families and 24 genera. The distribution of the genera according the classes was Chromadorea with 16 genera and Enoplea with 8 genera. The most diversified order was Monhysterida, with 8 genera followed by Chromadorida with 7 genera and Enoplida with genera. Among the families, only Chromadorida consisted of 3 genera. The rest of the families were 6 with two genera and 6 with only one genus each.

The systematic classification according estuaries resulted: Drini delta- 2 classes, 4 orders, 10 families and 16 genera; Semani delta- 2 classes, 5 orders, 9 families and 15 genera.

Nematode assemblages of the two estuaries presented a distinct diversity between them, sharing only 6 (or 25%) genera, concretely the genera *Viscosia*, *Enoploides*, *Enoplolaimus*, *Thersitrus*, *Daptonema* and *Terschellingia* (Tab.1).

Table 1. Relative frequency, feeding type and c-p value of identified genera according the estuaries

Genus	Feeding type	c-p value	Relative frequency (%)	
			Drini Delta	Semani Delta
<i>Viscosia</i>	2B	3	6,9	2,55
<i>Enoploides</i>	2B	2	22,6	4,25

<i>Enoplolaimus</i>	2B	2	5,6	5,51
<i>Xyala</i>	1B	2	0	0,4
<i>Axonolaimus</i>	1B	2	0	11,9
<i>Ascolaimus</i>	1B	2	0	15,7
<i>Bathylaimus</i>	2A	2	0	1,7
<i>Marylynnia</i>	2A	3	0	0,9
<i>Pontonema</i>	2A	3	0	0,4
<i>Limhonoeus</i>	2A	2	0	0,5
<i>Microlaimus</i>	1B	2	0	4,3
<i>Theristua</i>	1B	2	6,1	18,3
<i>Daptonema</i>	1B	2	2,7	20,2
<i>Eudorylaimus</i>	1B	2	0	4,7
<i>Terschellingia</i>	1A	3	1,1	8,7
<i>Tripyloides</i>	1A	3	0,6	0
<i>Rhabdodemia</i>	2B	4	9,6	0
<i>Prochromadorella</i>	2A	3	37,1	0
<i>Chromadorina</i>	2A	3	2,0	0
<i>Chromadorella</i>	2A	3	1,1	0
<i>Camacolaimus</i>	2A	3	1,9	0
<i>Comesomatides</i>	1B	2	0,3	0
<i>Sabatieria</i>	1B	2	0,4	0
<i>Metadesmolaimus</i>	1A	2	2,0	0

Frequency of occurrence

Genera composition among estuaries was statistically different (Fisher exact test; $p < 0.0001$). Based on the analysis of the data according to the estuaries, the genera presenting relative abundance $> 5\%$ were *Theristrus*, *Prochromadorella*, *Rhabdodemia*, *Enoploides*, *Viscosia*, *Enoplolaimus*, *Ascolaimus*, *Axonolaimus*, *Daptonema*, *Terschellingia* (Fig. 2). The abundance of these genera appeared different between the two estuaries. Drini delta was dominated mostly by *Prochromadorella* and *Enoploides*, with relative abundance over 20%. Semani delta was dominated mostly by *Daptonema*, *Theristrus* and *Ascolaimus*, with relative abundance over 15%.

The assemblages were quantitatively dominated by class Chromadorea, respectively, 57% in Drini delta and 81% in Semani delta. In Semani delta, this class is mainly represented by the order Monhysterida, with relative abundance of 76%. The species of this orders are recognized as species inhabiting both freshwaters and marine habitats. Monhysterida in Semani delta is represented by 3 families, Xyalidae, Axonolaimidae and Linhomoeidae. Family Xyalidae is represented by the genera *Daptonema*, *Theristrus* and *Xyala*; family Axonolaimidae by *Axonolaimus* and *Ascolaimus*; family Linhomoeidae by *Terschellingia* and *Limhonoeus*.

Except *Xyala*, all other genera were the dominant ones in the Semeni delta. In Drini delta, the class Chromadorea is mostly represented by order Chromadorida, family Chromadoridae, and the most prominent genera *Prochromadorella*.

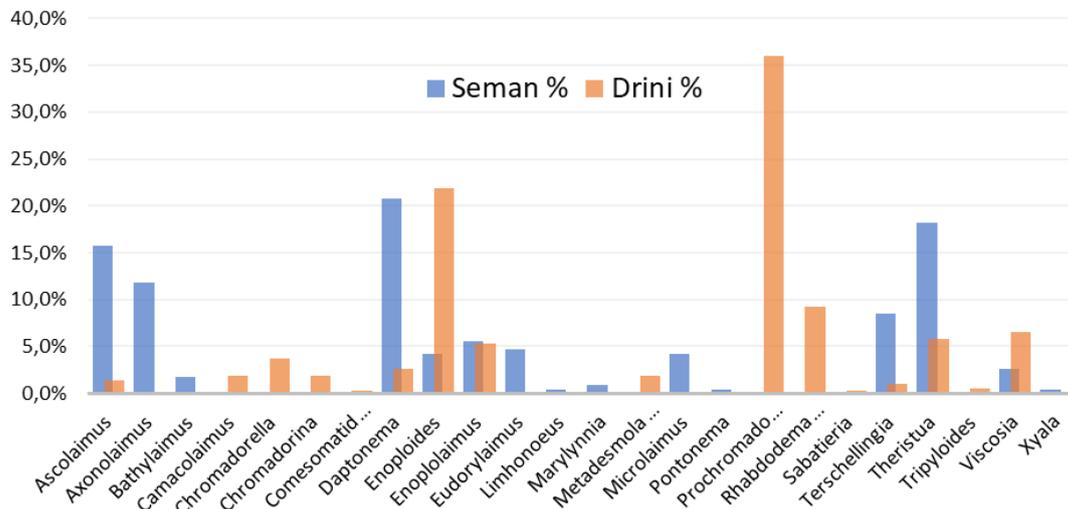

Figure 2. Relative abundance of genera according estuary areas, Drini delta and Semani delta

Biological traits and functional diversity

Trophic composition among estuaries was statistically different (Chi-square (3) = 310.7; p<0.0001). All four trophic groups have been observed in both estuaries (Tab. 1, Fig. 3), but with a pronounced dominance of non-selective deposit feeders (1B) in Semani delta and a codominance of epistrate feeders (2A) and predators/omnivores (2B) in Drini delta.

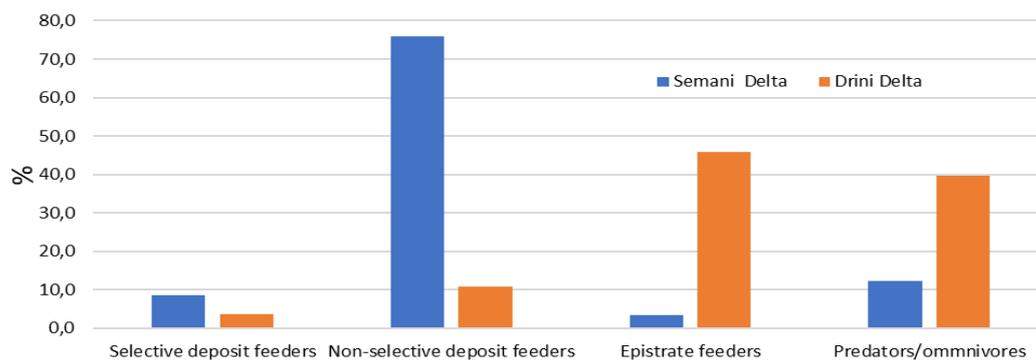

Figure 3. Relative frequency of trophic groups

Considering the life history traits, in Semani delta the assemblage was composed only by c-p 2 and c-p 3 ecological classes and strongly dominated by c-p 2 specimens (87%) (Tab. 1; Fig. 4). The assemblage in Drini delta represented 3 classes, c-p 2, c-p 3 and c-p 4, dominated by c-p 3, followed by c-p2. The dominance of

colonizer nematodes (c-p 2) is indicative of "r" reproductive strategies, reflecting the challenging conditions for settling assemblages in these environments.

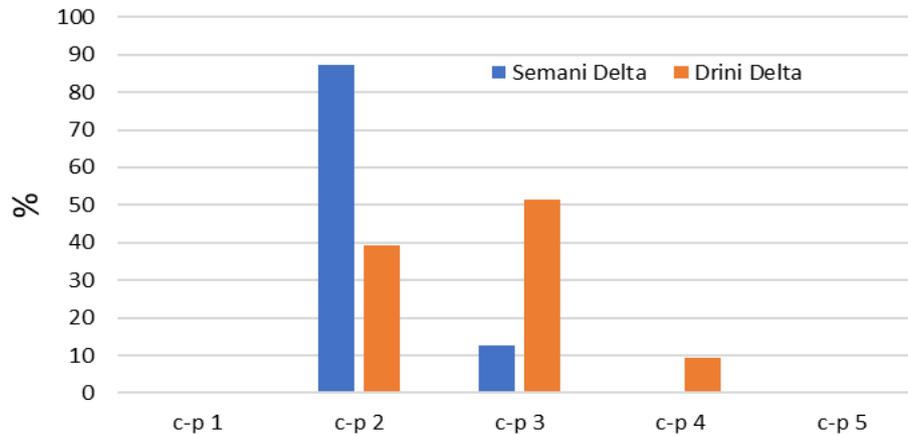

Figure 4. Relative frequency of ecological c-p classes

Conclusions

Although few and sporadic, the reports on the biological diversity of nematode assemblages are promising and a potential for a high diversity of this taxon in our country. The data of this paper contribute in gathering data on taxonomical diversity of free-living nematode assemblages and evaluation of biological traits adapted to a certain habitat. Evidence from this study indicates that nematodes present their own pattern depending on the influencing role of the habitat and the complexity of its ecological conditions.

Abstract: Honey is a natural food product used for nutritional, as well as medical purposes since ancient times. This work intended to analyze the use of honey in gastronomy. For that purpose, there were analyzed 150 recipes that included honey as an ingredient. The recipes were classified according to different criteria, namely the dish type, confection method, type of ingredient and the moment that honey was incorporated into the recipe. The results showed that the main dishes with meat and also bakery products were the ones that included more recipes with honey. The majority of the recipes involved cooking methods, with more relevance for roasting, grilling and baking. Moreover, honey was essentially used as a secondary ingredient, except for deserts and it was mostly incorporated in the beginning. The most relevant nutrients that were combined with honey were flour, bread, onion, salmon, chicken, butter, cheese, egg, milk, lemon, pepper, garlic, olive oil, sugar and salt. This work showed that honey has a wide range of applications as an ingredient in gastronomic preparations.

Keywords: Honey, recipe, gastronomy, ingredient.

Ciddi (Eds.), *Proceedings of ICEMST 2023-- International Conference on Education in Mathematics, Science and Technology* (pp. 2385-2397), Cappadocia, Turkiye. ISTES Organization.

Introduction

Honey is a sweet flavorful liquid produced from the floral nectar by *Apis mellifera* L. (a unique specie of honeybee) (Nikhat & Fazil, 2022; Zafar et al., 2020). This natural product is used by humankind since ancient

times for different purposes, whether in the area of nutrition or medicine (Arawwawala & Hewageegana, 2017; Ramli et al., 2021). Regarding its chemical composition, honey is composed by approximately 200 substances, being characterized by a complex mixture of sugars, mainly fructose (to 40%) and glucose (to 35%), water (17-20%) and a minor concentration of other components, such as proteins, minerals, vitamins, phenolic acids, flavonoids, organic acids, enzymes, aromatic compounds, pigments, waxes, pollen grains and other phytochemicals (Fernandes et al., 2021; Nguyen et al., 2019; Zarei et al., 2019). Due to its characteristics, honey consumption is associated with different nutritional and biological benefits, such as antimicrobial, antioxidant, antiviral, anti-parasitic, anti-inflammatory, anti-mutagenic, anticancer and immunosuppressive effects (Alvarez-Suarez et al., 2010; Samborska, 2019). Like all products of natural origin, honey physicochemical properties are dependent on the climate conditions, harvest and post-harvest techniques and also the botanical and geographical origin (Escuredo & Seijo, 2019). Furthermore, honey's quality is also influenced by the bees' species (Zarei et al., 2019).

Worldwide, in 2021, the average annual production of honey was approximately 1.77 million metric tons, with China being the biggest producer, followed by Turkey and Canada (Shahbandeh, 2023). Nowadays consumers choose food based not only in its organoleptic characteristics, but also in its nutritional value and potential health benefits. For that reason, due to its characteristics and associated health benefits, honey consumption has increased among the consumers in recent years (Šedík et al., 2022). Honey is usually consumed as food or can be incorporated as an ingredient in various food recipes (Guiné et al., 2022). In fact, honey is frequently used as an alternative to sugar in sweet products (Patrignani et al., 2022). Furthermore, honey it is also used to produce alcoholic and non-alcoholic beverages, being mead, for example, a traditional alcoholic drink based on honey (Dantas et al., 2021; Starowicz & Granvogel, 2020). In addition, this natural product is still used as an antioxidant agent or for other foods, such as for example meat (Antony et al., 2000; Johnston et al., 2005; Nor Hasyimah et al., 2022). This work aimed to study the potential of the incorporation of honey as an ingredient in different recipes. For that purpose, the recipes were analysed according to different parameters, namely the dish type, confection method, which includes cooking time, type of ingredient or the moment of incorporation into the culinary preparation.

Materials and Methods

Data Collection

The 150 recipes including honey used for this work were randomly selected from online internet cooking sites or from printed culinary books, and they were based on the diversity usage of honey.

Data Analysis

The classification of the recipes was performed according to the variables described in Table 1.

Table 1. Variables used for the classification of the honey recipes.

Variable	Description
Dish type	Soup/Starter Breakfast/Tea Snack Main dish – Fish, meat, vegetarian, others (shellfish, pizza, ...) Desert Bakery/Cookies Other types of dish (toppings, sauces, ...)
Cooking	Yes or No
Cooking method	Boiling Roasting Baking Grilling Frying Other cooking methods
Cooking time	Short – up to 10 min. Medium – between 10 and 30 min Long – over 30 min
Moment of incorporation of the honey	Beginning Middle End
Role of the honey	Primary or Secondary ingredient

As for the ingredients, they were classified according to two different criteria, as follows:

- Food groups (Cereals, Dairy & Eggs, Fish, Fruits, Herbs, Meat, Nuts & Dried Fruits, Oils & Drinks, Sauces, Shellfish, Spices, Vegetables & Legumes, Others)
- Relevance of the ingredients in the recipe (Major Ingredients, Complementary Ingredients, Minor Ingredients).

For the explanatory analysis of the data there were used different basic descriptive statistical tools.

Results

Recipes Characterization

As it can be observed in Figure 1, the main dishes with meat and also bakery products & cookies (n=21 in both cases) are the ones with more recipes that included honey. On the contrary, the number of recipes for other dishes (n=8) and for vegetarian dishes (n=14) is lower when compared to the other main dishes. The majority of

the recipes involved cooking (n=123), being roasting (n=30), grilling (n=25) and baking (n=11) the cooking methods most frequently used. As for the cooking time, 49 recipes have a cooking time from 10 to 30 minutes, 40 recipes take up to 10 minutes to be cooked and 34 recipes have a cooking time over than 30 minutes. In most of the recipes (n=94), honey is a secondary ingredient, being the principal ingredient in 56 recipes. In the majority of the recipes (n=84) honey was incorporated in the beginning, in 38 of them was added in the middle and 28 of the recipes incorporated in the end.

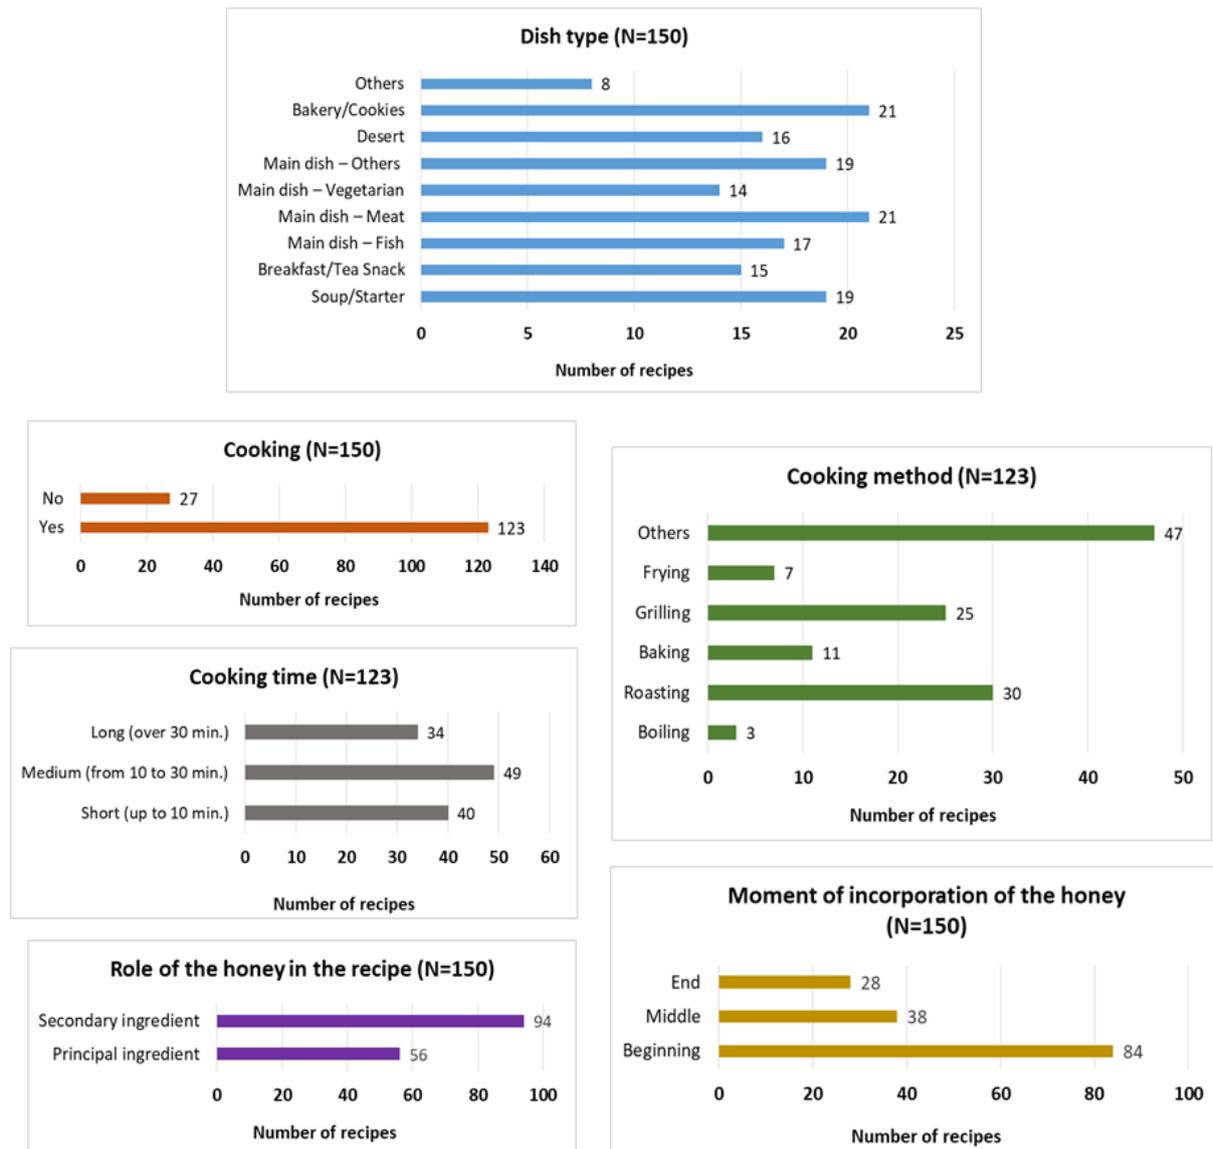

Figure 1. Classification of the recipes with honey under study.

Ingredients Characterization

For the 150 recipes analyzed all of the ingredients (N=1112), except honey, were classified according to the two criteria defined:

- 1) By food groups: Cereals, Dairy & Eggs, Fish, Fruits, Herbs, Meat, Nuts & Dried Fruits, Oils & Drinks, Sauces, Shellfish, Spices, Vegetables & Legumes and Others;
- 2) By relevance of the ingredients in the recipe: Major Ingredients, Complementary Ingredients, and Minor Ingredients.

As it can be observed in Figure 2, the highest number of ingredients (n=198) were in the spices category, followed by dairy & eggs (n=133) and finally shellfish (n=16).

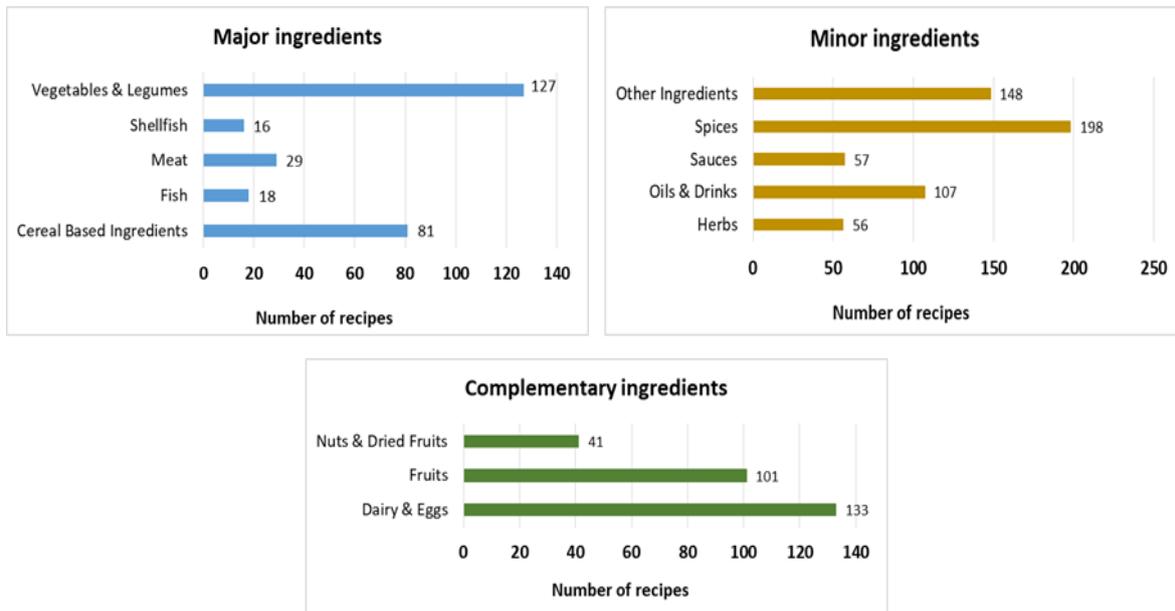

Figure 2. Classification of the ingredients according to the categories defined.

Table 2 shows the recipe count of the major ingredients according to the food groups and for that count were included the ingredients that appeared in at least two different recipes. Cereal and based ingredients were included in a high number of recipes, being flour (n=26) and bread (n=16) the most relevant ingredients. As for the fish group, only salmon (n=11) and sea bass (n=2) were included in at least two recipes. With respect to the meat group, both chicken and pork are present in a total of 9 recipes, followed by ham or bacon (n=5) and finally beef (n=3). Regarding shellfish, shrimp (n=7) was the ingredient most used in the recipes, followed by mussels (n = 3) and finally lobster and crabmeat (n = 2 for both).

Table 2. Number of recipes of the major ingredients according to the food groups.

Groups	Ingredients	Number of recipes
Cereal Based Ingredients	Flour	26
	Bread	16
	Oat	8
	Sesame	7

	Cornstarch	6
	Rice	3
	Wheat	2
	Flaxseed	2
	Chia seed	2
	Arrowroot starch	2
Fish	Salmon	11
	Sea bass	2
Meat	Chicken	9
	Pork	9
	Bacon/Ham	5
	Beef	3
Shellfish	Shrimps	7
	Mussels	3
	Lobster	2
	Crabmeat	2

With respect to the group of vegetables & legumes, there are 21 ingredients included in this group that appeared in the recipes more than once, with onion appearing in a higher number of recipes (n=30), being tomato the second most relevant ingredient (n=9).

Table 2 (Cont.). Number of recipes of the major ingredients according to the food groups.

Groups	Ingredients	Number of recipes
Vegetables & Legumes	Onion	30
	Tomato	9
	Carrot	8
	Shallot	6
	Tofu	5
	Scallion	5
	Bell pepper	5
	Arugula	4
	Vegetables	3
	Spinach	3
	Potato	3
	Pea	3
	Cucumber	3
	Brussel Sprouts	3

Broccoli	3
Pumpkin	2
Miso	2
Lentil	2
Cauliflower	2
Bean	2
Asparagus	2

Table 3 shows the number of recipes that include each of the ingredients, according to the complementary groups. As for the fruits group, the ingredient that appeared in a higher number of recipes were lemon (n=20), orange (n=12) or lime (n=8), or their juices. Nuts and dried fruits also appeared in some recipes more than once, with particularly relevance for almonds (n=9) and walnuts (n=6). Dairy and eggs are present in a higher number of recipes, with butter being present in 38 recipes, cheese in 27 and eggs in 25 recipes.

Table 3. Number of recipes of the complementary ingredients according to the food groups.

Groups	Ingredients	Number of recipes
Fruits	Lemon	20
	Orange	12
	Lime	8
	Lemon juice	8
	Lime juice	7
	Cocconut	6
	Orange juice	5
	Banana	5
	Apple	5
	Pear	4
	Peach	3
	Nectarine	3
	Mango	2
	Fig	2
	Berries	2
Nuts & Dried Fruits	Almonds	9
	Wwalnuts	6
	Raisins	4
	Pistachios	3
	Dates	3
	Cashew nuts	3

	Pecan nuts	2
	Chestnut	2
	Peanuts	3
	Peanut butter	4
Dairy & Eggs	Egg	25
	Egg yolk	5
	Egg white	2
	Butter	38
	Cheese	27
	Milk	15
	Cream	9
	Yogurt	8
	Condensed milk	2

As it can be observed in Table 4, parsley (n=12) and coriander (n=10) were the most frequently herbs used in the recipes. Spices were present in a higher number of recipes, highlighting the presence of pepper in 57 recipes and garlic in 48. With respect to sauces, soy sauce (n= 20) was the most relevant ingredient in this group. The most used oils and drinks were olive oil (n=43) and vinegar (n=22). Regarding the other ingredients, salt and sugar were the most used, in 81 and 28 recipes, respectively.

Table 4. Number of recipes of the minor ingredients according to the food groups.

Groups	Ingredients	Number of recipes
Herbs	Parsley	12
	Coriander	10
	Thyme	7
	Rosemary	6
	Chives	4
	Oregano	3
	Bay	3
	Basil	3
	Sage	2
	Mint	2

	Ketchup	3
	Barbecue sauce	3
	Oyster sauce	2
	Italian seasoning	2
	Hoisin sauce	2
	Chipotle sauce	2
Other ingredients	Salt	81
	Sugar	28
	Baking soda	12
	Baking powder	10
	Chocolate	8
	Yeast	4
	Cocoa	3

Discussion

Honey is the first sweetener used by humankind and biological people are programmed to like sweetness (Linford, 2018). Nowadays, honey is still used in many cuisines worldwide, in which is included the Mediterranean cuisine (Raguž, 2017). In fact, honey has different applications in food industry, and can be used not only has a sweetener, but also as a food preservative, spice or even marinade (Gündoğdu et al., 2019; Raguž, 2017).

There are different recipes including honey and the search to find new culinary usages for this product continues, in order to improve the richness of aroma and flavor, as well as the nutritional composition of the dishes (Raguž, 2017). Honey is submitted to a heating procedure, such as boiling or even baking and then cooled, in some recipes. In order to minimize the undesirable effects of heating, this process must be done carefully (Alarcon, 2006).

Honey's characteristics are determined by its floral origin used to collect nectar by honeybee, as well as the geographical location and the climatic conditions of the region (Gündoğdu et al., 2019). These factors originate honeys with different flavours, which is reflected in the results of the recipes according to the type of honey incorporated. These differences are explored by chefs and mixologists in their creations (Alarcon, 2006).

Conclusion

This work revealed interesting results about the multiplicity applications of honey for gastronomic purposes, not only for dishes like Deserts or Bakery/Cookies, but also to be used in Soups/Starters, Breakfast/Tea Snacks, Main Dishes with fish, meat, vegetarian or others. This natural product is generally used as a secondary ingredient, being incorporated into the recipes mostly in the beginning. Moreover, in the recipes, honey is combined with different ingredients, highlighting flour, bread, onion, salmon, chicken, butter, cheese, egg, milk, lemon, pepper, garlic, olive oil, sugar and salt.

Recommendations

Based on the results revealed through this research, the results of this study can be used for all the professionals and general public that have interest in incorporate honey into different recipes, allowing them expand their knowledge about this subject.

Notes

This work is funded by National Funds through the FCT - Foundation for Science and Technology, I.P., within the scope of the projects Ref. UIDB/00681/2020 (CERNAS), UIDB/00239/2020 (CEF). We would like to thank

the research centres CEF (Centro de Estudos Florestais), QFM-UC (Centro de Química Física Molecular da Universidade de Coimbra) and CERNAS-IPV (Centro de Estudos em Recursos Naturais Ambiente e Sociedade) and the Polytechnic Institute of Viseu for their support.

Abstract: In the implementation process of circular economy initiatives, many companies face several challenges in adopting the circular economy model in their business entirely. A suitable strategy is needed for a circular economy implementation. One of the ways to build the strategy is by understanding the circular economy implementation drivers and barriers. This work aims to identify the drivers and barriers of a circular economy implementation in Indonesian Food & Beverages (F&B) Small and Medium Enterprises (SMEs). The validation process starts through an extensive literature review and then employs a Modified Kappa method to examine the factors, incorporating experts from industry, non-governmental organizations (NGOs), academia, and government. The result shows eight drivers and fifteen barriers for the implementation of a circular economy in Indonesian F&B SMEs. These drivers and barriers are grouped into three dimensions, namely Economy, Social, and Environment. The output of this research might support the stakeholders in facing the issues regarding the feasibility of circular economy practices.

Keywords: Circular economy, Drivers and barriers, Food and beverages, Small medium enterprises

Introduction

Limited natural resources and an increasing world population threaten raw material scarcity and increased waste production in the world (Mathivathanan et al., 2022). According to The World Bank, the world population in 2021 will reach 7.84 billion people. Beside that, the amount of waste produced in the world will reach 2.24 billion tons in 2020 and is predicted to increase in 2050 to 3.88 billion tons (The World Bank, 2022).

A circular economy model emerges as a solution to minimize the scarcity of natural resources and restrain the

world's waste production (Khan et al., 2022). The circular economy itself can be defined as “an economic system that represents a change in people's perspective on interacting with the environment and aims to avoid resource scarcity, put energy and materials in a closed cycle, and facilitate sustainable development through the implementation of a circular economy at the micro (business and consumer), meso (stakeholder related to the economy), and macro (city, region, and government) level. The circular economy model calls for closed cycles and regenerative environmental innovation on how societies legislate, produce, and consume” (Prieto-Sandoval et al., 2018).

Implementing a circular economy in Small and Medium Enterprises (SMEs) has an essential role in this world because SMEs has a higher percentage of amount than big enterprise (Mura et al., 2020). SMEs dominate the world business by 90% and can employ half of the world's population (Dey et al., 2020). In Indonesia, there are 319.000 SMEs that employed 3,5 million workers in 2020 (Badan Pusat Statistik, 2022b, 2022a).

The implementation of a circular economy is difficult (Rizos et al., 2016) and requires a proper approach to ensure the continuity of the process (Gedam et al., 2021). Firms need to understand the drivers and barriers in their systems (Agyemang et al., 2019). The drivers of a circular economy adoption process are essential and must be identified to help the organization construct an effective and efficient implementation strategy (Khan et al., 2022). On the other hand, the barriers to a circular economy must be determined to find the proper enabler against the barriers. Hence, adopting a circular economy can be implemented without creating further problems (Khan et al., 2022).

BAPPENAS has identified five industry sectors that are prioritized to implement the circular economy concept. These sectors are the plastic, textile, electronic, construction, and food and beverage (F&B) industry (Bappenas et al., 2021). Previous studies focused on the drivers and barriers in Pakistanian manufacturing (Agyemang et al., 2019; Khan et al., 2022), and agriculture, textile, and F&B in India (Kumar et al., 2021; Mathivathanan et al., 2022; Mishra et al., 2022). These works mainly discuss big-scale businesses, and none focus on the drivers and barriers of implementing a circular economy in F&B SMEs.

The following research questions are suggested by this study to fulfill the research gap:

RQ1: What are the drivers of circular economy implementation in Indonesian SMEs in F&B sector?

RQ2: What are the barriers to circular economy implementation in Indonesian SMEs in F&B sector?

Hence, this study aims to identify the drivers and barriers of circular economy implementation in Indonesian F&B SMEs. In Indonesia, SMEs are classified into small and medium, and the two categories have a considerable financial and operational gap. Therefore, this study will focus more on medium-sized industries.

The remainder of this manuscript is organized as follows. Section II discusses the literature on a circular economy and the drivers and barriers to the circular economy implementation. Following that, section III discusses the methodology used in this research. Section IV discusses the results and discussion of this research.

The last section is the conclusions which consist of suggestions from the researcher.

Literature Review

Circular Economy

A circular economy is a regenerative system that uses resources repeatedly to impact the environment positively (Khan et al., 2022; Takacs et al., 2022). While the linear economy has the concept of “make-use-dispose”, the circular economy utilizes the reuse and replace concept for the resources rather than dispose of them (Gedam et al., 2021). A circular economy ensures minimizing waste production and benefits the environment by reducing resource consumption. A circular economy is implemented to achieve sustainable development through increased resource efficiency (Garcés-Ayerbe et al., 2019).

The circular economy model integrates all the 5R strategies, which consist of reduce, reuse, recycle, redesign, and repair to minimize resource consumption and ensure the resource or the product is still inside the closed loop so it can reduce waste production and environmental damage (Badhotiya et al., 2022; Chen et al., 2011; Delchet-Cochet, 2020; Garcés-Ayerbe et al., 2019; Khan et al., 2022). The circular economy concept separates economic growth from resource consumption and environmental loss through responsible resource use (Mathivathanan et al., 2022).

The circular economy has attracted many parties because it believes it can give economic, social, and environmental advantages (Bappenas et al., 2021; Garcés-Ayerbe et al., 2019). The government, organizations, non-governmental organizations (NGOs), and consultants have taken the initiative to adopt the circular economy, such as inventory optimization, environmental efficiency and effectivity, and reducing waste production (Khan et al., 2022). Despite the high presence of circular economy studies, the circular economy model implementation is still in the development stage (Takacs et al., 2022).

Drivers of Circular Economy Implementation

One study identified the drivers and strategies of circular economy implementation in SMEs (Dey et al., 2020). This work concludes seven drivers of the circular economy implementation, including *Increased Image*, *Reduction of Cost*, *Business Development*, *Reduction of Emission*, *Productivity*, *Sustainability*, and *Social Well-Being*. Furthermore, several studies have analyzed the inter-relationship among drivers to the implementation of a circular economy in the manufacturing sectors (Agyemang et al., 2019; Khan et al., 2022). They analyze 15-17 driver factors in the paper, i.e., *Sustainable Business and Growth*, *Company's Social Responsibility*, *Government Encouragement*, and *Resource Efficiency*. Moreover, another study also analyzed the drivers of circular economy implementation in SMEs (Mathivathanan et al., 2022). They focused on ten driver factors which consist of *Circular Economy Awareness*, *High Financial Ability for the Circular Economy*, *Need for Business Resilience and Competitive Advantage*, *Increasing Population and Urbanization*, *the Rise of Raw*

Material Consumption, Environmental Realization Among Consumers, Advanced Technology, Resource Efficiency, Product Design and Manufacturing, Consumer Perspective Towards Refurbished Products, and Social Responsibility and Ethics.

In Indonesia, the government collaborated with the United Nations Development Programme (UNDP) and the Embassy of Denmark and successfully identified several drivers for implementing a circular economy (Bappenas et al., 2021). These driver factors are *Reducing Environmental Impact, Building Brand Reputation, Developing New Markets, Comply with Government Regulations, Less Charge of Natural Resources, Improving the Ability to Attract Investment/ Capital, Attracting, Retaining, and Engaging Workers, Minimizing Price Volatility of Resources, and Build Loyalty with The Customer Base.*

This study identified 15 factors from the literature review for further analysis. These factors are *Minimize Resource Cost* (Agyemang et al., 2019; Bappenas et al., 2021; Dey et al., 2020; Khan et al., 2022), *Incentives from the Government* (Mathivathanan et al., 2022), *Advanced Technology* (Agyemang et al., 2019; Khan et al., 2022; Mathivathanan et al., 2022), *Increased Profitability* (Agyemang et al., 2019; Khan et al., 2022), *Sustainable Growth and Business* (Agyemang et al., 2019; Dey et al., 2020; Khan et al., 2022), *Increased Investor Attention* (Bappenas et al., 2021), *Reduced Resource Volatility* (Bappenas et al., 2021), *Increased Company Reputation* (Bappenas et al., 2021; Dey et al., 2020), *Company Social Responsibility* (Agyemang et al., 2019; Khan et al., 2022; Mathivathanan et al., 2022), *Consumer Awareness Towards Environmental Issues* (Mathivathanan et al., 2022), *Government Encouragement* (Agyemang et al., 2019; Bappenas et al., 2021; Khan et al., 2022), *Business Resilience and Competitive Advantage* (Bappenas et al., 2021), *Increasing Population and Urbanization* (Mathivathanan et al., 2022), *Reduce Environmental Impact* (Bappenas et al., 2021; Dey et al., 2020), and *Reduce Resource Consumption* (Agyemang et al., 2019; Khan et al., 2022; Mathivathanan et al., 2022).

Barriers to Circular Economy Implementation

Besides driver factors that can support organizations in implementing a circular economy, organizations must also be aware of the barriers they must face in adopting a circular economy. Several researchers have conducted studies that focused on the circular implementation barrier factors (Agyemang et al., 2019; Badhotiya et al., 2022; Bappenas et al., 2021; Chen et al., 2011; Dey et al., 2020; Garcés-Ayerbe et al., 2019; Gedam et al., 2021; Khan et al., 2022; Kumar et al., 2021; Rizos et al., 2016; Takacs et al., 2022).

Based on the literature review, two studies analyzed the barriers to implementing the circular economy in the Pakistanian manufacturing sector (Agyemang et al., 2019; Khan et al., 2022). Another study was also done to analyze the interrelationship among barrier factors in the SMEs (Takacs et al., 2022), prioritizing the barrier factor in the manufacturing sector (Badhotiya et al., 2022), identifying the barriers of industry 4.0 and circular economy in the agriculture supply chain (Kumar et al., 2021), analyzing the interrelationship among barrier factors in the textile industry (Chen et al., 2011), analyzing the interrelationship and prioritizing the barrier

factors in the F&B sectors (Gedam et al., 2021), identifying the behavior and barrier of a circular economy implementation (Garcés-Ayerbe et al., 2019), and identifying the barrier in the SMEs (Dey et al., 2020; Rizos et al., 2016).

We chose 20 barriers related to F&B SMEs from the literature review. These barriers are *Financial Limitations* (Bappenas et al., 2021; Dey et al., 2020; Gedam et al., 2021; Khan et al., 2022; Rizos et al., 2016), *Require High Investment* (Badhotiya et al., 2022; Garcés-Ayerbe et al., 2019; Gedam et al., 2021), *Limitation of Advanced Technology* (Badhotiya et al., 2022; Dey et al., 2020; Gedam et al., 2021; Khan et al., 2022; Takacs et al., 2022), *Limitation of Circular Potential and Supply Chain Design* (Gedam et al., 2021; Kumar et al., 2021; Takacs et al., 2022), *Limitation of Cold Chain and Packaging* (Bappenas et al., 2021; Kumar et al., 2021), *Limitation of Knowledge* (Badhotiya et al., 2022; Bappenas et al., 2021; Garcés-Ayerbe et al., 2019; Gedam et al., 2021; Khan et al., 2022; Kumar et al., 2021; Rizos et al., 2016; Takacs et al., 2022), *Focus on the Economic Issue* (Takacs et al., 2022), *Lack of Consumer and Organizational Awareness Towards the Environment* (Gedam et al., 2021; Kumar et al., 2021; Takacs et al., 2022), *Limitation of Skillful Workers* (Badhotiya et al., 2022; Dey et al., 2020; Garcés-Ayerbe et al., 2019; Gedam et al., 2021; Khan et al., 2022; Kumar et al., 2021; Rizos et al., 2016), *Lack of Encouragement and Incentive from the government* (Badhotiya et al., 2022; Kumar et al., 2021; Rizos et al., 2016), *Lack of Company's Commitment* (Badhotiya et al., 2022; Dey et al., 2020; Khan et al., 2022; Kumar et al., 2021; Rizos et al., 2016), *Lack of Supportive Regulation* (Badhotiya et al., 2022; Gedam et al., 2021; Khan et al., 2022; Kumar et al., 2021; Takacs et al., 2022), *Limitation of Reverse Logistics Infrastructure* (Masi et al., 2018), *Limitation of Collaboration* (Badhotiya et al., 2022; Gedam et al., 2021; Rizos et al., 2016; Takacs et al., 2022), *Limitation of Recycling Area* (Badhotiya et al., 2022), *Safety and Hygiene Issue* (Badhotiya et al., 2022), *Limitation of Reducing Gas Emission Scope* (Gedam et al., 2021), *Lack of Assurance of Environmental Safety* (Badhotiya et al., 2022), *Limitation of Food Waste Estimation Data* (Gedam et al., 2021), and *Complex Law, Administrative, and Permission* (Garcés-Ayerbe et al., 2019).

Methodology

This study identified the drivers and barriers to the implementation of a circular economy in Indonesian F&B SMEs from the literature review. After that, we gathered seven experts from industry, NGOs, academia, and government to validate the identified drivers and barriers. The experts' lists can be seen in Table 1.

Experts A – C are operational managers in Indonesian F&B SMEs. Expert D is a co-founder of one NGO in Indonesia which focuses on environmental issues. Experts E and F are academia whose work focuses on circular economy fields in Indonesia. Lastly, expert G is a waste management director of one government institution in Indonesia.

The experts then validated the drivers and barriers by filling out a validation questionnaire. The scale used in the questionnaire is a Likert scale ranging from 1 to 4, indicating each factor's relevance (1 = not relevant, 2 = quite

relevant, 3 = relevant, and 4 = very relevant) (Polit et al., 2007). The expert who gives a score of 1 or 2 will be considered to disagree with the factor, and the expert who gives a score of 3 or 4 will be considered agreeing to the factor.

Table 1. List of Experts in the Validation Stage

Expert	Background	Experience
A	Industry	> 20 Years
B	Industry	15 – 20 Years
C	Industry	10 – 15 Years
D	NGO	10 – 15 Years
E	Academia	> 20 Years
F	Academia	5 – 10 Years
G	Government	15 – 20 Years

After the questionnaire was collected from the experts, we validated the drivers and barriers using the Modified Kappa. Experts highly recommend this statistic as an examining interrater agreement tool. The kappa statistic shows the percentage of an agreement after the chance agreement is removed (Wynd et al., 2003). The kappa coefficient computation produces better content validity results because it can eliminate random chance agreement (Shrotryia & Dhanda, 2019).

The kappa coefficient computation is done by counting the probability of chance agreement, which shows in the following formula (Shrotryia & Dhanda, 2019):

$$P_c = \left[\frac{N!}{A!(N-A)!} \right] \times 0,5^N$$

After that, we calculate the kappa coefficient using the following formula (Shrotryia & Dhanda, 2019):

$$k = \frac{ICVI - P_c}{1 - P_c}$$

The ICVI variable is generated by (Kenanga & Ardi, 2022):

$$ICVI = \frac{\text{Total expert agreeing}}{\text{Total expert}}$$

The strength of agreement from the kappa coefficient is shown in Table 2. The acceptable kappa recommended by Gelfand and Hartmann (1975) has a kappa score $\geq 0,60$ (Wynd et al., 2003).

Table 2. Acceptance Level from Kappa Statistic

Acceptance Level	Kappa Statistic
Poor	< 0,40
Fair	0,40 - 0,59
Good	0,60 - 0,74
Excellent	0,75 - 1,00

Results and Discussion

Based on the Modified Kappa, it is obtained that there are eight drivers and fifteen barriers validated. All the validated drivers and barriers have an “Excellent” Strength of Agreement. The result of the Modified Kappa and the validated drivers can be seen in Table 3 and Table 4, and the barriers can be seen in Table 5 and Table 6.

Modified Kappa Results and Validated Drivers

Table 3. Modified Kappa Result for Drivers

No	Factor	I-CVI	k*	Agreement

15	Reduce Resource Consumption	1.0000	1.0000	EXCELLENT

Table 4. List of Validated Driver Factors

Dimension	Factor
Economy	Incentives from the government
	Sustainable business and growth
	Increased investor attention
Social	Increased company reputation
	Company social responsibility
	Government encouragement
Environment	Reduce environmental impact
	Reduce resource consumption

A circular economy requires high investment to provide advanced technology and a skillful workforce.

Therefore, the organization needs to be supported by the government, such as incentives to support the organization's financial aspect (Mathivathanan et al., 2022). Moreover, implementing a circular economy can help businesses grow and sustain, supported by 11% of respondents in a previous study (Agyemang et al., 2019). Furthermore, the study by the Indonesian government shows that implementing a circular economy can attract more attention from an investor to invest in an organization which can drive the organization to implement the circular economy (Bappenas et al., 2021).

From the Social dimension, one study shows that adopting a circular economy can increase the company's reputation, such as a green image among consumers and stakeholders, which can drive the company to do so (Dey et al., 2020). Besides that, the company has a social responsibility, which can be done by adopting a circularity in their business (Agyemang et al., 2019). More importantly, a company needs the government's support to implement a circular economy (Bappenas et al., 2021).

From the Environment dimension, the circular economy is believed to have the ability to minimize the environmental impact by reducing waste production (Bappenas et al., 2021). In addition, the circular economy implementation is also believed can reduce resource consumption by recycling and reusing products into new resources (Agyemang et al., 2019).

Modified Kappa Results and Validated Barriers

Implementing a circular economy requires high investment in conducting R&D and upgrading infrastructure and workforce to support the implementation process. The implementation process might not be successful if the organization has limited financial resources to invest in supporting infrastructure (Gedam et al., 2021). Furthermore, the circular economy model needs more advanced processes by advanced technology. If the company lacks advanced technology, implementing a circular economy might be difficult (Dey et al., 2020). Moreover, cold chain and packaging are essential in the F&B sector. Lack of cold chain and packaging, especially in developing countries, will lead to more food waste production, which contradicts the circular economy concept (Gedam et al., 2021). Additionally, a circular economy concept requires advanced knowledge, which can be obtained through formal or informal education, and employee training and learning (Badhotiya et al., 2022). On top of that, the implementation might be hindered by organizations focusing on economic rather than environmental issues (Takacs et al., 2022).

20	Complex Law, Administrative, and Permission	0.8333	0.8161	EXCELLENT

Table 6. List of Validated Barrier Factors

Dimension	Factor
Economy	Financial limitations
	Require high investment
	Limitation of advanced technology
	Limitation of cold chain and packaging
	Limitation of knowledge
	Focus on the economic issue
Social	Lack of consumer and organizational awareness towards the environment
	Limitation of skillful workers
	Lack of encouragement and incentive from the government
	Lack of company's commitment
	Lack of supportive regulation
	Limitation of reverse logistics infrastructure
	Limitation of collaboration
Environment	Lack of assurance of environmental safety
	Complex law, administrative, and permission

From the Social dimension, consumer and company awareness of the environment has a vital role in implementing the circular economy. The lack of awareness can lead to a strict circular economy implementation

(Gedam et al., 2021). Besides that, to implement a circular economy, the employee must know the technical know-how to do it effectively. Having a limited qualified workforce will hinder the implementation of the circular economy (Gedam et al., 2021). Furthermore, the majority of SMEs have limited financial resources. A lack of encouragement and incentive from the government will reduce the organization's initiative to implement the circular economy (Badhotiya et al., 2022).

Moreover, the lack of a company's commitment can hinder the circular economy implementation because it can lead to poor management expertise to adopt a circular economy (Badhotiya et al., 2022). Also, supportive government regulations such as policies, rules, regulations, and legislation are essential in implementing the circular economy. The organization's lack of government support can hinder the implementation process (Badhotiya et al., 2022). In addition, reverse logistics infrastructure is essential in the circular economy. The lack of reverse logistics infrastructure will limit the supply chain's material exchange (Masi et al., 2018). On top of that, the lack of a collaboration network can hinder the implementation of a circular economy because the core of a circular economy needs collaboration among stakeholders to adopt it (Gedam et al., 2021) effectively.

From the Environment dimension, the lack of assurance of environmental safety can hinder the implementation of a circular economy. The recycled or reused products might not be in safe and hygienic conditions for humans to consume (Badhotiya et al., 2022). Lastly, the complex law, administration, and permission also hinder the implementation of a circular economy. One study shows that organizations that already and have not implement a circular economy experience complex administrative or legal procedures to implement a circular economy (Garcés-Ayerbe et al., 2019).

Conclusion

In conclusion, this study identifies the circular economy implementation drivers and barriers in Indonesian F&B SMEs. The drivers and barriers were collected from the literature review, which discusses the drivers and barriers of circular economy implementation in several industry sectors, including F&B. Through literature review and expert opinion, eight drivers and fifteen barriers were identified. Those drivers and barriers are classified into three dimensions, which consist of Economy, Social, and Environment.

Recommendations

This study is limited to identifying the drivers and barriers of a circular economy implementation in Indonesian F&B SMEs using Modified Kappa technique to validate the identified factors. Future study is needed to analyze further and evaluate the drivers and barriers to know the interrelationship among factors and the priority level from all factors. Further research is also expected to construct an effective strategy to implement a circular economy in Indonesian F&B SMEs.

Policy Evaluation of Shipping Industry on CO2 Emission Production in Indonesia: A Causal Loop Analysis

Desy Ratnaningsih

Universitas Indonesia, Indonesia,  <https://orcid.org/0009-0005-9690-7006>

Romadhani Ardi

Universitas Indonesia, Indonesia,  <https://orcid.org/0000-0002-5525-9920>

Abstract: As an archipelagic country with two-thirds of its territory consisting of water and in line with global trade, Indonesia has made the shipping sector an essential and strategic role in supporting national development by paying more attention to developing its maritime industry. The increasing need for shipping services will also increase the phenomenon of global warming. CO2 emissions from the marine transportation sector have become a concern for transport policymakers and climate change regarding sustainability issues, including CO2 emissions in ports which continue to increase due to their significant impact on emerging environmental, social, and economic issues. However, the existing studies focus primarily on CO2 emissions from shipping, with little attention to vessel berthing in ports and cargo handling in ports. This study takes the marine transportation sector in Indonesian Ports by using part of the System Dynamics methodology, Causal Loop Diagram Analysis on the production of CO2 emissions, to show the interrelationships between these factors. The purpose of this study is to propose a CO2 emission mitigation strategy and evaluate policies that have been implemented in the marine transportation sector. The results show a validated Causal Loop Diagram that can be used for dynamic system assessment under the scenario.

Keywords: Causal Loop Analysis, CO2 Emissions, Policy Scenario, Port Sustainability

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2410-2419), Cappadocia, Turkiye. ISTES Organization.

Introduction

The distribution of goods will rise in response to increased industrial activity. Whereas more than 90% of worldwide trade is conducted by sea, distribution by sea is the most affordable option compared to air or land (Kong et al., 2022). According to a study by the Ministry of Environment and Forestry, transportation is the second-largest source of carbon dioxide (CO2) emissions in the energy sector, after electricity production, as shown in Figure 1, which shows estimates of an inventory of CO2 emissions for 2019 (KLHK, 2020). The

higher the energy consumption, the higher the Greenhouse Gas (GHG) emissions. Sea transportation is a contributor to GHG emissions of 2.89 percent (Meng et al., 2022).

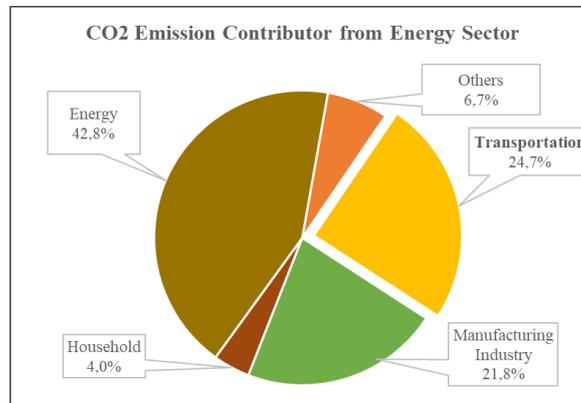

Figure 11. CO2 Emission Contributor from Energy Sector

(Source: KLHK (2020))

In sea transportation, two components have a vital role, namely, ships and ports. Ships are the largest source of emissions. According to Wang et al. (2023), port emissions are a small part of shipping emissions, accounting for around 3% of transportation emissions that ports release during production. As a form of commitment to reducing GHG emissions, in 2015, Indonesia signed the Paris Agreement. In this agreement, Indonesia agreed to reduce GHG emissions by 29% from BAU (Business As Usual) with national support in 2020 – 2030 and 41% with international assistance (ITF, 2018). These various commitments continue to be carried out in accordance with the targets set. One of these efforts is that Indonesia updated its Nationally Determined Contributions (NDC) document in July 2021. The document discusses the issue of shipping decarbonization and states that 19% of CO2 emissions come from shipping activities in Indonesia. These emissions come from the number and type of ships Indonesia owns (Kemenkomarves, 2022).

Through Presidential Regulation Number 59 of 2017 and decarbonization initiatives in the shipping industry in 2022, the Coordinating Ministry for Maritime Affairs and Fisheries is preparing to accelerate the spread of renewable energy and decarbonization in Indonesia. At sea, the efforts are to establish ports as one of the main actors in reducing emissions by applying environmentally friendly ports (green ports) by implementing zero carbon fuel for each ship's voyage. Most recently, at the SOE International Conference in the G20 series in 2022, the use of Onshore Power Supply (OPS) facilities at ports was signed, which is a land electricity service for ships carrying out loading and unloading activities at ports/terminals to replace the role of ship auxiliary engines, as steps to realize a green port to reduce CO2 emissions in the port sector (Kemenkomarves, 2022). In addition, in the shipping sector, Indonesia determines the use of low-sulfur fuel, which must be consumed by ships crossing Indonesian waters. Millions of tons of CO2 are emitted due to cargo fleet operations. Ports, the main hub of transportation for the shipping sector, play a crucial role in the economy and are strongly linked to expanding maritime freight. However, further study is required on the emissions generated in ports, notably in Indonesia. Understanding how the shipping industry operates and analyzing the evaluation of policy

interventions are necessary if one wants to get insight into how to reduce the production of CO₂ emissions in this sector. Understanding the system's structure and the causal connections between the variables that make it up requires a systems perspective.

In order to evaluate the feasibility of current strategies that improve port sustainability, this study aims to investigate the dynamics of sustainable ports. The policy analysis framework (Thissen & Walker, 2013) and system dynamics approach (Sterman, 2000; Moeis et al., 2020) are used to simulate the sustainability of the port system and examine how it impacts the economy, society, and environment. Implementing the Onshore Power System (OPS) and the carbon tax will be evaluated because of their potency in lowering air pollution and moderating the generation of CO₂ emissions. This research contributes to the knowledge of maritime logistics and sustainable development.

Literature Review

The authors conducted a literature review for several articles on this research topic. The purpose of the literature review is to gain in-depth knowledge of the research topic, learn more about the discussion of relevant topics in the research conducted, and find research gaps and research positions. Research about the CO₂ Emission Production in Indonesia is still limited due to its timeliness compared to other topics.

The shipping sector is an important part of global trade, and the increasing need for shipping services will increase the phenomenon of global warming. Global CO₂ emissions have increased by 1.9% in 2019 compared to 2018 (Cahyono et al., 2022). This increase was consistent with the 2018 global economic boom, which showed an increase to an average annual growth rate of 3.5% since 2012. Changes in per capita GDP and the energy intensity of transportation are the key contributors to the rise in CO₂ emissions in Asia, including Indonesia. The IPCC report states that global warming caused by industry increases the earth's temperature by 0.87% and will rise to 1.50C every year between 2032 - 2052. In 2019, Indonesia alone contributed 619,841 kilotons of CO₂.

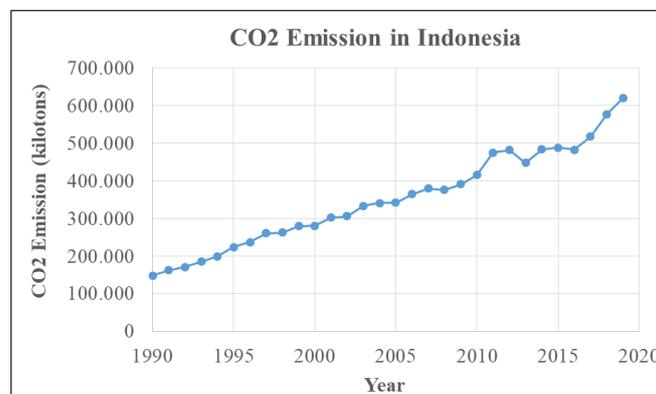

Figure 12. CO2 Emission in Indonesia
(Source: data.worldbank.org (2022))

0According to the Coordinating Ministry for Maritime Affairs and Fisheries, Indonesia's fleet currently numbers 39,510 cargo ships. It has 3,089 ports managed by PT Pelabuhan Indonesia, the Ministry of Transportation, and special terminals for private interests (Kemenkomarves, 2022). Because Indonesia has many international and domestic ports, many emissions must be generated (Huzaifi et al., 2020). Indonesia needs to implement the concept of green (low-emission) ports and evaluate the emissions from ships and ports. To realize this long-term objective, cooperation, sincerity, and consistency in policy are required.

Previous studies that evaluated the reduction of CO₂ emission production and its mitigation were carried out in industrialized nations like the United States, South Korea, Japan, and China. One is at the Taipei port to estimate container emissions and then determine the most efficient path for the container. Another study on emission calculations is among them. Then calculations were done on each activity's ship speed, and distance traveled, and energy consumption in Busan, Korea. Additionally, that research considers all active ship types and other port-related equipment, which will be examined to see whether emissions can be reduced (Liao et al., 2010; Shin & Cheong, 2011; Sim, 2018).

After conducting a literature review, the gap in research is determined from the studies that have been reviewed to determine the position of this research. Gaps from previous studies found that many studies focused on the shipping industry, both ports and ships. However, not many studies have evaluated policies on reducing CO₂ emission production using a dynamic system with case studies of the shipping industry in Indonesia. System dynamics is used in the analysis of complex systems. Since the study conducted here aims to offer recommendations for the government on port development alternatives that support sustainability, a system dynamics analysis that can consider a system's dynamics is necessary. The approach also attempts to provide modeling to address policy uncertainty (Pruyt, 2013). The present research is being done continuously. Modeling of CO₂ emission reduction needs to be done because the system is complex, and the many variables involved and influencing each other are difficult to study directly.

Method

In this study, the conceptual model as a component of the System Dynamics model is described using a Causal Loop Diagram (CLD). However, the scope of this study is restricted to model conceptualization, the first stage of the System Dynamics approach. The conceptualization of the model presents the overall picture of the subjects covered, such as the identification of stakeholders, the characterization of the problem and statement of objectives, the variables in the form of a CLD, and the policy interventions and scenarios for it.

Conceptualization of the model begins with defining the problem by determining the research topic based on the author's observations. The issue of problems with increasing production of CO₂ emissions is the focus of this observation. Then a literature study was carried out to understand the topic and find research gaps to decide on the position of this research. The Input-Process-Output (IPO) model is used to conceptualize the model in this

study. It consists of several factors that show a causal relationship with the generation of CO2 emissions at ports: inputs are the variables that will be utilized as separate inputs for the model, and processes are the elements and their interactions in the CLD system. The simulation results' dependent variable is the output. Multiple experts must authenticate the CLD to reflect real-world conditions accurately.

Results and Discussion

The conceptualization of the shipping industry model in port operations is presented in several stages. The data used to build the model results from literature studies and interviews with port experts. Therefore, several scenarios are applied to find the most appropriate strategy for reducing CO2 emission production.

System Diagram

The system diagram, as shown in Figure 13, is used to help understand the system's complexity under study by providing the overall model concept. The system diagram contains the following components: the problem owner, the objectives of the system being reviewed, stakeholders, strategies that the problem owner can apply to the system being reviewed, external variables that affect the system, the processes that occur in the system, namely for dynamic system modelling causal loop diagrams are used to determine the factors that influence each other in the system, and the output indicators of the system under review determine whether the objectives of the model are achieved or not.

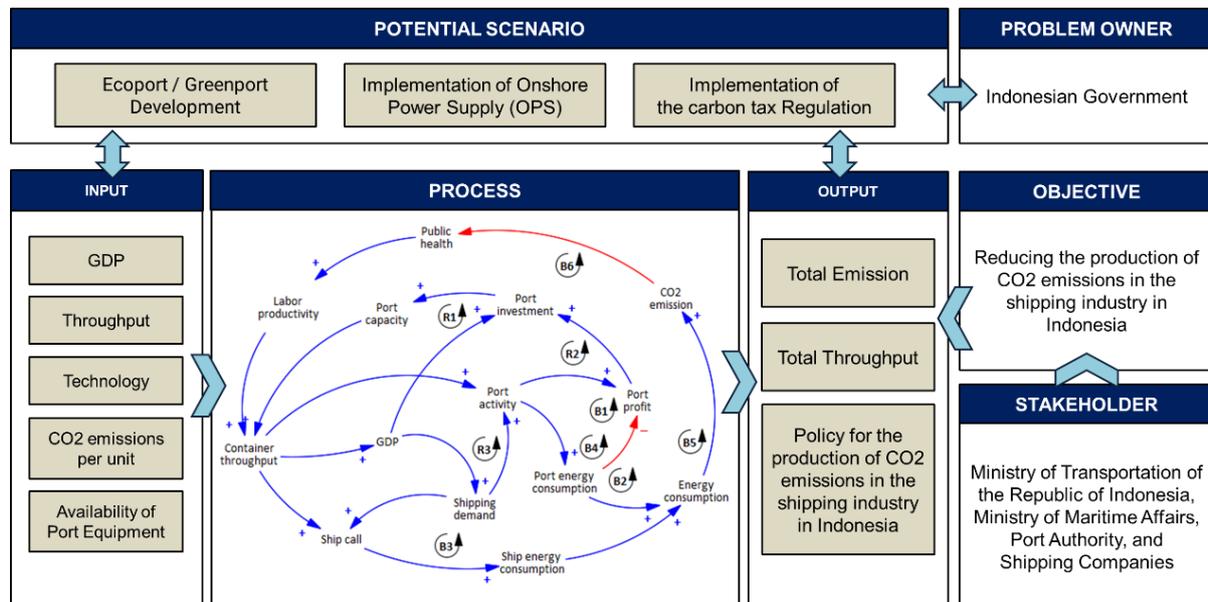

Figure 13. Model Conceptualization

A conceptualization model for applying shipping sector rules in port operations is being developed by the problem's owner, the Indonesian government, with the aim of better understanding how implementing policies

will affect the country's production of CO2 emissions. For the model conceptualization to be utilized in Indonesia, the chosen stakeholders are the key decision-makers and industry actors. As policymakers, the Ministry of Transportation, the Directorate of Sea Transportation, and the Ministry of Maritime Affairs are additional stakeholders in this issue. Port operators, who organize the policy, and shipping corporations, who carry out the policy's impact, are additional stakeholders.

This model consists of input, process, and output. The author needs data such as GDP growth rates, port throughput, emission factors, and port capacity. From the model designed and simulated, the author will get the total throughput and total emissions as output to achieve the goal of reducing the shipping industry's CO2 emission production at port operations. The author will apply a potential scenario of implementing green ports in the model: Onshore Power Supply (OPS) and carbon tax.

Causal Loop Diagram

The CLD describes the relationship of a system. The author combines reference models belonging to Li et al., (2019), Kong et al., (2022), and Moeis et al., (2020) which have been adapted to the context of CO2 emission production and also the operational situation of ports in Indonesia. The relationship of all variables is explained by arrows indicating the causal influence between variables. Each arrow is given a polarity, either positive (+) or negative (-), depending on the interaction between variables. The causal loop diagram was made with Vensim software and can be seen in Figure 14.

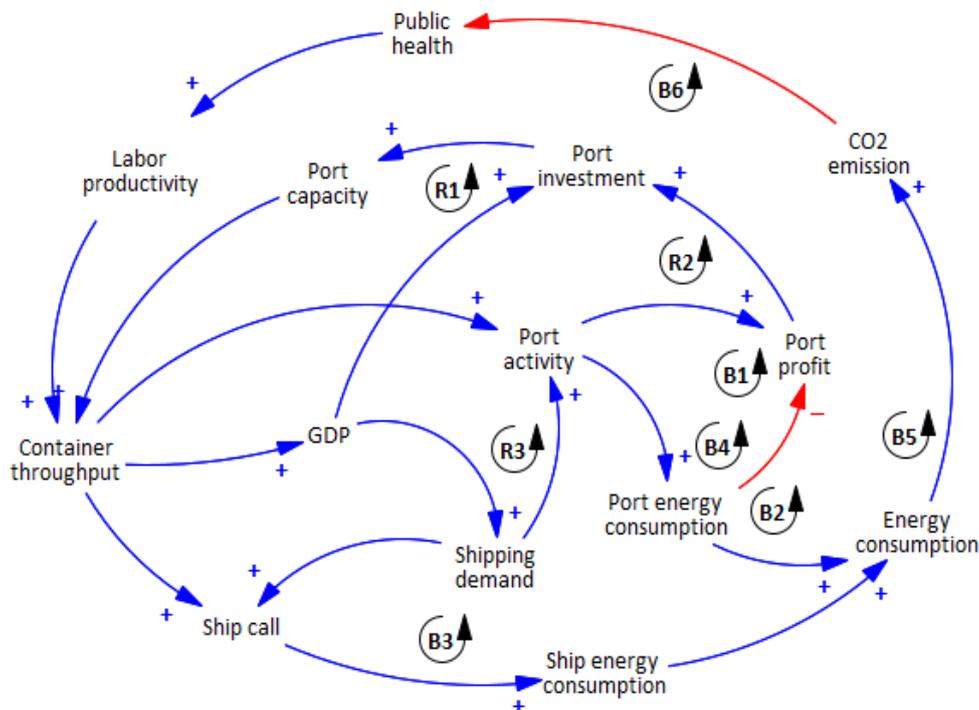

Figure 14. Causal Loop Diagram

The model has 9 (nine) causality loops: six balancing and three reinforcing. Output indicators to be used are Indonesia's GDP, container throughput, a number ships visiting the port, and energy consumption of ships at ports, to determine whether the model achieves the CO₂ emission reduction parameters as desired. This paper reviews the sources of CO₂ emission production, namely the amount of energy consumption. Energy consumption comes from energy consumption generated by ships at ports and energy consumption resulting from operational activities at ports. The use of proper equipment and fuel will reduce the production of CO₂ emissions produced by a port. In the case of port operations, the energy consumption generated by ships depends on the number of ships and the length of time they berthing at the port. Apart from ships, energy consumption is also generated by fuel in loading and unloading equipment at a port which depends on port throughput.

R1, R2, R3, B1 and B4 represent the economic and social loops. GDP, shipping demand, and port activity volume are the variables in these loops, which have positive polarity in loops R1, R2, and R3. According to Callen (1999), this relationship uses the total final use of commodities and services, as measured in buyer prices, which includes total consumption, investment, government spending, and exports. For this relationship, the theory that states that as GDP rises, so too will shipping demand makes sense. Additionally, port activity grows along with an increase in demand. The relationship between rising GDP and port activity is shown by loops B1 and B4, which will result in higher energy consumption and decreased port profits.

The environmental loop, B2, B3, B5, and B6, consists of demand for goods, port activities, energy consumption, and production of CO₂ emissions. This is built from the hypothesis that increased activity will support the acceleration of CO₂ emission pollution. A variety of fuels are used in the port's operations. Hence, when energy usage rises, it also increases the demand for fuel. Increased fuel use will result in greater emissions with various emission variables. Increased emissions from this will adversely affect the environment near the port and may raise awareness of adopting green energy (supporting sustainable energy).

Scenarios

After knowing the production flow of CO₂ emissions at the port and the relationship between the variables that influence each other, the authors designed two scenarios to reduce the amount of CO₂ emission production.

1) *Application of Onshore Power Supply (OPS)*

OPS allows electricity to be channeled to the berths so that a ship does not need to turn on its engine, which produces high emissions in the port. The application of OPS can reduce CO₂ emissions by more than 30%, nitrogen oxides and other exhaust gases by more than 95% and eliminate pollution (Gibbs et al., 2013; Styhre et al., 2017). In addition, implementing this policy also follows the Indonesian Government's commitment based on the Minister of Transportation No Decree 201 of 2013 concerning the Stipulation of the National Action Plan for Reducing Greenhouse Gas Emissions in the Transportation Sector and the Transportation Sector GHG Inventory, namely Port operational management efficiency.

2) Application of Carbon Tax

The application of a carbon tax, namely by giving a price to carbon emissions, can impact various countries with a maritime sector. A carbon tax is a pricing on emissions produced by increasing the price of energy consumption, which reflects its social costs. Several countries that have implemented carbon taxes include Norway, with a reduction in carbon emissions of 2.3%, Japan, can reduce carbon emissions by 8.2% in 2013 – 2018; and Finland, Denmark, the Netherlands and Sweden can reduce carbon emissions by 1, 5% - 6% (Rojon et al., 2021; Parry et al., 2018).

Conclusion

The production of CO₂ emissions is a problem that still has much potential to find a solution. The goal of this study is to create a conceptual model that gives a clearer understanding of the factors that contribute to reducing CO₂ emission production and may be used as a benchmark for future research. The CLD, created using step one of the System Dynamics technique, is at the center of the conceptual model. Nine loops focus on energy consumption, throughput growth, and environmental impact. Production CO₂ emissions cannot be eliminated, but the amount can be reduced. From the conceptual model, the key variables supporting emission handling in Indonesia are part of implementing the green port. This paper proposes two strategic scenarios expected to reduce CO₂ emission production significantly. The government must formulate different policies to mitigate environmental pollution in the shipping industry, which requires stakeholder collaboration.

Recommendations

A valid model conceptualization can support the following modeling stage. The next step in this research is to design stock and flow diagrams based on CLD and perform simulations to assess detailed quantitative and qualitative analyses while examining policies. Additionally, more relevant data must be collected to be verified and validated, affecting the simulation outcomes.

Abstract: Globalization in an increasingly advanced era without any restrictions on movement has encouraged the movement of goods. The development of the movement of goods encourages growth in demand for logistics services activities. Among the growing business fields in Indonesia, the logistics services industry has the highest growth opportunity among other business fields. At the same time, developments in business processes have the potential to be in a state of uncertainty and increase the risk of disruption. Hence, logistics service industry companies need a resilient supply chain strategy to help companies survive all possible risks that can harm the company. This study aims to develop a relevant supply chain resilience strategy for the logistics services industry in Indonesia. The data is taken from the literature review to obtain an initial shortlist of existing supply chain resilience strategies. Then strategies were assessed and validated by six logistic experts from industry, industry associations, and academic. Next, the scores were analyzed using the item-content validity index (I-CVI) and the modified kappa (K) statistic. From this study, 16 strategies have been validated and furthermore could be used by the logistics service industry to achieve their supply chain resilience system.

Keywords: Supply Chain Resilience Strategy, Logistics Service Provider, Content Validity Index, Kappa Analysis

Introduction

Developments in global production have increased the complexity of supply chains and strengthened the notion of strategic logistics as the implementation of business strategy elements, where logistics is a major component of the manufacturing system (Mehami et al., 2018). One of the most important logistics activities in the supply chain network is to meet the transportation needs of various products and various suppliers; the intermediary between the different supply chain members is played by the logistics service provider (Kucukaltan et al., 2022).

The growth in logistics service activities caused by increased demand, and then causing the movement of goods to increase. According to data on BPS (2022), the volume of movement of exported and imported goods in Indonesia from 2016 to 2022 has increased even though it experienced a decline in 2020. In addition, the growth in Gross Domestic Product (GDP) for transportation and warehousing jobs was the highest, reaching 15.79%, where transportation and warehousing are one of the logistics activities (BPS, 2022b).

The complexity of the supply chain network can reach 20 to 30 actors involved in one transaction (Arif & Jawab, 2018). But on the other hand, the company will focus more on the core business and establish partnerships with outsourced operating processes beyond the company's expertise. Logistics Service Provider (LSP) can provide benefits in terms of spending costs and maintaining operational processes in the supply chain by using the latest technological knowledge (Kucukaltan et al., 2022). According to Arif & Jawab (2018), the logistics service industry based on the outsourcing logistics model has four types, namely, Basic Services, Third-party Logistics Provider (3PL), Lead Logistics Provider (LLP), and Fourth-party Logistics Provider (4PL), each model has its characteristics, one or other based on the services offered from Basic Services are transportation, warehousing, etc., and the services offered will be increasingly more sophisticated respectively up to 4PL, such as integration supply chain.

According to presidential regulation of Indonesia number 26 of 2012, logistics service providers in Indonesia are dominated by shipping and freight forwarding with a total organization of 81.88%, and serving logistics service activities as much as 38.05%. While other service providers, such as shipping services serve logistics activities as much as 43.83%, warehousing 3.83%, courier 3.28%, and containers, packaging, land transportation and storage are below 3%. These logistics activities keep growing since there is a large number of various industrial sector that outsourcing their logistics. Companies in the 3PL sector were able to offer sophisticated logistics solutions on a continental or even global scale. By increasing their scale and breadth of operations, these LSPs aim to play a more strategic role in their clients' supply chains (Selviaridis & Spring, 2007). The term "3PL" typically refers to providing various bundled services instead of merely discrete transport or warehousing operations. Instead of spot purchases of logistical services, modern 3PL agreements are based on formal (short-term and long-term) contractual relationships.

Business processes to survive must always evolve. However, these developments will add risks to business activities. Risk will increase uncertainty through new product development, customer demand, geographical location or business strategy (Sheffi, 2015). Logistics performance is a part of supply risk which has an external position in the company but is internal to the supply chain network. Poor logistical performance is one of the causes of supply chain risk (Shekarian & Parast, 2021). The supply chain needs to be very reliable to help logistics service provider companies survive all possible risks that can harm the company. The benefit of building a corporate resilience strategy is an initial step to adapt to changes in the operating function to increase competitive ability, where avoiding damage can be done by evaluating the stages in the supply chain network (Sheffi, 2015).

The dynamic phase of disruption of SCR operations is based on the time sequence if a disruption occurs, namely readiness, response, recovery, and renewal (Song et al., 2022). Detection, prevention, and response are part of investing in risk management and resilience. Serves to reduce the duration and magnitude of the disruption. Hence, the supply chain system can detect risks as quickly as possible and provide added value to the company (Sheffi, 2015). The complexity of the supply chain resilience system makes it unable to be assessed with usual risk management assessments, due to unpredictable long-term disruption impact factors. Thus, in this context, it is very important to understand the various sources of uncertainty and the best strategic response for a company in a dynamic environment (Gunasekaran et al., 2015). A supply chain resilience strategy is the capacity of a company or business entity to survive, adapt, and grow in the face of turbulent changes (Isti'annah et al., 2021).

SCR is an adaptive capability that 3PLs can use to plan for unforeseen events, react to disturbances, and recover from them by ensuring business continuity. This capability involves handling, adjusting, and responding to supply chain disturbances. Given the complexity of their supply chain network and the unpredictability of the market, 3PLs must deal with operational issues brought on by inclement weather, disrupted or backed-up transportation networks, equipment failures or subpar service from logistics partners, among other things. They have to think about when a disruption might happen and how long things might take to return to normal. Therefore, this study aims to develop a supply chain resilience strategy in the Indonesian third-party logistics services industry. This study will discuss the element strategies that are relevance for 3PL supply chain resilience in Indonesia.

Method

Strategy Development

In this study, the existing literature review was carried out concerning the strategy of implementing supply chain resilience systems. This study's main objective is to identify relevant strategies for third-party logistics service supply chain resilience in Indonesia. Research methodology used in this study by incorporating several steps. The first step involves carrying out a study relating to the issues covered in this study, outlining the context of the issues, formulating the problems, setting research goals, and conducting a preliminary literature assessment to identify the research gap.

Next, some literature was reviewed to develop supply chain resilience strategy in the logistics service provider industry context. From the literature study, 21 strategies were identified. There are consisting of 6 strategies from the collaboration between various parties dimension (See Table 25), collaboration is regarded as a crucial component of SCR because it relates to information sharing between various parties, which is necessary for quick responses in disruption situation. Furthermore, there are 10 strategies from the flexibility of organizational adaptation dimension (see Table 26), Flexibility was recognized as one of the crucial qualities the business should cultivate, particularly during times of disruption. Flexibility demonstrates how businesses can successfully adjust to disruptions condition. Finally 5 strategies from the agility of system configuration

dimension (see Table 27), agility emphasizes rapid system reconfiguration in the face of unpredictable changes.

Table 25. List of SCR Strategies in The Collaboration Between Various Parties Dimension

No.	Code	Collaboration Strategy	Definition	Sources
1	C1	Sensitivity to situations	Employee capabilities in analyzing various information, then interpreting the information into continuous planning, mapping supply chain vulnerabilities, warning strategies, and risk mitigation.	Ali et al. (2017), Belhadi et al. (2021), Xu et al. (2021)
2	C2	Development of supply chain network robustness	Build collaborative programs in such as configuration, segmentation, and decentralization of infrastructure throughout the supply chain network to reduce uncertainty and increase responsiveness to disruption.	Ali et al. (2017), Lam & Bai (2016)
3	C3	Supply chain relationship development	Develop and maintain good relations with all actors in the supply chain for collaboration in dealing with possible disruptions that may occur.	Ali et al. (2017), Burgos & Ivanov (2021), Lam & Bai (2016), Praharsi et al. (2021), Sharma et al. (2021)
4	C4	Designing security system	Build an information security system to counteract counterfeit threats, cyber security, layered defend, form Public-Private Partnerships (PPP), and establish cooperation with supply chain partners	Ali et al. (2017)
5	C5	Knowledge management implementation	Implement supply chain knowledge management, workforce education and training, simulation and training in various supply chain conditions, moreover establish a risk management department.	Ali et al. (2017)
6	C6	Improved forecast accuracy by coordinating across levels of the supply chain	Develop an appropriate demand forecast strategy by sharing information at each level of the supply chain to increase the visibility and responsiveness of the supply chain system, thereby avoiding excess supply accumulation in inventory and avoiding long	Burgos & Ivanov (2021), Lam & Bai (2016), Praharsi et al. (2021)

queues of the loading and unloading process.

Content Validity Process

Content validity was performed for the next step to obtain the relevant supply chain resilience strategy in the context of the Indonesian logistics service provider. A questionnaire was distributed to experts on the third-party logistics and supply chain resilience as part of the validation procedure. The panel of expert had been selected based on the following criteria: 1) Have a minimum of 5 years experience in the logistics service industry; 2) Experts are from industry/logistics service companies, non-governmental agencies (NGOs), or academics field; 3) Holding managerial positions for private and non-private companies in the field of logistics services or having research experience in supply chain resilience for academics/NGOs.

Table 26. List of SCR Strategies in The Flexibility of Organizational Adaptation Dimension

No.	Code	Flexibility Strategy	Definition	Sources
1	F1	Order fulfilment optimization	Build a flexible service through the collaboration of several supply partners for order fulfilment and achieve resource flexibility.	Ali et al. (2017), Sharma et al. (2021)
2	F2	Expansion of the transportation network	Combining and expanding some of the flexibility of the transportation network to be able to meet consumer demands immediately, as well as increasing the ability to adapt to changes in environmental conditions that can disrupt the supply chain system.	Herold et al. (2021), Sharma et al. (2021)
3	F3	Postponement strategy implementation	Postpone the sale of services to carry out more detailed modularity regarding service differentiation to ensure the flexibility of the services provided and in accordance with the latest consumer needs.	Ali et al. (2017)
4	F4	Pricing dynamics	Adjusting the price list for services due to limited capacity by evaluating supply and demand data, complemented by analysis that can help determine the effectiveness of service pricing.	Ali et al. (2017), Sharma et al. (2021)
5	F5	Set up redundancy strategy	Build supply chain redundancy to anticipate disruptions by using excess capacity in transportation or resources from multi-	Ali et al. (2017), Burgos & Ivanov (2021), Belhadi et

			suppliers or low capacity utilization as an effort to mitigate the impact of disruptions.	al. (2021)
6	F6	Revenue stream innovation	Designing innovative financial stability solutions in the context of different scenarios, taking advantage of business potential that can still grow, and working capital liquidity.	Burgos & Ivanov (2021), Herold et al. (2021), Sharma et al. (2021)
7	F7	Infrastructure optimization	Optimizing shipments through consolidation with suppliers and consumers to make deliveries as needed without having to meet infrastructure capacity, as an effort to maintain main transportation routes.	Ali et al. (2017), Herold et al. (2021)
8	F8	Human resource management planning with new contracts	Implementation of a human resource management strategy with short time work which will temporarily reduce temporary workers to optimize work load and workforce.	Herold et al. (2021)
9	F9	Diversification and outsourcing strategy	Modify the service portfolio according to current conditions through analysis of core and non-core business descriptions, and use outsourcing through existing collaboration with external partners.	Sharma et al. (2021)
10	F10	Utilization of information technology for demand sensing	The supply chain information system uses big data capabilities to collect the latest information that occurs throughout the supply chain to support the right decision making.	Ali et al. (2017), Belhadi et al. (2021)

The experts scored by item-rating scale with four points, 1 = "not relevant," 2 = "somewhat relevant," 3 = "quite relevant," and 4 = "highly relevant" to rate a set of items derived from a thorough literature research on the notion of supply chain resilience. Then, to evaluate the content validity, I-CVI and multi-rater kappa statistics were both applied. Each item's CVI value (I-CVI) is based on the amount of experts who judge its content to be valid (3 or 4), or invalid (1 or 2). I-CVI is the proportion of experts who concur that the question is relevant to the field divided by the total number of experts. The multi-rater kappa coefficient of agreement was afterwards analyzed and compared. Fleiss et al. (2003), defined "K" as "excellent" if the value was greater than 0.74, "good" if it was between 0.60 and 0.74, "fair" if it was between 0.40 and 59, and "poor" if it was below 0.40. Those items classified as fair or poor were removed from the questionnaire list, while items classified as excellent or good will be taken into consideration for future research. Table 28 displays the results of the I-CVI and kappa analyses.

Table 27. List of SCR Strategies in The System Configuration Agility Dimension

No.	Code	Agility Strategy	Definition	Sources
1	A1	Contingency plan design	Performing time to market analysis, scenarios, reconfiguring supply chains, reconfiguring resources, then preparing recovery plans, restoration plans, and planning capacity additions.	Ali et al. (2017), Lam & Bai (2016), Praharsi et al. (2021)
2	A2	Strengthen market position	Increase financial, equity, efficiency, strategic alignment, and adaptability strength of the company in maintaining consumer trust and communication.	Ali et al. (2017)
3	A3	Knowledge management development	Evaluate feedback on post-disruption conditions, develop post-disruption curriculum insights, and increase innovation in business processes.	Ali et al. (2017)
4	A4	Increased visibility of IT-based supply chain systems	Adopting digital technology and advanced IT systems in several business processes to maintain essential business functions through system integration and connectivity.	Ali et al. (2017), Belhadi et al. (2021), Burgos & Ivanov (2021), Gupta et al. (2022), Herold et al. (2021), Praharsi et al. (2021), Sharma et al. (2021)
5	A5	Implementation of monitoring and maintenance of supply chain systems	Carry out performance control and monitoring activities by evaluating the KPI matrix to ensure suppliers, work partners, and personnel perform the expected performance.	Belhadi et al. (2021), Lam & Bai (2016), Praharsi et al. (2021)

Results

This study focused on the relevance strategies for supply chain resilience in third-party logistics provider industry. Six experts were given a questionnaire, and the results were gathered. A four-level scale was used by each expert to rate the relevance of the strategies. The result of this research was presented in Table 28, consist of I-CVI, K values, and interpretation of Kappa results. As a result, only 16 strategies from the initial set of 21 strategies selected for this study were determined to be relevant for the Indonesian logistics sector. Figure 15 compiles all of the relevant strategies.

The strategy on collaboration between various parties dimension, "sensitivity to situations", "development of supply chain network robustness", "supply chain relationship development", "knowledge management implementation", and "improved forecast accuracy by coordinating across levels of the supply chain" have an interpretation of K excellent, while "designing security system" was poor. For the flexibility of organizational adaptation dimension, "order fulfilment optimization", "expansion of the transportation network", "pricing dynamics", "set up redundancy strategy", "revenue stream innovation", "infrastructure optimization", and "utilization of information technology for demand sensing" strategies were excellent, beside that "postponement strategy implementation", and "diversification and outsourcing strategy" were fair, and "human resource management planning with new contracts" was poor. Lastly, for the system configuration agility dimension the strategies that has excellent interpretation of K were "contingency plan design", "knowledge management development", "increased visibility of IT-based supply chain systems", and "implementation of monitoring and maintenance of supply chain systems", meanwhile "strengthen market position" strategy was fair.

Table 28. Result of Expert Validation

Dimension	Strategy Code	Number of Agree	I-CVI	K	Interpretation of K
Collaboration Between Various Parties	C1	6	1.000	1.000	Excellent
	C2	6	1.000	1.000	Excellent
	C3	6	1.000	1.000	Excellent
	C4	3	0.500	0.273	Poor
	C5	5	0.833	0.816	Excellent
	C6	6	1.000	1.000	Excellent
Flexibility of Organizational Adaptation	F1	5	0.833	0.816	Excellent
	F2	6	1.000	1.000	Excellent
	F3	4	0.667	0.565	Fair
	F4	6	1.000	1.000	Excellent
	F5	5	0.833	0.816	Excellent
	F6	6	1.000	1.000	Excellent
	F7	5	0.833	0.816	Excellent
	F8	3	0.500	0.273	Poor
	F9	4	0.667	0.565	Fair
	F10	5	0.833	0.816	Excellent
System Configuration Agility	A1	5	0.833	0.816	Excellent
	A2	4	0.667	0.565	Fair
	A3	5	0.833	0.816	Excellent

A4	6	1.000	1.000	Excellent
A5	5	0.833	0.816	Excellent

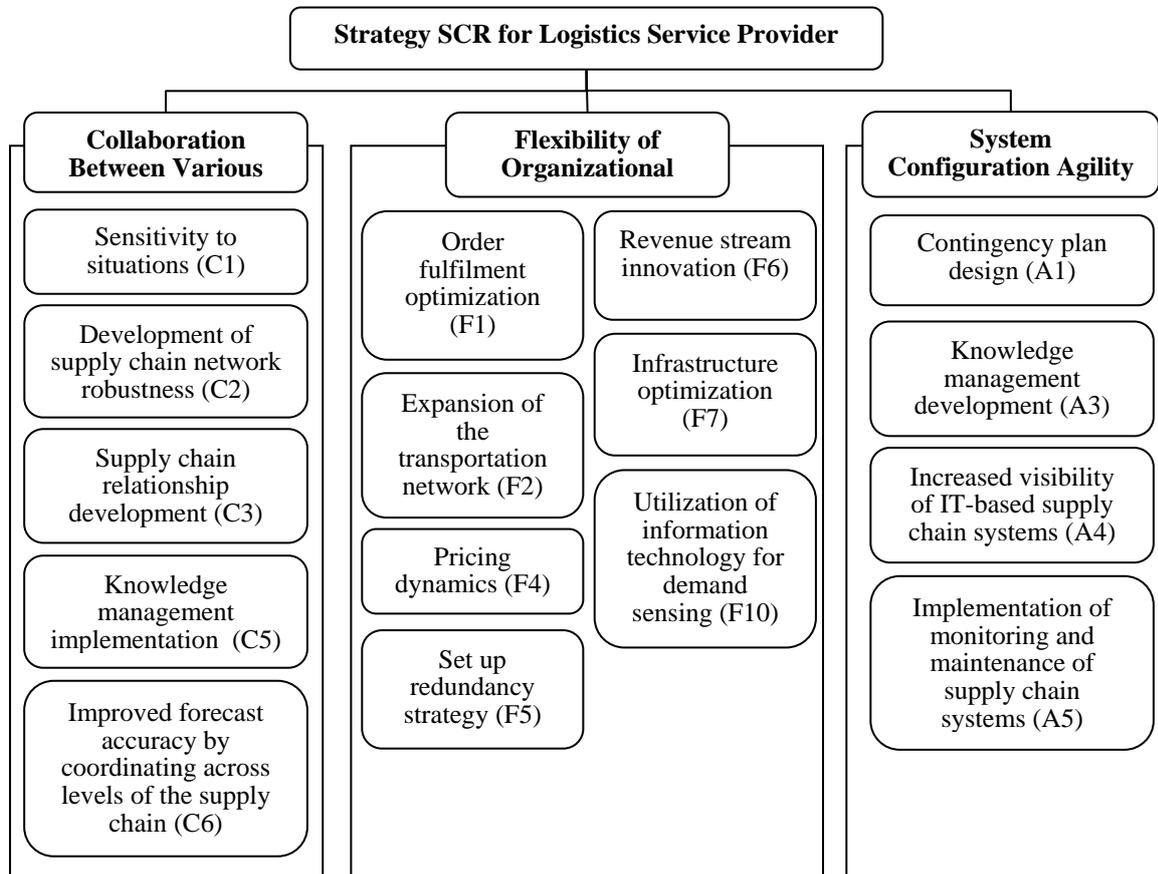

Figure 15. Supply Chain Resilience Strategy for Logistics Service Provider Industry

Discussion

According to the I-CVI values, items with an I-CVI of 0.78 or above for three or more experts could be regarded as strong evidence of content validity (Polit et al., 2007). However, I-CVI incapacity to account for chance agreement, and become one of its weaknesses. By converting item-level CVI into values of a modified kappa statistic, we were able to resolve issue. In terms of K value, "excellent" refers to scores above 0.74, "good" to scores between 0.60 and 0.74, "fair" to scores between 0.40 and 0.59, and "poor" to scores below 0.40 (Fleiss et al., 2003).

The supply chain resilience strategy namely "postponement strategy implementation", "diversification and outsourcing strategy", and "strengthen market position", were among the three strategies that received 'fair'. Then "designing security system" and "human resource management planning with new contracts" were strategies that received 'poor' outcomes in the Kappa analysis. Despite reflecting positive values, these items I-CVI and K values were not statistically significant. Therefore, these objects should to be dropped (Fleiss et al.,

2003). One of the advantages from using this method for validity is the denominator in Kappa Statistics computations represents the highest level of agreement achievable over and beyond what might be expected by chance. The agreements that truly go above and beyond the odds are completed in the numerator. As a result, this calculation demonstrates content validity by concentrating on relevant things; it only demonstrates that there is complete consensus among experts (Polit et al., 2007). In this study the result of I-CVI of all strategies are statistically significant, therefore none of the strategies has a "good" K value interpretation. So the Kappa Statistics also made sure the I-CVI would stay within threshold.

Meanwhile, the five strategies of the collaboration, there are "sensitivity to situations", "development of supply chain network robustness", "supply chain relationship development", "knowledge management implementation", and "improved forecast accuracy by coordinating across levels of the supply chain", has the K interpretation that produced 'excellent' results. Implementing internal integration within a company and working with outside parties to form supply chain partnerships allow companies to improve their competitive advantages such as sustainability and resilience (Tarigan et al., 2021). The strategies such as "supply chain relationship development" and "improved forecast accuracy by coordinating across levels of the supply chain" have a support to integration on supply chain.

The flexibility dimension has seven strategies that also receiving 'excellent' result in kappa analysis, i.e. "order fulfilment optimization", "expansion of the transportation network", "pricing dynamics", "set up redundancy strategy", "revenue stream innovation", "infrastructure optimization", and "utilization of information technology for demand sensing". In addition, the study on Siagian et al. (2021) indicates that supply chain integration enhances corporate performance by increasing supply chain resilience and flexibility. Additionally, supply chain resilience is impacted by supply chain flexibility. Therefore, a plan for preparing the company's adaptability and flexibility is required to achieve supply chain resilience.

Moreover, four of the agility strategies also has 'excellent' K interpretation, there are "contingency plan design", "knowledge management development", "increased visibility of IT-based supply chain systems", and "implementation of monitoring and maintenance of supply chain systems" strategies. The innovation system has an impact on supply chain resilience. The business may quickly innovate to create new goods and modify internal procedures in response to shifting consumer demand. Hence, business operation could achieved one of supply chain resilience objectives which is quick recovery to return to the norm (Bernardes & Hanna, 2009).

In total, just 16 items remained relevance to use in the further research for context of third-party logistics service provider in Indonesia. This finding suggests that internal integration has a variety of benefits for enhancing competitive advantage. According to Alamsjah & Asrol (2022) study's findings, even though the measurement of certain strategies may be appropriate in a business environment, but they may not be as relevant as in the context of Indonesia, which an example of a developing nation. This is due to the fact that Indonesian logistics are unique in that; they are marked by unusually high supply chain uncertainties, such as, inter-island logistics, the highest number of natural disasters worldwide, and inadequate infrastructure. The items that were removed

lacked precision in measuring some dimensions and weren't suitable for developing a supply chain resilience strategy. Finally, all of the strategies that were chosen for each dimension were found to be significant and relevant in structuring an appropriate SCR strategy for an Indonesian logistics service provider.

Conclusion

Supply chain resilience strategy was needed to be identified for business performance and growth. This research studied the relevance strategies for supply chain resilience in Indonesia logistics service provider industry. This study found there is 21 strategies in the context of logistics service provider industry through a literature review. The strategies were divided into three dimensions, i.e. collaboration (6 strategies), flexibility (10 strategies), and agility (5 strategies). Validation by six experts was carried out and calculated the K value, resulting 16 strategies that relevance for third-party logistics service provider in Indonesia. The relevance strategies are 5 strategies in collaboration between parties dimension, 7 strategies in flexibility of organizational dimension, and 4 strategies in system configuration agility dimension.

The main focus of this study was content validity. Future studies can therefore evaluate the other form of validation questionnaire or reliability. Implication of strategies in this research only for supply chain resilience of third-party logistics service provider in Indonesia. For the future research it is recommended to analyze the interrelationship between element strategy by using the multi-criteria decision-making (MCDM) approach. Recommended to develop a structure strategy to achieve the vision for several years in supply chain systems.

Exploiting Ontological Engineering Paradigm in Smart Decision Support Systems

Dace Ratniece

Beijing International Studies University, China, Liepaja University, Latvia

Abdel Badeeh M. Salem

Ain Shams University, Faculty of computer and information science, Abbassia, Cairo, Egypt

Abstract: Ontological engineering (OE) is a subset of knowledge engineering (KE). Ontology is a powerful technique for knowledge management, processing, and representation in a specific domain and enables inference as well as reasoning tasks. Most of the applications of OE in the fields of informatics and artificial intelligence (AI) are related to developing robust smart software systems and knowledge-based systems. On the other side, Knowledge-Based decision support systems (KDSS) are consultation intelligent systems that contain a knowledge base (KB) and inference engine (IE). The KB contains static knowledge and experiences (heuristics knowledge) of many experts in a specific task. In this article, we focus our discussion on the potential role of OE in Knowledge-Based Decision Support Systems (KDSS). Moreover, the article presents the research issues for developing ontologies for any task. In addition, web-based ontologies for expert systems, e-business, and e-medicine, e-education are also included. The ontological engineering paradigm is an effective methodology to manage and represent knowledge. Ontologies are now ubiquitous in many information-systems enterprises. They constitute the backbone of the Semantic Web as well as they are used in all e-activities and applications. Furthermore, the ontology approach enables us to solve the uncertainty and complexity of the instructional systems.

Keywords: Ontological Engineering, Knowledge-Based Decision Support Systems, E-Business, E-Medicine, E-Education.

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 2433-2448), Cappadocia, Turkiye. ISTES Organization.

Introduction

From a philosophical point of view, "Ontology" is the branch of philosophy that deals with the nature and the organization of reality. In the informatics and artificial intelligence domains, ontologies aim at generically capturing domain knowledge and providing a commonly agreed understanding of a domain, which may be

reused and shared across applications and groups. Ontologies provide a common vocabulary of a specific area. At present, there are many applications of ontologies in commercial, industrial, medical, bioinformatics, education, and business.

During the previous decade, increasing attention has been focused on OE (Fernández-López & Gómez-Pérez, 2022) and (Su & Ilebrekke, 2002). The main advantages of using the OE paradigm are: (a) to share insights and mutual understanding of the structure of information among people or intelligent software agents; (b) to enable the reusability of domain knowledge; (c) to represent the domain of interest in an explicit way; (d) to differentiate the domain knowledge from operational knowledge; and (e) to analyze domain of interests. Currently, there are applications of OE with commercial, industrial, biological, medical, educational, and research focuses (Su & Ilebrekke, 2002), (Tankeleviciene & Damasevicius, 2009), (Bodenreider & Burgun, 2005). On another side, ontology design, approaches, and methodologies are very important aspects of building ontologies in different domains and tasks. In the addition, reusability is a key issue that is determined by the level of compatibility among ontology concepts and among the theories of the different domains they convey.

In this article, we focus our discussion on exploiting the potential role of ontological engineering in knowledge-based decision support systems. Section 2 presents an overview of ontological engineering from the Artificial Intelligence Perspective. Section 3 discusses the research issues of ontological engineering. Section 4 introduces the main aspects and characteristics of knowledge computing and KDSS. Section 5 presents the general methodology for developing web-based ontology. Section 6 presents the web-based ontology for expert systems. Section 7 - Web-based Ontology for E-business Technology, Section 8 - Web-based Ontology for E-business Technology, Section 9 - Web-Based Ontology for Education. Finally, section 10 and 11 concludes the work.

Ontological Engineering (OE) from the Artificial Intelligence (AI) Perspective

According to (John, 2000), the main components of ontology are (a) concepts; (b) relations between concepts; (c) properties, and attributes of the concepts; and (d) rules, axioms, predicates, and constraints. The main objective of using ontologies is to share knowledge between computers or computers and humans. Computers are capable to transmit and present the information stored in files with different formats, but they are not yet compatible to interpret them. To facilitate communication and intelligent processing of information, all actors of the digital space (computers and humans) must have the same vocabulary. Ontologies are the foundation of cooperation and the semantical understanding between computers (running a lot of non-homogenous software programs) and of the cooperation between computers and humans. Trausan 2004 explained the idea that ontologies are the binder, which integrates database systems, knowledge-based systems, and object systems in collaboration-based applications.

Most of the usages of ontologies in the field of AI are related to knowledge-based systems and intelligent systems. These types of ontologies include a small number of concepts and their main objective is to facilitate reasoning. For example, in multi-agent systems, the knowledge representation is accomplished through a basic

ontology, private ontologies, and a knowledge base. Private ontologies of the agents are derived from the basic ontology. The names of the concepts used in private ontologies of the agents are unknown, but their definitions use terms from the basic ontology. From an AI perspective, OE involves a group of activities that focuses on the ontology development process, the ontology life cycle, the methodologies for building ontologies, and the languages and software tools that support them. Figure 1 shows the main aspects, activities, and components of OE (for more details, see Sowa 2000). Ontologies are the foundation of cooperation and the semantic understanding between computers (running many non-homogeneous software programs) and of the cooperation among humans and computers. Trausan 2004 explained the idea that ontologies are the binder, which combines database systems, knowledge-based systems, and object systems in collaboration-based applications.

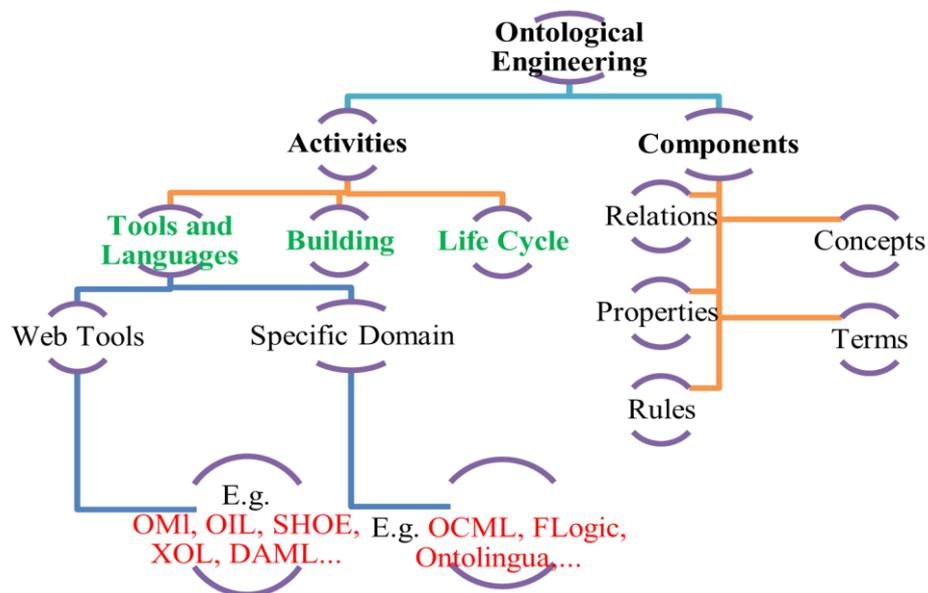

Figure 1. Activities and Components of Ontological engineering

OE is still an immature field of research where knowledge engineers employ their developing methodology. Ontology-building requirements differ based on the way of identifying concepts. There are three common approaches:

- "bottom-up" - it starts with the identification of the most concrete concepts to the most abstract concepts;
- "top-down" - it starts with the most abstract concepts to the most concrete concepts;
- "middle-out" - from the most closely related concepts to the most abstract concepts and most concrete concepts.

Ontological Engineering Research Issues

OE refers to the set of activities that concern the ontology development process, the ontology life cycle, methodologies for building ontologies, and the tool suites and languages that support them.

Methodologies

OE is still a relatively immature discipline; each research group employs its methodology. Ontology methodologies differ according to the strategy of identifying concepts. The well-known three possible strategies for identifying concepts are: (a) bottom-up from the most concrete to the most abstract; (b) top-down from the most abstract to the most concrete; and (c) middle-out from the most relevant to the most abstract and most concrete. The last one is the most common strategy.

Ontological Languages (OL) and tools

A great range of OL have been used for implementing ontologies during the last decade; e.g. Ontolingua, LOOM, OCML, FLogic, CARIN, OKBC, Telos, and Cyc (Parusheva, et al., 2017) and (Dean, et al., 2014). These languages are in a stable phase of development, and their syntax consists of plain text where ontologies are specified (many of them have a Lisp-like syntax).

Recently, Web-based ontology specification languages have been developed in the context of the World Wide Web. These languages have had a great impact on the development of the Semantic Web (e.g. SHOE, XOL, OML, OIL, DAML+OIL, and OWL. (Buraga, et al., 2006)). The syntax of these languages is based on XML. On the other side, ontological tools have emerged for creating, editing, and managing ontologies that are written in various languages. These tools usually provide a graphical user interface for building ontologies, which allows the ontologist to create ontologies without using directly a specific ontology specification language (e.g. OntoEdit, OilEd, WebODE, Ontolingua Ontosaurus Link Factory).

Ontology Interoperability

The domain of ontologies is extremely vast. A lot of ontologies were developed, even different ontologies for the same domain. To assure the interoperability between software applications, it is necessary to guarantee the interoperability between their ontologies. In the literature, there are different technologies related to the ontologies' interoperability, namely; ontology alignment, ontology mapping matching, ontology translation, ontology integration, ontology refinement, and ontology unification (Salem & Alphonse, 2007), (KhakAbi, et al., 2009), (Motta, et al., 2000).

- (a) **Ontology alignment:** Alignment is the process of mapping between ontologies possibly transforming them (i.e. eliminating the unneeded information or adding new concepts and relations to ontologies).
- (b) **Ontology mapping:** Despite the increasing usage of ontologies and the creation of standard languages to define ontologies, there are no common points of view regarding the formalism of ontologies' mapping.

- (c) **Ontology translation:** Ontology translation is used in tasks consisting in reusing the ontology or a part of the ontology.
- (d) **Ontology integration:** Ontology integration is the process of finding common parts of two (or more) ontologies (X and Y) and developing a new ontology Z that allows interoperability between two systems based on the ontologies (X and Y). The new ontology Z may replace ontology X or ontology Y or may be used as an “intermediary” (John, 2000). between the systems based on ontology X or ontology Y, respectively.
- (e) **Ontology refinement:** Refinement is the process of mapping between two ontologies so that every concept of one ontology has an equivalent in the other ontology. A primitive of one ontology may be equivalent to a non-primitive of the other ontology.
- (f) **Ontology unification:** Ontology unification is the process of aligning all concepts and relations of two ontologies. The unification process is the refinement process in both directions.

Ontology Validation

Validation is the process to determine whether a work product satisfies its requirements. Validation can be performed after the ontology has been developed, but it is usually better to validate while the ontology is being built. Several techniques can be used to validate ontology: (a) Verify the fulfillment of the purpose, (b) Check that all usage examples are expressible, (c) Create examples that are consistent with the ontology, and determine whether they are meaningful, and (d) Check that the ontology is formally consistent. The quality of the ontology is validated based on the following criteria: (a) consistency; (b) completeness; (c) conciseness; (d) clarity; (e) generality; and (f) robustness.

Ontology Evaluation

In (Lama, & Sánchez, 2009) perform ontology evaluation based on the following criteria: (a) completeness; (b) correctness; (c) decidability; (d) maintainability; (e) minimal redundancy; (f) rich axiomatization; and (g) efficiency. A more formal ontology evaluation method was proposed by Obrst et al. (Lama, & Sánchez, 2009), includes (a) the development of an ontology and ontology tool competition; (b) principled certification of ontologies by a reviewing organization or community; and the development of an ontology.

Knowledge Computing and Knowledge-Based Decision Support Systems (KDSS)

Knowledge Engineering and Computing

The disciplines of Knowledge Engineering (KE) and Knowledge Management (KM) are closely tied. KE deals with the development of intelligent information systems in which knowledge and reasoning play a pivotal role. KM is a developed field at the intersection of computer science and management, which deals with knowledge as a key source in modern organizations. Figure 2. shows the the main areas of research of

knowledge computing from the AI perspective.

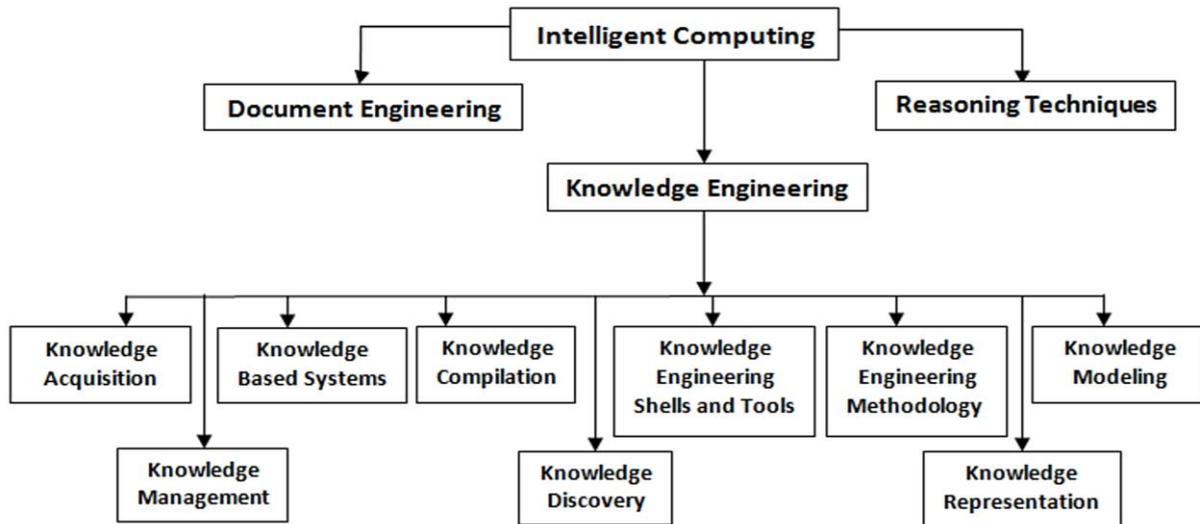

Figure 2. The Main Areas of Research of Knowledge Computing From the AI Perspective

Knowledge Based Decision Support systems (KDSS)

KDSS is a consultation intelligent system that contains a knowledge base (KB) and inference engine (IE). The KB contains static knowledge and experiences (heuristics knowledge) of many experts in a specific task. The most common KDSS is rule-based expert systems (RES) and case-based expert systems (CES). In RES the knowledge base stores the knowledge in the form of production rules. The IE contains a set of formal logic relationships which may or may not resemble the way that real human experts reach conclusions. CES uses a case-based reasoning methodology in which the system can reason from analogies from past cases.

On the other side, expert systems (ES) are a special type of knowledge-based system. It is a highly specialized piece of software that attempts to duplicate the function of an expert in some field of expertise. The ES acts as an intelligent consultant or advisor in the domain of interest, capturing the heuristic knowledge of one or more experts. Non-experts can then tap the ES to answer questions, solve problems, and make decisions in that domain.

Expert systems will make knowledge more widely available and will help overcome the age-old problem of translating knowledge into practical, useful results. And perhaps best of all, it is a new more way that technology is helping us get a handle on the information glut. All AI software is knowledge-based as it contains useful facts, data, and relationships that are applied to a problem. From the AI point of view, expert systems include the following topics; (a) Knowledge-representation techniques, (b) knowledge engineering tools and shells, (c) intelligent programming languages, (d) inference techniques (e) reasoning methodologies, (f) machine learning, and (g) user interface technologies.

General Methodology for Developing Web-based Ontology

Our methodology for developing the web-based ontology for any task in a specific domain can be summarized in the following steps:

Step 1: Organizing and scoping: Determining the objectives and defining the boundaries of the ontology.

Step 2: Data collection: the raw data needed for ontology development is acquired. In our applications, data was collected from AI, knowledge engineering, specific organizations, and books.

Step 3: Data analysis: the ontology is extracted from the results of data collection. This step includes the following tasks: (a) define the classes and class hierarchy, (b) define the properties of classes (slots), (c) define the facets of the slots (e.g., domain and range of a slot, cardinality, slot-value type), and (d) create individual instances of classes.

Step 4: Development of initial ontology: The preliminary ontology is developed (i.e., classes, relations, and properties). This process was done by using OWL-DL language using the Protégé-OWL editing environment (Protege is a free, open-source ontology editor that supports the latest OWL 2.0 standard. Protege has a pluggable architecture, and many plugins for different functionalities are available).

Step 5: Ontology refinement: The initial development is iteratively refined.

Step 6: Ontology validations: The process to determine whether a work product satisfies its requirements.

Web-based Ontology for Expert Systems

Expert systems were originally developed to solve ill-defined problems and well-defined problems that are not efficiently solved with algorithmic approaches. This technology provides innovative and robust techniques to capture and package knowledge. Its strength lies in its ability to be put to practical use when an expert is not available. This technology has proven to be especially effective when the task is in a rapidly changing environment. On the other side, ontology is the foundation of describing a domain of interest and it consists of a collection of terms organized in a hierarchical structure that shapes reality. The main objective of using ontologies is to share knowledge between computers or computers and humans. Most of the usages of ontologies in the field of artificial intelligence are related to knowledge-based systems and intelligent systems. These types of ontologies include a small number of concepts and their main objective is to facilitate reasoning tasks. This paper presents the development of a web-based ontology for expert systems technology. The developed ontology was encoded in OWL-DL format using the Protégé-OWL editing environment.

Web -based Ontology for E-business Technology

E-business or smart business is the integrated execution of all automated business processes of an enterprise using ICT and the use of the Internet of Things (IoT). E-business involves all aspects of business, which rely on the use of IT and networks. Comparing E-business and E-commerce, most authors emphasize that E-business is a somewhat broader concept. In addition to the buying and selling of products and services, E-business refers to servicing customers, electronically communicating, discovering information, collaborating with business partners, delivering e-learning, performing electronic transactions within an organization, e-government, social networks, and far more. Moreover, some researchers are ready “to use the broadest meaning of electronic commerce, which is equivalent to the broadest definition of E-business and these terms can be used interchangeably”. E-business links value chains across businesses involving new technologies in the value chain, reducing costs, and improving business efficiency.

The E-business is very complex and varied involving many activities, organizational units, and technologies. It includes many E-business applications. To perform these applications, organizations and companies need appropriate infrastructure and support areas. These support areas are the following: people, public policy, marketing and advertising, support services, and business partnerships. The new developments, maturation, and growth of E-business continue. One of the main prerequisites for this is the relentless evolution in technology and new commercial approaches, which exploit it. The latest trends in recent years in E-business are relevant to the growth of social media phenomenon and especially of social networks Facebook, Twitter, Google+, etc., and the use of mobile technologies and conducting E-business via mobile devices.

Our application presents the design and the development of five web-based ontologies for E-business technology, namely: (a) E-business applications; (b) E-business participants; (c) E-business infrastructure; (d) E-business support areas, and (e) Fields in E-business. The developed ontologies were encoded in the ontology web-based language OWL2 using the Protégé tool version 5.0.0 editing environment. Building ontologies is still a matter of craft skill rather than an understood engineering process. Some languages and tools have been created to support ontologies management. A semantic network refers to a graphic notation that enables the representation of knowledge in terms of interlinked nodes and arcs. It identifies the main objects and relationships between objects. The computerized implementations of semantic networks were first created to be applied in the AI and machine translation fields, but earlier versions have long been used in psychology, philosophy, and linguistics.

What distinguishes the semantic networks, they present a declarative graphic representation technique that can be used either to represent knowledge or to support automated systems for reasoning about knowledge. Figure 2 shows the proposed architectural diagram of the semantic net of E-business based on a comprehensive analysis of the literature published during the previous 10 years. In this net, there are five main super-classes namely (a) E-business applications; (b) E-business participants; (c) E-business infrastructure; (d) E-business support areas, and (e) Fields in E-business. Figure 2 shows the abstract view for the developed E-business ontology encoded in

OWL2 format using the Protégé tool Version 5.0.0 editing environment.

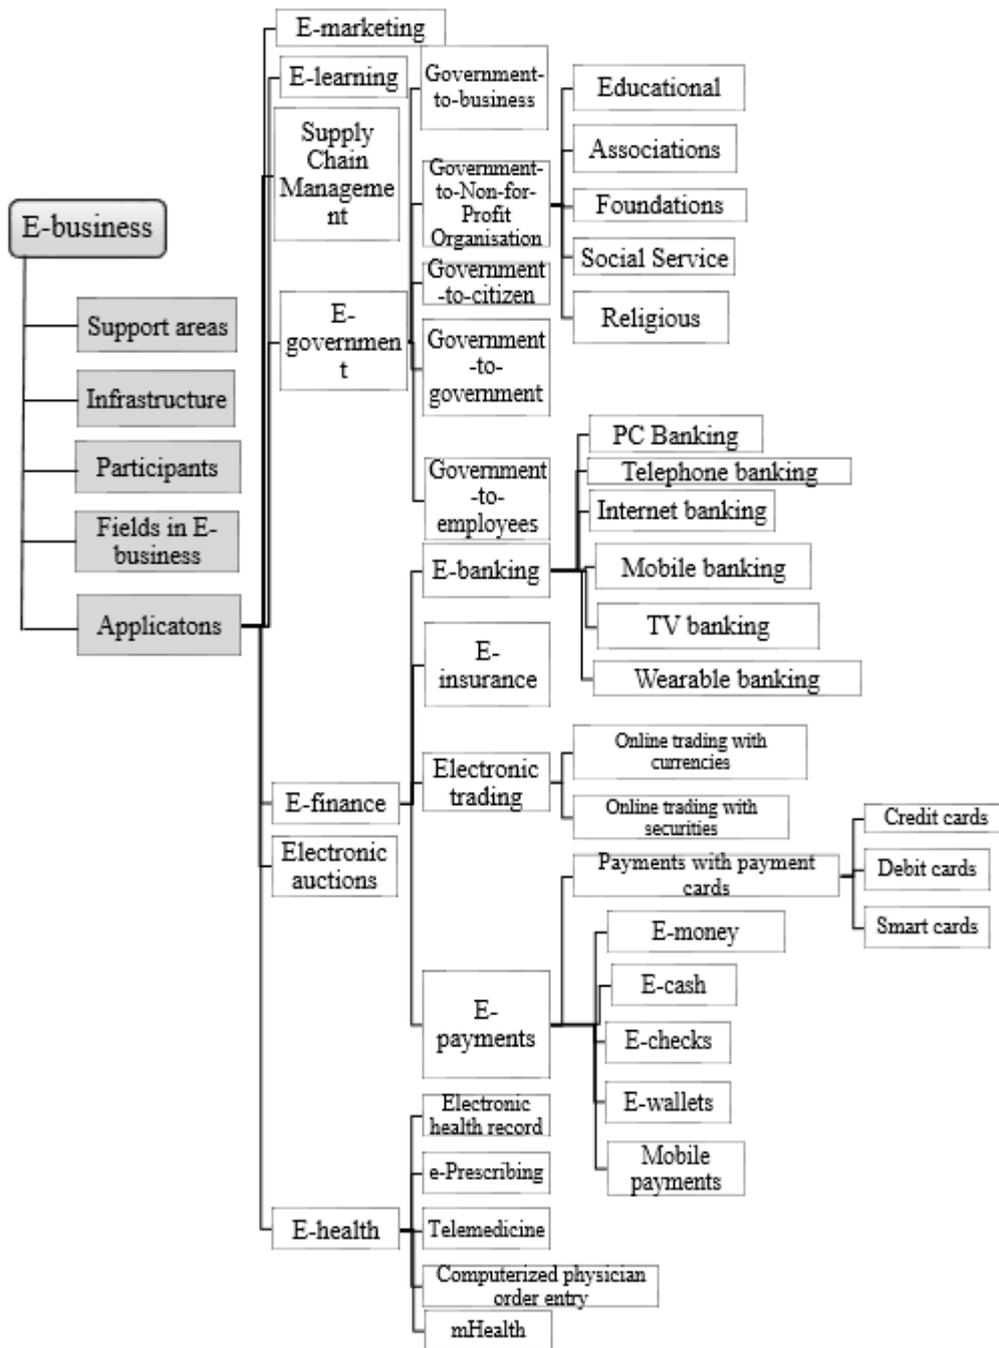

Figure 3. The Proposed Architectural Diagram of the Semantic Net of E-business

Web-based Ontology for Lung Cancer

Lung cancer, like all cancers, results from an abnormality in the cell, the body's basic unit of life. Fig 4 shows the initial ontology of Lung cancer encoded in OWL-DL format using the Protégé- OWL editing environment. In this ontology we have 4 main superclasses namely.

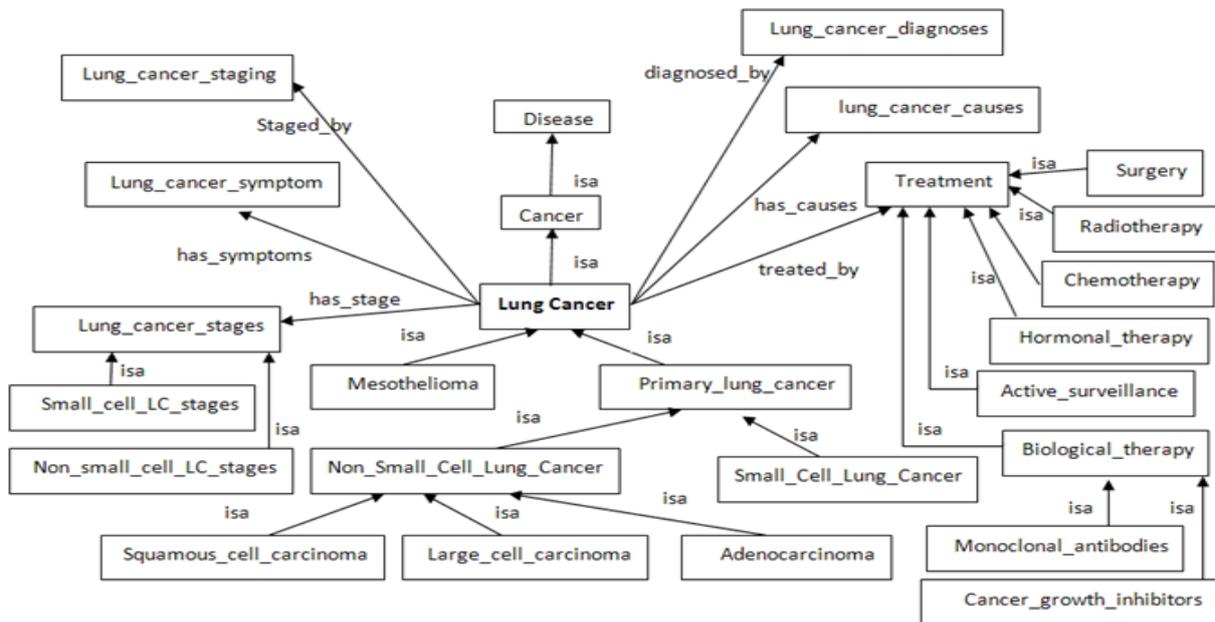

Figure 4. These semantic net knowledge representation of Lung Cancer.

People which have the subclasses; *male and female*.

Medical_Interventions which has subclasses: *Treatment, Staging, and Diagnosis*.

A disease that has subclass *cancer* which has subclass; *lung_cancers*.

Disease_attributes which has subclasses;

Causes, Disease_stage, Pathological_category, Staging_systems and Symptoms.

Web-based Ontology for the Education

In the educational domain, several ontologies have been developed. Ontologies have been developed to describe the learning contents of technical documents and formalize the semantics of learning objects; model the elements required for the design, analysis, and evaluation of the interaction between learners in computer-supported cooperative learning; and describe the learning design associated with a unit of learning in which the learning flow is explicitly declared. The field of education is now dominated by the use of quantitative, trend-identifying, predictive methodologies such as quantitative modeling, randomized control trials, surveys, brain imaging, and the like; and research funders are now specifying that these are the most appropriate methods to use. It needs to move from studying and understanding manifest phenomena to the structures that generate them since we are dealing with a stratified world. If the understanding of those manifest phenomena is misconceived, because, for example, the use of inappropriate methods, then our understanding of deeper lying structures, the actual and vertical relations, moments, and meeting points between these structures, and the many manifestations of agency that take place in the world, is likely to be limited (Lama, & Sánchez, 2009). The ontological perspective leads to raising the following questions: *What is the nature of learning? What happens and matters when it comes to education in current societies?*

What is key in the ontology of education is the human and natural world as it is and is becoming. Educational research is concerned with an ontology in motion—with transitions over time, which can be as small as learning a new word, as long and wide as the collective development of practices across generations, and as large as a global transition to online education due to the outbreak of a COVID 19 pandemic. These movements are defined, more specifically, by people acting from particular positions in the world (e.g., an institutional position as a student or teacher) with certain purposes defined by themselves (e.g., as students wanting to become a doctor) and for them (e.g., by educational standards) with emergent potential in the future (Akkerman, et al., 2021).

Today much is being done to promote competency-based education therefore one of the goals is to develop a competency ontology for the semantic web to be used as a shared reference in the description of competencies and competency profiles. Competency-based education, as well as competency-based knowledge management in organizations, both require a competency profile grouping related competencies in a structured way. Competency is a central concept for human resource management, training, and education. We define competency as the capacity of a person to display a generic skill with a certain level of performance when applied to one or more knowledge entities. Competencies, and competency referential grouping competencies, are essential elements for user models, e-Portfolios, adaptive learning, and personalization in Technology-based learning. Several competency definitions and competency profiles have been proposed in the last 15 years for specific knowledge domains. In most of the implementations we have consulted, competency is expressed as a simple natural language sentence, which is inherently informal and ambiguous. Competency profiles are a collection of these sentences, where semantic relations such as prerequisite relations are not explicit and any two competencies are difficult to compare. To be used in software environments for education or knowledge management, competency and competency profiles must be instances of a formal model that can be managed computationally.

- First, it must be generic to be specialized for any competency profile or model, and in any subject or knowledge domain.
- Second, it should be flexible in its use, meaning it can encompass a large variety of educational or knowledge management applications where competencies associated with persons and resources can be expressed, compared, and assessed.
- Third, it should take into account and have connections with the growing number of educational vocabularies and ontologies that populate the web of linked open data.

Competency can be related to another one by a subsumes (S) property declared as a sub-property of a SKOS broader transitive property, thus gaining a precise meaning defined in the W3C SKOS reference document. Also, a domain ontology is defined as a SKOS concept scheme designed to represent Resource Description Framework Schema (RDFS) or OWL ontologies as well as less elaborated knowledge schemes such as thesauri or taxonomies, thus adding flexibility to the notion of a “domain ontology”. The Skill’s taxonomy and performance Classes are both defined here as SKOS:OrderedCollections, also defined precisely in the SKOS definition document.

The next Stage1 —core competency model

The Core COMP2 model offers a structural description of competencies to be used in any educational application. We have maintained the COMP1 method to decompose a natural language competency statement into three structural parts: skill, knowledge, and performance. The generic skill and knowledge parts of a competency are both mandatory while the use of performance indicators is optional, but adds precision to a skill. The central Competency class shown in Fig.5 includes the mandatory properties in the Rteearch Core Dataset (RCD) information model: competency title and identifier related to a catalog term and an entry in this catalog.

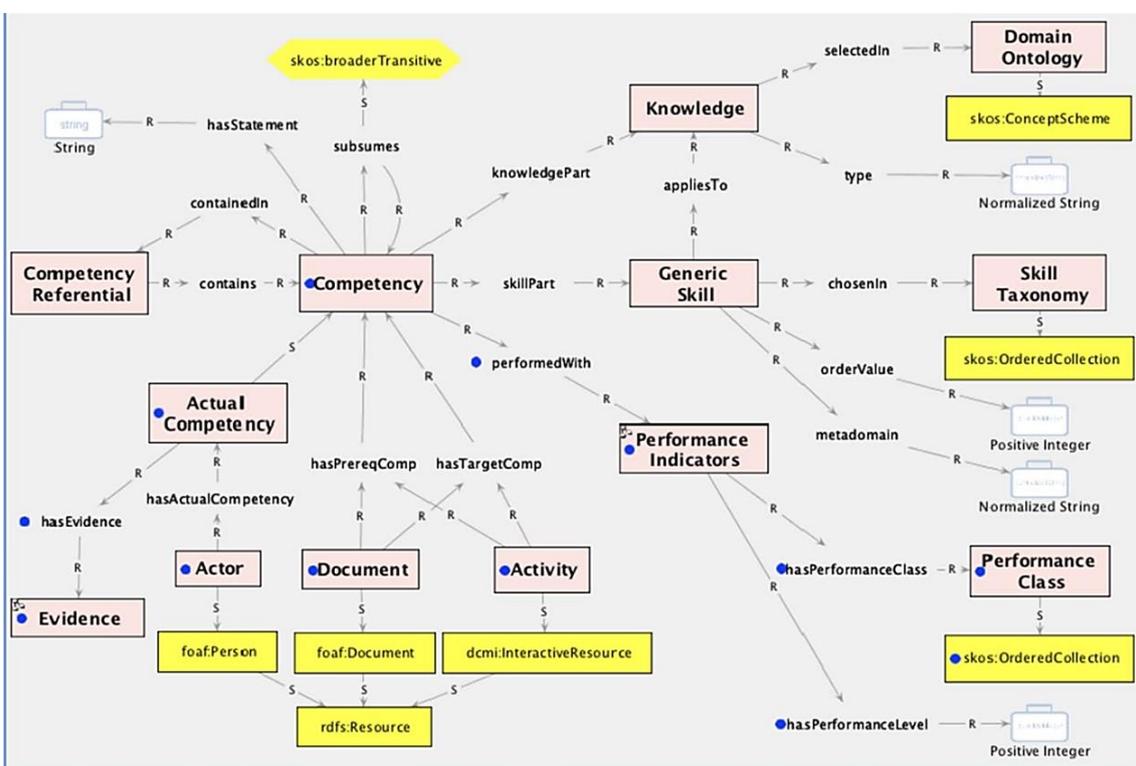

Figure 5. RDFS Model for the COMP1 Ontology

Stage 2—extension to competency performance and proficiency levels

The stage 2 extension adds (as a sub-model of stage 1) the classes and properties that are needed to define a proficiency level and a performance class. These concepts are based on five performance indicators: Frequency, Scope, Autonomy, Complexity, and Contextvariety.

Stage 3—extension to competency referencing of actors, activities, and resources

Stage 3 adds to the stage 1 model, independently of stage 2, the possibility to associate Competencies with Resources or Activities. A prerequisite competency property means that someone should have this competency

to use the resource or engage in the activity. A target competency means that someone who has built or used such a resource or achieved such activity has demonstrated the corresponding target competency. The resource or the activity can then serve as Evidence that an Assessed Actor now owns an Actual Competency.

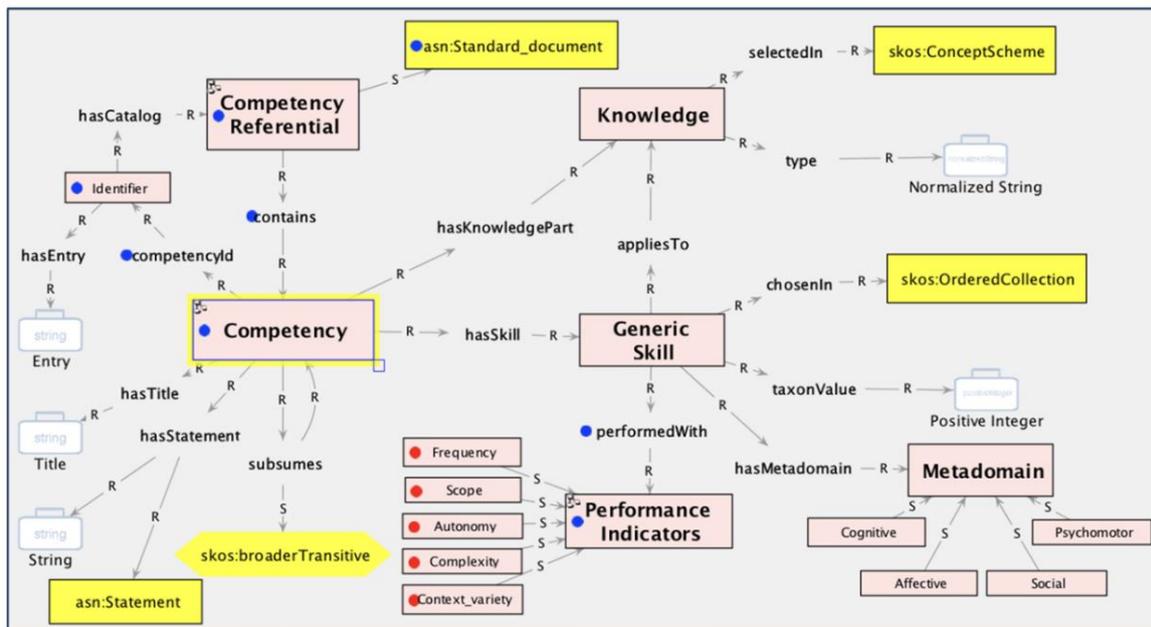

Figure 6: The Core COMP2 Competency Model

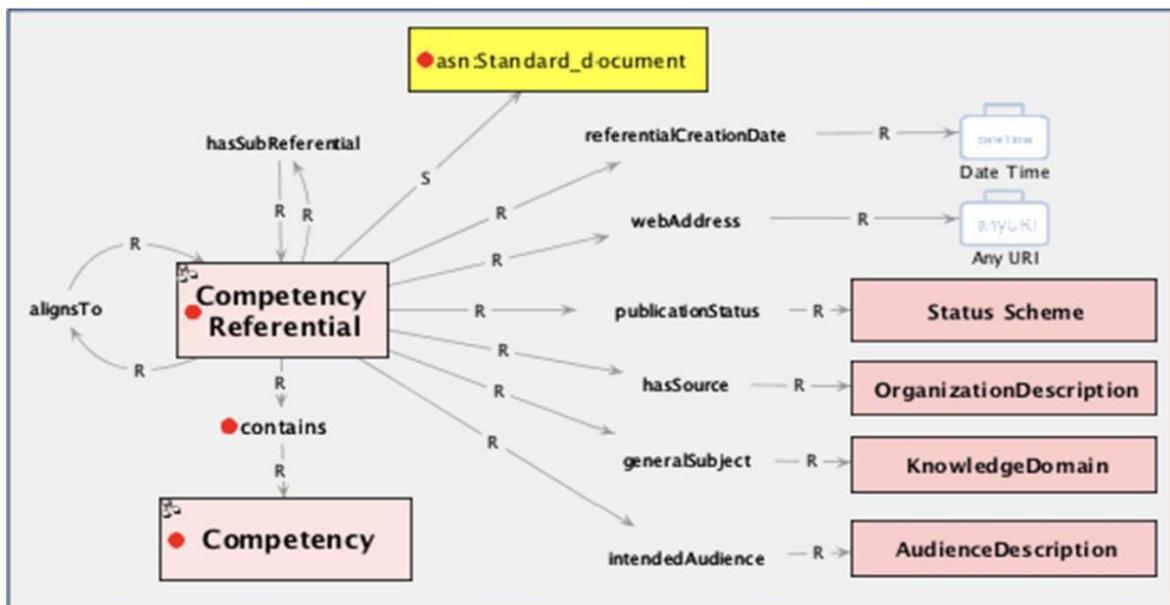

Figure 7. Competency Referential Information Sub-mode

Stage 4—extension to evidence records and portfolios

The stage 4 extension of the COMP2 ontology is centered on the Evidence class. Evidence owned by an

Assessed actor is grouped in Evidence Records that testify of the acquisition of an actual competency by this actor.

Stage 5—extension to contextual provenance information

Here is the last extension for the contextual provenance information of a competency referential, to compare and align competencies from different sources. As shown in Fig.6,a Competency Referential, that contains one or more competencies, can be subdivided into a tree of modules or competency sections by the `hasSubReferential` property. It can also be associated with another competency referential by an `aligned` property.

Specifying a competency referential

The general process for competency-based personalization of learning environments is schematized in Fig. 7. The role of the COMP2 ontology is to provide a generic schema that serves to define a particular competency referential for a learning environment or a work process. Competency referential is built by a process that starts with the COMP2 ontology model that structures the concepts, properties, and individuals in the subject domain of the learning environment.

In all fields of education and human resource management, competency definitions play essential roles. They provide clear objectives for learning or knowledge-based work processes. They help focus on the right knowledge to consider and the right strategies to employ. They are essential pieces of user models and e-portfolios showing evidence of competency acquisition. They provide a basis to evaluate a person's performance and personalize learning or working activities. Within competency management processes, some tasks can be performed by computer programs and others by human tutors or managers.

The principle of generativity means responsivity to what future is in the making, in the sense of care about what is given life and put into the world with the potential to develop further, although in unpredictable ways. The value of generativity, with responsivity and care for the future, has been stressed in other domains, including in social discourse, psychosocial development, and social change. In the context of educational research, it is about responsivity to what possibilities and impossibilities in positions, purposes, and emergent potential are (re)produced by and for people, including what sorts of interpretations and conditions scientific work coproduces along the way.

Ontologically then, generativity moves beyond determining the effects of targeted processes of learning. It includes care about what significance learning has for people's further lives while unfolding. When it comes to studying education and learning settings, generativity reflects even wider care about the significance of potentially lasting structures for current and next generations.

Discussion

Ontologies were developed in intelligent learning systems to facilitate knowledge sharing, refining, search, and reuse. These ontologies may be used as an assessment procedure. For example and from the educational point of view, candidates show their knowledge and understanding while creating ontologies. Knowledge entities that represent static knowledge of the domain are stored in the hierarchical order in the knowledge repository and can be reused by other candidates. At the same time, those knowledge entities can be also reused in the description of the properties or arguments of methods of another knowledge entity. Moreover, the ontology approach enables solving the complexity and the incertitude of the instructional systems. An intelligent learning system based on a multi-agent approach consists of a set of intelligent agents, which have to communicate. They collaborate through messages. Software agents can understand and interpret the messages due to a common ontology or the interoperability of private ontologies. In this work, the developed ontologies could be useful for researchers and specialists working for start-up organizations who need the knowledge to be represented in a semantic way that allows reasoning capabilities. On the other side and from the technical point of view, building ontologies is still a matter of craft skill rather than an understood engineering process. Some languages and tools have been developed to support ontologies management. Ontological web-based language, OWL, is the appropriate ontology implementation language as it is highly expressive, scalable, and possesses powerful inference capabilities.

Conclusion

The ontological engineering paradigm is an effective methodology to manage and represent knowledge. Ontologies are now ubiquitous in many information-systems enterprises. They constitute the backbone of the Semantic Web as well as they are used in all e-activities and applications. Furthermore, the ontology approach enables us to solve the incertitude and complexity of the instructional systems. Ontological web-based language, OWL, is the appropriate ontology implementation language as it is highly expressive, scalable, and possesses powerful inference capabilities. Our approach in this study demonstrates that the ontology development process needs some innovative efforts of meta-concepts definition that helps to name the groups and structure the chaos. Our future work will be related to research in the field of social business, social commerce, and social networks based on their phenomenal growth and prospects of increasing importance, as well as developing web-based ontologies for them.

Abstract: Food loss and waste is generated throughout the stages of the food supply chain – production, post-harvest & storage, processing & packaging, distribution & marketing, and consumption. Every year, the amount of food waste generated increases significantly, resulting in economic, environmental, and social losses. Indonesia is one of the countries that has committed to reducing half of the current amount of food waste through the Sustainable Development Goals 2030 agreement. To support this commitment, a policy that is comprehensive and integrated is needed to reduce the amount of food waste. This work aims to examine the dynamic relationships in food supply chain systems that produce food loss and waste. This study provides appropriate policy recommendations for reducing food loss and waste in Indonesia. This study uses a causal loop analysis to see the feedback relationship of the variables in the food supply chain system that results in food loss and waste. The result shows that two policies can be used to reduce food loss and waste: investment in infrastructure and technology and implementation of waste management.

Keywords: Food Loss, Food Waste, Food Supply Chain, Sustainability, Indonesia

Introduction

Food loss and waste are the food waste generation throughout the supply chain. Food loss refers to waste during production, post-harvest, storage, processing, and packaging. Meanwhile, food waste refers to waste that occurs during distribution, marketing, and consumption (Bappenas, 2021). This waste is also seen as a form of inefficiency in the operation of the food supply chain (Aramyan et al., 2021). According to the Food and Agriculture Organization's (FAO) report in 2011, the global food waste generated was 1.3 billion tons per year, equivalent to one-third of the total food produced. The amount of food waste will continue to increase every year, considering the growing human population, which increases the demand for food production (FAO, 2011).

Food loss and waste are global issues because the waste generated is a significant global problem due to ethical, environmental, and economic reasons, and it is difficult to manage because of its low visibility (Derqui et al., 2018). Food loss and waste is also a problem that has a negative impact on the environment. The amount of carbon emissions generated contributes to the world's third-largest carbon emissions after the United States and China, amounting to 3.6 GtCO₂ per year (FAO, 2015). Food loss and waste not only have environmental impacts but also cause economic losses due to the reduction of food value. Globally, the total losses generated by food loss and waste amount to \$936 billion, equivalent to the GDP of countries such as Indonesia or the Netherlands (FAO, 2015).

Indonesia, as the world's fourth most populated country, also faces a problem of food waste. With a continuously growing population, Indonesia has the potential to generate a significant amount of food loss and waste, which will only continue to increase. According to a report from the Ministry of Environment and Forestry in 2020, Indonesia has produced 40% of food waste out of the total waste generated (KLHK, 2020). Based on the food loss and waste study released by the Ministry of National Development Planning in 2021, the total food waste generated in Indonesia from 2000 to 2019 was between 23-48 million tons per year, or equivalent to 115-184 kg/capita/year (Bappenas, 2021). The increasing amount of food loss and waste in Indonesia supports the government's involvement in forming policy interventions to reduce food loss and waste. In 2015, Indonesia committed to supporting the Sustainable Development Goals (SDGs) agenda for 2030. One of Indonesia's goals is SDG 12, which focuses on responsible consumption and production. SDG 12.3 aims to "halve per capita global food waste at the retail and consumer levels and reduce food losses along production and supply chains, including post-harvest losses, by 2030" (Bappenas, 2021). To achieve integrated food loss and waste management, the Indonesian government has integrated food loss and waste management into the National Development Plan and Medium-Term Development Plan (RPJMN) 2020-2024, with one of the priority programs being the National Priority Program (PN) 6, which aims to build a sustainable environment, improve disaster resilience, and address climate change. Therefore, in 2021, through a food loss and waste report formed by Bappenas, Indonesia released a study on recommendations and strategies to support the reduction of food loss and waste in Indonesia. The five policy directions recommended for food loss and waste management include behavior change, improving food system support, strengthening regulation and optimizing funding, utilizing food loss and waste, and developing studies and data on food loss and waste.

Food waste is a national issue, so comprehensive and integrated management and handling are needed from upstream to downstream. The five policy directions recommended by Bappenas are the initial steps in a long journey toward implementing strategies and policies for food loss and waste management in Indonesia. There are no official government regulations specifically governing food waste management in Indonesia. Based on the 2018 Food Sustainability Index for middle-income countries, Indonesia ranks 53 out of 67 for sustainable food waste management. This index indicates that policies and food waste management in Indonesia are needed to make significant changes in terms of environmental and economic impact. Comprehensive and integrated waste management can provide economic, social, and environmental benefits and help change people's behavior to increase awareness of the importance of food waste management. Effective and efficient waste management

requires efforts to address food waste that requires legal certainty, clear responsibilities, community roles, government and local government authority, and the role of food businesses. Legal certainty ensures that public policies made by the government contain legal certainty accompanied by sanctions and wiser waste management rules. Therefore, as a country with the potential to produce more waste, Indonesia needs collective and multi-sectoral collaboration policies and strategies to work together for better and sustainable food loss and waste management. Multi-actors involved in food loss and waste management are government ministries and agencies, workers in the food sector, industry and small and medium-sized enterprises, communities (as consumers), academics, development partners, and the media.

Literature Review

According to literature studies, many countries are starting to realize the importance of specific policies for reducing food loss and waste in their respective countries. The United States is one of the countries that has implemented policies to reduce food waste through improving its citizens' behavior. Based on the "Food Recovery Hierarchy," the United States prioritizes food waste reduction at the top of the hierarchy and avoids landfilling as much as possible (Lozano et al., 2014). Singapore has also launched a pilot project to recycle food waste into compost and energy since 2010.

Over the past 30 years, 95% of research investments have been reported to focus on increasing food production, while only 5% have been directed towards reducing food waste, despite the high potential for reducing food waste to provide more food in the future. Several studies have researched ways to reduce the amount of food waste generated. Lozano created a hierarchy for food waste reduction that starts with prevention, reuse, recycling, recovery, and direct disposal (Lozano et al., 2014). Chalak suggested that reducing food loss and waste should be designed with non-binding action paths by both government and non-government, fiscal and economic enforcement regulations to increase decision-makers awareness, setting targets to reduce waste by a certain time, and creating and monitoring strategies to reduce food loss and waste (Chalak et al., 2018). Reducing food loss and waste is also done by using recycling methods or using natural biodegradable materials. Ng & Tay utilized China's government program to use Organic Waste Treatment Facility (OWTF) and implement a waste tariff payment based on volume to reduce food waste by 40% in China by 2022 (Ng & Tay, 2019). In addition, food waste in Cambodia is processed using four food waste management methods: turning food waste into compost, using natural decomposers, using anaerobic digestion, and using landfill (Chinda, 2022).

Babalola (2019) suggested strengthening existing government regulations and applying costs to food waste incineration activities to maximize the potential for processing the food waste and biodegradable materials in Japan (Babalola, 2019). In the United States, Chen & Chen (2018) implemented food donation activities, feeding animals, and using food waste as compost to reduce food loss and waste (Chen & Chen, 2018). In Australia, Verghese et al. (2015) improved product packaging and involved technological innovation in packaging production to reduce food loss and waste in the packaging aspect of products (Verghese et al., 2015).

Additionally, during the Post-Harvest Losses phase in Mozambique, Popat et al. (2022) recommended reducing food loss and waste by increasing the production of corn, reducing the use of water resources, increasing transportation efficiency, and increasing accessibility to private storage (Popat et al., 2022).

Overall, this study aims to develop a dynamic model for reducing the amount of food loss and waste using a system dynamically. The study aims to analyze the interconnectivity of various factors involved in the food supply chain that generates food loss and waste and apply intervention strategies scenarios to the food supply chain to reduce the amount of food loss and waste. The scenario strategies implemented can assist stakeholders in making more targeted policies for reducing food loss and waste from the upstream to the downstream food supply chain.

Method

The study focuses on the initial stage of the System Dynamics approach, which involves the conceptualization of the model by using Causal Loop Diagrams. Model conceptualization is translated into a system diagram to illustrate the model development. System diagram is a tool to describe the conceptual model formed from existing problems. The system diagram consists of a causal loop diagram, problem owners, related stakeholders, model objectives, policy interventions, model inputs, and output model results.

The causal loop diagram (CLD) is a tool to describe a system's structure and represent how a system works (Sterman, 2000). Causal loop diagrams have variables connected to each other by causal links and are indicated by arrows, and arrows can be understood as causal influences. The arrows are given positive (+) and negative (-) signs, which indicate the relationship between one variable and another. Variables that have been connected to each other will form a feedback loop, where several series of loops that are put together can create a coherent description of a particular problem (Kim, 1994). Each relationship is marked with causal polarity, either positive (+) or negative (-), to show how the dependent variable changes when the independent variable changes. The loop in the causal diagram indicates whether the rotation in the loop is positive feedback (reinforcing loop) or negative feedback (balancing loop).

Results

The development of the food loss and waste model is described in the conceptualization model, which is translated into the system diagram shown in Figure 1. The problem owner of this research is the Ministry of Environment and Forestry. The main goal of its problem is to reduce food loss and waste in Indonesia based on the output data generated from the model. The output that has resulted from the model are total food loss and waste, total recycled food waste, and total CO₂ gas emissions. The output is issued from the simulation results of two policy interventions: investment in infrastructure and technology and implementation of waste management policies. This intervention will affect the inputs in the model, namely Indonesia's population, food

demand, resource supply, population growth rate, food loss and waste factor, and the emission rate produced. Input will be run in the model structure, described using a causal loop diagram. The causal loop diagram was made based on reference models used from several kinds of literature, namely the food supply chain model (Balkan et al., 2021), the waste management model (Babalola, 2019), and the regulatory and education model for food waste (Ng & Tay, 2019). The causal loop diagram consists of 8 balancing loops and three reinforcing loops, resulting in three submodels: food supply chain modules, food loss and waste modules, and waste management modules.

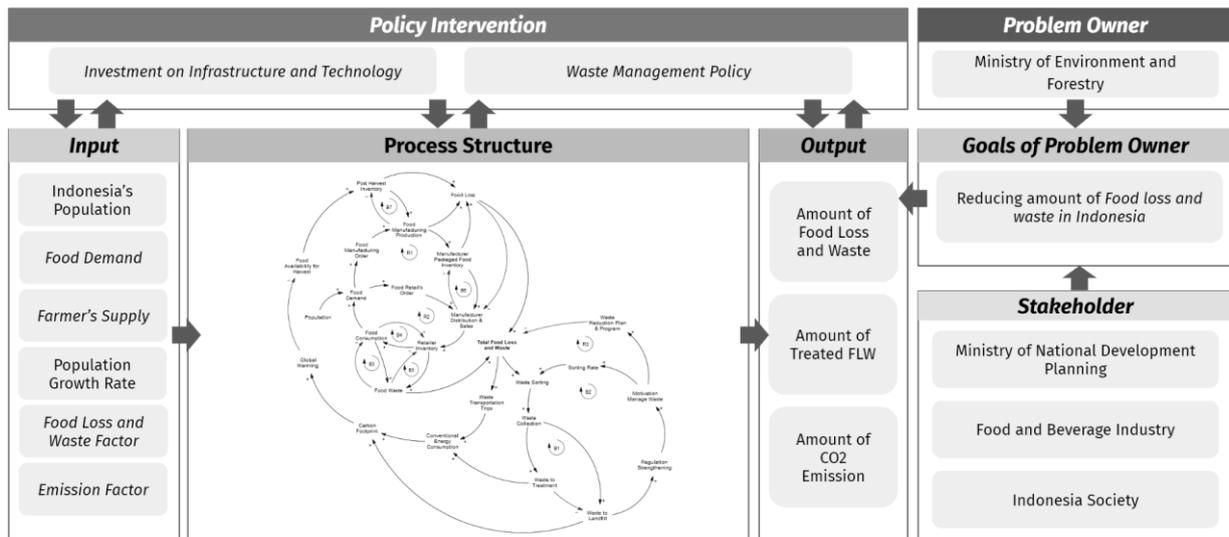

Figure 1. System Diagrams

Food Supply Chain Modules

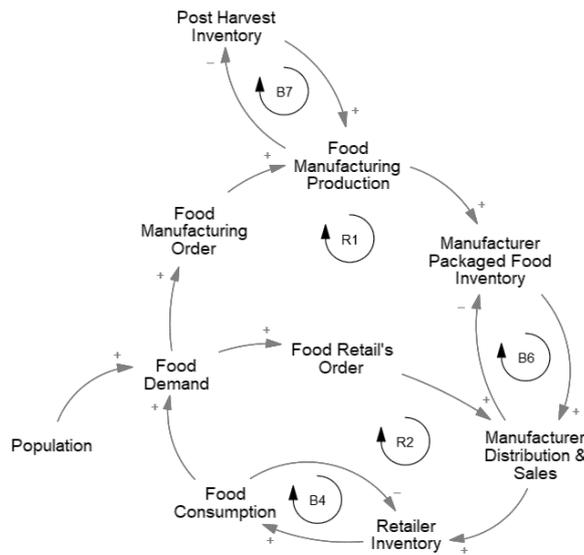

Figure 2. Food Supply Chain Modules

The Food Supply Chain is the basic system that influences the emergence of food loss and waste. This submodel

is influenced by the total population, which also influences the amount of food demand. Food demand will affect the flow of material orders and information in the food supply chain system from upstream to downstream. The food supply chain system is formed based on the real-world system of the forward supply chain, which has a feedback loop from variable demand to order flow in the supply chain. This submodel consists of R1, R2, B4, B6, and B7 that shown in Figure 2.

Food Loss and Waste Modules

Sources of food loss and waste come from the production and storage of food in the stages of the food supply chain. Food loss is generated from post-harvest inventory, food manufacturing production, and manufacturer-packaged food inventory. Food loss also affects the availability of the number of food products that will be ready to be sent to distributors and sales markets (Manufacturer Distribution & Sales). Meanwhile, food waste is generated by retailer inventory and food consumption. Total food loss and waste are obtained from the sum of the total food loss and food waste that arise along the food supply chain. The feedback loop in this submodel is the amount of waste that affects the availability of food in retail stores and the amount consumed by consumers. This submodel is shown in Figure 3.

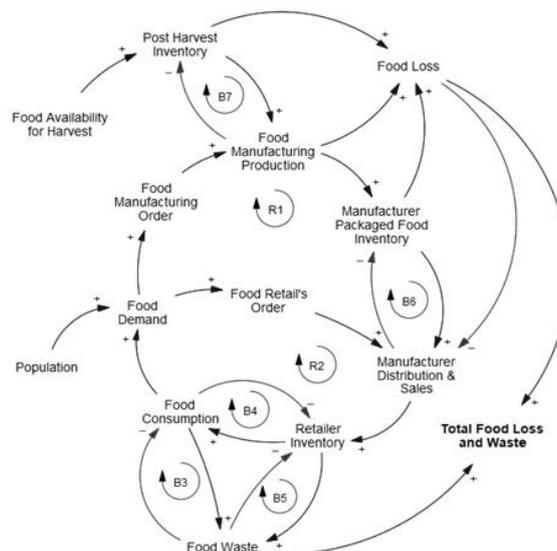

Figure 3. Food Loss and Waste Modules

Waste Management Modules

All waste has the opportunity to be processed first before being disposed of directly in public landfills. Food loss and waste is food waste that can be sorted and collected before finally being treated or handling the waste. Waste handling can be in the form of incineration or burning, composting, and biodigester implementation. The rest of the food waste processing will be disposed of directly in the general waste bin or landfill. The amount of waste in landfills will trigger increased regulation to increase motivation for waste management and also increase the emergence of planning and education programs to support food waste reduction. This submodel is shown in Figure 4.

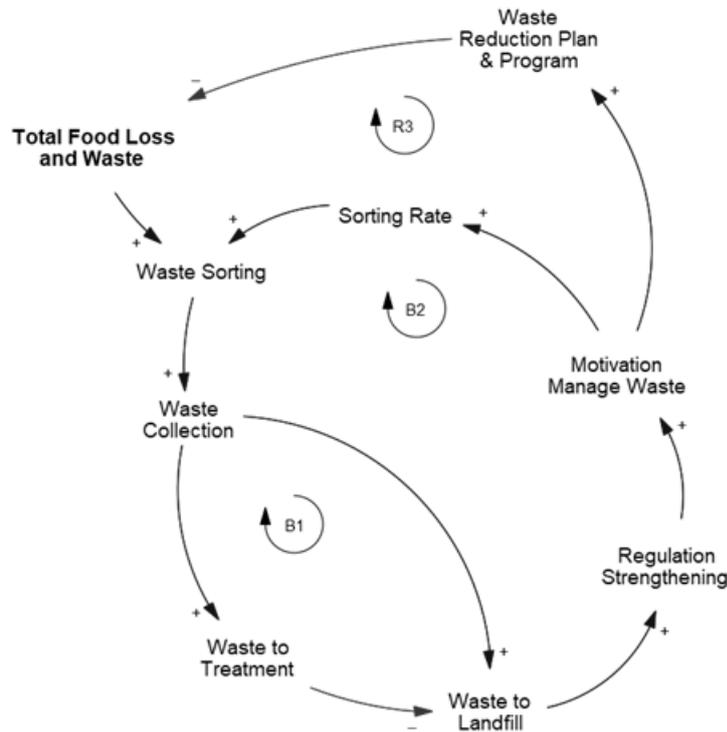

Figure 4. Waste Management Modules

Discussion

Based on the causal loop diagram, There are eight balancing loops and three reinforcing loops which are formed from variables that are connected to each other. The model aims to reduce the number of food loss and waste in Indonesia. Several policy recommendations are needed to be implemented. Two policy recommendations can be implemented to reduce food loss and waste: an investment in technology and infrastructure and the implementation of waste management.

Investment in Technology and Infrastructure

One of the policy recommendations that can be a solution for reducing food loss is optimizing investment funding to improve infrastructure and logistics. Infrastructure is an important aspect because it is one of the basic needs to support better food delivery and processing processes. Infrastructure improvements will support better logistics distribution of food, such as improving roads, providing appropriate long-distance transport, standardized storage, and refrigeration to preserve food. Infrastructure improvements can also be supported with the help of technology implementation for producers when harvesting and handling harvested products. Proper harvesting techniques will slow down the shelf life of food that will run out. The policy of optimizing funding for infrastructure and logistics is expected to be able to prevent food expiration dates so that the consumption period and form of food will last a long time to be deemed fit for consumption.

Waste Management Policy

Waste management policies, especially food waste, must be emphasized to all stakeholders within the scope of the food supply chain. Waste management can be implemented using the food recovery hierarchy released by the United States Environmental Protection Agency (EPA), which reduces the source of food surplus, donating excess food, feeding animals, composting, and landfills (Lozano et al., 2014). Waste management is one way to deal with the amount of food loss and waste before it is finally disposed to public trash. Waste management does not directly reduce the amount of waste generated in the food supply chain. Still, on the other hand, waste management can reduce the amount of food waste in landfills and reduce the environmental impact of food loss and waste on greenhouse gas emissions.

Conclusion

This study aims to develop a model conceptualization that illustrates food loss and waste that resulted from inefficient food supply chains in Indonesia. The amount of food loss and waste will always increase as long as humans still need food and produce food, so the policy is needed to be implemented to reduce the number of food loss and waste, especially in Indonesia. Food demand and population variables are the variables that most determine the amount of food loss and waste. This study conducts a results causal loop diagram consisting of three modules: the food supply chain, food loss and waste, and waste management modules. Food loss and waste are unavoidable, but the amount can be reduced by implementing several initiatives, such as investment in technology and infrastructure and applying the principles of waste management.

Recommendations

The model can be a pioneering reference for the next research study. Further study should be able to construct an extension model by making a stock and flow diagram that developed from a causal loop diagram. The stock and flow diagram will make specific quantitative and qualitative results while exploring the policies. Validation and simulations will be conducted to allow for quantitative analysis of the model.

Abstract: In this work chemical bath deposition (CBD) was used to prepare PbS thin films. These latter were grown on ordinary glass substrates. The precursor aqueous bath contained 1mole of lead acetate, 1mole of Thiourea and complexing agents (triethanolamine (TEA) and NaOH). Bath temperature and deposition time were fixed at 60°C and 3 hours, respectively. However, small rate (2%) of doping has been added in the reactive bath: Au nanoparticles, copper and zinc. A co-doping has also been realized by adding the same rate of Au nanoparticles and Zn simultaneously. Structural properties of the undoped deposited films were characterized by X-ray diffraction. The PbS crystal structure was confirmed. Optical studies showed that films thickness was strongly affected by doping nature, it varied between 380 nm for PbS: Cu films and 840 nm for PbS: Au films. The behavior of films growth has been studied. Energy band gap values have been calculated and found to take value in the range 0.67 - 1.46 eV. The used doping elements were revealed to enlarge the optical band gap and increase the disorder Eu. The properties of PbS make this material an excellent candidate in several fields as solar energy conversion near the infrared ray or IR detection.

Keywords: Pbs, Thin Films, Doping, X-Ray Diffraction, AFM, UV-Visible.

Introduction

Recently, thin films experienced a growing interest on the part of researchers. A particular craze was generated

by doping them using various elements according to the referred implementation. Ternary compounds thin films materials are attracting due to their potential applications in optoelectronics, gas and humidity sensors, solar control coatings, photo-electrochemical solar cells and many other fields (Nayak, et al., 1985), (Nadir, a tal., 2012). Lead sulfide (PbS) is an interesting semiconductor(Chattarki, et al., 2012), (Thiagarajan, et al., 2012).

. It is belonging to IV-VI group with a narrow band gap (0.41eV) and a large exciton Bohr radius of 18 nm (Rempel, 2007), (Obaid, et al., 2012). Thin material is used in infrared optics as a material for temperature sensors and photo-detectors (Rempel, 2007), (Bauer & Clemens, 1990). The influence on doping concentration on PbS films properties has been investigated by several workers (Bushan, et al., 2002), (Maskaeva, at.al., 2003). Kumar et al. 2014 recently reported that crystallite sizes determined by XRD have been enlarged with increasing Sb doping concentration in PbS. Thangavel et al. 2012 studied band gap of PbS films behavior as function of Cd doping rate. Band gap energy as high as 2.61 (2.66) eV is achieved by annealing and the addition of Cd element into PbS films. Doping represents an excellent way to widen the gap by replacing Pb with less heavy chemical elements. A judicious choice of the doping ion can enhance the electrical properties of PbS to be useful in photovoltaic applications. Depositions of ternary thin films have been demonstrated by a variety of techniques, including chemical bath deposition (CBD) (Gadave, et al., 1994), successive ionic layer adsorption and reaction (Puiso, et al., 2003) and sol-gel methods (Ray, et al., 1998). A lot of doping have been tested on thin films : conductive nanoparticles such as gold (Au) nanoparticles to dope silica glass intended to the manufacture of optical fibers(Le Rouge, 2013). Zn and Al doping effect on PbS thin films properties has been studied by B. Touati et al. 2015 and K.C Preetha et al. 2012, respectively. In this work, various impurities have been added in different PbS thin films deposited by CBD: Au nanoparticles, Cu and Zn. The main goal of the present work deals with the investigation of various doping effects on optical PbS thin films properties.

Experiment Details

Ordinary glass slides were used as substrates. They were washed with distilled water, immersed in methanol, cleaned ultrasonically for 20 min and dried in air, successively.

The deposition was done in a reactive bath prepared in a beaker. The bath was composed of distilled water as a solvent, sulfur and lead precursors, 1M of thiourea [CH_3CSNH_2] and 0.1M of lead acetate [$\text{Pb}(\text{CH}_3\text{COO})_2$]. Triethanolamine (TEA) [$\text{N}(\text{CH}_2\text{CH}_2\text{OH})_3$] was added as buffer solution to control the rate reaction and sodium hydroxide NaOH to fixe pH at 12.5. For the first part of this work, small rates (about 2 ml) of Au nanoparticles (colloidal gold), Cu (CuCl_2) and zinc ($\text{Zn}(\text{CH}_3\text{COO})_2 \cdot 2\text{H}_2\text{O}$) were added in different beakers keeping another bath undoped as reference. The second part consists in co-doping PbS thin films with Zn and Au nanoparticles by adding a same volume of colloidal gold and zinc acetate simultaneously.

Cleaned substrates were vertically dipped in the heated solutions by external hot plate set at 60°C for 3hours. After the deposition elapsed time, the synthesized samples (PbS: $x=0$, Au, Cu, Zn, Zn-Au) were removed from the bath and rinsed with distilled water. Films with mirror-like gray aspect were characterized by X-ray

diffraction using a X'PERT PRO diffractometer with $\text{CuK}\alpha$ radiation ($\lambda_{\text{CuK}\alpha} = 1.54\text{\AA}$). The optical transmission of the PbS films were carried out by a double-beam spectrophotometer system (*SHIMADZU 3100S*) in the wavelength range 190-3000 nm. A non-contact profilometer (*AltiSurf500*) was used for the films thicknesses measurements. Electrical measurements were carried out using two-probes method with the aid of a *Keithley 2000 multimeter*.

Results and Discussion

Part 1

Observed with the naked eye, all PbS deposited films present a high reflectivity. They are smooth and blackish gray. The variation in the thickness of PbS layers with different doping is shown in Table I. The increase in the number of ions in the bath, due to doping, reduced mobility in the solution for lack of space, which indicates a slowdown in the deposition on the substrate (Kumar, et al., 2014) (Das, et al., 2012). We conclude decreased growth rates regardless of the doping atoms. This effect is expressed in terms of thickness reduction for doping zinc or copper. For the doping with au nanoparticles, the slowdown of the growth rate is probably offset by the large size of doping element which slightly increases the thickness of the film (Gültekin, et al., 2014). Doping with Al with substantial quantities also increases the thickness of PbS film (Preetha, 2014).

Structural Properties

Figure 1 represents X-ray diffraction spectra of undoped and doped PbS thin films with the different elements: Au Np's, Cu and Zn. The spectra shows diffraction peaks at different 2θ angles assigned to the (111), (200), (220), (311), (222), (400) and (331) planes indicating the formation of PbS phase for all films. It can be seen the whole peaks intensities of PbS films are affected by doping; they decrease for Au Np's doping and increase for those with Zn and Cu. An appearance of a bump for the respective XRD spectra of the PbS: Cu and PbS: Zn films can be observed.

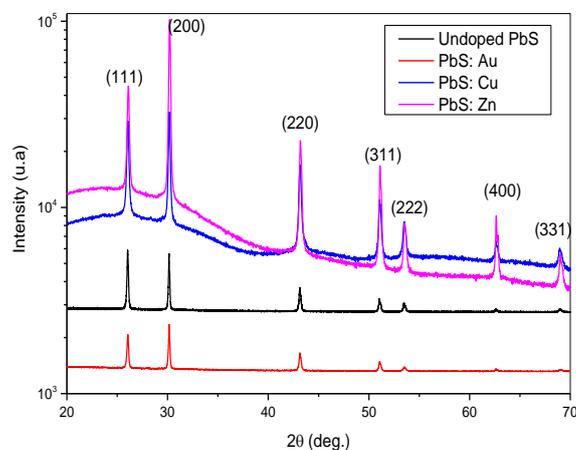

Fig.1. XRD patterns of PbS thin films, pur and with several doping (Cu, Zn and Au Np's).

This is generally indicative of the occurrence of an amorphous phase in the film but can also be due to the diffraction of the glass substrate (amorphous) caused by the thinness of the two films PbS: Cu and Cu: Zn (table I).

Table I. Optical properties of PbS films with several doping.

Samples	PbS	PbS: Au	PbS: Zn	PbS: Cu
Thickness (nm)	460	500	300	250
E_u (eV)	0.27	0.30	0.37	0.41
E_g (eV)	0.64	0.71	1.46	1.27

However, we notice the absence of peaks indicating the presence of Au, Cu and Zn in doped PbS films. This absence is probably due to the uniform dispersion of dopants in the PbS films network. Not forming clumps, those elements cannot diffract, as suggested in a study of the influence of Au N^os doped TiO₂ thin films (Gültekin, et al., 2014). It can also be assumed that at 2θ value of 53.5° there is a superposition of the (511) plane of the Au phase (card No. 021095) with the (222) plane of the PbS phase. The preferred orientation of crystallites growth in the deposited films is along the plane (111) for the undoped sample PbS and changes to the (200) for the doped films. This probably indicates a change in growth process in the presence of dopants. The change in the preferred orientation has been observed in many other materials (Preetha, et al., 2012), (Obaid, et al., 2013), (Osherov, et al., 2007) indicating the growth in three dimensions of the crystallites. The average crystallites size D and the strain ε within PbS doped films (along the preferred orientation) were calculated from the Scherrer equation:

$$\beta \cos\theta = k\lambda D + \varepsilon \sin\theta \quad (1)$$

Where β is the peak width at mid height, θ is the diffraction angle, k is constant having a value of 0.9, the constant $\lambda=1.54 \text{ \AA}$.

The obtained values are given in Table II. As it can be seen, the crystallites size is affected by the element and rate of doping. It decreases for PbS: Zn and PbS: Cu films comparatively with the undoped PbS film. This decrease of D can be explained by shrinkage of the unit cell in these films. The substitution of Pb atoms of the PbS unit cell by Cu or Zn atoms leads to its size reduction in size, given their atomic radius: 154 pm, 145 pm and 142 pm. By cons, the crystallite size in the PbS: Au films increases slightly compared with that in the undoped films. It is possible that Au nanoparticles, placed at the center of the PbS cells, exert an expansive stress thereon leading to the lengthening of lattice parameter a which, in turn, induces an increase of the crystallite size D in PbS: Au films (table II).

Table II. Structural properties of PbS films with several doping.

	2θ (°)	(hkl)	β	a (Å)	D (nm)	ε (10^{-2})
--	---------------	-------	---------	---------	----------	-----------------------------

<i>PbS</i>	26.33	(111)	0.086	5.923	102	1.05
<i>PbS: Au</i>	30.09	(200)	0.086	5.934	106	1.25
<i>PbS: Zn</i>	30.19	(200)	0.125	5.914	73	1.81
<i>PbS: Cu</i>	30.16	(200)	0.187	5.920	50	2.72

The lattice strain ϵ of doped PbS films is greater than those of the undoped ones. It is known that the injection of doping in the film network generally creates additional strains (Thangavel, et al., 2012), (Touati, et al., 2015).

Optical Properties

The transmittance spectra, in the visible and near infrared range wavelength of free and doped PbS films were shown in figure 2.

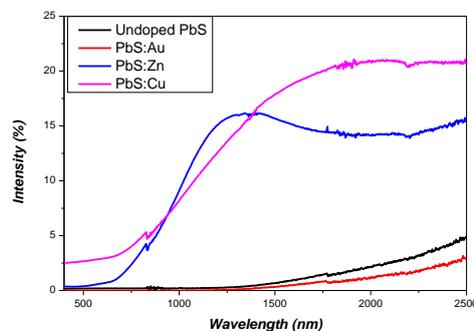

Fig.2. Transmittance spectra of PbS thin films, pur and with several doping (Cu, Zn and Au Np's).

The whole films exhibited a low transmittance in the visible range. The transmittance in the near infrared range varied from 3 to 20%. This difference can be explained in terms of difference in thickness (table I).

The optical energy gap E_g of the PbS films was calculated using Tauc formula:

$$\alpha h \nu = A (\alpha h \nu - E_g)^n \quad (2)$$

Where ν is the frequency of the incident photon, h is Planck's constant, A is constant, α is absorption coefficient and n is the number which characterizes the optical process ($n=1/2$ for direct transition).

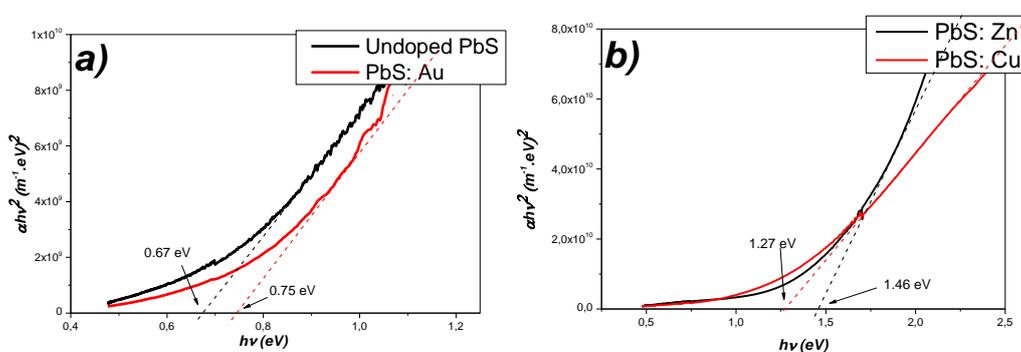

Fig.3. The plot of $\alpha h \nu^2$ as a function of $(h \nu)$ to extract energy band gaps of PbS thin films, pur and with several doping (Cu, Zn and Au Np's).

On figure 3, were represented the $(\alpha h\nu)^2$ variation as function of $h\nu$ to estimate the optical gap of doped PbS thin films. The results are reported in Table I. They indicate that the three elements: Cu, Zn and Au, tend to broaden the optical band gap of PbS films. This varies slightly from 0.67 eV for undoped sample to 0.75 eV for the PbS: Au film. However, a significant band gap widening was observed in PbS: Cu and PbS: Zn films, where its value is multiplied by a factor of 2 (1.27 eV and 1.46 eV for PbS: Cu and PbS: Zn films, respectively).

The three doping atoms would ensure an increase of the carrier concentration within PbS films. This increase shifts the Fermi level toward the valence band (p-type conductivity for all samples), it is the Burstein-Moss effect. The "seeming" optical gap in doped samples is greater than the gap of the undoped one. It is known that the optical gap is sensitive to doping. Several authors have observed its increase with doping concentration (Thangavel, et al., 2012), (Touati, et al., 2015). (Gültekin, et al., 2014).

Structural disorder E_u within PbS thin films network was calculated using Urbach formula (Urban formula). Its variation as function of the different doping elements is given in Table I. It can be observed that E_u varied from 0.27 to 0.41 eV with doping. The increase in the films disorder is a good indicator of the incorporation of doping atoms in the PbS matrix. This may be related to the different atomic radii of doping elements. The substitution of some Pb atoms by one of the three doping atoms leads probably to a slight variation such as the angle or length of the inter-atomic bonds. This fact leads to localized states appearance in PbS semiconductor which is the definition of disorder.

Electrical Properties

The electrical conductivity σ of PbS films are measured in the dark, at room temperature. The obtained values, as function of the doping metal, are reported in table III. The incorporation of Au nanoparticles improves the conductivity of more than an order of magnitude while the Cu and Zn doping decreases it. The gold nanoparticles doping provides films more holes which are majority carriers (p-type conduction) and, therefore, improves the conductivity. Substitution of some Pb^{2+} ions by Zn^{2+} and Cu^{2+} probably causes a reduction of crystallites size by shrinkage of the unit cell (table II).

Table III. Electrical properties of PbS films with several doping.

<i>Samples</i>	<i>PbS</i>	<i>PbS: Au</i>	<i>PbS: Zn</i>	<i>PbS: Cu</i>
σ (1/ Ω .cm)	0.15	2.06	0.014	0.04
<i>Type conductivity</i>	p	P	P	p

This fact is probably due to the inferiority of doping elements size comparatively with Pb^{2+} ions size (Touati, et al., 2015). The decrease of the size of the crystallites induces an increase in the grain boundaries density which impede carriers mobility and results in the decrease of the conductivity in the PbS: Zn and PbS: Cu films.

Part 2

Structural, optical and electrical PbS thin films properties can be altered through doping with various elements. There are several reports on PbS nanostructures doped with different elements as Al, Mn, Sn, Sb, and Cd (Kumar, et al., 2014), (Thangavel, et al., 2012), (Das, et al., 2012), (Thangavel, et al., 2010), (Silva, et al., 2009). B. Touati et al. 2015 have reported that Zn doping enlarges PbS films band gap from 0.72 eV to 1.46 eV and, then, suggested those films as absorbent layer in the modern solar cells devices. X. Zheng et al. 2016 attempted to reduce PbS thin films resistivity using Cu doping. They achieve a lowest value of 0.15 Ω cm at 6.3 at.% Cu doping but the optical film properties had not been studied. A low resistivity is desirable for electric and opto-electric device applications due to small power consumption. Besides, for solar cell, it will result in low series resistance and high fill factor so as to a high efficiency (Zheng, et al., 2016).

Structural Properties

Figure 4 represents X-ray diffraction spectra of co-doped PbS thin film. The spectra show diffraction peaks at different 2θ angles assigned to the (111), (200), (220), (311), (222), (400) and (331) planes indicating the formation of PbS phase for all films with no secondary phase. Peaks shift to higher angle values can be observed. However, we equally notice the absence of peaks indicating the presence of Au or Zn phases. This is probably due to the uniform dispersion of doping atoms in the PbS films.

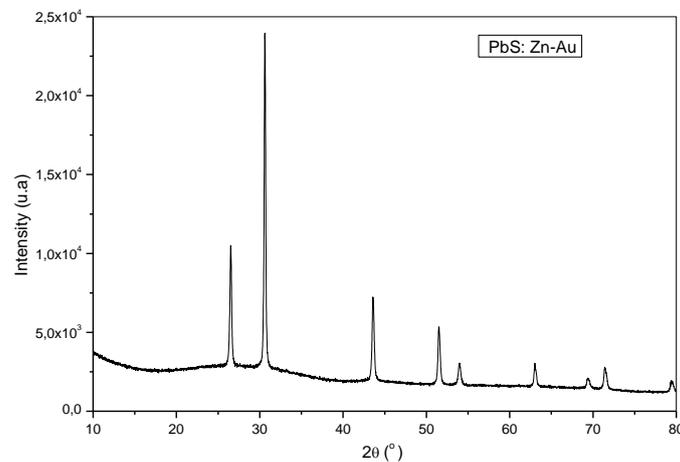

Fig.4. XRD patterns of Au-Zn co-doped PbS thin films.

The average crystallites size *D* and the strain ϵ within Zn-Au co-doped PbS films (along the preferred orientation) were calculated using Scherrer formula (equation 1). The obtained values are given in Table IV.

Table IV. Structural properties of Au-Zn codoped PbS thin films.

	$2\theta (^{\circ})$	(hkl)	β	$a (A^{\circ})$	$D (nm)$	$\epsilon (10^{-2})$
<i>PbS: Au-Zn</i>	26.33	(111)	0.181	5.830	45.35	1.30

As it can be seen, the crystallites size is affected by the co-doping. It decreases to achieve a value of 50 nm comparatively with the undoped PbS film (part 1). This decrease of D can be explained by shrinkage of the unit cell in these films. Lattice parameter a, also calculated and reported in table I.V, is actually smaller in Zn-Au co-doped films than in the other studied PbS films. The crystallites size in the Zn-Au co-doped PbS films is close to their size in the Cu doped films studied in the first part.

Optical Properties

The transmittance spectra in the visible and near infrared range wavelength of co-doped PbS film were shown in figure 5.

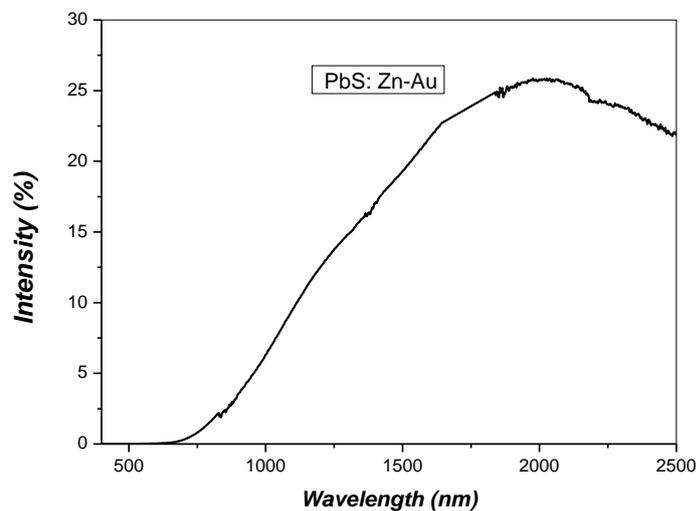

Fig.5. Transmittance spectra of Au-Zn co-doped PbS thin films.

The Zn-Au co-doped PbS film exhibited a low transmittance in the visible range and of about 25% in the infrared range.

The optical energy gap E_g of Au-Zn co-doped PbS films was calculated using Tauc formula (equation 2) and revealed to be equal to 1.39 eV. A significant band gap widening was observed in PbS: Au-Zn films as for PbS: Zn ones. The Burstein-Moss effect most be the explication of this gap widening.

Electrical Properties

The electrical conductivity σ of PbS: Au-Zn films was also measured in the dark, at room temperature. The obtained value was 0.37/ Ω .cm. This result show that Zn-Au co-doping, in addition to enlarge the band gap, improve also the electrical conductivity unlike the Zn doping.

Conclusion

PbS thin films were synthesized at low temperature (60 °C) by a simple chemical bath deposition. The influence of Au nanoparticles, Cu and Zn doping on PbS thin films properties has been explored. The crystalline nature, optical and electrical properties of the prepared films were determined using the X-ray diffraction, UV-visible spectrometry and Hall Effect measuring method. XRD studies showed that the deposited PbS films were polycrystalline and exhibited cubic crystal structure. There was a decrease in the crystallite size from 102 nm to 73 nm with Zn doping and to 50 with Cu doping in the PbS films. Hall Effect measurements showed that all deposited films have p type electrical conductivity. This last decreased by Zn doping and, on the contrary, increase with Au nanoparticles doping. Optical study on the analyzed films revealed that Zn et Cu doping enlarge band gap confirming the PbS film applicability as an absorber in modern solar cell devices. The Au-Zn co-dopage allows to broaden PbS film band gap and to improve its electrical conductivity at the same time which can be useful to reduce the resistance series in solar cell.

Abstract: DNA profiling from teeth was used for the first time in Albania in 2022, for forensic purposes. The case has been resolved in collaboration with experts of the Institute of Scientific Police and academic staff of Albanian University. On April 3, 2022, some bones and a skull were revealed to surface after the locals have burnt some bushes, in Fushë Kuqe, Kurbin, meanwhile, on May 2015, a 16 years old boy has been declared missing from his family. The police were informed and investigations began for identification. A full DNA profile of the victim was yielded by an intact molar tooth present in the recovered mandibula. The putative mother has already submitted a DNA profile, which was stored in the database of the Institute of Scientific Police. The two profiles were analyzed and compared, and the results consisted in a high compatibility leading to identification. The aim of this study case was to evaluate for the first time in Albania DNA profiling from teeth and provide expertise in the field. In conclusion, genetic profiling from teeth resulted in an efficient method for forensic identification purposes opening new perspectives for our country.

Introduction

Identification of human remains and their returning to families is a moral and legal obligation which is defined in international humanitarian law as a “sign of respect for family life...”(ICRC 2005). Article 24 (3) of CED highlights the obligation to return the human remains of the disappeared to the surviving members of the families (OHCHR., 2010). Also, Principle 2(4) of International Norms 2019 specifies that "return [of human remains] should also include the means and procedures necessary to ensure a dignified burial in accordance with the cultural rituals of their families and communities." (ICMP Bournemouth Protocol on Mass Grave Protection and Investigation published, 2020). Such principles and norms apply not only in identification of mass graves or massive disasters but without any doubt also in individualized cases such as homicide, trauma, accidents, where human remains can be identified and should return to their afflicted families to bring some relief.

Many times, the process of human identification can be very complex because of the inability to recognize the person by the usual identification methods. Identification of human remains is realized based on 4 different methods such as: fingerprints, analyses of physical indicators, DNA profiling and dental examinations (Zajkowska AZ., & Zander HH., 2022]. Dental identifications have been used since ancient times, and nowadays have become a very valuable tool because of the positive results in human identification. This identification is usually made through comparison of dental records before death (*ante mortem*) and after (*post mortem*). Different prosthetic pieces, orthodontic appliances, fillings, implants in oral cavity or specific dental characteristics such as teeth morphology, position, and alignment and palatal rugae patterns, can help in the process of identification, since the dental formula and oral cavity are unique and specific dental treatments are so individualistic.

However, identification of human remains is highly influenced by the post mortem interval, the environmental conditions to which the remains have been exposed and other factors that might have contributed to their deterioration, destruction or missing. When usual dental methods of identification cannot be applied, DNA material extracted from teeth can provide a genetic profile that can be used for identification. Comparison of DNA preserved in and extracted from the teeth of an unidentified individual can be made to a known *ante mortem* sample (stored blood, hairbrush, clothing, cervical smear, biopsy, etc) or to a parent or sibling (Pretty IA & Sweet D., 2001). In this context teeth are considered an excellent source of DNA material because they present a resistant nature to environmental assaults, such as incineration, immersion, trauma, mutilation, and decomposition (Schwarz TR., *et al.* 1991). Teeth are highly mineralized structures, the most resistant tissues of the entire human body, well protected by bone and muscles, which have a reduced chance of being

contaminated. Besides providing a good source of DNA teeth can also help in sex and blood group determination and age estimation (Nandini DB., & Joji, JG., 2020).

The recommendations for genetic identification are the collection of intact and well-preserved teeth, with completely formed root apices, and free of dental restorations or caries. From all types of teeth, first molars are the most recommended ones followed by second molars and third molars whereas incisors are the least preferred (International Commission on Missing Persons, ICMP 2015).

In this study we present a case of successful human remains identification using a full genetic profile from an intact first mandibular molar, extracted from a partly incinerated mandibula. This form of forensic identification was the first one of its kind realized ever in Albania and was made possible by specialists of Institute of Scientific Police and academic staff and alumni of Albanian University, in 2022.

Case Report

On May 18, 2015, 16-year-old M.GJ., woke up and told his mother that there was going to be an activity in the school and that he wouldn't be late. He left for school and was never seen again. His mother, after looking for him, asking relatives and neighbors all night long, went the next day to the police declaring her son missing. After some searching attempts for several months the police gave up, leaving the mother and familiars in expectation.

Figure 1. Photo from the place where the bones were found

On April 3, 2022, somewhere in Fushë-Kuqe, Kurbin, some bones and a skull were revealed after the locals burnt some bushes. The police were informed, the bones were recovered by them and the Prosecutor's Office of Kurbin immediately began investigations for their identification. After a few days, the Prosecutor's Office requested the DNA profile of the victim. The mother had already submitted a DNA profile which was stored in

the database of the Institute of Scientific Police. The two profiles were analyzed and compared, and the results consisted of a high compatibility. After 7 years the police confirmed that the victim has been identified as M.GJ. who was missing since 2015. Forensic experts have concluded that some of the bones found around Fushë-Kuqe, turned out to be damaged with strong tools. Specialists were not able to determine which were the tools used to hit the victim, but this fact has raised suspicions that M.Gj. was violated with hard objects before he was killed (www.panorama.al, 2022).

Method

From the recovered bones, a femur and a mandibula with some intact teeth in it (Figure 2), were sent by the police to the Institute of Scientific Police for analysis. One intact tooth, a first mandibular molar, was pulled out of the alveolus and prepared for DNA extraction.

Figure 2. Recovered mandibula

Preparation for sample extraction.

The first mandibular molar was cleaned by washing with Sodium Hypochloride 3%-5% for 5-10s 3 times, after the first wash scrubber with brush to clean the outer surface and washed twice, rinsed with saline water and washed with free DNA water. This first molar was dried in a fume cabinet for 4 - 5h at room temperature before cutting it into some pieces. The pieces of the first molar were powdered in the instrument “Analysette 3 Spartan pulverisette” (FRITSCH, Germany) with sieving time of 30 min twice. Regarding the quality of powder the process can be repeated till the fine powder is produced. Three samples were prepared for extraction with amounts of 50 mg, 120 mg and 180 mg of powder from the first molar. The same procedure was carried out for the femur and two samples of 120 mg and 180 mg were prepared.

DNA extraction

The extraction of DNA was done with PrepFiler® BTA™ Forensic DNA Extraction Kit following the manufacture's protocol for the sample of 50mg powder (Thermo Fisher Scientific) in Automate Express equipment. Incubation for all three samples was the same 56°C for 2 hours, meanwhile different quantities of lysis buffer solution, DTT 1M and proteinase K were used according to the amount of powder. The total DNA extracts of 50 µl were obtained for all the tree samples, as well as for the bone samples. The isolated DNA can be stored at 4°C for up to one week, or at -20°C for a longer time.

STR typing

The commercial STR kit used for this study is Applied Biosystem AmpFLSTR™ NGM SElect™ kit (Thermo Fisher) a five dyes kit which simultaneously amplifies 16 separate STRs: D3S1358, vWA, D16S539, D2S1338, D8S1179, D21S11, D18S51, D19S433, THO1, FGA, D10S1248, D22S1045, D2S441, D1S1656, D12S391 and SE33 and the sex determining marker Amelogenin. For all the samples, double pcr reactions were performed, so there were 6 pcr reactions in total. PCR reactions using mix and primers with maximum DNA extracted (10µl) and the final volume of PCR product is 25 µl performed in Veriti™96-Well Thermal Cycler according to manufacturer's guidelines.

Electrophoresis and analysis

Fragment separation was performed using ABI PRISM® 3500 Genetic Analyzer (Applied Biosystems) using POP-4 polymer and the collection software Data Collection, version 2.0. Data was sized using GeneMapper™ID-X Software version 1.5 (Applied Biosystems).

Figure 3. a. Analysette 3 Spartan pulverisette, b. Automate Express, c.3500 Genetic Analyzer

Results

All the processes described in this study were performed in the DNA forensic laboratory in the Institute of

Scientific Police in Tirana Albania. The same full DNA profile was obtained from the DNA extract of samples with 120 mg and 180 mg tooth powder from 4 PCR reactions. This profile is shown in Figure 4 and is a male DNA profile (Amelo X,Y). The DNA extract from the sample with 50 mg tooth powder gave a partial profile. All the positive loci in the three DNA profiles gave repeatability of the same results. As for the bone samples we couldn't get any genetic profile that we could analyze and compare.

The male DNA profile was compared with the DNA profile of a female which has spent several years searching for her missing son and her DNA profile was stored in the database of the Institute of Scientific Police. The DNA profile of the putative mother was obtained from a saliva swab, the extraction was performed manually, using QIAamp DNA Investigator Kit for extraction. For amplification was used the same kit as for the tooth and the sequencing was performed using ABI PRISM® 3500 Genetic Analyzer. The genetic profile of the putative mother is shown in Figure 5.

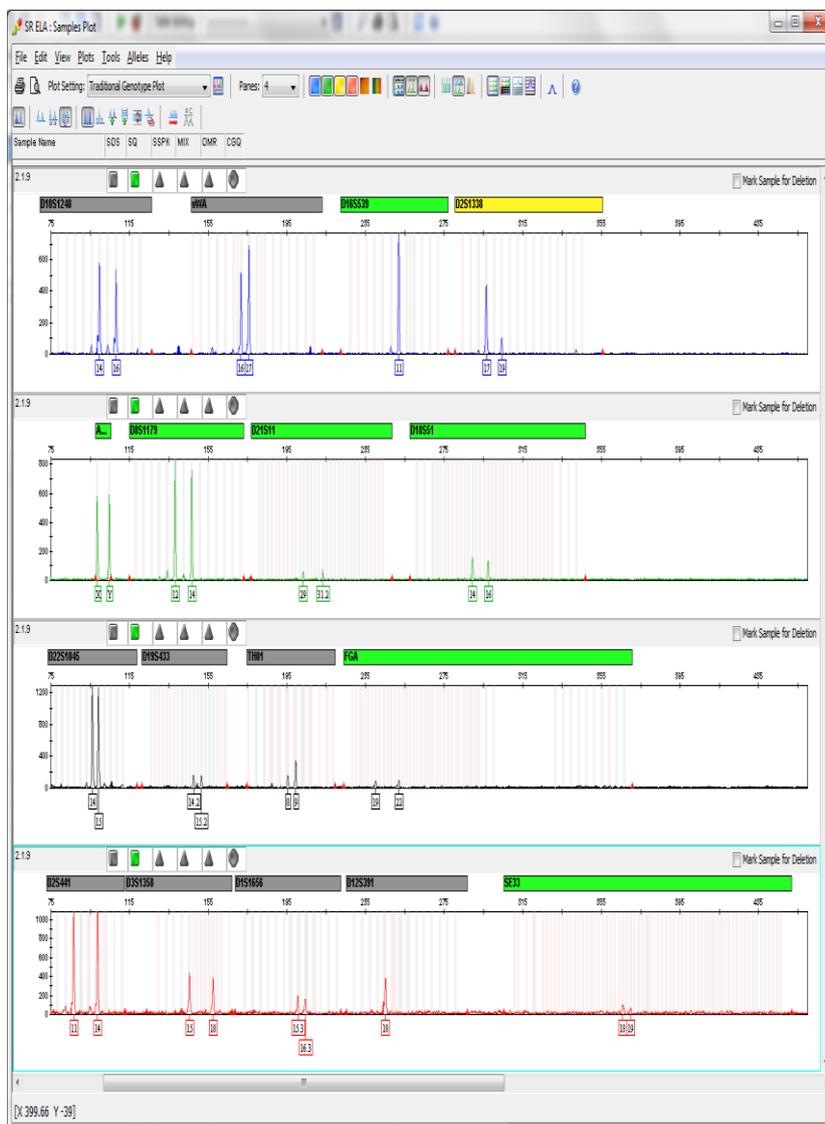

Figure 4. Full genetic profile from first mandibular molar

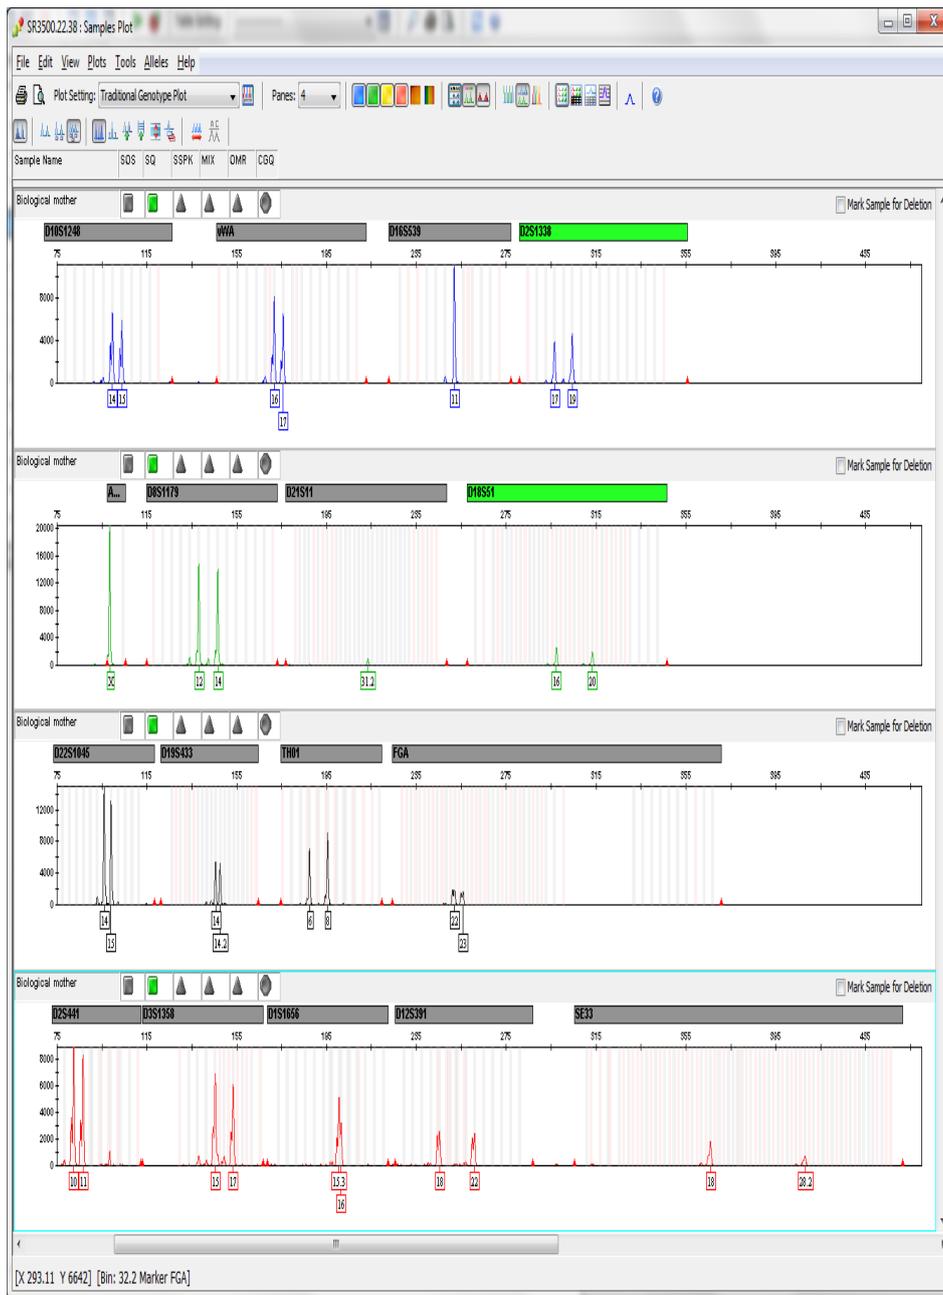

Figure 5. Full genetic profile from putative mother

By comparing these two DNA profiles we observed that for all the loci studied, one allele of the female DNA profile was present in the male DNA profile (see Table 1). This compatibility according to Mendel law for inheritance refers to the genetic relation biological mother- biological son. Statistical evaluation was performed with Familias software version 3 <http://www.familias.no>. Using the allele frequency of the Albanian population, the value for LR (likelihood ratio) is $LR = 834267.4103$. The LR is based on two hypotheses which are: hypothesis one - this female is the mother and hypothesis two - another female is the mother. This value of LR means that it is slightly more than 834267 times more likely that the putative mother is the biological mother of the profile obtained from the tooth than any other female chosen at random, from the Albanian population. This

led to the identification of the human remains and the identity of the missing person was confirmed.

Discussion

The results of this study confirm the fact that teeth play an important role in the identification of unidentified human remains and can be considered as reliable sources of DNA used for forensic cases. Teeth and bones are tissues that can preserve DNA for very long times due to their solid and very calcified structure, although

different environmental conditions, DNA extraction methods and DNA analysis seem to have an impact on the DNA concentration, quality and profiling success (Schwartz TR., *et al* 1991, Latham KE., *et al* 2018, Heathfield LJ., *et al* 2021, Lozano-Peral D., *et al* 2021). In our study samples from both femur and teeth underwent for analysis, but only teeth could provide a DNA profile useful for identification. We could not provide a successful DNA profile from the femur sample due to the highly destructive state caused by the burnt, even with greater amounts of bone powder (120mg and 180mg). Previous studies have shown that DNA extracted from burnt bone fragments may be highly degraded, making amplification of genetic markers difficult or even impossible (Schwark T., *et al*, 2011). In this case, bones were discovered after locals have been burning their lands and the fire must have degraded the bones entirely. As for the teeth, they were only partially burnt so DNA extraction was possible and genetic profiles could be generated.

In our study, three samples of 50 mg, 120 mg and 180 mg tooth powder were prepared. Although the PrepFiler® BTA Forensic DNA Extraction Kit protocol recommends a sample of up to 50 mg of tooth powder for DNA extraction (PrepFiler® and PrepFiler® BTA Forensic DNA Extraction Kits User Guide, 2012), we also prepared two other amounts of tooth powder, in order to compare the genetic profiles that could be yielded. The amount of DNA extracted from the larger samples of powder gave full genetic profiles compared to the 50 mg sample, which gave only a partial genetic profile. This result is consistent with those of Varrathyarom P., *et al*, (2022), who recommend greater amounts of powder for higher DNA yield.

According to Schwarz TR., *et al*. (1991), there are several factors affecting the amount of DNA in a tooth such as type of tooth (incisor, canine, premolar, molar), condition of teeth prior to extraction (degree of decay), condition of tooth following trauma, period of time from extraction to DNA isolation, and age of the individual. Regarding the type of tooth that can provide better results for genetic identification, Standard Operating Procedures of International Commission on Missing Persons (ICMP) (2015), recommend as first choice first permanent molars with closed apices and free of decay. Among all possible teeth candidates in the present study, the first mandibular molar was chosen for analysis and represented a very good candidate which provided sufficient amounts of powder for DNA extraction and profiling. However, there are other studies that suggest that premolars followed by canines perform better than molars in DNA profiling (Heathfield LJ. *et al*, 2021). We suggest that attempts with different types of teeth should be made in cases where there are no other choices, because they represent very good sources of DNA profile.

A study of Mansour H, *et al*. (2019), has shown that post mortem interval is the most important factor that influences DNA quantification. They demonstrated that 10 days after death the amount of dental DNA that could be yielded decreased dramatically. This observation is supported by the results of our study, where greater amounts of dental DNA were necessary to provide full genetic profiles, considering the long post mortem interval of 7 years.

In the literature there are several case reports of successful human identification from DNA profiling from teeth.

Sweet DJ, & Sweet CH, (1995) reported the identification of an entirely carbonized body from the DNA extracted from an unerupted third molar. Kaur S, *et al.* (2018) reported the identification of a severely decomposed body by dental DNA STR analysis. More recently, Kumar N, and Sharma A, (2021), used a powder - free method of dental DNA analysis, to successfully identify fragmented remains of a human skeleton, whereas Varrathyarom P., *et al.* (2022) demonstrated efficacy of bead-beating homogenization technique for DNA extraction in solving forensic casework by using teeth sample. There are cases also, where DNA profile cannot be generated due to very aggressive condition to which human remains are exposed to. Such a case was reported by Kumar *et al.* (2018) where DNA could not be extracted from molars and the premolars of a highly decomposed and badly charred body.

In Albania, forensic dentistry is at its beginnings since this was the first case of forensic identification that was resolved through DNA profile from teeth. The positive results of this study are very encouraging and create new opportunities for investigation of other difficult cases in our country, where usual techniques of identification fail. Regardless of harsh conditions or state of the human remains, efforts should be made to resolve those cases for legal and moral considerations.

Conclusion

In the present study, DNA profiling from teeth (first mandibular molar) showed better results than DNA profiling from bones (femur). Genetic profile from teeth resulted in positive identification of human remains and identity of person was established. Extraction with the PrepFiler BTA protocol was a suitable method. In every case, it is important to take in consideration all factors that can influence the extraction, concentration, quality and the profile of DNA. Environmental conditions as well as post mortem interval are very influential factors to the final result. Also, increasing the amount of tooth powder influences DNA concentration to be yielded and so the results. The findings of this study are very encouraging, and genetic profiling from teeth should be considered in other cases of forensic identification.

Recommendations

We recommend that the amount of dental material for DNA extraction should be at least 100 mg. The amounts of Lysis Buffer BTA, DTT 1M and proteinase K should be calculated depending on the initial amount of extracted DNA. We recommend DNA profiling from teeth as an important method of identification for forensic purposes when other identification methods fail.

Abstract: The eradication of microorganisms from the intricate anatomy of the root canal, microbial invasion of dentinal tubules, and formation of intracanal biofilm present significant challenges in endodontic treatment. However, the use of dental lasers has shown promising advancements in endodontic diagnoses. This study aims to assess the clinical and radiological efficacy of utilizing a diode laser for the treatment of chronic apical periodontitis. A total of 84 patients aged between 20 to 70 years participated in the study, with a combined total of 91 teeth. The patients were divided into two groups: the control group comprised 40 patients, with 30 monoradicular teeth and 11 multiradicular teeth, receiving the traditional chemo-mechanical processes. On the other hand, the study group consisted of 44 patients, with 36 monoradicular teeth and 14 multiradicular teeth, which underwent both chemo-mechanical processes and treatment with a diode laser operating at a wavelength of 980 nm. The cases were closely monitored clinically and radiologically for a period of 6 to 12 months to evaluate the efficacy of the treatments. The use of a diode laser resulted in a significantly lower number of complications compared to the control group. After 12 months, the study group exhibited an impressive success rate of 96% with a failure rate of only 4%. In contrast, the control group experienced several complications within the first 6 months, yielding a success rate of merely 78.1% after 12 months, along with a complication rate of 21.9%. These results strongly suggest that incorporating a diode laser in traditional chemo-mechanical processes may enhance the success rate of endodontic treatments in cases of chronic apical periodontitis. Moreover, diode laser processing has been found to effectively sterilize the root canals, leading to high-quality treatment outcomes. By modifying the traditional endodontic treatment protocol to include diode laser processing, the quality and effectiveness of root canal treatment can be significantly improved. This innovative approach has the potential to revolutionize the field of endodontics by ameliorating treatment success rates and minimizing complications. Further research and long-term studies are necessary to explore the full potential of diode lasers in endodontic therapy, but the preliminary findings of this study are promising and

provide a foundation for future advancements.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2481-2491), Cappadocia, Turkiye. ISTES Organization.

Introduction

Achieving an effective endodontic treatment heavily relies on ensuring a high-quality antiseptic treatment of the root canal. This crucial stage involves the removal of tissue remnants, the smear layer, and the thorough elimination of microorganisms (Haupt et al., 2020; Mancini et al., 2013). However, completely eradicating microorganisms from the root canal is challenging due to several factors. The complex anatomy of the canal, deep microbial invasion in the dentinal tubules, and the formation of an intraradicular biofilm, along with surface contamination at the root apex, contribute to the persistence of apical periodontitis (Siqueira et al., 2022; Abusrewil et al., 2020).

One of the most effective irrigants used in the chemical treatment of root canals is sodium hypochlorite (NaOCl) solution, typically ranging from 2.5% to 5.25%. This solution plays a crucial role in proteolysis of the pulp tissue and breakdown of organic components present in the softened dentine layer. Additionally, NaOCl exhibits strong antimicrobial properties (Haapasalo et al., 2014). To effectively target the inorganic components, a combination of NaOCl and 17% ethylenediaminetetraacetic acid (EDTA) is necessary. This combination allows for comprehensive cleaning and disinfection of the canals (Haapasalo et al., 2014). It is important to note that merely using mechanical instrumentation to eliminate bacterial microflora from the canals is insufficient. To address this, canal irrigation systems coupled with antiseptic medications have been employed (Haapasalo et al., 2014; Boutsoukis et al., 2022).

The application of laser technology in Endodontics has revolutionized the treatment of caries complications, introducing a wide range of characteristics that make it suitable for various sectors of dentistry (Bordea et al., 2020). The 980 nm laser diode operates by absorbing specific substances such as water, hemoglobin, and melanin, collectively referred to as "endochromophore substances." This absorption process leads to an increase in tissue temperature, known as the photothermal effect. Furthermore, the laser-induced plasma formation and tissue softening result in the photoacoustic effect. These effects initiate chemical reactions that break chemical bonds within molecules, demonstrating the photochemical effect (Fazlyab et al., 2021; Pelozo et al., 2023). It is important to note that neither laser treatment alone nor the use of hypochlorite irrigant can guarantee complete sterility of the root canal. The narrow diameter of dentinal tubules, measuring only

3 μm , along with the presence of lateral canals, limits the penetration depth of antiseptic solutions to a maximum of 100 μm (Virdee et al., 2020). In contrast, microorganisms can penetrate the dentin canals at depths ranging from 300 to 700 μm and beyond (Berkiten et al., 2000). Laser light exhibits potent bactericidal properties, enabling its action at depths of 500-1000 μm , depending on the power of the radiation source (Gutknecht et al., 2000).

The aim of this study is to demonstrate the efficacy of endodontic treatment, specifically in cases involving chronic apical periodontitis, by employing a diode laser with a wavelength of 980 nm and a laser power ranging from 0.8 to 1.0 W within the root canals. To achieve this, we will present radiological data that highlight the positive outcomes resulting from this laser-assisted approach.

Method

Study design

In this clinical study, a cohort of 84 patients, aged between 20 and 70 years, with a total of 91 teeth, was selected for treatment. Among these, 64 teeth were monoradicular, and 27 teeth were multiradicular, as detailed in Table 1. Prior to treatment, a comprehensive anamnesis was conducted, revealing that 21 patients had a diagnosis of chronic granular periodontitis affecting 24 teeth. Additionally, 48 patients presented with chronic granulomatous periodontitis involving 52 teeth, and 15 patients had reacute chronic periodontitis affecting 15 teeth.

Table 1. The distribution of patients and teeth based on the diagnosis.

Diagnosis		Number of patients	Number of teeth	Teeth	
				Monoradicular	Multiradicular
Chronic periodontitis	granular	21	24	14	10
Chronic periodontitis	granulomatous	48	52	40	12
	Cystic granuloma	15	15	10	5
	Total	84	91	64	27

The patients were divided into two groups, and informed consent was obtained from each participant after providing detailed information regarding the endodontic procedures, potential pain, and possible side effects.

Endodontic treatment of the first group

The first group, known as the control group, consisted of 40 patients. Within this group, 30 monoradicular teeth and 11 multiradicular teeth were selected for treatment using the traditional method, which involved performing

chemo-mechanical processing.

Following the diagnosis, the standard endodontic protocol was implemented, starting with the placement of a rubber dam to isolate the treatment area. The next step involved cavity preparation using a suitable bur kit from Dentsply Maillefer (Ballaignes, Switzerland). Chemo-mechanical preparation of each tooth commenced with the examination of root canal entrances, employing manual Ni-Ti instruments sized 10-15 (Dentsply Maillefer, Ballaignes, Switzerland), and alternating with Mtwo[®] rotary instruments from VDW GmbH (Munich, Germany).

Canal preparation was accomplished utilizing the step-back technique. Following the use of each instrument, the canals were thoroughly irrigated with 5.25% sodium hypochlorite (NaOCl) solution from Cerkamed (Stalowa Wola, Poland), followed by the application of 17% EDTA gel, also from Cerkamed, to remove the smear layer. For irrigation, a volume of 10 mL of NaOCl solution was used for each canal, which was left in contact with the canal for 20 minutes.

Following the previous step, saline solution was initially applied, followed by 2% chlorhexidine gluconate (GLUCO-CHEX; Cerkamed, Stalowa Wola, Poland) using a NaviTip 30-G needle from Ultradent (South Jordan, UT, USA) with passive irrigation. Each canal was then gently dried using sterile paper absorbent from Meta Biomed (Colmar, PA, USA). Once dry, the canals were sealed using AH Plus[®] sealer paste from Dentsply Sirona (Italy) and gutta-percha with lateral condensation, extending up to the physiological apex of the tooth root. The final restoration of the tooth crowns was achieved using Competence Universal[®] composite material from WP GmbH (Barmstedt, Germany).

Laser diode treatment of the second group

In the study group, which comprised the second group, a total of 44 patients were selected. Within this group, 36 monoradicular teeth with chronic periodontitis and periapical destruction, as well as 14 multiradicular teeth, were included. Similar to the control group, the endodontic protocol was applied to the study group. It commenced with the placement of a rubber dam to isolate the treatment area. Subsequently, the cavity was opened using an appropriate bur kit from Dentsply Maillefer. The chemo-mechanical preparation of each tooth began by examining the root canal entrances, utilizing manual Ni-Ti instruments with dimensions 10-15 from Dentsply Maillefer, in combination with Mtwo[®] rotary instruments from VDW GmbH.

The canal preparation was carried out using the step-back technique. After each instrument, the canals were thoroughly irrigated with 5.25% NaOCl solution from Cerkamed. Subsequently, a 17% EDTA gel from Cerkamed was applied to chelate and remove the smear layer. The NaOCl solution was used in a volume of 10 mL for each canal and left in contact with the canal for 20 minutes. Following the irrigation step, saline solution was applied, followed by the application of 2% GLUCO-CHEX from Cerkamed using a NaviTip 30-G needle from Ultradent, with passive irrigation.

In addition to the procedures described above, the study group underwent a laser therapy session. This session involved the presence of NaOCl irrigant inside the canal, followed by the insertion of a diode laser fiber optic (QuickLase Ltd, Canterbury, UK) with a wavelength of 980 nm and laser power ranging from 0.8-1.0 W. The fiber optic was applied with circular or spiral movements from the apex towards the crown for a duration of 30 seconds, with a frequency of 20 Hz and pulsed mode.

To disinfect the apical region, the optical fiber of the laser diode was securely fixed using a stopper at the appropriate working length. It was positioned at a distance of 1.5-2 mm away from the anatomical apex to prevent any potential damage to hard and soft tissues. The optical fiber had a diameter of 200 µm, and the 30-second laser procedure was repeated three times in each canal during the session. Throughout the procedure, the patient was instructed to promptly indicate any pain or discomfort, including an unbearable sensation of warmth.

Subsequently, the canals of these patients were carefully dried using sterile paper absorbents from Meta Biomed. Once dry, the final canal obturation was performed using AH Plus® sealer paste from Dentsply Sirona and gutta-percha with lateral condensation, extending up to the physiological apex of the tooth root. The restoration of the tooth crowns was accomplished using Competence Universal®, composite material from WP GmbH.

Both groups were closely monitored during a short-term follow-up period of 6 months and a long-term follow-up period of 12 months following the completion of the treatment.

Results

Radiological assessment of the control group

Following the completion of the definitive endodontic treatment, clinical complications were observed within the initial 6-month and 12-month periods. The overall outcome indicated a success rate of 78.1%, while complications accounted for 21.9% of the cases (Figure 1).

Shortly after the completion of the treatment, we conducted an assessment that included the following aspects:

i. Evaluation of pain:

We assessed the presence and intensity of pain experienced by the patients after the endodontic treatment. This included determining the occurrence of severe and persistent pain, as well as the reduction of pain, sensitivity, and discomfort during biting. Patients reported pain sensitivity that lasted from 1-2, 3-5, and even up to 6 or more days.

ii. Assessment of periodontal inflammation:

We examined the presence of signs indicating inflammation of the periodontium. These signs included changes in facial configuration, hyperemia (redness), and edema of the mucous membrane in the region of the

transitional fold. Additionally, we observed any pain experienced during biting, which could indicate inflammation in the affected area.

During subsequent follow-up appointments, we also evaluated the presence of persistent symptoms, objective signs of periodontal inflammation, and any changes in the periapical tissues. These assessments were made through radiographic examination to detect any abnormalities or changes in the affected area.

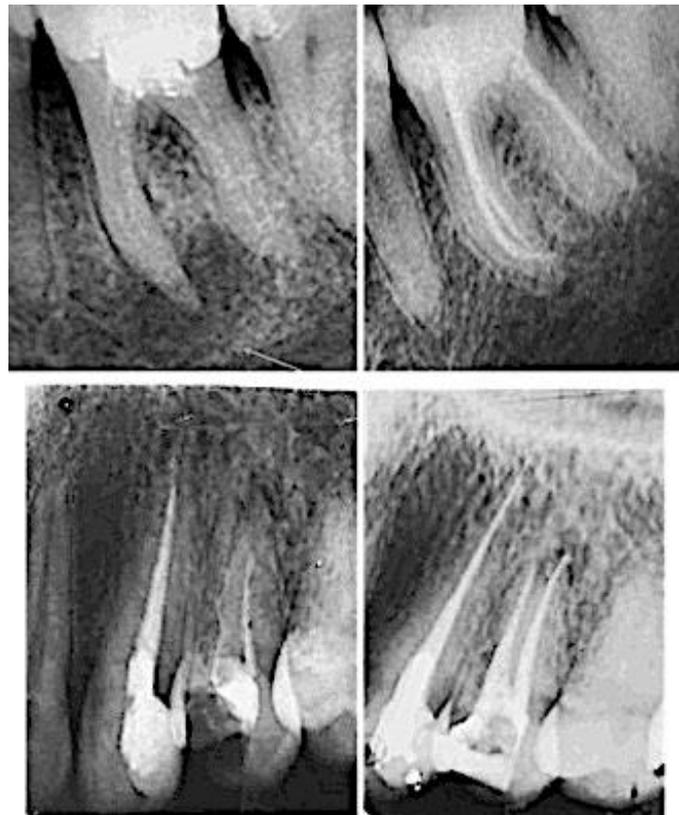

Figure 1. Radiographic presentation of chronic apical periodontitis cases from the control group:

In the upper panel, molar no. 46 is depicted before the treatment and after a 12-month follow-up period. Meanwhile, the lower panel displays the canine (no. 23) and premolar (no. 24) before the treatment and after a 12-month follow-up period. These cases demonstrate evidence of partial bone regeneration.

Radiological assessment of the study group

The laser endodontic treatment demonstrated its effectiveness over a period of 12 months. Notably, no patient reported suffering, and there were no clinical indications of periodontal inflammation. Furthermore, radiographic examinations revealed the absence of bone tissue destruction and instead displayed a positive regenerative trend.

During the long-term follow-up period, following the radiological control (as depicted in Figure 2), a significant decrease in the number of clinical complications was observed. The success rate reached an impressive 96%, with only a 4% failure rate after 12 months.

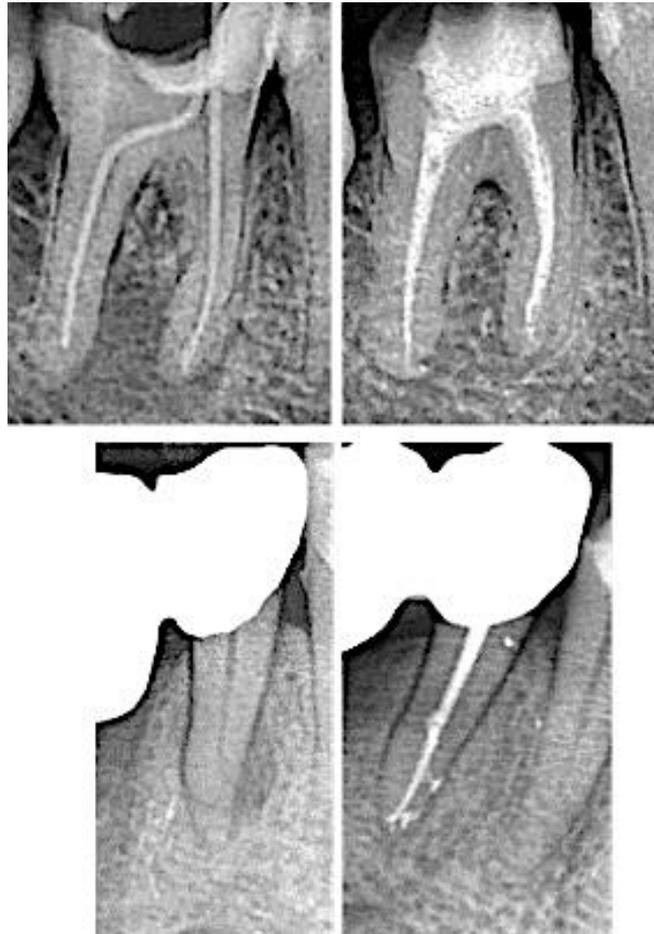

Figure 2: Radiographic evaluation of chronic apical periodontitis cases from the study group.

In the upper panel, molar no. 36 is displayed before the treatment and after a 12-month follow-up period. Meanwhile, the lower panel showcases the premolar (no. 45) before the treatment and after a 12-month follow-up period. In both cases, a remarkable and complete bone regeneration is clearly observed.

Discussion

The primary objective of this study was to demonstrate the effectiveness of endodontic treatment using a 980 nm diode laser in cases of chronic apical periodontitis. In order to minimize undesired heating caused by the photothermal effect during the laser procedure, a pre-irrigation step with NaOCl solution was implemented during the endodontic treatment of our clinical cases. Previous studies have highlighted that the propagation characteristics of laser light and the ability to penetrate energy into the dentin walls of the canal have contributed to a significantly higher disinfection efficacy compared to traditional chemical irrigation methods (Mishra et al., 2022; Silva et al., 2012).

During our study, we observed a notable acceleration in the stimulation and regeneration of destructive foci in the periapical bone tissue in the study group, particularly among young patients, who exhibited a faster

regenerative response. In contrast, the control group, treated with the traditional method, showed a deceleration in the regenerative processes of periapical foci, particularly in patients over 50 years of age. This observation suggests a decline in the body's immune response and a slower stimulation of regeneration in older individuals. These findings support the assertion that the modified endodontic protocol utilizing a diode laser in combination with NaOCl and EDTA can be safely and successfully applied, surpassing the efficacy of other traditional methods. Several authors have provided evidence in support of this claim, demonstrating that the utilization of a diode laser in conjunction with NaOCl irrigant and EDTA chelant significantly reduces the bacterial population in the endodontic system, including *Enterococcus faecalis*, in up to 99.9% of cases (Borges et al., 2017; Preethee et al., 2012).

Furthermore, we observed a significant reduction in post-operative complications associated with chronic apical periodontitis in the study group, achieving a success rate of 96% and a failure rate of 4% after 12 months. In contrast, patients in the control group experienced complications both within the first 6 months and after 12 months, resulting in a success rate of 78.1% and a complication rate of 21.9%. Mandras et al. demonstrated the effective decontamination capability of the laser in the presence of NaOCl, reaching a depth of 130 μm within the dentinal walls of the root canal (Mandras et al., 2020). It is worth highlighting that various authors have recommended the combination of laser with NaOCl irrigant for intracanal procedures to achieve optimal removal of the softened dentin layer (Sarda et al., 2019; Amin et al., 2016; Rajakumaran et al., 2019). On the other hand, the combination of laser with distilled water did not result in complete removal of necrotic tissue from dentin canals or the softened dentin layer. These findings emphasize the importance of utilizing the laser in conjunction with NaOCl irrigant for efficient disinfection and removal of infected tissue in the root canal, leading to improved treatment outcomes in cases of chronic apical periodontitis.

The combination of the diode laser with NaOCl has demonstrated strong bactericidal action, leading to the destruction of bacterial membranes and subsequent absorption (Sarda et al., 2019; Amin et al., 2016; Rajakumaran et al., 2019). Understanding the mechanism of action of the diode laser during endodontic treatments is crucial to comprehend its favorable results. The thermal energy generated by the diode laser induces changes in the intensity of penetration into the dentin walls, causing significant structural alterations in bacterial cells. The process starts with the destruction of the bacterial cell membrane, which disrupts the osmotic gradient and leads to changes, swelling, and ultimately, the destruction of the cells. The fundamental goals of endodontic treatment are to eliminate and stimulate the infected canal system, focusing on key stages such as preparation, disinfection, and intracanal obturation (Sarda et al., 2019). The photothermal effect of laser wavelengths damages cell membranes, and it should be noted that gram-negative bacteria are more easily destroyed compared to gram-positive bacteria, even with lower energy levels (Jambagi et al., 2021). These differences in bacterial susceptibility can be attributed to the structural characteristics of the cell membranes. Overall, the use of diode laser in combination with NaOCl irrigation provides effective bactericidal action in endodontic treatments, achieving the goals of preparing and disinfecting the infected canal system. The destruction of bacterial cell membranes through the photothermal effect is an essential mechanism by which laser therapy contributes to successful outcomes in endodontic procedures.

In addition to its bactericidal action, laser has been found to effectively remove the smear layer from the walls of root canals. This is achieved through the high temperature generated by the laser, which causes splitting and cracking of hard tissues, as well as the sealing of the main canal's foramina (Amin et al., 2016; Rajakumaran et al., 2019). It is worth noting that short-range laser does not get absorbed by hard dentinal tissue and does not have an ablating effect on the dentin surface (Alves et al., 2022).

The effect of laser treatment on the outer surface temperature of the root, depending on the thickness of the canal walls, has been the subject of limited research. However, some studies have reported on this aspect and have found that the change in temperature on the outer surface of the root during laser treatment is minimal (Beer et al., 2017).

It is important to acknowledge that this pilot study had limitations, including a small number of clinical cases considered. Despite the limited sample size, the use of laser treatment in cases of destructive chronic periodontitis showed promising results in stimulating the regeneration of periapical bone structure compared to traditional treatment methods. Laser therapy in endodontics is considered a safe alternative for disinfecting root canals with pulpal pathology.

Conclusions

The findings from our radiological study strongly suggest that the conventional protocol for endodontic treatment, with its traditional root canal processing, is insufficient to achieve long-lasting clinical effects. However, the modification of the root canal processing protocol using diode laser, specifically with a wavelength of 980 nm and a laser power of 1 W, demonstrated a significant improvement in canal disinfection and a rapid reduction in destructive foci through the stimulation of osteogenesis.

The potential of diode laser therapy highlights as a valuable addition to the field of endodontics, offering enhanced disinfection capabilities and promoting more efficient healing processes, facilitating better disinfection and stimulating osteogenesis.

Abstract: This research will examine the many kinds of plants and the various diseases that could harm them before developing a technique to detect plant ailments. Farmers should emphasize the diagnosis of plant diseases when planting in the garden. The procedure of identifying plant illnesses takes a long time if the garden space is too large. Arduino cameras were used to communicate with a system as a result of the development of new technologies like the Internet of Things (IoT). IoT-based Smart Farming for Plant Disease Detection's objectives are to explore plant disease detection with an object-oriented methodology, create a system that includes plant disease classification with machine learning techniques and assess the system. The Agile software development process consists of the following steps: planning, designing, developing, testing, releasing, and receiving feedback. The project was created using Python as the programming language, Flask as the Python web framework, MySQL as the database, Jupyter Notebook for creating model classification, and Visual Studio Code as the code editor. Customers will be able to use both the newly developed system and IoT cameras. This method may therefore more accurately boost evaluation efficacy and efficiency.

Introduction

Numerous nations have focused on the agriculture industry as a new kind of technology, especially interested on farming. Southeast Asian country Malaysia is mostly dependent on agriculture to combat poverty and maintain stability. Additionally, as the population increases, the company is under increasing pressure to meet client demand. Due to these two elements, agricultural practices must be productive, efficient and optimized. In Malaysia, IoT-based smart agriculture aims to increase the agricultural industry while also reducing poverty.

Developed technology that addresses planting, irrigation, harvesting and crop health components. Utilizing smart farming while developing IoT-connected equipment, applications, or websites for agriculture. IoT developments might potentially contribute to the development of more advanced agricultural practices. In terms of currently unattainable efficiency, cost and resource savings, automation and data-driven operations, the Internet of Things, like other industries, holds promise for agriculture. These advantages, however, don't contribute anything to agriculture; rather, they treat an entire industry that is struggling with a variety of grave issues. Farmers can now monitor their produce and the environment in real-time thanks to IoT-enabled agriculture. They are incredibly effective, have quick insights, can see problems coming before they happen, and can decide wisely how to prevent them.

IoT solutions for agriculture also include automation, such as demand-based irrigation, fertilization and robot harvesting. Short food supply chains are possible with IoT-based smart agriculture and hydroponic systems and they should be able to feed most people. Food can be cultivated in supermarkets, on the walls and rooftops of buildings, in cargo containers and everyone's convenience at home thanks to inventive closed-cycle agricultural systems. IoT relates to improved operational agility in agriculture. Farmers can respond quickly to any significant changes in the weather, humidity, air quality, or the state of each crop or soil on the field thanks to real-time monitoring and forecasting systems. New technologies support agricultural professionals in their efforts to safeguard crops from extreme weather fluctuations.

Farmers and agricultural professionals must constantly be able to recognize plant diseases. The suggested system's primary goal is to use IoT to find plant diseases. The disease typically starts on the plant's leaves. We have thus included leaf disease detection in the proposed study. Images are a vital source of data and information in the agricultural sciences. In recent years, Rosenblum stated photography has been the only method utilized to reproduce and communicate such as data (Rosenblum, 2020). However, quantitative analysis or quantification of photographic data may be challenging.

Thanks to improvements in computers and microelectronics connected to traditional photography, digital image analysis and image processing technologies enable to circumvent these issues. These technologies support the

enhancement of pictures from the microscopic to the telescopic visual range as well as the understanding of such images. Several image-processing programs have been created especially for agricultural applications. These apps employ devices with cameras or color scanners to enter the images. As computing technology advances regularly, computer-based image processing obviously changes. Specialized imaging systems on the market are not particularly customizable and more significantly, are extremely expensive.

Thus, it is imperative to create a highly efficient approach for identifying symptoms of illness utilizing scientific knowledge and skill. Images of the harvested fruit and vegetable leaves are first collected into datasets. The photos may be captured with a high-resolution mobile phone camera or a standard digital camera. After being picked, the leaves of the fruits and vegetables are image-processed. Wanjale (2017) started to find plant illnesses, a variety of image processing techniques are utilized, such as capture, pre-processing, restoration, segmentation, augmentation, feature extraction and classification. The pre-processing approach converts raw input leaf image datasets into appropriate process datasets format to improve leaf image quality and remove obtrusive areas from the photos.

To properly diagnose leaf disease, image augmentation is utilized to enhance and facilitate the representation of the leaf picture. By flipping, cutting and rotating the original leaf picture collection, more photos are added. As part of the augmentation process, the leaf images are also transformed to RGB via color transformation. The upgraded leaf photos, on the other hand, were developed to preserve a balance between image size and quality in the healthy and unhealthy leaf databases. It is also possible to detect diseases in colored images by using the categorization approach. This paper uses convolutional neural network (CNN) models, a classification technique. Even though some plant leaf diseases may be detected using several current agricultural technologies, no preventative action is offered. A graphical user interface is utilized to develop a system that can identify illnesses and provide a preventative strategy.

Deep Learning Algorithm

A subset of machine learning called deep learning focuses on how people really learn specific sorts of information. These feature learning algorithms construct several layers of representation by constructing simple but non-linear modules that convert the representation at one level into a higher and more abstract one (Lecun et al., 2015). Deep learning has two phases: inferring and training. During the training phase, enormous volumes of data must be classified and matched with their suitable attributes. The algorithm then contrasts and keeps track of those characteristics to make the proper judgements the next time it encounters data of a similar nature. The model organizes discovered data and draws conclusions from previously collected data during the inferring phase.

The technique of utilizing software tools to evaluate data to uncover patterns and consistency in very big datasets is known as data mining. It managed to find patterns in enormous amounts of data by determining the essential principles and qualities. Modern industry and research demand an ever-increasing amount of data,

necessitating the development of increasingly complicated and sophisticated instruments (Han & Kamber, 2000). Among the important data mining techniques that have been created and are now in use include classification, clustering, prediction, association, sequential patterns and regression. Each type of unhealthy plant is classified using a CNN model via an IoT-based smart farming technology.

Convolutional Neural Network

An example of a neural network used for image processing, classification, segmentation and other auto-correlated data processing is the convolutional neural network (CNN). CNN is a cutting-edge approach to adaptive image processing that serves as a link between generic feed-forward neural networks and adaptive filters (Browne & Ghidary, 2003). CNN is built on the premise that it can record or learn significant qualities from an image or video on several levels, much like the human brain can. CNN records the spatial elements of a picture. The connections between and arrangements of the pixels in an image are referred to as spatial characteristics. It facilitates precise item identification and aids in comprehending an object's position and relationship to other things in a picture.

Smart Farming

The IoT has drastically changed how people see agriculture thanks to smart farming. Modern agriculture now relies heavily on data to aid farmers in making critical decisions and smart farming innovations are becoming more and more popular because of better data management (Saiz-Rubio & Rovira-Más, 2020). Precision agriculture reduces overall costs while boosting product quality and quantity, agricultural sustainability and customer experience through expanding farming's connectedness and intelligence. Smart farming facilitates decision-making for effective farm management in their industry. An optimization system is essential to the production output of agricultural operations of all sizes while concentrating on the preservation of properties. Arduino is used in most smart farming projects to provide a concept for smart farming that tremendously benefits farmers.

Comparing System Existing

As an explanation of how each existing system related to and contrasted with the features of the suggested system. These details the capabilities of IoT-based plant disease detection. The findings of the comparisons are shown in Table 1.

The system would be utilized on a web-based and have numerous modules to include in the system, according to a synopsis of the three existing systems and the proposed system. Most of the algorithms classified the illness based on the leaf using classification as a data mining approach. The hardware for all current operating systems is created by taking a leaf picture with camera hardware and integrating it into the system.

Table 1. System's comparison

Features/System	Plant Leaf Diseases Identification using Convolutional Neural Network with Treatment Handling System	Brown Spot Disease Severity Level Detection using Binary- RGB Image Masking	Paddy Disease Detection System Using Image Processing	IoT Based Smart Farming for Plant Disease Detection
System Platform	Web-Based	Web-Based	Web-Based	Web-Based
Login / Registration Administrator login	No	No	No	Yes
Software Development	MATLAB R2019a	-	MATLAB 7.0	Jupyter Notebook, Visual Studio Code
Data Mining Technique	Classification, Clustering	Classification	Classification	Classification
Database	No	No	No	Yes
Live-Chat	No	No	No	Yes
Dashboard	No	No	No	Yes
Type of Disease	Bacteria Disease, Septoria Leaf Spot, Alternaria (Early Blight)	Brown Spot (BS)	Brown Spot Disease, Narrow Brown Spot Disease, Blast Disease	Paddy: Brown Spot, Hispa, Leaf Blast Chillli: Leaf Curl, Leaf Spot, Whitefly, Yellowish
Internet of Things (IoT) hardware	No	No	Yes	Yes

Method

Project development was decided to use the agile modelling methodology. This plan necessitates constant level-by-level growth as well as stakeholder discussions. This lifecycle model started with a variety of techniques to accelerate development to hasten the delivery of new software. Figure 1 below shows the agile paradigm as a project development method.

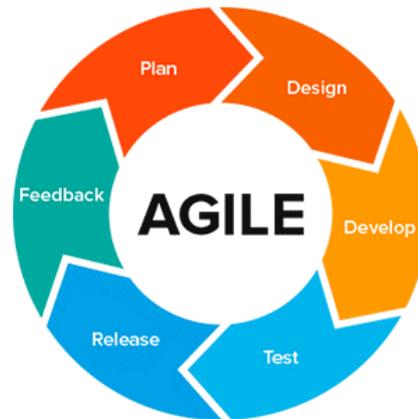

Figure 1. Agile methodology model

Planning Phase

Through this initiative, IoT devices are integrated into the system. The system should include a dashboard for tracking plant disease detection and IoT devices should be able to do so. The plant disease crop should be improved, or its relevant data should be gathered using image processing technology.

Designing Phase

Using Draw.io, an online application that makes it simple to create diagrams, the design process was started. It is a resource that is available for free and has several benefits, such as various trustworthy collaboration capabilities and an approachable design that makes it easier to grasp, especially for beginners.

Developing Phase

Using the code editor Microsoft Visual Studio Code, one may construct web apps. It is a free piece of software that supports several programming languages. The free relational database MySQL satisfies all needs for application development. For a training and testing model that must be utilized with a Jupyter Notebook and the Anaconda environment. A Wi-Fi connection will be made between the IoT hardware and the web system to enable the system to display the camera through the Arduino camera.

Testing Phase

Instead of waiting for development to be finished before testing, new features are introduced as they are made. If all stakeholders are to work together closely during the testing process, questions and responses are crucial. The system should be ready for the following stage if the stakeholders are satisfied.

Release Phase

When the deployment phase begins, end customers will be the ones to use it. During these first stages, keep an eye out for any weaknesses or errors that were overlooked during testing. With enough training, the production and support workers should transfer. The system's designers should make sure it functions properly and instruct users on how to utilize it. During this stage, the system's documentation will be finished and sent to production employees and end users.

Feedback Phase

A feedback phase begins once the system has been made available to end users. This stage will analyse the online system to get user feedback so that it may be improved. At this stage, the engineers learn how the web system will impact the goals.

Results

The results discussed the flow of IoT Based Smart Farming for Plant Disease Detection system, implementation of IoT hardware and retrieve the accuracy of model deep learning from image processing.

System Architecture

System architecture, a kind of software that offers fundamental operations and automation, establishes the structural layout of systems. Figure 2 depicts the system architecture of IoT-Based Smart Farming for Plant Disease Detection.

Main Flowchart

The system design displays the overall flowchart of IoT-Based Smart Farming for Plant Disease Detection. A flowchart is a diagram that shows how information flows through a system. A flowchart with all modules and operations shown is shown in Figure 3.

Main Menu Page

Figure 4 below displays the home interface following a successful login. The system will display the user's name at the top right of this screen. If the user is not yet logged in, the crop disease feature option will not be available.

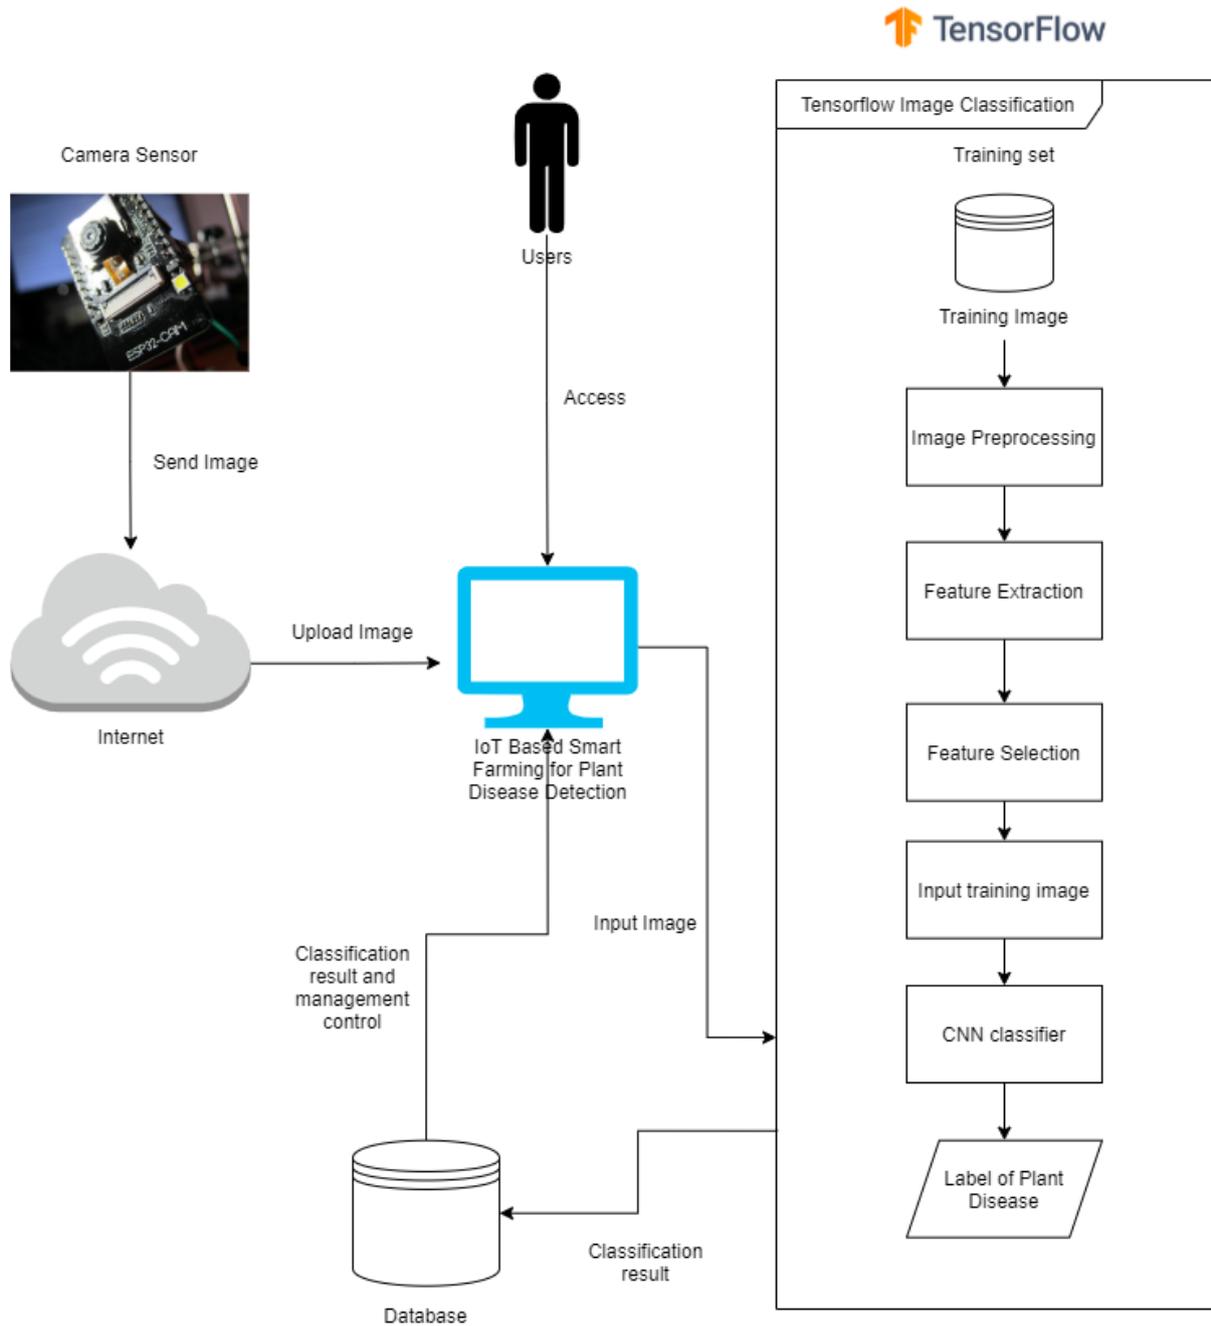

Figure 2. System architecture

Crop Disease Page

The crop disease interface shown in Figure 5 below uses Internet of Things (IoT) technology to allow users to upload or capture pictures to classify various plant diseases. The results will then indicate a plant disease, symptom and disease prevention.

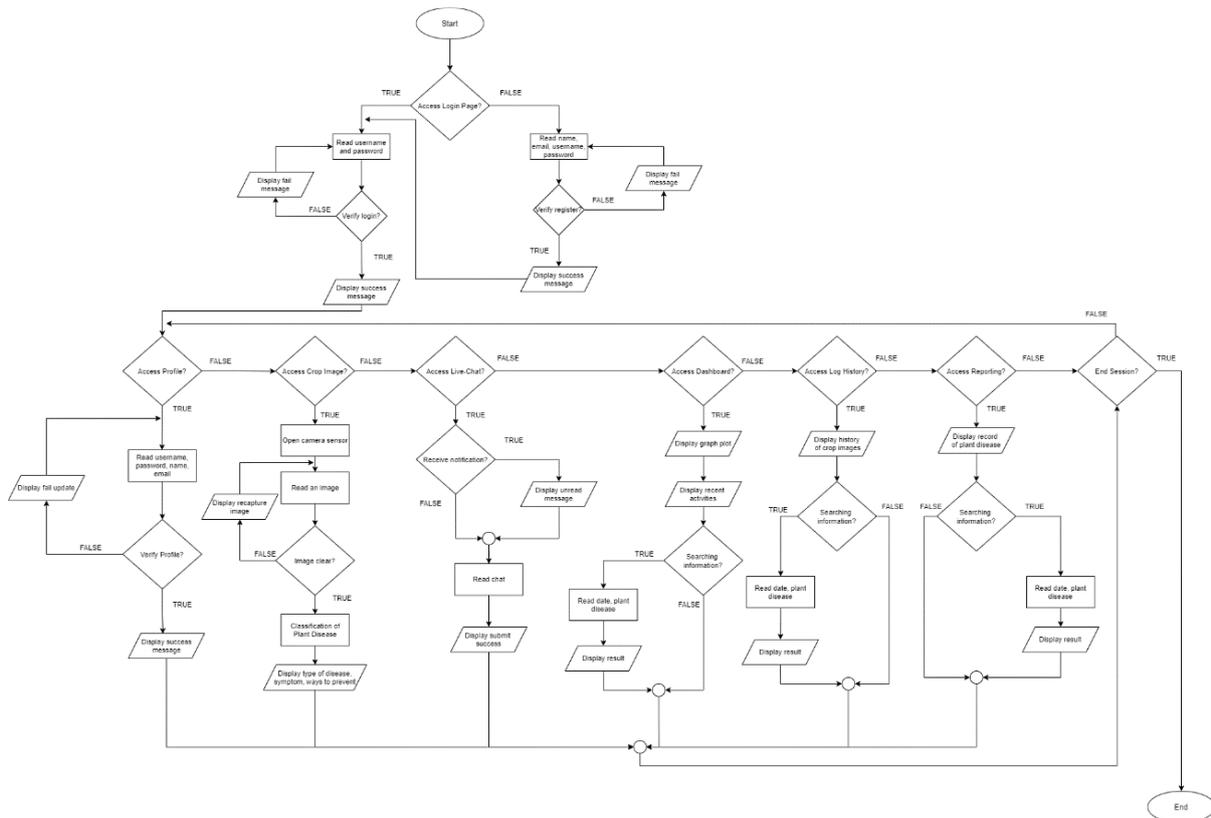

Figure 3. User flowchart

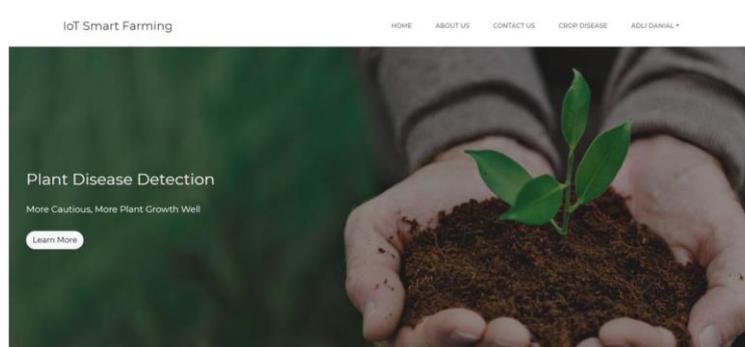

Figure 4. Home page

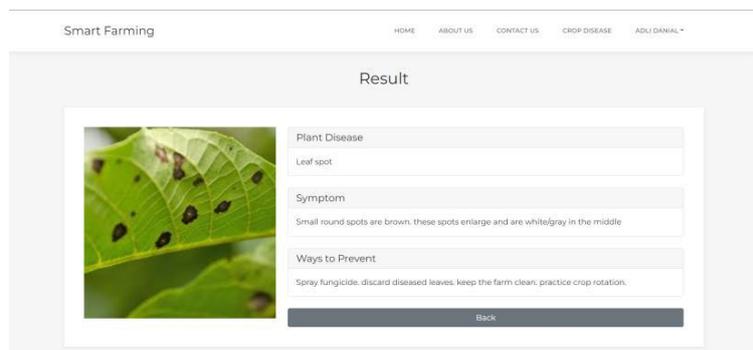

Figure 5. Crop disease page

Accuracy Result

Figure 6 below displays the accuracy prediction output from the CNN model using TensorFlow. Deep learning is used in the processing of image recognition to establish the classification of plant disease. Following model training, the accuracy prediction is 0.60, or 60%.

```
#model = Load_model('../output/kaggle/working/model.h5')
final_loss, final_accuracy = model.evaluate(X_val, Y_val)
print('Final Loss: {}, Final Accuracy: {}'.format(final_loss, final_accuracy))

5/5 [=====] - 1s 156ms/step - loss: 1.5008 - accuracy: 0.6042
Final Loss: 1.5007842779159546, Final Accuracy: 0.6041666865348816
```

Figure 6. Accuracy result

Discussion

Before the development system is approved for distribution or before it goes live online, user acceptability testing is often conducted. Figure 7 depicts the leaf being captured using ESP32-CAM as IoT hardware and Figure 8 depicts the illness's effects as detected by the IoT-based smart farming system for plant disease detection.

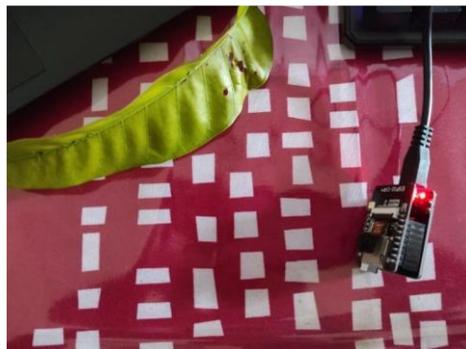

Figure 7. Captured using ESP-32 CAM

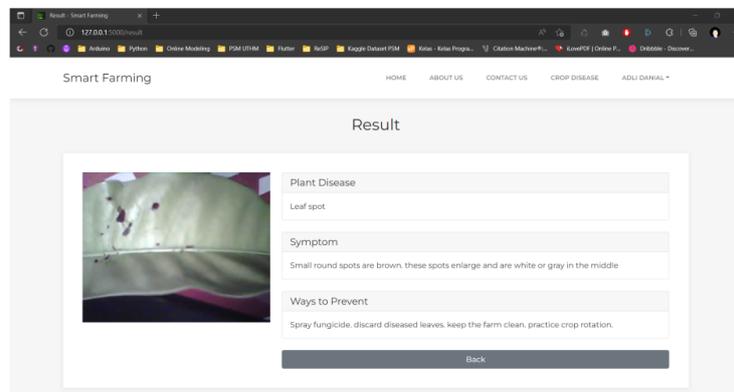

Figure 8. Result of disease

The ESP32-CAM is used in the simulation of this IoT hardware to capture any leaf, identify it using a deep learning model, identify the type of plant illness and display the results in the system. The outcome of the user acceptability testing form based on input from the respondents is shown in Figure 9. According to the findings, most respondents gave the system a rating between 3 and 5 on a scale. The IoT Based Smart Farming for Plant Disease Detection system's user-friendly layout and ability capture this input.

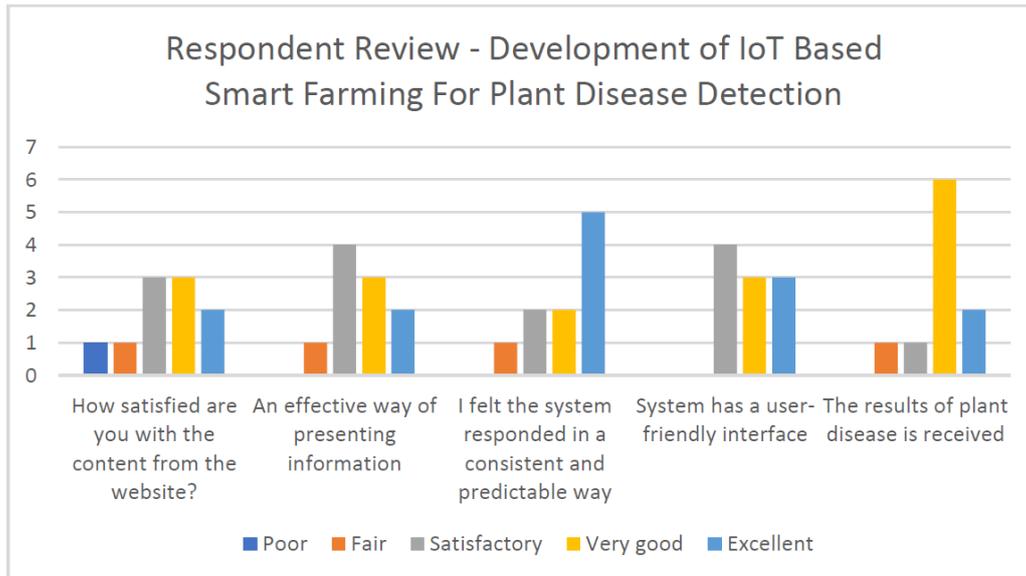

Figure 9. User acceptance testing form result

The IoT Based Smart Farming for Plant Disease Detection's deployment and testing phases have been explored and clarified. It is making sure the system is reliable and simple to use without any difficulties. Additionally, the testing process contains test cases for user acceptability testing and functional testing to gather input from users and enhance the system.

Conclusion

Thanks to modern technology, IoT-based smart farming for plant disease detection may aid farmers in quicker plant disease diagnosis. The benefits of this approach include stressing the pattern that covers disease zones on the leaves and introducing the farmer to plant care techniques based on disease categories. Thanks to new features like live chat, information exchanges about plants are becoming more linked. It will be easier to use and give rapid access to features and actions that are often performed.

Recommendations

It is possible to implement some ideas to enhance the system. The recommendations are training additional

datasets of plant disease photos to increase the deep learning model's accuracy, users are notified by chat-live when a new message is received and based on the specified elements, such as the form, button, header, colour and picture, the system should maintain consistency.

Abstract: A lot of organizations are implementing various advanced technologies as part of their daily operations. A lot of individuals will not be aware of coping up with these advancements, so this will place heavy demands on the IT team responsible for handling these systems. Hence a viable solution to assist the IT team in taking care of these issues is by implementing a "Service Desk System". Many organizations in modern times rely on IT ticketing systems to provide fast and effective customer service to ensure satisfied employees and increased efficiency in the operations of an IT department. A documented agreement is involved in identifying the services required by the customer and the level of service that can be expected of the service provider. This documented agreement is known as an SLA. The purpose of this study is to understand the various components involved in creating a Service desk management system. This project is being built for Protocol Systems. Protocol Systems has a Servicedesk system, but due to many redundant fields, it is become a lot more tedious to use thereby resulting in longer wait times to solve issues. To solve this issue, the project will be set up as a web-based system to curb the installation process. The project will also feature only the essential fields to reduce wait times. Database space is also wasted in the process of having many redundant fields, so having the necessary fields makes data retrieval faster as well. It is also designed to be scalable to accommodate processes that an IT expert would consider as a requirement for the future. This is also a way of collecting information about the IT problems that multiple employees encounter on a day-to-day basis. These problems will then be solved by the IT expert who has the necessary skills to solve these problems thereby allowing the workload to be systematically delegated to the experts responsibly while achieving effective customer service. The system is being designed by using a MERN Stack, a popular web stack that is used abundantly to develop user-friendly web applications while a potential solution is to host the application is MongoDB Realm, which is mostly used for mobile applications but can also be used for PC-based web applications.

Keywords: Servicedesk System, IT, SLA, MERN Stack, MongoDB Realm

Literature

A Servicedesk is a support management service that handles queries of company's internal and external contacts. It provides information on issues that are frequently asked about and aims to successfully resolve customers queries in an efficient manner. The complaint resolution task is automated using a ticket management system that transfers the complaint to the agent responsible for handling the issue (Ameyo Servicedesk, 2023).

There are various Servicedesks available based on business size and its target customers. These are:

- Web Servicedesk
 - Cloud-hosted or SaaS (Software-as-a-service)
 - Companies can rent these solutions to save up on cost.
- On-Premises Servicedesk
 - Company owns and hosts the system.
 - Company has complete control over it and is also responsible for its maintenance.
- Enterprise Servicedesk
 - Advanced features and highest level of customer service to address customer queries at a faster rate.
 - The advanced features also enable the company to improve overall efficiency.
- Open Source Servicedesk
 - No user licenses or permissions required to modify source code.
 - This makes it easier to modify according to the services the company plans to offer.

Servicedesks are very important as you can address employee and customer concerns as early as possible rather than having them wait and leave them dissatisfied. The following point highlight the important aspects of a Servicedesk:

- Customer Satisfaction
 - Issues resolved with quick and minimum effort.
 - FCR - First Contact Resolution
 - Status updates on their complaints.
 - Various modes of contact available to customers.
 - Ticket system generates ticket regardless of platform.
- Agent Productivity
 - Automation of repetitive tasks.
 - Agents can use repository of information available in knowledge base to help customers effectively.
 - Unified interface to enable support executives to maximize service to customer.

- Business Operations
 - Prioritize some actions and meet SLAs to streamline operational activities.
 - Providing easy-to-read details to supervisor in the form of graphs and data points to monitor contact center.
 - Supervisors can make informed decisions based upon data that is generated through the operations taking place.

ServiceDesk systems are generally more effective when ticket management system is integrated into the ServiceDesk application itself. Tickets help enhance customer interactions by providing faster solutions to problems from creation of the ticket to merging them when the problem is similar. The following points highlight the importance of ticketing system for ServiceDesks:

- No Missed Tickets
 - A ticket is created for every customer query so that the agent can attend to every customer using the system.
 - Ensures that the supervisor leaves no interaction unattended and monitor all the queries that are received by the application.
- Scalable Application
 - A smart application that assigns the tasks automatically to the respective agents allows the remaining agents to attend to other high-level tasks that are a part of daily office activities.
 - Thus, it allows for efficient progress in work while contributing to overall business growth and improving customer relations with problems be dealt more effectively.
- Ticket Prioritization
 - A key aspect of an automated ticketing system should be the ability to differentiate between high priority and low priority tasks.
 - This way problems with higher priority can be dealt with more quickly ensuring that the customers receive excellent customer service.

MERN Stack

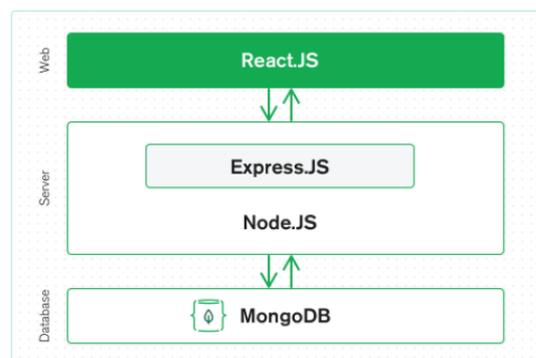

Fig. 1.1 MERN Stack

The MERN architecture is a popular web stack that is used extensively in building websites. It is a 3-tier architecture that is built entirely using JavaScript and JSON. We will be using MERN Stack to build our Servicedesk application but first let us understand what the MERN Stack is. Let us split the 3 components and discuss the MERN Stack (MongoDB, 2023).

Frontend – ReactJS

A JavaScript framework that allows developers to create dynamic client-side applications in HTML. It makes use of components (simple reusable bits of code) that allows one to create sophisticated interfaces, connect to data on the backend server and finally render them as HTML. It is particularly useful for the fact that it can handle stateful and data-driven interfaces with minimum coding.

JSX

For XML/HTML-like text to co-exist with JavaScript code, React uses an XML/HTML-like syntax that extends the ECMAScript.

With the help of JSX, you can write DOM like tree structures (HTML/XML) in the same JavaScript code. Babel transforms the HTML/XML parts into actual JavaScript code (Codecademy, 2023).

JSX allows us to integrate applications with HTML inside of JavaScript unlike the past where we could create webpages by integrating JavaScript inside of HTML.

```
var nav = (  
  <ul id="nav">  
    <li><a href="#">Home</a></li>  
    <li><a href="#">About</a></li>  
    <li><a href="#">Clients</a></li>  
    <li><a href="#">Contact Us</a></li>  
  </ul>  
)  
);
```

Fig. 1.2 JSX Example Code

Virtual DOM

Most JavaScript frameworks perform DOM manipulation and in fact it performs unnecessary operations. Let us consider that an application has a list of 4 items as an example. You only update one item off the list. But most

JavaScript frameworks will rebuild the entire list even though no operations were performed on the other 3 items. This is where Virtual DOM comes into the picture. React has a virtual DOM object for every DOM object. A virtual DOM object is a representation of a DOM object. Manipulating DOM is slower than updating Virtual DOM as the Virtual DOM only updates the copy of the tree and will perform the necessary updates through a process called diffing (React Enlightenment, 2023). This process brings about a major performance boost as React only updates the required parts of the DOM rather than rebuilding the entire DOM. A summary of updating the DOM in React is:

- Update to entire Virtual DOM
- Virtual DOM gets compared to snapshot of the pre-updated virtual DOM. React uses the diff algorithm to figure out the changes made.
- Only the changed objects are updated on the real DOM.
- Site refreshes to process these changes and update the view.

Backend – Express.js and Node.js

The backend features Express.js as a server-side framework which runs inside of a Node.js server. Let us look at some of the features of Node.js that make it a valuable choice for this application:

- Non-blocking I/O.
- Event driven.
- Multiple libraries that allow interfacing with OS, etc.
- Single-threaded

Express.js functions as a great web-framework for Node.js as it has powerful models for handling HTTP requests and responses and URL routing. We use this to make HTTP Requests/GETs/POSTs to connect to functions that enable users to explore the features of the application while these functions access and update data in the MongoDB database based on the user's choice of actions.

Database - MongoDB

Like any other database, it is used to store data that will be used by your application. In simple terms, it works by creation of JSON documents in the React.js frontend and sent to the Express.js server. The data is then processed at the Express.js server and stored into MongoDB. MongoDB offers a cloud solution which is known as MongoDB Atlas. Unlike SQL, it does not have any tables and rows and stores data in a field-value pair format. MongoDB is a NoSQL Database (MongoDB, 2023). The reasons why MongoDB is the preferred choice of database for cloud-based applications is due to:

- Rich Query Language
- High Performance
- Horizontal Scalability

Design And Development Methodologies

Sdlc – Modified Waterfall Model

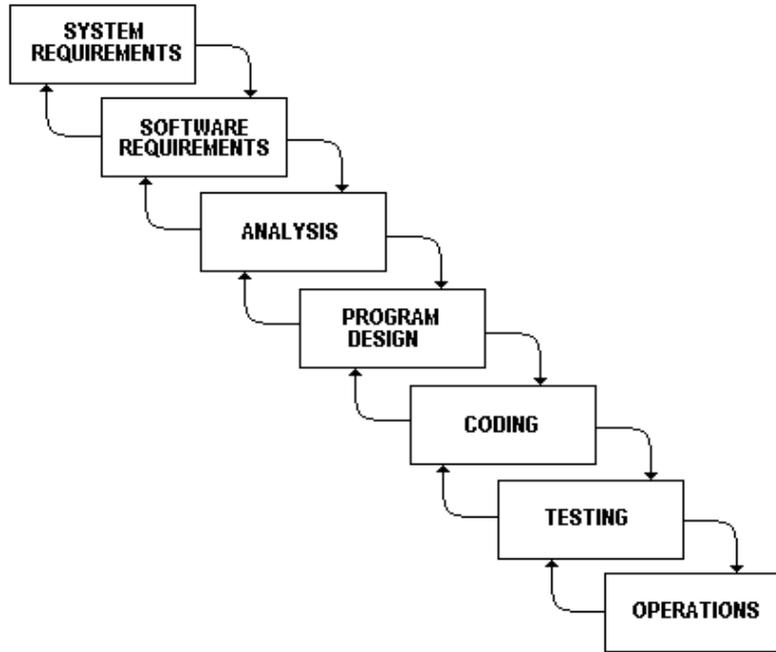

Fig. 2.1 Modified Waterfall Model

For the course of the development of our Servicedesk application, we will be using the modified waterfall model, where we will be gathering requirements and implementing the features in the application. To begin this process, we have developed a CRUD app that will function as a foundation for the application. The initial set of requirements that are a part of the application are to be implemented as part of the CRUD app and feature the Customer, Contact and Employee details. Below is the proposed layout based on the initial set of requirements.

Sample Screen Layout				
Customer Name :	<input type="text"/>	<input type="button" value="Q"/>		
<i>List Down the Customers Below with pagination</i>				
Customer Name	Customer Primary Contact Nar	Customer Phone	Customer Em	Primary Handled

Fig. 2.2 Sample Screen Layout for Customer Module

Design of Application

Backend

As we can see in the backend diagram, there are 4 parts to the backend that we will speak briefly on:

- **Model**
 - This holds the database schema that has been defined based on the requirements provided. It also allows interaction with MongoDB.
- **Controller**
 - Implements functions that processes API URL to retrieve requested data and display the data as well.
- **Router**
 - Receives HTTP requests and forwards request to appropriate controller.
- **Express**
 - Used for building REST APIs in Node.js application.

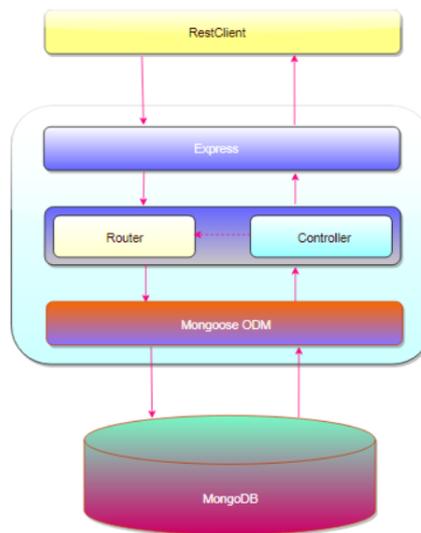

Fig. 2.3 Backend of MERN Stack

Backend – Server Setup

The backend can be setup in 2 possible ways; Either you can use the local database (must install local version of MongoDB on system) or we can connect to database using MongoDB Atlas (cloud-native database). The following setup below is to setup the database locally. For cloud-native database we can skip step 2, but we will have to adjust our backend code to connect to database hosted on MongoDB Atlas.

Open connection to MongoDB. (Should mention “Waiting for connections” at the end)

```

C:\Users\leone>cd backend

C:\Users\leone\backend>"C:\Program Files\MongoDB\Server\4.4\bin\mongo.exe"
MongoDB shell version v4.4.4
connecting to: mongodb://127.0.0.1:27017/?compressors=disabled&gssapiServiceName=mongod
Implicit session: session { "id" : UUID("742409a3-d3d1-4a25-a90e-211ef6d279f4") }
MongoDB server version: 4.4.4

---
The server generated these startup warnings when booting:
  2021-05-04T22:39:03.544+04:00: Access control is not enabled for the database. Read and write access to data and
configuration is unrestricted
  2021-05-04T22:39:03.545+04:00: This server is bound to localhost. Remote systems will be unable to connect to th
is server. Start the server with --bind_ip <address> to specify which IP addresses it should serve responses from, or wi
th --bind_ip_all to bind to all interfaces. If this behavior is desired, start the server with --bind_ip 127.0.0.1 to di
sable this warning
---

  Enable MongoDB's free cloud-based monitoring service, which will then receive and display
metrics about your deployment (disk utilization, CPU, operation statistics, etc).

The monitoring data will be available on a MongoDB website with a unique URL accessible to you
and anyone you share the URL with. MongoDB may use this information to make product
improvements and to suggest MongoDB products and deployment options to you.

To enable free monitoring, run the following command: db.enableFreeMonitoring()
To permanently disable this reminder, run the following command: db.disableFreeMonitoring()
---
>
    
```

Fig. 2.5 Database connection

Use Postman to test API

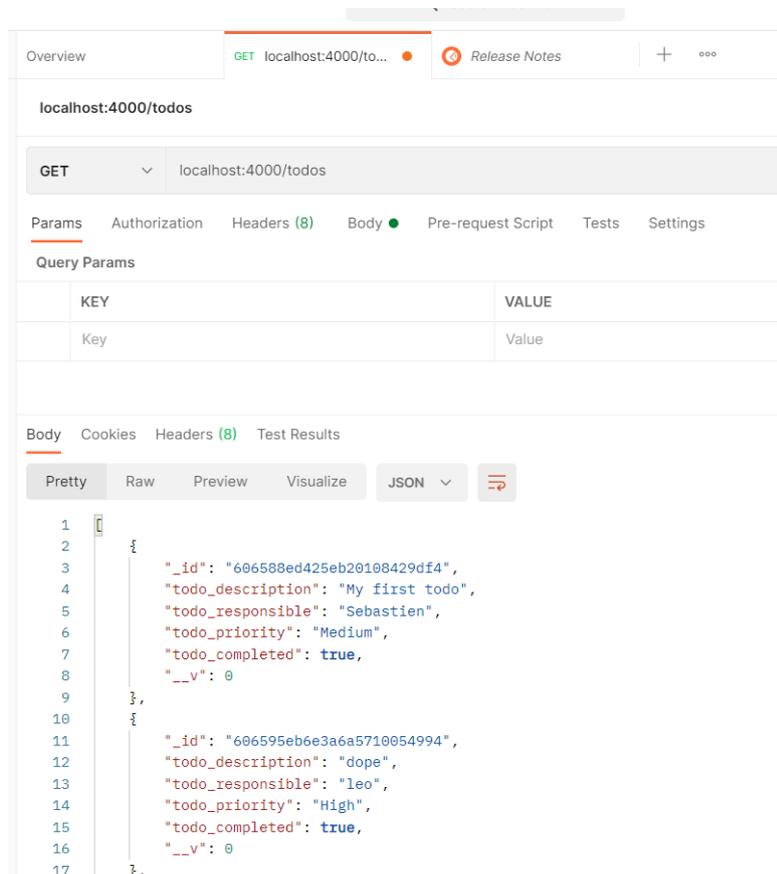

Fig. 2.6 API testing using Postman

Frontend

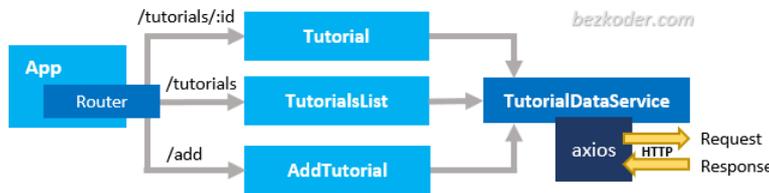

Fig. 2.7 Frontend of MERN Stack

The frontend has 3 parts to it that we will speak briefly on:

Axios

Library that enables us to make HTTP requests to external resources.

Components

These are small and independent bits of code. The advantage of having components in React is the fact that they are reusable and reduces redundant coding in the application.

App

This serves as the view for the user of the application. App is often a web browser that has a GUI for the user to interact and make use of the features available to the user.

CRUD App

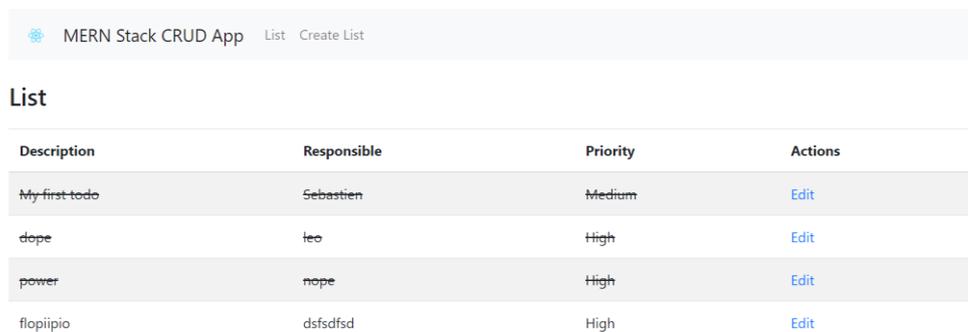

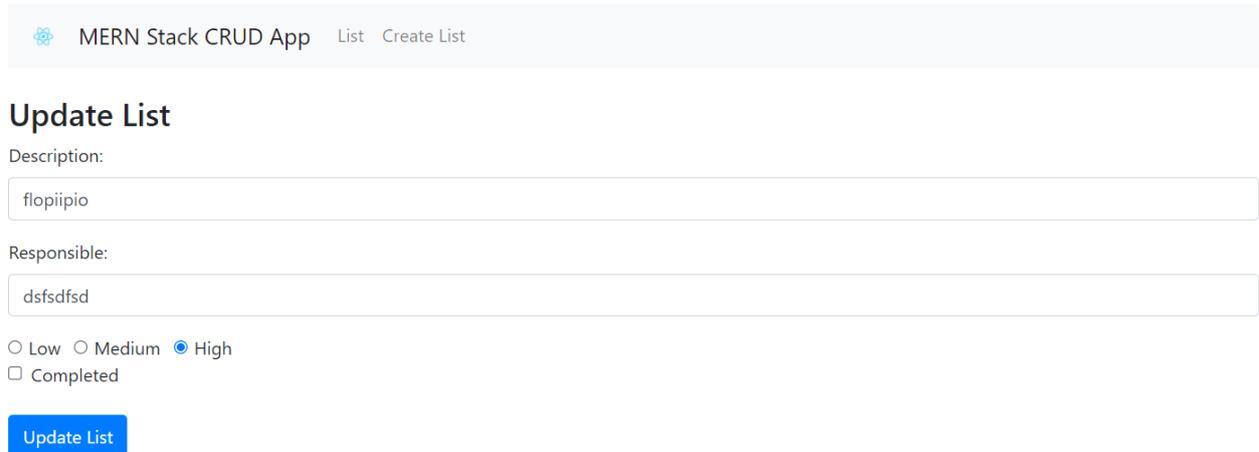

Fig. 2.8 CRUD app front page

Figure 5.8 above displays the CRUD app that I have created to work upon and implement the modules that will be assigned to me in the user requirements. CRUD is an acronym for Create, Read, Update and Delete. Using these 4 functions, I will implement the modules in the Servicedesk application to make it user-friendly while also improvising on the GUI. Figure 5.9 below depicts one of the functions which is Update. When we click on Edit, we can update an entry and once its completed, we can click the completed checkbox and it will strike the item on the list. This is like a scenario where you successfully resolve a client’s problem and click on completed to close the ticket.

Technologies Used

There are various technologies used for software development and a few of these technologies were used for development of the Servicedesk application. The following categories below will highlight the significant technologies that I have explored in brief:

Frameworks for Development

Frameworks generally refers to a platform used for application development. Frameworks are generally used for Full Stack development of applications. Frameworks provide the necessary tools to code and successfully build the application that caters to your requirements or the customer's requirements. Through research ,3 frameworks were explored, that could potentially be used for the Servicedesk application. The 3 frameworks are .NET Framework, MEAN and MERN. From the choice of 3 frameworks, shortlisted, 2 frameworks to build a CRUD app and test it out. Since MEAN and MERN are similar, after research and comparison of the 2 frameworks (FreeCodeCamp, 2023). MERN was the better choice for the Servicedesk application because of the component aspect of ReactJS. Components are small reusable bits of code that can be used for various functionalities. Hence, I chose to develop a CRUD app using MERN. Having built 2 separate CRUD apps using both ASP .NET with SQL as database and MERN stack, MERN was the best option to develop the Servicedesk application. The following are the reasons as to why MERN for the Servicedesk application is more effective:

- Since it is a cloud-based application, MERN is potentially better than ASP .NET due to MongoDB being the database for MERN.
- All the components MERN Stack comprises of, requires knowledge only 1 language and that is JavaScript. ASP .NET requires knowledge of both C# and JavaScript which makes it easier to work with the syntax for coding in MERN.
- Although ASP .NET can be used for developing the Servicedesk application, MERN is

prominently used in the market for web application development in the current market hence increasing the overall marketability of the product.

Online IDE

Any online IDE is essential for any developer who wants to run their code in an environment that is external to the developer's own PC. An online IDE is generally used to develop any programs without the need to install any software. To collaborate team member who is responsible to build separate modules as well, we decided to explore some of the online IDE's available and build our CRUD apps on them. We decided to use 3 different online IDE's; Replit, CodeSandbox and StackBlitz. An online IDE is a potential solution collaborating and building the app in real time so that it becomes easier to build and connect the modules together to build the Servicedesk application in a more efficient manner. Although there are very few online IDEs that support ReactJS application development. Replit allows you to code the app from scratch while allowing you to import and download any dependencies that you might require.

Unfortunately, due to limitations in the memory size, the CRUD app was not fully functional on Replit. CodeSandbox and StackBlitz had storage issues as it only allowed a select amount files to be uploaded on the IDE thereby limiting the ability to build the CRUD app on the online IDEs. These limitations were the result of a limited free plan that we had used to test the development of our application. The paid plan offers more storage and memory to work with, hence making them great online IDEs provided you pay the subscription fees. To fix this issue, we had no choice but to collaborate through online calling platforms such as Zoom and Google Meet and develop modules locally.

Web Hosting

The penultimate step in the process of successfully delivering the application to the customers is hosting the website and testing the application itself. Web hosting is crucial to any developer who wats to publish their application and it involves a cost as the website will need resources assigned to it so that it can be allocated space and published on the web server. We found a collaborative solution that would allow us to host our application and test it out. The solution we came across is MongoDB Realm (MongoDB, 2023); this is an excellent solution to host small applications and test your application on a generous free plan. MongoDB Realm allows you to build an application with a serverless backend. An added advantage is that it allows you to even host your application and provides a domain so that your application can be used in public.

But there are limitations to MongoDB Realm, and this is because it was built for hosting mobile applications rather than PC based web applications. It started to support PC based web applications from 2018 onwards, so support is limited as far a large-scale application is concerned. Nevertheless, it is a potential solution for large scale applications in the upcoming years, hence we chose this platform to host our application.

Tasks Accomplished

The following points below outline the main tasks completed through project and as well as other crucial tasks that are a part of any office environment:

- Research various Servicedesks such as:
 - ManageEngine
 - ZOHO Desk
 - Freshdesk
 - Ameyo
- Research on different frameworks and learn about them. The following are the frameworks have been researched upon:
 - MERN Stack
 - MEAN Stack
 - ASP .Net with SQL
- Development of a basic CRUD app to understand CRUD functions.
- Work using online IDEs to test out the app in environments external to the local PC.
- Online integration of CRUD App onto MongoDB Realm.
- Fully understand requirements provided and plan out activities that will help to design and implement the requirements as part of the software to provide the solutions in accordance with the specified requirements.
- Successful development of Employee Master module.
- Successful completion of tasks before the given deadline.
- Gain real-time knowledge of various problems and solve them in an effective manner as part of a work-based environment.

Results and Discussion

Fig. 5.1 Employee Master Front Page

Using the technologies, I experimented with and knowledge I had attained, I built a simple webpage for the Employees Master module. It follows the same CRUD principle that has been used in CRUD app. The development of this module took slightly longer since the backend and frontend require extensive code changes compared to the CRUD app. Figure 5.1 displays the list of employees that are already entered into the database. If one was to add a new record, then they can just click on New Employee Record, and this will redirect you to a new window as shown in Figure 5.2. The Edit at the side of each record will redirect you to a new window as shown in Figure 5.3 and allow you to update the Employee Details with the necessary changes. Contact Master has been developed as well in a similar manner.

First Name:

Last Name:

Designation:

Mobile Number:

Email:

Visa Expiry Date:

Salary (in DHS):

[Create List](#)

Fig. 5.2 Employee Master Create Function

Figure 5.2 displays the empty fields that you can enter data into. Once you have successfully entered all the necessary details, you can click on *Create List*, and it will add the record to the table. To view the list, you can click on *Employee List*, and this will redirect you to the window as shown in Figure 5.1.

Figure 5.3 displays the fields with the data you can modify (You cannot modify ID Number as it has no function assigned to and is meant to only be auto-incremented every time you enter a new record). Once you have successfully modified the data and made the necessary changes, you can click on *Update List* (The button is like *Create List* and is not displayed as this is the maximum size of the screenshot), and it will modify and display the record on the table. To view the list, you can click on *Employee List*, and this will redirect you to the window as shown in Figure 5.1.

Conclusion

The role of a Software Developer is to gather requirements and design and implement solutions as per the specified requirements. Due to this, it was possible to design and implement modules that were specified in the requirements. It is required to communicate and work effectively with team members while attaining knowledge from technical supervisor on various aspects that were a part of the development process. While teamwork and gaining knowledge are essential, improving personal skillset and continuously learning about the project assigned, is a major factor in improving resources as an individual and a developer. This experience has enhanced overall strengths and minimize weaknesses while also facilitated being more confident in a workplace environment. Overall, this experience will help to prepare for the future challenges of any organization.

- Different frameworks that are used in the field of software development.
- Current and potential technologies that can be used to develop software products in a more effective and efficient manner.
- Further improvement in problem solving skills and communication skills.

Acknowledgements

I would like to congratulate all teams members who have put extensive efforts in design and development of the enterprise system.

Abstract: Climate change poses enormous economic and political hazards to the global economy. Climate FinTech has become an essential component in digital transformation as the world has realized the urgency of climate change in protecting the environment. Many financial and non-financial organizations are increasingly partnering with FinTech firms to create FinTech initiatives that benefit people and the environment. The growing number of climate FinTech companies has helped to facilitate and expedite the global financial sector's transition toward a more sustainable future and greener world. The main objective of this conceptual paper is to review the past literature to discuss the issues concerning climate FinTech including the challenges and key opportunities for climate FinTech to contribute to sustainable development. The study's findings suggest that climate FinTech is essential in helping businesses migrate to more sustainable business models and more resilient to climate risks that will better integrate circular economy practices and a greener world.

Citation: Shamsudin, S.M., Mohamad, M. & Syed Mustapha Nazri, S.N.F. (2023). Exploring the Intersection of Climate, Finance, and Digital Technology: A Conceptual Review of Climate FinTech, In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2519-2524), Cappadocia, Turkiye. ISTES Organization.

Introduction

The climate is a large-scale, complicated process representing the average of several decades of weather occurrences, including off-planet factors, ocean, atmosphere, land, and biological interactions (Rivera-Collazo,

2022). Climate change is a global issue involving many dimensions, including economic, political, financial, and technological (D'Orazio & Thole, 2022; Tamasiga, Onyeaka & Ouassou, 2022). Climate change will affect the earth's temperature and bring negative impacts such as frequent severe snowstorms, melting ice, or disrupting the balance of the oceans. Thus, small changes in the earth's temperature could have a significant effect. Climate change has started since the industrial revolution as human activity has caused global temperature and weather changes. Climate change is often associated with the emissions of greenhouse gases such as carbon dioxide, which can increase the average global temperature (Pee & Pan, 2022). Climate change and environmental concerns are causing worry among many banks, financial regulators, and finance ministries as the traditional ways do not always consider the environment's health. As a result, we need practical steps to limit susceptibility to the consequences of climate change.

Climate FinTech is the convergence between finance, sustainability, and technology. Climate FinTech, also known as Sustainable FinTech or Green FinTech, is a digital financial technology that promotes carbon reduction. Previously, the term Climate FinTech was not widely known, but today many countries have begun to take numerous initiatives to support the various activities in their implementation (Murinde, Rizopoulos & Zachariadis, 2022). Climate and financial technology collide when both sectors have seen massive growth and increased demand for climate action and accountability across financial services from customers, employees, corporations, and investors (Chen et al., 2023).

Climate FinTech is critical to attaining environmental sustainability by delivering digital technologies, applications, and platforms that aid organizations and individuals in spending, saving, and investing in environmentally beneficial ways. The FinTech business is a greener option for the traditional financial industry and may increase financial institution sustainability by promoting green financing (Tamasiga, Onyeaka & Ouassou, 2022; Chen, Teng & Chen, 2022). Many climate FinTech business models are emerging nationally and internationally due to supportive policies and government initiatives. In a well-structured digital finance ecosystem, initiatives in traditional finance could be directed toward green digital finance (Coskun & Unalmis, 2022). By connecting banks, insurers, financial institutions, big tech firms, technology providers, regulators, and consumers, digital technologies and financial product innovations can help overcome climate finance challenges.

Literature Review

The public awareness of the global warming effect has caused many companies to adopt climate-positive operations. People's interest has increased to see the latest innovation in the financial and non-financial sectors that can create a greener world. The invention of climate technology will lead to more scalability and cost-effectiveness. The development of technologies through online platforms and the internet has enriched financial data and created alternatives to financial services for everyone (Murinde et al., 2023). The importance of sustainable finance and digital transformation has begun to be recognized worldwide. Concerns about the

environment have spurred various new trends in technology and financial management, with FinTech developing as a rival to established financial institutions. Chen et al. (2023) suggest that the efficiency of traditional financial services has improved by using FinTech. Climate FinTech is an essential intermediary in financial services, mobilizing resources and changing behavior. As a result, collaboration and partnership between fintech startups and financial institutions have grown and have become the future of financial services.

Climate FinTech solutions are digital technologies, applications, and platforms that help organizations and individuals save, spend, and invest in ecologically responsible ways. Jiang & Ma (2019) supported the positive effect of mitigating financial development. The recent technological advancement allows FinTech firms to offer various solutions to enable people to access financial services. FinTech gives people and businesses access to traditional financial services in novel ways previously unavailable in conventional economic methods. Customers, for example, may utilize mobile bank apps to examine their balance, transfer payments, or deposit a check online without visiting the bank in the new revolutionary digital banking environment. FinTech is already tapping into the customers' demand for greener products. Therefore companies should continue to invest in green projects to increase their competitive value in the industry.

The climate FinTech industry has enormous potential as it covers many aspects such as green payment, digital payments, investments, and green regtech to enhance the regulatory processes of digital data analytics. FinTech is one of the most promising breakthroughs to address unfairness, poverty, and financial services inaccessible (Banna et al., 2022). Climate FinTech companies and numerous organizations have emerged globally to reshape essential financial system functions that can tackle environmental issues. Climate FinTech helps customers make more conscious shopping decisions, verifying carbon credit quality across blockchains. The increased awareness among investors has changed their attitude toward climate-related financial risk. Investments are shifted towards greener assets and more climate-focused portfolios. Additionally, insurance companies can better analyze weather perils and underwrite climate risks better while assisting regulators in measuring missions from the largest corporations.

These digital innovations, applications, and platforms are critical intermediaries between stakeholders interested in advancing decarbonization solutions. Companies also can protect themselves against climate risks that can disrupt business operations. Companies are actively involved in climate FinTech projects because it will provide businesses with better tools for monitoring, measuring, mitigating their environmental impact, and minimizing losses. Digital technologies will drive capital, improve data analysis for greenhouse gas reduction projects, and maximize innovation for increased productivity, efficiency, and customer experience. Due to consumers' growing reliance on digital financial services, there has been an increase in partnership and collaboration between tech firms and traditional financial and non-financial institutions. Those who refuse to adapt face falling behind in today's market.

Climate-related risks can bring destabilizing effects on the global financial system. As one of the most regulated industries in the world, the financial sector needs to operate within the regulatory framework to safeguard

people's money and investment (Murinde, Rizopoulos & Zachariadis, 2022; Tok & Heng, 2022). It is challenging to comply with the increasing complexity and demand of the financial system, which will finally become a heavy burden. The FinTech industry is constantly changing, and regulatory bodies and policymakers are becoming more concerned about data privacy and working to keep up with the various risk management strategies. Therefore, the augmented in the core banking system toward digitalization can bring risks and opportunities.

Digital financial services will risk financial services and challenge financial stability. The systematic risk will rise with the growth of FinTech financial services. According to Banna et al. (2022), technological transformation is vital to promote a healthy financial stability system and reduce risk-taking behavior. However, the potential for fraudulent operations and cybercrime will also increase as technology advances. Cyberattacks, such as computer scams and vulnerabilities, often cause significant losses. Additionally, Murinde et al. (2022) argued that, even though the banking industry plays a pivotal role in the progress of society as it signals economic and financial strength, sometimes it is a challenge for companies to maintain transparency and traceability of technological innovations. As a result, collaboration among governments, regulators, and technology businesses will drive tremendous innovation and hasten sustainability adoption in everyday life.

Climate FinTech: The Way Forward

Climate FinTech concentrates on the mixture of finance, climate & digital tech (Climate Fintech, n.d.). It uses digital finance options to encourage decarbonization and work as financial intermediaries between those chasing that purpose (Mulwa, 2022). Though Climate FinTech is still in its infancy, interest in the bond between climate change & money is growing. For instance, the University of Cambridge will open a new center for finance & sustainability in February 2021 (Clancy, 2022). Future research into the interrelationship of climate, money & digital technology could extend in various ways. Researchers could ask questions about the ability of mobile & digital tech to modify climate finances, review innovative & untested solutions for climate change and business models, along with analyzing the role of financial intermediaries & pathways regarding decarbonization plans. Additionally, they could enquire into the regulation & legislation elements of Climate FinTech and consider possible impediments and struggles related to implementation.

Further research into this subject matter might assist in speeding up the move to a low-carbon, sustainable future. Exploration into the potentials of digital tech to upgrade climate risk assessment & management could take place, introducing novel methods for data collection, analysis & visualization - which might improve accuracy - along with examining insurtech & other FinTech inventions that can help with access & affordability when it comes to climate risk insurance. Other areas may include developing new Climate Fintech business models, analyzing the job lawmakers and regulators have in helping its development and appreciating ethical and social issues that come with this technology, as propounded by Akhtar&Nosheen (2022) and Yi et al. (2020).

Conclusion

Climate FinTech has entered the mainstream and becomes the new way to pursue decarbonization by nurturing an emerging digital ecosystem of climate capital catalysts. Climate Fintech has both downstream and upstream benefits, as it improves the environment, people's daily lives, and the actions of the largest financial institutions. Fintech-driven innovations have the potential to reshape the financial system to meet the demands of sustainable development better. Climate FinTech provides consumers with energy and banking infrastructure that can improve their quality of life. At the same time, companies will be incentivized to run their operations while considering the environmental impact. Financial product innovation and deployment are critical components of capital mobilization for decarbonization. Slowing down decarbonization will expedite the energy transition toward a sustainable future. A sustainable future can only be built on a financial system that allows for the rapid growth of crucial industries to green practices while accelerating the innovation of new market makers defining game-changing business models.

A Scalable Healthcare Data Science Framework Based on Service-Oriented Architecture

Veska Gancheva

Technical University of Sofia, Bulgaria,  <https://orcid.org/0000-0001-6334-5573>

Ivaylo Georgiev

Bulgarian Academy of Sciences, Stephan Angeloff Institute of Microbiology, Bulgaria

Abstract: The aim of the research presented in this paper is to propose a conceptual model and architecture of a service-oriented scalable framework, ensuring the implementation and verification of methods and algorithms for the integration, management, analysis, and visualization of biomedical data and the implementation of scientific research for the needs of precision medicine. The system architecture for big biomedical data analytics and discovering useful knowledge from data consists of the following components: biomedical data sources, data storage, data integration and preprocessing, real-time data flow, stream processing, analytical data storage, data modeling and analysis, and results visualization. A feed-forward artificial neural network is designed for data analysis, and during the training process, the input data is divided into training data and test data. The training error and its distribution over the weights of the neurons in the network are determined. A reduced set of statistical records related to cardiovascular disease analysis has been used as experimental data. The original database contains 76 attributes, and 14 of them have been used for the study. In addition, the data is split in a ratio of 0.8 to 0.2. The first 80% of the data was used to train the neural network and the remaining 20% to test the trained network. The calculated accuracy increases with increasing epochs and is higher for the training data and lower for the validation test data. Thus, the trained model can be saved, and loaded on another system, as well as available for review of the weight values. The trained model is applied in the system to calculate new input parameters that were not used either in training or validation.

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 2525-2536), Cappadocia, Turkiye. ISTES Organization.

Introduction

A significant amount of heterogeneous data has accumulated as a result of the development of new biomedical technologies that produce biomedical data, including genomics, medical generation - sequencers that produce

genetic data, and imaging tools such as computed tomography (CT) imaging, nuclear magnetic resonance imaging (MRI), multilayer microscopic imaging in cell analysis, and more. Due to the quick development of high-throughput sequencing studies, we have seen an explosion in the amount of bioinformatics data that is currently available over the past ten years. Clinical reports, genetic sequences, gene expression profiles, biomedical literature reports, medical imaging, and sensor data are all produced in unprecedented quantities every day.

Large amounts of biomedical data are gathered and made available to the medical research community with the development of new technologies in the medical sector (Raghupathi, W., Raghupathi, V., 2014). However, one of the most fascinating and difficult tasks for medical professionals is making an accurate prediction of a disease's course. Medical researchers frequently use artificial intelligence techniques because they enable the discovery and identification of models of complicated datasets and interactions between them, successfully predicting future outcomes of a disease type. These changes present researchers and clinicians with three main challenges: scalability, security, and interoperability (Bahmani, A., Alavi, A., Buerger, T. et al. 2021).

Utilizing modern techniques to derive meaning from massive amounts of data has the potential to lead to meaningful change in clinical practice, from population screening to electronic health record mining to individualized therapy and intelligent medication creation (Hulsen, et al, 2019), (Avila K, Sanmartin P, Jabba D, Jimeno M., 2017). The requirement for standardized data content, structure, and clinical criteria as well as a greater demand for collaborative networks with knowledge exchange are the main issues. Many existing healthcare information systems are composed of a number of heterogeneous systems and face the important problem of system scalability (Yang TH, Sun YS, Lai F., 2011). The use of emerging data management approaches along with open source technologies such as Hadoop can be used to create integrated data lakes to store large data sets in real time (McPadden J. et al, 2018).

Precision medicine has rapidly expanded as a result of the development of new tools and technology for Big Data analysis and visualization (Ow, G. S. and Kuznetsov, V. A., 2016). According to precision medicine, disease diagnosis, medical decisions, treatment, and therapy should be personalized to the unique characteristics of each patient, particularly based on genetic testing of the patient in question (Ginsburg G. S. and Phillips K. A., 2018). Large and comprehensive databases of genomic, transcriptomics, proteomics, or metabolomics variables, as well as conventional clinical patient characteristics and treatment records, have emerged at an increasingly rapid rate in the era of big data and with the development of electronic healthcare records (Panahiazar M., Taslimitehrani V., Jadhav A. and J. Pathak, 2014).

However, when used directly in a clinical setting for accurate diagnostic and illness outcome prediction, such data are frequently extremely heterogeneous, high dimensional, noisy, and difficult to understand (Viceconti M., Hunter P. and Hose R., 2015). Additionally, the data quality is frequently constrained by a small sample size, flawed technology, variations in clinical trials, a variety of patient groups, and the design of the healthcare system. Patient quality of life and health care outcomes can be improved with the implementation of Internet of

Medical Things as healthcare professionals can monitor conditions; have access to electronic medical records. Remote monitoring and consultations lead to a reduction in frequent hospitalizations (Balasubramanian V, Jolfaei A. 2020).

The study discussed in this paper is a part of a project that provides a scientific framework for intelligent management and analysis of big biomedical data streams in a way that supports both precision medicine and biomedical research. The main benefit is the automatic development of hypotheses and possibilities for decisions, as well as validation and verification using a biomedical data set and scientific competence. The objective is to develop an integrated open technology platform for intelligent solutions for multidimensional large-scale biomedical data analysis based on cutting-edge and successful techniques, tools, and algorithms for discovering, integrating, storing, and analysing biomedical data, as well as for knowledge discovery and decision-making for the needs of medicine. The purpose of the research is to propose scalable framework based on service-oriented architecture for integration, management, analysis and visualization of big biomedical data streams. The goal is to offer an integrated, service-based, scalable workflow development environment consisting of a set of software tools for implementing methods and algorithms for realizing scientific research in the field of medicine and bioinformatics.

Method

Scalable Framework Architecture for Big Biomedical Data Analytics

The architecture consists of modules and provides the necessary flexibility and interoperability of the systems, tools and services that are provided to the users of the platform in order to facilitate a secure and transparent sharing of data and functionality. The modular architecture is service-based and provides the ability to efficiently integrate several software tools that are developed using multiple technologies and tools. Figure 1 illustrates the framework architecture, and the following paragraphs provide a brief overview of the components.

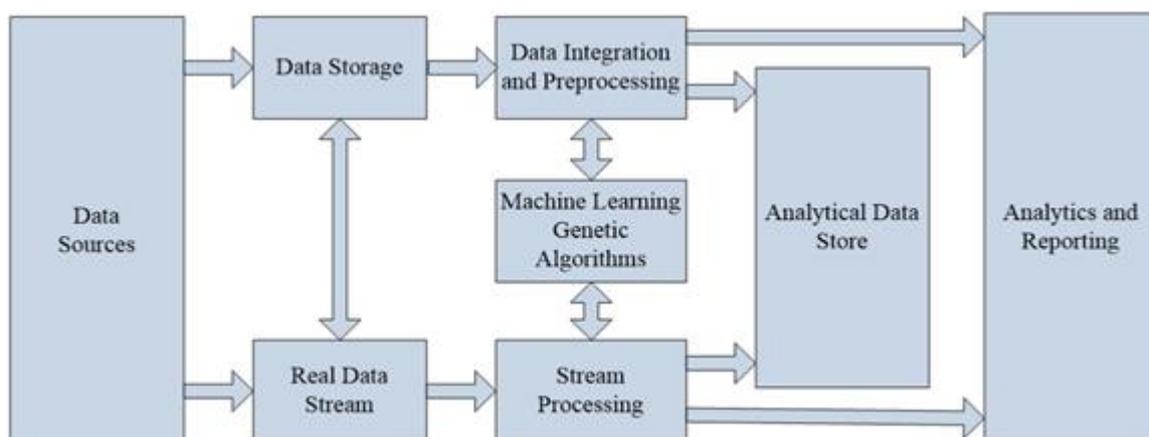

Figure 1. Architecture of a scalable framework for big biomedical data analysis

The system architecture for big biomedical data analytics and discovering useful knowledge from data consists of the following components: biomedical data sources, data storage, data integration and preprocessing, real-time data flow, stream processing, analytical data storage, data modeling and analysis, and results visualization. The technologies of streaming and parallel processing are applied. The research data warehouse has the capability to update multiple data for analysis and visualization. Data sources represent different sets of biological or medical data related to patients: digital records that include demographic data, medical history, laboratory test results, clinical data, genetic data, environmental factors, individual lifestyle parameters, etc. Data sets are usually distributed in large files in various formats. Real-time data streaming technology enables the collection and processing of data from multiple sources in real-time to extract insights. As a result, decisions can be made more quickly and with greater knowledge because data can be analyzed as soon as it is generated.

Large heterogeneous data sets that are represented in various formats, such as relational, NoSQL, and flat files, can be managed quickly with the aid of searching and integration services. The integration system is made up of services for integrating data in various formats and from multiple sources, translating a general request into a request in a particular language for each local database according to its nature. The prevalence of vast, varied, and complicated data sets in the public databases makes the need for scalable data integration systems for modern biology irrefutable.

Software tools for biological sequence alignment, multiple sequence alignment, feature extraction, and data set reduction are all included in data preprocessing services. Data management services include data discovery engines, data visualization tools, and software for pattern analysis. The data discovery engine is made up of modules that may process data in a variety of ways, including classification, clustering, genetic algorithms, and prediction. To avoid the complexity of important data sources, the query engine enables the establishment of data services. Servers for database/data warehouses are in charge of managing the required data. All produced patterns are stored in the knowledge repository. A pattern is produced as a result of the big data analytics process and is saved in the pattern repository. In particular, for evaluating the interest of the findings models or addressing demand, the knowledge base is helpful throughout the entire process of knowledge discovery from data.

The framework enables interoperability between different applications and sources based on standard interfaces, data sharing and information exchange. Each service is independent and includes business logic and data associated with it. Services are distributed, connected to others, and together form automated business logic. The solution consists of modules for accessing different types of data from different data sources, integration, data pre-processing, data analysis, knowledge interpretation and visualization of results. The proposed framework allows scientists an easy, fast and flexible approach to data processing. They can select the services they wish to be performed, use available software tools and database datasets, or enter their own data to be processed.

The framework architecture follows the processing pipeline for discovering useful knowledge from a collection of data and covers the following: data preparation, cleansing and selection; data processing and analyses, and

knowledge representation and visualization. The adaptability of the software architecture is accomplished by scalable experimental framework supporting various models and methods applied and scalability. The framework architecture includes knowledge representation and visualization in addition to data preparation, cleansing, and selection. Scalable experimental frameworks that support diverse models and application-specific methodologies enable adaptability of the framework architecture.

Software Environments and Tools of Framework for Big Biomedical Data Analytics

Software environments and tools of framework for big biomedical data analytics are presented in Figure 2. *Data stream processing and workflows* environment is based on Apache Spark. Apache Spark is a cloud-based open source framework supporting programming languages such as Java, Scala, SQL, Python, and R. The University of California created it to function in a clustered big data environment where two or more Spark applications might operate concurrently as distinct and independent processes. Apache Spark also comes with extra research tools like MLlib, which supports deep learning libraries based on deep learning pipeline structures and machine learning libraries.

Figure 2. Software environments and tools of framework for big biomedical data analytics

Biomedical data integration is based on the software integration tool Talend Open Studio. Talend Open Studio is an open source software for processing big data using a graphical user interface. Moreover, its functional architecture allows data analysis and review of analysis results and query when working with: databases based

on Oracle, SQL Server, Postgre SQL; big data using Hive, Amazon-Redshift. In addition, Talend Open Studio enables data access and processing by connecting the Apache Hadoop big data platform. This empowers the user to process big data on a Hadoop cluster using big data jobs designed with Talend. Talend Open Studio have been used to implement a workflow model through which a method for integrating biomedical big data streams was validated. Rules used to execute the modules were developed based on the workflow efficiency requirements for biomedical purposes. The studies are described in (Vetova, S., Biomedical Data Integration and Innovations Concept, 2021).

Orange Data Mining is a component-based visual programming software package for data visualization, machine learning, data mining, and data analysis. Components range from simple data visualization, subset selection, and preprocessing to empirical evaluation of learning algorithms and predictive modeling. Visual programming is implemented through an interface where workflows are created by connecting predefined or user-designed tools. Orange can be used as a Python library for data manipulation and tool replacement. Through Orange, studies have been carried out for classification of images by clusters for positive and negative cases, assessment of the accuracy parameter for positive and negative Covid cases, calculation of an error matrix using the methods: Logistic regression, Random forest, Naïve Bayes. The results are described in (Gancheva, V., Platform for Big Biomedical Data Streams Management and Analytics, 2020) and (Gancheva, V., Todorova, V., 2022).

TensorFlow is a platform for implementing machine learning algorithms and the implementations to run such algorithms. Computations performed using TensorFlow can be performed on heterogeneous systems ranging from mobile devices to distributed systems of hundreds of machines and thousands of computing devices, such as GPU cards. The system is flexible and can be used to implement a variety of algorithms, including training algorithms for deep neural network models. TensorFlow computations are described by a directed graph consisting of a set of nodes. Typically, customers construct a computational graph using either C++ or Python.

Keras is a high-level neural network application built in the Python programming language. Keras can be run in combination with the deep learning platforms TensorFlow or Theano. It implements a program model of a convolutional or recurrent neural network. The Keras model is characterized by two modes: training mode and testing mode. The training losses represent the arithmetic mean of the training data losses. As the model changes over time, the losses on the first training data are higher than on the last. The TensorFlow platform is used to implement a feed-forward neural network model for cardiovascular data analysis. The results achieved are discussed in each section.

MATLAB supports object-oriented programming and various types of program constructions, as well as image processing and visualization in 2D or 3D formats. MATLAB can be used as both a computational and an analysis tool. Technologies such as machine learning, deep learning and computer vision can be implemented. Deep neural network layers can be created and connected, custom training loops and automatic differentiation training layers can be built. The MATLAB environment was used for the implementation of unsharp masking

with local adaptive contrast enhancement of medical images (Draganov I., Gancheva V. Unsharp Masking with Local Adaptive Contrast Enhancement of Medical Images, 2021), optimal bilateral filtering of CT images (Draganov I., Gancheva V. Optimal Bilateral Filtering of CT Images, 2021) and image classification using wavelet analysis (Vetova S., Wavelet Analysis for Biomedical Data, Applications of Mathematics in Engineering and Economics, 2021).

Anaconda is one of the most popular platforms for data analysis, artificial intelligence and neural networks. The platform is open and provides access to a huge number of tools, applications and libraries for visualization, transformation and analysis of input data. The Anaconda platform was used to develop a software tool for the management and analysis of large biomedical data. The software tool is implemented in Python programming language.

3D Slicer is a free, open source software developed primarily for scientific purposes that allows the import of various medical data and the construction of 3D reconstructions from them. A workflow has been developed that includes interprocessing of multidimensional medical images to create three-dimensional reconstruction and automated interactive stereoscopic visualization of biomedical data. Sources of medical images can be, for example, computed tomography or nuclear magnetic resonance.

OpenGL is a cross-language, cross-platform application programming interface for rendering 2D and 3D vector graphics. It is typically used to interface with a GPU to achieve hardware-accelerated rendering. OpenGL tools were used for the resulting spatial visualization of biological data (Gancheva V., Knowledge Discovery Based on Data Analytics and Visualization Supporting Precision Medicine, 2020).

Unity is a cross-platform for developing PC games and virtual reality applications, supporting various desktop, mobile, console and virtual reality platforms. Especially popular for iOS and Android. Unity can be used to create three-dimensional (3D) and two-dimensional (2D) interactive simulations and other experiences. The environment is used for verification of the method developed within the project for spatial visualization of multidimensional large biomedical data.

Experimental Data on Cardiovascular Disease

The data used are a reduced set of statistical records of parameters related to cardiovascular disease analysis. The original database contains 76 different attributes, of which 14 are used. The data originates from Cleveland, USA, and can be freely downloaded from the Kaggle (Heart Disease Dataset <https://www.kaggle.com/datasets/johnsmith88/heart-disease-dataset>). The dataset is in .csv format, separated by semicolons.

Data parameters:

- Age - age in years
- Sex - gender (1 = male; 0 = female)

- CP - type of chest pain
- TRESTBPS – resting blood pressure measured in mm Hg on admission to the hospital
- CHOL – serum cholesterol in mg/dl
- FPS – blood sugar > 120 mg/dl) (1 = yes; 0 = no)
- RESTECH - resting electrocardiographic results
- THALACH – maximum heart rate
- EXANG – angina induced by angina pectoris (1 = yes; 0 = no))
- OLDPEAK - ST depression
- SLOPE – ST slope
- CA – saturation of stained major blood vessels (0-3)
- THAL – defect status (3 = normal; 6 = defect; 7 = reversible defect)
- TARGET – presence of disease (1 = yes; 0 = no)

Results and Discussion

Feed Forward Neural Network Model for Cardiovascular Data Analytics

A feed forward neural network was designed for data analysis using the Keras library (Figure 3). During the training of neural networks, it is necessary to separate the cardiovascular disease input data into training data and test data. The X vector takes the value of all 13 parameters from the input data. The 'target' parameter is extracted into the vector Y, which is used in the training process to compare with the output of the neural network. The vector Y is used to determine the training error and the inverse distribution of the error on the weights of the neurons in the network.

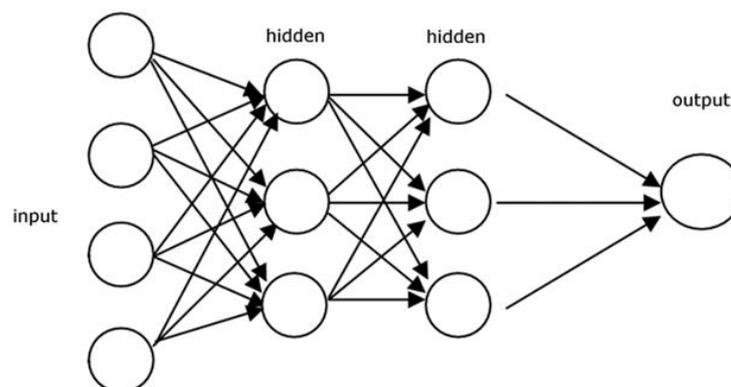

Figure 3. Feed forward neural network model with arbitrary number of layers and neurons

In addition to splitting the input 13 parameters and the output single parameter, the data is split once more in a ratio of 0.8 to 0.2. The first 80% of the data is used to train the neural network and the remaining 20% to test the already trained network. The vectors X_train and X_test contain the input data for training and testing, respectively, while the vectors y_train and y_test contain the output vectors for training and testing,

respectively.

Workflow for Cardiovascular Data Analytics

A Workflow for cardiovascular data analytics is designed (Figure 4) and includes follows phases: cardiovascular data selection and pre-processing, model creation, model training, model validation and evaluation. Categorization is one of the approaches to preprocessing the source data. The output vectors are converted from digital to binary. The next step is creating the neural network model. The selected model is of sequential type feed forward neural network model with any number of levels/layers and neurons (Figure 5). In this case, 13 input neurons are selected, which is the number of input parameters from the database, a second layer with 16 neurons, a third with 8 neurons, and 2 output neurons that are activated for a patient with a disease and a patient without a disease, respectively. The outcome is probabilistic. The total number of parameters in the neural network is 378, and these are all the weights of the connections between neurons, as well as the standard deviations for each neuron (bias).

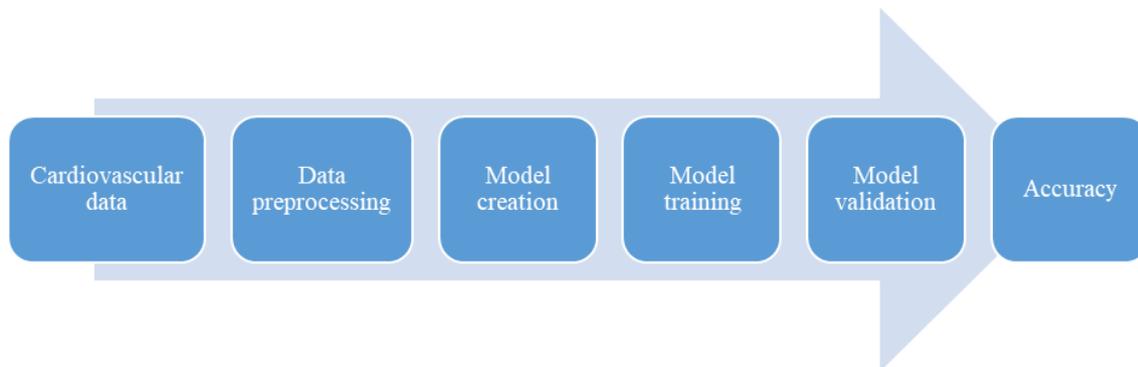

Figure 4. Workflow for cardiovascular data analytics

```
Model: "sequential"
Layer (type)           Output Shape           Param #
-----

dense_1 (Dense)        (None, 8)              136
dense_2 (Dense)        (None, 2)              18
-----
Total params: 378
Trainable params: 378
Non-trainable params: 0
None
```

Figure 5. Sequential feed forward neural network model

Next step is training the neural network. The training and test vectors are inputs to the neural network. The number of epochs is 200, which determines the number of complete training data passes to the model. The function takes the test 20% as validation data. Validation data is necessary to track the training process of the model, namely for the so-called 'underfitting' - a situation in which the model is not trained well enough and

'overfitting' - a situation in which the model is over-trained and does not generalize but simply memorizes the input data, leading to poor output results with new data.

After reading all training epochs, the accuracy of the model is plotted against the training data and the validation data (Figure 6). As expected, the accuracy increases with increasing epochs and is higher for the training data and lower for the validation test data. Thus, the trained model can be saved, loaded on another system, as well as available for review of the weight values (Figure 7).

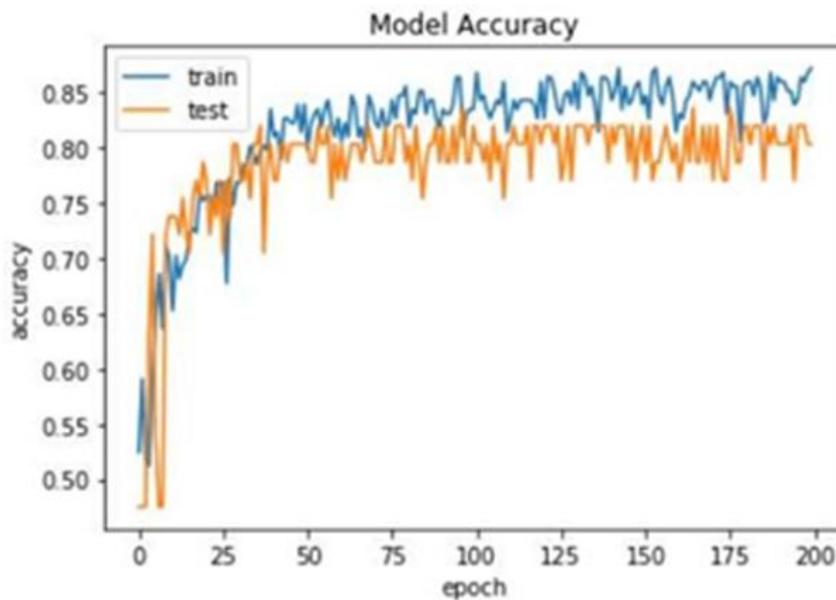

Figure 6. Feed forward neural network model accuracy

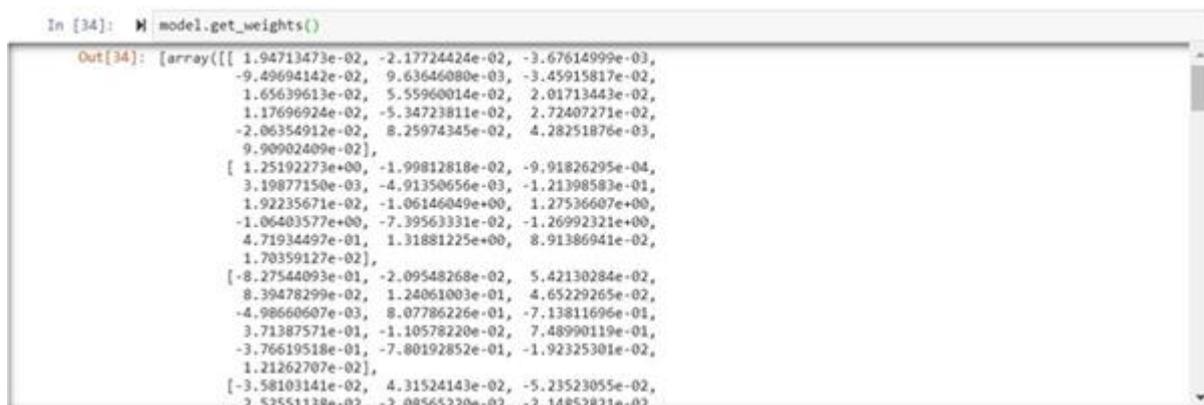

Figure 7. Trained feed forward neural network model

The purpose of the trained model is to use it to calculate input parameters that are new to the system and not used in training or validation. It is important to keep the order of the parameters in the vector in such a way that it matches the order of the training and validation data. The result is the probability distribution of the possibility that the patient has heart disease.

Conclusion

The research described in this paper aims to propose a conceptual model and architecture of a service-oriented scalable framework, ensuring the application and verification of methods and algorithms for the integration, management, analysis, and visualization of biomedical data as well as the application of scientific research for the needs of precision medicine. Biomedical data sources, data storage, data integration and preprocessing, real-time data flow, stream processing, analytical data storage, data modeling and analysis, and results visualization make up the system architecture for big biomedical data analytics and extracting knowledge from data. Parallel processing and streaming technologies are used. Multiple data can be updated in the research data warehouse for analysis and visualization.

A feed-forward artificial neural network is designed for the case study of cardiovascular data analysis. The input data are separated into training data and test data during the training phase. The training error and how it affects the network's neuron weights are calculated. As experimental data, a condensed collection of statistics on cardiovascular disease analysis has been used. 14 of the 76 attributes in the original database were used for the study. The data is also divided in a ratio of 0.8 to 0.2. The neural network was trained using the first 80% of the data, and the trained network was tested using the final 20%. As epochs are added, the computed accuracy becomes higher. With more epochs, the computed accuracy grows and is higher for training data and lower for validation test data. As a result, the trained model can be saved, loaded onto a different machine, and reviewed to check the weight values. The system uses the trained model to compute new input parameters that weren't used during either training or validation.

Marginalised Community in UNESCO Penang: A Qualitative Methodology

Dina Miza Suhaimi

Center for Policy Research and International Studies, Universiti Sains Malaysia, 11800 Gelugor, Penang, Malaysia,  <https://orcid.org/0000-0001-9174-3413>

Abstract: George Town was declared as a World Heritage Site (WHS) on July 7, 2008. Multiculturalism was the main element that secured the respective declaration. The importance of maintaining the heritage enclave's UNESCO WHS title became one of the key objectives that united the stakeholders, that include the state and federal governments, heritage activists, local residents, hotels, to name just a few. The battles to manage the heritage enclave and its community have generally revolved between the state-federal governments; let alone the voices of marginalised group, especially the Malays. Eleven Malay informants were chosen in order to: 1) investigate the patterns of ethnic marginalisation perceived by the Malay community in the heritage enclave and 2) construct the emergent typologies stemming from the meanings of ethnic marginalisation conveyed by Malay community. Generally, this study offers an exploration of ethnic marginalisation in the heritage enclave, by highlighting the qualitative research as the methodology.

Keywords: George Town, Qualitative, UNESCO.

Citation: Suhaimi, D. M. (2023). Marginalised Community in UNESCO Penang: A Qualitative Methodology. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 2537-2550), Cappadocia, Turkiye. ISTES Organization.

Introduction

George Town was awarded the UNESCO World Heritage Site (WHS) status in July, 2008. The prestigious listing was according to the UNESCO's cultural Outstanding Universal Values (OUVs), which represent the three selections of cultural criteria (UNESCO, 2022a; UNESCO, 2022b; Chan, 2020).

Multiculturalism was the key component that secured the heritage enclave as a UNESCO WHS. The importance of maintaining the UNESCO title became one of the key objectives that united respective stakeholders (Nomination Dossier, 2007; Connolly, 2017). In Penang, the State Heritage Committee (SHC) was established to manage the heritage enclave. The SHC representatives are of local-, state- and federal-level parties (Nomination Dossier, 2007).

Criterion (ii):

- "to exhibit an important interchange of human values, over a span of time or within a cultural area of the world, on developments in architecture or technology, monumental arts, town-planning or landscape design, where:
- George Town represents an exceptional examples of multi-cultural trading towns in Southeast Asia, forged from the mercantile and exchanges of Malay, Chinese, Indian and European cultures for more than 200 years”.

Criterion (iii):

- "to bear a unique or at least exceptional testimony to a cultural tradition or to a civilization which is living or which has disappeared, where:
- George Town is a living testimony to the multi-cultural heritage and tradition of Asia and European colonial influences. This multi-cultural tangible and intangible heritage is expressed in the great variety of religious buildings of different faiths, ethnic quarters, the many languages, worship and religious festivals, dances, costumes, art and music, food as well as daily life”.

Criterion (iv):

- "to be an outstanding example of a type of building, architectural or technological ensemble or landscape which illustrates (a) significant stage(s) in human history, where:
- George Town reflects a mixture of influences which have created a unique architecture, culture and townscape without parallel anywhere in Southeast Asia. In particular, George Town demonstrates an exceptional range of shophouses and townhouses. These buildings show many different types and stages of development of the building type”.

Source: Nomination Dossier of Historic Cities of the Straits of Malacca: Melaka and George Town (2007)

Apparently, much has been spoken about the efforts to manage UNESCO George Town's heritage properties and its community. The debate involves the federal government, state government, civil society organisations, to name just a few. In the debates to manage the heritage enclave, what tends to be ignored are the local residents. They are affected by the heritage enclave's conservation and development projects. This shows that the conservation and development projects are, more to the elite enterprises (Lowenthal, 2009). Moreover, much scholarship has been focusing on the heritage conservations as well as heritage development projects. They neglect the human and everyday experiences of the local residents (Ho, 2009).

Problem Statement

In problematising these issues, two conceptual vacuums have been identified:

1. In the debates to manage the heritage enclave, what tends to be neglected are the voices of its community (Aljunied, 2013).
2. The Chinese community are the majority, the Indian Muslim community are doing rather well socio-economically, but the Malays are left behind. This phenomenon is affecting the sustainability of the Malay community in the heritage enclave (Abdullah, et al., 2013)

This study offers an exploration of ethnic marginalisation in the heritage enclave of UNESCO George Town, by highlighting the qualitative research methodology.

Research Methodology

This study employed qualitative method. Qualitative study emphasises meanings (words) rather than frequencies (numbers). Typically, the use of numbers has been the key standard in distinguishing between quantitative versus qualitative studies (Creswell & Plano-Clark, 2007). Qualitative study is a method for discovering the meaning individuals or groups ascribe to a social issue. The development of qualitative study includes: (i) developing questions, (ii) collecting data in the informant's setting, (iii) analysing data and (iv) the researchers interpretate the meanings based on the qualitative data. Creswell & Creswell (2017) mentioned that, the qualitative researchers focus on individual meaning, as well as the reporting the complexity of a phenomenon.

“Qualitative researchers study things in their natural settings, attempting to make sense of, or to interpret, phenomena in terms of the meanings people bring to them” (Denzin and Lincoln, 2010).

Case Study Selection

Simons (2009) suggested that a case study is an in-depth exploration of a specific event, programme, institution, system or project in a 'real life'. Stake (2005) mentioned that it is a choice of what is to be explored – by

employing any methods that is chosen by the researchers. Merriam (1998) stated that in a case study, the samples of qualitative study depend on two levels. One, the choice of the case study; and two: the sampling / informants involved in the case study. In this study, the pattern of Malay marginalisation in the heritage enclave of UNESCO George Town is selected as the case study.

Sampling Selection

The samples (here after: informants) involved in this case study is chosen based on purposive sampling. This type of sampling is based on specific criteria (Porter, 1999) that aimed to ensure that the chosen informants have mutual experiences about the phenomenon (Flick, 2008). In this study, the chosen informants are according to this particular criterion: the Malays who are still residing/working in the heritage enclave, and/or those who have migrated; and at the same time, they still maintain good relationships with the community in this heritage enclave. The primary criteria of the informants are: they must be of Malay ethnic community. Also, they must have experienced residing and/or working in the UNESCO George Town. The Malay informants involved in this study were given pseudonyms with the purpose of protecting their anonymity (Table 2).

Table 2. The informants

Name	Ethnicity	Experienced living in the heritage enclave	Experienced working in the heritage enclave	Location	Length of living and/or working experience in the heritage enclave
Malay informant 1	Malay	Yes	No	Acheen Street	78
Malay informant 2	Malay	Yes	Yes	Acheen Street	60
Malay informant 3	Malay	Yes	Yes	Beach Street	55
Malay informant 4	Malay	Yes	Yes	Buckingham Street	47
Malay informant 5	Malay	No	Yes	Penang Road	12
Malay informant 6	Malay	No	Yes	Beach Street	10
Malay informant 7	Malay	No	Yes	Campbell Street	7
Malay informant	Malay	No	Yes	Acheen Street	6

informant 8

Malay informant 9	Malay	No	Yes	Acheen Street	6
-------------------	-------	----	-----	---------------	---

Malay informant 10	Malay	Yes	Yes	Carnavon Street	6
--------------------	-------	-----	-----	-----------------	---

Malay informant 11	Malay	No	Yes	Armenian Street	3
--------------------	-------	----	-----	-----------------	---

According to Lincoln and Guba (1988), the purposive sampling size is determined by informational considerations. The sample is terminated if there is no new information is gathered from new informants. Hence, redundancy becomes the primary criteria. Morse (1994) recommends six informants, Creswell (1998) recommends ten informants and Boyd (2001) recommends up to ten informants. These recommendations can help qualitative researchers to verdict how many informants is required. On top of that, other researchers agree about ‘saturation’ as an alternative way to consider about how many samples size is appropriate in conducting qualitative studies. Therefore, the concept of saturation can be an additional factor when estimating required number of informants. In this study, eleven Malay informants were involved according to the above-mentioned criteria.

Data Collection

In-depth interview is the most suitable data collection strategy for qualitative case studies (Creswell, 2007). This strategy allows the researchers to: provide a space for the informants to share their experiences, address the phenomenon profoundly and approach reality as faithfully as possible. The key criterion of the phenomenological interview is the meanings of phenomena described by the informants (Rubin & Rubin, 2012). In this study, the researchers conducted in-depth interviews with Malay informants vis-à-vis the meanings of ethnic marginalisation.

Research Instrument

According to Patton (1990), semi-structured in-depth interviews involved a set of questions, to be explored with a few informants before interviewing starts. The list of questions (also known as the interview guide) should be prepared earlier, that is before the interview. One of the advantages of preparing an interview guide is, it ensures that the interviewers (also the researchers) have carefully estimated the duration of an interview session.

A set of guided question in this study was set to guide the informants to focus on their own perceptions of ethnic marginalisation more openly. Thus, a set of interview question is used in this study, that is the semi-structured interviews for the Malay informants.

Data record

All interview sessions with the informants were recorded using tape recorder. Then, they were transcribed verbatim. This strategy protects against bias and in addition, it provides a permanent record of what was said and what was not said by the informants. It is also an advantage if the researchers to make field notes during each interview as well as immediately after conducting each interview (Morse, 1991).

Data analysis

The data was analysed based on Colaizzi's (1978). There are seven stages of analysing the data (Table 3). First, transcribe and read the descriptions; next, extract significant statements; followed by stage 3: formulate meanings; categorise into clusters of themes; validate; describe; go back to the informants for validation; and last of all: incorporate changes according to informants' validation.

Table 3. Summary of Colaizzi's method of analysis

Stages in analysis	Purpose
1. "Transcribe, read and reread the descriptions	• "To acquire general feeling for experience
2. Extract significant statements	• To generate information pertaining directly to phenomenon studied
3. Formulate meanings	• To illuminate meanings hidden in various contexts of the phenomenon
4. Categorise into clusters of themes and validate	• To identify experiences common to all informants with original text
5. Describe	• To generate a prototype of a theoretical model
6. Return to informants to validate	• To validate the findings
7. Incorporate any changes based on the informants"	• To present theoretical model that comprehensively reflects the feedback universal features of phenomenon"

Source: Wojnar and Swanson (2007)

Stage 1: Transcribe

In this study, the interviews with the informants were conducted by the researchers. All the interview sessions were recorded using: (i) voice recorder and (ii) handwritten note, as suggested by Othman Lebar (2009). The informants' narratives were transcribed as narrated (verbatim). Haase and Myers (1988) suggested the researchers to listen to the recorder for a few times. Colaizzi (1978) recommended the researchers to read and reread the informants' descriptions. The researchers initially listened to the recorder and read each transcript and

the descriptions of the phenomenon as suggested by the scholars. The informants were all Malays and all interview sessions were conducted in their native language, Malay language. Subsequently after transcribing, the researchers sent the transcripts to a Malay-English professional translator to translate the transcriptions from Malay language to English, as proposed by Birbili (2000) and Tsai et al. (2004). It is important to achieve the accuracy in translation because errors in translation have the potential to distort or misrepresent the informants' real experience.

Stage 2: Extract significant statements

After the revised transcript was completed, the researchers read thoroughly to identify and extract significant statements. The process of extracting significant statements involved identifying phrases that are related to the phenomenon – that is, the experience of ethnic marginalisation from informants' point of view.

Stage 3: Formulate meanings

According to Colaizzi (1978), the researchers attempt to formulate more meanings and restatements for each significant statement from the text. Haase and Myers (1988) stated that, as soon as the significant statements had been successfully extracted, the formulated meanings were then established. At this stage, the researchers reviewed the informants' significant statements and assigned meaning to each, respectively. Throughout this process, the formulated meanings were reconstructed a few times, until the researchers were satisfied with formulated meanings, where the meanings were exact reflection based on the informants' intended meanings. Table 4 demonstrates the process of how the researchers interpreted the informants' significant statements into formulated meanings that associated with the study phenomenon.

Table 4. The process of formulated meanings based on significant statements

Significant Statements	Formulated Meanings
Malay 2: I am Sumatran Rawa. But in my identity card, it is written Malay. Rawa in Malaysia are considered Malay.	Rawa descendants are categorised as Malay
Malay 3: My identity is Malay, but my self-identification is Arab. But in Malaysia, we (Arabs) are considered Malay.	Arab descendants are categorised as Malay
Malay 2: Here (in Penang), Rawa are considered Malay. But Rawa's culture is not considered as Malay culture.	Rawa's culture are not considered part of Malay's
Malay 3: Compared to the native Malays, we (Arabs) are a few. Because of that, our (Arab) culture is being marginalised. We adopt the	Arab's culture is not considered part of Malay's

Significant Statements

Formulated Meanings

Malay culture instead.

Stage 4: Categorise the formulated meanings into clusters

At this stage, when the formulated meanings of the significant statements were extracted individually, the researchers began to categorise the formulated meanings into themes, particularly into (i) clusters of themes and (ii) emergent themes (Colaizzi, 1978).

Table 5. The process of categorising the formulated meanings into cluster of themes and emergent themes

Formulated meanings	Cluster of themes	Emergent themes
Rawa descendants are categorised as Malay	Social identity marginalisation	Socio-cultural marginalisation
Arab descendants' culture is not considered part of Malay culture	Cultural marginalisation	
Malay batik shop is not being promoted	Heritage business marginalisation	Economic marginalisation
Malay restaurant is not being visited	Non-heritage business marginalisation	
Members of a political organisation (LPE) are politicians and they do not care about Malay people residing in this heritage enclave	Marginalisation of Malay-based political organisations	Political marginalisation
The Malay politician ignores the Malay residence in this heritage enclave		Political marginalisation

The formulated meanings were categorised into groups of similar experience. The cluster of themes were categorised into the emergent themes (Colaizzi, 1978). Table 5 displays the process of categorising the formulated meanings into cluster of themes and emergent themes. The informants' transcriptions that were derived from the interview were then validated by the informants, individually (Diagram 2). Blaikie (2007) mentioned that, "with the development of the emergent themes, the process of developing the first order construct had been successfully developed by the researchers. The construction of the first order construct derived from the informants' social reality".

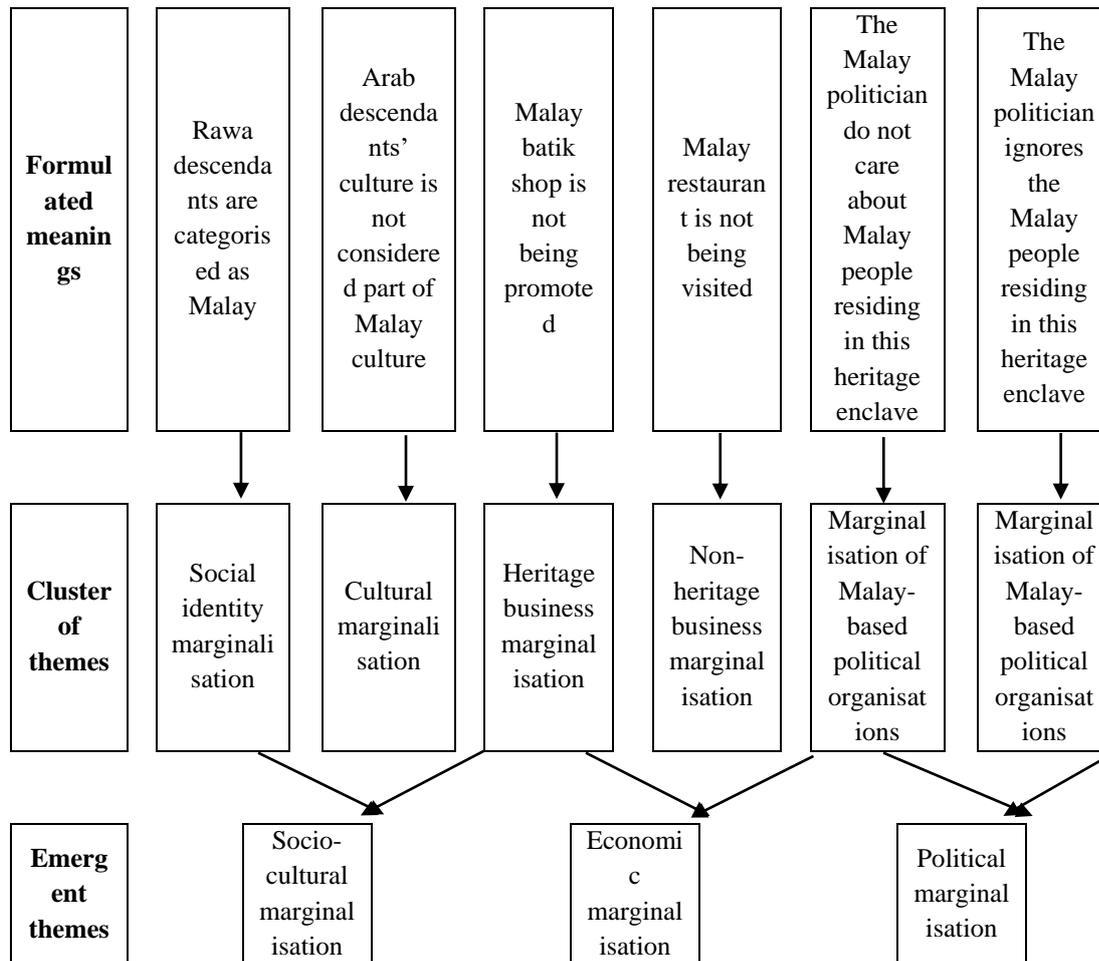

Diagram 2: The process of categorising the formulated meanings into cluster of themes and emergent themes

Stage 5: Describe

When the first order construct that were derived from the informants' social reality had been developed (Blaikie, 2007), Colaizzi (1978) suggested that the following stage to do is to develop the second order construct and exhaustively describe the investigated phenomenon to generate a prototype of a theoretical model. Colaizzi added that the second order construct must be derived from the first order construct that constitute the informants' social reality:

“The thought objects constructed by the social scientist, in order to grasp this social reality, have to be founded upon the thought objects constructed by the common-sense thinking of men, living in their daily life within their social world. Thus, the constructs of the social sciences are, so-to-speak, construct of the second degree, which is, construct of the constructs made by the actors on the social scene” (Schutz, 1954).

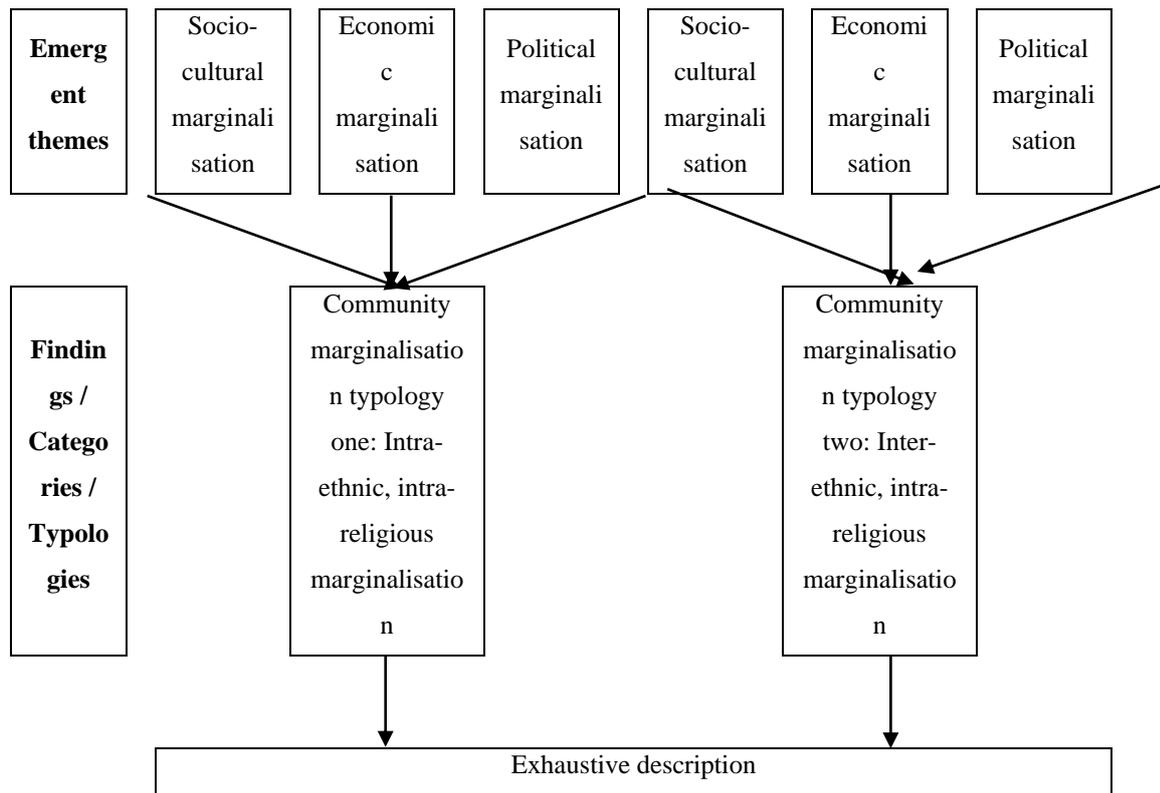

Diagram 3. The process of developing categories / typologies (Second order construct)

“The first order construct used by the researchers is designed to deal with a social problem – to make social interaction understandable to the informants. The second order construct is designed to deal with a social scientific problem – to describe the social phenomena” (Schutz, 1954).

The move from first order construct to second order construct requires the researchers to choose from the meanings of everyday life of those who are considered to be relevant to the purpose at hand and to construct models of the social world – typical informants with typical motives and typical courses of action in typical situations. In writing an exhaustive description of a phenomenon, the researchers are advised to revisit the: (i) formulated meanings; (ii) cluster of themes; and (iii) emergent themes - to identify the dimensions of the informants’ experiences of ethnic marginalisation in the heritage enclave. After finalising this process, the researchers come out with a full and inclusive descriptions of the phenomenon, integrating all the clusters of themes and emergent themes produced in stage 4. Subsequently, the researchers sought for an expert view, in order to review the findings and to confirm that the exhaustive descriptions reflect the meanings of ethnic marginalisation conveyed by Malays in the heritage enclave. After that, the researchers are advised to seek for a validation to these exhaustive descriptions from the researchers’ supervisor. After achieving the revised exhaustive description, the fundamental structure of the phenomenon was considered constructed (Diagram 3).

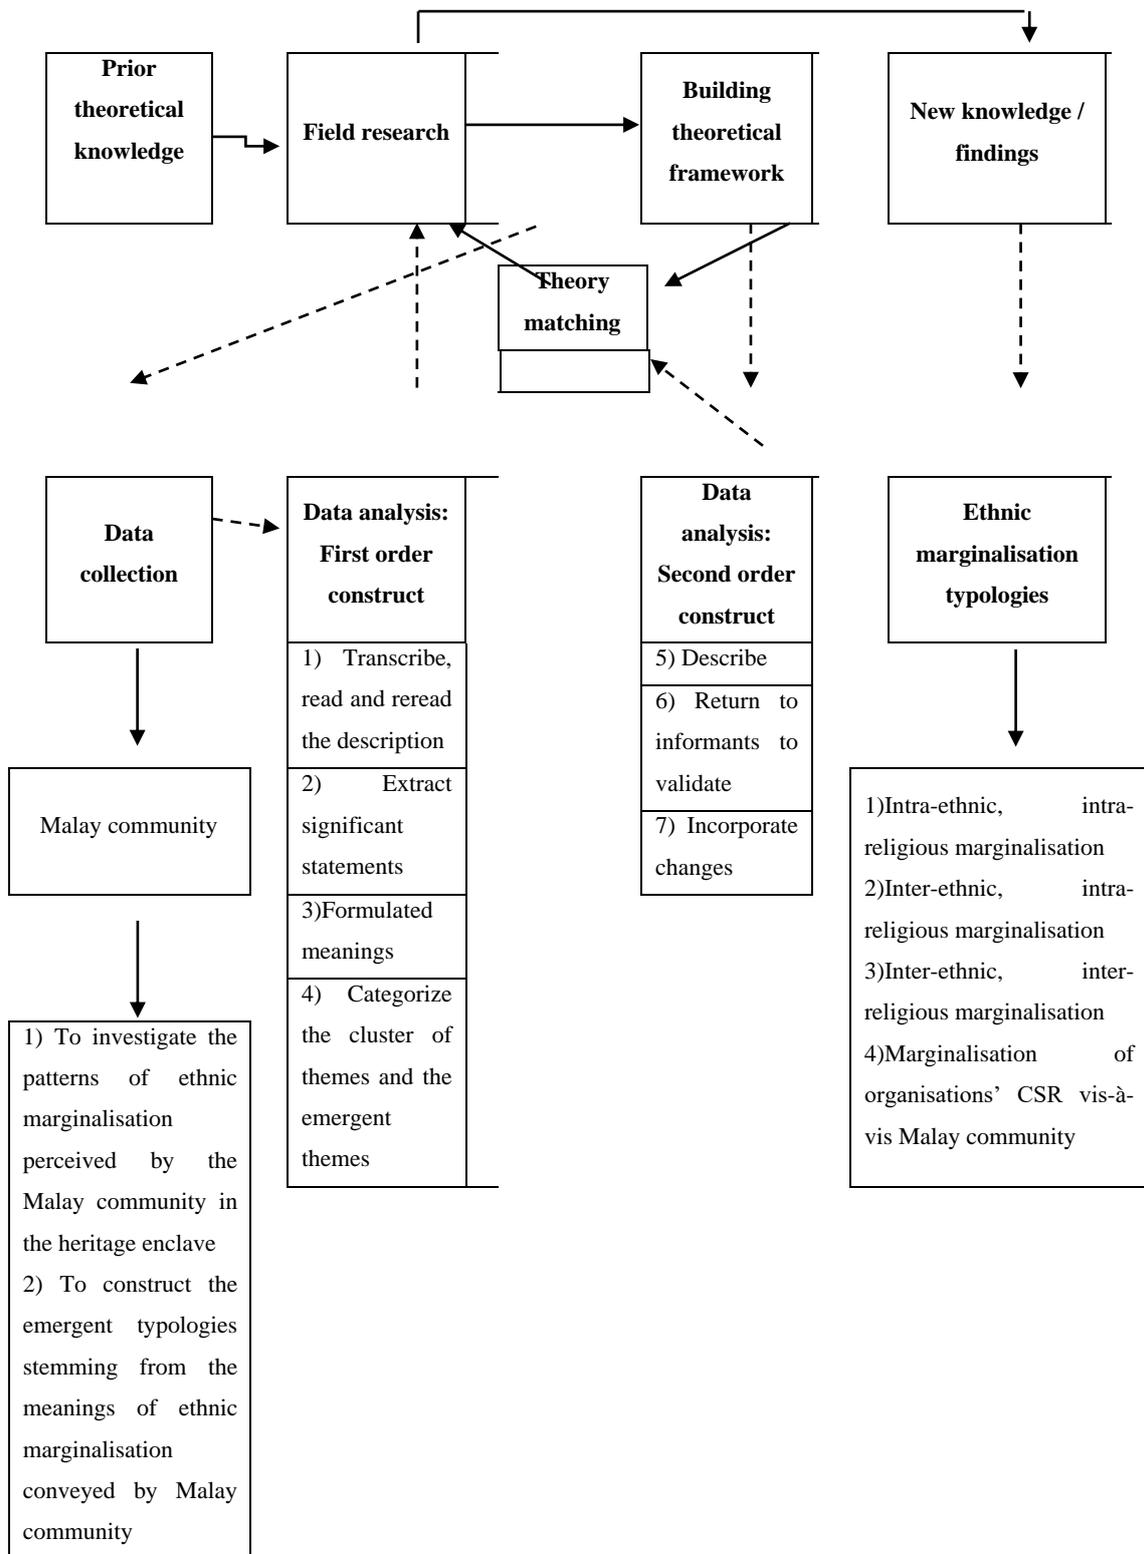

Diagram 4: The process of data collection and analysis

Stage 6: Return to the informants for validation

At this stage, the researchers made appointments with the informants to validate the essence of the phenomenon, compared with their experiences. The process of informants' validation was achieved by providing them with the exhaustive descriptions in Malay language (their native language). All of the informants confirmed that the descriptions reflected their experience of ethnic marginalisation in the heritage enclave.

Stage 7: Incorporate changes (if any)

The researchers skipped this stage because there were no changes in the exhausted descriptions, as validated by the informants. The process of analysis is presented in Diagram 4.

Conclusion

In this study, the ethnic marginalisation of Malay community in UNESCO George Town heritage enclave is chosen as a case study. The informants in this case study were based on the purposive sampling, that involved the Malays who are still based in the heritage enclave of George Town, and/or have migrated; and at the same time, they still maintain their relationships with the community in the heritage enclave. This study employed qualitative as the primary research method. The researchers personally conducted in-depth interviews with the informants and analysed the qualitative data according to Colaizzi's (1978) method as a guidance.
