Proceedings of International Conference on Research in Education and Science

© 2023 Published by the ISTES Organization

ISBN: 978-1-952092-44-2

Editors: Mustafa Koc, Omer Tayfur Ozturk, & Mustafa Lutfi Ciddi

Articles: 1-186

Conference: International Conference on Research in Education and Science (ICRES)

Dates: May 18-21, 2023

Location: Cappadocia, Nevsehir, Turkiye

Conference Chair(s):

Dr. Mack Shelley, Iowa State University, United States

Dr. Wilfried Admiraal, Leiden University, the Netherlands

Dr. I-Tsun Chiang, National Taiwan Normal University, Taiwan

Dr. Wenxia Wu, George Washington University, United States

© 2023 Published by the International Society for Technology, Education, and Science (ISTES) Organization

The proceedings is licensed under a Creative Commons Attribution-NonCommercialShareAlike 4.0 International License, permitting all non-commercial use, distribution, and reproduction in any medium, provided the original work is properly cited.

Authors alone are responsible for the contents of their papers. The Publisher, the ISTES Organization, shall not be liable for any loss, actions, claims, proceedings, demand, or costs or damages whatsoever or howsoever caused arising directly or indirectly in connection with or arising out of the use of the research material. All authors are requested to disclose any actual or potential conflict of interest including any financial, personal or other relationships with other people or organizations regarding the submitted work.

The submissions are subject to a double-blind peer review process by at least two reviewers with expertise in the relevant subject area. the review policy is available at the conference web page: www.icres.net

CONFERENCE PRESIDENTS

Dr. Mack SHELLEY - Iowa State University, United States
Dr. Wilfried ADMIRAAL - Leiden University, the Netherlands
Dr. I-Tsun CHIANG - National Taiwan Normal University, Taiwan
Dr. Wenxia WU - George Washington University, United States

SCIENTIFIC BOARD

Allan TARP - MATHeCADEMY, Denmark
Altay FIRAT - European University of Lefke, Cyprus
Andrea DEBELJUH - University Juraj Dobrila of Pula, Croatia
Ali Korkut ULUDAG - Ataturk University, Turkey
Brahim FERDI - Bechar University, Algeria
Branislav POPOVIĆ - University of Kragujevac, Serbia
Chalavadi SULOCHANA - Gulbarga University, India
Dariga NURKESHEVA - Nazarbayev University, Kazakhstan
Elizabeth ADAMSON - Edinburgh Napier University, United Kingdom
Farhad BALASH - Kharazmi University, Iran
Farouq ALMEQDADI - Emirates College for Advanced Education (ECAE), U.A.E.
Gordana SAVIC - University of Belgrade, Serbia
Haydar YUKSEK - Kafkas University, Turkey
Henry David KATNIYON - Federal College of Education, Pankshin, Plateau state, Nigeria
Hsin-Chih WU - National Taiwan Normal University, Taiwan
Jessie BUSTILLOS - London Metropolitan University, United Kingdom
Mesut AYDIN - Inonu University, Turkey
Milica PAVKOV HRVOJEVIĆ - University of Novi Sad, Serbia
Mohammad SARWAR - Scialert, Dubai, United Arab Emirates
Morteza BARIN - Farhangiyan University of Iran, Iran
Muteb ALQAHTANI - Rutgers University, United States
Nurten SARGIN - Necmettin Erbakan University, Turkey
Ognyan B. MANOLOV - European Polytechnic University, Bulgaria
Sanaa AL-DELAIMY - Mosul University, Iraq
Shynar BAIMAGANBETOVA - Nazarbayev University, Kazakhstan
Summer MOUALLEM - University of Central Lancashire, United Kingdom
Tamer USTUNER - Kahramanmaraş Sutcu Imam University, Turkey
Tri Marhaeni PUDJI ASTUTI - Semarang State University, Indonesia
Yi-Teng HSU - National Taiwan Normal University, Taiwan

ORGANIZING COMMITTEE

Aliya MUSTAFINA - Nazarbayev University, Kazakhstan
Ann D. THOMPSON - Iowa State University, United States
Halil SNOPE - South East European University, Macedonia
Hakan AKCAY - Yildiz Technical University, Turkey
Jacqueline T. MCDONNOUGH - Virginia Commonwealth University, United States
Mariusz JAWORSKI - Medical University of Warsaw, Poland
Mary M. CAPRARO - Texas A&M University, United States
Muhammad ZAYYAD - Al-Qasemi Academic College of Education, Israel
Murat BEYTUR - Kafkas University, Turkey
Mustafa PEHLIVAN - Necmettin Erbakan University, Turkey
Natela DOGHONADZE - International Black Sea University, Georgia
Natalija ACESKA - Ministry of Education and Science, Macedonia
Ossi AUTIO - University of Helsinki, Finland
O. Tayfur OZTURK - Necmettin Erbakan University, Turkey
Silvia MORARU - National High School Bucharest, Romania
Silviya KOSTOVA - The D.A. Tsenov Academy of Economics, Bulgaria

Table of Contents

A Study on the Users' Experience in Learning Using a Virtual Reality Laboratory for Medical Sciences.....	1
Gamification Using Labyrinths and Mazes to Learn Biomolecule's Nomenclature of Biochemistry in Chemistry Degree.....	17
Evaluating Physical Activities of Disabled Young People: Expectations & Challenges	30
Virtual Reality Trainers for Students with Disability: Analysis of Students' Motivation and Motor Performance	39
Exploring Learning Disability Students Experiences in Using AR Technology in Physical Education.....	56
New Curriculum of Education in Indonesia: How Do Natural Science Teachers Think about?.....	70
For Every Action in Nature There Is an Equal and Opposite Reaction, What about Education?	82
Assessing ESL University Students' Metacognitive Online Reading Strategies	93
Flipped Language Learning for Arts Students	113
Moodle System for Preparation Surgery Medical Students during the War	120
The Importance of Education for Democracy	131
Artificial Intelligence and Business Ethics: An Integrated Course-Design Framework	141
Anti-Corruption Education in Management Programmes: Learning Style Versatility and Artificial Intelligence (AI) Applications in Course Development and Delivery	152
Is the UAE ready for the Fourth Industrial Revolution in the age Artificial Intelligence? Development of Artificial Intelligence in the United Arab Emirates	162
Leadership Journey in School: A Bibliometric Analysis of Instructional Leadership from 1941 to 2022.....	172
Financial Education in the Digitalization Era: A Bibliometric Analysis	192
Teaching Aviation English: The Sweet and the Bitter	212
Constriction of Pancasila Student Profile Assessment for 21st Century Students in Elementary School.....	224
Teaching Sustainability outside the Classroom: Preliminary Findings of Food Waste from Indonesian University Students.....	240
Tertiary Educators' Awareness of and Readiness to use Virtual Reality (VR) in Remote Online Learning.....	256
The Effect of Teacher Job Satisfaction on Learners' Academic Success in Biology	275
The Effect of a Teacher's Qualifications and Work Experience on Learners' Achievement in Biology.....	283
The Development of Teachers' Sustainable Competency on 21st-Based Human Resources in Ensuring School Readiness for Higher Level on PISA (Program for International Students Assessments).....	293
Deep Dive into Teachers' Digital Competence to Support 21 st Century Learning: A Systematic Literature Review	313
Word of Mouth Strategy Combined Andhab Asor as Problem Solving in Planning and Organizing Problems of Curriculum Development.....	335
An Investigation of Rhetorical Questions in Obama and Cameron's Political Speeches.....	355
Emoji as a Means of Communication-Derivation from Use of Albanian Language.....	368

The Attitude of Malaysian East Coast Early Childhood Educators towards English and Their Language Support Practices	377
Introduction.....	378
How Glosses in Academic Texts are being Read?.....	393
Ethical Guidelines for Hijamah in Malaysia: A Review	405
The Correlation between Students' Question Words Mastery and Their Speaking Ability in Asking Information	414
Key Elements of Total Quality Management Implementation in Vocational High School	424
Assessing the Viability, Functionality, and Effectiveness of the Concurrent Classroom Modality: A Quantitative Study.....	440
Screen Time in Learning Management System as Student Learning Time Indicators for Academic Quality Assurance.....	462
The Degree of Students' Commitment to Virtual Lectures	476
Typology of Corporate Social Responsibility: The Applicability of CSR within SMES Companies in Developing Countries – The Case of Morocco	484
Project-Based Learning: Teachers' Perception & Learners' Preparedness	506
A Hybrid MCDM Model for Roles Selection in Supporting Talent Development Intervention Programme in Malaysia Public Higher Education Institution	516
Assessment Method for Potential Educational Technology Competency Standard Based on TPCCK in Malaysia Higher Education Institutions	533
Mirror, Mirror on the Wall, Which Skills Are Most Important in Aviation World?.....	559
Research on a Learner Assessment Model in Online Learning for Higher Education.....	573
The Impact of Preschool Education on the Administrative and Educational Competencies of Students in the First Cycle of Basic Education in Oman	588
Situating Scientific Literacy within the Context of a Pandemic	601
Reharmonizing Islam and Science of Creating a Scientific Civilization based on Religious Values: Case Study of Indonesian Fundamentals Pancasila.....	614
Dataset of Chinese Language Beginning Learners Reading Speech and Text-to-Speech.....	625
Volunteering in Non-Governmental Organization and Their Roles towards Community Development During COVID-19 Pandemic.....	640
Language Behaviors Signifying Lecturers' Social Identity in The Business English Teaching Context.....	650
Identifying Factors That Influence Medical Tourists' Perceptions of Satisfaction and Their Intention to Revisit Malaysia's Hospitals	664
Undergraduate Students' Digital Literacy Skills in The Digital World of Sustainable Development.....	677
Pre-service and in-service Elementary School Teacher's Procedural and Representational Knowledge of Fractions.....	701
Determination of Cognitive Structures of Secondary School Students on Active Citizenship Theme in Social Studies Course	713
An Impression that Lasts: Assessing the Impact of a Co-Curricular Service-Learning in Chemistry	725

From Ancient Gymnastics to Online Fitness Training – Evolution and Perspectives in Physical Training	737
The Use of Cultural Elements in Primary School Textbooks Towards Reshaping Their Attitudes in Learning English: Malaysian Primary Pupils’ Perception.....	746
Peculiarities of E-Learning in The Formation of Kazakh Patriotism in Adolescents on The Basis of National Values	769
MALL & Teaching Writing in ESL: What do Teachers Say	779
Integrating The Values of Leadership in Public Educational Policies For Training Nurses	796
Factors Promoting Student Agency and Community Engagement: Case of a Lebanese Public High School	808
Entrepreneurial Decisions and Problem-Solving: a Discussion for a New Perspective Based on Complex Thinking.....	822
George Town Festival 2022: The Promotions of Arts and Multi-Cultural Heritage in UNESCO George Town, Penang, Malaysia	831
Heritage Celebrations 2022: Intangible Cultural Heritage Promotions Vis-À-Vis Community In UNESCO Penang.....	846
Ensuring Intercultural Diversity Through the VNC104 Student Exchange Program	862
Rethinking (Non)Nativeness among English-Speaking Teachers in Vietnam.....	877
Introduction.....	877
The interlink between nativeness, identity, monolingual ideologies, and qualifications	879
The power of nativeness in monolingual ideologies	881
The power of non-nativeness in bilingual ideologies.....	884
An ambivalent approach to the bargaining power of (non)nativeness	887
Conclusion	890
Recommendations.....	891
References.....	892
An Educational Ethnography of the Development of Complex Thinking: Students' Point of View on Their Self-perception of Achievement	895
Professional Training in the Beekeeping Sector: Characterization and Identification of Needs.....	905
Mapping the Research Landscape of Falls in Older Adults: A Bibliometric Analysis	922
The On-the-job Training (OJT) Program: Students’ Future Careers and Personal Development.....	939
Introduction.....	939
Conclusion	953
Recommendations.....	953
References.....	953
The Role of Collectivity in Saudi Females’ Success.....	956
Undergraduate Occupational Therapy Students’ Experiences in Online Distance Learning for Skilled-Based Subjects During COVID-19 Pandemic: A Descriptive Phenomenology Study	979
A Philosophical Approach to Critical Thinking and Conflict	997
Investigation of 6th Grade Students' Cognitive Structures Towards the Concepts of Barcode, Banderol, Patent, Piracy, R&D, and Copyright.....	1004

Secondary School Students' Cognitive Structures on the Concepts of Good School and Good Teacher	1025
Competency-Based Education To Teach Translation: Jordan's Graduate Employability	1035
Malaysian In-Service Science Teachers' Conception of Nature of Science (NOS).....	1049
Curriculum Development Process with Personalized Learning Model in Early Reading for Autism Spectrum Disorder Students.....	1063
Financial Stability Challenges Posed By the COVID-19 Pandemic: A Review	1075
Cyberbullying Among Youths in Malaysia	1096
Can ChatGPT Facilitate the Implementation of Personal Learning Environments in Tertiary Education: Benefits and Risks.....	1113
Factors Affecting Customers' Acceptance of Rigid Plastic Packaging Design based on Material Value Conservation Paradigm.....	1137
Analysis of Symmetric Timetable Frameworks Based on Unfixed 4-Blocks.....	1149
A Hybrid Recommendation System for Tourism in the Sultanate of Oman.....	1163
The Origin of Slaves from the Island of Sumatra Based on Records of the Slave Trade by the Dutch VOC in the 18 th Century.....	1192
Evaluating Tiktok's Social Media From Islamic Perspectives With Technology Acceptance Model.....	1203
Evaluation of Features on Mobile Investment Application using Kano Model.....	1224
Machine Learning based Financial Management Mobile Application to enhance College Students' Financial Literacy	1237
Developing The Perspective of Preservice Mathematics Teachers Through Early Field Experience.....	1254
International Communication of Chinese Costume Culture: Taking Chinese Cheongsam (qipao) as an Example	1264
Students' Mathematics Problem Solving Skills between Full-Online Learning and Hybrid Learning in Statistics Course	1277
Learning Analytics as A Predictive Tool in Assessing Students' Online Learning Navigational Behavior and their Performance.....	1288
Role of Events, Festivals, and Celebrations in Creating a City Image.....	1301
EFL Teachers' Expectations and Satisfaction Levels of Professional Development.....	1312
A Study on the Effectiveness of Chunk Teaching Method in English Writing Teaching in China's Middle Schools.....	1330
Examining the Relative Effectiveness of Social Innovation Efforts of Hungarian Municipalities using the DEA Method	1343
Educationally Equitable Solutions for Social Innovation or the Foundations of Social Sustainability.....	1357
E-Learning Technologies in Continuing Medical Education of Family Doctors in Ukraine: Challenges and Opportunities.....	1374
The Foreign Language Anxiety and Self Coping Strategies of Chinese Language Learners in Vietnam.....	1386
The Relationship Between Knowledge Production and Google in Framing and Reframing AI Imaginary. A Comparative Algorithmic Audit between the US and Italy	1409
The Effects of Using QAR Strategy on ESL Young Learners' Reading Comprehension of Narrative Text.....	1422

Public-private Partnerships in Energy Projects in Low- and Middle-income Countries and Decarbonization of the Global Economy	1434
Implementation of New Education Policy in India and the Prospects of Transformational Female Leadership in Indian Higher Education	1445
An Investigation into the Implementation of a Mentoring Program for EFL Novice Teachers at an English Center in the Mekong Delta.....	1471
Introduction	1471
Why needs mentoring	1473
Conclusion	1483
References.....	1485
High School Students' Attitudes Towards Learning Genetics and Belief in Genetic Determinism.....	1505
Bibliometric Review on TVET and Industry Collaboration	1514
Appraising the Past: The Evaluative Language in Historical Texts	1528
Factors Influencing the Use of Donation-Based Crowdfunding Platforms in Indonesia and The Development Strategies.....	1539
Adaptive Approaches of Primary School Teachers Facilitating Environmental Studies	1567
Sociological Portraits: A Heuristic Tool	1589
Reforming Early Childhood Education Programs in Rural Areas of India: Equity in Preschool Education.....	1600
Factors Related to Students' Satisfaction with Social Constructivist Learning Environments on the EduNext Platform.....	1611
Contribution of Project-based Learning and Integrated Learning to Develop Student' HOTS	1628
EFL Teachers' Beliefs about Technology Integration into English Language Classrooms: A Case Study	1642
Factors Affecting Undergraduate Students' Adoption of Massive Open Online Courses (MOOCs)	1652
Experimental Research on the Challenges of Distance Learning.....	1671
A Framework of Universities' Smart Campus to Detect and Mitigate Vulnerabilities for IoT Devices	1681

Abstract: As a result of the worldwide dissemination of COVID-19, educational institutions across the globe, particularly those that serve students in the field of science, have been mandated to close their doors. Consequently, educators and students have increasingly relied on educational technology to obtain a diverse array of resources. This research aims to construct a science laboratory in virtual reality by employing the ADDIE Methodology, a well-established structure for designing instructional programs. Additionally, the study aims to evaluate the impact of the virtual reality laboratory on the level of immersion that 37 science students experienced during the learning process. This evaluation will compare the students' sense of presence before and after utilizing the facility. The concept of presence within the context of virtual reality (VR) pertains to the experience of being fully immersed in a digital environment, such that the user's cognitive processes interpret it as being authentic. The degree of immersion users perceive substantially impacts their engagement, conduct, and affective responses while engaging with virtual reality. For this experimental investigation, the participants were segregated into two distinct cohorts. Group 1 consisted of twenty participants who viewed scientific films in two dimensions, whereas Group 2 comprised seventeen participants who engaged in science education through a virtual reality laboratory. The findings suggest a significant presence in both cohorts, with the virtual reality (VR) cohort exhibiting superior performance compared to the other group. The present study offers significant findings for educators and software developers engaged in creating virtual reality (VR) resources for science instruction. In forthcoming studies of instructional technology that utilize virtual reality, it is suggested that cognitive load be scrutinized as a variable. In general, this research adds to the increasing corpus of evidence that showcases the favorable and comprehensive impacts of immersive learning in education.

Keywords: Laboratory, Sciences, Virtual Reality, Presences, CAMIL.

Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 1-16), Cappadocia, Turkiye. ISTES Organization.

Introduction

In response to current conditions, educational institutions have promptly adopted efficient strategies for managing student interactions, delivering online courses, and assessing students. Institutions have recognized the need to adapt to the changing environment caused by COVID-19 (Mukhtar et al., 2020) despite initial concerns about the effects of investing in online education. This presents an opportunity to adopt technology that meets the requirements of contemporary education, especially for science students. Technology advancements have increased the desirability of online and web-based learning methods, mainly when traditional approaches are impractical. Such methods enable educational institutions to adapt their blended learning strategies quickly during a pandemic (Panchal et al., 2021). However, it is essential to ensure that online education operates efficiently.

Virtual reality (VR) is an interactive experience that immerses consumers in computer-generated environments (Fabris et al., 2019; Mokmin & Ridzuan, 2022). VR technology grants users access to interactive, three-dimensional virtual environments that enhance learning (Oigara, 2019). Users are transported to a 360-degree virtual environment by wearing a VR headset that monitors their movements, allowing them to explore, navigate, and interact with the content. This enables students to take charge of their learning process and choose content that corresponds to their abilities and requirements (Yin et al., 2021). However, virtual reality technology also raises ethical concerns and potential dangers, such as privacy, consent, representation, and bias issues.

This study has identified research voids regarding the long-term effects of VR exposure, including its effects on visual performance, visual fatigue, and cognitive aftereffects (Szpak et al., 2019). Additionally, when utilizing VR technology, ethical concerns regarding privacy, consent, representation, and bias must be addressed (Kenwright, 2018). Recent developments in the educational use of virtual reality include virtual field trips to historical and touristic landmarks, simulation-based learning for practicing psychomotor skills in preclinical dental students, immersive language learning for speaking and listening, VR integration in special needs education for social and life skills training, and iPad-based blended learning approaches (Crawford et al., 2022)(Jiao et al., 2021).

To facilitate this research, a Virtual Reality Biology Lab (VRBL) with virtual experiences for students was created. The VRBL combines Experiential Learning Theory (ELT) and the Cognitive Affective Model to generate the CAMIL model, an immersive learning environment. This instructional method integrates

multimedia design and effective pedagogical techniques by utilizing the interactive capabilities of virtual reality. The study will assess pupil participation, engagement, and comprehension utilizing the Virtual Reality Laboratory (VRL) and conventional two-dimensional films on the same topics. The final prototype was designed and developed using the ADDIE Model, a recognized framework for VR-based technologies in scientific education. Educators and designers can use the findings of this study to create more engaging learning environments.

Background Study

Virtual reality encompasses four essential elements: virtual worlds, sensory feedback, immersion, and interactivity. Virtual worlds are computer-generated environments that permit real-time user interaction and simulate external sensations, providing a feeling of teleportation to the virtual world (Jiawei & Mokmin, 2023). Immersion enhances the authenticity of the experience by incorporating auditory and visual data, allowing users to become fully immersed using VR headsets and spatial audio. Sensory feedback replicates human perception, allowing VR equipment users to navigate, observe their on-screen movements, and interact with the virtual environment. VR can alter the perception of taste, scent, and force, in addition to audio and video. The fourth aspect is interactivity, which enables users to interact with the virtual world in real-time, fostering a sense of inclusion and immersion. Within the virtual world, users can perform actions such as slaying monsters, shooting, kicking, and selecting objects on the screen.

The technology seeks to simulate reality by utilizing VR equipment such as headsets, gloves, and goggles that transmit and receive data and display moving images and objects. When human motion is detected, the display alters in real-time, providing users with a realistic 3D experience. Explore the VR environment by walking, stepping, turning heads, and even touching 3D objects to experience them with their hands (Mokmin & Jamiat, 2021).

According to Heizenrader (2019), there are two primary types of virtual reality: non-immersive and immersive. Non-immersive VR technology provides the user with a computer-generated virtual environment in which they remain. There are two types of immersive VR: semi-immersive and truly immersive. Semi-comprehensive virtual reality provides a more immersive experience than non-immersive virtual reality, but is not as immersive as fully immersive virtual reality. Completely immersing the user in a virtual environment provides the most authentic experience possible. Fully immersive experiences require a headset or other wearable device that covers the user's eyes, hearing, and sometimes other senses. This research focuses on fully immersive technology because it provides a more interactive and comprehensive virtual reality (VR) learning environment.

Using avatars, students can engage in various virtual reality simulations and engage in learning without fear of making errors. For instance, Shorey & Ng (2021) explain how the performance of nurses during clinical training can be monitored and recorded using VR, which provides an authentic and distinctive training environment that enhances their sense of presence. Additionally, VR can be used for challenging educational duties, such as

assisting anxious patients receiving psychiatric care. Li et al. (2020) discovered that avatars in a virtual environment assist patients in identifying their emotions and practicing emotional responses.

Virtual Reality in Learning Science

The study of biology is essential to comprehending science, and it is included in the secondary school curriculum. Biology investigates the processes within living organisms, such as humans, plants, and animals, and forms the basis of medical science. It addresses questions concerning the origins of existence. However, pursuing biology at the secondary and bachelor's levels presents obstacles, particularly regarding teacher preparation and subject understanding. The psychosocial aspect relates to the student's interactions with the instructor, peers, and environment, whereas the physical aspect relates to the classroom's environment and resources. Effective interactions between instructors and students are crucial for educational success.

Due to the global proliferation of COVID-19, educational institutions have been forced to close their doors, particularly those training future medical professionals. Online education has filled the void and allowed students to continue their education. The course materials are delivered via online platforms in a manner that encourages student engagement and facilitates the evaluation of their progress. Virtual reality (VR) immerses users in a computer-generated environment, facilitating user interaction. Through sophisticated interaction techniques, VR technology provides educational applications with access to 3D simulated environments. By donning motion-sensing VR headsets (and sometimes portable controllers), individuals can experience a virtual 360-degree environment that completely replaces their immediate surroundings. This adaptability enables students to direct their own learning, selecting pertinent topics based on their own circumstances and receiving individualized instruction tailored to their specific skills.

The use of virtual reality in medical education and learning can be highly advantageous. Several studies have demonstrated the benefits of combining VR technology with conventional instructional methods in medical science education. Chen et al. (2020) discovered that virtual reality technology improved students' learning capacity, satisfaction levels, performance time, and confidence. Samadbeik et al. (2018) discovered in a review of studies on using virtual reality in medical science that 74% of the studies indicated enhanced learning outcomes, while 87% demonstrated that medical professionals trained with VR exhibited increased accuracy. Despite the many benefits of VR-based learning materials and environments in medical science education, Baniasadi et al., (2020) identified specific challenges and limitations that organizations and educators should consider prior to investing resources in the development of such materials and environments. To effectively utilize virtual reality, it is essential to meticulously align its educational purpose and consider it throughout the design and development phases.

Experiential Learning in Virtual Reality

Lewin, Dewey, and Piaget all created significant experiential learning models that have influenced the growth of the notion of experiential learning. These opinions all emphasize the value of experience or hands-on training. Students acquire knowledge through actual experience and subsequent processing of that knowledge. The process of learning by actual experience is referred to as "experiential learning". Relearning should always be a part of the learning process since learning is a process, not a product, and learning itself inspires people to learn. When experience is taken in and transformed, knowledge is created.

Four experiential learning methodologies were presented using this just as the foundation. The Active Experimentation, Reflective Observation, and Abstract Conceptualization Cycle in Four Stages (David A. Kolb, 2015). The experiential learning paradigm is one of the most frequently cited rationales for employing virtual reality in the classroom (Falloon, 2019). The knowledge required for efficient learning can only be obtained through firsthand experience. Because it centers the learner at the center of relevant lessons, virtual Reality (VR) has a lot of potential as a teaching tool (Alrehaili & Al Osman, 2019). Virtual Reality (VR) has also been shown to increase student engagement in chemistry, engineering education (Chang et al., 2022)(Halabi, 2019), and STEM subjects (Sattar et al., 2020).

Virtual reality (VR) technology's application in the medical sciences has been the focus of numerous studies that have looked at how to engage students' interest in learning. Virtual reality was used as a teaching tool for nurses to learn about childbirth throughout the trial. Their research indicates that when it comes to piquing students' interest in learning, employing virtual Reality (VR) to teach students is more effective than using more traditional methods. Students are significantly more engaged in virtual Reality (VR) learning than they are with video and text-based learning, according to research done by Sattar et al. (2020).

Cognitive Affective Model of Immersive Learning (CAMIL)

According to the Cognitive Affective Model of Immersive Learning (CAMIL), immersive media, such as virtual reality (VR), improve the learning experience. The function of multimedia design in enhancing immersive virtual learning environments is crucial (Makransky & Petersen, 2021). Visual, audio, and tactile feedback are used as virtual sensory inputs during immersive learning. This strategy is supported by motivation, curiosity, and multimedia learning, among others. Figure 1 depicts the six emotional and cognitive CAMIL components that can facilitate learning in immersive virtual reality (IVR) environments. These variables include interest, intrinsic motivation, self-efficacy, embodiment, cognitive burden, and self-regulation. Makransky & Mayer, (2022a) research indicates that effective instruction in virtual environments can improve learning outcomes. The hypothesis outlines six influences of presence and agency on the learning process. Figure 1 illustrates the relationships between CAMIL variables and factors such as cognitive burden, self-regulation, self-efficacy, and intrinsic motivation. Investigating the impact of the user presence scale and the VR Science Laboratory experience on learning will be the primary focus of this study.

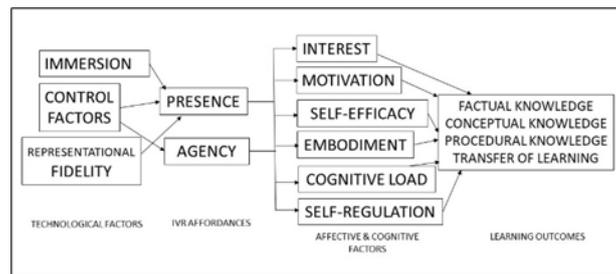

Figure 1. The Relations between the different variables in the CAMIL

Presences in Virtual Reality

Due to its requirement for user interaction within a virtual environment, virtual reality (VR) has received scant research attention despite its pervasive use. The feeling of presence is crucial for creating a more realistic virtual reality experience because it enables users to focus on the content rather than become distracted by illusionary flaws. Elements such as displaying actual constraints and equipment awareness can assist in reducing this subjective illusion. Moreover, social interactions with VR characters and internal factors such as personality traits and immersion propensity can influence a user's sense of presence while using VR (Servotte et al., 2020). After respondents have investigated the VR research facility, a questionnaire will be administered to determine their level of presence.

The sensation of being tangibly present within a virtual environment. It requires the user to feel truly present, interacting naturally with avatars, objects, and the surrounding environment. The objective is to create sensory experiences that closely mimic "being there." User characteristics and media attributes determine their presence in mediated contexts, according to Riva et al. (2003) classifications. Individual component perception plays a significant influence on presence (Bachmann et al., 2021). As it involves the subjective experience of the learner, different individuals may have varying levels of presence in response to the same experience. As our brain perceives all sensory information as a unified entity rather than discrete channels, developing multisensory experiences is essential for creating impactful moments. However, most VR research has primarily focused on enhancing image fidelity.

The term "immersion" is used to describe both the objective measure of creating a visually and aurally engaging virtual environment and the subjective impression of believability in that environment (Cummings & Bailenson, 2016). "Presence" refers to the mental perception of being physically present in a simulated environment, resulting in a "presence illusion." Contrary to prevalent belief, the primary objective of virtual reality is not to make users feel physically present in a virtual environment (Samur, 2016). Instead, "presence" refers to the sensation of being fully immersed in a digital world, predominantly on a visual level, despite the brain and body's response to environmental stimuli. In the VR industry, "presence" can be subjective and sometimes used interchangeably. "Presence" can also refer to the sensory realism of a virtual reality (VR) system (Slater & Sanchez-Vives, 2016).

Immersive VR experiences require tactile feedback, minimal latency, and the full integration of visual and auditory elements (Slater & Sanchez-Vives, 2016). High-fidelity visuals, immersive audio, and natural interaction flow create an immersive experience (Jung & Lindeman, 2021). Virtual reality (VR) technology aims to thoroughly immerse users in a virtual environment by providing visual, auditory, and sometimes tactile sensory feedback. VR headsets, motion controllers, and other specialized technologies aim to make the virtual world appear, hear, and feel astonishingly natural (Witmer & Singer, 1998). In the development of virtual reality (VR) experiences, it is essential to prioritize a high level of presence because it increases user engagement and facilitates prolonged interaction within the virtual environment. A high level of presence can enhance immersion and engagement, thereby enhancing the efficacy of scientific learning in a VR environment. Considering factors such as realism, engagement, and multisensory integration, additional research is necessary to fully comprehend the impact of presence on learning outcomes.

Design and Development

Virtual Reality Science Laboratory

Throughout the design and development phases, the ADDIE (Analysis, Design, Development, and Evaluation) methodology is applied. Using cutting-edge interactive technologies, the virtual reality (VR) laboratory develops highly engaging 3D virtual worlds for scientific study. Under the supervision of an instructor, students are able to navigate a fully immersive virtual laboratory using motion-sensing VR headsets and portable controllers. Students can investigate in-depth information about pathological elements such as cancer cells, germs, and bacteria via interactive 3D models and informative instructional videos. Consequently, students have more control over their academic journey and can tailor their education to their specific requirements and interests.

Hardware

Individuals can entirely immerse themselves in computer-generated virtual reality environments using various sensing devices, allowing them to experience and feel as if they are physically present in that location. Examples of such virtual environments include airplane cockpits and operating rooms. We increased participant engagement using the HTC Vive, a virtual reality headgear manufactured in the United States by HTC Corporation. With a field of view of 100 degrees and a resolution of 1,080 by 1,200 pixels per eye, the HTC Vive provides users with a high-quality visual experience. It also has a refresh rate of 90 Hz. The HTC Vive's built-in wireless adapter allows users to explore virtual environments without being physically tethered to a computer. To further facilitate interaction within the virtual world, we used a set of HTC controllers with two Vive trackers affixed to the feet and one Vive tracker placed on the torso (see Figure 2). Two lighthouse cameras continuously surveyed the 3x3 meter playing area, allowing precise tracking and movement within the virtual environment.

Figure 2. HTC headset and hand controller

Virtual Reality Science Laboratory Development Platform

The Virtual Reality component of the Virtual Medical System was created using the Unity platform. Creating a digital representation of the healthcare system was the initial step. Utilizing Blender and Photoshop, a detailed 3D model and texture were created for the virtual medical environment. This procedure required considerable time and effort. After creating the 3D model in Blender, it was imported into Unity and scaled accordingly. The roaming module functionality was implemented by encoding the required functions based on the predetermined design to facilitate user movement within the virtual laboratory scene. Individuals can immerse themselves in a computer-generated virtual reality environment using various sensing devices, providing an immediate sensation of presence and realistic experiences, such as being in the cockpit of an aeroplane or an operating site.

We employed the HTC Vive, a sophisticated virtual reality headset developed by HTC Corporation in the United States, to increase participant engagement. The HTC Vive features a 100-degree field of view and a display resolution of 1,080 by 1,200 pixels per eye. In addition, it has a refresh rate of 90 hertz, which ensures fluid and immersive visuals. The HTC Vive's wireless adapter enables users to freely investigate virtual worlds without requiring physical connections to a computer. To further facilitate user interaction within the virtual environment, we used a set of HTC controllers with two Vive trackers affixed to the feet and one Vive tracker placed on the torso (refer to Figure 2). Two lighthouse cameras continuously scanned a 3x3 meter area to accurately monitor user movements and interactions within the virtual environment.

Virtual Reality Science Laboratory

In the Virtual Reality Science Laboratory, there are six distinct sections, each featuring labeled 3D objects, movies, and infographics. One of these sections is dedicated to the study of animal, plant, and fungal cells, allowing students to explore their structures and understand the importance of precise labeling in a laboratory setting.

Figure 3. General view of VR science Lab

In the Virtual Reality Science Laboratory, viewers have the opportunity to observe 3D objects, such as Amoeba and Chlamydomonas, with their corresponding descriptions. This interactive experience enhances the understanding of the bacterial structures and their characteristics.

Figure 4. Cell and bacteria section

In the Virtual Reality Science Laboratory, the second area is dedicated to the exploration of cancer, tumors, and inflammatory diseases. Within this section, there are various three-dimensional objects, a movie, and interactive discussions that provide insights into inflammation, tumors, and the different stages of cancer.

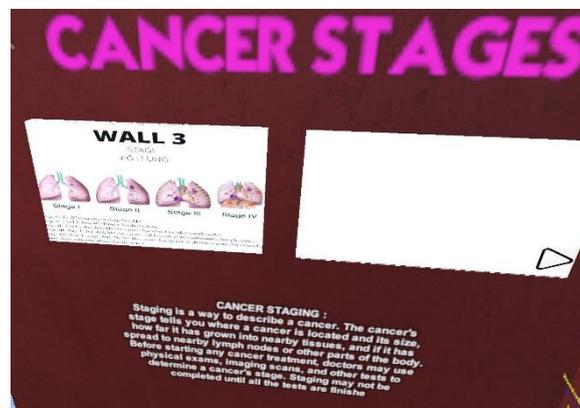

Figure 5. Cancer and inflammationsSection

Methodology

Research Approach

A descriptive quantitative methodology is used to address the study's research subjects. Students are asked to voluntarily participate in the study using a Google form, a pre-posttest, and open-ended questions as research tools.

Sample size and population

In this study, we assess participants' proficiency with the VR scientific lab and their presence experience about application when studying sciences. Two separate groups of 37 science students were given a set of questions as part of the study. Twenty kids will be in Group 1, studying Science through 2D movies, and 17 students will be in Group 2, studying Science using a Virtual Reality Science Lab. Both groups will get a set of questions following each session.

Instrument

An online questionnaire was utilized as the instrument to gather data for this study because it is a quick and easy process. There are two sections to the questionnaire: Part A and Part B. The information about respondents' backgrounds, including name, student number, and course, is gathered in Part A of the survey. In Part B of the survey, participants are asked to score their replies on a Likert scale that spans from strongly disagree to strongly agree in response to six questions (three for each group) concerning their presences experiences while learning in a virtual reality science lab and 2D video. The layout of the questionnaire is shown in Table 1.

Table 1: Students' Feedback- Questionnaire Part B (Likert Scale)

Questions

Group 1 (Video)

1. The "Cell Structure and Function" video seems to help me to visualize the cell itself better
2. My experience learning with "Cell Structure and Function" video similar as learning in the actual classroom
3. The "Cell Structure and Function" video attracts my attention for learning about topics

Group 2 (Virtual Reality)

1. The virtual science laboratory seems real to me
 2. The virtual science laboratory gave me the feeling of being there myself
 3. My experience in the virtual science laboratory seemed as though I was there in the real world
-

Data Analysis and Findings

Results

There are 3 outliers for this data collection. Therefore, the total collected is 37. Group 1 is 20, and group 2 is 17.

H_0 : There is no significant Different between Group 1(Video) and Group 2(VR) in the median mark score.

A non-parametric Mann-Whitney U test was performed to compare the mark scores between Group 1 (Video) and Group 2 (VR) in a data collection containing 37 observations, with 20 in Group 1 and 17 in Group 2. Since the data was not normally distributed, this test was chosen.

The results of the Mann-Whitney U test indicate that there is a statistically significant difference in the mark score distributions between Group 1 and Group 2. The test statistics show a U-value of 238.5, a z-value of 2.141, and a p-value of 0.036.

Based on the p-value being below the common significance level of 0.05, the null hypothesis, which states that there is no significant difference in the median mark scores between the two groups, is rejected.

Further analysis reveals that the median mark score in Group 2 (VR) is significantly higher (93.3) than in Group 1 (Video) (83.4).

In summary, the statistical analysis using the Mann-Whitney U test suggests that there is a significant difference in the median mark scores between Group 1 and Group 2, indicating that Group 2 (VR) has a higher median mark score compared to Group 1 (Video).

Table 2: Hypothesis test summary

	Null Hypothesis	Test	Sig.	Decision
1	The distribution of Mark is the same across categories of Group.	Independent-Samples Mann-Whitney U Test	0.036 ^a	Reject the null hypothesis.

Asymptotic significances are displayed. The significance level is 0.050.
a. Exact significance is displayed for this test.

Table 3: Independent-samples Mann-Whitney U Test summary

Total N	37
Mann-Whitney U	238.500
Wilcoxon W	391.500
Test Statistic	238.500
Standard Error	31.997
Standardized Test Statistic	2.141
Asymptotic Sig.(2-sided test)	0.032
Exact Sig.(2-sided test)	0.036

Table 4 :Distributions of the two group Independent-Samples Mann-Whitney U Test

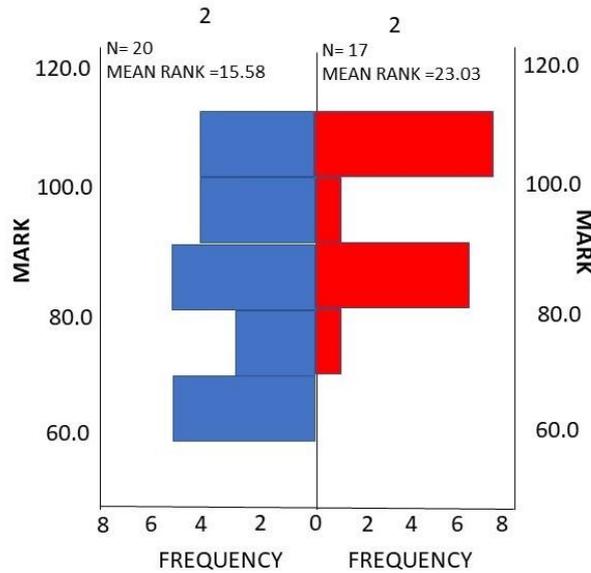

Table 5: The Mean, Std. Deviation and Median Report

Report

Group	Mean	N	Deviation	Median
1	83.000	20	13.4060	83.350
2	92.165	17	8.5712	93.300
Total	87.211	37	12.2042	86.700

Discussion

The study results indicate that the group taught science using 2D film demonstrated lower levels of presence than the group taught using virtual reality. This outcome is consistent with the immersion principle of multimedia learning, which suggests that immersive experiences foster increased engagement and presence. Makransky & Mayer (2022b) also supports this idea, stating that increased immersion in learning environments results in greater levels of presence. These findings support previous research demonstrating that less immersive mediums like video provide less virtual presence than high-end VR systems (Riva et al., 2003).

This study's primary objective was to comprehensively investigate the impact of the immersion principle on multimedia learning and to comprehend how virtual reality influences a learner's sense of presence when engaging with science. Presence is vital in virtual reality experiences, as it profoundly influences user engagement, behavior, and emotions. When users feel physically present in the virtual environment, they become more engaged with the content. Numerous studies have demonstrated that students in virtual reality

environments retain information better and perform better on related tasks. The concept of presence in virtual reality has numerous practical applications, ranging from therapeutic interventions to medical training and simulations. Virtual reality enables users to acquire and practice skills in a safe and controlled environment by fostering a sense of presence.

Conclusion

This research aimed to determine the efficacy of virtual reality (VR) applications incorporating the immersion principle in multimedia learning. The study compared the level of presence of two groups of students during scientific education, one using virtual reality and the other using conventional methods. The results revealed a significant difference between the two groups' levels of presence, with the VR group exhibiting higher levels of presence and performing better overall. These findings have significant implications for educators and developers, demonstrating the potential of virtual reality (VR) tools to improve scientific learning experiences.

It is recommended that future research investigate additional variables, such as cognitive load, in conjunction with VR learning aids. This will provide a deeper comprehension of the impact of virtual reality on learning outcomes and guide the development of effective VR interventions.

Virtual reality is not a permanent solution but a highly effective instructional instrument, especially for specialized learning applications. Its use in medical science, particularly in pathology education, has been thoroughly investigated. Virtual reality's future depends on its continuous incorporation into educational curricula and technological advancements that enable shared simulations of therapeutic encounters. This will enable the extensive and location-independent delivery of high-quality interprofessional education, thereby altering the educational landscape of the future.

Abstract: Gamification is a very useful technique, that has been fully increasing in the last years. During the CoVid19 pandemic, our innovation teaching group sent to our students several games, that were used by them for self-studying. Considering that many numerical problems can be proposed in Biochemistry, rather than numerical games (sudoku, adding and subtracting number games, ...) word games were preferred to learn biomolecule nomenclature. Among these word games, we adapted to Biochemistry: connecting dots, labyrinths, mazes, matching two sets, amidakuji, logic games, crossword puzzles, word search puzzles, knight's tour games or anagrams. In this work, we present several games related to labyrinths and mazes. Connecting dot games were adapted to Biochemistry by using intermediate metabolite of a pathway instead of numbers to develop a picture when connecting the dots. Anyway, as pathways don't contain a big number of metabolites, no difficult pictures can be used. Thus, a labyrinth with questions and answers and letters connecting questions with answers can be better used. Correct answers can develop the letters of a biomolecule's name. Other kind of labyrinth can be those where the letters can be taken from the shortest route. Labyrinths can also be used to develop a word following the route in labyrinths and taking letters to get the word, as an anagram. Several examples are shown hereby, adapted for Biochemistry students of Chemistry degree.

Introduction

Game-based learning is a term that is difficult to define, although it is often described as learning that involves game boards, cards, or dice, as well as video games [Stojanovska and Velevska, 2018]. According to Prensky [Prensky, 2000], it is crucial that students become fully engaged in the game process. To achieve this, games must contain six key elements for them to be effective: (1) rules of the game; (2) goals and objectives; (3) results and feedback; (4) conflict, competition, challenge, and opposition; (5) interaction; and (6) representation of a story or performance [Huang and Soman, 2013]. In fact, gamification is a popular method, that is increasingly being used to help students to acquire more knowledge and skills [Kim, 2013]. Traditional teaching methods in science, technology, engineering, and mathematics (STEM) often involve passive learning, which can lead to boredom and a lack of interaction on some students. The Moodle environment is highly suitable for gamification on self-learning tool, as it allows teachers to offer a wide range of games to students and analyzes which ones they prefer and how frequently they are used. This possibility of Moodle allows teachers to observe the interests of each student and encourages their personal fulfillment, just as is sought in the Montessori method [Palmarola, 2017]. According to this method, the teacher must promote students' interests by adapting the material to suit everybody individually. However, while some H5P activities can show if the student has been frequently connected, not all the games can be directly evaluated by Moodle.

In Biochemistry, gamification is not generally used since it is a more suitable methodology for non-scientific subjects. Learning based on solving numerical problems or medical cases is more commonly used. However, the nomenclature found in textbook glossaries [Stryer et al., 2015; Nelson and Cox, 2018] is complex and difficult to remember. For this reason, our consolidated teaching innovation group (GINDOC-UB/180) thought that gamification could be applied to self-learning the nomenclature and structure of biomolecules. After the pandemic we prepared several games based on four main groups: (a) words lacking a syllable or a group of letters [Centelles et al., 2021] [Centelles et al., 2022a] [Centelles et al., 2022b], (b) anagrams and labyrinths, (c) translation of codes [Centelles et al. 2022c], and (d) dominoes and other games to chain words [Centelles et al. 2022d] [Moreno and Centelles, 2021]. The aim of this work is to classify and apply the games that use anagrams and labyrinths (group b) to help Biochemistry students to self-learn the nomenclature of biomolecules.

Labyrinths are structures with one or several paths that deceive the visitor and make it difficult to find the center and the exit. In Greek mythology, labyrinths were used to hide something or someone inside them, and the labyrinth of Crete, for example, hid the Minotaur. Theseus was able to defeat the Minotaur and to escape the labyrinth because Ariadne showed him how to find his way back by unwinding a thread as he entered the labyrinth. In the Middle Age, labyrinths were Christianized, and the word "Ecclesia" was written in the center, or a cross was drawn, and their function was to protect this center. Only people initiated in the faith could access the labyrinth to follow the path to salvation. According to the path, the labyrinths are classified as unicursal and multicursal [Rivera-Dorado, 1995], where the unicursal labyrinths are those that have a single and complex path (labyrinth), while the multicursal labyrinths are composed of several paths (mazes). While the unicursal paths

follow a route from the entry point to the center of the labyrinth, and from there to the exit point, without the need to make decisions; multicursal labyrinths have dead-ends and sections not connected to the perimeter. A well-known unicursal labyrinth is the labyrinth of Chartres Cathedral, 16 m in diameter and 11 concentric circles, which traces a path of 264 m from the outside to the center of the labyrinth. This road was called the “Jerusalem Road” and had to be traveled on one's knees reciting the miserere to obtain an indulgence similar to that of pilgrimage to the Holy Land. On the other hand, the multicursal labyrinths are those that were designed in the romantic gardens at the beginning of the 19th century, such as the labyrinth in the Horta labyrinth park (Barcelona). The park is dedicated to love and its aspects, with allusions to Narcissus, Echo, the kidnapping of Europe, ..., and of course, Ariadne's thread.

In the field of education, labyrinths can be used as a tool to facilitate learning and promote problem-solving skills. They can be designed in different ways, including as mazes with dead-ends or as unicursal paths leading to a point. By navigating through these labyrinths, students can improve their cognitive abilities and enhance their understanding of complex concepts. Anagrams are another tool that can be used in gamification to facilitate learning. Anagrams are words or phrases formed by rearranging the letters of another word or phrase. They can be used to help students to learn vocabulary, spelling, and grammar. By rearranging letters and forming new words, students can develop critical thinking and problem-solving skills.

Method

Biochemistry glossaries enable the identification of the most frequent biomolecules [Stryer et al., 2015; Nelson and Cox, 2018]. The words in the glossaries were classified into six groups: (1) carbohydrates; (2) lipids; (3) amino acids and proteins; (4) nitrogenous bases, nucleosides, and nucleotides; (5) intermediates of metabolic pathways; (6) cell components and other related words. Once the most important words that students should know were identified, we analyzed possible games within the “anagrams and labyrinths” section, that could be used as pastimes to identify these words. We decided to use anagrams or alphagrams inside the labyrinth, to make the game more challenging to solve and more enjoyable for our students.

Anagrams or alphagrams

There are many anagram generators available on the Internet [Anagram generator], which makes it easy to prepare this type of games. However, it is also easy for students to solve these anagrams if they use them. Alphagrams, which involve sorting the letters in alphabetical order, are easier to prepare, if possible, than anagrams. However, for the players, anagrams or alphagrams are equally challenging to solve. If the anagrams make sense, they can provide an added value that helps players remember the new word more easily by simply recalling the anagram.

Unicursal labyrinths or labyrinths

For Catalan speakers, labyrinths are divided in two groups: unicursal or multicursal. Unicursal labyrinths are those that show only one road, that goes from origin to destiny, and although they are easy to solve, they could be long lines with several changes of direction, and this makes difficult to see the solution at first sight. Multicursal labyrinths or mazes contain several roads, and their aim is that to obtain the shorter way that goes from origin to destiny. In labyrinth (unicursal labyrinths), there is only one road that leads from origin to destiny.

Multicursal labyrinths or mazes

Multicursal labyrinths or mazes are those that show several roads, dead-end zones, and the player should find the shorter way from entrance to exit. A possibility to play a game with a maze consists in taking the letters found in the shortest road. The collected letters can form a word directly, or from them an anagram can be obtained that reveals the asked word. Another possibility consists in a maze containing labels connected with a letter, or questions and answers also connected with a letter. When answering the questions correctly, an anagram can be formed or a word can be obtained directly, just like in the labyrinths of letters found on the road.

Adapted amidakuji

We adapted the Japanese Amida lottery to a unicursal labyrinth, to connect two sets containing the same numbers of elements. After connecting the road, the second set of elements contained a question in order that the student could answer a test of true-false answer. This game could be more enjoyable than a simple test.

Results

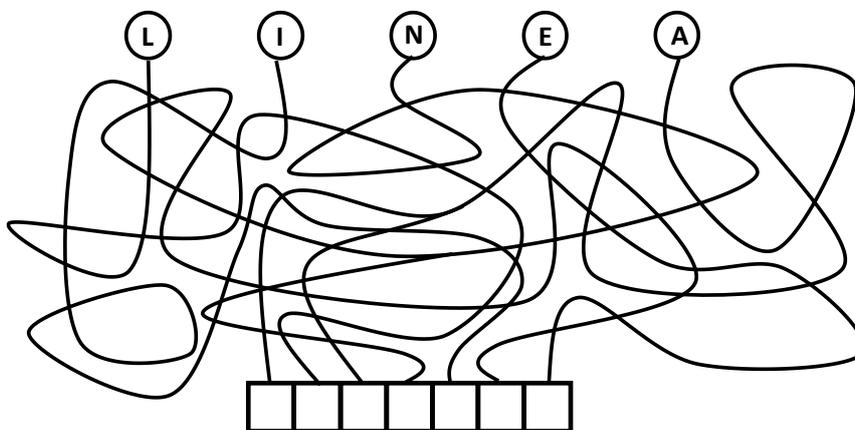

Unicursal labyrinth or labyrinths are roads with only one individual path. These kinds of games can be compared with anagrams or alphagrams, as the letters can be easily seen, although not their positions in the word. Nevertheless, labyrinths are easier to solve than anagrams or alphagrams, as it is easier to find the way than to try different possibilities. If roads are shorter or there are not so many roads, game is easier to solve, whereas complex roads lead to complex solutions. Multicursal labyrinths or mazes, instead, can show several paths. Nevertheless, the player should usually find the shorter way from the beginning to the end.

Unicursal labyrinth or labyrinths containing branched paths.

In the following games, some letters are repeated in the solution word, but they are only written once at the statement. The game can be prepared showing only one word, or several words. When solution contains only one word, the game is easier, whereas it is more difficult when several words must be found.

Labyrinths with branches paths developing only one word.

Follow the paths for each letter, that lead to the grid of the word. The name of an amino acid will be developed.

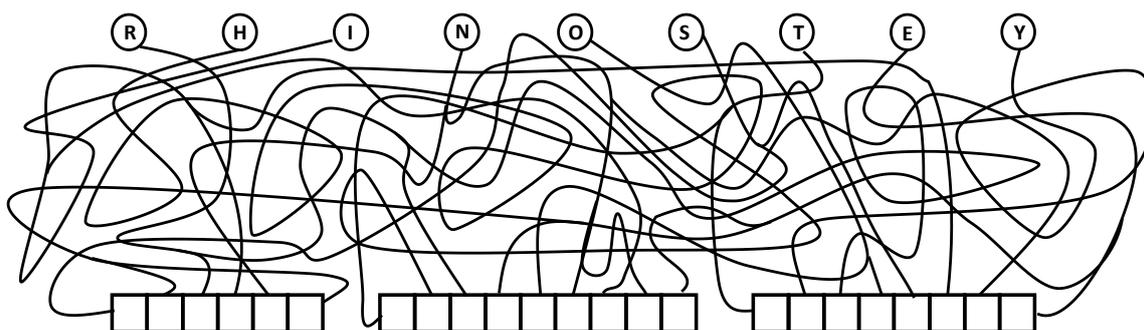

SOLUTION: Alanine

A and N have branched paths, as the letters are repeated twice in the solution word.

Labyrinths with branched paths developing several words.

Follow the paths for each letter, that lead to the grids of the words. The name of three amino acids containing hydroxyl groups will be developed.

SOLUTION: Serine, Threonine, Tyrosine

Serine and threonine are aliphatic amino acids, whereas tyrosine is aromatic. Serine contains a primary alcohol, threonine a secondary alcohol, and tyrosine a phenol.

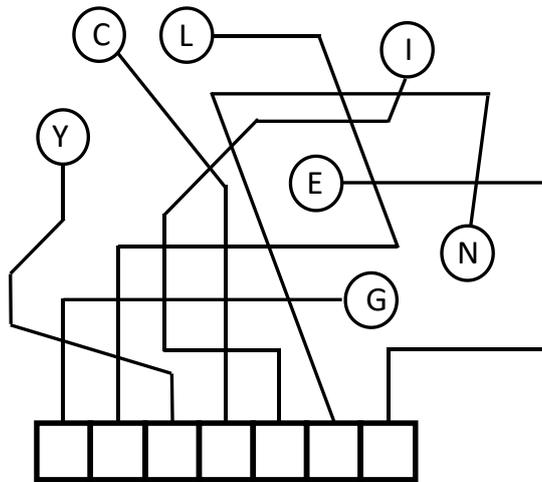

In this game, although H and Y have lineal paths, S, O and T appear twice in the grids, I and R three times, N four times and E five times. Paths for the last letters (S, O, T, I, R, N and E) are branched, in order that they arrive to the boxes of the grid several times.

Unicursal labyrinth or labyrinths containing lineal paths.

In the following games, although some letters could be repeated in the solution word, all the letters are written at the statement. The game can be prepared, as the previous one, showing only one word, or several words. When solution contains only one word, the game is easier, whereas it is more difficult when several words must be found.

Labyrinths with lineal paths developing only one word.

Follow the paths for each letter, that lead to the grid of the word. The name of an amino acid will be developed.

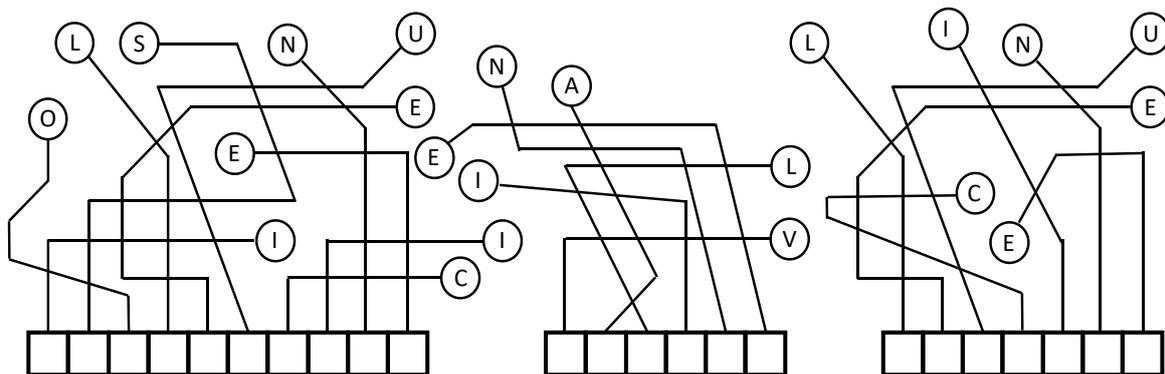

SOLUTION: Glycine

Glycine is the smaller amino acid in proteins. It is the only achiral amino acid in proteins.

The game is easier than a simple anagram or alphagram, since the lines reduce the number of options.

Labyrinths with lineal paths developing several words.

Follow the paths for each letter, that lead to the grids of the words. The name of the three branched chain amino acids will be developed.

SOLUTION: Isoleucine, Valine, Leucine

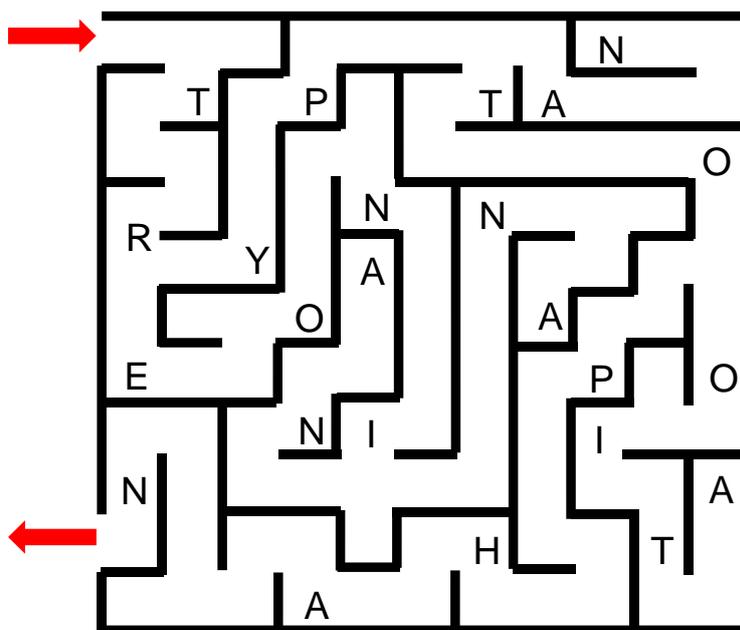

Valine contains 5 carbons, whereas leucine and isoleucine contain 6 carbons. All are branched chain amino acids.

Multicursal labyrinth or mazes taking letters on the road.

In the following games, some letters could be taken when walking through the correct path. Those letters could directly form a word, or an anagram and the word should be constructed from the anagram.

Mazes developing one word by following the road.

Follow the road through this labyrinth from the entrance (top arrow) to the exit (bottom arrow). Take all the letters found in the shorter path. The hidden word is the name of an aromatic amino acid.

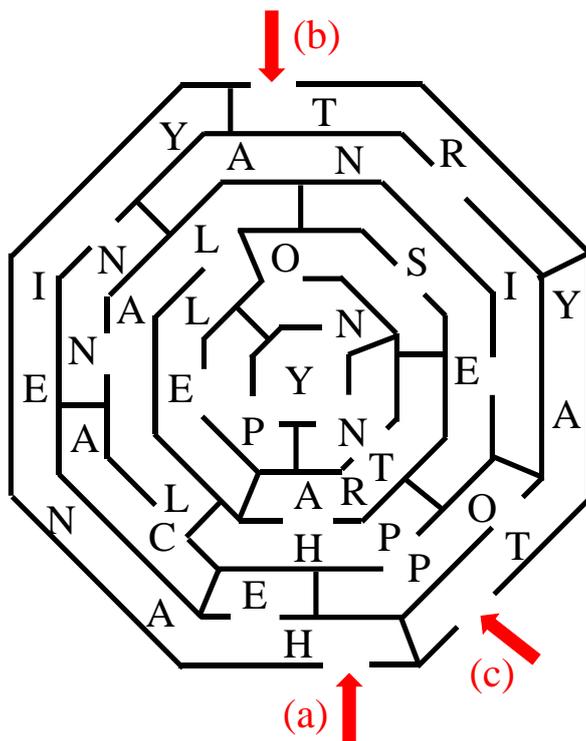

SOLUTION: Tryptophan.

Tryptophan is an aromatic amino acid. Neutral aromatic amino acids from proteins are phenylalanine, tyrosine, and tryptophan. Histidine is also an aromatic amino acid, but although phenylalanine, tyrosine and tryptophan are neutral amino acids, histidine is a basic amino acid.

Mazes developing anagrams of several words by following the road.

Follow the roads (a), (b) and (c) from the arrow to the center of the labyrinth. Take all the letters found in the 3 paths. Each road will develop an anagram of an aromatic amino acid. The hidden three words are anagrams of the three names of aromatic amino acids.

SOLUTION: (a) HANEINNALLEPY, Phenylalanine; (b) TRIESONY, Tyrosine; (c) TOPPHARTNY, Tryptophan.

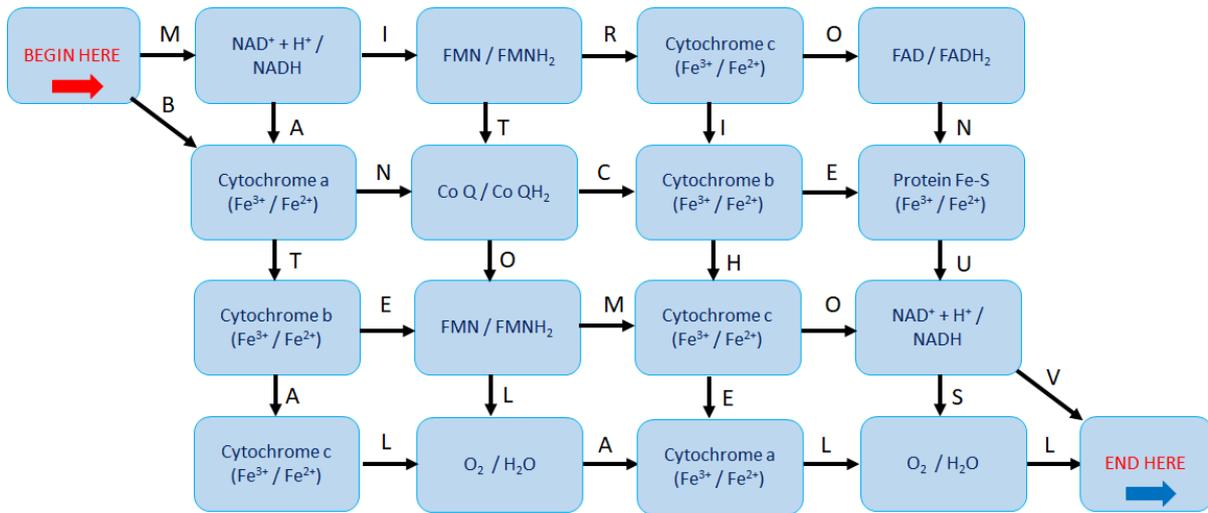

Neutral aromatic amino acids from proteins are phenylalanine, tyrosine, and tryptophan. Histidine is also an aromatic amino acid, but it is a basic amino acid.

Multicursal labyrinth or mazes with questions and answers.

The origin of this game in our group came originally from a dot-to-dot game, after labelling the dots as intermediate from a metabolic pathway [Centelles et al., 2022e]. As there were not many dots (not much intermediate in the metabolic pathway), we substituted the dot-to-dot figure with a label game. Different labels were connected by lines displaying a letter, and the students should order the labels following the metabolite intermediate in the order of the Biochemical pathway. Letters obtained in the road with the correct labels form a word (or an anagram or alphagram) related with the metabolic pathway. Later, a complex game was prepared using labels that contained questions and answers, and the letters collected between the questions and their correct answers could also form a word.

Mazes with labels of intermediates from a Biochemical pathway.

Beginning from the red arrow, order the intermediate of the electron chain. The letters that bind the labels show the surname of a scientist related with the electron chain metabolism.

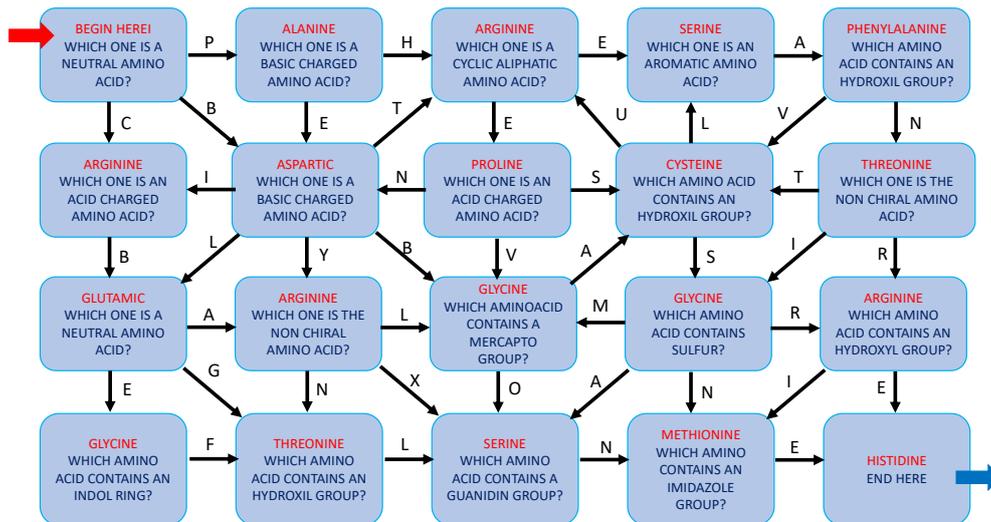

SOLUTION: $\text{NAD}^+ + \text{H}^+/\text{NADH}$, FMN/FMNH_2 , CoQ/CoQH_2 , Cytochrome b ($\text{Fe}^{3+}/\text{Fe}^{2+}$), Cytochrome c ($\text{Fe}^{3+}/\text{Fe}^{2+}$), Cytochrome a ($\text{Fe}^{3+}/\text{Fe}^{2+}$), $\text{O}_2/\text{H}_2\text{O}$. MITCHELL

Peter Mitchell (1920-1992) proposed the chemiosmotic theory, where ATP is formed due to the H^+ gradient formed by the electron chain metabolism.

Mazes with questions and answers.

Beginning from the red arrow, answer the questions (in blue) and decide which is the label that contains the correct answer (in red) from the labels connected. Collect the letters that connect the labels and with all the letters collected form the name of an amino acid.

SOLUTION: Phenylalanine.

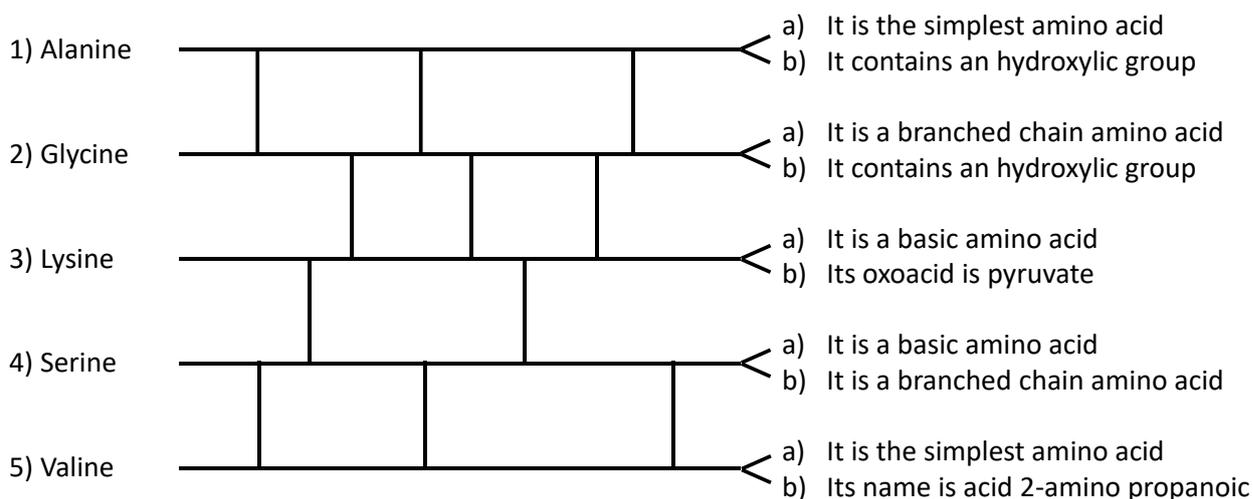

Which one is a neutral amino acid?: alanine / which one is a basic charged amino acid?: arginine / which one is a cyclic aliphatic amino acid?: proline / which one is an acid charged amino acid?: aspartic / which one is a

basic charged amino acid?: arginine / which one is the non-chiral amino acid?: glycine / which amino acid contains a mercapto group?: cysteine / which amino acid contains an hydroxyl group?: serine / which one is an aromatic amino acid?: phenylalanine / which amino acid contains an hydroxyl group?: threonine / which one is the non-chiral amino acid?: glycine / which amino acid contains sulfur?: methionine / which amino acid contains an imidazole group?: histidine.

Labyrinths adapted from an amidakuji.

This is not really a labyrinth, but it can be considered related since the game starts from one label and ends in another label that matches with the previous one. This puzzle has its origin in the Japanese Amida lottery, and it is also named Ghost Leg in China or Sadaritage (ladder climbing) in Korea. It is based on matching two sets containing the same components, for example, a set of numbers and a set of letters. Amidakuji is based on vertical lines connecting one set to the other, but to relate one number to one letter, several horizontal lines are drawn between two vertical lines. The number of horizontal lines is not important, but at least one line should be between each pair of adjacent vertical lines. To choose which number matches with a letter, the vertical line is followed until a horizontal line is reached, then it continues with the bound adjacent vertical line until the next horizontal line, or the end of the vertical line. In our adaptation, we changed the vertical lines to horizontal lines and added a question at the end, so that students must decide between two possibilities.

Match each amino acid expressed with number with one of the sentences at the end of the line. To play, move along the horizontal line, and when encounter a vertical line, change to the other horizontal line. Continue in this way until you find the end of one horizontal line, and afterwards decide whether the correct answer is a. or b.

SOLUTION: 1. Alanine, b. Its oxoacid is pyruvate; 2. Glycine, a. It is the simplest amino acid; 3. Lysine, a. It is a basic amino acid; 4. Serine, b. It contains an hydroxylic group; 5. Valine, a. It is a branched chain amino acid.

Discussion

In Internet there are many anagram generators, that could make easier to solve individual anagram games, although unicursal labyrinths can be solved in an easier way than games with only anagrams, just only following the road of each letter. Students can “cheat” with anagram generators [Anagram Generator]. When unicursal labyrinths contain branched paths, solution is more difficult to achieve, as anagram generators cannot be used to get the solution. Most of the students obtain the solutions by going from the letters to the grid, but other solve the game by going from the grid to the letter. Of course, games developing one word are easier than games developing several words, although in some cases it is easier to conclude the words. For example, for the branched chain amino acids, it could be easier to know that these amino acids are valine, leucine, and isoleucine, and afterwards to write them in the 10-grid, 6-grid and 7-grid places. Or to solve the 6-grid valine; and remember that the other two amino acids should be leucine and isoleucine. In all the cases, students will remember the three branched chain amino acids.

However, single unicursal labyrinths are easier to solve, since words contain a relatively low number of letters. Collective unicursal labyrinths are more complex than single ones and prevent anagram generators from being used to solve them. It is also easier to solve unicursal labyrinths when all the repeated letters are repeated also in the game. When some letters are missing, it is not possible to use anagram generators to “cheat”. Regarding to multicursal labyrinths or mazes, the usual shapes are rectangular, but any shape can be used (triangular, round, square, hexagonal, even star shape, and other shapes). Hereby we presented a square maze and a hexagonal maze. Anyway, all the mazes should have an entrance and an exit, although in some cases there are different possibles roads to arrive to the center. In children’s games, they could show a mouse and a cheese and ask to the children to find the road in order that the mouse could find and eat the cheese. In other cases, they can also show a mouse trap and ask to the children to find the road to the cheese but not the mouse trap. In our examples, we show letters for the roads.

In Biochemistry, we first though on a maze with only one road and the easy way was to write several letters inside the maze. The student should collect all the letters that he finds at the road. The game is more difficult if those letters are an anagram, and an added value is obtained when the anagram has a meaning. Nevertheless, if this anagram is an alphagram or is not a word, it could be difficult to find the right road, as the found letters give no clues about how to continue the road. Mazes with several roads can be used to collect families of biomolecules, where the letters obtained in each road generate the name of a biomolecule. In these cases, later it is possible to ask a question about the family of biomolecules obtained. Mazes with questions and answers are those that can give more knowledge to the student. Students should answer a question to solve this maze, and letters are collected from the line that connects the question with the answer. Students have several possible answers, and they must decide, which is the correct one. If they don’t answer correctly, they can get soon into a dead-end road, either because none of the answers is the correct one or because they get into a loop and they cannot get to the exit. Students have then to go back to the question answered with doubts. By the other hand,

the letters collected can also give a clue regarding the word obtained at the end of the maze. The game can be complicated if the word is an anagram or even more if it has no sense before solving.

Mazes with questions and answers evolved from our label games, where labels were intermediate of Biochemistry metabolism, and students should connect those labels by ordering these intermediates. In fact, these games were initially thought as dot-to-dot games. The new game is now more complete, as allows three games in one: to find the way inside the maze, to play answering the questions, to look for a word from the obtained anagram.

Regarding the amidakuji, the road is found following easy rules. In fact, a maze can be also solved by turning always to the right or to the left inside the labyrinths, although the road can be longer as can contain several dead-end roads and returning to original places. Thus, amidakuji can be considered as a special labyrinth, that we included in this paper.

Conclusion

Anagrams can be easily solved by using anagram generators in Internet. Unicursal labyrinths (or labyrinths) are easier to solve than multicursal labyrinths (or mazes). Adapted amidakuji is a sort of labyrinth, and the last question is more enjoyable than a simple true-false question. The most enjoyable games presented here are the mazes taking letters on the road or the mazes with questions and answers, as they allow several games inside the same game.

Notes

All authors belong to the QuiMet group (Metabolism in the Chemistry Degree) teaching innovation group consolidated (GINDOC-UB/180) and acknowledge to RIMDA, University of Barcelona, for recognizing our work. This work was possible by the project 2022PMD-UB/020 from RIMDA (Universitat de Barcelona).

Evaluating Physical Activities of Disabled Young People: Expectations & Challenges

Muhammet Demirbilek

Suleyman Demirel University, Turkiye,  <https://orcid.org/0000-0001-7448-9206/>

Abstract: After rehabilitation or treatment in hospitals, young people with disabilities often could not engage in a variety of sports due to their physical limitations related to their illness or disability. This gives rise to certain psychological problems, reduced self-esteem and self-confident. The aim of the ReSport project is to enable young people with disabilities to participate equally in sports activities, considering their health condition. Professionals from 8 project partners' countries aim to recognize the problems that are preventing young people with disabilities from participating in sports after rehabilitation. Partners collected local, regional, national and Europe wide best practices and concepts in the field of innovative approaches for motivation of youth with disabilities for sports, and developed a set of exercises to raise their inclusion in sport activities. The project "Re-Sport" encourages social inclusion and equal opportunities in sport, while the parallel topics are to promote voluntary activity in sport and education in and through sports with special focus on skills development. Two main target groups will benefit from the project results: a) youth with disabilities and b) volunteers from sports organisations. The purpose of this study is to learn and evaluate which physical activities youth with disabilities prefer, their expectations, challenges and good practices. This research was conducted with young people with disabilities in Slovenia, Austria, Italy, Croatia, Serbia, Sweden, Greece, and Turkey. Total number of participants were 230. Analysis and graphics were prepared with a special software based on the survey's answers. According to the answers received, investigations, inferences were made and reported.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 30-38), Cappadocia, Turkiye. ISTES Organization.

Introduction

After rehabilitation or treatment in hospitals, young people with disabilities often could not engage in a variety of sports due to their physical limitations related to their illness or disability. This gives rise to certain psychological problems, reduced self-esteem and self-confident. The aim of the project is to enable young people with disabilities to participate equally in sports activities, considering their health condition. Professionals from 8 project partners' countries aim to recognize the problems that are preventing young people

with disabilities from participating in sports after rehabilitation. Partners collected local, regional, national and Europe wide best practices and concepts in the field of innovative approaches for motivation of youth with disabilities for sports, and developed a set of exercises to raise their inclusion in sport activities.

The project "Re-Sport" encourages social inclusion and equal opportunities in sport, while the parallel topics are to promote voluntary activity in sport and education in and through sports with special focus on skills development. Two main target groups will benefit from the project results: a) youth with disabilities and b) volunteers from sports organisations. Creating an on-line learning portal for blended learning will enable execution of two kinds of workshops with the purpose to raise awareness about the importance of sport for health and prevention of injuries during execution of sports exercises for youths with disabilities. Particular attention will be given to the pursuit of outdoor sport activities in nature, using existing outdoor facilities, due to the free accessibility and the importance of being physically active outdoor.

The project "Re-Sport" can be easily replicated, enlarged, and multiplied; in the sense that it can become a model for providing a multicultural partnership, suitable for building better European conditions that promote physical activities for youth with disabilities in different European countries. As one of the first stages of the project, the consortium created a survey to learn and evaluate which physical activities youth with disabilities prefer, their expectations, challenges and good practices.

Goals of the ReSport Project

The goals of the ReSport project listed as below:

- On-line pre-event and post-event survey among young persons with disabilities.
- Guide of Best Practices in the field of motivating young persons with disabilities for doing sports.
- Manual of various types of disabilities and disability management.
- E-learning portal for education and learning material, including developed exercises for youths with disabilities.
- Sport programme Re-Sport with optimal set of outdoor sports and exercises for youths with disabilities after rehabilitation/treatment.
- Workshop training of the innovative programme "Re-Sport Volunteers".
- Workshop training of the innovative programme "Re-Sport Youths".
- Multiplier sport events to demonstrate the developed of the sport programme "Re-Sport" including youth with disabilities.

Sport Participation of Youths with Disabilities

Regular physical activity is a cornerstone of maintaining a healthy lifestyle. Engaging in continuous physical activity triggers health-enhancing processes, promoting muscle training and endurance. These positive effects extend to cardiovascular health and body composition, reducing the risk of cardiovascular diseases. Moreover, for individuals with disabilities, participating in sports and physical activities can significantly improve their

ability to carry out daily living activities, enhancing their overall quality of life (WHO, 2022). Over the past decade, there has been a decline in physical activity levels among people (Swanson, Colwell & Zha0, 2008). Office jobs necessitate employees to spend their day sitting at a desk, and post-work hours, many individuals prefer watching television or engaging in various forms of social media. This lack of physical activity may lead to adverse health consequences, including an increased risk of cardiovascular diseases, obesity, and type 2 diabetes mellitus (Dlugonski, Joyce & Motl, 2012). Individuals with physical disabilities tend to participate in sports at a lower rate compared to those without physical disabilities.

Sports participation offers similar benefits to individuals with physical disabilities as it does to those without such disabilities. Apart from the health-related advantages, like reducing the risk of heart disease, obesity, and type 2 diabetes (Tenenbaum & Eklund, 2007; Ellis et al. 2007), active people with physical disabilities also reported experiencing improved balance and psychosocial benefits, such as enjoyment, social interactions, acceptance of their disability, and enhanced self-confidence (Rimmer et al. 2004).

Method

The survey is part of the Erasmus+ funded project Re-Sport, that is developed to encourage social inclusion and equal opportunities in sport, and that aims to promote voluntary activity in sports and education. As one of the first stages of the project, a survey was prepared to learn and evaluate which physical activities disabled young people prefer, their expectations, challenges, observations and sharing of best practices.

Intended data:

Disabled youth:

- Current activity status and satisfaction levels,
- Activities they want to participate in,
- Difficulties they face in participating in activities,
- The effect of environmental and individual factors on their activities,
- Expectations for a better physical life.

This research was conducted with young people with disabilities in Slovenia, Austria, Italy, Croatia, Serbia, Sweden, Greece, and Turkey. Each partner received support from relevant organizations and educational institutions in their own country, through which young people with disabilities were reached. The questionnaire, developed by the project consortium, was prepared in English on a Google Forms digital platform, and translated into local language by each partner. With the prepared questionnaire forms, social media announcements, link sharing, young people who met the criteria were asked to fill out the questionnaire.

In addition, the survey links were sent to the managers of the relevant institutions and organizations by e-mail, and they were asked to share with the members, volunteers, and students. The survey was administered online. The answers given to the forms were automatically taken to the servers. With the completion of the survey

process, the answers in all different languages were duplicated and the open-ended answers were coded and duplicated. Analysis and graphics were prepared with a special software based on the survey's answers. According to the answers received, investigations, inferences were made and reported.

Results

Demographic Features

It was observed that the gender ratios of the participants showed relative similarity according to the gender ratio of the country and world population distribution. This shows the importance of results in terms of representation. The gender distribution of the 230 disadvantaged young people who filled out the questionnaire was observed as 51% for Male, 48% for Female, and 1% for Not Preferring Answering.

There are significant differences between the age groups of disadvantaged youth who participated in the survey. Accordingly, 57% of the participants were aged 20 and under, 29.25% were in the 21-23 age group, and 13.61% were in the 24-26 age group.

Life and Activity

Most of the participants stated that their disability is physical with a rate of 44.35%. This research, which included young people with neurological (22.61%), sensory (17.83%) and mental (15.22%) disabilities, respectively, revealed that young people do not isolate themselves from social life despite their disabilities, and they desire to socialize.

The fact that the participants were physically disabled at a high rate also revealed the importance of going into the details of the obstacles to the participation of disabled individuals in physical activities. When the participants were asked whether they wanted to participate in physical or sportive activities, almost all of them showed a positive attitude with a rate of 91.30%. When asked how often they participate in physical activities, it was observed that they were similarly active. The research also revealed that the rate of young people with disabilities participating in any sportive/physical activity at least once a week is as high as 71%. When the participants were asked how often they wanted to be physically active, it was understood that they wanted to be more active than they are now. It was observed that the rate of 71% who were in intense activity on weekdays increased to 86%, while the rate of 26% who did not participate in any sportive / physical activity decreased to 12%. When the participants were asked whether they were satisfied with their current physical activity level, 46.52% Yes, 53.48% No. It has been observed that dissatisfied individuals are in physical disability groups with 45% and in other disability groups with 55%. When the activities preferred by the participants were examined, it was concluded that 40.87% were group activities and 59.13% were individual activities.

Individuals with physical disabilities are in the first place in the preference of both activities, in the second

place; It was observed that those who preferred individual activities were neurologically disabled with 26.03%, and those who preferred group activities were individuals with sensory disabilities with 21.28%. When the sports and physical activities they want to participate in are examined, the first 5 places are: Swimming 23.55%, Athletics 13.04%, Football 10.87%, Cycling 9.06%, Table Tennis 7.97%. Bowling, which was answered in the other option, was preferred at the same level as Handball among the multiple-choice answers.

Considering the most preferred sports and physical activities; It is seen that individual, group and individual activities come to the fore. Participants gave the answer that their access to sports and physical activities is generally satisfactory (58.70%), 29.57% average and 11.74% bad. When the distribution of those who gave the bad answer is examined; It has been observed that there are individuals with 36% Physical, 24% Mental, 20% Sensory, and 20% Neurological disabilities. When asked to evaluate the variety of equipment offered to them, the participants replied that they were satisfied with 49.57%, found the average at a rate of 34.35%, and found it bad at a rate of 16.09%. When the distribution of those who gave the bad answer is examined; It has been observed that there are individuals with Physical disabilities with a rate of 46% and with Mental, Sensory and Neurological disabilities with equal rates of 18%. When the participants were asked how suitable the existing equipment was for their needs, 59.57% answered that it was satisfactory, 27.83% average, and 12.61% answered that it was not suitable for the needs. When the distribution of those who gave the answer "Not Appropriate" was examined; It was observed that there were individuals with 54% Physical, 18% Neurological, 14% Mental and Sensory disabilities.

It was observed that 83.91% of the participants, who were asked how much their parents supported them about their participation in sports and physical activities, answered that their families were supportive. 10.43% answered as average and 5.65% answered that they could not find enough support. When the distribution of those who gave information that their families did not support enough; It has been observed that there are individuals with Physical, Sensory and Neurological disabilities with a rate of 31% and individuals with a Mental disability with a rate of 7%.

Those who are quite satisfied with the support of their families; 50% Physical, They are 22% Neurological, 15% Sensory and 13% Mental disabilities. It was observed that 53.48% of the participants, who were asked whether they were supported by their schools regarding their participation in sports and physical activities, answered that their school was supportive. 28.26% answered as average, and 18.26% answered that they could not find enough support. When the distribution of those who gave information that their schools did not support them enough was examined; It was observed that individuals with Physical, Mental 28%, Neurological 20% and Sensory disabilities gave the answer 7% with a rate of 45%. Those who are very satisfied with the support of their schools; 45% Physical, 26% Neurological, 18% Sensory and 11% Mental disabilities.

It was observed that 66.96% of the participants, who were asked whether they were supported by their peers regarding their participation in sports and physical activities, answered that their peers were supportive. 25.22% answered as average, 7.83% answered that they could not find enough support. When the distribution of those

who gave information that their peers did not support enough; It was observed that 36% responded with Physical, Mental and Neurological 23%, and individuals with sensory disabilities gave the answer 18%. Those who are quite satisfied with the support of their peers; They are individuals with 45% Physical, 21% Neurological, 20% Sensory and 14% Mental disabilities. When asked to evaluate the Physical Factors (Transportation, Facility, Material, etc.) and Social Factors (Family, School, Peer, etc.) of the participants participating in this research, it was observed that their satisfaction levels were high. While this rate is in the first place with "Conformity to Need" with 60% in physical factors, it has been observed that the average satisfaction with physical factors is 56%.

Similarly, it has been concluded that while the support of families stands out with 84% in social factors, the average satisfaction rate in social factors is 68%. On the other hand, while the equipment variety is evaluated as bad in physical factors, the number of individuals who claim that the school's support is low in social factors is relatively higher than the others. The difficulties encountered by the participants while participating in sports activities; Environmental Factors by 42%, Individual Factors by 58%. When the sub-theme is examined, Physical Factors with 36%, Psychological Factors with 24%, Economic Factors with 19%, Disability Status with 15% and Social Factors with 6%. When the environmental and individual factors are analyzed on the basis of countries; It has been observed that the intensity range of environmental factors is 36%. This can be interpreted as the relatively low number of people with disabilities who do sports or participate in physical activity, so the probability of the society to meet people with disabilities engaged in physical activity is low. Among the difficulties of the participants: Transportation, High Costs, Lack of Activity and Pain of Injury take the first place. In addition to the benefits that sportive activities improve health, help prevent musculoskeletal problems that may develop due to inactivity, support independent living, increase self-esteem, reduce stress it is among the benefits that cannot be ignored that it provides socialization and gains new skills. The fact that the participants evaluate these benefits in parallel can be considered as the expected benefit from the survey and research. When the answers are examined; Health benefits ranked first with 32.83%. while the benefits for socialization took the second place with 24.92%, the benefits for mental health were observed as 20.67%, and the acquisition of new skills was observed as 11.55%. Thanks to the competitions, it has been observed that the benefits that can be added to each item above are mentioned at a rate of 10.03%. When the participants were asked whether they were in contact with people with disabilities or special needs like themselves, they answered Yes at a rate of 75.22% and No at a rate of 24.78%. It was observed that those who answered yes were 44% Physical, 21% Neurological, 19% Sensory, and 16% Mental disabled individuals. When the participants were asked whether they participated in activities with disabled individuals, 53.04% answered Yes, 46.96% answered No. It was observed that those who answered yes were 50% Physical, 19% Neurological, 16% Mental, and 15% Sensory disabled individuals. When the participants were asked which activities they participated in together; In the open-ended question, which also includes answers such as outdoor activities such as Traveling and Walking as well as volunteering activities, group trainings, and workshops, among the sports activities Swimming 22.41%, Athletics 12.97%, Table tennis 10.34%, Basketball-Walking-Football 7.76%, Gymnastics 6.90%.

Conclusions

Today, with many regulations regarding people with disabilities, it has been relatively easier for them to be intertwined with social life compared to the past (Alhassan& Osei, 2022; Al-shummarani, & Nasr, 2022; Alzahrani, & Flynn-Wilson, 2021; Hamadneh & Almogbel 2023; Ostry, Wolfe, & Wertalik, 2023; Nkomo, Dube, & Marucchi, 2020; Rodrigues, 2023; Utomo, & Syarifah, 2021). Arrangements such as the employment of people with disabilities, the fact that there are better opportunities to use many more places with environmental regulations, and more people with disabilities can go out with better regulations in public transportation vehicles are at a better level compared to the past, but of course they are not sufficient.

Another situation that is getting better in terms of disabled people is the initiatives to increase the participation of disabled people in physical activity. The benefits of physical activity are well known. These benefits apply not only to healthy individuals, but also to individuals with disabilities. Situations such as the sponsorship of many companies so that disabled people can be involved in sports / physical activity, municipalities opening sports clubs and centres with an increasing rate, universities developing and implementing physical activity programs for disabled individuals, the possibility of federations to reach children studying in schools for disabled people increase the participation of disabled people in physical activity.

The importance of physical activity, whose health benefits are so well known, is more important for disabled people than for healthy individuals. For this reason, it should be the duty of many individuals and institutions to ensure that many more disabled people meet and continue with physical activity.

According to the obtained results of the need analysis, we recommend the project steering committee to identify already existing solutions for easily accessible ways to be more physically active and select the best practice from each partner country at IO2 and it looks better to select them from swimming, athletics, football, cycling and table tennis.

In the light of the results obtained in this study, knowing the situations that prevent disabled individuals from participating in physical activity, removing them from obstacles and thus ensuring the participation of more disabled individuals in physical activity should be one of the ultimate goals. According to this research, people with disabilities have fears according to the geography they live in, their disability and especially when environmental factors are considered. In addition, initiatives for the participation of disabled people in collective physical activity should be seen among important goals.

According to the results of this research, municipalities have responsibilities especially in transportation, facilities and materials and urban planning. In addition to the state, private institutions should assume roles in directing disabled people to physical activity with the facilities they will establish, the organizations they will organize and sponsorships.

Recommendations

As a result of the need analysis, we recommend developing a manual of various types of disabilities and disability management as a unique pedagogical resource to describe various types of disabilities (physical, mental), disability management and injury prevention with instructions about what we must take care according to disability and sport activation. It is clear that it will raise awareness about health concerns and prevention of injuries during the sport exercise performing. It can be an important resource for training workshops for volunteers and sport trainers in the project, as well as for parents, teachers, mentors of disabled young people and wide public awareness of the severity of the disability and knowledge of it in the exercise of physical and sports activities.

It looks also good decision to prepare the set of physical activities and short exercises with guidelines for youths with disabilities, which they could performed after rehabilitation/treatment in hospital. In the light of the need analysis, it is important to educate volunteers about on the proper implementation of selected exercises for young people with disabilities after rehabilitation. We recommend the project partners to check defined good practices to find and select a best motivation strategy to motivate children with special needs to be more physically active.

In addition, media, educational institutions, public institutions should play an active role in raising the awareness of the whole society, especially the families of the disabled, about physical activity for the disabled. To reach the goals and objectives of the project, the project partner organisation should develop an easy navigate, attractive and accessible open education resource such as e-learning portal for education and learning material, including video and guidelines for developed exercises for youths with disabilities. This e-learning portal can be accessible for wider audience such as parents, mentors, teachers, volunteers, youth workers, coaches, and sport trainers.

As an intensive pedagogical resource in the project, it will be important to develop an innovative programme “Re-Sport Volunteers” for volunteers, coaches and trainers from different local sport organisations, associations, and clubs. By this method, they will be trained in performing the outdoor sport program “Re-Sport” for youth with disabilities in Austria, Croatia, Greece, Italy, Serbia, Slovenia, Sweden, and Turkey.

Abstract: There are few studies have examined the effective inclusion of Students with Learning Disability (SLD) in teaching and learning, despite the growing policy, educational, and political concern following the progressive trend towards enrolling students with disabilities in regular public schools. As inclusive education is a fundamental human right, educators should find more ways to include the SLDs. A highly motivating learning environment is provided by virtual reality (VR), which combines 3D virtual settings with technologically advanced modes of interaction. VR provides an interactive experience wherein one can become immersed in a computer-generated environment. Nonetheless, there is limited research on using VR for Students with Learning Disability (SLD). Physical Education (PE) has been a compulsory subject in Malaysia to develop skills, knowledge, values, and attitudes to stay healthy. Many studies have tested the use of VR in helping students learn PE. Thus, this study tested VR trainers in teaching PE to the SLDs. A VR application is being created as part of the study, and the users will be asked for their opinions. In this study, the motor performance and motivation of the experimental group were evaluated to measure the effectiveness of the VR trainers in helping the SLD to learn. The results proved that combining immersive technology with motor learning theory made it possible to motivate SLDs and increase their motor performance score in learning PE.

Introduction

An important component of the academic course that aims to enhance students' emotional, social, and physical development is Physical Education (PE). A person can learn about the body and how to maintain a healthy and

attractive body and how to keep our bodies free of injuries and illnesses through PE (Ravinder Kumar, 2023). Students with learning disabilities (LD) often face limitations when it comes to participating in physical activity and enjoying it. Coaching these students can be challenging as they require special attention and support to enhance their physical abilities while overcoming academic obstacles (Allam & Martin, 2021) and (Azlina & Rassy, 2022). In order to support students' physical, social, and emotional growth, PE is an essential component of the school curriculum. According to UNESCO, the educational environment should include opportunities for PE appropriate for kids with varied talents and interests, and inclusive education is a fundamental human right (Pocock & Miyahara, 2018).

Students with disabilities or SWD continue to be excluded in both conventional classroom settings and when the educational system is disrupted, for example during the COVID-19 epidemic, as the current research by Mullen & Hunt (2022). Teachers must be a key component of achieving the goals of the Malaysian National Education Philosophy by ensuring that SWD have the same access to education as other students (Noraini Abdullah et al., 2016). Physical activity is essential for a person's well-being and for preventing health problems, according to the World Health Organization (WHO) (Glance, 2020). School-based PE may provide essential opportunity for SWD to acquire the information required to promote a healthy lifestyle (Bertills et al., 2019). However, (Hildt, 2021) proved that when compared to healthy persons, In PE, SWD was six times prone to exhibit greater levels of self-efficacy and had a 57 percent greater chance of subsequently having health problems.

Despite the government's support for incorporating disabled students in the classroom, a research by Hss, (2016) found that just 41% of these students reported successful inclusion, while another 20% experiencing moderate success. Most students that require assistance go unnoticed or choose for different educational courses to reduce segregation. It is still unclear whenever the academic programmes were successful in Malaysian classrooms. According to (Wee & Chin, 2020), due to a shortage of teacher training, students' dislike of physical education, a lack of facilities and equipment, and certain schools replacing other topics for PE classes, implementing inclusive programmes is challenging.

One category of disability is a learning disability; by the year 2020, eighty-two percent of Malaysian students with special needs were classified into this category (SLD) (Bahagian Pendidikan Khas (Special Education Division), 2021). Due to the high percentage, this group of children deserves more attention. Physical educators must employ strategies to promote physical activity if they are to instruct students with learning disabilities effectively (Abdi, 2017). The crucial age group for PE is 13 to 17-year-old secondary school students. It's important to be mentally stable as well as physically well. According to studies, this group follows an unhealthy lifestyle and lacks desire for physical activity (Gaintza & Castro, 2020). Lack of educational resources that encourage SLDs to exercise and improve their motor skills may make the issue worse.

The effectiveness of learning experiences for children during traditional PE instruction may be affected by factors like space availability, equipment, and teacher skill (Laar et al., 2021). Fortunately, technology advancements have opened up new possibilities for improving PE teaching and learning (M. A. A. M. Hamizi et

al., 2022). One such emerging technology that shows promise for increasing physical education training is virtual reality (VR) (M. A. A. B. M. Hamizi et al., 2022). Virtual reality (VR) can revolutionise how students learn about movement, sports, and physical activity by imitating real-world surroundings and offering immersive and engaging experiences.

Technology advancements are growing more complex and modern as individuals become more accustomed to using digital gadgets both offline and online (Series & Science, 2021). To experience and interact with VR, specialised equipment is needed, such as VR glasses or a headset (Poetker, 2019). Utilising both VR gear and software, a multisensory experience must be created. Virtual reality (VR) technology brings together a number of different technologies to create multisensory, three-dimensional (3D) environments that allow users to completely immerse themselves in a virtual setting (Poetker, 2019). These tools include a head-mounted device (HMD) with a head-tracking system, headphones for sound or music and noise cancellation headphones, and manipulation/navigation tools.

VR creates new possibilities for inclusive and accessible physical education classes for students with disabilities. By providing virtual environments and interactive experiences, VR provides the potential to provide personalised coaching and adaptive learning opportunities, making PE more approachable and enjoyable for children with disabilities (Fu & Ji, 2023). This study investigated the possibility of VR as a tool for SWD PE training in order to enhance physical learning outcomes and support inclusive education.

Literature Review

Physical Education

Primary and secondary schools offer physical education classes that focus on the human body and psychomotor development (Tabuñar Fortunado, 2016). PE programmes can teach students how to live a healthy lifestyle, increase their physical fitness, and combine physical and mental activity (Dan et al., 2021). Direct teaching increases students' self-assurance and capacity to solve issues on their own, in groups, or in bigger groups (WHO, 2019). The encouragement of teamwork, sportsmanship, and physical togetherness as well as the teaching of basic body management techniques should be the goals of PE in schools. The lesson may spark the interest of students in physical education classes, attract in wandering students, encourage movement, and stress the value of exercise and good health (Speciality, 2019).

By taking into consideration students' intellectual, spiritual, emotional, and physical needs, Malaysia's educational system promotes students' overall growth (Wee, 2017). Thus, both primary and secondary schools must include physical education in the curriculum along with academic subjects. The main source of instructional materials for teachers in Malaysia's educational system continues to be textbooks. Pendidikan Jasmani dan Pendidikan Kesehatan (PJK) is the name of the physical education programme used in Malaysian

schools (Mustaffa et al., 2019), and It must cover the following five areas of study: (i) physical ability; (ii) application of physical skill; (iii) fitness for health; (iv) application of fitness capability; and (v) sports.

Students with Learning Disability

The Malaysian Ministry of Health estimates that 10% to 15% of students struggle with a learning disability. Statistics from the Division of Special Education indicates that almost all of SWD across Malaysia struggle with learning disabilities (LD). There are several terms for learning disability used globally, namely intellectual disabilities, learning difficulties (in the UK) or Down syndrome (in the US) (Mokhtar et al., 2022). In 2020, children with LD comprised about 82 percent of SWD. According to Abdullah and Hanafi (2017), the government's Ministry of Women, Family, and Community Affairs (KPWKM) now recognises six different kinds of disabilities as specific impairments: visual, communication, physical, learning difficulties, psychological, and other disabilities (Nurhidayah Abdullah & Hanafi, 2017). When IQ does not correspond to biological age, there is said to be a learning disability. This category also covers conditions involving autism (Autism Spectrum Disorder), Attention Deficit Hyperactivity Disorder (ADHD), and specific cognitive difficulties like dysphagia, dyslexia, and writing difficulty that affect a person's ability to learn (Radzi et al., 2019). LD students usually face learning issues that are complex, linked, and invisible (Adesokan, 2023). When creating appropriate learning resources for LD students, we should consider the distinct personalities of each LD child (Radzi et al., 2019). Motivating SWD with LD to learn may be difficult since they frequently lose interest in what they are learning.

Motivation in Physical Education

Kueh et al. (2019) pointed out that maintaining the health of Malaysian adults relies in large part on motivation for physical activity. Hidrus et al. (2020) and Mokmin, (2020) discovered that PE motivation is crucial for maintaining Malaysian adults' health. Any physical activity requires desire and incentive to get people to participate. The lack of good-quality physical activity in school environments may be the reason for the drop in physical activity among high school students (Kurniawan et al., 2022). Users' motivation for fitness activities may depend on a variety of things. Ennis & Ennis, (2017) found that motivation improved students' capacity to learn physical activity. Ferriz-valero (2023) stated that designing an effective strategy to improve student's motivation is the primary goal for educational systems including PE. Additionally, a great application design for physical activity could boost users' motivation to exercise (Pasco et al., 2017).

Therefore, practitioners should employ useful techniques to facilitate learning particular physical tasks. Fisher et al., (2019) state that there are numerous key components to making sure that children master particular skills. Making sure students obtain the right training they need, which may be divided into three different types: (i) randomly practice, (ii) blocked practice, and (iii) varied practice, is the most significant aspect to think about. Unlike the variable practice, which involves having students repeat similar actions or skills with varied parameters, random practice demands that the students alternate between various tasks that constantly call for

diverse skills. In another research, the students employed random practise to put the teaching strategy suggested by Haji Vosoogh et al., (2022) into practise after viewing the motions of the virtual model. The sensation of enthusiasm to do something, which we will do deliberately and not as a result of other things, is known as motivation. High motivation levels for any action result in more effort and persistence in performing that one thing until it becomes ingrained (Molanorouzi et al., 2015).

Therefore, this study also looked into how well fitness programmes engaged the intended users, primarily students with learning difficulties. To support their learning activities, children who exhibit some challenges in their learning processes involved approaches that are specialized and flexible Omar & Sulaiman, (2018), and technology, also known as assistive technology, can support the educational process. Both educating and motivating students are aided by these materials. Playing is very important for children's cognitive and emotional development, since it promotes reflection and practical thinking (Rocha et al., 2019). This research suggests that all these factors can be developed through an interactive environment.

Virtual Reality

The fast growth of diverse technologies gives opportunity for the advancement of fresh innovations in the field of education (Zeng, 2020) and sports (Félix et al., 2019). VR technology usually comes in three flavors (Poetker, 2019). Firstly, the greatest real world conceivable is fully immersed in for users, including hearing and seeing. The second style is semi-immersive, which combines real items with a sizable projector. This sort of VR is frequently used in instruction and training. Neither in a video game, the last choice is not immersive VR. Due to its potential to offer an exciting learning experience and the fact that users' learning effectiveness can be greatly increased by being immersed in a virtual environment, VR technology has become particularly popular in the field of education (Jiawei & Mokmin, 2023). It is straightforward to record and monitor performance when using VR for practical education of nursing (Shorey & Ng, 2021). Nurses can experience VR training, giving students a legitimate and unique atmosphere to study.

Due to the rise in fitness app popularity, VR technology is now used for health-related apps, PE, and training. According to studies by Guo et al. (2017) and Liu et al. (2017), using an agent to help with exercise activities is helpful. Senior users of a guided virtual Tai Chi training program gave it high ratings (Liang et al., 2018). VR technology can assist in displaying proper and incorrect swimming strokes, preventing injuries (Guo et al., 2017). It has been suggested that a VR simulation can motivate pregnant women to work out frequently to improve the flexibility of their muscles and joints. Practical and theoretical investigations indicate the effectiveness of virtual trainers in improving individual health (Vollrath, 2021).

VR has countless potential applications in PE. Jiao & Qian, (2020) employed VR in their study to teach PE by using the flip learning technique. According to their research, when VR and flip learning combine, students' satisfaction with physical education is considerably higher than in a typical classroom setting. It was demonstrated in Lee's 2020 study that Badminton coaching might make benefits of the technology. According to

the results of Lee et al. (2021) study, VR-based PE instruction could: (i) enhance comprehension; (ii) teach repeated practice; (iii) foster teamwork and mutual support; and (iv) boost motivation. These findings demonstrate that VR might be used to practice or teach PE skills.

In their study on the usefulness of Virtual Reality for Physical Education, Porter et al. (2016) suggested that if the VR system enables the training of significant invariant elements of behavior, underlying skill structures can be taught in VR and applied to the real world. This agreed by Syed-abdul et al. (2019) who believed VR may improve PE lessons, modernize the teaching approach, and enhance the effectiveness of PE instruction. Before deploying fully VR-based PE instruction, developers and teachers should consider a few application-specific difficulties. For students with learning difficulties, PE can be a difficult subject (Mokmin & Rassy, 2022). The students might not be adequately engaged by traditional coaching techniques, which would lower their drive and interest in the subject. VR coaching can offer a more individualized and engaging approach to PE by offering immersive and interactive experiences. This paper aims to analyze the motivation, opinions of SLD toward VR coaching in physical education.

Methodology

Study Design

This mixed-mode study measured students' motivation when learning using VR technology. The respondents were from a special needs school that specialized in teaching students with disabilities. The teacher selected all the respondents from the school using selected inclusive criteria such as: (i) guidelines must be understandable by students; and (ii) no underlying health issues. Despite the fact that the inquiries came in the format of a survey and an interview, the researchers and the teachers assisted in asking them directly one at a time.

Research Procedure

This study is divided into three main phases. In the first phase, the students were given a pre-test to know their motivation level. A group of 20 students with five teachers from the school were invited to the experiment center. They were first given instructions on the experiments and seated in a room. For the experiment to run well, the students were grouped into five students per group and were given the HMD to try on first. They could proceed to the experiment if they had no problem using it. Their motivation was assessed using a Pelletier et al. questionnaire (2013). Table 1 shows the questions from the questionnaire. The experiment ran for an hour and was facilitated by experienced school teachers who were certified to work with SLDs. In the second phase, an interview was conducted to know the students' opinions on learning lessons with virtual trainers. The students' response patterns were collected from observation in the third phase. The ethical committee has cleared this study by the university.

Research Instrument

For the first phase, a set of questionnaires was given to the student to measure their motivation before and after using the VR trainer. The questionnaire was divided into three parts assessing the students' intrinsic regulation, introjected regulation, and motivated regulation. Table 1 further describes the items included in the questionnaire. These questions have been validated and checked by an expert in the field.

Table 1. The Questionnaire

Types of Motivation	Pre- and Post-Motivation Questions
Intrinsic regulation	For the pleasure it gives me to know more about the sport that I practise. For the pleasure of discovering new training techniques. For the satisfaction I experience while I am perfecting my abilities. For the excitement I feel when I am really involved in the activity. Because I like the feeling of being totally immersed in the activity.
Integrated regulation	Because practising sports reflects the essence of whom I am.
Identified regulation	Because it is important to me to get better at my sport. Because, in my opinion, it is one of the best ways to meet people.
Introjected regulation	Because it is absolutely necessary to do sports if one wants to be in shape. Because I must do sports to feel good about myself.
External regulation	To show others how good I am at my sport. I play sports of my own choice.
Motivated regulation	I have the impression that I am incapable of succeeding in this sport. I can't seem to achieve the goals that I set for myself.

The second phase used a set of interview questions based on the technology acceptance model (TAM) and adapted from Kwak (2014). The interview was divided into four parts: (i) Item 1: perceived ease of use (PEU); (ii) Item 2: perceived usefulness (PU); (iii) behaviour intention (BI); and (iv) attitude (AT).

Design and Development

The App Design

The design and development follow the guide from the ADDIE model. For the analysis part, trainers' movement information was obtained from a secondary source. The movement followed the guidance from the special needs school. The app was validated by an instructional technology expert and content expert in PE for students with disabilities. Figures 1 and 2 are screenshots from the app.

Analysis

For the analysis at the beginning of the study, we interviewed a group of teachers and students from a special needs school. We assessed the ability of the students to understand 3D objects, use technologies, and follow steps listed in a certain task. The preliminary study showed that SLDs can understand 3D objects and have no issue using technology in learning. However, several students do need guidance from their teachers. Several documents and books were also used to get more information on SLD learning materials. Their module and textbook were used with permission to understand the required PE activity.

Design

A storyboard was constructed by following the instructions and movements guided by the textbook. Figure 1 displays the exercise training from the Malaysia textbook.

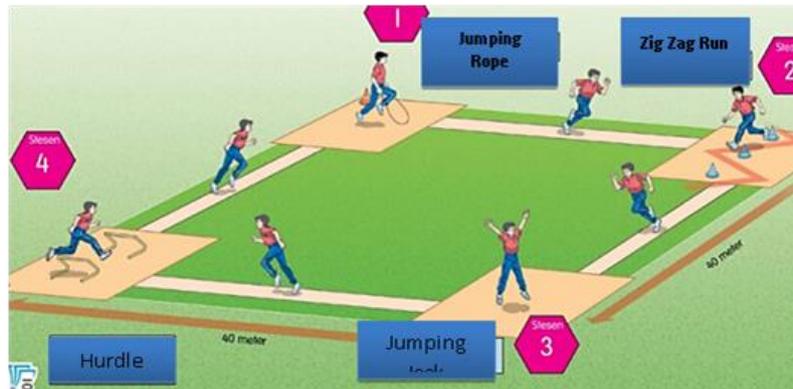

Figure 1. The PE Activities from Textbook

Development

The VR trainer was developed using Unity 3D software, a popular open-source software for VR app development. It was tested and deployed to the Steam platform and was then ready to be tested using an HTC Vive HMD.

Implementation

Implementation involved setting up the data collection lab with the track for the fitness activities. Figure 2 shows the HMD used in the data collection.

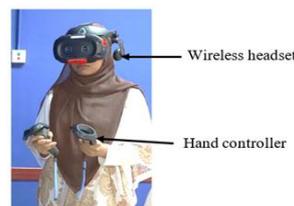

Figure 2. The HMD used for the data collection process

Evaluation

The evaluation process was carried out in a lab and is explained further in the methodology section. Figure 3 displays a screenshot from the app.

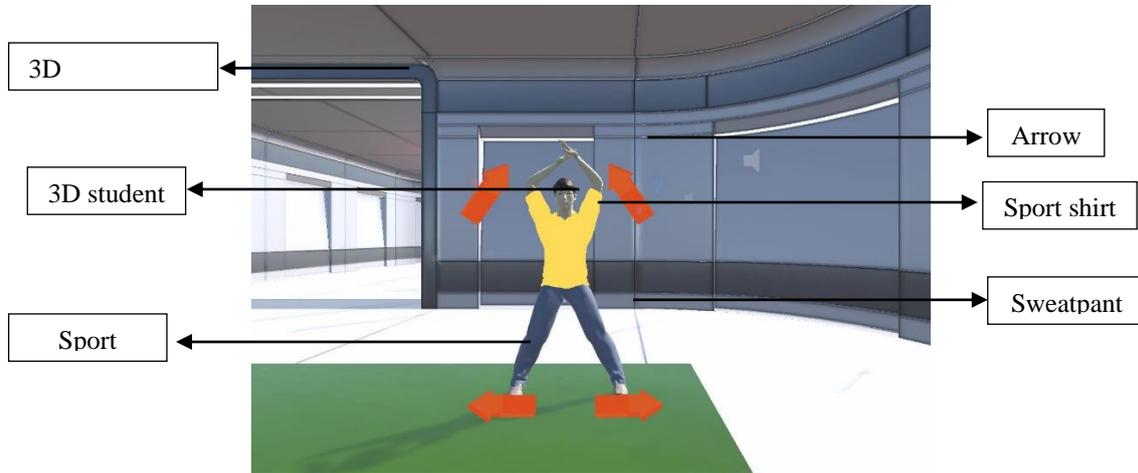

Figure 3. The VR trainer shows the Jumping Jack movement in the app

Figure 4. The VR trainers show the movement in the app

Results

Phase 1: Assessing the SLDs’ Motivation

A total of 20 students with learning disabilities were involved in this study. Eight of the respondents were female and 12 male. The age range was from 16 to 21 years. None of the students had prior experience of using VR. Information on PE results was obtained from their school to know their understanding of PE. Their PE exam results showed very low achievement. Please bear in mind that these students are special needs students and cannot be compared with the normal classroom. They were given training by the virtual trainer that was personalized according to their profile. Table 4 displays the demographic profile of the students.

Table 4. Students’ demographic profile

Data*	Gender	Age	Experience	PE exam grade	Trainer
Data 1	Female	21	No	E	Trainer 3
Data 2	Male	17	No	D	Trainer 3
Data 3	Female	18	No	D	Trainer 2
Data 4	Female	18	No	D	Trainer 2
Data 5	Female	17	No	D	Trainer 3
Data 6	Male	17	No	D	Trainer 2
Data 7	Male	17	No	D	Trainer 2
Data 8	Male	18	No	D	Trainer 1
Data 9	Male	17	No	C	Trainer 1
Data 10	Male	16	A little	D	Trainer 1
Data 11	Female	17	No	C	Trainer 4
Data 12	Female	17	No	D	Trainer 4
Data 13	Female	18	No	D	Trainer 1
Data 14	Female	16	No	C	Trainer 4
Data 15	Male	16	No	D	Trainer 3
Data 16	Male	16	No	D	Trainer 3
Data 17	Male	16	No	D	Trainer 3
Data 18	Male	16	No	D	Trainer 3
Data 19	Male	16	A little	D	Trainer 3
Data 20	Male	17	No	D	Trainer 3

A paired sample t-test was used to test the means of the two tests of the same group. A paired sample t-test was performed to compare the pre-test and post-test motivation. There was a significant difference in motivation between pre-test ($M = 4.18$, $SD = 0.41$) and post-test ($M = 5.69$, $SD = 0.60$); $t(19) = -8.34$, $p = 0.00$. Table 5 shows the paired t-test statistics from SPSS, and Table 6 shows the significant results of the sample test.

Table 5. Paired t-test statistics

		Paired sample statistics			
		Mean	N	Std. deviation	Std. error mean
Pair 1	Pre-test	4.18	20	0.41	0.09
	Post-test	5.69	20	0.60	0.14

Table 6. Paired t-test results

		Paired sample test				t	df	Sig. (2-tailed)
		Paired differences						
	Mean	Std. deviation	Std. error mean	95% confidence interval of the difference				
				Lower	Upper			
Pair 1 Pre-test – Post-test	-1.52	0.81	0.18	-1.90	-1.14	-8.34	19	0.00

Phase 2: Interviews to Investigate Opinions

Eight interview questions were asked to help understand the students' opinions on doing the activities using VR. Table 7 displays the interview results. The results show that most of the students informed the researchers that the VR coaches did help them to understand the movements in PE. They also found it to be fun and agreed that it could improve their performance. However, after the learning session, the students still preferred training in the outdoor setting. Table 7 shows the information that was extracted from the interviews.

Table 7. The interview results

Questions	Conclusion
What is your opinion on the VR trainer?	Most commented that it helped them to understand the steps because it showed step-by-step movements
Is the technology easy to use?	It was difficult to use at the beginning, but it became easier after some time
Do you think this VR technology is suitable to use in PE?	All the respondents said it was suitable
Do you like using VR for learning?	All except one student preferred VR to normal class
Why do you think it is good to use in learning?	Most said because it was fun. However, one respondent said he preferred to learn in the field
Do you feel satisfied and motivated?	All felt satisfied and agreed that it could improve their movements

Item 1: Perceived Ease of Use (PEU)

Question: Is this technology easy to operate and easy to understand?

“Easy to use and can view the demo.”

“Being able to play sports in another world, can see examples.”

“Easy to use and take anywhere, can be used inside and outside of class.”

Question: Do you like this VR technology?

“I like it because it is great like in the game. This is the first time I have used it.”

Question: Based on your answer (do you like this VR technology), please state your opinion.

“Because the graphics are the best. It feels like in a game.”

“Because it feels fun like in a game, like entering another world.”

“Because I feel like I am in another place.”

Item 2: Perceived Usefulness (PU)

Question: How do you feel about the virtual trainer?

“He (virtual trainer) helped me by showing an example to do the activity.”

“He is so sporting because he shows how to jump.”

“He was helpful and did not bother me.”

“He bothers me a little, like he is distracting and I cannot focus.”

Question: Can virtual trainers improve your motor performance results?

“It helps because after watching it, I understand how to do it.”

“Yes, at first I was not sure how to jump using virtual reality, but after watching the teacher (virtual trainer) I knew the steps.”

Item 3: Behavioural Intention (BI)

Question: Would you recommend the use of Virtual Reality in PE to others?

“Yes, I will recommend others to use VR for PE because it is so great.”

“Yes, everyone should try using VR in PE.”

Item 4: Attitude (AT)

Question: Do you feel satisfied after successfully doing the given activity?

“I am so satisfied to be able to do 60 jumps.”

“Very satisfied because this is the first time I used VR and I managed to complete the given number of jumps.”

Discussion

The motivation of the students is crucial when educators and learning material creators evaluate a suitable design for PE instruction. The results from this study find an increase in motivation for the post-test when the students learn using the VR coaches. The motivational aspect is what keeps the students working on the activity until certain goals are met (M. A. A. M. Hamizi et al., 2022). This idea claims that in order to motivate students, they need to have control over their education and autonomy so that they may finally concentrate on their objectives. It has been demonstrated that giving students some control over particular activities or assistance technology might improve their motor learning. Students must be motivated and persistent in order to complete training in order to maintain exercise and physical fitness during periods of movement restriction when they must primarily stay at home.

The ideal approach for PE in online education at home is to complement the instruction with materials that have

been imaginatively created and tailored to the requirements of the students. However, several more tests and improvements should be added to the subsequent development process to ensure correct and efficient training in PE, which can then be delivered to the target student and help to increase their health and improve their fitness. This study has also shown how observation is useful for PE instruction. Demonstration or observing is one of the most popular teaching strategies for acquiring motor skills observation (D’Innocenzo et al., 2016). The student's ability to learn by observing increased when various skill levels were raised (Mokmin & Ridzuan, 2022). Previous studies such as those by Bashabsheh et al., (2019) and Fu & Ji, (2023) described the effectiveness of VR for students with disabilities. However, in this study, we can see that there was still a mixed response among the students when VR coaching was introduced. The SLDs may have personal preferences regarding the type of coaching they receive. The results from the interviews supported this, where some of the students still preferred in-person coaching or a combination. Added to that, the accessibility of VR coaching is still very low for SLDs in Malaysia and some technical issues can cause frustration for SLDs during learning. This can impact their overall experience when using VR coaching.

Conclusion

The study investigated the best virtual trainer designs from the students' point of view, as well as how students may acquire physical education using virtual trainers. The outcomes proved that with a proper design, VR could function as an additional learning material and increase learning motivation. Although there was a mixed response among the students on the use of a VR coach for PE, most of the students agreed that the VR coach was a fun and great way to learn PE. The results from this study can increase understanding of the process of learning PE using VR and how the technology can help in learning motor skills. The study examines the effectiveness of VR coaching in improving students' motivation, participation, and overall performance in PE. The investigation's findings shed light on the potential of VR coaching as a tool for promoting PE for SLD. However, this study was only limited to a few workout routines. The study also ran for a limited time, and the results can only be applied to specific students.

Recommendations

We encourage researchers to look at how VR-based instructional materials affect students' interest and enjoyment. There should be an increase in the number of exercise treatments and respondents.

Exploring Learning Disability Students Experiences in Using AR Technology in Physical Education

Regania Pasca Rassy

Centre for Instructional Technology & Multimedia, Universiti Sains Malaysia

Nur Azlina Mohamed Mokmin

Centre for Instructional Technology & Multimedia, Universiti Sains

Abstract: In this century, Augmented Reality (AR) is a "reality" technology that has begun to be integrated into the school curriculum and subjects. As one of the learning strategies, the goal is to help increase student learning motivation, the effectiveness of learning activities, and much more. Unfortunately, only a few studies incorporate AR into teaching and learning activities for Adaptive Physical Education (APE) disciplines. Many types of disabilities, including learning disabilities (LD), can be found. Just like their peers, children with learning disabilities are intelligent. However, because of an impairment in their physical, mental, behavioral, or sensory abilities, they need adaptive learning activities that are as similar to the surroundings of children with special needs as possible to help them develop their abilities (Sukriadi, 2021). This study will explore how AR technology affects PE learning experiences for students with learning disabilities (SLDs). This study will use a qualitative exploratory case study to collect comprehensive data for each students learning experience using pre-interviews, observations, and in-depth interviews as the research instruments during PE class. The results of this study are expected to provide an overview of future PE subjects where technology has started to be incorporated and can be used as a new learning medium for teachers and students to create new learning experiences. It will also offer research opportunities for researchers and developers to enhance this application further.

Introduction

Technology in education has increased significantly over the past decade (Li et al., 2020). Educators can now employ technology to improve the learning experience for students, supported by the development of digital technology and the Internet (Mohalik & Sahoo, 2020). There are many ways that technology can be applied in

education, which can be used as an online learning platform (Abuhassna et al., 2020; Agormedah et al., 2020; Z. Y. Liu et al., 2020; Mokmin & Masood, 2015): learning management systems (Irfan et al., 2020; Putri & Sari, 2020): educational apps (Poláková & Klímová, 2019; Widyaningrum et al., 2020): and Digital textbooks (Cheng, 2020; Mahdy, 2020). Augmented Reality (AR) is one of the technologies that can be implemented as an educational app that is now being applied worldwide in educational technology to enhance help in teaching and learning processes (Mokmin, 2020). It also suggests that there has been ongoing interest in this topic, as evidenced by the growing number of related articles. However, A total of 174 studies used AR technology in the field of education shows the highest use of AR in education is applied to mathematics and statistics, the second is biology, and the third is manufacturing, construction, and engineering education (Ajit et al., 2020; Garzón et al., 2019; Saidin et al., 2015; Sirkaya & Alsancak Sirkaya, 2018). The results also showed that there was a lack of research on the use of AR in physical education.

Physical education is more than just a game or a recreational activity that gives people pleasure and comfort. It is the public face of education and shares the same goals as education. Physical education should be viewed as one of the fundamental components of the educational curriculum. It makes numerous contributions to the overall experience of students in schools, and encouraging students' physical and mental well-being is one of the most important (Harris & Cale, 2022). According to Caspersen et al. (1985), Physical Activity (PA) is any skeletal muscle-driven body movement that requires energy expenditure. Most children learn about the importance of PA in PE classes (Cheung, 2019). Physical activity has a favorable influence on children's physical and mental functions, and it is also significant in terms of risk factors for lifestyle-related diseases that are being discovered at a younger age, such as overweight/obesity and type 2 diabetes (Berman et al., 2012). However, the right kind of physical activity can be challenging for children with disabilities, whereas PA is crucial for their health development (Boman & Bernhardsson, 2019). Úbeda-Colomer et al. (2019) state that people with disabilities are commonly hindered from engaging in physical activities at all levels of society due to their health state and associated challenges such as discomfort, weariness, and a lack of energy. This is one of the challenges faced by people with disabilities in carrying out physical activities.

Individuals with Disabilities Education Act (IDEA) defines "learning disability" (LD) as "a specific disorder in one or more areas of psychological processes involved in understanding and using spoken or written language, resulting in deficits in the ability to listen, think, speak, read, write, spell, or do mathematics," but it excludes learning issues caused by sensory disorders, emotional disturbance, intellectual dissonance, or other conditions (U. Muktamath et al., 2022). Naset (2018) defined learning disability as a group of disorders that affect people's capacity to interpret what they see and hear or connect information from different brain sections. These limitations can manifest in various ways, including specific difficulty with spoken and written language, coordination, self-control, or attention. These challenges can extend to education and impair learning to read, write, and do math. Physical education and health are two related aspects, and they are two sides of one coin (Harris & Cale, 2022). Health is an essential component of physical education and health, which are both ways of achieving high levels of health.

Adapted physical education is a subset of physical education created to provide programs for students with special needs (Abdoellah, 1996). According to Hendrayana (2007), adaptive physical education is an individualized program incorporating physical activity, movement fitness, fundamental movement patterns and skills, swimming skills, dancing, and solo and team sports games developed for people with impairments. According to Putra (2019), adaptive physical education has several purposes:

- To assist students in improving conditions that can be improved.
- To assist students in protecting themselves and any conditions that may affect their condition by participating in certain physical activities.
- Provide children with disabilities the opportunity to learn about and participate in various sports activities.
- To assist students in making social changes and developing self-esteem.

However, sports learning should be tailored to each child's demands and degree of specificity to meet the physical and mental health needs of children with disabilities (Winnick et al., 2017). According to Jalip (2018), various factors inhibit the learning process in adaptive PE classes; Teachers rarely use fun teaching methods; Teachers rarely bring media or learning tools into the classroom; Learning materials that are not tailored to children's abilities, although the learning process of motion for children with disabilities necessitates a special program tailored to their level. In Malaysia, due to ambiguous regulations, a lack of human resources, and inadequate special education facilities, it has been observed that children with disabilities do not fully realize their constitutional right to an education (Ozel et al., 2017). In their research on Special Education in Malaysia, Abdul Nasir and Erman Efendi (2016) noted that these programs face a number of challenges, including a lack of facilities, preparation, resources, and instructional materials. Studies by Riyadi (2017) found that the obstacles faced by children with learning disabilities in conducting physical education activities are; weak thinking power and adaptive behavior, which results in their ability to capture responses that are not well coordinated, requiring a long time to receive teacher explanations. However, in traditional physical education, the instruction does not usually allow students to fully comprehend correct motions due to their viewing angles or teachers' quick demonstrations (Liang et al., 2023). Furthermore, because the teacher cannot provide individual coaching to many students, beginners cannot recognize the faults in their activities (Papastergiou & Gerodimos, 2012).

Augmented Reality in Physical Education

With many uses in many industries, including education, augmented reality (AR) has emerged as a promising technology (Khan et al., 2019). Integrating augmented reality (AR) into physical education classes was relatively new (Mokmin & Rassy, 2022a) It is crucial to remember that technology and teaching methods can advance quickly. Its inclusion in physical education lessons can potentially improve learning opportunities and student engagement (Guerrero et al., 2020).

Table 1. The use of augmented reality in physical education

Authors	Purpose	Results
(Liang et al., 2023)	To investigate the incorporation of information technology into physical education and use augmented reality (AR) as an auxiliary tool to examine the impact of this teaching style on the learning motivation, knowledge, and learning behavior of beginning runners.	The study's findings are as follows: First, the experimental group (using AR) outperforms the control group (video) in motor skill learning. The experimental group also has stronger motivations and outperforms the control group in motor skills, and the experimental group has a more favorable attitude towards and acceptance of the instructional materials.
(Y. Liu et al., 2022)	To analyze the impact of instructing using more realistic physical education techniques for developing and acquiring spatial orientation compared to traditional exhibition instruction.	The AR training method is effective, especially for improving student participation in sports and instructing schoolchildren in advances in physical education.
(Chang et al., 2020)	To validate the impacts of different difficulty levels on instructional materials and the effects of learning outcomes, motor skills, and learning motivation with AR-assisted teaching	The findings from the study suggest that AR-assisted learning with the 3D model improved learning and performed well for more challenging motor skill acquisition rather than video learning.
(Guerrero et al., 2020)	To compare the impact of augmented reality training in physical education for developing and acquiring spatial orientation to more traditional training based on the display approach.	It has been proven that the augmented reality teaching approach is effective in teaching high school students, in physical education subjects, particularly in the acquisition of spatially oriented knowledge.

Several articles have examined the use of AR technology in physical education subjects, as seen in the table above. The results show that using augmented reality to teach physical education is helpful, especially for helping students learn spatial concepts (Guerrero et al., 2020); the use of AR technology also increases motor skill learning, motivation, more favorable attitude toward the adoption of the educational materials (Liang et al., 2023); using the AR training method works well too for increasing student engagement and educating students on the latest developments in physical education (Y. Liu et al., 2022); Lastly, it was shown that AR-enhanced learning and performed well when learning more difficult motor skills. According to (Garzón, 2021) research, the future route of AR research in education is to use AR in learning environments populated by students with

special needs. However, Mokmin and Rassy's (2022b) study found that AR technology in adaptive PE is still lacking.

Due to the lack of learning facilities and material instructions for teaching children with disabilities, this research will try to use augmented reality technology as a learning strategy in physical education classes for learning disability students as an assistive tool in learning. The research questions to be answered in this study are:

1. What problems are faced by learning disability students in the traditional PE class?
2. How are the learning experiences of students with learning disabilities when using AR as an assistive learning tool in PE classrooms?
3. What are the results of student's movement abilities before and after using AR in the PE class?

Methodology

This paper uses qualitative case study methods with ten learning disability students in one of vocational senior high schools in Malaysia as participants. The procedure is divided into three stages: before intervention, the intervention, and after intervention. Before the intervention, students will be given an AR module (as a representation of the textbook that they usually use in the classroom when learning) to do a pre-test to try demonstrating the exercise movements in the module based on their understanding of the module. After they do the pre-test, a pre-interview will be conducted to find out the current situation in the traditional PE class according to the student's experiences.

After that, the intervention will be carried out (students will learn PE in the classroom with AR as an assistive tool); while the learning process takes place, observations will be carried out by teachers and researchers. Then after the learning process is done, students will be asked to do a post-test and in-depth interview. The data obtained will then be analyzed using thematic analysis. Meanwhile, the students selected to be participants in this study were required to be enrolled in a physical education class, a learning disability student with no difficulty in movement ability, visual problems, or physical problems, and fluently communicate with the Malay language.

Learning Materials

During this research, students will get the AR exercise applications and AR modules as learning materials in the PE classrooms. The content in the module is adapted from books on physical education for special education, and the exercises chosen have been adapted to the learner's needs and abilities. The picture below is an AR module used as a textbook representation that students usually use in class and as a marker used to trigger 3D objects in the AR application to come out. As explained earlier, this module has been adapted from PE textbooks. Also, the exercises selected have been adapted to the needs and abilities of students.

Figure 1. AR module

In this module, there are three chapters, where the first chapter contains balanced food suggestions for students, the second chapter includes suggestions for physical activities that students can do daily, and chapter three contains activity exercises that have been integrated with AR applications. This chapter has three sub bab: flexibility, muscle strength, and muscle endurance. Where in each activity, there are four movement exercises.

Figure 2. AR exercises App

The picture below is the AR Exercises App used; as seen in the application, no user interface is available to avoid the overload of memory on the students. The application was designed to make it easier for students to use, so students only need to open it before the camera appears. Students need to point the camera to the 2D image on the module they want to visualize. The image in the module will act as a marker that will trigger the animation in the form of a 3D object that will demonstrate the movement of exercises to students.

Results

The figure below shows the results of data analysis using the thematic map to show the relation of each theme. Two main themes exist regarding the student's learning experience in PE classrooms. The first is the student learning experiences while in traditional PE classrooms, and the second is when learning using AR Apps in PE classrooms, and there are sub-themes for each of these main themes.

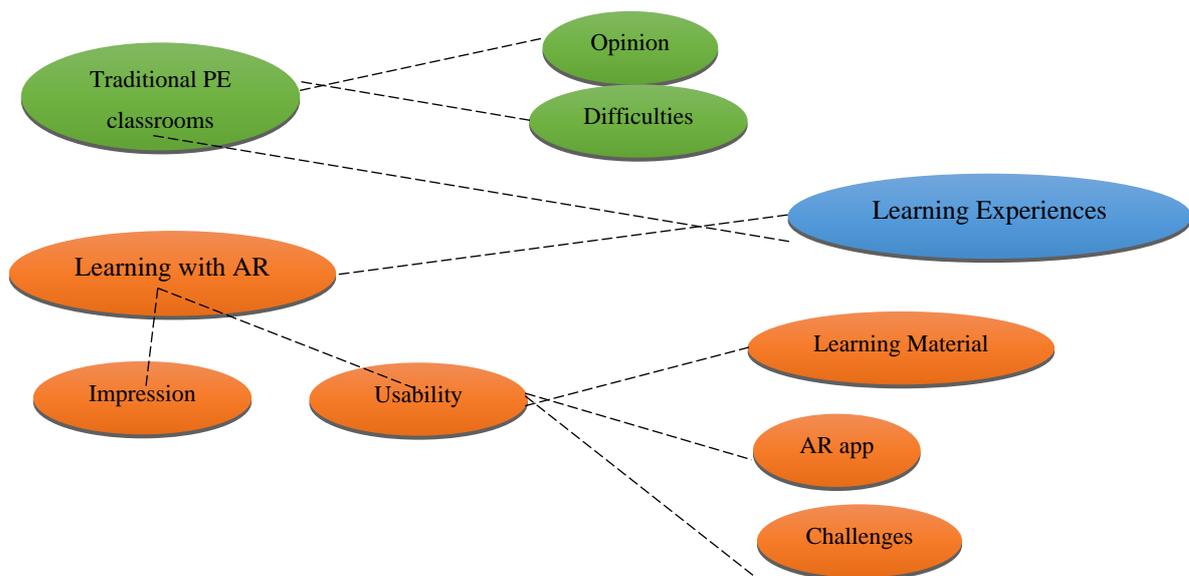

Figure 3. Thematic map

Problems Faced by LD Students in Traditional PE Classrooms.

There are two ways of learning in the PE learning curriculum: when students have to learn in the classroom using textbooks, they will also learn in the field to practice the material they have learned before. The analysis results found one theme about students' learning experiences in traditional PE classrooms with two sub-themes: opinions and difficulties. The first sub-theme describes student's opinions that students felt and experienced during learning in PE classrooms;

- Students said they felt bored when learning PE in the classroom because they were required to sit, write, and read a book. Meanwhile, they prefer to learn PE in the field.
- Students felt happy and enthusiastic about learning PE rather than other subjects because they could do any exercise and sports in the field.
- Students also said PE was good for their health and could release stress when they were tired of studying.

The second sub-theme describes student's difficulties that students experience during learning in PE classrooms;

- The students said that it is challenging to interpret 2D images in physical education textbooks.
- They have difficulty imagining the movement and how to exercise they should.
- Students also felt that reading the exercises movement descriptions in the textbooks and looking at the 2D images was insufficient to understand how the actual movements had to be made.
- Meanwhile, students felt that teachers do not have much time or opportunity to repeatedly show these movements to each student.

LD Student's Experience When Using AR.

After the intervention, in-depth interviews were conducted to know the students' experiences using the AR app. The result shows that there are fifth sub-themes found: Impression, Usability, Learning Materials, AR applications, and challenges exist.

The first sub-theme describes their Impression while using AR as a new technology in their PE classrooms;

- Students said this is a new learning tool since it is their first time using AR technology in their learning.
- They all like using the AR app and feel that learning by using it is fun because it can help them visualize the image on the module since it can show the animation of the exercise movement.
- Students are interested in using AR applications because now everyone uses technology, so this app helps them make their learning easier in classrooms and still up to date.

The second sub-theme describes AR Usability while using it in PE classrooms;

- Students said that by using the AR app and module, they did not need to rely on the teacher when they had difficulty understanding the 2D images (exercise movement) in the module, and they could also study at home.
- Students also said using this application in the classroom would make teaching easier for teachers.

Apart from that, the third sub-theme is the Learning materials which shows the student's impression when using

the AR module in learning;

- Students said that the instructions in the module were easy to understand because it focused on essential descriptions.
- The exercise movements shown by the 2D characters in the module were also easy to understand.
- The overall exercise movement in the module was easy to do.

The fourth sub-theme is the AR Application which shows the use of AR applications on students;

- AR application was easy to use.
- 3D objects used are clear, and the AR app's animations were easy to understand.

The last sub-theme is the Challenging when using the AR Application in the classroom;

- Students said that it was challenging to do the scissor jump movement.
- Students said that several 2D objects were difficult to detect, so 3D objects in the application did not appear immediately, and there were also blinking 3D objects.

LD Students Movement Ability Results

Before the intervention, students are asked to do a pre-test to see their movement ability of students without using the AR app. After learning, students will do a post-test using the same movement ability rubric. Below is a descriptive analysis of students' movement ability's pre and post-test results. The results showed that there was an increase in movement ability from the pre-test to the post-test.

Table 2. Student's movement ability results

	Pre	Post
Sample Size (Students)	10	10
Mean	8.28	9.68

Discussion

From the data collection and analysis results, this study found several difficulties that LD students faced when learning physical education in a traditional classroom. They stated, "It is challenging to translate 2D images from physical education textbooks into a movement for physical activity or exercises". By only looking at the images in the book and reading the explanation, it is considered insufficient by students because some students have difficulty remembering and understanding an instruction. Some students also need repeated explanations or demonstrations from the teacher when learning new exercise movements. This is in line with studies by Riyadi (2017) found that the obstacles faced by LD children in conducting physical education activities are weak thinking power and adaptive behavior, which results in their ability to capture responses that are not well coordinated, requiring a long time to receive teacher explanations. Tommy et al. (2022) found that LD students face difficulties in PE learning are understanding the material and the student interest; meanwhile, the problems teachers face are difficulties in delivering the material and the available learning tools.

With the discovery of several gaps in the pre-interview and after the in-depth interview, it was found that students were very impressed with the use of this technology in their learning and found it interesting since they had never used it in the classroom before. Research by Kraut & Jeknić (2015), which uses Augmented Reality Applications in the Field of Vocational Education and Training, found that students felt using augmented reality (AR) software in the classroom for their lessons wa AR also helps assist in student comprehension by visualizing various physical processes in the learning (Daineko et al., 2020). Then for its use in the classroom, AR can be their learning assistant that can help students and teachers so that they do not need to repeatedly demonstrate the movement of the exercises to each student since some students have a slow response in learning. According to Samuel's (2020) research, AR is one of the assistive technology that can help disabled students with their vision. In line with this research, AR act as assistive technology that helps students visualize 2D image on the module and become the 3D animation that demonstrates the exercise movement to the student. For the module used, students felt that there were no problems with the content, the text, label, design, or 2d images used, all of which were good. Karamanoli et al. (2016) suggested in their research that the creation of supplemental materials for history and other school subjects taught to students may be the subject of future research. This research followed PE textbooks to create the module and the guideline of cognitive load theory when designing and choosing the content for the module. Similar to the module, the AR app is easy for students to use, and the use of animation helps students understand the movements of the exercises described in the module. Since in the application and module, we do not want to provide too many menus or descriptions to avoid memory overload in students.

Conclusion

This study aims to explore the use of AR technology in PE subjects with learning-disabled students as a learning aid in the classroom. The results show that AR has successfully assisted and helped students understand the 2D image of the exercises movement on the module without reading any longer description by visualizing the exercises images in the module. Students with learning disabilities usually have a slow response to learning which requires the teacher to repeat in demonstrating the exercises movement to several students. On the other hand, AR also helps teachers minimize the repetition of demonstrating exercise movements to each student, saving teachers time and energy in the classroom. Teachers can focus on other things, such as observing student understanding, instead of repeatedly demonstrating movements to each student because the learning time is less effective if this happens continuously. Moreover, students can also repeat lessons and study independently at home. Using this app as an assisting tool in the adapted PE classroom also increased the students' interest and curiosity. However, this research also finds some limitations; the AR app is only suitable for Android users, with a minimum Android version being 7.0. If installed on a smartphone that has a version below that, several possibilities can occur, such as difficulty detecting the marker (image on the book), a black screen appearing, a line on the screen appearing or objects appearing with imprecision, and the last is that there are difficulties when detecting some markers.

Recommendation

Researchers suggest further research to adjust the availability of AR applications that will be built on the current operating system version at that time so that more users can use them. The second is to make an iOS version of the AR application as well since this app and module have been brought to the technology innovation exhibition, and it was found that many iOS users are also interested in this application. Last, to keep it updated on technological developments, it is recommended that future research be able to build AR applications for children with disabilities that have been integrated with AI and gamification on it to make it more interactive.

Abstract: The 21st century learning leads to create new skill of students, so the Indonesian government offers the new curriculum. In vocational school, project-based learning for the subject of the *Ilmu Pengetahuan Alam dan Sosial* (IPAS) Project is required to increase the creativity of student. Informations about the perspective of vocational teachers to conduct these learnings require to be elaborated more deeply. This research aims to describe the perspective of teachers to Kurikulum 2022. This study is phenomenology research. Participants of this study were 8 teachers of IPAS Project for vocational high school, in Indonesia. The data was collected by interviews. Data analysis was performed using ATLAS.ti 22 software. The results showed that the majority of teachers's response to the Kurikulum 2022 is positive which they explained that Kurikulum 2022 has more advantageous than the lack. The final goal is to improve quality of education in Indonesia. Pancasila profile has good response by teacher because it is more explicit and complex for building the character of student. The vocational teachers have totally prepared by their own creativity. The recommendation from teachers are expressed as a hope for improving quality of education, such as training for teacher, facilities and massive socialization.

Keywords: New Curriculum, Project-Based Learning, Pancasila Profile, Preparation, and Recommendation

Citation: Wahyudi, Retnawati, H., & Arliani, E. (2023). New Curriculum of Education in Indonesia: How Do Natural Science Teachers Think about? In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 70-81), Cappadocia, Turkiye. ISTES Organization.

Introduction

The development of science and technology is fast. This disruption requires fast change also in the learning area, and it means that education requires an adaptable approach. Indonesia is one of the G-20 members, which is

expected to have the ability for competing in Industrial Revolution 4.0. as it refers to the industrial system that is based on digitalization, smart machine, and the Internet of things (IoT). In other words, technology of factories in industry mobilized by robots uses cyber-physical system. This is a huge revolution, and Indonesia should change its industrial system, from the manual system to the digital system.

The competition in the 21st century is inversely proportional to the facts about Indonesia's position in Program for International Student Assessment (PISA) and Trends in International Mathematical and Science Studies (TIMSS). The results in 2015 PISA show Indonesia was ranked 64 out of 74 countries that are members of the Organization for Economic Cooperation and Development (OECD) with a score of 406 for scientific literacy. This score is still very low when compared to the average score for all OECD member countries, which is 493. Meanwhile, Indonesia's position in the TIMSS shows that students' science score was ranked 45 out of 48 countries with a score of 397. This means that there are still many things that need to be evaluated from the education system in Indonesia as a future projection.

As a solution to these problems, Indonesia government offers new curriculum, such Kurikulum 2022. This curriculum is expected to increase literacy and competence of 21st century skill. Another policy of government is Asesmen Kompetensi Minimum (AKM). AKM is minimum competence assessment to measure literacy level of student. This program aims to identify how the level of student in literacy level. Therefore, government could determine appropriately the best program for increasing level of literacy and competence of 21st century skill. New curriculum addresses that students should be taught to develop their thinking skills, so they could think complexly and have high order thinking skills (HOTS). Complex thinking described by skill that includes critical thinking skills, creative thinking, problem solving, and conclusion taking. Meanwhile, HOTS based on the revision of Bloom's Taxonomy by Anderson and Krathwohl includes the ability to analyze, evaluate, and create. Combination of complex thinking and HOTS become the 21st century skills (Anderson, 2011). The *Create* (C6) level is the highest taxonomy level in cognitive which government offers project-based learning as the main model in learning in the school.

The concept of curriculum develops in line with the development of educational theory and practice, also varies according to the flow or theory of education that it embraces. What needs to get an explanation in curriculum theory is the concept of curriculum. According to (Sukmadinata, 2000) that there are three concepts about the curriculum, curriculum as substance, as a system, and as a field of study. The first concept is curriculum as a substance. The curriculum is seen as a plan of learning activities for students in school, or as a set of goals to be achieved. A curriculum can also refer to a document containing formulations of objectives, teaching materials, teaching and learning activities, schedules, and evaluations. A curriculum can also be described as a written document as a result of mutual agreement between curriculum compilers and holders of educational wisdom with the community. A curriculum can also include a specific scope, a school, a district, a province, or an entire country. The second concept is curriculum as a system, namely the curriculum system. The curriculum system is part of the school system, the education system, and even the community system. A curriculum system includes the structure of personnel, and working procedures for how to structure a curriculum, implement, evaluate, and

perfect it. The result of a curriculum system is the arrangement of a curriculum, and the function of the curriculum system is how to maintain the curriculum to stay and be natural. The third concept is curriculum as a field of study is the field of curriculum study. This is a field of study of curriculum experts and education and teaching experts. The purpose of the curriculum as a field of study is to develop knowledge about the curriculum and curriculum system. Those who are steeped in the field of curriculum, learn basic concepts about the curriculum. Through literature studies and various research and experimental activities, they discover new things that can enrich and strengthen the curriculum field of study.

New curriculum focuses on project-based learning which is expected to increase literacy and competence of student. According to (Albar & Southcott, 2021) says that project-based learning stimulates the student creativity process. Furthermore, the results of the study (Shin, 2018) showed that project-based learning has a positive effect on learning motivation and leadership in cooperation or collaboration. In the context of physics learning, (Baran et al., 2018) explained that compared to conventional learning, project-based learning accompanied by games has more success and it is recommended for using in other materials in physics. It is appropriate with (Hanif et al., 2019) who found that STEM project-based learning has an effect on the creativity of learners which the dimensions of creativity studied are dimensions of resolution, elaboration and novelty. Lastly, (Almulla, 2020) found in his research that project-based learning techniques increase students' involvement in sharing and discussing knowledge, because PBL is highly recommended. Therefore, it is important to know deeply how readiness of teacher for facing new curriculum, especially for doing project-based learning and building character of Pancasila.

The project based learning is constructivist approach which student is led to think freely in doing instruction matter and purpose of learning. This model is totally compatible with Kurikulum 2022 which is expected to increase 21st century skill. Therefore, it is prominent to know deeply how the response of teacher for facing this new curriculum, especially for IPAS project subject in vocational high school in Indonesia. The research question on the research is "How do natural science teachers think about new curriculum in Indonesia?"

Method

A research design that the researcher used was a phenomenological philosophical perspective since the main object of the research was to investigate the response of teacher about new curriculum, Kurikulum 2022. The results of this research are more general instead of using of all phenomenological methodologies following their characteristic result. Hence, the overall procedures of the research used qualitative research procedures. The researcher uses phenomenology method because it enables the researcher to reveal various realities that occur in subjects' standpoints. The objective of this study is to describe the subjects' experience and perspective which stand distinctively for the sake of data provision.

Subject of Research

The researcher performed the information ethically, so the researcher maintained the school and the participants name, the participants' confidentiality, privacy, and safety. The samples were homogenous, the researcher used purposive sampling in selecting the participants. It was done in order to get the appropriate sample or subjects in which they were qualified as the research criteria being aimed in this study. Those samples were gotten according to some consideration choices that were suitable with this research need.

In phenomenology, (Creswell, 2013) explained that data are collected from the individuals who have experienced the phenomenon and often data collection in phenomenological studies consists of in-depth and multiple interviews with participants. The number of participants in this research is eight vocational teachers which consist of two vocational teacher from west Indonesia, five vocational teacher from Central Indonesia and one vocational teacher from east Indonesia. This is compatible to (Creswell, 2013) who stated that the exploration of this phenomenon with a group of individuals who have all experienced the phenomenon. Thus, a heterogeneous group is identified that may vary in size from 3 to 4 individuals to 10 to 15. The participants have much experience about natural science learning in vocational school because at least they have three years of experience as vocational teacher for natural science subject.

Data Collection

The data collection was conducted by depth interview. The questions were created by researcher based on main topic in this research. The collection is done by Zoom App, because the condition was pandemic era on April-May 2022.

Data Analysis

Creswell (2007) argues that phenomenology talks about the important thing to recognize how people interpret the world and what the people experience. Furthermore, to analyze the data, the observation field notes and the interview transcriptions were categorized and analyzed into relevant themes by the researcher. In addition, the triangulation strategy was used in this research to contrast and compare the data between the interview result and the observations' findings. To support this strategy, the researcher implemented the field notes and data transcription. To make an effective interview and observation, the use of memo in two-column forms was made and deliberated the notation process (Creswell, 2007). The researcher deliberated the responses and information to clearly interpret, explain, and analyze the teachers' perceptions. Data is analyzed by Atlas.ti 22 software to generate clear interpretation.

In analysis data, (Bogdan & Biklen, 2007) explains that analysis is a process of data reduction. Decisions to limit codes are imperative. Codes categorize information at different levels. Major codes are more general and sweeping, incorporating a wide range of activities, attitudes, and behaviors. Subcodes break these major codes

into smaller categories. (Creswell, 2013) argues that phenomenology talks about the important thing to recognize how people interpret the world and what the people experience. Therefore, to analyze the data, the observation field notes, and the interview transcriptions were categorized and analyzed into relevant themes by the researcher. The initial step to analyze data is to transcribe data of interview for each participant. The transcript was arranged for coding process. The coding process was conducted by ATLAS.ti 22. The process of data analysis generates data reduction and the interview transcriptions were categorized and analyzed into relevant themes. Data reductions are arranged based on the same subtheme to form code group in ATLAS.ti. Relationships or code groups generate conclusion or theme.

Data analysis in this research used thematic analysis as (Braun et al., 2017) explains that thematic analysis has advantages follows: (1) Flexibility. (2) Relatively easy and quick method to learn, and do. (3) Accessible to researchers with little or no experience of qualitative research. (4) Results are generally accessible to educated general public. (5) Useful method for working within participatory research paradigm, with participants as collaborators. (6) Can usefully summarize key features of a large body of data, and/or offer a ‘thick description’ of the data set. (7) Can highlight similarities and differences across the data set. (8) Can generate unanticipated insights. (9) Allows for social as well as psychological interpretations of data. (10) Can be useful for producing qualitative analyses suited to informing policy development.

Results

The figure 1, figure 2 and figure 3 are the result of data analysis by using ATLAS.ti 22. These figures are reviewed by vocational teacher on three regions in Indonesia, such as West Indonesia, Central Indonesia, and East Indonesia. Figure 1 describes the response of vocational teacher for new curriculum, and figure 2 describes advantages and lack of new curriculum based on vocational teacher’s perspective. Whereas Figure 3 describes how the response of vocational teacher in detail, such as PjBL on natural science project subject, Pancasila profile, preparation, and recommendation.

Theme 1: General response

The first theme data is showed by Sankey diagram. Sankey is generated by ATLAS.ti 22 by Code-Document Table analysis. The document group of participants is arranged by region, such as West Indonesia, Central Indonesia, and East Indonesia.

In the figure 1, the Sankey Diagram shows that majority of vocational teachers have positive response. Muhammad Yunus expressed “I like this curriculum”, whereas Muhammad Ikbal said ‘The new curriculum is good because student can focus on detail things’. The same response with Hasrianti, Alifiah, Harsina, Suriadi and Nurul Huria. The negative response was expressed by Ayu Sulistiwati, vocational teacher from West Indonesia. who said ‘I haven’t understood about Pancasila profile’ and she continued that ‘Teachers do not

know how to implement the curriculum'. Their perspective about new curriculum gives insight that teachers have positively responded but government should give understanding how the new curriculum is.

Figure 1. The response of vocational teacher for new curriculum based on region

Theme 2: The advantages and the lacks of new curriculum based on response of vocational teachers

The second theme data is showed by table Sankey diagram. Sankey is generated by ATLAS.ti 22 by Code-Document Table analysis. The document group of participants is arranged by region, such as West Indonesia, Central Indonesia and East Indonesia.

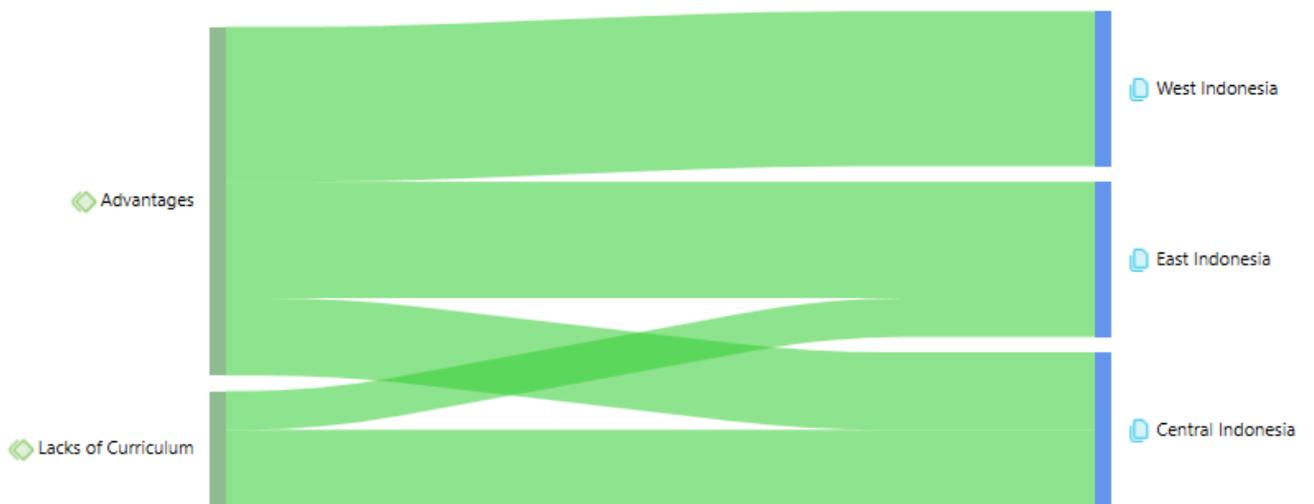

Figure 2. The advantages and lack of new curriculum which is reviewed by vocational teacher

In the second theme, vocational teachers were asked to mention what the advantages and lacks of this

curriculum. The Sankey diagram in the figure 2 shows that teachers have much opinion about this theme. Ayu Sulistiwati expressed ‘It’s match to vocational school because this curriculum directs on students’ talent and passion’. The same point of view with Alifiah, vocational teacher from central Indonesia. Harsina, vocational teacher from East Indonesia, added the advantages that Kurikulum 2022 is more flexible and focused on essential thing. ‘The burden of teacher decreased by implementation the curriculum’, Nurul Huria said. Therefore, it creates freedom for teacher.

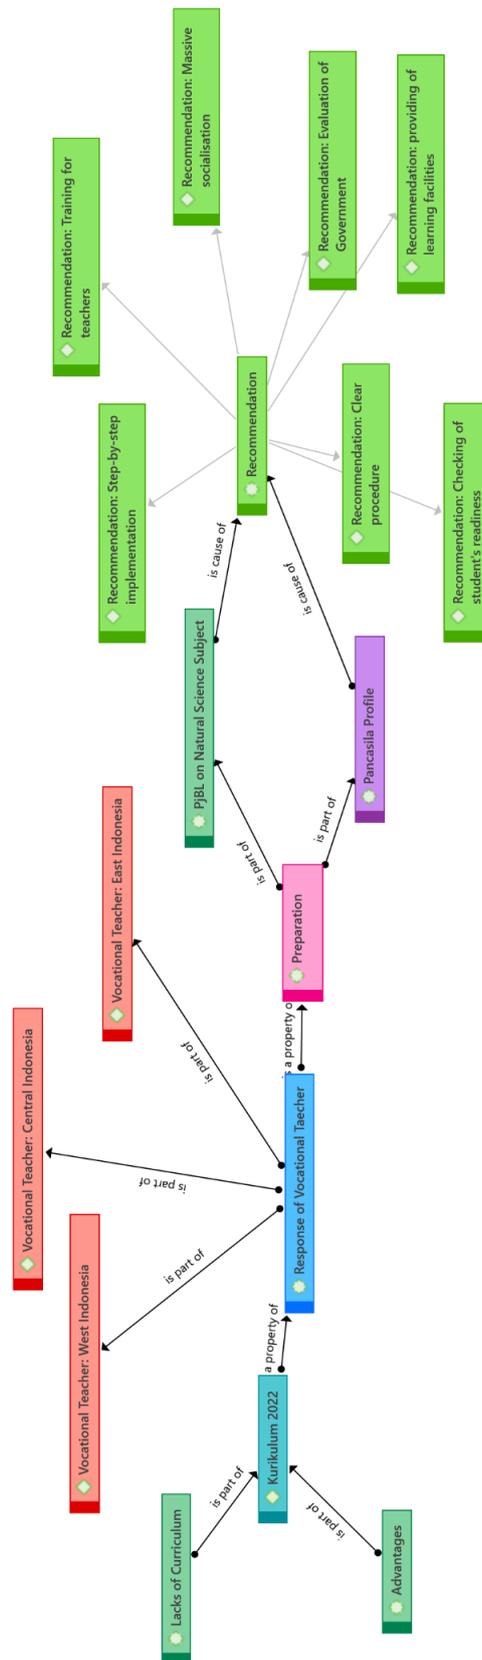

Besides, the lacks of curriculum also were expressed by vocational teacher. Alifiah said “sometimes old teacher is difficult in adaptation for new change”. Some teachers criticize the facilities that it is not complete in the school which it was expressed by Suriadi and Alifiah from Central Indonesia. The main point is less socialization, so the setting of this curriculum is unclearly understood. Harsina emphasized on intensive activities in the industry which take time too long, so student could not be controlled daily and awareness of student is required for conducting the program seriously. Briefly, actually the new curriculum has more advantageous than the lack. government could handle the problems by solving the problem which is expressed by teacher for better implementation in the future. The final goal is to improve quality of education in Indonesia.

Theme 3: Project-based learning (PjBL), Pancasila profile, preparation and recommendation based on response of vocational teachers

The third theme data is showed by table Sankey diagram. Sankey is generated by ATLAS.ti 22 by Code-Document Table analysis. The document group of participants is arranged by region, such as West Indonesia, Central Indonesia, and East Indonesia.

Figure 3. Response of vocational teacher for PjBL, IPAS, Pancasila profile, preparation and recommendation

Figures 4. The mind mapping of vocational teacher's

The last theme is specific things, such as project-based learning (PjBL) model, Pancasila profile, preparation and recommendation in the future. This curriculum emphasizes on project-based learning (PjBL) model for natural science subject. The teacher's point of view about this model is positive which majority of teacher mentioned the benefit of learning model. 'It's necessary', Suriadi said. Nurul Huria explained 'Project-based learning is good, because it stimulates student to create something new'. The same positive opinion from Ayu Sulistiwati who said 'PjBL accommodates the vocational student's competence'. For the challenge, PjBL requires innovative teacher, because sometimes teachers are confused for determining what kind of the project.

The new thing is Pancasila profile. It's about character of student to follow Pancasila values in their life. Pancasila values were explicitly explained by (Kemendikbud Ristek, 2021) which consisted of six values, such as good attitude, respect difference, independence, collaboration, critical thinking and creative. Vocational teachers have the important role for building character, and their perspective should be heard. Hasrianti appreciated this program because character building for student is more explicit and complex. She said 'maybe Pancasila profile is more specific than before'. The way to connect the learning can be conducted by the experiment, which good attitude, respect difference in one group of experiment, independence, collaboration, critical thinking, and creative can be created by the experiment activities.

Preparation for facing new curriculum was explicitly explained by participants with different ways. Hasrianti said 'preparation was done by updating information of new curriculum. collaborating to student and observing environment of school'. Harsina emphasized on giving motivation to student. Nurul Huria explained that preparation of facilities. Generally, vocational teachers have totally prepared by their own creativity. The recommendation from teachers were expressed as hope to better implementation this curriculum. Ayu Sulistiwati recommended to train vocational teachers because many teachers have not known the clear procedure. Alifiah stated that facilities is the key, and readiness of student should be checked. In the end, Alifiah emphasized that evaluation of government is really required.

Discussion

This research is qualitative research to explore how vocational teacher to respond new curriculum. This is important to explore how teacher's response, because their perspective is a reflective for this new curriculum. The teacher's point of view should be heard because they are the key subject who deliver materials in the class. The approach to look the experience in the qualitative research is phenomenology. (Creswell, 2013) explained that the approach of research used phenomenology type that the exploration of this phenomenon with a group of individuals who have all experienced the phenomenon. Therefore, to explore vocational teacher's response about the new curriculum utilized phenomenology approach, because the have experience about how to teach natural science in the school.

The new curriculum is offered by Indonesia government to create specialization based on student's passion and

competence. Furthermore, Indonesia government offer Pancasila profile to build the character of student based on Pancasila's value which it became foundation of nation. (Indarta et al., 2022) explained that the new Curriculum will replace learning methods that were originally implemented in the classroom to learning outside the classroom. The 21st century learning model also emphasizes students to create their skills independently. Teachers could use the 21st century learning model in the application of the independent learning curriculum in schools. Education in this era also emphasizes knowledge and technology in the development of students who will become human resources in the future.

Generally, response of vocational teacher is positive. They argued that this curriculum could improve the quality of education in Indonesia. It is relevant with (Faiz et al., 2022) found that the prototype curriculum is an effort to transform education in Indonesia. The direction of prototype curriculum development has a distinctive feature that supports learning recovery efforts. The prototype curriculum that will be implemented by the Ministry of Education and Culture and Research and Technology in the 2022/2023 academic year has a very good goal, namely wanting more active and adaptive learning by providing flexibility for educators to carry out learning process-oriented to learning projects. To achieve this, the support and hard work of various parties are needed to realize a better and more advanced Indonesian education.

Pancasila profile and project-based learning are new aspects in this curriculum. In the vocational school, natural and social science subject are combined into natural and social science project subject (Projek IPAS). It means that there are two consequences for this change. The first, the teacher of natural and social science have to collaborate to determine direction this subject in the class. The second, the model of learning have to utilize project-based learning (PjBL). In the research, the participant is the natural science teacher in West Indonesia, Central Indonesia and East Indonesia to explore how their response for this change.

Vocational teachers generally have prepared the way to teach for these aspects. They have their own creativity to develop the learning in the class. Rachmawati et al. (2022) found that Pancasila Student Strengthening Project makes a new sense in Education in Indonesia today, which with the allocation of separate time makes teachers more able to innovate planning projects according to the selection of dimensions and characteristics of students. In addition, it provides flexibility for educators to carry out a project-oriented learning process.

New curriculum has more advantageous than the lack. government could handle the problems by solving the problem which is expressed by teacher for better implementation in the future. The final goal is to improve quality of education in Indonesia. Therefore, the thing should be realized by the whole of teacher and principal is how to make a change in school atmosphere. (Rahayu et al., 2022) found that the keys to the success of the implementation of the curriculum are the teachers must think how to make changes. The principal as a leader should change the mindset of human resources in the school to make changes, so the new curriculum could be applied.

Conclusion and Limitations

Many vocational teachers on natural science subject have positive response for the new curriculum. They have explained that Kurikulum 2022 has more advantageous than the lack. Government could handle the problems by solving the problem which is expressed by teacher for better implementation in the future. The final goal is to improve quality of education in Indonesia. Pancasila profile is well response by teacher because it is more explicit and complex for building the character of student. The vocational teachers have totally prepared by their own creativity. The recommendation from teacher was expressed as the hope for better implementation this curriculum, such as training for teacher, facilities and massive socialization. The limitation of phenomenology relies heavily on the researcher's interpretation of participants' lived experiences. The researcher's preconceived notions, biases, and personal background can influence the analysis and interpretation of data, potentially leading to subjective interpretations. Furthermore, phenomenological research aims to provide a detailed understanding of the subjective experiences of a small group of participants. As a result, the findings may have limited generalizability to larger populations or different contexts. The emphasis was on the uniqueness of individual experiences rather than making broad generalizations. The last, participants were purposefully selected based on their experience of a particular phenomenon. This selection process may inadvertently exclude certain perspectives or experiences, leading to a biased representation of the phenomenon under study.

Abstract: The paper will try to provide an answer to the question whether there is going to be an opposite reaction to total online teaching during the COVID-19 pandemic. Moving totally online was the only outcome at that time, it was not easy either for teachers or for students, however, eventually many of them did quite well and even benefit from the situation. However, since the return to the traditional, face-to-face, regime of education, there are demands from many stakeholders, including the Ministry of Education, to totally forget the online teaching. The study tried to find out the opinions of students and teachers to what degree this reaction is. It was a qualitative study in the format of interview, which was held with students at Bachelor, Master's and Doctorate level in various majors in Georgia. The conclusion was made that, depending on the majors and the level of studies, the experience of total online teaching, with all its challenges, was a useful one, and its lessons should be further studied and their advantages go on being used.

Keywords: total Online Teaching, Face-To-Face Education, Lessons Of COVID-19 Pandemic

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 82-92), Cappadocia, Turkiye. ISTES Organization.

Introduction

According to Newton's third law of motion, for every action (force) in nature there is an equal and opposite reaction. As total online education was imposed on us by the environment and educational decision-makers, natural, there was a certain (sometimes passive and sometimes active) resistance to it. This paper will try to provide an answer to the question whether there is going to be an opposite reaction to the removal of total online teaching after the COVID-19 pandemic.

In March 2020, 185 countries in Asia, Europe, the Middle East, North America and South America had to shut

down schools and universities due to COVID-19 pandemic (Learning Portal, 2020), which had a dramatic effect on both teachers and students in those countries. The process involved a number of challenges, beginning with the availability of relative equipment and software, through lack of electronic educational materials, ending with teachers' and students' technical skills and awareness of possibilities of online teaching. Student and teacher stress, and decreased quality of education was mostly stated (Lavonen & Salmela-Aro, 2022; Hensley et al., 2021; Vachkova et al., 2022). Although, eventually, they more or less tackled the problem, there were many stakeholders, specialists and non-specialists, who expressed great displeasure with the quality of teaching and learning (Can & Bardakci, 2022; Ng, 2022; Tkacová et al, 2022; UNESCO, 2020a; 2020b). There was action (unplanned sudden transition to total online teaching) and counter-action (teacher, student and even society resistance to it. Therefore, there have been demands from many stakeholders, including even the Ministries of Education, to totally forget the online teaching as soon as the return to offline teaching became possible (Agenda.ge, 2022). The current paper will try to provide an answer to the question whether educators want to totally forget the total online teaching as a bad dream or whether they did benefit from it to a certain degree.

Method

Although it was an interview, the results could be analyzed both quantitatively and qualitatively. The analysis was done with the help of NVivo software. A survey was conducted among students and lecturers in Georgia. To conduct it, the researcher-made interview questions were developed. To assess their validity three specialists of online teaching were involved. After the recommended amendments were made, the interview was held. Its participants were volunteers. Some interviews were held in person and some online. The interviewers were the researchers.

The participants were 64 students and 31 teachers from Georgia. The students' majors were philology (7), art (18), business (9), medicine (11), tourism (4), and engineering (15). There were 41 Bachelor's, 15 Master's and 8 Doctorate students. Table 1 presents their data.

Table 1. Demographic data of the participants

	<i>Private university</i>	<i>Public university</i>	<i>University in the capital</i>	<i>Regional university</i>	<i>Total number</i>
Student number	28	36	38	26	64
Lecturer number	17	14	11	20	31

Although this is not a representative sample, it does reveal certain trends, as it represents types of universities and their various geographic location, student specialty and the degree they were studying for, giving a wide enough picture due to stratified and cluster sampling.

Results

The results were analyzed both for various groups separately and for students on the whole and lecturers on the whole. The participants' opinions are presented anonymously, as S1, S2, etc., L1, L2, etc.

Q1: What is your general assessment of the total online teaching / learning? Was it mostly positive, mostly negative or was it related to some advantages and some disadvantages?

The general assessment of the total online teaching / learning was positive, 59 students (92%) and 28 lecturers (90%) assessing it as mostly positive. The remaining respondents assessed it as related to both advantages and disadvantages. The students who chose the latter answer were from Bachelor's programs in medicine and engineering from the public universities situated in the capital. The lecturers who chose the latter answer were from public regional universities.

S5: In the beginning it was too hard both for us and teachers, but eventually we even enjoyed the process. We were protected from the virus, staying at home, didn't need to spend time commuting...

S16: Well, it was not as bad as one might have expected, the quality of lectures was fine, but I lacked socialization a lot, although lecturers did their best to provide communication and interaction.

L3: I was very annoyed in the beginning, it was so hard – sleepless nights in order to get ready for lectures, sore eyes due to spending all time in front of the computer... But finally I am glad to have learned to teach online effectively, self-confident and proud of myself.

L19: It wasn't a great difficulty for me, I even enjoyed it, especially with Master's and Doctorate students.

Q. 2: What advantages (if any) of total online teaching / learning can you name?

The advantages were classified into 3 large groups (resource management, pedagogical and psychological advantages), including more sub-groups (see Table 2).

Table 2. Classification of advantages of total online management

Themes	Codes/advantages	number of students	number of lecturers	Sub-codes/advantages	number of students	number of lecturers
Resource management	Time management	n/a	n/a	it saves time on commuting	60	30
				it develops time management skills	14	20
				it enables one to spend more time with one's family	12	25
				it enables to combine some house / family routines with	13	21

				learning / teaching		
	Space management	n/a	n/a	large classes do not matter	n/a	31
	Materials management	n/a	n/a	it provides all needed electronic materials	53	n/a
	Financial management: it saves money on:	n/a	n/a	renting a flat/room, as one can study from his native town/village	26	n/a
commuting				17	10	
even clothing and footwear				6	5	
Pedagogical advantages	one can teach/learn even when s/he is ill	60	31	n/a	n/a	n/a
	it may be used both synchronously and asynchronously	33	31	n/a	n/a	n/a
	it develops the skill of using educational technology	17	31	n/a	n/a	n/a
	it enables one to feel comfortable during the class	17	12	n/a	n/a	n/a
	it enables one to learn at a comfortable for him/her rate	14	12	n/a	n/a	n/a
	it provides various ways of interaction during the class	8	9	n/a	n/a	n/a
	it improves communication	7	11	n/a	n/a	n/a

	skills under non-standard conditions					
	it helps avoid disciplinary problems (noise) in the classroom	5	21	n/a	n/a	n/a
Psychological advantages	it decreases stress	45	51	n/a	n/a	n/a
	it ensures safety	41	31	n/a	n/a	n/a
	students become more independent	16	14	n/a	n/a	n/a
	it improves the attitude towards technology in education	15	23	n/a	n/a	n/a
	it is more motivating than learning face-to-face learning	13		n/a	n/a	n/a

While more than 70% of the students thought that total online education reduced stress, few teachers though so (from the next question we will see that for teachers it, in fact, increased stress). As some students' parents and students' income was frozen, while others lost jobs, saving money on rent, commuting and clothes was a very important factor for the majority of students. What is really valuable, was that all students and lecturers, even those who in the pre-COVID-19 period resisted the application of technologies in education, had to master the needed skills. Students and teachers with children especially valued the possibility of looking after their children while learning / teaching – this saved their money for baby-sitter and made children happier. While for many students who are X or Y generation studying via technologies was more motivating than without them, for the teachers it was not so. Master's and doctorate students mentioned that they managed to combine their online / offline work (in the daytime) with the online classes (in the evening), as they didn't need to spend time commuting. Both the students and the lecturers confirmed that students were seldom late for the classes and practically never missed them. Below see some interesting answers.

S17: During the pandemic I stayed with my parents in the village. I could help them with the housework. We didn't feel lonely. And it saved us a lot of money – renting a room, living alone, commuting... I had the Internet, and when the electricity sometimes went off, we had a generator, so it was OK. The classes were recorded, so, when I didn't understand or remember something, I could watch it when and as many times as I needed.

S 26: I didn't have to spend money on books and to "hunt" for them – all educational materials (scanned or e-

books) were provided by the university. I could sit, walk or lie during the class – that was great! I didn't really get tired. The teachers always noticed who "raised hands" and let everybody ask their questions or say what they wanted. We, students, organized our blog, which helped learning a lot, we were more supportive of each other than usually.

S 30: Neither I, nor the teacher ever missed a class, a quiz or a midterm exam, there was no need to compensate anything, which had always been a problem before. Maybe I shouldn't be saying so, but, if the lecture was dull, I could be there and simultaneously do something more pleasant and important. I've learnt to distribute my time so that I couldn't any more say "I didn't have the time to study / do homework."

L 2. I have two kids, one had stayed at home with a nanny and one had attended the kindergarten. They were ill all the time, because the elder one always brought some infection from the kindergarten. I had been torn between the children and my job. During the pandemic it was difficult to explain to them that mum is "at work" and they shouldn't interfere, but it was still easier and more comfortable than before.

L 7: I was among those who didn't lose their job and income during the pandemic, it was great! Of course I had to work much harder than before, practically day and night. But I felt safe financially and I didn't worry much about the family members' health (my son and husband both worked online like me).

L 21: Besides the video-recorded lectures, I uploaded so many resources for students – texts, audios, videos, articles, textbooks. "Autonomous learner" wasn't an empty word from the syllabus any more, the students had to learn autonomy, and many of them benefitted from it a lot.

Q3. What challenges / disadvantages of total online teaching / learning can you name?

The following challenges / disadvantages named are given in Table 3.

Table 3. Classification of challenges of total online management

Themes	codes / challenges	number of students	number of lecturers
Technical challenges	internet access and quality, availability of the needed hardware and software	11	17
	lack of IT skills	5	21
	quality of equipment	5	21
Pedagogical challenges	lack of educational e-materials	17	12
	lack of pedagogical knowledge dealing with online teaching	15	15
	lack of feedback	13	27
	difficulties of organization and self-organization	12	15
	need to make urgent changes to syllabi (e.g., assessment modes)	5	31
	cheating and difficulty of assessment		25

Psychological challenges	lack of socialization	61	29
	lack of emotional support	18	27
	demotivation	13	7
	distractions (from family members, internet and books)	12	23
	abnormal work/study/life balance	11	28
	stressfulness, especially in the beginning of the process	7	27
	low quality interpersonal communication (switched-off cameras, eye-contact)	7	18
	too much control by administration / lack of trust	n/a	22

Practically all students and lecturers suffered from the lack of socialization. Many of them lacked emotional support in that situation. Interestingly, none of them mentioned lacking technical support, so it looks like universities did their best to provide technical support (trainings), however, not only did not provide the needed emotional support, but also required from the teachers to be available online almost 24/7 and asked to do additional paper work. Most of them mentioned they were not trusted by the administration to hold the online lectures and were too much controlled (monitoring + paperwork). While for the students the period did not look too stressful, for the lecturers it was rather stressful. The challenges can be divided into three groups: technical (mentioned by the students 28 and by the lecturers 48 times), pedagogical (mentioned by the students 63 times and by the lecturers 148 times) and psychological (mentioned by the students 150 and by the lecturers 158 times). Although the lecturers were fewer in number, they complained more. However, the trend was the same with all the respondents: while the technical problems were least complained of, the psychological ones were the most complained of. Below see some interesting answers.

S1: As I was staying in the village with my family, there were electricity interruptions from time to time and I missed some classes, but it was good that I could watch the video-recordings, which, of course, could not substitute my engagement in the class, but it did help with understanding and not failing behind the group. And for a few first classes lecturers could not provide some educational resources, but with time this problem was solved. Some teachers were very nervous while using the software and sometimes we needed to help them, but finally it was all OK.

S21: All I did days long was study and sit at home, and that was stressful. I wanted to spend more time with friends. I even missed being in the university yard between the lectures. Frankly, I became a bit lazy – no need to wake up as early as usually, I had plenty of time to choose when to do homework...

L9: I do have some IT skills, but they were not enough to teach online efficiently. The first several lectures were extremely stressful. I couldn't even think of the content of the lecture to be delivered, so much I was concentrated on the technical issues. The university held an online meeting, after which it became easier. But I still believe that I could have taught much better had I known both the technologies and the online teaching pedagogy better.

L13: I spent nights scanning the books for students and making up my own e-materials. My eyes were sore. Some moments I thought I would have a nervous breakdown. I missed live communication so much – it energizes you so much, the student photos and even faces in the camera don't help much. Thanks god I knew some groups from the previous semester or year – then it was much easier to maintain the already established rapport.

L22: I didn't have a camera in my computer – I rushed for one – all were sold out! I borrowed one for a while, and finally I managed to buy my own. It was dreadful. No one, not even my family, understood the hard days I had. The lack of moral support and understanding was so devastating!

Q4. Now that there is no need in total online teaching / learning, would you like to go on teaching / learning totally online? Why (not)?

The majority (30) of the bachelor's students, all except the medical students (11), answered that they do not want to return to total online teaching, however, their answers were more related to the need to socialize with their peers than to the quality of teaching/learning. On the other hand, many (12) master's and almost all (7) doctorate students mentioned they would rather go on in the online regime – except the practical and laboratory classes.

S2: No, no way! I'd like to have some learning online, I've enjoyed having more freedom, more autonomy than before, but seeing your group mates in class and not only, spending time together, it's great fun! When face-to-face lectures were restored, many students who in the past missed many classes rushed to classes. The environment was so exciting! Really, we now value the cost of face-to-face learning!

S36: I'm a doctorate student and I combine work with study. The online regime made it much more feasible. I even attended some classes at my workplace, immediately after the work, not to be late to them. The online regime is very flexible. I realize lecturers' doubts about exams, but they may be held in class or computer lab, while the classes, even the seminars, can be very efficiently held in class.

L5: In the beginning it was somehow difficult to reorganize, but eventually I got used to it and evaluated its advantages. To my mind, the classes that are theoretical, whether lectures or seminars, can be better held online, while the practical classes need to be held face-to-face. That will balance the advantages and the drawbacks of online teaching. Hybrid mode is fine, especially for master's and doctorate students. Many of them not only work, but also have families, and the hybrid regime is optimal for them.

Q5. Now that there is no need in total online teaching / learning, would you like to teach / learn totally face-to-face? Why (not)?

Although the majority of the respondents (45) have realized the advantages of online learning / teaching and would like to benefit from them, however, they prefer some sort of hybrid regime: some classes from home online, some classes face-to-face, but with more application of the Internet and various software, while some classes totally offline. For the students, especially, for the bachelor's ones, face-to-face socialization at the university seems as important as the knowledge and skills gained there. As for homework, it can be delivered to lecturers completely online. No work will be lost or remain without feedback.

The teachers tend to think (27 of them) that bachelor's students should learn face-to-face, while master's and doctorate students can study in a hybrid regime. They believe that high quality of bachelor's study cannot be achieved only through online regime. And, of course, it depends on the specialty – for humanities online

education is more or less acceptable, while for medical and engineering and some other professions it's unacceptable.

Q6. Now that there is no need in total online teaching / learning, would you like to teach / learn in a way that benefits more from online education than before? Why (not)?

Almost no students and lecturers deny the eventual usefulness of the experience of total online teaching. Would it happen again, they would be much better prepared to it. They will apply the experience gained in this or that way – give more online homework, apply flipped and blended learning.

Discussion

It is essential that the attitude towards online teaching is not one-sided: we need to know the benefits and apply them, but we also need to foresee the possible challenges and to take maximum measures to avoid them (Can & Bardakci, 2022; Lavonen & Salmela-Aro, 2022; Maatuk et al., 2022). The obtained in the research conclusions dealing with the advantages (Goldenson et al., 2022; Punjani & Mahadevan, 2022; Stoian et al., 2022;) and challenges (Hensley et al., 2021; Tkacová et al., 2022; Vachkova et al., 2022) of total online education in Georgia were in line with numerous publications.

Conclusion

Numerous advantages of total online education experience were made by the respondents: Resource (time, space, materials, finances) management, pedagogical (holding / attending all classes, flexible regime, development of IT skills, comfort, adjustable rate, variety, discipline) and psychological (reduced stress, increased safety and autonomy, positive attitude towards IT in education) benefits. Certain challenges, however, were named too: technical (lack of IT skills, internet access and quality, availability and quality of the needed hardware and software), pedagogical (lack of educational e-materials, insufficient knowledge about how to teach / learn online efficiently, lack of feedback, difficulties of self-organization, urgent changes to syllabi, cheating problems) and psychological (lack of socialization and emotional support, demotivation, distractions, abnormal work/study/life balance, stress, quality of interpersonal communication, humiliation due to the lack of trust from administration) challenges. It was mentioned, that many challenges were overcome with time. Therefore, the conclusion was made that, depending on the majors and the level of studies, the experience of total online teaching, with all its challenges, was a useful one, and its lessons should be further studied and their advantages go on being used.

Recommendations

It can be recommended that the aftermath of total online learning is studied deeper and on a larger scale should be analyzed, to be better prepared for further analogous situations and to improve the quality of the traditional,

face-to-face education. To express gratitude to teachers and students for their insistence to teach and learn is essential, and, if not expressed so far, it is never too late. To apply the benefits of e-learning more actively in face-to-face education is a must, probably, the most important lesson learned from the education in the time of the COVID-19 pandemic.

Abstract: Extracting information through online reading has become second nature to ESL students in higher institutions. Although online reading is indispensable among ESL university students, they lack the ability to read effectively. The present study examines students' metacognitive online reading strategies and how those strategies reflect understanding of scientific online reading materials for academic purposes. This was conducted through an online survey and semi-structured interviews. Data was collected among 55 university students enrolled in various Science and Technology courses. Out of the same sample, ten students were selected to participate in the interviews. Data were analyzed using descriptive statistics and thematic analysis with the use of SPSS and NVivo respectively. Thematic analysis was validated using inter-rater reliability analysis through Cohen Kappa analysis that yielded substantial results, indicating that the findings were reliable. Although the findings from the survey revealed that problem-solving strategies were used mainly by students, semi-structured interviews found contradicting results where support reading strategies were believed to reflect understanding by students. Implications that can be drawn are two folds. Students are motivated to use metacognitive online reading strategies depending on the type of texts; two, the need to use different reading strategies to elicit purposeful information based on the subject matter.

Keywords: Metacognitive online reading strategies, English for Science and Technology, university students

Introduction

The most important skill of all four to master when learning a second language (L2) is reading because it directly relates to academic success at all grade levels. This is because information is obtained through reading. Hence, readers must be familiar with the reading process to understand and adhere to such information. It is important to note that the reading process is multifaceted, and learners who are new to reading and unfamiliar with reading strategies require different reading strategies to increase comprehension (Miller, 2017). There are several strategies that readers should consider before reading. This includes becoming aware of metacognition and metacognitive strategies.

Flavell (1976) described metacognition as someone's conscious ability to understand, control, and regulate cognitive process to reach maximum learning. Metacognition is a term that describes the process of comprehending information and realizing the full potential of your own mind through your own cognition (knowledge). In reading, it is the act of actively analyzing what you are reading to grasp its meaning. We refer to metacognitive awareness as our ability to reflect on what we already know with cognitive control. In other words, metacognition and metacognitive awareness are dependent on one another. In short, knowledge and attention go hand in hand.

The past decade has seen a continual development in research on reading strategies and reading comprehension. This consequently led to a demand for quality second language reading courses offered in schools and universities. Hence, to measure up to the aspirations in the Malaysian Education Blueprint, Higher Education (2015 - 2025), students are expected to have bilingual proficiency in Bahasa Melayu as the national language and English as the international language of communication (Ministry of Education [MOE], 2015). With that in mind, classroom reading instructions can be reassessed to improve students' reading comprehension. In addition, researchers have begun to emphasize reading strategies in studies of second language reading in the last 30 years. The discovery of reading strategies is vital for many reasons. They are believed to disclose the ways of learners' processes between the link with the text and the metacognitive process that they have (Daguay-James & Bulusan, 2020; Flavell, 1979; Newton, Ferris, Goh, Grabe, Stoller, & Vandergrift, 2018). In other words, it enables readers to read the text first, then organize and synthesize the information to reach their cognitive objectives.

There has been a significant increase in the studies of reading strategies employed by ESL university students (Daguay-James & Bulusan, 2020; Aziza M Ali & Abu Bakar Razali, 2019; Nguyen, 2018). Recently, the exponentially emerging online academic reading materials have become a choice of reference for students. However, in a different study conducted by Nazarov & Kovalev (2017) which concerns the transformation of 'new readers', digital materials are not the most preferred choice in reading. They have demonstrated that the reading format most preferred by youths is printed reading material as compared to digital and audio reading material, especially in Russia, the Czech Republic, and the USA. Interestingly, this result ties well with the

previous study by Jeong (2012), wherein students preferred printed reading materials as compared to digital reading material. It is interesting to note that the findings also revealed the reading comprehension of reading printed material is higher compared to digital material.

However, nowadays, online reading has become an integral part of educational practices. In academic settings, online materials have now become the main source of information for students, especially those in universities. Students are now required to read materials online daily, which can be an overwhelming experience if they struggle to understand what they read. For example, reading academic scientific materials may be difficult for students where English is not their first language. Considering the discussion above, the study on the reading strategies employed in reading online materials in the context of ESL STEM university students is yet to be explored. The following research questions were addressed:

1. What are the online reading strategies mostly used by ESL university students in reading online materials?
2. How do online reading strategies reflect students' understanding of online scientific materials?

Although previous studies have concentrated on metacognitive online reading strategies in improving reading comprehension (Miller, 2017; Ostovar-Namaghi & Noghabi, 2014; Sheorey & Mokhtari, 2001), more research is needed in online reading strategies used by university students in reading EST online materials. Therefore, this paper is determined to identify the metacognitive online reading strategies employed by ESL science and technical university students.

Literature Review

Reading Strategies

Reading requires cognitive and metacognitive reading strategies to effectively understand texts. Cognitive strategies involve thought processes that are also known as metacognitive reading strategies. They are self-regulated and self-monitoring thinking processes that are used by readers from various reading strategies based on the objectives and reading context. For example, cognitive strategies are procedures or actions used directly when readers are working with a text such as trying to guess words that they are not familiar with, whereas metacognitive strategies are actions that learners plan to manage reading, such as previewing the length and organization of the text (Sheorey & Mokhtari, 2001). Hence, being aware of reading strategies is important to ensure overall academic success.

Several studies have concentrated on metacognitive reading strategies in EFL and ESL classroom settings to enhance the reading comprehension of online texts. Stronger emphasis has been placed on metacognitive awareness and reading comprehension. Carrell, Devine, and Eskey (1988) and Sheorey and Mokhtari (2001) clearly define metacognitive awareness as reading strategies that readers employ during reading. They further

laborated that metacognitive awareness is the ability of the reader to set his reading goals and their awareness of their own reading process. The use of metacognitive reading strategies will enable readers to overcome problems they face when reading and ultimately help achieve reading comprehension. Research on metacognitive reading strategies has categorized these strategies into three subgroups: global, problem-solving and support strategies.

Global strategies are when readers plan their reading by previewing the text or having a purpose in mind whereas, problem-solving strategies refer to the actions of readers reading a text, such as guessing the meaning of words or rereading. Support reading strategies are those that readers use to assist in reading, such as looking up words in dictionaries or highlighting (Sheorey & Mokhtari, 2001). All these sub-categories fall under metacognitive reading strategies. When readers use metacognitive reading strategies, it enables them to overcome any problems they encounter and ultimately achieve comprehension. As stated in many studies, learners who are proficient readers utilize more metacognitive strategies than those who are less proficient (Magogwe, 2013; Miller, 2017), and they appear to monitor their reading process (Wu, 2014). This allows for better reading ability and proficiency. To become proficient readers, students should pay attention to metacognition and metacognitive strategies.

Metacognitive Online Reading Strategies

Studies have indicated that metacognitive awareness is an essential reading strategy for successful comprehension. Similarly, various studies have explored the use of metacognitive online reading strategies among students at the university level. In a local study by Zailani Jusoh and Liza Abdullah (2015), OSORS was used to identify online reading strategies among 155 students. The study compared two academic disciplines to identify differences in strategy use among the two groups. The study concluded that there was no significant difference in the strategy used among the two groups. However, problem-solving strategies were most favoured. This contradicts Nor Fazlin Saaduyah and Nadzrah (2011) that found support strategies to be most favoured. Similarly, in another local study by Ruhil Amal, Nor Fariza and Afendi (2017) most students used metacognitive reading strategies when reading academic texts online. The study was conducted among 55 Science and Technology students in a public university. Data was collected through OSORS among students. The data revealed that the mean score for each sub-category was 3.79, 3.51 and 3.22 for problem-solving, global and support reading strategies respectively. Hence, this indicates that problem-solving strategies were mostly used by university students.

In recent years, various studies have focused on metacognitive awareness as a reading strategy at the university level. For example, Zaidatul Akmal Abd Hamid et al. (2020) conducted a study on 495 students in the Centre of Foundation Studies of a local public university using OSORS to find out their metacognitive online reading strategy awareness. The study revealed that the students mostly used problem-solving strategies when dealing with online reading materials, followed by support strategies, and the least used strategy was global reading strategies. In relation to that, it was also reported that the top three most used problem-solving strategies by the

students were re-reading the text, paying closer attention to what they read and reading slowly and carefully to understand the text. In another study done by Heri Mudra (2018), aimed to explore the metacognitive online reading strategies used by 65 pre-service EFL teachers at a state college in Indonesia and to describe their experiences implementing those strategies. Data were collected both quantitatively and qualitatively using OSORS and semi-structured interviews, respectively. His study revealed that global reading strategies were the most frequently used strategy by his respondents, followed by problem-solving strategies and the last was support strategies. Surprisingly, the results do not seem to correlate with the findings of other studies which reported problem-solving strategies as the most favoured strategy (Zailani Jusoh & Liza Abdullah, 2015; Ruhil Amal et al., 2017; Zaidatul Akmal Abd Hamid, Ismail Sheikh Ahmad, Mohd Shukri Nordin & Zainurin Abdul Rahman, 2020). Meanwhile, the results from the semi-structured interviews indicated that there were various strategies employed to comprehend the online texts - focusing on simplified and colourful texts, translating texts into their mother tongue, which is Indonesian, reading for fun and utilising schemata or previous knowledge. Overall, these studies highlight the need for the application of metacognitive reading strategies to become successful online readers.

Reading strategies and reading comprehension

Newton et al. (2018) proposed interrelating skills and knowledge resources that affect reading comprehension among ESL students. Among the skills mentioned is the ability to apply reading strategies when dealing with difficult academic reading texts and observe reading comprehension with reading goals. However, the extent to which reading strategies employment's relation to reading comprehension is mixed (Gatcho & Hajan, 2019; Rastegar, Mehrabi Kermani & Khabir, 2017; Zuriyani Md Yasin & Mohamed Ismail Ahamad Shah, 2019). Gaucho and Hajan (2019) reported a significant increase in comprehension after explicit metacognitive reading strategies among ESL school students. A similar conclusion was reached by Rastegar et al. (2017), whereby a significant and positive relationship is found between metacognitive reading strategies and comprehension among ESL Iranian university students. This does not seem to be the case in the local Malaysian setting as Zuriyani Md Yasin and Mohamed Ismail Ahamad Shah (2019) pointed out that no correlation exists between reading strategies and reading comprehension. However, to become a proficient reader, students should pay attention to metacognition and metacognitive strategies.

Theoretical Discussion

Metacognitive Theory

The process of achieving reading comprehension requires a few factors related to metacognitive theory. Flavell (1979) posits that the mind perceives and monitors the cognitive process by determining the goals set for the task, strategies and actions employed to achieve the desired goals based on interactions between metacognitive experiences and metacognitive knowledge. Both metacognitive experiences and metacognitive knowledge are introduced as metacognitive strategies that relate to metacognitive theory. Metacognitive theory was expanded

into a metacognition model by Anderson (2002). This was then adapted to relate to the current study that focused more on reading strategies as opposed to Anderson (2002) that focused on mechanisms for learning strategies through metacognition. Both Flavell (1979) and Anderson (2002) theories and models were chosen for the current study because they depict principles that are useful for examining metacognitive reading strategies. Based on these principles, Anderson (2003) created an Online Survey of Reading Strategies (OSORS) that was very similar to Survey of Reading Strategies (SORS) created by Sheorey and Mokhtari (2001). However, OSORS and SORS differ in terms of some of the elements linked to reading online that cannot be used for reading printed texts such as ‘search’ activities. These instruments are widely used in SL reading research that included reading habits in an online environment, which SORS lacked.

Methodology

The aim of the study was two-fold. Firstly, it attempts to identify metacognitive strategies frequently used by ESL learners while reading EST online materials. Secondly, it purports to assess the influence of these strategies in understanding the online materials. To achieve this, a mixed-method research design was adopted for this study. In doing so, semi-structured interviews were conducted to support the data gained from OSORS.

Participants

Data were collected among students (n=55) that were enrolled in English for Technical Communication (ETC) course undertaken in their second-year study from the various undergraduate Science and Technology programs at the university. The participants consisted of 39 (71%) male and 16 (29%) female students between the ages of 20-22 years old. From this sample (n=55), ten students were purposely selected to take part in the semi-structured interviews. To elaborate further, opportunistic sampling was undertaken when selecting these ten volunteer participants as it can lead to novel ideas and surprising findings (Creswell, 2008). Pseudonyms were then used for each participating student (n=10) to conform to anonymity.

Instruments

Data was collected using a web-based survey platform. The survey consisted of a demographic profile and five-point Likert-scale statements. The statements were based on the Online Survey of Reading Strategies (OSORS) adapted and adopted from Anderson (2003). The survey measured metacognitive online reading strategies for academic purposes. It is made up of 36-items that measures: global reading strategies (16 items), problem-solving strategies (11 items) and support reading strategies (9 items) (Appendix A). The reliability for the Global Reading Strategies, Problem Solving Strategies and Support Strategies were 0.77, 0.64 and 0.69, respectively. The Cronbach alpha for the overall survey is 0.92. Hence, making the survey a reliable instrument. The semi-structured interview protocol was used to support the data gathered from OSORS. A set of questions was designed by the researcher that was guided by a study by Chen (2009) on a similar topic. Chen (2009)

explored students' online knowledge of reading strategies and their thinking processes as they read texts on the internet. Similarly, the current study also explored these elements of online reading strategies and measured strategy applications before, during and after reading materials on the internet. Ultimately, the questions used by Chen (2009) were restructured and used for the current study that explored tertiary level students' online reading strategies when reading academic EST online materials.

Data Collection

Data was collected twice (in week two and week four) during a 14-week academic calendar. In Week 2, the students (n=55) answered OSORS through an online survey. Students took approximately 15 minutes to complete the survey that was conducted through Survey Monkey after class time. From the sample, ten students were selected to be involved in the semi-structured interviews. In Week 4, the interviews were conducted at the participants' preferred time and location. All 10 participants agreed to be a part of the research and filled up consent forms. It was also agreed that pseudonyms would be used throughout the study to conform to anonymity.

Data Analysis

To obtain the frequency of each sub-category from OSORS, quantitative data analysis was determined through mean, median, standard deviation mode, which was computed through Statistical Package for Social Science (SPSS) software. However, qualitative data analysis was analysed and cross-checked by two raters. This form of verification was crucial to determine the level of agreement among the raters towards the themes created by the researcher. These raters are considered 'outside' experts who can confirm the themes and act as neutral individuals toward the data analysis (Cohen, 1960). The rating process was conducted separately and the rater's agreement on the codes, their definitions and comments were noted. Then, the researcher discussed any disagreements and feedback. Next, modifications were made based on their suggestions. The numbers of agreed and disagreed items from each rater were then gathered and calculated to obtain the Kappa value. The Kappa value was pulled from the interview data.

To validate the themes, Cohen Kappa inter-rater reliability analysis was used in the SPSS software. Cohen's Kappa was used to calculate the probability of similarity between the raters. The following formula was used to calculate the Kappa value of the developed themes.

$$k = \frac{fa - fc}{N - fc}$$

Inter rater one:

$$k = \frac{18 - 10}{20 - 10} = \frac{8}{10} = 0.8$$

Inter rater two:

$$k = \frac{16 - 10}{20 - 10} = \frac{6}{10} = 0.6$$

Mean score $.8 + .6 \div 2 = 0.7$

The calculation yielded a K value of 0.7 for the interviews. The K value for the interviews indicated there was substantial agreement thus, showing that the data analysis had high reliability. Another method for enhancing data trustworthiness and credibility is through triangulation. Denzin (1978) as cited in Merriam (2009) addressed four triangulation types, where this study applied multiple methods of data collection to triangulate the data. For this, data collected from OSORS was checked against what students answered in the semi-structured interviews. The purpose was to also identify how ORS reflect students understanding of reading online materials. In addition, for the semi-structured interviews, the themes that were derived from the interview transcripts were matched with the OSORS statements alongside the descriptive statistics.

Results

This study explored the metacognitive online reading strategies mostly used by students in reading EST online materials. In doing so, a survey was conducted online using the Online Survey of Online Reading Strategies (OSORS), which consists of three parts: Problem Solving strategies, Global Reading strategies and Support Reading Strategies. In addition, semi-structured interviews were conducted to support the data gained from the OSORS, which were then matched against the statements in OSORS and reported. Each subpart is described statistically in the following sections.

Problem-Solving Strategies

The three most frequent problem-solving strategies used were P26 (When an online text becomes difficult, I reread it to increase my understanding), P14 (When an online text becomes difficult, I pay closer attention to what I am reading) and P9 (I try to get back on track when I lose concentration) with the mean score $M = 4.40$, 4.26 and 4.13, respectively. For P26, out of 55 participants, 29% answered “4” *usually* and 56% answered “5” *always*. This showed that a total of 47 students chose to reread an online text which is difficult to comprehend.

The second highest strategy number P14, with a total of 47% answered “4” *usually* and 40% answered “5” *always* equating to a total of 48 students who concentrate on their online reading materials when the text becomes difficult. While the third highest statement under problem-solving strategies was P9 where, 45% answered “4” *usually* while 36% answered “5” *always* indicating that 45 students believe they would get back on track when they lose concentration. Similarly, these three statements were also listed in the top 5 problem-solving strategies frequently used by the participants in the study conducted by Zaidatul Akmal Abd Hamid et al. (2020) and generally, most of the statements under this strategy received high mean scores. Overall, data on OSORS indicated that students used problem-solving strategies the most in reading online materials for academic purposes. Figure 1 shows the strategies most employed under problem-solving strategies.

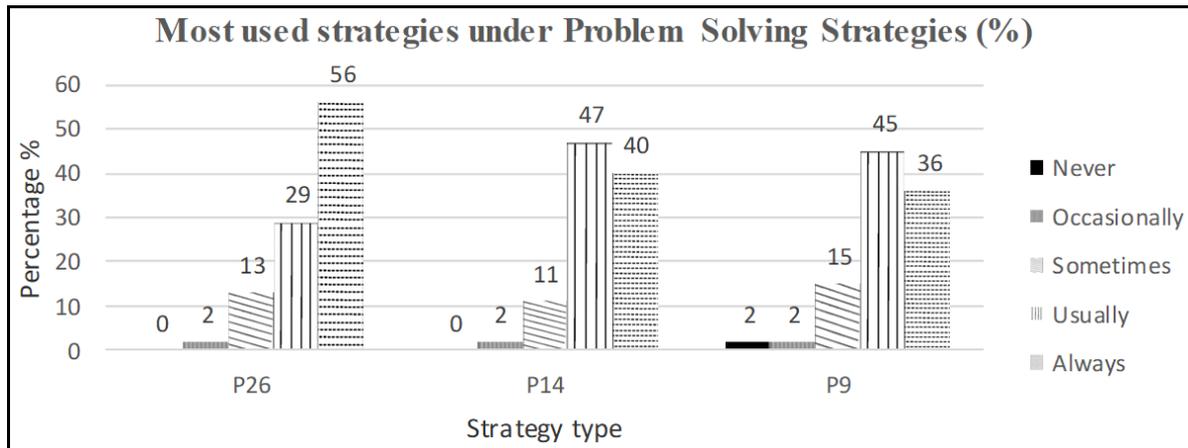

Figure 1. Problem-Solving Strategies

In addition to the data obtained from OSORS on problem-solving strategies, identification of problem-solving strategies was also obtained through semi-structured interviews. For example, three students mentioned the need to evaluate online reading texts by rereading the materials. This was problem-solving strategy No 26; *when an online text becomes difficult, I reread it to increase my understanding*. The extracts below depict this point:

- “Because just now I got write down the important points, then I will *go through the text again* so as to make sure I understand the context.” (Will)
- “I will print out the article and *read it again*.” (Fatin)
- “After reading, I will usually *look at my points* that I have jot down then I *look whether it is complete* or incomplete and if it is nothing much information that I get, then I will go to another text.” (Ida)

All three students above believe that rereading an online text would assist them to understand the texts better. This proves that online reading strategies were significant in understanding online scientific materials. For example, a study in a local context found students used problem-solving strategies the most in reading an English text to understand what they read (Abdul Rahim Hamdan, Mohamed Najib Ghaffar & Ahmad Johari Sihes, 2010). The study was conducted among a group of 57 students in a tertiary level institution in Malaysia. The study found that students put more attention to difficult texts by rereading them to increase understanding. Hence, problem-solving strategies such as rereading difficult texts are important for ESL learners. Meanwhile, two students reported using problem-solving strategies by evaluating the texts while reading online. The extracts below reflected strategy No 32; *I critically evaluate the online text before choosing to use information I read online*.

- “I try to find more sources and *analyse each source whether it is reliable* or not reliable. I try to collect more information, then only I categorise the information.” (Omar)
- “I try to *evaluate* the text. Do I need it?” (Amin)

Based on the excerpts above, two students admitted the need to evaluate online reading materials. This shows that students set their reading goals by evaluating the online reading text. Analysing the text critically helped the readers to decide whether to adapt the content or not (Heri Mudra, 2018). To summarize, Table 1 illustrates the themes identified in the interview responses that were matched with problem-solving strategies items in OSORS.

Table 1. Semi-Structured Interview Themes Matching Problem-Solving Reading Strategy Statements

Themes	Statement No.	Problem-Solving Strategy (in OSORS)
Reread online materials ($n = 3$)	26	When an online text becomes difficult, I reread it to increase my understanding.
Evaluate online text ($n = 2$)	32	I critically evaluate the online text before choosing to use information I read online.

Referring to Table 1, data gained from OSORS was supported through the analysis from the semi-structured interviews. The themes derived from the semi-structured interviews matched strategy No 26 ($n=3$) and 32 ($n=2$) in OSORS. Similarly, a study that looked at types of metacognitive online reading strategies and frequency in the use of these strategies found that less proficient learners used problem-solving strategies the most while proficient learners were found to use global strategies the most (Eghlidi, Abdorrahimzadeh, & Sorahi, 2014). A probable explanation for this is that students needed to take actions while working with online texts to achieve comprehension. They believed this is dealt with rereading when encountering difficult texts, paying closer attention to the difficult text they are reading and critically thinking about what they are reading, all of which are important components of problem-solving strategies.

Global Reading Strategies

The highest mean score for global reading strategies was for strategy number G3 (I think about what I know to help me understand what I read online) with 4.02, followed by strategy number G18 (I use context clues (i.e. look at other words) to help me better understand what I am reading online) with a mean score of 3.82 and 3.71 for strategy number G24 (I check my understanding when I come across new information). Both G24 and G25 (I try to guess what the content of the online text is about when I read) have the same mean of 3.71, and hence, the standard deviation is considered. The standard deviation for G24 is 0.78 while standard deviation for G25 is 1.04. G24 is chosen as the most-used global reading strategy instead of G25 because of its smaller standard deviation. A smaller standard deviation indicates that the data has small variation, and the data is less dispersed. Smaller standard deviation also means that the data is more consistent and, therefore, more precise.

Based on global reading strategy number G3, 58% answered “4” *usually*, while 23% answered “5” *usually*. This indicates that 45 participants (81%) think about what they know to help them understand what they read online. Based on Schema Theory, recall and comprehension are dependent on the reader’s background

knowledge and how it is matched to textual data (Carrell et al., 1988). This shows that background knowledge plays a significant role in online reading comprehension. With 53% answering “4” *usually* and 20% “5” *always* for strategy number G18, this clearly illustrates that students ($n=40$) used contextual clues to help them have a better understanding of what they read online. In addition, more than half (66%) ($n=36$) of the participants checked their understanding when they came across new information while reading online. This contributes to 53% of students that answered “4” *usually* while 13% answered “5” *always*. Figure 2 depicts the most global reading strategies used by students.

Figure 2. Global Reading Strategies

Based on the semi-structured interviews, having a purpose in mind before reading EST online materials is important. This theme matched OSORS strategy No. 1 *I have a purpose in mind when I read online*. The extracts below described this further:

- “I think I will clear my mind and *focus on what I am reading*.” (Seth)
- “Before I start reading, *I am going to plan* what am I going to search and *what is it about* before I look for the text.” (Kaden)
- “I read the title and then I try to understand, *if it’s interesting I will read everything if it’s not I am going to stop*.” (Omar)

Two of the students (Seth and Kaden) claimed they used this strategy before reading EST online materials. Another student (Omar) will determine what to read and what to ignore. This finding echoed an earlier study on online reading among 54 ESL university students where global strategies were found to be used more for reading online materials (Ostovar-Namaghi & Noghabi, 2014). The study concluded that when students can plan their reading, it implied that they were clear about the objectives of reading. This becomes a determining factor for successful learning. As Sheorey and Mokhtari (2001) hypothesize, metacognitive awareness encompasses the ability to set reading goals and awareness of the reading process. Based on the interview excerpts, it can be concluded that all three students utilize metacognitive knowledge. This contributes to successful reading of

online materials.

Scanning through the text before reading was one of the most preferred global strategies students used. This was like OSORS strategy No 30; *I scan the online text to get a basic idea of whether it will serve my purposes before choosing to read it*. The interview transcripts below illustrate that students scanned the text before reading.

- “Basically, when I am just reading the Science and Technology hypertext, I am just *scanning through* the lines and paragraph.” (Ida)
- “Before I read the text from the online and because the text is very long right, *I will go through some points* from the text *to see what the points are* in the first paragraph, second paragraph, and third paragraph so on. So, *I can easily understand* about the content inside later on.” (Will)
- “Normally I will *scan through* the article first rather than reading the entire text.” (Tini)
- “Normally I will *scan through* the article first la”. (Fatin)

Four students employed scanning strategy before reading to gain a general idea of the passage. It is considered a global reading strategy that provides students with an overview of the text. Clearly, students believe scanning through the online material is a much-needed reading strategy. This strategy transferred from paper-based reading was also found in a study that investigated online reading (Park & Kim, 2017). The study found that students adjust their reading strategies based on different reading environments and purposes. Overall, these results corroborate the notion that students transferred paper-based reading strategies to online reading.

Another feature of Global reading strategy that was identified in students' reading process was strategy No. 16; *I use tables, figures, and pictures in the online text to increase my understanding*. This is an important reading strategy as it allows readers to predict the text. In doing so, students would be able to activate their background knowledge when they apply this strategy before reading. This form of global reading strategy includes noting the length of the text, number of paragraphs or number of words. Interview excerpts below support this finding.

- “Normally I will read the title first and then *see whether it contains the graphics or photos* and then I will direct to the contents.” (Cindy)
- “I will see the *title first*. Mostly I’ll see the title first.” (Qay)
- “First, before I read an article I will *look for the title of the article* about what and then I will *open several article* and *read overall*.” (Fatin)
- “Before I read, I will skip through to the end and *count as how many paragraph* it has.” (Amin)

The excerpts above highlight four examples of students reading strategy in noting text features such as graphics or photos and number of paragraphs. This reading strategy may provide students with beneficial information about the text to increase their understanding of the reading text. Identifying text features before reading is important because it prepares students for what to expect in the reading texts. The students admitted that they

would scan the text, look at the title, and note text features before reading. According to Heri Mudra (2018), students preferred reading simplified and colourful texts which can help them to visualize the information to better understand the texts. Hence, it is important for students to utilize appropriate reading strategies before reading to activate their background knowledge of the reading materials. Table 2 illustrates global reading strategy statements matching the themes derived from the semi-structured interviews.

Table 2. Semi-Structured Interview Themes Matching Global Reading Strategy Statements

Themes	Statement No.	Global Reading Strategy Statement
Having a purpose ($n=3$)	1	I have a purpose in mind when I read online.
Scanning ($n=4$)	30	I scan the online text to get a basic idea of whether it will serve my purposes before choosing to read it.
Using text features and noting text characteristics ($n=4$)	16	I use tables, figures, and pictures in the online text to increase my understanding

As shown in Table 2, the themes identified in the semi-structured interviews that matched the global reading strategies obtained from the OSORS are strategy No. 1 ($n=3$), strategy No. 30 ($n=4$) and strategy No. 6 ($n=4$). It is apparent from this table that students used global reading strategies when reading online materials. Hence, reflects the use of online reading strategies in understanding online reading materials.

Support Strategies

The three most frequently used strategies under support strategies were strategies number S13 (I use reference materials (e.g. an online dictionary) to help me understand what I read online), S23 (I go back and forth in the online text to find relationships among ideas in it) and S36 (When reading online, I think about information in both English and my mother tongue). The lowest among the three most used support strategies is strategy S36 with the mean score of 3.71. 19 students answered “4” *usually* and 15 “5” *always* indicated that students do think about what they read in the language that they were familiar with to ease their understanding when reading online materials.

Strategy number S23, received the second most mean, $M = 3.76$ among the three most used support reading strategies. This shows that students try to find relationships among ideas when they read online materials to increase their understanding. On the other hand, strategy number S13 gave the highest mean, $M = 3.93$. Strategy number S13 indicates that participants use reference materials to guide them in understanding the text they read with 38 students stating that they *usually* and *always* do this. Figure 3 shows the most strategies used under support reading strategies in percentages.

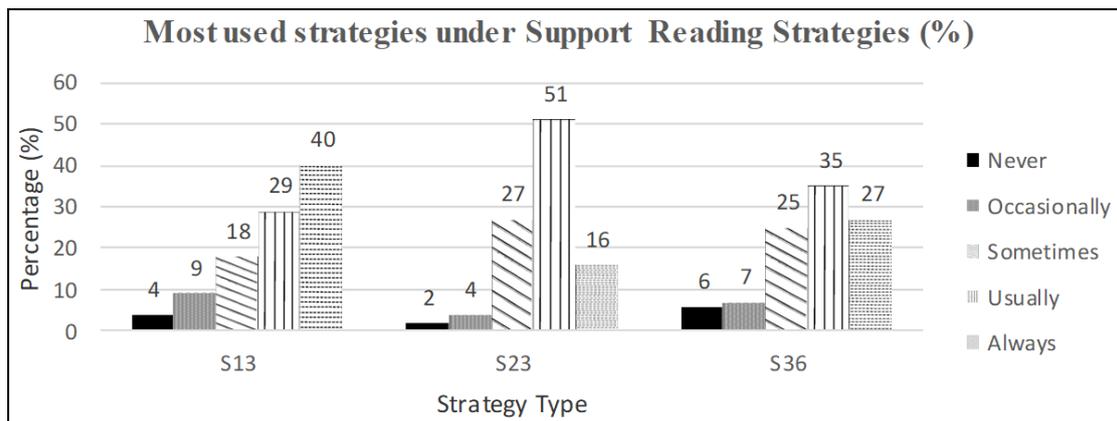

Figure 3. Support Reading Strategies

It is believed that support strategy No 2 *I take notes while reading online to help me understand what I read* are reflected the most in the semi-structured interviews. Most students have a preference to use this reading strategy while reading EST online materials. As displayed in the excerpts below, eight students reflected this reading strategy:

- “I will *take note the important information* that I wanted. I will *jot down the points* that I get from the text and I will try to understand from the elaboration.” (Ida)
- “I will find the main point and *make some writing on the paper* about the main point. That is all”. (Amin)
- “Maybe *I can jot down in the notebook* and somewhere then *next time I can use* it when I want to find out”. (Cindy)
- “I usually will *jot down the important points* from what I read. For future reference I guess”. (Tini)
- “After I read something like note means something that related to academic, I will make some *note in a piece of paper* so that I will know what the main point of the text I read.” (Kaden)
- “I will prepare a paper or prepare the note inside the laptop, then I will go through the points and *write it down the notes and maybe highlight* it. Or *I’ll underline certain words* that I don’t understand.” (Will)
- “While reading, I will *underline the main points and important messages* that being delivered from the text or *I will do a mind-map* in simpler form so that I can roughly get what it meant by just referring to the mind-map.” (Seth)

The interview transcripts above reflect the strategies students used when they read EST online materials by writing down important information, underlining main points and even doing a mind-map. They believe that these strategies are important because the notes that are written down may be used in the future or can be used as a reference and shared with others. This indicated that the students do invoke conscious strategies and utilize metacognitive knowledge in reading. Flavell (1979) posits that metacognitive knowledge allows a person to prioritize tasks and use various strategies to achieve the desired goals.

After reading EST online materials, some students summarize and paraphrase the ideas to understand and remember the texts better. This is support strategy No. 19 in OSORS *I paraphrase (restate ideas in my own words) to better understand what I read online* as depicted in the excerpts below:

- “I will *summarize my ideas and rewrite it* in full sentences so that it is complete and can understand better.” (Seth)
- “Because just now I got write down the important points, then *I will go through the text again and paraphrasing* it so as to make sure I understand the context.” (Will)
- “I will *summarize the point of article* and rephrase it a little”. (Fatin)
- “I just *review it again* and *make it simpler*.” (Ida)
- “I usually *make a conclusion* about it. I bear in mind what I understand from the paragraph.” (Kaden)

The excerpts above illustrate various forms of support reading strategies that students use. This includes summarizing, paraphrasing, and reviewing. According to the students, these strategies enable them to understand and remember the texts better. Another common support strategy used by students was to use reference materials such as online dictionaries and Google Translate to understand what they are reading online. This is support strategy No 13 *I use reference materials (e.g. an online dictionary) to help me understand what I read online*. This can be seen in the interview excerpts below.

- “I always read the text first. Later if I do not know the words, some vocabularies, so I will *check the dictionary*”. (Qay)
- “I *check the dictionary online*. So, that later on I can go through the text easily. Also, I will go *google search* the words. Other than google search, like wikipedia and so on”. (Will)
- “Sometimes when I found the problem I just *google* actually or I *look for dictionary* to find the meanings”. (Tini)
- “For phrases, I just basically ‘*google*’ it and then try the different webs that give the *meaning for that terminologies*.” (Ida)
- “I will *refer to the dictionary* or internet...Try to *search for the meaning of the phrases*”. (Kaden)
- “I will *refer to dictionary* to search for the words and its meaning online. I also *look for example of sentences and the way of using that words in a sentence*...I will search online maybe other websites maybe google translate for the meaning of the phrases.” (Seth)

As the interview excerpts depict, students relied heavily on using online dictionaries and Google Translate when they face reading difficulties such as incomprehensible words or sentences during reading. This indicated that students monitor their reading process by making the effort to comprehend the text they are reading. Students comfortably resort to these online resources when they face decoding problems. Using online support resources to compensate for the lack of word knowledge is found to be common among learners in online reading environments (Huang, Chern, & Lin, 2009) because decoding is crucially important for reading comprehension

(Grabe & Stoller, 2013). To summarize, Table 3 illustrates OSORS statements that matched the themes derived from the semi-structured interviews.

Table 3. Semi-Structured Interview Themes Matching Support Reading Strategy Statements

Themes	Statement No	Support Reading Strategy Statement
Taking down notes (<i>n=7</i>)	2	I take notes while reading online to help me understand what I read
Paraphrasing & summarizing (<i>n=5</i>)	19	I paraphrase (restate ideas in my own words) to better understand what I read online
Using reference materials (<i>n=6</i>)	13	I use reference materials (e.g. an online dictionary) to help me understand what I read online

It appears that strategy No 13 (*n=7*), is an important global reading strategy for the students. Students believe they need to use reference materials such as online dictionaries and google translate to help them understand difficult online reading materials. They also needed to ask friends or lecturers to understand some difficult reading texts they encountered.

Discussion

Results from OSORS indicated that students perceived problem-solving strategies to be more useful than global and support strategies. However, there is an inconsistency of data in OSORS to that of the semi-structured interviews. The interviews found problem-solving strategies to be the least used and support reading strategies were used the most by students. For example, 8 students admitted to taking notes while reading online, another 5 admitted to paraphrasing and summarizing ideas read online, while another 8 used reference materials to assist reading of online materials. In contrast to problem-solving strategies, only 3 students reread and 2 evaluate online materials. In total, there were 21 counts of using support reading strategies compared to only 5 students using problem-solving strategies. As reported by Zailani Jusoh and Liza Abdullah (2015), students in Information Technology course were generally more familiar with the Internet features such as online dictionaries and references, which could be a probable explanation why they employed more support reading strategies compared to other students in different field of studies. This is similar in the current context as students in this study. As all participants were from Science and Technology background, they might be applying support strategies more frequently than the other strategies due to the nature of the reading materials that they are dealing with throughout their studies. In addition, Zaidatul Akmal Abd Hamid et al. (2020) also reported that the use of reference materials to aid reading of online materials had the highest mean score of 4.17 in their study and none of the statements under support strategies fell under the low level of mean score. This shows that students are quite familiar with the use of support strategies when reading online.

Based on semi-structured interviews, most of the students reported that they are quite capable of using various

strategies in reading online materials. Four students (Will, Fatin, Ida, and Kaden) use all the strategies (problem-solving, global and support strategies) when reading online. However, there is some evidence to suggest that students lack other important reading strategies such as guessing contextual clues, visualizing information, and deciding what to read and whether content of online text fits reading purposes. These strategies are important to equip learners with online reading skills for them to effectively learn in an online environment (Magogwe, 2013). As past studies show, many students still need guidance at all levels and in most content areas (Green 2013; Lai et al 2014 and Wise 2009 as cited in Armbrecht (2018). Lessons should be executed to show or demonstrate how to use these strategies successfully. Therefore, there is a need to continue applying online reading strategies such as problem-solving strategies efficiently at all levels, including university and in all subject areas with multiple modalities.

The data also revealed that the metacognitive online reading strategies chosen were interrelated and led to one objective that is to improve student's understanding towards the text they read online. This is especially important for ESL students who are reading EST online materials at a higher level. Students in higher education need to use higher order thinking skills when reading academic online materials such as EST. Based on the statements selected by the students, it is believed that students need to apply these strategies in reading online materials at tertiary level.

Conclusion

The aim of this study was to explore the metacognitive online reading strategies used by university students in reading EST online materials. The contrasting data from two research instruments found a mismatch in the application of metacognitive online reading strategies among the students. The mismatch of data describing the students' familiarity to reading strategies may depend on the type of texts, need and the nature of texts (Daguay-James & Bulusan, 2020). Although students are prone to unconsciously reverting to metacognitive reading strategies, Ruhil Amal et al. (2017) asserts the need for students to be guided in the process of applying metacognitive reading strategies to promote effective understanding of texts. The employment of online metacognitive reading strategies emphasised the need for students to be aware of their reading objectives. The participants are ESL science and technology undergraduate students who are confronted with technical reading materials that require problem-solving strategies more than global and support strategies. The focus and interaction with a reading text will differ uniquely from field to field. It is imperative to note that the popularity of metacognitive online reading strategies found in this study is not conclusive to all technical fields.

Recommendations

There are several emerging research directions in the study that call for further action. The most prevalent research direction is the need to draw comparisons between different datasets. The engagement of focus groups with students from other fields of study can provide a comprehensive input on the effectiveness of online

metacognitive reading strategies. In addition to obtaining insights on the effectiveness by comparing the two datasets, the inclusion of a bigger sample in a study could provide a better representation of students' online metacognitive reading performance. Secondly, the underpinning of this study focused solely on online reading strategies in the academic settings. Future research could focus on the integration of technological tools and learning management systems in achieving comprehension regardless of texts. Another potential research strand is studying students' experience whilst applying online reading strategies. By investigating students' experiences in applying online reading strategies, not only will it provide insights into students' motivation but will also aid future research in understanding why certain reading strategies are preferred by students. This research is hoped to be a source for future contributions in studying metacognitive reading strategies.

Flipped Language Learning for Arts Students

Gulnara Gorgiladze

Batumi Art Teaching University, Georgia,  <https://orcid.org/0000-0001-5136-6334>

Abstract: Flipped learning is a teaching methodology which holds most theoretical learning in asynchronous regime online, after which practical classes are conducted face-to-face. This constructivist methodology became especially valuable during and after the total online learning during the COVID-19 pandemic. The greatest academic benefits of this methodology have been found in language, technology, and health-science (i.e., skills-based) courses. Among the English for Specific Purposes (ESP) directions, teaching arts students offers considerable advantages, as it enables the teachers to pre-teach the ESP language (terminology), as well as lets the students participate in virtual excursions to museums, view other videos related to the topic under study at the pace most comfortable for them, so that they are well prepared to the discussion and other communicative activities in class. A survey was conducted among students of an art university in Georgia. The conclusion was made that the majority of students like the methodology, especially if the homework part provides enough support in language (vocabulary, grammar) needed for the comprehension of the video materials.

Keywords: Flipped learning, Asynchronous regime, Face-to-face learning, English for specific purposes, English for arts students

Introduction

Flipped learning is a teaching methodology which holds most theoretical learning in asynchronous regime online, after which practical classes are conducted face-to-face. The idea of ‘flipped’ (or opposite to traditional) chemistry lessons was first suggested by Bergmann and Sams (2012):”Basically the concept of a flipped class is this: that which is traditionally done in class is now done at home, and that which is traditionally done as homework is now completed in class” (p.13). First, they found that using recorded classes helps students who miss classes to catch up with the class. Further, their students decided to apply the pre-recordings as homework – they watched them, and did their best to understand. The explanation in the classroom was based on students’ questions and helped them understand better what they had watched, so the educational process was student (and not teacher or coursebook)-centered. This enabled the researchers to personalize the face-to-face classes, as every student had a chance to ask questions and receive answers. The flipped class was more authentic than a regular one, as it moved out of classroom (videos could show processes in a lab or in a factory, etc.). The students could record their projects and share them with other students, while the discussion would take place in

class. As theoretical learning was done at home while listening to the ‘lectures’, in class students could develop (in case of language teaching, communicative) skills and gain practical experience. Teachers in flipped classrooms are not necessarily the material presenters: they are rather tutorial authors and/or selectors.

With time, the ideas of flipped classroom spread from science classes to language classes. Contemporary foreign/second language teaching is focused on communication and not learning about the language (Ellis, 2012; Loewen, 2014). However, students to some degree need to learn about language (e.g., vocabulary meaning, grammar rules in order to do admission and language level defining tests) and culture (to use the language appropriately) as well, and this can efficiently be done via the videos given to students as homework. As videos are watched individually, the language teacher can adjust the selected materials to the students’ language levels (e.g., videos on the same topic, but of different difficulty level) and interests (e.g., on sports topic winter and summer, male and female, athletic and artistic sports can be offered). In Brown and Lee (2015), Nation’s (2007) ten principles were interpreted for flipped language classes: comprehensible input through listening and reading, using activities raising consciousness (pre-listening or pre-reading tasks), variety, collaborative activities, deliberate learning of grammar, pronunciation and vocabulary in authentic context, developing language learning strategies (offering relevant videos), extensive listening/reading, focus on meaning, re-using the materials when/if needed, continuous assessment.

Of course, flipped language learning was characterized not only by the advantages discussed above, but also by some challenges. Cunningham (2017), for example, mentions that it is not easy to find reading/listening and video materials that exactly fit the syllabus and meet the students’ needs and language level. The search of relevant materials, due to it, is time-consuming. Students who did not apply this sort of pre-teaching materials would come to class, unable to participate in the activities. Then the teacher might need to present the materials to his/her students quickly. However, a more communicative outcome may be found – a brief small group activity can be organized in which students who did the homework have their peers quickly informed about it.

ESP and Flipped Learning

“In comparison with teaching EGP (English for general purpose), teaching ESP usually faces a lot more challenges. Focusing on the specific needs of the learners based on the need analysis, concentrating more on language in context and on the students’ need to acquire a set of professional skills and particular job-related to each function, ESP remains a major testing experience for every teacher in charge of it” (Fălăuș, 2017, p. 6). As teaching and learning ESP entails additional difficulties compared to teaching English for General Purposes, special approaches are needed to teach it efficiently. Flipped learning is one of such possible approaches.

According to Lee (2017), while applying flipped learning in English for Specific Purposes (ESP) classes “the impact on the student experience is significantly positive and with a higher level of satisfaction by students especially for those students who have TOEIC test experience before” (p. 4995). Parvaneh, Zoghi and Asadi (2020) found a significant positive effect of flipped classroom method on autonomy, which also reduced the

anxiety of Iranian language learners.

Hsiao (2021) held a quasi-experimental study with students who did not major in English, but studied it for Specific Purposes (ESP). The results of his study revealed that the experimental group students developed significantly higher self-efficacy and received higher course grades both for English and specialty courses than the control group. Moreover, the students' higher-order cognitive skills (critical thinking) improved. The students became able to make numerous associations between ideas. Fard et al. (2022) study demonstrated the positive influence of the flipped classroom on the students' task engagement and their critical thinking skills. Ebadi et al. (2022) studied the effects of flipped vocabulary learning via an online dictionary on EFL learners' listening comprehension. The students had to learn new vocabulary (the list of 20 vocabulary units per lesson offered to the students) via online dictionaries. They had to pay attention to the definition, antonyms, synonyms and the part of speech the words belonged to. The findings of the study suggested that flipped vocabulary learning can be applied as an effective instructional tool for the development of listening skills.

Therefore, flipped learning can benefit ESP (arts) students in the following ways:

- it enables the students who missed the class to catch up with their peers;
- it provides a comfortable learning environment (anxiety-devoid, timing and speed, number of repetitions);
- it is student-centered;
- it is authentic (language, activities);
- it enhances the communication in class;
- it enhances collaboration and cooperation;
- it helps develop their vocabulary (terminology) skills (especially, through electronic dictionaries and encyclopedias);
- it develops their reading and listening skills (increases the volume);
- it increases students' motivation, engagement and satisfaction.

Flipped ESP Teaching during the Pandemic

This constructivist methodology became especially valuable during and after the total online learning during the COVID-19 pandemic. While flipped learning before the pandemic involved online homework and offline classes, during the pandemic both stages were realized online: online homework done by the students asynchronously and online classes in the synchronous regime. For those students who were already accustomed to flipped learning, getting adjusted to fully online learning was less painful. Montaner-Villalba (2021) assessed the students' perception of the development of academic writing skills through flipped learning during the COVID-19 pandemic; the results of their study revealed that the students assessed the importance of general English writing skills with a mean of 4.4 on a 5-point Likert scale, while they assessed their own general English writing skills at 2.8 level and Business English writing skills at 2.81. In students' assessment, their

competence in Business English writing through flipped learning increased a lot – to 4.7. Mundir et al. (2022) compared face-to-face, flipped (homework online and classwork face-to-face) and completely online learning of vocabulary and found that both online and flipped groups outperformed the face-to-face group, while the flipped group had the highest results.

Method

A survey was conducted among students of an art university in Georgia. The tool used was a researcher-made questionnaire in a 5-point Likert scale format. The questionnaire was assessed for content validity by three professors in the relevant field and by a test-retest procedure for internal consistency (reliability) with 10 students who further were not involved in the study. R was found to be equal to 0.92, which is quite high.

Four flipped classes were held to a mixed-specialty group student (totally 18 students) during one month. The researcher selected the reading / watching materials and made up the tasks. For the first class, the teacher shared with the students a text selected online dealing with their specialty. There was a list of vocabulary with definitions, translations and examples. The students had to fulfil gap-filling and multiple-choice tasks on the vocabulary online at home. For the second class, the students were asked to find online a text about his/her favourite artist, to make up a list of key terms (minimum 20) used in the text, with definitions, translations and examples. The results of their work had to be uploaded to the group created for the purposes of the research. In class they had to present a short abstract of the text and answer their peers' questions on it. For the third class, the teacher chose a short video "What art museums are for?" (<https://www.youtube.com/watch?v=ThyY7efQJP0>). Several sentences from the video were grammatically analyzed for the students. The students had to fulfil gap-filling and multiple-choice tasks on the grammar emphasized in the teacher's materials online at home. And the final class, the teacher asked the students to find a short video about a museum of art and to upload the links to the group. During the face-to-face class 2-3 students chosen at random during the class demonstrated the videos and answered their peers' questions on it.

The structure of the classes was defined by the fact that flipped teaching arts students offers considerable advantages, such as it enables the teachers to pre-teach the ESP language (terminology), as well as lets the students participate in virtual excursions to museums, view other videos related to the topic under study at the pace most comfortable for them, so that they are well prepared to the discussion and other communicative activities in class. The questionnaire was held online.

Results

The students mentioned to the teacher that they were especially pleased with the classes when it was the teacher who provided the vocabulary included in the reading and in particular in listening texts. The questionnaire was online for one week and then closed. The obtained results are presented below.

Table 1. Questionnaire results

Item / descriptive statistics	1	2	3	4	5	M	SD
1. Have you ever before experienced the flipped learning?	18 (100%)	0	0	0	0	1	.00
2. Were the four classes held as flipped learning difficult for you?	5 (28%)	8 (44%)	2 (11%)	1 (6%)	2 (11%)	2.28	1.27
3. Did these classes help you more than usually to learn the vocabulary / terminology?	0	2 (11%)	1 (6%)	7 (39%)	8 (44%)	4.17	.99
4. Was this way of dealing with grammar comfortable for you?	1 (6%)	2 (11%)	3 (17%)	5 (28%)	7 (39%)	3.83	1.24
5. Do you think that the flipped classes contributed to the development of your reading skills?	0	1 (6%)	1 (6%)	7 (39%)	9 (50%)	4.33	.84
6. Do you think that the flipped classes contributed to the development of your listening skills?	0	0	0	8 (44%)	10 (56%)	4.56	.51
7. Did you enjoy the flipped classes?	0	0	2 (11%)	9 (50%)	7 (39%)	4.28	.67
8. Would you like to go on learning in this way?	0	1 (6%)	1 (6%)	6 (33%)	10 (56%)	4.39	.85

The standard deviation for items 2 and 4 is higher than 1, which reveals that on these issues the opinions of the respondents differed significantly, on other items their opinions are quite unanimous. All students have never experienced flipped classes before ($M=1$). The majority of them (83%) did not view the approach as a difficult one ($M=2.28$). They confirmed that the flipped classes helped them improve their vocabulary ($M=4.17$), grammar ($M=3.83$), reading ($M=4.33$) and listening ($M=4.56$) skills. The majority of them (89%; $M=4.28$) enjoyed the flipped classes and would like to go on learning in this way (89%, $M=4.39$).

Discussion

The lack of Georgian students' awareness about flipped classes in the current research is in line with that of

Korean students (Kim et al. 2015). Concerning the difficulties of flipped learning, Farrah and Qawasmeh (2018) mention only the technical ones (availability of the necessary technologies in class and at home), otherwise “the participants considered the flipped classroom exciting, motivating, and engaging” (p. 275), which is in line with the findings of the current research. The current study stated the positive impact of flipped language learning on the development of vocabulary skills. Likewise, Kirmizi and Kömeç (2019) found a positive impact of flipped classes on their students’ vocabulary skills. Pudín (2017) found that the students benefitted from flipped learning of grammar, which is in line with the given study. Karimi and Hamzavi (2017) found a beneficial effect of flipped learning on reading schools, while Amiryousefi (2019) revealed its positive impact on listening and speaking skills, as well as engagement in the class activities. This is relevant to the findings of the current study.

Conclusion

Flipped language learning is beneficial for arts students, as it improved their vocabulary, grammar, listening and learning skills more than the traditional classes with no online pre-teaching provided as their homework. Although students have not earlier experienced flipped classes, they did not find them difficult, on the opposite, they enjoyed them and would like to continue such learning. Their attitude was especially positive when the homework part provided pre-teaching of vocabulary and grammar needed for the comprehension of the video materials.

Recommendations

Using virtual excursions to museums and other videos as homework is highly recommended for teaching English to arts students. Flipped classes in which sometimes the teacher does the preliminary explanation and sometimes the learners themselves develop the language materials as homework, and then a big part of the face-to-face class can be dedicated to communicative activities will be both enjoyable and effective.

Abstract: Martial law has been introduced in Ukraine since February 24, 2022. Which other sectors, the education sector has been affected by this dire situation: educational institutions have started distance learning. Initially, a forced vacation was organized for the students, it was closed all educational institutions, teaching and learning are suspended activity. Subsequently, the training was continued in an online format for domestic and foreign citizens of all forms of education. Taking to attention, that the proper teaching of surgery in the whole complex of others discipline creates conditions for quality medical practice in the future, it became necessary to optimally use the modern one's information resources and technologies. Learning should be active the process is giving students tasks to use the received information in practical situations, while different ones are offered forms of communication: game, joint work, exchange of ideas when students can develop knowledge and skills using various cognitive and operational means and tools. At the same time, students are studying record and display their activities. This study aims to examine the effectiveness of remote of e-learning among medical students during study disciplines "Surgery" - module 1 "Emergency abdominal surgery and proctology" and identify possible problems, limitations, satisfaction as well as prospects for this learning approach in extreme conditions, especially learning practical skills in the context of distance learning of surgery. Practical skills include several categories of material, intended for assimilation and reproduction by students.

Citation: Sulyma V., Duka, R., Malinovskyj, S. & Yaroshenko, K. (2023). Moodle System for Preparation Surgery Medical Students during the War. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 120-130), Cappadocia, Turkiye. ISTES Organization.

Introduction

- 1) The technique of performing physical and additional research methods.
- 2) Results obtained using additional methods research.
- 3) Comparison of the clinical picture and the data of additional studies.

For the implementation of the tasks, the most acceptable are tools included in the Moodle educational platform. We have 3 categories of tests that can be used for implementation training and control practical skills, the most effective they turned out to be tests for the selection of missing words, where there are missing words in the text, the questions are filled in using the ones added to the menu. Instructions for performing each test are provided (example): control of practical skills is built on the principle of a test with five questions each on a separate screen, four of which contain lists answers from which the student, using his knowledge of this topic, must choose the correct ones, put a check mark opposite them. Number correct answers are not regulated. One question need choose a certain sequence of actions in the algorithm by selecting from identical lists given to each number in the algorithm. After that, the student must complete the attempt by clicking on the appropriate one button and then confirm the action or return to the questionable answer and review the questions, and reconfirm the completion of the test and sending results.

Moodle

Moodle allows you to create interactive mini-programs that can contain text, sound, video information, as well as any images. Using branched the script allows simulate diagnostic, treatment process with registration of the correct choice and erroneous actions of the student. In addition, scenarios may include the above tests that makes this module basic in solving the task of practical learning skills both in surgery and in other fields of medicine.

On the one hand, the advantages of distance education are the possibility of learning simultaneously a large number of students, facilitating the educational process, in the case of education of people with disabilities, adaptability - training using modern software and technical equipment then makes e-education more accessible. Also, usually distance learning is cheaper than regular education, first of all, for due to the reduction of expenses for moving, living in another city, reducing the costs of organizing the courses themselves. (*Moore et al., 2011*).

Opponents the use of distance education in medicine is considered as such it is impossible to master practical skills, which are the main ones a component in the training of future medical workers. However, on our opinion, the use of this form of education in medical educational institutions not only possible, but in wartime safe and necessary. It is certainly necessary to train a doctor in practical skills of traditional face-to-face contact, but all theoretical training and solving debatable issues of tactical decision-making issues in the treatment of the patient can be done remotely.

Principles of higher medical education

Taking into account that the level of qualification of the doctor is in the first place in various graduation system of educational societies it's understood the necessity to improve the quality of the doctor in institutes of higher education, in which directed implementation of the credit-module system to the educational process. Preparation of doctors of the general practice is the principal task of the medical institution of higher education, and therefore the proper teaching of surgery in the whole complex of other disciplines will create conditions for quality medical practice doctor in the future, especially for those professionals who plan to work as surgeons. The doctors of the general medical practice tasks determinations basic requirements of scope of knowledge and practical skills for graduating student of institute of higher education of IV level of accreditation: goal-directed methodical algorithm of questioning of the patient (getting anamnesis), physical examination, substantiation of provisional diagnosis, determinate algorithm of additional methods of investigations with analysis of received results, differential diagnosis, forming clinical diagnosis, substantiation of treatment program and its implementation.

And for the intern surgeon it's important to mastering of surgical manipulation and stages of surgical interventions in treating the most common surgical diseases or providing an emergency assistance in case of emergency conditions. Development of modern surgery is impossible without modern techniques, including laparoscopic technology, so it's necessary to prepare medical interns to work on equipment that meets the time. This requires to reconstruct the process of teaching surgery both students and medical interns towards a positive effect - mastering the full range of theoretical knowledge and practical skills with the help of modern equipment.

Method

Our study included a survey of 1058 students dents who are currently studying in 4-6 courses with clinical disciplines. At the beginning of the questionnaire, all participating students were explained the purpose of the survey and the obtained consent to participate in the study.

This study aims to examine the effectiveness of remote of e-learning among medical students during study disciplines "Surgery" - module 1 "Emergency abdominal surgery and proctology" and identify possible problems, limitations, satisfaction as well as prospects for this learning approach in extreme conditions, especially learning practical skills in the context of distance learning of surgery.

During 4 – 6 courses basic direction of educational process is mastering of theoretical knowledges and practical skills which must provide a young doctor possibility of independent supervision after a patient, forming of previous diagnosis, program of inspection and differentiation of basic socially meaningful diseases.

Mastering of this algorithm in-process doctor in a present tense acquires yet greater actuality in connection with

changes in priorities of grant of Medicare from stationary to primary ambulatory link, embodiment in work of surgeon's permanent establishment-deputy and mini-invasion technologies, introduction in practical activity of health protection institute of general practitioner.

Educational technologies among which acquire development and incarnated credit-module system of studies change, organization of educational process by system of his quality management. All of it needs new organizational and methodical approaches in studies, new textbooks in which from modern positions it is structured and compatible all educational material must be expounded. Important is and mastering of algorithm of diagnostic thought students at establishment previous, differential and clinical diagnosis.

The in addition, changed paradigm of grouping of material is from a nosology form depending on the organ of defeat, to distributing of diseases after a basic clinical syndrome. To our opinion, such approach must provide more quick mastering of material and approaches thought of student and young doctor to basic principles of work of doctor, when on principles of symptoms of disease, a basic clinical syndrome is formed, previous diagnosis and on their basis his clarification is conducted, differentiation and the program of treatment is formed. One of major factors of perfection treatment diagnostic there is an analysis of quality of clinical diagnostics a process. It is very important for this purpose, that doctors in medical establishments of different level communicated between itself one language and adhered to the unique principles of estimation of the state sick. In the first turn it touches recognition and construction of clinical diagnosis.

It costs to consider such after which the expediently directed follow and complete a correct clinical diagnosis, after these circumstances, medical and prophylactic measures. Coming from it, a necessity is a diagnosis timely (early) and complete (unfolded), logically faithful, nosology, etiologic and nootropics. Forming a diagnosis, a doctor determines the imagination about illness and patient. Thus, a doctor builds appearance exactness of which depends on his logic, ability of connection diagnostic value of symptoms of illness, conclusions about essence of disease and about being of patient in this stage. The correctly formed diagnosis allows being determined with the prognosis of disease and presence of complications.

The correctly recognized and formulated diagnosis creates pre-conditions for the choice of adequate medical tactic. Except for it, estimation of plenitude of the formed diagnosis, the correctly recognized disease creates terms for the analysis of quality of diagnostics and treatment, exposure of medical errors, and also increases of authenticity of medical statistics. Unfortunately, among doctors, especially youths, widespread idea, that quality of recognition of illnesses can be well-to-do, mainly, due to the difficult and exact methods of research. But more frequent all numerous researches, analyses, consultations, do not allow quickly and exactly to diagnose. Far rarer, especially young doctors, reflect above a problem that to the increase of efficiency of diagnostic process can lead optimization of thought of doctor. And more frequent all it shows up in the lack of ability to discover and define a leading clinical syndrome, and also symptoms, that he is made, the symptoms of disease are expressly and rationally interpreted not enough. It can be explained that nosology principle of diagnostics dominates in educational and monograph literature, when opinion of doctor is sent from the already set

diagnosis to remember those or other symptoms, characteristic for this nosology unit. (*Letterie, 2003*).

Professional activity of doctor hankers after from him a very opposite situation – syndrome thought. In practical work a doctor finds out some initial symptoms and must move from symptoms through leading syndromes to the previous diagnosis. It is formed the above-mentioned nosology principle of diagnostics of thought of doctor more frequent all it appears unable to reform on syndrome principle and correctly to interpret found out symptoms. All of it results in appearance of uneconomical and inefficient mechanisms of clinical thought which results more frequent all in an incorrect diagnosis or absence of diagnosis in general. Avoiding these failings is possible at the orientation of intellect at forming of clinical diagnosis on directions, which include syndrome principle of diagnostics, diagnostic algorithm and principle of optimum diagnostic expedience. The mortgage of progress of recognition of clinical diagnosis is a correct exposure of every symptom of disease and him distinctive criteria. It is a key moment of diagnostics, because if found out symptoms wrong or incompletely, no instrumental and laboratory diagnostics will not result in a correct diagnosis. For achievement of top quality of mastering of clinical surgery general practitioners in our program of studies are present the private questions of surgery, different nosology states, co-operation on groups, by basis each which a major clinical syndrome is of. A main difference and primary purpose of our studies is a concentration of attention on the processes of forming of previous diagnosis, ground of troubleshooting routine, with the purpose of clarification of diagnosis lead through of differential diagnosis.

To implement the system of planning, monitoring and evaluation of the education quality for a real degree of assimilation of students with specific components of the program during the academic year of surgery training and discipline for module “Emergency abdominal surgery and proctology” in general based on the cumulative number of ranking points for the European Credit Transfer System (ECTS).

This will improve the quality of learning discipline among the four-year students of enrolled this year, and develop common indicators for professionally-oriented exam after 6 years of study to get a general level of theoretical and practical knowledge and skills of physician’s interns of surgery.

The Department of Surgery № 1 of the Dnipro State Medical University was conduct structured, multiple planning of the study process and the use of different forms of the staging control. Taking into account the Standard program of the discipline, curriculum, working program for the department was create the specific actions by teachers, students and interns of surgery to achieve theoretical and practical knowledge, necessary resources and sequence of technological operations with the use of credit-modular system. Thus, there were additionally created classes for training with medical mannequin and simulators to master the practical skills of students in educational time and time for self-preparation on products firm “3B Scientific”. Nosologically principle of training that exists in most clinical departments, unfortunately, does not meet the practical work of a doctor, so we came to forming the curriculum by the syndrome principle: a practical training combines several pathological conditions, with oriental features, such as the module “Emergency abdominal surgery and proctology”, consists of two modules of content (substantial modules): “Urgent abdominal surgery” and “Urgent

Proctology”.

Thus, the substantial module “Urgent Proctology” includes “Syndrome of an acute pain in perianal area”, “Syndrome of rectal prolapses” and “Diarrhea-inflammatory syndrome”, combining similar diseases or their complications in the form of so-called educational elements, where, for example, a practice training for “Syndrome acute pain in perianal region” contains “Acute hemorrhoids”, “Acute anal fissures”, “Acute proctitis” and “Inflammation of the epithelial coccygeal passage”.

This approach is appropriate to expediently use the time of practical training, examine patients according to pathological syndrome, mastering the skills in classes with medical simulators, perform differential diagnosis with the definition of a rational treatment program.

To support the learning process developed by the principles of credit-modular system using multimedia lectures, the textbook “Surgery” in 3 volumes (5 books), methodological guide of development for students, methodological guide of development for teachers, hand book and individual plans for students, journal of the teacher.

For the practical training used division’s computer class (10 computers) - for computer testing of students, two classes of medical mannequins and simulators (products firm “3B Scientific”) - for acquiring and mastering practical skills, supervision of patients in the surgical department, supervised and theoretical survey in training rooms. For the interns besides the basic work in the surgical department with patients it’s necessary to mastery of the operational equipment in operation and manipulation rooms, as well as mastering of mini invasive surgery technology in the learning center “Endoscopic technologies in medicine”.

The algorithm of training and preparation on surgery of students of 4th course on practical studies (2 hours 40 minutes):

1. Muster, the announcement of a theme and the purpose of practical studies - 5 minutes;
2. Carrying out of theoretical computer testing on an studies theme in a computer class of chair (30 tests for 30 seconds on everyone students) - to 15 minutes;
3. Control of the mastered two concrete practical skills on an studies theme on simulators and firm training apparatus “3B Scientific” - to 50 minutes;
4. Investigation the thematic patient in surgical division of clinic after development of practical skills on simulators and firm training apparatus “3B Scientific” – to 30 minutes;
5. Theoretical analysis of results investigation the thematic patient and a theme of study with poll of each student - to 50 minutes;
6. Analysis of the basic errors admitted by students - 5 minutes;
7. The information on the task on preparation for following practical studies - 5 minutes.

After each study to student’s time for independent development of practical skills by preparation for following study is allocated.

Results

According to 867 (81.9%) students were satisfied with the quality of the survey distance learning according to the above methods. According to our data and the data of modern studies on the quality of education programs have proven that distance e-learning is very effective way of learning, but requires self-motivation of students as well the teacher's ability to constantly improve distance learning tools of education and strive to meet the needs of the applicants as much as possible.

These questions were mainly about student's demographics (age, gender, academic years and medical school), prior and current experience with distance learning, available technologies, distance learning benefits, drawbacks, their instructors' influence, challenges, attitudes towards the effectiveness of distance learning in medical education, and their perceptions about the future of distance learning in medical education.

Accordingly, this study included a convenient sample of 1058 students who are currently enrolled in their clinical years. Objectives and goals were explained at the beginning of the questionnaire to all participating students, and their enrollment was after they consent to participate in the study. Students must be active participants in the educational process, is in a learning center with a teacher acting as an advisor and supports interest in learning.

Discussion

The Bologna Declaration founded of June 1999 put in motion a series of reforms needed to make European Higher Education more compatible and comparable, more competitive and more attractive for Europeans and for students and scholars from other continents. Reform of Higher Education was needed then and reform is still needed today if Europe is to match the performance of the best performing systems in the world. (*Declaration, 1999*), Initiated by the European Commission (EC) special the Erasmus project was founded in 1987. After two years the European Commission felt that, whilst it was successful in terms of physical mobility of students, the Erasmus scheme was not working as well as it should because frequently the period of study of the student was not recognized by the student's own university. (*Chartia, 1988*). This meant that often study had to be repeated and examinations retaken.

Ways were considered of making improvements and the idea was put forward of a European Credit Transfer System (ECTS). A pilot scheme was launched for the 1989/90 academic year in five subject areas: History, Chemistry, Business Sciences, Mechanical Engineering and Medicine. Initially about 20 institutions per subject took part, but this increased to around 30 per subject by the end of the pilot phase (1995-1996). The pilot phase was designed to test the European potential of credit transfer as an effective means of academic recognition. It was based on mutual trust and confidence between institutions in terms of the quality of the educational experience enjoyed by the students. The pilot institutions were chosen for their general academic

compatibility of standards.

The scheme proved successful and was opened out in 1995 to all Higher Education Institutions in the European Union who wished to make use of it as a standard system for recognizing and transferring academic credits. It has now become the standard for all student exchange agreements where academic recognition of the study period abroad is required by the home institution. A breakthrough for ECTS was created with the Bologna Declaration (1999), after which ECTS became part of the Bologna process.

The European Universities Association (EUA), which represents and supports universities across Europe, approved of the ECTS Key Features in its annual conference in Zurich (2002). The Key Features are a concise document in which the essentials and principals of ECTS are stated. ECTS was further developed by the TUNING project (2004).

The aim of this project is to standardize and tune the educational structures in Europe. The European Commission in finally supported the development of ECTS by appointing a group of experts, the so-called ECTS Counselors. This group of experts designed an ECTS Users' Guide which can be found on the EC website. The three overarching objectives of the Bologna process have been from the start: introduction of the three-cycle system (bachelor/master/doctorate), quality assurance and recognition of qualifications and periods of study. In the Bucharest Communiqué (April 2012), identified three key priorities - mobility, employability and quality, and emphasized the importance of higher education for Europe's capacity to deal with the economic crisis and to contribute to growth and jobs. Ministers of Education also committed to making automatic recognition of comparable academic degrees a long-term goal of the European Higher Education Area.

Such statement of a question, the higher medical education of independent Ukraine to return to the solution of a difficult pedagogical task - urgently and systemically to pass from classical methods of teaching of subject matters to post-classical that would allow at catastrophically accruing volume of medical information various organizations' and administrative and medical (preventive, diagnostic, medical, rehabilitation), and also scientific genesis to turn it into knowledge of the student, and the theoretical knowledge received by the same student, to transform to his professional skills and abilities.

The Bucharest Communiqué builds on the Leuven Communiqué of 2009, which established priorities for 2010-2020:

1. Ensuring a quality higher education system
2. Adopting a two- or three-cycle system of study (bachelor, master, doctorate)
3. Promoting the mobility of students and academic and administrative staff
4. Introducing a credit system (ECTS) for the assessment of study performance
5. The Recognition of levels: adopting a system of easily identifiable and comparable levels
6. The Active involvement of higher education institutions, teachers and students in the Bologna Process and student participation in the management of higher education

7. Promoting a European dimension in higher education
8. Promoting the attractiveness of the European higher education area
9. Lifelong learning
10. A European higher education area and a European research area – two pillars of a society based on knowledge.

Covid-19 has been declared as a pandemic disease by the WHO on March 11th, 2020. The disease started in Wuhan province in China in late December 2019. Since that time, the global incidence of Covid-19 disease has increased dramatically. Distance learning of students in conditions quarantine Covid-19. The question of the use of this form of education in medical educational institutions remains controversial. On the one hand, the advantages of distance education are the possibility of teaching a large number of students at once, facilitating the educational process, in the case of teaching people with disabilities, adaptability - learning using modern software and hardware makes e-education more effective, also, usually, distance learning is cheaper than regular education. first of all, by reducing the cost of moving, living in another city, reducing the cost of organizing the courses themselves.

Opponents of the use of distance education in medicine believe that mastering practical skills, which are the main component in training future medical workers, is impossible in this way. However, in our opinion, the use of this form of education in medical schools is not only possible, but necessary.

On February 24, 2022, the Russian army started a war and invaded Ukraine, disrupting the usual life, work and education of millions of people, leading to suffering, injury and death. Many Ukrainian medical students, and especially foreign students, have been forced to switch to distance learning, to which they partially adapted during the Covid-19 quarantine.

Distance E-learning in medical education may represent a suitable alternative to traditional learning to deliver high-quality education. The availability of essential infrastructures and efficient institutional strategies represent a major challenge for integrating distance learning in medical education. Even blended education (i.e. distance and on-campus) is well adopted in different word countries, the effect of distance electronic learning is likely to be revolutionary especially in low-middle income countries.

Distance E-Learning is defined as using computer technology to deliver training, including technology-supported learning either online, offline, or both. It is aimed at the effective construction of knowledge regarding individual experience, practice, and knowledge of the learners and students. Internet-based learning, computer-based learning, virtual classrooms, and digital collaboration all represent different types of e-learning.

The structured, multifactor planning of the educational process and implementation of various forms of staging control were conducted. Based on the standard curriculum and learning plan was created the Working program

that regulates specific activities by teachers and students to achieve as a theoretical and practical knowledge required for this sequence of technological resources and action items using the credit-module system. The calculated threshold standards levels of education (sum of estimates after the module translates the 200-point scale ECTS) and communicated to students to stimulate their enthusiasm for learning to the maximum level.

Main objective of this passive method of training – lectures, is formation of an orientation basis for further assimilation by students of a training material, then when a source in this method of training is the word of the teacher that directly reflects its language of culture pedagogical professionalism. Besides, today lecture - as the passive method of study strengthened by such methods of presentation as an illustration (tables, schemes, presentations and so forth) and demonstration (slides, video movies). (*Rotimi et al., 2017*).

Conclusion

Amid the war period, the majority of the student have participated in distance learning in their medical schools. Further analysis of the non-participating students showed that 6th-year students were the least to be involved in distance learning as the majority of them have completed their academic courses before the war period curfew. Among the 538 students, smartphones were the most commonly used single device in e-learning (35.9%) followed by computers either laptops or desktops (14.5%). Two hundred and sixty seven students (49.6%) utilized multiple devices to access their learning sessions. With advances in technologies and social media, distance learning is a new and rapidly growing approach for undergraduate, postgraduate, and health care providers. Regardless of reported benefits, medical students preferred the blended approach in teaching as distance learning represented a major challenge to acquire adequate clinical medical skills. Satisfaction in distance learning is strongly linked to students' prior experience in distance learning as well as instructors' experiences and interactions. (*Shanahan, 2008*).

Distance E-learning has been proved as an efficient modality of learning in different educational and governmental studies. Data from the Institute of Educational Studies showed that learners revealed a more active attitude in learning when various methods such as electronic books and on-line articles were implemented in the teaching process. Technical and infrastructural resources reported as a major challenge for implementing distance learning, so understanding technological, financial, institutional, educators, and student barriers are essential for the successful implementation of distance learning in medical education on period war.

Recommendations

We recommend using the proposed technologies in the training of medical students for distance on-line surgery education.

Acknowledgments

We wish to gratefully acknowledge the advice and support of representatives and staff Dnipro State Medical University and Dnipro City Hospital #6 in the preparation of our work and this text.

The Importance of Education for Democracy

Ferit Baça

University of Tirana, Albania,  <https://orcid.org/0000-0002-4442-7108>

Abstract: A democratic government, whose power belongs to the people, serves all its citizens equally and protects their natural rights. Its highest priority is to treat and serve its citizens properly and fulfill their interests. In democratic regimes, conflicts and other social issues can be resolved through dialogue, compromise, and consensus between the government and people of a given country to have a better future. In a democratic society, civic education plays an important role in shaping people's values and behaviors, and it cannot be achieved without a stable and developed economy. However, the interest of the human society in education dates back to the dawn of civilization in ancient Greece, when Plato spoke about the importance of education in the development of the state. And, based on his initiative, he wrote at the entrance of the Academy, "*Do not go inside unless you are a geometer.*" Plato's concept of geometry is used to understand a man with a high cultural and scientific level. Thus, the European Enlightenment based on Platonic concepts of education gave it the role and place it deserves among all the professions that develop and civilize people. In ancient Greece, education was not valued as a luxury for a small number of people in the society, but as a right of all citizens. However, in order to achieve the practical goals of education, human society needs to regard it as the most important tool for its development. Therefore, this paper discusses the significance of education in the development of society by enriching it with modern philosophical concepts. The following issues will be addressed: The philosophical essence of education, Education for democracy as a social requirement, The importance of intercultural and multicultural education.

Keywords: Education, School, Democracy, Society, Philosophy.

Introduction

Deep economic and political transformations require the establishment of a developed democracy. However, the development of a democratic society is closely linked to the expansion of its well-being. Social foundations are built on two pillars: the rights and duties of each member of a given society. Every citizen becomes familiar with the protection and implementation of his/her rights and duties because of the deep and sustainable knowledge he/she has about them through education. Furthermore, the "rights and duties" of citizens converge with the protection of their social well-being. The concept of "well-being" encompasses all aspects of citizens'

social lives as well as the path that leads to their social improvement. Thus, social well-being is the only thing that can bring together all of society's individual tendencies, abilities, and interests. However, the achievement of social development is the result of the implementation of human ideas and works of great philosophers such as Socrates, Plato, and Aristotle.

A democratic system embodies many different elements that work together to nurture and sustain a truly developed society. However, these elements are related to the ability of individuals to dialogue, express convictions, make compromises, adapt to new social situations, evaluate actions for the benefit of the common interest, make decisions, and solve social issues. The ability of people to cooperate with one another and find solutions for different issues that may arise in a given society is an important part of the social life of people.

Throughout history, democratic societies have applied and followed new ideas and theories such as those of Rousseau, Montesquieu, Kant, and other philosophers. There can be no social community in the absence of a democratic climate and educational values. These values include both the fundamental and individual norms of society. From the top to the bottom of the social pyramid, everyone is interested in implementing and defending educational values. The most important task of the state is to educate its citizens, particularly the younger generations.

The school intends to standardize some aspects of civic and intellectual education for the members of the society. Thus, it expects students to learn and reflect on their own attitudes and opinions, even if they disagree on a particular issue. Moreover, civic education is a distinct front and a priority for schools, teachers and other social institutions such as family, religion, radio, television, media and government.

Furthermore, the feature that distinguishes a democratic society is that the process of education and civic values are not imposed by force on people. Their transmission and inculcation in young people are closely linked to the selection of the most appropriate remaining means: persuasion and reasoning. Simultaneously, the values of reasoning and logic in education constitute their intellectual synthesis. These values are promoted by both the individual and the society as a whole. Personal values are the result of an individual's intellectual level, which is based on his perception, thought, and idea processing abilities. While, social values are presented as "levels" of representation of an entire society.

A Literature Review

This research paper is the result of extensive reading and familiarization with relevant literature. Besides reading of relevant literature, I also used the reasoning and interpretation methods of existing information on education, taken from various sources. Also, these concepts were analyzed as the only trend for the development of the human society.

The Philosophical Essence of Education

Education remains one of the most important pillars of a society. Generally, education is a form of learning in which the knowledge, skills and habits of a group of people are inherited and passed on from generation to generation through teaching, training and research. Education takes place under the supervision of educators, such as teachers, lecturers, and so on. It can also be done through self-learning. However, any experience that has a formative effect on the path of thinking is valued and considered as educational. Thus, the ideas of Socrates, Plato, and Aristotle were influential in the development of educational concepts and methods, as well as their practical application. They began with the goal of educating a well-prepared and highly valued citizen. Socrates regarded education as a tool for discovering the truth, interpreting knowledge, combating ignorance and becoming acquainted with oneself and others. Socrates used a method of learning that became known throughout history as the *"Socratic method"*. According to this methodology, the teacher asks the students various questions and leaves room for them to judge before giving the answers. Moreover, it is also about fostering debates; it entails testing human knowledge and discovering the truth. Socrates urged young people to think deeply about philosophical and social issues.

In his writings, Plato, a disciple of Socrates, underlined the importance of social education by considering it as essential for the development of humanity. Moreover, He writes in his book entitled "The Republic": *"The aim of education is to illuminate what the child has in his soul. Not just bringing knowledge into the soul, but extracting what is hidden there and directing it towards the soul. Education is the most important social life scheme"* (Plato, 1999, p. 82). Plato believes that education is important for both justice and the state. According to him, education should be divided into stages in which young people are trained in various subjects and prepared to defend the state. Plato's educational scheme is designed to last until the age of 50. This is analogous to the modern concept of "lifelong learning". According to Aristotle, the concepts of education, human nature, habits, and reasoning are powerful forces that must be cultivated by the entire society through education. Aristotle emphasized the importance of education by arguing that knowledge is gained through scientific research and by nurturing individuals' experience and skills.

The views of Plato about education are still relevant today. His ideas aimed at forming the individual as a human being so that he or she could be educated as a worthy citizen of the society. Plato used metal values to support his point, by saying: *"When God created man, He put different metals in his composition. For example, in some people he placed gold, in others he placed silver, and in others, he placed bronze and copper"* (Plato, 1999, p. 109). His idea is clear, and the concept of "metal" refers to the gift of talent, which, according to him, is education that allows people to manifest these talents.

In the Platonic views on education, it is stated that the educational aspect of man is to be a worthy citizen of the state, society and the instruments that make his education possible. Based on Plato's and Aristotle's philosophical points of view, the school is considered as an important institution in the function of the individual and society. It operates through certain rules and norms, and its mission is to:

Educate citizens as members of the state.

Provide professional training.

Introduce an individual's values to the society and emphasize his or her skills.

Make an individual to be aware of his/her individual values.

Train people professionally and provide them with employment opportunities.

However, educational institutions are different from family and religious ones. The school as an institution brings together and works with students from a variety of social, religious, cultural, ethnic and economic backgrounds. Same as any other institution, the school as an institution has its own set of rules and procedures. It allows young citizens to advance to a higher level of education once they have correctly followed the rules and mastered the specified requirements. Thus, the school is a place where children can learn about facts, culture, national history, and patriotism. School educators teach students common languages and communication methods, as well as critical perspectives and thoughts for facing life challenges.

The process of education is realized during our daily life. Through action and experience, we as human beings may create our own level of culture and knowledge. It is about a culture that has the necessary tools to comprehend life and its processes. Active participation in society becomes possible by using these types of tools freely and efficiently. The result of the process of education is the development of a continuous cultural level both personally and collectively. Although the role of the school and the works of various philosophers are quite important in human education, the criterion of truth is found in everyday life. That is why this postulation is passed on through the generations: *"All life is a real school"*. During his early existence, man learned to read and write and was able to pass on inherited knowledge to future generations. With the expansion of knowledge came the need to have an institution of education and knowledge, which became a school. The keys to this education are found in our daily life and practice.

The mission of philosophy continues to be the illuminate life when there is darkness and to resolve social conflicts. Its mission is to end violence and provide solutions, as well as to uphold the rule of law and the truth. As a result, it is never outdated or obsolete to acquire Plato's and Aristotle's philosophical ideas on the need for education and upbringing of the younger generations prior to their coming of age and in running the affairs of the state; it is more important than ever today. The ancient Sophists as teachers promised to provide students with the knowledge and skills necessary for the development of Greek city-states. The primary goal of education, according to Aristotelian philosophy, is to contribute to the discovery, transmission, and application of knowledge. Moreover, Immanuel Kant emphasized: *"Education is the only way to become a man"* (Kant, 2004. P. 14). According to him, human beings as a unique existence can be real humans only through education. For Kant, education, in essence, is the process by which a society passes on accumulated knowledge from one generation to the next. Therefore, in essence, education is the process by which a society develops. Its mission is to dismantle social violence and provide solutions, as well as to understand and implement the rule of law.

Human education is essential in recognizing the values of society, the state, and the culture of people. The real

purpose of education is to guide young people on the right path of knowledge, to give them the opportunity to discover the present in order to prepare for the future, to get them acquainted with the institutions and the responsibility they carry in the service of their state, their national policies, as well as the relations of citizens themselves in the society where they live. Education is the battle of a society that runs on the path of knowing its rules, on the path of knowledge and values, as well as society-state relations, citizen-state relations, and state education.

Education is one of the most important fields in a society and in any social-political system because, through it, developmental values are transmitted to future generations. However, in all historical differences, a primary role is played by the education of society, especially that of the leading elites, which has sometimes accelerated the integration processes and sometimes slowed them down. In this respect, the education of the ruling elites continues to be a priority, which has both accelerated and slowed the integration process. Thus, the integration and strengthening of Albania's political, economic, and military relations are the "propellers" that push the "ship" towards Euro-Atlantic processes. Albanian institutions have a genuine desire and effort to integrate into the European Union, but it is also true that we do not go to Europe to "melt" or lose our national identity. Today, Albanian society offers the world the coexistence of different religious faiths, to which almost all of Europe is vulnerable, while Albania appears to have the golden key. This means that the next generation of Albanians must be well-versed in the culture and all that our people have inherited from generation to generation in the material and spiritual realms in order to pass it on to the next mosaic of European culture. Therefore, education is a process of constant change and reorganization, and its goal is to educate. The educational process should result in the ability to form a continuous formation, both social and personal.

Education for Democracy as Social Requirement

Education for democracy is the ability of a society to recognize and protect its freedom and democratic institutions. It (Education for democracy) should not be just a slogan, but a vital part of the life of people and the whole society. Education is the basis, the foundation of the overall development and future of a democratic and modern society. Thus, a comprehensive education in general, and democratic education in particular, are essential to society and the state because society and the state are governed by the same laws. Through education for democracy, the society is taught to love the state, the nation, to know itself, its responsibilities, etc. In democracy, the society and the institutions that make it up are tools of education and social formation. Therefore, education is still one of the most important aspects of any political and social system because it transmits developmental values to future generations. Moreover, it is about pursuing higher education from the comfort of one's own home, using technological advances such as the internet and the publication of electronic books. Of course, these phenomena of perspective not only represent the cutting edge of modern education but are also expected to play a progressive role in the phenomena of school attendance and its quality in the future. Considering higher education as the top of the pyramid and lower education as its base, we would emphasize the importance of maintaining the interactive relationship between the base and the top of this pyramid.

The purpose of education for democracy is to acquaint young people and the society in general with the principles and values of democracy. Thus, education for democracy is the essence of society; it is the promotion of the values of democracy and their implementation. Education is the foundation on which all moral, family, cultural, political institutions are developed. Democratic principles are the laws of life in a society and a democratic state. They are the pillars and values of that society. A democratic society is a free society, that is based on the principles of equality and justice. Freedom becomes possible when it is protected by laws. Only in this way can all citizens of a democratic decision be guaranteed equal protection and freedom. Therefore, freedom that knows no laws is debauchery; it is degeneration, and false illusion.

The basis of a democratic society is built on the premise that no power, including political ideologies and their leaders, has a monopoly of right. The philosophy of democracy moves and progresses along pragmatist rails. Even the values of theories surrounding them are primarily evaluated by the changes they bring to the society. Elections done in a given state in one period may be free and fair, reflecting the will of the sovereign and the people; whereas in another period and under different circumstances, these same elections may be manipulated or stolen by those in power. However, democratic systems educate citizens about democratic culture. The conduct of free elections becomes a fundamental criterion of their own freedom for them. For citizens of a democratic society, the rotation of powers is one of the essential gears by which democracy and society progress. The development of alternative and developmental ways of thinking is an undeniable value of democracy. Democracy creates equal opportunities for all members of a society.

There can be no social community without shared democratic values. These values emerge as the fundamental norms of a society and the individuals who inhabit it. Leaders and ordinary citizens are both concerned with the implementation and protection of these values. According to Ralph Dahrendorf, "*citizenship is a set of rights and obligations... citizenship is a concrete social function*" (Dahrendorf. 1997, p. 48). The essence of the rule of law is to establish a state in which the rule of law must prevail and all its citizens enjoy guaranteed rights as a result of these laws. Only members of a society who are equal before the law can create a prosperous democracy and society for themselves and their children.

The ethics and culture of democracy are of interest to the entire society. Therefore, the most important duty of the state is to educate members of the society, particularly the younger generations, about democratic values. However, in all aspects of social life, justice must be present and dominant. A democratic society is built on the fundamental concept of justice. Judgment is healthy when it is able to judge and evaluate the truth independently. We all require independent and impartial justice to discover and protect everyone's legal rights. Everyone seeks and desires justice. The desire for justice is an excellent starting point for the study of democratic values in schools and other institutions. The pursuit of justice for all is an unmistakable democratic value. Justice or "the first virtue of social institutions" is the basis of a democratic society. It governs how people behave in their relationships with others. Every individual in different communities has the right to be different and pursue his or her goals to the extent possible, as long as this is done without violating the basic laws and values of the society. The principles of justice require that each individual should have equal

opportunities to be happy and to enjoy other natural rights. This is the way to achieve equality. It must be remembered, however, that no one should pursue happiness to the exclusion of equal opportunities for others. In a democratic society, the government has the right to intervene and protect the rights of everyone to equal opportunities.

However, it is still the duty of every citizen, government agency, and educational institution to strengthen the pluralistic democratic system for the benefit of the present and upcoming generations. Despite the fact that civic education is implemented in all spheres of Albanian society, it is not by chance that we identified the role of intelligence and our country's educational system as a guarantee of accelerating the necessary developments within the integration processes. Thus, a sustainable economy is required for civic education in a democratic society. It is essential, especially in a democratic regime for all citizens to participate in the economic life of their society, but only within the context of freedom. The production, distribution, and exchange of goods and services between people constitute economic activity. Participation in this or that business is determined by market requirements. This is why democratic economic systems are frequently referred to as "market economies". Profit is the driving force behind this economy. Economic freedom or free initiative determines the effectiveness of a market economy. Economic freedom manifests itself in a variety of ways, including the ability to obtain a legitimate profit, the ability to buy and sell, the ability to compete, and the ability to innovate.

The Importance of Intercultural and Multicultural Education

The differences in people's worldviews make us aware of the existence of being different. The advancement of social democracy is one of the primary goals of modern education. The intercultural education system works to overcome differences in a multicultural society's daily life and shared relationships. Thus, this process can be achieved through mutual understanding, respect, and dialogue between groups from different cultures, as well as by providing equal opportunities and fighting discrimination. The essence of intercultural education among different people includes sensitive cultural areas that transmit and nurture friendly feelings between them, such as film screenings, theater performances, the organization of festivals, sporting events, scientific, philosophical, and political conferences, as well as visits to mutual and tourist attractions.

Education is at the heart of social cohesion's identity. It is closely linked to the system of factors that comprise it, particularly distinguishing the world views that nurture the way of thinking, as well as the feelings and actions of its members. It is the semantic differences between people that make us aware of the existence of being different. The educational system must take into account the multicultural nature of the society into which we want to integrate and contribute to the peaceful coexistence of people with different cultural backgrounds. From this point of view, there has traditionally been multicultural education, which allows for the recognition and acquisition of other cultures. It is the duty of every citizen, of state bodies, and of the structures of education and upbringing of generations to strengthen the system of pluralistic democracy.

The foundation of a democratic society is based on free and fair elections. The primary task of educating citizens and other state and social structures should focus on recognizing the democratic principles and norms for setting European standards. It aims at a more significant contribution from the education system to education and youths. Therefore, in dealing with the individual and his character, Lock came to the conclusion that: *"people are equal and independent, and no one should harm another's life, health, liberty, or property"* (Lock, 2005, p. 81). According to Lock, people, on the other hand, are aware of their inherent rights as well as their protection. However, in order to improve their rights and survive, they require an agreement or contract, which they entrust to a sovereign state. Contemporary democracy is representative of the values that free and liberal societies place on the relationship between politics and human rights. However, democracy is a form of government and a way for citizens, particularly young people, to participate in policymaking. Therefore, in everyday life, the most important front remains the education of citizens with a contemporary mentality. This important issue is almost left on the periphery of the work of state and social bodies, or better put, "in a free flow" and spontaneity, which is remembered only in special cases when pressure is exerted by European organizations.

The role of education is also to protect and develop the highest human values, especially equality and the right to live in dignity. Understanding the cultural traditions of different people, their intellectual and spiritual perspectives, their art, music, literature, way of life, value system, traditions, and religious beliefs are all examples of education. Friedrich von Hayek, a well-known political economist, used the phrase *"constitution of freedom"* instead of *"social democracy"*. He meant a set of elements that allowed the individual to coexist with society. Hayek highlights three of the most important aspects of this process. However, Jefferson, Locke, and Rousseau, based on a number of treaties, have been devoted to the individual's and society's freedom, rights, and duties. Thus, as stated in the Declaration of Independence of the American Revolution in 1776, all men are created equal, and further, the Creator (God) endows them with certain inalienable rights: *"There is no happiness without freedom; freedom without self-government; self-government without constitutionality; constitutionality without morals; and there are no such great goods without stability and order"* (Dhamo, 1999, p.24.).

In a pluralistic society, the consequences of globalization may aim to flatten the values and characteristics inherited from popular culture. It is an obvious reality that in our time there is need to outline and formulate theoretical-practical views on the causes of the failure of communist ideology and one of the most powerful philosophical currents of the last century, which had significant consequences and changes in today's human history. However, we cannot avoid the dangers that arise from the use of force and violence to solve problems and conflicts. This is because there is no greater paradox than the development of wars in the name of peace, even if only in the sense of an individual's life or that of the entire people of a nation. The phenomenon of globalization cannot exclude either the format of global culture, both in technological and sociological fields, without excluding philosophy, which can never be closed in the ivory tower but always stands at the forefront of socio-political developments. The imposition of global culture, particularly by the most developed capitalist countries with a consolidated democracy, may not find the right ground and bedrock due to the interdependence

of a number of developments in other fields of science, culture, and production. Every new phenomenon in human society immediately generates groups for and against it. This is because it does not occur immediately, but gradually replaces inherited values. This is the phenomenon of globalization. Therefore, the above issues lead to the conclusion that the mosaic of cultural pluralism should be treated and nurtured as the greatest asset of human society; it only does not endanger any people or nation but also enriches them and raises the demands of democracy to a greater degree.

Ethnocentrism makes intercultural communication and understanding difficult, if not impossible. To overcome these, it is necessary to work in a variety of areas, particularly through the intercultural integration of components in school curricula. This does not mean that we should not work on recognizing our cultural heritage at the same time, or that we should overestimate other cultures in comparison to our own. The Albanian people that live and work overseas develop new concepts and models for the development of small and large businesses, private initiatives, the free market, and the benefits of the democratic system. They return to their homeland to bring their lofty individual and social goals to life. But, from the start, they are confronted with the "mountain" of corruption obstacles that have gripped the public administration and state institutions, making their dreams and plans shrink or appear to fail.

In a democratic society, diversity is a current value. It is influenced by the population's diversity in terms of race, ethnicity, culture, and religious beliefs. At all levels, strata, and powers that exist in a democratic society, diversity remains the most important indicator. Ethnic and multicultural diversity simultaneously improve the quality of a society's democracy by respecting change for the sake of cultural and intellectual enrichment. Respect for diversity should not be regarded as a source of national disruption or a diverse population. In the presence of such a country, state, and population, commitment to universal democratic values remains their common honor, the vital cohesive factor that determines the present and future of this society with vital common interests. Only a truly democratic society is capable of preserving, defending, harmonizing, and respecting internal change and diversity, whether political, ethnic, religious, or multicultural in nature. This harmony is the foundation of this very democratic society.

Conclusion

Education remains one of the most important fields in any society and system, as it is through it that the most valuable knowledge, culture, and values are transmitted. As a result, education and society have a relationship that resembles a communication vessel with mutual influence. However, recently, education has been incoherent not only with countries' social changes, but also with their rapid technological and global developments.

The development of individual human resources and capacities remains the goal of education. Humans are engrossed in the process of the work that they perform on a daily basis. Democracy embodies moral, ideal, and political principles based on social coexistence. Culture is transformed into a means of free and full participation

in joint activities. In this way, it manages to foster social efficiency. The ethical value of democracy is achieving the benefits of social education. The goal of education is to form a reflective thought in order to formulate a hypothesis that will result in a specific attitude. To accomplish this goal, an individual must put his ideas into action and have the opportunity to testify about them. Intelligent learning, which implements the ability to think, is the only way to improve human theories and experiences

The laws of life in a democratic society and state are based on democratic principles. They are the foundations and values of a society. A democratic society is one that is free and founded on the principles of equality and justice. Only by legally protecting liberty can all citizens of a democratic society be equal and free. Democratic systems instill a democratic culture in citizens. The holding of free elections has become a fundamental criterion of their own liberty. For citizens of a democratic society, the rotation of powers is one of the essential gears by which democracy and society progress. The development of alternative and developmental ideas of thinking differently is undeniably a democratic value. Democracy creates equal opportunities for all members of a society.

Abstract: The last few years have witnessed significant integration of technology, particularly Information and Communication Technology (ICT) in both content as well as delivery of business courses in higher education. On the one side, the contents related to technological applications are increasingly expanding the space in business education curriculum while on the other hand the mode of delivery has also been significantly influenced. The teaching of business ethics involves a number of distinct issues, often challenging the educators to plan and deliver the course effectively. The current chapter, which is based on review of literature as well as authors' own experiences in teaching business ethics in university courses, critically examines the role of technology as enabler of business ethics course delivery. The Chapter also provides a framework of how the technology can be used to link the teaching, research and participative community action in enhancing the relevance of business ethics teaching in a given context. The chapter provides conclusions for deans, course leaders and faculty members in order to manage change smoothly.

Keywords: Technology, Business Ethics, Action-Learning, AI, Pedagogy, Education

Introduction

The Arm 2020 Global AI Survey (AGS, 2020) reports a number of benefits of AI, as expected by customers in different areas like automated automobile, healthcare or smart homes, etc. This implies the significant growth in AI-based products and solutions for consumers. Already, we can see the rapidly increasingly penetration of AI-driven solutions in our daily lives. Business application of AI is also increasing sharply in different business

functions and business processes ranging from logistics and manufacturing to customer relationship management and automated complaint handling. However, despite the increasing use of AI, the research on ethical implications of AI does not appear to be at the same pace as its' applications and thus, resulting into many unanswered ethical questions.

The ethical issues related to use of AI in business can be broadly classified in two categories in terms of time horizon: first, the short-term of immediate impact; and second, the long-term impact. These issues must be examined and clearly analyzed by the executives and decision-makers who recommend or decide upon of AI integration in the products, services or in-house business processes. For example, in recent years, many countries have witnessed increasing application of AI-based algorithm in social-media data analytics in influencing the electoral process through customized promotional messages. While the sophisticated technological algorithms have created good results for successful political groups or their respective consulting companies, its' long-term implication is yet to be tested with the time. Similarly, how the increasing use of technology will result into physiological, psychological or behavioural changes is yet another area, which will require significant long-term research and analysis by interdisciplinary research teams and scholars.

In this chapter, we focus on business ethics education in the age of AI. We mainly explores the main ethical issues relating to AI integration that a graduate or executive education participation must be sensitized about. We also propose a framework for effective and contextually relevant business ethics teaching framework that will address the issue of selecting the content as well as the pedagogy in business ethics teaching and research at the time of AI. While developing the chapters, in addition to secondary source reviews, we draw insights based on more than 45 years of combined learning in teaching ethics and moral values to the graduate and executive education students.

2.0 Ethical Issues Linked to AI Applications in Business

The application of AI has both short-term and long-term implications. From the perspective of business, the fundamental assumption in integration of AI is that it will help in enhancing value for business in one way or another. This may help in cost-reduction or enhancing some other benefits for example; precision in quality, speed or efficient customer relationship management. However, the long-term impact of AI on different stakeholders as well as on society and economy, appears to be often ignored.

LaPlante (2019) identifies two main risk areas in context of AI applications which include:

- i. Issues related to the model: Interpretability of the results and transparency in terms of how the results are generated, as this may lead unintentional biases.
- ii. Issues related to the data: Issues related to non-traditional data sources like social media and IoT (Internet of Things) technologies as it may involve data like race, disability status, and religious affiliation, etc.

which may be seen as unethical as well as raises issues related to customer's data usage and privacy rights.

In addition to other wider ethical issues related to impact of AI like job-loss or wealth-inequality, a Kambria (2019) blog article highlights the issues including: Errors and mistakes caused by AI; Self-Learning and updating of algorithm; and Ethical issues in treatment of AI (roboethics).

The ethical issues related to the AI can be classified in three broader categories

- A. AI Interface and Response, which includes the data use, algorithm transparency and consequent undesired and unintentional consequences emerging from application of AI.
- B. Long-Term AI Impact, which may include long-term economic and social consequence due to likely imbalance produced by the increase application of AI like job-loss, wealth inequality, etc.
- C. Limit for Responsible Use of AI, which includes policy making and ethical control on how the AI should be used and for what purpose.

In an interesting article, Jonathan Tarud (2018) observes: "... technologies like this often begin with good intentions. Nuclear technology was developed as a cheap power source, with implications toward people and the environment discovered later. AI represents many great commercial opportunities, but what will be the longer-term effects?"

Therefore, in context of business ethics, the first and foremost issue is to sensitize the managers and leaders about the contextual implication of the AI. One must understand both short-term and long-term issues relating to the use of AI not only related to the business results but also in terms of wider stakeholder considerations and long-term social-economic impact.

Business Ethics – AI Issues Interface from Teaching Perspective

It remains a major question how should the practically relevant and contextualized ethics teaching be planned and delivered. Tripathi (2013) in context of applied ethics teaching summarized the following attributes for an effective ethics course:

- a. Value-Linkage Focus: Should be able to condition the learners' values by harmonizing the desired core managerial values and ethical values.
- b. Holistic Approach: While delivering the anti-corruption issues, the method should be able to relate to the existing functional area knowledge and provide the total picture of the corruption

causes and solutions.

- c. Participatory: Should encourage learners' involvement in the process of teaching-learning.
- d. Context-Specific: Should offer flexibility to customize the contents as per the local demand and need without diluting the fundamental purpose of the course.
- e. Real-Time Knowledge Creation: Should provide opportunity for creating the knowledge contents by synchronizing the teaching and research function during the course delivery.
- f. Internalization: Should facilitate the internalization of the values that would provide foundation for bringing anti-corruption perspective required for managerial decision-making ethical behavior.

Developing and delivering a course with the above suggested attributes require careful planning in terms of desired course outcome, contents and delivery methods. How to decide about the course learning outcome of an ethics course, particularly with focus on degree of AI related content integration is the starting point of a purposeful ethics course in any given context. CTE (n.d., a) suggests that while designing of a course, one should address questions relating to context, desired learning goals, content, methods and assessment. Based on CTE (ibid.), here are some of the suggested questions for consideration in ethics course design:

- What knowledge regarding AI and ethics we want our students to develop?
- Are the intended learning outcomes in terms of knowledge, skills and attitudes relating to ethical considerations of AI are reasonable in the given context?
- How best we can align the content and methods to ensure that the students accomplish the desired learning goals?
- Are learning outcomes linked to theory or skill or both i.e. knowledge about ethical issues linked to AI as well as decision making ability in relation to responsible integration of AI.
- Are the learning outcomes specific, achievable, and measurable?
- The understanding of the context of the course would involve the analysis regarding target learning group as well as the positioning in the programme in which the course is planned to be offered. Some of the important issues regarding contextual issues could be summarized as under:
- Who are my students i.e., executive with experience or fresh graduates admitted to MBA or other Masters' level course?
- Why do they need knowledge about AI and ethics?
- What skills do they need in terms of analyzing and deciding about the ethical implications of AI in the businesses where they may work in future?
- What are the differences within my class in terms of culture, gender and age?
- Do they need to have any pre-requisite skill for learning AI and ethics course?
- What should be level of coverage regarding AI related content i.e., a complete ethics course or a module in the course?

The Taxonomy of Educational Objectives, also popularly referred as Bloom's Taxonomy (Bloom, 1956) provides a framework which educators often use to create learning outcomes, as it not only helps in adequate

coverage of the subject matter but also focuses on in-depth learning which a students should achieve (Anderson & Krathwohl, 2001).

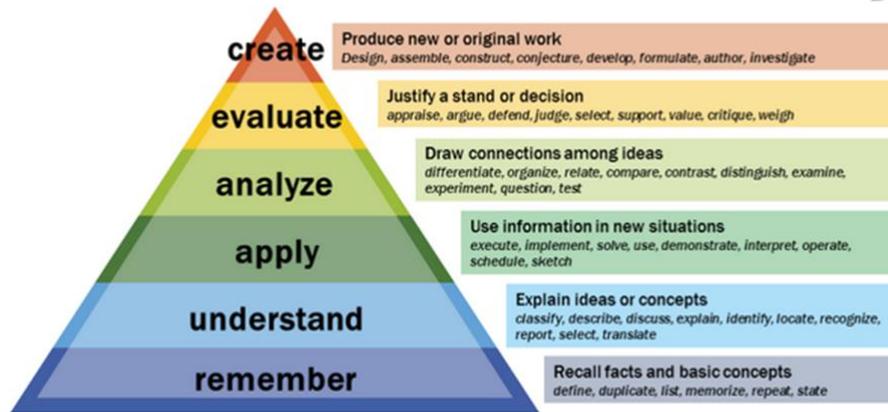

Figure 1. A Conceptual Framework for AI-Ethics Course in Graduate Level Management Programmes

Source: CTEUF (n.d.)

Based on the Bloom’s Taxonomy, the learning outcome for AI and ethics related course can be planned. Depending on the contextual factors, as discussed in preceding paragraphs, the different knowledge, skill and attitude related outcomes can be conceptualized. Some of the suggested outcomes as per the different levels in Bloom’s Taxonomy, and with special emphasis on AI and Business ethics, are presented in Table 1.0. The AI related ethical analysis involves both the theoretical foundations in ethics as well the analytical, decision-making skills in application of ethical theories in the given context. The student, at advanced level of learning, should also be able to create the solutions for ethical and responsible integration of AI in the given context.

Table 1. Examples of learning outcomes related to AI and Ethics

Bloom’s Taxonomy Level	Example of AI and Ethics Learning Outcome
Remember	Ability to display foundation level knowledge related to ethics theory
Understand	Understanding of ethical issues involved in integration of AI
Apply	Ability to apply the different ethical approaches to identify possible consequences of AI integration in the given context.
Analyze	Skills in analyzing ethical implications (using different ethical approaches) of AI integration in the given context.
Evaluate	Ability to critically examine the different types/ levels of AI integration in the given context
Create	Develop a solution for responsible AI integration in the given business context.

Reeves (1990) links the Cognitive and Affective domains of Bloom's Taxonomy (Bloom, 1956, op. cit.; CTE, n.d.,b) to teaching of business ethics. The article (Reeves, 1990, op. cit.) explains the six levels of the cognitive domain and illustrate how the six cognitive levels might be used and tested in the classroom using six-steps case method. Upon deciding the course outcome, the content of the course as well as the pedagogy can be decided in view of the target learning group characteristics, course positioning and other contextual factors.

A Framework for Business Ethics Education with AI Perspective

The business ethics course development requires a holistic perspective in terms of understanding the contextual issues. The ethical implications of relatively new innovations like AI are yet to be tested over time, which will set the direction for slow evolutionary changes. Constant adaptations will be key.

The immediate effect of the AI integration on the different stakeholders must be analyzed carefully. This is quite evident that the AI integration will influence the different constituencies and stakeholders with varying intensity. The varying influence on stakeholder groups remain one of the main issues in analyzing ethical impact of the AI. If one stakeholder group is benefitted at the cost of another stakeholders' loss, how to balance or optimize the benefits? This is particularly challenging when we apply ethical approaches that suggest 'zero tolerance' on ethical compromise. It is not always the situation of 'utilitarian' consideration and, therefore, the ethical analysis of AI application becomes a very important as well as sensitive issue. In view of the importance the first major decision regarding ethics and AI course is linked to the broader purpose of the course, which will eventually be influenced by the contextual factors as discussed in the preceding section.

Once the purpose of the course is agreed, its' positioning within the programme needs to be decided. One can integrate the ethical issues in every course of subject of study or one may design a complete stand-alone course on ethics and AI integration. Based on the positioning and preferred format, the course learning outcomes as well as other related decisions can be made. One important issue related to the AI and ethics is the lack of research-based information regarding the ethical implications of AI, however, this can also be considered as an opportunity in course design with active action-learning and research components. The integration of research will not only help in developing better understanding about the ethical issues in AI use but will also support the knowledge creation on the issue. A suggested framework for AI and ethics course development in business programmes is conceptualized in Figure 2.0 below.

The research component can be integrated as a part of learning methodology and can be linked to coursework assessment. Making the research as a continuous formative assessment component will help in enhancing the action-learning. This will also help in creation of evidence-based contents related to the course topics and the same can be used in classroom. The integration of the research as an embedded process will help in co-creation i.e. students will be participating in building the knowledge while at the same time learning for the desired course outcomes.

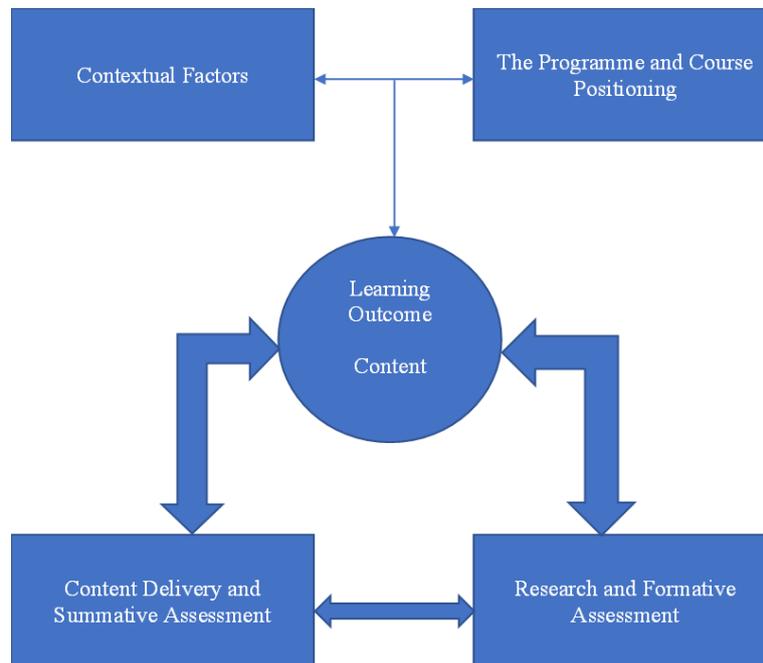

Figure 2. A Conceptual Framework for AI-Ethics Course in Graduate Level Management Programmes

The class-room delivery of the course, which can be linked to the course-end assessment or summative assessment, also needs to be planned carefully. While integration of teaching with the research through action and experiential learning will make the learning quite innovative, the class-room delivery methods should also be participative and as well as engaging. For example, the students can be given group tasks and projects involving ethical reasoning and decision-making related to different AI integration situations.

The stakeholder impact analysis part could be covered through field research or secondary research. Given the increasing use of technology in research activities, the participants can be effectively engaged in stakeholder research even without visiting the stakeholders and organizations physically. /use of innovative and tailored pedagogy would be critical in the success of the course in terms of the level of learning outcome accomplishment by the students.

This is important that course should be revised every time with the new group of students. The students are major influencing contextual factor. Given the highly research-intensive nature of the proposed ethics course, the tailoring of the course to the participating student characteristics will help in enhancing the course impact significantly. The suggested framework is conceptual in nature. The framework is neither prescriptive nor it is sequential, i.e., many activities related to course planning can be undertaken simultaneously.

Conclusions

The increasing use of AI is giving rise to many ethical concerns in the society and economy in general. It has been observed that the AI can be integrated both with the product/ service or in the process of the business. Irrespective of where and how it is used, the integration of AI triggers many ethical issues. In addition to other factors, the ethical issues related to AI can be due to algorithm, patterned learning by the machine or the use of private data. Depending on the degree and context of AI integration, the impact would be varying on different stakeholders and, therefore, optimization of positive stakeholder impact is one of the primary concerns in the ethical analysis of the AI integration.

Due to the importance of the theme, it is proposed that AI and Ethics course should be integrated with graduate level management programmes. Although, the content and pedagogy of the course would change according to context and programme positioning, a conceptual framework has been proposed to systematically design and deliver a contextualized ethics course in the given context. The framework suggests application of Bloom's Taxonomy in course learning outcome design. Also, the research and teaching is proposed to be aligned to foster the knowledge co-creation on the subject theme.

There is an additional layer of implications and conclusions. It raises the question to what extent faculty members and their institutions have the skills to readily master such course design and curricula adaptation processes? Two further considerations matter. First, is a course design or redesign also used as an opportunity to create an innovation which is merely me-too or cutting-edge? The process of designing and redesigning courses should, therefore, be linked to the overall strategic positioning of the school as either a thought and quality leader or an efficiency-focused, reactive institution. The latter may well differentiate in either dimensions or focus on an operational model which lower ambitions. Yet, there is a need to for any course designer to understand the bigger organizational context.

If there is ambiguity in this regard, faculty members and program directors have unique opportunity to create 'pocket of excellence', i.e., an area which may well be ahead of other departments or teams in the organization. A fresh course design could inspire others to uplift the quality of their offerings, which in turn could foster a culture of innovation and constant and never-ending improvements. In this context, it helps if faculty members and course leaders are fully aware of their own strengths and aspirations.

Organizations should not keep them too busy to notice what aspirations and talents exist. Mere busyness does not productivity as it could also signal a mere lack of capacity. What applies to course participants and graduates in terms of the obligation to develop self-awareness, also holds for faculty members and course leaders. They have agency to not only understand themselves better but to carry out a certain job crafting to shape the workplace, at least to some extent, in a way that is most conducive for them.

This has implications for business school and higher education governance. Deans should ensure the institutions

have a clear winning recipe in place, i.e., a solid understanding what the unique contribution of the institution is and how to win in a marketplace relevant to them. This includes idea on how graduates and researchers can win, too. Next to ensuring an institutional strategy exists, organizational governance must add value. The helm of the business school, or more generally put the helm of the higher education institution, must add value. Key questions for reflections include the following. What is currently at stake and is the current organizational leadership and institution overall effective in mitigating any threats while securing opportunities?

If this is not the case, deans ought to adapt their roles dynamically. In terms of AI, there are tremendous upsides and downsides. If we merely advance technological capabilities in societies without clarifying responsibilities, we miss opportunities to construct a better future. Deans should equally explore to what extent there are talents on board which need empowerment and decentralization to not only stay motivated but also add their own value and self-actualize. Talent management is not just a key responsibility for leaders in the corporate world. Also business schools and management education are fields in which talent attraction, motivation and retention matters significantly.

COVID-19 represents a period for many countries and institutions, which may well have been without precedence. Digitalization efforts often saw boosts, while internationalization of student bodies slowed down. International travel and face-to-face networking possibly catalyzing research got inhibited. COVID-19 was a critical event in the development of institutions. Naturally, past approaches to operational models had to be revisited. It is in those moments of critical events, during which institutions could trigger change more easily. Therefore, from a change management point of view, institutional leaders should reflect on their own change management acumen and monitor what the best conditions for organizational change are.

In the context of AI, a special summit, a social media-friendly dialogue between powerful CEOs arguing about AI, a breakthrough innovation, or a scandal in the news could ensure the relevant attention and awareness to bring about change. Change leaders then merely need to ensure the necessary sense of urgency in their organizations and units in order to trigger effective change with a lasting impact. In other words, critical events can represent unique opportunities to orchestrate change. Once more, the self-awareness of a change agent's transformation skills should be identified proactively and within business schools or higher education institutions, such change acumen should equally be built proactively.

In addition, it is essential to clarify how emerging ethics courses link to the other parts of programs. Pure ethics programs as a stand-alone offering may well entail limited commercial success and would not allow for a truly holistic education. Ethics courses should not be isolated in a program. They should not be perceived as an artificial ad-on. In turn, ethics courses should be fully integrated into a curriculum. It should be a natural element of a high-quality program to reflect upon not only knowledge but the skills needed in order to bring management and AI solutions to life. It should make sense intuitively that beyond knowledge and skills, courses address the being and becoming level.

Being allows for discussions on what type of leader or manager someone aspires to be. Nowadays, a number of psychometric tests exist to find out more about essential values in life and what genuine strengths exist amongst diverse talents. Case studies, YouTube videos, exercises, and simulations can equally help clarify one's values and skill levels already in place to deal with ethical dilemmas. Academic networks, such as the Academy of Management, offer a plethora of experts and resources on how to construct relevant, high-impact learning interventions. Faculty development workshops exist in different parts of the world as well. There is no excuse for not embarking on a learning journey on how to construct unique learning journeys – at reasonably low cost.

Moreover, the becoming level of learning fosters a dialogue about the growth trajectories over time. Like organizations and other organism in nature, course participants must understand how to evolve further over time in order to best cope with environmental complexity. Not everyone is likely to be born with the sufficient skills to direct AI projects with mitigated ethical dilemmas. There are project management skills to be mastered, communication skills to be added, and complexity skills to be honed. If participants of courses and graduates know how to be a role model team member, team leader and project director, they can add the right value at the right point in time.

Finally, the core point of our conclusion is the link of opportunities to change with the responsibility to trigger them. It is in business schools and higher education facilities where current and future leaders are educated. This is where their normative programming takes place. Once working on AI strategies in their companies, they might not have the time for deep reflections on ethics. Gaining clarity about what business must accomplish and who drives positive change must be discussed and clarified in the formative years. This helps avoid that the complexity of ethical discussions across value, process, and outcome ethics does not overwhelm when in frantic action.

This does not mean that learning stops with the end of a course or program as life-long learning will be inevitable. Yet clarity on what and how to develop as for the next skills can offer value. Institutions must understand in this context that not all learners are equal. Some learners like and even insist they drive their own learning from a control and decision-making perspective. Others are more open to others influencing their journey. Faculty members must move beyond a one-size-fits-all approach to managing learners and programs.

There is substantial potential in simplifying ethical discussions by deciding to have humanism as a North Star. Humanism in business simply inquires if a solution and an individual foster human dignity as an outcome of action? Of course, any solution should contribute to efficiency and effectiveness but should do so with an eye on protecting and furthering humanism in business. Human dignity has somewhat of a local connotation and, therefore, must be interpreted in each context individually. Yet doing so improves the quality of decisions and actions.

Abstract: The effective anti-corruption education requires careful understanding of the teaching-learning context. At the different stages of the designing an anti-corruption focuses course, we need to consider factors related to target learning group as well as the respective context in which they are. Learning style versatility is an important factor that needs to be analyzed for an effective and outcome linked course in Anti-Corruption. The emergence of artificial intelligence provides significant opportunities in improving the outcome-focused course design. Automating the identification of learning style versatility of target learning group can simplify the process of customizing the course contents, pedagogy and assessment framework for the given learning group. The article is conceptual in nature and provides a generic framework for applying artificial intelligence (AI) in developing the anti-corruption course, tailored to the target learning group characteristics. The suggested framework can be adapted under the different teaching-learning contexts, as per the need. The anti-corruption is an extended and applied area of ethics and, therefore, the framework can also be extended in developing course modules related to other similar themes.

Keywords: Anti-corruption; Artificial Intelligence (AI), Ethics, Learning Style Versatility, Course Design

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 152-161), Cappadocia, Turkiye. ISTES Organization.

Introduction

The main tasks in any course curriculum design includes the three broader stages: defining the course learning

outcomes; identifying the content sources; and setting the pedagogy. All these three stages require careful analysis of the target learning groups and a number of other context related variables. The analysis of learning style is one among the important factors that play important role in the curriculum development. The same steps are applied in the curriculum design and development in any of the courses in higher education, however, the focus on a particular stage could vary depending on the nature of subject, level and purpose of the course.

The course delivery and assessment are the part of implementation and once the designed course is ready for delivery, a number of contextual as well as target learning group related factors also becomes important for effective implementation. With the help of AI, many of the tasks related to course design and delivery can be simplified. While proposing the AI applications, we mainly aim to develop the mechanism where AI can complement the faculty/expert efforts and simplify the selection, analysis and feedback with right kind of data use. In next sections, we will be more specifically exploring the following dimensions in relation to anti-corruption education:

- a. Identification of different factors that influence the course design and delivery
- b. Analyzing the role of Learning Style Versatility (LSV) in effective curriculum design and delivery.
- c. Identification of possible AI application areas in course development and delivery.
- d. Suggesting a generic framework for AI enabled course development and delivery framework.

The analysis undertaken in the chapter is purely based on the secondary data sources. Most of the insights have been drawn from the published literature by experts or credible agencies. The application areas for AI has been suggested to improve the process, however, the chapter does not provide any technical details for designing the AI applications, as it is beyond the scope.

Factors Influencing Curriculum Design and Delivery

There is no universally acceptable model for standardized course development. Universities and institutions of education have suggested different frameworks which are often adapted in the process of curriculum development under any given situation. It is important to note that broadly the steps suggested in different frameworks are similar or quite related. For example; The Centre for Teaching and Learning, University of North Carolina, Charlotte suggests seven stepped approach for curriculum development. Adapting these steps in context of anti-corruption education, the following are the steps (UNCC, n.d.):

- A. Deciding expected learning goals for target group (Goals)
- B. Identification of best teaching approaches for anti-corruption (Methods/ Approaches)
- C. Identification of assessment for learning/ testing the progress (Assessment Tools)
- D. Availability of Time and Space (Duration)
- E. Availability of Technological Tools (Technology)
- F. Learning Sequence Planning (Order)

G. Experience based reflections for improvement (Reflection)

There are different considerations in designing an effective course curriculum. The analysis of learning styles of the target learning group is considered to be an important consideration in curriculum design. However, in addition to the learning styles of the target learning groups, there are other variables also that must be taken into account while developing an effective ethics teaching plan (Sims and Felton, Jr., 2005). Teaching anti-corruption is a part of applied ethics education, the following factors can be considered in designing effective teaching strategy:

F1: The learning styles of the members in target group (Learning Style)

F2: The nature of the ethics learning task (Nature)

F3: Target group's level of readiness for learning ethical concepts (Preparedness)

F4: Previous experience and knowledge in area of Anti-Corruption/ ethics (Relevant Knowledge/ Experience.

F5: The personality related factors of both students and teachers (Personality)

F6: The personality of other learners in the target group (Peer)

F7: The political ethos of the institution, including department/ school where the anti-corruption course is to be taught (Institutional Ethos)

F8: Dominant values and traditions of the culture, which the students belong to (Cultural Context)

F9: Balance between the active engagements of students with issues in real-life situations (Relevance);

The steps for curriculum development (A to G) and the important factors/ considerations in the curriculum development (F1 to F9) are the two main dimensions for developing the initial course map. Combining these two dimensions will help in developing the initial check-list for identification of the relevant issues. The process has been described in the following section.

Developing Initial Course Framework

The Exhibit 1.0 presents a 7 X 9 matrix which can be used as a check list for development of an effective anti-corruption curriculum. The specific requirements for each combination of the matrix could be highlighted. However, before mapping it as the larger matrix, as suggested, the specific combinations of the relevant factor-steps can be identified in the given context. Once, the check-list is confirmed, the requirements of the curriculum can be analysed in consultation with the different relevant experts and other stakeholder groups like target learning group, industry and organizations including NGOs, sponsors (mainly in case of customized executive programmes), regulatory bodies, etc.

Wherever, the secondary sources benchmarks are available, the same can be considered unless there are specific contextualization needs relating to the design and delivery of the curriculum. This is important to note that use of the term matrix here is in general sense to present a two-dimensional analytical table, not exactly the matrix comprising numbers. Based on the above the two main steps for anti-corruption course development would

comprise of: First, the checking of relevant Step-Factor map combination; and second, the detailed analysis of the specific requirements for given combination of the Step-Factor. Based on the analysis, the following elements of the desired course can be presented in the given template (Exhibit 2.0).

Exhibit 1.0: Initial Course Mapping Checklist

Steps in Course Development	Considerations in Course Development								
	F1	F2	F3	F4	F5	F6	F7	F8	F9

Course Description	<ul style="list-style-type: none"> Does it provide specific description of what the course intends to achieve?
Course Learning Outcomes (COs)	<ul style="list-style-type: none"> Do the COs provide the different combination of knowledge, skill and attitude related to anti-corruption/ ethical situation handling?
Course Contents (Duration)	<ul style="list-style-type: none"> Are the contents/ modules aligned to the COs? Have we adequately defined the distribution of contents to the time available?
Assessment Tools and Duration	<ul style="list-style-type: none"> Do the assessment methods match with the requirements of module learning as the COs?
Technological Support	<ul style="list-style-type: none"> What are the technological tools available to enhance the effectiveness of learning, delivery and assessment?
Innovative Pedagogical Methods	<ul style="list-style-type: none"> Are we using any innovative pedagogical method which is aligned to the target learning group characteristics?
References/ Support Material	<ul style="list-style-type: none"> Are available reading/ learning materials adequate and relevant?
CO Achievement Methodology	<ul style="list-style-type: none"> Have we defined how we are going to measure the accomplishment of the COs for the proposed course?

Learning Style Versatility (LSV) and Anti-Corruption Curriculum

The recent research shows the importance of Learning Style Versatility (LSV) in effecting teaching and learning. Learning style versatility (LSV) can not only help in better learning performance but also helps institutions in innovating, making education relevant and ensuring better return on education (Amann, 2021). LSV can be used for effective customization of contents and course-delivery.

The concept of LSV is based on the learning styles suggested by Peter Honey and Alan Mumford who suggested four distinct learning styles i.e. Activist, Theorist; Pragmatist and Reflector (Honey and Mumford, 1982). These different learning styles reflect the different individual preferences or approaches for the learning. The authors suggest that in order to effectively learn, one must know what is one's preferred learning style. However, they also suggest to have versatility in learning styles for effective learning i.e. one should try to be open to other learning preferences as well in order to maximize one's learning outcome (UOL, n.d.).

Extending and testing the concept in context of business and management education, it was found that the learning style versatility can add significantly to learning effectiveness of the target learning groups (Amann, 2021). Therefore, it becomes quite important for the learner and educator both that they try to align the teaching-learning in such a ways that it also creates interest for the learner to expand one's learning style and thus, contributing to enhancing the learning effectiveness at optimum level of efforts. Extending the concept in context of anti-corruption course development and delivery, we can address a number of issues related to the course planning (Exhibit 2.0) and its' delivery.

It is quite evident that under the limited time and scope of any course curriculum, we can not change the learning style of any target group, however, we can try to design the course (content, pedagogy and assessment) in such a way that: fits to the Learning Style Versatility (LSV) of the given target group; and contributes to enhance the LSV of the group through balanced design. We understand that the learning-journey in any course includes variety of different experiences which may be planned or spontaneous, direct or indirect and formal or informal. Understanding the LSV also helps in improving the learning skills of the group as well as the planned learning processes. The Learning Style Versatility (LSV) of the target learning group can be profiled to ensure that the pedagogy, content and assessment strategies for the course is relevant and attractive to the group we are designing for. The use of LSV not only helps in making learning easier but it also makes the learning more enjoyable and effective. Once we understand how the target group broadly learns, the learning opportunities i.e. content, pedagogy and assessment tools can be matched accordingly. Therefore, at the next stage, which would be third step of the process, the learning style versatility of the target learning group can be measured analysed. The next step can be alignment of the content, pedagogy and assessment in view of the existing group LSV. However, it is important to note that before aligning the content, pedagogy and assessment tools, it would be important to subjectively analyse the LSV characteristics of the target group, as the target group may require interventions to enhance LSV for improving the learning experience.

Therefore, the LSV should not only be interpreted and analysed for the entire LSV score rather the trends within the peer-group i.e. understanding the ‘learning style (s) which are more dominating in a group than others’. This is quite important as role of peer interaction and peer-group learning is quite important in any higher education course. Anti-corruption is such a highly contextual theme, which makes the peer-group learning extremely important for the overall course effectiveness. Therefore, it would be important to match the content, pedagogy and assessment with the group characteristics by matching with the LSV as well as the dominant peer-group learning style (s) in the given context. This task can be effectively done with the application of AI, as it can be helpful in eliminating the complexities, improving the accuracy and saving the time in analysis.

Developing Anti-Corruption Course: A Generic Framework for AI Application

The Artificial Intelligence (AI) can be very useful in the curriculum design. The AI technology provides opportunity to learn from the previous experiences. Systematic learning from the prior experience can help in continuous improvement of any course.

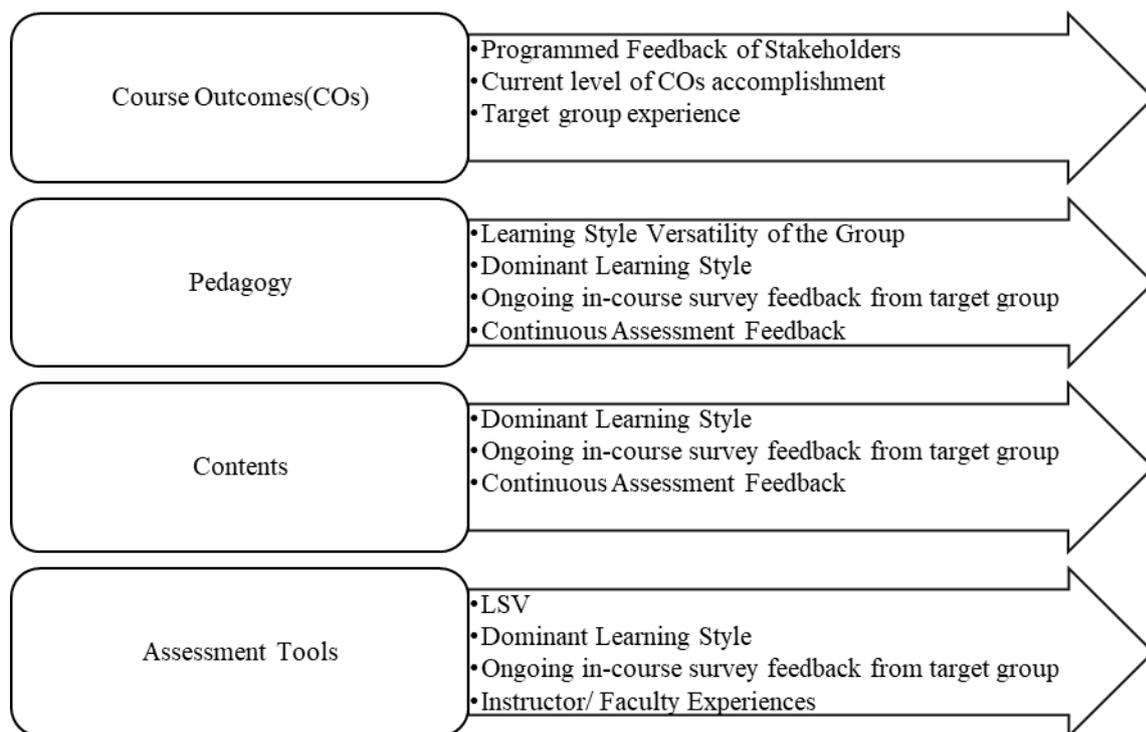

Figure 1.0: Specific Inputs for AI Applications in Different Areas of Course Development

The AI based curriculum development can facilitate improvements across the different areas ranging from course learning outcome to pedagogy selection and assessment design. However, it is important to understand that for specific AI application area, the inputs and sources must be defined carefully in developing the algorithm. Figure 1.0 shows the important areas of AI applications with required inputs and sources. This is an indicative and as per the need, it can be further customized.

Therefore, at the next stage, the input requirements for AI programme development must be specified. The effective application of AI would require interface with the different processes during and after course. This will help in collecting data from the different sources, and suggesting improvements as per the defined algorithm. However, in order to develop an AI programme for continuous improvement in the Anti-Corruption courses, it would be important to define the types of the input information requirements for the different aspects of the curriculum (Figure 1.0). Using the information, the desired improvements in the curriculum can be realized on the real-time basis. Also, it can help in predicting the LSV improvement potential in future cohorts based on the cumulative ongoing and previous cohort experiences in Anti-Corruption teaching.

Combining the previous stages, a generic framework for AI-enabled Anti-Corruption Course Development is suggested in Figure 2.0. The proposed framework for AI-enabled Anti-Corruption course development includes five steps. Each of these steps have been discussed earlier in the Chapter.

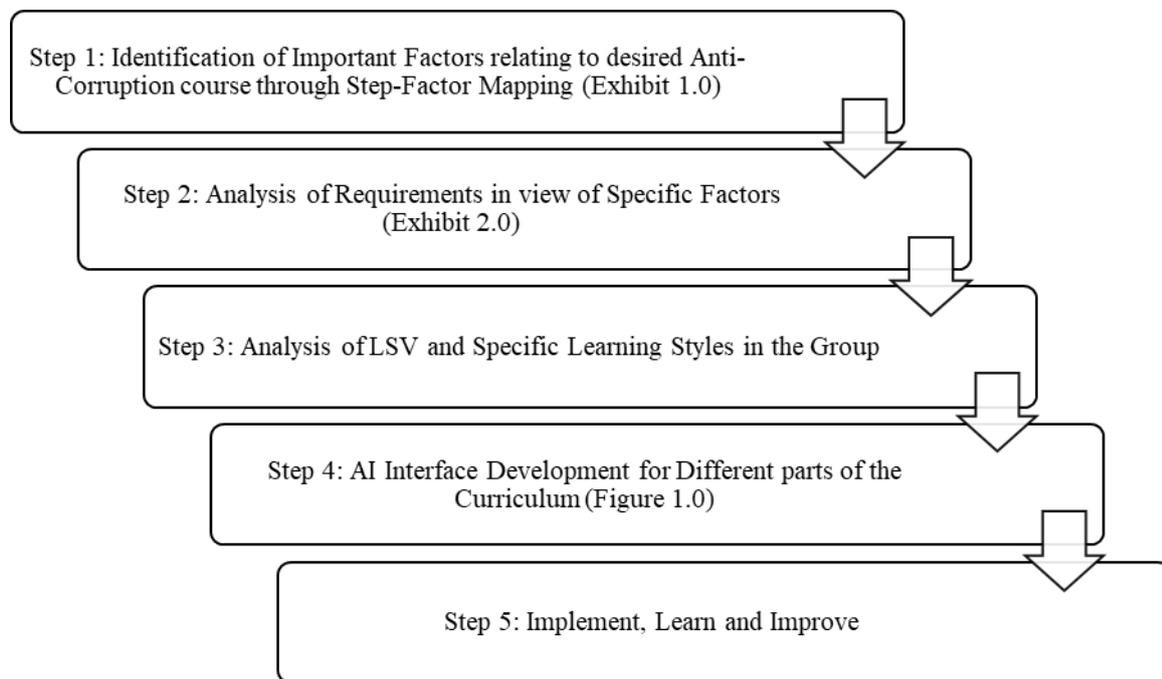

Figure 2.0: Generic Framework for AI Enabled Anti-Corruption Course Development

The AI interface can be planned for both Step 4.0 i.e. the aspects related to Anti-corruption curriculum as well as for entire process (Figure 2.0). The AI applications can also be deployed for the analysis of the specific steps in the framework. Like any other AI system, the effectiveness of the application would depend on the volume of the data and accuracy in defining the input-output relationship. However, the main advantage of the framework would be in terms of its’ potential to offer contextually relevant curriculum with real-time improvement, which is in-built in the process.

The technical aspects of the AI interface are to be developed by the experts in consultation with the concerned

faculty and target learning groups. Once the system is functional, it will provide opportunities for improvements based on accumulative experience of the cohorts. After initial fine-tuning and improvements in the framework, the standardized AI-enabled curriculum development for Anti-Corruption can be developed.

The suggested framework is primarily for the design and delivery of Anti-Corruption course in view of the highly contextual nature of the course. The framework is generic and with little customization, it could be applied to the different courses. The above framework can be very useful for courses, which require high degree of contextual alignment in course outcome, pedagogy, content and assessment.

Consideration in AI-Enabled Course Development

Application of AI in course development requires a number of issues to be addressed. The AI-enabled system complements the conventional course development process by simplifying the data identification and analysis, required for effective design and delivery of the course. The following factors should be considered while developing and delivering the AI-enabled course:

1. The technological support system i.e. AI programme development and its' interface with course process must be closely monitored by the faculty member/ instructor facilitating the course.
2. As far as possible, the real-time improvements should be encouraged, as that is one of the major advantages of using the technology.
3. Profiling of LSV and specific LS should also be done using AI and the output of the system can be integrated with the broader curriculum development system.
4. Regular monitoring of outcomes, contents, and pedagogy and assessment tools is required during the initial phases of the AI-enabled course development system.
5. All the participants and other stakeholders must be sensitized about the technological aspects of the entire process so that the desired feedback and improvements can be realized smoothly.
6. As far as possible, during the initial application phase, the automated results should also be supplemented with manual change option so that in case of an undesired deviation, the corrective action can be introduced by the faculty concerned.
7. The improvements in the curriculum planning and delivery should be based on cumulative learning from the system and, therefore, this aspect requires consideration at the stage of system design.

The faculty members, course planners and AI developments should work closely to develop system for value addition in the teaching-learning experience and the process. In previous sections, we have discussed the main

areas for AI application in Anti-Corruption course design. Some illustrations of how AI can be used across the different dimensions of the course design and delivery process is summarised in the D3 Approach below (Exhibit 3.0).

Exhibit 3.0: Dynamic Course Improvement using D3 Approach

D1: Dynamic Content Selection

Identifying the type of content (case, article, Chapter, etc.) from the already identified pool of resources (Example: PRME Anti-Corruption Toolkit, PRME 2013) and dynamically improving the course contents based on learner's learning style and demiostrated progress in the course. This implies that the course outcome and outline to be defined in the beginning but the process of selecting the contents will depend on the selected variables.

D2: Dynamic Pedagogy Update

This can be an used as real-time feedback driven system. The course facilitator can first select a set of pedagogical tools based on the initial analysis. Based on the learner's performance and need of the topic/theme in focus. the technology interface can be used for integrating the inputs in improving the pedagogy as per the need and context. Application of AI is particularly useful in view of accuracy enhancement with the increasing number of participants.

D3: Dynamic Assessment Improvement

The improvement in the assessment process can also be realizerd using the technology. So far, the feedback obtained through the initial course assessment mainly contributes to performance assessment of the learners, however, using the technology the assessment performance of once cycle can be ased as an input for improving the right assessment methods dufing the next cycle.

Assessment, pedagogy and contents are deeply integrated in designing and delivering any outcome-focused course. It can be seen that the use of technology, particularly AI, can be very effective in integrating these three dimensions for improved learning experience as well as better learning outcome. The integrated D3 approach to dynamic updates can be used and applied for design and delivery of context focused Anti-corruption course. It is important to note that the distinct feature of this approach lies in its' ability to track and utilize the real-time changes for making the learning effective and interesting.

Conclusions

The AI application can improve the relevance and effectiveness of the Anti-Corruption course planning and delivery. The experience shows that the Anti-corruption course, which can be considered as a part of applied

ethics education, is highly contextual in nature. The contextual relevance of the course can be enhanced by providing real-time inputs regarding the requirements in the given context during the course development process. Similarly, the participants experiences can be recorded for real-time improvement during the course delivery.

The Learning Style Versatility (LSV) can be very useful in developing an effective course for Anti-Corruption education. The suggested generic framework for AI – enabled course development and delivery can bring significant improvements not only in enhancing the user experiences but also in making the course contextually relevant and effective. The important feature of AI-enabled course development lies in its' unmatched potential for real-time improvement, which facilitates the continuous interaction of the different stakeholders on ongoing basis with aim of continuous improvement and impact.

Let us be ready for the innovation in the course development though integration of LSV with power of Artificial Intelligence. The framework is generic and, therefore, with some customization can be adapted in different courses, which requires high degree of contextual relevance. However, for developing the concept to practical model, the further consultation of experts in technology and educational instruction design will be desirable.

Abstract: Artificial Intelligence (AI) is now part of the daily lexicon given the widespread adoption of devices based on AI and related capabilities. Several studies suggest that AI has heralded the Fourth Industrial Revolution. The birth of the concept of AI can be traced back to the workshop held in 1956 at Dartmouth College in the United States based on the premise that machines would be invented that would be as intelligent as human beings. Several studies have been conducted to examine the development of AI since the 1956 inaugural workshop. The focus of this paper is to review the development of AI with particular reference to the United Arab Emirates (UAE) given the strategic intent of the government to transform the economy from oil dependency with the deployment of AI initiatives across the Emirates in a variety of industries including the transformation of the governance process in the UAE. The UAE's Ministry of Artificial Intelligence overall strategy is to provide assistance to support various future service, sectors and Emirates-wide infrastructure projects. The ultimate goal is to enhance government performance at every level through the integration of smart digital systems to boost efficiency and effectiveness of administrative, economic and social services.

Keywords: Artificial Intelligence, Fourth Industrial Revolution, Governance transformation, United Arab Emirates

Citation: Lewis, A., Stachowicz-Stanusch, A. & Elshareif, E. (2023). Is the UAE ready for the Fourth Industrial Revolution in the age Artificial Intelligence? Development of Artificial Intelligence in the United Arab Emirates. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 162-171), Cappadocia, Turkiye. ISTES Organization.

Introduction

Given that the concept of Artificial Intelligence (AI) is based on numerous disciplines, there is no singular

definition of AI. The origin of AI can be traced back to contributions from classical philosophers with their attempt to understand how human thinking operates based on mechanical utilization of symbols. Some philosophical contributions include syllogism by Aristotle and Al-Khwarizmi with algorithm (Berlinksi, 2000). Lull developing several logical machines (Bonner, 2007). Other contributors include Leibniz, Hobbes, Descartes and others (McCorduck,2004). Thereafter contributions from the field of computer science building upon the work of several mathematicians. The initial effort focused on programmable computers and code breaking computers (Russell & Norvig, 2003). This phase was followed by the synthesis of various fields such as mathematics, psychology, engineering, economics and political science with the aim of exploring the possibility of developing an artificial brain (Cordeschi, 2002).

There were many stages of development that has led to the current state-of the art in terms of AI. A few definitions given the lack of consensus include: “. . . The ability of a system to act appropriately in an uncertain environment, where appropriate action is that which increases the probability of success, and success is the achievement of behavioral subgoals that support the system’s ultimate goal” (Albus 1991); “Any system . . . that generates adaptive behavior to meet goals in a range of environments can be said to be intelligent.” (Fogel 1995); “Intelligent systems are expected to work, and work well, in many different environments. Their property of intelligence allows them to maximize the probability of success even if full knowledge of the situation is not available. Functioning of intelligent systems cannot be considered separately from the environment and the concrete situation including the goal” (Gudwin 2000); “. . . The essential, domain-independent skills necessary for acquiring a wide range of domain-specific knowledge – the ability to learn anything. Achieving this with ‘artificial general intelligence’ (AGI) requires a highly adaptive, general-purpose system that can autonomously acquire an extremely wide range of specific knowledge and skills and can improve its own cognitive ability through self-directed learning” (Voss 2005); “that activity devoted to making machines intelligent, and intelligence is that quality that enables an entity to function appropriately and with foresight in its environment” (Nilsson 2010).

Kumar (2018) offers the following as possible definitions of AI: “The ability of a digital computer or computer-controlled robot to perform tasks commonly associated with intelligent beings;” “a machine completing the tasks which involve a certain degree of intelligence which was previously deemed only to be done by humans;” “is the simulation of human intelligence processes by machines, especially computer systems. These processes include learning, reasoning, and self-correction;” “the capability of a machine to imitate the intelligent human behaviour.” In addition to the various definitions proposed, Kumar (2018) further classifies AI into two categories: Weak or Narrow AI and Strong AI. Narrow AI applies to machines with limited intelligence but assembled in such a manner as to appear smart. Strong AI on the other hand applies to systems that are capable of thinking and can execute tasks similar to humans.

Alzaidi (2018) suggests that AI represents a field of science that deals with competing possibilities of the modern computer systems in order to solve problems by applying complex human abilities of self-correction, learning, and reasoning. Floridi (2019), posits that AI are artificial agents that can be autonomous, smart,

informed and capable of performing morally significant actions without continuous input by the programmers. In our opinion AI can be simply defined as the system by which machines are capable to perform complex tasks associated with intelligent human behaviors.

AI in the UAE

From an historical perspective, the Smart City (composed of Smart Life, Smart Economy & Smart Tourism) initiative by the Dubai government in 2014 paved the way for the rapid adoption of AI in the UAE (Kressner, 2017). One definition of a smart city is “a community in which citizens, business firms, knowledge institutions, and municipal agencies collaborate with one another to achieve systems integration and efficiency, citizen engagement, and a continually improving quality of life.” Snow et al. (2016). Neirotti et al (2014) suggest that a smart city represents an ecosystem which is largely developed via the effective utilization of technology with the goal of enhancing the quality of life of the citizens by the efficient integration of systems and services. The foundation for a successful smart city include: well-designed information and communications technology (ICT), linked platforms to engage various stakeholders from idea formulation to implementation stage, efficient utilization of data gathered from interfaces with the key stake holders in addition to analysis of big data (Berron et al., 2016).

The UAE embarked on the road to full deployment of AI in 2011 as stated by Sheikh bin Rashid, the Vice President and Prime Minister of the UAE and Ruler of Dubai “we began providing e-government services 16 years ago. Today, we embark on a new phase, embracing AI in the public and private sectors” when the UAE Centennial Plan 2071 was launched in October of 2017. The Sheikh further stated that “we want the UAE to become the world’s most prepared country for artificial intelligence.....the new phase of governing in the UAE will focus on future skills, future sciences and future technology, as we prepare for the centenary to ensure a better future for our generations” (Stepfeed, 2019).

In addition to the UAE Centennial Plan 2071, the stated goal and plan for the UAE is to be recognized as the world leader in the field of AI by 2031. As such, in October 2017, the UAE Government launched ‘UAE Strategy for Artificial Intelligence (AI).’ This essentially signals a new era of governance which will be based on novel delivery of services, sectors and infrastructure projects. This is the first globally expressed strategy pertaining to AI with the aim of:

- achieving the stated objectives outlined in the UAE Centennial 2071 plan
- boosting government performance at all levels
- utilizing an integrated smart digital system capable of overcoming challenges and providing quick efficient solutions.
- Making the UAE the first in the field of AI investments in various sectors.
- Create new vital market with high economic value to boost the gross domestic as well as the gross national product of the UAE.

The UAE 2031 Strategy (About the UAE, May 2019) is directed at the following sectors:

- transport – to reduce accidents and cut operational costs
- health – to minimize chronic and dangerous diseases
- space – to help conduct accurate experiments, reduce rate of costly mistakes
- renewable energy – to manage facilities
- water – to conduct analysis and studies to provide water sources
- technology – to increase productivity and help with general spending
- education – to cut costs and enhance desire for education
- environment – to increase forestation rate
- traffic – to reduce accidents and traffic jams and draw more effective traffic policies.

The AI strategy will be guided by the following five themes:

- the formation of the UAE AI Council
- workshops, programs, initiatives and field visits to government bodies
- develop capabilities and skills of all staff operating in the field of technology and organize training courses for government officials
- provide all services via AI and the full integration of AI into medical and security services
- launch leadership strategy and issue a government law on the safe use of AI.

Another substantial addition to support the AI initiative is the creation of a Ministry for Artificial Intelligence and the appointment of His Excellency Omar Bin Sultan Al Olama as the Minister of State for Artificial Intelligence further showing the commitment of the UAE to comprehensive deployment of AI. Sheikh Mohammed bin Rashid Al Maktoum, Vice President and Prime Minister of the U.A.E and Ruler of Dubai stated that “we want the U.A.E. to become the world’s most prepared country for artificial intelligence,” said in a press release. He added that the new phase of governing in the U.A.E. will focus on “future skills, future sciences and future technology, as we prepare for the centenary to ensure a better future for our generations” Forbes Middle East (October 2017).

The UAE in furtherance of AI deployment/development has opened the first of a kind university – The Mohammad Bin Zayed University of Artificial Intelligence in Abu Dhabi which will be ready to receive students by September 2020. The university will only offer AI graduate programs at the Masters and PhD level in a variety of AI subfields such as machine learning, Computer vision and natural language processing. The UAE is in the process of introducing Project Oyoon based of thousands of interconnected surveillance cameras utilizing AI and machine learning to track criminals. There are also plans to deploy a variant of the technology to airports which will result in the phasing out of immigration officers (The National, 2018).

In October 2019, Dubai launched the world’s first Artificial Intelligence fatwa service. The platform will issue fatwas (Islamic rulings on religious matters). This service will replace the need for Islamic scholars answering questions over the phone. Table 1 below present a summary of AI milestone in the UAE.

Table 1. United Arab Emirates (UAE) Artificial Intelligence (AI) Milestones

DATE	INITIATIVE	PURPOSE
Dubai (2011)	Artificial Intelligence Deployment	Providing E-Government Services
Dubai 2014	Dubai Smart City	1. Employ AI capabilities to make Dubai more efficient by revolutionizing the way its residents and visitors live, work and play as it strives to become the world's smartest city by 2021. 2. Eliminate all applicable paper transaction by 2021.
UAE 2017	UAE National Artificial Intelligence Strategy 2031	For UAE to be recognized as the global leader in the field of AI by 2031 based on novel delivery of services, sectors
UAE 2017	UAE Centennial Plan 2071	The goal is for the UAE to be the best country in the world by 2071. The vision's objectives also include the development of education, with a focus on advanced technology and engineering, and instilling an Emirati moral values system in future generations" according to Shaikh Mohammad Bin Zayed Al Nahyan, Abu Dhabi Crown Prince and Deputy Supreme Commander of the UAE Armed Forces
UAE 2017	Ministry of Artificial Intelligence	Co-ordinate AI efforts in the UAE. The Ministry will invest in advanced technologies and AI tools that will be deployed in all fields of work and ensure the government's overall performance in terms of efficiency and effectiveness. The Ministry will also implement laws and legislation to govern AI in the UAE. The Ministry of Education and the Ministry of Higher Education will also work as partners in the areas of Scientific Research, National Curriculum and training people for the AI environment
UAE 2018	UAE Project Oyoon	The UAE is in the process of introducing Project Oyoon based of thousands of interconnected surveillance cameras utilizing AI and machine learning to track criminals. There are also plans to deploy a variant of the technology to airports which will result in the phasing out of immigration officers.
UAE 2019	UAE Citizenship	Official grant of UAE citizenship to an AI powered ROBOT named "Sophia." Sophia is capable of humanoid thinking that can communicate through human speech with real life facial expressions.
UAE 2019	University of Artificial Intelligence- Abu Dhabi	The UAE in furtherance of AI deployment/development has opened the first of a kind university – The Mohammad Bin Zayed University of Artificial Intelligence in Abu Dhabi which will be ready to receive students by September 2020. The university will only offer AI graduate programs at the Masters and PhD level in a variety of AI

		subfields such as machine learning, Computer vision and natural language processing.
Dubai 2019	Dubai AI Fatwa Service	Dubai launched the world's first Artificial Intelligence fatwa service. The platform will issue fatwas (Islamic rulings on religious matters). This service will replace the need for Islamic scholars answering questions over the phone.
UAE 2019	UAE Council for Artificial Intelligence	The Council was established to oversee AI integration initiatives in government departments and the education sector. The council is charged with proposing policies to create an AI-friendly ecosystem encourage advanced research in the sector and promote collaboration between the public and private sectors, including international institutions to accelerate the adoption of AI.
	UAE Building a Responsive Artificial Intelligence Nation (BRAIN)	The UAE National Program for Artificial Intelligence – BRAIN – is a comprehensive and consolidated compilation of resources that highlight the advances in AI and Robotics, with special emphasis on the UAE's policy objective to become a leading participant in the responsible use of AI and its tools, globally.
	UAE AI CAMP	The intent of the camp is to empower the next generation to be in the forefront of AI advances in order to support the UAE economy as well as boost UAE's position globally in all fields in collaboration with leading national and international technology and education companies in both the public and private sectors

Transitioning to the Age of Artificial Intelligence

The advent and deployment of AI has triggered the Fourth Industrial Revolution, adverse employment displacement of human resources (HR) can be expected. Given that UAE has expressly stated the quest to be the global leader in AI, the HR dynamics must also be explored. The First Industrial Revolution (1760-1840) was a period of significant innovations in manufacturing in Europe and the United States although the United Kingdom is recognized as leading the change. This period was marked with significant shift from the agrarian economy to a manufacturing context, overall transition from manual (hand) production methods to machine-based production, chemical manufacturing, iron production, advances in the utilization of steam/water power, development of various machine tools and implements and the transition to the mass manufacturing production (Landes, 1969). The Second Industrial Revolution (1870-1914) covered the period when significant improvements in steel production, electricity generation and utilization of petroleum products triggered several innovations with profound innovations that transformed society. The significant reduction in the cost of steel production allowed extensive railroad expansions and advances in the production of industrial machines (Hull, 1999). The Third Industrial Revolution also labelled Digital Revolution (1950-???) – this era heralded

semiconductors, computing (mainframe and personal), the internet, transition from analogue to digital platforms, demise of mechanical to digital technologies (Rifkin, 2011).

The above three revolutions can thus be summarized as the era of mechanical production to mass production and science to digital revolution. Thus, the Fourth Industrial Revolution, the era of Artificial Intelligence represents a discontinuous era which is not based on extrapolation. The First Industrial Revolution was positive overall in that average incomes rose substantially along with the improved standard of living overall (Lucas, 2002). The Second Industrial Revolution was more disruptive in terms of socio-economic consequences “these were turbulent years that saw labor violence, rising racial tension, militancy among farmers, and discontent among the unemployed. Burdened by heavy debts and falling farm prices, many farmers joined the Populist Party, which called for an increase in the amount of money in circulation, government assistance to help farmers repay loans, tariff reductions, and a graduated income tax” (Digitalhistory, 2016). The Third Industrial Revolution or the Digital Era is giving way to the Fourth Industrial AI triggered revolution. The Digital Era has had profound changes in all aspects of how people work and live. A good summation of the impact of the Digital Revolution era in *The Economist* magazine was thus stated “As manufacturing goes digital, a third great change is now gathering pace. It will allow things to be made economically in much smaller numbers, more flexible and with a much lower input of labour, thanks to new materials, completely new processes such as 3D printing, easy-to-use robots and new collaborative manufacturing services available online. The wheel is almost coming full circle, turning away from mass manufacturing and towards much more individualised production. And that in turn could bring some of the jobs back to rich countries that long ago lost them to the emerging world “(Markillie, 2012, Rivkin, 2011). The Fourth Industrial Revolution (AI era) is unlike the previous three eras due to the disruptive and discontinuous nature of the changes unlike the extrapolative nature of the past. The AI era is predicted to have profound socio-economic changes due to the advent of thinking and learning software and hardware with minimal need for human intervention.

In the past, human direction and oversight was needed to control/influence machines and processes. A survey conducted by the Mohammed Bib Rashid School of Government in 2017 found that more than 91% of Arab internet users were concerned about emerging technologies such as Artificial intelligence, 3D printing, cryptocurrencies and other emerging AI derived platforms. There are also concerns about political-economic, ethical, privacy and security due to these emerging technologies (The Arab World Online, 2017).

An Organization for Economic Cooperation and Development (OECD) brief confirmed that Information and Computing/communication Technology (ICT) has already profoundly changed the nature of jobs and skills as a result of the rate of discontinuous change which translates to skill obsolescence. As such, digital literacy and continuous training is needed to maintain currency by employees (Khaleej Times, 2014). According to a study conducted by the World Economic Forum (WEF) in 2017 found that advanced robotics and AI can translate to substantial profits in various industries but likewise AI is expected to result in job losses of around 5 million by 2020 globally. Furthermore, it was estimated that 47% the jobs in the UAE are at the risk of being automated (WEF, 2017).

Dubai appears to be in the fore-front in terms of AI deployment in the UAE. For example, an AI smart lab was launched in 2017 to train government and private sector employees in terms of utilizing AI in terms of service delivery. It is recognized that AI will make certain jobs obsolete yet humans will still be needed to undertake certain specific relationships with AI in the support role. For example, Dubai has deployed robot police at malls and tourist centers and the ultimate goal is to have a 255 robot police by 2030. Another target of the Dubai Government is to have 12% of city trips to be autonomous in order to reduce traffic congestion and increase safety (WEF, 2017). Dubai has also launched a 3D Printing Strategy with the goal of having 25% of building construction based on 3D printing. The strategy targets three areas such as construction, consumer and medical products.

Conclusion

Dubai constructed the world's first 3D printed office building constructed in 48 hours and printed in 17 days. The project employed one printing manager; installation required seven people plus ten technician and specialists to handle the engineering tasks. It was estimated that this approach resulted in 50% reduction in labor and construction costs (Lifegate, 2017). The Dubai statistics Center estimates that the disruption of this paradigm shift in construction would be significant given that about 30.6% of males over the age of 15 were engaged in the construction sector as of 2016. As such, low skilled jobs will have to shift to higher skilled jobs which will require extensive retraining (Dubai Statistics Center, 2016).

In the education field, a private company in Abu Dhabi, Alef Education is utilizing AI to transform how children learn. They have developed a platform which focuses on core subjects such as math, science and English to custom tailor the curriculum to each student, "We capture millions of data points on a daily basis, a human could not process that many data points," Alef Education CEO Geoffrey Alphonso told CNN. "What we do with that data is we look at machine-learning algorithms that can actually identify struggling concepts, mastery of different lessons," (CNN Business, 2019). Project Oyoon (eyes) will be deployed in Dubai to improve security with tens of thousands of surveillance cameras using artificial intelligence and machine learning to help track criminals. Facial recognition software will track and analyze movements and then issue warnings to suspects. An AI system will be deployed at the Abu Dhabi Airport Midfield Terminal to monitor travelers in and out of the country with the aim of phasing out immigration officers. Visitors will be able to walk through a scanning tunnel that will monitor their gait/physical characteristic in addition to other unique biometrics, such as iris recognition and finger prints, to ensure a seamless transition through airports (The National, 2018).

The UAE is acknowledged as a leader in AI. A report by dubaiadvantage.com (2019) noted that Dubai was ranked No. 1 in Foreign Direct Investment (FDI) Technology Transfer for AI & Robotics and No. 3 in in the Top Global FDI Locations for AI & Robotics. As AI becomes more advanced, the UAE government must align the legal environment to attain necessary congruence. At present, the debate about regulation ranges from a

laissez faire approach whereby the law should evolve responsively as opposed to a strict legal environment which could hamper creativity. There is also the need to effectively manage the employment displacement that will result from the on-going deployment of AI. Perhaps a new work structure such as a 4-day week may become appropriate given the changing nature of work. Stephen Hawking (2014) offered the following comment “everything that civilization has to offer is a product of human intelligence; we cannot predict what we might achieve when this intelligence is magnified by the tools that AI may provide. But the eradication of war, disease, and poverty would be high on anyone's list. Success in creating AI would be the biggest event in human history. Unfortunately, it might also be the last.”

AI has the future in terms of considerable benefits for government, business and economies via its significant contributions to efficiency, effectiveness, productivity and innovation. However, the future research should focuses more on the ethics side of AI and answers the following questions:

- Do we trust AI?
- Should we be afraid of Artificial Intelligence?
- Are we sure that our algorithms do what we want them to do and are aligned with human values?
- How we would like to cope with the fact that AI has no emotions, so it has no empathy as well?
- If artificial intelligence is faster, stronger and smarter than human beings are we still safe in our planet?
- How do we feel with the perspective that several jobs taken by humans will be lost in favor of machines?

Abstract: Leadership in educational settings, especially in schools, has a long history. Instructional leadership is a leadership style that is seen to increase school effectiveness. This study aims to map bibliographic data on instructional leadership over the past eight decades (1941-2022). The quantitative research approach to analyzing bibliographic information using bibliometric analysis was sourced from the Scopus database, which initially amounted to 951 documents, then became 717 documents after the screening process. Hallinger P. is the author with the most co-authorship networks, and the United States is the most co-authorship network on instructional leadership. The article "The Impact of Leadership on Student Outcomes: An Analysis of the Differential Effects of Leadership Types" by Robinson, V. M. J. (2008) is the article with the highest number of citations, and Hallinger P. is the author with the highest number of citations. The author's co-citation visualization of instructional leadership reveals 4 clusters: 1) measuring the instructional leadership, 2) school effectiveness and improvement, 3) the role of the school principal, and 4) leadership for school restructuring, performance, and achievement. The keyword network visualization for instructional leadership reveals 4 clusters: 1) the impact of instructional leadership on school climate, 2) the application of instructional leadership in school settings, 3) the relationship of instructional leadership with the concept of educational leadership in general, and school principals in particular, 4) instructional leadership efforts in developing professional and leadership teachers and teaching and learning processes that ultimately improve accountability. Future research about instructional leadership focuses more on teacher efficacy, school climate, principal preparation, and teacher professional learning.

Keywords: Instructional Leadership, Bibliometric Analysis, School Principal, School Effectiveness, School Climate

Citation: Arjanto, P., Bafadal, I., Atmoko, A., & Sunandar, A. (2023). Leadership Journey in School: A Bibliometric Analysis of Instructional Leadership from 1941 to 2022. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 172-191), Cappadocia, Turkiye. ISTES Organization.

Introduction

Instructional leadership has a positive impact on schools. Effective instructional leadership can create an excellent school (Bafadal et al., 2021); by supporting that facilitates learning for all school community (Hallinger & Hosseingholizadeh, 2020); explaining the vision and mission of the school, guiding teachers in curriculum preparation, and creating a safe and comfortable environment for learning to influence the teaching and learning process in schools and classrooms to improve for all students (Hallinger et al., 2020). Research shows that instructional leadership can create effective learning and teaching activities to create excellent schools. The principal's practice as a learning leader has a significant effect on learning outcomes and student achievement (Jalampang & Raman, 2020), improving student learning outcomes (Robinson et al., 2008) and developing teacher professions and competencies to enhance the quality of learning in schools (Brauckmann et al., 2016; Bush, 2015). The principal works with the teacher and provides feedback on the teaching and learning process in the classroom (Stewart, 2006), in the way the principal exerts his influence on the learning process of students through the practice of teachers (Hallinger & Hosseingholizadeh, 2020). Learning and teaching activities are the main focus and elements that distinguish instructional leadership from other leadership models. Curriculum and teaching management, monitoring and evaluating teacher performance and student development, identifying learning and teaching difficulties, and developing corrective strategies that have an impact on improving learning are requirements of instructional leadership (Alanoglu, 2022); effective school management will create a healthy child or student and a conducive learning environment (Sunandar et al., 2022). Thus, the positive impact of learning leadership carried out by the principal affects teachers, students, and school community. The principal is a dreamer of learning in the school. Principals who take on the most important roles as learning leaders are considered effective principals in the 21st century (Hallinger, 2011). In addition, instructional leadership focuses on the principal's concentration on the teaching and learning process and avoiding time-consuming administrative or managerial tasks (Brewster & Klump, 2005); the principal encourages teachers to make decisions according to student achievement or develop students, not just administrative matters (Stronge et al., 2008). A systematic review reveals that instructional leadership has emerged as one of the most influential models to guide research, policy, and practice in school leadership (Hallinger et al., 2020).

The concept of instructional leadership came to the fore because scholars identified the factors that influence the creation of effective schools. Initially, this concept appeared in the United States based on the evidence that leadership can positively impact student learning outcomes (Bush, 2015) and improve the effectiveness and efficiency of learning in schools (Spears, 1941). Path-goal theory by House forms the basis of an instructional

leadership approach. It is based on the idea that the leader sets goals for subordinates, guides and supports them to achieve the goals already set (House, 1996). Instructional leadership is a form of directive leadership centered on educational activities and transforming schools (Hallinger & Murphy, 1985). It is a blend of expertise and charisma that builds a culture and is oriented toward the school's vision, mission and goals (Alanoglu, 2022). Instructional leadership is directed at the teaching and learning process that results in interaction between teachers and students to achieve curriculum goals (Sim, 2011) in the form of actions taken or delegated by the principal to promote a quality learning process in the school (Mestry et al., 2013). Instructional leadership is a behavior demonstrated by the principal, which directly or indirectly affects teaching and learning (Çalik et al., 2012); to improve teacher performance in curriculum delivery through the learning process (Chabalala & Naidoo, 2021). Therefore, instructional leadership is the principal's ability to lead the school by performing roles and actions that are very important to develop the curriculum, improve teacher competence, and create a positive learning climate for students.

There have been many publications about instructional leadership research conducted in various countries recently such as in di Azerbaijan (Sindhvad et al., 2022) factors influencing instructional leadership capacity; Israel (Shaked et al., 2021) sociocultural norms that make up the principal's instructional leadership; U.S. and Belgium (Urlick et al., 2022) instructional leadership influence opportunity to learn; Turkey (Bellibaş et al., 2022) linking instructional leadership to teacher practices; Kuwait (Alsaleh, 2022) the influence of heads of departments' instructional leadership, cooperation, and administrative support on school-based professional learning; Maldives (Shafeeu, 2022) the Effect of Instructional Leadership on Student Achievement; Malaysian (Awang et al., 2022) influence of virtual instructional leadership on teachers' commitment, (Fred & Singh, 2021) instructional leadership practices in under-enrolled rural schools; China (Liu et al., 2022) instructional leadership related to teacher self-efficacy and student academic performance; Indonesia (Nurabadi et al., 2022) digital principal instructional leadership in new normal era (Puruwita et al., 2022) instructional leadership practices and teachers' job performance at high-performing vocational schools, (Anselmus Dami et al., 2022) principal self-efficacy for instructional leadership in the perspective of principal strengthening training; South Africa (Mestry & Govindasamy, 2021) perceptions of school management teams and teachers of the principal's instructional leadership role in managing curriculum changes, (Malinga et al., 2021) instructional leadership capacity of secondary school science heads of department; Sweden (Liljenberg, 2021) professional development practice to enhance principals' instructional leadership-enabling and constraining arrangements; and many more documents about instructional leadership since it was first published in 1941 until 2022 in international journals indexed by Scopus. However, no document examines instructional leadership using bibliometric analysis. This study aims to map bibliographic data on instructional leadership for the last eight decades (1941-2022).

Method

The authors use a quantitative research approach to analyze bibliographic data related to the literature collection on instructional leadership. The bibliometric analysis aims to explore clearly defined bodies of knowledge

(Kuzhabekova, 2021; Zupic & Čater, 2015), to highlight broad trends in knowledge production and dissemination (Hallinger & Kovačević, 2019), and to identify thematic research trends, and (co)citation analysis to locate the most highly cited researchers (McGinity et al., 2022). The bibliometric analysis leverages the capabilities of the VOSviewer software program to analyze a more significant number of documents when compared to previous review research (Hallinger & Kovačević, 2022). VOSviewer is a program we developed for constructing and viewing bibliometric maps (Van Eck & Waltman, 2010). Thus, bibliometric analysis with VOSviewer is considered appropriate for reviewing documents to reflect on the accumulated knowledge of instructional leadership after 80 years since it was first published.

Identification of documents

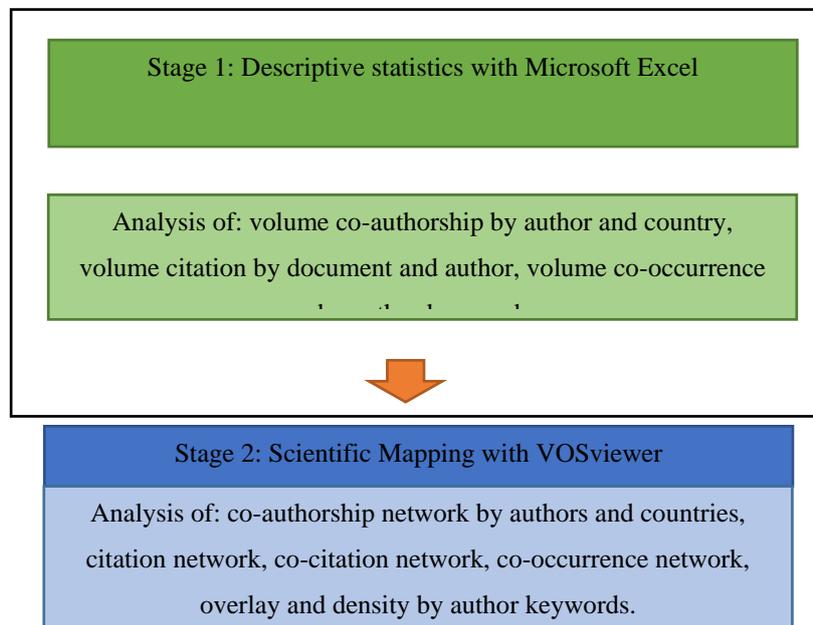

The Scopus index is used to identify published documents about instructional leadership. Authors use keywords TITLE-ABS-KEY ("instructional leadership"). The search yielded 951 published documents on instructional leadership from 1941 to 2022. The author uses the Scopus filter to limit only 'articles' to the document type, "final" to the publication stage, "journal" to the source type, "English" to the language to change the search keywords to TITLE-ABS-KEY ("instructional leadership") AND (LIMIT-TO (PUBSTAGE , "final")) AND (LIMIT-TO (DOCTYPE , "ar")) AND (LIMIT-TO (LANGUAGE , "English")) AND (LIMIT-TO (SRCTYPE , "j")). This led to the elimination of 231 documents. Thus, the final database consists of 720 articles. The bibliographic data is exported from Scopus to MS Excel in CSV format. The database consists of 720 rows corresponding to the document that has gone through the filter process and 54 columns of bibliographic data that describe the features of the document. Then, the author manually checks the database exported from Scopus so that it finds some unqualified documents. Four documents are unqualified because the author data and publication year are unclear, and three documents are unqualified because the document type, publisher, and ISSN are unclear, so 717 documents are obtained for bibliometric analysis.

Data analysis

The author performs two stages of analysis. The first research stage uses descriptive statistics to describe trends related to the volume of co-authorship by author and country, citation by document and author, co-occurrence by author keywords. Descriptive analysis is performed with Microsoft Excel. The second stage of analysis is using VOSviewer version 1.1.18 to displaying maps constructed using multidimensional scaling techniques (Van Eck & Waltman, 2010; Zupic & Čater, 2014). The bibliometric analysis includes co-authorship analysis, co-occurrence analysis, citation analysis, etc., which can be displayed in network visualization, overlay visualization and density visualization (Van Eck & Waltman, 2011).

Co-authorship network analysis is used to identify relationships between authors and between authors' countries. The applicability of co-authorship networks has been regarded for evaluation of research collaborations (HabibAgahi et al., 2022). Citation analysis is used to identify "high-impact" leadership documents. A high number of citations is generally construed as an indicator of 'scientific impact' based on the assertion that other

scholars' ideas in the cited documents have been read and used (Garfield, 2007). Co-citation analysis is used to identify the documents that most significantly influence articles on instructional leadership. When a couple of authors are frequently cited in the same list of references, there will likely be intellectual similarities in the content of their work (Small, 1973). Co-citation analysis is used to calculate the frequency of 'author pairs' cited in the reference list of instructional leadership articles which can ultimately identify the 'intellectual structure' of instructional leadership. The intellectual structure delves into authors, documents, or sources that significantly impact the academic field and help transmit knowledge (Khare & Jain, 2022). Finally, keyword analysis is used to highlight trends in publications. A keyword analysis is used to create a network map that visualizes the relationships between keywords which is then used to highlight the 'conceptual space' that appears in instructional leadership publications (Ding et al., 2001; Zupic & Čater, 2015).

Gambar 1. The bibliometric analysis process of the instructional leadership database

Results

Co-authorship Analysis

The author with the most collaborations with other authors on the topic of instructional leadership, namely: Hallinger P. collaborated with 43 authors, Goldring E. collaborated with 34 authors, Shaked H. collaborated with 16 authors, Bellibas M. S. collaborated with 15 authors, and Neumerski C. M. collaborated with 15 authors.

Based on Figure 1, it is clear that the co-authorship network by author consists of 4 clusters. The first cluster (C1) has the most co-authorship networks, consisting of 70 authors with Hallinger P. and Shaked H. as the

dominant writers. The second cluster (C2) has a co-authorship network of 40 authors with Goldring E. as the dominant author. The third cluster (C3) has a co-authorship network of 37 authors, but no dominant authors exist in this cluster. The fourth cluster (C4) has a co-authorship network of 35 authors with Bellibas M.S. as the dominant author. It can be seen that the dominant authors in each cluster are the top 5 co-authorships.

Table 1. Top 5 Co-authorship by author of instructional leadership, 1941–2022 (ranking by total link strength)

Author	Citations	Documents	Total Link Strength
Hallinger P.	23	1567	43
Goldring E.	10	366	34
Shaked H.	15	79	16
Bellibas M.S.	8	115	15
Neumerski C.M.	4	312	15

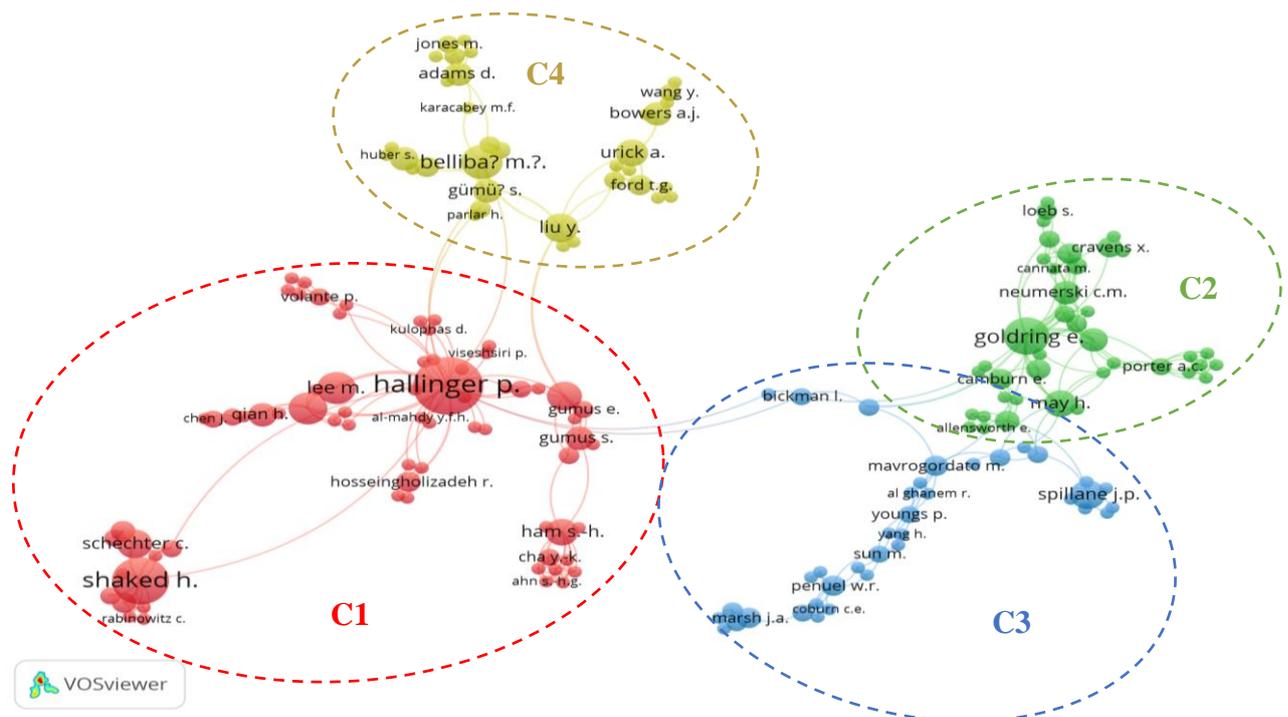

Figure 1. Network Visualization of Co-authorship by author of instructional leadership, 1941–2022

Table 2 shows the countries with the most collaborations with other countries on the topic of instructional leadership, namely: The United States collaborates with 44 countries, Thailand collaborates with 28 countries, South Africa collaborates with 26 countries, Hong Kong collaborates with 22 countries, and Malaysia collaborates with 19 countries.

Based on Figure 2, it is clear that the co-authorship network by country consists of 4 clusters. The first cluster (C1) has the most co-authorship networks, composed of 18 countries with South Africa as the dominant country.

The second cluster (C2) is a cluster with a co-authorship network of 12 countries but there is no dominant. The third cluster (C3) has a co-authorship network of 9 countries with the United States as the dominant country. The fourth cluster (C4) has a co-authorship network of 8 countries with Malaysia as the dominant country. It can be seen that the dominant country in each cluster is the top 5 co-authorship.

Table 2. Top 5 Co-authorship by country of instructional leadership, 1941–2022 (ranking by total link strength)

Country	Documents	Citations	Total Link Strength
United States	344	7245	44
Thailand	21	1022	28
South Africa	49	467	26
Hong Kong	28	565	22
Malaysia	42	211	19

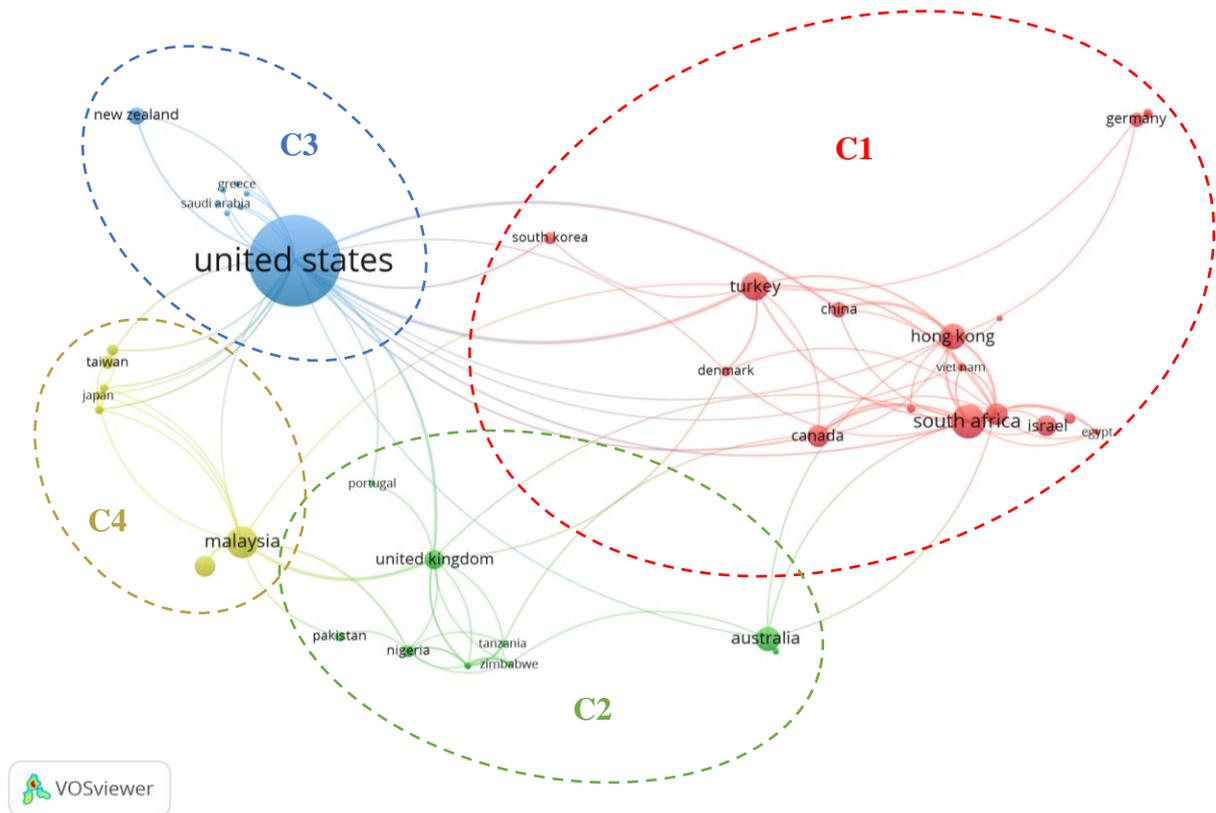

Figure 2. Network Visualization of Co-authorship by country of instructional leadership, 1941–2022

Citation Analysis

The document with the most citations on the topic of instructional leadership is "The Impact of Leadership on Student Outcomes: An Analysis of the Differential Effects of Leadership Types" with a total of 1,032 (Robinson et al., 2008), followed by "Leading Educational Change: reflections on the practice of instructional and

transformational leadership" with a total of 635 citations (Hallinger, 2003), "Leadership for School Restructuring" with 367 citations (Leithwood, 1994), "Teachers sense of efficacy and commitment to teaching" with 350 citations (Coladarci, 1992), and "The Impact of Leadership on Student Outcomes: How Successful School Leaders Use Transformational and Instructional Strategies to Make a Difference" with a total of 274 citations (Day et al., 2016).

Table 3. Top 5 Citation by document of instructional leadership, 1941–2022 (ranking by citations)

Document	Citations
Robinson V.M.J. (2008)	1032
Hallinger P. (2003)	635
Leithwood K. (1994)	367
Coladarci T. (1992)	350
Day C. (2016)	274

Table 4 shows the authors with the highest citations on instructional leadership. Hallinger P. is the author with the highest number of citations at 1,567, followed by Robinson V.M.J. with 1,199 citations, Spillane J.P. with 399 citations, Goldring E. with 366 citations, and Camburn E. with 355 citations. Robinson V.M.J is only four documents but has high citations.

Table 4. Top 5 Citation by author of instructional leadership, 1941–2022 (ranking by citations)

Author	Documents	Citations
Hallinger P.	23	1567
Robinson V.M.J.	4	1199
Spillane J.P.	6	399
Goldring E.	10	366
Camburn E.	3	355

Co-citation Analysis

The author's co-citation map for instructional leadership reveals 4 clusters, each comprised of scholars associated with a particular school of thought. Cluster 1 (C1) is about measuring instructional leadership. Scholars led by Spillane J.P., Louis K.S., and Goldring E. began to apply forms of capital and construction of instructional leadership, measuring school principals' instructional leadership competence and teacher evaluation systems. Cluster 2 (C2) is about school effectiveness and improvement. Scholars led by Hallinger P., Jantzi D., Walker A. dan Hoy W.K. began to apply leadership development for school effectiveness and improvement, program implementation, professional teacher learning, and leader development. Cluster 3 (C3) is about role of the school principal. Scholars led by Murphy J., Harris A., Bush T., Blasé J. and Day C. began to apply to assess and develop the instructional leadership of school principals, and barriers to implementing the

instructional leadership role. Cluster 4 (C4) is about leadership for school restructuring, performance and achievement. Scholars led by Leithwood K., Heck R.H., and Rowan B. began to apply leadership in schools responding to a variety of restructuring initiatives, principals’ instructional leadership and school performance, principal instructional leadership and the identification of high-and low-achieving schools.

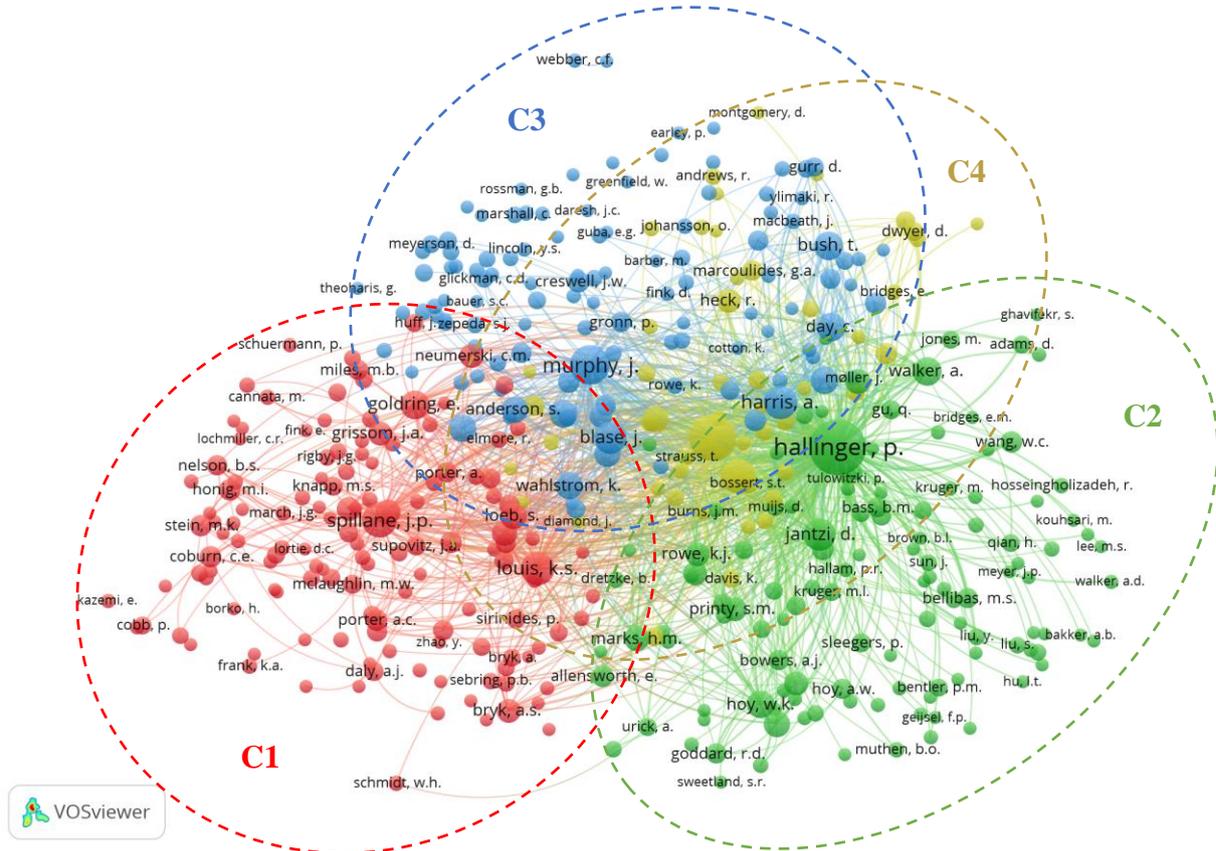

Figure 3. Author co-citation map of instructional leadership, 1941–2022 (threshold 20 citations, display 422 authors).

Co-occurrence Analysis

The most occurrence of keywords on the topic of instructional leadership, namely: leadership, principal, professional development, school leadership, transformational leadership, distributed leadership, school improvement, teacher leadership, management, educational leadership, principal preparation, student achievement accountability, teacher evaluation, and school climate. Other keywords only have occurrences below 11.

Keyword network visualization for instructional leadership reveals 4 clusters. Each cluster represents a subfield of scientific analysis. Cluster 1 (C1) consists of 19 keywords, such as school climate, teacher efficacy, self-efficacy, teacher professional learning, teacher collaboration, student achievement, student outcomes, etc.,

which is the impact of instructional leadership on school climate (Akhir et al., 2019; Dutta & Sahney, 2016; Jalapang & Raman, 2020), teacher (Ma & Marion, 2021; Qadach et al., 2020; Siriparp et al., 2022) and student (Goddard et al., 2021; Kazi, 2021; Rodrigues & Ávila de Lima, 2021). Cluster 2 (C2) consists of 18 keywords, such as school and district management, collaboration, school climate and culture, district-based administration, and administrators, etc. is the application of instructional leadership in a school setting (Kasprzhak et al., 2022; Lingam et al., 2021; Shaked, 2021), district management (Mestry, 2019; Mpundu et al., 2021; Sumintono et al., 2019) and school culture (Gümüş et al., 2022; Ismail et al., 2021; Liu et al., 2021). Cluster 3 (C3) consists of 17 keywords, such as leadership, educational leadership, principals, principal preparation, leadership preparation, and school principal, etc. is a relationship between instructional leadership and the concept of educational leadership in general (Wang, 2011), school Principal in particular (Aas & Paulsen, 2019; Goff et al., 2012). Cluster 4 (C4) consists of 16 keywords, such as professional development, accountability, teaching and learning, teacher professional development, teacher leadership, etc. are instructional leadership efforts in developing professional and leadership teachers and teaching and learning processes that ultimately increase accountability (Blasé & Blasé, 2000; Kim & Lee, 2020; Lee et al., 2012).

Table 5. Top 15 Co-occurrence by author keywords of instructional leadership, 1941–2022 (ranking by occurrences)

Keyword	Occurrences	Total Link Strength
Leadership	68	143
Principal	43	87
Professional Development	35	54
School Leadership	29	68
Transformational Leadership	28	63
Distributed Leadership	24	50
School Improvement	23	48
Teacher Leadership	23	72
Management	15	36
Educational Leadership	14	28
Principal Preparation	13	30
Student Achievement	13	31
Accountability	12	34
Teacher Evaluation	12	26
School Climate	11	44

The items are colored differently based on the year of publication. Based on Figure 5, shows that the topic of instructional leadership today (in 2020 and the future) is more focused on teacher efficacy (Siriparp et al., 2022; Sukarmin & Sin, 2021; Thien, Lim, et al., 2021), school climate (Dutta & Sahney, 2022; Jalapang & Raman, 2020), principal preparation (Vogel & Alhudithi, 2021), and professional teacher learning (Bellibaş et al., 2021;

effectiveness.

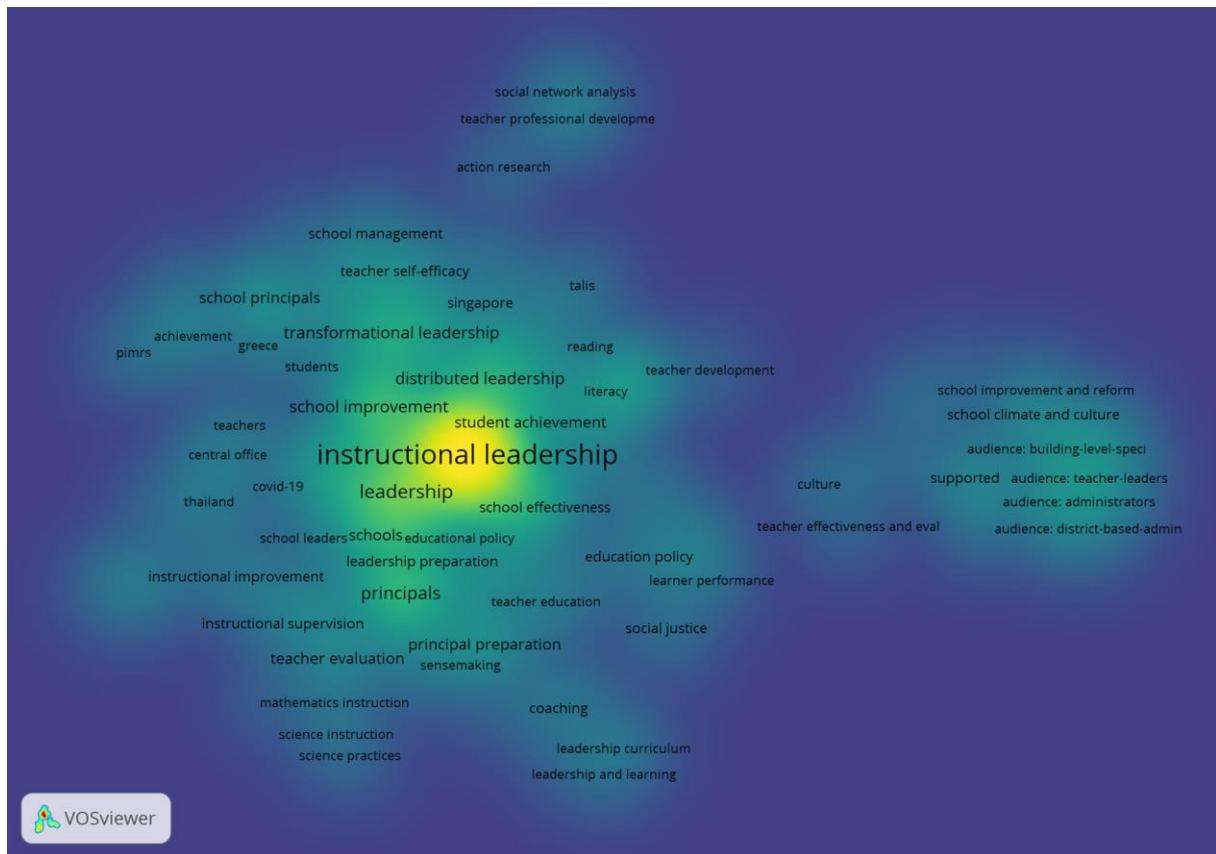

Figure 6. Keywords density visualization of instructional leadership (threshold five occurrences, display 81 keywords).

Discussion

Limitations

Earlier, we highlighted the methodological limitations of this review. Here we wish to add one additional limitation that concerns the generalizability of our findings to the field of instructional leadership. Our study examined a Scopus database of journal articles about instructional leadership. Moreover, co-authorship, citation, co-citation, and co-occurrence analysis enabled the identification of authors, countries, documents, and keywords beyond those contained in our dataset of instructional leadership journal articles. Thus, the results of this review should be interpreted as tentative benchmarks that can be reinterpreted through studies that use alternative methods and against new trends as they develop in the future.

Interpretation of the findings

The bibliometric analysis employed in this review offers a unique perspective on the long-term historical development of instructional leadership. We observed that there had been relationships between authors and

between countries on the topic of instructional leadership. The highest relations between authors amounted to 43 collaborations, and between countries amounted to 44 collaborations. Co-authorship is still an essential indicator of collaborative work and an appropriate means of studying patterns of cooperation (Santos & Santos, 2016). The development of citations from documents and authors on the topic of instructional leadership can be seen from the highest number of citations in documents 1,032 and authors 1,567 citations. To measure the influence of an author or paper, then citation is the most frequently used method since it can quickly identify existing scientific articles (Rashid, 1991; Zupic & Čater, 2015). The author's co-citation visualization of instructional leadership reveals 4 clusters: 1) measuring the instructional leadership, 2) school effectiveness and improvement, 3) the role of the school principal, and 4) leadership for school restructuring, performance and achievement. Co-citation has evolved as a complementary approach to analyzing scholarly impact (Zupic & Čater, 2015). Co-citation is the frequency with which two units (e. g. authors) are cited together in other documents (Small, 1999). Co-citation analysis assumes that when two authors are frequently 'cited together,' they share an intellectual affinity (Small, 1999; Zupic & Čater, 2015). The keyword network visualization for instructional leadership reveals 4 clusters: 1) the impact of instructional leadership on school climate, 2) the application of instructional leadership in school settings, 3) the relationship between instructional leadership and the concept of educational leadership in general, and school principals in particular, 4) instructional leadership efforts in developing teacher professional and leadership and the teaching and learning process which ultimately increases accountability. Co-occurrence analysis to analyze the structure and development of the scientific literature (Chen et al., 2016). The topic of instructional leadership today (in 2020 and the future) focuses more on teacher efficacy, school climate, principal preparation, and teacher professional learning. The overlay visualization is chosen as a more useful tool for verifying recent trends in the academic field as soon as it allows us to classify the items using a timescale (Shvindina, 2019). Instructional leadership is often associated with student achievement, leadership, and school effectiveness. Density visualization can be seen in the keywords that often appear (Hamidah et al., 2020).

Conclusion

Hallinger P. is the author with the most co-authorship networks, and United States is the country with the most co-authorship networks on instructional leadership. The article "The Impact of Leadership on Student Outcomes: An Analysis of the Differential Effects of Leadership Types" by Robinson, V. M. J. (2008) is the article with the highest number of citations. Still, Hallinger P. is the author with the highest number of citations. The author co-citation visualization of instructional leadership reveals 4 clusters: 1) measuring the instructional leadership, 2) school effectiveness and improvement, 3) role of school principal, and 4) leadership for school restructuring, performance and achievement. The keyword network visualization for instructional leadership reveals 4 clusters: 1) the impact of instructional leadership on school climate, 2) the application of instructional leadership in school settings, 3) the relationship of instructional leadership with the concept of educational leadership in general and school principals in particular, 4) instructional leadership efforts in developing teacher professional and leadership and the teaching and learning process which ultimately increases accountability

Recommendations

Future research about instructional leadership focuses more on teacher efficacy, school climate, principal preparation, and teacher professional learning.

Abstract: In the era of digitalization, financial education is essential because it is one of the most critical skills a tech-savvy generation z can acquire. Seeing the rapid change in financial access from traditional to digital today, with bibliometric approach seeks to present how financial education is needed in digital finance. It is increasingly evolving so that Generation Z does not fall into digital traps such as credit and impulsive purchases. Based on the Scopus database, 137 documents have been published from 1999 to 2022. Journals, authors, countries, articles, themes, and publication trends have been used to identify influential works, describe financial education in the era of digitalization, and identify gaps. The United States is the leading producing country with 69 documents and is also the most in citations. In addition, bibliometric analysis shows that the journal of financial counseling is the most productive journal researchers often go to on financial education; next, there is Journal of Consumer Affair. Of the 332 keywords used in the document, financial literacy, financial knowledge, and financial behavior are often identified. Recent themes identified in the last three years include financial inclusion, digital finance, and financial technology. This study provides a comprehensive overview of the state of research on financial education in digital finance for generation z in the transition period to lead to financial well-being. The results are particularly relevant for children studying financial education, given the rising levels of credit and impulsive purchases for Generation Z in the digital financial age, which exposes individuals to fast financial services and requires informed decision-making. This study helps academic researchers know the core of financial education and identify relevant areas that need to be investigated in future research.

Keywords: financial education, digital financial, generation-z, scopus database, bibliometric analysis

Introduction

Every stage of human life requires financial resources to fulfill our needs, from birth to old age. Technological advancements and globalization have provided people with easier access to financial products and services, but this also complicates financial decision-making. To avoid financial mistakes, individuals must be digitally finance-savvy. Proper understanding and management of finances contribute to a more prosperous life. Good financial knowledge is essential for effective financial management. Many criminal activities occur today due to financial struggles, often resulting from a lack of sound financial knowledge. Hence, financial education in both formal and non-formal settings is crucial, and it should start at a young age to instill positive financial habits.

At the highest global policy level, governments have prioritized youth as a target for financial education efforts (OECD 2012). Past research has shown that financial education in elementary schools can improve student financial literacy, especially when delivered through innovative methods like a simulated classroom economy (Batty et al., 2020). Comparing financial education in schools, the primary finding is that "investing in the implementation of school financial education curricula does indeed impact financial knowledge, and to a smaller extent financial behavior" (Kaiser & Menkhoff, 2020). Financial education programs for young people have significant and robust effects on financial knowledge, behavior, related preferences, and personality traits associated with financial behavior. Overall, the evidence supports school-based financial education programs as highly effective in increasing financial knowledge among children and youth (Frisancho, 2020).

This study examines the influence of financial education from an early age on life's welfare. As finance has become increasingly digital, this research also explores digital finance in today's world. In this context, children and teenagers quickly adopt financial technology trends. There has been no prior research specifically investigating the dynamics of financial education for children and adolescents in the digital era. This paper seeks to address the following research questions: 1. What are the publication trends in financial education related to digital finance, considering authors, countries, citations, and keywords? 2. What research themes are influential in this area? 3. How has research on financial education and digital finance evolved in recent years, and what are the current trends? 4. What are the gaps and recommendations for future research?

Drawing from the data sources and methodologies described, this article investigates the significance of financial education in schools for preparing children for financially independent lives. Young people who achieve financial independence can enhance the well-being of their parents. The article concludes by summarizing the primary findings, along with outlining conclusions and potential directions for future development.

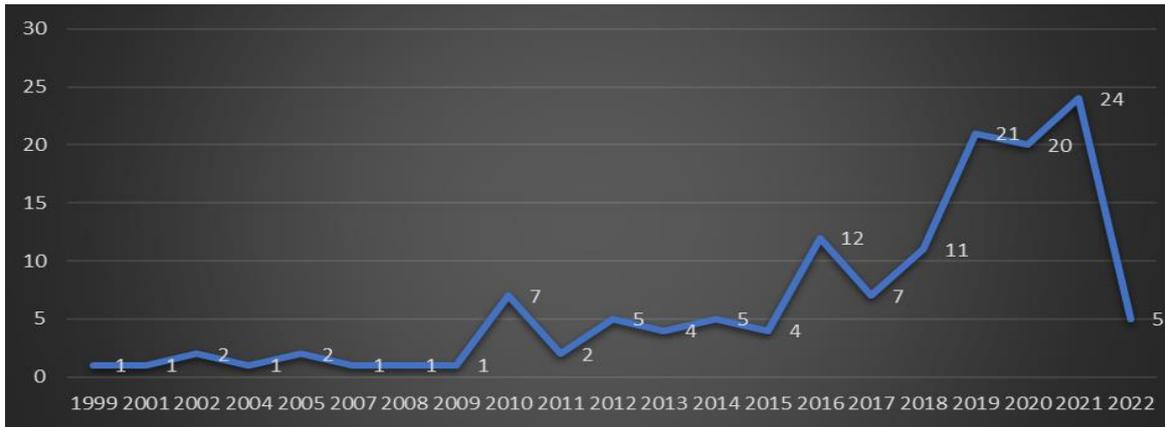

Fig. 1 Historical evolution of the article’s publication, data source Scopus.

Method

The bibliometric approach examines specific scientific research by utilizing bibliographic data for performance analysis (Noyons, Moed, and Luwel 1999) and is often employed to evaluate research within a particular domain (Liao et al., 2018). As such, bibliometric analysis serves as a valuable instrument for academics or scholars to examine citations, keywords, co-citations, countries, and article authors in a specific research field.

In the initial phase of this systematic review, a literature keyword search was conducted to minimize potential biases from researchers. The chosen terms included "financial education," "digital financial," "financial literacy," "generation z," and "high school," covering all years. The final sample comprised 137 articles in total. Subsequently, a bibliometric mapping method using VOS Viewer software (van Eck & Waltman, 2010) was employed, allowing for the visualization of various networks derived from co-authorship, co-occurrence, and co-citation analyses.

Results and Discussion

Number of publications

An upward trend was observed in the number of publications analyzed. Fig.1 displays the progression of the annual count of academic articles on financial education, digital finance, and financial literacy for Generation Z and high school students. After the first article (Peng et al., 2007), this research area received relatively limited attention for the next decade. However, a noticeable growth trend emerged in 2016, with a significant increase in the number of publications. Another surge was observed in 2019, with the highest number of publications recorded in 2021 (n=24). Various studies (Kangwa, Mwale, and Shaikh, 2021); (Sconti, 2022); (Jain & Raman, 2022); (Yin Yin, Yusof, and Abe, 2022) have explored the connection between finance and digitalization, as the Covid-19 pandemic has transformed the landscape into a fully digital environment.

Publication by Author

A total of 340 distinct authors contributed to the 137 articles. As evident in Table 1, Danes emerges as the most prolific author. In four of his studies, he collaborates with multiple authors from the same institution, indicating strong networking within this research community. Lastly, it is worth noting that the United States stands as the most represented country.

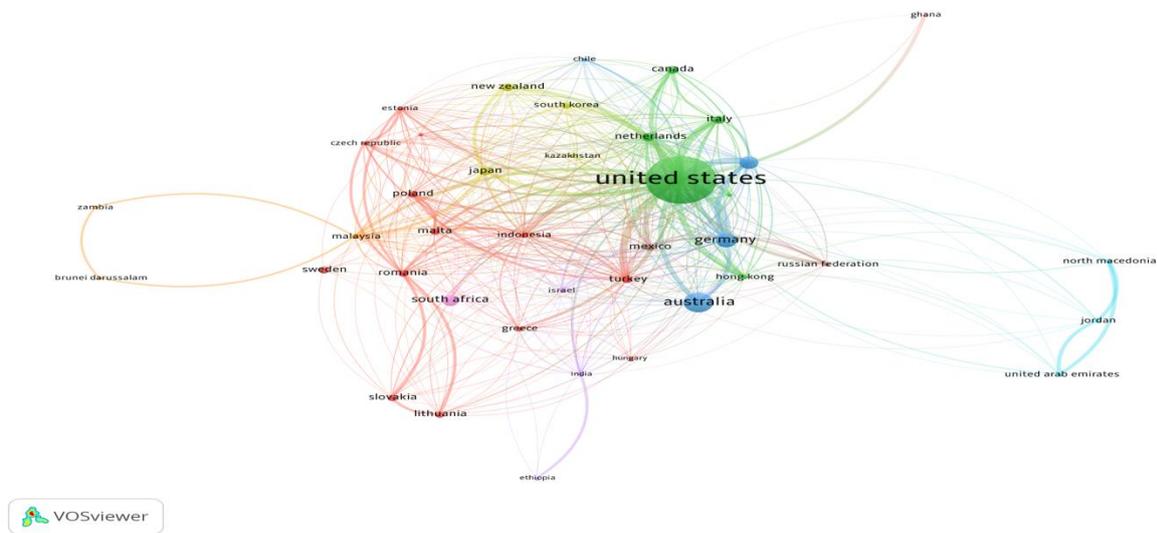

Fig. 2. Bibliographic coupling by country. Using VOSviewer software

Table 1. Most prolific authors in financial education and financial literacy

Rank	Name of Author	Country of Author	University/Institution	Number of publications
1	Danes S.M	USA	University of Minnesota	4
2	Gracia S	Mexico	UCC Business School	3
3	Xiao	USA	University of Rhode Island	3
4	Asarta	USA	University of Delaware	3
5	Walstad	USA	University of Nebraska - Lincoln	3
6	Bhattacharya	USA	California state University at Fullerton	3
7	Gill A	USA	California state University at Fullerton	3
8	Lucey T. A	USA	Illinois State university	3
9	Lusardi A	USA	George Washington University School of Business	3

Most cited articles

Table 2 presents the papers with the highest number of citations in absolute terms (>100). The most relatively cited paper, Lusardi and Mitchell (2010), can be used as a reference for literature reviews on this topic. Two of the most cited papers discuss the joint determination of financial education implementation in high schools. Peng et al. (2007) examine the impact of personal finance education provided in high schools and colleges, while Walstad, Rebeck, and MacDonald (2010) demonstrate that a well-designed and appropriately executed financial education program can positively and significantly enhance the financial knowledge of high school students, aligning with previous research findings.

Author’s Country

Table 3 reveals that the majority of the authors are affiliated with universities in the United States, with representation from other countries such as Germany, Mexico, and England. While many of the most influential institutions are American, the research focus in this area is relatively low. This suggests that interest in this topic is widespread among teams with diverse affiliations within these institutions, and as will be discussed later, there are some highly prolific authors.

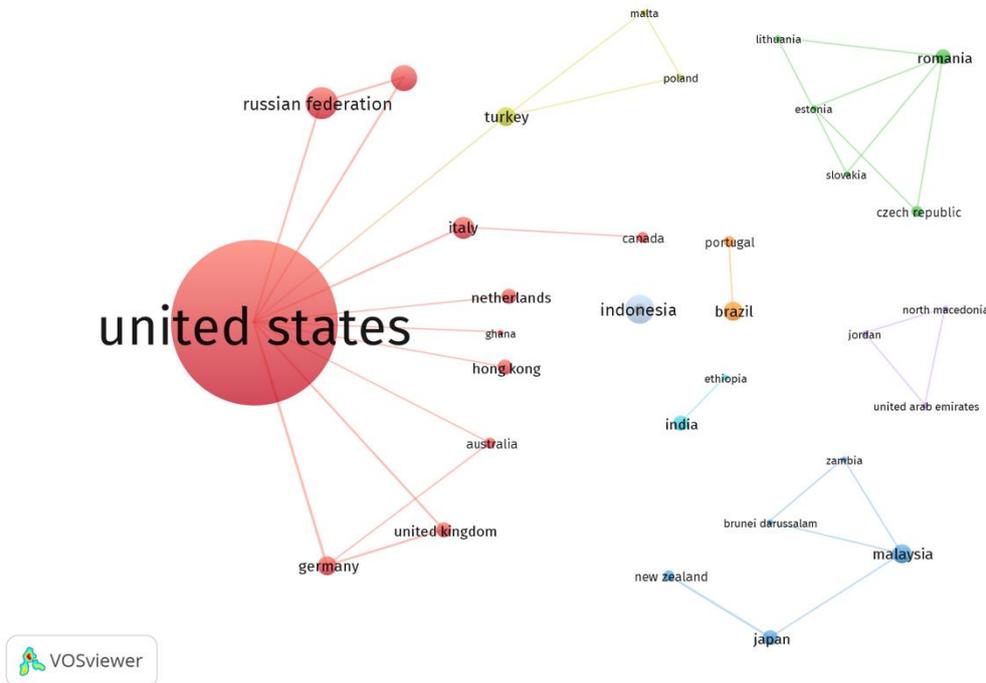

Fig. 3. Co-authorship by country, using VOSviewer software

Figure 3 displays that among the 44 countries of author origin, the largest cluster comprises 14 countries, represented by the red cluster. These include the United States, Germany, the United Kingdom, Australia, Hong Kong, Ghana, the Netherlands, Italy, Canada, the Russian Federation, Turkey, Malta, and Poland.

Table 3. Distribution of articles by most influential countries with the greatest total link strength.

Country	Document	Citations	Total Link Strength
United State	69	2709	16
Germany	4	134	6
Mexico	6	26	4
Romania	3	22	4
Russian Federation	8	7	4
United Kingdom	3	101	4
Italy	5	36	3
Japan	3	37	3
Malaysia	4	6	3
Turkey	4	27	3

Focusing on the most prolific journals, Figure 4 presents the sources with the highest number of articles on the research topic, along with the main areas to which the articles are connected. The journals are linked with various research areas, including economics, finance, counseling, family issues, and consumer affairs. Therefore, financial education and digital finance studies currently sit at the intersection of financial counseling, consumer affairs, and economic behavior. It is evident that there are no specialized publications exclusively dedicated to financial education and digital finance, indicating a potential gap to be addressed in future research.

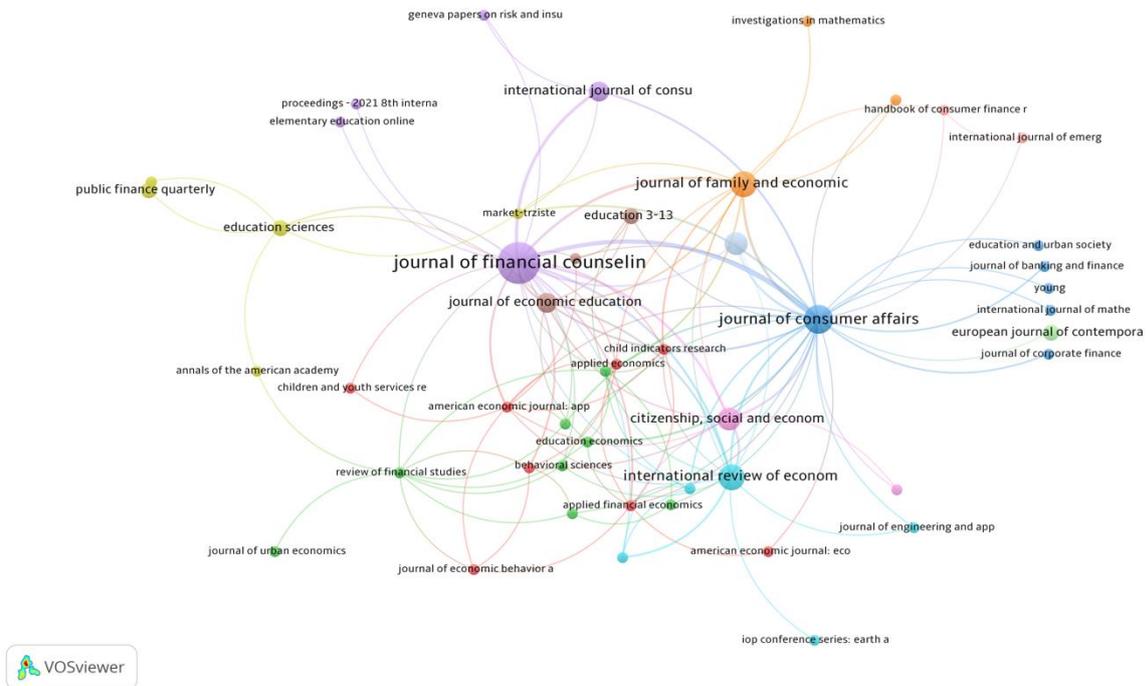

Fig. 4. Citation network of source, using VOSviewer software.

Lastly, the blue keyword group can be linked to financial education, as "students," "universities," "economic socialization," and "money attitude" are the most prominent keywords. The presence of these comparatively lower-frequency keywords suggests the potential for further development in this area of study.

Recent research trends

To identify the latest research trends and prominent topics, we conducted an in-depth analysis of articles published on the subject in 2021-2022, extracting the primary research themes, which we have summarized in Table 4.

Table 4. Research Trends 2021 & 2022

No	Reference	Title	Objective
1	(Khan et al. 2021)	Do financial literacy and financial education influence smoking behaviour in the United States? Conclusion

The results of our analysis indicate that financial education has been a topic of interest for high-level academics over the past 25 years, with a noticeable increase in publications during this time. However, the main limitation of this paper stems from the selection of documents for analysis. While we collected all publications in this

research stream from the Scopus database, some relevant studies may have been excluded, as some documents analyzed may not include keywords that could slightly alter the analysis results. The ongoing digitalization of finance is causing significant changes in financial management that could have long-term consequences for individuals and society. The question remains whether citizens are adequately prepared for this rapid process of change. Generation Z children will likely adapt more quickly to these changes, but can they manage their finances effectively? Will digitization make them more efficient or even more wasteful? The answers to these questions will significantly influence decisions and behavior as economic actors. Financial education plays an essential role in families and society. Children who study financial education will be better prepared for the future, and it will be easier for them to achieve financial independence. Learning about financial education from an early age can also improve parents' welfare. Moreover, there is a need for further research in the field of financial education and digital finance. Therefore, we hope that there will be a greater interest in discussing this topic in the future.

Abstract: The development of the aviation industry after the COVID-19 pandemic is prompting aviation institutions to improve their courses, including English courses. A teacher who teaches English for aviation has an important role to play in adapting the teaching style to the needs of the students. This paper explored the experiences of teachers in teaching aviation English to students in the aircraft maintenance program. The participants were three English teachers from three different aviation schools in Malaysia. Semi-structured interviews were conducted as part of a fully qualitative study, and the data were analyzed thematically using ATLAS.Ti software. The findings revealed that they faced both successes and challenges in teaching aviation English, which were categorized into three areas: opportunities, feelings, and progress. The subthemes for successes were seizing opportunities, positive feelings, and good progress, while missing opportunities, negative feelings, and slow progress were the subthemes for challenges. Seizing opportunities referred to participants mastering their teaching tasks, while positive feelings referred to satisfaction with teaching, feedback from students, and enjoyment of the learning process. The sub-theme of good progress referred to the participants' better progress. The sub-themes for challenges, on the other hand, were missing opportunities, negative feelings, and slow progress. It referred to the lack of institutional support, limited knowledge about aviation and sources, while the negative feelings referred to frustration with students, technical instructors and a lack of confidence in the knowledge they had. On the other hand, participants felt that their progress was slow when they had to deal with different levels of students, which was time-consuming and related to the nature of learning and teaching aviation English. The findings would help curriculum developers and English teachers to provide an English course that meets the needs of aviation students.

Keywords: Aviation English, Success, Challenges, English teachers

Citation: Mahmood, A, S, Saad, N, S. M., & Nur, N. M. (2023). Teaching Aviation English: The Sweet and the Bitter. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 212-223), Cappadocia, Turkiye. ISTES Organization.

Introduction

Aviation English is not only limited to the future pilot and air traffic controllers. It also refers to English that should be used by any persons who are responsible to provide services that are related to the safety of aviation such as maintenance line, cabin crew and airfield operations specialist. Aviation English is a part of ESP (English for Specific Purposes), a special English language designed specifically for aviation students and all aviation personnel to use in the workplace. It involves more jargon used among aviation personnel in terms of speaking and writing purposes to ensure smooth flight operations.

ESP is a language teaching approach, which directly deals with the syllabus, methods and activities (Hutchinson, 1987). The purpose of ESP is used for language learning based on the students 'needs and the needs of early learning. According to ESP model, which is developed by Hutchinson and Waters in 1987, there were three (3) elements which was highlighted in this model; necessities, lacks, and wants. 'Necessities' in this model refers to the type of needs that is determined by the demands of the target situations.

Meanwhile, 'lacks' in this model means the differences that exist between the target proficiency and what the target learners know. The last element is 'wants' which refers to the what the learners want to know. Teaching ESP is more challenging compared to teaching general English. It not only requires the teachers' English proficiency but also the knowledge in the specific field. Additionally, ESP teachers face difficulties when implementing an interdisciplinary approach in their classes (Prudnikova, 2013).

The voice of English teachers should be heard because they are the subject matter experts in the language to meet the needs of the students, e.g., in designing the course and selecting appropriate topics and materials. For countless years, this problem has been perceived as a phenomenon that will continue to worsen and recur frequently. This paper therefore examines the experiences of English teachers in teaching English to aviation students, particularly in the aircraft maintenance course.

Literature Review

Although 21st century education has introduced English for Specific Purposes (ESP), English teachers still face the challenge of equipping students with industry needs and communication skills. They face the challenge of teaching unfamiliar subjects and have to deal with subject specialists. Teachers of ESP lack professional value orientation and knowledge in a particular field (Khamis et al., 2019). Knezovic (2016) found that there is a gap between the practices of ESP teachers and curriculum developers and the demands of the labor market for some elements in their curriculum. This has led them to face a dilemma in terms of subject knowledge (Wu & Badger, 2009). They should be able to interpret the curriculum and select appropriate materials based on the content and tasks used in the learning process (Alexander (2012), Bracaj (2014), and Arno & Mancho (2015).

In Malaysia context, a study that was conducted by Khamis et al., (2015) had revealed some challenges that faced by ESP teachers which are lack of guideline for specific professional values, knowledge in the specific field and lack of ESP and teaching. However, this study did not focus in any aviation area. Meanwhile, English teachers faced issues with using modules or syllabuses, as well as significant issues in their daily teaching, such as student-related issues, time constraints, limited resources, and a lack of training (Sanitah et al. 2017). Nevertheless, this study only focused on the problems and challenges of teaching ESL in vocational colleges and the participants were only selected from certain location, which is Negeri Sembilan.

All the studies reported above did not focus specifically on English in aviation. Moreover, many previous studies focused only on the challenges faced by teachers. However, far too little attention has been paid to teachers' experiences of teaching ESP specifically in the area of aircraft maintenance, focusing on both the successes and the challenges. Therefore, this paper explored the experience of English teachers in teaching English to aviation students, focusing on both the successes and challenges specifically in teaching aircraft maintenance students.

Methodology

Research Question

The objective of this study was to determine the experiences of English teachers in teaching aviation English in Malaysia. Hence, the research question was formulated to guide the writing of the study. The research question was: What are the successes and challenges of teaching aviation English in Malaysia?

Methods

To obtain information about teachers' experiences of teaching aviation English in Malaysian aviation schools, this study used the semi-structured interview, which is commonly used in qualitative research and is the most common qualitative data source. It describes a good narrative of key events and provides insight into the participants' perspectives.

Participants

Three English teachers were involved in this study. All of them are currently teaching English at three different aviation schools in Malaysia. They have more than 8 years of teaching experience. The participants were assigned pseudonyms to preserve their identities. For example, DrSa is a PhD holder with 15 years of teaching experience, while MdmZue and MdmThi are master holders with 8 and 15 years of teaching experience respectively. A pseudonym is used in this study as the researcher wishes to keep the personal details of the participants confidential. According to Allen and Wiles (2016), a pseudonym is an unreal name often used by the researcher or author to protect the privacy of the participants.

Data Analysis

The data were analysed guided by Braun and Clarke’s six-step thematic analysis with the help of ATLAS.ti.

Results

The results of the qualitative study showed that teachers experienced both successes and challenges in teaching aviation English. Success can be interpreted as achieving the outcomes desired or hoped for by the participants. In this study, it refers to seizing opportunities in completing tasks, positive feelings and making good progress. In contrast, a challenge is a new or difficult task that tests participants' competence and expertise. This includes lack of institutional support, limited knowledge of aviation and also slow progress in learning and teaching aviation English. Figure 1 shows the three sub-themes for each success and challenge, which are key words in the research question.

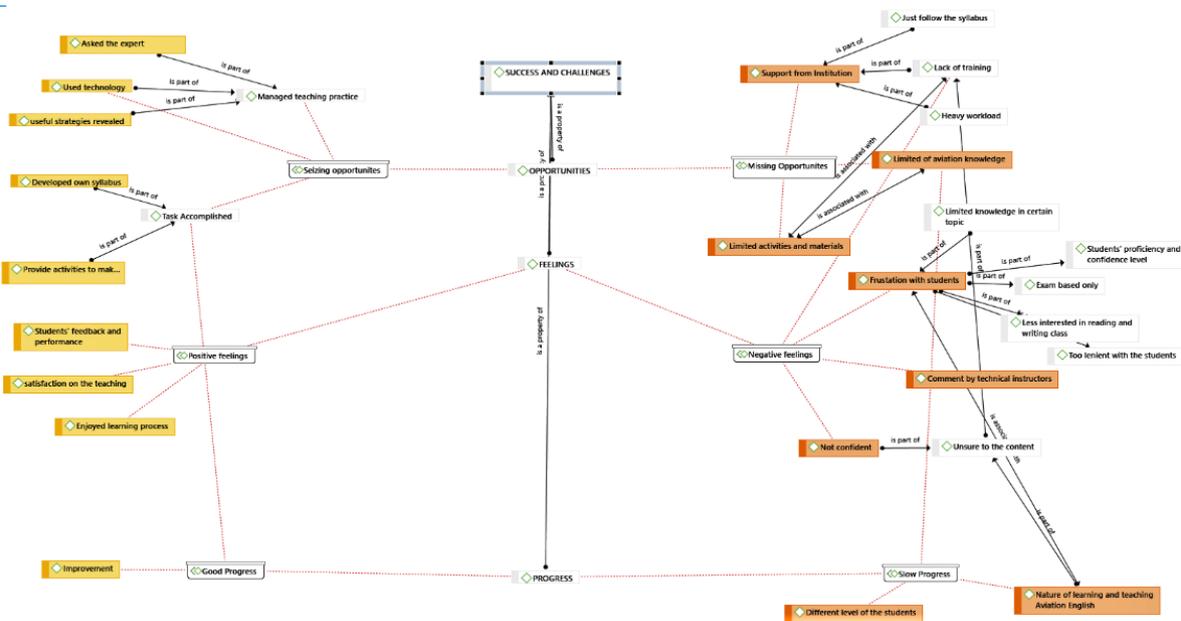

Figure 1. Three Sub-themes for Each Success and Challenge

Figure 1 is a network view output from ATLAS. ti. There were three sub- themes positioned under successes and three sub- themes for challenges in teaching aviation English. The details of sub- themes are as follows.

Theme 1: Successes in teaching Aviation English

The subthemes of successes in teaching are seizing opportunities, positive feelings, and good progress. The details of the success subthemes are like below.

Success- Seizing opportunities

The participants managed to conduct the lessons with the help of experts such as the technical instructor and the industry representative. They took the opportunity for discussion and guidance from the technical instructors, some of whom had previously worked in industry.

...Sure, I did that (asked questions) with persons from industry as well as technical lecturers....(DrSa)

Participants in this study also tended to use the technology facilities in order to assist them in carrying out their teaching tasks. The development of technology nowadays enables users to find information quickly and easily. Moreover, it can provide higher quality results. For example, participants used this type of tool when they had problems understanding a particular jargon and were unsure of the exact pronunciation.

...Normally, I look up the material on the internet. If I couldn't ask the engineer (technical instructor), I would look it up on the internet... (MdmZue)

Apart from that, the participants were also able to come up with some useful strategies for teaching. They learnt new things and strategies to achieve the learning outcomes of teaching and to implement their teaching practise. For example, they directly asked students about the current technical modules they had learnt to connect to aviation English, and prepared examples and activities related to aviation to promote students' engagement in class. In addition, the teachers also discovered strategies that were effective for teaching their students, such as activities involving project-based learning and teamwork.

.... I would say communicative... teaching and learning methodologies, and I prefer students to be more hands-on and involved in a variety of projects. They so enjoyed doing things together and functioning cooperatively in groups. They dislike reading and writing exercises that are typically done alone. It's a little stressful. So, a lot of teamwork.... (MdmThi).

In the same sub-theme, they were able to develop their own curriculum to meet the needs of the students. As content developers, they used the opportunity they had to improve the content of the curriculum, change and provide materials, lesson plans or even the tests if they did not meet their expectations.

In summary, they took the opportunity to implement their teaching tasks by questioning the expert, using technology and finding out some useful strategies for their teaching process. They also used the opportunity to accomplish tasks such as developing the curriculum and providing activities for their class.

Success- Positive feelings

In this study, participants also experienced positive feelings when students responded well and performed well

in class. When students responded well, teachers also expressed satisfaction about their teaching practise with enthusiastic words such as "very nice", "fun", "wow" and "successful".

.... Because I gave them a choice the last time, let's pretend they choose to bring the mock up to the class. Yet, if you can't, you'll have to make your own mock up. They did it based on a real mock-up of an aeroplane. Very nice... (DrSa)

Meanwhile, the teachers also expressed their positive feelings as they too learnt aviation English gradually. They reported that they made efforts to meet the students' needs and abilities by connecting with the real learning situation, e.g. by going to the aircraft hangar and workshop for visual learning.

....The student would be giving a presentation based on what they found in the workshop and hangar, so we had to be at the hangar and the workshop.... (DrSa)

In general, these positive feelings can be divided into three situations experienced by teachers: when students give feedback and are satisfied with their performance in class, when they are satisfied with the teaching and when they enjoy the learning process to understand the aviation area.

Success- Good Progress

Many participants pointed out that they generally felt a good progress, starting from the first year of teaching Aviation English to the current year. This good process of aviation knowledge enhancement is gradually getting better to meet teachers' expectations and students' needs. Most of them frequently used the words "improved", "more confident" and "better".

....As time passes, I believe it is critical to ask around. Now that I will be in my fifth year at this school, I am extremely certain that even when my students or colleagues and I am having a normal conversation, I can relate to them or clearly comprehend what they are talking about.... (MdmZue)

All participants showed gradual changes and improvements compared to the first year of teaching English

Theme 2: Challenges in teaching Aviation English

The sub-themes for challenges were missing opportunities, negative feelings and slow progress. The details of the sub-themes for challenges are as follows.

Challenge- Missing opportunities

On the contrary, participants felt that they encountered challenges when they missed opportunities for support

from the institutions in which they work. Firstly, one of the participants stated that English teachers were not adequately trained while they need to develop the right methodology and teaching materials.

.....Previously, we had English for Technical Purposes and English for Commercial Purposes, but now it has changed to general English, which is communicative English. So we no longer receive that type of training.... (MdmThi)

When asked about strategies to select the content her students need, she added that she has to follow the curriculum given by the institution as it is compulsory for teachers in class. It seems that she did not have the opportunity to research and develop her own curriculum based on the students' needs.

In terms of the content, I strictly stick to the syllabus, but in the end, we must follow it because it is a requirement... (MdmThi)

In addition, the participants felt that they did not receive support from the institutions due to their heavy workload. They did not have enough time to prepare the activities and materials for the classes because they had a tight schedule.

I sometimes talk with Madam Kay (her colleague) , and seek her advice on many topics. At one point, having to teach all the programs made me feel quite stressed. Technical English, Aviation Business, Pilot Program, and KV are also included....

Moreover, the sources and textbook for the maintenance section were very limited, unlike the English lessons for pilots and the air traffic control program. Therefore, they felt that they missed the opportunity to better prepare their students.

.... Because aviation English textbooks are highly pricey and not readily accessible. So, I usually google the information.... (MdmZue)

In addition, teachers have also missed the opportunity due to their inadequate knowledge of aviation, which may affect their teaching, and their sense of insecurity about certain aviation-related issues.

.... It would be a little tough for me to remember if I tried because you didn't have any experience in aviation or teaching English for a particular reason. since I used to teach the common English language in general, such as grammar. After that, it would take time for the transition from standard general English to aviation English... (DrSa)

The interviews revealed that teachers missed their opportunities due to inadequate institutional support in implementing the curriculum, lack of training and heavy workload. They also missed opportunities because they

had limited knowledge of aviation and limited sources such as activities and materials.

Challenge- Missing opportunities

Participants' challenges also parallel their feelings. Their feelings were negative when they faced challenges in the form of frustration with students and people around them like technical instructors and when they lacked confidence in their skills and knowledge. Teachers reported negative feelings such as frustration with students because of their skills and confidence and the attitude of students being less interested in literacy lessons.

.... They seem uninterested in writing and grammatical rules, in my opinion. They, therefore, gave those less attention. But we have writing assessments as part of our curriculum and testing. I have no idea why they didn't like writing at all....(MdmThi)

They also complained that students viewed the assessment of English subjects as only exam-based and not as lifelong learning. From this qualitative interview, it showed that the teachers were confronted with the students' attitude in the classroom, the negative comment from the technical instructor regarding their efforts, e.g. the exam papers that contained questions unrelated to their field. All this affected their confidence when teaching in the classroom.

Challenge- Slow Progress

Although good progress such as improvements has already been mentioned, participants also told us that they experienced slow progress. They saw it as a challenge that learning aviation English took a lot of time to encourage the students to excel.

....If, let's say, it weren't for teaching, I might not have been able to become familiar with aviation. Since students were being taught the contents, there was a need to know about aviation. So it came... I suggest that it took longer... slowly, or in another word, depending on needs.... (DrSa)

This teacher (DrSa) also pointed out that the different level of the students was one of the reasons for the slow progress. It was in the nature of mastering the English language in aviation, because she had to try different methods until she found the most successful approach or activities.

....As I have stated, try and error. Make a postmortem. We examine the topic here, I suppose. I frequently asked the other teachers about this particular batch. To compare with the performance in my class... (DrSa)

In summary, the participants made slow progress because they needed more time to find the best approach, materials and activities to teach. They used the 'trial and error' approach or did a follow up because they had different groups and different levels of students. They also admitted that it could be the nature of ESP itself, because even a teacher learns ESP.

Discussion

As reported earlier, participants experienced both successes and challenges in teaching English to the aviation students. They experienced success when they took opportunities to implement their teaching tasks, when they had positive feelings and when they made good progress. In contrast, they experienced challenges when they missed opportunities because they did not receive enough support from the institution, had limited knowledge of aviation, had negative feelings and made slow progress.

In terms of success in teaching aviation English, the teachers in the interviews agreed that they were able to fulfil their teaching responsibilities in the classroom, including preparing the activities and materials and developing the curriculum for the students. They took advantage of the opportunities available to them by consulting experts such as technical instructors and people working in the industry. At the same time, they used the internet to find all the information they wanted to know. By completing the teaching tasks, they were able to point out the useful strategies that are effective and can attract the attention of their students in the class. In the interviews, the teachers also commented positively on their students' performance and were happy to see their good progress in enhancing their knowledge of aviation English. It can be said that the teachers were motivated to use different strategies and methods to prepare lessons and meet the students' needs. The classroom and the teaching-learning process are more effective when teachers are motivated. A successful classroom and excellent learning outcomes depend on an engaged teacher. Motivation spurs people on, helps them focus and contributes to their ability to perform well over time. There is a link between teacher motivation and the motivational strategies teachers use, which in turn affect student motivation and English achievement (Bernaus et al., 2009). Therefore, any change in the education system that promotes teacher motivation can affect students' educational achievement.

Meanwhile, the research findings of this qualitative study also revealed several challenges categorised under three sub-themes: lack of opportunities, negative feelings and slow progress. On the sub-theme of lack of opportunities, teachers admitted that they were not adequately supported by the institutions in which they work. They had to cope with a heavy workload, were provided with the English as a Foreign Language curriculum, which was compulsory to follow, and did not receive sufficient ESP training. There was no adequate training to prepare teachers for the change in curriculum that affects teaching practise (Iswati & Triasuti, 2021; Sanitah et al., 2017). Inadequate training will certainly affect the teaching and learning process.

In this study, teachers also frequently mentioned their limited knowledge of aviation and inadequate sources of English aviation subjects. All these affect their confidence in teaching the subjects, which relates to the second sub-theme of challenges: negative feelings. They also expressed their frustration with the students' performance in class and the subject teacher's negative comments. Teachers are under pressure to show that they are "intellectually capable" of mastering the subject matter in order to overcome their inferiority problem (Melles et al., 2005). The experts acknowledged that the challenges facing English teachers were very serious and warned

of the implications for teachers' classroom practise as outlined by Benesch (2001). They needed skills that related to the learning of their student pilots and facilitated practises related to aviation, as well as meeting the demands of future flight personnel in the workplace.

Finally, the last sub-theme on the challenges of teaching aviation English is slow progress. Teachers felt that learning and teaching aviation English was not part of their area of expertise. Teaching is not only part of a planned task for the teachers, but also an ongoing process that takes place throughout the time the teacher is at the facilities and interacting with the students. In order to understand the context of aviation, the teacher has to go through a long process of mastering it and incorporating it into the lesson. The different language levels of the students, which forced the teachers to follow a 'trial and error' approach, also contributed to the slow progress.

Conclusion

Teaching experience is clearly linked to student success over the course of a teacher's career. This study provided a new perspective on the experiences of English teachers in aviation that was previously unexplored. The findings of the study were also crucial for researchers at ESP, as the issues raised formed the basis for future research and offered insights into the important success and challenges of teaching English to aviation students. All stakeholders, including teachers, technical educators, legislators, higher education institutions, and industry players, need to exchange ideas, take appropriate action, and share best practices to meet industry expectations.

Recommendations

This study used a qualitative technique with semi-structured interviews to get a complete picture of the case. Generalisability of industry players' views on workplace communication skills was not the intended aim of this study due to the small number of participants. Moreover, this study mainly examined communication skills in the aviation industry, specifically in aircraft maintenance.

Future research should examine workplace communication skills with a larger sample size, both qualitatively and quantitatively. More research is needed to evaluate the effectiveness of university courses that emphasise communication skills from an employer's perspective to meet industry needs.

Abstract: Student Profile Pancasila is a character that characterizes Indonesian students. For this reason, the character values of Pancasila students should be instilled in schools from an early age. The purpose of this study was to construct a Pancasila student character instrument for elementary school students. This study uses a quantitative approach with a sample of 697 grade 3 and grade 4 students in Soppeng district. Data analysis in this study uses validity and reliability. Content validity using Aiken's V for 40 items succeeded in reducing the instrument to 35 items with a validity index at 0.76 – 1. CFA analysis to prove content validity shows that the model is fit with 24 items. The reliability estimation shows that a 24-items instrument is reliable. Thus it can be concluded that the 24 items of the Pancasila Student Profile instrument in construction terms can be used to measure the character of 21st century students in Indonesia.

Keywords: character; pancasila student profile; validity; reliability

Introduction

To face the challenges of the 21st century, the study regarding character has become crucial among educational and psychological experts. Character has been a target of governments in various countries to create good, employable, sociable, and high moral global citizens (Taylor, 2018; Allen & Bull, 2018). The World Economic Forum (2015) identified three main skills that students must acquire in facing the 21st century challenges, called fundamental literacy, competencies, and character qualities. Furthermore, character qualities include curiosity, initiative, persistence, adaptability, leadership, and social and cultural awareness. Providing character education to students can improve social-emotional skills, and academic development (Lovat, 2017).

Various educational institutions uphold character education in achieving individual and societal welfare, although character education is termed differently such as life skills, character development, ethics education or values education (Jose, 2021). Character is a daily activity that can be observed (Wyne, 1991) and can be formed through the educational environment, especially character education. Character education as an educational institution's effort to improve the psychological development of students for them to have ethical, democratic, and effective behavior. Furthermore, they can contribute more to society and have high level of excitement to be a well-behaved person (McGrath, 2018). Creating the individual character is influenced by the environment (Lickona, 1994), which is both family and society; and the family is the initial place in educating someone's character (Patching, 2014). However, schools remain a place to provide good character stimulus to students (Sriwilujeng, 2017). Regulating education through character education will prepare students to face the challenges of the 21st century.

Indonesia is one of the countries which makes character education as they key point to make the citizens be ready to face the challenges in this century. Character education in Indonesia focuses on preparing an intelligent and superior society that is able to unite pluralism and a multicultural society (Najmina, 2018). Although character education in Indonesia has long been implemented, the strengthening of character education began to be felt since the 2013 curriculum change through the character education program (Sultoni, 2016). Currently, the Ministry of Education and Culture has established a character education formula called the Pancasila Student Profile. Pancasila Student Profile is a character that represents the way Indonesian people behave and act in accordance with the ideology of Pancasila (Asa, 2019). The Pancasila Student Profile is also a solution to the problem of character degradation that occurs among students due to foreign cultural acculturation. Thus, character based on Pancasila values is a solution in shaping the character of Indonesian society in facing the challenges of the 21st century.

The Pancasila Students Profile aims to form citizens who have a personality that can reflect Indonesian citizens and survival in the era of globalization (Sabon et al., 2022). The implementation of character education based on the Pancasila Student Profile in schools is carried out at school through formal and informal learning. In the implementation process, the Centre for Character Strengthening issued a frame of reference in the form of the Pancasila Students Profile dimensions. The dimensions of the Pancasila Students Profile include 6 aspects which are described as follows.

First, faith and fear of God. This contains religious values where this value can be a character foundation for the younger generation in facing the demands of the times (Astuti et al., 2020). Religion is a foundation of character in human life (Muhtar et al. 2019). The value of religiosity that a person believes will affect the ways and patterns of actions taken in everyday life. Religious values have an important power and have a strong social influence in social life (Emmons & Paloutzian, 2003). Indonesian students are expected to have noble morals that are manifested through good attitudes and behaviors towards themselves, others, and the environment as a reflection of their devotion to God Almighty and the manifestation of their beliefs (Pusat Penguatan Karakter, 2020).

The second is global diversity. 21st century education emphasizes producing global citizens who can take firm

responsibility in global challenges characterized by the uncertainty of time (Hartung, 2015). In education policy, globalization which is often also termed as the 21st century is related to intercultural understanding (Selter, P & Halbert, K., 2017). Global citizenship is further defined by Hartung (2015) as people who recognize themselves as democratic members of a global community that is not limited by the state. Indonesian students who are cultured, have a mature self-identity, can show themselves as a representation of the noble culture of their nation, while having a strong insight or understanding and openness to the existence of various regional, national, and global cultures (Kemdikbud, 2020).

The third is cooperative work. Cooperative work is defined as the ability to carry out activities together voluntarily so that activities can run smoothly, easily, and lightly (Mistiani et al., 2022). Cooperative work or *gotong royong* is a local wisdom that is the cultural heritage of the Indonesian people (Sibarani, 2018) which means cooperation to help each other in achieving common goals (Taylor & Aragon, 1991) by combining strength, potential, resources, and financing. Based on the two definitions expressed, cooperative work has similarities with cooperation and collaboration in 21st century skills.

The fourth is independence. Independence is one of the attitudes that has the initiative for self-development and its achievements based on the recognition of its strengths and limitations as well as the situation faced and is responsible for the process and results (Kemendikbud, 2020). Becoming more independent individuals that have self-confidence, and independence in doing their own tasks and responsibilities, respect time and have reliable skills in their duties (Gea, 2003). Independence can help individuals solve various problems they have without relying on others by relying on their knowledge, attitudes, and skills (Suryanti et al., 2022). Independence is one of the characteristics needed by society in facing the challenges of globalization.

The fifth is critical thinking. Critical thinking is one of the most discussed skills in education today. Indonesian students are expected to have the ability to process qualitative and quantitative information objectively, analyse information factually, evaluate information and conclude information and use it in decision making (Espey, 2017; Kemdikbud, 2020). Critical thinking skills involve reasoning and logic in decision making, problem solving, and inference (Fuad et al., 2017; Tiruneh et al. 2017; Akpur, 2020).

The last one is Creativity. The creativity within students will lead them to modify, reuse, and even create new ideas. In addition, learners can also view information from a different perspective (Rahardjanto, 2019). Creativity also presents the ability to create or provide unique ideas from alternative viewpoints (McGregor, 2007). Creative individuals can make connections or links between things that have never existed before and produce new (original) thoughts (Yusnaeni et al., 2017). Creativity is related to aspects of fluency, flexibility, originality, and elaboration (Tohir et al., 2018).

The six aspects of the Pancasila Student Profile dimension framed by the Indonesian Ministry of Education become a reference for educational institutions in developing programs and projects in character building to form a 21st century society. Character development does not just happen without environmental conditioning.

Character development is achieved through learning, training, habituation, and modelling (Pala, 2011). For this reason, the role of schools is expected to support the formation of 21st century character for students in a comprehensive and measurable manner.

Character measurement, especially the Pancasila Student Profile, is carried out by the Ministry of Education and Culture annually. However, measurement and evaluation are only carried out at certain levels recently. In addition, the available measuring instruments are also not owned by schools, so the evaluation materials are only sourced from the government. In addition, previous studies have developed scales to measure the character of the Pancasila Student Profile but only at the junior and senior high school levels (Sabon et al., 2022; Mistiani et al., 2022). No one has yet developed a Pancasila Student Profile assessment instrument specifically for secondary level primary schools (grades 3 and 4).

So far, teachers tend to conduct observations and interviews in measuring student character (Zuchdi et al., 2014). The self-assessment-based character instrument for elementary school that we developed specifically for the intermediate level can be used practically for schools to take measurements periodically, to see the progress of student character. The results of character measurement can be used as a reflection to see the success of the program developed by the school.

Based on the description above, this research was conducted with the aim of developing a self-assessment-based Pancasila Student Profile character assessment instrument for elementary schools. This instrument was developed based on the six dimensions of the Pancasila Student Profile that have been described previously. The instrument was developed scientifically and tested by validity and reliability estimation.

Method

Participants

We recruited grade 3 and 4 students from 16 primary schools in Soppeng Regency, South Sulawesi, to test the psychometric properties of the PSP scale. The selected schools were schools recommended by the Education Office, where the schools have implemented the latest curriculum in Indonesia that supports the Pancasila student profile character strengthening program. The questionnaire was completed by 697 students based on paper and pencil tests. Participation was anonymous, confidential, and voluntary. Students were given the freedom to decide whether to participate and fill out the questionnaire seriously.

Instrument Development

The elementary school Pancasila Student Profile instrument was developed with the stages of developing affective instruments (Mardapi, 2018: 18; Azwar, 2019) (1) Determining instrument specifications consisting of determining objectives, studying relevant theories, determining indicators, and preparing grids; (2) writing instruments, where we make statements based on indicators; (3) Determining scoring guidelines, negative and

positive items are each coded to facilitate scoring, positive items are worth 1 = never, 2 = rarely, 3 = often, 4 = always, and vice versa for negative items; (4) reviewing the instrument, we involved 7 competent experts (2 psychology experts, 2 measurement experts, 3 education practitioners) were asked to assess the developed instrument which was then analyzed using Aiken's formula; (5) conducting trials, small-scale trials and wide-scale trials. Initially, we conducted a pilot test with 26 students in grades 3 and 4 in one school to see their understanding of the instrument items developed. If there were sentences that were difficult to understand because they were ambiguous, we revised them. Then we went to 16 schools to conduct a wide-scale trial so that 697 students filled in and returned the instrument; (6) analyzing the instrument, after scoring the instrument that had been filled in by students, we conducted a quantitative analysis to get proof of validity and reliability; (7) assembling the instrument, items that were proven valid and reliable were rearranged into a series of ready-to-use instruments.

Data Analysis Procedure

Data analysis in this study used validity and reliability. Instrument validity was proven by content validity and construct validity. Content validity involved 7 experts and practitioners to evaluate the relevance of aspects, indicators, and the meaning and clarity of items on the initial 40-item developed. Each expert provided responses separately through a 4-point Likert scale form (1 = not relevant, 2 = somewhat relevant, 3 = moderately relevant, 4 = very relevant) to avoid neutral choices (Davis, 1992). We performed item revision and elimination based on Aiken's V value with a standard of 0.76 (Aiken, 1985). There were 5 items that had a validity index <0.76 so the items were eliminated from the instrument. Construct validity was proven through a pilot test of 697 grade 3 and grade 4 elementary school students.

The construct validity test was carried out using Confirmatory Factor Analysis (CFA). The CFA test is conducted to confirm the theory and confirm whether the indicator variables can confirm a factor (Hair et al., 2010; Ferdinand, 2014). Model fit criteria generally use 4 criteria namely (1) Model convergence and acceptable range of parameter estimates, (2) fit indices, (3) significance of parameter estimates and related diagnostics, and (4) measurement invariance across multiple samples (Netemeyer et al., 1996). However, in this study the criteria used are fit indices which are classified into absolute fit indices, comparative or incremental and parsimony. The analysis was carried out with the help of the windows version of the Lisrel application. The next analysis is the reliability test. Reliability is carried out with the aim of knowing the extent to which the measurement results of an instrument can be trusted (Otaya et al., 2020). In other words, reliability shows the consistency of the scores obtained from the measurement results (Liu, Yin, & Wu, 2020). Hair et al (2010) explained that the reliability test in CFA analysis includes composite reliability (CR) and variance extracted (AVE). Hair et al (2010) state that CR values ≥ 0.7 include good reliability, while CR values between 0.6 and 0.7 include acceptable reliability, provided that the indicator has a factor load that matches the criteria. Internal consistency can also be measured using the Average Variance Extracted (AVE) estimate. The recommended AVE value is > 0.5 (Hair et al, 2010).

Results

Instrument Validity

Instrument validity consists of content validity and construct validity. Construct validity was assessed by 7 experts by giving scores on several criteria such as 1) suitability of items for indicators and aspects, 2) instrument writing rules, 3) suitability of content and language selection for the target age of the instrument, 4) clarity of sentence use (unambiguous). Experts were given an assessment sheet in the form of a 4-points Likert scale. The results of expert evaluation were then analysed using Aiken's formula to obtain the validity index of each item (Retnawati, 2016; Azwar, 2014). The results are as follows.

Table 1. Distribution of aspects, indicators, items and V-Aiken

Aspects	Indicator	Item	Code	V-Aiken
Have faith and fear of God	Religious morals	I believe that everything on earth is created by God (favorable).	IT1	1.00
		I perform worship without any coercions from others (favorable).	IT2	0.95
	Personal morals	I have breakfast before going to school (favorable).	IT3	1.00
		I take a shower before going to school (favorable)	IT4	0.71
	Manners towards others	I visit friends who are in need (favorable)	IT5	0.76
		I make friends with anyone regardless of religion and ethnicity (favorable)	IT6	0.57
	Manners towards nature	I do not litter anywhere (unfavorable)	IT7	1.00
		I switch off the television after watching (unfavorable)	IT8	0.71
	Morals towards the Nation	I obey the class rules (favorable)	IT9	0.71
		I attend the flag ceremony on Monday (favorable)	IT10	0.95
Global diversity	Recognize and respect culture	I feel embarrassed when I speak Bahasa (unfavorable)	BG1	0.90
		I like listening to the folk songs (favorable)	BG2	1.00
	Intercultural communication and interaction	I find it difficult to talk to friends who go to a different school from me (unfavorable)	BG3	0.86
		I enjoy learning the local language of other ethnic groups (favorable)	BG4	0.86
	Reflection and responsibility towards the experience of diversity	I feel uncomfortable playing with friends who come from a different ethnicity to me (unfavorable)	BG5	0.95
		I feel that learning about other cultures will destroy our culture (unfavorable)	BG6	0.95
	Social justice	I feel sad when a friend is marginalized in class (favorable)	BG7	0.71

		I vote for the class leader if there is an election (favorable)	BG8	1.00
Cooperative Work	Collaboration	I am involved in completing group tasks (favorable)	GR1	0.81
		I prefer to do group work by myself (unfavorable)	GR2	0.95
	Concern	I join my friends cleaning the class (favorable)	GR3	0.95
		I donate to the natural disaster victims (favorable)	GR4	0.86
	Sharing	I never lend my pencil to my friends (unfavorable)	GR5	0.90
		I never share my meals with my friends (unfavorable)	GR6	0.86
Independency	Self-understanding	I cannot do my homework independently (unfavorable)	MD1	0.86
		I re-learn the difficult lessons at home (favorable)	MD2	0.90
	Self-regulation	I am easily angry when I get bullied by friends in class (unfavorable)	MD3	0.95
		I am late in completing assignments (unfavorable)	MD4	1.00
Critical thinking	Acquire and process information	I ask the teachers when I do not understand the lessons (favorable)	KT1	0.95
		I use one source only to finish the assignment (unfavorable)	KT2	0.95
	Analyze and evaluate reasoning	I look for the easiest way to complete the task (favorable)	KT3	0.90
		I do my assignments in a hurry (unfavorable)	KT4	1.00
	Reflecting on one's own thinking	I have expressed my opinion correctly (favorable)	KT5	0.86
		I think repeatedly before deciding something (favorable)	KT6	0.90
Creativity	Generate original ideas	I struggle when asked to express my opinion (unfavorable)	KR1	0.90
		express my different opinions in class (favorable)	KR2	1.00
	Produce original work	I create my assignment with my own ideas (favorable)	KR3	0.95
		I do my art assignments exactly the same as the examples given (unfavorable)	KR4	0.86
	Having flexible thinking	I can only copy the example given by the teacher (unfavorable)	KR5	0.95
		When given a free drawing assignment, I make it according to what is in my mind (favorable)	KR6	0.86

Based on the table above, the Aiken validity index score is in the range of 0.57 - 1.00. According to Aiken (1985), the cut off value for 7 raters with a 4-choice scale is 0.76. So that at this stage there are 5 items that are eliminated, namely IT4, IT6, IT8, IT9 and BG7. At this stage it became the first instrument reduction process with 35 items that were content valid.

The next stage is content validity with CFA using the windows version of Lisrel 8.8. We tested 35 items on 697 students in grades 3 and 4 for further item reduction. The initial CFA results on the Pancasila Student Profile character instrument are presented in table 2. Table 2 shows that in general the model is still not fit. The predetermined fit parameter values are still not met such as NFI, IFI, CFI, TLI, AGFI. The Pancasila Student Profile instrument model and loading factor values can be seen in Figure 1.

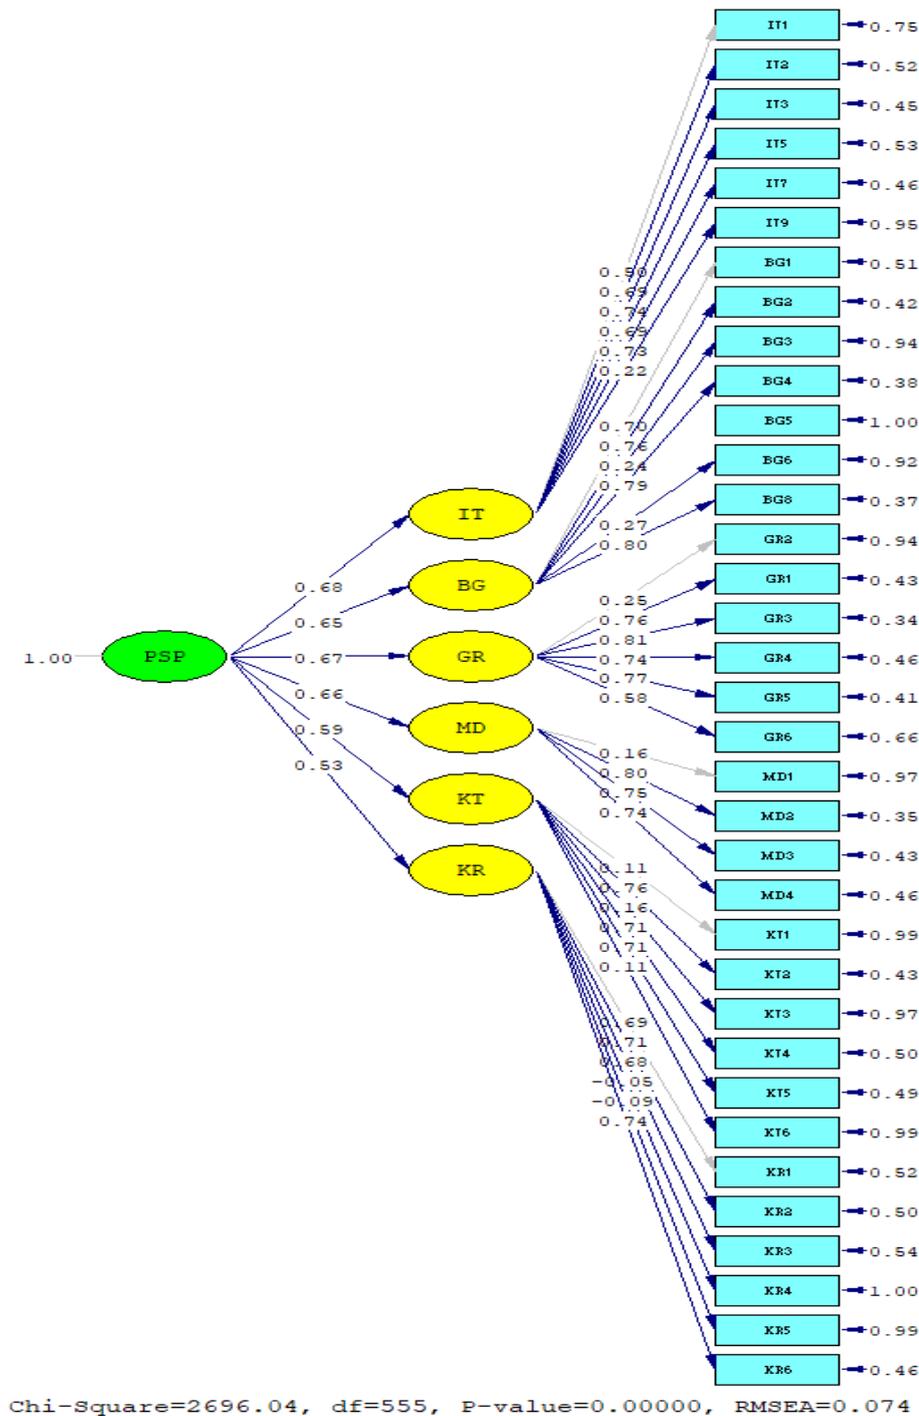

Figure 1. Initial measurement model of pancasila student profile instrument

Table 2. Evaluation of model fit of cfa first model

Category	Fit Parameters	Output	Criteria	Result
Absolute fit	Chi-Square	2696.04	≥ 0.05	Fit
	Goodness of fit index (GFI)	0.9	≥ 0.9	Fit
	Root mean square error of approximation (RMSEA)	0.074	≤ 0.05	Less Fit
Incremental fit	Normed fit index (NFI)	0.81	≥ 0.9	Not Fit
	Incremental Fit Index (IFI)	0.88	≥ 0.9	Not Fit
	Comparative Fit Index (CFI)	0.88	≥ 0.9	Not Fit
	Tucker-Lewis Index (TLI)	0.80	≥ 0.9	Not Fit
	Adjusted Goodness Fit of Index (AGFI)	0.88	≥ 0.9	Not Fit
Parsimonius fit	Parsimonius Normal Fit Index (PNFI)	0.75	0.6 – 0.9	Fit

Because the model does not yet fit, we modified the model to get a better model. Model modification is done by eliminating items that have a loading factor value < 0.5 . The loading factor weight used as the basis in this study was ≥ 0.5 (Hair et al, 2010). In Figure 1, there are 11 items that have a loading factor value below 0.5 so they are eliminated at this stage. These items are IT1, IT10, BG3, BG6, GR2, MD1, KT1, KT3, KT6, KR4, and KR6. Thus, the CFA test for the final model did not include these 11 items. The fit model parameters after 11 items are removed can be seen in table 3 and figure 2.

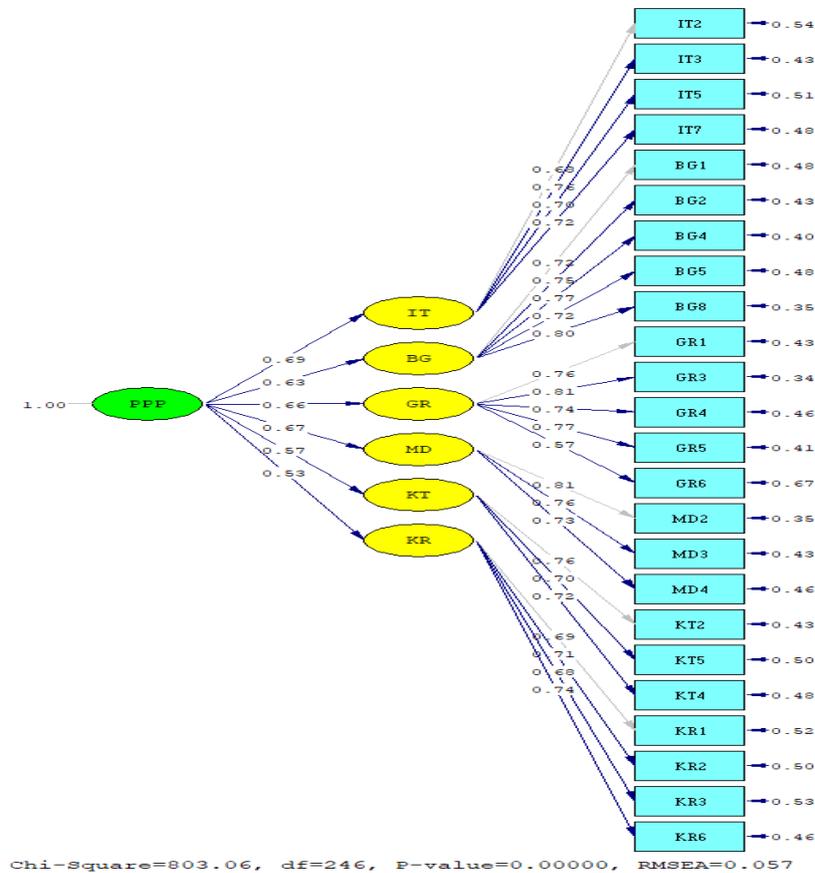

Figure 2. Final measurement model of pancasila student profile instrument

Table 3. Evaluation of model fit of final stage cfa results

Category	Fit Parameters	Output	Criteria	Result
Absolute fit	Chi-Square	803.06	≥ 0.05	Fit
	Goodness of fit index (GFI)	0.95	≥ 0.9	Fit
	Root mean square error of approximation (RMSEA)	0.057	≤ 0.05	Fit
Incremental fit	Normed fit index (NFI)	0.93	≥ 0.9	Fit
	Incremental Fit Index (IFI)	0.97	≥ 0.9	Fit
	Comparative Fit Index (CFI)	0.97	≥ 0.9	Fit
	Tucker-Lewis Index (TLI)	0.92	≥ 0.9	Fit
	Adjusted Goodness Fit of Index (AGFI)	0.94	≥ 0.9	Fit
Parsimonius fit	Parsimonius Normal Fit Index (PNFI)	0.83	0.6 – 0.9	Fit

Table 2 shows the results of the CFA test after modifying the reduction of several items. In the final model, the Chi-square p value is above 0.05, which means that there is no significant difference between the ideal model and the proposed model. The values in the Incremental fit category such as NFI, IFI, CFI, TLI, AGFI have also changed for the better so that they are in accordance with the fit model. Thus, the proposed model fits the empirical data. The complete model and factor loadings can be seen in Figure 2.

Instrument Reliability

After the validity test is carried out, the reliability test is then carried out. Reliability is the internal consistency of an instrument that can be measured based on the level of item homogeneity. We use CFA results to support the evidence of reliability with construct reliability (CR) and variance extracted (VE). The reference for instrument reliability is if the CR value from the calculation is ≥ 0.60 and the AVE value from the calculation is ≥ 0.40 (Wijanto, 2015: 76; Hair et al., 2010: 125). Another opinion used as a reference in this study is Huang (2017: 186) that a CR value of 0.63 is considered good and an acceptable VE value ranges between 0.30 and 0.66 (Huang et al., 2017).

Table 4. Construct reliability results with composite reliability (CR) and variance extracted (VE)

Aspects	CR	VE	Result
Have faith and devotion to God Almighty and have noble character (IT)	0,70	0,38	Reliable
Global diversity (GD)	0,84	0,45	Reliable
Cooperative Work (GR)	0,83	0,45	Reliable
Independence (IN)	0,75	0,50	Reliable
Critical Thinking (CT)	0,62	0,35	Reliable
Creativity (CR)	0,74	0,41	Reliable

Based on the table above, the Composite Reliability (CR) and Variance Extracted (VE) coefficient values for the

aspects of faith and devotion to God Almighty and noble character are 0.70 and 0.38, which means reliable. The Composite Reliability (CR) and Variance Extracted (VE) values for aspects of global diversity are 0.84 and 0.45, which means reliable. The Composite Reliability (CR) and Variance Extracted (VE) values for the gotong royong (cooperative work) aspect are 0.83 and 0.45 which means reliable. The Composite Reliability (CR) and Variance Extracted (VE) values of the independent aspect are 0.75 and 0.5 which means reliable. The Composite Reliability (CR) and Variance Extracted (VE) values of the critical reasoning aspect are 0.62 and 0.35 which means reliable. The value of Composite Reliability (CR) and Variance Extracted (VE) of the creative aspect is 0.74 and 0.41 which means reliable. Thus, the developed Pancasila student profile character assessment instrument can be said to be reliable so that it has a good level of reliability.

Discussion

This study aimed to develop and validate a comprehensive scale for measuring Pancasila Student Profile (PSP) based on the theoretical framework of Indonesian Ministry of Education and Culture. The instrument development process has gone through several reduction processes which were originally 40 items. The developed Pancasila Student Profile instrument consists of 6 aspects which are translated into 19 indicators and 24 items. This instrument can be used to measure student character because it has been proven valid and reliable. An instrument is said to be of good quality if it meets the criteria of validity, reliability, and practicality (Gronlund and Linn, 1990). If an instrument has not met the criteria of validity and reliability, the data obtained cannot be trusted and will affect the conclusions (Kerlinger, 2006). The instrument validation process with content validation testing, obtained valid evidence that 35 items meet the desired criteria. The results of the analysis using Aiken's V formula showed that the validity index was in the range of 0.51 - 1.00. 5 items were eliminated because they did not meet the cut score of 0.76, so the 35 surviving items will be tested at a later stage.

The results of construct validation as evidenced by the CFA test show that the proposed model fits the empirical data after codification. Initially, 35 items were analyzed using CFA to see the suitability of the model, but because there were still some criteria that did not fit, modifications were made by discarding items that had a loading factor value <0.5 . This reduced the valid instrument to 24 items which were retested with CFA resulting in a better measurement model. NFI, IFI, CFI, TLI, AGFI, which were initially not fit, have now increased after model modification so that they meet the fit indices criteria. Not only that, other criteria such as Chi-square, GFI, RMSEA and PNFI also look better after model modification. The results of instrument reduction at the CFA stage are reviewed based on each aspect. The findings on the first aspect, namely faith and fear of God, are measured by 4 valid and reliable items. The 5 indicators developed at the beginning have been reduced to 4 indicators. This happened because two items on the indicator "state morals" were eliminated during the validation process. As explained by Muhtar et al. (2019) that belief and piety to God can be manifested through polite behavior, cleanliness, tolerance, and concern towards the environment. So that the fulfilment of other indicators can form citizens who have good state morals.

The findings on the second aspect, global diversity, the items that remained valid and reliable which is 5 items. At the beginning of the development there were 7 items, 2 items were cancelled during the validation process, but all indicators are represented by items that measure this aspect. Several items that survive can measure aspects of global diversity, namely students who can love their ancestral culture, locality, and identity but can still think openly and accept differences through intercultural interactions (Jamaludin et al., 2022). The findings on the third aspect, cooperative work, the initial developed items were 6 items then reduced to 5 items. In this aspect, only 1 item was eliminated. The three valid items should reflect the value of *gotong royong* (cooperative work), which is a local wisdom of the Indonesian nation that generally means cooperation (Sibrani, 2018) to achieve common goals as social beings (Kurniawati & Mawardi, 2021). In the fourth aspect, independence, there are 3 valid and reliable items out of 4 originally developed items. Independence in the Pancasila Student Profile means that students do not always depend on others in making choices and completing their responsibilities (Kluwer et al., 2020). In the fifth aspect, critical thinking, the 6 items developed at the beginning were reduced to 3 items. However, the three items measure each indicator so that the indicators are still represented. This aspect was also observed to have the lowest validity and reliability compared to the others. In some studies, critical thinking is measured using cognitive tests, but because it is related to character, this study uses a Likert scale. Critical thinking in the Pancasila Student Profile means that students can make decisions on the consideration of existing facts by thinking fairly (Kemendikbud, 2022). The sixth aspect, creativity, has 4 items that are proven valid and reliable. There were 2 items that were cancelled during the validation process because initially the proposed 6 items. The four items describe the ability of students who can reuse, modify, and even create new and original ideas (Rahardjanto, 2019).

The last test conducted was reliability estimation as evidenced by composite reliability and variance extracted scores. The results show that all six aspects fulfil reliability with CV and VE values above 0.63 and 0.3. Composite reliability indicates internal consistency and homogeneous variance between measurement items (Whidhiharso, 2016), so that even though the sentence items are different, they still measure the same construct (Huck, 2007). Thus, it can be concluded that the Pancasila Student Profile Instrument to measure 21st century character is valid and reliable based on the instrument construction that has been carried out. This instrument can be used at the intermediate level in primary schools.

Conclusion

In conclusion, the construct of the Pancasila Student Profile instrument to measure student character in the 21st century is psychometrically valid and reliable. The 24-item Pancasila Student Profile instrument consists of six aspects, namely faith and devotion to God Almighty and noble character, global diversity, cooperative work, independence, critical reasoning, and creativity. The six aspects were developed into 19 indicators resulting in 24 items. The validity of the instrument is proven by construct validity through model fit test and evaluation of model fit criteria. The reliability of the instrument has also been proven to be good based on composite

reliability and variance extracted analyses. To our knowledge, this is the first instrument to measure the character of the Pancasila Student Profile specifically made for grades 3 and 4 in elementary school. The measurement results using this instrument can later be used as preliminary data in comparing the character scores of students at other levels in Indonesia.

Abstract: The fact that Indonesia becomes the first country contributing to food loss and food waste among the G20 countries in 2021 is an opportunity to evaluate the effectiveness of sustainability education taught in universities. This study aims to map students' initial knowledge and skills in processing the food waste and to create an integrated food waste management design in a higher education institution. An explanatory sequential mixed method was used in this study involving 641 student respondents for the quantitative phase and three institutions for the qualitative phase. The quantitative phase found that 67.71% of students did not have experience processing organic waste, and their perception about waste segregation benefit is still in the moderate category. However, the index number of students' self-identity is high (80.94) regarding their perception that they had behaved in an environmentally friendly manner. This finding is then communicated with several related institutions during the qualitative phase to develop an integrated sustainability education model outside the formal curriculum to improve students' knowledge and skills in processing food waste.

Introduction

Globally, Romero-Luis et al. (2021) found that campaign regarding the circular economy and bioenergy through education is still in their early stages and have a low level of maturity. Although many studies states that teaching about sustainability and circular economy in the classroom has shown a positive trend (Bugallo-Rodríguez & Vega-Marcote, 2020; Williams et al., 2018), there are also research results that criticize it. Several studies suggest that so far, the insights about the circular economy taught in class have been more conceptual (Hens et al., 2018; Kirchherr & Piscicelli, 2019) and inconsistent with the content of knowledge being taught (Fonseca et al., 2018). In addition, the material taught is not simple, concrete, inclusive and transparent (Corvellec et al., 2021). This causes the concept of sustainability and circular economy that are taught in classes are failed to develop critical, imaginative and innovative thinking about sustainable development (Kopnina, 2018). Another problem related to classroom learning regarding the circular economy, sustainability, and other relevant matters are difficulty to observe changes in student behavior permanently due to the limited number of meetings and evaluation duration (Bugallo-Rodríguez & Vega-Marcote, 2020), the need for more lecturers, the teaching load for lecturers will become heavier, faculty financial management problems related to the increasing complex activities to be carried out, construction of new facilities, and difficulty of determining the right evaluation design (Wandl et al., 2019).

The UN has a global performance ranking that assesses university performance in supporting SDGs called the Times Higher Education (THE) Impact Rankings. The 2022 Impact Rankings is the fourth edition and the overall ranking includes 1,406 universities from 106 countries/regions. THE Impact Ranking uses carefully calibrated indicators to provide comprehensive and balanced comparisons across four broad areas: research, stewardship, outreach, and teaching. In 2022, the university with the best TPB practice is Western Sydney University (Australia) with a score of 99.1; Arizona State University (United States) with a score of 98.5 and Western University (Canada) with a score of 97.8. Only 28 Indonesian universities are listed in this rank board. It implies that most universities in Indonesia have not paid much attention to their role in supporting sustainable development. The top 10 national rankings of listed Indonesian universities can be seen in Table 1.

Table 1. Listed Universities with the Highest Sustainable Development Score in Indonesia

No.	World Rank	University	Total Score
1.	18	Universitas Indonesia	95,1
2.	87	Universitas Gadjah Mada	89,2
3.	101-200	Institut Teknologi Bandung	82,1 – 88,5
4.	101 – 200	Universitas Padjajaran	82,1 – 88,5
5.	201-300	Universitas Airlangga	76,9 – 82,0
6.	201-300	Institut Teknologi Bandung	76,9 – 82,0
7.	201-300	Universitas Diponegoro	76,9 – 82,0

8.	301-400	Universitas Sebelas Maret	72,0 – 76,7
9.	301-400	Institut Teknologi Sepuluh November	72.0 – 76,7
10.	401-600	Universitas Brawijaya	65,0 – 71,9

Source: THE Impact Rankings (2022)

Table 1. shows that almost every university has a high partnership score (Partnership for the Goals -TPB number 17). Ironically, only two universities were able to achieve a high Education Quality score (TPB number 4), namely IPB and UNS. Apart from these two higher education institutions, there is no ranking regarding the quality of education that contributes to achieving the total score of the top 10 universities in Indonesia.

Although only a few universities in Indonesia are listed in THE impact rankings, several universities and study programs in Indonesia have introduced the concept of sustainable development. However, based on the results of searching various information using internet searching techniques, it was found that most of these courses were presented for the Master Program and the discussion in them was focused on the approach of each scientific discipline. For example, the Insitut Teknologi Sepuluh Nopember Surabaya (ITS) has a course on "Sustainable Development" which is taught to students of the Master Program in Development Studies, the Postgraduate School of Universitas Brawijaya (UB) offers courses on Sustainable Development and Environmental Insight in the Master Program in Environmental Resource Management and Development (<https://ppsub.ub.ac.id/akademik/program-studi-interdisciplinary/>), Tadulako University equips Master of Economics students with Green Economy courses (<https://siaga.kemdikbud.go.id>). Several universities also teach it to students in undergraduate study programs, but with a tendency to only teach it to certain study programs such as study programs related to engineering and economics. For example, Mulawarman University requires undergraduate students in the Development Economics Study Program to take Natural Resource and Environmental Economics courses, ITS with the same study program features courses on Sustainable Development Education (semester 5) and Sustainable Society: Theory and Practice (semester 6). Interestingly the courses in semester 6 are opened for other study programs. On the other hand, Universitas Negeri Semarang (UNNES) introduced the Environmental Education course as a general subject which is a mandatory for all undergraduate students in any study program.

The problems and obstacles to teaching sustainability inside the classroom require a more concrete solution than simply improving the existing curriculum design. De la Torre et al. (2021) argues that there are other ways to help transition of circular economy by promoting the concept of sustainability outside the formal curriculum. The results of these thoughts inspire novelty in this research: how universities should not only focus on integrating the concept of sustainability into the formal curriculum, but also be able to become pioneers of this transformation through a more concrete movement that is supported by all components of the HEIs.

Food Waste Problem in Indonesian HEIs

In 2021, Indonesia became the largest food waste producer in Southeast Asia according to Food Waste Index

2021 developed by United Nations report Environment Program (UNEP). The total food waste in Indonesia reaches 20.93 million tons annually. This number has a significant impact on greenhouse gas emissions. The related data could be seen in Figure 1.

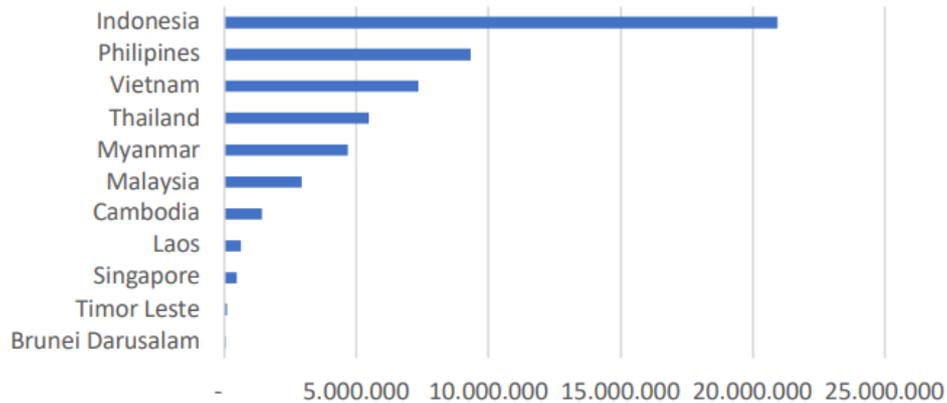

Figure 1. Household Foodwaste Estimate (tons/year) in South East Asia

Source: Food Waste Index, UNEP (2021)

Furthermore, according to the Sustainable Development Report (2022), Indonesia is listed as one of the countries that has not made enough progress in meeting the 2015 Paris Agreement targets. In general, the composition of organic waste in the form of food scraps in households is proven to have a larger amount than inorganic waste, which ranges from 60% to 73% of the total household waste generation (Arief, 2019; Brigita & Rahardyan, 2013; Khasanah et al., 2019; Widiarti, 2012). However, compared to inorganic waste management, the progress of food waste management in Indonesia seems quite slow. Several research results try to unravel the causes of the slow progress in food waste management activities, including: the lack of awareness of the government in providing special food waste processing facilities (Brigita & Rahardyan, 2013); lack of public awareness and knowledge in sorting waste (Brigita & Rahardyan, 2013; Kurniawan & Santoso, 2020; Yudistirani et al., 2016); there are no resources specifically employed to sort waste and a lack of creative communities in waste management (Kurniawan & Santoso, 2020).

Non-profit organizations whose activities focus on reducing FLW actually exist and are developing in Indonesia, such as "Food Cycle Indonesia" (Jabodetabek), "Garda Pangan" (Surabaya), "Hunger Bank" (Bandung), "Zero Waste Indonesia" (online community). Foodbank of Indonesia (FoI) and other similar non-profit organizations. Most of these organizations operate as food banks that are committed to distributing food assistance to underprivileged people in need. In addition, several organizations also carry out recycling activities and sell their products online. Several movements that focus on reducing food waste have also come from corporate initiatives in the form of Corporate Social Responsibility (CSR) such as McDonalds with the "Food Rescue" program, DBS Bank with the "Towards Zero Food Waste" program, or Aswata Insurance Company with the "Fighting the Food Waste" program. Food Waste Action".

In a smaller scope such as the university environment, most stakeholders still do not have awareness in waste management. The problem of waste in tertiary institutions still does not reflect the success of teaching in the classroom. The generation of waste in tertiary institutions is recorded in several studies as still high and the management is not optimal. The findings of Nurjannah et al. (2020) in their case study in a university canteen estimated the weight of leftover food produced by each respondent studied was 147 grams/day with a percentage of leftover food weight per individual of 38% of the portion served. The estimated value of food waste from this amount is IDR 4,244 per individual/day with the percentage value of food waste per individual being 38% of the total cost incurred for consuming food per day. Meanwhile, the results of other studies regarding waste generation in the campus environment found varying amounts, namely every day the campus produces waste weighing 123.43 kg (Masrida, 2017), 770 kg (Yuliandari et al., 2019), up to 12 tons (Retnoningsih et al., 2022). Based on the results of these studies, the percentage of types of organic waste is greater than other types of waste.

The number of students in Indonesia is 9.32 million people in 2022 (Indonesian Department of Education, 2023). They are all potential to be the agent of change regarding to environmental transformation. The irony that occurs in this case is that students who are expected to become the agents of change, especially in terms of promoting circular economy transformation and becoming pioneers of the concept of sustainability in all aspects of life, are in fact still far from expectations. A study by Sima et al. (2022) revealed that the lack of knowledge and lack of student interest in activities related to environmental issues is the biggest obstacle to the success of tertiary institutions in Romania. The majority of respondents to a study in the United Arab Emirates agreed that young people generate more food waste than their parents, most of which comes from excessive food purchases and poor food management (Yagoub et al., 2022).

Studies on the behavior of disposing of food waste by Indonesian students are still limited to describing the behavior of disposing of food waste and the factors that influence it (Amalia, 2019); identification of types of waste in the university area (Dewilda & Julianto, 2019); and an inorganic waste processing model (Sunandar et al., 2020). Studies on organic waste management models in HEIs involving the students are still very difficult to find in Indonesia. Therefore, the research questions of the current study are:

1. How is the students' perception about food waste management?
2. How university could build an integrated food waste management with students' active participation?

Method

An explanatory sequential mixed method was used in this study. The quantitative phase used a cross-sectional online survey conducted in Universitas Negeri Semarang, Indonesia which is the state university that declared their vision to be international reputable conservation university in Indonesia. As many as 641 students across disciplines and semesters filled in the survey anonymously to know about their knowledge about waste management, their perception about it, and their perception about their environmentally friendly self-identity.

The survey was adopted from Nguyen et al. (2022) with minor adjustment and had been re-tested in terms of its reliability and construct validity. The descriptive qualitative methods using index number was applied to explain the findings regarding research question number 1 up to 3.

The qualitative phase was done by doing interviews to 4 key persons, they are: the manager of the central landfills Jatibarang Semarang City, the head for integrated organic waste processing site of UNNES named *Tempat Pembuangan Sampah Terpadu* (TPST) UNNES, the staff of Conservation Development Unit (UPT Bangvasi) UNNES and the head for household sub-division of UNNES. The interview transcripts were analyzed using N-Vivo program to do the interactive method as Miles et al. (2018) explained which are data condensation, data display, drawing and verifying conclusion about how to build an integrated food waste management with students' active participation.

Results

Respondents Demographic Data

A total of 641 anonymous respondents who are active students in Universitas Negeri Semarang, Indonesia completed the online survey. The Demographic data and respondents' characteristics are shown in Table 2.

Table 2. The Demographic Data

Indicators	Answer Options	Total	Percentage
Sex	Female	485	73,4%
	Male	176	26,6%
Semester	1	414	64,59%
	3	122	19,03%
	5	74	11,54%
	7	15	2,34%
	More than 7	16	2,50%
Residence	Boarding house	485	73,4%
	Parents' house	128	19,4%
	Rent House	40	56,1%
	Private House	8	1,2%
Have experience in managing organic waste	No	450	68,1%
	Yes	211	31,9%
Have pet(s) or livestock	No	403	62,87%
	Yes	238	37,13%

Indicators	Answer Options	Total	Percentage
How to deal with the organic waste currently	Put it in garbage bin without sorting process	350	54,60%
	Put it in garbage bin after sorting process	100	15,60%
	Feed it to pet(s)/livestock	26	4,06%
	Put it in composter	11	1,72%
	Others	154	24,02%

As cited in the Table 2, more than a half of students do not have any experience in managing organic waste. However, the 31,9% students with the experience of managing organic waste shared interesting experience they did to their organic waste, such as: processing the organic waste into compost, utilizing food waste as animal feed (since 37,13% of respondents stated they have pets and livestock), restoring the leaves waste into artistic souvenirs, or just simply burying the organic waste at their backyard. As many as 54,60% students revealed that they just simply put the waste without sorting it. This fact requires deeper attention because waste separation is an important thing to achieve high rates of waste reuse and recycling (Stoeva & Alriksson, 2017). Despite this fact, the number of students who have taken care their waste separation reached 100 students, even only 11 students that put their organic waste into the composter by themselves.

Students' Perception about Food Waste Management

Table 3 describes the students' perception about food waste management based on 3 indicators: perceived personal benefits of sorting food waste, inconvenience in sorting food waste, and environmental self-identity by measuring index number for each indicator.

Table 3. Students' Perception about Food Waste (FW) Management

No	Statement	Answer Frequency (%)				Index	Category	
Personal benefits of sorting food waste (Cronbach's $\alpha = 0.89$)								
1	Putting FW into the green bin is the right thing to do	9,7	15,9	46,3	20,3	7,8	60,12	Moderate
2	I feel good when I sort and dispose of FW correctly into the green bin	7,3	10,3	33,1	28,9	20,4	68,96	Moderate
3	By using the green bin for FW, my rubbish bin stays cleaner and does not need to be taken out as frequently	19,8	28,5	30,3	12,5	8,9	52,44	Low

Inconvenience and lack of control in using the green bin (Cronbach's α =0.79)

4	I do not have sufficient information regarding FW going into the green bin	7,6	14,9	35,7	26,8	15	65,34	Moderate
5	It is expensive to buy supplies (e.g. compostable bags, kitchen caddy, etc.) to sort into the green bin	10,8	24	39,6	16,9	8,7	57,74	Moderate
6	I do not want to deal with the smell and the mess of food when sorting	10,5	18,4	33,8	24,8	12,5	62,08	Moderate
7	FW It takes too much time and effort to sort FW into the green bin	8,9	21,4	38,8	22,8	8,1	59,96	Moderate
8	I have no control over FW as other people in the house are the ones disposing FW	10,5	17,6	33,7	24	14,2	62,76	Moderate

Environmental self-identity (Cronbach's α =0.89)

9	Acting environmentally friendly is an important part of who I am	3,4	1,6	3,4	10,5	81,1	92,86	Very High
10	I am the type of person who acts in an environmentally friendly way	0,8	3,1	32,4	40,6	23,1	76,42	High
11	I see myself as an environmentally friendly person	1,4	4,1	39,4	35,6	19,5	73,54	High

Note: All items were assessed on 5-point Likert scales; higher values correspond to stronger agreement with the statement or higher frequency of recycling habit. FW=Food waste (Adopted from Nguyen et al., 2022)

University's Perception about Food Waste Management

According to the interviews with the key persons, the outcomes of qualitative phase in the current research were classified, sorted and arranged using NVivo to identify themes and patterns of interviews transcript. The NVivo tools used in this analysis are including: word frequency (word cloud and cluster analysis), text search, and hierarchy chart. Figure 2 displays the word cloud of 25 most frequent words mentioned during interviews with minimum length of word as many as 3 characters. The word "waste" dominated conversation by mentioned 82 times (4.92% of total words during interviews), followed by "UNNES" which mentioned 56 times (3.36%), "TPST" (34 or 2.04%), garbage (33 or 1.98%) and Bangvasi (23 or 1.38%). It implies that by putting aside the words "waste" and "UNNES" which are the main topics of conversation, TPST UNNES and Bangvasi are considered as the main actors related to waste management at UNNES, especially to set "programs" (22 times or 1.32%) for managing garbage.

The two main clusters talk about the wrong process of waste management (organic and inorganic waste) has become the main problem in the city final landfill (TPA Jatibarang) and the other cluster focuses more in UNNES waste management program. Furthermore, in the first cluster about TPA Jatibarang, the interview results revealed that they tried to develop an education program for citizens about organic waste management by cultivation Black Soldier Fly (BSF) larvae which has economic value to be traded as animal feed. Meanwhile, the waste management in UNNES is handled by TPST UNNES collaborating with UPT Bangvasi and Household Sub-division. BSF larvae cultivation is also implemented in TPST UNNES as a strategy to recover food waste energy into new energy, while other organic waste such as leaves and grass are processed into organic fertilizer. The food waste is collected from campus canteens and sorted by janitors before distributed to TPST UNNES. UPT Bangvasi claimed that the waste management program has been effective enough to handle campus' waste so far. However, when it comes to student community, they also admitted that there is a problem with sustainability and durability of typical student community concerning in conservation.

The discussion about youth community for supporting waste management campaign in university was led to some important points mentioned by the key persons during the interviews. The theme "community" itself was analyzed using text search query and produced some structured concepts shown in Figure 4.

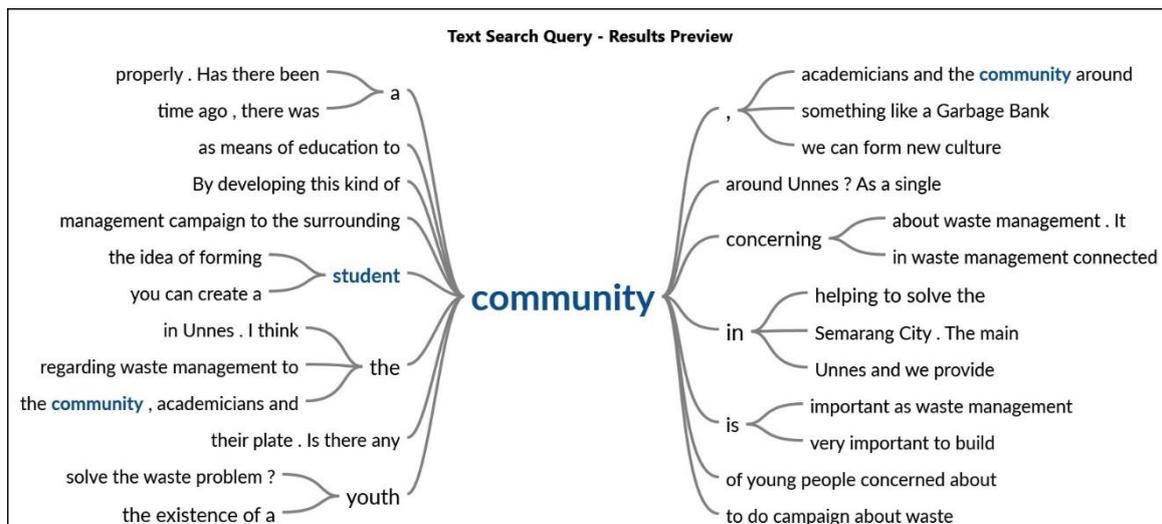

Figure 4. Text Search Query for Community Theme

Basically, all the key persons interviewed reacted positively about an idea to form a youth community concerning in waste management campaign. According to them, the following are some things that need to be considered if students want to create a waste-aware youth community: (1) representation; (2) program durability; and (3) sustainability. Representation was proposed by TPST considering there are many faculties in the university so each of it need its representative to make sure the waste management education can reach all students, lecturers, and canteen sellers in all faculties on campus. Program durability was suggested by Household Sub-Division as they experienced typical communities set short-term programs which do not have a solid management to achieve long-term goals. The implementation of this long-term program is important

because it takes a long time to change the culture, for example a culture for sorting waste, mindful eating, zero plate waste, etc. Meanwhile, sustainability was emphasized by UPT Bangvasi regarding the fact that some community just vanished simply when the founder graduated from university. The youth community in the university needs to make sure that the system they have can be run by all members of the community so that if there is a change in members this will not affect significantly to community activities.

Discussion

The interviews revealed that basically the university waste management units have implemented zero waste policy consistently by arranging university waste independently without sending them to the city landfills. However, this program run at institutional level by hiring people who professionally and specifically manage the waste. University should not forget its function to provide the waste management education for their students. The fact that students in conservatory university which has a particular and mandatory common course related to conservation knowledge named “Pendidikan Lingkungan Hidup” or “Environmental Education” in the first semester still have low awareness in managing their waste becomes evidence that incorporating environmental issues into the curriculum in the form of courses does not necessarily increase environmental awareness around students. Meanwhile, Kurniawan & Santoso (2020) found that more participation from the creative community is needed to overcome this waste processing problem, especially food waste.

Based on the interviews with university parties, student community might be needed to support the environmental education inside the class by providing more real action outside the class. Creating a community concerning in waste awareness and waste management among university students is not easy. Holdsworth & Quinn (2012) stated that there is always a possibility that students from different backgrounds may not have the sense of belonging or inclusiveness towards the community. This study in line with the finding of environmental self-identity variable that students are tend to create a positive image of themselves, in this case is to tell others that they care enough about environmental issues, even though in the reality they have not participated actively in protecting the environment.

Student community heavily depends on volunteers. Therefore, to build a strong student community it is important to treat the volunteers based on their motivation joining community. Clary et al. (1998) formulated a set of six essential motives of volunteers and developed the Volunteer Function Inventory (VFI) which consists of six motivational functions that volunteering may serve: (a) values, communicating values that are personally important; (b) understanding, learning about the world, developing skills; (c) social, strengthening one’s social relationships, being concerned about social rewards; (d) enhancement, growing psychologically; (e) career, gaining career-relevant experience; and (f) protective, addressing personal problems, reducing negative feelings. In order to get deal with sustainability issue, it is recommended that in recruiting volunteers, the committee should first identify their motivation in registering for the community program and assign them tasks that will enable them to achieve their goals.

In terms of community programs, there are studies suggested many programs to manage the waste designed specifically for students. For instance, in order to reduce canteen's plate waste, several studies have proposed various alternative interventions that can be carried out, such as: provision of food tasting spoons in the canteen (Cardwell et al., 2019; Malefors et al., 2022); doing campaign about plate waste (Visschers et al., 2020); plate tracker installation, forecasting canteen visitors (Malefors et al., 2022); changes in food serving infrastructure (Berkowitz et al., 2016; Lorenz et al., 2017; Thiagarajah & Getty, 2013; Vermote et al., 2018); and even providing incentives to consumers (Priefer et al., 2016). All those activities could be handled by student community by spreading volunteers in the campus canteen. In addition, volunteers could also be educated to transform food waste into products such as fertilizer (Kurniawan & Santoso, 2020; Loan et al., 2019) and BSF larvae (Fowles & Nansen, 2020; Ojha et al., 2020).

Other than the discussed aspects (representation; program durability; and sustainability), the future student community should also consider the role of social media in carrying out waste awareness campaigns. (Scholtz et al., 2016) found that the social media campaign had numerous positive benefits for promoting environmental awareness in South African HEIs. Social media can be utilized in online advocacy such as the Greenpeace Mediterranean food campaign which has had significant success in its short time in Turkey (Özdemir, 2012). The study of Haenlein et al. (2020) revealed that Instagram and TikTok are the most prominent social media recently because they have the youngest user bases. The implication is that these two social media users are very vulnerable to all forms of online communications, including online campaign about environmental awareness. The student community could manage their social media as one of the tools for campaigning, recruiting members, and informing their future agendas to public.

Conclusion

The fact that there is a gap between university programs and students' knowledge and skills in terms of waste management raises awareness to bridge this gap by grounding knowledge about the environment to be more than just in the form of formal courses. A student community is needed to increase the environmental awareness, knowledge and skills of students. However, building a community needs extra time and efforts. Therefore, university should plan some strategies to make sure the student community could be representative, durable, and sustainable. The strategies are including food waste campaigns in faculty canteens, several workshops, voluntary activities, and online campaigns using social media. By building the student community, the university gets the better chance to promote sustainability and environmental awareness outside the classroom in the more relatable and interesting way for students. The future study is planned to identify the students' motivation joining this community and how social media engagement support community agendas.

Abstract: COVID-19 pandemic has transformed the conventional education landscape to online remote learning. However, this transition has brought about certain challenges such as low levels of student engagement and motivation, which raises the question of whether students are actually learning. Using Virtual Reality (VR) in teaching and learning (T&L) could increase engagement as it provides interactive experience that necessitates students' online presence. Literature shows students are aware of VR benefits, yet not many tertiary educators are using VR. Thus, this study aims to investigate Malaysian tertiary educators' awareness of VR and readiness to explore its potential in remote online T&L through a questionnaire survey adapted from previous studies that applied the Technology Acceptance Model (TAM) as their theoretical framework. Of 26 respondents, only 4 had VR experience in the classroom. While others lacked VR experience, their perceptions were positive, and they were aware of the challenges of using VR. It can be concluded these challenges are partly the reasons why VR is under-utilised. The findings implicate the need to train and familiarise tertiary educators in the use of VR for the continuous intention to use VR. It is believed that when more educators have more intimate knowledge of VR, the more students will benefit regardless if the classes are remote online or otherwise.

Keywords: Virtual reality, Tertiary educators, Remote online learning, Technology Acceptance Model (TAM)

Tertiary Educators' Awareness of and Readiness to use Virtual Reality (VR) in Remote Online Learning. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 256-274), Cappadocia, Turkiye. ISTES Organization.

Introduction

The COVID-19 pandemic has necessitated the adoption of remote online learning (ROL). Due to lockdowns disrupting once-thriving classroom environments, education providers were forced to rapidly deploy online learning technologies to facilitate engagement with learners remotely (Turnbull et al., 2021). Remote learning is not to be confused with online learning. Online learning refers to learning that is facilitated online, but not necessarily remotely as both teacher and students can be in the same classroom while working through lessons (Roe, 2020). Remote learning refers to when learning takes place in distanced locations without the need for physical presence in a traditional classroom setting. In remote learning, technology is utilised to disseminate information such as through video conferencing, and discussion boards (Roe, 2020). ROL can take various forms, including live virtual classes conducted in real-time through video conferencing platforms, pre-recorded lectures or instructional videos that students can access at their convenience, online discussion forums or chat groups for collaboration and communication, and digital platforms or learning management systems where course materials, assignments, and assessments are shared and readily available for learners.

The COVID-19 pandemic has significantly accelerated the adoption and prominence of ROL, as it provides a flexible and accessible alternative to in-person education when physical attendance is not feasible or safe. As a result, educators have transitioned from the traditional face-to-face, synchronous learning approach to remote online teaching, where interactions with students occur virtually through online meeting platforms like Zoom, Microsoft Teams, or Webex. This shift has posed challenges as students grapple with learning in isolation, facing internet connectivity issues, family disruptions, and sharing devices with siblings (Song & Lim, 2022; Kruszewska et al., 2022). Furthermore, not only do educators have had to adapt to new platforms and systems, they also have had to contend with issues such as poor learner engagement and motivation (Capone & Lipore, 2022; Aldossari & Altalhab, 2022). Joshi et al. (2020) reported findings from a survey administered in 2 rounds on agriculture and natural resource science students and instructors in a US-based university that students consider the lack of hands-on experience and poor instructions as the most important weaknesses of online learning. This is because in online classes, students often attend with their cameras turned off, making it difficult for educators to gauge their level of participation.

Furthermore, in the new normal shaped by the pandemic, it has been observed that ROL is practical as many universities now embrace substitute blended learning (Shi et al., 2021). Different from blended learning in

which classrooms are flipped, ROL allowing students to cover specific materials beforehand and utilize class time for practice and discussions, in substitute blended learning, students take charge of their own learning for a designated period. Educators would provide carefully crafted and curated learning materials and assessments for students to access and complete during that period. Presently, the learning process is a one-way approach, lacking interactive elements. However, this signifies that ROL will endure in teaching and learning due to its convenience and flexibility. This follows that the issue of learner engagement will also persist as engaging and maintaining student engagement is a primary goal for educators. According to Tawafak et al. (2020), it is important to measure the academic performance for students through the improvement of using technology integration as a support for teaching methods to help students in their studies especially in online learning. The challenge of remote learning and online learning is ensuring learner engagement during online classes.

Virtual Reality (VR) in Teaching and Learning (T&L)

A potential solution to foster learner engagement for ROL is the integration of Virtual Reality (VR) in Teaching and Learning (T&L) practices. VR can be defined as a simulated interactive environment created by a three-dimensional computer-generated graphics system, complemented by various interface devices (Guttentag, 2010; Brey, 2014). This technology offers users an immersive experience, allowing them to explore and interact with artificial, digital worlds (Shen et al., 2020). A VR system typically provides real-time, viewer-centered head-tracking perspective, a wide field of view, interactive controls, and a binocular display (Doerner et al., 2022; Cruz-Neira et al., 1993). Popular examples of VR include games like Resident Evil 7 (PlayStation) (Pallavicini et al., 2018) and Microsoft Flight Simulator (Trinon, 2019). Unlike Augmented Reality (AR), which enhances the physical environment using tools like mobile phones e.g., to chase after a Pokémon in the streets, VR immerses users in a completely virtual world, effectively blocking out their real surroundings. This raises the question, “Is it more effective to rely on predominantly one-way learning approaches, or should students be immersed together in a virtual world for their learning experience?” Findings from recent studies indicate that students are interested in the use of this technology (Shen et al., 2018) and the idea that immersive learning through a virtual environment presents a compelling alternative.

Since VR's existence in the 1960s to its application in T&L in the late 90s and early 2000s, educators and researchers began recognizing the potential of VR as a tool to enhance learning experiences and improve engagement. Initially, VR was primarily utilized in specialized fields such as medical training and military simulations due to its cost and complexity. Over time, VR technology has become more advanced and more accessible. To date, its use in T&L has also expanded to various educational settings and disciplines such as science, engineering, art, history, offering students immersive and interactive experiences that can deepen their understanding and engagement with the subject matter. Literature reveals VR increases learner engagement, motivation and learning outcomes as VR makes learning not only an interactive experience that requires students' online presence (Shen et al. 2018), but students also find it more interesting and fun to learn as the emphasis is on the teaching materials (Ahmad et al., 2019). Literature has also shown that students were open enough to using VR to the extent that they were willing to pay extra tuition fees (Wong et al., 2020).

However, despite all its potential and the interest students have shown, the widespread adoption of VR in T&L is still relatively limited, and it remains largely under-utilised by educators in the classroom (Wong et al., 2020). Wong et al. (2020) further add that VR is still not a trend in local tertiary institutions as educators are still reluctant in adopting the technology mainly due to lack of technical skills. Similarly, according to Md Shamsudin and Abdul Majid (2019: p.19), “current pedagogical methods and tools at the tertiary level are unable to provide students with realistic and practical usage of virtual reality due to incompetence and lack of IT skills among educators”. To resolve that, Halili (2019) suggested for Malaysian educators to be given training to enhance their IT skills and be exposed to more VR applications.

Md Shamsudin and Abdul Majid (2019) also claimed that universities lack the needed facilities to prepare students and educators for VR in the teaching and learning process. It was argued that for the courses to apply mobile VR applications effectively, a framework should be developed and proposed to assist educators and students in higher education institutions. No doubt that the learning process will be more engaging and motivating for the learners using VR, but VR applications apparently bring a lot of challenges in terms of financial support from the learning institutions, and the readiness of the educators to apply VR in their classroom (Adnan, 2020; Md Shamsudin & Abdul Majid, 2019).

Furthermore, many VR applications require students to physically be in a lab or attached to Head Mounted Devices (HMD) which may not be possible in ROL. As such, how will educators address this challenge as the VR technology that educators can use in ROL would be limited. As such, Rafidi (2020) stated that it is high time for Malaysian educators to embrace 21st learning such as VR as it is one of the technology pillars of Industry Revolution 4.0. While the global lockdown is perceived negatively as it has disrupted the entire education system and student learning, it should be seen as a catalyst to spur 21st century learning and VR is among the technological pillars of the Industrial Revolution 4.0 (Rafidi, 2020).

Virtual Reality (VR) for Tertiary Education

The Ministry of Higher Education (MOHE)’s Fourth Industrial Revolution (IR4.0) Action Plan involves four strategies such as Strengthening Education Governance System towards IR4.0; Enhancing Education 4.0 Ecosystem; Developing Highly Skilled and Knowledgeable Talent for IR4.0; and Enhancing Research and Innovation Towards IR4.0 (Raman & Rathakrishnan, 2019). Therefore, Malaysian higher education institutions should be prepared to gear their educators to cater to the demand of the IR4.0 policy by providing them with appropriate knowledge, skills and values. The real problem faced by education in universities is a need for several applications in learning and education and tool technologies to improve their outputs and improve on teacher-student prospects (Tawafak et al., 2019). Our research has found that, to date, there is a lack of studies on Malaysian tertiary educators’ awareness and readiness on using VR applications for remote online teaching. While VR is promising for engaging learners in ROL, the question is whether educators are willing to adopt VR. Therefore, this study explored Malaysian tertiary educators’ awareness of VR. This study also aimed to provide insight to the educators’ readiness to explore VR in remote online T&L.

Technology Acceptance Model (TAM)

Technology Acceptance Model (TAM) is a theoretical framework that aims to explain the process of user adoption and acceptance of new technologies. This framework studies individuals' attitudes and intentions related to the use of a particular technology and how these factors influence their actual usage behavior. TAM consists of two significant components. Figure 1 illustrates TAM proposed by Davis (1989).

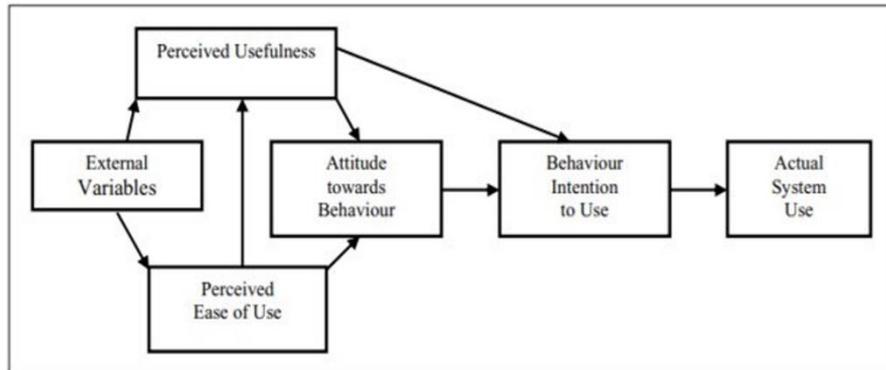

Figure 1. Technology Acceptance Model (TAM) by Davis (1989)

Perceived Usefulness (PU) is one of the primary components of TAM that refers to how users view a specific technology's ability to simplify tasks or enhance job performance. In other words, if users perceive a technology as valuable, they have more tendencies to accept and adopt it. Several research conducted in the past from various fields have proven this claim (Erjavec & Manfreda, 2022; Zhong et al., 2021). This study utilizes the concept of PU to investigate how tertiary educators perceive the usefulness of VR technology and its potential benefits in the context of ROL. These benefits encompass improved student engagement, enhanced comprehension and retention of complex concepts, and the ability to simulate real-world scenarios. Another essential component of the TAM is Perceived Ease of Use (PEOU), which focuses on users' perceptions of the effort needed to comprehend and utilize a technology. If users perceive a technology as user-friendly, they are more inclined to accept and adopt it (Al-Marroof et al., 2020; Yang & Shih, 2020). This might involve considering factors such as compatibility with existing educational technologies, the availability of support and training, and the perceived effort needed to implement VR into ROL settings. As shown in Figure 1, these two components directly impact users' attitudes and behavioral intentions towards technology usage. Attitude towards using a technology is influenced by both PU and PEOU. Consequently, the intention to use technology is influenced by the attitude towards it.

Researchers have expanded upon the TAM model by introducing additional factors like subjective norms and facilitating conditions. These additions enhance our understanding of technology acceptance. In this study, Section B of the questionnaire addresses educators' awareness and preparedness through seven qualitative questions. Awareness encompasses both perceived usefulness and perceived ease of use, which may or may not impact their readiness. Here, readiness refers to the behavioral intention to utilize VR in ROL. The TAM model

has been extensively applied and expanded in various research settings to examine and predict individuals' acceptance and adoption of new technologies. It offers valuable insights for technology designers, marketers, and researchers to evaluate and enhance user acceptance.

Method

Research Design

This study utilized a qualitative research design, chosen for its suitability in obtaining insights into the awareness and readiness of Malaysian tertiary educators regarding the integration of VR in ROL (Creswell & Clark, 2017). To accomplish this, the subsequent section will offer a comprehensive account of the employed research instrument, participant demographics, and the analysis conducted for this study.

Research Instrument

To explore educators' awareness and readiness in utilizing VR within ROL, this study adopted the TAM framework proposed by Davis (1989). A questionnaire consisting of two parts was distributed to participants through Google Form over a span of 4 weeks. Part A comprised demographic information such as age, gender, work experience and other relevant details. The demographic information is useful to provide context and background information on the participants. Part B included qualitative open-ended questions which were designed to gather insights into the participants' awareness and readiness when it came to using VR in ROL. Table 1 below shows the questions that were asked regarding their awareness of VR in Part B of the questionnaire.

Table 1. Part B Awareness of VR in ROL

Question Number	Description
Q1	Do you have any knowledge of using VR? If yes, to what extent?
Q2	Have you ever used VR in teaching?
Q3	List the courses you have used VR for and the VR application you used the purpose and duration (for example: YouTube VR and VR Headset - only 1 lesson about 2 hours during class time OR asynchronous)
Q4	How long did you use VR for? (For example: 2 semesters)
Q5	Do you think students would enjoy learning/ be engaged if VR is used for remote online learning? Why?
Q6	Would you be interested in using VR for teaching? Why?
Q7	What issues do you foresee if VR is used for remote online learning?

Part B's qualitative data provide insight into the educators' awareness and readiness for using VR technology in their classrooms. For clearer understanding, questions 1-5 focus on exploring their awareness, while questions 6

and 7 concern their readiness. These questions were aided by TAM theory. After obtaining both demographic and questionnaire data, thematic analysis was employed to uncover the awareness and readiness of the tertiary educators regarding the usage of VR for ROL.

Participants

The target participants of this study were tertiary educators from higher education institutions in Malaysia, with the majority of them from Universiti Malaysia Pahang (UMP), International Islamic University Malaysia (IIUM), and Universiti Teknologi MARA (UiTM) initially. Due to a poor response rate, the selection was extended to include educators from other institutions. This resulted in a total of 26 participants, which are described in Figure 2 below. The demographic data comprises of factors such as age, gender, teaching experience, and institution affiliation.

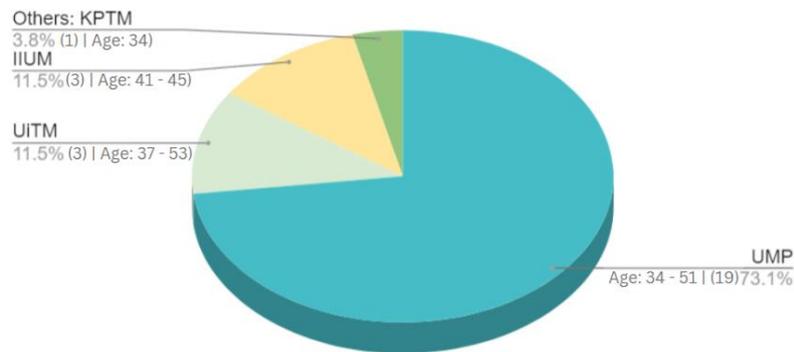

Figure 2. Respondents' demographic information

Figure 2 reveals that 26 respondents participated in the study, 19 of which were from UMP aged between 34 and 51. Three were from UiTM aged between 37 and 53, followed by 3 from IIUM aged between 41 and 45. Finally, there was one respondent from Kolej Poly-Tech MARA (KPTM) aged 34.

Results and Discussion

In Part B of the questionnaire, Malaysian tertiary educators' awareness and readiness to use VR for ROL was explored through 7 open-ended questions that were grounded in TAM (Davis, 1989). This section will discuss the findings on educators' VR awareness first. Subsequently, the educators' readiness to use VR for teaching in remote online classes is also examined.

Malaysian Tertiary Educators' Awareness of VR

In Part B of the open-ended questions, Questions 1 (Q1) to 5 (Q5) pertained to participants' awareness of VR. For improved comprehension, the findings for Questions 1 to 4 will be presented first. Of the 26 respondents, only seven acknowledged being knowledgeable when it comes to using VR, as depicted in Figure 3. Two of the seven respondents indicated their knowledge level to be "average" (R5) and "only a little" (R12).

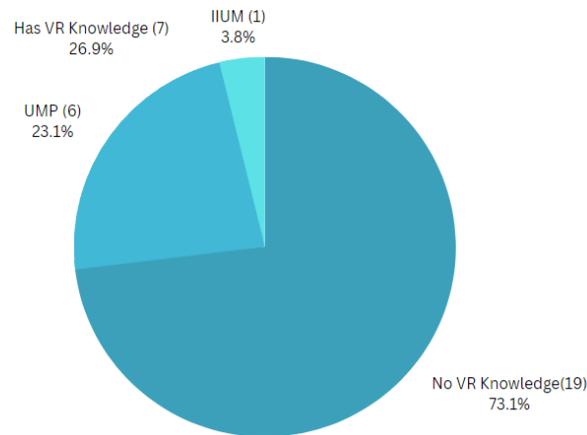

Figure 3. Breakdown of respondents with VR knowledge

Two respondents (R13 and R17) discussed acquiring knowledge through playing VR games and R17 discussed experiencing a virtual tour. Educator R6 stated that VR was applied to evaluate Final Projects while R13 experienced VR in the context of virtual clinic simulation. Two respondents, R9 and R19, used VR for teaching (R9 used VR for 1 semester and 4D Augmented Reality for almost 3 years, while R19 used VR for 2 lessons in the context of research). As illustrated in Figure 3, 6 out of 7 educators who had VR experience were from UMP and 1 from UiTM. The number of educators with VR experience, however, remains relatively low. Additionally, all respondents agreed that students would likely find learning with VR in ROL enjoyable and engaging. Reasons given by those who expressed reluctance to use VR in teaching and learning (Q6) ranged from high costs to technical difficulties.

For Question 5, 3 out of the 26 respondents did not provide reasons for their belief that students would enjoy using VR for remote online classes (R9, R10, R24). The reasons provided by the remaining 23 respondents were analyzed and categorized into four themes. By categorizing the responses into these themes, we gain a better understanding of the educators' considerations and challenges associated with integrating VR into ROL environments. The themes are as follows:

Theme 1: VR replicates real contexts

In Theme 1, based on the responses provided, the educators perceived that VR, by replicating real contexts, provides students with opportunities that they would not otherwise have access to within the bounds of traditional tertiary education. This sentiment is emphasized by the comments provided by R22, R25, and R26. With VR, students can engage in various activities, explore different environments, and gain experiences that were unimaginable before (R25). VR also has the potential to transform abstract concepts into tangible encounters and simulate realistic scenarios, such as lab sessions or clinic settings, providing enhanced visualization and a more immersive learning experience (R26). In a different setting, Kocur et al. (2020) investigated the impact of missing fingers in VR to prove how immersive the VR experience is and introduced the concept of phantom pain and avatar realism. Ultimately, VR's ability to replicate real contexts would

empower students by granting them novel experiences, exposing them to diverse environments, and fostering a sense of discovery and engagement that surpasses the limitations of traditional educational settings.

Theme 2: VR increases learners' engagement and enjoyment

Theme 2 represents how the educators (7 respondents) view VR from the students' perspective, in other words, how they are perceived to feel when they in "immersed" (R24) in VR if it is employed in remote online teaching. When students are exposed to novel experiences offered by VR, it naturally captures their attention and engages them in the learning process by easing their understanding (R16) as it shifts the learning process from passive to active (R5) making learning more interactive (R18). The interactive nature of VR enables students to actively participate and manipulate virtual objects resulting in a more dynamic and immersive learning experience (R24, R13). This finding is aligned with Allcoat and von Mühlénen (2018) that reported about the increase in students' engagement when using VR as compared to conventional teaching methods. Complex concepts can be visualized and explained in a more intuitive and accessible manner through virtual simulations, fostering a deeper level of engagement and understanding. As a result, students become more present, motivated, and invested in their lessons, actively involved in their own learning, and making the learning process more captivating and memorable.

It is also worth noting that VR is perceived to be able to accommodate different learning styles, enabling students to reach their VARK (i.e., visual, auditory, and kinesthetic) potential (R14). Moreover, VR facilitates collaborative activities and discussions within the virtual space, promoting student interaction and peer learning. Students can engage in collaborative projects, exchange ideas, and learn from one another, further enriching their educational experience. Lastly, VR resonates with today's digitally native generation, aligning with students' interests and preferences (R2). VR makes the learning journey more relatable, appealing and engaging for students as it is a technology that can reflect daily digital experiences.

Theme 3: VR creates novelty in learning context

Within this theme, a group of educators (consisting of five respondents) recognizes the potential of VR as a fresh and engaging method for delivering lessons. They view VR as a new approach, distinct from conventional one-way instructor-led methods, which are often considered monotonous and uninspiring. These educators understand the limitations of traditional online teaching and perceive VR as a more enjoyable and novel instructional tool. Similar to the findings of Dube et al. (2022), the educators believe that exposure to new and unfamiliar experiences, such as VR, can enhance skill development. At the same time, educators caution against using VR solely for entertainment, instead suggesting that it should be properly aligned with curricular objectives to ensure meaningful instructional experiences and meaningful ROL. They are careful to maintain a connection between VR activities and the subject material (R15), as they understand this is necessary to make the most of VR as an educational tool (R18). Consequently, educators need to be mindful when incorporating VR into their lesson plans, being sure it is relevant to the subject and beneficial to students. In conclusion, the

potential of VR to enhance learning should be weighed with its practicality in mind.

Theme 4: VR overcomes certain learning challenges

Theme 4 delves into the challenges that educators could foresee when adopting VR into ROL. One of the barriers identified is the availability of VR which R21 stressed that without proper technologies and materials, students will not be able to gain the true VR experience. Additionally, R20 points out the influence of student attitude and learning preferences when the educators tried to adopt VR. In accordance with this, R3 suggests that VR could potentially bring more benefits to those who are more visually inclined in ROL settings. Educators should consider factors such as students' needs and preferences when adopting VR in ROL while ensuring access and alternative approaches so that it promotes positive learning experiences. These concerns are legitimate as there are studies that showed that despite the use of VR, students did not perform well (Hamilton et al., 2021). An example Hamilton et al. (2021) cited is the study by Parong and Mayer (2018) who found that students who used VR during a biology lesson scored significantly poorer than those who learned using a PowerPoint. Another was by Makransky et al. (2017) whose findings show a similar decrease in students' performance. Both studies believed that it was possible that the high-fidelity graphics and animations of the VR applications used could have significantly increased cognitive load, which would have detracted from the learning task at hand. As such, suitability of VR and alignment to the learning outcomes are valid reasons not to use VR if it does not serve the purpose. Hamilton et al., (2021) therefore proposed a well-designed PowerPoint presentation would have facilitated better learning outcomes than the graphically rich VR experience. Ultimately, educators demonstrate a strong understanding of the potential impacts of VR in ROL environments, noting its immersive and interactive qualities, capacity to cater to different learning styles, encouragement of collaboration, and alignment with student interests.

However, educators also acknowledge the challenges associated with implementing VR in remote online teaching, particularly regarding accessibility as not all students have equal access to this technology. By acknowledging both the benefits and limitations of VR, educators demonstrate a balanced understanding of its potential within the educational landscape. This recognition of VR's strengths and challenges paves the way for further exploration and discussion on how to address accessibility issues and maximize the benefits of VR technology in ROL environments.

Malaysian Tertiary Educators' Readiness

To gauge educators' readiness and willingness to use VR for remote online teaching, two direct questions (Q6 and Q7) were posed. The findings from Q6, which explores educators' interest in using VR for teaching, will be discussed first, followed by the findings from Q7, which explores the issues educators foresee if VR is used for remote online teaching.

Q6 is "Would you be interested in using VR for teaching? Why?" Among the 26 respondents, 22 expressed their

interest in using VR for remote online teaching, while 4 indicated otherwise. Of those who answered "No," one respondent had prior experience using VR for the purpose of research and highlighted that VR would only be considered if it was research-related and if learners had access to the necessary tools and resources. As for the remaining 3 respondents who answered "No," one did not provide any specific reason (R24). R3 mentioned the lack of alignment between the current syllabus and VR as a deterrent for VR application for remote online teaching, while R15 also expressed concerns regarding the required equipment and time commitment.

For the remaining 22 respondents who expressed their interest in using VR for teaching, their provided reasons were analyzed and categorized into 3 themes:

Theme 1: Novelty

Seven respondents (R1, R4, R7, R10, R18, R20, R25) mentioned that they would use VR because it represents a "new method/new technology" to enhance teaching. They stated that using VR allows them to stay "up-to-date" and "catch up with technology," enabling them to make use of the latest advancements in teaching methodologies. These reasons align with the educators' perspectives on why they believed students would enjoy VR, as discussed in Q5. However, it is important to note Jang et al.'s (2021) findings regarding introducing VR and AR to 292 in-service elementary school teachers in Korea. In their research, it was found that when new technologies are introduced, or even required to be used, teachers can often become reliant on social conventions and organizational prerogatives, rather than adhering to their own educational beliefs. This can lead to teachers making their own decisions, regardless of outside influences.

Theme 2: Positive impacts on students' learning

Theme 2 reflects the educators' concern for learner engagement and their recognition of the benefits that VR potentially brings to students if employed for remote online teaching. They believe that using VR would enhance the effectiveness and improve online teaching, enriching teaching and learning to make it more interesting (R7, R16, R21). Five respondents mentioned that VR would be interesting, fun, and promising (R4, R10, R11, R13, R22). Three respondents highlighted the importance of VR being able to engage and increase students' interest (R8, R17, R23), as well as retain their interest and enhance teaching and learning (R7, R22, R25). The findings concurred with Cooper et al.'s (2019) findings where most of the pre-service teachers highlighted the positive impacts that VR has on students' learning. One of the reasons given was VR offers students the chance to explore new space without leaving the classroom such as learning about pyramids. The educators in this study also recognized other positive impacts such as that VR could provide an immersive learning experience (R5), enhance knowledge visualization (R6), facilitate the learning of clinical skills and anatomy subjects (R13, R14), and optimize learning during the pandemic and remote learning situations (R22, R26, R9). These reasons demonstrate their motivation to use VR for teaching, driven by the desire to create a more engaging and effective learning environment for their students.

Theme 3: Personal interest and motivation

Theme 3 provides valuable insights into the personal motivations and interests of educators regarding the integration of VR in ROL. The respondents expressed that they are fascinated with the idea of using VR, while R21 mentioned doing it "for the experience." Moreover, R12 highlighted their curiosity as a driving factor. These responses indicate that educators are personally captivated and driven by the potential of VR in diverse teaching approaches. The inquisitiveness and eagerness to explore VR originate from the aspiration to embrace this cutting-edge technology, showing their proactive attitude towards improving their teaching methods. These findings highlight that educators acknowledge the potential advantages of utilizing VR in learning; the belief in VR as a novel, captivating, and powerful tool to advance students' learning in remote seminars. The interest in VR is rooted in the anticipation of positive impacts on student engagement, motivation, deepening knowledge, and the ability to adapt to the challenges posed by the pandemic. As stated by Virmani et al. (2022), VR's three basic characteristics are Immersion, Interaction and Imagination. The immersive nature of VR, combined with its interactive capabilities and capacity for stimulating imagination, using VR would certainly impact students' learning positively in the education field. By providing engaging and realistic experiences, promoting active participation, and fueling creativity, VR holds great potential for enhancing educational experiences and empowering students in their learning journeys. Additionally, educators' personal curiosity and interest contribute to their readiness to experiment and implement VR in their teaching practices.

When educators were asked about the potential issues they foresee if VR is used for ROL in Q7, their responses were analyzed and categorized into five themes. These themes provide insights into the educators' readiness to adopt VR in their remote online teaching practices. However, it is important to note that one respondent did not provide a reason (R24). The themes are as follows:

Theme 1: Relevance and Practicality

In Theme 1, only one respondent highlighted concerns about VR not being relevant to the course (R15). However, after having responded as such, R15 demonstrated willingness to attempt to use VR if it is cost-effective and not cumbersome for both self and students. According to Hamilton et al. (2021), a study done by Allcoat and von Mühlénen (2018) found that the complexity of VR obstructed learning outcomes due to the unfamiliarity and novelty of the technology. This shows the importance of providing a period of free navigation or extending some time for familiarisation to use a new technology would be helpful for educators or new users of technology (Hamilton et al., 2021).

Theme 2: Knowledge and Technical Factors

This theme reflects the respondents' lack of familiarity with using VR. R9 stated that to use VR, one would need to understand the hardware and software involved. Other respondents highlighted the requirement for specific hardware for VR and the need to have expertise in VR content creation (R11, R6). These concerns were valid as

Jang et al. (2021) stated that teachers' knowledge of integrating the technology into their classrooms is one of the four variables that impact teachers' use of that particular technology. The other variables are supportive culture, self-efficacy, and pedagogical belief.

Theme 3: Technology Limitations

In Theme 3, educators highlighted various challenges associated with the technological aspect of using VR for remote online teaching. One notable concern the respondents raised was the issue of cybersickness (R5, R9). Cybersickness is the motion-sickness-like discomfort such as oculomotor discomfort, eyestrain, and nausea (Yip & Saunders, 2023) experienced by individuals when using virtual reality due to the sensory disconnect between virtual and physical environments (Li et al., 2023). This may affect the learning experience and hinder some students from fully appreciating VR. Additionally, the educators were aware that technical glitches may occur and identified the glitches as significant factors that could impede the adoption of VR in online teaching (R10, R12). Recognising potential obstacles may assist educators to take precautions to smooth VR implementation in remote learning settings. For example, Yip and Saunders (2023) found that the severity of cybersickness can be reduced by minimizing the processing of peripheral motion cues and restricting attention to the central visual field.

Theme 4: Human Factors

Theme 4 represents the educators' awareness towards concerns related to their age factor and the necessity of convincing 'more senior' educators to use VR (R22, R3). This factor is indeed a primary reason why VR is under-utilised. This is not hard to imagine as instructors were having technical problems with much simpler technology, as reported by Anastasakis et al. (2021). Furthermore, educators also expressed concerns about potential resistance or unwillingness from students to embrace VR (R23).

Theme 5: Accessibility and Resources

The last theme is the theme with the highest concerns highlighted by the educators. Issues regarding access and resources were prominent within this theme, such as the affordability of VR for students, budget allocation, data usage, the cost of VR devices, acquiring necessary equipment, and the use of head-mounted displays (R14, R26, R15, R8, R25, R20, R5). Educators emphasized the need for adequate tools and monitoring and mentioned the requirement for additional devices (R19, R18).

Additionally, educators expressed concerns about internet stability, connectivity, technical issues, and low connectivity, highlighting the importance of stable internet connections for successful VR implementation (R1, R2, R23, R24, R7). One educator (R3) specifically pointed out the challenge of high-speed internet requirements for students. Another (R13) specifically also pointed out that the issue of device compatibility must be resolved first, only then will the students have equal access to VR. These issues highlighted support the findings by

Anastasakis et al. (2021) who looked at barriers in online learning for undergraduates in Greece. Anastasakis et al. (2021) found among the issues these students faced during the pandemic, technical problems (i.e., internet connection issues while online classes were going on) was ranked first (559 of 2608 responses). Students also faced other issues like not having access (119 responses) to online learning as some students did not even own a laptop and some did not have access to an internet connection. Such problems are common and until these issues are resolved, there will be students who will be left behind.

Conclusion

The study findings have identified three distinct categories that reflect educators' awareness and readiness regarding the adoption of VR. In Category 1, we have found educators who are ready to embrace VR. These individuals hold positive views on both PU and PEOU of VR, leading them to enthusiastically consider integrating it into their teaching practices. They firmly believe that VR is beneficial and user-friendly. In Category 2, we find educators who are hesitant about using VR. They perceive VR as highly useful, but their PEOU is relatively lower. Consequently, their intention to adopt VR is not as strong. Interestingly, none of the participants in this study disagreed with the PU of VR. This emphasizes the significance of addressing factors related to PU, such as learning requirements, necessary devices and stable internet connectivity. Addressing this concern can play a crucial role in boosting the likelihood of VR adoption among educators in this category. Lastly, Category 3 includes educators who have yet to experience VR firsthand. Since they have not had the opportunity to try it, their PEOU remains unknown. However, they hold a positive view of the PU of VR and demonstrate a readiness to adopt it once they become familiar with its ease of use. This suggests that they can recognise the potential benefits VR can offer and are open to exploring its capabilities once they gain hands-on experience. To summarize, the study findings have unveiled three distinct categories of educators based on their awareness and readiness towards VR adoption via the framework of TAM (Davis, 1989) by looking at PU and PEOU. Within Categories 2 and 3, which consist of educators with high perceptions of both PU and PEOU, we can distinguish two subgroups. The first subgroup are educators who are ready to adopt VR in their ROL despite having no experience using VR themselves. They are willing to explore VR due to the potential it holds as they recognise the benefits that VR will offer in their teaching practices.

On the other hand, the second subgroup are educators who are not ready to incorporate VR in their ROL. Their reluctance is based on the external factors they highlighted which includes age (e.g., too old), time constraints (i.e., need to learn), as well as the perceived unsuitability of VR to achieve learning outcomes. This subgroup could be likened to a group of people who have a strong desire to engage in exercise because they are well aware of and they understand the benefits of exercise for fitness and health, but personal shortcomings and challenges limit them. In considering the categories, educators can decide which group they fit into. It is clear that readiness is indeed influenced by educators' awareness, in particular of the PU and PEOU of VR, and even if VR is perceived highly in terms of PU and PEOU, there are other factors that make educators wary to embrace VR such as how to use VR correctly, or accessibility of VR in terms of suitable technologies and the

opportunities to acquire VR resources, to name a few. As such, the integration of VR in ROL is more as an aspiration than something actually practical.

It can be concluded that while the majority of educators may have limited knowledge or experience with VR, they unanimously recognize its benefits and potential for engaging and interesting students. Educators who have taught using VR are particularly more aware of its challenges. However, they believe that VR could be effectively used for remote online teaching if accessibility issues are addressed.

Recommendations

Recommendations are usually based on limitations of the study, and this study is not without its limitations. The first limitation would be the sample size, which is relatively small with a sample size of 26 respondents. This limited sample may not fully represent the diverse perspectives and experiences of all educators in the Malaysian tertiary education system. Future research may want to increase sample size as conducting a study with a larger and more diverse sample of educators could enhance the representativeness and generalizability of the findings.

The second limitation would be the generalizability. The scope of research was limited to Malaysian tertiary educators; hence, the findings may not be applicable or generalizable to educators in other contexts or regions. Cultural, educational, and technological differences could also impact the results and limit their broader applicability. Furthermore, future research may want to view it from the students' perspective by examining the actual impact of VR integration in remote online teaching on student engagement, learning outcomes, and satisfaction to assess the effectiveness and benefits of using VR in educational settings.

The Effect of Teacher Job Satisfaction on Learners' Academic Success in Biology

Issah Ibrahim

Science Department, Methodist College of Education, Akim Asene – Abuobo Oda- Ghana

Abstract: This study sought to ascertain how job satisfaction affected learners' biology achievement in the New Juaben North District. The study's methodology was a survey design. The participants in the study are head teachers of senior high schools and teachers of biology in the district. To choose the participants for this particular research, purposive and random samplings were used. 84 individuals composed of the sample size, including 4 school heads and 80 biology teachers were used for this particular study. The main tool for data collection was a structured questionnaire, and the data was analyzed using the Statistical Package for Social Sciences (SPSS). According to the data analysis, 72.62% (61) of respondents were of the belief that changing teachers' working circumstances will have a favorable impact on students' academic achievement. Again, half of the biology teachers 32% (40) were of the view that their pay is insufficient and some must be done about it.

Keywords: Job satisfaction, Job dissatisfaction, Instructional approaches and Performance

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 275-282), Cappadocia, Turkiye. ISTES Organization.

Introduction

In spite of the fact that teachers are an essential component of educational opportunity systems, there are worries about their retention in the wake of the recent emergence of the labor market in general and within the educational system in particular, particularly in schools serving underprivileged regions. Studies show that when job satisfaction rises in the teaching profession, attrition falls (Robert, Jones, & Lynn 2004). A recent survey from various developing countries reveals that more than 25% of academics who left teaching did so since they were dissatisfied with their work. The above incidence has been related to a number of causes (Henke, Choy, Chen, Geis & Broughman 1997). There has been a lot of studies done on the topic of teachers' job satisfaction in recent years (De Nobile, 2003). This interest is hardly surprising given the links between job happiness and employee retention, attrition, truancy, productivity, and job stress that have been discovered (De Nobile & McCormick, 2005; Luthans, 2002; Spector, 2000). Zembylas and Papanastasiou (2006) established teacher job satisfaction as the teacher's emotional attachment to his or her teaching profession due to the strong positive association between what education offers and what educators desire from it. We frequently define teacher job satisfaction as a teacher's perceptions, emotions, and sense of fulfilment in light of these concepts.

Dissatisfied teachers who want to switch schools may be underperforming for a variety of reasons, including general motivational factors (Rockoff 2004; Hanushek, Kain, & Rivkin 2005) and the straightforward fact that they are secretly anticipating a move, giving little thought to their current research, and disregarding any longer-term plans for their students. The teachers' motivation is definitely a key element in shaping the pupils' capacity for learning. Those who are motivated are frequently those who made the decision to work at a certain school, as opposed to those who are just waiting to be transferred. Jackson (2010) uses student data from North Carolina to show that teachers' efficiency rises after they switch schools and that teacher-school matching can contribute significantly to teacher quality. If their children demonstrate more achievement development, teachers are less likely to change schools.

These results show that professors can want to change for a variety of reasons, one of which is that they feel uncomfortable at their present schools. Therefore, a better school employment fit could increase teacher productivity and significantly affect their academic success. Efficiency, output, truancy, attrition rates, intention to leave, and ultimately employee well-being may all be impacted by workplace satisfaction. A wide range of workers, including skilled educational professionals, can agree with this assumption. Certainly, teachers' health has a big impact on the quality of the instruction they deliver (Fenech, 2006).

Despite the fact that specialists in organizational behavior have researched work pleasure in great detail, it is noteworthy to point out that elements that affect job satisfaction also have an impact on job performance, which in turn determines the context of the job. Employee actions that increase organizational effectiveness are therefore said to have an effect on "the psychological, social, and organizational environment" of a worker's employment (Reio & Kidd, 2007).

Employees that demonstrate this kind of psychological empowerment might volunteer for additional duties, endure through difficult tasks, assist coworkers in completing their assignments, and support organizational policies and goals even when they don't agree with them (Reio & Kidd, 2007). This study will look at how biology student achievement in the New Juaben North district of the Eastern Region is influenced by teachers' work satisfaction.

Methodology

A statistical survey is used in this investigation. Eighty (80) biology teachers and four (4) school heads served as the accessible population's representatives. The school heads were chosen from the sampled schools while the teachers were chosen at random. Giving out cards to everyone, irrespective of what was printed on them, was the method used to pick the teachers. For anyone whose cards said "chosen" were chosen. Teachers and school heads completed surveys as part of the study. Data was gathered through giving questionnaires to respondents. Additionally, the acquired data were edited, encoded, and analysed using SPSS version 20.0, which stands for Statistical Package for Social Sciences.

My colleagues reviewed the instruments to boost the content validity. The ideas they made for enhancement were implemented after they reviewed the tools. Also performed on the instruments was a face-validation analysis. An evaluation of dependability was performed using Cronbach's alpha. Cronbach's alpha was used to calculate the dependability coefficient, which was discovered to be 0.982.

Results and Discussion

Table 1. The Respondents' Gender

Sex	Frequency	Percent	Valid Percent
MALE	50	59.5	59.5
FEMALE	34	40.5	40.5
Total	84	100.0	100.0

Source: Field work 2019

According to Table 1, there have been 40.5% (34) female participants and 59.5% (50) male participants. Due to long-held stereotypes and preconceptions about the social roles, occupations, and involvement of women, gender issues must be taken into account in both men's and women's education (UNESCO, 2006). This may provide evidence in favour of the widely held perception that particular academic fields, like as science, are typically viewed as "male" disciplines (FAWE, 2004). This made the sex ratio of the study's sample of participants interesting.

Table 2. The Respondents' Age Groups

Age Range	Frequency	Percent
23-30years	10	11.9
31-40years	50	59.5
41-50years	15	17.9
above 50years	9	10.7
Total	84	100.0

Source: Field work, 2019

11.9% (10) of the 84 responses came from people under the age of 23 and 30, 59.5% (50) from individuals between the ages of 31 and 40, 17.9% (15) from individuals with ages of 41 and 50, and 10.7% (9) from those above 50. This shows that a substantial majority of the teachers were young (between the ages of 31 and 40), particularly in the study's schools, which may have led to effective productivity. It was thought that a paucity of participants, particularly among biology, was unlikely because so many local teachers had retired. Those who responded also had a better understanding of how teaching methods and teacher inspiration impact students' performance when they are between the ages of (41 years and above 50 years) The participants were prompted to answer questions regarding their marital status. Table 3 provides a data on that.

Table 3. The Individuals' Marital Status Plainly

Marital Status	Frequency	Percent
Married	69	82.1
Single	11	13.1
Widowed	4	4.8
Total	84	100.0

Source: Field work, 2019

Out of the 84 participants, 82.1% (69) were married, 13.1% (11) were single, and 4.8% (4) were widowed. This illustrates that married people, especially those who were not involved in a romantic relationship, were seen as being more responsible, mature, and well-adjusted than those who were not married. Considering the aforementioned, it is possible that single persons will face discrimination in hiring procedures because they may be perceived as less committed to their careers and less likely to thrive as employees than married people. The respondents were questioned in-depth about their educational backgrounds.

Table 4. Levels of Education Of Survey Participants

Qualifications	Frequency	Percent
Diploma	8	9.5
Bachelor's degree	70	83.3
Master's degree	6	7.2
Total	84	100.0

Source: Field work, 2019

9.5% (8), 83.3% (70), and 7.2% (6) of the 84 participants, respectively, possessed diploma, a bachelor's degree, and a master's degree. All of the respondents had completed some type of formal higher education. Because of their credentials, the respondents were able to comprehend and adequately complete the questionnaire. According to Tremblay, Ross, and Berthelot, students at senior high schools do higher academic achievement when taught by teachers with more than ten years of experience (2001). According to Table 5's findings, teaching experience ranged from one to more than fifteen years. Table 5 shows that the researcher provided the respondents with the opportunity to divulge their employment history.

4.8%(4) of participants have taught for one to five years, 17.9%(15) for six to ten years, 59.5%(50) for eleven to fifteen years, and 17.8%(15) for more than fifteen years, then according Table 5. The majority of those surveyed are probably familiar with respective schools and have relevant employment experience, so they can give reliable information about them. Bandura (1997) asserts that more experienced teachers are more capable of managing the learning issues of their students. Since the majority of the respondents have between eleven and fifteen years of work experience, they are better qualified to share with the researcher their opinions and experiences about instructional tactics and teacher motivation.

Table 5. The Previous Work Experience of the Participants

Years of experience	Frequency	Percent
1-5years	4	4.8
6-10years	15	17.9
11-15years	50	59.5
above 15years	15	17.8
Total	84	100.0

Source: Field work, 2019

What effect does a teacher's job satisfaction have on the effectiveness of the biology students?

The biology instructors who conducted the study responded to the questions above. Regarding the relationship between biology students' achievement and teacher job satisfaction, the respondents were questioned. Table 6 displays their comments.

Table 6. The Association between Biology Learners' Performance and Teachers' Job Satisfaction

Teacher Viewpoint	Frequency	Percent
i. Students' excellent exam achievement	10	12.5
ii. Wages do not arrive on a routine basis	18	22.5
iii. Insufficient drive	20	25.0
iv. The pay is insufficient	32	40.0
Total	80	100.0

Source: Field work, 2019

Biology teachers had the opportunity to speak on how their degree of job satisfaction affects the achievement of their learners. 12.5%(10) of survey respondents claimed that successful tests are influenced by job happiness. However, 22.5%(18) of respondents claimed that their paychecks do not arrive on time, 25%(20) that they lack motivation, and 32%(40) that their paychecks are insufficient. Job satisfaction is the term we use to describe a teacher's sentiments and views of happiness and fulfilment at work. Additionally, research has shown that attrition decreases as work satisfaction in the teaching profession increases (Robert et al, 2004). The aforementioned scenario has been linked to a variety of factors, but a recent study from a number of developing countries highlighted the fact that more than 25% of teachers who left the profession did so because they were unhappy with their jobs (Henke et al, 1997).

In recent years, there has been a lot of research on the topic of teachers' job satisfaction (De Nobile, 2003). Given the links between job satisfaction and employee retention, attrition, absenteeism, productivity, and work stress, it is scarcely surprise that this topic has attracted so much interest (De Nobile & McCormick, 2005; Luthans, 2002; Spector, 2000). Dissatisfied teachers who want to transfer to that other school might perform poorly because of general motivational factors, the fact that they are secretly anticipating the transfer, paying

little attention to their current work, and the idea that they are disregarding any longer-term plans for their students (Hanushek, Kain & Rivkin 2005; Rockoff 2004). Fenech (2006) emphasised a number of factors that significantly contribute to teacher dissatisfaction, including poor working conditions, low compensation, a high workload, excessive expectations from supervisors, low professional status, organisational conflict, and a lack of autonomy.

The biology instructors and the school heads had the chance to share their ideas on how to maintain and enhance teachers' job satisfaction, as indicated in Table 7.

Table 7. The Factors That Maintain and Boost Teacher Job Satisfaction

Respondents' justifications	Frequency	Percent
i. Teachers' inspiration.	10	11.90
ii. Better teacher employment conditions.	61	72.62
iii. Construction of school facilities	3	3.57
iv. Teachers should be offered the opportunity to pursue additional education while on study leave.	6	7.15
v. Both learners and teachers must have access to instructional resources.	4	4.76
Total	84	100.0

Source: Field work, 2019

Out of the 84 survey participants, 11.90% (10) mentioned teacher motivation, 72.62% (61) mentioned that they should improve conditions for workers for teachers, 3.57% (3) mentioned school infrastructure, 7.15% (6) mentioned teachers' need for the chance to pursue additional education with study leave, and 4.76% (4) mentioned the need for materials for teaching and learning for both teachers and students.

Recommendations

Based on its findings, the study recommends the following:

1. Biology instructors should be supported by senior high school head teachers and the Ghana Education Service by giving them the resources, rewards, and pay they need to do their best work.
2. Head teachers of senior high schools must offer TLMs in order to promote activity-based teaching and learning techniques in biology classes.
3. To improve the academic accomplishment of their pupils and the effectiveness of their pedagogical and subject-matter knowledge, senior high school leaders must provide biology instructors with on-the-job training.

The Effect of a Teacher's Qualifications and Work Experience on Learners' Achievement in Biology

Issah Ibrahim

Science Department, Methodist College of Education, Akim Asene – Abuobo Oda- Ghana

John K. Eminah

Science Department, Methodist College of Education, Akim Asene – Abuobo Oda- Ghana

Abstract: The study tried to ascertain the impact of instructors' credentials and professional expertise on students' biology achievement in Birim Central Municipality, Eastern Region, Ghana. The study used survey design. The respondents were chosen using simple and selective probability sampling. 80 biology teachers and four head teachers gave us the 84-sample size. A questionnaire served as the main research tool, and the data analysis was accomplished with the help of the Statistical Package for Social Sciences (SPSS). Many respondents (60.7%) firmly agreed that teachers who possess superior knowledge and skills are better able to instruct students. Majority of those surveyed strongly agreed that experienced teachers are more understanding whenever it involves dealing with behavioral issues of children. This study was intended to considerably add to knowledge in order to enhance students' biology performance and comprehension.

Keywords: Teacher qualification, Achievement, Experience, Performance

Introduction

The convergence of numerous resources leads to education. Among these resources, teachers stand out as being particularly crucial for reaching the good standards that are being stressed in schools and educational institutions across the globe (Rice, 2003). According to Jones (2007), teachers play the most essential role in boosting pupils' academic achievement. This appears to back up previous research by (Rice 2003; Zuzovsky & Libman, 2003).

These studies showed a correlation between teacher education and improved student achievement. Khurshid (2008) conducted a study in Multan, Pakistan to ascertain the association between teachers' socioeconomic qualifications and their pupils' academic achievement at the secondary school level. These studies showed that

instructors' degrees had a favourable effect on student achievement because it was found that students taught by untrained teachers with B.A./B.Sc credentials did better than students taught by certified teachers with professional qualifications like B.Ed and M.Ed.

On the other hand, Zuzovsky (2009) performed study in Israel to reassess the correlation between higher levels of performance and greater levels of education, teaching experience, and active engagement in professional development activities. These features of a teacher's qualification were discovered to be positively correlated with math and science student achievement. Numerous studies have found a strong correlation between teachers' training and expertise in mathematics and students' mathematical achievement (Martin, Mullis, Gregory, Hoyle & Shen, 2000; Hill, Rowan & Ball, 2005; Mogari, Kriek, Stols & Iheanachor, 2009).

According to the Ghana Education Service (GES), teacher qualifications frequently play a direct role in students' inconsistent performance in Senior High School Biology classes, even though there seem not to be any conclusive studies on the topic (GES, 2007). Numerous administrations in Ghana have started various efforts targeted at maintaining academically and professionally prepared teachers in the classroom. Obasi (2010) further asserted that a teacher's professional and academic training and certification can enhance a student's chances of academic success.

This signifies that inexperienced teacher candidates may affect how students are taught and learn because the intellectual ability of those recruited to teach has an impact on the quality of education (Fullan & Stiegelbauer, 2000). To analyse student achievement, Koedel and Betts (2007) used the value-added gains technique. According to them, the qualifications of an instructor—including their experience, the prominence of their undergraduate institution, their degree, and their major—have no bearing on students' academic progress. According to Koedel and Betts' findings, Buddin and Zamarro (2009) came to the conclusion that teacher experience is only tangentially related to student achievement and that teachers' levels of education had little bearing on the learning outcomes of their students. In addition, Buddin and Zamarro (2009) argue that even though instructors with more education, training, or experience may be naturally better teachers (as determined by licencing exams), they may not always perform at their very best in the classroom.

Studies show that less experienced teachers frequently have less success than more experienced ones. The academic development of the pupils in their care will be insufficient if the teacher is inept. According to Yala and Wanjohi (2011) and Adeyemi (2010), the most crucial factors affecting students' academic achievement were the teachers' experience and educational background.

As a result, whether or not pupils perform well on exams, the qualifications of teachers are frequently questioned. Teachers in Ghana have the option of earning certificates, bachelor's degrees, or master's degrees, enabling them to work in secondary education. This investigation will examine how students' biology performance in Birim Central Municipality in the Eastern Region is influenced by teachers' training and experience.

Methodology

This study employed the survey research design. The respondents included four (4) head teachers and eighty (80) biology teachers. While the teachers in the study were chosen at random, the head teachers were specifically chosen from the studied schools. Questionnaires were distributed to teachers and head teachers of the participating schools as the study's instrument. The statistical package for social sciences (SPSS) version 20.0 was used to edit, encode, and analyse the data that was obtained. My supervisor assessed the instruments to improve their content validity. Following the inspection of the instruments, they provided feedback and suggested improvements, which were adopted. Testing on the instrument's face validity was also conducted. The reliability test was conducted using the Cronbach's alpha. Cronbach's alpha was employed to conduct a reliability test, and the results showed that the coefficient of dependability was 0.982.

Results And Discussion

Table 1. Respondents' Sexes

Sex	Frequency	Percent	Valid Percent
MALE	50	59.5	59.5
FEMALE	34	40.5	40.5
Total	84	100.0	100.0

Source: Field work 2016

Table above depict that 59.5% (50) of the responses were male and 40.5%(34) were female. Gender issues must be taken into account in both men's and women's education due to traditional beliefs and prejudices about women's responsibilities, employment opportunities, and social participation (UNESCO, 2006). This could strengthen the widespread idea that particular academic areas, such as science, are frequently perceived as'male' courses (FAWE, 2004). (FAWE, 2004). Against this setting, the gender distribution of the participants sample was the subject of this study. Table 2 shows the age groups that the respondents were asked to fill

Table 2. The respondents' Ages

Age Range	Frequency	Percent
23-30years	10	11.9
31-40years	50	59.5
41-50years	15	17.9
above 50years	9	10.7
Total	84	100.0

Source: Field work, 2016

Table illustrates that out of the 84 responses, 10.7% (9) were over 50, 17.9% (15) were between 41 and 50,

59.5% (50) were between 31 and 40, and 11.9% (10) were between 23 and 30. This reveals that the age distribution, especially in the studied schools, indicates that a sizable majority of the teachers were young (between the ages of 31 and 40), which might lead to effective productivity. Because of this, it was expected that there wouldn't be a lack of responses as a result of teacher retirement in the two municipalities—especially among biology teachers. When respondents' marital status was questioned, individuals between the ages of 41 and 50 had a greater understanding of the ways in which teacher-related factors affected students' performance. Table 3 illustrates this.

Table 3. Marital Status of the Participants

Marital Status	Frequency	Percent
Married	69	82.1
Single	11	13.1
Widowed	4	4.8
Total	84	100.0

Source: Field work, 2016

82.1%(69) of the total 84 responses were married; 13.1% (11), were single; and 4.8% (4) were widowed. This suggests that persons who were single were thought to be less responsible, mature, and well-adjusted than those who were married, especially those who were not deeply engaged. The aforementioned suggests that single people can experience prejudice in the workplace because they are thought to be less dedicated to their careers and less likely to succeed as employees. Respondents had the choice to say how much education they have. This is shown in Table 4.

Table 4. Responses to a Survey on Respondents' Educational Levels

Qualifications	Frequency	Percent
Diploma	8	9.5
Bachelor's degree	70	83.3
Master's degree	6	7.2
Total	84	100.0

Source: Field work, 2016

Of the 84 survey participants, 9.5% (8), 83.3% (70), and 7.2% (6) had a diploma, bachelor's degree, or post graduate degree(masters), respectively. Each participant has finished a formal higher education programme of some kind. Because of their credentials, the respondents were able to understand and properly complete the questionnaire. Students in senior high school perform better academically when instructed by teachers with more than 10 years of experience, according to Tremblay, Ross, and Berthelot (2001). According to Table 5's findings, there was a range of one to more than fifteen years of teaching experience. In Table 5, it is indicated that the researcher gave the respondents the chance to discuss their former career histories. Of the 84 survey

participants, 9.5% (8), 83.3% (70), and 7.2% (6) had a diploma, bachelor's degree, or master's degree, respectively. Each participant has finished a formal higher education programme of some kind. Because of their credentials, the respondents were able to understand and properly complete the questionnaire. Students in senior high school perform better academically when instructed by teachers with more than 10 years of experience, according to Tremblay, Ross, and Berthelot (2001). According to Table 5's findings, there was a range of one to more than fifteen years of teaching experience. The researcher gave the respondents the chance to discuss their former employment experience, as seen in Table 5, which is displayed.

Table 5. Working history of the respondents

Years of experience	Frequency	Percent
1-5years	4	4.8
6-10years	15	17.9
11-15years	50	59.5
above 15years	15	17.8
Total	84	100.0

Source: Field work, 2016

According to Table 5, 4.8%(4) of the respondents answered that they had been teachers for one to five years, 17.9%(15) for six to ten years, 59.5%(50) for eleven to fifteen years, and 17.8%(15) for more than fifteen years. It is reasonable to assume that most respondents have relevant professional experience and knowledge of their schools, making them qualified to offer reliable information about the institutions. Bandura (1997) came to the conclusion that teachers with more experience are more self-assured and self-sufficient in handling students' learning difficulties. The majority of respondents had between eleven and fifteen years of work experience, which puts them in a better position to speak with the researcher about their views and experiences relating to teacher-related topics.

What do teacher credentials affect how well learners perform in biology?

The study's biology instructors and the school head teachers provided responses to this question. The amount to which teacher qualifications affect educational outcomes was a question that the respondents were asked to comment on. The responses of the respondents are shown in Table 6.

Table 6. Extent to which Teachers' Qualifications Affect Learners' Achievement

ii. First-degree holders and higher teachers have strong subject-matter competence.	34	50	0	0	0

iii. My school's headmaster pays for me to go to subject-specific lectures, workshops, and training.	2	48	0	25	9
iv. The professional credentials of teachers have an impact on student progress.	46	38	0	0	0
v. Better instruction is provided to students by teachers having teaching credentials.	51	33	0	0	0

Source: Field work, 2016; SA= Strongly Agree; AA = Agree; UC =Undecided; DA = Disagree; SD = Strongly Disagree

Biology instructors and school heads' views on the impact of teacher credentials on learners' achievement

On the extent to which teacher credentials affect student achievement, the head teachers and the biology instructors were asked for their opinions. Opportunities for teachers to increase their expertise and advance their careers will promote student accomplishment, according to 9.52% (8), 35.71% (30), and 54.76% (46) strongly disagree responses. According to 40.48%(34) and 59.52%, teachers with a first degree or higher exhibit strong topic knowledge at the S.H.S level (50). According to the following percentages: 2.5%(2) greatly agree, 57.14% (48), agree, 29.76% (25) disagree, and 10.71%(9) severely disagree, my head of school funds subject workshops, training, and seminars. The professional credentials of instructors influence pupils' achievement, claim 54.76% (46), and 45.24%. (38). 39.29%(33) disagree, whereas 60.71%(51) strongly agree that teachers with teaching degrees are superior at instructing students.

The level of instruction delivered by schools in every country is directly influenced by the knowledge, intelligence, and academic competence of teachers (UNESCO, 1991). The level of science anxiety among students is influenced either favourably or unfavourably by a biology teacher's professional attributes (Nyongesa, 2010). Teacher quality, according to Buddin and Zamarro (2009), is an essential component in student academic progress. Ruthland and Bremer (2002) make a distinction between conventional and non-conventional teacher preparation programmes. After completing an undergraduate or graduate programme in education, traditional certification is earned. Alternative certification pathways are based on training in pedagogy and subject matter for those without a bachelor's degree in education.

Hardy and Smith (2006) list brief activities including peer reviews, seminars, and mentorship as alternatives to formal qualifications for better teaching. If they are unable to obtain employment right after, a graduate teacher with a first degree is more likely to continue teaching. Despite frequently being paid less than a fully educated teacher, they choose not to participate in the one-year post-graduate professional training, and as a result, lack the principles of teaching. According to Richardson's (2008) research, urban students performed better than those in rural areas. The study concluded that one factor affecting students' achievement must have been the availability of enough qualified teachers. However, in Kenya, several rural schools outperformed their urban

counterparts in terms of academic performance (Owoeye & Yara, 2011). Obasi (2010) asserts that a teacher's training, experience, and qualifications can improve a student's academic performance and accomplishments. This demonstrates that a certified teacher should be well-versed in the subject matter before the students because dealing with biology students' attitudes and science anxiety demands expert expertise. The biology instructors' replies to the topic of whether teacher credentials affect academic achievement are shown in Table 7.

Table 7. Effect of Teacher Qualifications on Learners' Biology Competency

explanations from teachers	Frequency	Percent
competent teachers use effective teaching strategies	80	100.0

Source: Field work, 2016

80 Of the biology teachers surveyed concurred that adopting efficient teaching methods by knowledgeable instructors enhances student achievement. Ruthland and Bremer (2002) make a distinction between conventional and non-conventional teacher preparation programmes. After completing an undergraduate or graduate programme in education, traditional certification is earned. Alternative certification courses are based on training in pedagogy and subject matter for those without a bachelor's degree in education. Hardy and Smith (2006) list brief activities including peer reviews, seminars, and mentorship as alternatives to formal qualifications for better teaching.

The first strand of the framework for assessing teacher quality, or teacher inputs, according to Goe and Stickler (2008), concentrated on teacher certifications. They believed that one of the most important resources instructors provided in the classroom was their training. The dependence on paper degrees as indicators of teacher quality appears to be holding sway in modern educational institutions (Goe & Stickler, 2008). (2008) Goe and Stickler. As a result, whether or not pupils perform well on exams, the qualifications of teachers are frequently questioned. In Ghana, secondary school teachers are required to hold a diploma, a bachelor's degree, or a master's degree.

Although there appear to have been no studies on the impact of teachers' highest/lowest qualifications on students' performance/achievement in Ghanaian SHS, this could explain the students' inconsistent output in SHS biology. Instructors enter the teaching profession with a variety of academic credentials. The majority of past research discovered a positive relationship between teachers' levels of certification and pupils' achievement, notably in math and science (Goldhaber & Brewer, 2002; Wayne & Youngs, 2003). Rice (2003) found that there were significant differences in the relationships between instructor characteristics and student achievement across grades and courses.

How does a teacher's professional background affect the biological performance of their students?

Participants in the study, including biology instructors and school heads, provided responses to this question. The respondents were questioned about how much teacher professional experience affects how well pupils achieve in biology. The responses of the respondents are shown in Table 8.

Table 8. How much teachers' professional experience affects students' effectiveness

Statement	SA	AA	UC	DA	SD
i. In the WASSCE, students with experienced teachers do well.	29	55	0	0	0
ii. Good teachers have experience.	26	53	0	5	0
iii. Competent teachers appropriately evaluate the students.	27	57	0	0	0
iv. Teachers with more competence are more patient when dealing with student-related issues.	41	43	0	0	0
v. Teachers with more experience are more effective educators	32	52	0	0	0

Source: Field work, 2016

34.52% (29) of the 84 responses strongly agree, 65.48% (55) agree, 30.95% (26) strongly agree, 63.10% (53), and agree—believe that students with experienced teachers perform better on the WASSCE. The remaining respondents—32.14% (27), strongly agree, 67.86% (57), agree, and 48.81% (41) disagree—also hold this belief. This is shown in Table 8. This implies that seasoned educators are capable of handling challenging circumstances and devoting a large amount of time to teaching their students to improve achievement. A teacher's quality is determined by the experience they accumulate over more years of teaching. As a result, it has been discovered that an experienced instructor can increase pupils' performance more successfully than a rookie teacher. Numerous empirical studies that demonstrate a significant and favourable correlation between the amount of years and students' achievement corroborate this (Rice, 2003). As shown in Table 9, the respondents (biology teachers) were given the chance to share their opinions on how the professional backgrounds of teachers affect how well their pupils succeed in biology.

Table 9. Impact of Teachers' Professional Experience on Learners' Biology Achievement

Teachers' Views	Frequency	Percent
I. Teaching is improved by experience.	44	55.0
II. Improved teacher evaluations come with experience	36	45.0
Total	80	100.0

Source: Field work, 2016

Out of 80 responses, 55% (44 respondents) thought that more experienced teachers are better educators, which has an impact on students' academic progress. 30 people, or 45%, agreed that teachers with more experience are better at evaluating students.

The aforementioned points to a campaign to promote the idea that an experienced teacher will be more effective

in his instruction and that his students will be more likely to perform academically compared to pupils taught by a teacher with less expertise, these students performed wonderfully in both internal and external school exams.

Recommendation

1. Ghana Education Service should hire biology teachers who have both professional credentials and great subject expertise.
2. In order to increase the effectiveness of biology teachers' pedagogical and subject-matter expertise and their students' performance, senior high school heads must offer on-the-job training for them.

Abstract: The purpose of this research is to review the literature regarding (1) the design of sustainable competency development in the 21st century for teachers, (2) sustainable competency subconstruct design from the perspective of tactical operation, (3) sustainable competency subconstruct design from the perspective strategic operation, (4) construct school readiness in the educational process. The exclusion carried out by this article is reviewed in terms of abstract and research results. Literature Research is limited to empirical articles or research for ten years (2012-2022), and the main book of a theory is not subject to limitations. Two hundred sixty-nine articles were collected, and the inclusion and exclusion criteria were implemented, totaling 84 articles. The results of this study are (1) the design of sustainable competency development consists of two main constructs, namely tactical dan strategic operation, (2) constructs of school readiness obtained by researchers include literacy knowledge and skills, science knowledge and skills, approaches to learning, (3) sustainable competence is considered capable of increasing school readiness in carrying out the educational process following the 4.0 era, and (4) through the development of sustainable competence the PISA ranking can be restored in stages.

Keywords: Sustainable Competence, Teachers, School Readiness, PISA

Introduction

PISA (Program for International Students Assessments) is part of the OECD in analyzing the performance of 15-year-old students in 3 main areas: science, mathematics, and literacy (Volante et al., 2017). Since 2000 PISA has provided opportunities for all countries to evaluate student learning achievements at the age of 15 as a reflection of developments in the world of education (OECD, 2019). Historically, in the early 2000s, Indonesia was ranked 39th to 41st, then over time, Indonesia also has not experienced significant changes in the mapping of the quality of education from the PISA perspective.

The causal causes of such PISA results in a country are influenced by several factors, namely (1) curriculum, (2) educational facilities and infrastructure, and (3) the competence of teaching staff as the main factor (Govorova et al., 2020). In today's era of the industrial revolution 4.0, digitalization in technology takes on some aspects of human life activities. The opinion of the authors is in line with the opinion of the expert that the era of the industrial revolution was part of an era of disruption with collaboration with technology, resulting in patterns of life in which most of the processes were assisted or taken over by the role of technology (Wrahatnolo & Munoto, 2018). The 4.0 industrial revolution affected various institutions, such as health, politics, government, economics, and even educational institutions, which were also influenced by the 4.0 era. Rationally, in terms of process, implementation, and evaluation in various fields, technology has been utilized for work efficiency. The education sector is also the same; regarding management, leadership, and supervision, it is appropriate to use technology as an intermediary for implementing these activities so that the desired goals can be achieved effectively and efficiently. Chiu further (2021) explains that when it comes to the educational process, technology should only be used to help, not to dominate the process. This is explained in this way because the role of technology cannot completely replace the essence of education; an educator remains the main actor. The era of the industrial revolution 4.0 is where the achievement targets that each individual must achieve are 4C skills, namely creativity, communication, collaboration, and critical thinking (Supena et al., 2021). The era of the industrial revolution 4.0 is a time of disruption and globalization merging into one (Mourtzis et al., 2018). education and the development of the times in the era of the industrial revolution 4.0 are related because, in simple terms, education is defined as a map or direction pointer from a country to develop human resource competence in education (Triwiyanto, 2014).

In the 4.0 era, individuals must have several skills, such as communication, collaboration, problem-solving, and critical thinking (Wardhani et al., 2021). The various abilities mentioned by the compiler are broad generalizations about the extensive abilities a teacher must have to create outcome nature of education link and match with the demands of the times. As educators, in actualizing their various competencies, teachers tend not to meet the optimal word. This is evidenced by the results of the UKG (Teacher Competency Test), which states that the average ability of teachers in Indonesia is 65 out of the minimum standard of 75. Other research also proves that the adaptability of teachers in implementing new learning models is appropriate to project-based learning in the implementation of the 4.0 era curriculum is quite low; the results of the study prove that the

Teacher's ability to adapt to the new curriculum and policies is in category (1) very good 5,7%, (2) good 21,9%, (3) fair 37,6%, (4) poor 27.1%, and (5) very poor 5%. The initial data presentation has proven a gap between the new paradigm, policy and curriculum concepts and the educators' readiness (Saputra & Nuchron, 2019). This research proves that the competence possessed by teachers is still not optimal at the level of forming students who are ready for the times, where one of the indicators is the achievement of optimal levels in PISA. The competence of teachers who are not yet optimal correlates to school readiness, especially in terms of (1) science knowledge and skills, (2) approaches to learning, and (3) literacy knowledge and skills (Tremaine, 2017). The researcher focuses on these three constructs because the theory directly relates to the Teacher. Departing from this idea, the gap in the form of a disruptive change in educational direction and the low level of teacher readiness, whenever there is a change in educating students towards an optimal PISA ranking is interesting to examine through the Development of Sustainable Competency in the 21st Based Human Resources to Teacher in Ensuring School Readiness for Higher Level on PISA (Program for International Students assessments), the assumptions of contemporary researchers can change, but if the Teacher has sustainable competence or sustainable Competency then adaptability and capability to respond to disruption will become easier to actualize.

Method

The research approach in this study is a systematic literature review from articles on teacher competency development and various studies on PISA, as well as factual data regarding competency achievements that teachers have achieved. The article inclusion criteria as a guideline for this SLR discusses (1) teacher competence, (2) development of 21st-century teacher competence, (3) sustainable competency development, (4) school readiness or school readiness in carrying out integrated educational processes, (5) human resource management, (6) school organizational culture, (7) school climate, and (8) a study of the determinants of factors and antecedents in the PISA ranking. The exclusion carried out by this article is reviewed in terms of abstract and research results. Literature Research is limited to empirical articles or research for ten years (2012-2022), and the main book of a theory is not subject to limitations. Mapping of the database used by researchers is science direct, Eric, and Sage publication. Articles that met the inclusion criteria were compiled and studied systematically.

The preparation of this article uses the identification of how (1) portraits of teacher achievements in carrying out their competencies, (2) the design of sustainable competency 21st on Teacher, (3) the impact of sustainable competency development on school readiness, and (4) the impact of continuous teacher competency development on achievement PISA ranking. The study in this article, through the steps by Harris (2019), covers (1) identification, (2) screening, (3) eligibility, and (4) inclusion so that the research results will be objectively crystallized. Related to this, the researchers produced 84 articles that passed to be used as references and reviewed based on the author's name, year of publication, method, research results, and research objectives.

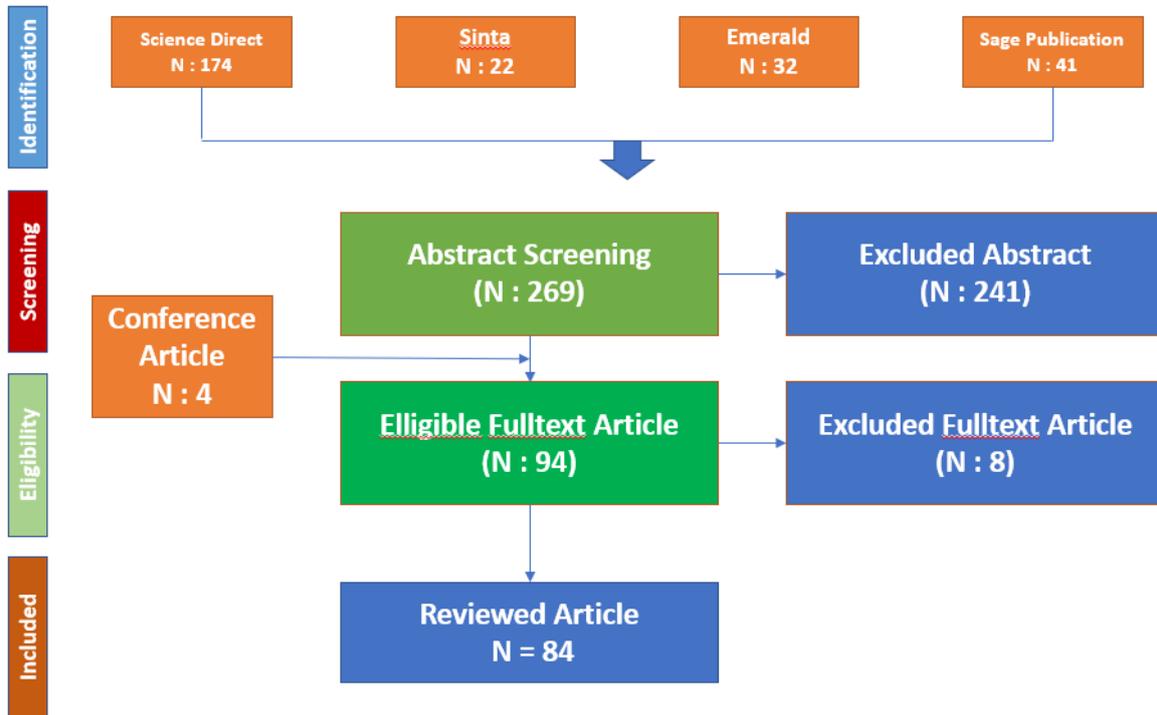

Figure 1. The Research Steps (D. Harris, 2019)

Results

Based on the collection of articles, 269 articles align with the design objectives of this SLR research by following the current search criteria as stated in the methodology. Of the 269 articles that the researchers successfully screened, 84 articles were collected that entered and passed the criteria which discuss the key constructs in the title of this study, namely (1) sustainable competence, (2) teacher competence, (3) school readiness, and (4) studies on PISA for literacy, numeracy, and Science skills. The 84 articles will be used as extraction material to be compiled in the article manuscript as listed in the writing of this scientific work.

The Development of Sustainable Competency 21st on Teachers

In this case, the main object is the Teacher because education in the current era leads to disruption. After all, it is in harmony with the times in the digitalization era. This phenomenon can occur this way because education is a tool to prepare students as raw input becomes output and reaches outcomes following the development of the times (Triwiyanto, 2017). Disruptive development of the times causes instrumental input and environmental input in education changes with the development of the times, such as policies, curriculum, the competence of educators and education, and dynamic educational facilities (Shahroom & Hussin, 2018). Curriculum change will affect other components such as funding, educational facilities and infrastructure, teacher expertise, principal expertise, and academic staff because the curriculum is one part of the educational process road map

that is the main indicator of achieving educational outcomes (Ferguson-Patrick et al., 2018). The problems in the current era refer to educational disruption, which leads to the unpreparedness of each academic unit to carry out new policies and achievement targets-output students in an educational institution (Pokhrel & Chhetri, 2021). The portrait of this problem according to the researcher's point of view, the portrait of this problem was created due to the lack of readiness of human resources because the construct of educational human resource development has not yet led to the formation of sustainable capabilities. Sustainable capability development means the high reliability of HR capabilities in the long term. Compiler opinion, if any Sustainable Competency based human resources management on teachers for educators is implemented, high disruption will not affect readiness to deal with continuous change. The authors' opinion is supported by Saboowala et al. (2021) if an institution can develop sustainable competencies, then no matter how hard the changes, the level of adaptation human resources in the education unit will be able to deal with it. The authors assume that if teachers face the dynamics of change with sustainable competency development, readiness to achieve goals will be more optimal because the principal, a leader, will be easy to contextualize old changes with new changes.

The construct of sustainable development referred to by the compiler consists of (1) motivational affirmation, (2) personal skills, (3) organization knowledge, (4) performance management, (5) competency management, (6) learning management system, (7) competency data, (8) organization strategy and development plans.

Figure 2. The 21st Century Sustainable Skills Development Construct

The main concept that can be studied from the visualization framework is related to sustainable competence, which is based on actual operation as a foundation for carrying out repetitive activities in educational institutions carried out daily by teachers as their professional duties. Respect to strategic operation is a competency that must be possessed to carry out tasks that are not repetitive every day but need to be carried out

routinely every month, semester, or once every year, which function is for the development of the Institute. The rationale of the compiler to implement (1) motivational affirmation, (2) personal skills, and (3) organizational knowledge as the lowest foundation is an expert's statement which emphasizes that the ability to know organizational characteristics and individual independence as personal skills in completing assignments is a basic competence of teachers in Finland so that independence does not interfere with other teachers' assignments but still has group cohesiveness (Tapani & Salonen, 2019).

The expert's idea can be interpreted as teacher competence in Finland, where teachers are required to have various individual skills or personal skills and knowledge about the characteristics of the Institute so that the process of carrying out the profession is in line with the vision and mission of the institution, and can focus on other teachers to complete their respective responsibilities while maintaining teamwork. The construct of motivational affirmation is a tactic that must be implemented as the main ability of the principal and an extensional ability for teachers. This is based on the theory of motivation from Herzberg (1966), where affirmation of motivation is a manifestation of appreciating all forms of responsibility and work from subordinates through the provision of wages, health insurance, and verbal and non-verbal praise. The principal must carry this out as a form of affirmation for a teacher. In another concept, this is said to be part of transactional leadership, so the results that can be obtained are positive affirmations from members because they feel valued (Baskoro, 2022). So the conclusion of the skills teachers and principals must possess giving subordinates affirmation so they are always motivated to provide more optimal performance in various tasks. At the level above, there are (1) performance management systems, (2) competency management, and (3) learning management assessments. Development of teacher competence in the form performance management system is represented through the Teacher's ability to objectively evaluate himself, colleagues, and institutions through a scientific basis based on data (Kaur et al., 2018). Researchers project that if the Teacher can implicate such a competency, then efficiency monitoring will emerge because accuracy will appear in these activities due to objectivity and scientific foundations.

In the construct, next to it, there is competency management, defined as a teacher who has competence in carrying out management functions in each of their main duties (Ismail et al., 2018). When examined theoretically, this is one of the derivatives of ability instructional leadership because it contains means management engineer. In other countries, such as Serbia, management skills are necessary for teachers to carry out planning and monitoring functions in every school activity (Simonović, 2021). Another construct learning management assessment is the Teacher's ability to utilize digital-based learning media and carry out evaluations of the implementation of learning the management system (Beer & Mulder, 2020). Last, in terms of its nature, the strategic operation is a competency that regulates the organization's strategy until competency data whose function is to manage strategy based on the management of objective numerical data or statistics for decision-making and Teacher implementation as a supporting factor for strategic management in educational institutions. This is based on research by Thao et al. (2022), which states that optimal teacher competency development in Vietnam implies strategic management skills and the ability to manage school decision-making data for teachers to assist school principals in a participatory manner. The researcher provides ideas if any competency data and

skills in strategic organizational management will direct a teacher to sustainable competence, which can help develop schools in a participatory rather than passive manner. Therefore, in the following discussion, the researcher will discuss in detail the concept of tactical operation and strategic operation.

Sustainable Competency-based Tactical Operation

Tactical operation is a concept where the actualization of 21st-century skills is attached to tactical or conceptual and practical activities combined (LeChasseur et al., 2020). The first thing to be the concept of tactical operation is a competency that must be implemented as the main ability of the principal and an extensional ability for teachers. This is based on the theory of motivation from Herzberg (1966), where affirmation of motivation is a manifestation of appreciating all forms of responsibility and work from subordinates through the provision of wages, health insurance, and verbal and non-verbal praise. The principal must carry this out as a form of affirmation for a teacher. In another concept, this is said to be part of transactional leadership, so the results that can be obtained are positive affirmations from members because they feel valued (Baskoro, 2022). For teachers, this must be implemented for students so that students enjoy when carrying out learning because it is given reinforcement in the form of a reward. So the conclusion of the skills teachers and principals must possess giving subordinates affirmation so they are always motivated to provide more optimal performance in various tasks. Such a concept is also provided by non-formal education. Suppose a tutor and mentor in training have their main competence in providing enthusiasm for participants, namely through affirmation and praise. In that case, this is carried out solely not to praise but to foster a high motivational passion. Optimum to achieve stage or the next stage in the form of training because motivation is the main capital in learning. If an individual has the motivation, then the main fuel for enthusiasm in understanding a material will be able to be achieved by an individual (Nyanjom, 2020).

On the other hand, motivational affirmations can be used by the Teacher as a curative action when students violate something, then at another time, the student has improved his attitude, as a form of improving self-discipline (Binning et al., 2019; Schutte et al., 2017; Smith et al., 2021). Wu et al. (2021) explained in more detail that when it comes to giving affirmations to a student, being able to increase student self-confidence and self-efficacy so that they are projected to be able to develop their abilities to obtain achievements according to their fields. It is based on various studies in both formal and non-formal education, and researchers view motivational affirmation must be internalized in teachers' design of sustainable competency development. On tactical operation from the chart, above from motivational affirmation is personal skills. Personal skills consist of several sub-constructs related to 4C skills (Creativity, Communication, Collaboration, Critical Thinking). This is supported by expert research, which states that in the 21st century, for continuous competence, a teacher is required to have 4C skills because students are required, and so does the Teacher because learning initiators must master them first before providing learning that produces 4C outputs (Kim et al., 2019; Mistareehi, 2020).

Teacher creativity is represented through its ability to combine learning methods and classroom management, communication is represented through teaching that is easily understood by the entire class population,

collaboration is represented through the Teacher's skills to coordinate with parents and teacher colleagues in constructing student learning development, and critical thinking is represented through problem-solving on contextual problems in class (Bhayangkara et al., 2020; A. Harris & Jones, 2019; Zilka et al., 2022). In the third case, organizational knowledge is in the bottom chart construct. Knowledge of the organization is a part that covers how an individual can understand (1) work climate, (2) patterns of coordination and communication and (3) ethics and organizational values (Monroe et al., 2019). Rational researchers include these competencies used to prevent conflicts that may arise in an institution or organization. This is reinforced by Monroe et al. (2019) if the ability to understand institutions in terms of culture and communication patterns, as well as ethics, can be used as a guide for an individual to be able to work in a comfortable environment because you are not comfortable it is difficult to complete your professional duties. Researchers understand this as a guide or reference for teachers to avoid non-productive conflicts so that they can work comfortably without any conflict pressure from other individuals or groups within the institution. Organizational knowledge plays a central role because when conflicts arise and cause work discomfort, self-efficacy and motivation to complete their professional duties are also low (Da'as & Zibenberg, 2021).

The next construct lies in the competence performance management system, which addresses the ability to coordinate and implement a holistic system for the performance of each member or division in the institution (Schleicher et al., 2018). Suppose this is taken to imply a teacher. In that case, a teacher must be competent to measure a student's ability in the context of cognitive, affective and psychomotor development, both in formative and summative forms. The expert stated that it is not only in manufacturing institutions that require human resources to understand performance management and control, but in educational institutions, it can be implicated through individual student journals, which include cognitive, affective, and psychomotor development through formative and summative assessments (Gbolli & Keamu, 2017). The essence of the construct performance management system is the placement of the Teacher's function through his competence to closely supervise students regarding their individual development so that there is no lag in student control and self-development.

Details of this are attached in (1) summative assessment by the Teacher, (2) formative assessment by the Teacher, (3) teacher's class journal on student development, and (4) data collection on student self-development and interests (Gbolli & Keamu, 2017). The next construct is competency management, which directs teachers to have capabilities in (1) management functions, (2) time management, and (3) ensuring quality school-based management. This is reinforced by several studies which explain that if the management competence of a teacher is actualized through the ability to carry out planning to supervision for the school management process, then it is also required for a teacher to be able to determine priority scales by prioritizing students in time management and being able to carry out the function as the second person who runs quality assurance in school management (Bostancı et al., 2020; Díez et al., 2020; Sahito et al., 2016). The researcher agrees with the expert's idea because if all management tasks are delegated to the school principal, there will be performance inconsistencies for the school and education system. After all, the school principal, as an academic staff needs to delegate a certain task to achieve goals by optimizing existing human resources. , not charged to one man on

every job. Learning management assessment is another construct that can be described as part of the final construct in tactical operations.

Learning management assessment is part of the learning management system, but more narrowed down to the part of the Teacher's competence, the reason for handling the learning management system. Academic staff in charge of information systems and technology have been implemented in schools. The assumptions of researchers and teachers serve as individuals who can carry out (1) content delivery, (2) collaborative feedback in UI and UX with the LMS planner, and (3) course collaboration. The researcher's opinion aligns with the expert's opinion, which states that the Teacher's role in LMS is to assess, provide input, and implement flowchart dari LMS (Kabassi et al., 2016). The meaning of discontent delivery is the Teacher's capability in channelling material in the school's LMS Collaborative feedback is input with the basis of a teacher who understands the concept of user interface and user experience in a learning application and course collaboration which leads to efficient use of LMS characterized by cooperative learning with students in information systems (Bradley, 2020; Hentati et al., 2021; Moon et al., 2022; Raymond et al., 2016; Wiratomo & Mulyatna, 2020).

Sustainable competency based Strategic Operation

Strategic operation is a concept in 21st-century competencies and skills that discusses strategic capabilities that teachers and principals can implement as the main actors in the field of education. This is supported by previous researchers who stated that tactical managerial skills must be supported by conceptual skills that can implement back up against a variety of tactical skills so problem-solving in tactical problems can be encountered (Demir et al., 2019). This section consists of two main constructs, namely (1) organization strategy and development plans and (2) competency data. Organization strategy and development plans is a competency that answers how individuals can design link and match vision and mission, strategies for continuous quality improvement, and setting individual skills in applying strategic management to condition an optimal work climate (Ertem et al., 2021; Fauzi et al., 2021; Kala & Tee, 2016; Sonia, 2021). This terminological understanding directs the axioms of researcher thinking to the sub-constructs of part point 1 consisting of related competencies (1) link and matches learning to industries through world growth, (2) continuous improvement on the learning process, (3) and applying strategic management and climate at school. In sustainable competency development, education is directed not to go off track for continuous improvement, at least in the learning construct (Lavigne, 2020).

In the last construct in the discussion in this article, especially in sustainable competency development, there are competencies or capabilities about competency data. Competency data is the ability to use statistical data, objective numerical data, and scientific research methods for decision-making in the management process (Ghasemaghaei et al., 2018). Research from information systems science can be used as a basis for application in sustainable competency development because teachers need to be able to implement this in their contribution to decision-making. Based on this theory, the sub-constructs of competency data are (1) applying statistical and graphical techniques data and (2) research and evaluation methods. Researchers place these two competencies as strategic operations because the theoretical concepts in this section have the scope and the intensity of activities

within a certain time frame regularly, but not repetitive or become daily activities. Therefore, it is said to be a strategic competence.

School Readiness in Achievement Levels in PISA

School readiness is addressed by existing sustainable competency in achieving the PISA ranking. The construct of school readiness consists of many theories. Here school readiness will be displayed by the researcher in Figure 3.

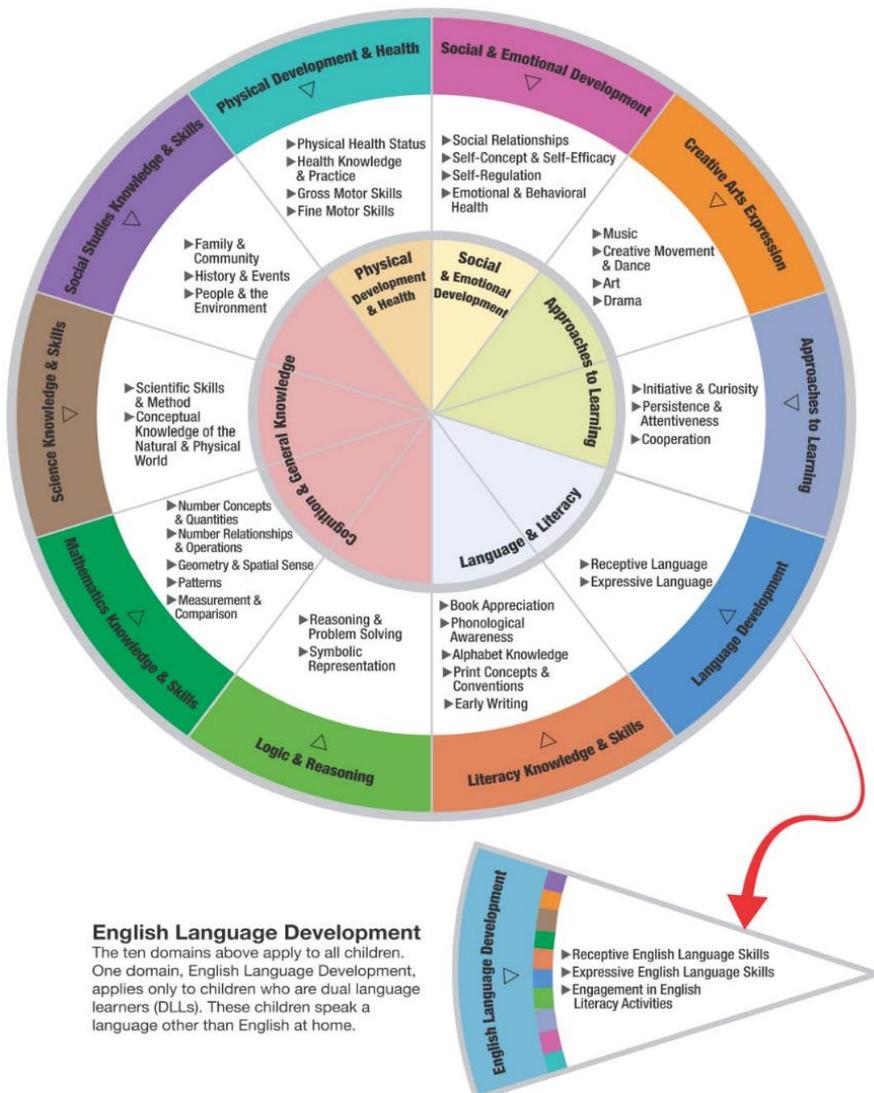

Figure 3. Deep Construct *School Readiness*

Source:(Tremaine, 2017)

In this concept, school readiness in the actualization of sustainable competencies, researchers will be directed to several deep constructs of school readiness, namely (1) science knowledge and skills, (2) approaches to learning, and (3) literacy knowledge and skills. The constructs linked by the compiler do not cover all the indicators contained in school readiness because, in this study, the authors focus on the implications of

sustainable competence, which are related to the three indicators mentioned in the previous description. Science and knowledge skills are the Teacher's ability to implicate knowledge and naturalization in the learning context (Hartman & Morris, 2019; Tremaine, 2017). Approaches to learning are part of persistence, the development of teacher learning models according to curriculum developments, and initiatives on learning innovation. Lastly are literacy and knowledge skills, which include (1) early writing, (2) book appreciation, and (3) phonological awareness. The reason the authors stipulate that these three things are included in the research indicators is that a theory that has a causal relationship to the PISA ranking indicator is numeracy, literacy, and skills in science, Ministry of Education and Culture, which fulfils the link and match on the three indicators chosen by the compiler to examine school readiness or school readiness in the implications of continuing competence which are new and revolutionary.

Discussion

Impact of Sustainable Competency Development on School Readiness

Science and knowledge skills from school readiness projected by researchers will increase due to continuous competency development. This is because the construct related to science and knowledge skills is continuous improvement in the learning process. It is said so because it relates to continuous improvement in the learning process and contains a steps plan, do check and act where this has implications for how a teacher can analyze where his teaching deficiencies are so that the PDCA process will be created self-learning. Previous researchers also supported this in the early 2000s. They stated that teachers who were aware of competency to continuous improvement independent learning would arise, through non-official training, reading professional development books, or carrying out independent learning through colleagues (Dinkelman, 2003). This old research still has strong relevance if, in the current era, researchers argue that various independent learning processes from teachers can be carried out through hybrid training, participating in seminars and workshops, and teachers can improve the process-teaching and learn through various platforms and social media. The researcher's opinion is in line with the expert's opinion, which states that the development of teacher knowledge in the current era can be carried out anywhere, anytime, and at a minimum cost if someone can take advantage of social media and scientific facilities that exist on internet networks (Ansari & Khan, 2020; Greenhow et al., 2020; Ibrahim, 2016). On the inner construct, science and knowledge skills be found in scientific skills and methods (Tremaine, 2017). This can be realized through competency data, which is a competence for teachers in continuously applying statistical, graphical, and research evaluation methods. Therefore, regarding science and knowledge easy for continuous competency development to create output in the form of teachers who can carry out research within the scope of the school and make scientific, objective and accountable decisions.

The second point approaches to learning, or approach to learning. Conceptually, in terms of personal competence skills, critical thinking and creativity will be a reference for researchers. Critical thinking has a major role in overcoming class problems through problem-solving efficiently, and creativity will take a role in preparing teacher-creative learning that refers to conduciveness in learning (Kasmaienezhadfar et al., 2015).

The researcher assumes the Teacher's creativity as a stimulus for creating a dynamic learning approach. Dynamic in this idea is not stagnant in the classical learning process. Expert confirms approaches to learning are not only implicated in creating learning. However, willingness to study teaching and learning with their friends is also a sub-indicator (Tremaine, 2017). These sub-indicators can be realized through continuous competence with personal skills and collaboration. Collaboration is the competence of a teacher to be able to coordinate with colleagues, principals, parents, and students to develop aspects that are lacking in their learning because, in the educational context, students are said to be core external customers who are the main customers of the educational process (Sallis, 2014). Another construct in approaches to learning can also be created by persistence and attentiveness through competency management, namely in the sub-construct-assure quality. Quality assurance in learning is intended and directed in the form of certainty of quality presentation and consistency of delivery of quality learning in the long term (Saeed & Saeed, 2018).

The last point is related to literacy knowledge and skills, which is represented in (1) early writing, (2) phonological awareness and (3) book appreciation. The three achievements of these abilities can be accessed or resolved through competence and personal skills in terms of communication. Communication in continuous competence describes a teacher who can explain material easily and relates to phonological awareness. Phonological awareness is an ability to organize language appropriately so that teachers' various communications and authorship in text form become easier to understand but still have scientific weight (Welcome & Meza, 2019). Departing from this, it can be concluded that phonological awareness in a study and school readiness can be created through personal competence skills in continuous competency development. Book appreciation is the Teacher's readiness in literacy by completing their reading, not just reading but not writing the book as a reference in their work, as well as maintaining the literacy materials they have (Tremaine, 2017). Researchers confirm this book appreciation will be represented through competency actualization work ethics and values because one ethics literacy for educators is to refer to books that have been read and store books or reading materials in the right place so that they can be used between generations (Campbell et al., 2020). Such characteristics are competencies not discussed in high quantity by researchers in competency development. Last, regarding early writing, of course, it has been represented. It can be achieved if a teacher has competent data or skills in methods and management of research results as a basic competency for writing scientific papers (Arifin et al., 2020). Based on these various things, it can be concluded that the development of sustainable competency impacts school readiness because every existing sub-competence or sub-construct is always related to the basic theory of school readiness to implement the educational process.

Impact of Continuing Competency Development for PISA Ratings

The description and discussion regarding the impact of continuous competency development on the PISA ranking by researchers will be connected through the antecedents and determinants of factors that influence a country's ranking. The antecedents in the ranking assessment for PISA are (1) numeracy, (2) science or natural knowledge, and (3) literacy (Hopfenbeck et al., 2018). The researchers' assumptions in this discussion regarding the antecedents of the factors that exist unsustainable competency related and have causality in the construct

tactical operations. It can happen that way because numeration is in tactical operations listed in competence numerical knowledge, which is the Teacher's capability to understand basic mathematics and applied mathematics in school management and learning (Hawes et al., 2020). This, if narrowed down, has a close relationship with a numerical assessment concept, where what is a supporting aspect in achieving optimal numeracy when measuring PISA is the ability of teachers, both Mathematics and non-Mathematics teachers, in terms of basic and applied numerical, because teachers have low numerical competence. It will not be easy to collaborate social and mathematical learning in one space correlated curriculum when the basic competencies in mathematical terms are not fulfilled (Hwa, 2018).

On other factors, when discussed, the antecedent factors in the form of science or natural knowledge can be affirmed and recognized by competence and creativity where deep personal skills In this aspect, an aspect that is thoroughly discussed is regarding the Teacher's capability in connecting one subject to another subject through an experience of inquiry in nature or a setting in which students spend time outside of school, this is referred to as project-based learning (Schutte et al., 2017). Finally, the third antecedent factor is literacy, which is deep tactical operations. This can be realized through competence and personal skills in creativity, which examines the capabilities of teachers in building literacy and naturalist skills of students. If associated with the construction of school readiness, which can be achieved through sustainable competency, the literacy assessment problem can be overcome with literacy and knowledge skills, especially deep phonological awareness and book appreciation. This can be achieved because teachers are ready and able to have grammatical awareness. The output that will be achieved is imitating the behaviour of students who speak with coherent, weighty, and always grammatical grammar. When communicating, reasoning at each closing statement (Wrahatnolo & Munoto, 2018). The second is ebook appreciation. If a teacher has competence in book appreciation, then a culture of reading books, reviewing books, and archiving books in the right way as a form of appreciation, as well as a culture of literacy, students will get used to it. The outcome that will emerge regarding this matter, a student will understand the basic concepts in literacy practice directly in everyday conditions.

Figure 4. Linkage of PISA Antecedent Factors and Tactical Operations in Sustainable Competency

The second discussion is the determinant factors related to achievement ranking PISA with strategic operation in sustainable competency. It should be noted that the determinant factors that determine the achievement ranking PISA are (1) school culture, (2) quality assurance in school management, and (3) decision-making ability and, (4) action research implemented by the school (Susongko & Afrizal, 2018). Sustainable competency compiled

by the researcher clearly illustrates the relationship between the four determinants of these factors. First, school culture and quality assurance in school management directly relate to organizational strategy and development plans. It can be generalized this way because, in the existing sub-designs, the construct contains a link and match between learning and industries, continuous improvement on the learning process, and strategic management and climate conditioning. Second, decision-making ability and action research have a connection with competency data. Competency data have sub-designs that apply statistics and graphical techniques to make decisions and research and evaluations model. As mentioned in the article in the results, these various sub-designs can allegedly provide sustainable competency development, which can raise Indonesia's ranking in PISA. This is also in line with research conducted by previous researchers in other countries, in which to achieve an optimal PISA for a country, the competence of teaching staff is needed, which is in line with the assessment aspects of (1) numeracy, (2) literacy, and (3) science, as well as being able to overcome institutional problems such as school culture and incompetent human resources to carry out their roles as educators (Hopfenbeck et al., 2018).

Figure 5. Linkage of PISA Antecedent Factors and Tactical Operations in Sustainable Competency

Conclusion

Through the development of sustainable competency 21st, several sustainable competencies are studied, which means disruptive changes will not fade them. The assumption is that all competencies may develop, but not all sustainable Competencies. Allocation exists in sustainable competency. This is the achievement of teacher competence link and matches with PISA and global developments, as well as to create high teacher adaptability in managing learning in an era of disruption. Sustainable competency development has two main constructs, tactical operations and strategic operations. Based on the available display, the antecedent factor is related to competence in tactical operations by teachers and strategic operations is related to the determinants of level achievement factors in PISA.

Recommendations

For readers, this article should be used as a reference for insights regarding teacher sustainable competence. Researchers should be able to research this theme in depth through qualitative research and quantitative design to examine the influence of each construct accurately and in-depth.

Abstract: Teachers' digital competence (TDC) should be possessed by teachers in the 21st century learning process because learning resources in this era are not only from one source but many sources along with technological developments. This study aimed to provide an overview of the dimensions of TDC, the level of TDC, obstacles, and solutions to improve teachers' digital competence. Data were collected through Sinta, Emerald, Elsevier, Wiley, IEEE, Taylor & Francis, ERIC, JSTOR Journals, MDPI, and Springer. From these, 47 articles were investigated to address the focus of this research issue. The results show that the dimension of TDC widely used was the DigCompEdu 2.0 framework from the European Commission. Based on TDCs' classification using teacher competence as stated in Indonesia's Law No. 14 of 2005, previous researchers tended to discuss the dimensions of TDC which focused on professional competence (46.67%), pedagogic competence (29.33%), social competence (12%), and personality competence (16%). Furthermore, teachers' average digital competence is still low. So, collaboration between the government and the school and organizing teacher training is needed to improve teacher digital competence. This study also revealed that heutagogy and synchronous collaborative learning models could be used to enhance TDC in the 21st century.

Keywords: Teachers' digital competence, Teachers' digital competence dimensions, Twenty-First century learning

Citation: Sari, P N., Siswandari, & Sangka, K. B. (2023). Deep Dive into Teachers' Digital Competence to Support 21st Century Learning: A Systematic Literature Review. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 313-334), Cappadocia, Turkiye. ISTES Organization.

Introduction

Twenty-First Century learning prioritizes the ability to use the internet and access learning technology. Learning

resources in 21st century learning come not only from one source but many sources along with technological developments. Teachers can combine appropriate learning models with technology to achieve learning objectives during the learning process. Research shows that digital tools and software are positioned as learning resources with better results than traditional teaching-learning resources (Reimers & Schleicher, 2020; Uluyol & Şahin, 2016). Chalkiadaki (2018) visualizes 21st century learning as an era primarily characterized by the evolution of technology and ICT, globalization, and innovation, consequently highlighting the need for students to develop relevant skills and competencies. A class dominated by Generation Z (1996-2009) encourages teachers to have adequate digital competence because that generation has the best digital abilities (Basantes-Andrade et al., 2020).

Previous literature has finally begun to develop the definition of teachers' digital competence needed in using technology in the classroom (From, 2017; Krumsvik et al., 2016). From (2017) defines teachers' digital competence as using Information and Communication Technology (ICT) such as digital tools or software. Other researchers define teachers' digital competence as a complex ability, such as teachers' ability when use technology tools and digital resources. Teachers' digital competence considers dimensions, attitudes, strategies, and awareness that enable teachers to effectively use effective technology to achieve teaching and learning goals. European Framework for the Digital Competence of Educators (DigCompEdu) considers digital competence as the technology safely, critically, and creatively to enrich teaching and learning objectives (Redecker & Punie, 2017).

The discussion of teacher digital competence is closely related to using digital learning technology. Digital learning technology tools are currently being developed to support the learning and teaching process in the classroom that promotes the implementation of 21st century learning. Several government policies have made efforts to ensure teachers have used technology in 21st century learning, such as organizing teacher training and empowerment programs. That programs aimed at accelerating the use of technology in education, such as the Lifelong Learning Strategy 2020 in Estonia (2014), the Good School Reform in Italy (2015), the Curriculum Reformation in Finlandia (2016), and Ayo Guru Belajar by the Indonesian Ministry of Education and Culture (2020). Although the government and schools have met the availability of hardware and software, using digital tools in learning practices and digital competence is still foreign to educators (Cattaneo et al., 2022). This condition shows that the completeness of the infrastructure only partially or not thoroughly explains the use of technology (Drossel & Eickelmann, 2017). The International Computer and Information Literacy Study (2018) documented that less than 50% of teachers use technology in their learning process (Fraillon et al., 2018). The Organization for Economic Co-operation and Development (OECD) Teaching and Learning International Survey results show that in training on technology-related skills, only 43% of teachers feel ready to use technology in teaching (OECD, 2019). In fact, due to the increasing demands for the use of technology in education during the COVID-19 pandemic teachers from 64 different countries worldwide are showing a diversity of their readiness to use technology in teaching (Scherer et al., 2021).

A country with big 4 world-population like Indonesia is expected to have gold generation in 2045. Besides, the

Internet users who are at the age of secondary and tertiary education (13-24 years) are 31.61% of the Indonesian population (BPS-Statistics Indonesia, 2021). This opportunity should encourage regulators to make policies regarding the existence of teacher digital competencies in basic teacher competencies that stated in The Law Number (No).14 of 2005 concerning teachers and lecturers. Based on the law, teacher competencies that must be possessed by teachers are pedagogic competence, personal competence, social competence, and professional competence that obtained through professional education. Teacher competency standards cover core teacher competencies which are developed into competencies for kindergarten teachers, Elementary School teachers, Junior High School Teachers, Senior High School Teachers, and Vocational High School Teachers. For vocational education, Sajidan et al. (2016) stated that the ability to operate technology is one of the assets that teachers must have in this digital age. Therefore, teacher digital competence should be included in the teacher professional education curriculum, so that pre-service teachers who graduate have competencies that are appropriate to their era, namely teacher digital competence.

The use of technology by teachers in the teaching and learning process has a significant impact on student learning outcomes. Students will achieve better learning outcomes when their teachers perceive that learning management systems are easy to use and learn (Cobo-Rendon et al., 2021). Using digital is meaningful for self-expression and is part of digital competence (Ala-Mutka, 2011; Eshet-Alkalai, 2004). Teachers who desire and can integrate ICT during the learning process will be better at communicating educational goals and have clear expectations about ICT use, provided they have mastered digital competencies. Meanwhile, teachers who have no desire or are unable to implement ICT in teaching and learning activities may have problems conveying lesson objectives and expectations (Moltudal et al., 2019). Nouri et al. (2020) revealed that digital competence includes advanced skills for creating materials, problem-solving, collaboration, and innovation. The benefits of using technology in the classroom if it is not supported by the digital competence of the teacher cause the learning objectives not to be achieved. Furthermore, the level of maturity in mastering digital competencies is one aspect that has an essential role in supporting the transformation of the learning industry 4.0 (Bergdahl et al., 2020; Rizaldi et al., 2020).

This phenomenon triggers researchers to provide an overview of the teachers' digital dimensions and the latest conditions related to teacher digital competence research in the 21st century. The study has a significant meaning considering teacher digital competence related to 21st century teacher competence, both at the elementary school, high school, and college levels. This systematic research literature review also offers solutions about suitable learning models to improve teacher competence in 21st century learning because selecting appropriate learning models and designs can assist teachers in implementing effective learning and using technology (Conole, 2013). Regarding the researcher's knowledge, no research discusses the four basic of teachers' competence that mentioned in Indonesia's Law Number (No). 14 of 2005 as a basic competence to develop the comprehensive of teachers' digital competence. Besides, this study tries to elaborate the learning models that can improve teachers' digital competence in 21st century learning using a systematic literature review.

Method

This systematic literature review study aims to provide an overview of the condition of digital competence in 21st century learning. To solve the problem, the researcher conducted a literature review using the procedure suggested by Cooper (1988) for literature synthesis. Systematic methods help to 1) formulate problem topics, 2) collect data, 3) select data through predetermined criteria, 4) analyze and interpret data, and 5) organize and discuss research results. Based on the phenomenon of teachers' digital competence described in 21st century learning, this systematic literature review is used to answer three questions as guidelines. First, the Author intended to elaborate on the dimensions of teacher digital competence used in relevant current research. Secondly, to investigate the digital competence status of teachers. Thirdly, describe the obstacles faced by teachers in improving digital competence. Last, the Author tried to provide the solution teachers can use to overcome the barriers to increasing digital competence. The next step of this systematic literature review is to identify and explain all the questions above to conduct an SLR study based on the literature that has been collected.

The data collected for the empirical study used a qualitative approach. The keywords used are "teachers' digital competence," "21st century learning competence", "ICT competence," and "teachers' digital competence and level." Other keywords were also used, such as "teacher and technology" and "teachers' perception of digital competence."

Results

The inclusion criteria allow the analysis of publications from 2009 to 2022. Table 2 showed that the most citation article was dominated by 2021 publication or 29,79% of as many as 14 articles.

Table 2. Number of Publications each Year Used in Research

Year	2009	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
n	1	1	2	-	3	3	5	4	3	6	14	5

Fourty-seven articles were found and used in a systematic literature review through a predetermined procedure. Of the 47 articles that appeared as samples in this study, the identification results showed 21 countries with Spain as a country that produced many articles related to the problem topics. In addition, one of the articles on Digital Teacher competency by European Framework for the Digital Competence of Educators (Redecker &

Punie, 2017) is not included in the worldwide popular distribution and number of selected studies (Figure 2). 15 articles focus on the issue of the dimensions of teacher competence used in this study, 17 articles focus on the case of the level or condition of teacher digital competence, and 19 articles focus on the issue of constraints and solutions offered to improve teacher digital competence. The same six articles are used on the digital competence level of teachers and the case of obstacles and solutions for increasing digital competence. For clarity, the use of articles can be seen in the Venn diagram (Figure 3). In addition, Table 3 presents the citation of the sources used in the results section.

Teachers' Digital Competence Dimension

The results of research on the dimensions of teacher digital competence are shown in Table 4. There are 15 models of teacher digital competence along with their dimensions. Furthermore, to make it easier to identify the dimensions of each teacher competency model, the basic Indonesian teacher competencies are used in this study, so that it is known which components are more dominant (professionalism, pedagogical, social, and personality).

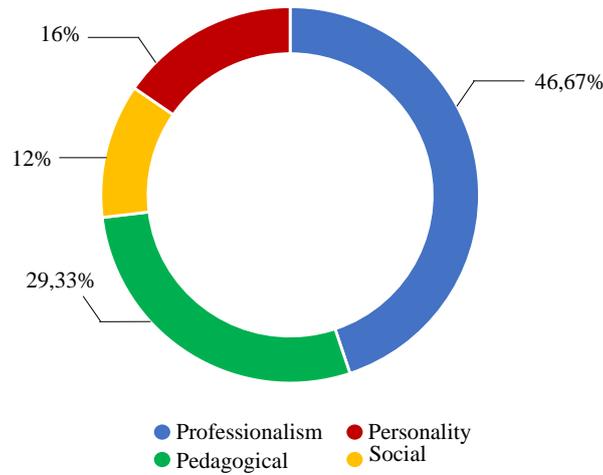

Figure 4. Classification of Teachers' Digital Competence Dimensions

Discussion

Teachers' Digital Competence Dimensions

The model that are usually used are DigCompEdu 2.0 (Redecker & Punie, 2017) and INTEF from Ministry of Education, Government of Spain (INTEF, 2017). First, framework model discussed in this section is the DigCompEdu 2.0 framework from the European Commission. The DigCompEdu 2.0 framework model has three main parts: teachers' professional competence, which discusses professional engagement; teachers' pedagogic competence, which includes digital resources, teaching, learning, empowering students, and assessment; and student's competence which provides for facilitating students' digital competence. Several studies adopted this model, namely, Alarcón et al. (2020), Benali et al. (2018), Bilbao-Aiastui et al. (2021), Cattaneo et al. (2022), Lucas et al. (2021), Fraile et al. (2018), and Portillo et al. (2020). Second, model from the Common framework for digital teaching competence model from INTEF (Spanish Ministry of Education), which has five dimensions, namely, information, communication, content creation, security, and problem-solving. This model was adopted by Fraile et al. (2018) and Garzón-Artacho et al. (2021).

Teachers' digital dimensions from 15 articles were designed based on the learning subject or students faced by the teacher. For example, Walker & White (2015) discussed teachers' digital competence in linguistics, Cabero-Almenara et al. (2016) revealed teacher digital competence for students with disabilities, Cattaneo et al. (2022) showed the digital competence of vocational teachers, and Dervenis & Fetsilis (2022) showed the digital competence of lecturers. In addition, each dimension that has been suggested has a tendency to develop teacher digital competence from several sides, such as Guillén-Gámez et al. (2020) which tends to focus on digital social skills, namely on the digital abilities of teachers with students, staff, and student families. Then Elstad & Christoperses (2017) prioritize self-efficacy or teacher internal factors in using technology. Not only that, some researchers also tend to prioritize dimensions related to digital-pedagogic teachers in learning, such as assessment, determining digital sources, teaching, learning, communication, etc.

Teachers' Competence in Indonesia (Based on The Law Number 14 of 2005)

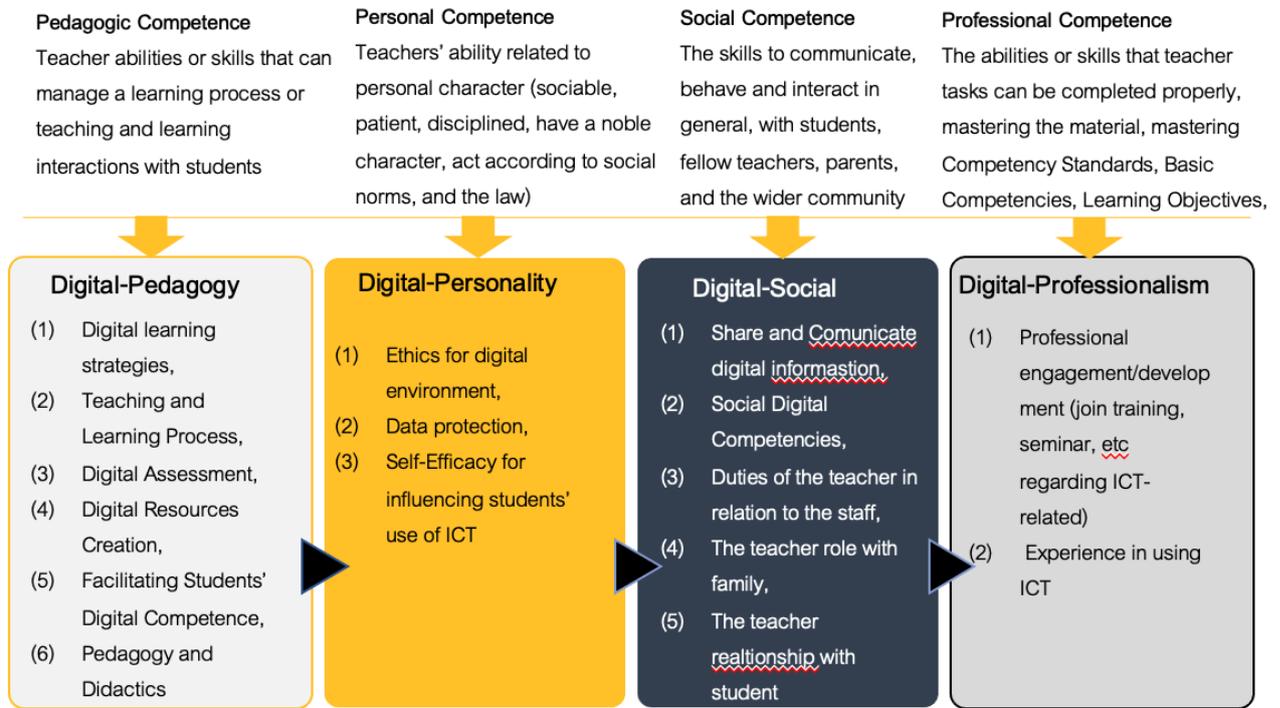

Figure 5. The Extended of Teachers' Digital Competence

The existence of differences in the perspectives of previous researchers in forming the dimensions of teacher digital competence has led to a tendency for the digital dimension of teacher competence in certain contexts, for example in professional, pedagogic, social, or personality contexts. One of the policies in Indonesia, teachers from various levels of education must fulfill the basic teacher competencies, including pedagogic competence, personal competence, social competence, and professional competence (Indonesia's Law Number (No). 14 of 2005). Research result showed on Figure 4, professionalism competence of teacher becomes the most concern of previous researchers in developing teachers's digital competence. This study in line with Dervenis & Fitsilis (2022), from 34 articles out of 39, have addressed the "professionalism", suggesting its necessity. The characteristics of Professionalism is the subject of one's professional activity in relation to how specialized a teacher is and how recognized he/she is in the field in which they teach. It also refers to how well he/she knows and applies methods and principles that govern their field while ensuring the interconnection between theory and practice (Dervenis & Fitsilis, 2022). Besides, Previous researchers did not pay much attention to the social and personality aspects of a teacher when building digital competence. To complete the gap, Figure 5 presents the dimensions of teachers' digital competence which are adjusted to the basic competencies. So, it can produce a more comprehensive dimension of teacher digital competence. Please note, Table 4 has several dimensions with different name but having same meaning. To make sure there are no duplicate words in every teacher competence, this study will choose the word that best represents each competency.

Teachers' Digital Competence Level

The collected teacher digital competence research was carried out using different dimensions (Table 4). Although using a different dimension, the researchers showed that the level of teacher competence was at a low level (Astuti et al., 2021; Benali et al., 2018; Diz-otero et al., 2022; Fraile et al., 2018; Garzón-Artacho et al., 2021; Mutohhari et al., 2021; Portillo et al., 2020; Suoh iypardi & Hakim, 2021; Zhao et al., 2021). Teachers' digital competence is said to be low because teachers do not understand specific competencies. The author divided two factors that make teachers' digital competence still low, namely internal and external factors. For internal factors, Teachers still have low scores on the ability to create, understand information literacy, and improve their problem-solving skills (Fraile et al., 2018; Garzón-Artacho et al., 2021), to ensure communication security (except for the protection of digital data and digital identity), content creation ability (Benali et al., 2018; Fraile et al., 2018), caring, capability, creativity, critical, and lack of years of experience in using digital technology (Astuti et al., 2021), teachers' knowledge of technology and teachers' using media (Diz-otero et al., 2022). For external factors, teachers only have a short time to attend training in the field of digital skills (Portillo et al., 2020), teachers do not use multi-media technology in the learning process (Supardi & Hakim, 2021), teachers only using low technology quality and the lack of available laboratories (Mutohhari et al., 2021).

The level of digital competence is at a medium to low level (Basilotta-Gómez-Pablos et al., 2022; Cabero-Almenara et al., 2021). Based on the literature study, it can be seen that the average digital competence of teachers is still low. For medium to low level of teachers' digital competence, even though the school is equipped with facilities and infrastructure, there are still digital competencies that need to be improved and that teachers need to understand, namely the evaluation competence of educational practice (Basilotta-Gómez-Pablos et al., 2022). Teachers who do not know digital learning resources fall into the medium to low category.

For medium level of teachers' digital competence (Benali et al., 2018; Bilbao-Aiastui et al., 2021; Guillén-Gámez et al., 2020; Prieto-Ballester et al., 2021), teachers need to improve the components of reflective practice and Learner empowerment and facilitate Students' Digital Competence. Besides, empowering students and ensuring facilities can support students' digital competence. In addition, teachers who do not adequately use ICT tools contribute to the digital competence of medium teachers (Guillén-Gámez et al., 2020).

Teachers identified as having a high level of digital competence can be found in teachers who have the drive to operate technology in learning. Hamzah (2021) stated that after the COVID-19 pandemic, digital teaching abilities were at a high level. Meanwhile, Benali et al. (2018) revealed that teachers with high digital competence have high trust when using technology and teachers with years of experience.

Obstacles to Increasing Digital Competence

The literature study results show that teachers' average digital competence is still low. The low digital competence of teachers is due to the obstacles experienced by teachers during the learning process and obstacles

that slow down the improvement of teacher digital competencies. The barriers experienced by teachers include the conditions of ICT infrastructure in the school, digital in curricula, and Teachers' motivation to understand digital competence.

ICT Infrastructure in School

Adequate digital competence of teachers in schools can be concluded as a practice in which at least there is an excellent technological infrastructure, teachers with a high level of technological-pedagogical knowledge, and well-functioning technology-mediated communication and administration (Olofsson et al., 2019). The school's ICT infrastructure needed to implement technology-based learning is at least the availability of a desktop computer; mobile devices such as laptops, notebooks, tablets, smartphones, etc.; broadband; school website, email addresses, virtual learning environment, etc.; deployment of equipment in classrooms, computer labs, libraries, etc.; maintenance (Wastiau et al., 2013).

School students who are dominated by a technology-literate generation make students able to operate gadgets more dexterously, especially in generation Z (Basantes-Andrade et al., 2020). These phenomena make students addicted to social media and entertainment content on social media. So, schools and teachers need to make school infrastructure an essential point in creating a digital environment. Moltudal et al. (2019) emphasize that the lack of ICT infrastructure dominates classroom management problems compared to teacher pedagogical problems. Teachers using low technology and schools with few laboratories lead to low teacher digital competence (Mutohhari et al., 2021). Furthermore, it should be noted that school infrastructure in rural and urban areas also affects the improvement of teacher competence. The condition of school infrastructure for teachers who teach in rural areas is different for teachers who teach in urban areas. So, teachers in rural areas are less motivated to develop strategies for using ICT than teachers in urban areas (Arredondo-Trapero et al., 2021). In addition, when teachers already have the motivation to use technology in classroom learning, other obstacles make it difficult for teachers to apply technology in the classroom, namely weak economic resources and the few students who have mobile phones (Enochsson et al., 2021). This condition contributes as an obstacle to increasing teacher digital competence.

Digital in Curricula

One of the obstacles to why digital competence is still low is that there is no discussion of technology in curriculum documents. There needs to be an integration of ICT into the curriculum (Arredondo-Trapero et al., 2021). Therefore, for educational institutions that are preparing digital competencies into the school curriculum, schools should develop awareness about teacher technology knowledge that will be integrated into the curriculum (Instefjord & Munthe, 2015). In addition, obstacles to increasing digital competence can be overcome by efforts to raise capital and social law and regulate one's resilience from an education system related to the SDGs (Portillo et al., 2020).

Teachers' motivation to understand digital competence

Teacher motivation in using digital in learning is one of the factors that can develop teacher knowledge about digital learning resources (Cabero-Almenara et al., 2021). Moltudal et al. (2019) stated that the teacher is the party responsible for facilitating the learning process with ICT. Teachers with less motivation tend not to apply technology in the classroom. Meanwhile, teachers who are motivated tend to use technology in the classroom. According to Kožuh et al. (2021), teachers' digital competence can be assessed by the subjects taught. Science and technology teachers use digital tools more often when learning than social humanities teachers. The existence of collaboration between teachers is also able to trigger teachers to use technology. Enochsson et al. (2021) revealed that teachers who have difficulty finding colleagues to collaborate on teaching and learning using learning technology are a cultural challenge that teachers must solve. Teachers need to have high confidence in using technology because teachers who fear being wrong when using technology can reduce their digital competence (Enochsson et al., 2021).

Solutions to Improve Teacher's Digital Competencies

The role of policymakers

School ICT infrastructure in urban and rural areas has different ways of implementing it. The proportion of ICT infrastructure assistance for schools in rural areas may be more significant than those in urban schools. The current state of each area can be a consideration for the government as the party making policies to overcome ICT infrastructure problems in rural areas by helping to provide facilities, facilities, and infrastructure that support the implementation of technology-based learning. Furthermore, Lu et al. (2015) showed that ICT infrastructure is essential in using technology-based classrooms. The government needs to determine the number of policies to formulate a tight and optimal budget for providing ICT infrastructure in schools. Wastiau et al. (2013) believe that a country's policies can play a significant role in supporting the above policies and actions needed to realize a digital education system, increasing the number of digitally supported schools and teachers, and students who have confidence in using digital education.

Teacher Training and Empowerment in the Field of Digital Competence

Concerning preparing digital competencies for teacher candidates currently taking teacher education, Ortega-Sánchez et al. (2020) stated that there is a need for training for prospective teachers or teachers who are already teaching. The training on digital competence given to student-teacher candidates in Spain and France shows differences in self-perceptions about teacher digital competence. The results of this study also indicate a need to improve technological-manipulative and didactic training for teachers in universities and to adapt teachers' digital competencies to the demands of the information communication society. Not only teacher candidates or teacher education students who need to attend training. Teachers who have taught in the world of education also need to improve their digital competence through the implementation of teacher training or empowerment in the areas of digital competence, teacher self-development, and motivation relevant to mastering digital technology

(Astuti et al., 2021; Basilotta-Gómez-Pablos et al., 2022; Kožuh et al., 2021; Mutohhari et al., 2021; Supardi & Hakim, 2021). Kožuh et al. (2021) further agree that teachers often use learning technology tools during the learning process. If teachers desire to follow technological developments and are willing to attend seminars and workshops, they can improve their digital competence.

Implementing the Twenty-First Century Learning Model

Research on implementing appropriate learning models to improve teacher digital competence is rarely carried out in systematic literature research. This study describes the efforts that can be used to overcome teachers' digital competence through the application of learning innovations or learning models. Selecting suitable learning models and designs can help teachers learn and use effective technology (Conole, 2013), one of which is heutagogy learning. Heutagogy is ideal for use with online learning or technology components (Agonács & Matos, 2019; Lapele et al., 2022). Heutagogy is a learning theory that prioritizes student-center. Heutagogy is a model that shape self-directed learning, self-determined learning, complexity, reflective practice, constructivism, self-efficacy, zones of proximal development, and transformative education for student (Blaschke, 2012; Blaschke & Marin, 2020). The existence of a person's opportunity to access technology and social media such as blogs, wikis, and social media (Blaschke, 2014) allows heutagogy to develop through the ability to create and share the content, connect and collaborate with others inside and outside the classroom, share experiential learning outcomes and provide students with opportunities to learn from one another, and to reflect on what was learned and how it was learned thereby making learning more personal, independent, and self-determined (Anderson, 2019; Blaschke & Hase, 2016). So that teachers will have a greater incentive to use learning technology during the learning process, especially in terms of presentation preparation. According to Fraile et al. (2018), it is necessary to integrate ICT by combining relational and didactic aspects. The results of other studies provide suggestions so that teachers can implement synchronous collaborative learning, which involves Information and communication technology. The elements that need to be considered are cross-border contexts, classroom arrangements, and collaborative teaching methodology (Isoda et al., 2021; Wannapiroon et al., 2021). Teachers can implement any learning model as long as it integrates technology in the learning model.

Conclusion

The existence of learning technology in 21st century learning encourages teachers to have good digital competencies. Learning resources in 21st century learning are not only from one source but more than learning resources. In addition, the existence of students (generation Z) who are more sophisticated in using technology increasingly requires teachers to be able to create learning resources through digital technology. Several models of the teacher's digital competence framework determine teachers' digital competence. The DigCompEdu model framework is the framework that researchers use most often. The results showed that the level of digital competence of teachers was still low or at the most basic level.

Furthermore, this is due to several obstacles faced by teachers. This study groups three blocks that cause teachers' digital competence to be still low: the condition of ICT infrastructure in the school, digital curriculum, and Teachers' motivation to understand digital competence. The study's results provide a solution through a systematic literature review. There are three solutions; first, the need for a role from policymakers or the government in creating a digital environment or ICT infrastructure in schools, especially in schools located in rural areas and schools with a high level of education—Economics of students or teachers who are not good. Second, there needs to be training and empowerment of teacher competencies in digital competence to give teachers a better understanding of digital competencies. The third is implementing appropriate learning models in 21st century learning, namely the heutagogy and synchronous collaborative learning models. Heutagogy is a model that integrates technology in it and aims to create self-determined and self-directed learning in students. So, this corresponds to the type of Shiva in the 21st Century.

This research has limitations in its implementation, namely study with research targets at all levels of education, both playground, elementary, secondary, and higher education levels. Further research can focus on only one type of education level to focus more on the problems faced at one level of education. In addition, this study only examined 47 articles collected according to the criteria. Further research can increase the number of articles studied to produce more comprehensive findings.

Acknowledgements

The author would like to thank Prof. Dr. Siswandari, M. Stats and Mr. Bayu Khresna Sangka, S. E., M. M., Ph. D. that helped the Author uncover how to think more deeply in writing scientific articles, and Author's colleagues who give me their advice on this research. The appreciation is also delivered to the Head of Study Program and the Lecturer in the Master program in Economics Education of Universitas Sebelas Maret and the team of LPDP RI for their materials and moral support.

Abstract: This research aims to describes (1) problems in planning and organizing (2) actualization of curriculum planning updates, (3) actualization of curriculum organization descriptions, (4) "Gethok Tular" word of mouth strategy, (5) description of low self-esteem or low self-esteem strategies. "Andhab Asor". The method used in this study is a qualitative method, through a phenomenological approach with a case study design in the Regional Coordinator of Bantur, Malang Regency. There are 3 data collection techniques used by researchers, namely interviews, documentation studies, and observation. Data analysis techniques used in this study include (1) data collection, (2) data compaction, (3) data presentation, (4) drawing conclusions/verification. The validity data obtained through this study used technical triangulation and source triangulation, with persistence, reference testing, and member checking. The results in this study indicate that (1) the main problems that occur in planning and organizing are the lack of technology, (2) the actualization of curriculum planning planning, using online vark questionnaires to determine the learning model used by teachers with the planned 2013 curriculum design, (3) the actualization of curriculum organization lies on the basis of the patchwork curriculum and the integrated curriculum as the type of organization. (4) the word of mouth strategy is considered capable of overcoming the lack of technology from senior teachers, (5) the "Self Humble" or "Andhab Asor" strategy is considered capable of overcoming the demotivation of teachers in learning to create digital-based media.

Keywords: Word of Mouth, Updated Curriculum, Planning, Organizing

Introduction

The development of the curriculum in Indonesia from time to time has changed, especially after the pandemic (Munajim et al, 2020). On this basis, various curriculum paradigms and curriculum concepts during the pandemic and after the pandemic underwent various reconstructions and massive renewals. This is allocated to improve the focus of students, especially in learning and learning, because the main purpose of updating the current curriculum during the endemic period is the alignment of learning improvements in all regions in Indonesia (Kemendikbudristek, 2022). The pandemic period that has passed, leaves various historical problems, especially the early days when the pandemic took place. The expert explained that during the pandemic, there was a psychological problem of learning from students, called *psychological cognitive shock* (Kuhfeld et al., 2020). This is a problem that leads to low student ability in learning because they feel *shock*, because learning that was initially carried out directly through various face-to-face learning approaches, was revolutionarily changed to indirect face-to-face learning or commonly known as Online. The revolution change due to the pandemic has caused students' enthusiasm for learning to drop drastically.

Research from Azhari & Fajri (2021) shows that students' enthusiasm for learning in Indonesia has decreased drastically, marked by (1) low task collection from students, (2) low parental readiness, and (3) teacher readiness in organizing learners is still not optimal because teacher adaptability has not touched the optimal level. The attitude related to this has received a progressive response from the government in Indonesia, namely the issuance of an independent curriculum and an emergency curriculum as a conceptual tool that is considered capable of neutralizing learning *lag or learning loss* during a pandemic. Research from Baharuddin (2021) explains that schools in Indonesia, especially those that are still far from district and urban centers, tend to choose to use emergency curricula to deal with *learning loss*. The selection of emergency curriculum as a conceptual tool in dealing with *learning loss* is due to the readiness of schools which are considered not optimal in terms of technology and human resources in fully implementing the actualization of the independent curriculum.

The ideas of experts and researchers in the previous paragraph, will be drawn on the conceptualization of curriculum planning renewal and general curriculum organization which will then be drawn according to the background of the research site carried out by the research team. Curriculum planning itself is defined as a projection of the practice of activities grouped into (1) objectives, (2) content, (3) teaching and learning methods and processes, (4) curriculum approaches and (5) evaluations in curriculum activities (Triwiyanto, 2014). Objectives are an outline of the projection of *outputs* and *outcomes* regarding learning and learning which are the main areas of the curriculum. Content is material and subjects that exist at a curriculum level. Method, is a step or way that can be implemented to optimize learning outcomes. Approach is philosophical planning that refers to certain aspects, for example, there is a cultural approach, a technological approach and so on. Finally, evaluation is a step to *recheck* the results of the learning and learning process to ensure quality, or often called quality *assurance in learning* (Sallis, 2014).

In another aspect, there is a study of curriculum organizing which is interpreted as the arrangement of curriculum components like units containing topics, activities in learning, to competency achievements (Insani, 2019). The concept of organizing and planning the curriculum is terminologically almost the same as planning, but in the process of organizing, related to the curriculum is more detailed in a certain construct, such as *correlated curriculum*, *subject centered curriculum*, *broad fields curriculum* and so on. Moving on from this, the existing goal of the concept of an independent curriculum and an emergency curriculum is to improve *learning loss* during the pandemic through a technological approach and optimization of the role of teachers as *science communicators* Rosidah et al., (2021). There is a *gap* that occurs when this is implemented in schools that are actually still far from the city center, which is assumed that the allocation of human resources for technological approaches to learning is still lacking. The meaning of the researcher's idea is a paradox of *link and match* between the provision of policies and the ability of institutions or school readiness (*school readiness*).

The background of the research conducted by researchers faces a problem called the generation *gap*, which means that the ratio of old to new generation teachers is higher in the old generation. This triggered a *lack of technology*, so there was a problem with *school readiness* in Korwil Bantul. The background of the research conducted by the research team, which is located in Korwil (Regional Coordinator of the District for Education) Bantul, carried out unique curriculum planning and organization in preparing *school readiness* so that learning with an emergency curriculum as a tool was able to reduce *learning loss* in educational units. Broadly speaking, the strategy used by the Head of Korwil Bantul is *Word Of Mouth* (WOM) which is represented through young teachers as *agents of change*, communication patterns of "inferiority" or in Javanese commonly known as "andhap ashor", and the use of practical technology for learning efficiency in overcoming existing problems. On this basis, how to update the planning, organization, and strategy of Korwil Bantul in overcoming existing problems is interesting to be examined more deeply in this article.

Method

This research approach uses qualitative phenomenology in the form of a case study design. Case studies are centralized research to provide concrete meaning and understanding through a single background that includes a single case, which then becomes the level of analysis to generalize an activity or event (Sugiyono, 2019). The results obtained from all these studies used interviews, non-participatory observations, participatory observations, and documentation studies as data collection techniques. The presentation used to attach all data results in the field is field notes, interview transcripts, and documentation. This research was conducted in mid-September to the end of September at the Regional Coordinator Office of the Bantul Education District with the main informants being the Head of the Bantul Regional Elementary School, the Head of SD Negeri Bantul 01, the Head of SD Negeri Bantul 02, the Head of SD Negeri 04 Wonokerto, the *fresh graduate* Class Teacher of SD Negeri Bantul 01, the Javanese Language Teacher of SDN Bantul 02, and the Class Teacher of

SD Negeri 04 Wonokerto.

Interviews conducted by researchers are carried out in depth through *indepth interview* with reference to the snowball technique. Observations carried out by researchers are carried out directly during the learning process, as well as indirect observations during the teacher meeting process. The data analysis techniques carried out in this study using steps from Milles, Huberman, & Saldana (2014) include data collection, data condensation, data presentation, and drawing conclusions. Then the research team used data credibility checking through source triangulation and engineering triangulation. This the results related to this research are accurate, certain, and in accordance with the reality in the field.

Result

Results of Actualization of Curriculum Update Planning Update in Korwil Bantul

The actualization of curriculum update planning in this study, provides the main focus on how (1) objectives, (2) content, (3) methods and (4) evaluation and assessment of learning carried out at the basic education level at Korwil Bantul. Broadly speaking, the mapping of the actualization of curriculum update planning in Korwil bantul will be attached to table 1.

Table 1. Curriculum Planning Structure in Korwil bantul

Purpose	Intended competence	Contents Curriculum structure	Learning
Preparation for the implementation of an independent curriculum in 2024 and reducing the impact of <i>learning loss</i> within the scope of elementary schools in Korwil Bantul	Basic Competencies (KD) simplified by the Government to focus on essential competencies and prerequisite competencies for the continuation of learning at the next level	Using the Elementary Curriculum Structure in the modified 2013 Curriculum, through internalization of the use of <i>Vark Questionnaire Online</i> as a tool to determine learning models in a particular class scope.	Learning focuses on essential and contextual education and learning so that teachers and students are not burdened with the demands of completing all curriculum achievements and parents are facilitated in learning assistance at home and adjustment of learner models to learning styles in the classroom population

A detailed presentation was put forward by the Head of Korwil bantul, if the purpose of curriculum planning refers to adjusting the direction of the independent curriculum to the abilities and characteristics of elementary schools in Korwil Bantul. The characteristics in question are the ability of human resources and the availability of facilities and infrastructure. The actualization of curriculum planning in Korwil Bantul, said by

the main informant, namely the Head of SDN Bantur 01, stated that the content of the existing curriculum refers to subjects that are separated for grade 1 and grade 4, while the remaining classes refer to learning that is thematic in nature. The difference that shows the practice of modifying the content and learning methods that must be carried out by each basic education unit at SDN Wonokerto 04 is the use of *Vark Questionnaire Online* as a determinant of the learning method implemented in each educational unit. Freshgraduate teachers at SDN 01 Bantur revealed that the allocation of *Vark Questionnaire Online* (VCO) in the learning process at Korwil Bantur, is the main guide in implementing the learning model. *Vark Questionnaire Online*, is a *free platform* that can be used by everyone in determining learning styles.

Technically, the use of VCO in the allocation of curriculum update planning is grouped or broken down into 5 stages according to exposure from *freshgraduate* teachers at SDN Bantur 01. This is done through (1) the translation of the English questionnaire on the *web*, which is written through a *print out page* and before printing the questionnaire is given first to teachers who have English skills so that there are no misinterpretations. The second is (2) *charging one by one* students to fill in the questionnaire through the assistance of a teacher on a *laptop* device. When carrying out the second stage, the teacher holds a *print out page* containing the translation of the questionnaire so that when students fill in, each item of the questionnaire will be explained by the teacher so that students understand the intention of each questionnaire and choose answers according to their preferences. Head of Korwil Bantur explained that the activity of filling one by one students with technical students advanced one by one to the front of the class or precisely the teacher's desk due to the limited *gadgets* owned by the students. Another thing, explained by the head of SDN Bantur 02, confirmed that this activity was carried out at the beginning of the subject meeting. The third is (3) a recapitulation of students' learning styles in one class. The freshgraduate teacher, explained that in this regard, one thing that is carried out is to collect data by students one by one, related to the tendency of their learning styles to be included in *visuals*, *read/write*, *kinesthetics*, or *audio*. Fourth, is (4) generalization of student learning style tendencies in a class group. The teacher when carrying out the fourth process carries out activities by interpreting all the learning styles of students in one study group or class, then it is determined that the majority of learning styles in the scope of the class are included in which learning style. Finally, the fifth step is (5) determining the emphasis of the learning process using which learning theory model, as well as adding media that will be used in the learning process. The following is a table of guidelines used by schools in determining the learning model used by teachers.

Table 2. Table in Model Determination and Learning Media based on VCO

No	Trends in Learning Styles in the Class Population	Learning Models and Media
1	Visual	Model : Demonstration, Simulation Media : Vidio, Compact <i>handout</i> in the form of PPT, props, textbooks, <i>quizziz platform</i>
2	<i>Read or Write</i>	Model: Project based learning, lectures, independent

		<p>assignments in the form of small essays.</p> <p>Media : Compact <i>handouts</i> in the form of PPT, textbooks, <i>quizziz platform</i></p>
3	<i>Audio</i>	<p>Model : Lectures, group discussions, collaboration, role-playing</p> <p>Media: interactive video, <i>utilization of youtube platform</i></p>
4	<i>Kinesthetics</i>	<p>Model : <i>field trip around schools</i></p> <p>Media: Utilization of teaching aids and the environment around the school, textbooks</p>

When the researcher asked about the reason for using such a learning model and media as shown in table 1, it was to avoid confusion from teachers whose nature belonged to the old generation, said the main informant, namely the Head of the Bantur Korwil. The comment on this was continued by an expression from a Javanese teacher, who said that during the meeting to determine the model and media, there were many designs from Korwil, but the teacher *enjoyed* and was more happy if the exposure to learning models and media was still thick with elements of the old but varied learning model. So it can be concluded that the method for planning curriculum renewal in Korwil bantur does not lead to learning that is thick with new elements, but still has an impact and is able to make teachers not feel objections in their teaching practice because the teacher's capital only needs to remember the syntax of learning that has been learned in the past.

The Head of SD Negeri 04 Wonokerto emphasized that the foundation used to determine curriculum update planning or specifically in learning methods, a technological approach is used. The technological approach is based on the use of *online questionnaire vark* in determining learning media. The head of SD Negeri Bantur 02 gave an explanation if this was considered effective, because the attention of students, when learning took place, was assessed by informants with a higher level of concentration. Projection from the Head of SD Negeri Bantur 02, it is due to the suitability of the learning model with the learning styles of students who encounter harmony. This is also evidenced by *freshgraduate* teachers where activities in the classroom are generally students easily sleepy, when using *vark questionnaire online* students are easier to provide *feedback* in two-way communication with the teacher.

The final focus, as the research team will explain, is the evaluation of student learning outcomes. In this process, there are two general assessments examined by researchers, namely the Midterm Assessment (PTS) and the End of Semester Assessment (PAS). The planning for curriculum updates related to the evaluation of learning outcomes or student learning assessment is prepared through a special team called KKG (Teacher Working Group) and there is assistance from Korwed (Coordinator of Education Division) for PTS while for PAS explained by the Head of Korwil Bantur compiled by the Education Office. Related to the assessment of student learning evaluation for grade 1 and grade 4 subjects are assessed separately, but for grades 2, 3, 5, and 6 the assessment process is carried out in an integrated manner, except for Mathematics and Javanese lessons

during pts. For the implementation of PAS is carried out separately in each subject.

Table 3. Allocation of PTS and PAS in Planning for Evaluation of Student Learning Outcomes

Types of Assessments	Drafting Team	Assessment Concept
Summative Midterm Assessment	KKG Team from the District Coordinator for Education and the Coordinator of the Head of Education	a) Grade 1 and grade 4 are implemented separately for each subject b) Grades 2, 3, 5, and 6 are carried out in an integrated manner, except for mathematics and Javanese subjects
Summative End of Semester Assessment	Malang District Education Office	At each grade level it is carried out separately

The Head of Korwil Bantur, emphasized that the process of pts by the KKG and Korwed teams was carried out according to the table above and related to Mathematics and Javanese language was separated, because to combine the constructs of the two subjects into other subjects was considered difficult, although it was actually capable of being carried out. The informant further stated that this was feasible, but reviewed from the depth of his assessment which was difficult to implement. Therefore, it can be concluded that the planning for curriculum renewal in Korwil Bantur, in content is still the same as the 2013 curriculum, which is different in terms of learning objectives, methods, and evaluations. The objectives emphasize technological preparation for an independent curriculum and emphasize the harmony of student learning styles with learning models and media by teachers. The method used focuses more on optimizing student attention and student passion in recovering *learning loss*, as well as evaluations that are carried out variably for each grade level.

Picture 1. Focus Group Discussion in KKG Team Activities

Actualization of Curriculum Organizing Updates in Korwil bantur

Updates in the organization of the curriculum in Korwil Bantur, will be explained the results of the research in

the field by the research team through two points, namely (1) the procedural basis for curriculum reorganization and (2) the type of organization used in the research background. The first point is explained by the main informant, namely the Head of the Korwil, if the reorganization in the curriculum update implemented refers to the patchwork and error studies in the previous period. This was reinforced by the presentation from the Javanese teacher who revealed, if practically, the organization of the curriculum and the implementation of the curriculum in the period before the modification, lies in the direction for an elusive learning model. It was revealed by the relevant informant, if the learning model is like *jigsaw* learning, then there is a learning model that is felt to be new for the old generation of teachers, the guide is abstract and difficult to understand. Through modifications in learning methods as one of the contents of the curriculum, equipped with the help of several strategies from Korwil, all teachers are able to adapt the existing learning process. The head of SDN Bantur 02 argued that the patchwork process in the curriculum that is now being carried out in Korwil Bantur, refers to the process of active involvement of all teachers, because they get knowledge updates, but are not effectively patronizing by new teachers. In this regard, it will be discussed more deeply by the research team in communication strategies and *word of mouth*.

Another core thing that the research team got was in the second focus, namely the type of curriculum organizing organized by Korwil Bantur. The type of curriculum organization launched by Korwil bantur is an integrated curriculum. The Head of Korwil Bantur described the *integrated* curriculum as a new curriculum organization. This is actualized in the presentation of learning materials in units without holding various restrictions between subjects. The results in subjects except Mathematics and Javanese language have no particular restrictions. The head of SD Negeri 04 Wonokerto stated that if there are no such restrictions, there are shortcomings in practice, namely teachers who tend to be lazy when getting supervision, there are often some suboptimal behaviors. This suboptimal behavior is due to the ability to create and innovate in teaching practices is still poor. Low motivation and laziness to combine different constructs in learning became the main problems. However, it was confirmed by the Head of SD Negeri 04 Wonokerto that if this does not happen to all teachers, only a small population will experience this obstruction.

Freshgraduate teachers from SDN Bantur 01 also stated that to implement an *integrated curriculum*, it takes a strong will and determination to be creative in compiling various constructs in subjects, so that they are able to be transformed into comprehensive learning so that learning objectives can be implemented. The information obtained from the Javanese teacher is also similar to the *fresh graduate* teacher, but the Javanese language teacher emphasizes more on work patterns in schools, which often Javanese teachers help other teachers to carry out the integrated curriculum. For the various ideas as conveyed, it can be concluded that in the basis of updating the curriculum organization in Korwil bantur using patchwork and the foundation of learning from old mistakes, then for the type of curriculum organization that becomes an update is the *integrated curriculum*.

***Word of Mouth* Strategies on Curriculum Planning and Organizing**

The problem that arises due to planning and organizing in curriculum updates in the Korwil bantur area is the

lack of technology, namely the lack of teacher capability in the process of using technology in learning and learning. This was revealed by the Head of Korwil Bantul, if the use of *technology platforms* as a support for the learning and learning process in Korwil Bantul is still bumped by teachers who are not able to operate various technological assistance. The Head of SD Negeri Bantul 01 stated that the problem of "Gaptek" or stuttering technology is represented through (1) the ability of teachers In using *quiziz* is still low for the allocation of variations in the student assessment process, (2) the ability to make *power points* is still poor, characterized by the lack of use of these media in learning in the pre-pandemic curriculum period, and (3) the creation of interactive videos that were still poor before the pandemic. Expressed by the *freshgraduate* teacher as an informant, if one of the reasons the teacher is not able to carry it out, is because every time there is training, the teacher does not feel that the instructor is there as a friend and the learning process stops when the training is over. Javanese teachers explained that in the past, teachers wanted teaching agents in each of their educational institutions, and were given special responsibility to teach by word of mouth without structured training.

It is on this basis that the head of the Korwil bantul allocates teachers under the age of 35 as peer teaching agents for teachers in his school through the provision of definite responsibilities, and the existing teaching process takes place incidentally. Head Korwil Bantul stated that if the old generation of teachers are meant, it is teachers whose age is calculated as of 2022 to exceed the age of 35 years. This is reinforced by a statement from the Head of SD Negeri Bantul 02, if himself and his colleagues who are still teachers also feel the *lack of technology* and feel efficient if the training is carried out through the selection of teachers under 45 years old as individuals who are given debriefing, then transmitted to their school members, so that whenever the teacher wants to consult it will always be able to be carried out without having to wait for training with certain institutions. or waiting for the Korwil program to be implemented.

Picture 2. Pelaksanaan Strategi *Word of Mouth*

Head Korwil Bantul stated, if in English this is called the word of *mouth* but if it is in Javanese concept, this can be called "Gethok Tular", but in the construct of teaching peers word of mouth tentatively. Therefore, the

process of implementing the *word-of-mouth* strategy in Korwil Bantur is carried out through several stages (1) *collecting*, (2) *guiding and building*, (3) *actuating*, (4) *controlling*, (5) *re-building*.

Collecting, is a process allocated to screen teachers in any elementary school within the scope of the Korwil Bantur area that is included in the *freshgraduate* category. The head of SD Negeri 02 Bantur, stated that what was declared *freshgraduate* was a teacher who had not touched 15 years after he graduated from his last education. The number of teachers collected will later be included in the *guiding and building* stage. In the *guiding and building* stage, what is carried out is the provision of training using a *workshop* model, which is followed by teachers who are screened in the *collecting* stage. The material provided in the guiding and building process is the management of (1) student test assessment through *quiziz*, (2) making interactive *powerpoints*, (3) *sparkol video animation maker* and (4) "inferior" or "andhap ashor" communication. The training lasts for 6 working days which is carried out in February with an allocation of 2 training days every week. Each training gets an allocation of 10 JP which is divided into 2 days. Related to the communication material "inferiority" allocated 3 JP in 1 day.

Guiding and building What has been carried out produces an agent of change in the curriculum process, will be continued by *actuating*, where teachers who have been equipped with these various abilities will transmit their knowledge to the school through activities compiled by the school itself. *The freshgraduate teacher* stated that when it comes to *actuating*, the majority of teaching to other teachers is carried out on a one on one or one on two basis, and a maximum of *one on three*. The number of teachers taught by teachers with curriculum change agents when exceeding three will generally be carried out small group training, but generally schools will carry out training internally which all teachers participate in. The Head of Korwil gave a statement, if teachers who have been equipped with workshops can provide teaching to other teachers through (1) structured training organized independently by the principal and (2) tentatively independent training if needed by teachers from their schools.

Picture 3. Implementation of *Building and Guiding* in *Freshgraduate* Teachers

The *controlling* stage is a step carried out by a school superintendent to check whether teachers have been able to carry out the creation of learning media and technology management as well as the initial goal of the *word of mouth* strategy from the head of Korwil Bantur. The last is the *rebuilding* stage, where an activity carried out is to coordinate what material should be used as *workshop* material for the next academic year. It can be concluded from the various exposures that exist, if the *word of mouth* or "gethok tular" strategy is an activity to overcome the lack of technology of teachers, through the appointment of teachers with *freshgraduate* criteria to become agents of change in the context of neutralization of "Gaptak" from teachers. Head Korwil Bantur stated that it can be called *a word of mouth* because schools more often carry out training individually and are tentative because they are considered more *enjoyable*, and cause an effect if the agents of change are not only teachers who are given *workshops*. Teachers who previously did not know the material, then taught the material by *the freshgraduate* teacher became able to create learning media, which then also taught their friends. Head Korwil Bantur stated that it was because of the domino effect of word of mouth in the context of making learning media that made him give the name *word of mouth* to this strategy.

"Inferior" Communication Strategies in Curriculum Planning and Organization

Explicitly, the informant, namely the Head of SDN Bantur 01, stated that a small problem that generally arises in the process of transforming new knowledge from peers in the school environment is the attitude of senior teachers who tend to feel patronized by their juniors. On this basis, the Head of Korwil Bantur attached a material on low self-esteem communication as a *workshop* that was carried out to reduce these problems. The low self-esteem communication strategy, in the *workshop* was launched through three main things, namely (1) the concept of looking at senior teachers as parents of *freshgraduate* teachers or the concept of "upload-unggah", (2) the main focus of teaching new things, not telling stories about achievements that make other teachers feel less competent, and (3) planting *a growth mindset*. The concept of viewing senior teachers as parents of *freshgraduate* teachers is a step used so that the teaching process individually or independently still internalizes the value of politeness in it. Therefore, *freshgraduate* teachers understand the material by being represented through always respecting senior teachers, placing themselves as children who teach parents, and giving smiles whenever senior teachers have difficulty in implementing the development of learning media for their teaching process in the classroom.

The head of SDN 04 Wonokerto gave his opinion, if the provision of material to focus on teaching, without boasting of themselves from *freshgraduate* teachers makes senior teachers more comfortable when the training is carried out. This is strengthened by the Javanese language teacher, if he explains that if *peer teaching* training is carried out with a communication process from a tutor who always prides himself proud, academic confusion will arise, which will certainly trigger demotivation in learning new things for senior teachers. Finally, with regard to the material on the application of *growth mindset*, it directs *freshgraduate* teachers not to feel more powerful and smart than senior teachers.

The idea of the class teacher at SDN 04 Wonokerto explained that the application of *growth mindset* material

in the *workshop* makes *freshgraduate* understand, although senior teachers are weak in terms of technology, senior teachers have experience in *handling* learning optimally in practice because of high flying hours, so that if you put yourself in the *growth mindset* of *freshgraduate* teachers. Not only does it teach new things to senior teachers, but it also learns new things to senior teachers about their teaching experiences to life experiences that are told generally when individual training is conducted if the *freshgraduate* teacher positions himself as a humble individual. Therefore, the head of Korwil Bantur stated that the embryo of the *word of mouth* was caused by a harmonious self-compaction between a *freshgraduate* teacher and a senior teacher.

Discussion

Actualization Analysis of Curriculum Planning Updates

Researchers are of the view that all aspects of the curriculum planning renewal implemented by Korwil Bantur contain the characteristics of the institution's self-awareness to develop by utilizing potential and overcoming *existing gaps*. In the realm of implementing the old curriculum towards the new curriculum, it is necessary to achieve short-term goals before entering into long-term goals. The researcher's opinion is in line with the expert opinion, which states that the maturity of an educational institution is represented through the ability to utilize the maximum potential possible through the initiation of a leader (Berkovich & Eyal, 2018). Rationally, when viewed from the existing objectives Korwil Bantur does not convey explicitly about the type of purpose. Research from the research team, constructing when it comes to aspects of goals, Korwil Bantur puts two objectives in its construct. These two things are short-term goals and Long-term goals.

The short-term goal allocated in the curriculum planning update is to overcome *learning losses* within the scope of Korwil Bantur elementary schools, while the long-term goal is to prepare for the implementation of

an independent curriculum in 2024 massively in Indonesia. Theoretically, such a pattern of curriculum objectives is said to be preventive and curative of curriculum problems in the context of future and present considerations (Rosidah et al., 2021). The management process of such curriculum renewal should be able to be adapted to various other educational units so that the short-term and long-term national curriculum can be optimally achieved. With regard to the content and methods as has been applied by Korwil Bantur, it focuses on learning that focuses on the suitability of the learning model with the learning style of a student. This in the renewal of curriculum planning is called a *link and match between context to fields* (Zadina, 2014). The impact that arises due to the *link and match* between learning styles and learning models by teachers will put students in the learning process through the *DNA of peak performance* conditions (Oettingen et al., 2009). The meaning of this is a condition where students are passionate about learning which is characterized by the student's passion for optimal learning in each subject.

With regard to the renewal of curriculum planning from the concept of evaluation and assessment of learners, using a varied model in the results. This makes the assessment more in-depth for the achievement of student competence, because research from Suyitno & Rochmad (2015) states that mathematics learning assessment cannot be combined with other learning contexts, if the learning and learning process can be internalized, but for end-of-semester and midterm tests it is not recommended. The cause of the expert theory is because the philosophical foundation of learning mathematics should indeed be given tests separately from other lessons, so that the development of mathematics *problem solving* can be delivered in depth and complex. Learning mathematics if the test is combined with other subjects, then all competency indicators cannot be implemented (Suyitno & Rochmad, 2015). The research is also in line with other research that discusses mathematics subjects Musdi & Anggrawati (2019) if the assessment in mathematics lessons must contain independent principles, which means not internalizing other disciplines so that *critical thinking* to solve story problems focuses on students' logical mathematical abilities.

With regard to the assessment of Javanese which is also separated like mathematics subjects, there is research that reveals that in Javanese language subjects assessment must be isolated from other subjects, because it discusses culture, word meaning, and habits that cannot be mixed with other lessons, when combined with the assessment test, the local linguistic ability of students will not be seen specifically (Meliana, Sudi Utami, & Sukoyo, 2020). Therefore, it can be concluded that for all existing exposures, in the update of curriculum planning in Korwil Bantur, it was found that the suitability of the context empirically and theoretically to various practices that have been implemented in the research background.

Curriculum Organizing Update Analysis

The results obtained by the research team in this study show that (1) the procedural foundation used for curriculum organization renewal is a patchwork and error study in the previous period, and (2) the allocation of *integrated* curriculum in the type of curriculum organization. In the first point, it can be concluded that the various implementations of curriculum organization renewal in Korwil Bantur are reflective processes. The

reflective process is a completion step that bases evaluation in the previous period to create a new, more guaranteed quality (Ghavifekr & Rosdy, 2015). The meaning of the expert's idea gives meaning that Korwil Bantur in this process is an educational institution that is able to carry out *continuous improvement*, because the leader of the institution is proactive to the various achievements of the institution he leads, so that the movement of subordinates towards optimal quality is easier to achieve. This is generalized to be easily achieved because of the *awareness* of high leaders in terms of responding to the performance of the institution. In line with the expert expression if the leader of the institution who has a high awareness in responding to falling performance, is an indicator that quality development will occur both in the short and medium term (Burhanuddin, 2017).

In the second point, a problem was found that in the implementation of the *integrated curriculum* through the observation of the principal, if teachers with low creativity tend to be lazy to carry out various activities in thematic learning. One thing that can be done to overcome this, is to provide academic supervision in a directive manner. This happens because the teacher is in the quadrant of teachers who *drop out*, meaning that the teacher has low motivation and a poor level of abstraction (Glickman, Gordon, & Gordon, 2013). The principal's role that can be carried out for such case studies is to provide assessment, guidance, and motivation in a directive manner where it is represented through daily observation of the teacher's development. Teachers will feel supervised at the beginning, but this makes teachers moved to change their lazy habits. Problems related to laziness when considered complete, the directive process in academic supervision is then through guidance to improve abstraction, can be included through seminars outside the school, or providing stimulation to stimulate the creative mindset of teachers from a supervisor or principal.

The researcher's opinion is in line with the expert's expression which states that the provision of directive supervision is represented through the perception of teachers who feel supervised but in a positive form, then accompanied by guidance by directing to *details* related to the context of the problem as stimulation so that teachers are able to increase abstraction and commitment in completing responsibilities as educators (Hoque et al., 2020). On the basis of experts and their comparison with the opinions of the research team, it can be concluded that the update of curriculum organization is in accordance with theoretical and practical expectations, but with regard to the implementation of the *integrated curriculum*, academic supervision assistance is needed so that these contextual problems can be neutralized.

Word of Mouth Strategy Analysis in Curriculum Planning and Organizing Updates

Based on the results as stated in the previous section, the main basis for implementing the *word-of-mouth* strategy is the condition of human resources in Korwil Bantur which is more old generation than the new generation (*generation gap*) which then causes problems in the form of *lack of technology*. Analysis related to the condition of human resources, researchers want to convey if the characteristics or identities of educators can certainly affect their teaching patterns. If examined thoroughly, generation X is an individual born between 1965 and 1980 (Lissitsa & Kol, 2016). The advantages of generation X characteristics according to

Yigit & Aksay (2015) a number of advantages of generation x are (1) adaptation to technology that is not too difficult because daily life has been assisted by technology, (2) not wanting everything instantly (3) generation X's intense and high work climate. If these three points are drawn into the context of updating curriculum organization, of course teachers in Korwil Bantur are suitable for implementing *word of mouth*. In the second point, it is a good enough advantage for an implementation of the learning development process, because the advantage of a teacher who does not want everything instantly is the fundamental foundation for the success of various learning innovations, because one of the causes of failure of an innovation and also change is the desire of a leader who wants to innovate and change instantly (Burhanuddin and Zahri, 2016). When connecting from various points, the third or last point is a point that refers to high x-generation workability.

This will certainly boil down to the breakthrough of an optimal comfort zone in the organization. Because it leads to a hard and committed organizational work. In line with the expression Razzaq & Forde (2013), that high work commitment can have an effect in the form of growing the quality of institutions that are positive in nature. Research from Juharyanto et al., (2020) states that if positive word of mouth information without specific direction, then gives implications for the development of a population towards quality improvement then it can be referred to as "Gethok Tular". The research, if connected with the results of research from the research team, the implementation of "Gethok Tular" occurs when structured initial planning is used to form *an agent of change* in the context of neutralizing the problem of *lack of technology* intended for *fresh graduate* teachers in senior teachers, actually developing positively. Namely the formation of *a learning community* from teachers because senior teachers who have gained new knowledge from *freshgraduate* teachers, although not given written responsibilities, he transmits this knowledge to his colleagues through word of mouth. *Learning community*, is a community that is formed both in a structured and spontaneous manner due to the mutual relationship between the giver of knowledge and the recipient of knowledge (Bednarz et al., 2011).

After being given an overall analysis *of the word-of-mouth* mechanism as a strategy to solve problems in planning and organizing curriculum updates, the research team will provide an analysis of the content or content of the existing material. Paparan mengenai konten atau materi yang ada Explained by the informant in the form of the use of *quiziz*, making interactive *power points*, and video animations. In terms of content or content of this strategy in accordance with the needs that exist in the learning process in the 4.0 era. In line with the expressions put forward by experts, when it comes to the allocation of media that is suitable for use now, is a media based on (1) measuring student values based on an *online* system, (2) exposure to interactive material with digital devices, and (3) providing illustrations from animations to strengthen a student's understanding of a certain material (Chick et al., 2020) . Apart from being more interesting because of the large number of colors that are not limited by the whiteboard, providing material through interactive exposure to both *power points* and animated videos can strengthen the memory of a student. Therefore, on the basis of various exposures as explained by the research team, it can be concluded that the implementation of *word of mouth* in overcoming the problems of planning and organizing curriculum updates in general and content-wise is the right step. At the level of planning and organizing the allocation of word of mouth as a conceptual and practical tool to create output in the form of teachers who are able to compile content, methods, evaluation and

learning models in accordance with the curriculum implementation reference, then create outcomes for the preparation of teachers at a higher level related to school readiness for massive independent curriculum implementation in the future.

Strategic Analysis of "Inferior" Communication Patterns in Curriculum Planning and Organizing Updates

The strategies used by the Head of the Korwil bantur in implementing the strategy of communication patterns are communicated through 3 constructs, namely (1) the practice of "uploading, (2) focusing on providing material rather than telling about one's own achievements, and (3) planting a *growth mindset*. Low self-esteem is a psychological condition When an individual feels that he still needs to improve the quality of himself and views the interlocutor or other person as an individual who can be used as an object to improve his personal qualities (Mroczek & Kolarz, 1998). When connected with other things whose nature is out of context, according to Mroczek & Kolarz (1998), *lowkey* or low self-esteem in adulthood can increase life *wellbeing* or happiness in life, because he feels that he is not competing with anyone to cause mild psychological disorders such as *overthinking* and *insecurity*. The practice and implementation of "upload-ungguh" in the strategy of inferiority communication, was assessed by the research team as a behavior that makes the interlocutor or others become appreciative of what is conveyed because the dimension of politeness is fulfilled.

The idea of the researcher, supported by research from experts, if the right *attitude* will make a person with the interlocutor allow the subconscious to obey the apperception and perception of the communicator (Nashori, 2009). Therefore, in some contexts of discussion about leadership, the attitude of the leader can determine the attitude of subordinates in completing the tasks ordered by the leader. Second, it is to focus more on the core of the transformation of knowledge than to be busy telling one's own achievements. On the concept of culture organisasi, hal tersebut merupakan bagian from *toxic* communication that directs the communication opponents of the communicator to a decrease in self-efficacy (Kreitner & Kinicki, 2001). Therefore, the allocation of such strategies to reduce the dominance side of *freshgraduate* teachers can be neutralized using this second method. The last is the cultivation of a growth mindset, an appropriate analogy to describe a *growth mindset* is a half-full cup which is interpreted as an individual's self-awareness to always be willing to learn from anyone regardless of status, age, class, race, religion, or rank (Zilka et al., 2022).

Broadly speaking, it can be considered that there is consistency between the theoretical and practical foundations implemented at Korwil Bantur to neutralize organizing problems and also curriculum planning. The research team wanted to provide other information about this, namely on a cultural basis, "upload-ungguh" reflects the manners of the Javanese community, especially to older people through subtle language and giving smiles (Chotimah, Untari, & Budiman, 2019). This is done in practice, for example, if there is a person whose job rank is higher than that of an older person, so if he uses "upload-ungguh", what will happen is that the superior still calls his subordinate politely by not calling his name directly, because in the context of

Language on "upload-unggah", calling someone directly by name is a misappropriation and comes out of the concept of "upload-unggah". The researcher's assumptions regarding the results of this study, of course, *freshgraduate* teachers have this dimension, so that various implementations of low self-esteem communication pattern strategies can be created in the educational environment of Korwil Bantur.

Conclusion

Based on the presentation of the results and discussions in this study, it can be concluded that (1) updating curriculum planning in Korwil bantur uses *online questionnaire vark* as a basis in determining the learning model and media used, (2) on curriculum planning in Korwil Bantur using content in accordance with the 2013 curriculum which is modified into an emergency curriculum through the concept of thematic learning methods, (3) the objectives in the renewal of curriculum planning consist of neutralizing the *lack of technology* of a teacher and the allocation of preparations for the implementation of an independent curriculum massively in the future, (4) on updating curriculum planning Korwil Bantur using evaluation of student learning in summative concepts through PTS and PAS which are distinguished between grades 1 and 4 using separate lesson units, while the rest of the classes use integrated summative assessments except in mathematics and Javanese subjects.

Fifth, is (5) the basis for updating curriculum organizations in Korwil Bantur using patchwork and evaluation of errors in the past, (6) using *integrated* curriculum as a type of curriculum organization. An interesting finding of the problem that exists within the scope of the study is the *generation gap* between *freshgraduate* teachers and senior teachers which causes a core problem in the form of *lack of technology* in teachers. *The problem solving* used to overcome these problems is (1) *word of mouth* or "gethok tular" strategies and (2) "low self-esteem" or "andhab asor" communication pattern strategies for *fresh graduate* teachers who are facilitators of senior teacher learning related to the operation of technology problems in learning. Various research findings and problem solving in Korwil Bantur are in line with theoretical and practical foundations, it's just that teachers who are lazy when carrying out integrated learning because their creativity is also low, should be given directive supervision as *problem solving* so that the teacher quadrant is not included in the *drop out* quadrant

Suggestion

Based on the various reviews in the conclusion, the researcher advises readers to (1) be able to imitate planning and organizing models, as well as *problem solving* as is the case in this article so that the implementation of the curriculum has a strong readiness, which starts from planning and organizing. For other researchers (2) the effectiveness of *such problem solving* should be further studied using a quantitative approach so that positivistic data exposure can be seen clearly measured.

Acknowledgement

An Investigation of Rhetorical Questions in Obama and Cameron's Political Speeches

Muslah Alham Fadhl

University of Diyala, Iraq,  <https://orcid.org/my-orcid?orcid=0000-0003-0872-8496>

Abstract: Rhetorical questions (henceforth RQs) are one of the significant linguistic forms used by a politician to achieve effective communication strategies. The present paper aims at investigating the significance of RQs in political discourse by examining Obama and Cameron's political speeches and comparing them to different social, political, and economic dimensions during the period (2014-2015). The study sample includes twenty speeches: ten speeches for each president. The method of research will be quantitative and qualitative in nature so as to examine the strategic use of RQs by Obama and Cameron to achieve their political goals. More specifically, it examines the functions, features, and types of these questions in light of the topic of speeches. The results show that Cameron is more capable of achieving rhetorical effects in his speeches than Obama and both of them use Wh-questions more than other types of RQs. Besides, the use of RQs in social topics is more than in political and economic topics.

Keywords: Rhetorical questions, Ordinary questions, Syntactic functions of RQs, Pragmatic Functions, and Political goals.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 355-367), Cappadocia, Turkiye. ISTES Organization.

Introduction

Rhetoric has been considered one of the significant linguistic forms used to affect the minds of an audience. Yankah (1994, p.3568, cited in Abioye, p. 290) defines rhetoric as "The art of effective argumentation with the view to influencing opinion". Since many years, scholars attempted to investigate it from different areas so it has gained some various definitions and labels. However, this reason makes rhetoric, which represented by RQs, more confused linguistic device. Functionally, QRs could achieve some effective communication strategies. Thus, politicians have taken advantage of them to play on the emotions of their audience to persuade people to take their sides. As a result, we see that RQs have been widely exploited in political, social, and cultural situations to convey an implicit message to the audience so as to win their agreement. They are often used to strengthen and support spoken assertions or send the implicit message to listener (Alleton, 1988). In this paper, the researcher aims to examine the use of RQs in selected political speeches conducted by Obama and Cameron during different celebrations in 2014 and 2015. It also examines the functions, features, and types of

these questions in light of the topic of speech.

Research Objectives

The topic under the study investigates RQs in President Obama and President Cameron's speeches on various occasions in (2014 and 2015). Thus, it aims to achieve the following objectives:

- To examine how Obama and Cameron exploit the various types of RQs according to achieve various functions.
- To examine the strategic use of RQs by Obama and Cameron to achieve their political goals.
- To investigate how Obama and Cameron use RQs in their speeches (in the years 2014 and 2015) on different economic, political, and social issues.

Literature Review

Many scholars have defined RQ differently. Richards & Schmidt (2002, p.459) defines it as "a forceful statement which has the form of a question but which does not expect an answer". According to this definition, the distinction between a statement and an RQ is nonexistent. Wales (1990, p.370) introduces RQ as "This is a question which does not expect an answer, since it really asserts something which is known to the addresser, and cannot be denied". In this case, the speaker can employ it as a tool to make an implicit claim or denial. Pope (1976, p.47) identifies that "RQs are questions that exhibit opposite polarity; a positive RQ is like a strong negative assertion, while a negative RQ is like a strong positive assertion". According to this definition, an RQ is functionally used to emphasize a point by using opposite polarity. In this respect, Han (2002, p. 213) adds that "an RQ has the illocutionary force of an assertion of the opposite polarity from what is apparently asked". Here, both of pope and Han highlight on the difference between the form and function of RQs. Abioye (2011, p. 291) stats that "RQ is used to admonish, make a plea or request, commend, pay tribute, condemn or vilify". According to this view, an RQ can be used for different purposes and it is difficult to define it in one definition because of its various functions. Balogun (2011) argued that the interrogative clause shows the attributes of a powerful statement. The assertion may be either positive or negative. This means that an RQ is similar to question in form but statement in function. The speaker is ready to tell the reader or listener the answer. As viewed from the above definitions, we can conclude that the gap between the forms of QRs and multi functions of QRs on other made the QR difficult to label to unified definition.

Rhetorical Questions and Ordinary Questions

RQs are formally different from information-seeking ordinary questions (OQs). OQs can be used in a situation if the answer is known only by the addressee, while an RQ is employed when both the speaker and the addressee are aware of the response. Moreover, with OQs, answers are obligatory and are given or decided by the addressee whereas the speaker or the addressee can offer responses to RQs. Sadock (1971; as cited in Han 2002,

pp. 203–204) highlighted the following points to demonstrate the difference between RQs and OQs:

- The expression “after all” can occur with RQs but not with OQs.
- RQs can be followed by a clause beginning with “yet,” but this is not possible with OQs.
- The phrase “by any chance” can occur only with OQs, as shown in the following example: “Are they winning the match, by any chance?”

As the speaker can use RQs to implicitly assert a particular point, some scholars have suggested that yes/no questions can functionally be RQs when they are used for emphasis.

Types of RQs

There are four syntactic structures in English that can be used to form RQs.

Yes/No Questions

According to Quirk et al. (1985) discuss that whereas a negative rhetorical yes-no question is equivalent to an intensely positive assertion, a positive rhetorical yes-no question is equivalent to a strongly negative assertion. Mosgavi (2009, pp. 38–39) stated that “Yes-no were identified as rhetorical if they serve as implicit assertion with a polarity opposite to that of the question that yes-no questions”. However, she emphasised that some yes/no questions may not exhibit opposite polarity. The following question: “Is that you, Henry?” (Mosgavi, 2009, p.38). We anticipate the response to be ‘yes’

Wh-Questions

According to Han (2002)and Swan (2005), negative wh-questions contain meanings that reflect the speaker's anticipation of a positive answer, have implications that convey the speaker's expectations of a positive answer”. Consider the following example, in which the teacher thinks that most students completed their tasks and wants to know who did not: “Who didn't finish the homework?”. In contrast to Quirk et al. (1985, p. 826), Bolinger (1957, as cited in Koshik, 2005, p. 52) indicated the following to be the most prominent types of rhetorical wh-questions:

Why / How Should....? These types can be used to reject suggestions, requests, and instructions (Swan, 2005, p. 467). For example, “why should you follow me ”

Why....? Such questions can be used to complain, criticise, or make a suggestion – for example, “Why do you waste time with trivial things?”

Who Cares....? This phrase often implies that nobody cares – for example, “I can run faster than him, who cares?”

How Could....? This phrase is used to convey denial or criticism – for example, “How could you think I did that?”

Mosgavi (2009, pp. 38–39) shows the difference between RQs and exclamations “RQs are semantically

questions, while exclamations do not express a question even on the semantic level and are therefore not answerable. For instance, how will this fellow save us? implies that (This fellow cannot save us) while (How awesome is this place!) implies that (This place is very awesome)”.

Alternative Questions

This type of RQ presents two alternatives to the audience. Two forms can be used for this: yes/no questions and wh-questions (Quirk et al., 1985). Hamzah (2011, p. 26) states that “The syntax of a yes/no alternative question is that of a yes/no question, but instead of a final rising tone, a rise occurs on each alternative of the question, followed by a fall on the last alternative indicates that the list is complete”. However, in some contexts, such questions are biased because the speaker tries to guide the audience to choose the response that reflects the speaker’s goal (Van Rooy & Šafářová, 2003). Thus, politicians exploit this type of RQ to make their audience pay more attention to the desirable alternative.

Balogun (2011) argues that the speaker’s attitude is employed to either confirm or dispute the point stated. The speaker makes some assumptions that may seem true to them with the intention of making the listener further clarify the matter, as in the following example: “She dances well, doesn’t she? He doesn’t wear his uniform, does he?”

Syntactic Functions of RQs

Many speakers use RQs more than statements because of the discrepancy between RQs’ form and function. This discrepancy leads to variations in the application of RQs in the language. The functions of RQs vary according to the purpose and goal of the speech. They can be stated as follows:

- To express and emphasise strong feelings using a series of RQs
- To start a new subject using a leading question
- To express a request using a command question
- To express a rebuke
- To express surprise
- To confirm something in the mind of the listener
- To express doubt about something

Pragmatic Functions of RQs

Niazi and Gautam (2010, p.270) pointed out that “RQs are similar to indirect speech acts, as there is a discrepancy between their forms and communicative functions. Ibid (2010, p.270) also stated that “RQs “may or may not have the illocutionary force of questioning but always bear the force of an indirect assertion”. Thus, the primary or major functions of RQs are those behind the questions constituting the speaker’s aims and purposes.

Ilie (1994, p. 46) argued that RQs can achieve more than one function simultaneously, such as expressing reproach (blame), promises, protest, and self-exemption. Abioye (2011) indicated that the aim of an RQ is to establish or deny a statement implicitly”. Therefore, RQs can fulfil many functions at different levels in the same context. The following are some of the basic functions of RQs:

Challenge

Koshik (2005, p. 21) divided challenges into two types: “a challenge to a prior turn from the present party (e.g., How could you do that?) and a challenge to a prior conversation from the non-present party (e.g., How can she say that?)”.

Complaint

RQs can be used to complain about unfair treatment – for example, “Why did you put so few vegetables?” (Koshik, 2005, p. 53).

Criticism

RQs are used for criticising (i.e., finding faults or evaluating and pointing out merits or demerits). Consider the following example: “Do you believe the work was done well?”

Denial

RQs are used to express denial – for example, “How could I do something like this?”

Persuasion

Blankeship & Graig (2006, p. 112) show that “RQs are used to “increase persuasion and message processing (via generating questions about the topic) when the topic of the message was not initially involving to participants”. RQs perform various functions in political discourses (as seen in the section on RQs in political speech); However, persuasion is commonly used by politicians to garner the audience’s support. For example, consider the following sentence: “[the] Republican Party would get 60 percent more votes than it received eight years ago, who would’ve believed this, who would’ve believed this? (Tramp, Cleveland, 2016)”.

Assertion

RQs can have two types of assertions: negative and positive.

Negative Assertion. RQs can be used as negative assertions, as in the following example: “How could you think I did it?” (Abioye, 2009, p. 4).

Positive Assertion. A negative RQ can be used as an affirmative assertion, as in the following example: “Why can’t you boys play well?” (Chen, 2006, p. 611).

Accusation

An accusation entails asserting that someone is responsible for a particular state of affairs that is bad (Searle & Vanderveken, 1985), as in the example, “Do two wrongs make a right?” (Hackstein, 2004, p. 169).

Command

RQs can be used as commands. Commanding indirectly through RQs can help avoid the use of direct threats(e.g., Shouldn’t you join the class?)

Reproach

RQs are used to express reproach (to criticise or blame someone’s behaviour) – for example, “Why are you so bad?”

Suggestion

RQs can be used to make a suggestion, as in the “Why don’t you ask her for a help?”

RQs in Political Speech

One of the major verbal strategies in political speeches is the use of RQs to achieve one or more of the following functions:

Persuasion

RQs aim to persuade the audience to win their approval and support for a general or specific case (Nguyen, 2010).

Challenge

RQs are used for challenging an opposite party “by inducing mental recognition of its obviousness and its logical acceptability” (Ilie, 1999, p. 28).

Self-Promotion

RQs are used by politicians to gain political authority and credibility (Edward, 2007).

Doubt-Inducement

RQs are employed to create doubt in the minds of the listeners to consider the implicit message, while the speaker plays a neutral role by avoiding the use of more leading or value-loaded declarations (Behdahmane & Mac Bonald, 1984).

Method

The research includes twenty sample speeches: ten speeches by Obama and ten by Cameron. The method adopted to carry out the data analysis will be a juxtaposition of quantitative and qualitative aspects so as to achieve a better understanding of the political speeches. Analysis of the data will depend upon the following:

- The frequency of RQs in each speech
- Analysis of the type of RQs in speech
- Finding out RQs in both presidents’ speeches according to the following topics:
 - Politics
 - Economics
 - Society
- Classifying each RQ sample according to the function of RQs as follows:
 - Self- promotion
 - Persuasion
 - Challenge
 - Doubt- inducing

The statistical method is used to analyze data and find out results.

Analysis of RQs in the Selected Speeches

- (1) “Where, after all, do universal human rights begin?” (Obama, 24 September 2014, New York)
- (2) “how can we allow the dark tactics of the 20th century to define this new century?” (Obama, 4 June 2014 American Rhetoric).
- (3) “The question is how we uphold that commitment” (Obama, 17 December 2014, The White House).
- (4) “Is whether we are going to help or hinder this progress?”. (Obama, 28 January 2014, Capitol, the US).
- (5) “Are we a nation that tolerates the hypocrisy of a system where workers who pick our fruit and make our beds never have a chance to get right with the law? Or are we a nation that gives them a chance to make amends, take responsibility, and give their kids a better future?”. (Obama, 20 November 2014).
- (6) “What the hell’s the presidency for?”. (Obama, 10 April 2014 Taxes).
- (7) “Oh well. Assume that it was funny. Does this happen to you, Joel? It does? Okay”. (Obama, 3 May 2014, Washington).

The first part of the analysis includes seven samples of RQ questions in Obama’s ten speeches (2014-2015) and the same thing applies to Cameron’s speeches on the second part.

In utterance (1), Obama uses the same question of Eleanor Roosevelt, a champion of the UN, to criticize human rights. Wh-question-RQ type is one of the RQs used to make a criticism accordingly (Monzoni, 2008). He says that it cannot be seen on any map of the world. He tries to explain that the world needs more freedom and peace. The question here motivates suspicion about application of one of important global essential conventions. Then, Obama uses Wh- question RQ type in utterance (2) speech. The answer of this RQ shows the complete refusal of the USA to this negative action (Chen, 2006). So Obama sent a clear message to the audience about the challenges of the of Russia's violation of Ukraine’s sovereignty and how to face these challenges by the national community, the USA. Furthermore, the question is used as a proposal, as a common starting point to open discussion (Quirk et al, 1985).

The declarative question in utterance (3) is one of the RQs that are used by the speaker to convey his truthfulness in doing things. Therefore, Barak Obama expresses his view of the inability to keep these commitments and to do the same thing for over five decades expecting to get a different result. Semantically, this RQ is understood as a negative assertion (Balogun, 2011). Yes-No question is one of the RQs used by politicians to be able to follow up on detailed information to persuade addressee about his view. Obama uses this alternative question in utterance (4) to start a discussion about his strategies for carrying out the most basic functions of his democracy and how to achieve it. He tries to garner the support of his audience. While utterance (5) applies a series of questions that help Obama to emphasise his implied expectations towards the answer to these questions (Han, 1998). He tries to win the audience’s agreement to his side and push the Congress to get this administrative reform. In utterance (6), Obama expresses his criticism because he believes that the president should not waste his time and authority on fruitless issues. The role of the president and the presidency says that A president should fight to achieve his political goals. He exploits this RQ for the function of self-promotion. (Edward, 2007).

The speaker can resort to another type of RQ such as yes-no question when he only expects the audience to accept or reject the proposition. It is positively biased. Here, Obama first uses a yes-no question in utterance (7)

to ask Joel if that also happens with him. Then, he uses another type of RQ (Declarative question) to ensure this fact (see Table 1).

Table 1. Frequency of RQs in Obama's Speeches

Issue	Total	Yes-no RQ	Wh-RQ	Alternative RQ	Declarative RQ
Economic	0	0	0	0	0
Political	4	1	1	2	0
Social	13	4	8	0	1
Total	17	5	9	2	1

Analysis of Rhetorical Questions in Cameron's Speeches

(1) when you look at all the central questions facing our country – whether Britain can compete, and grow, and create jobs, and pay its way in the world the answer is a resounding yes. (Cameron, 10 February 2015, Queen Elizabeth II Conference Hall, British Chambers of Commerce).

(2) But what about the role of our military? (Cameron, 25 September 2014, the UN General Assembly 2014).

(3) Scotland is right at the heart of that vision. Why? (Cameron ,29 August 2014, Prime Minister's Office, 10 Downing Street).

(4) That's the question next may. Do you want to go back to square one – or finish what've begun? (Cameron,1 October 2014, Birmingham).

(5) So where do we want to take our country? where do I want to take our country? (Cameron,1 October 2014, Birmingham).

(6) How dare they suggest I would put that at risk for other people's children? how dare they frighten those who are relying on the NHS right now? (Cameron,1 October 2014, Birmingham).

(7) who do you really trust? When it comes to your job...do you trust Labour – who wrecked our economy – or the Conservatives, who have made this one of the fastest-growing economies in the West? (Cameron, 1 October 2014, Birmingham).

In excerpt (1), Cameron starts his speech in the chamber of commerce with a declarative question to establish the known fact of developing and growing the major economic plans in Britain. He tries to make the audience agree with his assumption (Balogun, 2011). Pragmatically speaking, this RQ carries the illocutionary force of persuasion. The speaker aims to persuade the audience to win the approval and support of listeners in a general or special case (Nguyen, 2010). Cameron shows the big challenges in excerpt (2). He explains the role of the British army, with the western military in facing Islamic extremists in Iraq and Syria, and the role of the Royal air force in helping millions of people who have fled from ISIS (the Islamic State of Iraq and Syria). Here Wh-question encourages to suggest some possible answers and makes the listener observes the implicit meaning (Monzoni, 2008). Moving to excerpt (3), the RQ aims to create doubt in the minds of the audience and convey the speaker's knowledge and shows his assertion of the constituent parts of the United Kingdom can achieve together – the power of collaboration and what they'd lose if they pull apart. Scotland's strength cannot be built

alone (Quirk et al, 1985).

According to Han (1998), yes-no question is used when the speaker asks the listener to accept or refuse the proposal. Therefore, in excerpt (4), Cameron tries to get the support of the British people on his side in political and economic strategies and refuses the separation of Scotland from the kingdom. Cameron uses two direct wh-questions in example (5) with two different subject pronouns (We-I) respectively to win the emotions of the audience. He tries to say that we have a strong nation and we do all that in a coalition government not by what he wants to do. He is a British man and hopes that the British understand his political strategies. Cameron emphasises his idea by repeating the same question with two different pronouns; for instance, he attacks the Labour Party and their criticisms of the NHS system by repeating RQ twice. He challenges them by saying that they do not dare to say anything about this health system and are used for challenging an opposite party. This can be done by creating mental perception and logic acceptance (Ilie,1999). It is important to all families and children. So he hears the similar ridiculous things about the conservative and NHS. Again Cameron criticizes his opponent by asking direct wh-question. It is clear in utterance (7). He aims to say that no one trusts the Labour party. They do not make any development on political and economic levels. They have made an economic system comedown (see Table 2).

Table 2. Frequency of RQs in Cameron's Speeches

Issue	Total	Yes-no RQ	Wh-RQ	Alternative RQ	Declarative RQ
Economic	2	0	1	1	0
Political	2	0	2	0	0
Social	25	1	15	6	3
Total	29	1	18	7	3

Discussion and Results

The number of RQs for the economic issues in Obama and Cameron's speeches is too small to make a meaningful distinction on the scale as compared with the other two types of issues, so our analysis would be focused on political and social issues. Cameron used more RQs than Obama on social issues with (25-13) different types of RQs, respectively. However, both tended to use more Wh- type RQs. While Declarative questions are less preferred in the political and social speeches of Cameron and Obama. This may indicate that they are more confident in their political and social decisions and strategies (see Figure 1 and 2).

Wh –questions are observed dominating out of total RQs (29); Obama had 53% and 62% for Cameron's speeches. There is a noteworthy use of Wh- questions. Generally, they adopted this stronger strategy in their speeches to distinguish themselves as worthy challengers. There is a meaningful distinction between the use of Yes- No type questions as RQs by Obama and Cameron having 29% and 3%, respectively. This suggests that Cameron is more self-determined and offensive in social problems that his government faces than Obama.

Cameron used more alternative-type RQs as compared to Obama (24%-12%), respectively. This would show that David offers more options than Obama. There is no remarkable distinction in the use of declarative type RQs between the speeches of both presidents. It is obvious that both presidents do not offer options to their listeners to select (see Table 3).

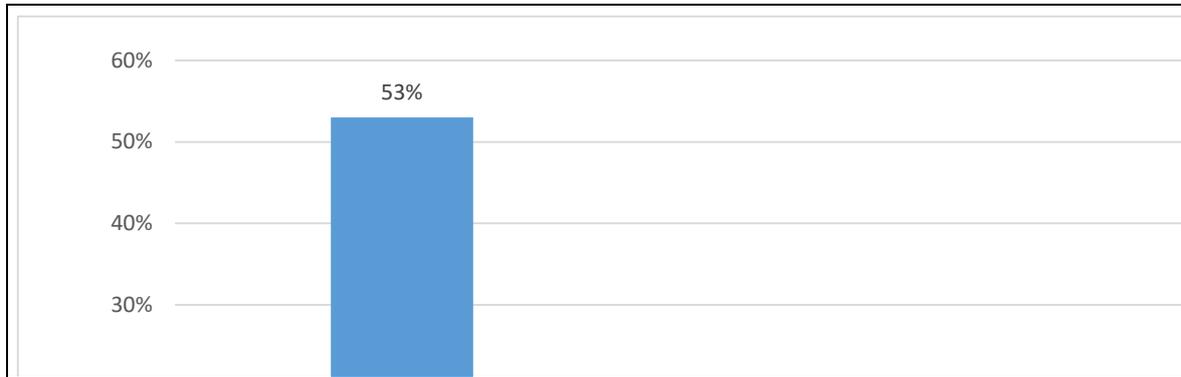

Figure (1) RQs in Obama's Speeches

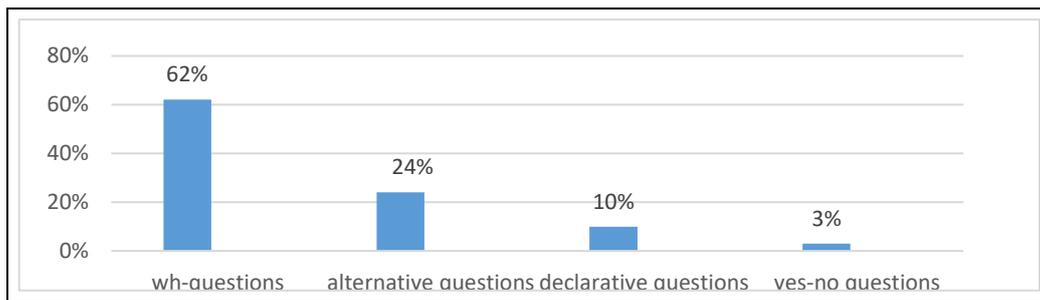

Figure (1) RQs in Cameron's Speeches

Table 3. Functions of RQ in Obama's and Cameron's Speeches

Functions	Obama	%	Cameron	%
Challenge	7	41%	11	37.93 %
Self-promotion	3	18%	2	6.89%
Persuasion	3	18%	8	27.58%
Doubt- Inducing	4	23%	8	27.58%
Total	17	100%	29	100%

It is note here that there was no large difference in the percentage of using RQs for the function of challenge between Obama and Cameron (41%-38%), respectively. These questions enable both Obama and Cameron to throw challenges that they and their governments face such as terrorism and at the same time they aim to criticize their opponents with great explicitness. Then, the second highest frequency was the use of the Doubt Inducing RQs which accounted (4-23%) and (8-27%) for the function of doubt inducing. This reflects that they both try to throw incapacity of their opponent to get political and economic success. However, Cameron is here more likely to attack the others than Obama. Regarding the function of self-promotion RQs, it is noted that

Cameron had more self-promotion RQs to have self-promotion than Obama at (3-18%, 2- 6.89%), respectively. He exploits them to send a clear message that his government can solve problems and lead the country toward the best future.

Conclusion

As observed above, Cameron uses more RQs than Obama in the selected political, economic, and social issues. Therefore, Cameron is more practical politician to use language devices achieve rhetorical effects in different issues than Obama. Both of them use Wh-question more than other types of RQs. This suggests that they are strong challengers and they fight for their strategies at the level of political, economic, and social actions and indirectly put blame on opposing parties. decisions and also induce doubt in rival parties in a more indirect manner. Generally, the topic being discussed affects the kind and frequency of RQs employed since the use of RQs in social topics is more than in political and economic topics. This means first that the type of RQs used in the speeches of both presidents may also depend upon the type of audience. Second, they both more focused to garner the emotion of their people. Cameron has a stiffer and more self-determined personality on social issues than Obama as he employs less indirect Wh- type RQs than Obama to first generalise the negative responsibility of the government or the Labour Party in social issues. Second, he wisely follows this new political strategy for electoral purposes. Cameron is more offensive than Obama to face his rival parties and win debates by inducing doubt.

Emoji as a Means of Communication-Derivation from Use of Albanian Language

Gilberta Hadaj

Albanian University, Albania,  <https://orcid.org/0000-0001-8335-9999>

Abstract: Language is a tool of communication. Communication is a process of conveying messages. Language changes dynamically, as new words can be created. Communication is considered static, as its basic steps remain unchanged. But the basics of communication do not change. However, new words enter the dictionary/vocabulary language almost daily. Communicating with others is a basic human need. Healthy living involves interacting and engaging with others. And our primary means of doing so is through shared language. Language is a system of communication that relies on verbal or non-verbal codes to transmit information. Communication is a way of exchanging messages or information between two or more people, focusing on the message. Over the last years we have witnessed the evolution of communication through emoji. This type of communication consists in these aspects:

1. Linguistic economics
2. Fast communication
3. Skipping grammatical rules
4. Failure of language evolution
5. Concealment of emotions

The results of the study will be derived according to the qualitative and quantitative method, through a questionnaire directed to a sample of 100 students in different study programs. The answers to the questionnaire will be analyzed by coming up with conclusions and recommendations.

Keywords: Communication, Albanian Language, Emoji, Language System

Citation: Hadaj, G. (2023). Emoji as a Means of Communication-Derivation from Use of Albanian Language. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 368-376), Cappadocia, Turkey. ISTES Organization.

Introduction

Language is a system of communication that relies on verbal or non-verbal codes to transmit information:

- Communication is a way of interchanging messages or information between two or more people, focusing on the message.
- Emoji have a widespread impact on multiple human science areas such as psychology, sociology, linguistics, and business. However, emoji might be translated into different meanings based on the

context and on the respective platforms they appear on. Thus, it is important that emoji have text attached to the context in which they appear to make sure there is no misunderstandings.

In digital communication, emoji help represent the human gestures, voice tones and physical expressions people do when communicating vocally. As such, people read emoji as emotional information, which help articulate the meaning of digital messages that can sometimes differ depending on the individual personality and on the individual social context.

Furthermore, some researchers argued that emoji have three linguistic functions: emotional indicators directly correlated to facial expressions, non-emotional indicators directly correlated to facial expressions and as indicators not correlated to facial expressions but to deep intention.

Method

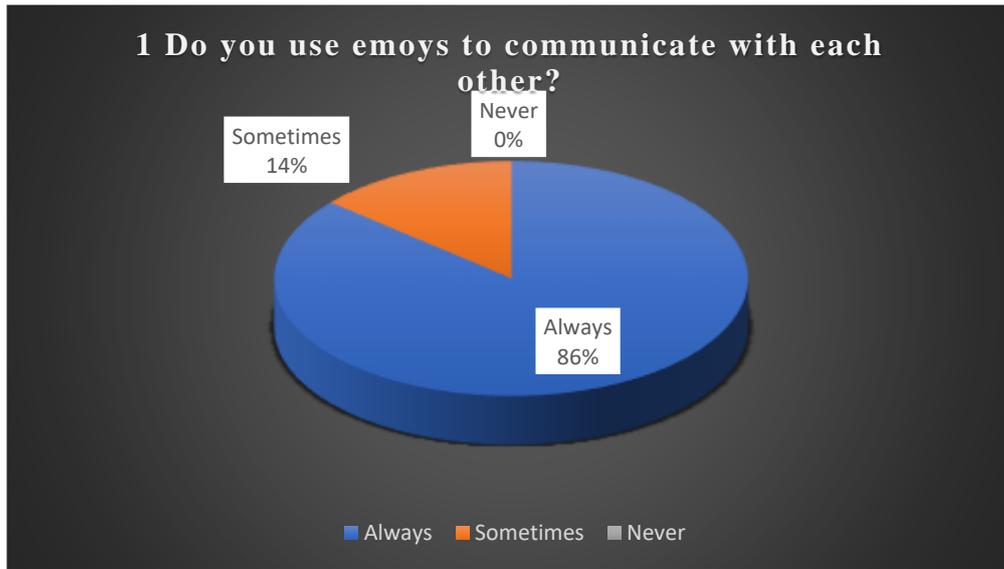

Methodological aspects of this paper: Observation and research. Descriptive analysis is both quantitative and qualitative. The questionnaire was conducted in a target group of 100 students. Data are based on statistics, both in tables and graphs, analyzed in %.

Analysis

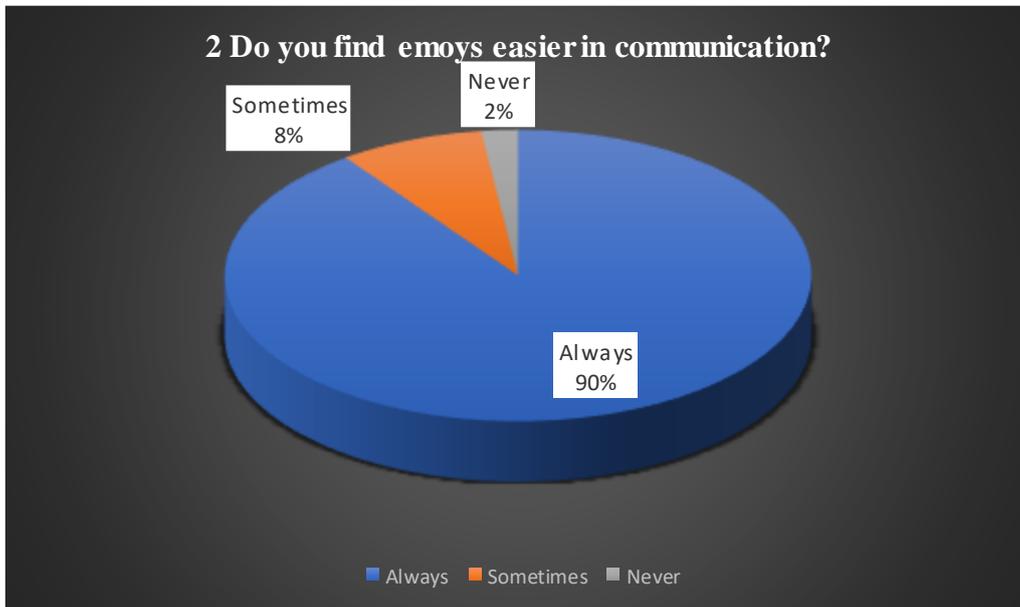

According to the study, emoji help facilitate non-verbal communication, such as facial expressions and gestures, across various digital platforms. These small icons convey an easily identified thought or emotion and allow us to add clarity and tone to our daily digital interaction.

- the digital equivalent of body language. In face-to-face communication, only 30% of our communication relies on actual words. The rest consists of our body language.
- improve digital communication by replicating what we do when we communicate in person: our gestures, voice, and body language.
- are used to inject emotion into a simple sentence, or they can be "sentences" themselves. Emoji seems like a new language that has entered and is now embedded in our digital social life.

6	Does the use of them highlights your real feelings?	50%	45%	5%
7	Does their usage show emotional state?	61.30%	6.10%	32.60%

8	Do you use them to make your communication more friendly?	85.30%	13.20%	1.50%
9	Do you think that this is damaging the Albanian language?	36%	23%	40.60%

Conclusion

On the personal level young people are social beings, they are part of a social circle, community, school club etc. They interact with each other...and this is the reason why communication with emoyos is something human. Human communication is complex; It's a deep topic to understand and evolves over many years to find the right form:

1. Emoy contains a wide range of emotions that young people can understand just by seeing one of them. Communication is not just some articulated words , but its more than that, is body language, movement, mimic, vision etc. Using emoyos , young people add layer of emotion to communication .
2. Young people are often part of one or more groups, tend to adapt , change some behaviors ,remove old ones ,learn new ones which over time they tend to become similar to those of the group. Therefore, if the friend will start using emoyos in communication, there will come a time when other young people who are part of the group will do the same .
3. We have to admit, emoyos are very cool. One of the things young people know is to follow trends to look cool ... smart (but they want to look cooler than smarter).And that's how it happened :once emoyos became a trend, we had a great desire to follow them . If the prime minister, the mayor or the president use them, why not young people?
4. Using emoyos comes as faster communication with each other . Does not refer to the use of Albanian language or the grammar.

Abstract: English proficiency is advantageous for any graduate. In Malaysia, despite English being formally introduced around age 5, proficiency in the language is still lacking in some graduates. English should be introduced to children during their formation years so they can be proficient. However, in many private preschools, English proficiency is not a priority in the hiring criteria of early childhood (EC) educators despite the introduction of the Malaysian English Language Education Roadmap 2015-2025. With EC educators being a primary provider of input in the system, it is essential to investigate their attitudes towards English, particularly on the East Coast of Malaysia, where English usage is not as extensive as on the west coast, and how these attitudes translate into their practices with the children. A questionnaire of 29 questions was distributed to 114 EC educators. Findings reveal that positive attitude leads to EC educators using English with the children. Although knowledge of the language may be limited, the positive attitude spurs them to find alternative ways to expose English to the children. The findings hence provide insight to how we can upgrade the quality of existing English language education provided in preschools, mapping it to the Roadmap 2015-2025 for the reform to succeed.

Keywords: Attitude, Practice, Early childhood educators, ESL, Preschool

Citation: Mohd Radzuan, N.R. Fauzi, W.J., Rosli, A.K., & Ali, F. (2023). The Attitude of Malaysian East Coast Early Childhood Educators towards English and Their Language Support Practices. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 377-392), Cappadocia, Turkiye. ISTES Organization.

Introduction

It is advantageous for any graduate to be proficient in English as it is a lingua franca, and perceived as a socially prestigious language (Mourão, 2021). Mourão, (2021) states that it is vital to provide early exposure of the English language to children, for it impacts the mastery and proficiency of the target language of the children. Thus, English should be introduced to children during their formation years (0 to 4) to increase proficiency and provide a head start to children to be employable graduates in the future. According to Mistry and Sood (2020), the first three years are the best opportunity to teach children a language as children's minds are known to easily and quickly acquire what they heard and learned compared to adults. In Malaysia, the Ministry of Education Malaysia has included the preschool years (5-6 years old) as part of the English Language Roadmap 2015-2025, acknowledging the importance of developing young children's English language for their success in the school years. Upon leaving preschools, the children are expected to achieve CEFR A1 (English Language Roadmap 2015-2025). Earlier in 2010, the National Preschool Standards-based Curriculum (NPSC) was introduced. In NPSC, all Malaysian preschool teachers were urged to use English to expose and prepare the children to master the target language before entering primary school.

However, even though English is being formally introduced at the ages of 5 and 6, proficiency in the language is still lacking. This is a gripe many industries have with the local graduates, stating that many local graduates lack communication skills in English (Ong et al., 2022) when English proficiency is among the top five skills that employers look for when hiring as revealed by the 2021 Malaysian Employers Federation (MEF) Salary Survey for Executives and Non-Executives (Menon & Rajaendram, 2022). Similarly, in Saudi Arabia, great emphasis has been placed on learning English as a foreign language as English has been assigned prestige and high status to those fluent in it (bin Towairesh, 2021). In Germany, Hahm and Gazzola (2022) shared that the more proficient German natives are in English, the higher their salary. This suggests that English proficiency is important to get a head-start and despite our current efforts, desired outcomes have not been achieved, which warrants more proactive measures. According to Al-Yaseen (2021), an early exposure to English language which is seen as a global language, could provide better opportunities in terms of education and employment in the future and this notion is supported by Kuwaiti kindergarten teachers who have a strong belief in exposing and teaching English to Kuwaiti children in kindergarten. Therefore, it is imperative to introduce English to children at an earlier stage, ensuring that the primary sources of language input, namely early childhood (EC) educators, possess a high level of proficiency.

Despite the emphasis on English usage by the NPSC, not all EC educators are sufficiently proficient in the language, particularly in private Malay medium preschools, where many lack qualifications to teach English. This becomes evident from the findings of Masturi, Kosnin, and binti Zainudin (2022) who highlighted the challenges faced by teachers in carrying out their teaching responsibilities due to their lack of familiarity with the language they are expected to teach. One contributing factor is that English proficiency is not prioritised in

the hiring criteria of EC educators, despite the introduction of the Malaysia English Language Education Roadmap 2015-2025. English proficiency becomes even less of a priority for children under the age of 4, as the emphasis on NPSC primarily targets preschool children between the ages of 5 and 6. Unless explicitly advertised as an English medium preschool, the primary language of instruction in most preschools will be Malay (Kong, 2023; Ting & Jintang, 2022; Yussof & Sun, 2020). Furthermore, in rural areas, English is perceived as a foreign language rather than as a second language as it should be in Malaysia due to students hardly using English for interactions outside the classroom. As reported by Rosli and Radzuan (2020), there is relatively less extensive use of English on the East Coast of Peninsular Malaysia compared to the west coast.

The aim of this study is to explore the attitudes and practices of EC educators in the East Coast region of Malaysia regarding the use of English language in early childhood education (EC education) settings. Despite the increasing importance of English proficiency in a globalized world, there is a significant gap in the literature concerning the specific attitudes and practices of educators in this region. Existing research has predominantly focused on larger cities such as Kuala Lumpur (Nordin et al., 2022; Goh & Luen Loy, 2021; El Masry & I Alzaanin, 2021), resulting in lesser understanding of the unique socio-cultural and linguistic characteristics of the East Coast. Furthermore, a considerable proportion of private sector preschool teachers in Malaysia possess minimal qualifications and experience (Foong et al., 2018), with English proficiency not being the primary hiring criterion. In Malaysia, the requirement to become a private preschool teacher is set as minimum as to having Malaysia Certificate of Education (MCE/ SPM). In some cases, some private preschools accept Form 3 Assessment (PT3/PMR) candidates to become a part of the workforce. The priority of hiring preschool teachers is not directed to those who are proficient in English but to those who have skillful experience in taking care of children (Foong et al., 2018).

However, recent initiatives, such as the Malaysia English Language Education Roadmap (2015-2025), have placed greater emphasis on the educational background of EC educators. As a result, more teachers possess ECE qualifications but may not be proficient in English. Similar challenges have been observed in Kuwait, where teachers' lack of confidence and proficiency in English, particularly in pronunciation, have led to the use of the first language as a teaching medium (Al Yaseen, 2021). While Al Yaseen (2021) also reported that the use of first language provides a feeling of security and validation allowing children to express themselves better, the researcher asserts that the teachers could have used pictures, posters, picture books and videos as teaching aids to facilitate learning so that the target language becomes more comprehensible to the children. Since the intention behind this approach was primarily to prevent the children's target language from being compromised or distorted, it is important to investigate how these attitudes and practices impact language learning outcomes, specifically the attitudes and practices of EC educators towards English in the East Coast region of Malaysia.

Attitude

Attitude plays a crucial role in shaping human behavior, influencing perceptions, and guiding decision-making processes (Grimley & Burnard, 2021; Moreno et al., 2021). It holds particular significance when examining

individuals' attitudes towards specific objects or concepts, such as the English language in educational contexts. Understanding the factors that shape these attitudes and their impact on teaching practices and learner outcomes is of utmost importance. This paper aims to explore the concept of attitude, specifically focusing on attitudes towards English in the context of EC education. By delving into relevant literature and research findings, we seek to uncover the relationship between EC educators' attitudes and teaching practices.

According to Fishbein (1961: p. 233), “An individual’s attitude toward any object is a function of his beliefs about the object (i.e., the probability that the object is associated with other objects, concepts, values or goals) and the evaluative aspect of those beliefs (i.e., the attitude towards the related objects)”. When considering attitude towards English, it is “a collection of feelings (good, bad, neutral) regarding language use and its status in society” (Ahmed, 2015: p.7). According to Conderman and Johnston-Rodriguez (2009) who examined teachers' perceptions of their preparedness in inclusive education, as well as the teachers’ views on the significance of related skills, attitude towards the teaching of English includes elements such as “liking, enjoyment, enthusiasm for teaching English, and confidence in their own teaching abilities (Ernest, 1989: p.25)”. Attitude, therefore, affects practice, affects the children’s interest and attitudes to English and its learning.

Language Support Practices

Activities in preschools should encourage children to develop their skills in life holistically, namely language, thinking, social and creativity skills. The NPSC developed by Ministry of Education Malaysia (2017) emphasizes children’s growth in terms of communication, spirituality, attitudes, and values as well as creativity, critical thinking and innovative, to name a few. Similar to Malaysian EC education aims, the preschool curriculum designed by the Ministry of National Education Turkiye also focuses on children’s learning by discovery and some of the activities listed and proposed involves language, art, drama, music, movement, play, science, mathematics, early literacy and field trip (Dere, 2019). Dere (2019) conducted a study with the children investigating their creativity after spending time in preschool. Findings from the analysis done from Torrance Creative Thinking Test (TCTT) which was developed by Torrance (1966) shows that the duration children spent time in the preschool impacts the creativity of the children positively. In other words, children were found to be more creative when they have spent a full day taking part in all the activities conducted in the preschool compared to other children who spent a half-day.

Activities in a preschool can be categorized into 2 categories: cognitively stimulating high-yield activities and least stimulating low-yield activities (Smidt & Embacher, 2020). Examples of cognitively stimulating high-yield activities are role-playing, oral communication, and constructive games, while napping, care-taking routines and circle games are examples of the least stimulating low-yield activities. In developing children’s proficiency and mastery particularly in oral communication, read-aloud is one the teacher-led activities that is expected to be conducted with the children at preschools. However, the Sweden preschool teachers reported that read-aloud was difficult to organize due to some reasons (Alatalo & Westlund, 2021).

In conclusion, attitudes towards English in EC education should have a profound impact on teaching practices and children's attitudes towards language learning. The various dimensions of attitude, including beliefs, and the language support practices, highlight the complexity of this topic. To address such a gap, following research questions were asked in this research:

- (1) What are Malaysian East Coast early childhood educators' attitudes towards English language?
- (2) How do these attitudes translate into their language support practices with the children?

Theory of Planned Behavior (TPB)

Ajzen (1991) developed the Theory of Planned Behavior (TPB) which is a psychological theory that aims to explain how attitudes, beliefs and perceptions effect an individual's behavior. Through the context of this study, the TPB is used to assess and comprehend an EC educator's thought process and emotions towards the teaching of English to young children, along with how such thought and emotion influences their actions. The TPB hypothesizes that three factors determine a person's actions; their attitudes, subjective norms and perceived control. Attitudes encompass the opinion and emotions for a behavior such as teaching English, subjective norms pertains to the social pressure and expectations experienced from peers or guardians and perceived control reflects the level of faith in the individual's ability to carry out the action (in this case, teaching English to young children). Figure 1 portrays the theoretical framework of the TPB.

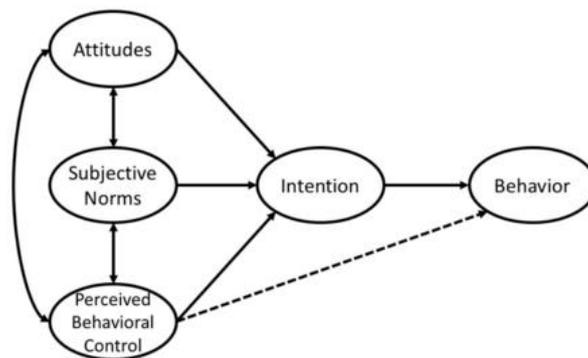

Figure 1. Theory of Planned Behavior (TPB) Framework (Ajzen, 1991)

By utilizing the TPB, this study was able to understand the EC educators' attitudes to teaching English, the expectations of them from others, and their confidence in being able to do so, in order to assess and facilitate the intentions and practices they had in English instruction. This framework shed light on why some educators exhibit more enthusiasm and confidence in teaching English, while others may feel uncertain or less motivated. Phuong et al. (2023) conducted a study that utilized TPB to examine how teaching beliefs influence the selection of techniques by English instructors for teaching young language learners. Similarly, Ateş and Yilmaz (2023) employed TPB to investigate the intentions of both pre-service and in-service teachers regarding the use of mobile-based assessment in their classrooms. Additionally, Kim and Jeong (2023) utilized TPB as the basis

of their research, focusing on the acceptance of coding education among kindergarten teachers. These studies share a commonality in recognizing TPB as a crucial theory for understanding teachers' attitudes, intentions, and decision-making processes. Overall, TPB helped in understanding how the thoughts, emotions, and perceptions of EC educators regarding English teaching impact their instructional practices, which, in turn, can have implications for children's language learning outcomes. In this paper, the focus will be only on the attitudes and how they are translated in language support practices.

Research Methodology

To measure preschool teachers' attitude based on their beliefs and practices in using English, this study employed an Early English Beliefs and Confidence Survey (EEBCS) that was adapted from a questionnaire developed by Chen et al. (2014) called Early Math Beliefs and Confidence Survey (EM-BCS). The decision to employ this questionnaire as the quantitative data collection instrument was based on its efficiency in gathering comprehensive responses from respondents within a short timeframe (Sekaran & Bougie, 2016). The adaptation of the EM-BCS questionnaire was deemed suitable because its design aligned with the current research focus, although Chen et al. (2014) primarily emphasized early mathematics beliefs among preschool teachers. In this study, the questionnaire was modified to address beliefs and confidence specifically related to the English language rather than mathematics. Several modifications were made to the original EM-BCS items. Examples of the modifications are shown in Table 1, which presents selected items from the original EM-BCS alongside their adapted versions.

Table 1. Original Items from EM-BCS (Chen et al., 2014) and Adapted Items in EEBCS

Original Items	Adapted Items
Most children in my class entered preschools with little Mathematics knowledge.	Most children in my class entered preschool with little English knowledge.
I am confident in my ability to plan activities to help children learn Mathematics.	I am confident in my ability to plan activities to help children learn English language.
I can easily convert fractions into percentages and decimal numbers.	I can translate Bahasa into English and vice versa easily.
I am confident in my ability to plan activities to help children learn Mathematics.	I am confident in my ability to plan activities to help children learn English language.

The questionnaire was administered personally by the researchers as it provides the ability to establish a relationship and motivation with the respondents as doubts can be clarified, it is less expensive, can achieve almost 100% response rate, and anonymity of respondents is high (Sekaran & Bougie, 2016). The questionnaire consisted of 3 parts: Part A – Demographic details, Part B – Attitude (14 items) and Part C – Practice (15 items). For Part B, respondents were to rate their agreement with the statements on a five-point Likert scale (Likert, 1932) with a value of 5 associated with a *Strongly Agree* opinion and a value of 1 for *Strongly Disagree* and for Part C, the value of 5 was associated with *Always* and 1 for *Never*. The Cronbach Alpha for the questionnaire is

0.92 which is considered high validity value (Cronbach, 1951). Table 2 shows the interpretation of mean scores for this study.

Table 2. Interpretation of Mean Scores

Mean scores	Interpretation
1.00 – 2.00	Low
2.01 – 3.00	Moderately low
3.01 – 4.00	Moderately high
4.01 – 5.00	High

For the Likert-type items in the questionnaire, we utilized the interpretation of mean scores based on Oxford's (1996) approach. This provides us with information on the strength of the EC educators opinions on the items in the questionnaire. Means ranging from 1.00 to 2.00 indicated low agreement and 2.01 to 3.00 indicated moderately low agreement. While those ranging from 3.01 to 4.00 were interpreted as moderately high and 4.01 to 5.00 indicated as high agreement.

Participants

In this study, purposive sampling was utilized to select the participants. One of the criteria for selection was that the respondents had to be EC educators teaching in the East Coast region of Peninsula Malaysia, specifically in Kelantan, Terengganu, and Pahang. The selected respondents were provided with a set of EEBCS questionnaires, which had been adapted from Chen's et al. (2014) EM-BCS items. The demographic data collected from 114 EC educators who returned the questionnaires are presented in Table 3.

Table 3. Early Childhood Educators Experience, Qualification and Age

Teachers Experience	N	Highest Qualification	N	Age	N
<1 Year	17	PT3/SPR/PMR	2	<20	2
1 - 3 Years	34	MCE/ SPM	45	21 - 25	40
4 - 6 years	36	Diploma	44	26 - 30	29
7 - 9 Years	6	Degree	22	31 - 35	17
10 Years>	21	Master	1	36 - 40	12
				40>	14
Total	114		114		114

Based on the responses as illustrated in Table 3, 36 educators had 4 to 6 years of work experience, followed by 34 educators with 1 to 3 years of experience and 21 educators with more than 10 years of work experience. In addition, 17 educators had less than 1 year of work experience and 6 educators had 7 to 9 years of work experience. It is believed that teachers with different years of experience have different personalities, beliefs, and methods of teaching, and this increases the depth and opulence of the data obtained (Singh et al., 2018). The

expectation is that the varying amount of teaching experience would reflect different (if not the same) beliefs and practices.

In terms of respondents' education qualifications, the data revealed that the highest qualification was a Master's degree, which was reported by 1 respondent. 45 educators were Malaysian Certificate of Education (MCE/SPM) holders, followed by 44 educators with a Diploma and 22 educators with a Degree. The lowest qualification reported was Form 3 Assessment (PT3/SRP/PMR), which was indicated by 2 respondents.

Table 3 also includes data on the age distribution of the respondents. The largest group consisted of educators between the ages of 21 to 25, with a total of 40 respondents. There were 29 educators aged 26 to 30, followed by 17 educators aged 31 to 35. Additionally, 14 educators were above 40 years old. Lastly, only two educators were below 20 years old.

Results and Discussion

In Part B of the questionnaire, an exploration of the EC educators' attitudes towards English on the east coast of Malaysia is conducted and the effects of these attitudes on their practices are considered. The discussion of findings for Part B is followed by the discussion of findings for Part C.

Early Childhood Educators' Attitude based on Beliefs

In Part B of the questionnaire, EC educators were asked to rate their confidence in their English language skills such as pronunciation, vocabulary, and proficiency. The responses were analyzed using SPSS and the statements were arranged in decreasing order of Mean values for better understanding. Table 4 presents the findings of Part B, which gauge the attitudes of EC educators towards their overall English language competence and their proficiency in using English with the children in their kindergarten.

Table 4. Early Childhood Educators' Attitude based on Beliefs

No.	Items	N	Mean	SD
1	I am confident in my ability to incorporate English language into learning during daycare activities (e.g., art or role play).	114	4.05	0.66
2	I am confident in my ability to plan activities to help children learn English language.	114	4.03	0.72
3	I am confident in my knowledge of the best practices and strategies for helping children to use English.	114	4.02	0.77
4	I am confident in my ability to improve children's English language knowledge when they make spontaneous English comments.	114	3.99	0.69
5	I am confident in my knowledge of the best way to assess children's command of English language.	114	3.9	0.74
6	I am confident in my knowledge of reasonable English goals for the children (able to	114	3.89	0.73

	read and write).			
7	I am confident in my ability to make sense of children's confusion when they learn English language.	114	3.89	0.73
8	I am confident in my ability to evaluate the children's knowledge about English language.	114	3.79	0.78
9	I am confident that it is easy for me to name objects in English.	114	3.76	0.69
10	I am confident that English was one of my favourite subjects in school.	114	3.53	0.77
11	I am confident that I can construct English sentences easily.	114	3.5	0.88
12	I am confident in my knowledge of the children's English language proficiency level when they enter the daycare.	114	3.42	0.80
13	I am confident that I can translate Bahasa Melayu into English and vice versa easily.	114	3.4	0.77
14	I am confident that I am good at pronouncing English words.	114	3.30	0.78

Based on the results, the EC educators demonstrated a moderately high attitude in which the minimum mean score was 3.30 and the highest mean score was 4.05. The three (3) items with the mean score above 4 are *"I am confident in my ability to incorporate English language into learning during day care activities (e.g., art or role play), I am confident in my ability to plan activities to help children learn English language and I am confident in my knowledge of the best practices and strategies for helping children to use English"*. With a mean score of 4.05, it shows that majority of the EC educators are very positive and confident in their knowledge to incorporate English learning into common preschool situations (such as art or dramatic play), which are considered cognitively stimulating high-yield activities (Smidt & Embacher, 2020). They even plan activities to help the preschoolers learn English (Item 7), with the mean score of 4.03. Furthermore, they are so positive that they have the knowledge of the best practices and strategies for helping preschoolers learn English (with the mean score of 4.02, Item 3).

In addition to that, with the mean score of 3.99, Item 8 shows that these EC educators strongly believe that they have the knowledge to further preschooler's English language acquisition when they make spontaneous English comments or discoveries. The lowest mean score is 3.3 which is *I am very good at pronouncing English words* (Item 14). It means that out of all the items, they are least confident in their English pronunciation. The next lowest is Item 12 with the mean score of 3.4 where these EC educators indicated that they lack the confidence in translating Malay to English and vice versa. It can be interpreted that these EC educators exhibited moderately positive attitude towards the use of English in teaching and learning to the children at their kindergarten. The findings of the current research are supported by the findings of Kouba et al. (2020) who found Lebanese preschool educators understand their role in developing language in the children. The findings are also supported by Goh's (2019) study in which the EC educators admitted the need and importance to have better language knowledge to assist children's language development and to perform more effectively in the classroom.

Additionally, the findings presented in Table 4 are aligned with the TPB by Ajzen (1991). According to TPB, attitudes play a crucial role in influencing behavior. In this study, the results indicate that the majority of the

educators demonstrated a positive attitude, as reflected by the moderately high mean scores. These positive attitudes can be interpreted as an indication that the educators believe in their ability to effectively teach English to young children and incorporate it into various preschool activities. This aligns with the TPB's notion that attitudes influence behavioral intentions and subsequent actions. In this case, the positive attitudes of the educators may lead to an increased intention to teach English and the implementation of language learning activities in their classrooms. It is evident that EC educators in the present study understand their role to develop children's language competence and they have moderately high confidence in their knowledge and competencies in English language. To sum up, the EC educators have positive attitudes towards the use of English language in their teaching practices.

The Practice of Early Childhood Educators in Using English

Table 5 presents the findings regarding the language support practices implemented by EC educators in preschools

Table 5. The Practice of Early Childhood Educators in Using English

No.	Items	N	Mean	S.D
1	I tell stories to the children	114	3.20	0.95
2	I read English storybooks to the children	114	3.09	0.98
3	I do outdoor activities in English	114	3.07	1.08
4	I do artwork in English	114	3.04	1.10
5	I correct their English language mistakes (implicit e.g. plural vs singular, tenses, pronunciation) in English	114	2.94	1.05
6	I do writing activities in English (e.g. postcards, speech card)	114	2.89	1.11
7	I give learning session instruction in English	114	2.82	0.96
8	I discipline the children in English	114	2.77	1.04
9	I do Circle Time activities in English	114	2.71	1.11
10	I give daily routine instructions in English	114	2.66	1.01
11	I sing English songs/ nursery rhymes with the children	114	2.64	1.06
12	I use English in my everyday greetings	114	2.51	1.86
13	I let children watch English cartoons	114	2.21	1.95
14	I praise the children in English	114	2.20	1.03
15	I count in English	114	1.97	0.89

Notably, the results indicate that a majority of EC educators engage in storytelling sessions with the children, achieving a commendable mean score of 3.2. Furthermore, they actively read English storybooks to the children, garnering a respectable mean score of 3.09. Additionally, outdoor activities conducted in English received a mean score of 3.07, showcasing the educators' efforts to incorporate the language into various settings. Another noteworthy practice with a mean score above 3.0 is the incorporation of English into artwork, indicating the educators' recognition of the language's role in creative expression. Conversely, the most unexpected finding

pertains to the infrequent use of English for counting, as reflected by an average mean score of 1.97. This observation may be attributed to the prevalent use of the native language when interacting with children in preschools, including counting activities. However, it is important to acknowledge that counting in English, or any other language, is fundamental to language learning.

Another unexpected finding that emerged from the study, was that the EC educators seldom praise children in English or allow them to watch English cartoons in kindergarten. The mean scores for these aspects were notably low, at 2.20 and 2.21 respectively. The use of English expressions like "Very good!" or "Great job" does not seem to be commonplace among these EC educators. Interestingly, the children were also not given frequent exposure to English cartoons at the preschools, making it unexpected that the EC educators were not utilizing this resource to help children acquire the English language. From the low mean scores of between 1.97 to 3.20 in the items, it can be interpreted that these EC educators seldom interact in English with the children nor do they incorporate English much into their teaching practices. These findings contradict the positive attitude towards English reported in Part B, where the EC educators expressed confidence in their English proficiency. However, when it comes to applying this knowledge in everyday interactions, English usage with the children is infrequent.

Based on the results, it can be concluded that some of the EC educators in preschools did utilize English to a moderate extent (i.e., those who scored their practice high), which is commendable considering that English is not compulsory in their curriculum. August et al. (2014) asserted that explicitly teaching reading skills to English language learners such as phonological awareness, phonics, and oral reading fluency is beneficial for children. Although many of the EC educators might not explicitly have taught these skills, reading storybooks to children exposes them to new vocabulary and correct pronunciation.

In Goh's (2019) study, EC teachers acknowledged frequent code-switching between English, the Malay language, and the children's mother tongue. The authors' personal observations in kindergartens also revealed frequent instances of code-switching. Hansen and Broekhuizen (2021) argue that the quality of the language-learning environment positively impacts toddlers' vocabulary development. This environment was measured by the educators' responsiveness, both verbal and non-verbal, their ability to expand children's ideas and vocabulary, and their encouragement through questioning and active listening. For EC educators to achieve this, they have to be proficient in the target language and to consistently use it with the children. To support their confidence in using the language with the children, Fauzi et. al (2021) recommended to use an application called Kindy Talk Application which was specifically developed to assist EC educators in their English communication in preschool context. However, native English speakers and specialized English teachers were still voted as the best instructors for teaching English in Catalonian kindergartens (Waddington, 2021). While adopting similar recommendations in the Malaysian context is feasible, careful consideration is required in multiple aspects.

The findings also shed light on the language support practices employed by EC educators in preschools and their

alignment with TPB. The results indicate that EC educators engage in certain language support practices in their preschools. When analyzed through the lens of TPB (Ajzen, 1991), it suggests that despite positive attitudes and beliefs, external factors or barriers influence educators' behavior. These factors include the prevalent use of the native language in kindergartens, code-switching practices, and limited exposure to English children's programmes and cartoons. Consequently, educators demonstrated a moderate level of English language support practices in their interaction and activities with the children. The findings imply that although EC educators demonstrated a moderate level of English language support practices, there is room for improvement in terms of consistent and effective language usage. Understanding the factors influencing their behavior can inform the development of interventions and strategies to enhance the integration of English language learning in the preschool environment, aligning with the principles of TPB.

Conclusion and Recommendations

The present study has several limitations. Firstly, the studies only involved EC educators from Malay medium private kindergartens located in the East Coast of Malaysia. Therefore, the findings should be cautiously interpreted as these are the reflections of these specific participants only. Future studies might include Chinese and Tamil medium private kindergartens in the East Coast or perhaps covering the whole of Malaysia to comprehensively examine the attitude and practices of the EC educators in terms of English language teaching and learning. Next, this study employed quantitative research design. More comprehensive findings can be achieved through data triangulation from both quantitative and qualitative approaches.

Despite the limitations, the findings of this study shed light on the use of English language and language support practices by EC educators in private Malay medium preschools in the East Coast of Malaysia. The study reveals that EC educators possess positive attitude towards English language and their ability in using the language, even though it is not fully reflected in their practice with the children in the preschools. Those who used English with the children used English even though it was not part of the curriculum. Hence, the use of English was moderate; and in several areas, improvement is needed.

One key finding is the infrequent use of English praise and limited exposure to English children's programmes and cartoons. This indicates missed opportunities for children to develop their English language skills through positive reinforcement and engaging educational content. Therefore, EC educators should be encouraged to incorporate more English language usage and praises in their interactions with children. This can enhance children's exposure to English and create a supportive learning environment.

Additionally, code-switching practices between English and Malay, the children's first language were observed, suggesting a need for clearer language boundaries and consistent language usage. Professional development programmes should be offered to EC educators to enhance their proficiency in the English language and provide them with effective strategies for language support. Furthermore, clear language policies and guidelines should

be established in preschools to minimize code-switching and promote consistent language usage. Perhaps, there should also be opportunities to collaborate with native English speakers or specialized English teachers. This would be beneficial in providing language input and modeling correct English usage.

On the whole, the results ultimately highlight the importance of a high-quality language-learning environment in fostering children's English language development. EC educators should strive to be proficient in the target language, actively engage children in verbal and non-verbal communication, expand their vocabulary, and encourage children through active listening and thoughtful questioning. By implementing these recommendations and addressing the identified areas for improvement, Malaysian preschools can create a more conducive environment for English language learning, ultimately benefiting the language development and future academic success of young children.

Most importantly, recognizing the significance of fostering positive attitudes towards English among educators and learners is crucial for creating an effective language learning environment. By nurturing favorable attitudes, we can enhance teaching practices, stimulate children's interest in English, and promote their language development. The findings, hence, provide insight to how the quality of existing English language education provided in preschools can be upgraded and mapped to Malaysia English Language Education Roadmap 2015-2025 for the reform to succeed. It is recommended that the Malaysia Education Ministry should make it compulsory for private preschools to use English as their medium of instruction and communication because the educators are actually quite capable of using English with the children but they do not do so because it is not compulsory. Furthermore, early English language exposure has been found to profoundly contribute to a more proficient mastery of English over the long term.

How Glosses in Academic Texts are being Read?

Nur Ainil Sulaiman

Faculty of Education, University Kebangsaan Malaysia, Malaysia,  <https://orcid.org/0000-0001-6212-7494>

Abstract: A gloss refers to a short definition or explanation of the meaning of a word in a text that can assist learners in reading comprehension and vocabulary learning. This study aims to investigate how glosses in English academic texts affect the reading behaviour of ESL undergraduates while reading is taking place. In addition, it also examines the effects of gloss on the learning of the glossed target words. Twenty ESL first year undergraduates who were grouped into proficient and less proficient learners based on their MUET (Malaysian University English Test) results participated in a reading experiment using the eye tracking device. Eye movement data (i.e. fixation duration and scan path) obtained from the eye tracker, retrospective interviews and three vocabulary tests were analysed. The glossed target words were selected from Coxhead's Academic Word List (AWL) and were placed in the same line with the target word in the texts, in right margin of the texts. Eye movement analyses showed that the position of the gloss either at the top, middle, or bottom of the page influences how and when participants read the gloss. Participants who read the gloss before or after reading the texts were high unlikely to regress to the text to infer to the target words in the text. However, participants who read the gloss while reading the text mostly regressed to the text and read the target words in the text. The fixation duration data revealed that proficient participants looked at more glosses than the less proficient participants. The retrospective interview confirmed the fact that the participants did not read the gloss in each encounter as they have become familiar with the target words in the gloss. Nonetheless, they agreed that the presence of glosses in the texts helped them to learn unknown words, particularly in noticing the form of the words. The finding suggests that the use glosses need to be emphasized in language teaching and learning, particularly in reading comprehension and vocabulary learning.

Keywords: gloss, eye movements while reading, vocabulary learning, reading academic text

Introduction

By having a robust vocabulary, learners can grasp ideas and concepts better, which will positively affect their academic achievement. Therefore, learning a word is important for the receptive use (listening and reading) and the productive use (writing and speaking) of language. In the academic context, vocabulary knowledge plays a vital role to facilitate learning. University students need to equip themselves with sufficient vocabulary knowledge for them to read and fully understand academic material independently (Laufer & Ravenhorst-Kalovski 2010; Rahman, Yap, & Darmi 2018) to achieve academic success. In addition, one of the ways to

expand learners' vocabulary through reading is by modifying the reading input so that it becomes more informative to the meaning of the target word, thereby facilitating the lexical inferencing process (Godfroid, Boers, Housen 2013). Modification of input (i.e., target words) such as input enhancement can be done through the use of gloss, manipulation of frequency of exposure, and the presentation of contextual information for the target words. Such enhancement can increase the saliency of the target words so that they will be noticed and are more likely to be acquired by learners.

A number of studies have investigated the effects of different types of input enhancements on incidental word learning from reading, for example, repeated exposures (Teng 2016; Godfroid et al. 2017; Mohamed 2017), contextual clue (Webb 2008), and gloss (Boers et al. 2017; Jung 2016; Ko 2012), to name a few. Glosses refer to the definition of meaning, synonym, or translation that is provided for a target language item, to facilitate reading comprehension. Rather than modifying a text which may affect the authenticity of the text, glossing can be used to modify the input to resolve lexical difficulty, and assist readers to understand the text better. However, the findings were inconclusive on the effects of glosses on reading comprehension and target word learning as glosses tend to be skipped most of the times. Hence, this study investigates how glosses in English academic texts affect the reading behaviour of ESL undergraduates while reading is taking place.

Gloss in Reading

Many studies in gloss studies examined the effect of different types of glosses on learning outcomes such as vocabulary acquisition or reading comprehension. The common ground of these approaches is that it helps to flag target language input so that learners can allocate their attention to the form and meaning constructions of target words while they read for the purpose of meaning comprehension (Godfroid & Uggen 2013). However, the modification of input does not guarantee the retention of target words.

Glosses refer to the definition of meaning, synonym, or translation that is provided for a target language item, to facilitate reading comprehension. Various input in the form of glosses have been investigated and compared, such as the use of first language (L1) versus second language (L2) in glosses (Ko 2012; Vela 2015; Ertürk 2016), the translation of target words in L1 (Rott 2007; Jung 2016), and the use of definition or synonym of the target word in L2 (Guidi 2009; Nowzan & Baryaji 2013; Gosssen, Camp, Verkoeijen, & Tabbers 2014), just to name a few. In addition, the type of glosses also differs across the studies: computerised versus paper based glosses (Bowles 2004), multimedia glosses (Hulstijn & Laufer, 2001; Guidi 2009; Boers, Warren, He, & Deconinck 2017), computer mediated gloss (Hu, Vongpumivitch, Chang, & Liou 2014; Marefat, Rezaee & Naserieh 2016), and multiple choice glosses (Hulstijn 1992; Rott, William, & Camero 2002; Duan 2018). In addition to the different input and types of glosses investigated across the studies mentioned above, the methods of L2 vocabulary learning assessment employed in these studies also vary, such as multiple-choice vocabulary test, meaning recall in L1, cloze tasks, and meaning recall in L2 to measure the form and meaning construction of the target words learned.

Another noteworthy difference seen across these studies is in terms of glossing condition, whereby several studies boldfaced the target word in the text (Ko 2012; Ertürk 2016; Danesh & Farvardin 2016; Warren et al. 2018; Duan 2018) while a few other studies did not bold the target word in the text (e.g. Boers et al. 2017; Jung 2016). Bolding may increase the chances for learners to notice the target word. However, boldfacing the target word in the text does not guarantee that it will attract readers' attention to read its iteration in the gloss (Warren et al. 2018). In a nutshell, the divergent of methodological approaches to glossing employed by these studies highly contribute to inconclusive findings in the effects of glosses on L2 vocabulary learning.

When reading for comprehension, readers probably dismiss unfamiliar words, or in other case, they might incorrectly infer the meaning of those unfamiliar words. In both cases, the learning of those unfamiliar words is highly unlikely to happen. According to Ko (2005), the use of glosses for unfamiliar words in the text will prevent learners to make wrong guessing and in doing so, it will ease the reading process itself. Moreover, glosses increase the opportunity for learners to read the target words more than once (Watanabe 1997). After the learner read the target word in the text, he/she would probably read the target word in the gloss, and probably go back to the text and read the target word again. The provided meaning plus repeated encounter of the target word would enhance incidental learning of the word. A considerable amount of past studies have shown that, overall gloss has a positive effect on vocabulary learning, compared to no gloss condition (Watanabe 1997; Ko 2012; Danesh & Farvardin 2016; Jung 2016; Duan 2018). However, the contradicting notion that gloss might deprive the learner's mental effort to search and infer the meaning of the word may cause in a less affirmative result on vocabulary learning (Huang & Lin 2014).

In addition, with regard to the effects of the different types of glosses, such as multiple-choice gloss, pictorial glosses, and computer-mediated glosses, the findings vary; for example, the findings of Boers et al.s (2017) study on the effects of multimodal glosses over text-only glosses on L2 vocabulary learning. In their study, two groups of participants read a narrative text containing six pseudo words glossed with textual information or textual information plus a picture. The study found no significant difference between the two glosses, claiming that picture may hamper participants' initial uptake of word form and meaning. This is evident in the results from three vocabulary tests posed to the participants, in which gloss with picture group showed the poorest performance in almost all the three tests (i.e., meaning recognition, form recall, content questions). The use of gloss is beneficial as it may compensate the lack of contextual input; however, this may diminish reader's chance to infer and hence reduce the effort in processing, which might affect the retention in long term memory (Watanabe 1997).

On the other continuum, one might suggest that new words will be effectively and efficiently learnt by making learners infer the meaning of unknown words using the information obtained from context (Hulstijn 1992). Burcu Varol and Gülcan Ercetin (2019)'s study investigated the effects of gloss type, position, and working capacity on second language comprehension in electronic reading. The findings demonstrated that the effects of gloss content rely on the type of task used to facilitate comprehension, while the effects on gloss position were still ambiguous. The main effect of the gloss position was significant in pop-up conditions compared to separate

window conditions in terms of frequency of access. Ko (2012)'s study investigated the effect of gloss and no gloss texts on L2 vocabulary learning. The findings demonstrated there was significant differences between glossed and no glossed conditions on L2 vocabulary learning. The result from a survey of the study revealed that participants preferred glosses in their reading materials and they looked at the gloss when they came across unknown words with the purpose to understand the text. While Ko's study only examined the effect of glosses on vocabulary learning, Jung (2016)'s study investigated how glossing in L2 texts affect learners' reading comprehension, L2 grammar and vocabulary learning. The results indicated that glossing significantly facilitated learning of the target constructions while having no influence on reading comprehension scores.

Many studies on glossing employed pre-test and post-test to investigate the effect of glossing on learning outcomes (Ko 2012, Vela 2015, Jung 2016, Boers, Warren, He & Deconinck 2017). Only a few utilised eye tracking and investigate the effect of glosses on reading behaviors and learning outcomes (Warren et. al). However, these studies do not address how glosses are being read and process specifically. Jung and Révész (2018) and Warren et. al (2018) were among the latest studies on glossing the used eye tracker as a research tool. Warren et. al (2018)'s investigated the effect of gloss types on learners' intake of new words. The findings showed that glosses have little effect on the distribution of attention (based on fixation duration) and gloss with definition and picture yielded better result in form and meaning recognition of the target word, while text only gloss tend to be skipped most of the times. On the whole, glossing has been found to facilitate vocabulary learning and ease reading comprehension. Nonetheless, different assessment methods and types of glosses investigated may entail different outcomes.

Methodology

Participants

A total of 20 first year Malaysian ESL undergraduates at a research university in Malaysia were chosen as participants for this study. All participants had received similar number of years of English language education before entering university, and attained Band 3 or Band 4 for the Malaysian University English Test (MUET) results. They were in the same field of study (i.e. social science) but from two different academic specialisations for their bachelor's degree programme namely, Bachelor of Social Science in Psychology and Bachelor of Education in Teaching English as a Second Language (TESL). To ensure the similarity in terms of familiarity and knowledge of the structures of the academic text, the participants chosen were those had not taken any preparatory courses related to English for Academic Purpose (EAP). Hence, they had not been formally taught the structure, types, and the language skills associated with academic discourse. The data of these participants were derived from a larger sample of participants which consisted of 41 participants from the TESL programme and 38 participants from the Psychology programme. All of the participants underwent the same research procedure set by this study. However, to gain more information regarding the reading processes involved when reading English academic texts, data (i.e. total fixation duration, analysis of scan paths, retrospective interview) were elicited from 20 participants, 10 from each undergraduate programme, for a detailed analysis.

Reading Materials

Three academic texts (labelled as Text A, Text B, and Text C) were adapted from the introduction section of three journal articles. The introduction section of a journal is deemed suitable to be used as a stimulus (reading material) for this study as the section generally provides relevant information about the topic and does not usually contain any methodological terms that may be unfamiliar to the participants. Since content familiarity eases reading comprehension (Pulido 2004), the content of journal articles was carefully selected to ensure that the participants will be able to understand the texts. The fact that the participants were from the social sciences and humanities cluster, the journal articles chosen were on research in social sciences and humanity, and are related to university students in general. The texts were on workplace writing, technology in education and skills among graduates. Each text had four paragraphs and each paragraph was displayed on a single screen. Glosses of four academic words were inserted on the right margin of the text. The glosses were placed in a box with blue outline, in line with the academic word in the text. The target words in the glosses were chosen from the least known academic words by ESL undergraduate students based on a study conducted by Sulaiman, Salehuddin and Khairuddin (2018). The words were derived from Academic Wordlist (AWL) by Coxhead (2000).

Instruments

The current study used TOBII TX300 Eye Tracker to investigate the participants' eye movement patterns (namely their fixation duration, fixation counts, reading time, and scan path) when reading academic texts. The eye tracker has a sampling rate of 300 Hz and a large head movement box which enables less restricted movements and more natural position for the respondents. The heat map displays the participant's degree of attention on certain stimuli. Areas that receive longer fixation durations or a higher number of fixations known as the "hot" zones are highlighted with warm colours (e.g., red), whereas areas that receive shorter fixation durations or fewer number of fixations known as the "cool" zones are highlighted with colder colours (such as green), and no colour reflects areas of no looks or no fixations (Conklin & Pellicer-Sanchez 2016).

Scan path is another form of visualization that encloses fixation positions that tells the sequence of the eye movements while looking at the stimuli. The numbering in the circle indicates the sequence of fixation and the line indicated the direction of the eye movement. The scan paths can be exported as image files or as animated visualization that show the recording of the participants from the integrated camera and speaker. The three academic texts were presented on a computer screen in regular Consolas font, size 18, double spaced. Each text consisted of four displays; each display contained 10 to 12 lines of text. A total of 12 displays were presented to the participants. In addition, to support the data obtained from the eye tracker, a retrospective interview was conducted on each participant right after they completed reading the three texts. The questions asked on the participants' comprehension of the texts that they have read, their reading behaviours (based on scan path recording) and the text in general.

Findings and Discussion

Ten participants from the high proficiency group were labelled as H1 to H10, while ten participants from the low proficiency group were labelled as L1 to L10. All three texts consisted of gloss of four target words namely, ‘confer’, ‘albeit’, ‘amend’, and ‘notion’. The words ‘confer’ and ‘amend’ appeared three times whereas the words ‘albeit’ and ‘notion’ appeared four times throughout the three texts. Table 1. presents the number and position of the gloss for each page in each text. The glosses provide meaning of the target word. The gloss of the target academic words appeared on the right-side margin of the screen. The gloss was placed in a box with blue outline, in line with the target word in the text. The number of glosses varies per screen, from zero to three.

Table 1. Number of gloss on each page

Text(Page)	Number of Gloss	Position of gloss on page
Text A (1)	1	Bottom
Text A (2)	2	Top, bottom
Text A (3)	-	-
Text A (4)	1	Top
Text B (1)	-	-
Text B (2)	3	Top, middle, bottom
Text B (3)	1	Middle
Text B (4)	1	Top
Text C (1)	1	Top
Text C (2)	2	Top, middle
Text C (3)	1	Bottom
Text C (4)	1	Bottom

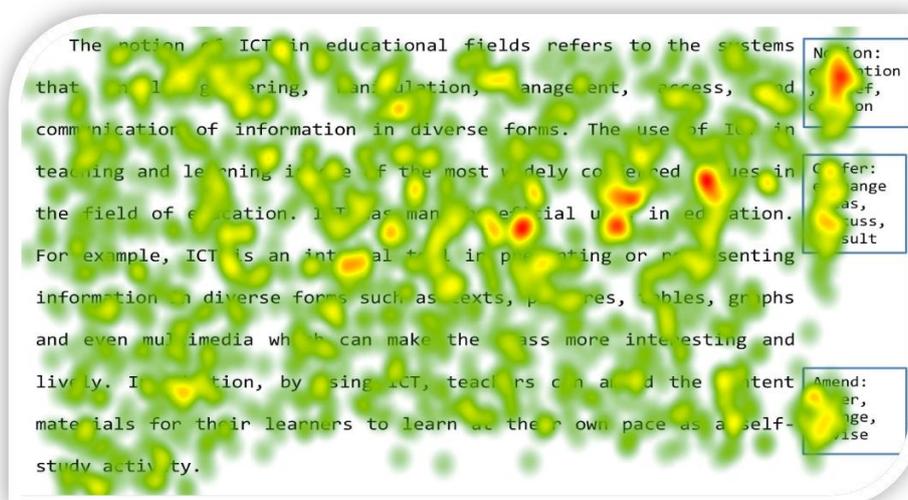

Figure 1. Sample of Heat Map

From the recording of the participants' scan path and heat maps, while reading the texts, it was noticed that the position of the gloss is one of the factors affecting how the participants read the gloss. Figure 1. shows the sample of heat map and Figure 2. illustrates the sample of scan path from one of the participants. Warm colour (red spot) was seen mostly on the first or top gloss that appear on the text. This reflects that gloss attracted the participants' attention.

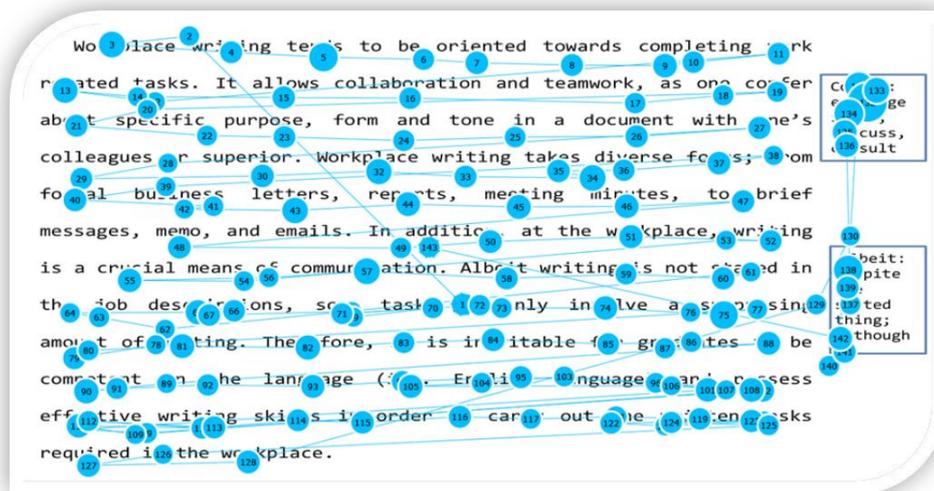

Figure 2. Sample of Scan Path

In addition, if a gloss is located at the top of the page, the participants would most likely read the gloss before or while reading the passage. For example, the gloss on the fourth page of Text A is located at the top of the page. Among the five proficient participants that read the gloss on page four (Text A), three participants read it while reading the passage, while four out of six less proficient participants who read the gloss also read it while reading the passage. On the other hand, a gloss that appeared at the bottom of the page is most likely to be read after the participants have read the entire passage. For instance, the gloss on page three (Text C) is located at the bottom of the page. All of the participants from the less proficient group who read the gloss on page three (Text C) read it after reading the whole passage, and a majority of the proficient participants who read the gloss also read it after they had completed reading the passage on that page. Most of the participants from both groups that referred to the gloss after they had read the passage did not go back to read the passage or search the target word (in the gloss) in the sentence. Most of the time, after reading the gloss, the participants would move on to the next page. In contrast, the participants who read the gloss while reading, either upon or before encountering the target words in the passage, mostly regressed or went back to the sentence in which the target words appeared, after reading the gloss.

Based on the percentage of glosses looked-up on each page as shown in Table 2., more participants from the proficient group referred to more glosses on almost all the pages compared to the less proficient participants. For both groups, Text C shows the lowest percentage of glosses looked-up. Almost all participants in both groups referred to gloss on the first page of Text A. This is most probably because it was the first gloss they

encountered while reading the passage. The second page of Text B which consists of three glosses also resulted in high percentages of glosses looked-up among the participants from both groups.

Table 2. Percentage of looked-up glosses on each page

Text (Page)	% of Glosses Looked-Up	
	Proficient	Less Proficient
Text A (1)	90%	100%
Text A (2)	60%	60%
Text A (4)	60%	50%
Text B (2)	90%	70%
Text B (3)	80%	50%
Text B (4)	70%	50%
Text C (1)	50%	30%
Text C (2)	70%	60%
Text C (3)	60%	40%
Text C (4)	40%	50%

Regarding of percentage of glosses referred as seen in Table 3., more than half of the participants from both groups looked at more than 70% of the total glosses provided. Three out of the ten participants from the less proficient group looked at less than 50% of the total glosses provided. Among the three participants, two participants only referred to two out of fourteen glosses provided in all texts. A similar pattern was seen in one proficient participant who only read two out of the fourteen glosses.

Table 3. Number of participants based on percentage of glosses looked-up

% of Glosses Looked Up	Number of participants	
	(Proficient)	(Less Proficient)
90-100	3	2
70-89	3	4
50-69	3	1
30-49	-	1
0-29	1	2

H6 was one of the proficient participants who looked at more than 90% of the glosses provided. Based on his/her scan path, H6 read the target word and the definition for all the glosses on Text A; however, she/he only looked at the rest of the glosses on other texts and merely read the target word. Nevertheless, H6 was able to recognise two out of the four target words in the gloss condition and successfully provided the meaning of three of the target words. Based on the interview transcript, H6 stated that she/he knew the meaning of the target words presented in the glosses and did not have to read the definition provided in each gloss thoroughly.

In the same vein, H8 who looked at all of the glosses was able to successfully recognise all four target words and provided the meaning of two target words correctly. During the retrospective interview, H8 asserts that she/he read the glosses after reading the text. This is in accordance with H8's scan path which revealed that he/she read all of the glosses after she/he had read the text on that page and did not go back to the passage. When H8 was asked why he/she referred to the gloss after reading, H8 said that *"because I want to know the gist of the text first, and then, I only refer...to the definition"*. Besides that, H2, who looked at more than 70% of the glosses, was able to recognise and recall the meaning of all the target words placed in the glosses. Based on H2's scan path and interview, it was apparent that H2 read the target word and the definition in the glosses while reading the passage. H2 went back to the passage to reread the lines that contained the target words in some of the glosses. Nevertheless, in some cases, a high percentage of glosses looked up does not necessarily lead to better recognition of target words. For instance, H7 has the least percentage of glosses looked up among proficient participants. However, he/she was able to recognise all of the target words and recalled the meaning of one target word. H7 stated that *"if I couldn't understand one word..i will refer to the gloss..then I just go back to the sentence...and start to reread"* indicating that he/she only refer to the gloss if there are words whose meaning he/she did not know.

On the other hand, L1 who only looked at one gloss (7.1%) while reading the texts failed to recognised any of the target words. In his/her retrospective interview, L1 asserted that he/she would search for the definition of unknown words if the content of the text is difficult to understand. L1 further added that he/she would reread the contents of the text or guess the meaning of the unknown words. The findings also revealed that the position of the gloss influenced how the participants read the gloss. According to Ko (2005), using glosses for unfamiliar words in the text will prevent learners from making wrong guesses and, in doing so, will ease the reading process. This was reflected in the current study, whereby, those who looked at the glosses while reading were better at recognising the target words and recalling the meaning of the target words compared to those who read the glosses after they have read the text. Even though, the participants did not fixate on the gloss in each encounter, they still agreed that gloss helped to know the meaning of unknown words. This is probably due to the fact that they have grasped the meaning of the words presented in the glosses and chose to ignore it in the following texts. Nonetheless, all the participants agreed that glosses had assisted them to cope with unfamiliar words while reading, and this corroborates the claim made by Duan (2018), Jung (2016), Ertürk (2016), and Ko (2012). However, it may not warrant comprehension of the text in general and target word learning in specific.

Conclusion

The use glosses need to be emphasized in language teaching and learning, particularly in reading comprehension and vocabulary learning. In addition, the findings revealed the provision of different input enhancements in reading material that can be adapted for second language vocabulary learning and teaching. Gloss has shown to enhance the noticeability of target words that leads to successful form recognition of the words among participants in the current study regardless of their language proficiency. The use of typographic enhancement

such as highlighting or bolding the target words in the passage could also increase the chances of deeper processing of the target words among participants. Vocabulary learning in the present study varies depending on input enhancement of academic target words and the participants' language proficiency. Therefore, language instructors should take into consideration these

Abstract: There is a lot of research conducted about hijāmah, particularly its wet-cupping therapy. Most research focuses on its effectiveness in curing specific illness and problems; least of them do focus on the ethics of hijāmah even though ethics are very important in guiding the practitioners not to cause harm and to give the best treatment for their patients. Without proper ethics, hijāmah therapists may face risk of litigation by their patients and related regulators. Therefore, this paper aims to review existing literature on ethics of hijāmah within Malaysia context. This study adopts meta-search analysis to extract all relevant literature from research databases and Islāmic texts. Our primary finding indicates that there is a missing integration of Islāmic ethics in the current guidelines developed by the Ministry of Health, Malaysia. Therefore, there is an opportunity to improve the current guidelines by integrating Sharī'ah compliance towards sustainable development and preservation of this Islāmic prophetic medicine.

Keywords: Ethical guidelines, Hijāmah, Sharī'ah compliance

Introduction

Hijāmah is a traditional Islāmic cupping medical practice since the time of Prophet Muḥammad (ﷺ). It has two main types of cupping therapy, they are: 1- Dried cupping which involves creating a vacuum in a cup and placing it on the skin to draw out toxins which is believed to promote blood circulation and relieve pain and inflammation. 2- Wet cupping which involves the use of small incisions made on the skin and the application of suction cups to create a vacuum that draws out small amounts of blood, fluid, and toxins from the body (Aboushanab & AlSanad, 2018). This type of wet cupping, known as hijāmah, was the primary form of cupping therapy used during the time of the Prophet Muhammad (ﷺ) and his companions; the terms hijāmah and faṣḍu were used interchangeably to refer to this particular form of therapy (Asar A.K., 2022). While hijama has been used for centuries in Islāmic cultures as a therapeutic tool, its practice raises ethical concerns that require careful consideration. The ethical guidelines of hijama is the most essential aspect in ensuring that the practitioners

provide quality care.

Ministry of Health (MoH) has recognized hijāmah therapy as one of the traditional and complementary medicines practices. Under the Traditional and Complementary Medicine Act (TCMA) 2016 which has come into operation on 1 August 2016 (Malaysia, 2016); MoH is the responsible authority to govern the policy and to impose the ethical guidelines on TCM practices and products. The aim of the TCMA is to ensure that TCM practices are safe, effective, and meet certain standards of education and training. MoH also has highlighted in their another document entitled the Traditional and Complementary Medicine Blueprint 2018-2027 Health Care (TCMBP)(Ministry of Health, 2017), that “well-declared ethical values” is the first criterion for the practices of hijāmah. However the details of the hijāmah ethical guidelines are not stated well. This paper discusses the current ethical guidelines for hijāmah highlighted by World Health Organization (WHO) and MoH.

Method

The first step in this methodology involves conducting a review of World Health Organization (WHO) and MoH current ethical guidelines for hijāmah in Malaysia. The second step involves a review of Islamic sources and Muslim scholarly opinions on the ethical principles to identify common themes and differences regarding the ethical guidelines. The final step in this methodology involves a synthesis of the findings to develop a proposed framework ethical guideline of hijāmah.

Ethical Guidelines of Hijāmah by World Health Organization (WHO)

Hijāmah, particularly its wet-cupping therapy has gained popularity in recent years with a lot of research conducted about it. Most research focuses on its effectiveness in curing specific illness and problems; there are ethical considerations that practitioners and patients should be aware of. In this review, we will discuss the ethical guidelines of hijāmah provided by WHO(Organization, 1999).

One of the most important ethical considerations of hijāmah is the **informed consent**. According to the WHO, the informed consent is a requirement for any research involving human participants. It involves providing an Informed Consent Form (ICF) with each proposal, indicating that the research participant has voluntarily decided to participate in the research(World Health Organization, n.d.). For hijāmah, informed consent means that the patient should be fully informed about the potential benefits and risks of the treatment. The practitioner should discuss any alternative treatments that may be available to the patient as well. In addition, the patient should be informed about the qualifications and experience of the hijāmah practitioner to ensure that they are receiving safe and effective treatment(AIBedah et al., 2015). It is essential that practitioners take the time to explain the procedure thoroughly, the risks and benefits, and the aftercare instructions. This process ensures that the patient understands what to expect and makes an informed decision about their treatment. By ensuring that

patients are fully informed, practitioners can help to build trust and establish a positive therapeutic relationship with their patients.

Confidentiality is the second critical ethical consideration in the practice of *hijamah*. Practitioners must prioritize maintaining patient confidentiality and respecting the privacy of their patients at all times. This includes ensuring that patient information is only shared with others when the patient provides explicit consent and that such information is only used for the purpose of providing medical care. The practitioners should ensure that they have obtained the patient's consent before disclosing any medical information to family members, other healthcare professionals, or any other third party. The practitioners should also take steps to ensure that patient records and other personal information are stored securely and confidentially for patient's safety and the quality of care (Koskimies, Koskenniemi, & Leino-Kilpi, 2020). This ethical consideration is critical in building and maintaining trust between the practitioner and the patient. By respecting the patient's privacy and maintaining their confidentiality, the practitioner can help create a safe and comfortable environment that encourages patients to share important information about their health and wellbeing.

The third ethical consideration in *hijamah* practice pertains to the use of **sterile equipments**. The practitioner should ensure that the equipment used for the procedure is sterile and that the procedure is performed in a hygienic environment to prevent the transmission of infectious diseases and other complications. This ethical guideline is not only in line with the standard guidelines of WHO and MoH but also with Islamic teachings. Cleanliness is highly valued in Islām, and Muslims are required to maintain cleanliness of their bodies and surroundings. The Prophet Muhammad (PBUH) emphasized the importance of cleanliness, stating that "*Cleanliness is part of faith, and faith leads to paradise*" (Sahih Muslim, Book 2, Hadith no.: 432). Hence, the use of sterile equipments and a hygienic environment is an essential aspect of the Islamic ethical guideline for *hijamah* practice, as it aligns with the Islamic emphasis on cleanliness and hygiene.

The fourth ethical consideration when it comes to *hijamah* is the importance of **proper training and qualifications for practitioners**. It is crucial for practitioners to have received the necessary training and qualifications to perform *hijamah*, and to have a sufficient understanding of human anatomy and physiology. They should also be knowledgeable about the potential risks and complications that can occur during the treatment process. Additionally, in Islām, seeking medical treatment and consulting with qualified medical professionals is highly emphasized. The Prophet Muhammad (PBUH) encouraged seeking medical treatment and stated that "*For every disease there is a cure, so if the medicine matches the disease, the patient will recover with the permission of Allah*" (Sahih Muslim, Book 31, Hadith 5807). Therefore, Muslims are encouraged to seek medical treatment for their illnesses and to consult with qualified medical professionals, including doctors and traditional healers, before undergoing any medical treatment. This ensures that practitioners have the necessary knowledge and skills to deliver *hijamah* safely and effectively, and that patients receive the best possible care.

The fifth ethical consideration in *hijamah* is the need for practitioners to engage in **ongoing professional**

development. Practitioners should stay abreast of the latest research and advancements in the field of *hijāmah* and continuously strive to enhance their knowledge and skills. This can be achieved through attending training programs, workshops, and conferences, as well as participating in online courses and other forms of continuing education. By staying up-to-date with the latest developments in the field, practitioners can provide their patients with the most effective and safe treatments possible. Furthermore, ongoing professional development is essential for maintaining the highest standards of ethical and professional conduct in the practice of *hijāmah*. It ensures that practitioners provide their patients with the best possible care and are able to adapt to changing circumstances and patient needs.

Ethical Guidelines of *Hijāmah* by Ministry of Health Malaysia (MoH)

Overall, the ethical guidelines for *hijāmah* by the Ministry of Health (MoH), Malaysia are based on the WHO ethical guidelines, with some additional guidelines specifically for practitioners in Malaysia. The ethical guidelines are stated in the general guidelines in the Traditional and Complementary Medicine Act 2013 (Ministry of Health, 2013). Those additional ethical guidelines are as follows:

Registration. In Malaysia, the Traditional and Complementary Medicine Act 2013 (Ministry of Health, 2013) requires that *hijāmah* practitioners to be registered with the Malaysian Traditional and Complementary Medicine Council. This registration process is in place to ensure that practitioners have the necessary knowledge and skills to perform *hijāmah* therapy safely and ethically. To become a registered *hijāmah* practitioner, an individual must first complete a recognized training program in *hijāmah* therapy. This training program should cover the theoretical and practical aspects of *hijāmah* therapy, including safety considerations and ethical principles. After completing the training program, the individual must pass an examination to obtain a certificate of competency in *hijāmah* therapy. However, the implementation of this registration requirement has been met with challenges, such as the lack of standardization in the training programs. This issue can potentially lead to discrepancies in the knowledge and skills of registered practitioners, which can affect the quality of care provided to patients. Therefore, the authorities need to ensure that the training programs are standardized to maintain the competency and quality of *hijāmah* practitioners in Malaysia.

Indications and Contraindications. The MoH's guidelines on *hijāmah* also address the indications and contraindications of the therapy. These guidelines suggest that the treatment is suitable for various conditions, including musculoskeletal disorders, respiratory problems, digestive disorders, and gynecological disorders, among others. However, the therapy is not recommended for patients with bleeding disorders, active infections, or skin conditions that could be worsened by the procedure (Ministry of Health, 2013). Additionally, certain medical conditions, such as cancer and blood disorders, are contraindicated for *hijāmah* therapy. The guidelines require practitioners to refer patients to medical doctors if they suspect any underlying medical conditions that could be contraindicated for the therapy. These guidelines reflect the importance of ensuring that patients are properly assessed before undergoing *hijāmah* therapy, to avoid any adverse effects and to ensure the safety and well-being of the patient.

Record-keeping. Record-keeping is an important aspect of *hijamah* practice that is emphasized in the guidelines. Practitioners are required to maintain accurate records of each patient's personal and medical history, as well as details of the *hijamah* treatment provided. This is important for several reasons. First, it ensures that the practitioner has a complete picture of the patient's health status and can make informed decisions about the appropriateness of *hijamah* treatment. Second, it provides a record of the treatment provided, which can be useful in case of any adverse events or complications. Finally, it can help to facilitate continuity of care, as the patient's records can be shared with other healthcare providers if necessary. The records should be kept confidential and made available to the patient upon request, as patients have the right to access their own medical records.

Islamic Ethical Guidelines in *Hijamah*

In addition to previous discussion, there are some Islamic ethical guidelines which related to *hijamah*; which do not applicable or discussed in the guidelines provided by WHO and MoH. There are as follows:

Intention. Intention is a crucial aspect of the practice of *hijamah*, and it is considered an ethical consideration as well. The primary intention behind *hijamah* is to seek blessings from Allah or to alleviate health problems. Therefore, the practitioner should have a sincere intention in giving the best treatment to the patient. The practitioner should not focus solely on monetary gain or reward from the service, but rather on seeking Allah's blessing in their work. When a practitioner has a sincere intention, it is believed that they can achieve mastery and perfection in their work. The concept of intention in *hijamah* is rooted in Islamic ethics, which emphasizes the importance of sincerity and the intention to seek Allah's pleasure in all aspects of life. It is believed that a practitioner who has a sincere intention will be more committed to providing the best possible care for their patients.

Invocation. In the practice of *hijamah*, invocation/ faith are important ethical considerations. Before starting the therapy, both the practitioner and patient should invoke the name of Allāh and seek His help in healing the ailments. This is in accordance with the prophetic tradition that states that Allah does not send down a disease without sending down a cure for it. The Prophet stated: *"Allah does not send down a disease without sending down a cure for it"* (Ṣaḥīḥ al-Bukhārī, 5678)(Al-Bukhārī, 1987). Moreover, faith in the healing power of this prophetic medical therapy is also crucial. The Prophet Muḥammad also stated *"The Prophet (ﷺ) said: "Healing is in three things: A gulp of honey, cupping, and cauterizing, but I forbid my followers to use cauterization"* (Ṣaḥīḥ al-Bukhārī, 5680) (Al-Bukhārī, 1987). However, this prohibition is not absolute, because some companions of the Prophet still do it, especially to heal wounds caused by war. The actual law is *makrūh* [disliked], it can still be used as a last resort if no other treatment works(Asar A.K., 2022). Therefore, practitioners and patients alike should have faith in the healing power of *hijamah*, and believe that it can effectively alleviate the ailments. This belief and invocation not only serve as ethical considerations but also provide a sense of comfort and reassurance to patients who are undergoing the therapy.

Perfection. The concept of perfection is an important consideration in the practice of hijama. According to a prophetic tradition, Allah loves it when people do something, they should do it perfectly. The Prophet states: *"Verily Allah loves that whenever any of you do something, you should perfect it"* (al-Jāmi' al-Ṣaghīr, 1855) (Al-Suyūfī, n.d.). This means that the practitioner should strive to master their work and provide the best possible treatment to their patients. In Islam, perfection means doing the best that one can, as it is mentioned in the Quran that Allah does not burden a soul beyond its capacity: *"Allah does not charge a self (anything) except its capacity"* (Sūrah al-Baqarah, 2: 286). Hence, every practitioner should aim to master their job and provide the best possible service to their patients. Additionally, even the Prophet Muhammad emphasized the importance of responsibility when performing any work or obligation. This highlights the importance of practitioners taking their work seriously and striving for excellence in the practice of hijama.

Separation of men and women. There are debates among Muslim scholars about the extent to which gender separation or segregation is required by Islāmic law. Some argue that gender segregation is a cultural practice that has been erroneously attributed to Islam, while others see it as an essential aspect of Islamic identity and morality. For researchers, the separation of gender is required in Islām to prevent immorality or adultery which may happen especially when two people of opposite sex stay together in a closed place. Male and female patients should be treated in separate spaces to maintain modesty and uphold Islamic teachings on gender interactions. It is not a requirement for a practitioner to be a *mahram* to the female patient; if there is an urgent need to get treatment, then the female patient can get that treatment. However, it must be based on the guidelines that have been explained by Muslim jurists to guard against the occurrence of *zinā*, or *fitnah* that may arise in society. One of the guidelines is to have her husband, guardian, or other trusted woman with the female patient when she receives treatment from the trusted practitioner (Asar A.K., 2022).

Modesty. Both the practitioner and the patient should observe modesty. Muslims are required to observe modesty in their dress, behavior, and interactions with others. Modesty is seen as a key aspect of Islamic morality and is often linked to the concepts of piety and righteousness. The Qur'ān contains numerous references to modesty, including Sūrah al-Nūr (Quran 24:30-31). Muslims expected to avoid arrogance, pride, and showiness. The Prophet Muhammad is reported to have said: *"Modesty is part of faith, faith is in the Heaven, obscenity is part of rudeness, and rudeness is in the Hell."* (Sunan al-Tirmidzī, 13509) (At-Tirmidzī, n.d.). In the practice of *hijāmah*, the observance of modesty is considered an essential ethical consideration. Practitioners and patients are expected to adhere to modesty in their interactions with each other. This is in accordance with Islamic teachings, which emphasize the importance of modesty in all aspects of life. Modesty is considered a fundamental component of Islamic morality and is associated with the concepts of piety and righteousness. The Qur'ān contains numerous references to modesty, such as Sūrah al-Nūr (Quran 24:30-31), which states that Muslim men and women should lower their gaze and guard their private parts. Muslims are expected to avoid arrogance, pride, and showiness, and instead, display humility and modesty in their behavior and interactions with others. The Prophet Muhammad is reported to have said: *"Modesty is part of faith, faith is in the Heaven, obscenity is part of rudeness, and rudeness is in the Hell"* (Sunan al-Tirmidzī, 13509). Therefore, both the practitioner and the patient are expected to observe modesty during the practice of *hijāmah*.

Respect. Both the practitioner and the patient should respect each other during the procedure. The patient's privacy should be respected, and the practitioner should maintain a respectful demeanor. Respect is a fundamental concept in Islām that emphasizes the importance of treating others with dignity and honor. Muslims are encouraged to show respect to all people, regardless of their background, race, or religion. This concept is based on the Islamic belief that all human beings are equal in the eyes of Allāh, and that showing respect to others is a way of showing gratitude and obedience to the God. The Qur'ān contains numerous references to respect, including Sūrah al-Ḥujurāt (Quran 49:11). Allāh states *"O you who have believed, let not a people ridicule [another] people; perhaps they may be better than them; nor let women ridicule [other] women; perhaps they may be better than them. And do not insult one another and do not call each other by [offensive] nicknames."* The Prophet Muhammad is also reported to have emphasized the importance of respect, saying: The Prophet (ﷺ) said, *"Whoever believes in Allah and the Last Day, should not hurt his neighbor and whoever believes in Allah and the Last Day, should serve his guest generously and whoever believes in Allah and the Last Day, should speak what is good or keep silent"*(Al-Bukhārī, 1987).

Based on previous discussion, these are the proposed ḥijāmah ethical guidelines for Muslims in Malaysia which are the integration of Islamic ethical guidelines with the standard guidelines of WHO and MoH. The guidelines aim to ensure that the practice of ḥijāmah adheres to the highest ethical standards and protects the health and well-being of patients. The proposed guidelines include the requirement for practitioners to be sincere in their intentions, invoking the name of Allāh and seeking His help in healing the ailments before starting the medical therapy, and observing modesty and respect during the procedure. The guidelines also emphasize the importance of gender separation, especially in closed places, to prevent immorality or adultery. These guidelines are in line with the Islamic principle of protecting the dignity and privacy of both the practitioner and the patient. By integrating Islamic ethical guidelines with WHO and MoH standards, these proposed ḥijāmah ethical guidelines for Muslims in Malaysia aim to promote a safe, effective, and ethical practice of ḥijāmah while upholding Islamic principles and values.

Table 1. Summary of the Ethical Guidelines

No	Ethical Guidelines	World Health Organization (WHO)	Ministry of Health, Malaysia (MoH)	Islām
1	Intention	Not applicable	Not applicable	Yes
2	Invocation	Not applicable	Not applicable	Yes
3	Perfection, proper training and qualifications	Yes	Yes	Yes
4	Ongoing professional development	Yes	Yes	Yes
5	Separation of men and women	Not applicable	Not applicable	Yes
6	Modesty	Not applicable	Not applicable	Yes

7	Respect and confidentiality	Yes	Yes	Yes
8	Registration	Yes	Yes	Not applicable
9	Cleanliness, Hygiene and Sterile equipment	Yes	Yes	Yes
10	Indications and Contraindications	Yes	Yes	Yes
11	Informed Consent	Yes	Yes	Yes
12	Record-keeping	Yes	Yes	Not applicable
13	Follow-up and Monitoring	Yes	Yes	Not applicable

Conclusion

Hijāmah is one of the global halal treatment industry in the world, particularly for the Muslim world such as Malaysia. Without proper ethics, hijāmah therapists or parctitioners may face risk of litigation by their patients and related regulators. In reality, the Islamic ethical guidelines of hijāmah do not contradict to the good practices or guidelines stated by both health organizations: WHO and MoH. With this proposed ethical guidelines which comprised of the standard guidelines and Islāmic guidelines for hijāmah, it paves the way for sustainable development and preservation of this Islāmic prophetic medicine.

Recommendations

Based on the findings of this research, there should be a standardization of practice in the field of hijāmah. This standardization includes the development of a code of ethics for hijāmah practitioners which complies with Islamic ethical guidelines. Regular training and assessment of practitioners; monitoring of their practice by regulatory bodies, and collaboration with healthcare professionals are also a must nowadays. Finally, there is a need for public education on the benefits and risks of hijāmah, as well as the ethical guidelines that practitioners should follow. This can be achieved through public awareness campaigns, educational programs, and the dissemination of information through traditional and social media platforms.

The Correlation between Students' Question Words Mastery and Their Speaking Ability in Asking Information

Elsa Desi Putri

Universitas Negeri Malang, Indonesia,  <https://orcid.org/0000-0003-1812-3968>

Abstract: The research proposed to examine whether there was any significant correlation between students' question words mastery and their speaking ability due to the students' difficulty in asking information about someone' personal information. There were 28 students as the samples selected by using simple random sampling. This research used a quantitative approach which was presented in correlational research design. In collecting the data, the researcher used a test which consisted of a written and spoken test. The written test aimed to measure the students' question words mastery consisted of 27 questions. Meanwhile, in measuring the students' speaking ability, the students were asked to do a short dialogue with their peers asking and giving information about their family. Then, the data analysis was conducted based on the students' written and spoken test results and its correlation was measured. The result of the data analysis of the students' question words mastery and their speaking ability were fair proved by the mean scores of these were 69.6 and 70.8. Finally, the value of $r_{obtained}$ was 0.608 which was higher than the value of r_{table} 0.374. In conclusion, there was a significant correlation between students' question words mastery and their speaking ability in asking information.

Keywords: Question words mastery, Speaking ability

Introduction

As a global language, English is taught and learned in many countries over the world either in English as a Second Language (ESL) or English as a Foreign Language (EFL) context. Then, English has become a compulsory subject since primary school to the tertiary school in some countries, including Indonesia. The reason why English has been included into Indonesian curriculum is that English as one of the most spoken languages nowadays would help Indonesian students to communicate globally with others from around the world. English is considered as a foreign language (EFL) in Indonesia where that means that English is not generally spoken in daily communication by the people. Therefore, it raises some challenges for Indonesian students to learn English effectively, especially when it comes to speaking where the students are expected to speak English fluently with the correct structures.

Speaking is one of language skills that is included to the productive skill, in which the students will not be able to produce the language if they do not have sufficient language input. In addition, according to Brown (2001), speaking skill is perceived as one of the most language skills needed in communication. Besides, to be successful in speaking English, a student is expected to be able to use grammar accurately, to use appropriate language depending on the target audience, to use proper vocabulary, and to be able to maintain the communication to create a successful interaction (Amelia et al., 2019). Meanwhile, as it was observed in EFL classroom, the challenges faced by the students in speaking English could be caused by the lack of grammatical competence, lack of vocabulary mastery, and the anxiety while speaking a foreign language. Thus, most of EFL students found that difficult to be able to speak fluently and grammatically correct in English. Since, whenever the students learn the grammar or tenses, they would start worrying about their sentences whether they speak it grammatically correct or not, then at the end it would stop them from communication. The challenges while speaking English have been always emerging in EFL students even though for speaking in daily topic, for instance talking about personal information.

In addition, there are three aspects of knowledge that should be involved in speaking of a language, namely 1) the knowledge of using the correct mechanics of language which consists of pronunciation, grammar, and vocabulary; 2) the knowledge of being able to maintain the communication in terms of changing information and giving worth message for the interlocuter; 3) the knowledge of being able to apply pragmatic norms (knowing who is speaking to whom, in what context, about what, and why) (Sitepu & Indari, 2021). Those elements or knowledge should be mastered by the EFL students to perform a good English-speaking ability. Furthermore, there are five aspects to measure someone's speaking ability according to Brown (2001), there are: 1) comprehension which refers to the ability of creating an understandable meaning to the interlocuter; 2) grammar is the use of proper language with a proper structure; 3) vocabulary is that a language learner needs sufficient vocabulary to communicate effectively; 4) pronunciation refers to the ability of pronouncing or spelling the words correctly and widely accepted; 5) fluency means that the language learner could speak without many pauses.

Besides, when it comes to interaction, there would be two people or more communicating by giving questions and information orderly. Since, English has its uniqueness in terms of the structure that is totally different from Indonesian structure, most of students perceived it more difficult to ask a question compared to answer or give the information in English. It is because the way Bahasa Indonesia and English in arranging a question sentence is different. Then, it makes the students get difficulty whenever they have to ask a question in English. In addition, in English, it is known that there are two kinds of question sentences, which are yes or no question and detailed-answer questions that use question words or WH-questions which consists of what, who, where, when, why, how, and so on.

In addition, teaching question words would help the students to improve their critical thinking as what it is required in the 21st century learners' characteristic. Since, creating a question sentence that is arranged well and understandable is not as easy as giving information when someone is being asked. It is because when the

students are required to give a question, they would need to link their prior knowledge, curiosity, and put all these into a meaningful question sentence. Furthermore, being able to give questions would play big role in improving the students' higher order thinking skills (Lee, 2015). Thus, to be able to give questions in English is highly important for the students.

Furthermore, EFL students were being asked about the literal meaning of each WH-questions, most of them would answer it correctly, in which, they students knew that *what* means *apa* in Bahasa, *when* means *kapan*, *who* means *siapa*, and so on. However, they still found it difficult whenever they have to create or arrange a complete question sentence which has gained all of the language elements that should be put there. Simultaneously with the research conducted by Silalahi (2017) on 60 university students as the participant. She did descriptive qualitative research and found out that the students still made mistakes in arranging question sentences in English by using WH-questions. The mistakes found were about choosing the right WH-questions to compose a question sentence, using the right article, verb, and an auxiliary verb, however, it was found that in terms of the meaningfulness of the question, the students were making little mistakes. In addition, she also found that most of EFL students are confused on using a particular question word especially on those which have similar meaning when those are translated into L1 as a result the students mixed up the use of each of the question word. For instance, the students were difficult to differentiate the use of *Who* and *Whom*, since those differences do not exist in Bahasa Indonesia.

The interference of mother tongue in learning L2 has always been an issue discussed in teaching English as a foreign language discussion. As what had been investigated by Kumar (2016) that most of Indian students made some errors due to the mother tongue interference that affected their L2 performance. Those students were repeating the same errors as using inappropriate question word, missing word, and putting the word order wrongly. This research result was in line with the study conducted by Sitepu and Indari (2021) focusing on the relationship of the students' WH-questions understanding and their speaking ability in expression of asking and giving opinion. They conducted study to the thirty-six of the eight-year students, and they found that there was significant correlation between those variables, namely the students' WH-questions understanding and their speaking ability in asking and giving opinions. Therefore, even though some people would agree that when someone is speaking English, the grammatical components do not really matter. However, it was proven that helping the students to improve their grammatical components understanding would highly affect the students' speaking ability becoming better.

Then, it was explained by Swan (1980) that the students would make some mistakes regarding to formulate a question sentence, especially by using WH-questions, namely 1) putting the order wrongly, for instance putting the subject after the main verb; 2) Omitting the auxiliary; 3) Overgeneralization the use of auxiliary verbs even when it is not needed. Therefore, it could be said that almost of EFL students faced challenges in creating a question sentence that led them to those mistakes. Furthermore, the existence of the auxiliary verbs in English is another challenge that has to be faced by Indonesian students in improving their WH-questions mastery, since such thing does not appear in Bahasa Indonesia structure.

Those situations also happened at one of senior high schools in Indonesia, where most of the students are able to answer the questions given orally, but they found it difficult if they had to express the question by using question words to maintain the communication, even for asking their friends' personal information. Even though, the students have learned how to talk and do introduction in English since they studied in elementary level, but if they had to ask someone about it, it was difficult for them. It might be caused by the lack of some aspects that are not mastered by the students to support their speaking ability as what has been stated earlier. Additionally, explaining the idea of the use question words in teaching English is useful for the students (Massytoh, 2021). Furthermore, if the students are being asked what they know about question words, they might know the meaning of *what*, *where*, *when*, *who*, *why*, and *how*, however if they are asked how to use those words properly in term of communication, they still found it difficult. It can happen because some words cannot be translated literally but it must be translated based on the context. For instance, "What is your name?" would have different meaning if the words in that sentence are translated word by word. Therefore, the students sometime get confused how to use the question words appropriately.

Previous study had been conducted by Massytoh (2021) related to the correlation between the students' mastery in using wh-questions and the students speaking ability at the junior high school level, and it showed that the students' mastery in using wh-question affected the students speaking ability. Other studies had also been conducted by Randong, and Marbun (2013) which was focused on the improvement of students' speaking ability through guided conversations. It was action research conducted to the students at junior high school. The result showed that by having a good grammar understanding, directly the students' speaking ability would increase especially for their accuracy and fluency. Both of those studies conducted at the junior high school level, however the current study conducted to the students at senior high school level which the assumption that the senior high school students' communication skill has developed to create a meaningful question sentence and apply their question words mastery to maintain the communication. In addition, the current study would focus on the ability of the students to ask questions in term of asking someone's personal information. Therefore, the current research was proposed under the title "*The Correlation Between the Students' Question Words Mastery and Their Speaking Ability in Asking Information*".

Research Questions

Based on the preliminary research conducted at one of senior high schools in Indonesia, the research questions were proposed as follows:

1. How are the students' mastery on using question words?
2. How are the students' speaking ability in term of asking information about someone' personal information?
3. Is there any significant correlation between the students' mastery on using question words and their speaking ability in asking information about someone' personal information?

Hypothesis

Ha: There is statistically significant correlation between the students' mastery on using question words and their speaking ability in asking information about someone' personal information.

Ho: There is no statistically significant correlation between the students' mastery on using question words and their speaking ability in asking information about someone' personal information.

Method

With regard to the research questions proposed earlier on seeking the students' question words mastery, the students' speaking ability in asking information about someone' personal information, and the correlation between the students' question words mastery and their speaking ability in asking information about someone' personal information, thus it was important to conduct a quantitative correlational research design. In addition, according to Gay (2009), the correlational study is used to measure the correlation between variables. In this study, it consists of two variables, namely the independent variable which is the students' WH-questions mastery (symbolized as variable X), and the dependent variable which is the students' speaking ability in asking someone' personal information (symbolized as variable Y). Furthermore, in the correlational study design, the researcher is trying to measure the degree of association between variables involved. Therefore, this study was aimed to find out the correlation between the students' mastery on using question words and their speaking ability in asking someone' personal information.

The participants of this research were the eleventh-grade students at one of state senior high school in Siak regency in which consisted of 281 students in total as the population of the study. Additionally, population is defined as all members that are eligible to participate in the study or it is defined as the group that the members have the similar characteristics. Then, from all members of population of the study, there were several members that were chosen as the samples of the study. As what has been stated by Ary (2016), sample is a set of data or group that was selected from the total number of the population by using method of sampling. Since, there were 281 students in total, then there were 28 students participated in this study chosen by using simple random sampling. It is because in determining the number of the sample in a study, if the total number of the population is less than 100 people/subjects then it is suggested to take all the members of the population as the study samples. However, if the total number of the population is more than 100, then it is allowed to take 10-15%. 20-25%, or more from the total number of the population as the study sample (Arikunto, 2015). Therefore, I took approximately 10% of the total population as the study samples. Since, in the correlational study, there would not be comparison among the participants, so the students were choosing by applying simple random sampling which meant all the students included in the population would have the same opportunity to be chosen as the samples of the study.

In addition, there were two tests applied to measure the students' question words mastery and their speaking

ability in asking information. The first test given was a written test aimed to find out the students' mastery of the use of question words. The written test given was focused on some aspects in constructing a question sentence, such as identifying each use of WH-questions, identifying the appropriate *be* across different tenses, identifying the appropriate *non-verb* complement for nominal sentence, identifying the appropriate auxiliary verb across different tenses, identifying the appropriate complement for the verbal sentence. The total number of the questions given were 27 questions in the form of multiple choices that had been validated by trying it out first. The second test given was a spoken test where the students were asked to do a peer-dialogue with their classmates asking information about their classmates' personal information. Before doing the dialogue, the students were told that they must gain information about their peers' personal information consisting of name, hobby, age, address, family, school, date of birth, and their food preference by using question words. The students would be recorded while doing the dialogue, then their speaking abilities would be assessed by the two raters. The students speaking ability would be assessed based on their comprehension, grammar, vocabulary, fluency, and pronunciation.

- The Validity of the Test

As what has been mentioned earlier, before giving the test to the students, the test designed was tested to measure the degree of the validity and the reliability of the test. So, the results of the test would be valid which meant the test given measured as what it was supposed to measure. In determining, the degree of the validity of the test, I used SPSS 22.0 version to measure the validity coefficient (known as r_{counted}) of each item of the test. Later, the r_{observed} was compared to t_{table} coefficient with significance level (α) was 0.05 and degree of freedom (df) was $N - 2$. Furthermore, the item of the test would be considered valid if $r_{\text{observed}} > t_{\text{table}}$. Additionally, from the 35 items of questions designed as the instrument of measuring the students' mastery on using WH-questions, 27 items met the criteria of the validity test.

- The Reliability of the Test

Before giving the test to the students, the reliability test was needed to measure whether the test given was consistent and stable. Then, I conducted re-test reliability for the written test and inter-rater reliability for the spoken test to measure the reliability degree of each test. Then, the reliability coefficient (known as the alpha value) gained by calculating it using SPSS 22.0, it was gained 0.893 for the written test and 0.809 for the spoken test which meant those were higher than the minimum value of reliability degree referring to Cohen et al guidelines (2007) in which it should be at least 0.60 to be considered as reliable.

- The Data Analysis Technique

To analyze the data obtained in this study, it applied *Pearson Product Moment* correlation (Chee, 2013) analysis between the two variables involved. The *Pearson Product Moment* analysis could be only applied if the data

obtained was distributed normal and linear. Furthermore, to assist in analyzing the data, the SPSS 22.0 was used. Then, the correlation coefficient result from the SPSS would be interpreted by referring to the table below:

Table 1. Interpretation of the Correlation Coefficient

Interval of the Correlation Coefficient	Interpretation
0.800-1.000	Very high
0.600-0.799	High
0.400-0.599	High Enough
0.200-0.399	Low
0.000-0.199	Very low

Adopted from Arikunto (2015)

By referring to the table above, then it could be determined whether the correlation degree between those variables was high or low. Furthermore, to decide whether there was or there was no significant correlation, the critical values of *Pearson's* correlation with the degree of freedom (df) = $N - 2 = 26$ was if the $r_{\text{result}} > t_{\text{table}}$, so H_a hypothesis was accepted.

Results and Discussion

It was explained in the previous section that in collecting the data it consisted of two types, namely the written test for collecting the data on the students' mastery on using words, and the spoken test was used to collect the data on the students' speaking ability in asking about someone' personal information. The data were given to the students one by one, the each of test were be scored. From the data obtained, the mean score of each test were measured. The total scores of the students' mastery on using questions (X) were worth as 194, then it was divided by the total samples (28), and the mean score result was 69.6. meanwhile, for calculating the mean score for the students' speaking ability in asking information about someone' personal information, two scores given by two raters were calculated and divided, then the whole score obtained was 1982, and then divided by the total number of the students involved in this study (28), the result was worth as 70.8.

Furthermore, the classification testing of the students' mastery on using question words are divided into five level namely excellent, good, fair, less, and poor. Based on the statistical measurement, there was 1 student who got the lowest score which was in the interval 33-42, there was 1 student who was in the interval 43-52, there were 6 students who were in the interval 53-62, there were 4 students who were in the interval 63-72, there were 4 students in the interval 73-82, and there were 12 students in the interval 83-92 as the highest score that was obtained from the data collection in this study. From the 28 students joining this study as the sample, there were 22 students who succeeded the multiple-choice test on the students' mastery in using question words, and there were 6 students who failed the test.

Based on the results, some students were still found it difficult to differentiate the use of wh-questions, especially to the question words that have different meaning from Indonesian and English, such as choosing *What is your address?* or *where is your address?* Furthermore, the students were difficult in using proper auxiliary verb such as *is, are, do, or does* to complete a nominal or verbal question sentence. It is caused in Indonesian, auxiliary verb did not appear on its structure, so it made the students get confused about it.

In the 21st century, the students are expected to have a good communication skill to communicate each other, especially to communicate in English. Based on the spoken test given to the students, it found that some students had acquired a good English-speaking ability, but some of them had not owned it yet. It proved that senior high school students speaking ability span in various ways. Their habitual language learning affected their language skill as well. The one who often practiced and spoke in English would be easier to express his/her idea and feeling, including in term of asking information by using English question words. However, based on the scores given by two raters who assessed the students' speaking ability in asking information about someone's personal information, there were 6 intervals of the students' speaking ability in asking information about someone' personal information.

It was found that there 1 student who was in the interval 61-63, there were 4 students who were in the interval 64-66, there were 3 students who were in the interval 67-69, there were 12 students who were in the interval 70-72, there were 4 students who were in the interval 73-75, and there were 4 students who were in the interval 76-78. It could be considered that there were 24 students who categorized in fair level and 4 students who were categorized in the good level of speaking in asking information about someone' personal information. Furthermore, the students speaking ability had gained different score for each aspect of speaking assessment. Some of students gained high score in pronunciation aspect, or some of them did better in term of the fluency and vocabulary. It all was caused by their habitual in learning English, some students said that they liked listening to English song which helped them to improve their vocabulary mastery and pronunciation.

Based on the data analysis conducted, the result of data analysis showed that the correlation coefficient between variable X and variable Y was 0.608. Furthermore, the value of r_{table} acquired could be used to determine whether there was any significant connection between two variables. Additionally, it could be noticed that the $r_{observed}$ was 0.608 with a degree of significance of 1%, the score of the r_{table} obtained was 0.479; as a result, $r_{observed} > r_{table}$ (0.608 > 0.479).

In contrast, with a degree of significance of 5%, the score of the r_{table} obtained was 0.374; as a result, $r_{observed} > r_{table}$ (0.608 > 0.374); the findings demonstrated that there was a significant correlation between the students' mastery of question words and their speaking ability in asking information about someone's personal information and the level of correlation was strong based on Riduan's classification (2010) of the interpretation of correlation coefficient which it was stated that if the correlation coefficient interval was 0.60-0.799, that meant that the correlation level between both variables were strong.

Conclusion

To conclude the research conducted on examining the correlation between the students' question words mastery and their speaking ability in asking information about someone', especially asking about someone's personal information at the eleventh-grade students at one of state senior high schools in Indonesia. The mean score of the students' question words mastery was 69.6 and the mean score of the students' speaking ability in asking information was 70.8, in which it could be said that both mean scores of the two variables were not significant different.

The result of coefficient correlation was 0.608 with a degree of significance of 1%, and 5% meanwhile for the r_{table} obtained with the degree significance of 1% and 5% were 0.479 and 0.374. It could be concluded that $r_{observed} > r_{table}$ at both degree of significance of 1% and 5% and that meant that there was a significant correlation between the students' question words mastery and their speaking ability in asking information. Additionally, the level of correlation obtained was strong, since the coefficient correlation obtained was in the range of 0.60-799 which was classified into strong correlation.

Based on the research result, it could be concluded that the alternative hypothesis (H_a) was accepted, and the null hypothesis (H_o) was rejected. Thus, enhancing the students' question words mastery could affect the students' speaking ability. Therefore, it is suggested that English teachers could explain idea of the use of question words to enhance students' understanding about its structure as well as to avoid misunderstanding different context between Indonesian and English.

Recommendations

The present research consisted of 28 participants; therefore, the future research will need to be conducted with larger participants to get more comprehensive result. In addition, digging students' perceptions on formulating the WH-questions sentence would enrich the result of the research.

Acknowledgements

The researcher would like to thank to the Indonesia Endowment Fund for Education/ Lembaga Pengelola Dana Pendidikan Indonesia (LPDP) for the support in this research funding process.

Abstract: The main projection of vocational high school graduates is to work. To be able to make graduates ready to work, schools must know what graduates need to enter the world of work so that they can produce graduates who meet customer expectations, which in this case are industry and business players. The application of total quality management as a philosophy to satisfy customers has finally become the choice of most vocational high schools. The aim of this study is to describe and model the key elements for the successful implementation of total quality management (TQM) in vocational high schools. The research approach used is descriptive qualitative with the literature study method. The results of the study show that several elements that are key in the implementation of total quality management (TQM) in vocational high schools include leadership, top management commitment, customer focus, customer motivation and commitment, continuous improvement, quality culture, communication, training and education, quality assurance, involvement and empowerment of academic staff, and teamwork. These key elements in the model are grouped into two major groups namely leadership and customer focus where top management commitment is included in the leadership group and motivation and commitment of employees are included in the customer focus group, while the rest are included in the combined leadership and customer focus group. The application of these key elements is ultimately expected to achieve customer satisfaction.

Keywords: Total Quality Management, Leadership, Customer Focus, Vocational High School

Introduction

Unemployment and employment have always been a major problem in most countries around the world (Soleh, 2019). The ever-increasing number of unemployed can affect the economic growth of a country (Franita & Fuady, 2019). An increase in the quantity of unemployment will lead to a deterioration in economic conditions,

which in turn can lead to the birth of other problems in people's lives (Harjanto, 2014). Unemployment is caused by a number of factors, while the most common is the imbalance between the availability of the job market or employment with the number of existing workers and the discrepancy of the competencies that the workforce has with the needs of the market or the world of work (Franita & Fuady, 2019; Suhandi et al., 2021). The consequences of these factors that cause the lack of absorption of Labor (Soleh, 2019).

Based on data, unemployment in the world is still high at 6.17% in 2021. Although this figure decreased compared to the time of the covid-19 pandemic, which at that time the unemployment rate, which was exacerbated by the number of layoffs, reached 6.57% in 2020, however, this figure is still quite high compared to the period before the pandemic, which was 5.35% in 2019 (International Labour Organization, 2022). In Indonesia in particular, based on data released by Badan Pusat Statistik (2022) Indonesia's Open unemployment rate (TPK) in February 2022 stood at 5.83%, a decrease compared to the previous year of 6.26% when the covid-19 pandemic was still at its peak. Although the figure is down, it is still quite high compared to the period before the pandemic which was far adrift at 4.94%. This shows that Indonesia even the world still has homework to solve these problems.

Efforts to resolve the unemployment rate of the education sector contained in the Sustainable Development Goals (SDGs) began in 2015. Target number 4.4 in quality education points strive to improve technical and vocational skills in youth and adults as a provision for work and entrepreneurship (Bappenas, 2015). As for one type of education that is the main target of meeting these targets is vocational education. This is in accordance with the opinion of Clarke and Winch (2007) yang said that vocational education is education with the aim of training young people to enter the workforce so that learning is done more towards mastering techniques and practices. In Indonesia, vocational education is available in the form of Vocational High School. In line with the opinion of Clarke and Winch on the official Vocational High School website it is written that the target of the education carried out is to prepare students to enter the world of work (Ari, 2012). However, Law No. 20 of 2003 article 15 also states the same thing that vocational education is secondary education whose purpose is to develop the ability of learners, especially to work. However, the fact states that based on the data on the number of TPK that has been mentioned previously, from a total of 5.83% the highest percentage is precisely from vocational school graduates which is 10.38%. While in other types of education the number is still less, namely 8.35% for high school graduates, 6.17% for graduates of Diploma IV, undergraduate, graduate, postgraduate and 6.09% for Diploma I/II/III graduates. This shows that the achievement of the objectives of the vocational school is not optimal.

Ensuring that students get what they need when they graduate from vocational school is one solution to improve the quality and minimize the number of unemployed vocational school graduates. This is because students are the main customers of a vocational school. Ensuring students get what they need right during the study, is one effort to ensure customer satisfaction or satisfy the customer, which in this case is the student who is the main customer of a school. This is consistent with the theory total quality management (TQM). In TQM mentioned that the services provided by an institution must be in accordance with the needs, expectations and desires of

customers (Sallis, 2011). We are a company engaged in the procurement of goods to facilitate field work in the procurement of goods to facilitate field work continuous improvement (Azhar, 2018). According to Davis et al., (2014) total quality is the quality of services or products produced, humans who do the service process, the process itself and its environment.

In Indonesia, TQM has been applied to most vocational schools. However, in reality there are still many schools that have not been able to implement so well as the lack of ability to attract partner industries that are stakeholders and also customers to be able to work together with schools (Arifin, 2012; Fatah et al., 2022), so that the expected results of the application of TQM has not seen the maximum. It is necessary to understand the important elements that must be ensured in the application of TQM in vocational schools. Adopting TQM into the field of education is certainly not an easy thing because in practice TQM is more widely applied in companies, so to determine the key elements of the successful application of TQM in vocational schools, a study is needed by matching which elements are included in the realm of education, especially vocational high schools. For that reason, this paper aims to examine more deeply related to the important elements that must be known and applied by vocational schools that apply TQM in school management so that the application of TQM and the expected results can be maximized. After concluding the important elements, the researcher then made a model related to the elements of TQM and its relation to customer satisfaction. To examine the important elements related to the implementation of TQM in vocational high schools, the researchers used literature review where the literature taken from journals linked to Scopus and other reliable sources in the span of 10 years and from the previous year as supporting data, so that the results of this study can be a good reference for vocational high schools that implement TQM in Indonesia in particular and in the world in general as well as a reference for other researchers who pursue similar research fields.

Method

To answer the research question about key elements of total quality management implementation in vocational high schools, a literature study is applied in this research. The method used is descriptive qualitative. The literatures studied are from scientific articles, books, and other type of research documents taken from national or international sources which related to the topic of the research. The primary sources chosen are them which in the range of ten years, while from other years are only for supporters. The process of the data analysis started when searching the sources. After getting enough sources that meet the criteria, all sources are entered to an analysis software to be analyzed. After getting some points, data was displayed. The conclusion and research model were made after the data display was done.

Results

Reed, Lemark, and Mero in Azhar (2018) agree that the key elements of TQM implementation include customer satisfaction, cost reduction, top management leadership and commitment, training and education, teamwork and

organizational culture. Almost agree with that opinion Zakuan et al., (2012) in the results of his literature review on the key elements in the implementation of TQM in higher education mentioned that there are seven elements, namely management and leadership commitment, continuous improvement, total customer satisfaction, employee engagement, training, communication and teamwork. Rahmawati & Supriyanto (2020) finding that leadership and teamwork are the main keys to implementing TQM in educational institutions. While Azhar, (2018) finding that to apply TQM in education there are at least two changes that must be made, namely cultural change and substantive change. Cultural change is a change in the way of thinking and work that must focus on quality. While the substantive change is a business arrangement and objectives aimed at meeting customer satisfaction with. Then, Megnounif et al., (2013); Taskov & Mitreva; El-Hilali et al.; Glushak et al.; Larina, (2015); Azhar (2018) agreed that quality assurance is also an important element in the application of TQM in education.

Several field studies focusing on key elements in the application of TQM in educational institutions have been conducted by previous researchers. Megnounif et al., (2013), conducting survey research found that the key elements of quality management at the Faculty of technology at the University in Tlemcen in the field of administration include training and stakeholder engagement. Selanjutnya Moldovan (2012) mention of Quality Management System (QMS) and quality assurance is key to the implementation of TQM in higher education in Romania. Taskov & Mitreva (2015) conducting survey research on higher education in Macedonia found that stakeholder engagement, leadership and top management commitment occupy the top positions as key elements. And the last one is dari Wibowo et al., (2019) who conducted a study on SD Tunas Bangsa in Kubu Raya regency found that the key elements of TQM implementation in the school include the quality of leadership, the quality of teamwork and efforts to build a culture of quality.

Discussion

Total Quality Management in education

Quality according to Firdaus dkk (2021) it is in accordance with established standards or requirements aimed at meeting customer expectations. Meanwhile, some figures cited by Hoyer & Hoyer (2001) have their own views related to the definition of quality, among others: (1) Crosby revealed that quality is in accordance with demand. (2) Deming revealed that quality is defined as customer satisfaction. (3) Feigenbaum states that quality is determined by the customer, not by the technician, not the marketing department or manager. (4) Ishikawa states that quality is the satisfaction of customers who are always changing. (5) Juran argues that quality consists of two levels. The first Level is that quality means meeting expectations, while the second level is that quality means satisfying customers. From the views of some figures regarding the definition of quality, it is concluded that quality is related to standards and customer satisfaction.

From the definition of quality or quality above, it can be said that total quality management it deals with how an institution achieves customer satisfaction by setting standards that are tailored to its requirements. Davis et al

(2014) mention that total quality management is a philosophy about focusing on customers by involving people, measurements and processes as an effort to achieve success. According to Besterfield dkk (2012) total quality management it is an art to achieve success. In addition, he also mentioned that total quality management it can be interpreted both as a philosophy and as a series of guidelines based on the principles of continuous improvement. Furthermore, it is also said that total quality management includes the application of quality techniques in all segments of the organization (Pries & Quigley, 2013). From these opinions, concluded that total quality management it is a series of guidelines that contain established standards and adhere to the principle of continuous improvement to achieve customer satisfaction.

Next, to define total quality management in education, it is necessary to elaborate on the quality of education itself. Quality in education according to Firdaus dkk (2021) is the level of achievement of assurance (quality assurance) made in a certain period in the education unit. Meanwhile, according to Sopiadin quoted by Zazin (2017) the quality of education is the quality of the services of educational institutions provided to students or teaching staff who aim to make a quality educational process so as to produce graduates with the competencies and abilities and knowledge needed when he plunged into the community environment. Then it was concluded that total quality management in education is a strategy to achieve customer satisfaction education by improving the quality of the educational process so as to print graduates who match expectations.

The customer education in question according to (Sallis, 2011), are as follows: (1) primary customers, namely customers who get services directly. In this case it is students. (2) secondary customers, that is, those who have a direct interest in the education of both individuals and institutions, including parents, governors, job seekers from vocational school students. (3) tertiary customers, namely those who have an indirect interest in education but have an important role in the world of education, including future employers, government and society as a whole. (4) internal customers, namely employees of the institution and who have an important role in the success of the organization.

The relationship between education customers is as shown in Figure 1.

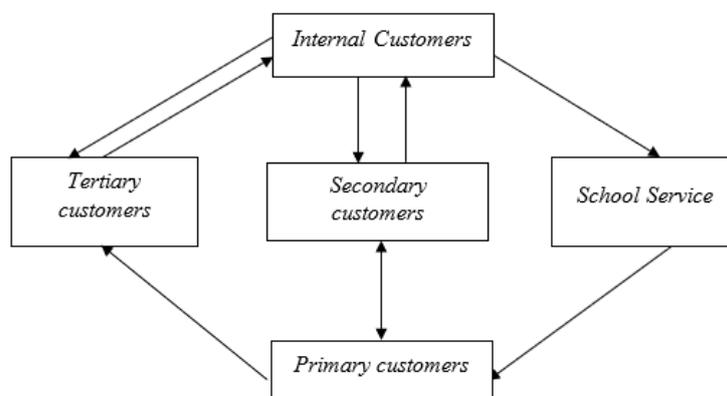

Figure 1. Customer Relations Education

(Source: Soetopo 2009)

Implementation of TQM in schools is said to be successful if it can achieve customer satisfaction education. The Mone team (Zazin, 2017) mention that school success can be measured from: (1) student satisfaction with school services, which include lessons received, treatment of teachers and leaders, school facilities or the overall situation of the school. (2) parents ' satisfaction with the services provided by the school to their children and the services received by parents in the form of student progress reports and school programs received by students. (3) satisfaction of the user or recipient of graduates which includes universities, industry and the community for receiving qualified graduates and according to expectations. (4) satisfaction of teachers and employees with the services received from the school in the form of division of labor, relationships and communication between teachers or leaders and other staff, salaries or honors received and other services.

To be able to achieve this success, schools that apply TQM according Zazin (2017) the following are some of the most important things to keep in mind: (1) continuous improvement (2) the standard of care (quality assurance) (3) cultural change (4) organization change (upside-down organization) (5) maintain a good relationship with customer (keeping close to the customer).

In addition, according to Salleh dkk (2018) successful implementation of TQM can be achieved through the application of the principles total quality management itself. According to Charantimath (2017) there are eight principles of TQM as follows: (1) focus on customers, meaning that an organization in meeting its customer satisfaction must listen to what they want because the success of the organization depends on customer assessment. As for some steps in meeting customer satisfaction, among others: (a) identify customer needs; (b) design products in accordance with customer needs; (c) produce products in accordance with customer demand; (d) improve service to complaints; (e) measure customer satisfaction; (f) improve quality in order to please customers. (2) leadership, meaning that an organization definitely needs direction from superiors to explain the value of quality, customer-oriented approach. Leaders in this case needed to be role model for members of the organization. (3) the involvement of each person, meaning that in total quality management everyone has the right to be involved, so that everyone can contribute work donations according to their individual abilities. (4) process approach, meaning that good results are produced when the process through which good anyway. The process approach is an important principle in total quality management. (5) management systems approach, i.e., identifying, understanding, and managing systems that contribute to organizational efficiency. (6) continuous improvement, meaning that all members of the organization must constantly improve performance to meet the needs of interested parties is a permanent goal of the organization. (7) decision making based on facts, meaning to be able to make good decisions required analysis of data and information so that the resulting decision to be effective. (8) the relationship between supplier, namely that the ability of the organization and supplier to produce a value can be done through a relationship of mutualism.

While according to Zakuan dkk (2012) this is a list of some of the most important factors in implementing TQM i.e., management commitment and leadership, continuous improvement, total customer satisfaction employee engagement involvement, training, communication and teamwork.

Key Elements of Total Quality Management Implementation in Vocational High School

From the findings related to several key elements in the application of TQM as well as important discussions related to the application of TQM in the world of Education Above, It is concluded that the following key elements are the most relevant to the application of TQM in vocational high schools some of the key elements include leadership, top management commitment, customer focus, customer motivation and commitment, continuous improvement, quality culture, communication, training and education, quality assurance, employee empowerment, involvement of academic staff, and teamwork.

Leadership

According to Taskov & Mitreva (2015) leadership is the essence that is very influential on the successful implementation of TQM. It is with the opinion Djuwariyah (2008) which states that leadership skills in moving and exploring the resources owned by the school is a determinant of success in the management and development of curriculum in vocational schools to produce quality graduates. The role of leaders in the implementation of TQM is very important, namely as an advisor and a driving force in the improvement effort (Rahmawati & Supriyanto, 2020).

As for according to (Sallis, 2011) the functions or roles of leaders in developing a quality culture are as follows: (1) having an integrated vision; (2) having a clear commitment to improving quality; (3) communicating quality; (4) ensuring that policies and all activities are centered on customer needs; (5) being a guide for staff development; (6) being a wise problem solver by not blaming someone without knowing the truth because the majority of problems occur not because of staff errors but due to institutional policies; (7) Creating Innovation; (8) creating organizational structures and clear distribution of responsibilities and delegating responsibilities to the right people; (9) committed to overcoming organizational or cultural obstacles (10) building an effective team; (11) controlling and evaluating performance results with appropriate mechanisms.

The leadership initiative in TQM according to Taskov & Mitreva (2015) includes commitment to the philosophy of TQM by actively participating in both academic and opinion delivery, applying a proactive work style, through cooperation, training and providing support for good work and achievement. In addition, in the process of quality improvement, according to Austin and Peters cited by Sallis (2011), the leader is someone who has a vision and role as a facilitator and is responsible for motivating his team. They call such leadership management by walking about (MBWA). This style of leadership allows the leader to stay close to the staff, leading to the creation of innovative and creative ideas. The characteristics of leaders who apply the MBWA style are: (1) listening to staff, this is intended to show that the leader cares about his employees. (2) teach and transmit values. (3) facilitate and provide assistance and advice directly on the spot. Good leadership from the principals of Vocational High Schools, Vice Principals, teachers and all school residents can make the implementation of TQM in vocational high schools run well and purposefully.

Top Management Commitment

One of the keys to the success of TQM is leadership as previously discussed. A leader must have a commitment, especially to keep members focused on the quality to be achieved by still communicating organizational goals to all members (Azhar, 2018). This commitment according to Glushak et al., (2015) is a form of quality in TQM. The principles of TQM in order to run in an educational organization take time and also commitment, especially commitment from the leader of the organization (Moldovan, 2012).

According to Taskov & Mitreva (2015) without a commitment from top management to create targets in making quality institutions TQM implementation will only spend time and money and can hinder the achievement of success. Wibowo et al (2019) finding that the successful implementation of TQM in one of schools in Indonesia is a strong commitment from senior leaders and teachers. Zakuan et al (2012) finding that top management commitment is one of the critical success factors of TQM implementation in educational institutions. Thus, the commitment of top management influences the successful implementation of TQM in vocational high schools.

Customer Focus

In order to compete in a fast-changing global world an educational institution must reorganize its academic programs in order to achieve stakeholder expectations (El-Hilali et al., 2015). This is because the desire of stakeholders or customers is the main objective of the implementation of TQM (Azhar, 2018; Glushak et al., 2015; Lapiņa et al., 2015). Therefore, to be able to achieve success in the implementation of TQM an organization must listen to the aspirations of the customer (Kędzierska-Bujak, 2021). Quality assurance carried out in TQM must focus on customers so as to achieve customer satisfaction (Megnounif et al., 2013). The focus on the customer is the starting point for improving the quality of service of educational organizations (Moldovan, 2012). In educational institutions all efforts such as curriculum management, revamping school culture and all the qualities to be achieved estuary school is customer satisfaction so that the school must depart from the needs of customers in conducting school affairs (Wibowo et al., 2019). In (Zakuan et al., 2012) it is stated that customer focus is the main goal of TQM and is the key to the success of TQM implementation. Thus, customer focus can be considered as one of the key elements of the implementation of TQM in vocational high schools.

Customer Motivation and Commitment

Commitment is one of the main concepts in the implementation of TQM (Azhar, 2018; Glushak et al., 2015; Moldovan, 2012). Therefore, the academic staff in the school should be rewarded for their work achievements because the poor assessment and treatment of these internal customers will cause them to lose their motivation and commitment (Megnounif et al., 2013). Commitment and motivation are academic staff greatly affect the success of the implementation of TQM in schools (Taskov & Mitreva, 2015). Wibowo et al (2019) finding that the lack of motivation from teachers can be an obstacle to the implementation of TQM, especially in continuous

improvement. This is reinforced by Zakuan et al (2012) who found that customer motivation and commitment to be a factor in the successful implementation of TQM in educational institutions. Starting from that, it is concluded that customer motivation and commitment can also be the key to successful implementation of TQM in vocational high schools.

Continuous Improvement

The main concept of TQM is continuous improvement (Azhar, 2018; Glushak et al., 2015). This is because quality improvement is a long process that requires gradual and continuous improvement (Azhar, 2018). Effective school management can be achieved through continuous improvement (Kędzierska-Bujak, 2021). Understanding the needs of students is important, but no less important must be followed by continuous improvement thereafter (Larina, 2015). To be able to perform continuous improvement needed a guideline, rules and quality standards to be achieved (Megnounif et al., 2013). Continuous improvement is one way to continue to improve the quality of Education (Taskov & Mitreva, 2015). One of the obstacles in running effective management is the lack of continuous learning and improvement (Taskov & Mitreva, 2015). In a school continuous improvement is important to improve the professionalism of teachers and other academic staff (Wibowo et al., 2019). Continuous improvement according to Zakuan et al (2012) like a wheel on a vehicle that can make the vehicle move forward. Thus, continuous improvement can be considered as one of the key elements of total quality management implementation in Vocational High School.

Quality Culture

To be able to spread the concept of TQM required a certain quality culture (Taskov & Mitreva, 2015). That is why quality culture is one of the causes of successful implementation of TQM (Azhar, 2018). To be able to improve the quality of organizational culture, it is necessary to have a strategic development chosen by an educational institution that must also be guided by the rules of organizational quality (Lapiņa et al., 2015). In addition, quality culture can also be achieved through training to all academic staff on a regular basis (Moldovan, 2012). Taskov & Mitreva (2015) mention that to be able to change organizational culture can be done by improving teamwork. Research results (Wibowo et al., 2019) finding that quality culture is one of the keys to the implementation of TQM in one of the schools by continuing to make quality improvements. From these discussions, it was concluded that quality culture is also the key to successful implementation of TQM in vocational high schools.

Communication

In TQM cooperation is carried out between everyone in the organization. In a school, all school residents ranging from principals, vice principals, teachers, administrative staff, gardeners to security guards work together to create a comfortable learning environment and atmosphere for customers, namely students. Such great cooperation needs to be bridged by effective communication so that every work done by each party is in

accordance with what has been shared previously and the school's goal of creating a comfortable atmosphere for students can be achieved (Azhar, 2018). In this case, the role of the leader in communicating the tasks of its members becomes very important so that the communication skills of the leader become one of the most important factors in the implementation of TQM in vocational high schools.

Research results by Lapiņa et al (2015) finding that to be able to change an organization towards a better direction requires a good internal communication process. Intensive communication with members in one department is also one that determines the successful implementation of TQM in educational organizations (Larina, 2015). Communication between different departments is also something that cannot be ruled out because good cooperation between different departments can lead the organization to success (Megnounif et al., 2013).poor communication between all parties in an organization will lead the organization to poor results as well (Taskov & Mitreva, 2015). Thus, communication is one way to increase the success rate of TQM implementation (Zakuan et al., 2012). Thus, it can be concluded that communication is one of the key elements of successful implementation of TQM in Vocational High School.

Training and Education

As an organization that aims to produce graduates who are able to work vocational high schools must adapt to the rapid development of technology so that schools can know the needs for their learners. To be able to know the needs of these students, schools need to ensure that teachers and other academic stars have an understanding that also adapts to the rapid development of the Times, which can be achieved through training and education (Azhar, 2018). It is also similar to that expressed by Glushak et al (2015), that to achieve quality in education it is necessary to have training and also continuous professional development for all school staff.

Megnounif et al (2013) mention that quality training is one of the things contained in quality planning. Staff training is aimed at achieving customer satisfaction because the staff who perform services to the main customers where in this case there are Vocational High School students (Moldovan, 2012). The training is also aimed at self-evaluation as well as external evaluation in order to overcome the lack of professional experience (Taskov & Mitreva, 2015). Less good a training can be a problem for management work (Taskov & Mitreva, 2015). Training can be aimed at teachers who have been teaching for a long time or who have recently received teaching assignments (new teachers) to improve their performance (Wibowo et al., 2019). The involvement of all school residents in school work causes them to stay updated on the capabilities needed for their involvement, and this can be achieved through training (Zakuan et al., 2012). Thus, training and education are important things to consider in the implementation of TQM in vocational high schools.

Quality Assurance

Quality assurance is a form of fulfillment of responsibilities and promises to stakeholders by steps to establish and meet the quality standards of managers consistently and sustainably (Sani, 2015). In the quality approach,

quality assurance against stakeholder demands is none other than to improve customer satisfaction (Megnounif et al., 2013). In addition, the limited resources in the implementation of education causes quality control to be carried out in the form of quality assurance. It is intended that educational services can achieve or exceed the expectations of stakeholders and the eight points of the national standard of Education (Zahrok, 2020). As a form of fulfilling the demands of stakeholders, quality assurance must be met in the implementation of quality education so that it can produce graduates who are skilled and have good skills (Zahrok, 2020). Competency standards of vocational high school graduates based on Permendikbud (Indonesian education and culture Ministerial Regulation) number 7 of 2022 is contained in the content standard developed from the analysis of material needs to achieve the expected graduate competencies. The content standard consists of two parts, namely general content and vocational content. The development of general content is equivalent to high school while the development of vocational content is specific in accordance with the program or competence of each skill.

Quality assurance of education should be set out in the form of a strategic document on the development of the institution. As for the content of the document, it should contain the relevance of quality management as an activity aimed at meeting the demands of stakeholders and ensuring the quality standards of educational activities based on process control focused on results and efficiency (Glushak et al., 2015). Presentation of a description of the quality assurance system to external evaluators, members of the organization, Students and other stakeholders can be in the form of a quality map (Larina, 2015). Deming in Larina (2015) states that quality assurance starts from the planning stage to set long-term goals. Examples of good planning include: (1) the formation of small groups that allow an individual approach; (2) classes scheduled according to the needs of students; (3) the selection of qualified academic personnel; (4) the required classrooms and teaching materials adapted to the characteristics of education and international requirements. With the quality assurance expected vocational high school has a clear benchmark related to graduates like what the school wants to produce.

Involvement and Empowerment of Academic Staff

Quality according to (Azhar, 2018) in the hands of stakeholders. Academic staff are stakeholders and also internal customers of vocational high schools, so their involvement and empowerment can be the key to successful implementation of TQM in vocational high schools. The aspirations of these academic staff are also important because they are the ones who are directly related to their respective tasks (Kędzierska-Bujak, 2021; Megnounif et al., 2013; Rahmawati & Supriyanto, 2020; Taskov & Mitreva, 2015). According to Stabback (2016) In the development of curriculum to create qualified vocational graduates, their involvement is very important.

Because the views of the academic staff can enable the creation of an inclusive and practical curriculum that can meet the needs of diverse learners. Stakeholder engagement can increase their satisfaction as customers can also increase their commitment to what they have voiced (Salleh et al., 2018). Conversely, lack of stakeholder involvement can be an obstacle to the implementation of TQM in vocational schools (Wibowo et al., 2019).

Thus, it is concluded that the involvement and empowerment of academic staff can be decisive for the successful implementation of TQM in vocational high schools.

Teamwork

The team is a group of people who have the same goal (Rahmawati & Supriyanto, 2020). In educational institutions, all residents in the educational institution are part of the team so that teamwork will be created if they are involved in activities at the institution (Rahmawati & Supriyanto, 2020). Solid teamwork is one of the most efficient ways to accomplish organizational tasks and missions (Belbin, 2010). This is because the thoughts of two or more people are considered better than one person, the results of the work of a team are better than those of a person or individual, communication and socialization between members can be better established through teamwork (Rahmawati & Supriyanto, 2020). In addition, according to Rukly in (Zakuan et al., 2012), teamwork can unite all staff of the organization in achieving quality improvement or quality repair.

Furthermore, to achieve the expected quality, it takes collaboration and contributions from all members of the organization and this can be achieved through teamwork (Wibowo et al., 2019). Therefore, teamwork is one of the key elements of successful implementation of TQM (Azhar, 2018; Wibowo et al., 2019; Zakuan et al., 2012). In addition, teamwork is considered an important component in the implementation of TQM because it can increase trust and communication between members and develop independence (Azhar, 2018; Wibowo et al., 2019). Teamwork can also be an initiator of organizational change (Taskov & Mitreva, 2015), so it should be expanded and completely spread throughout the institution (Azhar, 2018). From some of the opinions above, it can be concluded that teamwork is inseparable from the implementation of TQM in any sector, including its practice in curriculum preparation.

The way to build good cooperation is to develop active team behavior (Wibowo et al., 2019). The characteristics of the active team in question are as follows: (1) initiating discussions; (2) collecting information and opinions; (3) providing input related to procedures to achieve goals; (4) clarifying and elaborating ideas; (5) concluding and testing agreements; (6) acting as gatekeeper (information selectors); (7) organize conversations; (8) compromise and resolve disputes creatively (9) try to calm tensions and overcome difficulties in the Group; (10) make the group agree on standards, refer to data and documentation; (11) praise and correct others fairly; (12) accept praise and complaints.

In addition, to form a good teamwork in educational institutions, things that can be done include improving the quality of human resources through activities workshop, seminars to training (Rahmawati & Supriyanto, 2020). In line with this Taskov & Mitreva (2015) believes that teamwork in the implementation of TQM in schools, rests on Team training held over a long period of time and includes all members of the organization in accordance with their fields and jobs. Druskat and The Wolf Inside Taskov & Mitreva (2015) it also added that the elements of cooperation are the ability to work creatively that leads to professional contribution, respect for the opinions and attitudes of other members, willingness to be involved in management, passion for mutual

success and this will ultimately result in the development of mutual trust and respect, commitment, expansiveness, patience and loyalty to each other and even loyalty to the institution. Awareness of the importance of cooperation on each team member will be able to contribute positively to the successful implementation of TQM in vocational high school.

Model key elements of total quality implementation in vocational high school can be seen in Figure 2.

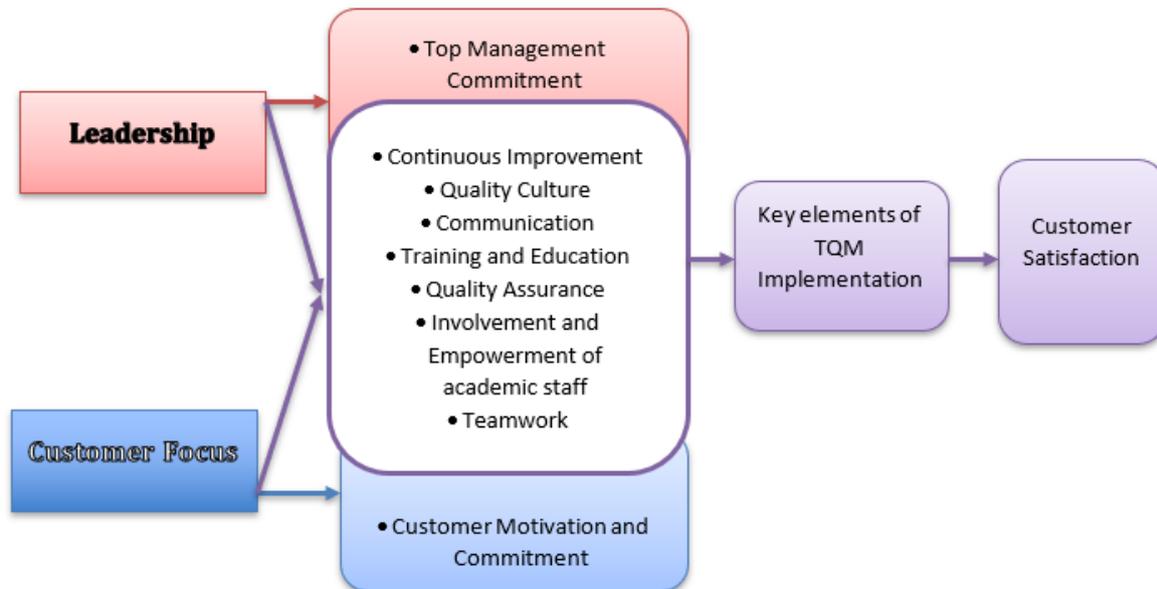

Figure 2. Key Elements of Total Quality Implementation in Vocational High schools

Conclusion

The results of the study show that several elements that are key in the implementation of total quality management (TQM) in vocational high schools include leadership, top management commitment, customer focus, customer motivation and commitment, continuous improvement, quality culture, communication, training and education, quality assurance, empowerment, involvement and empowerment of academic staff, and teamwork. These key elements in the model are grouped into two major groups namely leadership and customer focus where top management commitment is included in the leadership group and motivation and commitment of employees are included in the customer focus group, while the rest are included in the combined leadership and customer focus group. The application of these key elements is ultimately expected to achieve customer satisfaction. Future research on education management in vocational high school (case study).

Abstract: The study was conducted to evaluate the implementation of the Concurrent Classroom (CC) modality, a type of hybrid learning modality wherein an in-person teacher teaches in-person and online students simultaneously. The study utilized a quantitative research design to assess the implementation of the CC based on its viability, functionality, and effectiveness. Grades 4 to 12 students, teachers, and subject coordinators participated in the study. Quantitative data were obtained from the self-rating survey, classroom observation rating and summative assessment results. Remarks about the implementation of the CC were also solicited. Obtained results show that the CC modality has high viability. It is practical, useful, and suitable for instructional delivery. CC also shows high functionality. It has enabled teachers and students to perform tasks that are expected from them. Lastly, it is an effective modality because it has produced favorable positive learning outcomes. Recommendations are focused on providing a targeted professional development to empower teachers in effectively handling CC classes, focusing on equitable cognitive engagement, active participation, and balanced support and attention for both in-person and online student groups. Also, provision and functionality of required devices, technical equipment, and connectivity in the CC learning environment must be ensured and emphasized.

Introduction

School systems across the country are slowly reopening for face-to-face classes using different hybrid learning

modalities to deliver instructions. The hybrid learning modalities aim to prevent possible resurgence of the COVID pandemic and to address the varied needs of students who choose to attend online or in-person on-campus classes. There are varied types of hybrid learning modalities (e.g., rotation, blendflex, hyflex, multi-track, and concurrent classroom) which enable students to attend classes either online or in person. In anticipation of the use of hybrid learning modalities, La Salle Green Hills (LSGH) has considered and examined the implementation of the Concurrent Classroom or CC as its alternative modality in the conduct of classes.

Following the pilot implementation of the concurrent classroom model in select classes during the previous academic year (2021-2022), LSGH has decided to continue utilizing this hybrid approach as the preferred method of teaching and learning for the academic year 2022-2023. As per Tucker's definition (2021), a concurrent classroom involves the teacher teaching one group of students in-person while simultaneously teaching another group of students online. This model is now implemented for Grades 4 to 12 where both in-person and online groups attend the same classes and learn together simultaneously.

The implementation of the CC learning modality began with teacher training on the principles of instructional design for the CC and the different CC modes (simultaneous, split, individualized and combination). During the training, teachers produced instructional materials and practiced handling the technical equipment in selected CC venues and related software applications. The teacher training provided the various academic and support units concerned an opportunity to understand, experience and reflect on the preparations needed for the efficient and effective conduct of the Concurrent Classroom.

In the article authored by the University of Texas, it is stated that the primary challenge in the concurrent classroom is to ensure equitable learning opportunities and active participation for online students. This necessitates additional planning; nevertheless, concurrent classrooms offer specific advantages. The most significant benefit is that, if implemented thoughtfully and precisely, they empower students to have significant control over their own learning journey.

The Quality Assurance and Research Office (QARO) in collaboration with the academic supervisors of LSGH conceptualized this study to document and evaluate the different activities of the Concurrent Classroom. The primary focus of this study is to assess the implementation of the CC learning modality in terms of its *Viability*; the capacity of a learning modality to deliver instruction which helps to determine the usefulness of the CC modality for teaching and learning,

Functionality; the ability of teachers and students and the learning environment to do or perform the instructional, managerial and technical procedures and tasks that are expected of them, and *Effectiveness*; performance of students in summative assessments of competencies related to the learning goals of Acquisition, Make Meaning and Transfer. Data obtained from varying assessments and evaluation sources will be analyzed to answer the study's specific objectives and research questions.

Specific Objectives

The objectives of the study were as follows:

1. Evaluate the implementation of the concurrent classroom learning modality in terms of its viability, functionality, and effectiveness.
2. Determine the effect of the general hybrid online learning modality and the specific concurrent classroom process on student learning outcomes.
3. Compare the students' performance based on the assessment of the learning competencies according to the concurrent classroom learning groups: Online and In-person.
4. Identify aspects of the concurrent classroom implementation that help, hinder, and challenge the students' attainment of expected learning outcomes and teachers' instructional process; and,
5. Recommend actions that will improve the preparations for and implementation of the concurrent classroom.

Literature Review

As a means of delivering instruction during the pandemic, hybrid learning modalities have received much attention. In general, hybrid learning differs from blended learning which was already practiced by different schools before the pandemic. Siegelman (2021) observes that “‘blended courses’ and ‘hybrid courses’ are the terms most likely to be used interchangeably, but hybrid courses differ in that their online components are intended to replace a portion of face-to-face class time.” In hybrid learning, online class schedules are counted and regarded as part of the total teaching time.

Due to the varied conditions schools face as well as the diverse contexts of their students, various forms of hybrid learning modalities have emerged. For schools that plan to teach classes where online and in-person groups of students simultaneously meet, the CC modality provides the set-up for this type of instruction. Tucker (2021) states that “In a concurrent classroom, the teacher is teaching one group of students in class while simultaneously teaching another group of students online”. Unlike the rotation type where all students are either in online or face-to-face learning classes which are alternately scheduled, students in the CC may choose to be in an online or face-to-face learning group throughout the school year. Teachers also do one preparation for both groups unlike in other types of hybrid learning where the teachers have to do separate preparations for the online and face-to-face groups.

Being a new form of hybrid modality, much concern has been raised about the usefulness of the Concurrent Classroom for teaching and learning and attending to two learning groups at the same time. Although there are some studies which discuss principles of instructional design for hybrid learning (e.g., Beatty, 2019), there is little research done evaluating the Concurrent Classroom as practiced in basic education. Moreover, factors that

contribute to the productive implementation of the Concurrent Classroom have yet to be identified and examined. What is currently available for many basic education schools looking for direction and guidance for designing the Concurrent Classroom are presentations on Concurrent Classroom teaching such as those done by Caitlin Tucker in her blogs (caitlintucker.com) and YouTube videos of Concurrent Classroom practices uploaded by different school districts in the United States (e.g. Concurrent Classroom Instruction Practices at <https://www.youtube.com/watch?v=2ViSd-nm768> by the Fairfax County Public Schools, Fairfax, Virginia).

Because of the relatively scant research work done on the Concurrent Classroom, schools planning to implement the Concurrent Classroom stand to benefit from doing their own study. Schools can define the focus of their research based on particular concerns and questions by school administrators, teachers, students and other stakeholders. For LSGH, varied questions have been asked about how the Concurrent Classroom can respond to specific challenges such as managing students in two different learning settings (online and in-person) at the same time, sustaining student interest and engagement, and producing positive learning outcomes. These questions inquire into the usefulness or viability of the Concurrent Classroom as an instructional modality, the interaction of students and teachers in the Concurrent Classroom and student learning outcomes. In response to these concerns, this study then seeks to examine these perceived challenges regarding the viability, functionality and effectiveness of the Concurrent Classroom.

With regards to viability, among those who first studied the usefulness of a particular medium or technology to communicate or deliver intended information were Daft and Lengel (1986) who articulated the “media richness theory” which attributed the positive effects of a technology to its media properties. The theory has often been criticized for its narrow focus on technology features as the cause for positive communication results. While the theory has been able to underscore the importance of establishing users’ perception of technology’s capacity and its interface design, others have sought to build on these factors and examine other factors that influence people’s perception of a technology’s power.

For example, Webster and Hackley (1997) in their studies of distance learning technologies that involve online learning point out five critical factors that lead to positive perceptions of these technologies: student involvement and participation, cognitive engagement, technology self-efficacy (i.e., the belief that one has the capability to interact with a given technology), perceived usefulness of the technology employed, and the relative advantage or disadvantage of online delivery. Aside from technology features, when teachers see that a technology can facilitate other aspects such as student-teacher interaction and intellectual activity, teachers develop a positive view of the technology and deem the technology as important for teaching and learning.

Webster and Hackley’s factors also suggest the interplay of instructional, technical, and managerial aspects of implementing online or distance learning. The actual use of the technology entails selecting and using appropriate teaching strategies (instructional), following certain routines and protocols (managerial), and mastering the operation of the technology’s devices, equipment, and software applications. These aspects are applicable to the conduct of the Concurrent Classroom, and these may be regarded as part of the modality’s

functionality. Although the managerial aspect also pertains to the way teachers conduct synchronous and asynchronous classes, management in the Concurrent Classroom deals with providing equivalent attention to two groups of students simultaneously interacting with the teacher. The challenge of achieving this is examined in other studies where attention is conceptualized into four different types namely, selective attention, sustained attention, divided or limited attention and alternating attention (World Mental Healthcare Association). These types enable teachers to expand their understanding and ability to respond to students in two different learning groups. The different types of attention also suggest that implementing the Concurrent Classroom may involve varied modes with each type corresponding to a particular mode. For example, selective attention can be done for an individualized mode where teachers take time to provide specific feedback to particular students. Alternating attention can be carried out for a split mode where teachers give comments first to the in-person group and then to the online group or vice-versa.

In terms of effectiveness, various studies have compared the performance of students in various standardized or criterion-referenced assessments given as part of an online or distance learning program (e.g., Means, Toyama, Murphy, Bakya & Jones, 2010; Sahni, Polanin, Zhang, Michaelson, Coverley, Palese, & Young, 2021). Such studies examine the learning gains that students have achieved by comparing pre and post-test scores. Others differentiate learning outcomes in terms of attainment of learning goals as articulated by Wiggins and McTighe (2008). These goals are Acquisition, Make Meaning and Transfer and these go beyond the students’ recall of facts. These emphasize the depth of students’ analysis and reasoning and application of knowledge and skills in real world situations. These goals are already incorporated in the Philippine K12 summative assessments which are composed of quarterly exams, written works and performance tasks. Hence, when summative and formative assessments are designed and conducted in a Concurrent Classroom, the results are studied in terms of the attainment of these learning goals and considered as indicators of student learning outcomes.

Research Framework

The preceding literature review provides guidance in conceptualizing the aspects of viability, functionality, and effectiveness of the implementation of the Concurrent Classroom.

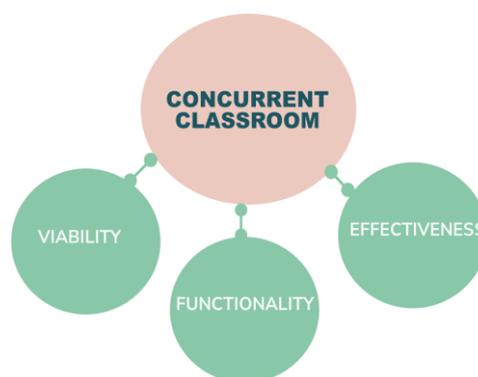

Figure 1. Framework of the Study

In this study, viability is operationalized as the capacity of a learning modality to deliver instruction in terms of five factors namely, students' participation, cognitive engagement, technological efficacy, perceived usefulness of the technology and relative advantage or disadvantage (Webster & Hackley, 1997). Viability answers the question: Is the CC modality useful for teaching and learning?

With regards to functionality, it is defined in this study as the ability of teachers and students and the learning environment to do or perform the instructional, managerial, and technical procedures and tasks that are expected of them. Functionality asks the questions: Are teachers, students, and the learning environment able to carry out the responsibilities or tasks assigned to them in the CC modality? How are teachers able to do the designated managerial, technical, and instructional procedures and tasks in the CC modality?

In terms of effectiveness, it pertains to the performance of students in summative assessments of competencies related to the learning goals of Acquisition, Make Meaning and Transfer. Competencies related to Acquisition involve the students' memorization and recall of facts and procedures. Competencies in line with Make Meaning are related to students' analysis, reasoning, and synthesis and evaluation. Competencies in line with Transfer pertain to the students' application of knowledge and skills in performance tasks based on real world scenarios and situations. Hence, for effectiveness, the questions raised are: How do students perform in assessments related to Acquisition, Make Meaning and Transfer? Does the CC modality affect the students' performance in these assessments?

These concepts of viability, functionality and effectiveness serve as the framework for the articulation of the following specific research questions:

1. How do students and teachers perceive the viability of the CC modality?
2. Is there a significant difference between the self-rating responses of students and teachers with regards to the viability of the full implementation of the CC?
3. How do teachers conduct and implement the teaching-learning process in a CC? How are teachers able to do the designated managerial, technical, and instructional procedures and tasks in the CC modality?
4. How do the students perform in the CC modality based on the results of the assessments of their learning competencies related to Acquisition, Make Meaning and Transfer?
5. What recommendations may be made to ensure the viability, functionality, and effectiveness of the CC modality?

Method

Research Design

A quantitative research design was utilized in the study, employing a structured data collection method that

included self-rating surveys, observation forms, and assessment results. Descriptive and inferential statistics were used to analyze the data gathered. Remarks of the subject coordinators about the accomplishment of procedures in the CC were also solicited.

Participants

Purposive sampling was used to determine the participants of the study. The participants included the following: for the pilot implementation, selected students ($N_1=281$) and teachers ($N_2=21$) who simultaneously experience online and in-person classes on campus during the initial preparation for the reopening of schools. A larger set of participants were engaged during the full implementation, wherein students from grade 4 - 12, ($N_3=1345$) and teachers ($N_4=47$) accomplished the self-rating survey; for functionality, subject coordinators ($N_5=24$) participated in the classroom observations; and for effectiveness, a total of $N_6=1033$ assessment results were gathered to measure students' academic performance based on the learning goals of acquisition, make meaning, and transfer.

Measures of the Study

For viability, a researcher-made Concurrent Classroom Self-Assessment Form was used. The survey questionnaire given to the students and teachers is focused on assessing their perception regarding their experience towards the conduct of the Concurrent Classroom classes. The questionnaire has 29 statements divided into 5 Critical Factors for Successful Online Learning of Webster & Hackley (1997) namely, student participation and involvement, cognitive engagement, technological efficacy, perceived usefulness of the technology, and the relative advantage or disadvantage. The survey questionnaire utilized a 4-point Likert type scale in determining the level of agreement to the statement.

The rating scales as shown in Table 1 and Table 2, were used in the interpretation of responses in the self-assessment form.

Table 1. Scale used in the survey

Numerical Equivalent	Interpretation
4	I strongly agree with the statement
3	I agree with this statement
2	I disagree with this statement
1	I strongly disagree with this statement

Table 2. Mean range used in the survey

Mean Range	Interpretation
3.00 – 3.99	Students'/Teachers' perception of the Concurrent Classroom

	shows high viability
2.00 – 2.99	Students'/Teachers' perception of the Concurrent Classroom shows moderate viability
1.00 – 1.99	Students'/Teachers' perception of the Concurrent Classroom shows low viability.

For functionality, a researcher-made Concurrent Classroom Observation Tool was utilized. The observation tool was accomplished by the subject coordinators in evaluating the conduct of the CC classes. It is composed of two sub-areas and utilized a 4-point scale: Classroom Observation Areas - this refers to the ability of teachers and students and the learning environment to do or perform the procedures and tasks that are expected of them. Functional areas - this covers the managerial, technical, and instructional aspects of the CC. Open-ended question was included to solicit remarks from the subject coordinators.

The rating scales as shown in Tables 3, 4 and 5, were used in the interpretation of responses in the self-assessment form.

Table 3. Mean range and verbal interpretation of the overall functionality mean ratings

Mean Range	Verbal Interpretation
0.00 to 0.99	Overall functionality of the Concurrent Classroom is poor.
1.00 to 1.99	Overall functionality of the Concurrent Classroom is low.
2.00 to 2.99	Overall functionality of the Concurrent Classroom is moderate.
3.00 to 3.99	Overall functionality of the Concurrent Classroom is high.

Table 4. Observation areas interpretation guide

Observation Areas	Mean Values and Interpretation
Teachers	0.00-0.99 Teacher's performance of expected functions in the Concurrent Classroom is poor.
	1.00-1.99 Teacher's performance of expected functions in the Concurrent Classroom is low.
	2.00-2.99 Teacher's performance of expected functions in the Concurrent Classroom is moderate.
	3.00-3.99 Teacher's performance of expected functions in the Concurrent Classroom is high.
Students	0.00-0.99 Students' participation in the Concurrent Classroom is poor.
	1.00-1.99 Students' participation in the Concurrent Classroom is low.
	2.00-2.99 Students' participation in the Concurrent Classroom is moderate.
	3.00-3.99 Students' participation in the Concurrent Classroom is high.

Learning Environment	0.00-0.99	The assistance of the learning environment in the Concurrent Classroom is poor.
	1.00-1.99	The assistance of the learning environment in the Concurrent Classroom is low.
	2.00-2.99	The assistance of the learning environment in the Concurrent Classroom is moderate.
	3.00-3.99	The assistance of the learning environment in the Concurrent Classroom is high.

Table 5. Functional areas interpretation guide

Functional Areas	Mean Values and Interpretation	
Technical	0.00-0.99	Learning environment's functionality in the Concurrent Classroom is poor.
	1.00-1.99	Learning environment's functionality in the Concurrent Classroom is low.
	2.00-2.99	Learning environment's functionality in the Concurrent Classroom is moderate.
	3.00-3.99	Learning environment's functionality in the Concurrent Classroom is high.
Managerial	0.00-0.99	Functionality of management in the Concurrent Classroom is poor.
	1.00-1.99	Functionality of management in the Concurrent Classroom is low.
	2.00-2.99	Functionality of management in the Concurrent Classroom is moderate.
	3.00-3.99	Functionality of management in the Concurrent Classroom is high.
Instructional	0.00-0.99	Functionality of instruction in the Concurrent Classroom is poor.
	1.00-1.99	Functionality of instruction in the Concurrent Classroom is low.
	2.00-2.99	Functionality of instruction in the Concurrent Classroom is moderate.
	3.00-3.99	Functionality of instruction in the Concurrent Classroom is high.

For effectiveness, results of the summative assessments of students were gathered. The assessments were administered during the conduct of the CC class. The assessments given to the students were categorized based on the three learning goals - acquisition, making meaning, and transfer.

The transmuted grade range and verbal description of assessment results are shown in Table 6.

Table 6. Transmuted grade range and verbal description of assessment results sy 2022-2023

Transmuted Grade Range	Verbal Description	Letter Grade Equivalent
96 and above	Outstanding	A
90 to 95	Highly Satisfactory	A-
86 to 89	Very Satisfactory	B+
80 to 85	Satisfactory	B

75 to 79	Moderately Satisfactory	B-
74 and below	Failed / Needs Improvement	C

Data Gathering Procedure and Statistical Analysis

For viability, the Concurrent Classroom Self-Assessment Form was distributed to the students and teachers using Google Form. Mean ratings were computed and interpreted according to a given scale that shows different levels of students and teachers' perceptions of the Concurrent Classroom's viability.

For functionality, the Concurrent Classroom Observation Tool was given to and accomplished by the Subject Coordinators. Mean ratings were computed and interpreted according to different scales. The first set of scales indicated levels of teachers' performance of expected functions, students' participation, and the assistance of the learning environment. The second set of scales indicated levels of functionality for the instructional, managerial, and technical aspects of implementation. Based on the mean results of the first and second scales, an overall functional rating was obtained. The scale below shows the interpretation of the ratings.

In terms of effectiveness, a Google worksheet was shared to the teachers for encoding of student scores from the summative assessments. The worksheet had columns for entries related to assessments of Acquisition, Make Meaning and Transfer. The sheet included the students' data on learning competencies, learning group (online or in-person).

The responses were downloaded and processed using MS Excel and SPSS. Frequency distribution, percentage and mean ratings were generated to determine the evaluation, observation, and assessment results based on the identified variables. Descriptive statistics were obtained from self-assessment rating and observation forms distributed to the students, teachers, and subject coordinators. T-tests were used to establish significant differences between the variables used in the study.

Results

Q1: How do students and teachers perceive the viability of the CC modality?

Research question 1 investigated the viability or usefulness of the CC modality. Viability answers the question: Is the CC modality useful for teaching and learning? As seen on Tables 7 and 8, the implementation of the concurrent classroom generally shows high viability among students and teachers. Students, in the Concurrent Classroom environment, highly agree on the essential role of technology in class and homework. Students also responded positively on items addressing communication with their teachers and classmates, observation of health precautions and protocols, and participation in class discussions and activities. Students also showed high regard for the use of technology on a given task, availability and access of instructional materials and options for the use of appropriate technological applications. In addition, the factor of perceived technology usefulness

received the highest mean rating among the teachers, followed by cognitive engagement and technological efficacy. All these results imply that the CC modality is practical, useful, and suitable for instructional delivery.

Table 7. Self-rating results based on self-rating results of the CC modality

Critical Factors for Successful Online Learning	Self-Rating Results	Pilot			Full		
		N	Mean	SD	N	Mean	SD
OVERALL MEAN							
• Student Participation and Involvement	Teachers	20	3.60	0.33	47	3.32	0.48
• Cognitive Engagement							
• Technological Efficacy							
• Perceived Usefulness of Technology	Students	208	3.72	0.44	1345	3.41	0.57
• Relative advantage and disadvantage							

(Mean Interpretation: 3.00-3.99- Students' perception of the Concurrent Classroom shows high viability, 2.00-2.99- Students' perception of the Concurrent Classroom shows moderate viability, 1.00-1.99- Students' perception of the Concurrent Classroom shows low viability)

Table 8. Self-rating results based on the learning group of the CC modality

Critical Factors for Successful Online Learning	Learning Group	Pilot			Full		
		N	Mean	SD	N	Mean	SD
OVERALL MEAN							
• Student Participation and Involvement	In-Person	109	3.89	0.24	1021	3.45	0.57
• Cognitive Engagement							
• Technological Efficacy							
• Perceived Usefulness of Technology	Online	99	3.56	0.53	324	3.30	0.55
• Relative advantage and disadvantage							

(Mean Interpretation: 3.00-3.99- Students' perception of the Concurrent Classroom shows high viability, 2.00-2.99- Students' perception of the Concurrent Classroom shows moderate viability, 1.00-1.99- Students' perception of the Concurrent Classroom shows low viability)

Q2: Is there a significant difference between the self-rating responses of students and teachers with regards to the viability of the full implementation of the CC modality?

Research question 2 tries to determine significant differences between the level of perceptions of teachers and students and in-person and online students with regards to the viability of the CC modality. Based on the results, which can be seen in Table 9, the full implementation of the concurrent classroom generally shows high

viability among students. The factor on perceived usefulness of technology achieved the highest mean rating ($M = 3.56$, $SD = 0.62$) followed by technology efficacy ($M = 3.52$, $SD = 0.60$). Students, in the CC environment, show high affirmation in the usefulness of technology. Students responded positively on items pertaining to the ability to communicate with their teachers and classmates, observe health precautions and protocols, and participate in class discussions and activities. Students also show high regard on the use of technology on a given task, availability and access of instructional materials and options for the use of appropriate technology applications. Areas on student participation, cognitive engagement, and relative advantage and disadvantage obtained high marks, as well.

Table 9. Descriptive and comparative t-test analysis of self-rating results of teachers and students based on the critical factors for successful online learning

Critical Factors for Successful Online Learning	Participants	N	Mean	SD	t	Sig. (2-tailed)
Student Participation and Involvement	Teachers	47	3.32	0.54	-.550	.582
	Students	1345	3.37	0.63		
Cognitive Engagement	Teachers	47	3.43	0.48	-.133	.894
	Students	1345	3.44	0.62		
Technological Efficacy	Teachers	47	3.39	0.49	-	.135
	Students	1345	3.52	0.60		
Perceived Usefulness of Technology	Teachers	47	3.49	0.53	-.805	.421
	Students	1345	3.56	0.62		
Relative Advantage & Disadvantage	Teachers	47	3.02	0.62	-	.012
	Students	1345	3.26	0.65		

(Mean Interpretation: 3.00-3.99- Students' perception of the Concurrent Classroom shows high viability, 2.00-2.99- Students' perception of the Concurrent Classroom shows moderate viability, 1.00-1.99- Students' perception of the Concurrent Classroom shows low viability)

Similarly for teachers, the factor on perceived usefulness of technology received the highest mean rating ($M = 3.49$, $SD = 0.53$) followed by cognitive engagement ($M = 3.43$, $SD = 0.48$) and technological efficacy ($M = 3.39$, $SD = 0.49$). Teachers also show high regard on the use of technology on a given task, availability and access of instructional materials and options for the use of appropriate technology applications. Areas on student participation, cognitive engagement, and relative advantage and disadvantage obtained high marks, as well.

Looking further, the comparative analysis as shown in Table 9, $p > .05$ show that there is no significant difference found between the perception of the students and teachers in terms of the participation, cognitive engagement, technological efficacy, and usefulness of the concurrent classroom modality. Both types of respondents seem to have similar perceptions in terms of implementation based on the response ratings of the students and teachers in the five factors. However, responses differ significantly for both groups in the area of

relative advantage and disadvantage. Students perceived the implications of the concurrent classroom higher than that of their teachers.

Table 10 displays the descriptive statistics and independent-sample t-test conducted to compare and determine the differences in the learning modality used by the students. Based on the mean rating results, students' level of agreement on all the factors for successful online learning is highly viable for both in-person and online learning modality. The perceived usefulness of technology ($M = 3.59$, $SD = 0.63$) obtains the highest mean score for in-person students while technology efficacy ($M = 3.50$, $SD = 0.58$) registered the top favored factor among online students.

Table 10. Descriptive and comparative t-test analysis of self-rating results based on the learning modality of students and critical factors for successful online learning

Critical Factors for Successful Online Learning	Modality	N	Mean	SD	t	Sig. (2-tailed)
Student Participation and Involvement	In-person	1021	3.44	0.61	6.823	.000
	Online	324	3.17	0.63		
Cognitive Engagement	In-person	1021	3.46	0.63	1.624	.105
	Online	324	3.39	0.61		
Technological Efficacy	In-person	1021	3.53	0.61	.685	.493
	Online	324	3.50	0.58		
Perceived Usefulness of Technology	In-person	1021	3.59	0.63	2.596	.010
	Online	324	3.49	0.59		
Relative Advantage & Disadvantage	In-person	1021	3.31	0.64	5.362	.000
	Online	324	3.09	0.65		

(Mean Interpretation: 3.00-3.99- Students' perception of the Concurrent Classroom shows high viability, 2.00-2.99- Students' perception of the Concurrent Classroom shows moderate viability, 1.00-1.99- Students' perception of the Concurrent Classroom shows low viability)

In the conduct of the t-test analysis, results show significant difference between in-person and online students' perception towards participation and involvement $t(1343) = 6.823$, $p < .05$, perceived usefulness of technology $t(1343) = 2.596$, $p < .05$, and relative advantage and disadvantage $t(1343) = 5.362$, $p < .05$. This implies that, based on the mean rating of responses, the differences in the level of agreement between in-person and online students for the following factors: participation and involvement, usefulness of technology, and relative advantage and disadvantage of online learning are statistically significant. In-person students are expected to respond more favorably to the different activities and situations covered under the concurrent classroom modality compared to students online.

Q3. How do teachers conduct and implement the teaching-learning process in a concurrent classroom? How are teachers able to do the designated managerial, technical, and instructional procedures and tasks in the

CC modality?

Research question 3 was posed to evaluate how teachers conduct and implement the teaching-learning process in the CC and how students perform the tasks expected of them. This refers to the functionality of the CC. Functionality also covers the managerial, technical and instruction aspects of the CC (Webster and Hackley, 1997).

Table 11. Descriptive statistics of the observation ratings in the full implementation of the CC based on observation areas

Classroom Observation Areas	N	Min	Max	Mean	SD	Interpretation
Part 1. The Teacher	24	1	4	3.73	0.598	Teacher's performance of expected functions is high.
Part 2: The Students	24	1	4	3.61	0.615	Students' participation is high.
Part 3: The Learning Environment	24	1	4	3.77	0.531	The assistance of the learning environment is high.

Mean Interpretation: 0.00 to 0.99: Functionality is poor.; 1.00 to 1.99: Functionality is low; 2.00 to 2.99: Functionality is moderate.; 3.00 to 3.99: Functionality is high.

Table 11 shows the observation mean rating of the teachers classified according to observation areas. The observation tool is divided into three parts namely, the students, the teachers, and the learning environment. The mean rating of all areas; teacher (M = 3.73, SD = 0.598), students (M = 3.61, SD = 0.615) and learning environment (M = 3.77, SD = 0.531) indicates that the teacher's performance of expected functions, the student's participation, and the assistance of the learning environment in the CC are all high.

Table 12. Descriptive statistics of the observation ratings in the full implementation of the CC based on functional areas

Functional Areas	N	Minimum	Maximum	Mean	SD	Interpretation
Technical	24	1	4	3.84	0.433	Learning environment's functionality is high.
Managerial	24	1	4	3.65	0.707	Functionality of management is high.
Instructional	24	1	4	3.66	0.576	Functionality of instruction is high.

Mean Interpretation: 0.00 to 0.99: Functionality is poor.; 1.00 to 1.99: Functionality is low; 2.00 to 2.99: Functionality is moderate.; 3.00 to 3.99: Functionality is high.

Table 12 displays the teacher's observation mean ratings classified according to functional areas. The observation tool is divided into 3 functional areas namely, technical, managerial, and instructional. The mean

rating of all areas; technical ($M = 3.84$, $SD = 0.433$), managerial ($M = 3.65$, $SD = 0.707$) and instructional ($M = 3.66$, $SD = 0.576$), indicates that the functionality of the learning environment, management and instruction in the CC is high. Generally, the teachers were able to implement the planned activities for the CC, were able to guide students to resolve problems related to access of resources or accomplishment of the activity, checks on student's progress and output and provides feedback to different groups in varied ways, and required learning resources were available and accessible to the students.

Table 13 displays the observation comments of the subject coordinators with regard to the things needed to be improved in the conduct of CC. Despite the high mean rating for student participation, observation comments indicate that online students need to be more involved in class activities. Teachers should give equal attention to both student groups and encourage both to participate in class discussions. These results serve as a challenge in implementing CC because the World Mental Healthcare Association suggests that the CC teachers must be able to expand their understanding and ability to respond to two different learning groups. Additionally, devices such as microphones, LCD projectors, TV monitors, and strong Wi-Fi connections need to be installed and monitored for their functionality in the CC.

Table 13. Summary of class observation comments: What needs to be improved in the classroom observation areas of the cc?

The Teacher	Students	Learning Environment
1. Equal attention must be given to both in-person and online students.	1. Students need to engage more in the class activities specifically the online students.	1. Proper wearing of mask must be observed.
2. Give more time for feedbacking of outputs.	2. Students need to be oriented regarding the CC mode of the day.	2. No LCD installed and some has an LCD projector but not working. Online students were not able to see the presentation of the teacher.
3. More conscious effort in using the CC modes.		3. Use lapel to have a clearer sound or audio for the online students.
4. Give more activities that focus on HOTS.		4. There was no TV monitor at the back of the classroom for teachers to see the online students.
5. Teacher got disconnected due to slow or intermittent internet connection.		5. There was no microphone installed.
		6. Internet was functional but very slow.

Generally, results of the observations as seen in Table 14, show that the CC modality has high functionality ($M = 3.69$, $SD = 0.598$). This suggested that the tasks being implemented, and various activities included in the CC framework were accomplished and achieved based on the requirements given for each area.

Table 14. Overall descriptive statistics of the observation ratings

Observation Area	N	Minimum	Maximum	Mean	SD	Interpretation
Overall CC Functionality	24	1	4	3.69	0.598	High Functionality

The teacher's performance of expected functions, the student's participation, and the assistance of the learning environment in the CC were all rated high. In terms of the teacher's observation, the functional areas namely, technical, managerial, and instructional achieved the mean rating range from 3.65 to 3.84 in all areas. The results indicated that the functionality of the learning environment, management and instruction in the concurrent classroom is high.

Q4. How do the students perform in the CC modality based on the results of the assessments of their learning competencies related to Acquisition, Make Meaning and Transfer?

Research question 4 tries to assess how the students perform in the written tests administered during the conduct of CC. The assessments are categorized according to the three learning goals; Acquisition (A), Make Meaning (M) and Transfer (T). Two assessments results were submitted per subject area. The effectiveness of the CC model is based on the results of students' performance in classroom-based and teacher-made assessments.

Table 15 shows that the assessment results of both in-person and online students towards the attainment of the three learning goals (Acquisition, Make Meaning, and Transfer) are ranging from very satisfactory (B+) for acquisition and make meaning to highly satisfactory (A-) for transfer. These results indicate that the skills under the three learning goals as articulated by Wiggins and McTighe (2008) were satisfactorily attained by the students.

Table 15. Assessment results per subject in the full implementation of the CC: in-person and online groups

Comparative analysis as shown in Table 16, indicates that online students outperformed in-person students in Math ($p < .05$) and English ($p < .05$) make-meaning assessments, while in-person students performed better in Computer ($p < .05$) transfer assessments than their online counterparts. These are the only results where significant differences are observed.

No statistically significant differences ($p > .05$) are observed in the results of other assessments administered by the other subjects. Overall, with regard to the learning goals, there is not enough evidence to suggest any significant differences in the acquisition, meaning-making, and transfer assessment results between the in-person and online students. The performance of students attending classes in-person is equivalent to that of their online counterparts in assessments.

In addition, Table 17 indicates that at $p > 0.05$, there is not enough evidence to show that the results of acquisition, make meaning and transfer assessments between the in-person and online students show significant differences. This indicates that generally, CC does not affect or favor any group in terms of their performance in the assessments.

Table 17. Independent t-test result between in-person and online learning groups

Learning Goals	Modality	N	Mean	SD	t	Sig. (2-tailed)
Acquisition	In-person	597	88.53	9.887	-0.046	0.963
	Online	226	88.56	9.892		
Make Meaning	In-person	584	89.51	10.313	-0.373	0.709
	Online	228	89.81	10.197		
Transfer	In-person	594	93.27	8.139	-0.056	0.955
	Online	226	93.30	8.344		

Discussion

The findings of the study indicate that the concurrent classroom implementation demonstrates a high level of viability among both students and teachers. Students highly acknowledge the crucial role of technology in their classroom and homework activities within the concurrent classroom environment. They also responded positively to items related to communication with teachers and classmates, adherence to health precautions and protocols, and active participation in class discussions and activities. Furthermore, students expressed a strong preference for the use of technology for various tasks, as well as the availability and accessibility of instructional materials and appropriate technological applications. This supports the media richness theory as described by Daft and Lengel (1986) that technology is a useful medium to communicate or deliver an instruction. Among the teachers, perceived technology usefulness received the highest mean rating, followed by cognitive engagement and technological efficacy.

Although results show that both student groups displayed a high positive perception of CC, the in-person students reported a more favorable CC experience compared to the online students. Tucker (2021) addressed the issue of teacher attention inequality that arises in concurrent classrooms. According to her, when students in the physical classroom can raise their hand or verbally seek assistance, they naturally receive more attention from the teacher. To address this issue, Tucker suggests that teachers should establish a uniform channel for all students to ask questions or seek support. Additionally, she recommends allocating dedicated time to confer with individual learners, regardless of whether they are participating online or in person, in order to discuss their progress.

In terms of functionality, observations revealed that the CC modality exhibited a high level of functionality. The tasks and activities included in the CC framework were successfully accomplished based on the given requirements. The teachers performed their expected functions, students actively participated, and the learning environment in the CC facilitated the process effectively. According to teacher observations, the functional areas of technology, management, and instruction received mean ratings ranging from 3.65 to 3.84 in all areas, indicating a high level of functionality in the concurrent classroom. While student participation received a high mean rating, observation comments suggest that online students need to be more actively engaged in class

activities. It is crucial for teachers to provide equal attention to both student groups and encourage participation from both in class discussions. These findings present a challenge in the implementation of concurrent classrooms, as the World Mental Healthcare Association highlights the need for CC teachers to broaden their understanding and enhance their ability to respond to the distinct learning needs of two different groups. According to Tucker (2021), educators who recognize the significance of building strong connections with students and who actively design and facilitate learning experiences that prioritize fostering these relationships are likely to achieve the greatest success in navigating the current challenging landscape of education.

In terms of effectiveness, there was insufficient evidence to show significant differences in the acquisition, meaning-making, and transfer assessment results between in-person and online students when considering the learning goals. This implies that CC does not affect or favor any group in terms of their performance in the assessments. Both in-person and online assessments results indicate that students performed from very satisfactory (B+) to highly satisfactory (A-) in achieving the three learning goals: Acquisition (A), Make Meaning (M), and Transfer (T). These goals are already incorporated in the Philippine K12 summative assessments which are composed of quarterly exams, written works and performance tasks. Hence, the attainment of these goals emphasizes the students' ability to critically analyze, reason, and apply their knowledge and skills in real-world situations. However, to further study on the effectiveness of the CC must be conducted to assess the impact of the CC on the achievement of students' learning outcomes.

Conclusion

The results and findings of this study reveals that the concurrent classroom modality, as implemented, shows high viability, functionality, and effectiveness as a hybrid learning approach. The CC learning modality is viable or has the capacity to deliver instruction. The usefulness of technology, particularly in completing tasks, accessing instructional materials easily, and using suitable technology applications, has received high affirmation from both students and teachers. Observations indicates that students were greatly involved and engaged in class discussions and activities but it is also noted that equal attention to both student groups must be given and online students must be encouraged to participate more actively in class. The CC has also demonstrated excellent functionality by enabling both teachers and students to perform their expected functions in terms of technical, managerial, and instructional aspects. In addition, the CC learning environment allowed teachers to enhance their capacity to cater and address the unique needs of two distinct learning groups. Lastly, achieving the three learning goals (acquisition, make meaning and transfer) shows that the CC modality is effective as it yields to positive and favorable learning outcomes.

Recommendations

For the continuation and further improvement of the implementation of the CC, the following are recommended:

1. Provide a targeted professional development to empower teachers in effectively handling CC classes, focusing on equitable cognitive engagement, active participation, and balanced support

and attention for both in-person and online student groups.

2. Ensure that the necessary devices, technical equipment, and connectivity in the CC learning environment (such as microphones, cameras, and Internet bandwidth) are sufficient and remain functional. Continuous use by teachers of these devices and equipment can result in wear and tear, making maintenance a necessity.
3. Conduct a study on the effectiveness of CC to further assess and evaluate the impact of the CC on the achievement of students' learning outcomes.

Acknowledgements

We extend our warmest gratitude to Br. Edmundo Fernandez FSC, President and to Mr. Emmanuel Bautista, Vice President of La Salle Green Hills for the support and inspiration given to this project. To the Academics Cluster headed by Ms. Carmela Boncodin, Principal, for the work collaboration and assistance in the execution of the research framework and data gathering procedure and to Ms. Cheryl Villanueva, QARO Lead, for the guidance, and encouragement in delivering the research tasks needed for this project.

Screen Time in Learning Management System as Student Learning Time Indicators for Academic Quality Assurance

Aziman Abdullah

University Malaysia Pahang, Malaysia,  <https://orcid.org/0000-0003-2945-1043>

Abstract: This study explores the potential of using screen time data in learning management systems (LMS) to estimate student learning time (SLT) and validate the credit value of courses. Gathering comprehensive data on actual student learning time is difficult, so this study uses LMS Moodle logs from a computer programming course with 490 students over 16 weeks to estimate SLT. The data was segmented into a minute for each record and total duration was calculated for each student on a weekly basis. The study found variations in SLT on a weekly basis and identified that the number of students who engaged with the LMS after midnight varied according to week, possibly due to assessment deadlines. These findings suggest that screen time data in LMS can be utilized for data-driven decision making for academic quality assurance in higher education. This study can help policy makers and academic institutions to make more informed decisions and promote personalized learning experiences.

Keywords: Screen Time, Student Learning Time, LMS, Quality Assurance

Citation: Abdullah, A. (2023). Screen Time in Learning Management System as Student Learning Time Indicators for Academic Quality Assurance. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 462-475), Cappadocia, Turkiye. ISTES Organization.

Introduction

Student learning time (SLT) is a critical aspect of higher education, as it is a key indicator of the amount of time that students 'expected' to spend to engage in learning activities that credited for their qualification. In practice, SLT has been determined based on notional learning hour which include all learning activities associated to achieve the learning outcomes. However, very few research and practice address the validation aspect of the credits due to the difficulty in gathering a comprehensive actual data of SLT in a course. Besides, it is important to note that the actual amount of time that a learner spends on a particular activity may vary depending on factors such as prior knowledge, learning style, and individual pace of learning. Getting data or responses from each student on how much they spent their actual time for learning in each course they enrolled through self-report or survey seems impractical. This is due to inaccuracy and incompleteness of the data to represent the whole student in individual manner. Nevertheless, many scholars have research using user engagement data or screen time data in learning management system (LMS) towards quality education(Zanjani, 2016). Therefore,

this paper aims to investigate the feasibility of measuring SLT based on screen time data in LMS as potential new indicator for academic quality assurance in higher education.

Literature Review

Student Learning Time

Student learning time (SLT) refers to the amount of time a student spends on academic activities such as attending lectures, participating in discussions, completing assignments, and studying for exams. SLT is a theoretical estimation based on the concept of notional learning time. Notional learning hours are often used to calculate the credit value of a course or module, and they can also be used to plan and schedule training activities. It was based on estimated value by the experts or higher education providers during the curriculum design stage. In the context of Malaysian higher education, SLT has been described as “*the amount of time that a student is expected to spend on the learning-teaching activities, including assessment to achieve specified learning outcomes.*” (Malaysian Qualification Agency, 2008).

A literature (Mohamed, 2016) that proposed the SLT model indicates there are four major operational components namely as official contact hours, guided learning time, self-study time and assessment time as shown in Figure 4. The model also categorized the the components as “*Guided Learning Time*” and “*Independent Learning Time*”. The “*Guided Learning Time*” might be used for face to face (F2F) or none face to face (NF2F) interactions or learning activities, while “*Independent Learning Time*” is typically used with NF2F learning activities.

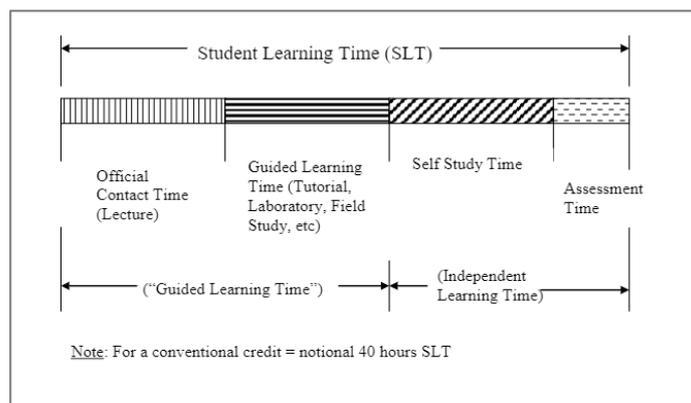

Figure 4 SLT Model (Mohamed, 2016)

Basically, the F2F is conducted based on the designated schedule can be practically quantified based on the duration of ‘contact hours’ either in classroom or online meetings normally with the presence of instructor. The amount of time for F2F sessions can be expected is the same for each learner. While for NF2F, where it been conducted without the presence of instructor, the amount of time student spend may varies due to various factors such as complexity of learning materials, learning style, personal disabilities, conduciveness of the learning environment as well as student’s personal commitment and responsibilities. Nevertheless, the total of SLT from

F2F and NF2F were used as indicators to determine the credit hours of the course.

In the Code of Practice for Programme Accreditation (COPPA) of higher education in Malaysia, SLT can be categorized as F2F and NF2F as shown in Figure 5. The NF2F of SLT is very significant for higher education since higher education is distinguished from general and secondary education by its focus on independent learning (Thompson, Pawson, & Evans, 2021). Research has shown that higher levels of NF2F SLT or independent learning are associated with better academic performance and higher rates of student retention (Kuh et al., 2008). Additionally, SLT has been linked to the development of key skills and competencies, such as critical thinking, problem-solving, and information literacy (Pascarella & Terenzini, 2005). The issue is, how to validate the NF2F SLT in term of accuracy and what are the variation of actual NF2F SLT in a course?

Distribution of Student Learning Time (SLT):								
Course Content Outline	CLO*	Learning and Teaching Activities						Total SLT
		Guided Learning (F2F)				Guided Learning (NF2F) e.g. e-Learning	Independent Learning (NF2F)	
		L	T	P	O			
1.								
2.								
3.								
4.								
Continuous Assessment		Percentage (%)		F2F		Independent Learning (NF2F)		Total SLT
1.								
2.								
Final Assessment		Percentage (%)		F2F		Independent Learning (NF2F)		Total SLT
1.								
2.								
GRAND TOTAL SLT								

L = Lecture, T = Tutorial, P = Practical, O = Others, F2F = Face to Face, NF2F = Non-Face to Face
*Indicate the CLO based on the CLO's numbering in Item 8.

Figure 5 SLT Calculation in COPPA (Malaysian Qualification Agency, 2008)

Learning Management System (LMS) in Higher Education

Learning Management System (LMS) is a type of information system or software that designed to manage, deliver and monitor online and offline educational courses and training programs. It typically involves the use of internet or digital platforms and can come in various forms, such as online courses, virtual classrooms, educational software, and mobile apps. Its features typically include user registration, course creation and management, tracking of progress, grading and assessment, and communication tools. LMS offers learners the

convenience and flexibility of accessing educational materials and interacting with instructors and peers at any time and from any location(Dimitrova, Mimirinis, & Murphy, 2004). Additionally, learners can personalize their learning experience by choosing the style and pace of their learning(Dhaiouir, Ezziyyani, & Khaldi, 2022). As a result, LMS has gained popularity in recent years and is increasingly being adopted by schools, universities, and organizations for educational programs and training. The recent global COVID-19 pandemic also has become a significant factor for global higher education to adopt LMS for their educational productivity(Wang, Li, Malik, & Anwar, 2022). With these benefits, LMS can be a significant technology for e-learning implementation to achieve the United Nation Sustainable Development Goals(Ghanem, 2020) as illustrated in Figure 6.

Figure 6. E-learning impacts on SDG (Ghanem, 2020)

In research, LMS holds great importance as it contains valuable data regarding the users' interactions with the system. This educational data known as system log is a valuable resource for scholars as it provides insights into human behavior, particularly related to the complexity of future learning and future competences in higher education(Kleimola & Leppisaari, 2022). Apart of that, these data can provide valuable information to administrators and policymakers about resource allocation and program evaluation using learning analytics(Hou, Lee, Chen, & Wu, 2023). Adopting learning analytics from LMS data oriented to academic quality assurance can bring about numerous advantages for educational institutions. For instance, instructors and administrators can receive immediate feedback through learning analytics, enabling them to pinpoint areas where students might be facing difficulties and modify their teaching approaches accordingly. This can enhance student achievement and, in turn, enhance the overall excellence of the educational program.

The crucial aspect linking learning analytics and SLT is the amount of time spent student engage in LMS. In LMS, the actual moment and duration of SLT either by guided learning or independent learning can be indicate by their screen time. In addition, learning analytics can also assist in identifying patterns and trends in student behavior, such as their level of engagement and participation in online discussions and assignments. By analyzing this data, instructors and administrators can gain valuable insights into how students are interacting with the course material and with each other, which can help them make informed decisions about how to improve the learning experience. Furthermore, learning analytics can also support decision-making related to resource allocation, as institutions can use the data to determine which courses and programs are most effective and where additional support may be needed. Overall, learning analytics provides a powerful tool for improving

the quality and effectiveness of education by leveraging the rich data generated through LMS.

Screen Time

Screen time (ST) is a concept that referring to the amount of time spent using a device with a screen such as a smartphone, computer, television or video game console. ST also can be determine based on digital engagement that include the context of time and object that user engage with in the LMS. In practice, the timestamp data play a crucial role to determine the moment and duration of ST in any information system like LMS. Some scholars refer this data as digital footprint(Pavlenko, Barykin, & Dadteev, 2021). Many literatures highlight the negative effects especially on excessive screen time (EST) on students' academic performance, physical health, and overall well-being. EST can lead to a sedentary lifestyle, which in turn can increase the risk of obesity(Benaich et al., 2021) and other health issues(Tang, Werner-Seidler, Torok, Mackinnon, & Christensen, 2021). Additionally, too much ST can negatively impact students' sleep patterns(Hjetland, Skogen, Hysing, & Sivertsen, 2021; Muhammad, Hussain, & Adnan, 2021), which can affect their ability to learn and retain information.

While many scholars associate screen time with negative impacts, there is a potential benefit of screen time in the context of academic quality assurance. Some scholars assess the ST by using self-report or survey based approach(Vizcaino, Buman, Desroches, & Wharton, 2019). Although self-reported is a well-established and commonly adopted in wide area of research studies, a study proves that self-reports can overestimated the actual use of ST(Hodes & Thomas, 2021). ST can be quantified by using specific tools or pre-designed mechanism of information system. In the context of data quality, there are ST software tools that have been developed that aim to manage the user screen time with objective manner(Kristensen et al., 2022). For example, the built-in ST software tools in mobile operating systems that assisting user to manage and monitor their screen time with smartphone as shown by Figure 7. Since LMS also stored the user engagement data or screen time data, there is potential how these data can be further utilized to quantify objectively SLT similarly from the existing ST software tools.

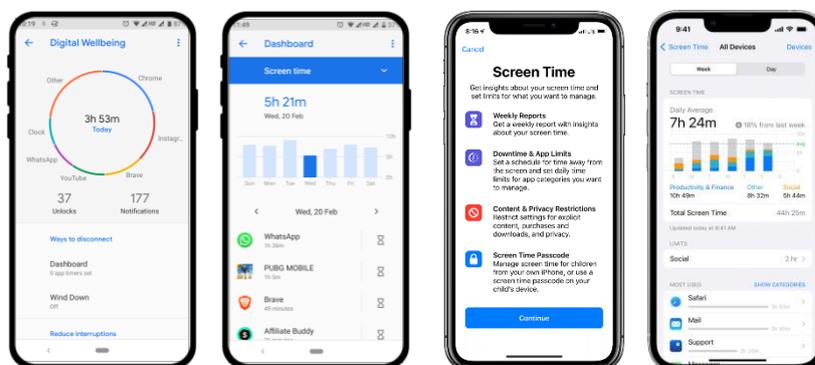

Figure 7. Screen Time Control in Android and iOS Mobile Operating System

Method

This study aims to quantify in objective manner the SLT based on ST in LMS. Research questions of the study are as follows:

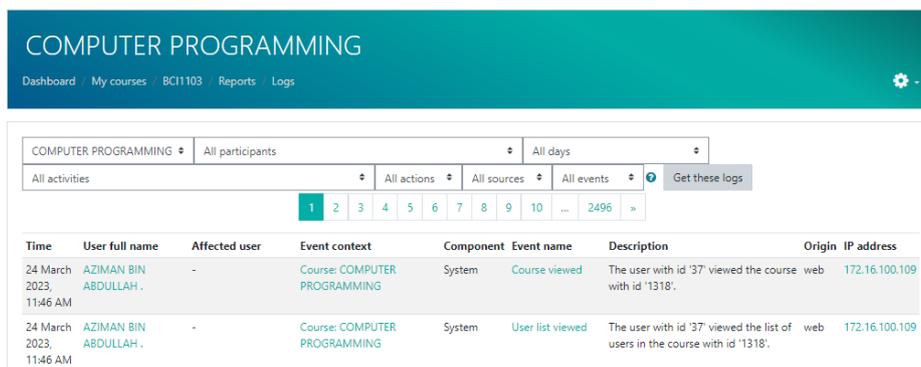

- How to visualize the SLT of one individual student?
- How to visualize the SLT of the whole student?

To answer the research questions, information about the research model, data collection and data analysis have been given.

Research model

This study adopts the learning analytics approach for acquiring the collected data from LMS. The following are the research model adopted in this study: -

1. The dataset was acquired from the log report that generated from LMS based on Moodle for Computer Programming course enrolled by 493 students. There are 9 parameters stored in the Moodle log as shown in Figure 8 and it can be downloaded into various file formats such as Comma Separated Values (.csv), Microsoft Excel (.xlsx) or HTML table.

Time	User full name	Affected user	Event context	Component	Event name	Description	Origin IP address
24 March 2023, 11:46 AM	AZIMAN BIN ABDULLAH .	-	Course: COMPUTER PROGRAMMING	System	Course viewed	The user with id '37' viewed the course with id '1318'.	web 172.16.100.109
24 March 2023, 11:46 AM	AZIMAN BIN ABDULLAH .	-	Course: COMPUTER PROGRAMMING	System	User list viewed	The user with id '37' viewed the list of users in the course with id '1318'.	web 172.16.100.109

Figure 8. Moodle LMS Log

2. Download the dataset in Microsoft Excel (.xlsx) format since the analysis will be done in Microsoft Excel software. The size file is subject to the total record of the log in the course. In principle, the bigger is the class size or number of student, the larger the size of the log or the size file to save all the record. However, the small class size with highly active online learning activities may result with large size file of the log.
3. Open the file in Microsoft Excel and transform the data of the date into 6 new parameters namely year, week, time, hour, minutes and day of the week as shown in Figure 9. This transformation can be done

by using specific Excel function and formula.

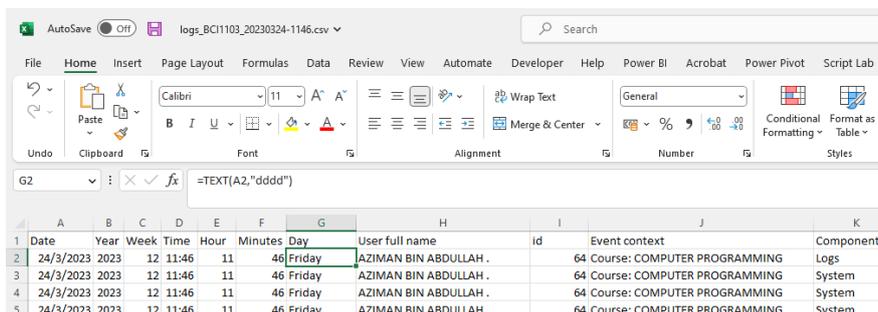

Figure 9. Transformed Dataset in Microsoft Excel

- Analyze the dataset with Microsoft Excel by using PivotTable to calculate the total number of ST to represent SLT.

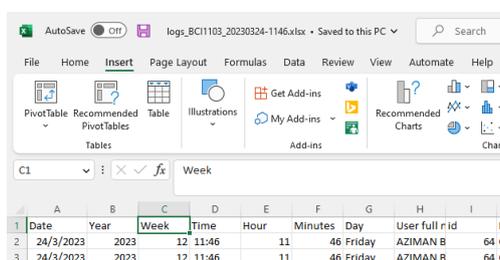

Figure 10. Data Analysis with PivotTable

- Based on the pivoted dataset, then many analysis can be used to explore the pattern of SLT by using various visualization techniques available in Excel.

Results

There are 24955 logs were retrieved from the LMS. The description of the study population is illustrated in Table 3.

Table 3. Dataset description

Faculty	Enrolled students
Faculty Of Chemical And Process Engineering Technology	86
Faculty Of Civil Engineering Technology	100
Faculty Of Electrical & Electronic Engineering Technology	57
Faculty Of Industrial Sciences & Technology	79
Faculty Of Manufacturing And Mechatronic Engineering Technology	37
Faculty Of Mechanical And Automotive Engineering Technology	131
Total	490

The findings from this study are organized based on the research questions as follows: -

1. How to visualize the SLT of one individual student?

Since the student’s timetable has been organized in a weekly basis, the analysis of SLT or ST should be view in a weekly basis. Data that represents the context of time should adopt the temporal visualization and we found bar chart similarly with the existing ST software tools can be effective visualizations to visualize SLT of one individual student. Figure 11 shows the fluctuation of ST frequency for each week of the highest ST overall sample. To explore the difference of the other student who are moderately engaged in LMS, this study uses another sample based on the median value of overall ST per semester as shown in Figure 12.

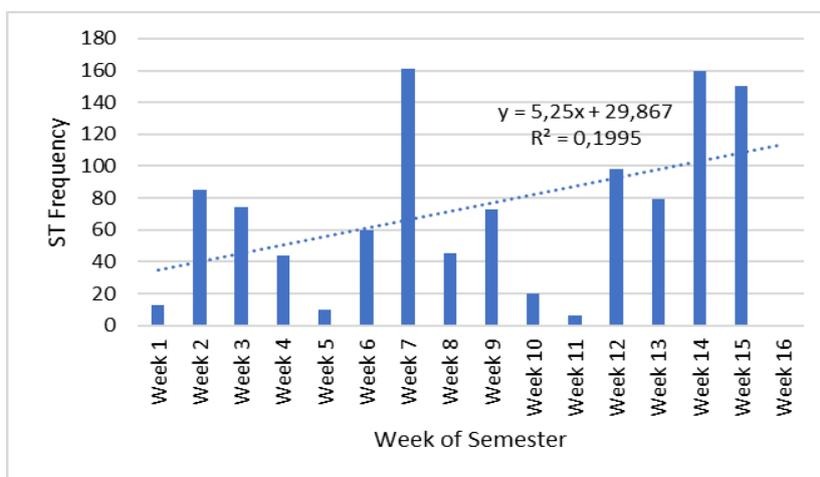

Figure 11. SLT Trend Per Week of Highest ST

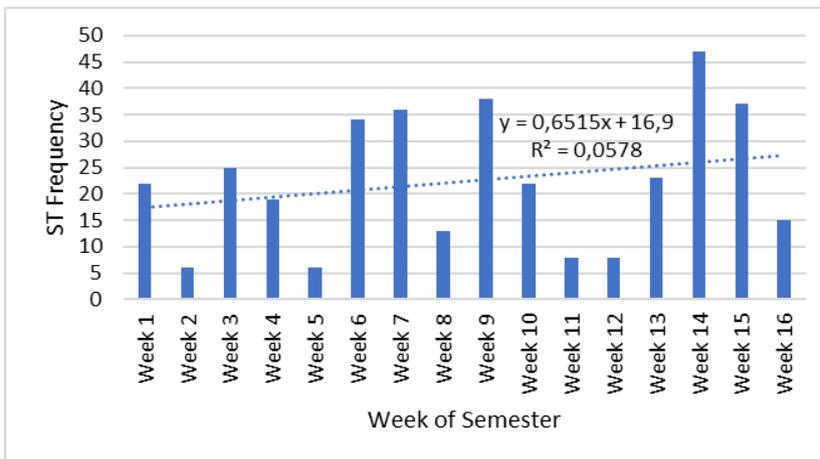

Figure 12. SLT Trend Per Week of Moderate ST

2. How to visualize the SLT of the whole student?

Based on the findings in Figure 11 and Figure 12, it is clear that the weekly SLT frequency pattern of two different student is varied. To visualize the pattern of the whole population with the size of 493 students, obviously the analysis and visualization for one student with simple linear regression is not appropriate. Therefore, this study attempts to visualize the SLT pattern of the whole student by using distribution

visualization. There are two distribution visualization techniques been adopted which are heatmap matrix and boxplot. The heatmap matrix used to indicate the distribution of actual number of students on contextual SLT according to the time clock and week of semester as shown in Figure 13. While Figure 14 displays a boxplot chart that can be used to further examine the weekly SLT pattern of all students over a semester.

Figure 13. Total Student with contextual SLT every week

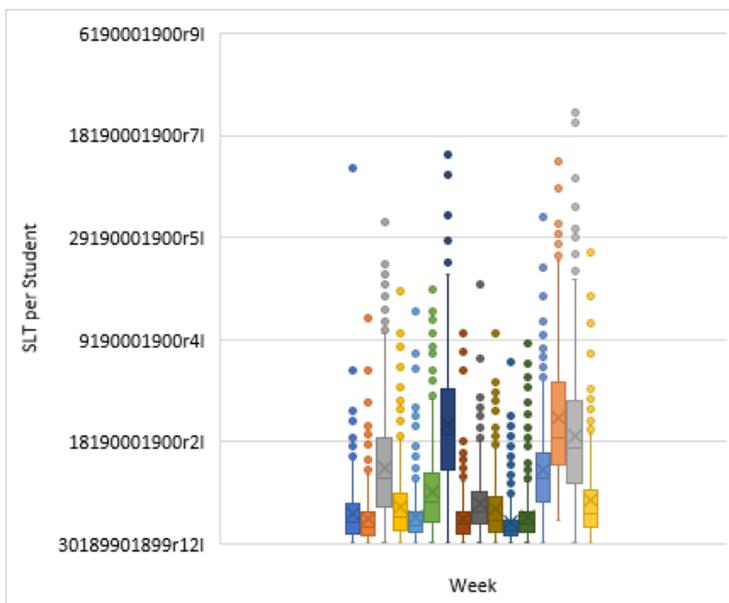

Figure 14. Weekly SLT Trend for Whole Student

Discussion

Based on the Figure 11 and Figure 12, both samples indicate the increasing trend of ST throughout the semester when the data is regressed linearly. The value of coefficient of determination (r^2) shows that the amount of SLT can be explained by the number of weeks in a semester. It seems the variation of the r^2 score can be used to

quantify the SLT pattern of student on weekly basis for a semester in individual manner. This analysis is potential to be used for data-driven decision making for students and instructors indicating their committed time for learning or SLT that can be translated from ST data. This is critical for higher education institution to promote and monitor personalized learning experiences (Bernacki, Greene, & Lobczowski, 2021). This type of analysis could be used to promote personalized learning experiences and monitor student progress in higher education institutions. By using ST data to track SLT, instructors and students can identify patterns and trends in their study habits and use this information to develop more effective time management strategies. For example, students who consistently spend more time on their coursework earlier in the semester may be better prepared for exams and assignments later on, while students who consistently procrastinate may benefit from additional support and resources to help them stay on track. Furthermore, the potential for data-driven decision making based on ST data has important implications for the e-learning industry. Personalization is becoming increasingly important in next-generation LMS (Kipp, 2018), and the ability to track and analyze SLT can be a valuable tool for instructors and developers looking to create more personalized and effective learning experiences for students. By utilizing this data to track and analyze student study habits, instructors and students can work together to promote academic success and personal growth.

There are many students were spending time in the LMS and staying late after midnight referring to Figure 13. One possibility is that the students were highly motivated and were using the LMS to supplement their learning. They may be working on assignments, studying for exams, or reviewing course materials to ensure that they fully understand the material especially when it is near to the deadlines or exam dates. In this case, spending extra time in the LMS could be a sign of their dedication to their studies and a desire to excel academically. However, there may be other reasons why students are staying up late in the LMS. For example, they may be struggling with the material and feel that they need to put in extra effort to catch up. They may also be dealing with personal or family issues that make it difficult for them to study during regular hours. In some cases, students may simply be procrastinating and putting off their work until the last minute (Reinecke et al., 2018). Regardless of the reason for their behavior, it is important for educators to be aware of the situation and provide support to students as needed.

Figure 11 suggests that there are some outliers in the student's weekly SLT as well as a high degree of variation in the average SLT per week for the entire semester. Outliers refer to values that are significantly higher or lower than the majority of the data points. In the case of Figure 11, this means that there are some students who are spending much more on self-regulated learning activities than the average student. This could be indicative of a variety of factors, such as differences in learning styles, motivation, or personal circumstances. Meanwhile, the high variation in the average SLT per week for the entire semester could suggest that students are having difficulty maintaining consistent study habits over the course of the semester. This could be due to several factors, such as changes in workload, stress levels, or competing priorities over the time.

By identifying these patterns through Figure 11, educators can better understand the challenges that students are facing and develop targeted interventions and support strategies to help students overcome these obstacles. For

example, educators could offer additional resources or support to help struggling students catch up or develop more effective study habits. They could also encourage students to reflect on their learning habits and identify areas for improvement. Overall, the insights gained from Figure 11 can inform data-driven decision making that ultimately leads to more effective and personalized support for students.

The potential impacts of utilizing screen time data in LMS as SLT indicators for academic quality assurance are significant across several sectors as follow:

1. **Society:** Utilizing LMS can be an effective strategy to enhance accessibility to education, advance learning achievements, and promote lifelong learning and collaboration, particularly for individuals from marginalized groups like people with disabilities or physical barriers. The research provides insights on how to create a more supportive and emphatic learning environment for such individuals by utilizing data-driven decision making to gain a better understanding of their actual learning experience within the course.
2. **Academia:** This approach has the potential to revolutionize how student learning time is measured, verified, and used to design, develop, and deliver academic programs. It could lead to a more accurate, objective and comprehensive understanding of the time students actually spend on learning activities, and therefore, enable institutions to ensure that students are meeting the necessary credit value of a course. It could also facilitate personalized learning experiences for students and provide instructors with insights on how to improve teaching practices.
3. **Government:** The use of screen time data in LMS could help regulators and accrediting bodies to verify the quality of academic programs and ensure they meet the necessary standards. This approach could also provide policymakers with valuable insights into the effectiveness of online learning environments and how they can support the expansion of digital learning opportunities.
4. **Industry:** This approach could lead to the development of better Learning Management Systems that are designed to collect and analyze screen time data and provide personalized learning experiences for learner either in education or corporate training. It could also foster the development of data-driven decision-making processes that can improve the overall quality of academic programs and contribute to better workforce outcomes.
5. **Environmental:** The use of screen time data in LMS could reduce the need for paper-based assessments and feedback, which would have a positive impact on the environment by reducing waste and resource consumption. This approach could also facilitate distance learning opportunities, which could reduce the need for students and instructors to travel, leading to reduced carbon emissions and a smaller environmental footprint.

Conclusion

The potential contribution of data-driven decision making based on student data from the LMS can be significant in supporting students who are spending time in the LMS and staying up late after midnight. By

analyzing student data, educators can gain insights into how students are using the LMS and identify patterns in their behavior, such as which activities they are spending the most time on and when they are most active in the LMS. This information can then be used to inform interventions and support strategies that are tailored to the needs of individual students. For example, if educators notice that a particular student is spending a lot of time on a particular activity but is not making progress, they may offer additional resources or support to help them understand the material better. In addition, by using SLT data to inform decision making, educators can develop more effective strategies for promoting healthy study habits and time management skills (Cao, Zhang, Chen, & Shu, 2022). They can identify which interventions are most effective for different types of students and adjust their approach accordingly. As digital learning has become an integral part of academic operations in many institutions, our findings can provide insight for policymakers and academics on how to use screen time data from LMS for data-driven decision making to ensure academic quality assurance in higher education.

Recommendations

Future research could build on the findings from this study and explore additional questions related to SLT in higher education. Here are some potential areas for further investigation:

1. **Factors influencing SLT:** This study identified that there is high variation in SLT among students. Future research could examine the factors that contribute to this variation, such as differences in learning styles, motivation, or personal circumstances. Understanding these factors could help educators develop targeted interventions and support strategies that are tailored to the needs of individual students.
2. **Relationship between SLT and academic performance:** This study did not examine the relationship between SLT and academic performance. Future research could explore whether there is a correlation between SLT and grades or other measures of academic success. This could help educators better understand how SLT relates to overall student achievement and inform strategies for promoting academic success.
3. **Relationship between SLT and digital well-being:** As students spend more time engaging with digital technologies, it is important to understand how this affects their well-being and how it may impact their ability to engage in effective self-regulated learning. Policy makers could work with educators and experts to develop guidelines for healthy digital use that can be shared with students and families.
4. **Longitudinal analysis of SLT:** This study examined SLT over one course of a single semester. Future research could conduct a longitudinal analysis of SLT over a longer period of time to better understand how students' study habits evolve over time and whether there are changes in SLT over the course of a student's academic career.
5. **Comparison of SLT across courses for the whole curriculum:** This study examined SLT among students in a

single course. Future research could compare SLT across different courses and student's level to explore whether there are differences in study habits and self-regulation strategies across courses.

6. Impact of support interventions on SLT: Finally, future research could examine the impact of support interventions on SLT. For example, researchers could explore whether offering additional resources or support to struggling students leads to an increase in SLT and improved academic performance. Understanding the effectiveness of different support strategies could help educators develop more effective and targeted interventions to support student success.

The Degree of Students' Commitment to Virtual Lectures

Omar. M. K. Mahasneh

AL-Balqa Applied University, Faculty of Shobak University College, Department of Basic and Applied
Science, Jordan,  ORCID ID: <https://orcid.org/0000-0001-6902-9109>

Abstract: The coronavirus pandemic has forced the world to change education policies in educational institutions. For example, Jordan's Ministry of Higher Education has allowed courses in academic programs to be taught in three types of education: distance e-learning, blended education, and traditional education. Hence this study came to reveal students' behaviors during virtual lectures. The researcher used the descriptive method, the sample consisted of (96) students from Shobak University College. The results of the study show that (68%) of students are committed to attending e-lectures fully and following up with teachers for a full explanation of lectures, (13%) are Commitment to attending without focus, (10%) Log in and get busy with something else, (7%) Make sure to attend some of the lectures, and (2%) Others attend lectures about me. Results on preferred learning patterns showed that (37%) of students prefer a face-to-face education pattern, (32%) of students prefer full e-learning, and (31%) of students prefer Blended education. Results of Students' focus on virtual lectures, 43% full lectures, 10% (10 minutes or less), 12% (11-25 minutes), 20% (26-40 minutes), and 15% (41-60 minutes). Result of Reasons for students' lack of attendance and focus during virtual lectures, (44%) there are no reasons, they attend all lectures, (18%) There is no internet and computer or smart device to be able to attend the lectures, (16%) There is no special place at home prepared to attend the lectures, (15%) Preoccupation with other work, and (7%) They lack the motivation to attend the lectures.

Keywords: Virtual Lectures, Behaviors of University Students.

Citation: Mahasneh, O. M. K. (2023). The Degree of Students' Commitment to Virtual Lectures. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 476-483), Cappadocia, Turkiye. ISTES Organization.

Introduction

Interest in e-education was not evident in Jordanian universities before the Corona pandemic, which engulfed Jordan by the Defense Law of 17/3/2020 (Bnitaha and Mahasneh, 2021), which directed the ministries of education and higher education to continue implementing academic programs by using distance education.

The Ministry of Higher Education has been working to change policies and regulations regarding the nature of teaching at universities, colleges, and institutes. Regulations No. (96) of 2021, which includes a system for the integration of e-learning in higher education institutions, stipulates the obligation of higher education institutions to restructure academic programs and plans of subjects by the requirements of the integration of e-

learning (Face-to-face, full E-learning, Blended education) (Jordan's Ministry of Higher Education and Scientific Research,2022).

By the legislation and regulations, universities and colleges in Jordan have taught courses in academic programs according to three types of education (Face-to-face, full E-learning, and Blended education).

Face-to-face Education

According to this pattern, there are courses in each academic program that must be studied face-to-face, especially practical courses (Mahasneh, 2021; Mahasneh,2020A).

Blended Education

According to this pattern, there are courses in each academic program that must be taught in a Blended Education, meaning teaching courses as face-to-face lectures and virtual lectures simultaneously and remotely asynchronously (Mahasneh,2020 B; Mahasneh,2020 C).

Full E-Learning

Electronic learning systems such as (Moodle) and some electronic applications such as (Teams) have been used to teach courses in academic programs at Jordanian universities and colleges since the adoption of legislation. Full e-learning can be defined as a pattern of education that enables a faculty member and a student to meet to attend virtual lectures simultaneously or asynchronously using an e-learning system or electronic applications (Mahasneh, 2021).

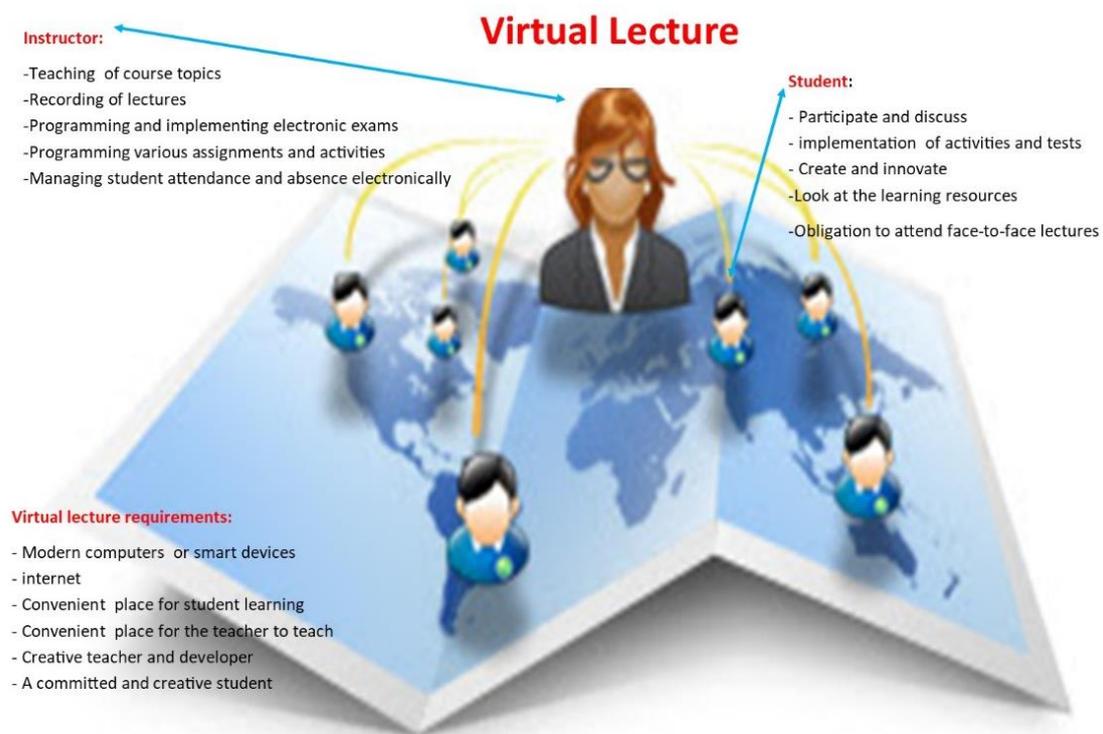

Figure 1.Illustrates the virtual lecture in the e-learning environment

Note. Figure 1. illustrates the virtual lecture in the e-learning environment, requiring the teacher to prepare well for the virtual lecture in terms of scientific material design and display for students, to being able to use the available e-learning systems as a system (Moodle) and various applications of virtual lectures such as (Teams), it is also necessary for the teacher to see the latest e-learning strategies such as flipped education strategy and use in the teaching process, to keep abreast of scientific developments in the use of technology in teaching (Mahasneh, Tawarah, & Al-lawama, 2021).

The student's role in virtual lectures is at the center of the educational process, intending to devote a place to attend virtual lectures, discuss create and provide solutions, in addition to the need for the student to have computers or modern smart devices and subscribe to the Internet.

The student in e-learning and virtual lecture is the basic pillar for achieving the course's learning output, requiring the student to create the right environment for him to learn, commit to attending and interact during lectures, carry out activities and perform the duties required by the course. So, this study came to reveal students' behaviors during virtual lectures.

After familiarizing the researcher with theoretical literature and previous studies, he found studies relevant to the subject of the study, conducted by Hollister, Nair, Hill-Lindsay, and Chukoskie (2022) A study entitled Engaging in Online Learning (Direction and Behavior) During the Coronavirus Pandemic, the study sample consisted of (187) Students from American universities. The results of the study showed that 72% of the study sample confirmed a decrease in students' participation in direct virtual lectures affected the experience of online learning. There are positive impressions of teachers and students feeling more comfortable asking questions and answering them in online classrooms.

Azmi, Khan, and Azmi (2022) conducted a study aimed at knowing the impact of virtual learning on students' educational behaviors and the spread of depression among college students due to the coronavirus pandemic. The study sample consisted of 157 students from two universities in Saudi Arabia. The results of the study showed that 75% of the study sample had different tactical symptoms. The online learning method is boring for students and 75% of students experience stress and fear in exams.

Curelaru, Curelaru, and Cristea (2022) conducted a study entitled Students' Perceptions of Distance Learning During the Coronavirus Pandemic. The study sample consisted of 209 students. The results of the study showed that there are negative aspects to online learning, including (Stress, anxiety, isolation, low motivation, indifference, misunderstanding, undernourishment, and lack of challenge) There are also advantages to online learning (rest, accessibility, saving time and money, psychological and medical safety).

Lin, Jin, Zhao, Yu, and Su (2021) studied the factors affecting changing students' behavior toward online learning to consider the coronavirus pandemic. The results of the study showed that there are factors that affect students' acceptance of online learning, including (usability, ease of use, teacher behavior, and matching tasks

with technology).

That it is the only study that attempted to study the **Universities' Students and Virtual Lectures** in Jordan that characterize the current study of previous studies. This study is consistent with the above studies in some molecules associated with the objectives of the current study.

Study Problems and Question

Through his experience teaching virtual lectures, the researcher noted behaviors from students that are incompatible with modern educational theories. Hollister, Nair, Hill-Lindsay, and Chukoskie's (2022) study confirmed that students' low participation in direct virtual lectures was detrimental to the experience of online learning. Hence, this study came to answer the following questions:

First question: **What is the form of education preferred by students?**

Second question: **how are the students committed to virtual lectures?**

Third question: **How long are the students concentrate with the teacher during virtual lectures?**

Fourth question: **What are the reasons causing students' lack of attendance and focus on virtual lectures?**

Methodology

The researcher used the descriptive method through an electronic questionnaire after ascertaining its validity and Reliability. The study sample consisted of 96 students from Shobak University College, who were selected in the available sample method. Figure 1 shows their distribution by sex variable. Repeats and percentages shown by Google Forms were used for electronic identification to answer study questions.

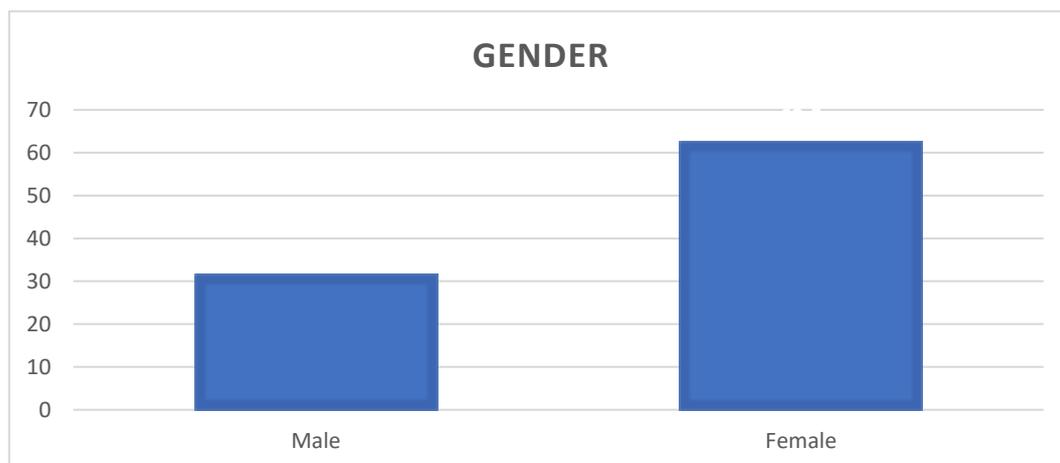

Figure 2. Dfistribution of study sample by gender

Figure 2. shows that the study sample was distributed to 39% males and 61% females

Results

Frequencies and percentages of responses to study questions have been found, these results are presented below:

Results related to the first question

Figure 2. shows the responses of the study sample to the first study question: What is the form of education preferred by students?

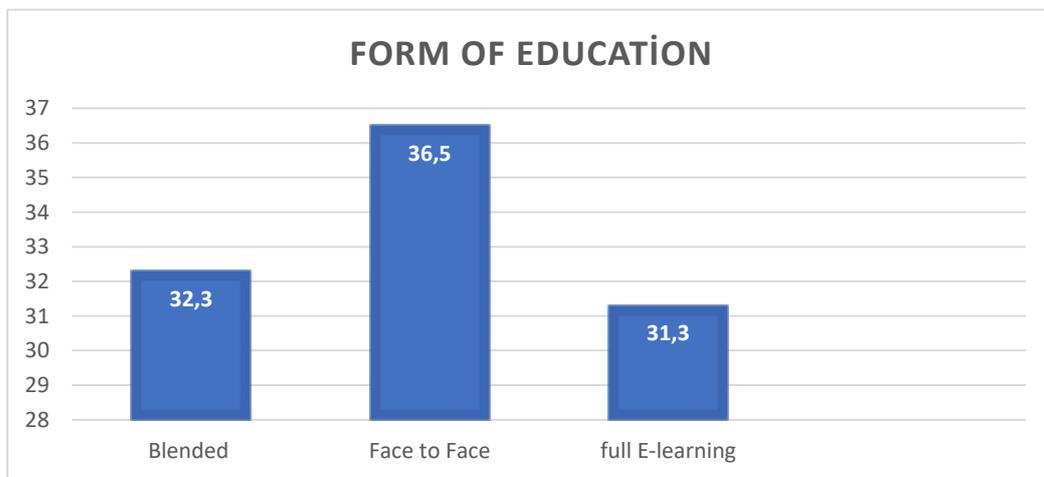

Figure 3. Students' preferred forms of education

Figure 3 shows Preferred learning patterns, 37% of students prefer a face-to-face education pattern, 32% of students prefer full e-learning, and 31% of students prefer Blended education.

Results related to the second question

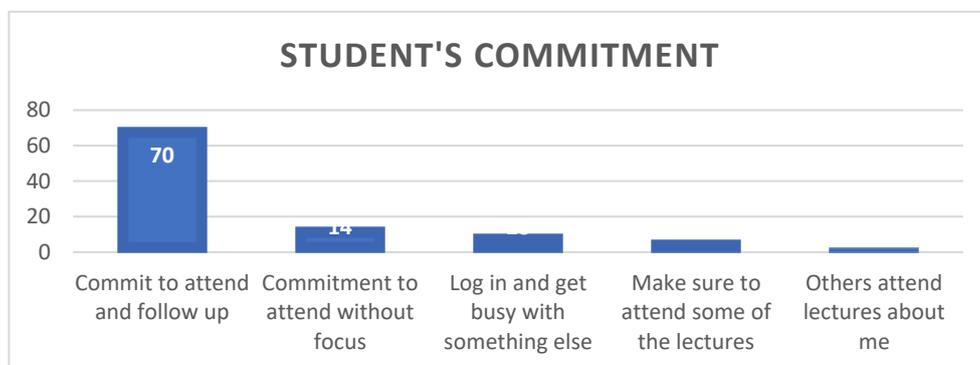

Figure 4. The responses of the study sample to the second study question: **how are the students commit to virtual lectures?**

Figure 4. shows Students attend virtual lectures, 68% Commit to attending and following up, 13% Commitment to attending without focus, 10% Log in and get busy with something else,7% Make sure to attend some of the lectures, and 2% Others attend lectures about me.

Results related to the Third question

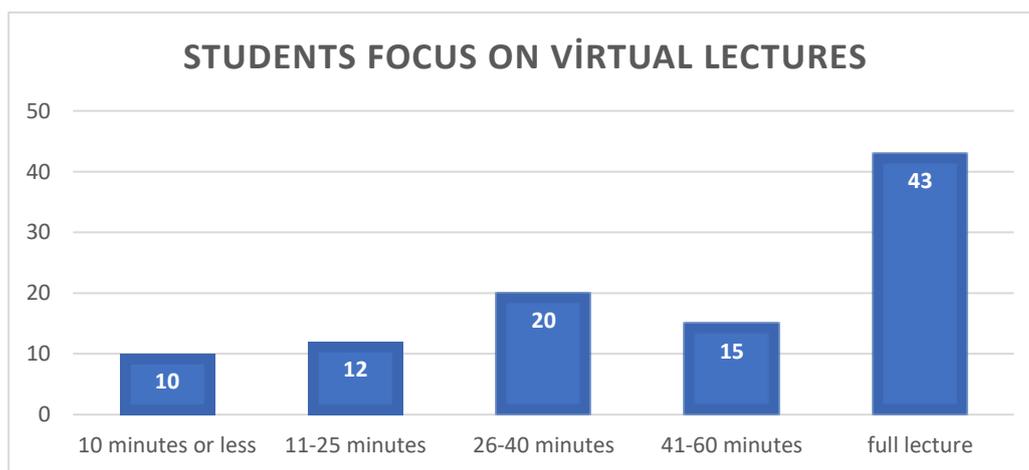

Figure 5. The responses of the study sample to the third study question: **How long are the students concentrate with the teacher during virtual lectures?**

Figure 5 shows Students' focus on virtual lectures, 43% full lectures, 10% (10 minutes or less), 12% (11-25 minutes),20% (26-40 minutes), and 15% (41-60 minutes).

Results related to the fourth question

Table 1. shows the responses of the study sample to the fourth study question: **What are the reasons causing students' lack of attendance and focus on virtual lectures?**

Table 1. Reasons for students' lack of attendance and focus on virtual lectures

n	Reasons for students' lack of attendance and focus on virtual lectures	frequency	%
1.	There are no reasons, they attend all lectures	48	44%
2.	They lack the motivation to attend the lectures	8	7%
3.	There is no special place at home prepared to attend the lectures	17	16%
4.	There is no internet and computer or smart device to be able to attend the lectures	19	18%
5.	Preoccupation with other work	16	15%

Table 1 shows the Reasons for students' lack of attendance and focus during virtual lectures, 44% there are no

reasons and they attend all lectures, 18% There is no internet and computer or smart device to be able to attend the lectures, 16% There is no special place at home prepared to attend the lectures, 15% Preoccupation with other work, and 7% They lack the motivation to attend the lectures.

Conclusions

Considering the results of the study the researcher confirms that:

1. There are some courses in academic programs that require teaching face-to-face such as practical courses that require experience and work. Therefore, students prefer to teach them face-to-face. Also, in some courses that include theoretical and practical aspects students prefer the blended learning style. Some courses include a theoretical aspect, so students prefer full e-learning.
2. That students vary in commitment to attend lectures due to self-motivation and students may be busy with other work. This result agrees with the result of a study (Hollister, Hill-Lindsay ,and Chukoskie, 2022).
3. The difference in the concentration rate of students due to their different circumstances and environments.
4. That the reason for this is the different motives and desires of students.

Abstract: This research aims to analyze and evaluate the constraints and factors that prevent the implementation of CSR principles within SMEs in developing countries, specifically in Morocco. Morocco has adopted a national sustainable development strategy in line with its 2011 constitution and international commitments. The National Strategy for Sustainable Development sets objectives for 2017-2030 and identifies operational measures. It is considered a continuous process that requires various actors, including SMEs, to modify their behavior by integrating socio-environmental components more significantly into their strategic roadmaps. However, recent diagnostics have revealed that while the elements of sustainability are present in the majority of policies, their implementation remains insufficient. This study focuses on both internal variables (employee commitment, strategic decisions, internal organization, and the posture of the entrepreneur-owner) and external variables (competition, business opportunities, and government incentives) that can influence the application and implementation of CSR in Moroccan SMEs. The results highlight significant gaps in terms of employee awareness, company strategy, organizational structure and processes, as well as owner awareness regarding CSR. The findings also suggest that company size, sector, and age are associated with distinct outcomes.

Typology of Corporate Social Responsibility: The Applicability of CSR within SMES Companies in Developing Countries – The Case of Morocco. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 484-505), Cappadocia, Turkiye. ISTES Organization.

Introduction

SMEs are often perceived as problematic in the CSR debate, primarily due to the perceived difficulty they face

in engaging in CSR practices. However, an alternative viewpoint suggests that the problem lies with the CSR debate itself and its current conceptualization, which fails to adequately include SMEs (Jenkins, 2004). CSR is commonly understood and presented as a singular and uniform field of research, which is misleading as it overlooks the specificities of CSR in SMEs (Louche and Michotte, 2011). The terminology associated with CSR may not be suitable for SMEs, as they often struggle to grasp the concept but are capable of defining what it means in the context of their own company (Lynch-Wood, Williamson, and Jenkins, 2009). It is evident that CSR in SMEs should not be studied as if an SME were a miniature version of a large company (Julien and Marchesnay, 1990). Unfortunately, research on CSR in SMEs often suffers from the influence of the "large company" perspective in which the concept of CSR was originally developed. The literature on CSR in SMEs primarily focuses on the strategic and economic aspects of CSR, while neglecting sociological and community issues (Mankelov, 2008). Similarly, when it comes to the role of employees in CSR research within SMEs, we observe similar trends to research conducted on large companies, with a predominant focus on management and external stakeholders. Employees are often regarded as mere recipients of CSR efforts, serving strategic purposes, while their voices are largely unheard, reinforcing a normative approach to CSR.

Global CSR

The notion of CSR is relatively recent, but the concern for the consequences of business and economic activities dates back more than 70 years (Capron, Quarel-Lanoiselee, 2010; Freeman and Hasnaoui, 2011). A socially responsible company is one that recognizes the impact of its actions on the environment, society, and the wider community. CSR has been defined through various approaches. Carroll (2021) argues that a company's efforts should go beyond mere "responsibility," which implies a sense of obligation, and should encompass a way of conducting business and embracing sustainable development. Prakash, Chandra, and Chandrashekar (2021) propose a three-level scheme to align a company's behavior with societal needs. This scheme includes "Social obligation," "Social responsibility," and "Social responsiveness," encouraging companies to anticipate and proactively address the needs of society, rather than simply reacting to them.

CSR and SMEs

Interest in the social responsibility of SMEs has emerged less than two decades ago (Gendron, Lapointe, and Turcotte, 2004). However, the number of academic studies on the subject is increasing (Quarel and Auberger, 2005; Ben Boubaker-Gherib, 2009; Berger-Douce, 2009; Fassin, Van Rossem and Buelens, 2011; Douyon & Paradas, 2022). Theories developed within the context of large corporations can only be partially applied to SMEs (Jenkins, 2004, 2009). The unique characteristics of these small economic entities (Torrès, 1997) pose significant challenges in integrating management principles and responding to specific motivations (Hamdoun, Achabou, and Dekhili, 2022). Moreover, most methodologies have been developed for application in large companies, aiming to ensure certain ethical standards in their activities. However, these CSR methodologies may include criteria that are not always appropriate or fully relevant to the reality of SMEs.

Nevertheless, the inapplicability of these globalized methods does not prevent us from using them as guidelines or parameters for assessing CSR management in SMEs. If we consider that CSR fundamentally refers to values such as ethics towards society, the environment, local authorities, etc., it becomes easier to interpret responsible management and adapt its application to SMEs.

Quairel and Auberger (2005) proposed a strategic framework for understanding CSR in SMEs. According to their approach, the efforts made by SME managers and civil society in relation to CSR expectations are important elements to consider. These authors also suggest that stakeholder theory is a relevant theoretical framework for modeling CSR, regardless of company size. In the management process of SMEs, the relationship between the entrepreneur and stakeholders is not analyzed as an agency relationship but as a relationship of dependence on resources.

Furthermore, Gherib, Spence, and Biwolé (2009) developed a theoretical framework for studying SMEs' commitment to sustainable development. They argue that the neo-institutionalist theory, which considers the company's embedding in a social environment, and the entrepreneurial theory, which focuses on the personal values of leaders, are suitable for analyzing this commitment. Buciuniene and Kazlauskaitė R. (2012) also suggest that economic and organizational approaches reveal that companies' commitment to CSR is primarily explained by organizational and environmental criteria. They note that while this finding applies to large companies, the commitment of SMEs to CSR practices is influenced by organizational criteria but also significantly impacted by the leader's role. Therefore, it is understood why SMEs with similar organizational and environmental criteria, but managed by individuals with different personalities, do not all adopt CSR strategies. The strong centralization often observed in small companies gives the manager and their motivations a crucial role. In a small business, the manager is often the sole decision-maker (Kechiche and Soparnot, 2012), and the vision of this leader becomes pivotal (Bayad and Garand, 1998). The leader is considered the driving force behind CSR and is expected to demonstrate a certain ethical perspective that directly relates to the concept of stakeholders, as discussed by Courrent (2003). The author posits ethics as a relationship with others, and managers must represent the interests of multiple stakeholders, which may have conflicting views. Ultimately, the leader represents just one stakeholder among others (Kechiche and Soparnot, 2012).

CSR Strategic positioning

The unique characteristics of the SME environment, including tools, constraints, and structures, result in different CSR practices compared to large corporations (Rim and Kim, 2016). The limited time, financial resources, and skills often hinder SMEs from formalizing their CSR commitments and effectively managing CSR issues internally or communicating about their actions in this area. Recent surveys conducted in several European countries (Aminudin, 2013; Arnaud and Wasilewski, 2014) indicate that SMEs tend to be more active in local sponsorship-type initiatives rather than adopting a fully structured approach to CSR.

The level of strategic involvement in CSR varies depending on the sector of activity. Industries exert different pressures on companies to consider CSR, given their specific characteristics (Hartmann, 2011). Two factors can

explain the interest in sectoral breakdown. Firstly, there is a need for product differentiation. In sectors where product differentiation based on price or quality has diminished, companies strive to differentiate themselves through environmental or social aspects of their products or production methods. This allows them to attract consumers willing to pay a premium for goods with ethical attributes (Buciuniene and Kazlauskaite, 2012; Rim and Kim, 2016).

CSR and owner's awareness

SMEs often revolve around the entrepreneur or owner, who typically maintains close relationships with employees and tends to communicate changes orally rather than formalizing strategies in writing (Laperche and Levratto, 2012). This informal nature of SMEs requires a specific approach when implementing a CSR strategy, which is based on the personal motivation of the leader. The leader's ethical awareness can lead to the allocation of funds for proactive approaches, while their lack of awareness or disapproval of environmental, social, and societal actions can become an additional obstacle. The central role of the SME manager has been emphasized in theoretical works (Gendron, Lapointe, and Turcotte, 2004; Berger-Douce, 2008) and surveys such as the ACFCI survey conducted by the Assembly of French Chambers of Commerce and Industry (2006), which reported that 91% of the surveyed SMEs identified the manager's conviction as the origin of their CSR approach.

Previous research has shown that the commitment of business leaders, entrepreneurs, and owners is crucial for the success and longevity of a CSR approach (Cooke and He, 2010). However, employee involvement at all stages of the CSR process, from design to implementation and evaluation, is equally important. While management's commitment and support are essential for initiating and sustaining the process, the active participation of employees is crucial in ensuring the effectiveness and efficiency of a responsible corporate policy (Essid, 2009). All internal stakeholders of the company need to be involved to align their work towards achieving the objectives set by the CSR approach.

CSR and Employees Engagement/Training

Few articles relate specifically to employees and their engagement in CSR in developing countries. Academic research on CSR in SMEs is primarily centered on the SME manager. Data related to the leaders is collected – their motivations, personality, origins, community, commitments, point of view, etc. – regardless of the question addressed (Courrent and Gundolf 2008; Del Baldo 2010; Berger-Douce 2011; Des Rochers and Turcotte 2012; Murillo and Lozano 2006; Paradas 2011; Koch, Bekmeier-Feuerhahn, Bögel and Adam, 2019; Kunz, 2020). Admittedly, the manager is a central figure in the SME. Its values and personality significantly guide the positioning and operation of the organization. Moreover, it is often difficult to distinguish the company from its owner in terms of values, policies and day-to-day practices (Murillo and Lozano 2006). However, research neglects the essential contribution of employees, particularly in interaction with the manager.

Employees occupy a central place in SMEs (Jenkins 2009), with most managers considering job creation as their major contribution to society (Painter-Morland and Dobie 2015; Morsing and Spence, 2019). Many researchers agree that employees represent the closest and most strategic stakeholder for the manager (Mankelow 2008; Preuss and Perschke 2010; Oldham and Spence, 2022). Members of an SME very often share the same workplace and the hierarchical distance is apparently less great. That being said, the hierarchical power can be stronger, because the leader and the owner are often one and the same person. The functions in the company are strongly intertwined. Strategic, administrative and operational decisions are then diffused within the organization. These specificities impact the way in which CSR materializes in SMEs (Arenas-Torres, Bustamante-Ubilla and Campos-Troncoso, 2021). Proximity relationships indeed generate processes of reciprocity, trust and cooperation that promote the assumption of social responsibility by SMEs (Murillo and Lozano 2006; Perrini 2006). These processes are implemented more intuitively, informally than strategically (Fassin 2008; Jenkins and Obara 2006), often through unnamed CSR. Codes of conduct or ethical charters are almost non-existent (Courrent 2003), the essence of CSR residing in the implementation of responsible practices at all levels of the organization, in a corporate culture rather than in formalization (Fassin 2008).

One observation across publications and findings is that CSR professional training is currently primarily intended for executive positions, whereas the objective should be to mobilize all of the company's players (management, managers, non-executive employees, staff representatives, etc.). It also appears that when employees take CSR training, it is not uncommon for them to be unable to put their learning into practice once they return to the company (Dubruc and Salameh, 2014). However, each category of actor is likely to make a contribution to the approach and bring it to its level. It should be noted that the actions of employees depend in part on the resources allocated to them by their managers and managers, as well as on the maturity of the sustainable development approaches in the company. Finally, since dialogue with stakeholders is an integral part of CSR, training in dialogue with stakeholders can therefore be considered as CSR training (Guzzo, Abbott, Madera and Dawson, 2022).

According to Turner, McIntosh, Reid and Buckley (2019), CSR accelerates recruitment and employee engagement, particularly among young people. Employees seem to be more committed when the company develops concrete CSR values and programs. In the same study, 51% of workers say they do not want to work for a company that does not have a strong social or environmental commitment. 58% say that CSR is an important criterion in choosing their job. Some even place this criterion above the salary: 55% of respondents say they would choose to work for a socially responsible company even if the salary offered was lower than their other proposals. In general, 70% of employees say they would be more loyal and more faithful to their employer if the latter were really invested in a responsibility approach. This observation is particularly strong among the young generation, namely the Millennials. 79% of Generation Y young people place CSR as a criterion for their job searches, and 76% place CSR above salary in these criteria. According to a Korn Ferry study, nearly 3/4 of employees even say they are disappointed that their employer does not offer more ways to engage on topics related to CSR (Waples and Brachle, 2020).

CSR context in Morocco

Morocco's decision to open its economy and align with the demands of globalization poses a significant challenge for Moroccan companies (El Abboubi and El Kandoussi, 2009). The emergence of new international competitors and the opening of markets compel companies to adopt similar management methods, including social responsibility, in order to maintain their competitiveness against multinational companies and local representatives (Filali, 2009). Corporate social responsibility in Morocco encounters both opportunities and obstacles (El Abboubi and El Kandoussi, 2009). On one hand, its development is motivated and encouraged by a favorable global context that includes innovative legal and institutional reforms.

From a political perspective, initiatives such as the National Initiative for Human Development, reforms in the legislative framework, and the standardization and labeling movement play crucial roles. The royal speech serves as a starting point, encouraging companies to engage in socially beneficial initiatives. The following excerpt from a royal speech illustrates this perspective: "The social responsibility of investors has as its counterpart and condition the social responsibility of companies. In this regard, we follow with interest and satisfaction the action of Moroccan companies that have voluntarily embarked on this path."

On the environmental front, Law 11-03, which pertains to the protection and enhancement of the environment, lays the foundations for the national policy in this area. This policy aligns with universal concerns aimed at safeguarding the environment from all forms of pollution and degradation, improving the living conditions of individuals, and defining guidelines to be followed in the legislative, technical, and financial fields related to environmental protection and management (El Baz, Laguir, Marais, and Staglianò, 2016).

On the legislative level, Moroccan legislation introduced a new labor code in 2004, reinforcing the commitment to human rights and international labor conventions (El Kandoussi & Radi, 2008). Furthermore, on the economic front, the CGEM (General Confederation of Moroccan Enterprises) launched a Label for Corporate Social Responsibility, which serves as a significant catalyst for the establishment and development of CSR in Morocco (CGEM, 2006).

However, several obstacles hinder the progress of CSR in Morocco. These include the predominance of small and medium-sized enterprises (SMEs) (Torres, 1997), the lack of university and professional training that educates future professionals about CSR (Ettahiri, 2009), and the prevailing Moroccan management style, which tends to be discreet and non-declarative, with managers displaying paternalistic tendencies rather than adopting a managerial approach (Echaine and Smouni, 2022). Increasingly, CSR-related work focuses on establishing a close relationship between environmental, social, and economic aspects in company management. Companies cannot fully implement their social responsibility without safeguarding human rights and reporting on them (Berger-Douce, 2008; Brandellec and Cadet, 2014; NgokEvina, 2018). This research does not isolate any of these variables but treats all three components simultaneously to align them effectively with the overall management principles of companies.

As mentioned earlier, CSR principles are employed by any company that aims to adopt a socially responsible approach in its day-to-day management practices. Several CSR principles that address the well-being of employees at work originate from the ISO 26000 guidelines. In this regard, the International Labor Organization (ILO) outlined four fundamental principles in its 1998 declaration that govern the relationship between individuals and work: freedom of association and representation, prohibition of forced labor, non-discrimination, and elimination of child labor.

Additionally, the SA 8000 standard emphasizes social responsibility and the treatment of employees within companies, promoting the establishment of fair and decent working conditions. SA 8000 seeks to globally disseminate codes of conduct concerning employee treatment beyond mandatory national legal frameworks. Introduced in 1997 by the Council on Economic Priorities, it advocates nine key areas of social performance: prohibition of forced labor and child labor, prohibition of disciplinary practices, adherence to essential health and safety regulations, freedom of association and collective bargaining rights, limitations on working hours, establishment of minimum wage levels that meet basic needs, non-discrimination based on race, gender, religion, etc., and independent monitoring and control to ensure compliance with the standard. However, the standard recognizes the necessity of adapting these principles to the local requirements and constraints of each company (Charpateau and Wiedemann-Goiran, 2012).

In Morocco, the CSR charter is considered the standard for corporate social responsibility. Its social component is reflected in the first two axes of the charter. The first axis promotes the respect for all human rights, including the right to freely join trade unions, the prohibition of child labor and forced labor, as well as the elimination of any form of racial or gender discrimination in the workplace. The second axis focuses on continuously improving employment and working conditions, as well as professional relationships. This is achieved through enhancing employee skills and employability, fulfilling the legal obligation of declaring all employees to social security and protection organizations, and ensuring compliance with health and safety regulations as mandated by the current legislation.

The definition of SMEs in Morocco has evolved over time. It began with the establishment of a simplified and accelerated procedure in 1972, followed by the introduction of the SME charter in 2002, the mobilization of a pilot line in 1978, and the promulgation of the investment code in 1983. Since 2002, in order to be classified as an SME, companies must meet the following conditions: existing companies should have a permanent workforce not exceeding 200 people and an annual balance sheet total not exceeding 50 million dirhams over the past two financial years. For newly established companies (less than two years old), they are considered SMEs if they have undertaken an initial investment program not exceeding 25 million dirhams and maintain an investment ratio per employee of less than 250,000 dirhams. To simplify matters, the final version of the new definition of SME, established in 2017, considers only the criterion of annual income and disregards the number of employees. It categorizes companies into three types based on their annual revenues: very small businesses with less than 3 million Moroccan dirhams in annual revenues, small businesses with revenues ranging from 3 to 10 million dirhams, and medium-sized enterprises with annual revenues between 10 and 175 million dirhams.

Research Design Methodology

A quantitative statistical approach was employed in this research, utilizing an online survey to investigate the applicability of CSR in Moroccan SMEs. The survey consisted of two parts. The first part aimed to explore the internal factors that may influence the implementation of CSR practices from the perspective of SME entrepreneurs-owners. The second part focused on the external factors. To design a reliable and valid questionnaire, discussions and meetings were conducted with 23 potential entrepreneurs and participants. Their input was sought to determine the important determinants that influence their perception of CSR applicability. From these discussions, two meta-dimensions emerged: internal and external dimensions. Annex 1 provides a summary of these determinants as drawn from the discussions.

A total of 250 potential participants were randomly selected, representing various industries and regions. The research was conducted in the second semester of 2021 and covered the cities of Casablanca, Rabat, and Tangier, which are the three most important economic regions in the country. Names and contact details were obtained from the Moroccan Office of Industrial and Commercial Property (OMPIC, 2022), the institution responsible for centralizing and providing access to company information in the country (such as legal status, activity, region, financial statements, etc.) based on the national commercial trade logbook. Potential participants were contacted via phone calls and emails and were invited to complete an online questionnaire (see Annex 2). Out of the 210 respondents, 123 valid questionnaires were considered for this study. Table 1 below displays the distribution of companies according to their profile:

Table 1. Main summary statistics

Variable/values	Statistic
Size: Very small	25.2%
Size: Small	29.3%
Size: Medium	45.5%
Sector: Primary	14.6%
Sector: Secondary	54.5%
Sector: Tertiary	30.9%
Number of employees	
Average	33.8
Median	20
Standard Deviation	30.4
Years in operation	
Average	8.8
Median	8
Standard Deviation	6.4

The method employed to collect data was through self-administered questionnaires. This presents the advantage of efficiency and standardization, providing participants with a clear understanding of the limited time required to answer. This method allows for the collection of data in a relatively quick manner while respecting the privacy of participants. Furthermore, the anonymity provided by questionnaires encourages honest responses. Standardization also helps to minimize incorrect and inappropriate responses. However, one important disadvantage is the uncertainty surrounding who actually completed the questionnaires. Once questionnaires are sent to participants, it becomes difficult to track and ensure their accurate completion. Additionally, it is challenging to assess the attitudes and feelings participants may have had when reading the questions, and there is a possibility of misinterpretation. While some of these issues could potentially be addressed through individual interviews, they cannot be entirely eliminated.

Table 2. List of questions presented to the respondents

Dimension	Information area	Variable	Question
Employees	Are Employees engagement in CSR principles?	INT_Empl_1	Would you say that employees are aware of the CSR principles?
		INT_Empl_2	Would you say that employees demonstrate engagement in CSR activities?
		INT_Empl_3	Would you say that employees are trained to apply CSR principles?
		INT_Empl_4	Would you say that employees demonstrate CSR principles understanding and interests?
Company's Strategy	Does the company' Strategic management reflect CSR principles?	INT_Str_5	Would you say that CSR principles are aligned with the company's strategy?
		INT_Str_6	Would you say that the company's strategy reflects any CSR application?
		INT_Str_7	Would you say that applying CSR principles strengthens the company's strategic decision?
		INT_Str_8	Would you say applying CSR principles will increase productivity and competitiveness?
Company's Structure	Is the company organized to support and capture CSR advantages?	INT_Org_Pro_9	Would you say that the company measures adequately its carbon footprint?
		INT_Org_Pro_10	Would you say that the company has sufficient time and competencies to implement CSR practices?
		INT_Org_Pro_11	Would you say that the company's IT system will support CSR principles application?
		INT_Org_Pro_12	Would you say that the company's global organization and processes are capable of supporting CSR practices?
		INT_Org_Pro_13	Would you say that CSR principles will improve productivity costs?
Owner Awareness	Is the owner aware? Does the owner	INT_Own_14	Would you say that you are fully aware of the CSR principles and objectives?
		INT_Own_15	Would you say that you promote CSR applications in your

	promote CSR?		company?
		INT_Own_16	Would you say that CSR principles and applications have its own merits?
		INT_Own_17	Would you say that you consult employees regarding CSR applications and challenges?
Competitive Advantage	Is CSR principles bringing value to the company?	EXT_Comp_18	Would you say that CSR principles will reinforce the company's market position?
		EXT_Comp_19	Would you say that CSR principles will give the company a reliable and stronger competitive advantage?
Business Opportunities	Is CSR principles helping to capture business opportunities?	EXT_Buz_Opp_20	Would you say that CSR principles will help to develop new business opportunities?
		EXT_Buz_Opp_21	Would you say that CSR principles will contribute to reach and capture new costumers?
		EXT_Buz_Opp_22	Would you say that CSR principles will help to enhance the company's quality of products/services?
		EXT_Buz_Opp_23	Would you say that CSR principles will help the company to develop business partnership?
Fundings issues	Is there enough support from the government?	EXT_Fund_24	Would you say that the government provides enough support to implement CSR practices and principles?
		EXT_Fund_25	Would you say that government/agencies provide enough support to implement CSR practices and principles?
		EXT_Fund_26	Would you say that government provides financial support to implement CSR practices and principles?
Incentives issues	Are incentives really attractive to implement CSR principles?	EXT_Inc_27	Would you say that government/agencies provide encouragement to develop and implement CSR principles?
		EXT_Inc_28	Would you say that Government Agencies provide enough incentives to implement CSR principles?
		EXT_Inc_29	Would you say that the Government Agencies communication strategies/actions are appropriate to help in applying CSR principles?

Note: respondents could choose between 5 levels of agreement, from 1 (strongly disagree) to 5 (strongly agree)

Anonymity

No respondent or company was ever disclosed. Respondents were ensured that field notes, data and transcripts did not contain personal identifiers. Raw and processed data was locked, and password protected.

Informed consent

To get informed consent from participants, trustful and reliable communication was established with participants. First, background information on the main researcher was provided. Furthermore, the aim and brief outline of the research was discussed and clarified. They were told the purpose of the questionnaire, how much time it should take to fill out and whether they wanted to receive the findings by email. They were told about the

general research schedule and planning.

Confidentiality

Participants were told sensitive data would not be shared. Any other type of data would be shared with those who are part of the research team. Results were reported in a way that protects participants' identity and prevents tracking back their sources. To reassure respondents, they were informed of all procedures used to keep data safe and under control. Moreover, data collected was not used for any other purpose.

Results

Descriptive statistics

We begin the analysis of the data by examining the average of the responses to all the questions presented in Table 1. Figure 1 illustrates the overall averages across all statements, differentiating between internal and external factors. Lower values indicate disagreement with the statements, while higher values indicate agreement. Respondents displayed a higher level of disagreement with statements concerning internal factors, particularly regarding whether employees are trained to apply CSR principles and whether the company adequately measures its carbon footprint. This indicates gaps in terms of employees' awareness, strategy, company structure and processes, as well as the owner's awareness. On the other hand, the highest level of agreement was found in relation to statements concerning external factors, specifically whether Government Agencies provide enough incentives to implement CSR principles. The average of responses for external factors is significantly higher than the average for internal factors (2.23 on average compared to 1.82 on average; p -value < 0.00 obtained from a paired t-test).

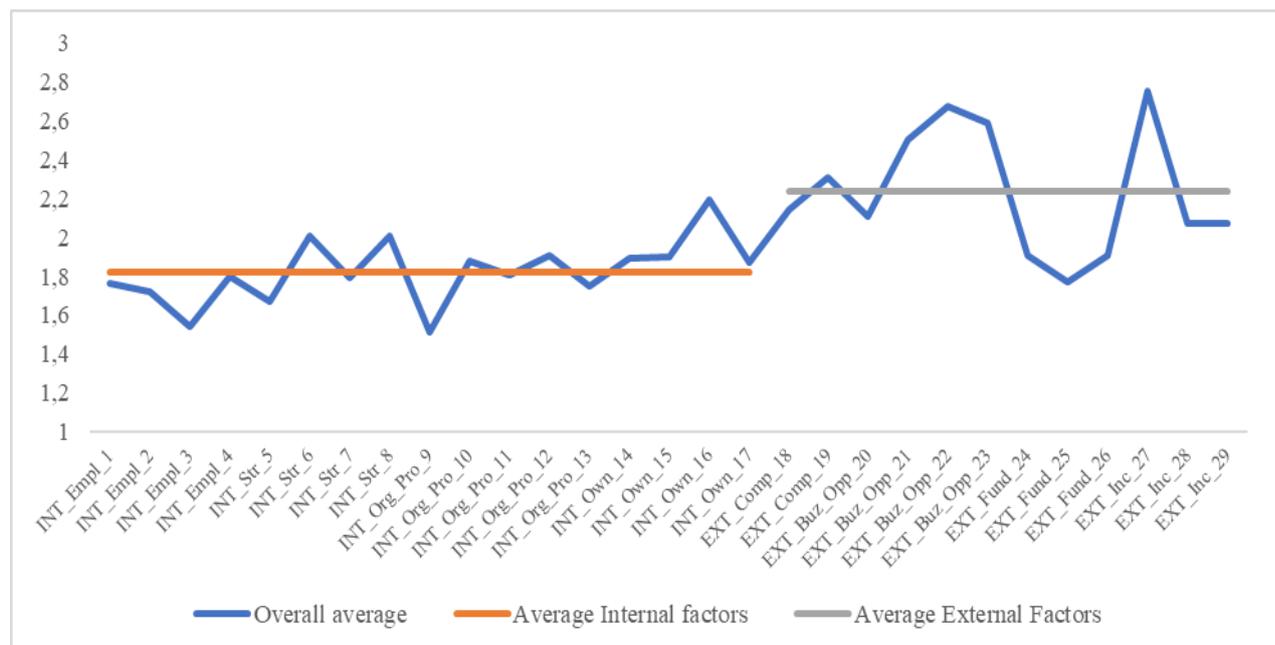

Figure 1: Average of answers to statements related to internal and external factors

Next, we examine whether there are significant differences in the importance of internal and external factors based on the size of the company (Figure 2), the sector in which it operates (Figure 3), and the number of years it has been in operation (Figure 4). The disparity in terms of company structure and processes becomes less pronounced when considering smaller companies. Very small companies tend to agree more that "the company's global organization and processes are capable of supporting CSR practices," while for small companies, external factors appear to be more important.

When assessing differences by sector, companies operating in the tertiary sector show a much stronger agreement with the statement that "government/agencies provide encouragement to develop and implement CSR principles." Examining differences by the number of years in operation, younger companies (in operation for up to 8 years) seem to agree more with statements related to business opportunities.

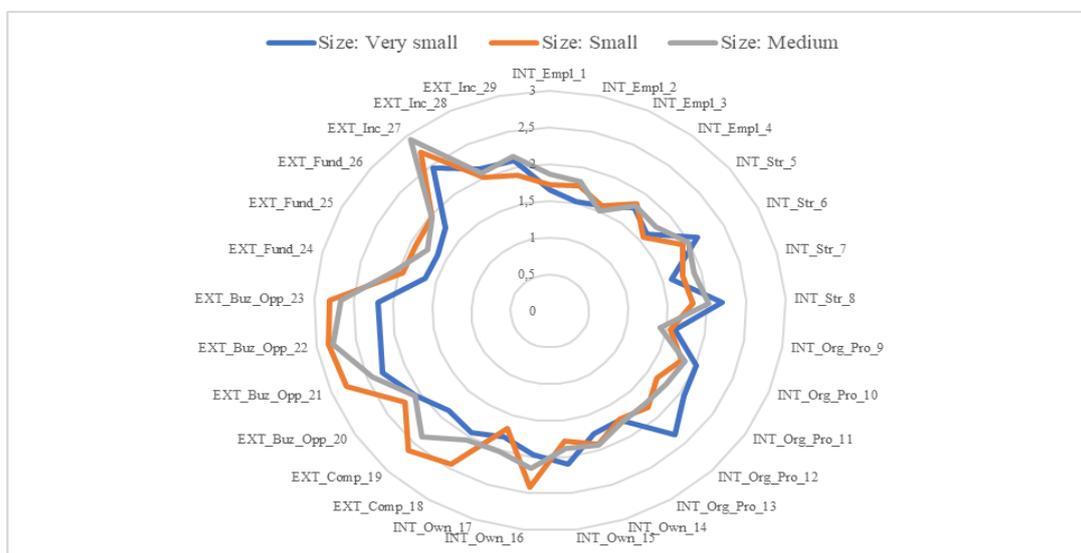

Figure 2: Average of answers to statements related to internal and external factors by size

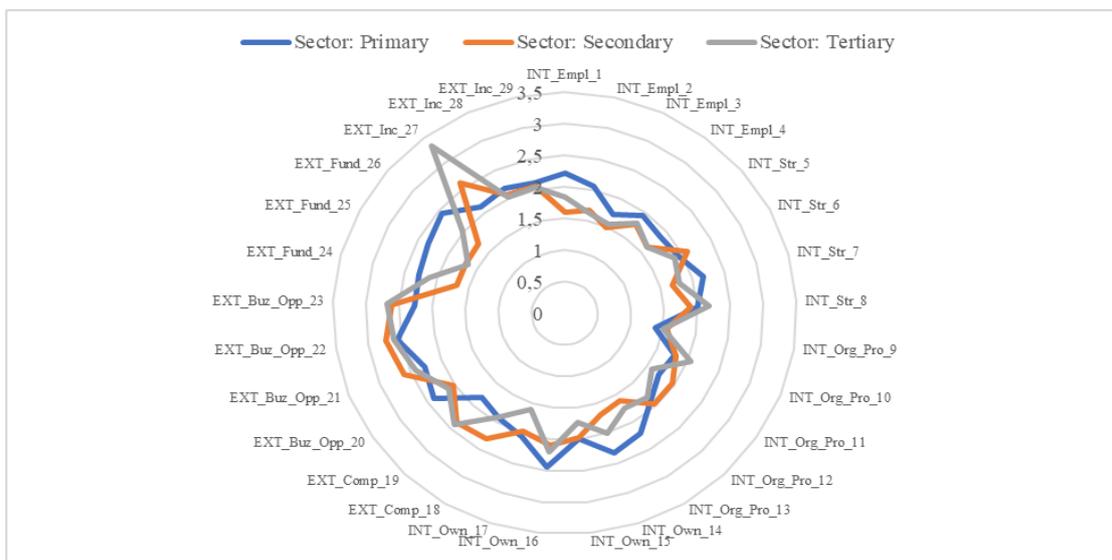

Figure 3: Average of answers to statements related to internal and external factors by sector

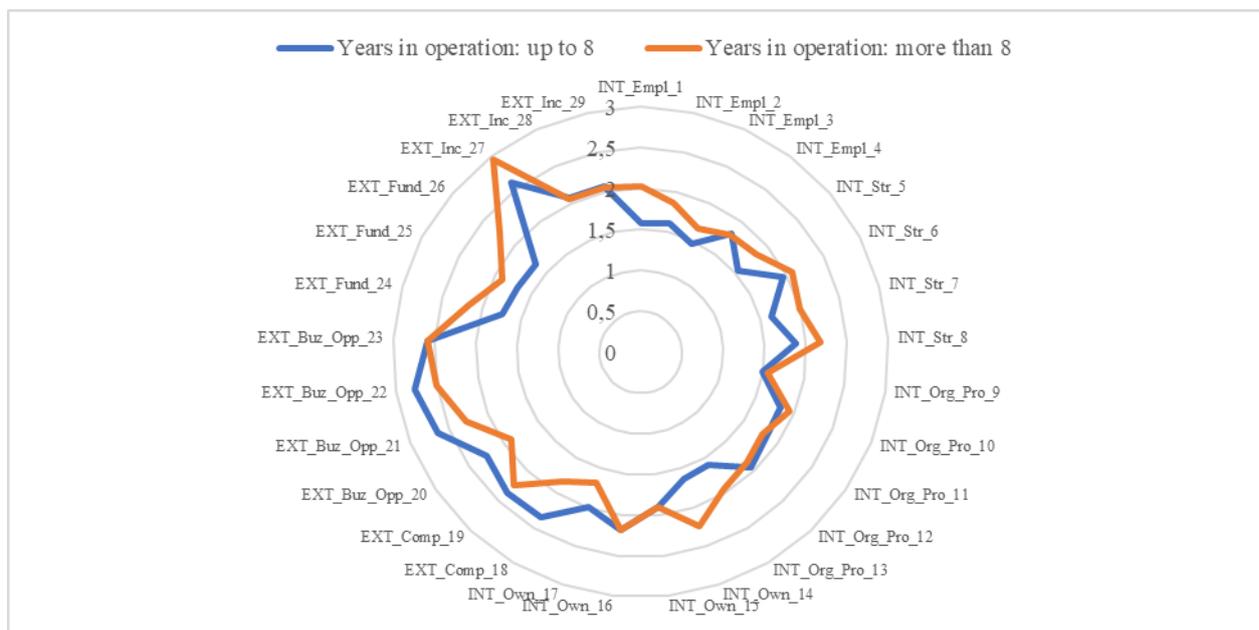

Figure 4: Average of answers to statements related to internal and external factors by years

Factor analysis

We utilized factor analysis (Bartholomew et al. 2008) to derive the dimensions mentioned in Table 1. Subsequently, we calculated individual score factors for each dimension. The statements int_empl1-int_empl4 were employed to derive the dimension "employees," which indicates the extent to which respondents perceive employees' awareness of and engagement with CSR principles. Answers to the statements INT_Str_5-INT_Str_8 were utilized to derive the dimension "strategy," representing the alignment of the company's strategy with CSR principles.

Concerning the statements pertaining to the company's structure, we derived two factors to capture sufficient variance: Process_time and Process_measurement. The former was based on statements INT_Org_Pro_10 and INT_Org_Pro_12, while the latter was based on INT_Org_Pro_9, INT_Org_Pro_11, and INT_Org_Pro_13. Finally, for the internal dimension "Owner," we employed the statements INT_Own_14-INT_Own_17. Individuals scoring higher on the Owner dimension agree that they are aware of the CSR objectives and promote them within the company, but they tend to not seek employee consultation on the matter.

Similarly, from the statements related to external factors, we extracted one dimension each for "Competitive advantage," "Opportunities," "Funding," and "Incentives." Those who score higher in terms of competitive advantage agree that CSR policies would strengthen the company's market position. Respondents with higher scores on the "Opportunities" dimension are more likely to agree that CSR will help the company capture business opportunities. Individuals scoring higher on the "Funding" dimension strongly believe that the government supports the implementation of CSR policies. On the other hand, "Incentives" refers to the extent to

which individuals believe government agencies provide sufficient incentives and have the appropriate communication strategy.

Table 2 presents the pairwise correlation coefficients between the score factors derived from the internal and external CSR dimensions. Individuals who score higher in terms of opportunities also score higher in terms of competitive advantage, showing a significant positive correlation of 0.74. Furthermore, those who score higher in terms of strategy also score higher in terms of employees' awareness (significant positive correlation of 0.60), funding (significant positive correlation of 0.63), and process measurement (significant positive correlation of 0.30). However, they exhibit a lower correlation with competitive advantage (significant negative correlation of -0.31), and there is no significant correlation with business opportunities. This indicates that, even among supporters of CSR policy implementation, the perceived impact in terms of competitive advantage is not seen as a driving factor.

Table 2. Correlation matrix between score factors of internal and external CSR dimensions

	Employee s	Strateg y	Process_tim e	Process_measur ement	Competitiv e advantage	Opportunitie s	Fundin g	Incentive s
Employees	1							
Strategy	0.6012*	1						
Process_time	-0.1366	-0.1364	1					
Process_measurement	0.3018*	0.3000*	-0.0269	1				
Owner	0.2205	0.296*	-0.093	-0.1394				
Competitive advantage	-0.3192*	-0.251*	-0.1688	-0.2437*	1			
Opportunities	-0.1152	-0.1485	-0.1721	-0.2623*	0.7433*	1		
Funding	0.6383*	0.6514*	-0.2009	0.2525*	-0.2790*	-0.0484	1	
Incentives	0.1701	0.0352	0.1369	0.0900	-0.2712*	-0.2167	-0.0023	1

We now inspect differences in score factors by groups of interest. Process time (i.e. having enough time and competencies to implement CSR policies) is significantly more important for very small companies; in addition, Competitive advantage and business opportunities are significantly more important for small companies (Table 3). We do not find a significantly greater awareness of employees in very small or small companies.

Table 3. Average score factors by company size

	Very Small	Small	Medium	ANOVA (P-Value)
Employees	-0.2	0.01	0.11	0.23

When comparing averages score factors by sector (Table 4), additional insights emerge. Awareness of employees is significantly greater in companies operating in the primary sector. Significantly greater in this sector also the alignment in terms of strategy and funding. Awareness of employees is much lower among companies operating the secondary sector.

Table 4. Average score factors by sector

Next, we present in Table 5 the comparison of average score factors between younger companies (operating for up to 8 years) and older companies (operating for more than 8 years). Older companies exhibit significantly higher scores in the dimensions of employees, strategy, process measurement, owner, and funding. However, older companies find it more challenging to perceive business opportunities and competitive advantage arising from CSR adoption.

Discussion

The results indicate that globally, internal factors such as employees, owner's awareness, company strategy, and company structure appear to have a stronger influence in preventing the implementation of CSR principles. Moreover, it seems that internal factors have a more significant impact on preventing CSR implementation within small (revenues less than US 1M) and medium-sized companies (revenues less than US 17.5M) compared to very small companies (revenues less than US 300K). Very small companies, according to their owners, are more likely to be receptive to CSR principles. This difference may be attributed to the fact that very small companies are highly results-oriented and adopt a managerial approach directly influenced by their day-to-day operations. Additionally, as these companies generate less than 3 million dollars annually, their leaders may believe that adopting CSR principles provides an opportunity for improvement and capturing market value. Very small companies may also be more flexible in implementing the necessary changes and improvements to integrate CSR principles.

Surprisingly, a significant number of very small companies included in the research belong to the tertiary sector, encompassing activities such as commerce, transport, financial and real estate services, business and personal services, education, and social work. This finding suggests that owners of very small companies perceive CSR principles as likely and easier to implement, as they may not require substantial investments compared to sectors such as primary industries, which involve heavy machinery and complex production processes necessitating significant investments. The presence of sustainability principles in the vision of managers of very small companies highlights the strategic nature of CSR.

Interestingly, the factors influencing CSR practices do not depend on the nature of the company (primary, secondary, or tertiary). This observation aligns with Simpson's paradox, which states that the same phenomenon can occur within different groups but is reversed when the groups are combined.

On the contrary, it appears that the older a company is, the more it tends to blame external factors, specifically funding and incentive issues. It seems that older companies attribute the lack of financial support from the government to their challenges. This could be explained by the fact that older companies may have a solid and

reliable internal structure, while implementing changes may require substantial investments that these companies cannot undertake. For these owners, government support is necessary and seen as a precondition to implementing CSR principles. Another explanation could be that owners of older companies may have already tried to obtain financial support, but it was declined or companies simply gave up due to complex, bureaucratic, and time-consuming procedures.

In conclusion, the results of this first part of the discussion indicate that small or medium-sized companies, regardless of their sector and operating for less than 8 years, are more likely to attribute blame to internal factors. Paradoxically, very small companies that blame internal factors tend to be more prevalent in the tertiary sector. These findings suggest that if the Moroccan government aims to address CSR implementation challenges, it should take into account the company's sector and age.

Older companies (more than 8 years in business) are characterized by significantly higher scores in the dimensions of employees, strategy, and process measurement. This indicates that, first, older companies have more difficulties in perceiving business opportunities and competitive advantages stemming from CSR adoption. Second, their employees, strategy, and internal processes and procedures are not significant obstacles to CSR implementation from the owner's point of view. As a result, the Moroccan government should promote CSR principles to companies that have been in operation for more than 8 years by emphasizing the benefits and competitiveness that come with it. Morocco has recently experienced a breakthrough in the field of corporate social responsibility with the obligation for companies listed on the Casablanca Stock Exchange to include an ESG chapter (environmental, social, and governance) in their annual reports. However, this may not be enough to encourage companies to improve their CSR effectiveness, especially considering that most listed companies belong to the 8+ age tier and are of medium size. Despite the Moroccan government and agencies promoting CSR as a vector for the sustainability of a company's activity in the medium and long term, and its impact on managerial strategy in terms of risk anticipation, efficiency improvement, and cost optimization, the results show that older and established companies are more concerned about the extent to which CSR effectively contributes to competitiveness and return on investments.

On the other hand, paradoxically, competitive advantage and business opportunities are significantly more important for small companies than for medium-sized ones. Combining the previous finding with this one, it suggests that small companies (with revenues between US \$300K and US \$1M) that have been in business for less than 8 years see CSR as a source of competitive advantage and business opportunities. For the Moroccan government, this result indicates that officials should tailor their approach to convince companies to adopt CSR principles by shaping their communication strategy and support, taking into consideration not only the size of the company but also the sector and the number of years in the market. It may be challenging for the government to segment the market based on these variables, but the results show that concerns significantly differ across sectors and company sizes. Additionally, the variable "process time" (having enough time and competencies to implement CSR policies) is significantly more important for very small companies. It appears that very small companies are either prepared to make the necessary changes in their practices to align with CSR

principles or they already possess the necessary competencies to adapt to CSR. Once again, promoting CSR principles among small and medium-sized enterprises (SMEs) to help them adopt these practices depends on multiple variables and requires a thorough and nuanced analysis by the government and public agencies responsible for CSR implementation nationwide.

Limitation

One of the major limitations of this research lies in the relatively small size of the population, considering that 98% of companies in Morocco are SMEs. Moreover, it is unclear to what extent participants genuinely responded to the questionnaire and whether some owners fully understood the questions, as some of them may be illiterate or have a limited understanding of the French language. Another limitation could be the geographical scope, as this study only covers three regions of the country, albeit the most economically active ones. There are several other cities and economic clusters that could be studied and analyzed for a more comprehensive understanding.

Conclusion

CSR is the contribution of companies to the challenges of sustainable development. A company that practices CSR will, therefore, seek to have a positive impact on society while being economically viable. The orientation of the Kingdom of Morocco towards sustainable development is reflected in the text and the spirit of its 2011 constitution. Indeed, the constitution assigns to the state the mission of working towards the achievement of sustainable human development, social justice, and the preservation of national natural resources and the rights of future generations. CSR remains a voluntary and structured approach that allows companies to be part of the sustainable development objectives and work towards their achievement. Each company can, according to its own means, participate in the achievement of CSR objectives.

However, this research shows that CSR adoption by SMEs in the country faces a number of obstacles. These include internal factors such as resources, competencies, shareholders' awareness, and companies' strategy, as well as external factors like government leadership communication to promote and support CSR. The findings indicate that government actions to help CSR development within SMEs should be tailored to the nature, sector, and age of these companies.

Abstract: Earlier at the ICRES 2022 we discussed readiness of teachers of the Chemistry Faculty of the Karaganda Buketov University for the student-centered learning approach lately implemented at the Kazakhstani universities. In particular, we studied the progress made by academic staff in mastering interactive lecturing, case-study, problem-based learning etc. In this study we focus on project-based learning (PBL) and reveal teachers' perceptions regarding the method benefits and challenges as well as preparedness for learning by doing from students' perspective. Academic staff of four Departments as well as students and Master students admitted in such educational programs as "Chemistry", "Chemistry-Biology" and "Pharmaceutical Manufacturing Engineering" were involved in our study. These educational programs train both future teachers and technologists. It was crucial to analyze how both undergraduates and postgraduates of different training programs evaluate the project method efficiency in mastering knowledge in chemical disciplines. Surveys of educators and learners were conducted. The collected data was processed and analyzed. The research results show that the academic staff and learners of the Faculty of Chemistry understand PBL from both positive and negative perspectives. The findings can be beneficial for teachers and students, as they will help them to reflect on their own practice in this educational strategy. There has been demonstrated the need for further research in this direction to better understand teachers' and learners' demands in order to improve the method application at the universities in Kazakhstan.

Introduction

New challenges in education require teachers to use new ways of learning and teaching. Universities in Kazakhstan replace traditional academic strategies of passive learning by student-centered learning. Our previous research focused on the teachers' methodological readiness for student-centered learning and challenges associated with its implementation (Minayeva Ye. et al., 2022). We also discussed the effectiveness of the student-centered learning approach for students' achievement in universities in Kazakhstan (Sugralina L. et al., 2017).

Project-based learning (PBL) is known as an effective student-centered learning method with the variety of benefits for students despite some difficulties for learners and challenges for educators. PBL is a teaching method that is engaging and motivating (Bell, 2010). It is a learner-driven, customized, and collaborative learning system that leads to transformational learning. Implementation of PBL has contributed to increases in students' retention of concepts, engagement, and academic success (Harrigan, 2014). PBL has the ability to enhance students' learning (Jones, 2007), engage students on a deeper cognitive level than traditional teaching methods. For some teachers and students, PBL is more effective than traditional teaching methods because different learning styles or multiple intelligences are intertwined in the learning strategy (Filippatou & Kaldi, 2010).

There are several positive reasons for integrating PBL in the practical classes. However, researchers have found that some teachers are reluctant to integrate PBL into the classroom. Major challenges for using PBL are time, effort, fairness, assessment, lack of resources, and control (Wirkala & Kuhn, 2011). Some educators find becoming a facilitator a challenge. They feel uncomfortable or even resist letting go of their control (Mitchell et al., 2009). To date, such disputes on PBL have been based mostly on international experience, and there is a lack of research discussing the situation at Kazakhstani universities. It remains unclear how teachers in Kazakhstan implement PBL, and what benefits and challenges of using PBL they identify. At the same time, it is necessary to investigate students' preparedness for learning by doing. Therefore, this study attempts to fill the research gap about the application of PBL in Kazakhstan. This paper aims to reveal the perception of teachers of the Chemistry Faculty of the Karaganda Buketov University towards the PBL approach and discuss students' preparedness to it.

Method

This is case study research that was conducted to determine faculty perceptions regarding the implementation of PBL, as well as students' readiness to learn in practice. The setting of the study is the Chemistry Faculty of the Karaganda Buketov University. In order to determine teachers' perceptions regarding problems and benefits of PBL implementation, we conducted a survey of the Chemistry Faculty teaching staff in 2022-2023 academic year. We developed our own questionnaire in two training languages, which included 11 closed and open-ended questions. A total of 31 teachers that was 52% of academic staff took part in the survey. A questionnaire for students and master students included 9 questions. A total of 93 students and master students of the Chemistry Faculty took part in the survey. Questionnaires of the teaching staff, students and master students were subjected to subsequent analysis of the data obtained.

Results

Information about respondents among teachers

Most of the respondents among teachers, namely 91% have an academic degree. Teachers with teaching experience from 15 to 19 years comprised the largest number of respondents, namely 26%. Representatives of all four departments of the Chemistry Faculty took part in the survey. Teachers of the Department of Organic Chemistry and Polymers were the most active ones (15 persons or 48 %). At the same time, teachers in the position of associate professor showed the greatest activity.

Teachers' proficiency in PBL

According to the survey results, 77% of academic staff consider themselves PBL proficient and 7% are unsure of their PBL proficiency. At the same time, 16% of respondents among teachers had difficulty answering this question. As regards the periodicity of using PBL in the teaching process, a total of 13 % of academic staff apply this approach consistently, whereas a total of 13% do not apply it in the instructional process. The majority of teachers, namely 74% of respondents use PBL occasionally.

Self-Evaluation of methodological preparedness for PBL practical implementation

In order to assess the methodological readiness of teachers to implement PBL in practice, chemistry faculty members were asked to rate it on a 0-5 scale. The results are summarized in Table 1.

Table 1. Self-Evaluation of methodological preparedness for the PBL practical implementation

Evaluation from 0 to 5-point scale	Percentage, %
0	3
1	0

2	6
3	39
4	29
5	23

As can be seen from the table a total of 23% of respondents confidently implement PBL.

The main incentive for teachers to use PBL in teaching/learning process

Among the significant incentives for using PBL in the instructional process, educators cited a desire to increase students' mental alertness and creativity. Other important incentives for using PBL in the teaching/learning process are listed in Table 2.

Table 2. The main incentives for using PBL in the educational process

Incentive	Number of respondents, persons	Percentage, %
Desire to enhance the students' mental activity and creative potential	25	81
Desire to comply with modern trends in education	10	32
Need for continuous improvement of students training	9	29
Need for a successful open session	4	13

Benefits in the application of PBL in the teachers' practice

In order to discuss the benefits of using PBL in faculty practice, academic staff were asked to highlight a number of benefits of the PBL approach. Faculty responses are shown in Table 3. Respondents could select several options in the response box.

Table 3. Benefits in the application of PBL in the teachers' practice

Benefits	Number of respondents, persons	Percentage, %
Achieving a better understanding by students of what they are doing and why	20	64
Development of critical thinking and creativity in students	16	52
Achieving greater student activity in acquiring knowledge and skills	12	39
Continuous professional development of academic staff	6	19

Problems which teachers face when implementing a PBL approach

Teachers were also asked to describe problems encountered when implementing PBL in teaching. Teachers' responses are summarized in Table 4. They were able to select several options.

Table 4. Problems which teachers face when implementing a PBL approach

Problems	Number of respondents, persons	Percentage, %
Students' unwillingness to take responsibility for managing projects; activities in the classroom and outside the classroom	18	58
Uneven assimilation of knowledge by students	15	48
Preparing for classes requires more teachers' time	10	32
Difficulty in assessing students' academic achievements	5	16
Noise in the classroom and chaotic organization of the learning space	2	6

Ways to solve problems arising from the implementation of PBL

To overcome problems associated with the PBL approach implementation, teachers suggested several ideas which are given in Table 5. Teachers could choose several options from the list.

Table 5. Ways to solve problems arising from the PBL implementation

Ways to overcome problems associated with PBL	Number of respondents, persons	Percentage, %
Phased implementation of PBL	13	42
Informing students about the ideas behind PBL	11	35
Methodological assistance to teachers for the implementation of educational innovations from the Faculty and the University	11	35
Application of various forms of stimulating students to independent learning activities	10	32
Giving students enough time to learn at their own pace and empowering learners as mentors to peers	10	32
Comprehensive support for the best experience in teaching for implementation of PBL approaches	6	19

Information about students

Most of the respondents among students, namely 91% were undergraduate students and 9% were master students. Representatives of first, second, third and fourth year of study took part in the survey. Students of the second and third year of study were the most active. At the same time, undergraduate students and graduate students admitted in such educational programs as “Chemistry”, “Chemistry-Biology” and “Pharmaceutical Manufacturing Engineering” were involved in our study. These educational programs train both future teachers and technologists.

Practical experience of students in PBL

In this part of the survey, students were asked if they were familiar with PBL. The vast majority of learners (54%) responded that they knew what the PBL approach was, while 34% of respondents were unaware of the method. In addition, students were asked if they had any experience with assignments in the form of project work. A total of 52% of students had completed assignments in the form of a project, while 40% had not.

Evaluation of PBL effectiveness by students

Students were asked to rate on a 5-point scale how effective their learning was with the PBL approach. The results are shown in Table 6.

Table 6. Evaluation of PBL effectiveness by students

Problems students encountered when completing PBL assignments

Students were also asked to discuss problems they had encountered with PBL assignments. When answering this question, students could select several options in the answer box. The results are given in Table 9.

Table 9. Problems students encountered when completing PBL assignments

Problems	Number of respondents, persons	Percentage, %
You had to study a large amount of additional scientific and educational literature	44	47
It took you a long time to prepare	40	43
You have had difficulty interacting with other team members	20	21
Lack of incentives for independent learning activities	15	16
An increased level of responsibility in carrying out independent work in the form of a project	8	9

Discussion

To begin, we wanted to find out how well teachers of the Chemistry Faculty are familiar with the PBL approach and how often they apply it in their teaching practice. According to the survey results, most of the teachers surveyed, namely 77% consider themselves to be proficient in PBL, while 7% were not confident about their proficiency in PBL. At the same time, 16% of educators had difficulty answering this question. Regarding the frequency with which project-based learning is used in the classroom, 13% of educators use the approach all the time, while 74% of respondents use it occasionally. A total of 13% of teachers do not use this approach in the teaching process at all.

At the same time, 23% of teachers evaluated their methodological preparedness for the maximum score on a 5-point system, while 39% of teachers, a majority, rated their readiness as a 3-point score. One respondent (3%) of the academic staff stated a complete lack of practical skills in PBL. In addition, among the most important incentives for the PBL approach implementation in the educational process, teachers named the desire to enhance the students' mental activity and creative potential as well as desire to comply with modern trends in education.

In order to explore the attitudes of teachers of the Chemistry Faculty to the PBL approach, we asked them to highlight a number of benefits and discuss problems associated with the PBL implementation into the teaching/learning process. Teachers mentioned the following benefits of a PBL approach:

- Achieving a better understanding by students of what they are doing and why – 20 respondents (65%);
- Development of critical thinking and creativity in students – 16 respondents (51%);
- Achieving greater student activity in acquiring knowledge and skills – 12 respondents (39%).

As regards problems which teachers face when implementing a PBL approach, it is worth to mention the following ones:

- Students' unwillingness to take responsibility for managing projects; activities in the classroom and outside the classroom - 18 respondents (58%);
- Uneven assimilation of knowledge by students - 15 persons (48%);
- Preparing for classes requires more teachers' time – 10 respondents (32%).

To overcome problems associated with the PBL approach implementation, teachers suggested phased implementation of PBL, informing students about the ideas behind PBL, as well as methodological assistance to teachers for the implementation of educational innovations from the Faculty and the University.

Turning to undergraduate and graduate students surveyed, the majority of students (54%) responded that they were familiar with the PBL approach, while 34% of respondents knew nothing about the method. In addition, undergraduate and graduate students were asked if they had any experience with assignments in the form of

project work. A total of 52% of students had completed assignments in the form of a project, while 40% of students had not. These results indicate that the Academic Council of the Chemistry Faculty should look at how to promote the PBL approach in the department and engage students in project-based activities.

Students also assessed how effective their learning was with the PBL approach. The results showed that 36% of respondents considered PBL to be a very effective method, while 16% of students surveyed considered the method ineffective. Students were asked to rate their readiness to perform PBL assignments on a 0-5 scale. A complete lack of practical PBL skills was reported by 18% of the students surveyed, while 38% of respondents were prepared to complete PBL assignments. Students rated on a 5-point scale their interest in completing project assignments in the future. It appeared that 40 students (44%) were confidently interested in doing PBL work in the future, while 7 respondents (8%) stated a complete lack of interest in PBL.

Students also noted that they encountered a number of problems while completing PBL assignments. Learners noted that they had to study a lot of additional scientific and scholarly literature; they needed a lot of time to prepare; and they had difficulty interacting with other team members. Looking for recommendations to improve the practice of the PBL approach in the department, students suggested improving the material conditions for practical assignments in the project method and finding more topics for project work. Surprisingly, the students surveyed chose to work on projects independently rather than in teams.

The results were discussed at the Academic Council of the Faculty of Chemistry. A number of recommendations were developed to improve the practice of using PBL at the Faculty of Chemistry. The obtained results can be useful for teachers and students, as they will help them to think about their own practice of applying this educational strategy. As a result of the case study research, the need for further investigation in this direction was identified in order to better understand the needs of teachers and students and to promote the application of the method in universities in Kazakhstan.

Conclusion

A total of 77% of the surveyed academic staff of the Chemistry Faculty are confident in PBL, although 74% of teachers use the approach occasionally in their teaching. Only 13% of respondent teachers use this method consistently in their teaching, and 13% of teachers do not use it at all. A total of 38% of students are confidently prepared to do PBL work. A complete lack of practical skills in PBL was reported by 18% of students. PBL is considered an effective tool because it provides students with the opportunity to learn through project activities, although this approach is time-consuming for both teachers and students. Problems with group work and cases of unequal contributions to the course of group work are also mentioned. Reported benefits include: increased engagement and motivation to learn, skill development, collaborative learning environment, and improved academic performance. Students also find PBL to be a method that promotes a better understanding of course content through a hands-on approach. It is important that students enjoy the class and are engaged in the

learning process. The findings can be beneficial for teachers and students, as they will help them to reflect on their own practice in PBL.

Acknowledgements

We are grateful to all colleagues, undergraduate students and master students of the Chemistry Faculty of the Karaganda Buketov University for participating in the surveys.

Abstract: The process of retaining leadership succession at higher education institutions (HEI) is crucial since it has entailed the process of selecting the ideal candidate. The goal is to guide universities toward maintaining organizations' excellence for their academic leadership and management (ALM) position. Due to the lack of established standards for assessing the competency of possible successors at their home institutions, many ALM of Malaysia HEIs are difficult to identify the proper replacement for their posts. This study aims to propose a multi criteria tacit knowledge acquisition framework (MC-TKAF) for supporting talent development intervention program in Malaysia HEIs. It will be based on cognitive apprenticeship, socialization and informal learning theory which mostly used in acquiring knowledge from expertise to overcome talent bottleneck among novice. Fuzzy Delphi will be used as the primary methodology in this study to gather agreement regarding the appropriate indicator to measure tacit knowledge competency among ALM at Malaysian HEIs. There are three phases: Phase 1 involves analyzing the current tacit knowledge acquisition (TKA) and identifying the appropriate parameters to build the intended framework. Phase 2 involves using the results of Phase 1 to create a new framework of tacit knowledge acquisition (TKAF) that is appropriate for the HEI environment. Phase 3's final objective is to assess the viability of the Talent Development Intervention Program's (TDIP) Tacit Knowledge Acquisition Framework (TKAF) utilising the Multi Criteria Decision Making (MCDM) approach. This paper's goal is to offer the hybrid MCDM approach as a talent performance indicator for the multi-criteria tacit acquisition framework. The final Phase 3 of the study design will essentially be the subject of this paper. The built-in indicators in this document may be utilised as a guide for the HEI sectors to create talent performance metrics that are appropriate for each TKA applied.

Keywords: Hybrid, MCDM, MC-TKAF, HEI, TDIP

Introduction

Succession planning and executive transition management have emerged as pressing issues in today's universities and colleges. (Ku, Akmal, & Kamil, 2016; Varhegyi & Denise, 2017). These issues are a direct outcome of the retirement or death of prominent academics in the past. Most of them are from the baby boomer age and will retire and leave the business at some point. Proven abilities and knowledge in academic leadership and management (ALM) at HEIs may benefit the entire institution, not just their assigned departments. Some people in most organizations still don't understand the processes behind the development of intellectual capital and the sharing of tacit knowledge among workers..(do Rosário, Kipper, Frozza, & Mariani, 2015).

For some reason, nevertheless, the ingrained expertise and knowledge of ALM's forerunner cannot be shaped by a targeted acquisition formulation. The transfer of tacit information can be more successful and, in some cases, saved if the underlying cause is identified and addressed through the selection of an appropriate transfer channel. Lack of efficient evaluation of tacit knowledge acquisition, which should be incorporated in the HEI environment as an interpersonal accelerator in Talent Development Intervention (TDI) Program., is a contributing element to this situation. (Khalid, 2019)

In Malaysian HEIs, rules have been established to ensure that faculty members' work is evaluated not just in terms of academic success, but also in terms of their ability and potential, with the goal of fostering growth through an appropriate talent development intervention programme. Academic staff selection at universities and colleges refers to the practise of hiring qualified individuals for teaching and other academic positions A few studies (Khalid, 2019; Matoskova et al., 2013) demonstrate that academics who are picked underwent explicit evaluations, including qualification, experience, and research activities, in the selection process. Academics are not evaluated when they participate in talent development programmes at their university.

Literature Review

Selection Process Scenario For ALM Roles in Malaysia HEI

According to Orange Book (Ministry of Education Malaysia (MoE), 2016), in Malaysia, only 9% of faculty at public universities considered themselves to be transformational leaders. That's fewer than the predicted ratios that would have been required in (Ministry of Education Malaysia (MoE), 2016) which is ten (10%) to twenty percent (20%) of faculty members should be qualified to serve as ALMs. The study's readiness factor for several types of professional paths shows that schools of higher education are not yet prepared for these options.

There will be fewer qualified candidates for ALM positions if proactive measures are not taken to intervene in the selection and development of potential candidates at the appropriate time. Having access to a pool of qualified candidates for available ALM roles in HEI is crucial for making important personnel decisions including recruiting, firing, and evaluating employee performance. Both assessments are often done

independently. Both of these situations need for a trustworthy system to evaluate skill and experience levels. The term talent excellence refers to a community of academicians who are inspiring educators, accomplished researchers, entrepreneurial personalities, and transformative thought leaders. These are committed individuals who strive ceaselessly to raise quality standards, embrace professional development, instigate innovative teaching and learning, and excel in research and innovation. They are supported by well-trained, dedicated, and qualified administrative, technical, and support personnel. This academic community will enhance the international stature of the institutions it serves. Institutions are able to consistently recruit high-quality international students, faculty, funding, and research grants due to their global prominence.

The significance of an academic leader's talent development role is comparable to his or her teaching and research duties. Each academic leader is responsible for fostering the character and skills of their students, motivating them on a personal and professional level, and ensuring that their knowledge, skills, and resources are fully utilised and developed. It is their institutional duty to cultivate a pool of academic leaders who will continue to fuel development and enhance the quality of Malaysian HLIs in order to produce exceptional academic outcomes. Each academic administrator is also obligated to cultivate exceptional Malaysians capable of advancing the nation's mission and Vision 2020 objectives. Thus, there is currently no established methodology for evaluating the tacit knowledge competency that academics insist upon possessing in order to function effectively as academic leaders or managers. In the next section, we'll discuss in greater depth the reasoning behind this proposed model: The next section will presents the Multi-Criteria Model for the Acquisition of Tacit Knowledge.

Multi Criteria Tacit Knowledge Acquisition Framework (MC-TKAF)

Competency is one of the required elements in evaluating potential ALM in an academic setting background such as managerial competence (Potgieter, Basson, & Coetzee, 2011) and leadership competence (Scott, Coates, & Anderson, 2008a). However, the skill and experience can only be gained from the process of acquisition and elicitation (Yau'Mee Hayati Hj Mohamed Yusof, Ruzaini, & Awanis, 2019) which is known as the tacit knowledge competence. Assessing tacit evaluation is crucial for establishing the level of tacit knowledge competence in novices, but it requires the use of intuition, judgement, and emotion. More thought needs to go into this kind of evaluation. However, this is the type of assessment that is most likely to measure how successfully employees apply tacit knowledge in their work.

We propose a method based on five theoretical frameworks for selecting the most appropriate indicator of ALM applicants' progress in developing tacit knowledge. Table 1 provides explanations of the terms used in Cognitive Apprenticeship Model (CAM), Socialization: SECI, Informal Learning, Self-Efficacy Theory, and Dreyfus Model. The elaboration about this framework was explained in details in (Yau'Mee Hayati Hj Mohamed Yusof et al., 2019). The next section will discuss on the method that was used to verify the criteria to evaluate proposed model by using Fuzzy Delphi Method in next section.

Table 4. MC-TKAF Underlying Theory

Author	Theory/Model	Parameter
(Collins, Brown, & Holum, 1991)	Apprenticeship (CAM)	Coaching
(Nonaka & Toyama, 2003)	Socialization (SECI)	Mentoring Job rotation
(Kirkpatrick & Kirkpatrick, 2009)	Informal Learning	On Job Training (OJT)
(Dreyfus, 2004)	Expertise	Novice Advanced beginner Competent Proficient Expert
(Bandura, 1998)	Self-Efficacy	Cognitive Motivational Affective Selection

Fuzzy Delphi Method (FDM)

The idea of traditional Delphi, which takes a lot of time, has been given a new twist. (Ishikawa et al., 1993) to avoid flaws like repeated surveys of experts, which are expensive and lead to a lower answer rate, especially if the survey is hard. According to (Ishikawa et al., 1993), as it is proposed, the Fuzzy Delph Method has the advantage of reducing: 1) Fuzziness, which is always present in the results; 2) the number of surveys; 3) the semantic structure of forecast items is made clear; and 4) the individual characteristics of the expert (forecaster) are made clear. The change is made to fix the flaws in the standard Delphi Method (DM), which lead to low agreement on the results, the loss of important information, and a slow investigation.(Saffie, Amirah Nur', & Rasmani, 2016).

Because this study can be done in many different ways, the FDM has been used as one of the tools to check the criteria to find expert agreement. The criteria that have been picked for this MCTKAF by experts through consensus are explained in this (Yau'Mee Hayati Hj Mohamed Yusof, Arshah, & Romli, 2020a). Figure 1 depicts the selection tree for selecting the consensus view. The following section will discuss the MCDM techniques selected for this study.

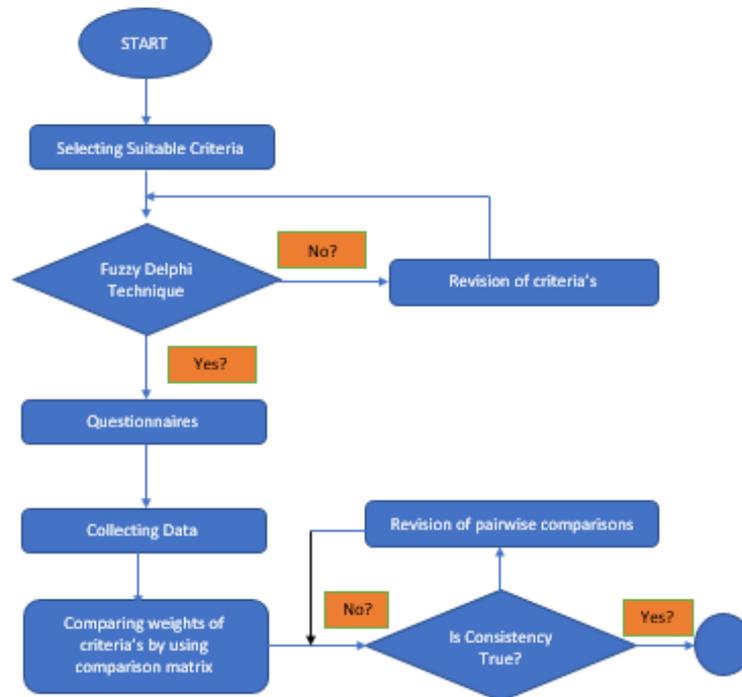

Figure 15. Fuzzy Delphi Method

Hybrid MCDM

The method of multi-criteria decision-making (MCDM) addresses the decision-making process in relation to multiple objectives. A decision-maker (DM) must select from numerous quantifiable or non-quantifiable criteria. One of the primary goals of MCDM is to assist DMs in integrating objective measurements with value judgements that are not dependent on the perspective of individuals but on collective thoughts. (Aruldoss, Lakshmi, & Venkatesan, 2013). This method provides powerful decision-making in areas where the best option is extremely complicated (Aruldoss et al., 2013). Generally, the objectives are incompatible, so the solution must be a compromise based on the preferences of the decision-maker. There are numerous situations in which weighing contending factors prior to making a decision is necessary. In MCDM models, a decision-maker must typically rank and select from a finite number of options. Frequently, it is also necessary to weight a limited number of criteria according to their relative importance. As demonstrated in Table 2, MCDM techniques have been utilised in a range of human selection applications to determine the optimal course of action. This study's primary objective is to apply MCDM as a talent performance indicator for selecting academic administration positions for aspiring academics. Several authors (Afshari, Mojahed, & Yusuff, 2010; Kolios, Mytilinou, Lozano-Minguez, & Salonitis, 2016; Mimi, Alias, & Abdullah, 2017) have discussed each method in MCDM which has different kind of formulas and objective to be fulfilled based on the areas needs as illustrated in Table 2. Due to many methods in MCDM, researchers make list of criteria to choose which one is the best to be used

according to area of application. According to (Eldrandaly, Ahmed, & AbdelAziz, 2009), different MCDM strategies are suited to various decision circumstances. AHP is recommended, for instance, when individuals cannot quantify their preferences for various criteria and alternatives. Numerous inexperienced users have difficulty determining which MCDM technique is most appropriate for their particular decision situation.

Table 5. MCDM Approach in Personal Selection as Academician

Area/Applications	Criteria	Source of Criteria's	SAW	TOPSIS	ELECTRE	CFPR	AHP
Finding the Right Personnel in Academic Institutions	Qualification Marks Experience in years Salary Expectation Ability handle different subject Research Activities Technical Skill Presentation/Communication Skill	NONE	(Kumar, Radhika, & Suman, 2013)	(Kumar et al., 2013)			(Kumar et al., 2013)

Process for	comes								
Multi-criteria	Recognition and Reputation								
Academic	Financial Performance								
Successor	Effective Implementation								
Selection.									

For example in the study done by (Kolios et al., 2016) in area of real estate and land management, they used seven (7) methods such as (ELECTRE), (MAUT), (ANP), (MACBETH), (AHP), (TOPSIS), (PROMETHEE) and four (4) criteria of choosing MCDM method that is suitable for the proposed model. Another study (Aruldoss et al., 2013) also comes with numerous methods and criteria such fuzzy TOPSIS, fuzzy VIKOR, and fuzzy GRA for evaluation on urban mobility projects. As proposed by (Aruldoss et al., 2013), the best alternative method can also use the veto rule to select. In other word, the alternative(s) that the majority of methods rank the highest will lastly be selected. The summary can be seen from Table 3.

Hybrid MCDM is widely used by many researcher in order to find the best solution in their prospect (Alguliyev, Aliguliyev, & Mahmudova, 2015; Chatterjee, Zavadskas, Tamošaitiene, Adhikary, & Kar, 2018; Dahooie, Abadi, Vanaki, & Firoozfar, 2018; Sitorus & Brito-Parada, 2020). For example in (Şenel, Şenel, & Aydemir, 2018), compared to the ELECTRE approach, the TOPSIS method provides more accurate and trustworthy findings in personnel selection. Comparison between MCDM method also been used in (Zhou, Wang, Lim, He, & Li, 2018) pertaining to the proposed hybrid fuzzy The DEMATEL-AEW-FVIKOR method demonstrates its flexibility with regard to the decision-maker's preference. Six techniques of MCDM, SAW, WPM, AHP, TOPSIS, CFPR, and ELECTRE, have been discovered to solve the nature of the MC TKAF, as shown in Table 4. As shown in Table 4, each MCDM technique has its own set of formulations and objectives based on the requirements of the various regions. Since there are numerous MCDM approaches, researchers compile a list of parameters to determine which one is optimal for a given application domain. According to (Eldrandaly et al., 2009) different for instance, AHP is recommended in situations where individuals are unable to measure their preferences for different parameters and alternatives. MCDM approaches fit different types of the decision situation. While CFPR is purposely used for simplifying the pairwise comparison (Mimi et al., 2017) and ELECTRE (Şenel et al., 2018), is used when comparing binary, superiority between different decision points for each rating factor, is employed. Many new users struggle to determine which sort of MCDM technique is optimal for their situation. Each technique's functions, calculation stages, and formulas are listed in the table below.

Table 6. MCDM Criteria Selection

Author	Area	Criteria of MCDM Selection
Kolios, A., Mytilinou, V., Lozano-Minguez, E., & Salonitis, K. (2016) (Kolios et al., 2016)	real estate and land management	The weighting of variables (optional action) Determining the framework of expected properties

		Calculation of the overall index of suitability The identification of the method best suited to resolve the decision-making problem
Aruldoss, M., Lakshmi, T. M., & Venkatesan, V. P. (2013) (Aruldoss et al., 2013)	urban mobility projects	the alternative (s) that is ranked as the highest by the majority of methods

Methodology

Research Design

As shown in Figure 2, the three sections of this study consist of Phases 1, 2, and 3. In phase one, three subphases of the current tacit knowledge acquisition (TKA) are analysed: document analysis, validation, and the fuzzy Delphi technique, in that order. In Phase 2, the findings of Phase 1 are utilised to develop a framework for Tacit Knowledge Acquisition Framework (TKAF) that is compatible with the HEI environment and employs Fuzzy Delphi to achieve consensus agreement. Using a multi-criteria decision-making procedure, the final stage of Phase 3 is to evaluate how well the Talent Development Intervention Programme (TDIP) will complement the Tacit Knowledge Acquisition Framework (TKAF).

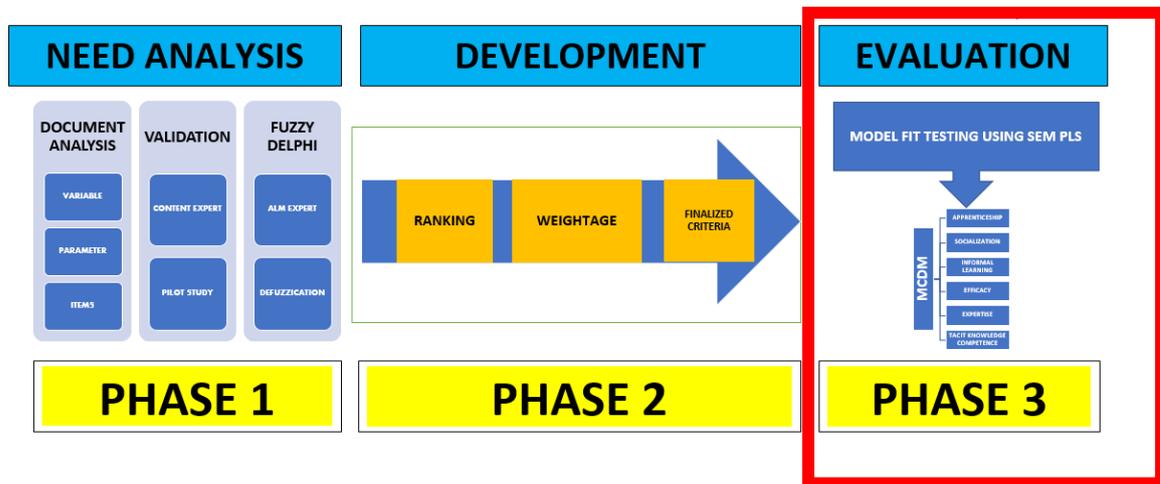

Figure 16. Research Design

Research Framework

The Proposed framework of MCTKAF will be evaluated by using Smart PLS 4.0. Five independent variables, and one Dependent variable have been chosen to be our proposed framework as illustrated in Figure 1.5. The parameter used for each indicator are based on (Odell, 2011) for coaching,(Pfund, Byars-Winston, Branchaw, Hurtado, & Eagan, 2016) for mentoring ,(Lu & Yang, 2015) for Job Rotation,(Dhliwayo, Nyanumba, &

Shepherd, 2014) for On Job Training,(Garcia & Garcia, 2015),(Chen & Gully, 2001),(Platt, 2010),(Bandura, 1998) for Efficacy,(2005, 1986) for Expertise and (BĂNACU, BUŞU, & Alexandra Cătălina, 2013) for Tacit Knowledge Competence. The result of the proposed framework will be discussed in our incoming paper. The figure 3 below show our model in this study.

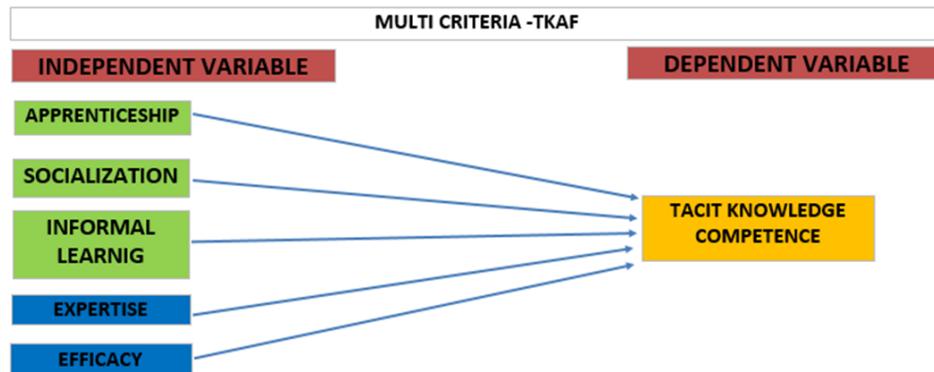

Figure 17. Research Model MCTKAF

Proposed Hybrid

Model

Decision Support System on MCTKAF are based on the flowchart in figure 4 below. The algorithm within the system will allow the decision maker to choose the right candidate to fill in the roles.

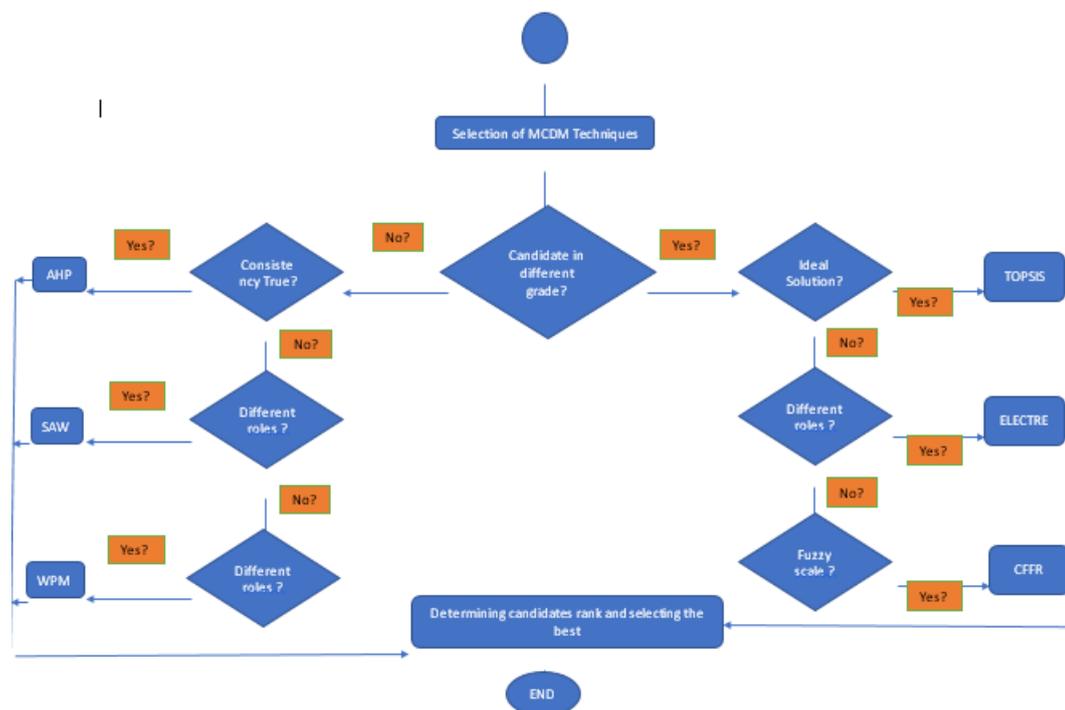

Figure 18. Hybrid MCDM Selection

Results

The finalized result has been transformed using six(6) different techniques of MCDM in which almost all of the techniques to produce similar result . The conclusion of the each of technique has been explained in TABLE 5.

Table 7. Result

	CFFR	ELECTRE	SAW	WPM	AHP	TOPSIS
Result	In this case UITM1 is the best personnel for the position of Deputy Rector followed by UITM2, and UITM3 Further discussion on results can be referred to (Yau'mee Hayati Hj Mohamed Yusof, Arshah, & Romli, 2021)	So in this case, by using ELECTRE formula, UITM1 is the best personnel for the position of Deputy Rector followed by UITM2, and UITM3 Further discussion on results can be referred to (Yau'mee Hayati Hj Mohamed Yusof et al., 2021)	SAW formula showed that UITM3 is the best personnel for the position of Deputy Rector followed by UITM2, and UITM1 Further discussion on results can be referred to (Yau'Mee Hayati Hj Mohamed Yusof, Arshah, & Romli, 2020b)	WPM formula finalized UITM 1 as the first choice, followed by UITM2, and UITM1 Further discussion on results can be referred to (Yau'Mee Hayati Hj Mohamed Yusof et al., 2020b)	AHP formula finalized UITM 1 as the first choice, followed by UITM2, and UITM1 Further discussion on results can be referred to (Yau'Mee Hayati Hj Mohamed Yusof et al., 2020b)	TOPSIS formula finalized UITM 1 as the first choice, followed by UITM2, and UITM1 Further discussion on results can be referred to (Yau'Mee Hayati Hj Mohamed Yusof et al., 2020b)

Sensitivity Analysis

To rank the candidates, the final normalized weight is computed. The candidate for that position who ranks first or has the highest final weight value is shown. The three candidates will be ranked for possible jobs as stated in TABLE 5 based on the final weight results for all procedures.

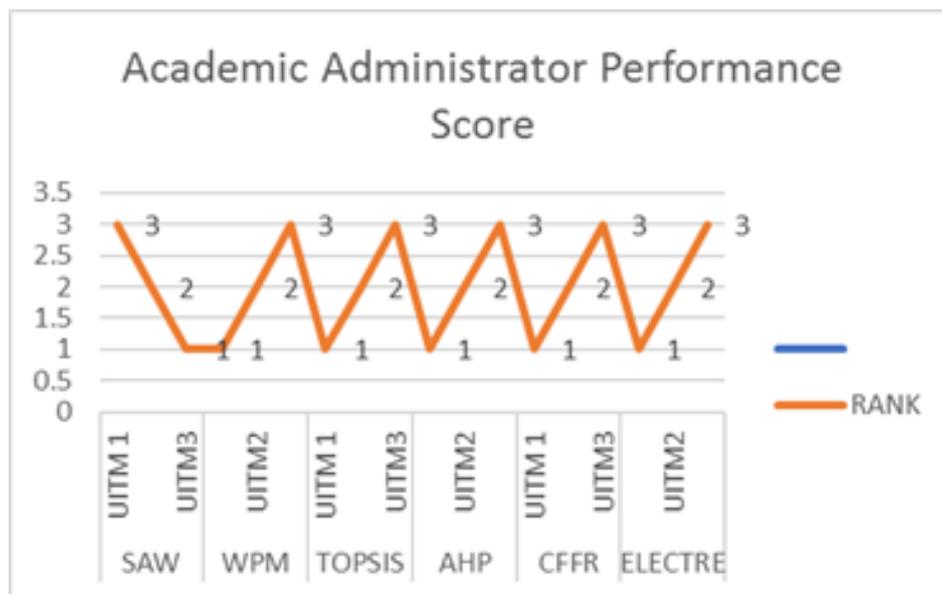

Figure 19. Academic Administrator Performance Score

The results of Table 6 and Figure 5 show that the selection for majority techniques provides a solution for the academic administrator jobs (Aruldoss et al., 2013) is consistent for candidate UITM 1 (ELECTRE,CFFR,WPM, AHP and TOPSIS) as the first choice. As proposed by (Aruldoss et al., 2013) the best alternative technique can also use the veto rule to select. In other words, the option(s) that the majority of ways score the highest will be chosen last. The criteria of selection are based on the technique that must support Multicriteria, Linguistic Fuzziness, and including the Fuzzy Delphi process as suggested by (Kolios et al., 2016)and (Aruldoss et al., 2013). According to (Aruldoss et al., 2013), selection of which MCDM technique is based on the study of own scope performance, for example, the method has to be chosen in such a way for different problems that have to be solved. This is equivalent to (Kolios et al., 2016) said that one technique outperforms the remainder since predictive precision depends on the nature of the issue, as well as the collection and handling of information in a manner that best suits each technique and implementation. Candidate UITM 1 (WPM, AHP, TOPSIS, CFPR, and ELECTRE) is the first choice in the majority of methods (Aruldoss et al., 2013) solution for academic administrator jobs selection. We can use the recommendation of (Kolios et al., 2016) and (Aruldoss et al., 2013)to choose which result is the best suit to the case. The next section will explain the hybrid MCDM that we would like to be integrated based on decision support system (DSS) on MCTKAF.

Database Structure

In proposed Decision Support System (DSS), the following ERD diagram is developed to create the structure of the database. Hybrid MCDM algorithm has been coded into the DSS for making the candidate selection is much able to seen via pattern rather that numbers.

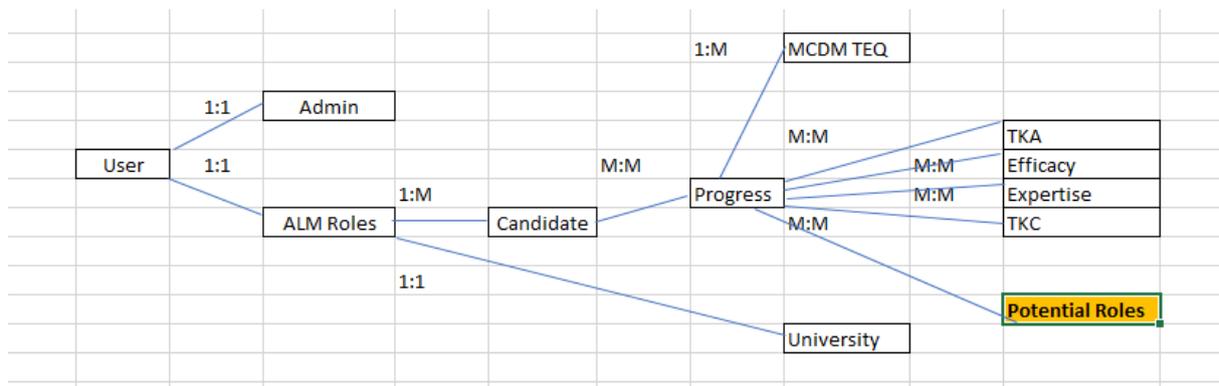

Figure 20. Database Structure in DSS MCTKAF

The following is the Personalization Interface for each candidate as shown in Figure 7.

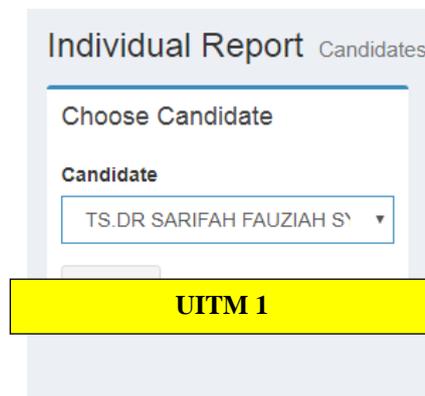

Figure 21. Personalization Interface

The following is the Candidate Progress Interface for each candidate as shown in Figure 8.

The following is the Candidate Comparison Progress for each candidate as shown in Figure 9.

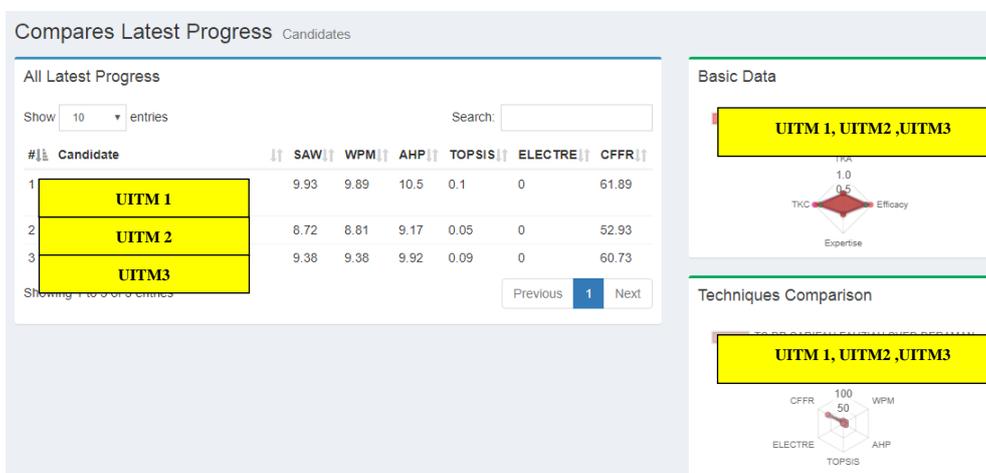

Figure 23. Candidate Report

Post Evaluation on Proof of Concept (POC)

Three assessors from three (3) categories of Malaysian public university have been approached to test practicality of the system. They have been asked to use the DSS MCTKAF to key in the profile of their suitable successor and get analysis from the system. The profile of each evaluator can be referred from this Table 6.

Table 9 Evaluator Brief Description

EVALUATOR	POSITION	TYPE OF MALAYSIAPUBLIC UNIVERSITY
1. UC EVALUATOR	RECTOR	COMPREHENSIVE
2. UF EVALUATOR	DIRECTOR	FOCUS
3. UR EVALUATOR	PROGRAM COORDINATOR	RESEARCH

Seven (7) questions on system usage been asked in Google Form (Content, Implementation, Need of Study, Phenomenon, Behaviour, Suitability and Overall) with the result of the evaluation may be referred on the following Table 7.

Overall, three(3) evaluators from three(3) different universities has been asked to use the POC of DSS MC-TKAF, all of them believe this POC has potential to be incorporated in Malaysian Public HEI Talent Development Intervention Program in order to retain the successor in academic and leadership line with some suggestion to add on some elements on explicit knowledge which will be considered later in other phases.

Table 10. Descriptive Analysis

UNIVERSITY CATEGORY: COMPREHENSIVE, FOCUS, RESEARCH							
ITEM	CONTENT	IMPLEMENTATION	NEEDS OF STUDY	PHENOMENON	BEHAVIOUR	SUITABILITY	OVERALL
MEDIAN	4	4	4	4	4	5	ACCEPTED

Conclusion

All of these ranked criteria can be used to select the ALM, and they will shed light on the relative importance of various features for each role. The proposed implementation of DSS MCTKAF might provide managers and HR with insights based on patterns rather than raw data. Managers and human resources departments may have a clear mental image of how they would use these factors to evaluate personnel. Thus, to assist decision-makers, MCDM researchers can utilize the recommendations of (Aruldoss et al., 2013), (Kolios et al., 2016) to determine which outcome is the best. The hybrid MCDM proposed in this paper yields UITM1 as the first successful candidate. Next up is UITM2, then UITM3. The ALM can be chosen based on these prioritized criteria, which also serve to illuminate the significance of specific aspects for their respective functions. The proposed implementation of DSS MCTKAF might provide managers and HR with insights based on patterns rather than raw data. Managers and HR departments may have a clear mental image of how they would evaluate people using these standards.

Recommendations

The proposed hybrid MCDM, which now a Decision Support System of MC-TKAF, aims to provide fresh perspective to the ALM for intervening in talent acquisition by targeting a new approach to building an intervention programme to foster talent development at a public university institution. This will deepen and broaden our knowledge of ongoing and future studies on this subject, which is especially useful for determining viable alternatives to existing talent development intervention programmes in higher education.

Abstract: Technology in education is purposely designed to help both educators and students in knowledge transfer and knowledge gain simultaneously. In many aspects, technology in education is supposed to prove that education can be delivered effectively and efficiently. However, there are cases in which technology in education can be frustrating and annoying for both parties. Government and university management have invested a lot of money to ensure that educators and students can really benefit from the technology. In spite of huge investment on educational technology tools (hardware and software) over the past decades in various education initiatives, the potential of technology usage in university level has not reached the desired level among educators and students. What is the missing link for the realization of the expected return-of-investment? The outcome of this study proposes an Educational Technology standard to be applied in university setting using TPCK (Technological Pedagogical Content Knowledge) as the basic framework. However, this paper will only discuss a part of our standard development in which highlighting the assessment method that was used during the implementation of ETC standard in our institutions.

Keywords: Educational Technology; TPCK, ICT Standard, University, Educators, Student

Introduction

For tertiary students, improved educational outcomes are a result of instructional technology. It is considered to be able to prepare this population for a bright future. Technology in education is intended to support knowledge transmission and knowledge acquisition for both teachers and students at the same time. And it supposed to demonstrate in numerous ways that instruction may be delivered successfully and efficiently. But there are times when using technology in teaching may be irritating and frustrating for everyone. Technology alone does not necessarily result in increased learning. Even though Massive Open Online Courses, or MOOCs, are a convenient way to learn and provide free education worldwide, they cannot instantly transform a person into a scholar. Another example is presenting information on an interactive whiteboard without engaging audience members. Educational technology contributes to the improvement of educational outcomes for postsecondary students. It is believed to be able to provide a bright future for this population. Technology in education is intended to facilitate knowledge transfer and knowledge acquisition simultaneously for both educators and students.

Occasionally, technology in education can irritate and frustrate both sides. To guarantee that instructors and students can fully benefit from the technology, the government and university administration have made major financial investments. Despite significant investments in Education Technology instruments (hardware and software) by various education initiatives over the past few decades, the potential for technology use among university educators and students has not yet reached the desired level. The pandemic Covid-19 that occurred within the past two years has drastically altered the majority of aspects of physical education. During the Covid-19 epidemic, educators were forced by their institutions to complete self-training in order to make sure they could give their lessons online or through another medium. What is missing in order to realize the anticipated return on investment? How are educators' ICT competencies in higher education assessed both before and after the Covid-19 pandemic?

Past and recent research (Ahmed & Rasheed, 2020; Chaiya Akarawang, Kidrakran, & Nuangchalerm, 2015; Hersh, 2014; Matherson, Wilson, & Wright, 2014; Zainani, Esfijani, & Damaneh, 2016) indicates that the issue stems from educators' lack of technical ICT skills and knowledge of effective pedagogical practice. Researchers in a variety of education-related disciplines have discussed the need for educators to have a solid ICT Competency standard (Fong, Ch'ng, & Por, 2013; Sani & Arumugam, 2017). Rarely is research conducted at the Higher Education Institutions (HEI) or University level, with the majority of studies focusing on pre-teacher education. The assessment strategy that will be used when the ETC standard is implemented at our institutions, however, will be the only topic covered in this paper, which will only cover a small part of the standard development process. In accordance with the Malaysia Education Blueprint 2015 - 2025 (Higher Education), it is predicted that university management will be able to evaluate and control educational technology initiatives intended to raise standards for teaching and learning.

Utilising modern IT is intricate and multifaceted, and psychological research shows that cognitive models may not fully account for the antecedents of conduct (Beaudry & Pinsonneault, 2010; Maatuk, Elberkawi, Aljawarneh, Rashaideh, & Alharbi, 2022). Researchers have discovered that the value of educational technology is directly proportional to the technological knowledge of educators, such that the greater the educators' technological expertise, the greater the students' ability to comprehend it (Guasch, Alvarez, & Espasa, 2010; Hechter, Phyfe, & Vermette, 2012; Hennessy, Harrison, & Wamakote, 2010; Herrero et al., 2015). This has no significant educational advantage over conventional whiteboards. In comparison to the price of a traditional whiteboard, the interactive use of interactive whiteboards to actively engage students with the subject matter through technology would likely justify the additional cost, schools in the United Kingdom, the United States, Australia, South Korea, and other countries are already largely equipped with interactive whiteboards (Kim, Kim, Lee, Spector, & DeMeester, 2013).

It is generally acknowledged that students who are actively involved learn and remember more material. Class enrollments have increased in response to tighter budgets and growing pressure to offer a high-quality education at a competitive price. While technology has the potential to increase student engagement, it should not replace traditional teaching methods (La Roche & Flanagan, 2013). Technology integration encompasses attitudes and behaviours affiliated with technology use. Therefore, if technology and teaching approaches are combined, instructors' technological pedagogical views may have an impact (Liu, 2011). In addition, the majority of teachers indicated that internal factors (such as a passion for technology and a problem-solving mindset) and external support (administrators and personal learning networks) influenced their practises significantly (Ertmer, Ottenbreit-Leftwich, Sadik, Sendurur, & Sendurur, 2012). Since the advent of educational technologies in the classroom, teacher education has been faced with the task of improving in-service teacher education. As a result, it's crucial for the institution to prepare teachers for the delivery of teacher education in a constructivist learning environment and to give student teachers a welcoming, nonthreatening atmosphere in which to successfully integrate computer instruction, since the challenge of improving in-service teacher education has been present in the field of teacher education (Sang, Valcke, Braak, & Tondeur, 2010). Consequently, professional development programmes must look past first-order barriers to the intrinsic, more complex second-order barriers of teachers' beliefs and how they influence ICT implementation in the classroom if teachers are to implement the type of pedagogical change outlined in current educational reform agendas (Prestridge, 2012).

This study aims to answer the question of which TPCK elements can serve as the basis for establishing Educational Technology Competency Standards in our institution. The primary objective of this study is to establish Educators' Technology Competency (ETC) Standards at our local university using TPCK as the foundation (Yau'Mee Hayati, Sarah Syazwani, & Nur Hazwani, 2015). This paper will, however, only discuss the findings of the pre-development of this study to guide educators' use of ETC Standards regarding the elements that should be included in the standard. It is envisaged that this paper will serve as a guide for a thorough ETC Standard in academic contexts, which will ultimately help to maximise the use of educator-student learning. One aspect of our standard development that will be proposed as a Competency Assessment Based System is the clarification of the assessment method that will be used throughout the implementation of

ETC standards in our institutions. In accordance with the Malaysia Education Blueprint 2015 - 2025 (Higher Education), it is anticipated that university administration will be able to review and regulate efforts to improve the educational technology standards in teaching and learning. There are two questions that has been asked in the beginning of the study which are as following:

1. What is the elements in TPCK which can used as standard in UiTM(CT) ?
2. How to use TPCK to produce a practical standard for UiTM(CT) ?

Literature Review

Competency Standard

Standards are used in the field of educational technology to assess the potential qualities a teacher or student must possess in order to pass a specific competency level or proficiency. It is necessary for them to upgrade their abilities because doing so is a crucial part of self-development. All educators agree that a standard is an essential requirement before a new educator may join the education queue. Most of the criteria (as stated in Table 1) are frequently applied to ICT training programmes for teachers in elementary and secondary schools. Some of them, nevertheless, focus on postsecondary education. It is obvious that the ET/ICT Standard can be implemented into professional development programmes for educators of the highest calibre. The instruments of the standard can be used in training courses to prepare new educators and advance the abilities of experienced educators. As a result, it is possible to evaluate educators' proficiency with the standards, which is necessary for professional development. Competency standards would improve in-service teacher training courses that are in line with competency standards and would reduce teachers' gaps in ICT proficiency (Fong et al., 2013).

Table 1. Prominent ICT Standard

Standard	Description
UNESCO ICT Competency Framework for Teachers 2018(Fallis, 2018)	The UNESCO ICT Competency Framework for Teachers was created by UNESCO in 2018 with the purpose of offering recommendations for structuring teacher preparation courses and training to help prepare teachers or to promote professional growth in ICT-integrated pedagogy. The three main parts of the UNESCO ICT Standard are knowledge production, knowledge deepening, and technology literacy.
ISTE STANDARD (International Society for Technology in Education, 2008)	The International Society for Technology in Education has created a formal standard that many American institutions will use when providing ICT teacher training.

<p>NATIONAL PROFESSIONAL STANDARDS FOR TEACHERS</p>	<p>The "NATIONAL PROFESSIONAL STANDARDS FOR TEACHERS: ICT Elaborations for Graduate Teacher Standards," published by the Australian Institute of Teaching and School Leadership, serves as a manual for future educators before they start their fieldwork in classrooms.</p>
<p>CHINA ICT STANDARD</p>	<p>China Educational Technology Standards (CETS) were developed and adopted in 2004. A new set of necessary teacher's certificate requirements has been put into place. The development of in-service teacher training programmes was funded by the Chinese government, which also kept an eye on it. The government chose regional testing and training institutes authorised for certification through a competitive tendering process. The pre-service teacher training courses were updated as a result.</p>

To train graduates, pre-service teachers, and some in-service teachers, all of these criteria are generally used in elementary and secondary schools. There aren't many current criteria that concentrate on the levels of colleges and other higher education institutions. This can be because research is valued more highly in higher education than teaching and learning. But now that ICT tools and applications have advanced, instructors in higher education institutions need to be prepared with the abilities and information required for their own professional development.

Technological Pedagogical Content Knowledge (TPACK)

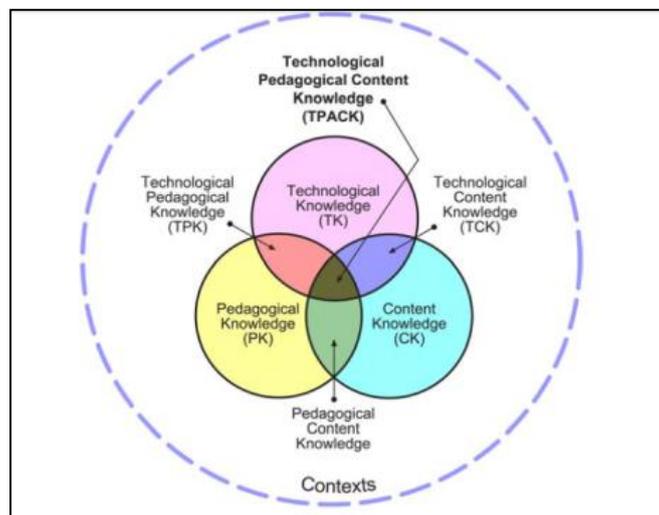

Figure 1. TPACK Framework (Adopted: The components of the TPACK framework (graphic from TPACK - Technological Pedagogical Content Knowledge, 2010).)

Technology Pedagogy Content Knowledge, or TPACK (as shown in Figure 1), is a framework that emphasises the importance of educating future teachers to use technology wisely while delivering a particular lesson to a particular group of students. This approach contends that technology integration spans a continuum of teaching and learning philosophies rather than calling for a particular pedagogical orientation (Becuwe et al., 2017). The

TPCK framework is helpful for giving instructors the information they need to incorporate technology into the classroom and how to grow this expertise (Baran, Chuang, & Thompson, 2011). The accompanying Table 2 lists the seven (7) components of this framework.

Table 2. Seven (7) Components Included in the Framework

Technology knowledge (TK)	The ability to use a variety of technologies, from low-tech ones like pencil and paper to digital ones like the Internet, digital video, interactive whiteboards, and software.
Content knowledge (CK)	Knowledge of the actual subject matter that teachers need to be knowledgeable about in order to teach.
Pedagogical knowledge (PK)	Knowledge of teaching techniques and procedures, such as lesson planning, assessment, and classroom management.
Pedagogical Content Knowledge (PCK)	PCK is an awareness of how certain subject-matter aspects are organised, modified, and portrayed for instruction. It is the merging of content and pedagogy.
Technical Content Knowledge (TCK)	Technical content knowledge (TCK) is an understanding of the relationship between technology and content. Technology limits the types of representations that can be used; however, newer technologies frequently allow for newer, more varied representations and provide users with a higher degree of flexibility while exploring these representations.
Technological Pedagogical Knowledge (TPK)	Technological pedagogical knowledge (TPK) is the understanding of the existence, elements, and capabilities of various technologies as they are applied in learning and teaching environments, as well as the potential effects on teaching of the usage of particular technologies.

A class of knowledge called TPCK is essential to technology instructors' work. Topic matter experts who are technologically savvy, technologists with limited topic or pedagogical understanding, and instructors with limited subject or technology knowledge are unlikely to possess this knowledge (Koehler & Mishra, 2009).

The TPCK framework has received a great deal of support from both scholars and practitioners in the majority of countries (Jang & Chang, 2016; Kihzoza, Mandela, Zlotnikova, & Bada, 2016; Wu, Hu, Gu, & Lim, 2016). The framework has offered a useful tool for planning teacher education programmes and evaluating teachers' expertise in technology integration. An obvious aspect of the TPCK's global effect as an emerging research and development tool for teachers and educators is the interest in using the TPCK framework and the TPACK survey for designing and assessing teachers' knowledge in various international teacher education contexts. According to Larsen (2014), TPACK is a theoretical framework for evaluating educators' understanding of how to use technology, and it is still applicable today, post-pandemi

Malaysia Education Blueprint 2015 – 2025 (Higher Education).

The overall percentage of Malaysians enrolled in higher education in 2021 was 48%. With 1.2 million students enrolled in public and private HLIs, such as public universities, polytechnics, community colleges, private universities, private university institutions, and private colleges, this marks a 70% increase in enrolment over the previous ten years. The number of students enrolling in bachelor's degree programmes climbed sixfold between 1990 and 2019, while the number of students enrolling in master's and doctoral degrees increased tenfold. According to the Executive Summary Malaysia Education Blueprint 2015–2025 (Higher Education) (Kementerian Pengajian Tinggi Malaysia (KPM), 2012), Malaysia currently ranks third among ASEAN countries for enrollment in Master's and Doctoral programmes, after Singapore and Thailand. Integrated learning models will spread throughout all HLIs as a common pedagogical approach in order to maintain the standard of HLI education at the neighbourhood university.

The strong cyber infrastructure that underpins innovations like videoconferencing, live streaming, and Massive Open Online Courses (MOOCs) will be advantageous to students. Malaysian HLIs will engage in worldwide MOOC consortiums in addition to creating MOOCs in their own fields of expertise, building the reputation of Malaysian education abroad. In terms of effectiveness, the Ministry aims to maximise the return on investment in higher education and sustain the existing level of government spending per student across all public institutions. The Ministry will work with HLIs to strengthen the capacities of the academic community in order to achieve these goals, and it will also take into consideration creating a national e-learning platform to oversee and direct content creation. Higher education is experiencing a huge disruption due to new digital technologies and delivery methods on a global scale. This chapter underlines crucial prerequisites for online learning in Malaysia's higher education system going forward. With the support of globalised online learning (GOL) platforms, Malaysia hopes to be a top educational hub. These platforms will improve education for Malaysians and the rest of the world in terms of accessibility, equity, and quality. Additionally, they will boost Malaysia's international education brand, enable more effective course delivery, and raise the profile of Malaysian HLIs, particularly in specialised disciplines.

Figure 2. Malaysia Education Blueprint 2015-2025

Launching

MOOCs on

Malaysia-specific disciplines such as Islamic banking and finance in collaboration with renowned international MOOC consortiums like EdX and Coursera to strengthen Malaysia's international reputation; Making blended learning models a requirement for up to 70% of programmes; making online learning an essential part of higher education and perpetual learning, starting with the conversion of typical undergraduate courses into MOOCs; creating the necessary cyber infrastructure (physical network infrastructure, information structure, platform, devices, and equipment); and improving the academic community's capacity to deliver online learning on a large scale. In Malaysia, HLI has used e-learning as a tool for education in one of two ways: entirely through e-learning or through blended learning, which blends traditional and online learning. The main method of instruction at Open University Malaysia (OUM) in Malaysia is e-learning through blended learning. OUM began operations in 2001 with 753 students; however, this figure rose sharply throughout the course of the year. This data indicates that there is interest in e-learning among students. It also shows that e-learning has achieved parity with conventional education without sacrificing the standard of instruction. According to Persidangan Meja Bulat E-Learning, IPTA, held in 2008 at UiTM, very few HLIs in Malaysia have created their own policy, guidelines, or standard for the implementation of e-learning facilities within their institutions. However, after the COVID-19 global campaign, many universities have come up with a lot of creative ways to use and improve their e-learning facilities.

Multi Criteria Decision Making (MCDM)

The multi-criteria decision-making (MCDM) approach takes into account the decision-making process with numerous goals. A decision-maker (DM) must choose from a variety of quantitative or qualitative criteria. One of the main objectives of MCDM is to help DMs combine objective measurements with value assessments that are based on group consensus rather than individual viewpoints (Aruldoss, Lakshmi, & Venkatesan, 2013). When the best course of action is extremely complex, this strategy makes effective decision-making possible (Aruldoss et al., 2013). Generally speaking, the goals are incompatible; hence, the best course of action is a compromise depending on the decision-maker's preferences. There are many circumstances where it is vital to analyse conflicting factors before making a choice.

In MCDM models, a decision-maker often has to rank and choose among a limited number of possibilities. In many cases, it is also required to assess the relative relevance of a small number of factors. Researchers develop a list of criteria to decide which MCDM approach is best for a particular application because there are so many different MCDM methods available. Seven (7) methods, including (ELECTRE), (MAUT), (ANP), (MACBETH), (AHP), (TOPSIS), and (PROMETHEE), were used in the study by Kolios, Mytilinou, Lozano-Minguez, and Salonitis (2016) in the area of real estate and land management; Four (4) criteria were also used to choose the MCDM method that is best suited for the proposed model. In the assessment of competency, different approaches have also been applied (Chung & Chang, 2015; Heidary Dahooie, Beheshti Jazan Abadi, Vanaki, & Firoozfar, 2018; Lin & Kuo, 2022). Due to their ease of calculation, SAW and WPM have been employed in our suggested methodology.

Table 3. MCDM Approach in Training Evaluation

Area/Applications	Criteria	Source of Criteria's	SAW	TOPSIS	ELECTRE	CFPR	AHP
Finding the Right Personnel in Academic Institutions	Qualification Marks	NONE	(Kumar, Radhika, & Suman, 2013)	(Kumar et al., 2013)			(Kumar et al., 2013)
	Experience in years						
	Salary Expectation						
	Ability handle different subject						
	Research Activities						
	Technical Skill						
Academic Staff Selection	Individual Factor Academic Factor Work Faculty	NONE			(Rouyendegh &

	Financial Performance						
Effective Implementation							

For example in the study done by (Kolios et al., 2016) in area of real estate and land management, they used seven (7) methods such as (ELECTRE), (MAUT), (ANP), (MACBETH), (AHP), (TOPSIS), (PROMETHEE) and four (4) criteria of choosing MCDM method that is suitable for the proposed model. Another study (Aruldoss et al., 2013) also comes with numerous methods and criteria such fuzzy TOPSIS, fuzzy VIKOR, and fuzzy GRA for evaluation on urban mobility projects. As proposed by (Aruldoss et al., 2013), the best alternative method can also use the veto rule to select. In other word, the alternative(s) that the majority of methods rank the highest will lastly be selected. The summary can be seen from Table 3.

UiTM-CT ETC Standard

The first campus of UiTM (Terengganu), often known as UiTMT, was established in Sura Gate, Dungun, on

July 1, 1975. The cornerstone ceremony in Sura Hujung was conducted on October 19, 1978, under the direction of the late Sultan Ismail Nasiruddin Shah. The major campus expansion was carried out over time in a number of phases. UiTMT has successfully developed the entire seaward area and 500,000 square metres across the lake as a result of putting the four phases and physical development indicated in the sixth and seventh Malaysian plans into practise. UiTM (Kuala Terengganu) was founded as a branch campus in 2008, and UiTM (Bukit Besi) followed in 2012. The UiTMT campus has been given full liberty to manage its own administration, stage by stage, by the Vice Chancellor of UiTM by 2013. The list of ICT training that has been provided in the past and is still being provided today via online webinar is shown in Table 4 below. Each educator at our institutions must complete 42 hours of training over the course of a year, including ICT training, as shown in Table 5.

Table 4. Pre-Pandemic

Course	Types	Frequency in a year
E-Learning		
Blended Learning	Software	4 times per year
Web 2.0 Tools	Software	3-5 times per year
Application for Productivity and Professional Software (APPS)		
Ipad for Teaching & Learning	Hardware	Once a year
Web Development :- Joomla	Software	Once a year
Microsoft Productivity Suite	Software	1-2 times per year
Image and Video Processing	Software	1 time per year
Research Productivity Suite	Software	3-8 times per year

*Details above are based on iLQAM (Terengganu) Working Calendar 2015

(Source: iLQAM (2015), UiTM (Terengganu))

We have come across the need to choose two forms of knowledge: internal and external expertise within our institution, in order to set the standard for our regional institution. External expertise relates to educators outside of our institution who are knowledgeable about the history of our institution, whereas internal expertise refers to our local educators within our university. These are chosen on a volunteer basis based on two criteria: experience and a strong interest in using ICT and ET in the classroom. Selected experts have received a number of the elements used in the initial draught of the proposed standard.

UiTM(T) ETC STANDARD

1

Vision : This UiTM(T) ETC standards aims to be ensure that all educators in Universiti Teknologi MARA have the **skills and capacity** to solve the complex problems facing students education nowadays and in the future especially when using Education Technology in Classroom.This Educational Technology Standard guides efforts to enhance teaching through the integration of technology and academics. It also provides a framework that supports the learning process.

2

Mission : This UiTM ETC standards will define the **skills(technology) ,knowledge (content), and pedagogy** that an educator need in order to teach, work, and learn in an increasingly connected global and digital society for current trend and in future.

3

Objective of UiTM(T) ETC Standard:

- 1) To fulfill university expectations for educators to acquire standard ICT/ET hours of training at least 12 hours per year.
- 2) To measure ICT/ET training effectiveness among educators in their classroom implementation within 6 months after training completion .
- 3) To provide guidelines for Training Unit/Department to direct appropriate ICT/ET training programme with minimum one educator per six (6) training per year.

Figure 3. UiTM(T) ETC Standard interface - 1

Technological Pedagogical Content Knowledge (TPCK) represents a class of knowledge that is central to teachers' work with technology. This knowledge would NOT typically be held by technologically proficient subject matter experts, or by technologists who know little of the subject or of pedagogy, or by teachers who know little of that subject or about technology (Koehler, & Mishra, 2009)

SIGNIFICANCE

1. University shall use technology standards as part of quality professional development training programs for educators
2. Instruments described in standards are incorporated into training programs to prepare new educators and to enhance the capability of senior educators;
3. Assessment of educators mastery of the standards is done accurately; and
4. Demonstration educators technology competence is required for professional development.

HOW?

1. This UiTM(T) ETC Standard should be applied in each ICT/ET Training conducted in UiTM(ET)
2. To ensure effectiveness, pre and post assessment shall be applied before and after attending Training
3. Educators should answer Pre and Post Assessment which is developed based on this UiTM(T) ETC Standard
4. Analysis for each Training will allow the Developer Team to monitor effectiveness for each Training.

Standard	Details	Focus Area
STANDARD 1 (7 Focus Area)	Technology knowledge (TK): Knowledge about various technologies, ranging from low-tech technologies, such as pencil and paper, to digital technologies, such as the Internet, digital video, interactive whiteboards, and software programs.	Awareness of technology's value Concept Skills Designing and implementing technology-supported lessons and activities Self Assessment Concepts of lifelong learning Using technology to support teaching and management, research and professional development, and media collaboration and communication
STANDARD 2 (4 Focus Area)	Content knowledge (CK): Knowledge about the actual subject matter that teachers must know about to teach.	Progressional Knowledge Core Knowledge Strategic Knowledge Facts, Concepts, Principles and whole structure of the subject.
STANDARD 3 (5 Focus Area)	Pedagogical knowledge (PK): Knowledge about the methods and processes of teaching such as classroom management, assessment, lesson plan development, and student learning.	Range of appropriate instructional tools Teaching approaches for different styles of students Ability to create atmosphere for appropriate interaction Teaching based on students' levels of comprehension Different teaching approaches to the content
STANDARD 4 (4 Focus Area)	Pedagogical Content Knowledge: PKK represents the blending of content and pedagogy into an understanding of how particular aspects of the subject matter are organized, adapted, and represented for instruction	Teaching expertise Multiple teaching approaches Effective teaching approaches Classroom Management
STANDARD 5 (4 Focus Area)	Technological Content Knowledge: Technological content knowledge (TCK) is knowledge about the manner in which technology and content are reciprocally related.	Content Delivery Promote teaching activities for a specific course unit Technology Content Adaptive Collect or organize information
STANDARD 6 (5 Focus Area)	Technological/Pedagogical Knowledge: Technological pedagogical knowledge (TPK) is knowledge of the existence, components, and capabilities of various technologies as they are used in teaching and learning settings, and conversely, knowing how teaching might change as the result of using particular technologies.	Teaching activities for interaction. Enhance teaching effectiveness Motivate the students to learning and help them learn efficiently Enrichment of teaching materials and content. Technology Pedagogy Adaptive

The best term and description for the focal area, description, and ICT Elaboration must be chosen and validated by specialists. Expertise had two weeks to complete the three rounds of their evaluation. The changes were made in accordance with the advice provided by the experts. This paper (Yau'Mee Hayati Mohamed Yusof, Abdullah, & Hamidah, 2019) draws conclusions from the analysis and proposes an educational technology standard to be implemented in university settings using TPCK (Technological Pedagogical Content Knowledge) as the foundational framework through the Deplhi method.

The proposed standard's shared mission, vision, and national aspiration for advancing technology in education make it potentially useful in a range of academic situations. This suggested standard needs to take into account a variety of factors, including 1) tailoring standards to local needs and circumstances, 2) creating better indicators to evaluate ET/ICT training programmes, and 3) raising educators' ET/ICT competency.

Pre and Post Evaluation Training

The pre-test is a set of inquiries given to participants before the training begins to ascertain their level of familiarity with the course material (I-Tech, 2010). Prior to the start of the programme, participants took a pre-test to gauge their level of familiarity with the course material. Participants take a post-test that either has the same questions or questions of a similar level of difficulty after finishing the course. The training provider can establish whether the training was successful in improving participants' knowledge of the training subject by comparing the post-test scores of participants to their pre-test scores. Pre- and post-testing material was chosen using a set of instruments (Table 6) created by Albion, Jamieson-Proctor, and Finger in 2010 and Jamieson-Proctor et al. in 2013.

Table 6. Pre and Post Assessment are Based on Set of Instrument

Items	Number of Items
A Interest in and Attitudes toward using ICT	5
B Confidence	2
C ICT Applications	20
D Digital Technologies (ICT) Competence	7
E The Professional Capabilities of the ICT Vocational Self Efficacy Scale	12

The training provider can establish whether the training was successful in improving participants' knowledge of the training subject by comparing the post-test scores of participants to their pre-test scores. Five ICT/ET courses were offered at random in order to achieve this. The band is then categorised as follows using the pre- and post-results: Beginner ($x \leq 0$), Intermediate ($0 < x < 1$), and Advanced ($x > 1$) in accordance with Table 7. The sum of the trainees' scores within each band is shown in Table 8 as a number.

Table 7. Band

Band	Mean Score
Beginner	$x < 0$
Intermediate	$0 > x < 1$
Advanced	$x > 1$

Table 8. Band According to Items

Band	Total Achiever based Category Items		
	ICT Application	Digital Technologies (ICT) Competence	Professional Capabilities of the ICT Vocational Self Efficacy Scale
Beginner	18	6	0
Intermediate	11	21	3
Advanced	15	8	32

Standard Self-Acceptance Test

Only 35 respondents have completed their pre- and post-assessments out of a total of 75 who participated in pre- and post-assessments delivered in five distinct ET/ICT courses with an average of 15 students in our local institutions. These selected respondents will then be assigned our proposed UITMT ETC criteria for self-acceptance based on their mean pretest and post-evaluation scores, which are then filtered through three categories: Beginner, Intermediate, and Advanced.

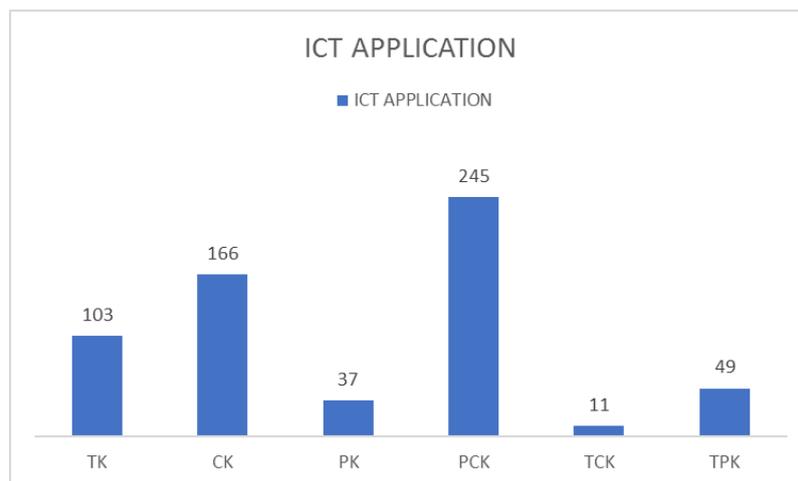

Figure 5. ICT Application

This division's purpose is to ensure that the standard can be adopted in ICT/ET training for our university educators' ET/ICT training in the selected areas: ICT APPLICATION, DIGITAL COMPETENCIES COMPETENCE, and PROFESSIONAL CAPABILITIES OF THE ICT VOCATIONAL SELF EFFICIENCY

SCALE, irrespective of band score. Only 19 individuals are able to complete the Standard Self-Acceptance Test, allowing us to deduce how they perceive themselves in comparison to the standard. The learner must select the scale (ranging from extremely good to extremely poor) that best shows his or her acceptance of the criteria. The results of the STANDARD SELF ACCEPTANCE TEST for the ICT trainees in our local institutions are depicted in Figures 4, 5, and 6 below. These figures elicit a GOOD score.

Findings in the ICT Competence category reveal that individual in the Beginner to Advanced range rate their adoption of the UiTMT ETC Competency Standard as GOOD, as shown in Figure 5. TCK and PK, on the other hand, receive the lowest scores among the elements in the UITMT ETC standard, whereas the other aspects are generally highly received by trainees.

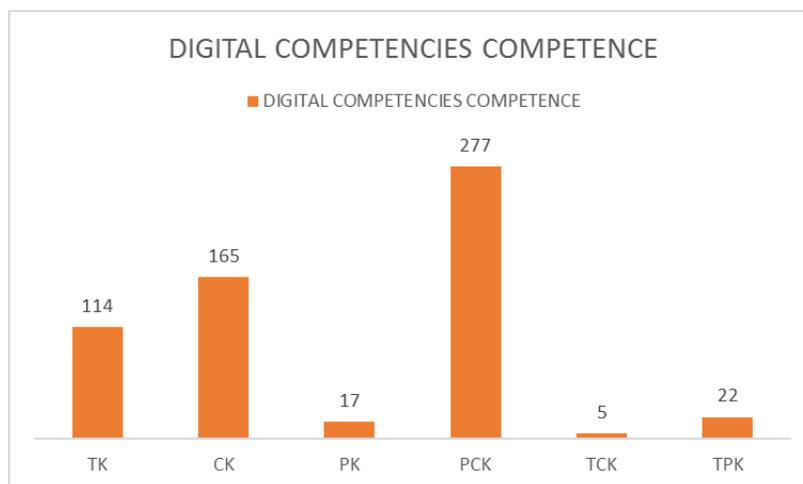

Figure 6. Digital Competencies Competence

The majority of people who rate themselves as GOOD in terms of accepting the UiTMT ETC Competency Standard in the Digital Competence category range from Beginner to Advanced, as shown in Figure 6. TCK and PK, on the other hand, receive the lowest scores among the elements in the UITMT ETC standard, while the other aspects are generally well-received by trainees.

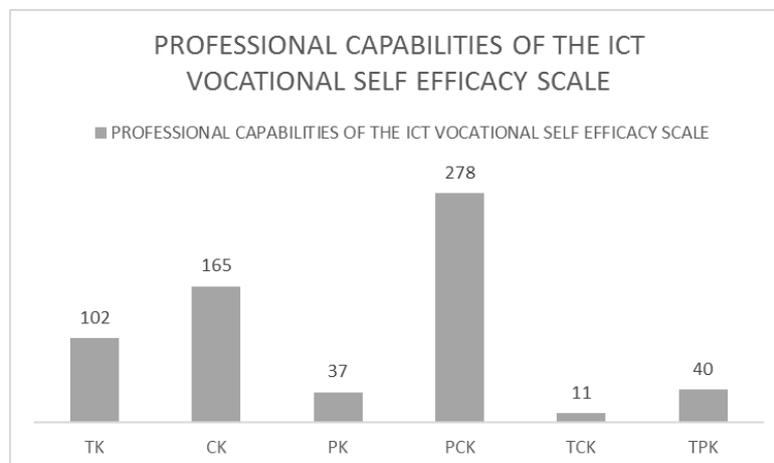

Figure 7. Professional Capabilities of the ICT Vocational Self Efficacy Scale

According to results from the Professional Competency Self Scale category, persons who rate themselves as Beginner to Intermediate rate themselves most frequently as GOOD in terms of their acceptance of the UiTMT ETC Competency Standard, as shown in Figure 7. The UITMT ETC standard's TCK and PK elements, however, receive the lowest scores overall, whereas the other elements are generally well-received by trainees.

Summary of the UITMT ETC Standard

According to Figure 8, majority of the educators at our institutions are able to accept the elements and criteria in our proposed UiTMT ETC Standard, as evidenced by the descriptive result using pre- and post-mean scores as band categories; this assessment approach is considered good towards our proposed standard. The results show that TCK (Technology Content Knowledge) and TPK (Technology Pedagogical Knowledge) are the most SCORE:GOOD components that are least accepted. This result appears to corroborate previous studies (Chaiya Akarawang et al., 2015; Bibi, 2017; Hersh, 2014) that suggest the knowledge of good pedagogical practises among educators may be lacking in technical ICT skills, which may prevent the potential for technology usage in universities from reaching the desired level among educators and students. It demonstrates that these components are crucial for combining technology, content, and pedagogy and should be emphasised during ICT/ET training at HEI. Due to the small number of sample respondents that were tested at our institutions, the descriptive analysis in this study should not be generalised as an overall response from educators in HEI in Malaysia.

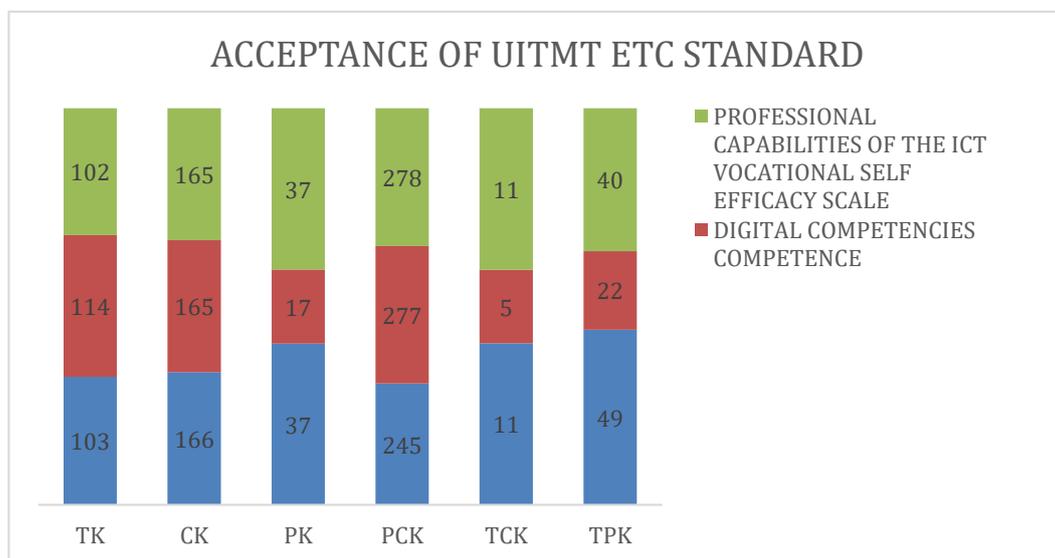

Figure 8. Acceptance of UiTMT ETC Standard

Research Methodology

Science philosophers have suggested that one of the most significant roles played by theoretical frameworks is

that they direct observation. In order to make sense of the complicated web of relationships that emerges when educators try to apply technology to the teaching of subject matter, we used TPCK in our research. The study technique that will be used to generate the Educational Technology Competency Standard (ETC), which will be used in university settings, is depicted in Figure 8.

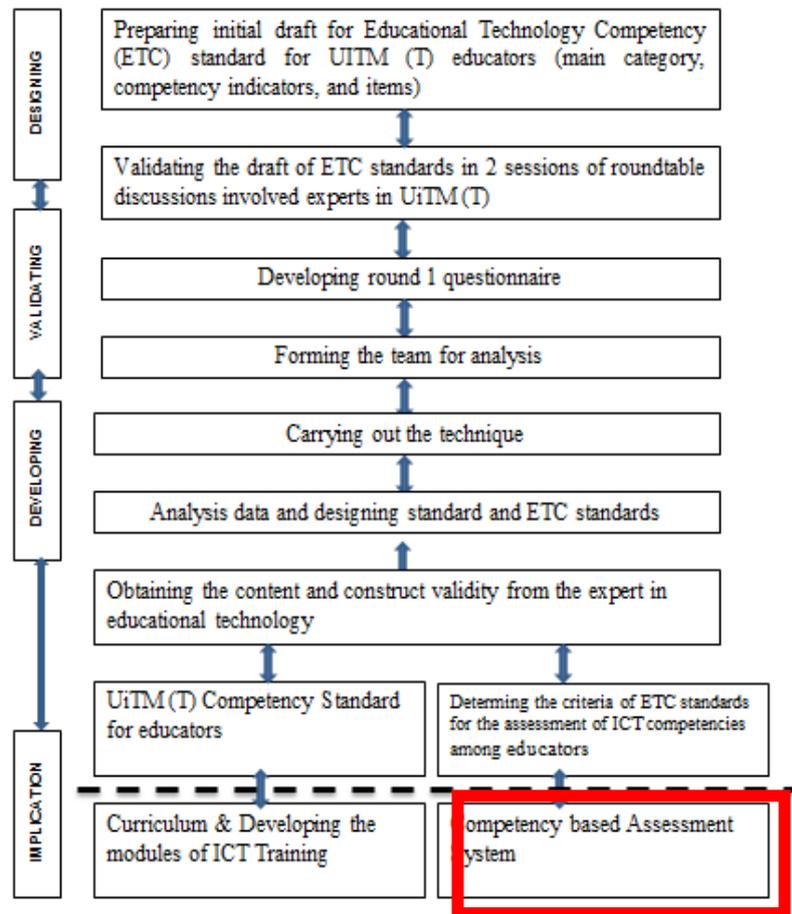

Figure 9. UITMT ETC Standard (Adopted: Research Methodology in Fong, Ch'ng, Por, & Abu Saada (2011))

This study also incorporates elements of the Delphi technique, which uses a group procedure to conduct surveys and gather expert opinions on a given subject (Hsu & Sandford, 2007). Using a variety of data collection and analysis tools, the Delphi technique is an iterative, multistage procedure used to reach consensus among experts (Fong et al., 2013). It is used whenever the basis for policies, programmes, or concepts must be sound judgement. Creating an instructional model is one of the reasons the Delphi technique is used (Linstone & Turoff, 2002). Figure 9 illustrates the process used to design, validate, and develop the instruments and items for the proposed ETC standards in our institutions using three (3) rounds of Delphi methodologies. The phase to which this paper refers is depicted by the red box square.

Problem Formulation

One trainee UiTMT ETC report who has taken three ICT-related training sessions was employed in this case

scenario.

The steps of using any MCDM technique begin with the following 13 steps: -

1. Identifying the suitable weights.
2. Among the different methods of calculating weights, Geometric Mean Method is popular because of its simplicity and consistency.
3. Find the relative importance of different attributes concerning achieving the goal.
4. Construct a pairwise comparison matrix by taking a suitable scale as given in Figure 4.
5. When there is an M number of attributes the relative importance matrix is a square matrix of size M X M.
6. All the diagonal elements Relative Importance matrix are 1 Because the attribute is checked by itself.
7. The remaining elements are to be filled from table 0.11. By following the rule $A1_{ij} = 1 / A1_{ji}$. Where A1 is Relative importance matrix.
8. Calculate the Geometric mean and weights
9. Calculate A3 and A4 matrices such that $A3 = A1 \times A2$ $A4 = A3/A2$
Where A1 is the Relative Importance matrix and A2 is weight matrix [w1,w2, ...,wj up to j attributes]
10. Calculate the maximum eigenvalue λ_{max} , by taking the average of A4 matrix.
11. Determine Consistency index $CI = \lambda_{max} - M / M-1$.
12. Obtain the Random index value from Figure 10 for the required attributes.

Matrix size	Random consistency index (RI)
1	0.00
2	0.00
3	0.58
4	0.90
5	1.12
6	1.24
7	1.32
8	1.41
9	1.45
10	1.49

Figure 10. Random Index Value

13. Calculate Consistency ratio: $CR = CI / RI$

In general CR value <0.1 is acceptable, if CR value is greater than 0.1, then we have to rethink the relative importance.

To each of the attributes in MC TKAF, the decision-maker assigns the important weights which become the coefficients of the variables. The steps are the following:

1. Determine Criteria from Alternative (Table 9)
2. Weightage for each criterion (Table 10 & 11)
3. Develop Normalization Matrix (Table 12)

4. Preference (which is the result is based on MCDM techniques used)

By using the assumption weightage, the result is based on the following table:

Pair Wise Comparison

Table 9. Weighted Normalized Decision Matrix

Weighted Decision Matrix	Normalized							Weight	Average	Consistency Measures	
Weight Criteria	TK	CK	PK	PCK	TCK	TPK					
TK	1.00	2.00	3.00	3.00	3.00	3.00	0.19	0.03	12.87

0.19	0.18	0.18	0.16	0.15	0.14

SAW

This method can help in decision making for a certain case, and the calculation that generates the greatest value will be chosen as the best alternative (Karlitasari, Suhartini, & Benny, 2017). It is based on based on the weighted average (Jafari, Jafarian, Zareei, & Zaerpour, 2008). The formula using SAW are based on following criteria:

Hata! Burada görünmesini istediğiniz metne Caption uygulamak için Giriş sekmesini kullanın..1

$$S^* = \{S_i \mid \max_i \sum_{j=1}^n \mu_j^{c_i}(x) \times \mu_j^i(x) / \sum_{j=1}^n \mu_j^i(x)\}$$

Pi = normal (i)

Where wj is weight matrix, Mij Normal is a normalized matrix of basic table.

Formula for Normalization Matrix as following:

Hata! Burada görünmesini istediğiniz metne Caption uygulamak için Giriş sekmesini kullanın..2

$$x_n = \left\{ \frac{x_n}{\max_i x_j} \right.$$

$$x_n = \left\{ \frac{\min x_n}{x_j} \right.$$

The decision maker can then obtain a total score for each alternative simply by multiplying the scale rating for each attribute value by the importance weight assigned to the attribute and then summing these products over all the attributes SAW (Jafari, Jafarian, Zareei, & Zaerpour, 2008).

Table 13. SAW

	TK	CK	PK	PCK	TCK	TPK
TRAINING A	0.11	0.13	0.11	0.12	0.11	0.08
TRAINNG B	0.16	0.13	0.11	0.12	0.11	0.08
TRAINING C	0.14	0.18	0.14	0.08	0.08	0.11

WPM

Weighted Product Method (WPM) is similar to SAW Method but instead of addition, there is multiplication in the model. The normalized values are calculated and each normalized value is raised to the power of relative weight. The alternative with highest Pi is the best alternative among others.

Pi= [normal] w j (ii)

Hata! Burada görünmesini istediğiniz metne Caption uygulamak için Giriş sekmesini kullanın..3

$$A^{*WSM} = \max_i \sum_j^m a_{ij} w_j$$

Hata! Burada görünmesini istediğiniz metne Caption uygulamak için Giriş sekmesini kullanın..4

$$R\left(\frac{A_k}{A_l}\right) = \prod_{j=1}^n \left(\frac{a_{kj}}{a_{lj}}\right)^{w_j}$$

Table 14. Rank of Training Type

	TK	CK	PK	PCK	TCK	TPK	
TRAINING A	0.90	0.95	0.91	0.95	0.96	0.93	0.66
TRAINNG B	0.97	0.95	0.91	0.95	0.96	0.93	0.72
TRAINING C	0.94	1.00	0.96	0.89	0.90	0.97	0.70

The final normalized weight is calculated to rank the training type. The highest value of final weight indicates the first rank of the training type. The final weight results for all techniques will be used to rank the three (3) training type for the best result on educators training program as shown in Table 14 respectively.

Although we can infer from this chart that Training B (Figure 11) has had a greater impact on this trainee's UiTMT ETC Standard Competency than any other sort of training, there is some consistency in the results. However, based on the regularity of the results, we can state that this trainee succeeded in adapting to the UiTMT ETC Standard at a very Excellent level.

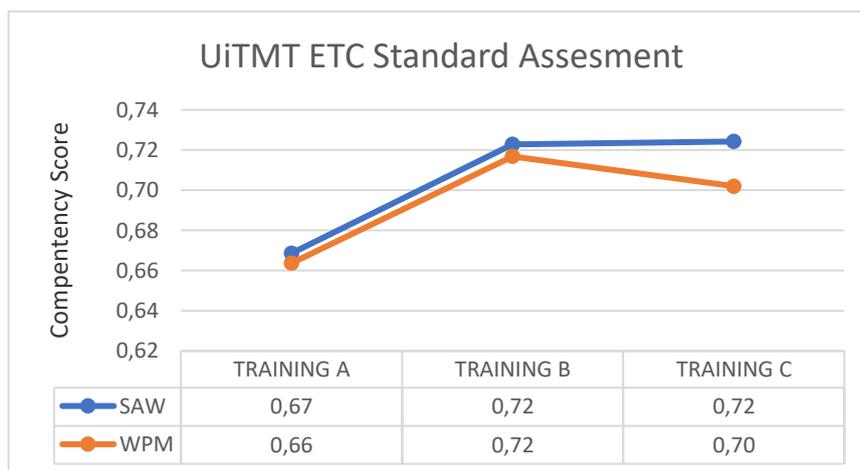

Figure 11. UiTMT ETC Standard Assessment

Digital / ICT Training Competency Based Assessment System

Below is the proposed Training Competency Assessment Based System (Figure 12) that been proposed to help

the university administration to monitor their educators Digital/ICT Competency. This proposed flow chart is hoped to make the university administration are clear with their Digital /ICT training direction towards upgrading their educators in public HLI institutions to meet with Malaysia Ministry of Higher Education Blueprint 2015-2025 vision and mission.

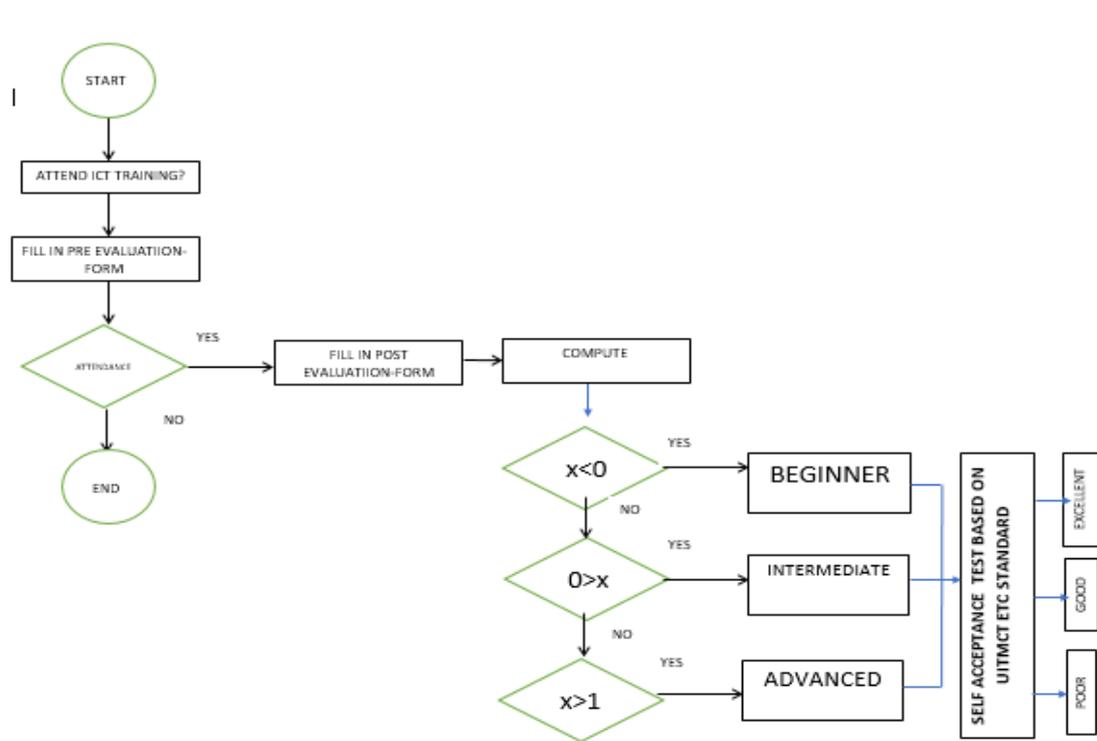

Figure 12. Flow Chart Training Competency Assessment

Discussion

To emphasise the significance of taking into account technological possibilities in light of developmentally appropriate practises and specific learning objectives in ICT/ET training provided for educators in HEI in Malaysia, it is nonetheless suggested that this assessment and study's findings be used as a guidance method for ETC Standard implementation in university settings. In this study, it is hoped that the following questions will be addressed:

1. What is the elements in TPCK which can used as standard in UiTM(CT) ?

A Standard using TPCK for UiTM (T) Educator as Educational Technology Competency Standard has been developed using delphi method via three round of analysis. Almost most elements in TPCK are accepted by the expert choice.

2. How to use TPCK to produce a practical standard for UiTM(CT) ?

Analysis the sample of Educators who used the standard be done, and the result showed that UiTMT ETC standard were well received by the respondents. This finding seems to support the research done by (C Akarawang, 2015) that indicates that the gap between technical ICT skills and the knowledge of good pedagogical practice among educators might disallow the potential of technology usage in University to reach the desired level among educators and students. It shows that these elements should be stressed out during the ICT/ET training in HEI as it is the most needed elements in integrating technology-content – pedagogy. The descriptive analysis in this study however should not be generalized as a whole response from educators in HEI in Malaysia due to limitation of sample respondents that has been tested in our institutions. Further detail analysis must be taken to carry out realistic result of the effectiveness of this proposed standard.. However to make sure that this UiTMT ETC Standard much more practical to be used, we would like to propose a Digital / ICT Training Competency Based Assessment System to evaluate educator competency using multi criteria decision making approach such SAW and WPM based on the standard.

Conclusion

However, the utilisation of ICT/ET instruments in the classroom is entirely dependent on the training and skills of our local educators. Therefore, it is imperative for UiTMT to establish a firm competency standard for their educators in order to ensure that the use of educational technology in the teaching and learning process is a worthwhile endeavour. In order to maximise the potential of Educational Technology instruments in Malaysian universities, this study will cast light on the context of the Educational Technology Competency (ETC) standard in a university setting. The findings of this study will contribute to the full utilisation of educator-student learning by introducing strategies that can be guided by the application of ETC Standards.

Abstract: Communication is treated as one of the most important issues in all aviation professions, including aircraft maintenance, where passenger safety is paramount. Employer dissatisfaction with the performance of engineers, including aviation graduates, as communicators in the workplace remains controversial. Therefore, this study was conducted to examine the types and functions of communication skills required in the aircraft maintenance workplace. Twelve participants, consisting of aircraft maintenance technicians and licenses aircraft engineers (LAE), were involved in semi-structured interviews. The data were analysed thematically and managed using ATLAS.ti software. The results showed that seven sub-themes were identified in relation to oral communication activities and five sub-themes in relation to written communication a written communication is as important as oral communication for aircraft maintenance personnel. In addition, both written and oral communication are expected to be clear, concise and precise. The identified need for communication skills would help aviation institutions develop solutions to meet the needs of the aviation industry.

Keywords: Communication Skills, Aircraft Maintenance, Oral, Written.

Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 559-572), Cappadocia, Turkiye. ISTES Organization.

Introduction

Communication skills are considered a significant skill for any profession, including the aviation industry. It is a fundamental prerequisite for aviation personnel to disseminate information, expertise, and experience to others.

They need to communicate on a frequent basis with their supervisors, colleagues, customers and team members. One of the most important components of worksite safety is communication (Yusof & Misnan, 2019). All aircraft workers must communicate in English to avoid accidents.

In the aviation industry, effective communication is important to ensuring timely flight operations as well as safe takeoff and landing (Torquato, 2004). This is also true in the aircraft maintenance industry, which requires strong English communication to avoid accidents (White, 2018). Miscommunication or a misunderstanding of communication can lead to death. According to Dalkilic (2017), as stated by Shukri et al. (2021), the average percentage of aircraft accidents related to maintenance issues was about 10% between 2009 and 2013. Notwithstanding the fact that maintenance problems cause only a very small proportion of commercial aviation incidents, accidents are often tragic (Cacciabue et al., 2003). This illustrates why maintenance works are crucial to aircraft safety and economic costs. Several aviation maintenance activities involve a significant amount of English, and maintenance personnel must be fluent in English to guarantee that tasks are performed accurately and smoothly (Shukri et al., 2021). Therefore, the communication skills of aviation personnel should be developed and refined during their studies.

Universities should work closely with industry to identify their communication needs and modify the curriculum to give aviation people the necessary profile of a technician or engineer. Hence, this study was conducted to investigate the functions that both oral and written communication skills perform in the workplace of aircraft maintenance. This study was also carried out to find out which skills are most important for maintenance technicians and licensed aircraft engineers in the aviation sector. The findings from the study should help educational institutions prepare their students for the future and ensure that their students have the professional skills they need to enter the workforce in the near future. This will be very important and helpful to the aviation sector, as there is still a lack of this type of study in Malaysia, especially in the field of aircraft maintenance.

Literature review

One of the things that leads to globalisation is aviation. It connects the world and makes it more accessible and open. The language of aviation is English. Aviation English is a highly specialized language used mainly in aviation or aeronautics. Since aviation is a restricted and highly contextualised perspective, efficient English for Specific Purpose (ESP) approach taught through content (Basturkmen, 2006). Aviation English has numerous applications and it is used not only by pilots and crews, but also by ground staff such as aircraft maintenance technicians.

The aviation industry needs to prioritise safety issues because there are many aircraft that need to be properly maintained so that hundreds of passengers can fly safely every day. To ensure this, the industry needs to hire qualified aviation maintenance professionals who are responsible for maintaining aircraft, performing routine maintenance, and repairing any defect parts that are discovered during inspection. Aircraft maintenance

technicians are considered to be hands-on workers. It is also worth noting that good aircraft maintenance personnels have excellent communication skills.

The disparity between what students have to learn and what industry requires implies that there is still a gap between students' skills and real situation in the industry (Kahiroli et al., 2010). The study is similar with earlier findings in that it suggests that the communication skills of engineering graduates are generally poor, although engineering departments have explicitly worked to improve the communication skills of their staff (Donnel et al., 2011).

Lack of communication skills and a lack of understanding of the Aircraft Maintenance Manual (AMM) are two issues faced by aircraft maintenance students during their internships in the industry (Sasila & Mahmood, 2017). The findings of this study in the Malaysian context appear to be comparable to previous studies that found that polytechnic students in aircraft maintenance have not yet mastered certain oral and written communication skills and oral presentation skills (Sanmugam & Kadir, 2019).

Compared to studies explaining what engineering schools could do for communication education, there is little discussion of industry expectations for engineering graduates' communication skills, including in aviation (Donnel et al., 2011). Therefore, more focused research into the specific communication skills required by industry should help educational institutions rethink their approaches to training students to be better communicators.

Graduates must be able to write reports, letters, and emails in English (Masduki & Zakaria, 2020). Companies expect careful planning and confident presentation of work results. Employers expect detailed preparation and confident presentation of work results, using good non-verbal communication to gain and maintain audience attention and build rapport to achieve business success (Lenard & Pintaric, 2018). However, the study did not focus on a specific engineering industry, and the research was also conducted with a limited sample of participating employers. The data also revealed general feedback and no further action was taken in response to industry participants' input.

Employers require engaged listeners, capable first language speakers, and English-speaking facilitators, according to a study by Lenard and Pintaric (2018). In addition, the study discovered that employees are required to adhere to email etiquette, have excellent grammar and style in both written and oral communication, as well as use proper non-verbal communication methods. However, this study used a survey as its research method, which contained closed-ended questions that may be less valid than open-ended questions. In addition, this study did not focus on the perspective of the aviation stakeholders, which was highlighted in the problem statement in the previous section.

For the reasons stated above, this study was done to identify the various types and functions of communication skills used by aircraft maintenance personnel.

Method

Design of the study

The semi-structured interview, which is commonly used in qualitative research, was used in this study. It is one of the most often used qualitative data collection strategies to gather information about communication skills issues and needs in any industry. It provides a good representation of the main events as well as insights from the participants.

Participants

Purposive sampling was used to choose twelve (12) aviation workers for this study. They are all currently employed by twelve different Malaysian aviation companies that specialize in aircraft or helicopter maintenance, aircraft simulation, and aircraft parts manufacturing. The identity of the companies was not disclosed. Most of them were between 23 and 45 years old. To hide their identities, the participants were given pseudonyms such as "Boy" and "Moon.". A pseudonym is a fictional persona that is frequently employed by researchers or authors to preserve the anonymity of participants (Allen & Wiles, 2016). There were ten (10) male participants and two (2) female participants in this study. Most of them have 2 to 24 years of experience in the industry. Table 1 provides an overview of the aircraft technicians and engineers who were interviewed for this study. It shows the pseudonyms used in this study, as well as their age, years of industry experience and their position in the companies.

Table 1. Participant background information.

No	Pseudonym (Male/Female)	Years (Working experience)	Position
1	Mir (M)	3	Technician
2	Hah (F)	2	Junior technician
3	Moon (F)	5	Technician
4	Boy (M)	9	Senior engineer
5	Keman (M)	3	Assemble technician
6	Tony (M)	8	License aircraft engineer (LAE)
7	Mezar (M)	5	Industry engineer
8	Kerol (M)	2	Simulator technician
9	Ad (M)	9	License aircraft approval
10	Pejol (M)	24	License aircraft engineer (LAE)
11	Mad (M)	16	License aircraft engineer (LAE)
12	Kemal (M)	14	License aircraft engineer (LAE)

These participants were chosen for this study because they had prior knowledge in their respective professions and had completed their courses in aircraft maintenance at a Malaysian aviation school approved by the Malaysian Civil Aviation Authority (CAAM).

Data collection and analysis

All participants were interviewed individually as part of the data collection process. Each interview lasted 60 to 80 minutes, and they were asked questions about function of oral and written communication that they commonly experienced. They were also asked what skills were most important in the industry in terms of communication.

Following the interview, it was transcribed verbatim and distributed to participants for editing, refinement, addition or revision. The data were analyzed using a six-step thematic analysis (Braun & Clarke, 2006) and ATLAS. It helped with data management and presentation.

Results

The results of the qualitative research revealed two significant themes that emerged from the transcribed data and were categorised as oral communication and written communication. Based on the interviews conducted with twelve aviation personnel, 7 sub-themes were identified in relation to oral communication functions and 5 sub-themes in relation to written communication functions. Figure 1 shows the three themes of aviation industry workplace communication.

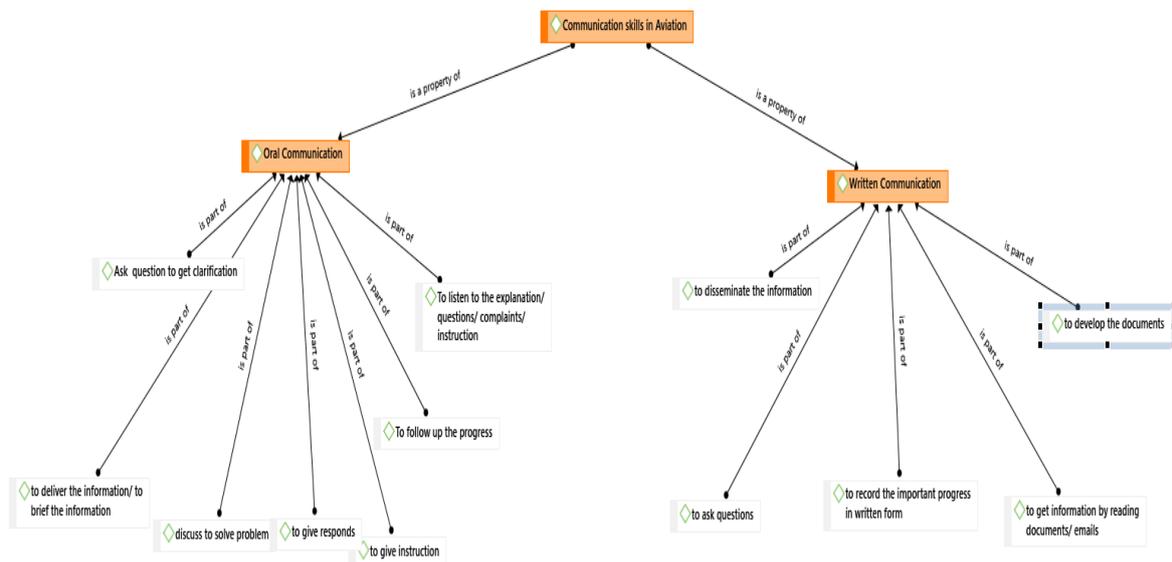

Figure 1. Network view of the communication skills in aviation

Theme 1: Oral Communication

To ask questions

All participants agreed that oral communication is essential for workers in the aviation industry, especially in aircraft maintenance, to ensure that all instructions and descriptions of work procedures and tasks are thoroughly

understood and that misunderstandings can be avoided, thereby preventing accidents in the workplace. Most of them said that they prefer to ask questions directly if there is confusion or they do not understand the tasks they have to perform. One of the participants shared that, as the leader of an engineering team, he preferred for his team members to just ask him directly when something was not clear, adding that two-way communication is important in teamwork.

..... We are quite straightforward, so if there's anything you don't understand, please ask us again. We had also two-way communication, whatever it was.... (TONY)

One of the participants also mentioned that after the morning briefing, which they had every day, the leader asks the team members if they have any problems before they start the maintenance tasks. This shows that although the maintenance team has to deal with machines, planes, tools and equipment and can refer to manuals, they still have to use oral communication to make sure they are doing the right job.

..... After the briefing, he will ask on the floor, "Any questions or problems, just tell me," to which we all listen. As a result, we make inquiries or offer suggestions. (MIR)

To deliver the information/ brief the information

Besides that, the aircraft maintenance technician and engineers also use oral communication to deliver or to brief the information. A team briefing brings leaders and their teams together face-to-face to share information, ask questions, and gather feedback. One of the technicians involved explained that the briefing is important for the team to be informed about the current progress of the project and the team's target for production in a given week or period.

.....He will typically give us a briefing on Monday about how many components or wings we need to manufacture each week. So, the information is conveyed to the subordinate or another staff member using communication. ensuring that the staff is informed about the project's progress... (KEMAN)

To discuss and solve problem

In addition, the maintenance team also uses oral communication to discuss and solve problems they face while performing the task. Discussion is important for teamwork as it encourages the team to work together and coordinate their efforts. It fosters a climate where everyone can present their point of view on the chosen topic, creating a productive environment for teamwork. One of the technicians involved explained that discussions with the partners or team members are important to ensure that he is doing the job properly without wasting time or even the cost.

...As you clarify the work you want to do, talk with your partner, or teams, and the engineer from the

quality department to solve a specific problem... (KEMAN)

To give responds

Participants also agreed that they needed to know how to react and respond to the questions of others, such as their supervisors, clients, and team members. Hah mentioned that her supervisor observes her work and makes sure she is doing it right by asking questions. Therefore, she needs to make sure that she knows how to respond to these questions.

...I have to respond and explain to everybody who questions me. Listen to the briefing in the morning. After reading the work scope at the beginning of the day, the SV will ask me what I understand or have a team member have a conversation with me. I will then explain, carry out the assignment, and the SV will sit next to me and watch what I did... (HAH)

To give instructions

In addition, one of the participants agreed that he uses oral communication to give instructions to his teammates and ensure that they can complete the tasks in the allotted time. He shared his strategies and different approaches to avoid the culture of procrastination or that the company has to pay penalties to the clients if the work is not done in the given time.

... Similar to what I previously said, I usually talk in a normal tone to give instructions at the first level, and if there is still no action at that point, I will give more strict instructions. I need everything finished in a half-hour. Please do that for me... (TONY)

To follow up the progress

Moreover, some of the engineers involved in the interviews agreed that they use face-to-face conversations to get updates from their technicians or other engineers on the current status of certain projects. Face-to-face communication conveys a wealth of information, including non-verbal cues and body language, and allows for immediate feedback that is as rich as the initial message. One of the engineers mentioned that he always uses face-to-face communication to get updates on the status of certain projects, as he learns about the progress immediately.

It is important for me to communicate with my team member to know about the progress of project. If I just let them do the job without follow up, we might miss the deadline that we need to complete the job. Then, we might get the penalty from the clients.... (TONY)

To listen the explanation/ questions/ complaints/ instruction

Furthermore, most participants also agreed they must have good listening skills to understand the instructions , questions, explanations or complaints from the others to ensure that they perform a proper job as a team. One of the participants called his position as the mediator between the technicians and top managements. The technicians usually will approach him to complaints about certain problem during work and he will discuss with the top management to come out with better solutions.

....So, the industrial engineer is the one who they may complain to most easily. Alright, Mezar , these two improvements can be made to this tool. They therefore take note. The meeting will then be called and announced to all departments. There will be an improvement as a result of our conversation....
(MEZAR)

In conclusion, this study has uncovered seven different functions of oral communication that aviation personnel frequently use. They must also rely on oral communication in their practical work to ensure that tasks are completed successfully and without incident.

Theme 2: Written Communication

Written communication is one of the communication skills that people use to convey information because it is a very tangible type of evidence. The accuracy of the information transmitted remains the same for all recipients, as the information does not differ from person to person.

This study describes five functions of written communication used in industry among maintenance technicians and engineers. These functions of written communication are described in detail below.

To disseminate the information

Sharing certain information with a group of people or with individuals, internally or externally, is important in the workplace, whether through printed or electronic documents. Most of the participants agreed that they need to use English when they write emails or write reports. One of the participants said that she has to write a report before passing the tasks to the other person in the next shift. She also added that she has to write an email to the person in charge of another department if there are major problems.

English only. Usually when I have to hand the task over before the shift is finished. Make a report. In addition, I have to mention a part failure when necessary. We must therefore write in English. Well, um, it is required that I use English in my email correspondence with the PIC for the Engine Department. (HAH)

It seems that written communication is important to pass on information to others when working in a team. To

ensure that they completed the task, they also had to use written communication.

To ask questions

In addition, the maintenance technicians and engineers involved in this study agreed that they use written communication to ask questions, especially by email and also by WhatsApp. Emails and letters are written records of communication that can be used to keep important emails. This can be useful if we need to refer to something someone said in a previous message and provide evidence.

One of the participants mentioned that sometimes he sometimes received task from foreign centres and when he has a problem, he contacts another technician from a foreign centre to get the suggestion to solve the problem.

When working with a foreign technician, the task is frequently requested from another centre, such as Singapore, Hong Kong, and so forth, via email and TEAMS. I gave a brief explanation of the situation and requested their suggestions for how to resolve it. (KEROL)

To record the important progress

In addition, written communication is also important to record certain stages or progress in certain tasks. It can serve as a guide or reference for other staff. At the same time, it is also important for audits that are carried out at certain periods. There are many types of reports that the aircraft maintenance technician and engineers need to complete when doing certain tasks. For example, Inspection Report Card (IRC), Job Scope, Letter of Intent, Task Card and Shop Order. One of the engineers shared his experience of doing the repair based on the report written by another person in the quality department. This shows that report writing is one of the written forms of communication used from one person to another to fix certain defect.

...The PIC from the quality control department comes to inspect the product. If a defect is discovered, the PIC will produce a report describing it. For example, in one unit, the sealant has a problem and is damaged. The PIC will record the defect as a result. As the technician, it is my responsibility to fix the defect and then document what I did in the report... (KEMAN)

To get information by reading documents

Besides that, all participants felt that written documents are important in their position as they rely heavily on documentation before starting a work process, such as the aircraft maintenance manual, work scope and technical log, service bulletin, manufacturing order, task card and many others. One participant noted that he started his day by studying the manual before starting maintenance work to ensure that he followed the necessary steps and procedures.

All of the manuals must be read because they must be printed out before we can begin the task. We do the tasks in pairs. Our partner read the instructions before we started the job. We need to communicate to one another regularly. After reading it, take this and this out. One other listen and completes the task...(MIR)

To develop the documents

Moreover, one of the engineers involved in this study explained that he is responsible for developing the manuals and policies of the company, as the company is new and everything is still in the early stages. He develops the manuals based on the aircraft the company will be working with. Then he sends them to the authorities and prepares the presentation to get approval.

...Yes, I am the one that write the policy, manual. Because this company is new company, so everything start from the scratch. (BOY)

To summarise, although written communication has fewer subtopics than oral communication, it is still important to use them as official documents so that people in aviation can quickly recognise what is right and what is wrong.

Written communication is as important as oral communication.

This study also revealed that most participants felt that written communication was as important as oral communication and that they could not be separated. Since they need to refer to the manual before starting maintenance tasks, they still need to consult verbally with teammates and supervisors to make sure they will do the right thing. The same goes applies to the oral communication. They cannot simply carry out tasks based on the verbally delivered message but must refer to the written documents to avoid misunderstandings and communication obstacles such as the noise that often occurs in their workplace. In addition, the important documents prove that there are references to the performance of certain tasks, such as the instructions in the email sent.

...Balance. To complete the task, we must first check the written text. Then, to comprehend the tasks, we listen to the instructions, ask questions, and chat with others. The task is then reported, written...(MIR)

...In my role, I communicated through two different channels. written and verbally. You must put both of these into practise if you work in the industry. Then it will be finished. Because we wouldn't be able to fully understand what was said if we only provided a written report. If we just communicate verbally,

we must be incorrect or have forgotten what was said previously. Perhaps after talking about this and that, we forgot what he had just said?... (AD)

Discussion

As mentioned above, the participants considered both written and oral communication equally important. They agreed that the success of task performance depends on how effective communication is at work. Good communication skills in engineering are becoming increasingly important as the engineering industry evolves. Good communication skills are needed to explain ideas and projects to a wider audience. These skills are important to ensure that all project participants are on the same page and working towards the same goal. Communication skills should be valued equally with technical expertise especially for those who want to move up to the position of manager or team leader. For example, the leader discuss new projects with clients and their own supervisors. They also pass on project specifications and deadlines in their reports, while keeping their bosses and clients informed. Misunderstandings, frustration, tension, and even accidents can be the result of poorly delivered messages.

Based on the findings discussed in the previous section, this points to the importance of English language use in the industry, as it involves not only local companies but also international companies from all over the world. Engineering students who were fluent in English were able to progress in their careers and compete in the industry (Chan, 2019; Saleh & Murtaza, 2018 and Zahari et al., 2016).

Asking questions is one of the functions of oral communication in the workplace to ensure that technicians and engineers follow the correct procedure. By asking questions, they are given the opportunity to understand others' perspectives and work authentically with individuals. Employees must be willing to ask questions and actively participate in team interactions to improve their general abilities (Zakaria et al., 2018).

Apart from this, it is also important to have a high level of self-confidence in the task done and to explain it properly to answer the supervisor's request or relate the task done. People with a lot of confidence are needed because they can captivate others and convince them of their point of view or reasons (C. Alih et al., 2018).

Everyone in aviation, from technicians to aircraft engineers to senior engineers in management positions, has to read and produce a variety of documents. This includes developing structured reports to communicate data. One of the technicians mentioned that after completing a task, she has to write down information to indicate an error, a defect, or an additional action that the next person should take. The logbook is one of the official records of all aircraft data, and the information it contains is used to assess the condition of the aircraft, the date of inspection, and so on (Terenzi, 2021).

Nevertheless, writing activities in aviation schools do not adhere to the structure required by the aviation industry and students are not adequately prepared to write reports or other work related to their assignments

(Vieira & dos Santos, 2010). According to Ruiz (2004), the written assignments in aviation schools should accurately reflect the type of communication that these professionals may encounter in their work. According to Terenzi (2021), this is consistent with Yusuf et al. (2018) that English writing skills are important in today's global business environment, especially when writing memos, emails, notices, minutes, agendas, contract documents, reports (technical, daily, and problem reports), and contracts. Consequently, institutions need to pay more attention to this issue and improve in order to train future aviation employees who are well prepared before they enter the industry.

Both written and oral communication must be clear, concise, and precise. When messages are clear, concise, and precise, there is no opportunity for misinterpretation or change of message, which reduces the potential for conflict. If conflict does occur, effective communication is essential to ensure that it is resolved in a respectful manner.

Conclusion

The study found that aircraft maintenance graduates need oral and written communication skills to succeed in the industry. The study has helped to identify the functions of oral and written communication and the types of situations in which employees need to communicate in the industry. It can help stakeholders, especially teachers and curriculum developers, improve university English courses by identifying the types of communication skills used in the workplace and carefully considering which aspects should be retained and which should be improved or outsourced. Language training modules that teach functional skills to aircraft maintenance students help them meet employment standards.

Recommendations

This study used a qualitative technique with semi-structured interviews to get a complete picture of the case. The generalisability of industry players' perceptions of communication skills in the workplace was not the intended aim of this study due to the small number of participants. Furthermore, this study was mainly concerned with communication skills in the aviation industry, particularly in aircraft maintenance. Future studies should investigate workplace communication skills with a larger sample size, both qualitatively and quantitatively. Additional research is needed to evaluate the effectiveness of university courses that focus on communication skills from an employer's perspective and meet industry needs.

Abstract: The COVID-19 pandemic has tackled global sustainability without prejudice or geographical constraint. It has also prompted people to advance to the post-pandemic era. However, it is possible that in the future, extreme negative effects in response to crisis, especially during a pandemic, would recur. In fact, it might worsen. This situation has forced the education sector to adjust its teaching and learning approach in order to implement a new solution based on a selected component, namely assessment. In such case, the implementation of assessment has been activated for online learning platform. Hence, it is crucial to refer and study the current environment mode of the E-Assessment model in view the of the model development perspective and the features of the assessment concept for model development. The seven features that make up the degree of assessment conceptual dominance in online learning are authenticity, responsiveness, practicability, adaptation, transparency, alignment, and affordance. In accordance with the overall analysis of the conceptual features, the possibility of frequent and synchronized usage may be extended in detail for further investigation.

Keywords: E-Assessment, online learning, model

Citation: Jamalludin, S., & Romli, A., (2023). Research on a Learner Assessment Model in Online Learning for Higher Education. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 573-587), Cappadocia, Turkiye. ISTES Organization.

Introduction

Assessment is an essential component of learning as it is a useful method to visualize the engagement between learners and educators (Taras, 2005). Respectively, assessment can improve teaching and learning, as well as can be used to hold learners and institutions accountable (Talib et al., 2020). Assessment in the twenty-first century should encourage students' use of critical thinking, analysis, synthesis, and inference (Segers et al., 2003). Hence, it is key to prove if an education system is producing the desired outcomes for learners, the economy, and society at large (Clarke, 2012). In response to the online learning environment, it is relevant to consider the E-Assessment component. Learners' E-Assessment is the process of testing students' knowledge

and abilities using information and communication technology (ICT) for all assessment processes, including design, implementation, reaction recording, and feedback provision as perceived by learners, teachers, lecturers, and tutors (Wuisan & Wibawa, 2019). Meanwhile, Gaytan contends that technology, delivery, pedagogy, learning styles, and learning outcomes all play a role in the positive E-Assessment outcomes (Gaytan, 2005). Pursuant to this, assessment has brought various positive perspectives that are not just confined to the platform approach. Due to the emergency shift, the most recent assessment case study in the digital world showed negative views when assessment activities have the potential to cause discontent, irritation, and anxiety in the summative assessment approach (Losad et al., 2020).

The Highlighted E-Assessment Changes in Response to the Crisis

The changes brought about by emergency remote teaching and learning (ERTL) are indeed compulsory and from different perspectives. These perspectives may vary depending on the context and individual experiences of learners and educators.

Firstly, the emergency remote teaching and learning (ERTL) strategy has been activated generally without assessment. Although there must be drastic changes, the factor of relevancy has presented challenges for both educators and learners. With the current issue, it is clear that perspectives toward assessment need to be tolerated. The COVID-19 pandemic has activated the emergency transition mode when it dreadfully disrupts the education sector. An online learning activation mode by minimum plan, zero plan, or unexpected condition within a limited timeframe is referred to as an emergency transition, specifically to the education domain as remote teaching (ERT) (Bozkurt & Sharma, 2020; Nassr et al., 2020). Respectively, ERT's uniqueness is the new response phase discovery for the COVID-19 pandemic due to its global impact on the education sector, without prejudice at any level. As opposed to the prior crisis, the local effects were due to events like earthquakes, protests, severe floods, conflict, Ebola, and SARS.

The second problem lies in the status and level of assessment necessity in relation to the teacher and the student. The COVID-19 pandemic sample crisis initiates learning assessment adjustment activities. Applying online evaluations to courses meant for face-to-face instruction is challenging. The major challenge is the struggle to evaluate learners using the continued existing assessments that are assigned in a normal situation (Mumtaz et al., 2021). The worst adjustment occurs when the assessment is cancelled and the institution has to claim it as less important (Burgess & Sievertsen, 2020). Furthermore, during ERT, an assessment was identified from two (2) different perspectives (Jankowski, 2020a). First, since assessment is optional, it was set aside while professional development focused on online instruction and technology rather than on assessment or learning. Secondly, the administration should consider skipping the evaluation if it causes the faculty to be overburdened under normal circumstances and the grading evaluation letters to pass and fail are diverted (Jankowski, 2020b; Means & Neisler, 2020; Watermark, 2020). The learners were given the option of grading their assessments using pass-fail or grading conventions in detail (Means & Neisler, 2020). 60% might have opted for grading pass-fail to

grade, 6% chose mandatory pass-fail, and 34% had no choice but to continue receiving a letter grade (Means & Neisler, 2020). For example, in reaction to the Canterbury earthquake, the final test and take-home assignment had been cancelled and their weighting were redistributed among other evaluations (Agnew & Hickson, 2012).

Thirdly is the assessment methodology and pedagogical. During COVID-19, various adjustments had been made according to several different case studies. Most case studies were based on surveys. Henceforth, the assessment was done in light of the learner demand (Jankowski, 2020b; Rice, 2020), frequent technology use (Rice, 2020), the extension of the report deadline (Jankowski, 2020b; Rice, 2020), and the modification of assessment planning activities for the future (Rice, 2020). Furthermore, educators must also be flexible when determining the number of outcomes they assess (Watermark, 2020). On top of that, the necessity of a management assessment system is made much more pressing during a crisis (Watermark, 2020). The increased workload and pressure during a crisis can lead to a breakdown in communication, decision-making, and collaboration. Uniquely, there is also an assessment approach to capture a wide range of learner learning evidence, including field experience and other clinical practice measures (Watermark, 2020). Moreover, formative assessments are used, and surprisingly, the students performed well on tests and quizzes (Chen et al., 2021). Another viewpoint claims that assessments can be roughly divided into timed, remotely proctored exams, and open-ended tests (Guangul et al., 2020). A variety of learning management systems, such as series of quizzes, open-book, take-home assessments, professional presentations or demonstrations, annotated bibliographies, fact sheets, and e-portfolios can be used to administer remotely proctored exams. Meanwhile, open-ended assessment is another applicable concept of E-Assessment. The valid concept of open-ended assessment is suggested based on 11 guidelines: ask more conceptual questions; eliminate multiple-choice and fill-in questions; change the numbers, names, or scenarios if using problems from textbooks; randomize discrete parts of the problem when applying for an exam; avoid questions that consist of only simple computations; clear about the rules for take-home exams; remind students of the academic integrity policies; ask learners to sign the college academic integrity intent prior to the take-home exams; set time limits for the take-home exams to prevent contract cheating and help seeking; and offer learners to ask for clarification when necessary (Guangul et al., 2020).

On top of that, as more and more educational institutions and organizations move towards online learning and remote assessments—crucially because of emergency transition—cheating is a growing concern (Daniels et al., 2021; Durcheva & Rozeva, 2019; Gamage et al., 2020; Hamdan et al., 2021; Hickson & Agnew, 2013; Hosseini et al., 2020; Meccawy et al., 2021; Ng, 2020; Peytcheva-Forsyth & Aleksieva, 2021). However, the study's findings showed that the three contexts under study—face-to-face exams, submission of paper assignments prepared without a teacher, and submission of online assignments without the presence of a teacher—have different effects on the opportunities for dishonest behavior in assessment. Nevertheless, technology primarily modifies cheating methods rather than promoting academic lying or dishonesty (Peytcheva-Forsyth & Aleksieva, 2021).

It is crucial to note that there are indeed two main approaches—learner academic integrity and software-based

measures—for preventing and verifying cheating in online assessments. According to Hosseini, the important contributing factors to academic integrity include learner behaviors, attitudes, perceptions, understandings of deserving greater attention, and the effectiveness of institutional practices in helping students avoid academic misconduct (Hosseini et al., 2020). As a result, students who commit academic misconduct for the first time will, at the very least, be given a "0" for their task, or the lecturer may award an "F" to them for the course. Additionally, the specific institution enforced their code of conduct and severely penalize individuals who violated it (Meccawy et al., 2021). Not limited to the learner, Meccawy stresses that the educator has been trained to detect the cheating method. In addition, a case study by a researcher showed that learners prefer face-to-face assessments because educators transfer their experiences and methods for evaluating students from face-to-face to online settings without adapting and changing for the latter's particulars (Peytcheva-Forsyth & Aleksieva, 2021). Furthermore, the educator can create and ask a different set of questions as another manual for use in online assessments to prevent cheating (Verhoef & Coetser, 2021a).

Ideally, software-based measures should emphasize two timelines; pre-cheating and post-cheating. As an example, Turnitin (or text similarity) is used as a post-cheat software. On the contrary, pre-cheating or online monitoring software based on automated monitoring that runs on the computer of the test-taker can automatically analyze the data from their screen, video, and audio stream to notice any undesired activities (ProctorEdu, 2023). These, nevertheless, may end up being ineffective and reduce lecturers' statuses from educators and instructors to policing officers (Verhoef & Coetser, 2021a).

The Recognition of New Normal Phase

New normal phase is getting significant now that COVID-19 has brought about the prolonged suspension, cancellation program, and uncertainty. Although the phrase “new normal” is not new, it requires exclusive attention as a consequence of the pandemic. On the other hand, moving forward for crisis preparation and adaptation without suspension or cancellation is a solution for sustainability and reliability. Previous research claims that the new normal, which has been defined and applied to the diversity of climates or the occurrence of weather events, is not what it used to be (Lewis et al., 2017; Trenberth et al., 2015). In contrast, when this differs from the scenario that existed prior to the commencement of the crisis, a new normal is a state to which an economy, society, and others settle after a crisis (International Labour Organization, 2020). It is used to compare to the normal situation or an old normal. Additionally, the research of COVID-19 in education has identified a particular new normal term as a way in which education is anticipated to occur in the post-COVID-19 era that will be distinct from the manner education was typically exercised during the pre-COVID-19 days (Xiao, 2021). The new normal phase has brought about several changes to the way education is delivered, including the increased use of technology and online platforms, the adoption of new pedagogical approaches that emphasize student-centered learning, and the recognition of the importance of mental health and well-being in the learning process. Therefore, it is important to adjust every single aspect, including E-Assessments in teaching and learning.

Methodological of Analysis

The purpose of this article is to demonstrate the method applied for article analysis, which helps with the construction of the E-Assessment model development. It is useful to ensure that the associated track is followed in a way that allows for the systematic and target-oriented development of the E-Assessment model. It is important to preview the model that has previously been thoroughly explored based on four main factors: objectives, conceptual criteria, approaches, and procedures. In actuality, the respective factors have been extracted from ten (10) different E-Assessment models throughout the course of eleven (11) years of updates. Subsequently, it is anticipated that the criteria will assist in establishing a reference methodology flow scheme that is legal to practice. Therefore, the flow scheme that can be referred to is in Figure 1 below.

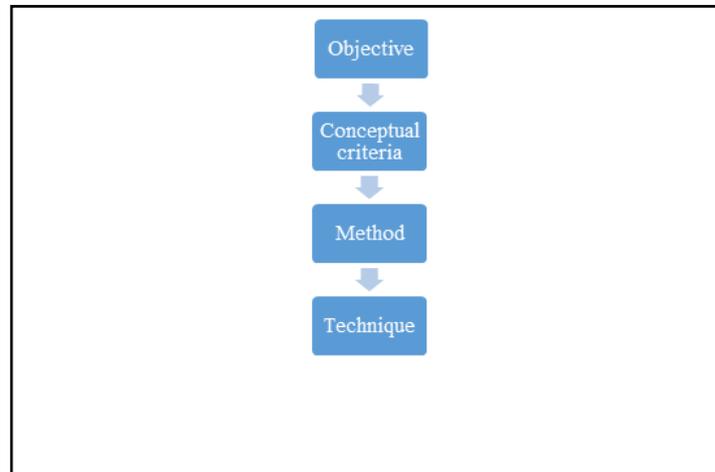

Figure 24. Methodology of Flow Scheme

On the other hand, Table 1 shows the range of eleven (11) years update from 2009 to 2020. Therefore, the significant trend of environment discovery for the E-Assessment model is in the pre-crisis or normal case. The development is well-planned in mode. To date, there is no preparation to deal with environmental uncertainties within the associated time frame. Therefore, the exploration is attempting to delve in-depth into another associated factor.

Table 1. E-Assessment Models

(Philips et al., 2020)	New Digital Assessment Model and resource gateway	Pre-crisis

When the needs and abilities of two direct stakeholders, the learner and the educator, are synchronized on concepts, activities, and learning outcomes by technology, device, and application support, this offers another intriguing perspective that is able to advance smart education. The chaos in teaching and learning in response to the crisis trigger on survival with a minimum of or without achieving the targeted learning outcome and concept, as well as the level of technological familiarity and devices, come first.

Analysis Component

The analysis component is capable to explore the E-Assessment model from multiple scholars in depth and with interest. On top of that, the justification of the model development should be clear so that other scholars may use it to enhance on a different perspective in order to collaborate, upgrade, or improve prior limitations. The specification must therefore include the criteria for the objective, concept, method, and approach.

Objective

Initially, the necessary objectives of the previous studies need to be described. Based on the main purpose of development, the trends of model construction can be categorized into two: first, the intention to meet the needs and requirements of the direct stakeholders; and second, the advancement of technology movement. Hence, nine (9) models that fulfilled the needs and requirements of the direct stakeholders, such as learners, instructors, educators, or course designers, were reviewed (Amante et al., 2019; Barana & Marchisio, 2016; de Villiers et

al., 2016; McCracken et al., 2012; Padayachee et al., 2018; Philips et al., 2020; Schiller, 2009; Sewell et al., 2010; Tinoca et al., 2013). As a result, the model's priority is designed from the perception of the medium and the lowest hierarchy of stakeholders. Moreover, there are direct implementers who react to the viability of the adopted model. Most of the selected models believe that the adaptability of both educator and learner is the main preference when the indicated elements of concept are to optimize performance of the implementer. In contrast, there was a single E-Assessment model that aimed to facilitate technological innovation with human factor ignorance (Pauli & Gill, 2020).

Therefore, for the objective justification of the model, the limitations of the learner and the educator as a result of crisis should be taken into account.

Concept

The next component or concept involves the highlighted factors of the associated E-Assessment conceptual model. The factors are represented as an element, a dimension, a principle, or a strategy. They are compulsory components because they serve as the main reference for activity design and learning outcomes. The justification of the activities must be in line with the factors that have been assigned so that changes in activities are controlled consistently to achieve the desired result. With respect to the crisis situation, the reference of E-Assessment conceptual model to be used for drastic transition activities during emergencies is still unclear. In addition, it can be challenging to ascertain the rationale for the emergency transition criteria, which executes the suspension of physical teaching and learning. E-Assessment is therefore a viable option for surviving in an online platform.

The factors that are regularly implemented in the preceding models must therefore be addressed first. However, it is crucial to note that the implementation is limited for pre-crisis environments. For each model, various factors have been incorporated. However, the factors that are most consistent may be adopted in the future model. If the same element appears frequently in at least two (2) separate models, it is to be introduced into the future model. The Schiller model in Table 1 is thus excluded from Table 2 because the dedicated factors are inconsistent with other models. According to Table 2's authors (Amante et al., 2019; Barana & Marchisio, 2016; de Villiers et al., 2016; McCracken et al., 2012; Pauli & Gill, 2020; Sewell et al., 2010; Tinoca et al., 2013), the consistent factors are authenticity, responsiveness, practicability, adaptation, transparency, alignment, and affordance. Six (6) models established authenticity, four (4) models established responsiveness, two (2) models established practicability, adaptation, and affordance, and three (3) models employed transparency and alignment. Despite the consistency of the appropriate factors utilized at least twice, there is no assurance of robustness in the context of the pre-crisis, crisis, and post-crisis phases. Therefore, it is relevant to propose an additional new factor that will influence each of the selected factors to be sufficiently functional and effective throughout all phases. Table 2 lists seven (7) factors of nine (9) E-Assessment models. The keyword of terms is elaborated in Table 3. Moreover, definitions of represented factors are concluded based on the selected models. (1) authenticity refers to the use or application of actual contexts and real tasks in learning and E-Assessments while

taking situational constraints and the online environment into consideration, (2) responsiveness refers to the speed and quality of feedback in E-Assessments that is timely, informative, and encourages positive attitudes towards future learning amongst students in the online environment, (3) practicability refers to the feasibility of the E-Assessment strategies in terms of effective management and assessment complexity from stakeholders' perspectives. This dimension is particularly important to design E-Assessments competently and efficiently given the complexity of its design in the online learning context, (4) adaptation to the application of multiple E-Assessment approaches including platforms by allowing a diverse range of opportunities for students to adequately exhibit learnt competencies and skills, and to enhance their learning to address the limitations of online assessments, (5) transparency refers to the explicit description and mutual comprehension of E-Assessment criteria, goals, procedures, and expectations by both educators and learners, (6) alignment refers to the learners' ability to demonstrate that they have achieved the learning outcomes in E-Assessments, and (7) affordance refers to the E-Assessment management system's capacity to deliver formative, diagnostic, or summative assessments and feedback, similar or equal to alternative technologies or assessment tools.

7	Aff	Affordance

Method

In these particular models, the incorporation of various methods was applied, including mixed quantitative and qualitative methods. In addition, experience is the most crucial factor to be assessed when justifying the validation method with reference to the nine (9) selected models. The role and the experience are two more aspects on the criteria that will be considered as the approach is developed.

Due to an experience factor, 70% of the models were validated wholly (pure-method) or partially (mixed-method) by qualitative techniques (Barana & Marchisio, 2016; de Villiers et al., 2016; Philips et al., 2020; Schiller, 2009; Sewell et al., 2010; Tinoca et al., 2013). In contrast, 20% of the models (Amante et al., 2019; Padayachee et al., 2018) used quantitative approaches. Although Padayachee E-Assessment model adopted a quantitative approach, it is important to note that the categorization of questions has been divided into two (2) distinct categories, namely open-ended and close-ended, to accommodate the stakeholders' varied and broad experiences (Padayachee et al., 2018). In contrast, Barana and Marchisio's only study employed close-ended questions to measure experience (Barana & Marchisio, 2016). Furthermore, a unique case occurred when Pauli and Gill conducted their study using the rationale of professional experience to produce the outcome of an E-Assessment model (Pauli & Gill, 2020).

On the contrary, the main respondents involved were from five (5) different stakeholders, including educators, instructors, learners, and course or content designers. Despite the fact that there were many different stakeholders, the problem solving strategy was started from the bottom up by taking into consideration the experiences of each stakeholder.

Technique

These techniques indicate the meaningful assessment activities that are pertinent to the concept mapping (Gaytan & McEwen, 2007). Furthermore, numerous studies concur that one of the assessment techniques' capabilities is to be exemplary and guide learners towards achieving the desired learning outcomes in a virtual environment (Kucina et al., 2014; Sewell et al., 2010). As a conceptual evaluation guideline, the eight (8) traits

of authenticity, difficulty, coherence, engagement, respect, responsiveness, rigor, and validity are evaluated with exceptional precision (Huba & Freed, 1999). Meanwhile, the learning experiences that learners have while using the learning strategies contribute to the ultimate learning outcome, including what they have learned and how effectively they have learned it (Weimer, 2002).

E-Assessment and innovation are being used in a variety of effective ways, which strengthens their capacity to drive learning processes and outcomes (Romeu Fontanillas et al., 2016). If an E-Assessment activity adheres to the assessment standards, learning objectives, and applicable E-Assessment guidelines, it is deemed to be fully compatible (Tinoca, 2012; Wuisan & Wibawa, 2019). Various E-Assessment strategies, assignments, and evaluators should also be included. E-Assessment could be viewed as reliable if it is assumed to be constant. (SAQA, 2001). Therefore, there is validity in the correlation between three (3) different perspective criteria, namely assessment techniques, learning outcomes, and concepts, with consistency being the primary criterion.

Unfortunately, adopting the alternative assessment activities as a crisis response without violating pre-crisis principles has avoided the issue of alignment status from the perspective. Constructing the activities through the learning outcomes and the concept is the key step in the creation of assessment using the bottom-up methodology. The precise correlation between assessment activities, learning outcomes, and concept criteria is henceforth shown in Figure 2, which is shown below.

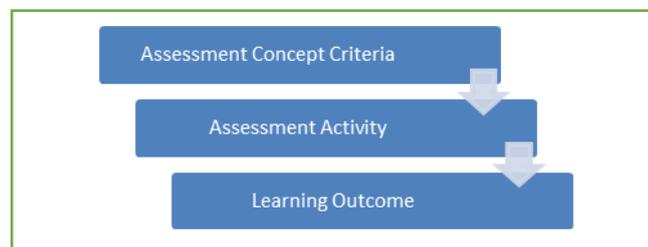

Figure 2. The Correlation Component of E-Assessment Model

Conclusion

With the advent of technology, it has been seen that the numerous E-Assessment conceptual model developments have produced the climactic result for quality learning. On top of that, it has the ability to generate an efficient assessment that benefits the learner, instructor, and educator, as well as a layer for implementation effect.

It is crucial to note that prior studies only discovered instances of the development of an E-Assessment conceptual model in usual circumstances. It is intriguing to note that according to mathematical perspectives, the pre-crisis and the crisis meet in the new normal phase. First, directly duplicating the offline assessment activities to the online environment will raise reliability and validity concerns as this approach is utilized to raise

performance and learning standards. Second, there is a possibility that misalignment occurs when amendments to assessment activities are not in line with learning concepts and outcomes in a way that allows for continual progress for survival. To reset the significant factors that complement both phases, a novel solution known as the normal phase has been devised. Figure 3 is a new normal Venn Diagram that might help to visualize the concept of phase complementary.

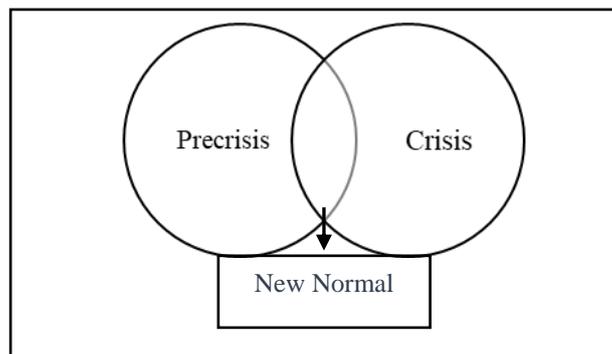

Figure 3. The New Normal Phase in Venn Diagram Imagination

An E-Assessment case study during an emergency determines that it is supposed to tolerate or be flexible with learning outcomes in order to survive (Reimers & Andreas, 2020). However, can the assessment method survive and still produce optimum quality with unparalleled concepts and activities? Accordingly, a study concluded that designing the assessment becomes an intriguing choice when offline assessment cannot be substituted by an online assessment with the same learning outcomes and concepts utilizing a technological approach (Joshi et al., 2020). Due to the critical phase of the multiple detrimental effects on teaching and learning, we also need to accept that now is the moment to utilize the complementary nature of offline and online platforms.

Additionally, a process and procedure for assessment should be designed that can be used with both platforms without the need for an emergency adjustment phase and is dependable to take into account any circumstances in the new normal phase. This kind of planning can quantify the degree to which online and offline platforms complement one another. It is vital to establish that flexibility is the main factor that able to influence the seven devoted factors that conceptual E-Assessment model relies on to endure the tolerability of emergency in the new normal phase. On top that, this is a novel solution to remain consistent and relevant with both phases and technological orientation.

Abstract: The research used a descriptive-analytical method and a sample of (350) female field teachers to examine the effects of preschool education on the administrative and educational competencies of students in Oman's first cycle of basic education. The research came to the following conclusions: Students who entered preschool education had a high arithmetic average of (3.93) for administrative competencies, and their educational competencies were also rated highly as the arithmetic average reached a high level (3.85). Administrative skills were ranked in the following manner for the first axis: (Planning, Communication, Organization, and Leadership). In terms of the second axis, which is concerned with educational skills, the study's results for reading, listening, and writing all fell within a high degree (3.67–4.09) of the arithmetic mean. This result is consistent with many international studies and trends in all countries, which concurred on the significance of the preschool education stage. Despite its significance, the research indicated that this stage is still optional in the Sultanate of Oman. The research suggests that the Ministry of Education makes preschool education mandatory by supplying and utilizing all the resources.

Keywords: Preschool education 1, Administrative competencies 2, Educational competencies 3, First cycle 4, Basic education 5.

The Impact of Preschool Education on the Administrative and Educational Competencies of Students in the First Cycle of Basic Education in Oman. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 588-600), Cappadocia, Turkiye. ISTES Organization.

Introduction

Childhood is a crucial stage in a person's development because it has been shown by numerous researchers and psychologists to have an impact on a child's personality (Abdul Hadi, 2006), and numerous studies have shown

that the idea of education at this stage is attractive to scientists and researchers. (Lonis, Abdullah, 2019). Early childhood education is a field of educational theory that deals with the formal or informal instruction of children from birth to age eight. It is also referred to as primary education or preschool education. (Mcdevitt, 2016). In most societies, this stage results in reading difficulties, and in some other societies, their prevalence is believed to be between 15% and 20%. (Qarhoush and Bedawi, 2020).

The studies done by researchers on preschool children and the effects of their education and academic achievement and the importance of preschool care (2018, Becton) prove the significance of the kindergarten stage in developing the child's personality and giving them various learning skills like reading and arithmetic skills as well as the development of their multiple intelligences: such as intelligence Mathematics, visual intelligence, and linguistic intelligence. (Rasmi, 2019). This was supported by the studies of Bazrawi (2021) and Al-Saedi (2020). Numerous research studies point to the importance of the kindergarten stage on the one hand and the importance of learning reading skills on the other as a gateway to learning other educational materials, a tool for self-expression, feelings and needs, and a tool for social communication.

We are driven to give this kind of education particular attention for a number of fundamental reasons that led to the establishment of kindergartens. Al-Qabbali (2021) and Abu Hassoun (2021) outlined these as follows: social goals, which entail fostering a supportive social setting for children to interact in, and they simultaneously experience Children whose parents hold certain types of jobs, with a home environment that makes up for the things they used to find in their families, and with a fundamental psychological drive that shapes the child's personality by fostering a sense of balance and through which it has a significant influence on how the child will live their next life, as well as a drive for education that is crucial and does important work. The process of preparing a child for the new environment of classroom learning includes kindergarten.

Consequently, the study's significance is clear. determining how preschool education affects first-cycle elementary school pupils' administrative skills (leadership, communication, organization, planning). To identify the quality of preschool education, its current curricula, and their role in highlighting the educational and administrative personality of the child, as well as to identify the role of preschool education in developing educational competencies (reading, writing, and listening), as well as to come up with a good recommendation for pre-school education in those skills.

Theoretical background

The child was put at the fore of the future of nations and the cornerstone of their formation due to the various changes that affected societies in various social, political, and cultural areas (Al-Mufti, 2006). Care for the child and his childhood and caring for him are necessary for him to grow up as a healthy and balanced individual. This concern is not limited to the educational and health aspect only, but also includes the educational aspect, especially the linguistic aspect. Many different events affect the development of their personality, language, and morals. (Bel Abbasi, 2020) I concur that the majority of educational scholars emphasize the significance of

kindergarten as a stage that comes before the first stage of education. (Abdul Wahed, 2015).

One of the most crucial times in a person's existence is kindergarten. The importance of this stage must be accompanied by a growing belief and conscious appreciation of the enormity of responsibility and the highness of the message that kindergarten teachers aspire to because of its significant impact on what will come in the subsequent educational stages and because it is during this stage that the child's personality is formed; one of the most crucial components for accomplishing kindergarten objectives (Souman, 2014). According to Prestige (2021), this stage is the child's first interaction with the outside world and the beginning of personality development as the child learns about society, forms relationships apart from his family, and starts to pick up new skills.

As a result, we discover that childhood is the first crucial stage in a child's life during which he or she learns about the world around him and displays his or her feelings, behaviors, and mental abilities. Numerous studies have also shown that education imparts a variety of skills that help a person develop their perceptions, and they have all emphasized the significance of pre-school education. (Abdullah, 2019). The Ministry of Education in the Sultanate of Oman has not disregarded this, as it has given early education great attention, worked to increase enrollment rates in early education institutions by encouraging investment in private education, and implemented the (preparation classes) project in some government schools of the first cycle in the academic year (2005/2006). (1-4). The Ministry has also worked on developing a unique curriculum for this level. (Al-Rahbiyah, 2018).

Statistics show that there is a noticeable increase in these institutions and an increase in the enrolment of children in early education institutions, as the number of children enrolled in the academic year 2021–2022 reached (71018), and as a result, the number of female teachers in these institutions increased (Yearbook of Education Statistics, 2021/2022). The education of children in the Sultanate of Oman is provided by private early education institutions, which are constantly expanding.

The development of preschool education

The evolution of education and care from birth until the eighth year throughout history can be seen in the history of early childhood education and care. (UNESCO, 2006). Ibn Sina wrote in his book *Al-Qanun* about the necessity of working to give the child the opportunity to play until he turns six, just as Imam Al-Ghazali loudly proclaimed the need to work to make space for the child to play without affectation, signaling the beginning of the Arabs' interest in studying the characteristics of children. (Hariri, 2015) Additionally, the researcher Comenius (1592-1670) thought of working to establish schools for young children, as well as work to take care of them and give them special care. He worked on the necessity of entertaining the child, in addition to educating him, and he also thought of working to establish schools for children. (Badran, 2000).

The Berry Pre-School Project, which was implemented in the 1960s in Ypsilanti, is one of the oldest social

experiments in the field of early childhood education. It has had a significant impact on politics in the United States of America and around the world. 128 children were subjected to an experiment in African Americans bet, and before 1960, the method of educating young children was carried out in the first place as being within the responsibility of families within the home. This population was divided into a treatment group and a control group at random. Active study days during the week for the therapy group included 2.5 hours per day of instruction. The goal is to enhance parent-child interactions at home in addition to instructors' weekly 1.5-hour visits to the kids' homes (Our, 2019; Council, 2015; Schweinhart et al., 2005). (Heckman, and all, 2019).

Preschool education changed in terms of growth and development rather than remaining in its familiar shape. The first person to work on creating a prestigious kindergarten was Ferdik Frewell from Germany, and that was in the first part of the twentieth century, starting in 1984 AD. (Al-Duailij, 2008). Since 2004, the majority of American preschoolers spend a portion of their days away from their parents, the majority participate in some kind of center-based program before entering kindergarten, and in 2001, 52% of three- and four-year-olds were enrolled in preschool or another program. Prior to starting school, the enrollment percentage for four-year-olds in 2001 matched that of five-year-olds in 1970. (Alaa, 2020).

As a result of their favourable effects on children's behavior and educational achievement, pre-school and kindergarten are regarded as essential factors that must be taken into account. Despite the fact that kindergarten and pre-school education are extremely important, the ministries in charge of education did not want to make this period of a child's life mandatory by working to organize kindergartens and provide their study materials. (Hourani, 2022).

The importance of Preschool education

The preschool education stage is a crucial one in a child's life because it prepares them for entering a new environment—the official school environment—with its established rules, procedures, and topic laws. At this stage, the child learns some fundamental abilities that will help him later in life as he embarks on his next educational adventure, both psychologically and emotionally. (Al-Qebzi, 2022). As a result, its significance can be seen in what it does to create a diverse learning environment, which is based on games like disassembling and reassembling and other technical tools like educational spaces and corners that are intended to foster children's mental and skilled development. (Schuman, 2008).

Because this stage, according to psychologists, is the crucial one that shapes the student's personality, it must meet special standards in terms of buildings, facilities, and spaces such as playgrounds, gardens, and equipment. This stage is regarded as the fundamental preparation for the child to accept the school later. In order to practice all activities that achieve integration, balance, and inclusion of the various aspects of the child's personality development (physical, cognitive, linguistic, and social), it is also necessary to take into account their physical, cognitive, emotional, and social characteristics. As a result, the idea of integrated education is achieved by implementing all fundamental activities. (Atef, 2005).

The significance of kindergarten lies in its ability to inspire and support the development of pre-school students' administrative and educational competencies in a variety of skills (mental, social, emotional, skilled...) that make up the child's administrative and educational life and aid in its refinement in various ways and multiple ways, and among those are: The following fundamental abilities help children improve their administrative and academic competencies: (Rehab, 2005), (Al-Arabi, 2012), (Tarik, 2008), (Abdul Qader, 2007), and (Karkoush, 2008) (Mustafa, 2009).

Language skills:

The development of language skills starts at a young age. Children don't start out speaking a language, but after 10 months they can recognize speech sounds and speak in the baby's language. Children typically acquire receptive language skills before oral or expressive language abilities. The internal processing and comprehension of language in the brain are known as receptive language skills. Al-Nashif (1996) divided these skills into speaking, listening, reading, and writing and explained that it is important to deal with each skill separately in order to provide the child with the appropriate activities. As receptive linguistic abilities continue to grow, the expressive (spoken) language begins to develop slowly. This was supported by the research of Karkoush (2008), who found that language plays a significant part in interaction between children and others and has a relationship to other skills.

Technical skill:

Technical methods are one type of self-expression, and they give the child a variety of ways to learn, which in turn aids in the development of his skills and views of creativity and imagination. Therefore, the child's drawing process is a complex process in which the child combines multiple forms and different symbols from his prior experiences and experiences to make something new and meaningful out of them (Abdul Aziz, 2016). He views artistic activities as a dynamic and comprehensive process with a vital role in educating children. She emphasizes that every action a child takes is motivated by a desire to accomplish an objective. As a result, we discover that when we make comments about someone's behavior, he responds in a manner that makes sense. In actuality, we were the ones who were unable to comprehend the reasons behind his actions and what motivates him to do them. With this task, we need to understand the purpose or significance of a particular behavior in order to explain it.

Social skills:

Whereas these abilities are viewed as a fundamental pillar that influences a child's personality in the preschool stage, through which the child can engage with others, integrate with them, play with them, and work alongside them to achieve goals, as well as learn the concepts of self-independence and self-reliance. In many of the jobs and duties he completes, he also gains the ability to engage in play, problem-solving, and emotional participation with his peers. The ability of a child to communicate and interact with his peers in a tactful, respectful, and intelligent manner as well as the capacity to handle situations, whether positive or negative, and appreciate conversation are referred to as social skills. Therefore, it is crucial for children in pre-primary education to develop and acquire social skills. Accepting the other can also help people overcome traits like

stubbornness, loneliness, and timidity. According to Al-Farhat (2014), social abilities are helpful in a variety of ways, which I have outlined below:

- One of the most crucial elements in assisting children in their process of social assimilation within the groups to which they are innately belonged as well as society is their social skills.
- Children who possess social skills are better able to solve many of the issues they face and control how they engage with others.
- Children who have social skills appreciate the activities they participate in and meet their psychological needs.
- Children who develop their social skills have greater liberty, self-reliance, and enjoyment of their free time.
- Children who are socially adept are more likely to participate in activities that are within their realm of competence and to develop their own sense of self-worth.
- Developing social skills, the ability to engage positively with fellows, and engaging in creative and innovative endeavours within the confines of their mental and physical capacities.

Study Procedures:

Research Delimitations:

The topic: Preschool education

The implementation timeframe:2022/2023.

The Study Population: The study population represents basic education female teachers in the first field in the schools of the first cycle from (1-4) and their number is (5802) according to the statistics of the Statistical Book of the Ministry of Education for the year (Ministry of Education, 2022).

The Study Sample: The sample of the study was chosen randomly, and it consisted of (350) female teachers in the first field of basic education schools, the first stage from (1-4).

The Scale: The researcher used the five-point Likert scale, which is symbolized by: (Lowly agree - Moderately agree - Highly agree - Disagree - Strongly disagree). Where the data were coded according to the following table:

Table 1. five-point Likert scale

average	1–1.8	1.81- 2.60	2.61–3.40	3.41–4.20	4.21–5
the level	very low	Low	Medium	High	very high

The study instrument and its validity:

The study tool was created by the researchers by creating and constructing a tool that was derived from other

tools, and before applying the tool, it was displayed to (5) experts as the tool initially comprised of (2) axes and (35) items: (19) items. The tool's final version included (16) items in the first axis for administrative competencies and (12) items in the second axis for educational competencies. Following the experts' process, the researchers made changes in accordance with what they had noticed.

The study instrument stability

The tool was given to roughly (60) male and female teachers from different basic education schools during the first cycle in the Sultanate of Oman to evaluate the tool's validity. The results are shown in the accompanying table.

Table 2. The stability of the study tool

#	Domain	Items	Stability coefficient
1	Administrative Skills	16	0.83
2	Educational skills	12	93
	the total	28	0.86

According to Cronbach's alpha scale, which measures the coherence of the tool's expressions, the average value obtained by the previous axes, which is (0.86), confirms that the stability coefficient of the two axes came close to and is categorized with high stability as shown in Table 2.

Data Analysis

After being pulled by Excel, the data were encoded by the well-known statistical program SPSS. What percentage of elementary education students who got preschool instruction are currently using administrative competencies? The arithmetic means and standard deviations for the percentage of basic education students who got preschool instruction were extracted to provide an answer to this query.

Table 3. Arithmetic means and standard deviations for the competence of administrative

#	Items	SMA	SD	level	Order
Leadership					
1	The personality of the student within the class tends to lead his classmates	3.08	0.879	Medium	16
2	The student likes to dominate his peers	4.22	0.889	Very high	2
3	The student relies on himself to complete the work assigned to him.	4.15	0.799	High	4
4	The student can influence his fellow students.	3.20	0.878	Medium	15
Connection and communication					
5	The student is excited to participate and discuss the class	4.20	0.895	very high	3
6	The student loves to participate in the school's social and	4.12	0.887	High	5

recreational activities					
7	The student is characterized by a cheerful and jovial spirit in the classroom.	3.94	0.678	High	12
8	The student has an interesting style while speaking.	4.00	0876	High	10
Organization					
9	The student is distinguished by keeping and organizing his tools	4.11	0.923	High	7
10	The student maintains a good appearance and behavior	3.65	0.789	High	14
11	The student is calm and disciplined in class and school	3.90	0.897	High	13
12	The student organizes his speech when answering questions	4.10	0.854	High	6
Planning					
13	The student attends his daily lessons continuously.	4.23	0.823	very high	1
14	The student directs his answers towards the given question.	4.03	0.678	High	9
15	The student plans future classes accurately	3.97	0.874	High	11
16	Few errors occur from the requester during execution	4.09	0.789	High	8
The Total		3.93	0.826	High	

As shown in Table 3, the average of the administrative competencies axis had an arithmetic mean of (3.93) and a standard deviation of (0.826), which denotes a high degree. Accordingly, the planning-related item No. 13 ranked first with an arithmetic mean of (4.23) and a standard deviation of (0.823), which denotes a very high degree. The second order definition of leadership is "the student likes to impose his control over his peers," with an arithmetic mean of 4.22 and a standard deviation of 1. (0.889).

Item (3) regarding leadership, the student relies on himself in carrying out the tasks entrusted to him in the fourth order, with an arithmetic mean (4.15) and a standard deviation (0.799), it is of a high level. Item (5) related to communication, the student is enthusiastic about participation and class discussion, came in the third order, with an arithmetic mean (4.20) and a standard deviation (0.895), which represents a high degree level. The researchers explain this by saying that the students have developed a self-reliant society. The student can impact his fellow students, according to leadership item #4. It has an average level with an arithmetic mean of 3.08 and a standard variation of 0.879. This, according to the researchers, is since kids at this age are all striving for glory and elevation, and it also demonstrates that students have a certain degree of awareness thanks to kindergarten.

To answer to the second question: "What is the degree of the practice of basic education students of educational competencies who receive preschool teaching?", The arithmetic means and standard deviations were extracted for the degree of basic education students' practice of educational competencies who received preschool teaching as shown in table (4).

Table 4. Arithmetic means and standard deviations for the educational competencies axis.

#	Items	SMA	SD	Level	Order
Reading					
1	The student reads the words correctly	4.27	0.846	very high	1
2	The student pronounces the letters according to their correct exits	4.25	0.889	very high	2
3	The student reads the texts consecutively without mistakes	3.99	0.799	High	5
4	The student distinguishes between the pronunciation of consonants.	3.87	0.878	Medium	7
Writing					
5	The student wrote the words correctly	4.15	0.895	High	3
6	The student differentiates between writing hamzas in the word.	3.36	0.887	Medium	11
7	The student draws the letters correctly	3.98	0.678	High	6
8	The student distinguishes between the tied and the open "T".	3.20	0.876	Medium	12
Listening					
9	The student listens carefully while listening.	4.09	0.923	High	4
10	The student answers the teacher's questions after listening.	3.85	0.789	High	9
11	The student remembers a lot of the information he listened to.	3.70	0.897	High	10
12	The student analyses the situations listened to carefully.	3.84	0.854	High	8
The Total		3.85	0.839	High	

The average of the educational skills axis had an arithmetic mean (3.85) and a standard deviation (0.839), which is a high degree, according to table (4). The reading-related item No. 1, "The student reads the words correctly," appeared in first place and had an extremely high degree of accuracy (arithmetic mean: 4.27; standard deviation: 0.846). The researchers' credit this to the student's kindergarten instruction in word reading and the effective reading curricula because it shows the child's family's ongoing interest in and commitment to correct reading, and phrase No. (2) showed up. In relation to literature, "The student pronounces the letters according to their correct exits" came in the second place, with an arithmetic mean (4.25) and a standard deviation (0.889), which represents a very high degree.

A high degree level was also demonstrated by item (5), which was linked to reading and in which the student correctly spelled the written words. This item appeared in the third order and had an arithmetic mean of 4.15 and a standard deviation of 0.895. The student pays close attention to what they are hearing as they attend, according to item (9). In the fourth position, with a high level arithmetic mean (4.09) and standard deviation (0.923). The habituation trait that the student gained during the preschool educational stage is credited by the researchers as the cause of this. The last thing was number four, which has to do with writing. The student distinguishes between the bound and open letters. With an arithmetic mean (3.20) and a standard deviation (0.876), which is of an average level. The researchers attribute this to the fact that the preschool stage is in which students find it difficult to distinguish between the pronunciation and writing of some letters, especially similar ones.

The answer to the third question: "What is the order of basic education students' practice of the educational competencies axis and the educational competencies who received preschool teaching?", from the arithmetic means, and standard deviations were extracted to arrange the axis of basic education students' practice of educational and administrative competencies who received pre-school teaching as follows:

1.Ranking of Administrative Competencies

Table 5. Arithmetic means and standard deviations for the administrative competencies dimension.

#	Domain	SMA	SD	Level	Order
1	Planning	4.08	0.791	High	1
2	Connection and Communication	4.06	0.834	High	2
3	Organization	3.94	0.865	High	3
4	Leadership	3.66	0.836	High	4
	the total	3.92	0.821	High	

The dimensions of administrative competencies were arranged in the following sequence using table (5): The first rank arrived at the planning axis with a high level of experience represented by an arithmetic mean (4.08) and a standard deviation (0.791). The second order arrived at the axis of connections and conversation with a high level of practice, as indicated by its arithmetic mean (4.06) and standard deviation (0.834). The organization axis came in third order with an arithmetic mean (3.94) and a standard deviation (0.865), and the leadership axis came in last order with an arithmetic mean (3.66) and a standard deviation (0.879), which represents a medium degree of practice.

2.Ranking of Educational Competencies

Table (6) Means and Standard Deviations for Ethical Leadership Dimensions

#	Domain	SMA	SD	Level	Order
1	Reading	4,095	0.836	High	1
2	Writing	3.67	0.833	High	3
3	Listening	3.87	0.865	High	2
	The Total				

The dimensions of educational competencies are listed in the following sequence according to table 6: The reading axis comes in first place with an arithmetic mean of 4.095 and a standard variation of 0.836, indicating a high level of practice. The listening axis, with an arithmetic mean of 3.87 and a standard variation, is in second place. (0.865). And the writing axis, which indicates a medium level of practice, came in last with an arithmetic mean (3.67) and a standard deviation (0.833).

Conclusion

The study's findings concluded that students with basic education who enrolled in pre-school education for administrative competencies had high arithmetic averages (3.93), which are close to very high, and that they had high levels of educational competencies because their arithmetic averages reached 3.93. (3.85). This shows the confluence of the two skills and how these students' abilities were polished during the preschool years. Regarding the rankings of the skills within each axis, the research revealed that the administrative axis' ranks were as follows: (planning, connections, communication, organization, and leadership). It was discovered that each of these abilities was accompanied by a strong math average, demonstrating the significance of the preschool years for students. Reading, listening, and writing were ranked in that sequence on the second axis of educational skills, and all three of them scored highly and fell within the range of the arithmetic mean (4.09–3.67), demonstrating the significance of the preschool years.

'The study demonstrates that education has a positive effect on students not only from a scientific (academic) standpoint, but also in terms of the child's personal skills, which are crucial for developing the child's personality. Most international studies and trends in all nations concur on the significance of the pre-school education stage. Despite its significance, the research revealed that this stage is still optional in the Sultanate of Oman.

Recommendations

- The Ministry of Education should take the full responsibility for early education, as this is a crucial time for forming a child's scientific and intellectual outlook on life.
- Carefully choosing the preschool education stage's course offerings to align them with Oman 20/40's vision and current educational trends worldwide.
- The selection of pre-school employees with bachelor's degrees in kindergarten studies.

Abstract: Society has increasingly looked upon science education to prepare the public for Industrial Revolution 4.0, as scientific reasoning and practices can hone 21st century skills, including scientific literacy. However, the COVID-19 pandemic has changed how science is taught and learned. Hence, this mixed methods study seeks to determine if there would be a significant increase in scientific literacy among undergraduate students after taking a six-week online course offered during the first year of the pandemic as part of their science education. It also aims to examine which aspects of the course offering students attributed, if any, their scientific literacy. Using a one-tailed paired sample t-test ($\alpha = 0.05$) to compare the Global Scientific Literacy Questionnaire scores of 67 undergraduate students surveyed at the start and end of the online course, this study demonstrated a significant increase in their scientific literacy despite the constraints brought by the pandemic ($p = 0.03$). Specifically, these students became better at systematic thinking and information management ($p = 0.01$) as well as self-directed planning and monitoring ($p = 0.02$). A focus group discussion with five students revealed that course design and the nature of remote learning could explain the gain in their scientific literacy.

Keywords: Scientific literacy, Science education, Industrial revolution 4.0, COVID-19 pandemic

Ciddi (Eds.), *Proceedings of ICRES 2023--International Conference on Research in Education and Science* (pp. 601-613), Cappadocia, Turkiye. ISTES Organization.

Introduction

The digital revolution that characterizes the 21st century has ushered our society into Industrial Revolution (IR) 4.0 (Reddy, 2021). It has accelerated scientific progress more than ever by making most of the technological advancements of previous industrial revolutions: the use of steam power in the mechanization of manufacturing during the first industrial revolution, electrical energy for large-scale production during the second industrial revolution, and computerized information technology for automated production during the third industrial

revolution (Melinda & Sa'ud, 2022). Although science and technology have become accessible to many because of this digital revolution, pseudoscientific views and misinformation have also abounded (Reddy, 2021). These attempts to discredit science can be countered though by nurturing scientific literacy among the public wherein they, according to the Organisation for Economic Co-operation and Development (2019) in their Programme for International Student Assessment, demonstrate the “ability to engage with science-related issues, and with the ideas of science, as a reflective citizen” (p. 16).

Science education has therefore become more salient in fostering scientific literacy in this age of IR 4.0. It has been increasingly viewed in society as a strategic approach to equip students with 21st century skills that will allow them to navigate through the socio-economic and socio-cultural transformation involved in IR 4.0 (Dovgyi et al., 2020). Expectedly, institutions responsible for science education must respond to the demands and challenges brought by the technological breakthroughs of IR 4.0 to our society (Morales et al., 2022). They need to address four essential elements comprising Education 4.0 as a counterpart of IR 4.0: development of critical competencies in today's students, application of new learning methods, incorporation of current and emerging technologies in the teaching-learning process, and use of innovative infrastructure to enhance the educative experience (Miranda et al., 2021).

However, the COVID-19 pandemic has disrupted our daily lives, including how science is taught. Teaching in many parts of the world suddenly shifted to remote learning as campuses abruptly closed to mitigate the spread of COVID-19. This unprecedented shift has exacerbated the digital divide between developed and less developed countries, adversely affecting the attainment of educational outcomes, such as scientific literacy, due to disparate access among and within countries to inclusive, equitable, and quality education (United Nations, 2020).

Nonetheless, “the COVID-19 pandemic,” as Shi (2022) argues, “offers vivid examples of teachable aspects of the nature of science” (p. 311). For example, the public has witnessed the role of scientific progress and technological innovation in overcoming the pandemic as well as the importance of scientific culture and scientific spirit in making informed decisions and policies during such a global crisis (Han, 2020). These teachable aspects for scientific literacy take place despite the “infodemic of misleading information about the pandemic” (Schneegans & Nair-Bedouelle, 2021, p. 17) as the scientific community and the education sector, among others, have growingly recognized “the critical need for prompt, universal access to science” in a time of a public health crisis (Persic et al., 2021, p. 14).

Further research is warranted though to support views that science education within the context of a pandemic can bring about scientific literacy. Hence, this study aims to determine if there would be a significant increase in scientific literacy among undergraduate students after taking the mandated *Science, Technology, and Society* as a six-week online course offered during the first year of the COVID-19 pandemic. It also seeks to examine which aspects of their science education in a time of a pandemic would these students find helpful in making them scientifically literate. Findings from this study can contribute to efforts geared toward achieving

Sustainable Development Goals on quality education by providing valuable insights on how science education can best promote scientific literacy despite the challenges and constraints brought by adverse situations, including the recent pandemic.

Theoretical Framework

Scientific literacy, as a social construct, has differed through the years to suit the ever-changing circumstances and needs of society (Choi et al., 2011). Its meaning has evolved from a public understanding of science to critical engagement with the social practices of science (Braund, 2021). However, the notion of scientific literacy as an individual characteristic to possess still prevails against radical views of it as a collective human praxis (Choi et al., 2011; Roth, 2003). This predominant concept though is deemed as no longer responsive to meet the demands and challenges of the 21st century (Mun et al., 2015). Hence, there are resounding calls to rethink current stances of scientific literacy to account for perspectives, competencies, and values orientation that are necessary to live in a global society (Choi et al., 2011; Mun et al., 2015).

In response to these calls, Choi et al. (2011) propose Global Scientific Literacy as a framework that can be more fitting in the 21st century wherein local issues have become worldwide concerns. This Global Scientific Literacy Framework consists of five dimensions that work together: scientific content knowledge, habits of mind, character and values, science as a human endeavor, and metacognition and self-direction. Scientific content knowledge refers to an integrated understanding of core ideas of science, which are foundational to applying scientific concepts to solve real-world problems (Mun et al., 2015). Habits of mind are characterized by the use of scientific reasoning and practices to explore natural phenomena and address science-related social, ethical, and moral issues (Choi et al., 2011; Mun et al., 2015). These scientific reasoning and practices include skills in critical thinking, problem solving, decision-making, information management, communication, and collaboration (Choi et al., 2011).

Character and values, on the other hand, pertain to a display of ecological worldview, moral and ethical sensitivity, appreciation of cultural diversity, socio-scientific accountability, an ethic of care, and compassion for others (Mun et al., 2015). They stand for belief systems and preferences that have become utmost necessary in the 21st century society (Choi et al., 2015). Science as a human endeavor involves having an awareness of science as tentative, subjective, and value-laden, an understanding of how science, technology, and society are interrelated, and adherence to the spirit of science, such as curiosity, intellectual honesty, creativity, skepticism, tolerance of ambiguity, and openness to new ideas (Mun et al., 2015). Lastly, metacognition and self-direction are key processes that bind these four dimensions together (Choi et al., 2011). These cognitive processes include self-directed planning to determine which strategies and resources are needed to complete a task, self-directed monitoring to track one's progress in view of identified strengths and limitations, and self-directed evaluating to reflect on one's past experiences and use these insights in tackling similar situations in the future (Choi et al., 2011; Mun et al., 2015).

Method

A mixed methods research design was carried out in this study to make the most of the quantitative and qualitative approaches in understanding the development of scientific literacy among undergraduate students during a pandemic. Specifically, an explanatory sequential research design was used as findings from the focus group discussion (qualitative data) were tapped to make sense of the results from the survey (quantitative data). Qualitative data gathering and analysis in this instance followed quantitative data gathering and analysis to arrive at an explanation of the phenomenon under study (Edmonds & Kennedy, 2017).

Setting and Participants

This mixed methods study was set at Ateneo de Manila University, an institution of Jesuit higher education in the capital of the Philippines. Its undergraduate curriculum includes *Science, Technology, and Society* as part of the students' science education and in fulfillment of the general education curriculum mandated by the country's Commission of Higher Education (CHED). To foster scientific literacy, the following are the learning outcomes of *Science, Technology, and Society* as stated in the syllabus:

- 1) Students should be able to evaluate the capabilities as well as limitations of Science and Technology through distinguishing what questions and methods are valid in the realm of science based on its nature and practice.
- 2) Students should be able to contextualize issues using perspectives from and beyond Science and Technology to dissect the interplay of various factors in analyzing the complexity of the human experience.
- 3) Students should be able to synthesize insights from various disciplines to propose solutions to contemporary issues with a view toward sustainable development and improving quality of life.
- 4) Students should demonstrate how individuals and an entire generation - guided by Ignatian Values - can participate in and contribute to the practice of Science and Technology, driving the transformation of society through their various professions and leadership.

During the first year of the COVID-19 pandemic, *Science, Technology, and Society* was delivered online for six weeks using Zoom for synchronous learning and Canvas Learning Management System for asynchronous learning. In general, this course consisted of four modules, namely 1) the Nature and Practice of Science and Technology; 2) Science, Technology, and Lifestyle; 3) Environment and Sustainable Development; 4) the Origin of Life and Universe.

After this study obtained ethics approval from an accredited institutional review board, undergraduate students enrolled in *Science, Technology, and Society* during the second semester of the academic year 2020 to 2021 in

Ateneo de Manila University were recruited by volunteer sampling to take part in this study. The second semester of academic year 2020 to 2021 was chosen as the period for data gathering instead of the first semester so that both teachers and students were accustomed to online learning by then. Students eligible as participants for this study completed the four modules either from 10 February 2021 to 7 April 2021 or from 12 April 2021 to 5 June 2021.

Data Gathering

A pre-test survey was sent through the institutional emails of eligible study participants at the start of the course. An online survey was deployed in this study as it was the most appropriate mode of administration given the lockdown and restrictions imposed by the Philippine government as a response to the pandemic. This survey included demographic questions and 48 items from the Global Scientific Literacy Questionnaire (GSLQ) by Mun et al. (2015). The 5-point Likert scale items from the GSLQ were developed to measure four dimensions of the Global Scientific Literacy Framework: habits of mind (i.e., 5 items for communication and collaboration, while 8 items for systematic thinking and information management), character and values (i.e., 7 items for ecological worldview and compassion, while 2 items for socio-scientific accountability), science as a human endeavor (i.e., 3 items for characteristics of scientific knowledge, whereas 10 items for science and society as well as the spirit of science), and metacognition and self-direction (i.e., 10 items for planning and monitoring, whereas 3 items for evaluating). Scientific content knowledge was not included in the development of GLSQ by Mun et al. (2015) as they believed this dimension may require other measures. These scale items were tested validly based on exploratory and confirmatory factor analysis. The items in each dimension also showed good internal consistency as they displayed a Cronbach's alpha of 0.80 and above.

A post-test survey was then emailed at the end of the course to the study participants, who completed the pre-test questionnaire. This survey included the same questions and items from the pre-test questionnaire to facilitate comparison. Specifically, giving the same questions and items for the pre-test and post-test to the students allowed the researchers to determine if *Science, Technology, and Society* as a six-week online course offered within the context of a pandemic can bring about an increase in scientific literacy.

To make sense of the results gathered from the surveys, a focus group discussion was carried out after the grades were released for the second semester. A focus group discussion, as Stewart and Shamdasani (2015) point out, can add depth to the survey responses by making most of the group interaction to yield "a very rich body of data expressed in the respondents' own words and context" (p. 42). Around four to six students, as suggested by Krueger (2015), were needed as participants in the focus group discussion. Aside from offering a comfortable environment, this small focus group size is conducive for participants to detail insights and observations about their experience. In this study, participants in the focus group discussion were randomly sampled from the list of undergraduate students enrolled in *Science, Technology, and Society* during the second semester of the academic year 2020 to 2021. Those who consented were asked to take part in the focus group discussion via Zoom as the videoconferencing platform.

Data Analysis

Mean and standard deviation were employed to describe the central tendency of the GSLQ scores on pre-test and post-test. To determine if there is a significant increase in scientific literacy among undergraduate students after taking *Science, Technology, and Society* as a six-week online course offered during the COVID-19 pandemic, a one-tailed paired sample t test of the GSLQ scores was performed at a 95% confidence interval and 0.05 level of significance using Microsoft Excel. To examine which aspects of the course these students find helpful in making them more scientifically literate at a time of a pandemic, a thematic analysis of the verbatim transcript of the focus group discussion was carried out to find out recurring meanings. Thematic analysis in this study involved 1) familiarizing with the data through reading and re-reading the transcript; 2) generating initial codes through in vivo coding; 3) coming up with candidate themes by searching for meaningful patterns among the codes; 4) reviewing and re-classifying the themes by checking them against the transcript; 5) reporting the findings based on the emerging themes that were drawn from the gathered data (Braun et al., 2018).

Results

A total of 67 students coming from different sections completed both the pre-test and post-test surveys sent to them via email. These surveys yielded an approximately 10% response rate. The survey respondents were 19.54 ± 0.93 years old. 62.69% (42 of them) were females, while 37.31% (25 of them) were males. Almost all were in their second year of undergraduate studies.

Table 1 shows the GSLQ scores of the survey respondents on pre-test and post-test. Out of the highest possible sum of 240, their total GSLQ scores on pre-test and post-test were 205.33 ± 17.15 and 208.54 ± 20.76 , respectively. One-tailed paired sample t test revealed there was a statistically significant increase in the total GSLQ scores of the survey respondents after taking *Science, Technology, and Society* over for six weeks during the first year of the COVID-19 pandemic ($p = 0.03$). Among the constructs of the Global Scientific Literacy Framework, statistically significant higher scores were observed at the end vis-à-vis at the start of the course for systematic thinking and information management ($p = 0.01$) as well as self-directed planning and monitoring ($p = 0.02$). The rest of the constructs, however, posted no significant difference in scores before and after the six-week online classes in *Science, Technology, and Society*.

Table 1. Pre-Test and Post-Test GSLQ Scores (n = 67)

<i>Dimensions of Global Scientific Literacy Framework</i>	<i>Pre-Test Score</i>	<i>Post-Test Score</i>	<i>p value</i>
Habits of Mind			
Communication/Collaboration	20.87 ± 2.75	21.10 ± 2.43	0.21
Systematic Thinking/Information Management	33.12 ± 4.46	38.28 ± 4.13	0.01
Character and Values			
Ecological Worldview/Compassion	29.30 ± 4.26	29.75 ± 4.98	0.14

www.icres.net	May 18-21, 2023	Cappadocia, Turkiye	www.istes.org
Socio-Scientific Accountability	08.13 ± 1.95	08.34 ± 1.97	0.15
Science as a Human Endeavor			
Characteristics of Scientific Knowledge	13.51 ± 1.39	13.28 ± 1.45	0.13
Science and Society/Spirit of Science	46.54 ± 3.17	46.59 ± 4.26	0.47
Metacognition and Self-Direction			
Planning and Monitoring	41.70 ± 4.87	42.85 ± 5.23	0.02
Evaluating	12.16 ± 2.09	12.45 ± 2.21	0.15
Total	205.33 ± 17.15	208.54 ± 20.76	0.03

A total of five students took part in the focus group discussion. They were 19.40 ± 0.55 years of age. 20% (1 student) described themselves as female, whereas 80% (4 students) identified themselves as male. 60% (3 students) and 40% (2 students) were in their second year and third year of undergraduate studies, respectively. 60% (3 students) were from the field of science and engineering, 20% (1 student) belonged to the field of humanities, and another 20% (1 student) came from the field of management.

When asked during the focus group discussion what are their understanding of scientific literacy, student A considered it as “beyond being knowledgeable about scientific facts.” For student B, scientific literacy is “not just about formulas.” He defined it as the “use of science in real, urgent issues.” Scientific literacy, as student C pointed out, also involves the application of scientific reasoning and practices to “connect the dots” to arrive at “a better grasp of real-world phenomena.” It entails, according to students B, D, and E, “triangulating credible sources” to distinguish the scientific truth from erroneous claims.

Whether they regard themselves as scientific literate based on their understanding of it, all of them believed so and they partly attributed their increase in scientific literacy to *Science, Technology, and Society*. Student A felt this course reinforced and built on the competencies they learned from previous science classes. Student B even brought up how “thankful” he is that his classes in *Science, Technology, and Society* “reminded [him] of what matters the most about science,” while student C found the course offering itself as “very insightful and interesting.”

This positive feedback about their experiences in *Science, Technology, and Society* can be due to the topics covered in class as they piqued the interest of the focus group discussion participants. Although students A and C found topics, such as the scientific method and the environmental impact of climate change, were already tackled in their previous subjects, the discussion of the module contents offered them “new perspectives.” Specifically, the application of “social frameworks” in understanding how science and technology are intertwined with society, as student C explained, gave them an “interdisciplinary view.” For student B, the approach to *Science, Technology, and Society* was “very different from how [he] learned in elementary.” It was not “bookish.” Furthermore, the assigned readings and complementary resources like the curated YouTube videos, according to students C, D, and E, were quite engaging. The learning materials made available to them also impressed students B and E as several of these resources are “contextualized to Philippine realities.”

Student B appreciated the compulsory use of the discussion board in their Canvas Learning Management System in fostering his scientific literacy as there were opportunities to exchange views with his classmates about science-related issues. Additionally, most of the focus group discussion participants, such as student A, identified the classes held online through Zoom as helpful in making them learn and become more scientifically literate since their teachers can explain further the concepts and synthesize the main points of the module. The way they were assessed for the course learning outcomes could have contributed as well to facilitating their scientific literacy. Instead of being given objective test items, which for students B, C, and D can be easily passed through rote memorization, they were “challenged to understand the lessons well,” “research on the topic,” and “organize their thoughts” so that they could better compose essays synthesizing their learning and insights about the module. There were also occasions to learn from their classmates and gather different perspectives as they must collaborate for their group requirements.

The focus group participants, however, felt that the six-week duration to go through the four modules in *Science, Technology, and Society* was rather short. For instance, the assigned readings, as student D pointed out, “was too much” given the limited time to complete the course. Students B and E deemed they could have learned further if there was a presentation of their module synthesis in which they could share with others their insights and engage the class in a meaningful discussion. Such activities were not taken up in their classes due to time constraints, among others.

Discussion

The COVID-19 pandemic has upended the way we carry out our daily lives. How science is taught and learned is no exception as educational institutions across the world have resorted to online delivery of classes to minimize the disruption to learning in spite of the public health crisis. On one hand, this abrupt shift from in-person classes to remote learning has posed challenges to teachers and students alike as both have been caught off guard by the pandemic: teachers must swiftly translate their lessons to make them suitable for remote learning, while students must quickly adapt to the unfamiliar terrains of learning in an online environment. On the other hand, the pandemic has accelerated the adoption of online platforms for teaching as educational institutions harness the positive aspects of information technology in promoting scientific literacy, among others, despite the global crisis. There are, however, few studies that look at students’ acquisition of scientific literacy within the context of adverse situations, such as a pandemic. Hence, this study seeks to find out if there would be a significant increase in scientific literacy among undergraduate students after taking the government-mandated science education as a six-week online course offered during the first year of the COVID-19 pandemic. It also intends to understand which aspects of their science education during a time of pandemic would these students find helpful in facilitating their scientific literacy.

Comparing the total GSLQ scores on pre-test and post-test, this study showed there was a significant increase in scientific literacy among undergraduate students after going through a six-week online course offered during the

first year of the pandemic as part of their science education. Qualitative data from the focus group discussion supported these results as student participants felt they became more scientifically literate by the end of the course offering based on their understanding of scientific literacy as the use of scientific reasoning and practices not only to comprehend the world but to also solve urgent issues in society. This gain in scientific literacy could be particularly attributed to improvement in their systematic thinking and information management as well as in self-directed planning and monitoring.

Systematic thinking and information management are foundational to scientific inquiry (Krajcik & Sutherland, 2010). They represent higher levels of thinking, which allow individuals to see the whole without losing sight of its parts (Almamuri & Shaalan, 2021). They entail logically organizing gathered data and critically evaluating various resources to find relevant information, methodically analyzing data for patterns to explain observations and arrive at valid conclusions, and innovatively applying new or prior understanding to draw the best solutions to real-world problems (Mun et al., 2015).

In this study, students probably became better at systematic thinking and information management due to the course design. First, the topics covered in class were engaging for the students, affording them to see multiple perspectives with the use of social frameworks to examine science-related issues. Ensuring that the course content in an online setting would be engaging to students, as Tsang et al. (2021) point out, is crucial in motivating them to learn in adverse situations. Doing so can foster higher levels of thinking despite the constraints brought by the pandemic as students are given meaningful opportunities to break down, integrate, and synthesize concepts, discover nuances, and apply the knowledge they acquired in challenging ways (Schaber & Shanedling, 2012). Second, the incorporation of online discussion boards as part of the students' asynchronous learning helped them to externalize their thinking and exchange views with other students about science-related issues. Embedding student-student interaction using online discussion boards can facilitate student-content interaction as students, according to Ertmer et al. (2011), are offered meaningful opportunities to "interact with each other over course-related topics" through the "processes of articulating, reflecting on, and negotiating their understandings of course content" without the pressure of responding to the posts instantaneously (p. 158). Third, employing videoconferencing for synchronous learning provided the students with real-time support from their teachers as concepts in class can be clarified and main points from the module can be run through. This student-teacher interaction, which among others involves students asking questions and their teachers providing timely feedback, is vital in promoting higher levels of thinking and mediating learning outcomes as there are meaningful opportunities to connect new concepts with prior knowledge (Tsang et al., 2021). Lastly, knowledge construction instead of rote learning was the focus of the assessment as students must collaborate for their group requirements and they must individually demonstrate a deep understanding of science-related issues in view of course content. Student-student interaction in an online environment through giving collaborative learning tasks can facilitate higher levels of thinking by recognizing that knowledge takes place within a social context (Hussin et al., 2019), while student-content interaction through assigning reflective tasks can similarly foster higher levels of thinking by emphasizing the contribution of meaning-making in effective learning (Ertmer et al., 2011; Safitri et al., 2019).

Self-directed planning and monitoring are also transferable skills that are necessary for carrying out a scientific inquiry. They, as Mun et al. (2015) describe, “refer to an individual’s capability to use cognitive resources actively in order to regulate one’s own thinking and improve [the] capability to understand” (p. 1746). These transferrable skills help individuals to decide when they need further information, what data they need, and whether they understand the gathered information (Choi et al., 2011).

In this study, self-directed planning and monitoring improved among students after taking *Science, Technology, and Society* within six weeks during the first year of the pandemic probably because of the nature of remote learning, which demands greater responsibility among learners for their learning. Specifically, asynchronous learning warrants independence and self-regulation, while synchronous learning necessitates connectivity, interaction, and collaboration (Garrison, 2003). Such findings reflect how the students were bound to take control of their learning by being proactive and autonomous as teaching abruptly shifted to an online setting during the pandemic. Similar to the study of Maphalala et al. (2021), these students were challenged by the extraordinary circumstances to adopt learning strategies that would help them navigate through remote learning within the context of a pandemic.

The other dimensions of the Global Scientific Literacy Framework, however, were not further developed among the students in this study due to several reasons. First, the six weeks allotted for the online course offering may not be enough for the students to acquire the other dimensions of scientific literacy. Second, cognitive overload could have taken place as there were plenty of learning materials to go through over a short period. Third, the pandemic is not an ideal context to learn. Fourth, some students may have not adapted well to the abrupt shift from in-person classes to remote learning. Fifth, there could have been more collaborative tasks to promote social presence in an online setting.

Conclusion

Scientific literacy has become imperative in this age of I.R. 4.0. The COVID-19 pandemic, however, has challenged the acquisition of scientific literacy among students as the delivery of science education has suddenly shifted from in-person classes to remote learning. Nevertheless, this mixed methods study showed that there could still be a gain in scientific literacy despite the constraints on science education by the pandemic. An improvement in systematic thinking and information management as well as self-directed planning and monitoring among the students can account for such an increase in scientific literacy. Students became better at systematic thinking and information management possibly because of the course design wherein elements of student-teacher interaction, student-student interaction, and student-content interaction were purposively included in the teaching-learning process that takes place in an online setting. The very nature of remote learning that requires students to be more responsible for their learning, on the other hand, can explain why there was an improvement in their self-directed planning and monitoring. The role of teachers as facilitators of

learning within the context of adverse situations, such as pandemics, is therefore crucial as they map out and implement course design and they offer instructional as well as psycho-emotional support to students, who must adjust to the unfamiliar terrain of remote learning. Findings from this study can offer valuable insights for science educators and higher education institutions on how to ensure quality education when using remote learning during pandemics and other adverse situations.

Recommendations

Several recommendations for future research are listed below in view of the limitations that were encountered in this study. First, the constructs used for scientific literacy in this study were confined to the theoretical framework suggested by Choi et al. (2011) and Mun et al. (2015). Other studies may consider other theoretical frameworks in measuring and evaluating scientific literacy. Second, this study only offered observations and explanations on the acquisition of scientific literacy during the latter part of the first year of the pandemic. Additional studies may be needed to better understand the development of scientific literacy among students during the early months of the pandemic and throughout the remainder of this public health crisis. Third, the study participants volunteered to take part in this research and may not represent other students within and outside the examined university. Future studies may benefit from carrying out probability sampling and investigating multiple educational institutions. Fourth, this study only yielded a 10% response rate to the online surveys despite the researchers repeatedly sending out email notifications. It also garnered more female participants than males. Asking the teachers to remind their students about the surveys, giving incentives to the respondents, and assuring the students of the anonymity of their responses and the practical usefulness of these responses are some of the strategies that other studies may employ to increase the survey response rate. Lastly, the study participants came from classes handled by different teachers. Their learning experiences during the pandemic may therefore vary. Future studies may find it useful to use analysis of covariance to account for the difference in teachers.

Reharmonizing Islam and Science of Creating a Scientific Civilization based on Religious Values: Case Study of Indonesian Fundamentals Pancasila

Naila Intania

Wahid Hasyim University, Indonesia,  <https://orcid.org/0009-0005-0704-6903>

Rosida Kerin Meirani

Abstract: The deviated assumptions between religion, especially Islam, and science have been in vogue for a while. Many people today explicitly distort the foundation norms of Islam and what is taught in today's modern science and culture. To illustrate, Islamophobia is a common perception of Islam—portraying it as violent, terror-filled, and inhumane. Experts are beginning to realize that there is a big mistake to distinguish between religion and science. For instance, it turns out that many of today's scientific discoveries were written thousands of years ago in the Qur'an, the Muslim holy book. Al-Isra 7 calls upon humans to practice more kindness and mutual respect towards fellow humans, while Al-Baqarah 205 emphasizes the prohibition against destroying the earth, including plants and livestock. Indonesia is a country that has managed to unite multiculturalism and has become one of the countries with the largest Muslim population. The state does not distinguish between religion and science. The state harmonizes Islam and science through Pancasila as the *kalimatun sawa*. The data in this paper are sourced from reviews, literature relevant to the writing. The results of the review, as well as the relevant literature, are then analyzed and presented.

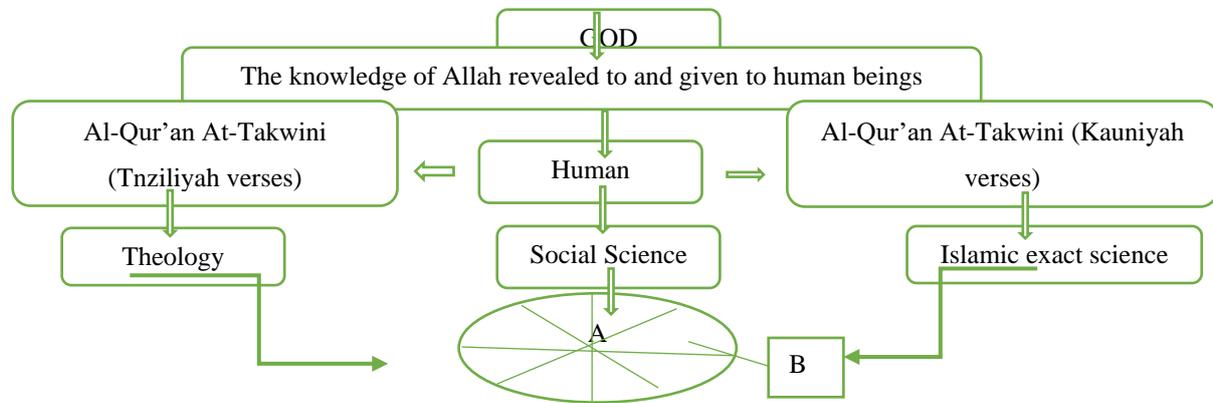

Keywords: Reharmonizing, Scientific Civilization, Religious Values, Pancasila

Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 614-624), Cappadocia, Turkiye. ISTES Organization.

Introduction

Science and religion, especially Islam, are actually classic and sustainable issues, but along with changing the paradigm and developing knowledge in all fields, opportunities for the integration of science are wide open. This relationship shows how positively Islam views science (and matters related to scientific activities). In this regard, Islamic education can be internalized and understood in a complete and "kaffah" (whole and comprehensive, without a dichotomy between religious education and general education) (Murtopo, Ali. 2017).

A. M. Saefuddin and M. Zainuddin proposed creative thinking formulations to be integrated in a coherent manner with knowledge in Islam (M. Zainuddin, 2008). The combination in simple terms can be seen in the following scheme:

Information:

A = Integration of Islamic Sciences

B = Specialization of Science

The unification of science with religious values, in this case Islamic teachings, the insights of knowledge are no longer dichotomously separated in the division of religious and non-religious sciences, but will be differentiated (not separated) into knowledge that concerns qauliyah verses. (Written in the Qur'an and Hadith) and the sciences of ayat kauniyah (sciences about natural sciences). Review of Islam and science integration will be in touch with people's culture in religion practice. (Kuntowijoyo, 2011) stated that Islam is portrayed in the following table:

Display of Islam			
Basic: values of Islam	Myth	Ideology	Sciene
Way of thinking	Pre-logic	Non-logic	Logic
Form	Magic	Abstract/a priori	Concrete/empiric

M. Syafii Anwar, he states that Islam should be oriented to the empiricism and should become the problem solver for people, strengthen people through social practice and politics, and bargain with the state as well. (Munadi, M. 2016). To illustrate, Islamophobia is a common perception of Islam—portraying it as violent, terror-filled, and inhumane. The exact definition of Islamophobia continues to be discussed with academics such as Chris Allen saying that it lacks a clear definition. (Allen, Chris 2010), (Burak Erdenir 2010) According to Erik Bleich, in his article "Defining and Researching Islamophobia", even when definitions are more specific, there is still significant variation in the precise formulations of Islamophobia. As with parallel concepts like homophobia or xenophobia, Islamophobia connotes a broader set of negative attitudes or emotions directed at individuals of groups because of perceived membership in a defined category. (Bleice, Erik. 2011) Mattias Gardell defines Islamophobia as "socially reproduced prejudices and aversion to Islam and Muslims, as well as

actions and practices that attack, exclude or discriminate against persons on the basis that they are or perceived to be Muslim and be associated with Islam."

For instance, it turns out that many of today's scientific discoveries were written thousands of years ago in the Qur'an, the Muslim holy book. Al-Isra 7 calls upon humans to practice more kindness and mutual respect towards fellow humans, while Al-Baqarah 205 emphasizes the prohibition against destroying the earth, including plants and livestock. From this verse, Quriash Shihab interprets this verse more in the general context, namely doing evil and good deeds. Whereas in Tafsir Jalalain it is stated more specifically that then We say (if you do good) by doing obedience (meaning you do good for yourself) because actually the reward of goodness is for yourself (and if you do evil) by causing damage (then the crime is for yourselves) in retaliation for your crime. (And when the time of punishment comes) for the (second) crime, We send them again (to darken your faces) to make you sad because you were killed and captured so that the effect of that sadness can be read from your countenances (and they enter into mosque) namely the Baitulmaqdis to destroy it (as your enemies enter it) and destroy it (for the first time and to destroy) to carry out destruction (against whatever they control) which they can defeat (with all-out destruction) with the destruction after -end. (Al Suyuthi, Jalaluddin. 2015). Tafsir QS. Al Baqarah (2): 205. By Muhammad Quraish Shihab: When they hold a power, they do not seek improvement. They even use it to damage and destroy crops and livestock. Allah does not like people like this, because He does not like corruption. (Shihab, M. Quraish. 2000). From the description of these 2 verses, Indonesia is a country that has succeeded in uniting multiculturalism with the largest Muslim population. A country that can harmonize religion and science, especially the Islamic religion contained in Pancasila as the basis of the Republic of Indonesia and is commonly known as *Kalimatunsawa*.

Reviews about how scientific al-Qur'an and sunnah are getting various from year to year. Whether it is individually or collectively, both locally or internationally. The review is individually because it is arranged by only one writer. For example, review of psychology by Ahmad Mubarak from Indonesia in 1999. While from abroad, there was the book of spirit science in al-Qur'an written by M. Utsman Najati. It was firstly published in 1985. In exact science, there was a book entitled al-Qur'an: Ilmu Kedokteran Jiwa dan Kesehatan Jiwa (al-Qur'an: Science of Spirit Medicine and Health) written by Dadang Hawari that published in 1998. Previously in 1976 Maurice Bucaille wrote Bible, al-Qur'an, and modern science or La Bible, Le Coran et La science in French. The newest one was by Agus Purwanto, a physician from ITS. He wrote about the Verses of the Universe: The Forgotten Sides of al-Qur'an (2012) and the Logic of the Verses of the Universe. Both reviews focused more on science specially on physics. While a various review in al-Qur'an was conducted by Nadiah Thayyarah (2013). The title was smart book of science in al-Qur'an. There were a lot of matters discussed in the book such as the miracle of Al-qur'an and the relationship with various science whether in medical field, embriology, astronomy, as well as food. (Munadi, M. 2016). Islam and Science provides a clear and concise historical introduction to the intellectual developments that have shaped Islamic civilization, both religious and scientific. Hence, the research inquiries addressed in this study are:

1. Relation between Islam and science as well as the reason why they are disharmonized in many

countries?

2. Why reharmonizing between Islam and science is a must and how to do it?
3. Is Pancasila effective to reharmonize Islam and science?
4. What is the result if Islam and science reharmonized, could it lead to a harmony to intimate Indonesia as a country with Pancasila as the fundamentals to create scientific civilization based on religious values?

Method

This study used literature review to achieve research objectives with the type of library research. Literature review is an objective, thorough summary and critical analysis of academic and non-academic literature relevant to the topic being studied (Hart, 1998; Cronin, et al., 2008). A literature review also includes a critical evaluation of the material. It is a process of reviewing the literature, as well as a form of writing. Reading combined with critical analysis can help to refine a topic and frame research questions. Conducting a literature review establishes the familiarity with and understanding of current research in a particular field before carrying out a new investigation. Research conducted with a focus on exploring sources related to the theme, such as books, journals, research reports, service reports, manuscript notes, and some others that are relevant to the research problem. (Ibrahim, 2015). The emphasis on library research is to find various theories, laws, propositions, principles, opinions, ideas and others that can be used to analysed and solve the problems studied. The main problem in this research is to find out whether Pancasila as the foundation of Indonesia can reharmonize Islam and science to create a scientific civilization based on religious values. Research shows that Pancasila can re-harmonize Islam and science because Indonesia has been proven to unite multiculturalism as well as one country.

Results

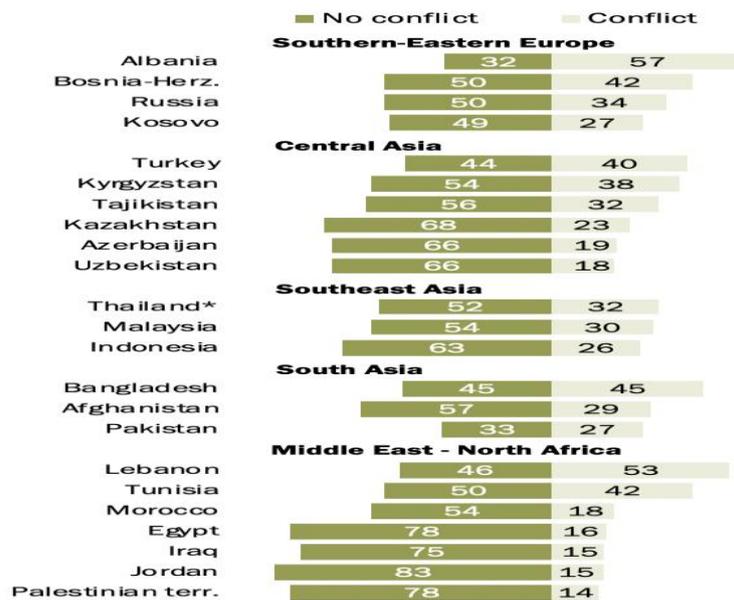

Over the centuries, the relationship between science and religion has ranged from conflict and hostility to harmony and collaboration, while various thinkers have argued that the two concepts are inherently at odds and entirely separate. There have also been reports of hate crimes targeting Muslims across Europe. These incidents have increased after terrorist attacks by extremist groups such as ISIL. (BBC News, 2015). Far-right and right-wing populist political parties and organizations have also been accused of fueling fear and hatred towards Muslims. (Reuters, 2017), (Nossiter, Adam, 2015), (Bender, Ruth. 2016), (Hume, Tim. 2017). Hate crimes such as arson and physical violence have been attempted or have occurred Norway, (Reuters, 2017) Poland, Sweden, France, Spain, Denmark, Germany and Great Britain. Politicians have also made anti-Muslim comments when discussing the European migrant crisis (Haddad, Yvonne et al., 2014).

Furthermore, experts are beginning to realize that there is a big mistake to distinguish between religion and science. Representative surveys of Muslims in countries around the world find variation in the share of Muslims

who see any conflict between science and religion, although this share is less than half in most countries surveyed. The 2018 Wellcome Global Monitor asked respondents if “science has ever disagreed with the teachings of your religion.” Across 51 countries that have large enough samples of Muslims that their views can be broken out separately and analyzed, a common response is that science has “never disagreed” with Islamic religious teachings.

Is there a conflict between religion and science?

% of Muslims who say there is or is not generally a conflict between science and religion

*Interviews conducted with Muslims in five southern provinces only. Note: Based on Muslims. Respondents who did not give a response are not shown.

Source: Global Survey of Muslims 2011-2012. Q19. "The World's Muslims: Religion, Politics and Society"

PEW RESEARCH CENTER

Similarly, a Pew Research Center survey conducted in 2011 and 2012 that examined the views of Muslims found that, in most regions, half or more said there was no conflict between religion and science, including 54% in Malaysia (Muslims in Singapore were not surveyed). Three-in-ten Malaysian Muslims said there is a conflict between science and religion; the share of Muslims around the world who took this position ranged from a high of 57% in Albania to a low of 14% in the Palestinian territories. (Pew Research Center, 2020).

For instance, it turns out that many of today's scientific discoveries were written thousands of years ago in the Qur'an, the Muslim holy book. Al-Isra 7 calls upon humans to practice more kindness and mutual respect towards fellow humans, while Al-Baqarah 205 emphasizes the prohibition against destroying the earth, including plants and livestock. Indonesia is a country that has managed to unite multiculturalism and has become one of the countries with the largest Muslim population. The state does not distinguish between religion and science. The state harmonizes Islam and science through Pancasila as the *kalimatun sawa*.

Islam is a religion embraced by many people in the world. (Intania, Naila, 2020) The Qur'an is the main and first

source for Muslims as a guide, a guide for those who study and practice it. And contains divine revelation which has no equal and no opponent in the natural life of the universe. The Qur'an as a guide of life which certainly does not only regulate human relations with Allah alone but the Qur'an also regulates relations among humans and the universe, one of the forms of the Qur'an's demands on the universe is protecting the environment. As explained in Al-Isra 7 & Al-Baqarah 205, in which the contents of the two letters are Allah stating that if the Children of Israel do good, then goodness is for themselves. However, the provisions contained in this verse are not specific to themselves, but generally apply to all mankind at all times. Therefore, if humans do good or do good, then the reward for that kindness will be felt, both in this world and in the hereafter. The good that they will receive in the world is that they will be a strong people defending themselves from the evil plans planned by their enemies. They will have the opportunity to multiply wealth as a means of life, and continue their descent as caliphs on earth. They will become a strong nation, which can embody a high culture to further excite their lives, and ensure the smooth running of their business and worship to Allah SWT. Meanwhile, eternal happiness is heaven full of pleasures that are provided and promised to them, as proof of Allah's pleasure for the good they have done. If they do evil by committing acts that are contrary to the revelations and events of their own nature, such as against the truth and norms in their own way of life, then the result of their actions will be Allah's wrath against them. Thus, they will become a divided nation because they are enslaved by lust, so that one group tries to concentrate the other group. An example is the story of the Aqsa Mosque which was torn down and a building named Jupiter Capitolina was erected on it. Then the Jewish kingdom was also destroyed so that the Jewish people had no kingdom anymore. They scatter to the protectors of the corners of the world. This event occurred in 132 AD. (NU Online)

Meanwhile, Al-Baqarah 205 provides an explanation in Tafsir Ibnu Katsir, Darud Thayyibah Linnasyari Wat Tauzi', Volume 8, p. 254 Have no desire to destroy the earth, while you live in it. And do not do bad to something that was created by Allah. It can be seen clearly that Allah does not like damage on earth. In this case, humans have a responsibility to preserve the environment. But the problem of environmental damage is no longer a foreign discussion. Environmental problems cannot be separated from religious issues with various types of damage to the earth in general rooted in the spiritual crisis and the existence of modern humans. This causes them to legally or illegally exploit nature to meet their needs without regard to nature, in order to gain personal welfare by doing things that harm other people. (Muhammad, Abdullah., 2022) The verse explains that Allah SWT. has spread the earth, made mountains and plants grow, then humans must be responsible for managing and utilizing natural resources based on the principle of sustainability to achieve prosperity so that they can meet the needs of mankind. (Shihab, M Quraish., 2000) Humans as a component of the population have a major role in utilizing, managing and controlling phenomena that occur in nature. Humans are responsible for the sustainability of the ecosystem because humans were created as caliphs. The environment is a gift given by Allah SWT. to all of His creatures to be put to good use. The environment must be maintained and preserved as a form of concern to manifest a sense of love and compassion for Allah SWT's creation. Islam teaches about environmental maintenance which must be implemented in human attitudes and behavior so as not to cause damage to the earth. (Intania, Naila et all., 2022).

Pancasila effective to reharmonize Islam and science

Pancasila is the ideology of the nation that should be the spirit of every pulse of life of citizens and constitutional activity, because the Pancasila is seen as media acculturation in various partial thoughts on religion, education, cultural, political, social and even economic. As a result of making the philosophy of Pancasila as a nation, we can realize Indonesian nationalism. Pancasila is a revolutionary concept that advanced civilizations, especially for Indonesia, Pancasila as well as forming the character and identity of a great nation, modern, dignified and civilized. (Amir, Syafruddin. 2013) The name Pancasila comes from Sanskrit which consists of two words, namely 'panca' which means 5 and 'sil'a which means principle or principle. This means that there are 5 important guidelines for the Indonesian people in the life of the nation and state. The five precepts are Belief in One Almighty God, just and civilized Humanity, Indonesian Unity, Democracy led by wisdom in deliberations/representations, social justice for all Indonesian people.

Researcher will take one of the topics that can connect between Islam and science from Pancasila. That is how the relationship of Pancasila to prevent the extinction of natural ecosystems. An ecosystem is an ecological system formed by an inseparable reciprocal system between living things and the environment. Ecology is the study of the interrelationships between organisms and their environment. Reporting from the Encyclopaedia Britannica (2015), there are components that cause the formation of ecosystems, namely biotic and abiotic components. Living things and abiotic factors in an environment are a unit called an ecosystem. With Pancasila values we can prevent the extinction of natural ecosystems, the relationship is: 1. Believe in the one supreme GOD, belief in the Creator. This is the main foundation that should not be forgotten. This universe is the creation of the Creator, all religions recognize it and humans must protect and care for it. If nature is not cared for, it is the same as we do not believe in God's power over it. Destroying God's property is tantamount to not acknowledging the existence of God, and not recognizing God is definitely not Pancasila. 2. The second Justice and civilized humanity. The occurrence of the "karhutla" incident has clearly negated the human side, let alone being just and civilized. If there is only a group of people who have power over several thousand hectares of land, they can do anything on that land, they will also argue when a fire occurs, they are even euphoric as a group that cares about the environment, a company with the best CSR, that is where the sense of justice and humanity is in the precepts. both are disturbed. 3. The third precept, unity, is very clearly connected with the first and second. All of us are in one expanse of interconnected areas. Pain on one side will be a nuisance on all sides. Unity means having the meaning of needing each other, feeling each other, being bound in one inseparable series. If the actions we take cause ulcers to appear and damage relations with other parties, we have disrupted that unity. A river that originates in one province but flows downstream to another area, then it must be considered as one expanse, one landscape. 4. The fourth precept, the democracy led by understanding wisdom among honorable representatives from the parliament house, is an important point to say that all of this country's bloodshed must be treated as well as possible, wisely for prosperity, with enthusiasm.

Then the last one is to discuss the fifth principle of social justice for all Indonesian people. Justice is a principle that is very important and has a high position in Islam. The word "fair" is used in four ways, namely balance,

equality and non-discrimination, granting rights to those who are entitled, and delegation of forms based on level and feasibility. Divine justice means that every being takes the form and perfection of its form according to what is appropriate and possible for it. (Mutahhari, Murtadha. 2009) Justice is classified into three types, namely justice in the form of legislation (al-' is al-qanuniyyah), social justice (al-' is al-ijtima'iyah), and international justice (al- -,is al-daulyyah). (Yasid, Abu, 2004) Justice in Islam depends on the justice that has been determined by Allah himself. Because it is impossible for humans to know that justice is true and correct. Here too faith precedes understanding, because it has been determined that everything determined by Allah SWT must be fair. Whatever its nature, justice in Islam is formulated by adhering to divine law or the will of Allah SWT which was formulated by the scholars to be used as law in living together as citizens. Justice is a collectivistic ideal that views justice as a harmonious relationship with various social organisms. Every citizen must carry out his duties according to his position and nature. (Almubarok, Fauzi. 2018)

Discussion

Islam and science provide a clear and concise historical introduction to the intellectual developments that have shaped Islamic civilization, both religious and scientific. The reason for reharmonization between Islam and science is a must. The approach used by the Qur'an is in educating and teaching humanity to achieve balance in life. Harmony means living in peace even though we discriminate against each other or eliminate signs of position in society or between individuals so that social relations still look harmonious and good. Indonesia as a pluralistic country consisting of different tribes, customs and religions, people's lives can be harmonious and peaceful. For this reason, this harmonious life must be maintained and can even be spread to other countries as a role model and we must protect it. For the Indonesian people, Pancasila is the sentence of sawa' which unites the diversity of ethnicity, race, culture and religion. Even though at the beginning of independence Indonesia felt long about state ideology, the founding fathers found common ground in terminology called Pancasila. I believe this model of social relations is being sought in this world," said Vice President (Vice President) K.H. Ma'ruf Amin in an interview with Nusantara TV via video conference from the Vice President's official residence, Jalan Diponegoro No.2, Central Jakarta, Monday (11/9/2020).

Conclusion

This paper has argued that Indonesia is a country that is successful in uniting multiculturalism at the same time as one of the countries with the most Muslim population. The state does not differentiate between religion and science, let alone separate them. In Indonesia, the state actually harmonizes Islam and science in the Pancasila as the *kalimatun sawa*, the meeting point between spiritual needs and the encyclopedias reality in the purpose of creating a scientific civilization based on religious values. Reflecting on scientific evidence and a country as a role model for the success of the harmonization of religion and science, the world, therefore, should not distinguish between these two interrelated things. Indonesia follows the ways of the Prophet. Therefore, even though the majority of Indonesia's population are Muslims, they still provide opportunities for other religions to live together in harmony and harmony.

Dataset of Chinese Language Beginning Learners Reading Speech and Text-to-Speech

Yoke Lian Lau

Universiti Malaysia Sabah: Kota Kinabalu, Sabah, Malaysia,  <https://orcid.org/0000-0002-7949-7683>

Abstract: Three categories of audio recordings, a web service platform, and commercial software were involved in this analysis process. The three categories of audio recordings included eight filtered student recordings, an audio recording provided by a Mandarin instructor from University Malaysia Sabah, and an audio recording generated by Text-to-Speech MP3, available at <https://ttsmp3.com/>. All ten recordings will be uploaded into the NCH WavePad Sound Editor to build a spectrum image. This will allow us to compare and identify differences in tone reading, emotion reading, etc. You can download the NCH WavePad Sound Editor from <https://www.nch.com.au/WavePad/index.html>. This information is beneficial for all Mandarin language beginners and their teachers, as it can be used for comparison purposes. With this knowledge, they can further undertake a pilot study. This study provides a foundation for investigating differences in human and machine reading from multiple perspectives. Furthermore, this dataset can be used to analyze reading speed. It serves as a crucial starting point for spectrum, voice wave, and reader behavior research.

Keywords: NCH Wave Pad Sound Editor, teaching, learning, foreign language, spectrum

Citation: Lau, Y.L. (2023). Dataset of Chinese Language Beginning Learners Reading Speech and Text-to-Speech. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds.), *Proceedings of ICRES 2023-- International Conference on Research in Education and Science* (pp. 625-639), Cappadocia, Turkiye. ISTES Organization.

Introduction

The data collection process can be divided into three distinct phases: the preparation period, the data collection period, and the data validation period. The planning stage begins in early January 2020, with a team meeting to confirm the research plan and timeline. Team members will recommend six proficient Mandarin instructors who will provide three Mandarin sentences from the University of Malaysia Sabah Mandarin Class textbook. These sentences will be compiled in a Google Drive document. The selected Mandarin instructors will have approximately five months to determine the appropriate sentences.

The team will inform Level 1 Mandarin students at the University of Malaysia Sabah about the study and encourage their participation. They will discuss the research and ensure the students are prepared for the recording process. After May 2020, the team will reconvene to select the ten most relevant sentences for reading speech. A research assistant will prepare for data collection and invite interested individuals to join a WhatsApp group.

The data collection period commences in June 2020 and concludes in July 2020. The research assistant will brief the participants before they begin recording their readings. Participants will be required to carefully read the Participant Consent Form, sign it, and submit it to the research assistant. Furthermore, the research assistant will distribute honorariums to each participant prior to data collection. Participants will then record themselves reading the ten Mandarin sentences listed in section C of the participant authorization form and send the audio file to the research assistant via email or WhatsApp.

During the data validation phase, if there are any errors in the recordings, the participant will be requested to resubmit them.

In total, 16 audio recordings in MP3, MP4, M4A, and MPEG file formats were obtained voluntarily from 14 participating students who used their smartphones to record their readings. These were then sent to the researcher via email or WhatsApp. The NCH WavePad Sound Editor, available at <https://www.nch.com.au/WavePad/index.html>, was used to capture 10 spectrum images in PDF format. The software was downloaded onto a Windows 10 personal computer. Six experienced Mandarin language teachers at the University of Malaysia Sabah each proposed three classic, culture-based Mandarin sentences. These were added to a Word document containing ten Mandarin sentences and stored in a Google Drive document. Finally, ten of the eighteen sentences were selected for reading speech. All sentences were chosen from the University Malaysia Sabah Mandarin Class textbook.

Participant Selection Criteria

Students from the Mandarin Level 2 class volunteered for this research. The criteria for participation were as follows:

1. Participants must have joined the research from Mandarin Level 1.
2. Participants must be able to read and understand the provided sentences.
3. Participants must not have any disabilities that would prevent them from performing the tones and rhythms of the language.

Reading Criteria:

Recordings were obtained from students, a Mandarin language lecturer, and Text-to-Speech MP3 recordings at <https://ttsmp3.com/>. All recordings had to meet these criteria:

1. The recording must be done in a quiet room.
2. The recording must be audibly clear, pronunciation must be correct, and the speed and rhythm of speech must be natural.

All recordings had to meet these criteria: I. The recording must be done in a quiet room. II. The recording must be audibly clear, the pronunciation must be correct, and the speed and rhythm of speech must be natural.

Selection of Sentences for Reading

1. The sentences are in classic Mandarin and may be in dialogue form.
2. The sentences used were suggested by Mandarin language teachers who chose them based on their reflection of one or more of the following: a. Describing Mandarin culture b. Reflecting the Mandarin lifestyle c. Common sentences often used in the Mandarin language.

Before pre-recording, the researchers explained the meaning of each sentence to each participant and also provided translations in Malay for each sentence. Every participant was thoroughly briefed before the recording took place.

Limitation

The study's subjects were limited to students of the University of Malaysia Sabah. Additionally, the recordings were limited to sentences appearing in the Mandarin language textbook of the Mandarin language class.

The research took place at:

- Institution: University Malaysia Sabah
- City/Town/Region: Kota Kinabalu, Sabah
- Country: Malaysia
- Latitude: 6° 02' 7.20" N
- Longitude: 116° 07' 4.20" E

Methodology

Tools Used

Every participant, including native Mandarin language speakers, used a smartphone app or recorder to create the recording. The Text-to-Speech feature from the Text-to-Speech MP3 at <https://ttsmp3.com/> provided a free text-to-speech recording via a web service.

Method

The NCH WavePad Sound Editor, which can be downloaded from <https://www.nch.com.au/WavePad/index.html>, was primarily used to analyze and observe the spectrum of the recording. All participants were encouraged to record their readings using smartphone audio recording applications. Each participant, including a native Mandarin instructor, utilized a smartphone application to generate the recording. The Text-to-Speech MP3 provided a free text-to-speech recording through a web service. The NCH WavePad Sound Editor was mainly used to analyze and monitor the recording's spectrum.

Analysis

The NCH WavePad Sound Editor was used to perform a spectrum comparison of the recordings. To simplify the comparison, the spectrums of the recordings were segmented into similar-length, fixed-size sections.

Materials

Several essential materials were required to complete the investigation. These included a Google Drive spreadsheet, a Mandarin textbook (Liu, 2010), a Respondent Consent Form (Lau, 2022b), Spectra (Lau, 2022b), and Audio Recordings (Lau, 2022a). The research team recommended six proficient Mandarin instructors to contribute three Mandarin sentences from the University Malaysia Sabah Mandarin Class textbook (Liu, 2010). These sentences were compiled into a Google Drive document sheet. The selected Mandarin instructors were given approximately five months to finalize the appropriate sentences.

For audio recording collection, the research assistant briefed the participants before they started recording. Participants were required to carefully read the Participant Consent Form, sign it, and return it to the research assistant.

Results

This article references three types of data (Lau, 2022a, 2022b) that are available on Mendeley Data (Mendeley Data, 2022) via a specified URL. The initial contents of the "Audio SGA0028-2019" folder (Lau, 2022a) include 16 audio recordings. The "Spectrums and Respondent Consent Form" PDF file (Lau, 2022b) contains "Spectrums" on pages 1 to 3, and a "Respondent Consent Form" (Lau, 2022b) on pages 4 and 5.

The "Audio SGA0028-2019" folder (Lau, 2022a) contains 16 MP4-formatted audio files. They are labelled as Audio A, Audio A+1, Audio B, Audio B+1, Audio C, Audio D, Audio E, Audio F, Audio H, Audio I, Audio J, Audio K, Audio L, Audio M, and Audio N. Additionally, there is a file titled "Spectrum and Respondent Consent Form" (Lau, 2022b). This file contains 10 voice wave displays. These include eight sound waves from student audio readings, one sound wave from a native Mandarin speaker, and one sound wave from the Text-to-Speech MP3 (2022). These sound waves are represented in spectrum form on pages 1 to 3. The respondent consent form is presented on pages 4 and 5.

Table 1. Details of 16 audio files

Audio Nama	Read by	Item Type	Size	Length(time)	Note
Audio A	Male	MP3	5.89MB	00:02:34	Respondent A provided two recordings
Audio A+1	Male	MP4	1.17MB	00:01:15	
Audio B	Male	MP4	1.82MB	00:01:57	Respondent B provided two recordings
Audio B+1	Male	MP4	1.58MB	00:01:42	

Audio C	Female	MP3	1.34MB	00:01:46	
Audio D	Female	MP4	1.29MB	00:02:40	
Audio E	Female	MP4	1.63MB	00:01:45	
Audio F	Female	MPEG	3.32MB	00:01:27	
Audio G	Male	MP3	4.83MB	00:02:06	
Audio H	Male	M4A	836KB	00:01:39	
Audio I	Female	MP4	1.12MB	00:01:12	
Audio J	Male	MP4	659KB	00:01:20	
Audio K	Female	M4A	839KB	00:01:43	
Audio L	Female	M4A	854KB	00:01:41	
Audio M	Female	MPEG	1.10MB	00:01:12	
Audio N	Female	MP3	4MB	00:01:44	

Table 1 provides information about the sixteen audio files. The table lists the 16 audio file names, the gender of the person who read each file, and whether they were saved in MP3, MP4, M4A, or MPEG format. It also includes information about their size, duration, and notation. The majority of the recordings are between 1MB and 2MB in size, and between 1 and 2 minutes in duration.

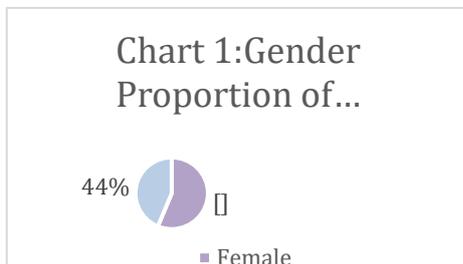

Chart 1. Gender proportion of recordings readers

Chart 1 presents the gender distribution of the readers who participated in the recordings, represented as percentages of the sixteen recordings obtained from University Malaysia Sabah, seven were performed by male students and nine by female students.

Recordings F %

MP3	25
MP4	43,75
M4A	18,75
MPEG	12,5

Chart 2. Percentage of file types for audio recordings

Chart 2 illustrates the distribution of file types for audio recordings, expressed as percentages. Files are saved in either MP3, MP4, M4A, or MPEG formats. Specifically, 4 files were saved in MP3 format, 7 in MP4, 3 in M4A, and 2 in MPEG.

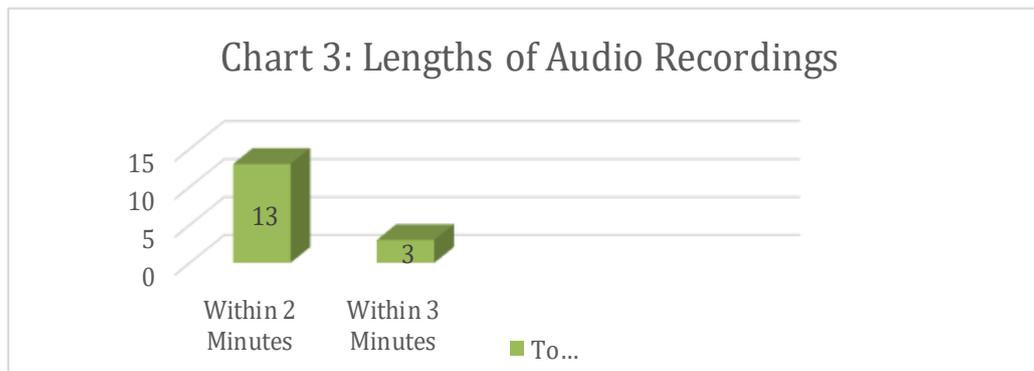

Chart 3. Lengths of Audio Recordings

Chart 3 depicts the total count of audio recordings that are two to three minutes long.

The "Spectrums" (Lau, 2022b) section contains 10 spectrum photos. These include spectra from Subjects 1, 2, 3, 4, 5, 6, 7, and 8. There's also a spectrum from the Text-to-Speech MP3 (2022) reading and one from the Mandarin instructor's reading. All these reading speech recordings were converted into spectrum files using the NCH WavePad Sound Editor, which can be downloaded at <http://www.nch.com.au/WavePad>.

Table 2: Categories of Spectrums

Spectrums	Machine reading	Human reading	Explanation
Subject 1		v	
Subject 2		v	
Subject 3		v	
Subject 4		v	
Subject 5		v	
Subject 6		v	
Subject 7		v	
Subject 8		v	
Subject 9		v	
TTSMP3 Reading	v		TTSMP3 refers to Text-to-Speech MP3
Reading of Mandarin Language Lecturer		v	

Table 2 presents the categories of spectrums (Lau, 2022b). Subjects 1 through 8 were randomly selected from the 16 student-submitted recordings and then converted into spectrums for the comparative study. The category "TTSMP3(2022)" refers to the spectrums converted from the Text-to-Speech MP3 web service (Free Text-To-Speech for US English language and MP3 Download | ttsMP3.com, 2022). The "Reading of Mandarin Language Lecturer" category, on the other hand, refers to the spectrums converted from the recording made by the Mandarin instructor at the University Malaysia Sabah.

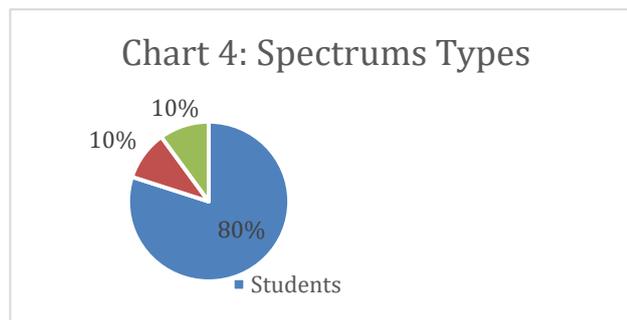

Chart 4. Spectrums Type

Chart 4 represents the types of spectrums as a pie chart. Of these, 80% are derived from student audio recordings, 10% from machine readings, and 10% from a Mandarin instructor's readings. The researcher purchased all spectrums from the NCH WavePad Sound Editor online, thereby gaining access to all functionalities of the web service. Each analysis was conducted in accordance with the website's, web services', and software's open rules and standards (NCH Software legal terms, 2022). The "Respondent Consent Form" (Lau, 2022b) provided pertinent instructions.

Table 3: Components of the Respondent Consent Form and their duties

Part	Components	Purposes	Duties	Action was taken by
A	Name	Check the credentials of respondents.	Ensure that the actual name is written.	Research Assistant
	Gender		Ensure that the correct gender is written.	Research Assistant
	Age		Ensure that they are between 18 and 22 years old.	Research Assistant
	Course Code		Ensure that the correct Mandarin course code is written.	Research Assistant
	Religion		Ensure that the respective religion is written.	Research Assistant
	Which language are you studying as a foreign language?		Ensure that "Mandarin" is written	Research Assistant
	to what extent?		Ensure Level 2 is documented	Research Assistant
	From University Malaysia Sabah Main campus/ Sandakan Campus or Labuan Campus:	Area restrictions of the respondent.	Ensure that one of these campuses is indicated.	Research Assistant

	How to pay you? By way of BOOST? GRAB PAY? TNGO: (Please supply your telephone number or account number.)	Honorarium payments.	Ensure that the payment received details are recorded.	Research Assistant
B	Please record yourself reading the 10 sentences stated below in Part C .	Describe the requirements of the recording.	Ensure that the respondents comprehend the recording's terms and conditions.	Mandarin language lecturer
	Please ensure you receive your honorarium payment prior to beginning the recording.	Describe the requirements of the recording.	Ensure that the respondents comprehend the recording's terms and conditions.	Mandarin language lecturer
	All of these recordings will be used as research data to determine the volume/volume of tones/frequency/spectrum of reading speech, etc.	Describe the requirements of the recording.	Ensure that the respondents comprehend the recording's terms and conditions.	Mandarin language lecturer
	As a respondent, your participation in the study signifies that you consent to the use of your data for analysis, sharing, and research purposes and that the researchers will keep it secure.	Describe the requirements of the recording.	Ensure that the respondents comprehend the recording's terms and conditions.	Mandarin language lecturer
	Please use a recorder to create a recording, and please make the recording clear, read it out loud (and before you read it, please read the translation words first), and record what you read properly, correctly, and neatly. After that, please WhatsApp or email your recording to yokelian@ums.edu.my. Thank you for your assistance; the file name should be Mandarin +your name.	Describe the requirements of the recording.	Ensure that the respondents comprehend the recording's terms and conditions.	Mandarin language lecturer

Table 3 consists of four components. Part A requests the respondent's information to verify that the respondent matches the intended participant. Respondents are asked to provide their E-wallet number, linked to their mobile phone number. They will be informed about their compensation prior to the recording session. Part B outlines the recording criteria. The recording must meet these specified standards, or a retake will be necessary. Part C

comprises 10 sentences from a Mandarin textbook (Liu, 2010). Each sentence is accompanied by its Pinyin and English translation to ensure that each respondent comprehends the meaning and pronunciation of each Mandarin term. The final section, Part D, requires respondents to sign their names, record their identification numbers, and check a box to indicate their agreement with the terms and conditions governing the researchers' use of their data.

Discussion

This research involves three parties. University Malaysia Sabah provides an appropriate platform, locations, and resources for conducting language research, cooperating with the research team and suggesting a proficient Mandarin instructor for the project. The University also assists in the development of each section of the consent form, rules, and conditions related to the audio recording criteria, and verifies the accuracy of all data. The research assistant aids in the payment of honorariums to all respondents, maintains contact with respondents, and examines all acquired data.

The architecture of this study integrates an online machine reading web service, online software, and human reading. The research team selected Text-to-Speech MP3 (2022) to construct machine speech reading audio from text-to-MP3 format due to its user-friendly nature.

Text-to-Speech MP3 (2022) is a free web service accessible to all users. Upon enabling cookies from the homepage, users can access all features of the website for free. This web service has a character limit of 3,000, and the device's speakers must be activated. The researchers selected Chinese Mandarin, the fourteenth option in the drop-down menu, as their target language. They then inserted the ten Mandarin sentences from section C of the "Respondent Consent Form" (Lau, 2022b) into the empty column, clicked 'read', and downloaded the MP3 file of the speech reading. The machine-reading audio recording was thus generated.

To complete the Mandarin-Level-2 learners' speech-reading audio recordings, the research team engaged a research assistant to gather the human speech-reading audio recordings. As the potential respondent was unfamiliar with the recording equipment, they were notified about the research seven months in advance. A member of the research team who also served as a Mandarin instructor at University Malaysia Sabah performed the instructor's speech reading.

After collecting all audio recordings, the research team converted the files to spectrums using the NCH WavePad Sound Editor (2022). As this software wasn't free, the research team paid for it using provided research funds. Ten identically-sized spectrums (Lau, 2022b) were laid out for visual analysis. The analysis focused on reading tone, reading mood, loudness level, sensitivity to key words, and the relationship between word-by-word reading and reading tone speed (Yoke et al., 2021).

Conclusion

Text-to-Speech MP3 (2022) offers a human-like reading format, recording syllable-by-syllable and word-by-word. In the process of translating text to speech, the system combines syllables and words into sentences and then vocalizes them. One of its limitations is the inability of text-to-speech technology to convey human emotions such as happiness, grief, and frustration during the reading process. The data (Lau, 2022a, 2022b) provide an overview of the progression of technology and the extent to which it can substitute humans in education. These data are valuable for a variety of quantitative and qualitative research approaches.

This information can be beneficial to all beginners of the Mandarin language and their teachers. Both instructors and beginner-level Mandarin language learners could utilize the data (Lau, 2022a, 2022b) for comparative purposes. The reading characteristics or style of Malaysian Mandarin may be of interest to researchers. With this understanding, they can conduct a pilot study. The data (Lau, 2022a, 2022b) provide several angles to examine human and machine reading from various perspectives. This dataset (Lau, 2022a, 2022b) can also be used to analyze reading speed, and it illustrates how some students read in a highly formal manner while others do not. It serves as a critical starting point for spectrum, voice wave, and reader behavioral studies. The audio recordings (Lau, 2022a, 2022b) are easy to access and analyze. They can be accessed anywhere and analyzed using any relevant software. Given the typical difficulty of obtaining audio recording type data from respondents, this ready-to-use data is particularly valuable.

Those wishing to learn culture-based Mandarin sentences from the perspective of a native Malaysian Chinese speaker could use the selected sentences from a Mandarin textbook (Liu, 2010) — which are believed to convey cultural traits — as a guide. Mandarin instructors can use it as a data gathering model, while Mandarin learners can use it as a means of self-improvement.

The audio recordings are ideal data for analyzing the differences between human and machine readings. Converting audio recordings into spectrums allows for a clear and vivid visual comparison of the spectrums generated by the three groups of respondents. This provides a straightforward analysis to meet the objectives of the research.

The findings contribute to the achievement of the three goals of the original study. Firstly, they determine the effectiveness of Text-to-Speech in reading Mandarin, the limitations of Text-to-Speech, and the differences between machine and human readings. Secondly, the study suggests that while Text-To-Speech technology is sufficiently advanced at present, there are still challenges to be addressed in certain areas such as conveying human nuances, incorporating more elements of human nature, and expressing human emotions in future reading processes. Lastly, the study can broaden the research scope regarding innovative language teaching and learning technologies.

Abstract: The concept of empowering the culture of volunteering was very broad, considering that this dimension focuses on development community as a whole. The needs of education among the community itself was a challenged. The term volunteering is a term global which is getting more and more attention because of its ability in stimulate community participation to get involved with charity work which brings benefits to the public. The Movement Control Order (MCO) enforced in Malaysia for three phases from 18 March 2020 to 31 August 2020 following the COVID-19 outbreak has had a big impact to Malaysians. To help government efforts, volunteers from various voluntary organizations went to the field to help the community affected by this situation. This concept paper focuses on the roles among the volunteers from non-governmental organizations (NGOs) during the past COVID-19 occurred. It will also explore the mental health issues faced by a community facing by NGO volunteers in Malaysia when conducting aid missions, help support communities, develop roles and plans to improve their readiness in the field towards the community development in Malaysia. At the same time, the need of an educational knowledge towards volunteering also will be explore. The scope of volunteering during this pandemic is very broad. Volunteers can choose to be on the 'front line', volunteers can also choose to be in the 'middle line' and for groups at risk such as the elderly or those with other constraints, volunteers are seen to still be able to engage in this voluntary work by being in the 'back line', which is work that can be carried out in a safe location or at home. As a conclusion, a volunteer especially the NGO's involved, can evoke feelings of love among the community. This feeling of love is not only to be fostered among the family members only, but it needs to go beyond the boundaries before a harmonious society can be formed. All the efforts shown by the NGO's as a volunteer during Pandemic COVID-19, has proved that their roles are very important to the community development in Malaysia.

Their Roles towards Community Development During COVID-19 Pandemic. In M. Koc, O. T. Ozturk & M. L. Ciddi (Eds), *Proceedings of ICRES 2023- International Conference on Research in Education and Science* (pp. 640-649), Cappadocia, Turkiye. ISTES Organization.

Introduction

The definition of volunteering includes the following four key components which are sincerity, education, empowerment and engagement (Hamzah & Suandi, 1994). Volunteering is a sort of prosocial activity where individuals actively and voluntarily look for opportunities to help those in need (Omoto et al., 2020) and serve others who are not their next of kin (Lai et al., 2013). It is a characteristic that has existed in most individuals since the emergence of human civilization and communities, and it is viewed as a concept of service and sharing, a process of education or a learning experience, and the active participation of citizens in community issues and matters (Maharam Mamat et al., 2018). Volunteering is the act of serving the community by providing time, energy, skills, and resources to benefit the needy without expecting monetary or non-monetary rewards in return (Wan Zakaria & Jaafar, 2021; Akintola, 2011). Ali Salman et al., (2015) insisted that volunteering should be instilled in every level of society to produce a community that is aware of the issues around them and helps shape a strong and developed nation.

Three different types of volunteering have been proposed by Fischer et al., (1991) which are formal volunteering for unpaid work for organizations, informal volunteering for unpaid service in one's community, and personal volunteering for aiding relatives. Formal volunteering typically takes the form of formal enlistment in an organised group or institution with a clearly defined social structure, role, and function (Surjit Singh et al., 2005). It typically happens when a person performs unpaid, voluntary work in a non-profit group or volunteer programme under the direction or supervision of a non-profit organisation (Wan Zakaria & Jaafar, 2021). Meanwhile, volunteering that is done informally takes place outside of established organisations or charity causes (Surjit Singh et al., 2005). Unpaid babysitting, assisting a neighbour with home tasks, and donating one's clothes to a local charity are a few examples of it that are more spontaneous and aren't organised by any official non-profit groups (Wan Zakaria & Jaafar, 2021). Additionally, there is corporate volunteering as well as mobile volunteering (Seelig & Lough, 2015).

Since volunteering is an activity, program, or service that is planned and executed sincerely and voluntarily, it exposes someone to many experiences that are related to one's career, boosts self-worth, reduces negative behaviours, strengthens social ties, increases positive life practices, and increases emotional resilience (Maharam Mamat et al., 2018). Although volunteering enables one to experience a distinct sense of well-being and purpose, volunteers may have different motivations for doing so and anticipate other benefits for the work they perform (Hamzah et al., 2016), such as reward, interest, obligation (Ismail et al., 2014), and satisfaction (Zid et al., 2021; Gage III & Thapa, 2012; Pauline, 2011; Bang & Ross 2009). According to Lee et al., (2014) and Chua et al., (2021), positive attitudes towards volunteering will enhance the likelihood of working as a

volunteer even in the long term. Individual resources such as education level, good income, a secure job, a lot of free time, and good health also play an important role in volunteering (Musick & Wilson, 2008).

Volunteers are crucial for communities as they positively contribute to community development through numerous activities (Ferreira et al., 2012). According to Coursey et al., (2011), the choice of a volunteer activity is largely influenced by its compatibility with the individual's motivational palette, which is influenced by the sharing of values within social networks and extrinsic rewards, particularly personal development and long-term intentions of career advancement. People participate in volunteer work for a variety of reasons, including altruism, social contact, personal interest, emotional needs (Yeung, 2004), altruistic, ideological, egoistic, material or reward motives, status, social relationships, leisure, time (Fischer and Schaffer, 1993), values, understanding, enhancement, career, social, protection, social justice function, equality promotion, socialization, a sense of community, and official requirements to serve (Clary et al., 1998; Ferreira et al., 2012; Jiranek et al., 2013).

Studies have shown that voluntary work performed out of altruistic motives lasts longer than commitments resulting from egoistic reasons, and a variety of factors such as organisational support, volunteer satisfaction, social trust, self-esteem, self-efficacy, and well-being make volunteering more likely to be satisfying and sustainable (Stukas et al., 2014; 2016). As a result, it is critical to encourage volunteering for the positive development of a society by changing informal norms and attitudes that influence how people perceive and act on governing institutions and inspiring direct participation. It is a mutual relationship in which volunteers benefit local communities and volunteers benefit personally and professionally. All major components of social interaction connectedness, reliance, and mutuality among individuals, communities, and larger mediums; integration; and the sentiment of belonging to a group benefit from volunteering and have a positive impact on the personal level through knowledge, education, and skill acquisition (Foley et al., 2012).

Trust between volunteers and communities can have a significant impact on social capital (Wollbaeck & Selle, 2002). Volunteering also has the potential to help the social and emotional development of individuals in such areas as communication skills, problem solving, collaboration, and the development of career opportunities, as well as foster awareness (Abdul Rahman et al., 2020), enhance personal skill development, a sense of civic responsibility, career choice, and employability (Hall et al., 2009; Musick & Wilson 2008), and enhance human capital, which includes knowledge, skills, abilities, leadership opportunities, and work experience (Statham & Rhoton, 1986).

In addition, volunteering can lead to small shifts in gendered power relations for some women, manifested in increased confidence, social networks, and independence (Peach, 2011). Meanwhile, the young volunteers can be moulded into active leaders and useful citizens, develop positive social behaviours that can help reduce negative risk-taking, and prepare for employment and the transition to responsible adulthood (Hamzah et al., 2016).

Volunteering in Malaysia

Various efforts should be made to empower non-governmental organisations (NGOs) to influence civil society development processes. According to Kamal and Lukman (2017), volunteer retention and recruitment continue to pose a challenge to an organization. Therefore, appropriate voluntary activities must be developed according to the interests and needs of individuals. For example, the ASEAN Youth Volunteer Programme (AYVP) is a dedicated youth volunteerism platform that creates opportunities for knowledge-driven volunteerism, supports the exchange of learning experiences, develops capacity, enhances cross-cultural understanding, and forges a sense of regional identity while making a sustainable difference to communities across ASEAN, including China, Japan, and the Republic of Korea.

Meanwhile, Muslim Volunteer Malaysia and Islamic Relief Malaysia are independent international humanitarian aid organisations that serve as fundraisers and project implementers at the local and international level. On the other hand, Mercy Malaysia is an international non-profit organisation focusing on providing medical relief, sustainable health-related development, and risk reduction activities for vulnerable communities in both crisis and non-crisis situations.

All of these organisations clearly have different visions and missions that meet the differences in people's interests. Thus, the utilisation of new technologies, especially mobile platforms, through messaging services, social media, and various apps definitely can enhance volunteering and its effects on developing an ecosystem to support volunteering (Seelig & Lough, 2015). People's awareness can be increased through campaigns, volunteer ads, and supportive environments for participation, engagement, and volunteering. Since NGOs act as a bridge linking government support and community needs (Abdul Rahman et al., 2020), further collaboration and cooperation should be made to cultivate the culture of volunteering in society. Research on volunteering is also vital in helping NGOs, corporate organizations, communities, and the government develop better programmes in the future.

Numerous studies on volunteering have been conducted in Malaysia, including those that examining the factors that influence and motivate people to volunteer (Turiman et al., 2011; Maharam Mamat et al., 2018; Ismail et al., 2014), the challenges in voluntary work (Mohamad Kamaludin et al., 2013), empowering youth volunteerism and motivating factors (Sahri et al., 2013), altruism as motivational factors toward volunteerism among youth (Zaliha & Arshad, 2012), psychosocial factors that influence the volunteers to offer their services to the community (Surjit et al., 2005), the relationship between motivation and participation in volunteer work (Abdullah Sahimi et al., 2018), the relationship and correlation between the management and retention practices of volunteers (Bukhari et al., 2018), factors that motivates the retirees in volunteering (Surjit Singh et al., 2005), the benefits, needs, and reasons for volunteering among youth (Hamzah et al., 2016), and volunteers satisfaction and intention to continue volunteering Zid et al., (2021).

Methodology

To fulfil the purpose of the study, which is to see which aspects of education can be improved through the volunteering of non-governmental organisations (NGO) facing the COVID-19 pandemic in Malaysia, the methodology of this concept paper is based on library research. Selection of appropriate secondary materials: emphasis is placed on searching electronically through internet facilities for articles and reference materials online that meet the needs of the study. Through this method, every piece of material, such as journal articles, books, proceedings, and related official reports, related to the education issues of community development and the COVID-19 pandemic is collected to increase knowledge and improve understanding of the issue studied. The resources obtained through this method are very helpful in strengthening the information that is needed. After this secondary data is obtained and collected, the study continues by classifying themes based on content analysis techniques. The division of themes is determined by the suitability of the debate for the education issues that arise as a result of NGO volunteer tasks in the face of the COVID-19 pandemic, particularly in Malaysia. In the analysis of the content carried out, there are four themes discussed: introducing a lay counsellor, educating the community by raising public awareness about mental health care, raising awareness of family wellbeing issues, and practising strategic communication.

Discussion

The COVID-19 pandemic has had a huge impact on community development (Abiddin et al., 2022). This meta-analysis study will focus on the implications from the point of view of mental health issues, which is one of the branches of healthy community development. How do volunteers play their part to help the communities involved? As we can see, throughout the period of MCO implementation, various problems have occurred that affect the well-being of the community. The limitations due to these restrictions are certain and have created an atmosphere that induces stress, anxiety, and depression towards society in this country more widely across at-risk groups than under normal circumstances. Based on the Talian Kasih Report published by the Ministry of Development Women, Family, and Community (KPWKM), case records for the period of 18 March 2020 to 31 March 2020, which is during Phase I of the MCO, recorded 336 complaints on physical, mental, emotional, and sexual abuse and exploitation and neglect involving the categories of children, domestic violence, people with disabilities, and the elderly; and to get counselling services, which represents 47.3 percent of the 710 complaints after being dismissed with a complaint on welfare assistance applications and inquiries from 1,535 complaints, which represent a total of If society or the government fails to manage this stressful situation, it will weaken the immune system and interfere with the ability of the individual's body to overcome infection and disease, in addition to inviting the problems that have been mentioned before. Therefore, efforts to contain the spread of this epidemic at the micro level may also be slightly affected. As a result, the NGO has been tasked with dealing with these issues. There are NGOs that have taken some initiatives by creating an educational service for the community about the benefits of *lay counsellors*. Secondly, volunteers educate by raising public awareness about mental health care. Third, by educating the community about the importance of family well-being issues

during the COVID-19 pandemic. Finally, when dealing with the community, use strategic communication.

Lay Counsellors

For NGO groups, this initiative is very important in educating and producing more members of the public who can provide services by volunteering. With the right form and method of counselling assistance at the right level, the community can compensate for the current lack of counsellors. Thus, a total of 5,500 volunteers have been born through the Lay Program Counsellors implemented by KPWKM since 2015 and are targeted to reach 10,000 people in 2019. They need to be fully utilized, for example, by being absorbed as Sahabat Psychological Support Team (sPST) volunteers or other platforms. A database that is constantly updated and integrated with the system or other support programmes should also be established to avoid wasting the existence of lay counsellors in this country. The NGO's organisation is also advised to develop appropriate extension programmes to improve the knowledge and competence of this volunteer continuously, so they can be categorised as highly skilled volunteers. This was part of the NGO's volunteer role during and after the COVID-19 pandemic.

Educate Community by Raising Public Awareness About Mental Health Care

Most importantly, post-COVID-19 needs to be well managed to ensure that it does not interfere with a person's daily functioning. Individuals directly involved with COVID-19, such as victims, quarantined individuals, and health workers, are those who are most affected by this crisis, in addition to leaving a psychological impact on the general public. As a result, all volunteers and non-governmental organisations have taken proactive measures to avoid the worst-case scenario. Through various mediums, education that is concerned with mental health awareness has been given to the whole community all the time. From the time COVID-19 happened until the MCO ended, all the NGO's and volunteers made an effort to increase mental health awareness among the community through campaigns, talks, and group counselling, as well as a spiritual approach, in order to have a coping strategy (*coping skill*) for facing pressure.

Awareness of Family Wellbeing Issues

The COVID-19 pandemic is a global issue that is threatening family well-being and litigation. The COVID-19 outbreak is seen as a contributing factor to the stress in family institutions since the world has just identified the transmission of a killer virus and is still struggling with various related uncertainties. During the MCO period, all educational institutions involving all levels, including primary, secondary, and higher education institutions, have been closed. Children in nursery services are no exception. This situation has put pressure on parents because they have to be responsible in the aspect of children's education as well as ensure that aspects of home management run smoothly. Stress and emotions in parents' negativity also lead to abusive and potentially abusive parenting styles for children. Furthermore, the Ministry of Women, Family, and Community Development reports that there have been 1,929 complaints about cases of domestic violence that occurred

during the MCO period beginning March 2020. Domestic violence is most commonly reported when the perpetrator injures or physically harms the victim, which is then followed by intentional violence or attempts to put the victim in fear of physical injury, and the perpetrator commits psychological and emotional abuse against the victim. Realizing this, volunteers and NGOs try to increase a high level of understanding of the practise of philanthropy among the community, which is very important when the country is hit by the COVID-19 pandemic. This is because it can ensure that individuals who are less fortunate can be helped from an economic perspective. During this MCO period, many parties other than the government contribute funds to help individuals in need. This is evident when MyCARE Johor successfully raises RM6,300 from the general public, where with this fund MyCARE Johor was able to donate basic necessities for the target group in the south of the country. Besides, there are also individuals who voluntarily sew protective clothing (personal protective equipment, or PPE) to be distributed to all hospitals in Malaysia. Government bodies are also like PETRONAS, through which the PETRONAS Foundation has donated medical equipment and supplies worth RM20 million to help hospitals and healthcare frontline workers.

Practicing Strategic Communication

In a civilised society, voluntary activities reflect humanity. It is a pure bond that binds a person together with other individuals and fosters a sense of common purpose. Voluntary activities are an important basis in the effort to create a more inclusive society. a strong culture of volunteerism forming confident individuals, empowered communities, and a safe and friendly place to live; better service; local and national governments that are more responsive; and an economy that is more lively. Volunteering is one of the ways to strengthen relationships with others and get closer to the community. Volunteers can improve their interpersonal skills while also expanding their social networks and contacts. Volunteers use interpersonal skills to delve into the feelings or expressions of the community. When society is comfortable with volunteers, there will be trust in one another to tell the truth. Being friends with this group of people makes it easier for them to feel comfortable sharing problems. When para-volunteers began to serve the community as if they were friends looking out for one another, the community was more willing to accept the advice given as well as the various stories that could be unravelled and solved. In this way, it becomes an alternative and a facilitator to educate the community, and the objective of developing a more open society will be realized. The benefits obtained by volunteers when using an effective strategy are to create trust with the community and volunteers. Communication strategy is very important because the selection, setting, and use of effective strategies will benefit both parties. It will make the role of volunteers easier because the community's trust will make it easier for them to collaborate.

Conclusion

The spirit of volunteerism must be inculcated in every Malaysian citizen from the very beginning. This is because all parties will play an important role in the country's development as a potential leader and in determining its future national leadership. Everyone's involvement in volunteer activities brings various positive

benefits to society. The more active communities and volunteers who participate in activities such as this volunteerism, the more benefits the country will receive. The benefits of volunteering for the development of a society are a form of empowerment that can develop the people and the country overall.

Sociolinguistics, Faculty of Humanities, Ivane Javakhishvili Tbilisi State University, Georgia

 <https://orcid.org/0000-0003-2187-1297>

Abstract: The present study aims to investigate the socio- and applied linguistic functions and frequency of lecturers' language behaviors (code-switching (CS), code-mixing (CM), and translanguaging) in terms of showing lecturers' social identity in the Georgian educational discourse, namely, in teaching Business English (English for Specific Purposes - ESP) at the university level. An examination of Georgian discursive peculiarities is a novel addition to this field of research, as there are very few studies focusing on Georgian lecturers' language behaviors in English for Specific Purposes (ESP). Both quantitative (online questionnaires (70 students) and qualitative (8 lecturers' recorded lectures) research methods are used to illustrate the functions of using code-switching, code-mixing, and translanguaging in English for Specific Purposes (ESP) (lecturers' recorded lessons (80 hours). Surprisingly, in contrast to previous studies' findings, we found that the Georgian and English languages are equally used for informal and formal purposes. Both languages are used to express solidarity in classroom conversations. The given study is a unique example in which both English and Georgian are used as marked/unmarked ("We-code", "They-code") choices, as previous studies only considered L1 (first language) as "we-code" and a foreign language (English) was regarded solely as "they code." Within 80 hours of recordings (ESP), 549 cases of code-switching, 103 cases of code-mixing, and 177 cases of translanguaging, planned use of L1 (Georgian) were detected in teaching vocabulary. Consequently, using translanguaging can be beneficial to business English lecturers seeking to improve and fossilize students' Georgian business terminology. The business English lecturers consider the English language to be an inseparable part of their identity, however, they still incorporate the mother tongue in their lectures for encouraging the enhancement of the Business terminology in the Georgian language.

Keywords: ESP, Code-switching, Code-mixing, Translanguaging, Social identity

Introduction

This research studies Business English lecturers and their students across two Georgian state universities.

Business English (B2-C1 level) is taught as a compulsory course at Ivane Javakishvili Tbilisi State University and as an optional course (B1-B2 levels) at Ilia State University. The study combines both quantitative and qualitative research methods. The article will suggest a combination of psycholinguistic, sociolinguistic, and structural perspectives to provide a deeper explanation of language behaviors captured in the recorded lectures.

Moreover, this paper illustrates the co-existence of the competitive terms: translanguaging, code-switching, and code-mixing. The original use of translanguaging as a language behavior has two core aims: 1. For students to gain a deeper comprehension of the content; 2. For students to acquire both languages simultaneously since these languages represent inseparable parts of bilingual speakers' repertoire. There is no such notion as language, but 'lect', and idiolect is a subject of interest in translanguaging studies.

As for code-switching (code-mixing) behavior, it refers to the switching of languages depending on the purpose and environment of the communication within one conversation. Some unconscious switches, those which are not associated with comprehension and acquiring knowledge, can be found in the educational discourse.

The research questions are the following:

1. What are the sociolinguistic functions of using code-switching, code-mixing, and translanguaging in English for Specific Purposes (ESP) context (based on the data collected in two state universities in Tbilisi)?
2. What is the structural representation of code-switching, code-mixing, and translanguaging in English for Specific Purposes (ESP) context (based on the data collected in two state universities in Tbilisi)?
3. What are the attitudes Georgian lecturers and students have toward lecturers using L1 (Georgian) in business English classrooms?

The structure of the paper follows the three WH-questions: what (the terminological clarification of the words: translanguaging, code-switching, code-mixing, diglossia, borrowings, how (theoretical framework: a description of quantitative and qualitative methods used in the study), and where (discourse, in our case, teaching ESP – Business English).

Code-switching and its related vocabulary

The term 'code' has been widely observed. In sociolinguistics, 'code' is employed in both a general (i.e., system of signs) and specific (i.e., dialect and register, etc.) sense. Code refers to the language and a variety of languages that are transmitted by different groups in social situations (Swann, 2004). Swann suggests a broad understanding of code (the language and a variety of a language). A language variety, also called a 'lect', is a specific form of a language or language cluster, which may include languages, dialects, registers, styles, or other

forms of language, as well as a standard variety.

Based on the definition of the term code (general/specific), the definition of code-switching is determined. According to Myers-Scotton, code-switching is the use of two or more languages in the same conversation usually within the same conversational turn or even within the same sentence of that turn (Myers-Scotton 1997:47). Mayers-Scotton suggests the general understanding of the word code, which refers to language (i.e., Georgian, English, etc.).

There are other terms used in the scientific literature concerning code-switching; these are code-mixing, translanguaging, diglossia, and bilingualism. This article will discuss the terminological distinction between the above-given terminologies.

Table 1. Terminological definition of code-switching related words

Code-mixing	Wardhaugh (1986:103) suggests that code-mixing occurs when conversants use both languages together to the extent that they change from one language to the other during a single utterance. It means that the conversant just changes some of the elements in their utterance. Code mixing takes place without a change of topic and can involve various levels of language, e.g., morphology and lexical items.
Translanguaging	Translanguaging is the use of the full linguistic repertoire “without regard for watchful adherence to the socially and politically defined boundaries of named languages”. - Oftentimes, it is assumed that bilinguals have one dominant language, and thus there is a hierarchical relationship between their known languages (García et al 2017).
Borrowing	It has been claimed that from synchronic examination [i.e., without comparative or etymological evidence] no loans are discoverable or describable (see Fries and Pike, 1949, see also Haugen, 1950a, Weinreich 1953) presumably because they are perfectly assimilated to the recipient language patterns (Poplack and Sankoff, 1984).
Diglossia	A state of “being bilingual”. A situation, in which a community uses two different languages or varieties of a language for different situations (high variety and low variety).

The distinctions between code-switching and borrowing are vivid since borrowed words do not have an equivalent in the recipient language and become perfectly assimilated into it. On the contrary, code-switching and code-mixing may represent better versions of the existing units or fill the lexical gap in the recipient language. Importantly, they never become fully assimilated to the receiver (language).

Code-switching and code-mixing are also easily distinguished since one represents the switch on the intersentential (between sentences) level and the other intrasentential (within the sentence) which may involve

morphology and lexical items.

Diglossia is a situation in which two languages or two varieties of one language have their status (high, low). On the one hand, there is a standard language, which is used in education and literature, for official documents, etc. On the other hand, there is a low variety of language, which is only used in oral discourse and used as a standard language. The perfect example of diglossia is Arabic languages, standard Arabic and Arabic dialects, which are never used interchangeably. Communities living in such diglossic situations are bilingual.

There is considerable confusion surrounding translanguaging, as it can be an all-encompassing term for diverse multimodal and multilingual practices, which have traditionally been described as code-switching, code-mixing, code-meshing, and crossing.

There are two views of teaching languages in the classroom. The conventional view represents the process when two languages are generally taught as two isolated systems. The focus has tended to be historically on the structure of those languages, i.e., vocabulary, grammatical structure, and so on. But most people, who live in bilingual and multilingual parts of the world, engage in practices where they borrow words from one language that pop them into the language that they are using.

Table 2. Conventional versus Contemporary Views

Code-switching and translanguaging	
Conventional view:	Contemporary view:
<ul style="list-style-type: none"> • Two languages are taught as separate entities (Lambert, 1991). • Focus on form (structure – lexis, syntax, 4 skills) • Code-switching and code-mixing are regarded as illegitimate practices. • Code-switching is the alternating use of chunks (clauses, sentences, paragraphs) of two or more languages. • Code mixing, usually inserting/including one or two words here & there from a second language into the predominant use of one language. 	<ul style="list-style-type: none"> • two languages, part of the student’s repertoire (bilinguality/multilinguality) (Agnihotri, 2007), • Focus on (social) process – ‘languaging’ (Swain, 2006), ‘translanguaging’ (Garcia, 2009). • Increasing awareness of what bilingual learners do to make meaning. • Reappraisal of the role of translation and Interpreting.

Translanguaging is using language as a unitary meaning-making system of the speakers. It is characterized by bilingual speakers. Languages are not perceived separately in translanguaging, rather they are seen from speakers' perspective as a language repertoire, from which they select features that are appropriate to

communicate. In Pedagogy, translanguaging is used as an approach to make the context better understandable with the help of using bilingual speakers' (students') repertoire.

The concepts of translanguaging and code-switching using bilingual classrooms are often confused. However, they can be distinguished in terms of language interference and individuals involved in language practice.

There are several distinctive features between these two terms: Garcia and Wei (as cited in Molina & Samuelson, 2016) think that code-switching is seen as the process of changing two languages, whereas translanguaging is about "the speakers' construction that creates the complete language repertoire" (Molina & Samuelson, 2016: 3).

Table 3. Terminological Distinctions between Code-switching and Translanguaging

Translanguaging	<ul style="list-style-type: none"> • An existing controllable cognition (bilinguals know what they are saying while producing words in both languages) • analyses "how bi/multilingual individuals are involved in their linguistic practice" (Hornberger and Link, 2012: 267) • focuses on learning both languages at the same time without separating (Lewis, Jones, and Baker, 2012)
Code-switching	<ul style="list-style-type: none"> • "Changing languages within a single conversation"(Baker & Jones, 58) (bilingual individuals shift between two or more languages, which depend on the purpose and environment of the communication) • Has been considered a linguistically incompetent ability • searches for "language interference and transfer" (Hornberger and Link, 2012: 267) • According to Lewis, Jones, and Baker (2012), code-switching practices the notion of separate languages.

Thus, code-switching is seen as the process of changing two languages (1. using at least a clause in a sentence in one language and switching over to a new one, then developing a second clause, a subordinate clause in the second language; 2. one sentence in one language and then, alternating with one sentence in the second language; 3. speaking for five minutes in one language or writing a paragraph in one language and switching over and writing or speaking in the other language) for deliberate purposes, whereas translanguaging is about perceiving languages as unitary meaning-making systems, bilingual repertoire.

Translanguaging has been studied in bilingual and multilingual societies (Garcia, 2009; Wei, 2011). It must be said that the term translanguaging was originally intended to be a descriptive label for a specific language practice. It was Baker's (2001) English translation of Williams's (Williams, 1994) Welsh term 'trawsieithu', to describe pedagogical practices that Williams observed in Welsh revitalization programs, where the teacher would try and teach in Welsh and the pupils would respond largely in English. William suggested that they help

to minimize the learners' and the teacher's linguistic resources in the process of problem-solving and knowledge construction.

Wei (2017) elaborated on two related concepts translanguaging space and translanguaging instinct to bridge the artificial and ideological divides between the so-called socio-cultural and the cognitive approaches to translanguaging practices. Current studies use the notion of translanguaging since both sociocultural and cognitive (acquiring language through bilingual communication) aspects of using L1 versus target language in the Business English classes. In terms of code-switching and code-mixing behaviors, we are interested in the sociolinguistic and psycholinguistic aspects of using L1 in the same context.

Method

Both qualitative and quantitative studies were used to better illustrate the core aim of the given paper. On the one hand, we analyzed Business English lectures recorded via the Zoom platform. On the other hand, two questionnaire forms were filled out by eight lecturers (teaching Business English) and their students (taking Business English courses) from two state universities (Ivane Javakishvili Tbilisi State University and Ilia State University). The participants are randomly chosen for both, quantitative and qualitative studies, the questionnaires were sent to as many students and lecturers as possible via platforms (argus.iliauni.edu.ge; LMS.tsu.ge) which are used in the above-mentioned universities. We asked 11 lecturers to record their Business English lectures, however only 8 complied with our request.

The quantitative data was collected with the help of Google forms from 70 students (taking Business English course) and from eight teachers who recorded the Business English lectures (80 hours overall, 10 hours, 5 lessons each). As for the qualitative data, 80 Zoom lectures were transcribed with the help of online software (otter.ai). The lecturers' moments of switching from the target language (English) to L1 (Georgian) were analyzed by using conversational analytics (CA) (Auer, 1988), interactional sociolinguistic (IS) (Bailey, 2015), and contextualization cues (Gumperz, 2002) methods. According to the CA approach, language choice and turn-taking define the teachers' attitudes toward each language. A change in register and implicature (IS) signifies the language identity. Lecturers' language choice is also determined by their identity ("we-code and "they-code"); Employing the structural analysis in our research qualitative data is also illustrated quantitatively.

Results and Discussion

Translanguaging cannot fully have the same usage in multilingual classrooms (knowing more languages than a native one) as it has among bilingual speakers (people naturally have an inborn ability to speak two languages). This research focuses on cases in which the monolingual approach is a dominant teaching method for Business English. Thus, some elements of translanguaging are included together with code-switching and code-mixing behaviors.

Business English is the most popular field of interest in teaching English for specific purposes (ESP) due to several reasons. First, business administration has become one of the most demanded professions in Georgia. Across Georgia's higher education institutions, from 6000 to 7000 (21-22%) of BA students study at the faculty of Business Administration based on the statistical data of 2018-2022. Second, English, in addition to being a lingua franca, obtained a function of code used in business communications worldwide; therefore, a specific English terminology bank is formed, and equivalent terms may not be found in other languages. Thus, the paper is focused on Business English (ESP), rather than English as a foreign language (EFL).

Qualitative research

Eight participant Business English lecturers were categorized in the following way: their demographical data, their attitude towards the English language, and functions of using L1 in their Business English classes. The demographic values are illustrated in the table below.

Table 4. Demographical Data of the Research Participants

Business English lecturers	Age	Gender	Place of birth	The highest level of Education they have	Their mother tongue	The language they use with their family members
Teacher 1	41-45	F	Georgia	MA	Georgian	English
Teacher 2	41-45	F	Georgia, Tbilisi	Ph.D.	Georgian	Georgian
Teacher 3	36-40	F	Georgia, Tbilisi	MA	Georgian	Georgian
Teacher 4	31-35	F	Georgia, Tbilisi	MA	Georgian	Georgian
Teacher 5	31-35	F	Georgia, Chiatura	MA	Georgian	Georgian
Teacher 6	56-60	F	Georgia, Sokhumi	Ph.D.	Georgian	Georgian
Teacher 7	36-40	M	Georgia, Tbilisi	MA	Georgian	Russian
Teacher 8	21-30	F	Georgia, Tbilisi	MA	Georgian	Georgian

The table shows that most of the lecturers (4 out of 8) surveyed are from 31 to 40 years old and were born in Tbilisi, Georgia. Only one lecturer is male. Most of them (6 out of 8) have MA degrees. Most individuals speak Georgian with their family members but two use either English or Russian.

Based on our survey two lecturers work at Ilia State University, while six work at Ivane Javakhishvili Tbilisi State University. Six out of eight lecturers believed having a good command of English is very important and seven out of eight lecturers considered the English language as an important part of their identities. All eight

participants claimed that they use and prefer to use either only English or a combination of English and Georgian languages. None of them prefer nor use only Georgian in their Business English classes.

Based on the recorded Business English lectures (80 hours), we managed to identify the functions of using lecturers' code-switching and code-mixing language behaviors and to single out the translanguaging moments. The paper aimed to structurally analyze and categorize the parts of speeches found in lecturers' code-switching and code-mixing examples.

Within the 80 hours of recordings (ESP), 549 cases of code-switching, 103 cases of code-mixing, and 177 cases of translanguaging were used by the Business English lecturers. These three language behaviors are analyzed separately. All five translanguaging behaviors found in the recordings had comprehensive functions, lecturers used them namely for Business English vocabulary clarification purposes code-switching and code-mixing language behaviors had almost similar functions:

- to give instructions
- to explain difficult concepts
- to explain grammar explicitly
- to check for comprehension
- to introduce unfamiliar materials/topics in Business
- to explain the differences between the students' L1 (Georgian) and English
- to draw students' attention to the correct pronunciation of sounds in English
- to maintain classroom discipline and the structure of the lesson
- to provide praise/feedback/personal remarks about students' performance
- to encourage student's participation in classroom activities
- to build/strengthen interpersonal relationships between the teacher and students
- to reduce students' anxiety in learning Business English
- to increase students' motivation and confidence in learning Business English

Table 5. The Structural Stratification of the Given Language Behaviors

Structural forms:	English for Specific Purposes (Business English)
Paragraph	Code-switching (16); Translanguaging (21)
Phrase	Code-switching (14) Translanguaging (2)
Collocation	Code-switching (3); Translanguaging (4)
Idioms	Code-switching (0); Translanguaging (0)
Participle	Code-mixing (1)
Noun	Code-mixing (12); Translanguaging (2)
Adjective	Code-mixing (4); Translanguaging (1)
Numeral	Code-mixing (2)

Adverb	Code-mixing (17)
Verb	Code-mixing (31)
Particle	Code-mixing (25)
Interjection	Code-mixing (4)
Conjunction	Code-mixing (2)

Structurally, there were dominant parts of speech found in the recordings. Code-mixing and translanguaging behaviours are categorized to show the quantity of each part of speech in the lecturers' language repertoire.

In terms of code-switching and translanguaging, L1 is used mostly in the form of a paragraph, while code-switching is mostly presented as a verb.

Sentences were classified according to their content.

Table 6. Classification of Sentences found in the Business English Teaching Context

Types of sentences:	English for Specific Purposes
Declarative Sentence	Overall: 243 Code-switching (154); Translanguaging (90)
Interrogative Sentence	Overall: 127 Code-switching (113); Translanguaging (14)
Exclamation Sentence	Overall: 111 Code-switching (92); Translanguaging (19)
Interrogative-exclamatory Sentence	Overall: 103 Code-switching (85); Translanguaging (18)
Imperative Sentence	Code-switching (31)
Negative Sentence	Overall: 44 Code-switching (38); Translanguaging (6)

Declarative sentences are the most, while the negative sentence type is the least used.

Some examples are discussed in this section of the paper: code-witching, code-mixing, and translanguaging.

Notes:

// - Pause 0.5 seconds and more

= - a direct link between sentences

[] – speeches coincide

, - hesitation

? - rising tone

. - falling tone

— - Georgian sentences are underlined

() - English Translation

Example 1/01:28 (code-switching)

Topic: Reading (Problem Solving); Grammar (Past modals)

Function: (1) (2) to solve the problem created in the process of lecturing: interrogative

S: მიჭედავდა და ხმა კარგად არ მესმის./mitchedavda da khma kargad ar mesmis. (It was stuck and I barely hear the voice.)

T: (1) არ ისმის ახლა ჩემი ხმა?/ar ismis akhla chemi khma? (?) (Can you hear my voice, now?)

S: ახლა კი, არ ვიცი რატომ ჭედავს./akhla ki, ar vitsi ratom tchedavs. (now yes, I don't know why it is unstable)

T: (2) უი, რატომ?/ui, ratom? (?) (oh, why?)

This example shows the pitfalls of online learning. e.g., interruptions caused by weak internet connection. As can be seen from the example, both sides use the Georgian language, consciously or unconsciously, in order to quickly eliminate the mentioned problem. The choice of the Georgian language by the lecturer is determined by the students' language choice.

Example 2/1:38:37 (code-mixing)

Topic: Writing (Minutes)

Function: Greetings/Farewells

T: Okay, I guess you have no questions, would you like to, I don't know, say something before we say goodbye?

Ss: (silence)

T: okay, then guys, have a nice day. Have a nice weekend and see you next week.

Ss: Thank you, Okay, goodbye.

T: Okay, bye,

S: goodbye,

T: ნახვამდის/nakhvamdis (goodbye).

The example shows a change in register, namely the English language is used either formally (would you like to, goodbye) or informally (guys, bye, okay). The Georgian is used formally (ნახვამდის/nakhvamdis (goodbye)). The function of the example is seeing off in the form of interjection.

Example 3/1:22:33 (Translanguaging) (Code-switching) (Code-mixing)

Topic: Vocabulary (Law)

Function: Code-switching - (1) (2) (6) (7) to check for comprehension, to ask, to inquire so that the students answer by themselves.

Code-mixing (3) to ask, to inquire so that the students answer by themselves.

Translanguaging - (4) (5) (8) to explain difficult concepts

T: Okay (.) (1) ახლა, რამე სიტყვები რაც თქვენ გახსოვთ აქედან?/akhla, rame sityvebi rac Tqven gakhsovT aqedan? (now any vocabulary items you remembered from the task?)

S1: Excruciating

T: (2) რა არის ეგ?/ra aris eg? (what does that mean?)

S1: მტანჯველი/mtanjveli (gives a Georgian definition of the word)

T: yeah! = (3) კიდევ?/kidev? (what else?)

S2: trepidation?

T: (4) რადაც ოსეთი/raghats iseti (something like) = trepidation. So, you, you feel trepidation (.) (5)

რადაც/raghats (something) excitement-სავითარი ხო?/excitement-saviTari kho? კიდევ?/kidev? (like excitement, isn't it? what else?)

S2: incredulously,

T: Yeah, (6) კარგი სიტყვა არის. კიდევ რა, ვის რა აქვს?/kargi sityva aris. Kidev ra, vis ra aqvs? (it is a nice word, what else, what else do you have?)

S3: vigor

T: vigor! = (7) რა არის გ (student's name) vigor? /ra aris G = vigor? (G (student's name) what is vigor?)

S3: ძალა!/Dzala! (power!)

T: (8) ენერჯია ხო? სხვათაშორის vigor არ არის მარტო ენერჯია, ეს არის ფიზიკური ძალაც და აი, ჯანმრთელი რომ ხარ./energia kho? Skhvatashoris vigor ar aris marto energia, es aris fizikuri dzalats da ai, janmrтели rom khar. (Energy, right? Vigor is not only energy, but also physical power and, like being healthy.) = You are vigorous and full of energy.

This example incorporates all language behaviors. Translanguaging is used to clarify the meanings of the unknown terms; With the help of using translanguaging, lecturer tries to teach his or her students the business terms, both in Georgian and English. Code switching is used to check for comprehension (რა არის ეგ? /ra aris eg? (What does that mean?)). Code mixing is used by the lecturer to make his or her students talk. The example can be analyzed with the help of CA (lecturer encourages his or her students to use Georgian).

Quantitative research

Participants: 70 BA Students, taking a Business English course, from Ivane Javakhishvili Tbilisi State University and Ilia State University.

Quantitative research aims to answer the following research questions: 1. What is the correlation between Business English students' sex and their identity; 2. How Business English students' English language competence is correlated with their identity; 3. How functions of using L1 (Georgian) by lecturers are determined by students' identity, sex, and English language competence.

- 86% of Business English students believe that the English language is part of their identity. Only 14% of students surveyed believe that the English language is not part of their identity and consider it only as means of communication.

- (No difference in Gender - Fisher's Exact Test = .543, Pearson Chi-Square =.733).

- In terms of Identity, there is no difference in results between students born in Tbilisi and the regional

parts of Georgia. (Fisher's Exact Test = .484, Pearson Chi-Square = .695).

Business English Students want their lecturer not to use the Georgian Language, but to reinforce using the English language for expressing the following functions:

- to explain the differences between the students' L1 (Georgian) and English
- to encourage student's participation in classroom activities
- to build/strengthen interpersonal relationships between the lecturer and students
- to reduce students' anxiety in learning Business English
- to increase students' motivation and confidence in learning Business English

Please use 10-point font size. Please margin the text to the justified. Manuscripts should be 1.5 times spaced. Footnotes and endnotes are not accepted. All relevant information should be included in main text. Do not indent paragraphs; leave a 1.5 times space of one line between consecutive paragraphs. Do not underline words for emphasis. Use italics instead. Both numbered lists and bulleted lists can be used if necessary. Before submitting your manuscript, please ensure that every in-text citation has a corresponding reference in the reference list. Conversely, ensure that every entry in the reference list has a corresponding in-text citation.

Conclusion

Based on both, quantitative and qualitative research methods, we came to the following conclusions:

In the Georgian educational discourse, within 80 hours of recordings (English for Specific Purposes (ESP), 549 examples of code-switching, 103 examples of code-mixing, and 177 examples of translanguaging were found.

The language behavior examples are classified according to the structural forms and sentence types. Overall, the most spread ones are a paragraph and declarative sentence type.

The lecturers' frequently-expressed functions of code-switching and code-mixing behaviors are (1) to explain the differences between the students' L1 (Georgian) and English; (2) to encourage student's participation in classroom activities, and (3) translanguaging – to explain the specific Business term.

All participants (8 lecturers) claimed that they use and prefer to use either only English or a combination of English and Georgian languages. None of them prefer or/and use only Georgian in their Business English classes.

Even though the Georgian lecturers have a conventional view of teaching a foreign language, English wasn't the only language used in their Business English classes. The use of the first language (L1- Georgian in our case) was also detected in their recorded lectures.

Although there is a considerable amount of L1 (Georgian) used by the lecturers in the Business English classes, still English was the dominant language of instruction used by the lecturers to show their positive attitude towards using it.

The majority of Business English students (86%) believe that the English language is part of their identity. Only a few (14%) of them consider it only as means of communication. Regarding attitude, there is no difference in Gender (Fisher's Exact Test = .543, Pearson Chi-Square = .733).

Considering students' identity there is no difference in results between students born in Tbilisi and the regional parts of Georgia. (Fisher's Exact Test = .484, Pearson Chi-Square = .695).

Students' attitudes toward lecturers using L1 (Georgian) are far more negative than the lecturers themselves in the Business English classes. Although there is a considerable amount of L1 (Georgian) used by the lecturers in the Business English classes, English was still the dominant language of instruction used by the lecturers to show their positive attitude towards using it.

In brief, using translanguaging in the Business English teaching context can have a positive outcome and result in reinforcing not only the business terminology in English but also its equivalents in Georgian. The English language being part of the lecturers' social identity can help them contribute to the betterment of the business field in the Georgian language.

Recommendations

The future perspective of this study is observing students' language behaviors found in the recordings. As for the applied linguistics, the productivity of using L1 by the lecturers and their students would also play a role in the development of the business English teaching methodology.

Abstract: Cognitive model of the antecedents and consequences of satisfaction decisions in Malaysia medical tourism context cannot be ignored by applying the concept to become a new scope of a marketing strategy to increase and integrate medical tourist revisit interest to Malaysia. Objectives include (a) investigating the factors that influence medical tourists' perception on satisfaction in their intention to revisit Malaysia's hospitals; (b) determining the relationship between perceived value, perceived authenticity, and destination image in relation to the perception of satisfaction; (c) investigating if employee attitude has an indirect effect on perceived satisfaction towards revisit intention; (d) proposing the moderation role of perceived satisfaction in the relationship between the extended factors (perceived authenticity, perceived value, and destination image) of continuity and medical tourist revisit intention; and (e) to validate the extended determinants of the medical tourists' revisit intention model in the context of Malaysia. All suggested paths based on previous related studies This study adopted a quantitative research method, data will be collected through a survey questionnaire. SEM – PLS will be used to analyze the collected data. The study sample will be selected based on a probability sampling that focuses on medical tourist's that have visited Malaysia medical hospitals. The study is expected to pave opportunity to expand previous studies by exploring the moderating role of satisfaction in the relationship between employees' attitude, perceived authenticity, perceived value, and destination image towards medical tourist intention to revisit.

Keywords: Medical tourism, Revisit intention, Value, Authenticity, Satisfaction, Attitude, Destination image

Introduction

The healthcare providers in Malaysia excelled in cardiology, oncology, fertility, orthopaedics, and cosmetic surgery with patients mostly from Indonesia, China, and Indochina (Vietnam, Cambodia, Myanmar). Meanwhile, Malaysia's medical tourism revenue is estimated at RM800 million in 2020, compared to RM1.7 billion revenue posted in 2019 (Mohd Daud Mohd Arif of Malaysia Healthcare Travel Council). However, due to the interruption of Covid-19 pandemic, Malaysia aims to generate RM650 million in revenue from the medical tourism industry in 2021, assuming the country opens its borders for international travellers by the fourth quarter of the year, according to Malaysia Healthcare Travel Council (MHTC). Forecast on the international tourist arrivals in Malaysia from 2010 to 2025 (in millions) report projected that international tourist arrivals in Malaysia will hit again reach 27.23 million by 2025 as achieved in the year 2014 with 27.44million (Degenhard, 2021). However, the forecast has been adjusted due to the expected impact of COVID-19 (Degenhard, 2021). In addition, Transparency Market Research (2017) forecasted that medical tourism in Malaysia would grow at a compound annual growth rate of 30.1% per annum from 2016 to 2024 and that revenue would increase to US \$3.5Million (RM14) billion by 2024. These estimates have now been revised downwards because of the COVID-19 pandemic (Narayanan & Wah, 2021). With the uncertainty, medical tourism sectors must establish strategies and employ new strategies application in current business models (Lipiäinen, 2014), which would lead to an increase in medical tourists' visiting and revisit Malaysia Medical hospital as their option of medical tourism destination. Previously, studies have focused on promoting the visit intentions of medical tourists to the destination, but those that focus on the moderating effect of satisfaction in the relationship between cognitive model of the antecedents and consequences of satisfaction decisions and medical tourist intention to revisit in the context of Malaysia are limited.

Problem Statement

Thus, this study aims to investigate the factors that may lead to high revenue attaining and provide consistent medical tourist increase to Malaysia medical tourism industry. This study explore how medical tourists revisit intention will enact the existing medical tourism research variables. The study will allow to determine if adaption of Cognitive model of the antecedents and consequences of satisfaction decisions and extended factors assume to support the medical tourism capability to increase medical tourists' revisit intention to destination. Theory of cognitive model of the antecedents and consequences of satisfaction decisions base in this current

study is aligned with satisfaction behavioural intention by Oliver's (1980) factors, which has been widely adapted (Harasis, Qureshi, & Rasli, 2018; Piehler, Wirtz, & Daiser, 2016; Solomon Oluyinka et al., 2022; Chen, Chen, & Lee, 2013; Huang & Hsu, 2009). The explored the creation of an enhanced model for continuance with respect to information system (IS) through the concepts of expectation- confirmation models.

The theory is considered relevant because it includes disconfirmation, satisfaction, expectation attitude, and behavioural intention in this current study. Meanwhile, previous studies have revealed that perceived value, satisfaction, and destination image and employees' attitude, as well as perceived authenticity, are common determinants towards revisit intention (Cham, 2016; Cham *et al.*, 2021; Manaf *et al.*, 2015; Maryam Fard *et al.*, 2021; Mohammad Jamal *et al.*, 2020; Rahman, 2019; Rahman & Zailani, 2016; Sultana *et al.*, 2014, Khan *et al.*, 2020; Lim *et al.*, 2017; Ismail *et al.*, 2018; Irimiás & Volo, 2018; Mihaela, 2015; Shivany, 2013). And studies affirmed that there is a relationship between destination image and perceived satisfaction towards tourist decisions on destinations (Mohaidin *et al.*, 2017; Mun *et al.*, 2015; Shafiee *et al.*, 2016).

These literature findings provide justification for further research into the moderating role of satisfaction in the relationship between perceived authenticity, perceived value, and destination image towards the revisit intention of medical tourists. Disconfirmation is one aspect of the Cognitive model of the antecedents and consequences of satisfaction decisions that was not considered since none of the previous studies utilized it. It could also be interchanged with perceived authenticity (Choi, Ramaprasad & So, 2021). Nevertheless, conceptualized framework for this study is demonstrated in Figure 1.

Revisit Intention

A medical tourist **revisit intention** represents a dependent variable in this study Because revisit intention is regarded as an extension of satisfaction. When tourists derive pleasant feelings from a tourism destination, they will probably be satisfied with that place, leading to an increased intention to revisit (Ayodele Abubakar et al., (2017); Khasawneh & Alfandi, 2019; Stylos *et al.*, 2016). In addition, Zhang *et al.*, (2014), revealed that revisit intention signifies customer loyalty and further explained that in the service industry, more than five per cent of the upsurge in retention of customers will yield 85 per cent additional profit based on their satisfaction level.

Perceived authenticity

Perceived authenticity, in general, is an indistinct concept that is term as interpreted diversely in different fields (Yu Chiang Lin & Yun Chiao Liu 2019). authenticity was firstly introduced by Dean McConnell, giving meaning to authenticity as a means of identifying what the customers want. The authenticity of Malaysia medical healthcare must meet the conditions of “integrity” and/or “authenticity” and be of “outstanding universal value. Nonetheless, authenticity and integrity are useful guiding concepts in striving for a systematic approach to preservation in diverse contexts (Domínguez-Quintero et al., 2018).

Perceived value

Perceived value is understood as a customer perception based on cognitive behavior such as an individual's feelings in respect to what customer expects or gains from services or purchase of products (Dodds, 1991; Hsu *et al.*, 2010; Songshan Huang & Hsu, 2008; Klijs *et al.*, 2016; Nilashi *et al.*, 2019; Ormond & Sulianti, 2017; Rahman, 2019; Shima *et al.*, 2016; Shivany, 2013). In this study, perceived value refers to as overall assessment by medical tourist on the perceived medical services either monetary or non-monetary value received, and its quality of available facilities at the destination. Medical tourism and medical healthcare services in Malaysia, medical tourist is expected to received value for both tangible and intangible measure such as monetary and or non-monetary aspect.

Destination image

Destination image in the mind of the visitors plays a vital role in their travel purchase decisions, and subsequently it stimulates their revisiting intentions (Cham, 2021; Cham *et al.*, 2021; Crooks *et al.*, 2011; Ganguli & Ebrahim, 2017; Lim *et al.*, 2017; Mohaidin *et al.*, 2017; Nilashi *et al.*, 2019; Rahman, 2019). Some studies agreed that the main elements considered by visitors in a destination are natural and scenic resources, accessibility, cultural resources, security, nightlife and entertainment, and quality/price ratio (Bigné *et al.*, 2001; Chen & Tsai, 2007; Chi & Qu, 2008; Shafiee *et al.*, 2016). Heydari *et al.*, (2021); Milman & Pizam (1995); Mohammad Jamal *et al.*, (2016) explained that destination image has three consisting components, namely: the product, for instance, the quality of the attraction; the second is the behaviour and attitude of the destination hosts, and; thirdly, the environment such as weather, scenery, and facilities. In the case of Malaysia medical tourism destination image, the positive destination image in the mind of medical tourist is important to achieve the confidence that could lead to medical tourist revisit to the Malaysia healthcare

Employee attitude

Examining the impact of **employee attitude** on customer's decision within an unprecedented competitive environment is crucial for sensitizing employees to recognize their essential role in customer satisfaction within an instance of improving or providing adequate relevant information, communication, commitment and interaction that could influence medical tourist revisit intention (Rodrigues., *et al.*, 2017; Heydari Fard *et al.*, 2021; Agyeiwaah & Dayour, 2021; Huang & Hsu, 2009; Agyeiwaah & Dayour, 2021). While examining the role of employee attitude in relationship to medical tourist revisit intention, the study underpin Oliver's 1980 cognitive model of the antecedents and consequences of satisfaction decisions to explain customer attitudinal loyalty through employee attitude fully but more so helps to understand the significant role of employees' attitudes. This is pertinent for managers to make effective changes to the service climate to improve employee performance and customer satisfaction.

Perceived satisfaction

Extensive research has been conducted to examine tourist satisfaction and tourist intention to revisit destination (Mohaidin *et al.*, 2017; Rahman, 2019). The question is how does this **perceived satisfaction** is important to this study? Perceived satisfaction is generally reflecting the individual’s “medical tourist” overall judgement or perception of performance on product or services in relation to expectation (Sunny and John, 2014; Albert Caruana *et al.*, 2012). However, with an extensive research study conducted from the previous studies on perceived satisfaction (Bruno Miguel Sousa, 2019; Cham *et al.*, 2016; Cham, 2021; Manaf *et al.*, 2015; Chi & Qu, 2008). Exploring moderating effect of perceived satisfaction between antecedent factors particularly in terms of medical tourist revisit intention need more limelight. In the case of Malaysia, perceived satisfaction by medical tourist is important to the medical tourism healthcare not just for the purpose of making profit but, also, for the purpose of aspiration by the Malaysian government to make the sector most service value chain, this assertion gave more reason to project and campaign positively for medical tourist intention interest to revisit the destination.

In all indications from the literature evidence, the medical tourism research studies that explore and analyse the above explained factors on medical tourist revisit intention are uncommon, and convincingly, study that explore perceived satisfaction as moderator variable to moderate between explained variables and medical tourist revisit intention is considered new. The value expected from a medical destination is paramount. Therefore, the conceptual model of this study is proposed (as seen in **Figure 1**). The proposed model will test perceived satisfaction and medical tourist revisit intention concurrently. The model will test the moderating effect of perceived satisfaction indirect relationships between independent variable and medical tourist revisit intention.

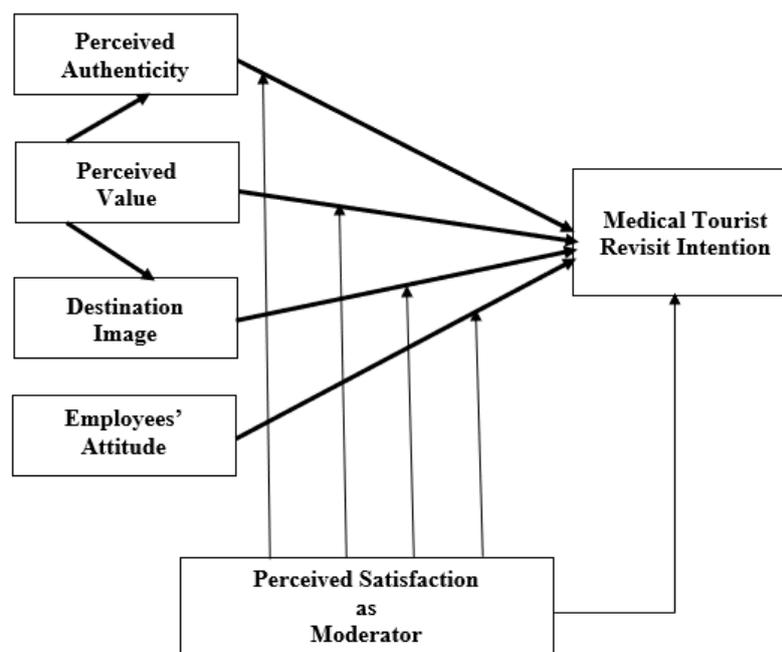

Figure 1. Proposed Conceptual Model

The relationship between perceived satisfaction and the other four independent factors towards revisit intention. In addition, satisfaction perception suggested considered as a moderator towards explain medical tourist revisit intentions to hospitals in Malaysia demonstrated in **Figure 1**, the conceptual framework of this study. Nonetheless, related studies to each construct and their attributes shall be discussed while developing the hypotheses related the constructs. In a nutshell, we developed constructs for this proposed study based on the Cognitive model of the antecedents and consequences of satisfaction decisions (Oliver, 1980) and Heydari Fard *et al.*, (2021) determinants of medical tourists' "revisit intention."

Method

The nature and method scope of this study, in general, is to adopt a quantitative research method aimed at applying hypotheses as a means of testing. Aforementioned that this study will adapt the Cognitive model of the antecedents and consequences of satisfaction decisions (Oliver 1980) and determinants of medical tourist's revisit intention model (Heydari Fard *et al.*, 2021). The cognitive model explains the expectancy is a precursor of attitude. expectancy and disconfirmation as precursors to satisfaction, and attitude will influence behavioural intention and confirmation (Oliver, 1980; Liao *et al.*, 2009). Perceived value influences perceived satisfaction towards revisit intention (Heydari Fard *et al.*, 2021). The current models suggested perceived authenticity, perceived value, destination image and employee attitude and perceived satisfaction as moderator. These variables have been validated in the field of IS and social sciences to investigate behavioural intention. Meanwhile, this current study is limited to investigating the relationship between perceived authenticity, perceived value, destination image and employee attitude while perceived satisfaction will moderate the variables mentioned in relation to medical tourist revisit intention.

Prospective literature was referred to from several sources such as government agencies and associations, professional data, publications on tourism management, information social science studies, related methodology and analytical techniques, and frameworks considered from two decades of publications. However, fewer old references are cited.

Study is important since the reviewed related literature shows that tourist satisfaction, perceived value, attitude, and destination image play a vital role in medical tourists' intentions and decisions. The study is expected to validate an established medical tourism and hospitality research framework, contributing to medical tourism marketing operationalization based on existing research literature underpinning continuity concepts and selected variables that support the objectives of this study. The study will contribute ideas and support to the government's economic policy through the study outcome and suggestions. Economic competition is imminent as the world is preparing to exit the COVID-19 pandemic turmoil. Therefore, this study will significantly contribute to the government creating policies that promote medical tourism destinations in Malaysia. In return, revenue will be generated while more job opportunities will be created.

Participants / Study Location

The location for this current study is limited to Malaysia and medical tourists whose purpose of visit includes medical treatment, medical consultation, beauty therapy, and specialist hospitals in Malaysia. The selected locations are Johor Bahru and Kuala Lumpur, because these parts of Malaysia have main port entries for tourists and the medical centres are easily accessible (Thoo, Khairuddin, Tat, Sulaiman, Lai, & Mas' od, 2020; Chandran *et al.*, 2017; Vashu *et al.*, 2018; Alkelani & Habil, 2018). However, using medical tourists from the mentioned locations could be one of the limitations of this current study's generality and more location may be suggested for this study. Nonetheless, the chosen participants and locations are intended to support the study's objectives.

Questionnaire Development

The research questionnaire is designed to address the research objectives. The study objectives include investigating the factors that influence medical tourists' perception on satisfaction in their intention to revisit Malaysia's hospitals; (b) determining the relationship between perceived value, perceived authenticity, and destination image in relation to the perception of satisfaction; (c) investigating if employee attitude has an indirect effect on perceived satisfaction towards revisit intention; (d) proposing the moderation role of perceived satisfaction in the relationship between the extended factors (perceived authenticity, perceived value, and destination image) of continuity and medical tourist revisit intention; and (e) to validate the extended determinants of the medical tourists' revisit intention model in the context of Malaysia.

In addition, the research questionnaire was adopted and adapt from past literature study such as demographic respondents' profile with eight-item questions, were adopted and adapted from Kim *et al.*, (2012); Medical tourist revisit intention with five-item questions were adapted from Li & Liu (2014) and Limayem & Cheung (2008); perceived authenticity with five-item questions were adapted from (Das & Mukherjee, 2016; Heydari Fard *et al.*, 2021; Botterill *et al.*, 2013; Cook, 2010). Also, perceived value with five-item questions, were adopted and adapted from Cham *et al.*, (2021) and Manaf *et al.*, (2015); destination image with five-item questions adapted from Cham *et al.*, (2021); employee's attitude with five-item questions adapted from (Rodrigues., *et al.*, 2017; Heydari Fard *et al.*, 2021; Huang & Hsu, 2009; Agyeiwaah, & Dayour, 2021) and perceived satisfaction with the five-item questions adopted and adapted from Cham (2021) and Manaf *et al.*, (2015). The modified survey questionnaire suggested by this study will be used to collect relevant data from medical tourists in Malaysia. The study considered a survey questionnaire as the research instrument for an easier and faster way of collecting data. The items were organized, and precision will be checked by expert.

Expected Results in General

The expected result from the study is theoretically and practically important. It is critical for stakeholders to understand that an integrated of ccognitive model of the antecedents and consequences of satisfaction decisions

might potentially raise the intention of medical tourist to revisit and boost the economy's revenue forecast. In particular, the knowledge and expected results from this proposed study will contribute to the medical tourism sector, strengthening their marketing operational while integrating the extended continuity factors towards medical tourists' revisit intention.

Moreover, the study is important since the reviewed related literature shows that tourist perceived satisfaction, perceived value, employee attitude, and destination image play a vital role in medical tourists' revisit intentions and decisions making as well as perceived authenticity. For academia, the study is expected to validate an established medical tourism and hospitality research framework, contributing to medical tourism marketing operationalization based on existing research literature underpinning continuity concepts and selected variables that support the objectives of this study. The significance of the study to the government will contribute ideas and support economic policy. Economic competition is imminent as the world is preparing to exit the COVID-19 pandemic turmoil. Therefore, this study will significantly contribute to the government creating policies that promote medical tourism destinations in Malaysia. In return, revenue will be generated while more job opportunities will be created.

Expected results Base on Hypothesis

The expected results based on literature, recommendations, and arguments from Heydari Fard (2021); study hypothesized that; *perceived authenticity may influence intention of the medical tourist to revisit (H1)*. Based on literature, recommendations, and arguments from Moon *et al.*, (2013) and Pandža Bajs (2015) *that perceived value has a significant effect on medical tourist revisit intention (H2)*. Based on literature, recommendations, and arguments from Cham, (2016); Mohaidin *et al.*, (2017); Mohammad Jamal Khan *et al.*, (2016); Shafiee *et al.*, (2016) *that medical tourist revisit intention may be influenced by destination image (H3)*. Based on literature, recommendations, and arguments from Mankame (2021); Lee and Choi (2020); Mohaidin *et al.*, (2017); Thiumsak & Ruangkanjanases (2016) *that the employee's attitude may have a direct impact on medical tourist revisit intention (H4)*. Based on literature, recommendations, and arguments from Hernandez-Fernandez and Collin (2019); Mohammad Jamal Khan *et al.*, (2016); Shafiee *et al.*, (2016); Assaker & Hallak (2013) *that there is a significant relationship between perceived value and perceived authentication that influence medical tourist revisit intention (H5) also, thus hypothesized that: there is a significant relationship between perceived value and destination image that influence medical tourist revisit intention (H6)*.

In addition to hypothesis one (1) to hypothesis six (6). Moderating effect is expected to be applied. Integrating perceived satisfaction as a moderator in the relationship, among other suggested variables. Based on literature, recommendations, and arguments from Thiumsak & Ruangkanjanases, (2016); Mohaidin *et al.*, (2017); Heydari Fard *et al.*, (2021); Moon *et al.*, (2013); Yin *et al.*, (2014); Lee *et al.*, (2014); Lu *et al.*, (2015); Gholipour Soleimani & Einolahzadeh, (2018); Park *et al.*, (2019) the expected results thus *hypothesized that; perceived satisfaction will influence medical tourist intention to revisit (H7)* and thus, it is *hypothesized that perceived satisfaction is a moderator between perceived authenticity, perceived value, destination image, and employees'*

attitude toward medical tourists' intention to revisit Malaysia hospitals (H7a-d).

Conclusively, Figure 2 demonstrated the hypothetical conceptual framework for the perceived satisfaction moderation model based on the cognitive model of satisfaction decision (Oliver, 1980) and determinants of the medical tourists' revisit model (Heydari Fard *et al.*, 2021) reviewed.

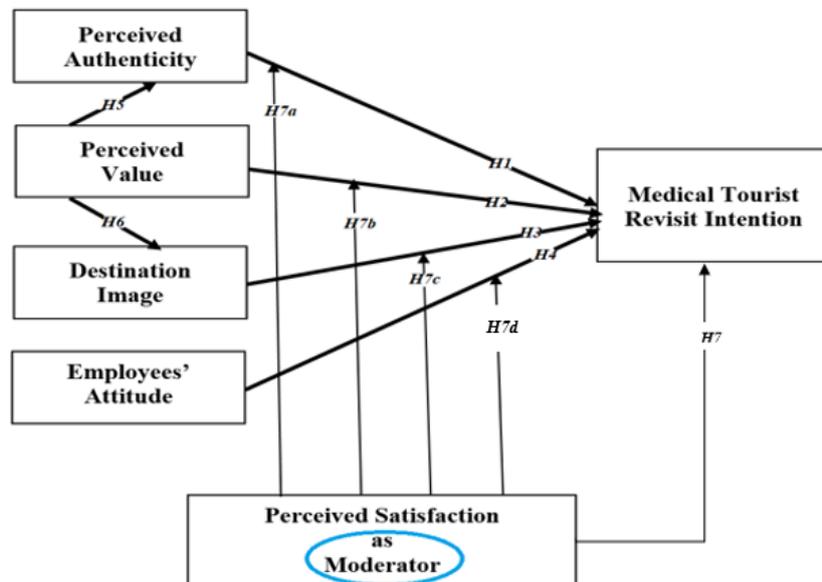

Figure 2. Framework

Discussion

The study adopts quantitative research method using survey questionnaire as a tool. The survey questionnaire is divided into seven (7) sections—Section 1. Questions into the demographic respondents' profile with eight-item questions, which are adopted and adapted from Kim *et al.*, (2012). Section 2. Probe into Medical tourist revisit intention with five-item questions adapted from Li & Liu (2014) and Limayem & Cheung (2008). Section 3 Questions related to perceived authenticity with five-item questions adapted from (Das & Mukherjee, 2016; Heydari Fard *et al.*,2021; Botterill *et al.*,2013; Cook, 2010). Section 4. Questions into a perceived value with five-item questions, which are adopted and adapted from Cham *et al.*, (2021) and Manaf *et al.*, (2015). Section 5. Questions relating to destination image with five-item questions adapted from Cham *et al.*, (2021). Section 6. Questions related to employee's attitude with five-item questions adapted from (Rodrigues., *et al.*, 2017; Heydari Fard *et al.*, 2021; Huang & Hsu, 2009; Agyeiwaah, & Dayour, 2021). Section 7. Questions about perceived satisfaction with the five-item questions adopted and adapted from Cham (2021) and Manaf *et al.*, (2015). These questions will be based on a 5-point Likert scale according to research conducted by Bosque Salmones *et al.*, (2009), with a scale showing "Option 5" as "Strongly Agree" and "1" Strongly Disagree." The respondents will be asked to indicate their answers by checking an answer box containing the scale as mentioned above after questions are made in a statement form.

Conclusion

Research ethics is imperative in any research study. Saunders *et al.*, (2012) stated that any research produced should follow ethical protocols. Academicians have concluded that several ethical principles need to be followed when research is conducted, such as informed consent, voluntary participation, privacy, and confidentiality (Bergbom & Kinnunen, 2014; Tearney *et al.*, 1996; Tien & Berg, 2003). This study will take ethical consideration within this approach very seriously, and the anonymity of the participants will be strictly preserved, while the participants will be voluntary. Informed consent will be attached to the questionnaire for the respondents to understand the research's purpose and scope. The participants will be given an option to withdraw from the study. The respondents' names from which the data are collected will not be revealed to preserve the participants' privacy. As the questionnaires are shared with the respondents through smart devices such as iPad, Android Tablet and other smartphone, the data collected will be stored in the google data deposit tools.

Recommendations

Undergraduate Students' Digital Literacy Skills in The Digital World of Sustainable Development

Dieu Dang Lam Ngoc

FPT University, Vietnam

Su Li Chong

University of Technology Petronas, Malaysia

Abstract: The world of globalization and the high development speed has raised high demands on equitable quality education and lifelong learning to all, which is also known as the objectives of Sustainable Development Goal 4 (SDG 4). Thanks to the rapid expansion of digital technology, educational quality and equity are gradually achieved. In addition, information technology (IT) plays vital roles of electronic instructors, guiders, tools and materials in supporting individuals' lifelong learning. Therefore, it is tremendously crucial that young generations should prepare themselves not only academic competencies but also a variety of skills including digital skills (e-skills) in a digital society that is densely linked and moves at a quick pace. This research emphasizes the significance of being digitally-enabled in the sustainable development world. It aims to find out how undergraduate students view themselves in terms of several facets of digital literacy, such as the capacity to handle digital issues, the processing of data and information, the production of online contents, the usage of communication tools and the ability to create online contents. The findings give an analysis of university students' current digital literacy and their application, whose outcomes can be used to enhance learning, teaching and administrative activities in education in general; and to attain SDG4 in particular.

Keywords: undergraduate students, e-skills, digital literacy skills, sustainable development, higher education, digital tools, digital learning

Introduction

At the heart of UNESCO's mission is "Education transforms life" for the sustainable development world. While "transform" implies various aspects of education, it also markedly refers to digital transformation in Industry 4.0. Genuinely, in the UNESCO's Sustainable Development Goal 4 (SDG 4) targetting "lifelong learning", SDG4.4.2 emphasizes boosting "the percentage of youth/adults who have achieved at least a minimum level of

proficiency in digital literacy skills". In a world characterized by the omnipresent innovation of technologies and digital transformation, digital literacy and skills have become crucial in generating and sustaining economic growth. Hence, on the policy agenda of most countries including Viet Nam, education focusing on skills, especially Internet access and technology usage, are of great compulsion.

When it comes to the current situation in Vietnam, under the rapid pace of economic growth and the reallocation of jobs away from agriculture in recent years, Vietnam is facing new challenges. As the size of its workforce is turning to be expanding and demanding, her youth population is shrinking and lacks of necessary skills to meet the firms' increasing requirements. Therefore, there is urging need for a more productive and skilled workforce for its further economic modernization in the coming decade and beyond. Despite the impressive literacy and numeracy achievements among Vietnamese workers, many Vietnamese firms report a shortage of workers with adequate skills as a significant obstacle to their activity. The statistics of the Vietnamese Ministry of Information and Communications shows that the number of job openings in the software and IT industry increases by about 30,000 every year. By 2020, the recruitment demand of enterprises would be 1 million IT personnel. With such a fertile IT job market, Vietnam, however, is predicted to be in shortage of some 400,000 IT workers and each year. Although experts claimed that digital technology must be used more often in education to train students on essential digital skills and competencies to adapt to the digital revolution (Herman, 2019), only about 27% of IT workers can meet the requirements, the rest need additional training for a minimum of three months. According to the Ministry of Education and Training, 37.5% of universities and colleges in Vietnam offer ICT majors, and there are about 50,000 IT graduates (over 400,000 IT vacancies) each year. With the high pressures on the demand in quantity and quality of labors, it is questioning whether education in ICT has been in its right track, and whether educators know "what is happening to their students?".

The concept of digital literacy encompasses skills and capabilities that enable learners to accomplish commissions, solve complex challenges, try out new things, and ease and enrich life under technology support (Hatlevik and Christophersen, 2013; Kim, Hong, and Song, 2019). To young adults, digital literacy is vital because all of our daily activities ranging from study, work, and entertainment to communication greatly depend on technology. Apparently, digital literacy is not just about scrolling a website up and down, or posting some pictures and writing comments on social media, it is more about acquiring knowledge of technology, what it can help to solve real-life purposes, and how to use it smartly; therefore, apply and build a strong career out of their lives. However, most young adults are partly aware of what digital literacy skills actually are and how digitally literate they really are. As Rogers (2000) asserted that students' attitudes are primary elements in the successful integration of new technology in education, an insight into their self-assessment on literacy in the concepts and the uses of technology should be well delved into by not only students themselves but also teachers and academicians. While there have been hundreds of studies on digital competence, an empirical study on students' digital literacy in the Vietnamese Southern context is still scarce and needs more investigation. This study aims at identifying university students' self-evaluation of their digital literacy due to two primary reasons. Firstly, undergraduates are those who will be soon new employees in international workplaces and potential global citizens. It is expected that they are well literate in technologies to meet the needs of their career requirements in

the 21st century. Secondly, university students are those who have completed their compulsory 12-year education and are reaching their degrees in some professions. They are, to some extent, expected to acquire the necessary digital skills that have been trained. This study, on the one hand, is able for students to evaluate their e-skill acquisition before any further education and career decisions. On the other hand, the study outcome is taken as proof of the current national curriculum in digital literacy education. It is significant for teachers and educators who directly work with students to know what and how to update and adjust for more efficient education in the future.

Research Questions

1. What is the general digital literacy skill level of Vietnamese undergraduate students according to Digital Literacy Global Framework (DLGF)?
2. What is the strongest digital literacy skill in the overall Vietnamese sample?
3. What is the weakest digital literacy skill in the overall Vietnamese sample?

Research objective

- To examine the general level of digital literacy skills according to their self-assessment.
- To identify the strongest literacy skill from the Vietnamese students' self-evaluation.
- To identify the weakest literacy skill from the Vietnamese students' self-evaluation.

Significance of the study

This study is significant because there has not been a lot of research conducted to identify the current issue of young people's digital literacy progress in the Mekong Delta, Vietnam. As Vietnam has become an active member of UNESCO in the "Sustainable Development" campaign, the pursuit of accomplishing the campaign targets, including education-oriented targets, is of great concern more than ever. Regarding education plans, terminologies like life-long learning, skills, digital, literacy, equity and equality, and sustainable development are key as well as goals. Self-assessment is able to boost an upward cycle of learning (Ross, 2006), the findings, hence, can help teachers, administrators and researchers draw a general picture of the digital literacy skill level of young citizens before any practical actions are carried out. Pertinent to their self-assessment is proven to improve performance through the element of self-efficacy, (Bandura, 1997), self-confidence and effort (Ross, 2006).

Theoretical background

Digital literacy skills (ICT skills/ e-skills)

Digital literacy has been defined in various ways since the term was first introduced in the 1990s by Gilster

(1997). Eshet-Alkalai (2004) generalized digital literacy into three dimensions: technical, cognitive and sociological skills, which are used to deal with problems within the environment of a digital society. In 2005, Martin (2006) suggested a more complete definition of digital literacy: individual realization, attitude and usage capacity of digital tools in order to access, manage, integrate, analyze, and synthesize digital information sources. Hatlevik and Christophersen (2013) described *digital competence* as the acquisition and processing of digital information and the ability to produce digital information. It was not until recent years that Law et al. (2018) initiated a more concrete definition of the term digital literacy. According to these scientists, it refers to the use of digital technology, communication tools, gadgets, and networks to access, manage, integrate, evaluate, and create information safely and appropriately for a knowledge society. Clearly, digital literacy is a broad concept embracing different aspects, and its continuous progress ranges from the acquisition of instrumental skills to that of productive and strategic competence and cognitive skills (Calvani, Fini, Ranieri, & Picci, 2012). Digital literacy is identified and analyzed in different concepts, such as internet skills (van Deursen & van Dijk, 2011; Hargittai, 2010), digital literacy (Eshet-Alkalai & Yoram, 2012), digital readiness (Arthur-Nyarko & Moses, 2019), and digital skills (Reedy, Boitshwarelo, Barnes, & Billany, 2015). In this paper, digital literacy or e-skill literacy includes the abilities of (1) generating new digital knowledge, and (2) using various forms of digital media in order to communicate, create and reflect the concepts within daily life situations in the digitally-rich world.

Digital literacy framework

Digital competence is even regarded as a key determinant for understanding and interpreting digital learning resources and online learning services (Lopez-Meneses, Sirignano, Vazquez-Cano, & Ramírez-Hurtado, 2020). Hence, plenty of attention is paid to the panorama of digital competence, including employing a digital competence scale (Tzafilkou, K., Perifanou, M. & Economides, 2022), digital competence models (Amaro, Oliveira, & Veloso, 2017; Tournon, Deborah Martin, Enrique Navarro, Silvia Pradas, & Victoria Inigo, ~ 2018), digital competence building blocks (Janssen et al., 2013) and applying comprehensive frameworks (Vukčević et al., 2021). Some of the frameworks to assess digital competence include the European Computer Driving License (Leahy and Dolan, 2010), the iCritical Thinking framework of the International ICT Literacy Panel (Verizon et al., 2002), and the Digital Competence Assessment Framework (Calvani et al., 2008). On the other hand, some research has also attempted to evaluate digital competence using qualitative (Çebi, A., & Reisoglu, ~ I. (2020) as well as mixed method approaches (Burgos-Videla et al., 2021). In this study, an empirical study was carried out to assess the digital competencies of university graduates based on the Vietnamese Digital Literacy Global Framework (Do et al., 2021) and the Digital Literacy Global Framework (DLGF) (Law et al., 2018). The current version of the DLGF was modified from Digital Competence Assessment Framework 2.0 (DIGCOMP 2.0) (Vuorikari et al., 2016).

Digital Literacy Global Framework (DLGF) (Law et al., 2018)

DLGF (shown in Table 1) is developed based on Digcomp 2.0 (Vuorikari et al., 2016), which originated from

DigComp 1.0 by Evangelinos and Holley (2015). The DigComp 2.0 framework suggests a pattern for evaluating the core competencies necessary for all citizens who adapt and actively participate in the digital world. The DigComp 2.0 framework accomplishes the concept of digital literacy both in scope (extension) and content (intensity). It includes 5 areas of competencies: (1) Information and data literacy; (2) Communication and collaboration; (3) Digital content; (4) Safety; and (5) Problem-solving. According to the scholars, the first three areas cover competencies that are applied within specific interactions and uses, whereas the two remainings incline to more specialized activity performed through digital technologies.

Compared to Digcomp 2.0, the updated model is more specific in measuring the digital literacy skills of global citizens because there are two more competence areas added (as can be seen in Table 1), which are Devices and software operations (ranked first) and Career-related competences (ranked last). These two newborn competencies are fundamental to fully scrutinize the field of digital literacy in teaching and learning, as well as best measure its proficiency level. Likewise, underlying is career-related competence when there are incongruities between what is taught and what is applied, what the teachers provide and what the entrepreneurs expect.

DLGF was created from the DLGF project aiming to generalize “a methodology that can serve as the foundation for thematic Indicator 4.4.2 and the development of digital literacy frameworks, curricula, and assessments across different countries and regions” (Law et al., 2018). Therefore, the instrument of the present study is highly based on DLGF. The design of the questionnaire is primarily constructed from the description of each competence area.

Table 1. Description of competences and competence areas in the DLGF

Competence area and competences	Description
0. Devices and software operations	To identify and use hardware tools and technologies. To identify data, information and digital content needed to operate somewhere tools and technologies
0.1. Physical operations of digital devices	To identify and use the functions and features of the hardware tools in technologies
0.2. Software operations in digital devices	To know and understand the data information and/or digital content that are needed to operate software tools and technologies.
1. Information and data literacy	To articulate information needs, to locate and retrieve the digital data, information and content. To judge the relevance of source and its content. To store, manage, and organize digital data, information and content
1.1. Browsing, searching and filtering data, information and digital content	To articulate information needs, to search for data, information and content in digital environments, to access them and to navigate between them. To create and update personal search strategies.

1.2. Evaluating data, information and digital content	To analyse, compare and critically evaluate the credibility and reliability of sources of data, information and digital content. To analyse, interpret and critically evaluate the data, information and digital content.
1.3. Managing data, information and digital content	To organise, store and retrieve data, information and content in digital environments. To organise and process them in a structured environment.
2. Communication and collaboration	To interact, communicate and collaborate through digital technologies while being aware of cultural and generational diversity. To participate in society through public and private digital services and participatory citizenship. To manage one's digital identity and reputation.
2.1. Interacting through digital technologies	To interact through a variety of digital technologies and to understand appropriate digital communication means for a given context.
2.2. Sharing through digital technologies	To share data, information and digital content with others through appropriate digital technologies. To act as an intermediary, to know about referencing and attribution practices.
2.3. Engaging in citizenship through digital technologies	To participate in society through the use of public and private digital services. To seek opportunities for self-empowerment and for participatory citizenship through appropriate digital technologies
2.4. Collaborating through digital technologies	To use digital tools and technologies for collaborative processes and for co-construction and co-creation of resources and knowledge.
2.5. Netiquette	To be aware of behavioural norms and know-how while using digital technologies and interacting in digital environments. To adapt communication strategies to the specific audience and to be aware of cultural and generational diversity in digital environments.
2.6. Managing digital identity	To create and manage one or multiple digital identities, to be able to protect one's own reputation, to deal with the data that one produces through several digital tools, environments and services.
3. Digital content creation	To create and edit digital content. To improve and integrate information and content into an existing body of knowledge while understanding how copyright and licenses are to be applied. To know how to give understandable instructions for a computer system.
3.1. Developing digital content	To create and edit digital content in different formats, to express oneself through digital means.
3.2. Integrating and re-elaborating digital content	To modify, refine, improve and integrate information and content into an existing body of knowledge to create new, original and relevant content and knowledge.
3.3. Copyright and licenses	To understand how copyright and licences apply to data, information and digital content.
3.4. Programming	To plan and develop a sequence of understandable instructions for a

	computing system to solve a given problem or perform a specific task.
4. Safety	To protect devices, content, personal data and privacy in digital environments. To protect physical and psychological health, and to be aware of digital technologies for social well-being and social inclusion. To be aware of the environmental impact of digital technologies and their use.
4.1. Protecting devices	To protect devices and digital content, and to understand risks and threats in digital environments. To know about safety and security measures and to have due regard to reliability and privacy.
4.2. Protecting personal data and privacy	To protect personal data and privacy in digital environments. To understand how to use and share personally identifiable information while being able to protect oneself and others from damages. To understand that digital services use a "Privacy policy to inform how personal data is used.
4.3. Protecting health and wellbeing	To be able to avoid health-risks and threats to physical and psychological well-being while using digital technologies. To be able to protect oneself and others from possible dangers in digital environments (eg. cyber bullying). To be aware of digital technologies for social well-being and social inclusion.
4.4. Protecting the environment	To be aware of the environmental impact of digital technologies and their use.
5. Problem solving	To identify needs and problems and to resolve conceptual problems and problem situations in digital environments. To use digital tools to innovate processes and products. To keep up to date with the digital evolution.
5.1. Solving technical problems	To identify technical problems when operating devices and using digital environments, and to solve them (from trouble-shooting to solving more complex problems).
5.2. Identifying needs and technical responses	To assess needs and to identify, evaluate, select and use digital tools and possible technological responses to solve them. To adjust and customise digital environments to personal needs (e.g. accessibility)
5.3. Creatively using digital technologies	To use digital tools and technologies to create knowledge and to innovate processes and products. To engage individually and collectively in cognitive processing to understand and resolve conceptual problems and problem situations in digital environments.
5.4. Identifying digital competence gaps	To understand where one's own digital competence needs to be improved or updated. To be able to support others with their digital competence development. To seek opportunities for self-development and to keep up-to-date with the digital evolution.
5.5. Computational thinking	To process a computable problem into sequential and logical steps as a

	solution for human and computer systems.
6. Career-related competences**	To operate specialised digital technologies and to understand, analyse and evaluate specialised data, information and digital content for a particular field.
6.1 Operating specialised digital technologies for a particular field**	To identify and use specialised digital tools and technologies for a particular field.
6.2 Interpreting and manipulating data, information and digital content for a particular field**	To understand, analyse and evaluate specialised data, information and digital content for a particular field within a digital environment.

Self-assessment

Boud (2009) states that judgment is simply a daily activity at work and in life about where one is, the effectiveness of what one has done, and what one should do in the future. For Boud (2010a), assessment is sustainable when it comes to not only to high education requirements and outcomes, but also to what is primary for lifelong learning.

Research has shown that assessment has a tremendous impact on student learning and development (see e.g. Price et al. 2011), while inappropriate or poor thoughts can diminish the beneficial effects of good teaching practices if these are not captured in assessment approaches (Boud 1995).

Regarding self-assessment, it involves one's own making critical judgments about their achievements and learning outcomes (Boud & Falchikov, 1989). According to the Oxford Dictionary (2022), self-assessment is the process of judging one's own progress, achievements, etc. During the process, an individual reviews what was performed to identify elements that can be improved or exploited to achieve certain predefined. It is inevitably important for students to form the capacity for 'informed judgment' either individually or collectively before any further steps are considered to be taken. Self-assessment is appropriate for adolescents because they are more realistic in their approach to self-assessment of their performance, which, therefore, reflects a higher level of reliability (ibid, in Ross 2006:3).

When it comes to digital literacy skill self-assessment, it is a subjective evaluation of one's own digital competence, skills, relevant decisions made and progress towards some particular purposes. Students' self-awareness of the essence of e-skills and their level of e-skill competence enables them to self-regulate their own learning progress. Moreover, this investigation helps teachers and educators timely assist their children with appropriate policies, curriculum and teaching methodologies. The validity of self-assessment is guaranteed as the authors meant to inform from the beginning in the open letter that the questionnaire is served for the students' own self-regulation and research purposes only. It was also stated that the results would not be used

for testing or grading their performances. The mean and mean range (see Table 2) were utilized to identify the students' level of digital competence skills and sub-skills.

Table 2. Categorization of responses for Digital Literacy self-assessment

Means	Descriptive Equivalent	Interpretation
4.51 – 5.00	Very High	Digital Literacy is always manifested.
3.51 – 4.50	High	High Digital Literacy is often manifested.
2.51 – 3.50	Moderate	Moderate Digital Literacy is sometimes manifested.
1.51 – 2.50	Low	Low Digital Literacy is seldom manifested.
1.0 – 1.50	Very low	Very Low Digital Literacy is never manifested

Previous studies

In the year later since DigComp Framework 2.0 was introduced, Al Khateeb (2017) designed a standardized questionnaire on the basis of the framework to investigate in-service English language teachers' digital competence. The outcomes of the current research revealed that the majority of teachers are not adequately digitally competent according to the level and standards required to enable them to be good digital teachers of the twenty-first century. Further digital-related competencies should be promoted to teachers as part of continuous professional development (CPD). Such competencies also need to be incorporated into different teacher education programmes. S Vishnu et al. (2022) also applied the Digital Competence Framework 2.0 of EU Science Hub (DIGCOMP) in their study assessing students' digital competence in a Turkey agriculture university. Their study's result was satisfactory as the students performed at an acceptable level of competence in most aspects of e-skill competence.

In consideration of DL in the Asian context, numerous studies have been conducted. [Son, Park, and Park \(2017\)](#) compared the DL of undergraduates learning English for academic purposes (EAP) and EFL in two universities in Canada and Japan. The study reported that all EAP participants taking part in the study were aware of digital technologies and were familiar with using them. In addition, most EAP students indicated that their level of DL was good or very good, while most EFL participants self-assessed their DL level as acceptable or good. [Cote and Milliner \(2017\)](#) surveyed first-year college students preparing for their study abroad program to find out students' specific DL levels. The results indicated that almost all students in the sample thought they had limited DL and lacked the necessary experience and skills. [Kim, Ahn, and Kim \(2019\)](#) conducted research to assess Korean primary and secondary school students' DL and found that students' DL had progressed. [Dashtestani and Hojatpanah \(2020\)](#) researched the DL levels of Iranian students. The questionnaire results depicted that students' DL is low, and they do not apply a broad range of computer applications and software. The study also indicates that the low DL level results from the Ministry of Education's ill-defined plans as regards improving students' levels of DL. [Mega \(2020\)](#) contributed to the digital literacy research field by *defining the Indonesian students' perception of digital literacy competencies as learning sources. In her study*

using the descriptive qualitative method, digital literacy areas based on Paul Gilster's theory (1997) such as internet searching, hypertext navigation, content evaluation, and knowledge assembly were under study. The outcome was disappointing when only one over nine students considered him/herself digitally literate. Zulkarnain et al. (2021) also adopted DigComp Framework 2.0 as the basis and the questionnaire from previous studies to carry out their research. The samples were 389 students studying multiple academic programs in UiTM, Kelantan Branch in Malaysia. The quantitative study concluded that Malaysian students have a "High level" of digital competence. However, respondents were not very competent in two areas out of five main areas of problem solving and digital content creation.

In Vietnam, a large-scale study was carried out by Nguyent et al. (2020) whose participants were up to 1661 English as a foreign language (EFL) learners at Vietnamese universities. According to the study, it is indicated that digital tools have a positive effect on their studies and students are aware of the essence of technologies towards their language learning. However, students' technology skill levels normally range from a low level to an average level, and they do not frequently apply technologies when learning English. Surprisingly, while seniors' attitudes toward using ICT tools are the most positive, their skills are the lowest among the year groups. Bearing that the sample of the study was served for language learning and primarily from Ha Noi (the capital city from the North), Ho Chi Minh (the most bustling and developed city), and Kien Giang (a province from the South) without clarification of students' DL levels of the three regions. This study, aiming to focus on students from the Mekong Delta will provide a more detailed picture of the current phenomenon. Besides that, identifying students' DL readiness for future careers, rather than learning a subject, is considered more vital for senior students.

Methodology

Participants

In order to generalize the picture, the study investigates 482 participants who are from 4 distinct universities in the Mekong Delta. They are all senior students because the study aims to investigate their self-evaluation in digital literacy before their graduation and employment. Moreover, students whose majors are technology or computer science related are excluded from the study due to the assumption that those undergraduates can gain an acceptable level of general digital literacy skills. In their curriculum, they have definitely learned basic information technology courses; therefore, their digital literacy should be explored in other studies which require other specialized research instruments.

Instruments

The instrument used for this study was a questionnaire which was designed under careful review from various sources. This questionnaire was constructed following the UNESCO Digital Literacy Global Framework (Law et al. 2018) and a previous questionnaire by Zhao et al. (2021). Zhao et al. designed their study mainly based on

the research instrument by Martínez et al. (2010) and DGLF 2.0 model, which comprises five main competence areas. This research is, rather only adapted from Zhao et al, extended two other competence areas, which were devices and software operations, and career-related competence (introduced in the updated DLGF). The questionnaire was created in Vietnamese with English translation via Google form. Definitions of digital terms were included in the questionnaire to help students clearly understand the question items. The questionnaire is written in both English and Vietnamese. It comprises two main sections: (I) sociodemographic characteristics of students and, (II) a self-assessment on digital literacy, which includes 50 question items categorized into six subscales, in line with the defined areas in the DLGF. These competence areas are as follows: (2.1) devices and software operations, (2.2) information and data literacy, (2.3.) digital content creation, (2.4) communication and collaboration, (2.5) safety, and problem-solving, and (2.6) career-related competence. The development of digital literacy was assessed on a five-point scale (5 – I'm confident I can do, 4 – I'm somewhat confident I can do, 3 – I'm confident I know, 2 – I'm somewhat confident I know/can do, and 1- I don't know/cannot do), whereby a higher score indicates more developed digital competences of a student. The reliability of the assessment scale on the student sample was 0.84 expressed by Cronbach's alpha.

Research procedure

For the guarantee of reliability and validity, the designed questionnaire went through two reviewing stages. The validation of the instrument was first reviewed by a panel of Information Technology lecturers who analyzed the content validity and an exploratory factor analysis was applied to complete the construct validity. It is to ensure that technical terms were precisely used and the meanings were not changed after the translation. The characteristics and external validity of the questionnaire were examined in discussion with experienced researchers in the fields of research methods, education and linguistics. After that, the questionnaire was revised in line with the recommendations of the experts. In the second stage, the questionnaire was piloted in a group of 30 participants. The Cronbach's Alpha coefficient reached a value of 0.987, representing a very high level of reliability.

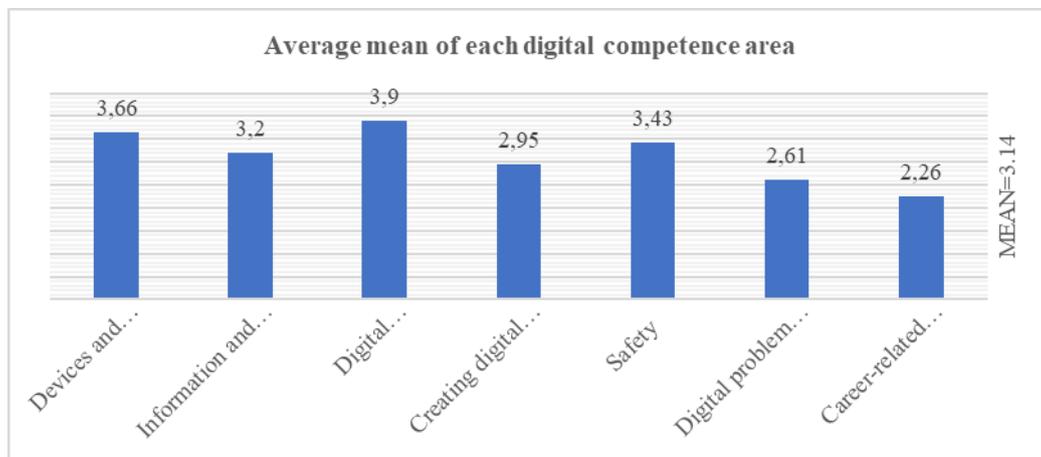

Consent emails were sent to the Deans of the four departments of the four universities in the Mekong Delta. After having got permission, I received the email addresses of lecturers who could help forward the email (including the student consent form and the questionnaires) to their students. The purposes of the study were explained in the email, which clearly stated that the outcomes of the questionnaire would be secured, only used for research purposes, and not for grading or evaluation. The number of participants is not narrowed in the English language Department only because the question items were already translated into Vietnamese. Students were able to share the link with their friends and anyone was welcome to answer the online questionnaire voluntarily.

After one month of the data collection process, 482 responses were digitally collected. The data were processed by using the IBM SPSS Statistics 20 statistical software in order to measure arithmetic mean and percentages. The results were then compared with the Categorization of responses for Digital Literacy self-assessment (Table

1).

Findings

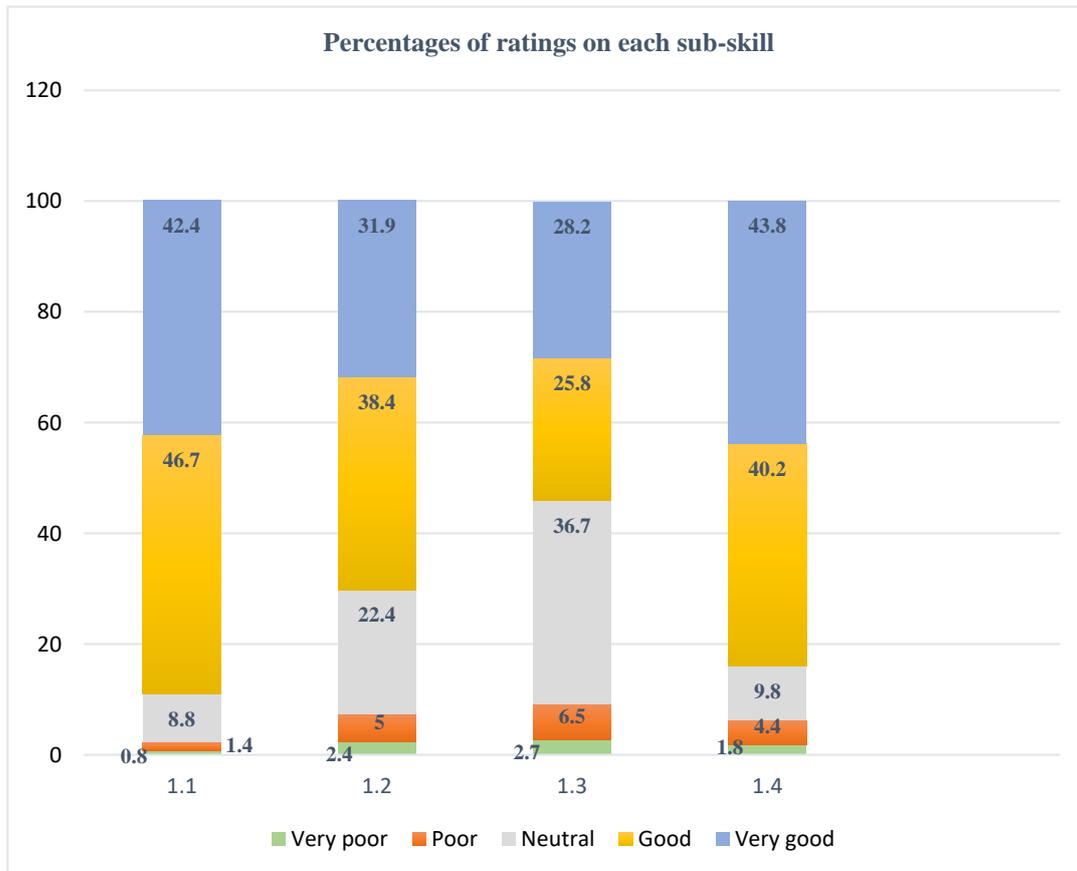

The present study was designed aiming to assess a sample of Vietnamese students in terms of their level of digital competence skills from their own perspectives. In this section, undergraduate students' self-evaluation of their digital competence skills (50 items) will be presented according to the following competency areas: information and data literacy (6 items); communication and collaboration (13 items); digital content creation (6 items); safety (7 items) and problem-solving (7 items). As mentioned above, to avoid bias, participants responded on a Likert-type scale of 1 to 5.

Graph 1. The comparison of average means of the seven digital competence areas

Graph 1 indicates the average values of the 7 digital literacy skills of undergraduates from four universities in the Mekong Delta. Overall, the participants from the four institutions placed themselves at a moderately high level with the total average mean=3.14. It is noticeable that digital communication and collaboration skill has the highest rating, with the mean being up to 3.9 and even higher than devices and software operation skills, with mean=3.66 only. However, students shown apparently much less confidence in productive digital skills such as creating digital content, digital problem solving and career-related competence skills (with the mean being no more than 3.0). Among the three aforementioned skills, career-oriented competence skill is the weakest, whose mean is only 2.26 and lower than the average.

In order to go deeper into the analysis of the results, the average scores of subskills in each competence area are presented in the following tables. Graph 2 provides information on the students' self-assessment of the first competence area. In comparison with other ones, the device and software operation competence area is the most extraordinary field with a mean ranging from 3.7 to 4.3. Among the four sub-skills, the highest score is seen in students' abilities to operate digital devices and basic softwares on a daily basis, reaching up to mean=4.3. The number of respondents who rate negatively in the four sub-skills is low, with no more than 10% each.

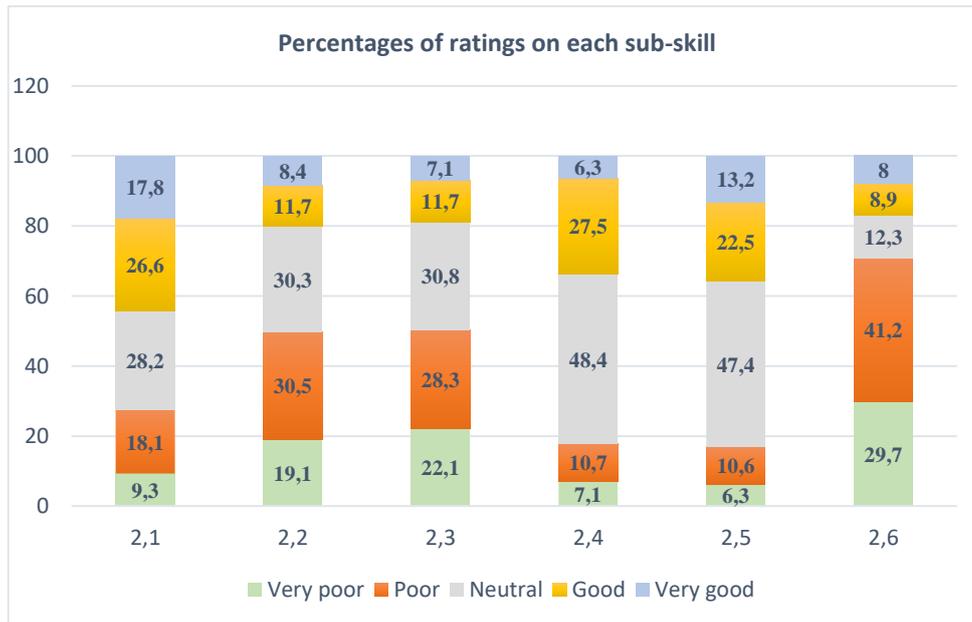

1. Device and software operation	Mean
1.1. I know how digital devices physically operate.	4.3
1.2. I am able to operate digital devices for my daily purposes.	3.9
1.3. I know how basic softwares and applications operate	3.7
1.4. I am able to operate basic softwares for my daily purposes.	4.2

Graph 2. University students' self-evaluation of digital competence on Device and software operation

As can be seen in Graph 3, students gain an acceptable ability in information and data literacy, with all of its sub-skills' mean values higher than 2.5. This shows that the individuals from the four institutions are able to use ICT tools to search, organize, evaluate... information, and apply different methods and tools to manage and store information (mean=3.4 each).

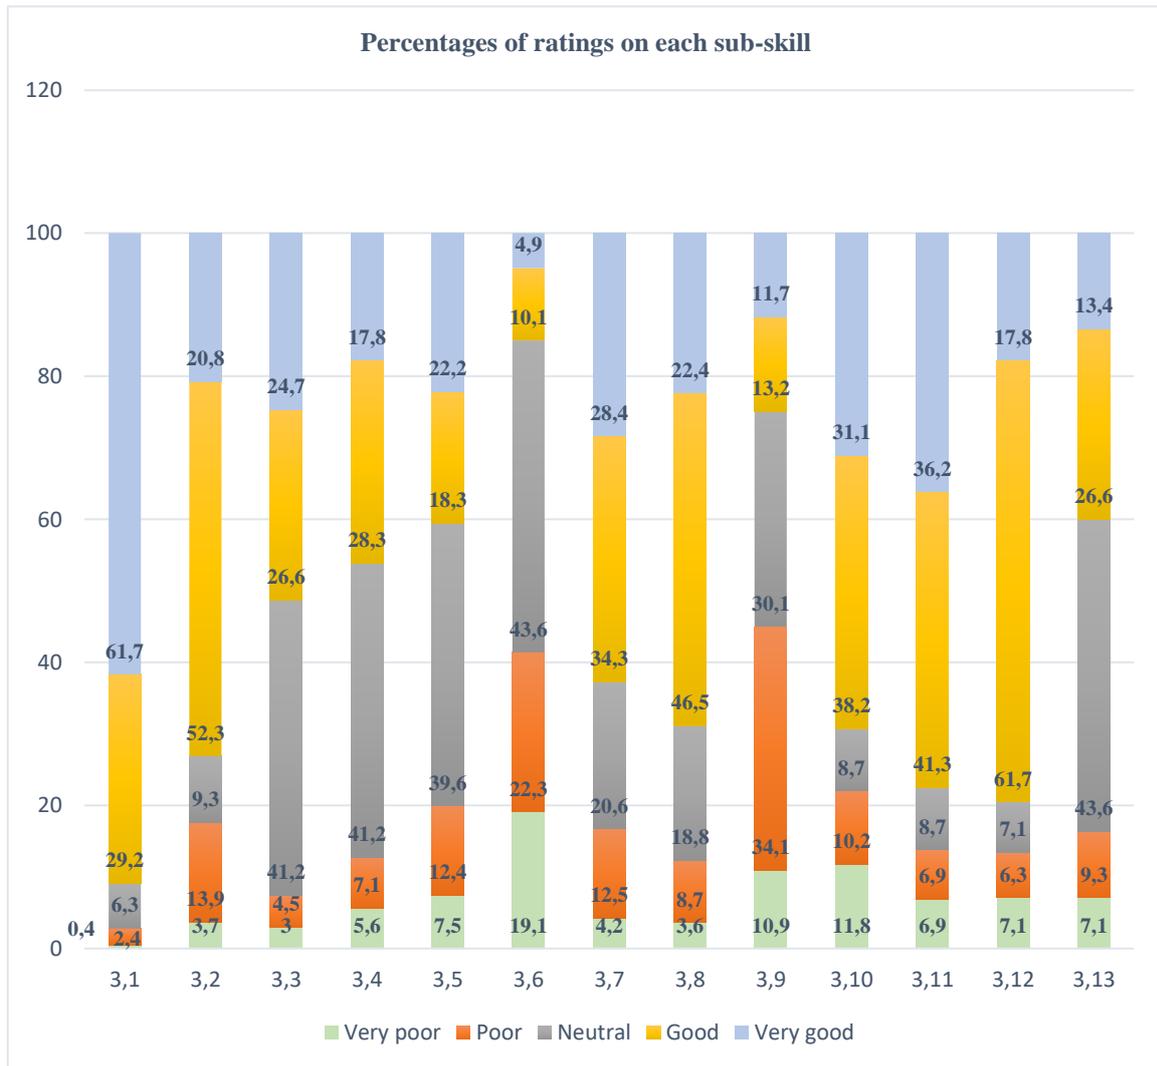

Another positive outcome is seen in students' ability to critically analyze and comment on data sources and digital content well (mean=3.3). Whereas, nearly half of the students feel uncertain about their abilities to analyze and comment critically, verify the information, and apply different methods and tools to manage and store information. It does not mention that up to 41.2% of students rated themselves "weak" in the ability to use their own strategies to organize and retrieve information and data.

2. Information and Data Literacy	Mean
2.1. I use ICT tools to search, locate, select, organize, evaluate, process, store, transform, disseminate, cite and communicate information.	3.4
2.2. I use specialized search engines and meta-search engines with various mechanisms (Identify keywords, synonyms and related terms, search in more than one language...).	2.7
2.3. I understand different sources of information and can build search strategies correctly based on them.	2.6
2.4. I analyse and comment critically on information, data sources and digital content, verify the validity and timeliness of the information located.	3.3
2.5. I apply different methods and tools to manage and store information, data and digital content for easy retrieval.	3.4
2.6. I have my own strategy to organize and retrieve information and data.	2.3

Graph 3. University students' self-evaluation of digital competence on Information and Data Literacy

Students unveil their strengths in communication and collaboration competence, with up to 90% being able to communicate and interact through various digital devices and applications (mean=4.7) (see Graph 4,). This is also the highest digital sub-skill among the 44 under the survey. Besides, students are also literate in sharing knowledge and multimedia content via social networks and online communities (up to 73%). However, half of the students do not pay their specific attention to interacting with partners in their familiar educational or professional fields. A similar number of students also do not feel engaged in online citizen participation. In the discussion of teamwork, around 40% of students seem reluctant to apply digital technologies to getting together or solving groupwork tasks. In relation to ethnicity and security issues, nearly 70% of young respondents are aware of virtual world rules and remind families and friends of basic ethnic behaviors although about 50% of them report that they are not sure how they can actually protect their own digital reputation.

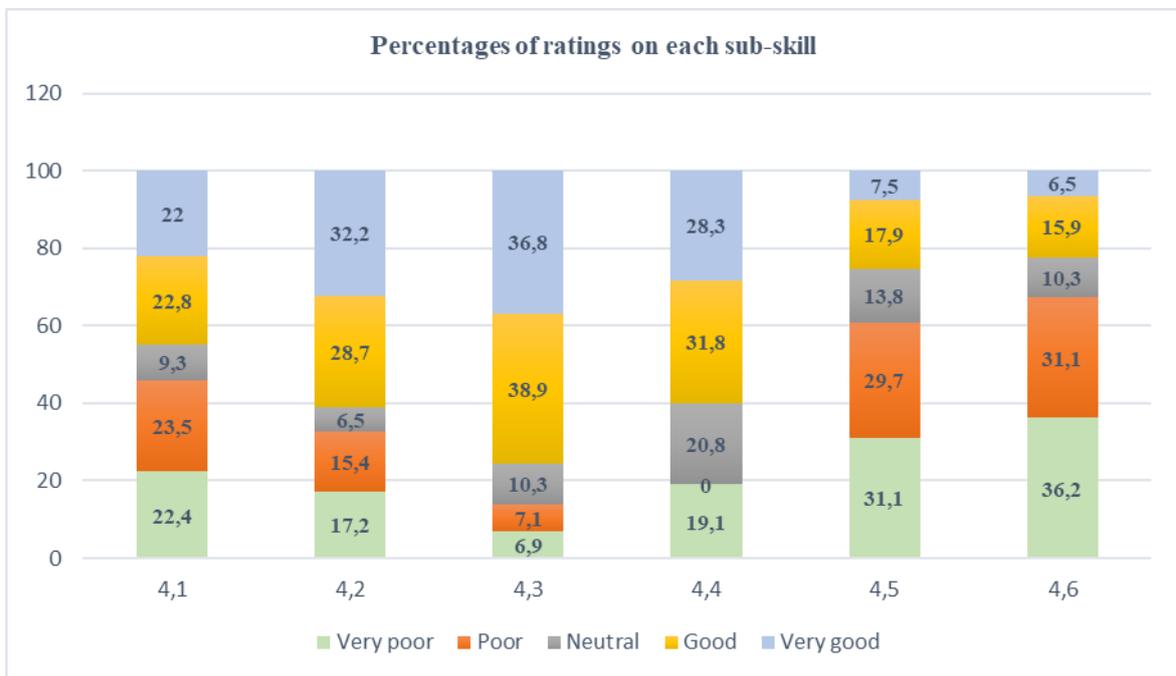

3. Communication and Collaboration

Mean

3.1. I communicate and interact through a variety of digital devices and applications (SMS, email, cloud, QQ, WeChat, video conferencing).	4.7
3.2. I participate in social networks, collaborative platforms and online communities where I share knowledge, multimedia content and information.	3.9
3.3. I collaborate through the Internet with other people in my educational or professional field that form my personal learning network (PLN).	3.8
3.4. I engage with society through online participation (social, political, cultural, administrative action) and am aware of the potential of technology for citizen participation.	3.6
3.5. I use digital technologies and media for teamwork.	3.4
3.6. I use technology and collaboration tools to plan, execute and share monitoring of activities and projects.	2.6
3.7. I participate in learning activities such as MOOCs through collaborative environments.	3.7

3.8. I am familiar with the rules of conduct online or in the virtual world, such as being friendly, respecting people’s privacy and being careful with my language.	3.8
3.9. I stay up to date with ethics regarding internet use.	2.8
3.10. I take care to remind my family and friends of the basic rules of behaviour on the Internet.	3.7
3.11. I know how to create and manage a public, personal and professional profile on social media.	3.9
3.12. I am able to manage several digital identities depending on the objective or context.	3.9
3.13. I pay attention to what I post online and I know how to protect my digital reputation and/or that of others.	3.4

Graph 4. University students’ self-evaluation of digital competence on Communication and Collaboration

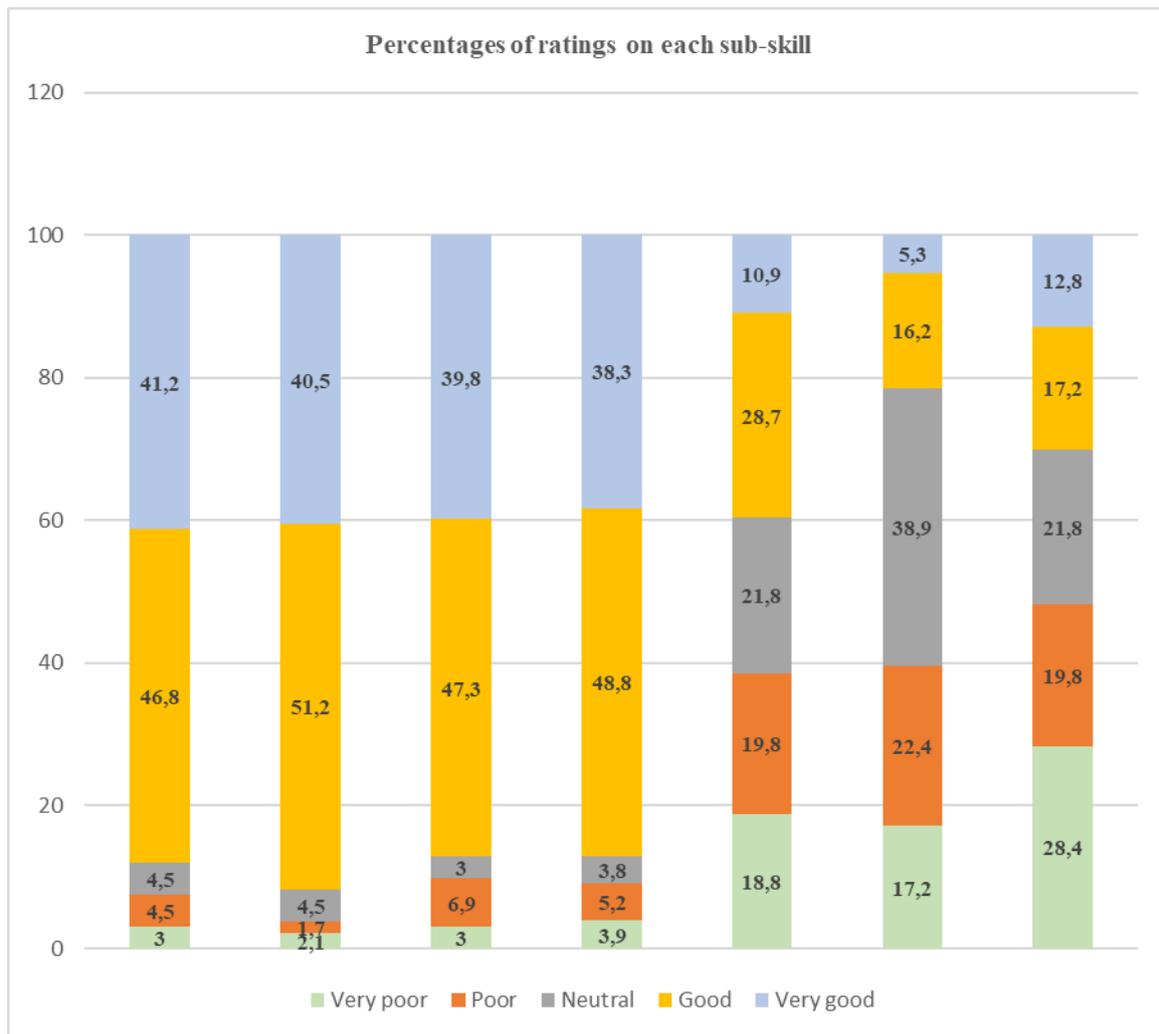

4. Digital Content Creation

Mean

4.1. I use a variety of tools and software to create multimedia content in a variety of formats.	3.0
4.2. I am able to use different media and methods to present ideas in a creative way.	3.4
4.3. I am able to edit, modify, improve and combine existing resources to create new and relevant content and knowledge.	3.9
4.4. I understand the basic knowledge and laws of intellectual property and the licensing of information and digital content when working with ICTs.	3.2
4.5. I know the basics of digital processes, understand the principles of programming and what is behind a programme.	2.4
4.6. I make modifications to computer programs, applications, configurations and equipment as needed	2.3

Graph 5. University students’ self-evaluation of digital competence on Digital Content Creation

Referring to Graph 5, digital content creation is the fourth digital literacy skill that requires students to be productive. The depressing point is that around 46% of the students revealed that they could not apply various tools and software to create multimedia contents. The figures are even higher in terms of understanding the principles of programming (60.8%) and making modifications to computer programs or applications (67.3%). These two aforementioned sub-skills also have very low mean scores, with 2.4 and 2.3 respectively. However, the optimistic finding is discovered when more than half can creatively create contents and present ideas through different media. They also show a good understanding of laws and principles of intellectual property (49.3%).

5. Safety

Mean

5.1. I understand the risks associated with the use of online tools and devices.	4.2
5.2. I protect my equipment and multimedia content.	4.3
5.3. I keep data security and protect my personal privacy.	4.1
5.4. I understand the health risks associated with the use of related technologies.	4.3
5.5. I prevent and avoid physical and mental health threats when using the Internet	2.9

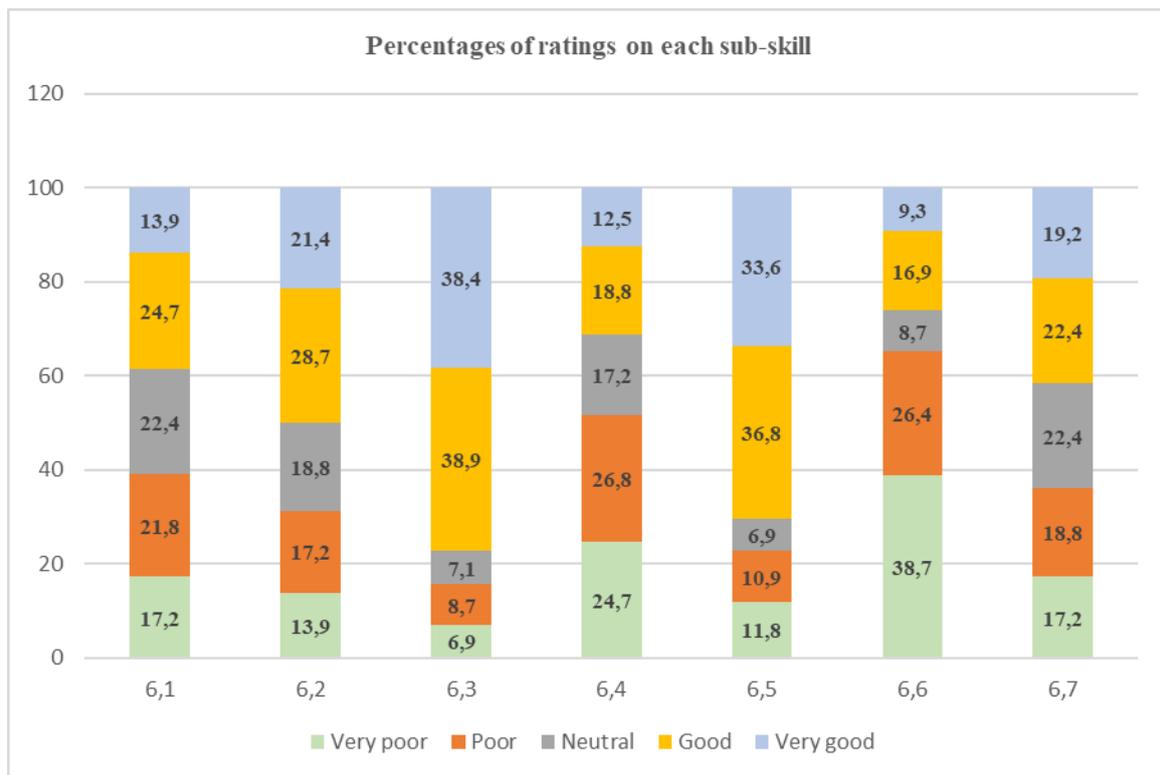

and multimedia devices, such as poor sitting posture and cyberbullying.

5.6. I know the positive and negative aspects associated with the use of technology on the environment. 2.7

5.7. I apply basic measures to save energy, recycle devices and protect the environment. 2.7

Graph 6. University students' self-evaluation of digital competence on safety

Another very important digital literacy skill is safety whose sub-skills, as shown in Graph 6, are unevenly rated. The sub-skill 5.1, 5.2, 5.3 and 5.4 own mean values higher than 4.0. In particular, approximately 90% of students are confident in their understanding of personal risks related to the use of technologies and they are also able to protect the privacy of their equipment and multimedia contents. Interestingly, although up to 87% of participants claimed to know the possible physical and mental health risks caused by the use of technologies, not many (only 39%) made attempts to prevent and avoid negative health effects. Moreover, environmental risks are also less concerned by the young generation, with only 18% knowing about environmental problems caused by the technologies and taking action to protect the environment.

6. Problem Solving

Mean

6.1. I am familiar with the operation of digital devices and am able to identify possible technical problems.	3.0
6.2. I solve daily technical problems.	3.3
6.3. I evaluate and select appropriately a tool, device service to perform my tasks and	3.9

meet my needs.

6.4. I keep myself updated on new developments and emerging technology trends, and innovate using digital technology. 2.7

6.5. I use various methods such as text, images and audio to make my expression more creative and innovative. 3.7

6.6. I actively attend events and workshops on digital creation, and participate in collaborative multimedia and digital projects. 2.3

6.7. I understand the needs to improve and update my own competence and to help others in developing their digital competence. 3.1

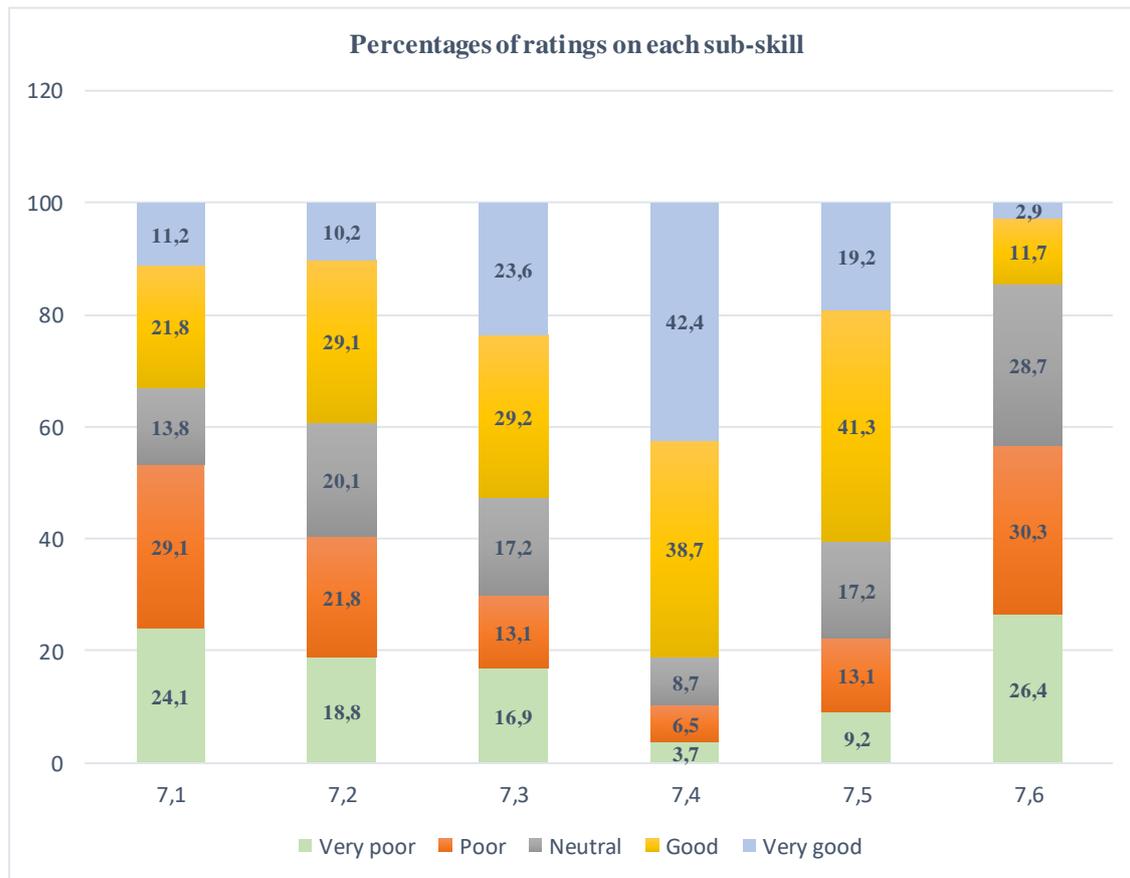

Graph 7. University students' self-evaluation of digital competence on Problem Solving

Graph 7 points out students' self-assessment in the sixth digital skill – problem-solving, whose means are generally lower than other previously mentioned skills. There are no sub-skills whose means are higher than 4.0, with the highest coming to the ability to evaluate and select appropriate tools to meet the needs, at 3.9. In fact, up to 77% of students rate themselves “good” and “very good” in this sub-skill. It is closely followed by sub-skill 6.5, whose mean is 3.7 and the positive rating is around 70%.

Conversely, students do not find themselves familiar with technical problems relating to digital device operation (with up 39% rating “poor” and “very poor” and 22.4% holding a “neutral” idea about that). Half of the students, moreover, do not particularly care about keeping themselves updated on new developments or technology trends. The bright side of the problem-solving literacy skills is that students are able to evaluate and select appropriate tools and services to accomplish their tasks (77%) and use a variety of methods and tools such as texts, images and audio to make their expressions more innovative (70.4%).

In Graph 8 below, the seventh competence is the essential digital literacy skill due to its career-related roles. It can be recognized that students gained an acceptable level of career-related competence as the means of subskills are mostly higher than 2.5. In particular, the ability to use different media and methods to present ideas is a proud subskill to the students (with both “good” and “very good” ratings being 80%). In addition, 60% of students have good knowledge of laws of intellectual property and the licensing of information when working with ICTs.

For creating multimedia contents for work purposes, the proportion is relatively lower, accounting for 52.8%. It is then followed by the ability to edit, modify, improve and combine existing resources for new career-related products (40%). Students seem less competent in the operation and process of some specialized digital technologies in their career fields (with only 53.2% rating “very poor” and “poor”). Just a small percentage of them (13.6%) are able to modifications to computer programs, applications and equipment to serve my career purposes.

7. Career-related competence	Mean
7.1. I understand how specialised digital technologies of my career field operate and process.	2.7
7.2. I am able to edit, modify, improve and combine existing resources to create new and relevant career-related digital products.	2.9
7.3. I use a variety of tools and software to create multimedia contents for my work purposes.	3.3
7.4. I am able to use different media and methods to present ideas to my colleagues, employers and partners in a creative way.	4.1
7.5. I understand my career-specialised knowledge and laws of intellectual property, and the licensing of information and digital content when working with ICTs.	3.5
7.6. I make modifications to computer programs, applications, configurations and equipment to serve my career purposes.	2.3

Graph 8. University students' self-evaluation of digital competence on Career-related competence

Discussion

Digital literacy has become indispensable for every global citizen, whether to communicate, to find

comprehensive employment, to achieve education, to socialize, and even to survive. Acquiring the right series of digital skills is not only compulsory for learning and workforce readiness but also essential to a more open, inclusive and secure community. It is widely known that digital literacy skills, like other 21st-century literacy skills, should start at school. Therefore, it is important to have a very primary consideration of the learners' own assessment of their current level of digital literacy before any further steps should be made. There are no digital competence areas under the survey record low level of students' self-evaluation.

Findings from the study pinpoint that students perceive a moderate level of digital competence. This is an unsurprising finding due to the fact that all of the participants (ranging from 18 to 21) belong to Generation Z, who is coined "digital natives". Although the current outcome is noticeably lower compared to those in developed countries such as Finland in the study of Khan and Vuopala (2019), Canada in the study of Son, Park and Park (2017), in which students rated their own e-skill competence "highly develop" and "very good", the outcome is more positive compared to previous studies in Asian regions. In specific, Vietnamese students surpassed Japanese students in the study of Cote and Milliner (2017), Indonesian students in the study of Mega (2020), and as competent as Malaysian students. Most interestingly, this study is inconsistent with a previous paper conducted in Northern Vietnam by Nguyen and Habók (2021), which depicts the students' level of technological skills just hovering around low to average.

When the defined areas of digital competencies are considered, the obtained results indicate that students in the Mekong Delta stated that their digital competencies are most developed in the areas as follows: device and software operation, information and data literacy, communication and collaboration, and digital content creation. Such results are understandable when Vietnamese children are allowed to use gadgets at the early ages (VVN, 2016). On the other hand, students assess their digital competencies as less developed in the remaining three areas: safety, problem-solving, and career-related competence. This is in line with the study of Zulkarnain et al. (2021) whose participants also claimed not to be very literate in areas of problem-solving and digital content creation. It can be assumed that students perceive basic competencies related to how to run a technological device and software, and use technologies to create digital content serving their study and career purposes. This can be explained by the fact that students have become used to the activities that have frequently conducted at school and in their daily life.

It is known that the Vietnamese curriculum from the very beginning level of education integrates lessons in using technologies. In detail, pupils in primary schools are taught to know how to operate a technological device as the first step before being instructed on how to create digital contents at the secondary level, how to solve digital problems in high school, and finally how to apply digital literacy in a career in tertiary level. Virtually, solving technical problems, and ensuring the protection for devices, data, health and the environment are more complex competencies that require more critical thinking, additional work and more applications. It might be possible that the syllabus and teaching materials at different faculties do not sufficiently incorporate elements from the last three areas of competence, given that they cover different scientific fields.

Conclusion

To the best of my knowledge, this research can be considered as a pioneer study in the Mekong Delta that uses DGLF as a standard for the self-assessment of the young generation's digital competence. The empirical results show that all the respondents were satisfactorily competent in the areas such as information and data literacy, communication and collaboration, digital content creation and safety, and the abilities for the appropriation of technologies and the digital practices presented by Vuorikari et al. (2016). This pinpoints that they possess the ability to express themselves through digital means with respect the security measures such as reliability and privacy. However, it is not the same in the case of problem-solving (i.e., an individual's capacity to understand and resolve problem situations), which has been found as an under-developed area of competence. More specifically, by identifying the highest and lowest competency, it was delightful that Southern Vietnamese students show a highly moderate proficiency in safety which refers to the awareness of "netiquette" including behavioral norms, online, cultural, and generational diversity in digital environments. Whereas, the finding revealed that career-related competence (i.e., an individual's capacity to perform career-related tasks) is the least well-performed one in the seven areas of DLGF. It is also evident from the findings of the study that individuals' responses toward the information produced and processed by these technologies are unique. However, they possess deep connection with the society where information flows and knowledge evolves (Dunaway, 2011).

In the wake of rapid economic growth and significant innovation in technology, digital literacy is more important than ever. Digital literacy skills are paramount to 21st-century citizens who make the choice of either controlling or being lost out in the world of information explosion that is sweeping through all the sectors. Because our young generations will have to cope with new challenges and risks coming with living with technology, there is no way that we need to expose and prepare them with the skills to stay safe and thrive. A digitally-implemented education system should be in discussion to ameliorate digital citizenship and intense students' cognitive competencies beyond the classroom (Rafi et al., 2019). When it comes to introducing digital learning into the curriculum, it is the role of the government, online providers, parents, and teachers who are prompted to work together to support and protect their children online. This study, to some extent, highlights a case of the Mekong Delta students' digital literacy skills as a useful resource for further curriculum development and research.

The current study cannot avoid some limitations that should be acknowledged when interpreting the results. The research covers a wide range of senior students from different majors in four institutions in Vietnam. Therefore, to draw more specific conclusions, future researchers should focus on students in some particular field. Additionally, the study sample only focused on last year students from universities in the Mekong Delata in Vietnam; hence, the study results cannot be generalized to all educational contexts. It is suggested that further research can be done in which digital literacy level of students in more various age range throughtout Vietnam can be compared using DLGF. Furthermore, regarding to the participants' digital skills, as all survey questions

required them to self-assess their skills, it is also vital that students need to have accurately assessed their digital skills via a test or a tool. In other words, the discrepancy between their perceived and actual skills may be trivial (Aesaert et al., 2017), or there may be some gap between students' self-rated skills and their actual skills (Gross and Latham, 2012). Future studies can discover students' actual skills from practical digital tasks or compare their perceived and actual skills of using technology in some specific context.

Pre-service and in-service Elementary School Teacher's Procedural and Representational Knowledge of Fractions

Samar Tfaili

Lebanese University, Lebanon

Abstract: The main purpose of this study is to assess pre-service and public elementary mathematics school teachers' conceptual understanding and computational abilities of fractions. 20 pre-service mathematics teachers and 24 in-service mathematics teachers participated in this study. In-service teachers were divided into two categories; one for teachers having a degree in mathematics and the other for teachers having a degree in any other discipline. Results showed that both pre-service and in-service teachers' computational knowledge is greater than their representational knowledge. However, in-service teachers had difficulties in multiplication of mixed numbers (41.7% correct answers). The study revealed that regarding the computational knowledge no significant difference was found between in-service and pre-service teachers. When considering representational abilities, pre-service teachers were able to perform better than in-service teachers. The difference was significant ($p < 0.005$). however, when we compared preservice teachers' performance to in service teachers who graduated from the faculty of pedagogy, there was no significant difference ($p = 0.717$). Moreover, faculty of pedagogy graduate in-service teachers performed better than preservice teachers which shed a light on the importance of teachers' specialization even in elementary classes.

Keywords: Fractions, Representational abilities, Computational abilities, Inservice teachers, Preservice teachers

Ciddi (Eds), *Proceedings of ICRES 2023- International Conference on Research in Education and Science* (pp. 701-712), Cappadocia, Turkiye. ISTES Organization.

Introduction

The NCTM' Principles and Standards for School Mathematics (NCTM, 2000) states that fractions are fundamental because of their significant application in daily-life situations. It is a concept that extends over most of the elementary grades (from grade 3 till grade 7 in the Lebanese curriculum and often revisited in all mathematics subject areas) and in which students have difficulties in almost all levels. Sowder & Wearne found that even in the middle grades, fractions represented a challenge for students. Results of their research showed that students have a weak understanding of fraction concepts (Sowder & Wearne, 2006). This lack of understanding is then transposed into difficulties with 'fraction computation, decimal and percent concepts, and the use of fractions in other content areas, particularly algebra' (Brown & Quinn, 2007; National Mathematics Advisory Panel, 2008).

In parallel, teachers that do not understand fraction and are not able to interpret them conceptually will find difficulties in helping their students make sense of that concept (Ball, 1990; Graeber, et al., 1989; Redmond & Utley, 2007). Representations and conceptual understanding are very important to help students understand operations on fraction (Mewborn, 2001).

In teacher education program in the Lebanese university, elementary mathematics education students experience three years of learning how to teach mathematics to students ranging from grade one to grade six. They learn methods of teaching mathematics through three required method courses in year one and year two. Yet, their certification is not a requirement for the Lebanese ministry of education to enable them to enter elementary classes in public schools. Any university degree is acceptable to teach elementary mathematics according to the ministry of education.

The purpose of this study is to assess Lebanese University mathematics pre-service teachers' and public elementary schools' teachers', whether having a degree in teaching mathematics or not, knowledge in fractions, including their conceptual understanding and computational abilities.

Review of literature

When students start learning about fractions, they start constructing their understanding of a different type of number system with its own representations and symbols (Wright, 2008). Students should be taught operations with fractions in concrete terms (Martin & Sebesta, 2004; Patterson, Capraro, Kemp, Standish & Sun, 2003) once the concept is introduced to them (Naiser, Wright & Capraro, 2004). That is why it is very important for teachers to construct activities for student to develop conceptual comprehension of fractions and operations involving fractions. The achievement of such conceptual comprehension can be accelerated through the use of mathematical models and representations like physical and mental actions; a picture, drawing, symbol, or a concrete means entailing the relationship conveyed by a mathematical concept. The representations can be employed to enable students develop new concepts and relationships in their minds, to help students establish the relationships between concepts and symbols, and to assess the level of comprehension in students' mind (Olkun and Toluk Uçar, 2012).

Literature has shown that pre-service teachers' understanding of fraction content knowledge is very weak (Simon, 1993; Cramer, Post, & del Mas, 2002). Ball (1990) found that pre-service teachers have difficulties with the concept of fractions and the meaning of division of fractions. Other researchers showed that pre-service teachers have difficulty in explaining fractions to children and why algorithms work (Chinnappan, 2000). Pre-service teachers will be teaching mathematics in elementary schools and their weak performance may cause serious problems. Therefore, this issue is extremely important and should be addressed.

In-service elementary teachers also showed difficulties in explaining the concept behind operations of fractions. In their research that aimed at looking for in service teachers' knowledge on multiplication and division of

fractions at primary schools, Veloo & Puteh (2017) found that teachers prefer algorithmically approach in their work rather conceptual approach. Their practices showed that they lacked understanding of conceptual explanations. Although they came up with correct solutions, they were unable to give explanations for their work through drawings.

Teachers need to have the necessary specialized knowledge, such as knowledge of a variety of representations including concrete models and real-world problems, to help students understand mathematical concepts (Taber, 2000). Yetkiner & Capraro (2009) recommended that middle school teachers should be "equipped with the necessary knowledge to help students develop conceptual understanding of fractional concepts such as accurate and appropriate representations."

Theoretical background

The visual takes a wide space in our lives. Everything around us is filtered through our eyes before analyzing and understanding it. Also in the learning process, visual representations play a very important role. Many psychological studies confirm that using visual representations in teaching help a deeper understanding of concepts. "For a mathematical thinking and communication, we need to represent in some way the elements of mathematical structures. Communication requires external representation in the form of language resources, written symbols, figures and objects" (Lesh, Post& Behr, 1987).

Cognitive psychologists defined two types of representations:

- External representations that can be: enactive, iconic and symbolic (written and spoken language, symbols).
- Internal representations: they are the mental representations that cannot be directly observed but needed in order to conceptualize about a mathematical concept.

Cognitive psychologists have formulated two hypotheses on representations:

- 1) There is a connection between internal and external representation of a concept. We can make logical deduction about internal representation, about their quality with the help of manipulating external representations.
- 2) Internal representations are interconnected, they form a network, that of mathematical concepts and principals. These connections can be simulated by constructing the right connections between external representations (Ambrus, 2001, cited in Debrenti, 2013). External representations, such as figures and text definitions influence the nature of internal representation. This also holds the other way round. The way a student reperesents his/her knowledge externally shows the way he/she represents the information internaly (János, 1998 cited in Debrenti, 2013)

Visual representations facilitate sense making and understanding because people remember images better than words (Ambrus, 2001). "Using concrete and iconic representations is necessary not only for the so called slow students or elementary students. These representations are important for all students and are useful throughout the entire learning process" (Wittmann, 1998)

Didactics states that iconic representations are important in the early stages of learning, and as students' age and

mental development increase symbolic representations take over. However, there are other views that suggest that iconic representation should be implemented at all stages (Ambrus, 2001).

According to NCTM (2000) representations are useful in all areas of mathematics because they help us develop, share, and preserve our mathematical thoughts. "[They] help to portray, clarify, or extend a mathematical idea by focusing on its essential features" (p 206)

Cognitive theories prefer the term representation while researchers prefer model and modeling. The two terms are to a large extent interchangeable especially when researches in science and mathematics are involved (Gravemeijer, Lehrer, Van Oers, & Verschaffel, 2003; Greer, 1997).

Research Questions

Three questions are posted:

- 1) To what extent could pre-service and in-service mathematics teachers solve problems involving operations on fractions and how do they compare?
- 2) To what extent could pre-service and in-service mathematics teachers demonstrate their solving of comparison, addition, subtraction, and multiplication of fractions with representations and how do they compare?
- 3) How do in-service teachers with mathematics education degree and in-service teachers with other degrees compare in solving and representing fraction problems?

Method

Participants

A total of 44 teachers participated in the study for data collection. Participants consisted of 20 pre-service mathematics teachers and 24 in-service mathematics teachers. Pre-service teachers are enrolled in a 3-year mathematics teacher education program at the Lebanese University, faculty of Pedagogy, branch1. These University- Faculty have completed the required 9 credit hours in mathematics education. In service teachers are actually teaching elementary mathematics in several public schools in Beirut. Ten of them have a degree in teaching mathematics from the Lebanese university and 14 of them are other faculties' graduates. The table below shows the profiles of the participants.

Table1. Teachers' profiles

Pre-service teachers	In-service teachers			
	Faculty of Education		Other Faculties	
	Years of experience			
20	≤ 5	> 5	≤ 5	> 5
	4	6	8	6

Instrument

One instrument was used in this study. A fraction knowledge test, adapted and adopted from several previous studies on teachers' knowledge of fractions, was constructed to provide emphasis on both procedural and conceptual knowledge. The test consisted of five tasks that measure areas related to: (1) comparison, (2) addition, (3) subtraction, (4) multiplication, and (5) division. An item exemplified as "How much is $\frac{3}{4}$ of $\frac{2}{3}$?" is considered as a procedural knowledge item, and an item exemplified as "Explain how you determined your answer by giving an illustration or representation for $\frac{3}{4}$ of $\frac{2}{3}$?" is considered as representational knowledge. The test contains contextual and non-contextual tasks.

Data collection and analysis method

Data was collected by using a fraction assessment test. Test was submitted by hand to each participant who answered the test items in presence of the researcher. All items were corrected according to a rubric that categorized the answers as true, partially true or false. An answer was considered false if no work was shown at all or the answer is inappropriate. Partially true if the answer is not complete and true if it is correct and complete. Descriptive statistics was used in order to answer the research questions. Percentages were found for each item of the test. In addition, Pearson correlation was used to explore whether there is a significant relationship between two sets of points.

Results

The data collected in this research was intended to portray pre-service and in-service teachers' knowledge of computing and representing fractions. Educational background of in-service teachers was also taken into consideration. The results are presented in the following section in a way to answer the research questions.

Comparison of fractions

When teachers were asked to compare two fractions the pre-service teachers were 85% able to give true answers while the in-service teachers had 100% true answers. When they were asked to use a representation (model) to clearly demonstrate the comparison only 30% of pre-service teachers and 16.7% of in-service teachers gave a full true answer. The below table illustrates the answers.

Question1: comparison of fractions					
Pre-service Teachers			In-service teachers		
Computation					
True	False	Partially true	True	False	Partially true
17	1	2	24	0	0
85%	5%	10%	100%	0%	0%

Representation					
True	False	Partially true	True	False	Partially true
6	12	2	4	16	4
30%	60%	10%	16.7%	66.7%	16.7%

Table2. Pre-service and in-service teachers' results of Q1

40% of in-service teachers who were graduated from the faculty of education were able to represent correctly the comparison of two fractions while 0% who graduated from other faculties were able to do so.

Table3. In-service teachers' results of Q1

Question1: comparison of fractions					
In-service- teachers Q1					
Faculty of Education teachers			Other faculties teachers		
Computation					
True	False	Partially true	True	False	Partially true
10	0	0	14	0	0
100%	0%	0%	100%	0%	0%
Representation					
True	False	Partially true	True	False	Partially true
4	4	2	0	12	2
40%	40%	20%	0%	86%	14%

Multiplication of fractions

When teachers were asked to multiply two fractions less than one, 85% of pre-service teachers had a completely true answer compared to 75% of in-service teachers. When they were asked to explain by giving an illustration or representation of how they multiplied the fractions, 45% of PST and 25% of IST gave complete true answers

Table 4. Pre-service and in-service teachers' results of Q2

Question2: Multiplication of Fractions					
Pre-service Teachers			In-service teachers		
Computation					
True	False	Partially true	True	False	Partially true

True	False	Partially true	True	False	Partially true
4	2	4	2	10	2
40%	20%	40%	14%	72%	14%

Multiplication of mixed numbers

In question3 where teachers were supposed to calculate and represent multiplication of two mixed numbers, 70 % of pre-service teachers and 41.7 % of in-service teachers answered correctly while only 35 % of pre-service teachers and 8.3 % of in-service teachers were able to represent the multiplication correctly.

Table6. pre-service and in-service teachers results of Q3

Question3: Multiplication of Mixed Numbers					
Pre-service Teachers			In-service teachers		
Computation					
True	False	Partially true	True	False	Partially true
14	3	3	10	14	0
70%	15%	13%	41.7%	58.3%	0%
Representation					
True	False	Partially true	True	False	Partially true
7	9	4	2	22	0
35%	45%	20%	8.3%	91.7%	0%

60% of in-service teachers who are faculty of education graduates computed the multiplication of mixed numbers correctly compared to 86% of graduates of other faculties. On the other hand, 40 % of those who are FOE graduates represented the multiplication of mixed numbers correctly compared to 14% of other faculties

graduates.

Table 7. In-service teachers result of Q3

Q3: Multiplication of mixed numbers. In-service teachers					
Faculty of Education teachers			Other faculties teachers		
Computation

Representation					
True	False	Partially true	True	False	Partially true
4	2	4	2	10	2
40%	20%	40%	14%	72%	14%

Addition of fractions

In question4 teachers were supposed to add two fractions and then to represent the addition by a model. 70% of pre-service teachers and 83.3% of in-service teachers did the computation correctly, while 60% of pre-service teachers and 25% of in-service teachers were able to give a model for representation

Table 8. pre-service and Inservice results for Q4

Question4: Addition of fractions					
Pre-service Teachers			In-service teachers		
Computation					
True	False	Partially true	True	False	Partially true
14	5	1	20	4	0
70%	25%	5%	83.3%	16.7%	0%
Representation					
True	False	Partially true	True	False	Partially true
12	4	4	6	12	6
60%	20%	20%	25%	50%	25%

80% of in-service teachers from the faculty of education added correctly two fractions and 40% of them were able to represent this addition, while 85.7% of teachers from other faculties added the two fractions correctly and only 14.3% were able to represent the addition.

Table 9. in-service teachers result for Q4

In-service teachers Q4	
Faculty of Education teachers	Other faculties teachers

Computation

100%	0%	0%	85.7%	14.3%	0%
Representation					
True	False	Partially true	True	False	Partially

4	6	0	0	14	true
40%	60%	0%	0%	100%	0%

A t test comparison of percentages of correct answers for representations of fractions between in-service and pre-service teachers showed a significant difference ($p=0.006221$, $p<0.05$), while no significant difference was noted when comparing their computational skills.

A t test comparison of percentages of correct representations of different types of fraction operations between in-service teachers having a degree in mathematics education and those having other university degrees revealed a significant difference ($p<0.05$). no significant difference was revealed between the two types of in-service teachers regarding the computational skills.

Conclusion

In conclusion, the results of this study showed that there is a difference between computational abilities and representational abilities of both in-service and pre-service teachers in all studied domains: comparison of fractions, multiplication of fractions and of mixed numbers, addition of fractions and division of fractions. The results showed that pre-service and in-service teachers' computational knowledge is greater than their representational knowledge. However, in-service teachers had difficulties in multiplication of mixed numbers (41.7% correct answers). The study revealed that regarding the computational knowledge no significant difference was found between in-service and pre-service teachers.

When considering representational abilities, pre-service teachers were able to perform better than in-service teachers in all the studied domains. The difference was significant ($p<0.005$). however, when we compared preservice teachers' performance to in service teachers who graduated from the faculty of pedagogy, there was no significant difference ($p=0.717$). Moreover, faculty of pedagogy graduate in-service teachers performed better than preservice teachers in all domains which shed a light on the importance of teachers' specialization even in elementary classes.

There still are some limitations to this study. First, the sample was small in size. Second, only students enrolled in the education program of the Lebanese public university participated in the study. Also, in-service teachers were only public-school teachers. Another study with a larger representative sample could validate the results of this study if its results were similar.

Abstract: Student's learning and retention of academic content in a meaningful way depends on strengthening their cognitive structures. Once this structure, which provides a framework in which new knowledge will be included, is ascertained, engaging in teaching activities can create an opportunity for learners to have a different learning experience. Word association test are very functional in revealing the networks between the cognitive structure of the students and the concepts in this structure. The aim of this research is to reveal the cognitive structures of secondary school students who take social studies course towards the concepts in the unit of "active citizenship". In the research conducted in the survey model, the word association test was used as a data gathering tool in the study. As a result of the research, it has been observed that students mostly associate the concept of institution with school, organization with country, management with presidential, involvement with vote, and active citizen with mindfulness.

Keywords: Social studies, Cognitive structure, Word association test, Active citizenship

Introduction

Social studies is a discipline that aims to understand the world, guides how to use what has been learned in life, and strives for the participation of responsible individuals in society (Barr, Barth, & Shermis, 1977). Adopting an interdisciplinary understanding will ensure the integration of social sciences and will be effective in fulfilling the competencies expected from the student. The primary purpose of social studies is to raise effective citizens. An active citizen is a citizen who has adopted the values of the society he lives in and lives in harmony with the society culturally (Safran, 2015). Raising citizens who learn from the past, have decision-making skills and have high awareness in the society are among the duties expected from social studies (Levstik, & Tyson, 2008).

Today, there are basic skills aimed at gaining students. Social studies play a leading role in gaining these skills. Learning units within the social studies discipline are prepared for the acquisition of these basic skills. Each learning unit also contributes to the development of different thinking skills in students (Mutluer, 2013). The active citizenship study area within the scope of the social studies course has undertaken an intermediary mission in drawing the boundaries of the definition of the ideal citizen and in raising awareness of active participation as a citizen. Within this learning unit, it was aimed to reveal some questions in the cognitive structures of the students and they were provided to find answers to these questions: What does the concept of citizenship mean? What is active participation? What are our rights and responsibilities as citizens? What is the role of individuals in management? What is the place of non-governmental organizations in society? (Myers et al., 2002). Cognitive structure provides a broad visualization of how various concepts are perceived by students.

In order for students to perform a meaningful learning without falling into misconceptions, they should be provided to construct knowledge by associating information with correct concepts, away from rote understanding (Ausubel, 1968). The individual tries to complete the process by associating the newly learned concept or knowledge with another concept in his cognitive structure in the meaningful learning stage. Failure to make the correct association between concepts causes misconceptions to emerge at the end of the process (Novak, et al., 2005). Piaget stated that if there is a disconnection between newly acquired knowledge and existing knowledge, new connection points can't be created where this relationship can be established. Thus, a new pattern can be created in the cognitive structure of the student (Ünal, 1999). Social studies is one of the disciplines in which meaningful learning is provided by associating the information in the learning fields. Revealing the cognitive structures of the students related to the active citizenship learning field, which is within the scope of the social studies discipline, provides information about the realization of the meaningful learning goal (Doğanay, 2008). Social studies programs aim to raise principled citizens in themselves. The cognitive structures of the students related to the active citizenship learning unit are indicative of the level of realization of these goals. The fact that this field of study adopts the principle of raising individuals with various skills, respectful to democratic values, and social consciousness also serves the purpose of the social studies course (Parker, & Jarolimek, 1984). Especially in recent years, it has been accepted by societies that social studies have an undeniable effect on the ideal of being an active citizen. This situation was supported by the active citizenship learning unit. This learning unit aims to raise individuals who have acquired moral values, are conscious of human rights and are highly aware of the obligations of their rights. This emerging situation responds to the expectation of the society about the active citizen (Ross, 2006).

In the literature, there are studies on the field of active citizenship learning (Akar, 2021; Avcı, et al., 2020; Çağrı, 2020; Yeler, & Ocak, 2021). It is seen that the studies are not aimed at examining the cognitive structures of the students related to this learning unit. The aim of this study is to reveal the cognitive structures of students at different grade levels towards the learning domain of active citizenship. At the same time, this study is also important in terms of making determinations about whether there is conceptual confusion about the concepts in the learning field.

Method

The research's based on survey model since it is tried to explain the existing cognitive structures of secondary school students regarding the concepts of institution, organization, management, participation and active citizen. In descriptive studies, the situation that is the subject of the research is described in its own conditions and as it exists (Karasar, 2012).

Participants

The participants of the study consist of 213 students studying in 5 (n=71), 6 (n=70) and 7th grades (n=72), one private and two public secondary schools located in a city center in Turkey. 108 of the students are female and 105 are male. While determining the schools, diversity was tried to be ensured, and students taking the social studies course were included in the study.

Data Collection and Analysis

The cognitive structures of the students for the concepts selected from the active citizenship learning unit of the social studies course curriculum were collected by using the word association test. On the first page of the word association test, an application example and an instruction on how to perform the application are presented. Then, a page layout was created with each concept on one page. Key concepts were written ten times under each other to prevent chain response risk (Bahar, & Özatlı, 2003). During the application phase of the test, a 45-second period was given for each key concept, and students were asked to write down the words that came to their minds about the key concept during this time. The process was completed in 10 minutes, including the necessary instructions about the test and the sample application.

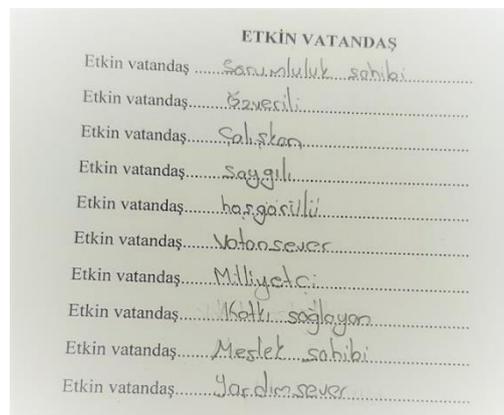

Figure 25. Response sheet of one of the participants

After the implementation of the WITs, the words obtained regarding the concepts were examined in detail and a

table showing the frequency of the words was prepared. Considering the frequencies in the table, word clouds and concept networks were created. While the frequency of the words produced about the key concepts are included in the word clouds, the relationships between the words and concepts in the cut-off range determined by using the cut-off points technique (Bahar, Johnstone, & Sutcliffe, 1999) are shown in the concept networks. For example, concepts with a cut-off point in the range 31-45 represent participant-generated response words between 31-45.

Results

The results obtained from the research are presented with tables and figures. The frequencies of the words produced for the concepts of institution, organization, management, involvement, and active citizen are given in Table 1, and the frequency of the words produced for each key concept, taking into consideration the frequencies, is given in the word clouds.

Table 1. Frequencies of produced words related to key concepts

Figure 26. Frequency of words produced about the institution key concept

The frequency of the words produced by the students regarding the institution key concept is presented in the word cloud image above (Figure 2). The words most frequently associated with the key concept are school

(f=160), hospital (f=101), state (f=22), municipality (f=15), manage (f=12), principal (f=11) and governor (f=10).

Figure 1. Frequency of words produced about the organization key concept

The frequency of the words produced by the students regarding the key concept of organization is presented in the word cloud image above (Figure 3). The words most frequently associated with the key concept are country (f=43), school (f=27), hospital (f=16), state (f=16), institution (f=13) and civil society (f=11).

Figure 2. Frequency of words produced about the management key concept

The frequency of the words produced by the students regarding the key concept of management is presented in the word cloud image above (Figure 4). The words most frequently associated with the key concept are president (f=112), principal (f=69), governor (f=34), country (f=33), school (f=25), state (f=22), leadership (f=13) and municipality (f=12).

Figure 3. Frequency of words produced about the involvement key concept

The frequency of the words produced by the students regarding the key concept of participation is presented in

the word cloud image above (Figure 5). The words most frequently associated with the key concept are vote (f=39), manage (f=7), democracy (f=6), election (f=6) and presidential (f=5).

Figure 4. Frequency of words produced about the active citizen key concept

The frequency of the words produced by the students regarding the active citizen key concept is presented in the tree image above (Figure 6). The words most frequently associated with the key concept are mindfulness (f=59), tax (f=57), responsibility (f=51), helpful (f=35), vote (f=31), right (f=30), patriot (f=22), good (f=19) and country (f=10). In the analysis of KIT results, the number of common answer words given to key concepts and the order in which they are said are also important, as well as the types and frequency of the answer words given to the key concepts. It enables the analysis of semantic closeness between these keywords and transforming it into a concept network. The concept network is constructed using data from the frequency table. The concept networks prepared for the answer words given to the key concepts in the research with a frequency value above 15 are shown below.

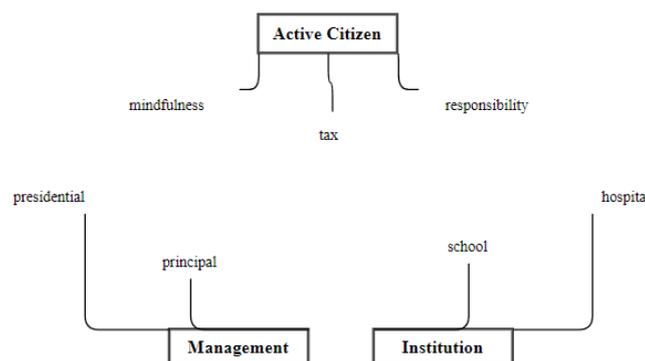

Figure 5. Concept network structured according to cut-off point 46 and above

In Figure 7, there is a concept network created according to the cut-off point 46 and above. When the figure is analyzed, it is seen that the key concept of active citizen is associated with the word's mindfulness, tax and responsibility, the key concept management with the words president and principal, and finally the key concept institution with the words school and hospital. There was no relationship between key concepts in this range.

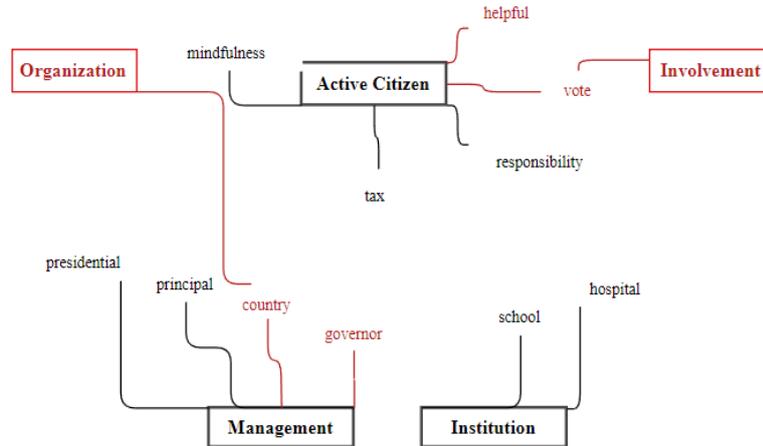

Figure 6. Concept network structured according to cut-off point 31 and 45 range

Figure 8 shows the concept network created for the breakpoint between 31 and 45. When the figure is examined, it is seen that words related to the key concept of involvement (vote) and organization (country) are produced. Relationships between key concepts started in this interval, thanks to the word vote, between the concepts of active citizen and involvement; Thanks to the word country, a relationship has been established between the key concepts of organization and management. In addition, the word helpful was produced for the concept of active citizen.

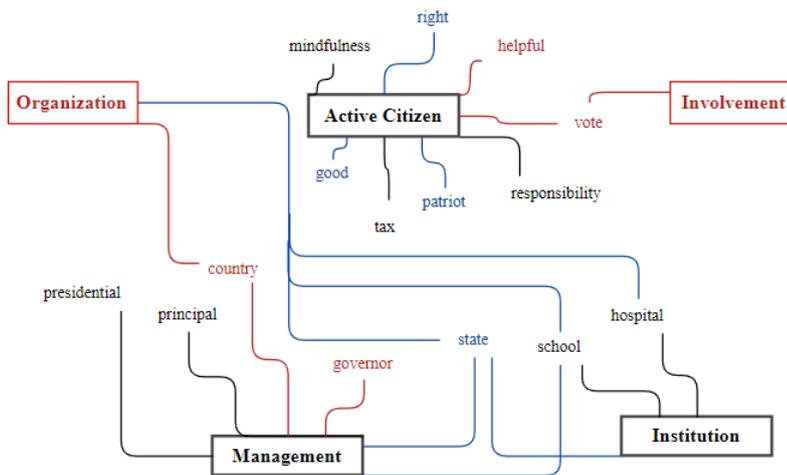

Figure 7. Concept network structured according to cut-off point 16 and 30 range

Figure 9 shows the concept network created for the breakpoint between 16 and 30. It is seen that words related to the active citizen (right, patriot, good) and management (state) key concepts are produced when the figure is observed. According to associations between the key concepts, it is clarified that there is a relationship between the concepts of organization, management and institution thanks to the word state. In addition, in this interval, the answer word school mediated the link between the key concept of institution and organization and management.

Conclusion, Discussion and Recommendations

In this study, the cognitive structures of the students for the key concepts of institution, organization, management, involvement, active citizen in the 7th grade active citizenship learning field were studied. It has been observed that the students derive 48 different words while associating the given key concepts. The fact that the resulting words are semantically far from each other can be interpreted as different cognitive structures of the students. It is seen that the key concept of Institution is associated with words such as school, hospital, state, municipality. Considering the words associated with the concept of Institution, it is seen that each of them is state-affiliated institutions. The fact that students especially relate the concepts of institution and state enables us to confirm that they accept institutions as parts of the state. Studies in this area also confirm the discourse that the state cooperates with institutions. Ayhan (2009) claims in his study that the prerequisite for the existence of nations by becoming a state is to have institutions.

It has been seen that they associate the key concept of organization with words such as country, school, hospital, civil society. The reason why they associate the key concept of organization with the word civil society may be the similarity in the pronunciation of the words. Besides, the first thing that comes to mind when it comes to organization in society is civil society. This may be due to civil society organizations influencing people with their beneficial activities. Şahin and Akboğa (2019) supported this view with their studies. According to this study, people wanted to be a part of civil society institutions in order to be involved in democracy and be beneficial to society. The fact that the words associated with the concepts of institution and organization are the same indicates that there is conceptual confusion regarding these two key concepts.

The key concept of management is often associated with words such as president, principal, governor, country, school. Associating the key concept with the qualifications representing the managerial position of various institutions allows us to say that the concept of management is positioned correctly in the cognitive structures of students. We can also interpret that people in these positions are seen as leaders by looking at the associated words. Bulut and Bakan (2005) expressed a similar view in their studies and associated the concept of management with leadership. They stated that people who are managers should also have leadership characteristics. The keyword involvement is associated with words such as vote, manage, democracy. Considering the words associated with the concept of involvement, it can be said that this concept has a political counterpart in students' cognitive structures. In the studies in the literature, the concept of involvement has mostly been used to meet a political meaning (Eser, & Sarışahin, 2016; Gökçe, Özdemirci, & Ceylan, 2017; Gökçimen, 2008; Özdemir, 2019; Özgüşi, 2014).

Participants often associated the key concept of active citizen with words such as mindfulness, tax, responsibility, helpful, vote, right, patriot. Based on the associated words, we can interpret that the person defined as an active citizen has positive characteristics in students' cognitive structures. In addition, the concept of active citizen has been associated with words expressing some social duties. A similar situation is also valid

in the studies in the literature. In the study of Kara, Topkaya and Şimşek (2012), students defined active citizens as citizens who know their rights and responsibilities. In the study conducted by Aydın and Çelik (2017), the students emphasized that the person defined as an active citizen should be beneficial to the society. Dere and Akdeniz (2021) stated in their study that a person who is defined as an active citizen should be helpful, patriotic and responsible. In their study, Eryılmaz, Bursa, and Ersoy (2018) stated that with the concept of active citizen, participatory, conscious, using their rights correctly and responsible people should come to mind.

While the key concepts of organization, management, institution are related through the answer words state, school; There is no common relationship including the concept of active citizen and involvement. The fact that the relationship between concepts belonging to the same learning unit is limited, based on common words, can be interpreted as the fact that the students cannot make enough connections between these concepts and therefore cannot make enough sense of them. The fact that the words associated with some concepts cannot meet the meaning in the literature shows that there is conceptual confusion in students.

In the findings, while the frequencies of the concepts of organization, management and active citizen are high, institution and involvement is striking that the frequencies of concepts are significantly low. This shows that while some of the concepts have equivalents in students' cognitive structures, their knowledge of some of them is limited. The gap in the cognitive structures of the students for these concepts may have been caused by the lack of learning or the forgetting of some information by the students. Learning is a process in which knowledge and skills are acquired for the student. In this process, the active participation of the student in the process should be ensured by the instructor in order to ensure permanent learning (Ünal, 1999). On the other hand, the parallelism of the words that students associate with key concepts with titles such as rights, responsibilities, benevolence, citizenship in the 5th, 6th, and 7th grade social studies textbooks shows that students achieve a certain level of success towards the goals of this learning unit.

- ✓ Studies can be carried out to identify and eliminate misconceptions about the learning field.
- ✓ By identifying the key concepts that students have the most difficulty in producing words, interdisciplinary studies can be carried out to teach these concepts.
- ✓ By organizing trips to various institutions and organizations, which are among the key concepts, it can be ensured that students gain concrete experiences regarding these concepts.

Abstract: Co-curricular service-learning has increasingly attracted participants from students as it can enrich their experience of learning chemistry, among others. An example is *Kimikamahika*, wherein chemistry students from a Catholic university in the Philippines volunteer in public schools, orphanages, daycare centers, and local organizations to promote interest in chemistry among children by demonstrating eye-catching experiments. However, studies are few on the lasting impression of co-curricular service-learning among students compared to their peers without such community engagement. Hence, this mixed-methods study assessed the long-lasting impact of *Kimikamahika* on its past volunteers vis-a-vis their peers not part of this service-learning in terms of gains in course-related skills, real-world application, career opportunities, leadership skills, and community engagement. A one-tailed Mann-Whitney U Test ($\alpha = 0.05$) of the survey responses revealed significantly higher ratings given by 54 volunteers of *Kimikamahika* in the acquisition of course-related skills ($p = 0.033$), application of classroom learning to real-world situations ($p = 0.045$), and participation in community engagement ($p = 0.013$) against the ratings of 24 peers not involved in this service-learning. A thematic analysis of interviews with thirteen past *Kimikamahika* volunteers further showed the lasting impression of a co-curricular service-learning on their academic, personal, professional, and civic life.

Introduction

Many higher education institutions have undergone curricular reforms to respond to the demands of equipping undergraduate students for a life beyond their degrees (Sewry & Paphitis, 2018). They recognize their unique responsibility to prepare undergraduates not only with the essential knowledge related to their discipline, but also with the much-needed “skills and dispositions to be active citizens through both their personal and professional lives” (Richard et al., 2016, p. 60). For instance, students taking an undergraduate degree in chemistry, as Sewry and Paphitis (2018) point out, “need to be educated not only in the theory and practice of chemistry, but also equipped with critical skills to navigate society and the employment market” (p. 973).

However, most undergraduate students in the field of science, technology, engineering, and mathematics (STEM), such as chemistry, have been heavily trained for specialization, disciplinary knowledge, and research (Najmr et al., 2018). Their opportunities for community engagement have been limited. As a result, they are often far removed from issues that matter in society (McGowin & Teed, 2019).

A well-established academic practice in providing undergraduate students with powerful learning experiences that can transform communities is service-learning (Cooper, 2002). Bringle, Hatcher, and Hahn (2017) define service-learning as:

a course or competency-based, credit-bearing educational experience in which students (a) participate in mutually identified service activities that benefit the community, and (b) reflect on the service activity in such a way as to gain further understanding of course content, a broader appreciation of the discipline, and an enhanced sense of personal values and civic responsibility (p. 10).

This widely used definition particularly refers to curricular service-learning, which has been commonly associated with improved cognitive goals and course-related skills, enhanced interpersonal and leadership skills, increased community engagement, better career opportunities, improved self-esteem, self-efficacy, and self-confidence, and increased ability in applying course content to real-world situations (Esson, Stevens-Truss, & Thomas, 2005). For undergraduates in chemistry, curricular service-learning has allowed them to learn about society beyond the laboratory (Sewry & Paphitis, 2018). They have also come to understand how their chosen profession would fit society (McGowin & Teed, 2019).

Notably, service-learning can take place as well in co-curricular settings (Judge et al., 2011). This form of experiential learning can exist without being based on a course subject that students would earn credits for (Griswold, 2013). Co-curricular service-learning applies to community engagements wherein students participate voluntarily outside their normal class (Bartkus et al., 2012; Farokhi et al., 2022). This community engagement seeks to enrich the students’ prescribed curriculum (Bartkus et al., 2012). An example of co-curricular service-learning is community engagement by a campus organization (Judge et al., 2011). Although not formally part of the students’ curriculum, co-curricular service-learning still incorporates the necessary

elements to be considered service-learning in its broadest sense (Cooper, 2002; Griswold, 2013).

However, most empirical evidence on the impact of service-learning among students is curricular in nature (Griswold, 2013; Richard et al., 2016). “The potential contribution of co-curricular service-learning to develop engaged citizens,” as Keen and Hall (2009) emphasize, “is relatively unexplored” (p. 59). There are also a few studies that have assessed the enduring influence of co-curricular service-learning on graduates, who participated in this form of community engagement while they were in college (Keen & Hall, 2009; Richard et al., 2016).

Hence, this study aims to assess the long-lasting impact of co-curricular service-learning through a longitudinal follow-up. Specifically, it seeks to determine if ratings on course-related skills, real-world application, career opportunities, leadership skills, and community engagement are significantly higher among past volunteers of a co-curricular service-learning in chemistry compared to their peers not part of such undertaking. It also intends to examine closely the lasting impression of a co-curricular service-learning in chemistry on past volunteers in terms of the various areas stated above. This assessment of a co-curricular service-learning in chemistry can help higher education institutions, faculty, and campus organizations in identifying strengths and areas for improvement, which can contribute to their program planning so that service-learning will remain faithful to its purpose.

Method

In assessing the long-lasting impact of a co-curricular service-learning in chemistry, this study carried out a mixed-methods research design to gather a more comprehensive understanding from both quantitative and qualitative datasets (Leavy, 2023). Specifically, it employed an explanatory-sequential approach to follow up the quantitative results with qualitative data (Edmonds & Kennedy, 2017). This explanatory-sequential approach seeks to contextualize the quantitative results from a survey using qualitative findings from interviews (Leavy, 2023).

Setting and Participants

This mixed-methods study was set in a Catholic university in one of the highly urbanized cities in the Philippines. The Catholic university in this study seeks to form its undergraduates into leaders, who can contribute to nation-building, through the education of the whole person. Its liberal arts curriculum aims to prepare its graduates not only for excellence in their chosen professions, but also for a life of service to their community as professionals-for-and-with-others.

One of the co-curricular service-learning for undergraduate students in this Catholic university is *Kimikamahika*. Depicted as a magic show in chemistry, *Kimikamahika* strives to draw interest in chemistry within and outside

the university through eye-catching experiments performed by student volunteers from a campus organization. Instituted in 2004, *Kimikamahika* aims to address underachievement in science in the country by promoting a better appreciation of chemistry as a field that children can take part in. This co-curricular service-learning has since engaged with public schools, orphanages, daycare centers, and local organizations by showing chemistry and science as fun and simply a “magic show” to enjoy by children.

After securing ethics clearance from an accredited institutional review board, this mixed-methods study recruited participants from the list of undergraduate students and graduates belonging to the campus organization responsible for *Kimikamahika* from 2004 to 2021. For the quantitative phase, an email notification was sent to them to provide details about the study and to seek their participation in a survey. Survey respondents, who took part in *Kimikamahika*, were assigned to the volunteer group, while those who have never been involved in this co-curricular service-learning while they were in college were placed in the comparison group. For the qualitative phase, this study invited past volunteers of *Kimikamahika* for an interview until data saturation was reached or, as Saunders et al. (2018) describe, when no new data emerged.

Data Gathering

An online survey was conducted using Google Forms for its ease of collecting data as it is not bound by time and location (Levefer, Dal, & Matthíasdóttir, 2007). The survey questionnaire contained items asking for the respondents’ demographic information, such as their age, gender, and employment. It also included an instrument that was adopted from Gelmon et al. (2001) and Esson et al. (2005) to measure course-related skills (e.g., *I become more knowledgeable about chemistry*), real-world application (e.g., *I can identify the chemistry behind real-world situations*), career opportunities (e.g., *The organization assisted me in clarifying my career plans*), leadership skills (e.g., *Participation in the organization helped me enhance my leadership skills*), and community engagement (e.g., *I have a responsibility to serve my community*). Each area in the instrument consisted of five items. Survey respondents were requested to rate the truthfulness and applicability of each item to them on a Likert scale of 1 (i.e., *strongly disagree*) to 7 (i.e., *strongly agree*). The developed instrument exhibited high reliability (i.e., overall $\alpha = 0.93$, course-related skills $\alpha = 0.85$, real-world application $\alpha = 0.72$, career opportunities $\alpha = 0.73$, leadership skills $\alpha = 0.85$, and community engagement $\alpha = 0.85$) and is deemed suitable for the purposes of this study.

The semi-structured interviews of past volunteers of *Kimikamahika* were carried out through Google Meet as videoconferencing platform. Interviewing using videoconferencing offers the same features as in-person interviews aside from the flexibility and convenience it affords (Irani, 2019). To gain a better understanding of the lasting impression of *Kimikamahika* as a co-curricular service-learning in chemistry, some of the questions asked to start the interview are the following:

- 1) Can you describe your experience in *Kimikamahika*?
- 2) What did you learn through this experience?
- 3) Have you done anything differently as a result of your experience?

- 4) Has *Kimikamahika* created any new opportunities for you?
- 5) What did you find most challenging and rewarding? Why?

When needed, the past volunteers were probed to elaborate on their responses. The interviews were video-recorded for documentation purposes. Each video-recording was transcribed verbatim. Before data analysis, the verbatim transcripts were anonymized and each interviewed participant was assigned a pseudonym.

Data Analysis

Mean and standard deviation were utilized as descriptive statistics for continuous data, while frequency and percentage distribution were used for nominal data. Chi-square tests were performed to determine if there are significant differences in the characteristics of the volunteer and comparison groups. To determine if the ratings on course-related skills, real-world application, career opportunities, leadership skills, and community engagement among the volunteer group are significantly higher than the comparison group, one-tailed Mann-Whitney U Tests were carried out at a 95% confidence interval and 0.05 level of significance. Non-parametric statistics were employed since assumptions for normality and homogeneity of variance were not met.

Thematic analysis was carried out to make sense of the qualitative data gathered from the interviews. It involved familiarization with the data by reading the transcripts several times and writing down analytical memos when insights would occur. Codes were then assigned to selected words or phrases from the transcripts to describe the likely meanings they represented. Predetermined or a priori codes based on the study of Esson et al. (2005) were applied along with spontaneous or in vivo codes. Related codes were thereafter categorized together. Finally, patterns were looked for among the identified categories to come up with emerging themes (Bergin, 2018; Creswell & Poth, 2018; Yin, 2016).

Several steps, as suggested by Stahl and King (2020), were taken to ensure the trustworthiness of this study's findings. First, this study provided a detailed account of the research process to facilitate an audit trail. Second, data triangulation was done by following up the survey with interviews to strengthen the credibility of the findings. Third, the identified themes were reviewed against the verbatim transcripts. Fourth, reported themes were supported by relevant quotes from study participants. Lastly, the initial findings of this study were presented to a panel of experts as part of peer debriefing.

Results

A total of 78 respondents participated in the survey. 54 of them were past volunteers of *Kimihama* and 24 were not involved in this co-curricular service learning while they were in college. Table 1 shows their distribution by age, gender, and employment. Chi-square tests at a 0.05 level of significance revealed there were no significant differences in the distribution of the volunteer and comparison groups by age ($\chi^2 = 1.56$, $df = 2$, $p = 0.458$), gender, ($\chi^2 = 0.01$, $df = 1$, $p = 0.939$), and employment ($\chi^2 = 5.99$, $df = 4$, $p = 0.200$). These results demonstrated that the volunteer and comparison groups were relatively similar based on their age, gender, and

employment.

Table 1. Characteristics of the Study Population

<i>Characteristics</i>	<i>Volunteer Group</i>	<i>Comparison Group</i>
<i>Age</i>		
Under 25 years old	11 (20.37%)	8 (33.33%)
25 to 34 years old	36 (66.67%)	13 (54.17%)
35 to 44 years old	7 (12.96%)	3 (12.50%)
<i>Gender</i>		
Female	23 (42.59%)	10 (41.67%)
Male	31 (57.41%)	14 (58.33%)
<i>Employment</i>		
Undergraduate Student	6 (11.11%)	3 (12.50%)
Graduate Student	4 (7.41%)	6 (25.00%)
Employed	40 (74.07%)	12 (50.00%)
Self-Employed	4 (7.41%)	2 (8.33%)
Not Employed	1 (1.85%)	1 (4.17%)

The mean average ratings for course-related skills, real-world application, career opportunities, leadership skills, and community engagement between the volunteer and comparison groups are shown in Table 2. One-tailed Mann-Whitney U Tests revealed participants from the volunteer group significantly rated themselves higher than the comparison group for course-related skills ($p = 0.033$), real-world application ($p = 0.045$), and community engagement ($p = 0.013$). However, the effect sizes or the magnitude of their differences in these areas were relatively small (less than 0.50).

Table 2. Mean Average Scores on Five Areas between the Volunteer and Comparison Groups

<i>Areas</i>	<i>Volunteer Group</i>	<i>Comparison Group</i>	<i>p value</i>	<i>Effect Size</i>
Course-related skills	4.96 ± 0.94	4.57 ± 1.12	0.033	0.26
Real-world application	5.80 ± 0.72	5.38 ± 0.99	0.045	0.24
Career opportunities	4.19 ± 1.15	4.62 ± 1.29	0.904	0.18
Leadership skills	5.40 ± 0.90	5.10 ± 1.47	0.296	0.08
Community engagement	6.03 ± 0.76	5.42 ± 1.20	0.013	0.32

Thirteen past volunteers of *Kimikamahika* underwent semi-structured interviews. Three (23.08%) were under 25 years of age, nine (69.23%) were 25 to 34 years of age, and one (7.69%) was 35 to 44 years of age. Three (23.08%) were females, whereas ten (76.92%) were males. Two (15.38%) were undergraduate students in their senior year, ten (76.92%) were currently employed, and one (7.69%) was self-employed.

Five themes emerged from the responses of the interviewed participants about the long-lasting impact of *Kimikamahika* on them. Specifically, the past volunteers felt this co-curricular service-learning gave them opportunities to develop course-related skills, appreciate real-world application of chemistry, and deepen their community engagement. They also brought up how *Kimikamahika* helped them strengthen their leadership skills and recognize career opportunities despite survey results showing no significant differences in comparison to their peers not involved in this co-curricular service-learning.

First, their experiences in *Kimikamahika*, according to the interviewed participants, helped them to acquire further the necessary skills for their chemistry-related course subjects. For example, Participant 4 considered their involvement in this co-curricular service-learning allowed them “to deepen their knowledge about chemistry.” Participants 1, 3, and 4, among others, were also challenged to apply the concepts in their chemistry-related course subjects so that they can better communicate the science behind the magical experiments. That is why Participant 1 recognized that they should not “just show the experiments,” but they should “discuss them as well.” Moreover, they, as Participant 4 emphasized, “must communicate the science in simpler terms for the children to understand them.” The experiments demonstrated in *Kimikamahika*, as stated by Participants 1 and 4, should also be “entertaining” and “engaging” for the children. As the experiments should have a “wow factor,” many of the interviewed participants narrated how this co-curricular service-learning contributed to their development of course-related skills, such as the skills needed for better science communication.

Second, this co-curricular service-learning provided the interviewed participants with opportunities for real-world application of their learning in the classroom. Participant 6, for instance, was able to use “what [they] know and what [they were] learning for the sake of others” because of *Kimikamahika*. Most of the interviewed participants, such as Participants 8 and 9, also found *Kimikamahika* as an “avenue” for them to apply chemistry to the “outside world.”

Third, their involvement in *Kimikamahika* helped the interviewed participants to deepen their community engagement. In fact, all interviewed participants pointed out how community engagement is the “biggest impact” of this co-curricular service-learning on them. They, including Participant 4, considered their efforts in *Kimikamahika* have in one way or another contributed to a better appreciation of chemistry and science among less privileged children. Participant 1 also looked back on how *Kimikamahika* became a starting point for them to build lasting relationships with those in their service-learning community considering that they would still communicate with them even after they graduated from college. Because of these instances, Participant 9 and others felt “a sense of fulfillment that [they] did their best in reaching out to people... [and that they] did something to change other people’s lives.”

Fourth, taking part in *Kimikamahika* as a co-curricular service-learning allowed the interviewed participants to strengthen “invaluable soft skills,” such as leadership skills. Since they must prepare before their demonstration of experiments to children in public schools, orphanages, daycare centers, or local organizations, Participants 1,

2, 5, and 7 learned the importance of communication and collaboration in planning projects. Until now, Participant 13 and others would tap on the leadership skills that they learned from *Kimikamahika* in “dealing with different personalities, managing timelines, and setting expectations” in their workplace. Furthermore, they, according to Participants 10 and 12, were prepared by this co-curricular service-learning on how to lead in “high-pressure situations” because of the “work ethics” that they picked up.

Finally, *Kimikamahika* exposed the interviewed participants to career opportunities. Their involvement in this co-curricular service-learning helped many of them to pursue careers based on their “talents” and “capabilities.” For Participants 3 and 9, *Kimikamahika* made them realize career opportunities aside from the industry. Specifically, this co-curricular service-learning influenced them to take on a career in teaching as they found joy in demonstrating experiments to children and explaining the science behind them.

Discussion

Mounting evidence has shown that curricular service-learning is a high-impact educational practice that can prepare students for a life beyond their degrees (Faulconer & Kam, 2023; Kilgo, Ezell Sheets, & Pascarella, 2015). Also, research on curricular service-learning has documented its usefulness among students of chemistry (Esson et al., 2005; Faulconer & Kam, 2023; Sewry & Paphitis, 2018). However, literature is scarce on the impact of co-curricular service-learning. Studies are also few on its long-lasting influence among students involved in this type of service-learning, particularly in chemistry.

This mixed-methods study aims to fill this gap in knowledge by assessing the lasting impact of co-curricular service-learning through a longitudinal follow-up. Survey results showed past volunteers of *Kimikamahika* rated themselves higher in course-related skills, real-world application, and community engagement compared to their peers not involved in such co-curricular service-learning. These results were supported by a thematic analysis of interviews with thirteen past volunteers of *Kimikamahika*. Survey results also revealed that past volunteers and their peers did not differ in leadership skills and career opportunities. However, findings from the interviews of past volunteers identified leadership skills and career opportunities as emerging themes on the likely impact of co-curricular service-learning on them. There is a discrepancy probably because their peers could have acquired these two outcomes from other co-curricular activities of the campus organization. Furthermore, not all past volunteers took on leadership roles during their involvement in *Kimikamahika*.

Research on curricular service-learning has demonstrated the acquisition of course-related skills among chemistry students involved in such community engagement (Esson et al., 2005; Faulconer & Kam, 2023). This study offered a new perspective that course-related skills can likewise be developed in co-curricular service-learning even if it is not associated with a credit-bearing course subject. An explanation for this observation is that past volunteers of *Kimikamahika* drew from their learning in chemistry-related course subjects to come up with entertaining demonstrations of experiments. Similar to the study of Najmr et al. (2018) wherein curricular

service-learning in chemistry can offer opportunities among undergraduate students to practice science communication, this study suggests that skills necessary for science communication can likewise be fostered in co-curricular service-learning since past volunteers of *Kimikamahika* must explain to the children the science behind the “magic” in simpler terms and an understandable manner.

Based on its definition, service-learning entails applying course content in addressing the articulated needs of the community (Bringle et al., 2017). It involves rendering community service, such as the educational shows of *Kimikamahika*, as part of solving real-world problems like underachievement in science in the country. This study showed that real-world application is possible too in co-curricular service-learning as past volunteers of *Kimikamahika* used eye-catching experiments in chemistry to encourage interest in science among children in the hope of alleviating their underperformance in science.

Numerous studies have revealed the civic outcomes that come along with curricular service-learning (Kilgo et al., 2015). A growing number of studies have also documented civic identity, social responsibility, and commitment to community service, among others, as the effects of a curricular service-learning done for a chemistry class (Esson et al., 2005; McGowin & Teed, 2019). In this study, past volunteers of *Kimikamahika* expressed how their involvement in this co-curricular service-learning has largely influenced their community engagement. They learned to relate with those in the community and build lasting relationships.

The development of leadership skills is another outcome of curricular service-learning that has been demonstrated in literature (Cress et al., 2010; Esson et al., 2005; Wurr & Hamilton, 2012). Noticeably, leadership positions in campus organizations can provide formative experiences for students to learn how to lead (Wurr & Hamilton, 2012). In this study, past volunteers of *Kimikamahika* occupying leadership roles benefited most from their involvement in this co-curricular service-learning. They recalled how the leadership skills they learned in *Kimikamahika* have become handy in their workplace.

Lastly, research has shown career development as an outcome of curricular service-learning (Bowen, 2007; Esson et al., 2005). Experiences in curricular service-learning that are concretely aligned with their chosen discipline can aid students make informed decisions about their careers (Bowen, 2007). Most importantly, these experiences of community engagement can influence students to choose careers inclined toward civic commitment (Mitchell & Rost-Banik, 2019). This study documented how past volunteers of *Kimikamahika* realized there are career opportunities for them aside from working in the industry. Several of them, for example, became involved in science education.

Limitations and Future Directions for Research

This mixed-methods study encountered several limitations, which can affect how its findings can be generalizable. First, there is selection bias given that purposive sampling was used in recruiting study

participants. Future studies should employ probability sampling and consider multiple settings to address this bias. Second, the study participants could have given socially desirable responses when answering the survey and responding to the interviews. Later studies should ensure anonymity and data confidentiality during the informed consent process to minimize socially desirable responses. Third, recall bias is likely as study participants were asked to recollect their experiences of co-curricular service-learning while they were in college and relate them to their current circumstances. Future research should consider carrying out prospective studies to manage recall bias. Fourth, baseline data on course-related skills, real-world application, career opportunities, leadership skills, and community engagement are not available. Some of the study participants might have scored higher in these areas at the onset. This constraint can be addressed in future research by conducting prospective studies to measure baseline information so that a better understanding of the lasting influence of co-curricular service-learning can be arrived at. Lastly, other factors may have contributed to the long-lasting impact of co-curricular service-learning among study participants. The Catholic university in this study, for instance, has a strong tradition of community service, which can inspire its students to be oriented toward community engagement. Further research is warranted to explore how other factors interplay.

Conclusion

Despite not being tied to a credit-bearing course subject, co-curricular service-learning can offer the same benefits as curricular service-learning. The impact of co-curricular service-learning among students, as shown in this study, includes far-reaching effects on areas, such as their course-related skills, real-world application, and community engagement. Co-curricular service-learning can also bring about leadership skills when students are given the occasions to lead in their campus organizations. Furthermore, it can provide them with career opportunities particularly when community engagement is asked for. In sum, co-curricular service-learning can leave an impression that lasts on a student's academic, personal, professional, and civic life. It does so by complementing and enriching the curriculum of students, such as those in chemistry.

Declaration of Funding and Competing Interest

This research received funding from the Office of Admission and Aid where the study was set and from the local government of Marikina City. The authors do not have competing interests to declare.

Abstract: All the Olympic Movement activities have been set to promote sport, culture and education, drawing inspiration from the physical training practiced by the ancient civilizations in the **Middle East and Asia. From the very first evidence of men's interest in training the body through disciplined exercises, 7000 years ago, the spread of sport was meant to cultivate** the joy found in effort, the educational value of good example and respect for universal fundamental ethical principles. The present study analyzes the alternatives offered by sports trainers and fitness coaches, highlighting the positive, long-term aspects, as well as the evolutionary and revolutionary steps taken towards the diversification of physical training programs in accordance to a large variety of the public. If ancient gymnastics involved only athletes, we currently observe a tendency to identify the movement needs of people according to age, ailments, the body's ability to withstand effort, etc. The modern trend is to design and customize training according to one's needs, and online training programs are well suited to successfully accomplish this mission. Therefore, we are going to prove the importance of online fitness apps for the continuing education of mind and body together with the perpetuating of Olympic education principles.

Keywords: Olympism, Motivation, Exercise, Fitness, Adulthood.

Introduction

All the activities of the Olympic Movement have been aimed at promoting sport, culture and education to build a better world, taking their starting point and inspiration from the physical training practiced by ancient civilizations in the Middle East and Asia.

Since the earliest evidence of man's interest in training the body through disciplined exercise 7000 years ago, the spread of sport has been designed to cultivate the satisfaction found in effort, the educational value of good

example and respect for universal fundamental ethical principles, but never, until the coronavirus pandemic, did people feel so keenly the importance of movement and sport.

This study reviews the alternatives offered by sports coaches in general and fitness trainers in particular during the period of isolation and highlights the positive, long-term aspects as well as the evolutionary and revolutionary steps made towards diversifying physical activity training programs according to a wide variety of audiences. The modern trend is to design and customize training according to personal needs, and online training programs are well suited to successfully accomplish this mission. Therefore, we propose to demonstrate the importance of Olympism in the formation of motivations and physical culture of personality through traditional and online fitness applications aimed at continuous training of mental and psychomotor sphere of women and men of early adulthood in the conditions of modern society (Shephard, 2018).

According to several scholars (Sion, 2003; Schioppa & Verza, 1997; Trofaia, 2007), the first period of adulthood is a whole string of maximum achievements of the human personality. This period of age (35-45 years) represents the period of highest productivity in work, because high yields are achieved with minimum energy consumption. This is because the stabilisation, harmonisation and psychological (of interests, skills, abilities, and the character traits involved in the work process) and social (of ways of interacting with others), which began in youth, take on a stable form in mature people (Schioppa & Verza, 1997). The main specific features of this age period are: professional activity - engagement in productive, valued and socially useful work; family relations - care for one's own children, extension of responsibilities for family life and concern for other members of society. Often at this age there is further training, retraining, a university degree or doctorate, etc. Social statuses and roles start to become more loaded with responsibilities (Mocanu et al., 2020; Sion, 2003; Verza, 2000).

Thus, the stabilization, harmonization and psychological (interests, skills, abilities, character traits implicit in the work process) and social (ways of interrelationship), begun in youth, take their stable forms in the mature man. In addition to these characteristics of psycho- and socio-behavioural normality, i.e. characteristics that individualise the maturity of the human personality, its psychophysical and psychosocial health and psychomotor training are a particularly important aspect of an integral and active personality, capable of successfully resolving the multiple objectives of everyday life.

Results and Discussion

Taking into account that the main factor contributing to the formation and maintenance of a higher level of psychophysical health, psychosocial adaptation and psychomotor training of the personality is physical exercise, we carried out a questionnaire on a sample of 202 women and 202 men aged 35-45 years. The purpose of conducting this questionnaire was to determine the importance and preferred forms of organising motor activities in the practice of daily life.

To the question "Do you know the importance and role of regular exercise on the human body?", the answers given by the respondents were evenly distributed among both women and men:

- 98% of respondents confirmed the value and role of exercise in maintaining the level of psychophysical health and psychomotor fitness needed for activities of daily living;
- and only 2% (4 people) mentioned "relatively" to this phenomenon.

At the same time, for the response variants that we proposed, i.e. these values of purposeful motor activity are of greatest importance for this age group of both male and female respondents, the responses were distributed in the following order (see Figure 1).

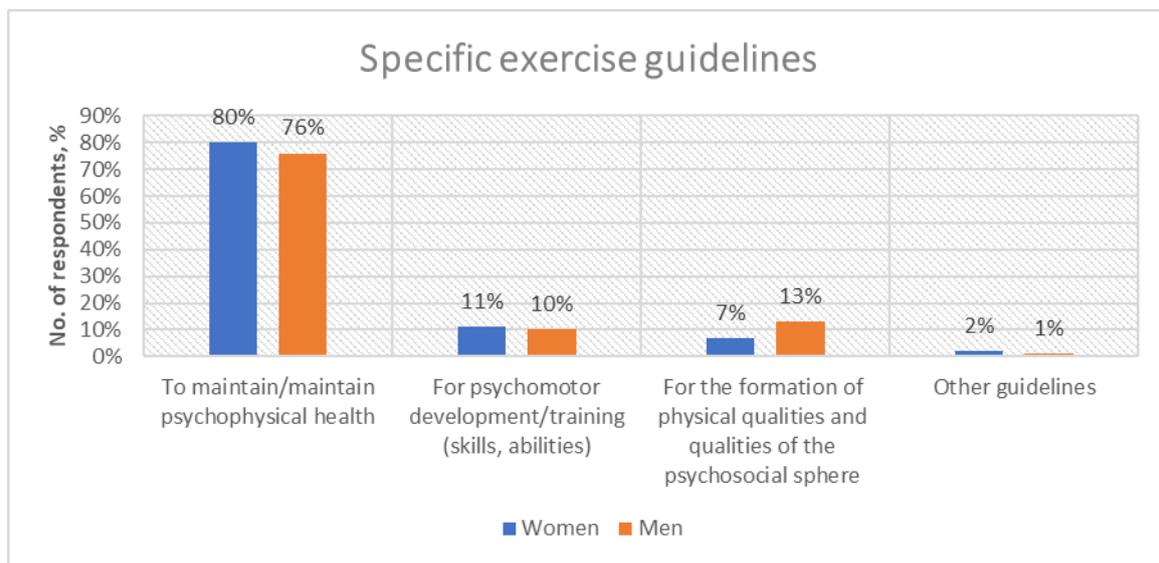

Figure 1. Respondents' views on the importance and role of systematic exercise on the body

The majority of respondents believe that exercise helps to increase, strengthen and maintain their psychophysical health (80% women and 76% men). Given the specificity of their bodies and psychology, the index is higher in women and this can be explained by the fact that women are more attentive to any changes, restructurings that occur in the process of maturity. While men consider health as a constant state of well-being and pay attention to it in problematic situations. Compared to women, men have a lower level of psychological personality anxiety.

Equally important for women and men, but much less so than in the previous indices, is the factor of "psychomotor training" in terms of the formation of motor skills and abilities. Note here the close homogeneity of the statistical indices for women and men (11% and 10% respectively). Such a low evaluation of this factor can be explained by the fact that, in general physical education practice, the knowledge aspects of motor skills and skills training are not adequately reflected and it is believed that once exercises are performed, they are formed in the same context through repeated practice.

At the same time, we can note the relatively low indicators of the factor of physical and psycho-social qualities (women 7%, men 13%), which can be explained from the point of view of this age group, where the main value orientation is to maintain the acquired physical condition. The higher rate of this factor in men (13%, almost 2 times) than in women can be explained by the following:

- the specific nature of male professions which place certain demands on the manifestation of personal psychophysical qualities (strength, stamina, speed, etc.);
- the specificity of strength training exercises, which are preferable for men in terms of building body culture.

Thus, we can note the heterogeneous distribution of respondents' opinions on the importance of equivalent factors due to a low level of information (knowledge) in the main categories of physical education. In this context, the determination of sources related to obtaining such information and knowledge is of particular interest.

In the context of classifying the sources of information that determined the importance of exercise for respondents, we proposed some response variants, which as a result were distributed differently between women and men in the following order (see Figure 2):

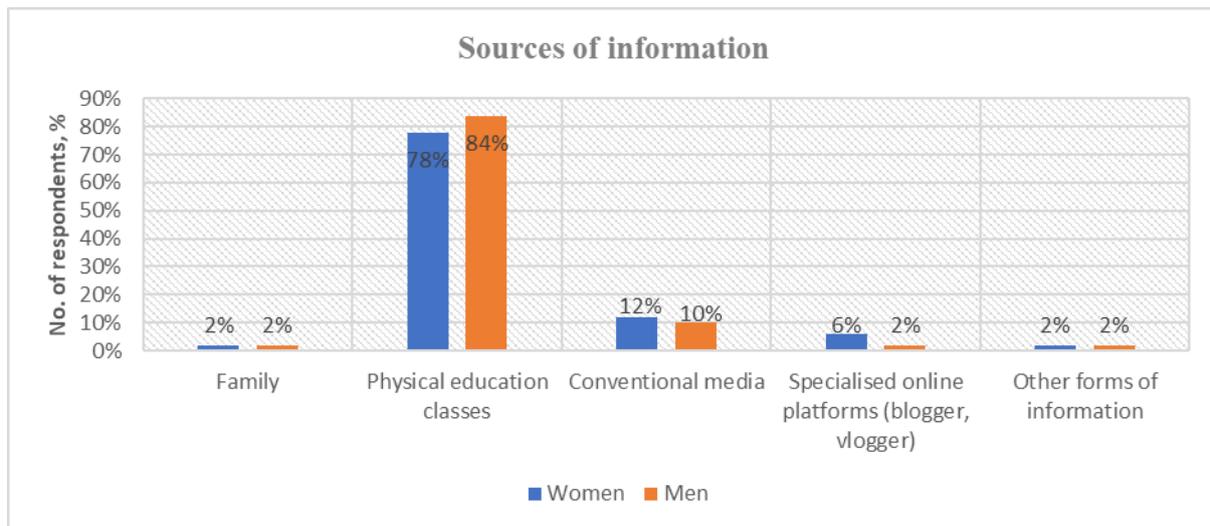

Figure 2. Sample responses on identifying sources of information that determined the importance of exercise

From what is illustrated in Figure 2, we observe that the basic and main source of determining the importance of physical exercise in a person's daily life for both groups of respondents is previous experience related to the educational content of the school subject "Physical Education" (females - 78%, males - 84%). A certain predominance of this factor in males can be explained by the fact that this subject is of greater interest to male schoolchildren at all stages of education.

In second place in terms of the importance of factors, we note "Media", which are roughly equally distributed between women and men - 12% and 10% respectively. This can be explained by the fact that in recent years the

media has paid more and more attention to educational programmes on the use of physical exercise with a focus on health and recreation.

The same unequivocal distribution can also be stated for the insignificant factors "Family" (2% each for both groups) and "Other forms of information" (2% each for both groups). The low indicator of the factor "Family", we believe, is due to the fact that the family relies almost entirely on school and does not pay enough attention to this sphere of education.

At the same time, the 2% indicator in the "Other sources of information" factor allows us to see that a fairly small number of people are looking for additional sources of information other than traditional ones. And as they see it, more rational and efficient.

Of particular interest, in terms of its non-homogeneous indicators, is the factor "Specialized online platforms" (6% of women and only 2% of men). Such a difference, we believe, can be explained by the fact that women are more attracted by the external attributes that accompany the process of exercise sessions (design, equipment, composition of participants, forms of rhythmic accompaniment, etc.).

At the same time, to the question "What are the major events and mainstream sports forums that support the attraction, value and motivation to exercise as part of a modern lifestyle?", the statistics of the female and male groups were almost evenly distributed across all response options in the proposed questionnaire (see Figure 3).

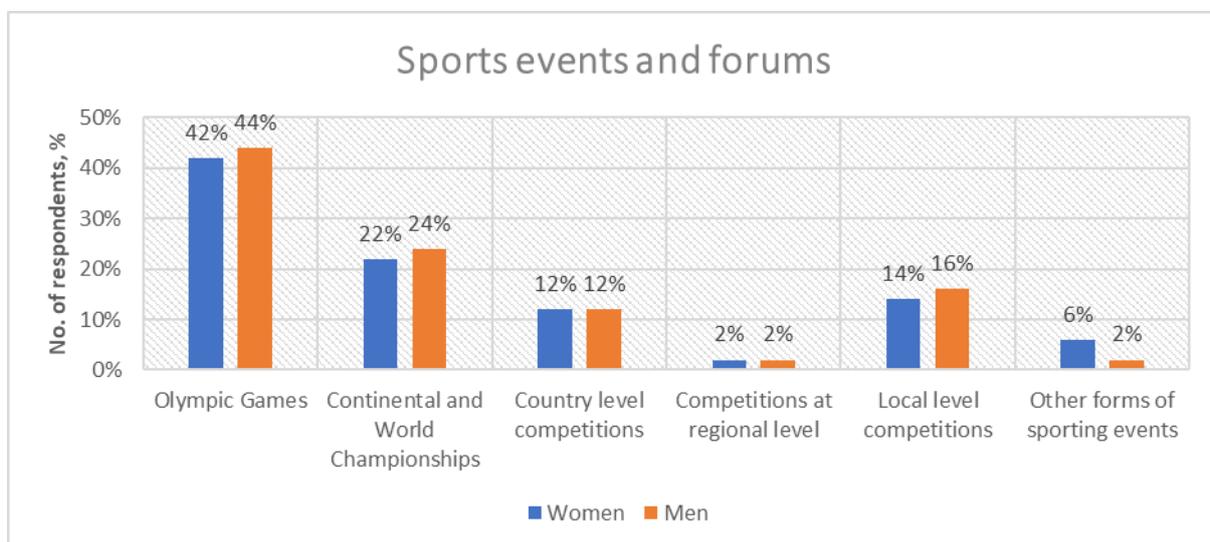

Figure 3. Respondents' answers on the source of motivation for exercising as a component of the modern way of life

The predominant majority of respondents (42% women and 44% men) mentioned the Olympic Games as the main factor supporting their motivation to practice general motor exercises and sports events through the cultural attractiveness of world events.

Also with relatively lower statistics are "Continental and World Championships" (22% women and 24% men)

and "Country Competitions" (12% each for women and men). The given statistics, in our opinion, can be explained by the fact that for this level of competitions programmes with a certain narrow diapason of sport specializations are characteristic, which limits the interest of the general public by the complex level of perception of professional procedures in competitions.

This opinion can also be confirmed by the statistical data resulting from the relatively high values for the impact of the factor "Local competitions" (14% for women and 16% for men), as this level of competitions is of particular interest given their involvement and the possibility of their direct participation in these events.

The low rating we mention in the factor "Competitions at regional level", which can be explained by their specialized character, unrated sports performances and their poor presentation in the media.

Thus, mass sports events, which are a main component of the Olympic Movement, are factors that update and stimulate the motivation to value and practice motor activities as an integral part of the active personality.

The majority of respondents, including 74% of women and 64% of men surveyed, say that specific exercise is an integral part of their daily regimen. In their opinion, for purposeful exercise, depending on the form of organisation and content of the sessions, 20 to 60 minutes are offered.

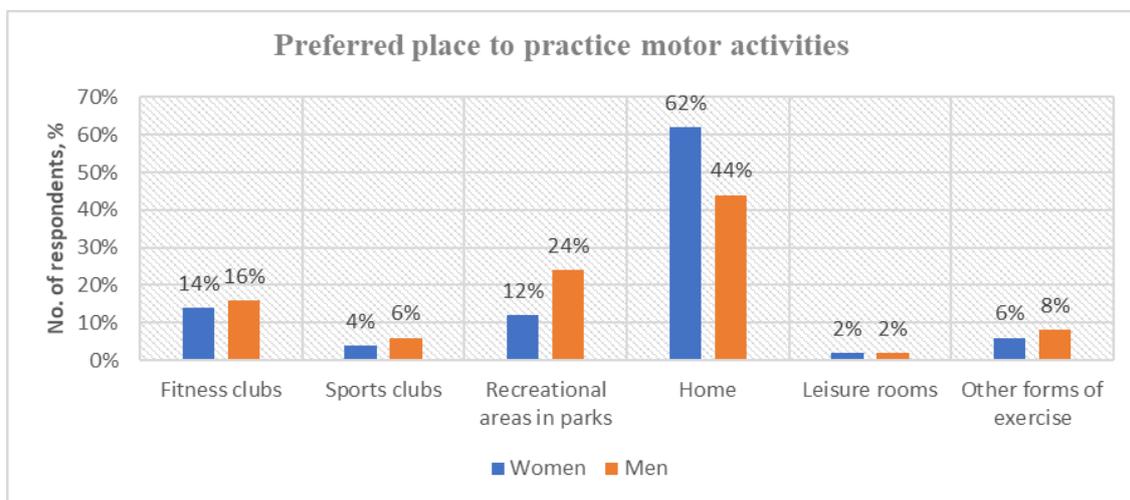

Figure 4. Respondents' answers on their preferred place to practice motor activity

According to the statistics of this survey (see Figure 4), home conditions are the most preferred form of organising physical exercise for both groups of respondents, where this index is much higher for women than for men (62% and 44%, respectively). This is explained by the fact that the very content of the sessions is a traditional complex of hygienic and maintenance gymnastics, which are performed at a convenient time and do not require special conditions and additional time for their execution. Also, a higher rate in women can be explained by the fact that women at this age prefer constancy of conditions, comfort, in any kind of activity. While men prefer variable conditions and exercises associated with large movements in space - running in the

background, overcoming various obstacles, etc., this may explain their higher indicator of the form of organisation "Leisure area in parks" (24% compared to 12% indicator in women).

It should be mentioned that in recent years, professionally organised sessions in fitness clubs have become increasingly popular among both men and women and are one of the main forms of exercise with various formative and developmental orientations, which is confirmed by the survey indicators, where such a form of motor activity is in third place, is used equally by women and men (14% and 16% respectively). Also noteworthy are independent, amateur forms of organised motor activity, significant in terms of their indicators (6% women and 8% men), which points to the need to study this experience in order to introduce it massively into the practice of physical culture for the adult population.
