

# Comparing the adoption of TSN between automotive and non-automotive networks

*Avik Bhattacharya*

*2020*

*Product Manager, Network test solutions, Keysight*

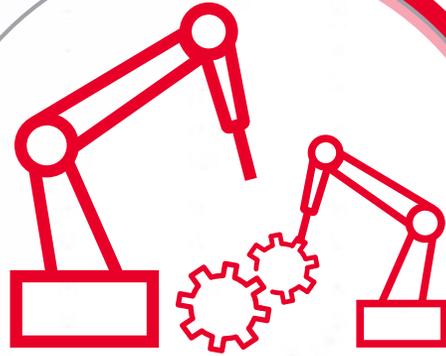

**IEEE Ethernet & IP @ Automotive Technology Week, Sept 2020**

# What is common in these industries?

PRO AV

INDUSTRIAL

AUTOMOTIVE

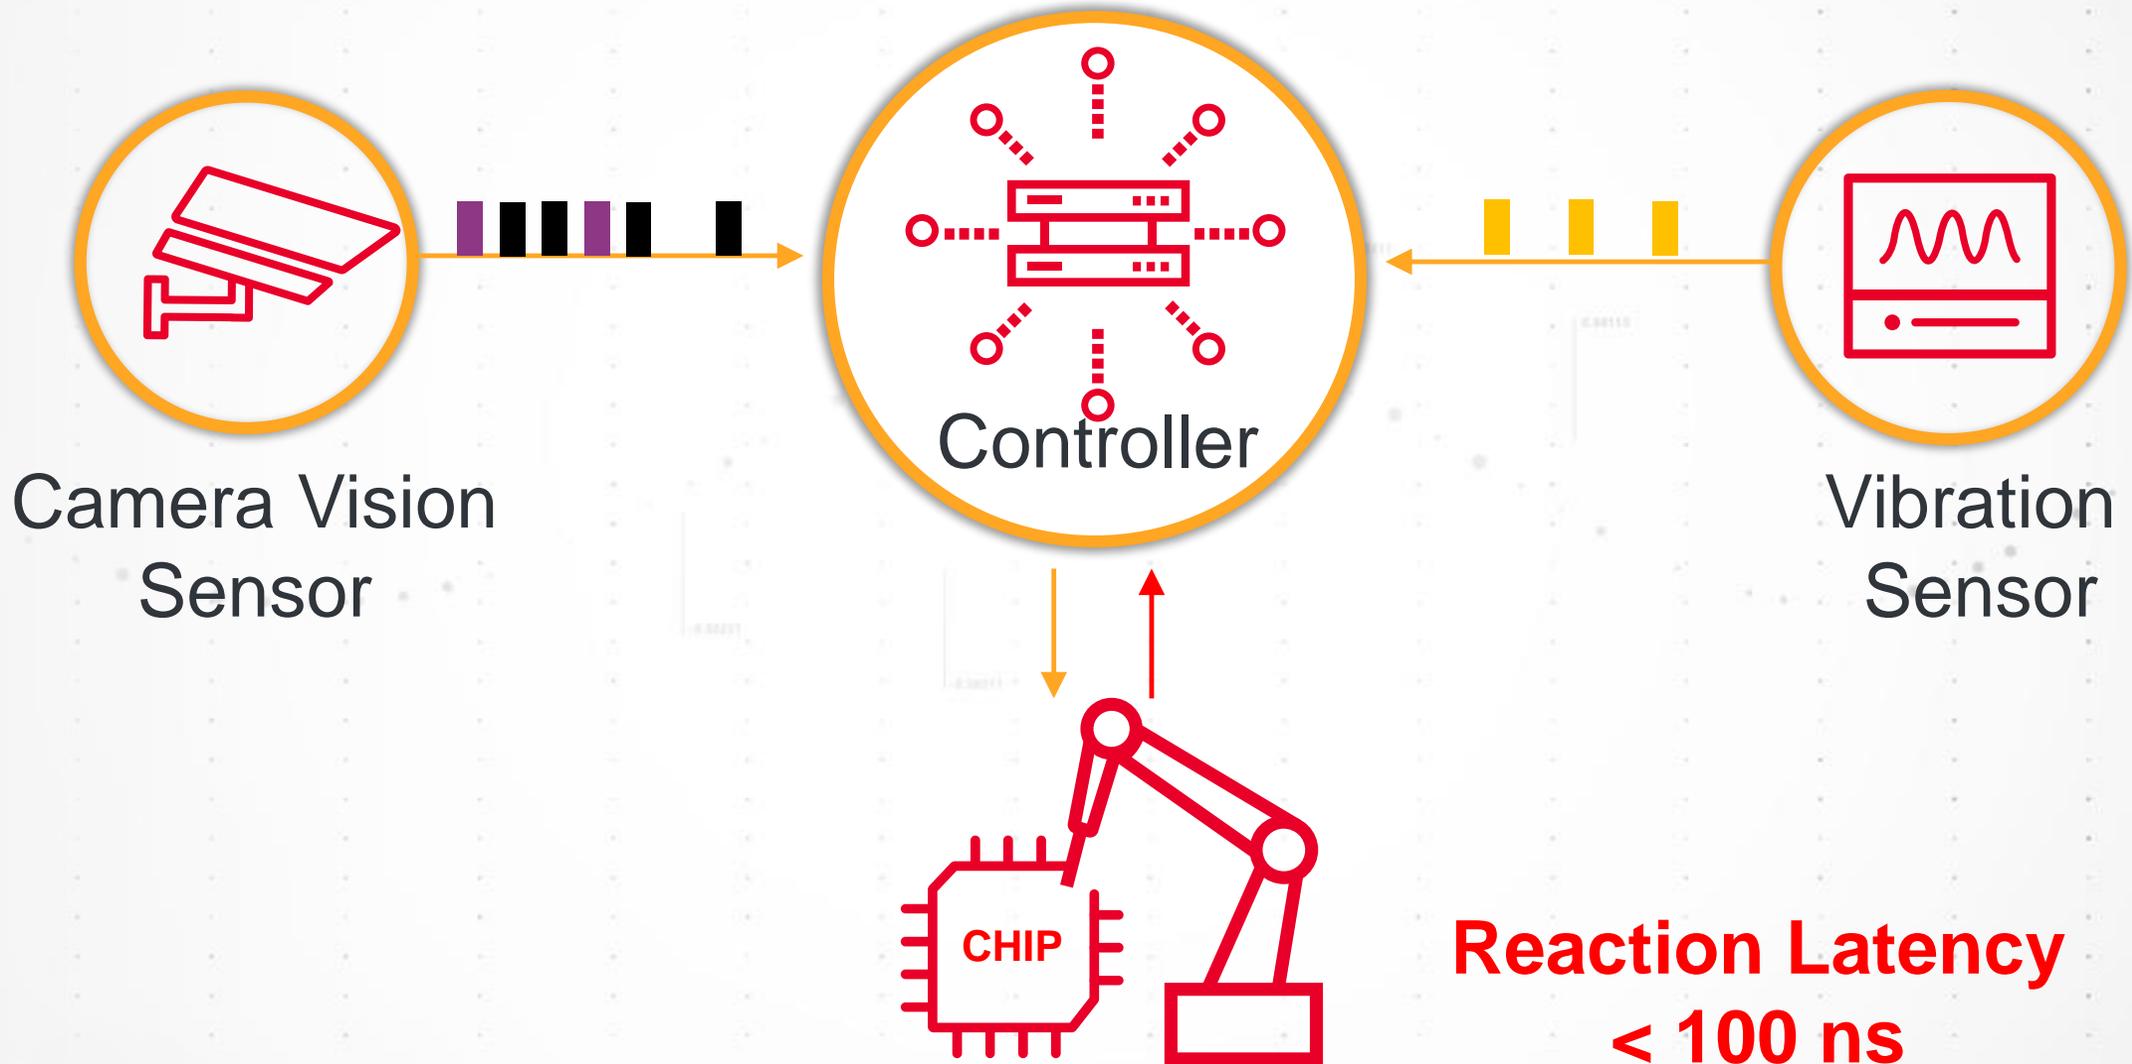

RADIO ACCESS NETWORKS

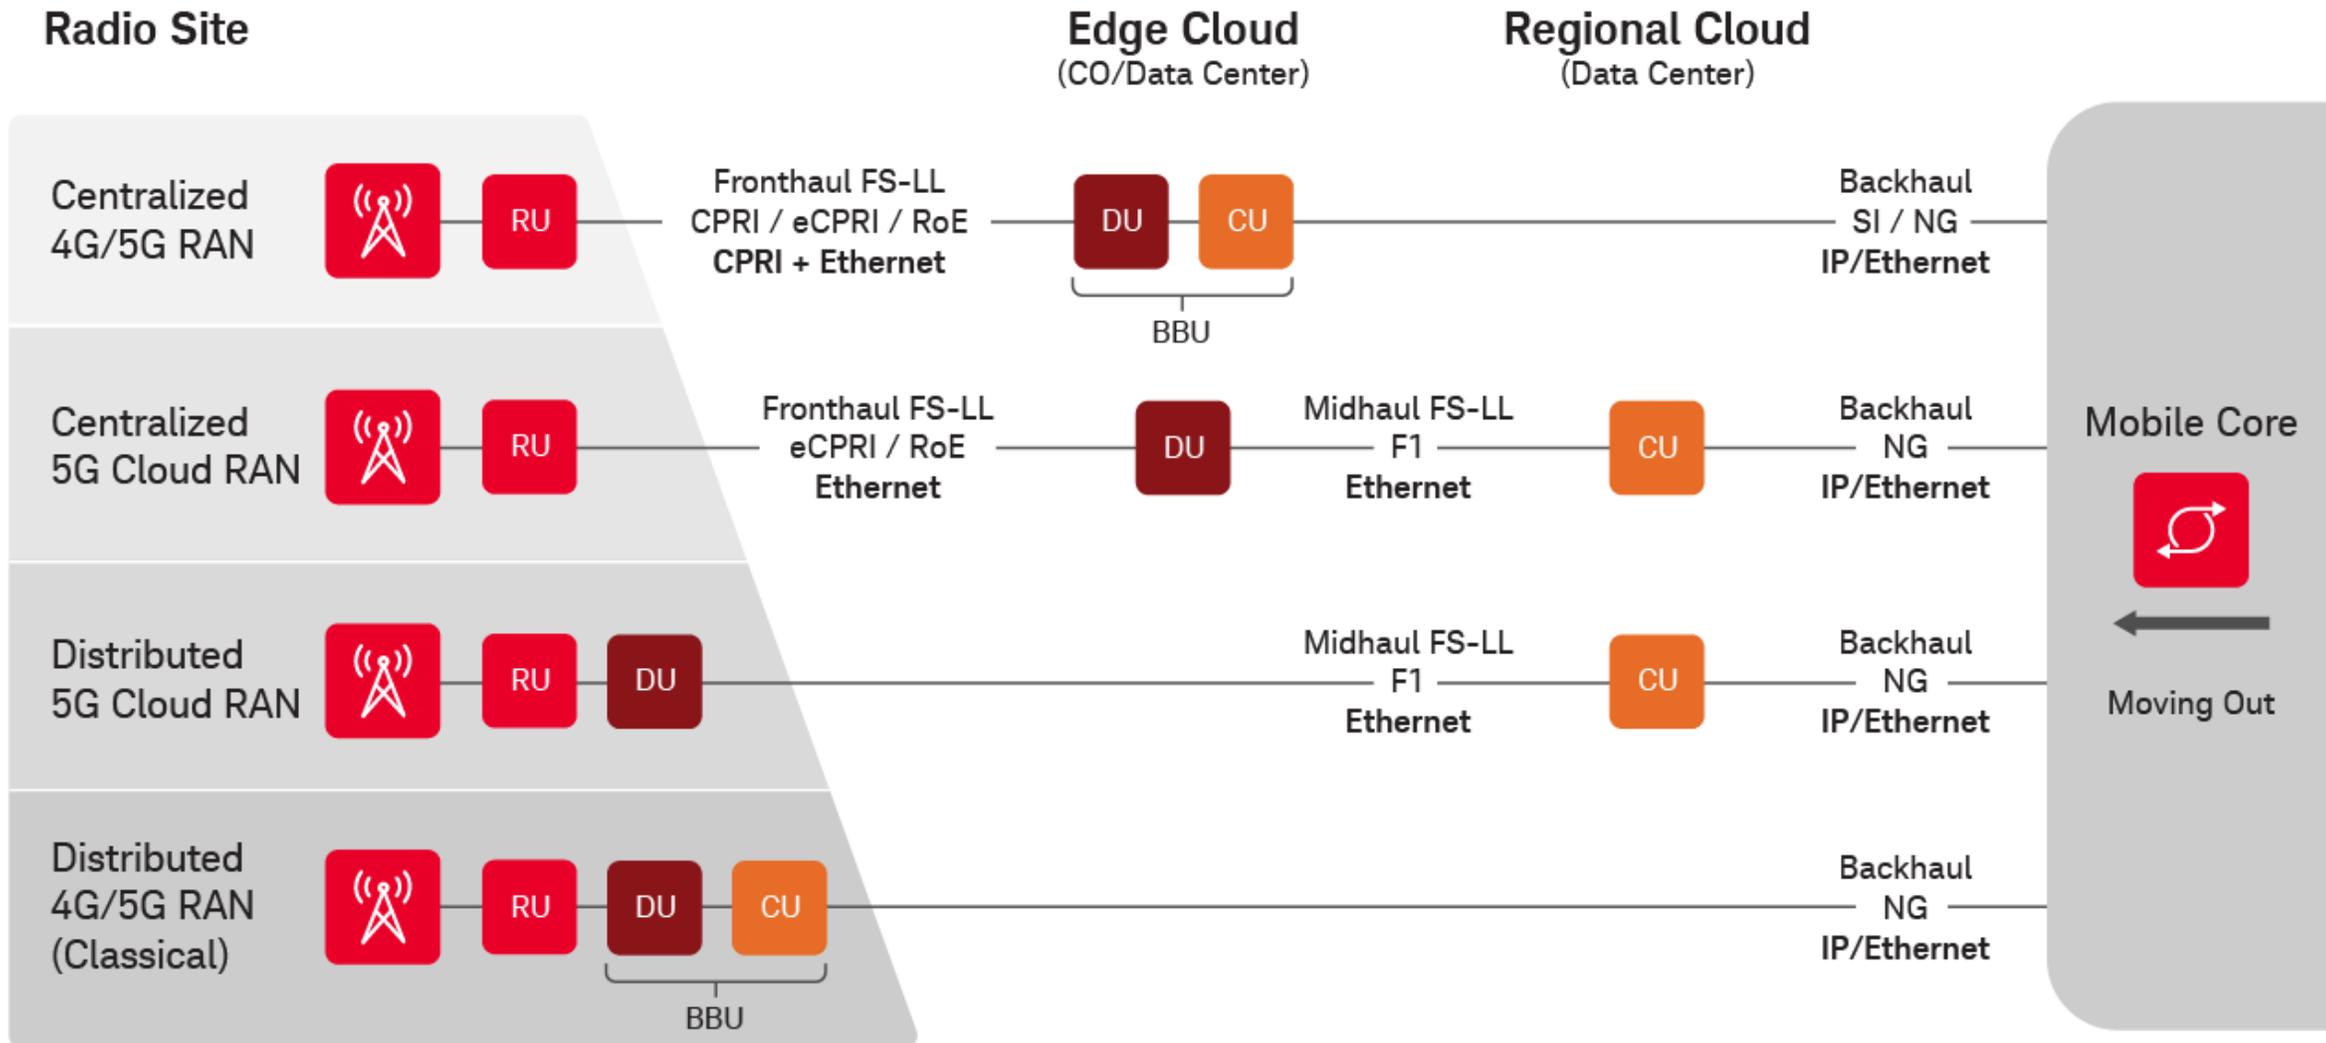

**LOW & DETERMINISTIC  
LATENCY**

**GUARANTEED  
DELIVERY**

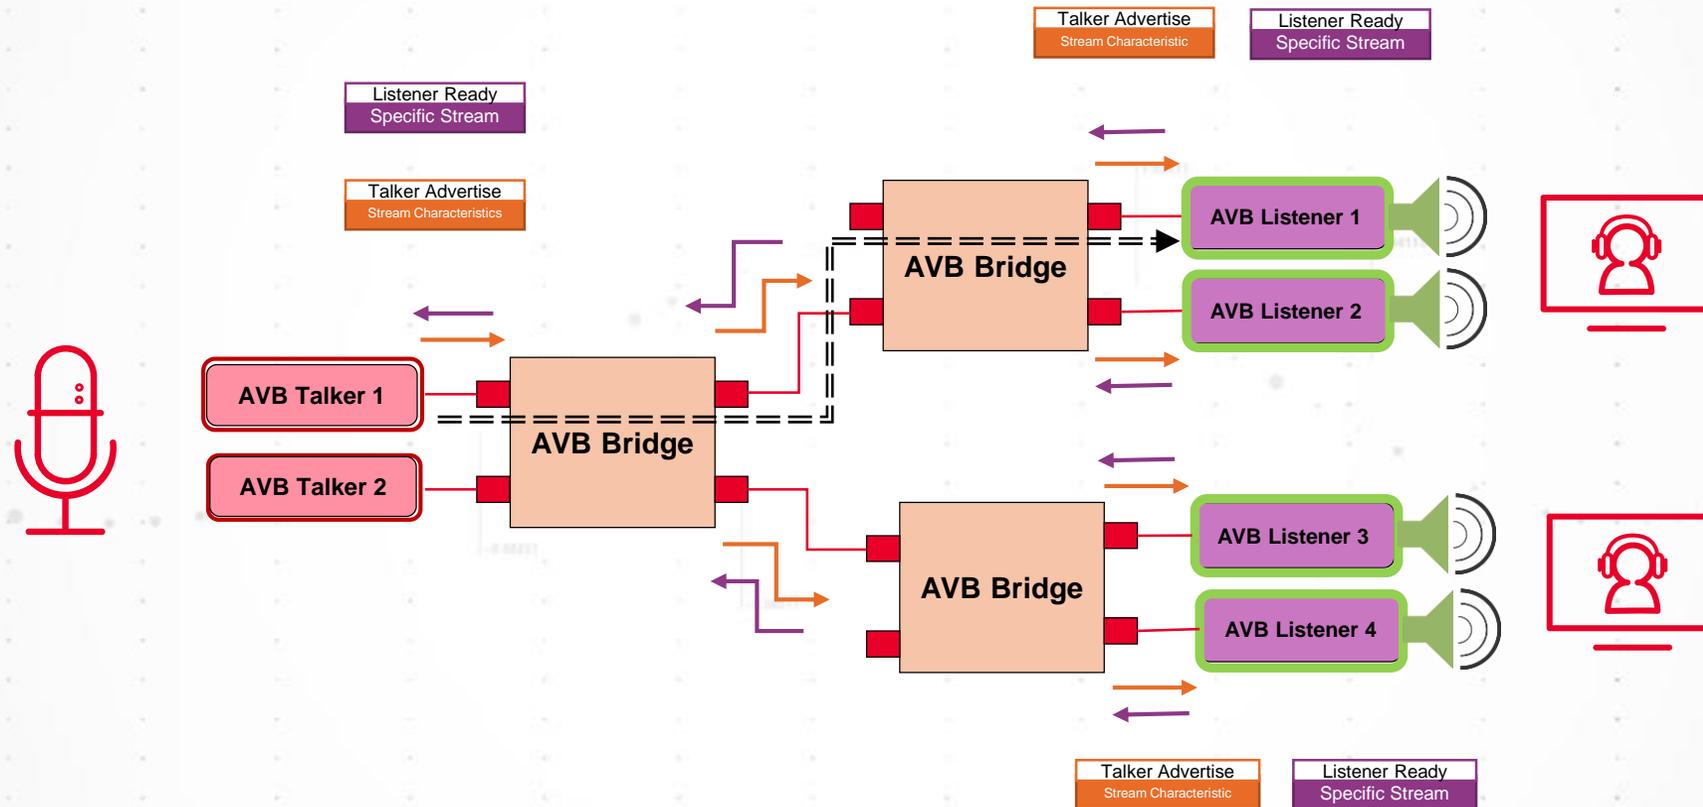

# Scenario 1: A semiconductor fabrication plant

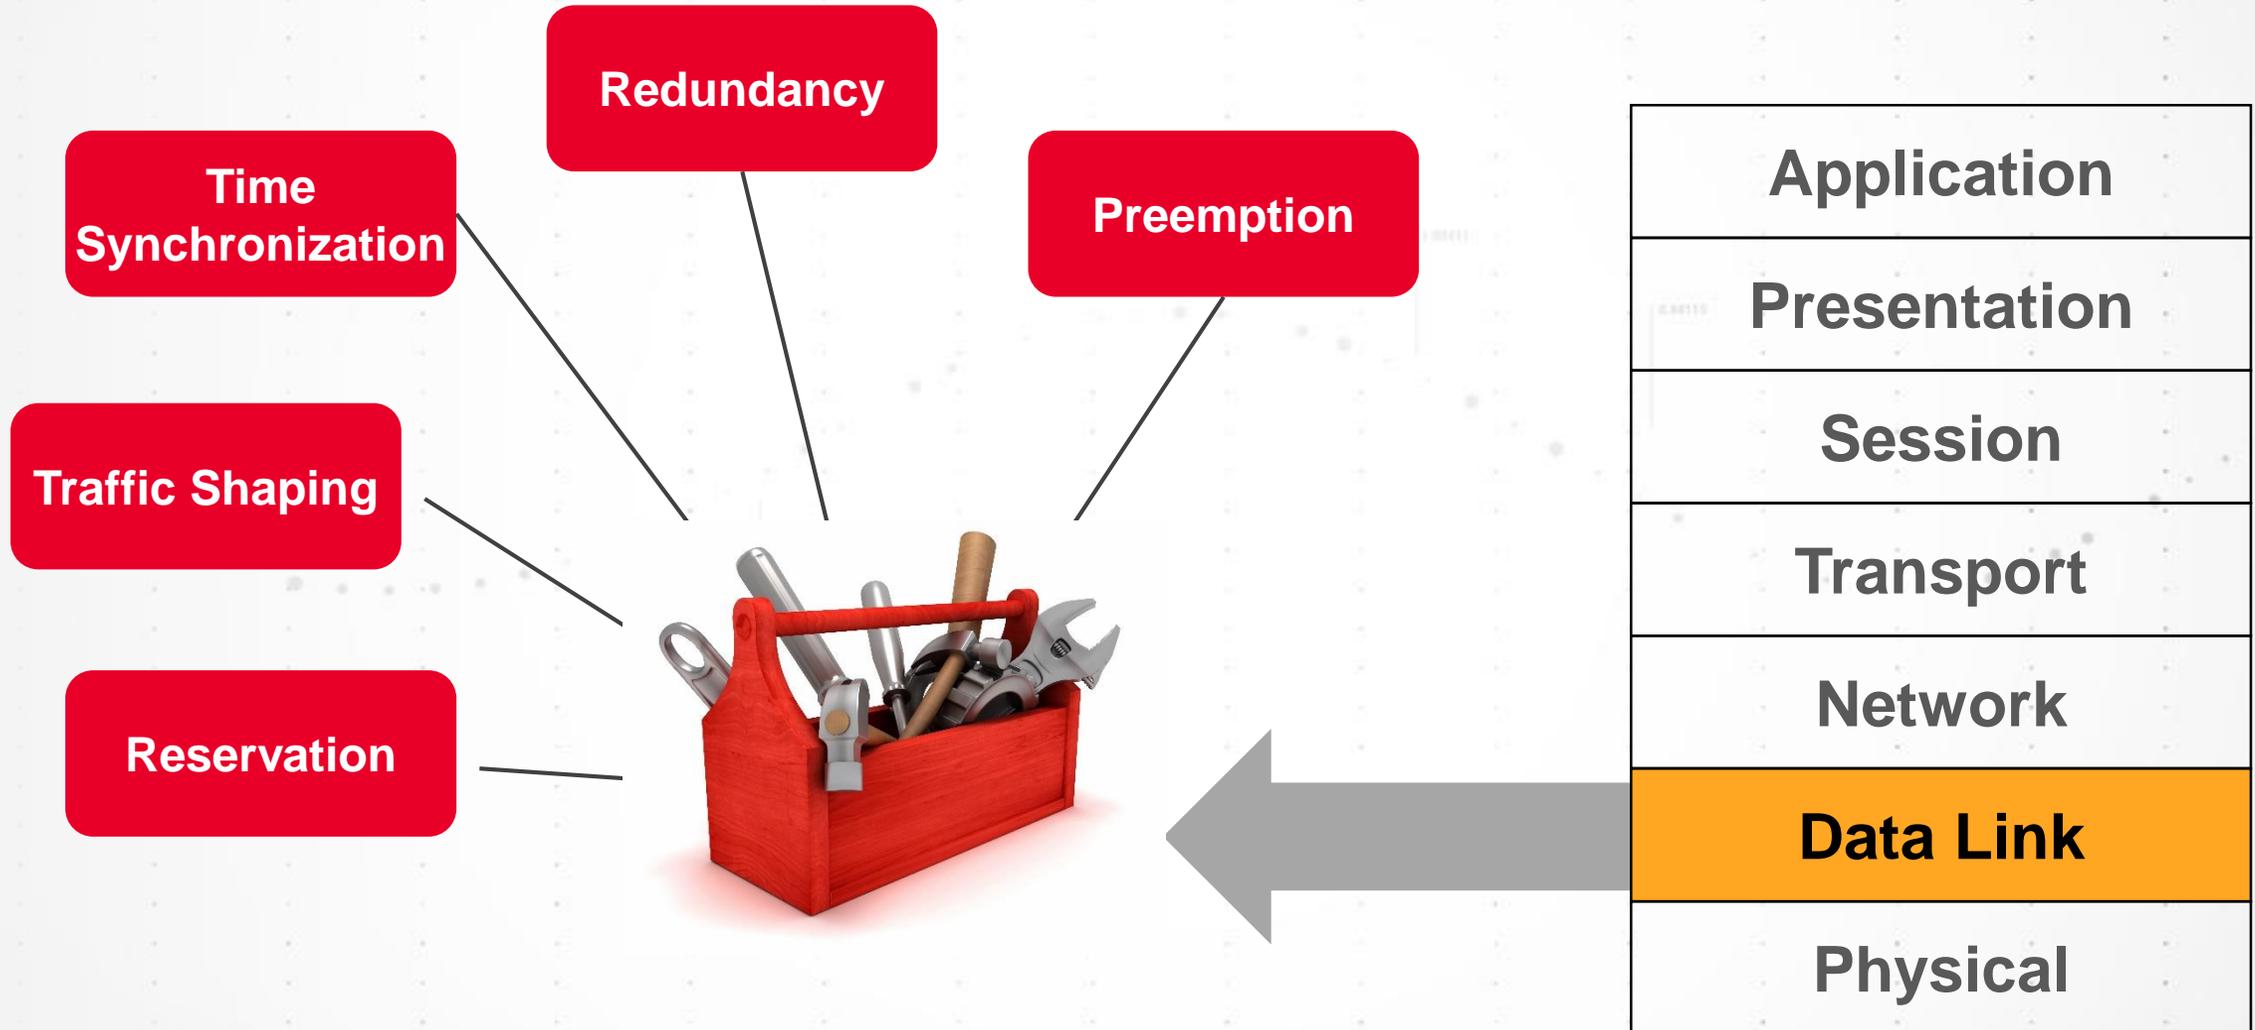

# Scenario 2: A 5G fronthaul network carrying radio data

# Scenario 3: Audio Video broadcasting network

# The TSN “ToolBox” approach

# The Network requirements are very different from each other

Characteristics	Automotive	Industrial	Pro AV	5G RAN
<b>Network Size</b>	Small	Medium	Medium / Large	Large
<b>Network Type</b>	Static	Mixed	Mixed	Dynamic
<b>Interface speeds</b>	Mostly <= 1G Occasionally 2.5/5/10GE	< 10GE	Mostly 10/40 GE Occasionally 100GE	10/25/50/100GE
<b>Traffic Types</b>	Engineered	Engineered	Engineered	Non-Engineered

Implementing Redundancy is expensive for large networks

Eliminates complexities from change in configuration over network lifetime

Gain of preemption diminishes with higher link speed

Time based traffic shaping is more effective in engineered networks

# The Latency requirements vary based on application needs

TABLE I  
END-TO-END LATENCY AND JITTER REQUIREMENTS FOR TYPICAL ULL APPLICATIONS

Area	Application	QoS Requirements	
		Latencies	Jitter
<b>Medical</b> [47]–[49]	Tele-Surgery, Haptic Feedback	3–10 ms	< 2 ms
<b>Industry</b> [50]	Indust. Automation, Control Syst.	0.2 $\mu$ s–0.5 ms for netw. with 1 Gbit/s link speeds 25 $\mu$ s–2 ms for netw. with 100 Mbit/s link speeds	meet lat. req. meet lat. req.
	Power Grid Sys.	approx. 8ms	few $\mu$ s
<b>Banking</b> [51]	High-Freq. Trading	< 1 ms	few $\mu$ s
<b>Avionics</b> [52]	AFDX Variants	1–128ms	few $\mu$ s
<b>Automotive</b> [53]–[56]	Adv. Driver. Assist. Sys. (ADAS)	100–250 $\mu$ s	few $\mu$ s
	Power Train, Chassis Control	< 10 $\mu$ s	few $\mu$ s
	Traffic Efficiency & Safety	< 5 ms	few $\mu$ s
<b>Infotainment</b> [57]	Augmented Reality	7–20 ms	few $\mu$ s
	Prof. Audio/Video	2–50 ms	< 100 $\mu$ s

# 5G RAN vs Automotive : More Stringent Latency

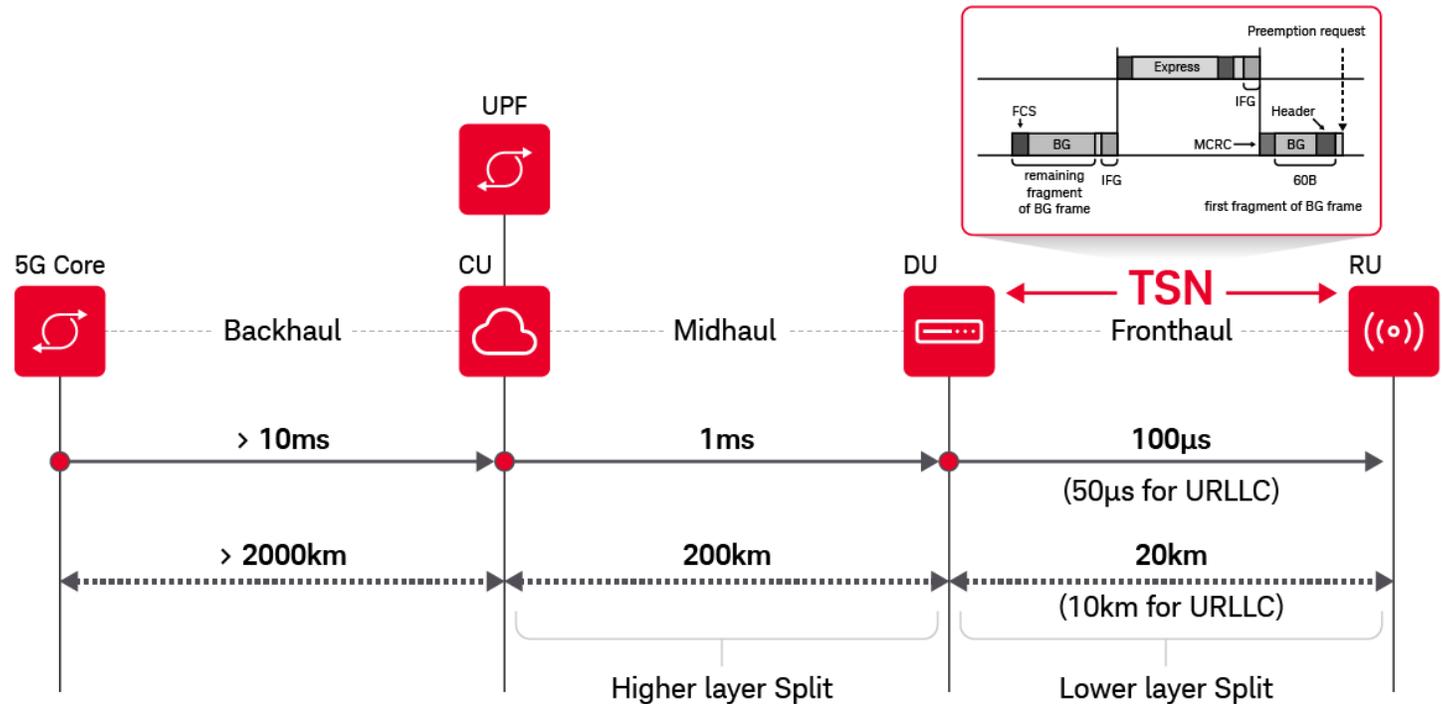

## 5G RAN FRONTHAUL

- More stringent Latency
- End-to-end 100us over 20km
- Other Traffic not predictable

## AUTOMOTIVE

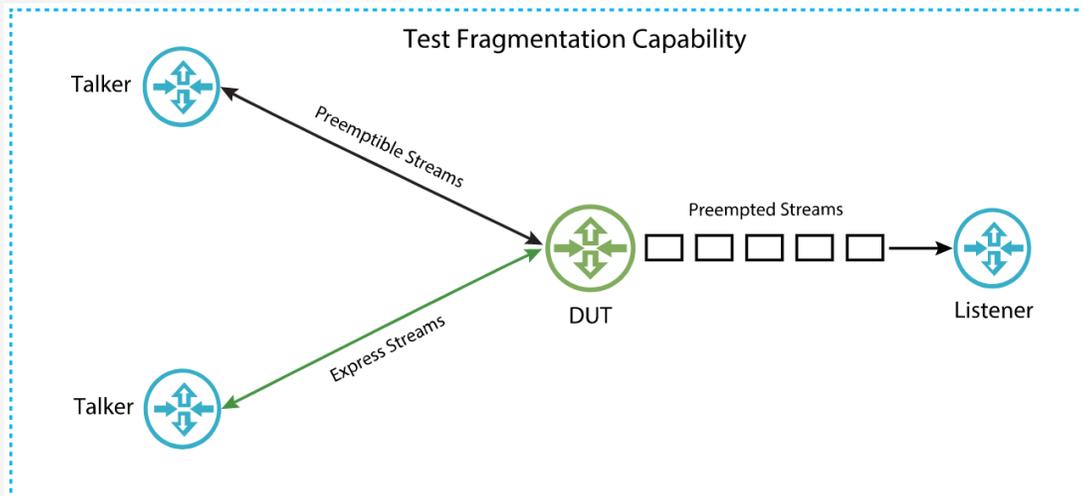

- Relatively Lenient
- Traffic Engineering Possible
- Frame preemption not required

# 5G RAN vs Automotive : More Stringent Latency

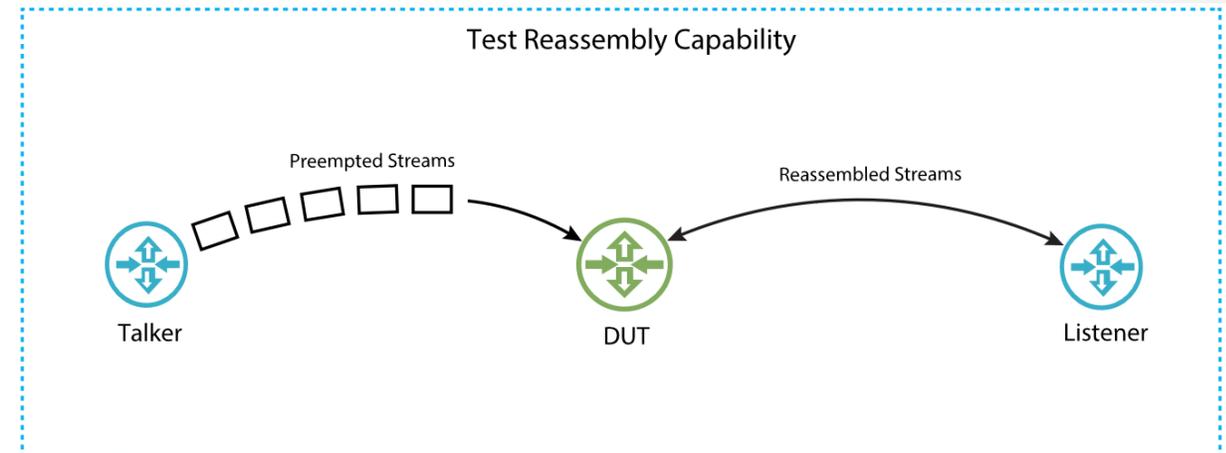

## *IxNetwork tests performed by the 5G fronthaul vendors*

### Validate Fragmentation capability of the switch

1. Emulate a mix of Express radio traffic and low priority preemptable traffic
2. Validate the fragmentation done at the fronthaul switch at line rate
3. Ensure latency guarantee of the express radio traffic.

### Validate Reassembly capability of the switch

1. Emulate a mix of fragmented traffic and Express radio traffic.
2. Ensure there is no loss for the fragmented traffic.
3. Validate reassembly of fragments by the receiving fronthaul switch.

# Open Networks vs Automotive : 1588 Time Domains

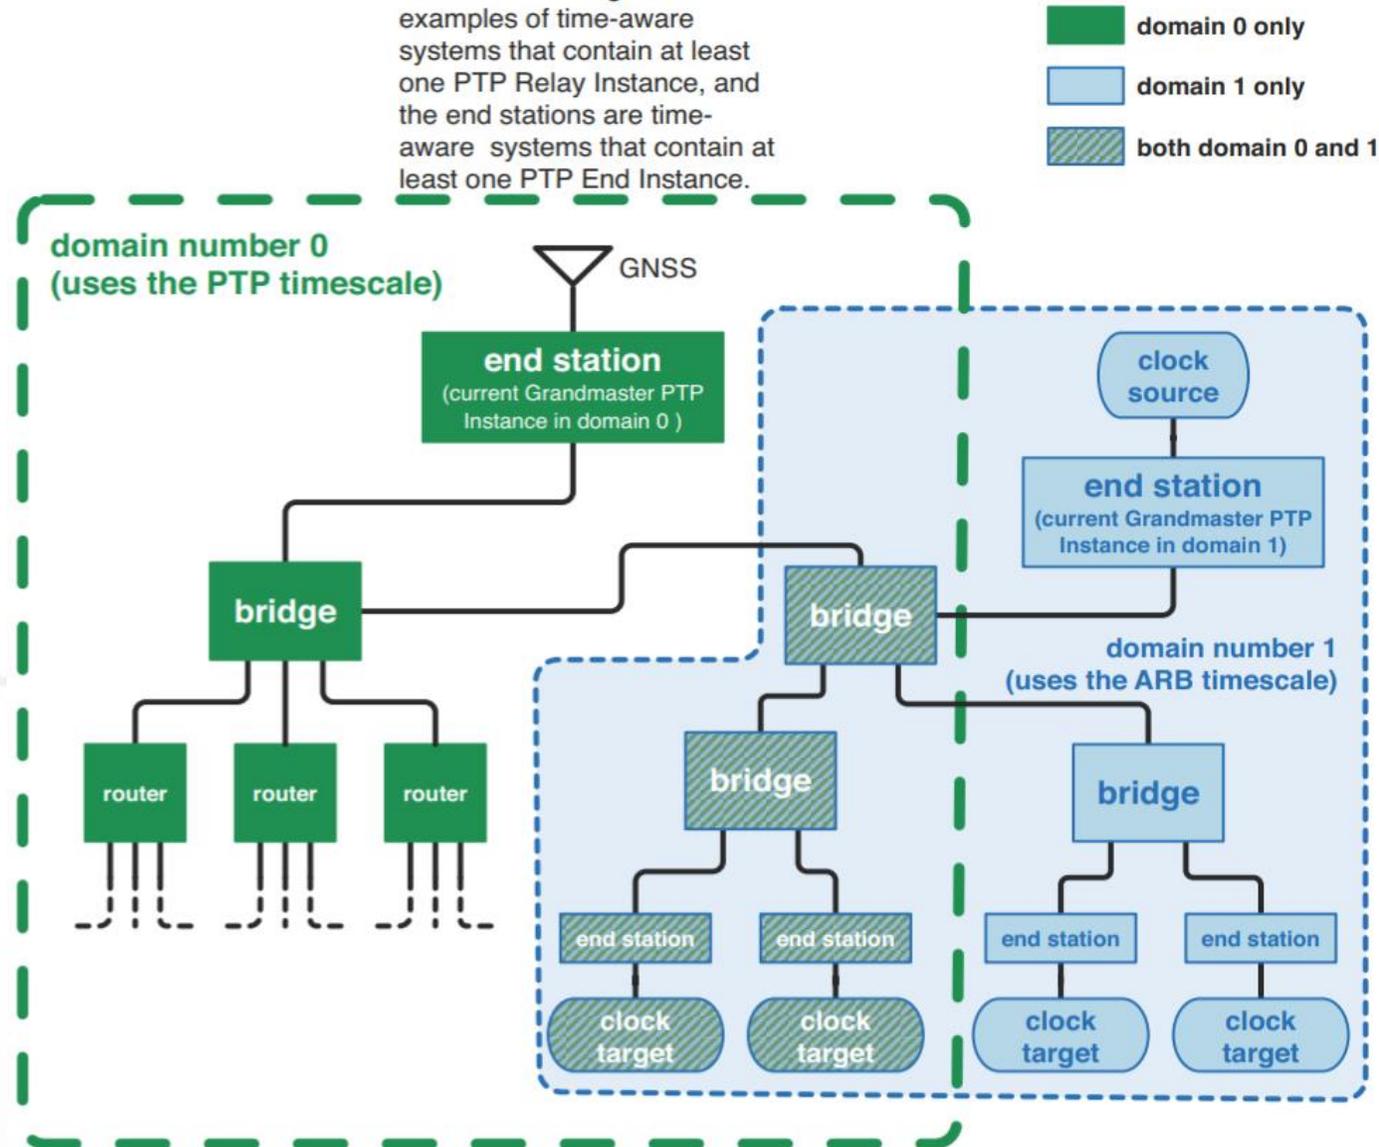

## AUTOMOTIVE

- Domain based Architecture
- Internal Domain can be isolated from the outside world
- Usage of ABR Time scale
- Multiple domain over ARB and PTP Time scale

## INDUSTRIAL / TELECOM

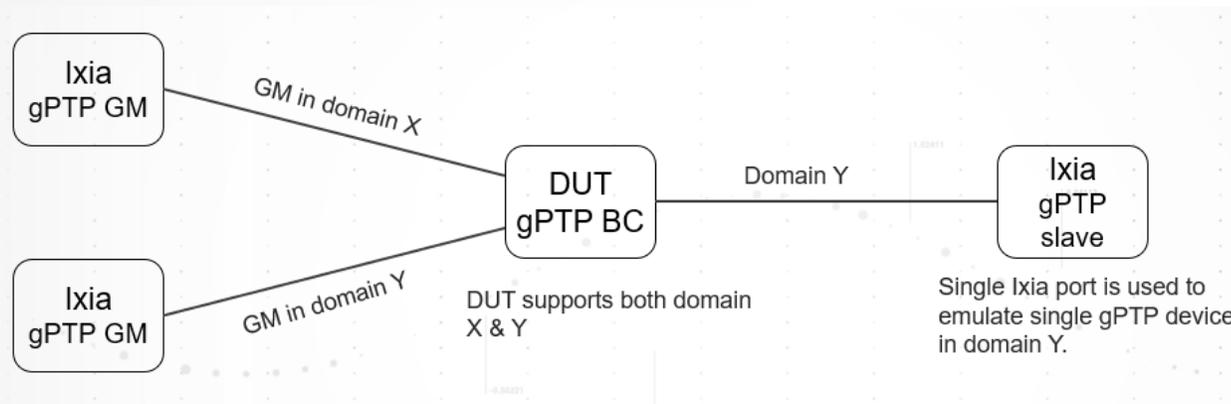

- Shared Network Architecture
- Need to be in sync with Global components
- Usage of PTP Time scale

Note: all the "bridges" and "routers" in this figure are examples of time-aware systems that contain at least one PTP Relay Instance, and the end stations are time-aware systems that contain at least one PTP End Instance.

# Open Networks vs Automotive : 1588 Time Domains

## Validation method of 802.1AS2020 by Automotive engineers

- Validating Domain gateways which are part of two different time domains
- Validating PTP enabled nodes are able to maintain time sync based on ARB time scale

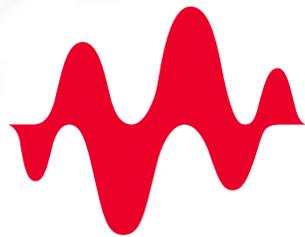

# Time Synchronisation Redundancy Used in Automotive vs Non-Automotive

## Automotive

- GM roles are preconfigured into ECU's and doesn't change too often.
- Need for running BMCA is less as new node addition to IVN is not a dynamic process.
- In absence of BMCA, Standby GM is best option for maintaining synchronization in case of a Node Failure.

## Non-Automotive

- GM roles are not preconfigured in nodes that part of an Industrial Network.
- Whenever there is need for re-electing GM, BMCA runs across to elect the best clock as GM.
- Multiple domains can be still used in industrial networks, but Standby GM can be avoided.
