Supplemental Table 2: Association between concentrations of cytokines, chemokines, and bacterial taxa, and the presence of abnormal microbiota.

Wilcoxon rank-sum was used to assess for associations between the log₂ concentrations of cytokines and chemokines tested, or the log₁₀ concentrations of bacterial taxa tested, and the presence of abnormal microbiota (defined as Nugent score ≥ 4). Cytokine concentrations are reported as log₂ pg/mL. Bacterial concentrations are reported as log₁₀ genome copies/swab.
