## COVID-19: ASSESSING RISK FOR HEALTHCARE WORKERS

### Assessing risk for healthcare workers during the pandemic: don't forget workplace safety committees or airborne transmission

Raymond M Agius,<sup>1</sup> Lewis T Hughes,<sup>2</sup> Denise Kendrick,<sup>3</sup> John F R Robertson,<sup>3</sup> Marcia Stewart<sup>4</sup>

Khunti and colleagues advocate integrating “the workplace, the workforce, and the individual” in “assessing risk for healthcare workers during the covid-19 pandemic.”<sup>1</sup> The same approach is relevant to other workers, notably in social care. It also warrants highlighting that health and safety law requires a “suitable and sufficient” risk assessment and the involvement of workers and their representatives.<sup>2</sup>

The pandemic ought to encourage active and effective safety committees and safety representatives in all workplaces since they can make valuable contributions to risk assessment. These committees and representatives are legally mandated with provisions made for activities to be undertaken during paid time.<sup>3</sup> Such collective representative mechanisms offer an essential counterweight to the imbalance of power which exists between employees and employers. This is particularly important when the balance of power in organisations does not necessarily favour the most vulnerable, as with ethnic minority colleagues in the NHS or the poorly paid.

The article refers to aerosol generating procedures (AGP). This term implies that those procedures are the main source of viral aerosol to which healthcare workers are exposed, contradicting the evidence.<sup>4</sup> Worse still for healthcare workers, AGP is often considered to the exclusion of other procedures or even processes such as coughing or speaking<sup>5</sup> which are then not mitigated against.<sup>6</sup> The concept of AGP has limited applicability in practice and probably represents little more than early attempts to “rationalise the rationing” of protective measures and ignores important lessons about worker protection.<sup>7</sup> Those in workplaces such as general practice can be exposed to viral aerosols, even if not engaged in AGP.<sup>8</sup> All workers encountering such exposure must have a sufficient workplace assessment and appropriate risk reduction such as through better ventilation and filtering face piece respirators.<sup>9</sup>
